Yu cites other studies. One in particular (Ellis, J. B., "Pollution Aspects of Urban Runoff" in Urban Runoff Pollution edited by H. C. Torno et al., NATO ASI Series, Springer-Verlag (1985)) concluded that urban highway runoff can be a significant source of pollution discharging high metal and hydrocarbon loadings. This study was based on data from European and Australian sources.

Yu's report contains a chapter on management of storm water quantity and a chapter on management of quality. Measures to control quality are subdivided, as they typically are, into non structural and structural measures. There is no discussion of street sweeping or catch basin cleaning. The report includes descriptions and design considerations for structural controls. Tools for planning and decision making are presented and institutional aspects are also discussed in the report.

VOL 12 2 6478

PART 2 MAJOR FINDINGS SUMMARIZED BY SUBJECT MATTER

1. Constituents and their concentrations in highway storm water runoff

Characterization data for highway runoff was found in the following sources:

- The mid 1970 to mid 1980 FHWA study
- 1993 monitoring data for Colorado Department of Transportation
- 1995 monitoring data for Oregon Department of Transportation
- 1992-93 monitoring data at transportation corridors for Santa Clara Valley Water District
- 1994-95 monitoring data for Caltrans Districts 3 and 6, and 8 and 12.

Priority pollutants in runoff are considered to be heavy metals and organics. Generally highway runoff has been found (Oregon Department of Transportation) to be comparable with data from residential, commercial and industrial sites, but dissolved lead (Santa Clara Valley Water District), dissolved copper, and oil and grease are often higher for highway runoff sites. On the other hand total Kjeldhal nitrogen, total phosphorous, and fecal coliform are generally lower for highway runoff sites (Oregon Department of Transportation). In Alameda County recent conclusions indicate that "metals should be de-emphasized as a cause of toxicity during storm events" and that monitoring emphasis should be placed on toxicity due to organics, pesticides, sediments (and sedimentation), and eutrophication. Earlier studies (Maestri, 1988) had indicated that metals were of greater concern than nutrients while recently (1994) Clark County found that bacteria was their primary pollutant of concern. Organic toxicants have been found in relatively greater frequencies from parking areas and vehicle service areas, and relatively high concentrations of lead have been found in runoff from vehicle service areas and streets (Pitt, 1995).

Available data are assembled in Part 3 of this report. Some observations, based on the literature are summarized here.

Highway Runoff Quality Data in California

Available data are assembled in Part 3 of this report. Some observations, based on the literature are summarized here. The data available for sites in California includes:

- FHWA data for the three sites in California (Los Angeles, Sacramento, and Walnut Creek). These data were collected in 1979, 1980, and 1981.
- Monitoring data in Districts 3, 4, 6 and 8 as required by their respective permits.

A summary of the FHWA storm water quality data from the three sites in California are shown in Table 2.1. Nationwide data reported in the literature (Barrett et al., 1993) and recent data collected by Caltrans Districts 3 and 6 are presented in Table 2.2. As seen in Tables 2.1 and 2.2 the mean concentrations reported for California sites (both by FHWA and Caltrans) are within the range of mean concentrations that were reported in the literature. Caltrans data are being compiled into a data base in MS Excel spreadsheet. The data base is preliminary and requires a quality control review before any statistical analysis can be performed.

[1] The reported values (the first three columns with data) are for the average values that were reported in the literature (Barrett, 1993).

[2] Caltrans data are summarized for Districts 3, 4, 6, and 8. This summary is preliminary and should not be cited. The numbers indicate the range of reported concentrations and the number of measurements are shown in parentheses. ND is for Not detected

R0059775

Oregon Department of Transportation (ODOT) Monitoring Program:

ODOT has developed a monitoring program with two flow-weighted composite sampling locations (near Portland (I-5) and Eugene (I-105)), five grab sampling locations to represent the western region of Oregon, and five snow sampling locations to represent snow melt runoff quality. The monitoring program sampling plan is summarized in Table 2.3. Samples were collected for the first cycle during January 1995 through June 1995, except for the grab sampling locations. A summary of the monitoring data is shown in Table 2.4.

Colorado Department of Transportation (CDOT) Monitoring Program:

CDOT's monitoring program is focused on testing for parameters that were detected during the first sampling episode (during 1993) and in the 1970s FHWA data that were collected in Colorado. The constituents included in the monitoring program are shown in Table 2.5.

A summary of the CDOT and FHWA monitoring data for Colorado is shown in Table 2.6. The data shown in Table 2.6 were collected in 1993 and 1980 for CDOT and FHWA monitoring, respectively. The data shown are comparable except for TSS and lead. The TSS difference was attributed to a single high TSS reading during one storm. The difference in lead concentration is attributed to switching to unleaded gasoline.

2. Factors affecting constituents and their concentrations in storm water runoff

Factors affecting the quality of storm water runoff are reported in Barrett et al (1993). The most influential factors are the rainfall itself, dustfall, traffic volume during the event, and removal processes such as air turbulence and storm intensity. It is recognized that there is a correlation between heavy metals and suspended solids (Sansalone, 1995), that some pollutants (e.g. lead) are associated with large particles and others (e.g. zinc) are associated with small particles (Barrett et al, 1993). Organics have been found to be more prevalent at locations where people get out of their vehicles, such as parking lots and vehicle service areas (Pitt et al, 1995).

It is clear that there are many factors affecting constituents found in storm water runoff from highways and associated right-of-way. The variability and complex combinations of these factors cause great variability in concentrations of constituents found in runoff. In reviewing available runoff data, information on the causal factors is generally not provided or is inconsistently provided. It is important to consistently record all of the factors which may contribute to runoff quality when data is collected. A composite list of factors has been drawn up by Caltrans and a task order has gone out to Woodward Clyde to compile the data for all of the appropriate factors for locations at which monitoring is being conducted in 1995/96. This data will be useful in seeking explanations for variability of concentrations in the results obtained this year. The compilation of data for contributing factors will also enable Caltrans to determine whether the 1995/96 monitoring has captured the full range of runoff quality. This can be done by looking for combinations of factors that are expected to result in concentrations at the high and the low end of the spectrum.

3. Need for continued monitoring for characterization of runoff

Because of the extreme variability of concentrations of constituents found in storm water runoff and the number of factors contributing to that variability a large amount of data would be needed to develop and verify models relating the concentrations to the factors. Continued monitoring at a few sites across California is not likely to yield sufficient data for modeling. The objective of monitoring for characterization of runoff should therefore be examined carefully.

One possible objective is to determine the likely range of concentrations of constituents in highway runoff and to compare these concentrations with those found in California municipal and industrial runoff, to data for highway runoff in other states, and to water quality criteria. After the 1995/96 monitoring season there may be enough data to achieve this objective. Another objective could be monitoring for trends in runoff quality. This would require fewer sites. Those sites should be selected to capture the most important factors contributing to runoff quality. Monitoring will also be needed for special studies. A data base compiling all monitoring data for transportation facilities in California would be useful.

4. Other objectives of monitoring.

There are many objectives for monitoring beyond those discussed above. The objectives can be divided into two categories which are identification of the problem and study of the effectiveness of solutions. Monitoring is often used in special studies. The literature review, and discussions with other permitted agencies has revealed the following objectives and associated monitoring:

- Estimation of contribution of wet weather and dry weather flow contributions to loads of pollutants, by monitoring at outfalls to receiving water. (Clark County regional Flood Control District)
- Estimation of cost effectiveness of catch basin cleaning by monitoring removal efficiency (Felstul et al, Oregon)
- Estimation of contribution of highway runoff (or constituents in the runoff) as a percentage of all contributions in a drainage area.

R0059779

- Identification of overall effectiveness by monitoring at point of discharge
- Comparison of before and after concentrations when BMPs are implemented
- Comparison of concentrations upstream and downstream of a BMP
- Estimation of pounds of pollutants removed by a BMP
- Prioritization of pollutants of concern
- Prioritization of sources of pollutants of concern

Monitoring should be targeted at objectives that will be most useful to the discharger in the storm water management program

5. Cost and effectiveness of monitoring

No discussion of the cost effectiveness of monitoring has been found. Colorado Department of Transportation estimates the cost of monitoring at $50,000 per site per year. *(Can follow up with local agencies that have permits - now have a list)*

6. Application of toxicity testing and microtox tests

The limited number of studies that have included toxicity testing of highway runoff (see Seiber, 1995, quoting from FHWA 1990, and Lopes, 1995) indicate some toxicity at 100% concentration of runoff.

FHWA results showed that, of five species (Mayfly, isopod, water flea, gammarid, and fathead minnow) used in acute laboratory bioassays, only gammarid exhibited a toxic response to undiluted highway runoff.

Lopes (1995) found toxicity to flathead minnows and to waterfleas. The percentage of first flush samples exhibiting toxicity was larger than the percentage of flow weighted samples. In most cases dilution of the storm water runoff at 1 in 2 or 1 in 4 removed the toxicity. For some samples, mostly associated with recent repaving or oiling of paved surfaces, dilution's in excess of 1 to 16 were required to remove toxicity.

Since the expected dilution of storm water runoff, on entering receiving waters is generally very large (with the exception of local creeks), the toxicity results described above do not suggest that receiving waters will become toxic due to the addition of constituents in storm water. In fact increases in concentrations of constituents in receiving water may and often do remain undetected upstream and downstream of an outfall in the receiving water.

Toxicity testing accompanied by Toxicity Identification Evaluation (TIE) to identify the constituent(s) causing the toxicity could be useful for studying hot spots or for monitoring the improvements achieved by specific structural BMPs. However there is often no toxicity at 100% concentration of runoff.

7. Identification of hot spots

No discussion of this topic has been found (except for identification of illicit connections and discharges) however information about the factors affecting runoff quality are useful in prioritizing

VOL 12 2 6487

R0059780

efforts in the search for hot spots. In one study (Lopes et al, 1995) the most toxic samples were found at sites which had recently been reparved or resealed.

8. System inventories/definition of major outfalls

The Washington State Storm Water Management Program provides a good example of the inventories needed in order to plan an effective management system.

9. Receiving water monitoring, sensitivity, and impacts

Impacts on receiving waters are site specific. Therefore it is important to have information about the receiving water. Some of this information is available but the literature reviewed has not covered this topic. One paper discusses establishment of a National Water Quality Monitoring Program (Powell, 1995). A limited number of local (California) studies have been done, these are generally a cooperative effort...need to explore more *(We have a list of local agencies with permits and can follow up on this)*

10. BMPs and their effectiveness

The initial response to NPDES requirement for implementation of BMPs is generally focused on source controls and general "good housekeeping" practices for highway operation and maintenance. Both source controls and structural BMPs are being implemented on construction sites, in maintenance yards, and at parking lots. The high costs and often high maintenance required for structural BMPs makes them unattractive to developers, for use in new developments, and to public agencies for use on highways. Roesner and Ott, 1995, estimate the cost of control measures at $6,000 per square mile of drainage area for simple source controls, and up to $3.5 million per square mile of drainage area for implementation of treatment controls as well as source controls. The literature contains many lists and descriptions of structural BMPs

11. Prioritizing efforts

The generally recognized best approach to allocation of limited resources is to use both need and cost effectiveness as prioritization criteria. Need is established by the constituent concentrations or level of toxicity of run off at any particular location and the sensitivity of the receiving water based on its uses and its existing condition.

The Best Management Practices Handbook (Municipal) area for makes the point that, in order to move the program forward, a plan should be formulated based on what is known and that the plan should include work to learn more about the problem and the alternative solutions. Each permittee is at liberty to propose their own unique plan and devise ways to evaluate the effectiveness of the plan and the BMPs for future planning efforts.

Need has been used extensively in prioritizing efforts. The identification of illicit discharges and illegal dumping which may cause hot spots in the system has received high priority. The sensitivity of the receiving water, though elusive to pin down, is considered of importance in prioritizing

VOL 12 2 6488

R0059781

effort. Construction sites which can contribute large quantities of sediment to storm drains; maintenance yards which have the potential to discharge pollutants; and parking lots where oil, gasoline, and debris accumulate are generally targeted for implementation of structural BMPs. Now, within each of these programs and within the highway maintenance and operation program, further prioritization should be based on cost effectiveness.

Using the guidelines in the Best Management Practices Handbook (Municipal) it would be logical to base prioritization of need on known factors that affect runoff quality. For example drainage from high ADT roadways would receive highest priority, drainage systems delivering the largest volume of runoff to a receiving water would receive highest priority, or drainage systems affecting drinking water or sensitive receiving waters would receive highest priority. The State of Washington DOT has taken this approach to prioritization (see Schaftlein).

It is expected that the SWRCB will want to see plans for measuring effectiveness in the resulting quality of runoff. Pamela Barkdale of the Central Valley RWQCB specifically mentioned the need to evaluate the effectiveness of source controls. It can be argued that several years of monitoring for trends in event mean concentrations are needed to evaluate the bottom line effectiveness of the system wide BMPs being implemented now and that this time should be provided before more costly (retrofit) measures are implemented. This seemed to be indicated as an acceptable approach when we interviewed Bruce Fujimoto and Mary Anne Jones. If District 7 is required to implementation costly retrofit BMPs pilot projects to study the effectiveness of such retrofit BMPs can be proposed in the SWMP as special studies.

(Note: The District 7 SWMP appears to arrive at a set of near term BMPs without going through the process of setting goals and prioritization. It could be argued that since the highway runoff pollution problem - to the extent that there is one - is pervasive and low level, BMPs should principally be "good housekeeping" and should be implemented system wide. Construction activities and maintenance yard activities are rightly selected as high priority areas because of their higher potential for creating problems in runoff. Evaluation of effectiveness, for future planning is not addressed well in the District 7 SWMP)

12. Cost/Effectiveness of BMPs

Cost effectiveness of structural BMPs can be based on the cost per pound to remove undesirable constituent(s). However, even if this cost per pound could be estimated (data on costs has not been found), nothing in the literature reviewed provides a basis for evaluating the result as cost effective or not cost effective.

A fair amount of information is available on structural BMP design and effectiveness. Settlement and infiltration are the two most commonly cited processes. Settlement effectively removes large particles and their associated constituents but infiltration, which is much more costly is needed for removal of finer particles. One of the major problems is selection of the design storm size and the required capacity of the BMP. Effectiveness is generally measured by the percentage reduction in sediments and in specific constituents, particularly metals. Percentage effectiveness for various measures are cited in the literature (Barrett et al, 1993; Dunn et al, 1995). The city of Sacramento has initiated a nationwide storm water special study/BMP data base (Sacramento County Water Agency, 1995)

VOL 12 2 6489

R0059782

Although most agencies are implementing source controls and "good housekeeping" BMPs, because these are less costly than retrofitting existing facilities with structural BMPs, very little is known about their cost or their effectiveness. The use of performance curves for optimization of maintenance activities is proposed by Felstul et al., 1995. Costs generally will be absorbed into the day to day operating budget of the agency and will diminish funds available for other maintenance activities.

Since the non-structural BMPs are generally being implemented on a system wide basis it will not be possible to measure their individual effectiveness. Their combined effectiveness will not be easy to determine either because there will be a phasing in period and their full implementation would have to be ensured before their combined effectiveness could be determined. Long term monitoring may provide trend data which will give some indication of the effectiveness of non-structural BMPs. The only agency known to be attempting to evaluate the effectiveness of non-structural BMPs is Sacramento County where a small watershed will be selected for intense implementation of non-structural BMPs and motoring to evaluate their effectiveness.

POSSIBLY ADD TO PART 1

Reporting results from 3 storm events at one site in Denver during 1993, Colorado DOT shows average TSS concentrations of 1419 mg/l. Sampling was done at the last inlet located in the median just before the outfall to a creek. The three storms occurred in July and August and had antecedent dry periods of 144, 120, and 48 hours. TSS was highest for the first storm event (2910 mg/l). The earlier FHWA study monitored 16 storm events at a different site in Denver and reported an average TSS of 345 mg/l. Highest concentrations of TSS were 1185 mg/l and 1029 mg/l and both occurred in spring (April an May).

Controlling Toxic Pollution In Urban Stormwater Runoff:

Options for Local Governments

WHAT IS URBAN RUNOFF?

Urban runoff consists of material deposited on land which is washed from urban surfaces by storms or other sources of flowing water, through the flood control system, into creeks, lakes and bays, and the ocean. Urban runoff contributes many pollutants to receiving waters. This contamination includes bacteria and viruses, toxic heavy metals and organic compounds. Prior to its discharge into receiving water, urban runoff is considered "nonpoint source pollution" (sources that are diffuse and difficult to identify). "Point source" pollution is easily traced to a specific discharge pipe such as a municipal sewage treatment plant.

WHERE DOES THE POLLUTION FROM URBAN RUNOFF ORIGINATE?

Sources of pollution in urban runoff include oil and grease, diesel emissions and leakage, car exhaust, pesticides and fertilizers, urban bird and pet waste, street litter accumulation, road surface abrasion by traffic, vehicle tire wear, sedimentation from construction, and the illegal disposal of toxic wastes by businesses, industry and individuals.

HOW MUCH WATER POLLUTION IS ATTRIBUTED TO URBAN RUNOFF?

In recent years evidence has accumulated indicating that in most urbanized areas **stormwater is one of the most significant sources of water pollution.** A recent study by the Aquatic Habitat Institute indicates that urban runoff accounts for one-third of the PCBs and PAHs found in the San Francisco Bay, in addition to one-sixth of the hydrocarbons, one-fourth of the mercury and one-tenth of the lead. Nonpoint pollution expert Michael Stenstrom from UCLA estimates that about 50% of the oil and grease pollutants in Southern California oceans and bays comes from runoff.

WHO IS TAKING RESPONSIBILITY FOR CONTROLLING POLLUTION FROM RUNOFF?

The State of California has not yet developed a coherent management strategy for controlling pollution from urban runoff.

Section 208 of the National Clean Water Act requires states to develop a statewide nonpoint source assesment program describing the measures the state will take to address nonpoint source pollution, however federal funding for this program has been eliminated. The State of California has proceeded, without funding, and has developed a draft assessment plan and a management plan.

This preliminary document has begun the process of determining the impact of nonpoint source pollution on California's receiving waters. Some regional water quality control boards have gone further. The San Francisco Bay Area Regional Water Board is working with Santa Clara and Alameda Counties to institute a planning program. The City of Los Angeles is currently evaluating its runoff problem with a $3.3 million study of the relative contributions of different land uses to nonpoint pollution.

R0059787

VOL 12 2 6494

Section 405 of the Clean Water Act will require municipalities to acquire a NPDES (National Permit Discharge Elimination System) permit for stormwater discharges. The specific requirements of these permits should be released by the EPA in February, 1989. In general, cities and counties will be required to identify pollutants in the outfall and to list pollution control measures. Measures to control illegal dumping will receive specific attention.

City and county public works departments will usually be the responsible agencies. Cities and counties with combined sewer/storm runoff systems will not be affected.

Most steps toward cleaning up pollution from urban runoff will require local government action. **Local governments can and should take responsibility today for leading the way in addressing the control of pollution from urban runoff.**

URBAN RUNOFF POLLUTION CONTROL OPTIONS

Pollution control of urban runoff can be addressed either at the point of pollution generation or at the point of pollution transport.

Intervention at the point of generation attempts to stop the introduction of the pollutant to the storm drain system. Intervention at the point of transport is designed to "treat", contain or minimize the effluent after it has been introduced into the environment, mainly through structural measures. To control the level of pollution in urban runoff, it is necessary to control the transportation of sediments. Most toxic materials are hydro-phobic -- they naturally seek out particles in the flow (such as pebbles or grains of sand) and attach to the surface of these solids. Thus, dealing with sedimentation is viewed as the principal strategy for the structural control of urban runoff quality.

INTERVENTION AT THE POINT OF POLLUTION GENERATION

When it can be accomplished, it is obviously preferable to prevent the introduction of toxic substances into urban runoff rather than to put a band-aid on the problem. The measures listed below are preventive strategies. All are important steps to take and can be implemented alone or in tandem with one another.

Automobile Tune-ups

A significant portion of the hydrocarbons which occur in urban runoff can be traced to incomplete combustion of automobile fuels or dripping oil pans. A well functioning smog control device and regular automobile tune-ups can dramatically reduce auto pollutants. Local governments should make their citizens aware of the importance of proper automobile maintenance to the preservation of their rivers, oceans and bays.

Oil Recycling Facilities

20 to 30% of waste lubricating oil disappears and is apparently improperly disposed of in landfills or storm drains. Local governments should take steps to assure that oil recycling centers are available to the citizens of the community and should promote their use by community residents. In Ventura County, when a hazardous waste generator agrees to serve as a waste oil recycling collection site, the business's local hazardous waste fees are reduced by 75%.

R0059788

VOL 12 2 6495

Small Business Programs

Small businesses are the group most likely to improperly dispose of toxic waste. Local governments have several options to encourage proper disposal:

- o Spur development of small business cooperative waste recycling and disposal ventures;
- o Provide small business with educational programs; and
- o Incorporate small businesses into existing regulatory programs: local generator inspection programs and industrial wastewater permit programs.

(See Local Government Commission Guidebooks: Low Cost Ways to Promote Hazardous Waste Minimization: A Resource Guide for Local Governments; and POTWs Can Help Industry Reduce Toxic Waste and Discharges.)

Waste Reduction Programs

Once a specific site has been identified as a contributor to nonpoint pollution, e.g. a parking lot or construction site, local government can develop educational, technical assistance or regulatory programs to help identify and correct the particular practices that are leading to the contamination.

Educational programs provide hazardous waste reduction information to the operators of the problem site. Technical assistance programs provide in-depth, direct assistance through on-site consultations. Regulatory programs promote reduction through additions to codes, licences, permits and permit applications. (For a general understanding of these three program options, see LGC guidebooks: Low Cost Ways to Promote Hazardous Waste Minimization: A Resource Guide for Local Governments; POTWs Can Help Industry Reduce Toxic Waste: and Discharges; and Local Government Regulatory Options for Reducing Hazardous Waste.)

Reducing Pesticide and Fertilizer Use

Reducing pesticide and fertilizer use at the source may be the only viable way to remove these pollutants from urban runoff. Local governments should adopt Integrated Pest Management programs for use on their own public grounds in addition to promoting their use to community residents. (Integrated Pest Management (IPM) is an agricultural strategy for reducing reliance on synthetic pesticides and fertilizers. It is a systems approach that employs techniques such as crop rotation, conservation tillage and natural insect predators to ward off crop pests and prevent soil depletion.)

Institute Household Hazardous Waste Disposal Programs

Household chemicals are among the most harmful to receiving waters: contributing foul odors, killing aquatic life, destroying visual aesthetics and making water unsuitable for swimming. All local governments should provide their residents and small businesses with a safe method of disposal of household hazardous wastes and consumer education regarding less toxic product alternatives. The general public should be informed of the dangers of using the sewers or the storm drains to dispose of household toxics, including hazards to the environment, food chain etc.. (See Golden Empire Health Planning Center guidebooks available through the Local Government Commission for assistance in establishing a household hazardous waste disposal program: Alternatives to Landfilling Household Toxics; Household Hazardous Waste: Solving the Disposal Dilemma; and Making the Switch: Alternatives to Using Toxic Chemicals in the Home.)

VOL 12 2 6496

R0059789

Local Enforcement of Disposal Waste Laws

Experts feel that illegal dumping is a major source of nonpoint pollution, thus more aggressive enforcement of existing laws will prevent this source of contamination. Local enforcement involves tracing the point at which the contaminant is introduced to the system and eliminating the illegal activity. This could involve the creation of a toxics strike force. (See Local Government Commission guidebook for information on the establishment of a toxics strike force: Toxics Law Enforcement: Taking Local Action.)

Prevention of the Erosion of Construction Sites

Newly excavated sites tend to contribute significant amounts of sediments and toxic materials to the drainage system. Certain steps can be taken to minimize this process.

- Minimization of stripped areas
- Straw bale filters
- Temporary seeding and mulching of all stripped areas
- Conservation cultivation practices on steep slopes
- Traffic control on construction sites
- Berms and crushed stone on construction roads
- Temporary water diversion on steeply sloping sites and temporary chutes
- Temporary checkdams on all waterways draining more than one-half acre of land under construction
- Entrapment of sediment from runoff prior to discharge from construction sites
- Reduction of effective slope length in critical areas with benches or terraces
- Establishment of protective vegetation on steep slopes

All San Francisco communities are recommended to have erosion control ordinances by the San Francisco Bay Area Regional Water Board. For an example of an erosion control ordinance, see Attachment B, Alameda County Ordinance 82-17. For an example of a watercourse protection ordinance, see Attachment C, Alameda County Ordinance 82-18.

Intervention at the Point of Pollution Transport

The structural interventions listed below are but a few of the many possible strategies for dealing with urban runoff. If we are to effectively deal with the problem, it is necessary to conceive of the issue comprehensively. The following alternatives will work best if they are implemented conjunctively, in addition to the preventive measures listed above.

Street Sweeping

Street sweeping is one of the most common means of controlling pollution from urban runoff. Sweeping picks up the dust and dirt particles to which all sorts of pollutants adhere. Sediment picked up includes contaminants such as heavy metals, oils and grease, floatables and salts. Sweeping is less effective at capturing nutrients, bacteria, and pesticides and herbicides because these adhere to the finest dust particles, which sweepers do not capture well.

Because it is the rain which is responsible for carrying street pollutants into waterways, the most important times to sweep are prior to storms -- especially just before the first flush of the rainy season and then frequently during the rainy months. Cleaning commercial and industrial areas three times per week, just before and during the rainy season, is recommended.

New technologies using wet-sweeping methods have been found to be much more effective than the traditional sweepers that often simply wash contaminants into storm drains. New sweepers use non-toxic solvents to loosen particles from street surfaces and vacuum them.

R0059790

VOL 12 2 6497

Oil-Water Separators

An oil-water separator is a tank or box which reduces turbulence. The oil, being lighter than the water, rises to the surface and is skimmed off.

Runoff from commercial properties and parking lots contains oil and grease concentrations three times higher than runoff from residential areas, thus oil-water separators are most useful placed in these locations.

Reduction in the Amount of Impervious Surfaces

A study by Michael Stenstrom and Associates determined that if the flow from parking and commercial property could be controlled, oil and grease emissions into local receiving waters would be reduced by over 50%. Planning greenbelts and reducing the amount of impervious surfaces and replacing them with porous alternatives such as porous asphalt paving and precast lattice concrete and bricks will allow for some of the runoff to percolate into the soil underneath the paved surface. It is crucial that this strategy be employed only where there is no danger of polluting groundwater supplies.

Detention /Retention Basins

Detention basins are ponds which hold back some of the runoff for delayed release to prevent flooding. During this period much of the debris settles, thereby improving water quality. Detention basins do not reduce the total volume of stormwater to the streams. Because dissolved solids can percolate down to the water table, detention basins should not be used where there is a danger of contaminating groundwater.

Retention basins operate on the same principal as the detention basins but are designed to retain a portion of the runoff for evaporation or infiltration back into the ground. Retention basins will not work in areas where clay and other impervious soils exist and should not be used in areas where groundwater could be contaminated. Wet basins which maintain a permanent water pool have been demonstrated by the National Urban Runoff Program, run by the EPA, to remove 90% of the particulates.

Catch Basins in Stormdrain Openings

A catch basin is a box placed underneath a gutter which catches solids and allows liquid to flow over the edge.

Used in the mouths of stormdrain openings, catch basins could act as the first point of sediment settling for urban runoff. However, to be effective, catch basins must be cleaned periodically, especially during the storm season.

Grassy Swales

The placement of vegetation on the sides of stormdrain channels has been demonstrated to significantly reduce the amount of pollutants in stormwater. The velocity of the water is slowed, which allows for sedimentation. Periodic maintenance is required to remove accumulated materials in order to prevent clogging and the release of accumulated contaminants into the water of later storms.

Gravel and Small Stones in Stormdrains

Working with the principal that most toxics are hydro-phobic, gravel and small stones tend to attract the chlorinated hydrocarbons and heavy metals suspended in the flow. The toxics naturally adhere to the surface of these solids in the flow. Periodic maintenance is required to clean contaminants from the channels and to prevent clogging.

VOL 12 2 6498

R0059791

Natural and Artificial Wetlands

As demonstrated by the San Diego Water Reclamation Agency and several Bay Area cities, wetlands have been shown to significantly improve the water quality of urban runoff. Sedimentation appears to be the primary method of water quality improvement in wetlands. Heavy metals tend to be absorbed by the peat in wetlands as well as by the suspended particles. Petroleum hydrocarbons may be evaporated, dissolved in water or digested by bacteria. Nutrients will be taken up by wetland plants. However the eventual effects of cumulative sedimentation and concentration of contaminants on the wetland's vegetation and wildlife are unknown.

Treatment

Experience with storm drains that are combined with sewer systems has shown that large storms can cause an overflow in the sewer system, causing severe health and management problems. There are steps which might be taken to avoid this problem. Only the first few hours of a storm, or a small storm (the period most damaging in terms of picking up toxics) would be routed into the treatment system. Another alternative would be to divert the flow from commercial and industrial areas to specifically designed primary treatment plants. Detention ponds would hold the flow for later treatment.

One of the most promising new technologies for the treatment of urban runoff is the Coordinate Chemical Bonding and Absorption (CCBA) process (Appendix C). The San Diego Water Reclamation Agency has already demonstrated the capability of the process to remove toxics and organics from industrial, municipal and urban runoff waste. Since CCBA plants only cost one-fourth of that of a conventional treatment plant and only take up a quarter of the space, it may be possible to use the CCBA process to treat both sewage and urban runoff.

CRITERIA TO USE IN EVALUATING CONTROL OPTONS

Criteria to use in judging the most desirable control options would include the following:

- Addressing the largest pollutant contributors
- Reducing the most damaging pollutants
- Giving the biggest "bang for the buck"
- Choosing options that are relatively easy to implement
- Keeping or restoring the beneficial uses of receiving waters
- Judging whether the control option simply transfers pollution from one medium to another, or whether it actually reduces pollution at the source.

No single control method provides the answer to reducing pollution from urban runoff, no single technology offers a panacea. To control the pollution of our rivers, bays and oceans, local elected officials must take a strong leadership position, implementing many of the interventions listed above.

ORDINANCE NO. 82-17

AN ORDINANCE ESTABLISHING MINIMUM STANDARDS AND PROVIDING REGULATIONS FOR GRADING, CONSTRUCTION AND MAINTENANCE OF LAND FILLS AND EXCAVATION AND FOR CONTROL OF EROSION AND SEDIMENT

The Board of Supervisors of Alameda County, State of California, do ordain as follows:

SECTION I

CHAPTER 9 (Commencing with Section 7-110.0) is hereby added to Title 7 of the Ordinance Code of the County of Alameda to read as follows:

CHAPTER 9

GRADING, EROSION AND SEDIMENT CONTROL

ARTICLE 1. PURPOSE AND DEFINITIONS

Sec. 7-110.0 Title. This Chapter shall be known as the Grading Ordinance of Alameda County.

Sec. 7-110.1 Purpose. This Chapter is enacted for the purpose of regulating grading on private property within the unincorporated area of Alameda County to safeguard life, limb, health, property and public welfare; to avoid pollution of watercourses with nutrients, sediments, or other earthen materials generated on or caused by surface runoff on or across the permit area; and to ensure that the intended use of a graded site is consistent with the Alameda County General Plan, any Specific Plans adopted thereto and applicable Alameda County Ordinances including the Zoning Ordinance.

Sec. 7-110.2 Definitions: Unless the particular provision or the context otherwise requires, wherever the following terms are used in this Chapter, they shall have the meaning ascribed to them in this section:

(a) AGRICULTURAL OPERATION is any land related activity for the purpose of cultivating or raising plants or animals or conserving or protecting lands for such purposes when conducted on agriculturally zoned lands and is not surface mining or borrow pit operations nor preparation for construction or construction of any structure for human occupancy.

(b) BEDROCK is the solid undisturbed rock in place either exposed at the ground surface or beneath surficial deposits of loose rock or soil.

(c) BENCH is a relatively level step excavated into sloping natural ground on which engineered fill or embankment is to be placed.

(d) CIVIL ENGINEER is a professional engineer registered as a Civil Engineer by the State of California.

(e) COMPACTION is the increase of density of a soil or rock fill by mechanical means.

(f) CUT. See Excavation.

(g) DEPTH OF FILL is the vertical dimension from the exposed fill surface to the original ground surface.

(h) DEPTH OF EXCAVATION (Cut) is the vertical dimension from the exposed cut surface to the original ground surface.

(i) DIRECTOR OF PUBLIC WORKS is the Director of Public Works of Alameda County, California, acting either directly or through his authorized deputies.

(j) EMBANKMENT. See Fill.

(k) ENCROACHMENT PERMIT is a written permit authorizing certain work within a publicly maintained right-of-way.

(l) ENGINEERING GEOLOGIST is a registered geologist certified as an Engineering Geologist by the State of California.

(m) ENGINEERING GEOLOGY is the application of geologic knowledge in the investigation and evaluation of naturally occurring rock and soil for use in the design of civil works.

(n) EROSION is the wearing away and transporting of earth material as a result of the movement of wind, water or ice.

(o) EXCAVATION (Cut) is the removal of naturally occurring earth materials by mechanical means, and includes the conditions resulting therefrom.

(p) EXISTING GRADE is the elevation of the ground surface at a given point prior to excavating or filling.

(q) EXPANSIVE SOIL is any soil which exhibits significant expansive properties as determined by a Geotechnical Engineer or the Director of Public Works.

(r) FILL (Embankment) is the deposit of soil, rock or other materials placed by man and includes the conditions resulting therefrom.

(s) FINISH GRADE is the final grade of the site after excavating or filling which conforms to the approved final grading plan. The finish grade is also the grade at the top of a paved surface.

(t) GEOLOGIC HAZARD is any condition in naturally occurring earth materials which may endanger life, health or property. Geologic hazards include, but are not limited to: faults; existing or potential landslides, mudslides or rock falls; weak, expansive or creeping soil; subsidence; earthquake induced shaking, ground movement, ground failure or liquefaction; and seiche or tsunami inundation.

(u) GEOTECHNICAL ENGINEER is a Civil Engineer registered by the State of California who is qualified in the field of soil mechanics and soil engineering.

(v) GEOTECHNICAL ENGINEERING is the application of the principles of soil mechanics in the investigation, evaluation and design of civil works involving the use of earth materials and may include the inspection, testing and construction thereof.

(w) GRADING is any land excavation, or filling or combination thereof, or the removal, plowing under or burial or vegetative groundcover.

(x) GRADING PLAN is a plan prepared in accordance with this Chapter showing grading and related work.

(y) GRADING WORK is grading and related work, such as, but not limited to, drainage improvements and erosion and sediment control.

(z) KEYWAY is a special backfilled excavation which is constructed beneath the toe area of a planned fill slope on sloping ground to improve the stability of the slope.

(aa) LANDSCAPE ARCHITECT is a landscape architect registered by the State of California.

(bb) LOT — see Parcel.

(cc) OWNER is the person shown as the legal owner of the property on the latest equalized assessment roll in the Office of the County Assessor.

(dd) PARCEL (Lot) is land described as a lot or parcel in a recorded deed or shown as a lot or parcel on a subdivision map or parcel map on file in the County Recorder's Office.

(ee) PERMIT is a written grading permit issued pursuant to this Chapter authorizing certain grading work.

(ff) PERMITTEE is any person to whom a permit is issued pursuant to this Chapter.

(gg) PERSON is any natural person, firm, corporation or public agency whether principal, agent, employee, or otherwise.

(hh) PRELIMINARY GRADING PLAN is a plan that shows the proposed grading work in relation to the existing site prepared and submitted with the application for a grading permit.

(ii) RAINY SEASON is the period of the year during which there is a substantial risk of rainfall. For the purpose of this Chapter, the rainy season is defined as from October 1 to April 15, inclusive.

(jj) ROUGH GRADE is the stage at which the grade approximately conforms to the approved plan. It is also the subgrade required for construction of a road or other paved surface.

(kk) SEDIMENT is any material transported or deposited by water, including soil and debris or other foreign matter.

(ll) SITE is any lot or parcel of land or combination of contiguous lots or parcels of land, whether held separately or joined together in common ownership or occupancy, where grading is to be performed or has been performed.

(mm) SLOPE is an inclined ground surface the inclination of which may be expressed as the ratio of horizontal distance to vertical distance.

(nn) SOIL is all earth material of any origin that overlies bedrock and may include the decomposed zone of bedrock which can be excavated readily by mechanical equipment.

(oo) TERRACE is a relatively level step constructed in the face of a graded slope surface for drainage, maintenance or other purposes.

(pp) VEHICULAR WAY is a private roadway or driveway.

(qq) WATERCOURSE is any natural or manmade channel flowing continuously or intermittently in a definite direction and course or used for the holding, delay or storage of waters, which functions at any time to convey or store stormwater runoff. Natural channels shall generally be limited to those designated by a solid line or a dash and three dots as shown in blue on the most recent U. S. Geological Survey 7 5 minute series of topographic maps. At the discretion of the Director of Public Works, the definition of natural channel may be limited to those channels having a watershed area of 50 acres or more, and this definition will be commonly used in connection with the administration of this Ordinance except for those cases in which the Director of Public Works determines that the definition must be extended to a natural channel with a watershed smaller than 50 acres in order to prevent a condition which is a menace to life and limb, endangers property, is a hazard to public safety, adversely affects the safety, use of serviceability of adjacent property, public way or drainage channel, or could adversely affect the water quality of any water bodies or watercourses were the definition not extended to a particular natural channel with a watershed below 50 acres.

(rr) WORK. See Grading Work.

VOL 12 2 6503

ARTICLE 2. GENERAL REQUIREMENTS

Sec. 7-111.0 **Grading Permit Required:** Except for the specific exemptions listed hereinafter, no person shall do or permit to be done any grading on any site in the unincorporated area of Alameda County without a valid permit obtained from the Director of Public Works.

Sec. 7-111.1 **Exemptions:** The following grading may be done without obtaining a permit:

(a) Minor projects which have cuts or fills, each of which is less than five feet in vertical depth at its deepest point measured from the existing ground surface, and which include all of the following:
  (1) Less than 150 cubic yards of graded material.
  (2) The removal, plowing under or burial of less than 10,000 square feet of vegetation on slopes ten percent or greater or any amount of vegetation on slopes less than ten percent.
  (3) Do not create unstable or erodible slopes.

(b) Grading done by or under the supervision or construction control of a public agency that assumes full responsibility for the work.

(c) Excavations in connection with a building, swimming pool, retaining wall, or other structure authorized by a valid building permit.

(d) Grading necessary for agricultural operations unless such grading will create a cut or fill whose failure could endanger any structure intended for human or animal occupancy or any public road, or could obstruct any watercourse or drainage conduit.

(e) Trenching and grading incidental to the construction or installation of approved underground pipe lines, septic tank disposal fields, conduits, electrical or communication facilities, and drilling or excavation for approved wells or post holes. Such work shall be backfilled and the surface restored to its original condition, including reseeding or otherwise restoring vegetation on all disturbed earth surfaces if slopes exceed 2 percent, as soon as possible after such grading work is completed.

(f) Excavations for soil or geological investigations by a Geotechnical Engineer or Engineering Geologist. Such work shall be backfilled and shaped to the original contour of the land under the direction of the Geotechnical Engineer or Engineering Geologist as soon as possible after the investigation.

(g) Grading in accordance with plans incorporated in an approved surface mining permit, reclamation plan or sanitary landfill.

(h) Maintenance of existing firebreaks and roads to keep the firebreak or road substantially in its original condition.

(i) Routine cemetery excavations and fills.

(j) Performance of emergency work necessary to protect life or property when an urgent necessity therefor arises. The person performing such emergency work shall notify the Director of Public Works promptly of the problem and work required and shall apply for a permit therefor within ten calendar days after commencing said work.

Exemption from the requirement of a permit shall not be deemed to be permission to violate any provision of this Chapter.

Sec. 7-111.2 **Grading:** No person shall do or permit to be done any grading in such a manner that quantities of dirt, soil, rock, debris, or other material substantially in excess of natural levels are washed, eroded, or otherwise moved from the site, except as specifically provided for by a permit.

Sec. 7-111.3 **Water Obstruction:** No person shall do or permit to be done any grading which may obstruct, impede or interfere with the natural flow of storm waters, whether such waters are unconfined upon the surface of the land or confined within land depressions or natural drainage ways, unimproved channels or watercourses, or improved ditches, channels or conduits, in such manner as to cause flooding where it would not otherwise occur, aggravate any existing flooding condition or cause accelerated erosion except where said grading is in accordance with all applicable laws, including but not limited to permit requirements.

Sec. 7-111.4 **Safeguarding of Watercourses:** Any proposed grading work which could result in a connection or discharge into or modification of the flow of a watercourse may, at the discretion of the Director of Public Works, require a separate permit under the provisions of the Alameda County Watercourse Protection Ordinance or the Alameda County Flood Control and Water Conservation District Permit Ordinance.

VOL 12 2 6504

Sec. 7-111.5 **Levee Work:** No person shall excavate or remove any material from or otherwise alter any levee required for river, creek, bay, or local drainage control channel, without prior approval of the local governmental agency responsible for the maintenance of the levee.

Sec. 7-111.6 **Construction in Public Rights-of-Way:** No person shall perform any grading work within the right-of-way of a public road or street, or within a public easement, without prior approval of the Director of Public Works.

Sec. 7-111.7 **Hazards:** Whenever the Director of Public Works determines that any grading on private property constitutes a condition which is a hazard to public safety, endangers property, adversely affects the safety, use or stability of adjacent property, or an overhead or underground utility, or a public way, watercourse or drainage channel, or could adversely affect the water quality of any water bodies or watercourses, the owner of the property upon which the condition is located, or other person or agent in control of said property, upon receipt of notice in writing from the Director of Public Works shall, within the period specified therein, abate such condition and render the grading in conformance with the requirements of this Chapter. The Director of Public Works may require the submission of plans or soil or geological reports, detailed construction recommendations, or other engineering data prior to and in connection with any corrective or proposed work or activity.

Sec. 7-111 8 **Not Retroactive:** This Chapter shall be prospective in operation only. The provisions of this Chapter shall not apply to existing construction for which all previously necessary permits were obtained. Said provisions shall also not apply to a project or development not yet constructed provided than an appropriate permit has been obtained and said permit bears a date prior to the effective date of this Chapter.

Sec. 7-111 9 **Administration:** This Chapter shall be administered for Alameda County by the Alameda County Flood Control and Water Conservation District.

ARTICLE 3. PROCEDURES

Sec. 7-112 0 **Filing:** Applications for permits shall be filed with the Director of Public Works on forms furnished by his office. Each application shall include a plan checking fee and other fees as required, preliminary or final grading plans and a statement of the intended use of the site. Only one application and permit is allowed for grading work to be done on a site at one time. The Director of Public Works shall determine whether the application is complete in accordance with provisions of Article 4 herein and may require additional information from the applicant before accepting the application as complete.

Sec. 7-112.1 **Compliance with CEQA:** The California Environmental Quality Act (CEQA) may require the preparation of environmental documents concerning a proposed grading project. In such event, Alameda County will be a Responsible Agency or may function as the Lead Agency. The Director of Public Works will advise the applicant as to any additional information required with the permit application.

Sec. 7-112.2 **Referral to Other Public Agencies:** The Director of Public Works may refer an application to other interested public agencies for their recommendations.

Sec. 7-112.3 **Permit Conditions:**

(a) No permit shall be granted until the Director of Public Works is satisfied that a proposed project conforms with the Alameda County General Plan, any Specific Plan adopted thereto, and applicable Alameda County Ordinances including the Zoning Ordinance.

(b) Where a proposed grading project requires the filing of a tentative map or the intended use requires approval of a discretionary zoning permit, no grading permit shall be granted prior to approval by the applicable planning authority.

(c) The permit shall be limited to work shown on the grading plans approved by the Director of Public Works. In granting a permit, the Director of Public Works may impose any condition deemed necessary to protect the health, safety and welfare of the public, to prevent the creation of a nuisance or hazard to public or private property, and to assure proper completion of the grading, including but not limited to:
   (1) Mitigation of adverse environmental impacts.
   (2) Improvement of any existing grading to comply with the standards of this Chapter.
   (3) Requirements for fencing or other protection of grading which would otherwise be hazardous.
   (4) Requirements for dust, erosion, sediment and noise control, hours of operation and season of work, weather conditions, sequence of work, access roads and haul routes.
   (5) Requirements for safeguarding watercourses from excessive deposition of sediment or debris in quantities exceeding natural levels
   (6) Assurance that the land area in which grading is proposed and for which habitable structures are proposed is not subject to hazards of land slippage or significant settlement or erosion and that the hazards of seismic activity or flooding can be eliminated or adequately reduced.

Sec. 7-112.4 **Permission of Other Agencies or Owners:** No permit shall relieve the permittee of responsibility for securing other permits or approvals required for work which is regulated by any other department or agency of the County, or other public agency, or for obtaining any easements or authorization for grading on property not owned by the permittee.

Sec. 7-112.5 **Location of Property Lines:** Whenever the location of a property line or easement or the title thereto is disputed during the application process or during a grading operation, a survey by a licensed Land Surveyor or Civil Engineer or resolution of title all at the expense of the applicant may be required by the Director of Public Works

VOL 12 2 6505

R0059798

Sec. 7-112.6 Time Limits:

(a) The permittee shall perform and complete all the work required by the permit within time limits specified in the permit. If the work cannot be completed within the specified time, a request for an extension of time setting forth the reasons for the requested extension shall be presented in writing to the Director of Public Works no later than 30 days prior to the expiration of the permit. The Director of Public Works may grant additional time for the work.

(b) If all the permit work required is not completed within the time limit specified in Subsection (a) above, no further grading shall be done without renewing the permit. A written request for renewal shall be submitted to the Director of Public Works who may require a new application and fees depending on the time between the expiration date and the renewal request, revisions in County regulations, or changed circumstances in the immediate area. Any revised plan shall be submitted to the Director of Public Works for review, and any costs thereof shall be at the applicant's expense.

Sec. 7-112.7 **Validity:** The issuance of a permit or approval of plans and specifications shall not be construed as an approval of any violation of the provisions of this Chapter or of any other applicable laws, ordinances, rules or regulations; and shall not prevent the Director of Public Works from thereafter requiring the correction of errors in said plans and specifications or from preventing work being carried on thereunder in violation of this Chapter, or any other applicable law, ordinance, rule or regulation.

Sec. 7-112.8 **Appeals:** Appeals from decisions pursuant to this Chapter shall be made to the Board of Supervisors in writing setting forth the specific grounds thereto within 15 calendar days from the date of such decision.

ARTICLE 4. PLANS AND SPECIFICATIONS

Sec. 7-113.0 **Application — Plans:** Two or more complete sets of plans, as determined by the Director of Public Works, including but not limited to profiles, cross sections, topographic maps and specifications shall be submitted to the Director of Public Works with each application for a grading permit, or when otherwise required by the Director of Public Works for enforcement of any provision of this Chapter. At the time of application, the applicant may provide preliminary grading plans. Prior to the issuance of a grading permit the applicant must furnish final grading plans. Preliminary grading plans with appropriate changes and additions thereto may be accepted as final grading plans. When the final grading plans and other required documents have been approved, a grading permit will be issued by the Director of Public Works. The work shall be done in strict compliance with the approved plans and specifications which shall not be changed or altered except in accordance with the provisions of this article.

Sec. 7-113.1 **Preliminary Grading Plans:** Preliminary grading plans provide for review and determination of grading permit requirements prior to approval of final plans and issuance of a grading permit. Precise design at this stage is not required. The plans shall be clearly and legibly drawn and entitled "Preliminary Grading Plans," shall contain a statement of the purpose of the proposed grading, and shall include the following, unless waived by the Director of Public Works:

(a) On a map of appropriate scale, but not smaller than 1" = 100':
   (1) A plan entitled "Preliminary Grading Plan" and the name and signature of preparer and date of preparation.
   (2) A vicinity sketch (not a map scale) indicating the location of the site relative to the principal roads, lakes and watercourses in the area.
   (3) A site plan indicating the site of the work and any proposed divisions of land.
   (4) The complete site boundaries and locations of any easements and rights-of-way traversing and adjacent to the property, appropriately labeled and dimensioned.
   (5) The location of all existing and proposed roads, buildings, wells, pipelines, watercourses, and other structures, facilities and features of the site, and the location of all improvements on adjacent land within 50 feet of the proposed work.
   (6) Location and nature of known or suspected soil or geologic hazard areas.
   (7) Contour lines of the existing terrain and proposed approximate finished grade at intervals not greater than five feet, showing all topographic features and drainage patterns throughout the area where proposed grading is to occur. The contour lines shall be extended to a minimum of 50 feet beyond the affected area, and further if needed to define intercepted drainage, and shall be extended a minimum of 100 feet outside of any future road rights of way.
   (8) Approximate location of cut and fill lines and the limits of grading for all the proposed grading work, including borrow and stockpile areas. A written description of offsite locations of said areas will suffice.
   (9) Location, width, direction of flow and approximate location of tops and toes of banks of any watercourses.

R0059799

(10) Approximate boundaries of any areas with a history of flooding.
(11) Proposed provisions for storm drainage control and any existing or proposed flood control facilities or septic tank disposal fields in the vicinity of the grading.
(12) A conceptual plan for erosion and sediment control including both temporary facilities and long term site stabilization features such as planting or seeding for the area affected by the proposed grading. This requirement may be waived by the Director of Public Works for sites having no slopes greater than five percent unless the large size of the site, its proximity to sensitive areas or other conditions make an erosion or sediment discharge hazard possible.
(13) North arrow and scale.
(14) General location and character of vegetation covering the site and the locations of trees with a trunk diameter of twelve inches or more, measured at a point three feet above average ground level, within the area to be disturbed by the proposed grading. The plans shall indicate which trees are proposed to remain and how they are to be protected.

(b) Typical cross sections (not less than two) of all existing and proposed graded areas taken at intervals exceeding 200 feet and at locations of maximum cuts and fills.

(c) An estimate of the quantities of excavation and fill, including quantities to be moved both on and off site.

(d) The estimated starting and completion dates of grading.

(e) Such supplemental information as required for processing and approval of the design concept and the application as required by the Director of Public Works.

Sec. 7-113.2 Final Grading Plans — Engineer Required: Final grading plans and specifications shall be prepared and signed by a Civil Engineer, except as otherwise provided herein, on sheets at least 24" x 36". The plans shall include the following, in addition to all requirements for preliminary grading plans, unless waived by the Director of Public Works.

(a) A title block. Plans shall be entitled "Grading Plan" and state the purpose of the proposed grading and the name of the engineer or firm by whom this plan is prepared.

(b) Accurate contour lines at intervals not greater than five feet, showing topographic features and drainage patterns and the configuration of the ground before and after grading, relative to a bench mark established on site.

(c) Location, extent and finished surface slopes of all proposed grading and final cut and fill lines.

(d) Cross sections, profiles, elevations, dimensions and construction details based on accurate field data.

(e) Construction details for roads, watercourses, culverts, bridges and drainage devices, retaining walls, cribbing, dams, and other improvements existing or to be constructed, together with supporting calculations and maps as required.

(f) Complete construction specifications.

(g) A detailed erosion and sediment control plan including specific locations, construction details, and supporting calculations for temporary and permanent sediment control structures and facilities, when required by the Director of Public Works.

(h) A landscaping plan, when required by the Director of Public Works, including temporary erosion control plantings, permanent slope plantings, replacement of temporary groundcover, and irrigation facilities.

(i) An estimate of the quantities of excavation and fill, adjusted for anticipated swell or shrinkage.

(j) The location of any borrow site or location for disposal of surplus material.

(k) A projected schedule of operations, including, as a minimum, the dates of:
(1) Commencement of work.
(2) Start and finish of rough grading.
(3) Completion of drainage facilities.
(4) Completion of work in any watercourse.
(5) Completion of erosion and sediment control facilities.
(6) Completion of hydromulching and other landscaping. If rough grading is proposed between October 1 and April 15, a more detailed schedule of grading activities and use of erosion and sediment control facilities may be required.

(l) Itemized cost estimated of the proposed grading and related work.

(m) Other information as may be required by the Director of Public Works.

VOL 12 2 6507

Sec. 7-113.3 **Final Grading Plans — Engineer Not Required:** All plans and specifications shall be prepared and signed by a Civil Engineer except that the Director of Public Works may waive this requirement if the grading is minor in nature, would not endanger the public health, safety or welfare as determined by the Director of Public Works; and would not involve or require any of the following:

(a) Cuts and fills with a combined total of 1500 cubic yards or more.

(b) An access road serving three or more existing or potential residences.

(c) A cut or fill that is intended to support structures.

(d) A cut or fill that is located so as to cause unduly increased pressure or reduce support upon any adjacent structure or property.

(e) The construction of any extensive drainage or sediment control structures, culverts, or facilities or alteration of any existing drainage course.

(f) The creation or aggravation of an unstable slope condition.

Sec. 7-113.4 **Modification of Approved Plans:**

(a) Proposed modifications of an approved final plan shall be submitted to the Director of Public Works for his written approval.

(b) All necessary soils and geological information and design details shall accompany any proposed modification.

(c) The modification shall be compatible with any subdivision map or land use requirements.

Sec. 7-113.5 **Seasonal Requirements:** Implementation of erosion and sediment control plans shall be based on the season of the year and the stage of construction at forecasted periods of rainfall and heavy storms. Erosion and sediment control plans shall allow for possible changes in construction scheduling, unanticipated field conditions, and relatively minor changes in grading. Modifications to plans may be required after initial plan approval.

Sec. 7-113.6 **Distribution and Use of Approved Plans:** Two sets of approved plans and specifications shall be retained by the Director of Public Works and one or more sets of approved and dated plans and specifications shall be provided to the applicant or his engineer. One set of approved plans and permit shall be retained on the site at all times during the work.

ARTICLE 5. PERMIT REQUIREMENTS

Sec. 7-114.0 **General:** The Director of Public Works may deny the issuance of a grading permit if final grading plans fail to satisfy the provisions of this Chapter or any of the conditions imposed. The Director of Public Works shall identify the provision, requirement or condition which has not been met or performed by the applicant.

Sec. 7-114.1 **Fees:**

(a) The schedule of fees and costs shall be those established and adopted by the Board from time to time by resolution. Before a permit is issued, the applicant shall deposit with the Director of Public Works cash or a certified or cashier's check, in a sufficient sum to cover the fee for issuance of the permit, charges for review of plans, specifications and reports, other engineering services, field investigations, necessary inspection or other work and routine laboratory tests of materials and compaction, all in accordance with schedules established and adopted by the Board.

(b) No fee shall be required of public agencies.

(c) Public utilities may, at the option of the Director of Public Works, make payment for the above charges as billed by the Director of Public Works instead of by advance deposit as required above.

(d) If, upon completion of any work under a permit there remains any excess of deposit or of fees or charges, the Director of Public Works shall certify the same to the Auditor for refund to the permittee or refund the same from any trust fund established under his jurisdiction for such purposes.

(e) If, upon completion of any work under a permit there is an insufficient deposit to cover the cost of the work, the Director of Public Works may require the permittee to reimburse the amount equal to the cost deficit.

(f) If grading work is done in violation of this Chapter or such work is not done in accordance with an approved permit, a fee covering investigation of any violation and inspection and plan checking of work required to correct such violation shall be charged to the violator to cover all actual costs.

Sec. 7-114.2 **Geotechnical Investigation Required:** A soil or geologic investigation report shall accompany the application in any of the following circumstances:

(a) When the proposed grading includes a cut or fill exceeding five feet in depth at any point and the slope of the natural ground within 30 feet of the cut or fill exceeds ten percent; however, for vehicular ways, a soil investigation shall not be required unless the grading includes a proposed cut or fill that exceeds ten feet in depth and the slope of the natural ground exceeds 20 percent.

(b) When highly expansive soils are present.

(c) In areas of known or suspected geological hazards, including landslide hazards and hazards of ground failure stemming from seismically induced ground shaking.

VOL 12 2 6508

Sec. 7-114.3 **Investigations:** Those portions of the soil or geologic investigation that constitute "civil engineering" as defined by Section 6734 of the Business and Professions Code of the State of California shall be conducted by a Geotechnical Engineer. Those portions of the investigation that involve the practice of "geology" as defined by Section 7802 of the Business and Professions Code of the State of California shall be conducted by an Engineering Geologist.

The investigations shall be based on observation and tests of the material exposed by exploratory borings or excavations and inspections made at appropriate locations. Additional studies may be necessary to evaluate soil and rock strength, the effect of moisture variation on soil, bearing capacity, compressibility, expansiveness, stability and other factors.

Sec. 7-114.4 **Reports — General:** Any soil or geologic investigation report shall be subject to the approval of, and supplemental reports and data may be required by, the Director of Public Works. Recommendations included in the reports and approved by the Director of Public Works shall be incorporated in the final plans and specifications.

Sec. 7-114.5 **Soil Geologic Investigation Report:** The soil or geologic investigation report shall contain all of the following as they may be applicable to the subject site:

(a) An index map showing the regional setting of the site.

(b) A site map showing the topographic features of the site and locations of all soil borings and test excavations.

(c) A classification of the soil types (Unified Soil Classification); pertinent laboratory test data; and consequent evaluation regarding the nature, distribution and strength of existing soils.

(d) A description of the geology of the site and the geology of the adjacent areas when pertinent to the site.

(e) A suitably scaled map and cross sections showing all identified areas of land slippage.

(f) A description of any encountered groundwater or excessive moisture conditions.

(g) A description of the soil and geological investigative techniques employed.

(h) A log for each soil boring and test excavation showing elevation at ground level and the depth of each soil or rock strata.

(i) An evaluation of the stability of pertinent natural slopes and any proposed cut and fill slopes.

(j) An evaluation of settlement associated with the placement of any fill.

(k) Recommendations for grading procedures and specifications, including methods for excavation and subsequent placement of fill.

(l) Recommendations regarding drainage and erosion control.

(m) Recommendations for mitigation of geologic hazards.

Sec. 7-114.6 **Final Report:** Upon completion of rough grading work, the Director of Public Works may require a final geotechnical report that includes, but is not necessarily limited to the following:

(a) A complete record of all field and laboratory tests including location and elevation of all field tests.

(b) A professional opinion regarding slope stability, soil bearing capacity, and any other pertinent information.

(c) Recommendations regarding foundation design, including soil bearing potential, and building restrictions or setbacks from the top or toe of slopes.

(d) A declaration by the Geotechnical Engineer or Engineering Geologist in the format required by the Director of Public Works that all work was done in substantial accordance with the recommendations contained in the soil or geologic investigation reports as approved and in accordance with the approved plans and specifications.

Sec. 7-114.7 **Changed Conditions:** Where soil or geologic conditions encountered in the grading operation deviate from that anticipated in the soil and geologic investigation reports or where such conditions warrant changes to the recommendations contained in the original soil investigation, a revised soil or geologic report shall be submitted for the approval of the Director of Public Works.

VOL 12 2 6509

Sec. 7-114 8 **Special Inspection:**

(a) The Director of Public Works may require the permittee to provide a private Geotechnical Engineer to perform continuous inspection work, and upon completion of the work to provide a written statement acknowledging that he has inspected the work and that in his professional judgment the work was performed in accordance with the approved plans and specifications. The permittee shall make his own contractual arrangements for such services and be responsible for payment of all costs. Continuous inspection by a Geotechnical Engineer shall include but not be limited to the following situations:
   (1) During the preparation of a site for the placement of fills which exceed five feet indepth on slopes which exceed ten percent and during the placing of such fills; however, for vehicular pathways, fill placement shall be continuously inspected when fills exceed ten feet in height.
   (2) During the preparation of a site for the placement of any fill and during the placement of such fill which is intended to support any building or structure.
   (3) During the installation of subsurface drainage facilities.
   (4) Such other inspections as may be required by the Director of Public Works.

(b) Reports filed by the private Geotechnical Engineer regarding special inspection shall state in writing that from his personal knowledge the work performed during the period covered by the report has been performed in substantial accordance with the approved plans and specifications.

(c) The use of a private Geotechnical Engineer for inspections shall not preclude the Director of Public Works from conducting inspections using his or other authorized inspectors as may be necessary.

Sec. 7-114.9 **Non-Compliance Notification by Private Geotechnical Engineer:** The permittee shall cause the work to be done in accordance with the approved plans. If during the course of construction the private Geotechnical Engineer finds that the work is not being done substantially in accordance with the approved plans and specifications, he shall immediately notify the person in charge of the work and the Director of Public Works of the non-conformity and the corrective measures to be taken. When changes in the plans are required, he shall prepare such proposed changes and submit them to the Director of Public Works for approval.

Sec. 7-114.10 **Periodic Progess Reports by Private Geotechnical Engineer:** Periodic progress reports shall be rendered by the private Geotechnical Engineer as required by the Director of Public Works including, but not limited to, laboratory tests, slope stability, placement of materials, retaining walls, drainage, utilities and any special permit or plan requirements.

Sec. 7-114.11 **Progress Report by Permittee:** Periodic progress reports shall be rendered by permittee on specified calendar dates and at commencement and completion of major key grading and erosion and sediment control operations. The dates of operations upon which such reports are required and their content shall be as required by the Director of Public Works in the permit.

Sec. 7-114.12 **Submit "As-Built" Plan:** Permittee shall submit the the Director of Public Works an "As-Built" grading plan following completion of grading operations.

Sec. 7-114.13 **Performance of Work — Inspection:** The Director of Public Works may inspect any work done pursuant to a permit under this Chapter. No permittee shall be deemed to have complied with this Chapter until a final inspection of the work has been made by the Director of Public Works and he has certified in writing that the work has been competed in accordance with all requirements and conditions of the permit. The permittee shall provide adequate access to the site for inspection by the Director of Public Works during the performance of all work and for a minimum period of one year after acceptance by the Director of Public Works of all improvements pursuant to Subsections 7-116.0(b) and 7-116.0(c) herein.

Sec. 7-1114.14 **Other Responsibilities of Permittee:** The permittee shall also be responsible for the following:

(a) **Protection of Utilities.** The permittee shall be responsible for the prevention of damage to any public utilities or services.

(b) **Protection of Adjacent Property.** The person doing or causing the grading is responsible for the prevention of damage to adjacent property. No person shall excavate on land sufficienty close to the property line to endanger any adjoining public street, sidewalk, alley or other public or private property, without supporting and protecting such property from damage which might result.

(c) **Advance Notice.** The permittee shall notify the Director of Public Works at least 24 hours prior to the start of work.

VOL 12 2 6510

(d) **Erosion and Sediment Control.** It shall be the responsibility of the permittee to prevent discharge of sediment from the site in quantities greater than before grading occurred, to any watercourse, drainage system, or adjacent property and to protect watercourses and adjacent properties from damage by erosion, flooding, or deposition which may result from the permitted grading. Permittee shall implement all measures necessary to discharge this responsibility even if such measures exceed the requirements of an approved Erosion and Sediment Control Plan prepared pursuant to this Chapter.

Sec. 7-114 15 **Transfer of Permit:** No permit issued under this Chapter may be transferred or assigned in any manner whatsoever, voluntarily or by operation of law, without the express consent of the Director of Public Works.

ARTICLE 6. DESIGN STANDARDS

Sec. 7-115.0 **Excavation:** Excavations shall be constructed or protected so that they do not endanger life or property.

Sec. 7-115.1 **Excavation Slope:** The slope of cut surfaces of permanent excavations shall not be steeper than two horizontal to one vertical exclusive of terraces and exclusive of roundings described herein. Steeper slopes may be permitted in competent bedrock provided such slope inclinations are in accordance with recommendations contained in the geotechnical or geological report. The bedding planes or principal joint sets in any formation when dipping towards the cut face shall not be daylighted by the cut slope unless the soils and geologic investigations contain recommendations for steeper cut slopes. The Director of Public Works may require the excavation to be made with a cut face flatter in slope than two horizontal to one vertical for stability and safety. Cut slopes shall be rounded into the existing terrain to produce a contoured transition from cut face to natural ground.

Sec. 7-115 2 **Fill Placement:** Fills shall be constructed in layers. The loose thickness of each layer of fill material before compaction shall not exceed eight inches. Completed fills shall be stable masses of well integrated material bonded to adjacent materials and to the materials on which they rest. Fills shall be competent to support anticipated loads and be stable at the design slopes shown on the plans. Proper drainage and other appropriate measures shall be taken to ensure the continuing integrity of fills. Earth materials shall be used which have no more than minor amounts of organic substances and have no rock or similar irreducible materials with a maximum dimension greater than six inches.

Sec. 7-115.3 **Fill Compaction:** All fills shall be compacted throughout their full extent to a minimum of 90 percent of maximum density as determined by appropriate ASTM standard method or other alternate methods approved by the Director of Public Works. Tests to determine the density of compacted fills shall be made on the basis of not less than one test for each two-foot vertical lift of the fill but not less than one test for each 1000 cubic yards of material placed. Additional density tests at a point approximately one-foot below the fill slope surface shall be made on the basis of not less than one test for each 1000 square feet in slope surface but not less than one test for each ten-foot vertical increase of slope height. Additional tests may be required throughout the fill as determined by the inspector for the Director of Public Works. All tests shall be reasonably uniformly distributed within the fill or fill slope surface. Results of such testing and location of tests shall be presented in the periodic and final reports. Compaction may be less than 90 percent of maximum density, as determined by the above test, within six inches of the slope surface when such surface material is placed and compacted by a method acceptable to the Director of Public Works for the planting of the slopes. Compaction of temporary storage fills, to be used for a period of not greater than six months, shall not be required, except where the Director of Public Works determines that compaction is necessary as a safety measure to aid in preventing saturation, sliding, or erosion of the fill. Where compaction is required, it shall be done as specified by the Director of Public Works.

Sec. 7-115.4 **Ground Preparation For Fill Placement:** The natural ground surface shall be prepared to receive fill by removing vegetation, non-complying fill, top soil, and other unsuitable material, and where slopes are five horizontal to one vertical or steeper, by benching into competent material in a manner acceptable to the Director of Public Works. They keyway under the toe, if specified, shall be at least ten feet wide.

Sec. 7-115.5 **Fill Slopes:** The slope of permanent fills shall not be steeper than two horizontal to one vertical exclusive of terraces and exclusive of roundings described herein. The Director of Public Works may require that the fill be constructed with an exposed surface flatter than two horizontal to one vertical or may require such other measures as he deems necessary for stability and safety. Fill slopes shall be rounded into existing terrain to produce a contoured transition from fill face to natural ground or to abutting cut or fill surfaces where conditions permit.

VOL 12 2 6511 1

Sec. 7-115.6 **Adjacent Structures Protection:** Footings which may be affected by any excavation shall be underpinned or otherwise protected against settlement and shall be protected against lateral movement. Fills or other surcharge loads shall not be placed adjacent to any building or structure unless such building or structure is capable of withstanding the additional loads caused by such fill or surcharge. The rights of coterminous owners shall be as set forth in Section 832 of the Civil Code of the State of California.

Sec. 7-115.7 **Setbacks — General:** Unless otherwise recommended in a soil and geologic investigation report, Figures 1 and 2 and Table 70c on Pages 683 and 684 of the 1976 Uniform Building Code or said similar provisions as provided for in adopted successor code shall be used for establishing setbacks for property boundaries, buildings and structures other than fences and retaining walls.

Sec. 7-115.8 **Drainage — General:** The drainage structures and devices required by this Chapter shall be designed and contructed in accordance with standards and criteria authorized by the Director of Public Works.

Sec. 7-115.9 **Drainage — Disposal Requirements:** All drainage facilities shall be designed to carry surface and subsurface waters to the nearest adequate street, storm drain, natural water course or other juncture, and shall be subject to the approval of the Director of Public Works. Drainage areas shall conform to patterns established by the Director of Public Works.

Sec. 7-115.10 **Drainage — Water Accumulation:** All areas shall be graded and drained so that water will not pond or accumulate. Drainage shall be effected in such a manner that it will not cause erosion or endanger the stability of any cut or fill slope or any building or structure.

Sec. 7-115.11 **Drainage Protection of Adjoining Property:** When surface drainage is discharged onto any adjoining property, it shall be discharged in such a manner that it will not cause erosion or endanger any cut or fill slope or any building or structure.

Sec. 7-115.12 **Terrace Drainage:** Terraces at least eight feet in width shall be established at not more than 25 feet in height intervals for all cut and fill slopes exceeding 30 feet in height. Where only one terrace is required, it shall be at approximately mid-height. Suitable access shall be provided to permit proper cleaning and maintenance of terraces and terrace drains. Swales or ditches on terraces shall have a minimum depth of one foot, a minimum longitudinal grade of four percent, a maximum longitudinal grade of twelve percent, and must be paved with reinforced concrete not less than three inches in thickness or an approved equivalent paving. Down-drains or drainage outlets shall be provided at approximately 300-foot intervals along the drainage terrace. Down-drains and drainage outlets shall be of approved materials and of adequate capacity to convey the intercepted waters to the point of disposal. If the drainage discharges onto natural ground, adequate erosion protection shall be provided.

Sec. 7-115.13 **Subsurface Drainage:** Cut and fill slopes shall be provided with subsurface drainage as necessary for stability.

Sec. 7-115.14 **Erosion and Sediment Control:** The following shall apply to the control of erosion and sediment from grading operations:

(a) Grading plans shall be designed with long term erosion and sediment control as a primary consideration.

(b) No grading operations shall be conducted during the rainy season except upon a clear demonstration, to the satisfaction of the Director of Public Works, that at no stage of the work will there be any substantial risk of increased sediment discharge from the site.

(c) Should grading be permitted during the rainy season, the smallest practicable area of erodible land shall be exposed at any one time during grading operations and the time of exposure shall be minimized.

(d) Natural features, including vegetation, terrain, watercourses and similar resources shall be preserved wherever possible. Limits of grading shall be clearly defined and marked to prevent damage by construction equipment.

(e) Permanent vegetation and structures for erosion and sediment control shall be installed as soon as possible.

(f) Adequate provision shall be made for long term maintenance of permanent erosion and sediment control structures and vegetation.

(g) No topsoil shall be removed from the site unless otherwise directed or approved by the Director of Public Works. Topsoil overburden shall be stockpiled and redistributed within the graded area after rough grading to provide a suitable base for seeding and planting. Runoff from the stockpiled area shall be controlled to prevent erosion and resultant sedimentation of receiving water.

(h) Runoff shall not be discharged from the site in quantities or at velocities substantially above those which occurred before grading except into drainage facilities whose design has been specifically approved by the Director of Public Works.

(i) Permittee shall take reasonable precautions to ensure that vehicles do not track or spill earth materials into public streets and shall immediately remove such materials if this occurs.

VOL 12 2 6512

R0059805

Sec. 7-115.15 **Emergency Conditions:** Should increased sediment discharge occur or become imminent permittee shall take all necessary steps to control such discharge. Such steps may include construction of additional facilities or removal or alteration of facilities required by approved erosion and sediment control plans. Facilities removed or altered shall be restored as soon as possible afterward or appropriate changes in the plan shall be immediately requested pursuant to this Chapter. Permittee shall take prompt action to resolve emergency problems; otherwise the Director of Public Works may institute abatement proceedings pursuant to provisions of Section 7-117.1 herein.

Sec. 7-115.16 **Erosion and Sediment Control Plans:** Erosion and sediment control plans prepared pursuant to this Chapter shall comply with all of the following:

(a) The erosion and sediment control plan need not be a separate sheet if all facilities and measures can be shown on the grading sheets without obscuring the clarity of either the grading plan or the erosion and sediment control plan.

(b) An erosion and sediment control plan shall be required whenever:

1. The graded portion of the site includes more than 10,000 square feet of area having a slope greater than five percent.
2. There is a significant risk that more than 2,500 square feet will be unprotected or inadequately protected from erosion during any portion of the rainy season.
3. Grading will occur within 20 feet of any watercourse.
4. The Director of Public Works determines that the grading will or may pose a significant erosion or sediment discharge hazard for any reason.

(c) The applicant shall submit, with his erosion and sediment control plans, a detailed cost estimate covering this work.

(d) Erosion and sediment control plans shall include an effective revegetation program to stabilize all disturbed areas which will not be otherwise protected. All such areas where grading has been completed between April 1 and September 15 shall be planted by October 1. Graded areas completed at other times of the year shall be planted within 15 days. If revegetation is infeasible or cannot be expected to stabilize an erodible area with assurance during any part of the rainy season and the unstable area exceeds 2,500 square feet, additional erosion and sediment control measures or irrigation of planted slopes may be required as appropriate to prevent increased sediment discharge.

(e) Erosion and sediment control plans shall be designed to prevent increased discharge of sediment at all stages of grading and development from initial disturbance of the ground to project completion. Every feasible effort shall be made to ensure that site stabilization is permanent. If grading occurs in distinct phases or the site will remain unstable through more than one rainy season, more than one set of plans may be required. Plans shall indicate the implementation period and the stage of construction where applicable.

(f) Erosion and sediment control plans shall comply with the recommendations of any Civil Engineer, Geotechnical Engineer, Engineering Geologist, or Landscape Architect involved in preparation of the grading plans.

(g) The structural and hydraulic adequacy of all storm water containment or conveyance facilities shown on the erosion and sediment control plans shall be verified by a Civil Engineer, and he shall so attest on the plans. Sufficient calculations and supporting material to demonstrate such adequacy shall accompany the plans when submitted.

(h) Erosion and sediment control plans shall be designed with sufficient flexibility to meet unanticipated field conditions.

(i) Erosion and sediment control plans shall provide for inspection and repair of all erosion and sediment control facilities at the close of each working day during the rainy season and for specific sediment cleanout and vegetation maintenance criteria.

(j) Erosion and sediment control plans shall comply with any and all standards and specifications adopted by the Director of Public Works for the control of erosion and sedimentation on grading sites.

The Director of Public Works may waive the requirement for an erosion and sediment control plan if, in his opinion, no significant erosion or sediment discharge hazard exists.

Sec. 7-115.17 **Vehicular Ways — General:** Vehicular ways shall conform to the grading requirements of this Chapter.

Sec. 7-115.18 **Vehicular Ways — Cut Slopes:** The Director of Public Works may approve grading for a vehicular way where a cut slope is steeper than two horizontal to one vertical if all of the following are met:

(a) The daylight line of a plane sloping at two horizontal to one vertical is more than 20 feet from any adjoining property line, building and structure.

(b) It is necessary to avoid excessive grading. However, the steeper slope shall not be allowed where the proposed vehicular way can be realigned so as to reduce excessive grading.

(c) The owner executes and records a hold harmless agreement in a form approved by the Director of Public Works relieving the County from any liability for this exception.

VOL 12 2 6513

R0059806

Sec. 7-115.19 **Vehicular Ways — Drainage:** Vehicular ways shall be graded and drained in such a manner that will not allow erosion or endanger the stability of any adjacent slope. Surface discharge onto adjoining property shall be controlled in such a manner that it does not cause erosion. Bridges and culverts installed in watercorses shall be approved by the Alameda County Flood Control and Water Conservation District.

ARTICLE 7. IMPROVEMENT SECURITY

Sec. 7-116.0 **Security Required:**

(a) As a condition for the issuance of a permit, the Director of Public Works may require the deposit of improvement security in sufficient amount deemed necessary by him to assure faithful performance of the work or the cost of removing the work or otherwise reconstructing or restoring a site to conditions existing prior to such work in the event of default on the part of permittee or, in the case of a subdivision, where the permittee does not proceed with preparations and obtaining the approval of a final map. Said security shall be in the form of cash, a certified or cashier s check, a letter of credit, or a faithful performance bond executed by the applicant and a corporate surety authorized to do business in this state.

(b) In the case of subdivisions, the improvement shall remain in effect until final inspections have been made, all grading work and subdivision improvements have been accepted by the Director of Public Works, and all other requirements of the subdivision contract have been satisfied.

(c) For projects other than subdivisions, the improvement security shall remain in effect until final inspections have been made and all grading work has been accepted by the Director of Public Works.

(d) In addition to the improvement security, the Director of Public Works may also require the deposit of maintenance security in sufficient amount deemed necessary by him to guarantee and maintain the grading work to assure the proper functioning of drainage systems and adequate erosion and sedimentation control. Said maintenance security shall be in the form of cash, a certified or cashier's check, a letter of credit, or a faithful performance bond executed by the applicant and a corporate surety authorized to do business in this state and shall remain in effect for a period of one year after the date of expiration of the improvement security as designated in Subsections (b) and (c) above.

(e) Any bond or deposit required by the Director of Public Works pursuant to this ordinance shall be payable to the Alameda County Flood Control and Water Conservation District.

(f) Upon satisfaction of applicable provisions of this Chapter, the improvement and maintenance security deposits or bonds will be released. However, upon failure to complete the work, failure to comply with all of the terms of the permit, or failure of the completed site to function properly to provide proper drainage or erosion and sedimentation control, the County may do the required work, or cause it to be done and collect from the permittee or surety all costs incurred thereto, including administrative and inspection costs. Any unused portion of a deposit or bond shall be refunded to the permittee after deduction by the county of the cost of the work.

ARTICLE 8. ENFORCEMENT

Sec. 7-117.0 **Suspension and Revocation of Permit:** The Director of Public Works may suspend or revoke a permit for good cause, subject to appeal to the Board of Supervisors. However, no work shall be performed pending appeal except as authorized by the Director of Public Works.

Sec. 7-117.1 **Abatement:** Whenever the Director of Public Works determines that any hazard exists, such as is described in Section 7-111.7 herein, or that any violation of this Chapter exists, any such condition or violation may be declared to be a public nuisance and may be abated pursuant to the provisions of Chapter 7 of Title 7 of this Code.

Sec. 7-117.2 **Injunction:** The County Counsel, at the direction of the Board of Supervisors shall, or in the case of an emergency at the request of the Director of Public Works may, petition the Superior Court for the issuance of a temporary restraining order, temporary injunction, or permanent injunction, or combination thereof, as may be appropriate, requiring any person not complying with this Chapter to comply therewith.

Sec. 7-117.3 **Nonexclusive Remedies:** The remedies provided herein are not exclusive, and are in addition to any other remedy or penalty provided by law for violation of this Chapter.

ARTICLE 9. ADDITIONAL PROVISIONS

Sec. 7-118.0 **Enforcement Official:** The Director of Public Works shall enforce the provisions of this Chapter.

Sec. 7-118.1 **Right of Entry:** Whenever necessary to enforce the provisions of this Chapter the Director of Public Works may enter the premises at all reasonable times in the manner provided by law to perform any duty imposed by this Chapter. If such entry is refused, the Director of Public Works shall have recourse to every remedy provided by law to secure entry.

Sec. 7-118.2 **Stop Work Orders:** Whenever any work is being done contrary to the provisions of this Chapter or any other applicable law, ordinance, rule or regulation, the Director of Public Works may order the work stopped by serving written notice on any persons engaged in, doing, or causing such work to be done. Any such person shall forthwith stop such work until authorized by the Director of Public Works to proceed with the work. If there are no persons present on the premises, the notice may be posted in a conspicuous place. The notice shall state the nature of the violation. Any person violating a stop work order shall be guilty of a misdemeanor

VOL 12 2651 4

R0059807

Sec. 7-118 3 Liability: Neither issuance of a permit under the provisions of this Chapter nor compliance with the provisions hereof or with any conditions imposed in a permit issued hereunder shall relieve any person from responsibility for damage to any person or property or impose any liability upon the County of Alameda for damage to any person or property.

Sec. 7-118.4 Denial of Other Permits: No building permit, septic tank, water, sewer, electrical permit, or any other permit shall be issued by the County to any person for any premises or portion thereof which is in violation of this Chapter and which violation is not corrected or approved for correction by the Director of Public Works.

Sec. 7-118 5 Notice to Adjacent Owners: Upon the filing of an application for a permit, the Director of Public Works may notify by mail the owners of property abutting the site, as shown on the latest equalized assessment roll, that an application for a grading permit has been submitted pursuant to this Chapter, that they may comment at any stage of the procedure, and may lodge an appeal pursuant to the provisions of this Chapter

Sec. 7-118 6 Severability: If any section, subsection, paragraph, subparagraph, sentence, clause or phrase of this Chapter is for any reason held to be invalid or unconstitutional, such invalidity or unconstitutionality shall not affect the validity or constitutionality of the remaining portions of this Chapter; and the Board declares that this chapter and each section, subsection, paragraph, subparagraph, sentence, clause, and phrase thereof would have been adopted irrespective of the fact that one or more of such section, subsection, paragraph, subparagraph, sentence, clause or phrase be declared invalid or unconstitutional.

SECTION II

Section 7-12 0 of Chapter 1 of Title 7 of the Alameda County Ordinance Code is amended to read:

Section 7-12 0 Permit required: No person, firm or corporation or organization shall install, erect, construct, enlarge, add to, alter, repair, move, remove, demolish, convert, occupy, equip or improve any building or structure, any electrical, plumbing or mechanical installation or cause the same to be done without first obtaining a permit from the Building Official.

A separate permit shall be required for each building or structure, but the permit may include pertinent accessories such as fences, retaining walls, exterior lighting, underground utilities and sprinkler systems, providing such work is shown on the approved plans or described on the application. The Building Official may authorize issuance of a single permit for several buildings where in his opinion the convenience of the County will be served.

Prior to issuance of a permit by the Building Official, a separate permit or approval shall be secured from the Health Officer for private water supply and private sewage disposal systems. In addition, separate permits for wells are required pursuant to Article 14, Chapter 6, Title. 5.

Additional permits shall be required for pertinent accessories regulated by this Title which are proposed to be constructed but not shown on the approved plans or described on the application.

A grading permit may also be required subject to provisions of the Alameda County Grading Ordinance.

Subsection 7-22.19 (b) of Chapter 2 of Title 7 of the Alameda County Ordinance Code is amended to read:

(b) Excavations. Except when permitted under a valid grading permit as set forth in Section 7-115.1 of Chapter 9 of Title 7 of the Alameda County Ordinance Code, the slope of cut surfaces of permanent excavations shall not be steeper than 2 horizontal to 1 vertical. The slope of cut surfaces shall not be steeper than the bedding planes or principal joint sets in any formation where the cut slope will lie on the dip side of the strike line unless the soils and geologic investigations contain recommendations for steeper slopes. Footings which may be affected by any excavation shall be underpinned or otherwise protected against settlement and shall be protected against lateral movement.

SECTION III

This Ordinance shall take effect and be in force thirty (30) days from and after the date of its passage and before the expiration of fifteen (15) days after its passage it shall be published once with the names of the members voting for and against the same in The Inter-City Express, a newspaper published in the said County of Alameda.

Adopted by the Board of Supervisors of the County of Alameda, State of California, on the 16th day of March, 1982, by the following called vote:

AYES: Supervisors Cooper, Excell, Santana and Chairman Bort — 4.

NOES: None.

EXCUSED: Supervisor George — 1.

JOSEPH P. BORT,
Chairman of the Board of Supervisors of the
County of Alameda, State of California.

ATTEST:

WILLIAM MEHRWEIN,
Clerk of the Board of Supervisors,
County of Alameda, State of California.
By: WILLIAM MEHRWEIN.

ATTACHMENT C

VOL 12 2 6516

ORDINANCE NO. 82-18
AN ORDINANCE ESTABLISHING REQUIREMENTS FOR PROTECTION OF WATERCOURSES

The Board of Supervisors of Alameda County, State of California, do ordain as follows:

SECTION I

CHAPTER 10 (Commencing with Section 7-200.0) is hereby added to Title 7 of the Ordinance Code of the County of Alameda to read as follows:

CHAPTER 10
WATERCOURSE PROTECTION
ARTICLE 1. GENERAL PROVISIONS

Sec. 7-200.0 **Title:** This Chapter shall be known as the Watercourse Protection Ordinance of Alameda County.

Sec. 7-200.1 **Purpose:** This Chapter is enacted to safeguard and preserve watercourses, protect lives and property, prevent damage due to flooding, protect drainage facilities, control erosion and sedimentation, restrict discharge of polluted materials and enhance recreational and beneficial uses of watercourses.

Sec. 7-200.2 **Definitions:** Unless the context clearly requires a different meaning, the meanings given for the following words and phrases shall apply when said words and phrases are used in this Chapter:

(a) AGRICULTURAL OPERATION means any land related activity for the purpose of cultivating or raising plants or animals or conserving or protecting lands for such purposes when conducted on agriculturally zoned lands, and is not surface mining or borrow pit operations nor preparation for construction or construction of any structure for human occupancy.

(b) BANK means any embankment, dike, levee, weir or similar feature of natural or man-made origin which adjoins or parallels any watercourse and which has as a function the confinement of the water of said watercourse.

(c) BOARD means the Board of Supervisors of Alameda County.

(d) CITY means an incorporated city in Alameda County.

(e) DEVELOPMENT means any act of filling, depositing, excavating or removing any natural material, or constructing, reconstructing or enlarging any structure, which requires a permit issued by the Director of Public Works.

(f) DIRECTOR OF PUBLIC WORKS means the Director of Public Works of Alameda County, California, acting either directly or through his authorized deputies.

(g) DISTRICT means the Alameda County Flood Control and Water Conservation District.

(h) FLOODWAY means the channel of a watercourse and adjacent land areas that must be reserved in order to convey flood flows as determined by the Director of Public Works. Where shown on a Flood Boundary and Floodway Map of the Federal Insurance Administration, "Floodway" means such a designation on said map.

(i) MAINTENANCE means the desilting, pruning or removal of vegetation, the removal of trash and debris, the removal of algae, water treatment, mosquito abatement activities, repair, or any other work required to maintain conveyance or storage capacities of watercourses or purity and quality of water, or to safeguard public health.

(j) PERMIT means a permit issued by the Director of Public Works pursuant to the provisions of this Chapter.

(k) PERMITTEE means any person granted a permit under the provisions of this Chapter.

(l) PERSON means any individual or group of individuals, firm, corporation or public agency.

(m) PUBLIC AGENCY means any Federal, State, regional or local government entity or any subdivision thereof.

(n) SETBACK means a distance adjacent to an open channel watercourse within which development shall be controlled. Setback limits are defined in Article 5.

(o) STRUCTURE means any works or constructions of any kind, including those of earth or rock, permanent or temporary, and including fences, poles, buildings, pavings, inlets, levees, tide gates, spillways, drop structures and similar facilities.

(p) WATERCOURSE means any conduit or appurtenant structure or any natural or man-made channel through which water flows continuously or intermittently in a definite direction and course or which is used for the holding, delay or storage of water. Natural channels shall generally be limited to those designated by a solid line or dash and three dots as shown in blue on the most recent U. S. Geological Survey 7.5 minute series of topographic maps. At the discretion of the Director of Public Works, the definition of natural channel may be limited to those channels having a watershed area of 50 acres or more, and this definition will be commonly used in the administration of this Chapter except for those cases in which the Director of Public Works determines that the definition must be extended to a natural channel with a watershed area smaller than 50 acres in order to prevent a condition which is a menace to life and limb, endangers property, is a hazard to public safety, adversely affects the safety, use or serviceability of adjacent property, public way or drainage channel, or could adversely affect the water quality of any water body or watercourse were the definition not extended to a particular natural channel with a watershed area below 50 acres.

Sec. 7-200 3 **Jurisdiction:** This Chapter shall apply to the unincorporated area of Alameda County.

Sec. 7-200 4 **Responsibility of Director of Public Works:** It shall be the responsibility of the Director of Public Works to enforce the provisions of this Chapter and he is hereby so authorized.

Sec. 7-200 5 **Owner's and Tenant's Responsibility:** Every person owning property through which a watercourse passes, or said person's lessee or tenant, shall keep and maintain that part of the watercourse within said property reasonably free of trash, debris, excessive vegetation and other obstacles which would pollute, contaminate or significantly retard the flow of water through the watercourse; shall maintain existing privately owned structures within or adjacent to a watercourse, so that such structures will not become a hazard to the use, function or physical integrity of the watercourse; and shall not remove healthy bank vegetation beyond that actually necessary for said maintenance or other maintenance specified in Sec. 7-201.10 (c) herein, nor remove said vegetation in such a manner as to increase the vulnerability of the watercourse to erosion.

Sec. 7-200 6 **Not Retroactive:** This Chapter shall be prospective in operation only. The provisions of this Chapter shall not apply to existing construction for which all previously necessary permits were obtained. Said provisions shall also not apply to a project or development not yet constructed provided that an appropriate permit has been obtained and said permit bears a date prior to the effective date of this Chapter.

Sec. 7-200.7 **Administration:** This Chapter shall be administered for Alameda County by the District.

ARTICLE 2. PERMIT PROCEDURES

Sec. 7-201.0 **Requirements:** No person shall commit or cause to be committed any of the following acts, unless a written permit has first been obtained from the Director of Public Works:

(a) Discharge into or connect any pipe or channel to a watercourse;

(b) Modify the natural flow of water in a watercourse;

(c) Carry out development within a setback, as defined in Article 5;

(d) Deposit in, plant in, or remove any material from a watercourse including its banks, except as required for necessary maintenance;

(e) Construct, alter, enlarge, connect to, change, or remove any structure in a watercourse; or

(f) Place any loose or unconsolidated material along the side of or within a watercourse or so close to the side as to cause a diversion of the flow, or to cause a probability of such material being carried away by storm waters passing through said watercourse.

Sec. 7-201.1 **Restrictions:** The intent of this Chapter is to safeguard watercourses. A permit shall not be granted where, in the opinion of the Director of Public Works, a proposed activity in or adjacent to a watercourse could result in disposal or deposition of oils, chemicals, poisons, trash, or other materials harmful to said watercourse.

Sec. 7-201.2 **District Ordinance in Effect:** Nothing contained herein shall in any way supersede, void or preempt requirements of District Ordinance No. 34 (Alameda County Ordinance No. 441 N.S.). Said Ordinance includes permit requirements for activities in District-owned rights-of-way or facilities.

Sec. 7-201.3 **Other Permits:** Nothing contained herein shall in any way supersede, void or preempt requirements of other governmental agencies, including federal, state, and local agencies, in regard to activities affecting watercourses. Also, the requirements of this Chapter are not intended to duplicate the requirements of another agency. If, in the opinion of the Director of Public Works, the requirements of this Chapter will be substantially met by conditions prescribed by a permit granted by another agency, the Director of Public Works may waive the permit requirements of this Chapter. Any violation, however, of the requirements of this Chapter, regardless of whether such violation may have occurred under provisions of another permit, may be subject to enforcement procedures and penalties prescribed by this Chapter.

Sec. 7-201.4 **Permit Applications:** Permit applications shall be filed with the Director of Public Works on forms furnished by his office. A schedule of fees and costs and a list of requirements and instructions shall be furnished each applicant. The Director of Public Works may require any additional information he considers necessary to establish the identity of the applicant, the location of the project site, details concerning the proposed project, a timetable of proposed activities, existing site conditions, and anticipated site conditions following the proposed activities. An application shall be accepted as complete upon receipt of all required information and payment of fees.

Sec. 7-201.5 **Permit Issuance:**

(a) In issuing a permit, the Director of Public Works may prescribe conditions reasonably necessary to safeguard the affected watercourse pursuant to provisions of this Chapter. Non-compliance with said conditions is deemed a violation of this Chapter.

(b) A permit may be issued for any reasonable term and may be renewed if good cause therefor is shown. A written request for renewal shall be submitted to the Director of Public Works who may require a new application and required fees, considering the time between the expiration date and the renewal request, revisions in County regulations, or changed circumstances in the immediate area of the site. Any revised plan shall be submitted to the Director of Public Works for review, and any costs thereof shall be at the applicant's expense.

(c) If a proposed activity could significantly affect the physical characteristics of a watercourse in another jurisdiction such as an unincorporated city or an adjoining county, or could result in disposal or deposition of a foreign material in a watercourse upstream from such jurisdiction, that jurisdiction shall be notified prior to issuing a permit

VOL 12 2 6511

Sec. 7-201 6 **Prosecution of Work:** The permittee shall begin the work or use authorized by a permit issued pursuant to this Chapter within 90 days from the date of issuance unless a different period is provided in the permit. Failure to begin said work or use on time or to prosecute it diligently shall be deemed a violation of this Chapter.

Sec. 7-201.7 **Appeals:** The issuance, denial, cancellation, or conditioning of a permit pursuant to this Chapter may, within 15 calendar days of such action, be appealed in writing by any person to the Board. An appeal shall set forth the grounds therefor, the work proposed to be done and the method of accomplishing said work, together with sufficient factual, engineering and technical data to set forth the basis and the reasons for the appeal. Board shall make a final interpretation of requirements and shall announce its decision within 30 calendar days after receipt of said written appeal.

Sec. 7-201.8 **Responsibility:**

(a) Neither the issuance of a permit nor compliance with the conditions thereof, nor with the provisions of this Chapter, shall relieve any person from any responsibility otherwise imposed by law for damage to persons or property; nor shall the issuance of a permit hereunder serve to impose any liability upon the County of Alameda, the District, a City, a special district, or its officers or employees, for injury or damage to persons or property. A permit issued pursuant to this Chapter does not relieve the permittee of the responsibility of securing and complying with any other permit which may be required by any other public agency ordinance, directive or law.

(b) It shall be the responsibility of any person whose operation may result in discharge into a watercourse to comply with applicable Federal, State and local water quality standards and regulations.

Sec. 7-201.9 **Fees:**

(a) The schedule of fees and costs shall be those established and adopted by the Board from time to time by resolution. Before a permit is issued, the applicant shall deposit with the Director of Public Works cash or a certified or cashier's check, in a sufficient sum to cover the fee for issuance of the permit, charges for review of plans, specifications and reports, other engineering services, field investigations, and necessary inspection or other work, all in accordance with schedules established and adopted by the Board.

(b) No fee shall be required of public agencies.

(c) Public utilities may, at the option of the Director of Public Works, make payment as billed by the Director of Public Works instead of in advance.

(d) If, upon completion of any work under a permit there remains any excess of deposit or of fees or charges, the Director of Public Works shall certify the same to the auditor for refund to the permittee or refund the same from any trust fund established under his jurisdiction for such purposes.

(e) If, upon completion of any work under a permit there is an insufficient deposit to cover the District's cost, the Director of Public Works may require the Permittee to reimburse the District in an amount equal to the cost deficit.

Sec. 7-201.10 **Exemptions:** The following activities are exempted from the provisions of this Article except as provided herein:

(a) Agricultural operations, as long as these activities do not significantly pollute or damage watercourses or cause excessive erosion of banks and deposition of sediments in watercourses thereby requiring abatement measures and imposing cost burdens on the District and its taxpayers.

(b) Work within a public roadway right-of-way, where said public roadway right-of-way crosses a watercourse. The affected jurisdiction shall advise the District of details and schedule for such work.

(c) Minor or routine maintenance work performed by a property owner or his tenant on a watercourse flowing through his property pursuant to Sec. 7-200.5 herein. Said maintenance work shall be limited to pruning and removal of excessive vegetation and removal of trash and debris.

VOL 12 2 6518

R0059811

(d) Performance of emergency work necessary to protect life or property when an urgent necessity therefor arises. The person performing such emergency work shall notify the Director of Public Works promptly of the problem and work required and shall apply for a permit therefor within ten calendar days after commencing said work.

(e) The Director of Public Works may, at his discretion, exempt the permit requirements of this article when an Alameda County Grading Permit has been obtained and all applicable requirements of this Chapter have been satisfied.

Sec. 7-201.11 **Performance of Work — Inspection:** The Director of Public Works may inspect any work done pursuant to a permit under this Chapter. No permittee shall be deemed to have complied with this Chapter until a final inspection of the work has been made by the Director of Public Works and he has certified in writing that the work has been completed in accordance with all requirements and conditions of the permit.

Sec. 7-201.12 **Security:** At the discretion of the Director of Public Works, a permit may be withheld until the applicant has posted security in an amount satisfactory to the Director of Public Works for the faithful performance of the work or the cost of removing the work or otherwise reconstructing or restoring a watercourse to conditions existing prior to such work in the event of default on the part of permittee. Said security shall be in the form of cash, a certified or cashier's check, a letter of credit, or a faithful performance bond executed by the applicant and a corporate surety authorized to do business in this state.

Sec. 7-201.13 **Transfer of Permit:** No permit issued under this Chapter may be transferred or assigned in any manner whatsoever, voluntarily or by operation of law, without the express consent of the Director of Public Works.

ARTICLE 3. ENFORCEMENT

Sec. 7-202.0 **Suspension and Revocation of Permit:** The Director of Public Works may suspend or revoke a permit for good cause, subject to appeal to the Board of Supervisors. However, no work shall be performed pending appeal except as authorized by the Director of Public Works.

Sec. 7-202.1 **Abatement:** Whenever the Director of Public Works determines that any existing condition is a hazard to life or limb, or endangers structures, or adversely affects the use, function or physical integrity of a watercourse, or that any violation of this Chapter exists, any such condition or violation is hereby declared to be a public nuisance and may be abated pursuant to the provisions of Chapter 7 of Title 7 of this Code.

Sec. 7-202.2 **Injunction:** The County Counsel, at the direction of the Board of Supervisors shall, or in the case of an emergency at the request of the Director of Public Works may, petition the Superior Court for the issuance of a temporary restraining order, temporary injunction, or permanent injunction , or combination thereof, as may be appropriate, requiring any person not complying with this Chapter to comply therewith.

Sec. 7-202.3 **Nonexclusive Remedies:** The remedies provided herein are not exclusive, and are in addition to any other remedy or penalty provided by law for violation of this Chapter.

ARTICLE 4. ADDITIONAL PROVISIONS

Sec. 7-203 0 **Right of Entry:** Whenever necessary to enforce the provisions of this Chapter the Director of Public Works may enter the premises at all reasonable times in the manner provided by law to perform any duty imposed by this Chapter.

Sec. 7-203.1 **Liability:** Neither issuance of a permit under the provisions of this Chapter nor compliance with the provisions hereof or with any conditions imposed in a permit issued hereunder shall relieve any person from responsibility for damage to any person or property or impose any liability upon the County for damage to any person or property.

Sec. 7-203.2 **Denial of Other Permits:** No building, septic tank, water, sewer, electrical, or any other permit shall be issued by the County to any person for any premises or portion thereof which is in violation of this Chapter and which violation is not corrected or approved for correction by the Director of Public Works.

Sec. 7-203.3 **Notice to Adjacent Owners:** Upon the filing of an application for a permit, the Director of Public Works may notify by mail the owners of property abutting the site, as shown on the latest equalized assessment roll, that an application for a watercourse protection permit has been submitted pursuant to this Chapter, that they may comment at any stage of the procedure, and may lodge an appeal pursuant to the provisions of this Chapter.

Sec 7-203.4 **Severability:** If any section, subsection, paragraph, subparagraph, sentence, clause or phrase of this Chapter is for any reason held to be invalid or unconstitutional, such invalidity or unconstitutionality shall not affect the validity or constitutionality of the remaining portions of this Chapter; and the Board declares that this chapter and each section, subsection, paragraph, subparagraph, sentence, clause, and phrase thereof would have been adopted irrespective of the fact that one or more of such section, subsection, paragraph, subparagraph, sentence, clause or phrase be declared invalid or unconstitutional.

VOL 12 2 6519

ARTICLE 5. SETBACKS

Sec 7-204.0 Requirements:

(a) Setbacks are hereby established adjacent to open channel watercourses in conformance with details shown in Sec. 7-204.1.

(b) The purpose of setbacks is to safeguard watercourses by preventing activities that would contribute significantly to flooding, erosion or sedimentation, would inhibit access for watercourse maintenance, or would destroy riparian areas or inhibit their restoration. Accordingly, no development shall be permitted within setbacks, except as otherwise provided herein.

(c) In certain situations, where, in the opinion of the Director of Public Works, it would be in the public interest to permit limited development within a setback, the Director of Public Works may grant a permit for said development provided that the above specified purpose would be satisfied. In such cases, the permit applicant shall submit sufficiently detailed plans and specifications, and any additional material required by the Director of Public Works, to demonstrate that a proposed development adjacent to an open channel watercourse would meet said requirements.

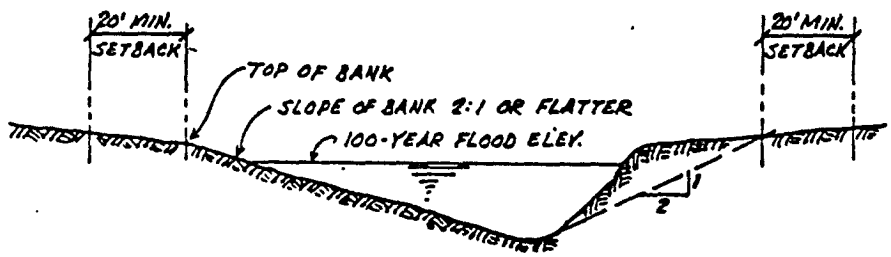
(d) In all cases where development adjacent to an open channel is permitted within setback limits, the owner of the developed property shall assume all responsibility for any damage whatsoever to his property or to any structures erected thereon.

(e) No development shall be permitted within a setback where it would conflict with the requirements of any applicable County, District or City ordinance, regulation, directive or law.

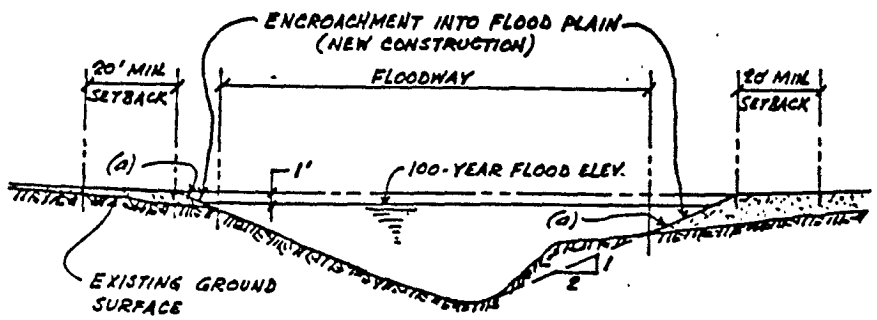
(f) Setbacks shall be located outside of floodways.

(g) The Director of Public Works shall make the determination as to setback limits and any permitted development within a setback.

Sec. 7-204.1 Setback Criteria:



SECTION A — TYPICAL WHERE 100-YEAR STORM FLOW IS CONTAINED WITHIN BANKS OF EXISTING WATERCOURSE

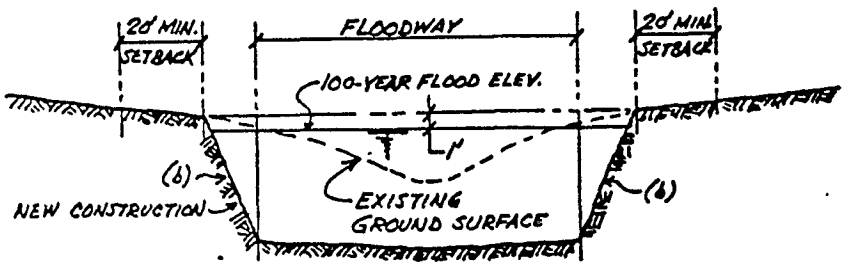


R0059813

VOL 12 2 6520

(a) Slope of bank shall be 2 horizontal to 1 vertical or flatter, as determined by Director of Public Works.

SECTION B — TYPICAL WHERE EXISTING CHANNEL IS SUFFICIENTLY LARGE TO ALLOW SIDE ENCROACHMENT



(b) Sides of channel shall be structurally stable. If sides are of earth, they shall have a maximum slope of 2 horizontal to 1 vertical..

SECTION C — TYPICAL FOR A FLOOD PLAIN WHERE THE WATERCOURSE MUST BE ENLARGED TO PERMIT DEVELOPMENT

NOTES:

1. Sections B and C shall be based on maximum development under existing General Plan.
2. Sections A, B and C are not applicable to developed areas where provisions of Sec. 7-200.6 (Not Retroactive) apply.

SECTION II

This Ordinance shall take effect and be in force thirty (30) days from and after the date of its passage and before the expiration of fifteen (15) days after its passage it shall be published once with the names of the members voting for or against the same in The Inter-City Express, a newspaper published in the said County of Alameda.

Adopted by the Board of Supervisors of the County of Alameda, State of California, on March 16, 1982, by the following called vote:

AYES: Supervisors Cooper, Excell, Santana and Chairman Bort — 4.

NOES: None.

EXCUSED: Supervisor George — 1.

JOSEPH P. BORT,
Chairman of the Board of Supervisors of the
County of Alameda, State of California.

ATTEST:

WILLIAM MEHRWEIN,
Clerk of the Board of Supervisors of the
County of Alameda, State of California,
By: WILLIAM MEHRWEIN.

COORDINATE, CHEMICAL BONDING AND ADSORPTION

Coordinate, Chemical Bonding and Adsorption (CCBA) is an innovative new process which has been developed by the San Diego Water Reclamation Agency for the treatment and reclamation of industrial wastewater, municipal wastewater, and hazardous waste. The process produces water which is clean enough for unrestricted recreational use, and converts the residual sludge from the treatment process into a valuable and useful lightweight ceramic aggregate. Thus, the CCBA process produces cleaner water than conventional primary treatment and does not create hazardous and useless solid waste, as conventional biological treatment plants do.

The CCBA process adds clay, polyacrylic acid, and alum to wastewater. The mix is then flocculated and the heavy floc is settled out of the water in a clarifier. The water from the clarifier will meet secondary treatment requirements. The sludge from the process is pumped from the clarifier and fired in a kiln, producing pellets of a ceramic material. The exhaust from the process is channeled back into the original mix, where the particulate matter becomes, once again, part of the floc which is ceramicized. The water from the CCBA process can be used for recreation and irrigation, and the ceramic aggregate can be best used for the construction industry (replacing cinder blocks).

CCBA is now in its fourth stage of testing and evaluation, which began in June, 1986. Phase one demonstrated that the CCBA process can:

1. Treat and reclaim raw municipal wastewater economically.

2. Turn the sludge into a lightweight ceramic aggregate which has uses in the building and other industries.

3. Treat waste water at a quarter of the capital cost of an activated sludge secondary treatment facility.

4. Treat the same volume of wastewater in 25% of the space of a standard primary, secondary biological facility.

5. The operations and maintenance costs of the CCBA plant can be greatly reduced by the revenue from the sale of the resources (ceramic aggregate) recovered.

Phase II studied the ability of the CCBA process to remove heavy metals and toxic organics from mixed municipal and industrial waste. Nearly 150,000 gallons of raw sewage from Tijuana, Mexico was processed in the CCBA pilot plant. The process removed 100% of the chromium and silver, and between 77% to 96% of all

cadmium, zinc, lead, nickel, and copper from the wastewater. The process also removed between 36% to 99% of the toxic organics in the sewage, including 96% of the methylene chloride and 98% of the napthalene to 36% of the chlorobenzene and 44% of the chloroform.

Phase II also demonstrated that the heavy metals captured in the ceramic pellets were converted to metal silicates and silicates of glasses in such a manner as to be trapped and therefore no longer a threat to the environment. In addition, this stage of the pilot program demonstrated the capacity of CCBA to remove bacterial and viral indicators from the sewage. The pilot plant removed 78.6% of total coliform bacteria and 78.5% of F-specific bacteriophages. These removal rates are comparable to the rates of conventional secondary treatment by activated sludge.

Phase III of the project demonstrated that the CCBA process can:

1. take dewatered industrial sludge and convert it to ceramic aggregate;

2. take liquid industrial sludge containing heavy metals and convert it to ceramic aggregate, and

3. take liquid industrial sludge containing toxic organics and destroy the toxics while producing the ceramic aggregate.

Phase IV involves demonstrating the ability of the CCBA process to meet state standards for the removal of viruses and bacteria so that the reclaimed water can be safely used. The final report on this phase will be complete in January of 1989. An economic analysis is also currently in progress.

THE SAN DIEGO WATER RECLAMATION AGENCY

The goal of this agency, which is comprised of municipalities, county agencies, and special districts which provide sewer and/or water service, is to advance the technology of wastewater reclamation and to promote its reuse as a supplemental water supply. The San Diego Water Reclamation Agency (SDWRA) attempts to fill the gap between research and its application in the community. To do so, SWDRA has established four objectives:

1. "To jointly study the methods and technology of water reclamation, water management, and the reuse of wastewater."

2. "To establish one or more centers for the conduct of such studies."

3. "To experiment, test and apply in an operational setting advanced techniques for the reclamation and reuse of water."

4. "To develop water reclamation plans and programs that may be adopted by the members of the agency for use and application within their respective jurisdictions."

The Reclamation Agency is funded by assessments against each of the member agencies and through grants.

SDWRA has accomplished the following:

1. Found that artificial wetlands can provide an economic alternative to dentrifying secondary treatment systems which also remove BOD and suspended solids. Artificial wetlands can also provide secondary treatment of primary effluent and provide a high degree of nitrogen removal. In addition, the SDWRA study found that artificial wetlands can remove certain heavy metals, such as copper, zinc and cadmium from effluent.

2. Demonstrated the feasibility of maintaining live-streams by supplementing existing streambeds with reclaimed waters. The agency has shown that it is possible to develop and maintain water-oriented recreational parks and campgrounds in urban areas.

4. Pioneered the conversion of organic matter resulting from wastewater treatment into energy or other valuable products. This process is known as Coordinate, Chemical Bonding and Adsorption.

THE BELLEVUE (WASHINGTON) STORM AND SURFACE WATER UTILITY

The Bellevue Storm and Surface Water Utility (BBSWU) was created to address the problems of increased erosion, flooding and the conveyance of surface pollutants to receiving waters. The BBSWU was created to manage the drainage system while providing protection from property damage, maintain hydrologic balance, and protect water quality. The drainage utility attempts to manage stormwaters using as much of the natural drainage system as possible without degrading the natural system.

The BSSWU has five major programs:

1. Administration -- involves policy development, financial management, rates administration, comprehensive drainage planning, general administration, and support for the City council and Utility Commission.

2. Development regulation -- entails reviewing plans and making inspections to ensure all new development complies with utility policies and standards.

3. Capital improvement -- plans, design, acquires property and constructs flood control, water quality treatment and stream enhancement projects.

4. Operations and maintenance -- involves the repair and replacement of structural facilities, the operations of small dams and other control structures for flood control, and the emergency storm response program.

5. Water quality control program -- includes drainage system cleaning, routine monitoring of receiving waters, investigative monitoring and emergency response for water pollution events, stream enhancement programs, lake restoration studies, and coordination with other water quality control agencies.

The utility interacts closely with other government agencies, working with the Washington Department of Ecology and the Pudget Sound Water Quality Authority to assure that the requirements of the local water quality plan are fulfilled, monitored and enforced.

The five programs listed above are financed the same as for water and sewer utilities. Rates are charged on the basis of contribution to run-off and the rate structure is based on the amount of run-off produced. Since the level of run-off actually produced cannot be measured directly, an estimate is made on the basis of the extent of impervious surface on a property and its size.

The drainage utility computes its rate classifications on the basis of a system of run-off coefficients. These coefficients are developed primarily from the amount of developed surface on a parcel of land and on whether the property has other physical improvements which alter the hydrology. The rate ratios of the five classifications--undeveloped, light development, moderate development, heavy development, and very heavy development--are multiplied by property area and the total revenue requirement to determine the service charge.

The utility receives the majority of its revenue from the rates charged property owners. BBSWU also collects permit fees to offset the costs of its development regulation program. The utility also receives a buy-in charge at the time of development, similar to the fee charged by water and sewer utilities for capital costs. Latecomer and developer extension agreements are another source of revenue. The former requires the utility to collect from future developments which benefit from privately funded capital improvements to reimburse the original financier. Thus, the utility is expanded at no cost to the taxpaying public.

Federal funds have financed a recent education and enforcement program: "Stream Teams" have been formed which provide neighborhood surveillance for illegal dumping. A program in the schools teaches children the effects on the ecosystem of the inappropriate disposal of garbage.

Another recent addition is a recycling program for crank case oils.

The Bellevue Utility is regarded as highly successful. King County is now beginning a county-wide program based on the Bellevue model.

for the next item. Thank you.

MR. COE: We are going to have a short break here at this time.

(A brief recess was taken.)

MR. COE: This is Item No. 8 on your agenda, Waste Discharge Requirements and the NPDES permit for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles.

At this time I would like to call on staff to present the opening statement. That's Carlos Urrunaga.

MR. URRUNAGA: Thank you, Mr. Chairman.

Mr. Chairman, members of the Board, ladies and gentlemen, my name is Carlos Urrunaga, and I am an Environmental Specialist 3 with the Regional Water Quality Control Board. My business address is 101 Centre Plaza Drive in Monterey Park.

This is a hearing for this Board to consider adoption of Waste Discharge Requirements and a National Pollutant Discharge Elimination System permit, herein after referred to as NPDES, for the control of pollutants and discharges of storm water and urban runoff by the county of Los Angeles and 85 municipalities within the county.

These discharges flow into municipal

VOL 14

00088

R0060014

separate storm sewer systems, also called storm drain systems, and any water courses within the county that are under the jurisdiction of this Regional Board.

This hearing is being held in accordance with state and federal regulations. This hearing and the Board's intent to provide Waste Discharge Requirements and issue an NPDES permit were publicly noticed as follows:

Published in the Los Angeles Times on June 12, 1996, and the change of location and time of this hearing on July 7, 1996.

Copies of the tentative NPDES permit and revisions thereof were mailed on May 25, 1996, and July 6, 1996, respectively, to the principal permittee, the permittees, the U.S. Environmental Protection Agency, the State Water Resources Control Board, and other interested agencies, organizations, associations, and persons.

The tentative permit and revisions thereof are also accessible to the Regional Board's electronic bulletin board system and listed in the Regional Board's meeting agenda mailed on July 2, 1996 to the permittees and to all known interested agencies, parties, and persons.

The agenda is also accessible to the Regional Board's electronic bulletin board system. And copies of the agenda are available on the table at the back

VOL 14 00099

R0060015

of this room.

Testimony during today's hearing will cover requirements for the control of pollutants and discharges of storm water and urban runoff contained in the proposed NPDES permit and whether the Board should adopt the proposed NPDES permit.

The storm drain permit will take place 15 days after Regional Board adoption provided Regional Administrator of the U.S. Environmental Protection Agency Region 9 has no objection.

After the close of the hearing, the Board may consider the proposed NPDES permit, written comments received, and written and oral testimony presented at this hearing, and consider adoption of the permit.

Those who desire to record their position on the permit but not speak are asked to please fill out a yellow card and give it to a Regional Board staff member. The yellow cards are located on the table at the back of this room. The yellow cards will be given to the Board members during this hearing.

Those who desire to give testimony should fill out a blue card and give it to a Regional Board staff member. The blue cards are also located on the table at the back of this room.

The order of the presentation will be as

VOL 14

0010

R0060016

follows:

Regional Board staff and state board panel presentation, 40 minutes; elected officials, 30 minutes; permittees other than those represented by elected officials, 30 minutes; other public agencies, 20 minutes; business associations, 30 minutes; public interest groups, 30 minutes; other interested parties, 30 minutes.

Each person testifying should begin by stating his or her name, address, and whom he or she represents. The hearing will not be conducted according to technical rules of evidence. The Board reserves the right to limit any evidence or testimony which is irrelevant or repetitious. Only one representative will be allowed to speak from each permittee, agency, organization or association.

Based on the number of individuals under each category who wish to speak, the Chair will announce the time limit for each speaker at the beginning of that category. For example, if there are ten elected officials who wish to speak, each official will be given three minutes to speak. It is recommended that parties having similar concerns be represented by a spokesperson. At his discretion, the Chair may give that spokesperson additional time to address the Board.

The Board, Staff, and Counsel may ask

VOL 14 0011

R0060017

questions to clarify the testimony of a witness at any time. Limited cross examination of any witness by others will be allowed following the completion of direct testimony by all persons.

This proceeding is being recorded on magnetic tape. Any person wishing a copy of the master tape, at their own expense, may make appropriate arrangements through the Board's Executive Assistant, Robyn Shipley.

This proceeding is also being recorded by a court reporter. Any person wishing a copy of the record must make his or her on arrangements directly with the court reporter.

I would like to end my opening statement by entering into the administrative record of this hearing all comments, letters, resolutions received, and all files Staff has pertaining to the NPDES permit.

Chairman Coe, will you now please administer the oath to those testifying and open the hearing.

MR. COE: Thank you.

All persons who wish to testify at this hearing, if you will now stand and raise your right hand and take the following oath.

(Oath administered.)

VOL 14

0012

MR. COE: I want to welcome everyone to this hearing today. We have got a long agenda, as you can tell. The time has been allocated among groups.

To get through the hearing on time and provide an opportunity for everyone who wishes to speak today, all should abide by the time limits. We are not trying to be rude, but, to be practical and considering the number of people here and the number of people who took the oath, you know it's going to be an extensive exercise.

The allocation of time was provided you in the agenda which was mailed out in advance. As Staff has indicated in the opening statement, the amount of time that any one individual will have to testify will depend on the number of speaker cards that were turned in.

I want to also encourage people to use the yellow cards similar to the process we used earlier for the hearing on the Toland Road Landfill. These cards will be passed among the Board members, and these are the cards where you want to indicate your comments or position without speaking. And these cards will be distributed to the Board members during the process.

Secondly, I strongly suggest that parties having similar concerns select a spokesperson to represent your group. We want to avoid repetition wherever possible. If we all cooperate in this way, I believe

VOL 14 0013

R0060019

everyone will have an opportunity to have their views recorded for the administrative record and we can complete the hearing in a reasonable amount of time.

As it is, even if we do not deviate a minute from the time schedule announced by our staff, we are looking at about three and a half hours of testimony, at least that's how much has been allocated, after which the Board will conduct its deliberations on this matter.

There will be a lunch break. We are sort of looking at 12:30. It will sort of depend on when the logical break between groups occurs.

At this time, Staff will make its presentation, and Catherine Tyrrell will lead that.

MS. TYRRELL: Good morning, Mr. Chairman, members of the Board, and Dr. Ghirelli. My name is Catherine Tyrrell, and I am the Assistant Executive Officer for Service Water Programs at the Regional Board. My business address is 101 Centre Plaza Drive in Monterey Park.

Before I begin the staff presentation today, I'd like to do two things. First, I would very much like to thank the staff of the Regional Board that worked with me on the Storm Water Permit. It's been a very intense effort, and they have worked very hard to bring this forward to you today.

VOL 14

0014

In particular, I would like to thank Winnie Jesena, who was the unit chief who led this effort, Xavier Swamikannu, who is a Senior Environmental Specialist, and Carlos Urrunaga, and also other members of Winnie Jesena's staff who have also pitched in and worked very hard.

MR. COE: Are they here? If they would stand.

MS. TYRRELL: Yes, they are. Would you like to stand up.

(Applause.)

MR. COE: It's been about a year and a half, 51 meetings or something like that?

MS. TYRRELL: Something like that, yes.

I'd like to also show a short video before we get to the staff presentation that was produced by two elected officials active on the Santa Monica Bay Restoration Project along with other members of the Bay Restoration Project who were responsible for the video. It was sent to every City Council in the county in early June as a background for today's meeting.

So if we could show the video over here.

(Video shown.)

MS. TYRRELL: With that excellent background, I would like to begin this panel presentation by

VOL 14

0015

R0060021

introducing the panel members. They are Jorge Leon, Staff Counsel who you know very well; Catherine Kuhlman, who is the Chief of Permits and Compliance Grants at U.S.P.A. Region 9; Don Wolfe, the Executive Director of the L.A. County Department of Public Works; Amy Glad, Vice President of the Building Industry Association; and Mike Kissel, Environmental Specialist with Carl Karcher Enterprises on behalf of Carl's Jr., and Dr. Mark Gold, the Executive Director of Heal the Bay.

After I complete a short staff presentation, they will each present comments from the various perspectives that they represent. They each have been involved in some aspect in shaping the ultimate permit that we have before you today. And they will also be available to answer questions.

Okay. Over here we are going to have the staff presentation. And the permit before you today is for the reissuance of a Storm Water and Urban Runoff Pollution Control Permit first issued by this Board back in 1990. It is currently one year overdue.

The permit is being issued to the County of Los Angeles as the principal permittee and the 85 municipalities of Los Angeles County as permittees. However, to keep to the schedule, I will emphasize basically three things: the contents of the permit, which

VOL 14 0016

R0060022

is the overview that we will pursue today; changes made; and lastly, issues that we see as still being remaining.

The 1987 amendments to the Clean Water Act in Section 402(p) are the origin of this permit. This section states that permits for discharges for municipal storm sewers may be issued on a system- or jurisdiction-wide basis and shall include requirements to effectively prohibit non-storm water discharges into the storm sewers and storm drains and shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques, et cetera.

In 1990, EPA issued regulations which require activities in these listed areas to be undertaken by municipalities. Because a permit had been issued here in Los Angeles County before the EPA regulations were issued, the Part 1/Part 2 application process ordinarily necessary is not required. However, the permit must accomplish the objectives and meet any minimum requirements set out in the regulations.

The permit revision process began back in December of 1994 with the submittal of the application for reissuance of the 1990 permit by the county and the cities. The permit now before you is the result of 18 months of discussions with affected parties and countless

VOL 14 0017

R0060023

meetings to hammer out differences, including those arising from differing municipal perspectives.

Great care was taken to thoroughly review comments received and to make responsive changes as evidenced in our May tentative permit. Additional modifications to clarify meaning have been made based on comments on the May draft as well as final comments which I will discuss.

Now I'd like to summarize the contents of the permit. Note that the permit has a table of contents which serves as a useful outline. Because it is impossible to go into detail in a ten-minute overview, I am going to run through several of the key parts of the permit.

The first is program management, a very important part of the permit considering the complexity of issuing a permit to 85 cities in the county.

The program management portion of the permit addresses the roles and responsibilities of the principal permittee, permittees, and the Watershed Committee. It also calls for the principal permittee to provide a budget summary format for permittees to use and asks permittees to provide budget information within 60 days of budget adoption.

Program management also calls for permittees to demonstrate that they have legal authority to

VOL 14 0018

R0060024

prohibit or require various activities. And if not, to provide a schedule for obtaining it.

As stated on page 23 of the permit, the requirement that permittees possess legal authority to control specified discharges does not require inspection of private property, something that I think some cities had feared. So we made some very specific changes to that regard. Its purpose is to assure that municipalities can abate problems when they are identified.

This section also includes a procedure for substituting alternative BMPs or programs for those required within the permit. This is some of the language on program substitution, so you can see that we created that kind of flexibility in the permit. This shows that a permittee may petition the Executive Officer to substitute or eliminate any BMP or program with appropriate documentation as identified in the permit.

Program management also contains -- the section also contains various procedures for review and acceptance of reports and documents for resolving differences in compliance expectations and for public review of documents submitted to the Executive Officer for review.

And the next two, first this one. This is a quote from the permit dealing with public review

VOL 14 0019

R0060025

opportunities.

The principal permittee shall distribute for public comment the initial Storm Water Management Plan and other storm water program requirements that are submitted to the Executive Officer for approval.

And then other parts of the permit, wherever there are BMPs for various kinds of activities being submitted by the county and the co-permittees, there are -- they actually are going to bring those to the Regional Board. We will bring these to the Regional Board for discussion and approval.

MR. COE: Ms. Rogers, do you have a question?

MS. ROGERS: Yes, sir.

Catherine, was this subset of all the materials that are in the permit selected because they are less controversial?

MS. TYRRELL: Yes.

They affect the various players, businesses, et cetera, more than anything else. So that's why we selected those for coming to the Board.

MS. ROGERS: So they will have hearings down the road so, when we have read all if these materials that have brought up these issues, we will have another shot and hear discussions on these?

MS. TYRRELL: On these specific items, they

VOL 14

00020

R0060026

will come back to the Board.

The permit calls for action in four key areas. Effectively prohibiting pollution to the MS-4, that's the storm drain system, from first illicit connections and discharges, from future development and construction, for permittees' own public agency activities, and also by providing public information and education to the residential sector, business, and industry.

In each of these first three areas, the permit follows a basic pattern of, first, development of a model by the principal permittee with consultation from other permittees. Secondly, submitting that model to the Regional Board's E.O. and other interested parties. Thirdly, approval of the model by the Executive Officer. And then, lastly, implementation by the permittees.

For instance, within the illicit connection program, the objective is to develop a program to find and eliminate any connections to the storm drain that do not have a permit, excluding things like roof drains and other similar kinds of connections.

The principal permittee could also model a program, with the input of the permittees, submit it to the Executive Officer for review, and after the 45-day public review period and within 120 days as called for in the Administrative Review Procedures, the Executive Officer

VOL 14 0021

R0060027

must respond on its adequacy. Then the permittees implement their own program based on the model.

And the timing is related to the city's budget approval process. That was an addition that we added so that there would be adequate time in each city to consider the issues and then act and put it into the budget as appropriate.

Also under this section of the permit is a listing of non-storm water discharges that need not be prohibited. After much discussion of what should or should not be in this listing, we decided to list exactly the same categories as in the EPA regulations.

As there are many possible additions, the permit has a procedure for exemptions. So we also included a procedure there for the various parties to bring forward additional exemptions.

The pattern described above of model development, review, and implementation applies here as well in the development planning and construction portion of the permit. And it applies here also to the public agency activities.

The public education program is a central component of the permit, much of it aimed at the general public and the residential sector.

Added to this section in the May draft

VOL 14 00222

R0060028

was the development of industrial/commercial BMP lists and educational site visits to businesses. In previous drafts, these programs were not just site visits for educational purposes but actual inspections.

Additional changes were made in the July final permit such that cities do not need to report when the businesses they visit need to file NOIs with the Regional Board under the state industrial storm water permit. However, cities do need to notify the Board of those they visit so that we can coordinate the state program with the local program as envisioned in the federal regulations.

Also in the area of site visits there is a provision for a permittee to substitute with an equally effective program.

A number of changes have been made in response to comments. Again, to save time, I'm not going to discuss each of these in detail but simply show that significant changes have been made in a number of different areas.

We have made changes to the receiving water limitations language such that compliance with the permit is equal to compliance with receiving water limits. We do need to have a receiving water limit section in the permit. In fact, having it here this way is more

VOL 14 00023

R0060029

protective for the permittees because, as you know, the basic plan is there regardless of whether we put it in the permit. So this actually provides greater protection for permittees.

We have also made changes to program management and reporting based on the comments we have received.

We have made changes to new development and construction planning along the lines that you see here.

We have made changes to the industrial/commercial program; in particular, the one dealing with we no longer have inspections but, rather, we have education site visits.

And then lastly we made changes to the monitoring program and projects where they are not actually required any longer on the part of cities, only the county is implementing these major programs.

And then lastly we made changes to the implementation schedules, first adopting the county's recommendations and then refining it in the latest draft so that the cities have adequate time to review it in their budgets and put it in their budget for the next fiscal year.

In the last few days we have also had a

VOL 14 0024

R0060030

few calls from some of the various parties, and we do have a change sheet with these changes on it. I'm not going to go into a lot of detail other than indicate that they were considered priority by some of the permittees and others.

The first one is prior to revising the pollution control efforts and including additional language, considering beneficial use and permits as a basis. And I think we will just, in the interest of time, just skip through these next two. You have the change sheet there. If you have any questions on those, we can talk about them later.

Now, the permittee issues, this is sort of what's it's come down to now in terms of key issues. Vulnerability to enforcement action, cost, unfunded mandate, scientific evidence of local problems requiring permit issues, cities doing the state's work, and adequacy of public review.

In spite of the many changes made, and in some cases because of them, the permittees and other interested parties are either more satisfied or less satisfied with the permit. Relative to permittee issues remaining, we are primarily hearing these kinds of concerns.

In spite of these changes, including the drafting of receiving water limitations section, the

VOL 14 0025

R0060031

Regional Board cannot completely protect permittees from third-party lawsuits. That provision is part of the Clean Water Act.

We do believe, however, that any city implementing this permit in good faith will be protected from lawsuits by their demonstrated implementation.

The cities are also concerned about the cost of implementing this permit. The Regional Board cannot make the permit cost free. However, modifications made to the permit --

MR. COE: We have a question.

MS. ROGERS: Catherine, on the vulnerability of enforcement action, is the vulnerability increased, decreased, or stay the same as it currently is given there is currently the laws in place and so on and so forth?

In other words, when we are saying vulnerability to enforcement action, there are always lawsuits.

MS. TYRRELL: Right.

MS. ROGERS: Is there a change in terms of vulnerability based on this?

MS. TYRRELL: We believe we have made it much -- we have made cities less vulnerable by including the receiving water limitations language we have and various other provisions that I think show that, if a

VOL 14 00026

R0060032

permittee is implementing in good faith and in a timely way, it would be very difficult to bring a lawsuit against them.

MS. ROGERS: So relative to the current status quo, you feel it's either equal or better?

MS. TYRRELL: I think it's better, yes.

DR. GHIRELLI: Ms. Rogers, I think the point should be made that the language in this permit is unprecedented. No other NPDES permit issued by this Board has language that we think tries to do what the cities have been asking for in terms of protection, at least to the extent we can, to third-party lawsuits.

MS. ROGERS: I guess that's what my question really went to because there is no such thing as protection against third-party lawsuits.

DR. GHIRELLI: That's correct.

MS. ROGERS: I mean, I don't care who you are or what you are doing. And so I think it's a relative level of protection, and there is a relative current risk. That's why I asked, what is the change in their relative status since it's never an absolute under any circumstance?

MS. TYRRELL: We worked very hard to put appropriate protections, including administrative review proceedings, into the permit that assure as much security as is possible.

VOL 14

00027

R0060033

Then relative to cost, although substantiated cost information is hard to come by, a comparison of costs estimated by the San Gabriel Valley Association of Governments, with a study done of costs of programs in other parts of California, show that costs here are equal or possibly lower than elsewhere in the state.

Of course, many benefits are derived from clean water as alluded to in the opening video. We are working with the State Board to pursue a more accurate cost benefit analysis for future use.

Some permittees have also asked for the permit to be delayed until scientific proof of a problem is identified by the Regional Board. However, the federal regulations do not really require that regulatory agencies prove there is a problem. Nonetheless, we believe that it is evident that there are problems out there that have resulted from the storm water.

Other concerns such as cities doing state work and public review adequacy we believe have been addressed in the permit revisions very clearly as we have alluded to in some of the examples we have shown you.

There are also issues that have been raised by interested parties. They are not necessarily completely happy with the permit either. They are concerned that the permit lacks inspections and

VOL 14

00028

enforcement; that cities should be doing additional monitoring or pilot EMT projects; that schedules for implementation are really too general; and that permitees are not really required to involve other stakeholders in the process.

So, in conclusion, I urge you to issue this NPDES permit today for a number of reasons.

First, it implements the federal regulations that the current permit does not.

Secondly, 18 months of discussions with many stakeholders have transpired in creating this permit, which is already a year past its renewal due date.

Third, as shown in the previous discussion of stakeholder issues, a reasonable balance between competing concerns has been established. If anything, we believe we have stretched our interpretation of the regulations in favor of municipalities in the interest of a cooperative partnership for storm water management. Cities really do need to be partners in this effort, and we would like them to be good faith partners if at all possible.

Lastly, the permit does include a reopener clause should the process laid out fail in some way.

For all of these reasons, I recommend

VOL 14 00029

R0060035

your approval of the permit today. And before questions, I'd like to introduce Jorge Leon and then actually have the rest of the panel complete the presentation as I think they have perspectives that will add to this.

Thank you.

MR. LEON: Mr. Chairman, thank you very much.

One of the first things that I want to point out is that, as I mentioned earlier with respect to the other major item on the permit, ex parte communications are prohibited by law. And what may have happened in this matter, as well as in other matters, is that if you attempted to communicate with the Board members and did not receive a call back or a written communication back from the Board members, please don't assume that they were just refusing to comment or to talk to you, but, rather, I advised them that it's a problem for us if they communicate with the parties on an item that's on the agenda or will be on the agenda.

So, with that, I would like to address some of the issues. And as you know, since the first draft was issued sometime back, we have received many written comments, many verbal comments. There have been lots of meetings. We have received lots of legal issues that have been raised through those comments.

We prepared and I issued a memorandum on

VOL 14 0030

R0060036

April 17th of this year that attempted to deal with the issues that we were aware of at that point. Since that time, some of the issues have persisted and some other twists have occurred to the issues. And basically today I'm just going to deal, in a summary fashion, with those remaining issues.

One of the very first is sort of a procedural, large issue, and that is whether we ought to be involved today in permit issuance at all. Some parties have commented that what we should be doing in order to implement the Clean Water Act requirements and the federal regulations is to, instead of involving ourselves in this, we ought to be -- what we are trying to do is to control storm water dischargers to rule making.

Rule making is the same thing as regulation writing. This Board is technically authorized to draft and issue regulations; however, in the past, historically, none of the Regional Boards have actually embarked on rule making simply because it would create a problem in performing the EMT. Rather, the State Board is the agency that typically gets involved in issues of regulations.

Now, some other comments have come in to the effect that, in fact, while we are calling it permit issuance, the activity that we are engaged in today by

VOL 14 0031

R0060037

proposing the adoption of this permit is rule making. And the arguments, in summary, are that it is rule making because Staff has taken guidance from other documents and inserted it into the draft document that you see before you today, and in the earlier drafts, and is applying those requirements to the parties.

Well, I completely disagree with those arguments simply because the Clean Water Act requires that the Board issue a permit; and that the staff has engaged in drafting the permit pursuant to the applicable regulations and codes.

To the proceeding today, under Water Code Section 13377 regarding NPDES permits under the state delegated authority, Government Code Section 15375 provides a definition of what a permit is. And 11352 of the Government Code also, out of the Administrative Procedure Act, exempts permit writing from rule making requirements.

One of the reasons I believe that the argument has been made that we ought to be engaged in rule making is because it gives a further opportunity for another level of review. At this point in the permit issuance process, the Regional Board adopts the permit and it becomes law, subject, of course, to appeals to the State Board and perhaps the courts.

Under the APA procedure, however, if we

VOL 14 0032

R0060038

were, instead, engaged in rule making, there would be a further level of review, and that would be at the Office of Administrative Law. However, that process simply does not apply because we are, in fact, involved in permit issuance.

The other reason perhaps for arguing for rule making is that it is a connected issue involving state mandates. If a state agency issues regulations, or purports to issue regulations, that cost cities or the districts additional money, there is a provision in the Constitution that says that that agency has to provide for that funding. And you have perhaps heard the arguments that this permit creates unfunded mandates.

Well, as Catherine pointed out, it's certainly true that issuing this permit will cost significant amounts of money to those that have to implement it, the permittees. However, by not involving ourselves in rule making, we do not come under the state unfunded mandates type requirements. We are exempt from that.

Therefore, those arguments about a procedural remedy for unfunded remedies -- I'm sorry -- unfunded mandates doesn't apply.

MR. COE: Isn't it also true because it's a Clean Water Act that comes from a federal law or

VOL 14 0033

R0060039

regulation?

MR. LEON: That's correct.

AUDIENCE MEMBER: We can't hear.

MR. LEON: The question was, isn't it also true that it's because the Clean Water Act requires issuance of this permit? And the answer is, yes, that's correct. We are, in fact, engaged in implementing a federal requirement as opposed to a state law.

Another comment that came up, another legal issue has to do with jurisdiction for the Board even to issue a permit. There were lengthy filings by the city of Vernon that basically argued that the Board does not have jurisdiction to issue the permit, and, in part, it's because what we are doing has the resemblance to rule making.

Again, I completely disagree with those arguments as well. Again, we are proceeding under the permit issuance requirements and provisions of the Clean Water Act. The city of Vernon's arguments, while well thought out, I think take provisions out of the Clean Water act -- I'm sorry -- out of the Porter-Cologne Act, the state law, and apply them to an argument that just doesn't fit into the permit issuance authority of the Regional Board. They are basically irrelevant to the activity of the Regional Board today.

VOL 14

0034

R0060040

We have also heard, and even as late as today I noticed, that there was submissions from cities that recommend modifications in the findings of the permit. The permit, as every other permit, basically consists of two general parts where the findings establish the background, the historical, factual, legal side for the provisions. The provisions constitute that portion of the permit which is legally enforceable and that portion of the permit that lays out what activity is expected of the permittee.

Clearly it's within your discretion to determine which findings are appropriate and which are not and to entertain the comments of the parties. But you should be aware that it is those provisions that are enforceable. The findings are not enforceable. They are merely an attempt to lay down the factual, scientific, historical background that is relied upon to develop the provisions.

And, finally, one argument that has permeated throughout is that the provisions of the permit are greatly in excess of the Clean Water Act requirements. In one of the slides that you saw up here, basically you saw the whole text, virtually the whole text, of the Clean Water Act requirements.

It's a very general provision within

VOL 14 0035

R0060041

Section 402(p) of the Clean Water Act. It basically says that the states must control waste dischargers to storm water drainage systems through permitting. It does not provide detail.

The permit regulations issued by the federal government provide some guidance as to the meaning of the Clean Water Act, but again, they don't provide sufficient detail to embark upon an application of an actual permit to have jurisdiction the size of L.A. County.

And my review of the draft permit shows that the provisions, while much more detailed than the Clean Water Act, the provisions are completely consistent with the requirements of the Clean Water Act. And, therefore, we do not run into any kind of problem in exceeding the requirements of the Clean Water Act.

Thank you.

MR. COE: Thank you.

Catherine, were you going to introduce the panel?

MR. SLEZAK: I have a question.

This was basically asked of Catherine Tyrrell, but I think it's a legal question. Are the permittees more or less subject to third-party suits with this permit?

VOL 14 0036

R0060042

What's your opinion?

MR. LEON: Well, I agree with Catherine that the issuance of this permit basically narrows the focus, narrows the objectionable conduct by the permittees a great degree.

Right now there is very limited guidance as to what is required of the cities and whether or not the activities that are currently adopted and being implemented by the cities are efficient, leaving the cities with alternatives quite exposed, in my opinion.

However, the permit provisions, particularly in receiving water limitations, make it very clear that, as long as the parties are implementing the provisions in good faith, then they are not considered by the Regional Board to be in violation of the permit or the Clean Water Act. That provides a great deal of protection.

MR. COE: Any other questions? Do you want me just to go ahead, Catherine?

MS. TYRRELL: Yes. I have notified them of the order.

MR. COE: Fine. Ms. Kuhlman is up first.

MS. KUHLMAN: My name is Catherine Kuhlman, and I'm with the Environmental Protection Agency in San Francisco. My business address is 75 Hawthorne Street,

VOL 14

00371

R0060043

San Francisco, California.

Thank you for providing the opportunity to speak on these permits. It's been a long, long road. I just want to briefly cover three major areas.

The first is just to reaffirm that L.A. has a major environmental issue around urban runoff. And this permit is a second good step to making sure that that pollution that comes from the rivers and affects both the rivers and the groundwater and the ocean in this basin will be better protected. And I say second because it will be the second issuance of this permit.

The amount of pollution coming out from the rivers themselves now is about equal to, in terms of loadings, to what the ocean is receiving from the POTWs. It's a very significant set of loadings that are coming in. And this is then information that I summarized and presented to the Board in tabular form, I think it was, April 1st of this year.

I think, finally, on the environmental points, the recent epidemiological study that came out made it clear that swimmers are at risk when they are swimming near storm drains.

The second point I'd like to make is that this permit is fully consistent with other permits that are being issued within the state of California and

VOL 14

00038

R0060044

around the country in terms of both the content and the scope of the coverage as well as cost.

I'm also looking forward to a more -- some better cost information both from the cities as well as from the State Board. I think that will be a very useful tool as we move down the road towards implementation of this permit.

I guess, just in conclusion, I feel that this permit is a good mixture of trading off various interests by some pretty different points of view. And I think people have really done a good job in trying to balance viewpoints in this permit. And it's been 18 months in negotiation, and it's a year past the time the permit should have been issued.

So I would just urge this Board to adopt the permit and move on to implementation. There are a lot of really tough issues to be faced down the line. I think the permit gives the flexibility to adjust this permit as necessary as we learn more.

Thank you

MR. COE: Thank you.

Any comments by the Board?

We are going to change something here. I understand there's some students that have a 12:30 bus to catch, and they have come a long ways, and they have

VOL 14 00399

R0060045

something to say. They may or may not have a spokesman. But with everyone's permission, we will hear from the students at this time.

A spokesperson would be helpful, whoever is in charge of the students. How is this going to be arranged? Is there one spokesperson? I understand there's going to be one spokesman; am I correct?

AUDIENCE MEMBER: Yes.

MR. COE: Okay. There will be some introductions. You will have to speak right into the mic.

MR. RAMIREZ: My name is Andre Ramirez from Venice, and I go to Mark Twain.

MR. COE: From Venice?

MR. RAMIREZ: Yes, Venice.

And these students are from Santa Monica Boulevard Elementary.

I would just like to say that the storm drain is a big problem and that you shouldn't put so much trash into it. And the storm drain shouldn't go into the ocean because I like to swim in the ocean and ride my boogie board in it or go bodysurfing. And I hate it when I dig for a sand crab and then I pick up a piece of trash instead. It's really disturbing.

MR. COE: Do you know what city this trash comes from?

VOL 14 00470

R0060046

MR. RAMIREZ: So we want to stop the pollution going in. Because there's trash cans all over the beach, you know. And pollution is a horrible problem, so you should really just not be lazy and just put it in the trash can.

I'm here because I love the ocean and the beach and it's one of my favorite places to go. And I don't want to stop going there just because of the pollution.

Thank you.

MR. COE: Thank you very much. We appreciate it. The leaders of tomorrow.

Don Wolfe I guess is next. That's a tough act to follow.

MR. WOLFE: That is a tough act to follow, and I should just say ditto and sit down.

MS. ROGERS: You are responsible for knowing which city it came from.

MR. WOLFE: I think we all feel the same way. We all actually feel the same way. This young gentleman just expressed them very well.

I am Don Wolfe of with Los Angeles County Department of Public Works. I am representing the County of Los Angeles as principal permittee, and I'm also representing --

VOL 14

0041

R0060047

MS. CRAVEN: Excuse me. It's still very hard to hear you.

MR. COE: I just got a report from the back of the room that some people are being heard and others aren't; and that those being heard are the ones speaking directly into the microphone. I know it's difficult. It shouldn't be this difficult, but that's the way the electronics are.

Speak directly in and speak loud.

MR. WOLFE: Okay.

I'm also representing all the permittees as Chairman of the Executive Advisory Committee, a committee made up of representatives from the city of Los Angeles, county of Los Angeles, and city representatives from the various watersheds elected by the watersheds.

First I'd like to speak as representative of the principal permittee, the county of Los Angeles. A few months ago I thought I would be here with a very large ax to grind on behalf of the county of Los Angeles, the principal permittee. And I am happy to say that that is not the case.

We had a lot of concerns with the drafts of the permit. And the staff of your Board and the other interested parties in this permit have worked very closely

VOL 14 00472

R0060048

with us. And all of the concerns that the principal permittee in the permit had, as of this afternoon, have been resolved.

As principal permittee, which is a voluntary position on our part, we have committed significant resources to the success of this permit and for developing the programs and the coordination necessary for the evaluations and the water quality monitoring that's required under this permit.

We estimate that, in our role as principal permittee, we will spend $16 million in the first fiscal year of this permit. This was our goal as principal permittee. That does not include the cost of the various county departments for implementing the programs that they are going to have to implement.

So we are committed to doing this, and we are not sorry anymore that we volunteered to be principal permittee. And we are very much looking forward to engaging in the roles that are required of us under the permit.

Some of those would be that we have entered into a contract that cost $1.2 million to develop a county-wide storm water management plan and monitoring program. This important role has been a concern to a lot of people, and continues to be, because it requires that we

VOL 14 0043

R0060049

submit, in a various time frame, various elements of the Storm Water Management Plan which must be implemented by ourselves and the other cities. And that is a big unknown.

I'm here to promise, to make a commitment to your Board and to the other interested parties, the cities, environmental community, industry, that we have a plan that will include all interested parties in the development of the various elements of the Storm Water Management Plan. And it's going to require a lot of work on everybody's part, but we are definitely going to include everybody who is interested in the loop and try our best to resolve all those issues that come up before we submit the elements to your staff for the approval of your Executive Officer.

We also have the lion's share, if not all, of the monitoring requirements under the permit. And we have entered into a contract with the USCC Grant Program, USC Santa Barbara at a cost of about $650,000 to study impacts of storm water on the coastal receiving waters. And, in addition, we have a multi-million dollar commitment to do monitoring of all of the contributing drains.

We have committed to a $5.2 million educational program which will go a long ways towards

VOL 14

0044

R0060050

meeting the educational requirements under the permit for all the permittees.

One of the biggest issues for us and for the other permittees has been what's called the Site Educational Program or the site visits that's going to be required for us to go into all industries, commercial facilities, and do an education program on what their requirements are under the storm water program.

We looked at that. If you have a stand-alone program, it's going to be very expensive. So we have entered into negotiations with the Department of Health Services and the County Fire Department to include those inspections or those site visits in their annual inspections of businesses. That will be a very efficient way to do it.

We have set up a pilot program. And it's our intent, and we have so notified the Board of Supervisors in a letter to the Board, that if that program is successful and the agencies who are already inspecting the facilities continue to agree to cooperate, that we make that process available to all the cities that contract with the county, and those that don't contract we would commit an equal amount of money per inspection to their programs.

Our follow-up with the Board of Supervisors on that is vague, but it's been very positive.

VOL 14 0045

R0060051

That's not a commitment but it definitely is, I think, a program that's going to work and go a long ways toward satisfying the concerns and having a very effective and consistent program across the board.

As you are probably aware, the L.A. County Board of Supervisors passed a motion July 2 which basically asked your Board, Board's staff, to work very closely with the cities, the permittees, to resolve all their main concerns and then encourage your Board to pass this permit today, hopefully having worked out all of those concerns.

Changing hats real quickly and speaking as Chairman of the Executive Advisory Committee, having said all the concerns of the principal permittee have been resolved, you are going to hear today, I'm sure, that all the concerns of the other permittees have not been resolved. They have many great concerns, and I'm not going to state them because you're going to hear from the individual cities.

But as Chairman of the EAC, I respectfully request that you listen very carefully. I think that their concerns are legitimate and that, in your decision-making process today, that you consider their concerns and make any appropriate changes to the permit to satisfy those if you can.

Thank you very much.

MR. COE: Thank you, Mr. Wolfe.

We have a question here, Mr. Wolfe.

MS. CRAVEN: I have a question.

You spoke of all these programs and contracting and the $5 million and the $60 million dollars and other millions of dollars. I'm wondering where these come from. Do you have a benefit assessment of these established or are you collecting fees from --

MR. WOLFE: It depends on what the program is, ma'am.

For example, our department is basically -- when we say the principal permittee is the county of Los Angeles, it's basically the principal permittee is the County Flood Control District.

Those tasks that are distinctly those of the principal permittee; for example, the county-wide educational program and other county-wide programs, will be funded from our benefit assessment.

We have twice gone to the L.A. County Board of Supervisors and gotten very minor increases in that assessment for the specific purpose of funding our duties as a principal permittee. The other programs will be funded out of the funds that are allotted to the various programs.

VOL 14 0047

R0060053

For example, there will be a lot of road-related issues in the permit, but it will all come out of the road fund. The permit and construction issues will all come out of the General Fund, and, for our airports, it will be out of the airport fund, et cetera. It depends on the activity.

So there will be an impact on almost every fund that the county of Los Angeles has.

MS. CRAVEN: Thank you.

MS. ROGERS: This may come out further down the road. But as the principal permittee, of the 80 cities, how many support the ordinance right now and how many are opposed? Do you know what the current count is?

MR. WOLFE: No, we don't. And we tried to do that. We did a survey of the cities. And, of course, when you do that, the only official position the city can give is that their Council has passed a motion; okay?

So in most cases there has -- of the 85 cities, I think only a small handful have passed motions; a small handful in favor, a small handful in opposition. And those numbers I don't know.

So we kind of up gave up in frustration in trying to get a feel or a sense of, even those cities that talked to us, many of them wouldn't talk to us, said, "I will only say this if you promise to us you won't make

VOL 14 0048

R0060054

it public."

MS. ROGERS: We have enough paper to create an environmental problem here because of the number of letters that have come in. And it's a little hard to distinguish out of this what is officially the cities in support, but we don't know officially what that is for the individuals or the cities who oppose or whatever.

So you are saying right now that you can't officially give a count. Does this have to end up going through an ordinance process or a City Council vote at each city?

MR. WOLFE: It's my understanding no. But Jorge should answer that.

MR. LEON: With respect to the legal authority provisions of the requirements of the permit, many cities already have the ordinances that they need to meet the requirements. The others who don't need to tell us what kind of schedule they will adopt for the ordinances to provide the enforcement of the permit requirements.

So the answer is yes for some.

MR. WOLFE: Wasn't your question, Ms. Rogers, whether the City Council had to adopt this permit?

MS. ROGERS: Yes.

Ultimately, I think we are trying to sort through, we have 80 -- basically, you are the

VOL 14 0049

R0060055

principal permittee, but we have 80 permittees. And I'm trying to get some gross feeling, while it's not a majority rule or anything, just where the different groups come out.

And I just wondered if there would be any -- I mean, have we got as much of a yea or a nae as we are going to get, or is there any other process we are going to have to go through?

MR. WOLFE: It's my understanding that, once the Board issues a permit, that there's no vote of a City Council or a Board of Supervisors that has to be made. That's it.

MS. ROGERS: Right.

That's all. If there was any other procedural thing that we will be seeing down the road?

MR. LEON: No.

MR. COE: Thank you.

MS. GLAD: Members of the Board, my name is Amy Glad. I am the Executive Vice President for the Building Industry Association of Southern California. My office address is 1330 South Valley Vista Drive in Diamond Bar, California. Our member companies engage in residential and light commercial and industrial development within a six-county Southern California region, including Los Angeles County.

VOL 14

0050

I just want to give you a brief synopsis of our experience on this permit. Like Don, I did not believe I would be here today saying that we have resolved most of our major problems. But since December when the first draft of the permit was issued for public review, your Board's staff, county and city staff, and other interested groups have met with us as well.

We were strongly opposed to that December draft and have come here today being able to state that our major issues have been resolved. Obviously, we are mostly interested in the development, planning, and construction portion of the permit. We believe it has been substantially improved to incorporate the streamlining necessary for a workable storm water management program.

There is an emphasis on cities and counties working together to develop guidance material. Hopefully that will stop people from having to reinvent the wheel in every city.

Further, we support the concept of watershed planning. The permit addresses the fact that more work must be done to adequately identify the types and sources of pollutions in watersheds in this region. My outstanding comment ended up on one of the overheads in Catherine's presentation; and that is, whereas the original draft permit in December included stakeholder organizations

VOL 14 0051

R0060057

on watershed management committees, the current permit before you today does not.

And should you choose not to make that change today, I would just hope that staff and others would emphasize the need to work with stakeholder organizations in doing the watershed planning that is considered in this permit.

Finally, we appreciate the emphasis on education in all areas of this permit. Our organization has worked with the counties of San Bernardino and Riverside in the Inland Empire to do videos that are at their building official offices for construction workers to look at to understand the storm water issue and their responsibilities under this permit.

Further, we are interested in continuing our work as a designated stakeholder organization and all the work that is yet to do after you adopt this permit today.

I'm happy to answer any questions.

MR. DRANE: How many members do you have?

MS. GLAD: I think we have 1,500 member companies within Los Angeles County. I can't tell you of that portion in L.A. County.

MR. DRANE: How do you derive at the consensus of your judgment on this issue with your members?

VOL 14

00552

R0060058

MS. GLAD: Well, we have Government Affairs Committees within our trade organization. We have two Chapters within Los Angeles County that are affected by this permit, and that would be our greater Los Angeles/Ventura Chapter and our Los Angeles County East Chapter. And they both also have Government Affairs Committees that have building members on them.

And we have let them know since the beginning about this permit. We have worked with those two committees. They have come to the meetings, not only individual building company members but staff such as myself, and other of our Chapter Executive Officers that worked on the legislative issues.

MR. DRANE: But you didn't actually make any poll by voting --

MS. GLAD: No. That's not our regular routine.

MR. DRANE: -- where you send each member a ballot to vote yes or no?

MS. GLAD: No, not at all. We never do that on government issues.

MR. DRANE: Because I understand a number of your members are really not that enthralled in this.

MS. GLAD: I can only do what our organization does in terms of membership development.

MR. DRANE: Thank you.

VOL 14

0053

R0060059

MR. KISSEL: Good morning everybody. My name is Mike Kissel. I am an Environmental Specialist with Carl's Jr. Restaurants. We are at 1200 North Harbor Boulevard in Anaheim, California. And I am here to give our perspective on what our involvement has been with the Storm Water Pollution Prevention Plan.

Our involvement actually occurred some years ago. We had certain cities bringing to our attention certain practices that were not considered acceptable for the prevention of the contamination of storm water, such as housekeeping areas outside.

Since then we have incorporated into our standard operating procedures ways that restaurants can accommodate this by certain practices as far as good housekeeping outside, the way of washing the floor mats inside, keeping trash in its place, and a host of other areas that we have already set up. And that's how our awareness first came to fruition.

We have had plenty of these in our operation guidelines, in our procedures, and cleanup prevention and basic housekeeping. We just found that this not only looks good, it's good business sense, and we found this is something that is doable in training.

The challenges for that are in training and making sure we can implement this on a consistent basis

VOL 14

0054

R0060060

throughout our restaurants. And this is in all of our Carl's Jr. corporate restaurants, not just in Los Angeles County.

We have worked with the L.A. County D.P.W. in setting up -- gave our input in the checklist they had set up for inspections that would come by on an advisory basis, which we appreciate, with our restaurants and certain areas that they were looking at that may have needed improvement in handling certain practices in preventing the contamination of storm water. And a lot of them are housekeeping practices, best management plans, if you will.

We do -- we have worked with, also, the Water Quality Board, with Catherine, and we appreciate the cooperation that they have extended to us and the opportunity to work in a partnership with them.

However, we have had and do have certain concerns that we are sort of wondering, and we have shared this, of course, with Catherine. And they are areas where post-consumer waste that are at issue, post-consumer waste being that kind of waste that comes from a take-out order or a drive-thru situation, is to be removed from our site.

And sometimes certain members of the public will not be as consciencious as others are and dispose of the waste. And we feel that this is something

VOL 14 0055

R0060061

beyond our control. Post-consumer waste is an unfortunate reality. We certainly provide trash receptacles and encourage the proper disposal of waste on our site, and we try to do this also by example by keeping our facilities clean.

But we do want to make clear that post-consumer waste is an issue that is something that is beyond the control of the restaurant industry.

Another concern is how the funding of this will occur as far as taking care of the inspections when the inspections are made at our facility. We are concerned about, down the road, maybe certain fees arising that would be beyond us. And we feel like we can accomplish this goal without the necessity of having that kind of thing happen.

Again, thank you for the opportunity, and I can answer any questions that you might have.

MS. ROGERS: When you raised your concerns, do you have any specific comments in terms of the permit that's in front of us that you want to see changed?

MR. KISSEL: Well, I don't know if they are that clear in the permit. And there are items that maybe are not in the permit but that we are concerned about that, administratively, it may come down the road, whether it's in the permit or not, and this involves the fee-making that

VOL 14 0056

R0060062

would occur probably at the city level, is what I'm talking about, because it would be probably the cities that would be enforcing this on us as far as any fees we have to have on an annual basis or whatever. And I think that's what we are talking about.

And I don't know if that would be something that would be covered necessarily in the permit per se.

MR. COE: Thank you very much.

MR. KISSEL: Okay. Thank you.

Mark Gold.

MR. GOLD: Good afternoon Board members. I am Dr. Mark Gold, Executive Director of Heal the Bay located at 2701 Ocean Park Boulevard, Suite 150, in Santa Monica.

On behalf of Heal the Bay, I strongly urge the Regional Water Board to approve the tentative permit without further delay. As demonstrated in a ground-breaking study by USC, swimming near storm drains and swimming in water with high indicator bacteria density can make you sick, even in dry weather.

Storms, the cause of winter swells, incredibly attract tens of thousands of surfers in the region, leaving most of the county's coast with densities of indicator bacteria that pose a significant health risk.

Nearly two thirds of the 62 beaches

VOL 14

00571

monitored by the city and county receive a "C", "D", or "F" on our beach pollution report card during wet weather.

Storm water runoff leaves our beaches looking like trash dumps after every rain, costing millions of dollars annually to clean up while our catch basins cause extensive and costly property damage.

Storm drains dump sediment which cause swimming hazards at our marina and ports and smother precious wetlands and our aquarian habitats. According to the Southern California Coastal Waters Research Projects and UCLA study, both dry weather runoff and storm water runoff from local drains are toxic to marine life. Contaminated sediments carried by runoff have posed toxicity problems to marine life for decades.

Hot spots have been found at the mouth of Ballona Creek, Marina Del Rey, the L.A. and San Gabriel Rivers, and Dominguez Creek. There is no question that runoff is the most significant source of coastal pollution in Southern California today.

85 cities in the county have been operating under a broad, ambiguous permit for over six years. The tentative permit before you today is the product of 18 long, tedious, and contentious months of negotiations with seemingly every interested party in the entire region.

VOL 14 0058

R0060064

As all of you know, most NPDES permits have one draft and a 30-day comment period. For this permit there have been four delays, at least three drafts, and countless discussions with cities, business people, regulators, government agencies, and environmental groups.

One year of delays is already one year too many for the 50 million annual visitors to county beaches and those business that are part of the county's $2 billion a year coastal tourism industry.

As a negotiator on behalf of the environmental committee, it's my responsibility to inform you how far we have compromised on this permit in order to reduce the regulatory and financial burden on cities in the county comparing the current tentative permit to the December 18th draft. Here are just a few of those changes.

The industrial/commercial facility inspection regulatory requirements have been eliminated and subsequently replaced by educational site visit requirements with no threat, no threat, of enforcement to businesses.

One recent change, the elimination of the requirement to pass Phase I industrial facilities staff if they file a Notice of Intent to Comply form, or if they have a Storm Water Pollution Prevention Plan on site as

VOL 14 0059

R0060065

required, was eliminated over our vehement objection. We have little faith that the Water Board has the staff to implement this program without at least minimal assistance.

Also, municipalities have been encouraged to add these education elements to existing inspection programs like health, fire, and industrial waste in order to reduce or eliminate the cost of new personnel.

The requirement for cities to draft a new comprehensive storm water pollution control ordinance have been replaced by simple, common-sense prohibition, many of which have been watered down, again over our objections.

It's impossible to meet receiving water requirements that they eliminate largely thanks to environmental communities' lobbying efforts of the EPA and the State Water Board. Construction requirements, once opposed by the BIA as too burdensome and costly, are now evidently acceptable to the BIA.

There has been an 85-percent reduction in reporting requirements, and the schedules have been pushed very far back. All city monitoring requirements have been eliminated. Also over our objections, all requirements to implement watershed-specific projects have been eliminated for cities.

VOL 14 00660

R0060066

The environmental committee has gone as far as it can go. Further delay means further weakening of the permit. It's as simple as that. As it is, the teeth in the permit have been largely extracted. When only asked to look at the many, many cuts and substitutions in the last three drafts, it's proof that further delay means less water quality protection.

Please don't be swayed by unfunded mandate arguments. They have already been responsible for many of the changes I have listed previously.

Also, don't be swayed by some cities' arguments that they already are spending millions of dollars on storm water pollution control. Look closely at those buttons. They include recycling programs mandated by AB-939. They include Department of Integrated Waste Management funded oil recycling programs, and street sweeping, public trash receptacles, and catch basin cleaning programs that existed long before Congress ever required municipalities to control their storm water pollution.

Recently, some elected officials have stated that they haven't had enough time to thoroughly analyze the cost impacts of the permit. Considering the fact that an Executive Advisory Committee to the cities has existed for over a year and the fact that numerous

VOL 14 0061

R0060067

drafts have been disseminated by Board's staff since December, one has to question who is at fault for this miscommunication, your staff or, more likely, public work staff in some cities.

The permit, even with all these changes, is still supported by most of the environmental community. As you have seen, hundreds of businesses, numerous Chambers of Commerces, thousands of individuals, the city of L.A., the county, and the Coastal Commission have expressed their support for this permit, a Storm Water Pollution Prevention Plan that primarily focused on targeted public education.

This permit is as close a consensus as we are ever going to get. We realize that all nine million people in the county are potential pollution sources to our coast. Nothing less than a fundamental change in the waste disposal behavior of every person and every business in the county is needed to enhance and protect our region's most important resource, our coast.

Failure to adopt this permit today doesn't only reflect on the Water Board's commitment to protecting the region's beneficial uses. If the permit does not get approved, the action would be a direct reflection on the failure of the Santa Monica Bay Restoration Project to implement a plan that will result in a healthier bay ecosystem and cleaner and safer beaches.

VOL 14 00662

R0060068

The Bay Restoration Plan, approved by Governor Wilson, targeted urban runoff as the No. 1 pollution problem in the bay. Here we are $8 million later, thousands of volunteer hours, and seven years later at the threshold of making a decision on the single most important action within the plan.

If the Board supports the permit, then all of this time, money, and energy was well worth it. If not, then this Board's commitment to true watershed management will have proven to be little more than a permit rescheduling exercise.

Thank you.

(Applause.)

MR. COE: Did you bring all your cousins here, Mark?

Mr. Vernon has a comment.

MR. VERNON: I will ask you the question, Mark, and hope maybe at least your answer will go through the P.A. system.

Nobody is more up on research on receiving waters in the Santa Monica Bay than Heal the Bay. And as a part of trying to take a very broad look at the situation in macro terms, right currently are bay waters declining in quality, holding steady, or improving? Just take a flash look at it.

VOL 14 00663

R0060069

MR. GOLD: As a scientist, it's one of those questions that's not really easy to answer. And one thing I would say is, from the standpoint of the center of the bay, obviously the POTWs are well on their way of doing an excellent job for reducing pollution to the bay.

So from the standpoint of the marine life, we have seen, I think already, a tremendous improvement most notably on hyperion discharges. But from the standpoint of beach pollution, storm water pollution, there's been no progress.

As long as we continue to develop the region at the rate we are, and I don't see that really stopping, then we are going to continue to have increasingly worse beach pollution problems, and we are going to continue to have the health risks that we currently see today from people swimming in runoff contaminated waters.

MR. COE: Thank you very much.

I think I indicated a little earlier that we were going to try to break at 12:30. Obviously, we didn't.

We had a straw vote up here, among most of the Board members I could reach, to go another 30 minutes to try to pick up the elected officials, which is the next category. 30 minutes was allocated to them. We

VOL 14 0064

R0060070

do have 19 who have indicated a desire to express themselves, not for very long individually.

But we are going to have to reduce the time that they have asked to about a minute and a half in order to stay within the total allocated time because of the number of people.

There will be a couple-minute break right now to change the paper for the court reporter.

(A brief recess was taken.)

MR. HAYDEN: Mr. Chairman, members, my name is Tom Hayden. I am a Senator representing the area of Santa Monica Bay. I have been involved with this problem for 17 years. I have been following these negotiations for 18 months. I attend meetings with the restoration project.

And I read every line of the permit and the amendments and would ask for more than a minute and a half. Because a legislative hearing will occur on this anyway. So I would like to see at least three minutes' opportunity to go into some of the details. But if not, I will simply submit the testimony.

MR. COE: Go ahead, and we will see how this works out.

MR. HAYDEN: I struggled last night and this morning, actually wrote a statement in which I struggled to be able to say that I support this permit. But in

VOL 14 00655

R0060071

conscience, I cannot support, as an environmentalist, this permit.

I can comment on it and tell you that the reason that I'm here in support is because I support the children and the environmentalists and the Mark Gold's of the world who, I think, are such devoted defenders of Santa Monica Bay that they are committed and will be committed to lobbying you and hounding you and, if necessary, suing you for the next five years. In that sense, I am here as a supporter.

17 years ago, my children, who were then smaller than the children you saw today, were playing as part of a play group in the storm drain runoff at Pico-Kenter. That is an act of official neglect, which I think you can understand as a parent, an act of neglect not telling people, not doing anything about it, and it is not easy to forget.

Before my attention to this issue, there were defenders of the bay like Rim Fay. And after I'm gone, there will be people like Mark Gold and Terry Tamminen, and Gail Feuer, and Marabelle Marin who have labored to negotiate this permit today.

But I would like to say this about history; that institutions that promote excessive growth and rampant pollution have a life of their own while the

VOL 14 00666

R0060072

bay itself is always dependent upon official promises made after a few dedicated citizens bring bay pollution briefly to public attention.

From the long view, therefore, my concern is this. I am convinced that while this permit is good in the sense of requiring best management practices to reduce pollutants and good in the sense of promoting public education so that future generations are not as illiterate ecologically as we have been, it still is a permit to stall any serious action on the bay's programs until the 21st century.

There are at least four very serious deficiencies. The three-year delays are endless throughout. And one might be asking what the regulatory agency has been doing about such things as reporting and eliminating these illicit discharges all along, and why it is still necessary in 1996 to develop a model program for doing something about them three years after the model program. Today's amendments, which I just got, actually promote further delay.

Secondly as a deficiency, there are loopholes everywhere that allow stalling. I count a minimum of 18 having to do with conditional language like the extent practicable, I don't know if that's the word, but that's the word the permit uses, and other

VOL 14 0067

R0060073

representations that cost to business should always be balanced against public health benefits. My own view is that golf courses with pesticides on them get more consideration than a swimmer's lungs in the writing of this permit.

The third deficiency is it marks a further retreat from enforcement, as Mark Gold said, by capitulating on the issue of inspection programs. Inspection programs contain the implicit obligation to enforce the law against violators. Those have been replaced by so-called site education for dischargers combined with reliance on self-assessment, the words of the permit, for how the programs are working.

The Regional Board, as you know my view, has given only lip service to enforcement for a number of years. This permit pulls the last of its teeth.

The fourth serious deficiency is the reduction or even elimination of public participation in the so-called Watershed Management Committees, which the language even implies an attempt to eliminate the state requirement for open meetings. But there's no public representation on the Watershed Management Committees.

This is particularly offensive because there would be no progress whatever on cleaning up the bay were it not for the public participation of public interest

VOL 14 00688

R0060074

groups like Heal the Bay, Baykeeper, and NRDC.

The permit to stall has to be understood in the context of the past year and a half this permit is overdue. It has given polluters or permittees an extra year's license for business as usual already. And since the stalling of the past must be considered a hint of things to come, no one should be surprised if the proposed three-year deadlines in this permit are renegotiated and stalled in the future.

I understand why certain cities are unhappy. I understand that well. But if they believe that spending money on programs to clean up the bay is not a good investment by local government, I can't agree.

If, on the other hand, they believe that this particular permit is a waste of money because it's not tough enough, fine. They should have been advocating that the Regional Board pursue polluters more and process paperwork less. They have had plenty of time to do that.

Let me conclude by asking you this. Would you stall if a member of your own family was sick and needed medical treatment? Would you stall to see how sick they were, then give them the cheapest treatment possible and practicable? That's what this permit does for Santa Monica Bay as a marine environment and for the people who enjoy its shores.

VOL 14 0069

R0060075

As Mark pointed out, while this stalling goes on, thousands of swimmers, hundreds of thousands of swimmers and beach-goers are getting infections and diarrhea from swimming near the storm drains as my children did.

The recent study of health defects referred to only skim the surface of the bay. It did not analyze the impact of toxic chemicals in addition to sewage. It did not analyze the effect of pollution on marine life. The cancer risk from white croaker latent with DDT and PCB is incredibly high, and still nothing has been done about it.

Given all this, it is incredible that there should be any opposition to passing this permit framework a year too late.

As Chairman of the National Resources Committee and the Senate, I can tell you that the Senate is increasingly concerned with the official retreat from our coastal water quality and environmental laws. We have recently dumped an appointee to the Fish & Game Commission, and we are now battling against the threatened destruction of the Coastal Commission.

This fall we will be holding investigative hearings into the retreat from enforcement and protection of Santa Monica Bay and the coastline. We

VOL 14 00710

R0060076

will be looking at this regulatory agency here and the Coastal Commission, seeking new alternatives to the failed policies of the past.

I call on you to approve this permit today and work with us tomorrow towards a new covenant with the sea around us.

Thank you.

MR. COE: Senator, I have a question if you have a moment here.

Do you recommend that this Board approve this permit today?

MR. HAYDEN: Yes.

MR. COE: Okay.

MR. HAYDEN: The good argument for approving it is that I don't like it. I tried to communicate that with Governor Wilson's administration. They know my position. They know my doggedness. I will be around. I will be on your back. I will be breathing down your neck. And we will enjoy our relationship.

It is a permit so feable, so loopholed that this Board should have nothing to fear in approving it.

Thank you.

MR. DRANE: Now, we don't want you to go away mad.

VOL 14

0071

R0060077

MR. HAYDEN: I'm not mad.

MR. DRANE: You just want to get even; right?

Without me commenting whether I'm for the permit or against the permit, I think, as one of our great Americans once said, our government is the art of compromise.

And you, as the Senator, would you agree to the fact there has to be some compromise on most issues that ride within the government's spectrum?

MR. HAYDEN: I think you should fight for what you believe in until you can get nothing more. If you call that a compromise, so be it.

This measure, this permit, turns the corner on promoting greater public education. My concern is that these kids you saw today will be the Mark Gold's and Terry Tamminens of tomorrow fighting in the year 2010 on the next version of the permit still trying to make the bay better.

But the public education is a step forward. And as the earlier gentleman said, nobody can oppose good housekeeping methods, which are essentially what best management practices are.

My worry is that, if the polluters don't get the message that there are consequences, including penalties, fines, and jail time, and if you allow

VOL 14 00712

R0060078

unmitigated growth to continue in the Los Angeles basin, even with good housekeeping, the net impact on the bay will far outweigh the cleanup measures that are so gradually being implemented. And, therefore, these kids will come back in 10 or 15 years before you as activists or advocates, and they will be before you again.

So there's nothing wrong with compromise. But if you view this in a 20- or 30-year framework, which I have experienced, and if your kids were playing in the storm drains without your knowledge that they were latent with this stuff in 1978 or 1979, it would get a bit tiring to be told that we have to compromise again.

Thank you very much.

MR. COE: Thank you very much.

MS. ROGERS: Given the Senator's standing and importance on all of these issues in the state, I think the extra time is appropriate. But I would like to request that we go back to our shortened up time, whatever it is, to get to our other officials because we have a very long day.

MS. NEWMAN: Good morning. My name is Laurie Newman. I am the field deputy for Assembly member Sheila Kuel whose district includes the coastal cities from Santa Monica to Malibu.

VOL 14 0079

R0060079

As Sheila's representative, I sit on both the Oversight Committee and the Watershed Council of the Santa Monica Bay Restoration Project. I am speaking here today as Assembly Member Kuel's representative and as an active member of the bay project.

Assembly Member Kuel urges you to approve this Storm Water Permit which will aid us on a regional level in improving the health of Santa Monica Bay.

The Santa Monica Bay Restoration Project was established by the state in 1988 and was charged with the responsibility of assessing the bay's problems, developing solutions, and most important of all, putting them into action.

The project's membership is quite diverse. We are an active partnership of government representatives, environmentalists, scientists, and representatives of industry and the general public.

Storm water management is a key component of the Bay Plan, which is a product of a five-year consensus-based effort by the bay's stakeholders. The Bay Plan recommends that a number of actions be taken to improve storm water management.

Among the recommended actions, this storm water permit is one of the most important tools

VOL 14 0074

R0060080

needed to achieve the goals of the Bay Plan. Your approval of the permit today will be a huge step forward in reaching our goal of restoring the bay and protecting it for years to come.

We urge you to approve the permit and to ensure that it is environmentally sound, consistent with conservation principles of aquatic biology; that it incorporates the recommendations contained in the Bay Plan; and that it provides for timely implementation of the monitoring program.

Thank you very much for your time and consideration.

MR. COE: Thank you.

Debra Bowen.

MS. BOWEN: Good afternoon, Mr. Chair and Board members. I am Assemblywoman Debra Bowen. My business address is 18411 Crenshaw Boulevard, Suite 280, in Torrance. And my assembly district stretches from the Venice/Santa Monica border down the coast to Palos Verdes Estates, including not only a great deal of coastline but also a thriving tourism industry.

I am pleased to join today the broad coalition of business people, local government leaders, and environmentalists in support of the immediate adoption of this storm water permit. I commend you for the work you

VOL 14

00715

R0060081

have done so far to reach a consensus, particularly the staff. And I encourage you to continue working with those who are not yet fully engulfed in this process, no pun intended, to bring them into the water with you.

I understand that no one can possibly be satisfied with every single aspect of the permit, but I think there has been a great deal of progress made. As you know, the coastal economy, which is a $3 billion a year tourism industry, is highly dependent on the health of the bay.

While there are costs of local government to implement this permit, I think, in the long run, there are much greater costs of not implementing the permit. I think we would see not only a decline in our municipalities' local sales tax base as tourism declines but also a decline in property values which would threaten our property tax assessments that we use to provide other services to our citizens.

With my wishful thinking cap on, as you begin to implement the permit, I urge you to work with cities of all sizes to help them implement the permit in the most cost-effective way. Cities in California are undoubtedly in a difficult situation. They have been placed in that situation by the federal and state governments, mostly before I was there, of course, and

VOL 14 0076

R0060082

despite my efforts to protect cities from unfair raids on their treasury.

And, of course, the will of the voters has also created fiscal constraints on local governments. But the federal Clean Water Act clearly gives cities the responsibility of monitoring pollutants through the storm drain.

I am here today primarily to assure you that I will be taking a leadership role in the state legislature in assisting the cities to find the resources to comply with this federal mandate.

I understand that there are existing resources that are available to cities that we may look at as well as some possible piggy-backing on existing educational visits that we can use to minimize the fiscal impact on cities as we move forward with this attempt to clean up the bay.

I also believe that the $5 million program that the county of Los Angeles is undertaking will help reduce costs to the cities.

There are also, I believe, some state responsibilities that can be undertaken again to assist the cities in this, recognizing that the financial and economic health of the cities and the businesses in those cities is not just a benefit to the city governments but also to the

VOL 14 0077

R0060083

state government as a whole.

So the legislature and the state government also have a role to play in this. And I am pleased to be in a position to be able to press that role on behalf of all of the cities in Los Angeles County, not just those that I represent.

The fact that this permit is supported currently by business leaders and environmentalists, a broad coalition from realtors, businesses, to Heal the Bay I think is testament to the importance of this issue. And I think it proves once again that good environmental policies can be good business policies and vice versa. The two can come together. All of these concerns can come together. Or, as the hot dog vendor said to the vend master, make we one with everything.

In closing, I urge you to adopt this permit without further delay. I think it will help us strengthen our economy in the long run as well as cleaning up our environment.

Thank you.

MR. COE: Thank you.

We will hear now from Council Member Ruth Galanter followed by Beatrice LaPisto-Kirtley followed by Mayor Margaret Clark.

MS. GALANTER: Thank you, Mr. Chairman and

VOL 14 0078

R0060084

members. I am Ruth Galanter, Council Member of the Sixth District of the city of Los Angeles. I also live in Venice like the young man you heard before, but I know we have got everybody's trash at the beach. I think he knows it too.

I am here primarily to present you with a resolution adopted unanimously by the City Council urging that you adopt this permit today and not put it off any further. In a rare moment of unaminity, we not only had the entire Council, we also had the support of the Mayor.

And I am proud to say that I believe that that support, which was expressed in a joint news conference that also included some of our business interests and some of our environmental interests held last Friday, that support derives from a recognition throughout the city of Los Angeles that, even though some of these things cost money, this is an investment in not only our environment but our economic health and also in our ability to continue to function as a region.

I know that not all of the cities feel as we do. I hope that they will come to feel as we do. But in the meantime, I think it is important that we get the show on the road here, or the boat in the water as the case may be.

So I brought you copies of our unanimous resolution and hope you already have them. But just in

VOL 14 0079

R0060085

case, I have some more. And I do hope that you will act today. We are all getting tired, as I know you are, of having to come back to rehash the issues that have already been worked out.

The last thing I would like to say is I'd like to express the appreciation of the City of Los Angeles for the work your staff has done in being available to meet with us, to talk with us, to resolve problems as they came up.

We didn't start out loving this permit. We had some concerns. But your staff has been particularly helpful and receptive. And our staff is here if you have any specific technical questions for the city.

Thank you.

MR. COE: Thank you.

MS. LA PISTO-KIRTLEY: Nice size podium.

My name is Beatrice LaPisto-Kirtley. My business address 234 North El Molino Avenue, Suite 202, Pasadena. I am President of the San Gabriel Valley Council of Governments.

Mr. Chairman and members of the Board, I am here this morning to speak to you on behalf of the San Gabriel Valley Council of Governments. The COG is a joint-powered agency comprised of 26 cities working together to serve the more than 1.7 million residents

living in the San Gabriel Valley.

The Board of Directors formed a task force of our cities' public works directors to evaluate the draft rules and regulations, including the anticipated financial impact relating to this program.

In April, the task force submitted their report and identified four areas of concern. We issued a letter to the Water Resources Board questioning that these points be -- requesting that these points be reviewed and addressed prior to the issuance of the final draft rules and regulations.

Two weeks ago, our task force members and other elected officials in our cities met with Catherine Tyrrell to review our list of concerns and corresponding adjustments that were made to the document being discussed today. We were pleased to learn that several of those previously raised issues have been addressed. And we thank the staff for their attention and responsiveness to our concerns.

Mr. Nasser Abbaszadeh, Chair of our NPDES task force, is here today and will speak under separate comments about some specific technical issues that remain unresolved regarding this proposed program and its implementation.

Perhaps the most important to our Board,

VOL 14

0081

R0060087

which is comprised of elected officials in our 26 member cities, is the financial impact resulting from this program for our respective cities.

Our staff analysis, which has been reviewed by your staff, indicates that this program will cost San Gabriel Valley cities between $8.00 and $10.00 annually per resident to implement. This represents an estimated $10 million in increased cost to our cities for this new program. Clearly it will require new user fees and charges.

More important, should Jarvis II pass in November, it is likely that such new fees will require voter approval. Should that approval not be successful at the ballot box, these new costs will become yet another in a never-ending series of General Fund liability hits to our cities; for example, it could cost the City of Pasadena a million dollars per year.

Our Board supports the objectives of this program; however, this means does not justify the end. We are strongly opposed to this unfunded mandate and urge you to withhold approval of the new regulations until those technical issues to be discussed by Mr. Nasser Abbaszadeh are met and until which time the federal government provides the resources to us to fund its implementation.

As cities serving the more than 1.7

VOL 14 00082

R0060088

million California taxpayers living in the San Gabriel Valley, we cannot and should not bear the financial burden for this federal government mandated program.

I thank you very much. I am also immediate past President of California Contract Cities Association. And on behalf of the president, its current president, I have letters for all of you asking that you defer your consideration for 90 days so we can have input from public elected officials.

I wanted to let you know that the video that you saw this morning, elected officials saw that the first time in June at the league meeting. And we have not been aware of this process. I realize everyone says it's been going on for a year or over a year, but elected officials have not been aware of this. We support you but would like input into this.

Thank you very much for your consideration.

MR. COE: Margaret Clark is next followed by Joyce Lawrence and Marilyn White.

MS. CLARK: I am Margaret Clark, Mayor of the city of Rosemead. My address is 8838 East Valley Boulevard in Rosemead.

I would like to clarify something that Ms. Kirtley mentioned. We have been aware of the process.

VOL 14 00083

R0060089

However, in March, for example, I serve on the Southern California Association of Governments Energy Environment Committee, and we brought the issues before the SCAG Committee and before Ms. Tyrrell.

Some of those issues were not addressed. We asked for another meeting in June, and we were given only a conference call and told at that time that the Board members on the call could not respond. And I understand your problem that the Board couldn't. But I'm wondering why Board members were put on that call if we could not, by their presence, be able to discuss the specifics?

All we are asking here is an extension of time to work out the details. None of us disputes the fact that there is a tremendous pollution problem. None of us is opposed to clean water. We simply want more time to work out the problems.

And my main concern is that, if there are lawsuits involved in this, either with third parties or by other means, it will delay the cleanup. Money will merely go to the pockets of attorneys instead of prevention and cleanup. This has been the case with cities. In one suit we were sued as third parties for merely arranging for the trash to be hauled there. The Cartwright/Simpson case with the sewer was another example where monies, precious, scarce taxpayer dollars, went to attorneys' fees instead of

solving the problem.

So I plead with you, we are on your side. We want clean water. We want the process to go forward. However, we need more time to work out the problem so we can avoid the lawsuits that will take place.

Assembly Member Dominic Cortese phoned me this morning and told me that he -- he is the Chair of the Water and Wildlife and Parks Committee in the Assembly. And he informed me that he was attempting to schedule a hearing in this process in order for us to have more input into the problems that we have.

I do appreciate very much Senator Hayden's and Assembly Member Bowen's concerns for our financial needs, and we want to see that happen.

I also am very concerned about the buck stopping where we are. The children that were before you have legitimate concerns, but their parents are the ones that are going to be asked to pay for these programs. And if the public is oversaturated with the fees, they are going to turn around and not want to pass the SB-900, the water issue that was just signed in to put it on the ballot by the Governor last week, I believe. And that will have an effect on the water issues in the state. And it would be a shame to have this, if it's passed without the refinements that we need, to stand in the way of that

VOL 14 00085

R0060091

issue.

So I would ask you -- I have brought letters from Assembly Members Dominic Cortese and Diane Martinez who have concerns, share our concerns that the process be left open. We are not opposed to the permit. We are opposed to passing it today before we have had the chance to work out the problems.

So we plead with you to please consider our comments.

MS. LAWRENCE: Good afternoon. My name is Joyce Lawrence. I am the Mayor of the city of Downey, 11111 Brookshire, Downey 90241.

Bea LaPisto-Kirtley made some good points about the Jarvis initiative, and that's hanging over all of our cities' heads, including ours, but it's a charter city. We are concerned about that.

I brought you a copy, a certified copy, of our resolution asking you to defer for many of the same reasons. I don't know who to present it too.

And I feel badly that some of us that were going to express city concerns are characterized in advance as whining or otherwise dragging our feet. That bothers me. Polarization bothers me.

The time schedule here was very crucial for our cities, and our attorney may speak later. But the

VOL 14 00086

R0060092

time from the revised draft that we got, which was dated July 5, our city received it July 8. There were 111 pages of material to go through. There were changes in all but six pages of the permit, and we had it in our hands for one week.

We had this resolution on our agenda the next night after asking please for some more time. We don't like dirty water either. We have had voluntary programs in Downey for 20 years, not until just when we got AB-939 money. We have been recycling 20 years. We have been having volunteer cleanups of our city. We know it goes in the river. We want to stop it. We support clean water.

We are in a joint group with all of our other cities in our region to enhance the economic value for our cities.

One final thing. I know it's probably a minute and a half. I was pleased that the large businesses like Carl's Jr. found a way to support these things. It makes we very happy. We have that business in our community. But we also have hundreds and hundreds of small businesses that make up the bulk of our jobs in our city.

These inspections, educational or whatever, are going to be just as labor intensive. We can't go to the headquarters of Carl's Jr. and say, "Tell

VOL 14 00087

R0060093

all your units." We have to go to each one for our educational things, so it is labor intensive. We are worried about the funds. We would like a little bit more time.

Thank you.

MR. COE: I want to again ask that we shorten this up a little bit.

MS. WHITE: I will be as quick as I possibly can. I am Marilyn White. I am the Mayor Pro Tem for Redondo Beach.

MR. COE: I would like Eileen Ansari to follow you and Paul Rosenstein to follow.

MS. WHITE: All right. Is that a go?

MR. COE: That's a go.

MS. WHITE: Okay.

I also have a resolution that was considered and passed at our meeting of July 2nd of 1996. And I would move that you receive that. The dates that are coming for these resolutions at this hearing are I think something that should be considered.

We are a beach community. We have a wonderful city. We are concerned with water quality and perhaps have been more so than a lot of other cities from perhaps even a greater period of time. But we have to also have input with the people who are going to be paying the

bills on this one.

I won't repeat the obvious comments made from other speakers because they are also much our concerns. But if we, as a city, are to be held responsible for the plan and its implementation and the payments and the penalties, then we should have input from not only our Council but the people who are going to be paying this.

Our city, like others in the area, are experiencing a lower tax base and higher expectations from the citizens. How do we pay for this? How much? Because we cannot any longer arbitrarily say, "Oh, we are going to raise your taxes." That bird won't fly.

I would respectfully request that you please give us a period of time. At our meeting on July 2 at the Redondo Beach City Council we adopted the resolution requesting you to defer issuing the proposed tentative order and to direct your staff to work with our city. Come to our city, send your staff to our city. Let's have a public hearing. Let's get the input. We would like to hear from you.

Thank you very much.

MS. ANSARI: Good afternoon. Thank you very much for letting me speak. I am Eileen Ansari. I am Mayor of the City of Diamond Bar. I am a delegate from District 37 to the SCAG Regional Government, and I am also on the

VOL 14 00089

R0060095

Energy Environment Committee. I am an environmentalist. I started to save Tonner Canyon, and that is how I got involved in politics.

I am concerned, as many people in our community of Los Angeles, that we need clean water and we need healthy water for our children to be playing in and drinking.

As Margaret Clark mentioned before, as a member of the SCAG Energy Committee, we did contact Cathy Tyrrell. We met with her. We expressed our concerns many times. We met with her in March, and we had a conference call in June.

Our concern as cities is that we want to be not adversarial. We want to be part of the process and work with you.

Our City Attorney, Richard Watkins, had worked with us to try to modify and change the revisions. And some of the revisions we have gone along with gladly. The latest revision as of July 15, our attorneys answered you on July 12, and you have a copy of that, I think each of you, that we sent to you.

We ask for you to give us at least two to three months to respond to cities. The cities have not been part. And us, as elected officials, have to answer to our members of our city and our population. We have not

VOL 14 00990

R0060096

been part of the process. We would like to give you and speak with you about our concerns. Many of these are things that have been addressed today.

One is the receiving waters area. Another is the fact that policy makers have only -- have not been part of the process. We have tried to work with you and we would like to continue working with you and ask that you postpone this for two or three months so that all of our cities can be more involved.

Policy makers were not informed. We have not been part of the process. There have been maybe two or three policy makers involved with that, and that's our area of concern. We wish to be part of the process, but give us two or three months.

Thank you.

MR. WASHBURN: Mr. Chairman, members of the Board. I'm Dennis Washburn, Councilman from the city of Calabasas and Director and President of the Resource Conservation District of the Santa Monica mountains and a member of the Bay Restoration Project Bay Watershed Council and Oversight Committee.

I worked with staff and with a fellow Council Member, Bob Pinzler from Redondo Beach, Mark Ryback and Dorothy Greene and others from Heal the Bay, to produce the video which you saw. And I think that it's been

VOL 14 0091

R0060097

successful in stirring dialogue and engagement in the process. I am happy to see that. Maybe we have been a little too successful in terms of generating interest of the elected officials looking at the number of us who are trying to talk in the minute and a half that we have to speak.

I used to be critical of the media and government-derived phrase "the peace process." Peace, to me, is a state of being as opposed to a dynamic process. But I think the new President of Israel has indicated that peace is not possible without security and security is not possible without peace. That kind of, I guess, dependency is what we are being faced with here.

And pollution control is a process that we are embarked upon. A healthy ecosystem is not possible without awareness and action. And awareness and action are not possible without self-control and a sense of responsibility.

We are stepping up the program to heal our ecosystems by prevention, which is probably most economical; source reduction, which is probably most efficient; remediation, which is the most practical given what we are facing today; mitigation, which is probably most needed; and ultimately enforcement, which is most feared as you have heard today from some of my colleagues.

VOL 14 00992

R0060098

We have to develop the concept of a pollution control process. And I don't think it ends with a meeting here today. It's ongoing and it needs to be high profile. I am excited to see that we have at least stimulated the debate where this is not a routine passage of a permit, like in 1990, but instead has brought out a lot of great thinking and a lot of dedicated people to be able to deal with the problems that are ours to share.

To avoid or alleviate the inequities that will likely arise out of the passage and implementation of this permit I think is what we are dealing with at this time. And I hope that the process is established by which this can be ongoing, dynamic, flexible, and resilient.

Calabasas has passed a resolution of support for this permit. I believe, personally, that it has not gone far enough, and I concur with many of the things that Senator Hayden has said.

But we are, at this point, prepared and have budgeted for what we think will be the program described in this permit. We are seeking creative solutions to our common problems. Our city will have a storm water ordinance for review by the council by the end of this month. And we would be happy to share our discoveries in that process with anyone who is interested.

VOL 14 00993

R0060099

On the other hand, we don't want to exacerbate the problem of the unfunded mandates that are clearly a potential in this problem. Yes, again, we must heighten our awareness of the problems and solve rebuilding the permit process to be just that, a dynamic and flexible process to prevent economic inequities, an important factor that we will have to consider.

I do urge, and my Council urges, your passage of this permit. This is just the beginning. We need to work together to make sure we can accomplish the goals that we have here and some of those, in fact, that have not been addressed and need to be.

Thank you very much.

MR. COE: I called Paul Rosenstein earlier to be followed by Dee Hardinson and Cristina Madrid.

MR. ROSENSTEIN: Thank you. I will try and be brief.

My name is Paul Rosenstein. I am the Mayor of the city of Santa Monica. And my City Council has passed a resolution last week urging you to strongly support the proposed permit.

When I hear the discussion here, I begin to have mixed feelings because I see that, on the one hand, the staff has made such valiant efforts to respond to the concerns that the cities have raised, but they have

VOL 14

00994

R0060100

developed a lot of flexibility in the system. And the more they do that, the more I have to be concerned about the ultimate effectiveness of this program.

But we are here to support the program. And we say it is the single most important mechanism to ensure the protection and restoration of the Santa Monica Bay.

Now, the effect on business is something I think we have to really be concerned about. And our business community has studied this issue very carefully, and our Chamber of Commerce in the City of Santa Monica has unanimously approved a motion urging the adoption of this permit. They feel they can live within the restrictions that are being contemplated.

Many cities are saying that they can't afford this and there's cost issues. One thing we would like to point out is things that we have down in Santa Monica where we tried to look at innovative ways to be cost effective. For example, we have taken some of our inspection pretreatment permitting and we have combined that with inspection programs that prohibit the discharge of commercial and industrial waste water into the storm drain system.

Our inspectors who regularly go out into various sites are trained and are able to deal with this,

VOL 14 0095

R0060101

like fire inspectors and others, so that we found ways to be cost-effective as well as being effective in dealing with waste water treatment.

It's important also to notice that the latest draft of the permit is sensitive to the cities' budgetary process and gives the cities the ability to understand what they are getting into when they adopt a budget.

Hearing some of the requests to delay further reminds me of what we go through in the cities when we have assessment hearings on sidewalk repair, gutter repair, things like that, where we send notices, we make valiant efforts to communicate with those involved. And somehow some people do not pay attention and do not hear the efforts. And then when we hold the hearing and get ready to make a decision, we have very similar requests to delay.

I would say that our city has been involved in this for a year and a half. And if other cities are not aware of what's going on, maybe it's their staff that's the program. But somebody in their cities has been informed about what's going on, and they were derelict in forwarding that information to their City Councils.

I'd like to conclude on this note, about the health studies of the bay. Some people think that

VOL 14 00966

R0060102

coastal cities like Santa Monica, yes, we are sensitive to the need to heal the bay, we are very sensitive to that, but some people think it's just an issue for coastal cities. And, yet, as we see it, it's an issue for all those in the region.

For example, people in inland cities come to our beaches to enjoy themselves and to recreate. And they are in danger, their health is in danger, by what they experience when they are there.

So it seems to me that if cities inland are concerned about the health of their own residents and the ability of their residents to enjoy the bay, they will see that they have common cause with the coastal cities.

So we see this as a regional issue. It affects tourism, and it affects the ability of our residents also to enjoy the bay. So we urge you as strongly as we can to adopt this permit today and then help us move forward so that we can implement it and really clean up the bay and make this a more attractive bay for people to enjoy.

Thank you.

MR. COE: We have a question for you.

MS. ROGERS: The last gentleman took five minutes, and I estimate we will be here until 9:00 if we don't run on a tighter time frame. I think we have got to

VOL 14 0097

R0060103

put, like, a sign up saying one minute or a minute and a half and say stop and whatnot or it's going to be midnight before anybody gets out.

MR. COE: Let me suggest that those who are in favor, like the last speaker from Santa Monica, if you just say, "Hey, we think it's great. We favor it," and then maybe step aside. And that will provide some time for those who oppose it and their ideas, which can be considered.

But I'm going to raise my -- you are going to raise your hand from now on after a minute and a half. You can see my attorney if you don't like it.

MS. HARDISON: New ground rules. My Council in my community loves that when you do that to them.

MR. COE: I said a minute and a half at the beginning of this section.

MS. HARDISON: But no one spoke for a minute and a half.

I am Dee Hardison, the Mayor of the City of Torrance. I'm also the newly elected Chairperson of the South Bay Council of Cities, which is speaking for 15 cities here.

You have our printed material. We passed a resolution from the COG. You have that. And you have a letter of our Council meeting of July 9, so I'm not

VOL 14 00998

R0060104

going to give you any more paper.

Our concerns in the city of Torrance are obviously two. One is the process that we went through. And the concerns have been that the elected officials didn't become part of this process until late into the process. I became aware of it in March when Catherine Tyrrell came out to the South Bay COG and spoke.

And at that point, yes, my staff had been involved before then. But until our staff got the answers back to the questions that the cities asked, and we didn't get those answers until late May, early June, there was really nothing our staff could bring to our City Council to take a position on. So we have not had time --

(Applause.)

MS. HARDISON: Don't clap, folks. You are taking part of my time.

Anyway, so it is the time issue. But we are beyond that now. And I know we weren't part of the original process.

Again, I think we all want the clean water. That's not the question. Again, it is the financial impacts to our city.

A little different perspective. When Catherine Tyrrell came out to the South Bay cities meeting in March, I asked her if a study had been done on the

R0060105

VOL 14 00999

financial impacts to the city. I even volunteered the city of Torrance to be a part of that study.

And I have to tell you, I'm still waiting today for that study or for some results to be given to me. I understand there's something from San Gabriel. But I have to tell you not a piece of paper has come to my desk to indicate what those thoughts are.

So we know it will cost more in the city of Torrance. We have already done some financial analysis. But we would like to have that opportunity to know those cost figures, to have the time to know what the impact would be to our city.

And, with that, I have other comments, but we will stop. Thank you very much.

MR. COE: We want Mr. John Robinson and Carolyn Van Horn to follow Christina.

Christina is not here?

John Robinson is next.

AUDIENCE MEMBER: John left.

MR. COE: Carolyn Van Horn followed by Francisco Alonso and Robert Bruesch.

MS. VAN HORN: Thank you very much. I am Carolyn Van Horn, Malibu City Council, and I'm speaking on behalf of the City Council.

We have supported the NPDES all along.

VOL 14

0100

R0060106

I am -- I regret that it is, in my view, weakened, but I urge you to support. I think it's a beginning.

We are a little over five years old as an incorporated area, and we have been involved with the Santa Monica Bay Restoration project, with the Malibu Canyon Watershed Council, and everything that we could be in terms of reducing the contamination of our ocean waters.

As adults, I can speak as a parent and as a Council member. As adults, we are very good at making things complicated, and I think we can work through it. I think we are going to have to. What we have heard here today is sort of an adult's position of adults making things very complicated and then figuring out how to get through it and children who really get very simply right down to the point.

I am a little appalled as a parent and as an elected official that we are debating the health of children versus a pocketbook because prevention is always the cheaper way to go. And I urge you --

MR. COE: So you support?

MS. VAN HORN: Yes. The city unanimously supports the resolution. Thank you.

MR. COE: Are you Mr. Alonso?

MR. BRUESCH: No. I'm Bob Bruesch.

VOL 14

01101

R0060107

MR. COE: Go ahead, Mr. Bruesch.

MR. BRUESCH: I am Robert W. Bruesch. I am Councilperson for the city of Rosemead and Treasurer of the San Gabriel Valley Association of Council and Governments. And I am Bob Bruesch. I am the environmental teacher in the city of Rosemead who has taken at least 40 classrooms on floating laboratories in the very bay you are talking about to discover the issues that are before us. So I'm caught in the middle.

We all know that the bay needs cleaning up. But I represent a contract city, and the costs are real to us. Let me give you a quick rundown of what happened to our city NOI. We too were told that we were protected from third-party lawsuits. We too were told that our amount of trash would not be considered in the litigation.

And when the judge threw that issue out, we paid $800,000, $800,000, five percent of my city budget. So this is a real issue to us. And if that language isn't cleared up, we cannot, we cannot, be in favor of language like that.

Being a contract city, we contract all our inspections out. We do not have hired city staff. What do we do when there is a choice between a site visit to look at the pollution going into the storm drain or a

VOL 14

0102

home visit to see if the latches on a window -- the bars on the window are safe enough?

MR. COE: Can I ask you if the city of Rosemead support this?

MR. BRUESCH: No, we do not.

We oppose the language in there as such absolutely against the legal aspects, legal authority. We need to know more clarification. We have to have more language on what we are expected to do, what we are required to do. And we need to know -- that's why we need the time to look at this. We need the City Attorney to look at this and find out exactly what we are required to do.

May I just say one thing as a teacher?

MR. COE: One sentence.

MR. BRUESCH: Please do not make --

MS. ROGERS: You know, we are not going to get through the evening. I think this gentleman said his position. I would like to move on.

MR. COE: Mr. Alonso followed by Lawson Pedigo and Harry Baldwin. And let's get up to bat Bob Pinzler and John Fasana, and that will complete the elected officials.

MR. ALONSO: Board members, I am Francisco Alonso. I am a Council member of the city of Monterey Park. Business address, 320 West Newmark, Monterey Park.

VOL 14 0103

R0060109

While our staff has not had any difficulties with this permit, it has been brought to my attention that nearby cities such as Rosemead, that they do have a difficulty in some of the language in the permit that has been presented. And we are trying to see if, per chance, an extension of time so some of these concerns can be addressed. I think it would be wise and prudent to do so.

Thank you.

MR. COE: Thank you.

MS. ROGERS: Thank you for the time you took.

MR. PEDIGO: My name is Lawson Pedigo. I am the Mayor of the small town of Lomita. It's a little contract city in the South Bay, 1.7 square miles.

I oppose this permitting language for economic reasons. It would cost us approximately $50,000 for enforcement and implementation of storm drain water that doesn't even flow to the ocean from our town. We go into a small lake in our area which is used for cooling for an industrial area.

So we have already spent a lot of money and we are involved in a program that is rather ambiguous. I believe that it would be very costly, and I think that a lot more study needs to be done before we spend any more money in our city in economic hard times.

VOL 14

0104

R0060110

So, again, I oppose this. And thank you for my time.

MR. COE: Thank you.

MR. PINZLER: My name is Bob Pinzler. I am a member of the Board of the Santa Monica Bay Restoration Project. I am the elected representative of coastal cities, and I was given credit for the writing and directing of the video that you saw earlier. And it's that perspective that I would like to speak to for just a moment.

I think one of the problems that we have here is the lack of communication that has occurred over time. Much of the discussion that went on in our Council -- I am a Council member from the city of Redondo Beach whom you have had representation.

But one of the issues that was raised at that time was that so much information is going to be coming down the line. Those are the open questions. Those are the things that are of greatest concern to people. The great unknown.

I think that an effort must be made and can be made through the way that you work through the language of the permit, as well as what comes down later, to make sure there is conclusiveness in the process that will be coming down, even, perhaps, using the dispute

VOL 14 0105

R0060111

resolution services that are available to make sure that those things that are still to be decided -- and there are things that are still to be decided and there are things that are primarily what is of concern to the cities -- that a joint effort is made to make sure that those things are solved to the satisfaction of both sides.

So I was part of the process. I am one of those policy makers that they spoke about who was involved in this process. I have got a lot of scars on my back from what this whole process is all about. And I understand what both sides are speaking about.

And it is from that perspective that I wanted to address you, not exclusively about the permit itself, but about the process itself.

Thank you.

MR. COE: Thank you.

MS. CRAVEN: Excuse me. I still don't understand. Do you want me to support it? Do you want a delay? Do you oppose it?

MR. PINZLER: My Council has voted to ask for a delay. I am bound by what my Council has voted.

MS. CRAVEN: Thank you very much.

MR. COE: Did Harry Baldwin go? I called Harry Baldwin.

MR. FASANA: I think Harry Baldwin had to

VOL 14 0106

R0060112

leave.

MR. COE: All right. You are John Fasana?

MR. FASANA: I am John Fasana. I am Council member of the city of Duarte. My city is opposed, to get that on the record, at this point.

A couple of facts. First of all to talk about the unfunded mandates. It's not an abstract issue when you are faced with daily choices as far as public safety, police and fire, parks and recreation programs that deal with at risk youths. There are many choices that need to be made.

I think the big problem that I am hearing both from the supporters of this permit and the opponents, one thing we both agree on, is that there are no teeth basically because the resources have not been identified here.

We agree with the opponents that resources have not been identified. And until we see some resolution, basically from the state level -- because, frankly, we think this permit goes above and beyond what the federal guidelines stated. Some of the members from the state that have been here, they are part and parcel to the loss of the funding that we experienced as cities. That money has not been restored even as the state moves to prosperity.

And we think that up front, if this issue of funding is not addressed thoroughly, particularly now with Prop 62, the decision there and the Jarvis initiative coming forward, we don't have the flexibility to implement revenue increases without going to the voters.

We think it may be fair to step back, look at a process that squarely identifies the funding that's going to be required so we can get on with restoration because I think that's something we all agree needs to be done.

Thank you.

MR. COE: Thank you very much.

We will now break for a late lunch. I know it's difficult for people to find places to eat in the civic center, but let's try to get back at 1:45 -- 2:45. We are going to start at 2:45 whether you are here or not.

***

(At the hour of 1:55 p.m., a luncheon recess was taken, the hearing to be resumed at 2:45 p.m.)

VOL 14

01/08

LOS ANGELES, CALIFORNIA; MONDAY, JULY 15, 1996

2:50 p.m.

-000-

***

DR. GHIRELLI: Mr. Chairman, members of the Board, and members of the audience, I have been asked by the Board to keep a close watch on the clock here. So when your time is up, I am going to hold up a yellow card. And that will be your statement that your time is up.

MR. COE: This is a public hearing and the testimony is under oath. And if there are some people who came in after I gave the oath that are going to testify, if so, if you will rise.

(Oath administered.)

MR. COE: We will start off with Sarah Wan.

MS. WAN: Thank you.

I'm Sarah Wan. I live at 22250 Carbon Mesa Road in Malibu, and I am a California Coastal Commissioner. And I am here to present a letter that was voted on and approve unanimously on Thursday by the Commission.

It says that the California Coastal Commission urges the Los Angeles Regional Water Quality Control Board to adopt the issue of the Los Angeles County Municipal Storm Water Permit. The Commission believes that

VOL 14 01109

R0060115

taking this action will advance coastal act policies and implementation of the Santa Monica Bay Restoration Plan as well as the goals of Section 6217 of the Coastal Zone authorization amendments of 1990.

The California Coastal Act contains policies that will be heard by adopting a comprehensive storm water permit for the Los Angeles Region. These provisions call for the protection and restoration of coastal waters, including streams, wetlands, and related waters.

The proposed permit will help accomplish this by focusing attention on the reduction of pollutants for both existing and new development. Adoption of this permit is critical to the successful implementation of the Santa Monica Bay Restoration Project which relies upon the county and the cities having an effective urban runoff control program.

The Commission is of the opinion that the proposed permit is an important step towards ensuring comprehensive programs throughout the region.

Lastly, this permit is designed in a manner that is supportive of the state of California's efforts to meet the goals and objectives of CZARA. This proposed permit will help advance a consistent approach to implementing management measures to control runoff from

VOL 14 0110

R0060116

both new and existing developments. And we applaud that Regional Water Quality Control Board's attention to these matters.

In conclusion, the Commission found that the proposed permit is a significant improvement over the 1990 permit and supports its adoption. And the Commission acknowledges the difficult negotiations and compromises that have been a part of the reissuance process and looks forward to the improvements to coastal water quality that can be anticipated from an effective implementation of the new permit.

And might I add personally that this is a long overdue first step. And I urge that it should be passed.

Thank you.

MR. COE: We are getting into the category now of permittees that have not been represented previously during this hearing by elected officials.

And based on the number of blue cards submitted, the average would be two minutes apiece. Please keep that in mind. And you will see a yellow card when your time is up.

The first is Oka Lampman followed by Daniel Keesey and followed by Desi Alvarez.

MR. LAMPMAN: Mr. Chairman, member of the

VOL 14

0111

R0060117

Commission, Dr. Ghirelli, it's Oral Lampman.

MR. COE: I'm sorry.

MR. LAMPMAN: That's all right.

I'm Oral Lampman, Public Works Director for the city of Burbank.

Last Tuesday evening, I presented to the City Council a resolution taking a position that the meeting or the hearing be continued for certain corrections. Frankly, it was that day we had received the latest revised permit. And as I mentioned to the City Council, I think that the Board's staff has fairly adequately responded to the concerns we have.

So we are not taking a position of supporting. Our City Council isn't taking a position of supporting the resolution, but we don't oppose it. As I told the City Council, I have been working with the EAC on this issue for two years, and I'm tired of it.

We will implement the program, and I think, in cooperation both with the county and Regional Board, we will be able to accomplish the ultimate goal.

I would also say that, frankly, I don't see, from Burbank's perspective, and I have to speak simply for Burbank, we don't see it, as it's presently written, as being a major cost obligation on the part of the city. We have already implemented some of the programs in the

initial permit.

MR. COE: Do you foresee that your city, after reviewing the revision, will come out and support officially the permit?

MR. LAMPMAN: I think yes. I would have, no problem going to the City Council supporting the permit. Because, again, as I've mentioned in the past, the city of Burbank has had an NPDES permit in our water reclamation plant for 30 years, and we have worked well with the staff over that period of time.

MR. COE: Thank you very much.

MR. KEESEY: Mr. Chairman, members of the Board, thank you.

First of all, I'd like to say that I work for the city of La Verne. I am representing the city of La Verne and the Council. My name is Dan Keesey. The business address 3660 East "D" Street, La Verne, California.

First of all, I wanted to thank the Board and the staff for the work they have done on this permit. I have been very active in helping put the permit together. I have served on the Executive Advisory Committee. And we, in La Verne, are comfortable with the permit now.

The Board has -- the staff has done a

VOL 14

0113

R0060119

great job in responding to the comments that we had on the December 18th graft. However, there are a few issues that I would like to point out to you and ask that they be resolved prior to your adopting the permit. And I will just briefly mention what those are.

First, it has been mentioned before that the cost associated with this permit is unknown really. We have estimated anywhere from a couple hundred thousand dollars to half a million dollars, depending upon the types of projects that may be implemented by the permit and the subsequent plans that are required in the program.

The permit contains ambiguous enforcement. Language such as "to the extent practicable" is very difficult to define. And in any court of law I think you will find that we are going to be going back and forth with things like that.

One major concern we have is that it's state-delegated responsibilities. The Board's staff is trying to ask the cities or demand that the cities carry on obligations of the Board for permits that this Board issues, various industries and construction activities. We feel that the time lines to implement many of the programs in the permit are unrealistic considering the scheduling of Board hearings, public notices, and things of that nature that have to occur.

VOL 14

0114

R0060120

And lastly, that it contains too many levels of bureaucracy.

Thank you for your time.

MR. COE: Thank you.

Mr. Alvarez followed by -- what's that last name -- Leiga, who would like to interject himself at this point, and Ed Schroder please.

MR. ALVAREZ: Good afternoon, Mr. Chairman, members of the Board. I am Desi Alvarez representing the city of Glendale. My business address 633 South Broadway, Glendale, California.

We do agree that the tentative order before you today is a tremendous improvement from the earlier drafts that we have seen, and we would like to commend the staff on their work.

The city of Glendale prides itself on a lot of environmental programs, and currently it's spending in excess of three and three quarter million dollars a year in compliance with the requirements of the current permit.

We believe that the proposed tentative order needs some additional work to address some of the concerns remaining with our city. We think that the permit still imposes regulations which go beyond federal requirements and is going to propose unwarranted additional requirements for residential and unfairly target small

VOL 14 0115

R0060121

businesses in our community.

The permit will require the city to conduct educational site visits. These are educational site visits that we have to conduct at specified time intervals. We believe that this requirement demonstrates a lack of flexibility concerning cost effectiveness. If the intent is truly to have an educational program, we believe that the cities should be allowed to develop the best approach that meets their community requirements.

We believe that the permit shifts some of the state's responsibilities with respect to their facilities on the city without any compensation, and it's unfair to require the cities to do so.

The permit will require the cities to fund and carry out unknown programs. And these are programs that are going to be developed that are in the terms of the permit. This is probably the area of greatest concern to us. Many of these programs will require the implementations of requirements, all at some cost, and that cost is unknown at this time.

We believe that some of the language in the permit is still vague and exposes the city to litigation. The findings that are underlying the permit fail to establish a complete scientific basis for regulating all waters in the county, and some of the

VOL 14 0116

R0060122

discharge requirements exceed federal standards.

In summary, the City Council, on July 9, considered the permit and unanimously adopted a resolution urging you to delay action on this until some of those issues can further be resolved.

I would like to enter a copy of that resolution into the record.

MR. COE: Thank you.

MR. LEIGA: Thank you, Mr. Chairman, members of the Board. I am Al Leiga, Mayor of the city of Claremont, 207 North Harvard, Claremont, California 91711.

Last week our City Council looked at the available permit we have on it and unanimously passed a resolution opposing the new revisions of the permit and actually spelled out why. And I will give you a copy of that.

Basically we said we find it completely unacceptable. It's an unfunded mandate that will put a burden on all cities and not likely to produce the necessary results to clean up the storm drain outflows to the ocean. There are some additional details in here, and I will pass that along.

Also last week we received the latest revisions to the permit, substantial as they are, and today there is more revisions. Although the permit has gone

VOL 14

0117

R0060123

through 18 months of reviews, more changes probably occurred during the past month than the previous 17.

I think this is a permit in process. There has been no chance to review the series of the latest changes to see what the impact to the cities truly will be. I think elected officials would like to have a chance to provide some meaningful input on the permit as it keeps changing.

There's really been no analysis of the current permit -- who has been implementing the best management practices. We don't know what we are accomplishing at this point to see where we go from here.

The issue of cost has been brought up by a number of other speakers. There has been no serious analysis of the cost. The Council of Governments has done some. We looked at that. And the funding is certainly not there. It's clearly an unfunded mandate which is going to have soma serious implications if the new Jarvis initiative passes as well. I think these kinds of programs should be funded by federal or state to have some success.

We also have a very serious concern about third-party lawsuits. It looks like we are almost federalizing some local ordinances, in fact. Considerable time and funds have been spent during the first permit with these various lawsuits if you look at cities like Burbank,

VOL 14 0118

R0060124

Azusa, L.A. County, et cetera.

Our request is that the adoption of the permit be postponed so we can provide appropriate analysis. I know there are a lot of people here with T-shirts on and slogans. But I think this is a very serious matter, and it should be addressed in a serious manner and not be intimidated by that.

I think we need some response so we can get a proper analysis of what these latest significant changes really mean.

Thank you for your time.

MR. COE: Thank you.

Ed Schroder to be followed by Sid Mousari and Raymond Holland.

MR. SCHRODER: Thank you, Mr. Chair. I am Ed Schroder. I am a public worker for the city of El Segundo.

The city of El Segundo also passed a resolution urging the Board to refer this item back to Staff to resolve some of the issues that we are concerned with.

Just as an example, I had an opportunity to review the changes of July 7. And as it turns out, those changes have raised another issue that I think is significant and hasn't been addressed yet; and that is, on page 21, on Item No. 4, it talks about "prohibit the

VOL 14 0119

R0060125

discharge of untreated runoff." And that statement makes an implication that treated runoff is allowed, in which case the question then arises, what level of treatment is approved and who authorizes it? Who issues a permit to allow that discharge?

I have been involved in this for 18 months, and I have not once ever discussed cities issuing permits, okay. I did call Catherine last week and raise the question to her as to whether the Board would be issuing permits to any business that wants to discharge something in the storm drain system.

At that time, she said she didn't know and she would get back to me. We talked about it this morning. And as of right now, it's still an unresolved issue. I don't know of a city in this room that has considered a permitting process as part of this program.

So again, I have given you a copy of our resolution for your record, but I also urge you to help us and resolve these issues so we know what we are getting into before we are tasked with these responsibilities.

Thank you very much.

MR. MOUSARI: Good morning. My name is Sid Mousari, and I am Director of Public Works for the city of Baldwin Park. I am here representing the city of Baldwin Park.

VOL 14 0120

R0060126

The city of Baldwin Park also passed a resolution last week opposing the permit the way it was presented to them, and that was the previous permit.

Since then, there has been some changes to that permit that the Council is not aware of. The Council's concerns were the litigation resulting from the permit and also the financial impact on the city.

The City Council requests that the Board would postpone the matter until such time all these issues are resolved and further time is alloted them to evaluate the details.

With that, thank you very much. And if it's possible, I would like to defer some of my time to one of my colleagues so he can talk about another issue.

Is that possible?

MR. COE: Representing the city of Baldwin Park?

MR. MOUSARI: I'm sorry?

MR. COE: Is your colleague from the city of Baldwin Park?

MR. MOUSARI: No. He is from the city of Whittier. His name is Ray Tahir.

MR. COE: Why didn't he turn in a blue card?

MR. MOUSARI: He has already.

MR. COE: Oh. Well, we will get to him.

VOL 14

0121

R0060127

MR. MOUSARI: Okay. I was just deferring some of my time to him.

MR. COE: Oh, all right. Thank you very much.

MR. HOLLAND: Mr. Chair, members of the Board, Staff, my name is Ray Holland. I am the Director of Public Works for the city of Long Beach. And I want to read to you a portion of a letter from James Hagman, the City Manager of Long Beach. And I have just given a copy of that letter, as well as some attachments, which I would like to have all of them entered into the record and distributed to the Board members and key staff.

Submitted herewith for your consideration is a resolution adopted on July 2 by unanimous vote of the city of Long Beach representing over 425,000 citizens urging you to defer the issuance of the tentative order to the Municipal Storm Water and Urban Runoff Discharges within the county of Los Angeles.

The City Council makes this request because they believe this permit is deficient in a number of areas; and that the permit, as written, does not comply with state and federal law, exposing Los Angeles County cities to an unreasonable risk of lawsuits.

Therefore, please direct your staff to respond to the issues set forth here in this letter in our resolution and in the City Attorney's letter to

VOL 14

0122

R0060128

Dr. Ghirelli dated June 26, 1996, and to make corresponding revisions to the draft permit.

Long Beach firmly believes the tentative order greatly exceeds the legal authority of the Regional Board and that it exceeds the requirements of the Clean Water Act and does not comply with the Porter-Cologne Water Quality Act.

The following are some of the city's major concerns outlined in the resolution. These concerns are based on review of the tentative order received on May 29, 1996. I'm just going to read two of many.

The findings and permit requirements do not comply with the Clean Water Act. Additionally, they are not based on any sound scientific examination of the impact of storm water and urban runoff on the receiving waters of Long Beach, and I want to stress the receiving waters of Long Beach. Most of the testimony you have heard here today relates to the Santa Monica Bay. We are not with the Santa Monica Bay.

MR. COE: Mr. Holland, may I interrupt? I just have a question here.

The city of Long Beach has two minutes, and I see two blue cards here for different people from the city of Long Beach.

MR. HOLLAND: I don't know who the other person

VOL 14

0123

R0060129

is.

AUDIENCE MEMBER: I'd be happy to waive my time.

MR. COE: Is that the City Attorney?

AUDIENCE MEMBER: I'd be happy to waive my time. But I understood that, in the past, if there have been multiple representatives from a city, they have each gotten the opportunity to speak. If that's not the rule you are going to apply, then I will defer to Mr. Holland.

MR. COE: All right.

MR. HOLLAND: Thank you, Mr. Chairman.

The second point of many, and the only one that I'm going to read at this point, is requirements will impose significant additional costs on the city of Long Beach estimated at 3.5 million the first year. That's on top of a $30 million deficit in our General Fund.

The city of Long Beach calls on this Regional Water Quality Control Board to defer issuance of this tentative order and to direct its staff to revise the tentative order as follows in your letter that has eight points. I would like you to read those. I object that I don't have enough time to read it. Other speakers have had time. We haven't.

I'm going to summarize one point. This is the perspective of the City Staff and the City Council

VOL 14 0124

R0060130

of Long Beach.

We believe that when the citizens and business owners of Los Angeles County fully realize the significant impacts this tentative order has on their daily lives and business operations, we will see a reaction similar to what happens when one swats a hornet's nest. If you are prepared to swat such a nest, it seems to me you would want a solid foundation for doing so. Respectfully, Long Beach does not believe you have such a foundation.

Please, as I've already said, incorporate this letter and the attached documents as part of the official record, and we thank you for allowing us to speak.

MR. COE: The city of Azusa is next, Nasser Abbaszadeh, followed by Rufus Young followed by Richard Burtt from the city of Torrance.

MR. ABBASZADEH: Thank you, Mr. Chairman. My name is Nasser Abbaszadeh for the city of Azusa.

I wanted to enter into the record that Resolution No. 96-690, which the city of Azusa City Council unanimously adopted, and urges the Board to delay action on this permit until all the issues have been resolved. This document is eight pages long. I won't go through all the points made in there.

However, just to bring up a couple of

VOL 14

0125

the items that we've addressed, we have objected to the tentative order being a work in progress. There have been changes since December almost on a daily basis. We would like to see a finalized document before we can thoroughly evaluate it and figure out the fiscal impact and all the requirements that are imposed on us.

The second point I wanted to raise was our great concern with site visits. If the goal is to disseminate educational information to businesses, the cities should be allowed the flexibility to handle that internally instead of forcing the city's hand and imposing the site visits on the cities.

Thank you very much.

MR. YOUNG: Good afternoon, Mr. Chair, members of the Board. My name is Rufus C. Young, Jr. I am an attorney with Burke, Williams & Sorensen. My address is 611 West Sixth Street, Los Angeles, 90017. I appear today on behalf of the cities of Downey, Bellflower, Alhambra, and El Segundo. I'll make as many points as I can before time expires.

The first is that the time period has not been 18 months; it's closer to ten days. The permit is dated the 5th of July. It was not received by the cities until the 8th or 9th, making it a seven- or eight-day old permit.

VOL 14 0126

R0060132

Second, the cities have been hampered in their preparation for comment on this permit and the analysis of the permit by delays by the Board in responding to several Public Records Act requests, the first one of which was dated the 15th of February. We did not receive a written response to that Public Records Act request until the 11th of July, four days ago.

The third point -- well, I will add to that; that we did receive an opportunity to review some documents, in some cases boxes of documents, that were unidentified as to just what they referred to.

The third point, receiving water limitations. We understand the importance of the receiving water limitations. We understand that the language in the permit about discharge of storm water does not cause nuisance or recurring impairment, and we support these concepts.

The flaw in this permit is that much of what the cities do with respect to storm water is beyond their control. Cities cannot control gravity and the cities cannot control storms. And storms sweep things into storm water systems, particularly what's called automobile manure; that is, the things, the effluent, from automobiles and trucks: brake pads, oil, transmission fluid, coolants. All that is beyond the cities' control.

VOL 14 0127

R0060133

The fourth point, rule making. We believe that what has occurred with the preparation of this permit, improved as it may be, has encompassed rule making. Mr. Leon suggests otherwise. We take the view that, if you look at this permit, it's apparent that it is replete with shalls, musts, timetables. It is a rule.

When we commented on this earlier to Mr. Leon, he said, "Well, we can go beyond the Clean Water Act requirements because we have the Porter-Cologne Act." Well, if you are relying on the Porter-Cologne Act, you are making rules, and making rules is subject to administrative procedures.

Finally, with respect to the County's support for the permit, that should come as no surprise if you read the settlement agreement between NRDC and the County. That settlement agreement calls for County to use its best efforts to gain the approval of this permit.

So I would not infer, from the County's support, that they view this as just a peachy-keen permit that ought to be supported on its merits.

Thank you very much for your time.

MR. COE: Richard Burtt. I guess your Mayor testified a little earlier. Theoretically this is supposed to be group permittees where public officials have not testify, so please keep it brief, followed by Charles

VOL 14

0128

R0060134

Silher and Ted Semaan.

MR. BURTT: Thank you, Mr. Chairman. I appreciate the opportunity to speak to you and the members of the Board.

The City Council of Torrance last week took an action on mainly four issues in opposition to the tentative order that you have before you today. The concerns can probably be best summarized as a matter of uncertainty and a matter of cost from the standpoint of the city of Torrance.

The first issue is that, from our estimate, the initial cost for the city of Torrance over the next 12 months will be some $300,000 purely for administrative and monitoring costs for which we do not see any sort of product being returned. Again, there is no funding for this.

The second issue is the development of programs and studies that will require actions to be taken in the future which we cannot quantify now.

The third issue imposes future financial obligations that are presently unknown.

And fourthly, the permit should recognize the relative costs and the environmental benefits in relation to competing public needs, or I should say, public works needs.

VOL 14 0129

R0060135

Many things that are mentioned in the tentative order mention things such as the storm water system, the sewer system, the street system. Each one of these elements are, in most communities in Southern California, in dire need of investment. If they are not properly invested into, they again become part of the problem.

We have a very limited source of funds to work with. Anything that we take away from our current efforts to improve our street system, our sewer system, our drainage system is also going to have an impact on what we are all trying to achieve here.

I thank you.

MR. SIHLER: Charles Sihler, city of Pomona Public Works Department, 505 South Garey, Pomona 91769.

I am not going to go into the detail that everybody has in the past because I think they have beaten the subject quite nicely. However, a couple of points I'd like to go to.

For those who object to the 36-month time frame to allow us to implement this does allow the cities to try and at least develop some revenue sources which was not included in the earlier points.

However, the final draft, as received, did not allow our community adequate time to make any

response whatsoever. I personally received this on my desk on Tuesday, last Tuesday afternoon, and was asked to get a response back to the Board, which I did.

Sitting in here listening to earlier comments and reading parts of the report, I found parts that I fully missed and omitted in my review that would have been included in my letter to the Board.

However, there were two points that we looked at in the discussion that we felt really needed to be addressed properly, the public information, public outreach, which is a real forward step on the part of the Board to look at the best way of solving the problem is to educate the people.

But in the training materials, developing educational materials for training of employees, unlike the balance of the permit, this is not put on the principal permittee. And having run a training program in the Navy Reserve, I know that if you have a good training module to work from, it's rather easy to implement and modify and do your own.

There is only one thing worse than no curriculum at all and it's a bad curriculum. If we want our employees to be properly trained, we are going to need to come up with a good directive to do so.

In the immediate outreach, there is a

VOL 14 0131

R0060137

comment regarding "shall maintain a list of qualified personnel." I think that who defines that should be clearly identified within the permit.

And the final item was in the attachments in the glossary of terms. There was a little thing in there that our code says, you know, as an allowable, permissible discharge, and that's clean, dechlorinated swimming pool water. And you had eliminated, in the body of your permit, a clean and swimmable verbiage which basically points the thing to a point of failure.

All in all, I would like to congratulate the Board on working hard. I wish we had gotten this permit to us two months ago so we could have actually done an adequate review and could have come up with an official city position. We weren't able to do so. But all in all, I congratulate them on the effort they have done.

Thank you.

MR. COE: Is Ted Semaan here? Gone.

Ray Tahir has made out three cards, so this requires some explanation.

MR. TAHIR: Well, I represent three cities, Alhambra, Whittier, and Lakewood, all three of which adopted resolutions the other night essentially opposing the proposed permit.

MR. COE: We just heard somebody represent four

VOL 14

0132

cities, and they still had just the two minutes.

MR. TAHIR: Could I have four and a half minutes? I'll be out of here in four and a half.

MR. COE: No. We just had an attorney who represented four cities, and he had two minutes.

MR. TAHIR: Well, I don't know if he represents them on an ongoing basis or he is specifically representing them today. I know one of those cities, Alhambra, has designated me to speak on their behalf today.

MR. COE: You had better start.

MR. TAHIR: My name is a Ray Tahir. My business address is 11500 West Olympic Boulevard in Los Angeles. I am a consultant to several cities in Los Angeles County on NPDES matters. As I mentioned to you, three of these cities have asked me to urge you to return to your staff the proposed tentative order to correct several problems which I believe --

MR. DRANE: Sir, I think you need to slow down a little bit for the court reporter.

MR. TAHIR: I'm sorry. I'm on a time limit, though.

MR. COE: Why don't you just summarize your written statement rather than read it.

MR. TAHIR: Hey, okay.

With regard to industrial/commercial

VOL 14

01333

R0060139

site visits, contrary to what staff has asserted, the proposed order does not remove the enforcement aspect from the permit. This is something you need to note. While the permit may emphasize public education, it also compels cities to impose on businesses, by ordinance, some 17 storm water pollution prevention practices, practices such as requiring parking lots with 25 or more spaces to be free of visible oil leaks and debris.

The problem is that, if city or county fire departments, or code enforcement personnel --

MR. LEON: Excuse me, Mr. Tahir. If you could slow down. I don't think the reporter is catching most of this. So it's up to you whether you want to be recorded or not.

MR. TAHIR: I will take it slow.

The problem is that, if the city or county fire department, or code enforcement personnel, visits a facility for public education purposes and discovers an on-site violation of one or more of the 17 ordained requirements, that individual would also be compelled by duty to cite that facility.

If the Regional Board Staff really believes that no enforcement is required, then it should remove the 17 legal authority requirements affecting businesses.

VOL 14

0134

Now, with regard to non-storm water discharges. Under one section of the order, only non-storm water discharges that are exempted under the order or that are covered by an NPDES permit are allowed to enter the municipal storm water system.

However, under the legal authority section of the permit, quite contradictorily, the permit says that it is okay to discharge treated storm water or wash water to the municipal storm water system. But under the non-storm water discharge exemption section of the proposed order, treated wash waters are not listed as permissible non-storm water discharges. That is a conflict that must be resolved or it will lead to inconsistency and possibly litigation against cities and businesses.

The proposed order also raises another problem connected to non-storm water discharges. Although NPDES provisions of the Clean Water Act exempt potable water, that is ordinary tap water discharges to the municipal storm water system --

MR. COE: You have a yellow card.

MR. TAHIR: Let me just make one point and I'm out of here.

The proposed order exempts such discharges conditionally. Specifically, potable water may be discharged to the municipal storm water system only if

VOL 14

0135

R0060141

it is managed in accordance with industry-wide Storm Water Pollution Prevention Practices developed by the American Water Works Association. As you know, Chairman Coe, these practices were developed for water production industries and do not relate and shouldn't apply to residences or businesses.

MR. COE: Will Gary Hildebrand please approach.

MR. TAHIR: Second, that non-storm water discharge prohibitions apply to residential, commercial, and indusrial facilities as well, not just to water production activities, activities such as hyperchlorinating water lines. Therefore, how can a resident apply these practices to the discharge of potable water discharged from a garden hose to a sidewalk or to a driveway?

I have a few other points. I'm sorry I don't have the opportunity to share them with you.

MR. COE: You can leave that written statement for the record.

Thank you.

MR. HILDEBRAND: My name is Gary Hildebrand. I am with the Los Angeles County Department of Public Works.

AUDIENCE MEMBER: Didn't Los Angeles County already get their two minutes? You have to treat them all the same.

VOL 14

0136

R0060142

MR. COE: Go ahead.

MR. HILDEBRAND: My address is 900 South Fremont, Alhambra, California. Yes, Don Wolfe did present the County's position earlier.

MR. COE: Yes. Don Wolfe was an invited member of the Panel. He was part of the staff presentation.

MR. HILDEBRAND: And as part of the Panel presentation, he did state the County's position. So I'm not here to repeat the comments that he stated before.

However, I would like to address the issue that was raised by Rufus Young concerning the county and its NRDC settlement.

I was involved directly in the developing of the terms of the settlement, and I can confidently say that there is nothing in that particular settlement that requires the county to support the tentative permit that's before the Board today.

The county based its support of the permit on the evaluation of the requirements of that permit and its relative merits versus of county's responsibilities and obligations.

So, to repeat, there is nothing in our settlement agreement that specifically requires the County to support this particular permit that's before you today.

Thank you.

MR. COE: The next group is public agencies. And nobody turned a blue card in from public agencies as such, so we will go to business associations.

According to the blue cards here, a maximum of three minutes each. If we can reduce that, we may get back on schedule.

John Parsons followed by Jennifer Taggart followed by Gerald Brgitbart.

Is John Parsons here?

AUDIENCE MEMBER: John Parsons had to leave.

MR. COE: Jennifer Taggart?

AUDIENCE MEMBER: She is going to come back. She is not back yet.

MR. COE: Gerald Brgitbart followed by Joe Louis Sedano. Excuse me. I'm sorry. Jose Luis Sedano and Dr. David Kay.

MR. BRGITBART: Mr. Chairman, I am Gerald Brgitbart, and I am with the California Restaurant Association. Our address is 3435 Wilshire Boulevard, Los Angeles, 90010.

While we commend the staff and group that put this permit together, we feel that we have been unfairly singled out as an industry group within here; that finger pointing at us as a singular group is not fair.

We feel that it will have tremendous

VOL 14 0130

R0060144

financial impact because the cities don't have the money to enforce the rules that will be imposed here; and that we will again have another fee imposed upon us.

We would like to have been brought into this process a whole lot earlier than finding out about it about four months ago or five months ago. So we feel that this permit needs to be held back until such time as all of the stakeholders are permitted to have something of their concerns addressed.

Thank you very much.

MR. COE: Thank you.

Is Mr. Sedano here?

Dr. David Kay followed by Gregory Mastin followed by Andy Goodman.

DR. KAY: Good afternoon, Chairman Coe, members of the Board, Dr. Ghirelli. I'm David Kay, Senior Environmental Specialist at Southern California Edison, an Edison International Company located at 2244 Walnut Grove Avenue in the city of Rosemead. And I have taken the oath.

Edison is the nation's second largest privately-owned electric utility serving nearly eight million customers in over 200 cities throughout a 50,000 square mile service territory within Central and Southern California.

VOL 14

01399

Edison recommends that the Board adopt the Waste Discharge Requirements before you. Edison believes these Waste Discharge Requirements represent a reasonable cost-effective approach toward controlling pollution in our urban runoff and consequently improving the local coastal water quality pursuant to the federal Clean Water Act.

Edison actively participated in the Santa Monica Bay Restoration Project and continues to work with Board's staff and other stakeholders on implementing the Bay Restoration Plan. This permit is one of the most important elements of that plan.

As a major permitted discharger to the coastal waters, Edison has a direct interest in seeing that the pollution of the coastal zone from urban runoff is reduced. We are privileged to be able to use the coastal waters to cool our El Segundo, Redondo, Long Beach, and Alamitos generating stations.

We recognize that our ability to retain that privilege may depend, at least in part, on efforts to restore our near-shore water quality, efforts that include the Bay Restoration Plan and the Waste Discharge Requirements before you today.

In addition, many of the commercial and industrial enterprises located in our coastal cities also

VOL 14

0140

R0060146

depend on either the ability to discharge regulated waste waters or on the recreational and tourism revenues that a clean coastline address. Many of these enterprises are also Edison customers, and so we also have an economic interest in seeing them prosper.

We are aware that some of the cities we serve who are also affected by these Waste Discharge Requirements still feel important issues remain unresolved. We are sympathetic to their concerns and urge you to direct staff to continue working to resolve these issues.

Thanks for your consideration.

MR. COE: Thank you.

Is Gregory Mastin here?

Andy Goodman?

When I call your name, if you want to work your way up, followed by Douglas Gardner and Jonathan Stein.

MR. GOODMAN: Mr. Chairman, the reason for my delay -- my name is Andy Goodman -- is I think I would probably be more properly grouped with the public interest groups. But since I have to pick up my son from day camp in 15 minutes, if I could take the opportunity to speak now, I'd appreciate it.

MR. COE: As long as you keep within your time

VOL 14 0141

R0060147

limit.

MR. GOODMAN: My name is Andy Goodman. I am President of the Environmental Media Association based at 3679 Motor Avenue in Los Angeles.

Because you have probably never heard of us, we are a group that works with other environmental groups around the country helping them get out their message and communicate to the public and helping them work towards solutions. And I think that gives me a somewhat unique perspective on what's happened today, and I just want to share that with you because that perspective is about this process that has brought together government groups and business and environmental groups working together for a solution.

Groups around the country are trying to do the same thing. And right now this is the whole new wave of environmentalism that is probably the most productive wave that we have ever experienced. It's not environmentalists shouting at business or shouting at industry and saying, "This is what you must do, and the cost of the reality be damned."

These are people sitting down at the table together, the stakeholders, and trying to come up with solutions and doing it. And it's working all around the country. So what's happening today is an opportunity

VOL 14 0142

R0060148

for you to say that this process works; that collaboration does work.

To reject this proposal, to delay, is to send a message that cooperation doesn't work; that you will be tied up in red tape; or that you will ultimately be turned away, even if you sit down and look across the table at the people who have other interests.

So on behalf of my group and on behalf of the environmental groups all over the country who are trying to work constructively toward solutions, I urge you to adopt the permit. It is not perfect, as everyone has said to you. It is clearly not perfect, but it is progress.

So on behalf of the process, I urge you to vote for progress.

Thank you.

MR. GARDNER: Mr. Chairman, my name is Doug Gardner. My address is 13250 Jefferson Boulevard in Los Angeles. I am with McGuire/Thomas Partners, a large development company headquartered in Los Angeles. And I am the project manager for the Playa Vista project, a major project located on the west side of Los Angeles.

Since my firm's initial involvement with Playa Vista in 1989, we have been continuously reminded of the critical importance of water quality in general, and

VOL 14

0143

R0060149

helping Santa Monica Bay in specific, which, in turn, relates to the economic wellbeing of our entire region.

From our perspective, the permit before you is reasonable and workable; and that this investment today will pay great dividends in terms of the long-term health of our economy. Responsible developments in environmental protection can not only co-exist but is mutually supportive and mutually competitive.

We support the permit and urge its approval, an action which will both enhance our economic resurgency and improve a vital resource.

And I should add, in conclusion, that we are only one of a large group of businesses supporting this permit. You have heard some today. You will hear a few more, including Southern California Gas, Jon Douglas, NBC Entertainment, the L.A. County Boards of Real Estate, West Side Council and Chambers of Commerce, and many others.

Thank you for your time.

MR. COE: Jonathan Stein followed by John Perenchio, who would be the last presentation under this category.

MR. STEIN: Yes. Thank you.

I am Jonathan Stein. I am a lawyer. My office is 1244 Sixth Street in Santa Monica.

I have three points, but the first one

VOL 14 0144

R0060150

doesn't have to do with being a lawyer. It has to do with being a resident of Manhattan Beach. I swim in or run along the ocean several times a week year-round for many years now.

And you should know that I'm used to going to court for oral arguments broken out from bacteria in the water. I convinced my doctor to give me an unending prescription of penicillin so that every time I get a sore throat from swimming, I can pop two or three days' worth of penicillin. These are standard operating procedures for anybody who swims a lot in the ocean.

My second point is lawsuits. You have heard a lot about lawsuits. Moliere once said he was ruined twice in his life; once when he lost a lawsuit, the second time when he won one.

There is a lot of difficulty hearing lawsuits. Right now a small city has a 50/50 chance of getting hit by environmental lawsuits. They are cookie cutters. They are very simple. You come up with one complaint, pop in $200.00 in court, you can put that same complaint in against 40 cities. Cookie cutter stuff, very easy to do. Maybe they have a 50 percent chance of being sued, 80 percent chance of losing.

They are supposed to implement stuff to the maximum extent practicable. They are not; okay? 50

VOL 14 0145

R0060151

percent chance of being sued; 80 percent chance of losing.

If you go with this permit today, the chance of being sued by an environmental law organization probably drops to less than five percent. It's a permit. A judge is going to give deference to the State Board. It's going to give deference to a city. It's going to solve all but about five percent of the problem.

The chance of winning that lawsuit goes from 20 percent probably up to 75 percent. You're probably going to win it because you are going forward in good faith. It's very hard to show bad faith on the city. Have you seen anybody here proceeding in bad faith or arguing that we want to screw up the bay? No.

Third point, unfunded state mandate. Six years ago, you fulfilled the requirement, as close as you are going to get to fulfilling the requirement, of unfunded state mandate. You go forward to the Office of State Mandates to petition, and then you argue to your legislature, through assemblymen and state senators like you've seen, give us money for it.

In six years, has anybody gone forward with that? Is there a single petition pending with the State Mandates Office?

Thank you.

MR. PERENCHIO: I am John Perenchio. I am with

VOL 14 0146

the Malibu Bay Company. I am a principal and owner of the company. We are a real estate development and management company situated in Malibu. We happen to be the largest commercial property owner. We have developed properties and undeveloped properties.

We are very familiar with the proposed permit and we are very supportive of it. Actually, we have been very successful in making an argument, a pro business argument, about the permit with other business leaders throughout the county.

And the argument is very simple, and I think you should really heed it; and that is, our coastal resources are an asset. Besides being a natural asset and a natural amenity for all of us to enjoy, it also is a very important asset for our community, our business community.

Right now I can tell you I'm a member of the Malibu Chamber. Our Chamber office gets numerous calls daily about the water quality issues in the local Malibu waters. Those same calls are also happening in other Chamber offices along the coastal strip.

If people don't come to visit our local waters in the County, it ends up having a negative ripple effect throughout the County. And that ends up being an adverse consequence for all businesses. Because as you know, an active growing business population and base is

VOL 14 0147

R0060153

really important for all the business throughout the County.

So this really ends up being a pro business permit that is before you. And I really urge you to support it based upon that argument.

Thank you very much.

MR. COE: Did Jennifer Taggart return? I guess not.

The next category is public interest groups. And based on the number of cards, we have a maximum of five minutes. Please adhere to that.

Gail Roderman Feuer followed by Mark Ryavec followed by Michael Stokes.

MS. FEUER: Mr. Chair, members of the Board, I am Gail Roderman Feuer. I am Senior Attorney with the Natural Resources Defense Council.

I am here on behalf of the Natural Resources Defense Council and our 50,000 members in California who are here to say -- I am here on their behalf to say we want clean waters.

We hear a lot of people here today, including a number of the cities, who come here and say, "We oppose the permit" or "We want more delay, but we want clean water." Those two things are inconsistent.

A vote today against the permit or a

VOL 14

0148

R0060154

vote today even for a three-month delay means that we are not going to have clean beaches; that we are going to continue to have trash and pollution on our beaches and in our waters.

Because of the time limits, let me address three points today.

One, is, what is this permit? Is it a compromise or is it a permit, as suggested by some, to benefit, perhaps, environmental groups at the detriment of cities?

Second, as an attorney, I would like to address the many points that were raised with respect to, will this open cities up to more lawsuits or fewer lawsuits?

And third, I would like to address the permit.

First, there has been some suggestion by cities that this is a permit that really is there to benefit the environmental groups and not the cities and to the detriment of the cities.

It's important for you all to know that the environmental group, at the beginning of this process, came to the table with a long list of what we wanted in the permit. Many of those concerns that we had addressed are not addressed in this permit. And we have submitted

VOL 14 0149

R0060155

written comments -- and I'm not going to go through them now -- that list many things in the permit that we think should be stronger. And we said, from day one, we want more.

We wanted, from day one, yearly inspections of industrial facilities, restaurants, and auto repair shops and other facilities. That's not there now. At most, you have a frequency of once every two years, and these are educational visits.

The important thing is that we support the permit because environmental groups, cities, governmental entities, the business community came together and worked out a compromise. And I'm not here today to say please change the permit.

There are 40 things, if we sat down, I'd tell you, "This is what we want." But it's time to end the process. The process has been going on for 18 months. And the cities that come here today, the elected officials that say, "We were not part of that process," that's not true.

Their Public Works Directors and their people from the city came to the table. They submitted comments to their cities. And if they chose not to involve their public officials in the process, that was their option. We have been trying to get public officials involved in this process.

VOL 14 0150

And I have a list here I just wanted to show you. Regional Board Staff can show you this list. This is a stack of the comments that were received on the December 1995 draft of this permit over seven months ago. And there were comments in here from many of the cities that spoke today saying they don't like the permit. Alhambra, Azusa, Bellflower, Downey, El Segundo, Lakewood, Lomita, Long Beach, Rosemead and Torrance. They submitted comments. Those comments were addressed. Many changes were made to the permit.

It is disingenuous for them to come here today and say, seven months later, "Gee, we just got this two weeks ago." The reality is the permit before you today is much weaker than the permit we saw in December. You have heard from several people, the inspection requirement is now a site visit requirement. The frequency is, at most, once every two years. The monitoring requirement, you heard them say, that is gone. Cities have no requirement regarding monitoring.

Receiving water limitations. The environmental groups, as Dr. Gold said earlier, we helped make the change so that cities have no concern. If they comply with the permit, they can't be sued because oil and grease and other pollutants are still going into the ocean.

VOL 14

0151

R0060157

The deadlines. We started this process saying a lot of the things in this permit are required by the old permit, and we want to see them implemented in a year. Well, now the deadlines, many of them, say within three years. I don't like that.

But I'm here to say this is a good start and we support it. But to have cities come in and say, "We need more than three years" is very frustrating to us because a lot of those requirements were in there before.

Two other quick things. I know my time is running.

Lawsuits. NRDC, as you may have heard, along with the Baykeeper, has filed a number of the lawsuits that have said that the cities are out of compliance with the 1990 permit. One of those cases went to trial against Caltrans. And a judge, who himself professed that he was not a huge fan of the Clean Water Act, went on to issue a fair amount of injunctions against Caltrans finding them in violation of the permit. We reached settlements with three cities.

The old permit said cities have to implement best management practices to the maximum extent practicable. That's the whole permit.

What we have said to cities who have complained for years there is no specificity, how do we

VOL 14 0152

R0060158

know what to do? here is what you need to do. This permit is an insurance policy. It says to the cities, "This is what you need to do. And if you do it, you won't see NRDC or the other environmental groups at your front door." And that's a good thing.

We have already been talking with the cities under the old permit. You may know that the word is out. We even drafted notice letters to some cities saying, "We think that you are in violation of the old permit." We put them in a file cabinet. We sent the letters to cities, to many cities, saying, "We think you are in violation," but we packed them away.

My time is up. Let me just quickly sum up. We packed those away. We said, we are going to negotiate with you. We don't want to be in the litigation business. Here is a permit that says what the cities need to do. And if they comply, then they won't be sued. And that's the best thing the cities can have.

The approval today that you will act and you will adopt this permit tells them what to do. And if they do it, they won't be sued. So we urge you to to adopt it today. Please don't delay it any further.

Three months from now if we are still negotiating, our list of 40 concerns is going to come back on the table and we are going to say, "We want these 40

R0060159

VOL 14 0153

things. We don't support the permit anymore." And there's 2,000 people who will say, who sent you letters, they don't support it anymore either. So please adopt it the way it is today.

Thank you very much.

MR. COE: Thank you very much.

MR. RYAVEC: Good afternoon. My name is Mark Ryavec. I am a Board member of the American Oceans Campaign. American Oceans Campaign is a nonprofit environmental organization created by actor Ted Danson approximately ten years ago.

The incident that occasioned Mr. Danson to create American Oceans Campaign was taking his two young daughters to Will Rogers Beach and finding that there were signs posted that said, "Polluted Runoff. No swimming."

He had trouble believing and understanding how we could have allowed our bay to come to the point that we couldn't swim in it. And now we are gathered here ten years later to finally try to start some serious efforts to turn that issue around.

I would like to speak to you about three issues that have been discussed before you. One of them is the question of the legal mandate under which this permit is being issued. The other issue is unfunded mandates. And the final issue is cost. And I will try to keep this

VOL 14

0154

R0060160

as brief as I can.

The Clean Water Act requires the NPDES permit to be issued in order to reduce storm water discharges to the waters of the United States. Amendments to the Coastal Zone Act that occurred subsequently require reductions of urban runoff flowing specifically to coastal waters.

Cities, as operators of storm water systems that discharge to the waters of the U.S., are subject to these requirements. I don't think there is any debate about that. The tentative permit is designed to meet those legal requirements.

Although the Board used a consensus process to determine how to comply with these requirements, whether to comply is not an option. The Board must issue an NPDES permit that reduces urban runoff, the sources of 50 to 60 percent of our water pollution.

There will never be unanimous support for any change, but the consensus process has narrowed many differences. And it's now time for the Board to exercise its leadership and fulfill its legal obligations and to adopt the document that has resulted from the consensus process.

On the issue of unfunded mandates, some cities continue to claim that the permit represents an

R0060161

VOL 14

0155

unfunded mandate. We do not believe that this is true.

First, the permit has been modified so that educational visits replace inspections. Cities are not saddled with enforcement responsibilities that they believe belong properly to the Water Board.

Second, much to the dismay of the environmental community, the permit was modified to dispense with key industry reporting requirements; for example, the requirement of filing a Notice of Intent and having a plan, thus removing any vestige of there being an unfunded mandate.

And then on the issue of cost, some cities, complaining that the permit is too costly, have not been entirely forthcoming in their cost calculations. And may I speak as a bit of an expert witness. I've served as both a legislative analyst for the city of Los Angeles and as the Chief Deputy Assessor for the county of Los Angeles.

The cities claim that the storm water program will cost them hundreds of thousands, if not millions, of dollars, despite the fact that cities as small as Santa Monica have been willing to take this on, and big cities like the city of Los Angeles have been willing to take this on. There still is this continual Red Herring brought up that this is going to be terribly expensive.

The truth is that storm water management

VOL 14 0156

R0060162

is a multi-purpose, multi-benefit undertaking whose costs must be allocated to a range of benefits, not just to pollution control.

For example, street sweeping. It's not just a cost that's allocated to polluted runoff control. Sweeping streets helps to prevent clogged storm drains, and thus is a flood control measure. It prevents road hazards, injury, and legal liability and is thus a safety measure. It enhances the attractiveness of the urban environment. And it's very important in improving property values.

It is unfair for cities, for example, to harp on this thing, the street sweeping, and other mandates that will come from this permit as being totally related to pollution and runoff control. An honest assessment would allocate costs according to the array of benefits derived from the activity and not, as some have done, assign all the costs exclusively to -- excuse me. I'm repeating myself. I'll move to the next paragraph.

With regard to storm water management, more generally, the discussions have lost sight of an essential truth. Either we pay up front to prevent polluted runoff or we pay more in the end. We spent huge sums to rake debris from beaches, especially after heavy rains. We pay millions to dredge and dispose of contaminated sediments that flow into marinas and harbors.

VOL 14 0157

R0060163

Not only must these sediments be handled as hazardous waste, because they are contaminated, they can't be used to replenish our beaches, which means we miss the opportunity of using that in that setting.

Let me give you one classic example of how this saves money, this provision will save money.

Let me give you one classic example of how this saves money. The city of Santa Monica has found that controlling polluted runoff will indeed save money. The city installed barriers in high-traffic pedestrian areas during the dry season to prevent trash from getting into the storm drain system.

Instead of having to clean out storm basins, catch basins, four times a year, as they did before, they only have to do it once a year; so that they have a significant cost saving in labor cost by having put the barriers up in the first place.

I'm sorry. I'm going over my time. If I can simply urge you to --

MR. COE: Come to a conclusion.

MR. RYAVEC: If I can. Thank you.

We have spent 18 months in intense negotiations over this permit. Frankly, enough is enough. I don't find that the concerns of the city at this juncture are fair in light of the fact that they had 18 months to --

did make their comments. As the previous speaker indicated, they have all participated in this process even though they would like you to believe otherwise.

The Board has a legal duty to act and should do so now without any additional delay or any amendment.

Thank you.

MR. COE: Is Michael Stokes here?

Terry Tamminen, Santa Monica Baykeeper, followed by Martin Byhower.

MR. TAMMINEN: Thank you for your time. My name is Terry Tamminen. I am the Santa Monica Baykeeper. And I'm disturbed to see that they haven't given you one of these T-shirts. So in the spirit of compromise, let me give you the shirt off my back, Mr. Chair. And we will ask someone to come give shirts to the other members.

MR. COE: If you take a picture of this, I'm in big trouble.

MR. TAMMINEN: Thank you for your time.

Unlike the other speakers that you have heard here today, I live and work on and in the waters of Santa Monica Bay and our local coastal waters every single day of my life. And I wish I could show you firsthand the things that I see coming out of the storm drains every day.

VOL 14

01159

If I did, there wouldn't be a debate here. If I could show the people from these cities and others who are opposing this permit or suggesting it be amended or delayed, there would be no debate here today.

When I go diving in Ballona Creek, and yes, I do, to collect scientific samples, if I could show you the acres and acres and acres of ten-foot deep of tires and Christmas trees and plastic bags that smother the ocean habitat and come washing back up on our beaches where Baywatch is filmed every week where a billion people a week see that program, it has an impact not only on the environment but on the economy of this area. If I could show you that, there wouldn't be a debate.

If I could show you the oil and paint that comes out of the storm drains that ends up on birds and sea lions every single day, there wouldn't be a debate here today.

But this permit, although I'm the first one to tell you it does not begin to thoroughly enough address these issues, it does so in a way better than the permit we currently have. And that's why I'm here to support it. I'm here to support it somewhat under protest because I think we have weakened it as far as we possibly can.

The inland cities have come up in front

VOL 14 0160

R0060166

of you and told you it's too expensive and that they need delays for one reason or another. It seems to me that we are starting to polarize the inland cities versus the beach cities. And this is all of our economies, and this is all of our places to recreate. This is all of our environment. And it's all of us contributing pollution to these important coastal resources.

So I ask you to be fair to those cities like Santa Monica who spoke eloquently about the fact that they found ways to make this work. It doesn't bust the budget. They have been doing it for five years, not just for the last 18 months or thinking about it for the last week.

I am willing to say, fine, let's forget about the permit as it exists today. Let's take that as a five-year learning curve, and now let's start over basically where we should have been five years ago. It's taken us this long to learn. That's fine.

But I, for one, am saying that's enough. This environmental coalition that you are hearing from today I believe will disintegrate if you vote to delay or modify this permit after today. Because as far as I'm concerned, a delay or a change to this permit is a no vote. If that happens, I, for one, will start tomorrow enforcing the existing permit we have even more than we

VOL 14 0161

R0060167

have done so far. I, tomorrow, will go to war.

So I am asking you today to do the right thing and pass the permit now. Pass the permit now. Pass the permit now. Pass the permit now. Pass the permit now. Pass the permit now. Pass the permit now.

How much more time do I have?

Thank you.

MR. COE: I have two cards on the Surfriders Foundation, Dr. Pierce Flynn and Pierre Mataro. I may not have gotten that right. Does somebody represent Surfriders? You will be it.

MS. KUDLICKI: Yes.

I am Beth Kudlicki, and I am on the Executive Committee with the South Bay Chapter of Surfriders.

MR. COE: All right.

And you are taking the five minutes for Surfriders?

MS. KUDLICKI: Yes, I am. Pierce Flynn had to leave, but he gives our full support.

I am also a business woman and a surfer. The Surfrider Foundation is dedicated to education, research, and conservation of our nation's natural coastal resources.

As a nonprofit volunteer organization of

surfers and bodyboarders, water men and women of all types with a deep love and respect for the ocean, we spend much of our time in and around the shoreline. We have a vested interest in the quality of these waters.

We recognize that the NPDES permit and implementation of federal Clean Water Act requirements is a valuable and necessary step in addressing the damaging effects of urban runoff and non-point source pollution on the waters in which we swim and surf daily. We commend the Board and its staff on the consensus approach taken in drafting this permit. We applaude the emphasis on public and private sector education.

Many responsible individuals lack the information needed for the necessary lifestyle or business changes which could result in dramatically reduced pollution of this type. Last week a neighbor of mine dumped his septic tank into the storm drain because he didn't know any better. He said he had no idea. So this is kind of the education that we need to really get out there.

We look to the Board for leadership and strong enforcement of all permit requirements once adopted. Enforcement of water quality standards, or the lack of same, will have a direct impact on our members each and every day.

VOL 14

01163

We ask the Board to unanimously approve and furthermore to strictly enforce and implement all provisions of this permit as a beginning step in curbing pollution runoff and cleaning our local waters.

We pledge our continued sort and personal assistance in whatever ways we can to help in this endeavor. And I invite all of you to our next beach cleanup because you will get an entirely different perspective once you start picking up styrofoam and syringes.

Thank you.

MR. COE: I understand that Jose Luis Sedano has returned?

You are in the category of the three minutes. You have three minutes.

MR. SEDANO: Fine. Thank you.

Good afternoon. My name is Jose Luis Sedano, and I live at 588 East Avenue 28 here in Los Angeles. Thank you for allowing me the time.

I am with the Latino Scholastic Achievement Corporation, a 501(C)3 corporation.

California is known for its beaches. A day at the beach enjoyed free by anyone, regardless of household income, there should be no question that this is one of the enjoyments of living in Los Angeles.

VOL 14

0164

R0060170

Our community, the Latino community, the Mexican American community of Los Angeles, because of our household medium income, enjoys the beach more than anyone else in our community.

As a businessman and one that works as a public information officer working in the media, I would like to point out to you that there should be no question that you should pass this permit. I'm here to speak in support of the permit because it's obvious there is a need for clean waters, clean coastal environment. This is what we are known for. And our community is very much needed by -- this permit is needed.

I hope that you will take this into consideration because a majority of our community is, what, 55 percent of the population? And some 67 percent of the students in the Los Angeles city school system are also of our community.

That's all I have to say. But it is a wonderful start, and you should definitely pass this.

Thank you very much.

MR. COE: Thank you.

We now come to the last category. It's called other interested parties. And the first -- based on the number of cards, there's a maximum of six minutes each.

VOL 14 0165

R0060171

Madelyn Glockfeld followed by Robert Bronkall followed by Kenneth Fields please.

Is Madelyn here? Is Robert Bronkall here? Kenneth Fields? Barbara Taylor?

Barbara Taylor followed by Robert Wright, which is the last one.

Barbara Taylor, you are next. The other people weren't here. I'm sorry I didn't make that clear.

MS. TAYLOR: I'm sorry. I didn't understand that either.

Well, I'm here just as an interested citizen. I have lived in the Pacific Palisades since 1965 with my children. I've taken them to the beach every other day, and they are grown now.

But I still continue to enjoy the beach. I take my boogie board and I go down below Santa Monica Pier and I ride the waves too. And I take my windsurfer and I go out at Marina Del Rey to windsurf in the harbor. And unlikely though it may seem, relative to my age, I do all those things.

And my daughter also rowed for a UCLA crew team on Ballona Creek, and I've seen the trash accumulate. And I'd like to have you do whatever it is in your power to make our beaches better because I think they are a resource of value to all of us.

VOL 14

0166

R0060172

I think we all receive not only enrichment due to our athletic activities down there but, if I can say, an almost spiritual quality to going down and feeling that sun on your skin and the breeze blowing and the water moving past your body when you swim in it. And that's too important to lose. And that should also be beyond a few dollars and cents.

I would like to say that I also represent a group of people who will never be heard here or seen here, and they are the people who don't mind paying some more money in taxes. I know it would put me in a real minority to say I don't think I pay enough in taxes, but I think that's true. I think we have been very spoiled in thinking that we can have this good life with all of the benefits that we have in this country without paying for it.

And I don't think that we can do it by saving paper clips or managing our businesses more effectively. I think it's going to take more money, but it's well worth it.

And I think if you think back on some of your experiences outdoors, you will agree that this is just one way we can save the planet. Because we are just talking about the ocean, but we can make the same argument for our good air and our good water and all the other

things that we enjoy.

We have become too big a population, probably, so it's doubly important that we use every means at our disposal to control our trash, our garbage, our poop, our effluent, and everything else.

And I just hope you will take into your consideration these items that maybe aren't costly and aren't business oriented too.

Thank you.

MR. COE: Thank you.

Is Robert Wright here? Robert Wright?

MR. WRIGHT: Thank you for letting us have a little time. I have heard everything that's said here today. My name is Robert Wright, and it says on the card that I am representing myself.

I have been involved with the Santa Monica Bay since I was two years old. And somebody got polio down in the Las Pulgas Pond.

MR. LEON: Mr. Wright, would you get closer to the microphone.

MR. WRIGHT: Did anybody hear that?

I have been involved with the Santa Monica Bay since I was two years old, 42 years ago. And someone got polio in Las Pulgas Pond on the sand in Santa Monica Bay.

VOL 14 0168

R0060174

And a lot of people have addressed a lot of issues here, and I would like to take those as my own statements as a question of saving time.

Can anybody phrase that sentence better?

So anyways, there's a number of things. And we currently have a lack of enforcement on our litter laws. And there's another thing that was brought up as -- somebody said they got sick when they ran along the coast in Redondo Beach and they want a lifetime prescription of, whatever, I don't know what they said. But that institute over in France where -- who has a biochem background here?

MR. COE: I think he said penicillin.

MR. WRIGHT: There you go.

And who was that guy that was involved with the wine making? Who invented penicillin?

MR. COE: We want to stay on the subject here.

MR. WRIGHT: You want to understand the subject?

MR. COE: No. We want you to stay on the subject.

MR. WRIGHT: That is the subject is our scientific knowledge of what's going on. We have a lot of people who haven't been here who have the knowledge, whether it's the head of Hyperion, I got to speak with him,

VOL 14

01169

R0060175

whether it's our U.S. Fish & Wildlife Service who is under duress from our current national administration, who I don't believe have yet signed the EPA science -- the head of the science department for the EPA yet. It's only been three years. Maybe they will get around to it. Maybe they need a background check on it.

But other than these other -- so there's a lot of trash in the bay. We spent a lot of money to create the huge digesters down at Hyperion. Perhaps this document needs a little scrupulous going over to make sure that it can have its greatest benefit for the costs involved.

Thank you very much.

MR. COE: Mr. Wright, there is a question here.

MS. CRAVEN: I have a question. I thought I was with you until you said it needs some more scrupulous going over.

In just one word, do you oppose or approve of this?

MR. WRIGHT: I haven't read the whole thing yet.

MS. CRAVEN: So you testified not telling us whether you were opposing it or supporting it?

MR. WRIGHT: Well, if you didn't understand something, what would you do?

VOL 14

0170

MS. CRAVEN: Well, I'm going to tell you what I'm going to do in a little while. I'm trying to find out what you, as a person testifying --

MR. WRIGHT: What are you going to do in a little while?

MS. CRAVEN: You will find out.

MR. WRIGHT: Well, see, your mind is already made up, so why are you bothering to ask me?

MR. COE: We are going to have a discussion right now, actually. You are the last one to testify.

MR. WRIGHT: I wanted to get a sound bite in too.

MS. CRAVEN: Okay. Thank you.

MR. COE: Thank you very much.

We are all out of cards, so this concludes the testimony, and I declare the hearing closed. And I would like to open up the Board discussion. So we can start out with Chuck.

MR. VERNON: Mr. Chairman, I will make just a few comments here. I'll try to be brief, and I hope that the comments will help frame our discussion.

First, I think that we need to keep this permit discussion relatively simple because there are some very powerful, simple elements to it. And some elements that are not simple are elements that we can deal with.

VOL 14

0171

R0060177

First, one of the simple things is that we do have a health risk, and we have a very credible epi study to demonstrate this. The epi study has even been adopted as a model by EPA with a possibility, in their minds, that it may apply to every storm drain system in the country to some degree.

Secondly, another simple fact is that protection of receiving waters is the responsibility of this Board. And as far as the storm drains go and the bays and the ocean waters, our Board has been involved in the effort to protect those waters, now Mark Gold said for seven years, I count eight.

Secondly, I want to just go through and highlight a couple of the points in the history of that eight years.

Eight years ago we formed a committee under SCAG, and I was your representative on that committee. And at that time there were two major sources of pollution of our ocean waters that were identified. One was sewage and the other was storm drain. And our efforts first focused on sewage.

And we had exactly -- we could replay this whole hearing if we go through the whole thing to do with, what people are politely calling, POTWs. We had the specter of costs as being entirely unreasonable and

VOL 14

0172

R0060178

unmanageable, and we had the request for delays and delays further and delays.

But finally we worked through that. And after we worked through it, the very agencies that said the costs were too high and requested delays became strong supporters. And now those two agencies are supporters of this storm drain permit.

Then in the proceeding, then, as you were told today, by cleaning the sewage, if you don't mind my just using that word because that's what it is, to a higher level, we have eliminated many of the problems of the bay. We have eliminated, maybe not eliminated, but we have made great progress on the kind of problems that inadequately treated sewage causes to a marine environment, and we are all proud of them.

Then proceeding along with the brief history, the next step was the 1990 permit. And this Board issued that 1990 permit, and it was indeed a voluntary type of permit. What happened under that permit is again reflected in what you heard today. We had cities that were very, very conscientious indeed about trying to carry out the permit.

The Board's approach to it would make it voluntary. Staff, please work with the cities. Please help educate them. And please help them come up to

VOL 14

0173

R0060179

compliance.

Well, we had other cities that, in spite of the very best efforts that we made, the message never even got through to the City Council, never got past staff or whatever. You heard that discussed, the problem of communication from the Board, the Board's staff to city representatives, and then from city representatives onto the elected representatives.

And, finally, you have heard from NRDC that actually they filed suit. They felt maybe that our Board wasn't doing enough, so they had to file a suit, those suits against those cities that had done nothing under the 1990 permit, and they were highly successful in court. That is also behind us.

But we heard a great deal today from the cities opposed to the permit. We heard a great deal of mistrust. We heard mistrust in regulations. We heard fear of costs. And yet, at the same time, we have model permits, not only throughout the country but throughout the state, where regional agencies working together with the cities have been successful in keeping the cost within line. And you had testimony to that effect today, that they can be kept in line.

Probably this issue has received the maximum of public interest of any issue that we have dealt

VOL 14 0174

R0060180

with here, the number of letters we received, the number of phone calls and so on.

Finally, kind of based on what I've said so far, what you've heard about the legal liability is actually reduced and the fact that some cities say the cost is manageable, what I would like to do is I would like to just place a motion before the Board that will contain direction to the staff that would address some of the remaining issues, and then that would, I think, provide a good basis for the Board discussion.

I'd like to move approval of the permit. At the same time, along with the motion to approve, let there be direction from this Board to the staff to assist the cities in implementing cost-effective manners in compliance and to continue the involvement of stakeholders in the development of the permit.

The reason for these directions to staff, I think we have had ample indication here today that we have a flexible permit and that a lot of things are left open for development. Well, who is going to develop them? I think the cities -- a lot of the cities fear that it's not going to be development but it's going to be demand and control from the staff.

Therefore, my proposal is that we add this language, this direction to staff, to the motion to

VOL 14 0175

R0060181

approve the permit.

Thank you.

MR. COE: Mr. Drane.

MR. DRANE: There's a motion. Shall we discuss it?

MR. COE: We should have got into a round-table discussion. My script says we get into a discussion.

MR. DRANE: If we've got a motion, we ought to have a second.

MR. SLEZAK: I will second the motion.

MR. COE: We have got a second.

MR. DRANE: Well, I have some problems with it, and that's not to say that I am opposed to it. I think the cities have brought up some very worthy and bona fide issues. The cost factor cannot be overlooked or disregarded. That's a real fact of life that they face day in and day out. And also the lawsuit, of course, has to be looked at as an issue that is real and genuine.

I think we've really put a lot of credence in what the County had to say about their support of the permit. And they, for some unknown reason, indicated it had nothing to do with the lawsuit. But if you look on page 20, I think you will find that that was part of the agreement that they made. So I hope we will not put too much credence in that.

As I said before on this Board, for over 25 years I have owned property on the beach in Malibu, and I know the great natural resource that's available there. But these other issues must be taken into consideration.

I don't know whether we can hit a happy medium. Many of the cities are saying that some of the information they have received, they did not receive it on time. Certainly they are entitled to receive any changes in the timely manner so they can take it to the City Council and make some bona fide judgment on it.

The Assemblywoman said that she felt there was money to be obtained from the federal government. Well, if that's the case, then maybe we should get that money or see if it is available before we pass this expense along to the cities.

The scientific information probably needs to be refined and honed up a little bit. I think there is a whole multitude, array of issues that are still an open issue and open book. And I haven't decided which way I would vote

MR. COE: John.

MR. SLEZAK: First of all, from the perspective of legal obligations, the Clean Water Act requires the attainment of the goal that all waters be drinkable and

VOL 14

0177

R0060183

swimmable. And specifically Section 402(p) requires permits for urban storm water discharged by municipal separate storm drains, and it requires that controls reduce discharge to the maximum extent practicable.

Now, we have, I think, credible scientific evidence, and we have a very specific epidemiological study that demonstrates that there is an increased risk of acute illness caused by swimming near flowing storm drains. We do have credible findings that storm water from urban runoff is a significant source of pollutants, causing impairment of water quality and beneficial uses of receiving water.

What are the beneficial uses we are talking about? We are talking about water contact and non-contact recreation: sport fishing, groundwater recharge, wildlife habitat, marine life.

Now, the majority of the public entities oppose. The Los Angeles County came before us and say they favor the permit. A large minority of cities argued that the permit would be too costly and asked us to defer it. Having been in the minority many times, I'm not going to automatically go with the majority. But here I think that the majority has demonstrated that this is a valid permit to be adopted now.

The findings I believe are based on

VOL 14 0178

R0060184

valid studies. They do show that surface and groundwater recharge can be materially impaired by storm water pollution.

On the issue of the receiving water limits, the opponents argue that the receiving water limits necessary for maintaining beneficial uses should be deleted from this permit. I believe that that would be tantamount to a request for the dedesignation for the beneficial uses of recreation and fishing in coastal waters and the recharge of groundwater basins. And that is not appropriate to do.

However, under this permit, the permittees are deemed in compliance with the receiving water limits if they are fulfilling the implementing provisions of the permit even if the receiving water limits are not being met. And, frankly, I don't think they are being met with regard to the number of pollutants. But nevertheless, the cities will be protected in that event.

And as to third-party suits, I think the cities are measurably better off and safer from third-party litigation with this permit than without it. The Clean Water Act authorizes third-party suits, and they have been successfully brought without permits. And with the predecessor permit, specifically they were brought against Caltrans successfully and against other cities. So I think

VOL 14 0179

R0060185

the permit will actually protect the cities.

As to the unfounded mandate and cost benefit arguments, I think the cost to municipalities are in line with other state programs. And I think that, with the augmentation of the motion to direct Staff to work with cities in utilizing cost-effective measures, that cost-effectiveness will be satisfied.

I think the benefits that would be lost by allowing continued storm water pollution far outweigh the costs of the program. And first and foremost, water contact recreation, the economic value of water quality sufficient for beach uses to safely swim is in the billions of dollars of Southern California's economy.

Secondly, the economic value of Southern California for the sport fishing industry is in the hundreds of millions of dollars.

Third, the economic value of groundwater recharge within Los Angeles County is in the tens of millions of dollars annually. And if you count the Santa Clara River Shed, it's probably in the hundreds of millions of dollars.

There is major recharge from the San Gabriel River and the Santa Clara River. And it is necessary that that water needs water quality parameters, otherwise it will impair the extremely valuable groundwater

VOL 14

0180

R0060186

basins on which the Southern California economy depends.

The wildlife habitat values that are impaired by storm water pollution are significant but incalculable.

And then, finally, there are beneficial uses that have already been sacrificed to the development of Los Angeles infrastructure. The Wetlands and Riparian Corridors have been, in large part, paved over and taken. And those provided the function of oxydizing and decomposing. They are no longer present.

Now, the streambeds have been paved over. They served as the filters for pollutants. The inland fisheries have been, in large part, taken.

I also think that this permit represents a good compromise among the environmental groups as well as the needs of the cities and the county that represent all of us. And I, therefore, would support the permit as drafted for immediate adoption with the amendments.

MR. COE: Ms. Craven.

MS. CRAVEN: I think we have all heard the things that we have classified into several different types of reasons or arguments for delaying this today, and I would like to address several of those.

One of them came from cities regarding delay it because they didn't have time to respond. Many of

VOL 14 0181

R0060187

you know that I am involved with the city, although the city I'm involved with is not in Los Angeles County, so I do not have a conflict of interest in this. I'm sure you have been sitting there wondering how I'm reacting to the cities' arguments.

Through the years, the ten years that I have been involved with my city, I have been part of many different efforts to get all the agencies to come together and discuss and agree. I remember sitting for 18 months discussing a Solid Waste Management Plan that ended with the state saying, "We are not going to do coastal problems anymore." And now all of a sudden you have got to stop all this and start all over again and move to a different type of thing.

And I can remember sitting around talking about water plans and discharge plans and all kinds of other plans, including funding plans and law enforcement plans with other cities in the county. And what's often happened is that many of us -- and please understand, in Ventura County, there are only ten cities in the county. So all ten of us will get together, and in the end there may be three of us sitting talking after 17 or 18 months.

I can appreciate the problem Staff had in trying to coordinate discussions with -- or facing a problem of coordinating discussions with 86 cities in the

VOL 14 0182

R0060188

county plus other interested parties in Los Angeles County. And I think the unfortunate part is that only a handful of cities in the county, and probably more other interested groups than cities, were able to be involved.

I would hope that the next time around somehow all of the cities would be able to get minutes and updates of what's going on to keep them current. Because what always happens, even if the cities are supposed to be involved and they don't show up at the meetings, is that, in the end, they never heard of what was going on and it's a real shocker. And today what we heard were the results of the city saying, "This is a shock."

In reading the exemption -- in reading the things that came to us last week -- and I hope everybody out there knows, we got about this much stuff in the mail (indicating.) And in searching through it, I don't pretend to have read every letter that came, but you search through and you read representative letters from the various groups.

And in looking at the ones that came from the cities, when I first started reading them I thought, how can some of this be? And then I got into the permit and the requirements. And there is a misunderstanding in some of what they were saying. Because some of the things that some of them wrote to us telling us

VOL 14

0183

R0060189

were going to be required are in the list of exemptions. So there are some misunderstandings there. And I hope that those things will get resolved.

But I'm not here as a city representative. I am here as a representative of the public, and our charge is to protect the waters. So I have to take all of that into the background in making my decision. I have to consider that this is a renewal of an existing permit. Perhaps the conditions and terms of the existing permits are not something that the existing council members are aware of either.

I recognize that the requirements in this permit are weaker than the requirements of some of the other permits in other parts of the state. And I'm not -- I think that the staff has done a very good job of trying to make a reasonable effort to compromise, compromise what all of the interested parties wanted and felt they could do.

Some of these best management practices that people are -- that these agencies are having a problem with are things that other agencies have been doing for quite a while. The other agencies adopted them as part of water conservation efforts, but they also were water quality efforts.

I was glad to hear that there was going

VOL 14 0184

R0060190

to be some way to perhaps have staff work with the cities to try to determine some cost-effective ways to implement these conditions of the permit. And some of the things that some of the cities feel they can't do other cities have been doing.

I think, in looking at them, the ones that -- the cities that have been doing these for years are the ones that have their own treatment plants. And the cities that don't have treatment plants have not been implementing them. I think that's where we come into going into people's businesses and looking at what they're discharging. People who have treatment plants don't have any problem doing that because they have been checking on what's going into their sewer systems for a long time.

So I think maybe some more education with the public agencies needs to take place as to how this can be done. I'm not sure how Staff is going to do that.

But I do not understand -- the last thing I don't understand is the statement that we got from several cities of, "Gosh, we haven't had time to take this to our City Council to have them approve it." It wasn't my understanding this was something that required City Council approval. This was something that requires this Board's approval. The permit is for the cities. Once they get the permit and understand more what the conditions are, they

VOL 14
0185
R0060191

will then have to comply with it. They don't have to vote on it.

So I believe that this is a fair permit. I believe it does what we have been charged with doing. Even though I recognize that the environmental groups believe it isn't strong enough, I believe that this is one that I can support.

MS. ROGERS: I think each one of us has spent a great deal of time trying to trade up on all the information to date, but I think we have killed the entire Redwood forest just to produce the paper that we got. That's an ancillary environmental issues in terms of paper that we consume in this process.

Since everybody is giving a little background, in 1992, I guess it was, I served on the California Competiveness Council and I gave speeches around the state regularly on all of the evils of regulation, including unfunded mandates. Unfunded mandates, they are really interpreted as anything the government says, and you have to pay for it, which can be a lot of stuff, including the school system or anything else in terms of unfunded mandates, which is a valid point.

Cumulative impact. Yes, it's fine for us to hit everybody with another 20 bucks, but it's us, and then it's the Air Board, and then it's the local hotel tax,

VOL 14
0186
R0060192

and it's the local excise tax. And by the time you are done, it's no one group's fault.

But the tax rate in California gets so high that we have an exodus of businesses or a problem with the businesses in our community. That the dollars we are trading off are not business dollars, that's convenient, to say, "Oh, we are going to help a business, we are going to help a developer." And it's evil profits versus some aspect of the environment.

The dollars we are trading off, generally speaking, are your General Fund dollars. And if you take that three or four dollars and buy more ambulances, get a better school to teacher ratio, or do we do this, ultimately it all comes back to the same tax base.

So it's not usually people feeling evil about not wanting to help the ocean or not wanting to help this or that. It's a systematic look at, what are we trading off?

Layered in bureaucracy there are problems here. We have a Water Board and we have the County and we have cities involves, different lawyers that you have to run up and down and figure out who is on first, not to mention the fact we have to bring in the sanitation department and all sorts of other groups to do your

VOL 14 0187

R0060193

partnering.

Fine. I liked the Lomita gentleman's comment, well, we just put ours over here in the lake and it never does go into the ocean. Or Long Beach's comment related to it's beach versus the Santa Monica area.

Delay, the fact that the paperwork goes out in a very short period of time, and I go along with Charlotte's comment, maybe that short period of time was the only time anyone bothered to pay attention, even though you've been 24 months in the process or had five years of the permit that should have been followed or not.

And I think there is another thing, speaking as someone who lives now most of the time up in Ventura County but grew up on the west side, I was there for 15 years, we have heard a great deal today from the coastal cities, specifically Santa Monica and Malibu. And, of course, these are affected. They have a large environmental community that's been very active that's been responsible for the creation of a great deal of the environmental body of law.

They are not San Dimas. They are not the inland areas. And they have a very particular niche of the environment that they relate to but a very important one. And that brings up probably some issues of the environmental equity because the west side is a very

VOL 14

0188

particular place.

Now, with all that that I'm looking at and I'm giving speeches on, that's why I decided to serve on a regional board. Because when you write up those speeches and you go up to Sacramento and you live in the ozone of all these committees, how does this really work on the ground? What are the inherent contradictions you are dealing with that you never see? And I think that's true of either side of this, whether you are in the boat business or environmental side. The real world is a lot more complex.

I must say, I began to lax over the whole issue just as Senator Hayden says he's against it. That peaked my interest no end because I've got to look at that carefully now, don't I? And when Mr. Perenchio stood up and said he was for it, I got completely confused.

Okay. Those are all the negatives. Then I come to read this document with all those negatives very clearly in my mind and state that they are kind of there inherently or generically in these processes.

I think we have to look at several things; one John said. It is true, we have no choice. We will have a storm water non-point source pollution program. And, frankly, the more I got into this, I absolutely think we should. And I think it goes back to what several other

VOL 14

0189

R0060195

members of the Board have said here.

This isn't just a single-purpose event. It has a lot to do with keeping the streets clean, keeping all kinds of bacteria out of the water system. While I'm saying to West L.A. that, for example, we turn to Santa Monica who uses this, what's the ultimate use of the groundwater, the ocean water, L.A. has -- going to Jose Luis' comment, Los Angeles has only one acre per 5,000 people of park in Los Angeles. And the Latin culture is based around parks and families.

And if you go out to the beach, you have millions of people there in the summer. It is our only park. It is the only place people can go.

What I find, I think where I want to come down -- maybe it takes, Chuck, adding a little more to your language. The cities who came in have told us all the things that are not right with this permit, and there's got to be a ton of them, as has the environmental community. But the fact is this permit has been written to try to go to the local level, which is the whole push of getting away from unfunded mandates, and say to the local cities, "We are going to give you a relatively flexible document. And in that flexibility you have some stuff that looks like command and control, and you have a whole lot of language that's really quite ambiguous."

VOL 14

01190

R0060196

And it is my understanding of the basic intent here, and I believe the intent of the Board, is to turn around and say to the cities, "Within some guidelines we want you to come up with and get on with a non-point source pollution program."

And I think we all have to be realists. The cities wouldn't have shown up today if we weren't going to vote, and we have their attention. And I think we need to have permits in these areas.

I've looked over what we have in Ventura County, and Charlotte served there. For a very reasonable amount of money, and we have some charts in here, they have had a much more stringent, not much more, but a more stringent ordinance and been able to handle fiscally in a very practical way.

So I find it a bit disingenuous when we hear categorically it can't be done rather than seeing some stabs at doing it. I will be the first, if we can have some of those stabs at doing it -- if Long Beach comes in and shows it goes bankrupt and has no ambulances, no schools, no police, and no civic life based on this, you have, believe me, an argument.

I'm only being lighthearted here because really there isn't staff at the Board to go out and know your problems. If you really have a set of problems with

R0060197

VOL 14 0191

how this is structured when you sit down to do your own program, I think that's true of all the cities here, you have a Board that will be responsive to you.

But this document will get you to go draft a program, and that's what we need to see. And I think that the effort that has been put out, what I'm happy to hear is that everybody is unhappy a little bit and very few people are unhappy a lot. And I think that means there has been a process that has worked.

And I would like to see, Chuck, something a little more -- a little stronger, like, at the end of six months, we have three or four of the cities who have strong objections come back with their pilot programs and they can show us what it costs, or we can bring in models from Ventura County that can show people how it works.

I think that, as a Board, this is so important, we ought to be responsive. But I have to be responsive in the concrete. I have got to see the actual cost, the actual programs, the actual problems that you are going to have before I can do anything else.

MR. VERNON: The maker of the motion has no objection to an expansion of the motion. And I think that if monitoring and reporting back to the Board and hearing from some of our stakeholders is going to give people more

VOL 14 0192

R0060198

of a feeling that we are really in this together, I am in favor of it.

MS. ROGERS: If Simi and Moorpark and Camarillo can do it, we can find a way for 80 cities in L.A. to come up with a good program.

And with that caveat in mind, I support it.

MS. CRAVEN: Mr. Chair, could I ask for a clarification?

MS. ROGERS: It's not a six-month permit. I'm just saying whatever is a bench mark -- maybe, Catherine, you could comment on a bench mark time period where groups such as Rosemead and Long Beach, once this is submitted, to get back to us within a reasonable work period that relates to the permit. And you could pick the time period.

MS. TYRRELL: We will do that. Unless you want to do it right now, we will work with the cities to determine what a good time period would be.

MR. COE: I'd like to see some language now.

If either Chuck or Beth would like to restate the motion.

MS. ROGERS: Chuck, you have done this a lot more than me. You give it a go.

MR. VERNON: I think that, if I understand, what we would like would be a clear-cut, additional

VOL 14 01993

R0060199

directive to staff, and that would have to do with the progress report to the Board. Am I on target? Is it confusing, Charlotte?

MS. CRAVEN: Well, you know, a minute ago I wanted to ask a question for clarification, and everybody talked and I didn't ask my question. So let me ask my question and maybe that will help you in answering the question how to rephrase the motion.

I guess what I'm not understanding is if you want this to come back as a progress report after development of their program or if you want it to come back for another vote? What did you want?

MS. ROGERS: No.

Charlotte, I just want a progress report in the following sense, not just Staff making a progress report, but the cities here today that feel particularly their ox is being gored when they have taken the time to look at models in other areas such as Simi and Camarillo that would be acceptable, as I understand it, within the framework, that they should come back to us if they have any continuing problems.

I just don't, as a Board, want to hear about it again five years from now when we do another renewal. I'd like to have us stay apprised of what issue the city has run up against. And if there are some

VOL 14 0194

R0060200

substantive areas where we can be of assistance in helping them get through their financial or organization or bureaucratic or unfunded mandates, or any and all of those other horrors, if they really had some kind of a problem, I just would like us to stay involved with it more in the process.

MR. VERNON: I think one of the things the Board has been trying to avoid from the beginning is a command and control approach. And when we went to the State Board meeting and meeting those 85 cities, and so on, we were, in essence, putting command and control behind us.

And so I will just throw something out with the idea that it will be a point for departure.

If Staff -- I know that it's going to take some time, with a permit this flexible and with this many cities and with this many concerns of those that are not on board yet, no matter what the reason, it might be whether it was the Staff not getting back to them in a timely manner, or whatever the reason may have been, it's going to take a little time.

And if the amendment is that our staff would work with the cities to help them implement on a cost-effective basis and not something we are going to do overnight, I think we have to bear in mind that the terms

VOL 14 0195

R0060201

of the permit are so flexible that if a city is implementing the permit, in the broadest terms, they are considered in compliance.

So, therefore, suppose that -- I'll throw this out. Suppose we have an additional direction to Staff that they return with a progress report to the Board, not with the idea that we are going to revise the permit, a progress report to the Board; and that we would ask Staff to set a reasonable time for that. And then that, at the progress report, that the stakeholders would be invited to the Board meeting at which the progress report was given; and that they would have the opportunity for input at that time.

MR. COE: But not another hearing?

MR. VERNON: Not another hearing, no. A progress report with a section of the progress report from Staff and a response as part of the same progress report from the stakeholders who wish to address the Board.

MR. DRANE: Mr. Chairman.

MR. COE: Let me point out that there will be -- I'm visualizing a problem with 35 cities reporting to the Board. There will be a mechanism, sort of an informal EAC or coordinating committee, that will assist perhaps with that group representing the cities --

MR. VERNON: That's right. That would be

VOL 14

01/96

R0060202

done.

So I would just amend the language and make it with the EACs having their section of the party.

MR. COE: Mr. Drane.

MR. DRANE: I am just wondering, if you follow that procedure, what would attract the stakeholders or the other cities who partake if they just have discussion and no input as far as an official standpoint? It wouldn't change the situation at all. What would be any reason for them to participate?

MR. VERNON: In my opinion, listening to the testimony and listening to the same thing hashed out in the Santa Monica Bay project, the thing that -- if I can quote history to you. Some of you may remember that Stonewall Jackson was asked why he was so successful, and he said, "Because I don't make council of my peers."

We have heard a great deal of that today. And I think what would motivate the cities to come back here, or the EACs to come back here, was if we were not keeping our promises.

I believe that we have heard from cities that said, "We are implementing it, and it can be done, and it can be done cost-effectively." And we have been in this area, and we know that other cities in other regions -- we have indications from EPA of they are implementing it

VOL 14 01/97

R0060203

cost-effectively and within the same framework and costs, apparent costs that are in our permit. We have got that as background information.

If we are not being successful in helping our cities and within our region to fall within what we have told them is reasonable and being done elsewhere, I think that is what would motivate them to come back. We need to leave that door open.

MR. COE: So it should be clear that the implementation of the permit should start immediately.

MR. VERNON: Yes. And I will make reference to that.

MS. ROGERS: I think this is just the point you are making, Chuck, to underscore it. Up in Ventura County we have been told, as they have, over the last couple of years, implemented what we are asking for and felt comfortable with it, it's not just reports from out in the outer Mongolian. We actually have people we know, cities we know, that have done this successfully.

And if the cities, therefore, that we have heard from today feel very strongly they can't do it and give it the old college try, we would like to understand why they can't when these other cities feel they can.

So I think they are going to go forward

VOL 14

0198

R0060204

and do it, but we want to understand if they can't get there from here. Because a lot of them are saying they can't get there from here, but other cities have been able to.

Where is the difference?

MR. COE: Any further discussion? Could I try to state the motion?

Well, I believe there's a pollution problem. No question about that. I think some of the water quality objectives in the basin plan upon the coastal waters, particularly as to recreation, have been violated. I think the Clean Water Act requires us to act. It's been over one and a half years of meet and confer, over 60 meetings.

I also realize that many of the cities will have some significant cost problems, financial problems, that they will have to work out. I think overall, however, that this permit represents a fair compromise, and I will vote for its support.

Any further discussion before I try to restate the motion?

MR. DRANE: Call the roll.

MR. COE: Should I try to restate the motion or is that clear enough? Is it clear enough?

Call the roll.

VOL 14

0199

R0060205

MS. SHIPLEY: Ms. Craven?

MS. CRAVEN: Support.

MS. SHIPLEY: Mr. Drane?

MR. DRANE: I'm very dissatisfied with the answers and response we gave the cities in not giving it consideration, so I will give it a reluctant aye.

MS. SHIPLEY: Ms. Rogers?

MS. ROGERS: Aye.

MS. SHIPLEY: Mr. Slezak?

MR. SLEZAK: Aye.

MS. SHIPLEY: Mr. Vernon?

MR. VERNON: Aye.

MS. SHIPLEY: And Mr. Coe?

MR. COE: Aye.

Thank you very much. The permit is adopted. Thank you all for coming and spending the day with us.

(At the hour of 4:55 p.m., the hearing on Item 8 was concluded.)

COUNTY OF LOS ANGELES)

I, Debbie Strickland, CSR 9036, a certified shorthand reporter in and for the county of Los Angeles, state of California, do hereby certify;

That on Monday, July 15, 1996, I did report in stenograph writing all of the testimony and proceedings in the foregoing hearing before the California Regional Water Quality Control Board, Los Angeles/Ventura Region;

That said proceedings were thereafter reduced to typewriting under my direction.

I further certify that the foregoing is a full, true, and correct transcript of said testimony and proceedings.

I further certify that I am neither counsel for nor related to any party to said action, nor in anywise interested in the outcome thereof.

Dated this 24th day of July, 1995.

Debbie Strickland

Dr. Robert P. Ghirelli
California Regional Water Quality
Control Board, Los Angeles Region
101 Centre Plaza Drive
Monterey Park, CA 91754-2156

Dear Dr. Ghirelli:

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM
PERMIT NO. CA 0061654 - CI6948
REPORT OF WASTE DISCHARGE SUBMITTAL

As required by Task 5.2 of the current Permit, enclosed is an original and one copy of the subject Report. The Report is comprised of eight volumes. With submittal of the Report, we have provided the information requested under Tasks 5.2.1 through 5.2.6 of the current Permit.

We have received your letter dated October 31, 1994, providing comments on the draft Report provided to you on October 17, 1994. All comments were considered and, where feasible within the constraints of finalizing the Report for submittal to you, appropriate revisions were made. Comments that could not be addressed at this time will be addressed through the Permit renewal process and the further development of the stormwater management plans.

Volume 1 consists of a summary of Best Management Practices being developed and/or implemented by each Permittee, and a summary and evaluation of the baseline BMPs listed in your letter of January 11, 1993. Volume 1 was prepared to satisfy Task 5.2.2-5.2.4. It was prepared using information collected from a survey questionnaire which was sent to all Permittees. The questionnaire was prepared with the input and cooperation of your staff, and was designed to collect all information currently available from the Permittees on their existing stormwater programs. The data gathered in these surveys reflects the best information available to date regarding the required activities under the current Permit. Some of your comments on Volume 1, as stated in your October 31, 1994 letter, could not be fully addressed at this time. Addressing these comments would require information on the BMPs that has not been compiled by the Permittees through their current programs. With the transition to a watershed-wide approach to stormwater management under the upcoming Permit, a tracking system to collect this information will be built into the program.

VOL 15

00002

R0060223

Volumes 2 through 7 are Stormwater Management Plans for the six watersheds proposed for the next Permit. These volumes satisfy Tasks 5.2.5 and 5.2.6 of the current Permit. The stormwater management plans are to serve as an overall framework to allow for further development of a watershed-wide approach to stormwater management. This reflects the refocusing of the stormwater program from an agency-oriented program (each Permittee developing and implementing their own program), as provided for under the current Permit, to a watershed-oriented program (all Permittees within each watershed jointly developing and implementing the same program). The watershed-oriented program was developed referencing the guidelines developed by the Regional Board staff. The comments in your October 31, 1994 letter concerning watershed-wide issues which require collective input from all agencies in the watershed will be addressed as the stormwater management plan for each watershed is fully developed under the next Permit. It should be noted that the current Permit separated the Co-Permittees into three Phases, each having a three-year program. Phase III, consisting of 30 new Co-Permittees did not begin their program until July 1993. In order to reorient the stormwater program into a watershed-oriented focus, a transitional period is needed. The Report documents the needed time to develop such a watershed-oriented program.

Volume 8 is an evaluation of the water quality data collected during the current Permit by the existing monitoring program. It also includes the work plan for the stormwater/urban runoff monitoring program being established in Phases I, II, and III. This volume satisfies Task 5.2.1 of the current Permit. We have incorporated your comments in this volume where appropriate.

If you have any questions regarding the Report, please contact Mr. Gary Hildebrand, of my staff, Monday through Thursday, 7:00 a.m. to 5:30 p.m.

Very truly yours,

HARRY W. STONE

INTRODUCTION

On June 18, 1990, the National Pollutant Discharge Elimination System (NPDES) Permit - Order #90-079, NPDES #CA0061654-CI6948 was issued to the County of Los Angeles and 17 cities tributary to Santa Monica Bay. During the subsequent years 2 newly incorporated cities within the Santa Monica Bay Watershed, Caltrans, and the County of Ventura also became Co-Permittees. This Permit outlined a three-year program which required each Permittee to: characterize drainage areas; develop and schedule the implementation of Best Management Practices to enhance the quality of stormwater/urban runoff within its jurisdictional boundaries and storm drains it owns and operates. On July 1, 1992, 36 additional cities were initiated into the Permit and began their three-year program. By July 1, 1993, the remaining 30 cities in Los Angeles County within the drainage basin were initiated into their three-year program. The cities were grouped according to their starting dates and referred to as Phases I, II, and III, respectively (See Table A). In general, the boundaries of each Phase did not encompass whole watersheds but portions of various watersheds (See Figure 1).

The Permit has a five-year duration and although Phase III cities have only completed year one of their three year program, the Permit requires the submittal of a Report of Waste Discharge (ROWD) which serves as an application for a subsequent NPDES Permit to replace NPDES Permit #CA0061654, which expires on June 18, 1995. Therefore, the County of Los Angeles, the County of Ventura, Caltrans, and the 85 cities are submitting this Report in compliance with Task 5.2 of the current Permit. The Report comprises eight volumes: Volume 1, will consist of a summary of Best Management Practices by city and a summary and evaluation of baseline BMPs. This is prepared to satisfy Task 5.2.2 through 5.2.4 of the current Permit.

Volumes 2 through 7 are six Watershed Management Plans which joint covers all the area within the current Permit. These watersheds are: Santa Monica Bay - Malibu Creek and Other Rural Areas; Santa Monica Bay - Ballona Creek and Other Urban Areas; Dominguez Channel/Los Angeles Harbor Drainage; Los Angeles River; San Gabriel River; and Santa Clara River (See Figure 2). The agencies represented in each of the watersheds are outlined in Table B and Figure 2. These volumes are to satisfy Task 5.2.5 and 5.2.6 of the current Permit.

Volume eight will evaluate the results of the existing Monitoring Program on a Countywide basis and by the various watersheds. This volume also includes the work plans for the Monitoring Program in Phases I, II, and III of the current Permit. This volume is prepared to satisfy Task 5.2.1 of the current Permit.

REPORT OF WASTE DISCHARGE

VOLUME 1

SECTION (A)

SUMMARY OF BEST MANAGEMENT PRACTICES BY CITIES

0011

R0060232

The original returned questionnaires and the comments sent in by Co-Permittees after the first draft of this summary was released for their review, are kept in file at the Los Angeles County Department of Public Works, Waste Management Division, Water Quality Section. Interested individuals should make arrangements with the above agency to review these documents. A copy of the original eight-page questionnaire is included as reference in the next page for the reader.

JURISDICTION: _____ **SAMPLE QUESTIONNAIRE**

STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

OUR STORMWATER PERMIT REQUIRES THE PREPARATION OF A REPORT OF WASTE DISCHARGE WHICH IS TO INCLUDE A SUMMARY OF ALL BMP's BEING IMPLEMENTED BY EACH CO-PERMITTEE. THE PURPOSE OF THIS QUESTIONNAIRE IS TO COLLECT INFORMATION FROM EACH CO-PERMITTEE ON THE STATUS OF IMPLEMENTING THE 13 "BASELINE" BMP's AND ALL OTHER BMP's THAT ARE A PART OF YOUR PROGRAM. WE ALSO WOULD LIKE YOU TO USE THE QUESTIONNAIRE TO SUGGEST ANY OTHER BMP's THAT YOU ARE AWARE OF THAT SHOULD BE CONSIDERED FOR IMPLEMENTATION IN LOS ANGELES COUNTY.

- PLEASE BE AS COMPLETE AND CONCISE AS POSSIBLE; "BEST ESTIMATES" WILL GENERALLY BE SUFFICIENT WHERE NUMBERS ARE NEEDED. USE BACK OF PAGE IF MORE SPACE IS NEEDED; INDICATE "NA" FOR QUESTIONS THAT DO NOT APPLY.
- REFERENCES TO "CURRENT PERMIT PERIOD" MEAN THE TIME PERIOD BEGINNING WITH THE DATE YOUR AGENCY WAS REQUIRED TO COMPLY WITH THE STORMWATER/URBAN RUNOFF DISCHARGE REQUIREMENTS OF THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION.
- IF YOU HAVE QUESTIONS, PLEASE CALL SORIN ALEXANIAN OR LEE STARK AT (213) 974-6425 (MONDAY-THURSDAY, 7:30 AM - 6:00 PM)

---

1. STENCIL CATCH BASINS

- DO YOU OWN AND MAINTAIN CATCH BASINS? YES ___ NO ___
- HAVE YOU IMPLEMENTED A PROGRAM FOR MESSAGE STENCILING ON CATCH BASINS? YES ___ NO ___
- STENCIL DESIGN? HEAL THE BAY ___ OTHER ___ (PLEASE ATTACH COPY)
- HOW MANY HAVE BEEN STENCILED? _____ TOTAL COST TO DATE? _____
  DO YOU PLAN TO STENCIL THE OTHERS? YES ___ NO ___
- BRIEFLY EXPLAIN YOUR PROGRAM (VOLUNTEERS OR EMPLOYEES, TYPE OF MATERIALS, ETC.)_____
  _____
  _____
- DESCRIBE ANY PROBLEMS ENCOUNTERED (VANDALISM, GRAFFITI, DURABILITY, APPLICATION PROCESS, ETC.) _____
  _____
  _____
- HOW WOULD YOU DESCRIBE THE GENERAL EFFECTIVENESS OF THE CATCH BASIN STENCILING PROGRAM? _____
  _____
- CAN YOU SUGGEST ANY CATCH BASIN STENCILING PROGRAM MODIFICATIONS?_____
  _____
  _____

2. DEVELOP PROGRAMS TO PROMOTE PUBLIC REPORTING OF ILLEGAL DISCHARGES/DUMPING

- HAVE YOU IMPLEMENTED ANY PROGRAMS TO ENCOURAGE AND FACILITATE PUBLIC REPORTING OF ILLEGAL DISCHARGES/DUMPING? YES ___ NO ___

VOL 15
0013
R0060234

• OTHER THAN THE COUNTY HOTLINE, HAVE YOU ESTABLISHED ANY OTHER HOTLINE OR REPORTING SYSTEM? YES ___ NO ___WHEN? _____ DESCRIBE: ____
_____

• HOW MANY REPORTINGS HAVE YOU RECEIVED? _____

• HOW DID YOU INFORM THE PUBLIC OF THE HOTLINE SERVICE AND/OR YOUR OWN REPORTING SYSTEM? _____
_____

• HAS THE HOTLINE BEEN EFFECTIVE IN DISCOURAGING ILLEGAL DISCHARGES/ DUMPING INTO THE STORMDRAIN SYSTEM? EXPLAIN: _____
_____
_____

• ARE THERE OTHER PROGRAMS THAT YOU USE OR COULD SUGGEST TO ENCOURAGE PUBLIC REPORTING? DESCRIBE: _____
_____
_____

3. <u>ADOPT RUNOFF CONTROL ORDINANCE</u>

• HAVE YOU IMPLEMENTED URBAN RUNOFF CONTROL MEASURES? Y___ N___
DESCRIBE (INCLUDE MUNICIPAL CODE NUMBERS IF APPLICABLE): _____
_____
_____

• WHEN WERE THESE MEASURES ADOPTED OR APPROVED? _____
• DO YOU THINK THESE MEASURES HAVE BEEN EFFECTIVE IN REDUCING POLLUTANTS IN URBAN RUNOFF? Y___ N___ EXPLAIN: _____
_____
_____

• HAVE YOU MODIFIED YOUR ORDINANCES THAT CONTROL URBAN RUNOFF DURING THE CURRENT PERMIT PERIOD IN RESPONSE TO REQUIREMENTS OF THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD? YES___ NO___
EXPLAIN: _____
_____
_____
_____

• CAN YOU SUGGEST OTHER ORDINANCE MODIFICATIONS THAT MAY BE EFFECTIVE? _____
_____

4. <u>DEVELOP PUBLIC EDUCATION AND OUTREACH PROGRAMS</u>

• HAVE YOU IMPLEMENTED PROGRAMS TO EDUCATE THE PUBLIC ON THE PROBLEM OF STORMWATER POLLUTION? Y___ N___ DESCRIBE: _____
_____
_____

R0060235

VOL 15

0014

• HOW EFFECTIVE DO YOU THINK THESE OUTREACH AND EDUCATIONAL PROGRAMS HAVE BEEN IN THE REDUCTION OF STORMWATER POLLUTION?
EXPLAIN: _____

• CAN YOU SUGGEST OTHER TECHNIQUES THAT MIGHT BE EFFECTIVE IN INFORMING THE PUBLIC ON STORMWATER POLLUTION? _____

5. CLEAN CATCH BASINS REGULARLY

• DO YOU HAVE A CATCH BASIN CLEANING PROGRAM? YES___ NO___
• DESCRIBE YOUR CLEANING PROGRAM. (HOW OFTEN, WHEN, METHOD OF CLEANING, ETC.) _____

• HOW EFFECTIVE HAS YOUR CATCH BASIN CLEANING PROGRAM BEEN IN PREVENTING DEBRIS FROM ENTERING THE STORM DRAINS? EXPLAIN: _____

• HAVE YOU MODIFIED YOUR CATCH BASIN CLEANING PROGRAM DURING THE CURRENT PERMIT PERIOD IN RESPONSE TO REQUIREMENTS OF THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD? YES ___ NO ___ EXPLAIN: _____

6. INCREASE ROADSIDE TRASH RECEPTACLE USAGE

• DOES YOUR JURISDICTION PROVIDE PUBLIC ROADSIDE TRASH RECEPTACLES? YES___ NO___ HOW MANY? _____
• HOW OFTEN ARE THE RECEPTACLES EMPTIED? _____
• HAVE YOU IDENTIFIED PROBLEM LITTER AREAS AND, IF SO, HAVE YOU MADE SPECIAL PROVISIONS TO COLLECT THIS LITTER? EXPLAIN: _____

• HAVE YOU MODIFIED YOUR ROADSIDE TRASH RECEPTACLE PROGRAM DURING THE CURRENT PERMIT PERIOD IN RESPONSE TO REQUIREMENTS OF THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD? YES ___ NO ___
EXPLAIN:___ _____

PAGE 4

7. INCREASE STREET SWEEPING

• DO YOU HAVE A ROUTINE STREET SWEEPING PROGRAM? YES___ NO___

VOL 15 0015
R0060236

• HOW MANY MILES OF IMPROVED STREETS ARE THERE IN YOUR JURISDICTION? ___
• NUMBER OF CURB MILES SWEPT? ____ NUMBER OF SWEEPER TYPE: VACUUM ___ BROOM____
• CURB MILES USING THIS EQUIPMENT: VACUUM ____ BROOM ____
• SWEEPING FREQUENCY: RESIDENTIAL ____ COMMERCIAL ____ INDUSTRIAL ____
• HAVE YOU MODIFIED YOUR STREET SWEEPING PROGRAM DURING THE CURRENT PERMIT PERIOD IN RESPONSE TO REQUIREMENTS OF THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD? YES ___ NO ___ EXPLAIN: _____

• HOW EFFECTIVE HAS YOUR INCREASED STREET SWEEPING PROGRAM BEEN IN PREVENTING DEBRIS THAT HAVE COLLECTED IN STREETS AND GUTTERS FROM ENTERING THE STORM DRAIN SYSTEM? _____

8. <u>DISCOURAGE IMPROPER DISPOSAL OF LITTER, LAWN CLIPPINGS AND PET FECES</u>

• DO YOU HAVE PROGRAMS DESIGNED TO DISCOURAGE IMPROPER DISPOSAL OF LITTER, LAWN CLIPPINGS AND PET FECES? YES ___ NO ___ DESCRIBE: ___

• ARE THERE PENALTIES FOR IMPROPER TRASH DISPOSAL? YES ___ NO ___
• HAVE YOU MODIFIED THIS PROGRAM DURING THE CURRENT PERMIT PERIOD IN RESPONSE TO REQUIREMENTS OF THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD? YES ___ NO ___ EXPLAIN: _____

• CAN YOU SUGGEST OTHER TYPES OF PROGRAMS TO DISCOURAGE IMPROPER LITTER DISPOSAL? _____

9. <u>INSPECT AUTO PARTS, REPAIR AND BODY SHOPS; GASOLINE STATIONS AND RESTAURANTS</u>

• DO YOU HAVE AN INDUSTRIAL WASTE INSPECTION PROGRAM? DESCRIBE: _____

• DO YOU INSPECT FOR NON-STORM WATER DISCHARGES TO THE STORM DRAIN SYSTEM? YES ___ NO ___ EXPLAIN: _____

PAGE 5

• AS PART OF YOUR PROGRAM, DO YOU INSPECT THE FOLLOWING TYPES OF BUSINESSES? IF SO, HOW OFTEN?

VOL 15 0016
R0060237

- AUTO PARTS: YES ___ NO ___ _____
- AUTO REPAIR: YES ___ NO ___ _____
- AUTOBODY SHOPS: YES ___ NO ___ _____
- GASOLINE STATIONS: YES ___ NO ___ _____
- RESTAURANTS: YES ___ NO ___ _____
- OTHER? _____

• UNDER WHAT LEGAL AUTHORITY DO YOU CONDUCT YOUR INSPECTIONS? _____
_____

• WHAT IS THE APPROXIMATE PERCENTAGE OF NON-COMPLIANCE? _____
• DO YOU TRACK VIOLATIONS BY INDUSTRY TYPE YES ___ NO ___
• HOW ARE VIOLATIONS ENFORCED? _____
_____

• HAVE YOU MODIFIED YOUR INDUSTRIAL WASTE INSPECTION PROGRAM DURING THE CURRENT PERMIT PERIOD IN RESPONSE TO REQUIREMENTS OF THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD? YES ___ NO ___ EXPLAIN: _____
_____
_____

10. ENCOURAGE REMOVAL OF DIRT, RUBBISH AND DEBRIS FROM SIDEWALKS AND ALLEYS

• DO YOU HAVE A PUBLIC OUTREACH/EDUCATION PROGRAM TO ENCOURAGE THE PUBLIC TO REMOVE DIRT, RUBBISH AND DEBRIS FROM SIDEWALKS AND ALLEYS? EXPLAIN: _____
_____
_____
_____

• HOW WELL HAVE THE FOLLOWING SECTORS OF THE COMMUNITY RESPONDED TO THE PROGRAM? RESIDENTIAL _____ COMMERCIAL _____
INDUSTRIAL _____
• HAVE YOU MODIFIED THIS OUTREACH PROGRAM DURING THE CURRENT PERMIT PERIOD IN RESPONSE TO REQUIREMENTS OF THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD? YES ___ NO ___ EXPLAIN: _____
_____
_____

• CAN YOU SUGGEST OTHER OUTREACH PROGRAMS THAT COULD BE EFFECTIVE? ____
_____
_____

11. PROMOTE RECYCLING

• HAVE YOU IMPLEMENTED A RECYCLING PROGRAM? YES ___ NO ___
• DO YOU HAVE A PERMANENT RECYCLING CENTER? YES ___ NO ___

R0060238

VOL 15

0017

• DO YOU ROUTINELY COLLECT MATERIALS AT CURBSIDE? YES ___ NO ___
• WHAT MATERIALS ARE RECYCLED? _____

• HAVE YOU ESTABLISHED A COMPREHENSIVE PUBLIC OUTREACH AND EDUCATION PROGRAM ON THE BENEFITS OF RECYCLING? YES ___ NO___

• WHAT ARE THE ELEMENTS OF THIS PROGRAM? _____

• DESCRIBE OTHER COMPONENTS OF YOUR RECYCLING PROGRAM:_____

• PLEASE ESTIMATE THE PERCENTAGE OF RUBBISH THAT IS BEING DIVERTED FROM LAND FILLS AT THIS TIME _____
• HAVE YOU MODIFIED YOUR RECYCLING PROGRAM DURING THE CURRENT PERMIT PERIOD IN RESPONSE TO REQUIREMENTS OF THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD? YES ___ NO ___ EXPLAIN: _____

• DESCRIBE ANY ALTERNATIVES TO YOUR PRESENT PROGRAM THAT YOU HAVE TRIED, CONSIDERED OR PLAN TO IMPLEMENT: _____

12. <u>MOTIVATE RESIDENTS TO PROPERLY DISPOSE OF HOUSEHOLD HAZARDOUS WASTE</u>

• DO YOU PARTICIPATE IN THE COUNTYWIDE HOUSEHOLD HAZARDOUS WASTE MANAGEMENT PROGRAM?
YES ___ NO ___

• DO YOU CONDUCT ADDITIONAL HOUSEHOLD HAZARDOUS WASTE COLLECTIONS?
YES ___ NO ___ EXPLAIN (PERMANENT FACILITY, FREQUENCY OF COLLECTION, ETC): _____

• DO YOU HAVE OTHER METHODS TO HELP ENSURE PROPER DISPOSAL OF HOUSEHOLD HAZARDOUS WASTE? EXPLAIN: _____

PAGE 7

• HAVE YOU MODIFIED YOUR HOUSEHOLD HAZARDOUS WASTE COLLECTION/DISPOSAL PROGRAM DURING THE CURRENT PERMIT PERIOD IN RESPONSE TO REQUIREMENTS OF THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD? YES ___ NO ___ EXPLAIN:
_____

0018

• HOW EFFECTIVE DO YOU THINK YOUR PROGRAM IS IN ENCOURAGING THE PROPER DISPOSAL OF HOUSEHOLD HAZARDOUS WASTE? _____

• CAN YOU SUGGEST OTHER WAYS OF ENCOURAGING PROPER DISPOSAL OF HOUSEHOLD HAZARDOUS WASTE? _____

13. ENCOURAGE CONSERVATION OF WATER

• DO YOU HAVE A WATER CONSERVATION PROGRAM THAT REDUCES RUNOFF TO STORM DRAINS FROM OUTDOOR WATER USE? YES ___ NO ___ EXPLAIN: _____

• DO YOU HAVE A PROGRAM TO INFORM THE PUBLIC REGARDING THE SEDIMENTS, WASTE MATERIALS AND CONTAMINANTS CARRIED TO THE DRAINAGE SYSTEM ASA RESULT OF RUN-OFF FROM OVER-WATERING LANDSCAPING, WASHING SIDEWALKS, CARS, ETC. YES ___ NO ___ EXPLAIN: _____

• HAVE YOU MODIFIED YOUR WATER CONSERVATION PROGRAMS DURING THE CURRENT PERMIT PERIOD IN RESPONSE TO REQUIREMENTS OF THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD? YES ___ NO ___ EXPLAIN: __

14. OTHER BMP PROGRAMS

• PLEASE USE THIS SECTION TO DESCRIBE ALL OTHER BMP'S BEING IMPLEMENTED OR PROPOSED FOR IMPLEMENTATION BY YOUR AGENCY. ALSO, IF YOU HAVE HEARD ABOUT OTHER BMP PROGRAMS THAT SHOULD BE CONSIDERED FOR USE IN THE LOS ANGELES BASIN, WE WOULD LIKE TO HEAR ABOUT THEM. PLEASE USE A SEPARATE SHEET FOR EACH PROGRAM AND PROVIDE THE SAME TYPE OF INFORMATION ASKED FOR THE ABOVE BMP'S, INCLUDING (BUT NOT LIMITED TO):

BMP MATRIX: RATING CRITERIA

The following criteria were used to create the preceding draft matrix, summarizing the status of BMP's by jurisdiction. It should be noted that: a) status is based on current achievements, not programs that may be in the planning stages and b) criteria level was based on the information provided through the questionnaires.

1. STENCIL CATCH BASINS

FULLY IMPLEMENTED.....All catch basins stenciled.
PARTIALLY IMPLEMENTED.....Some catch basins stenciled.
PLANNED/PROPOSED.....Indication that City is developing program.
NOT IMPLEMENTED.....No indication that City will implement program.

2. DEVELOP PROGRAMS TO PROMOTE PUBLIC REPORTING OF ILLEGAL DISCHARGES/DUMPING

FULLY.....City participates in reporting and has an active public outreach program.
PARTIALLY.....City participates in reporting and is planning a public outreach program.
PLANNED.....Indication that City plans to promote hotline.
NOT.....No indication that City is addressing BMP.

3. ADOPT RUNOFF ORDINANCE

FULLY.....Adopt or modify codes to improve runoff control.
PARTIALLY.....Identify or draft codes/ordinances.
PLANNED.....Indication that work is planned.
NOT.....No indication that City plans to control runoff.

4. DEVELOP PUBLIC EDUCATION AND OUTREACH PROGRAMS

FULLY.....Articles in newsletter and/or similar publication. Also, developed 2 or more pamphlets/brochures.
PARTIALLY.....Pamphlets/brochures available for public.
PLANNED.....Indication that outreach programs will begin.
NOT.....No indication that City is addressing outreach.

5. CLEAN CATCH BASINS REGULARLY

FULLY.....Cleaned at least once a year.
PARTIALLY.....Cleaned in response to complaints only.
PLANNED.....Indication that City will implement program.
NOT.....No indication that City will implement program.

6. INCREASE ROADSIDE TRASH RECEPTACLE USAGE

FULLY.....Receptacles emptied on a regular basis. Litter prone areas inspected and receptacles added as needed.
PARTIALLY.....Cleaned as needed; no inspection of litter prone areas.
PLANNED.....Indication that City will provide receptacles.
NOT.....No indication that City will provide receptacles.

VOL 15
0021
R0060242

7. INCREASE STREET SWEEPING

FULLY.....All streets swept at least once a month.
PARTIALLY.....Streets swept in response to complaints only.
PLANNED.....City plans to implement street sweeping.
NOT.....No indication that City will sweep streets.

8. DISCOURAGE IMPROPER DISPOSAL OF LITTER, LAWN CLIPPING, PET FECES

FULLY.....Articles in City newsletters and/or ordinance. Also, at least one handout and penalties for improper disposal.
PARTIALLY.....Pamphlets/brochures available for public.
PLANNED.....Indication that City will implement program.
NOT.....No indication that City will implement program.

9. INSPECT AUTOMOBILE USES AND RESTAURANTS

FULLY.....Regular inspection program in place, including illegal discharge.
PARTIALLY.....Officials inspect on as needed basis.
PLANNED.....Indication that program is being developed.
NOT.....No indication that City will implement inspections.

10. ENCOURAGE REMOVAL OF DIRT, RUBBISH & DEBRIS FROM SIDEWALKS/ALLEYS

FULLY.....Articles in newsletters/other similar format. Also, at least one handout.
PARTIALLY.....Pamphlets/brochures available for public.
PLANNED.....Indication that program is being developed.
NOT.....No indication that City will implement program.

11. PROMOTE RECYCLING

FULLY.....Established recycling program, including scheduled curbside pickup and public education.
PARTIALLY.....Recycling facilities provided and/or non-scheduled curbside pickup and no education program.
PLANNED.....Indication that City is developing recycling program.
NOT.....No indication that City will implement recycling.

12. MOTIVATE RESIDENTS TO PROPERLY DISPOSE OF HOUSEHOLD HAZARDOUS WASTE

FULLY.....Participates in either the County round-up or has own waste collections.
PARTIALLY.....N/A
PLANNED.....Indication that City will implement program.
NOT.....No indication that City will implement program.

13. ENCOURAGE CONSERVATION OF WATER

FULLY.....Articles in newsletter and/or ordinance. Also, at least one handout.
PARTIALLY.....Pamphlets/brochures available to public.
PLANNED.....Indication that City will develop program.
NOT.....No indication that city will develop program.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF AGOURA HILLS

City of Agoura Hills: Phase I Co-Permittee
Population (1994): 21,000
Land area: 8.05 sq. mi.

Agoura Hills is located along the Ventura (101) Freeway, 32 miles west of downtown Los Angeles. In 1994 it ranked 64th in population in Los Angeles County. The City land use mix is overwhelmingly low density residential and it has a small job base with services being the predominant sector. Its median family income was $76,361 in 1989.

1. The City has stenciled all of its 105 catch basins with the Heal the Bay design. Los Angeles County Public Works completed the painting and maintains the catch basins.

2. City publicity (newspaper articles, City newsletter, information brochures, etc) encourage reporting of illegal discharges to either the City Public Works Department or the Sheriff's.

3. An urban runoff ordinance is in place in the City. It addresses urban runoff, low head drainage, water efficient landscapes and overspray. A water conservation ordinance was also adopted.

4. Public education pamphlet series promotes "good housekeeping" practices for the construction trades. Two most recent City newsletters address NPDES issues.

5. Catch basins are cleaned annually by County Public Works in the fall and as needed.

6. Six trash receptacles are emptied three times weekly. Litter prone areas are monitored by City staff and cleaned as needed.

7. All 62 miles of streets (1631 curb miles) are swept 1 time per month. 164 tons of material is collected yearly.

8. City ordinance requires proper disposal of materials. Penalty provisions are included in the ordinance.

9. The City contracts with Los Angeles County Public Works for industrial waste services. The inspection program is the same as that provided in the unincorporated areas. City responds to "dumping in progress" calls.

VOL 15 00027

10. County Code Title 16, adopted by reference, requires that rights-of-way be kept clean. City code enforcement officer assists private owners and encourages fencing to deter illegal dumping. No expansion of this program is anticipated due to budget constraints.

11. A recycling program is in effect, diverting 14% of rubbish from landfills. Commercial recycling is planned.

12. The City participates in the County's hazardous waste management program. City distributes a booklet on proper waste disposal.

13. City ordinances address runoff, low head drainage, water efficient landscape and overspray and water conservation. City newsletter with articles on water conservation is delivered to all residents.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF ALHAMBRA

City of Alhambra: Phase II Co-Permittee
Population (1994): 86,300
Land area: 7.626 sq. mi.

Alhambra is located 8 miles northeast of the Los Angeles Civic Center, in the West San Gabriel Valley. It was incorporated in 1903 and ranks 19th among Los Angeles County cities in terms of its 1994 population. Its land uses are primarily residential but it also has a large job base dominated by services and retail trade. The City median family income in 1989 was $34,170.

1. The City is in the process of obtaining City Council approval for stenciling catch basins.

2. City publicity via public education, mailers, newsletter and outreach events inform the public of the County hotline.

3. An urban runoff ordinance was adopted by the City a few years ago. It prohibits illicit discharges into municipal sewers, streets, alleys and public property. Future ordinance will address stormwater run-off pollution.

4. Public education campaigns used include City sponsored events, mailers, newsletters, flyers, school presentations, City Hall tours.

5. 356 City owned catch basins are cleaned manually at least annually and more frequently as needed.

6. 135 trash receptacles are emptied three times a week.

7. All 150 miles of improved streets (300 curb miles) are swept weekly in residential areas and daily in commercial and industrial areas.

8. City ordinance prohibits disposal of refuse, debris, garbage etc. on public rights of ways. Penalties are included in ordinance. Program supported by articles in City newsletters and brochures.

9. The Los Angeles County Sanitation District is contracted to perform annual inspections and to issue industrial waste discharge permits. Legal authority falls under the Alhambra Municipal Code, Fire Prevention and Hazardous Material Code.

VOL 15

00299

R0060250

10. The Alhambra Municipal Code requires individual property owners to maintain public areas adjacent to their property. Program supported by articles in City newsletters and brochures.

11. A recycling program including a recycling center is in effect. Public outreach is established to involve all waste generators in the City. The City's goal is to divert 25% of the rubbish by 1995.

12. The City is a participant in the Countywide household hazardous waste management program. A contract will shortly be finalized to allow Chief Auto Parts to collect waste motor oil from Alhambra residents.

13. A water conservation ordinance is in place. Outreach programs via fliers, mailers and presentations educate residents about water conservation and water conserving nozzles are provided to residents.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF ARCADIA

City of Arcadia: Phase II Co-Permittee
Population (1994): 49,800
Land area: 11.36 sq. mi.

Arcadia was incorporated in 1903 and it is located 16.5 miles northeast of the Los Angeles Civic Center along the 210 (Foothill) Freeway. In 1994 it is the 38th most populous City in Los Angeles County. Arcadia has primarily residential land uses but it also has a large job base, mainly in the retail trade and service industries. It had a median family income of $57,238 in 1989.

1. The City intends to contract with the Los Angeles County Department of Public Works to stencil all City-owned catch basins. An alternate design than Heal the Bay's is planned.

2. Arcadia's Police and Fire Communications Center will handle calls regarding illegal dumping. The City is developing a water bill insert listing the County's and the City's Hotline phone numbers.

3. A draft Stormwater and Discharge Control Ordinance (No. 2010) is anticipated to be adopted August 16, 1994.

4. Articles related to stormwater discharge have, and will continue to appear in the City's newsletter as well as water bill inserts.

5. Catch basins are cleaned annually, inspected after heavy rainstorms for debris, and problem basins are inspected regularly.

6. Arcadia has 200 roadside trash receptacles that are emptied weekly. Problem litter areas are inspected after weekends and holidays.

7. Six broom type sweepers are used to sweep all 146 miles (24,000 curb miles/year) of city streets. Residential areas are swept once a week; non-residential areas twice a week.

8. The City has anti-littering and leash laws. Modifications to these are proposed as part of the pending Stormwater Ordinance.

9. Arcadia has no set program to inspect for illegal waste discharges into the storm drains. Violations are reported as the result of other regular inspections.

VOL 15

0031

10. The City does not have a public education program about removal of dirt, rubbish and debris from sidewalks and alleys.

11. Arcadia estimates that it is diverting 11% of all rubbish from landfills through recycling programs that include single family, multi-family and backyard composting.

12. Arcadia participates in the countywide household hazardous waste management program, has implemented a local motor oil recycling program, and distributes public information.

13. A voluntary water conservation program is in effect that discourages hosing of sidewalks and driveways, and encourages use of drought resistant vegetation and efficient watering.

14. Supplemental Best Management Practices:

A. Contractors and utility companies are required to use construction methods in roadways to minimize the amount of pollutants entering storm drains.

B. Fire hydrant use is restricted, and downstream catch basins are cleaned of any debris prior to testing of fire hydrants.

C. Downstream catch basins are checked and cleaned of debris prior to testing, flushing or construction of water mains.

D. All new development that may cause stormwater erosion are required to erect controls to contain or reduce runoff.

SUMMARY STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF ARTESIA

City of Artesia: Phase III Co-Permittee
Population (1994): 16,100
Land area: 1.61 sq. mi.

Artesia is located 18.8 miles southeast of downtown Los Angeles, and it ranks 69th in population among Los Angeles County cities. The City was incorporated in 1959 and has a large job base, dominated by the service industry. Its' land use mix is mainly residential with some commercial. In 1989 the City had a median family income of $37,332.

1. The County will stencil catch basins in the near future.

2. The City has designated a phone line for community reporting. Press releases, cable television and community meetings are used to inform the public of the City hotline. Two reportings have been received in a 6 month period.

3. The City's Municipal Code contains provisions related to sanitary sewers and industrial waste. Presently reviewing these ordinances in order to recommend modifications.

4. The City has not implemented programs to educate the public on the problem of stormwater pollution, however it is in the process of developing such a program.

5. The Los Angeles County Department of Public Works cleans the City's catch basins regularly.

6. The 26 roadside trash receptacles are emptied twice a week.

7. The 29.6 miles of improved streets are swept every two weeks. This program is currently being evaluated.

8. Recycling program being implemented in compliance with State mandated Reduction and Recycling program. The City has established specially scheduled clean-up days.

9. The Los Angeles County Department of Public Works is contracted to conduct the industrial waste inspection program. Businesses are inspected routinely or when reported.

10. The City conducts Clean-Up-Days and encourages citizen participation. Code Enforcement and City Rehabilitation staff promote beautification of neighborhoods.

VOL 15
0033
R0060254

11. A recycling program including a recycling center has been implemented. 12.6 percent of the collected rubbish is being diverted at this time. The benefits of recycling are explained in City newsletters, fliers and bulletins distributed to community residents.

12. The City participates in the Countywide Household Hazardous Waste Collection program but does not conduct additional hazardous waste collections.

13. The City does not have a water conservation program.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF AZUSA

City of Azusa: Phase II Co-Permittee
Population (1994): 42,900
Land area: 8.83 sq. mi.

Azusa is located 24.5 miles east of central Los Angeles. It was incorporated in 1898 and it currently ranks 42nd in the County by population. Azusa has a large job base, dominated by manufacturing and retail trade. Its land uses are mixed, with some residential, extensive industrial, quarries, retail and vacant land. The City median family income in 1989 was $34,200.

1. The City plans to contract with Los Angeles County to stencil all catch basins.
2. The County hotline number will be advertised when the City begins its public outreach program.
3. The City plans to adopt a runoff ordinance by February 1995.
4. The City is in the planning stages of developing a public outreach program.
5. Catch basins are cleaned on an as needed basis.
6. Thirty roadside trash receptacles are emptied once a week.
7. The street sweeping program includes 78 street miles and 156 curb miles. Sweeping frequency is weekly in residential and industrial areas and bi-weekly in commercial areas.
8. The Azusa Municipal Code prohibits illegal disposal of litter.
9. City code enforcement action will be taken against illegal dischargers with reported to or observed by City officers.
10. The public outreach/education program should be in place by the end of January 1995.
11. City is discussing plans for a recycling program--perhaps a joint effort with adjacent cities--and plans a public outreach/education program.
12. The City participates in the Countywide Household Hazardous Waste Management program but does not conduct its own program.
13. A water conservation program has not been developed however a public outreach program will be in place by the end of January 1995.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF BALDWIN PARK

City of Baldwin Park: Phase II Co-Permittee
Population (1994): 72,000
Land area: 6.77 sq. mi.

Baldwin Park is located 17.7 miles east of downtown Los Angeles, and was incorporated in 1956. It has a small but growing job base, dominated by service, manufacturing and retail trade industries. Baldwin Park land uses are primarily residential and its median family income was $33,029 in 1989.

1. City employees began stenciling city owned catch basins in July 1994.

2. Other than the county hotline, the city has not established any other reporting system.

3. The City has not adopted a runoff control ordinance.

4. A City newsletter sent to all residents describes the problem of stormwater pollution.

5. The City cleans its catch basins twice a year in November and February.

6. The City maintains trash receptacles in parks and commercial areas. They are emptied twice a week.

7. The 103 miles of streets are swept as follows: residential twice a month; commercial and industrial weekly.

8. A City newsletter article mailed to all residents described the problems with the improper disposal of litter, lawn clippings and pet feces.

9. **NO ANSWER PROVIDED**

10. Article published in City newsletter encouraged the removal of dirt, rubbish and debris from sidewalks and alleys.

11. Glass, newspaper and plastic is recycled in the City. 26% of rubbish is diverted from landfills.

12. In addition to the County's program, the City conducts a hazardous waste collection once a year.

13. Water is supplied by three water companies - the City is not involved.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF BELL

City of Bell: Phase III Co-Permittee
Population (1994): 35,800
Land area: 2.81 sq. mi.

Bell was incorporated in 1957 and it is located 8.1 miles southeast of downtown Los Angeles. Its current population ranks the City 49th in Los Angeles County. Bell is located within the central, older industrial areas of Los Angeles County, next to the L.A. River. Its land uses are mixed and include residential, commercial and industrial. The job base is moderate and it is concentrated in manufacturing, utilities, retail trade and services. The median income in the City was $23,262 in 1989.

1. Stenciling of city-owned catch basins will be contracted with County in Fiscal Year 94-95.

2. Other than the County Hotline, the City has not established any other reporting system.

3. Bell will consider adoption of Model Runoff Control Ordinance in F.Y. 1994-95.

4. Public education and outreach program will be developed in Fiscal Year 94-95.

5. The cleaning of catch basins is contracted with the County.

6. No City does not provide any trash receptacles. The program is planned for Fiscal Year 94-95.

7. The 14 miles of improved streets (28 curb miles) are swept weekly in residential areas, and four times a week in commercial and industrial areas.

8. Municipal and other codes prohibit the improper disposal of litter, lawn clippings and pet feces. Enforcement and public outreach will be developed in Fiscal Year 94-95.

9. No industrial waste program at this time -- will be contracted with the County in Fiscal Year 94-95.

10. No program at this time -- will develop in Fiscal Year 94-95.

11. No program at this time -- will develop in Fiscal Year 94-95.

VOL 15

00371

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF BELLFLOWER

City of Bellflower: Phase III Co-Permittee
Population (1994): 63,900
Land area: 6.14 sq. mi.

Bellflower, incorporated in 1957, is traversed by Artesia Freeway (91), 17.7 miles southeast of the Los Angeles Civic Center. This city ranks 26th in population size among Los Angeles County cities. Land uses are primarily mixed residential with some commercial and industrial. It has a small job base, the main employers being the service and retail industries. Median family income in 1989 was $37,026.

1. The 160 City owned catch basins were stenciled with white and blue paint by Cub scouts.

2. In addition to the County hotline, residents can call the Sheriff's Office to report illegal discharges.

3. The City has adopted ordinances in 1957 making it illegal to drain, wash, run or divert water into or upon any public street.

4. The City is in the process of airing Public Service announcements on cable TV.

5. City crews clean catch basins yearly and twice a year if needed.

6. The 60 roadside trash receptacles are emptied once a week.

7. The 100 miles of improved streets are swept weekly in residential and industrial areas and twice a week in commercial areas. Alleys and centerlines are cleaned monthly.

8. The City has adopted an anti-litter ordinance.

9. The City contracts with the County for industrial waste inspections which are performed annually. Non-storm water discharges inspections are limited to code enforcement, observation and/or complaint.

10. The City is developing an education program that will include encouragement to remove dirt and litter

11. The City has established a recycling program and maintains a recycling center. Three to five percent of rubbish is being diverted from landfills. The City is modifying program based on AB 939 requirements.

VOL 15

00399

R0060260

12. The City is a participant in the Countywide Household Hazardous Waste Management program but does not conduct additional hazardous waste collections.

13. The City has adopted a drought tolerant landscaping requirement as part of the Zoning Code.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF BELL GARDENS

City of Bell Gardens: Phase III Co-Permittee
Population (1994): 43,700
Land area: 2.39 sq. mi.

Bell Gardens, incorporated in 1961, is located 9.1 miles southeast of the Los Angeles City Hall. It ranks 41st in terms of population in Los Angeles County, and had a median family income of $23,308 in 1989. Like Bell, the City is located in the industrial core of the County, next to the L.A. river and contains mixed residential, with some industrial and commercial land uses. The job base is moderate in size, dominated by manufacturing and services.

1. Bell Gardens has budgeted to have Los Angeles County Public Works stencil approximately 22 catch basins.

2. A budget has been approved to begin a public outreach program and hotline for reporting illegal dumping.

3. The City anticipates adopting an ordinance, to control urban runoff, this fiscal year.

4. The City has approved a budget to establish a public outreach program on the problem of stormwater pollution this fiscal year.

5. Beginning this fiscal year, catch basins will be checked and cleaned as needed every two months, under a contract to the County Department of Public Works.

6. The Belvedere Trash District provides 22 roadside trash receptacles in the City. Problem areas have not been identified.

7. The City has one vacuum-type street sweeper which maintains 120 curb miles within the city. Residential areas are cleaned once a week and commercial areas three times per week.

8. A budget has been approved to conduct public outreach concerning proper disposal of litter, lawn clippings and pet feces.

9. A budget has been approved to begin an industrial waste inspection program this fiscal year. Frequency of inspections is yet to be determined.

10. A budget has been approved to conduct public outreach concerning removal of dirt, rubbish and debris from sidewalks and alleys.

VOL 15

00411

R0060262

11. The City has implemented a curbside recycling program collecting paper, glass, aluminum and green waste. It does not have a recycling center, but has implemented a promotional campaign. Approximately 22% of rubbish is being diverted.

12. The City participates in and conducts public outreach about the County's household hazardous waste collections.

13. Bell Gardens has a water conservation program in effect during severe drought that would indirectly reduce runoff to storm drains. The proposed public education program will include water conservation information.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF BEVERLY HILLS

City of Beverly Hills: Phase I Co-Permittee
Population (1994): 32,600
Land area: 5.69 sq. mi.

Beverly Hills, incorporated in 1914, lies 10.9 miles west of the Los Angeles Civic Center. This City's upscale and designer shops are an attraction for tourists, providing a very strong job base dominated by services and finance. Its land uses include low density residential and high density residential, commercial and office. Its population ranks 53rd among L.A. County cities and the City had an $83,272 median family income in 1989, one of the highest in the County.

1. The City has stenciled 1230 catch basins with the Heal the Bay design.

2. In addition to the County hotline, the City has established a hotline in 1992 to allow the reporting of illicit/illegal discharges or dumping.

3. The City has adopted ordinances encouraging water conservation and a reduction in run-off in 1993. A water mitigation ordinance and stormwater run-off ordinance is now being considered by the City Council.

4. The City has utilized brochures to inform the public about stormwater pollution.

5. All catch basins are cleaned annually, with some cleaned bi-weekly due to deciduous tree problem.

6. Hundreds of trash receptacles are emptied daily with those near bus stops, parking garages and heavy pedestrian areas monitored more often.

7. The City's street sweeping program includes daily sweeping in commercial and industrial areas and weekly in residential.

8. The City uses outreach brochures in utility bills, the recycling program, municipal ordinances and catch basin stenciling to discourage improper disposals.

9. The City has a contractual agreement with the County to inspect businesses on an annual basis.

10. Outreach brochures are sent to all utility customers and distributed at community affairs to encourage the public's assistance in maintaining sidewalks and alleys.

VOL 15
00043
R0060264

11. The City's recycling program includes material recycling, public outreach through newspaper advertising, direct mailings and two annual hazardous round-ups. At this time 14% of rubbish is recycled. Most solid waste now goes to energy plant to generate electricity.

12. Two City round-ups are conducted every year in addition to the County's Household Hazardous Waste program.

13. The City has adopted erosion and run-off control provisions, and water conservation ordinances.

VOL 15 0044

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF BURBANK

City of Burbank: Phase II Co-Permittee
Population (1994): 98,700
Land area: 17.12 sq. mi.

Burbank was incorporated in 1911, lies 10.9 miles northwest of central Los Angeles, and it has the 12th largest population in the County. Burbank has a very strong job base, relying primarily on manufacturing and services, with a very strong presence by the motion picture and related industries. Burbank is also the home of the Burbank-Glendale-Pasadena Airport, one of the busiest in the region after LAX. Its land uses are diverse with single family residential the most common. Median income in Burbank was $42,148 in 1989.

1. The City has not implemented a catch basin stenciling program because it would provide little benefit and require continuous maintenance.

2. The City has not implemented any programs to facilitate public reporting of illegal discharges/dumping. Since 1976 listings in the phone book have been maintained for the Fire Department and Public Works Department.

3. Urban runoff control measures were adopted many years ago.

4. The City is in the process of developing a public outreach program to educate the public on the problem of stormwater pollution.

5. The City has recently implemented an annual catch basin cleaning program.

6. The City provides 205 roadside receptacles which are emptied once per week to once per day. Receptacles are placed in high traffic areas and collected frequently.

7. The street sweeping program includes 470 curb miles and services residential, commercial and industrial areas at a rate of twice per month. The City is planning to assess the benefits of increasing street sweeping in several areas.

8. The City has automated curbside pickup of green waste, garbage and recyclables with public outreach.

VOL 15

00455

9. The City inspects land uses three times per year for industrial discharge to sanitary sewer only and conducts inspections for non-storm water discharges on a complaint basis. The City is currently working on a storm drain inspection program as a BMP.

10. The City is developing a program to encourage the public to remove dirt, rubbish and debris from sidewalks and alleys.

11. The recycling program consists of curbside collections of recyclables, public outreach/education to school grades 1-8, adult service organizations and businesses. At this time 38% of rubbish is being diverted from landfills.

12. The City participates in the Countywide Household Hazardous Waste Management program but does not conduct additional waste collections. Public outreach is used to ensure proper disposal of hazardous waste.

13. Programs of public education are being developed and water conservation program was developed during the drought years to reduce water consumption.

14. <u>Additional BMP's</u>

A. Construction Pollution Control ordinance requires erosion control plan for grading permit.

B. Demolition Construction Pollution Control ordinance being considered will set standards for pollution control during demolition of structures.

C. Stormdrain Inspection being considered will require field inspection of stormdrains to determine connections and reduce pollution sources.

D. Stormdrain Inspection being considered will survey system to determine areas of greatest pollution.

E. Discharge Assessment being considered will survey and assess type and number of non-storm water discharges into the storm drain system.

F. Program for Control of Illegal Discharges being considered will regulate discharges to storm drain, establish permit program and procedure.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF CALABASAS

City of Calabasas: Phase II Co-Permittee
Population (1994): 17,700
Land Area: 12.85 sq. mi.

The City of Calabasas is located 28.2 miles west of the L.A. Civic Center along the Ventura (101) freeway and was incorporated in 1991. Land uses in the city are primarily residential with some commercial along the Ventura freeway.

1. The County has stenciled all basins that are owned by the City. Basins that have not yet been stenciled are located within gated communities which are maintained by individual Homeowners Associations.

2. The City has established an 800 hotline number. The public was informed of the hotline through advertisement jointly with recycling program.

3. The City has drafted an urban runoff control ordinance presently under review by City staff.

4. Public outreach has begun through the local cable channel airing of L.A. County and Heal the Bay videos.

5. The County of Los Angeles provides catch basin cleaning annually.

6. The City's roadside trash receptacles are emptied weekly.

7. The City contracts with a private street sweeping firm to maintain all non-gated roadways. Streets are swept once per week. Gated communities are maintained by the respective Homeowners Associations.

8. The public service announcement on local cable channel discusses the improper disposal of litter, lawn clippings and pet feces.

9. An industrial waste inspection program has not been implemented. The City addresses industrial waste control in the review of new applications for industrial and commercial development and in the plan checking process. The City's Building and Safety Division monitors the installation of the required trap systems.

10. The City has not implemented a public outreach/education program to encourage the public to remove dirt, rubbish and debris from sidewalks and alleys.

VOL 15

0047

R0060268

11. The City recycles materials at curbside. Approximately 19% of rubbish is diverted. Mailers, recycling hotline, exhibits and Earthday recycling art contest are the elements of the outreach/education program.

12. The City participates in the Countywide Household Hazardous Waste Management program but does not conduct additional waste collections.

13. The Las Virgenes Municipal Water Company promotes water conservation by providing a free exterior audit and review of sprinkler heads/system and a free self-guided tour is available showing low-flow irrigation systems to be duplicated at home. Additionally, the public is further encouraged to conserve water by recorded messages on Water District telephones during transferring of calls or when callers are placed on hold.

SUMMARY STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CALTRANS Phase I, II, III Co-Permittee

1. Caltrans has implemented a Stenciling Program and to date has completed approximately 1083 catch basins. The rest will be completed by November 30, 1994.

2. A 24-hour Caltrans hot line where the public can report illegal discharges and dumping is in place for more than a year.

3. Urban runoff control measures were adopted in November 1993. These measures appear to be effective.

4. A limited public outreach program has commenced. Flyers have been distributed and bumper stickers and informational brochures are being prepared for distribution.

5. Catch basins are generally cleaned every 2 years, and more frequently when inspection by Maintenance forces show the pipe is clogged. Also, erodible materials and debris are regularly removed from retention/detention basins, preventing them from going into streams or waterways.

6. Roadside trash receptacles are provided and are emptied according to demand.

7. 1,166 centerline miles are swept when accumulated debris reaches a certain prescribed level.

8. Improper disposal of litter is discouraged by highway signs stating: No Littering (plus a fine).

9. Every 90 days clarifiers are pumped out; storm drains are constantly monitored. Auto related facilities are inspected daily, gas stations are lead tested once a year.

10. This item is not applicable to Caltrans.

11. Curbside recycling is not applicable to Caltrans; however, Caltrans utilizes recycled materials and estimates that it has diverted approximately 5% of rubbish from landfills due to recycling efforts. A pilot program to allow usage of 15% recycled asphalt concrete has been started. Shops recycle used oil, anti-freeze, oil filters and aluminum.

12. Caltrans does not participate in the Countywide Household Hazardous Waste Management Program.

13. Water Conservation is encouraged by the water policy/action plan. Measures include: use of non-potable water when possible, cooperation with local water agency conservation

VOL 15

0049

plans, fertilize only when absolutely necessary, increase chipping and mulching. Signs noting use of reclaimed water remind the public for need of water conservation.

14. ADDITIONAL BMP's

A. Leaking Underground Storage Tanks Five Year Plan

Included in this program will be site investigation, leak detection of tanks, removal, remediation and installation of fuel canopies over fuel islands.

B. Right-of-Way Maintenance Vegetation Control Program

Vegetation when properly maintained and controlled provides the benefits of motorists' safety and erosion control.

C. Public Information and Participation Program--Adopt a Highway

This program removes litter from roads. Permits are issued to organizations, clubs or individuals who agree to "adopt" a 2 mile section of a highway. Participants are provided with tools and equipment and are required to clean their section at least 12 times per year.

D. Personnel Training Program

Personnel is educated on highway maintenance or related subjects and available BMP's on a regular basis. Some of the courses are: Hazardous Substance Spill Awareness and Pesticide Safety and Vegetation Management.

E. Erosion and Sediment Control Practices

Where slopes show evidence of erosion, slides and or slipouts, remedial measures are taken to stabilize the slope. Efforts are made to dispose of eroded soil, rock and debris at approved dumping sites.

F. Priority Lists of Drains and Pump Houses

A priority list of drains and pump houses requiring cleaning based on the following will be developed: recent flooding or historically poor drainage areas, and amounts of sediments. Drainage facilities requiring cleaning will be sampled and tested and then cleaned.

G. Inspection of Excess Land Parcels

Investigation, identification and remediation program for hazardous waste and debris on excess parcels.

VOL 15 0050

H. Contractor Water Pollution Control Program

A requirement has been added that contractors submit a plan for water pollution control during construction operations. Operations may be temporarily halted if inadequate provision has been made for water quality protection.

SUMMARY: STORMWATER/URBAN RUNOFF PROGRAM QUESTIONNAIRE

CITY OF CARSON

City of Carson: Phase III Co-Permittee
Population (1994): 86,300
Land area: 19.24 sq. mi.

Carson lies 18.5 miles south of Los Angeles City Hall, just east of the 110 (Harbor) Freeway and was incorporated in 1968. It has the 20th largest population in the County and a very large job base with manufacturing and wholesale trade dominating. Land uses reflect the job base of this city with significant commercial and industrial sectors. There are also single family residential uses and some vacant lands. Median family income was $47,387 in 1989.

1. The City has purchased stencils and received donated paints. City staff has painted several basins in and industrial area and all basins in the vicinity of the Civic Center. Citizen groups are organized to begin a concerted painting effort in late September.

2. The City has established its own illegal dumping hotline in addition to the County's. The City has informed the public of the hotline services in its newsletter and brochures. Additionally, City staff has been informed of the importance of reporting illegal dumping.

3. An urban runoff control ordinance dating from 1968 is in effect that the city thinks has been effective. The City expects to adopt a model ordinance in 1995.

4. An outreach program with newsletter articles, fliers, and handouts sent to the public and pamphlets available at City Hall has been implemented.

5. Carson's catch basins are maintained by Los Angeles County once a year.

6. The City provides trash receptacles at all bus stops which are emptied daily.

7. Carson has 1 vacuum and 3 broom sweepers that are used to clean all 407 miles of City curbs once weekly.

8. The City has an ordinance to discourage improper disposal of litter, lawn clippings and pet feces. Penalties are included.

9. Under a contract, the County inspects non-storm water discharges from industrial sites.

10. Carson has annual alley and street clean up days with citizen volunteers. They work well in the residential and industrial

VOL 15
0052
R0060273

areas and fair in the commercial areas. In addition to annual clean up program, the municipal code, section 5302, requires all property owners to clean sidewalks and alleys.

11. The City has implemented a curbside recycling program collecting newspaper, glass, and plastic. It does not have a recycling center, but does offer oil recycling, and green waste recycling. About 16% of rubbish is being diverted.

12. The City participates in the countywide household hazardous waste management program.

13. The Dominguez Water Company which serves the City has a water conservation program. Additionally, the City has completed a demonstration xeriscape garden at the Civic Center. The emphasis of the garden is water conservation.

R0060274

SUMMARY: STORMWATER/URBAN RUNOFF PROGRAM QUESTIONNAIRE

CITY OF CERRITOS

City of Cerritos: Phase III Co-Permittee
Population (1994): 54,200
Land area: 8.79 sq. mi.

Cerritos is located 18.8 miles southeast of the Los Angeles Civic Center along the Santa Ana Freeway and adjacent to the Orange County line. It has a large job base with manufacturing, retail trade and services dominating. Land uses are primarily single family residential with substantial industrial and commercial sectors. The City was incorporated in 1956 and it has the 33rd largest population in the County. Median family income was $60,689 in 1989.

1. The County will be stenciling the City's catch basins with the Heal the Bay design.

2. The City has promoted the County's illegal dumping hotline through its city newsletter.

3. Cerritos is now preparing an urban runoff ordinance.

4. Public education and outreach programs on stormwater runoff are in the conceptual stage (see note below).

5. The City contracts with the County Public Works Department to annually clean out its catch basins.

6. Cerritos has roadside trash receptacles that are emptied weekly.

7. Broom type sweepers are contracted for to clean 400 curb miles weekly.

8. Cerritos uses its newsletter to build public awareness of proper disposal of litter and other materials.

9. The City inspects businesses periodically for compliance with waste disposal regulations. Storm drains are checked frequently for non-storm water discharges.

10. Cerritos does not have any program to encourage removal of dirt and other materials from sidewalks and alleys.

11. The City intends to begin a recycling program in January 1995.

12. The City participates in the countywide household hazardous waste management program.

VOL 15
0054
R0060275

13. Cerritos has an ordinance prohibiting hosing of driveways during MWD-declared drought periods.

14. Additional BMP's

A. Cerritos indicates that it is considering implementation of a Public Outreach and Pollution Prevention Program, to educate residents and businesses about stormwater pollution prevention.

VOL 15
0055

SUMMARY: STORMWATER/URBAN RUNOFF PROGRAM QUESTIONNAIRE

CITY OF CLAREMONT

City of Claremont: Phase II Co-Permittee
Population (1994): 33,200
Land area: 13.43 sq. mi.

Claremont was incorporated in October, 1907, and is located 32.4 miles east of Los Angeles City Hall along the San Bernardino County line, just north of the San Bernardino Freeway. Its job base is moderate, dominated by the service and retail sales sectors. City land uses are mixed with mostly single family residential and commercial. 1989 median family income was $62,203.

1. The County will be stenciling a majority of the catch basins. City-owned catch basins will be stenciled by volunteers. The Heal the Bay design will be used.

2. The City has promoted the County's illegal dumping hotline through its city newsletter.

3. Claremont is in the process of creating an urban runoff control measure, however it is already conditioning all grading permits for erosion control.

4. The City has placed educational articles in the City newsletter concerning stormwater pollution.

5. Claremont has started to clean catch basins once a year.

6. The City has 30 roadside trash receptacles that are emptied as needed. This year it is considering further actions for litter control.

7. Claremont uses 2 vacuum and 1 broom type sweepers to clean all 105 miles of city streets once per month.

8. Code enforcement efforts help to discourage improper disposal of litter and other materials.

9. The City does not have a formal program to inspect industrial waste disposal. There are very few industrial users. The employees are informally on the lookout for illegal discharges. Restaurants are inspected as needed.

10. Claremont does not have any program to encourage removal of dirt and other materials from sidewalks and alleys.

11. The City has a recycling program and a permanent recycling center, however the program is just beginning and there is no curbside collection of materials yet.

VOL 15

00056

R0060277

12. The City participates in the countywide household hazardous waste management program.

13. Claremont has published water conservation articles in its City newsletter, and completed major renovation of its own landscaping and irrigation systems.

R0060278

SUMMARY STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF COMMERCE

City of Commerce: Phase III Co-Permittee
Population (1994): 12,400
Land area: 6.55 sq. mi.

Incorporated in 1960, Commerce is located 7 miles east/southeast of the Los Angeles Civic Center, primarily between the Los Angeles river and the Santa Ana Freeway. This is the heart of the County's industrial base with predominant land uses being manufacturing, some commercial and some residential. Commerce has a very strong job base with a very high ratio of 3 jobs for every resident. Manufacturing and wholesale trade are the two dominant industries. Median family income was $29,331 in 1989 and the City ranks 75th in population among Los Angeles County cities in 1994.

1. All catch basins within the City are owned and maintained by Los Angeles County. The City plans to request the county to stencil all of its catch basins using the 8 inch Heal the Bay stencil.

2. No awareness program has been implemented yet but the City plans to encourage residents and businesses to report illegal dumping.

3. The City has an existing ordinance, section 9.04.070, which prohibits illegal dumping in/upon any public or private road, highway, street, alley, public way or any public or private property of any kind. Section 12.16.060 prohibits non-storm water discharge. The City also plans to adopt a storm water/urban runoff control ordinance prior to June 18, 1995.

4. No programs have been established but the City intends to develop and implement a public education and outreach program in FY 95-96.

5. Catch basins are cleaned by the County Department of Public Works once a year. They are also cleaned on an as-needed basis in response to complaints throughout the year.

6. The City provides approximately 100 receptacles placed at bus stops, parks, city facilities and commuter train station. Those at the city parks are emptied once a day. Receptacles at other locations are emptied twice a week. Receptacles have been added in litter prone areas and are emptied as necessary to prevent overflow.

7. 120 curb miles are swept once per week. The City feels that this frequency is adequate to maintain an absence of debris but feels street sweeping does not prevent debris from entering storm drains-it only reduces a quantity of it from entering receiving waters.

VOL 15
0058
R0060279

8. Section 904.070 of the City Code prohibits littering of any material including lawn clippings on public property. In addition, 8.04.500 prohibits the disposal of pet feces except into street gutters. Penalties, including fines and imprisonment, are imposed for improper disposal.

9. Industrial waste inspections are contracted to Los Angeles County. No non-storm water discharges are inspected as part of the industrial waste program but City code enforcement staff is responsible for citing those who illegally discharge. Auto related businesses, gas stations and restaurants are not inspected.

10. The City has not implemented a public education/outreach program to encourage the public to remove dirt, rubbish, and debris from sidewalks and alleys. However, these practices are required by ordinance and enforced by code enforcement. During FY 1994-95, the City plans to promote these good housekeeping BMPs as part of its comprehensive storm water/runoff pollution prevention public education/outreach program.

11. Curbside recycling collection is provided to residents and businesses. Various media is employed to encourage participation in the program including cable tv, newsletters, information packets, brochures and other literature. The City estimates that approximately 50% of rubbish is being diverted from landfills.

12. The City encourages residents and small businesses to participate in the HHW round-ups and informs the public when these events are occurring.

13. The City has a water conservation in landscaping ordinance which indirectly reduces non-storm water discharge. Section 12.16.060 prohibits the discharge of any water flow. The City plans to incorporate water conservation into its storm water pollution prevention outreach program.

VOL 15

0059

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF COMPTON

City of Compton: Phase III Co-Permittee
Population (1994): 91,600
Land area: 10.11 sq. mi.

Compton lies 11.6 miles south of downtown Los Angeles, north of the Artesia Freeway (91), between the Long Beach (710) and the Harbor (110) Freeways. Its population makes it the 16th largest city in Los Angeles County and the City maintains a large job base. The largest employers are manufacturing, trade and services. Land uses are mainly residential and industrial with some commercial. Median family income in 1989 was $25,699.

1. The City has not implemented a stenciling program. A service request/purchase order for Los Angeles County to do the work is in progress.

2. The City public works field office number, (310) 605-5691, is open for complaints on infrastructure problems and can be used to report illegal dumping. City staff and the public have been informed of the existence of this phone number.

3. The City's Water Department has policies related to water conservation measures and periodically informs the residents by fliers and displays at City Hall.

4. The City is in the process of developing the program.

5. The catch basin cleaning program consists of annual cleaning prior to the rainy season, and, also on an "on-call" basis, as problems of clogging are reported.

6. Roadside trash receptacles are placed in commercial areas and emptied once a week. An inspection program of problem litter areas has not been established but General Services Department makes sure that receptacles are emptied as necessary and are in good condition.

7. The street sweeping program covers all areas of the City on a weekly frequency.

8. The improper disposal of litter, lawn clippings and pet feces is discouraged through public outreach fliers, and block club meetings. Penalties are in place for improper trash disposal.

9. The County Sanitation District performs the industrial waste inspections for the City.

VOL 15

00060

10. Removal of dirt, rubbish and debris from sidewalks and alleys is and has been an on-going function of City field crews. Public outreach and employee participation was developed in 1988 to report existence.

11. The recycling program includes curbside pick up, an education program and source reduction. 21% of rubbish is diverted.

12. The City participates in the Countywide Household Hazardous Waste program but does not conduct its own collections. It sends out fliers from L.A. County to inform the public.

13. The water conservation program consists of voluntary compliance. The City's Water Department sends fliers periodically. No penalties. Also, the school district has an on-going program getting the school children involved by having a display of their drawings and sketches on the importance of conserving water. The City is in the process of developing a program to inform the public regarding the problems of urban runoff.

0061
R0060282

SUMMARY: STORMWATER/URBAN RUNOFF PROGRAM QUESTIONNAIRE

CITY OF COVINA

City of Covina: Phase II Co-Permittee
Population (1994): 44,450
Land area: 6.995 sq. mi.

Covina is located 22.9 miles east/northeast of downtown Los Angeles, north of the San Bernardino Freeway. It was incorporated in 1901 and it is 39th in population among Los Angeles County cities. Covina has a strong job base dominated by the service, manufacturing and retail trade sectors. Land uses are mixed and include single family residential, industrial and commercial. Median family income in 1989 was $44,375.

1. Covina has about 70 catch basins to stencil. The City will use volunteers and will purchase templates from the County.

2. The City is distributing fliers to developers and the public and publishing articles that advertise the County's hotline number for reporting illicit dumping. City staff is receiving training in identifying illegal dumping sources.

3. An urban runoff ordinance became effective in Covina on July 23, 1994. The ordinance is already being used to enforce against two auto shops.

4. The City does not have a comprehensive program to educate the public about stormwater pollution, but has published articles about it in the City newsletter.

5. Covina personnel inspect catch basins throughout the year, and before the storm season, and clean them as necessary.

6. Approximately 100 roadside trash receptacles are located in Covina and they are emptied weekly. Staff plans to evaluate additional capacity needs in the coming months, and will address the problem of scavengers scattering trash.

7. Covina uses broom sweepers to clean 525 curb miles per month. Residential and industrial areas are cleaned once per month; commercial areas are cleaned up to 12 times per month.

8. The City has not yet created a program to discourage improper disposal of litter and other materials. Improper trash disposal is a misdemeanor under local codes.

9. Covina is just beginning to inspect specifically for non-storm water discharges to the storm drain system.

10. The City has not yet implemented a public education program to encourage removal of dirt and other material from sidewalks and alleys.

VOL 15
0062

11. A comprehensive recycling program has been established which includes curbside pick-up of recyclables, public outreach and education, and recycling of motor oil at Chief Auto Parts.

12. The City widely publicizes the County's household hazardous waste round-ups, and has the local motor oil recycling program.

13. Covina has not yet created a water conservation program. It is installing low maintenance, water conserving landscaping at one of its parks.

14. Additional Best Management Practices:

A. Covina can require the cleaning of privately owned storm drains.

B. The City requires all refuse containers to have covers, and endeavors to insure that covers are kept closed.

C. Covina has modified handling of its own green waste so that it is less likely to be scattered by wind.

D. Open storm channels in two parks are cleaned monthly and before predicted storms.

E. The City is expanding its efforts to recycle materials and intercept debris from its own vehicle maintenance program.

F. Covina is beginning to notify contractors about containment of construction debris and proper disposal practices.

G. Contractors working in public rights of way are required to prevent discharge of non storm water run-off into the storm drain system.

H. Dirt and other materials transported over paved roadways must be covered.

I. Newly developed land must have 90% landscape coverage within 1 year and 100% coverage within 3 years.

J. Covina will work to improve interdepartmental communication and responsibilities for responding to hazardous materials incidents.

K. The City has created an equipment management brochure to distribute to developers and construction crews.

VOL 15
0063
R0060284

SUMMARY: STORMWATER/URBAN RUNOFF PROGRAM QUESTIONNAIRE

CITY OF CUDAHY

City of Cudahy: Phase III Co-Permittee
Population (1994): 23,750
Land area: 1.09 sq. mi.

Cudahy was incorporated in 1960, and is located 12.2 miles south/southeast of the Los Angeles Civic Center. The City has a very small job base with less than 10 jobs per 100 residents, primarily found in the retail trade. Land uses are primarily medium density residential with some commercial. Its median family income was $22,245 in 1989.

1. Cudahy will contract with the County in FY 94-95 to have its catch basins stenciled.

2. The City will develop a public outreach program concerning illegal discharges in FY 94-95.

3. Adoption of the model runoff control ordinance will be considered in FY 94-95.

4. Public education and outreach on the problem of stormwater pollution will be developed in FY 94-95.

5. Cudahy contracts with the County to clean out catch basins prior to the storm season. Will reevaluate program in FY 94-95.

6. Cudahy has 9 public roadside trash receptacles which are emptied weekly. Heavily used receptacles are emptied more often.

7. A broom type sweeper is used to clean all 26 curb miles within the City twice weekly.

8. Several municipal code sections prohibit improper disposal of debris and other materials. A public outreach program will be developed in FY 94-95.

9. Businesses with industrial waste permits are inspected annually under a contract with the County. The inspection program will be expanded in FY 94-95 to comply fully with this BMP.

10. A public outreach program, concerning removal of dirt and other materials from sidewalks and alleys, will be developed in FY 94-95.

11. Cudahy will be developing a recycling program in FY 94-95.

VOL 15

0064

12. Cudahy participates in Countywide Household Hazardous Waste Management Program.

13. A public outreach program will be developed in FY 94-95 to inform the community of water runoff pollution.

VOL 15 0065

SUMMARY: STORMWATER/URBAN RUNOFF PROGRAM QUESTIONNAIRE

CULVER CITY

Culver City: Phase I Co-Permittee
Population (1994): 39,450
Land area: 4.97 sq. mi.

Culver City incorporated in 1917, lies 10.9 miles west of L.A. City Hall, south of the Santa Monica Freeway, and it has the 44th largest population among cities in Los Angeles County. Culver City also has a very large job base with services, retail trade and manufacturing dominating the job market. Land uses are primarily single family residential, with some commercial and industrial. Median family income was $50,411 in 1989.

1. Culver City has stenciled all of the approximately 750 catch basins in the City with the Heal the Bay design. After 1 1/2 years, some stencils are fading and will have to be re-done.

2. The City has actively publicized the County's storm water hotline by (1) distributing door hanger-type flyers to all residents; (2) publishing several newsletter articles about runoff pollution; (3) distributing brochures containing the hotline number at Ballona Creek Clean-up Day; and (4) airing runoff pollution-related videos on the City's cable television channel.

3. The City has adopted several ordinances that operate to reduce contaminants in storm water and non-storm water runoff and has incorporated by reference into its municipal code the Uniform Building Code which, among other things, prohibits sediment discharges associated with construction activities.

4. The City has implemented the following programs to educate the public on stormwater pollution: distributed door-hangers explaining the problem of runoff pollution; has aired storm water pollution videos on local cable; and, has published storm water pollution awareness articles in City newsletter.

5. Culver City cleans its catch basins annually just prior to the storm season. County owned catch basins in the City are cleaned by the County on about the same schedule. Thereafter basins are cleaned on an as-needed basis.

6. The City has approximately 200 refuse receptacles in place in litter-prone areas--most are not roadside. These receptacles are emptied once to twice a week.

7. Street sweeping is conducted on all 160 curb miles of the City once a week. 3-4 vacuum type sweepers are used to clean alleys, public parking lots, as well as streets.

*

VOL 15
0066
R0060287

8. The City's municipal code prohibits the littering and improper disposal of lawn clippings and pet feces. Violating these ordinance provisions is punishable by fines and other sanctions. The City has encouraged compliance with these requirements through (1) door hanger fliers; (2) articles in the City newsletter; and (3) airing of storm water management videos.

9. The City conducts inspections of auto parts, auto repair, and body shops, as well as gas stations and restaurants. Generally, auto parts, repair, and body shops are subject to industrial waste water permit requirements as required by City ordinance. The City contracts with Los Angeles County to perform annual inspections. The City's Fire Department also performs annual inspections of facilities that handle and store hazardous materials.

10. The City has encouraged residents to remove dirt, rubbish, and debris from sidewalks and alleys through brochures and other print media.

11. Culver City has implemented a single and multi-family residential recycling program, and operates 11 drop-off centers. About 23% of rubbish is being diverted.

12. The City encourages residents to participate in the Countywide household hazardous waste round-ups and to drop-off hazardous materials at the City of Santa Monica's waste collection facility.

13. Culver City has an ordinance which prohibits residents and businesses from using water in a way as to cause runoff into City streets.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF DIAMOND BAR

City of Diamond Bar: Phase II Co-Permittee
Population (1994): 54,500
Land Area: 14.77 sq. mi.

Diamond Bar is located 31.1 miles east/southeast of the L.A. Civic Center, along the Pomona (60) freeway, adjacent to the San Bernardino County line. The city is primarily residential with some retail commercial. It ranks 32nd in the County in terms of population

1. The City contracted with L.A. County who has stenciled approximately 260 catch basins with the Heal the Bay design. The stenciling program has been effective in increasing general public awareness.

2. In addition to the County hotline the City operated a hotline in cooperation with the Sheriff since December 1993. In August 1994, the City will implement a 24-hour dumping reporting telephone number at City Hall. The public has been informed through community newsletters and informational brochures.

3. In January of 1990 the City adopted by reference the L.A. County Code, Title 20 relating to Sanitary Sewers and Industrial Waste.

4. Flier/brochures have been developed to increase awareness and to provide encouragement for proper disposal of materials.

5. The catch basins are cleaned annually prior to the storm season. This program has not been changed in response to RWQCB requirements.

6. The City does not provide roadside trash receptacles. However, there is a litter abatement program utilizing private contractors.

7. Sweeping of 215 curb miles is done bi-weekly. This program has been in effect since 1989.

8. Since November 1993, the City has required waste haulers to provide compost bins to single family residences. This helps to discourage the improper disposal of lawn clippings. "Adopt a Street" program is suggested as a way to discourage improper litter disposal.

9. The L.A. County Department of Public Works provides industrial waste and non-storm water discharge inspections. Industrial

VOL 15 0068

R0060289

users are inspected on a regular schedule based on types of processes, industrial classification and inspection fee class. Auto related businesses and gas stations are inspected 1-3 times per year and restaurants are inspected once per year. Less than 10% of businesses are found to not be in compliance.

10. The City has developed fliers/brochures to encourage the proper disposal of materials.

11. A curbside recycling program has been implemented. Aluminum, glass, plastics, and newspapers are included in the program. The City has established a comprehensive public outreach program and estimates that approximately 32% of rubbish is being diverted from landfills. A greenwaste and a commercial sector program are being considered.

12. The City participates in the Countywide program and conducts curbside collection of used motor oil. Increased public education efforts will augment its collection program.

13. The City has water efficient landscape regulations. Developers are required to provide information to buyers/tenants on water efficient techniques.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF DOWNEY

City of Downey: Phase III Co-Permittee
Population (1994): 94,800
Land Area: 12.7 sq. mi.

Located 13 miles southeast of the Los Angeles Civic Center, just east of the Long Beach (710) and north of the Century (105) Freeways, Downey was incorporated in 1956. Its land uses are mixed urban with well established residential, industrial and commercial areas. Service and manufacturing industries provide Downey with a large job base. The 1994 population ranks Downey 15th among L.A. County cities. Median family income for the City was $41,897 in 1989.

1. 720 catch basins have been stenciled with the Heal the Bay design by local boy scouts. There are plans to stencil the remaining ones.

2. The City uses the "WE TIP" program in addition to the County hotline to encourage reporting of illegal dumping. Cash rewards are given out anonymously. 20-25 reports have been received.

3. Section 8218 of the Downey Municipal Code and Chapter 70 of the UBC address urban runoff control. These measures, adopted in 1988, are being more rigorously enforced.

4. The City is waiting for formal approval for L.A. County to send out a county non-point source pollution publication to residents.

5. Catch basins are cleaned by City personnel twice per year. This program has been very effective and has not been modified in response to RWQCB requirements.

6. The City provides 20 roadside trash receptacles which are emptied weekly. "Operation Brightside" addresses citywide clean-up while the "Adopt a Street" program is a business area clean-up.

7. 512 curb miles are swept; residential and industrial areas weekly and commercial areas bi-weekly. This program has not been modified in response to RWQCB requirements.

8. The City sponsors "Waste in Place" programs in elementary schools to discourage littering. Penalties exist for improper trash disposal. The city suggests that enforcement of current litter laws would discourage improper litter disposal.

VOL 15
00070
R0060291

9. Field investigations are conducted of all complaints regarding industrial waste. Auto related businesses, gas stations, and restaurants are all inspected based on complaints under the authority of Sections 4116 and 4117 of the Downey Municipal Code.

10. A yearly clean-up is held and response to the program has been good. The City has become more pro-active due to the RWQCB regulations.

11. The City has implemented a voluntary curbside recycling program. Newspaper, aluminum, tin and steel cans, glass and certain plastic containers are collected. Fliers and brochures were sent to the public, programs were conducted at schools and community group meetings to publicize the program. Currently, 6%-7% of rubbish is being diverted from landfills. The City plans to make the recycling program mandatory in late 1994.

12. The City participates and promotes County Hazardous Waste roundups. A used oil recycling program will be implemented this year.

13. The public is informed about the problems of overwatering in a publication to residents. Per the Downey Municipal Code, runoff water from landscaped area is not allowed in the streets. Field personnel constantly monitor.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF DUARTE

City of Duarte: Phase II Co-Permittee
Population (1994): 21,300
Land Area: 6.8 sq. mi.

Duarte is located 19.8 miles northeast of the downtown Los Angeles Civic Center along the Foothill (210) Freeway and the northern end of the San Gabriel River (605) Freeway. It was incorporated in 1957 and currently ranks 63rd in population size among L.A. County cities. Duarte has a large job base dominated by the manufacturing and service industries. Dominant land uses are institutional (hospital), residential and commercial, with some industrial. Median family income in 1990 was $37,965.

1. The City plans to stencil catch basins and it is estimated that all stenciling will completed by October 1994.

2. In addition to the County hotline, the City has established a city hall contact and has publicized information in the city quarterly newsletter. An article on pollution effects and prevention measures was also included.

3. Several ordinances/code sections/city policies address urban runoff control. Contractors are required to control dust, restore drainage ditches, clean catch basins and culverts, prevent water, soil and debris from depositing in gutters and to remove excess materials. These measure have been enhanced in response to RWQCB requirements.

4. The City has established a public education program which includes articles published in the City newsletter and video broadcasts. Awareness has been enhanced thanks to this program.

5. Catch basins are cleaned each October and as needed during the year.

6. 120 roadside trash receptacles are provided and they are emptied weekly or more often as required. This program has been enhanced due to RWQCB requirements.

7. 128 curb miles are swept every other week in residential areas and twice per week in commercial and industrial areas. Sweeping frequency has been increased in response to RWQCB requirements.

8. Improper litter disposal is addressed in several city regulations and policies. Penalties exist for improper disposal. No modifications have been made in response to RWQCB requirements.

VOL 15
0072

9. The City contracts with L.A. County for industrial waste and storm drain system inspections. Inspections are conducted on a regular basis per County requirements.

10. The City has encouraged the removal of dirt, rubbish and debris through video broadcast on local cable TV, and an article in the City newsletter.

11. The City has a curbside recycling program for plastic, glass, aluminum, paper, cardboard, junk mail, newspaper and green waste. Information on this program is provided in the quarterly newsletter, from the refuse company and in a school education program. Approximately 18% of rubbish is being diverted at this time. The City may consider expanding the program to multi-family units, and industrial and commercial businesses.

12. The City participates in the Countywide program and publishes information in the city newsletter and in handouts.

13. The City prohibits draining of pools into the gutter and has informed the public on the problem of overwatering etc. in the quarterly newsletter.

SUMMARY: STORMWATER/URBAN RUNOFF PROGRAM QUESTIONNAIRE

CITY OF EL MONTE

City of El Monte: Phase II Co-Permittee
Population (1994): 111,000
Land Area: 9.57 sq. mi.

El Monte was incorporated in 1912 and lies 12.3 miles east of Los Angeles City Hall along the San Bernardino Freeway east of the San Gabriel river. Land uses are mixed urban with residential, industrial and commercial most common. Its population ranks 7th among Los Angeles County cities. Dominating the job market are the manufacturing and retail trade sectors, providing El Monte with a large job base. Median family income in 1989 was $28,004.

1. The City of El Monte has stenciled all 200 of its catch basins.

2. The City has just established a hotline to the Fire Department for reporting illegal discharges, and plans to conduct public outreach through city newsletter articles.

3. El Monte adopted an ordinance that provides urban runoff controls on 5/23/94.

4. El Monte has a school program on stormwater pollution given by its Fire Department personnel.

5. The City contracts out yearly inspection and cleaning of its catch basins.

6. El Monte provides 70 roadside trash receptacles which are emptied daily. It has not identified problem litter areas.

7. El Monte uses 1 vacuum and 3 broom sweepers to clean all 260 curb miles within the city. Residential and industrial areas are swept weekly, and commercial areas are swept daily.

8. City codes include penalties for littering and the improper disposal of other trash materials.

9. The County Public Works Department provides industrial waste inspections in the City of El Monte.

10. The City's public outreach program includes distribution of the booklet "About Managing Yard Waste", which partially addresses the need for removal of dirt, rubbish, and debris from sidewalks and alleys.

11. The City provides for curbside collection of glass, plastics and paper. It has not established a comprehensive outreach program on recycling.

VOL 15
0074
R0060295

12. The City indicates that it participates in the countywide household hazardous waste management program.

13. The City has a water conservation program primarily to regulate household interior water usage; there are no programs to discourage outdoor runoff.

14. Additional Best Management Practices:

A. Underpass pumps are cleaned quarterly &/or before the rainy season.

B. Maintenance of drainage culverts is done once a year.

C. Construction sites must submit a satisfactory control plan to eliminate illegal discharges.

SUMMARY STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF EL SEGUNDO

City of El Segundo: Phase I, III Co-Permittee
Population (1994): 15,650
Land Area: 5.51 sq. mi.

El Segundo was incorporated in 1917. Located 19.5 miles southwest of the Los Angeles Civic Center along the coast, with LAX adjacent to the north, the City ranks 70th in population size among L.A. County cities. El Segundo has a very large job base dominated by aerospace and high-tech, and includes major petroleum refineries. There are also significant commercial/office and residential land uses. El Segundo had a family median income of $53,215 in 1989.

1. All catch basins have been stenciled by Boy Scout volunteers with a stencil/logo contest winning design.

2. The City has established reporting hotlines through the water department, police, city engineer, etc. Cable TV and local newspaper have been extensively used for public outreach.

3. The City has existing runoff control measures and has prepared a draft Runoff Control Ordinance which was scheduled for City Council consideration in July 1994.

4. The City has established many public outreach programs. These include storm drain video, cable TV bulletin board, newspaper articles, water bill notices, and stencil logo contest.

5. Catch basins are cleaned twice per year.

6. The City provides 40 roadside trash receptacles which are emptied twice weekly. City's Street Maintenance Supervisor monitors the program, adding additional containers where necessary.

7. Residential and industrial streets within the city are swept weekly. Commercial streets are swept daily.

8. The City actively enforces its No Littering Ordinance, and has trained its staff to be more aware of illegal dumping and reporting procedures. Cable TV is used to educate the community.

9. Annual inspections of all commercial and industrial site (includes auto related businesses, gas stations and restaurants) are conducted by L.A. County under contract. Dry weather flows and new connections are inspected.

10. The municipal code addresses responsibility for removal of dirt and debris. Fliers and articles have informed the public. Future fliers and TV outreach will improve program.

VOL 15

00076

11. The City has a curbside recycling program for newspapers, plastics, glass, metal and aluminum. Used oil and batteries are accepted by the city maintenance facility. Approximately 20% of rubbish is being diverted from landfills at this time.

12. The City participates in the Countywide Household Hazardous Waste Management program. The City also provides yearly HHW collection service. Fliers, newspaper and TV notification publicize these events.

13. The City has a voluntary 10% conservation program which includes restrictions on lawn and landscape irrigation, sprinkler overwatering, washing of facilities, vehicles or other mobile equipment, etc. In addition, water rate schedules have been changed recently to encourage use of recycled water. Also, a reclaimed water plant is under construction.

14. ADDITIONAL BMP'S

A. Industrial Waste Study for the City Maintenance Facility

The City has had an environmental consultant do an industrial waste study and prepare a Storm Water Pollution Prevention Plan (SWPP) for the City Maintenance Facility.

B. Illegal Discharges/Illicit Disposal Practices

The City has developed a check list for plan checking. Necessary storm water requirements for inclusion in building and grading permits are identified.

C. Flow Monitoring and Analysis

Monitoring and analysis of dry weather flows to the city's 5 pump stations could help to determine the origin of these minor flows.

D. Closed Circuit Television of Wastewater Mains (CCTV)

The City has videotaped the interior of all 46 miles of sanitary sewer mains. This allows for locating problems and preventing overflows into the storm drains. It allows the city to set up a program to identify immediate problems and to set up a long range repair and replacement program.

E. Hydro Flush Program

The City has a yearly hydroflush program for the 46 miles of sanitary sewers. This program essentially precludes wastewater overflows.

VOL 15
0077

F. Wastewater Lift Stations

A rehab program for sewage lift stations keeps the wastewater plants in good operating condition. This prevents failures and overflows and keeps sewage out of the storm drains.

G. New Telemetering System

A modern telemetering system, the Supervisory Control and Data Acquisition System, will improve monitoring and reliability of the City's storm water and wastewater pumping plants.

H. New Storm Water Forms

Public Works has developed new forms and a standard storm water enforcement letter to improve documentation and provide records for projections and program management. These include: plan check list of review items concerning storm water, construction inspectors report, storm water catch basin cleaning record form, and standard storm water enforcement letter.

I. Participation in the Santa Monica Bay Restoration Project

City officials and residents have been part of the Santa Monica Bay Restoration Project Management Committee, the Technical Advisory Committee and the Public Works department has provided support to those efforts.

J. Storm Water City Drawings

During catch basin stenciling an update of the City Catch Basin Plan was prepared. The City will coordinate with L.A. County Public Works as to ownership and maintenance.

K. Control of Surface Runoff and Pollutants from Construction Sites

Permits are required for all construction work in the city. Site grading plans are required to identify possible drainage problems in the planning stages. Building inspectors check for permit conformance and code requirements for residential projects. The City will be using new standards forms to assist Public Works inspectors and planning department staff.

VOL 15
0078
R0060299

SUMMARY: STORMWATER/URBAN RUNOFF PROGRAM QUESTIONNAIRE

CITY OF GARDENA

City of Gardena: Phase III Co-Permittee
Population (1994): 53,900
Land Area: 5.67 sq. mi.

Gardena lies 14.2 miles southwest of downtown Los Angeles, west of the 110 (Harbor) Freeway. It was incorporated in 1930 and has an area of 5.67 square miles. Gardena ranks 34th in population among Los Angeles County cities. The job base is very large with manufacturing, retail trade and service industries providing the major sources of jobs. In addition, land uses include significant residential and retail commercial. Median family income was $37,096 in 1989.

1. Gardena is a Phase III city. It will stencil its catch basins in compliance with permit deadlines. Currently no catch basins have been stenciled.

2. The City has not begun any programs to encourage reporting of illegal discharges. It plans to begin a hotline as part of its overall public outreach program.

3. A number of City code sections are cited as having the effect of reducing storm water pollution. The City plans to adopt a comprehensive storm water ordinance before June 1995.

4. Gardena is currently developing a public outreach program that will be implemented prior to permit deadlines.

5. The City cleans catch basins every fall and inspects catch basins during storms to remove trapped debris.

6. Roadside trash receptacles are not provided by the City. The City increases street sweeping in problem areas.

7. All 193 curb miles within the City are swept. Residential areas are swept once weekly; commercial and industrial areas are swept two to three times weekly.

8. Several sections of Gardena's codes require all materials such as litter, lawn clippings and pet feces to be picked up immediately. City staff anticipates further code changes as part of its planned comprehensive Storm Water Ordinance.

9. Gardena contracts with Los Angeles County for Industrial Waste Inspections, which are conducted annually.

10. Gardena plans to have public outreach encouraging removal of dirt, rubbish and debris from sidewalks and alleys as part of its planned comprehensive outreach program. It also intends to inspect alleys every 3 months.

VOL 15

00079

R0060300

11. The City has a permanent recycling center, provides curbside pick-up of aluminum, steel, glass, plastics and wood products, and conducts public outreach through articles in the City newsletter and cable TV. Staff estimates that 30.8% of rubbish is being diverted from landfills.

12. Gardena participates in the countywide household hazardous waste management program. It plans to begin accepting used motor oil for recycling and to publicize the waste roundups.

13. Encouraging conservation of water will be made part of Gardena's planned comprehensive public outreach program.

14. Additional Best Management Practices:

A. Gardena has an existing weed and rubbish abatement program for both developed and undeveloped properties.

B. City crews report and clean up illegally deposited non-hazardous materials in City rights of way.

C. Gardena has an abandoned vehicle removal program.

D. The City's own vehicle maintenance program ensures that all vehicles are washed in areas that drain only to the sewer. Used engine oil, filters and batteries are stored in contained areas and are recycled.

E. Gardena has a program in place to respond rapidly to contain hazardous materials spills.

F. The City has a landscaping program to reduce landscape-related constituents in stormwater.

G. The City plans to require sandbagging at all construction sites between October 15 and May 15 to collect all runoff.

SUMMARY: STORMWATER/URBAN RUNOFF PROGRAM QUESTIONNAIRE

CITY OF GLENDALE

City of Glendale: Phase II, III Co-Permittee
Population (1994): 190,200
Land Area: 30.49 sq. mi.

Glendale is located 7.1 miles north of Los Angeles City Hall, was incorporated in 1906, and has the 3rd largest population among all cities in Los Angeles County. Glendale has a very large job base dominated by retail trade, manufacturing, finance and service industries. It is a major center within the County and it also contains extensive residential areas. The 1989 median family income in Glendale was $39,652.

1. The City of Glendale owns and maintains catch basins but has not implemented a stenciling program.

2. The City has established a 24-hour hotline number for reporting illegal discharges, but has not yet informed the public of its availability.

3. Glendale is in the process of modifying its municipal code to address runoff control.

4. The City has not yet implemented a program to educate the public on the problem of stormwater pollution.

5. Glendale has a program of cleaning its catch basins before rainstorms and on an as-needed basis.

6. The City has 204 public roadside trash receptacles that are emptied 3 times per week.

7. All 800 curb miles of streets in Glendale have street sweeping service. Residential and industrial areas are swept every 2 weeks, and commercial areas are swept 4 times per week.

8. To discourage improper disposal of lawn clippings and other materials, the City has bi-weekly curb pick-up of yard trimmings. The Parks Department, on a trial basis, is providing bags for dog owners to use to dispose of feces.

9. Glendale has an industrial waste inspection program under which it inspects for non-stormwater discharges. It inspects all permittees under the program once a year.

10. The City does not have a public outreach program concerning removal of dirt and other materials from sidewalks and alleys.

VOL 15

00081

11. Glendale has a comprehensive recycling program that includes a permanent recycling center; curbside pickup of paper, glass, aluminum and other cans, plastics, and yard waste; and, an outreach program that includes mailed pamphlets, door hangers, and news articles. About 32% of rubbish is being diverted.

12. The City participates in the County's household hazardous waste program and also regularly collects household hazardous waste at its recycling center.

13. Glendale has not implemented a program that reduces runoff to storm drains from outdoor water use.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF GLENDORA

City of Glendora: Phase II Co-Permittee
Population (1994): 49,850
Land Area: 19.16 sq. mi.

Glendora was incorporated in 1911 and lies 25.9 miles northeast of the Los Angeles Civic Center, along the foothills of the Angeles National Forrest and north of the Foothill (210) Freeway. It is the 37th largest city in Los Angeles County in terms of population. Glendora has a small job base, of which the largest employers are in retail trade and services. Its land uses include single family residential, some industrial and commercial, and significant vacant areas. The 1989 median family income was $51,444.

1. The City has stenciled all of its catch basins with the Heal the Bay design.

2. In addition to the County hotline, on 4/14/94 the Glendora Administrative Policy manual established a reporting procedure, which was disseminated to the public through newsletters and public service announcements.

3. A draft urban runoff pollution ordinance is being considered by the City.

4. Library displays, school presentations, pamphlets, video presentations on cable T.V. have been used to educate the public on the problem of stormwater pollution.

5. The County of Los Angeles Department of Public Works cleans all catch basins regularly.

6. The City's 20 roadside trash receptacles are emptied weekly and the business district is monitored to ensure adequate coverage.

7. The City's 310 curb miles are swept once a week in commercial areas and every two weeks in residential and industrial areas Commercial areas were recently upgraded to once a week.

8. The City' draft runoff ordinance addresses improper disposal. Penalties are included in the proposed ordinance.

9. The City does not have an industrial waste inspection program. However, on a complaint basis, Code Enforcement will take action to abate illegal non-storm water discharges.

10. Community newsletter and cable T.V. announcements is used as a pro active educational approach to encourage the public to remove dirt, rubbish and debris from sidewalks and alleys.

VOL 15

00883

11. The City has implemented a routine curbside recycling pickup and newsletters, articles and public informational announcements to inform the public of the benefits of recycling. Approximately 13% of rubbish is being diverted from landfills.

12. The City participates in the Countywide Household Hazardous Waste Management program.

13. City ordinance identifies prohibited conduct and establishes enforcement capability. Public information brochures are used to inform the public regarding water conservation.

VOL 15 0084

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF HAWAIIAN GARDENS

City of Hawaiian Gardens: Phase III Co-Permittee
Population (1994): 14,250
Land Area: 0.96 sq. mi.

Hawaiian Gardens is located 21.8 miles southeast of the Los Angeles Civic Center and was incorporated in 1964. The population ranks the City 72nd among Los Angeles County cities. It has a small job base, led by construction, retail trade and service industries. Land uses are primarily residential with some commercial. Median family income in 1989 was $29,379.

1. The City has not yet implemented a stenciling program but plans to stencil all catch basins with the County's stencil. The program will begin in summer 1994.

2. A 24 hour City hotline has been established. The hotline was publicized though the city newsletter and community meetings. 6 reports have been received.

3. No runoff control ordinance has been adopted.

4. No public education program has been established but the City mentions that articles will be published in the City newsletter in both English and Spanish to inform residents about illegal dumping.

5. Catch basins are cleaned yearly which is very effective in keeping debris from entering the storm drains.

6. The City provides 20 trash receptacles which are emptied weekly. Problem areas at major bus stops have been identified and the receptacles there are emptied bi-weekly. In response to the requirements of the RWQCB the City now assures that all bus stops, parks, agency owned shopping centers and City facilities have enough trash receptacles.

7. 78 curb miles are swept twice per week. This program has been very successful in preventing debris from entering the storm drain system and has not been modified in response to RWQCB requirements.

8. The City's 24 hour hotline is used to discourage improper disposal of litter, lawn clippings and pet feces.

9. Industrial waste inspections are provided by L.A. County Fire Department. Public Works staff inspects drains and notes any evidence of illegal discharge. No inspections are made of auto related businesses, gas stations or restaurants.

VOL 15

00085

10. The City's 24 hour hotline is used to encourage removal or dirt, rubbish and debris. In response to the RWQCB requirements the City has a program for residents to call in for items that are not normally picked-up in regular curb side collection. The City also provides a block clean-up program where bins are placed on the street for periods of time to allow residents to dispose of junk.

11. No recycling program has been implemented.

12. The City participates in the County household hazardous waste management program and seeks to expand the block clean-up program to include hazardous materials.

13. The City has adopted an ordinance for the usage of drought tolerant plants in new construction and for all City facilities.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF HAWTHORNE

City of Hawthorne: Phase III Co-Permittee
Population (1994): 74,400
Land Area: 5.99 sq. mi.

Incorporated in 1922, Hawthorne is located 15 miles southwest of downtown Los Angeles and it has the 23rd largest population in the County. Hawthorne is a mixed use city with various types of residential, commercial and industrial land uses. The job base is very large with manufacturing being the strongest sector, containing 59% of the total jobs. Median family income was $35,366 in 1989.

1. The City has stenciled all of its catch basins during summer of 1994.

2. The City has not established any programs to promote public reporting of illegal discharges in addition to the County hotline. The hotline number has been advertised on the city cable channel.

3. Existing Municipal Code Sections 12.30.010, 13.40.010, and 12.28.020 address runoff control. In addition, the City plans to adopt a more stringent ordinance based on the model ordinance produced by the working group.

4. Information and education pamphlets have been distributed; notices will be inserted with the next water bill; Hawthorne Cable Television plans a video program which will show stenciling and cleaning catch basins and explain the NPDES program, City will place article in local newspaper and use direct mail to send information to local businesses.

5. The catch basins are cleaned yearly before the rainy season and on an as needed basis. In response to the RWQCB requirements, the City plans to increase the frequency of catch basin cleaning.

6. 32 roadside trash receptacles are provided and they are emptied once a week. A continuous inspection and cleaning program has been implemented especially in litter prone areas.

7. 231 curb miles are swept, once per week in residential areas, and three times per week in commercial areas. This program has not been modified in response to RWQCB requirements.

8. The City's program to discourage improper disposal of litter, lawn clippings and pet feces includes the use of the recycling program, outreach pamphlets, water bill inserts, and direct-

VOL 15

00087

mail notices. The City recently established 2 locations for used oil recycling and advertised for them in Hawthorne's newspaper and on cable television. In addition, Hawthorne Municipal Code regulates any improper disposal of litter and imposes fees for clean up. A citation program handled by code enforcement personnel is suggested.

9. The City has developed the database necessary for the industrial waste inspection program. Code enforcement personnel are making daily observations for non-storm water discharges. A yearly inspection program will be implemented in the future using either Los Angeles County Department of Public Works (L.A. C.D.P.W.) or the City of Hawthorne inspectors. Los Angeles County Sanitation District currently conducts industrial Waste Water inspections in the City of Hawthorne.

10. The City is implementing a program encouraging the public to remove dirt and debris. Notices were mailed out for cleaning all alleys and sidewalks; door-to-door hanger-type fliers were distributed; an article will be placed in local newspaper. The City also encourages removal of dirt and debris by having the engineering department send letters asking residents to clean up debris.

11. The City has a curbside recycling program. Paper, glass, tins, aluminum, plastic, printed materials and cardboard are collected. Approximately 10% of rubbish is being diverted from landfills at this time.

12. The City participates in the Countywide Household Hazardous Waste Management Program. The City also joins with neighboring cities and major industries in their hazardous waste collection programs.

13. The City has a water conservation program which has reduced water use by 10% from 1989 levels. The programs asks for less watering, prohibits washing of sidewalks, driveways, parking areas and cars. The public is informed of the problem of overwatering through this program.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF HERMOSA BEACH

City of Hermosa Beach: Phase I Co-Permittee
Population (1994): 18,700
Land Area: 1.36 sq. mi.

Hermosa Beach is a beach city, located 21 miles southwest of the Los Angeles Civic Center. It was incorporated in 1907 and it ranks 67th by population size among L.A. County cities. Primarily residential, it has a small job base, mainly retail. Median family income in 1989 was $65,085.

1. All City catch basins have been stenciled. Problem: Water-based paint is already eroding. Suggestion: Stencil sides of curbs so message is visible to vehicular traffic.

2. The City actively promotes use of the County Hotline. Its public education encourages reporting to either the City or the County; door-hanger fliers and City publications sent to all residents are program components. The City intends to adopt a Storm Water and Urban Runoff Pollution Control Ordinance to provide them with increased enforcement authority.

3. The City has not as yet implemented urban runoff control measures, although a draft Storm Water Pollution Prevention Ordinance is scheduled for adoption by October 1994.

4. The City's public outreach program has included: 1) CATV public service announcements (Heal-the-Bay video); 2) distribution of information packets to downtown business owners; 3) distribution of door hanger-type fliers to 50% of all City residents; 4) preparation and distribution at special events of educational fliers, including encouragement of participation in the City's "Neighborhood Gutter Patrol" program; and 5) presentations on pollution prevention education at the City's public schools.

5. The City cleans all catch basins every 3 months.

6. The City empties its 300 public trash receptacles at least three times a week--daily in the downtown area.

7. All City streets, alleys and parking lots are swept once a week.

8. City ordinances, supported by fines and sanctions, prohibit improper litter disposal.

VOL 15
0089
R0060310

9. Industrial waste inspections are made of all industrial and related uses, as permitted by the City's fire prevention and hazardous materials codes. To increase their authority to inspect the storm drain system for non-storm water discharges, the City is planning to adopt a Storm Water Pollution Prevention Ordinance.

10. While the City does not have a direct public outreach program to encourage trash removal from sidewalks and alleys, they do enforce a City ordinance prohibiting the placing of trash in these areas. The City plans to add this facet to their public education program for runoff pollution prevention.

11. Aluminum cans, glass, plastics and newspaper is collected at curbside for recycling. Cable TV and quarterly articles in the City's newsletter promote the program.

12. The City's Environmental Coordinator informs residents and businesses of the County's hazardous waste round-up program.

13. The City's water supplier and a City resolution encourage residents and businesses to conserve water. The draft Storm Water Pollution Prevention Ordinance will discourage excessive outdoor water use by prohibiting non-storm water discharge to the storm drain system.

SUMMARY: STORMWATER/URBAN RUNOFF PROGRAM QUESTIONNAIRE

CITY OF HIDDEN HILLS

City of Hidden Hills: Phase II Co-Permittee
Population (1994): 1,850
Land Area: 1.72 sq. mi.

Located between Ventura County and the Ventura (101) Freeway, Hidden Hills is 27 miles northwest of downtown Los Angeles. Established in 1961, Hidden Hills is a small residential community with exclusively low density residential land uses. There are only a few jobs in the city and are in either services or construction. Median income in 1989 was $150,001.

1. Hidden Hills does not own catch basins; the County owns the catch basins and will stencil them in the future.

2. The City has publicized the County's hotline for reporting illegal discharges through its city newsletter, city access cable, notice posting and handouts.

3. Hidden Hills has ordinances in effect to control liquid waste and runoff. These were last revised in 1993.

4. The City has used its newsletter, handouts, cable TV and posting to educate the public on the problem of stormwater pollution.

5. The catch basins in Hidden Hills are owned, and therefore maintained by the County.

6. The City does not provide roadside trash receptacles. All streets are privately owned and maintained daily by Community Association-hired crews.

7. A vacuum and a broom sweeper are used by the City to clean all 25 curb miles within the city twice a month.

8. To discourage improper disposal of lawn clippings and other materials, the City provides green waste and horse manure recycling.

9. Hidden Hills has no industrial uses or restaurants within its borders, therefore it does not have an inspection program.

10. Hidden Hills does not contain any sidewalks or alleys.

11. The City has two drop-off recycling centers and has curbside pick-up of newspaper, paper, glass, aluminum and plastics. Public education and outreach is conducted through the City newsletter cable, and handouts. About 17% of all rubbish is being diverted.

VOL 15

0091

12. County household hazardous waste collection dates are advertised by the City through fliers, cable TV, the City newsletter, and announcements at City Council meetings.

13. Hidden Hills adopted a water efficient landscaping ordinance in 1993. It has a program to inform the public about the polluting effects of runoff that includes handouts, articles in the City newsletter and cable TV.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF HUNTINGTON PARK

City of Huntington Park: Phase III Co-Permittee
Population (1994): 58,600
Land Area: 3.00 sq. mi.

Five miles south of the Los Angeles Civic Center lies the City of Huntington Park, incorporated in 1906. With its unusual shape, it borders 6 cities and the unincorporated area of Florence. The job base of the city is small. Manufacturing is the leading industry, followed by services and retail trade. Land uses include industrial, commercial and mixed residential. Huntington Park is the 31st most populous city in the County and had a median family income of $24,268 in 1989.

1. The City has not yet implemented stenciling but a program is budgeted for fiscal year 1994-95.

2. In addition to the County hotline the police department 24 hour hot line can be used to report illegal dumping.

3. The City is in the process of adopting a runoff control ordinance. This would be accomplished in the 1994-95 fiscal year.

4. The City has not yet implemented any educational programs but they are budgeted for the 1994-95 fiscal year.

5. Catch basins are cleaned twice yearly. This program has been modified in response to the RWQCB requirements.

6. Approximately 250 roadside trash receptacles are provided. They are emptied daily.

7. 130 curb miles are swept weekly in residential and industrial areas and daily in commercial areas. This program has not been modified in response to the RWQCB requirements.

8. The City has regulations in the Municipal Code to discourage improper trash disposal. There are penalties for improper disposal.

9. The City does not have an industrial waste inspection program. However, a continuous program under contract with the County Waste Management division is being considered. Non-storm water discharges are inspected by the L.A. County Sanitation District. There are no inspections of auto related businesses, gas stations, or restaurants. Any inspections are completed under the authority of building permits.

VOL 15 00933

R0060314

10. An ordinance to encourage removal of dirt, rubbish and debris from sidewalks and alleys is pending.

11. The City has implemented a recycling program for phone books and Christmas trees and has a mobile center where residents can take aluminum cans, glass and plastics. Outreach programs have been established for local schools and businesses. The City estimates that 30% of rubbish is being diverted from landfills at this time.

12. The City participates in the Countywide household hazardous waste management program. The City is a co-sponsor of roundups and distributes advertising material to publicize the event. A used oil facility will soon be sited in the City. The hazardous waste collection program has been modified in response to the RWQCB requirements. The City suggests requiring a deposit at the point of sale as an incentive to return used oil.

13. The City has an existing water conservation program though no details are provided. No program to notify the public on the results of overwatering or washing off of sidewalks etc. has been established.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF INDUSTRY

City of Industry: Phase II Co-Permittee
Population (1989): 680
Land Area: 11.94 sq. mi.

The City of Industry is located 22 miles east of downtown Los Angeles and is the second smallest city in the County by population, ranked 87th. Established in 1957, the City is named for its primary land use. Industry's job base is very large with manufacturing dominating, followed by wholesale trade and services. Median family income in 1989 was $34,000.

1. No catch basins have yet been stenciled but the City does plan to implement a stenciling program and to use their own design.

2. In addition to the County hotline the City has sent a flier to all city addresses regarding the NPDES program and giving the City Hall telephone number. 2 reports have been received.

3. The City, on July 14, 1994, adopted ordinance No. 609 establishing storm water and urban runoff pollution prevention controls.

4. A public outreach program to educate the public on the problem of stormwater pollution has been established. The program includes the use of fliers and presentations to public groups. The City feels that informing the public will be effective.

5. Catch basins are cleaned once per year and as needed as determined by visual inspection. This program has been modified in response to RWQCB requirements and is estimated to be very effective.

6. The City provides roadside trash receptacles which are emptied weekly. Modifications in response to RWQCB requirements include increased number of receptacles and closer inspection.

7. The City sweeps 100 curb miles weekly (commercial and industrial areas). Inspection frequency and quality have been increased in response to RWQCB requirements.

8. The City discourages improper litter disposal through a public outreach program and Ordinance No. 609. These programs have been developed and implemented in conjunction with the NPDES program.

VOL 15
0095

9. An industrial waste inspection program will be implemented per Ordinance No. 609. The City does inspect for non-storm water discharges. Auto related businesses, gas stations and restaurants are inspected under the authority of Ordinance 609.

10. The City has an outreach/education program to encourage removal of dirt and debris. Fliers and presentations inform the public. This program was implemented in response to RWQCB requirements.

11. The City has a recycling program but no curbside collection. A 5,700 ton materials recovery facility is planned for construction. It is estimated that 38% of rubbish is being diverted from landfills at this time. The City will augment the public outreach program to encourage recycling of oil, antifreeze, glass, plastic etc.

12. The City participates in the Countywide Household Hazardous Waste Management Program and promotes roundups through fliers and other information.

13. The City as well as the City of Industry Waterworks System has developed and implemented a water conservation program as part of the public outreach program. The outreach program includes information on problems of overwatering and washing of sidewalks etc.

14. ADDITIONAL BMP'S

A. Applicants for grading permits on sites of 5 acres or more will be required to provide copies of their Notice of Intent (NOI) and Storm Water Pollution Prevention Plan (SWPPP) prior to issuance of their grading permit. City inspectors will monitor the implementation of SWPP's.

B. All field personnel attend an initial NPDES information session conducted by the NPDES Program Coordinator. Annual refresher information sessions will be conducted, which will also allow for feedback to the program coordinator regarding observations, concerns, recommendations and problems encountered.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF INGLEWOOD

City of Inglewood: Phase I, III Co-Permittee
Population (1989): 113,600
Land Area: 9.04 sq. mi.

Inglewood is 13 miles southwest of downtown Los Angeles and was incorporated in 1908. It is home to the Forum (L.A. Lakers and Kings) and a racetrack at the Hollywood Turf Club. Its job base is large with over 1/3 of the jobs in services. Inglewood is the 9th largest city in the County in terms of population and had a median income of $32,077 in 1989.

1. All catch basins in the City have been stenciled with the Heal the Bay design. The City estimates that there has been a 10% reduction in accumulation due to the stenciling program.

2. No programs have been established to promote public reporting of illegal discharges. The County hotline is not publicized.

3. No runoff control measures have been implemented. Presently, an RFP is being prepared for obtaining a consultant to develop a stormwater ordinance.

4. The City has educated the public through published articles and circulated bulletins. Some aspects of the education effort appear to have a significant effect.

5. All catch basins are cleaned annually prior to the rainy season. Problem basins are cleaned as often as weekly in some cases. Estimates are that 50-80 tons of debris are removed annually.

6. 102 roadside trash receptacles are provided and are emptied weekly. Some districts with problem litter areas are serviced daily. This program has not been modified in response to RWQCB requirements.

7. 195 miles of improved streets are swept weekly in residential and industrial areas and daily in commercial areas.

8. Improper disposal of lawn clippings is discouraged through workshops and containers for household composting. No specific pet feces regulations exist.

9. City staff does not specifically inspect for industrial waste except as related to issuance of Los Angeles County Industrial Waste Permits. Non-storm drain discharges are not specifically inspected. No program exists for inspection of auto related businesses, gas stations and restaurants.

VOL 15

00971

10. The City encourages removal of dirt and debris by co-sponsoring bi-annual clean-up days and existing codes prohibiting placement of materials in public right of way are enforced by code enforcement officers, building inspectors, and engineering inspectors.

11. Curbside recycling has not been implemented. Outreach programs to local businesses, schools and citizens groups have been established to promote recycling. Green waste and used oil recycling programs have been established. The City estimates that 10% of rubbish is being diverted from landfills at this time.

12. The City participates in the County Household Hazardous Waste Management Program. City staff has promoted used oil collection at retail outlets and circulated fliers to inform the public.

13. Landscape Ordinance No.93-20 regulates runoff and maintenance of irrigation systems. Some of the issues of overwatering have been addressed but no on-going program exists.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF IRWINDALE

City of Irwindale: Phase II Co-Permittee
Population (1994): 1,060
Land Area: 9.47 sq. mi.

Established in 1957, Irwindale is located 17.5 miles northeast of the Los Angeles Civic Center. Irwindale has a very large employment base though it is the 4th smallest L.A.. County city by population. Approximately half of the jobs are in the manufacturing sector, while services come in a distant second. Land uses are primarily industrial with some commercial, residential and vacant. Median family income was $29,917 in 1989.

1. The City will stencil its catch basins beginning September 1, 1994.

2. The City has implemented a hotline or reporting system.

3. A runoff control ordinance has not been adopted, however the City is in the process of developing one.

4. The City has not implemented programs to educate the public on the problem of stormwater pollution.

5. The City cleans its catch basins annually.

6. The seven roadside trash receptacles are emptied weekly and litter areas are inspected on a regular basis.

7. Street sweeping on the 52 curb-miles of improved streets is performed weekly.

8. The City has not implemented programs to discourage the public from improper disposal of litter, lawn clippings and pet feces.

9. The City contracts with the county for the industrial waste inspection program.

10. The City will implement a public outreach/education program during Fiscal Year 94-95.

11. The City's recycling program includes curbside pick up of recyclables, and public outreach/education.

12. The City participates in the Countywide household hazardous waste management program but does not conduct additional collections.

VOL 15

00999

R0060320

13. The water conservation program consists of voluntary water conservation and drought tolerant landscaping. No outreach or education programs have been implemented yet -- expected in Fiscal Year 94-95.

14. ADDITIONAL BMP's

A. A comprehensive public education program is planned in Fiscal Year 94-95. This will include informational fliers, handouts, newsletters.

B. During Fiscal Year 94-95, building inspectors will be trained to identify illicit discharges/connections. Also the City will develop contract specifications intended to reduce pollutants from paving operations.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF LA CANADA-FLINTRIDGE

City of La Canada-Flintridge: Phase II, III Co-Permittee
Population (1994): 19,700
Land Area: 8.61 sq. mi.

At the base of the Angeles National Forest and just over 13 miles north of downtown Los Angeles lies the City of La Canada-Flintridge, which was established in 1976. The Foothill Freeway (210) passes through the southern part of the city. Its job base is small with retail trade and services being the leading sectors. Land uses are overwhelmingly low density residential with substantial open space and vacant land. Median family income was $87,041 in 1989.

1. Although it owns and maintains catch basins, the City has not implemented a stenciling program primarily because of budget constraints. However, L.A. County catch basins are currently being stenciled by the County.

2. In addition to the County hotline, the City through newsletter articles has informed the public that they may call the Sheriff after 5:00 p.m. and on weekends to report illegal discharges/dumping.

3. The City has L.A. County's Industrial Waste and Urban Runoff Ordinance as its Industrial Waste and Urban Runoff Ordinance.

4. The City newsletter has been used to inform the public regarding stormwater pollution.

5. The City cleans its catch basins annually and in cases of emergency.

6. Roadside receptacles (no number given) are emptied once a week.

7. The City sweeps its 50 miles of improved streets every other week.

8. The City newsletter has been used to inform the public regarding proper disposal of litter, lawn clippings and pet feces.

9. The City contracts with L.A. County for industrial waste inspection.

10. The City newsletter has been used to inform and encourage the public regarding the removal of dirt, rubbish and debris from sidewalks and alleys.

VOL 15

0101

R0060322

11. The City recycles various materials and diverts approximately 14% of refuse collected. An educational program, primarily but not solely aimed at new residents regarding the benefits of recycling has been established.

12. The City participates in the Countywide Household Hazardous Waste Management program conducts its own curbside collection of motor oil.

13. The City does not have a water conservation program; however the City Council has repeatedly stressed the importance of water conservation in light of the drought.

SUMMARY STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF LA HABRA HEIGHTS

City of La Habra Heights: Phase II, III Co-Permittee
Population (1994): 6,500
Land Area: 6.39 sq. mi.

Incorporated in 1978, La Habra Heights is located 23.5 miles southeast of the Los Angeles Civic Center, at the Orange County boundary. Most of the City land uses are residential, with a very small job base. La Habra Heights has one of the smallest populations in L.A. County, ranking 81st among all the cities.

1. Although the City owns and maintains catch basins, it has not implemented a stenciling program at this time. The City is planning to implement the program in the near future.

2. In addition to the County hotline, residents can report illegal discharges/dumping incidents to the City's Volunteer Fire Department. The hotline number is published in community newspapers.

3. The City requires erosion control plans and governs amount of impervious coverage on each lot.

4. Although not implemented yet, the City is preparing articles/information to be included in community publications.

5. The City contracts with Los Angeles County Public Works for the annual cleaning of the catch basins.

6. The City does not provide roadside trash receptacles.

7. The City does not have a routine street sweeping program primarily because the majority of the streets in the community are private and do not have curb/gutter.

8. The City promotes residents/businesses to leave their grass clippings on the lawn.

9. The City does not have an industrial waste inspection program, primarily because there are no industrial uses within the City.

10. A public outreach/education program is not implemented because most streets in the City do not have sidewalks and there are no alleys within the City.

11. A recycling program/recycling center is in operation with 3% of rubbish diverted from landfills (glass, cans, newspaper). Articles and a pamphlet are sent to residents describing the benefits of recycling. Volunteers work the recycling center on Saturdays.

VOL 15

0103

12. The City participates in the Countywide Household Hazardous Waste Management program but does not conduct its own hazardous waste collections.

13. The La Habra Heights Water District provides brochures for water conservation. Also, the District provides workshops on irrigation and rebates for replacing toilets.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF LAKEWOOD

City of Lakewood: Phase III Co-Permittee
Population (1994): 75,300
Land Area: 9.54 sq. mi.

Lakewood is 19.5 miles southeast of downtown Los Angeles and was incorporated in 1954. With a large retail mall within its boundaries, over half the city's employment is comprised of retail trade. Overall, the job base is small. Lakewood has the 22nd largest population in the County. Land uses are primarily low density residential. Median family income was $48,519 in 1989.

1. All catch basins, with the exception of three, are owned and operated by the County of Los Angeles.

2. The City has developed programs to promote public reporting of illegal discharges/dumping to the extent of (a) participating in the storm water hotline program; (b) publicizing the toll-free hotline number in Lakewood Living, the City's newsletter; (c) airing storm water pollution prevention videos; and (d) incorporating the storm water hotline into its existing program of encouraging residents and businesses to report hazardous material/waste leaks or spills, discovery of suspicious containers on public or private property for investigation by City personnel or Los Angeles County Fire Department Haz-Mat.

3. The City has not adopted an urban runoff control ordinance but plans to enact such an ordinance by June 18, 1995.

4. The City has not implemented programs to educate the public on stormwater pollution but intends to do so during Fiscal Year 94-95.

5. The County of Los Angeles cleans catch basins annually and as needed.

6. Approximately 100 trash receptacles are placed at bus stops and parks and emptied at least every other day. Litter prone areas have receptacles which are cleaned as often as necessary.

7. The approximately 400 curb miles in the City are swept once a week.

8. City ordinances prohibit the improper disposal of litter, lawn clippings and pet feces. The City intends to implement a comprehensive stormwater/urban runoff pollution prevention public education/outreach program during Fiscal Year 94-95.

VOL 15

0105

9. The City currently contracts with Los Angeles County to provide industrial waste water inspections. City plans to extend its contract to include storm water inspections of auto repair, auto body, auto parts shops, gas stations, restaurants, and other industrial and commercial facilities that handle, store, and dispose significant materials.

10. The City has not implemented a public outreach/education program to encourage the public to remove dirt, rubbish and debris from sidewalks and alleys. These practices are required by ordinance and compelled through code enforcement.

11. The City recycling program includes ten recycling centers where residents can drop off recyclables. Residents are encouraged to recycle through the City's public education program. City also encourages commercial facilities to require their refuse collection companies to recycle a variety of waste products. City's landfill diversion rate is approximately 17%.

12. The City is a participant in the Countywide Household Hazardous Waste Management program, but does not conduct additional waste collections. Residents are encouraged to drop off used oil at recycling centers.

13. City water conservation ordinance prohibits the use of water which causes runoff. Public outreach/education regarding water conservation will be incorporated in the stormwater pollution program to be implemented in the near future.

VOL 15
0106
R0060327

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF LA MIRADA

City of La Mirada: Phase III Co-Permittee
Population (1994): 44,250
Land Area: 7.78 sq. mi.

Bordering Orange County, La Mirada is 19.5 miles southeast of the Los Angeles Civic Center area and it has the 40th largest population among County cities. La Mirada was incorporated in 1960. The job base is large with three sectors, manufacturing, retail trade and services contributing 75% of all jobs. Land uses are primarily residential with some industrial and commercial. Median family income was $48,519 in 1989.

1. The City has authorized L.A. County Public Works, as of July 27, 1994, to stencil County owned catch basins. City owned catch basins have not yet been stenciled.

2. The City encourages residents to report illegal dumping to the Environmental Services Department, Customer Service Center(CSC), or the County hotline. The CSC was publicized through press releases, articles in newsletter and newspapers, and reports on cable TV.

3. Construction sites are required to have erosion control plans under the UBC and La Mirada Code 17.04, adopted 1992. In addition to the erosion control plans the City also inspects construction sites to detect and prevent erosion.

4. The City publishes newsletter articles, and issues press releases on storm drain maintenance throughout the year.

5. The City contracts with L.A. County Public Works for catch basin cleaning twice per year. Also, the City removes debris when needed. In response to RWQCB requirements the City uses a broom or a shovel to remove debris from catch basins instead of flushing them.

6. The City does not provide roadside trash receptacles.

7. 230 curb miles are swept once a week. This program has been in effect for many years and has not been modified. In addition, special service is provided as needed between scheduled sweepings.

8. The City has many programs and codes to discourage improper disposal including receptacle requirements, special item pick-up, and illegal dumping provisions. Community composting and greenwaste recycling are being considered. The City suggests regular public workshops and environmental education in schools to discourage improper disposal.

VOL 15

0107

9. There is no proactive industrial waste inspection program though illegal discharges are reported to the proper authorities. Auto related businesses, gas stations, and restaurants are not inspected.

10. The City's newsletter that is periodically mailed to all residents provides public outreach to encourage removal of dirt, rubbish and debris from sidewalks and alleys.

11. Curbside recycling, to replace a drop-off program, is scheduled for implementation in December 1994. The program will be publicized through brochures, local cable commercials, press releases, public meetings and newsletters. Presently, 11% of rubbish is being diverted from landfills. The City has also adopted a Source Reduction and Recycling Element.

12. The City has adopted a Household Hazardous Waste Element, and promotes roundups through press releases, City Hall marquee and cable TV. In addition, a used oil program is being developed.

13. The City implemented a comprehensive Water Conservation Program for its residents and City employees in 1991. City landscape projects use drought resistant and water efficient plants. Brochures on water conservation are distributed by the City and water purveyors, newsletter articles promote conservation and the local schools participate in water conservation programs.

14. Other BMP's

a. Emergency/Major Spill Clean-up Procedures. Spills and cleanup of gasoline products or other toxics, or fires extinguished by foam can leave contaminants that could easily be washed into the storm drain system. Policies and procedures to block such flow and properly dispose of the residue are in place in the City.

VOL 15

0108

STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

LOS ANGELES COUNTY

Los Angeles County — Principal Permittee

Population (Total including cities) (1994): 9,230,600
Population (Unincorporated): 961,800
Land Area (Total): 4,083 sq. mi.
Land Area (Uninc.): 2,668 sq. mi.

Los Angeles County has by far the largest population of all counties in the nation and, by many measures, is larger than most countries in the world. It has more than 3,700,000 jobs and its median family income in 1994 was $45,200.

1. 12,114 catch basins have so far been stenciled. Before stenciling County owned catch basins within a city, the City must submit a letter of support. Public awareness of the stenciling program has been increased due to transit shelter signs displaying the stencil located throughout the County. Magnets with the stencil design and program mascot will soon be distributed at public education events. The stencil program is estimated to be completed in three years. The program has not encountered any major problems and it appears to be effective. A maintenance program needs to be developed.

2. The County 800 hotline and 458-HELP are used to report illegal dumping. Tracking of hotline complaints has been established. A follow-up letter has been implemented for minor dumping violations. Hotline number is advertised in newspapers, and in literature distributed at County events. The program appears effective due to the increasing number of calls received. The hotline could be further advertised by utilizing free cable channels, radio broadcasts and other public service announcement media.

3. The County Building Code has provisions on erosion control for sites with active grading. These measures have been in effect since 1965 and are effective in improving the quality of urban runoff. Ordinance 92-0127 strengthened the erosion control provisions and includes penalties for violations. Modifications could include, erosion control programs to cover all building sites and phases of construction, and improve enforcement.

4. The County has established a campaign for increasing public awareness of stormwater pollution. Brochures, booklets, television, radio and newspaper advertisements, and bus stop shelters are methods used for distributing information. Public awareness and outreach programs are effective as long as they educate citizens and make them more environment-conscious. Surveys will be conducted to determine

VOL 15

01109

R0060330

effectiveness of programs. Advertising campaigns utilizing billboards, bus shelters and bus posters , point of purchase campaigns, business and industry outreach, and school programs are suggested.

5. County catch basins are cleaned annually by hired contractor prior to rainy season. This is an effective program because a large amount of debris can accumulate. Data on the quantity of debris is being collected and could justify additional cleaning.

6. Roadside trash receptacles are provided but the number in the unincorporated area is not recorded. Receptacles are emptied weekly and additional ones, some lined with plastic, are added to problem litter areas. Modification to the program in response to the RWQCB requirements includes adding receptacles in identified area for service by County personnel until added to trash collection company's route.

7. 3025 curb miles (both sides of streets) are swept using vacuum and broom equipment. Residential, commercial and industrial areas are swept once per week. In response to RWQCB requirements double sweeping has been started on selected streets. In addition, areas along parkways and shoulders that experience frequent dumping are being cleaned so that these materials do not get into the storm drain system. Additional personnel including juvenile camp crews and general relief workers are being used to provide cleaning. Enforcement of no parking on street sweeping days has been requested.

8. County Health Department, Fire Department and Animal Control regulations govern disposal of litter, lawn clippings, and pet feces. Any persons violating the above Ordinances will be asked to terminate such practices and take corrective actions, or face enforcement actions. The brochure "The Ocean Begins at Your Front Door!" is used to educate the public on the impact of improper disposal on stormwater quality.

9. All commercial and industrial facilities which generate industrial wastes are issued permits subject to inspection. Inspection frequency is based on industry type and special circumstances. Field personnel investigate any non-stormwater discharges promptly. The following businesses are investigated: auto parts (2/year), auto repair(3/year), autobody shops(2/year), gas stations(1/year), restaurants(1/year). Auto accessory, car washes and truck maintenance facilities are also inspected. Only those facilities with an Industrial Waste permit are inspected regularly. Authority is provided through the Industrial Waste agreement with the contract city and under Los Angeles County Code Title 20, Division 2. Presently, ordinances are being reviewed by the RWQCB to comply with legal authority requirements of the stormwater permit. A program for identifying all connections to the storm drain system is

VOL 15

0110

scheduled for implementation in 1995. A pilot field study is being conducted during summer 1994.

10. An Adopt-a-Highway program has been fully implemented in all County Road Maintenance Districts to encourage and help with litter cleanup along roadways. The County publicizes the program's activities periodically in local and regional papers. Signs setting along the adopted highways and roadways add to the exposure of the program. Several groups are already participating in the program and the County has received many inquiries from citizens and referrals from cities. The application has detailed information on the program and is used as a handout to inform the public. Other outreach programs that could be effective are: televising the conditions of littered sidewalks and alleys, school education programs on hygiene; and promoting city's cleanliness to aesthetics.

11. The County does have a curbside recycling program and a permanent recycling center. Materials recycled include, aluminum and metal cans, newspapers, glass bottles and jars and plastics in some areas. The program has been publicized though an elementary school education program (video, booklets, presentations), outreach to residents through participation in environmental fairs, exhibitions and events, Woody Woodpecker calendar contest, and outreach materials such as brochures, fact sheets, comic books, and slide shows. The recycling program was established in response to AB939 and is adequate to handle current solid waste demand. The County is expanding the program to accommodate future needs.

12. The County Department of Public Works along with the County Sanitation Districts conduct and administer Household Hazardous Waste (HHW) Roundup events throughout the county. Residents are able to drop off leftover hazardous products for free. 90% of the materials collected are recycled. The program has an educational component that educates the public on proper disposal. In addition to the HHW roundups, a mobile collection program is also operated. The HHW program has been modified in response to RWQCB requirements in that the program has been made permanent and a used oil recycling program is in the process of being established.

13. The County had a Water Wasting Ordinance, in effect during the previous drought seasons, to reduce runoff to the storm drains by prohibiting various kinds of wasting of water such as hosing off driveways and overwatering lawns. A similar ordinance could be adopted under another critical drought condition as needed. In terms of public education, a brochure is used to inform the public of the consequences of wasting water in carrying waste materials and contaminants to the storm drain system. The water conservation regulations are meant to minimize the effect of a shortage of water supplies on customers.

VOL 15

14. ADDITIONAL BMP'S

A. Ballona Creek Debris Fence

A fence was installed on July 19, 193 and is used to reduce the amount of debris entering the ocean by detaining floatable trash and debris for later collection. The Department of Beaches and Harbors reports a 40% decrease in trash accumulation at Marina del Rey.

B. County Airport Runoff Structural Controls

To reduce contaminants from stormwater, structural controls have been added at airports. These include: fuel pumps located under a roof, stormwater diversion system with clarifiers, concrete berms for secondary containment of waste oil, oil and water separator at floor drains, retention ponds, infiltration basins, and sand filters. These controls either eliminate the pollutants or reduce a significant amount of them from entering the storm drain system.

C. County Airport Cleaning and Maintenance

These non-structural controls are good management practices for aircraft cleaning and maintenance. Washing of aircraft in designated area with oil and water separator, aircraft maintenance performed indoors, waste oil recycling. Warnings are issued and penalties include removal of plumbing fixture. Program is effective and reduces non-point source pollution and illegal dumping.

D. County Airport Materials Handling and Storage Controls

These measures prevent spills of polluting materials. Aircraft fueling at fuel pit, filling of fuel tanks at storage sites, underground fuel tanks with secondary containment, overfill protection, automatic leak detection systems, daily inventory monitoring and quality control procedures, waste oil tanks with secondary containment covered by a roof and disposal performed by a contract vendor, paint storage monitored and elevated from dampness and corrosive water, absorbent material on hand. This program has been very effective. In last four years there has been a perfect record of no fuel spillage.

E. Airport Operations and Disposal Controls

This project, scheduled for implementation in September 1994, will advise tenants and users of County airports on proper operation and disposal of products. Handouts explaining the problems of non-point source pollution and prevention measures will be distributed to airport users and mailed to tenants to increase awareness.

VOL 15
0112
R0060333

F. State Approved NPDES Industrial Activity Permit

Required at all County airports to ensure compliance with State Water Resources Control Board requirements.

G. County Airport Hazardous Waste Storage and Disposal Controls

Each airport lessee is responsible for reporting the presence or release of hazardous materials to appropriate public agencies. The program has just begun so effectiveness cannot yet be determined. The program can potentially reduce stormwater pollution.

H. County Airport Drainage Collection Structures Stenciling

This program, similar to the catch basin stenciling program, is scheduled to begin in August 1994 and should discourage dumping of wastes.

I. In-House Task Force

Members of various Public Works divisions meet to discuss the development and implementation of BMP's. This program has been in operation for 2 years.

J. Open Channel Inspections/ Sump Inspections

To reduce the amount of debris entering the ocean, field personnel inspect open channels and sumps to pump plants after storms and clean up any debris.

K. Construction of Inflatable Rubber Dam

Beginning in September 1994, an inflatable dam will be built across the San Gabriel River to impound surface runoff which will be recharged into the aquifer. Pollutants are removed during this process and therefore the quantity of pollutants reaching the ocean is reduced.

L. Storm Drain Plan Review Procedures for Private Development

Standard notes have been added to private drain and miscellaneous transfer drain plans, erosion control plans, and connection permit sheets stating that NPDES permits are required from the RWQCB prior to discharge.

M. Containment Procedures and Equipment Evaluation

An evaluation of latest developments regarding improved containment procedures and equipment has been done and procedures were found to be adequate. However, new reporting procedures are being developed.

VOL 15

0113

N. Department Directive to Report Water Quality Problem

A department directive has been issued requesting all employees to report any observed water quality problems to facilitate early action. This program has increased awareness of water quality problems.

O. Storm Drain System Identification Program

Detailed maps showing the location of each storm drain, its manholes, and catch basin connector pipes are being prepared. The location and source of discharge for all connections is being inventoried. A GIS system is being developed to allow for the management and analysis of this data. When developed, monitoring of illegal connections and discharges can be done more efficiently.

P. Sewage Overflow Response Procedures Revision/ Root Control Review

This involves improvement of procedures for containment and cleanup of spilled sewage resulting from overflow. Sandbags are carried by crews at all times to stop flow into catch basins. Crews will also patrol critical pump stations during severe storms to correct any malfunction and minimize response time. In addition to this program, a map of the Palos Verdes area is being prepared which will identify lines with root problems. Sewage overflow due to root stoppage in sewer lines will be controlled.

Q. Standby Maintenance Crew

This on-going program places a maintenance crew on stand-by during heavy rainfall for the Trancas and Malibu Sewage Treatment plants which minimizes response time if vacuuming is needed to prevent overflows.

R. Reline Sewer Lines

Two locations will undergo relining of existing sewer lines to prevent infiltration and exfiltration.

S. Sewer Pipeline Reconstruction

Reconstruction of pipelines prevents pollution by sewage. 127 miles of cement pipelines will be televised and analyzed and replaced or rehabilitated within 5 years.

T. Sealing of Manhole Covers and Bar Holes

This program has sealed manhole covers and bar holes in areas subject to flooding. This prevents infiltration of stormwater into the sanitary sewer system.

VOL 15
0114
R0060335

U. Expansion of Emergency Call List

To improve response to sewage system failures, all supervisors, superintendents and standby crews beeper numbers were added to emergency call list.

VOL 15
0115
R0060336

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF LA PUENTE

City of La Puente: Phase II Co-Permittee
Population (1994): 39,300
Land Area: 3.45 sq. mi.

Eighteen and a half miles east/southeast of the Los Angeles Civic Center lies La Puente, which is bounded by the City of Industry along 2/3 of its border. The job base is very small and its population places La Puente in 45th place among L.A. County cities. Land uses are primarily residential. The majority of jobs are in the service and retail trade sectors. Median family income was $33,997 in 1989.

1. Although the City owns and maintains catch basins, it has not implemented a catch basin stenciling program. The City plans to implement the program in the near future.

2. In addition to the County hotline, City staff is trained to handle illegal discharges/dumping calls at City Hall. The telephone numbers are published in English/Spanish in City newsletter.

3. City ordinance requires erosion control plans.

4. City newsletter includes information about stormwater pollution and telephone number to report incidents.

5. The City contracts with Los Angeles County Public Works for the annual cleaning of catch basins.

6. The seventy roadside trash receptacles are emptied twice a week. High traffic areas have more trash receptacles.

7. The 66 miles of improved streets (140 curb miles) are swept once a week in residential and industrial areas and four times a week in the commercial areas.

8. The City collects green waste separately.

9. The City contract with the Los Angeles County Public Works Department for industrial waste inspections.

10. Articles are published in the City newsletter regarding litter.

11. The City recycling program and private recycling center include curbside collection of recyclables and printed handbooks describing the benefits of recycling.

VOL 15
0116
R0060337

12. The City participates in the Countywide Household Hazardous Waste Management program and plans to hold two waste collections per year starting in the fall of 1994.

13. The City does not have a water conservation program. However, future plans include articles regarding water conservation.

VOL 15
0117

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF LA VERNE

City of La Verne: Phase II Co-Permittee
Population (1994): 31,500
Land Area: 8.42 sq. mi.

Incorporated in 1906, La Verne is over 31 miles east of the Los Angeles Civic Center. La Verne is to the north of the San Bernardino Freeway, extending northward to the Angeles National Forest. Mostly residential, La Verne also contains several large parks and reservoirs. The job base is very small. Top industries include retail trade, manufacturing and services. The City ranks 55th in population size among L.A. County cities. Median family income in 1989 was $53,431.

1. The City owned catch basins will be stenciled in the future by volunteers, scouts and city employees.

2. Other than the County hotline, the City has not established any other hotline or reporting system.

3. **NO ANSWER PROVIDED**

4. The City has not implemented programs aimed at educating the public on the problem of stormwater pollution.

5. The City conducts an annual inspection of city owned catch basins and cleans those catch basins containing excessive debris.

6. The City provides an unknown number of roadside trash receptacles. No specific answer was provided for emptying frequency.

7. The City's street sweeping program includes the 96.7 miles of improved streets (383 curb miles) with residential areas swept once every 30 days and commercial and industrial areas once every 20 days. The City recently increased sweeping in commercial and industrial areas and alleys and problem areas.

8. The City's Municipal Code prohibits the disposal of trash onto any public streets and/or private property.

9. The County of Los Angeles Public Works Department is contracted to perform industrial waste inspections. Non-storm water discharges to the stormdrains are inspected upon complaint.

10. The City does not have a public outreach/education program aimed at removing dirt, rubbish and debris from sidewalks and alleys.

VOL 15

0118

11. The City has implemented a recycling program which includes plastics, newspaper, glass aluminum and tin cans. Other components include Christmas tree recycling, phone book recycling and commercial recycling. Thirty-seven percent of rubbish is diverted form landfills. The elements of the public outreach program include neighborhood block leaders, information network, workshops and school visits.

12. The City participates in the Household Hazardous Waste Management program sponsored by the County and in the future will establish used oil recycling drop off centers.

13. The City's water conservation program consists of ordinances prohibiting the watering of paved areas. The ordinance, adopted in 1991 was disseminated to the residents of the City through newsletters, articles in local newspapers and reminders about water conservation.

VOL 15

0119

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF LAWNDALE

City of Lawndale: Phase III Co-Permittee
Population (1994): 28,750
Land Area: 1.93 sq. mi.

Over 19 miles southwest of downtown Los Angeles lies the City of Lawndale which was incorporated in 1959. Its population size ranks it 58th in Los Angeles County. Primarily a residential community, it has a small job base. However, Hawthorne Boulevard, a major commercial artery, bisects this city and results in most of its employment to be in the retail trade and service sectors. The San Diego Freeway also runs through Lawndale. Median family income in 1989 was $36,604.

1. The City has not implemented a program of catch basin stenciling but plans to stencil catch basins in the near future.

2. The City has not implemented programs to encourage the public reporting of illegal discharges/dumping nor a City hotline or reporting system.

3. The City has not adopted any urban runoff control measures however plans to adopt such an ordinance in the near future.

4. The City has not implemented programs intended to educated the public on the problem of stormwater pollution.

5. The Los Angeles County Department of Public Works cleans the catch basins annually.

6. The City's trash receptacles are placed at all bus shelters and emptied twice a week.

7. Street sweeping on the city's 26 miles of streets (52 curb miles) is done one time a week in residential areas and two times per week in commercial and industrial areas.

8. The City has not implemented programs designed to discourage improper disposal of litter, lawn clippings and pet feces.

9. The Los Angeles County Department of Public Works conducts the industrial waste program.

10. The City has not implemented a public outreach/education program to encourage the public to remove dirt, rubbish and debris from sidewalks and alleys.

VOL 15

0120

11. The City's recycling program consists of collections at curbside of recyclables with an estimate of 15% being diverted from landfills. The City has obtained grants to implement public education/outreach and used oil collections.

12. The City participates in the Countywide Household Hazardous Waste Management program but does not conduct any additional waste collections.

13. The City does not have a water conservation program but plans to implement a public education/outreach program in the near future.

VOL 15
0121

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF LOMITA

City of Lomita: Phase III Co-Permittee

Population (1994): 19,650
Land Area: 1.89 sq. mi.

Lomita lies 21.5 miles south of central Los Angeles, just west of the Harbor (10) Freeway. Incorporated in 1964, Lomita is the 66th most populous city in the County. It has a very small job base, spread thinly among the various industries, the largest being services and retail trade. Land uses are primarily residential with some retail commercial. Median family income was $42,284 in 1989.

1. The City has not implemented a catch basin stenciling program but intends to in the future with assistance from Los Angeles County.

2. The City has not implemented any programs to promote public reporting of illegal discharges/dumping.

3. The City has not implemented a runoff control ordinance.

4. The City has not implemented programs to educate the public on the problem of stormwater pollution.

5. The County conducts annual cleaning of the City's catch basins.

6. The City's ten roadside receptacles are emptied as needed.

7. The street sweeping program covering the 65 curb miles includes weekly sweeping in residential, commercial and industrial areas.

8. The City has not implemented programs designed to discourage improper disposal of litter, lawn clippings and pet feces.

9. The Los Angeles County Department of Public Works conducts the industrial waste inspection program.

10. The City does not have a public outreach/education program to encourage the public to remove dirt, rubbish and debris from sidewalks and alleys.

11. The City's recycling program includes the collection of recyclables at curbside and an outreach program encouraging recycling through city newsletters, cable television. direct mailing, workshops and water billing inserts. 16.4% of rubbish is diverted from landfills.

VOL 15

0122

R0060343

12. The City participates in the Countywide Household Hazardous Waste Management program but does not conduct additional hazardous waste collections.

13. The City's water conservation program consists of a voluntary 10% water usage reduction.

VOL 15
0123
R0060344

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF LONG BEACH

City of Long Beach: Phase III Co-Permittee
Population (1994): 436,800
Land Area: 49.72 sq. mi.

Long Beach is located 23.9 miles south of central Los Angeles along the southern coastline and it has the second largest population among L.A. County cities. Long Beach has a large job base led by services, manufacturing and retail trade. Land uses are mixed urban with residential, major commercial and industrial well represented. Long Beach was incorporated in 1897 and had a median family income of $36,305 in 1989.

1. The City has not stenciled any of its catch basins; they plan to develop a stenciling program during the upcoming year-two NPDES activities.

2. The City supports the County Hotline by publishing the phone number in a flood control brochure that is distributed annually with a billing statement to all utility users in the City.

3. The City has no urban runoff control ordinance, although they plan to enact one as part of their second year NPDES activities.

4. The City has numerous public outreach programs, including brochures, that result in public education on stormwater pollution, including "Adopt-A-Gutter", Coastal Awareness Day and recycling programs.

5. All City catch basins are cleaned annually, before the rainy season.

6. The City empties its ±500 public roadside trash receptacles on a weekly basis.

7. The City sweeps all its streets on a weekly basis.

8. The City does not have programs to discourage improper trash disposal; such programs will be developed during the NPDES second year program.

9. The City has an industrial waste annual inspection program for businesses generating hazardous waste, including all vehicle service facilities. Inspections do not include review of storm drain discharge practices.

VOL 15

0124

10. The City sweeps all alleys on a weekly basis. They plan to develop a formal public outreach/education program in NPDES year two.

11. Aluminum cans, glass, plastic, cardboard, newspaper and motor oil are routinely collected curbside. There are about 10 privately owned recycling centers in the City. An extensive recycling program exists, that includes numerous printed materials.

12. The City promotes the Countywide Household Hazardous Waste Roundups using utility bill inserts, grocery bag inserts and newspaper advertisements. A City hotline is available for information on the County roundups.

13. The City has a water conservation program, but it does not specifically address surface runoff; there is no public education component.

0125
R0060346

SUMMARY STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF LOS ANGELES

City of Los Angeles: Phase I, II, III Co-Permittee

Population (1994): 3,620,500
Land Area: 468.797 sq. mi.

Los Angeles was incorporated in 1850 and is the oldest and largest city in Los Angeles County, both by population and land area. It has a large job base spread among most major industry categories although manufacturing, services and retail trade dominate. Los Angeles also enjoys a diversity of geographic features, stretching from the northern edges of the San Fernando Valley to the Santa Monica Bay, San Pedro and the Western boundaries of the San Gabriel Valley. Median family income in the city in 1989 was $34,364.

1. City has stenciled approximately 15,000 catch basins as of June 30, 1994, and plans to stencil an additional 10,000 by the end of 1994. Volunteer workers are recruited from areas being stenciled, and information on the program is distributed throughout those areas.

2. In addition to supporting the County Hotline, the City has had a reporting system at their Bureau of Sanitation for the past eight years, and has a newly implemented Stormwater Management Division HOTLINE and reporting system. The City's reporting system helps identify dischargers who have not been evaluated for the required permits. The new HOTLINE--publicized through printed brochures, refrigerator magnets and press releases--is designed to achieve the quickest possible response to reports of illegal dumping.

3. The City has numerous provisions in their Municipal Code for regulating urban runoff. To provide more effective control over storm drain discharges, the City is currently in the process of developing a Stormwater Pollution Control Ordinance.

4. The City has implemented a comprehensive public education/outreach program, divided into the following three categories: 1) General Outreach Program--includes television, billboard and media outreach campaigns; 2) Grass Roots Community Outreach Program--focusing on the publicity for the catch basin stenciling program, including a minority outreach component to adjust the program for greatest effectiveness in the various City communities and 3) School Education Program--primarily the K-6 "Magical City Forest" curriculum pilot program involving incentives for both students and teachers. A specific outreach group has been private industry; the City conducted a mass mailing to facilities that potentially would be required to file a Notice of Intent for the General Industrial Stormwater Permit.

VOL 15

0126

5. The City has grouped their catch basins into "routes" that are inspected monthly and cleaned as needed. An increase in cleaning has resulted in a decrease in the number of odor complaints and emergency calls regarding plugged basins during a rain event. A computer-assisted pilot Stormwater Information Management and Maintenance system has been initiated for three drainage areas.

6. All 970 of the City's roadside trash receptacles are emptied weekly. A private vendor contract is expected to provide a total of 2,500 trash receptacles by 1997.

7. Of the City's residential streets, approximately 1/3 of them are posted and swept weekly; the remaining unposted 2/3 are swept monthly. Commercial and most industrial streets are swept at night; the frequency varies form once per week to seven nights per week, depending on needs. A pilot street cleaning study employing a vacuum sweeper and an air regenerative sweeper is being planned, to begin in January 1995; the study will include benefit/cost analysis, pollutant removal efficiency, etc.

8. Numerous City codes--with penalties--prohibit the improper disposal of litter. Public service television and radio campaigns, along with other public education programs create public awareness of the problem. Recycling programs and public trash receptacles help make it convenient to comply.

9. The City has an extensive program to issue, inspect and enforce Industrial Wastewater Permits issued for non-stormwater discharges to the storm drain system. Permit conditions include compliance with numerical as well as aesthetic quality standards. Industrial and related operations are inspected between 1 and 4 times per year. Violations for unpermitted discharges are usually detected as a result of public reports on the HOTLINE, described in 2, above. A specialized inspection group focusing on improving stormwater quality and eliminating illegal discharges and illicit disposal practices is staffed by the Bureau of Engineering.

10. All City BMP public information materials include admonitions to remove and properly dispose of materials on and around their property. Focus group research and surveys are being used to gauge the level of public awareness and the effectiveness of the BMP program components.

11. Yard trimmings, tin and aluminum cans, glass, plastic, newspaper, cardboard and brown paper bags are routinely collected at curbside and recycled. The City's Public Education and Outreach Program promotes recycling; a speakers bureau is available.

*

VOL 15
0127

12. The City participates in the countywide household hazardous waste management program as well as provides a hazardous waste mobile (Hazmobile) that travels to various sites throughout the City and accepts waste products by appointment. A used oil recycling program is being co-sponsored with an oil company, who collects used motor oil at participating stations. The City suggests coordinated/ expanded public education programs to encourage use of less toxic products and cleaning methods.

13. The City implements the "Water Conservation Plan of the City of Los Angeles" that contains specific prohibitions against excessive/ unnecessary outdoor water usage. Public education programs include tips on how to control excess runoff.

14. Other BMP's:

a. Low-flow Storm Water Reclamation Plant. Project currently undergoing a feasibility study; if determined to be effective, plant would be constructed to treat storm water from the Pico-Kenter storm drain to reduce pollutant loading to the Santa Monica Bay.

b. Storm Drain Pollution Sensor System. Construction scheduled for FY 95-96 to detect levels of pollution in the storm drain system to that flow could be diverted to treatment plant for clean-up.

c. Geographic Information System. Designed to support the information management need of the City's stormwater pollution abatement efforts, the heart of this System is a Water Quality Model which will estimate and predict pollutant runoff by drainage areas. It will also provide computer-based tools for further analysis.

d. Street Inspection Program. At present, the Bureau of Street Maintenance enforces violations of excess water and other fluids into the street system primarily on a complaint basis; this program--when funded--would add two inspection teams to more aggressively and systematically monitor street discharges.

e. Closed Circuit Television (CCTV) of Storm Drain Lines. Contract executed on July 29, 1994 to provide closed circuit television of storm drain interiors to detect cracks, misalignments, deposits, debris and illegal connections and/or discharges.

f. Oil/Water Separator. Special equipment has been installed at Ranch Park Golf Course to remove oils and oil-based cleaning agents, as well as organic material, from surface water that drains into the storm drain system. The three sub-systems are effective, but expensive to operate; two of the

VOL 15
0128
R0060349

sub-systems have experienced recurring clogging problems and are being retrofitted.

g. Stormwater Drainage Component of General Plan Infrastructure Element. Amendment to City's General Plan includes general requirements of Federal and State stormwater regulatory program as well as policies and programs for stormwater pollution abatement; City ordinances must be based on adopted policy.

h. Centralized Hazardous Waste Storage Facility. Three pre-fabricated storage buildings have been installed at the Los Angeles Aqueduct Filtration Plant to isolate hazardous materials from other buildings. One building is for storage of hazardous material; the other two are for temporary storage of hazardous waste generated within the plant.

i. Revisions to Storm Drain Design Manual. Standards for flood control projects are being modified to incorporate stormwater pollution reduction components. Consideration is being given to adopting Los Angeles County standards for hydrology and sedimentation. Further evaluation of available references is expected to result in either revisions to Standard Plans or a new manual.

j. Inter-jurisdictional Stormwater Reuse Task Force. City has formed and participates in a multi-jurisdictional task force to implement diversion, capturing and possibly reusing high quality stormwater runoff. Background issues, existing practices and new alternatives were presented in a "Capture and Conservation of Stormwater Runoff" report prepared in 1993 by the Stormwater Detention and Reuse Task Force.

k. Stormwater Pollution Abatement--Street Maintenance Yards. Four street maintenance yards, including an asphalt processing plant, are being studied as potential sources for storm water pollution. Findings and operation modifications will be applied to other maintenance yards.

l. Illegal Discharge/Illicit Disposal Screening. A comprehensive program is in operation to identify all outfalls in the city's storm drain system and their tributary drainage areas and to gather as much information as possible for incorporation into a computer database. Both visual observations and outfall samplings are used to identify and prioritize drainage areas for investigation of possible pollutant discharges.

m. Investigation of Storm Drain Lines. This program is designed to stop discharge of pollutants from specific facilities by monitoring maintenance holes around suspected sources.

VOL 15
0129
R0060350

n. Spill Prevention, Containment and Response Procedures--City Facilities. Program is to ensure that facilities have adequate spill prevention, containment and emergency response procedures. City is identifying all City-owned facilities that do not have adequate procedures as they relate to stormwater pollution abatement and will implement improved procedures as needed.

o. Limitation of Sewage Infiltration into Storm Drain System. The City traces the infrequent instances of sewage infiltration into the storm drain system using a variety of techniques, including smoke testing, dye testing and video inspection of sewer and storm drain lines.

p. Manual of BMP Construction Guidelines. Screening guidelines and construction standards are being prepared aimed at reducing stormwater pollution from construction sites, based on established BMP's as well as "good housekeeping" practices.

q. Enhanced Construction Site Inspection and Enforcement Program. City plans to review Municipal Code requirements for construction sites to ensure that they are sufficient and consistent with the State of California General Construction Activity Stormwater Permit requirements.

r. Construction Education and Training Program. City's aim in this three phase program, currently in progress, is to increase the awareness of those involved tn the construction process with regard to stormwater pollution abatement activities. Video and printed materials are in preparation that address erosion control and sedimentation issues.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF LYNWOOD

City of Lynwood: Phase III Co-Permittee
Population (1994): 64,300
Land Area: 4.85 sq. mi.

Lynwood is located 10.6 miles south of the Los Angeles Civic Center, crossed by the Century (105) Freeway, immediately to the west of Long Beach (710) Freeway and the L.A. River. The City was incorporated in 1921 and it is the 25th most populous city in the County. It has a small job base concentrated in retail trade, services and manufacturing. Land uses in the City are mixed urban dominated by residential. Median family income in 1989 was $26,439.

1. A program is in progress to stencil all City catch basins.

2. In addition to the County Hotline, the City has a Fire Department dispatched Hotline for reporting of illegal discharges/dumping. The program is publicized through handouts.

3. While the City has not as yet implemented urban runoff control measures, they expect to be adopting a model ordinance during the 1994-95 FY.

4. The City provides public education and outreach on the problem of stormwater pollution by participating in block watch meetings to distribute handouts and explain the goals of the NPDES program.

5. The City routinely cleans all its catch basins at least once a year and responds to complaints with additional cleaning, as needed.

6. The City empties its 50 public roadside trash receptacles twice a week, with special pick-ups of overflowing receptacles as needed.

7. The City sweeps all public streets once a week.

8. The City discourages improper litter disposal through its public outreach program (speakers, handouts). They plan to include additional provisions in a model ordinance to be adopted in FY 1994-95.

9. The City contracts with Los Angeles County for industrial waste inspections.

VOL 15

0131

10. City crews and students clean streets, sidewalks and alleys, working each day on debris and rubbish removal.

11. The City does not have a recycling program.

12. The City participates in the countywide household hazardous waste management program.

13. The City has no water conservation program.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF MALIBU

City of Malibu: Phase I Co-Permittee
Population (1994): 11,350
Land Area: 19.61 sq. mi.

Malibu is one of the most recently incorporated cities in the County. It is located 24.5 miles west of the L.A. Civic Center, along Pacific Coast Highway and the Pacific coast. It ranks 76th in population among L.A. County cities and its land uses are primarily residential and open space.

1. All City catch basins have been stenciled. Refrigerator magnets distributed to residents in "door hanger" to publicize stencil program.

2. The City supports the County Hotline to promote public reporting of illegal discharges/dumping. The hotline number is included on the refrigerator magnet distributed by the city. Public Works inspector seeks voluntary compliance by violators; there has been full compliance, without question, to date. Publicity has included newspaper articles on clean water and door-to-door distribution of information.

3. City ordinances provide for erosion control and post-development pollution controls for both new construction and remodeling. Active inspection and compliance monitoring program. City developing a staff education program, specifically focusing on construction site operations. City has program for Short-term Erosion and Sediment Control in place to respond in emergency situations such as heavy rains/flooding. Long-term Erosion Control program scheduled for implementation.

4. The City has reached all Malibu residents with their public education and outreach programs that includes city newsletters, door-to-door material and a Gutter Patrol program. Following are important points of contact: schools, homeowners associations, adjoining public agencies and prominent environmental groups.

5. Most of the catch basins within the City are maintained by the County. The City's catch basins are cleaned as needed and upon request.

6. City does not have receptacles. Most debris accumulations occur along Pacific Coast Highway which has roadside trash receptacles that are maintained by Caltrans.

VOL 15
0133
R0060354

7. All City streets are swept bi-weekly. Pacific Coast Highway is maintained by Caltrans; City is attempting to coordinate sweeping schedules.

8. City Municipal Code includes provisions for enforcing improper trash disposal.

9. An inspection/reporting program for non-storm water drain discharges will be expanded in 1995 to include an industrial waste inspection program.

10. City's recently implemented public outreach program encourages cleaning of sidewalks and alleys.

11. Glass, plastics and paper are routinely collected at curbside. Public outreach programs include press releases to local newspapers, newsletters and homeowners associations, and distribution of recycling newsletters to City residents and businesses.

12. The City aggressively promotes the County's household hazardous waste "roundups".

13. The City's public outreach program addresses the problem of overwatering and urban runoff.

14. Other BMP's: Storm Water Quality Management Plan--scheduled for implementation by fall 1994, this comprehensive management plan would coordinate objectives and activities of all BMP's and related programs.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF MANHATTAN BEACH

City of Manhattan Beach: Phase I Co-Permittee
Population (1994): 33,100
Land Area: 3.87 sq. mi.

Manhattan Beach is a coastal city lying 22.0 miles southwest of downtown Los Angeles and was incorporated in 1912. It ranks 52nd by population among L.A. County cities. The job base is small and dominated by retail trade and services. Land uses are primarily residential. Median family income was $79,027 in 1989.

1. The City, with the help of volunteers, has stenciled all its catch basins with the Heal the Bay design. The program has been effective in bringing the storm water pollution problem to the attention of the public.

2. In addition to the County hotline the City has established a phone number for reporting. Approximately 35 reportings have been received. To publicize the need to report illegal dumping, presentations have been made at local schools, articles have been published in local papers, brochures have been made available and banners have been displayed.

3. The City has several codes (7.04.010, 7.16.160, 12.08.230, 12.08.24) which cover runoff related activities which were adopted during the 1970's. These measures have been effective in the past but will be even more so with an increased enforcement program which is underway.

4. The public outreach program includes brochures, school programs, newspaper articles and street banners.

5. Under contract, Los Angeles County cleans all catch basins at least once per year. City staff inspects them twice a week and cleans them as needed.

6. The City provides both trash and recycling receptacles citywide. They are emptied once a week generally though those in high traffic areas are emptied daily. Improvements to this program have been in response to RWQCB and Waste Management Board requirements.

7. 237 curb miles are swept once per week in residential areas, and at least once per week in commercial and industrial areas. The street sweeping program has been expanded in response to RWQCB requirements and a public education program beginning in August 1994 will encourage no on street parking on street sweeping days.

VOL 15

0135

8. The Ocean Safe program brochure includes information on improper litter disposal. Community Services Officers are able to cite anyone who engages in improper disposal. Recycling and composting program teach how to reuse litter and lawn clippings.

9. A combination of City and County personnel conduct industrial waste and non-storm water discharge inspections on a complaint basis. The plan check process is also used to prevent discharges. Auto related businesses and gas stations are inspected on a complaint basis while restaurants are regularly inspected.

10. The Ocean Safe program includes information on dirt and debris removal from sidewalks and alleys. This program has been modified in response to RWQCB requirements.

11. The City has a curbside recycling program for plastic, glass, paper, metal and green waste. The program has been publicized through information in brochures and fliers. The City estimates that 25% of rubbish is being diverted from landfills at this time.

12. The City participates in and promotes, through brochures and newspaper articles, the Countywide program. The City suggests school programs to teach proper disposal of hazardous materials.

13. Water conservation is part of the message of the Ocean Safe program. Brochures distributed to residents include information on the result of overwatering etc. Modifications have been in response to drought conditions and RWQCB requirements

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF MAYWOOD

City of Maywood: Phase III Co-Permittee
Population (1994): 28,850
Land Area: 1.18 sq. mi.

Maywood lies 7.9 miles south of central Los Angeles, west of the L.A river, and has mostly residential land uses, though it is surrounded by industry. It became a City in 1924, and by population ranks 57th among Los Angeles County cities. It has a very small job base with manufacturing and wholesale industries slightly ahead. Median family income was $25,559 in 1989.

1. Stenciling program is not yet underway. Stenciling of City owned catch basins will be contracted with L.A. County Public Works in fiscal year 1994-95.

2. No program has been established yet but the City plans to develop a public outreach program in 94-95 to inform the community of the hotline reporting system.

3. No runoff control measures have yet been implemented. Adoption of the model runoff ordinance will be considered in fiscal year 94-95.

4. No public education program to inform the public on the problem of stormwater pollution has been implemented but the City will develop an outreach program in the 94-95 fiscal year.

5. The City contracts with the County for catch basin cleaning prior to storm season. The catch basin cleanout program will be evaluated in 1994-95 to determine if modifications are required.

6. No trash receptacles are currently provided but a city-wide program is planned for fiscal year 94-95.

7. 28 curb miles are swept weekly in all areas (residential, commercial, industrial). The street sweeping program will be evaluated in 94-95 to determine if modifications are required.

8. Municipal Code 5-22.01 and other codes prohibit improper disposal of debris. An enforcement and public outreach program will be developed in 1994-95.

9. There is no industrial waste inspection program at this time. An industrial waste inspection program will be contracted with the County in FY 94-95.

VOL 15

0137

R0060358

10. A public outreach/education program will be developed in FY 94-95 to increase community awareness.

11. No recycling program presently exists. The contract trash hauler is developing a M.R.F. program.

12. The City does participate in the Countywide Household Hazardous Waste Management Program.

13. No water conservation program has been implemented. The City plans to develop a public outreach program in FY 94-95.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF MONROVIA

City of Monrovia: Phase II Co-Permittee

Population (1994): 37,550
Land Area: 13.69 sq. mi.

Monrovia is located 19.1 miles northeast of the Los Angeles Civic Center just north of the Foothill (210) Freeway in the foothills of the San Gabriel Mountains. It ranks 47th in population among L.A. County cities and was incorporated in 1886. It has a large job base, heavily concentrated in the manufacturing, service and retail trade industries. Land uses are mixed but mostly residential with some vacant land also present. Median family income was $40,803 in 1989.

1. The City maintains catch basins but has not begun a stenciling program and does not plan one at this time. The City feels that a stenciling program encourages graffiti and is not cost effective.

2. The City encourages the reporting of illegal discharges to the County hotline. Information has been mailed out in water utility bills and public announcements on cable have been made.

3. The City will adopt a runoff control ordinance in October 1994. The ordinance will give the City authority to inspect and enforce.

4. The City has prepared a brochure covering various BMP's for residential, commercial, industrial and construction practices. Also, information is included in utility bills and public services announcements are made on local cable TV.

5. The City cleans its catch basins yearly and estimates that the program has reduced debris from entering the storm drain by 98%. This program has been expanded from a response to complaint basis.

6. The City provides 35 roadside trash receptacles which are emptied weekly. Additional receptacles and more frequent cleanup have been installed in certain areas. City staff and citizens have been informed to report areas requiring clean-up to public works dept.

7. 145 miles of improved streets are swept weekly. Prior to March 1994, streets were swept every other week.

VOL 15

0139

8. To discourage improper disposal of litter, lawn clippings and pet feces the City sends out a BMP brochure to residents and to landscape contractors with their annual business license renewal.

9. Beginning October 1994, a program will be established for City staff to increase awareness of discharges needing permits. Auto related business, gas stations and restaurants will be inspected annually under authority of the storm water ordinance. Businesses with NPDES and County Sanitation permits will also be inspected.

10. Beginning in October 1994, the city will encourage the removal of dirt/debris by distributing a brochure with quarterly water bill.

11. The City has established a curbside recycling program for a wide variety of materials. Yard waste and commercial recycling was also recently established. Public announcements on cable TV and utility bill mailings publicize the program. The City estimates that 28% of rubbish is being diverted from landfills.

12. The City participates in and publicizes the Countywide Household Hazardous Waste Program and has also arranged for HHZ drop off at the local rubbish facility. The City has secured a state grant for curbside oil collection and is seeking funding for a HHZ hotline.

13. The City encourages water conservation though water bill mailings and local cable TV public service announcements.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF MONTEBELLO

City of Montebello: Phase II, III Co-Permittee
Population (1994): 60,900
Land Area: 7.73 sq. mi.

Montebello lies 9.2 miles east of downtown Los Angeles, south of the Pomona Freeway. It is the 29th most populous city in the County and was incorporated in 1920. The job base is large and concentrated in services, manufacturing and trade. Land uses are also mixed with residential, commercial and industrial. Median family income in 1989 was $34,416.

1. So far 240 County owned catch basins have been stenciled with the Heal the Bay design. The L.A. County Department of Public Works will complete the stenciling of the City owned catch basins in Aug. 1994.

2. No programs or additional hotlines to encourage public reporting of illegal dumping have been established. The County hotline has been publicized through newspaper advertising and 5 reports have been received. Cable TV and radio ads could help to encourage reporting.

3. The City's Grading Code and Street Code address urban runoff control. These measures were adopted in 1963 and revised in 1992.

4. The City plans to soon develop newspaper articles, news releases and brochures to educate the public on stormwater pollution.

5. The City cleans debris from catch basins every 6 months. This program is effective and has not been modified.

6. 50 roadside trash receptacles are provided and they are emptied twice per week. The City has found that problem litter areas occur near bus stops. This program has not been modified in response to RWQCB requirements.

7. 291 curb miles are swept using vacuum equipment. Residential and industrial areas are swept weekly, commercial areas 3 times per week. This program was modified in response to RWQCB requirements.

8. The City has posted "No litter" signs throughout the city, especially near the Rio Hondo channel and has begun a green waste collection program to discourage improper disposal practices.

VOL 15

0141

9. The City does not have an industrial waste program and does not inspect for non-storm water discharges. Auto parts business, gas stations and restaurants are inspected once a year, auto repair shops are inspected twice per year and auto body shops are inspected 4 times per year under authority of the Montebello Fire Department.

10. Property owners are required to maintain sidewalks by Municipal Code 12.8.050. There has been good response to the program which was modified in response to RWQCB requirements. The City plans to start publishing information in newsletters, and local newspaper.

11. The City has implemented a curbside recycling program and has a permanent recycling facility. Newspaper, plastic, tin, aluminum and glass are recycled. Seminars, community meetings and publications have been used to publicize the program. The City plans to expand the program to include commercial and industrial sectors.

12. The City participates in the Countywide household hazardous waste management program and suggests advertising safe disposal and storage practices. A used oil recycling program is being started.

13. The City's 5 water districts encourage water conservation and have ordinances specifying penalties but they presently are not enforced.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF MONTEREY PARK

Monterey Park: Phase II Co-Permittee
Population (1994): 63,100
Land Area: 7.73 sq. mi.

Located 7.8 miles east of the Los Angeles Civic Center between the San Bernardino and the Pomona Freeways, Monterey Park has the 27th largest population in the County. It has a small job base concentrated in the service, manufacturing and retail trade industries. Land uses are mainly residential and the median family income in 1989 was $36,808.

1. The City has not stenciled any catch basins to date, although they plan to begin the program later this year and stencil all basins by March 1995.

2. The City supports the County Hotline and plans to begin publicizing the program by distributing brochures and promoting it on their cable channel and in newspapers.

3. Industrial waste ordinance currently provides limited runoff controls; a specific Runoff Control Ordinance is being drafted.

4. The City of Monterey Park has started its public education and outreach program. The City has placed articles in a local City newsletter, prepared handouts available to the public, advertised the NPDES program on local cable television and has initiated a school outreach program.

5. The City cleans all catch basins as needed, generally before the rainy season and after storms.

6. The City provides public roadside trash receptacles that are emptied twice weekly. They plan to analyze the effectiveness of the program and make modifications, as necessary.

7. The City sweeps all residential and industrial streets once a week and commercial streets twice a week. They plan to analyze the effectiveness of the program and make modifications, as necessary.

8. The City discourages improper disposal of litter, lawn clippings and pet feces through public outreach and NPDES literature.

9. The City does not presently have an industrial waste inspection program, although they do have a sewer and industrial waste code that provides for prosecution of

VOL 15

0143

R0060364

violators. They are currently purchasing equipment and hiring a consultant to implement a program during this fiscal year that will provide for annual inspections of industrial and related businesses.

10. The City encourages the removal of dirt, rubbish and debris from sidewalks and alley through public outreach and literature. The City has a public works summer program that uses children to remove trash from public streets.

11. Plastic, glass, aluminum cans and newspapers are routinely collected at curbside. A green waste recycling program is planned for implementation during this fiscal year. Brochures are distributed that provide basic recycling information.

12. The City participates in the countywide household hazardous waste management program. They plan to distribute brochures containing proper disposal practices and listing disposal collection stations.

13. The City promotes water conservation and prevention of runoff in brochures--currently being revised and expanded, and will be including information on water conservation in City water bills.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF NORWALK

City of Norwalk: Phase III Co-Permittee
Population (1994): 97,300
Land Area: 9.35 sq. mi.

Norwalk is located 15.7 miles southeast of central Los Angeles, at the eastern end of the Century (105) Freeway. Incorporated in 1957, Norwalk has the 14th largest population among L.A. County cities. Most of its small job base is concentrated in the service and retail trade industries. Land uses are primarily residential with some industrial and commercial. Median family income was $40,369 in 1989.

1. No stenciling of catch basins has been completed yet but a program has been approved. L.A. County will do the stenciling using the "universal icon" stencil developed by Heal the Bay and the City of L.A."

2. The City has a graffiti/vandalism hotline which can be used to report illegal dumping. Many calls have been received but there is no record of how many are related to stormwater pollution. This hotline was advertised in the city newsletter and at public meetings. The City states that the public needs to be made aware of the NPDES goals and what it can do to help achieve those goals. The City has established two telephone "hotlines", to facilitate the public reporting of illegal discharges and/or dumping.

3. Ordinances which control illegal discharges/illicit connections and stormwater/urban runoff from commercial, industrial, residential, and construction sites were adopted prior to the NPDES Permit. The City has evaluated existing ordinances, in the context of the NPDES Permit requirements, and plans to prepare and adopt a single stormwater ordinance which will provide all of the legal authority the City must have under the NPDES Permit. Existing ordinances may be revised, if necessary, to better support the City's needs in the implementation of the NPDES Permit requirements. The implementation of these activities, new ordinance adoption and existing ordinance revision, is planned for fiscal year 1994-95.

4. The City anticipates initiation of a comprehensive stormwater management public outreach program in fiscal year 1994-95. Although the City has implemented some stormwater management type public outreach activities, to-date efforts have centered on the accumulation of information in preparation for the comprehensive program.

VOL 15

0145

5. L.A. County Public Works cleans catch basins annually. No information on effectiveness or need to modify is available at this time. Efforts will be made to acquire such information.

6. 18 public roadside trash receptacles are provided by the City and are emptied and cleaned weekly. High use areas are monitored twice weekly and cleaned as necessary. This additional aspect was implemented in 1993.

7. 400 curb miles are swept weekly. Increased street sweeping began in Feb. 1994 in response to citizen concern. There is a positive difference in visible debris but amount has not been quantified.

8. The City has an Anti-Litter and Weed Control ordinance (Section 5-14 of the Municipal Code) and an "Animal Control Ordinance" which prohibit improper disposal and specify penalties. The City has evaluated its ordinances and will consider their modification; moreover, the City plans to prepare and adopt a single, comprehensive stormwater management ordinance which will provide the City with the legal authority required by the NPDES Permit. A greenwaste program is planned for 1995.

9. L.A. County Sanitation District inspectors and Public Works inspectors enforce Title 20 of the County Code. City staff sometimes assists. No program for regular inspection of auto business, gas stations or restaurants. Facilities are inspected on an "as needed" basis.

10. Although some activities have been implemented, no comprehensive public education program on stormwater management has yet been established.

11. A curbside recycling program is planned for implementation in October 1994. Informative articles have been printed in city newsletter. The City is currently in the process of implementing a used oil recycling program. A used oil program has been in effect at the Public Works Maintenance yard for years. Approximately 11% of rubbish is estimated to be diverted from landfills.

12. The City participates in the County household hazardous waste program. The use of household hazardous wastes should be reduced and the City suggests that information be posted at retail stores to remind purchasers that unused hazardous material must be disposed of in a proper manner.

13. A water conservation ordinance adopted in 1991 prohibits hosing down paved surfaces and runoff to streets. A Water Efficient Landscaping Ordinance was adopted January 1993 to reduce landscaping watering and runoff.

VOL 15

0146

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF PALOS VERDES ESTATES

City of Palos Verdes Estates: Phase I, III Co-Permittee
Population (1994): 13,650
Land Area: 4.77 sq. mi.

Palos Verdes Estates is located on the west side of the Palos Verdes Peninsula, 27.4 miles southwest of the Los Angeles Civic Center. It was incorporated in 1939 and currently ranks 73rd in population in L.A. County. Its job base is very small and concentrated in the service industry. Land uses are almost entirely low density residential. Median family income was $109,244 in 1989.

1. Local boy scouts stenciled all 450 catch basins with the Heal the Bay design. The City feels that the program effectively discourages people from throwing waste in the catch basin.

2. In addition to the County hotline, residents can call the city or the police to report illegal dumping. An informational article was published in the quarterly city newsletter.

3. Ordinance #093-563 prohibits dumping unlawful substances into open channels, gutters, inlets, storm drains etc. No other modifications have been made in response to the RWQCB requirements.

4. Informational articles have been published in the city newsletter to educate the public on the problem of stormwater pollution. The City feels the program has been effective since phone calls have been received reporting illegal dumping.

5. The City issues an annual contract for catch basin cleaning prior to the rainy season and the City cleans out individual catch basins when necessary.

6. 50 roadside trash receptacles are provided and are emptied 3 times per week. This program has not been modified in response to RWQCB requirements.

7. 2,000 curb miles of residential streets are swept once a week. The two commercial areas, Lunada Bay Plaza and Malaga Cove Plaza, are swept once a week.

8. City codes 8.16, 12.24.130, and 12.24.180 prohibit improper disposal of litter, lawn clippings, and pet feces. There are penalties for improper disposal.

9. No industrial sites exist within the City so there is no waste inspection prog.am. Auto related businesses are not inspected

VOL 15
0147
R0060368

but gas stations and restaurants are inspected in response to complaints under the authority of ordinance 093-563.

10. A public instruction program intended to invite the public to report illegal rubbish and debris dumping is mentioned as a way to encourage removal of debris from sidewalks and alleys. Phone numbers are periodically published in the City news.

11. The City has a backyard recycling program. Plastic, glass, aluminum, tin and newspapers are recycled and the program has resulted in 12% of rubbish being diverted from landfills.

12. The City participates in the County household hazardous waste management program. In addition the City sponsors a hazardous waste collection day which had an overwhelming response.

13. The City passed the Water Efficient Landscape Ordinance (7/93) which imposes watering regulations on new development. Resolution R-91-21 encourages residents to conserve by not hosing off hard surfaces.

VOL 15

R0060369

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF PARAMOUNT

City of Paramount: Phase III Co-Permittees
Population (1994): 52,700
Land Area: 4.66 sq. mi.

Paramount lies 16.5 miles south/southeast of downtown Los Angeles, just east of the Long Beach (710) Freeway and was incorporated in 1957. Its population ranks 36th largest among Los Angeles County cities. It has a large job base heavily concentrated in the manufacturing and service industries. Land uses are mixed urban with large industrial tracts dominating. Median family income in 1989 was $30,540.

1. Stenciling of catch basins will be done during fy 94-95. It is expected that L.A. County will paint the stencil under a City purchase order.

2. Public outreach program is anticipated to be developed during 1994-95. Quarterly newsletter will used for public outreach.

3. It is anticipated that a runoff control ordinance similar to the model ordinance drafted by the subcommittee formed by L.A. County will be adopted by the City.

4. Public outreach program will be initiated during Fiscal Year 94-95.

5. L.A. County cleans the catch basins annually. A monitoring program to inspect the catch basins every two months to determine if additional cleaning is necessary will be initiated in the 1994-95 fiscal year.

6. 55 trash receptacles are provided and are emptied once per week. Receptacles in problem areas around convenience stores are emptied twice per week. Only modification to the program has been additional emptying.

7. 160 curb miles are swept; once per week in residential and industrial areas and twice per week in commercial areas. Program has not been modified.

8. Existing ordinances prohibit improper disposal of litter, lawn clippings and pet feces. These ordinances are enforced by code enforcement officers. An outreach program will be established in 1994-95 to inform the public on the benefits of proper disposal.

VOL 15
0149
R0060370

9. An industrial waste program which will probably include inspection for non-storm water discharges will be initiated in 1994-95. It is anticipated that the new ordinance will authorize yearly inspections of auto related businesses, gas stations, and restaurants.

10. City ordinances prohibit illegal dumping of dirt, debris and rubbish on private and public property. The City provides flyer inserts in utility bills that encourage removal of such materials from sidewalks and alleys. They plan to expand this program to include additional printed materials.

11. Trash hauler has the responsibility for separating glass, newspaper, aluminum and green waste for recycling. Approximately 12% of rubbish (per day) is being diverted.

12. The City participates in the Countywide household hazardous waste management program. The City does propose a public outreach program.

13. The present water rate schedule is graduated based on usage. Also, when the water supply is determined to be endangered by drought conditions, a conservation program is placed in effect which requires the reduction of water use for irrigation, car washing etc.

SUMMARY STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF PASADENA

City of Pasadena: Phase II, III Co-Permittee
Population (1994): 134,800
Land Area: 23.14 sq. mi.

At the foot of the Angeles National Forest, Pasadena is 10 miles northeast of downtown Los Angeles and was the sixth most populous City in Los Angeles County in 1994. Incorporated in 1886, Pasadena is the second oldest City in the County as well. Noted for a century of annual Rose Parades and as host of the Rose Bowl Football game, Pasadena has a very large job base. Services account for about 50% of jobs, followed by retail trade, finance and manufacturing. Land uses are primarily residential with commercial and some industrial. Median family income was $40,435 in 1989.

1. The City is selecting 20 - 25 manhole covers in areas where catch basins collect considerable debris. Covers, rather than sidewalks, will be stenciled and monitored for one year. If surveys determine that stenciling decreases catch basin debris, program will be expanded. At this point, the City does not want to apply stencil to over 900 sidewalk locations, due to aesthetic concerns.

2. The City has a 24 hour Spill Response telephone number at their Police Department to facilitate public reporting of illegal discharges/dumping. The service was publicized in the City's In-Focus flyer, distributed to all City residents and businesses. Expansion of public outreach will include hotline phone number display on the City's cable channel.

3. Runoff control measures are required for any construction on land with a slope of 15% or greater. A Storm Water Management Ordinance was adopted in July 1994 that provides specific regulatory controls over construction grading.

4. The City's public outreach program includes articles in their bi-monthly newsletter regarding catch basins and storm drainage systems and their function. The City also plans special fliers to insert with utility bills and airing a special video on their cable TV channel. Attending City of Los Angeles Public Outreach Meetings have been helpful.

5. The City contracts to have all its catch basins cleaned at least annually in October. One hundred of the 920 basins which are in the vicinity of the Rose Parade and game are cleaned a second time in January.

6. The City's 252 public roadside trash receptacles are emptied 3 - 5 times per week. Special Pasadena events such as the Rose Bowl/ Parade and, this year, the World Soccer Cup require

VOL 15 0151

concentrations of receptacles and more frequent collections. Additional permanent receptacles will be added in Old Pasadena when a pedestrian environment improvement plan is implemented in 1995.

7. All City streets are swept, with recently approved frequency. Residential streets are now swept a minimum of twice per month; commercial and industrial areas 3 times per week.

8. The City's litter control ordinance permits penalty enforcement of improper disposal of litter. A public outreach program is planned. The City suggests using a universal logo on trash receptacles that are located around waterways and storm drain facilities.

9. The City's Fire Department conducts an industrial waste inspection program that checks waste disposal practices and the storage of hazardous waste. Auto parts, repair and body shops and gasoline stations are inspected once a year; restaurants are inspected 3 times per year. City and State ordinances provide enforcement authority.

10. The City is planning to implement a public outreach/education program. They cite the beneficial information available by attending City of Los Angeles Public Outreach meetings.

11. Aluminum and tin cans, glass, plastic, newspapers, junk mail, magazines, telephone books, used motor oil and cardboard are routinely collected at curbside for recycling. A permanent recycling center is available. Yard waste recycling and composting programs are also offered. A variable rate structure for refuse collection encourages waste reduction and recycling. A public information/outreach program includes direct mail brochures, information in libraries and public counters, speaking engagements and school presentations, special events, newspaper and City newsletter articles.

12. The City participates in the countywide household hazardous waste management program as well as provides used motor oil collection both curbside and at auto parts stores. A program to provide free containers for used motor oil is to begin this year. Brochures are mailed to residents explaining the program. The City suggests more displays at point-of-purchase to encourage proper disposal of hazardous products.

13. The City provides an indoor/outdoor water conservation counseling program, including preparation of a water use reduction plan whenever possible. During drought conditions a City ordinance requires all water users to follow conservation measures. Water conservation educational materials are distributed to the general public and at local schools. There is an annual Water Awareness Month.

VOL 15

0152

14. Additional BMP's

Replacement of a sewage pump station by construction of a gravity flow sewer, thereby eliminating the possibility of pump failure and greatly reducing the potential for sewage spills into the storm drain system. $1.6 million program scheduled for completion in November 1994.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF PICO RIVERA

City of Pico Rivera: Phase III Co-Permittee
Population (1994): 60,600
Land Area: 8.23 sq. mi.

Located 13.5 miles southeast of the Los Angeles Civic Center, Pico Rivera was incorporated in 1958, and is generally north of the intersection of Santa Ana (5) and San Gabriel River (605) freeways. It has the 30th largest population among L.A. County cities. The employment base is large. Almost half of all jobs are found in manufacturing. Land uses are mixed urban with single family residential dominating. Median family income was $36,023 in 1989.

1. All catch basins have been stenciled with the Heal the Bay design. The City does not feel that the stencil will deter someone intent on illegal dumping into catch basin.

2. No program has been established to encourage reporting. The City plans to include County hotline number on cable TV message board.

3. Chapter 8.12, 8.16, and 12.56 of the Municipal Code (adopted 1-29-94) addresses urban runoff control. It is unknown what the net effects of these measures are.

4. Public education has been undertaken with occasional articles in City paper. This has probably had a minimal effect in reducing stormwater pollution.

5. Catch basins are inspected and cleaned at least twice per year. This program has not been modified in response to the requirements of the RWQCB and the City estimates that its effectiveness is fair.

6. The City provides trash receptacles at all bus stops which are emptied daily. Problem areas are cleaned in response to visual inspections. This program has not been modified in response to RWQCB requirements.

7. 280 curb miles are swept; every two weeks in residential areas and weekly in commercial and industrial areas. This program has not been modified.

8. Articles in City paper discourage improper disposal of litter, lawn clippings and pet feces. There are penalties for improper trash disposal. No modifications have occurred due to RWQCB requirements.

VOL 15

0154

9. No industrial waste inspection program exists but the City will implement a routine program beginning in August 1994. The City does respond to complaints and to visual observation of non-storm water discharges. Auto related businesses, gas stations, and restaurants are inspected quarterly under the authority of the municipal code. This program has been increased from periodic to regular.

10. The City encourages removal of dirt, rubbish and debris through occasional articles in City newspaper. Response has been fair. The program has not been modified.

11. A curbside recycling program for greenwaste and newspaper exists and 2 privately owned recycling centers are located in the City. The City estimates 15% of rubbish is being diverted. No outreach or education program has been established.

12. The City participates in the County household hazardous waste program. Suggestion that there be more centers to receive these wastes and that regular trash companies be allowed to pick them up.

13. Water conservation program for City parks and medians, businesses and residences with runoff problems are contacted.

VOL 15

0155

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF POMONA

City of Pomona: Phase II Co-Permittee
Population (1994): 138,600
Land Area: 22.97 sq. mi.

Over 31 miles east of downtown Los Angeles lies the City of Pomona, incorporated in January, 1888. With three freeways passing through it, Pomona borders San Bernardino County to the east and is the 4th largest City in the County. The job base for Pomona is small, but relatively well diversified. The greatest number of jobs is in the service industries, followed by manufacturing, retail trade and government. Land uses are mixed with residential commercial and industrial. Median family income was $34,751 in 1989.

1. The City is implementing a program August 1 to stencil all catch basins.

2. In addition to supporting the County Hotline, the Pomona Fire Department has a hotline to encourage and facilitate public reporting of illegal discharges/dumping.

3. The City has adopted a Storm Water Management and Discharge Control Ordinance designed to: 1) eliminate non-storm water discharges to the City storm sewer, 2) control discharges to City storm sewers from spills, dumping or disposal of materials other than storm water and 3) reduce pollutants in storm water discharges to the maximum extent practicable.

4. A public awareness program will be implemented during the 1994-95 FY. City staff has been participating in County Public Information Committee meetings to determine most efficient methods of public education.

5. All catch basins are cleaned on a regular schedule during the year with additional cleaning as needed.

6. The City empties its 33 public roadside trash receptacles twice a week. It adds additional litter receptacles of special public events.

7. Sweeping of all public streets occurs twice per month.

8. The City's Municipal Code and public outreach programs discourage improper disposal of all litter. Staff is reviewing additional options to decrease illegal/improper disposal practices.

9. The City inspects auto repair and body shops, gasoline stations and restaurants annually under their Industrial Waste Inspection program.

VOL 15
0156
R0060377

10. A City newsletter that provides general information and direction to residents on City policies and programs will supplemented during the 1994-95 FY by specific brochures and other materials being developed.

11. Glass, metal, paper, cardboard, aseptic packaging, aluminum, and plastics are routinely collected curbside for recycling. The program is being expanded to include white goods (appliances) and green waste. Handouts and water bill stuffers are currently used to publicize the program; a newsletter to all residents is being prepared.

12. The City supports the countywide household hazardous waste management program, promoting it in the City newsletter and other outreach materials. The City has targeted their public information program on the increased public awareness of proper hazardous material disposal practices.

13. City Code has significant prohibitions on wasting of water, promoted by a water "hotline" program, TV public service announcements and utility bill stuffers.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF RANCHO PALOS VERDES

City of Rancho Palos Verdes: Phase I Co-Permittee
Population (1994): 42,200
Land Area: 13.43 sq. mi.

Incorporated in 1973, Rancho Palos Verdes is the 43rd most populous City in L.A. County. It is located along the southern coast of the County on Palos Verdes Peninsula, and is 27 miles southwest of the Los Angeles Civic Center. The City is predominantly residential and has a very small employment base. Almost 80% of the jobs are in government, retail trade and service sectors. Median family income was $87,528 in 1989.

1. Boy Scout volunteers have stenciled all 550 City owned catch basins with the Heal the Bay design. Heavy written public relations support explaining the stencil program is a suggested modification.

2. The City has implemented programs to encourage public reporting of illegal dumping. Only County hotline is available and it has been publicized through the City newsletter and cable public access channel. Too soon to determine effectiveness.

3. In October 1989, the City prohibited Discharge of Offensive or Damaging Substances (Municipal Code Section 20.36.010). Unknown if this measure has been effective in reducing pollutants. The City plans to adopt a runoff control ordinance in the next 4 months.

4. Quarterly City newsletter articles, brochures, direct mailing to businesses and cable public access have all been used to educate the public on stormwater pollution. It is felt that public education program will convince people to alter their behavior but a more coordinated countywide message would be helpful.

5. Catch basins are cleaned annually and monitored for problems. This program is effective and has not been modified.

6. 18 trash receptacles, emptied weekly, are provided. Bus stops will receive recycling containers. This program has been modified to meet RWQCB and AB939 mandates.

7. 260 curb miles are swept monthly in residential areas and the arterials are swept weekly. The City has added a City wide sweeping before first rain in response to RWCQB requirements which should be effective in reducing debris swept to ocean during first storm.

VOL 15 0158

R0060379

8. Improper disposal is discouraged through education; newsletter articles and cable channel. This program has not been modified. The City has tried greenwaste recycling but it is presently on hold.

9. An industrial waste inspection program is being developed.

10. Public education program to encourage debris removal includes newsletter articles, newspaper articles, cable public access, and direct brochure mailing. This program has been modified in response to RWQCB requirements.

11. Newspaper, glass, plastics, aluminum and tin are recycled curbside. Recycler of the month promotion gives one year free trash collection to winner, Beautification award is funded by recycling revenue. A City program was established before RWQCB requirements.

12. The City participates in the County program. Used oil program will be established in FY 94-95.

13. Water conservation and runoff information is promoted through public education. The City now emphasizes water conservation as a method of saving resources and reducing pollution.

0159

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF REDONDO BEACH

City of Redondo Beach: Phase I, III Co-Permittee
Population (1994): 62,700
Land Area: 6.35 sq. mi.

Located almost 23 miles southwest of downtown Los Angeles, Redondo Beach is a coastal City which was incorporated in 1892. The Pacific Coast Highway passes through the southern portion of the City which extends to the San Diego (405) Freeway to the east. The employment base is large, with retail trade, government and services being the dominant sectors. Redondo Beach ranks 28th by population among Los Angeles County cities and had a median family income of $58,760 in 1989.

1. The City has stenciled all 1200 of its catch basins with the Heal the Bay design. The City feels that this program has been very effective in promoting awareness.

2. The County hotline is used for reporting illegal dumping and it has been publicized in the Chamber newsletter and City quarterly newsletter. The City does not have a system for tracking reports of illegal dumping but suggests tracking, as well as promotion of reporting through schools as ways to encourage reporting.

3. On March 15, 1994 the City adopted amendments to Chapter 4 of Title 5 relating to the Waste Water and Storm Water Drainage system.

4. Public education/outreach is occurring through written media newsletters which has been somewhat effective in promoting awareness. Concentrating programs on schools should be effective.

5. Catch basins are cleaned twice per year and as needed. This cleaning program has not been modified.

6. Roadside trash receptacles are provided and are emptied once a week. Recycling containers have been provided in high impact areas. The City also maintains signs as part of the recycling display project to increase public awareness. Trash and litter problems are monitored by a private collection service and the City is notified of problems.

7. 260 curb miles are swept weekly in residential and twice per week in commercial areas. This was a preexisting program.

8. The City discourages improper disposal through a recycling program, promotion of composting and the recent adoption of the Source Reduction and Recycling Element. There are

*

VOL 15 0160

penalties for improper disposal. This program was underway prior to the mandatory BMP's.

9. There is no industrial waste inspection program at this time. Inspections for non-storm water discharges are made only if there is a known problem.

10. The public outreach/education program to encourage removal of dirt, rubbish and debris from sidewalks and alleys is tied to all other City recycling/water quality programs.

11. The City has a pretty extensive curbside recycling program. Public outreach/education is through regular notices, contract waste services, and use of block leaders. Approximately 25% of rubbish is being diverted from landfills.

12. The City does participate in the Countywide household hazardous waste program and there is also a permanent facility within the City and a once a year well publicized roundup for City residents.

13. No water conservation program has been adopted though the City does support programs sponsored by water purveyor.

VOL 15

0161

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF ROLLING HILLS

City of Rolling Hills: Phase I, III Co-Permittee
Population (1994): 1,919
Land Area: 2.98 sq. mi.

Rolling Hills is located on the Palos Verdes Peninsula, 25 miles southwest of downtown Los Angeles. Incorporated in 1957, Rolling Hills is almost entirely residential, with a very small job base. Ninety percent of the jobs are in the service or construction sectors. Its population ranks 83rd among the 88 L.A. County cities and its median family income was $150,000 in 1989.

1. The County and Community Association maintain County-owned catch basins within the City. Storm drains have been stenciled by Los Angeles County Public Works.

2. Reports of illegal dumping can be made to City Hall in addition to the County hotline. The public continues to be informed of the County's hotline telephone number through the twice monthly newsletter sent to every household and at the City Hall counter handout display.

3. In 1993 the City adopted Good Housekeeping Requirements for Reduction of Urban Runoff, Urban Runoff Reduction Requirements for New Development Projects and Urban Runoff Reduction Requirements for Projects Under Construction and a water efficient landscape ordinance. These are part of the Rolling Hills Municipal Code, Section 5.04.142, and 17.27.020.

4. Every household receives the City newsletter twice-a-month that contains articles on issues of stormwater pollution. Two brochures on Household Hazardous Waste (County) and Hazardous Household Products (State) are available to residents at the City Hall counter handout display. Separate pamphlets are being developed on General Construction & Site Supervision, and Erosion Control Methods, & Landscaping, Gardening and Pool Maintenance. Residents are alerted to State-wide information that is also broadcast on radio, TV, and printed in newspapers.

5. The County maintains and cleans storm drains. The Rolling Hills Community Association also inspects and cleans catch basins each fall. No flooding due to storm drain backups have been reported.

6. No roadside trash receptacles are provided primarily due to the nature of the City. It is entirely residential and rural with private roads and estate sized lots.

VOL 15

01162

R0060383

7. The City has no street sweeping program again due to the fact that all roads are private.

8. Ordinances control improper disposal. Articles printed in the City's twice-monthly newsletter discourage the improper disposal of litter, lawn clippings, and pet feces in this all residential community. All streets are private and maintained by the individual property owners. There are penalties for improper disposal and the program has been modified to include stormwater runoff control measures required by the Regional Water Quality Control Board. The City publishes notices, distributes fliers and publicizes nearby classes given by the County and USC on their Master Composting and Backyard Greenwaste Programs. The City distributes fliers announcing County coordinated Environmental Contests for children.

9. There are no auto related businesses, gas stations or restaurants within the City. Land use is entirely residential.

10. There are no sidewalks or alleys with the City.

11. The City of Rolling Hills has a recycling program with containers located at City Hall where residents deposit newspapers, glass, plastic, aluminum, and tin. Manure is collected by the waste hauler (BFI) for composting. Publicity is being formulated for the collection at the centrally located fire station of used telephone books that will be recycled. Program publicity in the twice-monthly newsletter includes articles, graphs and rates of recycling as well as the benefits of recycling. Approximately 28% of rubbish is being diverted from landfills. The City is negotiating with its trash hauler to offer residential recycling pick-up and a composting education program.

12. The City newsletter that is printed twice-monthly is used to publicize the County household hazardous waste management program and other programs.

13. The City has adopted a water efficient landscape ordinance and encourages the use of drought tolerant landscaping. Again the City newsletter is used to alert residents to the problem of overwatering etc.

VOL 15

0163

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF ROLLING HILLS ESTATES

City of Rolling Hills Estates: Phase I, III Co-Permittee
Population(1994): 8,025
Land Area: 3.44 sq. mi.

Incorporated in 1957, Rolling Hills Estates is located on the Palos Verdes Peninsula, 23 miles southwest of downtown Los Angeles. The employment base is large, with 69% of the jobs in the service or retail trade sectors. The population is the 61st largest in the County and median family income was $90,698 in 1989.

1. All 75 City catch basins have been stenciled. City suggests use of more durable paint.

2. In addition to County Hotline, City has initiated a reporting system available 24 hours per day; phone number is included in directory of City services in every quarterly newsletter.

3. Municipal Code incorporates strict controls on urban runoff; emphasis is on grading/slope alteration, with violation penalties for contractors and builders. City also coordinates with county in providing sandbagging materials during rainy periods.

4. Every household receives regular City newsletter that contains articles on such issues as stormwater pollution; environmentally proactive community. City suggests using signs on beach trash receptacles to promote program.

5. All catch basins are cleaned annually in October, or more frequently if needed. Problem catch basins are inspected monthly.

6. City has 10 public roadside trash receptacles that are emptied twice weekly. To help prevent litter accumulation, City implements quarterly litter pickup program with volunteer community groups as well as an "Adopt-A-Trail" cleanup and maintenance program.

7. All City streets are swept--residential areas twice a month, commercial areas once a month. Per-mile costs were reduced by 40% when the City joined neighboring cities in a joint servicing contract; savings provides for extra sweeping when needed, such as during construction projects or during rainy periods.

8. Ordinances control improper disposal. City provides funding for community groups to regularly collect litter in the "Adopt-A-Street" program and backyard green waste composting program.

VOL 15
0164
R0060385

9. Both City and County staff participate in an industrial waste inspection program under ordinances adopted by reference from L.A. County codes. Gasoline stations and restaurants are inspected annually. Currently adding enforcement personnel.

10. City public outreach/education programs, along with funding for services, result in neighborhood cleanup campaigns by community groups. There are approximately 20 residential programs per year and 15 in commercial areas (no industrial areas exist).

11. Newspaper, glass, plastic, aluminum, tin, used motor oil and manure from Municipal Stables are routinely recycled. Backyard composting is another type of recycling supported by the City. Grant applications have been filed with California Integrated Waste Management Board to fund used oil curbside collection and recycling programs. Program publicity includes articles in the City newsletter, spots on the local cable channel and notices in trash billings. As an incentive, trash hauler holds quarterly drawing of residents who routinely recycle: prize is 1 year free refuse service. City plans to add green waste collection and composting to program in January 1995.

12. The City supports countywide household hazardous waste management program by publicizing service to residents and providing City staff to answer questions. City suggests using commercial television to reach broader audience.

13. City ordinances prohibit excessive outdoor water usage and require water efficient landscaping. City newsletter, local press and cable channel provide public education on misuse of outdoor water.

VOL 15

0165

SUMMARY STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF ROSEMEAD

City of Rosemead: Phase II Co-Permittee
Population (1994): 53,800
Land Area: 4.96 sq. mi.

Eleven miles east/northeast of the Los Angeles Civic Center is the City of Rosemead, which was established in 1959. The San Bernardino (10) Freeway bisects the City. Rosemead's employment base is small. 32% of all jobs are in transportation/public utilities, followed by services, retail trade and manufacturing. Land uses are mixed with residential commercial and industrial. It is the 35th most populous City in the County and it median family income was $30,905 in 1989.

1. City is scheduled to have all 64 of its catch basins stenciled by the County during the 1994-95 fiscal year.

2. City supports County Hotline by publicizing service in quarterly newsletter.

3. While no runoff control ordinance is now in place, City anticipates adopting ordinance drafted by L.A. County Model Ordinance Subcommittee; City wants expanded authority to accommodate new programs dealing with illegal and illicit discharges into their storm drain system and the required inspection of auto related businesses.

4. A City newsletter to all residents is being used to inform residents of City programs and issues, including stormwater pollution. The program will be expanded in the 1994-95 FY to include additional materials and techniques for public communication, including pamphlets and brochures that will be delivered to each home and made available at all public counters.

5. All catch basins are inspected every two months and cleaned as needed. Program much more effective than previous schedule of single annual cleaning prior to October.

6. The City's 31 public roadside trash receptacles are emptied every week--or more frequently, if needed.

7. All City streets are swept at least once a week, with commercial and industrial areas swept twice a week.

8. City ordinances prohibit the improper disposal of litter, etc.; enforced by Police Department.

9. The City has funded a training program for City employees in order to implement an industrial waste inspection program during the 1994-95 FY. They plan to inspect all industrial and related uses at least once a year.

10. The City's newsletter informs all residents of the need to keep debris from washing into storm drains. An expanded

VOL 15

0166

R0060387

public outreach program will be initiated during the 1994-95 FY.

11. Plastics, newspaper, glass, metal and green waste are routinely collected at curbside. To publicize program, full page announcements are printed twice each year in quarterly news letter, and notices included with monthly trash bills.

12. City participates in the countywide household hazardous waste management program; collection dates and locations are included in quarterly newsletter.

13. The City's public outreach program, notably their newsletter, has included educational information on the need for water conservation and how excessive outdoor water use directly affects quality of storm drain water.

0167
R0060388

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF SAN DIMAS

City of San Dimas: Phase II Co-Permittee
Population (1994): 33,900
Land Area: 15.35 sq. mi.

South of the 210 Freeway, San Dimas is located 29 miles east/northeast of downtown Los Angeles. Incorporated in 1960, it has the 50th largest population in the County. The Bonelli Regional County Park and the Puddingston Reservoir are recreational features of the area. The job base is small with half of the jobs in either services or manufacturing. Median family income was $55,790 in 1989.

1. The City has stenciled 65% of its catch basins with the L.A. County logo design. The remaining catch basins will also be stenciled.

2. The Public Works main telephone number can be used for reporting illegal dumping during business hours and after hours the County hotline is used. The public was informed of these phone numbers through a community newsletter. A suggestion to encourage public reporting: A "We Tip" hotline with some type of compensation.

3. Municipal Code section 14.04, 15.06, 18.180 pertain to water drainage requirements; all were adopted prior to NPDES requirements. The City is in the process of modifying the municipal code to provide additional regulations and penalties.

4. No outreach program has been implemented yet but the City is in the process of establishing one for the general public and school children.

5. L.A. County, under contract, cleans City catch basins. City crews also monitor for additional problems. City staff is receiving increased training on the need to keep basins clean.

6. Roadside trash receptacles are provided by the City and are emptied at least once per week. Additional receptacles are provided at bus stops and at civic functions.

7. 230 curb miles are swept twice monthly in residential and industrial areas and weekly in commercial areas. 200 cubic yards of trash/debris is collected each month.

8. Section 8.12 of the Municipal Code addresses garbage disposal requirements. The City has expanded the code enforcement program to monitor for improper disposal of litter and debris.

9. The City contracts with L.A. County Public Works for industrial waste services and follows up by investigating any questionable practices. Problems are immediately referred to

VOL 15 0168

DPW. All inspections of auto related businesses, gas stations and restaurants are done by L.A. County under the authority of Title 20.

10. There is no program to encourage removal of dirt, rubbish and debris from sidewalks and alleys.

11. Curbside recycling is part of normal residential trash collection. No estimate on percentage of rubbish being diverted.

12. The City participates in the Countywide household hazardous waste management program and in addition collects used motor oil. Newsletters, television and fliers will be used to remind residents of proper disposal.

13. Water conservation is addressed in the San Dimas Municipal Code Sections 18.14 and 18.124.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF SAN FERNANDO

City of San Fernando: Phase II Co-Permittee
Population (1994): 23,700
Land Area: 2.37 sq. mi.

Incorporated in 1911, San Fernando is located 20.8 miles northwest of the Los Angeles Civic Center in the San Fernando Valley. San Fernando has a large employment base. Almost 50% of the jobs are in manufacturing, followed by 20% in the service sector. It is the 61st most populous City in the County and its median family income was $32,070 in 1989.

1. All City-owned catch basins have been stenciled with the Heal the Bay design by local Boy Scouts.

2. Residents can report illegal dumping to the City's 24 hour hotline. The public was informed of this hotline service through notice in the local newspaper.

3. The City says that it has adopted urban runoff control measures and goes on to state that it has adopted the City of Los Angeles Building and related codes. No additional information on the runoff measure is provided.

4. The City will distribute a brochure identifying what constitutes illegal dumping of household wastes to all single and 4 unit multi-family residences. It is also suggested that educational information can be combined with water conservation presentations at schools and during school tours of City Hall.

5. Catch basins are cleaned twice per year or more if necessary.

6. 35 roadside trash receptacles are provided and are emptied three times per week.

7. 90 curb miles are swept frequently. 40 curb miles are swept daily.

8. The City has a contract for curbside collection of yard clippings. City code specifies procedures for disposing of lawn clippings and pet feces. The City will be conducting a pollution reduction poster contest for children.

9. The City has a contract with Los Angeles County for City-wide industrial waste inspections. Auto related businesses, gas stations and restaurants are inspected once per year and as needed. The inspections are conducted under the authority of the City industrial waste ordinance.

10. Removal of dirt, rubbish and debris is encouraged through public outreach programs and the public is generally responsive.

VOL 15

0170

11. The curbside recycling program has diverted approximately 17% of rubbish from landfills. Newsletter informational brochure and ads on public access cable have publicized the program. The City has implemented a pilot home composting program and plans to distribute a commercial solid waste reduction informational brochure.

12. The City participates in the Countywide program. Hazardous waste left for normal trash collection are tagged with a non-collection notice.

13. Section 28.11 of the San Fernando Municipal Code encourages minimizing run-off from landscaped areas and discourages washing debris from hard surfaced areas. Brochures on landscape water conservation are distributed to single family residences.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF SAN GABRIEL

City of San Gabriel: Phase II Co-Permittee
Population (1994): 38,700
Land Area: 4.10 sq. mi.

San Gabriel is located 10.4 miles northeast of downtown Los Angeles, with the San Bernardino (10) Freeway as its southern boundary. San Gabriel was incorporated in 1913 and it ranks 46th by population among L.A. County cities. The employment base in the City is large. 40% of the jobs are in the service sector, followed by 22% in retail trade and 14% in manufacturing. Median family income in 1989 was $35,991.

1. No catch basins have been stenciled but the City plans to stencil them during annual cleaning.

2. The City has informed the public of the County hotline through public access cable TV.

3. No runoff control ordinance has been adopted.

4. The City has prepared public counter handouts as a method of public education/outreach.

5. Catch basins are cleaned once per year in September and October.

6. Approximately 20 trash receptacles are provided and they are emptied 3 times per week.

7. 144 curb miles are swept every 10 days. Additional sweeping is done if necessary in problem areas.

8. The City has not established a program to discourage improper disposal of litter, lawn clippings and pet feces.

9. No industrial waste inspection program has been implemented but the City does make visual inspections for non-storm water discharges and responds to residents complaints. Auto body, auto repair and restaurants are inspected at change of occupancy under the authority of Section 25501 of the California Health & Safety Code.

10. The City has not established a program to encourage removal of dirt, rubbish, or debris but does suggest utilizing the City's public access cable station for outreach.

11. The City has a curbside recycling program and collects glass, plastic, aluminum, and newspaper. No estimate of the percentage of rubbish being diverted from landfills.

VOL 15

0172

R0060393

12. The City does participate in the Countywide household hazardous waste management program and the "roundups" are publicized on the City's public access cable station.

13. The City has adopted a water efficient landscape ordinance.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF SAN MARINO

City of San Marino: Phase II Co-Permittee
Population (1994): 13,050
Land Area: 3.75 sq. mi.

Established in 1913, San Marino is 10.5 miles northeast of the Los Angeles Civic Center, and ranks 74th in population among L.A. County cities. San Marino is a primarily residential City known for the Huntington Library and Art Museum. The employment base is small. Half of the City's jobs are in the service sector. Median family income was $105,123 in 1989.

1. All City catch basins have been stenciled with a RAIN WATER ONLY logo by high school volunteers.

2. In addition to supporting the County Hotline, the City's Environmental Network Committee has a hotline that can be used to report illegal dumping. The City's newsletter and Environmental Network meetings publicize the reporting systems.

3. The City has implemented numerous urban runoff control measures including construction procedures, prohibition of excessive irrigation and prohibition on sweeping of garden clippings into the street.

4. City newsletter articles, Environmental Network meetings and outreach programs have been used by the City to educate the public on the problem of stormwater pollution. The local water purveyor is being asked to insert notices in monthly bill envelopes.

5. All catch basins are cleaned at least annually by City staff before the first winter storm.

6. The City has 40-50 public roadside trash receptacles that are emptied weekly.

7. All City streets are swept at least weekly, with commercial areas swept 2-3 times per week. the streets and catch basins stay very clean.

8. City ordinances prohibit improper disposal of litter, lawn clippings and pet feces.

9. The City has very few industrial and related uses at present and have not implemented an industrial waste inspection program; a program is currently being developed, however.

10. Community pride results in uniformly clean sidewalks and general appearance on the part of residents and business owners.

VOL 15

0174

11. Paper, glass, tin, aluminum, plastic, cardboard and other periodically discarded materials are routinely collected; mandatory recycling will be implemented in fall of 1994, as will a green waste recycling program. Trash removal contractors and the Environmental Network provide public information on recycling programs.

12. The City participates in the countywide household hazardous waste management program and has sanctions against haulers who collect hazardous waste improperly.

13. A water conservation ordinance prohibits flooding of sidewalks and gutters and other forms of water waste.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF SANTA CLARITA

City of Santa Clarita: Phase III Co-Permittee
Population (1994): 128,800
Land Area: 42.63 sq. mi.

The City of Santa Clarita is located in the Santa Clarita Valley along the Golden State (5) freeway, 26 mile north of the L.A. civic center. It ranks 7th in population among L.A County cities. Its land uses are mixed with extensive residential and some industrial, commercial and vacant.

1. The City has stenciled about 50% of its catch basins with the Heal the Bay design. Eagle scouts have been doing the stenciling.

2. The City has a routine reporting system and also does press releases on the County hotline. The County number is included in City public information documents.

3. On 11-24-92 the City adopted a Hillside Development Ordinance which contains provisions for drainage, erosion control, run off and landscaping. $10,000 has been budgeted for the review of existing ordinances and adoption of an additional runoff ordinance is required.

4. In developing public education and outreach programs the City has held meetings with public information groups, the Chamber of Commerce, and business groups. A budget and study outlining the level of public education has been provided.

5. A new maintenance schedule for catch basin cleaning has not been established. Previously, they were cleaned whenever necessary. The new schedule will be covered in the Master Storm Drain study beginning after August 10, 1994.

6. 25 roadside receptacles are provided in problem litter areas. They are emptied weekly.

7. 275 miles of public streets are swept every other week in residential and industrial areas and weekly in commercial areas. The frequency of cleaning has been increased.

8. The City has been awarded a grant to implement parks and trails recycling and trash collection program. (Not yet established.)

9. The County handles industrial waste permits and inspections though the City is in the process of developing a system for NPDES inspections. Auto related businesses, gas stations and restaurants are inspected based on complaints or when information is obtained that an inspection is needed.

10. A debris removal program was started after the Jan. 17 earthquake.

VOL 15 0176

R0060397

11. The City has a pretty extensive recycling program which has resulted in a diversion of 25% of rubbish from landfills. A speakers bureau, technical resource library, repair hotlines, education programs, composting demonstrations, business recycling assistance and motor oil drop off locations are all part of the program.

12. The City participates in the Countywide household hazardous waste management program and believes that public education programs help ensure proper disposal.

13. Ordinance 9.38 was adopted as a water conservation measure. Handouts and brochures inform the public on problems of overwatering, washing sidewalks, etc.

14. ADDITIONAL BMP'S

A. Rivers, washes and storm drains are periodically monitored for water quality. Samples are taken and analyzed to detect sources of upstream discharge.

B. The City has created a Stormwater Utility Enterprise Fund to fund the NPDES program.

01177

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF SANTA FE SPRINGS

City of Santa Fe Springs: Phase III Co-Permittee
Population (1994): 15,550
Land Area: 8.72

Located 13.6 miles southeast of downtown Los Angeles, Santa Fe Springs ranks 71st in population among L.A. County cities. The Santa Ana (5) Freeway and the San Gabriel River form the western boundaries. Although known as primarily an industrial City, commercial and residential areas also exist. The job base is very large, with the leading sector being manufacturing. Median family income was $37,010 in 1989.

1. The City has not stenciled any of its catch basins at this time and does not plan to in the future. The City questions the effectiveness of the stenciling program and feels that there should be an emphasis on outreach and education programs. More permanent alternatives to stencils are being considered.

2. A 24 hour spill response telephone number has been implemented and has been publicized in the City newsletter and memos to the Chamber of Commerce and the Industrial League.

3. Runoff control measures are contained in various sections of the City code. A water pollution control ordinance for more specific regulations regarding urban runoff discharges is being reviewed for approval by Spring 1995.

4. The City supports outreach measures in various media. Suggests implementing school, business and general outreach program, the appointment of a public outreach coordinator and use billboards, radio and local cable television.

5. Catch basins are cleaned on a yearly basis and as needed.

6. 62 roadside trash receptacles are provided and are emptied weekly or as needed. Bus shelters have been identified as a problem area.

7. Sweeping of the 200 curb miles of street occurs bi-weekly for residential areas, weekly for commercial areas and monthly for industrial areas.

8. The City discourages improper disposal of litter etc. by installing "No dumping" signs in target areas. An "Adopt a Highway" program and property maintenance program also exist.

9. An industrial waste inspection program is handling through the City fire department and consists of an inspection program, plan review, permit issuance and enforcement activities. Industrial waste inspector requires a permit for disposal of wastewater to sewer. Auto related businesses, gas stations and restaurants are inspected annually and as needed under

VOL 15

0178

R0060399

Section 18-1 of the City Code. Violations are enforced through County Code Section 20.24.160.

10. The City has property maintenance inspectors who reach out to the community plus a Beautification Committee, "Good Neighbor" and "Home Improvement" programs that encourage removal of debris.

11. The City does not presently have a curbside recycling program, but such a program is being considered at this time. Various materials are recycled commercially through several businesses in the City. The City has a Christmas tree recycling program and estimates that 30% of rubbish is being diverted from landfills at this time. City is working on establishment of a MERF facility.

12. The City participates and actively supports the Countywide program.

13. The City supports "Water Awareness Week" and other MWD programs. The public has been informed through pamphlets, fliers and notices, and water bill inserts.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF SANTA MONICA

City of Santa Monica: Phase I Co-Permittee
Population (1994): 89,800
Land Area: 8.15 sq. mi.

Sixteen miles due west of downtown Los Angeles lies Santa Monica, the oldest beachside City (incorporated in 1886) with a strong residential community as well as commercial and recreational areas. Santa Monica has a very large, diversified job base, including service, retail and manufacturing sectors. It ranks 17th among L.A. County cities in population and had a median family income on $51,085 in 1989.

1. The City has stenciled all of its catch basins with the Heal the Bay design. Stenciling was initially done by the City and later by volunteers.

2. A hotline for reporting illegal dumping has been established through the fire emergency dispatcher and the City maintenance office. This service was publicized through the City newsletter.

3. Chapter 7.10 of the City municipal code requires runoff reduction and good housekeeping. Ordinance was passed 9/8/92.

4. Outreach programs include video on public television, various pamphlets and public education.

5. Catch basins are typically cleaned 4 times per year; more often if necessary/if complaints are received. The City is attempting to keep track of the debris removed.

6. Roadside trash receptacles are provided and are emptied twice a day or every other day as needed.

7. 42,000 curb miles and 3,350 alley miles are swept. Residential areas are swept weekly, while commercial and industrial areas are swept daily. The City is proud of its clean reputation.

8. The improper disposal of litter, lawn clippings and pet feces is illegal and subject to penalties according to the City Municipal Code Chapters 4.04, 7.10, and 7.48. Further a violation is considered a public nuisance that can be abated by Civil action in addition to the fines of $100 a day.

9. City inspectors at least annually check industrial waste sewer connections and check for violation or pollution problems. The following types of businesses are checked: auto parts, auto repair, auto body shops, gas stations, and restaurants under authority of the municipal code.

10. Various pamphlets, newspaper articles, newsletters and a video have been used to reach the public to encourage the removal of

VOL 15

0180

dirt, rubbish and debris from sidewalks and alleys. The City has also begun a "sustainable city" program.

11. 14% of rubbish is being diverted from landfills due to the recycling program. The City also subsidizes residents purchase of composting bins.

12. The City does not participate in the Countywide Hazardous Waste Management program but does maintain a permanent hazardous waste drop off facility. The City continuously expands and improves public outreach programs.

13. Low flow fixtures and runoff reduction for new construction are required through City ordinances. Pamphlets, newsletters, videos on City cable TV are used to inform and educate the public on water conservation.

14. ADDITIONAL BMP'S

A. The City has begun a program to install boards over the openings to about 80 catch basins. The boards keep the basins clean and discourage people from throwing debris into the basins.

B. The City is presently considered a program to treat storm water flows from the Pico Kenter and Pier storm drains to prevent pollution from entering the ocean.

0181

SUMMARY STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF SIERRA MADRE

City of Sierra Madre: Phase II Co-Permittee
Population (1994): 10,950
Land Area: 2.93 sq. mi.

Incorporated in 1907, Sierra Madre is located 16.5 miles northeast of the Los Angeles Civic Center at the base of the Angeles National Forest. Most of Sierra Madre's 2.9 square miles consist of single-family residential neighborhoods. It has a very small employment base, with over 1/3 of its jobs in the service sector. Sierra Madre ranks 77th among L.A. County cities and had a median family income of $56,668 in 1989.

1. The City has not implemented a stenciling program for its catch basins.

2. The City has no programs other than the County Hotline to promote public reporting of illegal discharges/dumping.

3. The City has not implemented urban runoff control measures.

4. The City has not implemented programs to educate the public on the problem of stormwater pollution.

5. City catch basins are cleaned annually.

6. The City's public roadside trash receptacles are emptied weekly.

7. All City streets are swept at least bi-weekly, with commercial areas swept weekly.

8. City has no programs to discourage improper disposal of litter, lawn clippings and pet feces.

9. The City has a hazmat handler disclosure program to regulate disposal of waste oil and coolant from auto repair shops. Auto parts and repair shops, gasoline stations and restaurants are inspected under City ordinance and California health and safety codes.

10. The City has no program to encourage removal of dirt, rubbish and debris from sidewalks and alleys.

11. Plastics, paper and green waste are routinely collected at curbside; an estimated 35% - 40% of rubbish is being diverted from landfills. Study sessions, public hearings and the media help promote public outreach and education.

12. The City participates in the Countywide household hazardous waste management program.

13. No water conservation programs are operative at this time. During drought (1991), water rates scaled to penalize excess use, and low flow hose nozzles were distributed.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF SIGNAL HILL

City of Signal Hill: Phase III Co-Permittee
Population (1994): 8,800
Land Area: 2.14 sq. mi.

Twenty-three miles south of downtown L.A. and surrounded by Long Beach is the City of Signal Hill, incorporated in 1924. Signal Hill has a combination of residential, commercial and industrial uses, and has a large and diversified employment base. It ranks 78th in population among L.A. County cities and its median family income was $38,776 in 1989.

1. The City has contracted with the County to stencil all catch basins. In addition to Heal the Bay stencil, City suggests stenciling all curb faces, which would be visible to vehicular traffic.

2. The City supports the County Hotline to promote reporting of illegal discharges/dumping. The program is publicized in the City's newsletter which is mailed to all residents and businesses.

3. The City adopted the County's Industrial Waste Code in 1990 to provide them with the authority to inspect waste discharge facilities, require compliance and issue citations for non-compliance.

4. The NPDES video, prepared by the City of Los Angeles, was broadcast on the Signal Hill cable access channel. A City-prepared newsletter focusing on environmental issues--specifically storm water runoff--was mailed to all residents and businesses. City suggests using public service messages on bus shelter signboards.

5. All catch basins are cleaned at least annually, or as needed, prior to the rainy season. City in preliminary stages of developing new catch basin programs.

6. The City's approximately 25 roadside trash receptacles are emptied weekly.

7. City contracts with a private service for weekly sweeping of all streets. All City streets are posted "No Parking" during sweeping hours.

8. City newsletter notified residents/businesses to place improper items in trash receptacle, rather than sweeping or washing them into the street; penalties for improper trash disposal. City sent letters to homeowners associations requesting that they require their landscaping services to pick up debris, rather than blowing it into street.

9. Industrial waste consultant hired to monitor and provide annual inspections. Auto parts, repair and body shops and

VOL 15 0183

restaurants inspected 1 to 6 times per year under authority of Municipal Code. The 10% non-compliance cases are enforced through citations and/or jail terms.

10. Publicity by City has encouraged citizens to organize "Community Clean-Up" programs. City assists by sweeping all alleys monthly.

11. Paper, newspaper, plastic bottles, glass, cardboard and aluminum are routinely collected at curbside. Refuse rates are structured to encourage recycling. Recycling pamphlets mailed to all residents and businesses, recycling presentations made at City schools and meetings held with homeowners associations. Approximately 28% of rubbish is being recycled.

12. City participates in the countywide household hazardous waste management program as well as picks up and disposes of hazardous materials left at curbsides, alleys, etc. City suggests encouraging local businesses that sell motor oil, paints, etc. to provide collection services.

13. City has an adopted Water Conservation Ordinance, and has published newsletter articles asking residents to reduce watering of landscaped areas. Water rate structure penalizes excessive water usage.

SUMMARY STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF SOUTH EL MONTE

City of South El Monte: Phase II Co-Permittee
Population (1994): 21,450
Land Area: 2.80 sq. mi.

South El Monte is 12 miles east of the Los Angeles Civic Center and was incorporated in 1957. It has a very large employment base. Manufacturing is the primary industry, accounting for over 60% of all jobs. It is the 62nd largest City by population in L.A. County and had a median family income of $27,157 in 1989.

1. City employees are scheduled to stencil all catch basins with the Heal the Bay design during August 1994.

2. City is promoting the County Hotline for reporting illegal discharges/dumping by announcements at City Council meetings, articles in bi-monthly City newsletter and postings of fliers in all City facilities.

3. Modifications to City ordinances that control urban runoff are in progress.

4. Using material developed by City of Los Angeles, City is distributing fliers at City facilities and including articles in the City newsletter that help educate the public on the problem of stormwater pollution.

5. All City catch basins are cleaned at least annually in the summer, with high-maintenance basins cleaned quarterly.

6. The City's 15 roadside trash receptacles are emptied weekly; City plans to increase number of receptacles at bus stops. Ordinance introduced to require waste receptacles for commercial establishments.

7. All City streets are swept weekly.

8. The City has anti-litter laws, an environmental damage ordinance and a mandatory residential green waste recycling program.

9. Observations for non-storm water discharges are made daily by field code enforcement personnel and street sweeper operators. Random inspections of industrial-related operations are conducted quarterly, with about 15% of the inspections found to be in violation of their business license or industrial waste permit.

10. Fliers available at City facilities and articles in the City's newsletter educate the public on the need to remove dirt, rubbish and debris from sidewalks and alleys.

11. Green waste, metals, plastic, paper, glass and cardboard are routinely collected at curbside. The program is promoted through school presentations, videos for loan to community

VOL 15

0185

R0060406

groups and newsletter articles. An estimated 26% of rubbish is being diverted from landfills.

12. The City participates in the countywide household hazardous waste management program and is developing a pilot program for the collection of used motor oil.

13. Water efficient landscape ordinance in place for new developments; City Council currently reviewing proposed City-wide ordinance.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF SOUTH GATE

City of South Gate: Phase III Co-Permittee
Population (1994): 88,900
Land Area: 7.32 sq. mi.

Incorporated in 1923, South Gate is 9.7 mile southeast of downtown Los Angeles and ranks 18th in population size among L.A. County cities. Major thoroughfares include Firestone Blvd. and the Long Beach (710) Freeway. Two rivers, the Los Angeles and Rio Hondo also pass through South Gate. The job base is small. Manufacturing accounts for over 1/3 of jobs, followed by services and retail trade. Median family income in 1989 was $28,980.

1. The County will be stenciling all City catch basins with the Heal the Bay design. City suggests use of bilingual stencils.

2. In addition to the County Hotline, in 1991 the City established a reporting system for reporting improper discharges. Approximately 800 inspections are made each year and stormwater information is distributed as needed.

3. Urban runoff controls were added to the City's Municipal Code, Industrial Waste Section, in 1991; emphasis is on runoff from industrial uses.

4. The City has developed public education and outreach programs through its industrial waste inspections, videos, brochures and pamphlets. City suggests greater emphasis on bilingual educational materials.

5. All catch basins are cleaned at least annually. A system of measuring removed debris is being developed.

6. The City has approximately 80 public trash receptacles that are emptied on a regular basis. They are located at bus stops, parks and busy streets. Litter prone areas are inspected and special pick-up is performed as needed.

7. All 128 miles of City streets are swept at least weekly, with commercial areas swept twice weekly.

8. City Public Works staff implements Municipal Code sections that discourage improper disposal; City is near implementation of a curbside green waste recycling program.

9. City has an industrial waste inspection program that includes inspection of all auto parts, repair and body shops; gasoline stations, restaurants and other target industries between 1 and 6 times per year. Approximately 10% of inspections are violations, which are enforced by citations, fines and possible jail sentences. City also investigates improper surface discharges.

VOL 15

0187

R0060408

10. The City has a public outreach program to promote the disposal of rubbish and debris from sidewalks and alleys. The City has a program already in place to pick up materials in alleys and sidewalks in response to calls from the general public.

11. Newspaper, glass, plastic and cans are routinely recycled at curbside. Curbside pick-up of used oil, white goods and furniture is available; a collection center is used for green waste, although curbside service is planned. The City promotes their recycling program through public presentations, brochures, newspaper articles and multimedia presentations.

12. The City participates in the Countywide household hazardous waste management program. They suggest encouraging sellers of paints, oil, etc. to post addresses of recycling centers.

13. The City has a water conservation ordinance and has an active program to encourage water conservation. This includes school handouts and bilingual pamphlets and other public outreach materials.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF SOUTH PASADENA

City of South Pasadena: Phase II, III Co-Permittee
Population (1994): 24,300
Land Area: 3.47 sq. mi.

Located 7.3 miles north of downtown Los Angeles, South Pasadena incorporated in 1887. Access is generally provided by the Pasadena (110) Freeway. Primarily a residential community, there are also small commercial areas. The employment base is small, with retail trade and services accounting for over 60% of all jobs. South Pasadena is the 59th City in L.A. County in terms of population size and had a median family income of $55,808 in 1989.

1. The City has no catch basin stenciling program.

2. The County Hotline is available for reporting of illegal discharges and dumping. No other related programs have been implemented by the City.

3. The City has not adopted urban runoff control measures.

4. The City has not implemented programs to educate the public on the problem of stormwater pollution.

5. All catch basins are cleaned by hand annually prior to the rainy season; additional cleaning is done as needed in response to public complaints.

6. The City empties all 20 of its roadside trash receptacles at least weekly--some are emptied daily. No problem litter areas have been identified.

7. The City has a contract service sweep all 50 miles of its streets. Residential areas are swept every three weeks; commercial areas are swept daily.

8. The Municipal Code discourages improper disposal of litter, lawn clippings and pet feces, and provides penalties for improper trash disposal.

9. The City utilizes the County's industrial waste inspection program to inspect auto parts, repair and body shops; gasoline stations and restaurants.

10. The City has no programs to encourage removal of dirt, rubbish and debris from sidewalks and alleys.

11. The City collects cans, glass and newspaper at curbside for recycling. They have established a permanent recycling center and provide educational materials through local schools and public mailings which promote recycling.

VOL 15

0189

12. The City participates in the Countywide household hazardous waste management program, which they judge to be effective, based upon strong public support and participation. No other household hazardous waste disposal programs have been established.

13. The Municipal Code restricts the use and wasting of water, and regulates water use for landscaping.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF TEMPLE CITY

City of Temple City: Phase II Co-Permittee
Population (1994): 32,200
Land Area: 3.85 sq. mi.

Temple City is in the San Gabriel Valley, 13.4 miles northeast of central Los Angeles and was incorporated in 1960. Its employment base is very small, with services as the leading sector. It is 49th in population in Los Angeles County and its median family income was $44,768 in 1989.

1. The City plans to stencil its catch basins but none have been completed. A contractor will stencil with the Heal the Bay design.

2. Other than the County hotline, no programs to promote public reporting of illegal discharges have been established.

3. No urban runoff control measures have been adopted.

4. The City has not established a public education or outreach program.

5. Los Angeles County cleans the catch basins once per year and on an "on-call" basis. This program has been very effective and has not been modified in response to the RWQCB requirements.

6. 106 roadside trash receptacles are provided and they are emptied weekly. No problem litter areas have been identified and the program has not been modified in response to the RWQCB requirements.

7. There are 112 miles of improved streets in the City and they are swept bi-weekly in residential and industrial areas and weekly in commercial areas.

8. The Temple City Municipal Code section 4105 prohibits illegal dumping. There are penalties for improper trash disposal. This program has not been modified in response to the RWQCB requirements.

9. The industrial waste inspection program is handled by L.A. County. Non-storm water discharges to the storm drain system are not inspected. Auto related businesses, gas stations, and restaurants are inspected yearly.

10. There is no public outreach/education program to encourage the public to remove dirt and debris from sidewalks. The Temple City Municipal Code does have regulations concerning depositing debris and vegetation not to obstruct sidewalks.

VOL 15
0191

11. The City has established a curbside recycling program and collects paper, plastic, cans, glass and green waste. The program has been publicized through the City newsletter. The City estimates that 20% of rubbish is being diverted from landfills at this time.

12. The City participates in the Countywide household hazardous waste management program.

13. Irrigation by the City is constantly monitored to insure little or no runoff. At this time no program has been established to inform the public regarding the sediments, waste materials and contaminants carried to the drainage system as a result of runoff from overwatering landscaping, washing sidewalks, cars, etc.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF TORRANCE

City of Torrance: Phase I, III Co-Permittee
Population (1994): 136,700
Land Area: 19.94 sq. mi.

Incorporated in 1921, Torrance is 19 miles southwest of the Los Angeles Civic Center, on the western coast of the County. Torrance has a substantial industrial base, with emphasis on aerospace and oil refining. Torrance has a large and diversified employment base, with most jobs in the services, manufacturing and retail sectors. It is the 5th largest City by population size in the County and its 1989 median family income was $55,678.

1. The City has begun stenciling its catch basins with the Heal the Bay design. Approximately 60 have been completed and there are plans to stencil the rest. Areas where people tend to congregate have been targeted in the pilot program.

2. In addition to the County hotline the City's environmental quality officer investigates reports of illegal dumping/discharge reported to that office.

3. Construction permits include requirements for erosion control and prevention of practices that would carry dirt and debris onto public streets. However, other agencies ordinances are being reviewed for possible revisions to City code.

4. Public education and outreach programs include public works newsletter, water bill insert and information booth at the City's environmental and water conservation expo. A possible technique for informing the public could be through movie theaters previews/leaders.

5. Catch basins are cleaned each year prior to the start of the rainy season (and as needed) and approximately 9 tons of debris is removed annually.

6. Approximately 90 roadside trash receptacles are provided by the City and by Gannett Industries at problem litter locations. They are emptied weekly.

7. 600 curb miles of street are swept weekly. 200-300 tons of debris are removed from the streets each month.

8. Improper disposal of litter, lawn clippings, and pet feces has been discouraged through information included in public works newsletter and water bill inserts. Several positions, in addition to the environmental quality officers have been given power to cite violators.

9. Industrial waste inspections are done on a complaint basis only. Environmental quality officers issue warnings/citations. There are plans to expand this to a annual inspection.

VOL 15

0193

R0060414

10. Public Works newsletters and water bill inserts have been used to encourage the public to remove dirt and debris from sidewalks.

11. The City has a recycling program which has diverted approximately 21% of rubbish from landfills. Yard waste composting workshops and promotion through distribution of fliers and inserts in water bills are part of the program.

12. The City participates in the Countywide hazardous waste management program and also maintains a list of recyclers for public inquiries.

13. The City has a water conservation program which includes inserts in water bills, pamphlets encouraging water conservation (i.e. don't hose down driveways and sidewalks, don't leave hose running while washing car, don't overwater lawns).

14. Additional BMP's

A. The City has implemented a storm water retention basin cleaning program.

B. Alarms have been installed in sewer and storm drain pump systems designed to decrease the potential of raw sewage entering the storm drain system. It has been in operation for 2 years.

C. For the past 1 1/2 years conditions have been added to construction/excavation permits requiring site cleanup.

D. The City has increased clean up of sewers and storm drains which has decreased the number of sewer backups.

E. For past 2 years large construction sites to have been required to have staging areas to free vehicles of debris/dirt prior to entering public ROW. This keeps sediments from entering storm drain system.

F. The City has developed water pollution control and conservation elements in the general plan. In effect since October 1992.

G. Control of pollutant section added to public works projects contracts. This program has been in operation for a year.

H. The City has a program to reduce surface application of fertilizers which has been in operation for 2 years.

I. For 2 years the City has required that tarping be used on City vehicles when hauling material. This prevents material from being blown or falling from trucks to street.

J. The irrigation systems on public property are inspected and repaired weekly to reduce volume of water flowing in gutters. This has been in operation for 2 years.

VOL 15
0194
R0060415

K. The City restricts the use of leaf blowers by City staff to reduce the volume of yard waste and sediment entering the storm drain. This has been in operation for 2 years.

L. The City has evaluated the use of pesticides for replacement with less toxic materials to reduce the volume of toxic materials entering the storm drain system.

M. City used lawn mowers are required to have a collection system to keep lawn clippings from entering storm drain system.

N. Yard wastes from City property are collected and recycled.

O. The City is in the process of inspecting storm drain lines to identify illegal connections and determine pipe condition.

P. The City is identifying stationing of all connections to storm drain system. As built permits or disconnect notices are issued.

Q. The City is in the process of identifying businesses by SIC code.

R0060416

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

COUNTY OF VENTURA Phase I Co-Permittee

1. The catch basin stenciling program, using a customized design, was set to kick-off on July 21, 1994. Volunteers will do stenciling.

2. No programs to encourage the reporting of illegal dumping have been implemented.

3. It is expected that a stormwater ordinance consolidating all authority to control stormwater quality and drainage will be developed in the near future. Presently, runoff control is handled though a flood control watercourse ordinance, a floodplain management ordinance, control of water quality, soil erosion of new agriculture hillside development and building code regulations.

4. A public outreach program to educate the public on the problem of stormwater pollution has been implemented. Residents are also encouraged to: dispose of trash properly, recycle and not throw anything in catch basins. Door hangers, brochures, handouts, mail inserts and special event displays have been used.

5. Catch basins are inspected annually and cleaned "as needed".

6. No roadside trash receptacles are provided.

7. Residential street sweeping of 57 curb miles is done every other week.

8. Improper disposal of litter, lawn clippings, and pet feces is enforced through the Ventura County code. Solid Waste Management distributes public information on proper disposal. The "Resource Efficient Yard Care" brochure by Ventura County Solid Waste Management will be modified to include specific stormwater runoff information.

9. An illicit discharge control program has been initiated to inspect the storm drain system and identify suspected illegal sources. Presently none of the listed businesses (auto related etc.) exist in the watershed area. They will be inspected if they exist in the future and controlled initially through education/outreach.

10. A public outreach program encourages residents to properly dispose of trash, compost or recycle yard waste, and keep from disposing anything into catch basins or gutters.

11. 15% of rubbish is being diverted from landfills at this time. Recycling program includes public education through newsletters, brochures and inserts.

VOL 15

0196

12. Recyclable household hazardous wastes are accepted twice per month at a permanent facility established by the City of Thousand Oaks which has a contract with the County.

13. Water conservation program includes encouraging efficient use of water outdoors, low-water using plants, efficient irrigation systems to reduce runoff and use of spray nozzles on garden hoses.

14. ADDITIONAL BMP'S

A. Ordinance No. 3539 Control of Water Quality, Soil Erosion, and Sedimentation of New Agricultural Hillside Developments established standards within new agricultural developments to reduce environmental damage in critical erosion areas.

VOL 15

01971

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF VERNON

City of Vernon: Phase III Co-Permittee
Population (1994): 80
Land Area: 5.01 sq. mi.

Located 4.8 miles south of downtown Los Angeles and incorporated in 1905, Vernon is an overwhelmingly industrial City located in the industrial core of the L.A. basin. The Los Angeles River runs through this City, which has very large employment base. Over half of the jobs are in manufacturing. Median family income in 1989 was $16,250.

1. A Heal the Bay stencil has been ordered and when received the City will stencil approximately 340 catch basins. Los Angeles County Public Works has been requested to stencil the catch basins it owns within the City boundaries.

2. The public is encouraged to report any illegal dumping to the Community Services Department. Information on the hotline service was provided in the Vernon Journal quarterly newspaper. Future messages on utility bills will also encourage reporting.

3. Vernon Municipal Code 21.19 (adopted 5/7/68) prohibits discharge of any substance into the ground or catch basin. Education has been provided by inspectors who investigate sources.

4. As part of the public education program the City has published articles in the "Vernon Journal". The City also plans to educate through the bi-monthly mayor breakfasts and utility bill messages.

5. Catch basins are cleaned twice a year, more if necessary, by a vac truck. It is estimated that tons of debris have been kept out of the storm drain system over the years due to the cleaning program.

6. Receptacles are emptied as often as needed, but at least once each week. Litter prone areas have been inspected and the existing receptacles have been placed in these areas. City streets are under daily surveillance to identify litter prone areas and additional receptacles will be placed as necessary.

7. 97 curb miles of street are swept weekly.

8. Vernon Municipal Code 12.3 prohibits the improper disposal of litter and imposes a penalty. Vernon is a primarily industrial City and a great majority of properties have been developed with zero landscaping. Because of this, lawn clippings and pet feces are nearly nonexistent.

9. Auto related businesses and gas stations are inspected every other year, businesses with underground storage tanks every

VOL 15

01198

year and restaurants 3 times per year. Vernon Municipal Code 21.19 allows the inspections.

10. Public reporting of dirt, rubbish and debris accumulation is encouraged. Businesses are encouraged to maintain their frontages.

11. The recycling program has diverted 51% of rubbish from landfills. Pamphlets have been mailed to industries and distributed during inspections to increase public awareness of the program. The City has a source reduction and recycling element plan to evaluate waste reduction and is considering adoption of an ordinance to reduce the number of waste haulers to improve monitoring.

12. Vernon residents, of which there are less than 100, are more aware than most of the dangers of disposing of household hazardous wastes.

13. The City has no water conservation program but some public education efforts through newspaper articles and messages in utility bills will be made. The City is primarily industrial and has no mandatory landscape requirements.

VOL 15
0199

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF WALNUT

City of Walnut: Phase II Co-Permittee
Population (1994): 30,850
Land Area: 8.61 sq. mi.

The City of Walnut is over 27 miles east of downtown Los Angeles south of the San Bernardino Freeway, and was incorporated in 1959. Walnut has a small employment base, with over half of the jobs in the service sector. It is the 56th City in the County by population size and its median family income in 1989 was $64,866.

1. The City is in the process of implementing the catch basin stenciling program. The design has not been chosen and it has not been determined who will do the stenciling. The City suggested that the catch basin stenciling program only be required where a problem is identified.

2. A 24 hour emergency telephone number has been established. The number was publicized in the Walnut Weekly and community awareness of illegal dumping has been heightened.

3. The City requires erosion control plans which help reduce water contaminated with soil from entering the storm drain system.

4. Code enforcement staff goes door to door educating businesses on storm water pollution. The City is also preparing brochures and considering expanding the door to door program.

5. Catch basins are cleaned annually through contract with Los Angeles County Public Works.

6. Roadside trash receptacles are provided and are emptied twice per week. The greatest amount of litter has been found to occur around bus stops.

7. 165 curb miles are swept twice per month. Brooming has been found to be more efficient than vacuuming.

8. Green wastes are collected separately and the City offers information on composting.

9. The City does not have an industrial waste inspection program but does inspect commercial business and especially focuses on several sites adjacent to a natural creek. Under the authority of the City code, auto related businesses, gas stations and restaurants are inspected annually and in response to complaints, they are inspected more frequently.

10. The City publishes newspaper articles and press releases and does door to door outreach to encourage the public to remove dirt and debris from sidewalks and alleys.

VOL 15

02000

R0060421

11. The City recycling program has diverted 22% of rubbish from landfills. Expansion of the program to commercial areas is underway.

12. The City participates in the Countywide hazardous waste management program and is in the process of implementing a used oil recycling program.

13. A flyer to educate residents about water conservation is being prepared. The City uses reclaimed water for irrigation and landscapes with drought tolerant plants.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF WEST COVINA

City of West Covina: Phase II Co-Permittee
Population (1994): 99,800
Land Area: 16.15 sq. mi.

West Covina is located 20 miles east of the Los Angeles Civic Center, and has the 11th largest population of all L.A. County cities. The San Bernardino Freeway passes through the northern third of West Covina for over 10 miles. Incorporated in 1923, it has a small job base. West Covina had a median family income of $46,081 in 1989.

1. The City has implemented a stenciling program using a customized design. 131 catch basins have been stenciled and there are plans to complete the rest. The City suggests a stencil visible to drivers as well as pedestrians.

2. A 24 hour phone number to report emergencies to the City Hall operator also can be used for reporting illegal dumping.

3. On June 7, 1994 an ordinance to control urban runoff was adopted.

4. As a method of public education the City published an article on the problem of stormwater pollution in the quarterly newsletter. The City also suggests a PBS special documenting the origins of the NPDES program.

5. Catch basins are cleaned quarterly except for "hot spots" which are cleaned monthly.

6. The City provides 80 roadside trash receptacles which are emptied weekly. Receptacles are placed in identified problem areas.

7. 896 curb miles are swept, twice per month in residential areas and twice per week in commercial areas.

8. The City has an automated yard waste program to discourage improper disposal. There are penalties for improper disposal.

9. An industrial waste inspection is included in Citywide code enforcement activities as is non-storm water discharge. Auto related business and gas stations are inspected quarterly, restaurants are inspected monthly. Violators are referred to the City prosecutor.

10. The City has a "Clean-Up Saturday" program that encourages the public to remove rubbish and debris from their residence. This program was in effect prior to RWQCB requirements and has been successful.

11. The City has a greenwaste recycling program ONLY.

*

VOL 15

02202

12. The City participates in the Countywide household hazardous waste management program. Methods for ensuring proper disposal include public education via newspaper, clean-up campaign fliers and information inserted in the monthly trash bill.

13. A voluntary water conservation program exists in the City. Inserts are inserted in monthly water bill encouraging conservation and conservation kits are given to customers. The City plans to inform the public in the future with newspaper and newsletter articles.

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF WEST HOLLYWOOD

City of West Hollywood: Phase I Co-Permittee
Population (1994): 37,050
Land Area: 1.981 sq. mi.

West Hollywood is located approximately 10 miles northwest of downtown Los Angeles. In 1994 it ranked 48th in population in Los Angeles County, and in terms of persons per square mile, West Hollywood is one of the most densely populated communities in California. The City's land uses can be characterized by a mixture of high density apartments/condominiums, entertainment and service related job base and light manufacturing. In 1990 the median family income was $33,657.

1. The City has stenciled 350 catch basins with the Heal the Bay design. In conjunction with the stenciling the City hosted "Storm Water Awareness Week" to draw attention to storm water issues.

2. A phone line has been established for reporting of illegal dumping. 24 hour per day emergency clean-up is provided though contract with Consolidated Waste Industries. 4 reports have been received.

3. The City adopted zoning ordinance amendments (ORD. 334) to prohibit non-storm water/urban runoff discharges without NPDES permit. Standard development permit conditions have been revised and require plans for management of water discharges during construction, and placement of dumpsters and construction equipment.

4. The public awareness program for the City includes: distribution of door hanger notices, Heal the Bay brochures, articles in newsletters, and Storm Water Awareness Week.

5. Catch basins are cleaned at least annually with those with especially significant debris accumulation cleaned every other week. This includes storm drain basins owned by the City of Los Angeles which have been ignored.

6. Approximately 150 roadside trash receptacles are placed on commercial streets and pedestrian areas Citywide. They are emptied up to 5 times per week depending on volume.

7. 93 curb miles of street are swept weekly. (Sunset and Santa Monica Blvds. are swept 3 times per week).

8. City municipal code prohibits: improper disposal of litter and lawn/garden and pet wastes, and leaf blowers. Code enforcement staff and public works inspectors have authority to issue citations.

VOL 15 0204

9. City contracts with L.A. County public works for industrial waste permit inspection. Facilities (including auto body, repair and parts shops, gas stations, restaurants, car washes, dry cleaners hotel and supermarkets) are inspected at least once per year.

10. The City has an aggressive code enforcement program to encourage the public to keep rubbish and debris off sidewalks and alleys. The City has informed the public of the need to clear debris, rubbish and dirt from sidewalks and alleys in the Neighborhood Watch newsletter and on a door-hang tag distributed to residents.

11. The recycling program has diverted 18% of rubbish from landfills. It is expected that starting in fiscal year 94-95 increased levels of recycling will occur. Commercial properties will also be included.

12. City code enforcement staff have been trained to issue citations for violation of disposal regulations.

13. City has adopted water conservation ordinances requiring low flow fixtures and drought tolerant landscaping on all new development. An outreach program has been initiated to alert the public to issues/hazards of runoff from excess use of water.

VOL 15

0205

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF WESTLAKE VILLAGE

City of Westlake Village: Phase I Co-Permittee
Population (1994): 7,650
Land Area: 5.43 sq. mi.

Westlake Village is located on the western edge of Los Angeles County, 35 miles from downtown Los Angeles and bordering Ventura County. The 101 Freeway passes through the northern portion of Westlake Village, which was incorporated in 1981. The City is known for its lake, waterfront residences and pleasant climate. Although a small community, there is a large job base with over half the jobs in manufacturing and services. Median family income was $79,976 in 1989.

1. Working with the City of Thousand Oaks and Ventura County Flood Control District, the City has begun stenciling catch basins with a customized design. City staff and volunteers have coordinated efforts. The first event, conducted in July 1994, resulted in the stenciling over 80 basins. The remainder of catch basins were stenciled on September 10, 1994.

2. Public reporting of illegal dumping has been encouraged through use of door hangers and magnets, as well as newspaper articles on clean water. Possible school outreach program is suggested as a way to encourage reporting. Door hangers and refrigerator magnets with 800-hotline number encourage reporting.

3. Based on current City policy, erosion control and post-development pollution controls are implemented by staff. City plans to adopt an ordinance (summer 1994) to give greater police power related to urban runoff control.

4. Public education programs, including newspaper articles, newsletters, and door hangers have been undertaken, and all residents have been reached by at least one. The City has spear-headed a task force of the five local cities to take a regional approach to public outreach and general NPDES compliance.

5. 95% of the storm drains in the City are maintained and cleaned annually by the County. Remaining drains are cleaned by the County via a service contract.

6. No roadside trash receptacles are provided. There are receptacles in City parks which are emptied daily.

7. 35 curb miles are swept bi-weekly (weekly in autumn). The City has modified its sweeping program by posting selected streets as no parking.

VOL 15
0206
R0060427

8. Improper disposal of lawn clippings is prohibited by requiring City landscape contractors to pick up all green waste.

9. Non-storm water discharges are subject to an inspection and reporting program by public works staff. County waste management staff inspects some other businesses. The City is coordinating with the County to expand inspections. This expanded service should be implemented by the end of 1994.

10. Outreach to encourage removal of dirt, rubbish and debris from sidewalks and alleys is via newspaper and newsletter articles and door hangers.

11. The recycling program has resulted in 25% of rubbish being diverted from landfills. Press releases, newsletters and coordination with Homeowners associations has been part of this program.

12. The City participates in the Countywide household hazardous waste management program and aggressively promotes "roundups" at the Calabasas landfill.

13. The problem of overwatering has been addressed in the education program implemented by the City, and will continue to be a component. The City and Water District are currently preparing a reclaimed water conservation program addressing irrigation watering.

14. ADDITIONAL BMP'S

A. The City, working with L.A. County Flood Maintenance Division and the County Waste Management Division constructed a oil boom and debris fence across Lindero flood control channel. By measuring the quantity of materials removed, the City can gauge the magnitude of urban runoff pollution.

B. The City prepared a specific Storm Water Quality Management Plan which was completed in December 1993.

VOL 15

02207

SUMMARY
STORMWATER/URBAN RUNOFF PROGRAMS QUESTIONNAIRE

CITY OF WHITTIER

City of Whittier: Phase III Co-Permittee
Population (1994): 80,600
Land Area: 12.40 sq. mi.

Located almost 15 miles southeast of downtown Los Angeles, Whittier is just east of the 605 Freeway. Incorporated in 1898, the City is the 21st most populous City in the County with a large job base. Services and retail trade account for over half of all employment. Median family income was $44,224 in 1989.

1. The City has stenciled 55 of its catch basins so far with the Heal the Bay design and plans to stencil the others as well. Volunteer groups did the application.

2. The City has not implemented any programs to encourage public reporting of illegal dumping but suggested that a reward system would encourage public reporting.

3. Two water conservation ordinances (one apparently a modification of the first) have been adopted and the City feels they have been effective in reducing pollutants in runoff.

4. No public education programs have been implemented.

5. The catch basins in the City are shoveled out annually and the City also responds to requests for cleaning. This program has removed a lot of debris that would have entered the storm drain system.

6. Thirty roadside trash receptacles have been provided. They are emptied weekly unless in problem litter areas where frequency of collection has been increased.

7. 456 curb miles are swept on either a weekly (residential and industrial) or bi-weekly (commercial) schedule.

8. City ordinances discourage the improper disposal of litter, lawn clippings, and pet waste. The City also intends to promote these good housekeeping practices into its runoff pollution prevention public education program.

9. The Sanitation District of Los Angeles County provides industrial waste inspection program. The scope of its industrial waste water inspection program includes all industrial and commercial facilities that handle, store, and dispose of significant materials.

10. The City has not implemented a public education/outreach program to encourage the public to remove dirt, rubbish, and debris from sidewalks and alleys. However, these practices are required by ordinance and enforced by code enforcement.

VOL 15

02008

R0060429

During FY 1994-95, the City plans to promote these good housekeeping BMPs as part of its comprehensive storm water/runoff pollution prevention public education/outreach program.

11. The City recycling program includes ten recycling centers where residents can drop off recyclables. Residents are encouraged to recycle through the City's well-developed public education program (newsletter and newspaper articles, door-to-door neighborhood recycling education campaign, and community events). City also encourages commercial facilities to require their refuse collection companies to recycle a variety of waste products. City's landfill diversion rate is approximately 17%.

12. The City participates in the County's hazardous waste management program and also provides oil collection facilities.

13. Residents are encouraged to conserve water by not washing down sidewalks or driveways. The public is informed of the sediments carried to the drainage system through a handout sent with water bill.

REPORT OF WASTE DISCHARGE

VOLUME 1

SECTION (B)

SUMMARY AND EVALUATION OF BASELINE BMPs

0210

R0060431

BMP 1: STENCIL CATCH BASINS

LEVEL OF IMPLEMENTATION	NUMBER OF JURISDICTIONS	PERCENTAGE
FULLY IMPLEMENTED	23	26.14
PARTIALLY IMPLEMENTED	13	14.77
PLANNED/PROPOSED	44	50.00
NOT IMPLEMENTED	7	7.95
NO CITY RESPONSE/NOT APPLICABLE	1	1.14
TOTALS	88	100.00

BMP DESCRIPTION AND PURPOSE:

Anything that is thrown or dumped on an impervious surface or directly into the catch basins will be washed down a gutter with the next rain, into a storm drain and the receiving water such as streams, lake or the ocean. The objective of this BMP is to remind the general public that any material that they place on the ground in such a way that it will be washed into the storm drain system will be deposited via stormwater, untreated, into the ocean. Eye-catching signs, painted on paving adjacent to storm drains or posted nearby, should be frequent reminders to the public of their responsibility to keep pollutants out of the storm drain system.

Short term BMP compliance requires stenciling of all high debris collecting catch basins; the long term goal is to stencil all catch basins.

ELEMENTS AND HIGHLIGHTS OF IMPLEMENTATION:

This program is the clearest of all BMP's to implement and measure--as a long-term goal, all storm drains are to have the same design developed by "Heal the Bay" and the City of Los Angeles or similar stencil painted near each drain, visible to the public.

Storm drain stenciling is a reasonably inexpensive program, for which many cities have used volunteer labor. Some cities have contracted with the County or outside vendors to provide stenciling of their catch basin.

Most jurisdictions have either completed their stenciling program or plan to have it completed shortly. While most use a stencil design developed by "Heal the Bay", some have designed their own--such as "Rain Water Only". There is a potential for both pedestrian and motor vehicle passengers to view such signs, and some cities have chosen to place the sign on the curb face so that it can be seen directly from the street. Standard paint seems to be wearing off rather quickly.

VOL 15 0211

Very few cities have chosen not to participate at all in this BMP. Of those few cities that show no indication of participating in this program, cited as reasons are cost, lack of stencil durability, ineffectiveness and the opinion that the stencils are a form of graffiti.

EFFECTIVENESS:

This is a public education program with indirect program effectiveness. While no measure of pollution reduction can be directly attributed to this program, several co-permittees have stated its value as a public outreach technique. The program is relatively inexpensive, although the stencils are likely to fade quickly and need repainting.

SUGGESTED MODIFICATIONS:

This BMP is labor intensive; several jurisdictions recommended using a high quality, water resistant paint to prolong the readable life of the stenciling. Some jurisdictions are using a horizontal-format stencil that can be applied to the curb face; the stencil could be read by passing motorists.

EVALUATION:

While this BMP has been or will soon be completed by a large majority of jurisdictions, it is not an active-involvement type of program with directly measurable results; its level of effectiveness is unknown.

VOL 15
0212
R0060433

BMP 2: PUBLIC REPORTING PROGRAMS

LEVEL OF IMPLEMENTATION	NUMBER OF JURISDICTIONS	PERCENTAGE
FULLY IMPLEMENTED	55	62.50
PARTIALLY IMPLEMENTED	11	12.50
PLANNED/PROPOSED	11	12.50
NOT IMPLEMENTED	10	11.36
NO CITY RESPONSE/NOT APPLICABLE	1	1.14
TOTALS	88	100.00

BMP DESCRIPTION AND PURPOSE:

Individuals may be unaware, or unconcerned, that illegal dumping or discharges into the storm drain system is a serious problem. The purpose of this BMP is to encourage the public to report instances of illegal dumping, to allow for clean up and, if possible, identification of the violator. Establishment of reporting hotlines, along with promotion of these phone numbers should cut down on the incidence of illegal dumping.

Short term minimum compliance is simply the establishment of a countywide hotline which has already been done, plus development of programs to promote it. The long term goal is to incorporate the hotline as part of a comprehensive public outreach and education program.

ELEMENTS AND HIGHLIGHTS OF IMPLEMENTATION:

The majority of jurisdictions provide at least some information to the public on the availability of the County hotline number for the reporting of illegal discharges/dumping. Few jurisdictions indicated that they had established a separate phone number exclusively for such reporting, though many stated that their fire, police, or public works departments could be used to make a report. Some of the larger jurisdictions, however, have established their own hotlines and have extensive public outreach programs. A few jurisdictions send follow-up letters to violators. One small city provides a cash award for the reporting of violators.

Publicity has taken several forms; many cities--especially the smaller jurisdictions--use their newsletters to inform the public of the County hotline and any city reporting services. Other popular methods of disseminating information include: local newspaper articles, distribution of brochures to residents and businesses, cable television public service announcements, and in a few cases, community meetings and educational programs in local schools.

VOL 15
0213
R0060434

BMP 2: PUBLIC REPORTING PROGRAMS--Page 2

EFFECTIVENESS:

In general, relatively few reportings have been received. In some instances this is due to the newness of the city programs and the lack of a tracking system. Obviously, larger jurisdictions have received a greater number of reports. The city with the anonymous cash award program has received a relatively large number of reports.

SUGGESTED MODIFICATIONS:

Several suggestions were made by various agencies on increasing the effectiveness of this measure. To increase awareness of the need for public reporting, handouts could be given at the County Fair, the public could be informed of the NPDES goals and what they can do to achieve them, a reporting system through local schools could be established and a "WE TIP" compensation system could be implemented.

EVALUATION:

The reporting hotline is an easy to establish measure that, if effective, could have a significant impact on the amount of materials illegally dumped. However, based on the few reportings so far, this BMP is not yet very useful. The publicity aspect of this program does not appear to be extensively implemented.

VOL 15

0214

BMP 3: ADOPT RUNOFF CONTROL ORDINANCE

LEVEL OF IMPLEMENTATION	NUMBER OF JURISDICTIONS	PERCENTAGE
FULLY IMPLEMENTED	44	50.00
PARTIALLY IMPLEMENTED	12	13.64
PLANNED/PROPOSED	21	23.86
NOT IMPLEMENTED	10	11.36
NO CITY RESPONSE/NOT APPLICABLE	1	1.14
TOTALS	88	100.00

BMP DESCRIPTION AND PURPOSE:

Surface runoff from construction sites and urbanized areas carries sediments, waste materials and/or other contaminants to the drainage system. To mitigate this problem, ordinances and or/policies for both new and existing developments must be adopted which will result in the reduction of pollutants found in urban runoff.

Short term minimum compliance constitutes the identification and/or the modification of existing codes or policies to achieve reduction of pollutants in urban runoff. The long term goal is to develop new ordinances and/or policies as needed, enforce ordinances/policies and prosecute violators.

ELEMENTS AND HIGHLIGHTS OF IMPLEMENTATION:

Half of the permittees have adopted or modified codes/policies to improve runoff quality. Components of these ordinances include erosion controls, industrial runoff controls, prohibitions on excessive irrigation, dust control, inspections of illegal discharges, enforcement and penalties.

Approximately 20% of the permittees are in the process of developing ordinances to control urban runoff. Some have indicated that the Model Runoff Control Ordinance developed by a consortium of permittees will be used and tailored to the needs of the individual jurisdiction.

Ten jurisdictions have not implemented nor indicated any intention to initiate work on an ordinance.

EFFECTIVENESS:

Most cities indicate that the ordinances they have adopted provide the legal authority to regulate illegal actions and prosecute violators. These ordinances are also effective in reducing runoff/erosion--especially in hillside areas. Others feel that educating the public and, in many cases, the applicant should be the emphasis; this has not been done.

VOL 15 0215

Finally, some respondents cannot determine effectiveness because no comparative data is available; also, it is too premature to make such judgments.

SUGGESTED MODIFICATIONS:

A few cities presented ideas intended to improve effectiveness. These include the development of a stormwater ordinance consolidating all legal authority to control stormwater quality and drainage, erosion controls to cover all building sites and the improvement of enforcement.

EVALUATION:

While this BMP has been implemented by 50% of the permittees, ordinance provisions seem to be different from city to city, and therefore not all aspects of urban runoff are addressed in the legislation. As with any other ordinance, enforcement is the key element in ensuring effective implementation.

VOL 15
0216
R0060437

BMP 4: DEVELOP PUBLIC EDUCATION AND OUTREACH PROGRAMS

LEVEL OF IMPLEMENTATION	NUMBER OF JURISDICTIONS	PERCENTAGE
FULLY IMPLEMENTED	36	40.91
PARTIALLY IMPLEMENTED	16	18.18
PLANNED/PROPOSED	27	30.68
NOT IMPLEMENTED	8	9.09
NO CITY RESPONSE/NOT APPLICABLE	1	1.13
TOTALS	88	100.00

BMP DESCRIPTION AND PURPOSE:

The public, for the most part, is unaware that anything that enters the storm drain system goes untreated, directly into the ocean. A public outreach campaign would help educate the public about the function of the storm drain system and how residents can reduce non-point pollution at its source.

Short term minimum compliance includes articles in city newsletters to inform the general public, while the long term goal is to establish a comprehensive public outreach and education program.

ELEMENTS AND HIGHLIGHTS OF IMPLEMENTATION:

Two out of five respondents have fully implemented this BMP. Numerous methods are used to inform the public on ways to help keep the storm drain system free of pollutants. These include:

- Mailers, flyers, brochures, pamphlets, handouts, city newsletters, door hangers, utility bill inserts and information packets to downtown businesses.
- Radio and newspaper advertisements, press releases, movie theater previews, cable television announcements, and videos.
- City sponsored events and expos, school programs, block watch meetings, and stormwater awareness week.
- Neighborhood Gutter Patrol programs.
- Billboards, street banners, signs on beach receptacles, bus shelter posters and library displays.
- Appointment of public outreach coordinator.

Approximately one third of the respondents indicated that a public outreach program is being planned/proposed during the current Fiscal Year. Ten percent of the permittees have not, nor indicated that they will, implement this BMP.

VOL 15

02117

R0060438

EFFECTIVENESS:

Outreach and education regarding stormwater pollution is a continuous process. Most cities are unable to quantify the success of the public outreach program; effectiveness is difficult to gauge and there is insufficient data. A few cities believe that public outreach is effective because it raises awareness of the issue and expect that the public will respond well.

SUGGESTED MODIFICATIONS:

Suggested modifications and additions to BMP No. 4 include more of a coordinated countywide message, the combination of educational information on discharges with water conservation, especially at school presentations, bilingual educational materials and surveys to determine effectiveness.

EVALUATION:

Almost two-thirds of the permittees have not yet implemented a public outreach program. An initial program consists of articles in the city newsletter and one or more brochures or pamphlets available at City Hall and/or other public places. If established by all permittees, this relatively inexpensive program could provide measurable results.

0218
R0060439

BMP 5: CLEAN CATCH BASINS REGULARLY

LEVEL OF IMPLEMENTATION	NUMBER OF JURISDICTIONS	PERCENTAGE
FULLY IMPLEMENTED	79	89.77
PARTIALLY IMPLEMENTED	7	7.95
PLANNED/PROPOSED	1	1.14
NOT IMPLEMENTED	0	0.00
NO CITY RESPONSE/NOT APPLICABLE	1	1.14
TOTAL	88	100.00

BMP DESCRIPTION AND PURPOSE:

Dirt and debris that accumulate in catch basins is flushed down the storm drain system directly into the ocean. Regular cleaning of catch basins removes the debris, preventing it from reaching the ocean. The most effective time to perform the cleaning is just before the heavy rainy season begins in the fall.

Short term compliance is to make sure that catch basins are cleaned at least yearly; long term refinements includes evaluating the effectiveness of the cleaning program and making appropriate changes.

ELEMENTS AND HIGHLIGHTS OF IMPLEMENTATION:

Nearly all jurisdictions have implemented at least annual cleaning of their catch basins. Those who do not clean their catch basins on a regular schedule clean them "as needed", either in response to requests or when the amount of debris reaches a certain level. Less than yearly cleaning is generally due to budget constraints.

EFFECTIVENESS:

Overwhelmingly, cities feel that this program is effective. Estimates on the amount of debris removed from catch basins--which is prevented from being conveyed to the ocean--range up to 80 tons per year. Cities with more frequent street sweeping find that less debris accumulates in catch basins.

SUGGESTED MODIFICATIONS:

No specific suggestions are offered for modifications to this BMP.

VOL 15 02199

EVALUATION:

An at least annual catch basin cleaning program has been implemented by the majority of jurisdictions; most of them have stated that they find the program effective. Although only a few cities actually estimated total debris removed, it appears that the amount is substantial. A few cities indicated that they were developing a monitoring system.

VOL 15
0220
R0060441

BMP 6: INCREASE ROADSIDE TRASH RECEPTACLE USAGE

LEVEL OF IMPLEMENTATION	NUMBER OF JURISDICTIONS	PERCENTAGE
FULLY IMPLEMENTED	61	69.32
PARTIALLY IMPLEMENTED	16	18.18
PLANNED/PROPOSED	2	2.27
NOT IMPLEMENTED	3	3.41
NO CITY RESPONSE/NOT APPLICABLE	6	6.82
TOTALS	88	100.00

BMP DESCRIPTION AND PURPOSE:

The more convenient it is to properly dispose of litter, the less trash there will be that is tossed on the ground to end up in the storm drain system. The convenient placement of trash receptacles encourages proper waste disposal. To be most effective, receptacles should be emptied often enough to prevent overflowing. This BMP encourages the placement and use of public trash receptacles, and includes program evaluation to determine if more frequent emptying or placement of additional receptacles are needed.

The BMP short term goal is to monitor litter prone areas and evaluate the need for additional receptacles and/or more frequent emptying of existing receptacles. The long term goal is to provide adequate trash receptacles and emptying program throughout the jurisdiction.

ELEMENTS AND HIGHLIGHTS OF IMPLEMENTATION:

Most jurisdictions provide and maintain trash receptacles in major commercial areas, parks, at bus stops and other places of public gathering. Most programs provide for emptying of receptacles at least weekly; some are emptied as often as twice per day. A few smaller cities--especially those that are predominantly residential--do not have public receptacles, but do generally provide for street clean-up.

"Overflow" problems may be encountered on weekends and for special events; for special events most jurisdictions either provide additional temporary receptacles or empty the existing ones on a more frequent basis. Where another jurisdiction has responsibility--such as Caltrans along State highways, that agency provides the service where needed. A relatively minor problem may arise in areas where scavengers tend to scatter trash. Bus stops were occasionally mentioned as areas prone to littering.

Equally effective to public receptacles are those provided and emptied privately by selected commercial uses such as drive-through fast food restaurants or shopping centers. Some jurisdictions require the placement and maintenance of receptacles as part of their commercial permit approvals.

*

VOL 15
0221
R0060442

BMP 6: INCREASE ROADSIDE TRASH RECEPTACLE USAGE--Page 2

EFFECTIVENESS:

This BMP is at least partially implemented by over 80% of all jurisdictions. There was no mention of debris problems arising in areas due to lack of public trash receptacles. Assuming that without convenient receptacles that much of the trash collected would wind up on the ground, this BMP is clearly a cost-efficient way of keeping debris out of the storm drain system.

SUGGESTED MODIFICATIONS:

A recommended modification is to provide recycling containers adjacent to receptacles used for general, non-recyclable trash. While most jurisdictions use city staff to empty the receptacles, it may be more cost effective to have the city's refuse pick-up service empty the receptacles on their regular routes; if adjacent cities use the same refuse service, a coordinated program could be even more cost-effective.

EVALUATION:

This BMP is well received, implemented and effective in keeping large quantities of debris out of the storm drain system.

VOL 15
0222
R0060443

BMP 7: INCREASED STREET SWEEPING

LEVEL OF IMPLEMENTATION	NUMBER OF JURISDICTIONS	PERCENTAGE
FULLY IMPLEMENTED	84	95.45
PARTIALLY IMPLEMENTED	1	1.14
PLANNED/PROPOSED	0	0.00
NOT IMPLEMENTED	1	1.14
NO CITY RESPONSE/NOT APPLICABLE	2	2.27
TOTALS	88	100.00

BMP DESCRIPTION AND PURPOSE:

Dirt and debris accumulate in the streets and gutters and, if not removed, eventually enter the storm drain system. Regular street sweeping helps reduce the amount of such dirt and debris from entering the system.

The short range, minimum compliance objective of this BMP is to sweep all streets within the jurisdiction at least once per month, monitored for maximum effectiveness and practicality. The long term goal is to increase sweeping, if warranted.

ELEMENTS AND HIGHLIGHTS OF IMPLEMENTATION:

This BMP has one of the highest percentages of full implementation. Cities that have not implemented at least monthly sweeping are rural communities with privately maintained streets, generally without curbs and gutters. Both broom and vacuum sweepers are used, though broom sweepers are more prevalent. Commercial streets are generally swept more frequently--in several jurisdictions even daily--than either residential or industrial streets. A few jurisdictions indicated that in areas that experience frequent dumping or excessive litter, sweeping frequency has been increased.

EFFECTIVENESS:

This is a highly effective program for removing debris which would otherwise eventually end up in the drainage system. A number of cities mentioned that their street sweeping program is important because it promotes the image of a "clean" city. A few cities are planning an analysis and monitoring program to determine program effectiveness.

SUGGESTED MODIFICATIONS:

No specific modifications were offered for enhancing this program.

VOL 15
0223
R0060444

BMP 7: INCREASED STREET SWEEPING--Page 2

EVALUATION:

This program is effective and prevents a substantial amount of debris from entering the drainage system. The majority of cities have long-established sweeping programs; only a few have increased the frequency of sweeping in response to RWQCB requirements.

VOL 15
0224
R0060445

BMP 8: DISCOURAGE IMPROPER DISPOSAL OF LITTER, LAWN CLIPPINGS AND PET FECES

LEVEL OF IMPLEMENTATION	NUMBER OF JURISDICTIONS	PERCENTAGE
FULLY IMPLEMENTED	26	29.55
PARTIALLY IMPLEMENTED	43	48.86
PLANNED/PROPOSED	9	10.23
NOT IMPLEMENTED	9	10.23
NO CITY RESPONSE/NOT APPLICABLE	1	1.14
TOTALS	88	100.00

BMP DESCRIPTION AND PURPOSE:

The public is generally unaware that anything discharged into the storm drain system goes untreated directly into the ocean. In order to raise public awareness and to achieve implementation and enforcement of current regulations of disposal practices, the public needs to become acquainted with the problems associated with illegal dumping.

Short term minimum compliance consists of articles in city newsletters informing the public of the problem of illegal discharges. The long term goal is to establish a comprehensive public outreach and education program.

ELEMENTS AND HIGHLIGHTS OF IMPLEMENTATION:

Most respondents indicate that they discourage the improper disposal of litter, lawn clippings and pet feces through City codes. In several jurisdictions the County's codes covering this subject have been adopted by reference. These codes include penalties for non-compliance.

A few respondents--one out of five--have also implemented a public outreach effort in conjunction with municipal code requirements. The typical public outreach includes brochures in utility bills, articles in City newsletters, cable television, handouts and highway signs.

Almost half of the permittees have partially implemented this BMP. 10% indicated plans to implement the program in the near future, while another 10% did not indicate any plans for implementation.

EFFECTIVENESS:

It appears that the legal authority, including penalties, to discourage improper disposals has been established within most jurisdictions. However, public education and outreach is an important element of this measure and therefore should be established concurrently; in this respect most permittees have faltered. There is no direct measure of debris collected as a BMP

VOL 15
0225
R0060446

result of this indirect, public education/awareness program. Its impact overlaps with other programs such as recycling and roadside trash receptacles.

Full implementation of this BMP seems to be relatively inexpensive. The educational value and public awareness could have very positive results.

SUGGESTED MODIFICATIONS:

Suggested new programs and modifications to existing ones include:
- "Adopt a Street Program" to discourage improper litter disposal.
- Recycling programs which will render easier compliance with program.
- "No Dumping" Highway signs.
- Separate collection of green waste.

EVALUATION:

This BMP is relatively inexpensive to implement through ordinance adoption and public education and outreach. Nevertheless, only a small percentage of permittees have taken steps to implement the BMP fully.

VOL 15 0226

BMP 9: INSPECT AUTOMOBILE USES AND RESTAURANTS

LEVEL OF IMPLEMENTATION	NUMBER OF JURISDICTIONS	PERCENTAGE
FULLY IMPLEMENTED	45	51.14
PARTIALLY IMPLEMENTED	21	23.86
PLANNED/PROPOSED	14	15.91
NOT IMPLEMENTED	3	3.41
NO CITY RESPONSE/NOT APPLICABLE	5	5.68
TOTALS	88	100.00

BMP DESCRIPTION AND PURPOSE:

Auto parts, stores repair and body shops, gasoline stations, and restaurants generate waste materials that require proper disposal--a cost factor to the operation. Such facilities are generally inspected for their overall operations. Part of that inspection program should focus on the prevention of discharges of chemicals or other toxic materials or debris into the storm drain system. Inspection and enforcement require enactment of implementing ordinances.

Short term minimum compliance with this BMP includes incorporation of inspection of facilities for storm water concerns into existing industrial waste inspection programs. The long term goal is to develop a regular inspection program for industrial and related facilities, and to prosecute violators.

ELEMENTS AND HIGHLIGHTS OF IMPLEMENTATION:

While this BMP can be directly effective in preventing illegal or accidental discharges from industrial and related uses into the storm drain system, less than half of all jurisdictions have fully implemented this program by conducting regular inspections. Several others, however, have partially implemented the program by inspecting on an "as needed" or "complaint" basis. Many of the cities have adopted the County's regulating ordinances. The majority of the implementing cities contract with the County to administer the inspection program.

Of those jurisdictions that do not have an inspection program, some cite the costs involved, while others are basically residential cities and have no need for such a program.

EFFECTIVENESS:

In those jurisdictions with inspection programs, the mere knowledge that inspections will occur on a regular basis is a significant deterrent to would-be polluters--especially if the implementing ordinances incorporate violation penalties. This program provides direct interception in the process of illegal pollutant discharge. For those jurisdictions that provided data, typically about 10% of the inspections detected non-compliance conditions.

VOL 15
0227

BMP 9: INSPECT AUTOMOBILE USES AND RESTAURANTS--Page 2

SUGGESTED MODIFICATIONS:

Cost efficiencies are possible when a single inspection is able to consider multiple impact areas; potential pollution to the storm drain system should be directly considered when inspecting for industrial-type use operations. Smaller cities, especially, will likely find that it is more cost effective to contract with the County or a private agency for this service, rather than hire a full time specialist.

EVALUATION:

This program that has the potential to directly intervene in the discharge of toxics into the storm drain system is only partially implemented. The implementation that is occurring is preventing such products as gasoline, lubricants, motor oil and used cooking oil from polluting the ocean.

VOL 15
0228
R0060449

BMP 10: ENCOURAGE REMOVAL OF DIRT, RUBBISH AND DEBRIS FROM SIDEWALKS AND ALLEYS

LEVEL OF IMPLEMENTATION	NUMBER OF JURISDICTIONS	PERCENTAGE
FULLY IMPLEMENTED	20	22.73
PARTIALLY IMPLEMENTED	31	35.23
PLANNED/PROPOSED	17	19.32
NOT IMPLEMENTED	17	19.32
NO CITY RESPONSE/NOT APPLICABLE	3	4.55
TOTALS	88	100.00

BMP DESCRIPTION AND PURPOSE:

Dirt, rubbish and debris left on sidewalks and alleys are washed into the street and into the storm drain system. An outreach and education program as to how the public can reduce non-point pollution at its sources should be established.

Short term minimum compliance consists of articles in city newsletters to inform the general public about this problem and encourage the removal of dirt, rubbish and debris from sidewalks and alleys. A long term goal for this BMP is the establishment of a comprehensive public outreach and education program.

ELEMENTS AND HIGHLIGHTS OF IMPLEMENTATION:

Approximately 23% of the respondents have fully implemented this BMP by disseminating information to the public regarding the removal of debris, and litter from sidewalks and alleys. Another 23% of the respondents did not indicate city implementation plans for this BMP.

Permittee responses for public education and outreach include the use of brochures, newsletters, door hangers, water bill inserts, cable television, and hot line for reporting debris accumulation or improper disposal. Some jurisdictions promote and conduct "Clean Up Days", "Clean-Up Saturdays, annual or bi-annual clean-ups. In some case volunteers, such as students or residents clean litter and debris from sidewalks and alleys.

Ordinances are in place in some cities, and penalties included to require owners to maintain areas adjacent to their properties. A few responses noted the frequency of alley cleaning or the vacuuming of problem sidewalk areas.

EFFECTIVENESS:

Public education and outreach is the primary objective of this BMP. Twenty-three percent of the permittees have implemented this relatively inexpensive public education/outreach-oriented program. As some of the respondents indicated, the effectiveness of public

VOL 15
0229
R0060450

education/outreach is difficult to measure. However, it is generally agreed that raising public awareness is beneficial in the long range.

SUGGESTED MODIFICATIONS:

No specific or significant modifications have been offered for this BMP.

EVALUATION:

This BMP is relatively inexpensive to implement through public education and outreach. Since only a little over a fifth of the respondents have fully implemented education/outreach, an average rating is warranted.

VOL 15
0230
R0060451

BMP 11: RECYCLING PROGRAM

LEVEL OF IMPLEMENTATION	NUMBER OF JURISDICTIONS	PERCENTAGE
FULLY IMPLEMENTED	64	72.73
PARTIALLY IMPLEMENTED	12	13.64
PLANNED/PROPOSED	7	7.95
NOT IMPLEMENTED	3	3.41
NO CITY RESPONSE/NOT APPLICABLE	2	2.27
TOTALS	88	100.00

BMP DESCRIPTION AND PURPOSE:

Material which is improperly disposed of may eventually enter the storm drain system. Encouraging citizens to recycle discarded products not only saves natural resources but also helps reduce the amount of material entering the drainage system. Recycling can also increase overall environmental awareness. Frequently recycled products include glass, plastic, aluminum and tin and newspapers and paper products. An increasing number of jurisdictions are providing for recycling of used motor oil and green waste.

Short term minimum compliance requires each permittee to have an active recycling program, which includes public education. The long term goal incorporates a comprehensive public outreach and education program.

ELEMENTS AND HIGHLIGHTS OF IMPLEMENTATION:

Most jurisdictions have implemented recycling program of some sort; curbside pick-up is usually, although not always, provided. In general, cities have established recycling programs in response to the requirements of AB939 and not exclusively in response to storm water/urban runoff concerns.

Outreach to publicize recycling is usually a part of the program; newsletter and newspaper articles, cable TV notices, brochures, handouts, school presentations and press releases are common methods. Estimates of the amount of rubbish being diverted from landfills range from 3% to 51%. Unique ideas to encourage recycling include refuse rate structure changes to make recycling cost-effective to residents; a recycler-of-the- month promotion, with one year free trash collection to the winner, is another incentive.

EFFECTIVENESS:

In most jurisdictions this program appears to be effective as a waste reduction measure. Though exact measurements were not given, most jurisdictions estimated at least a 10% reduction in materials being sent to landfills. This program will be more effective in the future as cities are required by AB939 to reduce landfill

VOL 15
0231
R0060452

wastes even further. While landfill wastes are definitely reduced, the amount of material prevented from reaching the storm drain system due to this program has not been estimated.

SUGGESTED MODIFICATIONS:

Some jurisdictions feel that the addition of commercial/industrial recycling, composting programs and used oil drop off facilities are potential modifications which would increase the effectiveness of the recycling program. A few cities indicated that the modifications will soon be underway.

EVALUATION:

This program is highly effective in reducing the amount of materials currently being sent to landfills and will be even more effective in the future. However, it is not possible, or is at least very difficult, to quantify the degree to which this program prevents recyclable materials from entering the storm drain system. The effectiveness of this measure as a BMP is debatable.

VOL 15
0232
R0060453

BMP 12: MOTIVATE RESIDENTS TO PROPERLY DISPOSE OF HOUSEHOLD HAZARDOUS WASTE

LEVEL OF IMPLEMENTATION	NUMBER OF JURISDICTIONS	PERCENTAGE
FULLY IMPLEMENTED	86	97.73
PARTIALLY IMPLEMENTED	0	0.00
PLANNED/PROPOSED	0	0.00
NOT IMPLEMENTED	0	0.00
NO CITY RESPONSE/NOT APPLICABLE	2	2.27
TOTALS	88	100.00

BMP DESCRIPTION AND PURPOSE:

Improper disposal of household hazardous waste materials such as paint-related products, motor oil, car batteries, pesticides and detergents results in pollution of storm drain water. The problem is both one of public education and the provision of proper disposal alternatives. This BMP is intended to ensure that proper disposal facilities are available to the public and that an outreach program be established to inform the public of the harm caused by improper disposal and of the availability of collection facilities.

Short term minimum compliance is to either establish a household hazardous waste roundup program or to participate in a regional program. The long term goal would add the establishment of a comprehensive public outreach and education program.

ELEMENTS AND HIGHLIGHTS OF IMPLEMENTATION:

Collection and disposal of hazardous wastes is a costly operation. The need for a convenient, cost efficient disposal program is not confined to city boundaries. In a cooperative effort, the County of Los Angeles sponsors hazardous waste "roundups" throughout the County for all residents, while the cities provide support by encouraging their residents to use these facilities. Nearly all cities participate by publicizing the program, with a few cities--generally the larger ones--holding "roundups" of their own.

In addition to the general collection of hazardous wastes, some jurisdictions provide for collection of used motor oil through agreements with auto parts stores and other private oil vendors.

Publicity for collection programs is often carried on local cable TV channels. Flyers in utility bills, posters and notices at point-of-sale are frequently-used public education techniques.

EFFECTIVENESS:

There are few options to the proper disposal of hazardous (generally liquid) wastes: a) dump into the sanitary sewer system,

VOL 15 0233

R0060454

where it must then be processed at municipal treatment plants; b) discard in household trash, which is then placed in landfills where it may eventually contaminate groundwater or c) dump on the ground where it then may filter to, and contaminate, local groundwater or be washed into the storm drain system. The material collected at any of the facilities, then, would have otherwise contaminated groundwater or ocean water, or have been expensive to remove from liquid sewage. The "roundups"--the largest being Los Angeles County and City of Los Angeles--have collected large amounts of hazardous wastes from throughout the entire County. Publicity creating the impression that the roundups are "special opportunities" most likely helps to increase participation.

SUGGESTED MODIFICATIONS:

There are few suggestions for modifying this very effective BMP. Collection facilities are generally available, and there is extensive publicity about the need to properly dispose of hazardous wastes. Commercial TV could reach a greater audience, but at a much higher cost than the free services of cable channels. Since most people would avail themselves of collection facilities only infrequently, it would be helpful if disposal locations could be standardized throughout the County (all public facilities of a certain type or all private auto parts dealers, for example) so that there would be no need for someone to have to call to locate the nearest facility.

EVALUATION:

This BMP has widespread community support and is very effective in collecting household hazardous wastes. Even more could be done to publicize collection programs.

VOL 15 0234

R0060455

BMP 13: ENCOURAGE WATER CONSERVATION

LEVEL OF IMPLEMENTATION	NUMBER OF JURISDICTIONS	PERCENTAGE
FULLY IMPLEMENTED	33	37.50
PARTIALLY IMPLEMENTED	35	39.77
PLANNED/PROPOSED	11	12.50
NOT IMPLEMENTED	7	7.95
NO CITY RESPONSE/NOT APPLICABLE	2	2.27
TOTALS	88	100.00

BMP DESCRIPTION AND PURPOSE:

Runoff from over-watering, washing sidewalks and cars, etc. carries sediments, waste materials and contaminants to the drainage system. Encouraging the proper use and conservation of outdoor water will prevent excessive runoff and the resultant negative impacts on storm water quality.

Short term minimum compliance includes the publication of articles in city newsletters for the general public. The long term goal would incorporate the establishment of a comprehensive public outreach and education program.

ELEMENTS AND HIGHLIGHTS OF IMPLEMENTATION:

Several cities have adopted ordinances to prevent excessive use of water--especially under drought conditions. While some of these regulations do prohibit washing sidewalks and cars, as well as restrictions on landscape watering, in general they are enforced only during droughts as a way to reduce water consumption. Some jurisdictions have restrictions on landscape watering of city-maintained properties, requirements for the installation of low flow equipment, guidelines for the use of drought tolerant plant species. Several jurisdictions mentioned that they use reclaimed water. The use of drought tolerant plants indirectly reduces runoff since less water is necessary. However, the use of reclaimed water, by itself, does not change the amount of runoff. It may adversely impact the quality of such runoff. Furthermore, low flow shower heads and toilets do not effect the storm drain system except by reducing the volume of sewage in the sanitary sewer line which could present an overflow in the event of line blockage or pump station breakdown.

The public is made aware of the importance of water conservation in a variety of ways. Education programs in schools, cable TV public access, city newsletters, and brochures are used by several cities. Other methods include an exterior audit of water usage and handouts with water bills which discuss costs savings for use reduction.

VOL 15
0235
R0060456

BMP 13: ENCOURAGE WATER CONSERVATION--Page 2

EFFECTIVENESS:

Most of the water conservation programs discussed by the jurisdictions have the potential to reduce water usage and, indirectly, runoff. Very few actually address the problem of pollution prevention. Generally, reduced consumption is the goal. Another problem is that in non-drought situations it appears that enforcement of provisions is relaxed and cities simply "encourage" conservation rather than require it. Only a few cities have regulations that require a certain percentage use reduction.

SUGGESTED MODIFICATIONS:

The only modification suggested was to make existing voluntary programs mandatory, as they would be under drought conditions.

EVALUATION:

A reduction in water usage--particular outdoor use--has the potential to reduce runoff to the storm drain system. Presently, many of the conservation programs in effect have only indirect impact on runoff and are implemented in an effort to reduce water consumption only. Water conservation programs will have to be strengthened to have a significant effect on runoff.

SANTA MONICA BAY:
MALIBU CREEK AND OTHER RURAL AREAS
STORMWATER MANAGEMENT PLAN

INTRODUCTION

On June 18, 1990, the National Pollutant Discharge Elimination System (NPDES) Permit - Order #90-079, NPDES #CA0061654-CI6948 was issued to the County of Los Angeles and 17 cities tributary to Santa Monica Bay. During the subsequent years, two newly incorporated cities within the Santa Moncia Bay watershed, Caltrans, and the County of Ventura also became Co-Permittees. This Permit outlined a three-year program which required each Permittee to: characterize drainage areas; develop and schedule the implementation of Best Management Practices to enhance the quality of stormwater/urban runoff within its jurisdictional boundaries and storm drains it owns and operates. On July 1, 1992, 36 additional cities were initiated into the Permit and began their three-year program. By July 1, 1993, the remaining 30 cities in Los Angeles County within the drainage basin were initiated into their three-year program. The cities were grouped according to their starting dates and referred to as Phases I, II, and III respectively (See Table A). In general, the boundaries of each Phase did not encompass whole watersheds but portions of various watersheds (See Figure 1).

The Permit has a five year duration and although Phase III cities have only completed year one of their three year program, the Permit requires the submittal of a Report of Waste Discharge (ROWD) which serves as an application for a subsequent NPDES Permit to replace NPDES Permit #CA0061654, which will expire on June 18, 1995. Therefore, the County of Los Angeles, Ventura County, Caltrans, and the 85 cities are now parties to the subsequent NPDES Permit application utilizing the Municipal Stormwater Management Plan (herein after called the Plan) concept.

The Plan is based on the Stormwater Management Plan Components developed by the California Regional Water Quality Control Board, Los Angeles Region (Regional Board), and is proposed on behalf of the County of Los Angeles and the other participating agencies, see Table B. The Plan describes the stormwater management activities to be undertaken during the next single, five-year NPDES Municipal Stormwater Permit. The Plan involves the subdivision of the area of the County under a single, new Permit, into six watersheds, each with its own stormwater management plan. For these watersheds and the agencies in each of these watersheds, see Table B and Figure 2.

As required by the current Permit, all Permittees have proposed BMPs for their jurisdictions, described in Volume One and under prior submittals made to the Regional Board. These BMPs have already addressed many of the program areas discussed under the stormwater management plan. As required by the current Permit and continuing on under the new Permit, the Permittees will continue to implement these BMPs. This stormwater management plan will involve reorganizing the individual city-based BMP programs into a single stormwater plan for each watershed. The timeline shown in this document reflects the time needed for the transition from individual city-based programs to the preparation of a mutually agreed upon and collectively developed watershed plan by

VOL 15
0240
R0060461

all parties of the new Permit for each of the watershed areas. The first step in beginning this process will be the reorganization of the current three-phase program into a new watershed based program. A reorganization of the Phases into watersheds which are based on hydrologic characteristics will allow for the consistent development and implementation of programs among Permittees, referencing land use and drainage infrastructure within their respective watersheds. Consistency of programs throughout the watershed will be beneficial in terms of targeting specific pollutant problems and areas.

This watershed is within the targeted area of the Santa Monica Bay Restoration Project (SMBRP), which was formed in 1988 when Santa Monica Bay was included in the National Estuary Program (NEP) as one of seventeen significant estuaries or coastal water bodies nationwide. The SMBRP has developed the Santa Monica Bay Restoration Plan, which identifies 74 Priority Actions to be implemented within the SMB Drainage Basin to improve the quality of Santa Monica Bay. The SMBRP has released its draft plan in April 1994 for public review, to be completed by the end of this year. Upon approval of U. S. Environmental Protection Agency, the State Water Resources Control Board, and other agencies, the priority actions discussed in the plan will be implemented by a variety of agencies and parties. Detailed development of the stormwater management plan for this watershed will incorporate those Priority Actions targeted for the improvement of stormwater/urban runoff quality.

This specific Plan will address the stormwater management issues for the Malibu Creek and Other Rural Areas watershed, which include the following cities and agencies:

- **Agoura Hills**
- **Calabasas**
- **Caltrans**
- **Los Angeles County**
- **Malibu**
- **Westlake Village**
- **Ventura County**

County (Regional) Parks

- Landscape maintenance activities at public-owned parks will be reviewed as part of additional plan development to ensure the use of proper management measures.

Mosquito Abatement

- Coordination with the County Agricultural Commissions will be done for mosquito abatement programs to avoid adverse impact on the quality of stormwater/urban runoff.

Water Districts

- Activities with regards to the Water Districts activities will be reviewed and, when feasible, comply with the watershed program regulations and requirements.

Other entities, both private and public which have major land holdings and/or authorities that impact the quality of stormwater/urban runoff should be initiated to participate actively in the program.

3. CITY-SPECIFIC INTERAGENCY ARRANGEMENTS

Each city will need to develop the institutional framework to address operation, maintenance, construction, redevelopment, and other activities performed by city agencies such as Public Works, Parks and Recreation, Planning, and Public Owned Treatment Works (POTWs). These city agencies will need to participate in the planning and implementation of relevant plan program areas.

C. FISCAL RESOURCES

As each of the Plan chapters are completed, each Permittee will develop a budget for implementing that portion of the Plan. A complete budget for the Plan will be produced upon completion of development for all Plan components by December 1996. The budget will provide information such as funding sources, staff resources, contract services, and cost sharing arrangements.

VOL 15
0246
R0060467

1. **AREA-WIDE**

In implementing the Plan, the Permittees may elect the jointly fund a single program for certain BMPs, such as Public Education, that are area wide in nature. Funding agreements including budgets and cost per agency would be developed.

2. **CITY-SPECIFIC**

Each Permittee will develop a budget detailing the cost of implementing Plan activities within its jurisdiction. Special funding in the form of grants, donations, or other forms of contribution should also be actively pursued to assist in funding special studies and/or BMPs.

D. LEGAL AUTHORITY

Each Permittee is responsible for implementing the Plan within its jurisdictional boundaries and therefore must acquire all needed legal authority. Each Permittee, being separate legal entities, are to have adopted as required by the existing Permit, ordinances that will provide them with the adequate legal authority to develop, administer, implement, and enforce storm water/urban runoff management programs within their own jurisdiction. The ordinance must provide for its enforcement and at a minimum specify that violators may be subject to penalties including, but are not limited to, fines and termination of the activity causing the violation. A plan for identifying any additional legal authorities needed by the Permittees will be included in the completed Plan for the Malibu Creek and Other Rural Areas watershed by December 1995. Upon completion of development of the Stormwater Management Plan, enforcing compliance with the Plan will be the responsibility of the Regional Board.

R0060468

II. ILLICIT DISCHARGES

The elimination of illegal connections and illicit disposal (IC/ID) practices is an important component for any program aiming to enhance the quality of stormwater/urban runoff.

Although more information is needed to assess fully the benefits and costs of conducting IC/ID programs, we can make logical decisions regarding application of best management practices (BMPs) to minimize such incidents. These BMPs will vary due to the jurisdictional differences which exist within each watershed. Each jurisdiction within the watershed will be developing and implementing those activities which adequately serve the jurisdiction and the watershed as a whole.

IC/ID practices are intermittent discharges of pollutants into the storm drain system that can degrade the quality of receiving waters. This can occur through catch basins, area drains and even on gutters and street surfaces. Some illegal dumping activities are done by individuals who do not know that such practices are illegal and can adversely impact the environment. Yet, others may be carrying out such practices with the full knowledge that such activities are prohibited.

A. ILLICIT CONNECTIONS

In order to implement an illicit connection management program, jurisdictions as a whole will need to develop and implement the procedures for investigating each of their respective storm drain systems.

Detailed procedures to eliminate illicit connections depends on the complexity of the storm drain system. A consistent watershed wide concept will be developed to investigate illicit connections to the storm drain system. Based on the results of field screening activities, or other appropriate information which indicates an area of reasonable potential of containing illicit connections, detection and follow up procedures would be followed. Priority should be established to focus on major problem areas and allow for a cost-effective approach to eliminate illegal connections. This concept will be developed by December 1995.

1. SYSTEM SURVEY

A system survey is a necessary component of an illicit connection elimination program. Although the basic concept is similar, the actual techniques and methods which jurisdictions within the watershed use to conduct system surveys can be quite different.

In conducting system surveys, the intent is to avoid costly investigations within areas not suspected of containing illicit connections. Field screening, map

VOL 15 0248

R0060469

research, and land use investigation activities will be done initially to identify potential problem areas. Public outreach efforts will be used to inform citizens in the area about the problem. Enforcement action will be taken to terminate such illegal connections. It should be noted that more detailed and sophisticated techniques such as televised inspection and dye testing will only be used in special situations as needed.

Presently, Los Angeles County has begun a system survey. Maps detailing the location of each storm drain, its manholes and catch basin connector pipes are being prepared by Los Angeles County to facilitate monitoring of illegal connections and discharges. The location and source of discharge for connections is being inventoried. A GIS system to allow management and analysis of this data is also being developed. This information will be used in the storm drain inspection program which is ongoing. The program is targeting open channel storm drains. All open channels will be inspected for evidence of illegal discharges. The open channel inspections will also be used to collect information on dry weather discharges from underground drains for use in prioritizing future underground drain inspections.

2. ONGOING SYSTEM INSPECTIONS

Ongoing system inspections for illicit connections will involve the techniques identified in Section 1. above, along with some additional activities. In smaller systems where the storm drain goes into several pumping stations, a regular inspection of the pumping stations for, among other things, evidence of illicit discharges will be sufficient.

In larger and more complex systems, a program of field screening will be used. Evidence of pollution will be categorized and prioritized. The storm drain alignment tributary to the suspect illegal connection can then be further investigated for illicit connections. If a discharge can be traced to a particular facility, the facility will be investigated to identify where exactly the pollutants are coming from and efforts needed to stop the discharge.

Another means of detecting illicit connections may be to rely on reports of illicit discharge from the public. This will utilize the County's or another agency's established "hotline" number that the public can call and report such observations.

VOL 15
0249
R0060470

3. REPORTING

A consistent recording system will be established to track report of illegal connections. This recording system will be used by the Permittees within the watershed.

B. ILLEGAL DUMPING

Due to the intermittent and unpredictable nature of illegal dumping, apprehension rate of violators could be quite low. The first course of action is to develop an area wide educational and reporting system along with prompt response procedures. This will be accomplished by December 1995.

1. OUTREACH

Reporting hotlines, in conjunction with outreach/publicity programs, can help minimize the problems of illegal dumping. The County has established an 800 hotline for the reporting of illegal dumping. In addition to this hotline the cities of Agoura Hills and Calabasas have established their own reporting numbers. All five cities in the watershed have public outreach programs to promote the reporting of illegal dumping. Newsletter articles, brochures, door hangers and refrigerator magnets are outreach methods which have been used.

2. SYSTEM SURVEILLANCE

Measures that may be used for this aspect of the program may include but not limited to regular inspections of vacant facilities, street use inspection programs to detect illegal discharges and dumping into the street system, and a public complaint and reporting system.

Caltrans' system surveillance program involves investigation, identification and remediation for hazardous waste and debris dumped on excess land parcels.

See **Chapter VII Public Information and Participation** of this report for a detailed discussion of the outreach program.

3. SPILL RESPONSE

The Health Hazardous Materials Division (HHMD) of the Los Angeles County Fire Department is generally the primary spill responder. If the material is found to be hazardous, the cleanup and disposal of the material will be done under the supervision of HHMD. If the material is non-hazardous, the responsibility will fall on local agencies to coordinate cleanup,

VOL 15
0250
R0060471

disposal and attempt to identify and prosecute the violators. Cooperation among all agencies will be needed to allow for prompt action and joint effort to deter such violators. All agencies will have local authority against such illegal dumping activities.

4. COMPLAINT RESPONSE

The County and some local agencies have established a stormwater telephone "hotline" that can be utilized by all citizens. Public complaints are generated through these "hotlines" and also through regular channels such as calls to Fire or Police agencies or to public works or legislative offices. Although responses to these complaints will vary depending on the nature of the complaint, action shall be taken.

Only Los Angeles County has established a complaint response procedure. Hotline complaints are being tracked and a follow-up letter to violators has also been implemented.

5. COORDINATION OF ALTERNATIVE DISPOSAL

Alternative disposal is one way of reducing non-stormwater materials that can potentially find their way into the storm drain system. Recycling programs are one of the most effective ways to reduce waste material. The recycling program can either be at the curbside or through drop-off centers. Household hazardous wastes can be dropped at mobile collection centers or at fixed sites. Co-permittees in the basin generally participate in the County's Household Hazardous Waste collection program. Effectiveness of those programs may be enhanced by a public outreach program that will inform the public of the locations and/or schedules for such events. Technical assistance or information may also be provided to businesses that want to develop a pollution prevention, waste minimization or alternative disposal program.

Alternative disposal programs are effective and within this watershed they are very popular. With the exception of Caltrans, to which the program is not applicable, all jurisdictions have implemented curbside recycling programs. They have also publicized the program to increase participation. The Countywide Household Hazardous Materials Round-up is also successful. Ventura County accepts hazardous materials twice per month at a permanent facility. All cities participate and actively promote the events. Caltrans, who does not participate in the Countywide program recycles its own materials including, used oil, anti-freeze, oil filters and aluminum.

VOL 15 0251

R0060472

6. REPORTING

Incidents involving a hazardous material entering the storm drain system are to be reported by the responsible party, or, if not known, the responding agency, to the California Regional Water Quality Control Board, Los Angeles Region (Regional Board). Complaints received through the County wide and local city hotlines will be tracked and reported to the Regional Board.

C. ENFORCEMENT PROCEDURES

Enforcement actions against discharges are done through either state hazardous and toxic materials statutes or through municipal ordinances that are already in the codes of the permittees. Industrial Waste Ordinances may be used in enforcement actions against illicit connections. Furthermore, anti-littering, health codes, plumbing codes and fire codes may be utilized for dumping or spill incidents. Enforcement actions can be taken by different municipal agents, including but not limited to, Industrial Waste Inspectors, Building or Plumbing Inspectors, Fire Department Inspectors, Park Rangers, Street Use Inspectors, Health Inspectors, Police Officers, Community Services Officers, Animal Control Officers, Code Enforcement Staff or Public Works Inspectors. Some of these agents are empowered to either issue citations, issue notices of violations, issue cease and desist orders, or even make arrests depending on the type of violation and the code provisions that they are enforcing. Some of these agents are also empowered to enforce not only municipal ordinances but also state laws. A review of the various enforcement tools used by the Permittees will be performed. A recommendation will result on a consistent enforcement approach for the watershed for consideration by all Permittees in their own enforcement programs. This recommendation will be developed by December 1995.

Four jurisdictions have ordinances within their Municipal Codes to prohibit illegal dumping/littering. In general these ordinances include penalties. Alternatively, one city relies on education programs to encourage the public not to litter, Caltrans posts No Littering signs with fines, and Westlake Village requires landscape contractors to pick up all green wastes. The cities rely on Code Enforcement officers, Health Department, Fire Department and Animal Control staff to enforce the regulations.

D. COORDINATION WITH STATE NON-STORMWATER PERMITS

In order to characterize the nature of the existing non-storm discharges in the receiving waters within the watershed, a list of NPDES Permits issued by the Regional Board will be obtained. This will help in determining unexpected discharge during dry weather and to allow enforcement actions to focus on illegal dumping activities.

VOL 15
0252
R0060473

There is also a need to coordinate with other environmental agencies to ensure that requirements imposed by these agencies do not conflict with stormwater regulations. Requirements of many agencies do complement stormwater regulations. These agencies, include but not limited to, Fish and Game, DTSC, USEPA, and the Coastal Commission. Coordination with these agencies will help minimize overlapping investigations and result in a more efficient use of resources. A watershed wide concept will be developed by December 1995.

1. **IDENTIFICATION OF PERMISSIBLE/PERMITTABLE DISCHARGES**

   A list of non-stormwater discharges that can be allowed to discharge into the Waters of the State will be established by the Regional Board.

2. **APPROPRIATE MANAGEMENT PRACTICES**

   Continued communication with the Regional Board will allow current information to be circulated among all agencies.

3. **REPORTING**

   Any conflict in requirements of other environmental programs/agencies must be reported immediately to the Regional Board for ruling as to which one should take precedence.

P:\ORV\WSHED2.MAL\II

VOL 15 0253

R0060474

III. INDUSTRIAL/COMMERCIAL SOURCES

Each Permittee shall develop and implement a program that focuses on the identification and control of storm water pollutant discharges from industrial/commercial facilities within their jurisdiction. This program shall provide for the inspection of a facility's compliance with storm water regulations, as well as general outreach for all facilities that are potential industrial and commercial dischargers.

Each Permittee is responsible, under the requirements of the Municipal Stormwater Permit, for all discharges from commercial and industrial facilities within its jurisdiction. Many industries are also required to be permitted under the State General Industrial Activities Stormwater Permit. Enforcement of the specific provisions of the State General Permit is the responsibility of the State.

A. IDENTIFICATION OF SOURCES

As required under the current Permit, the Permittees have produced a listing of industries by SIC category for each drainage area. Also a breakdown of major land use types was also performed for each drainage area.

A pollutant source identification program will be designed to identify significant pollutant sources (ie. parking lots, industrial activities, etc.), with the hope that remedial action can be undertaken to reduce any significant impacts so identified. It will focus on monitoring very small areas (ie., less than five acres) where a specific and/or interrelated set of pollutant generating activities are occurring. Its objective is to provide data for selecting BMPs for specific activities rather than characterizing discharges for long-term pollutant loading estimates.

Identification of pollutant sources can be done using a number of methods. Potential sources of storm water pollutants can be identified by records of chemical use and/or storage, by studies of specific activities which lead to the deposition of pollutants throughout the watershed, and by field inspection or monitoring. Watersheds which may contain significant pollutant sources can be identified through land use information or by mass load estimates.

By mid January 1995, the County will begin targeted monitoring of a municipal corporation yard in the Santa Monica Watershed. This will provide data on industrial activities which can take place at such a facility such as vehicle maintenance and repair, materials storage, equipment storage and repair. A more comprehensive program to identify various pollutant sources will be developed by December 1995.

VOL 15 0254

R0060475

1. CATEGORICAL LIST

Sources identified as a categorical industry regulated by the U.S. Environmental Protection Agency (EPA) will be grouped into a categorical listing of industries. The categorical list provides an organized overview of the target facilities that, based on land use, operation, and activities, could potentially contribute significant amounts of pollutants into storm water runoff. Some of the industrial categories regulated by the U.S. EPA include, but not limited to:

- Aluminum Forming
- Asbestos Manufacturing
- Battery Manufacturing
- Canned & Preserved Fruits & Vegetables
- Cement Processing
- Copper Forming
- Electroplating
- Glass Manufacturing
- Grain Mills
- Machinery Manufacturing & Rebuilding
- Soap & Detergent Manufacturing
- Metal Finishing
- Metal Molding & Casting
- Oil & Gas
- Organic Chemicals & Plastics & Synthetic fibers
- Paint Formulating
- Pesticides
- Plastic Molding & Forming
- Rubber Manufacturing
- Sugar Processing
- Textile Mills

2. RANKING

Industrial and commercial facilities identified as pollutant sources shall be ranked in order of priority for development of management measures. Facilities considered to be high priority are those whose operations and activities are determined to potentially contribute the most significant pollutant impacts to storm water discharge.

3. UPDATE PROCEDURE

Each year the Co-Permittees will evaluate the results of the monitoring program, the illicit discharge investigation program, and other available information , to identify likely sources of specific pollutants. The annual report to the California Regional Water Quality Control Board, Los Angeles Region (Regional Board) will recommend a strategy for pollutant source identification during the following year, including specific sites and/or activities to be monitored.

VOL 15
0255
R0060476

B. CONTROL MEASURES

Specific urban runoff control programs for major potential pollution sources shall be developed by March 1996. Within these programs storm water pollution control measures shall be developed for various pollutant sources. Control measures such as source control and treatment control offer different, but complimentary approaches to storm water pollution control.

Source control measures focus on good housekeeping practices, pollution prevention and minimization, and education. They are also less costly than treatment controls.

Treatment controls involve physical treatment of the runoff, usually through structural means. Also treatment controls will not remove all pollutants and their removal efficiency is difficult to predict given the limited understanding of the relationship between facility design criteria and performance.

The initial focus will be on the development of source control measures. As information is collected under the pollutant source identification program regarding specific pollutant sources, specific control measures, including structural, will be evaluated as to their effectiveness in addressing these sources.

1. POLLUTION PREVENTION MEASURES

Source minimization and education are the first steps in effective source control. Other activities that contribute to source control are:

- Site design alternatives (ie. roof over fueling stations and carwash slab, provide spill containment curb around stored material, etc.)
- Good housekeeping practices

2. STRUCTURAL (TREATMENT) MEASURES

A variety of treatment control measures have been utilized throughout the country for storm water quality. However, the effectiveness of these controls are highly dependent on local conditions such as climate, hydrology, soils, groundwater conditions, and extent of urbanization.

Some of the more common treatment controls are:

- Oil/water separators - Oil/water separators are designed to remove one specific group of contaminants: petroleum compounds and grease. However, separators will also remove floatable debris and settleable solids.

VOL 15 0256

R0060477

- Infiltration - A family of systems in which the majority of the runoff from small storms is infiltrated into the ground rather than discharged to a surface water body. Infiltration systems include: ponds, vaults, trenches, dry wells, porous pavement, and concrete grids.

- Wet ponds - A wet pond has a permanent water pool to treat incoming storm water.

- Constructed Wetlands - Constructed wetlands have a significant percentage of the facility covered by wetland vegetation.

- Biofilters - Biofilters are of two types: swale and strip. A swale is a vegetated channel that treats concentrated flow. A strip treats sheet flow and is placed parallel to the contributing surface.

- Extended Detention Basins - Extended detention basins are dry between storms. During a storm the basin fills. A bottom outlet releases the storm water slowly to provide time for sediments to settle.

- Media Filtration - Consists of a settling basin followed by a filter. The most common filter media is sand; some use peat/sand mixture.

- Multiple Systems - Multiple systems are a combination of two or more of the preceding controls in series.

C. OUTREACH

General outreach for all facilities that are potential industrial and commercial dischargers shall be set up area-wide by the Management Committee, to provide general guidance in complying with the storm water program by March 1996. It shall also serve as a reminder of pollution prevention measures and keep facilities informed of their obligations to the storm water program.

Subcommittees may be established to develop specific outreach materials for industrial and commercial categories and specific activities that are identified as high priority.

For additional information on outreach, refer to **Chapter VII Public Information and Participation.**

D. INSPECTIONS

Most municipalities have existing programs such as industrial waste, fire, and health in which industrial and commercial facilities are inspected on a regular basis. Each

VOL 15
0257
R0060478

Permittee may elect to have inspections for the storm water program incorporated into these existing inspection programs, or be done as a completely separate program, depending on the needs of the Permittee.

The purpose of these inspections is to ensure that facilities are in full compliance with the storm water regulations and to ensure that control measures are being implemented. The frequency of inspection of facilities will be prioritized based on the operation and categorization of the facility.

Inspectors consisting of public personnel will be trained adequately to recognize and handle problematic activities concerning storm water pollution that may be existing or potential; and inspect for the deterioration of the storm drain system and illegal/improper connections. Training programs will be developed through the Watershed Management Committee and possibly specific Permittees for use by all Permittees.

Procedures for the identification, investigation, enforcement, and prosecution to the full extent of a jurisdiction's legal authority will be developed.

Only one co-permittee in the watershed has not implemented some type of inspection program at this time. Los Angeles County issues permits to all commercial and industrial facilities which generate industrial wastes. Included within this program are auto related businesses, gas stations, and restaurants. Facilities with industrial waste permits are regularly inspected. In addition to those businesses in the unincorporated areas, the County Department of Public Works also provides industrial waste inspections, under contract, for two cities in the watershed. One city is planning to expand its non-storm water discharge inspection program to include an industrial waste program in 1995. In Ventura County, an illicit discharge control program has been initiated. Caltrans inspections include daily examination of its auto related facilities, lead testing of the gas stations once per year, quarterly pumping of clarifiers, and constant storm drain monitoring. A program to inspect underground storage tanks is part of a five year plan.

1. CHECKLIST

Inspectors shall have a uniform checklist to use as guidance and reference throughout an inspection. It may also serve as a general guide for the public, providing information about the requirements necessary to comply with the storm water regulations.

VOL 15
0258
R0060479

2. SCHEDULE

The inspection program shall be developed by March 1996. The frequency of inspections shall be scheduled according to the type of operation and the categorization of the facility. Revisit inspections shall be done on an as needed basis.

3. REPORTS

Inspectors shall report on all activities related to and/or violating the local storm water ordinance to the local governing agency. Standard reporting procedures will be developed.

4. FOLLOW-UP PROCEDURES

Individual Permittee review and assessment of the reports may result in the need for follow-up procedures, such as reinspection or legal action, provided the jurisdiction has the adequate legal authority to do so. Follow-up procedures will be developed to insure a uniform and consistent approach.

E. LOCAL INCENTIVE PROGRAMS

In developing the industrial/commercial program, the Permittees may consider the development of optional measures such as clean business incentive programs that may offer more focused control on industrial and commercial sources. Optional measures such as these may be developed by March 1996.

F. TRAINING

Development of training programs for industrial storm water inspection staff is projected to be completed by March 1996.

1. PUBLIC EMPLOYEES

All public employees shall be trained in the storm water regulations so that they abide by the regulations in the course of their work day. Also they need to be able to recognize and distinguish between legal and illegal activity so as to administer the proper protocol in handling the situation.

The Los Angeles County Department of Public Works has requested all employees to report any observed water quality problems. Caltrans employees have received education in hazardous substance spill awareness, pesticide safety and vegetation management.

VOL 15
0259
R0060480

2. INSPECTORS

Inspectors who visit industrial and commercial facilities shall be adequately trained to determine compliance with the storm water regulations and educate the facilities about the requirements of the program. In addition, they should be able to recognize and handle immediate problems as they are encountered, during an inspection; and inspect for the deterioration of the storm drain system and illegal/improper connections. Citation training will be necessary for inspectors in agencies that have the citation authority.

G. COORDINATION WITH STATE INDUSTRIAL STORM WATER PERMIT

The Permittees have existing local ordinances governing industrial discharges and other non-stormwater discharge that require compliance activities similar to those in various State Regulations. Because coordination between the Permittees and the Regional Board is anticipated concerning the regulations of industries, a mutual agreement may be required regarding industrial inspections and enforcement. Additional issues could also be addressed. Federal stormwater regulations hold local municipalities responsible for stormwater discharges from all industrial/commercial facilities, including those covered by General Permit.

1. MEMORANDUM OF UNDERSTANDING

A Memorandum of Understanding (MOU) may be used to formalize the agreement between municipalities and the Regional Board on industrial compliance program issues. A MOU among all local agencies may also be needed to ensure co-operation between all the agencies. The need for and specific requirements for such agreements would be developed upon completion of development of the industrial/commercial program by March 1996.

2. REPORTS

The MOU discussed above may include the exchange of information between the Permittees and the Regional Board. Appropriate formats for such reports would be developed as required.

VOL 15 0260

R0060481

IV. NEW DEVELOPMENT AND REDEVELOPMENT

Managing stormwater and runoff from both new construction and redevelopment, will reduce pollutants from entering the storm drain system and subsequently the receiving water.

A. PLANNING PROCESS

Quality of stormwater discussion should be included in the General Plan and the Zoning ordinances. Efforts to enhance the quality of storm water can filter into the Subdivision actions. Much of the storm water concerns can be channeled through the compliance effort of the California Environmental Quality Act (CEQA). A watershed wide concept will be developed by June 1996.

Two Permittees currently have programs addressing stormwater quality in the planning process. Caltrans has a contractor water pollution program which requires a plan for water pollution control during construction operations Caltrans' projects; and the City of Westlake Village through its Stormwater Quality Management Plan.

1. WATERSHED PROTECTION POLICIES

An integrated strategy will be developed for the watershed. Pollution control efforts should be prioritized. A variety of statutory and regulatory requirements could be used for this watershed oriented program. Watershed protection policies need to be adopted by the local jurisdictions which control land-use within the watershed.

2. COORDINATION WITH CEQA

The current CEQA "Environmental Checklist Form" that is used for initial studies assessment indirectly address potential impacts to stormwater. Additions could be made to the Form to directly assess stormwater quality impacts.

CEQA requires agencies to use feasible alternatives or mitigation measures to lessen potentially significant effects. The ability to identify a.) when an effect is significant, and b.) which mitigation measures could be adopted to reduce the effect, is critical to the CEQA process. A clear assessment of any development, its potential adverse impacts on stormwater quality will allow for a determination of "significance" which will enable the decision maker to make development decisions upon full disclosure of possible adverse impacts.

VOL 15 0261

R0060482

3. SITE PLANNING PROCESSES

All development will require the review and approval of a site/plot plan or development drawings prior to issuance of a building permit. Incorporating the consideration of potential water quality impacts including erosion and sedimentation during the early stages of the planning process will allow these issues to be addressed before substantial investments in engineering and design have been made.

4. GENERAL PLAN CHANGES

The General Plan is the legal backbone of the planning process. All development approvals, zoning ordinances, subdivision approvals and public works projects must be consistent with the policies, objectives, and principles set forth in the General Plan. Discussion of stormwater issues in the General Plan could greatly enhance the awareness of the issues and encourage full assessment of possible adverse impacts on stormwater quality as the result of new and redevelopment.

5. USE OF MASTER PLANS

For agencies which utilizes master plans to guide their development activities, stormwater issues can be outlined in such documents. This will channel efforts to fully assess the possible adverse impacts on stormwater quality as the results of any development within the master plan area.

6. OTHER POLICIES

Numerous other policies or mechanisms could be used to incorporate stormwater management goals into the planning/development process. Other concepts will be evaluated for their feasibility during the more detailed development of this Chapter.

7. PLANNING-PUBLIC WORKS INTERFACE

A variety of mechanisms for coordinating planning and public works activities exist. An example could be some form of CIP (capital improvements program). Ideally, any planning documents which target or project population growth are coordinated with CIP. Integrating stormwater management into CIP will allow for mitigation of major adverse impacts on the quality of stormwater prior to any actual construction.

VOL 15
02662
R0060483

8. IMPLEMENTATION PROCEDURES

Implementing policies to integrate stormwater management considerations with existing planning/development mechanisms will require a variety of approaches depending upon the existing conditions within each Co-Permittee and the particular remedies selected. It is anticipated that each Co-Permittee will propose procedures applicable to it's unique jurisdictional considerations at later stages in the permit process.

B. CONSTRUCTION SITES

Pollutants from construction activities can have a major impact on the quality of stormwater/urban runoff. A watershed wide concept to reduce such pollutants will be developed by December 1995.

1. EROSION CONTROL REQUIREMENTS

Federal stormwater regulations hold local municipalities responsible for stormwater discharges from all construction sites. In addition, construction sites involving a total of five acres or more of land disturbance are required to apply for the State General Construction Activity Storm Water Permit (GCASP). The GCASP: 1) eliminates or reduce to the extent feasible non-storm water discharges from construction sites and 2) permits stormwater discharges, but requires the use of controls to limit pollutant loading in site effluent. Preparation of a Stormwater Pollution Prevention Plan and identification/utilization of BMPs are the key components of this Permit.

Many local agencies also have erosion control requirements for any grading and construction activities. Regulation of pollutants from construction sites of five acres or less will be done by the local agency through its stormwater management plan.

Construction site erosion has the potential to introduce sediment into runoff. For example, fugitive dust control at construction sites typically use water. Minor modifications/clarification of existing fugitive dust practices could substantially address runoff pollution concerns. In addition to fugitive dust control practices, additional measures could be adopted to curtail dry weather runoff, and control pollutant laden storm water runoff. These measures may address 1) physical site design considerations and 2) temporal considerations such as seasonal timing and phasing of activities.

Five jurisdictions have adopted ordinances which provide for erosion control and slope stabilization. The City of Westlake Village has identified these components as part of an urban runoff control ordinance.

VOL 15
02663
R0060484

Los Angeles County's ordinance has been in effect since 1965. However, in 1992 these provisions were strengthened to include stiffer penalties for violations.

2. CHEMICAL AND WASTE MANAGEMENT REQUIREMENTS

Chemical and waste handling activities are also currently subject to a variety of regulations. BMPs to address this pollution source are largely centered around "good housekeeping practices". It involves storing, handling, using, and disposing of these potential pollutant sources in ways that restrict opportunities for unintended introduction of the materials into site runoff. Proper chemical and waste management will reduce any accidental discharge into the storm drain system.

3. INSPECTIONS

Inspections are a routine part of local jurisdictions oversight of regulated construction activity. Its purpose is to ensure that construction site runoff control measures are being implemented. Existing practices should be examined and modified accordingly to satisfactory stormwater/urban runoff objectives.

a. Checklist

A checklist would encourage possible streamlining of any requirements. It could be cumbersome if an overly rigid approach were taken which resulted in unnecessary administrative burden. However, careful design of the checklist could avoid this pitfall.

b. Schedule

Inspection schedules will depend upon existing practices. It may be desirable to have several schedules, depending upon the types of activities/permits and/or the timing of activities.

c. Reports

A standardized reporting format is needed to allow for consistency among all jurisdictions. Furthermore reports are also a useful tool for future refinement of pollution control regulations.

VOL 15
0264
R0060485

d. **Follow-up Procedures**

A format will be developed to do follow-up inspections on problem facilities. Its frequency will greatly depend on the land use and the degree of non-compliance of each facility.

C. LOCAL PERMITS

Permits are a form of "cross checking" by local agencies to ensure that regulations are being implemented. Prior to the issuance of a permit, information must be submitted for review and approved. A watershed wide concept to provide some consistency in local permits will be developed by June 1996.

1. COORDINATION WITH EXISTING PERMITS

Storm water issues should be incorporated into existing permits.

2. NEW PERMIT ISSUES

Storm water issues should be clearly stated in new permits to be issued for new and/or redevelopment activities.

D. TRAINING

Training will enable staff to keep current of the latest storm water regulations. A watershed wide staff training concept will be developed by June 1996.

1. PLANNING PERSONNEL

(See E.1.b. below)

2. PUBLIC WORKS PERSONNEL

(See E.1.b. below)

3. INSPECTORS

(See E.1.b. below)

E. CONTROL MEASURES

Best management practices for the control of construction related pollution can generally be divided into three categories:

VOL 15
0265
R0060486

Nonstructural Source Controls for Reducing Urban Stormwater Pollutants:

- Practices that reduce the generation and accumulation of potential stormwater contaminants at or near their source.

Development Layout Stormwater Controls:

- Practices that are directed at controlling the volume and discharge rate of runoff from urban areas, as well as, reduction of the magnitude of pollutants in discharges through temporary storage or flow restrictions.

Erosion and Sediment Controls:

- Practices that can prevent or treat problems related to transport of eroded material from construction and other land disturbing activities.

Development layout stormwater controls are of particular interest. These control measures can be incorporated in the initial planning phase of any project. A watershed wide concept will be developed by June 1996.

1. POLLUTION PREVENTION MEASURES

a. Site Design

Effective implementation of urban BMPs requires integration of water quality control elements early in the site planning and design process. Development of the water quality controls should not only achieve maximum pollutant removal with minimal costs, but also reduce potential maintenance.

This may include incorporating water quality concerns into the site layout and design (ie. maximize pervious areas, minimize directly connected impervious areas, etc.) and/or treatment control measures proven to be cost effective for local climate, soil, and development conditions.

Due to the diversity of climate and local conditions, the development of BMPs vary from location to location, and even jurisdiction to jurisdiction. The selected management practices should be designed for the local site conditions and especially seasonal rainfall conditions that are experienced in Southern California. Suitability for the major land use and drainage characteristics should also be fully assessed.

VOL 15
0266
R0060487

Nonstructural Source Controls for Reducing Urban Stormwater Pollutants:

- Practices that reduce the generation and accumulation of potential stormwater contaminants at or near their source.

Development Layout Stormwater Controls:

- Practices that are directed at controlling the volume and discharge rate of runoff from urban areas, as well as, reduction of the magnitude of pollutants in discharges through temporary storage or flow restrictions.

Erosion and Sediment Controls:

- Practices that can prevent or treat problems related to transport of eroded material from construction and other land disturbing activities.

Development layout stormwater controls are of particular interest. These control measures can be incorporated in the initial planning phase of any project. A watershed wide concept will be developed by June 1996.

1. POLLUTION PREVENTION MEASURES

a. Site Design

Effective implementation of urban BMPs requires integration of water quality control elements early in the site planning and design process. Development of the water quality controls should not only achieve maximum pollutant removal with minimal costs, but also reduce potential maintenance.

This may include incorporating water quality concerns into the site layout and design (ie. maximize pervious areas, minimize directly connected impervious areas, etc.) and/or treatment control measures proven to be cost effective for local climate, soil, and development conditions.

Due to the diversity of climate and local conditions, the development of BMPs vary from location to location, and even jurisdiction to jurisdiction. The selected management practices should be designed for the local site conditions and especially seasonal rainfall conditions that are experienced in Southern California. Suitability for the major land use and drainage characteristics should also be fully assessed.

VOL 15
02667
R0060488

b. **Education/Training**

Education/training is imperative to the success of any BMPs selected for new or redevelopment projects. BMPs will fail if not properly designed, installed, and maintained. Only well trained personnel should be assigned to these responsibilities.

A program for effective education/training should be based on four objectives:

- Promote a clear identification and understanding of the problem, including activities with the potential to pollute stormwater;
- Identify solutions (structural and nonstructural BMPs);
- Make every employee responsible for stormwater pollution and its solution; and
- Integrate employee feedback into training and BMP implementation to improve BMPs.

c. **Other**

In many cases stormwater pollution control may already be achieved by existing regulations or programs. In California, the General Plan Law and the California Environmental Quality Act (CEQA) provide a basis for municipalities to review and comment on all projects within their jurisdiction. Under the General Plan Law, municipalities are required to develop policies and regulations which guide development within the municipality. Each development project is then reviewed for conformance with these policies. Under CEQA, projects are also subject to review and comment for any adverse impact the projects may have on the environment, including impacts from stormwater discharges.

2. **POST CONSTRUCTION (TREATMENT) MEASURES**

a. **Applicability**

Each site considered for development or redevelopment will (at the conclusion of construction) have final improvements and unique site characteristics such as: drainage patterns; soils; landscaping; topography; percent of impervious surfaces; rainfall; pollutants inherent with the use of the development; and pollutants that may be background to the area (existing vegetation, air fallout, etc.). The applicability of various treatment control BMPs for use in new

VOL 15
02688
R0060489

development will be evaluated through the use of pilot studies and examination of studies done on treatment control measures by other agencies.

b. Effectiveness

Prior to implementing any treatment control measures, they will need to be evaluated for their effectiveness. This can be done through pilot studies which could include elements such as: pre and post storm event inspections; water quality monitoring; record keeping to document deficiencies in the BMPs; Operation and Maintenance requirements and cost effectiveness.

c. Retrofit Opportunities

The feasibility of retrofitting existing developments with treatment control measures will be evaluated. However, the effectiveness of a treatment control measure vs. its cost must be fully evaluated prior to considering its use as a retrofit measure.

3. OPERATION AND MAINTENANCE

a. Requirements

Jurisdictions within the watershed will need to insure that BMPs incorporated into a private development are properly maintained. Deed restrictions, covenants, conditions and restrictions (CC&R) could be used to direct such requirements and responsibilities.

b. Responsible Party

The contractor, during construction, must ensure that the post-construction BMPs are installed properly and that any maintenance that may be necessary during construction is performed. After the project is completed, it will then be the responsibility of the fee owner, private or public, to provide for long term operation and maintenance. This may be accomplished by deed restriction and/or CC&R.

4. CONFLICTS WITH OTHER MANDATES

Often regulations of various Federal, State, and local agencies would conflict with each other. Health, fire, and building codes often have requirements focusing on short term human health and safety and neglecting the impacts on the environment.

VOL 15
02569
R0060490

a. **Identification of Conflicts**

As the Plan is developed, other regulatory requirements that conflict with the stormwater program requirements may be uncovered. Clarification of these regulations should be directed to the various responsible regulatory agencies.

b. **Conflict Resolution**

For regulatory conflict caused by local regulations, efforts will be taken to resolve them within the agencies. Input form other local, state, and federal agencies should be incorporated into a modification of current standards. The Regional Board should resolve conflicts involving other State and/or Federal requirements.

F. OUTREACH

See Chapter VII Public Information and Participation.

G. ENFORCEMENT

See Chapter II Illicit Discharges, Section C Enforcement Procedures.

H. COORDINATION WITH STATE GENERAL CONSTRUCTION ACTIVITIES STORM WATER PERMIT

Compliance with the GCASP requirements is the responsibility of the developer/contractor, and enforcement is the responsibility of the SWRCB/Regional Board staff.

1. MEMORANDUM OF UNDERSTANDING

An agreement between the Regional Board and Co-Permittees may be used to enhance compliance of construction site BMPs. The need for such an agreement will be evaluated. If found to be desirable, an agreement will be developed by June 1996.

2. REPORTS

The local enforcement agency of the State Construction Stormwater Permit, which is the Regional Board, should forward all information, including Notices of Intent filed and any inspections and enforcement actions taken, to the

VOL 15
02710
R0060491

Permittees so that this information can be available to local municipal construction site inspectors to alert them of any specific concerns on the job site.

3. OTHER ISSUES

The Regional Board should explore funding to be channelled to the Co-Permittees so the Co-Permittee can be more actively involved with the State on the Permit.

P:\ORV\WSIIED2.MAL\IV

VOL 15 0271

R0060492

V. PUBLIC AGENCY ACTIVITIES

All municipalities perform functions that have an impact on stormwater quality. These include, among other things, vehicle maintenance, landscape maintenance, weed control, water body maintenance including swimming pool maintenance, etc. Other activities such as construction and maintenance of streets and roads, and construction and maintenance of the flood control system also could directly or indirectly cause adverse impact on the quality of stormwater/urban runoff. Since municipalities must address all significant sources of pollutants, all of these activities must be examined and mitigation measures be incorporated into the routines. As part of the requirements of the current Permit, many of the Permittees have already begun implementation of measures to address the above activities. An examination of these existing measures will be done on a watershed wide basis to establish the most effective approach to address these activities. Such approaches shall be developed and begin implementation by September 1996.

A. SEWAGE SYSTEMS

Sewage spills must not be allowed to enter the storm drain. Control procedures for identifying, repairing, and remediating sewer blockages, infiltration, inflow, and wet weather overflows from the sewers to the storm drain system should be implemented to protect stormwater quality. These procedures could include, but are not limited to, quick field response to overflows, follow-up testing, and complaint investigation.

When sewage spills do occur, they must be contained and collected for proper disposal. Individual permittees may need to modify their sewage overflow response procedures. The field personnel should also have procedural training for field screening, sampling, smoke/dye testing, and TV inspection, if appropriate, to be able to properly investigate any suspect connections or cross connections to the storm drain system.

Los Angeles County has a number of programs aimed at preventing sewage spills from entering the storm drain system. These include:

- Sewage Overflow Response Procedures Revision/Root Control Review. This involves improvement of procedures for containment and cleanup of spilled sewage resulting from overflow.
- Standby Maintenance Crew. This on-going program places a maintenance crew on stand by during heavy rainfall for Trancas and Malibu Sewage Treatment plants.
- Reline Sewer Lines. Two locations will undergo relining of existing sewer lines to prevent infiltration and exfiltration.

VOL 15
02712
R0060493

- Sewer Pipeline Reconstruction. 127 miles of cement pipelines will be analyzed and replaced or rehabilitated within 5 years.

- Sealing of Manhole Covers. This program has sealed manhole covers and bar holes in areas subject to flooding.

- Expansion of Emergency Call List. Beeper numbers of all supervisors, superintendents and standby crews were added to emergency call list.

B. CORPORATION YARDS

Corporation yards include any area or facility that is used for vehicle maintenance or washing, other maintenance, chemical storage, paint facilities, and supportive activities for field crews. Permittees will need to incorporate pollutant control measures at these facilities and develop a plan for each facility outlining the measures to be implemented. Since these are industrial type activities, the corporate yards would need to implement measures as described in the Industrial/commercial Source Chapter.

1. STORM WATER POLLUTION PREVENTION PLANS (SWPPP)

Though not required, permittees may elect to use some form of SWPPP as a vehicle for compliance. Any BMPs to be implemented must be part of a comprehensive plan designed to address the various pollutant sources at each corporate yard. To achieve this goal, the municipalities should first identify the potential pollution sources and who is responsible for implementing the storm water management measures. Based on the facility type, management practices and schedule of implementation will be developed. BMPs that can be used to improve the quality of runoff include, but are not limited to, housekeeping practices, material storage control, vehicle leak and spill control, and illegal dumping control.

2. OUTDOOR LOADING/UNLOADING OF MATERIALS

Municipal employees who handle potentially harmful materials should be trained in good housekeeping practices to prevent or reduce the discharge of pollutants to storm water from outdoor loading/unloading of materials. Materials spilled, leaked or lost during loading/unloading may collect in the soil or on other surfaces and be carried away by runoff or when the area is cleaned.

Applicable BMPs should be selected based on the following four factors: 1) Extent of exposure of material to rainfall, 2) preventing stormwater run-on, 3) checking equipment regularly for leaks, and 4) containing spills during transfer operations.

VOL 15
0273
R0060494

3. MATERIAL STORAGE CONTROL

A program should be developed to prevent or reduce the discharge of pollutants to storm water from outdoor container storage areas using measures such as installing safeguard again accidental releases, secondary containment, conducting regular inspections, and training employees in standard operating procedures and spill cleanup techniques. Employee education is paramount for successful implementation. Employees should be trained in emergency spill cleanup procedures.

To limit the possibility of storm water pollution, containers used to store dangerous waste or other liquids should be kept inside the building unless this is impractical due to site constraints. Storage of reactive, ignitible, or flammable liquids must comply with the fire and California OSHA codes. Practices such as placing containers in a designated area should be employed to enhance such requirements.

4. VEHICLE AND EQUIPMENT WASHING AND MAINTENANCE

Washing vehicles and equipment outdoors or in areas where wash water flows onto the ground can pollute storm water. For municipalities that wash vehicles or pieces of equipment on-site, it should be performed in a designated area equipped with an oil/water separator.

Vehicle or equipment maintenance is a potentially significant source of storm water pollution. Parts are cleaned with solvents. Many of these cleaners are harmful and must be disposed of as a hazardous waste. Appropriate BMPs are waste reduction, use of alternate products, recycling, and spill leak clean up control.

5. WASTE HANDLING AND DISPOSAL

Proper waste management is possible by tracking waste generation, storage, and disposal; reducing waste generation and disposal through source reduction; and preventing run-on and runoff from waste management areas.

C. PARKS AND RECREATION

Park Departments manage landscaping and swimming pools. Both of these activities involve the use of chemicals, waste management, and non-storm water discharges. In addition maintenance of swimming pools requires the periodic discharge of large quantities of swimming pool water.

VOL 15
0274
R0060495

1. FERTILIZERS/PESTICIDES

a. Use/Application management

Municipal facilities should develop controls on the application of pesticides, herbicides, and fertilizers. Control may include:

- List of approved pesticides and selected use;
- Product and application information for users;
- Equipment use and maintenance procedures; and
- Record keeping.

Employees can be educated about environmentally sensitive alternative products by using information developed by various public agencies and other environmental organizations.

b. Storage

Improper storage of fertilizers and pesticides can lead to potential groundwater, soil, and stormwater contamination. To prevent or reduce their impact on stormwater pollution, material storage areas must be designed and maintained to reduce exposure to storm water. The following BMPs can help to achieve this goal:

- Store materials inside or under cover on paved surfaces,
- Use secondary containment,
- Minimize storage and handling of hazardous materials,
- Inspect storage areas regularly.

2. FACILITY MANAGEMENT

a. Wash Waters

Wash waters cannot be discharged into the storm drains untreated. The storage area should be slightly sloped for wash water collection. If the water is not discharged to the sanitary or process waste sewer, or to a dead-end sump, the outlet should be equipped with an oil/water separator or other treatment systems.

b. Maintenance

Landscape maintenance involves the use of pesticides and fertilizers. Proper use of these materials will reduce the risk of loss to storm water. Whenever possible, leave or plant native vegetation to reduce

VOL 15
0275
R0060496

water, fertilizer, and pesticide needs. Integrated pest management should be employed where appropriate. The Park Departments should also establish a schedule for irrigation and fertilization. The chemicals will be carried from the site by the next storm if they are applied during the wet season. Overwatering leads to discharge of water that may have become contaminated with nutrients and pesticides.

Storm water from parking lots may contain undesirable concentrations of oil, grease, suspended particulates, and metals, as well as the petroleum byproducts of engine combustion. Possible maintenance BMPs include periodic sweeping and cleaning catch basins.

c. Swimming Pool Waters

The drainage of swimming pool water must insure that chlorine residual is below allowable water quality limits. The potential for recycle/reuse for irrigation of lawns and landscapes may be investigated. Swimming pool filter backwash waters should not be discharged to the storm drain, but should be allowed to settle and then disposed to the sanitary sewer. Other possible alternative measures would be to use the backwash for irrigation or disposal on a dirt area.

D. STORM DRAIN SYSTEM OPERATION AND MANAGEMENT

The maintenance and operation of the storm drain system has an impact on storm water quality and must be addressed. Material clogging storm drains cannot be discharged into drains. It must be disposed of properly.

1. INLET MAINTENANCE

Regular maintenance of public and private catch basins and inlets is necessary to ensure their proper function. Maintenance will remove pollutants, reduce high pollutant concentrations during the first flush of storms, prevent clogging of the downstream conveyance system, and restore the catch basin's functional capacity. Keys to effective catch basin cleaning include the following:

- All basins should be cleaned annually prior to the onset of the rainy season;
- Clean catch basins in known problem areas more frequently to remove sediments and debris accumulated during the dry weather months;
- Keep records of the number of catch basins cleaned; and
- Track the amount of waste collected.

VOL 15
0276
R0060497

Caltrans will develop a priority list of drains and pump houses requiring cleaning.

Five jurisdictions within this watershed perform catch basin cleaning annually. The City of Malibu and Ventura County inspect catch basins and subsequently clean them as needed.

2. DRAIN MAINTENANCE

Open channel storm drains should be cleaned at least annually prior to the rainy season. Problem areas should be cleaned more frequently as needed. Channels should also be monitored during the rainy season for any debris buildup and cleaned where needed.

To reduce the amount of debris entering the ocean, Los Angeles County field personnel inspect open channels and sumps after storms and clean up any debris.

3. WASTE MANAGEMENT

Excessive waste buildup will decrease the capacity of the channel, it is therefore crucial to reduce pollutant levels in storm water by regularly removing illegally-dumped items and material from storm drainage channels and creeks. A program should be developed to identify problem areas of illegal dumping so regular inspection and clean up can maintain the channel's optimum capacity and prevent the discharge of contaminants.

4. NEW SYSTEM DESIGNS

Current design standards for the construction of new storm drain systems will be evaluated in light of currently available pollutant control measures. Design standards may be modified to incorporate measures deemed appropriate for local conditions.

5. RETRO-FIT OPPORTUNITIES

The majority of the existing storm drain systems are in highly urbanized areas providing little opportunity for cost effective retro-fitting. However, currently available pollutant control measures will be reviewed for their effectiveness and possible use. This may include pilot studies to evaluate the performance of management practices under local conditions.

VOL 15 0277

R0060498

E. STREETS AND ROADS

Construction, operation, and maintenance of roads has an impact on storm water quality and will be addressed in the management plan.

1. SWEEPING

Street sweeping can collect refuse on street surfaces to prevent it from entering the storm drain system through catch basins.

a. Storm Water Quality Based Operation

In order to effectively implement the sweeping program, the permittees should keep accurate operation logs to track the program. Areas generating excessive refuse should be swept more frequently. Sweeping frequency may also be increased before the rainy season to reduce the amount of refuse entering the storm drain system. Parking on sweeping days should be regulated to facilitate the operation.

Three jurisdictions sweep roadways on a weekly basis while two perform this service bi-weekly. Ventura County's residential street sweeping is done every other week while Caltrans sweeps its roadways on a regular schedule determined by observable debris.

b. Waste Management

Two jurisdictions collect rubbish from roadside trash receptacles on a weekly schedule, while the City of Malibu and Ventura County do not provide any trash receptacles. The City of Agoura Hills' six trash receptacles are emptied three times a week while Westlake Village provides receptacles within City parks with a daily pick up schedule. Caltrans empties trash receptacles on an as needed basis.

2. STREET/PAVEMENT WASHING

Wash waters from street/pavement washing are contaminated and must be managed as non-storm water discharges.

3. MAINTENANCE

a. Saw-cut Slurry Management and Paving Practices

Existing saw-cut management and paving practices conducted by the permittees will be evaluated and appropriate control measures

VOL 15 02178

R0060499

developed. Possible control measures to be considered that would help reduce the impacts to storm water:

- Avoid paving during wet weather;
- Regularly repair potholes and worn pavement to reduce sediment loading;
- Store materials away from drainage courses to prevent pollution of storm water run-on; and
- Follow the storm water permitting requirements for industrial activities when mixing concrete with an on-site plant.

b. Waste Management

Vehicles transporting waste should have spill prevention equipment that can prevent spills during transport. The refuse collected will be transported to the appropriate disposal facilities.

Good housekeeping practices will be implemented to insure proper management of any waste products that may be generated during maintenance activities. For example, to prevent concrete waste from entering the storm drain system, washout of concrete trucks should be conducted off-site or on-site in designated area. Excess concrete should not be dumped on site. Employees and subcontractors should be trained in proper concrete waste management.

The following steps will help reduce storm water pollution from concrete wastes:

- Store dry and wet materials under cover, away from drainage areas;
- Avoid mixing excess amounts of fresh concrete or cement on-site;
- Do not wash out concrete trucks into storm drains, open ditches, streets, or streams;
- Do not allow excess concrete to be dumped on-site, except in designated areas;
- Avoid paving during wet weather;
- Regularly repair potholes and worn pavement to reduce sediment loading; and
- Cover catch basins and manholes when applying seal coat, tack coat, slurry seal, fog seal, etc.

VOL 15 0279

R0060500

Employee/subcontractor training to insure implementation of good housekeeping measures should be based on four objectives:

- Promote a clear identification and understanding of the problem, including activities with the potential to pollute storm water;
- Identify solutions (BMPs selection);
- Promote employee/subcontractor ownership of the problems and the solutions; and
- Integrate employee/subcontractor feedback into training and BMP implementation.

c. Medians/Landscaped Right-of-Way

i. Irrigation

Overwatering of landscaping produces runoff. A properly timed irrigation schedule should be set up to minimize overwatering. Drip irrigation system should be used when feasible in new installations.

ii. Fertilizers/Pesticides

The handling, storage, and usage of fertilizers/pesticides are addressed in Chapter V, Section C-1.

Caltrans has an existing Right-of-Way Maintenance Vegetation Control Program which provides Benefits for motorist' safety and erosion control.

F. FLOOD CONTROL

Common municipal practices, such as construction and operation and maintenance of the flood control system, may have a potentially adverse impact on storm water quality. Consequently, these practices shall be coordinated to the extent of preventing pollutants from impacting the water quality.

1. COORDINATION WITH NEW PROJECTS

Current design standards for the construction of new storm drain systems will be evaluated in light of currently available pollutant control measures. Design standards may be modified to incorporate measures deemed appropriate for local conditions. During construction, all appropriate BMPs will be utilized to control pollutants during the construction of the facility.

VOL 15
02800
R0060501

2. COORDINATION OF MAINTENANCE ACTIVITIES

Current maintenance activities with regards to desilting/sediment removal, vegetation management, and waste management shall be reviewed to insure that appropriate management measures are developed to comply with the storm water regulations.

3. OPERATION OF FACILITIES

Flood control facility operations will be reviewed to identify where appropriate management measures could be incorporated. However, primary consideration will need to be given to the flood control function of the facility to protect health and safety.

4. RETROFIT OPPORTUNITIES

The majority of the existing storm drain systems are in highly urbanized areas providing little opportunity for cost effective retro-fitting. However, currently available pollutant control measures will be reviewed for their effectiveness and possible use. This may include pilot studies to evaluate the performance of management practices under local conditions.

The City of Westlake Village working with L. A. County Flood Control Maintenance division constructed an oil boom across Lindero flood control channel. By measuring the quantity of materials removed the City can gauge the magnitude of urban runoff pollution.

G. PUBLIC FACILITIES

Storm water runoff and non-storm water discharges from other public facilities must also be addressed, including chemical use by these facilities, pressure blasting/cleaning sidewalks and other surfaces.

1. PARKING FACILITIES

Storm water from parking lots may contain undesirable concentrations of oil, grease, suspended particulates, and metals. Some control measures such as periodic sweeping and cleaning catch basins should be implemented. The need for more advanced structural controls would be evaluated through the pollutant source identification program. Pilot studies would be conducted on candidate structural controls to evaluate their effectiveness prior to large scale implementation.

VOL 15
0281
R0060502

2. GOLF COURSES

Golf courses require the use of large amount of water, fertilizers, and pesticides. Field personnel should be trained on the proper handling, storage, and usage of these chemicals (Refer to Chapter V, Section C-1 for detail). To prevent excess irrigation water from entering the storm drain system, proper management of watering schedules should be required.

3. SCHOOLS

The maintenance of playgrounds and athletic fields at schools require fertilizers and pesticides. Their safe storage and use affect not only the stormwater quality but also the health of the students and the staff. Therefore, BMPs under Chapter V, Section C-1-b should be implemented. Each municipality should develop a program to encourage these schools to use environmentally sensitive products for fertilizers, pesticides, detergents, and other chemicals. The schools should have proper material handling, storage, and disposal procedures for chemicals used in school laboratories.

4. HOSPITALS

Each hospital should have BMPs to control the handling and storage of medically related hazardous materials. All materials should be inventoried regularly, with record keeping protocols on supply and consumption. All personnel should be trained on the proper procedures on handling these materials, as well as emergency response. Each hospital should maintain a list of supervisors to be contacted if accident does occur. Disposal of these materials should be contracted out to commercial specialists.

5. PARKS/LANDSCAPES

Refer to **Section C Parks and Recreation**, of this Chapter, for information.

6. OTHER BUILDINGS/PLAZAS

Refer to **Section C-2 Parks and Recreation - Facility Management**, of this Chapter, for information.

H. PONDS, FOUNTAINS, AND OTHER PUBLIC WATER BODIES

Maintenance practices used on public water bodies, including waste management and non-stormwater discharges, must be addressed in the plan.

VOL 15
02882
R0060503

1. ALGAE CONTROL

a. Use of Chemicals

The use of herbicides or other chemicals to control algae growth should be carefully controlled and monitored to insure strict adherence to manufacturers' guidelines for use. Water sampling may be necessary to insure effective control.

2. CHLORINE MANAGEMENT

The use of chlorine for disinfection should be controlled. High dosage of chlorine may be harmful to the aquatic habitats. Dechlorination of pools and other water bodies would be required prior to draining.

3. MAINTENANCE

Each municipality should develop BMPs to prevent and control trash, debris, and other pollutants from entering water bodies. These measures could include routine trash collection along and on water bodies, public outreach to educate the public about the impacts of illegal dumping, and increase enforcement for violations.

P:\ORV\WSHED2.MAL\V

VOL 15

0283

R0060504

VI. RESIDENTIAL

INTRODUCTION

Residential activities including private vehicle washing and maintenance; use of chemicals such as pesticides, herbicides, and paints; private swimming pool maintenance; and other household and landscape maintenance can contribute to storm water pollution. These are all examples of non-point source pollution, a significant impact on water quality. Measures that can be taken to improve the quality of the runoff from residential area all require active public participation. Feasible BMPS to mitigate the stormwater pollution problem should include practicing good housekeeping and the use of environmentally sensitive alternative products, vehicle leak and spill control, and water conservation. Development of the residential stormwater program will be completed by December 1995.

A. HOUSEKEEPING PRACTICES

This BMP involves the development of a program to promote efficient and safe housekeeping practices (storage, use, and cleanup) when handling materials which may pollute stormwater/urban runoff. This could include, but are not limited to, fertilizers, pesticides, cleaning solutions, paint products, automotive products, and swimming pool chemicals.

A public education program will be developed to provide information on stormwater pollution and the beneficial effects of proper disposal on water quality; reading product labels; safe storage, handling, and disposal of hazardous products; list of local agencies; and emergency phone numbers. The above information can be disseminated through brochures or booklets made available at places such as public information fairs, municipal offices, and household hazardous waste collection events and facilities. City newsletter to residents is another means to inform the public, especially for those who do not participate or visit any offices or events.

B. ENVIRONMENTALLY SENSITIVE ALTERNATIVE PRODUCTS

This BMP, promoting the use of less environmentally sensitive products, can be implemented in conjunction with housekeeping practices. Alternatives exist for most product classes including fertilizers, pesticides, cleaning solutions, and automotive and paint products. The key to success will be to promote a willingness to try alternatives and to modify old habits.

General information will be developed and made available to the public on such alternatives. The emphasis may be placed on the need to preserve the natural environment of the receiving waters (ocean, bay, stream, wetland, etc.) with the use of alternative products because of their less toxic nature and proper disposal after its use.

VOL 15
0284
R0060505

C. VEHICLE LEAK AND SPILL CONTROL

This BMP prevents or reduces the discharge of pollutants to storm water/urban runoff from vehicle leaks and spills by reducing the chance for spills, stopping the source of spills, containing and cleaning up spills, and properly disposing of spill materials.

Vehicles will leak and spill fluids. The key to successful pollution management is to reduce the frequency and severity of leaks and spills; and when they do occur, to prevent or reduce the environmental impacts. Through education, the public should be encouraged to regularly inspect and maintain their vehicles. Guidelines should be developed to inform the public on spill containment and cleanup procedures such as having absorbent material on hand and disposing the material properly.

D. WATER CONSERVATION

Water is a scarce resource, especially so in Southern California. Wasteful use of water could channel pollutants into the receiving waters. Practices such as hosing the driveway and overwatering the landscape contribute not only to stormwater pollution, but also to the depletion of our natural resource. In order to prevent stormwater pollution, the public has to be educated on the mechanics of our storm drain system - discharges into the system will flow untreated into the receiving water. They have to know that the lawn clippings they wash down the road will end up in the ocean. Public awareness of the function of the storm drain system, of the important of environmental health, and of our necessity to slow down the depletion of water resources will be a long way in reducing the pollution of stormwater/urban runoff.

Ordinances could be use to endow the related officials with legal authority to enforce water conservation. An ordinance prohibiting the wasting of water is one way of enforcement.

In addition to the specific programs and plans outlined in this report, several watershed Co-Permittees have targeted activities occurring in and around the home that tend to contribute to degradation of storm water runoff quality. A practice that carries on-the-ground pollutants directly to storm drains is misuse of exterior water, namely the overwatering of landscaping, the hosing of driveways/sidewalks and the washing of cars in driveways--all of which allow water to run down the street into the nearest storm drain.

This situation can be addressed in two ways: 1) either reduce/prevent pollutants from being placed in areas where they may be carried by water into the streets or 2) minimize the amount of water allowed to flow on impervious surfaces that are connected to the street system.

VOL 15
0285
R0060506

Water conservation measures can be designed to address the issue of impervious surface water flow. While conservation has historically been used to conserve domestic water, many jurisdictions are now recognizing the additional benefit of prohibiting water flows from private properties onto the street system. All co-permittees within this watershed implement water conservation programs. Public outreach is a component of all programs, many of which carry fines for water wasting practices. Most jurisdictions encourage water efficient landscape. While some ordinances were established specifically to conserve water during periods of drought, several jurisdictions are keeping such controls in place at all times as measures to control pollution runoff.

Domestic water for much of this area is supplied by the Las Virgenes Municipal Water District. That agency promotes water conservation by providing a free exterior audit and review of sprinkler heads/systems and a free self-guided tour showing low-flow irrigation systems that can be installed at home.

Other residential programs that reduce pollution include Agoura Hills' actions encouraging property owners to fence their property to reduce the possibility of future dumping. Malibu has developed erosion control measures; the mountainous areas are particularly vulnerable to runoff during heavy rains.

P:\ORV\WSIIED2.MAL\VI

VOL 15
0286
R0060507

VII. PUBLIC INFORMATION AND PARTICIPATION

It is necessary to involve the public in the stormwater program for it to be effective. The outreach program should be focused on the specific needs of the individual cities. Due to the inter-relationship among the stormwater issues, the public information and participation program should be recognized as a whole, rather than a number of separate outreach programs. All public awareness efforts should clarify to the public that they are the ultimate beneficiaries of a successful stormwater management program.

A. GENERAL OUTREACH

The targeted audiences of a general outreach will include municipal employees, local construction contractors, businesses in the area, and the general public. They should be made aware of their responsibility for both the problems and the solutions to stormwater pollution. In order to effectively communicate the stormwater pollution abatement message throughout the watershed; written, audio, and visual materials should be utilized. The actual level, priority, and schedule of public information activities must be based on the community's needs and resources to maximize program effectiveness. A watershed-wide concept will be developed by December, 1995.

All Co-Permittees within the watershed acknowledge the value of public outreach. Extensive efforts have been made or are planned by every agency to supply the public with information on a full range of storm water quality activities with the intention of achieving a high level of public cooperation and participation. The cities within this watershed are particularly aggressive in promoting multi-jurisdictional programs, citing both greater effectiveness and cost savings as benefits. Westlake Village initiated a regional public education program in cooperation with Agoura Hills, Westlake Village, Thousand Oaks, Hidden Hills and Calabasas. Advantages include a uniform approach and cost savings by the elimination of redundant programs.

1. WRITTEN MATERIAL

Co-Permittees should produce a variety of written materials to inform the residents within the watershed. Materials can include, but are not limited to, the following: flyers, brochures, door-hangers, newspaper articles, mail-inserts, banners, and posters. When necessary, these materials should be translated into a variety of foreign languages to reach minority residents in the community.

Print media outreach programs have been used extensively throughout the watershed, particularly by Westlake Village, Agoura Hills, Malibu, Caltrans,

VOL 15
0287
R0060508

and Ventura and Los Angeles Counties. City newsletters in Agoura Hills, Malibu and Westlake Village mailed to all residents have included articles promoting various storm water programs. Utility bill inserts are also used extensively to promote public awareness. Billboard and bus stop shelter advertising are among the programs used by Los Angeles County. Door hangers and refrigerator magnets are distributed by Malibu, Westlake Village and Los Angeles County. The County will soon have a program mascot, Chilly Willy, to be used at public events.

2. AUDIO MATERIAL

Similarly, Co-Permittees may utilize audio materials to convey information regarding stormwater management. Examples of audio materials include radio advertisements/public service announcements and informational cassettes.

When calling the City of Calabasas, a caller placed on "hold" hears public service announcements that promote various City programs, including those that affect storm water quality.

3. VISUAL MATERIAL

Catch basin stenciling program is an excellent means of educating the public on the mechanics of the storm drain system. The intent of the program is to enhance public awareness of the impact of stormwater pollution on receiving waters and to discourage improper waste disposal practices. Another effective medium for communicating the importance of stormwater management is through television. Possible measures include producing a public service announcement, cable access programs, and/or an informational video.

The most universal of the general outreach programs--catch basin stenciling--is receiving full cooperation throughout the watershed. Extensive stenciling has already been done by all watershed jurisdictions, with some having completed the task. Westlake Village and Ventura County have used custom stencils; the others have used the stencil designed by Heal the Bay and City of Los Angeles.

Among broadcast media outreach, five cities--Westlake Village, Hidden Hills, Agoura Hills, Calabasas and Thousand Oaks--jointly sponsor cable TV public service announcements. Los Angeles County uses both television and radio outreach.

VOL 15
0288
R0060509

4. DISTRIBUTION PLAN

General outreach efforts must be conducted throughout the entire watershed. Materials should be available at all public counters and distributed at public events such as environmental fairs and contests. A city newsletter is another effective method of conveying the pollution abatement message.

B. FOCUSED OUTREACH

Efforts should be made to target special groups. Focus could be on specific pollutants, practices and/or activities, or businesses. A watershed-wide concept will be developed by June 1996.

1. POLLUTANT SPECIFIC

For a particular watershed, there may be priority pollutants which are of more concern than others. The reduction of these pollutants may be addressed in a more focused public education and outreach program. Any of the methods used in the general outreach program may be utilized in a pollutant specific outreach program.

2. PRACTICE/ACTIVITY SPECIFIC

Everyone who lives or works in a particular watershed must realize that their actions have a direct affect on the quality of stormwater. These special groups must be made aware that their current practices/activities may be contributing to stormwater pollution. Practice/activity specific outreach programs should be developed and implemented throughout the watershed. The use of written, audio, or visual materials should convey three primary messages: (1) what activities can cause stormwater pollution, (2) how Best Management Practices are used to prevent pollution, and (3) how one can report occurrences of stormwater polluting activities.

Practice/activity specific outreach should promote, publicize, and facilitate public reporting of illegal dumping, illicit discharges, or water quality impacts associated with discharges from municipal separate storm sewers. An effective program should include the establishment, operation, and promotion of a reporting hotline. Timely reporting by the public of improper disposal and illicit discharges are critical in controlling such sources of stormwater pollution. Increase in public involvement may be achieved by sending a follow-up letter to callers or providing callers with some type of reward. Educational efforts throughout the watershed should inform the public about the existence of the Los Angeles County-wide hotline and any other local

VOL 15
0289
R0060510

hotlines; provide them with information regarding what to look for, and guidelines/procedures on how to report incidents.

Another critical component of practice/activity outreach is the development of a program to facilitate the proper management and disposal of used oil and toxic materials. An effective program could include, but are not limited to, the operation of recycling facilities and the conduction of household hazardous waste round-ups. The program could also include information about alternatives to toxic materials. Educational efforts throughout the watershed should provide the public with detailed information regarding the Los Angeles County-wide Household Hazardous Waste Round-ups and any other local programs.

The varied sources/causes of storm water pollution have resulted in implementation activities that target specific types of pollutants, activities and land uses/types of businesses. Within this watershed co-permittees take part in public information and participation programs specifically aimed at preventing improper disposal of hazardous household products and encouraging actions that keep general wastes out of the storm drain system--such as recycling programs, public trash receptacles and the cleaning of sidewalks, alleys and vacant lots. Illegal dumping and discharges are also specific targets.

Such activities are encouraged through general outreach programs (discussed above) that promote such programs as toll-free phone hotlines for reporting illegal polluting activities, topic-specific brochures, speakers bureaus, special recycling facilities (used motor oil, hazardous products, etc.) Westlake Village promotes their recycling program through homeowners associations. Malibu's focused outreach includes promotion of their Gutter Patrol program. Ventura County is modifying its "Resource Efficient Yard Care" brochure to include specific storm water runoff information; this material can be used in conjunction with their yard waste composting workshops. Los Angeles County has a wide range of focused programs that can be tailored for special exhibits and interest groups, including elementary schools. Calabasas has an Earthday recycling art contest; the City also has a recycling hotline with recorded information. Agoura Hills has produced a series of seven pamphlets that outline good housekeeping practices for the construction trades.

3. BUSINESS SPECIFIC

Due to the fact that some business operation have a higher potential of discharging pollutants into the storm drain system, a more focused public education and outreach program should be developed for them. Employees of these businesses should be educated on the issue of nonpoint source

VOL 15
0290
R0060511

pollution and the effectiveness of Best Management Practices in reducing pollution. Besides written, audio, or visual materials that focus on specific businesses and their practices, mass mailings or articles in a trade/industry magazines are other possible means of focused outreach.

C. EDUCATION PROGRAMS

Increasing awareness is the major goal of the Public Information and Participation Program. An ideal means of accomplishing this task is through educational programs. Programs should be developed for a variety of audiences, including public employees and school children. Educational programs can also be an important part of a general or focused outreach. A watershed-wide concept will be developed by June 1996.

1. PUBLIC EMPLOYEES

It is important to educate all of the public employees about the stormwater program so that they do not continue with any practices that are counter productive. Furthermore, they can participate in the implementation and enforcement of the program. Ideas and suggestions of employees can be used to modify the program for improved effectiveness. The outreach must involve employees on many different levels - from program managers to field personnel. Educational programs for public employees may include, but are not limited to, articles in City newsletters, training classes, checklists for field personnel, and interdepartmental forum or committee. Any of the materials utilized in an outreach program - written, audio, or visual materials - may be used in a public employee educational program.

Both general and focused outreach are essentially programs of public education. More formal training/education is also conducted by Caltrans and the County of Los Angeles. Caltrans personnel is educated on highway maintenance--specifically on such subjects as Hazardous Substance Spill Awareness and Pesticide Safety and Vegetation Management. County personnel meet regularly to discuss development of and evaluate storm water quality practices. Malibu is developing a staff education program, specifically focusing on construction site operations. Ventura County has a hands-on watershed model for use in public presentations. That county also conducts a joint teacher workshop on water conservation and storm water pollution prevention.

VOL 15
0291
R0060512

2. K-12

School children can play an important role in a public information and participation program. First, children are generally more easily motivated and the behavior changes made at that point in life tend to stay with them through adulthood. Secondly, school children can convey the stormwater pollution prevention messages to the members in their family. School programs must include information on the storm drain system, stormwater quality awareness, and may also include, but are not limited to, illegal dumping awareness, source minimization, and pollution prevention. Written material, videos, assembly programs, and field trips are examples of effective components of a K-12 educational program.

3. OTHER

Educational programs can also be developed for professionals and technicians who are not public employees. Agencies should include public outreach material for business license renewal or outreach effort through professional and business associations.

D. CITIZENS PARTICIPATION

The residents of the watershed should not only be made aware of the stormwater program, they should be encouraged to participate in its implementation. Specific outreach programs should be developed to allow the public to participate and to inform them of available means for providing ideas and comments regarding the stormwater program. A watershed-wide concept will be developed by June 1996.

Residents can assist public agencies in the development and implementation of storm water quality programs. Several watershed jurisdictions have enlisted the assistance of neighborhood volunteers in the catch basin stenciling program. Caltrans' Adopt-A-Highway program relies on voluntary private participation to help with clean-up activities. Hotline programs also enlist the assistance of residents in active participation.

1. VOLUNTEER MONITORING

Volunteer monitoring is the result of increased public awareness and participation. The public can utilize the hotline for reporting suspected illegal practices. Such involvement, which is similar to the Neighborhood Watch Program on crime, usually has good results.

VOL 15
0292
R0060513

2. COOPERATIVE OUTREACH

In order to promote public participation, cooperative outreach programs should be developed. These cooperative programs should help to create an awareness and an identification with the watershed. The catch basin stenciling and other signing programs are excellent examples of this type of cooperative effort. One possibility for cooperative outreach is an "Adopt-A-" program. Residents can "adopt" a highway, storm drain, catch basin, stream, etc. Other cooperative outreach efforts include events such as "Stormwater Pollution Awareness Week." The purpose of any of these activities is to inform and involve the local residents in regards to the stormwater management program.

3. COMPLAINT PROCEDURES

Public comments/complaints are important to the success of a stormwater program. A hotline is an excellent mechanism for allowing the public to provide information. In Section B, "Focused Outreach - Practice/Activity", the various aspect of outreach effort is discussed.

E. EFFECTIVENESS EVALUATION

Permittees should develop a process to evaluate the effectiveness of their programs. Methods such as surveys and focus groups can be used to assess program's effectiveness. Results should gauge the community's level of awareness. Surveys and focus groups can also be used to provide insight into the program's direction and the formulation of attainable goals. A watershed-wide concept will be developed by June 1996.

There have been no reports of formal programs to assess program effectiveness, although staff discussions and management reviews have provided subjective evaluations that have resulted in program development and modifications.

P:\ORV\WSIIED2.MAL\VII

VOL 15
0293
R0060514

VIII. PROGRAM EVALUATION

The effectiveness of the storm water programs developed under the Municipal Storm Water Management Plan (hereinafter called the Plan) must be assessed on a regular and consistent basis. The Plan for this evaluation must include a schedule for evaluation, a methodology for the evaluation, a discussion of who will carry out the evaluation, and what will be evaluated. In addition, there must be a mechanism to follow up on the information generated by the evaluation. The Plan should be adjusted based on the program evaluation.

A. PERFORMANCE STANDARDS

The Permittees will develop standards to judge the effectiveness of the activities and control measures proposed under each chapter of the Plan. The standards will serve as minimum performance levels to evaluate the implementation of control measures. The subsequently developed performance evaluation procedures/methodologies will be the tool to determine if a particular BMP has an impact on stormwater quality. In developing these procedures, we resolve to ensure that each BMP is implemented to the maximum extent practicable. The targeted completion of this phase will be December 1996.

1. DEVELOPMENT OF PROCEDURES

General performance standards for evaluating the effectiveness of the Best Management Practices (BMPs) will be developed for all the BMPs proposed in the Plan. The Watershed Management Committee will be responsible for developing and adopting these evaluation criterion. The Management Committee may elect to establish subcommittees to develop performance standards for specific program areas. The area-wide Executive Advisory Committee will then review and endorse the standards. Standard recording format and implementation schedule will be developed for each BMP by the Management Committee for use by all permittees. The permittees will be required to document BMP implementation using the standard format according to an established schedule. The utilization of quantitative approaches in measuring effectiveness will be used whenever possible. Methods that would yield comparable results for year to year evaluation will be developed.

2. ACTIVITY/SOURCE/ACTION AREA SPECIFIC

Program effectiveness will be performed based on the information generated by the performance evaluation procedures. Using street sweeping as an example, the Plan will propose a method of determining if street sweeping has

VOL 15 0294

R0060515

an impact on water quality. This could include determining what kind of pollutants are removed by the sweeping, measuring the size of the pollutants and the amount removed. Methodologies would be developed for each BMP, which will assure that each control measure or action is implemented to the maximum extent practicable. For street sweeping; this may include the frequency of sweeping now, the method of sweeping, the equipment used, how the equipment is cleaned and maintained, and the method of disposal for the material collected. A schedule and format of evaluation shall be developed for all the BMPs.

The Regional Board has recommended 13 Baseline BMPs, to be developed and/or implemented by all permittees by the end of the current NPDES Permit. Existing Permit Task 5.2.5 requires an evaluation of the need for additional BMPs, source control, and/or structural control measures.

BMPs have only been implemented for a short time period by Phase I and Phase II cities. Phase III, which contains 30 new cities, has not yet implemented any BMPs. Therefore there is little or no data available to adequately assess effectiveness. In lieu of recommending any changes or additions to BMPs currently being implemented or proposed by the Permittees, a uniform data collection methodology will be established for each of the 13 baseline BMPs. This methodology would be used by all Permittees to compile data on their BMP implementation to allow for a uniform Countywide evaluation of BMP effectiveness. Priority will be given to the development of a uniform data collection methodology to document the success or effectiveness of these 13 BMPs. Upon reorganization of the NPDES Permit Program, as described in Chapter I, this will be the first task addressed by the Watershed Management Committee. The Uniform data collection methodology will be developed by January 15, 1995 for the Santa Monica Bay watershed and by July 1995 for all other watersheds with subsequent implementation by all permittees in each watershed.

B. ANNUAL REPORTS

An annual report for each watershed will be submitted to the Regional Board not more than 45 days after the end of each permit year. Each annual report will include a summary on the programs implemented during the previous year and plan activities that will be implemented during the current year. Any revisions to the Plan would be addressed in the report.

1. FORMAT/STRUCTURE

In order to insure uniform annual reporting by all watersheds, the Executive Advisory Committee will develop a uniform annual report outline for use by

VOL 15
0295
R0060516

each watershed. Each Watershed Management Committee will develop a standard format to be used by all the permittees in its watershed in reporting the progress and the status of all stormwater programs implemented in its jurisdiction. The Principal Permittee will utilize this information to develop the annual report for the watershed. Upon approval by the Management Committee, the annual report will be provided to the Executive Advisory Committee which will compile the annual reports from all watersheds for submittal to the Regional Board.

2. EFFECTIVENESS MEASURES

Under Chapter VIII, Section A, the permittees will have developed performance standards for each BMP. These performance standards will be used to assess the effectiveness of the BMPs. By the end of each permit year, the findings of the previous program year will be evaluated and used to suggest changes that are appropriate for implementation during the next year. Focus should also be given to the use of empirical studies, in a control setting, to more fully assess the effectiveness of BMPs.

3. CONTENT

The annual report will include a matrix illustrating the levels of implementation for all permittees. Tables will be developed for each BMP listing all the participating Co-Permittees, describing the status of implementation by each Co-Permittee of the BMP, and documenting any modifications of the BMP from the standard program. The effectiveness of each program area will be assessed using the performance standards developed under Chapter VIII, Section A. For effectiveness measures, the findings should be presented graphically for ease of comparison with the established levels of effort. Fiscal budget for all the BMPs implemented should also be prepared, grouped by programs. An analysis and evaluation of the results of the past year's monitoring program data will also be included in the report. Any revisions to the Plan should be addressed here, with all the elements affected discussed in their entirety. All relevant information, such as water samples analyses and evaluation, should be included in the appendices.

C. SEMI-ANNUAL REPORTS

A semi-annual progress report will update the Regional Board on Permit compliance activities six months into each permit year. The semi-annual report will be provided to the Regional Board within 30 days after the end of the six-month period.

VOL 15
0296
R0060517

1. PURPOSE

The semi-annual report will serve as a status report on the progress of the implementation of the Plan.

2. FORMAT/STRUCTURE

In order to insure uniform semi-annual reporting by all watersheds, the Co-Permittees will use the standard format developed for the annual report in reporting the progress and status of all the BMPs implemented in their jurisdictions. The Principal Permittee will utilize this information to develop the semi-annual report for the watershed for submittal to the Regional Board.

3. CONTENT

The semi-annual report will include a matrix illustrating the levels of implementation for all permittees. Tables will be developed for each BMP listing the participating Co-Permittees, describing the status of implementation by each Co-Permittee of the BMP, and documenting any modifications of the BMP from the standard program. The permittees will describe the problems encountered during implementation and discuss the modifications to the program in order to solve these problems.

D. INTERNAL REPORTING

In order to facilitate the preparation of semi-annual and annual reports, standard internal formats for use by all Permittees will be developed. The internal reporting procedures will be completed for all Plan chapter elements by December 1996.

1. STANDARD FORMS

The Watershed Management Committee will be responsible for developing standard forms for use by each Permittee. Standard forms will be developed for each BMP to monitor its progress. Some Permittees may have to customize the standard forms in order to reflect their programs' additional features. The forms will collect all the information essential to the preparation of the annual and semi-annual reports. In developing the standard report forms, information that is quantifiable and specific for each program area and/or BMP will be collected.

2. PROCEDURES

Co-Permittees will submit all the BMP report forms to the Principal Permittee at the end of the six-month period and the permit year, respectively.

VOL 15
0297
R0060518

3. RECORD KEEPING

The Regional Board does not need to see all of the extraneous information, but the records will be retained by the Principal Permittee for 2 years. Each Permittee will keep a permanent copy of its reporting forms in case they are needed.

E. STORM WATER MANAGEMENT PLAN REVISIONS

There will be an annual review process that will allow the Permittees to revise the Plan for the next year and for the rest of the permit period. Revision procedures will be developed by December 1996.

1. PROCESS

In the annual report, Permittees will compare the progress made on all the BMPs with the established level of effort. If the level of implementation is inadequate, the program should be adjusted to accelerate the progress. If the progress made to date shows that the program is ineffective or inefficient in protecting the stormwater quality, a new program should be developed and implemented for the next fiscal year and the rest of the permit period.

2. REPORTING

All refinements or revisions to be made in the fiscal year will be documented in the annual report, with the dates of implementation proposed.

P:\ORV\WSHED2.MAL\VIII

VOL 15
0298
R0060519

IX. MONITORING

The Monitoring Program is a critical element in the Stormwater Management Plan. It will provide important data for use in characterizing existing stormwater/urban runoff quality, guiding future development, and modifications to the Plan and also to assess its effectiveness. A watershed wide monitoring program shall be developed by December 1996.

A. SYSTEM CHARACTERIZATION

The existing Permit subdivided the County into six drainage basins with information to be collected to characterize each of the basins.

1. WATERSHED

Each drainage basin has been subdivided into numerous drainage areas, based on an evaluation of the existing drainage system and surface flow patterns. For each drainage area, the following information has been compiled: size; breakdown of existing land use; imperviousness; description of soils; location of waste disposal facilities; and the location, type, and number of industries by Standard Industrial Classification (SIC) Code. This information has been submitted to the California Regional Water Quality Control Board, Los Angeles Region, for Phases I and II. Phase III watershed characterization is in progress and will be completed by the end of December 1994. Due to the volume of the watershed characterization data, this information has not been included herein, but is available for review at either the Regional Board or the Los Angeles County Department of Public Works.

This information will provide a basis for developing other monitoring program elements such as pollutant loading estimates from major land uses and watersheds; pollutant source identification, and identification of illegal discharges/illicit disposal practices.

2. STORM DRAIN SYSTEM

In subdividing each basin into drainage areas, the drainage area tributary to all major outfalls has been identified. Within each drainage area, the tributary storm drain system is being identified and mapped. Key information such as the size of the storm drain facilities, locations of manholes and inlets, and storm drain connections is being compiled. This information will be vital in conducting storm drain inspections to identify and eliminate illegal discharges.

VOL 15
02999
R0060520

3. RECEIVING WATERS

Due to the extent of urbanization in Los Angeles County over the past decades, most of the streams designated as receiving waters in the Los Angeles basin have been replaced with man-made storm drainage systems to provide flood protection to the urbanized areas. These streams have been mapped as part of the storm drain system mapping done under A.2. above. The remaining natural streams are also being mapped.

The Los Angeles County Department of Public Works (Department) has been performing surface water quality monitoring on a voluntary basis since the late 1960s. Samples have been collected and analyzed from various receiving water streams and channels throughout the County to collect general information as to the quality of the surface runoff within our storm drain system.

The program in existence at the time the current Permit was issued was established in the mid 1980s. Twenty-eight sites are sampled monthly for dry weather flows. Twenty-one of the 28 sites are sampled for storm flows up to five times per year. The collected samples are analyzed for general minerals, pH, total dissolved solids, specific conductance, biochemical oxygen demand, bacteria, heavy metals, pesticides, PCBs, total organic carbon, volatile organic compounds, and total petroleum hydrocarbons.

The sample collection at these sites will continue while the new National Pollutant Discharge Elimination System (NPDES) Permit monitoring stations are established. Once all NPDES Permit monitoring stations are operational, sampling at these 28 sites will be discontinued.

In order to provide an initial assessment of the water quality in the major streams and channels in the County, an analysis has been performed on the data collected through the existing surface water monitoring program. The analysis has been done on a Countywide basis and also by major drainage basin. The report can be found in Volume 8.

To better assess the receiving water impacts of stormwater the Department will be developing a program to further study stormwater impacts on selected receiving waters, including conducting toxicity studies. Initial efforts will focus on the Santa Monica Bay Watershed. A Request for Proposal for the development of such a program will be advertized by January 15, 1995.

The water quality data collected by the new NPDES Monitoring Program will provide more detailed data to better assess in upcoming years the quality of our receiving waters. Ten monitoring stations have been proposed along the

VOL 15
03000
R0060521

major streams in the County. A description of these site locations can be found in the monitoring work plans for Phases I, II, and III, previously submitted to the Regional Board, see Volume 8.

4. LAND USE

As described under Section A.1. above, the existing land use categories within each drainage area have been identified. This information has been used to select drainage areas comprised of a single homogeneous land use for land use specific monitoring. A total of 14 land use monitoring sites are being established in the County. Five sites are being installed in the Santa Monica Bay Watershed with the remaining nine to be selected from within the Los Angeles, San Gabriel, and Santa Clara River Watersheds. For a description of the sites, please see Volume 8. These sites will provide valuable information as to the types and levels of pollutants found in runoff from various land uses. This information can then be used to refine the Stormwater Management Plan to develop specific management measures to target identified problems.

B. SOURCE IDENTIFICATION

Identifying the sources of stormwater pollutants from both specific land uses and specific activities will provide the information needed to identify problem areas and allow specific management measures to be developed to address these problems.

1. SPECIFIC LAND USE

As described in Section A.4. above, major land use classifications will be subject to individual monitoring to determine the types and levels of pollutants present.

2. SPECIFIC ACTIVITIES

a. A pollutant source identification program will be designed to identify significant pollutant sources (i.e., parking lots, industrial activities, etc.), with the hope that remedial action can be undertaken to reduce any significant impacts so identified. It will focus on monitoring very small areas (i.e., less than five acres) where a specific and/or interrelated set of pollutant generating activities are occurring. Its objective is to provide data for selecting BMPs for specific activities rather than characterizing discharges for long-term pollutant loading estimates.

Identification of pollutant sources can be done using a number of methods. Potential sources of storm water pollutants can be identified

VOL 15
0301
R0060522

by records of chemical use and/or storage, by studies of specific activities which lead to the deposition of pollutants throughout the watershed, and by field inspection or monitoring. Watersheds which may contain significant pollutant sources can be identified through land use information or by mass loading estimates.

By mid January 1995, the County will begin targeted monitoring of a municipal corporation yard in the Santa Monica Bay Watershed. A full program for pollutant sources identification will be developed by December 1996.

b. A storm drain inspection program has also been developed and is being implemented. The first phase of the inspection program will target the open channel storm drains to identify illegal discharges.

The open channel inspections will also be used to screen outfalls from underground storm drains for the presence of dry weather flows. This information will be used in the next phase of the storm drain inspection program to prioritized the underground storm drain system for further field screening and inspection of problem areas.

C. CONTROL MEASURE EFFECTIVENESS

It is unlikely that the effectiveness of the various control measures implemented by the storm water management plan can be determined solely through the data produced by monitoring the quality of storm drain flows, because it is difficult to obtain statistically significant comparisons of watershed-wide control measure performance with such data. For this reason the effectiveness of control measures will be assessed through other means.

Two general types of methods are available for assessment of control measure effectiveness: direct water quality (conventional) monitoring and indirect (non-conventional) monitoring. Direct water quality monitoring can be used to determine pollutant reduction by a specific facility or devise. This technique is commonly used for structural or treatment controls, such as detention basins and constructed wetlands, where there is an accessible inflow and outflow. Inflow and outflow results are compared to determine pollutant removal and effectiveness.

Direct water quality monitoring of site runoff before and after implementation of non-structural control measures is also possible. However, it is difficult to demonstrate effectiveness at a statistically significant level because of the high degree of variability in stormwater pollutant concentration and mass loading data. The water quality improvement due to non-structural control measures is generally expected to be less dramatic than that achieved through structural controls. A larger

VOL 15
03002
R0060523

number of samples is therefore required to produce a statistically significant result. This is especially difficult in relation to the monitoring of the pre-control measure condition. Collection of adequate baseline information is necessary prior to the implementation of management practices. Direct monitoring of the effectiveness of non-structural controls is feasible typically only under experimentally controlled conditions (e.g., selection of small, well-defined watershed; control of management practice implementation; effective sitting and timing of monitoring activities), including a sufficient number of samples to achieve statistical significance.

Indirect monitoring currently is the primary method of choice of assessment of management plan effectiveness. A number of indirect monitoring techniques are available for assessment of management plan effectiveness.

Verification of program implementation is an indirect monitoring method that can be used to determine how a management plan is being implemented. Another indirect monitoring method, pollutant removal inventories, can be used to assess the amounts of pollutants that have been prevented from entering the municipal storm drain system.

The 13 Baseline BMPs recommended for implementation by the Regional Board plus other BMPs proposed by the various Co-Permittee are in general all non-structural control measures. In the short-term, a uniform data collection methodology will be developed for use by all Permittees to compile information on the level of implementation of the 13 Baseline BMPs. This will allow for a uniform watershed-wide evaluation of BMP effectiveness. For the Santa Monica Bay watershed, this uniform data collection methodology will be developed and begin implementation by January 15, 1995. For the other watersheds, implementation would begin July 1, 1995.

For the long-term, as the various chapters of the Plan are more fully developed, possibilities for the use of direct water quality monitoring for control measure assessment will be evaluates as opportunities arise.

D. POLLUTANT LOADING

One of the objectives of the monitoring program is to estimate the annual pollutant loadings from each watershed. Knowing the types and quantities of pollutants discharged into receiving waters are important in assessing the impacts of stormwater and, in turn selecting appropriate control measures to address problem areas.

The 24 permanent monitoring stations that are being established Permit-wide will be utilized to estimate pollutant loads from each watershed and also from various land uses. For a description of the methodology to be used to estimate pollutant loadings, please see Volume 8. For the Santa Monica Bay Watershed, the pollutant loading

VOL 15
0303
R0060524

model will be tested and operational by January 15, 1995. Actual pollutant loadings will be calculated subsequent to storm events occurring for which water quality data has been obtained. For the other watersheds, a schedule for pollutant load modelling will be provided by January 15, 1995.

To more closely model pollutant loadings and evaluate control measure impacts, a more detailed dynamic modelling will be undertaken on a smaller, representative sub-watershed. The EPA-SWMM model has been selected for use in our dynamic modelling efforts. For the Santa Monica Bay Watershed, the Kenter Canyon Drain sub-watershed has been selected for this modelling efforts. This sub-watershed is typical of the urbanized areas in the Santa Monica Bay Watershed. It is comprised of multiple land uses, has well-defined boundaries, and has no upstream flow regulation. We are reviewing and identifying the existing drainage system, defining current and future land uses, and conducting field checks. The model will be tested and operational by January 15, 1995, with actual modelling results to be available later when local water quality data from our monitoring stations becomes available. Based on the results of the dynamic modelling of the Kenter Canyon sub-watershed, other sub-watersheds may be selected from the other major watersheds in the County.

E. COMPONENTS OF A MONITORING PROGRAM PLAN

The components of the monitoring program plan such as monitoring site locations, dry/storm sampling frequency and methodology, constituents to be sampled, field and laboratory procedures, QA/QC, etc., can be found in Volume 8 which has been previously provided to the Regional Board.

The Monitoring Program elements described in Volume 8 will be revised to address the Monitoring Program needs described in Section A - D above as agreed to in the letter from the County to the Regional Board dated September 22, 1994.

As the various chapters of the Plan are more fully developed, the Monitoring Program will be revised to address any additional monitoring needs that may result

F. DATA MANAGEMENT

For water quality data collected at the 24 monitoring stations, please see Volume 8 for data storage and reporting methods.

For each Section A - E of the Monitoring Program described above, an annual report will be prepared detailing the data collected, with an evaluation and interpretation the data including water quality impacts.

SANTA MONICA BAY:
BALLONA CREEK AND OTHER URBAN AREAS
STORMWATER MANAGEMENT PLAN

INTRODUCTION

On June 18, 1990, the National Pollutant Discharge Elimination System (NPDES) Permit - Order #90-079, NPDES #CA0061654-CI6948 was issued to the County of Los Angeles and 17 cities tributary to Santa Monica Bay. During the subsequent years, two newly incorporated cities within the Santa Monica Bay Watershed, Caltrans and the County of Ventura also became Co-Permittees. This Permit outlined a three-year program which required each Permittee to: characterize drainage areas; develop and schedule the implementation of Best Management Practices to enhance the quality of stormwater/urban runoff within its jurisdictional boundaries and storm drains it owns and operates. On July 1, 1992, 36 additional cities were initiated into the Permit and began their three year program. By July 1, 1993, the remaining 30 cities in Los Angeles County within the drainage basin were initiated into their three year program. The cities were grouped according to their starting dates and referred to as Phases I, II, and III respectively (See Table A). In general, the boundaries of each Phase did not encompass whole watersheds but portions of various watersheds (See Figure 1).

The Permit has a five-year duration and although Phase III cities have only completed year one of their three year program, the Permit requires the submittal of a Report of Waste Discharge (ROWD) which serves as an application for a subsequent NPDES Permit to replace NPDES Permit #CA0061654, which will expire on June 18, 1995. Therefore, the County of Los Angeles, Ventura County, Caltrans, and the 85 cities are now parties to the subsequent NPDES Permit application utilizing the Municipal Stormwater Management Plan (herein after called the Plan) concept.

The Plan is based on the Stormwater Management Plan Components developed by the California Regional Water Quality Control Board, Los Angeles Region (Regional Board), and is proposed on behalf of the County of Los Angeles and the other participating agencies, see Table B.. The Plan describes the stormwater management activities to be undertaken during the next single, five-year NPDES Municipal Stormwater Permit. The Plan involves the subdivision of the area of the County under a single new Permit, into six watersheds, each with its own stormwater management plan. For these watersheds and the agencies in each of these watersheds, see Table B and Figure 2.

As required by the current Permit, all Permittees have proposed BMPs for their jurisdictions, described in Volume One and under prior submittals made to the Regional Board. These BMPs have already addressed many of the program areas discussed under the stormwater management plan. As required by the current Permit and continuing on under the new Permit, the Permittees will continue to implement these BMPs. This stormwater management plan will involve reorganizing the individual city-based BMP programs into a single stormwater plan for each watershed. The timeline shown in this

document reflects the time needed for the transition from individual city-based programs to the preparation of a mutually agreed upon and collectively developed watershed plan by all parties of the new Permit for each of the watershed areas. The first step in beginning this process will be the reorganization of the current three-phase program into a new watershed based program. A reorganization of the Phases into watersheds which are based on hydrologic characteristics will allow for the consistent development and implementation of programs among Permittees, referencing land use and drainage infrastructure within their respective watersheds. Consistency of programs throughout the watershed will be beneficial in terms of targeting specific pollutant problems and areas.

This watershed is within the targeted area of the Santa Monica Bay Restoration Project (SMBRP), which was formed in 1988 when Santa Monica Bay was included in the National Estuary Program (NEP) as one of seventeen significant estuaries or coastal water bodies nationwide. The SMBRP has developed the Santa Monica Bay Restoration Plan, which identifies 74 Priority Actions to be implemented within the SMB Drainage Basin to improve the quality of Santa Monica Bay. The SMBRP has released its draft plan in April 1994 for public review, to be completed by the end of this year. Upon approval of U. S. Environmental Protection Agency, the State Water Resources Control Board, and other agencies, the priority actions discussed in the plan will be implemented by a variety of agencies and parties. Detailed development of the stormwater management plan for this watershed will incorporate those Priority Actions targeted for the improvement of stormwater/urban runoff quality.

This specific Plan will address the stormwater management issues for the Ballona Creek and Other Urban Areas watershed, which include the following cities and agencies:

- **Beverly Hills**
- **Caltrans**
- **Culver City**
- **El Segundo**
- **Hermosa Beach**
- **Los Angeles**
- **Los Angeles County**
- **Manhattan Beach**
- **Palos Verdes Estates**
- **Rancho Palos Verdes**
- **Redondo Beach**
- **Rolling Hills**
- **Rolling Hills Estates**
- **Santa Monica**
- **West Hollywood**

I. PROGRAM MANAGEMENT

A. PROGRAM STRUCTURE

The County of Los Angeles is designated as the Principal Permittee. The other agencies are designated as Co-Permittees. The following are conditions that establish the responsibilities of all Permittees.

1. RESPONSIBILITIES OF PRINCIPAL PERMITTEE

Anticipated duties of the Principal Permittee include:

- Being the coordinators of permit activities and chairing the area-wide Executive Advisory Committee and the Watershed Management Committees;
- Providing the resources necessary for development of the stormwater management plan;
- Providing technical and administrative support for both the Executive Advisory and Management Committees;
- Implementing the monitoring program;
- Providing the resources necessary for developing annual reports including evaluating monitoring program data and BMP effectiveness;
- Complying with all the responsibilities of a Co-Permittee as outlined below.

2. RESPONSIBILITIES OF ALL CO-PERMITTEES

Each Co-Permittee is designated a number of duties under the proposed stormwater management plan:

- Participate in the development of the stormwater management plan;
- Implement the stormwater management plan within their jurisdictional boundaries and the storm drains they own and operate;
- Provide information needed by the Principal Permittee on program implementation for development of the annual reports.

VOL 15 0314

R0060535

The area under the Permit will be subdivided into the six watersheds tributary to the following waterbodies: Santa Monica Bay, which is further divided into a) Malibu Creek and Other Rural Areas, and b) Ballona Creek and Other Urban Areas; Los Angeles River; San Gabriel River; Dominguez Channel/Los Angeles Harbor Drainage; and the Santa Clara River (See Figure 2). Managing these watersheds is a task that will require a collective and cooperative effort on the part of all governmental entities named in the Permit that are within each watershed.

The management structure of the Plan consists of an area-wide Executive Advisory Committee, Watershed Management Committees, and Subcommittees. This particular structure is intended to provide a suitable program for the unique characteristics of each watershed and shall be developed by April 1995.

The Co-Permittees tributary to the Ballona Creek and Other Urban Areas watershed shall adopt this watershed stormwater management program structure as a guide to allow for an area-wide uniformity of compliance of the Permit.

3. EXECUTIVE ADVISORY COMMITTEE

The area-wide Executive Advisory Committee shall consist of the County of Los Angeles, as Chair, and two representative Co-Permittees from each of the six watersheds. This Committee assumes no responsibility for the adequacy or inadequacy of any individual city's program and should not be viewed as the responsible agency in this sense. The Committee's main role is to facilitate programs within each watershed and to enhance consistency among all of the programs. Additional responsibilities of the committee are:

a. Making recommendations on area-wide issues to each of the Watershed Management Committees;

b. Reviewing the stormwater management plans as developed by each Watershed Management Committee and provide direction and guidance on the plans for consideration by the Watershed Management Committees;

c. Assessing the consistency of all area-wide BMPs;

d. Preparing and forwarding unified submittals to the Regional Board upon receipt of information and materials submitted by the Watershed Management Committee in compliance with Permit requirements;

VOL 15
0315
R0060536

e. Scheduling and coordinating meetings and correspondence to allow for communication between the Co-Permittees and the Regional Board;

f. Acting as liaison between all Permittees and the Regional Board on Permit issues as well as mediating conflict among the Permittees.

4. WATERSHED MANAGEMENT COMMITTEE

A management committee within the watershed will be comprised of the County of Los Angeles, as Chair, and one representative from each of the Co-Permittees in the watershed. The committee shall be responsible for:

a. Establishing goals and objectives for the watershed;

b. Preparing the stormwater management plan for the watershed (This includes the development of all chapter components of the Plan);

c. Assessing the effectiveness of the plan and making appropriate changes;

d. Preparation of the semi-annual progress reports and annual Permit reports on Permit activities within the watershed for submittal to the Regional Board (For the annual Permit report, a draft will be circulated to each Co-Permittee and the Executive Advisory Committee for its review and comment. Final copies of reports shall be forwarded to the Executive Advisory Committee through which a compilation from all six watersheds shall be submitted to the Regional Board);

e. Enhancing the implementation of the storm water management plan within the Ballona Creek and Other Urban Areas watershed.

5. SUBCOMMITTEES

Subcommittees will be established where needed as determined by the Management Committee and/or the Executive Advisory Committee. The Subcommittees would be focused on specific program areas and can provide more specific oversight on the development, implementation, and evaluation of selected program areas. These subcommittees shall be scheduled to meet on a routine basis.

VOL 15 0316

R0060537

B. INSTITUTIONAL ARRANGEMENTS

Management of the stormwater program requires the collective efforts and the cooperation of all Permittees. No Permittee has the ability and the legal authority to assume the responsibility of all activities of this Permit. Therefore, agreements will need to be formally developed amongst the Permittees to insure proper implementation of the Permit requirements.

1. PROGRAM PARTICIPANT ARRANGEMENTS

As the Principle Permittee, the County of Los Angeles will be designated as the lead agency for coordination of Permit activities and therefore shall chair the executive committee and the management committee meetings as they are scheduled. The lead agency is responsible for coordination of the Permit but is not responsible for the adequacy or inadequacy of any individual Permittee's program. All other entities are Co-Permittees and will be responsible for the Permit compliance of their own agency's program. An implementation agreement will be drafted formally detailing the responsibilities of the Principal Permittee and the Co-Permittees. The agreement would also address the funding of various watershed-wide activities such as plan development, annual evaluation and reporting, and monitoring. Execution of the agreement by all Permittees is targeted for December 1995.

2. AREA-WIDE INTERAGENCY

As the Plan for each watershed is more fully developed, the Watershed Management Committee will coordinate with special agencies and districts that also regulate and/or perform activities addressed under different elements of the Plan. This coordination will attempt to ensure that their functions and the Plan are compatible. A few of these agencies include:

County Hazmat

- Any overlap of waste regulations, Household hazardous waste programs and or Industrial inspections shall be recognized and addressed, by all entities that fall under this Permit, in reference to the watershed program.

County Health

- Inspections of restaurants and other food handling establishments shall be coordinated with the Permittees.

VOL 15 0317

R0060538

Local Transportation/Congestion Management

- Local municipalities have limited authority over motor vehicle usage and regional transportation planning. Where feasible, plan development and implementation will be coordinated with local transportation agencies.

County (Regional) Parks

- Landscape maintenance activities at public-owned parks will be reviewed as part of additional plan development to ensure the use of proper management measures.

Mosquito Abatement

- Coordination with the County Agricultural Commissions will be done for mosquito abatement programs to avoid adverse impact on the quality of stormwater/urban runoff.

Water Districts

- Activities with regards to the Water Districts activities will be reviewed and, when feasible, comply with the watershed program regulations and requirements.

Other entities, both private and public which have major land holdings and/or authorities that impact the quality of stormwater/urban runoff should be initiated to participate actively in the program.

3. CITY-SPECIFIC INTERAGENCY ARRANGEMENTS

Each city will need to develop the institutional framework to address operation, maintenance, construction, redevelopment, and other activities performed by city agencies such as Public Works, Parks and Recreation, Planning, and Public Owned Treatment Works (POTWs). These city agencies will need to participate in the planning and implementation of relevant plan program areas.

VOL 15
0318
R0060539

C. FISCAL RESOURCES

As each of the Plan chapters are completed, each Permittee will develop a budget for implementing that portion of the Plan. A complete budget for the Plan will be produced upon completion of development for all Plan components by December 1996. The budget will provide information such as funding sources, staff resources, contract services, and cost sharing arrangements.

1. AREA-WIDE

In implementing the Plan, the Permittees may elect to jointly fund a single program for certain BMPs, such as Public Education, that are area wide in nature. Funding agreements including budgets and cost per agency would be developed.

2. CITY-SPECIFIC

Each Permittee will develop a budget detailing the cost of implementing Plan activities within its jurisdiction. Special funding in the form of grants, donations, or other forms of contribution should also be actively pursued to assist in funding special studies and/or BMPs.

D. LEGAL AUTHORITY

Each Permittee is responsible for implementing the Plan within its jurisdictional boundaries and therefore must acquire all needed legal authority. Each Permittee, being separate legal entities, are to have adopted as required by the existing Permit, ordinances that will provide them with the adequate legal authority to develop, administer, implement, and enforce storm water/urban runoff management programs within their own jurisdiction. The ordinance must provide for its enforcement and at a minimum specify that violators may be subject to penalties including, but are not limited to, fines and termination of the activity causing the violation. A plan for identifying any additional legal authorities needed by the Permittees will be included in the completed Plan for the Ballona Creek and Other Urban Areas watershed by December 1995. Upon completion of development of the Stormwater Management Plan, enforcing compliance with the Plan will be the responsibility of the Regional Board.

II. ILLICIT DISCHARGES

The elimination of illegal connections and illicit disposal (IC/ID) practices is an important component for any program aiming to enhance the quality of stormwater/urban runoff.

Although more information is needed to assess fully the benefits and costs of conducting IC/ID programs, we can make logical decisions regarding application of best management practices (BMPs) to minimize such incidents. These BMPs will vary due to the jurisdictional differences which exist within each watershed. Each jurisdiction within the watershed will be developing and implementing those activities which adequately serve the jurisdiction and the watershed as a whole.

IC/ID practices are intermittent discharges of pollutants into the storm drain system that can degrade the quality of receiving waters. This can occur through catch basins, area drains and even on gutters and street surfaces. Some illegal dumping activities are done by individuals who do not know that such practices are illegal and can adversely impact the environment. Yet, others may be carrying out such practices with the full knowledge that such activities are prohibited.

A. ILLICIT CONNECTIONS

In order to implement an illicit connection management program, jurisdictions as a whole will need to develop and implement the procedures for investigating each of their respective storm drain systems.

Detailed procedures to eliminate illicit connections depends on the complexity of the storm drain system. A consistent watershed wide concept will be developed to investigate illicit connections to the storm drain system. Based on the results of field screening activities, or other appropriate information which indicates an area of reasonable potential of containing illicit connections, detection and follow up procedures would be followed. Priority should be established to focus on major problem areas and allow for a cost-effective approach to eliminate illegal connections. This concept will be developed by December 1995.

1. SYSTEM SURVEY

A system survey is a necessary component of an illicit connection elimination program. Although the basic concept is similar, the actual techniques and methods which jurisdictions within the watershed use to conduct system surveys can be quite different.

VOL 15
03200
R0060541

In conducting system surveys, the intent is to avoid costly investigations within areas not suspected of containing illicit connections. Field screening, map research, and land use investigation activities will be done initially to identify potential problem areas. Public outreach efforts will be used to inform citizens in the area about the problem. Enforcement action will be taken to terminate such illegal connections. It should be noted that more detailed and sophisticated techniques such as televised inspection and dye testing will only be used in special situations as needed.

Two jurisdictions, Los Angeles County and the City of Los Angeles have undertaken system surveys. The County is preparing maps showing the location of each storm drain, its manholes, and catch basin connector pipes. The location and source of discharge for all connections is being inventoried and a GIS system is also being developed. This information will be used in the storm drain inspection program which is ongoing. The program is targeting open channel storm drains. All open channels will be inspected for evidence of illegal discharges. The open channel inspections will also be used to collect information on dry weather discharges from underground drains for use in prioritizing future underground drain inspections.

Los Angeles has a comprehensive program in operation to identify all outfalls in the storm drain system and their tributary drainage areas for possible incorporation into a database. Visual observations and outfall samplings are used to identify and prioritize drainage areas for investigation of pollutant discharges. The City is also in the process of ongoing system inspections. Storm drain lines are inspected to stop discharge of pollutants from specific facilities by monitoring maintenance holes around suspected sources. Additionally, closed circuit television of storm drain interiors, provided by a contracted vendor on a "on call" basis, to detect cracks, misalignments, deposits, debris and illegal/illicit connections is underway. These programs will provide related information which will be used as reference materials for the development of a watershed wide program.

2. ONGOING SYSTEM INSPECTIONS

Ongoing system inspections for illicit connections will involve the techniques identified in Section 1. above, along with some additional activities. In smaller systems where the storm drain goes into several pumping stations, a regular inspection of the pumping stations for, among other things, evidence of illicit discharges will be sufficient.

In larger and more complex systems, a program of field screening will be used. Evidence of pollution will be categorized and prioritized. The storm drain alignment tributary to the suspect illegal connection can then be further

VOL 15
0321
R0060542

investigated for illicit connections. If a discharge can be traced to a particular facility, the facility will be investigated to identify where exactly the pollutants are coming from and efforts needed to stop the discharge.

Another means of detecting illicit connections may be to rely on reports of illicit discharge from the public. This will utilize the County's or another agency's established "hotline" number that the public can call and report such observations.

3. REPORTING

A consistent recording system will be established to track reports of illegal connections. This recording system will be used by the Permittees within the watershed.

B. ILLEGAL DUMPING

Due to the intermittent and unpredictable nature of illegal dumping, apprehension rate of violators could be quite low at the outset. The first course of action is to develop an area wide educational and reporting system along with prompt response procedures. This will be accomplished by December 1995.

1. OUTREACH

Hotlines for reporting illegal dumping, plus an outreach program to publicize the phone numbers, can be very effective. The County has established an 800 hotline for reporting illegal dumping. Nine cities have additional hotlines, generally a 24 hour City Hall phone number. It is also possible to make reports to the Fire Department, Police and City Engineer in some cities. All the cities in the watershed have some type of outreach program to publicize the reporting hotlines. Methods include: an outreach brochure, door hangers, cable television announcements, banners on city streets and articles and phone numbers printed in city newsletter. The city newsletter was the most widely used. The cities of Los Angeles, Santa Monica and West Hollywood, as well as Los Angeles County, have extensive outreach programs.
See **Chapter VII Public Information and Participation** of this report for a detailed discussion of the outreach program.

2. SYSTEM SURVEILLANCE

Measures that may be used for this aspect of the program may include but not limited to regular inspections of vacant facilities, street use inspection programs to detect illegal discharges and dumping into the street system, and a public complaint and reporting system.

VOL 15
0322
R0060543

Caltrans and Los Angeles have begun system surveillance programs. Caltrans inspects excess land parcels to identify and remediate hazardous waste and debris dumping. The Los Angeles Bureau of Street Maintenance enforces violations of excess water and other fluids into the street system, primarily on a complaint only basis.

3. SPILL RESPONSE

The Health Hazardous Materials Division (HHMD) of the Los Angeles County Fire Department is generally the primary spill responder. If the material is found to be hazardous and poses an imminent threat to public health and safety, the cleanup and disposal of the material will be done under the supervision of HHMD. If the material is non-hazardous, the responsibility will fall on local agencies to coordinate cleanup, disposal and attempt to identify and prosecute the violators. Cooperation among all agencies will be needed to allow for prompt action and joint effort to deter such violators. All agencies will have local authority against such illegal dumping activities.

Spill response procedures have been established by the Culver City Fire Department, who investigates hazardous materials spills, and West Hollywood, where 24 hour emergency clean-up is provided. The City of Los Angeles is ensuring that city-owned facilities have adequate spill prevention, containment and response procedures.

4. COMPLAINT RESPONSE

The County and some local agencies have established a stormwater telephone "hotline" that can be utilized by all citizens. Public complaints are generated through these "hotlines" and also through regular channels such as calls to Fire or Police agencies or to public works or legislative offices. Although responses to these complaints will vary depending on the nature of the complaint, action shall be taken.

5. COORDINATION OF ALTERNATIVE DISPOSAL

Alternative disposal is one way of reducing non-stormwater materials that can potentially find their way into the storm drain system. Recycling programs are one of the most effective ways to reduce waste material. The recycling program can either be at the curbside or through drop-off centers. Household hazardous wastes can be dropped at mobile collection centers or at fixed sites. Co-permittees in the basin generally participate in the County's Household Hazardous Waste collection program. Effectiveness of those programs may be enhanced by a public outreach program that will inform the public of the locations and/or schedules for such events. Technical assistance or

VOL 15
0323
R0060544

information may also be provided to businesses that want to develop a pollution prevention, waste minimization or alternative disposal program.

Recycling programs and hazardous materials round-ups can help minimize illegal dumping. The implementation of recycling programs in this watershed is excellent. 13 of the 14 jurisdictions have curbside recycling programs and the city without curbside pick-up provides drop-off service at City Hall. Caltrans, which cannot participate in curbside recycling, does recycle used materials its shops. Notable is the City of Rancho Palos Verdes who sponsors a recycler of the month promotion which gives one year free trash collection to the winner as a inducement to participate in the recycling program. The majority of cities participate in the Countywide Household Hazardous Waste Round-ups. Only Santa Monica, who maintains its own drop-off facility, and Caltrans, who recycles its own materials, do not take part.

6. REPORTING

Incidents involving a hazardous material entering the storm drain system are to be reported by the responsible party, or, if not known, the responding agency, to the California Regional Water Quality Control Board, Los Angeles Region (Regional Board). Complaints received through the County wide and local city hotlines will be tracked and reported to the Regional Board.

C. ENFORCEMENT PROCEDURES

Enforcement actions against discharges are done through either state hazardous and toxic materials statutes or through municipal ordinances that are already in the codes of the permittees. Industrial Waste Ordinances may be used in enforcement actions against illicit connections. Furthermore, anti-littering, health codes, plumbing codes and fire codes may be utilized for dumping or spill incidents. Enforcement actions can be taken by different municipal agents, including but not limited to, Industrial Waste Inspectors, Building or Plumbing Inspectors, Fire Department Inspectors, Park Rangers, Street Use Inspectors, Health Inspectors, Police Officers, Community Services Officers, Animal Control Officers, Code Enforcement Staff or Public Works Inspectors. Some of these agents are empowered to either issue citations, issue notices of violations, issue cease and desist orders, or even make arrests depending on the type of violation and the code provisions that they are enforcing. Some of these agents are also empowered to enforce not only municipal ordinances but also state laws. A review of the various enforcement tools used by the Permittees will be performed. A recommendation will result on a consistent enforcement approach for the watershed for consideration by all Permittees in their own enforcement programs. This recommendation will be developed by December 1995.

VOL 15
0324
R0060545

The majority of cities stated that municipal codes and ordinances have been adopted. Several of these regulations include penalties for non-compliance. City staff, Community Service Officers, Public Works staff, and Code Enforcement personnel are responsible for ensuring that citizens obey these rules.

D. COORDINATION WITH STATE NON-STORMWATER PERMITS

In order to characterize the nature of the existing non-storm discharges in the receiving waters within the watershed, a list of NPDES Permits issued by the Regional Board will be obtained. This will help in determining unexpected discharge during dry weather and to allow enforcement actions to focus on illegal dumping activities.

There is also a need to coordinate with other environmental agencies to ensure that requirements imposed by these agencies do not conflict with stormwater regulations. Requirements of many agencies do complement stormwater regulations. These agencies, include but not limited to, Fish and Game, DTSC, USEPA, and the Coastal Commission. Coordination with these agencies will help minimize overlapping investigations and result in a more efficient use of resources. A watershed wide concept will be developed by December 1995.

1. IDENTIFICATION OF PERMISSIBLE/PERMITTABLE DISCHARGES

A list of non-stormwater flows that can be allowed to discharge into the Waters of the State will be established by the Regional Board.

2. APPROPRIATE MANAGEMENT PRACTICES

Continued communication with the Regional Board will allow current information to be circulated among all agencies.

3. REPORTING

Any conflict in requirements of other environmental programs/agencies must be reported immediately to the Regional Board for ruling as to which one should take precedence.

P:\ORV\WSHED2.BAL\II

VOL 15
0325
R0060546

III. INDUSTRIAL/COMMERCIAL SOURCES

Each Permittee shall develop and implement a program that focuses on the identification and control of storm water pollutant discharges from industrial/commercial facilities within their jurisdiction. This program shall provide for the inspection of a facility's compliance with storm water regulations, as well as general outreach for all facilities that are potential industrial and commercial dischargers.

Each Permittee is responsible, under the requirements of the Municipal Stormwater Permit, for all discharges from commercial and industrial facilities within its jurisdiction. Many industries are also required to be permitted under the State General Industrial Activities Stormwater Permit. Enforcement of the specific provisions of the State General Permit is the responsibility of the State.

A. IDENTIFICATION OF SOURCES

As required under the current Permit, the Permittees have produced a listing of industries by SIC category for each drainage area. Also a breakdown of major land use types was also performed for each drainage area.

A pollutant source identification program will be designed to identify significant pollutant sources (i.e., parking lots, industrial activities, etc.), with the hope that remedial action can be undertaken to reduce any significant impacts so identified. It will focus on monitoring very small areas (i.e., less than five acres) where a specific and/or interrelated set of pollutant generating activities are occurring. Its objective is to provide data for selecting BMPs for specific activities rather than characterizing discharges for long-term pollutant loading estimates.

Identification of pollutant sources can be done using a number of methods. Potential sources of storm water pollutants can be identified by records of chemical use and/or storage, by studies of specific activities which lead to the deposition of pollutants throughout the watershed, and by field inspection or monitoring. Watersheds which may contain significant pollutant sources can be identified through land use information or by mass load estimates.

By mid January 1995, the County will begin targeted monitoring of a municipal corporation yard in the Santa Monica Bay watershed. This will provide data on industrial activities which can take place at such a facility such as vehicle maintenance and repair, materials storage, equipment storage and repair. A more comprehensive program to identify various pollutant sources will be developed by December 1995.

VOL 15
0326
R0060547

1. CATEGORICAL LIST

Sources identified as a categorical industry regulated by the U.S. Environmental Protection Agency (EPA) will be grouped into a categorical listing of industries. The categorical list provides an organized overview of the target facilities that, based on land use, operation, and activities, could potentially contribute significant amounts of pollutants into storm water runoff. Some of the industrial categories regulated by the U.S. EPA include, but not limited to:

- Aluminum Forming
- Asbestos Manufacturing
- Battery Manufacturing
- Canned & Preserved Fruits & Vegetables
- Cement Processing
- Copper Forming
- Electroplating
- Glass Manufacturing
- Grain Mills
- Machinery Manufacturing & Rebuilding
- Soap & Detergent Manufacturing
- Metal Finishing
- Metal Molding & Casting
- Oil & Gas
- Organic Chemicals & Plastics & Synthetic fibers
- Paint Formulating
- Pesticides
- Plastic Molding & Forming
- Rubber Manufacturing
- Sugar Processing
- Textile Mills

2. RANKING

Industrial and commercial facilities identified as pollutant sources shall be ranked in order of priority for development of management measures. Facilities considered to be high priority are those whose operations and activities are determined to potentially contribute the most significant pollutant impacts to storm water discharge.

3. UPDATE PROCEDURE

Each year the Co-Permittees will evaluate the results of the monitoring program, the illicit discharge investigation program, and other available information , to identify likely sources of specific pollutants. The annual report to the California Regional Water Quality Control Board, Los Angeles Region (Regional Board) will recommend a strategy for pollutant source identification during the following year, including specific sites and/or activities to be monitored.

B. CONTROL MEASURES

Specific urban runoff control programs for major potential pollution sources shall be developed by March 1996. Within these programs storm water pollution control

VOL 15
0327
R0060548

measures shall be developed for various pollutant sources. Control measures such as source control and treatment control offer different, but complimentary approaches to storm water pollution control.

Source control measures focus on good housekeeping practices, pollution prevention and minimization, and education. They are also less costly than treatment controls.

Treatment controls involve physical treatment of the runoff, usually through structural means. Also treatment controls will not remove all pollutants and their removal efficiency is difficult to predict given the limited understanding of the relationship between facility design criteria and performance.

The initial focus will be on the development of source control measures. As information is collected under the pollutant source identification program regarding specific pollutant sources, specific control measures, including structural, will be evaluated as to their effectiveness in addressing these sources.

1. POLLUTION PREVENTION MEASURES

Source minimization and education are the first steps in effective source control. Other activities that contribute to source control are:

- Site design alternatives (i.e., roof over fueling stations and carwash slab, provide spill containment curb around stored material, etc.)
- Good housekeeping practices

2. STRUCTURAL (TREATMENT) MEASURES

A variety of treatment control measures have been utilized throughout the country for storm water quality. However, the effectiveness of these controls are highly dependent on local conditions such as climate, hydrology, soils, groundwater conditions, and extent of urbanization.

Some of the more common treatment controls are:

- Oil/water separators - Oil/water separators are designed to remove one specific group of contaminants: petroleum compounds and grease. However, separators will also remove floatable debris and setable solids.
- Infiltration - A family of systems in which the majority of the runoff from small storms is infiltrated into the ground rather than discharged

VOL 15
0328
R0060549

to a surface water body. Infiltration systems include: ponds, vaults, trenches, dry wells, porous pavement, and concrete grids.

- Wet ponds - A wet pond has a permanent water pool to treat incoming storm water.
- Constructed Wetlands - Constructed wetlands have a significant percentage of the facility covered by wetland vegetation.
- Biofilters - Biofilters are of two types: swale and strip. A swale is a vegetated channel that treats concentrated flow. A strip treats sheet flow and is placed parallel to the contributing surface.
- Extended Detention Basins - Extended detention basins are dry between storms. During a storm the basin fills. A bottom outlet releases the storm water slowly to provide time for sediments to settle.
- Media Filtration - Media filtration consists of a settling basin followed by a filter. The most common filter media is sand; some use peat/sand mixture.
- Multiple Systems - Multiple systems are a combination of two or more of the preceding controls in series.

C. OUTREACH

General outreach for all facilities that are potential industrial and commercial dischargers shall be set up area-wide by the Management Committee, to provide general guidance in complying with the storm water program by March 1996. It shall also serve as a reminder of pollution prevention measures and keep facilities informed of their obligations to the storm water program.

Subcommittees may be established to develop specific outreach materials for industrial and commercial categories and specific activities that are identified as high priority.

For additional information on outreach, refer to **Chapter VII Public Information and Participation.**

D. INSPECTIONS

Most municipalities have existing programs such as industrial waste, fire, and health in which industrial and commercial facilities are inspected on a regular basis. Each Permittee may elect to have inspections for the storm water program incorporated

VOL 15
0329
R0060550

into these existing inspection programs, or be done as a completely separate program, depending on the needs of the Permittee.

The purpose of these inspections is to ensure that facilities are in full compliance with the storm water regulations and to ensure that control measures are being implemented. The frequency of inspection of facilities will be prioritized based on the operation and categorization of the facility.

Inspectors consisting of public personnel will be trained adequately to recognize and handle problematic activities concerning storm water pollution that may be existing or potential; and inspect for the deterioration of the storm drain system and illegal/improper connections. Training programs will be developed through the Watershed Management Committee and possibly specific Permittees for use by all Permittees.

Procedures for the identification, investigation, enforcement, and prosecution to the full extent of a jurisdiction's legal authority will be developed.

Facilities which generate industrial wastes are issued permits by Los Angeles County. Auto related businesses, gas stations, and restaurants are included within this program. Facilities with industrial waste permits are regularly inspected. In addition to those businesses in the unincorporated areas, the County Department of Public Works also provides industrial waste inspections, under contract, for five cities in the watershed. In two of these, city staff assists with the inspections. The City of Los Angeles has an extensive program to issue, inspect and enforce Industrial Wastewater Permits issued for non-stormwater discharges. Facilities are inspected between 1-4 times per year.

Three additional cities have inspection programs; Santa Monica conducts annual inspections of industrial waste sewer connections, and both Culver City and Hermosa Beach depend on their Fire Department staff to investigate facilities which utilize hazardous materials. One city in the watershed is developing an inspection program, while two cities, Rancho Palos Verdes and Rolling Hills, report no industrial uses within their boundaries. However, auto related businesses are inspected in Rancho Palos Verdes. Only one city reports not having a program at this time. Caltrans inspections include daily examination of auto related facilities, leak testing of gas stations once per year, quarterly pumping of clarifiers, and constant storm drain monitoring. A program to inspect underground storage tanks is part of a five year plan.

VOL 15
0330
R0060551

1. CHECKLIST

Inspectors shall have a uniform checklist to use as guidance and reference throughout an inspection. It may also serve as a general guide for the public, providing information about the requirements necessary to comply with the storm water regulations.

2. SCHEDULE

The inspection program shall be developed by March 1996. The frequency of inspections shall be scheduled according to the type of operation and the categorization of the facility. Revisit inspections shall be done on an as needed basis.

3. REPORTS

Inspectors shall report on all activities related to and/or violating the local storm water ordinance to the local governing agency. Standard reporting procedures will be developed.

4. FOLLOW-UP PROCEDURES

Individual Permittee review and assessment of the reports may result in the need for follow-up procedures, such as reinspection or legal action, provided the jurisdiction has the adequate legal authority to do so. Follow-up procedures will be developed to insure a uniform and consistent approach.

E. LOCAL INCENTIVE PROGRAMS

In developing the industrial/commercial program, the Permittees may consider the development of optional measures such as clean business incentive programs that may offer more focused control on industrial and commercial sources. Optional measures such as these may be developed by March 1996.

F. TRAINING

Development of training programs for industrial storm water inspection staff is projected to be completed by March 1996.

1. PUBLIC EMPLOYEES

All public employees shall be trained in the storm water regulations so that they abide by the regulations in the course of their work day. Also they need

VOL 15
0331
R0060552

to be able to recognize and distinguish between legal and illegal activity so as to administer the proper protocol in handling the situation.

The Los Angeles County Department of Public Works requested all employees to report any observed water quality problems. Caltrans has educated its employees in hazardous substance spill awareness, pesticide safety and vegetation management. The City of Los Angeles has a specialized inspection group trained to focus on improving storm water quality and eliminating illegal discharges and illicit disposal practices which is staffed by the Bureau of Engineering.

2. INSPECTORS

Inspectors who visit industrial and commercial facilities shall be adequately trained to determine compliance with the storm water regulations and educate the facilities about the requirements of the program. In addition, they should be able to recognize and handle immediate problems as they are encountered, during an inspection; and inspect for the deterioration of the storm drain system and illegal/improper connections. Citation training will be necessary for inspectors in agencies that have the citation authority.

G. COORDINATION WITH STATE INDUSTRIAL STORM WATER PERMIT

The Permittees have existing local ordinances governing industrial discharges and other stormwater discharges that require compliance activities similar to those in various State Regulations. Because coordination between the Permittees and the Regional Board is anticipated concerning the regulation of industries, a mutual agreement may be required regarding industrial inspections and enforcement. Additional issues could also be addressed. Federal stormwater regulations hold local municipalities responsible for stormwater discharges from all industrial/commercial facilities, including those covered by General Permit.

1. MEMORANDUM OF UNDERSTANDING

A Memorandum of Understanding (MOU) may be used to formalize the agreement between municipalities and the Regional Board on industrial compliance program issues. A MOU among all local agencies may also be needed to ensure co-operation between all the agencies. The need for and specific requirements for such agreements would be developed upon completion of development of the industrial/commercial program by March 1996.

VOL 15
0332
R0060553

2. REPORTS

The MOU discussed above may include the exchange of information between the Permittees and the Regional Board. Appropriate formats for such reports would be developed as required.

P:\ORV\WSHED2.BAL\III

VOL 15
0333
R0060554

IV. NEW DEVELOPMENT AND REDEVELOPMENT

Managing stormwater and runoff from both new construction and redevelopment, will reduce pollutants entering the storm drain system and subsequently the receiving water.

A. PLANNING PROCESS

Quality of stormwater discussion should be included in the General Plan and the Zoning ordinances. Efforts to enhance the quality of storm water can filter into the Subdivision actions. Many of the storm water concerns can be channeled through the compliance effort of the California Environmental Quality Act (CEQA). A watershed wide concept will be developed by June 1996.

1. WATERSHED PROTECTION POLICIES

An integrated strategy will be developed for the watershed. Pollution control efforts should be prioritized. A variety of statutory and regulatory requirements could be used for this watershed oriented program. Watershed protection policies need to be adopted by the local jurisdictions which control land-use within the watershed.

The Contractor Water Pollution Control Program is required by Caltrans during construction activities. Construction activities may be halted if inadequate provisions have been made for water quality protection.

2. COORDINATION WITH CEQA

The current CEQA "Environmental Checklist Form" that is used for initial studies assessment indirectly address potential impacts to stormwater. Additions could be made to the Form to directly assess stormwater quality impacts.

CEQA requires agencies to use feasible alternatives or mitigation measures to lessen potentially significant effects. The ability to identify a.) when an effect is significant, and b.) which mitigation measures could be adopted to reduce the effect, is critical to the CEQA process. A clear assessment of any development, its potential adverse impacts on stormwater quality will allow for a determination of "significance" which will enable the decision maker to make development decisions upon full disclosure of possible adverse impacts.

VOL 15
0334
R0060555

3. SITE PLANNING PROCESSES

All development will require the review and approval of a site/plot plan or development drawings prior to issuance of a building permit. Incorporating the consideration of potential water quality impacts including erosion and sedimentation during the early stages of the planning process will allow these issues to be addressed before substantial investments in engineering and design have been made.

4. GENERAL PLAN CHANGES

The General Plan is the legal backbone of the planning process. All development approvals, zoning ordinances, subdivision approvals and public works projects must be consistent with the policies, objectives, and principles set forth in the General Plan. Discussion of stormwater issues in the General Plan could greatly enhance the awareness of the issues and encourage full assessment of possible adverse impacts on stormwater quality as the result of new and redevelopment.

Amendment to Los Angeles City's General Plan includes general requirements of Federal and State storm water regulatory program as well as policies and programs for storm water pollution abatement.

5. USE OF MASTER PLANS

For agencies which utilize master plans to guide their development activities, stormwater issues can be outlined in such documents. This will channel efforts to fully assess the possible adverse impacts on stormwater quality as the results of any development within the master plan area.

The City of Los Angeles is currently reviewing standards and considering modifications for flood control projects to include storm water pollution reduction components.

6. OTHER POLICIES

Numerous other policies or mechanisms could be used to incorporate stormwater management goals into the planning/development process. Other concepts will be evaluated for their feasibility during the more detailed development of this Chapter.

VOL 15
0335
R0060556

7. PLANNING-PUBLIC WORKS INTERFACE

A variety of mechanisms for coordinating planning and public works activities exist. An example could be some form of CIP (capital improvements program). Ideally, any planning documents which target or project population growth are coordinated with CIP. Integrating stormwater management into CIP will allow for mitigation of major adverse impacts on the quality of stormwater prior to any actual construction.

8. IMPLEMENTATION PROCEDURES

Implementing policies to integrate stormwater management considerations with existing planning/development mechanisms will require a variety of approaches depending upon the existing conditions within each Co-Permittee and the particular remedies selected. It is anticipated that each Co-Permittee will propose procedures applicable to it's unique jurisdictional considerations at later stages in the permit process.

B. CONSTRUCTION SITES

Pollutants from construction activities can have a major impact on the quality of stormwater/urban runoff. A watershed wide concept to reduce such pollutants will be developed by December 1995.

1. EROSION CONTROL REQUIREMENTS

Federal stormwater regulations hold local municipalities responsible for stormwater discharges from all construction sites. In addition, construction sites involving a total of five acres or more of land disturbance are required to apply for the State General Construction Activity Storm Water Permit (GCASP). The GCASP: 1) eliminates or reduces to the extent feasible non-storm water discharges from construction sites and 2) permits stormwater discharges, but requires the use of controls to limit pollutant loading in site effluent. Preparation of a Stormwater Pollution Prevention Plan and identification/utilization of BMPs are the key components of this Permit.

Many local agencies also have erosion control requirements for any grading and construction activities. Regulation of pollutants from construction sites of five acres or less will be done by the local agency through its stormwater management plan.

Construction site erosion has the potential to introduce sediment into runoff. For example, fugitive dust control at construction sites typically use water. Minor modifications/clarification of existing fugitive dust practices could

VOL 15 0336

R0060557

substantially address runoff pollution concerns. In addition to fugitive dust control practices, additional measures could be adopted to curtail dry weather runoff, and control pollutant laden storm water runoff. These measures may address 1) physical site design considerations and 2) temporal considerations such as seasonal timing and phasing of activities.

Ten jurisdictions have adopted erosion control/urban runoff reduction requirements. Three jurisdictions have identified and/or drafted textual language, while two jurisdictions are planning to begin developing legislation.

2. CHEMICAL AND WASTE MANAGEMENT REQUIREMENTS

Chemical and waste handling activities are also currently subject to a variety of regulations. BMPs to address this pollution source are largely centered around "good housekeeping practices". This involves storing, handling, using, and disposing of these potential pollutant sources in ways that restrict opportunities for unintended introduction of the materials into site runoff. Proper chemical and waste management will reduce any accidental discharge into the storm drain system.

3. INSPECTIONS

Inspections are a routine part of local jurisdiction's oversight of regulated construction activity. Inspection activities should be enhanced to ensure that construction site runoff control measures are being properly implemented. Existing practices should be examined and modified accordingly to satisfactory stormwater/urban runoff objectives.

The City of Los Angeles plans to review current requirements for construction sites to ensure consistency with the State of California and establish an Enhanced Construction Inspection program. The City of El Segundo has developed new forms and a standard enforcement letter for record keeping and program management. These include plan check list of review items concerning storm water, construction inspectors report, storm water catch basin cleaning record form, and standard storm water enforcement letter.

a. Checklist

A checklist would encourage possible streamlining of any requirements. It could be cumbersome if an overly rigid approach were taken which resulted in unnecessary administrative burden. However, careful design of the checklist could avoid this pitfall.

VOL 15 0337

R0060558

b. **Schedule**

Inspection schedules will depend upon existing practices. It may be desirable to have several schedules, depending upon the types of activities/permits and/or the timing of activities.

c. **Reports**

A standardized reporting format is needed to allow for consistency among all jurisdictions. Furthermore reports are also a useful tool for future refinement of pollution control regulations.

d. **Follow-up Procedures**

A format will be developed to do follow-up inspections on problem facilities and activities. Frequency of use will greatly depend on the land use and the degree of non-compliance of each facility.

C. LOCAL PERMITS

Permits are a form of "cross checking" by local agencies to ensure that regulations are being implemented. Prior to the issuance of a permit, information must be submitted for review and approved A watershed wide concept to provide some consistency in local permits will be developed June 1996.

El Segundo has developed a checklist for storm water requirements to be used during plan check. Site grading plans are also required to identify drainage problems in the planning stages.

1. COORDINATION WITH EXISTING PERMITS

Storm water issues should be incorporated into existing permits.

2. NEW PERMIT ISSUES

Storm water issues should be clearly stated in new permits to be issued for new and/or redevelopment activities.

D. TRAINING

Training will enable staff to keep current of the latest storm water regulations. A watershed wide staff training concept will be developed by June 1996. Los Angeles City's planned Construction Education and Training program is intended to increase the awareness of those involved in the construction process with regard to storm

VOL 15
0338
R0060559

water pollution abatement activities. Videos and printed materials will be distributed.

1. PLANNING PERSONNEL

(See E.1.b. below)

2. PUBLIC WORKS PERSONNEL

(See E.1.b. below)

3. INSPECTORS

(See E.1.b. below)

E. CONTROL MEASURES

Best management practices for the control of construction related pollution can generally be divided into three categories:

Nonstructural Source Controls for Reducing Urban Stormwater Pollutants:

- Practices that reduce the generation and accumulation of potential stormwater contaminants at or near their source.

Site Planning Stormwater Controls:

- Practices that are directed at controlling the volume and discharge rate of runoff from urban areas, as well as, reduction of the magnitude of pollutants in discharges through temporary storage or flow restrictions.

Erosion and Sediment Controls:

- Practices that can prevent or treat problems related to transport of eroded material from construction and other land disturbing activities.

Site planning stormwater controls are of particular interest. These control measures can be incorporated in the initial planning phase of any project. A watershed wide concept will be developed by June 1996.

The City of Los Angeles is reviewing construction standards and considering modifications aimed at reducing storm water pollution from construction sites.

VOL 15
0339
R0060560

1. POLLUTION PREVENTION MEASURES

a. Site Design

Effective implementation of urban BMPs requires integration of water quality control elements early in the site planning and design process. Development of the water quality controls should not only achieve maximum pollutant removal with minimal costs, but also reduce potential maintenance.

This may include incorporating water quality concerns into the site layout and design (ie. maximize pervious areas, minimize directly connected impervious areas, etc.) and/or treatment control measures proven to be cost effective for local climate, soil, and development conditions.

Due to the diversity of climate and local conditions, the development of BMPs will vary from jurisdiction to jurisdiction, and even location to location. The selected management practices should be designed for the local site conditions and especially seasonal rainfall conditions that are experienced in Southern California. Suitability for the major land use and drainage characteristics should also be fully assessed.

b. Education/Training

Education/training is imperative to the success of any BMPs selected for new or redevelopment projects. BMPs will fail if not properly designed, installed, and maintained. Only well trained personnel should be assigned these responsibilities.

A program for effective education/training should be based on four objectives:

- Promote a clear identification and understanding of the problem, including activities with the potential to pollute stormwater;
- Identify solutions (structural and nonstructural BMPs);
- Make every employee responsible for stormwater pollution and its solution; and
- Integrate employee feedback into training and BMP implementation to improve BMPs.

VOL 15
0340
R0060561

c. **Other**

In many cases stormwater pollution control may already be achieved by existing regulations or programs. In California, the General Plan Law and the California Environmental Quality Act (CEQA) provide a basis for municipalities to review and comment on all projects within their jurisdiction. Under the General Plan Law, municipalities are required to develop policies and regulations which guide development within the municipality. Each development project is then reviewed for conformance with these policies. Under CEQA, projects are also subject to review and comment for any adverse impact the projects may have on the environment, including impacts from stormwater discharges.

2. POST CONSTRUCTION (TREATMENT) MEASURES

a. **Applicability**

Each site considered for development or redevelopment will (at the conclusion of construction) have final improvements and unique site characteristics such as: drainage patterns; soils; landscaping; topography; percent of impervious surfaces; rainfall; pollutants inherent with the use of the development; and pollutants that may be background to the area (existing vegetation, air fallout, etc.). The applicability of various treatment control BMPs for use in new development will be evaluated through the use of pilot studies and examination of studies done on treatment control measures by other agencies.

b. **Effectiveness**

Prior to implementing any treatment control measures, they will need to be evaluated for their effectiveness. This can be done through pilot studies which could include elements such as: pre and post storm event inspections; water quality monitoring; record keeping to document deficiencies in the BMPs; Operation & Maintenance requirements; and cost effectiveness.

c. **Retrofit Opportunities**

The feasibility of retrofitting existing developments with treatment control measures will be evaluated. However, the effectiveness of a treatment control measure vs. its cost must be fully evaluated prior to considering its use as a retrofit measure.

VOL 15
0341
R0060562

3. OPERATION AND MAINTENANCE

a. Requirements

Jurisdictions within the watershed will need to insure that BMPs incorporated into a private development are properly maintained. Deed restrictions, covenants, conditions and restrictions (CC&R) could be used to direct such requirements and responsibilities.

b. Responsible Party

The contractor, during construction must ensure that the post-construction BMPs are installed properly and that any maintenance that may be necessary during construction is performed. After the project is completed, it will then be the responsibility of the fee owner, private or public, to provide for long term operation and maintenance. This may be accomplished by deed restriction and/or CC&R.

4. CONFLICTS WITH OTHER MANDATES

Often regulations of various Federal, State, and local agencies would conflict with each other. Health, fire, and building codes often have requirements focusing on short term human health and safety and neglecting the impacts on the environment.

a. Identification of Conflicts

As the Plan is developed, other regulatory requirements that conflict with the stormwater requirements may be uncovered. Clarification of these regulations should be directed to the various responsible regulatory agencies.

b. Conflict Resolution

For regulatory conflict caused by local regulations, efforts will be taken to resolve them within the agencies. Input form other local, state, and federal agencies should be incorporated into a modification of current standards. The Regional Board should resolve conflicts involving other State and/or Federal requirements.

F. OUTREACH

See Chapter VII Public Information and Participation.

VOL 15
0342
R0060563

G. ENFORCEMENT

See Chapter II Illicit Discharges, Section C Enforcement Procedures. A watershed-wide concept will be developed by June 1996.

H. COORDINATION WITH STATE GENERAL CONSTRUCTION ACTIVITIES STORM WATER PERMIT

Compliance with the GCASP requirements is the responsibility of the developer/contractor, and enforcement is the responsibility of the SWRCB/Regional Board staff.

1. MEMORANDUM OF UNDERSTANDING

An agreement between the Regional Board and Co-Permittees may be used to enhance compliance of construction site BMPs. The need for such an agreement will be evaluated. If found to be desirable, and agreement will be developed by June 1996.

2. REPORTS

The local enforcement agency of the State Construction Stormwater Permit, which is the Regional Board, should forward all information, including Notices of Intent filed and any inspections and enforcement actions taken, to the Permittees so that this information can be available to local municipal construction site inspectors to alert them of any specific concerns on the job site.

3. OTHER ISSUES

The Regional Board should explore funding to be channelled to the Co-Permittees so the Co-Permittee can be more actively involved with the State on the Permit.

P:\ORV\WSHED2.BAL\IV

VOL 15
0343
R0060564

V. PUBLIC AGENCY ACTIVITIES

All municipalities perform functions that have an impact on stormwater quality. These include, among other things, vehicle maintenance, landscape maintenance, weed control, water body maintenance including swimming pool maintenance, etc. Other activities such as construction and maintenance of streets and roads, and construction and maintenance of the flood control system also could directly or indirectly cause adverse impact on the quality of stormwater/urban runoff. Since municipalities must address all significant sources of pollutants, all of these activities must be examined and mitigation measures be incorporated into the routines. As part of the requirements of the current Permit, many of the Permittees have already begun implementation of measures to address the above activities. An examination of these existing measures will be done on a watershed wide basis to establish the most effective approach to address these activities. Such approaches shall be developed and begin implementation by September 1996.

A. SEWAGE SYSTEMS

Sewage spills must not be allowed to enter the storm drain. Control procedures for identifying, repairing, and remediating sewer blockages, infiltration, inflow, and wet weather overflows from the sewers to the storm drain system should be implemented to protect stormwater quality. These procedures could include, but are not limited to, quick field response to overflows, follow-up testing, and complaint investigation.

When sewage spills do occur, they must be contained and collected for proper disposal. Individual permittees may need to modify their sewage overflow response procedures. The field personnel should also have procedural training for field screening, sampling, smoke/dye testing, and TV inspection, if appropriate, to be able to properly investigate any suspect connections or cross connections to the storm drain system.

Los Angeles County has a number of programs aimed at preventing sewage spills from entering the storm drain system. These include:

- Sewage Overflow Response Procedures Revision/Root Control Review. This involves improvement of procedures for containment and cleanup of spilled sewage resulting from overflow.

- Standby Maintenance Crew. This on going program places a maintenance crew on stand by during heavy rainfall for Trancas and Malibu Sewage Treatment plants.

- Reline Sewer Lines. Two locations will undergo relining of existing sewer lines to prevent infiltration and exfiltration.

VOL 15
0344
R0060565

- Sewer Pipeline Reconstruction. 127 miles of cement pipelines will be analyzed and replaced or rehabilitated within 5 years.

- Sealing of Manhole Covers. This program has sealed manhole covers and bar holes in areas subject to flooding.

- Expansion of Emergency Call List. Beeper numbers of all supervisors, superintendents and standby crews were added to emergency call list.

The City of El Segundo has implemented a number of programs intended to prevent spills from entering the storm drain system. They include:

- Closed Circuit Television of Wastewater Mains (CCTV). The videotaping of the interior of as sanitary sewer mains allows for locating immediate problems and to set up repair and replacement program.

- Hydro Flush Program. The yearly hydro flush program precludes wastewater overflows.

- Wastewater Lift Stations. The rehab program for sewage lift stations keeps wastewater plants in good operating condition and prevents failures and overflows.

Los Angeles City's Limitation of Sewage Infiltration into Storm Drain System traces sewage infiltration into the storm drain system using a variety of techniques.

B. CORPORATION YARDS

Corporation yards include any area or facility that is used for vehicle maintenance or washing, other maintenance, chemical storage, paint facilities, and supportive activities for field crews. Permittees will need to incorporate pollutant control measures at these facilities and develop a plan for each facility outlining the measures to be implemented. Since these are industrial type activities, the corporate yards would need to implement measures as described in the Industrial/commercial Source Chapter.

1. STORM WATER POLLUTION PREVENTION PLANS (SWPPP)

Though not required, permittees may elect to use some form of SWPPP as a vehicle for compliance. Any BMPs to be implemented must be part of a comprehensive plan designed to address the various pollutant sources at each corporate yard. To achieve this goal, the municipalities should first identify the potential pollution sources and who is responsible for implementing the storm water management measures. Based on the facility type, management

VOL 15
0345
R0060566

practices and schedule of implementation will be developed. BMPs that can be used to improve the quality of runoff include, but are not limited to, housekeeping practices, material storage control, vehicle leak and spill control, and illegal dumping control.

The City of Los Angeles is presently undertaking the following studies: a) Storm Water Pollution Abatement--Street Maintenance Yards. Four street maintenance yards, including an asphalt processing plant, are being studied as potential sources of storm water pollution; and b) Spill Prevention, Containment and Response Procedures--City Facilities. This program, in the City of Los Angeles ensures that facilities have adequate spill prevention, containment and emergency response procedures.

The City of El Segundo has prepared an industrial waste study and prepare a Storm Water Pollution Prevention Plan for the City Maintenance Facility.

2. OUTDOOR LOADING/UNLOADING OF MATERIALS

Municipal employees who handle potentially harmful materials should be trained in good housekeeping practices to prevent or reduce the discharge of pollutants to storm water from outdoor loading/unloading of materials. Materials spilled, leaked or lost during loading/unloading may collect in the soil or on other surfaces and be carried away by runoff or when the area is cleaned.

Applicable BMPs should be selected based on the following four factors: 1) Extent of exposure of material to rainfall, 2) preventing stormwater run-on, 3) checking equipment regularly for leaks, and 4) containing spills during transfer operations.

3. MATERIAL STORAGE CONTROL

A program should be developed to prevent or reduce the discharge of pollutants to storm water from outdoor container storage areas using measures such as installing safeguards against accidental releases, secondary containment, conducting regular inspections, and training employees in standard operating procedures and spill cleanup techniques. Employee education is paramount for successful implementation. Employees should be trained in emergency spill cleanup procedures.

To limit the possibility of storm water pollution, containers used to store dangerous waste or other liquids should be kept inside the building unless this is impractical due to site constraints. Storage of reactive, ignitible, or flammable liquids must comply with the fire and California OSHA codes.

VOL 15
0346
R0060567

Practices such as placing containers in a designated area should be employed to enhance such requirements.

The City of Los Angeles has a Certified Hazardous Waste Storage Facility. Three pre-fabricated storage buildings have been installed at the Los Angeles Aqueduct Filtration Plan to isolate hazardous materials.

4. VEHICLE AND EQUIPMENT WASHING AND MAINTENANCE

Washing vehicles and equipment outdoors or in areas where wash water flows onto the ground can pollute storm water. For municipalities that wash vehicles or pieces of equipment on-site, it should be performed in a designated area equipped with an oil/water separator.

Vehicle or equipment maintenance is a potentially significant source of storm water pollution. Parts are cleaned with solvents. Many of these cleaners are harmful and must be disposed of as a hazardous waste. Appropriate BMPs are waste reduction, use of alternate products, recycling, and spill leak clean up control.

5. WASTE HANDLING AND DISPOSAL

Proper waste management is possible by tracking waste generation, storage, and disposal; reducing waste generation and disposal through source reduction; and preventing run-on and runoff from waste management areas.

C. PARKS AND RECREATION

Park Departments manage landscaping and swimming pools. Both of these activities involve the use of chemicals, waste management, and non-storm water discharges. In addition maintenance of swimming pools requires the periodic discharge of large quantities of swimming pool water.

1. FERTILIZERS/PESTICIDES

a. Use/Application management

Municipal facilities should develop controls on the application of pesticides, herbicides, and fertilizers. Control may include:

- List of approved pesticides and selected use;
- Product and application information for users;
- Equipment use and maintenance procedures; and
- Record keeping.

VOL 15
0347
R0060568

Employees can be educated about environmentally sensitive alternative products by using information developed by various public agencies and other environmental organizations.

b. Storage

Improper storage of fertilizers and pesticides can lead to potential groundwater, soil, and stormwater contamination. To prevent or reduce their impact on stormwater pollution, material storage areas must be designed and maintained to reduce exposure to storm water. The following BMPs can help to achieve this goal:

- Store materials inside or under cover on paved surfaces,
- Use secondary containment,
- Minimize storage and handling of hazardous materials,
- Inspect storage areas regularly.

2. FACILITY MANAGEMENT

a. Wash Waters

Wash waters cannot be discharged into the storm drains untreated. The storage area should be slightly sloped for wash water collection. If the water is not discharged to the sanitary or process waste sewer, or to a dead-end sump, the outlet should be equipped with an oil/water separator or other treatment systems.

b. Maintenance

Landscape maintenance involves the use of pesticides and fertilizers. Proper use of these materials will reduce the risk of loss to storm water. Whenever possible, leave or plant native vegetation to reduce water, fertilizer, and pesticide needs. Integrated pest management should be employed where appropriate. The Park Departments should also establish a schedule for irrigation and fertilization. The chemicals will be carried from the site by the next storm if they are applied during the wet season. Overwatering leads to discharge of water that may have become contaminated with nutrients and pesticides.

Storm water from parking lots may contain undesirable concentrations of oil, grease, suspended particulates, and metals, as well as the petroleum byproducts of engine combustion. Possible maintenance BMPs include periodic sweeping and cleaning catch basins.

VOL 15
0348
R0060569

The City of Los Angeles has installed special equipment at Rancho Park Golf Course to remove oils and oil-based cleaning agents as well as organic material from surface water that drains into the storm drain system.

c. Swimming Pool Waters

The drainage of swimming pool water must insure that chlorine residual is below allowable water quality limits. The potential for recycle/reuse for irrigation of lawns and landscapes may be investigated. Swimming pool filter backwash waters should not be discharged to the storm drain, but should be allowed to settle and then disposed to the sanitary sewer. Other possible alternative measures would be to use the backwash for irrigation or disposal on a dirt area.

D. STORM DRAIN SYSTEM OPERATION AND MANAGEMENT

The maintenance and operation of the storm drain system has an impact on storm water quality and must be addressed. Material clogging storm drains cannot be discharged into drains. It must be disposed of properly.

1. INLET MAINTENANCE

Regular maintenance of public and private catch basins and inlets is necessary to ensure their proper function. Maintenance will remove pollutants, reduce high pollutant concentrations during the first flush of storms, prevent clogging of the downstream conveyance system, and restore the catch basin's functional capacity. Keys to effective catch basin cleaning include the following:

- All basins should be cleaned annually prior to the onset of the rainy season;
- Clean catch basins in known problem areas more frequently to remove sediments and debris accumulated during the dry weather months;
- Keep records of the number of catch basins cleaned; and
- Track the amount of waste collected.

Caltrans will develop a priority list of drains and pump houses requiring cleaning.

Nine jurisdictions clean their catch basins annually, while the cities of Santa Monica and Hermosa Beach perform this cleaning four times a year. Three other jurisdictions clean catch basins twice a year and the City of Los Angeles has grouped their catch basins into "routes" that are inspected and/ cleaned at least once a year.

VOL 15
0349
R0060570

2. DRAIN MAINTENANCE

Open channel storm drains should be cleaned at least annually prior to the rainy season. Problem areas should be cleaned more frequently as needed. Channels should also be monitored during the rainy season for any debris buildup and cleaned where needed.

To reduce the amount of debris entering the ocean, Los Angeles County field personnel inspect open channels and sumps after storms and clean debris as needed.

3. WASTE MANAGEMENT

Excessive waste buildup will decrease the capacity of the channel, it is therefore crucial to reduce pollutant levels in storm water by regularly removing illegally-dumped items and material from storm drainage channels and creeks. A program should be developed to identify problem areas of illegal dumping so regular inspection and clean up can maintain the channel's optimum capacity and prevent the discharge of contaminants.

4. NEW SYSTEM DESIGNS

Current design standards for the construction of new storm drain systems will be evaluated in light of currently available pollutant control measures. Design standards may be modified to incorporate measures deemed appropriate for local conditions.

The City of El Segundo provides the following operations and maintenance of the storm drain system:

- Flow Monitoring and Analysis. Monitoring and analysis of dry weather flows to the city's 5 pump stations could help to determine the origin of these minor flows.
- New Telemetering System. This system will improve monitoring and reliability of the city's storm water and waste water pumping plants.
- Storm Water City Drawings. During catch basin stenciling an update of the City Catch Basin Plan was prepared.

The City of Los Angeles has formed an Inter-Jurisdictional Storm Water Re-Use Task Force to implement diversion, capturing and possibly re-using high quality storm water run-off; also the City is modifying standards for flood control projects by incorporating storm water pollution reduction components.

VOL 15
0350
R0060571

5. RETRO-FIT OPPORTUNITIES

The majority of the existing storm drain systems are in highly urbanized areas providing little opportunity for cost effective retro-fitting. However, currently available pollutant control measures will be reviewed for their effectiveness and possible use. This may include pilot studies to evaluate the performance of management practices under local conditions.

The City of Santa Monica, with some assistance from the City of Los Angeles, is undergoing a feasibility study for a Low Flow Storm Water Reclamation Plant that would be constructed to treat storm water from the Pico Kenter storm drain. Also the City's Storm Drain Pollution Sensor System is scheduled for FY 95-96 to detect levels of pollution in the storm drain system.

The City of Santa Monica has begun the installation of boards over the openings of catch basins and is also presently considering a program to treat storm water flows from the Pico Kenter and Pier storm drains to prevent pollution into the ocean.

E. STREETS AND ROADS

Construction, operation, and maintenance of roads has an impact on storm water quality and will be addressed in the management plan.

1. SWEEPING

Street sweeping can collect refuse on street surfaces to prevent it from entering the storm drain system through catch basins.

a. Storm Water Quality Based Operation

In order to effectively implement the sweeping program, the permittees should keep accurate operation logs to track the program. Areas generating excessive refuse should be swept more frequently. Sweeping frequency may also be increased before the rainy season to reduce the amount of refuse entering the storm drain system. Parking on sweeping days should be regulated to facilitate the operation.

Nine jurisdictions perform street sweeping on a weekly basis, two jurisdictions twice a month and one jurisdiction once a month in residential areas while materials are swept weekly.

VOL 15
0351
R0060572

The City of Rolling Hills does not provide street sweeping services because all of the roads are privately owned, Los Angeles City provides weekly sweeping in approximately 1/3 of the posted streets and monthly service in the remaining areas. Caltrans sweeps its roadways on a regular schedule determined by observable debris.

b. Waste Management

Seven jurisdictions empty roadside trash receptacles weekly, while two jurisdictions perform this service twice a week. Two other jurisdictions empty trash receptacles three times a week while the cities of Santa Monica, West Hollywood and Beverly Hills collect the rubbish as often as once per day. The City of Rolling Hills does not provide roadside trash receptacles because it is entirely residential with private streets.

2. STREET/PAVEMENT WASHING

Wash waters from street/pavement washing are contaminated and must be managed as non-storm water discharges.

3. MAINTENANCE

a. Saw-cut Slurry Management and Paving Practices

Existing saw-cut management and paving practices conducted by the permittees will be evaluated and appropriate control measures developed. Possible control measures to be considered that would help reduce the impacts to storm water:

- Avoid paving during wet weather;
- Regularly repair potholes and worn pavement to reduce sediment loading;
- Store materials away from drainage courses to prevent pollution of storm water run-on; and
- Follow the storm water permitting requirements for industrial activities when mixing concrete with an on-site plant.

b. Waste Management

Vehicles transporting waste should have spill prevention equipment that can prevent spills during transport. The refuse collected will be transported to the appropriate disposal facilities.

VOL 15
0352
R0060573

Good housekeeping practices will be implemented to insure proper management of any waste products that may be generated during maintenance activities. For example, to prevent concrete waste from entering the storm drain system, washout of concrete trucks should be conducted off-site or on-site in designated area. Excess concrete should not be dumped on site. Employees and subcontractors should be trained in proper concrete waste management.

The following steps will help reduce storm water pollution from concrete wastes:

- Store dry and wet materials under cover, away from drainage areas;
- Avoid mixing excess amounts of fresh concrete or cement on-site;
- Do not wash out concrete trucks into storm drains, open ditches, streets, or streams;
- Do not allow excess concrete to be dumped on-site, except in designated areas;
- Avoid paving during wet weather;
- Regularly repair potholes and worn pavement to reduce sediment loading; and
- Cover catch basins and manholes when applying seal coat, tack coat, slurry seal, fog seal, etc.

Employee/subcontractor training to insure implementation of good housekeeping measures should be based on four objectives:

- Promote a clear identification and understanding of the problem, including activities with the potential to pollute storm water;
- Identify solutions (BMPs selection);
- Promote employee/subcontractor ownership of the problems and the solutions; and
- Integrate employee/subcontractor feedback into training and BMP implementation.

c. Medians/Landscaped Right-of-Way

i. Irrigation

Overwatering of landscaping produces runoff. A properly timed irrigation schedule should be set up to minimize overwatering.

VOL 15
0353
R0060574

Drip irrigation system should be used when feasible in new installations.

Caltrans Right-of-Way Maintenance Vegetation Control Program provides benefits of motorists' safety and erosion control.

ii. **Fertilizers/Pesticides**

The handling, storage, and usage of fertilizers/pesticides are addressed in Chapter V, Section C-1.

F. FLOOD CONTROL

Common municipal practices, such as construction and operation and maintenance of the flood control system, may have a potentially adverse impact on storm water quality. Consequently, these practices shall be coordinated to the extent of preventing pollutants from impacting the water quality.

The City of Los Angeles is reviewing standards and considering modifications for flood control projects to incorporate storm water pollution reduction components. Evaluation of available references is expected to result in either revisions to Standard Plans or a new manual.

1. COORDINATION WITH NEW PROJECTS

Current design standards for the construction of new storm drain systems will be evaluated in light of currently available pollutant control measures. Design standards may be modified to incorporate measures deemed appropriate for local conditions. During construction, all appropriate BMPs will be utilized to control pollutants during the construction of the facility.

Los Angeles County's Ballona Creek Debris Fence was installed in July of 1993, to prevent debris from entering the ocean by detaining floatable trash and debris for later collection.

2. COORDINATION OF MAINTENANCE ACTIVITIES

Current maintenance activities with regards to desilting/sediment removal, vegetation management, and waste management shall be reviewed to insure that appropriate management measures are developed to comply with the storm water regulations.

VOL 15
0354
R0060575

3. OPERATION OF FACILITIES

Flood control facility operations will be reviewed to identify where appropriate management measures could be incorporated. However, primary consideration will need to be given to the flood control function of the facility to protect health and safety.

4. RETROFIT OPPORTUNITIES

The majority of the existing storm drain systems are in highly urbanized areas providing little opportunity for cost effective retro-fitting. However, currently available pollutant control measures will be reviewed for their effectiveness and possible use. This may include pilot studies to evaluate the performance of management practices under local conditions.

The County of Los Angeles, in September 1994, has built an inflatable dam across the San Gabriel River to impound surface runoff which will be recharged into the aquifer. During this process any trash and debris accumulating will be removed.

G. PUBLIC FACILITIES

Storm water runoff and non-storm water discharges from other public facilities must also be addressed, including chemical use by these facilities, pressure blasting/cleaning sidewalks and other surfaces.

1. PARKING FACILITIES

Storm water from parking lots may contain undesirable concentrations of oil, grease, suspended particulates, and metals. Some control measures such as periodic sweeping and cleaning catch basins should be implemented. The need for more advanced structural controls would be evaluated through the pollutant source identification program. Pilot studies would be conducted on candidate structural controls to evaluate their effectiveness prior to large scale implementation.

2. GOLF COURSES

Golf courses require the use of large amount of water, fertilizers, and pesticides. Field personnel should be trained on the proper handling, storage, and usage of these chemicals (Refer to Chapter V, Section C-1 for detail). To prevent excess irrigation water from entering the storm drain system, proper management of watering schedules should be required.

VOL 15
0355
R0060576

3. SCHOOLS

The maintenance of playgrounds and athletic fields at schools require fertilizers and pesticides. Their safe storage and use affect not only the stormwater quality but also the health of the students and the staff. Therefore BMPs under Chapter V, Section C-1-b should be implemented. Each municipality should develop a program to encourage these schools to use environmentally sensitive products for fertilizers, pesticides, detergents, and other chemicals. The schools should have proper material handling, storage, and disposal procedures for chemicals used in school laboratories.

4. HOSPITALS

Each hospital should have BMPs to control the handling and storage of medically related hazardous materials. All materials should be inventoried regularly, with record keeping protocols on supply and consumption. All personnel should be trained on the proper procedures on handling these materials, as well as emergency response. Each hospital should maintain a list of supervisors to be contacted if accident does occur. Disposal of these materials should be contracted out to commercial specialists.

5. PARKS/LANDSCAPES

Refer to **Section C Parks and Recreation**, of this Chapter, for information.

6. OTHER BUILDINGS/PLAZAS

Refer to **Section C-2 Parks and Recreation - Facility Management**, of this Chapter, for information.

H. PONDS, FOUNTAINS, AND OTHER PUBLIC WATER BODIES

Maintenance practices used on public water bodies, including waste management and non-stormwater discharges, must be addressed in the plan.

1. ALGAE CONTROL

a. Use of Chemicals

The use of herbicides or other chemicals to control algae growth should be carefully controlled and monitored to insure strict adherence to manufacturers' guidelines for use. Water sampling may be necessary to insure effective control.

VOL 15
0356
R0060577

2. CHLORINE MANAGEMENT

The use of chlorine for disinfection should be controlled. High dosage of chlorine may be harmful to the aquatic habitats. Dechlorination of pools and other water bodies would be required prior to draining.

3. MAINTENANCE

Each municipality should develop BMPs to prevent and control trash, debris, and other pollutants from entering water bodies. These measures could include routine trash collection along and on water bodies, public outreach to educate the public about the impacts of illegal dumping, and increase enforcement for violations.

P:\ORV\WSHED2.BAL\V

VOL 15
0357
R0060578

VI. RESIDENTIAL

INTRODUCTION

Residential activities including private vehicle washing and maintenance; use of chemicals such as pesticides, herbicides, and paints; private swimming pool maintenance; and other household and landscape maintenance can contribute to storm water pollution. These are all examples of non-point source pollution, a significant impact on water quality. Measures that can be taken to improve the quality of the runoff from residential area all require active public participation. Feasible BMPS to mitigate the stormwater pollution problem should include practicing good housekeeping and the use of environmentally sensitive alternative products, vehicle leak and spill control, and water conservation. Development of the residential stormwater program will be completed by December 1995.

A. HOUSEKEEPING PRACTICES

This BMP involves the development of a program to promote efficient and safe housekeeping practices (storage, use, and cleanup) when handling materials which may pollute stormwater/urban runoff. This could include, but are not limited to, fertilizers, pesticides, cleaning solutions, paint products, automotive products, and swimming pool chemicals.

A public education program will be developed to provide information on stormwater pollution and the beneficial effects of proper disposal on water quality; reading product labels; safe storage, handling, and disposal of hazardous products; list of local agencies; and emergency phone numbers. The above information can be disseminated through brochures or booklets made available at places such as public information fairs, municipal offices, and household hazardous waste collection events and facilities. City newsletter to residents is another means to inform the public, especially for those who do not participate or visit any offices or events.

B. ENVIRONMENTALLY SENSITIVE ALTERNATIVE PRODUCTS

This BMP, promoting the use of less environmentally sensitive products, can be implemented in conjunction with housekeeping practices. Alternatives exist for most product classes including fertilizers, pesticides, cleaning solutions, and automotive and paint products. The key to success will be to promote a willingness to try alternatives and to modify old habits.

General information will be developed and made available to the public on such alternatives. The emphasis may be placed on the need to preserve the natural environment of the receiving waters (ocean, bay, stream, wetland, etc.) with the use of alternative products because of their less toxic nature and proper disposal after its use.

VOL 15
0358
R0060579

C. VEHICLE LEAK AND SPILL CONTROL

This BMP prevents or reduces the discharge of pollutants to storm water/urban runoff from vehicle leaks and spills by reducing the chance for spills, stopping the source of spills, containing and cleaning up spills, and properly disposing of spill materials.

Vehicles will leak and spill fluids. The key to successful pollution management is to reduce the frequency and severity of leaks and spills; and when they do occur, to prevent or reduce the environmental impacts. Through education, the public should be encouraged to regularly inspect and maintain their vehicles. Guidelines should be developed to inform the public on spill containment and cleanup procedures such as having absorbent material on hand and disposing the material properly.

D. WATER CONSERVATION

Water is a scarce resource, especially so in Southern California. Wasteful use of water could channel pollutants into the receiving waters. Practices such as hosing the driveway and overwatering the landscape contribute not only to stormwater pollution, but also to the depletion of our natural resource. In order to prevent stormwater pollution, the public has to be educated on the mechanics of our storm drain system - discharges into the system will flow untreated into the receiving water. They have to know that the lawn clippings they wash down the road will end up in the ocean. Public awareness of the function of the storm drain system, of the importance of environmental health, and of our necessity to slow down the depletion of water resources will go a long way in reducing the pollution of stormwater/urban runoff.

Ordinances could be use to endow the related officials with legal authority to enforce water conservation. An ordinance prohibiting the wasting of water is one way of enforcement.

In addition to the specific programs and plans outlined in this report, several watershed co-permittees have targeted activities occurring in and around the home that tend to contribute to degradation of storm water runoff quality. A practice that carries on-the-ground pollutants directly to storm drains is misuse of exterior water, namely the overwatering of landscaping, the hosing of driveways/sidewalks and the washing of cars in driveways--all of which allow water to run down the street into the nearest storm drain.

This situation can be addressed in two ways: 1) either reduce/prevent pollutants from being placed in areas where they may be carried by water into the streets or 2) minimize the amount of water allowed to flow on impervious surfaces that are connected to the street system.

VOL 15
0359
R0060580

Water conservation measures can be designed to address the issue of impervious surface water flow. While conservation has historically been used to conserve domestic water, many jurisdictions are now recognizing the additional benefit of prohibiting water flows from private properties onto the street system. All co-permittees within this watershed implement water conservation programs. Hermosa Beach has drafted a Storm Water Pollution Prevention Ordinance which will discourage excessive outdoor water use by prohibiting non-storm water discharges to the storm drain system. Public outreach is a component of all programs, many of which carry fines for water wasting practices. Most jurisdictions encourage water efficient landscape. While some ordinances were established specifically to conserve water during periods of drought, several jurisdictions are keeping such controls in place at all times as measures to control non-stormwater runoff.

P:\ORV\WSHED2.BAL\VI

VOL 15
03600
R0060581

VII. PUBLIC INFORMATION AND PARTICIPATION

It is necessary to involve the public in the stormwater program for it to be effective. The outreach program should be focused on the specific needs of the individual cities. Due to the inter-relationship among the stormwater issues, the public information and participation program should be recognized as a whole, rather than a number of separate outreach programs. All public awareness efforts should clarify to the public that they are the ultimate beneficiaries of a successful stormwater management program.

A. GENERAL OUTREACH

The targeted audiences of a general outreach will include municipal employees, local construction contractors, businesses in the area, and the general public. They should be made aware of their responsibility for both the problems and the solutions to stormwater pollution. In order to effectively communicate the stormwater pollution abatement message throughout the watershed; written, audio, and visual materials should be utilized. The actual level, priority, and schedule of public information activities must be based on the community's needs and resources to maximize program effectiveness. A watershed-wide concept will be developed by December, 1995.

All Co-Permittees within the watershed have active, multi-media public outreach programs. Extensive efforts have been made or are planned by every agency to supply the public with information on a full range of storm water quality activities with the intention of achieving a high level of public cooperation and participation. West Hollywood has hosted "Storm Water Awareness Week" to draw attention to storm water issues.

1. WRITTEN MATERIAL

Co-Permittees should produce a variety of written materials to inform the residents within the watershed. Materials can include, but are not limited to, the following: flyers, brochures, door-hangers, newspaper articles, mail-inserts, banners, and posters. When necessary, these materials should be translated into a variety of foreign languages to reach minority residents in the community.

A diversity of print media outreach programs have been used extensively throughout the watershed. Newsletters and brochures mailed to all residents have often included articles on various storm water programs. Utility bill inserts are also used extensively to promote public awareness. Billboard and bus stop shelter advertising is used by both Los Angeles City and County. Street banners are one of the devices used by Manhattan Beach. Los Angeles

VOL 15 0361

R0060582

City and County have refrigerator magnets to promote their programs. Door hangers are distributed by Culver City, Hermosa Beach, West Hollywood and Los Angeles City and County. Los Angeles City and Manhattan Beach have posters and street banners promoting storm water runoff quality.

2. AUDIO MATERIAL

Similarly, Co-Permittees may utilize audio materials to convey information regarding stormwater management. Examples of audio materials include radio advertisements/public service announcements and informational cassettes.

3. VISUAL MATERIAL

Catch basin stenciling program is an excellent means of educating the public on the mechanics of the storm drain system. The intent of the program is to enhance public awareness of the impact of stormwater pollution on receiving waters and to discourage improper waste disposal practices. Another effective medium for communicating the importance of stormwater management is through television. Possible measures include producing a public service announcement, cable access programs, and/or an informational video.

The most universal of the general outreach programs--catch basin stenciling--is receiving full cooperation throughout the watershed. Most jurisdictions have completed their stenciling program. El Segundo, Palos Verdes Estates and Rancho Palos Verdes received assistance from the Boy Scouts; Los Angeles, Manhattan Beach and Santa Monica also noted the use of volunteer groups. Particularly in the urban areas with stop-and-go traffic, it was suggested that by stenciling the curbsides motorists could read the signs. El Segundo has a stencil logo contest. Four cities commented that the stenciling was beginning to fade, suggesting that a more durable, water resistant paint be used.

Among broadcast media outreach, the City of Los Angeles has prepared a public service announcement which has been shown on cable access channels. With cable television service available throughout the watershed, most jurisdictions have used this medium for public service announcements and special programming. Los Angeles County uses both television and radio outreach.

4. DISTRIBUTION PLAN

General outreach efforts must be conducted throughout the entire watershed. Materials should be available at all public counters and distributed at public events such as environmental fairs and contests. A city newsletter is another effective method of conveying the pollution abatement message.

VOL 15
0362
R0060583

General outreach to targeted groups is an objective of some co-permittees--especially Los Angeles City who has a student/teacher school education program (K-6 "Magical City Forest") and a mailing program directed at private industries likely to be required to obtain a General Industrial Storm Water Permit.

B. FOCUSED OUTREACH

Efforts should be made to target special groups. Focus could be on specific pollutants, practices and/or activities, or businesses. A watershed-wide concept will be developed by June 1996.

1. POLLUTANT SPECIFIC

For a particular watershed, there may be priority pollutants which are of more concern than others. The reduction of these pollutants may be addressed in a more focused public education and outreach program. Any of the methods used in the general outreach program may be utilized in a pollutant specific outreach program.

2. PRACTICE/ACTIVITY SPECIFIC

Everyone who lives or works in a particular watershed must realize that their actions have a direct affect on the quality of stormwater. These special groups must be made aware that their current practices/activities may be contributing to stormwater pollution. Practice/activity specific outreach programs should be developed and implemented throughout the watershed. The use of written, audio, or visual materials should convey three primary messages: (1) what activities can cause stormwater pollution, (2) how Best Management Practices are used to prevent pollution, and (3) how one can report occurrences of stormwater polluting activities.

Practice/activity specific outreach should promote, publicize, and facilitate public reporting of illegal dumping, illicit discharges, or water quality impacts associated with discharges from municipal separate storm sewers. An effective program should include the establishment, operation, and promotion of a reporting hotline. Timely reporting by the public of improper disposal and illicit discharges are critical in controlling such sources of stormwater pollution. Increase in public involvement may be achieved by sending a follow-up letter to callers or providing callers with some type of reward. Educational efforts throughout the watershed should inform the public about the existence of the Los Angeles County-wide hotline and any other local hotlines; provide them with information regarding what to look for, and guidelines/procedures on how to report incidents.

VOL 15
003633
R0060584

Another critical component of practice/activity outreach is the development of a program to facilitate the proper management and disposal of used oil and toxic materials. An effective program could include, but is not limited to, the operation of recycling facilities and the conduction of household hazardous waste round-ups. The program could also include information about alternatives to toxic materials. Educational efforts throughout the watershed should provide the public with detailed information regarding the Los Angeles County-wide Household Hazardous Waste Round-ups and any other local programs.

The varied sources/causes of storm water pollution have resulted in implementation activities that target specific types of pollutants, activities and land uses/types of businesses. Within this watershed co-permittees take part in public information and participation programs specifically aimed at preventing improper disposal of hazardous household products and encouraging actions that keep general wastes out of the storm drain system–such as recycling programs, public trash receptacles and the cleaning of sidewalks, alleys and vacant lots. Illegal dumping and discharges are also specific targets.

Such activities are encouraged through general outreach programs (discussed above) that promote such programs as toll-free phone hotlines for reporting illegal polluting activities, topic-specific brochures, speakers bureaus and special recycling facilities (used motor oil, hazardous products, etc.). Redondo Beach has a Recycling Hotline. The trash hauler in Rolling Hills Estates holds a quarterly drawing of residents who routinely recycle; the prize is one free year of refuse service. Manhattan Beach has an Ocean Safe Enterprise campaign, complete with window decals, to encourage restaurants and other businesses to observe safe disposal practices. A companion program, Ocean Safe Community, is aimed at the entire area. Los Angeles County has an outreach program focusing on airport operations; a component of the program is structure stenciling. The City of Los Angeles has a wide range of focused programs that can be tailored for special exhibits and interest groups, including elementary schools.

3. BUSINESS SPECIFIC

Due to the fact that some business operations have a higher potential of discharging pollutants into the storm drain system, a more focused public education and outreach program should be developed for them. Employees of these businesses should be educated on the issue of nonpoint source pollution and the effectiveness of Best Management Practices in reducing pollution. Besides written, audio, or visual materials that focus on specific businesses and their practices, mass mailings or articles in a trade/industry magazines are other possible means of focused outreach.

VOL 15 0364

R0060585

C. EDUCATION PROGRAMS

Increasing awareness is the major goal of the Public Information and Participation Program. An ideal means of accomplishing this task is through educational programs. Programs should be developed for a variety of audiences, including public employees and school children. Educational programs can also be an important part of a general or focused outreach. A watershed-wide concept will be developed by June 1996.

1. PUBLIC EMPLOYEES

It is important to educate all of the public employees about the stormwater program so that they do not continue with any practices that are counter productive. Furthermore, they can participate in the implementation and enforcement of the program. Ideas and suggestions of employees can be used to modify the program for improved effectiveness. The outreach must involve employees on many different levels - from program managers to field personnel. Educational programs for public employees may include, but are not limited to, articles in City newsletters, training classes, checklists for field personnel, and interdepartmental forum or committee. Any of the materials utilized in an outreach program - written, audio, or visual materials - may be used in a public employee educational program.

Both general and focused outreach are essentially programs of public education. More formal training/education is also conducted by Caltrans and the City and County of Los Angeles. Caltrans personnel is educated on highway maintenance--specifically on such subjects as Hazardous Substance Spill Awareness and Pesticide Safety and Vegetation Management. City and County personnel meet regularly to discuss development of and evaluate storm water quality practices. Rio Hondo Community College staff provides on-site hazardous materials training classes for West Hollywood employees.

2. K-12

School children can play an important role in a public information and participation program. First, children are generally more easily motivated and the behavior changes made at that point in life tend to stay with them through adulthood. Secondly, school children can convey the stormwater pollution prevention messages to the members in their family. School programs must include information on the storm drain system, stormwater quality awareness, and may also include, but are not limited to, illegal dumping awareness, source minimization, and pollution prevention. Written material, videos, assembly programs, and field trips are examples of effective components of a K-12 educational program.

VOL 15
0365
R0060586

Los Angeles City also has a school education pilot program, "The Magical City Forest", for grades K-6. School programs are conducted in Hermosa Beach and Manhattan Beach, as well. The County will soon have a program mascot to be used at public events.

3. OTHER

Educational programs can also be developed for professionals and technicians who are not public employees. Agencies should include public outreach material for business license renewal or outreach effort through professional and business associations.

D. RESIDENTS PARTICIPATION

The residents of the watershed should not only be made aware of the stormwater program, they should be encouraged to participate in its implementation. Specific outreach programs should be developed to allow the public to participate and to inform them of available means for providing ideas and comments regarding the stormwater program. A watershed-wide concept will be developed by June 1996.

1. VOLUNTEER MONITORING

Volunteer monitoring is the result of increased public awareness and participation. The public can utilize the hotline for reporting suspected illegal practices. Such involvement, which is similar to the Neighborhood Watch Program on crime, usually has good results.

2. COOPERATIVE OUTREACH

In order to promote public participation, cooperative outreach programs should be developed. These cooperative programs should help to create an awareness and an identification with the watershed. The catch basin stenciling and other signing programs are excellent examples of this type of cooperative effort. One possibility for cooperative outreach is an "Adopt-A-" program. Residents can "adopt" a highway, storm drain, catch basin, stream, etc. Other cooperative outreach efforts include events such as "Stormwater Pollution Awareness Week." The purpose of any of these activities is to inform and involve the local residents in regards to the stormwater management program.

Residents can assist public agencies in the development and implementation of storm water quality programs. Several watershed jurisdictions have enlisted the assistance of such groups as the Boy Scouts and neighborhood volunteers in the catch basin stenciling program. Caltrans' Adopt-A-Highway program relies on voluntary private participation to help with clean-up activities. Rolling Hills

VOL 15
03666
R0060587

Estates has a similar Adopt-a-Street program. Hermosa Beach residents and businesses are encouraged to participate in the City's "Neighborhood Gutter Patrol" program. Hotline programs also enlist the assistance of residents in active participation.

3. COMPLAINT PROCEDURES

Public comments/complaints are important to the success of a stormwater program. A hotline is an excellent mechanism for allowing the public to provide information. In Section B, "Focused Outreach - Practice/Activity", the various aspect of outreach effort is discussed.

E. EFFECTIVENESS EVALUATION

Permittees should develop a process to evaluate the effectiveness of their programs. Methods such as surveys and focus groups can be used to assess program's effectiveness. Results should gauge the community's level of awareness. Surveys and focus groups can also be used to provide insight into the program's direction and the formulation of attainable goals. A watershed-wide concept will be developed by June 1996.

The City of Los Angeles has conducted a pre-survey to determine the general level of public awareness about storm water pollution. They plan to conduct a post survey in 1995 to gauge the progress made in their public education program. There have been no other reports of formal programs to assess program effectiveness, although staff discussions and management reviews have provided subjective evaluations that have resulted in program development and modifications.

P:\ORV\WSHED2.BAL\VII

VOL 15
03671
R0060588

VIII. PROGRAM EVALUATION

The effectiveness of the storm water programs developed under the Municipal Storm Water Management Plan (hereinafter called the Plan) must be assessed on a regular and consistent basis. The Plan for this evaluation must include a schedule for evaluation, a methodology for the evaluation, a discussion of who will carry out the evaluation, and what will be evaluated. In addition, there must be a mechanism to follow up on the information generated by the evaluation. The Plan should be adjusted based on the program evaluation.

A. PERFORMANCE STANDARDS

The Permittees will develop standards to judge the effectiveness of the activities and control measures proposed under each chapter of the Plan. The standards will serve as minimum performance levels to evaluate the implementation of control measures. The subsequently developed performance evaluation procedures/methodologies will be the tool to determine if a particular BMP has an impact on stormwater quality. In developing these procedures, we resolve to ensure that each BMP is implemented to the maximum extent practicable. The targeted completion of this phase will be December 1996.

1. DEVELOPMENT OF PROCEDURES

General performance standards for evaluating the effectiveness of the Best Management Practices (BMPs) will be developed for all the BMPs proposed in the Plan. The Watershed Management Committee will be responsible for developing and adopting these evaluation criterion. The Management Committee may elect to establish subcommittees to develop performance standards for specific program areas. The area-wide Executive Advisory Committee will then review and endorse the standards. Standard recording format and implementation schedule will be developed for each BMP by the Management Committee for use by all permittees. The permittees will be required to document BMP implementation using the standard format according to an established schedule. The utilization of quantitative approaches in measuring effectiveness will be used whenever possible. Methods that would yield comparable results for year to year evaluation will be developed.

2. ACTIVITY/SOURCE/ACTION AREA SPECIFIC

Program effectiveness will be performed based on the information generated by the performance evaluation procedures. Using street sweeping as an

VOL 15
03688
R0060589

example, the Plan will propose a method of determining if street sweeping has an impact on water quality. This could include determining what kind of pollutants are removed by the sweeping, measuring the size of the pollutants and the amount removed. Methodologies would be developed for each BMP, which will assure that each control measure or action is implemented to the maximum extent practicable. For street sweeping; this may include the frequency of sweeping now, the method of sweeping, the equipment used, how the equipment is cleaned and maintained, and the method of disposal for the material collected. A schedule and format of evaluation shall be developed for all the BMPs.

The Regional Board has recommended 13 Baseline BMPs, to be developed and/or implemented by all permittees by the end of the current NPDES Permit. Existing Permit Task 5.2.5 requires an evaluation of the need for additional BMPs, source control, and/or structural control measures.

BMPs have only been implemented for a short time period by Phase I and Phase II cities. Phase III, which contains 30 new cities, has not yet implemented any BMPs. Therefore there is little or no data available to adequately assess effectiveness. In lieu of recommending any changes or additions to BMPs currently being implemented or proposed by the Permittees, a uniform data collection methodology will be established for each of the 13 baseline BMPs. This methodology would be used by all Permittees to compile data on their BMP implementation to allow for a uniform Countywide evaluation of BMP effectiveness. Priority will be given to the development of a uniform data collection methodology to document the success or effectiveness of these 13 BMPs. Upon reorganization of the NPDES Permit Program, as described in Chapter I, this will be the first task addressed by the Watershed Management Committee. The Uniform data collection methodology will be developed by January 15, 1995 for the Santa Monica Bay watershed and by July 1995 for all other watersheds with subsequent implementation by all permittees in each watershed.

B. ANNUAL REPORTS

An annual report for each watershed will be submitted to the Regional Board not more than 45 days after the end of each permit year. Each annual report will include a summary on the programs implemented during the previous year and plan activities that will be implemented during the current year. Any revisions to the Plan would be addressed in the report.

VOL 15 0369

R0060590

1. FORMAT/STRUCTURE

In order to insure uniform annual reporting by all watersheds, the Executive Advisory Committee will develop a uniform annual report outline for use by each watershed. Each Watershed Management Committee will develop a standard format to be used by all the permittees in its watershed in reporting the progress and the status of all stormwater programs implemented in its jurisdiction. The Principal Permittee will utilize this information to develop the annual report for the watershed. Upon approval by the Management Committee, the annual report will be provided to the Executive Advisory Committee which will compile the annual reports from all watersheds for submittal to the Regional Board.

2. EFFECTIVENESS MEASURES

Under Chapter VIII, Section A, the permittees will have developed performance standards for each BMP. These performance standards will be used to assess the effectiveness of the BMPs. By the end of each permit year, the findings of the previous program year will be evaluated and used to suggest changes that are appropriate for implementation during the next year. Focus should also be given to the use of empirical studies, in a control setting, to more fully assess the effectiveness of BMPs.

3. CONTENT

The annual report will include a matrix illustrating the levels of implementation for all permittees. Tables will be developed for each BMP listing all the participating Co-permittees, describing the status of implementation by each Co-permittee of the BMP, and documenting any modifications of the BMP from the standard program. The effectiveness of each program area will be assessed using the performance standards developed under Chapter VIII, Section A. For effectiveness measures, the findings should be presented graphically for ease of comparison with the established levels of effort. Fiscal budget for all the BMPs implemented should also be prepared, grouped by programs. An analysis and evaluation of the results of the past year's monitoring program data will also be included in the report. Any revisions to the Plan should be addressed here, with all the elements affected discussed in their entirety. All relevant information, such as water samples analyses and evaluation, should be included in the appendices.

VOL 15
0370
R0060591

C. SEMI-ANNUAL REPORTS

A semi-annual progress report will update the Regional Board on Permit compliance activities six months into each permit year. The semi-annual report will be provided to the Regional Board within 30 days after the end of the six-month period.

1. PURPOSE

The semi-annual report will serve as a status report on the progress of the implementation of the Plan.

2. FORMAT/STRUCTURE

In order to insure uniform semi-annual reporting by all watersheds, the Co-Permittees will use the standard format developed for the annual report in reporting the progress and status of all the BMPs implemented in their jurisdictions. The Principal Permittee will utilize this information to develop the semi-annual report for the watershed for submittal to the Regional Board.

3. CONTENT

The semi-annual report will include a matrix illustrating the levels of implementation for all permittees. Tables will be developed for each BMP listing the participating Co-Permittees, describing the status of implementation by each Co-Permittee of the BMP, and documenting any modifications of the BMP from the standard program. The permittees will describe the problems encountered during implementation and discuss the modifications to the program in order to solve these problems.

D. INTERNAL REPORTING

In order to facilitate the preparation of semi-annual and annual reports, standard internal formats for use by all Permittees will be developed. The internal reporting procedures will be completed for all Plan chapter elements by December 1996.

1. STANDARD FORMS

The Watershed Management Committee will be responsible for developing standard forms for use by each Permittee. Standard forms will be developed for each BMP to monitor its progress. Some Permittees may have to customize the standard forms in order to reflect their programs' additional features. The forms will collect all the information essential to the preparation of the annual and semi-annual reports. In developing the standard report forms, information that is quantifiable and specific for each program area and/or BMP will be collected.

VOL 15 03711

R0060592

2. PROCEDURES

Co-Permittees will submit all the BMP report forms to the Principal Permittee at the end of the six-month period and the permit year, respectively.

3. RECORD KEEPING

The Regional Board does not need to see all of the extraneous information, but the records will be retained by the Principal Permittee for 2 years. Each permittee will keep a permanent copy of its reporting forms in case they are needed.

E. STORM WATER MANAGEMENT PLAN REVISIONS

There will be an annual review process that will allow the Permittees to revise the Plan for the next year and for the rest of the permit period. Revision procedures will be developed by December 1996.

1. PROCESS

In the annual report, Permittees will compare the progress made on all the BMPs with the established level of effort. If the level of implementation is inadequate, the program should be adjusted to accelerate the progress. If the progress made to date shows that the program is ineffective or inefficient in protecting the stormwater quality, a new program should be developed and implemented for the next fiscal year and the rest of the permit period.

2. REPORTING

All refinements or revisions to be made in the fiscal year will be documented in the annual report, with the dates of implementation proposed.

P:\ORV\WSII\D2.BAL\VIII

VOL 15
0372
R0060593

IX. MONITORING

The Monitoring Program is a critical element in the Stormwater Management Plan. It will provide important data for use in characterizing existing stormwater/urban runoff quality, guiding future development, and modifications to the Plan and also to assess its effectiveness. A watershed wide monitoring program shall be developed by December 1996.

A. SYSTEM CHARACTERIZATION

The existing Permit subdivided the County into six drainage basins with information to be collected to characterize each of the basins.

1. WATERSHED

Each drainage basin has been subdivided into numerous drainage areas, based on an evaluation of the existing drainage system and surface flow patterns. For each drainage area, the following information has been compiled: size; breakdown of existing land use; imperviousness; description of soils; location of waste disposal facilities; and the location, type, and number of industries by Standard Industrial Classification (SIC) Code. This information has been submitted to the California Regional Water Quality Control Board, Los Angeles Region, for Phases I and II. Phase III watershed characterization is in progress and will be completed by the end of December 1994. Due to the volume of the watershed characterization data, this information has not been included herein, but is available for review at either the Regional Board or the Los Angeles County Department of Public Works.

This information will provide a basis for developing other monitoring program elements such as pollutant loading estimates from major land uses and watersheds; pollutant source identification, and identification of illegal discharges/illicit disposal practices.

2. STORM DRAIN SYSTEM

In subdividing each basin into drainage areas, the drainage area tributary to all major outfalls has been identified. Within each drainage area, the tributary storm drain system is being identified and mapped. Key information such as the size of the storm drain facilities, locations of manholes and inlets, and storm drain connections is being compiled. This information will be vital in conducting storm drain inspections to identify and eliminate illegal discharges.

VOL 15
03773
R0060594

3. RECEIVING WATERS

Due to the extent of urbanization in Los Angeles County over the past decades, most of the streams designated as receiving waters in the Los Angeles basin have been replaced with man-made storm drainage systems to provide flood protection to the urbanized areas. These streams have been mapped as part of the storm drain system mapping done under A.2. above. The remaining natural streams are also being mapped.

The Los Angeles County Department of Public Works (Department) has been performing surface water quality monitoring on a voluntary basis since the late 1960s. Samples have been collected and analyzed from various receiving water streams and channels throughout the County to collect general information as to the quality of the surface runoff within our storm drain system.

The program in existence at the time the current Permit was issued was established in the mid 1980s. Twenty-eight sites are sampled monthly for dry weather flows. Twenty-one of the 28 sites are sampled for storm flows up to five times per year. The collected samples are analyzed for general minerals, pH, total dissolved solids, specific conductance, biochemical oxygen demand, bacteria, heavy metals, pesticides, PCBs, total organic carbon, volatile organic compounds, and total petroleum hydrocarbons.

The sample collection at these sites will continue while the new National Pollutant Discharge Elimination System (NPDES) Permit monitoring stations are established. Once all NPDES Permit monitoring stations are operational, sampling at these 28 sites will be discontinued.

In order to provide an initial assessment of the water quality in the major streams and channels in the County, an analysis has been performed on the data collected through the existing surface water monitoring program. The analysis has been done on a Countywide basis and also by major drainage basin. The report can be found in Volume 8.

To better assess the receiving water impacts of stormwater the Department will be developing a program to further study stormwater impacts on selected receiving waters, including conducting toxicity studies. Initial efforts will focus on the Santa Monica Bay Watershed. A Request for Proposal for the development of such a program will be advertized by January 15, 1995.

The water quality data collected by the new NPDES Monitoring Program will provide more detailed data to better assess in upcoming years the quality of our receiving waters. Ten monitoring stations have been proposed along the

VOL 15
0374
R0060595

major streams in the County. A description of these site locations can be found in the monitoring work plans for Phases I, II, and III, previously submitted to the Regional Board, see Volume 8.

4. LAND USE

As described under Section A.1. above, the existing land use categories within each drainage area have been identified. This information has been used to select drainage areas comprised of a single homogeneous land use for land use specific monitoring. A total of 14 land use monitoring sites are being established in the County. Five sites are being installed in the Santa Monica Bay Watershed with the remaining nine to be selected from within the Los Angeles, San Gabriel, and Santa Clara River Watersheds. For a description of the sites, please see Volume 8. These sites will provide valuable information as to the types and levels of pollutants found in runoff from various land uses. This information can then be used to refine the Stormwater Management Plan to develop specific management measures to target identified problems.

B. SOURCE IDENTIFICATION

Identifying the sources of stormwater pollutants from both specific land uses and specific activities will provide the information needed to identify problem areas and allow specific management measures to be developed to address these problems.

1. SPECIFIC LAND USE

As described in Section A.4. above, major land use classifications will be subject to individual monitoring to determine the types and levels of pollutants present.

2. SPECIFIC ACTIVITIES

a. A pollutant source identification program will be designed to identify significant pollutant sources (i.e., parking lots, industrial activities, etc.), with the hope that remedial action can be undertaken to reduce any significant impacts so identified. It will focus on monitoring very small areas (i.e., less than five acres) where a specific and/or interrelated set of pollutant generating activities are occurring. Its objective is to provide data for selecting BMPs for specific activities rather than characterizing discharges for long-term pollutant loading estimates.

Identification of pollutant sources can be done using a number of methods. Potential sources of storm water pollutants can be identified

VOL 15 0315

R0060596

by records of chemical use and/or storage, by studies of specific activities which lead to the deposition of pollutants throughout the watershed, and by field inspection or monitoring. Watersheds which may contain significant pollutant sources can be identified through land use information or by mass loading estimates.

By mid January 1995, the County will begin targeted monitoring of a municipal corporation yard in the Santa Monica Bay watershed. A full program for pollutant sources identification will be developed by December 1996.

b. A storm drain inspection program has also been developed and is being implemented. The first phase of the inspection program will target the open channel storm drains to identify illegal discharges.

The open channel inspections will also be used to screen outfalls from underground storm drains for the presence of dry weather flows. This information will be used in the next phase of the storm drain inspection program to prioritize the underground storm drain system for further field screening and inspection of problem areas.

C. CONTROL MEASURE EFFECTIVENESS

It is unlikely that the effectiveness of the various control measures implemented by the storm water management plan can be determined solely through the data produced by monitoring the quality of storm drain flows, because it is difficult to obtain statistically significant comparisons of watershed-wide control measure performance with such data. For this reason the effectiveness of control measures will be assessed through other means.

Two general types of methods are available for assessment of control measure effectiveness: direct water quality (conventional) monitoring and indirect (non-conventional) monitoring. Direct water quality monitoring can be used to determine pollutant reduction by a specific facility or device. This technique is commonly used for structural or treatment controls, such as detention basins and constructed wetlands, where there is an accessible inflow and outflow. Inflow and outflow results are compared to determine pollutant removal and effectiveness.

Direct water quality monitoring of site runoff before and after implementation of non-structural control measures is also possible. However, it is difficult to demonstrate effectiveness at a statistically significant level because of the high degree of variability in stormwater pollutant concentration and mass loading data. The water quality improvement due to non-structural control measures is generally expected to be less dramatic than that achieved through structural controls. A larger

VOL 15 0376

R0060597

number of samples is therefore required to produce a statistically significant result. This is especially difficult in relation to the monitoring of the pre-control measure condition. Collection of adequate baseline information is necessary prior to the implementation of management practices. Direct monitoring of the effectiveness of non-structural controls is feasible typically only under experimentally controlled conditions (e.g., selection of small, well-defined watershed; control of management practice implementation; effective siting and timing of monitoring activities), including a sufficient number of samples to achieve statistical significance.

Indirect monitoring currently is the primary method of choice of assessment of management plan effectiveness. A number of indirect monitoring techniques are available for assessment of management plan effectiveness.

Verification of program implementation is an indirect monitoring method that can be used to determine how a management plan is being implemented. Another indirect monitoring method, pollutant removal inventories, can be used to assess the amounts of pollutants that have been prevented from entering the municipal storm drain system.

The 13 Baseline BMPs recommended for implementation by the Regional Board plus other BMPs proposed by the various Co-Permittees are in general all non-structural control measures. In the short-term, a uniform data collection methodology will be developed for use by all Permittees to compile information on the level of implementation of the 13 Baseline BMPs. This will allow for a uniform watershed-wide evaluation of BMP effectiveness. For the Santa Monica Bay watershed, this uniform data collection methodology will be developed and begin implementation by January 15, 1995. For the other watersheds, implementation would begin July 1, 1995.

For the long-term, as the various chapters of the Plan are more fully developed, possibilities for the use of direct water quality monitoring for control measure assessment will be evaluated as opportunities arise.

D. POLLUTANT LOADING

One of the objectives of the monitoring program is to estimate the annual pollutant loadings from each watershed. Knowing the types and quantities of pollutants discharged into receiving waters are important in assessing the impacts of stormwater and, in turn selecting appropriate control measures to address problem areas.

The 24 permanent monitoring stations that are being established Permit-wide will be utilized to estimate pollutant loads from each watershed and also from various land uses. For a description of the methodology to be used to estimate pollutant loadings, please see Volume 8. For the Santa Monica Bay Watershed, the pollutant loading

VOL 15
03717
R0060598

model will be tested and operational by January 15, 1995. Actual pollutant loadings will be calculated subsequent to storm events occurring for which water quality data has been obtained. For the other watersheds, a schedule for pollutant load modelling will be provided by January 15, 1995.

To more closely model pollutant loadings and evaluate control measure impacts, a more detailed dynamic modelling will be undertaken on a smaller, representative sub-watershed. The EPA-SWMM model has been selected for use in our dynamic modelling efforts. For the Santa Monica Bay Watershed, the Kenter Canyon Drain sub-watershed has been selected for this modelling efforts. This sub-watershed is typical of the urbanized areas in the Santa Monica Bay Watershed. It is comprised of multiple land uses, has well-defined boundaries, and has no upstream flow regulation. We are reviewing and identifying the existing drainage system, defining current and future land uses, and conducting field checks. The model will be tested and operational by January 15, 1995, with actual modelling results to be available later when local water quality data from our monitoring stations becomes available. Based on the results of the dynamic modelling of the Kenter Canyon sub-watershed, other sub-watersheds may be selected from the other major watersheds in the County.

E. COMPONENTS OF A MONITORING PROGRAM PLAN

The components of the monitoring program plan such as monitoring site locations, dry/storm sampling frequency and methodology, constituents to be sampled, field and laboratory procedures, QA/QC, etc., can be found in Volume 8, which has been previously provided to the Regional Board.

The Monitoring Program elements described in Volume 8 will be revised to address the Monitoring Program needs described in Section A - D above as agreed to in the letter from the County to the Regional Board dated September 22, 1994.

As the various chapters of the Plan are more fully developed, the Monitoring Program will be revised to address any additional monitoring needs that may result.

F. DATA MANAGEMENT

For water quality data collected at the 24 monitoring stations, please see Volume 8 for data storage and reporting methods.

For each Section A - E of the Monitoring Program described above, an annual report will be prepared detailing the data collected, with an evaluation and interpretation the data including water quality impacts.

DOMINGUEZ CHANNEL/LOS ANGELES HARBOR DRAINAGE STORMWATER MANAGEMENT PLAN

INTRODUCTION

On June 18, 1990 the National Pollutant Discharge Elimination System (NPDES) Permit - Order #90-079, NPDES #CA0061654-CI6948 was issued to the County of Los Angeles and 17 cities tributary to Santa Monica Bay. During the subsequent years, two newly incorporated cities within the Santa Monica Bay watershed, Caltrans, and the County of Ventura also became Co-Permittees. This Permit outlined a three year program which required each Permittee to: characterize drainage areas; develop and schedule the implementation of Best Management Practices to enhance the quality of stormwater/urban runoff within its jurisdictional boundaries and storm drains it owns and operates. On July 1, 1992, 36 additional cities were initiated into the Permit and began their three year program. By July 1, 1993, the remaining 30 cities in Los Angeles County within the drainage basin were initiated into their three year program. The cities were grouped according to their starting dates and referred to as Phases I, II, and III respectively (See Table A). In general, the boundaries of each Phase did not encompass whole watersheds but portions of various watersheds (See Figure 1).

The Permit has a five year duration and although Phase III cities have only completed year one of their three year program, the Permit requires the submittal of a Report of Waste Discharge (ROWD) which serves as an application for a subsequent NPDES Permit to replace NPDES Permit #CA0061654, which will expire on June 18, 1995. Therefore, the County of Los Angeles, Ventura County, Caltrans, and the 85 cities are now parties to the subsequent NPDES Permit application utilizing the Municipal Stormwater Management Plan (herein after called the Plan) concept.

The Plan is based on the Stormwater Management Plan Components developed by the California Regional Water Quality Control Board, Los Angeles Region (Regional Board), and is proposed on behalf of the County of Los Angeles and the other participating agencies, see Table B. The Plan describes the stormwater management activities to be undertaken during the next single, five year NPDES Municipal Stormwater Permit. The Plan involves the subdivision of the area of the County under a single, new Permit, into six watersheds, each with its own stormwater management plan. For these watersheds and the agencies in each of these watersheds, see Table B and Figure 2.

As required by the current Permit, all Permittees have proposed BMPs for their jurisdictions, described in Volume One and under prior submittals made to the Regional Board. These BMPs have already addressed many of the program areas discussed under the stormwater management plan. As required by the current Permit and continuing on under the new Permit, the Permittees will continue to implement these BMPs. This stormwater management plan will involve reorganizing the individual city-based BMP programs into a single stormwater plan for each watershed. The timeline shown in this document reflects the time needed for the transition from individual city-based programs to the preparation of a mutually agreed upon and collectively developed watershed plan by all parties of the new Permit for each of the watershed areas. The first step in beginning this process will be the reorganization of the current three phase program into a new watershed based program. A reorganization of the Phases into watersheds which are based on hydrologic characteristics will allow for the consistent development and implementation of programs among Permittees, referencing land use and drainage infrastructure within their

VOL 15
03802
R0060603

respective watersheds. Consistency of programs throughout the watershed will be beneficial in terms of targeting specific pollutant problems and areas.

This specific Plan will address the stormwater management issues for the Dominguez Channel/Los Angeles Harbor Drainage watershed, which includes the following cities and agencies:

- **Caltrans**
- **Carson**
- **Gardena**
- **Hawthorne**
- **Inglewood**
- **Lawndale**
- **Lomita**
- **Los Angeles**
- **Los Angeles County**
- **Torrance**

I. PROGRAM MANAGEMENT

A. PROGRAM STRUCTURE

The County of Los Angeles is designated as the Principal Permittee. The other agencies are designated as Co-Permittees. The following are conditions that establish the responsibilities of all Permittees.

1. RESPONSIBILITIES OF PRINCIPAL PERMITTEE

Anticipated duties of the Principal Permittee include:

- Being the coordinators of permit activities and chairing the area-wide Executive Advisory Committee and the Watershed Management Committees;
- Providing the resources necessary for development of the Stormwater Management Plan.
- Providing technical and administrative support for both the Executive Advisory and Management Committees;
- Implementing the monitoring program;
- Providing the resources necessary for developing annual reports including evaluating monitoring program data and BMP effectiveness;
- Complying with all the responsibilities of a Co-Permittee as outlined below.

2. RESPONSIBILITIES OF ALL CO-PERMITTEES

Each Co-Permittee is designated a number of duties under the proposed stormwater management Plan:

- Participate in the development of the management plan;
- Implement the stormwater management plan within their jurisdictional boundaries and the storm drains they own and operate.
- Provide information needed by the Principal Permittee on program implementation for development of the annual reports.

The area under the Permit will be subdivided into the six watersheds tributary to the following waterbodies: Santa Monica Bay, which is further divided into a) Malibu Creek and Other Rural Areas, and b) Ballona Creek and Other Urban Areas; Los Angeles River; San Gabriel River; Dominguez Channel/Los Angeles Harbor Drainage; and the Santa Clara River (See Figure 2). Managing these watersheds is a task that will require a collective and cooperative effort on the part of all governmental entities named in the Permit that are within each watershed.

R0060609

VOL 15 0388

The management structure of the Plan consists of an area-wide Executive Advisory Committee, Watershed Management Committees, and Subcommittees. This particular structure is intended to provide a suitable program for the unique characteristics of each watershed and shall be developed by April 1995.

The Co-Permittees tributary to the Dominguez Channel/Los Angeles Harbor Drainage watershed shall adopt this watershed stormwater management program structure as a guide to allow for an area-wide uniformity of compliance of the Permit.

3. EXECUTIVE ADVISORY COMMITTEE

The area-wide Executive Advisory Committee shall consist of the County of Los Angeles, as Chair, and two representative Co-Permittees from each of the six watersheds. This Committee assumes no responsibility for the adequacy or inadequacy of any individual city's program, and should not be viewed as the responsible agency in this sense. The Committee's main role is to facilitate programs within each watershed and to enhance consistency among all of the programs. Additional responsibilities of the committee are:

a. Making recommendations on area-wide issues to each of the Watershed Management Committees;

b. Reviewing the stormwater management plans as developed by each Watershed Management Committee and provide direction and guidance on the plans for consideration by the Watershed Management Committees;

c. Assessing the consistency of all area-wide BMPs;

d. Preparing and forwarding unified submittals to the Regional Board upon receipt of information and materials submitted by the Watershed Management Committee in compliance with Permit requirements;

e. Scheduling and coordinating meetings and correspondence to allow for communication between the Co-Permittees and the Regional Board;

f. Acting as liaison between all Permittees and the Regional Board on Permit issues as well as mediating conflict among the Permittees.

VOL 15
03889
R0060610

4. WATERSHED MANAGEMENT COMMITTEE

A management committee within the watershed will be comprised of the County of Los Angeles, as Chair, and one representative from each of the Co-Permittees in the watershed. The committee shall be responsible for:

a. Establishing goals and objectives for the watershed;

b. Preparing the stormwater management plan for the watershed (This includes the development of all chapter components of the Plan);

c. Assessing the effectiveness of the Plan and making appropriate changes;

d. Preparing the semi-annual progress reports and annual Permit reports on Permit activities within the watershed for submittal to the Regional Board (For the annual Permit report, a draft will be circulated to each Co-Permittee and the Executive Advisory Committee for its review and comment. Final copies of reports shall be forwarded to the Executive Advisory Committee through which a compilation from all six watersheds shall be submitted to the Regional Board);

e. Enhancing the implementation of the storm water/management plan within the Dominguez Channel/Los Angeles Harbor Drainage watershed.

5. SUBCOMMITTEES

Subcommittees will be established where needed as determined by the Management Committee and/or the Executive Advisory Committee. The Subcommittees would be focused on specific program areas and can provide more specific oversight on the development, implementation, and evaluation of select program areas. These subcommittees shall be scheduled to meet on a routine basis.

B. INSTITUTIONAL ARRANGEMENTS

Management of the stormwater program requires the collective efforts and the cooperation of all Permittees. No Permittee has the ability and the legal authority to assume the responsibility of all activities of this Permit. Therefore, agreements will need to be formally developed amongst the Permittees to insure proper implementation of the Permit requirements.

VOL 15 03900

R0060611

1. PROGRAM PARTICIPANT ARRANGEMENTS

As the Principle Permittee, the County of Los Angeles will be designated as the lead agency for coordination of Permit activities and therefore shall chair the executive committee and the management committee meetings as they are scheduled. The lead agency is responsible for coordination of the permit but is not responsible for the adequacy or inadequacy of any individual Permittee's program. All other entities are Co-Permittees and will be responsible for the permit compliance of their own agency's program. An implementation agreement will be drafted formally detailing the responsibilities of the Principal Permittee and the Co-Permittees. The agreement would also address the funding of various watershed-wide activities such as Plan development, annual evaluation and reporting, and monitoring. Execution of the agreement by all Permittees is targeted for December 1995.

2. AREA-WIDE INTERAGENCY

As the Plan for each watershed is more fully developed, the Watershed Management Committee will coordinate with special agencies and districts that also regulate and/or perform activities addressed under different elements of the Plan. This coordination will attempt to ensure that their functions and the Plan are compatible. A few of these agencies include:

County Hazmat

- Any overlap of waste regulations, Household hazardous waste programs and or Industrial inspections shall be recognized and addressed, by all entities that fall under this Permit, in reference to the watershed program.

County Health

- Inspections of restaurants and other food handling establishments shall be coordinated with the Permittees.

Local Transportation/Congestion Management

- Local municipalities have limited authority over motor vehicle usage and regional transportation planning. Where feasible, plan development and implementation will be coordinated with local transportation agencies.

VOL 15
0391
R0060612

County (Regional) Parks

- Landscape maintenance activities at publicly owned parks will be reviewed as part of additional plan development to ensure the use of proper management measures.

Mosquito Abatement

- Coordination with the County Agricultural Commissions will be done for mosquito abatement programs to avoid adverse impact on the quality of stormwater/urban runoff.

Water Districts

- Activities with regards to the Water Districts activities will be reviewed and, when feasible, comply with the watershed program regulations and requirements.

Other entities, both private and public which have major land holdings and/or authorities that impact the quality of stormwater/urban runoff, should be initiated to actively participate in the program.

3. CITY-SPECIFIC INTERAGENCY ARRANGEMENTS

Each city will need to develop the institutional framework to address operation, maintenance, construction, redevelopment, and other activities performed by city agencies such as Public Works, Parks and Recreation, Planning and Public Owned Treatment Works (POTWs). These city agencies will need to participate in the planning and implementation of relevant plan program areas.

C. FISCAL RESOURCES

As each of the Plan chapters are completed, each Permittee will develop a budget for implementing that portion of the plan. A complete budget for the plan will be produced upon completion of development for all Plan components by December 1997. The budget will provide information such as funding sources, staff resources, contract services, and cost sharing arrangements.

1. AREA-WIDE

In implementing the Plan, the Permittees may elect to jointly fund a single program for certain BMPs such as Public Education that are area wide in

VOL 15
03992
R0060613

nature. Funding agreements including budgets and cost per agency would be developed.

2. CITY-SPECIFIC

Each Permittee will develop a budget detailing the cost of implementing Plan activities within its jurisdiction. Special funding in the form of grants, donations, or other forms of contribution should also be actively pursued to assist in funding special studies and/or BMPs.

D. LEGAL AUTHORITY

Each Permittee is responsible for implementing the Plan within its jurisdictional boundaries and therefore must acquire all needed legal authority. Each Permittee, being separate legal entities are to have adopted as required by the existing Permit, ordinances that will provide them with the adequate legal authority to develop, administer, implement, and enforce storm water/urban runoff management programs within their own jurisdiction. The ordinance must provide for its enforcement and at a minimum specify that violators may be subject to penalties including, but are not limited to, fines and termination of the activity causing the violation. A plan for identifying any additional legal authorities needed by the Permittees will be included in the completed Plan for the Dominguez Channel/Los Angeles Harbor Drainage watershed by December 1996. Upon completion of development of the Stormwater Management Plan, enforcing compliance with the Plan will be the responsibility of the Regional Board.

P:\ORV\WSHED2.DOM\I

VOL 15
0393
R0060614

II. ILLICIT DISCHARGES

The elimination of illegal connections and illicit disposal (IC/ID) practices is an important component for any program aiming to enhance the quality of stormwater/urban runoff.

Although more information is needed to fully assess the benefits and costs of conducting IC/ID programs, we can make logical decisions regarding application of best management practices (BMPs) to minimize such incidents. These BMPs will vary due to the jurisdictional differences which exist within each watershed. Each jurisdiction within the watershed will be developing and implementing those activities which adequately serve the jurisdiction and the watershed as a whole.

IC/ID practices are intermittent discharges of pollutants into the storm drain system that can degrade the quality of receiving waters. This can occur through catch basins, area drains and even on gutters and street surfaces. Some illegal dumping activities are done by individuals who do not know that such practices are illegal and can adversely impact the environment. Yet, others may be carrying out such practices with the full knowledge that such activities are prohibited.

A. ILLICIT CONNECTIONS

In order to implement an illicit connection management program, jurisdictions as a whole will need to develop and implement the procedures for investigating each of their respective storm drain systems.

Detailed procedures to eliminate illicit connections depends on the complexity of the storm drain system. A consistent watershed wide concept will be developed to investigate illicit connections to the storm drain system. Based on the results of field screening activities, or other appropriate information which indicates an area of reasonable potential of containing illicit connections, detection and follow up procedures would be followed. Priority should be established to focus on major problem areas and allow for a cost-effective approach to eliminate illegal connections. This concept will be developed by December 1996.

1. SYSTEM SURVEY

A system survey is a necessary component of an illicit connection elimination program. Although the basic concept is similar, the actual techniques and methods which jurisdictions within the watershed use to conduct system surveys can be quite different.

In conducting system surveys, the intent is to avoid costly investigations within areas not suspected of containing illicit connections. Field screening, map

VOL 15
0394
R0060615

research, and land use investigation activities will be done initially to identify potential problem areas. Public outreach efforts will be used to inform citizens in the area about the problem. Enforcement action will be taken to terminate such illegal connections. It should be noted that more detailed and sophisticated techniques such as televised inspection and dye testing will only be used in special situations as needed.

As mentioned above, a system survey is a necessary component of an illicit connection elimination program. At this time three jurisdictions have undertaken such a survey. Identification of all connections to the storm drain system, with the issuing of as-built permits or disconnect notices, has been undertaken by one city. Detailed maps showing the location of each storm drain, its manholes and catch basin connector pipes are being prepared by Los Angeles County to make monitoring of illegal connections and discharges more efficient. Also the location and source of all discharge connections is being inventoried and a GIS system is being developed. This information will be used in the storm drain inspection program which is ongoing. The program is targeting open channel storm drains. All open channels will be inspected for evidence of illegal discharges. The open channel inspections will also be used to collect information on dry weather discharges from underground drains for use in prioritizing future underground drain inspections.

The City of Los Angeles has contracted with a vendor to provide "on call" closed circuit television of storm drain interiors to detect cracks, misalignments, deposits, debris and illegal/illicit connections and discharges. The larger jurisdictions are the ones who have taken the lead in undertaking a system survey.

2. ONGOING SYSTEM INSPECTIONS

Ongoing system inspections for illicit connections will involve the techniques identified in Section 1. above, along with some additional activities. In smaller systems where the storm drain goes into several pumping stations, a regular inspection of the pumping stations for, among other things, evidence of illicit discharges will be sufficient.

In larger and more complex systems, a program of field screening will be used. Evidence of pollution will be categorized and prioritized. The storm drain alignment tributary to the suspect illegal connection can then be further investigated for illicit connections. If a discharge can be traced to a particular facility, the facility will be investigated to identify where exactly the pollutants are coming from and efforts needed to stop the discharge.

VOL 15
03995
R0060616

Another means of detecting illicit connections may be to rely on reports of illicit discharge from the public. This will utilize the County's or another agency's established "hotline" number that the public can call and report such observations.

Ongoing system inspection was mentioned by only one city which is now in the process of inspecting storm drain lines to identify illegal connections and to determine the conditions of existing pipes.

3. REPORTING

A consistent recording system will be established to track reports of illegal connections. This recording system will be used by the Permittees within the watershed.

B. ILLEGAL DUMPING

Due to the intermittent and unpredictable nature of illegal dumping, apprehension rate of violators could be quite low. The first course of action is to develop an area wide educational and reporting system along with prompt response procedures. This will be accomplished by December 1996.

1. OUTREACH

See **Chapter VII Public Information and Participation** of this report for a detailed discussion of the outreach program.

2. SYSTEM SURVEILLANCE

Measures that may be used for this aspect of the program may include but not limited to regular inspections of vacant facilities, street use inspection programs to detect illegal discharges and dumping into the street system, and a public complaint and reporting system.

A couple of system surveillance programs have been established. A program for investigation and identification of hazardous waste and debris dumped on excess parcels has been undertaken by Caltrans and in the City of Los Angeles, the Bureau of Street Maintenance enforces violations of excess water and fluids in the street system. This program is primarily on a complaint basis but will be even more effective when funded. A program to investigate storm drain lines to stop discharge of pollutants from specific facilities is planned.

VOL 15
03966
R0060617

3. SPILL RESPONSE

The Health Hazardous Materials Division (HHMD) of the Los Angeles County Fire Department is generally the primary spill responder. If the material is found to be hazardous and poses an imminent threat to public health and safety, the cleanup and disposal of the material will be done under the supervision of HHMD. If the material is non-hazardous, the responsibility will fall on local agencies to coordinate cleanup, disposal and attempt to identify and prosecute the violators. Cooperation among all agencies will be needed to allow for prompt action and joint effort to deter such violators. All agencies will have local authority against such illegal dumping activities.

Three jurisdictions have established specific procedures for responding to spills. These responses are: a program to respond rapidly to contain spills, establishment of adequate spill clean up procedures for city owned facilities and alarms installed in storm drains. One jurisdiction reports that an evaluation of the latest developments regarding improved containment and equipment was done, and although their procedures were found to be adequate, new procedures are being developed to continue further refinement of the program.

4. COMPLAINT RESPONSE

The County and some local agencies have established a stormwater telephone "hotline" that can be utilized by all citizens. Public complaints are generated through these "hotlines" and also through regular channels such as calls to Fire or Police agencies or to public works or legislative offices. Although responses to these complaints will vary depending on the nature of the complaint, action shall be taken.

The County has established an 800 hotline which is available to all county residents for reporting illegal dumping. This phone number has been publicized through outreach programs to some degree by over half the jurisdictions and agencies within this watershed. Three larger cities have established their own hotlines and outreach programs and one smaller city reports that it plans to begin a hotline as well. Methods used to publicize hotline phone numbers include advertisement on local cable television, notices on utility bills, articles in city newsletter and use of brochures, press releases and refrigerator magnets. Three jurisdictions report they are in the process of developing outreach programs to encourage public reporting at this time. Los Angeles County has established tracking of complaints. Hotline complaints are registered and minor dumping violations are followed up with a letter.

VOL 15
03977
R0060618

5. COORDINATION OF ALTERNATIVE DISPOSAL

Alternative disposal is one way of reducing non-stormwater materials that can potentially find their way into the storm drain system. Recycling programs are one of the most effective ways to reduce waste material. The recycling program can either be at the curbside or through drop-off centers. Household hazardous wastes can be dropped at mobile collection centers or at fixed sites. Co-permittees in the basin generally participate in the County's Household Hazardous Waste collection program. Effectiveness of those programs may be enhanced by a public outreach program that will inform the public of the locations and/or schedules for such events. Technical assistance or information may also be provided to businesses that want to develop a pollution prevention, waste minimization or alternative disposal program.

Alternative disposal programs have been very successful. All jurisdictions/agencies have established some sort of recycling program. One city has only a green waste and used oil recycling program. Caltrans does not have a curbside recycling program, since such a program is not applicable to that agency. All other cities have curbside recycling of a variety of materials. Another method of alternative disposal, the Countywide Household Hazardous Waste Roundups are extremely popular. Only Caltrans, who recycles its own hazardous materials, does not participate in the countywide program. Also noteworthy, one smaller city joins with neighboring cities and major industries in waste collection programs and Los Angeles provides a special "Hazmobile" that travels to various sites and accepts wastes by appointment.

6. REPORTING

Incidents involving a hazardous material entering the storm drain system are to be reported by the responsible party, or, if not known, the responding agency, to the California Regional Water Quality Control Board, Los Angeles Region (Regional Board). Complaints received through the County wide and local city hotlines will be tracked and reported to the Regional Board.

C. ENFORCEMENT PROCEDURES

Enforcement actions against discharges are done through either state hazardous and toxic materials statutes or through municipal ordinances that are already in the codes of the permittees. Industrial Waste Ordinances may be used in enforcement actions against illicit connections. Furthermore, anti-littering, health codes, plumbing codes and fire codes may be utilized for dumping or spill incidents. Enforcement actions can be taken by different municipal agents, including but not limited to, Industrial Waste Inspectors, Building or Plumbing Inspectors, Fire Department Inspectors, Park

VOL 15
03988
R0060619

Rangers, Street Use Inspectors, Health Inspectors, Police Officers, Community Services Officers, Animal Control Officers, Code Enforcement Staff or Public Works Inspectors. Some of these agents are empowered to either issue citations, issue notices of violations, issue cease and desist orders, or even make arrests depending on the type of violation and the code provisions that they are enforcing. Some of these agents are also empowered to enforce not only municipal ordinances but also state laws. A review of the various enforcement tools used by the Permittees will be performed. A recommendation will result on a consistent enforcement approach for the watershed for consideration by all Permittees in their own enforcement programs. This recommendation will be developed by December 1996.

Five jurisdictions and Caltrans have ordinances prohibiting improper disposal. All of these impose penalties on violators. One city is in the process of developing a program and another encourages proper disposal by providing composting containers, conducting workshops and sponsoring bi-annual clean-up days. The larger jurisdictions use a variety of personnel in enforcement. Health inspectors, Fire Department staff, Animal Control officers, Code Enforcement personnel and Environmental Quality officers are mentioned as those with authority to issue citations within the cities in the watershed. Two larger jurisdictions with active enforcement procedures also have programs to create public awareness. The City of Gardena deserves mention for having implemented extensive programs to discourage improper disposal including weed and rubbish abatement programs, alley inspections, and abandoned vehicle regulations.

D. COORDINATION WITH STATE NON-STORMWATER PERMITS

In order to characterize the nature of the existing non-stormwater discharges in the receiving waters within the watershed, a list of NPDES Permits issued by the Regional Board will be obtained. This will help in determining unexpected discharge during dry weather and to allow enforcement actions to focus on illegal dumping activities.

There is also a need to coordinate with other environmental agencies to ensure that requirements imposed by these agencies do not conflict with stormwater regulations. Requirements of many agencies do complement stormwater regulations. These agencies, include but not limited to, Fish and Game, DTSC, USEPA, and the Coastal Commission. Coordination with these agencies will help minimize overlapping investigations and result in a more efficient use of resources. A watershed wide concept will be developed by December 1996.

1. IDENTIFICATION OF PERMISSIBLE/PERMITTABLE DISCHARGES

A list of non-stormwater discharges that can be allowed to discharge into the Waters of the State will be established by the Regional Board.

VOL 15
03999
R0060620

2. APPROPRIATE MANAGEMENT PRACTICES

Continued communication with Regional Board will allow current information to be circulated among all agencies.

3. REPORTING

Any conflict in requirements of other environmental programs/agencies must be reported immediately to the Regional Board for ruling as to which one should take precedence.

P:\ORV\WSHED2.DOM\II

VOL 15 04000

R0060621

III. INDUSTRIAL/COMMERCIAL SOURCES

Each Permittee shall develop and implement a program that focuses on the identification and control of storm water pollutant discharges from industrial/commercial facilities within their jurisdiction. This program shall provide for the inspection of a facility's compliance with storm water regulations, as well as general outreach for all facilities that are potential industrial and commercial dischargers.

Each Permittee is responsible, under the requirements of the Municipal Stormwater Permit, for all discharges from commercial and industrial facilities within its jurisdiction. Many industries are also required to be permitted under the State General Industrial Activities Stormwater Permit. Enforcement of the specific provisions of the State General Permit is the responsibility of the State.

A. IDENTIFICATION OF SOURCES

As required under the current Permit, the Permittees have produced a listing of industries by SIC category for each drainage area. Also a breakdown of major land use types was also performed for each drainage area.

A pollutant source identification program will be designed to identify significant pollutant sources (i.e., parking lots, industrial activities, etc.), with the hope that remedial action can be undertaken to reduce any significant impacts so identified. It will focus on monitoring very small areas (i.e., less than five acres) where a specific and/or interrelated set of pollutant generating activities are occurring. Its objective is to provide data for selecting BMPs for specific activities rather than characterizing discharges for long-term pollutant loading estimates.

Identification of pollutant sources can be done using a number of methods. Potential sources of storm water pollutants can be identified by records of chemical use and/or storage, by studies of specific activities which lead to the deposition of pollutants throughout the watershed, and by field inspection or monitoring. Watersheds which may contain significant pollutant sources can be identified through land use information or by mass load estimates.

By mid January 1995 the County will begin, targeted monitoring of a municipal corporation yard in the Santa Monica Bay watershed. This will provide data on industrial activities which can take place at such a facility such as vehicle maintenance and repair, materials storage, equipment storage and repair. A more comprehensive program to identify various pollutant sources will be developed by March 1997.

VOL 15
0401
R0060622

1. CATEGORICAL LIST

Sources identified as a categorical industry regulated by the U.S. Environmental Protection Agency (EPA) will be grouped into a categorical listing of industries. The categorical list provides an organized overview of the target facilities that, based on land use, operation, and activities, could potentially contribute significant amounts of pollutants into storm water runoff. Some of the industrial categories regulated by the U.S. EPA include, but not limited to:

- Aluminum Forming
- Asbestos Manufacturing
- Battery Manufacturing
- Canned & Preserved Fruits & Vegetables
- Cement Processing
- Copper Forming
- Electroplating
- Glass Manufacturing
- Grain Mills
- Machinery Manufacturing & Rebuilding
- Soap & Detergent Manufacturing
- Metal Finishing
- Metal Molding & Casting
- Oil & Gas
- Organic Chemicals & Plastics & Synthetic fibers
- Paint Formulating
- Pesticides
- Plastic Molding & Forming
- Rubber Manufacturing
- Sugar Processing
- Textile Mills

2. RANKING

Industrial and commercial facilities identified as pollutant sources shall be ranked in order of priority for development of management measures. Facilities considered to be high priority are those whose operations and activities are determined to potentially contribute the most significant pollutant impacts to storm water discharge.

3. UPDATE PROCEDURE

Each year the Co-Permittees will evaluate the results of the monitoring program, the illicit discharge investigation program, and other available information , to identify likely sources of specific pollutants. The annual report to the Regional Board will recommend a strategy for pollutant source identification during the following year, including specific sites and/or activities to be monitored.

VOL 15
0402
R0060623

B. CONTROL MEASURES

Specific urban runoff control programs for major potential pollution sources shall be developed by March 1997. Within these programs storm water pollution control measures shall be developed for various pollutant sources. Control measures such as source control and treatment control offer different, but complimentary approaches to storm water pollution control.

Source control measures focus on good housekeeping practices, pollution prevention and minimization, and education. They are also less costly than treatment controls.

Treatment controls involve physical treatment of the runoff, usually through structural means. Also treatment controls will not remove all pollutants and their removal efficiency is difficult to predict given the limited understanding of the relationship between facility design criteria and performance.

The initial focus will be on the development of source control measures. As information is collected under the pollutant source identification program regarding specific pollutant sources, specific control measures, including structural, will be evaluated as to their effectiveness in addressing these sources.

1. POLLUTION PREVENTION MEASURES

Source minimization and education are the first steps in effective source control. Other activities that contribute to source control are:

- Site design alternatives (i.e., roof over fueling stations and carwash slab, provide spill containment curb around stored material, etc.)
- Good housekeeping practices

2. STRUCTURAL (TREATMENT) MEASURES

A variety of treatment control measures have been utilized throughout the country for storm water quality. However, the effectiveness of these controls are highly dependent on local conditions such as climate, hydrology, soils, groundwater conditions, extent of urbanization, etc.

Some of the more common treatment controls are:

- Oil/water separators - Oil/water separators are designed to remove one specific group of contaminants: petroleum compounds and grease. However, separators will also remove floatable debris and settleable solids.

VOL 15
0403
R0060624

- Infiltration - A family of systems in which the majority of the runoff from small storms is infiltrated into the ground rather than discharged to a surface water body. Infiltration systems include: ponds, vaults, trenches, dry wells, porous pavement, and concrete grids.

- Wet ponds - A wet pond has a permanent water pool to treat incoming storm water.

- Constructed Wetlands - Constructed wetlands have a significant percentage of the facility covered by wetland vegetation.

- Biofilters - Biofilters are of two types: swale and strip. A swale is a vegetated channel that treats concentrated flow. A strip treats sheet flow and is placed parallel to the contributing surface.

- Extended Detention Basins - Extended detention basins are dry between storms. During a storm the basin fills. A bottom outlet releases the storm water slowly to provide time for sediments to settle.

- Media Filtration - Consists of a settling basin followed by a filter. The most common filter media is sand; some use peat/sand mixture.

- Multiple Systems - Multiple systems are a combination of two or more of the preceding controls in series.

C. OUTREACH

General outreach for all facilities that are potential industrial and commercial dischargers shall be set up area-wide by the Management Committee, to provide general guidance in complying with the storm water program by March 1997. It shall also serve as a reminder of pollution prevention measures and keep facilities informed of their obligations to the storm water program.

Subcommittees may be established to develop specific outreach materials for industrial and commercial categories and specific activities that are identified as high priority.

For additional information on outreach, refer to **Chapter VII Public Information and Participation.**

D. INSPECTIONS

Most municipalities have existing programs such as industrial waste, fire, and health in which industrial and commercial facilities are inspected on a regular basis. Each

VOL 15 0404

R0060625

Permittee may elect to have inspections for the storm water program incorporated into these existing inspection programs, or be done as a completely separate program, depending on the needs of the Permittee.

The purpose of these inspections is to ensure that facilities are in full compliance with the storm water regulations and to ensure that control measures are being implemented. The frequency of inspection of facilities will be prioritized based on the operation and categorization of the facility.

Inspectors consisting of public personnel will be trained adequately to recognize and handle problematic activities concerning storm water pollution that may be existing or potential; and inspect for the deterioration of the storm drain system and illegal/improper connections. Training programs will be developed through the Watershed Management Committee and possibly specific Permittees for use by all Permittees.

Procedures for the identification, investigation, enforcement, and prosecution to the full extent of a jurisdiction's legal authority will be developed.

Presently Los Angeles County issues permits to all commercial and industrial facilities which generate industrial wastes. Included within this program are auto related businesses, gas stations, and restaurants. Facilities with industrial waste permits are regularly inspected. In addition to those businesses in the unincorporated areas, the County Department of Public Works also provides industrial waste inspections, under contract, for four cities in the watershed. Los Angeles has an extensive program to issue, inspect and enforce Industrial Wastewater Permits issued for non-storm waster discharges. Facilities are inspected between 1-4 times per year. One city reported that industrial waste inspections are on a complaint basis, while another stated that certain city staff are alerted to look for non-storm water discharges. Caltrans inspections include daily examination of auto related facilities, lead testing of gas stations once per year, quarterly pumping of clarifiers, and constant storm drain monitoring. A program to inspect underground storage tanks is part of a five year plan.

1. CHECKLIST

Inspectors shall have a uniform checklist to use as guidance and reference throughout an inspection. It may also serve as a general guide for the public, providing information about the requirements necessary to comply with the storm water regulations.

VOL 15 0405

R0060626

2. SCHEDULE

The inspection program shall be developed by March 1997. The frequency of inspections shall be scheduled according to the type of operation and the categorization of the facility. Revisit inspections shall be done on an as needed basis.

3. REPORTS

Inspectors shall report on all activities related to and/or violating the local storm water ordinance to the local governing agency. Standard reporting procedures will be developed.

4. FOLLOW-UP PROCEDURES

Individual Permittee review and assessment of the reports may result in the need for follow-up procedures, such as reinspection or legal action, provided the jurisdiction has the adequate legal authority to do so. Follow-up procedures will be developed to insure a uniform and consistent approach.

E. LOCAL INCENTIVE PROGRAMS

In developing the industrial/commercial program, the Permittees may consider the development of optional measures such as clean business incentive programs that may offer more focused control on industrial and commercial sources. It is projected that such programs shall be developed by March 1997.

F. TRAINING

Development of training programs for industrial storm water inspection staff is projected to be completed by March 1997.

The Los Angeles County Department of Public Works has issued a department directive requesting all employees to report any observed water quality problems. Caltrans employees have received education in hazardous substance spill awareness, pesticide safety, and vegetation management. In the City of Los Angeles, a specialized inspection group focusing on improving storm water quality and eliminating illegal discharges and illicit disposal practices is staffed by the Bureau of Engineering.

1. PUBLIC EMPLOYEES

All public employees shall be trained in the storm water regulations so that they abide by the regulations in the course of their work day. Also they need

VOL 15
0406
R0060627

to be able to recognize and distinguish between legal and illegal activity so as to administer the proper protocol in handling the situation.

2. INSPECTORS

Inspectors who visit industrial and commercial facilities shall be adequately trained to determine compliance with the storm water regulations and educate the facilities about the requirements of the program. In addition, they should be able to recognize and handle immediate problems as they are encountered, during an inspection; and inspect for the deterioration of the storm drain system and illegal/improper connections. Citation training will be necessary for inspectors in agencies that have the citation authority.

G. COORDINATION WITH STATE INDUSTRIAL STORM WATER PERMIT

The Permittees have existing local ordinances governing industrial discharges and other stormwater discharges that require compliance activities similar to those in various State Regulations. Because coordination between the Permittees and the Regional Board is anticipated concerning the regulation of industries, a mutual agreement may be required regarding industrial inspections and enforcement. Additional issues could also be addressed. Federal stormwater regulations hold local municipalities responsible for stormwater discharges from all industrial/commercial facilities, including those covered by General Permit.

1. MEMORANDUM OF UNDERSTANDING

A Memorandum of Understanding (MOU) may be used to formalize the agreement between municipalities and the Regional Board on industrial compliance program issues. A MOU among all local agencies may also be needed to ensure co-operation between all the agencies. The need for and specific requirements for such agreements would be developed upon completion of development of the industrial/commercial program by March 1997.

2. REPORTS

The Mou discussed above may include the exchange of information between the Permittees and the Regional Board. Appropriate formats for such reports would be developed as required.

P:\ORV\WSHED2.DOM\III

VOL 15
0407
R0060628

IV. NEW DEVELOPMENT AND REDEVELOPMENT

Managing stormwater and runoff from both new construction and redevelopment, will reduce pollutants entering the storm drain system and subsequently the receiving water.

A. PLANNING PROCESS

Quality of stormwater discussion should be included in the General Plan and the Zoning ordinances. Efforts to enhance the quality of storm water can filter into the Subdivision actions. Many of the storm water concerns can be channeled through the compliance effort of the California Environmental Quality Act (CEQA). A watershed wide concept will be developed by June 1997.

1. WATERSHED PROTECTION POLICIES

An integrated strategy will be developed for the watershed. Pollution control efforts should be prioritized. A variety of statutory and regulatory requirements could be used for this watershed oriented program. Watershed protection policies need to be adopted by the local jurisdictions which control land-use within the watershed.

2. COORDINATION WITH CEQA

The current CEQA "Environmental Checklist Form" that is used for initial studies assessment indirectly address potential impacts to stormwater. Additions could be made to the Form to directly assess stormwater quality impacts.

CEQA requires agencies to use feasible alternatives or mitigation measures to lessen potentially significant effects. The ability to identify a.) when an effect is significant, and b.) which mitigation measures could be adopted to reduce the effect, is critical to the CEQA process. A clear assessment of any development, its potential adverse impacts on stormwater quality will allow for a determination of "significance" which will enable the decision maker to make development decisions upon full disclosure of possible adverse impacts.

3. SITE PLANNING PROCESSES

All development will require the review and approval of a site/plot plan or development drawings prior to issuance of a building permit. Incorporating the consideration of potential water quality impacts including erosion and sedimentation during the early stages of the planning process will allow these

VOL 15
0408
R0060629

issues to be addressed before substantial investments in engineering and design have been made.

Caltrans requires a plan for water pollution control for construction projects. Construction may be halted if inadequate provisions have not been made for water quality protection.

4. GENERAL PLAN CHANGES

The General Plan is the legal backbone of the planning process. All development approvals, zoning ordinances, subdivision approvals and public works projects must be consistent with the policies, objectives, and principles set forth in the General Plan. Discussion of stormwater issues in the General Plan could greatly enhance the awareness of the issues and encourage full assessment of possible adverse impacts on stormwater quality as the result of new and redevelopment.

Two jurisdictions have amended their General Plans to include water pollution control, conservation elements and general requirements of federal and state storm water regulatory programs.

5. USE OF MASTER PLANS

For agencies which utilize master plans to guide their development activities, stormwater issues can be outlined in such documents. This will channel efforts to fully assess the possible adverse impacts on stormwater quality as the results of any development within the master plan area.

6. OTHER POLICIES

Numerous other policies or mechanisms could be used to incorporate stormwater management goals into the planning/development process. Other concepts will be evaluated for their feasibility during the more detailed development of this Chapter.

7. PLANNING-PUBLIC WORKS INTERFACE

A variety of mechanisms for coordinating planning and public works activities exist. An example could be some form of CIP (capital improvements program). Ideally, any planning documents which target or project population growth are coordinated with CIP. Integrating stormwater management into CIP will allow for mitigation of major adverse impacts on the quality of stormwater prior to any actual construction.

VOL 15
04009
R0060630

8. IMPLEMENTATION PROCEDURES

Implementing policies to integrate stormwater management considerations with existing planning/development mechanisms will require a variety of approaches depending upon the existing conditions within each Co-Permittee and the particular remedies selected. It is anticipated that each Co-Permittee will propose procedures applicable to it's unique jurisdictional considerations at later stages in the permit process.

B. CONSTRUCTION SITES

Pollutants from construction activities can have a major impact on the quality of stormwater/urban runoff. A watershed wide concept to reduce such pollutants will be developed by December 1996.

1. EROSION CONTROL REQUIREMENTS

Federal stormwater regulations hold local municipalities responsible for stormwater discharges from all construction sites. In addition, construction sites involving a total of five acres or more of land disturbance are required to apply for the State General Construction Activity Storm Water Permit (GCASP). The GCASP: 1) eliminates or reduces to the extent feasible non-storm water discharges from construction sites and 2) permits stormwater discharges, but requires the use of controls to limit pollutant loading in site effluent. Preparation of a Stormwater Pollution Prevention Plan and identification/utilization of BMPs are the key components of this Permit.

Many local agencies also have erosion control requirements for any grading and construction activities. Regulation of pollutants from construction sites of five acres or less will be done by the local agency through its stormwater management plan.

Construction site erosion has the potential to introduce sediment into runoff. For example, fugitive dust control at construction sites typically use water. Minor modifications/clarification of existing fugitive dust practices could substantially address runoff pollution concerns. In addition to fugitive dust control practices, additional measures could be adopted to curtail dry weather runoff, and control pollutant laden storm water runoff. These measures may address 1) physical site design considerations and 2) temporal considerations such as seasonal timing and phasing of activities.

VOL 15
0410
R0060631

Five jurisdictions have implemented ordinances intended to control erosion. Two jurisdictions have identified or drafted runoff control ordinances, while two others are planning to prepare one in the near future. Los Angeles County's 1965 Ordinance was strengthened in 1992 to include penalties for violations.

The City of Los Angeles is considering the development of a manual aimed at reducing runoff from construction sites. Also the City plans to review Municipal Code requirements to ensure consistency with the State of California General Construction Activity Storm water Permit Requirements.

2. CHEMICAL AND WASTE MANAGEMENT REQUIREMENTS

Chemical and waste handling activities are also currently subject to a variety of regulations. BMPs to address this pollution source are largely centered around "good housekeeping practices". This involves storing, handling, using, and disposing of these potential pollutant sources in ways that restrict opportunities for unintended introduction of the materials into site runoff. Proper chemical and waste management will reduce any accidental discharge into the storm drain system.

3. INSPECTIONS

Inspections are a routine part of local jurisdiction's oversight of regulated construction activity. Inspection activities should be enhanced to ensure that construction site runoff control measures are being properly implemented. Existing practices should be examined and modified accordingly to satisfactory stormwater/urban runoff objectives.

a. Checklist

A checklist would encourage possible streamlining of any requirements. It could be cumbersome if an overly rigid approach were taken which resulted in unnecessary administrative burden. However, careful design of the checklist could avoid this pitfall.

b. Schedule

Inspection schedules will depend upon existing practices. It may be desirable to have several schedules, depending upon the types of activities/permits and/or the timing of activities.

VOL 15 0411

R0060632

c. **Reports**

A standardized reporting format is needed to allow for consistency among all jurisdictions. Furthermore reports are also a useful tool for future refinement of pollution control regulations.

d. **Follow-up Procedures**

A format will be developed to do follow-up inspections on problem facilities and activities. Frequency of use will greatly depend on the land use and the degree of non-compliance of each facility.

C. LOCAL PERMITS

Permits are a form of "cross checking" by local agencies to ensure that regulations are being implemented. Prior to the issuance of a permit, information must be submitted for review and approved. A watershed wide concept to provide some consistency in local permits will be developed by June 1997.

1. COORDINATION WITH EXISTING PERMITS

Storm water issues should be incorporated into existing permits.

2. NEW PERMIT ISSUES

Storm water issues should be clearly stated in new permits to be issued for new and/or redevelopment activities.

D. TRAINING

Training will enable staff to keep current of the latest storm water regulations. A watershed wide staff training concept will be developed by June 1997.

1. PLANNING PERSONNEL

(See E.1.b. below)

2. PUBLIC WORKS PERSONNEL

(See E.1.b. below)

3. INSPECTORS

(See E.1.b. below)

VOL 15 0412

R0060633

E. CONTROL MEASURES

Best management practices for the control of construction related pollution can generally be divided into three categories:

Nonstructural Source Controls for Reducing Urban Stormwater Pollutants:

- Practices that reduce the generation and accumulation of potential stormwater contaminants at or near their source.

Site Planning Stormwater Controls:

- Practices that are directed at controlling the volume and discharge rate of runoff from urban areas, as well as, reduction of the magnitude of pollutants in discharges through temporary storage or flow restrictions.

Erosion and Sediment Controls:

- Practices that can prevent or treat problems related to transport of eroded material from construction and other land disturbing activities.

Site planning stormwater controls are of particular interest. These control measures can be incorporated in the initial planning phase of any project. A watershed wide concept will be developed by June 1997.

The City of Torrance imposes conditions on excavation/construction permits requiring site cleanup; also staging areas are required to free vehicles of debris/dirt prior to entering the public right of ways.

1. POLLUTION PREVENTION MEASURES

a. Site Design

Effective implementation of urban BMPs requires integration of water quality control elements early in the site planning and design process. Development of the water quality controls should not only achieve maximum pollutant removal with minimal costs, but also reduce potential maintenance.

This may include incorporating water quality concerns into the site layout and design (i.e., maximize pervious areas, minimize directly connected impervious areas, etc.) and/or treatment control measures proven to be cost effective for local climate, soil, and development conditions.

VOL 15
0413
R0060634

Due to the diversity of climate and local conditions, the development of BMPs will vary from jurisdiction to jurisdiction, and even location to location. The selected management practices should be designed for the local site conditions and especially seasonal rainfall conditions that are experienced in Southern California. Suitability for the major land use and drainage characteristics should also be fully assessed.

b. Education/Training

Education/training is imperative to the success of any BMPs selected for new or redevelopment projects. BMPs will fail if not properly designed, installed, and maintained. Only well trained personnel should be assigned these responsibilities.

A program for effective education/training should be based on four objectives:

- Promote a clear identification and understanding of the problem, including activities with the potential to pollute stormwater;
- Identify solutions (structural and nonstructural BMPs);
- Make every employee responsible for stormwater pollution and its solution; and
- Integrate employee feedback into training and BMP implementation to improve BMPs.

c. Other

In many cases stormwater pollution control may already be achieved by existing regulations or programs. In California, the General Plan Law and the California Environmental Quality Act (CEQA) provide a basis for municipalities to review and comment on all projects within their jurisdiction. Under the General Plan Law, municipalities are required to develop policies and regulations which guide development within the municipality. Each development project is then reviewed for conformance with these policies. Under CEQA, projects are also subject to review and comment for any adverse impact the projects may have on the environment, including impacts from stormwater discharges.

VOL 15
0414
R0060635

2. POST CONSTRUCTION (TREATMENT) MEASURES

a. Applicability

Each site considered for development or redevelopment will (at the conclusion of construction) have final improvements and unique site characteristics such as: drainage patterns; soils; landscaping; topography; percent of impervious surfaces; rainfall; pollutants inherent with the use of the development; and pollutants that may be background to the area (existing vegetation, air fallout, etc.). The applicability of various treatment control BMPs for use in new development will be evaluated through the use of pilot studies and examination of studies done on treatment control measures by other agencies.

b. Effectiveness

Prior to implementing any treatment control measures, they will need to be evaluated for their effectiveness. This can be done through pilot studies which could include elements such as: pre and post storm event inspections; water quality monitoring; record keeping to document deficiencies in the BMPs; Operation & Maintenance requirements; and cost effectiveness.

c. Retrofit Opportunities

The feasibility of retrofitting existing developments with treatment control measures will be evaluated. However, the effectiveness of a treatment control measure vs its cost must be fully evaluated prior to considering its use as a retrofit measure.

3. OPERATION AND MAINTENANCE

a. Requirements

Jurisdictions within the watershed will need to insure that BMPs incorporated into a private development are properly maintained. Deed restrictions, covenants, conditions and restrictions (CC&R) could be used to direct such requirements and responsibilities.

b. Responsible Party

The contractor, during construction, must ensure that the post-construction BMPs are installed properly and that any maintenance

VOL 15 0415

R0060636

that may be necessary during construction is performed. After the project is completed, it will then be the responsibility of the fee owner, private or public, to provide for long term operation and maintenance. This may be accomplished by deed restriction and/or CC&R.

4. CONFLICTS WITH OTHER MANDATES

Often regulations of various Federal, State, and local agencies would conflict with each other. Health, fire, and building codes often have requirements focusing on short term human health and safety and neglecting the impacts on the environment.

a. Identification of Conflicts

As the Plan is developed, other regulatory requirement that conflict with the stormwater program requirements may be uncovered. Clarification of these regulations should be directed to the various responsible regulatory agencies.

b. Conflict Resolution

For regulatory conflict caused by local regulations, efforts will be taken to resolve them within the agencies. Input form other local, state, and federal agencies should be incorporated into a modification of current standards. The Regional Board should resolve conflicts involving other State and/or Federal requirements.

F. OUTREACH

An outreach program concerning new development and re-development shall be developed by each individual Permittee by June 1997.

The City of Los Angeles has initiated a three phase program intended to increase the awareness of those involved in the construction industry regarding storm water pollution abatement activities. Videos and printed materials will be distributed.

For additional outreach discussion see **Chapter VII Public Information and Participation.**

G. ENFORCEMENT

See **Chapter II Illicit Discharges, Section C Enforcement Procedures.**

VOL 15 0416

R0060637

H. COORDINATION WITH STATE GENERAL CONSTRUCTION ACTIVITIES STORM WATER PERMIT

Compliance with the GCASP requirements is the responsibility of the developer/contractor, and enforcement is the responsibility of the SWRCB/Regional Board staff.

1. MEMORANDUM OF UNDERSTANDING

An agreement between the Regional Board and Co-Permittees may be used to enhance compliance of construction site BMPs. The need for such an agreement will be evaluated. If found to be desirable, and agreement will be developed by June 1996.

2. REPORTS

The local enforcement agency of the State Construction Stormwater Permit, which is the Regional Board, should forward all information, including Notices of Intent filed and any inspections and enforcement actions taken, to the Permittees so that this information can be available to local municipal construction site inspectors to alert them of any specific concerns on the job site.

3. OTHER ISSUES

The Regional Board should explore funding to be channelled to the Co-Permittees so the Co-Permittee can be more actively involved with the State on the Permit.

P:\ORV\WSHED2.DOM\IV

VOL 15

0417

R0060638

V. PUBLIC AGENCY ACTIVITIES

All municipalities perform functions that have an impact on stormwater quality. These include, among other things, vehicle maintenance, landscape maintenance, weed control, water body maintenance including swimming pool maintenance, etc. Other activities such as construction and maintenance of streets and roads, and construction and maintenance of the flood control system also could directly or indirectly cause adverse impact on the quality of stormwater/urban runoff. Since municipalities must address all significant sources of pollutants, all of these activities must be examined and mitigation measures be incorporated into the routines. As part of the requirements of the current Permit, many of the Permittees have already begun implementation of measures to address the above activities. An examination of these existing measures will be done on a watershed wide basis to establish the most effective approach to address these activities. Such approaches shall be developed and begin implementation by September 1997.

A. SEWAGE SYSTEMS

Sewage spills must not be allowed to enter the storm drain. Control procedures for identifying, repairing, and remediating sewer blockages, infiltration, inflow, and wet weather overflows from the sewers to the storm drain system should be implemented to protect stormwater quality. These procedures could include, but are not limited to, quick field response to overflows, follow-up testing, and complaint investigation.

When sewage spills do occur, they must be contained and collected for proper disposal. Individual permittees may need to modify their sewage overflow response procedures. The field personnel should also have procedural training for field screening, sampling, smoke/dye testing, and TV inspection, if appropriate, to be able to properly investigate any suspect connections or cross connections to the storm drain system.

Los Angeles City's Limitation of Sewage Infiltration into Storm Drain System traces sewage infiltration into the storm drain system using a variety of techniques.

Los Angeles County has a number of programs aimed at preventing sewage spills from entering the storm drain system. These include:

- Sewage Overflow Response Procedures Revision/Root Control Review. This involves improvement of procedures for containment and cleanup of spilled sewage resulting from overflow.

- Reline Sewer Lines. Two locations will undergo relining of existing sewer lines to prevent infiltration and exfiltration.

VOL 15
0418
R0060639

- Sewer Pipeline Reconstruction. 127 miles of cement pipelines will be analyzed and replaced or rehabilitated within 5 years.

- Sealing of Manhole Covers. This program has sealed manhole covers and bar holes in areas subject to flooding.

- Expansion of Emergency Call List. Beeper numbers of all supervisors, superintendents and stand-by crews were added to emergency call list.

B. CORPORATION YARDS

Corporation yards include any area or facility that is used for vehicle maintenance or washing, other maintenance, chemical storage, paint facilities, and supportive activities for field crews. Permittees will need to incorporate pollutant control measures at these facilities and develop a plan for each facility outlining the measures to be implemented. Since these are industrial type activities, the corporate yards would need to implement measures as described in the Industrial/commercial Source Chapter.

The City of Los Angeles has implemented and is expanding the following programs related to corporation yards:

- Spill Prevention, Containment and Response Procedures--City Facilities. This program ensures that facilities have adequate spill prevention, containment and emergency response procedures. The City is identifying all City-owned facilities that do not currently have adequate procedures as they relate to storm water pollution abatement.

- Certified Hazardous Waste Storage Facility. Three pre-fabricated storage buildings have been installed at the Los Angeles Aqueduct Filtration Plan to isolate hazardous materials.

- Storm water Pollution Abatement--Street Maintenance Yards. Four street maintenance yards, including an asphalt processing plant, are being studied as potential sources of storm water pollution.

The City of Gardena's vehicle maintenance program ensures that all vehicles are washed in areas that drain only to the sewer. Used engine oil, filters and batteries are stored in contained areas and are recycled. These practices are followed by many other agencies in the Watershed.

The City of Torrance yard wastes from city owned properties are collected and recycled.

VOL 15
0419
R0060640

1. STORM WATER POLLUTION PREVENTION PLANS (SWPPP)

Though not required, permittees may elect to use some form of SWPPP as a vehicle for compliance. Any BMPs to be implemented must be part of a comprehensive plan designed to address the various pollutant sources at each corporate yard. To achieve this goal, the municipalities should first identify the potential pollution sources and who is responsible for implementing the storm water management measures. Based on the facility type, management practices and schedule of implementation will be developed. BMPs that can be used to improve the quality of runoff include, but are not limited to, housekeeping practices, material storage control, vehicle leak and spill control, and illegal dumping control.

2. OUTDOOR LOADING/UNLOADING OF MATERIALS

Municipal employees who handle potentially harmful materials should be trained in good housekeeping practices to prevent or reduce the discharge of pollutants to storm water from outdoor loading/unloading of materials. Materials spilled, leaked or lost during loading/unloading may collect in the soil or on other surfaces and be carried away by runoff or when the area is cleaned.

Applicable BMPs should be selected based on the following four factors: 1) Extent of exposure of material to rainfall, 2) preventing stormwater run-on, 3) checking equipment regularly for leaks, and 4) containing spills during transfer operations.

3. MATERIAL STORAGE CONTROL

A program should be developed to prevent or reduce the discharge of pollutants to storm water from outdoor container storage areas using measures such as installing safeguards against accidental releases, secondary containment, conducting regular inspections, and training employees in standard operating procedures and spill cleanup techniques. Employee education is paramount for successful implementation. Employees should be trained in emergency spill cleanup procedures.

To limit the possibility of storm water pollution, containers used to store dangerous waste or other liquids should be kept inside the building unless this is impractical due to site constraints. Storage of reactive, ignitible, or flammable liquids must comply with the fire and California OSHA codes. Practices such as placing containers in a designated area should be employed to enhance such requirements.

VOL 15
0420
R0060641

4. VEHICLE AND EQUIPMENT WASHING AND MAINTENANCE

Washing vehicles and equipment outdoors or in areas where wash water flows onto the ground can pollute storm water. For municipalities that wash vehicles or pieces of equipment on-site, it should be performed in a designated area equipped with an oil/water separator.

Vehicle or equipment maintenance is a potentially significant source of storm water pollution. Parts are cleaned with solvents. Many of these cleaners are harmful and must be disposed of as a hazardous waste. Appropriate BMPs are waste reduction, use of alternate products, recycling, and spill leak clean up control.

5. WASTE HANDLING AND DISPOSAL

Proper waste management is possible by tracking waste generation, storage, and disposal; reducing waste generation and disposal through source reduction; and preventing run-on and runoff from waste management areas.

C. PARKS AND RECREATION

Park Departments manage landscaping and swimming pools. Both of these activities involve the use of chemicals, waste management, and non-storm water discharges. In addition maintenance of swimming pools requires the periodic discharge of large quantities of swimming pool water.

1. FERTILIZERS/PESTICIDES

a. Use/Application management

Municipal facilities should develop controls on the application of pesticides, herbicides, and fertilizers. Control may include:

- List of approved pesticides and selected use;
- Product and application information for users;
- Equipment use and maintenance procedures; and
- Record keeping.

Employees can be educated about environmentally sensitive alternative products by using information developed by various public agencies and other environmental organizations.

VOL 15
0421
R0060642

The City of Torrance has evaluated the use of a replacement for pesticides that contains less toxic materials; also the City has implemented a program to reduce surface application of fertilizers.

The City of Los Angeles has installed special equipment at Rancho Park Golf Course to remove oils and oil-based cleaning agents, as well as organic material from surface water that drains into the storm drain system.

b. Storage

Improper storage of fertilizers and pesticides can lead to potential groundwater, soil, and stormwater contamination. To prevent or reduce their impact on stormwater pollution, material storage areas must be designed and maintained to reduce exposure to storm water. The following BMPs can help to achieve this goal:

- Store materials inside or under cover on paved surfaces,
- Use secondary containment,
- Minimize storage and handling of hazardous materials,
- Inspect storage areas regularly.

2. FACILITY MANAGEMENT

a. Wash Waters

Wash waters cannot be discharged into the storm drains untreated. The storage area should be slightly sloped for wash water collection. If the water is not discharged to the sanitary or process waste sewer, or to a dead-end sump, the outlet should be equipped with an oil/water separator or other treatment systems.

b. Maintenance

Landscape maintenance involves the use of pesticides and fertilizers. Proper use of these materials will reduce the risk of loss to storm water. Whenever possible, leave or plant native vegetation to reduce water, fertilizer, and pesticide needs. Integrated pest management should be employed where appropriate. The Park Departments should also establish a schedule for irrigation and fertilization. The chemicals will be carried from the site by the next storm if they are applied during the wet season. Overwatering leads to discharge of water that may have become contaminated with nutrients and pesticides.

VOL 15
0422
R0060643

Storm water from parking lots may contain undesirable concentrations of oil, grease, suspended particulates, and metals, as well as the petroleum byproducts of engine combustion. Possible maintenance BMPs include periodic sweeping and cleaning catch basins.

c. Swimming Pool Waters

The drainage of swimming pool water must insure that chlorine residual is below allowable water quality limits. The potential for recycle/reuse for irrigation of lawns and landscapes may be investigated. Swimming pool filter backwash waters should not be discharged to the storm drain, but should be allowed to settle and then disposed to the sanitary sewer. Other possible alternative measures would be to use the backwash for irrigation or disposal on a dirt area.

D. STORM DRAIN SYSTEM OPERATION AND MANAGEMENT

The maintenance and operation of the storm drain system has an impact on storm water quality and must be addressed. Material clogging storm drains cannot be discharged into drains. It must be disposed of properly.

1. INLET MAINTENANCE

Regular maintenance of public and private catch basins and inlets is necessary to ensure their proper function. Maintenance will remove pollutants, reduce high pollutant concentrations during the first flush of storms, prevent clogging of the downstream conveyance system, and restore the catch basin's functional capacity. Keys to effective catch basin cleaning include the following:

- All basins should be cleaned annually prior to the onset of the rainy season;
- Clean catch basins in known problem areas more frequently to remove sediments and debris accumulated during the dry weather months;
- Keep records of the number of catch basins cleaned; and
- Track the amount of waste collected.

Eight jurisdiction clean their catch basins at least annually, while Caltrans catch basins are generally cleaned every two years. The City of Los Angeles has grouped its catch basins into "routes" that are inspected and/or cleaned at least once a year.

VOL 15
0423
R0060644

2. DRAIN MAINTENANCE

Open channel storm drains should be cleaned at least annually prior to the rainy season. Problem areas should be cleaned more frequently as needed. Channels should also be monitored during the rainy season for any debris buildup and cleaned where needed.

Los Angeles County field personnel inspect open channels and sumps to clean debris and prevent them from entering the ocean.

Caltrans will develop a priority list of drains and pump houses requiring cleaning.

3. WASTE MANAGEMENT

Excessive waste buildup will decrease the capacity of the channel, it is therefore crucial to reduce pollutant levels in storm water by regularly removing illegally-dumped items and material from storm drainage channels and creeks. A program should be developed to identify problem areas of illegal dumping so regular inspection and clean up can maintain the channel's optimum capacity and prevent the discharge of contaminants.

The City of Torrance has increased clean up of sewers and storm drains to decrease the number of sewer back ups.

4. NEW SYSTEM DESIGNS

Current design standards for the construction of new storm drain systems will be evaluated in light of currently available pollutant control measures. Design standards may be modified to incorporate measures deemed appropriate for local conditions.

The City of Los Angeles has formed an Inter-Jurisdictional Storm Water Re-Use Task Force to implement diversion, capturing and possibly re-using high quality storm water run-off; also the City is reviewing standards and considering modifications for flood control projects by incorporating storm water pollution reduction components.

The City of Torrance has installed alarms in sewer and storm drain pump systems designed to decrease the potential of raw sewage entering the storm drain system.

VOL 15
0424
R0060645

5. RETRO-FIT OPPORTUNITIES

The majority of the existing storm drain systems are in highly urbanized areas providing little opportunity for cost effective retro-fitting. However, currently available pollutant control measures will be reviewed for their effectiveness and possible use. This may include pilot studies to evaluate the performance of management practices under local conditions.

E. STREETS AND ROADS

Construction, operation, and maintenance of roads has an impact on storm water quality and will be addressed in the management plan.

1. SWEEPING

Street sweeping can collect refuse on street surfaces to prevent it from entering the storm drain system through catch basins.

Eight jurisdictions within this watershed sweep their streets at least weekly, while the City of Los Angeles's posted streets are swept weekly and the others monthly. Caltrans sweeps its roadways on a regular schedule determined by observable debris.

a. Storm Water Quality Based Operation

In order to effectively implement the sweeping program, the permittees should keep accurate operation logs to track the program. Areas generating excessive refuse should be swept more frequently. Sweeping frequency may also be increased before the rainy season to reduce the amount of refuse entering the storm drain system. Parking on sweeping days should be regulated to facilitate the operation.

b. Waste Management

Proper waste management practices shall be developed for the refuse collected through street sweeping.

Six jurisdictions empty their trash receptacles at least weekly, while in Lawndale they are emptied twice a week.

2. STREET/PAVEMENT WASHING

Wash waters from street/pavement washing may be contaminated and must be managed as non-storm water discharges.

VOL 15
0425
R0060646

3. MAINTENANCE

a. Saw-cut Slurry Management and Paving Practices

Existing saw-cut management and paving practices conducted by the permittees will be evaluated and appropriate control measures developed. Possible control measures to be considered that would help reduce the impacts to storm water:

- Avoid paving during wet weather;
- Regularly repair potholes and worn pavement to reduce sediment loading;
- Store materials away from drainage courses to prevent pollution of storm water run-on; and
- Follow the storm water permitting requirements for industrial activities when mixing concrete with an on-site plant.

b. Waste Management

Vehicles transporting waste should have spill prevention equipment that can prevent spills during transport. The refuse collected will be transported to the appropriate disposal facilities.

The City of Torrance requires tarping on city vehicles when hauling material.

Good housekeeping practices will be implemented to insure proper management of any waste products that may be generated during maintenance activities. For example, to prevent concrete waste from entering the storm drain system, washout of concrete trucks should be conducted off-site or on-site in designated area. Excess concrete should not be dumped on site. Employees and subcontractors should be trained in proper concrete waste management.

The following steps will help reduce storm water pollution from concrete wastes:

- Store dry and wet materials under cover, away from drainage areas;
- Avoid mixing excess amounts of fresh concrete or cement on-site;
- Do not wash out concrete trucks into storm drains, open ditches, streets, or streams;

VOL 15
0426
R0060647

- Do not allow excess concrete to be dumped on-site, except in designated areas;
- Avoid paving during wet weather;
- Regularly repair potholes and worn pavement to reduce sediment loading; and
- Cover catch basins and manholes when applying seal coat, tack coat, slurry seal, fog seal, etc.

Employee/subcontractor training to insure implementation of good housekeeping measures should be based on four objectives:

- Promote a clear identification and understanding of the problem, including activities with the potential to pollute storm water;
- Identify solutions (BMPs selection);
- Promote employee/subcontractor ownership of the problems and the solutions; and
- Integrate employee/subcontractor feedback into training and BMP implementation.

c. Medians/Landscaped Right-of-Way

i. Irrigation

Overwatering of landscaping produces runoff. A properly timed irrigation schedule should be set up to minimize overwatering. Drip irrigation system should be used when feasible in new installations.

The City of Torrance inspects its irrigation systems and repairs them weekly to reduce volume of water flowing into gutters.

ii. Fertilizers/Pesticides

The handling, storage, and usage of fertilizers/pesticides are addressed in Chapter V, Section C-1.

F. FLOOD CONTROL

Common municipal practices, such as construction and operation and maintenance of the flood control system, may have a potentially adverse impact on storm water quality. Consequently, these practices shall be coordinated to the extent of preventing pollutants from impacting the water quality.

VOL 15
0427
R0060648

1. COORDINATION WITH NEW PROJECTS

Current design standards for the construction of new storm drain systems will be evaluated in light of currently available pollutant control measures. Design standards may be modified to incorporate measures deemed appropriate for local conditions. During construction, all appropriate BMPs will be utilized to control pollutants during the construction of the facility.

2. COORDINATION OF MAINTENANCE ACTIVITIES

Current maintenance activities with regards to desilting/sediment removal, vegetation management, and waste management shall be reviewed to insure that appropriate management measures are developed to comply with the storm water regulations.

The City of Torrance has implemented a storm water retention basin cleaning program. Also, lawn mowers used by City staff are required to have a collection system to keep lawn clippings from entering the storm drain system.

The City of Gardena has a City landscaping program to reduce landscape-related constituents in storm water.

3. OPERATION OF FACILITIES

Flood control facility operations will be reviewed to identify where appropriate management measures could be incorporated. However, primary consideration will need to be given to the flood control function of the facility to protect health and safety.

4. RETROFIT OPPORTUNITIES

The majority of the existing storm drain systems are in highly urbanized areas providing little opportunity for cost effective retro-fitting. However, currently available pollutant control measures will be reviewed for their effectiveness and possible use. This may include pilot studies to evaluate the performance of management practices under local conditions.

G. PUBLIC FACILITIES

Storm water runoff and non-storm water discharges from other public facilities must also be addressed, including chemical use by these facilities, pressure blasting/cleaning sidewalks and other surfaces.

VOL 15
0428
R0060649

1. PARKING FACILITIES

Storm water from parking lots may contain undesirable concentrations of oil, grease, suspended particulates, and metals. Some control measures such as periodic sweeping and cleaning catch basins should be implemented. The need for more advanced structural controls would be evaluated through the pollutant source identification program. Pilot studies would be conducted on candidate structural controls to evaluate their effectiveness prior to large scale implementation.

2. GOLF COURSES

Golf courses require the use of large amount of water, fertilizers, and pesticides. Field personnel should be trained on the proper handling, storage, and usage of these chemicals (Refer to Chapter V, Section C-1 for detail). To prevent excess irrigation water from entering the storm drain system, proper management of watering schedules should be required.

3. SCHOOLS

The maintenance of playgrounds and athletic fields at schools require fertilizers and pesticides. Their safe storage and use affect not only the stormwater quality but also the health of the students and the staff. Therefore BMPs under Chapter V, Section C-1-b should be implemented. Each municipality should develop a program to encourage these schools to use environmentally sensitive products for fertilizers, pesticides, detergents, and other chemicals. The schools should have proper material handling, storage, and disposal procedures for chemicals used in school laboratories.

4. HOSPITALS

Each hospital should have BMPs to control the handling and storage of medically related hazardous materials. All materials should be inventoried regularly, with record keeping protocols on supply and consumption. All personnel should be trained on the proper procedures on handling these materials, as well as emergency response. Each hospital should maintain a list of supervisors to be contacted if accident does occur. Disposal of these materials should be contracted out to commercial specialists.

5. PARKS/LANDSCAPES

Refer to **Section C Parks and Recreation**, of this Chapter, for information.

VOL 15
0429
R0060650

6. OTHER BUILDINGS/PLAZAS

Refer to Section C-2 Parks and Recreation - Facility Management, of this Chapter, for information.

H. PONDS, FOUNTAINS, AND OTHER PUBLIC WATER BODIES

Maintenance practices used on public water bodies, including waste management and non-stormwater discharges, must be addressed in the plan.

1. ALGAE CONTROL

a. Use of Chemicals

The use of herbicides or other chemicals to control algae growth should be carefully controlled and monitored to insure strict adherence to manufacturers' guidelines for use. Water sampling may be necessary to insure effective control.

2. CHLORINE MANAGEMENT

The use of chlorine for disinfection should be controlled. High dosage of chlorine may be harmful to the aquatic habitats. Dechlorination of pools and other water bodies would be required prior to draining.

3. MAINTENANCE

Each municipality should develop BMPs to prevent and control trash, debris, and other pollutants from entering water bodies. These measures could include routine trash collection along and on water bodies, public outreach to educate the public about the impacts of illegal dumping, and increase enforcement for violations.

P:\ORV\WSHED2.DOM\V

VOL 15 0430

R0060651

VI. RESIDENTIAL

INTRODUCTION

Residential activities including private vehicle washing and maintenance; use of chemicals such as pesticides, herbicides, and paints; private swimming pool maintenance; and other household and landscape maintenance can contribute to storm water pollution. These are all examples of non-point source pollution, a significant impact on water quality. Measures that can be taken to improve the quality of the runoff from residential area all require active public participation. Feasible BMPS to mitigate the stormwater pollution problem should include practicing good housekeeping and the use of environmentally sensitive alternative products, vehicle leak and spill control, and water conservation. Development of the residential stormwater program will be completed by December 1996.

A. HOUSEKEEPING PRACTICES

This BMP involves the development of a program to promote efficient and safe housekeeping practices (storage, use, and cleanup) when handling materials which may pollute stormwater/urban runoff. This could include, but are not limited to, fertilizers, pesticides, cleaning solutions, paint products, automotive products, and swimming pool chemicals.

A public education program will be developed to provide information on stormwater pollution and the beneficial effects of proper disposal on water quality; reading product labels; safe storage, handling, and disposal of hazardous products; list of local agencies; and emergency phone numbers. The above information can be disseminated through brochures or booklets made available at places such as public information fairs, municipal offices, and household hazardous waste collection events and facilities. City newsletter to residents is another means to inform the public, especially for those who do not participate or visit any offices or events.

B. ENVIRONMENTALLY SENSITIVE ALTERNATIVE PRODUCTS

This BMP, promoting the use of less environmentally sensitive products, can be implemented in conjunction with housekeeping practices. Alternatives exist for most product classes including fertilizers, pesticides, cleaning solutions, and automotive and paint products. The key to success will be to promote a willingness to try alternatives and to modify old habits.

General information will be developed and made available to the public on such alternatives. The emphasis may be placed on the need to preserve the natural environment of the receiving waters (ocean, bay, stream, wetland, etc.) with the use of alternative products because of their less toxic nature and proper disposal after its use.

VOL 15
0431
R0060652

C. VEHICLE LEAK AND SPILL CONTROL

This BMP prevents or reduces the discharge of pollutants to storm water/urban runoff from vehicle leaks and spills by reducing the chance for spills, stopping the source of spills, containing and cleaning up spills, and properly disposing of spill materials.

Vehicles will leak and spill fluids. The key to successful pollution management is to reduce the frequency and severity of leaks and spills; and when they do occur, to prevent or reduce the environmental impacts. Through education, the public should be encouraged to regularly inspect and maintain their vehicles. Guidelines should be developed to inform the public on spill containment and cleanup procedures such as having absorbent material on hand and disposing the material properly.

D. WATER CONSERVATION

Water is a scarce resource, especially so in Southern California. Wasteful use of water could channel pollutants into the receiving waters. Practices such as hosing the driveway and overwatering the landscape contribute not only to stormwater pollution, but also to the depletion of our natural resource. In order to prevent stormwater pollution, the public has to be educated on the mechanics of our storm drain system - discharges into the system will flow untreated into the receiving water. They have to know that the lawn clippings they wash down the road will end up in the ocean. Public awareness of the function of the storm drain system, of the importance of environmental health, and of our necessity to slow down the depletion of water resources will go a long way in reducing the pollution of stormwater/urban runoff.

In addition to the specific programs and plans outlined in this report, several watershed co-permittees have targeted activities occurring in and around the home that tend to contribute to degradation of storm water runoff quality. A practice that carries on-the-ground pollutants directly to storm drains is misuse of exterior water, namely the overwatering of landscaping, the hosing of driveways/sidewalks and the washing of cars in driveways--all of which allow water to run down the street into the nearest storm drain.

This situation can be addressed in two ways: 1) either reduce/prevent pollutants from being placed in areas where they may be carried by water into the streets or 2) minimize the amount of water allowed to flow on impervious surfaces that are connected to the street system.

Water conservation measures can be designed to address the issue of impervious surface water flow. While water conservation has historically been used to conserve domestic water, many jurisdictions are now recognizing the additional benefit of prohibiting water flows from private properties onto the street system. Each Co-

VOL 15 0432

R0060653

permittee within the Dominguez Channel/Los Angeles Harbor Drainage Watershed could develop regulations within an ordinance to endow the related officials with the legal authority to enforce water conservation.

Public outreach is a component of all programs, many of which carry fines for water wasting practices. Jurisdictions such as Inglewood have adopted specific standards for the control of runoff, including requirements for maintenance of irrigation systems. While some ordinances were established specifically to conserve water during periods of drought, several jurisdictions are keeping such controls in place at all times as measures to control pollution runoff.

P:\ORV\WSHED2.DOM\VI

VOL 15
0433
R0060654

VII. PUBLIC INFORMATION AND PARTICIPATION

It is necessary to involve the public in the stormwater program for it to be effective. The outreach program should be focused on the specific needs of the individual cities. Due to the inter-relationship among the stormwater issues, the public information and participation program should be recognized as a whole, rather than a number of separate outreach programs. All public awareness efforts should clarify to the public that they are the ultimate beneficiaries of a successful stormwater management program.

A. GENERAL OUTREACH

The targeted audiences of a general outreach will include municipal employees, local construction contractors, businesses in the area, and the general public. They should be made aware of their responsibility for both the problems and the solutions to stormwater pollution. In order to effectively communicate the stormwater pollution abatement message throughout the watershed; written, audio, and visual materials should be utilized. The actual level, priority, and schedule of public information activities must be based on the community's needs and resources to maximize program effectiveness. A watershed-wide concept will be developed by December 1995.

All Co-Permittees within the watershed acknowledge the value of public outreach, although several jurisdictions are in the early phases of program implementation. Extensive efforts have been made or are planned by most agencies to supply the public with information on a full range of storm water quality activities with the intention of achieving a high level of public cooperation and participation.

The most universal of the general outreach programs--catch basin stenciling--is receiving full cooperation throughout the watershed. Extensive stenciling has already been done by Los Angeles City and County, Inglewood, Torrance and Caltrans. Some agencies have enlisted the assistance of volunteer groups. All co-permittees have plans to implement and complete a stenciling program in compliance with permit deadlines.

1. WRITTEN MATERIAL

Co-Permittees should produce a variety of written materials to inform the residents within the watershed. Materials can include, but are not limited to, the following: flyers, brochures, door-hangers, newspaper articles, mail-inserts, banners, and posters. When necessary, these materials should be translated into a variety of foreign languages to reach minority residents in the community.

VOL 15
0434
R0060655

Print media outreach programs have been used extensively by Los Angeles City and County; Inglewood and Torrance have also been active in these aspects of public education. City newsletters mailed to all residents have often included articles on various storm water programs. Utility bill inserts and door-hangers are also used extensively to promote public awareness. The cities of Inglewood and Los Angeles, along with Los Angeles County, have printed brochures aimed at public education. Billboard and bus stop shelter advertising is used by both Los Angeles City and County. Los Angeles City and County have refrigerator magnets to promote their programs. Los Angeles City also has posters and street banners promoting storm water runoff quality.

2. AUDIO MATERIAL

Similarly, Co-Permittees may utilize audio materials to convey information regarding stormwater management. Examples of audio materials include radio advertisements/public service announcements and informational cassettes.

3. VISUAL MATERIAL

Catch basin stenciling program is an excellent means of educating the public on the mechanics of the storm drain system. The intent of the program is to enhance public awareness of the impact of stormwater pollution on receiving waters and to discourage improper waste disposal practices. Another effective medium for communicating the importance of stormwater management is through television. Possible measures include producing a public service announcement, cable access programs, and/or an informational video.

Among broadcast media outreach, the City of Los Angeles has prepared a public service announcement which has been shown on cable access channels. Several co-permittees use cable access for public outreach. Los Angeles County uses both television and radio. Torrance provides general outreach through a booth at the City's environmental and water conservation expo and suggests using movie theater leaders to further promote general public outreach.

4. DISTRIBUTION PLAN

General outreach efforts must be conducted throughout the entire watershed. Materials should be available at all public counters and distributed at public events such as environmental fairs and contests.

VOL 15
0435
R0060656

General outreach to targeted groups is an objective of some co-permittees--especially Los Angeles City who has a student/teacher school education program (K-6 "Magical City Forest") and a mailing program directed at private industries likely to be required to obtain a General Industrial Storm water Permit.

B. FOCUSED OUTREACH

Efforts should be made to target special groups. Focus could be on specific pollutants, practices and/or activities, or businesses. A watershed-wide concept will be developed by September 1996.

1. POLLUTANT SPECIFIC

For a particular watershed, there may be priority pollutants which are of more concern than others. The reduction of these pollutants may be addressed in a more focused public education and outreach program. Any of the methods used in the general outreach program may be utilized in a pollutant specific outreach program.

2. PRACTICE/ACTIVITY SPECIFIC

Everyone who lives or works in a particular watershed must realize that their actions have a direct affect on the quality of stormwater. These special groups must be made aware that their current practices/activities may be contributing to stormwater pollution. Practice/activity specific outreach programs should be developed and implemented throughout the watershed. The use of written, audio, or visual materials should convey three primary messages: (1) what activities can cause stormwater pollution, (2) how Best Management Practices are used to prevent pollution, and (3) how one can report occurrences of stormwater polluting activities.

Practice/activity specific outreach should promote, publicize, and facilitate public reporting of illegal dumpings, illicit discharges, or water quality impacts associated with discharges from municipal separate storm sewers. An effective program should include the establishment, operation, and promotion of a reporting hotline. Timely reporting by the public of improper disposal and illicit discharges are critical in controlling such sources of stormwater pollution. Increase in public involvement may be achieved by sending a follow-up letter to callers or providing callers with some type of reward. Educational efforts throughout the watershed should inform the public about the existence of the Los Angeles County-wide hotline and any other local hotlines; provide them with information regarding what to look for, and guidelines/procedures on how to report incidents.

VOL 15
0436
R0060657

Another critical component of practice/activity outreach is the development of a program to facilitate the proper management and disposal of used oil and toxic materials. An effective program could include, but is not limited to, the operation of recycling facilities and the conduction of household hazardous waste round-ups. The program could also include information about alternatives to toxic materials. Educational efforts throughout the watershed should provide the public with detailed information regarding the Los Angeles County-wide Household Hazardous Waste Round-ups and any other local programs.

The varied sources/causes of storm water pollution have resulted in implementation activities that target specific types of pollutants, activities and land uses/types of businesses. Within this watershed co-permittees take part in public information and participation programs specifically aimed at preventing improper disposal of hazardous household products and encouraging actions that keep general wastes out of the storm drain system--such as recycling programs, public trash receptacles and the cleaning of sidewalks, alleys and vacant lots. Illegal dumping and discharges are also specific targets.

Such activities are encouraged through general outreach programs (discussed above) that promote such programs as toll-free phone hotlines for reporting illegal polluting activities, topic-specific brochures, speakers bureaus and special recycling facilities (used motor oil, hazardous products, etc.). Torrance conducts yard waste composting workshops.

Los Angeles County has an outreach program focusing on airport operations; a component of the program is structure stenciling. The City of Los Angeles has a wide range of focused programs that can be tailored for special exhibits and interest groups, including elementary schools.

3. BUSINESS SPECIFIC

Due to the fact that some business operations have a higher potential of discharging pollutants into the storm drain system, a more focused public education and outreach program should be developed for them. Employees of these businesses should be educated on the issue of nonpoint source pollution and the effectiveness of Best Management Practices in reducing pollution. Besides written, audio, or visual materials that focus on specific businesses and their practices, mass mailings or articles in a trade/industry magazines are other possible means of focused outreach.

VOL 15
0431
R0060658

C. EDUCATION PROGRAMS

Increasing awareness is the major goal of the Public Information and Participation Program. An ideal means of accomplishing this task is through educational programs. Programs should be developed for a variety of audiences, including public employees and school children. Educational programs can also be an important part of a general or focused outreach. A watershed-wide concept will be developed by September 1996.

Both general and focused outreach are essentially programs of public education. More formal training/education is also conducted by Caltrans and the City and County of Los Angeles.

1. PUBLIC EMPLOYEES

It is important to educate all of the public employees about the stormwater program so that they do not continue with any practices that are counter productive. Furthermore, they can participate in the implementation and enforcement of the program. Ideas and suggestions of employees can be used to modify the program for improved effectiveness. The outreach must involve employees on many different levels - from program managers to field personnel. Educational programs for public employees may include, but are not limited to, articles in City newsletters, training classes, checklists for field personnel, and interdepartmental forum or committee. Any of the materials utilized in an outreach program - written, audio, or visual materials - may be used in a public employee educational program.

Caltrans personnel is educated on highway maintenance--specifically on such subjects as Hazardous Substance Spill Awareness and Pesticide Safety and Vegetation Management. Los Angeles City and County personnel meet regularly to discuss development of and evaluate storm water quality practices.

2. K-12

School children can play an important role in a public information and participation program. First, children are generally more easily motivated and the behavior changes made at that point in life tend to stay with them through adulthood. Secondly, school children can convey the stormwater pollution prevention messages to the members in their family. School programs must include information on the storm drain system, stormwater quality awareness, and may also include, but are not limited to, illegal dumping awareness, source minimization, and pollution prevention. Written material, videos, assembly programs, and field trips are examples of effective components of a K-12 educational program.

VOL 15
0438
R0060659

Los Angeles City also has a school education pilot program, "The Magical City Forest", for grades K-6. The County will soon have a program mascot to be used a public events.

3. OTHER

Educational programs can also be developed for professionals and technicians who are not public employees. Agencies should include public outreach material for business license renewal or outreach effort through professional and business associations.

D. RESIDENTS PARTICIPATION

The residents of the watershed should not only be made aware of the stormwater program, they should be encouraged to participate in its implementation. Specific outreach programs should be developed to allow the public to participate and to inform them of available means for providing ideas and comments regarding the stormwater program. A watershed-wide concept will be developed by September 1996.

1. VOLUNTEER MONITORING

Volunteer monitoring is the result of increased public awareness and participation. The public can utilize the hotline for reporting suspected illegal practices. Such involvement, which is similar to the Neighborhood Watch Program on crime, usually has good results.

2. COOPERATIVE OUTREACH

In order to promote public participation, cooperative outreach programs should be developed. These cooperative programs should help to create an awareness and an identification with the watershed. The catch basin stenciling and other signing programs are excellent examples of this type of cooperative effort. One possibility for cooperative outreach is an "Adopt-A-" program. Residents can "adopt" a highway, storm drain, catch basin, stream, etc. Other cooperative outreach efforts include events such as "Stormwater Pollution Awareness Week." The purpose of any of these activities is to inform and involve the local residents in regards to the stormwater management program.

Residents can assist public agencies in the development and implementation of storm water quality programs. Several watershed jurisdictions have enlisted the assistance of such groups as the Boy Scouts and neighborhood volunteers in the catch basin stenciling program. Caltrans' Adopt-A-Highway program

VOL 15
0439
R0060660

relies on voluntary private participation to help with clean-up activities. Hotline programs also enlist the assistance of residents in active participation.

3. COMPLAINT PROCEDURES

Public comments/complaints are important to the success of a stormwater program. A "hotline" program is an excellent mechanism for allowing the public to provide information. In Section B, "Focused Outreach - Practice/Activity", the various aspect of outreach effort is discussed.

E. EFFECTIVENESS EVALUATION

Permittees should develop a process to evaluate the effectiveness of their programs. Methods such as surveys and focus groups can be used to assess program's effectiveness. Results should gauge the community's level of awareness. Surveys and focus groups can also be used to provide insight into the program's direction and the formulation of attainable goals. A watershed-wide concept will be developed by September 1996.

The City of Los Angeles has conducted a pre-survey to determine the general level of public awareness about storm water pollution. They plan to conduct a post survey in 1995 to gauge the progress made in their public education program. Many of the other watershed co-permittees are in the early phases of implementation; there have been no reports of formal programs to assess program effectiveness, although staff discussions and management reviews have resulted in program development and modifications.

P:\ORV\WSHED2.DOM\VII

VOL 15 0440

R0060661

VIII. PROGRAM EVALUATION

The effectiveness of the storm water programs developed under the Municipal Storm Water Management Plan (hereinafter called the Plan) must be assessed on a regular and consistent basis. The Plan for this evaluation must include a schedule for evaluation, a methodology for the evaluation, a discussion of who will carry out the evaluation, and what will be evaluated. In addition, there must be a mechanism to follow up on the information generated by the evaluation. The Plan should be adjusted based on the program evaluation.

A. PERFORMANCE STANDARDS

The Permittees will develop standards to judge the effectiveness of the activities and control measures proposed under each chapter of the Plan. The standards will serve as minimum performance levels to evaluate the implementation of control measures. The subsequently developed performance evaluation procedures/methodologies will be the tool to determine if a particular BMP has an impact on stormwater quality. In developing these procedures, we resolve to ensure that each BMP is implemented to the maximum extent practicable. The targeted completion of this phase will be December 1997.

1. DEVELOPMENT OF PROCEDURES

General performance standards for evaluating the effectiveness of the Best Management Practices (BMPs) will be developed for all the BMPs proposed in the Plan. The Watershed Management Committee will be responsible for developing and adopting these evaluation criterion. The Management Committee may elect to establish subcommittees to develop performance standards for specific program areas. The area-wide Executive Advisory Committee will then review and endorse the standards. Standard recording format and implementation schedule will be developed for each BMP by the Management Committee for use by all permittees. The permittees will be required to document BMP implementation using the standard format according to an established schedule. The utilization of quantitative approaches in measuring effectiveness will be used whenever possible. Methods that would yield comparable results for year to year evaluation will be developed.

2. ACTIVITY/SOURCE/ACTION AREA SPECIFIC

Program effectiveness will be performed based on the information generated by the performance evaluation procedures. Using street sweeping as an example, the Plan will propose a method of determining if street sweeping has an impact on water quality. This could include determining what kind of

VOL 15
0441
R0060662

pollutants are removed by the sweeping, measuring the size of the pollutants and the amount removed. Methodologies would be developed for each BMP, which will assure that each control measure or action is implemented to the maximum extent practicable. For street sweeping; this may include the frequency of sweeping now, the method of sweeping, the equipment used, how the equipment is cleaned and maintained, and the method of disposal for the material collected. A schedule and format of evaluation shall be developed for all the BMPs.

The Regional Board has recommended 13 Baseline BMPs, to be developed and/or implemented by all permittees by the end of the current NPDES Permit. Existing Permit Task 5.2.5 requires an evaluation of the need for additional BMPs, source control, and/or structural control measures.

BMPs have only been implemented for a short time period by Phase I and Phase II cities. Phase III, which contains 30 new cities, has not yet implemented any BMPs. Therefore there is little or no data available to adequately assess effectiveness. In lieu of recommending any changes or additions to BMPs currently being implemented or proposed by the Permittees, a uniform data collection methodology will be established for each of the 13 baseline BMPs. This methodology would be used by all Permittees to compile data on their BMP implementation to allow for a uniform Countywide evaluation of BMP effectiveness. Priority will be given to the development of a uniform data collection methodology to document the success or effectiveness of these 13 BMPs. Upon reorganization of the NPDES Permit Program, as described in Chapter I, this will be the first task addressed by the Watershed Management Committee. The Uniform data collection methodology will be developed by January 15, 1995 for the Santa Monica Bay watershed and by July 1995 for all other watersheds with subsequent implementation by all permittees in each watershed.

B. ANNUAL REPORTS

An annual report for each watershed will be submitted to the Regional Board not more than 45 days after the end of each permit year. Each annual report will include a summary on the programs implemented during the previous year and plan activities that will be implemented during the current year. Any revisions to the Plan would be addressed in the report.

1. FORMAT/STRUCTURE

In order to insure uniform annual reporting by all watersheds, the Executive Advisory Committee will develop a uniform annual report outline for use by each watershed. Each Watershed Management Committee will develop a

VOL 15 0442

R0060663

standard format to be used by all the permittees in its watershed in reporting the progress and the status of all stormwater programs implemented in its jurisdiction. The Principal Permittee will utilize this information to develop the annual report for the watershed. Upon approval by the Management Committee, the annual report will be provided to the Executive Advisory Committee which will compile the annual reports from all watersheds for submittal to the Regional Board.

2. EFFECTIVENESS MEASURES

Under Chapter VIII, Section A, the permittees will have developed performance standards for each BMP. These performance standards will be used to assess the effectiveness of the BMPs. By the end of each permit year, the findings of the previous program year will be evaluated and used to suggest changes that are appropriate for implementation during the next year. Focus should also be given to the use of empirical studies, in a control setting, to more fully assess the effectiveness of BMPs.

3. CONTENT

The annual report will include a matrix illustrating the levels of implementation for all permittees. Tables will be developed for each BMP listing all the participating Co-Permittees, describing the status of implementation by each Co-Permittee of the BMP, and documenting any modifications of the BMP from the standard program. The effectiveness of each program area will be assessed using the performance standards developed under Chapter VIII, Section A. For effectiveness measures, the findings should be presented graphically for ease of comparison with the established levels of effort. Fiscal budget for all the BMPs implemented should also be prepared, grouped by programs. An analysis and evaluation of the results of the past year's monitoring program data will also be included in the report. Any revisions to the Plan should be addressed here, with all the elements affected discussed in their entirety. All relevant information, such as water samples analyses and evaluation, should be included in the appendices.

C. SEMI-ANNUAL REPORTS

A semi-annual progress report will update the Regional Board on Permit compliance activities six months into each permit year. The semi-annual report will be provided to the Regional Board within 30 days after the end of the six-month period.

VOL 15
0443
R0060664

1. PURPOSE

The semi-annual report will serve as a status report on the progress of the implementation of the Plan.

2. FORMAT/STRUCTURE

In order to insure uniform semi-annual reporting by all watersheds, the Co-Permittees will use the standard format developed for the annual report in reporting the progress and status of all the BMPs implemented in their jurisdictions. The Principal Permittee will utilize this information to develop the semi-annual report for the watershed for submittal to the Regional Board.

3. CONTENT

The semi-annual report will include a matrix illustrating the levels of implementation for all permittees. Tables will be developed for each BMP listing the participating Co-Permittees, describing the status of implementation by each Co-Permittee of the BMP, and documenting any modifications of the BMP from the standard program. The permittees will describe the problems encountered during implementation and discuss the modifications to the program in order to solve these problems.

D. INTERNAL REPORTING

In order to facilitate the preparation of semi-annual and annual reports, standard internal formats for use by all Permittees will be developed. The internal reporting procedures will be completed for all Plan chapter elements by December 1997.

1. STANDARD FORMS

The Watershed Management Committee will be responsible for developing standard forms for use by each Permittee. Standard forms will be developed for each BMP to monitor its progress. Some Permittees may have to customize the standard forms in order to reflect their programs' additional features. The forms will collect all the information essential to the preparation of the annual and semi-annual reports. In developing the standard report forms, information that is quantifiable and specific for each program area and/or BMP will be collected.

2. PROCEDURES

Co-Permittees will submit all the BMP report forms to the Principal Permittee at the end of the six-month period and the permit year, respectively.

VOL 15
0444
R0060665

3. RECORD KEEPING

The Regional Board does not need to see all of the extraneous information, but the records will be retained by the Principal Permittee for 2 years. Each Permittee will keep a permanent copy of its reporting forms in case they are needed.

E. STORM WATER MANAGEMENT PLAN REVISIONS

There will be an annual review process that will allow the Permittees to revise the Plan for the next year and for the rest of the permit period. Revision procedures will be developed by December 1997.

1. PROCESS

In the annual report, Permittees will compare the progress made on all the BMPs with the established level of effort. If the level of implementation is inadequate, the program should be adjusted to accelerate the progress. If the progress made to date shows that the program is ineffective or inefficient in protecting the stormwater quality, a new program should be developed and implemented for the next fiscal year and the rest of the permit period.

2. REPORTING

All refinements or revisions to be made in the fiscal year will be documented in the annual report, with the dates of implementation proposed.

P:\ORV\WSHED2.DOM\VIII

VOL 15
0445
R0060666

IX. MONITORING

The Monitoring Program is a critical element in the Stormwater Management Plan. It will provide important data for use in characterizing existing stormwater/urban runoff quality, guiding future development, and modifications to the Plan and also to assess its effectiveness. A watershed wide monitoring program shall be developed by December 1997.

A. SYSTEM CHARACTERIZATION

The existing Permit subdivided the County into six drainage basins with information to be collected to characterize each of the basins.

1. WATERSHED

Each drainage basin has been subdivided into numerous drainage areas, based on an evaluation of the existing drainage system and surface flow patterns. For each drainage area, the following information has been compiled: size; breakdown of existing land use; imperviousness; description of soils; location of waste disposal facilities; and the location, type, and number of industries by Standard Industrial Classification (SIC) Code. This information has been submitted to the California Regional Water Quality Control Board, Los Angeles Region, for Phases I and II. Phase III watershed characterization is in progress and will be completed by the end of December 1994. Due to the volume of the watershed characterization data, this information has not been included herein, but is available for review at either the Regional Board or the Los Angeles County Department of Public Works.

This information will provide a basis for developing other monitoring program elements such as pollutant loading estimates from major land uses and watersheds; pollutant source identification, and identification of illegal discharges/illicit disposal practices.

2. STORM DRAIN SYSTEM

In subdividing each basin into drainage areas, the drainage area tributary to all major outfalls has been identified. Within each drainage area, the tributary storm drain system is being identified and mapped. Key information such as the size of the storm drain facilities, locations of manholes and inlets, and storm drain connections is being compiled. This information will be vital in conducting storm drain inspections to identify and eliminate illegal discharges.

VOL 15 0446

R0060667

3. RECEIVING WATERS

Due to the extent of urbanization in Los Angeles County over the past decades, most of the streams designated as receiving waters in the Los Angeles basin have been replaced with man-made storm drainage systems to provide flood protection to the urbanized areas. These streams have been mapped as part of the storm drain system mapping done under A.2. above. The remaining natural streams are also being mapped.

The Los Angeles County Department of Public Works (Department) has been performing surface water quality monitoring on a voluntary basis since the late 1960s. Samples have been collected and analyzed from various receiving water streams and channels throughout the County to collect general information as to the quality of the surface runoff within our storm drain system.

The program in existence at the time the current Permit was issued was established in the mid 1980s. Twenty-eight sites are sampled monthly for dry weather flows. Twenty-one of the 28 sites are sampled for storm flows up to five times per year. The collected samples are analyzed for general minerals, pH, total dissolved solids, specific conductance, biochemical oxygen demand, bacteria, heavy metals, pesticides, PCBs, total organic carbon, volatile organic compounds, and total petroleum hydrocarbons.

The sample collection at these sites will continue while the new National Pollutant Discharge Elimination System (NPDES) Permit monitoring stations are established. Once all NPDES Permit monitoring stations are operational, sampling at these 28 sites will be discontinued.

In order to provide an initial assessment of the water quality in the major streams and channels in the County, an analysis has been performed on the data collected through the existing surface water monitoring program. The analysis has been done on a Countywide basis and also by major drainage basin. The report can be found in Volume 8.

To better assess the receiving water impacts of stormwater the Department will be developing a program to further study stormwater impacts on selected receiving waters, including conducting toxicity studies. Initial efforts will focus on the Santa Monica Bay Watershed. A Request for Proposal for the development of such a program will be advertized by January 15, 1995.

The water quality data collected by the new NPDES Monitoring Program will provide more detailed data to better assess in upcoming years the quality of our receiving waters. Ten monitoring stations have been proposed along the

VOL 15 0447

R0060668

major streams in the County. A description of these site locations can be found in the monitoring work plans for Phases I, II, and III, previously submitted to the Regional Board, see Volume 8.

4. **LAND USE**

As described under Section A.1. above, the existing land use categories within each drainage area have been identified. This information has been used to select drainage areas comprised of a single homogeneous land use for land use specific monitoring. A total of 14 land use monitoring sites are being established in the County. Five sites are being installed in the Santa Monica Bay Watershed with the remaining nine to be selected from within the Los Angeles, San Gabriel, and Santa Clara River Watersheds. For a description of the sites, please see Volume 8. These sites will provide valuable information as to the types and levels of pollutants found in runoff from various land uses. This information can then be used to refine the Stormwater Management Plan to develop specific management measures to target identified problems.

B. SOURCE IDENTIFICATION

Identifying the sources of stormwater pollutants from both specific land uses and specific activities will provide the information needed to identify problem areas and allow specific management measures to be developed to address these problems.

1. SPECIFIC LAND USE

As described in Section A.4. above, major land use classifications will be subject to individual monitoring to determine the types and levels of pollutants present.

2. SPECIFIC ACTIVITIES

a. A pollutant source identification program will be designed to identify significant pollutant sources (i.e., parking lots, industrial activities, etc.), with the hope that remedial action can be undertaken to reduce any significant impacts so identified. It will focus on monitoring very small areas (i.e., less than five acres) where a specific and/or interrelated set of pollutant generating activities are occurring. Its objective is to provide data for selecting BMPs for specific activities rather than characterizing discharges for long-term pollutant loading estimates.

Identification of pollutant sources can be done using a number of methods. Potential sources of storm water pollutants can be identified

VOL 15
0448
R0060669

by records of chemical use and/or storage, by studies of specific activities which lead to the deposition of pollutants throughout the watershed, and by field inspection or monitoring. Watersheds which may contain significant pollutant sources can be identified through land use information or by mass loading estimates.

By mid January 1995, the County will begin targeted monitoring of a municipal corporation yard in the Santa Monica Bay watershed. A full program for pollutant sources identification will be developed by December 1996.

b. A storm drain inspection program has also been developed and is being implemented. The first phase of the inspection program will target the open channel storm drains to identify illegal discharges.

The open channel inspections will also be used to screen outfalls from underground storm drains for the presence of dry weather flows. This information will be used in the next phase of the storm drain inspection program to prioritize the underground storm drain system for further field screening and inspection of problem areas.

C. CONTROL MEASURE EFFECTIVENESS

It is unlikely that the effectiveness of the various control measures implemented by the storm water management plan can be determined solely through the data produced by monitoring the quality of storm drain flows, because it is difficult to obtain statistically significant comparisons of watershed-wide control measure performance with such data. For this reason the effectiveness of control measures will be assessed through other means.

Two general types of methods are available for assessment of control measure effectiveness: direct water quality (conventional) monitoring and indirect (non-conventional) monitoring. Direct water quality monitoring can be used to determine pollutant reduction by a specific facility or device. This technique is commonly used for structural or treatment controls, such as detention basins and constructed wetlands, where there is an accessible inflow and outflow. Inflow and outflow results are compared to determine pollutant removal and effectiveness.

Direct water quality monitoring of site runoff before and after implementation of non-structural control measures is also possible. However, it is difficult to demonstrate effectiveness at a statistically significant level because of the high degree of variability in stormwater pollutant concentration and mass loading data. The water quality improvement due to non-structural control measures is generally expected to be less dramatic than that achieved through structural controls. A larger

VOL 15
0449
R0060670

number of samples is therefore required to produce a statistically significant result. This is especially difficult in relation to the monitoring of the pre-control measure condition. Collection of adequate baseline information is necessary prior to the implementation of management practices. Direct monitoring of the effectiveness of non-structural controls is feasible typically only under experimentally controlled conditions (e.g., selection of small, well-defined watershed; control of management practice implementation; effective siting and timing of monitoring activities), including a sufficient number of samples to achieve statistical significance.

Indirect monitoring currently is the primary method of choice of assessment of management plan effectiveness. A number of indirect monitoring techniques are available for assessment of management plan effectiveness.

Verification of program implementation is an indirect monitoring method that can be used to determine how a management plan is being implemented. Another indirect monitoring method, pollutant removal inventories, can be used to assess the amounts of pollutants that have been prevented from entering the municipal storm drain system.

The 13 Baseline BMPs recommended for implementation by the Regional Board plus other BMPs proposed by the various Co-Permittees are in general all non-structural control measures. In the short-term, a uniform data collection methodology will be developed for use by all Permittees to compile information on the level of implementation of the 13 Baseline BMPs. This will allow for a uniform watershed-wide evaluation of BMP effectiveness. For the Santa Monica Bay watershed, this uniform data collection methodology will be developed and begin implementation by January 15, 1995. For the other watersheds, implementation would begin July 1, 1995.

For the long-term, as the various chapters of the Plan are more fully developed, possibilities for the use of direct water quality monitoring for control measure assessment will be evaluated as opportunities arise.

D. POLLUTANT LOADING

One of the objectives of the monitoring program is to estimate the annual pollutant loadings from each watershed. Knowing the types and quantities of pollutants discharged into receiving waters are important in assessing the impacts of stormwater and, in turn selecting appropriate control measures to address problem areas.

The 24 permanent monitoring stations that are being established Permit-wide will be utilized to estimate pollutant loads from each watershed and also from various land uses. For a description of the methodology to be used to estimate pollutant loadings, please see Volume 8. For the Santa Monica Bay Watershed, the pollutant loading

VOL 15
0450
R0060671

model will be tested and operational by January 15, 1995. Actual pollutant loadings will be calculated subsequent to storm events occurring for which water quality data has been obtained. For the other watersheds, a schedule for pollutant load modelling will be provided by January 15, 1995.

To more closely model pollutant loadings and evaluate control measure impacts, a more detailed dynamic modelling will be undertaken on a smaller, representative sub-watershed. The EPA-SWMM model has been selected for use in our dynamic modelling efforts. For the Santa Monica Bay Watershed, the Kenter Canyon Drain sub-watershed has been selected for this modelling efforts. This sub-watershed is typical of the urbanized areas in the Santa Monica Bay Watershed. It is comprised of multiple land uses, has well-defined boundaries, and has no upstream flow regulation. We are reviewing and identifying the existing drainage system, defining current and future land uses, and conducting field checks. The model will be tested and operational by January 15, 1995, with actual modelling results to be available later when local water quality data from our monitoring stations becomes available. Based on the results of the dynamic modelling of the Kenter Canyon sub-watershed, other sub-watersheds may be selected from the other major watersheds in the County.

E. COMPONENTS OF A MONITORING PROGRAM PLAN

The components of the monitoring program plan such as monitoring site locations, dry/storm sampling frequency and methodology, constituents to be sampled, field and laboratory procedures, QA/QC, etc., can be found in Volume 8 which has been previously provided to the Regional Board.

The Monitoring Program elements described in Volume 8 will be revised to address the Monitoring Program needs described in Section A - D above as agreed to in the letter from the County to the Regional Board dated September 22, 1994.

As the various chapters of the Plan are more fully developed, the Monitoring Program will be revised to address any additional monitoring needs that may result.

F. DATA MANAGEMENT

For water quality data collected at the 24 monitoring stations, please see Volume 8 for data storage and reporting methods.

For each Section A - E of the Monitoring Program described above, an annual report will be prepared detailing the data collected, with an evaluation and interpretation the data including water quality impacts.

LOS ANGELES RIVER
STORMWATER MANAGEMENT PLAN

INTRODUCTION

On June 18, 1990, the National Pollutant Discharge Elimination System (NPDES) Permit - Order #90-079, NPDES #CA0061654-CI6948 was issued to the County of Los Angeles and 17 cities tributary to Santa Monica Bay. During the subsequent years, two newly incorporated cities within the Santa Monica Bay watershed, Caltrans, and the County of Ventura also became Co-Permittees. This Permit outlined a three year program which required each Permittee to: characterize drainage areas; develop and schedule the implementation of Best Management Practices to enhance the quality of stormwater/urban runoff within its jurisdictional boundaries and in storm drains it owns and operates. On July 1, 1992, 36 additional cities were initiated into the Permit and began their three-year program. By July 1, 1993, the remaining 30 cities in Los Angeles County within the drainage basin were initiated into their three-year program. The cities were grouped according to their starting dates and referred to as Phases I, II, and III respectively (See Table A). In general, the boundaries of each Phase did not encompass whole watersheds but portions of various watersheds (See Figure 1).

The Permit has a five-year duration and although Phase III cities have only completed year one of their three-year program, the Permit requires the submittal of a Report of Waste Discharge (ROWD) which serves as an application for a subsequent NPDES Permit to replace NPDES Permit #CA0061654, which will expire on June 18, 1995. Therefore, the County of Los Angeles, the County of Ventura, Caltrans, and the 85 cities are now parties to the subsequent NPDES Permit application utilizing the Municipal Stormwater Management Plan (herein after called the Plan) concept.

The Plan is based on the Stormwater Management Plan Components developed by the California Regional Water Quality Control Board, Los Angeles Region (Regional Board), and is proposed on behalf of the County of Los Angeles and the other participating agencies, see Table B. This Plan describes the stormwater management activities to be undertaken during the next single, five-year NPDES Municipal Stormwater Permit. The Plan involves the subdivision of the area of the County under a single, new Permit, into six watersheds, each with its own stormwater management plan. For these watersheds and the agencies in each of these watersheds, see Table B and Figure 2.

As required by the current Permit, all Permittees have proposed BMPs for their jurisdictions, described in Volume One and under prior submittals made to the Regional Board. These BMPs have already addressed many of the program areas discussed under the stormwater management plan. As required by the current Permit and continuing on under the new Permit, the Permittees will continue to implement these BMPs. This stormwater management plan will involve reorganizing the individual city-based BMP programs into a single stormwater plan for each watershed. The timeline shown in this document reflects the time needed for the transition from individual city-based programs to the preparation of a mutually agreed upon and collectively developed watershed plan by all parties of the new Permit for each of the watershed areas. The first step in beginning

VOL 15
0456

this process will be the reorganization of the current three-phase program into a new watershed based program. A reorganization of the Phases into watersheds which are based on hydrologic characteristics will allow for the consistent development and implementation of programs among Permittees, referencing land use and drainage infrastructure within their respective watersheds. Consistency of program throughout the watershed will be beneficial in terms of targeting specific pollutant problems and areas.

This specific plan will address the stormwater management issues for the Los Angeles River watershed, which include the following cities and agencies:

I. PROGRAM MANAGEMENT

A. PROGRAM STRUCTURE

The County of Los Angeles is designated as the Principal Permittee. The other agencies are designated as Co-Permittees. The following are conditions that establish the responsibilities of all Permittees.

1. RESPONSIBILITIES OF PRINCIPAL PERMITTEE

Anticipated duties of the Principal Permittee include:

- Being the coordinators of permit activities and chairing the area-wide Executive Advisory Committee and the Watershed Management Committees;
- Providing the resources necessary for development of the stormwater management plans;
- Providing technical and administrative support for both the Executive Advisory and Management Committees;
- Implementing the monitoring program;
- Providing the resources necessary for developing annual reports including evaluating monitoring program data and BMP effectiveness;
- Complying with all the responsibilities of a Co-Permittee as outlined below.

2. RESPONSIBILITIES OF ALL CO-PERMITTEES

Each Co-Permittee is designated a number of duties under the proposed stormwater management plan:

- Participate in the development of the stormwater management plan;
- Implement the stormwater management plan within their jurisdictional boundaries and the storm drains they own and operate;
- Provide information needed by the Principal Permittee on program implementation for development of annual reports.

The area under the Permit will be subdivided into the six watersheds tributary to the following waterbodies: Santa Monica Bay, which is further divided into a) Malibu Creek and Other Rural Areas, and b) Ballona Creek

VOL 15
0462
R0060682

and Other Urban Areas; Los Angeles River; San Gabriel River; Dominguez Channel/Los Angeles Harbor Drainage; and the Santa Clara River (See Figure 2). Managing these watersheds is a task that will require a collective and cooperative effort on the part of all governmental entities named in the Permit that are within each watershed.

The management structure of the Plan consists of an area-wide Executive Advisory Committee, Watershed Management Committees, and Subcommittees. This particular structure is intended to provide a suitable program for the unique characteristics of each watershed and shall be developed by April 1995.

The Co-Permittees tributary to the Los Angeles River watershed shall adopt this watershed stormwater management program structure as a guide to allow for an area-wide uniformity of compliance of the Permit.

3. EXECUTIVE ADVISORY COMMITTEE

The area-wide Executive Advisory Committee shall consist of the County of Los Angeles, as Chair, and two representative Co-Permittees from each of the six watersheds. This Committee assumes no responsibility for the adequacy or inadequacy of any individual city's program and should not be viewed as the responsible agency in this sense. The Committee's main role is to facilitate programs within each watershed and to enhance consistency among all of the programs. Additional responsibilities of the committee are:

a. Making recommendations on area-wide issues to each of the Watershed Management Committees;

b. Reviewing the stormwater management plans as developed by each Watershed Management Committee and provide direction and guidance on the plans for consideration by the Watershed Management Committees;

c. Assessing the consistency of all area-wide BMPs;

d. Preparing and forwarding unified submittals to the Regional Board upon receipt of information and materials submitted by the Watershed Management Committee in compliance with Permit requirements;

e. Scheduling and coordinating meetings and correspondence to allow for communication between the Co-Permittees and the Regional Board;

f. Acting as liaison between all Permittees and the Regional Board on Permit issues as well as mediating conflict among the Permittees.

VOL 15
0463
R0060683

4. WATERSHED MANAGEMENT COMMITTEE

A management committee within the watershed will be comprised of the County of Los Angeles, as Chair, and one representative from each of the Co-Permittees in the watershed. The committee shall be responsible for:

a. Establishing goals and objectives for the watershed

b. Preparing the stormwater management Plan for the watershed (This includes the development of all chapter components of the Plan);

c. Assessing the effectiveness of the Plan and making appropriate changes;

d. Preparation of the semi-annual progress reports and annual Permit reports on Permit activities within the watershed for submittal to the Regional Board (For the annual Permit report, a draft will be circulated to each Co-Permittee and the Executive Advisory Committee for its review and comment. Final copies of reports shall be forwarded to the Executive Advisory Committee through which a compilation from all six watersheds shall be submitted to the Regional Board);

e. Enhancing the implementation of the stormwater/management plan within the Los Angeles River watershed.

5. SUBCOMMITTEES

Subcommittees will be established where needed as determined by the Management Committee and/or the Executive Advisory Committee. The Subcommittees would be focused on specific program areas and can provide more specific oversight on the development, implementation, and evaluation of selected program areas. These subcommittees shall be scheduled to meet on a routine basis.

B. INSTITUTIONAL ARRANGEMENTS

Management of the stormwater program requires the collective efforts and the cooperation of all Permittees. No Permittee has the ability and the legal authority to assume the responsibility of all activities of this Permit. Therefore, agreements will need to be formally developed amongst the Permittees to insure proper implementation of the Permit requirements.

VOL 15
0464
R0060684

1. PROGRAM PARTICIPANT ARRANGEMENTS

As the Principle Permittee, the County of Los Angeles will be designated as the lead agency for coordination of Permit activities and therefore shall chair the executive committee and the management committee meetings as they are scheduled. The lead agency is responsible for coordination of the Permit but is not responsible for the adequacy or inadequacy of any individual Permittee's program. All other entities are Co-Permittees and will be responsible for the Permit compliance of their own agency's program. An implementation agreement will be drafted formally detailing the responsibilities of the Principal Permittee and the Co-Permittees. The agreement would also address the funding of various watershed-wide activities such as plan development, annual evaluation and reporting, and monitoring. Execution of the agreement by all Permittees is targeted for December 1995.

2. AREA-WIDE INTERAGENCY

As the Plan for each watershed is more fully developed, the Watershed Management Committee will coordinate with special agencies and districts that also regulate and/or perform activities addressed under different elements of the Plan. This coordination will attempt to ensure that their functions and the Plan are compatible. A few of these agencies include:

County Hazmat

- Any overlap of waste regulations, Household hazardous waste programs and or Industrial inspections shall be recognized and addressed, by all entities that fall under this Permit, in reference to the watershed program.

County Health

- Inspections of restaurants and other food handling establishments shall be coordinated with the Permittees.

Local Transportation/Congestion Management

- Local municipalities have limited authority over motor vehicle usage and regional transportation planning. Where feasible, plan development and implementation will be coordinated with local transportation agencies.

VOL 15 0465

R0060685

County (Regional) Parks

- Landscape maintenance activities at public-owned parks will be reviewed as part of additional plan development to ensure the use of proper management measures.

Mosquito Abatement

- Coordination with the County Agricultural Commissions will be done for mosquito abatement programs to avoid adverse impact on the quality of stormwater/urban runoff.

Water Districts

- Activities with regards to the Water Districts activities will be reviewed and, when feasible, comply with the watershed program regulations and requirements.

Other entities, both private and public which have major land holdings and/or authorities that impact the quality of stormwater/urban runoff should be initiated to participate actively in the program.

3. CITY-SPECIFIC INTERAGENCY ARRANGEMENTS

Each city will need to develop the institutional framework to address operation, maintenance, construction, redevelopment, and other activities performed by city agencies such as Public Works, Parks and Recreation, Planning, and Public Owned Treatment Works (POTWs). These city agencies will need to participate in the planning and implementation of relevant plan program areas.

C. FISCAL RESOURCES

As each of the Plan chapters are completed, each Permittee will develop a budget for implementing that portion of the Plan. A complete budget for the plan will be produced upon completion of development for all Plan components (*December 1996*). The budget will provide information such as funding sources, staff resources, contract services, and cost sharing arrangements.

1. AREA-WIDE

In implementing the Plan, the Permittees may elect to jointly fund a single program for certain BMPs, such as Public Education, that are area wide in

VOL 15
0466
R0060686

nature. Funding agreements including budgets and cost per agency would be developed.

2. CITY-SPECIFIC

Each Permittee will develop a budget detailing the cost of implementing Plan activities within its jurisdiction. Special funding in the form of grants, donations, or other forms of contribution should also be actively pursued to assist in funding special studies and/or BMPs.

D. LEGAL AUTHORITY

Each Permittee is responsible for implementing the Plan within its jurisdictional boundaries and therefore must acquire all needed legal authority. Each Permittee, being separate legal entities, are to have adopted as required by the existing Permit, ordinances that will provide them with the adequate legal authority to develop, administer, implement, and enforce storm water/urban runoff management programs within their own jurisdiction. The ordinance must provide for its enforcement and at a minimum specify that violators may be subject to penalties including, but are not limited to, fines and termination of the activity causing the violation. A plan for identifying any additional legal authorities needed by the Permittees will be included in the completed Plan for the Los Angeles River watershed *December 1995*. Upon completion of development of the Stormwater Management Plan, enforcing compliance with the Plan will the responsibility of the Regional Board.

P:\INEZ\PLAN\PLAN2.LAR\I

VOL 15
0467
R0060687

II. ILLICIT DISCHARGES

The elimination of illegal connections and illicit disposal (IC/ID) practices is an important component for any program aiming to enhance the quality of stormwater/urban runoff.

Although more information is needed to assess fully the benefits and costs of conducting IC/ID programs, we can make logical decisions regarding application of Best Management Practices (BMPs) to minimize such incidents. These BMPs will vary due to the jurisdictional differences that exist within each watershed. Each jurisdiction within the watershed will be developing and implementing those activities that will adequately serve the jurisdiction and the watershed as a whole.

IC/ID practices are intermittent discharges of pollutants into the storm drain system that can degrade the quality of receiving waters. This can occur through catch basins, area drains, and even on gutters and street surfaces. Some illegal dumping activities are done by individuals who do not know that such practices are illegal and can adversely impact the environment. Yet, others may be carrying out such practices with the full knowledge that such activities are prohibited.

A. ILLICIT CONNECTIONS

In order to implement an illicit connection management program, jurisdictions as a whole will need to develop and implement the procedures for investigating each of their respective storm drain systems.

Detailed procedures to eliminate illicit connections depends on the complexity of the storm drain system. A consistent watershed wide concept will be developed to investigate illicit connections to the storm drain system. Based on the results of field screening activities, or other appropriate information that indicates an area of reasonable potential of containing illicit connections, detection and follow up procedures would be followed. Priority should be established to focus on major problem areas and allow for a cost-effective approach to eliminate illegal connections. This concept will be developed by December 1995.

1. SYSTEM SURVEY

A system survey is a necessary component of an illicit connection elimination program. Although the basic concept is similar, the actual techniques and methods that jurisdictions within the watershed use to conduct system surveys can be quite different.

In conducting system surveys, the intent is to avoid costly investigations within areas not suspected of containing illicit connections. Field screening, map

VOL 15
0468
R0060688

research, and land use investigation activities will be done initially to identify potential problem areas. Public outreach efforts will be used to inform citizens in the area about the problem. Enforcement action will be taken to terminate such illegal connections. It should be noted that more detailed and sophisticated techniques such as televised inspection and dye testing will only be used in special situations as needed.

Under the current Permit, three jurisdictions have undertaken a system survey. The County of Los Angeles is preparing maps detailing detail the location of each storm drain, its manholes and catch basin connector pipes to facilitate monitoring of illegal connections and discharges. The location and source of discharge for connections is also being inventoried. The County is developing a GIS system to allow management and analysis of this data. This information will be used in the storm drain inspection program which is ongoing. The program is targeting open channel storm drains. All open channels will be inspected for evidence of illegal discharges. The open channel inspections will also be used to collect information on dry weather discharges from underground from underground drains for use in prohibiting future underground drain inspections.

The City of Los Angeles has contracted with a vendor to provide "on call" closed circuit television inspection of storm drain interiors suspected of being damaged or containing illegal/illicit connections. The City has also in operation a program to identify all outfalls in the storm drain system and their tributary drainage areas. This information is being gathered for incorporation into a database that will be used to identify and prioritize drainage areas for investigation of possible illicit discharge. One city is considering a program that will require field inspections of storm drains to determine connections.

2. ONGOING SYSTEM INSPECTIONS

Ongoing system inspections for illicit connections will involve the techniques identified in Section 1 above, along with some additional activities. In smaller systems where the storm drain goes into several pumping stations, a regular inspection of the pumping stations for, among other things, evidence of illicit discharges will be sufficient.

In larger and more complex systems, a program of field screening will be used. Evidence of pollution will be categorized and prioritized. The storm drain alignment tributary to the suspect illegal connection can then be further investigated for illicit connections. If a discharge can be traced to a particular facility, the facility will be investigated to identify where exactly the pollutants are coming from and what efforts are needed to stop the discharge.

VOL 15 0469

R0060689

Another means of detecting illicit connections may be to rely on reports of illicit discharge from the public. This will utilize the County's or another agency's established "hotline" number that the public can call and report such observations.

3. REPORTING

A consistent recording system will be established to track report of illegal connections. This recording system will be used by the Permittees within the watershed.

B. ILLEGAL DUMPING

Due to the intermittent and unpredictable nature of illegal dumping, apprehension rate of violators could be quite low. The first course of action is to develop an area wide educational and reporting system along with prompt response procedures. This will be accomplished by December 1995.

1. OUTREACH

See **Chapter VII Public Information and Participation** of this report for a detailed discussion of the outreach program.

2. SYSTEM SURVEILLANCE

Measures that may be used for this aspect of the program may include, but are not limited to, regular inspections of vacant facilities, street use inspection programs to detect illegal discharges and dumping into the street system, and a public complaint and reporting system.

Three jurisdictions have begun system surveillance programs. One city presently enforces violations of excess water and fluids in the street system on a complaint basis. This program, when funded, would add inspection teams to monitor street discharges aggressively. This city also has a storm drain line investigation program that is designed to stop discharge from specific facilities by monitoring maintenance holes around suspected sources. A program has been established for County-owned airports requiring lessees to report the release of hazardous materials to the proper agencies. Finally, one city is considering a storm drain inspection program, a discharge assessment, and a program for control of illegal discharges that would establish a permit procedure.

VOL 15
0470
R0060690

3. SPILL RESPONSE

The Health Hazardous Materials Division (HHMD) of the Los Angeles County Fire Department is generally the primary spill responder. If the material is found to be hazardous and poses an imminent threat to public health and safety, the cleanup and disposal of the material will be done under the supervision of HHMD. If the material is non-hazardous, the responsibility will fall on local agencies to coordinate cleanup, disposal, and attempt to identify and prosecute the violators. Cooperation among all agencies will be needed to allow for prompt action and joint effort to deter such violators. All agencies will have local authority against such illegal dumping activities.

Spill response procedures have been established by three jurisdictions. One city is in the process of replacing a sewage pump station with a gravity flow sewer that eliminates the possibility of pump failure and reduces the potential for sewage spills. Another city is presently identifying all city-owned facilities to ensure that they have adequate spill containment procedures. Improved procedures for inadequate facilities are to be established. The third jurisdiction is developing new spill reporting procedures.

4. COMPLAINT RESPONSE

The County and some local agencies have established a stormwater telephone "hotline" that can be utilized by all citizens. Public complaints are generated through these "hotlines" and also through regular channels such as calls to either Fire or Police agencies, public works, or legislative offices. Although responses to these complaints will vary depending on the nature of the complaint, action shall be taken.

The use of reporting hotlines, in conjunction with outreach/publicity programs, can help minimize the problems of illegal dumping. The County has established an 800 hotline for the reporting of illegal dumping. In addition to this hotline, thirteen of the cities in the watershed have established their own reporting phone numbers. Generally these numbers are handled through the individual police or fire departments. However, one city has established a system through their Bureau of Sanitation and another through the city's Environmental Network. Approximately half of the co-permittees indicated that they are actively publicizing the hotlines. The most frequently used method to promote reporting hotlines is through city newsletters, with newspaper articles, handouts/flyers, press releases, water and utility bill inserts, and local cable television. Seven of the cities who do not currently have outreach procedures report that they have planned or budgeted for programs.

VOL 15
0471
R0060691

A complaint response procedure has been established by Los Angeles County to track hotline complaints. A follow-up letter to violators has also been implemented.

5. COORDINATION OF ALTERNATIVE DISPOSAL

Alternative disposal is one way of reducing non-stormwater materials that can potentially find their way into the storm drain system. Recycling programs are one of the most effective ways to reduce waste material. The recycling program can either be at the curbside or through drop-off centers. Household hazardous wastes can be dropped at mobile collection centers or at fixed sites. Co-Permittees in the basin generally participate in the County's Household Hazardous Waste collection program. Effectiveness of those programs may be enhanced by a public outreach program that will inform the public of the locations and/or schedules for such events. Technical assistance or information may also be provided to businesses that want to develop a pollution prevention, waste minimization, or alternative disposal program.

All jurisdictions participate in the Countywide Household Hazardous Waste Round-ups and the majority of them presently use, or plan to use, a variety of methods to notify the public of the events. Nine cities have already developed, or plan to develop, used oil recycling and a few are considering green waste programs. Only Caltrans does not participate in the round-ups, but it does recycle its used oil and other hazardous materials at maintenance yards. Curbside recycling, another alternative disposal measure, has been implemented by a majority of the cities. Only 6 jurisdictions/agencies do not routinely pick-up materials. However, 5 of these either has drop off centers, seasonal programs (Christmas trees, phone books), or plan to begin programs by 1995.

6. REPORTING

Incidents involving a hazardous material entering the storm drain system are to be reported by the responsible party, or, if not known, the responding agency, to the California Regional Water Quality Control Board, Los Angeles Region (Regional Board). Complaints received through the County wide and local city hotlines will be tracked and reported to the Regional Board.

C. ENFORCEMENT PROCEDURES

Enforcement actions against discharges are done through either state hazardous and toxic materials statutes or through municipal ordinances that are already in the codes of the permittees. Industrial Waste Ordinances may be used in enforcement actions against illicit connections. Furthermore, anti-littering, health codes, plumbing codes,

VOL 15 0472

R0060692

and fire codes may be utilized for dumping or spill incidents. Enforcement actions can be taken by different municipal agents, including but are not limited to, Industrial Waste Inspectors, Building or Plumbing Inspectors, Fire Department Inspectors, Park Rangers, Street Use Inspectors, Health Inspectors, Police Officers, Community Services Officers, Animal Control Officers, Code Enforcement Staff, or Public Works Inspectors. Some of these agents are empowered to either issue citations, issue notices of violations, issue cease and desist orders, or even make arrests depending on the type of violation and the code provisions that they are enforcing. Some of these agents are also empowered to enforce not only municipal ordinances but also state laws. A review of the various enforcement tools used by the Permittees will be performed. A recommendation will result on a consistent enforcement approach for the watershed for consideration by all Permittees in their own enforcement programs. This recommendation will be developed by December 1995.

Enforcement of regulations that discourage improper disposal are undertaken in a variety of ways by the cities within the watershed. Fourteen cities have adopted ordinances that generally include penalties for non-compliance. Eleven cities presently have no enforcement procedures but five of these are planning appropriate programs. An additional three have recycling programs that encourage proper litter disposal though these programs are not mandatory. Enforcement is handled by Code Enforcement officers, Public Works inspectors, Health Department, Fire Department and Animal Control staff, and in one city by the Police Department. Several cities have implemented educational programs in a effort to encourage compliance with regulations and to minimize the need for enforcement penalties. One such city, La Canada-Flintridge, includes educational information along with business license renewal.

D. COORDINATION WITH STATE NON-STORMWATER PERMITS

In order to characterize the nature of the existing non-storm discharges in the receiving waters within the watershed, a list of NPDES Permits issued by Regional Board will be obtained. This will help in determining unexpected discharge during dry weather and to allow enforcement actions to focus on illegal dumping activities.

There is also a need to coordinate with other environmental agencies to ensure that requirements imposed by these agencies do not conflict with stormwater regulations. Requirements of many agencies do complement stormwater regulations. These agencies include, but are not limited to, Fish and Game, DTSC, USEPA, and the Coastal Commission. Coordination with these agencies will help minimize overlapping investigations and result in a more efficient use of resources. A watershed wide concept will be developed by December 1995.

VOL 15 0473

R0060693

1. **IDENTIFICATION OF PERMISSIBLE/PERMITTABLE DISCHARGES**

A list of non-stormwater discharges that can be allowed to discharge into the Waters of the State will be established by the Regional Board.

2. **APPROPRIATE MANAGEMENT PRACTICES**

Continued communication with the Regional Board will allow current information to be circulated among all agencies.

3. **REPORTING**

Any conflict in requirements of other environmental programs/agencies must be reported immediately to the Regional Board for ruling as to which one should take precedence.

P:\INEZ\PLAN\PLAN2.LAR\II

VOL 15
0474
R0060694

III. INDUSTRIAL/COMMERCIAL SOURCES

Each Permittee shall develop and implement a program that focuses on the identification and control of storm water pollutant discharges from industrial/commercial facilities within their jurisdiction. This program shall provide for the inspection of a facility's compliance with storm water regulations, as well as general outreach for all facilities that are potential industrial and commercial dischargers.

Each Permittee is responsible, under the requirements of the Municipal Stormwater Permit, for all discharges from commercial and industrial facilities within its jurisdiction. Many industries are also required to be permitted under the State General Industrial Activities Stormwater Permit. Enforcement of the specific provisions of the State General Permit is the responsibility of the State.

A. IDENTIFICATION OF SOURCES

As required under the current Permit, the Permittees have produced a listing of industries by SIC category for each drainage area. Also a breakdown of major land use types was also performed for each drainage area.

A pollutant source identification program will be designed to identify significant pollutant sources (i.e. parking lots, industrial activities, etc.), with the hope that remedial action can be undertaken to reduce any significant impacts so identified. It will focus on monitoring very small areas (i.e. less than five acres) where a specific and/or interrelated set of pollutant generating activities are occurring. Its objective is to provide data for selecting BMPs for specific activities rather than characterizing discharges for long-term pollutant loading estimates.

Identification of pollutant sources can be done using a number of methods. Potential sources of storm water pollutants can be identified by records of chemical use and/or storage, by studies of specific activities which lead to the deposition of pollutants throughout the watershed, and by field inspection or monitoring. Watersheds which may contain significant pollutant sources can be identified through land use information or by mass load estimates.

By mid January 1995, the County will begin targeted monitoring of a municipal corporation yard in the Santa Monica Bay watershed. This will provide data on industrial activities which can take place at such a facility such as vehicle maintenance and repair, materials storage, equipment storage and repair. A more comprehensive program to identify various pollutant sources will be developed by December 1995.

VOL 15 0475

R0060695

1. CATEGORICAL LIST

Sources identified as a categorical industry regulated by the U.S. Environmental Protection Agency (EPA) will be grouped into a categorical listing of industries. The categorical list provides an organized overview of the target facilities that, based on land use, operation, and activities, could potentially contribute significant amounts of pollutants into stormwater runoff. Some of the industrial categories regulated by the U.S. EPA include, but are not limited to:

- Aluminum Forming
- Asbestos Manufacturing
- Battery Manufacturing
- Canned & Preserved Fruits & Vegetables
- Cement Processing
- Copper Forming
- Electroplating
- Glass Manufacturing
- Grain Mills
- Machinery Manufacturing & Rebuilding
- Soap & Detergent Manufacturing
- Metal Finishing
- Metal Molding & Casting
- Oil & Gas
- Organic Chemicals & Plastics & Synthetic fibers
- Paint Formulating
- Pesticides
- Plastic Molding & Forming
- Rubber Manufacturing
- Sugar Processing
- Textile Mills

2. RANKING

Industrial and commercial facilities identified as pollutant sources shall be ranked in order of priority for development of management measures. Facilities considered to be high priority are those whose operations and activities are determined to contribute potentially the most significant pollutant impacts to storm water discharge.

3. UPDATE PROCEDURE

Each year the Co-Permittees will evaluate the results of the monitoring program, the illicit discharge investigation program, and other available information , to identify likely sources of specific pollutants. The annual report to the California Regional Water Quality Control Board, Los Angeles Region (Regional Board) will recommend a strategy for pollutant source identification during the following year, including specific sites and/or activities to be monitored.

VOL 15
0476
R0060696

B. CONTROL MEASURES

Specific urban runoff control programs for major potential pollution sources shall be developed by March 1996. Within these programs storm water pollution control measures shall be developed for various pollutant sources. Control measures such as source control and treatment control offer different, but complimentary approaches to storm water pollution control.

Source control measures focus on good housekeeping practices, pollution prevention and minimization, and education. They are also less costly than treatment controls.

Treatment controls involve physical treatment of the runoff, usually through structural means. Also treatment controls will not remove all pollutants and their removal efficiency is difficult to predict given the limited understanding of the relationship between facility design criteria and performance.

The initial focus will be on the development of source control measures. As information is collected under the pollutant source identification program regarding specific pollutant sources, specific control measures, including structural, will be evaluated as to their effectiveness in addressing these sources. None of the cities mentioned any programs.

1. POLLUTION PREVENTION MEASURES

Source minimization and education are the first steps in effective source control. Other activities that contribute to source control are:

- Site design alternatives (ie. roof over fueling stations and carwash slab, provide spill containment curb around stored material, etc.)
- Good housekeeping practices

2. STRUCTURAL (TREATMENT) MEASURES

A variety of treatment control measures have been utilized throughout the country for storm water quality. However, the effectiveness of these controls are highly dependent on local conditions such as climate, hydrology, soils, groundwater conditions, and extent of urbanization.

Some of the more common treatment controls are:

- Oil/water separators - Oil/water separators are designed to remove one specific group of contaminants: petroleum compounds and grease. However, separators will also remove floatable debris and settleable solids.

VOL 15
0477
R0060697

- Infiltration - A family of systems in which the majority of the runoff from small storms is infiltrated into the ground rather than discharged to a surface water body. Infiltration systems include: ponds, vaults, trenches, dry wells, porous pavement, and concrete grids.

- Wet ponds - A wet pond has a permanent water pool to treat incoming storm water.

- Constructed Wetlands - Constructed wetlands have a significant percentage of the facility covered by wetland vegetation.

- Biofilters - Biofilters are of two types: swale and strip. A swale is a vegetated channel that treats concentrated flow. A strip treats sheet flow and is placed parallel to the contributing surface.

- Extended Detention Basins - Extended detention basins are dry between storms. During a storm the basin fills. A bottom outlet releases the storm water slowly to provide time for sediments to settle.

- Media Filtration - Media filtration consists of a settling basin followed by a filter. The most common filter media is sand; some use peat/sand mixture.

- Multiple Systems - Multiple systems are a combination of two or more of the preceding controls in series.

C. OUTREACH

General outreach for all facilities that are potential industrial and commercial dischargers shall be set up area-wide by the Management Committee, to provide general guidance in complying with the storm water program by March 1996. It shall also serve as a reminder of pollution prevention measures and keep facilities informed of their obligations to the storm water program.

Subcommittees may be established to develop specific outreach materials for industrial and commercial categories and specific activities that are identified as high priority.

For additional information on outreach, refer to **Chapter VII Public Information and Participation.**

VOL 15 0478

R0060698

D. INSPECTIONS

Most municipalities have existing programs such as industrial waste, fire, and health in which industrial and commercial facilities are inspected on a regular basis. Each Permittee may elect to have inspections for the storm water program incorporated into these existing inspection programs, or be done as a completely separate program, depending on the needs of the Permittee.

The purpose of these inspections is to ensure that facilities are in full compliance with the storm water regulations and to ensure that control measures are being implemented. The frequency of inspection of facilities will be prioritized based on the operation and categorization of the facility.

Inspectors consisting of public personnel will be trained adequately to recognize and handle problematic activities concerning storm water pollution that may be existing or potential; and inspect for the deterioration of the storm drain system, and illegal/improper connections. Training programs will be developed through the Watershed Management Committee and possibly specific Permittees for used by all Permittees.

Procedures for the identification, investigation, enforcement, and prosecution to the full extent of a jurisdiction's legal authority will be developed.

Commercial and industrial facilities generating industrial wastes are issued permits by the Los Angeles County. Facilities issued this permit, which include auto related businesses, gas stations, and restaurants, are regularly inspected. In addition to those permitted businesses in the unincorporated areas, the County Department of Public Works also provides industrial waste inspections, under contract, for 9 cities in the watershed. The City of Los Angeles also issues and enforces Industrial Wastewater Permits for non-storm water discharges. Facilities are inspected between 1-4 times per year. Five cities reported that they have industrial waste, or non-storm water discharge inspection programs on a regular basis, while one reported inspections were done at random. Five cities inspect auto related businesses, and restaurants regularly and nine others are planning to implement an inspection program by the end of 1995. One city, Hidden Hills, has no commercial or industrial facilities within its boundary. Caltrans inspects its auto related facilities daily, tests its gas stations for leak yearly, and pump out its clarifiers quarterly. Besides, its storm drains are constantly monitored. Caltrans has also included a program to inspect underground storage tanks as part of its five-year plan.

1. CHECKLIST

Inspectors shall have a uniform checklist to use as guidance and reference throughout an inspection. It may also serve as a general guide for the public, providing information about the requirements necessary to comply with the storm water regulations.

VOL 15
0479
R0060699

2. SCHEDULE

The inspection program shall be developed by March 1996. The frequency of inspections shall be scheduled according to the type of operation and the categorization of the facility. Revisit inspections shall be done on an as needed basis.

3. REPORTS

Inspectors shall report on all activities related to and/or violating the local storm water ordinance to the local governing agency. Standard reporting procedures will be developed.

4. FOLLOW-UP PROCEDURES

Individual Permittee's review and assessment of the reports may result in the need for follow-up procedures, such as reinspection or legal action, provided that the jurisdiction has the adequate legal authority to do so. Follow-up procedures will be developed to insure a uniform and consistent approach.

E. LOCAL INCENTIVE PROGRAMS

In developing the industrial/commercial program, the Permittees may consider the development of optional measures such as clean business incentive programs that may offer more focused control on industrial and commercial sources. This phase will be completed by March 1996.

F. TRAINING

The Los Angeles County Department of Public Works has issued a department directive requesting all employees to report any observed water quality problems. Caltrans has educated its staff on hazardous substance spill awareness, pesticide safety and vegetation management. The City of Los Angeles has a specialized inspection group trained to focus on improving storm water quality and to eliminate illegal discharges and illicit disposal practices. Development of training programs for industrial storm water inspection staff is projected to be completed by March 1996.

1. PUBLIC EMPLOYEES

All public employees shall be trained in the storm water regulations so that they abide by the regulations in the course of their work day. Also they need to be able to recognize and distinguish between legal and illegal activity so as to administer the proper protocol in handling the situation.

The Los Angeles County Department of Public Works has requested all employees to report any observed water quality problems. Caltrans has

R0060700

VOL 15 0480

educated its staff on hazardous substance spill awareness, pesticide safety, and vegetation management.

2. INSPECTORS

Inspectors who visit industrial and commercial facilities shall be adequately trained to determine compliance with the storm water regulations and to educate the facilities about the requirements of the program. In addition, they should be able to recognize and handle immediate problems as they are encountered, during an inspection; and inspect for the deterioration of the storm drain system and illegal/improper connections. Citation training will be necessary for inspectors in agencies that have the citation authority.

G. COORDINATION WITH STATE INDUSTRIAL STORM WATER PERMIT

The Permittees have existing local ordinances governing industrial discharges and other stormwater discharges that require compliance activities similar to those in various State Regulations. Because coordination between the Permittees and the Regional Board is anticipated concerning the regulations of industries, a mutual agreement may be required regarding industrial inspections and enforcement. Additional issues could also be addressed. The Federal stormwater regulations hold local municipalities responsible for stormwater discharges from all industrial/commercial facilities including those covered by General Permit. The targeted completion date for this phase is March 1996.

1. MEMORANDUM OF UNDERSTANDING

A Memorandum of Understanding (MOU) may be used to formalize the agreement between municipalities and the Regional Board on industrial compliance program issues. A MOU among all local agencies may also be needed to ensure co-operation among all the agencies. The need and specific requirements for such agreements would be developed upon completion of development of the industrial/commercial program by March 1996.

2. REPORTS

The MOU discussed above may include the exchange of information between the Permittees and the Regional Board. Appropriate formats for such reports would be developed as required.

P:\INEZ\PLAN\PLAN2.LAR\III

VOL 15 0481

R0060701

IV. NEW DEVELOPMENT AND REDEVELOPMENT

Managing stormwater and runoff from both new construction and redevelopment, will reduce pollutants entering the storm drain system and subsequently the receiving water.

A. PLANNING PROCESS

Quality of stormwater discussion should be included in the General Plan and the Zoning ordinances. Efforts to enhance the quality of storm water can filter into the Subdivision actions. Many of the storm water concerns can be channeled through the compliance effort of the California Environmental Quality Act (CEQA). A watershed wide concept will be developed by June 1996.

1. WATERSHED PROTECTION POLICIES

An integrated strategy will be developed for the watershed. Pollution control efforts should be prioritized. A variety of statutory and regulatory requirements could be used for this watershed oriented program. Watershed protection policies need to be adopted by the local jurisdictions which control land-use within the watershed.

The City of Los Angeles is reviewing its standards and considering modifications for flood control projects to include storm water pollution reduction.

2. COORDINATION WITH CEQA

The current CEQA "Environmental Checklist Form" that is used for initial studies assessment indirectly address potential impacts to stormwater. Additions could be made to the Form to directly assess stormwater quality impacts.

CEQA requires agencies to use feasible alternatives or mitigation measures to lessen potentially significant effects. The ability to identify a.) when an effect is significant, and b.) which mitigation measures could be adopted to reduce the effect, is critical to the CEQA process. A clear assessment of any development, its potential adverse impacts on stormwater quality will allow for a determination of "significance" which will enable the decision maker to make development decisions upon full disclosure of possible adverse impacts.

VOL 15
0482
R0060702

3. SITE PLANNING PROCESSES

All development will require the review and approval of a site/plot plan or development drawings prior to issuance of a building permit. Incorporating the consideration of potential water quality impacts including erosion and sedimentation during the early stages of the planning process will allow these issues to be addressed before substantial investments in engineering and design have been made.

4. GENERAL PLAN CHANGES

The General Plan is the legal backbone of the planning process. All development approvals, zoning ordinances, subdivision approvals and public works projects must be consistent with the policies, objectives, and principles set forth in the General Plan. Discussion of stormwater issues in the General Plan could greatly enhance the awareness of the issues and encourage full assessment of possible adverse impacts on stormwater quality as a result of new and redevelopment.

5. USE OF MASTER PLANS

For agencies which utilize master plans to guide their development activities, stormwater issues can be outlined in such documents. This will channel efforts to fully assess the possible adverse impacts on stormwater quality as a result of any development within the master plan area.

The City of Los Angeles is currently reviewing standards and considering modifications for flood control projects to include storm water pollution reduction components.

6. OTHER POLICIES

Numerous other policies or mechanisms could be used to incorporate stormwater management goals into the planning/development process. Others concepts will be evaluated for their feasibility during the more detailed development of this Chapter.

7. PLANNING-PUBLIC WORKS INTERFACE

A variety of mechanisms for coordinating planning and public works activities exist. An example could be some form of CIP (capital improvements program). Ideally, any planning documents which target or project population growth are coordinated with CIP. Integrating stormwater management into

VOL 15
0483
R0060703

CIP will allow for mitigation of major adverse impacts on the quality of stormwater prior to any actual construction.

8. IMPLEMENTATION PROCEDURES

Implementing policies to integrate stormwater management considerations with existing planning/development mechanisms will require a variety of approaches depending upon the existing conditions within each Co-Permittee and the particular remedies selected. It is anticipated that each Co-Permittee will propose procedures applicable to its unique jurisdictional considerations at later stages in the permit process.

B. CONSTRUCTION SITES

Pollutants from construction activities can have a major impact on the quality of stormwater/urban runoff. A watershed wide concept to reduce such pollutants will be developed by December 1995.

1. EROSION CONTROL REQUIREMENTS

Federal stormwater regulations hold local municipalities responsible for stormwater discharges from construction sites. In addition, construction sites involving a total of five acres or more of land disturbance are required to apply for the State General Construction Activity Storm Water Permit (GCASP). The GCASP: 1) eliminates and reduces to the extent feasible non-storm water discharges from construction sites and 2) permits stormwater discharges, but requires the use of controls to limit pollutant loading in site effluent. Preparation of a Stormwater Pollution Prevention Plan and identification/utilization of BMPs are the key components of this Permit.

Many local agencies also have erosion control requirements for any grading and construction activities. Regulation of pollutants from construction sites of five acres or less will be done by the local agency through its stormwater management plan.

Construction site erosion has the potential to introduce sediment into runoff. For example, fugitive dust control at construction sites typically use water. Minor modifications/clarification of existing fugitive dust practices could substantially address runoff pollution concerns. In addition to fugitive dust control practices, additional measures could be adopted to curtail dry weather runoff, and control pollutant laden storm water runoff. These measures may address 1) physical site design considerations and 2) temporal considerations such as seasonal timing and phasing of activities.

VOL 15
0484
R0060704

Fourteen jurisdictions have adopted or modified erosion control regulations within their municipal codes. Three jurisdictions have identified and/or drafted code regulations related to urban runoff, while eleven jurisdictions have indicated that formulation of these code requirements are planned or proposed. A Demolition Construction Pollution Control ordinance is being considered by the City of Burbank.

Erosion and sediment control practices and a contractor water pollution program have been established by Caltrans to stabilize slopes and protect water quality. The City of Los Angeles is preparing guidelines and construction standards aimed at reducing storm water pollution and an enhanced enforcement program for construction sites consistent with the State of California General Construction Activity Storm Water Permit requirements.

2. CHEMICAL AND WASTE MANAGEMENT REQUIREMENTS

Chemical and waste handling activities are also currently subject to a variety of regulations. BMPs to address this pollution source are largely centered around "good housekeeping practices". This involves storing, handling, using, and disposing of these potential pollutant sources in ways that restrict opportunities for unintended introduction of the materials into site runoff. Proper chemical and waste management will reduce any accidental discharge into the storm drain system.

3. INSPECTIONS

Inspections are a routine part of local jurisdiction's oversight of regulated construction activity. Inspection activities should be enhanced to ensure that construction site runoff control measures are being properly implemented. Existing practices should be examined and modified accordingly to satisfactory stormwater/urban runoff objectives.

a. Checklist

A checklist would encourage possible streamlining of any requirements. It could be cumbersome if an overly rigid approach were taken which resulted in unnecessary administrative burden. However, careful design of the checklist could avoid this pitfall.

VOL 15 0485

R0060705

b. **Schedule**

Inspection schedules will depend upon existing practices. It may be desirable to have several schedules, depending upon the types of activities/permits and/or the timing of activities.

c. **Reports**

A standardized reporting format is needed to allow for consistency among all jurisdictions. Furthermore reports are also a useful tool for future refinement of pollution control regulations.

d. **Follow-up Procedures**

A format will be developed to do follow-up inspections on problem facilities and activities. Frequency of use will greatly depend on the land use and the degree of non-compliance of each facility.

C. LOCAL PERMITS

Permits are a form of "cross checking" by local agencies to ensure that regulations are being implemented. Prior to the issuance of a permit, information must be submitted for review and approved. A watershed wide concept to provide some consistency in local permits will be developed by June 1996.

1. COORDINATION WITH EXISTING PERMITS

Storm water issues should be incorporated into existing permits.

2. NEW PERMIT ISSUES

Storm water issues should be clearly stated in new permits to be issued for new and/or redevelopment activities.

D. TRAINING

Training will enable staff to keep current of the latest storm water regulations. No information is reported. A watershed wide staff training concept will be developed by June 1996. For example, Los Angeles City's planned Construction Education and Training program is intended to increase the awareness of those involved in the construction process with regard to storm water pollution abatement activities.

VOL 15 0486

R0060706

1. PLANNING PERSONNEL

(See E.1.b. below)

2. PUBLIC WORKS PERSONNEL

(See E.1.b. below)

3. INSPECTORS

(See E.1.b. below)

E. CONTROL MEASURES

Best management practices for the control of construction related pollution can generally be divided into three categories:

Nonstructural Source Controls for Reducing Urban Stormwater Pollutants:

- Practices that reduce the generation and accumulation of potential stormwater contaminants at or near their source.

Site Planning Stormwater Controls:

- Practices that are directed at controlling the volume and discharge rate of runoff from urban areas, as well as, reduction of the magnitude of pollutants in discharges through temporary storage or flow restrictions.

Erosion and Sediment Controls:

- Practices that can prevent or treat problems related to transport of eroded material from construction and other land disturbing activities.

Site planning stormwater controls are of particular interest. For example, the City of Los Angeles is reviewing construction standards and is considering modifications aimed at reducing storm water pollution from construction sites. These control measures can be incorporated in the initial planning phase of any project. A watershed wide concept will be developed by June 1996.

VOL 15
0487
R0060707

1. POLLUTION PREVENTION MEASURES

a. Site Design

Effective implementation of urban BMPs requires integration of water quality control elements early in the site planning and design process. Development of the water quality controls should not only achieve maximum pollutant removal with minimal costs, but also reduce potential maintenance.

This may include incorporating water quality concerns into the site layout and design (i.e. maximize pervious areas, minimize directly connected impervious areas, etc.) and/or treatment control measures proven to be cost effective for local climate, soil, and development conditions.

Due to the diversity of climate and local conditions, the development of BMPs will vary from jurisdiction to jurisdiction, and even location to location. The selected management practices should be designed for the local site conditions and especially seasonal rainfall conditions that are experienced in Southern California. Suitability for the major land use and drainage characteristics should also be fully assessed.

b. Education/Training

Education/training is imperative to the success of any BMPs selected for new or redevelopment projects. BMPs will fail if not properly designed, installed, and maintained. Only well trained personnel should be assigned these responsibilities.

A program for effective education/training should be based on four objectives:

- Promote a clear identification and understanding of the problem, including activities with the potential to pollute stormwater;
- Identify solutions (structural and nonstructural BMPs);
- Make every employee responsible for stormwater pollution and its solution; and
- Integrate employee feedback into training and BMP implementation to improve BMPs.

VOL 15
0488
R0060708

c. **Other**

In many cases stormwater pollution control may already be achieved by existing regulations or programs. In California, the General Plan Law and the California Environmental Quality Act (CEQA) provide a basis for municipalities to review and comment on all projects within their jurisdiction. Under the General Plan Law, municipalities are required to develop policies and regulations which guide development within the municipality. Each development project is then reviewed for conformance with these policies. Under CEQA, projects are also subject to review and comment for any adverse impact the projects may have on the environment, including impacts from stormwater discharges.

2. POST CONSTRUCTION (TREATMENT) MEASURES

a. **Applicability**

Each site considered for development or redevelopment will (at the conclusion of construction) have final improvements and unique site characteristics such as: drainage patterns; soils; landscaping; topography; percent of impervious surfaces; rainfall; pollutants inherent with the use of the development; and pollutants that may be background to the area (existing vegetation, air fallout, etc.). The applicability of various treatment control BMPs for use in new development will be evaluated through the use of pilot studies and examination of studies done on treatment control measures by other agencies.

b. **Effectiveness**

Prior to implementing any treatment control measures, they will need to be evaluated for their effectiveness. This can be done through pilot studies which could include elements such as: pre and post storm event inspections; water quality monitoring; record keeping to document deficiencies in the BMPs; Operation and Maintenance requirements; and cost effectiveness.

c. **Retrofit Opportunities**

The feasibility of retrofitting existing developments with treatment control measures will be evaluated. However, the effectiveness of a treatment control measure versus its cost must be fully evaluated prior to considering its use as a retrofit measure.

VOL 15 0489

R0060709

3. OPERATION AND MAINTENANCE

a. Requirements

Jurisdictions within the watershed will need to insure that BMPs incorporated into a private development are properly maintained. Deed restrictions, covenants, conditions and restrictions (CC&R) could be used to direct such requirements and responsibilities.

b. Responsible Party

The contractor, during construction must ensure that the post-construction BMPs are installed properly and that any maintenance that may be necessary during construction is performed. After the project is completed, it will then be the responsibility of the fee owner, private or public, to provide for long term operation and maintenance. This may be accomplished by deed restriction and/or CC&R.

4. CONFLICTS WITH OTHER MANDATES

Often regulations of various Federal, State, and local agencies would conflict with each other. Health, fire, and building codes often have requirements focusing on short term human health and safety and neglecting the impacts on the environment.

a. Identification of Conflicts

As the Plan is developed, other regulatory requirements that conflict with the stormwater program requirements may be uncovered. Clarification of these regulations should be directed to the various responsible regulatory agencies.

b. Conflict Resolution

For regulatory conflict caused by local regulations, efforts will be taken to resolve them within the agencies. Input form other local, state, and federal agencies should be incorporated into a modification of current standards. The Regional Board should resolve conflicts involving other State and/or Federal requirements.

VOL 15
0490
R0060710

F. OUTREACH

See Chapter VII Public Information and Participation.

G. ENFORCEMENT

See Chapter II Illicit Discharges, Section C Enforcement Procedures.

H. COORDINATION WITH STATE GENERAL CONSTRUCTION ACTIVITIES STORM WATER PERMIT

Compliance with the GCASP requirements is the responsibility of the developer/contractor, and enforcement is the responsibility of the SWRCB or Regional Board staff.

1. MEMORANDUM OF UNDERSTANDING

An agreement between the Regional Board and Co-Permittees may be used to enhance compliance of construction site BMPs. The need for such an agreement will be evaluated. If found to be desirable, an agreement will be developed by June 1996.

2. REPORTS

The local enforcement agency of the State Construction Stormwater Permit, which is the Regional Board, should forward all information, including Notices of Intent filed and any inspections and enforcement actions taken, to the Permittees so that this information can be available to local municipal construction site inspectors to alert them to any specific concerns on the job site.

3. OTHER ISSUES

The Regional Board should explore funding to be channelled to the Co-Permittees so the Co-Permittee can be more actively involved with the State on the Permit.

P:\INEZ\PLAN\PLAN2.LAR\IV

VOL 15
0491
R0060711

V. PUBLIC AGENCY ACTIVITIES

All municipalities perform functions that have an impact on stormwater quality. These include, among other things, vehicle maintenance, landscape maintenance, weed control, water body maintenance including swimming pool maintenance, etc. Other activities such as construction and maintenance of streets and roads, and construction and maintenance of the flood control system also could directly or indirectly cause adverse impact on the quality of stormwater/urban runoff. Since municipalities must address all significant sources of pollutants, all of these activities must be examined and mitigation measures be incorporated into the routines. As part of the requirements of the current Permit, many of the Permittees have already begun implementation of measures to address the above activities. An examination of these existing measures will be done on a watershed wide basis to establish the most effective approach to address these activities. Such approaches shall be developed and begin implementation by September 1996.

A. SEWAGE SYSTEMS

Sewage spills must not be allowed to enter the storm drain. Control procedures for identifying, repairing, and remediating sewer blockages, infiltration, inflow, and wet weather overflows from the sewers to the storm drain system should be implemented to protect stormwater quality. These procedures could include, but are not limited to, quick field response to overflows, follow-up testing, and complaint investigation.

When sewage spills do occur, they must be contained and collected for proper disposal. Individual permittees may need to modify their sewage overflow response procedures. The field personnel should also have procedural training for field screening, sampling, smoke/dye testing, and TV inspection, if appropriate, to be able to properly investigate any suspect connections or cross connections to the storm drain system.

Los Angeles County has a number of programs aimed at preventing sewage spills from entering the storm drain system. These include the following:

- Sewage Overflow Response Procedures Revision/Root Control Review. This involves improvement of procedures for containment and cleanup of spilled sewage resulting from overflow.
- Reline Sewer Lines. Two locations will undergo relining of existing sewer lines to prevent infiltration and exfiltration.
- Sewer Pipeline Reconstruction. 127 miles of cement pipelines will be analyzed and replaced or rehabilitated within 5 years.

VOL 15
0492
R0060712

- Sealing of Manhole Covers. This program has sealed manhole covers and bar holes in areas subject to flooding.

- Expansion of Emergency Call List. Beeper numbers of all supervisors, superintendents and stand-by crews were added to emergency call list.

Los Angeles City's Limitation of Sewage Infiltration into Storm Drain System traces sewage infiltration into the storm drain system using a variety of techniques.

B. CORPORATION YARDS

Corporation yards include any area or facility that is used for vehicle maintenance or washing, other maintenance, chemical storage, paint facilities, and supportive activities for field crews. Permittees will need to incorporate pollutant control measures at these facilities and develop a plan for each facility outlining the measures to be implemented. Since these are industrial type activities, the corporate yards would need to implement measures as described in the Industrial/commercial Source Chapter.

1. STORM WATER POLLUTION PREVENTION PLANS (SWPPP)

Though not required, permittees may elect to use some form of SWPPP as a vehicle for compliance. Any BMPs to be implemented must be part of a comprehensive plan designed to address the various pollutant sources at each corporate yard. To achieve this goal, the municipalities should first identify the potential pollution sources and who is responsible for implementing the storm water management measures. Based on the facility type, management practices and schedule of implementation will be developed. BMPs that can be used to improve the quality of runoff include, but are not limited to, housekeeping practices, material storage control, vehicle leak and spill control, and illegal dumping control.

Los Angeles County has incorporated the following measures intended to control pollutants from entering the storm drain at County-owned airports.

- Airport Runoff Structural Controls. A number of structural controls including fuel pumps located under a roof, storm water diversion system with clarifiers, concrete beams for secondary containment of waste oil, oil and water separator at floor drains, retention ponds, infiltration basins and sand filters have been implemented at County airports.

- Airport Cleaning and Maintenance. A number of non-structural controls including washing of aircraft in designated areas with oil and

VOL 15
0493
R0060713

water separator, aircraft maintenance performed indoors and waste oil recycling have been implemented at County airports.

- Airport Materials Handling and Storage Controls. Measures to prevent spills of polluting materials have been in effect at County airports.

- State Approved NPDES Industrial Activity Permit. This program requires all airports to ensure compliance with State Water Resources Control Board.

2. OUTDOOR LOADING/UNLOADING OF MATERIALS

Municipal employees who handle potentially harmful materials should be trained in good housekeeping practices to prevent or reduce the discharge of pollutants to storm water from outdoor loading/unloading of materials. Materials spilled, leaked or lost during loading/unloading may collect in the soil or on other surfaces and be carried away by runoff or when the area is cleaned.

Applicable BMPs should be selected based on the following four factors: 1) Extent of exposure of material to rainfall, 2) preventing stormwater run-on, 3) checking equipment regularly for leaks, and 4) containing spills during transfer operations.

3. MATERIAL STORAGE CONTROL

A program should be developed to prevent or reduce the discharge of pollutants to storm water from outdoor container storage areas using measures such as installing safeguards against accidental releases, secondary containment, conducting regular inspections, and training employees in standard operating procedures and spill cleanup techniques. Employee education is paramount for successful implementation. Employees should be trained in emergency spill cleanup procedures.

To limit the possibility of storm water pollution, containers used to store dangerous waste or other liquids should be kept inside the building unless this is impractical due to site constraints. Storage of reactive, ignitible, or flammable liquids must comply with the fire and California OSHA codes. Practices such as placing containers in a designated area should be employed to enhance such requirements.

Three pre-fabricated storage buildings have been installed at the Los Angeles Aqueduct Filtration Plan to isolate hazardous materials.

VOL 15
0494
R0060714

4. VEHICLE AND EQUIPMENT WASHING AND MAINTENANCE

Washing vehicles and equipment outdoors or in areas where wash water flows onto the ground can pollute storm water. For municipalities that wash vehicles or pieces of equipment on-site, it should be performed in a designated area equipped with an oil/water separator.

Vehicle or equipment maintenance is a potentially significant source of storm water pollution. Parts are cleaned with solvents. Many of these cleaners are harmful and must be disposed of as a hazardous waste. Appropriate BMPs are waste reduction, use of alternate products, recycling, and spill leak clean up control.

Every 90 days, Caltrans will pump out its clarifiers. In the City of Arcadia fire hydrant use is restricted and downstream catch basins are cleaned of any debris prior to testing of fire hydrants. The City of Los Angeles has a program to ensure that its facilities have adequate spill prevention, containment and emergency response procedures.

5. WASTE HANDLING AND DISPOSAL

Proper waste management is possible by tracking waste generation, storage, and disposal; reducing waste generation and disposal through source reduction; and preventing run-on and runoff from waste management areas.

The City of Los Angeles is conducting a study of four street maintenance yards, including an asphalt processing plant for potential sources of stormwater pollution.

Caltrans Leaking Underground Storage Tanks Five Year Plan will include site investigation, leak detection of tanks, removal, remediation and installation of fuel canopies over fuel islands.

C. PARKS AND RECREATION

Park Departments manage landscaping and swimming pools. Both of these activities involve the use of chemicals, waste management, and non-storm water discharges. In addition maintenance of swimming pools requires the periodic discharge of large quantities of swimming pool water.

VOL 15
0495
R0060715

1. FERTILIZERS/PESTICIDES

a. Use/Application management

Municipal facilities should develop controls on the application of pesticides, herbicides, and fertilizers. Control may include:

- List of approved pesticides and selected use;
- Product and application information for users;
- Equipment use and maintenance procedures; and
- Record keeping.

Employees can be educated about environmentally sensitive alternative products by using information developed by various public agencies and other environmental organizations.

b. Storage

Improper storage of fertilizers and pesticides can lead to potential groundwater, soil, and stormwater contamination. To prevent or reduce their impact on stormwater pollution, material storage areas must be designed and maintained to reduce exposure to storm water. The following BMPs can help to achieve this goal:

- Store materials inside or under cover on paved surfaces,
- Use secondary containment,
- Minimize storage and handling of hazardous materials,
- Inspect storage areas regularly.

2. FACILITY MANAGEMENT

a. Wash Waters

Wash waters cannot be discharged into the storm drains untreated. The storage area should be slightly sloped for wash water collection. If the water is not discharged to the sanitary or process waste sewer, or to a dead-end sump, the outlet should be equipped with an oil/water separator or other treatment systems.

b. Maintenance

Landscape maintenance involves the use of pesticides and fertilizers. Proper use of these materials will reduce the risk of loss to storm water. Whenever possible, leave or plant native vegetation to reduce

VOL 15
0496
R0060716

water, fertilizer, and pesticide needs. Integrated pest management should be employed where appropriate. The Park Departments should also establish a schedule for irrigation and fertilization. The chemicals will be carried from the site by the next storm if they are applied during the wet season. Overwatering leads to discharge of water that may have become contaminated with nutrients and pesticides.

Storm water from parking lots may contain undesirable concentrations of oil, grease, suspended particulates, and metals as well as the petroleum byproducts of engine combustion. Possible maintenance BMPs include periodic sweeping and cleaning catch basins.

c. Swimming Pool Waters

The drainage of swimming pool water must insure that chlorine residual is below allowable water quality limits. The potential for recycle/reuse for irrigation of lawns and landscapes may be investigated. Swimming pool filter backwash waters should not be discharged to the storm drain, but should be allowed to settle and then disposed to the sanitary sewer. Other possible alternative measures would be to use the backwash for irrigation or disposal on a dirt area.

D. STORM DRAIN SYSTEM OPERATION AND MANAGEMENT

The maintenance and operation of the storm drain system has an impact on storm water quality and must be addressed. Material clogging storm drains cannot be discharged into drains. It must be disposed of properly.

1. INLET MAINTENANCE

Regular maintenance of public and private catch basins and inlets is necessary to ensure their proper function. Maintenance will remove pollutants, reduce high pollutant concentrations during the first flush of storms, prevent clogging of the downstream conveyance system, and restore the catch basin's functional capacity. Keys to effective catch basin cleaning include the following:

- All basins should be cleaned annually prior to the onset of the rainy season;
- Clean catch basins in known problem areas more frequently to remove sediments and debris accumulated during the dry weather months;
- Keep records of the number of catch basins cleaned; and
- Track the amount of waste collected.

VOL 15
0497
R0060717

All jurisdictions within the Los Angeles River watershed clean their catch basins at least annually. Two exceptions are Caltrans whose catch basins are generally cleaned every two years and the City of Bell Gardens which will initiate a catch Basin cleaning program shortly. Caltrans will develop a priority list of drains and pump houses requiring cleaning.

2. **DRAIN MAINTENANCE**

Open channel storm drains should be cleaned at least annually prior to the rainy season. Problem areas should be cleaned more frequently as needed. Channels should also be monitored during the rainy season for any debris buildup and cleaned where needed.

Underpass pumps in the City of El Monte are cleaned quarterly and/or before the rainy season. Maintenance of drainage culverts is also performed once a year.

3. **WASTE MANAGEMENT**

Excessive waste buildup will decrease the capacity of the channel, it is therefore crucial to reduce pollutant levels in storm water by regularly removing illegally-dumped items and material from storm drainage channels and creeks. A program should be developed to identify problem areas of illegal dumping so regular inspection and clean up can maintain the channel's optimum capacity and prevent the discharge of contaminants.

The City of Arcadia requires contractors and utility companies to use construction methods in roadways to minimize the amount of pollutants entering storm drains.

4. **NEW SYSTEM DESIGNS**

Current design standards for the construction of new storm drain systems will be evaluated in light of currently available pollutant control measures. Design standards may be modified to incorporate measures deemed appropriate for local conditions.

The City of Los Angeles has formed an Inter-Jurisdictional Storm Water Re-Use Task Force to implement diversion, capturing and possibly re-using high quality storm water run-off. The City is also reviewing standards and considering modifications for flood control projects by incorporating storm water pollution reduction components.

VOL 15
0498
R0060718

5. RETRO-FIT OPPORTUNITIES

The majority of the existing storm drain systems are in highly urbanized areas providing little opportunity for cost effective retro-fitting. However, currently available pollutant control measures will be reviewed for their effectiveness and possible use. This may include pilot studies to evaluate the performance of management practices under local conditions.

E. STREETS AND ROADS

Construction, operation, and maintenance of roads has an impact on storm water quality and will be addressed in the management plan.

1. SWEEPING

Street sweeping can collect refuse on street surfaces to prevent it from entering the storm drain system through catch basins.

a. Storm Water Quality Based Operation

In order to effectively implement the sweeping program, the permittees should keep accurate operation logs to track the program. Areas generating excessive refuse should be swept more frequently. Sweeping frequency may also be increased before the rainy season to reduce the amount of refuse entering the storm drain system. Parking on sweeping days should be regulated to facilitate the operation.

Twenty-four jurisdictions perform weekly street sweeping, while five jurisdictions perform this service twice weekly and four twice monthly. Caltrans sweeps its roadways on a regular schedule determined by observable debris. The City of Los Angeles's posted streets are swept weekly and others monthly.

b. Waste Management

Vehicles transporting waste should have spill prevention equipment that can prevent spills during transport. The refuse collected will be transported to the appropriate disposal facilities.

Eighteen of the jurisdictions in this watershed empty their roadside trash receptacles weekly. Three agencies collect rubbish twice a week, another three agencies empty on an as needed basis and three others do not provide any trash receptacles. Four jurisdictions provide collections three times a week while the cities of El Monte and

VOL 15
0499
R0060719

Huntington Park provide this service on a daily basis. In Bell Gardens this program is being planned and in the City of Pasadena the emptying of trash receptacles occurs 3 to 5 times a week.

2. STREET/PAVEMENT WASHING

Wash waters from street/pavement washing may be contaminated and must be managed as non-storm water discharges.

3. MAINTENANCE

a. Saw-cut Slurry Management and Paving Practices

Existing saw-cut management and paving practices conducted by the permittees will be evaluated and appropriate control measures developed. Possible control measures to be considered that would help reduce the impacts to storm water:

- Avoid paving during wet weather;
- Regularly repair potholes and worn pavement to reduce sediment loading;
- Store materials away from drainage courses to prevent pollution of storm water run-on; and
- Follow the storm water permitting requirements for industrial activities when mixing concrete with an on-site plant.

The City of Arcadia requires contractors and utility companies to use construction methods in roadways to minimize the amount of pollutants entering storm drains.

b. Waste Management

Good housekeeping practices will be implemented to insure proper management of any waste products that may be generated during maintenance activities. For example, to prevent concrete waste from entering the storm drain system, washout of concrete trucks should be conducted off-site or on-site in designated area. Excess concrete should not be dumped on site. Employees and subcontractors should be trained in proper concrete waste management.

VOL 15
0500
R0060720

The following steps will help reduce storm water pollution from concrete wastes:

- Store dry and wet materials under cover, away from drainage areas;
- Avoid mixing excess amounts of fresh concrete or cement on-site;
- Do not wash out concrete trucks into storm drains, open ditches, streets, or streams;
- Do not allow excess concrete to be dumped on-site, except in designated areas;
- Avoid paving during wet weather;
- Regularly repair potholes and worn pavement to reduce sediment loading; and
- Cover catch basins and manholes when applying seal coat, tack coat, slurry seal, fog seal, etc.

Employee/subcontractor training to insure implementation of good housekeeping measures should be based on four objectives:

- Promote a clear identification and understanding of the problem, including activities with the potential to pollute storm water;
- Identify solutions (BMPs selection);
- Promote employee/subcontractor ownership of the problems and the solutions; and
- Integrate employee/subcontractor feedback into training and BMP implementation.

The City of Los Angeles has installed special equipment at Rancho Park Golf Course to remove oils and oil-based cleaning agents, as well as organic material from surface water that drains into the storm drain system.

c. Medians/Landscaped Right-of-Way

i. Irrigation

Overwatering of landscaping produces runoff. A properly timed irrigation schedule should be set up to minimize overwatering. Drip irrigation system should be used when feasible in new installations.

VOL 15
0501
R0060721

ii. **Fertilizers/Pesticides**

The handling, storage, and usage of fertilizers/pesticides are addressed in Chapter V, Section C-1.

Caltrans has an existing Right-of-Way Maintenance program and Maintenance Vegetation Control Program which provide benefits for motorists' safety and erosion control.

F. FLOOD CONTROL

Common municipal practices, such as construction and operation and maintenance of the flood control system, may have a potentially adverse impact on storm water quality. Consequently, these practices shall be coordinated to the extent of preventing pollutants from impacting the water quality.

1. COORDINATION WITH NEW PROJECTS

Current design standards for the construction of new storm drain systems will be evaluated in light of currently available pollutant control measures. Design standards may be modified to incorporate measures deemed appropriate for local conditions. During construction, all appropriate BMPs will be utilized to control pollutants during the construction of the facility.

2. COORDINATION OF MAINTENANCE ACTIVITIES

Current maintenance activities with regards to desilting/sediment removal, vegetation management, and waste management shall be reviewed to insure that appropriate management measures are developed to comply with the storm water regulations.

Los Angeles County performs open channel inspections/sump inspections and cleaning to reduce the amount of debris entering the ocean.

3. OPERATION OF FACILITIES

Flood control facility operations will be reviewed to identify where appropriate management measures could be incorporated. However, primary consideration will need to be given to the flood control function of the facility to protect health and safety.

VOL 15
0502
R0060722

4. RETROFIT OPPORTUNITIES

The majority of the existing storm drain systems are in highly urbanized areas providing little opportunity for cost effective retro-fitting. However, currently available pollutant control measures will be reviewed for their effectiveness and possible use. This may include pilot studies to evaluate the performance of management practices under local conditions.

The City of Los Angeles is reviewing standards and considering modifications for flood control projects to incorporate storm water pollution reduction components.

G. PUBLIC FACILITIES

Stormwater runoff and non-storm water discharges from other public facilities must also be addressed, including chemical use by these facilities, pressure blasting/cleaning sidewalks and other surfaces.

1. PARKING FACILITIES

Stormwater from parking lots may contain undesirable concentrations of oil, grease, suspended particulates, and metals. Some control measures such as periodic sweeping and cleaning catch basins should be implemented. The need for more advanced structural controls would be evaluated through the pollutant source identification program. Pilot studies would be conducted on candidate structural controls to evaluate their effectiveness prior to large scale implementation.

2. GOLF COURSES

Golf courses require the use of large amount of water, fertilizers, and pesticides. Field personnel should be trained on the proper handling, storage, and usage of these chemicals (Refer to Chapter V, Section C-1 for detail). To prevent excess irrigation water from entering the storm drain system, proper management of watering schedules should be required.

3. SCHOOLS

The maintenance of playgrounds and athletic fields at schools require fertilizers and pesticides. Their safe storage and use affect not only the stormwater quality but also the health of the students and the staff. Therefore BMPs under Chapter V, Section C-1-b should be implemented. Each municipality should develop a program to encourage these schools to use environmentally sensitive products for fertilizers, pesticides, detergents,

VOL 15
0503
R0060723

and other chemicals. The schools should have proper material handling, storage, and disposal procedures for chemicals used in school laboratories.

4. **HOSPITALS**

Each hospital should have BMPs to control the handling and storage of medically related hazardous materials. All materials should be inventoried regularly, with record keeping protocols on supply and consumption. All personnel should be trained on the proper procedures on handling these materials, as well as emergency response. Each hospital should maintain a list of supervisors to be contacted if accident does occur. Disposal of these materials should be contracted out to commercial specialists.

5. **PARKS/LANDSCAPES**

Refer to **Section C Parks and Recreation**, of this Chapter, for information.

6. **OTHER BUILDINGS/PLAZAS**

Refer to **Section C-2 Parks and Recreation - Facility Management**, of this Chapter, for information.

H. PONDS, FOUNTAINS, AND OTHER PUBLIC WATER BODIES

Maintenance practices used on public water bodies, including waste management and non-stormwater discharges, must be addressed in the plan.

1. ALGAE CONTROL

a. Use of Chemicals

The use of herbicides or other chemicals to control algae growth should be carefully controlled and monitored to insure strict adherence to manufacturers' guidelines for use. Water sampling may be necessary to insure effective control.

2. CHLORINE MANAGEMENT

The use of chlorine for disinfection should be controlled. High dosage of chlorine may be harmful to the aquatic habitats. Dechlorination of pools and other water bodies would be required prior to draining.

VOL 15
0504
R0060724

3. MAINTENANCE

Each municipality should develop BMPs to prevent and control trash, debris, and other pollutants from entering water bodies. These measures could include routine trash collection along and on water bodies, public outreach to educate the public about the impacts of illegal dumping, and increase enforcement for violations.

P:\INEZ\PLAN\PLAN2.LAR\V

VOL 15

R0060725

VI. RESIDENTIAL

INTRODUCTION

Residential activities including private vehicle washing and maintenance; use of chemicals such as pesticides, herbicides, and paints; private swimming pool maintenance; and other household and landscape maintenance can contribute to storm water pollution. These are all examples of non-point source pollution, a significant impact on water quality. Measures that can be taken to improve the quality of the runoff from residential area all require active public participation. Feasible BMPs to mitigate the stormwater pollution problem should include practicing good housekeeping and the use of environmentally sensitive alternative products, vehicle leak and spill control, and water conservation. Development of the residential stormwater program will be completed by December, 1995.

In addition to the specific programs and plans outlined in this report, several watershed Co-Permittees have targeted activities occurring in and around the home that tend to contribute to degradation of storm water runoff quality. A practice that carries on-the-ground pollutants directly to storm drains is misuse of exterior water, namely the overwatering of landscaping, the hosing of driveways/sidewalks and the washing of cars in driveways--all of which allow water to run down the street into the nearest storm drain.

This situation can be addressed in two ways: 1) either reduce/prevent pollutants from being placed in areas where they may be carried by water into the streets or 2) minimize the amount of water allowed to flow on impervious surfaces that are connected to the street system.

Water conservation measures can be designed to address the issue of impervious surface water flow. While conservation has historically been used to conserve domestic water, many jurisdictions are now recognizing the additional benefit of prohibiting water flows from private properties onto the street system. Most co-permittees within this watershed implement water conservation programs. Some water districts, such as Signal Hill and Paramount, have a rate structure that penalizes excessive water usage. Public outreach is a component of all programs, many of which carry fines for water wasting practices. Several jurisdictions encourage water efficient landscape. Pasadena provides a water usage counseling program.

While some ordinances were established specifically to conserve water during periods of drought, several jurisdictions are keeping such controls in place at all times as measures to control pollution runoff.

VCL 15 0506

R0060726

A. HOUSEKEEPING PRACTICES

This BMP involves the development of a program to promote efficient and safe housekeeping practices (storage, use, and cleanup) when handling materials which may pollute stormwater/urban runoff. This could include, but are not limited to, fertilizers, pesticides, cleaning solutions, paint products, automotive products, and swimming pool chemicals.

A public education program will be developed to provide information on stormwater pollution and the beneficial effects of proper disposal on water quality; reading product labels; safe storage, handling, and disposal of hazardous products; list of local agencies; and emergency phone numbers. The above information can be disseminated through brochures or booklets made available at places such as public information fairs, municipal offices, and household hazardous waste collection events and facilities. City newsletter to residents is another means to inform the public, especially for those who do not participate or visit any offices or events.

B. ENVIRONMENTALLY SENSITIVE ALTERNATIVE PRODUCTS

This BMP, promoting the use of less environmentally sensitive products, can be implemented in conjunction with housekeeping practices. Alternatives exist for most product classes including fertilizers, pesticides, cleaning solutions, and automotive and paint products. The key to success will be to promote a willingness to try alternatives and to modify old habits.

General information will be developed and made available to the public on such alternatives. The emphasis may be placed on the need to preserve the natural environment of the receiving waters (ocean, bay, stream, wetland, etc.) with the use of alternative products because of their less toxic nature and proper disposal after its use.

C. VEHICLE LEAK AND SPILL CONTROL

This BMP prevents or reduces the discharge of pollutants to storm water/urban runoff from vehicle leaks and spills by reducing the chance for spills, stopping the source of spills, containing and cleaning up spills, and properly disposing of spill materials.

Vehicles will leak and spill fluids. The key to successful pollution management is to reduce the frequency and severity of leaks and spills; and when they do occur, to prevent or reduce the environmental impacts. Through education, the public should be encouraged to regularly inspect and maintain their vehicles. Guidelines should be developed to inform the public on spill containment and cleanup procedures such as having absorbent material on hand and disposing the material properly.

VOL 15
0507
R0060727

D. WATER CONSERVATION

Water is a scarce resource, especially so in Southern California. Wasteful use of water could channel pollutants into the receiving waters. Practices such as hosing the driveway and overwatering the landscape contribute not only to stormwater pollution, but also to the depletion of our natural resource. In order to prevent stormwater pollution, the public has to be educated on the mechanics of our storm drain system - discharges into the system will flow untreated into the receiving water. They have to know that the lawn clippings they wash down the road will end up in the ocean. Public awareness of the function of the storm drain system, of the importance of environmental health, and of our necessity to slow down the depletion of water resources will go a long way in reducing the pollution of stormwater/urban runoff.

Ordinances could be use to endow the related officials with legal authority to enforce water conservation. An ordinance prohibiting the wasting of water is one way of enforcement.

P:\INEZ\PLAN\PLAN2.LAR\VI

VOL 15
0508
R0060728

VII. PUBLIC INFORMATION AND PARTICIPATION

It is necessary to involve the public in the stormwater program for it to be effective. The outreach program should be focused on the specific needs of the individual cities. Due to the inter-relationship among the stormwater issues, the public information and participation program should be recognized as a whole, rather than a number of separate outreach programs. All public awareness efforts should clarify to the public that they are the ultimate beneficiaries of a successful stormwater management program.

Most Co-Permittees within the watershed acknowledge the value of public outreach. Efforts have been made or are planned by many co-permittees to supply the public with information on a full range of storm water quality activities with the intention of achieving a high level of public cooperation and participation. Many jurisdictions are in the early phases of NPDES program implementation and are just now beginning to budget for and develop outreach programs.

A. GENERAL OUTREACH

The targeted audiences of a general outreach will include municipal employees, local construction contractors, businesses in the area, and the general public. They should be made aware of their responsibility for both the problems and the solutions to stormwater pollution. In order to effectively communicate the stormwater pollution abatement message throughout the watershed; written, audio, and visual materials should be utilized. The actual level, priority, and schedule of public information activities must be based on the community's needs and resources to maximize program effectiveness. A watershed-wide concept will be developed by December 1995.

Most of the Phase III Co-Permittees are in the program development stages. Five co-permittees do not have and have not indicated plans for any type of public outreach involving printed or broadcast media (most are Phase III Co-Permittees and will likely be expanding their programs); Caltrans reaches the general motoring public, however, by posting State highways and freeways with "No Littering" signs. Temple City suggested that the Federal Government provide local public outreach.

General outreach to targeted groups is an objective of some Co-Permittees – especially Los Angeles City who has a student/teacher school education program (K-6 "Magical City Forest") and a mailing program directed at private industries likely to be required to obtain a General Industrial Storm Water Permit.

VOL 15 0509

R0060729

1. WRITTEN MATERIAL

Co-Permittees should produce a variety of written materials to inform the residents within the watershed. Materials can include, but are not limited to, the following: flyers, brochures, door-hangers, newspaper articles, mail-inserts, banners, and posters. When necessary, these materials should be translated into a variety of foreign languages to reach minority residents in the community.

Print media outreach programs have been used extensively by Los Angeles City and County and several other Co-Permittees. City newsletters mailed to all residents have often included articles on various storm water programs. Utility bill inserts are also used extensively to promote public awareness.

2. AUDIO MATERIAL

Similarly, Co-Permittees may utilize audio materials to convey information regarding stormwater management. Examples of audio materials include radio advertisements/public service announcements and informational cassettes. Los Angeles County uses radio broadcast to conduct outreach.

3. VISUAL MATERIAL

Catch basin stenciling program is an excellent means of educating the public on the mechanics of the storm drain system. The intent of the program is to enhance public awareness of the impact of stormwater pollution on receiving waters and to discourage improper waste disposal practices. Another effective medium for communicating the importance of stormwater management is through television. Possible measures include producing a public service announcement, cable access programs, and/or an informational video.

The most universal of general outreach programs - catch basin stenciling - is receiving general cooperation throughout most of the watershed. Extensive stenciling has already been done by several jurisdictions; most of the remaining jurisdictions have plans to complete the stenciling program. Volunteers have been or will be used by many jurisdictions. Of the thirty-five Co-Permittees in this watershed, eight are not fully participating in the program at this time. Pasadena is stenciling selected manhole covers, rather than catch basins, in a pilot project because the City does not want to mark their sidewalks. Program suggestions from the permittees include the use of bilingual text and curb face stencils.

Billboard and bus stop shelter advertising is used by both Los Angeles City and County. Los Angeles City and County have refrigerator magnets and

VOL 15
0510
R0060730

door hangers to promote their programs. The City also has a poster and street banners to promote storm water runoff quality. The County will soon have a program mascot, Chilly Willy, to be used at public events.

The City of Los Angeles has prepared a public service announcement which has been shown on cable access channels. Los Angeles County also uses television outreach. Other jurisdictions using broadcast media--generally public service cable TV--include Hidden Hills, La Canada-Flintridge, Monrovia, Pasadena, San Fernando, San Gabriel, Signal Hill, South El Monte and South Gate.

4. DISTRIBUTION PLAN

General outreach efforts must be conducted throughout the entire watershed. Materials should be available at all public counters and distributed at public events such as environmental fairs and contests. A city newsletter is another effective method of conveying the pollution abatement message.

B. FOCUSED OUTREACH

Efforts should be made to target special groups. Focus could be on specific pollutants, practices and/or activities, or businesses. A watershed-wide concept will be developed by June 1996.

1. POLLUTANT SPECIFIC

For a particular watershed, there may be priority pollutants which are of more concern than others. The reduction of these pollutants may be addressed in a more focused public education and outreach program. Any of the methods used in the general outreach program may be utilized in a pollutant specific outreach program.

2. PRACTICE/ACTIVITY SPECIFIC

Everyone who lives or works in a particular watershed must realize that their actions have a direct affect on the quality of stormwater. These special groups must be made aware that their current practices/activities may be contributing to stormwater pollution. Practice/activity specific outreach programs should be developed and implemented throughout the watershed. The use of written, audio, or visual materials should convey three primary messages: (1) what activities can cause stormwater pollution, (2) how Best Management Practices are used to prevent pollution, and (3) how one can report occurrences of stormwater polluting activities.

VOL 15
0511
R0060731

Practice/activity specific outreach should promote, publicize, and facilitate public reporting of illegal dumping, illicit discharges, or water quality impacts associated with discharges from municipal separate storm sewers. An effective program should include the establishment, operation, and promotion of a reporting hotline. Timely reporting by the public of improper disposal and illicit discharges are critical in controlling such sources of stormwater pollution. Increase in public involvement may be achieved by sending a follow-up letter to callers or providing callers with some type of reward. Educational efforts throughout the watershed should inform the public about the existence of the Los Angeles County-wide hotline and any other local hotlines; provide them with information regarding what to look for, and guidelines/procedures on how to report incidents.

Another critical component of practice/activity outreach is the development of a program to facilitate the proper management and disposal of used oil and toxic materials. An effective program could include, but is not limited to, the operation of recycling facilities and the conduction of household hazardous waste round-ups. The program could also include information about alternatives to toxic materials. Educational efforts throughout the watershed should provide the public with detailed information regarding the Los Angeles Countywide Household Hazardous Waste Round-ups and any other local programs.

Co-Permittees take part in public information and participation programs specifically aimed at preventing improper disposal of hazardous household products and encouraging actions that keep general wastes out of the storm drain system - such as recycling programs, public trash receptacles and the cleaning of sidewalks, alleys and vacant lots. Illegal dumping and discharges are also specifically targeted.

These activities are encouraged through general outreach programs (discussed above) that promote such programs as toll-free phone hotlines for reporting illegal polluting activities, topic-specific brochures, speakers bureaus and special recycling facilities (used motor oil, hazardous products, etc.). Every co-permittee within this watershed either promotes or is planning to promote the County's illegal dumping hotline; some also have their own hotlines. Focused outreach to promote recycling programs is also conducted by nearly every jurisdiction.

Both the City and County of Los Angeles have outreach programs focusing on their airport operations; the County will have handouts for tenants and users of County airports explaining the problems and prevention of non-point source pollution.

VOL 15
0512
R0060732

3. BUSINESS SPECIFIC

Due to the fact that some business operations have a higher potential of discharging pollutants into the storm drain system, a more focused public education and outreach program should be developed for them. Employees of these businesses should be educated on the issue of nonpoint source pollution and the effectiveness of Best Management Practices in reducing pollution. Besides written, audio, or visual materials that focus on specific businesses and their practices, mass mailings or articles in a trade/industry magazines are other possible means of focused outreach.

The City of Los Angeles has initiated a three phase program intended to increase the awareness of those involved in the construction industry regarding storm water pollution abatement activities. Videos and printed materials will be distributed.

C. EDUCATION PROGRAMS

Increasing awareness is the major goal of the Public Information and Participation Program. An ideal means of accomplishing this task is through educational programs. Programs should be developed for a variety of audiences, including public employees and school children. Educational programs can also be an important part of a general or focused outreach. A watershed-wide concept will be developed by June 1996.

1. PUBLIC EMPLOYEES

It is important to educate all of the public employees about the stormwater program so that they do not continue with any practices that are counter productive. Furthermore, they can participate in the implementation and enforcement of the program. Ideas and suggestions of employees can be used to modify the program for improved effectiveness. The outreach must involve employees on many different levels - from program managers to field personnel. Educational programs for public employees may include, but are not limited to, articles in City newsletters, training classes, checklists for field personnel, and interdepartmental forum or committee. Any of the materials utilized in an outreach program - written, audio, or visual materials - may be used in a public employee educational program.

More formal training/education is also conducted by Caltrans and the City and County of Los Angeles. Caltrans personnel is educated on highway maintenance - specifically on such subjects as Hazardous Substance Spill Awareness and Pesticide Safety and Vegetation Management. City and

VOL 15
0513
R0060733

County personnel meet regularly to discuss development of and evaluate storm water quality practices.

2. K-12

School children can play an important role in a public information and participation program. First, children are generally more easily motivated and the behavior changes made at that point in life tend to stay with them through adulthood. Secondly, school children can convey the stormwater pollution prevention messages to the members in their family. School programs must include information on the storm drain system, stormwater quality awareness, and may also include, but are not limited to, illegal dumping awareness, source minimization, and pollution prevention. Written material, videos, assembly programs, and field trips are examples of effective components of a K-12 educational program.

Examples of diversified outreach programs include San Fernando's pollution reduction poster contest for children. The following are examples of other educational programs implemented by the cities. The City of Los Angeles has a school education pilot program, "The Magical City Forest", for grades K-6. El Monte has a school education program presented by the Fire Department. Pasadena, South El Monte, Signal Hill and Los Angeles County also offer school presentations - particularly to promote recycling. Long Beach is developing a Public Education Resource Portfolio.

3. OTHER

Educational programs can also be developed for professionals and technicians who are not public employees. Agencies should include public outreach material for business license renewal or outreach effort through professional and business associations.

Monrovia has a program to distribute BMP information to landscape contractors with their annual business license renewal.

D. RESIDENTS PARTICIPATION

The residents of the watershed should not only be made aware of the stormwater program, they should be encouraged to participate in its implementation. Specific outreach programs should be developed to allow the public to participate and to inform them of available means for providing ideas and comments regarding the stormwater program. A watershed-wide concept will be developed by June 1996.

VOL 15 0514

R0060734

1. VOLUNTEER MONITORING

Volunteer monitoring is the result of increased public awareness and participation. The public can utilize the hotline for reporting suspected illegal practices. Such involvement, which is similar to the Neighborhood Watch Program on crime, usually has good results.

2. COOPERATIVE OUTREACH

In order to promote public participation, cooperative outreach programs should be developed. These cooperative programs should help to create an awareness and an identification with the watershed. The catch basin stenciling and other signing programs are excellent examples of this type of cooperative effort. One possibility for cooperative outreach is an "Adopt-A-" program. Residents can "adopt" a highway, storm drain, catch basin, stream, etc. Other cooperative outreach efforts include events such as "Stormwater Pollution Awareness Week." The purpose of any of these activities is to inform and involve the local residents in regards to the stormwater management program.

Several watershed jurisdictions have enlisted the assistance of such groups as the Boy Scouts, students and neighborhood volunteers in the catch basin stenciling program. Caltrans' Adopt-A-Highway program relies on voluntary private participation to help with clean-up activities. Long Beach has an "Adopt-A-Gutter" program. Hotline programs also enlist the assistance of residents in active participation.

3. COMPLAINT PROCEDURES

Public comments/complaints are important to the success of a stormwater program. A hotline is an excellent mechanism for allowing the public to provide information. In Section B, "Focused Outreach - Practice/Activity", the various aspect of outreach effort is discussed.

E. EFFECTIVENESS EVALUATION

Permittees should develop a process to evaluate the effectiveness of their programs. Methods such as surveys and focus groups can be used to assess program's effectiveness. Results should gauge the community's level of awareness. Surveys and focus groups can also be used to provide insight into the program's direction and the formulation of attainable goals. A watershed-wide concept will be developed by June 1996.

VOL 15
0515
R0060735

The City of Los Angeles has conducted a pre-survey to determine the general level of public awareness about storm water pollution. They plan to conduct a post survey in 1995 to gauge the progress made in their public education program. Many watershed co-permittees are in the early phases of implementation; there have been no other reports of formal programs to assess program effectiveness, although staff discussions and management reviews have resulted in program development and modifications.

P:\INEZ\PLAN\PLAN2.LAR\VII

VOL 15
0516
R0060736

VIII. PROGRAM EVALUATION

The effectiveness of the storm water programs developed under the Municipal Storm Water Management Plan (hereinafter called the Plan) must be assessed on a regular and consistent basis. The Plan for this evaluation must include a schedule for evaluation, a methodology for the evaluation, a discussion of who will carry out the evaluation, and what will be evaluated. In addition, there must be a mechanism to follow up on the information generated by the evaluation. The Plan should be adjusted based on the program evaluation.

A. PERFORMANCE STANDARDS

The Permittees will develop standards to judge the effectiveness of the activities and control measures proposed under each chapter of the Plan. The standards will serve as minimum performance levels to evaluate the implementation of control measures. The subsequently developed performance evaluation procedures/methodologies will be the tool to determine if a particular BMP has an impact on stormwater quality. In developing these procedures, we resolve to ensure that each BMP is implemented to the maximum extent practicable. The targeted completion of this phase will be December 1996.

1. DEVELOPMENT OF PROCEDURES

General performance standards for evaluating the effectiveness of the Best Management Practices (BMPs) will be developed for all the BMPs proposed in the Plan. The Watershed Management Committee will be responsible for developing and adopting these evaluation criterion. The Management Committee may elect to establish subcommittees to develop performance standards for specific program areas. The area-wide Executive Advisory Committee will then review and endorse the standards. Standard recording format and implementation schedule will be developed for each BMP by the Management Committee for use by all Permittees. The Permittees will be required to document BMP implementation using the standard format according to an established schedule. The utilization of quantitative approaches in measuring effectiveness will be used whenever possible. Methods that would yield comparable results for year to year evaluation will be developed.

2. ACTIVITY/SOURCE/ACTION AREA SPECIFIC

Program effectiveness will be performed based on the information generated by the performance evaluation procedures. Using street sweeping as an example, the Plan will propose a method of determining if street sweeping has an impact on water quality. This could include determining what kind of

VOL 15
0517
R0060737

pollutants are removed by the sweeping, measuring the size of the pollutants and the amount removed. Methodologies would be developed for each BMP, which will assure that each control measure or action is implemented to the maximum extent practicable. For street sweeping; this may include the frequency of sweeping now, the method of sweeping, the equipment used, how the equipment is cleaned and maintained, and the method of disposal for the material collected. A schedule and format of evaluation shall be developed for all the BMPs.

The California Regional Water Quality Control Board, Los Angeles (Regional Board) has recommended 13 Baseline BMPs, to be developed and/or implemented by all Permittees by the end of the current NPDES Permit. Existing Permit Task 5.2.5 requires an evaluation of the need for additional BMPs, source control, and/or structural control measures.

BMPs have only been implemented for a short time period by Phase I and Phase II cities. Phase III, which contains 30 new cities, has not yet implemented any BMPs. Therefore there is little or no data available to adequately assess effectiveness. In lieu of recommending any changes or additions to BMPs currently being implemented or proposed by the Permittees, a uniform data collection methodology will be established for each of the 13 baseline BMPs. This methodology would be used by all Permittees to compile data on their BMP implementation to allow for a uniform Countywide evaluation of BMP effectiveness. Priority will be given to the development of a uniform data collection methodology to document the success or effectiveness of these 13 BMPs. Upon reorganization of the NPDES Permit Program, as described in Chapter I, this will be the first task addressed by the Watershed Management Committee. The Uniform data collection methodology will be developed by January 15, 1995 for the Santa Monica Bay watershed and by July 1995 for all other watersheds with subsequent implementation by all Permittees in each watershed.

B. ANNUAL REPORTS

An annual report for each watershed will be submitted to the Regional Board not more than 45 days after the end of each permit year. Each annual report will include a summary on the programs implemented during the previous year and plan activities that will be implemented during the current year. Any revisions to the Plan would be addressed in the report.

1. FORMAT/STRUCTURE

In order to insure uniform annual reporting by all watersheds, the Executive Advisory Committee will develop a uniform annual report outline for use by

VOL 15 0518

R0060738

each watershed. Each Watershed Management Committee will develop a standard format to be used by all the permittees in its watershed in reporting the progress and the status of all stormwater programs implemented in its jurisdiction. The Principal Permittee will utilize this information to develop the annual report for the watershed. Upon approval by the Management Committee, the annual report will be provided to the Executive Advisory Committee which will compile the annual reports from all watersheds for submittal to the Regional Board.

2. EFFECTIVENESS MEASURES

Under Chapter VIII, Section A, the permittees will have developed performance standards for each BMP. These performance standards will be used to assess the effectiveness of the BMPs. By the end of each permit year, the findings of the previous program year will be evaluated and used to suggest changes that are appropriate for implementation during the next year. Focus should also be given to the use of empirical studies, in a control setting, to more fully assess the effectiveness of BMPs.

3. CONTENT

The annual report will include a matrix illustrating the levels of implementation for all permittees. Tables will be developed for each BMP listing all the participating Co-Permittees, describing the status of implementation by each Co-Permittee of the BMP, and documenting any modifications of the BMP from the standard program. The effectiveness of each program area will be assessed using the performance standards developed under Chapter VIII, Section A. For effectiveness measures, the findings should be presented graphically for ease of comparison with the established levels of effort. Fiscal budget for all the BMPs implemented should also be prepared, grouped by programs. An analysis and evaluation of the results of the past year's monitoring program data will also be included in the report. Any revisions to the Plan should be addressed here, with all the elements affected discussed in their entirety. All relevant information, such as water samples analyses and evaluation, should be included in the appendices.

C. SEMI-ANNUAL REPORTS

A semi-annual progress report will update the Regional Board on Permit compliance activities six months into each permit year. The semi-annual report will be provided to the Regional Board within 30 days after the end of the six-month period.

VOL 15
0519
R0060739

1. **PURPOSE**

The semi-annual report will serve as a status report on the progress of the implementation of the Plan.

2. **FORMAT/STRUCTURE**

In order to insure uniform semi-annual reporting by all watersheds, the Co-Permittees will use the standard format developed for the annual report in reporting the progress and status of all the BMPs implemented in their jurisdictions. The Principal Permittee will utilize this information to develop the semi-annual report for the watershed for submittal to the Regional Board.

3. **CONTENT**

The semi-annual report will include a matrix illustrating the levels of implementation for all permittees. Tables will be developed for each BMP listing the participating Co-Permittees, describing the status of implementation by each Co-Permittee of the BMP, and documenting any modifications of the BMP from the standard program. The Permittees will describe the problems encountered during implementation and discuss the modifications to the program in order to solve these problems.

D. INTERNAL REPORTING

In order to facilitate the preparation of semi-annual and annual reports, standard internal formats for use by all Permittees will be developed. The internal reporting procedures will be completed for all Plan chapter elements by December 1996.

1. **STANDARD FORMS**

The Watershed Management Committee will be responsible for developing standard forms for use by each Permittee. Standard forms will be developed for each BMP to monitor its progress. Some Permittees may have to customize the standard forms in order to reflect their programs' additional features. The forms will collect all the information essential to the preparation of the annual and semi-annual reports. In developing the standard report forms, information that is quantifiable and specific for each program area and/or BMP will be collected.

2. **PROCEDURES**

Co-Permittees will submit all the BMP report forms to the Principal Permittee at the end of the six-month period and the permit year, respectively.

VOL 15
0520
R0060740

3. RECORD KEEPING

The Regional Board does not need to see all of the extraneous information, but the records will be retained by the Principal Permittee for 2 years. Each Permittee will keep a permanent copy of its reporting forms in case they are needed.

E. STORM WATER MANAGEMENT PLAN REVISIONS

There will be an annual review process that will allow the Permittees to revise the Plan for the next year and for the rest of the permit period. The targeted completion date for this phase is December 1996.

1. PROCESS

In the annual report, permittees will compare the progress made on all the BMPs with the established level of effort. If the level of implementation is inadequate, the program should be adjusted to accelerate the progress. If the progress made to date shows that the program is ineffective or inefficient in protecting the stormwater quality, a new program should be developed and implemented for the next fiscal year and the rest of the permit period.

2. REPORTING

All refinements or revisions to be made in the fiscal year will be documented in the annual report, with the dates of implementation proposed.

P:\INEZ\PLAN\PLAN2.LAR\VIII

VOL 15
0521
R0060741

IX. MONITORING

The Monitoring Program is a critical element in the Stormwater Management Plan. It will provide important data for use in characterizing existing stormwater/urban runoff quality, guiding future development, and modifications to the Plan and also to assess its effectiveness. A watershed wide monitoring program shall be developed by December 1996.

A. SYSTEM CHARACTERIZATION

The existing Permit subdivided the County into six drainage basins with information to be collected to characterize each of the basins.

1. WATERSHED

Each drainage basin has been subdivided into numerous drainage areas, based on an evaluation of the existing drainage system and surface flow patterns. For each drainage area, the following information has been compiled: size; breakdown of existing land use; imperviousness; description of soils; location of waste disposal facilities; and the location, type, and number of industries by Standard Industrial Classification (SIC) Code. This information has been submitted to the California Regional Water Quality Control Board, Los Angeles Region, for Phases I and II. Phase III watershed characterization is in progress and will be completed by the end of December 1994. Due to the volume of the watershed characterization data, this information has not been included herein, but is available for review at either the Regional Board or the Los Angeles County Department of Public Works.

This information will provide a basis for developing other monitoring program elements such as pollutant loading estimates from major land uses and watersheds; pollutant source identification, and identification of illegal discharges/illicit disposal practices.

2. STORM DRAIN SYSTEM

In subdividing each basin into drainage areas, the drainage area tributary to all major outfalls has been identified. Within each drainage area, the tributary storm drain system is being identified and mapped. Key information such as the size of the storm drain facilities, locations of manholes and inlets, and storm drain connections is being compiled. This information will be vital in conducting storm drain inspections to identify and eliminate illegal discharges.

VOL 15
0522
R0060742

3. RECEIVING WATERS

Due to the extent of urbanization in Los Angeles County over the past decades, most of the streams designated as receiving waters in the Los Angeles basin have been replaced with man-made storm drainage systems to provide flood protection to the urbanized areas. These streams have been mapped as part of the storm drain system mapping done under A.2. above. The remaining natural streams are also being mapped.

The Los Angeles County Department of Public Works (Department) has been performing surface water quality monitoring on a voluntary basis since the late 1960s. Samples have been collected and analyzed from various receiving water streams and channels throughout the County to collect general information as to the quality of the surface runoff within our storm drain system.

The program in existence at the time the current Permit was issued was established in the mid 1980s. Twenty-eight sites are sampled monthly for dry weather flows. Twenty-one of the 28 sites are sampled for storm flows up to five times per year. The collected samples are analyzed for general minerals, pH, total dissolved solids, specific conductance, biochemical oxygen demand, bacteria, heavy metals, pesticides, PCBs, total organic carbon, volatile organic compounds, and total petroleum hydrocarbons.

The sample collection at these sites will continue while the new National Pollutant Discharge Elimination System (NPDES) Permit monitoring stations are established. Once all NPDES Permit monitoring stations are operational, sampling at these 28 sites will be discontinued.

In order to provide an initial assessment of the water quality in the major streams and channels in the County, an analysis has been performed on the data collected through the existing surface water monitoring program. The analysis has been done on a Countywide basis and also by major drainage basin. The report can be found in Volume 8.

To better assess the receiving water impacts of stormwater the Department will be developing a program to further study stormwater impacts on selected receiving waters, including conducting toxicity studies. Initial efforts will focus on the Santa Monica Bay Watershed. A Request for Proposal for the development of such a program will be advertized by January 15, 1995.

The water quality data collected by the new NPDES Monitoring Program will provide more detailed data to better assess in upcoming years the quality of our receiving waters. Ten monitoring stations have been proposed along the

VOL 15
0523
R0060743

major streams in the County. A description of these site locations can be found in the monitoring work plans for Phases I, II, and III, previously submitted to the Regional Board, see Volume 8.

4. **LAND USE**

As described under Section A.1. above, the existing land use categories within each drainage area have been identified. This information has been used to select drainage areas comprised of a single homogeneous land use for land use specific monitoring. A total of 14 land use monitoring sites are being established in the County. Five sites are being installed in the Santa Monica Bay Watershed with the remaining nine to be selected from within the Los Angeles, San Gabriel, and Santa Clara River Watersheds. For a description of the sites, please see Volume 8. These sites will provide valuable information as to the types and levels of pollutants found in runoff from various land uses. This information can then be used to refine the Stormwater Management Plan to develop specific management measures to target identified problems.

B. SOURCE IDENTIFICATION

Identifying the sources of stormwater pollutants from both specific land uses and specific activities will provide the information needed to identify problem areas and allow specific management measures to be developed to address these problems.

1. SPECIFIC LAND USE

As described in Section A.4. above, major land use classifications will be subject to individual monitoring to determine the types and levels of pollutants present.

2. SPECIFIC ACTIVITIES

a. A pollutant source identification program will be designed to identify significant pollutant sources (i.e., parking lots, industrial activities, etc.), with the hope that remedial action can be undertaken to reduce any significant impacts so identified. It will focus on monitoring very small areas (i.e., less than five acres) where a specific and/or interrelated set of pollutant generating activities are occurring. Its objective is to provide data for selecting BMPs for specific activities rather than characterizing discharges for long-term pollutant loading estimates.

Identification of pollutant sources can be done using a number of methods. Potential sources of storm water pollutants can be identified

VOL 15 0524

R0060744

by records of chemical use and/or storage, by studies of specific activities which lead to the deposition of pollutants throughout the watershed, and by field inspection or monitoring. Watersheds which may contain significant pollutant sources can be identified through land use information or by mass loading estimates.

By mid January 1995, the County will begin targeted monitoring of a municipal corporation yard in the Santa Monica Bay watershed. A full program for pollutant sources identification will be developed by December 1996.

b. A storm drain inspection program has also been developed and is being implemented. The first phase of the inspection program will target the open channel storm drains to identify illegal discharges.

The open channel inspections will also be used to screen outfalls from underground storm drains for the presence of dry weather flows. This information will be used in the next phase of the storm drain inspection program to prioritize the underground storm drain system for further field screening and inspection of problem areas.

C. CONTROL MEASURE EFFECTIVENESS

It is unlikely that the effectiveness of the various control measures implemented by the storm water management plan can be determined solely through the data produced by monitoring the quality of storm drain flows, because it is difficult to obtain statistically significant comparisons of watershed-wide control measure performance with such data. For this reason the effectiveness of control measures will be assessed through other means.

Two general types of methods are available for assessment of control measure effectiveness: direct water quality (conventional) monitoring and indirect (non-conventional) monitoring. Direct water quality monitoring can be used to determine pollutant reduction by a specific facility or device. This technique is commonly used for structural or treatment controls, such as detention basins and constructed wetlands, where there is an accessible inflow and outflow. Inflow and outflow results are compared to determine pollutant removal and effectiveness.

Direct water quality monitoring of site runoff before and after implementation of non-structural control measures is also possible. However, it is difficult to demonstrate effectiveness at a statistically significant level because of the high degree of variability in stormwater pollutant concentration and mass loading data. The water quality improvement due to non-structural control measures is generally expected to be less dramatic than that achieved through structural controls. A larger

VOL 15
0525
R0060745

number of samples is therefore required to produce a statistically significant result. This is especially difficult in relation to the monitoring of the pre-control measure condition. Collection of adequate baseline information is necessary prior to the implementation of management practices. Direct monitoring of the effectiveness of non-structural controls is feasible typically only under experimentally controlled conditions (e.g., selection of small, well-defined watershed; control of management practice implementation; effective siting and timing of monitoring activities), including a sufficient number of samples to achieve statistical significance.

Indirect monitoring currently is the primary method of choice of assessment of management plan effectiveness. A number of indirect monitoring techniques are available for assessment of management plan effectiveness.

Verification of program implementation is an indirect monitoring method that can be used to determine how a management plan is being implemented. Another indirect monitoring method, pollutant removal inventories, can be used to assess the amounts of pollutants that have been prevented from entering the municipal storm drain system.

The 13 Baseline BMPs recommended for implementation by the Regional Board plus other BMPs proposed by the various Co-Permittees are in general all non-structural control measures. In the short-term, a uniform data collection methodology will be developed for use by all Permittees to compile information on the level of implementation of the 13 Baseline BMPs. This will allow for a uniform watershed-wide evaluation of BMP effectiveness. For the Santa Monica Bay watershed, this uniform data collection methodology will be developed and begin implementation by January 15, 1995. For the other watersheds, implementation would begin July 1, 1995.

For the long-term, as the various chapters of the Plan are more fully developed, possibilities for the use of direct water quality monitoring for control measure assessment will be evaluated as opportunities arise.

D. POLLUTANT LOADING

One of the objectives of the monitoring program is to estimate the annual pollutant loadings from each watershed. Knowing the types and quantities of pollutants discharged into receiving waters are important in assessing the impacts of stormwater and, in turn selecting appropriate control measures to address problem areas.

The 24 permanent monitoring stations that are being established Permit-wide will be utilized to estimate pollutant loads from each watershed and also from various land uses. For a description of the methodology to be used to estimate pollutant loadings, please see Volume 8. For the Santa Monica Bay Watershed, the pollutant loading

VOL 15
0526
R0060746

model will be tested and operational by January 15, 1995. Actual pollutant loadings will be calculated subsequent to storm events occurring for which water quality data has been obtained. For the other watersheds, a schedule for pollutant load modelling will be provided by January 15, 1995.

To more closely model pollutant loadings and evaluate control measure impacts, a more detailed dynamic modelling will be undertaken on a smaller, representative sub-watershed. The EPA-SWMM model has been selected for use in our dynamic modelling efforts. For the Santa Monica Bay Watershed, the Kenter Canyon Drain sub-watershed has been selected for this modelling efforts. This sub-watershed is typical of the urbanized areas in the Santa Monica Bay Watershed. It is comprised of multiple land uses, has well-defined boundaries, and has no upstream flow regulation. We are reviewing and identifying the existing drainage system, defining current and future land uses, and conducting field checks. The model will be tested and operational by January 15, 1995, with actual modelling results to be available later when local water quality data from our monitoring stations becomes available. Based on the results of the dynamic modelling of the Kenter Canyon sub-watershed, other sub-watersheds may be selected from the other major watersheds in the County.

E. COMPONENTS OF A MONITORING PROGRAM PLAN

The components of the monitoring program plan such as monitoring site locations, dry/storm sampling frequency and methodology, constituents to be sampled, field and laboratory procedures, QA/QC, etc., can be found in Volume 8, which has been previously provided to the Regional Board.

The Monitoring Program elements described in Volume 8 will be revised to address the Monitoring Program needs described in Section A - D above as agreed to in the letter from the County to the Regional Board dated September 22, 1994.

As the various chapters of the Plan are more fully developed, the Monitoring Program will be revised to address any additional monitoring needs that may result.

F. DATA MANAGEMENT

For water quality data collected at the 24 monitoring stations, please see Volume 8 for data storage and reporting methods.

For each Section A - E of the Monitoring Program described above, an annual report will be prepared detailing the data collected, with an evaluation and interpretation the data including water quality impacts.

SAN GABRIEL RIVER
STORMWATER MANAGEMENT PLAN

INTRODUCTION

On June 18, 1990, the National Pollutant Discharge Elimination System (NPDES) Permit - Order #90-079, NPDES #CA0061654-CI6948 was issued to the County of Los Angeles and 17 cities tributary to Santa Monica Bay. During the subsequent years, two newly incorporated cities within the Santa Monica Bay watershed, Caltrans, and the County of Ventura also became Co-Permittees. This Permit outlined a three year program which required each Permittee to: characterize drainage areas; develop and schedule the implementation of Best Management Practices to enhance the quality of stormwater/urban runoff within its jurisdictional boundaries and in storm drains it owns and operates. On July 1, 1992, 36 additional cities were initiated into the Permit and began their three-year program. By July 1, 1993, the remaining 30 cities in Los Angeles County within the drainage basin were initiated into their three-year program. The cities were grouped according to their starting dates and referred to as Phases I, II, and III respectively (See Table A). In general, the boundaries of each Phase did not encompass whole watersheds but portions of various watersheds (See Figure 1).

The Permit has a five-year duration and although Phase III cities have only completed year one of their three-year program, the Permit requires the submittal of a Report of Waste Discharge (ROWD) which serves as an application for a subsequent NPDES Permit to replace NPDES Permit #CA0061654, which will expire on June 18, 1995. Therefore, the County of Los Angeles, the County of Ventura, Caltrans, and the 85 cities are now parties to the subsequent NPDES Permit application utilizing the Municipal Stormwater Management Plan (herein after called the Plan) concept.

The Plan is based on the Stormwater Management Plan Components developed by the California Regional Water Quality Control Board, Los Angeles Region (Regional Board), and is proposed on behalf of the County of Los Angeles and the other participating agencies, see Table B. This Plan describes the stormwater management activities to be undertaken during the next single, five year NPDES Municipal Stormwater Permit. The Plan involves the subdivision of the area of the County under a single, new Permit, into six watersheds, each with its own stormwater management plan. For these watersheds and the agencies in each of these watersheds, see Table B and Figure 2.

As required by the current Permit, all Permittees have proposed BMPs for their jurisdictions, described in Volume One and under prior submittals made to the Regional Board. These BMPs have already addressed many of the program areas discussed under the stormwater management plan. As required by the current Permit and continuing on under the new Permit, the Permittees will continue to implement these BMPs. This stormwater management plan will involve reorganizing the individual city-based BMP programs into a single stormwater plan for each watershed. The timeline shown in this document reflects the time needed for the transition from individual city-based programs to the preparation of a mutually agreed upon and collectively developed watershed plan by

VOL 15
0531
R0060751

all parties of the new Permit for each of the watershed areas. The first step in beginning this process will be the reorganization of the current three-phase program into a new watershed based program. A reorganization of the Phases into watersheds which are based on hydrologic characteristics will allow for the consistent development and implementation of programs among Permittees, referencing land use and drainage infrastructure within their respective watersheds. Consistency of programs throughout the watershed will be beneficial in terms of targeting specific pollutant problems and areas.

This specific plan will address the stormwater management issues for the San Gabriel River watershed, which include the following cities and agencies:

Artesia	**Azusa**	**Baldwin Park**
Bellflower	**Bradbury**	**Caltrans**

I. PROGRAM MANAGEMENT

A. PROGRAM STRUCTURE

The County of Los Angeles is designated as the Principal Permittee. The other agencies are designated as Co-Permittees. The following are conditions that establish the responsibilities of all Permittees.

1. RESPONSIBILITIES OF PRINCIPAL PERMITTEE

Anticipated duties of the Principal Permittee include:

- Being the coordinators of permit activities and chairing the area-wide Executive Advisory Committee and the Watershed Management Committees;
- Providing the resources necessary for development of the stormwater management plans;
- Providing technical and administrative support for both the Executive Advisory and Management Committees;
- Implementing the monitoring program; and
- Providing the resources necessary for developing annual reports including evaluating monitoring program data and BMP effectiveness;
- Complying with all the responsibilities of a Co-Permittee as outlined below.

2. RESPONSIBILITIES OF ALL CO-PERMITTEES

Each Co-Permittee is designated a number of duties under the proposed stormwater management plan:

- Participate in the development of the stormwater management plan;
- Implement the stormwater management plan within their jurisdictional boundaries and the storm drains they own and operate.
- Provide information needed by the Principal Permittee on program implementation for development of the annual reports.

The area under the Permit will be subdivided into the six watersheds tributary to the following waterbodies: Santa Monica Bay, which is further divided into a) Malibu Creek and Other Rural Areas, and b) Ballona Creek and Other Urban Areas; Los Angeles River; San Gabriel River;

R0060757

VOL 15 0537

Dominguez Channel/Los Angeles Harbor Drainage; and the Santa Clara River (See Figure 2). Managing these watersheds is a task that will require a collective and cooperative effort on the part of all governmental entities named in the Permit that are within each watershed.

The management structure of the Plan consists of an area-wide Executive Advisory Committee, Watershed Management Committees, and Subcommittees. This particular structure is intended to provide a suitable program for the unique characteristics of each watershed and shall be developed by April 1995.

The Co-Permittees tributary to the San Gabriel River watershed shall adopt this watershed stormwater management program structure as a guide to allow for an area-wide uniformity of compliance of the Permit.

3. EXECUTIVE ADVISORY COMMITTEE

The area-wide Executive Advisory Committee shall consist of the County of Los Angeles, as Chair, and two representative Co-Permittees from each of the six watersheds. This Committee assumes no responsibility for the adequacy or inadequacy of any individual city's program and should not be viewed as the responsible agency in this sense. The Committee's main role is to facilitate programs within each watershed and to enhance consistency among all of the programs. Additional responsibilities of the committee are:

a. Making recommendations on area-wide issues to each of the Watershed Management Committees;

b. Reviewing the stormwater management plans as developed by each Watershed Management Committee and provide direction and guidance on the plans for consideration by the Watershed Management Committees.

c. Assessing the consistency of all area-wide BMPs;

d. Preparing and forwarding unified submittals to the Regional Board upon receipt of information and materials submitted by the Watershed Management Committee in compliance with Permit requirements;

e. Scheduling and coordinating meetings and correspondence to allow for communication between the Co-Permittees and the Regional Board;

f. Acting as liaison between all Permittees and the Regional Board on Permit issues as well as mediating conflict among the Permittees.

R0060758

VOL 15 0538

4. WATERSHED MANAGEMENT COMMITTEE

A management committee within the watershed will be comprised of the County of Los Angeles, as Chair, and one representative from each of the Co-Permittees in the watershed. The committee shall be responsible for:

a. Establishing goals and objectives for the watershed;

b. Preparing the stormwater management Plan for the watershed (This includes the development of all chapter components of the Plan);

c. Assessing the effectiveness of the plan and making appropriate changes;

d. Preparing the semi-annual progress reports and annual Permit reports on Permit activities within the watershed for submittal to the Regional Board (For the annual Permit report, a draft will be circulated to each Co-Permittee and the Executive Advisory Committee for its review and comment. Final copies of reports shall be forwarded to the Executive Advisory Committee through which a compilation from all six watersheds shall be submitted to the Regional Board);

e. Enhancing the implementation of the storm water/management plan within the San Gabriel River watershed.

5. SUBCOMMITTEES

Subcommittees will be established where needed as determined by the Management Committee and/or the Executive Advisory Committee. The Subcommittees would be focused on specific program areas and can provide more specific oversight on the development, implementation, and evaluation of selected program areas. These subcommittees shall be scheduled to meet on a routine basis.

B. INSTITUTIONAL ARRANGEMENTS

Management of the stormwater program requires the collective efforts and the cooperation of all Permittees. No Permittee has the ability and the legal authority to assume the responsibility of all activities of this Permit. Therefore, agreements will need to be formally developed amongst the Permittees to insure proper implementation of the Permit requirements.

VOL 15
0539
R0060759

1. PROGRAM PARTICIPANT ARRANGEMENTS

As the Principle Permittee, the County of Los Angeles will be designated as the lead agency for coordination of Permit activities and therefore shall chair the executive committee and the management committee meetings as they are scheduled. The lead agency is responsible for coordination of the Permit but is not responsible for the adequacy or inadequacy of any individual Permittee's program. All other entities are Co-Permittees and will be responsible for the Permit compliance of their own agency's program. An implementation agreement will be drafted formally detailing the responsibilities of the Principal Permittee and the Co-Permittees. The agreement would also address the funding of various watershed-wide activities such as plan development, annual evaluation and reporting, and monitoring. Execution of the agreement by all Permittees is targeted for December 1995.

2. AREA-WIDE INTERAGENCY

As the Plan for each watershed is more fully developed, the Watershed Management Committee will coordinate with special agencies and districts that also regulate and/or perform activities addressed under different elements of the Plan. This coordination will attempt to ensure that their functions and the Plan are compatible. A few of these agencies include:

County Hazmat

- Any overlap of waste regulations, Household hazardous waste programs and or Industrial inspections shall be recognized and addressed, by all entities that fall under this Permit, in reference to the watershed program.

County Health

- Inspections of restaurants and other food handling establishments shall be coordinated with the Permittees.

Local Transportation/Congestion Management

- Local municipalities have limited authority over motor vehicle usage and regional transportation planning. Where feasible, plan development and implementation will be coordinated with local transportation agencies.

VOL 15
0540
R0060760

County (Regional) Parks

- Landscape maintenance activities at public-owned parks will be reviewed as part of additional plan development to ensure the use of proper management measures.

Mosquito Abatement

- Coordination with the County Agricultural Commissions will be done for mosquito abatement programs to avoid adverse impact on the quality of stormwater/urban runoff.

Water Districts

- Activities with regards to the Water Districts activities will be reviewed and, when feasible, comply with the watershed program regulations and requirements.

Other entities, both private and public which have major land holdings and/or authorities that impact the quality of stormwater/urban runoff should be initiated to actively participate in the program.

3. CITY-SPECIFIC INTERAGENCY ARRANGEMENTS

Each city will need to develop the institutional framework to address operation, maintenance, construction, redevelopment, and other activities performed by city agencies such as Public Works, Parks and Recreation, Planning, and Public Owned Treatment Works (POTWs). These city agencies will need to participate in the planning and implementation of relevant plan program areas.

C. FISCAL RESOURCES

As each of the Plan chapters are completed, each Permittee will develop a budget for implementing that portion of the Plan. A complete budget for the Plan will be produced upon completion of development for all Plan components (*December 1997*). The budget will provide information such as funding sources, staff resources, contract services, and cost sharing arrangements.

1. AREA-WIDE

Stormwater Program activities such as Plan development, annual reporting, monitoring, and public education that are area wide in nature will have

VOL 15
0541
R0060761

budgets developed indicating the total cost for these items and the portion to be funded by each Permittee.

2. CITY-SPECIFIC

In implementing the Plan, the Permittees may elect to jointly fund a single program for certain BMPs, such as Public Education, that are area-wide in nature. Funding agreements including budgets and cost per agency would be developed.

D. LEGAL AUTHORITY

Each Permittee is responsible for implementing the Plan within its jurisdictional boundaries and therefore must acquire all needed legal authority. Each Permittee, being separate legal entities, are to have adopted as required by the existing Permit, ordinances that will provide them with the adequate legal authority to develop, administer, implement, and enforce storm water/urban runoff management programs within their own jurisdiction. The ordinance must provide for its enforcement and at a minimum specify that violators may be subject to penalties including, but are not limited to, fines and termination of the activity causing the violation. A plan for identifying any additional legal authorities needed by the Permittees will be included in the completed Plan for the San Gabriel River watershed (*December 1996*). Upon completion of development of the Stormwater Management Plan, enforcing compliance with the Plan will be the responsibility of the Regional Board.

P:\P:\INEZ\PLAN\PLANLSOR\I

VOL 15 0542

R0060762

II. ILLICIT DISCHARGES

The elimination of illegal connections and illicit disposal (IC/ID) practices is an important component for any program aiming to enhance the quality of stormwater/urban runoff.

Although more information is needed to assess fully the benefits and costs of conducting IC/ID programs, we can make logical decisions regarding application of best management practices (BMPs) to minimize such incidents. These BMPs will vary due to the jurisdictional differences which exist within each watershed. Each jurisdiction within the watershed will be developing and implementing those activities which adequately serve the jurisdiction and the watershed as a whole.

IC/ID practices are intermittent discharges of pollutants into the storm drain system that can degrade the quality of receiving waters. This can occur through catch basins, area drains and even on gutters and street surfaces. Some illegal dumping activities are done by individuals who do not know that such practices are illegal and can adversely impact the environment. Yet, others may be carrying out such practices with the full knowledge that such activities are prohibited.

A. ILLICIT CONNECTIONS

In order to implement an illicit connection management program, jurisdictions as a whole will need to develop and implement the procedures for investigating each of their respective storm drain systems.

Detailed procedures to eliminate illicit connections depends on the complexity of the storm drain system. A consistent watershed wide concept will be developed to investigate illicit connections to the storm drain system. Based on the results of field screening activities, or other appropriate information which indicates an area of reasonable potential of containing illicit connections, detection and follow up procedures would be followed. Priority should be established to focus on major problem areas and allow for a cost-effective approach to eliminate illegal connections. This concept will be developed by December 1996.

1. SYSTEM SURVEY

A system survey is a necessary component of an illicit connection elimination program. Although the basic concept is similar, the actual techniques and methods which jurisdictions within the watershed use to conduct system surveys can be quite different.

VOL 15 0543

R0060763

In conducting system surveys, the intent is to avoid costly investigations within areas not suspected of containing illicit connections. Field screening, map research, and land use investigation activities will be done initially to identify potential problem areas. Public outreach efforts will be used to inform citizens in the area about the problem. Enforcement action will be taken to terminate such illegal connections. It should be noted that more detailed and sophisticated techniques such as televised inspection and dye testing will only be used in special situations as needed.

Presently, Los Angeles County has begun a system survey. Maps detailing the location of each storm drain, its manholes and catch basin connector pipes is being prepared by the Los Angeles County to facilitate monitoring of illegal connections and discharges. The location and source of discharge for connections is being inventoried. A GIS system to allow management and analysis of this data is also being developed. This information will be used in the storm drain inspection program which is ongoing. The program is targeting open channel storm drains. All open channels will be inspected for evidence of illegal discharges. The open channel inspections will also be used to collect information on dry weather discharges from underground drains for use in prioritizing future underground drain inspections.

An ongoing system inspection program is planned by the City of Irwindale to begin in Fiscal Year 94-95. Building inspectors will be trained to identify illicit discharges and connections. These programs will provide related information which will be used as reference materials for the development of a watershed wide program.

2. ONGOING SYSTEM INSPECTIONS

Ongoing system inspections for illicit connections will involve the techniques identified in Section 1. above, along with some additional activities. In smaller systems where the storm drain goes into several pumping stations, a regular inspection of the pumping stations for, among other things, evidence of illicit discharges will be sufficient.

In larger and more complex systems, a program of field screening will be used. Evidence of pollution will be categorized and prioritized. The storm drain alignment tributary to the suspect illegal connection can then be further investigated for illicit connections. If a discharge can be traced to a particular facility, the facility will be investigated to identify where exactly the pollutants are coming from and efforts needed to stop the discharge.

Another means of detecting illicit connections may be to rely on reports of illicit discharge from the public. This will utilize the County's or another

VOL 15 0544

R0060764

agency's established "hotline" number that the public can call and report such observations.

3. REPORTING

A consistent recording system will be established to track reports of illegal connections. This recording system will be used by the Permittees within the watershed.

B. ILLEGAL DUMPING

Due to the intermittent and unpredictable nature of illegal dumping, apprehension rate of violators could be quite low. The first course of action is to develop an area wide educational and reporting system along with prompt response procedures. This will be accomplished by December 1996.

1. OUTREACH

See **Chapter VII Public Information and Participation** of this report for a detailed discussion of the outreach program.

2. SYSTEM SURVEILLANCE

Measures that may be used for this aspect of the program may include but not limited to regular inspections of vacant facilities, street use inspection programs to detect illegal discharges and dumping into the street system, and a public complaint and reporting system.

Caltrans has implemented a system surveillance program. The program is an investigation, identification, and remediation program targeted at hazardous waste and debris dumped on excess land parcels.

3. SPILL RESPONSE

The Health Hazardous Materials Division (HHMD) of the Los Angeles County Fire Department is generally the primary spill responder. If the material is found to be hazardous, the cleanup and disposal of the material will be done under the supervision of HHMD. If the material is non-hazardous, the responsibility will fall on local agencies to coordinate cleanup, disposal and attempt to identify and prosecute the violators. Cooperation among all agencies will be needed to allow for prompt action and joint effort to deter such violators. All agencies will have local authority against such illegal dumping activities.

VOL 15
0545
R0060765

Spill response procedures have been established by Los Angeles County at County-owned airports which require lessees to report the presence or release of hazardous materials. The County has also evaluated the latest developments regarding containment procedures and equipment and will develop new reporting procedures. City of Covina is planning to work to improve interdepartmental communication and responsibilities for responding to hazardous materials incidents.

4. COMPLAINT RESPONSE

The County and some local agencies have established a stormwater telephone "hotline" that can be utilized by all citizens. Public complaints are generated through these "hotlines" and also through regular channels such as calls to Fire or Police agencies or to public works or legislative offices. Although responses to these complaints will vary depending on the nature of the complaint, action shall be taken.

Los Angeles County has established a complaint response procedure. The County is tracking hotline complaints and has implemented a follow-up letter for minor dumping violations.

5. COORDINATION OF ALTERNATIVE DISPOSAL

Alternative disposal is one way of reducing non-stormwater materials that can potentially find their way into the storm drain system. Recycling programs are one of the most effective ways to reduce waste material. The recycling program can either be at the curbside or through drop-off centers. Household hazardous wastes can be dropped at mobile collection centers or at fixed sites. Co-Permittees in the basin generally participate in the County's Household Hazardous Waste collection program. Effectiveness of those programs may be enhanced by a public outreach program that will inform the public of the locations and/or schedules for such events. Technical assistance or information may also be provided to businesses that want to develop a pollution prevention, waste minimization or alternative disposal program.

Alternative disposal programs are popular and effective. All jurisdictions, except for Caltrans who recycles its own used oil, anti-freeze, oil filters and aluminum, participate in the Countywide Hazardous Materials Round-ups and most have programs to promote the events. Three cities have additional hazardous materials collection programs. Recycling programs are equally prevalent. Seventeen cities have implemented curbside recycling programs. Approximately another third of the cities in the watershed have some recycling program such as drop-off centers, pick-up of seasonal materials, or they plan to begin programs. Eight cities have begun green waste/composting

VOL 15
0546
R0060766

programs. One city does not have a recycling program and it did not indicate that one is planned. Curbside recycling is not applicable to Caltrans. Experiences from these programs will provide reference to further refine the practices.

6. REPORTING

Incidents involving a hazardous material entering the storm drain system are to be reported by the responsible party, or, if not known, the responding agency, to the California Regional Water Quality Control Board, Los Angeles Region (Regional Board). Complaints received through the County wide and local city hotlines will be tracked and reported to the Regional Board.

C. ENFORCEMENT PROCEDURES

Enforcement actions against discharges are done through either state hazardous and toxic materials statutes or through municipal ordinances that are already in the codes of the Permittees. Industrial Waste Ordinances may be used in enforcement actions against illicit connections. Furthermore, anti-littering, health codes, plumbing codes and fire codes may be utilized for dumping or spill incidents. Enforcement actions can be taken by different municipal agents, including but not limited to, Industrial Waste Inspectors, Building or Plumbing Inspectors, Fire Department Inspectors, Park Rangers, Street Use Inspectors, Health Inspectors, Police Officers, Community Services Officers, Animal Control Officers, Code Enforcement Staff or Public Works Inspectors. Some of these agents are empowered to either issue citations, issue notices of violations, issue cease and desist orders, or even make arrests depending on the type of violation and the code provisions that they are enforcing. Some of these agents are also empowered to enforce not only municipal ordinances but also state laws. A review of the various enforcement tools used by the Permittees will be performed. A recommendation will result on a consistent enforcement approach for the watershed for consideration by all Permittees in their own enforcement programs.A watershed wide enforcement approach for use by all Permittees will be developed by December 1996.

Improper disposal ordinances have been adopted by several of the cities in the watershed. These ordinances occasionally include fines for non-compliance. Code Enforcement personnel are the most likely to be given the authority to cite violators. Additionally, Fire Department, Health Department and Animal Control staff also enforce improper disposal regulations. The City of Santa Fe Springs and Caltrans also post signs stating No Dumping and No Littering to deter littering.

VOL 15
0547
R0060767

D. COORDINATION WITH STATE NON-STORMWATER PERMITS

In order to characterize the nature of the existing non-storm discharges in the receiving waters within the watershed, a list of NPDES Permits issued by the Regional Board will be obtained. This will help in determining unexpected discharge during dry weather and to allow enforcement actions to focus on illegal dumping activities.

There is also a need to coordinate with other environmental agencies to ensure that requirements imposed by these agencies do not conflict with stormwater regulations. Requirements of many agencies do complement stormwater regulations. These agencies, include but not limited to, Fish and Game, DTSC, USEPA, and the Coastal Commission. Coordination with these agencies will help minimize overlapping investigations and result in a more efficient use of resources. A watershed wide concept will be developed by December 1996.

1. IDENTIFICATION OF PERMISSIBLE/PERMITTABLE DISCHARGES

A list of non-stormwater discharges that can be allowed to discharge into the Waters of the State will be established by the Regional Board.

2. APPROPRIATE MANAGEMENT PRACTICES

Continued communication with the Regional Board will allow current information to be circulated among all agencies.

3. REPORTING

Any conflict in requirements of other environmental programs/agencies must be reported immediately to the Regional Board for ruling as to which one should take precedence.

P:\INEZ\PLAN\PLAN2.SGR\II

VOL 15 0548

R0060768

III. INDUSTRIAL/COMMERCIAL SOURCES

Each Permittee shall develop and implement a program that focuses on the identification and control of storm water pollutant discharges from industrial/commercial facilities within their jurisdiction. This program shall provide for the inspection of a facility's compliance with storm water regulations, as well as general outreach for all facilities that are potential industrial and commercial dischargers.

Each Permittee is responsible, under the requirements of the Municipal Stormwater Permit, for all discharges from commercial and industrial facilities within its jurisdiction. Many industries are also required to be permitted under the State General Industrial Activities Stormwater Permit. Enforcement of the specific provisions of the State General Permit is the responsibility of the State.

A. IDENTIFICATION OF SOURCES

As required under the current Permit, the Permittees have produced a listing of industries by SIC category for each drainage area. Also a breakdown of major land use types was also performed for each drainage area.

A pollutant source identification program will be designed to identify significant pollutant sources (i.e., parking lots, industrial activities, etc.), with the hope that remedial action can be undertaken to reduce any significant impacts so identified. It will focus on monitoring very small areas (i.e., less than five acres) where a specific and/or interrelated set of pollutant generating activities are occurring. Its objective is to provide data for selecting BMPs for specific activities rather than characterizing discharges for long-term pollutant loading estimates.

Identification of pollutant sources can be done using a number of methods. Potential sources of storm water pollutants can be identified by records of chemical use and/or storage, by studies of specific activities which lead to the deposition of pollutants throughout the watershed, and by field inspection or monitoring. Watersheds which may contain significant pollutant sources can be identified through land use information or by mass load estimates.

By mid January 1995, the County will begin targeted monitoring of a municipal corporation yard in the Santa Monica Bay watershed. This will provide data on industrial activities which can take place at such a facility such as vehicle maintenance and repair, materials storage, equipment storage and repair. A more comprehensive program to identify various pollutant sources will be developed by March 1997.

VOL 15 0549

R0060769

1. CATEGORICAL LIST

Sources identified as a categorical industry regulated by the U.S. Environmental Protection Agency (EPA) will be grouped into a categorical listing of industries. The categorical list provides an organized overview of the target facilities that, based on land use, operation, and activities, could potentially contribute significant amounts of pollutants into storm water runoff. Some of the industrial categories regulated by the U.S. EPA include, but not limited to:

- Aluminum Forming
- Asbestos Manufacturing
- Battery Manufacturing
- Canned & Preserved Fruits & Vegetables
- Cement Processing
- Copper Forming
- Electroplating
- Glass Manufacturing
- Grain Mills
- Machinery Manufacturing & Rebuilding
- Soap & Detergent Manufacturing
- Metal Finishing
- Metal Molding & Casting
- Oil & Gas
- Organic Chemicals & Plastics & Synthetic fibers
- Paint Formulating
- Pesticides
- Plastic Molding & Forming
- Rubber Manufacturing
- Sugar Processing
- Textile Mills

2. RANKING

Industrial and commercial facilities identified as pollutant sources shall be ranked in order of priority for development of management measures. Facilities considered to be high priority are those whose operations and activities are determined to potentially contribute the most significant pollutant impacts to storm water discharge.

3. UPDATE PROCEDURE

Each year the Co-Permittees will evaluate the results of the monitoring program, the illicit discharge investigation program, and other available information , to identify likely sources of specific pollutants. The annual report to the California Regional Water Quality Control Board, Los Angeles Region (Regional Board) will recommend a strategy for pollutant source identification during the following year, including specific sites and/or activities to be monitored.

VOL 15
0550
R0060770

B. CONTROL MEASURES

Specific urban runoff control programs for major potential pollution sources shall be developed by March 1997. Within these programs storm water pollution control measures shall be developed for various pollutant sources. Control measures such as source control and treatment control offer different, but complimentary approaches to storm water pollution control.

Source control measures focus on good housekeeping practices, pollution prevention and minimization, and education. They are also less costly than treatment controls.

Treatment controls involve physical treatment of the runoff, usually through structural means. Also treatment controls will not remove all pollutants and their removal efficiency is difficult to predict given the limited understanding of the relationship between facility design criteria and performance.

The initial focus will be on the development of source control measures. As information is collected under the pollutant source identification program regarding specific pollutant sources, specific control measures, including structural, will be evaluated as to their effectiveness in addressing these sources.

1. POLLUTION PREVENTION MEASURES

Source minimization and education are the first steps in effective source control. Other activities that contribute to source control are:

- Site design alternatives (i.e., roof over fueling stations and carwash slab, provide spill containment curb around stored material, etc.)
- Good housekeeping practices

2. STRUCTURAL (TREATMENT) MEASURES

A variety of treatment control measures have been utilized throughout the country for storm water quality. However, the effectiveness of these controls are highly dependent on local conditions such as climate, hydrology, soils, groundwater conditions, and extent of urbanization.

Some of the more common treatment controls are:

- Oil/water separators - Oil/water separators are designed to remove one specific group of contaminants: petroleum compounds and grease. However, separators will also remove floatable debris and settleable solids.

VOL 15
0551
R0060771

- Infiltration - A family of systems in which the majority of the runoff from small storms is infiltrated into the ground rather than discharged to a surface water body. Infiltration systems include: ponds, vaults, trenches, dry wells, porous pavement, and concrete grids.

- Wet ponds - A wet pond has a permanent water pool to treat incoming storm water.

- Constructed Wetlands - Constructed wetlands have a significant percentage of the facility covered by wetland vegetation.

- Biofilters - Biofilters are of two types: swale and strip. A swale is a vegetated channel that treats concentrated flow. A strip treats sheet flow and is placed parallel to the contributing surface.

- Extended Detention Basins - Extended detention basins are dry between storms. During a storm the basin fills. A bottom outlet releases the storm water slowly to provide time for sediments to settle.

- Media Filtration - Media filtration consists of a settling basin followed by a filter. The most common filter media is sand; some use peat/sand mixture.

- Multiple Systems - Multiple systems are a combination of two or more of the preceding controls in series.

C. OUTREACH

General outreach for all facilities that are potential industrial and commercial dischargers shall be set up area-wide by the Management Committee, to provide general guidance in complying with the storm water program by March 1997. It shall also serve as a reminder of pollution prevention measures and keep facilities informed of their obligations to the storm water program.

Subcommittees may be established to develop specific outreach materials for industrial and commercial categories and specific activities that are identified as high priority.

For additional information on outreach, refer to **Chapter VII Public Information and Participation.**

VOL 15
0552
R0060772

D. INSPECTIONS

Most municipalities have existing programs such as industrial waste, fire, and health in which industrial and commercial facilities are inspected on a regular basis. Each Permittee may elect to have inspections for the storm water program incorporated into these existing inspection programs, or be done as a completely separate program, depending on the needs of the Permittee.

The purpose of these inspections is to ensure that facilities are in full compliance with the storm water regulations and to ensure that control measures are being implemented. The frequency of inspection of facilities will be prioritized based on the operation and categorization of the facility.

Inspectors consisting of public personnel will be trained adequately to recognize and handle problematic activities concerning storm water pollution that may be existing or potential; and inspect for the deterioration of the storm drain system and illegal/improper connections. Training programs will be developed through the Watershed Management Committee and possibly specific Permittees for use by all Permittees.

Procedures for the identification, investigation, enforcement, and prosecution to the full extent of a jurisdiction's legal authority will be developed.

Los Angeles County issues permits to all commercial and industrial facilities that generate industrial wastes. Included within this program are auto related businesses, gas stations, and restaurants. Facilities with industrial waste permits are regularly inspected. In addition to those businesses in the unincorporated areas, the County Department of Public Works also provides industrial waste inspections, under contract, to approximately one third of the cities in the watershed. Six cities report that they have implemented their own inspection programs, with a broad range coverage. One city has just begun its program; another city does periodic checks for compliance with waste disposal regulations. Inspections, in two cities, are made in response to complaints; one city handles the program through its code enforcement staff; and two more cities inspect only auto related businesses and restaurants on a regular basis.

Three additional cities, Industry, Santa Fe Springs and Long Beach report that they have extensive inspection programs. Caltrans inspections include daily examination of auto related facilities, leak testing of gas stations once per year, quarterly pumping of clarifiers, and constant storm drain monitoring.

VOL 15
0553
R0060773

1. CHECKLIST

Inspectors shall have a uniform checklist to use as guidance and reference throughout an inspection. It may also serve as a general guide for the public, providing information about the requirements necessary to comply with the storm water regulations.

2. SCHEDULE

The inspection program shall be developed by March 1997. The frequency of inspections shall be scheduled according to the type of operation and the categorization of the facility. Revisit inspections shall be done on an as needed basis.

3. REPORTS

Inspectors shall report on all activities related to and/or violating the local storm water ordinance to the local governing agency. Standard reporting procedures will be developed.

4. FOLLOW-UP PROCEDURES

Individual Permittee review and assessment of the reports may result in the need for follow-up procedures, such as reinspection or legal action, provided the jurisdiction has the adequate legal authority to do so. Follow-up procedures will be developed to insure a uniform and consistent approach.

E. LOCAL INCENTIVE PROGRAMS

In developing the industrial/commercial program, the Permittees may consider the development of optional measures such as clean business incentive programs that may offer more focused control on industrial and commercial sources. The targeted completion date for this phase is March 1997.

F. TRAINING

Development of training programs for industrial storm water inspection staff is projected to be completed by March 1997.

1. PUBLIC EMPLOYEES

All public employees shall be trained in the storm water regulations so that they abide by the regulations in the course of their work day. Also they need to be able to recognize and distinguish between legal and illegal activity so as to administer the proper protocol in handling the situation.

VOL 15
0554
R0060774

Caltrans employees have received education in hazardous substance spill awareness, pesticide safety and vegetation management. The Los Angeles County Department of Public Works has requested all employees to report any observed water quality problems.

2. INSPECTORS

Inspectors who visit industrial and commercial facilities shall be adequately trained to determine compliance with the storm water regulations and educate the facilities about the requirements of the program. In addition, they should be able to recognize and handle immediate problems as they are encountered, during an inspection; and inspect for the deterioration of the storm drain system and illegal/improper connections. Citation training will be necessary for inspectors in agencies that have the citation authority.

G. COORDINATION WITH STATE INDUSTRIAL STORM WATER PERMIT

The Permittees have existing local ordinances governing industrial discharges and other non-stormwater discharge that require compliance activities similar to those in various State Regulations. Because coordination between the Permittees and the Regional Board is anticipated concerning the regulations of industries, a mutual agreement may be required regarding industrial inspections and enforcement. Additional issues could also be addressed. Federal stormwater regulations hold local municipalities responsible for stormwater discharges from all industrial/commercial facilities, including those covered by General Permit.

1. MEMORANDUM OF UNDERSTANDING

A Memorandum of Understanding (MOU) may be used to formalize the agreement between municipalities and the Regional Board on industrial compliance program issues. A MOU among all local agencies may also be needed to ensure co-operation between all the agencies. The need for and specific requirements for such agreements would be developed upon completion of development of the industrial/commercial program by March 1997.

2. REPORTS

The MOU discussed above may include the exchange of information between the Permittees and the Regional Board. Appropriate formats for such reports would be developed as required.

VOL 15

0555

R0060775

IV. NEW DEVELOPMENT AND REDEVELOPMENT

Managing stormwater and runoff from both new construction and redevelopment, will reduce pollutants from entering the storm drain system and subsequently the receiving water.

A. PLANNING PROCESS

Quality of stormwater discussion should be included in the General Plan and the Zoning ordinances. Efforts to enhance the quality of storm water can filter into the Subdivision actions. Much of the storm water concerns can be channeled through the compliance effort of the California Environmental Quality Act (CEQA). A watershed-wide concept will be developed by June 1997.

1. WATERSHED PROTECTION POLICIES

An integrated strategy will be developed for the watershed. Pollution control efforts should be prioritized. A variety of statutory and regulatory requirements could be used for this watershed oriented program. Watershed protection policies need to be adopted by the local jurisdictions which control land-use within the watershed.

Caltrans requires contractors to submit plans for water pollution controls during construction activities. Construction activities may be halted if inadequate provisions have been made for water quality protection.

2. COORDINATION WITH CEQA

The current CEQA "Environmental Checklist Form" that is used for initial studies assessment indirectly address potential impacts to stormwater. Additions could be made to the Form to directly assess stormwater quality impacts.

CEQA requires agencies to use feasible alternatives or mitigation measures to lessen potentially significant effects. The ability to identify a.) when an effect is significant, and b.) which mitigation measures could be adopted to reduce the effect, is critical to the CEQA process. A clear assessment of any development, its potential adverse impacts on stormwater quality will allow for a determination of "significance" which will enable the decision maker to make development decisions upon full disclosure of possible adverse impacts.

VOL 15 0556

R0060776

3. SITE PLANNING PROCESSES

All development will require the review and approval of a site/plot plan or development drawings prior to issuance of a building permit. Incorporating the consideration of potential water quality impacts including erosion and sedimentation during the early stages of the planning process will allow these issues to be addressed before substantial investments in engineering and design have been made.

4. GENERAL PLAN CHANGES

The General Plan is the legal backbone of the planning process. All development approvals, zoning ordinances, subdivision approvals and public works projects must be consistent with the policies, objectives, and principles set forth in the General Plan. Discussion of stormwater issues in the General Plan could greatly enhance the awareness of the issues and encourage full assessment of possible adverse impacts on stormwater quality as the result of new and redevelopment.

5. USE OF MASTER PLANS

For agencies which utilizes master plans to guide their development activities, stormwater issues can be outlined in such documents. This will channel efforts to fully assess the possible adverse impacts on stormwater quality as the results of any development within the master plan area.

6. OTHER POLICIES

Numerous other policies or mechanisms could be used to incorporate stormwater management goals into the planning/development process. Other concepts will be evaluated for their feasibility during the more detailed development of this Chapter.

7. PLANNING-PUBLIC WORKS INTERFACE

A variety of mechanisms for coordinating planning and public works activities exist. An example could be some form of CIP (capital improvements program). Ideally, any planning documents which target or project population growth are coordinated with CIP. Integrating stormwater management into CIP will allow for mitigation of major adverse impacts on the quality of stormwater prior to any actual construction.

VOL 15
0551
R0060777

8. IMPLEMENTATION PROCEDURES

Implementing policies to integrate stormwater management considerations with existing planning/development mechanisms will require a variety of approaches depending upon the existing conditions within each Co-Permittee and the particular remedies selected. It is anticipated that each Co-Permittee will propose procedures applicable to it's unique jurisdictional considerations at later stages in the permit process.

B. CONSTRUCTION SITES

Pollutants from construction activities can have a major impact on the quality of stormwater/urban runoff. A watershed wide concept to reduce such pollutants will be developed by December 1996.

1. EROSION CONTROL REQUIREMENTS

Federal stormwater regulations hold local municipalities responsible for stormwater discharges from all construction sites. In addition, construction sites involving a total of five acres or more of land disturbance are required to apply for the State General Construction Activity Storm Water Permit (GCASP). The GCASP: 1) eliminates or reduce to the extent feasible non-storm water discharges from construction sites and 2) permits stormwater discharges, but requires the use of controls to limit pollutant loading in site effluent. Preparation of a Stormwater Pollution Prevention Plan and identification/utilization of BMPs are the key components of this Permit.

Many local agencies also have erosion control requirements for any grading and construction activities. Regulation of pollutants from construction sites of five acres or less will be done by the local agency through its stormwater management plan.

Construction site erosion has the potential to introduce sediment into runoff. For example, fugitive dust control at construction sites typically use water. Minor modifications/clarification of existing fugitive dust practices could substantially address runoff pollution concerns. In addition to fugitive dust control practices, additional measures could be adopted to curtail dry weather runoff, and control pollutant laden storm water runoff. These measures may address 1) physical site design considerations and 2) temporal considerations such as seasonal timing and phasing of activities.

Sixteen jurisdictions within this watershed have existing erosion control requirements within their municipal codes. Seven jurisdictions plan to prepare runoff control ordinances, while four have already identified or

VOL 15
0558
R0060778

drafted ordinance texts. The City of Covina requires 90% landscaping on newly developed land within one year and 100% landscaping within 3 years.

2. CHEMICAL AND WASTE MANAGEMENT REQUIREMENTS

Chemical and waste handling activities are also currently subject to a variety of regulations. BMPs to address this pollution source are largely centered around "good housekeeping practices". It involves storing, handling, using, and disposing of these potential pollutant sources in ways that restrict opportunities for unintended introduction of the materials into site runoff. Proper chemical and waste management will reduce any accidental discharge into the storm drain system.

3. INSPECTIONS

Inspections are a routine part of local jurisdictions oversight of regulated construction activity. Its purpose is to ensure that construction site runoff control measures are being implemented. Existing practices should be examined and modified accordingly to satisfactory stormwater/urban runoff objectives.

a. Checklist

A checklist would encourage possible streamlining of any requirements. It could be cumbersome if an overly rigid approach were taken which resulted in unnecessary administrative burden. However, careful design of the checklist could avoid this pitfall.

b. Schedule

Inspection schedules will depend upon existing practices. It may be desirable to have several schedules, depending upon the types of activities/permits and/or the timing of activities.

c. Reports

A standardized reporting format is needed to allow for consistency among all jurisdictions. Furthermore reports are also a useful tool for future refinement of pollution control regulations.

d. Follow-up Procedures

VOL 15 0559

R0060779

A format will be developed to do follow-up inspections on problem facilities. Its frequency will greatly depend on the land use and the degree of non-compliance of each facility.

C. LOCAL PERMITS

Permits are a form of "cross checking" by local agencies to ensure that regulations are being implemented. Prior to the issuance of a permit, information must be submitted for review and approved. A watershed wide concept to provide some consistency in local permits will be developed by June 1997.

1. COORDINATION WITH EXISTING PERMITS

Storm water issues should be incorporated into existing permits.

2. NEW PERMIT ISSUES

Storm water issues should be clearly stated in new permits to be issued for new and/or redevelopment activities.

D. TRAINING

Training will enable staff to keep current of the latest storm water regulations. A watershed wide staff training concept will be developed by June 1997.

1. PLANNING PERSONNEL

(See E.1.b. below)

2. PUBLIC WORKS PERSONNEL

(See E.1.b. below)

3. INSPECTORS

(See E.1.b. below)

VOL 15
0560
R0060780

E. CONTROL MEASURES

Best management practices for the control of construction related pollution can generally be divided into three categories:

Nonstructural Source Controls for Reducing Urban Stormwater Pollutants:

- Practices that reduce the generation and accumulation of potential stormwater contaminants at or near their source.

Development Layout Stormwater Controls:

- Practices that are directed at controlling the volume and discharge rate of runoff from urban areas, as well as, reduction of the magnitude of pollutants in discharges through temporary storage or flow restrictions.

Erosion and Sediment Controls:

- Practices that can prevent or treat problems related to transport of eroded material from construction and other land disturbing activities.

Development layout stormwater controls are of particular interest. These control measures can be incorporated in the initial planning phase of any project. A watershed wide concept will be developed by June 1997.

1. POLLUTION PREVENTION MEASURES

a. Site Design

Effective implementation of urban BMPs requires integration of water quality control elements early in the site planning and design process. Development of the water quality controls should not only achieve maximum pollutant removal with minimal costs, but also reduce potential maintenance.

This may include incorporating water quality concerns into the site layout and design (ie. maximize pervious areas, minimize directly connected impervious areas, etc.) and/or treatment control measures proven to be cost effective for local climate, soil, and development conditions.

Due to the diversity of climate and local conditions, the development of BMPs vary from location to location, and even jurisdiction to jurisdiction. The selected management practices should be designed

VOL 15 0561

R0060781

for the local site conditions and especially seasonal rainfall conditions that are experienced in Southern California. Suitability for the major land use and drainage characteristics should also be fully assessed.

b. Education/Training

Education/training is imperative to the success of any BMPs selected for new or redevelopment projects. BMPs will fail if not properly designed, installed, and maintained. Only well trained personnel should be assigned to these responsibilities.

A program for effective education/training should be based on four objectives:

- Promote a clear identification and understanding of the problem, including activities with the potential to pollute stormwater;
- Identify solutions (structural and nonstructural BMPs);
- Make every employee responsible for stormwater pollution and its solution; and
- Integrate employee feedback into training and BMP implementation to improve BMPs.

c. Other

In many cases stormwater pollution control may already be achieved by existing regulations or programs. In California, the General Plan Law and the California Environmental Quality Act (CEQA) provide a basis for municipalities to review and comment on all projects within their jurisdiction. Under the General Plan Law, municipalities are required to develop policies and regulations which guide development within the municipality. Each development project is then reviewed for conformance with these policies. Under CEQA, projects are also subject to review and comment for any adverse impact the projects may have on the environment, including impacts from stormwater discharges.

VOL 15 0562

R0060782

2. POST CONSTRUCTION (TREATMENT) MEASURES

a. Applicability

Each site considered for development or redevelopment will (at the conclusion of construction) have final improvements and unique site characteristics such as: drainage patterns; soils; landscaping; topography; percent of impervious surfaces; rainfall; pollutants inherent with the use of the development; and pollutants that may be background to the area (existing vegetation, air fallout, etc.). The applicability of various treatment control BMPs for use in new development will be evaluated through the use of pilot studies and examination of studies done on treatment control measures by other agencies.

b. Effectiveness

Prior to implementing any treatment control measures, they will need to be evaluated for their effectiveness. This can be done through pilot studies which could include elements such as: pre and post storm event inspections; water quality monitoring; record keeping to document deficiencies in the BMPs; Operation & Maintenance requirements; and cost effectiveness.

c. Retrofit Opportunities

The feasibility of retrofitting existing developments with treatment control measures will be evaluated. However, the effectiveness of a treatment control measure versus its cost must be fully evaluated prior to considering its use as a retrofit measure.

3. OPERATION AND MAINTENANCE

a. Requirements

Jurisdictions within the watershed will need to insure that BMPs incorporated into a private development are properly maintained. Deed restrictions, covenants, conditions and restrictions (CC&R) could be used to direct such requirements and responsibilities.

VOL 15
0563
R0060783

b. Responsible Party

The contractor, during construction, must ensure that the post-construction BMPs are installed properly and that any maintenance that may be necessary during construction is performed. After the project is completed, it will then be the responsibility of the fee owner, private or public, to provide for long term operation and maintenance. This may be accomplished by deed restriction and/or CC&R.

4. CONFLICTS WITH OTHER MANDATES

Often regulations of various Federal, State, and local agencies would conflict with each other. Health, fire, and building codes often have requirements focusing on short term human health and safety and neglecting the impacts on the environment.

a. Identification of Conflicts

As the Plan is developed, other regulatory requirements that conflict with the stormwater program requirements may be uncovered. Clarification of these regulations should be directed to the various responsible regulatory agencies.

b. Conflict Resolution

For regulatory conflict caused by local regulations, efforts will be taken to resolve them within the agencies. Input form other local, state, and federal agencies should be incorporated into a modification of current standards. The Regional Board should resolve conflicts involving other State and/or Federal requirements.

F. OUTREACH

See **Chapter VII Public Information and Participation.**

G. ENFORCEMENT

The City of Industry requires a Storm Water Pollution Prevention Plan and copies of a Notice of Intent prior to issuance of a grading permit. Also, all field personnel must attend an NPDES information session.

See **Chapter II Illicit Discharges, Section C Enforcement Procedures** for additional information.

VOL 15 0564

R0060784

H. COORDINATION WITH STATE GENERAL CONSTRUCTION ACTIVITIES STORM WATER PERMIT

1. MEMORANDUM OF UNDERSTANDING

An agreement between the Regional Board and Co-Permittees may be used to enhance compliance of construction site BMPs. The need for such an agreement will be evaluated. If found to be desirable, an agreement will be developed by June 1996.

2. REPORTS

The local enforcement agency of the State Construction Stormwater Permit, which is the Regional Board, should forward all information, including Notices of Intent filed and any inspections and enforcement actions taken, to the Permittees so that this information can be available to local municipal construction site inspectors to alert them to any specific concerns on the job site.

3. OTHER ISSUES

The Regional Board should explore funding to be channelled to the Co-Permittees so the Co-Permittees can be more actively involved with the State on the Permit.

P:\INEZ\PLAN\PLAN2.SGR\IV

VOL 15
0565
R0060785

V. PUBLIC AGENCY ACTIVITIES

All municipalities perform functions that have an impact on stormwater quality. These include, among other things, vehicle maintenance, landscape maintenance, weed control, water body maintenance including swimming pool maintenance, etc. Other activities such as construction and maintenance of streets and roads, and construction and maintenance of the flood control system also could directly or indirectly cause adverse impact on the quality of stormwater/urban runoff. Since municipalities must address all significant sources of pollutants, all of these activities must be examined and mitigation measures be incorporated into the routines. As part of the requirements of the current Permit, many of the Permittees have already begun implementation of measures to address the above activities. An examination of these existing measures will be done on a watershed wide basis to establish the most effective approach to address these activities. Such approaches shall be developed and begin implementation by September 1997.

A. SEWAGE SYSTEMS

Sewage spills must not be allowed to enter the storm drain. Control procedures for identifying, repairing, and remediating sewer blockages, infiltration, inflow, and wet weather overflows from the sewers to the storm drain system should be implemented to protect stormwater quality. These procedures could include, but are not limited to, quick field response to overflows, follow-up testing, and complaint investigation.

When sewage spills do occur, they must be contained and collected for proper disposal. Individual permittees may need to modify their sewage overflow response procedures. The field personnel should also have procedural training for field screening, sampling, smoke/dye testing, and TV inspection, if appropriate, to be able to properly investigate any suspect connections or cross connections to the storm drain system.

Los Angeles County has a number of programs aimed at preventing sewage spills from entering the storm drain system. These include the following:

- Sewage Overflow Response Procedures Revision/Root Control Review - This involves improvement of procedures for containment and cleanup of spilled sewage resulting from overflow.
- Reline Sewer Lines - Two locations will undergo relining of existing sewer lines to prevent infiltration and exfiltration.
- Sewer Pipeline Reconstruction - One hundred and twenty-seven miles of cement pipelines will be analyzed and replaced or rehabilitated within 5 years.

VOL 15 0566

R0060786

- Sealing of Manhole Covers - This program has sealed manhole covers and bar holes in areas subject to flooding.

- Expansion of Emergency Call List - Beeper numbers of all supervisors, superintendents and stand-by crews were added to emergency call list.

B. CORPORATION YARDS

Corporation yards include any area or facility that is used for vehicle maintenance or washing, other maintenance, chemical storage, paint facilities, and supportive activities for field crews. Permittees will need to incorporate pollutant control measures at these facilities and develop a plan for each facility outlining the measures to be implemented. Since these are industrial type activities, the corporate yards would need to implement measures as described in the Industrial/commercial Source Chapter.

1. STORM WATER POLLUTION PREVENTION PLANS (SWPPP)

Though not required, permittees may elect to use some form of SWPPP as a vehicle for compliance. Any BMPs to be implemented must be part of a comprehensive plan designed to address the various pollutant sources at each corporate yard. To achieve this goal, the municipalities should first identify the potential pollution sources and who is responsible for implementing the storm water management measures. Based on the facility type, management practices and schedule of implementation will be developed. BMPs that can be used to improve the quality of runoff include, but are not limited to, housekeeping practices, material storage control, vehicle leak and spill control, and illegal dumping control.

Los Angeles County has incorporated the following measures intended to control pollutants from entering the storm drain at County-owned airports:

- Airport Runoff Structural Controls - A number of structural controls including fuel pumps located under a roof, storm water diversion system with clarifiers, concrete beams for secondary containment of waste oil, oil and water separator at floor drains, retention ponds, infiltration basins and sand filters have been implemented at County airports.

- Airport Cleaning and Maintenance - A number of non-structural controls including washing of aircraft in designated areas with oil and water separator, aircraft maintenance performed indoors and waste oil recycling have been implemented at County airports.

VOL 15
0567
R0060787

- Airport Materials Handling and Storage Controls - Measures to prevent spills of polluting materials have been in effect at County airports.

- State Approved NPDES Industrial Activity Permit - This program requires all airports to ensure compliance with State Water Resources Control Board.

Caltrans will develop a priority list of drains and pump houses requiring cleaning. Open storm channels in two City of Covina parks are cleaned monthly and before predicted storms. The City can also require the cleaning of privately owned storm drains.

2. OUTDOOR LOADING/UNLOADING OF MATERIALS

Municipal employees who handle potentially harmful materials should be trained in good housekeeping practices to prevent or reduce the discharge of pollutants to storm water from outdoor loading/unloading of materials. Materials spilled, leaked or lost during loading/unloading may collect in the soil or on other surfaces and be carried away by runoff or when the area is cleaned.

Applicable BMPs should be selected based on the following four factors: 1) Extent of exposure of material to rainfall, 2) preventing stormwater run-on, 3) checking equipment regularly for leaks, and 4) containing spills during transfer operations.

3. MATERIAL STORAGE CONTROL

A program should be developed to prevent or reduce the discharge of pollutants to storm water from outdoor container storage areas using measures such as installing safeguard again accidental releases, secondary containment, conducting regular inspections, and training employees in standard operating procedures and spill cleanup techniques. Employee education is paramount for successful implementation. Employees should be trained in emergency spill cleanup procedures.
To limit the possibility of storm water pollution, containers used to store dangerous waste or other liquids should be kept inside the building unless this is impractical due to site constraints. Storage of reactive, ignitible, or flammable liquids must comply with the fire and California OSHA codes. Practices such as placing containers in a designated area should be employed to enhance such requirements.

VOL 15
0568
R0060788

4. VEHICLE AND EQUIPMENT WASHING AND MAINTENANCE

Washing vehicles and equipment outdoors or in areas where wash water flows onto the ground can pollute storm water. For municipalities that wash vehicles or pieces of equipment on-site, it should be performed in a designated area equipped with an oil/water separator.

Vehicle or equipment maintenance is a potentially significant source of storm water pollution. Parts are cleaned with solvents. Many of these cleaners are harmful and must be disposed of as a hazardous waste. Appropriate BMPs are waste reduction, use of alternate products, recycling, and spill leak clean up control.

The City of Covina is expanding its efforts to recycle materials and intercept debris from its own vehicle maintenance program.

5. WASTE HANDLING AND DISPOSAL

Proper waste management is possible by tracking waste generation, storage, and disposal; reducing waste generation and disposal through source reduction; and preventing run-on and runoff from waste management areas.

C. PARKS AND RECREATION

Park Departments manage landscaping and swimming pools. Both of these activities involve the use of chemicals, waste management, and non-storm water discharges. In addition maintenance of swimming pools requires the periodic discharge of large quantities of swimming pool water.

1. FERTILIZERS/PESTICIDES

a. Use/Application management

Municipal facilities should develop controls on the application of pesticides, herbicides, and fertilizers. Control may include:

- List of approved pesticides and selected use;
- Product and application information for users;
- Equipment use and maintenance procedures; and
- Record keeping.

Employees can be educated about environmentally sensitive alternative products by using information developed by various public agencies and other environmental organizations.

VOL 15 0569

R0060789

b. **Storage**

Improper storage of fertilizers and pesticides can lead to potential groundwater, soil, and stormwater contamination. To prevent or reduce their impact on stormwater pollution, material storage areas must be designed and maintained to reduce exposure to storm water. The following BMPs can help to achieve this goal:

- Store materials inside or under cover on paved surfaces,
- Use secondary containment,
- Minimize storage and handling of hazardous materials,
- Inspect storage areas regularly.

2. **FACILITY MANAGEMENT**

a. **Wash Waters**

Wash waters cannot be discharged into the storm drains untreated. The storage area should be slightly sloped for wash water collection. If the water is not discharged to the sanitary or process waste sewer, or to a dead-end sump, the outlet should be equipped with an oil/water separator or other treatment systems.

b. **Maintenance**

Landscape maintenance involves the use of pesticides and fertilizers. Proper use of these materials will reduce the risk of loss to storm water. Whenever possible, leave or plant native vegetation to reduce water, fertilizer, and pesticide needs. Integrated pest management should be employed where appropriate. The Park Departments should also establish a schedule for irrigation and fertilization. The chemicals will be carried from the site by the next storm if they are applied during the wet season. Overwatering leads to discharge of water that may have become contaminated with nutrients and pesticides.

Storm water from parking lots may contain undesirable concentrations of oil, grease, suspended particulates, and metals as well as the petroleum byproducts of engine combustion. Possible maintenance BMPs include periodic sweeping and cleaning catch basins.

The City of Covina has modified handling of its own green waste so that it is less likely to be scattered by the wind.

VOL 15
0570
R0060790

c. **Swimming Pool Waters**

The drainage of swimming pool water must insure that chlorine residual is below allowable water quality limits. The potential for recycle/reuse for irrigation of lawns and landscapes may be investigated. Swimming pool filter backwash waters should not be discharged to the storm drain, but should be allowed to settle and then disposed to the sanitary sewer. Other possible alternative measures would be to use the backwash for irrigation or disposal on a dirt area.

D. STORM DRAIN SYSTEM OPERATION AND MANAGEMENT

The maintenance and operation of the storm drain system has an impact on storm water quality and must be addressed. Material clogging storm drains cannot be discharged into drains. It must be disposed of properly.

1. INLET MAINTENANCE

Regular maintenance of public and private catch basins and inlets is necessary to ensure their proper function. Maintenance will remove pollutants, reduce high pollutant concentrations during the first flush of storms, prevent clogging of the downstream conveyance system, and restore the catch basin's functional capacity. Keys to effective catch basin cleaning include the following:

- All basins should be cleaned annually prior to the onset of the rainy season;
- Clean catch basins in known problem areas more frequently to remove sediments and debris accumulated during the dry weather months;
- Keep records of the number of catch basins cleaned; and
- Track the amount of waste collected.

Twenty-seven jurisdictions clean their catch basins at least annually. The Cities of Covina and Azusa clean their catch basins on an as needed basis, and Caltrans once every two years.

2. DRAIN MAINTENANCE

Open channel storm drains should be cleaned at least annually prior to the rainy season. Problem areas should be cleaned more frequently as needed. Channels should also be monitored during the rainy season for any debris buildup and cleaned where needed.

Los Angeles County field personnel inspect open channels and sumps to clean debris and prevent them from entering the ocean.

VOL 15
0571
R0060791

Caltrans will develop a priority list of drains and pump houses requiring cleaning. Open storm channels in two City of Covina parks are cleaned monthly and before predicted storms. The City of Covina can also require the cleaning of privately owned storm drains.

3. WASTE MANAGEMENT

Excessive waste buildup will decrease the capacity of the channel, it is therefore crucial to reduce pollutant levels in storm water by regularly removing illegally-dumped items and material from storm drainage channels and creeks. A program should be developed to identify problem areas of illegal dumping so regular inspection and clean up can maintain the channel's optimum capacity and prevent the discharge of contaminants.

4. NEW SYSTEM DESIGNS

Current design standards for the construction of new storm drain systems will be evaluated in light of currently available pollutant control measures. Design standards may be modified to incorporate measures deemed appropriate for local conditions.

5. RETRO-FIT OPPORTUNITIES

The majority of the existing storm drain systems are in highly urbanized areas providing little opportunity for cost effective retro-fitting. However, currently available pollutant control measures will be reviewed for their effectiveness and possible use. This may include pilot studies to evaluate the performance of management practices under local conditions.

E. STREETS AND ROADS

Construction, operation, and maintenance of roads has an impact on storm water quality and will be addressed in the management plan.

1. SWEEPING

Street sweeping can collect refuse on street surfaces to prevent it from entering the storm drain system through catch basins.

a. Storm Water Quality Based Operation

In order to effectively implement the sweeping program, the permittees should keep accurate operation logs to track the program. Areas generating excessive refuse should be swept more frequently.

VOL 15
0572
R0060792

Sweeping frequency may also be increased before the rainy season to reduce the amount of refuse entering the storm drain system. Parking on sweeping days should be regulated to facilitate the operation.

Twenty-nine jurisdictions sweep their street surfaces at least one time monthly. Some of these jurisdictions perform street sweeping once per week. Caltrans sweeps its roadways on a regular schedule determined by observable debris. The City of Long Beach sweeps its alleys on a weekly basis.

b. Waste Management

Vehicles transporting waste should have spill prevention equipment that can prevent spills during transport. The refuse collected will be transported to the appropriate disposal facilities.

The City of Pico Rivera provides trash receptacles at all bus stops. They are emptied daily. Lakewood's roadside trash receptacles are emptied every other day. Seventeen jurisdictions provide weekly service of roadside trash receptacles while 6 jurisdictions service them every other week. The City of Covina requires covers on all refuse containers.

2. STREET/PAVEMENT WASHING

Wash waters from street/pavement washing may be contaminated and must be managed as non-storm water discharges.

3. MAINTENANCE

a. Saw-cut Slurry Management and Paving Practices

Existing saw-cut management and paving practices conducted by the Permittees will be evaluated and appropriate control measures developed. Possible control measures to be considered that would help reduce the impacts to storm water:

- Avoid paving during wet weather;
- Regularly repair potholes and worn pavement to reduce sediment loading;
- Store materials away from drainage courses to prevent pollution of storm water run-on; and
- Follow the storm water permitting requirements for industrial activities when mixing concrete with an on-site plant.

VOL 15
0573
R0060793

b. **Waste Management**

Good housekeeping practices will be implemented to insure proper management of any waste products that may be generated during maintenance activities. For example, to prevent concrete waste from entering the storm drain system, washout of concrete trucks should be conducted off-site or on-site in designated area. Excess concrete should not be dumped on site. Employees and subcontractors should be trained in proper concrete waste management.

The following steps will help reduce storm water pollution from concrete wastes:

- Store dry and wet materials under cover, away from drainage areas;
- Avoid mixing excess amounts of fresh concrete or cement on-site;
- Do not wash out concrete trucks into storm drains, open ditches, streets, or streams;
- Do not allow excess concrete to be dumped on-site, except in designated areas;
- Avoid paving during wet weather;
- Regularly repair potholes and worn pavement to reduce sediment loading; and
- Cover catch basins and manholes when applying seal coat, tack coat, slurry seal, fog seal, etc.

Employee/subcontractor training to insure implementation of good housekeeping measures should be based on four objectives:

- Promote a clear identification and understanding of the problem, including activities with the potential to pollute storm water;
- Identify solutions (BMPs selection);
- Promote employee/subcontractor ownership of the problems and the solutions; and
- Integrate employee/subcontractor feedback into training and BMP implementation.

The City of Irwindale will develop contract specifications intended to reduce pollutants from paving operations.

VOL 15
0574
R0060794

c. Medians/Landscaped Right-of-Way

i. Irrigation

Overwatering of landscaping produces runoff. A properly timed irrigation schedule should be set up to minimize overwatering. Drip irrigation system should be used when feasible in new installations.

ii. Fertilizers/Pesticides

The handling, storage, and usage of fertilizers/pesticides are addressed in Chapter V, Section C-1.

Caltrans has an existing Right-of-Way Maintenance Vegetation Control Program which ensures that the Right-of-Way areas are properly maintained and erosion free.

F. FLOOD CONTROL

Common municipal practices, such as construction and operation and maintenance of the flood control system, may have a potentially adverse impact on storm water quality. Consequently, these practices shall be coordinated to the extent of preventing pollutants from impacting the water quality.

1. COORDINATION WITH NEW PROJECTS

Current design standards for the construction of new storm drain systems will be evaluated in light of currently available pollutant control measures. Design standards may be modified to incorporate measures deemed appropriate for local conditions. During construction, all appropriate BMPs will be utilized to control pollutants during the construction of the facility.

2. COORDINATION OF MAINTENANCE ACTIVITIES

Current maintenance activities with regards to desilting/sediment removal, vegetation management, and waste management shall be reviewed to insure that appropriate management measures are developed to comply with the storm water regulations.

3. OPERATION OF FACILITIES

Flood control facility operations will be reviewed to identify where appropriate management measures could be incorporated. However, primary

VOL 15
0575
R0060795

consideration will need to be given to the flood control function of the facility to protect health and safety.

4. RETROFIT OPPORTUNITIES

The majority of the existing storm drain systems are in highly urbanized areas providing little opportunity for cost effective retro-fitting. However, currently available pollutant control measures will be reviewed for their effectiveness and possible use. This may include pilot studies to evaluate the performance of management practices under local conditions.

G. PUBLIC FACILITIES

Storm water runoff and non-storm water discharges from other public facilities must also be addressed, including chemical use by these facilities, pressure blasting/cleaning sidewalks and other surfaces.

1. PARKING FACILITIES

Storm water from parking lots may contain undesirable concentrations of oil, grease, suspended particulates, and metals. Some control measures such as periodic sweeping and cleaning catch basins should be implemented. The need for more advanced structural controls would be evaluated through the pollutant source identification program. Pilot studies would be conducted on candidate structural controls to evaluate their effectiveness prior to large scale implementation.

2. GOLF COURSES

Golf courses require the use of large amount of water, fertilizers, and pesticides. Field personnel should be trained on the proper handling, storage, and usage of these chemicals (Refer to Chapter V, Section C-1 for detail). To prevent excess irrigation water from entering the storm drain system, proper management of watering schedules should be required.

3. SCHOOLS

The maintenance of playgrounds and athletic fields at schools require fertilizers and pesticides. Their safe storage and use affect not only the stormwater quality but also the health of the students and the staff. Therefore BMPs under Chapter V, Section C-1-b should be implemented. Each municipality should develop a program to encourage these schools to use environmentally sensitive products for fertilizers, pesticides, detergents,

VOL 15
0576
R0060796

and other chemicals. The schools should have proper material handling, storage, and disposal procedures for chemicals used in school laboratories.

4. **HOSPITALS**

Each hospital should have BMPs to control the handling and storage of medically related hazardous materials. All materials should be inventoried regularly, with record keeping protocols on supply and consumption. All personnel should be trained on the proper procedures on handling these materials, as well as emergency response. Each hospital should maintain a list of supervisors to be contacted if accident does occur. Disposal of these materials should be contracted out to commercial specialists.

5. **PARKS/LANDSCAPES**

Refer to **Section C Parks and Recreation**, of this Chapter, for information.

6. **OTHER BUILDINGS/PLAZAS**

Refer to **Section C-2 Parks and Recreation - Facility Management**, of this Chapter, for information.

H. PONDS, FOUNTAINS, AND OTHER PUBLIC WATER BODIES

Maintenance practices used on public water bodies, including waste management and non-stormwater discharges, must be addressed in the plan.

1. ALGAE CONTROL

a. Use of Chemicals

The use of herbicides or other chemicals to control algae growth should be carefully controlled and monitored to insure strict adherence to manufacturers' guidelines for use. Water sampling may be necessary to insure effective control.

2. CHLORINE MANAGEMENT

The use of chlorine for disinfection should be controlled. High dosage of chlorine may be harmful to the aquatic habitats. Dechlorination of pools and other water bodies would be required prior to draining.

VOL 15
0577
R0060797

3. MAINTENANCE

Each municipality should develop BMPs to prevent and control trash, debris, and other pollutants from entering water bodies. These measures could include routine trash collection along and on water bodies, public outreach to educate the public about the impacts of illegal dumping, and increase enforcement for violations.

P:\INEZ\PLAN\PLAN2.SOR\V

VOL 15

0578

R0060798

VI. RESIDENTIAL

INTRODUCTION

Residential activities including private vehicle washing and maintenance; use of chemicals such as pesticides, herbicides, and paints; private swimming pool maintenance; and other household and landscape maintenance can contribute to storm water pollution. These are all examples of non-point source pollution, a significant impact on water quality. Measures that can be taken to improve the quality of the runoff from residential area all require active public participation. Feasible BMPs to mitigate the stormwater pollution problem should include practicing good housekeeping and the use of environmentally sensitive alternative products, vehicle leak and spill control, and water conservation. Development of the residential stormwater program will be completed by December 1996.

A. HOUSEKEEPING PRACTICES

This BMP involves the development of a program to promote efficient and safe housekeeping practices (storage, use, and cleanup) when handling materials which may pollute stormwater/urban runoff. This could include, but are not limited to, fertilizers, pesticides, cleaning solutions, paint products, automotive products, and swimming pool chemicals.

A public education program will be developed to provide information on stormwater pollution and the beneficial effects of proper disposal on water quality; reading product labels; safe storage, handling, and disposal of hazardous products; list of local agencies; and emergency phone numbers. The above information can be disseminated through brochures or booklets made available at places such as public information fairs, municipal offices, and household hazardous waste collection events and facilities. City newsletter to residents is another means to inform the public, especially for those who do not participate or visit any offices or events.

In addition to the specific programs and plans outlined in this report, several watershed Co-Permittees have targeted activities occurring in and around the home that tend to contribute to degradation of storm water runoff quality. A practice that carries on-the-ground pollutants directly to storm drains is misuse of exterior water, namely the overwatering of landscaping, the hosing of driveways/sidewalks and the washing of cars in driveways--all of which allow water to run down the street into the nearest storm drain.

This situation can be addressed in two ways: 1) either reduce/prevent pollutants from being placed in areas where they may be carried by water into the streets or 2) minimize the amount of water allowed to flow on impervious surfaces that are connected to the street system.

VOL 15
0579
R0060799

B. ENVIRONMENTALLY SENSITIVE ALTERNATIVE PRODUCTS

This BMP, promoting the use of less environmentally sensitive products, can be implemented in conjunction with housekeeping practices. Alternatives exist for most product classes including fertilizers, pesticides, cleaning solutions, and automotive and paint products. The key to success will be to promote a willingness to try alternatives and to modify old habits.

General information will be developed and made available to the public on such alternatives. The emphasis may be placed on the need to preserve the natural environment of the receiving waters (ocean, bay, stream, wetland, etc.) with the use of alternative products because of their less toxic nature and proper disposal after its use.

C. VEHICLE LEAK AND SPILL CONTROL

This BMP prevents or reduces the discharge of pollutants to storm water/urban runoff from vehicle leaks and spills by reducing the chance for spills, stopping the source of spills, containing and cleaning up spills, and properly disposing of spill materials.

Vehicles will leak and spill fluids. The key to successful pollution management is to reduce the frequency and severity of leaks and spills; and when they do occur, to prevent or reduce the environmental impacts. Through education, the public should be encouraged to regularly inspect and maintain their vehicles. Guidelines should be developed to inform the public on spill containment and cleanup procedures such as having absorbent material on hand and disposing the material properly.

D. WATER CONSERVATION

Water is a scarce resource, especially so in Southern California. Wasteful use of water could channel pollutants into the receiving waters. Practices such as hosing the driveway and overwatering the landscape contribute not only to stormwater pollution, but also to the depletion of our natural resource. In order to prevent stormwater pollution, the public has to be educated on the mechanics of our storm drain system - discharges into the system will flow untreated into the receiving water. They have to know that the lawn clippings they wash down the road will end up in the ocean. Public awareness of the function of the storm drain system, of the important of environmental health, and of our necessity to slow down the depletion of water resources will be a long way in reducing the pollution of stormwater/urban runoff.

Ordinances could be use to endow the related officials with legal authority to enforce water conservation. An ordinance prohibiting the wasting of water is one way of enforcement.

VOL 15
0580
R0060800

Water conservation measures can be designed to address the issue of impervious surface water flow. While conservation has historically been used to conserve domestic water, many jurisdictions are now recognizing the additional benefit of prohibiting water flows from private properties onto the street system. Most Co-Permittees within this watershed implement or plan to implement water conservation programs. Most programs are supported by ordinance, although a few jurisdictions rely on voluntary compliance. Public outreach is a component of all programs, many of which carry fines for water wasting practices. Most jurisdictions encourage water efficient landscape, with several agencies noting that local parks and other public landscapes are designed to be water conserving. The La Habra Heights Water District conducts workshops on irrigation.

While some ordinances were established specifically to conserve water during periods of drought, several jurisdictions are keeping such controls in place at all times as measures to control non-stormwater runoff.

P:\INEZ\PLAN\PLAN2.SOR\VI

VOL 15
0581
R0060801

VII. PUBLIC INFORMATION AND PARTICIPATION

It is necessary to involve the public in the stormwater program for it to be effective. The outreach program should be focused on the specific needs of the individual cities. Due to the inter-relationship among the stormwater issues, the public information and participation program should be recognized as a whole, rather than a number of separate outreach programs. All public awareness efforts should clarify to the public that they are the ultimate beneficiaries of a successful stormwater management program.

A. GENERAL OUTREACH

The targeted audiences of a general outreach will include municipal employees, local construction contractors, businesses in the area, and the general public. They should be made aware of their responsibility for both the problems and the solutions to stormwater pollution. In order to effectively communicate the stormwater pollution abatement message throughout the watershed; written, audio, and visual materials should be utilized. The actual level, priority, and schedule of public information activities must be based on the community's needs and resources to maximize program effectiveness. A watershed-wide concept will be developed by December 1995.

All Co-Permittees within the watershed have or are planning active, multi-media public outreach programs. Extensive efforts are being made or are planned by most Co-Permittees to supply the public with information on a full range of storm water quality activities with the intention of achieving a high level of public cooperation and participation. While many jurisdictions are in the early phases of program participation, there appears to be little hesitancy to implement the major suggested programs.

1. WRITTEN MATERIAL

Co-Permittees should produce a variety of written materials to inform the residents within the watershed. Materials can include, but are not limited to, the following: flyers, brochures, door-hangers, newspaper articles, mail-inserts, banners, and posters. When necessary, these materials should be translated into a variety of foreign languages to reach minority residents in the community.

About half of the jurisdictions within this large watershed presently have printed outreach materials available. City newsletters and brochures on various programs are the most frequently used methods. Most of the remaining jurisdictions are developing or plan to prepare and distribute a variety of general outreach materials. Utility bill inserts, door hangers and

VOL 15
0582
R0060802

refrigerator magnets are other forms of printed materials. Hawaiian Gardens plans to produce materials in both English and Spanish.

2. AUDIO MATERIAL

Similarly, Co-Permittees may utilize audio materials to convey information regarding stormwater management. Examples of audio materials include radio advertisements/public service announcements and informational cassettes. Los Angeles County uses radio outreach.

3. VISUAL MATERIAL

Catch basin stenciling program is an excellent means of educating the public on the mechanics of the storm drain system. The intent of the program is to enhance public awareness of the impact of stormwater pollution on receiving waters and to discourage improper waste disposal practices. Another effective medium for communicating the importance of stormwater management is through television. Possible measures include producing a public service announcement, cable access programs, and/or an informational video.

Catch basin stenciling is receiving widespread cooperation throughout the watershed. Many jurisdictions have implemented their stenciling program. With the exception of Santa Fe Springs, all other jurisdictions have plans to complete the stenciling of all catch basins. Some jurisdictions are receiving assistance from the Boy Scouts, Cub Scouts or other local volunteer groups. Some jurisdictions are using customized stencil designs, although most use the pattern developed by Heal the Bay and the City of Los Angeles.

With cable television service available throughout the watershed, eleven Co-Permittees use this medium for public service announcements and special programming. Los Angeles County uses television for outreach. Several other jurisdictions are planning to include this public outreach component in their programs.

Other visual materials such as billboard and bus stop shelter advertising are used by Los Angeles County. The City of Walnut is preparing multi-lingual "No Dumping" signs to educate its minority residents.

4. DISTRIBUTION PLAN

General outreach efforts must be conducted throughout the entire watershed. Materials should be available at all public counters and distributed at public events such as environmental fairs and contests. A city newsletter is another effective method of conveying the pollution abatement message.

VOL 15
0583
R0060803

B. FOCUSED OUTREACH

Efforts should be made to target special groups. Focus could be on specific pollutants, practices and/or activities, or businesses. A watershed-wide concept will be developed by September 1996.

The varied sources/causes of storm water pollution have resulted in implementation activities that target specific types of pollutants, activities and land uses/types of businesses. Within this watershed most co-permittees implement or plan to implement public information and participation programs specifically aimed at preventing improper disposal of hazardous household products and encouraging actions that keep general wastes out of the storm drain system--such as recycling programs, use of public trash receptacles and the cleaning of sidewalks, alleys and vacant lots. Illegal dumping and discharges are also specific targets; Downey provides cash rewards for the reporting of illegal discharges/dumping into the storm drain system.

1. POLLUTANT SPECIFIC

For a particular watershed, there may be priority pollutants which are of more concern than others. The reduction of these pollutants may be addressed in a more focused public education and outreach program. Any of the methods used in the general outreach program may be utilized in a pollutant specific outreach program.

2. PRACTICE/ACTIVITY SPECIFIC

Everyone who lives or works in a particular watershed must realize that their actions have a direct affect on the quality of stormwater. These special groups must be made aware that their current practices/activities may be contributing to stormwater pollution. Practice/activity specific outreach programs should be developed and implemented throughout the watershed. The use of written, audio, or visual materials should convey three primary messages: (1) what activities can cause stormwater pollution, (2) how Best Management Practices are used to prevent pollution, and (3) how one can report occurrences of stormwater polluting activities.

Practice/activity specific outreach should promote, publicize, and facilitate public reporting of illegal dumpings, illicit discharges, or water quality impacts associated with discharges from municipal separate storm sewers. An effective program should include the establishment, operation, and promotion of a reporting hotline. Timely reporting by the public of improper disposal and illicit discharges are critical in controlling such sources of stormwater pollution. Increase in public involvement may be achieved by sending a

VOL 15
0584
R0060804

follow-up letter to callers or providing callers with some type of reward. Educational efforts throughout the watershed should inform the public about the existence of the Los Angeles County-wide hotline and any other local hotlines; provide them with information regarding what to look for, and guidelines/procedures on how to report incidents.

Another critical component of practice/activity outreach is the development of a program to facilitate the proper management and disposal of used oil and toxic materials. An effective program could include, but are not limited to, the operation of recycling facilities and the conduction of household hazardous waste round-ups. The program could also include information about alternatives to toxic materials. Educational efforts throughout the watershed should provide the public with detailed information regarding the Los Angeles County-wide Household Hazardous Waste Round-ups and any other local programs.

The County of Los Angeles has an outreach program focusing on airport operations, which will have handouts for tenants and users of County airports explaining the problems and prevention of non-point source pollution. The County also has a wide range of focused programs that can be tailored for special exhibits and interest groups, including elementary schools.

3. BUSINESS SPECIFIC

Due to the fact that some business operation have a higher potential of discharging pollutants into the storm drain system, a more focused public education and outreach program should be developed for them. Employees of these businesses should be educated on the issue of non-point source pollution and the effectiveness of Best Management Practices in reducing pollution. Besides written, audio, or visual materials that focus on specific businesses and their practices, mass mailings or articles in a trade/industry magazines are other possible means of focused outreach.

The City of Covina notifies contractors about construction debris containment, proper disposal practices and distributes equipment management brochures to developers and construction crews.

C. EDUCATION PROGRAMS

Increasing awareness is the major goal of the Public Information and Participation Program. An ideal means of accomplishing this task is through educational programs. Programs should be developed for a variety of audiences, including public employees and school children. Educational programs can also be an important part

VOL 15
0585
R0060805

of a general or focused outreach. A watershed-wide concept will be developed by September 1996.

1. **PUBLIC EMPLOYEES**

It is important to educate all of the public employees about the stormwater program so that they do not continue with any practices that are counter productive. Furthermore, they can participate in the implementation and enforcement of the program. Ideas and suggestions of employees can be used to modify the program for improved effectiveness. The outreach must involve employees on many different levels - from program managers to field personnel. Educational programs for public employees may include, but are not limited to, articles in City newsletters, training classes, checklists for field personnel, and interdepartmental forum or committee. Any of the materials utilized in an outreach program - written, audio, or visual materials - may be used in a public employee educational program.

Formal training/education is also conducted by Caltrans and the County of Los Angeles. Caltrans personnel are educated on highway maintenance - specifically on such subjects as Hazardous Substance Spill Awareness and Pesticide Safety and Vegetation Management. County personnel meet regularly to discuss development of and evaluate storm water quality practices.

2. **K-12**

School children can play an important role in a public information and participation program. First, children are generally more easily motivated and the behavior changes made at that point in life tend to stay with them through adulthood. Secondly, school children can convey the stormwater pollution prevention messages to the members in their family. School programs must include information on the storm drain system, stormwater quality awareness, and may also include, but are not limited to, illegal dumping awareness, source minimization, and pollution prevention. Written material, videos, assembly programs, and field trips are examples of effective components of a K-12 educational program.

School programs are components of the educational programs in Glendora, La Mirada, Whittier and Duarte. Glendora also uses library displays. Downey conducts "Waste In Place" programs in elementary schools to discourage littering.

VOL 15
0586
R0060806

3. OTHER

Educational programs can also be developed for professionals and technicians who are not public employees. Agencies should include public outreach material for business license renewal or outreach effort through professional and business associations.

D. CITIZENS PARTICIPATION

The residents of the watershed should not only be made aware of the stormwater program, they should be encouraged to participate in its implementation. Specific outreach programs should be developed to allow the public to participate and to inform them of available means for providing ideas and comments regarding the stormwater program. A watershed-wide concept will be developed by September 1996.

1. VOLUNTEER MONITORING

Volunteer monitoring is the result of increased public awareness and participation. The public can utilize the hotline for reporting suspected illegal practices. Such involvement, which is similar to the Neighborhood Watch Program on crime, usually has good results.

An 800 hotline has been established by Los Angeles County which is available for reporting illegal dumping. A large number of jurisdictions in the watershed have also established their own reporting hotlines through their City Halls, fire departments or environmental services departments. To increase the effectiveness of the hotlines, outreach programs to encourage their use have been established. Approximately half of the cities have publicized the hotlines in their city newsletter. Other popular methods include articles in local newspapers, press releases, community meetings, and announcements on local cable channel. One city suggested the use of cash reward programs to encourage reporting. Downey, who has used the "WE TIP" system and anonymous cash rewards, reports that it has been successful.

La Puente publishes notices about the County's Hotline for the reporting of illegal dumping in both English and Spanish. Long Beach uses grocery bag inserts as one method to inform the public of the Hotline.

2. COOPERATIVE OUTREACH

In order to promote public participation, cooperative outreach programs should be developed. These cooperative programs should help to create an

VOL 15 0587

R0060807

awareness and an identification with the watershed. The catch basin stenciling and other signing programs are excellent examples of this type of cooperative effort. One possibility for cooperative outreach is an "Adopt-A-" program. Residents can "adopt" a highway, storm drain, catch basin, stream, etc. Other cooperative outreach efforts include events such as "Stormwater Pollution Awareness Week." The purpose of any of these activities is to inform and involve the local residents in regards to the stormwater management program.

Residents can assist public agencies in the development and implementation of storm water quality programs. Several watershed jurisdictions have enlisted the assistance of such groups as the Boy Scouts and neighborhood volunteers in the catch basin stenciling program. Caltrans' and Los Angeles County's Adopt-A-Highway programs rely on voluntary private participation to help with clean-up activities. Santa Fe Springs, Downey and Diamond Bar have similar Adopt-a-Street programs; Long Beach has an Adopt-a-Gutter program. Artesia encourages resident participation in its Clean-Up-Days, and West Covina has a "Clean-Up-Saturday" program. Hotline programs also enlist the assistance of residents in active participation.

3. COMPLAINT PROCEDURES

Public comments/complaints are important to the success of a stormwater program. A hotline is an excellent mechanism for allowing the public to provide information. In Section B, "Focused Outreach - Practice/Activity", the various aspect of outreach effort is discussed.

E. EFFECTIVENESS EVALUATION

Permittees should develop a process to evaluate the effectiveness of their programs. Methods such as surveys and focus groups can be used to assess program's effectiveness. Results should gauge the community's level of awareness. Surveys and focus groups can also be used to provide insight into the program's direction and the formulation of attainable goals. A watershed-wide concept will be developed by September 1996.

P:\INEZ\PLAN\PLAN2.SGR\VII

VOL 15
0588
R0060808

VIII. PROGRAM EVALUATION

The effectiveness of the storm water programs developed under the Municipal Storm Water Management Plan (hereinafter called the Plan) must be assessed on a regular and consistent basis. The Plan for this evaluation must include a schedule for evaluation, a methodology for the evaluation, a discussion of who will carry out the evaluation, and what will be evaluated. In addition, there must be a mechanism to follow up on the information generated by the evaluation. The Plan should be adjusted based on the program evaluation.

A. PERFORMANCE STANDARDS

The Permittees will develop standards to judge the effectiveness of the activities and control measures proposed under each chapter of the Plan. The standards will serve as minimum performance levels to evaluate the implementation of control measures. The subsequently developed performance evaluation procedures/methodologies will be the tool to determine if a particular BMP has an impact on stormwater quality. In developing these procedures, we resolve to ensure that each BMP is implemented to the maximum extent practicable. The targeted completion of this phase will be December 1997.

1. DEVELOPMENT OF PROCEDURES

General performance standards for evaluating the effectiveness of the Best Management Practices (BMPs) will be developed for all the BMPs proposed in the Plan. The Watershed Management Committee will be responsible for developing and adopting these evaluation criterion. The Management Committee may elect to establish subcommittees to develop performance standards for specific program areas. The area-wide Executive Advisory Committee will then review and endorse the standards. Standard recording format and implementation schedule will be developed for each BMP by the Management Committee for use by all Permittees. The Permittees will be required to document BMP implementation using the standard format according to an established schedule. The utilization of quantitative approaches in measuring effectiveness will be used whenever possible. Methods that would yield comparable results for year to year evaluation will be developed.

2. ACTIVITY/SOURCE/ACTION AREA SPECIFIC

Program effectiveness will be performed based on the information generated by the performance evaluation procedures. Using street sweeping as an example, the Plan will propose a method of determining if street sweeping has an impact on water quality. This could include determining what kind of

VOL 15 0589

R0060809

pollutants are removed by the sweeping, measuring the size of the pollutants and the amount removed. Methodologies would be developed for each BMP, which will assure that each control measure or action is implemented to the maximum extent practicable. For street sweeping; this may include the frequency of sweeping now, the method of sweeping, the equipment used, how the equipment is cleaned and maintained, and the method of disposal for the material collected. A schedule and format of evaluation shall be developed for all the BMPs.

The California Regional Water Quality Control Board (Regional Board) has recommended 13 Baseline BMPs, to be developed and/or implemented by all Permittees by the end of the current NPDES Permit. Existing Permit Task 5.2.5 requires an evaluation of the need for additional BMPs, source control, and/or structural control measures.

BMPs have only been implemented for a short time period by Phase I and Phase II cities. Phase III, which contains 30 new cities, has not yet implemented any BMPs. Therefore there is little or no data available to adequately assess effectiveness. In lieu of recommending any changes or additions to BMPs currently being implemented or proposed by the Permittees, a uniform data collection methodology will be established for each of the 13 baseline BMPs. This methodology would be used by all Permittees to compile data on their BMP implementation to allow for a uniform Countywide evaluation of BMP effectiveness. Priority will be given to the development of a uniform data collection methodology to document the success or effectiveness of these 13 BMPs. Upon reorganization of the NPDES Permit Program, as described in Chapter I, this will be the first task addressed by the Watershed Management Committee. The Uniform data collection methodology will be developed by January 15, 1995 for the Santa Monica Bay watershed and by July 1995 for all other watersheds with subsequent implementation by all Permittees in each watershed.

B. ANNUAL REPORTS

An annual report for each watershed will be submitted to the Regional Board not more than 45 days after the end of each permit year. Each annual report will include a summary on the programs implemented during the previous year and plan activities that will be implemented during the current year. Any revisions to the Plan would be addressed in the report.

1. FORMAT/STRUCTURE

In order to insure uniform annual reporting by all watersheds, the Executive Advisory Committee will develop a uniform annual report outline for use by

VOL 15
0590
R0060810

each watershed. Each Watershed Management Committee will develop a standard format to be used by all the permittees in its watershed in reporting the progress and the status of all stormwater programs implemented in its jurisdiction. The Principal Permittee will utilize this information to develop the annual report for the watershed. Upon approval by the Management Committee, the annual report will be provided to the Executive Advisory Committee which will compile the annual reports from all watersheds for submittal to the Regional Board.

2. EFFECTIVENESS MEASURES

Under Chapter VIII, Section A, the permittees will have developed performance standards for each BMP. These performance standards will be used to assess the effectiveness of the BMPs. By the end of each permit year, the findings of the previous program year will be evaluated and used to suggest changes that are appropriate for implementation during the next year. Focus should also be given to the use of empirical studies, in a control setting, to more fully assess the effectiveness of BMPs.

3. CONTENT

The annual report will include a matrix illustrating the levels of implementation for all permittees. Tables will be developed for each BMP listing all the participating Co-Permittees, describing the status of implementation by each Co-Permittee of the BMP, and documenting any modifications of the BMP from the standard program. The effectiveness of each program area will be assessed using the performance standards developed under Chapter VIII, Section A. For effectiveness measures, the findings should be presented graphically for ease of comparison with the established levels of effort. Fiscal budget for all the BMPs implemented should also be prepared, grouped by programs. An analysis and evaluation of the results of the past year's monitoring program data will also be included in the report. Any revisions to the Plan should be addressed here, with all the elements affected discussed in their entirety. All relevant information, such as water samples analyses and evaluation, should be included in the appendices.

C. SEMI-ANNUAL REPORTS

A semi-annual progress report will update the Regional Board on Permit compliance activities six months into each permit year. The semi-annual report will be provided to the Regional Board within 30 days after the end of the six-month period.

VOL 15
0591
R0060811

1. **PURPOSE**

The semi-annual report will serve as a status report on the progress of the implementation of the Plan.

2. **FORMAT/STRUCTURE**

In order to insure uniform semi-annual reporting by all watersheds, the Co-Permittees will use the standard format developed for the annual report in reporting the progress and status of all the BMPs implemented in their jurisdictions. The Principal Permittee will utilize this information to develop the semi-annual report for the watershed for submittal to the Regional Board.

3. **CONTENT**

The semi-annual report will include a matrix illustrating the levels of implementation for all permittees. Tables will be developed for each BMP listing the participating Co-Permittees, describing the status of implementation by each Co-Permittee of the BMP, and documenting any modifications of the BMP from the standard program. The Permittees will describe the problems encountered during implementation and discuss the modifications to the program in order to solve these problems.

D. INTERNAL REPORTING

In order to facilitate the preparation of semi-annual and annual reports, standard internal formats for use by all Permittees will be developed. The internal reporting procedures will be completed for all Plan chapter elements by December 1997.

1. **STANDARD FORMS**

The Watershed Management Committee will be responsible for developing standard forms for use by each Permittee. Standard forms will be developed for each BMP to monitor its progress. Some Permittees may have to customize the standard forms in order to reflect their programs' additional features. The forms will collect all the information essential to the preparation of the annual and semi-annual reports. In developing the standard report forms, information that is quantifiable and specific for each program area and/or BMP will be collected.

2. **PROCEDURES**

Co-Permittees will submit all the BMP report forms to the Principal Permittee at the end of the six-month period and the permit year, respectively.

VOL 15
0592
R0060812

3. RECORD KEEPING

The Regional Board does not need to see all of the extraneous information, but the records will be retained by the Principal Permittee for 2 years. Each Permittee will keep a permanent copy of its reporting forms in case they are needed.

E. STORM WATER MANAGEMENT PLAN REVISIONS

There will be an annual review process that will allow the permittees to revise the Plan for the next year and for the rest of the permit period. The targeted completion date for this phase is December 1997.

1. PROCESS

In the annual report, Permittees will compare the progress made on all the BMPs with the established level of effort. If the level of implementation is inadequate, the program should be adjusted to accelerate the progress. If the progress made to date shows that the program is ineffective or inefficient in protecting the stormwater quality, a new program should be developed and implemented for the next fiscal year and the rest of the permit period.

2. REPORTING

All refinements or revisions to be made in the fiscal year will be documented in the annual report, with the dates of implementation proposed.

P:\INEZ\PLAN\PLAN2.SGR\VIII

VOL 15 0593

R0060813

IX. MONITORING

The Monitoring Program is a critical element in the Stormwater Management Plan. It will provide important data for use in characterizing existing stormwater/urban runoff quality, guiding future development, and modifications to the Plan and also to assess its effectiveness. A watershed wide monitoring program shall be developed by December 1997.

A. SYSTEM CHARACTERIZATION

The existing Permit subdivided the County into six drainage basins with information to be collected to characterize each of the basins.

1. WATERSHED

Each drainage basin has been subdivided into numerous drainage areas, based on an evaluation of the existing drainage system and surface flow patterns. For each drainage area, the following information has been compiled: size; breakdown of existing land use; imperviousness; description of soils; location of waste disposal facilities; and the location, type, and number of industries by Standard Industrial Classification (SIC) Code. This information has been submitted to the California Regional Water Quality Control Board, Los Angeles Region, for Phases I and II. Phase III watershed characterization is in progress and will be completed by the end of December 1994. Due to the volume of the watershed characterization data, this information has not been included herein, but is available for review at either the Regional Board or the Los Angeles County Department of Public Works.

This information will provide a basis for developing other monitoring program elements such as pollutant loading estimates from major land uses and watersheds; pollutant source identification, and identification of illegal discharges/illicit disposal practices.

2. STORM DRAIN SYSTEM

In subdividing each basin into drainage areas, the drainage area tributary to all major outfalls has been identified. Within each drainage area, the tributary storm drain system is being identified and mapped. Key information such as the size of the storm drain facilities, locations of manholes and inlets, and storm drain connections is being compiled. This information will be vital in conducting storm drain inspections to identify and eliminate illegal discharges.

VOL 15
0594
R0060814

3. RECEIVING WATERS

Due to the extent of urbanization in Los Angeles County over the past decades, most of the streams designated as receiving waters in the Los Angeles basin have been replaced with man-made storm drainage systems to provide flood protection to the urbanized areas. These streams have been mapped as part of the storm drain system mapping done under A.2. above. The remaining natural streams are also being mapped.

The Los Angeles County Department of Public Works (Department) has been performing surface water quality monitoring on a voluntary basis since the late 1960s. Samples have been collected and analyzed from various receiving water streams and channels throughout the County to collect general information as to the quality of the surface runoff within our storm drain system.

The program in existence at the time the current Permit was issued was established in the mid 1980s. Twenty-eight sites are sampled monthly for dry weather flows. Twenty-one of the 28 sites are sampled for storm flows up to five times per year. The collected samples are analyzed for general minerals, pH, total dissolved solids, specific conductance, biochemical oxygen demand, bacteria, heavy metals, pesticides, PCBs, total organic carbon, volatile organic compounds, and total petroleum hydrocarbons.

The sample collection at these sites will continue while the new National Pollutant Discharge Elimination System (NPDES) Permit monitoring stations are established. Once all NPDES Permit monitoring stations are operational, sampling at these 28 sites will be discontinued.

In order to provide an initial assessment of the water quality in the major streams and channels in the County, an analysis has been performed on the data collected through the existing surface water monitoring program. The analysis has been done on a Countywide basis and also by major drainage basin. The report can be found in Volume 8.

To better assess the receiving water impacts of stormwater the Department will be developing a program to further study stormwater impacts on selected receiving waters, including conducting toxicity studies. Initial efforts will focus on the Santa Monica Bay Watershed. A Request for Proposal for the development of such a program will be advertized by January 15, 1995.

VOL 15 0595

R0060815

The water quality data collected by the new NPDES Monitoring Program will provide more detailed data to better assess in upcoming years the quality of our receiving waters. Ten monitoring stations have been proposed along the major streams in the County. A description of these site locations can be found in the monitoring work plans for Phases I, II, and III, previously submitted to the Regional Board, see Volume 8.

4. LAND USE

As described under Section A.1. above, the existing land use categories within each drainage area have been identified. This information has been used to select drainage areas comprised of a single homogeneous land use for land use specific monitoring. A total of 14 land use monitoring sites are being established in the County. Five sites are being installed in the Santa Monica Bay Watershed with the remaining nine to be selected from within the Los Angeles, San Gabriel, and Santa Clara River Watersheds. For a description of the sites, please see Volume 8. These sites will provide valuable information as to the types and levels of pollutants found in runoff from various land uses. This information can then be used to refine the Stormwater Management Plan to develop specific management measures to target identified problems.

B. SOURCE IDENTIFICATION

Identifying the sources of stormwater pollutants from both specific land uses and specific activities will provide the information needed to identify problem areas and allow specific management measures to be developed to address these problems.

1. SPECIFIC LAND USE

As described in Section A.4. above, major land use classifications will be subject to individual monitoring to determine the types and levels of pollutants present.

2. SPECIFIC ACTIVITIES

a. A pollutant source identification program will be designed to identify significant pollutant sources (i.e., parking lots, industrial activities, etc.), with the hope that remedial action can be undertaken to reduce any significant impacts so identified. It will focus on monitoring very small areas (i.e., less than five acres) where a specific and/or interrelated set of pollutant generating activities are occurring. Its objective is to provide data for selecting BMPs for specific activities rather than characterizing discharges for long-term pollutant loading estimates.

VOL 15 0596

R0060816

Identification of pollutant sources can be done using a number of methods. Potential sources of storm water pollutants can be identified by records of chemical use and/or storage, by studies of specific activities which lead to the deposition of pollutants throughout the watershed, and by field inspection or monitoring. Watersheds which may contain significant pollutant sources can be identified through land use information or by mass loading estimates.

By mid January 1995, the County will begin targeted monitoring of a municipal corporation yard in the Santa Monica Bay watershed. A full program for pollutant sources identification will be developed by December 1996.

b. A storm drain inspection program has also been developed and is being implemented. The first phase of the inspection program will target the open channel storm drains to identify illegal discharges.

The open channel inspections will also be used to screen outfalls from underground storm drains for the presence of dry weather flows. This information will be used in the next phase of the storm drain inspection program to prioritized the underground storm drain system for further field screening and inspection of problem areas.

C. CONTROL MEASURE EFFECTIVENESS

It is unlikely that the effectiveness of the various control measures implemented by the storm water management plan can be determined solely through the data produced by monitoring the quality of storm drain flows, because it is difficult to obtain statistically significant comparisons of watershed-wide control measure performance with such data. For this reason the effectiveness of control measures will be assessed through other means.

Two general types of methods are available for assessment of control measure effectiveness: direct water quality (conventional) monitoring and indirect (non-conventional) monitoring. Direct water quality monitoring can be used to determine pollutant reduction by a specific facility or devise. This technique is commonly used for structural or treatment controls, such as detention basins and constructed wetlands, where there is an accessible inflow and outflow. Inflow and outflow results are compared to determine pollutant removal and effectiveness.

Direct water quality monitoring of site runoff before and after implementation of non-structural control measures is also possible. However, it is difficult to demonstrate effectiveness at a statistically significant level because of the high degree of variability in stormwater pollutant concentration and mass loading data. The

VOL 15
0597
R0060817

water quality improvement due to non-structural control measures is generally expected to be less dramatic than that achieved through structural controls. A larger number of samples is therefore required to produce a statistically significant result. This is especially difficult in relation to the monitoring of the pre-control measure condition. Collection of adequate baseline information is necessary prior to the implementation of management practices. Direct monitoring of the effectiveness of non-structural controls is feasible typically only under experimentally controlled conditions (e.g., selection of small, well-defined watershed; control of management practice implementation; effective sitting and timing of monitoring activities), including a sufficient number of samples to achieve statistical significance.

Indirect monitoring currently is the primary method of choice of assessment of management plan effectiveness. A number of indirect monitoring techniques are available for assessment of management plan effectiveness.

Verification of program implementation is an indirect monitoring method that can be used to determine how a management plan is being implemented. Another indirect monitoring method, pollutant removal inventories, can be used to assess the amounts of pollutants that have been prevented from entering the municipal storm drain system.

The 13 Baseline BMPs recommended for implementation by the Regional Board plus other BMPs proposed by the various Co-Permittee are in general all non-structural control measures. In the short-term, a uniform data collection methodology will be developed for use by all Permittees to compile information on the level of implementation of the 13 Baseline BMPs. This will allow for a uniform watershed-wide evaluation of BMP effectiveness. For the Santa Monica Bay watershed, this uniform data collection methodology will be developed and begin implementation by January 15, 1995. For the other watersheds, implementation would begin July 1, 1995.

For the long-term, as the various chapters of the Plan are more fully developed, possibilities for the use of direct water quality monitoring for control measure assessment will be evaluates as opportunities arise.

D. POLLUTANT LOADING

One of the objectives of the monitoring program is to estimate the annual pollutant loadings from each watershed. Knowing the types and quantities of pollutants discharged into receiving waters are important in assessing the impacts of stormwater and, in turn selecting appropriate control measures to address problem areas.

The 24 permanent monitoring stations that are being established Permit-wide will be utilized to estimate pollutant loads from each watershed and also from various land

VOL 15
0598
R0060818

uses. For a description of the methodology to be used to estimate pollutant loadings, please see Volume 8. For the Santa Monica Bay Watershed, the pollutant loading model will be tested and operational by January 15, 1995. Actual pollutant loadings will be calculated subsequent to storm events occurring for which water quality data has been obtained. For the other watersheds, a schedule for pollutant load modelling will be provided by January 15, 1995.

To more closely model pollutant loadings and evaluate control measure impacts, a more detailed dynamic modelling will be undertaken on a smaller, representative sub-watershed. The EPA-SWMM model has been selected for use in our dynamic modelling efforts. For the Santa Monica Bay Watershed, the Kenter Canyon Drain sub-watershed has been selected for this modelling efforts. This sub-watershed is typical of the urbanized areas in the Santa Monica Bay Watershed. It is comprised of multiple land uses, has well-defined boundaries, and has no upstream flow regulation. We are reviewing and identifying the existing drainage system, defining current and future land uses, and conducting field checks. The model will be tested and operational by January 15, 1995, with actual modelling results to be available later when local water quality data from our monitoring stations becomes available. Based on the results of the dynamic modelling of the Kenter Canyon sub-watershed, other sub-watersheds may be selected from the other major watersheds in the County.

E. COMPONENTS OF A MONITORING PROGRAM PLAN

The components of the monitoring program plan such as monitoring site locations, dry/storm sampling frequency and methodology, constituents to be sampled, field and laboratory procedures, QA/QC, etc., can be found in Volume 8, which has been previously provided to the Regional Board.

The Monitoring Program elements described in Volume 8 will be revised to address the Monitoring Program needs described in Section A - D above as agreed to in the letter from the County to the Regional Board dated September 22, 1994.

As the various chapters of the Plan are more fully developed, the Monitoring Program will be revised to address any additional monitoring needs that may result

F. DATA MANAGEMENT

For water quality data collected at the 24 monitoring stations, please see Volume 8 for data storage and reporting methods.

For each Section A - E of the Monitoring Program described above, an annual report will be prepared detailing the data collected, with an evaluation and interpretation the data including water quality impacts.

SANTA CLARA RIVER
STORMWATER MANAGEMENT PLAN

INTRODUCTION

On June 18, 1990, the National Pollutant Discharge Elimination System (NPDES) Permit - Order #90-079, NPDES #CA0061654-CI6948 was issued to the County of Los Angeles and 17 cities tributary to Santa Monica Bay. During the subsequent years, two newly incorporated cities, Caltrans, and the County of Ventura also became Co-Permittees. This Permit outlined a three-year program which required each Permittee to: characterize drainage areas; develop and schedule the implementation of Best Management Practices to enhance the quality of stormwater/urban runoff within its jurisdictional boundaries and in storm drains it owns and operates. On July 1, 1992, 36 additional cities were initiated into the Permit and began their three-year program. By July 1, 1993, the remaining 30 cities in Los Angeles County within the drainage basin were initiated into their three year program. The cities were grouped according to their starting dates and referred to as Phases I, II, and III respectively (See Table A). In general, the boundaries of each Phase did not encompass whole watersheds but portions of various watersheds (See Figure 1).

The Permit has a five-year duration and although Phase III cities have only completed year one of their three-year program, the Permit requires the submittal of a Report of Waste Discharge (ROWD) which serves as an application for a subsequent NPDES Permit to replace NPDES Permit #CA0061654, which will expire on June 18, 1995. Therefore, the County of Los Angeles, the County of Ventura, Caltrans, and the 85 cities are now parties to the subsequent NPDES Permit application utilizing the Municipal Stormwater Management Plan (herein after called the Plan) concept.

The Plan is based on the Stormwater Management Plan Components developed by the California Regional Water Quality Control Board, Los Angeles Region (Regional Board), and is proposed on behalf of the County of Los Angeles and the other participating agencies, see Table B. This Plan describes the stormwater management activities to be undertaken during the next single, five-year NPDES Municipal Stormwater Permit. The Plan involves the subdivision of the area of the County under a single, new Permit, into six watersheds, each with its own stormwater management plan. For these watersheds and the agencies in each of these watersheds, see Table B and Figure 2.

As required by the current Permit, all Permittees have proposed BMPs for their jurisdictions, described in Volume One and under prior submittals made to the Regional Board. These BMPs have already addressed many of the program areas discussed under the stormwater management plan. As required by the current Permit and continuing on under the new Permit, the Permittees will continue to implement these BMPs. This stormwater management plan will involve reorganizing the individual city-based BMP programs into a single stormwater plan for each watershed. The timeline shown in this document reflects the time needed for the transition from individual city-based programs to the preparation of a mutually agreed upon and collectively developed watershed plan by all parties of the new Permit for each of the watershed areas. The first step in beginning

this process will be the reorganization of the current three-phase program into a new watershed based program. A reorganization of the Phases into watersheds which are based on hydrologic characteristics will allow for the consistent development and implementation of programs among Permittees, referencing land use and drainage infrastructure within their respective watersheds. Consistency of programs throughout the watershed will be beneficial in terms of targeting specific pollutant problems and areas.

This specific Plan will address stormwater management for the following permittees:

Caltrans **Los Angeles County** **Santa Clarita**

I. PROGRAM MANAGEMENT

A. PROGRAM STRUCTURE

The County of Los Angeles is designated as the Principal Permittee. The other agencies are designated as Co-Permittees. The following are conditions that establish the responsibilities of all Permittees.

1. RESPONSIBILITIES OF PRINCIPAL PERMITTEE

Anticipated duties of the Principal Permittee include:

- Being the coordinators of permit activities and chairing the area-wide Executive Advisory Committee and the Watershed Management Committees;
- Providing the resources necessary for development of the stormwater management plans;
- Providing technical and administrative support for both the Executive Advisory and Management Committees;
- Implementing the monitoring program;
- Providing the resources necessary for developing annual reports including evaluating monitoring program data and BMP effectiveness;
- Complying with all the responsibility of a Co-Permittee as outlined below.

2. RESPONSIBILITIES OF ALL CO-PERMITTEES

Each Co-Permittee is designated a number of duties under the proposed stormwater management plan:

- Participate in the development of the stormwater management plan;
- Implement the stormwater management plan within their jurisdictional boundaries and the storm drains they own and operate;
- Provide information needed by the Principal Permittee on program implementation for development of the annual reports.

The area under the Permit will be subdivided into the six watersheds tributary to the following waterbodies: Santa Monica Bay, which is further divided into a) Malibu Creek and Other Rural Areas, and b) Ballona Creek and Other Urban Areas; Los Angeles River; San Gabriel River;

VOL 15
0609
R0060829

Dominguez Channel/Los Angeles Harbor Drainage; and the Santa Clara River (See Figure 2). Managing these watersheds is a task that will require a collective and cooperative effort on the part of all governmental entities named in the Permit that are within each watershed.

The management structure of the Plan consists of an area-wide Executive Advisory Committee, Watershed Management Committees, and Subcommittees. This particular structure is intended to provide a suitable program for the unique characteristics of each watershed and shall be developed by April 1995.

The Co-Permittees tributary to the Santa Clara River watershed shall adopt this watershed stormwater management program structure as a guide to allow for an area-wide uniformity of compliance of the Permit.

3. EXECUTIVE ADVISORY COMMITTEE

The area-wide Executive Advisory Committee shall consist of the County of Los Angeles, as Chair, and two representative Co-Permittees from each of the six watersheds. This Committee assumes no responsibility for the adequacy or inadequacy of any individual city's program and should not be viewed as the responsible agency in this sense. The Committee's main role is to facilitate programs within each watershed and to enhance consistency among all of the programs. Additional responsibilities of the committee are:

a. Making recommendations on area-wide issues to each of the Watershed Management Committees;

b. Reviewing the stormwater management plans as developed by each Watershed Management Committee and provide directions and guidance on the plans for consideration by the Watershed Management Committees;

c. Assessing the consistency of all area-wide BMPs;

d. Preparing and forwarding unified submittals to the Regional Board upon receipt of information and materials submitted by the Watershed Management Committee in compliance with Permit requirements;

e. Scheduling and coordinating meetings and correspondence to allow for communication between the Co-Permittees and the Regional Board;

f. Acting as liaison between all Permittees and the Regional Board on Permit issues as well as mediating conflict among the Permittees.

R0060830

VOL 15 0610

4. WATERSHED MANAGEMENT COMMITTEE

A management committee within the watershed will be comprised of the County of Los Angeles, as Chair, and one representative from each of the Co-Permittees in the watershed. The committee shall be responsible for:

a. Establishing goals and objectives for the watershed;

b. Preparing the stormwater management Plan for the watershed (This includes the development of all chapter components of the Plan);

c. Assessing the effectiveness of the Plan and making appropriate changes;

d. Preparing the semi-annual progress reports and annual Permit reports on Permit activities within the watershed for submittal to the Regional Board (For the annual Permit report, a draft will be circulated to each Co-Permittee and the Executive Advisory Committee for its review and comment. Final copies of reports shall be forwarded to the Executive Advisory Committee through which a compilation from all six watersheds shall be submitted to the Regional Board);

e. Enhancing the implementation of the storm water management programs within the Santa Clara River watershed.

5. SUBCOMMITTEES

Subcommittees will be established where needed as determined by the Management Committee and/or the Executive Advisory Committee. The Subcommittees would be focused on specific program areas and can provide more specific oversight on the development, implementation, and evaluation of selected program areas. These subcommittees shall be scheduled to meet on a routine basis.

B. INSTITUTIONAL ARRANGEMENTS

Management of the stormwater program requires the collective efforts and the cooperation of all Permittees. No Permittee has the ability and the legal authority to assume the responsibility of all activities of this Permit. Therefore, agreements will need to be formally developed amongst the Permittees to insure proper implementation of the Permit requirements.

1. PROGRAM PARTICIPANT ARRANGEMENTS

As the Principle Permittee, the County of Los Angeles will be designated as the lead agency for coordination of Permit activities and therefore shall chair

R0060831

VOL 15 0611

the executive committee and the management committee meetings as they are scheduled. The lead agency is responsible for coordination of the Permit but is not responsible for the adequacy or inadequacy of any individual Permittee's program. All other entities are Co-Permittees and will be responsible for the Permit compliance of their own agency's program. An implementation agreement will be drafted formally detailing the responsibilities of the Principal Permittee and the Co-Permittees. The agreement would also address the funding of various watershed-wide activities such as plan development, annual evaluation and reporting, and monitoring. Execution of the agreement by all Permittees is targeted for December 1995.

2. AREA-WIDE INTERAGENCY

As the Plan for each watershed is more fully developed, the Watershed Management Committee will coordinate with special agencies and districts that also regulate and/or perform activities under different elements of the Plan. This coordination will attempt to ensure that their functions and the Plan are compatible. A few of these agencies include:

County Hazmat

- Any overlap of waste regulations, Household hazardous waste programs and or Industrial inspections shall be recognized and addressed, by all entities that fall under this Permit, in reference to the watershed program.

County Health

- Inspections of restaurants and other food handling establishments shall be coordinated with the Permittees.

Local Transportation/Congestion Management

- Local municipalities have limited authority over motor vehicle usage and regional transportation planning. Where feasible, plan development and implementation will be coordinated with local transportation agencies.

County (Regional) Parks

- Landscape maintenance activities at public-owned parks will be reviewed as part of additional plan development to ensure the use of proper management measures.

R0060832

VOL 15
0612

Mosquito Abatement

- Coordination with the County Agricultural Commissions will be done for mosquito abatement programs to avoid adverse impact on the quality of stormwater/urban runoff.

Water Districts

- Activities with regards to the Water Districts activities will be reviewed and, when feasible, comply with the watershed program regulations and requirements.

Other entities, both private and public which have major land holdings and/or authorities that impact the quality of stormwater/urban runoff should be initiated to participate actively in the program.

3. CITY-SPECIFIC INTERAGENCY ARRANGEMENTS

Each city will need to develop the institutional framework to address operation, maintenance, construction, redevelopment, and other activities performed by city agencies such as Public Works, Parks and Recreation, Planning, and Public Owned Treatment Works (POTWs). These city agencies will need to participate in the planning and implementation of relevant plan program areas.

C. FISCAL RESOURCES

As each of the Plan chapters are completed, each Permittee will develop a budget for implementing that portion of the Plan. A complete budget for the Plan will be produced upon completion of development for all Plan components (*December 1997*). The budget will provide information such as funding sources, staff resources, contract services, and cost sharing arrangements.

1. AREA-WIDE

In implementing the Plan, the Permittees may elect to jointly fund a single program for certain BMPs, such as Public Education, that are area-wide in nature. Funding agreements including budgets and cost per agency would be developed.

2. CITY-SPECIFIC

Each Permittee will develop a budget detailing the cost of implementing Plan activities within its jurisdiction. Special funding in the form of grants, donations, or other forms of contribution should also be actively pursued to assist in funding special studies and/or BMPs.

R0060833

VOL 15 0613

D. LEGAL AUTHORITY

Each Permittee is responsible for implementing the Plan within its jurisdictional boundaries and therefore must acquire all needed legal authority. Each Permittee, being separate legal entities, are to have adopted as required by the existing Permit, ordinances that will provide them with the adequate legal authority to develop, administer, implement, and enforce storm water/urban runoff management programs within their own jurisdiction. The ordinance must provide for its enforcement and at a minimum specify that violators may be subject to penalties including, but are not limited to, fines and termination of the activity causing the violation. A plan for identifying any additional legal authorities needed by the Permittees will be included in the completed Plan for the Santa Clara River watershed (*December 1996*). Upon completion of development of the Stormwater Management Plan, enforcing compliance with the Plan will be the responsibility of the Regional Board.

P:\INEZ\PLAN\PLAN2.SCR\J

R0060834

VOL 15 0614

II. ILLICIT DISCHARGES

The elimination of illegal connections and illicit disposal (IC/ID) practices is an important component for any program aiming to enhance the quality of stormwater/urban runoff.

Although more information is needed to assess fully the benefits and costs of conducting IC/ID programs, we can make logical decisions regarding application of Best Management Practices (BMPs) to minimize such incidents. These BMPs will vary due to the jurisdictional differences which exist within each watershed. Each jurisdiction within the watershed will be developing and implementing those activities which adequately serve the jurisdiction and the watershed as a whole.

IC/ID practices are intermittent discharges of pollutants into the storm drain system that can degrade the quality of receiving waters. This can occur through catch basins, area drains and even on gutters and street surfaces. Some illegal dumping activities are done by individuals who do not know that such practices are illegal and can adversely impact the environment. Yet, others may be carrying out such practices with the full knowledge that such activities are prohibited.

A. ILLICIT CONNECTIONS

In order to implement an illicit connection management program, jurisdictions as a whole will need to develop and implement the procedures for investigating each of their respective storm drain systems.

Detailed procedures to eliminate illicit connections depends on the complexity of the storm drain system. A consistent watershed wide concept will be developed to investigate illicit connections to the storm drain system. Based on the results of field screening activities, or other appropriate information which indicates an area of reasonable potential of containing illicit connections, detection and follow up procedures would be followed. Priority should be established to focus on major problem areas and allow for a cost-effective approach to eliminate illegal connections. This concept will be developed by December 1996.

1. SYSTEM SURVEY

A system survey is a necessary component of an illicit connection elimination program. Although the basic concept is similar, the actual techniques and methods which jurisdictions within the watershed use to conduct system surveys can be quite different.

In conducting system surveys, the intent is to avoid costly investigations within areas not suspected of containing illicit connections. Field screening, map

VOL 15 0615

R0060835

research, and land use investigation activities will be done initially to identify potential problem areas. Public outreach efforts will be used to inform citizens in the area about the problem. Enforcement action will be taken to terminate such illegal connections. It should be noted that more detailed and sophisticated techniques such as televised inspection and dye testing will only be used in special situations as needed.

Presently, Los Angeles County has undertaken such a survey. Maps detailing the location of each storm drain, its manholes and catch basin connector pipes are being prepared to facilitate monitoring of illegal connections and discharges. The location and source of discharge for connections is being inventoried. A GIS system to allow for the management and analysis of this data is also being developed. This information will be used in the storm drain inspection program which is ongoing. The program is targeting open channel storm drains. All open channels will be inspected for evidence of illegal discharges. The open channel inspection will also be used to collect information on dry weather discharges from underground drains for use in prioritizing future underground drain inspections.

2. ONGOING SYSTEM INSPECTIONS

Ongoing system inspections for illicit connections will involve the techniques identified in Section 1 above, along with some additional activities. In smaller systems where the storm drain goes into several pumping stations, a regular inspection of the pumping stations for, among other things, evidence of illicit discharges will be sufficient.

In larger and more complex systems, a program of field screening will be used. Evidence of pollution will be categorized and prioritized. The storm drain alignment tributary to the suspect illegal connection can then be further investigated for illicit connections. If a discharge can be traced to a particular facility, the facility will be investigated to identify where exactly the pollutants are coming from and efforts needed to stop the discharge.

Another means of detecting illicit connections may be to rely on reports of illicit discharge from the public. This will utilize the County's or another agency's established "hotline" number that the public can call and report such observations.

3. REPORTING

A consistent recording system will be established to track report of illegal connections. This recording system will be used by the Permittees within the watershed.

VOL 15
0616
R0060836

B. ILLEGAL DUMPING

Due to the intermittent and unpredictable nature of illegal dumping, apprehension rate of violators could be quite low. The first course of action is to develop an area wide educational and reporting system along with prompt response procedures. This will be accomplished by December 1996.

1. OUTREACH

See **Chapter VII: Public Information and Participation** of this report for a detailed discussion of the outreach program.

2. SYSTEM SURVEILLANCE

Measures that may be used for this aspect of the program may include, but are not limited to, regular inspections of vacant facilities, street use inspection programs to detect illegal discharges and dumping into the street system, and a public complaint and reporting system.

For example, Caltrans has established a system surveillance program for investigation, identification, and remediation of hazardous waste and debris dumped on excess parcels.

3. SPILL RESPONSE

The Health Hazardous Materials Division (HHMD) of the Los Angeles County Fire Department is generally the primary spill responder. If the material is found to be hazardous, the cleanup and disposal of the material will be done under the supervision of HHMD. If the material is non-hazardous, the responsibility will fall on local agencies to coordinate cleanup, disposal and attempt to identify and prosecute the violators. Cooperation among all agencies will be needed to allow for prompt action and joint effort to deter such violators. All agencies will have local authority against such illegal dumping activities.

To increase efficiency, Los Angeles County has evaluated the latest developments and equipment regarding improved containment procedures. Though their procedures were found to be adequate, new procedures are being developed. The County has also established a tracking system for complaints. While hotline complaints are registered, minor dumping violations will be followed up with a letter.

VOL 15
0617
R0060837

4. COMPLAINT RESPONSE

The County and some local agencies have established a stormwater telephone "hotline" that can be utilized by all citizens. Public complaints are generated through these "hotlines" and also through regular channels such as calls to Fire or Police agencies or to public works or legislative offices. Although responses to these complaints will vary depending on the nature of the complaint, action shall be taken.

5. COORDINATION OF ALTERNATIVE DISPOSAL

Alternative disposal is one way of reducing non-stormwater materials that can potentially find their way into the storm drain system. Recycling programs are one of the most effective ways to reduce waste material. The recycling program can either be at the curbside or through drop-off centers. Household hazardous wastes can be dropped at mobile collection centers or at fixed sites. Co-Permittees in the basin generally participate in the County's Household Hazardous Waste collection program. Effectiveness of those programs may be enhanced by a public outreach program that will inform the public of the locations and/or schedules for such events. Technical assistance or information may also be provided to businesses that want to develop a pollution prevention, waste minimization or alternative disposal program.

One example of alternative disposal is the Household Hazardous Waste Roundup events sponsored by the Los Angeles County Department of Public Works and the County Sanitation Districts. Rather than participating in the roundups, Caltrans recycles its used oil, anti-freeze, and other wastes. In addition, Los Angeles County has established a curbside recycling program for various materials including, aluminum, newspaper, glass, metal, and plastic.

6. REPORTING

Incidents involving a hazardous material entering the storm drain system are to be reported by the responsible party, or, if not known, the responding agency, to the California Regional Water Quality Control Board, Los Angeles Region (Regional Board). Complaints received through the County wide and local city hotlines will be tracked and reported to the Regional Board.

C. ENFORCEMENT PROCEDURES

Enforcement actions against discharges are done through either state hazardous and toxic materials statutes or through municipal ordinances that are already in the codes of the Permittees. Industrial Waste Ordinances may be used in enforcement actions against illicit connections. Furthermore, anti-littering, health codes, plumbing codes

VOL 15
0618
R0060838

and fire codes may be utilized for dumping or spill incidents. Enforcement actions can be taken by different municipal agents, including but not limited to, Industrial Waste Inspectors, Building or Plumbing Inspectors, Fire Department Inspectors, Park Rangers, Street Use Inspectors, Health Inspectors, Police Officers, Community Services Officers, Animal Control Officers, Code Enforcement Staff or Public Works Inspectors. Some of these agents are empowered to either issue citations, issue notices of violations, issue cease and desist orders, or even make arrests depending on the type of violation and the code provisions that they are enforcing. Some of these agents are also empowered to enforce not only municipal ordinances but also state laws. A review of the various enforcement tools used by the Permittees will be performed. A recommendation will result on a consistent enforcement approach for the watershed for consideration by all Permittees in their own enforcement programs. This recommendation will be developed by December 1996.

Both the Los Angeles County and Caltrans has regulations prohibiting improper disposal. The County regulations are enforced by Health Department, Fire Department, and Animal Control inspectors. Caltrans posts "No Littering" signs and fines violators. Santa Clarita has property maintenance inspections and a Beautification Committee that reach out to the community to discourage improper disposal.

D. COORDINATION WITH STATE NON-STORMWATER PERMITS

In order to characterize the nature of the existing non-storm discharges in the receiving waters within the watershed, a list of NPDES Permits issued by the Regional Board will be obtained. This will help in determining unexpected discharge during dry weather and to allow enforcement actions to focus on illegal dumping activities.

There is also a need to coordinate with other environmental agencies to ensure that requirements imposed by these agencies do not conflict with stormwater regulations. Requirements of many agencies do complement stormwater regulations. These agencies, include but not limited to, Fish and Game, DTSC, USEPA, and the Coastal Commission. Coordination with these agencies will help minimize overlapping investigations and result in a more efficient use of resources. A watershed wide concept will be developed by December 1996.

1. IDENTIFICATION OF PERMISSIBLE/PERMITTABLE DISCHARGES

A list of non-stormwater discharges that can be allowed to discharge into the Waters of the State will be established by the Regional Board.

VOL 15
0619
R0060839

2. APPROPRIATE MANAGEMENT PRACTICES

Continued communication with the Regional Board will allow current information to be circulated among all agencies.

3. REPORTING

Any conflict in requirements of other environmental programs/agencies must be reported immediately to the Regional Board for ruling as to which one should take precedence.

P:\INEZ\PLAN\PLAN2.SCR\II

VOL 15 0620

R0060840

III. INDUSTRIAL/COMMERCIAL SOURCES

Each Permittee shall develop and implement a program that focuses on the identification and control of storm water pollutant discharges from industrial/commercial facilities within their jurisdiction. This program shall provide for the inspection of a facility's compliance with storm water regulations, as well as general outreach for all facilities that are potential industrial and commercial dischargers.

Each Permittee is responsible, under the requirements of the Municipal Stormwater Permit, for all discharges from commercial and industrial facilities within its jurisdiction. Many industries are also required to be permitted under the State General Industrial Activities Stormwater Permit. Enforcement of the specific provisions of the State General Permit is the responsibility of the State.

A. IDENTIFICATION OF SOURCES

As required under the current Permit, the Permittees have produced a listing of industries by SIC category for each drainage area. Also a breakdown of major land use types was also performed for each drainage area.

A pollutant source identification program will be designed to identify significant pollutant sources (i.e. parking lots, industrial activities, etc.), with the hope that remedial action can be undertaken to reduce any significant impacts so identified. It will focus on monitoring very small areas (i.e. less than five acres) where a specific and/or interrelated set of pollutant generating activities are occurring. Its objective is to provide data for selecting BMPs for specific activities rather than characterizing discharges for long-term pollutant loading estimates.

Identification of pollutant sources can be done using a number of methods. Potential sources of storm water pollutants can be identified by records of chemical use and/or storage, by studies of specific activities which lead to the deposition of pollutants throughout the watershed, and by field inspection or monitoring. Watersheds which may contain significant pollutant sources can be identified through land use information or by mass load estimates.

By mid January 1995, the County will begin targeted monitoring of a municipal corporation yard in the Santa Monica Bay watershed. This will provide data on industrial activities which can take place at such a facility such as vehicle maintenance and repair, materials storage, equipment storage and repair. A more comprehensive program to identify various pollutant sources will be developed by March 1997.

VOL 15 0621

R0060841

1. CATEGORICAL LIST

Sources identified as a categorical industry regulated by the U.S. Environmental Protection Agency (EPA) will be grouped into a categorical listing of industries. The categorical list provides an organized overview of the target facilities that, based on land use, operation, and activities, could potentially contribute significant amounts of pollutants into storm water runoff. Some of the industrial categories regulated by the U.S. EPA include, but not limited to:

- Aluminum Forming
- Asbestos Manufacturing
- Battery Manufacturing
- Canned & Preserved Fruits & Vegetables
- Cement Processing
- Copper Forming
- Electroplating
- Glass Manufacturing
- Grain Mills
- Machinery Manufacturing & Rebuilding
- Soap & Detergent Manufacturing
- Metal Finishing
- Metal Molding & Casting
- Oil & Gas
- Organic Chemicals & Plastics & Synthetic fibers
- Paint Formulating
- Pesticides
- Plastic Molding & Forming
- Rubber Manufacturing
- Sugar Processing
- Textile Mills

2. RANKING

Industrial and commercial facilities identified as pollutant sources shall be ranked in order of priority for development of management measures. Facilities considered to be high priority are those whose operations and activities are determined to potentially contribute the most significant pollutant impacts to storm water discharge.

3. UPDATE PROCEDURE

Each year the Co-Permittees will evaluate the results of the monitoring program, the illicit discharge investigation program, and other available information , to identify likely sources of specific pollutants. The annual report to the Regional Board will recommend a strategy for pollutant source identification during the following year, including specific sites and/or activities to be monitored.

VOL 15
0622
R0060842

B. CONTROL MEASURES

Specific urban runoff control programs for major potential pollution sources shall be developed by March 1997. Within these programs storm water pollution control measures shall be developed for various pollutant sources. Control measures such as source control and treatment control offer different, but complimentary approaches to storm water pollution control.

Source control measures focus on good housekeeping practices, pollution prevention and minimization, and education. They are also less costly than treatment controls.

Treatment controls involve physical treatment of the runoff, usually through structural means. Also treatment controls will not remove all pollutants and their removal efficiency is difficult to predict given the limited understanding of the relationship between facility design criteria and performance.

The initial focus will be on the development of source control measures. As information is collected under the pollutant source identification program regarding specific pollutant sources, specific control measures, including structural, will be evaluated as to their effectiveness in addressing these sources.

1. POLLUTION PREVENTION MEASURES

Source minimization and education are the first steps in effective source control. Other activities that contribute to source control are:

- Site design alternatives (i.e. roof over fueling stations and carwash slab, provide spill containment curb around stored material, etc.)
- Good housekeeping practices

2. STRUCTURAL (TREATMENT) MEASURES

A variety of treatment control measures have been utilized throughout the country for storm water quality. However, the effectiveness of these controls are highly dependent on local conditions such as climate, hydrology, soils, groundwater conditions, and extent of urbanization.

Some of the more common treatment controls are:

- Oil/water separators - Oil/water separators are designed to remove one specific group of contaminants: petroleum compounds and grease. However, separators will also remove floatable debris and settleable solids.

VOL 15 0623

R0060843

- Infiltration - A family of systems in which the majority of the runoff from small storms is infiltrated into the ground rather than discharged to a surface water body. Infiltration systems include: ponds, vaults, trenches, dry wells, porous pavement, and concrete grids.

- Wet ponds - A wet pond has a permanent water pool to treat incoming storm water.

- Constructed Wetlands - Constructed wetlands have a significant percentage of the facility covered by wetland vegetation.

- Biofilters - Biofilters are of two types: swale and strip. A swale is a vegetated channel that treats concentrated flow. A strip treats sheet flow and is placed parallel to the contributing surface.

- Extended Detention Basins - Extended detention basins are dry between storms. During a storm the basin fills. A bottom outlet releases the storm water slowly to provide time for sediments to settle.

- Media Filtration - Media filtration consists of a settling basin followed by a filter. The most common filter media is sand; some use peat/sand mixture.

- Multiple Systems - Multiple systems are a combination of two or more of the preceding controls in series.

C. OUTREACH

General outreach for all facilities that are potential industrial and commercial dischargers shall be set up area-wide by the Management Committee, to provide general guidance in complying with the storm water program by March 1997. It shall also serve as a reminder of pollution prevention measures and keep facilities informed of their obligations to the storm water program.

Subcommittees may be established to develop specific outreach materials for industrial and commercial categories and specific activities that are identified as high priority.

For additional information on outreach, refer to **Chapter VII: Public Information and Participation** of this report.

VOL 15 0624

R0060844

D. INSPECTIONS

Most municipalities have existing programs such as industrial waste, fire, and health in which industrial and commercial facilities are inspected on a regular basis. Each Permittee may elect to have inspections for the storm water program incorporated into these existing inspection programs, or be done as a completely separate program, depending on the needs of the Permittee.

The purpose of these inspections is to ensure that facilities are in full compliance with the storm water regulations and to ensure that control measures are being implemented. The frequency of inspection of facilities will be prioritized based on the operation and categorization of the facility.

Inspectors consisting of public personnel will be trained adequately to recognize and handle problematic activities concerning storm water pollution that may be existing or potential; and inspect for the deterioration of the storm drain system and illegal/improper connections. Training programs will be developed through the Watershed Management Committee and possibly specific Permittees for use by all Permittees.

Procedures for the identification, investigation, enforcement, and prosecution to the full extent of a jurisdiction's legal authority will be developed.

For example , Los Angeles County issues permits to all commercial and industrial facilities that generate industrial wastes. Included within this program are auto related businesses, gas stations, and restaurants. Facilities with industrial waste permits are regularly inspected. In addition to those businesses in the unincorporated areas, the County Department of Public Works also provides industrial waste inspections, under contract, for Santa Clarita. The City is in the process of developing an inspection program in which facility inspections are performed in response to complaints.

1. CHECKLIST

Inspectors shall have a uniform checklist to use as guidance and reference throughout an inspection. It may also serve as a general guide for the public, providing information about the requirements necessary to comply with the storm water regulations.

2. SCHEDULE

The inspection program shall be developed by March 1997. The frequency of inspections shall be scheduled according to the type of operation and the

VOL 15
0625
R0060845

categorization of the facility. Revisit inspections shall be done on an as needed basis.

3. REPORTS

Inspectors shall report on all activities related to and/or violating the local storm water ordinance to the local governing agency. Standard reporting procedures will be developed.

4. FOLLOW-UP PROCEDURES

Individual Permittee review and assessment of the reports may result in the need for follow-up procedures, such as reinspection or legal action, provided the jurisdiction has the adequate legal authority to do so. Follow-up procedures will be developed to insure a uniform and consistent approach.

E. LOCAL INCENTIVE PROGRAMS

In developing the industrial/commercial program, the Permittees may consider the development of optional measures such as clean business incentive programs that may offer more focused control on industrial and commercial sources. The targeted completion date for this program is March 1997.

F. TRAINING

Development of training programs for industrial storm water inspection staff is projected to be completed by March 1997.

1. PUBLIC EMPLOYEES

All public employees shall be trained in the storm water regulations so that they abide by the regulations in the course of their work day. Also they need to be able to recognize and distinguish between legal and illegal activity so as to administer the proper protocol in handling the situation.

For example, the Los Angeles County Department of Public Works has requested all employees to report any observed water quality problems. Caltrans employees have received education in hazardous substance spill awareness, pesticide safety, and vegetation management.

2. INSPECTORS

Inspectors who visit industrial and commercial facilities shall be adequately trained to determine compliance with the storm water regulations and educate

VOL 15
0626
R0060846

the facilities about the requirements of the program. In addition, they should be able to recognize and handle immediate problems as they are encountered, during an inspection; and inspect for the deterioration of the storm drain system and illegal/improper connections. Citation training will be necessary for inspectors in agencies that have the citation authority.

G. COORDINATION WITH STATE INDUSTRIAL STORM WATER PERMIT

The Permittees have existing local ordinances governing industrial discharges and other non-stormwater discharges that require compliance activities similar to those in various State Regulations. Because coordination between the Permittees and the Regional Board is anticipated concerning the regulation of industries, a mutual agreement may be required regarding industrial inspections and enforcement. Additional issues could also be addressed. Federal stormwater regulations hold local municipalities responsible for stormwater discharges from all industrial/commercial facilities, including those covered by General Permit.

1. MEMORANDUM OF UNDERSTANDING

A Memorandum of Understanding (MOU) may be used to formalize the agreement between municipalities and the Regional Board on industrial compliance program issues. A MOU among all local agencies may also be needed to ensure co-operation between all the agencies. The need for and specific requirements for such agreements would be developed upon completion of development of the industrial/commercial program by March 1997.

2. REPORTS

The MOU discussed above may include the exchange of information between the Permittees and the Regional Board. Appropriate formats for such reports would be developed as required.

P:\INEZ\PLAN\PLAN2.SCR\III

VOL 15 0627

R0060847

IV. NEW DEVELOPMENT AND REDEVELOPMENT

Managing stormwater and runoff from both new construction and redevelopment, will reduce pollutants from entering the storm drain system and subsequently the receiving water.

A. PLANNING PROCESS

Quality of stormwater discussion should be included in the General Plan and the Zoning ordinances. Efforts to enhance the quality of storm water can filter into the Subdivision actions. Much of the storm water concerns can be channeled through the compliance effort of the California Environmental Quality Act (CEQA). A watershed wide concept will be developed by June 1997.

1. WATERSHED PROTECTION POLICIES

An integrated strategy will be developed for the watershed. Pollution control efforts should be prioritized. A variety of statutory and regulatory requirements could be used for this watershed oriented program. Watershed protection policies need to be adopted by the local jurisdictions which control land-use within the watershed.

Both Caltrans and the City of Santa Clarita have regulations for watershed protection. Caltrans has established a requirement for water pollution control for construction projects. Construction may be halted if inadequate provisions have not been made for water quality. Santa Clarita, in November 1992, adopted a Hillside Development ordinance that contains provisions for drainage, erosion control, runoff, and landscaping. Los Angeles County has existing Ordinances that address drainage erosion control, runoff, and landscaping.

2. COORDINATION WITH CEQA

The current CEQA "Environmental Checklist Form" that is used for initial studies assessment indirectly address potential impacts to stormwater. Additions could be made to the Form to directly assess stormwater quality impacts.

CEQA requires agencies to use feasible alternatives or mitigation measures to lessen potentially significant effects. The ability to identify a) when an effect is significant, and b) which mitigation measures could be adopted to reduce the effect, is critical to the CEQA process. A clear assessment of any development, its potential adverse impacts on stormwater quality will allow

VOL 15 0628

R0060848

for a determination of "significance" which will enable the decision maker to make development decisions upon full disclosure of possible adverse impacts.

3. SITE PLANNING PROCESSES

All development will require the review and approval of a site/plot plan or development drawings prior to issuance of a building permit. Incorporating the consideration of potential water quality impacts including erosion and sedimentation during the early stages of the planning process will allow these issues to be addressed before substantial investments in engineering and design have been made.

4. GENERAL PLAN CHANGES

The General Plan is the legal backbone of the planning process. All development approvals, zoning ordinances, subdivision approvals and public works projects must be consistent with the policies, objectives, and principles set forth in the General Plan. Discussion of stormwater issues in the General Plan could greatly enhance the awareness of the issues and encourage full assessment of possible adverse impacts on stormwater quality as the result of new and redevelopment.

5. USE OF MASTER PLANS

For agencies which utilizes master plans to guide their development activities, stormwater issues can be outlined in such documents. This will channel efforts to fully assess the possible adverse impacts on stormwater quality as the results of any development within the master plan area.

6. OTHER POLICIES

Numerous other policies or mechanisms could be used to incorporate stormwater management goals into the planning/development process. Other concepts will be evaluated for their feasibility during the more detailed development of this Chapter.

7. PLANNING-PUBLIC WORKS INTERFACE

A variety of mechanisms for coordinating planning and public works activities exist. An example could be some form of CIP (capital improvements program). Ideally, any planning documents which target or project population growth are coordinated with CIP. Integrating stormwater management into CIP will allow for mitigation of major adverse impacts on the quality of stormwater prior to any actual construction.

VOL 15
0629
R0060849

2. CHEMICAL AND WASTE MANAGEMENT REQUIREMENTS

Chemical and waste handling activities are also currently subject to a variety of regulations. BMPs to address this pollution source are largely centered around "good housekeeping practices". It involves storing, handling, using, and disposing of these potential pollutant sources in ways that restrict opportunities for unintended introduction of the materials into site runoff. Proper chemical and waste management will reduce any accidental discharge into the storm drain system.

3. INSPECTIONS

Inspections are a routine part of local jurisdictions oversight of regulated construction activity. Its purpose is to ensure that construction site runoff control measures are being implemented. Existing practices should be examined and modified accordingly to satisfactory stormwater/urban runoff objectives.

a. Checklist

A checklist would encourage possible streamlining of any requirements. It could be cumbersome if an overly rigid approach were taken which resulted in unnecessary administrative burden. However, careful design of the checklist could avoid this pitfall.

b. Schedule

Inspection schedules will depend upon existing practices. It may be desirable to have several schedules, depending upon the types of activities/permits and/or the timing of activities.

c. Reports

A standardized reporting format is needed to allow for consistency among all jurisdictions. Furthermore reports are also a useful tool for future refinement of pollution control regulations.

d. Follow-up Procedures

A format will be developed to do follow-up inspections on problem facilities. Its frequency will greatly depend on the land use and the degree of non-compliance of each facility.

VOL 15
0630
R0060850

C. LOCAL PERMITS

Permits are a form of "cross checking" by local agencies to ensure that regulations are being implemented. Prior to the issuance of a permit, information must be submitted for review and approved. A watershed wide concept to provide some consistency in local permits will be developed by June 1997.

1. COORDINATION WITH EXISTING PERMITS

Storm water issues should be incorporated into existing permits.

2. NEW PERMIT ISSUES

Storm water issues should be clearly stated in new permits to be issued for new and/or redevelopment activities.

D. TRAINING

Training will enable staff to keep current of the latest storm water regulations. A watershed wide staff training concept will be developed by June 1997.

1. PLANNING PERSONNEL

(See E.1.b. below)

2. PUBLIC WORKS PERSONNEL

(See E.1.b. below)

3. INSPECTORS

(See E.1.b. below)

E. CONTROL MEASURES

Best management practices for the control of construction related pollution can generally be divided into three categories:

Nonstructural Source Controls for Reducing Urban Stormwater Pollutants:

- Practices that reduce the generation and accumulation of potential stormwater contaminants at or near their source.

R0060851

Development Layout Stormwater Controls:

- Practices that are directed at controlling the volume and discharge rate of runoff from urban areas, as well as, reduction of the magnitude of pollutants in discharges through temporary storage or flow restrictions.

Erosion and Sediment Controls:

- Practices that can prevent or treat problems related to transport of eroded material from construction and other land disturbing activities.

Development layout stormwater controls are of particular interest. These control measures can be incorporated in the initial planning phase of any project. A watershed wide concept will be developed by June 1997.

1. POLLUTION PREVENTION MEASURES

a. Site Design

Effective implementation of urban BMPs requires integration of water quality control elements early in the site planning and design process. Development of the water quality controls should not only achieve maximum pollutant removal with minimal costs, but also reduce potential maintenance.

This may include incorporating water quality concerns into the site layout and design (i.e. maximize pervious areas, minimize directly connected impervious areas, etc.) and/or treatment control measures proven to be cost effective for local climate, soil, and development conditions.

Due to the diversity of climate and local conditions, the development of BMPs vary from location to location, and even jurisdiction to jurisdiction. The selected management practices should be designed for the local site conditions and especially seasonal rainfall conditions that are experienced in Southern California. Suitability for the major land use and drainage characteristics should also be fully assessed.

b. Education/Training

Education/training is imperative to the success of any BMPs selected for new or redevelopment projects. BMPs will fail if not properly designed, installed, and maintained. Only well trained personnel should be assigned to these responsibilities.

VOL 15 0632

R0060852

A program for effective education/training should be based on four objectives:

- Promote a clear identification and understanding of the problem, including activities with the potential to pollute stormwater;
- Identify solutions (structural and nonstructural BMPs);
- Make every employee responsible for stormwater pollution and its solution; and
- Integrate employee feedback into training and BMP implementation to improve BMPs.

c. Other

In many cases stormwater pollution control may already be achieved by existing regulations or programs. In California, the General Plan Law and the California Environmental Quality Act (CEQA) provide a basis for municipalities to review and comment on all projects within their jurisdiction. Under the General Plan Law, municipalities are required to develop policies and regulations which guide development within the municipality. Each development project is then reviewed for conformance with these policies. Under CEQA, projects are also subject to review and comment for any adverse impact the projects may have on the environment, including impacts from stormwater discharges.

2. POST CONSTRUCTION (TREATMENT) MEASURES

a. Applicability

Each site considered for development or redevelopment will (at the conclusion of construction) have final improvements and unique site characteristics such as: drainage patterns; soils; landscaping; topography; percent of impervious surfaces; rainfall; pollutants inherent with the use of the development; and pollutants that may be background to the area (existing vegetation, air fallout, etc.). The applicability of various treatment control BMPs for use in new development will be evaluated through the use of pilot studies and examination of studies done on treatment control measures by other agencies.

b. Effectiveness

Prior to implementing any treatment control measures, they will need to be evaluated for their effectiveness. This can be done through pilot studies which could include elements such as: pre and post storm event inspections; water quality monitoring; record keeping to

VOL 15 0633

R0060853

document deficiencies in the BMPs; Operation and Maintenance requirements; and cost effectiveness.

c. **Retrofit Opportunities**

The feasibility of retrofitting existing developments with treatment control measures will be evaluated. However, the effectiveness of a treatment control measure versus its cost must be fully evaluated prior to considering its use as a retrofit measure.

3. OPERATION AND MAINTENANCE

a. **Requirements**

Jurisdictions within the watershed will need to insure that BMPs incorporated into a private development are properly maintained. Deed restrictions, covenants, conditions and restrictions (CC&R) could be used to direct such requirements and responsibilities.

b. **Responsible Party**

The contractor, during construction, must ensure that the post-construction BMPs are installed properly and that any maintenance that may be necessary during construction is performed. After the project is completed, it will then be the responsibility of the fee owner, private or public, to provide for long term operation and maintenance. This may be accomplished by deed restriction and/or CC&R.

4. CONFLICTS WITH OTHER MANDATES

Often regulations of various Federal, State, and local agencies would conflict with each other. Health, fire, and building codes often have requirements focusing on short term human health and safety and neglecting the impacts on the environment.

a. **Identification of Conflicts**

As the Plan is developed, other regulatory requirements that conflict with the stormwater program requirements may be uncovered. Clarification of these regulations should be directed to the various responsible regulatory agencies.

b. **Conflict Resolution**

For regulatory conflict caused by local regulations, efforts will be taken to resolve them within the agencies. Input form other local, state, and federal agencies should be incorporated into a modification of current

VOL 15 0634

R0060854

standards. The Regional Board should resolve conflicts involving other State and/or Federal requirements.

F. OUTREACH

See Chapter VII: Public Information and Participation for information.

G. ENFORCEMENT

See Chapter II: Illicit Discharges, Section C Enforcement Procedures for information.

H. COORDINATION WITH STATE CONSTRUCTION STORM WATER PERMIT

1. MEMORANDUM OF UNDERSTANDING

An agreement between the Regional Board and Co-Permittees may be used to enhance compliance of construction site BMPs. The need for such as agreement will be evaluated. If found to be desirable, an agreement will be developed by June 1996.

2. REPORTS

The local enforcement agency of the State Construction Stormwater Permit, which is the Regional Board, should forward all information, including Notices of Intent filed and any inspections and enforcement actions taken , to the Permittees so that this information can be available to local municipal construction site inspectors to alert them of any specific concerns on the job site.

3. OTHER ISSUES

The Regional Board should explore funding to be channelled to the Co-Permittees so the Co-Permittee can be more actively involved with the State on the Permit.

P:\INEZ\PLAN\PLAN2.SCR\IV

VOL 15 0635

R0060855

V. PUBLIC AGENCY ACTIVITIES

All municipalities perform functions that have an impact on stormwater quality. These include, among other things, vehicle maintenance, landscape maintenance, weed control, water body maintenance including swimming pool maintenance, etc. Other activities such as construction and maintenance of streets and roads, and construction and maintenance of the flood control system also could directly or indirectly cause adverse impact on the quality of stormwater/urban runoff. Since municipalities must address all significant sources of pollutants, all of these activities must be examined and mitigation measures be incorporated into the routines. As part of the requirements of the current Permit, many of the Permittees have already begun implementation of measures to address the above activities. An examination of these existing measures will be done on a watershed wide basis to establish the most effective approach to address these activities. Such approaches shall be developed and begin implementation by September 1997.

A. SEWAGE SYSTEMS

Sewage spills must not be allowed to enter the storm drain. Control procedures for identifying, repairing, and remediating sewer blockages, infiltration, inflow, and wet weather overflows from the sewers to the storm drain system should be implemented to protect stormwater quality. These procedures could include, but are not limited to, quick field response to overflows, follow-up testing, and complaint investigation.

When sewage spills do occur, they must be contained and collected for proper disposal. Individual permittees may need to modify their sewage overflow response procedures. The field personnel should also have procedural training for field screening, sampling, smoke/dye testing, and TV inspection, if appropriate, to be able to properly investigate any suspect connections or cross connections to the storm drain system.

For example, the Los Angeles County has a number of programs aimed at preventing sewage spills from entering the storm drain system. These include the following:

- Sewage Overflow Response Procedures Revision/Root Control Review - This involves improvement of procedures for containment and cleanup of spilled sewage resulting from overflow.
- Reline Sewer Lines - Two locations will undergo relining of existing sewer lines to prevent infiltration and exfiltration.
- Sewer Pipeline Reconstruction - One hundred and twenty-seven miles of cement pipelines will be analyzed and replaced or rehabilitated within 5 years.

VOL 15
0636
R0060856

- Sealing of Manhole Covers - This program has sealed manhole covers and bar holes in areas subject to flooding.

- Expansion of Emergency Call List - Beeper numbers of all supervisors, superintendents and stand-by crews were added to emergency call list.

B. CORPORATION YARDS

Corporation yards include any area or facility that is used for vehicle maintenance or washing, other maintenance, chemical storage, paint facilities, and supportive activities for field crews. Permittees will need to incorporate pollutant control measures at these facilities and develop a plan for each facility outlining the measures to be implemented. Since these are industrial type activities, the corporate yards would need to implement measures as described in the Industrial/commercial Source Chapter.

1. STORM WATER POLLUTION PREVENTION PLANS (SWPPP)

Though not required, permittees may elect to use some form of SWPPP as a vehicle for compliance. Any BMPs to be implemented must be part of a comprehensive plan designed to address the various pollutant sources at each corporate yard. To achieve this goal, the municipalities should first identify the potential pollution sources and who is responsible for implementing the storm water management measures. Based on the facility type, management practices and schedule of implementation will be developed. BMPs that can be used to improve the quality of runoff include, but are not limited to, housekeeping practices, material storage control, vehicle leak and spill control, and illegal dumping control.

2. OUTDOOR LOADING/UNLOADING OF MATERIALS

Municipal employees who handle potentially harmful materials should be trained in good housekeeping practices to prevent or reduce the discharge of pollutants to storm water from outdoor loading/unloading of materials. Materials spilled, leaked or lost during loading/unloading may collect in the soil or on other surfaces and be carried away by runoff or when the area is cleaned.

Applicable BMPs should be selected based on the following four factors: 1) Extent of exposure of material to rainfall, 2) preventing stormwater run-on, 3) checking equipment regularly for leaks, and 4) containing spills during transfer operations.

VOL 15 0637

R0060857

3. MATERIAL STORAGE CONTROL

A program should be developed to prevent or reduce the discharge of pollutants to storm water from outdoor container storage areas using measures such as installing safeguard again accidental releases, secondary containment, conducting regular inspections, and training employees in standard operating procedures and spill cleanup techniques. Employee education is paramount for successful implementation. Employees should be trained in emergency spill cleanup procedures.

To limit the possibility of storm water pollution, containers used to store dangerous waste or other liquids should be kept inside the building unless this is impractical due to site constraints. Storage of reactive, ignitible, or flammable liquids must comply with the fire and California OSHA codes. Practices such as placing containers in a designated area should be employed to enhance such requirements.

4. VEHICLE AND EQUIPMENT WASHING AND MAINTENANCE

Washing vehicles and equipment outdoors or in areas where wash water flows onto the ground can pollute storm water. For municipalities that wash vehicles or pieces of equipment on-site, it should be performed in a designated area equipped with an oil/water separator.

Vehicle or equipment maintenance is a potentially significant source of storm water pollution. Parts are cleaned with solvents. Many of these cleaners are harmful and must be disposed of as a hazardous waste. Appropriate BMPs are waste reduction, use of alternate products, recycling, and spill leak clean up control.

5. WASTE HANDLING AND DISPOSAL

Proper waste management is possible by tracking waste generation, storage, and disposal; reducing waste generation and disposal through source reduction; and preventing run-on and runoff from waste management areas.

C. PARKS AND RECREATION

Park Departments manage landscaping and swimming pools. Both of these activities involve the use of chemicals, waste management, and non-storm water discharges. In addition maintenance of swimming pools requires the periodic discharge of large quantities of swimming pool water.

VOL 15
0638
R0060858

1. FERTILIZERS/PESTICIDES

a. Use/Application management

Municipal facilities should develop controls on the application of pesticides, herbicides, and fertilizers. Control may include:

- List of approved pesticides and selected use;
- Product and application information for users;
- Equipment use and maintenance procedures; and
- Record keeping.

Employees can be educated about environmentally sensitive alternative products by using information developed by various public agencies and other environmental organizations.

b. Storage

Improper storage of fertilizers and pesticides can lead to potential groundwater, soil, and stormwater contamination. To prevent or reduce their impact on stormwater pollution, material storage areas must be designed and maintained to reduce exposure to storm water. The following BMPs can help to achieve this goal:

- Store materials inside or under cover on paved surfaces,
- Use secondary containment,
- Minimize storage and handling of hazardous materials,
- Inspect storage areas regularly.

2. FACILITY MANAGEMENT

a. Wash Waters

Wash waters cannot be discharged into the storm drains untreated. The storage area should be slightly sloped for wash water collection. If the water is not discharged to the sanitary or process waste sewer, or to a dead-end sump, the outlet should be equipped with an oil/water separator or other treatment systems.

b. Maintenance

Landscape maintenance involves the use of pesticides and fertilizers. Proper use of these materials will reduce the risk of loss to storm water. Whenever possible, leave or plant native vegetation to reduce

VOL 15
0639
R0060859

water, fertilizer, and pesticide needs. Integrated pest management should be employed where appropriate. The Park Departments should also establish a schedule for irrigation and fertilization. The chemicals will be carried from the site by the next storm if they are applied during the wet season. Overwatering leads to discharge of water that may have become contaminated with nutrients and pesticides.

Storm water from parking lots may contain undesirable concentrations of oil, grease, suspended particulates, and metals, as well as the petroleum byproducts of engine combustion. Possible maintenance BMPs include periodic sweeping and cleaning catch basins.

c. Swimming Pool Waters

The drainage of swimming pool water must insure that chlorine residual is below allowable water quality limits. The potential for recycle/reuse for irrigation of lawns and landscapes may be investigated. Swimming pool filter backwash waters should not be discharged to the storm drain, but should be allowed to settle and then disposed to the sanitary sewer. Other possible alternative measures would be to use the backwash for irrigation or disposal on a dirt area.

D. STORM DRAIN SYSTEM OPERATION AND MANAGEMENT

The maintenance and operation of the storm drain system has an impact on storm water quality and must be addressed. Material clogging storm drains cannot be discharged into drains. It must be disposed of properly.

1. INLET MAINTENANCE

Regular maintenance of public and private catch basins and inlets is necessary to ensure their proper function. Maintenance will remove pollutants, reduce high pollutant concentrations during the first flush of storms, prevent clogging of the downstream conveyance system, and restore the catch basin's functional capacity. Keys to effective catch basin cleaning include the following:

- All basins should be cleaned annually prior to the onset of the rainy season;
- Clean catch basins in known problem areas more frequently to remove sediments and debris accumulated during the dry weather months;
- Keep records of the number of catch basins cleaned; and
- Track the amount of waste collected.

VOL 15 0640

R0060860

The Los Angeles County cleans its catch basins annually by hired contractor prior to the rainy season. Data on the quantity of debris is being collected to determine whether additional cleaning is justified.

2. DRAIN MAINTENANCE

Open channel storm drains should be cleaned at least annually prior to the rainy season. Problem areas should be cleaned more frequently as needed. Channels should also be monitored during the rainy season for any debris buildup and cleaned where needed.

To reduce the amount of debris entering the ocean, the Los Angeles County field personnel inspect open channels and sumps to pump plants after storms and clean as needed. Caltrans is preparing a priority list of drains and pump houses requiring cleaning, based on data from recent flooding.

3. WASTE MANAGEMENT

Excessive waste buildup will decrease the capacity of the channel, it is therefore crucial to reduce pollutant levels in storm water by regularly removing illegally-dumped items and material from storm drainage channels and creeks. A program should be developed to identify problem areas of illegal dumping so regular inspection and clean up can maintain the channel's optimum capacity and prevent the discharge of contaminants.

4. NEW SYSTEM DESIGNS

Current design standards for the construction of new storm drain systems will be evaluated in light of currently available pollutant control measures. Design standards may be modified to incorporate measures deemed appropriate for local conditions.

5. RETRO-FIT OPPORTUNITIES

The majority of the existing storm drain systems are in highly urbanized areas providing little opportunity for cost effective retro-fitting. However, currently available pollutant control measures will be reviewed for their effectiveness and possible use. This may include pilot studies to evaluate the performance of management practices under local conditions.

E. STREETS AND ROADS

Construction, operation, and maintenance of roads has an impact on storm water quality and will be addressed in the management plan.

VOL 15
0641
R0060861

1. SWEEPING

Street sweeping can collect refuse on street surfaces to prevent it from entering the storm drain system through catch basins.

a. Storm Water Quality Based Operation

In order to effectively implement the sweeping program, the permittees should keep accurate operation logs to track the program. Areas generating excessive refuse should be swept more frequently. Sweeping frequency may also be increased before the rainy season to reduce the amount of refuse entering the storm drain system. Parking on sweeping days should be regulated to facilitate the operation.

For example, the Los Angeles County sweep its 3025 curb miles weekly using vacuum and broom equipment. In response to the requirements of California Regional Water Quality Control Board (Regional Board), double sweeping has initiated on selected streets. Caltrans sweeps its roadways on a regular schedule determined by observable debris.

b. Waste Management

Vehicles transporting waste should have spill prevention equipment that can prevent spills during transport. The refuse collected will be transported to the appropriate disposal facilities.

Roadside trash receptacles are used by the Los Angeles County, Caltrans, and the City of Santa Clarita for waste management. The receptacles are emptied either weekly or on as needed basis.

2. STREET/PAVEMENT WASHING

Wash waters from street/pavement washing may be contaminated and must be managed as non-storm water discharges.

3. MAINTENANCE

a. Saw-cut Slurry Management and Paving Practices

Existing saw-cut management and paving practices conducted by the permittees will be evaluated and appropriate control measures developed. Possible control measures to be considered that would help reduce the impacts to storm water:

VOL 15
0642
R0060862

- Avoid paving during wet weather;
- Regularly repair potholes and worn pavement to reduce sediment loading;
- Store materials away from drainage courses to prevent pollution of storm water run-on; and
- Follow the storm water permitting requirements for industrial activities when mixing concrete with an on-site plant.

b. Waste Management

Good housekeeping practices will be implemented to insure proper management of any waste products that may be generated during maintenance activities. For example, to prevent concrete waste from entering the storm drain system, washout of concrete trucks should be conducted off-site or on-site in designated area. Excess concrete should not be dumped on site. Employees and subcontractors should be trained in proper concrete waste management.

The following steps will help reduce storm water pollution from concrete wastes:

- Store dry and wet materials under cover, away from drainage areas;
- Avoid mixing excess amounts of fresh concrete or cement on-site;
- Do not wash out concrete trucks into storm drains, open ditches, streets, or streams;
- Do not allow excess concrete to be dumped on-site, except in designated areas;
- Avoid paving during wet weather;
- Regularly repair potholes and worn pavement to reduce sediment loading; and
- Cover catch basins and manholes when applying seal coat, tack coat, slurry seal, fog seal, etc.

Employee/subcontractor training to insure implementation of good housekeeping measures should be based on four objectives:

- Promote a clear identification and understanding of the problem, including activities with the potential to pollute storm water;
- Identify solutions (BMPs selection);
- Promote employee/subcontractor ownership of the problems and the solutions; and

VOL 15 0643

R0060863

- Integrate employee/subcontractor feedback into training and BMP implementation.

c. Medians/Landscaped Right-of-Way

i. Irrigation

Overwatering of landscaping produces runoff. A properly timed irrigation schedule should be set up to minimize overwatering. Drip irrigation system should be used when feasible in new installations.

ii. Fertilizers/Pesticides

The handling, storage, and usage of fertilizers/pesticides are addressed in Chapter V, Section C-1.

F. FLOOD CONTROL

Common municipal practices, such as construction and operation and maintenance of the flood control system, may have a potentially adverse impact on storm water quality. Consequently, these practices shall be coordinated to the extent of preventing pollutants from impacting the water quality.

1. COORDINATION WITH NEW PROJECTS

Current design standards for the construction of new storm drain systems will be evaluated in light of currently available pollutant control measures. Design standards may be modified to incorporate measures deemed appropriate for local conditions. During construction, all appropriate BMPs will be utilized to control pollutants during the construction of the facility.

2. COORDINATION OF MAINTENANCE ACTIVITIES

Current maintenance activities with regards to desilting/sediment removal, vegetation management, and waste management shall be reviewed to insure that appropriate management measures are developed to comply with the storm water regulations.

3. OPERATION OF FACILITIES

Flood control facility operations will be reviewed to identify where appropriate management measures could be incorporated. However, primary

VOL 15
0644
R0060864

consideration will need to be given to the flood control function of the facility to protect health and safety.

4. RETROFIT OPPORTUNITIES

The majority of the existing storm drain systems are in highly urbanized areas providing little opportunity for cost effective retro-fitting. However, currently available pollutant control measures will be reviewed for their effectiveness and possible use. This may include pilot studies to evaluate the performance of management practices under local conditions.

G. PUBLIC FACILITIES

Storm water runoff and non-storm water discharges from other public facilities must also be addressed, including chemical use by these facilities, pressure blasting/cleaning sidewalks and other surfaces.

1. PARKING FACILITIES

Storm water from parking lots may contain undesirable concentrations of oil, grease, suspended particulates, and metals. Some control measures such as periodic sweeping and cleaning catch basins should be implemented. The need for more advanced structural controls would be evaluated through the pollutant source identification program. Pilot studies would be conducted on candidate structural controls to evaluate their effectiveness prior to large scale implementation.

2. GOLF COURSES

Golf courses require the use of large amount of water, fertilizers, and pesticides. Field personnel should be trained on the proper handling, storage, and usage of these chemicals (Refer to Chapter V, Section C-1 for detail). To prevent excess irrigation water from entering the storm drain system, proper management of watering schedules should be required.

3. SCHOOLS

The maintenance of playgrounds and athletic fields at schools require fertilizers and pesticides. Their safe storage and use affect not only the stormwater quality but also the health of the students and the staff. Therefore BMPs under Chapter V, Section C-1-b should be implemented. Each municipality should develop a program to encourage these schools to use environmentally sensitive products for fertilizers, pesticides, detergents,

VOL 15
0645
R0060865

and other chemicals. The schools should have proper material handling, storage, and disposal procedures for chemicals used in school laboratories.

4. HOSPITALS

Each hospital should have BMPs to control the handling and storage of medically related hazardous materials. All materials should be inventoried regularly, with record keeping protocols on supply and consumption. All personnel should be trained on the proper procedures on handling these materials, as well as emergency response. Each hospital should maintain a list of supervisors to be contacted if accident does occur. Disposal of these materials should be contracted out to commercial specialists.

5. PARKS/LANDSCAPES

Refer to **Section C Parks and Recreation**, of this Chapter, for information.

6. OTHER BUILDINGS/PLAZAS

Refer to **Section C-2 Parks and Recreation - Facility Management**, of this Chapter, for information.

H. PONDS, FOUNTAINS, AND OTHER PUBLIC WATER BODIES

Maintenance practices used on public water bodies, including waste management and non-stormwater discharges, must be addressed in the plan.

1. ALGAE CONTROL

a. Use of Chemicals

The use of herbicides or other chemicals to control algae growth should be carefully controlled and monitored to insure strict adherence to manufacturers' guidelines for use. Water sampling may be necessary to insure effective control.

2. CHLORINE MANAGEMENT

The use of chlorine for disinfection should be controlled. High dosage of chlorine may be harmful to the aquatic habitats. Dechlorination of pools and other water bodies would be required prior to draining.

VOL 15
0646
R0060866

3. MAINTENANCE

Each municipality should develop BMPs to prevent and control trash, debris, and other pollutants from entering water bodies. These measures could include routine trash collection along and on water bodies, public outreach to educate the public about the impacts of illegal dumping, and increase enforcement for violations.

P:\INEZ\PLAN\PLAN2.SCR\V

VOL 15 0647

R0060867

VOL 15 0648

VI. RESIDENTIAL

INTRODUCTION

Residential activities including private vehicle washing and maintenance; use of chemicals such as pesticides, herbicides, and paints; private swimming pool maintenance; and other household and landscape maintenance can contribute to storm water pollution. These are all examples of non-point source pollution, a significant impact on water quality. Measures that can be taken to improve the quality of the runoff from residential area all require active public participation. Feasible BMPS to mitigate the stormwater pollution problem should include practicing good housekeeping and the use of environmentally sensitive alternative products, vehicle leak and spill control, and water conservation. Development of the residential stormwater programs will be completed by December 1996.

A. HOUSEKEEPING PRACTICES

This BMP involves the development of a program to promote efficient and safe housekeeping practices (storage, use, and cleanup) when handling materials which may pollute stormwater/urban runoff. This could include, but are not limited to, fertilizers, pesticides, cleaning solutions, paint products, automotive products, and swimming pool chemicals.

A public education program will be developed to provide information on stormwater pollution and the beneficial effects of proper disposal on water quality; reading product labels; safe storage, handling, and disposal of hazardous products; list of local agencies; and emergency phone numbers. The above information can be disseminated through brochures or booklets made available at places such as public information fairs, municipal offices, and household hazardous waste collection events and facilities. City newsletter to residents is another means to inform the public, especially for those who do not participate or visit any offices or events.

B. ENVIRONMENTALLY SENSITIVE ALTERNATIVE PRODUCTS

This BMP, promoting the use of less environmentally sensitive products, can be implemented in conjunction with housekeeping practices. Alternatives exist for most product classes including fertilizers, pesticides, cleaning solutions, and automotive and paint products. The key to success will be to promote a willingness to try alternatives and to modify old habits.

R0060868

VOL 15

General information will be developed and made available to the public on such alternatives. The emphasis may be placed on the need to preserve the natural environment of the receiving waters (ocean, bay, stream, wetland, etc.) with the use of alternative products because of their less toxic nature and proper disposal after its use.

C. VEHICLE LEAK AND SPILL CONTROL

This BMP prevents or reduces the discharge of pollutants to storm water/urban runoff from vehicle leaks and spills by reducing the chance for spills, stopping the source of spills, containing and cleaning up spills, and properly disposing of spill materials.

Vehicles will leak and spill fluids. The key to successful pollution management is to reduce the frequency and severity of leaks and spills; and when they do occur, to prevent or reduce the environmental impacts. Through education, the public should be encouraged to regularly inspect and maintain their vehicles. Guidelines should be developed to inform the public on spill containment and cleanup procedures such as having absorbent material on hand and disposing the material properly.

D. WATER CONSERVATION

Water is a scarce resource, especially so in Southern California. Wasteful use of water could channel pollutants into the receiving waters. Practices such as hosing the driveway and overwatering the landscape contribute not only to stormwater pollution, but also to the depletion of our natural resource. In order to prevent stormwater pollution, the public has to be educated on the mechanics of our storm drain system - discharges into the system will flow untreated into the receiving water. They have to know that the lawn clippings they wash down the road will end up in the ocean. Public awareness of the function of the storm drain system, of the important of environmental health, and of our necessity to slow down the depletion of water resources will be a long way in reducing the pollution of stormwater/urban runoff.

Ordinances could be use to endow the related officials with legal authority to enforce water conservation. An ordinance prohibiting the wasting of water is one way of enforcement.

0649

R0060869

VII. PUBLIC INFORMATION AND PARTICIPATION

It is necessary to involve the public in the stormwater program for it to be effective. The outreach program should be focused on the specific needs of the individual cities. Due to the inter-relationship among the stormwater issues, the public information and participation program should be recognized as a whole, rather than a number of separate outreach programs. All public awareness efforts should clarify to the public that they are the ultimate beneficiaries of a successful stormwater management program.

A. GENERAL OUTREACH

The targeted audiences of a general outreach will include municipal employees, local construction contractors, businesses in the area, and the general public. They should be made aware of their responsibility for both the problems and the solutions to stormwater pollution. In order to effectively communicate the stormwater pollution abatement message throughout the watershed; written, audio, and visual materials should be utilized. The actual level, priority, and schedule of public information activities must be based on the community's needs and resources to maximize program effectiveness. A watershed-wide concept will be developed by December 1995.

1. WRITTEN MATERIAL

Co-Permittees should produce a variety of written materials to inform the residents within the watershed. Materials can include, but are not limited to, the following: flyers, brochures, door-hangers, newspaper articles, mail-inserts, banners, and posters. When necessary, these materials should be translated into a variety of foreign languages to reach minority residents in the community.

A diversity of print media has been used, particularly by the Los Angeles County. County publications include specific information on various storm water programs. The County also uses billboard and bus stop shelter advertising. Door hangers and refrigerator magnets are also distributed by the County.

2. AUDIO MATERIAL

Similarly, Co-Permittees may utilize audio materials to convey information regarding stormwater management. Examples of audio materials include radio advertisements/public service announcements and informational cassettes.

VOL 15
0650
R0060870

3. VISUAL MATERIAL

Catch basin stenciling program is an excellent means of educating the public on the mechanics of the storm drain system. The intent of the program is to enhance public awareness of the impact of stormwater pollution on receiving waters and to discourage improper waste disposal practices. Another effective medium for communicating the importance of stormwater management is through television. Possible measures include producing a public service announcement, cable access programs, and/or an informational video.

Catch basin stenciling is receiving full cooperation throughout the watershed. Portions of the catch basins within each Co-Permittee's jurisdiction have been stenciled, with plans by all to stencil the remainder. In terms of the use of public media, the Los Angeles County has used television to promote its activities through public service announcements and special programming.

4. DISTRIBUTION PLAN

General outreach efforts must be conducted throughout the entire watershed. Materials should be available at all public counters and distributed at public events such as environmental fairs and contests. A city newsletter is another effective method of conveying the pollution abatement message.

B. FOCUSED OUTREACH

Efforts should be made to target special groups. Focus could be on specific pollutants, practices and/or activities, or businesses. A watershed-wide concept will be developed by September 1996.

1. POLLUTANT SPECIFIC

For a particular watershed, there may be priority pollutants which are of more concern than others. The reduction of these pollutants may be addressed in a more focused public education and outreach program. Any of the methods used in the general outreach program may be utilized in a pollutant specific outreach program.

2. PRACTICE/ACTIVITY SPECIFIC

Everyone who lives or works in a particular watershed must realize that their actions have a direct affect on the quality of stormwater. These special groups must be made aware that their current practices/activities may be contributing to stormwater pollution. Practice/activity specific outreach programs should be developed and implemented throughout the watershed.

VOL 15
0651
R0060871

The use of written, audio, or visual materials should convey three primary messages: (1) what activities can cause stormwater pollution, (2) how Best Management Practices are used to prevent pollution, and (3) how one can report occurrences of stormwater polluting activities.

Practice/activity specific outreach should promote, publicize, and facilitate public reporting of illegal dumpings, illicit discharges, or water quality impacts associated with discharges from municipal separate storm sewers. An effective program should include the establishment, operation, and promotion of a reporting hotline. Timely reporting by the public of improper disposal and illicit discharges are critical in controlling such sources of stormwater pollution. Increase in public involvement may be achieved by sending a follow-up letter to callers or providing callers with some type of reward. Educational efforts throughout the watershed should inform the public about the existence of the Los Angeles County-wide hotline and any other local hotlines; provide them with information regarding what to look for, and guidelines/procedures on how to report incidents.

Another critical component of practice/activity outreach is the development of a program to facilitate the proper management and disposal of used oil and toxic materials. An effective program could include, but are not limited to, the operation of recycling facilities and the conduction of household hazardous waste round-ups. The program could also include information about alternatives to toxic materials. Educational efforts throughout the watershed should provide the public with detailed information regarding the Los Angeles County-wide Household Hazardous Waste Round-ups and any other local programs.

Within this watershed, Co-Permittees take part in outreach programs specifically aimed at preventing improper disposal of hazardous household products and encouraging actions that keep general wastes out of the storm drain system. Examples of these programs include recycling programs, public trash receptacles, and the cleaning of sidewalks, alleys, and vacant lots. Illegal dumping and discharges are also specifically targeted.

3. BUSINESS SPECIFIC

Due to the fact that some business operation have a higher potential of discharging pollutants into the storm drain system, a more focused public education and outreach program should be developed for them. Employees of these businesses should be educated on the issue of non-point source pollution and the effectiveness of Best Management Practices in reducing pollution. Besides written, audio, or visual materials that focus on specific businesses and their practices, mass mailings or articles in a trade/industry magazines are other possible means of focused outreach.

VOL 15 0652

R0060872

C. EDUCATION PROGRAMS

Increasing awareness is the major goal of the Public Information and Participation Program. An ideal means of accomplishing this task is through educational programs. Programs should be developed for a variety of audiences, including public employees and school children. Educational programs can also be an important part of a general or focused outreach. A watershed-wide concept will be developed by September 1996.

1. PUBLIC EMPLOYEES

It is important to educate all of the public employees about the stormwater program so that they do not continue with any practices that are counter productive. Furthermore, they can participate in the implementation and enforcement of the program. Ideas and suggestions of employees can be used to modify the program for improved effectiveness. The outreach must involve employees on many different levels - from program managers to field personnel. Educational programs for public employees may include, but are not limited to, articles in City newsletters, training classes, checklists for field personnel, and interdepartmental forum or committee. Any of the materials utilized in an outreach program - written, audio, or visual materials - may be used in a public employee educational program.

More formal training/education of employees are conducted or provided by all three Co-Permittees. The City of Santa Clarita has implemented a program to educate City staff while Caltrans personnel is educated on highway maintenance.

2. K-12

School children can play an important role in a public information and participation program. First, children are generally more easily motivated and the behavior changes made at that point in life tend to stay with them through adulthood. Secondly, school children can convey the stormwater pollution prevention messages to the members in their family. School programs must include information on the storm drain system, stormwater quality awareness, and may also include, but are not limited to, illegal dumping awareness, source minimization, and pollution prevention. Written material, videos, assembly programs, and field trips are examples of effective components of a K-12 educational program.

3. OTHER

Educational programs can also be developed for professionals and technicians who are not public employees. Agencies should include public outreach

VOL 15
0653
R0060873

material for business license renewal or outreach effort through professional and business associations.

D. CITIZENS PARTICIPATION

The residents of the watershed should not only be made aware of the stormwater program, they should be encouraged to participate in its implementation. Specific outreach programs should be developed to allow the public to participate and to inform them of available means for providing ideas and comments regarding the stormwater program. A watershed-wide concept will be developed by September 1996.

1. VOLUNTEER MONITORING

Volunteer monitoring is the result of increased public awareness and participation. The public can utilize the hotline for reporting suspected illegal practices. Such involvement, which is similar to the Neighborhood Watch Program on crime, usually has good results.

The Los Angels County has established an 800 hotline number that is available to all County residents for reporting illegal dumping. Outreach programs to publicize the hotline include advertising in newspapers and distributing of literature at various events.

2. COOPERATIVE OUTREACH

In order to promote public participation, cooperative outreach programs should be developed. These cooperative programs should help to create an awareness and an identification with the watershed. The catch basin stenciling and other signing programs are excellent examples of this type of cooperative effort. One possibility for cooperative outreach is an "Adopt-A-" program. Residents can "adopt" a highway, storm drain, catch basin, stream, etc. Other cooperative outreach efforts include events such as "Stormwater Pollution Awareness Week." The purpose of any of these activities is to inform and involve the local residents in regards to the stormwater management program.

The following are two examples of residents assisting public agencies in the development and implementation of storm water quality programs:

- The City of Santa Clarita has enlisted the assistance of the Eagle Scouts in its catch basin stenciling program.

VOL 15
0654
R0060874

- Caltrans and the Los Angeles County both have Adopt-A-Highway programs that rely on voluntary private participation to help with clean-up activities.

3. COMPLAINT PROCEDURES

Public comments/complaints are important to the success of a stormwater program. A hotline is an excellent mechanism for allowing the public to provide information. In Section B, "Focused Outreach - Practice/Activity", the various aspect of outreach effort is discussed.

E. EFFECTIVENESS EVALUATION

Permittees should develop a process to evaluate the effectiveness of their programs. Methods such as surveys and focus groups can be used to assess program's effectiveness. Results should gauge the community's level of awareness. Surveys and focus groups can also be used to provide insight into the program's direction and the formulation of attainable goals. A watershed-wide concept will be developed by September 1996.

P:\INEZ\PLAN\PLAN2.SCR\VII

VOL 15
0655
R0060875

VIII. PROGRAM EVALUATION

The effectiveness of the storm water programs developed under the Municipal Storm Water Management Plan (hereinafter called the Plan) must be assessed on a regular and consistent basis. The Plan for this evaluation must include a schedule for evaluation, a methodology for the evaluation, a discussion of who will carry out the evaluation, and what will be evaluated. In addition, there must be a mechanism to follow up on the information generated by the evaluation. The Plan should be adjusted based on the program evaluation.

A. PERFORMANCE STANDARDS

The Permittees will develop standards to judge the effectiveness of the activities and control measures proposed under each chapter of the Plan. The standards will serve as minimum performance levels to evaluate the implementation of control measures. The subsequently developed performance evaluation procedures/methodologies will be the tool to determine if a particular BMP has an impact on stormwater quality. In developing these procedures, we resolve to ensure that each BMP is implemented to the maximum extent practicable. The targeted completion of this phase will be December 1997.

1. DEVELOPMENT OF PROCEDURES

General performance standards for evaluating the effectiveness of the Best Management Practices (BMPs) will be developed for all the BMPs proposed in the Plan. The Watershed Management Committee will be responsible for developing and adopting these evaluation criterion. The Management Committee may elect to establish subcommittees to develop performance standards for specific program areas. The area-wide Executive Advisory Committee will then review and endorse the standards. Standard recording format and implementation schedule will be developed for each BMP by the Management Committee for use by all permittees. The permittees will be required to document BMP implementation using the standard format according to an established schedule. The utilization of quantitative approaches in measuring effectiveness will be used whenever possible. Methods that would yield comparable results for year to year evaluation will be developed.

2. ACTIVITY/SOURCE/ACTION AREA SPECIFIC

Program effectiveness will be performed based on the information generated by the performance evaluation procedures. Using street sweeping as an example, the Plan will propose a method of determining if street sweeping has an impact on water quality. This could include determining what kind of

VOL 15 0656

R0060876

pollutants are removed by the sweeping, measuring the size of the pollutants and the amount removed. Methodologies would be developed for each BMP, which will assure that each control measure or action is implemented to the maximum extent practicable. For street sweeping; this may include the frequency of sweeping now, the method of sweeping, the equipment used, how the equipment is cleaned and maintained, and the method of disposal for the material collected. A schedule and format of evaluation shall be developed for all the BMPs.

The California Regional Water Quality Control Board (Regional Board) has recommended 13 Baseline BMPs, to be developed and/or implemented by all permittees by the end of the current NPDES Permit. Existing Permit Task 5.2.5 requires an evaluation of the need for additional BMPs, source control, and/or structural control measures.

BMPs have only been implemented for a short time period by Phase I and Phase II cities. Phase III, which contains 30 new cities, has not yet implemented any BMPs. Therefore there is little or no data available to adequately assess effectiveness. In lieu of recommending any changes or additions to BMPs currently being implemented or proposed by the Permittees, a uniform data collection methodology will be established for each of the 13 baseline BMPs. This methodology would be used by all Permittees to compile data on their BMP implementation to allow for a uniform Countywide evaluation of BMP effectiveness. Priority will be given to the development of a uniform data collection methodology to document the success or effectiveness of these 13 BMPs. Upon reorganization of the NPDES Permit Program, as described in Chapter I, this will be the first task addressed by the Watershed Management Committee. The Uniform data collection methodology will be developed by January 15, 1995 for the Santa Monica Bay watershed and by July 1995 for all other watersheds with subsequent implementation by all permittees in each watershed.

B. ANNUAL REPORTS

An annual report for each watershed will be submitted to the Regional Board not more than 45 days after the end of each permit year. Each annual report will include a summary on the programs implemented during the previous year and plan activities that will be implemented during the current year. Any revisions to the Plan would be addressed in the report.

1. FORMAT/STRUCTURE

In order to insure uniform annual reporting by all watersheds, the Executive Advisory Committee will develop a uniform annual report outline for use by

VOL 15 0657

R0060877

each watershed. Each Watershed Management Committee will develop a standard format to be used by all the permittees in its watershed in reporting the progress and the status of all stormwater programs implemented in its jurisdiction. The Principal Permittee will utilize this information to develop the annual report for the watershed. Upon approval by the Management Committee, the annual report will be provided to the Executive Advisory Committee which will compile the annual reports from all watersheds for submittal to the Regional Board.

2. EFFECTIVENESS MEASURES

Under Chapter VIII, Section A, the permittees will have developed performance standards for each BMP. These performance standards will be used to assess the effectiveness of the BMPs. By the end of each permit year, the findings of the previous program year will be evaluated and used to suggest changes that are appropriate for implementation during the next year. Focus should also be given to the use of empirical studies, in a control setting, to more fully assess the effectiveness of BMPs.

3. CONTENT

The annual report will include a matrix illustrating the levels of implementation for all Permittees. Tables will be developed for each BMP listing all the participating Co-Permittees, describing the status of implementation by each Co-Permittee of the BMP, and documenting any modifications of the BMP from the standard program. The effectiveness of each program area will be assessed using the performance standards developed under Chapter VIII, Section A. For effectiveness measures, the findings should be presented graphically for ease of comparison with the established levels of effort. Fiscal budget for all the BMPs implemented should also be prepared, grouped by programs. An analysis and evaluation of the results of the past year's monitoring program data will also be included in the report. Any revisions to the Plan should be addressed here, with all the elements affected discussed in their entirety. All relevant information, such as water samples analyses and evaluation, should be included in the appendices.

C. SEMI-ANNUAL REPORTS

A semi-annual progress report will update the Regional Board on Permit compliance activities six months into each permit year. The semi-annual report will be provided to the Regional Board within 30 days after the end of the six-month period.

VOL 15
0658
R0060878

1. PURPOSE

The semi-annual report will serve as a status report on the progress of the implementation of the Plan.

2. FORMAT/STRUCTURE

In order to insure uniform semi-annual reporting by all watersheds, the Co-Permittees will use the standard format developed for the annual report in reporting the progress and status of all the BMPs implemented in their jurisdictions. The Principal Permittee will utilize this information to develop the semi-annual report for the watershed for submittal to the Regional Board.

3. CONTENT

The semi-annual report will include a matrix illustrating the levels of implementation for all permittees. Tables will be developed for each BMP listing the participating Co-Permittees, describing the status of implementation by each Co-Permittee of the BMP, and documenting any modifications of the BMP from the standard program. The Permittees will describe the problems encountered during implementation and discuss the modifications to the program in order to solve these problems.

D. INTERNAL REPORTING

In order to facilitate the preparation of semi-annual and annual reports, standard internal formats for use by all Permittees will be developed. The internal reporting procedures will be completed for all Plan chapter elements by December 1997.

1. STANDARD FORMS

The Watershed Management Committee will be responsible for developing standard forms for use by each Permittee. Standard forms will be developed for each BMP to monitor its progress. Some Permittees may have to customize the standard forms in order to reflect their programs' additional features. The forms will collect all the information essential to the preparation of the annual and semi-annual reports. In developing the standard report forms, information that is quantifiable and specific for each program area and/or BMP will be collected.

2. PROCEDURES

Co-Permittees will submit all the BMP report forms to the Principal Permittee at the end of the six-month period and the permit year, respectively.

VOL 15
0659
R0060879

3. RECORD KEEPING

The Regional Board does not need to see all of the extraneous information, but the records will be retained by the Principal Permittee for 2 years. Each Permittee will keep a permanent copy of its reporting forms in case they are needed.

E. STORM WATER MANAGEMENT PLAN REVISIONS

There will be an annual review process that will allow the Permittees to revise the Plan for the next year and for the rest of the permit period. The targeted completion date for the phase is December 1997.

1. PROCESS

In the annual report, Permittees will compare the progress made on all the BMPs with the established level of effort. If the level of implementation is inadequate, the program should be adjusted to accelerate the progress. If the progress made to date shows that the program is ineffective or inefficient in protecting the stormwater quality, a new program should be developed and implemented for the next fiscal year and the rest of the permit period.

2. REPORTING

All refinements or revisions to be made in the fiscal year will be documented in the annual report, with the dates of implementation proposed.

P:\INEZ\PLAN\PLAN2.SCR\VIII

VOL 15
0660
R0060880

IX. MONITORING

The Monitoring Program is a critical element in the Stormwater Management Plan. It will provide important data for use in characterizing existing stormwater/urban runoff quality, guiding future development, and modifications to the Plan and also to assess its effectiveness. A watershed wide monitoring program shall be developed by December 1997.

A. SYSTEM CHARACTERIZATION

The existing Permit subdivided the County into six drainage basins with information to be collected to characterize each of the basins.

1. WATERSHED

Each drainage basin has been subdivided into numerous drainage areas, based on an evaluation of the existing drainage system and surface flow patterns. For each drainage area, the following information has been compiled: size; breakdown of existing land use; imperviousness; description of soils; location of waste disposal facilities; and the location, type, and number of industries by Standard Industrial Classification (SIC) Code. This information has been submitted to the California Regional Water Quality Control Board, Los Angeles Region, for Phases I and II. Phase III watershed characterization is in progress and will be completed by the end of December 1994. Due to the volume of the watershed characterization data, this information has not been included herein, but is available for review at either the Regional Board or the Los Angeles County Department of Public Works.

This information will provide a basis for developing other monitoring program elements such as pollutant loading estimates from major land uses and watersheds; pollutant source identification, and identification of illegal discharges/illicit disposal practices.

2. STORM DRAIN SYSTEM

In subdividing each basin into drainage areas, the drainage area tributary to all major outfalls has been identified. Within each drainage area, the tributary storm drain system is being identified and mapped. Key information such as the size of the storm drain facilities, locations of manholes and inlets, and storm drain connections is being compiled. This information will be vital in conducting storm drain inspections to identify and eliminate illegal discharges.

VOL 15
0661
R0060881

3. RECEIVING WATERS

Due to the extent of urbanization in Los Angeles County over the past decades, most of the streams designated as receiving waters in the Los Angeles basin have been replaced with man-made storm drainage systems to provide flood protection to the urbanized areas. These streams have been mapped as part of the storm drain system mapping done under A.2. above. The remaining natural streams are also being mapped.

The Los Angeles County Department of Public Works (Department) has been performing surface water quality monitoring on a voluntary basis since the late 1960s. Samples have been collected and analyzed from various receiving water streams and channels throughout the County to collect general information as to the quality of the surface runoff within our storm drain system.

The program in existence at the time the current Permit was issued was established in the mid 1980s. Twenty-eight sites are sampled monthly for dry weather flows. Twenty-one of the 28 sites are sampled for storm flows up to five times per year. The collected samples are analyzed for general minerals, pH, total dissolved solids, specific conductance, biochemical oxygen demand, bacteria, heavy metals, pesticides, PCBs, total organic carbon, volatile organic compounds, and total petroleum hydrocarbons.

The sample collection at these sites will continue while the new National Pollutant Discharge Elimination System (NPDES) Permit monitoring stations are established. Once all NPDES Permit monitoring stations are operational, sampling at these 28 sites will be discontinued.

In order to provide an initial assessment of the water quality in the major streams and channels in the County, an analysis has been performed on the data collected through the existing surface water monitoring program. The analysis has been done on a Countywide basis and also by major drainage basin. The report can be found in Volume 8.

To better assess the receiving water impacts of stormwater the Department will be developing a program to further study stormwater impacts on selected receiving waters, including conducting toxicity studies. Initial efforts will focus on the Santa Monica Bay Watershed. A Request for Proposal for the development of such a program will be advertized by January 15, 1995.

VOL 15
0662
R0060882

The water quality data collected by the new NPDES Monitoring Program will provide more detailed data to better assess in upcoming years the quality of our receiving waters. Ten monitoring stations have been proposed along the major streams in the County. A description of these site locations can be found in the monitoring work plans for Phases I, II, and III, previously submitted to the Regional Board, see Volume 8.

4. LAND USE

As described under Section A.1. above, the existing land use categories within each drainage area have been identified. This information has been used to select drainage areas comprised of a single homogeneous land use for land use specific monitoring. A total of 14 land use monitoring sites are being established in the County. Five sites are being installed in the Santa Monica Bay Watershed with the remaining nine to be selected from within the Los Angeles, San Gabriel, and Santa Clara River Watersheds. For a description of the sites, please see Volume 8. These sites will provide valuable information as to the types and levels of pollutants found in runoff from various land uses. This information can then be used to refine the Stormwater Management Plan to develop specific management measures to target identified problems.

B. SOURCE IDENTIFICATION

Identifying the sources of stormwater pollutants from both specific land uses and specific activities will provide the information needed to identify problem areas and allow specific management measures to be developed to address these problems.

1. SPECIFIC LAND USE

As described in Section A.4. above, major land use classifications will be subject to individual monitoring to determine the types and levels of pollutants present.

2. SPECIFIC ACTIVITIES

a. A pollutant source identification program will be designed to identify significant pollutant sources (i.e., parking lots, industrial activities, etc.), with the hope that remedial action can be undertaken to reduce any significant impacts so identified. It will focus on monitoring very small areas (i.e., less than five acres) where a specific and/or interrelated set of pollutant generating activities are occurring. Its objective is to

VOL 15
0663
R0060883

provide data for selecting BMPs for specific activities rather than characterizing discharges for long-term pollutant loading estimates.

Identification of pollutant sources can be done using a number of methods. Potential sources of storm water pollutants can be identified by records of chemical use and/or storage, by studies of specific activities which lead to the deposition of pollutants throughout the watershed, and by field inspection or monitoring. Watersheds which may contain significant pollutant sources can be identified through land use information or by mass loading estimates.

By mid January 1995, the County will begin targeted monitoring of a municipal corporation yard in the Santa Monica Bay watershed. A full program for pollutant sources identification will be developed by December 1996.

b. A storm drain inspection program has also been developed and is being implemented. The first phase of the inspection program will target the open channel storm drains to identify illegal discharges.

The open channel inspections will also be used to screen outfalls from underground storm drains for the presence of dry weather flows. This information will be used in the next phase of the storm drain inspection program to prioritized the underground storm drain system for further field screening and inspection of problem areas.

C. CONTROL MEASURE EFFECTIVENESS

It is unlikely that the effectiveness of the various control measures implemented by the storm water management plan can be determined solely through the data produced by monitoring the quality of storm drain flows, because it is difficult to obtain statistically significant comparisons of watershed-wide control measure performance with such data. For this reason the effectiveness of control measures will be assessed through other means.

Two general types of methods are available for assessment of control measure effectiveness: direct water quality (conventional) monitoring and indirect (non-conventional) monitoring. Direct water quality monitoring can be used to determine pollutant reduction by a specific facility or devise. This technique is commonly used for structural or treatment controls, such as detention basins and constructed wetlands, where there is an accessible inflow and outflow. Inflow and outflow results are compared to determine pollutant removal and effectiveness.

VOL 15 0664

R0060884

Direct water quality monitoring of site runoff before and after implementation of non-structural control measures is also possible. However, it is difficult to demonstrate effectiveness at a statistically significant level because of the high degree of variability in stormwater pollutant concentration and mass loading data. The water quality improvement due to non-structural control measures is generally expected to be less dramatic than that achieved through structural controls. A larger number of samples is therefore required to produce a statistically significant result. This is especially difficult in relation to the monitoring of the pre-control measure condition. Collection of adequate baseline information is necessary prior to the implementation of management practices. Direct monitoring of the effectiveness of non-structural controls is feasible typically only under experimentally controlled conditions (e.g. selection of small, well-defined watershed; control of management practice implementation; effective sitting and timing of monitoring activities), including a sufficient number of samples to achieve statistical significance.

Indirect monitoring currently is the primary method of choice of assessment of management plan effectiveness. A number of indirect monitoring techniques are available for assessment of management plan effectiveness.

Verification of program implementation is an indirect monitoring method that can be used to determine how a management plan is being implemented. Another indirect monitoring method, pollutant removal inventories, can be used to assess the amounts of pollutants that have been prevented from entering the municipal storm drain system.

The 13 Baseline BMPs recommended for implementation by the Regional Board plus other BMPs proposed by the various Co-Permittee are in general all non-structural control measures. In the short-term, a uniform data collection methodology will be developed for use by all Permittees to compile information on the level of implementation of the 13 Baseline BMPs. This will allow for a uniform watershed-wide evaluation of BMP effectiveness. For the Santa Monica Bay watershed, this uniform data collection methodology will be developed and begin implementation by January 15, 1995. For the other watersheds, implementation would begin July 1, 1995.

For the long-term, as the various chapters of the Plan are more fully developed, possibilities for the use of direct water quality monitoring for control measure assessment will be evaluates as opportunities arise.

VOL 15
0665
R0060885

D. POLLUTANT LOADING

One of the objectives of the monitoring program is to estimate the annual pollutant loadings from each watershed. Knowing the types and quantities of pollutants discharged into receiving waters are important in assessing the impacts of stormwater and, in turn selecting appropriate control measures to address problem areas.

The 24 permanent monitoring stations that are being established Permit-wide will be utilized to estimate pollutant loads from each watershed and also from various land uses. For a description of the methodology to be used to estimate pollutant loadings, please see Volume 8. For the Santa Monica Bay Watershed, the pollutant loading model will be tested and operational by January 15, 1995. Actual pollutant loadings will be calculated subsequent to storm events occurring for which water quality data has been obtained. For the other watersheds, a schedule for pollutant load modelling will be provided by January 15, 1995.

To more closely model pollutant loadings and evaluate control measure impacts, a more detailed dynamic modelling will be undertaken on a smaller, representative sub-watershed. The EPA-SWMM model has been selected for use in our dynamic modelling efforts. For the Santa Monica Bay Watershed, the Kenter Canyon Drain sub-watershed has been selected for this modelling efforts. This sub-watershed is typical of the urbanized areas in the Santa Monica Bay Watershed. It is comprised of multiple land uses, has well-defined boundaries, and has no upstream flow regulation. We are reviewing and identifying the existing drainage system, defining current and future land uses, and conducting field checks. The model will be tested and operational by January 15, 1995, with actual modelling results to be available later when local water quality data from our monitoring stations becomes available. Based on the results of the dynamic modelling of the Kenter Canyon sub-watershed, other sub-watersheds may be selected from the other major watersheds in the County.

E. COMPONENTS OF A MONITORING PROGRAM PLAN

The components of the monitoring program plan such as monitoring site locations, dry/storm sampling frequency and methodology, constituents to be sampled, field and laboratory procedures, QA/QC, etc., can be found in Volume 8 which has been previously provided to the Regional Board.

The Monitoring Program elements described in Volume 8 will be revised to address the Monitoring Program needs described in Section A - D above as agreed to in the letter from the County to the Regional Board dated September 22, 1994.

VOL 15 0666

R0060886

As the various chapters of the Plan are more fully developed, the Monitoring Program will be revised to address any additional monitoring needs that may result

F. DATA MANAGEMENT

For water quality data collected at the 24 monitoring stations, please see Volume 8 for data storage and reporting methods.

For each Section A - E of the Monitoring Program described above, an annual report will be prepared detailing the data collected, with an evaluation and interpretation the data including water quality impacts.

Evaluation of the Stormwater and
Dry Weather Monitoring Data

This Report as required by Permit Task 5.2.1, evaluates the existing data for the Stormwater and Dry Weather Monitoring Programs. This Report evaluates the water quality data in comparison to the 1994 California Regional Water Quality Board's Basin Plan and the 1990 Ocean Plan. It also provides a long-term trend analyses and a comparison of water quality data to the Best Management Practices implemented by the Permittees.

SECTION 1 - INTRODUCTION

1.0 PURPOSE

The Los Angeles County National Pollutant Discharge Elimination System (NPDES) Municipal Storm water Permit No. CA0061654 requires establishment of a monitoring program to assess the quality of storm water/urban runoff discharges and an analysis of the results of the monitoring program. The purpose of this report is to provide an evaluation of surface water quality monitoring data for inclusion in the "Report of Waste Discharge" (ROWD), which will be submitted by the Los Angeles County Department of Public Works (LADPW) to the California Regional Water Quality Control Board, Los Angeles Region (Regional Board) for the renewal of the existing NPDES permit. This report summarizes the results of the surface water quality monitoring data collected by LACDPW from 1988 through 1994.

1.1 PROJECT OUTLINE

This project includes an evaluation of pertinent historical water quality monitoring data in the Los Angeles County. The following is an outline of the general tasks performed and presented in this report:

1. A description of water quality monitoring activities under both dry weather and storm flow monitoring conditions.

2. An assessment of the monitoring sites, including locations in the regional basins, a description of their tributary watersheds, and an evaluation of the tributary basin land uses.

3. A description of sampling frequency and constituents analyzed.

4. An assessment of applicable regulatory guidelines including the "Basin Plan" and "Ocean Plan" water quality objectives.

5. A screening analysis to flag non-compliance with water quality objectives specified by the "Basin Plan" and "Ocean Plan". The "top ten" non-compliance parameters were used in performing spatial and trend analysis.

6. A spatial analysis to present average and maximum concentration of pollutants throughout the Los Angeles County and its regional watersheds.

VOL 15
0674
R0060894

7. An assessment of trends over the sampling periods, including detecting periods of high concentrations and reductions. The trend analysis includes assessments of specific monitoring stations, as well as that in the regional watersheds and the entire Los Angeles County.

8. A comparison of water quality conditions at all stations to that at an undeveloped watershed station (Station 28-Monrovia Creek has been selected as the baseline for this study), and to the water quality objectives.

9. An assessment of urbanization impacts on water quality conditions.

10. An evaluation of the BMP programs implemented previously and their effectiveness (if any), on water quality.

VOL 15
0675

R0060895

SECTION 2 - REGULATORY OVERVIEW

2.1 NPDES PERMIT

The NPDES (National Pollutant Discharge Elimination System) was previously required by the federal government for sanitary sewer systems. In 1972, the federal Clean Water Act (CWA) was amended by the EPA to provide that the discharge of pollutants to waters of the United States from storm water runoff effectively be prohibited, unless the discharge is in compliance with the NPDES permit. In 1987, Congress reauthorized the Clean Water Act, an edict which provided a comprehensive nationwide storm water management program under the NPDES permit program. The federal regulations were finalized in the Federal Register on November 16, 1990.

Federal regulations require that municipal storm system operators prepare monitoring programs for collection of representative water quality data at points of outfall or field screening points. The monitoring program is to indicate sampling frequency, constituents of concern, sampling equipment, and a description of samples representative here. The objectives are to identify the type, magnitude (both concentration and mass load), and sources of pollutants in the storm water systems in order to evaluate compliance and prevention measures.

In California, EPA's NPDES permit program is being administered by the State Water Resources Control Board (SWRCB) and on a regional basis through the nine State Water Resources Control Boards. The Regional Water Quality Control Boards (RWQCB) are charged with the responsibility for the protection of the waters of the State "for the use and enjoyment of the people of California." The RWQCB, Los Angeles Region (4) Board oversees implementation of the NPDES permit in the Los Angeles County area.

On June 18, 1990, Los Angeles County was issued a NPDES Municipal Storm water Permit by the California Regional Water Quality Control Board, Los Angeles Region, for its storm drain system (NPDES Permit No. CA 0061654). The permit expires June 18, 1995, with another five year permit to be issued at that time. One of the major requirements of the NPDES permit is the development and implementation of a monitoring program. On December 18, 1994, six months prior to the expiration of the existing NPDES permit a "Report of Waste Discharge" (ROWD) including an analysis of the results of the monitoring program, must be submitted to the Regional Board for permit renewal consideration.

The County of Los Angeles as the "Principal Permittee" of this Municipal Permit is responsible

R0060896

VOL 15 0676

for administering the order and coordinating cooperation by "Co Permittees" (cities and recognized entities), including implementation of local self-monitoring programs and Best Management Practices (BMPs), and preparation/submittal of required reports. According to the permit, the constituents of concern and significance in Los Angeles County are:

- *total and fecal coliform and Enterococci bacteria*
- *total suspended solids*
- *biochemical oxygen demand*
- *oil and grease*
- *heavy metals*
- *nutrients (general minerals)*
- *polychlorinated biphenyls*
- *polycyclic aromatic hydrocarbons*
- *pesticides and herbicides*
- *petroleum hydrocarbons*

Although the Municipal Permit requires that waste discharge requirements issued by the Regional Boards shall include provisions to implement water quality based objectives, numerical water quality standards are not provided in the permit. The permit indicates that numerical water quality objectives will be developed by the Regional Board staff for consideration during the permit renewal process and utilized to evaluate the effectiveness of Best Management Practices.

The Municipal Permit partitions Los Angeles County and its adjacent areas into five regional drainage basins for the purposes of program implementation. These drainage basins have been delineated based on hydrological characteristics of the watersheds, perceived importance and beneficial uses of water bodies, and existence of adequate infrastructures for program implementation. The designation of the five-drainage basin map is shown in Exhibit "A" and will be described in detail in Section 4.

The SWRCB establishes water quality standards for all the waters in the State of California through development of the "Ocean Plan" and "Enclosed Bays and Estuaries Plan." The SWRCB adopted a Water Quality Control Policy for the Enclosed Bays and Estuaries of California on May 16, 1974. This policy prohibits discharge of industrial process waters to enclosed bays and estuaries. However, storm runoff is not considered an industrial processes water. The SWRCB subsequently adopted a revised Water Quality Control Plan for ocean waters of California ("Ocean Plan") on March 22, 1990, which amended the Plan adopted on September 22, 1988. The Regional Board further adopted a revised Water Quality Control Plan for the Los Angeles Region ("Basin Plan") in 1975, and reprinted it with changes in 1978, 1990,

VOL 15 0677

R0060897

1991, and 1992. The "Basin Plan" was recently updated and a draft plan was presented on April 28, 1994. Although the numerical water quality standards have not been assigned to LADPW Municipal Storm water Permit No. CA0061654, The water quality objectives described in the "1994 draft Basin Plan" and "1990 Ocean Plan" are used in this study to compare with the values of monitoring parameters. It should be pointed out that such comparisons are strictly voluntary, with the intention of improving future monitoring activities. Therefore, the results of this study should not be interpreted as either violating or complying with these two plans.

2.2 BASIN PLAN REQUIREMENTS

The Water Quality Control Plan for the Los Angeles Region (4), which includes the Santa Clara River Basin and the Los Angeles River Basin, was originally prepared in 1975 and revised in 1978, 1990, 1991, and 1992. The "Basin Plan" is designed to preserve and enhance water quality and to protect the beneficial uses of all regional waters. The "Basin Plan" describes beneficial uses and water quality objectives for individual streams and water bodies in the LA Region. Beneficial use designations have been assigned to all hydrologic areas in order to protect against water quality degradations.

The "Basin Plan" was further revised recently with a draft plan presented on April 28, 1994. Communications with the Regional Board indicated that this plan is currently under review and is anticipated to be adopted by the end of 1994. The Regional Board does not anticipate any further modifications of the draft "Basin Plan."

The 1992 revised "Basin Plan" and 1994 draft "Basin Plan" beneficial uses assigned to drainage systems associated with the existing Los Angeles County monitoring stations are summarized on Tables 1 and 2, respectively. Exhibit "B" shows the locations of the Los Angeles County monitoring stations. The beneficial uses listed in these tables include objectives for inland surface waters and for the coastal monitoring stations include objectives assigned to coastal features. For the purpose of comparison, the 1994 draft "Basin Plan" objectives were utilized in the analysis and evaluations of water quality data presented in this report. The 1992 revised "Basin Plan" beneficial uses are provided for the purposes of comparison with the new, draft 1994 "Basin Plan." The following is a brief description of the beneficial uses listed on Tables 1 and 2

Municipal and Domestic Supply (MUN) - Uses of water for community, military, or individual water supply systems including, but not limited to, drinking water supply.

Agricultural Supply (AGR) - Uses of water for farming, horticulture, or ranching including, but not limited to, irrigation, stock watering, or support of vegetation for range grazing.

VOL 15 0678

R0060898

Industrial Process Supply (PROC) - Uses of water for industrial activities that depend primarily on water quality.

Industrial Service Supply (IND) - Uses of water for industrial activities that do not depend primarily on water quality including, but not limited to, mining, cooling water supply, hydraulic conveyance, gravel washing, fire protection, or oil well re-pressurization.

Ground water Recharge (GWR) - Uses of water for natural or artificial recharge of ground water for purposes of future extraction, maintenance of water quality, or halting of saltwater intrusion into freshwater aquifers.

Freshwater Replenishment (FRSH) - Uses of water for natural or artificial maintenance of surface water quality (e.g., salinity) or quantity.

Water Contact Recreation (REC-1) - Uses of water for recreation activities involving body contact with water, where ingestion of water is reasonably possible. These include, but are not limited to, swimming, wading, water-skiing, skin and scuba diving, surfing, white water activities, fishing, or use of natural hot springs.

Non-contact Water Recreation (REC-2) - Uses of water for recreational activities involving proximity to water, but not normally involving body contact with water, where ingestion of water is reasonably possible. These uses include, but are not limited to, picnicking, sunbathing, hiking, beachcombing, camping, boating, tidepool and marine life study, hunting, sightseeing, or aesthetic enjoyment in conjunction with the above activities.

Commercial and Sport Fishing (COMM) - Uses of water for commercial or recreational collection of fish, shellfish, or other organisms including, but not limited to, uses involving organisms intended for human consumption or bait purposes.

Warm Freshwater Habitat (WARM) - Uses of water that support warm water ecosystems including, but not limited to, preservation or enhancement of aquatic habitats, vegetation, fish, or wildlife, including invertebrates.

Cold Freshwater Habitat (COLD) - Uses of water that support cold water ecosystems including, but not limited to, preservation or enhancement of aquatic habitats, vegetation, fish, or wildlife, including invertebrates.

Wetland Habitat (WET) - Uses of water that support wetland ecosystems, including, but not limited to, preservation or enhancement of wetland habitats, vegetation, fish, shellfish, or wildlife,

VOL 15 0679

R0060899

and other unique wetland functions which enhance water quality, such as providing flood and erosion control, stream bank stabilization, and filtration and purification of naturally occurring contaminants.

Marine Habitats (MAR) - Uses of water that support marine ecosystems including, but not limited to, preservation or enhancement of marine habitats, vegetation such as kelp, fish, shellfish, or wildlife (e.g., marine mammals, shorebirds).

Wildlife Habitat (WILD) - Uses of water that support terrestrial ecosystems including, but not limited to, preservation and enhancement of terrestrial habitats, vegetation, wildlife (e.g., mammals, birds, reptiles, amphibians, invertebrates), or wildlife water and food sources.

Preservation of Biological Habitats (BIOL) - Uses of water that support designated areas or habitats, such as Areas of Special Biological Significance (ASBS), established refuges, parks, sanctuaries, ecological reserves, or other areas where the preservation or enhancement of natural resources requires special protection.

Rare, Threatened, or Endangered Species (RARE) - Uses of water that support habitats necessary, at least in part, for the survival and successful maintenance of plant or animal species established under state or federal law as rare, threatened, or endangered.

Migration of Aquatic Organisms (MIGR) - Uses of water that support habitats necessary for migration, acclimatization between fresh and salt water, or other temporary activities by aquatic organisms, such as anadromous fish.

Spawning, Reproduction, and/or Early Development (SPWN) - Uses of water that support high quality aquatic habitats suitable for reproduction and early development of fish.

Shellfish Harvesting (SHELL) - Uses of water that support habitats suitable for the collection of filter-feeding shellfish (e.g., clams, oysters, and mussels) for human consumption, commercial, or sports purposes.

Navigation (NAV) - Uses of water for shipping, travel, or other transportation by private, military, or commercial vessels.

Estuarine Habitat (EST) - Uses of water that support estuarine ecosystems including, but not limited to, preservation or enhancement of estuarine habitats, vegetation, fish, shellfish, or wildlife (e.g., estuarine mammals, waterfowl, shorebirds).

R0060900

VOL 15 0680

The major difference between the revised 1992 "Basin Plan" and the draft 1994 "Basin Plan" is the addition of MUN beneficial uses to all inland surface waters (and ground waters) in the later plan. With the adoption of the State Board Resolution No. 88-63 in 1988 (Regional Board Resolution No. 89-03), the water bodies of the region are required to be protected as potential sources of drinking water ("Sources of Drinking Water Policy"). The Regional Board will consider reviewing the "Sources of Drinking Water Policy" to develop criteria to exempt a water body from the MUN designation. However, no new implementations are implied by the new MUN designations until the Regional Board officially adopts criteria to exempt water bodies. Water quality objectives included in the Basin Plan are the limits of water quality constituents which are established for the reasonable protection of beneficial uses of waters for a specific area.

Comparison of overall numerical water quality standards specified in the revised 1992 "Basin Plan," the draft 1994 "Basin Plan," and the "Ocean Plan" to compare the Los Angeles County monitoring activities (parameters) are summarized in Table 3. This comparison reveals lack of monitoring data in the following chemical groups: synthetics, chlorinated hydrocarbons, toxics, non-carcinogen toxics, carcinogen toxics, and other miscellaneous compounds. In addition, dissolved oxygen (DO) was not included in the monitoring program previously conducted (1988 to 1994).

Table 4 provides monitoring station specific numerical water quality standards limits. For coastal monitoring stations where both "Basin Plan" and "Ocean Plan" numerical water quality objectives apply, the more stringent standards were used.

On the other hand, the 1988 through 1994 water quality monitoring data examined includes many compounds without specific "Basin Plan" or "Ocean Plan" requirements. In the category of general minerals, these include: calcium, alkalinity, total hardness, iron, manganese, phosphate-P, specific conductance, and volatile suspended solids. The list includes all total heavy metals, chromium IV (dissolved), iron (dissolved), and manganese (dissolved). In the category of purgeable organics (Volatile), there are no limits associated with: bromoform, bromomethane, chloroethane, 2-chloroethylvinyl ether, chloromethane, dibromochloro-methane, dichlorodifluoromethane, and vinyl chloride. In the category of pesticides, these include: alpha-BHC, beta-BHC, delta-BHC, endosulfan I and II, and endosulfan sulfate. Finally, in the category of miscellaneous compounds, neither plan has any requirement for monitoring: TPH, TOC, organic nitrogen, COD, phenol, oil and grease, and silica. However, the compounds monitored are included in the NPDES Permit as the required compounds to be monitored.

2.3 OCEAN PLAN REQUIREMENTS

The SWRCB revised Water Quality Control Plan for Ocean Waters of California (March 22, 1990)

R0060901

VOL 15 0681

contains water quality objectives for the coastal waters of California. According to the "Ocean Plan," the beneficial uses of the ocean waters of the State that shall be protected include industrial water supply, water contact and non-contact recreation, such as aesthetic enjoyment, navigation, commercial and sport fishing, mariculture, preservation and enhancement of Areas of Special Biological Significance (ASBS), rare and endangered species, marine habitat, fish migration, fish spawning and shellfish harvesting.

The "Ocean Plan" water quality numerical objectives are summarized on Table 3. The "Ocean Plan" objectives are either equal to, or more stringent than, the "Basin Plan" except Volatile Purgeable Organics. In addition, the "Ocean Plan" contains objectives under the categories of Toxics, Non-Carcinogen Toxics, and Carcinogen Toxics which are numerically absent in the "Basin Plan." For Los Angeles County monitoring stations (discussed in Section 4) with both "Basin Plan" and "Ocean Plan" numerical water quality objectives, the more stringent limits were selected and used in the evaluations presented in this report. Table 4 provides numerical water quality limits for specific monitoring stations.

VOL 15
0682

R0060902

SECTION 3 - MONITORING ACTIVITIES

3.1 MONITORING PROGRAM

The LADPW has been actively monitoring surface water quality conditions in the County's principal storm drains and water conservation facilities, on a voluntary basis, since the late 1960s. Since the mid-1980s, a monitoring program consisting of 28 sampling sites has been in effect. Grab samples are collected from all 28 sites on a monthly basis (or more) for dry weather flows. Twenty-one of the 28 sites are also sampled (grab samples) for storm flows three to four times per year.

The dry weather monitoring data evaluated in this report includes data collected from May 1988 to April 1994 for all stations, except for Station 13 which includes data collected from January 1990 to April 1994. The wet weather monitoring data evaluated for Stations 12, 16, 8, 6, 3, and 26 started in February 1988; for Stations 22, 11, 14, 21, 20, 11, 5, 4, 2, 27, 25, 23, and 24 it atarted in October 1987; for Station 10 it started in February 1989; and for Station 13 it started in February 1990. April 1994 was the last date of sampling.

A detailed description of each monitoring station location, their tributary basins and land uses is provided in Section 4. The location of the monitoring stations are shown on Exhibit "B".

CHEMICAL CONSTITUENTS: Table 3 provides a list of chemicals monitored by the Los Angeles County. A distinction is made between dry and storm weather samples. Flow measurements were not available in the data set examined. The dry weather samples are generally analyzed for general minerals, pesticides, total petroleum hydrocarbons, heavy metals, and bacteria (total and fecal coliform, KF Streptococci and Enterococci). Volatile organic constituents are tested semi-annually at selected stations. Storm water runoff is monitored for minerals, pesticides, heavy metals (total and dissolved), bacteria, total and organic suspended solids, oil and grease, biochemical oxygen demand, total organic carbon, and volatile organics. Dissolved Oxygen (DO) was not monitored in the 1988 to 1994 period. Considering the importance of this parameter in water quality evaluation, storm weather DO data from 1980 to 1988 was added to the data and reviewed in this report. Overall, 54 additional compounds are analyzed for storm weather samples (127 compounds for storm weather samples verses 73 compounds for dry weather samples).

The Method of Detection Limits (MDLs) used in the analyses for storm and dry weather samples are listed on Table 3. Comparison of water quality objectives ("Basin Plan" and "Ocean Plan") with MDLs indicated that a total of seventeen compounds in four chemical groups have MDLs

VOL 15
0683
R0060903

higher than the numerical objective standards. In the dissolved heavy metals category, MDLs for mercury and silver exceeded the "Ocean Plan" objectives. In the pesticides category, MDL for heptachlor exceeded both the "Basin Plan" and "Ocean Plan" objectives; epoxide MDL exceeded the "Basin Plan" objective; and aldrin, chlordane, dieldrin, pp:DDD, pp:DDE, and pp:DDT exceeded the "Ocean Plan" objectives. Efforts should be made to ensure that MDLs are set at or below the numerical objective standards. The MDLs for all seven PCBs analyzed exceeded the "Basin Plan" and "Ocean "Plan" objectives. The higher MDLs used for the last 5-year monitoring program were strictly adhere to the requirements of the old "Basin Plan" which specifies the analyses be conducted using the APWA (American Public Works Association) water and wastewater standard methods, as opposed to the Maximum Contamination Levels (MCLs) used in the 1994 draft plan. The later has a much lower MDLs.

The following provides a brief description of significant water quality parameters and their importance in detecting receiving water deterioration:

Temperature: Significant temperature changes could have severe impacts on receiving waters. As a rule of thumb, the rates of chemical reactions are double for every 10 degree C rise in temperature. Cooler waters usually have a wider diversity of biological species. At higher temperatures, dissolved oxygen levels are usually lower.

pH: pH is a measurement of the activity of hydrogen ions, present in water. Low and high pH values are indications of acidity and alkalinity of the water. Values outside the 6.5 - 8.5 range could have detrimental affects on aquatic organisms.

Total Dissolved Solids: Total Dissolved Solids (TDS) may be organic or inorganic. The major common ions in natural waters includes sodium, calcium, magnesium, bicarbonate, sulfate, chloride. The secondary constituents include iron, strontium, potassium, carbonate, nitrate, fluoride, boron, and silica. The common ions are measured separately and their sum on an equivalent basis represent TDS.

Total and Volatile Suspended Solids: Solid content in water is measured as suspended solids, volatile and nonvolatile suspended solids, turbidity, and settled solids. High solid concentrations cause reduced light transmission, reduced growth, clogging of fish gills, reduced spawning areas, rapid sedimentation of ponds, and reduced aesthetics values.

Total solids is the sum of dissolved and suspended solids. Volatile solids are those that burn off at a temperature of 550 degrees C and are considered to be organic in nature.

Bacteria (Fecal coliform): Fecal coliform is a pathogen indicator which may be present in

R0060904

VOL 15 0584

elevated amounts in urban runoff. These organisms are found exclusively in the intestinal tract of warm-blooded animals and are excreted in large numbers with faces.

Nutrients: Nutrients are chemicals that stimulate the growth of algae and water plants as well as causing odors, algal scums, water discoloration, and toxic releases. The basic macronutrients are carbon, nitrogen, and phosphorous. Common measures include nitrates, ammonia, TKN (Total Kjeldahl Nitrogen), total phosphates, and ortho phosphates. In urban runoff theses nutrients may be present in landscaped runoff (washed or leached off fertilizers), accidental wastewater discharges, and animal waste. Excess nitrate levels in drinking water can cause health problems in humans (infants are most sensitive). High levels of nitrogen in surface water also leads to excess aquatic growth and can contribute to high levels of NO_3 in ground water as well.

Heavy Metals: A wide variety of metals are present in urban runoff. Most common metals in urban runoff include zinc, copper, and lead. Excessive concentrations of cadmium, chromium, mercury, nickel, selenium, silver, and arsenic may also be present. Toxic metals are harmful to humans and other organisms in small quantities.

Total Chlorine: Priority pollutants, such as chlorines, may be present in urban runoff. Due to extreme solubility, all washed off chlorines end up in surface or ground water. Low concentrations of chlorines are damaging to aquatic life.

Oil and Grease: Oil and grease are not readily soluble in water and form a film on the water surface. Oil and grease can have detrimental impacts on birds and aquatic life, as well as cause nuisance conditions.

Dissolved Oxygen and Chemical Oxygen Demand: Free oxygen is necessary in water to maintain life. Fish kills and reduction in aesthetic values have resulted from low-DO conditions. Oxygen demand is estimated by indirect measures, such as biochemical oxygen demand (BOD), chemical oxygen demand (COD), oil and greases, and total organic carbon (TOC). COD is a measure of amount of oxygen required to chemically oxidize organic matter to carbon dioxide and water.

DO is a good indicator of overall water pollution because it is usually the result of an over-enrichment by some other oxygen demanding pollutants, such as decaying organic matter. Also, slow shallow waters sometimes become over-heated resulting in lower saturated DO concentrations. Usually declines in DO levels are attributed to increased runoff from urban construction and increased wastewater due to increased population pressures.

VOL 15
0685
R0060905

Specific Conductance: The ability of water to conduct electricity, known as specific conductance, is a function of its ionic strength. An approximate of Total Dissolved Solids are often made by determining the Specific Conductance. However, only ionized substances contribute to specific conductance. Specific conductance is often used in a qualitative basis to monitor changes in TDS. Also, as water temperature increases, specific conductance increases as well.

Pesticides/Purgeable Organics: Excess uses in agricultural operations and improper discharges from industrial areas may contribute these substances to receiving waters. Human and aquatic organism tolerance level to most of these substances is usually very low. As percentage of these substances increase, they become a substantial health problem.

Turbidity: Turbidity is a measure of the extent to which light is either absorbed or scattered by suspended material in water. It is an indirect measure of suspended solids in water.

VOL 15
0686
R0060906

SECTION 4 - WATERSHED CONDITIONS

The Municipal permit divides the Los Angeles County area and immediate vicinity into five general regional basins. These regional basins have been delineated based on hydrological characteristics of the watersheds, perceived importance and beneficial uses of water bodies, and existence of adequate infrastructures for program implementation. The five drainage basins are:

I. Santa Monica Bay Drainage Basin;
II. Upstream Los Angeles River Drainage Basin, to and including Sycamore Canyon Channel (San Fernando Valley);
III. Upper San Gabriel River (San Gabriel Valley) Drainage Basin;
IV. Lower Los Angeles River Drainage Basin;
V. Lower San Gabriel River Drainage Basin (V-south); and Santa Clarita Valley Basin (V-north).

The five drainage basins are shown on Exhibits "A" and "B".

The principal surface waters of the Los Angeles area flow through mostly natural mountains in the upstream reaches, urbanized foothill and valley areas, high density developed coastal areas, and terminate at highly utilized beaches and harbors. The following presents a brief summary of watersheds and water quality conditions in the Los Angeles County regional basins, as presented in the 1994 (Draft) "Basin Plan":

Los Angeles River Watershed: The Los Angeles River is lined with concrete along the majority of its length except for the reach in the narrows area where the channel is unlined. In the unlined reach of the river ground water rises to the river streambed, providing a natural habitat for fish and other wildlife. The Los Angeles River Basin is highly urbanized. Urban runoff and illegal dumping are major contributors to impaired water quality in the watershed. Below the Sepulveda Basin, flows are dominated by tertiary-treated effluent from municipal wastewater treatment plants.

San Gabriel River Watershed: The upper San Gabriel River and its tributaries are mostly in a relatively pristine condition. Water quality problems in the upper reaches of the river are caused by recreational uses, eroding sediment, and improper sediment sluicing which have an impact on aquatic and riparian habitats and groundwater recharge areas. The middle reach of the river has been extensively modified and extensive sand and gravel operations exist along the river. The lower reach of the river has been mostly lined and flows are dominated by effluent

VOL 15 0687

R0060907

from wastewater treatment plants and urban runoff. Impairment to the beneficial uses of the lower reaches of the river have been evidenced by ambient toxicity and bioaccumulation of metals in fish tissue.

Santa Clara River Watershed: The Santa Clara River comprises the largest river system in Southern California that has remained in a relatively natural state. There are currently many areas of high quality riparian habitat along the river. Threats to water quality in this river system include increasing development in the floodplain areas and channelization of the river which have resulted in increased flows and loss of natural habitat.

Santa Monica Bay Watershed: This area includes the Malibu Creek and ballona Creek Watersheds. Both watersheds have been developed extensively; and many of the river systems in the watersheds have been channelized. In the Malibu Creek Watershed, the pollutants of concern, many of which are discharged from nonpoint sources, include excess nutrients, sediment, and bacteria. In the Ballona Creek Watershed, pollutants of concern, which may be attributed to industrial and municipal effluents as well as urban runoff, include chlorides, sulfates, heavy metals, and bacteria. Several untreated sewage overflows discharged into Ballona Creek during the rainy season have caused beach closures along the Santa Monica Bay. Long-term water quality problems in the mouth of Ballona Creek and in Marina Del Rey are attributed to discharges with high concentrations of DDT (detected in sediments).

According to the "Basin Plan" (1994, Draft), general surface water problems in the Los Angeles County include the following:

- Poor mineral quality in some areas due to a variety of reasons including geology, agricultural runoff, discharge of highly mineralized ground water, and poor quality of some imported waters.
- Bioaccumulation of toxic compounds in fish and other aquatic life.
- Impacts from increased development and recreational uses.
- In-stream toxicity from point and nonpoint sources.
- Diversion of flows necessary for the propagation of fish and wildlife populations.
- Channelization, dredging, and other losses of habitat.
- Impacts from transient camps located along creeks and lagoons.

R0060908

VOL 15 0688

. Illegal dumping.

. Introduction of non-native plants which are of little value to the biota and clog the streams.

. Natural oil seeps.

. Eutrophication and the accumulation of toxic pollutants in lakes.

The following provides a brief description of hydrology, major drainage systems, beneficial uses, land uses, and Los Angeles County monitoring stations within each drainage basin. Tables 1 and 2 summarize the beneficial uses for all monitoring stations based on the revised 1992 and draft 1994 "Basin Plans" respectively. However, the evaluations presented in this report are based on the Draft 1994 "Basin Plan" and the "Ocean Plan" objectives. The tributary area land usage at each monitoring station is summarized on Table 5.

4.1 SANTA MONICA BAY DRAINAGE BASIN (BASIN I)

Santa Monica Bay Drainage Basin (Basin I) is comprised of approximately 410 square miles of mixed natural and developed land in the southwestern portion of Los Angeles County. The majority of the area to the west is currently undeveloped and runoff in the natural canyons and streams flow in a generally southerly direction toward culverts underneath the Pacific Coast Highway and the Pacific Ocean. The central (Santa Monica) southeastern portions of the basin are more developed and urbanized. Runoff in this area flows in a generally southwesterly direction, in improved drainage facilities (i.e., lined channels, and pipes) towards the Pacific Ocean. There are currently nine monitoring stations in the Santa Monica Bay Drainage Basin. Dry weather flows have usually been present at all stations in this Basin, due to the soil type, the relatively high imperviousness of the tributary basins, as well as contributions from other individual point source dischargers (i.e., POTW, industrial NPDES discharger, illicit sources) .

VOL 15 0689

R0060909

The following is a description of conditions and activities at each station:

Station 1 is located at Ballona Creek at Fairfax Avenue. Only dry weather samples are collected at this station. Runoff direction in this area is mostly southwesterly. The area upstream of the station is about 45 square miles, including improved drainage system laterals which discharge into the Ballona Creek, a lined channel. The overall imperviousness of the tributary watershed is about 53 percent. The land use in the basin includes 50 percent urbanized (highest among all monitoring station tributary areas), 29 percent partially urbanized, 20 percent natural, and 1 percent industrial uses.

The beneficial uses of the Ballona Creek at this location include: potential Municipal and Domestic Supply (MUN), potential Water Contact Recreation (REC-1), existing Non-contact Water Recreation (REC-2), potential Warm Freshwater Habitat (WARM), and existing Wildlife Habitat (WILD).

Station 2 is located at Ballona Creek at Sawtelle Boulevard. This station is downstream of Station 1. Dry and wet weather samples are collected at this station. Runoff direction in this area is mostly southwesterly and southeasterly. The area upstream of the station is about 88 square miles, including improved drainage system laterals which discharge into the Ballona Creek eventually drains into the Pacific Ocean in the Playa Del Rey area. The overall imperviousness of the tributary watershed is about 53 percent. The land use in the basin includes 46 percent urbanized, 30 percent partially urbanized, 21 percent natural, and 3 percent industrial uses.

The beneficial uses of the Ballona Creek at this location include: potential Municipal and Domestic Supply (MUN), potential Water Contact Recreation (REC-1), existing Non-contact Water Recreation (REC-2), potential Warm Freshwater Habitat (WARM), and existing Wildlife Habitat (WILD).

Station 9 is located at the Sepulveda Channel at Culver Boulevard. Only dry weather samples are collected at this station. Runoff direction in this area is mostly easterly and southeasterly, via improved drainage systems into the Sepulveda Channel, an improved channel. Further downstream and to the southeast of this station, Sepulveda Channel joins the Ballona Creek and eventually drains into the Pacific Ocean in the Playa Del Rey area. The area upstream of the station is about 23 square miles. The overall imperviousness of the tributary watershed is about 49 percent. The land use in the basin includes 42 percent urbanized, 29 percent partially urbanized, 26 percent natural, and 3 percent industrial uses.

The beneficial uses of the Sepulveda Channel at this location include: potential Municipal and Domestic Supply (MUN), potential Water Contact Recreation (REC-1), existing Non-contact

R0060910

VOL 15 0690

Water Recreation (REC-2), potential Warm Freshwater Habitat (WARM), and existing Wildlife Habitat (WILD).

Station 3 is located at Centinela Creek at Centinela Boulevard. The Centinela Creek at this location is an improved channel which is a westerly tributary of Ballona Creek, located downstream. Ballona Creek eventually drains into the Pacific Ocean in the Playa Del Rey area. Dry and wet weather samples are collected at this station. Runoff direction in this area is mostly westerly. The area upstream of this station is about 9 square miles. The overall imperviousness of the tributary watershed is about 51 percent. The land use in the basin includes 54 percent partially urbanized, 27 percent urbanized, 13 percent natural, and 6 percent industrial uses.

The beneficial uses of the Centinela Creek at this location include: potential Municipal and Domestic Supply (MUN), potential Water Contact Recreation (REC-1), existing Non-contact Water Recreation (REC-2), potential Warm Freshwater Habitat (WARM), and existing Wildlife Habitat (WILD).

Station 5 is located at Kenter Drain at Pico Boulevard (project 249). Both dry and wet weather samples are collected at this station. Kenter Drain is aligned in a southwesterly direction and collects runoff from laterals in the area. Ultimately, it discharges into the Pacific Ocean, about 1100 feet downstream of the monitoring station and to the southwest of the Santa Monica Municipal Pier. The area upstream of the station is about 6 square miles. The overall imperviousness of the tributary watershed is about 39 percent. The land use in the basin includes 43 percent natural, 30 percent partially urbanized, 23 percent urbanized, and 4 percent industrial uses. Due to its close proximity to the ocean, this station is constantly under tidal influence which also affect the sample characteristics.

The "Ocean Plan" water quality objectives may have to be satisfied at this station. The beneficial uses of the Kenter Drain watershed have been designated as: potential Municipal and Domestic Supply (MUN); existing Navigation; existing Water Contact Recreation (REC-1); existing Non-contact Water Recreation (REC-2); existing Commercial and Sport Fishing (COMM); potential Warm Freshwater Habitat (WARM); existing Marine Habitat (MAR); existing Wildlife Habitat (WILD); existing Migration of Aquatic Organisms; existing Spawning, Reproduction, and/or Early Development (SPWN); existing Shellfish Harvesting (SHELL).

Station 8 is located at Santa Monica Canyon Channel at Short Street. The Santa Monica Canyon Channel at this location is an improved channel aligned in a southwesterly fashion which discharges into the Pacific Ocean, approximately 1100 feet southwest. Dry and wet weather samples are collected at this station. The area upstream of this station is about 16 square miles. The overall imperviousness of the tributary watershed is about 14 percent. The land use in the

VOL 15 0691

R0060911

basin includes mostly natural (87 percent), 12 percent partially urbanized, and 1 percent urbanized uses.

Due to the monitoring station proximity to the Pacific Ocean, all "Ocean Plan" water quality objectives may have to be satisfied at this station. The beneficial uses of the Santa Monica Canyon Channel in this area include: potential Municipal and Domestic Supply (MUN); existing Navigation (NAV); existing Water Contact Recreation (REC-1); existing Non-contact Water Recreation (REC-2); existing Commercial and Sport Fishing (COMM); potential Warm Freshwater Habitat (WARM); existing Marine Habitat (MAR); existing Wildlife Habitat (WILD); existing Migration of Aquatic Organisms (MIGR); existing Spawning, Reproduction, and/or Early Development (SPWN); and existing Shellfish Harvesting (SHELL).

Station 10 is located at Topanga Canyon at Pacific Coast Highway. Topanga Canyon is a natural stream, aligned in a southerly direction, which crosses through culverts under the Pacific Coast Highway. The stream discharges into the Pacific Ocean, just downstream of this station. Dry and wet weather samples are collected at this station. The area upstream of the station is about 19 square miles. The overall imperviousness of the tributary watershed is about 8 percent. The land use in the basin includes mostly natural (90 percent), 9 percent partially urbanized, and 1 percent urbanized uses.

Due to the monitoring station proximity to the Pacific Ocean, all "Ocean Plan" water quality objectives may have to be satisfied at this station. The beneficial uses of the Topanga Canyon at this location include: potential Municipal and Domestic Supply (MUN); existing Navigation (NAV); existing Water Contact Recreation (REC-1); existing Non-contact Water Recreation (REC-2); existing Commercial and Sport Fishing (COMM); existing and intermittent Warm Freshwater Habitat (WARM); existing Estuarine Habitat (EST); existing and intermittent Marine Habitat (MAR); existing Wildlife Habitat (WILD); existing Rare, Threatened, or Endangered Species (RARE); existing Migration of Aquatic Organisms (MIGR); existing Spawning, Reproduction, and/or Early Development (SPWN); and existing Wetland Habitat (WET).

Station 6 is located at Malibu Creek at Cross Creek Road. Malibu Creek is a natural stream which meanders in a generally southerly direction and crosses through culverts under the Cross Creek Road. At about 4000 feet downstream, Malibu Creek flows through the Malibu Lagoon and finally discharges into the Pacific Ocean in the Malibu Point area. Both dry and wet weather samples are collected at this station. The area upstream of the station is about 110 square miles. The overall imperviousness of the tributary watershed is about 13 percent. The land use in the basin includes mostly natural (83 percent), 11 percent partially urbanized, 5 percent

R0060912

VOL 15 0692

urbanized, and 1 percent industrial uses.

Due to the monitoring station proximity to the Pacific Ocean, all "Ocean Plan" water quality objectives may have to be satisfied at this station. The beneficial uses of the Malibu Creek in this area include: potential Municipal and Domestic Supply (MUN); existing Navigation; existing Water Contact Recreation (REC-1); existing Non-contact Water Recreation (REC-2); existing Warm Freshwater Habitat (WARM); existing Cold Freshwater Habitat (COLD); existing Estuarine Habitat (EST); existing Marine Habitat (MAR); existing Wildlife Habitat (WILD); existing Rare, Threatened, or Endangered Species (RARE); existing Migration of Aquatic Organisms (MAR); existing Spawning, Reproduction, and/or Early Development (SPWN); existing Shellfish Harvesting (SHELL); and existing Wetland Habitat (WET).

Station 13 is located at Corral Canyon Creek at Pacific Coast Highway. Corral Canyon Creek is a natural stream which meanders in a generally southerly direction and crosses through culverts under the Pacific Coast Highway toward the Pacific Ocean, located immediately to the south. Both dry and wet weather samples are collected at this station. The area upstream of this station is about 4 square miles. The overall imperviousness of the tributary watershed is about 3 percent. The land use in the basin includes mostly natural (97 percent), and 3 percent partially urbanized (very low density) uses.

Due to the monitoring station proximity to the Pacific Ocean, all "Ocean Plan" water quality objectives may have to be satisfied at this station. The beneficial uses of the Corral Canyon Creek at this location include: intermittent Municipal and Domestic Supply (MUN), existing Navigation (NAV); existing Water Contact Recreation (REC-1), existing Non-contact Water Recreation (REC-2), existing Commercial and Sport Fishing (COMM); intermittent Warm Freshwater Habitat (WARM); existing Marine Habitat (MAR); existing Wildlife Habitat (WILD); potential Spawning, Reproduction, and/or Early Development (SPWN); and existing Shellfish Harvesting (SHELL).

R0060913

VOL 15 0693

4.2 UPSTREAM LOS ANGELES RIVER DRAINAGE BASIN, TO AND INCLUDING SYCAMORE CANYON Channel (SAN FERNANDO VALLEY - BASIN II)

The upstream Los Angeles River Drainage Basin (Basin II) is comprised of approximately 443 square miles of mostly natural land in its northern and northeastern areas and mixed developed land in the remainder of its area. Runoff in Basin II is conveyed in natural canyons in the upstream portions of the Basin and improved drainage facilities in the downstream portions, in a generally southerly direction, and the Los Angeles River, a major improved river system in Los Angeles County. The Los Angeles River flows in a mostly easterly and southerly direction in Basin II. The Los Angeles River enters Basin IV and flows in a southerly direction toward San Pedro Bay and the Pacific Ocean. There are currently only two monitoring stations in the Upstream Los Angeles River Drainage Basin. Dry weather flows have usually been present at both stations because of their very large tributary basins, and types of soils.

The following is a description of conditions and activities at each station:

Station 19 is the most upstream monitoring station in Basin II and is located at the Los Angeles River at the Tujunga Wash confluence. Hansen Basin and Sepulveda Basin are located in the basin upstream of this monitoring station. Runoff in this area is generally southerly via mostly improved drainage systems and toward the improved Los Angeles River which flows in a mostly easterly fashion. Only dry weather samples are collected at this station. The area upstream of this station is about 351 square miles. The overall imperviousness of this station's tributary watershed is about 32 percent. The land-use in the basin includes mostly natural (60 percent), 27 percent partially urbanized, 6 percent urbanized, and 7 percent industrial uses.

The beneficial uses of the Los Angeles River in this area include: potential Municipal and Domestic Supply (MUN); potential Industrial Service Supply (IND); existing Ground water Recharge (GWR); existing Water Contact Recreation (REC-1); existing Non-contact Water Recreation (REC-2); existing Warm Freshwater Habitat (WARM); existing Wildlife Habitat (WILD); and Wetland Habitat (WET).

Station 17 is located at the Los Angeles River at the Arroyo Seco confluence. Station 17 is downstream of Station 19 described above. Again, Hansen Basin and Sepulveda Basin are located in the basin upstream of this monitoring station. Runoff in this area is generally southerly and southwesterly in the undeveloped areas upstream and southerly via improved drainage facilities toward the improved Los Angeles River. The Los Angeles River flows in a mostly easterly and southerly fashion in the basin upstream of this station. Only dry weather samples are collected at this station. The area upstream of this station is about 443 square miles. The overall imperviousness of this station's tributary watershed is about 33 percent. The land use

R0060914

VOL 15 0694

in the basin includes mostly natural (56 percent), 28 percent partially urbanized, 6 percent urbanized, and 10 percent industrial uses.

The beneficial uses of the Los Angeles River in this area include: potential Municipal and Domestic Supply (MUN), potential Industrial Service Supply (IND), existing Ground water Recharge (GWR), existing Water Contact Recreation (REC-1), existing Non-contact Water Recreation (REC-2), existing Warm Freshwater Habitat (WARM), existing Wildlife Habitat (WILD), and existing Wetland Habitat (WET).

4.3 UPPER SAN GABRIEL RIVER (SAN GABRIEL VALLEY) DRAINAGE BASIN (BASIN III)

The Upper San Gabriel River (San Gabriel Valley) Drainage Basin (Basin III) is comprised of approximately 553 square miles of mostly natural land in its northern and northeastern areas and mixed developed type land in the remainder of its area. Runoff in Basin III originates from the peaks in the San Gabriel Mountains and is mostly conveyed in natural canyons in the upstream portions of the Basin and improved drainage facilities in the downstream portions in a generally southerly and southwesterly direction. Basin III encompasses the eastern portions of the County. The three major improved channels in Basin III are the San Jose Creek, the Rio Hondo channel, and the San Gabriel River. The San Jose Creek is located to the east and is aligned in a generally westerly fashion; and the Rio Hondo and San Gabriel Rivers are aligned in a generally southerly fashion in the central portions of this Basin. There are many dams and flood control basins in Basin III. The largest include: Puddingstone Dam upstream of Walnut Creek Wash, San Gabriel Dam and Santa Fe Basin upstream of the San Gabriel River, and Whittier Narrows Basin downstream of the San Jose Creek and San Gabriel River. Whittier Narrows Basin is the final outlet from Basin III. Downstream of the Whittier Narrows, runoff splits via two separate channels into two separate basins, Basin IV and Basin V (south), in the Rio Hondo Channel and the San Gabriel River, respectively. The Rio Hondo flows in a southwesterly direction toward the Los Angeles River, which is aligned in a generally southerly direction toward San Pedro Bay and the Pacific Ocean. The San Gabriel River is also aligned in a generally southerly direction in Basin V (south) and finally discharges into the Pacific Ocean in the Seal Beach area of the Orange County. There are currently three monitoring stations in the Upper San Gabriel River Drainage Basin. Dry weather flows have usually been present at all stations because of their mostly very large tributary basins and types of soils.

The following is a description of conditions and activities at each station:

Station 28 is the most upstream monitoring station in Basin III and is located at Monrovia Creek above Sawpit Creek. Station 28 is considered the only station that samples an

R0060915

VOL 15 0695

essentially one hundred percent undeveloped watershed. Natural condition water quality is expected at this station. The "1994 draft Basin Plan" states that the area is "relatively pristine". Accordingly, LADPW has designated this station as the "natural condition" station, essentially unaffected from urbanization impacts. In the analysis provided in Sections 4 and 6, comparisons and conclusions from data collected at this station are made to the other 27 stations to identify any noticeable differences and whether they might be attributed to urbanization. Runoff in the upstream watershed tributary to station 28 is generally southerly through the natural narrow and steep canyon. Runoff from Monrovia Creek flows toward Sawpit Creek, which itself flows in a southwesterly direction toward Rio Hondo Channel. The Rio Hondo Channel is aligned in a southwesterly direction, discharges into the Whittier Narrows Basin, and finally confluences with the Los Angeles River in Basin IV. The Los Angeles River alignment is mostly southerly and finally outlets into the Pacific Ocean in the San Pedro Bay area. Both dry and wet weather samples are collected at this station. The area upstream of this station is about 1.8 square miles. The overall imperviousness of this station's tributary watershed is about four percent. The land use in the basin is entirely natural (100 percent) comprised of fairly dense trees and shrubs typical of the upper San Gabriel range.

The beneficial uses of the Monrovia Creek in this area include: intermittent Municipal and Domestic Supply (MUN), intermittent Ground water Recharge (GWR), intermittent Water Contact Recreation (REC-1), intermittent Non-contact Water Recreation (REC-2), intermittent Warm Freshwater Habitat (WARM), existing and intermittent Wildlife Habitat (WILD), and existing Wetland Habitat (WET).

Station 23 is located at the Rio Hondo Channel at San Gabriel Boulevard. Station 23 is located at the downstream end of the Basin III watershed that discharges into Basin IV and at the downstream end of the Whittier Narrows Basin. Station 28 is located in the upstream eastern canyons of the watershed tributary to station 23. Runoff in this watershed flows in a generally southerly direction in natural canyons upstream and improved drainage systems downstream toward the Whittier Narrows Basin and the Rio Hondo Channel. The Rio Hondo Channel is aligned in a southwesterly direction, discharges into the Whittier Narrows Basin, and finally confluences with the Los Angeles River in Basin IV. The Los Angeles River alignment is mostly southerly and finally outlets into the Pacific Ocean in the San Pedro Bay area. Only dry weather samples are collected at this station. The area upstream of this station is about 116 square miles. The overall imperviousness of this station's tributary watershed is about 35 percent. The land use in the basin includes 40 percent natural, 39 percent partially urbanized, 11 percent urbanized, and 10 percent industrial uses.

The beneficial uses of the Rio Hondo Channel in this area include: potential Municipal and Domestic Supply (MUN); intermittent Ground water Recharge (GWR); intermittent Water Contact

VOL 15
0696
R0060916

Recreation (REC-1); existing and intermittent Non-contact Water Recreation (REC-2); potential Warm Freshwater Habitat (WARM); intermittent and potential Wildlife Habitat (WILD); existing Rare, Threatened, or Endangered Species (RARE); and existing Wetland Habitat (WET).

Station 27 is located at the San Jose Creek at Workman Mill Road. Station 27 is located at the downstream end of the San Jose Creek right before its confluence with the improved San Gabriel River and discharge into the Whittier Narrows Basin. Station 27's tributary area includes the southeastern portions of Basin III. The San Gabriel River has a very large tributary area (almost 352 square miles) which encompasses the majority of Basin III. After confluence with the San Gabriel River and discharge into the Whittier Narrows Basin, the San Gabriel River continues on in Basin V (south) in a mostly southerly direction toward the Pacific Ocean in the Seal Beach area of Orange County. The improved San Jose Creek flows in a generally southwesterly and westerly direction and collects runoff from some natural streams upstream and many improved drainage facilities downstream. Contributors to dry weather flow typically include industrial and municipal NPDES dischargers such as the County Sanitation District POTW. Both dry and wet weather samples are collected at this station. The area upstream of this station is about 86 square miles. The overall imperviousness of this station's tributary watershed is about 39 percent. The land use in the basin includes 37 percent natural, 37 percent partially urbanized, 19 percent urbanized, and 7 percent industrial uses.

The beneficial uses of the San Jose Creek in this area include: potential Municipal and Domestic Supply (MUN), intermittent Ground water Recharge (GWR), potential Water Contact Recreation (REC-1), intermittent Non-contact Water Recreation (REC-2), intermittent Warm Freshwater Habitat (WARM), and existing Wildlife Habitat (WILD).

4.4 LOWER LOS ANGELES RIVER DRAINAGE BASIN (BASIN IV)

The Lower Los Angeles River Drainage Basin (Basin IV) extends from southern Los Angeles County in Long Beach all the way to the San Gabriel Range on the north. Basin IV is located downstream of Basins II and III, where the two large improved river systems, Los Angeles River and Rio Hondo Channel confluence (in the City of Lynwood). Following the confluence, the Los Angeles River flows in a southerly direction toward the San Pedro Bay and the Pacific Ocean. Basin IV is approximately 330 square miles, comprised of mostly natural land above its northern neck and mixed open space/developed land in the remainder of its area. Runoff in Basin IV originates from the peaks of the San Gabriel Mountains and is mostly conveyed in natural canyons in the upstream portions of the Basin and improved drainage facilities in the downstream portions in a generally southerly direction toward Rio Hondo Channel and the Los Angeles River. There are currently nine monitoring stations in the Lower Los Angeles River

VOL 15 0697

R0060917

Drainage Basin. Dry weather flows have been usually present at all stations because of the large tributary basins, the soil types, and the presence of other NPDES point source dischargers (i.e., Burbank POTW).

The following is a description of conditions and activities at each station:

Station 18 is located at the Los Angeles River at Firestone Boulevard. Station 18 is downstream of Station 17 and Basin II, described above. Hansen Basin and Sepulveda Basin, two major flood control facilities, are located in Basin II, upstream of this monitoring station. Runoff in the watershed tributary to this station initiates from the San Gabriel Mountain Range on the north and the runoff direction is generally southerly through natural streams upstream and improved drainage facilities downstream and toward the improved Los Angeles River system. The Los Angeles River flows in a mostly southeasterly and southerly fashion in this basin. Just downstream of this monitoring station, Los Angeles River confluences with the Rio Hondo Channel, then continues southerly toward the San Pedro Bay and the Pacific Ocean. Both dry and wet weather samples are collected at this station. The area upstream of this station is about 567 square miles. The overall imperviousness of this station's tributary watershed is about 34 percent. The land use for the area's tributary to this monitoring station includes mostly natural (52 percent), 28 percent partially urbanized, 8 percent urbanized, and 12 percent industrial uses.

The beneficial uses of the Los Angeles River in this area include: potential Municipal and Domestic Supply (MUN), potential Industrial Service Supply (IND), existing Ground water Recharge (GWR), existing and potential Water Contact Recreation (REC-1), existing Non-contact Water Recreation (REC-2), existing and potential Warm Freshwater Habitat (WARM), and potential Wildlife Habitat (WILD).

Station 22 is located at the Rio Hondo Channel at the Rio Hondo Spreading Grounds. The runoff tributary to Station 22 originates from the western ridges of Basin III (San Gabriel Mountain). Stations 28 and 23, located in Basin III, are upstream of Station 22. The runoff tributary to this monitoring station flows in a generally southerly direction in natural canyons upstream and improved drainage systems downstream toward the Rio Hondo Channel. The Rio Hondo Channel is aligned in a southwesterly direction and discharges into the Whittier Narrows Basin upstream of Station 22. Downstream of Station 22, Rio Hondo Channel confluences with the Los Angeles River. From the point of this confluence, the Los Angeles River alignment is mostly southerly and finally outlets into the Pacific Ocean in the San Pedro Bay area. Both dry and wet weather samples are collected at this station. The area upstream of this station is about 128 square miles. The overall imperviousness of this station's tributary

VOL 15 0698

R0060918

watershed is about 37 percent. The land use in the basin tributary to this station includes 40 percent partially urbanized, 37 percent natural, 12 percent urbanized, and 11 percent industrial uses.

The beneficial uses of the Rio Hondo Channel in this area include: potential Municipal and Domestic Supply (MUN), intermittent Ground water Recharge (GWR), potential Water Contact Recreation (REC-1), existing Non-contact Water Recreation (REC-2), potential Warm Freshwater Habitat (WARM), and intermittent and potential Wildlife Habitat (WILD).

Station 24 is located at the Rio Hondo Channel at Steward and Gray Road Intersection. The runoff tributary to Station 24 originates from the western ridges of Basin III (San Gabriel Mountain). Stations 28 and 23 located in Basin III, and Station 22 located in Basin IV, are upstream of Station 24. The runoff tributary to this monitoring station flows in a generally southerly direction in natural canyons upstream and improved drainage systems downstream toward the Rio Hondo Channel. The Rio Hondo Channel is aligned in a southwesterly direction and discharges into the Whittier Narrows Basin upstream of Station 24. Downstream of Station 24, Rio Hondo Channel confluences with the Los Angeles River. From the point of this confluence, the Los Angeles River alignment is mostly southerly and finally outlets into the Pacific Ocean in the San Pedro Bay area. Both dry and wet weather samples are collected at this station. The area upstream of this station is about 139 square miles. The overall imperviousness of this station's tributary watershed is about 39 percent. The land use in the basin tributary to this station includes 39 percent partially urbanized, 35 percent natural, 12 percent urbanized, and 14 percent industrial uses.

The beneficial uses of the Rio Hondo Channel in this area include: potential Municipal and Domestic Supply (MUN), intermittent Ground water Recharge (GWR), potential Water Contact Recreation (REC-1), existing Non-contact Water Recreation (REC-2), potential Warm Freshwater Habitat (WARM), and intermittent and potential Wildlife Habitat (WILD).

Station 14 is located at Compton Creek at Greenleaf Boulevard. Only dry weather samples (typically collected from the stagnant ponding water in the channel as a result of intermittent flows during the dry weather conditions) are collected at this station. The runoff direction in this area is mostly southerly and southeasterly via improved drainage systems into the Compton Creek, an improved channel. Further downstream and to the southeast of this station, Compton Creek joins the Los Angeles River. From this point on, the Los Angeles River flows in a southerly direction toward the San Pedro Bay and the Pacific Ocean. The area upstream of the station is about 39 square miles. The overall imperviousness of the tributary watershed is about 59 percent. The land use in the basin includes 40 percent partially urbanized, 37 percent

VOL 15 0699

R0060919

urbanized, 17 percent industrial, and 6 percent natural uses.

The beneficial uses of the Compton Creek at this location include: potential Municipal and Domestic Supply (MUN), existing Ground water Recharge (GWR), existing and potential Water Contact Recreation (REC-1), existing Non-contact Water Recreation (REC-2), existing Warm Freshwater Habitat (WARM), existing Wildlife Habitat (WILD), and existing Wetland Habitat (WET).

Station 20 is located at the Los Angeles River at Wardlow Road. Station 20 is located in the southern portion of Basin IV, in the City of Compton. It receives runoff from Basin III via the Rio Hondo Channel, from Basin II via the Los Angeles River, and from a majority of the Basin IV area except the southern and southwestern areas. The major flood control facilities upstream of this monitoring station include the Whittier Narrows Basin, Hansen Basin, Sepulveda Basin, Rio Hondo Spreading Grounds, and Dominguez Spreading Grounds. Runoff in the watershed tributary to this station initiates from the San Gabriel Mountain Range on the north and the runoff direction is generally southerly through natural streams upstream and improved drainage facilities downstream and toward the improved Los Angeles River and Rio Hondo Channel systems. Downstream of this station, the Los Angeles River flows in a southerly direction toward the San Pedro Bay and the Pacific Ocean. Both dry and wet weather samples are collected at this station. The area upstream of this station is about 769 square miles, the largest tributary area among all monitoring stations. The overall imperviousness of this station's tributary watershed is about 37 percent. The land use for the areas tributary to this monitoring station includes mostly 45 percent natural, 32 percent partially urbanized, 13 percent industrial, and 10 percent urbanized uses.

The beneficial uses of the Los Angeles River in this area include: potential Municipal and Domestic Supply (MUN); potential Industrial Service Supply (IND); potential Industrial Process (PROC); existing Ground Water Recharge (GWR); existing and potential Water Contact Recreation (REC-1); existing Non-contact Water Recreation (REC-2); existing and potential Warm Freshwater Habitat (WARM); existing Marine Habitat (MAR); existing and potential Wildlife Habitat (WILD); existing Rare, Threatened, or Endangered Species (RARE); potential Migration of Aquatic Organisms (MIGR); potential Spawning, Reproduction, and/or Early Development (SPWN); and potential Shellfish Harvesting (SHELL).

Station 4 is located at the Dominguez Channel at Vermont Avenue. Station 4 is located in the southwestern portions of Basin IV, in the City of Gardena. It receives runoff from Basin IV's southwestern areas. Runoff in this area is conveyed in a mostly southerly and southeasterly fashion via improved drainage facilities toward the improved Dominguez Channel. Downstream of this monitoring station, Dominguez Channel flows in a southeasterly and southerly direction

VOL 15
07000
R0060920

toward the Long Beach Harbor and the Pacific Ocean. Both dry and wet weather samples are collected at this station. The area upstream of this station is about 40 square miles. The overall imperviousness of this station's tributary watershed is about 62 percent, the second highest among all monitoring basin tributary areas. The land use for the area's tributary to this monitoring station includes 35 percent urbanized, 30 percent industrial, 25 percent partially urbanized, and 10 percent natural uses.

The beneficial uses of the Dominguez Channel in this area include: potential Municipal and Domestic Supply (MUN); potential navigation (NAV); existing Water Contact Recreation (REC-1); existing Non-contact Water Recreation (REC-2); existing Commercial and Sport Fishing (COMM); potential Warm Freshwater Habitat (WARM); existing Estuarine Habitat (EST); existing Marine Habitat (MAR); existing Wildlife Habitat (WILD); existing Rare, Threatened, or Endangered Species (RARE); existing Migration of Aquatic Organisms (MIGR) and existing Spawning, Reproduction, and/or Early Development (SPWN).

Station 11 is located at Torrance Lateral at Main Street (project 1232). Station 11 is located in the southwestern portions of Basin IV, in the City of Torrance. It receives local runoff from Basin IV's southwestern areas. Runoff in this area is conveyed in a mostly easterly direction via improved drainage facilities and private drains toward the Torrance Lateral, designated as project 1232, itself a tributary of the improved Dominguez Channel. About 6,000 feet east of this monitoring station, the Torrance Lateral discharges into the Dominguez Channel. From this point, the Dominguez Channel flows in a southeasterly and southerly direction toward the Long Beach Harbor and the Pacific Ocean. Both dry and wet weather samples are collected at this station. The area upstream of this station is about 10 square miles. The overall imperviousness of this station's tributary watershed is about 68 percent, the highest percent among all monitoring basin tributary areas. The land use for the area's tributary to this monitoring station includes 40 percent industrial (the highest industrial percent among all monitoring station tributary areas), 35 percent urbanized, 20 percent partially urbanized, and 5 percent natural uses.

The beneficial uses of the hydrologic unit associated with the Torrance Lateral include: potential Municipal and Domestic Supply (MUN); potential Navigation (NAV); existing Water Contact Recreation (REC-1); existing Non-contact Water Recreation (REC-2); existing Commercial and Sport Fishing (COMM); potential Warm Freshwater Habitat (WARM); existing Estuarine Habitat (EST); existing Marine Habitat (MAR); existing Wildlife Habitat (WILD); existing Rare, Threatened, or Endangered Species (RARE); existing Migration of Aquatic Organisms (MIGR); and existing Spawning, Reproduction, and/or Early Development (SPWN).

Station 12 is located at the Wilmington Drain at Pacific Coast Highway (project 9813).

VOL 15
0701
R0060921

Station 12 is the southernmost station in Basin IV, in the Wilmington area. Among all monitoring stations, Station 12 has the smallest tributary area, an area of approximately 0.6 square miles. It receives local runoff from north and east. Project 9813 is aligned in a southerly and westerly direction for about 4,500 feet prior to joining Project 643, which shortly downstream discharges into Harbor Lake, located west of the Harbor Freeway (I-110). The flow out of Harbor Lake is conveyed in a storm drain system to the West Basin, and from there into the Pacific Ocean in the Los Angeles Harbor area. This station also contains stagnant ponding water during the dry weather conditions and is subject to tidal influence. Both dry and wet weather samples are collected at this station. The overall imperviousness of this station's tributary watershed is about 56 percent. The land use for the area's tributary to this monitoring station includes 68 percent partially urbanized (the highest percent among all monitoring station tributary areas), 30 percent urbanized, and 2 percent natural uses.

The beneficial uses of the hydrologic unit associated with the Wilmington Drain include: potential Municipal and Domestic Supply (MUN); potential Navigation (NAV); existing Water Contact Recreation (REC-1); existing Non-contact Water Recreation (REC-2); existing Commercial and Sport Fishing (COMM); potential Warm Freshwater Habitat (WARM); existing Estuarine Habitat (EST); existing Marine Habitat (MAR); existing Wildlife Habitat (WILD); existing Rare, Threatened, or Endangered Species (RARE); existing Migration of Aquatic Organisms (MIGR); and existing Spawning, Reproduction, and/or Early Development (SPWN).

4.5 LOWER SAN GABRIEL RIVER DRAINAGE BASIN (BASIN V [SOUTH])

The Lower Los Angeles River Drainage Basin (Basin V [south]) includes the eastern and southeastern portions of Los Angeles County. Basin IV is located downstream of Basins III's central and eastern portions, immediately downstream of the Whittier Narrows Dam. There are many dams and flood control basins in Basin III (upstream) and Basin V (south). The largest includes Puddingstone Dam upstream of Walnut Creek Wash, San Gabriel Dam and Santa Fe Basin upstream of the San Gabriel River, Whittier Narrows Basin downstream of the San Jose Creek and San Gabriel River, and San Gabriel Canyon Spreading Grounds. The Whittier Narrows Basin is the final outlet from Basin III. Downstream of the Whittier Narrows Basin, runoff is conveyed in mostly improved drainage laterals and some natural streams into the improved San Gabriel River. San Gabriel River is aligned in a generally southerly direction in Basin V (south) and finally discharges into the Pacific Ocean in the Seal Beach area of Orange County. Basin V (south) is approximately 160 square miles of mostly natural land in the eastern areas and mixed open/developed uses in the remainder of the area. Runoff in Basin V (south) originates from the peaks in the San Gabriel Mountains and is mostly conveyed in natural canyons in the upstream portions of the Basin and improved drainage facilities in the

R0060922

VOL 15 07102

downstream portions and in a generally southerly direction. There are currently six monitoring stations in the Lower San Gabriel River Drainage Basin. Dry weather flows have been usually present at all stations because of their mostly very large tributary basins and types of soils.

The following is a description of conditions and activities at each station:

Station 25 is located at the San Gabriel River at San Gabriel Spreading Grounds. Station 25 is downstream of Basin III, described above. The Whittier Narrows, Puddingstone Dam, San Gabriel Dam, Santa Fe Basin, and San Gabriel Spreading Grounds comprise the largest flood control facilities upstream of this monitoring station. Runoff in the watershed tributary to this station initiates from the San Gabriel Mountain Range on the north; the runoff direction is generally southerly through natural streams upstream and improved drainage facilities downstream and toward the improved San Gabriel River. The San Gabriel River is aligned in a mostly southerly fashion downstream of this station toward the outlet into the Pacific Ocean. Both dry and wet weather samples are collected at this station. The area upstream of this station is about 445 square miles. The overall imperviousness of this station's tributary watershed is about 23 percent. The land use for the areas tributary to this monitoring station includes mostly natural (65 percent), 20 percent partially urbanized, 7 percent urbanized, and 8 percent industrial uses.

The beneficial uses of the San Gabriel River in this area include: potential Municipal and Domestic Supply (MUN); potential Industrial Service Supply (IND); potential Industrial Process (PROC); Intermittent Ground water Recharge (GWR); existing and intermittent Water Contact Recreation (REC-1); existing and intermittent Non-contact Water Recreation (REC-2); intermittent Warm Freshwater Habitat (WARM); existing and intermittent Wildlife Habitat (WILD); and existing and intermittent Rare, Threatened, or Endangered Species (RARE).

Station 26 is located at the San Gabriel River at Willow Street. Station 26 is downstream of Station 25, described above. The Whittier Narrows, Puddingstone Dam, San Gabriel Dam, Santa Fe Basin, and San Gabriel Spreading Grounds comprise the largest flood control facilities upstream of this monitoring station. Runoff in the watershed tributary to this station initiates from the San Gabriel Mountain Range on the north; and the runoff direction is generally southerly through natural streams upstream and improved drainage facilities downstream and toward the improved San Gabriel River. The San Gabriel River is aligned in a mostly southerly fashion downstream of this station toward the outlet into the Pacific Ocean. Both dry and wet weather samples are collected at this station. The area upstream of this station is about 471 square miles. The overall imperviousness of this station's tributary watershed is about 25 percent. The land use for the areas tributary to this monitoring station includes mostly natural (62 percent), 22 percent partially urbanized, 7 percent urbanized, and 9 percent industrial uses.

R0060923

VOL 15 0703

The beneficial uses of the San Gabriel River in this area include: potential Municipal and Domestic Supply (MUN); existing Water Contact Recreation (REC-1); existing Non-contact Water Recreation (REC-2); potential Warm Freshwater Habitat (WARM); and potential Wildlife Habitat (WILD).

Station 15 is located at Coyote Creek at Orangethorpe Boulevard. Only dry weather samples are collected at this station. The runoff direction in this area is mostly southerly and southwesterly via natural streams and improved drainage systems into the improved Coyote Creek. Further downstream and to the southwest of this station, Coyote Creek joins the San Gabriel River. From this point on, the San Gabriel River flows in a southerly direction toward the Seal Beach Pier and the Pacific Ocean. The area upstream of the station is about 134 square miles. The overall imperviousness of the tributary watershed is about 42 percent. The land use in the basin includes 35 percent natural, 30 percent partially urbanized, 20 percent industrial, and 15 percent urbanized uses.

The beneficial uses of the Coyote Creek at this location include: potential Municipal and Domestic Supply (MUN); existing Industrial Service Supply (IND); potential Industrial Process (PROC); existing Navigation (NAV); existing Water Contact Recreation (REC-1); existing Non-contact Water Recreation (REC-2); existing Commercial and Sport Fishing (COMM); potential Warm Freshwater Habitat (WARM); existing Estuarine Habitat (EST); existing Marine Habitat (MAR); existing Wildlife Habitat (WILD); existing and intermittent Rare, Threatened, or Endangered Species (RARE); existing Migration of Aquatic Organisms (MIGR); existing Spawning, Reproduction, and/or Early Development (SPWN); and potential Shellfish Harvesting (SHELL).

Station 16 is located at Coyote Creek at Willow Street. Both dry and wet weather samples are collected at this station. The runoff direction in this area is mostly southerly and southwesterly via natural streams and improved drainage systems into the improved Coyote Creek. Shortly downstream and to the southwest of this station, Coyote Creek joins the San Gabriel River. From this point on, the San Gabriel River flows in a southerly direction toward the Seal Beach Pier and the Pacific Ocean. The area upstream of the station is about 177 square miles. The overall imperviousness of the tributary watershed is about 43 percent. The land use in the basin includes 38 percent partially urbanized, 28 percent natural, 17 percent industrial, and 17 percent urbanized uses.

The beneficial uses of the Coyote Creek at this location include: potential Municipal and Domestic Supply (MUN); existing Industrial Service Supply (IND); potential Industrial Process (PROC); existing Navigation (NAV); existing Water Contact Recreation (REC-1); existing Non-contact Water Recreation (REC-2); existing Commercial and Sport Fishing (COMM); potential Warm Freshwater Habitat (WARM); existing Estuarine Habitat (EST); existing Marine Habitat

R0060924

VOL 15 0704

(MAR); existing Wildlife Habitat (WILD); existing and intermittent Rare, Threatened, or Endangered Species (RARE); existing Migration of Aquatic Organisms (MIGR); existing Spawning, Reproduction, and/or Early Development (SPWN); and potential Shellfish Harvesting (SHELL).

Station 21 is located at Los Cerritos Channel at Stearns. Both dry and wet weather samples are collected at this station. The runoff direction in this area is mostly southerly through improved drainage systems into the improved Los Cerritos Channel. The Los Cerritos Channel is aligned parallel to the San Gabriel River just south of Spring Street and collects runoff from a number of laterals in the area. Shortly downstream, Los Cerritos Channel outlets into the Marine Stadium of Alamitos Bay and finally the Pacific Ocean. The area upstream of the station is about 31 square miles. The overall imperviousness of the tributary watershed is about 50 percent. The land use in the basin includes 50 percent partially urbanized, 20 percent industrial, 16 percent urbanized, and 14 percent natural uses.

The beneficial uses of the Los Cerritos Channel at this location include: potential Municipal and Domestic Supply (MUN), potential Water Contact Recreation (REC-1), intermittent Non-contact Water Recreation (REC-2), intermittent Warm Freshwater Habitat (WARM), and existing and intermittent Wildlife Habitat (WILD).

4.6 SANTA CLARITA VALLEY BASIN (BASIN V- [NORTH])

The Santa Clarita Valley Basin (Basin V [north]), encompasses the northwesternmost portions of Los Angeles County. Among the regional basins delineated in the NPDES Permit, the Santa Clarita Valley Basin has the largest watershed area. Basin V (north) consists of approximately 680 square miles of mostly natural land with some mixed type developed areas. Castaic, Bouquet, and Palmdale Reservoirs are located within Basin V (north). Runoff in Basin V (north) originates from the peaks on the south, east, and west and is mostly conveyed in natural canyons and streams toward the Santa Clara River, a major river system aligned in a mostly east to west fashion in northern Los Angeles County and Ventura County. Santa Clara river has many small and large tributaries and finally discharges into the Pacific Ocean in the City of Ventura. There is currently only one monitoring station in the Santa Clarita Valley Drainage Basin. Dry weather flows have been usually present at this station because of the very large tributary basin.

The following is a description of conditions and activities at this station:

Station 7 Is at the Santa Clara River at the Old Road. Runoff in this area is generally through unimproved streams and canyons and in a northerly and southwesterly direction toward the

R0060925

VOL 15 07705

Santa Clara River. The sediment accumulation in the Santa Clara River is known to be fairly high and runoff generated in this area usually has high sediment content. The Santa Clara River is aligned in a generally westerly direction and finally discharges into the Pacific Ocean in the City of Ventura. Both dry and wet weather samples are collected at this station. The area upstream of this station is about 441 square miles. The overall imperviousness of this station's tributary watershed is about 13 percent. The land use in the basin includes mostly natural (86 percent), 5 percent partially urbanized, 5 percent urbanized, and 4 percent industrial uses.

The beneficial uses of the Santa Clara River in this area include: potential Municipal and Domestic Supply (MUN); existing Industrial Service Supply (IND); existing Industrial Process (PROC); existing Agriculture (AGR); existing Ground water Recharge (GWR); existing Freshwater Replenishment (FRESH); existing Water Contact Recreation (REC-1); existing Non-contact Water Recreation (REC-2); existing Warm Freshwater Habitat (WARM); existing Wildlife Habitat (WILD); existing Prevention of Biological Habitats; existing Rare, Threatened, or Endangered Species (RARE); existing Shellfish Harvesting (SHELL); and existing Wetland Habitat (WET).

VOL 15
0706

R0060926

SECTION 5 - SCREENING PROCEDURE

A screening procedure was utilized to select the chemical compounds exceeding the water quality objective limits (Table 4) during the 1988-1994 sampling period for the twenty-eight monitoring stations evaluated. This included comparing each data set with the objective limits and counting the total number of exceedences for the constituents analyzed at each monitoring station. Tables 6 and 7 summarize the total number of non-compliant compounds for each monitoring station under both dry and storm weather conditions, respectively.

Tables 6 and 7 only show compounds that exceed the objective limits. In other words, those compounds which were monitored (Table 3) and are not listed on these tables did not exceed the water quality objectives at any time during the monitoring period. The total number of samples taken during the monitoring period are also included on these two tables. Blank spaces in the tables indicate no analyses were performed for that particular compound at the specified sampling site. As can be seen, of the 127 compounds monitored during storm weather, only 17 exceeded the numerical water quality objectives during the monitoring period. For the dry weather samples, of the 73 compounds monitored, only 23 exceeded the numerical water quality objectives.

However, not all the exceedences reflect a sufficient significance to be included in the water quality evaluations. For example, of the 28 monitoring stations and more than five years of dry weather monitoring, barium exceeded the water quality objectives only once (Table 6). There were other compounds that also exhibited a small number of exceedences. Compounds with a very low number of exceedence may reflect data outliers, which may be attributed to a number of errors inherent in water quality data acquisition. Outliers are values which are obviously higher or lower than the majority of the data set.

The last column on Tables 6 and 7 provides the total number of times (for all monitoring stations) a compound exceeded the objective limits during the monitoring period. For example, in all dry weather monitoring data analyzed, fecal Enterococci exceeded the water quality limits 157 times. The total number of exceedences were counted and the top ten compounds were selected for the water quality evaluations of this report.

The following is a list of the ten compounds which exhibited the highest numbers of non-compliance with the numerical objectives for both dry and storm weather monitoring data:

R0060927

VOL 15 07087

TOP TEN NON-COMPLIANCE MONITORING PARAMETERS (EXCEEDENCE)

Compound	Dry Weather Samples	Storm Weather Samples
Fecal coliform	1,152	320
TDS	738	14
Ammonium	310	4
Chloride	299	5
Nitrite-N	276	12
pH	246	49
Sulfate	234	15
Total coliform	160	112
Fecal Enterococci	157	60
Lead	113	10

Exhibit "C" and "D" display compounds which exceeded the water quality objectives at least five percent of the time for dry weather samples and wet weather samples, respectively. These exhibits provide a schematic summary of potential "pollutants of concern" at each monitoring station.

The long-term trend analysis and the evaluation of urbanization impacts presented in the following sections are performed on the top ten non-compliance compounds presented above. In the analysis of data, all measurements are included. This includes the extremely high and low data which, as mentioned previously, may represent outliers in the data set. Even though the accuracy of some of the data outliers seems questionable, they were included since there is not sufficient evidence to show that they are erroneous. As a result, outliers were included and analyzed with the rest of the data.

R0060928

VOL 15 07088

SECTION 6 - LONG-TERM TREND ANALYSIS

A long-term trend analysis was performed for the ten water quality constituents selected through the screening procedure from all monitoring stations over the period from 1988 to 1994. The constituents analyzed include: ammonium, chloride, sulfate, pH, nitrite, total dissolved solids, lead, total coliform, fecal coliform, and fecal Enterococci. An analysis was also conducted to assess the trends of these water quality parameters on a county-wide basis and on a regional basis for each of the five drainage basins within the County. For comparison purpose, the water quality objectives from the "1994 draft Basin Plan" and "1990 Ocean Plan" were used to assess the previous monitoring data. It should be pointed out that a non-compliance parameter from such comparison does not constitute any legal enforcement actions or require any corrective actions, since currently there are no enforceable numerical water quality objectives assigned to LADPW under the existing NPDES permit.

6.1 TREND ANALYSIS FOR INDIVIDUAL SAMPLING SITE

The water quality data of the ten parameters analyzed was provided by LADPW for samples collected between 1988 and 1994. For each monitoring station, only the non-compliance parameters (parameters which exceeded the water quality objectives according to the screening procedures) were analyzed.

Among the top ten compounds selected in the screening process, long-term trend analysis for each monitoring station was performed using only those compounds which exceeded the water quality objectives in more than ninety (90) percent of samples taken. In other words, if 90 percent of the total samples taken exhibited higher concentrations than the objective limit value for a particular compound (or parameter), that compound/parameter was selected for performing long-term trend analysis at a particular station. Take Station 1 as an example, compounds that exceeded the water quality objectives 90 percent of the time or more, include: Total Dissolved Solids (66 out of the 68 samples taken exceed the objectives) and fecal coliform (62 out of the 68 samples taken exceed the objectives). Trends for samples collected during both dry and storm weather conditions were analyzed separately. Constituent concentrations were plotted against time for each monitoring site. Average concentrations over the monitoring period, specific water quality objectives, and data from Station 28 (used as a background or natural basin condition) are also provided in the graphs for comparison purposes. Results are summarized in Appendix "A".

VOL 15 07009

R0060929

6.1.1 Dry Weather Analysis

Station 1: Ballona Creek at Fairfax Avenue

Two parameters were found to be of significance at Station 1, Total Dissolved Solids and fecal coliform. Throughout the sampling period, TDS exhibits an initial trend of increase between 1988 and 1992, then it shows a decreasing trend from 1992 until the present Fecal coliform remains relatively stable with maximum concentrations observed in the last quarter of 1990 and a generally increasing trend from 1991 through mid-1993. The average concentrations of both parameters exceeded those measured at Station 28 and the basin plan objectives.

Station 2: Ballona Creek at Sawtelle Blvd.

TDS, fecal coliform, and pH were the non-compliant parameters at Station 2. Both TDS and fecal coliform appear to be consistently above the values of Station 28 with average concentrations above the Basin Plan objective. The pH value varied between 7.6 and 9.0, and appeared to be very similar to those found at Station 28. The above average pH value is relatively close and below the upper limit of water quality objective specified in the Basin Plan.

Station 3: Centinela Creek at Centinela Blvd.

TDS, fecal coliform, and pH were the non-compliant parameters at Station 3. TDS concentrations reflect generally increasing trend from 1988 to mid-1990, a downward trend from mid-1990 to late 1993, and an upward trend from there on. TDS average concentration is above the Basin Plan objectives and those observed at Station 28. pH values indicate average pH concentrations are below the upper limit of the Basin Plan with an upward trend with peaks in 1992 ; which appears to be consistent with that analyzed at Station 28. Extreme fecal coliform were observed in 1989. Most concentrations are above the Basin Plan objectives and those observed at Station 28. The trend seems to be a fluctuating one with a general reduction past 1993.

Station 4: Dominiguez Channel at Vermont Avenue

Parameters of pH, Chloride, fecal coliform, and TDS were evaluated at Station 4. The average value of pH remained close to the water quality objective. The pH trend shows an increase from 1988 to 1991, and a decrease from 1991 to 1994. The trends of chloride and TDS remain relatively unchanged throughout the entire monitoring period and are similar to the water quality objectives, except for several isolated occasions. Fecal coliform shows more fluctuations, but in most cases with values above the water quality objective and those of Station 28.

VOL 15
0710
R0060930

Station 5: Kenter Drain at Pico Blvd.

Fecal coliform, fecal Enterococci, total coliform, lead, TDS, chloride, and ammonium were analyzed for Station 5. Among the parameters, lead, total coliform, fecal coliform, fecal Enterococci, and ammonium show wide fluctuations between 1988 and 1990. After 1990, these parameters all became relatively steady and show a trend of reduction. Additionally, lead, total coliform, and ammonium are shown to approach the water quality objectives and the conditions at Station 28. TDS exhibits more variations with several extremes. These extremes may be attributed to data outliers (described previously) and due to errors made during sampling, data analysis, and/or reporting.

Station 6: Malibu Creek at Cross Creek Road

Ammonium, sulfate, pH, total coliform, fecal coliform, and fecal Enterococci were evaluated for Station 6. For most of the period analyzed, total coliform and fecal coliform show a horizontal trend and are close to the water quality objectives and those of Station 28. Fecal Enterococci shows a slight increasing trend from 1991 to mid-1994, follows the data observed at Station 28, and are mostly above or at the Ocean Plan water quality objectives. pH shows a slight increase between 1988 and 1992, but more fluctuating patterns between 1993 and 1994 similar to that of Station 28. But in general, the average value of pH is lower than the upper limit of Basin Plan objectives. Sulfate shows an increasing trend from 1991 to 1993 and largely exceeded that of Station 28. Nevertheless, the average value of sulfate is close to the water quality objective values.

Station 7: Santa Clara River at the Old Road

Ammonium, chloride, sulfate, nitrite, TDS, and total coliform were evaluated. The general trends of nitrite, total coliform, and sulfate remain relatively steady throughout the years, except some fluctuations occurred for each parameter at different times (i.e., a surge of coliform concentration in late 1993, sulfate changes between mid-1990 and early 1993). TDS and chloride correspond with each other closely and both show a slight decreasing trend from 1990 to 1994. Ammonium shows a trend of constant fluctuation throughout the years.

VOL 15 0711

R0060931

Station 8: Santa Monica Canyon at Short Street

Fecal coliform, fecal Enterococci, total coliform, and lead were analyzed. The bacteria constituents show two different trends. The total coliform value remains steady throughout the years and shows very little fluctuation, which is similar to Station 28. Fecal coliform and Enterococci, on the other hand, show more variation. Several extremes may be due to sampling, analysis, and/or reporting errors. Lead concentrations appear to be high from 1988 to 1990 and decrease to a steady level similar to that in Station 28.

Station 9: Sepulveda Channel at Culver Blvd.

Fecal coliform, lead, TDS, pH, sulfate, and chloride were selected for analysis at Station 9. High lead concentrations were observed between 1988 and late 1992. It shows a reduction trend and is similar to those displayed at Station 28. Fecal coliform exhibits a fluctuating trend without specific patterns. TDS, sulfate, and chloride show much more variations and are all higher than those exhibited at Station 28. pH follows a similar pattern as that depicted at Station 28 with an average value slightly lower than the upper limit of the Basin Plan water quality objective.

Station 10: Topanga Canyon at Pacific Coast Highway

Total coliform, fecal coliform, fecal Enterococci, sulfate, and pH were analyzed. The bacteria parameters show a greater variation but similar pattern as that depicted at Station 28, with an increasing trend between 1991 and late 1993. The pH values show a slight increasing throughout the years and the average value is slightly lower than the water quality objective.

Station 11: Torrance Lateral at Main Street

Chloride, pH, TDS, and fecal coliform were analyzed at this station. Chloride and TDS correspond well with each other and show wide fluctuations. The average values of both parameters are above those shown for Station 28. The trends of pH and fecal coliform show greater fluctuation before 1990, and remain relatively close to those at Station 28.

R0060932

VOL 15 0712

Station 12: Wilmington Drain at Pacific Coast Highway

Fecal coliform, TDS, sulfate, chloride, and ammonium were chosen for analysis. Fecal coliform and ammonium follow closely to those values depicted at Station 28. TDS, sulfate, and chloride are all showing similar pattern and displayed above the values at Station 28.

Station 13: Corral Canyon at Pacific Coast Highway

Fecal Enterococci, fecal coliform, and total coliform were analyzed. All of these parameters show some variations from those collected at Station 28. The average value of fecal coliform is less than the Ocean Plan water quality objective limits, while the average values of coliform and fecal Enterococci are slightly higher than the Ocean Plan objective limits.

Station 14: Compton Creek at Greenleaf Blvd.

Ammonium, pH, lead, and fecal coliform were analyzed. Ammonium exhibits a similar trend as that of Station 28. pH values are general in the more active range than that of Station 28, but relatively close to the upper limit of Basin Plan water quality objective. Several high lead concentrations were reported prior to 1991. Lead data between 1990 and 1994 appears to be consistent with that of Station 28. Fecal coliform concentrations are slightly higher than that of Station 28 and the Basin water plan quarterly objective limit.

Station 15: Coyote Creek at Orangethorpe Blvd.

Fecal coliform and TDS were evaluated for Station 15. Fecal coliform depicts a steady trend and the values appear to be higher than those of Station 28 and water quality objective limits. TDS shows a slight increasing trend and the average exceeds both the Basin Plan water quality objectives and data observed at Station 28.

Station 16: Coyote Creek at Willow Street

Fecal coliform, TDS, nitrite, and ammonium were analyzed. TDS shows a slight increasing trend and nitrite shows a slight descending trend from 1992 to 1994 parameters. Both are generally higher than those at Station 28 and the water quality objective limits. Fecal coliform trend appears steady and almost coincides with the trend at Station 28. Ammonium shows a slight decreasing trend since 1992 and is generally higher then that for Station 28.

R0060933

Station 17: Los Angeles River at Arroyo Seco

Fecal coliform, nitrite, chloride, and ammonium were evaluated. All of these parameters depict a horizontal trend with some fluctuations. Chloride and ammonium are higher than those at Station 28. However, the average value of chloride is less than the Basin Plan water quality objective limit. Nitrite and fecal coliform appear to be close to the values shown for Station 28.

Station 18: Los Angeles River at Firestone Blvd.

Chloride, fecal coliform, nitrite, pH, and ammonium were analyzed. All of these parameters depict a horizontal trend with some fluctuations. Chloride, nitrite, and ammonium are shown to be higher than the Station 28 data. Fecal coliform and pH are similar to those shown for Station 28. The average pH value is lower but closer to the Basin Plan objective.

Station 19: Los Angeles River at Tujunga

Nitrite, sulfate, chloride, fecal coliform, and ammonium were evaluated for Station 19. The concentrations of nitrite, chloride, sulfate, and ammonium are higher than those found at Station 28, with a wide range of fluctuations. Fecal coliform coincides with the trend depicted for Station 28. Sulfate shows an increasing trend from mid-1990.

Station 20: Los Angeles River at Wardlow Road

The trends of ammonium, total coliform, chloride, pH, and nitrite were investigated for this station. There seems to be no specific trends exhibited in any of these plots. Ammonium, chloride, and nitrite show wide fluctuations and exceed the values of Station 28. Total coliform and pH were relatively close to the trend of Station 28 and the water quality objectives.

Station 21: Los Cerritos Channel at Stearns

The samples of pH and fecal coliform were analyzed for this station. Both of these parameters show a similar trend to that of Station 28. The average pH remains close but below the upper limit of the Bain Plan objective.

R0060934

VOL 15 0714

Station 22: Rio Hondo Channel at Rio Hondo Spreading Grounds

Ammonium, nitrite, and fecal coliform were analyzed. Ammonium shows wide fluctuations with most values exceeding that of Station 28. Nitrite and fecal coliform remained close to the trend of Station 28.

Station 23: Rio Hondo Channel at San Gabriel Blvd.

Nitrite, fecal coliform, and ammonium were analyzed. Nitrite shows a slight decreasing trend with the average value slightly lower than the Basin Plan water quality objective limit. Fecal coliform follows a similar trend as that of Station 28. Ammonium shows wide fluctuations and exceeded the values shown for Station 28.

Station 24: Rio Hondo Channel at Steward and Gray

Fecal coliform, pH, and chloride were evaluated for Station 24. All of these three compounds show no particular trends. Fecal coliform and pH followed closely to the values measured at Station 28. Chloride concentrations are higher than those found at Station 28. But pH values fluctuate above and below those of Station 28.

Station 25: San Gabriel River at San Gabriel Spreading Grounds

Ammonium, nitrite, and fecal coliform were plotted for trend analysis. Ammonium shows a generally reducing trend but the values are higher than those of Station 28. Nitrite concentrations are higher than those of Station 28, and its average value is slightly higher than the Basin Plan water quality objective limit. Fecal coliform follows very similar trend as that for Station 28.

Station 26: San Gabriel River at Willow Street

Fecal coliform, TDS, nitrite, and ammonium were evaluated. The concentrations for ammonium, TDS, and nitrite are generally higher than those at Station 28. Additionally, ammonium shows a slight decreasing trend after 1992. Nitrite and fecal coliform have average concentrations greater than the Basin Plan water quality objective. Fecal coliform are similar to that of Station 28.

R0060935

VOL 15 0715

Station 27: San Jose Creek at Workman Mill Road

TDS, nitrite, sulfate, chloride, and ammonium were analyzed. All of these compounds show some fluctuations throughout the years. The concentrations of TDS, sulfate, and chloride are above those shown at Station 28. Nitrite and ammonium were similar to the trends shown at Station 28.

Both TDS and chloride show a slight increasing, but more steady trend since 1992 and their values are mostly above Station 28.

6.1.2 Storm Weather Analysis

Storm weather trend analysis for a number of the monitoring stations indicated extreme bacteria concentration peaks throughout the sampling period. These peaks may be attributed to sewage overflows discharged to storm drain systems during flooding events. The following is a general discussion of storm weather trend analysis at each monitoring station:

Station 2: Ballona Creek at Sawtelle Blvd.

Fecal coliform and pH were analyzed for Station 2. Fecal coliform appears to be steady and is close to the values depicted for Station 28 except for an increase from mid-1993. The pH value has a greater fluctuation but it seems to be closer to the lower limit of the Basin Plan water quality objectives. During the monitoring period, pH remained below the values obtained for Station 28.

Station 3: Centinela Creek at Centinela Blvd.

TDS, fecal coliform, pH, and chloride were analyzed for Station 3. TDS, chloride, and fecal coliform depict a horizontal trend with values close to those of Station 28. The pH values remains below those obtained from Station 28 and closer to the lower limit (acidic range) of the Basin Plan water quality objectives.

Station 4: Dominiguez Channel at Vermont Avenue

Parameters of Lead, pH, and fecal coliform were evaluated for Station 4. Fecal coliform appears to be consistent with conditions observed at Station 28. Lead shows a reducing trend with values reaching the same level as those at Station 28. The pH values are below those of Station 28 and close to the lower limit of the Basin Plan water quality objectives.

R0060936

VOL 15 0716

Station 5: Kenter Drain at Pico Blvd.

Fecal coliform, fecal Enterococci, total coliform, TDS, and pH were analyzed for Station 5. Fecal coliform, fecal Enterococci, and TDS have similar values and follow the same trends as those of Station 28. The pH values are below those reported for Station 28 and are closer to the lower limit of the Basin Plan water quality objectives.

Station 6: Malibu Creek at Cross Creek Road

Sulfate, total coliform, fecal coliform, and fecal Enterococci were plotted for Station 6. Total coliform and fecal coliform show an increasing trend since 1990 and their concentrations are above the water quality objectives and those reported for Station 28 for the majority of the monitoring period. Fecal Enterococci shows a slight increasing trend, but remains close to values reported for Station 28 and the Ocean Plan water quality objective. Sulfate shows wide fluctuations and rises on one occasion above the Basin Plan water quality objective, but its average value does not exceed the objective limit. Sulfate values are above those reported for Station 28.

Station 7: Santa Clara River at the Old Road

Sulfate and total coliform were evaluated. Sulfate shows an increasing trend after 1991 and rises above the Basin Plan water quality objective and the Station 28 data on a few occasions. Total coliform data remains similar to those at Station 28.

Station 10: Topanga Canyon at Pacific Coast Highway

Total coliform, fecal coliform, and fecal Enterococci were analyzed. These bacteria parameters show an increasing trend since 1991 and exceed those values obtained from for Station 28.

Station 11: Torrance Lateral at Main Street

Fecal coliform and pH were plotted for trend analysis. The values of pH remain close to the lower limit of the Basin Plan water quality objective and are less than those obtained from Station 28. Fecal coliform shows a slight increasing trend after 1991, when it rises above the Station 28 data and the water quality objective.

Station 12: Wilmington Drain at Pacific Coast Highway

Fecal coliform and pH were analyzed. Fecal coliform depicts a slight increasing trend after 1991

R0060937

VOL 15 07117

and stays above values reported for Station 28. pH shows a decreasing trend after 1992 and plunge below the lower limit of the Basin Plan water quality objective.

Station 16: Coyote Creek at Willow Street

Fecal coliform, TDS, and nitrite were analyzed. TDS and nitrite show a horizontal trend with wide fluctuations. For the majority of the monitoring period, TDS and nitrate concentrations remain below the water quality objectives with nitrite exceeding that of Station 28. Fecal coliform values remain similar to those of Station 28.

Station 18: Los Angeles River at Firestone Blvd.

Fecal coliform and pH were analyzed. Fecal coliform follows a horizontal trend and coincides with data observed at Station 28. The values of pH fluctuates and remains close to the lower limit of the water quality objectives and below those of Station 28.

Station 20: Los Angeles River at Wardlow Road

The trends of Total coliform and pH were plotted at this station. Total coliform follows a horizontal trend and coincides with the data obtained from Station 28. The values of pH fluctuates and remains close to the lower limit of the water quality objective and below those observed at Station 28.

Station 21: Los Cerritos Channel at Stearns

pH and fecal coliform trends were investigated at this station. Fecal coliform follows a horizontal trend and coincides with that observed at Station 28. The values of pH fluctuates around the lower limit of the water quality objective and remains below those observed at Station 28.

Station 22: Rio Hondo Channel at Rio Hondo Spreading Grounds

Fecal coliform and pH were analyzed. Fecal coliform follows a horizontal trend similar to that of Station 28's. The values of pH fluctuate and stay close to the lower limit of the water quality objectives and below Station 28 reported values.

Station 24: Rio Hondo Channel at Steward and Gray

Fecal coliform and pH were evaluated for Station 24. After 1991, fecal coliform shows an increasing trend as it rises above the Station 28 data. pH shows an increasing trend from 1988

R0060938

VOL 15 0718

to 1992 and then a descending trend thereafter. After 1992, pH values drop below the lower limits of the Basin Plan water quality objectives.

Station 25: San Gabriel River at San Gabriel Spreading Grounds

Fecal coliform was investigated at this station. The data shows some fluctuations, but generally with concentrations higher than those of Station 28.

Station 26: San Gabriel River at Willow Street

Fecal coliform, TDS, and nitrite were evaluated. TDS and nitrite depict a slightly increasing trend from 1991. TDS generally remains below the water quality objective. Nitrite fluctuates and rises above the Station 28 data. The concentration average of nitrite is close to the water quality objective. Fecal coliform appears to follow a horizontal trend and very close to that of Station 28.

Station 27: San Jose Creek at Workman Mill Road

The Fecal coliform trend was investigated and The values coincided with those of Station 28.

6.2 TREND ANALYSIS ON A COUNTY-WIDE BASIS

The trend analysis performed for individual monitoring stations described above and presented in Appendix "A", were integrated for the entire Los Angeles County to identify the long-term trend for the County as a whole. The analysis presented here, incorporates all reported data throughout the County and for the entire monitoring period. Again, the trend analysis is performed for the ten compounds identified in Section 5 (non-compliance compounds). Constituent concentrations are plotted against time for the entire Los Angeles County. Average concentrations over the monitoring period and water quality objectives are also provided in the graphs for comparison purposes. Results are summarized in Appendix "B".

Storm weather trend analysis on a County-wide basis indicated extreme bacteria concentration peaks throughout the sampling period. These peaks may be attributed to sewage overflows discharged to storm drain systems during flooding events. The following represents a summary of water quality trends throughout the Los Angeles County:

- Total coliform

Dry weather monitoring: The data shows a general trend of reduction on total coliform

R0060939

VOL 15 0719

concentration since 1988.

Storm weather monitoring: The total coliform concentration does not show any particular trend. However, a slight increase of coliform concentration is observed in 1994 but higher concentrations were observed in 1987 and 1988.

For both dry and storm weather conditions, the total coliform concentrations largely exceed the basin and ocean plan objectives.

Fecal coliform

Dry and storm weather monitoring: Higher fecal coliform concentrations are observed for both the dry and storm weather samples late in the 1980s. The trend shows a decreasing pattern thereafter, and then slightly increases in 1994.

Lead

Dry weather monitoring: The data shows a trend of reductions from 1988 to 1991, and generally exceeded the Basin Plan and Ocean Plan water quality objectives. From 1991 to 1994, lead concentration remains essentially constant and complied with the Basin and Ocean plan objectives.

Storm weather monitoring: The data shows a trend of reduction and lead concentrations generally complied with the Ocean and Basin Plan objectives, except that high concentrations of lead were observed in 1988.

Nitrite

Dry weather monitoring: There is no significant change in nitrite concentration from 1988 to 1994, and the values exceed the water quality objective throughout the entire period.

Storm weather monitoring: Nitrite concentrations show a trend of increase since 1990 with the highest concentrations detected in early 1994. The data also indicates that nitrite concentrations are mostly, but not always, in compliance with the Basin Plan Objective.

Total Dissolved Solids

Dry weather monitoring: The average total dissolved solid concentrations are lower between 1988 and 1991 than those between 1991 and 1994. Additionally, a significant number of

VOL 15
0720
R0060940

samples exhibit concentrations above the Basin Plan objectives.

Storm weather monitoring: The total dissolved solids concentrations show an increasing trend and the data are mostly complied with the upper limit of the Basin Plan objective.

Sulfate

Dry weather monitoring: Sulfate shows a trend of slight increase from 1988 to 1994, with the majority of the values exceeding the Basin Plan objective.

Storm weather monitoring: A trend similar to that detected for the dry weather data.

Chloride

Dry weather monitoring: The chloride concentrations stay constant between 1988 and 1991 and slightly thereafter. Most of values exceed the upper limit of the Basin Plan objectives.

Storm weather monitoring: The chloride concentrations show an increasing trend and the data are mostly in compliance with the lower limits of Basin Plan objectives.

Ammonium

Dry and storm weather monitoring: The ammonium concentrations does not show any change over the years.

pH

Dry weather monitoring: pH does not show any significant change or trend between 1988 and 1994. Nevertheless, a significant number of the samples taken during the monitoring period are above the upper limit of the Basin Plan objectives.

Storm weather monitoring: pH stays mostly between the limits listed in the Basin Plan without any significant change between 1988 and 1994. The average pH concentrations are slightly more acidic for storm- than for dry-weather monitoring data.

6.3 TREND ANALYSIS ON A REGIONAL BASIN-WIDE BASIS

As mentioned in Section 4, the entire Los Angeles County and adjacent areas have been divided

R0060941

VOL 15 0121

into five regional drainage basins (Exhibits A and B). The graphs, showing the water quality trends for individual monitoring stations of each regional basin, were integrated to show the overall water quality trend in the five basins. Basin-wide water quality trend curves were developed for the ten compounds selected in the screening process and are presented in Appendix "C".

The graphs in Appendix "C" were carefully examined in order to identify any specific water quality trends that might have occurred during the monitoring period. Specific trends were observed for a few compounds in each basin. In general, lead concentrations in all basins have shown to decrease since 1988, except that there are reoccurrences of elevated lead in the 1993 water samples. Most bacterial indicators, such as fecal Enterococci and coliforms, appear to have been reduced between 1988 and 1993, but their populations increase again in 1994. Storm weather trends indicate extreme bacteria concentrations throughout the sampling period. These peaks may be attributed to sewage overflows discharged to storm drain systems during flooding events. The following represents a summary of Total Dissolved Solids (TDS), chloride, and sulfate concentrations, have shown a gradual increase in Basin II. Sulfate concentrations have increased in Basins IV and V (both North and South). A similar trend has also been noted for nitrite in Basin V (North). The following provides a general description of specific trends observed in each basin:

6.3.1 Basin I - Santa Monica Bay Drainage Basin

Lead

Dry weather monitoring: The highest lead concentrations occurred in 1988, with most of the data exceeding the Basin Plan and Ocean Plan water quality objectives. Between 1988 and 1993, there was a significant reduction of lead in dry weather samples and most of the data obtained during this period was below the water quality objectives. A surge of lead concentrations was noted in 1993, with peaks exceeding the objective limits. However, this appeared to be only temporary and lead concentrations again dropped below the objective limits for the remaining monitoring period.

Storm weather monitoring: There is a rapid decreasing trend for lead in storm weather samples from 1988 to 1994. Most data obtained in 1988 exceeds the Basin Plan objective and some are above the Ocean Plan objective. After 1988, lead concentrations are in compliance with all water quality objective limits.

VOL 15 0122

R0060942

Total Coliform

Dry weather monitoring: *Peak* coliform concentrations were observed in 1988. Although there has been a drastic reduction in total coliform since 1991, its populations still exceed the Basin Plan and Ocean Plan objective limits.

Storm weather monitoring: Peak concentrations were observed in 1987 and 1988. The trend seems to follow a gradual but increasing pattern from 1987 to 1988. A sharply decreasing trend is noted between 1988 and 1993, then total coliform concentrations increased slightly in 1994. Throughout the monitoring period, most data have been shown to exceed the Basin Plan and Ocean Plan objective limits.

Fecal Coliform and Fecal Enterococci

Storm weather monitoring: The concentrations of both bacterial indicators exhibit a rapidly decreasing trend from 1987 to 1993. However, an escalation in bacterial concentrations is noticed between 1993 and 1994. Overall, the concentrations of both indicators exceed the water quality objective limits.

6.3.2 Basin II - Upstream Los Angeles River Drainage Basin

Only dry weather monitoring was performed in Basin II.

Chloride

Chloride concentrations exhibit an increasing trend from 1988 to 1992, and a decreasing trend thereafter. Most data, except for some obtained in 1990 and 1992, are in compliance with the Basin Plan objective.

Sulfate

Sulfate concentrations have gradually increased over the monitoring period. Most data, except for some isolated peaks in 1991, 1992, and 1993, are in compliance with the Basin Plan objectives. The isolated peaks may be data outliers.

Lead

Significant reduction in lead concentrations is noted from 1990 to 1994, with a few isolated peaks occurring in 1993. The data obtained after 1990 generally falls below the limit of the Basin Plan

VOL 15
0723
R0060943

objective limit.

Total Coliform

Since the late 1980's, there has been a rapid decrease in total coliform concentrations. However, elevated coliform populations were noted again in 1994. Throughout the entire monitoring period, most coliform data exceed the Basin Plan objective limit.

VOL 15
0724

R0060944

Total Dissolved Solids

Although there is an increasing trend in TDS concentrations over the monitoring period, most of the existing TDS data are well below the Basin Plan objective limit.

6.3.3 Basin III - Upper San Gabriel River Drainage Basin

Ammonium

Dry weather monitoring: There is a very slight reducing trend detected for ammonium over the monitoring period. The majority of the data, however, are still above the Basin Plan objective limit.

Lead

Dry and storm weather monitoring: Peak lead concentrations are found in 1988 and 1989. Then concentrations decrease rapidly from 1989 to the end of the monitoring period. The levels after 1989 are below the Basin Plan objective limit.

Total Coliform

Dry and storm weather monitoring: After 1990, there appears to have been a notable decreasing trend in total coliform concentrations. However, such trend was reversed in 1994 and the coliform concentration raises again in 1994. Most data acquired throughout the years are above the Basin Plan objective limit.

6.3.4 Basin IV - Lower Los Angeles River Drainage Basin

Sulfate

Dry weather monitoring: There seems to be a gradual increase in sulfate concentrations over the monitoring period. Prior to 1991, most data are below the lower limit of the Basin Plan objective. Beyond 1991, a significant number of data escalates above the lower limit of the Basin Plan objective.

VOL 15 0725

R0060945

Lead

Dry weather monitoring: There is a decreasing trend in the lead concentrations from 1988 to 1994, with a slight surge observed in 1993. Since 1991, most lead concentrations are in compliance with the Basin Plan objective.

Storm weather monitoring: Starting in 1989, a decreasing trend is observed in lead concentrations. After 1989, all lead data are below the Basin Plan objective limit.

Total Coliform

Dry and storm weather monitoring: The concentrations of total coliform appears to follow a decreasing trend over the monitoring period, with a slight increase in 1994. Nevertheless, most data are above the Basin Plan objective limit.

Fecal Coliform

Storm weather monitoring: Prior to May 1990 and after 1994, there seems to have been an increase in fecal coliform concentrations. The majority of the fecal coliform concentrations exceed the Basin Plan objective limit.

Dry weather monitoring: There is a drastic reduction in fecal coliform levels after 1989 and the concentrations become relatively steady throughout the remaining monitoring period. Most fecal coliform data, however, exceed the Basin Plan objective limit.

Fecal Enterococci

Storm weather monitoring: The concentrations of fecal Enterococci have shown a slight decreasing trend after 1990. However, a dramatic increase in fecal Enterococci concentrations is noted in 1994. Most data obtained during the monitoring period are above the Basin Plan objective limit.

6.3.5 Basin V - (South) Lower San Gabriel River Drainage Basin

Sulfate

Dry weather monitoring: Sulfate concentrations have shown to gradually increase over the monitoring period. Most measurements are below the upper limit of the Basin Plan objective limit; and during about half of the monitoring period, sulfate concentrations remain below the

VOL 15
0726
R0060946

lower limit of the Basin Plan objective limit.

Total Dissolved Solids

Dry weather monitoring: There is a slight increase in TDS concentrations over the 5-year monitoring period. Beyond 1991, most of the TDS data exceed the upper limit of the Basin Plan objective.

Lead

Dry and storm weather monitoring: There is a decreasing trend in lead concentrations over the monitoring period for both dry and storm weather conditions. After 1990, most data plunges below the Basin Plan objective limit. In both cases, lead begins to show a decreasing trend since December 1988 and its concentrations are all below the Basin Plan objective limit. A surge of lead concentrations in water is noted between May and June 1994. However, this may be due to sampling/analytical errors or caused by other possible outliers.

Total Coliform

Dry weather monitoring: Total coliform concentrations have shown a drastic reduction after 1989. Nevertheless, most data still exceed the Basin Plan objective limit.

Fecal Coliform

Storm weather monitoring: Initially, a decreasing trend is noticed for fecal coliforms between 1989 and 1993; however, concentrations increase again in 1994. Most fecal coliform data collected from the last 5 years are above the Basin Plan objective limit.

Fecal Enterococci

Dry and storm weather monitoring: Initially, a decreasing trend for fecal Enterococci is noticed under storm weather conditions. Then, the concentration increases between 1993 and 1994. Over the monitoring period, most fecal Enterococci data are above the Basin Plan objective limit.

VOL 15
0727
R0060947

6.3.6 Basin VI - North Santa Clarita Basin

Chloride

Dry weather monitoring: Chloride concentrations display a slightly decreasing trend between 1991 and 1994, with the majority of data below the Basin Plan objective limit.

Storm weather monitoring: There appears to have been an increasing trend in chloride concentrations between 1991 and 1994. However, all measured data are below the Basin Plan objective limit.

Sulfate

Storm weather monitoring: Sulfate concentrations exhibit an increasing trend from 1991 to 1994. After 1991, some sulfate data exceeds the Basin Plan objective limit.

Nitrite

Storm weather monitoring: Nitrite concentrations show a slight increasing trend between 1991 and 1994, with most data below the Basin Plan objective limit.

TDS

Storm weather monitoring: There is a trend of slight increase in TDS concentration for the last 5 years. High TDS fluctuation is also noted in recent years (1993 and 1994). Nevertheless, all data are below the Basin Plan objective limit.

Lead

Dry weather monitoring: There is a decreasing trend in lead concentrations from 1988 to 1994, with a slight surge observed in 1993. Beyond 1988, all lead data are in compliance with the Basin Plan objective limit.

Storm weather monitoring: Lead concentrations are reduced significantly over the monitoring period. Beyond 1988, all data are in compliance with the Basin Plan objective limit.

VOL 15 0728

R0060948

Total Coliform

Dry and storm weather monitoring: The trend can be described as fluctuating, with no change until 1994, when escalated concentrations are observed. Most coliform concentrations are above the Basin Plan objective limit.

Fecal Coliform and Fecal Enterococci

Storm weather monitoring: Concentrations of fecal Enterococci seem to fluctuate in a horizontal pattern until 1994 when a sharp increase is noted. Most data collected during the last 5 years are above the Basin Plan objective limits.

VOL 15
0129
R0060949

SECTION 7 - URBANIZATION IMPACTS

7.1 IMPACT OF WATER QUALITY DUE TO URBANIZATION AND INDUSTRIALIZATION

A land use analysis was performed to identify existing land use categories for the sub-basins tributary to the twenty-eight surface water quality monitoring sites and to assess the impact of land use on water quality. The analysis included identifying the areas tributary to the sites and estimating the land use percentages upstream. The land uses were grouped into four general categories: natural, partially urbanized, urbanized, and industrial. The results of the analysis is summarized on Table 5.

In order to evaluate the impact on water quality as a result of the urbanization of the areas, the monitoring sites with the highest percentages of industrial and urbanized upstream land uses were selected. These monitoring sites included the highly industrialized watersheds of Station 4 (30% industrial), Station 11 (40% industrial), Station 15 (20% industrial), and Station 21 (20% industrial), and the highly urbanized watersheds of Station 1 (50% urbanized), Station 2 (46% urbanized), Station 4 (35% urbanized), Station 9 (42% urbanized), and Station 14 (37% urbanized).

Tables 8 and 9 present the average and maximum concentration values of the water quality parameters for the 28 sampling sites for dry and storm weather conditions, respectively. The analysis included evaluating and comparing water quality data from the highly urbanized and highly industrialized stations with that at Station 28, a 100% natural basin. Plots summarized in Appendices A, B, and C compare water quality trends observed at Station 28 to water quality trends at individual monitoring stations throughout Los Angeles County and on a basin-wide level, respectively. Tables 8 and 9 summarize and group the water quality results for the regional Los Angeles County Basins, and from upstream to downstream. The evaluations included an assessment of the water quality conditions at individual monitoring stations, from upstream to downstream, incorporating changes in land use between stations. The following is a summary of our findings and a preliminary assessment of water quality impact associated with urbanization and industrialization of the watersheds:

VOL 15
07300
R0060950

Industrialization Impact

Sampling Site	Parameters with High Concentration	Impact	
4	Chloride, sulfate, TDS, lead	Yes	
11	Total coliform, fecal coliform, TDS	No	
15	Chloride, TDS, lead, total coliform, fecal coliform		Yes
21	Chloride, TDS, total coliform, fecal coliform	No	

Urbanization Impact

Sampling Site	Parameters with High Concentration	Impact
1	Sulfate, nitrite, lead, TDS	Yes
2	Ammonium, lead, total coliform	Yes
4	Chloride, sulfate, TDS, lead	Yes
9	Ammonium, chloride, sulfate, TDS, lead	Yes
14	Lead, total coliform, fecal coliform	Yes

As mentioned above, Tables 8 and 9 group the water quality parameters for each monitoring station within the six regional drainage basins. The sites are listed in the order of most upstream to most downstream within each basin. The most urbanized basins are Basins IV and V South, shown on Exhibit B. In Basin IV, the concentrations of chloride, TDS, lead, total coliform, and fecal Enterococci increase from upstream to downstream, which may be due to increased urbanized uses of the tributary areas. In Basin V South, sulfate, TDS, nitrite, and lead show an increasing trend from the upstream to downstream, which again may be attributed to increased urban uses of the areas. The patterns in these two basins indicate that water quality conditions may have been impacted by increased urbanized uses of the tributary areas.

7.2 POTENTIAL POLLUTANT SOURCES

The potential sources for water quality pollutants include: industries, various activities in residential and commercial areas, vehicle exhaust, and agriculture. High concentrations of ammonium and nitrite can be attributed to agricultural and landscaping activities, including the use of fertilizers and pesticides. High chloride, sulfate, TDS, and lead concentrations are usually detected in runoff generated from industrial areas. Variation of the pH value is an indicator of the industrialization of the tributary watersheds. The pH levels monitored from the storm weather data, for most sites, exhibited greater acidity than the dry weather data. This may be attributed to higher acid levels in rain storms developed from industrial air pollution. The increased bacterial compound levels in surface flows may be attributed to contact with air, soil, living or

VOL 15
0731
R0060951

decaying plants or animals, mineral sources, and fecal excrement.

VOL 15
0132

R0060952

SECTION 8 - BEST MANAGEMENT PRACTICES EVALUATION

This section briefly describes the Best Management Practices (BMPs) implemented by the cities (Municipal Permit, Co-Permittees) located in the watersheds tributary to the monitoring stations evaluated. It is of particular importance to show whether any of the constituent reductions over the monitoring period described in the long-term trend analysis described in Section 6 are attributed to BMP implementations. The BMP information utilized in evaluations presented in this section were obtained from the Report entitled: "Summaries of Storm water/Urban Runoff Quality Management Programs Questionnaire (Draft)" prepared in August 1994, by the Department of Regional Planning for the Los Angeles County Department of Public Works Waste Management Division.

A rating criteria was used to rate the implementation of thirteen BMPs by the Co-Permittee cities. The BMPs implemented include a variety of non-structural measures. The following is a list of the BMPs:

1. Stencil Catch Basins
2. Develop Programs to Promote Public Reporting of Illegal Discharges /Dumping
3. Adopt Runoff Ordinance
4. Develop Public Education and Outreach Programs
5. Clean Catch Basins Regularly
6. Increase Roadside Trash Receptacle Usage
7. Increase Street Sweeping
8. Discourage Improper Disposal of Litter, Lawn Clipping, Pet Feces
9. Inspect Automobile Uses And Restaurants
10. Encourage Removal of Dirt, Rubbish, and Debris From Sidewalks/Alleys
11. Promote Recycling
12. Motivate Residents to Properly Dispose of Household Hazardous Waste
13. Encourage Conservation of Water

Four criteria were used in evaluating the BMPs listed above at each city. The four criteria and codes used to describe them by Los Angeles County include: Fully Implemented (10), Partially Implemented (5), Planned/Proposed (P), and Not Implemented (X). Appendix "D" provides a list of all co-permittees' BMP implementation ratings. Los Angeles County has indicated that the majority of these BMPs have been implemented in the near past and/or are planned for implementation.

VOL 15
0133
R0060953

The long-term trend analysis for the twenty-eight monitoring stations is discussed in Section 6. Constituent reduction over the monitoring period (or increments of the monitoring period) were observed only for a few compounds at eight monitoring stations. Table 10 provides a summary of the monitoring stations exhibiting any reduced compound concentrations over the monitoring period, as well as a summary of upstream cities and their effective BMP implementation.

Table 10 also indicates that the majority of cities have fully implemented BMPs such as: cleaning catch basins on a regular basis, increasing street sweeping, and motivating residents to properly dispose of household hazardous waste. Other BMPs, such as: stenciling catch basins, adopting runoff ordinances, discouraging improper disposal of litter, and encouraging conservation of water, are partially implemented or planned to be implemented.

The most significant reductions have been observed in TDS, fecal coliform, lead, ammonium, and nitrite concentrations. Stations 25 and 26 (downstream of Station 25) with over fifteen upstream cities implementing or partially implementing various non-structural BMP programs have experienced a reduction in the total ammonium levels. Station 16, located in the same basin, has also experienced lower ammonium levels. A reduction in the nitrate levels was observed in the dry weather flows of Station 23. TDS levels have decreased in the dry weather flows of Station 1, with mostly fully implemented BMP programs in its upstream cities (Beverly Hills and Los Angeles). Station 3, in the same basin as Station 1 and downstream of Culver City, has experienced lower TDS and fecal coliform levels in its dry weather flows. Dry weather flows sampled at Station 9, located in the City of West Hollywood which has fully implemented all the BMPs, exhibit a reduction in fecal coliform and lead levels. However, lower lead levels have also been observed in storm weather flows of Station 4, with partially implemented or proposed BMP programs.

It should be noted that it is extremely difficult to make any conclusions as to the reduced trends being attributed to implementation of any of the BMP programs. As the matrix in Appendix "D" indicates, there were many other cities that implemented BMP programs upstream of monitoring stations which displayed no reduced pollutant levels over the monitoring period. The non-structural BMPs listed in Table 10 and Appendix "D" have all been implemented in the very recent past and/or are proposed to be implemented. It is usually rare to observe improvements in water quality conditions due to non-structural BMPs in a short time frame. More information, such as exact date of implementation of these programs and more water quality data, will be necessary before conclusions can be made regarding the effectiveness of the BMP programs.

VOL 15 0134

R0060954

SECTION 9 - SUMMARY AND CONCLUSIONS

This report presents a general assessment of the surface water quality conditions within the Los Angeles County area by examination of the surface water quality data collected by LADPW between 1988 and 1994. The purpose of this report is to provide an evaluation of surface water quality monitoring data for inclusion in the "Report of Waste Discharge" (ROWD), which will be submitted to the California Regional Water Quality Control Board, Los Angeles Region pursuant to the requirement of the Los Angeles County National Pollutant Discharge Elimination System (NPDES) Municipal Storm water Permit No. CA0061654.

The Municipal permit divides the Los Angeles County area and immediate vicinity into five general regional basins. These regional basins include: (I.) Santa Monica Bay Drainage Basin; (II.) Upstream Los Angeles River Drainage Basin, to and including the Sycamore Canyon Channel (San Fernando Valley); (III.) Upper San Gabriel River (San Gabriel Valley) Drainage Basin; (IV.) Lower Los Angeles River Drainage Basin; (V.) Lower San Gabriel River Drainage Basin (V-south); and Santa Clarita Valley Basin (V-north).

The LADPW has been actively monitoring surface water quality conditions in the County's principal storm drains and water conservation facilities, on a voluntary basis, since the late 1960s. After the mid-1980s, a program of 28 sampling sites has been in effect. Grab samples are collected from all 28 sites on a monthly basis (or more) for dry weather flows. Twenty-one of the 28 sites are sampled (grab samples) for storm flows three to four times per year.

The dry weather samples are typically analyzed for general minerals, pesticides, total petroleum hydrocarbons, heavy metals, and bacteria (total and fecal coliform, KF streptococci and Enterococci). Volatile organic constituents are tested semi-annually at selected stations. Storm water runoff is monitored for minerals, pesticides, heavy metals (total and dissolved), bacteria, total and organic suspended solids, oil and grease, biochemical oxygen demand, total organic carbon and volatile organics. Overall, more compounds are analyzed from storm weather samples (127 compounds for storm weather samples versus 73 compounds for dry weather samples).

The prior sections of the report provided a description of water quality monitoring activities conducted by the LADPW and an assessment of the monitoring sites, including a description of their tributary watersheds and an evaluation of the tributary basin land uses.

The regulatory guidelines, including "Basin Plan" and "Ocean Plan" objectives and requirements, were fully investigated and a screening analysis was used to flag "non-compliance" parameters with the regulatory water quality objectives. It should be pointed out that the term "non-

VOL 15
0735
R0060955

compliance" used throughout this study does not constitute a violation of LADPW's existing NPDES Permit, since no specific numerical water quality objective limits have been assigned. Additionally, the "Ocean Plan" includes an initial dilution clause, which implies it is for point sources of municipal and industrial origins and not from storm water runoff which is typically considered a non-point source. "The process which results in the rapid and irreversible turbulent mixing of wastewater with ocean water around the point of discharge" is the initial dilution and this factor is applied to the water objective standards. Permits are developed around models which define the dilution at the outfall. Permits are developed around models which define the dilution at the outfall. The State Water Resource Control Board, Division of Water Quality, Ocean Plan Unit, completed a California Control Ocean Plan Triennial Review 1991-4 (Doc 92-5WQ, October 22, 1992). On page 37, the "staff concluded that the Ocean Plan should be amended to clarify its applicability to storm water dischargers. A schedule of compliance for dischargers similar to the schedule in the Inland Surface Waters and the Enclosed Bays and Estuary Plans should be considered." Based on this, the quantitative data presented in this report cannot be directly evaluated for distribution and impact on health via the Ocean Plan. It is our opinion that the California Ocean Plan can be considered a state opinion of which chemicals are important to evaluate, but, not as having a direct quantitative relationship to the compounds that are present.

Furthermore, the comparisons between grab samples (as they have been collected by LADPW in the last five years) and some Ocean Plan criteria which are based on a 30-day average concentration, may not be objective. However, such problems will be eliminated by the installation of automatic sampling stations.

Average and maximum concentration of pollutants throughout Los Angeles County and its regional watersheds were computed and summarized. Long-term trend analysis was performed over the sampling period for the individual monitoring stations, the regional watersheds, and the overall Los Angeles County. The analysis included a comparison of water quality conditions at all stations with those obtained from the undeveloped watershed station (Station 28-Monrovia Creek), and to the applicable water quality objectives. Additionally, the impacts of urbanization on water quality conditions were examined. Finally, the BMP programs enforced previously were evaluated and their effectiveness on water quality conditions was assessed.

The screening analysis flagged the compounds that exceeded the water quality objectives ("Basin Plan" or "Ocean Plan") at any one time during the monitoring period. The top ten compounds with the highest numbers of exceedence were selected for a detailed analysis and investigation of the water quality conditions. These compounds include: fecal coliform, fecal Enterococci, TDS, ammonium, chloride, nitrite-N, pH, sulfate, total coliform, and lead. The long-term trend analysis and the evaluation of urbanization impacts were performed for these

R0060956

VOL 15 0736

compounds.

The long-term trend analysis was performed on all twenty-eight dry weather samples and twenty-one storm weather samples collected over the period from 1988 to 1994. An analysis was also conducted to evaluate the trends of the water quality parameters on a Los Angeles County-wide basis and on each of the five regional watershed-wide basis.

Results indicated that for most water quality parameters there are no distinct trends of increase or reduction observed within this monitoring period. The majority of the monitoring stations in the lower basins (e.g., Basins V-south, and IV), show greater concentrations of chloride, sulfate, lead, and TDS than those located in the upstream areas (e.g., Basin II, V-north). The bacterial parameters, including total coliform, fecal coliform, and fecal Enterococci, monitored at stations in the urbanized areas generally exhibit similar trends to one another and to that observed at Station 28, which has a 100% natural tributary watershed. Lead concentration in many areas appears to have been reduced sharply after 1990 and remains below the water quality objective limits. The pH values for almost all monitoring stations follows a horizontal showing slightly alkaline pH during dry weather monitoring and slightly acidic pH during storm weather monitoring. On a county-wide basis, the pollutants of concern include: chloride, sulfate, TDS, nitrate, and lead, which are normally found in higher concentrations in the lower and more urbanized basins.

It should be noted that a great number of the data exhibited extreme peaks, especially those of the bacteria parameters. Some of this data may represent outliers, which may be attributed to a number of errors inherent in water quality data acquisition. Outliers are values which are obviously higher or lower than the majority of the data set. Even though the accuracy of some of the data outliers seems questionable, they were included in the analysis, since there is not enough evidence to show that they are erroneous. However, in the case of bacteria compounds, many of the extreme peaks may be attributed to sewage overflows discharging into storm drain systems during flooding events.

The land use analysis evaluated existing land uses at the watersheds tributary to the twenty-eight surface water quality monitoring sites and assessed the impacts of urbanization and industrialization on water quality when comparing with the conditions at Station 28 (mostly natural tributary area). Results indicated that several monitoring stations experienced higher total coliform, fecal coliform, lead, TDS, chloride, and sulfate concentrations which may be attributed to the highly industrial uses of their upstream watersheds. Higher chloride, sulfate, TDS, nitrate, ammonium, total coliform, and lead concentrations have been reported for stations with high urban type watersheds (as compared to Station 28). Several monitoring stations also appeared to have higher levels of bacterial count and chemical concentrations in their dry

VOL 15
0737
R0060957

weather samples. These are thought to be caused by the following sources or reasons: POTW (Public Owned Treatment Works), industrial point source dischargers, illicit dischargers, ground water recharge, or sea water intrusion. Additionally, several monitoring sites are known to contain stagnant or semi-stagnant water which also tends to concentrate pollutants and bacterial populations.

Furthermore, water quality data between the upstream and downstream of the two most urbanized regional basins (IV and V) were compared. In Basin IV, the concentrations of chloride, TDS, lead, total coliform, and fecal Enterococci increase from upstream to downstream, which may be due to increased urbanized uses of the tributary areas. In Basin V South, sulfate, TDS, nitrite, and lead show an increasing trend from the upstream to downstream, which again may be attributed to increased urban uses of the tributary areas. The patterns in these two basins indicate that there is a direct negative impact on water quality caused by the urbanized uses of the tributary areas. The potential sources of water quality pollutants include: industries, various activities in residential and commercial areas, vehicle exhaust, and agriculture.

Finally, the effect of Best Management Practices (BMPs) implemented by the cities located in the watersheds tributary were evaluated to determine whether any of the constituent reductions over the monitoring period could be attributed to the BMP implementations. A rating criteria was used to rate the implementation of thirteen non-structural BMPs by the cities in the Los Angeles County. The most common fully implemented BMPs by the cities include cleaning catch basins on a regular basis, increasing street sweeping, and motivating residents to properly dispose of household hazardous waste. Other BMPs, such as stenciling catch basins, adopting runoff ordinances, discouraging improper disposal of litter, and encouraging conservation of water, are mostly partially implemented or planned to be implemented by the cities.

Results indicated that constituent reductions over the monitoring period (or increments of the monitoring periods) were observed only for a few compounds at eight monitoring stations. The most significant reductions are TDS, fecal coliform, lead, ammonium, and nitrate concentrations. Although several monitoring stations with non-structural BMPs implemented upstream have experienced reductions in certain compounds, it is extremely difficult to make any conclusions as to whether the reduced trends could be attributed to implementation of any of the BMP programs. It should be noted that the non-structural BMPs have all been implemented recently and therefore, it is uncommon to notice any immediate improvements in water quality conditions. More information needs to be collected through a systematic long-term monitoring program before conclusions can be made regarding the effectiveness of the BMP programs.

VOL 15

TABLE 3 COMPARISON OF "BASIN PLAN" AND "OCEAN PLAN" OBJECTIVES TO L.A. COUNTY MONITORING

* Compounds monitored from 1987 to 1994

(1) See Table 5

(2) See Table 4

(3) Instantaneous Maximum

(4) Not to exceed limits specified in Title 17, Division 5, Chapter 4, Group 3, Article 3, Section 30269 of the California Code of Regulations

(5) Combined Radium-226 and 228 < 5 pCi/l, Gross alpha particle activity < 15pCi/l, Tritium < 20000 pCi/l, Strontium-90 < 8 pCi/l, Gross beta particle activity < 50 pCi/l, Uranium < 20 pCi/l,

(6) Average survival in undiluted effluent from any three consecutive 96-hour static or continuous flow bioassays test shall be at least 90%

(7) See Table 6

(8) See Table 7

(9) When natural turbidity is between 0 and 50 NTU increases should not exceed 20%. Where natural turbidity is greater than 50 NTU, increases shall not exceed 10%.

(10) The maximum concentration is 70 pg/l for human health protection, 14 ng/l for aquatic life protection.

(11) In waters designated as (REC1) fecal coliform concentration < 200/100ml, as (REC2) fecal coliform concentration <2000/100ml, as (SHELL) total coliformconcentration <70/100ml

(12) Sum of 4,4 DDT/ 2,4 DDT /2,4 DDE/4,4 DDE/4,4DDD/2,4 DDD/ has to be lower than 0.17ng/l (30 adys average)

(13) Sum of chlorinated biphenyls has to be lower than 0.019 ng/l

(14) 30 days average water quality objectives were used in the absence of instantaneous maximum limiting concentration as mentioned in Chapter IV (page11) of the Ocean Plan(1990)

* Compound monitored by LACFCD

* Water Quality Objectives in the Basin (Draft 1994) and Ocean (1990) Plan were given in terms of ammonia NH3 (mg/l NH3) and Total Ammonia (mg/l NH3) and were converted to Ammonium (NH4-N) mg/l for comparison with LA County monitoring data using the following formulas:

[NH4](mg/l) = [Total Amonia](mg/l)-[NH3](mg/l)

NH4-N (mg/l) = (14/18)[NH4] (mg/l)

(Molecular Weight of N = 14 g/mol and Molecular Weight of NH4 = 18g/mol)

TASK 5.2

REPORT OF WASTE DISCHARGE (ROWD)

VOLUME 8 OF 8 (TASK 5.2.1)

SECTION B - Work Plan for the Phase I, II, and III Stormwater Monitoring Program

LOS ANGELES COUNTY DEPARTMENT OF PUBLIC WORKS
WASTE MANAGEMENT DIVISION
WATER QUALITY SECTION

VOL 15

1016

R0061236

SECTION B

Work Plans for the Phase I, II, and III
Stormwater/Urban Runoff Monitoring Program

Work plans for the Monitoring Program for all three Phases have been previously submitted to the Regional Board as required by the current NPDES Permit. Two work plans were submitted: one for Phase I, and another for Phases II and II. With the exception of the actual monitoring site locations, all other elements of the two work plans are the same (i.e., sampling methodology, constituents to be sampled, frequency of sampling, QA/QC, etc.). Therefore, only the site description portion of the Phase I work plan is included herein. For all other Monitoring Program elements, please refer to the Phase II and II work plan herein.

Also, Appendices 1 through 4 of the Phase II and III work plan will only be included in the copy of the ROWD provided to the Regional Board. These Appendices are available upon request by contacting the Los Angeles County Department of Public Works, Waste Management Division, Water Quality Section, at (818) 458-6972.

VOL 15

1018

R0061238

II. PROPOSED MONITORING SITES

SITE SELECTION CRITERIA

A. Monitoring Site Selection Overview

In order to characterize the quality of runoff from the Santa Monica Bay Drainage Basin, a combination of single land-use sites and large watersheds representing multiple land uses ("mass emissions" sites) have been selected.

For the Santa Monica Bay Drainage Basin nine monitoring sites have been proposed. Four of the nine sites will be mass emissions stations. Five will be land-use specific stations. The remaining site will function as both a mass emissions and land-use specific monitoring station. Additional land-use specific monitoring stations will be proposed as part of the monitoring program to be developed for Phase III of the NPDES Permit. As stated in our third-year report, dated July 1, 1993, we estimated submittal of the proposed monitoring program for Phase II to the RWQCB by February 28, 1994.

The proposed monitoring sites represent an effort to select the most suitable locations based on our established criteria for sampling. Where feasible, we have incorporated into the program those storm drains which have water quality issues which are of concern to the community.

B. Specific Criteria for Mass Emissions Monitoring Sites

Mass emissions monitoring sites shall be located at the outlet (or the furthest downstream position practicable) of watersheds contributing the largest relative inputs to the Santa Monica Bay. These watersheds will typically have a complex multiple land-use composition. See Figure II-1.

C. Specific Criteria for Land-Use Specific Monitoring Sites

Land use-specific monitoring sites shall be located in watersheds where the upstream tributary area is comprised predominantly of one land use. It is important that the contributing watershed be at least 50 acres in size, in order to produce effective runoff characteristics.

VOL 15 1019

D. Criteria for both Mass Emissions and Land-Use Specific Sites

In selecting a specific storm drain for inclusion as either a mass emissions or land-use specific site, the following technical and operational requirements were addressed:

- What type of sampling equipment is to be used, and what limitations exist?
- What are the hydraulics of the underground storm drain, open channel/natural watercourse? What is the Design Q?
- Is there past flow data available for the given stream?
- What past hydrology studies have been performed in the watershed?. What is the hydrologic Q?
- If the storm drain is underground, is it currently under designed? Could it experience surcharge conditions?
- Within the watershed, what is the corresponding land use? Is land use uniform and homogenous throughout the upper tributary area? If yes, this is a possible land-use site.
- Has previous sampling in the potential watershed been conducted in the past? Where? When? Why?
- Are tidal or backwater influences a concern?
- Is the location selected the only outfall point for the upstream watershed, or are there multiple outfall points?
- Is the storm drain structurally sound at present? Will installation of sampling equipment compromise the stability of the storm drain?
- Will the monitoring equipment impede flow or reduce flood protection?
- For natural watercourses, is there an existing improved section where a rating curve can be easily established?
- What is the practicable design distance from the storm drain invert (low flow) to the location where the sampler shall be placed?
- Can electric power be provided, in a cost- effective manner, to the site?

VOL 15
1020

- Will additional right-of-way be required?
- Will the sampler installation interfere with projects planned or in progress in the general vicinity?
- If located in a residential neighborhood, will the location of the automated sampler and its operation result in any objections from the local residents?

VOL 15
1021

PROPOSED MASS EMISSIONS AND LAND-USE SPECIFIC MONITORING SITES

A. The following locations have been proposed as Mass Emissions sites:

1. Ballona Creek at Los Angeles County Department of Public Works Stream Gauge No. F38C-R in the City of Los Angeles.

The Ballona Creek station will be located at the existing stream gauge station between Sawtelle Boulevard and Sepulveda Boulevard. This facility currently measures stream flow and precipitation. At this location, the upstream tributary watershed of Ballona Creek is 88.7 square miles. The entire Ballona Creek watershed at its outlet to the ocean is 127.1 square miles, but because of tidal influences the sampling site must be located upstream. Therefore, the actual sampled watershed is less.

The land-use breakdown is as follows:

Open Space/Agriculture	19%
Low Density Residential	1%
Single Family Residential	25%
Low Density Multi-Family	5%
High Density Multi-Family/Institutional	32%
Commercial	14%
Industrial	4%

The overall impervious factor for this watershed is 53%.

Ballona Creek, at the gaging station, is an improved (concrete lined) trapezoidal channel. The vertical lift from the invert of the channel to the sampler location is approximately 30 feet. The horizontal distance is approximately 100 feet. Due to the elevation difference, an auxiliary pump will be required. See Figure III-3 for the proposed sampler installation.

This proposal replaces the existing County Department of Public Works Surface Water Quality Monitoring Station at the Sawtelle Boulevard bridge.

2. Malibu Creek at County Stream Gauge No. F130-R in Unincorporated County of Los Angeles.

The Malibu Creek monitoring station will be located at the existing stream gauge station, off of Malibu Canyon Road, south of Piuma Road. The existing facility provides flow measurement only. Because of

VOL 15
1022

tidal influences and the lack of any downstream improved section, the sampling site must be located here. Constructing an improved section at a location downstream would be costly, and would yield little difference in results. At this location, the tributary watershed to Malibu Creek is 104.9 square miles. The entire Malibu Creek watershed at its outlet to the ocean is 109.9 square miles. Therefore the actual sampled watershed is less.

The land-use breakdown is as follows:

Open Space/Agriculture	54%
Low Density Residential	29%
Single Family Residential	7%
Low Density Multi-Family	4%
High Density Multi-Family/Institutional	1%
Commercial	4%
Industrial	1%

The overall impervious factor for this watershed is 13%.

There are at least seven agencies, presently, that are monitoring the quality of surface water, sediment, groundwater and/or the overall health of the ecosystem (bioassessment and biomonitoring) within the Malibu Creek watershed. This proposed sampling location will replace the existing County Department of Public Works Surface Water Quality Sampling Station at Cross Creek Road.

3. **County of Los Angeles Kenter Canyon Storm Drain in the City of Santa Monica.**

Kenter Canyon Storm Drain is an underground brick arch drain. It outlets at the west end of Pico Boulevard. The outlet structure is commonly referred to as the Pico-Kenter storm drain. This outlet is the combination of three storm drains: Kenter Canyon, Caltrans 10 Freeway Storm Drain, and County Bond Issue Project No. 249, Pico Boulevard Drain, Line B. Only flows from the Kenter Canyon Storm Drain will be sampled.

The location where sampling will be conducted is upstream of the outlet structure. The tributary watershed area for Kenter Canyon Storm Drain is 6.4 square miles (the tributary area of the Caltrans drain and Pico Boulevard Drain is 0.8 square miles).

VOL 15 1023

R0061243

The land-use breakdown is as follows:

Open Space/Agriculture	5%
Low Density Residential	39%
Single Family Residential	22%
Low Density Multi-Family	8%
High Density Multi-Family/Institutional	10%
Commercial	12%
Industrial	4%

The overall impervious value for this watershed is 39%.

The Pico-Kenter Drain has been a focal point for Santa Monica Bay with regards to the quality of dry-weather flows. The City of Santa Monica is currently pumping dry-weather flows to a City of Los Angeles sanitary sewer line, existing below The Promenade.

The County Department of Public Works presently samples the Pico-Kenter outlet structure. This proposed sampling location replaces the existing County Department of Public Works Surface Water Quality Monitoring Station at the Pico-Kenter outlet structure.

4. County of Los Angeles Bond Issue Project No. 1105, Line A, in the Cities of Hermosa and Redondo Beach.

Project No. 1105, Line A is an underground box/pipe in Herondo Street from Hermosa Avenue/Harbor Drive to Pacific Coast Highway. The proposed sampling location is near the intersection of Herondo Street and Valley Drive. At this location, the tributary watershed area is 4.23 square miles.

The land-use break down is as follows:

Open Space/Agriculture	2%
Low Density Residential	0%
Single Family Residential	63%
Low Density Multi-Family	16%
High Density Multi-Family/Institutional	4%
Commercial	10%
Industrial	5%

The overall impervious value for this watershed is 50%.

It is proposed that the sampling station be placed in the center median of Herondo Street. This is due to the lack of adequate sidewalk clearance. Tidal influences, depth to storm drain invert, and surcharge effects are the major factors impacting the selection of this site.

VOL 15
1024

B. The following locations have been chosen as Land-Use Specific sites:

1. Trancas Canyon at Private Drain No. 658 in the City of Malibu.

The Trancas Canyon watershed is proposed for the monitoring of open space. The upstream watershed of Private Drain (PD) No. 658 is virtually undeveloped, with the only significant development being the Malibu Country Club in the upper reach. The Santa Monica Mountains National Recreation Area is the largest land holder in the watershed.

The proposed monitoring site is to be located at the upstream end of PD No. 658, adjacent to the northerly end of Paseo Canyon Drive. PD No. 658 is a reinforced concrete trapezoidal channel. Immediately upstream exists a small debris basin which will provide protection for the sampler. The residential area surrounding PD No. 658 is privately maintained. Installation of the monitoring station will be dependent on our ability to satisfy the requirements of the local homeowners association. The tributary watershed area is 7.45 square miles.

The land-use breakdown is as follows:

Open Space/Agriculture	97%
Low Density Residential	3%
Single Family Residential	0%
Low Density Multi-Family	0%
High Density Multi-Family/Institutional	0%
Commercial	0%
Industrial	0%

The overall impervious value for this watershed is 1%.

It is anticipated that because of the size, impervious value, soil types, and vegetation within the watershed, little to no dry-weather flows will exist. This has been previously observed.

2. County Bond Issue Project No. 5401, Line A in the City of Manhattan Beach.

Project No. 5401 is proposed for the monitoring of a single family residential area.

VOL 15
1025

At the proposed monitoring location, Project No. 5401 is an underground box drain. This storm drain discharges to a pond in Polliwog Park. During a storm, the pond serves as a detention basin for flood control. After reaching a certain elevation, stormwater in the pond is pumped over a hill, under Manhattan Beach Boulevard, to the west to Project No. 552. One potential location for placement of the sampler appears to be in the park, however, because stormwater may back up into the drain, an alternative location for sampling is at Redondo Avenue and 11th Street. The tributary watershed area is approximately 200 acres.

The land-use breakdown is as follows:

Open Space/Agriculture	0%
Low Density Residential	0%
Single Family Residential	98%
Low Density Multi-Family	0%
High Density Multi-Family/Institutional	0%
Commercial	2%
Industrial	0%

The overall impervious value for this watershed is 42%.

Homes and lots are generally similar in type and size throughout the tributary drainage area, providing an ideal homogenous land use.

3. City of Los Angeles Storm Drain No. D-2361 located in downtown Los Angeles.

The City's Storm Drain No. D-2361 is proposed for the monitoring of a commercial/industrial land use.

The proposed monitoring site is near the intersection of 21st Street and Grand Avenue. Storm Drain No. D-2361 is a 48" diameter pipe. The tributary watershed area is about 150 acres.

The land-use breakdown is as follows:

Open Space/Agriculture	0%
Low Density Residential	0%
Single Family Residential	0%
Low Density Multi-Family	0%
High Density Multi-Family/Institutional	0%
Commercial	49%
Industrial	51%

VOL 15 1026

R0061246

The overall impervious value for this watershed is 91%.

It is believed with all certainty that this storm drain will experience, at some time, surcharge conditions. The storm drain is more than 50 years old and is undersized. Based on our research, however, this would be the only location available in the Santa Monica Bay Drainage Basin for the monitoring of a sizeable industrial area.

4. City of Santa Monica Pier Storm Drain adjacent to the Santa Monica Mall.

The City's Pier Storm Drain is proposed to be a monitoring site for commercial land use.

The monitoring site will be located at the intersection of Second Street and Colorado Avenue. The section of drain under consideration is from Ocean Avenue to 2nd Street in Colorado Avenue. This reach of drain empties into a manhole shaft of a deeper storm drain which subsequently discharges below the Santa Monica Pier. The tributary watershed area is approximately 50 acres.

The land-use breakdown is as follows:

Open Space/Agriculture	0%
Low Density Residential	0%
Single Family Residential	0%
Low Density Multi-Family	0%
High Density Multi-Family/Institutional	4%
Commercial	96%
Industrial	0%

The overall impervious value for this watershed is 92%.

This watershed is dominated by the Santa Monica Mall. The remaining land-use elements are commercial office buildings, small shops, restaurants and high density apartments/hotels.

5. County Bond Issue Project No. 558, Line A in the City of Palos Verdes Estates.

The monitoring location proposed for Project 558 will not only be utilized as a mass emissions station, but also function as a single family residential land-use site.

VOL 15

1027

The monitoring site for this storm drain will be in the vicinity of the intersection of Paseo Lunado and Palos Verdes Drive West. The tributary watershed area is approximately 1.7 square miles.

The land-use breakdown is as follows:

Open Space/Agriculture	14%
Low Density Residential	0%
Single Family Residential	81%
Low Density Multifamily	3%
High Density Multifamily/Institutional	0%
Commercial	2%
Industrial	0%

The overall impervious value for the watershed is 40%.

It is anticipated that because of the size, impervious value, soil types, and vegetation within the watershed, little to no dry-weather flows will exist. This has been previously observed.

Monitoring Site Installation

The monitoring sites have been prioritized for installation as follows:

Ballona Creek
Malibu Creek
Trancas Canyon (Private Drain 658)
Kenter Canyon
Herondo Drain (Bond Issue Project 1105)
Bond Issue Project 558
Bond Issue Project 5401
City of Santa Monica Storm Drain
City of Los Angeles Storm Drain

Priority has been given to the open channel sites, which are the easiest to install plus serve as the mass emissions stations. The remaining sites involve the underground drains. We are targeting to have as many sites as possible operational by the onset of the rainy season, with the remainder to follow as soon as possible during the rainy season.

1. INTRODUCTION

As required by National Pollutant Discharge Elimination System (NPDES) Permit No. CA0061654, a proposed Stormwater/Urban Runoff Monitoring Program for Phase II and III of the Permit, the Upper Los Angeles River (II), Upper San Gabriel River (III), Lower Los Angeles River (IV), Lower San Gabriel River (V), and Santa Clara River Drainage Basins is hereby submitted to the Regional Water Quality Control Board, Los Angeles Region (RWCQB), for approval. Comments and concerns made by the RWQCB in its December 21, 1993 letter to the Los Angeles County Department of Public Works (LACDPW) related to our proposed Santa Monica Bay Stormwater/Urban Runoff Monitoring Program, have been incorporated into this report.

The monitoring program described herein includes the establishment of fifteen monitoring sites for both mass emissions and individual land use monitoring. Five mass emissions sampling sites are identified in this report. One other mass emission sampling site will be located in the Santa Clarita Valley Basin (Santa Clara River Watershed), and will be identified later this year in a supplemental report to the RWQCB. Eight land use specific sites will likewise be identified in the supplemental report to be submitted later this year to the RWQCB.

Storm samples will be collected for five storms per year. Dry-weather samples will be collected bimonthly. Samples will be tested for a wide range of constituents including Bacteria; General Minerals; Biochemical Oxygen Demand; Total Organic Carbon and total Petroleum Hydrocarbons; Volatile Organic Compounds and Suspended Solids; Volatile Suspended Solids; and Semi-volatile Organic Compounds.

Automated refrigerated water samplers will be utilized in the collection of flow-composite samples. These samplers will be located on the ground surface in secure enclosures allowing easy access for retrieval of samples. The samplers have large (10 gallon) water collection capacity, and, thus, can be programmed in advance to cover a wide range of storm sizes without requiring one or more bottle change outs during a storm event.

Data collected by the program will be used for water quality modelling to estimate pollutant loads to receiving waters. Also, questions concerning what types of pollutants emanate from various land uses will be addressed. Lastly, data collected over the years under this program can be used in an attempt to assess any long-term trends in water quality.

II. PROPOSED MONITORING SITES

A. SITE SELECTION CRITERIA

1. Monitoring Site Selection Overview

In order to characterize the quality of runoff from the Phase II and III areas, a combination of large watersheds representing multiple land uses ("mass emissions" sites) and single land use sites are to be selected.

For these Drainage Basins fifteen monitoring sites are proposed. Six of the fifteen sites will be mass emissions stations (one to be submitted at a later date). Nine proposed sites will be land use specific stations (to be submitted at a later date) where smaller homogenous land use watersheds will be sampled.

The proposed monitoring sites represent an effort to select the most suitable locations based on our established criteria for sampling. Where feasible, we have incorporated into the program those storm drains which have water quality issues which are of concern to the community.

2. Specific Criteria for Mass Emissions Monitoring Sites

Mass emissions monitoring sites have been proposed along drainage systems covering the largest tributary watershed area feasible within each drainage basin. These watersheds will typically have a complex multiple land use composition.

In selecting a specific storm drain for inclusion as either a mass emissions or land use specific site, the following technical and operational requirements were addressed:

- What type of sampling equipment is to be used, and what limitations exist?
- What are the hydraulics of the underground storm drain, open channel/natural watercourse? What is the Design Q?
- Is there past flow data available for the given stream?
- What past hydrology studies have been performed in the watershed?. What is the hydrologic Q?
- If the storm drain is underground, is it currently under designed? Could it experience surcharge conditions?
- Within the watershed, what is the corresponding land use? Is land use uniform and homogenous throughout the upper tributary area? If yes, this is a possible land use site.
- Has previous sampling in the potential watershed been conducted in the past? Where? When? Why?

VOL 15 1033

R0061253

- Are tidal or backwater influences a concern?
- Is the location selected the only outfall point for the upstream watershed, or are there multiple outfall points?
- Is the storm drain structurally sound at present? Will installation of sampling equipment compromise the stability of the storm drain?
- Will the monitoring equipment impede flow or reduce flood protection?
- For natural watercourses, is there an existing improved section where a rating curve can be easily established?
- What is the practicable linear distance from the storm drain invert (low flow) to the location where the sampler shall be placed?
- Can electric power be provided, in a cost-effective manner, to the site?
- Will additional right-of-way be required?
- Will the sampler installation interfere with projects planned or in progress in the general vicinity?
- If located in a residential neighborhood, will the location of the automated sampler and its operation result in any objections from the local residents?

B. Monitoring Site Installation

The monitoring sites have been prioritized for installation as follows:

Los Angeles River @ Wardlow Road
Rio Hondo Channel @ Beverly Boulevard
San Gabriel River @ San Gabriel River Parkway
Coyote Creek @ Spring Street
Los Angeles River @ Tujunga Avenue

We propose to have these sites operational by the onset of the 1995-96 rainy season.

VOL 15 1034

R0061254

C. PROPOSED MASS EMISSIONS MONITORING SITES

1. LOS ANGELES RIVER downstream of Wardlow Road at Los Angeles County Department of Public Works Stream Gage No. F319-R in the City of Long Beach.

The Los Angeles River monitoring station will be located at the existing stream gage station between Willow Street and Wardlow Road. This facility currently measures stream flow and precipitation. At this location, the total upstream tributary drainage area for Los Angeles River is 815 square miles. This river is the largest watershed outletting to the Pacific Ocean in Los Angeles County. Tidal influences dictate the position for the sampling site.

Los Angeles River, at the gaging station, is an improved (concrete lined) trapezoidal channel. The vertical lift from the invert of the low-flow channel to a sampler location above the western levee is approximately 23 feet. Since the vertical lift exceeds 15 feet, an auxiliary pump will be needed to perform automated sampling. The linear distance from the top of the river levee to the low-flow channel exceeds 200 feet. The linear distance posses some concern. Pump wear and tear for reverse and forward pump cycles for this linear distance would be excessive. Since it is typical to find dry weather flows uniformly across the channel at this location (the low-flow channel can no longer carry the volume of flow found in the river), it maybe feasible to locate the strainer along the invert near the side of the river as the preferred design. Another option for placement of the automated sampler involves lowering the sampling equipment adjacent to the toe of the levee slope, and jacking the necessary conduits through the levee. This design may eliminate the need for an auxiliary pump if the strainer is positioned near the side of the river, however, it cannot compromise the levee by allowing storm water to migrate through the conduits.

The Los Angeles River sampling location below the Wardlow Road bridge (Old TG PG 70B-6/ New TG PG 795C-1) has been an active stream gaging station since 1931.

Flows in the River are partially regulated by the following: Sepulveda, Pacoima, Big Tujunga, Hansen, Devil's Gate, Lopez Debris Dam, as well as Whittier Narrows, Santa Anita, Sawpit, Eaton, Sierra Madre, and Santa Fe Dams; Project No. 85 Diversion; as well several spreading grounds, and debris basins. This will require an immense coordination effort in gathering, collecting and interpreting water quality data collected from this station. Because these dams and spreading grounds serve as flood control and water conservation facilities, small storms may not produce significant runoff from particular areas within the watershed, and therefore not contribute to the flow which is measured at the Wardlow Road gaging station. Large storms which produce significant runoff maybe detained, only to be released at a time when it is believed that potential flooding hazard conditions have subsided. There are numerous other scenarios which may occur, all impacting our water quality monitoring efforts at this site.

The overwhelming majority of the flows found in the River during dry weather periods are the result of NPDES permitted point discharges regulated by the California Regional Water Quality Control Board.

VOL 15
1035
R0061255

Various land uses exist within the River's tributary watershed area. Residential areas of various sizes and densities include single family, duplexes, condominiums / townhomes, and apartments. Commercial strips of many uses, malls, office buildings, etc., can be found within the watershed. Industrial developments of all types and sizes are identified within the tributary watershed. Undeveloped or open space properties are typically found in the foothill areas, but are not limited specifically to these areas. A percentage breakdown for these land uses will be included in the supplemental Monitoring Program Report to be submitted later this year.

This proposal will replace the existing County Department of Public Works surface water grab sampling site at Wardlow Road.

2. **COYOTE CREEK below Spring Street at Los Angeles County Department of Public Works Stream Gage No. F354-R in the City of Long Beach.**

The Coyote Creek station will be located at the existing stream gage station below Spring Street. This facility currently measures stream flow and precipitation. At this location the upstream tributary area is 185 square miles (extending into Orange County). The confluence with San Gabriel River dictates the position for the sampling site.

Coyote Creek, at the gaging station, is an improved (concrete lined) trapezoidal channel. The vertical lift from the invert of the low-flow channel to a sampler location above the western levee is approximately 20 feet. Since the vertical lift exceeds 15 feet, an auxiliary pump will be needed to perform automated sampling. The linear distance to the low-flow channel is nearly 60 feet, and does not appear to be a problem. The strainer and pressure transducer can be mounted in the low-flow channel. Another option being explored for placement of the automated sampling equipment involves lowering the equipment along the backside of the levee towards the toe of the levee slope, and jacking the necessary conduits through the levee. This design may eliminate the need for an auxiliary pump, however, it cannot compromise the levee by allowing storm water to migrate through the conduits during a storm.

The Coyote Creek sampling location below the Spring Street (Old TG PG 76F-1 / New TG PG 796H-2) has been an active stream gaging station since 1963.

Flows in the River are partially regulated by the following: Fullerton, Brea, and Carbon Canyon Dams. This factor will require coordination with Orange County in gathering, collecting and interpreting water quality data collected from this station. Because these dams, as well as other facilities serve as flood control structures, small storms may not produce significant runoff from particular areas within the watershed, and therefore not contribute to the flow which is measured at the Spring Street gaging station. Large storms which produce significant runoff maybe detained, only to be released at a time when it is believed that potential flooding hazard conditions have subsided. There are numerous other scenarios which may occur, all impacting our water quality monitoring efforts at this site.

The overwhelming majority of the flows found in the Creek during dry weather periods are the result of NPDES permitted point discharges regulated by the California Regional Water Quality Control Board.

Various land uses exist within the Creek's tributary watershed area. Residential areas of various sizes and densities include single family, duplexes, condominiums / townhomes, and apartments. Commercial strips of many uses, malls, office buildings, etc., can be found within the watershed. Industrial developments of all types and sizes are identified within the tributary watershed. Undeveloped or open space properties are typically found in the foothill areas, but are not limited specifically to these areas. A percentage breakdown for these land uses will be included in the supplemental Monitoring Program Report to be submitted later this year.

This proposed sampling location will replace the existing LACDPW surface water quality grab sampling stations at Orangethorpe Boulevard and at Willow Street.

3. **LOS ANGELES RIVER at Tujunga Avenue at Los Angeles County Department of Public Works Stream Gage No. F300-R in the City of Los Angeles.**

This Los Angeles River station will be located at the existing stream gage station above Tujunga Avenue. This facility currently measures stream flow. At this location the upstream tributary area is 401 square miles (almost half of the entire Los Angeles River watershed area).

Los Angeles River, at the gaging station, is an improved (concrete lined) open box channel. The vertical lift from the invert of the low-flow channel to a sampler location above the northerly wall of the channel is approximately 19 feet. Since the vertical lift exceeds 15 feet, an auxiliary pump will be needed to perform automated sampling. The linear distance to the low-flow channel is nearly 90 feet, and does not appear to pose a problem. The strainer and pressure transducer can be mounted in the low-flow channel. The auxiliary pump would have to be mounted in a vault in the channels northern wall between 10 and 15 feet above the invert.

The Los Angeles River proposed sampling location above the Tujunga Avenue bridge (Old TG PG 23D-4 / New TG PG 562J-6), and downstream of the Tujunga Wash outfall has been an active stream gaging station since 1950.

Flows in the River are partially regulated by the following: Sepulveda, Pacoima, Big Tujunga, Hansen, Lopez Debris Dams; also Project No. 85 Diversion; as well as several spreading grounds and debris basins. This will require an immense coordination effort in gathering, collecting and interpreting water quality data collected from this station. Because these dams and spreading grounds serve as flood control and water conservation facilities, small storms may not produce significant runoff from particular areas within the watershed, and therefore not contribute to the flow which is measured at the Tujunga Avenue gaging station. Large storms which produce significant runoff maybe detained, only to be released at a time when it is believed that potential flooding hazard conditions have subsided. There are numerous other scenarios which may occur, all impacting our water quality monitoring efforts at this site.

The overwhelming majority of the flows found in the River during dry weather periods are the result of NPDES permitted point discharges regulated by the California Regional Water Quality Control Board.

Various land uses exist within the River's tributary watershed area. Residential areas of various sizes and densities include single family, duplexes, condominiums / townhomes, and apartments. Commercial strips of many uses, malls, office buildings, etc., can be found within the watershed. Industrial developments of all types and sizes are identified within the tributary watershed. Undeveloped or open space properties are typically found in the foothill areas, but are not limited specifically to these areas. A percentage breakdown for these land uses will be included in the supplemental Monitoring Program Report to be submitted later this year.

This proposal will replace the existing LACDPW surface water quality grab sampling station at Tujunga Avenue.

4. **RIO HONDO CHANNEL - Above Beverly Boulevard, and downstream of Whittier Narrows Dam, at U.S.G.S. - U.S. Army Corps of Engineers Stream Gage No. 11102300 or E327-R.**

Rio Hondo Channel station will be located at the existing stream gage station above Beverly Boulevard. This facility currently measures stream flow. At this location the upstream tributary area is 124 square miles (excluding the area above Santa Fe Dam).

Rio Hondo Channel, at the gaging station, is an improved (concrete lined) trapezoidal channel. The vertical lift from the invert of the low-flow channel to a sampler location above the western levee is approximately 19 feet. Since the vertical lift exceeds 15 feet, an auxiliary pump will be needed to perform automated sampling. The linear distance to the channel's invert (there is no low-flow channel) is nearly 50 feet and does not appear to be a problem. The strainer and pressure transducer can be mounted in the invert of channel. Another option for placement of the automated sampler involves lowering the equipment along the backside of the levee towards the toe of the levee slope, and jacking the necessary conduits through the levee. This design may eliminate the need for an auxiliary pump, however, it cannot compromise the levee by allowing storm water to migrate through the conduits. The U.S.G.S. indicates that discharges below 100 cfs are poor for stream gaging.

The Rio Hondo Channel sampling location above the Beverly Boulevard bridge (Old TG PG 54F-1 / New TG PG 676F-1) has been an active stream gaging station since 1965 and is operated by the U.S.G.S. and the U.S. Army Corps of Engineers.

Flows in the Channel are partially regulated by the following: Sierra Madre, Santa Anita, Sawpit, Eaton, Santa Fe and Whittier Narrows Dams; as well as several spreading grounds and debris basins. This factor will require an immense coordination effort in gathering, collecting and interpreting water quality data collected from this station. Because these dams, as well as other facilities serve as flood control structures, small storms may not produce significant runoff from particular areas within the watershed, and therefore not contribute to the flow which is measured at the Beverly Boulevard gaging station. Large storms which produce significant runoff maybe detained, only to be released at a time when it is believed that potential flooding hazard conditions have subsided. There are numerous other scenarios which may occur, all impacting our water quality monitoring efforts at this site.

The overwhelming majority of the flows found in the Channel during dry weather periods are the result of NPDES permitted point discharges regulated by the of California Regional Water Quality Control Board.

Various land uses exist within the Channel's tributary watershed area. Residential areas of various sizes and densities include single family, duplexes, condominiums / townhomes, and apartments. Commercial strips of many uses, malls, office buildings, etc., can be found within the watershed. Industrial developments of all types and sizes are identified within the tributary watershed. Undeveloped or open space properties are typically found in the foothill areas, but are not limited specifically to these areas. A percentage breakdown for these land uses will be included in the supplemental Monitoring Program Report to be submitted later this year.

5. **SAN GABRIEL RIVER - Downstream of San Gabriel River Parkway, downstream of Whittier Narrows Dam at Los Angeles County Department of Public Works Stream Gage No. F263C-R.**

The San Gabriel River monitoring station will be located at the existing stream gage station, below San Gabriel River Parkway. This facility currently measures stream flow. At this location the upstream tributary area is 460 square miles.

San Gabriel River, at the gaging station, is a grouted rock-concrete stabilizer along the western levee, and a natural section on the eastern side. Flow measurement and water sampling will occur in the grouted rock area along the western levee of the river. The vertical lift from the invert of the concrete stabilizer to a sampler location above the western levee is approximately 15 feet. Since the vertical lift to the sampler would be in excess of 15 feet, an auxiliary pump to perform automated sampling may be warranted. The linear distance to the concrete stabilizer is nearly 70 feet. The linear distance to the concrete stabilizer does not appear to be a problem. The strainer and pressure transducer will be mounted in the concrete stabilizer.

The San Gabriel River sampling location below the San Gabriel River Parkway bridge (Old TG PG 55C-1 / New TG PG 676J-2) has been an active stream gaging station since 1968.

Flows in the River are partially regulated by the following: Whittier Narrows, Big Dalton, San Dimas, Puddingstone Diversion, Puddingstone, Live Oak, Thompson Creek, Santa Fe, Morris, San Gabriel, and Cogswell Dams; as well several spreading grounds; and debris basins. This will require an immense coordination effort in gathering, collecting and interpreting water quality data collected from this station. Because these dams and spreading grounds serve as flood control and water conservation facilities, small storms may not produce significant runoff from particular areas within the watershed, and therefore not contribute to the flow which is measured at the San Gabriel River Parkway gaging station. Large storms which produce significant runoff maybe detained, only to be released at a time when it is believed that potential flooding hazard conditions have subsided. There are numerous other scenarios which may occur, all impacting our water quality monitoring efforts at this site.

The overwhelming majority of the flows found in the River during dry weather periods are the result of NPDES permitted point discharges regulated by the California Regional Water Quality Control Board.

Various land uses exist within the River's tributary watershed area. Residential areas of various sizes and densities include single family, duplexes, condominiums / townhomes, and apartments. Commercial strips of many uses, malls, office buildings, etc., can be found within the watershed. Industrial developments of all types and sizes are identified within the tributary watershed. Undeveloped or open space properties are typically found in the foothill areas, but are not limited specifically to these areas. A percentage breakdown for these land uses will be included in the supplemental Monitoring Program Report to be submitted later this year.

III. MONITORING EQUIPMENT

A. WATER QUALITY SAMPLERS

Refrigerated Water Quality Samplers

Stormwater sampling for this NPDES permit must include a technique for collecting flow composite samples for storms as well as time composite samples for dry weather applications. The utilization of automatic refrigerated water quality samplers (Figure III-1) represent the best available technology at present to meet the goals of the Permit.

The water quality samplers to be utilized at each of the monitoring sites will be AC powered to carry the load needed to provide refrigeration. All samples will be stored at 4°C.

Each sampler will incorporate a peristaltic pump for sample collection. Due to the inability of the peristaltic pump to effectively pump beyond a vertical lift of 15 feet, a water tight auxiliary pump will be required at all stations. The reason for the the auxiliary pump to be water tight is that it may become submerged for periods of time during a storm. For underground drains the auxiliary pump needs also to be rated explosion proof. The explosion proof rating is required for the auxiliary pump because gases in a confined space, such as an underground storm drain, may excite the pumps motor causing an explosion. Most of our sites have vertical lifts in excess of 15 feet, requiring auxiliary pumps.

Each sampler will be securely stored in a steel box, similar to a traffic signal controller enclosure. Samplers will be located on the sidewalk or secured right-of-way for closed conduits or along the banks of open channels and natural watercourses.

B. FLOW MONITORING

Flow monitoring equipment is a fundamental aspect of water quality sampling. Because the Monitoring Program proposal includes flow composite sampling during storms, flow monitoring equipment must be utilized with the sampler. There are various makes and models of flow meters. Some of the various flow meters available utilize pressure transducers, ultrasonic sensors, bubblers, stilling wells utilizing a float, etc.

The above mentioned flow measuring devices are designed for open-channel flow conditions. The water elevation in a storm drain is measured by the flow monitoring equipment and then, from either a rating table previously established at the site, or from an equation such as Manning's a flow rate is determined. The County's Department of Public Works uses rating tables which are generated from analysis of storm drain cross sections and upstream/downstream flow characteristics. The rating tables are modified if it is demonstrated in the field that the stream velocity measurements indicate a non-uniform relationship with the calculated table values. Past efforts in stormwater flow measurement indicates that all of the proposed stations will require time and multiple storm events to gather necessary data needed for calibration of the measurement devices.

The type of flow measurement device selected for use is a pressure transducer. The maximum depth of flow for the proposed five sites approaches 23 feet. With the pressure transducer fixed at the bottom of the drain, a depth range from dry condition to 23 feet will have to be measured. The flow meter incorporating the pressure transducer must be compatible with the sampler.

VOL 15 1045

R0061265

Closed conduits, however, present an additional problem (none of the proposed five sampling sites identified in this report are within enclosed drains). Many closed conduits surcharge during storm conditions, usually caused by the conduit being undersized for its tributary watershed. The frequency of surcharging is dependent on the degree to which the storm drain is undersized. When surcharge conditions are reached, the drain now functions under pressure flow. The flow measurement devices discussed above are only operable under open channel flow conditions. The measurement of flow under pressure would require the use of velocity meters. These are very costly devices that would need to be located directly in the flow stream. Therefore, efforts were made to select storm drains that do not surcharge, or do so infrequently to an extent that flow measurements are not significantly compromised.

C. RAIN GAGE

For every monitoring station, a minimum of one automatic (intensity measuring) rain gage will be placed within the upper tributary watershed. Los Angeles County Department of Public Works operates various automatic rain gages throughout the County. Existing gages in close proximity to the proposed monitored watersheds will be utilized in calculating stormwater runoff and shall be essential to developing runoff characteristics of these watersheds.

Large watersheds such as those identified in this Report will require multiple rain gages to accurately characterize the rainfall. The number and location of these additional rain gages is currently being researched.

D. EQUIPMENT INSTALLATION

The approach taken for the installation of sampling equipment is important to those who will maintain it. Access, ease of operation, safety, protection from the elements, etc., are typical design considerations. Each station's design must take into account at least these basic elements.

Figures III-2, III-3, and III-4 show typical installations of sampling equipment in storm drains utilized in the Monitoring Program.

Selected site conditions will dictate the approach taken with regards to installation of the monitoring equipment.

The automated sampler intake hose and the flow meter pressure transducer cable must be protected from trash and debris, vandalism, and the physical forces of the flow velocity during storm events. It must also be installed to allow routine inspection and maintenance. Therefore, the intake hose and pressure transducer cable will be placed in separate conduits below the invert surface, a few inches below the channel's finished surface.

The strainer and pressure transducer will likewise be located within a protective enclosure to shield them from trash and debris and to minimize vandalism.

As stated before an auxiliary peristaltic pump will be needed at many sites due to the hydraulic lift requirements. This will complicate installation, maintenance and operations. The auxiliary pump will be placed above the low-flow, dry weather level to ensure that it will not be continuously submerged. A seperate conduit will be utilized to run power to the auxiliary pump.

IV. MONITORING EQUIPMENT PROGRAMMING

A. Storm Weather Sampling

The automated sampler will need to be properly programmed in order to collect a representative flow-composite sample.

To program the sampler, the following information is needed: target storm size, flow rate to trigger sampling, estimate of runoff volumes, total sample volume required, number of sample intervals desired, sample volume to be collected at each interval, and flow rate to end sampling.

B. Storm Size to be Sampled

The "Surface Drainage Water Quality Monitoring Program" report, prepared by Woodward-Clyde Consultants for the Santa Monica Bay Restoration Project, analyzed local rainfall data to determine the appropriate storm size to be targeted for monitoring. Based on their analysis, targeted storm events should be between 6 and 25 hours in duration and average rainfall of about 0.4 to 1.7 inches.

C. Minimum Sample Volume to be Collected

The minimum volume of stormwater needed to perform the necessary analyses is shown below, (for composite flow-weighted samples only):

Constituent	Quantity
Semivolatile Organic Compounds	1 L
Pesticides and PCBs	1 L
Herbicides	1 L
Soluble Metals	500 ml
Other Constituents	4,325 ml
	7,825 ml = 8 Liters or approx. 2 Gallons

The refrigerated automated sampler has a total capacity of 10 gallons. Subtracting the two gallons required for analysis, the sampler will have an eight gallon reserve capacity. Therefore, the sampler will be programmed to collect two gallons of stormwater from a 0.4" storm. With the eight gallon excess capacity, the sampler would theoretically have adequate capacity to handle storms up to two inches in size (0.4" x 5 = 2.0"). This will significantly reduce the need to change bottles during a storm event.

R0061271

VOL 15 1051

D. Estimate of Runoff Volume

To program the sampler, the estimated runoff volume from a minimum precipitation of a 0.4-inch storm event over the entire area of a watershed must be calculated. The procedure used to estimate the runoff volume of the above storm is taken from the Los Angeles County Department of Public Works Hydrology Manual, which is generally accepted by agencies within Los Angeles County for the performance of hydrology studies.

The procedure to be used is briefly described below.

a) Calculate the Overall Runoff Coefficient for the Watershed:

$$C_D = 0.9\ IMP + Cu\ (1 - IMP)$$

where:

IMP = Proportion impervious for the land use comprising the watershed.

C_u = Undeveloped area runoff coefficient (based on soil type and rainfall intensity).

C_D = Developed area runoff coefficient.

For watersheds with multiple land use types, the overall C_D for the watershed is the weighted average of the C_D for each land use type:

$$C_D = \frac{\sum_{1-n} C_{DX} A_X}{\sum_{1-n} A_X}$$

b) Calculate the rainfall volume for the watershed:

The rainfall volume is calculated by multiplying the storm size, in inches, by the area of the watershed.

c) Calculate the runoff volume for the watershed:

The resultant runoff volume is determined from the following formula:

Runoff Volume = Rainfall Volume x (C_D)

(A detailed example of the above procedure can be found in Appendix 1).

VOL 15 1052

R0061272

E. Determination of Sampling Parameters

As discussed previously, eight liters of stormwater runoff will need to be collected by composite sampling. A minimum of 20 aliquots will be collected from each storm to obtain the eight liter composite sample. Therefore, the volume of sample to be collected at each aliquot is:

8 liters/20 aliquots = 400 ml

The 20 aliquots will be spaced at equal runoff volume intervals throughout the storm. Therefore, the size of the runoff volume interval (▲ runoff volume) for a specific watershed would be determined as follows:

▲ runoff volume = total runoff volume / 20

where:

total runoff volume = total estimated runoff volume for targeted storm.

The flow rate at which storm sampling would be initiated at each station would be dependent on whether the site has any consistent dry weather or base flow.

For stations that do not have any dry weather flow, sampling would be initiated upon detection of flow. For those having dry weather flow, sample collection would begin after detecting a flow rate above the maximum-observed, yearly dry weather flow level. Sampling would halt when the flow returns to 120 percent of pre-storm base flow. As the monitoring program progresses, more specific operational criteria for the samplers at each station can be developed based on site specific flow information.

F. Dry Weather Sampling

Dry weather flow samples will be collected at all sites exhibiting adequate dry weather flow. For those sites with continuous dry weather flow, a 24-hour composite sample will be collected. For those with intermittent flow, a sample will be collected as flow is available.

R0061273

VOL 15 1-053

V. MONITORING CONSTITUENTS

A. List of Constituents

The selection of the monitoring constituents was based on an evaluation of the EPA final stormwater regulations and the existing monitoring program of the LACDPW. Initially, the constituents monitored during dry weather and under storm conditions will be the same. As water quality data is gathered over time and analyzed, revisions to the list of constituents monitored for both dry weather and under storm conditions may be made as deemed appropriate.

B. Constituents and Sample Collection Methods

The sample collection methods proposed for use are a combination of grab sampling and composite sampling. The details of each method will be elaborated in Part VI: Sampling Procedures. The definitions of sample types are:

- **Grab Sample** - a discrete, individual sample taken within a short period of time, usually less than 15 minutes.
- **Composite Sample** - a mixed or combined sample formed by combining a series of individual and discrete samples (aliquots) of specific volume, collected at specific volume intervals.

The time required to complete the cycle of compositing a sample covers a wide range, from a few hours to over to over 24 hours.

However, certain constituents have very short holding times and specific collection or preservation needs. The existence of and concentration of these constituents cannot be tested by composite samples and must be analyzed from grab samples.

All constituents listed in Table V-1 will be tested by composite sampling. Those listed in Table V-2 must be collected manually by grab samples.

Grab samples are preferred for certain water quality tests because field measurements such as pH and temperature should be instantaneous measurements of stormwater; bacteria have a short holding time; oil and grease tends to adhere on the surfaces that it contacts; volatile organic compounds (VOCs) have a tendency to volatilize when in contact with air; and cyanide is very reactive and unstable.

C. Chemical Analysis Methods

The chemical analysis methods for each constituent is listed in Tables V-1 and V-2. Also listed are the associated detection limits, sample volumes, preservation needs, and holding times required of each analysis method.

Weather forecasting and estimation of storm size is an inexact science. Therefore, rainstorms may occur where the total sample volume collected via composite sampling is insufficient to perform all the desired analyses.

Table V-3 presents a prioritized list of the water quality tests to be performed on the composite sample. For those storms where an insufficient total sample volume has been collected, the tests to be performed will be in accordance with the priority listed on Table V-3.

FOOTNOTES (Tables V-1 and V-2)

1 Should be added to empty sample container to be used for collection of sample if residual chlorine is present in the sample.

2 Samples must be extracted within seven days and extract must be completely analyzed within 40 days.

3 Use NaOH or H_2SO_4, as needed, to adjust the pH. Volume of acid of base must be noted.

4 If Aldrin is one of the pesticides to be tested and the sample is known to have residual chlorine present, then this preservative should in the empty sample container to be used for the collection of the sample.

5 Maximum holding time is 24 hours when sulfide is present. Optionally, sample may be tested with lead acetate paper before pH adjustment, to determine if sulfide is present. If sulfide is present, it can be removed with the addition of Cadmium nitrate powder until a negative spot is obtained. The sample then should be filtered and NaOH added to adjust the pH to > 12.

6 Should only be used in the presence of residual chlorine.

7 This is an arbitrary selected holding time. None is given in EPA method 418.1 - the approved method to use for TPH testing.

8 According to 40 CFR 136.3 Table II Notes, Note (2): "For composite chemical samples, each aliquot should be preserved at the time of collection. When use of an automated sampler makes it impossible to preserve each aliquot, then chemical samples may be preserved by maintaining at 4°C until compositing and sample splitting is completed."

R0061283

VI. SAMPLING PROCEDURES

This Stormwater/Urban Runoff Monitoring Program is divided into two sub-programs, namely: the dry weather flow monitoring sub-program, and the storm weather flow monitoring sub-program. For each of these sub-programs, two types of samples will be collected at each monitoring location: Grab samples and composite samples. The constituents to be analyzed for either a grab or composite sample are discussed in Section V, and the automated sampling equipment to be used is described in Section III.

A. Storm Sampling

1. Pre-storm Preparation

In preparing and mobilizing personnel and equipment for a given sampling event, LACDPW will utilize the weather forecasts from the National Weather Service and from Pacific Weather Analysis, along with other Department resources such as the LACDPW Alert System. The Alert System is a system of rain and stream flow gages within the LACDPW flood control system which predicts/measures runoff amounts at key locations and transmits the data via telemetry to LACDPW headquarters. Important deciding factors in mobilizing for a storm sampling event include the probability of rainfall, its expected amount, and its intensity. When a representative storm is expected, sampling personnel will prepare for collection of grab samples and verify that the automated samplers are activated for composite flow sampling.

2. Grab Samples

All attempts will be made to collect grab samples during the beginning of the storm on the rising limb of the hydrograph. Such timing is expected to provide concentrations reflecting the higher levels of contaminants which are expected to be observed in the first part of a storm event as compared to those observed during the remainder of the event.

Grab samples will normally be collected using manual sampling equipment such as bucket with rope, dipper, funnel, etc. For manual grab sampling, please refer to Appendix 2 - "Surface Water Sampling Instruction Manual". Grab sample bottles, however, would have to be filled using manual operation of the automated samplers if sample points are inaccessible, such as the closed conduit sampling stations.

3. Flow-Composite Samples

Flow-composite storm samples will be obtained using an automated sampler to collect samples at flow paced intervals. Samples collected at each station will be combined in the laboratory to create a single flow-weighted sample from each station for analysis.

During a storm event, the sampler is programmed to activate automatically when the water level in the channel or storm drain exceeds the maximum annual dry weather flow rate. A sample will be collected each time a set volume of water has passed the monitoring point. The sample will be distributed into glass containers within the refrigerated sampler. The containers will need to accumulate a minimum of eight liters of runoff during each storm, so as to ensure a sufficient sample volume available to perform the necessary laboratory analyses. The automated sampler will deactivate when the water level in the channel or storm drain falls to about 120 percent of the observed maximum annual dry

VOL 15 1064

R0061284

weather flow rate. For detailed discussion on the automated sampler programming, please see Section IV.

Upon conclusion of the storm event, samples will be retrieved from the automated samplers. Samples will be retrieved within the maximum allowable holding times required of the various test methods. At the same time samples are collected, rainfall and runoff data will be logged and stored for transfer to the office.

B. Dry Weather Sampling

The frequency of dry weather sampling is once every other month. This frequency was established based on the assumption that the majority of the flow during dry weather is from discharges that are presently covered by permits issued by the RWQCB. The deviation in test results from time to time would therefore be expected to be minor.

As water quality data is gathered under this program, it may be necessary to increase the frequency of monitoring of some constituents, and likewise may be necessary to decrease or eliminate the monitoring frequency of other constituents, shown not to be of a concern.

1. Grab Samples

Grab samples will normally be collected using manual sampling equipment such as bucket with rope, dipper, funnel, etc. For manual grab sampling, please refer to Appendix 2 - "Surface Water Sampling Instruction Manual". Grab sample bottles, however, would have to be filled using automated samplers if sample points are inaccessible, such as closed conduit sampling stations. Specific grab samples will be collected each time composite samples are retrieved.

2. Flow-Composite Samples

During dry weather, an eight liter composite sample will be collected over a 24-hour period.

Samples will be retrieved and delivered to the laboratory within the maximum allowable holding times of all the various test methods.

C. Sample Transfer and Chain of Custody

The LACDPW contracts for laboratory services with the Los Angeles County Agricultural Commission Laboratory, located at 11012B Garfield Avenue, South Gate, CA 90280.

LACDPW maintains a sampling protocol involving appropriate procedures for manually collecting surface water samples and transferring custody of samples. This sampling protocol is detailed in the attached Surface Water Sampling Instruction Manual (Appendix 2). In addition LACDPW maintains frequent contact with our contract laboratory as to the proper containers and handling of samples in order to effect appropriate analyses of the constituents of interest. A chain of custody record will be completed for each sample collected to allow step-by-step accounting of the sampling path from origin to analysis. Important information on the custody form includes:

VOL 15 1065

R0061285

- Name of Person(s) collecting the sample
- Sample Laboratory ID numbers
- Date and Time of Sample Collections
- Names and signatures of all persons handling the samples in the field and in the laboratory.

D. Personnel Training

LACDPW's Surface Water Sampling Instruction Manual (Appendix 2) deals with procedures and equipment used in surface water sampling for both manual and automated sampling, grab samples and composite samples, chain-of-custody, and safety of the field personnel. A copy of this manual is issued to all field personnel.

Prior to sampling, all water quality field personnel are provided training that includes familiarization with all the sampling areas, procedures for proper labeling, handling and storage of sample bottles, getting samples from each monitoring site to the laboratory, handling chain-of-custody, performing manual sampling, and operating automatic sampling equipment.

E. Health and Safety

General health and safety issues and concerns when performing water quality monitoring is also addressed in the LACDPW Health & Safety Program for all its employees. The program requires each employee to complete a safety matrix, which details hazards, that could be encountered in performing his/her duties. Safety Directives covering instructions on how to deal with said hazards are issued each employee. Example of hazards on a field sampler's safety matrix include: hazardous weather conditions, working in confined spaces, hazards associated with chemicals, snakes, poison ivy, traffic, falling, drowning, etc.

It is also LACDPW policy to require field sampling personnel to undergo a minimum of 40 hours of Hazardous Materials Awareness training, and subsequent required review courses. This training includes instructions on how to evaluate potentially hazardous situations and safety concerns.

VOL 15 1066

R0061286

VII. FIELD QUALITY ASSURANCE/QUALITY CONTROL PLAN

A. Overview

Properly performed monitoring station set up, water sample collection, transport, and laboratory analysis are vital to the collection of accurate data. Quality Assurance / Quality Control is an essential component of the Monitoring Program.

It is important to note that this Quality Assurance/Quality Control Plan is for the fixed sites described in the Monitoring Plan, Section II, and not for the planned Illegal/Illicit Discharge Investigation Program which will have its own QA/QC plan.

This QA/QC Plan describes the procedures for bottle labeling, chain-of-custody tracking, field setup, the sampler equipment check and setup, sample collection, the use of field blanks to assess field contamination, the use of field duplicate samples, and transportation to the lab. The QA/QC Plan shall be in place and enforced at all times.

An important part of this QA/QC Plan is the continued learning process of all field personnel. Field personnel must be adequately trained from the onset and must continue to have new information about stormwater sampling techniques shared with them. During the early stages of implementation, field personnel will evaluate the field activities and the possible effects on the QA/QC Plan. Enhancement of the Plan, if needed, will be implemented and an updated QA/QC Plan submitted to the Regional Water Quality Control Board for their use.

B. Bottle Preparation

Bottles will be grouped in sets. For each monitoring station, a minimum of three sets will exist in order to guarantee a consistent rotation of bottles. All bottle labels will be generic in appearance and will look similar to the following example:

BOTTLE NUMBER: _____ of _____	DATE:
STATION NAME:	TIME:
☐ GRAB OTHER: ☐ COMPOSITE _____	PRESERVATIVES:
LABORATORY ANALYSIS REQUESTED:	TEMPERATURE:
	COLLECTED BY:

Figure VII-1

Bottles shall be cleaned at the laboratory. After the bottles are returned, they will be labeled and stored away as a set package. Each station will have the same number, size and types of bottles existing for each rotation, unless special grab samples are requested. Clean bottles utilized for composite sampling will be replaced in the sampler at the time of each bottle collection, assuring a pre-setup sampling routine. All bottles not in use will be stored in plastic ice chests used for

VOL 15
1067
R0061287

transporting bottles. The size of composite sample bottles has been limited to a maximum of 2½ gallons each, to ensure ease of handling.

C. Chain-of-Custody Procedure

Chain-of-custody procedures and forms provide legal evidence that a sample has not been tampered with. This is achieved by establishing a written record tracing possession of the sample from collection through its final analysis. Primarily we are interested in field chain-of-custody procedures. The contract laboratory's own QA/QC includes chain-of-custody procedures which are in agreement with the field procedures. (See attached Laboratory QA/QC plan.) The chain-of-custody forms will remain at all times with the corresponding samples. Chain-of-custody forms shall be filled out and signed by field staff before actual physical possession of water samples are turned over either to other staff or to the laboratory. A sample chain-of-custody form is presented as Figure VII-2.

VOL 15

D. Field Setup Procedures

All field sampling locations are fixed sites, with the sampler placed on public road rights of way or flood control rights of way. One field staff member can conduct the sampler setup, but two staff members are necessary for sample collection at each monitoring station. After each sample collection, field staff will prepare the sampler to collect samples either in storm mode or in dry weather mode. Staff members will also inspect visible hoses and cables to ensure proper working conditions in accordance with site design. Inspection of the strainer, pressure transducer and auxiliary pump can only occur during daylight hours in non-storm conditions.

During a storm event, grab samples will be collected during the initial portion of the storm (on the rising limb of the hydrograph) and subsequently taken directly to the lab. The automated sampler will be checked at the time grab samples are collected to ensure proper working conditions at the site (to see if flow composite samples are being collected). Dry weather collection techniques will be similar with a 24-hour composite sample and subsequent grab samples being collected.

After a sampling event, all bottles will be collected and samples packed with ice and foam insulation inside individually marked ice chest(s). Field personnel will transport these samples to the Department of Public Works headquarters. Chain-of-custody forms will be completed by field staff before relinquishing them to other staff personnel for transportation of the samples to the laboratory. Under no circumstance will samples be removed from the ice chest during transportation from the field to the laboratory. All samples transported to the laboratory will meet the holding time criteria described in Section V.

E. Travel Blanks and Field Duplicates

Potential field contamination will be assessed through analysis of travel blanks and duplicate composite samples. The use of field travel blanks for each monitoring station during every sampling event, represents an attempt to quantify post sampling contamination. The Monitoring Program will also include the use of field duplicates to assess the accuracy of lab results. The collection of a field duplicate will occur for each sampling event. The duplicate will be for one sampling station, unknown to the laboratory. At the present time, this methodology for assessing post sampling contamination and the accuracy of laboratory testing procedures will provide adequate data to measure the accuracy of the results provided to us from the laboratory.

LABORATORY QUALITY ASSURANCE/QUALITY CONTROL

The Los Angeles County Department of Public Works has contracted with the Office of the County Agricultural Commissioner/Weights and Measures Environmental Toxicology Laboratory for all laboratory analysis. A part of this Quality Assurance/Quality Control Plan for the Monitoring Program includes the QA/QC for the Laboratory which is enclosed as two documents (see Appendices 3 and 4). The Laboratory QA/QC Plan is a part of the Monitoring Program.

VOL 15
1070
R0061290

VIII. DATA STORAGE AND REPORTING

The following categories of data are being collected as part of the monitoring program:

- Rainfall
- Runoff
- Water Quality Test Data
- Quality Assurance/Quality Control Information

All of the data will be stored in electronic format to allow for ease of retrieval interpretation, and graphic presentation.

Rainfall and runoff data will be collected from each monitoring station after each storm event and stored in a central file. The data will be arranged by monitoring station to show the total rainfall amount and total runoff volume, plus a hydrograph for each sampled storm event.

Water quality data for each monitoring station will be stored in a PC database. QA/QC information will be stored in a PC database.

For each sampled storm event, a report will be prepared summarizing the rainfall, runoff, and water quality data. At the end of each storm season (July 1 to June 30), a yearly monitoring report will be prepared summarizing the data collected.

R0061291

VOL 15 1071

IX. PROGRAM MANAGEMENT

Implementation and overall coordination of the Monitoring Program activities, including evaluation of the contract laboratory services will be the responsibility of the Program Manager. The Program Manager will assign field sampling personnel from a pool of technical staff (14 currently available) trained in sampling procedures and methods.

The Program Manager is responsible for evaluation of weather forecasts as provided by our storm forecasting service, and will decide on which storms warrant mobilization for the sampling activities. The Program Manager will assign one of the Field Engineers as an Event Coordinator, who will coordinate the sampling event with the designated field personnel.

For storm weather and dry weather sampling, the stations have been divided into two groups as shown below. The stations have been apportioned based on anticipated difficulty of sampling as well as travel to and from each station.

GROUP	MONITORING STATIONS
1	Los Angeles River @ Tujunga Avenue
	Los Angeles River @ Wardlow Road
2	San Gabriel River @ San Gabriel River Parkway
	Rio Hondo Channel @ Beverly Boulevard
	Coyote Creek @ Spring Street

Two individuals will be assigned to perform field sampling for each group. Each sampling crew will be responsible for all the sampling activities needed at each site within each group. Each staff member assigned to a Group of stations will be responsible for: Field equipment maintenance and operation; proper collection and handling of samples; and field QA/QC and field sampling protocol.

The Program Manager will be responsible for on-going review, and evaluation of the overall QA/QC program related to sampling and laboratory procedures.

VOL 15 1072

R0061292

X. ESTIMATION OF POLLUTANT LOADINGS

One of the objectives of the monitoring program is to assess the annual pollutant loadings from large watersheds within these Drainage Basins. Knowing the types and quantities of pollutants discharged from these watersheds are important in assessing the impacts of stormwater on receiving waters.

A. Model Selection

The model to be utilized to calculate basin-wide mass pollutant loadings is the Simple Method as described in the EPA's "Guidance Manual for the Preparation of Part 2 of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems." Due to the size of these Drainage Basins, this method will provide a good estimate of pollutant loadings, without requiring the extensive amount of detailed hydrologic and hydraulic data needed by more sophisticated models. Once pollutant loads have been estimated basin wide, an initial assessment can be made as to their potential impacts on receiving waters. Subsequently, more detailed, dynamic modelling of select, representative watersheds in these Drainage Basins can be performed to more accurately track and assess pollutant impacts.

B. Calculation Procedure

Calculation of annual pollutant loadings will be performed as follows:

1. Calculate annual pollutant loads for each drainage area.

   Utilizing the formula below, calculate annual pollutant loads for each drainage area:

   Equation 1:

$$L_i = \frac{(P)\ (CF)\ (Rv_i)}{12}\ (C_i)\ (A_i)\ (2.72)$$

   where:

   L_i = Annual pollutant load (lb/drainage area/yr)
   P = Annual precipitation (in/yr)
   CF = Correction factor that adjusts for storms where no runoff occurs
   Rv_i = Weighted-average runoff coefficient for the drainage area
   C_i = Event mean concentration of pollutant (mg/L)
   A_i = Drainage area (acres)

   The numbers 12 and 2.72 are conversion factors that account for unit conversions.

   Each of the parameters in Equation 1 is defined below:

   - Annual pollutant load is the total amount of a specific pollutant discharged in pounds per time period (in this case, per year) for the particular drainage area being modeled.
   - Annual precipitation is the total inches of rainfall occurring in a single year. Estimates of the annual rainfall are calculated utilizing the historical rainfall data

VOL 15
1073
R0061293

compiled for Los Angeles County by the Los Angeles County Flood Control District and, subsequently, the LACDPW.

- **Correction factor** is an adjustment factor for the number of storm events that do not actually produce any runoff (i.e., the percentage of storm events that have a total accumulation greater than a specific threshold value). This value will be calculated based on a review of historic rainfall data for Los Angeles County.

- **Weighted-average runoff coefficient** is a relative measure of the percentage of rainfall that becomes surface runoff. Runoff coefficients will be calculated utilizing the procedure described in Section IV.

- **Event mean concentration of pollutant** is the event mean concentration value for the specific pollutant determined from an analysis of the flow-weighted composite samples obtained by the monitoring program.

- **Drainage area** is the size of the area being modeled.

2. Use the per-drainage area annual pollutant loads to calculate per-watershed annual pollutant loads.

The following equation will be used to calculate per-watershed annual pollutant loads.

Equation 2:

$$L_w = \Sigma L_i$$

where:

L_w = Annual pollutant load for a particular watershed

ΣL_i = Summation of individual annual pollutant loadings from all drainage areas within a specific watershed

3. Use the per-watershed annual pollutant loadings to calculate basin-wide annual pollutant loads.

The following equation will be used to calculate basin-wide annual pollutant loads.

Equation 3:

$$L_n = \Sigma L_w$$

where:

L_n = Annual pollutant load for entire basin

ΣL_w = Summation of individual annual pollutant loadings from all watersheds within the basin

The above procedure can also be utilized to estimate seasonal pollutant loads and per storm event pollutant loads as needed.

R0061294

VOL 15 1074

Constituents to be Modeled

Annual pollutant loadings will be calculated for the following constituents:

BOD_5	Total Phosphorus
COD	Dissolved Phosphorus
TSS	Cadmium
Dissolved Solids	Copper
Total Nitrogen	Lead
Total ammonia plus organic nitrogen	Zinc

Development of Annual Pollutant Loadings

We are targeting installation of our monitoring stations to commence May 1995. Upon completion of the storm season, April 1996, and assuming sufficient storms have occurred for sampling and that sampling equipment can be calibrated, event mean concentrations will be calculated. We estimate that the pollutant loads could be developed by August 1, 1996.

R0061295

VOL 15 1075

XI. LONG-TERM TRENDS IN STORMWATER/URBAN RUNOFF QUALITY

As discussed in Section II, a total of fifteen fixed-station monitoring sites are proposed for the Upper and Lower Los Angeles River, Upper and Lower San Gabriel River, and the Santa Clarita Valley (Santa Clara River) Drainage Basins. The locations of five of these sites have been chosen to be representative of the various watersheds within the Basin. The locations to be selected and included in a supplemental submittal, one mass emissions sampling site in the Santa Clarita Valley Basin and nine land use specific sites, will meet the same criteria as established in this Monitoring Program Report.

In addition to providing data necessary for calculation of the event mean concentrations, long-term data from these sites can be evaluated for trends. The objective of this evaluation is to determine if there are any statistically significant differences in pollutant concentrations and loadings which could be related to the implementation of Best Management Practices (BMPs) as opposed to random variability in hydrologic factors such as the frequency, intensity, and duration of storm events.

Complicating this evaluation is the fact that there is no, location specific, baseline data available prior to the implementation of BMPs. Monitoring at these selected sites will commence concurrently with implementation of various BMPs. Therefore, dependent on the number of storms available, at least five or more years of data will be needed before reasonable statistical analysis of trends could be performed due to the large degree of natural variability. Therefore, we recommend that any statistical analysis of trends be performed after the conclusion of the fifth year of monitoring.

VOL 15

APPENDIX 1

STEP-BY-STEP PROCEDURE

FOR

RUNOFF ESTIMATION

VOL 15

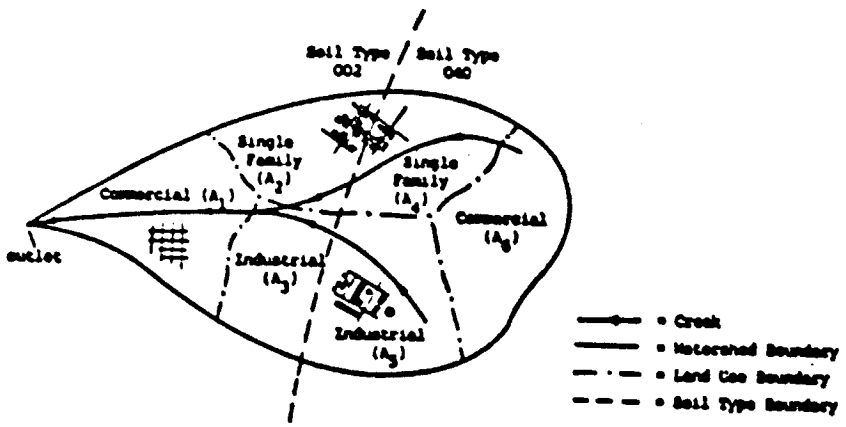
10077

R0061297

EXAMPLE

1. Calculate the Runoff Coefficient for a Study Area

   Typical Example: The Study Area shown is comprised of two soil types and three land-use types.



Upon examining the Study Area, there are six unique soil types - land-use type combination areas. The areas are numbered 1 through 6. The data for these areas is summarized below:

Area Number	Soil Type	Land Use	Imp.	Area (Square Miles)
1	002	COM	.95	6
2	002	SF	.42	2
3	002	IND	.90	3
4	040	SF	.42	3
5	040	IND	.90	2
6	040	COM	.95	3

In general, the runoff coefficient is first calculated for each individual area. A weighted average calculation is performed to arrive at the overall runoff coefficient for the Study Area.

The detailed procedures is described below:

a) First the Undeveloped Runoff Coefficient (C_u) is determined for each area from the runoff coefficient curve for the soil type for the area. This is done by first choosing th rainfall intensity (in/hr). With this rainfall intensity value go to the runoff coefficient curve and select C_u.

R0061298

VOL 15 1078

b) The developed Runoff Coefficient (C_D) is then calculated for each area based on the following formula:

$C_D = .9IMP + C_y (1-IMP)$

The IMP is the imperviousness value assigned to the land use within each area.

c) After calculating C_D for each individual area, a weighted average calculation is performed to come up with the average C_D for the entire Study Area.

Now we will calculate C_D for the Study Area:

Select rainfall intensity

The rainfall intensity to be used will be 1.5 in/hr. If the rainfall intensity is not known or no specific value is to be used, then C_y automatically goes to the minimum or default value of 0.1 which is the same for all soil types. The calculation process should be established to use the default value unless a user specified rainfall intensity is provided.

Determine C_y

The Study Area is comprised of two soil types. C_y for these soil types is:

Soil type	C_y
002	.79
040	.75

Calculate C_D

Calculate C_D for each area:

Area No.	C_y	Imp.	C_D
1	.79	.95	.89[1]
2	.79	.42	.83
3	.79	.90	.79
4	.75	.42	.81
5	.75	.90	.89
6	.75	.95	.89

1) C_D for Area 1 = .9(.95) + .79(1-.95) = 0.89

Therefore, C_D for the Study Area is:

VOL 15
1079
R0061299

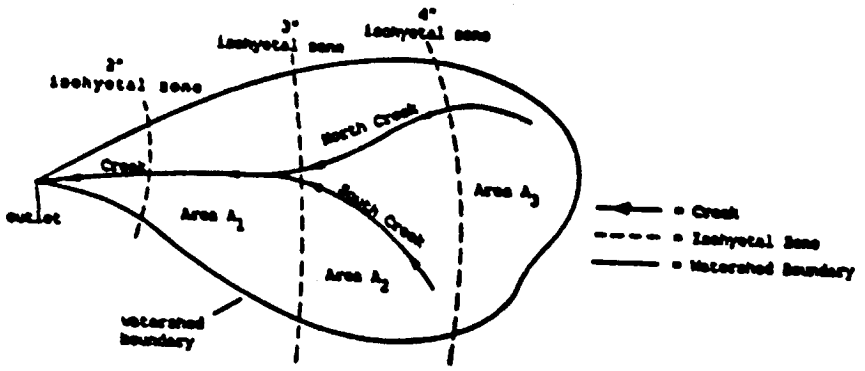
$$C_D \text{ Study Area} = \frac{C_{D1}\,\text{Area}_1 + C_{D2}\,\text{Area}_2 + C_{D3}\,\text{Area}_3 \ldots}{(\text{Area}_1 + \text{Area}_2 + \text{Area}_3 \ldots)}$$

$$= \frac{.89(6) + .83(2) + .79(3) + .81(3) + .89(2) + .89(3)}{(6+2+3+3+2+3)}$$

$$= .86$$

2. Calculate Rainfall Volume Over the Study Area

The Study Area is shown below and encompasses the indicated isohyetal zones.



The total area of the Study Area is 10 mi^2. The portion of the Study Area encompassed by each isohyetal zone is listed below:

Zone	Area(mi^2)
2"	3
3"	7
4"	9

The total rainfall volume deposited on the study area is:

$$\text{rainfall volume} = [2(3) + 3(7) + 4(9)]\ (640\ \tfrac{\text{acres}}{\text{mile}^2})\ (1/12)$$

$$= 3360 \text{ Acre-feet}$$

$$\text{or } \frac{3360}{19(\text{mi}^2)}\ \frac{12\ (\frac{\text{inches}}{\text{foot}})}{(640\ \frac{\text{acre}}{\text{mile}^2})} = 3.3\text{" depth over the entire study area}$$

VOL 15 1080

R0061300

3. Calculate the Runoff Volume for a Study Area

For the Study Area used in this example, the runoff coefficient (C_p)=0.86.

runoff volume = Rainfall Volume (C_p)

= 3360 Acre•feet (0.86)

= 2890 Acre•feet

1. INTRODUCTION

This manual covers collection of surface water samples for the Department's Stormwater/Urban Runoff Monitoring Program, and compliments the sampling procedures contained in the Work Plan for the Stormwater/Urban Runoff Monitoring Program (Work Plan).

Two sampling techniques, Manual Sampling (sampling by hand) and Automated Sampling (sample collection by use of powered devices such as the Automated sampler) are used in the monitoring program. Both manual sampling and automated sampling techniques are discussed in this sampling manual, with reference to the above-mentioned Work Plan.

Samples collected for both dry weather and storm flow monitoring programs are typed either "Grab" or "Composite". Grab sample is an individual discreet sample collected for characterizing water quality at a particular time. Grab samples normally would be collected using manual sampling techniques, unless sampling collection can only be achieved using automatic samplers, such as at manhole stations that are very deep and not accessible using manual grab sampling equipment. Composite samples are series of individual samples collected at paced intervals and combined to create a single weighted composite. Composite samples would normally be obtained, using automated sampling techniques.

The following instructions will help you collect samples and transport water samples safely and correctly. Safety is of the utmost importance, but if a sample is not collected or transported correctly, the subsequent lab analysis results will be compromised or invalidated.

It should be noted that these instructions are merely a guide to meet the specific needs of the Department. They are not intended to be a comprehensive guide to water quality sampling. Numerous textbooks, handbooks, and manuals are available for those interested in more detailed information on sampling methodology.

VOL 15

1085

R0061305

II. COLLECTION OF SAMPLES

Water samples will be collected in bottles supplied by the contract laboratory. All sample bottles, except bacteria bottles have been acid-washed and thoroughly rinsed with distilled water to eliminate contamination. Bacteria bottles contain a dechlorinating chemical. DO NOT RINSE THE SAMPLE BOTTLES BEFORE FILLING.

However, the bucket, dipper and funnel should be rinsed at each new sampling location. Use the water at each new site to rinse off any contaminates left in the bucket from prior sites.

DO NOT USE SOAP OR ANY OTHER DETERGENTS TO CLEAN SAMPLING EQUIPMENT.

A. Manually Collecting Grab Samples

A Manual grab is collected by inserting a container (bucket, dipper, etc.) under the surface of the water body to be sampled and/or dipping a container down current of a discharge with the container opening facing upstream. The following manual sampling procedures should be followed, in accordance with the source of the sample as well as requirements for certain analyses:

1. Nonflowing - Reservoirs, Lakes, and Ponds

The sampling technique will depend on the location and purpose of the investigation. The following general rules should be observed:

a. Select a location away from areas where water may tend to be stagnant.

b. Take samples at a location that is definable in plan and depth so that subsequent samples can be taken from the same location. This is important where a study is to be made regarding water quality changes with time.

2. Flowing Water

a. When sampling with a bucket and line from above the streamflow, first attach the line to the bridge railing or some other firmly fixed object. Lower the bucket gently into the center of the channel. Make sure the bucket is submerged to avoid the collection of floating debris.

R0061306

b. When sampling for oil and grease, sample should be collected at the air/water interface to insure collection of representative samples.

c. Avoid hitting the bottom of the channel so that deposited sediments are not collected.

d. When using the bucket and line adjacent to the low-flow channel, gently swing the bucket into the center of the flow to collect the sample.

e. After raising the bucket, take the temperature of the sample immediately for at least 30 seconds.

f. Pour off any floating debris and decant the water from the bucket into the sample bottles.

3. Bacteriological Samples

Bacteriological samples should be taken under sterile conditions, observing the following precautions (also refer to Section C 2. Sample Bottles):

a. Do not rinse the bottle. The bacteria bottle contains a dechlorinating chemical which must mix with the sample.

b. Do not fill the bottle completely; leave about 1/2 inch to allow mixing of the contents.

c. When sampling, prevent contaminating the lip and cover of the sampling bottle by avoiding contact with anything but the sample or the source of the sample.

B. Collecting Grab Samples By Automated Sampler

Collection of grab samples can also be accomplished by using the automated samplers. This is accomplished by temporarily bypassing the automated sampling program and utilizing the pumping unit of the automated sampler to fill the grab sample bottles. This sampling technique may be used if sample points for grab samples are inaccessible, such as at sampling stations that are very deep below the ground surface and cannot be accessed using manual grab sampling equipment. However, once the grab samples are collected, the automated sampling system must be restored to its ready mode for performing its programmed functions.

R0061307

VOL 15 1087

C. Flow Composite Samples

Flow weighted composite samples are collected using the automated samplers, programmed to collect samples for Storm Sampling (at flow paced intervals), and for Dry Weather Sampling (at fixed time intervals). For both storm sampling and dry-weather sampling, sample bottles must be retrieved within the maximum holding times required of the various test methods. Sample bottles are to be placed in coolers with frozen blue ice for transport to the laboratory for compositing and analysis.

VOL 15
1088

R0061308

III. SAMPLING EQUIPMENT

You will be provided with the sampling equipment necessary for your assignment. The equipment may consist of the following items:

- Bucket and rope
- Sample bottles
- Thermometer
- Personal equipment: (if applicable)
  - Hard hat and vest
  - Flashlight
  - Thomas Guide and location sketch
  - Rubber Gloves

A. Bucket and Rope

All surface samples collected manually by the Water Quality Management/Storm Water Section are of the type known as "grab samples". Under this procedure a sample may be collected in a bucket at a randomly selected time, over a period of time not to exceed 15 minutes.

B. Sample Bottles

You will be provided with the appropriate sample bottles and containers by the contract laboratory. Sample containers are easy to contaminate, therefore, AVOID TOUCHING the mouth of the bottle or the inner surface of the cap. Except when otherwise stated all containers should be filled to within 1" of the top NEVER TO OVERFLOWING. Identify the sample and provide necessary information requested on the container label using a waterproof ink pen. Place all glass containers into plastic protective bubble pack bags, and/or pack the containers in the cooler with shock absorbing materials to minimize the possibility of breakage. Add frozen blue ice, and deliver to the contract laboratory.

2. **SPECIFIC INSTRUCTIONS**

a. General Mineral (Gen Min):

Fill unpreserved container to within 1" of the top. It is not necessary to rinse out the container with the sample. Tighten the cap to prevent leakage.

b. Microbiology (Micro):

Fill unpreserved 1 Liter plastic container to within 1" of the top. It is not necessary to rinse out the container with the sample. Tighten the cap to prevent leakage. Place container in cooler with "Blue Ice" to minimize the effect of high temperatures on deaths of microbes. The maximum holding time for bacteria samples is six hours from the time of collection. Therefore, the samples must immediately be transported to the laboratory. Also, refer to preceding Section B 3. Bacteriological Samples.

c. Total Petroleum Hydrocarbon (TPH or TPH, Cr+6):

Fill unpreserved container to within 1" of the top. It is not necessary to rinse out the container with the sample. Tighten the cap to prevent leakage. This container is glass and, if possible, should be placed into a bubble bag for transportation to prevent breakage.

VOL 15
1091
R0061311

d. Metals:

Fill preserved container to within 1" of the top. DO NOT RINSE OUT OR OVERFILL. Contains Nitric Acid as a preservative. Tighten cap to prevent leakage.

e. Oil and Grease (O & G) :

Fill preserved container to within 1" of the top. DO NOT RINSE OUT OR OVERFILL. Contains Sulfuric Acid as a preservative. Tighten cap to prevent leakage. This container is glass and, if possible, should be placed into a bubble bag for transportation to prevent breakage.

f. Pesticide-PCB's (Pest-PCB):

Fill unpreserved container to within 3" of the top. It is not necessary to rinse out the container with the sample. Tighten the cap to prevent leakage. This container is glass and, if possible, should be placed into a bubble bag for transportation to prevent breakage.

g. Total Organic Carbon (TOC):

Fill unpreserved container to within 1" of the top. It is not necessary to rinse out the container with the sample. Tighten the cap to prevent leakage. This container is glass and, if possible, should be placed into a bubble bag for transportation to prevent breakage.

h. Biological Oxygen Demand (BOD):

Fill unpreserved container to within 1" of the top. It is not necessary to rinse out the container with the sample. Tighten the cap to prevent leakage.

i. Volatile Organics (EPA 601/602):

Slowly fill the two 40ml vials to overflowing, being careful not to aerate the sample. Carefully place the cap onto the vial and tighten to prevent leakage. Make sure that the teflon surface of the septum (hard white side) is facing the sample, the soft silicon side of the septum should be visible from the top of the cap. Invert the vials to confirm proper sample collection (bubbles should not be observed). If bubbles are present, open the vials, add more sample, reseal the vials, and recheck for air bubbles. Place the glass vials into the plastic protective bubble bag and, if possible, store in a cooler with "Blue Ice".

j. Base-Neutral-Acid Extractables (BNA):

Fill unpreserved container to within 3" of the top. It is not necessary to rinse out the container with the sample. Tighten the cap to prevent leakage. This container is glass and, if possible, should be placed into a bubble bag for transportation to prevent breakage.

R0061312

VOL 15 1092

k. Herbicides (Herb):

Fill unpreserved container to within 3" of the top. It is not necessary to rinse out the container with the sample. Tighten the cap to prevent leakage. This container is glass and, if possible, should be placed into a bubble bag for transportation to prevent breakage.

3. SPECIAL SAMPLES

a. Organic Nitrogen (TKN):

Fill preserved 250 ml plastic container to within 1" of the top. DO NOT RINSE OUT OR OVERFILL. Contains Sulfuric Acid as a preservative. Tighten cap to prevent leakage.

b. Radioactivity (Gross alpha & beta):

Fill preserved 1 Liter plastic container to within 1" of the top. DO NOT RINSE OUT OR OVERFILL. Contains Nitric Acid as a preservative. Tighten cap to prevent leakage.

c. Asbestos:

Fill unpreserved 1 Liter plastic container to within 1" of the top. It is not necessary to rinse out the container with the sample. Tighten the cap to prevent leakage.

d. Chlorinated Organic Substances (COS):

Use same sampling procedure as for EPA 601/602. The EPA reference manual is available in the Water Quality Section.

e. Nitrite-N (1 ppb DL):

Fill unpreserved 125 ml plastic container to within 1" of the top. It is not necessary to rinse out the container with the sample. Tighten the cap to prevent leakage.

C. Thermometer

Water temperatures are always taken during sampling, and you will be provided with a thermometer for this purpose.

D. Dissolved Oxygen Meter

If your assignment requires the measurement of dissolved oxygen, you will be provided with a DO meter and instructions on its use. Calibration of the meter is essential prior to each use. Instructions to operate the DO meter will be provided prior to usage.

R0061313

VOL 15 1093

E. Personal Equipment

Before leaving on a sampling assignment, make sure that you have all of the personal equipment necessary to carry out your assignment. This would include your hard hat and vest, gloves,flashlight if necessary, Thomas Guide, etc, and location sketches showing the various surface sampling stations and access points.

VOL 15
1094

R0061314

IV. SAFETY

Safety Reminders:

1. Safety is more important than the samples. Never place yourself in a dangerous or unsafe sampling situation.
2. Always park your vehicle where it is safe. Pull into an access road or park your vehicle on a street where parking is permitted and walk to the site. NEVER PARK ON A BRIDGE.
3. Wear your hard hat and a high-visibility vest when you leave your vehicle.
4. Wear waterproof boots with high-traction soles when walking or standing on wet surfaces. Slippery surfaces should be avoided.
5. Never stand or walk in moving water.
6. Never get too close to a low-flow channel. Use your bucket and line to obtain a surface sample.
7. Never enter an enclosed drain, tunnel, or a confined space.
8. If waters are flowing outside the low-flow channel, lower the bucket and line from a bridge.
9. When sampling from a bridge, always tie one end of your rope to the railing or some other firmly fixed object. Do not lean excessively over the guard rail.
10. Be alert for hazardous situations. Your personal safety is your first responsibility. Common sense safety precautions must be exercised if you come upon an unusual material, discharge, smell, dumping, etc. Take note of your observations. Your notes may be used in follow-up investigations and/or supporting future analytical findings. Sample must not be taken if common sense judgement indicate that your safety is jeopardized.
11. Wear gloves when handling samples and wash your hands with soap and water when finished.
12. Wash all equipment, boots, gloves, bucket, etc., when finished.
13. When ascending or descending unstable or slippery slopes and embankments, avoid holding breakable bottles, and pointed or sharp objects with bare hands.
14. Each employee has Physical Class Limitations established under the Occupational Health Manual of Policies and Procedures of the Department. Exerting physical efforts or lifting weights over your physical class limit must be avoided to prevent physical injury. Ice chests with full sample bottles may exceed the weight-class requirements; in such cases, the ice chest must be transported by a minimum of two persons.

R0061315

VOL 15 1095

V. LABELING AND FIELD OBSERVATIONS

Each sample bottle will normally be pre-labeled by the Water Quality Unit. It is important, however, that each sample be identified as to the source, date, and time of acquisition. If a sample is taken from a large body of water, for example, the location should be described in such a way as to enable the same sample point to be relocated in the future if it becomes necessary.

VOL 15
1096

R0061316

VI. DELIVERY OF SAMPLES

Samples should be delivered to the contract laboratory as soon as possible to prevent alteration of the sample between time of sampling and time of analysis. In order to avoid the need to preserve the samples overnight, samples should be delivered to the contract laboratory no later than 5:00 p.m., unless prior arrangement with the contract laboratory is made.

VOL 15

1097

R0061317

VII. CHAIN OF CUSTODY

The Chain-of-Custody Record form shown must be completed for each delivery of samples to the contract laboratory. When sampling for potential court case litigation, consult the laboratory for the appropriate testing procedures, splitting and sealing of samples, and chain of custody.

QA OBJECTIVES

1. Establish the laboratory's ability to qualitatively and quantitatively analyzed various types of environmental samples for pollutants by:

   - identifying the qualifications and responsibilities of laboratory personnel;
   - enumerating the existing laboratory instrumentation and equipment together with the procedures for their sevice and maintenance to assure proper operation;
   - providing sources of analytical methods accepted by regulatory agencies for use in the laboratory.

2. Provide guidelines pertaining to sampling protocols, chain-of-custody, and storage of samples to maitain sample integrity prior to analyses.

3. Define the laboratory's calibration procedures and frequency of calibration.

4. Identify all the necessary steps to validate the laboratory's results.

5. Define all the necessary quality control checks that must be followed prior to the analysis and/or in the course of analyzing samples.

6. Identify all laboratory records and information needed to document the quality of analyses performed in the laboratory.

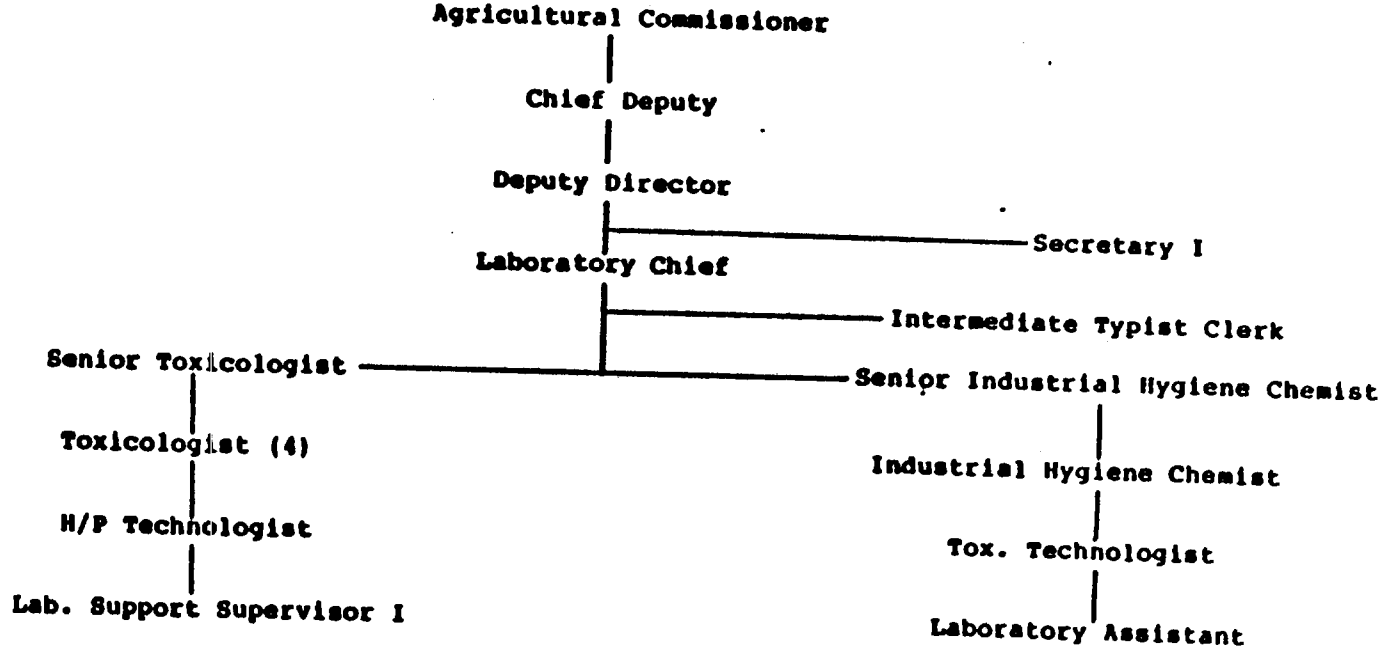
COUNTY OF LOS ANGELES
Office of Agricultural Commissioner/Weights and Measures
ENVIRONMENTAL TOXICOLOGY LABORATORY

Organizational Chart



R0061325

1. Organization

A. Minimum Personnel Qualification and Background

1. Deputy Director Graduation from an accredited college with specialization in chemistry, biochemistry, biology, or agricultural chemistry, and three years experience in analytical chemistry, biochemistry, pharmacology, or toxicology laboratory. An advanced degree in chemistry or biochemistry will be accepted for the required experience on the basis of one year for Master's degree and two years for a Ph.D.

2. Chief-A Bachelor of Science degree and at least three years experience in chemistry, biochemistry, pharmacology, biology, or toxicology, one year of which must have involved the chemical analysis of environmental samples. An advanced degree in chemistry or biochemistry will be accepted for the required experience on the basis of one year for a Master's degree and two years for a Ph.D.

3. Senior Toxicologist-Graduation from an accredited college with specialization in chemistry or biochemistry, and two years experience in analytical chemistry, biochemistry, pharmacology, or toxicology. An advanced degree in chemistry or biochemistry will be accepted for the required experience on the basis of one year for a Master's degree and two years for a Ph.D.

4. Senior Industrial Hygiene Chemist-Master of science degree with a major in general or physical chemistry and five years experience as a professional chemist conducting basic analytical research in chemistry, or four years experience as as Industrial Hygiene Chemist.

5. Toxicologist-Graduation from an accredited college with specialization in chemistry or biochemistry, and one year experience in analytical chemistry, biochemistry, pharmacology, or toxicology. Completion of one year graduate work in an accredited college with specialization in chemistry or biochemistry will be accepted for the required experience.

6. Industrial Hygiene Chemist-Bachelor of science degree with major in chemistry a biochemistry, and either (1) a Master's degree in chemistry, biochemistry, or a related field of environmental chemistry and two years experience as a professional chemist doing increasingly complex analytical procedures, or (2) four years experience as a professional chemist doing increasingly complex analytical procedures.

7. Herbicide Pesticide Technologist-Graduation from an accredited college with specialization in chemistry, biochemistry, toxicology, biological & natural sciences and six months experience performing chemical analyses or completion of sixty semester units of which 16 must have been in chemistry and two years experience performing toxicological analyses.

VOL 15 1106

R0061326

8. Toxicological Technologist-same as Herbicide/Pesticide Technologist.

9. Senior Laboratory Assistant-Six months experience at the laboratory assistant level.

10. Laboratory Assistant-Six months experience in laboratory work in a public health, medical, chemical, or biological laboratory, or completion of a course in laboratory science such as general chemistry or bacteriology.

B. Personnel Responsibilities

1. Deputy Director

-Directs, plans, assigns, reviews and evaluates work performed by laboratory personnel.

-Provides consultation in environmental toxicology to DHS, Agriculture Comm. and other agencies.

-Testifies as an expert witness for Los Angeles County on the analysis and interpretation of findings.

-Supervises the analysis and interpretation of laboratory data and correlates this with biochemical and metabolic effects.

-Publish scientific papers and reports. Make presentations concerning H/P contamination in our community. Attends and participates in conventions, meetings and conferences of professional organizations concerning H/P.

2. Chief

-Assists in the planning, assignment, supervision, and review of the work of laboratory personnel.

-Provides technical direction to laboratory personnel in performing a variety of chemical analyses of water, soil, plant, animal and other environmental samples utilizing various techniques such as spectrophotometry, chromatography, gravimetric, and volumetric analyses.

-Establishes and sets up special test procedures for detecting pesticides and other chemicals for which the laboratory has minimal or no experience, including all required and necessary quality control steps in such procedures.

VOL 15 1107

R0061327

-Establishes minimum quality control guidelines for all methods and tests performed in the laboratory.

-Develops laboratory statistics and reports on analytical procedures in assisting laboratory personnel in making the more difficult or unusual determinations, to identify priorities, and to establish work flow measures.

-Conducts training of laboratory personnel.

-May testify as an expert witness for the Chief Environmental Toxicologist.

3. Senior Toxicologist

-Provides technical guidance to laboratory personnel and performs chemical analyses to determine the presence and quantity of pesticides and other chemicals of interest in samples submitted to the laboratory for study utilizing wet and instrumental methods.

-Develops procedures for and conducts non-routine analysis on samples involving new and uncommon pesticides where standard methods are not established.

-Routinely monitors at regular intervals the accuracy and precision of laboratory results by checking quality control data obtained by laboratory personnel as part of their daily workload.

-Ensures that all quality control guidelines of the laboratory are met and recorded in specific quality control record books.

-Prepares daily work assignments of lower level laboratory personnel.

-Engages in continuing research and experimentation to develop and improve analytical procedures.

-Writes reports on analyses outlining methods used and results.

-Assists the Supervising Toxicologist in performing an analysis of unknown substances.

-Contacts pathologists, law enforcement officers, pharmacists and others to obtain information on cases as necessary.

VOL 15 1108

R0061328

4. Senior Industrial Hygiene Chemist

-Prepares work schedules, assigns and rotates Industrial Hygiene Chemists to various jobs, evaluates work performance and recommends resolutions to employee relations problems.

-Tests or directs the testing of new equipment, prepares written evaluations, and makes recommendations for its acquisition; prepares written instructions on the application and operation of new equipment for the procedure manual.

-Supervises a program of quality control to ensure the accuracy of test reports.

-Orients new employees to the overall operations of the section and trains or supervises their training.

-Serves as the consultant to Public Health Programs staff on problems relating to toxic and potentially dangerous chemicals.

-Analyzes samples that require the highest level of technical skill, experience and knowledge.

-Instructs environmental health personnel in the proper procedures for collecting field samples.

-Calibrates all laboratory equipment for the section.

5. Toxicologist

-Performs chemical analyses of water, soil, plant, animal, and other samples utilizing standard laboratory techniques such as spectrophotometry, chromatography and gravimetric and volumetric analysis.

-Follows accepted procedures and required quality control measures for conducting routine analyses such as determinations for pesticides and other organic/inorganic compounds.

-Writes reports on analyses outlining methods used and results.

-Contacts inspectors, law enforcement officers, and others to obtain information on cases as necessary.

-Assists the Senior Toxicologist in performing analysis of unknown substances.

VOL 15 1109

R0061329

-Prepares standard chemical solutions and reagents to specific requirements.

6. Industrial Hygiene Chemist

-Collects field samples and conducts surveys regarding industrial hygiene, sanitation, and exposure of workers to health hazards.

-Conducts laboratory and field analyses of abrasives, solvents, and other materials used in industrial plants and makes specialized measurements of air samples to identify and measure contaminants.

-Maintains and operates a chemical laboratory, anticipating needs for ordering chemicals and equipment.

-Develops new and special methods, procedures and equipment to be used for chemical and physical determinations in laboratory and field studies.

-Conducts research on problems of toxicology and other chemical problems as necessary for industry, County and other governmental agencies.

-Maintains laboratory records and prepares reports on results of studies and projects.

-Interprets data and confers with engineers, various divisions of the Health Department, and industrial managers to solve chemical problems concerning industrial health and hazards to workers.

-Operates a variety of laboratory and field testing equipment.

7. Herbicide/Pesticide Technologist

-Performs chemical procedures requiring the use of analytical apparatus to confirm existence of herbicides and pesticides in plant, soil, water, and animal tissue specimens.

-Utilizes techniques such as gas chromatography in chemical analyses of various specimens to determine the quantity of herbicides and pesticides present.

-Follows quality control guidelines on all chemical procedures and analyses performed.

VOL 15

R0061330

-Conducts preliminary research contributing to the development of new methods and procedures for the purpose of enhancing the quality of test analysis.

-Prepares standard chemical solutions and reagents to specific requirements.

-Performs routine maintenance on laboratory equipment and apparatus including cleaning and calibration.

-Prepares written reports delineating technical procedures exercised during analysis and test findings.

-Interprets gas chromatography graphs to determine specimen findings and submits interpretations to a Senior Toxicologist for review.

8. Toxicological Technologist

-Performs chemical analysis of environmental and biological samples using established procedures to determine the presence or absence of pesticides.

-Utilizes known instrumentation techniques such as gas and high pressure liquid chromatographs to determine the quality and quantity of pesticides present.

-Follows quality control gridelines on all chemical procedures and analyses performed.

-Prepares reference standards, chemical solutions, and reagents to specific requirements.

-Performs routine maintenance on laboratory equipment and apparatus including cleaning and calibration.

-Interprets charts and reading generated by various laboratory instruments used and submits interpretations to a toxicologist or senior toxicologist for review.

-Maintains register of all samples which includes detailed information on the methods used and findings.

-Assist in the development of new methods and procedures to improve the quality and reliability of test results.

-Follows experimental procedures under the guidance of a senior toxicologist to test for new pesticides.

VOL 15

R0061331

9. Senior Laboratory Assistant

-Trains laboratory assistants in the specific procedures established by the laboratory for the preparation of samples for analysis by toxicological technologists and toxicologists, the preparation of reagents, and the performance of other such laboratory tasks.

-Observes the performance of other laboratory assistants of their assigned tasks both in training and on-the-job situations, and makes corrections necessary to assure maintenance to established quality and quantity standards.

-Prepares samples for laboratory testing by adding reagents, solvents, and/or standards using prescribed techniques and instruments appropriate to the type of sample.

-Processes samples for subsequent analysis by higher level personnel by performing duties such as extractions and filtrations.

-Operates laboratory equipment pre-calibrated by qualified personnel to perform assigned tasks such as platform shakers, rotovaporators, and pH meters.

-Prepares specific quantities of reagents and solutions of compounds including acids and bases, following written procedures, by mixing components to standard ratios using such laboratory apparatus as weighing balances and volumetric glasswares; lifts and moves containers holding several gallons or other substantial quantities of constituent parts or compounds produced.

-Performs routine maintenance on miscellaneous devices such as water baths, rotovaporators, and platform balances.

-Cleans and treats glassware used in laboratory testing following steps and procedures prescribed by higher level personnel.

-Stores apparatus, glassware, and other supplies in designated areas when not in use.

-Stores reagents and chemicals in designated areas as required by safety rules and regulations.

VOL 15 1112

R0061332

10. Laboratory Assistant

-Receives samples such as water, soil, plant, etc. together with standard laboratory request form providing information such as sample I.D. and tests to be performed; verifies sample I.D. and assigned laboratory I.D. number by matching information on request form and sample container.

-Assigns laboratory identification to all samples received and writes this I.D. number on request forms and corresponding sample containers.

-Logs in sample information such as sample I.D., laboratory I.D. number, and tests to be performed in laboratory record book.

-Stores all samples received in appropriate storage locations and submit corresponding laboratory request forms to senior toxicologist.

-Prepares samples for analyses by chopping, weighing, and/or measuring where appropriate.

-Performs preliminary work on samples such as adding solvents and reagents, setting-up necessary glassware, and loading on platform shakers.

-Operates automatic laboratory equipment pre-calibrated by qualified personnel such as a pH meter to perform specific test.

-Transcribes laboratory test results from laboratory worksheets into permanent record book.

-Cleans & treats glassware used in laboratory testing following steps & procedures prescribed by higher level personnel.

-Cleans and stores apparatus, glassware and other supplies in designated areas when not in use.

-Stores reagents and chemicals in designated areas as required by safety rules and regulations.

VOL 15

R0061333

II. Sampling Procedures

A. Hazardous Waste

1. Organochlorine pesticides, Polychlorinated Biphenyls, and Organophosphorous Pesticides.

Wide mouth borosilate or soda glass container of 16 oz. size should be used. The container must have tight, screw-type lid with teflon liner. Sample bottle must not be prewashed with the sample before collection. Composite sample should be collected in refrigerated glass container.

The sample must be iced or refrigerated from the time of collection until extraction. Preservatives should not be used in the field unless more than 24 hour will be elapse before delivery to laboratory. If the sample will not be extracted within 48 hours of collection, the sample should be adjusted to pH range of 6.0 to 8.0 with sodium hydroxide or sulfuric acid. Note the volume of acid or base added to the sample.

All samples must be extracted within 7 days and completely analyzed within 30 days of collection for organochlorine, pesticide and polychlorinated biphenyls, and analyzed within 14 days of collection for organophosphorous pesticides.

2. Phenols

Wide mouth borosilate or soda glass container must be used, and the container must not be prewashed with sample before collection. Composite samples should be collected in refrigerated glass container.

The sample must be iced or refrigerated from the time of collection until extraction. If free chlorine is present in the sample, add 35 mg. of sodium thiosulfate per ppm free chlorine per liter/kg. Adjust the sample pH to approximately 2, as measured by pH paper with sulfuric acid solution or 10 N sodium hydroxide. record the weight of sodium thiosulfate and volume of sulfuric acid or sodium hydroxide used.

All samples must be extracted within 7 days and completely analyzed within 30 days of collection.

VOL 15 1114

R0061334

3. Halogenated Volatile Organics, Non-Halogenated Volatile Organics, and Acrolein, Acrylonitrile, Acetonitrile.

Samples must be collected in glass containers of at least 25 ml. size. Fill the sample container in such a manner that no air bubbles pass through the sample as the container is being filled. Seal the bottle so that no air bubbles are entrapped in it. Solid and semisolid samples are to be taken in the same way.

The samples must be iced or refrigerated from the time of collection until extraction. If the sample may contain free or combined chlorine, add 10 mg. sodium thiosulfate per. 40 ml./gm. for up to 5 ppm. chlorine. Fill the container with sample just to overflowing, seal the container, and shake vigorously for 1 minute.

All the samples must be analyzed within 14 days of collection.

4. Base, neutral, acid extractables.

All samples must be collected in glass container with teflon-lined screw caps. The samples must be iced or refrigerated at 4°c from time of collection until extraction. All samples must be extracted within 14 days of collection and completely analyzed within 40 days of extraction.

5. Phthalate Esters, Nitroaromatics, Cyclic Ketones, Poly nuclear Aromatic Hydrocarbons and Chlorinated Hydrocarbons.

All samples must be collected in refrigerated glass containers and the containers must not be prewashed with sample before collection. The sample must be iced or refrigerated from time of collection until extraction. Chemical preservative should not be used unless more than 24 hour will elapse before delivery to the laboratory. If the samples will not be extracted within 48 hours of being collected, the sample should be adjusted on a pH range of 6.0-8.0 with sodium hydroxide or sulfuric acid. Record the amount of acid or base used.

All samples must be extracted within 7 days and completely analyzed within 30 days of collection.

VOL 15

1115

R0061335

6. Toxic Metals

All sample containers must be prewashed with detergents, acids and deionized water. Plastic and glass containers are acceptable. Aqueous samples must be acidified to pH less than 2 with nitric acid. Non-aqueous sample shall be refrigerated. The maximum holding time of sample for mercury is 38 days in glass container and 13 days in plastic container.

7. Non-metallic

a. Cyanide

Oxyidizing agents decompose most cyanides. To test the presence of oxidizing agents, test a drop of liquid sample with potassium iodidestarch test paper: a blue color indicates the need for treatment. Add ascorbic acid a few crystals at a time until a drop of sample produce no color on the test paper. Then add an additional 0.6 gm. of ascorbic acid for each liter of liquid sample.

Samples must be preserved with 2 ml. of 10 N. sodium hydroxide per liter of sample at time of collection (pH is greater than or equal to 12).

Samples should be refrigerated at 4°c and analyzed as soon as possible.

Sample could be stored in glass or plastic container.

b. Fluoride

Sample should be collected in glass or plastic container.
Maximum holding time is 28 days.

c. Sulfide

Sample should be collected in glass or plastic container. Aqueous samples must be preserved with zinc acetate or the analysis must be started immediately.

8. Physical property testing

All samples should be collected in glass container with teflon liner and stored at 4°c.

VOL 15 116

R0061336

B. Drinking Water

1. Organochlorine Pesticides and Nitrogen - and Phosphorus-Containing Pesticides

Use 1-L borosilicate glass bottle with TEF-fluorocarbon lined screw cap, add 10 mL. of mercuric chloride as preservative to the bottle for a concentration of 10 mg/L.

When sampling tap water, allow the system to flush for about 10 minutes to stabilize temperature. Adjust the water flow to approx. 500 ml./min. befor collecting the sample. Note that the bottle must not be pre-rinsed with the sample. If a well is to be sample, collect the water in a wide-mouth beaker then transfer to the sample bottle with preservative. Seal the bottle then shake vigorously for 1 minute.

Store the sample at 4°c. Extract within 7 days of collection and analyze within 40 days of extraction.

2. Volatile Organic Compounds

Use 40 ml. vials with screw caps equipped with PTFE-faced silicone septum. These vials maybe ordered from Pierce or equivalent pre-cleaned and ready to use. Carry a field blank filled with reagent water to the sampling site with empty vials.

Fill sample bottles to overflowing. No air bubbles should pass through the samples as the bottle is filled, or be trapped in the bottle when the bottle is sealed.

When sampling tap water, allow the system to flush for about 10 minutes to reach stable temperature. Adjust water flow to about 500 ml./min. them collect the sample. If a well is to be sampled, collect the water in a wide-mouth beaker then transfer to the sample vial.

Collect all samples in duplicate.

Adjust pH of sample to< 2 by the addition of 2 drops of 50% HCl. Seal the sample bottle with the PTFE-face down and shake vigorously for 1 minute. Immediately store sample at 4°c after collection. Analyze samples within 14 days of collection.

VOL 15

R0061337

3. Carbamate Pesticides

Use 100-ml. or larger capacity glass or plastic bottle equipped with screw cap. Carry a field blank filled with Type II water to the sampling site with the empty sample bottle. Add 7 mg/100 ml. of sodium thiosulfate to the empty bottles and field blanks as preservative.

Do not pre-rinse container with sample before sampling.

When sampling tap water, allow the system to flush for about 10 minutes to obtain stable temperature. Adjust the flow to approx. 500 ml./min. then collect water in a wide-mouth beaker the carefully transfer the sample to the bottle. Fill the bottle within 2 cm. of the top.

In the laboratory, samples to be analyzed for oxamyl, 3-hydroxycarbofuran, and carbanyl must be further preserved immediately at the laboratory by adjusting pH to 3. This maybe done with the addition of 50% HCL.

Store samples at 4°c and extract within 7 days of collection and complete the analysis within 40 days of extraction.

4. Trace Metals

Use 125-ml. polyethylene bottles with screw caplid. Prior to use, wash bottle with detergent and tap water; rinse with 1:1 nitric acid, tap water, 1:1 hydrochloric acid, tap water, and finally de-ionized water in that order.

For determination of dissolved or suspended metals, no preservative need be added at the time of collection. For determination of total metals, both dissolved and suspended, acidify sample to pH 2 or less with the addition of 1:1 redistilled HNO_3 at the time of collection. For determination of total recoverable metal acidify sample at the time of collection with 0.625 ml. of conc. $HN\ O_3$ for 125 ml. of sample. Analyze sample within 30 days of collection.

C. Sample Labeling and Identification

Immediately after collection, the sample must be sealed, labeled, and the sample analysis request form filled out for each sample.

VOL 15

R00061336

1. Sample Labels

Sample labels are used for the specific identification of samples. Gummed paper labels affixed to the containers are adequate, but it should not be affixed to the sample lids. The labels should be filled out at time of collection and should include the following information:

Field Number
Name of Collector
Date and Time
Place of Collection

2. Sample Seals

Sample seals are used to detect unauthorized tampering of samples after collection, upto the time of analysis. The seals must be affixed to the sample container in a way that it has to be broken in order to open the sample container.

Seals must be affixed to the container by the collector.

3. Sample Analysis Request Form

Sample analysis request form accompanies the sample when it is delivered to the laboratory. The field portion of this form should be completed by the collector. The laboratory section is for completion by the laboratory analyst. The sample request form should include at the minimum:

Name of Collector
Date and Time of Collection
Location of Sampling Site
Field Number
Type of Sample
Analysis Requested
Date Received by the Laboratory
Laboratory Number
Results of Analysis
Date of Analytical Report
Name of Analyst
Remarks on Sample

VOL 15 1119

R0061339

III. Sample Custody

When a sample arrives, it should be logged in immediately. The laboratory receiving personnel should look at the sample to verify:

-Is the proper container used?
-Is the container properly filled?
-Is the quantity sufficient?
-Is the sample seal intact?
-Is the sample request form filled properly?

If the answer to any of the above question is no, the laboratory supervisor must be notified immediately. Also, the receiving personnel must verify if the sample had been appropriately preserved. If not, if must be preserved according to instructions in Table 1. This Table is posted for reference in the receiving area.

All samples received must be logged in a logbook and a unique laboratory number must be noted on the sample container, sample analysis request form, and log-book. In addition, the logbook must include information of laboratory sample number, sample identification information, type and condition of sample, and analysis requested. The recipient of the sample should sign the chain of custody form (see below).

Chain of Custody

Chain of Custody is a documentation of the sample history form collection to data reporting. A sample is considered under a person's custody if (1) it is in a person's physical possession, (2) in view of the person after he has taken possession, (3) secured by that person so that no one can tamper with the sample, or (4) secured by that person in an area which is restricted to authorized personnel.

The chain of custody form records the history of sample possession from collection, to analysis, and finally, to sample disposal. The form is printed on the same sheet as the sample request form. It must accompany the sample upon delivery to the laboratory. Information on the chain of custody form should include at least the following:

Name of the person in possession of sample
Affiliation of the person in possession
Date in possession

Once the sample has been logged in and the laboratory assume responsibility for it, the sample must be stored in a secure location. Whether the location should be refrigerated or not depends on the type

VOL 15 1120

R0061340

of sample or analysis requested. Refer to Table 1 for storage conditions. Typically, all samples for organic analyses must be stored in the refrigerator/freezer. Samples for trace metal analysis maybe stored at room temperature except those requiring Chromium VI analysis. The latter must be refrigerated.

Refrigerator/Freezer used for sample storage must be different from those used for storing standards. In addition, samples for volatile analysis must be stored separately form non-volatiles. On each refrigerator/freezer, a chart is posted outside to record daily temperature readings, date, and name of person monitoring the temperature.

After properly receiving and securing the sample, worksheets are written up providing information on sample laboratory number, type, analysis requested, received date, and maximum holding time. Table 1 posted in the receiving area also contain information on holding times as a guide in preparing the work sheets.

A copy of this section on sample custody is posted in the receiving area to serve as a guide for the receiving personnel.

B. Drinking Water

Analysis Requested	Storage & Preservation	Maximum Holding Time
Volatile Organic Chemicals	4°C, Acidify to pH 2 with 1+1 HCl (1 drop/20 ml. sample)	14 days
Base/Neutral and Acid Extractables, Non-purgeable Organic Chemicals	4°C, Protected from light, For chlorinated waters add Sodium Thiosulfate, 80 mg/L of sample	Extract within 7 days; complete analysis with 40 days of extraction
Ethylene Dibromide (EDB) Dibromochloropropane (DBCP)	4°C, No chemical Preservative	28 days
Organohalide Pesticides and Aroclors	4°C, Sodium Thiosulfate, 3 mg crystals/	Extract within 7 days; complete analysis with 40 days of extraction
Nitrogen or phosphorus Containing Pesticides	4°C, *Mercuric Chloride to 10 mg/L	14 days
Chlorinated Pesticides	4°C, *Mercuric Chloride to 10 mg/L	Extract within 7 days; complete analysis with 40 days of extraction
Chlorinated Herbicides	4°C, No chemical preservative	Extract within 7 days; complete analysis with 40 days of extraction
N-Methyl Carbamoyloximes	4°C**, Sodium Thiosulfate, 7 mg/100 ml.; Acidity to pH3 with HCl (1+1) (Samples for Aldicarb and Endothall must be frozen)	Extract within 7 days; complete analysis with 40 days of extraction
Bentazon	4°C, No chemical preservative	Extract within 7 days; complete analysis with 40 days of extraction

*Use caution in handing this toxic chemical. Dispose of contaminated sample in appropriate manner.

VOL 15 1123

R0061343

IV. Calibration Procedures and Frequency of Calibration

A. Standards and References

1. Sources of Standards

99% of our standards come from the following sources:

Quality Assurance Branch
EMSL - Cincinnati
U.S. Environmental Protection Agency
Cincinnati, Ohio 45268

U.S. Environmental Protection Agency
Pesticides & Industrial Chemical Repository
(MD-8)
Research Triangle Park, NC 27711

Supelco, Inc.
Supelco Park
Bellefonte, PA 16823-0048

Aldrich Chemicals
P.O. Box 2060
Milwaukee, Wisconsin 53201

National Bureau of Standards
Gaithersburg, Maryland 20899

All standards are obtained from reliable sources who can certify the purity of the materials.

Upon receipt, all neat standards are entered into an inventory book which includes the data received, who received it, source or supplier, lot number, conc./purity, expiration date, date opened, and who opened the bottle. The bottle itself containing the neat standard is labelled with the data received and initialled, expiration date, and date opened and initialled.

2. Preparation of Standards

Standards are prepared as outlined in the laboratory's specific Standard Operating Procedures (SOP) Manual. All information pertinent in the preparation of the standard are entered in the laboratory's Standard Preparation Book. Which include the following:

VOL 15
1124
R0061344

7.						
8.						

R0061345

VOL 15 1125

Standard solution bottles are also labelled individually with the concentration, solvent used, date prepared, expiration date and initials of the preparer.

3. Storage of Standards

All degradable and volatile organic compounds are stored in a freezer at below 0°C. This is true for any concentration: neat or solution.

Trace metal standards, except chromium VI, are stored at room temperature. Chromium VI is refrigerated.

4. External Reference Standards

Whenever possible, check standards are ordered from the EPA or NIST. These are used to verify the accuracy of the working standards. If unavailable from EPA or NIST, standards from another supplier or different lot number from the same supplier are used as check standards.

B. Calibration Procedures and Frequency

Specific calibration procedures are included in the analytical method and in the operator manual of that instrument. Each analytical instrument is calibrated at least daily when in use. The analyst is responsible for calibration. All the calibration data are kept in specific QC books.

There are calibration guidelines in the use of gas chromatographs, HPLC's, and atomic absorption spectrophotometers. These guidelines are applicable regardless of the instruments' make and model.

GC and HPLC Calibration Guidelines

1. Calibration Curve

Initially before use, a 5-point calibration curve must be established for each analyte of interest in order to determine the linearity of the concentration range of interest in the GC system to be used. A calibration curve is established by plotting the system response, as in peak height or peak area, versus the concentration of the standard applied to the system. The concentration of the standards used must correspond to the expected range of concentration in real samples, or must define the working range of the detector used. One standard concentration that must be included should be near but above the method detection limit (check individual method references for tabulated list of MDLs). An alternative to establishing a calibration curve is

VOL 15 1126

R0061346

the definition of calibration factors (CFs) for the analyte of of interest at each standard concentrations.

$$CF = \frac{\text{Total Peak Area/Height}}{\text{Mass Injected (ng)}}$$

For each analyte, five CFs would be obtained. Calculate the percent relative standard deviation of the CFs. If the %RSD is less than 20%, it can be assumed that the line defined by the CFs is linear through the origin and that the CF can be used instead of a calibration curve for calculation of the concentration of the analyte in real samples.

2. Calibration Standard

On a daily basis, a calibration standard must be injected and analyzed in the GC system to be used in the analysis. The response of the standards must fall within ±15% of the established calibration curve or factor (see appropriate QC Record Book for current values). If outside the ±15% limit, the cause of change must be determined and corrected, if possible. If the problem is one that is inherent in the system and cannot be corrected, then a new 5-point calibration curve must be established (see Pre-Analysis QC Requirements) before any real sample can be analyzed. Monitor the response of the calibration standard every 10 samples. The ±15% limit must be met with every injection of the standard. Record daily calibration parameter in Form 2.

3. Retention Time (RT) Windows

Prior to any new analyte testing and each time a new GC column is installed, retention time windows must be defined initially for each analyte and its corresponding surrogate and matrix spike standards there after. To determine the RT windows, make a minimum of three injections of all single analyte standard mixture and multiresponse analyte like chlordane over a 71-hour period. Calculate the standard deviation of the absolute RTs of each analyte with every injection. For multiresponse analyte, choose a major peak from the group of peaks and calculate the standard deviation of its absolute RTs from every injection. The RT windows are defined as the ±3S, where S is the standard deviation, of the absolute retention time for each analyte. Record all RTs and windows in Form 2. From the injection of the calibration standard of the analyte of interest, determine the retention time and make certain it falls within the established windows.

VOL 15
1127
R0061347

AA Spectrophotometer Calibration Guidelines

Calibration Curve

- must be prepared each day with a minimum of a reagent blank and three standards at different levels of concentrations. Determine the absorbances of each blank and standards. Plot the absorbances versus the concentrations. This plot establishes the linear curve for the day of the atomic absorption spectrophotometer used. Follow themanufacturer's instructions in preparing the calibration curve for the particular instrument used. Verify the curve every ten samples by analyzing a blank and a mid-level standard. The results of the verification should be within +20% of the original curve. If not a new curve must be generated. Use form 3 to record calibration data.

VOL 15

R0061351

V. Analytical Procedures

A. Methods Used

All the analytical procedures used are from published sources from the following list:

1. Test Methods for Evaluating Solid Waste, SW-846, 3rd Edition, Office of Solid Waste and Emergency Response, U.S. Environmental Protection Agency, Washington, D.C. November, 1986.

2. Methods for Chemical Analysis of Water and Wastewater, EPA-600/4-79-020, 1984 U.S. Environmental Protection Agency.

3. Standard Methods for the Examination of Water and Wastewater, 15th and 16th Edition, APHA-AWWA-WPCF, Washington, D.C. (1980-1085).

4. The Determination of Inorganic Anions in Water by Ion Chromatograph - Method 300.0, EPA-600/4-84-017, March 1984, U.S. Environmental Protection Agency.

5. EPA Drinking Water Methods, 500 Series.

If applicable; certain methods are written in out line form for routine use in the laboratory. They are included in the laboratory's Standard Operating Procedure (SOP) Manual. For any analyst using methods for the first time, it is recommended that references noted on the upper right hand corner of the outlined form be thoroughly studied prior to the use of the outline.

B. Detection Limit

Method Detection Limit (MDL)

Method detection limit is the lowest concentration level detectable in the laboratory instrument. It corresponds to an analyte signal-to-noise ratio of two with the analyte being introduced to the instrument in clean solution, i.e., reagent water or reagent grade organic solvent. Typically, the laboratory has the same MDL as those listed under specific analytical methods such as the EPA 500 series. The laboratory verifies that the listed MDLs are indeed applicable by directly injecting or introducing standards at the MDL level to the instrument and obtaining a signal-to-noise ratio of at least two from the injection.

VOL 15 1132

R0061352

Practical Quantitation Limit (PQL)

Practical quantitation limit (PQL) is the lowest quantifiable level that can be reliably achieved during a routine laboratory analysis of an analyte in a given matrix. This value is typically higher than the MDLs because it is matrix dependent. In determining PQLs, the laboratory follows the method given in the publication EPA-600/4-82-057, Appendix A.

C. Record of Analysis

For each analytical batch, all pertinent data related to the analysis including method used, sample weight or volume, dilutions, standard concentrations, description of instruments used and name of analyst are entered into a permanent log-book (Hazardous Waste) or worksheets (drinking water) which are filed as permanent records of the laboratory.

D. The laboratory maintains Standard Operating Procedures (SOP) Manual for both hazardous waste and drinking water analyses. These manuals contain the different analytical methods used in the laboratory in outline form. This is a cookbook-type outline generated from published methods which includes, whenever applicable, the following:

1. Scope and Applications
2. Detection limits (instrument and method)
3. Precision and Bias
4. Working range
5. Summary of Method
6. Sample collection, preservation, and holding times
7. Comments
   - A. Interferences
   - B. Helpful hints
8. Safety issues (specific to the method)
9. Apparatus
10. Reagents and standards
11. Procedure (detailed step-by-step)
    - A. Sample preparation
    - B. Calibration
    - C. Analysis
12. QA/QC requirements
    - A. QC samples

    - C. Significant figures and reporting values below detection limit
15. References
    - A. Method source
    - B. Deviations from source method and rationale

VOL 15 1133

R0061353

VI. Data Reduction, Validation and Reporting

A. Data Reduction

Equations and calculation procedures are included in the laboratory's SOPs. All the calculations must be attached to the copy of laboratory report for filing. Corrections for the blanks maybe made where appropriate. Calculations by the instrument/integrator is acceptable.

B. Data Validation

All results generated by the laboratory must be validated through the simultaneous analyses of required quality control (QC) samples/standards with the unknown sample. These include:

1. Instrument calibration with three concentration levels of standard and continuing single standard calibration every ten sample of an analytical batch.

2. Analysis of a method blank every batch of 20 samples for hazardous waste (every batch of 10 samples for drinking water) or type of matrix, which ever is more frequent.

3. Analysis of matrix spiked samples in duplicate at least once for every batch of 20 samples for hazardous waste (every batch of 10 samples for drinking water) or type of matrix which ever is more frequent.

4. Once during the analysis, an external reference standard should be used to check the concentration of the calibration standard.

After completing the analyses of an analytical batch, results of the above QCs must be recorded and plotted in the appropriate quality control chart (see form 4). Precision and accuracy control charts are maintained to determine if the QC results of an analysis are within established control limits. Control limits are initially set after the analysis of ten matrix spike and duplicate samples.

Thereafter, they are periodically set to reflect current performance.

It is the responsibility of the analyst to determine that all appropriate quality control operations have been performed and that all QC results fall within established limits. If any of the required QC is out of control the analyst must initiate corrective actions.

VOL 15 1134

R0061354

C. Data Reporting

Analytical results are ready to be reported as soon as it is verified that all quality control data fall within the laboratory's established limits. All data generated, both for the actual sample and the quality control sample must be entered in the appropriate worksheet, log-book and QC books. All information related to the sample analysis such as weight, volume, and QC results must be recorded. All results reported to the submitting agency would be presented with the appropriate number of significant figures, proper units such as ppm, method used, and practical quantitation limits. Worksheets, instrument out puts (e.g. chromatogram), analytical results, sample request for and report of analysis form are put together in a file and submitted to the laboratory supervisor for review. The supervisor signifies his/her approval by signing the report of analysis form to be sent to the submitting agency.

R0061356

VII. Internal Quality Control Procedures

In order to document the laboratory's ability to test for the analyte of interest, certain quality control procedures are followed. These procedures are divided into two: (1) pre-analysis QC requirements and (2) daily or on-going QC requirements.

1. Pre-Analysis QC Requirements - QC Check Samples

   The laboratory's ability to generate results with acceptable accuracy and precision using a published method must first be verified before the analysis of actual samples. This is done through the analysis of four QC check samples prepared according to Sec. 8.6.2, Method 8000, SW-846. Briefly, QC check samples are prepared by spiking four aliquots of reagent water with known amounts of the analytes in the method to be used. The average recovery ($\bar{R}$) of the analytes in ug/L and the standard deviation (s) in ug/L of the recoveries are calculated and compared with those listed under the QC Acceptance Criteria Table found at the end of each published method. If the $\bar{R}$ and s values calculated fall within the limits defined in the table, then the system performance is acceptable and analysis of actual samples can begin. If any individual analyte's $\bar{R}$ or s fall outside the limit, then the system performance in unacceptable for that analyte. QC check samples must then be analyzed just for the analyte that failed. If re-analysis produced results within limits, then the system performance is acceptable. Repeated failure signifies a general problem with the measurement system. If this occurs, the source of the problem must be located and corrected - then QC check samples must again be ran for <u>all</u> the analytes.

2. Daily QC Requirements

   On a daily basis or each time a sample or batch of samples is analyzed, certain quality control samples must be ran: method blanks, duplicates, and matrix spike/matrix spike duplicates. From these quality control samples, control charts may then be generated which would allow for the establishment of accuracy and precision limits for the laboratory.

   Method Blank

   The analytical result of the method blank (or reagent blank) must be free of any analyte contamination. If contaminated, the source of contamination must be determined and corrected. After correction, the batch must then be re-analyzed if the sample quantity permits; or

VOL 15 1137

R0061357

if not, results of the analysis maybe released with appropriate warnings on the nature of the contamination.

Hazardous waste - blanks must be ran once every analytical batch of 20 samples or less or each type of matrix whichever is more frequent. Since it is impossible to obtain a universal matrix blank for non-aqueous/solid samples, only reagent water is used.

Drinking water - blanks must be ran once every analytical batch of ten or less. Reagent grade water is used as blank.

Duplicate Samples

Duplicate samples are prepared by dividing a sample in two and analyzing them separately. Duplicate samples serve the purpose of monitoring the precision of measurement system. The results of the duplicate analyses must be within 20% of each other. If not an error has occured and it must be determined and corrected. The batch must then be re-analyzed. If the duplicate samples are negative for the analytes tested, then the matrix spike (see below) must be ran in duplicate to measure the precision. Duplicates must be ran once for every batch of 20 hazardous waste samples or less or each matrix type whichever is more frequent. Drinking water analysis requires duplicates to be ran every 10 samples.

Matrix Spike/Matrix Spike Duplicates (MS/MSD)

A predetermined amount of the analyte standard is added to a sample matrix to prepare the matrix spike sample. If the unknown samples to be analyzed are expected to be negative, then the sample matrix for spiking is first split into duplicates prior to the addition of the standard. Both matrix spike and matrix spike duplicate are analyzed simultaneously with the unknown samples. Recoveries of the analyte from the spike samples measure the accuracy of the method and the percent difference between the matrix spike and matrix spike duplicate assesses the precision of the analysis. The level of standard for spiking must be at the regulatory level or the method quantification limit. Samples with analyte concentration greater than 0.1% do not require the analysis of matrix spikes. Matrix spike and matrix spike duplicates must be ran for 5 % of the total analytical batch or each matrix type of hazardous waste. Drinking water requires the analysis of MS/MSD for 10% of the analytical batch. The accuracy and precision obtained from the MS/MSD must fall within the established lower and upper control limits of the laboratory. Continuing spike recoveries are recorded in form 4.

VOL 15 1138

R0061358

3. Other QC Requirements

Periodically, samples are re-analyzed by another analyst. This is especially true in situations wherein a seemingly valid result is obtained but does not agree with the history of the sample.

Good Laboratory Practices

Good laboratory practices are followed to assure continued production of reliable results. These include not only topics previously discussed, i.e., sample custody, calibration, analytical procedures, data handling, and internal quality control procedures, but also glassware cleaning, verification that the sample containers, reagents and laboratory water are free of contamination, local and state safety codes are followed, fume hoods are routinely monitored, and hazardous waste are disposed of properly.

1. Glassware cleaning - glassware used for metal analysis should be acid washed. Refer to the published analytical methods for detailed procedures. Glassware used for organic analysis should be washed with solvent used in the analytical procedure. If trace amount of the organic contamination is found, it maybe necessary to clean the glassware in a muffle furnace.

2. Only reagent grade chemicals are used.

3. Type II deionized water is used in the analytical method and for method blanks.

4. Sample containers must be verified to be free of contamination. To accomplish this, a container from every lot received is rinsed with water or methanol, whichever is applicable, and analyzed.

5. Air flow in the fume hoods are monitored periodically by qualified personnel. The maximum operating height of the fume hood door is marked accordingly.

6. Safety procedures are adhered to. The laboratory has a safety manual that is distributed to all personnel. It covers topics on emergency procedures as in cases of fire or chemical spills, laboratory safety procedures with regards to handling different types of chemicals and executing certain laboratory tasks, and state-required hazardous material communication procedures.

7. Local and state safety codes are incorporated in the laboratory safety manual. As with all other safety procedures in the manual, they must be adhered to.

VOL 15

1139

R0061359

VIII. Performance and System Audits

The laboratory undergoes periodic performance and system audits through external and internal proficiency samples.

External Proficiency Samples

Currently, the laboratory has three sources of external proficiency samples. They are the California Dept. of Food and Agriculture, California Dept. of Health Services, and the Environmental Protection Agency.

CDFA Proficiency Samples

On a quarterly basis, the CDFA sends a minimum of four proficiency samples to the laboratory. Fifty percent of these are plant tissues and the other 50% are environmental samples such as water, soil, and swabs. The samples are spiked with pesticides from the organochlorine, organophosphorus, and/or carbamate group. Results of the proficiency sample analyses are sent back to CDFA for evaluation and they in turn mailback to the laboratory statistical analysis of results as compared with theoretical valves and other laboratories' results.

CDHS

Periodically, the laboratory had received performance evaluation samples from the CDHS. The samples received were for both hazardous waste and drinking water analysis. The samples were spiked with some of the analytes the laboratory was accredited for. As with the CDFA proficiency samples, after submitting the P.E. sample results to CDHS, the laboratory receives a statistical analysis of the results reflecting the comparison of results with the CDHS's accept/reject criterion.

EPA

On January 1990, the laboratory enrolled with the EPA to participate with the latter's Performance Evaluation Sample Program in water pollution. As a result, the laboratory anticipates receiving and analyzing P.E. sample for waste water periodically in the future.

Internal Proficiency Sample

Effective January 1990, the laboratory, on a quarterly basis, prepares and analyzes internal proficiency samples. A minimum of three samples are involved representing any of the environmental samples such as water, soil, plant, and wipe. The proficiency samples are spiked with some of the analytes typically ran in the laboratory. Reports are prepared from the results of the proficiency samples and compiled in the appropriate QC record book.

VOL 15 1140

R0061360

IX. Preventive Maintenance

All minor maintenance and repair needed are accomplished by laboratory personnel. For major breakdowns, sufficient funds are budgeted annually to enable the laboratory to obtain service calls from qualified manufacturer's service engineers. The laboratory maintains a log book on any repair or maintenance of instruments.

All microbalance and platform balance are calibrated annually by qualified service engineers. On a weekly basis, the calibration of the balances are verified with standard weights.

All other service and maintenance needed by our laboratory for instruments and equipments are referred to their corresponding manufacturers. Based on yearly service expenses of the past years, sufficient amount budgeted annually to cover any future costs.

With the exception of Tracor Instruments which is located in Texas, all other manufacturers of our instruments could provide service within 48 hours after notification. Tracor has no local service representative so they take approximately one week before they send a serviceman.

The laboratory maintains a log book on instrument maintenance and repair for all major equipment used in the laboratory. It contains records on when an instrument is maintained and/or serviced, who provided the service, and what actions were taken.

VOL 15 1141

R0061361

X. Assessment of Accuracy and Precision

Accuracy

Accuracy means the nearness of a result or the average of a set of result to the true value. Accuracy is represented by the percent recovery (R) if an analyte from a given matrix using a specific method. The percent recovery may be calculated as:

$$R = \frac{A-B}{T} \times 100\%$$

where: A is the calculated concentration of the analyte in the spiked matrix after analysis

B is the background concentration of the analyte in the matrix blank, if any.

T is the known value of the analyte spiked in the matrix blank.

To set the accuracy control limits of an analyte in a given matrix using a specific method, calculate the average of R values ($\bar{R}$) and their standard deviation (S_r). The accuracy control limit as recommended by the EPA is then defined as:

$$RLCL = \bar{R} - 2S_r$$
$$RUCL = \bar{R} + 2S_r$$

where: RLCL is the accuracy lower control limit
RUCL is the accuracy upper control limit.

Precision

Precision is the measurement of agreement of a set of replicate results among themselves without the assumption of any prior information as to the true value. Precision is measured using replicate or duplicate sample analysis. Precision as relative percent difference (RPD) is calculated as:

$$RPD = \frac{X_1 - X_2}{X} \times 100\%$$

where: X_1 and X_2 are results of duplicate analyses

X is the average of X_1 and X_2

As recommended by EPA, the laboratory's precision limit is ±20%.

VOL 15 1142

R0061362

Control Charts

Precision and accuracy control charts are maintained for at least 10% of the analytes (min. 3 and max. 10) for a given method using form 4. Control limits are initially set after 10 data points. Thereafter, limits are periodically set to reflect current performance.

VOL 15 1143

R0061363

XI. Corrective Action

Corrective action is initiated in out-of-control situations. A situation is considered out-of-control if any of the laboratory's internal quality control samples (see section VII) are outside established limits, i.e.:

1. Method blanks are coming out positive for the analyte of interest signifying that the analytical system is contaminated.

2. Results of duplicate samples are outside the 20% limit.

3. Spike recoveries fall outside the established laboratory's accuracy control limits.

For any of the above conditions, the senior personnel assigned to the unit will be notified immediately. It is his/her responsibility to decide which of the following corrective actions must be taken:

1. The analyst provides additional information or recalculations.

2. Instrument calibration and operation are checked. Calibration standards are checked and new ones are prepared if necessary. Instrument malfunctions are corrected.

3. New reagents are used if needed.

4. The analyst repeats the analysis of spiked samples using the same method.

5. A different analyst repeats the analysis of spiked samples using the same method.

6. The analyst repeats the analysis of spiked samples using a modified or new method.

No laboratory result will be sent until the problem is solved. All out-of-control situations and the corrective actions taken are documented by the senior personnel and submitted to the laboratory supervisor and/or chief for review.

VOL 15 1144

R0061364

XII. Quality Assurance Report

On a monthly basis, senior personnel assigned to different units submit quality assurance reports for review by laboratory supervisor/chief. The reports contain a summary of the unit's QA activities during the period. The report includes the following information:

1. Date of analysis
2. Number of samples in the batch
3. Analytical batch number
4. Type of matrix
5. Analyte tested
6. Number of method blanks and results.
7. Number of matrix spikes and results
8. Number of duplicates and results
9. Detection limits
10. Name of analyst

In additon a copy of reports on out-of-control situations and corrective actions taken during the period are attached. The laboratory supervisor and/or chief reviews the QA report, signifies approval by signing them, and the reports are filed accordingly.

QA OBJECTIVES

1. Establish the laboratory's ability to perform qualitative and quantitative microbiology testing of drinking water and wastewater by:

   - identifying the qualifications and responsibilities of laboratory personnel (in previous QA Manual);
   - enumerating the existing laboratory instrumentation and equipment used in microbiology testing together with the procedures for their service and maintenance to assure proper operation;
   - providing sources of analytical methods accepted by regulatory agencies for use in the laboratory.

2. Provide guidelines pertaining to sampling protocols, chain-of custody, and storage of samples to maintain sample integrity prior to analyses.

3. Define the laboratory's calibration procedures and frequency of calibration.

4. Identify all the necessary steps to validate the laboratory's results.

5. Define all the necessary quality control checks that must be followed prior to the analysis and/or in the course of analyzing samples.

6. Identify all laboratory records and information needed to document the quality of analyses performed in the laboratory.

VOL 15 1151

R0061371

SAMPLING PROCEDURES

Containers

Approved container for bacteriological sampling are presterilized Nasco Whirl-Pak bag or 4 oz. sterilized Nalgene or glass bottles. All samples containers must contain two drops of 10% sodium thiosulfate. One sample bottle from each batch of bottles prepared must be checked for sterility by adding several sterile tubes of single strenght lauryl tryptose and incubating for 48 hours and checking for growth.

Collection

Samples must be representative of the potable water distribution system. Water taps used for sampling are free of aerators, strainers, hose attachments, mixing type faucets, and purification devices. Maintain a steady water flow for at least 2 minutes to clear the service line before sampling. Collect at least a 100 mL sample volume, allow at least ¼ inch air space to facilitate mixing of sample by shaking. Do not rinse sample container!

Holding/travel time between sampling and analysis is not to exceed 30 hours for potable water samples. If laboratory is required by State regulation to analyze samples after 30 hours and up to 48 hours, the laboratory is to indicate that the data may be invalid because of excessive delay before sample processing. No samples received after 48 hours are to be analyzed. Sample collectors who deliver samples directly to the laboratory should ice samples immediately after sample collection. All samples received in the laboratory are to be analyzed on the day of receipt.

Waste and surface water sample holding time is not to exceed 6 hours.

Labeling and Identification

Immediately after collection, the sample bottle must be labeled and the sample analysis request and report form filled out for each sample.

1. **Sample Labels**

   Samples labels are used for the specific identification of samples collected. Gummed paper labels affixed to the containers are adequate, but it should not be affixed to the sample lids. The labels should be filled

VOL 15

1152

R0061372

out at the time of collection and should include the following information:

Sampling Site
Name of Collector
Date and Time of Collection

2. Sample Analysis Request and Report Form

The sample analysis request and report form (exhibit 1) accompanies the sample when it is delivered to the laboratory. The collector should complete the field portion of this form by providing information on sample site location, sample type, purpose of the sample, date and time of collection, free chlorine residual, collector's initial, and any remains.

Upon receipt of the sample the laboratory will log-in the sample and at the minimum, the following information will be stored and maintained:

Date of Collection, Receipt, and Analysis
Time of Collection, Receipt, and Analysis
Receiving personnel initial
Client and/or System name
Sample Site location and/or description
Purpose of the sample
Assigned individual laboratory identify number
Name of the Analyst
Analysis Requested
Results of Analysis
Remarks on the sample (if any)

EQUIPMENT TEMPERATURE AND USE RECORD

Incubator Temperature

The total coliform incubator are maintained at 35± 0.5°c and have a thermometer graduated in at least 0.5°c increments. A daily log of the temperatures read to 0.1°c are kept together with the date the entry was made and the initial of the person making the entry (see exhibit 2).

Water Bath Temperature (For Fecal Coliform)

Similarly, the fecal coliform water bath are maintained at 44.5± 0.2°c and have a thermometer graduated in at least 0.2°c increments. A log of the temperatures when the water bath is in use read to 0.1°c are kept together with the date the entry is made and the initials of the person making the entry (see exhibit 3).

Sterilizing Oven Temperature

A thermometer immersed in a sand bath is kept inside the sterilizing over to monitor the temperature. Records of all items being sterilized, total sterilization time, and temperature are kept (see exhibit 4).

Autoclave

An autoclave/Sterilization log is maintained. The log includes the date, time in, time out, total elapsed time, sterilization time, items sterilized, sterility controls, maximum temperature reached, and any maintenance performed (see exhibit 5).

Certified Thermometer

All thermometers used in laboratory are crosschecked against a certified thermometer annually. Records of calibrations and corrections are maintained (see exhibit 6).

LABORATORY WATER QUALITY MONITORING

Bottled water is purchased from an outside source with an accompanying certificate of suitability. This is the water used to prepare the media. The parameters in the certificate include:

PARAMETER	LIMITS	FREQUENCY
Conductivity	>0.5 megohms resistance or <2 micromhos/cm at 25°c	Monthly
Pb, Cd, Cr, Cu, Ni, and Zn	Not greater than 0.05 mg/L per contaminant. Collectively, no greater than 0.1mg/L	Annually
Total Chlorine Residual	Nondetectable	Monthly
Heterotrophic	<500/mL	Monthly
Quality of Reagent	Ratio 0.8 - 3.0	Annually

Copies of the certificates of suitability are kept and maintained on file.

VOL 15

R0061381

MEDIA PREPARATION

The attached exhibit 7 is completed for each batch of media prepared. The information included in the form are:

- Data of preparation
- Preparer's initial
- Media prepared
- Weight of dehydrated media taken
- pH of autoclaved media
- Test of media with positive/negative cultures
- Sterility check

All completed media preparation forms are kept in a binder for easy reference.

ANALYTICAL PROCEDURES

Methods

The methods followed by the laboratory taken from Standard Methods for the Examination of Water and Wastewater, 16th edition, 1985 are:

Total Coliform by Multi-Tube Fermentation (MPN)	Method 908A
Fecal Coliform by MPN	Method 908C
Total Coliform by Membrane Filter (MF)	Method 909A
Fecal Coliform by MF	Method 909C

The outline forms of the above methods are attached as Appendix A of this supplemental manual.

Quality Control

1. For each bottle of media positive, negative, and sterile checks will be performed and a log of the check results will be maintained (see exhibit 8).

2. Positive and sterile checks will be performed for every batch of prepared media and a log of the check results will be maintained (see exhibit 9).

3. Positive and negative controls are ran with each analytical batch for EC test.

4. For each analytical batch tested by membrane filtration technique, a sterile control is ran at the beginning and end of the sample run, and a positive control is ran after the last sample.

5. For each lot of membrane filters, sterile and positive checks are ran.

6. The Completed Test must be done every three months or every positive confirmed potable water sample, which ever applies. A log of all positive potable confirmed sample is maintained.

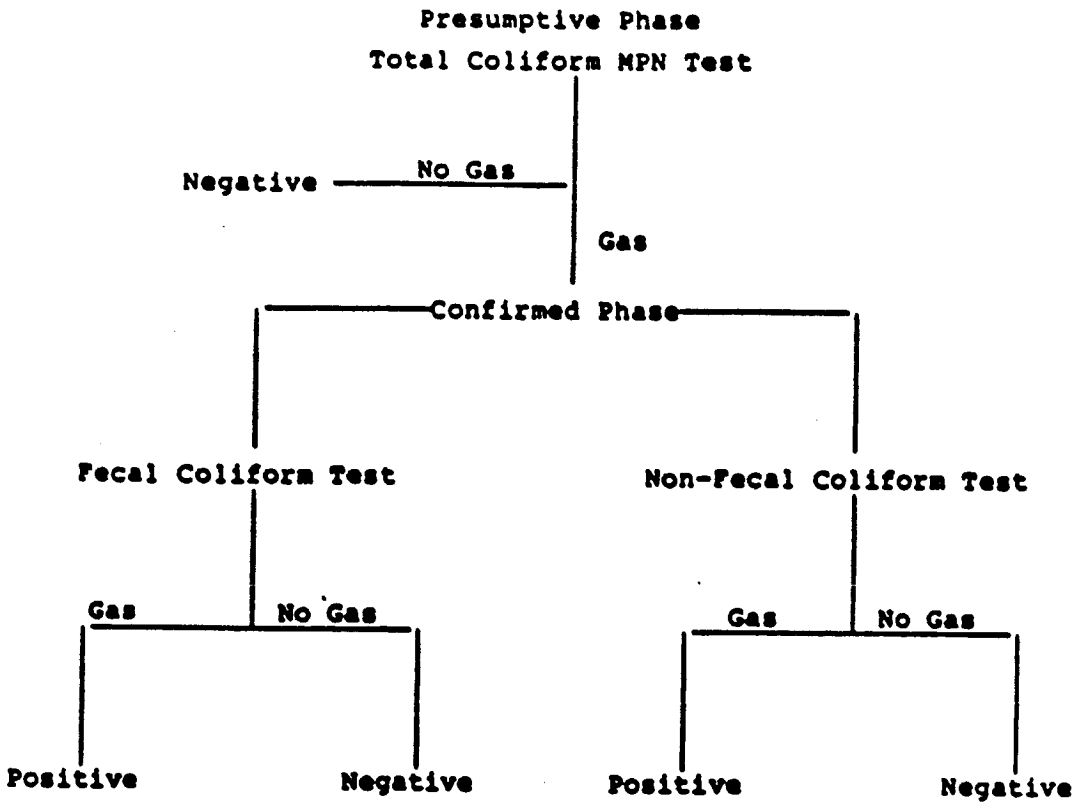
SUMMARY
OF
MULTIPLE-TUBE FERMENTATION TECHNIQUE
FOR THE COLIFORM GROUP



VOL 15
1169
R0061389

Effective Date: May 1991
Reference: Standard Method 908A

Total Coliform Multiple Tube Test

Reagents: Presumptive phase fermentation tubes with lauryl tryptose broth.

Quality Control:

Perform duplicate analyses on 10% of samples or at least one sample per test run.

Procedure:

1. Pipet ten 10 ml portions of the sample in a series of presumptive phase fermentation tubes; mix thoroughly.
2. Incubate fermentation tubes at 35± 0.5°c.
3. After 24± 2h, shake the tubes and examine for gas formation then take the following steps:

Gas Formation	Step To Proceed
Yes	Positive Test - continue to test for fecal and non-fecal coliforms.
No	Continue to step 4 below.

4. Continue incubating up to 48± 3h then again reexamine for gas formation.

Gas Formation	Steps To Proceed
Yes	Positive Test - continue to test for fecal and non-fecal coliform.
No	Negative Test - procedure completed

NOTE: For drinking and recreational water samples with heavy growth but no gas formation, continue on to test for non-fecal coliforms.

Calculation: See Calculation: Estimation of Bacterial Density

VOL 15 1170

R0061390

Effective Date: May 1991
Reference: Standard Method 908

Fecal Coliform Test

Reagent: EC Medium Tubes

Quality Control:

Run one each positive and negative controls for each analytical batch.

Procedure:

1. Gently shake or rotate presumptive tube.
2. With a sterile 3 mm metal loop, transfer one loopful of culture to EC medium tubes.
3. Incubate tubes in a water bath at 44.5± 0.2°c for 24± 2hr. Be certain to Place all EC tubes in the water bath within 30 minutes after the transfer of the culture.
4. Periodically check the EC medium tube during the incubation period for any gas formation.

Gas Formation	Steps To Proceed
Yes	Positive - fecal coliforms present
No	Coliforms present are of non-fecal origin and next step will depend on the result of the non-fecal coliform test.

Calculation: See Calculation: Estimation of Bacterial Density

VOL 15

R0061391

Effective Date: May 1991
Reference: Standard Method 908A

Non-Fecal Coliform Test

Reagent: Brilliant Green Lactose Bile Broth (BGB) fermentation tube.

Procedure:

1. Gently shake or rotate primary fermentation tube showing gas.
2. With a sterile metal loop 3 mm in diameter, transfer one loopful of culture to a BGB fermentation tube.
3. Incubate BGB tube for 48± 3 hr. at 35± 0.5°c.
4. Periodically check BGB tubes during the incubation period for any gas formation.

Gas Formation	Steps To Proceed
Yes	Positive Confirmed Test - proceed to completed test for 10% of positive samples or at least one positive source water every quarter.
No	Negative Confirmed Test - procedure completed.

Calculation: See Calculation: Estimation of Bacterial Density

VOL 15
1172
R0061392

Effective Date: May 1991
Reference: Standard Method 9221D, 16th ed.

Calculation: Estimation of Bacterial Density

This method is used to calculate the Most Probable Number (MPN) of coliform/100 ml of sample.

No. of Tubes Giving Positive Reaction Out of 10 of 10 ml Each	MPN Index/ 100 ml	95% Confidence Limits (Approximate) Lower	Upper
0	<1.1	0	3.0
1	1.1	0.03	5.9
2	2.2	0.26	8.1
3	3.6	0.69	10.6
4	5.1	1.3	13.4
5	6.9	2.1	16.8
6	9.2	3.1	21.1
7	12.0	4.3	27.1
8	16.1	5.9	36.8
9	23.0	8.1	59.5
10	>23.0	13.5	Infinite

No. of Tubes Giving Positive Reaction Out of 5 of 10 ml each	MPN Index/ 100 ml	95% Confidence Limits Lower	Upper
0	2.2	0	6.0
1	2.2	0.1	12.6
2	5.1	0.5	19.2
3	9.2	1.6	29.4
4	16.0	3.3	52.9
5	16.0	8.0	Infinite

For volumes other 5ml or 10ml, use the following equation to solve for the MPN value:

$$\text{MPN value (from table)} \times \frac{10}{\text{Largest vol. tested}} = \text{MPN/100ml}$$

Note: MPN value is taken from table 9221:V of the Standard Methods.

VOL 15 1173

R0061393

Total Coliform Membrane Filter Procedure

Reagents: LES Endo Agar in petri dishes

Quality Control:

Run a sterile control at the beginning and end of the analytical batch and a positive control after the last sample.

Procedure:

1. Assemble filtration apparatus according to manufacturer's instruction.
2. Filter 100 ml sample under partial vacuum.
3. Rinse filtration apparatus with filter still in place with three 20 ml partions of sterile dilution water.
4. Remove membrane filter with a sterile forcep and place it on LES Endo Agar-filled petri dishes with a rolling motion to prevent entrapment of air.
5. Incubate dish for 22 to 24 hr. at 35± 0.5°c.
6. Count colonies that have pink to dark-red color with a metallic green-gold surface sheen using low-powered dissecting microscope.
7. Confirm all sheen colonies counted or a minimum of five colonies from drinking water samples by transferring growth from each colony to parallel tubes of lauryl tryptose broth and brilliant green lactose bile (BGB) broth.
8. Incubate both tubes at 35± 0.5°c for 48 hr.
9. Formation of gas in the BGB tubes confirms the colony as coliform. If only the lauryl tryptose broth showed any gas production, then transfer to a second BGB tubes. This second BGB tube must produce gas at 35± 0.5°c with 48 hr. to verify the colony as coliform.

VOL 15 1174

R0061394

Calculation:

$$\frac{\text{(Total) Coliform Colonies}}{100\ \text{ml}} = \frac{\text{Coliform Colonies Counted X100}}{\text{ml sample filtered}}$$

95% Confidence Limits Using 100 ml Sample.

Number of Coliform Colonies Counted	95% Confidence Limits Lower	Upper
1	0.025	3.0
2	0.35	4.7
3	0.81	6.3
4	1.4	7.7
5	1.6	11.7
10	4.8	18.4

For counts, c, greater than 20 organism, the above limits maybe calculated by:

$$\text{Upper Limit} = c + [2(2 + \sqrt{c})]$$
$$\text{Lower Limit} = c - [2(1 + \sqrt{c})]$$

VOL 15
1175
R0061395

Effective Date: May 1991
Reference: Standard Method 909C

VOL 15

Fecal Coliform Membrane Filter Procedure

Reagents: M-FC Broth

Quality Control:

Run a Sterile control at the beginning and end of the analytical batch and a positive control after the last sample.

Procedure:

1. Preparation of culture dish: Place a sterile absorbent pad in each culture dish and pipet approximately 2 ml M-FC broth to saturate the pad. carefully remove any excess liquid from culture dish.

2. Assemble filtration apparatus according to manufacturer's instruction.

3. filter 100 ml sample under partial vacuum.

4. Rinse filtration apparatus with filter still in place with three 20 ml partions of sterile dilution water.

5. Remove membrane filter with sterile forcep and place it on prepared culture dish in a rolling motion to prevent entrapment of air.

6. Seal petri dishes, submerge in water bath, and incubate for 24± 2h at 44.5± 0.2°c. Anchor dishes below water surface to maintain critical temperature requirements. Make certain that the petri dishes are in the water bath within 30 minutes after filtration.

7. Count colonies in various shades of blue using low powered microscope. These are colonies produced by fecal coliform bacteria.

Calculation:

$$\text{(Total) Coliform Colonies/100 ml} = \frac{\text{Coliform Colonies Counted X100}}{\text{ml sample filtered}}$$

95% Confidence Limits: The same as for Total Coliform Membrane Filter Technique.

1176

R0061396

Effective Date: September 1991

14th Edition
Method 910A

Presumptive Test for Fecal Streptococcus Group

(Multiple-Tube Technique)

Reagents: Presumptive Phase Tubes with Azide Dextrose Broth

Quality Control:

1. Perform duplicate analyses on 10% of samples or at least one sample per test run.
2. Run Sterility Check and Positive Control with each batch of samples.

Procedure:

1. Pipet ten 10ml sample in a series of presumptive phase tubes: mix thoroughly.
2. Incubate tubes at 35 deg C ± 0.5 deg C.
3. After 24±2 hours, shake and examine tubes for turbidity then take the following steps:

Turbid	Step to Proceed
yes	Positive Test - continue to test fecal and non-fecal streptococcus.
no	Continue to step 4 below.

4. Continue incubating up to 48±3 hours then again re-examine for turbidity.

Turbid	Step to Proceed
yes	Positive Test - continue to test for fecal and non-fecal streptococcus.
no	Negative - procedure completed.

VOL 15

Confirmed Test for Fecal Streptococcus

Reagent: Petri dishes with Enterococcesel (BBL trade name)

Quality Control:

Run one each of positive and sterile controls with each batch.

Procedure:

1. Gently shake or rotate presumptive tube.
2. With a sterile 3mm metal loop, streak a portion of the growth from each positive presumptive tube (with azide dextrose broth) on a petri dish containing enteroccocosel agar.
3. Incubate the dish inverted at 35±0.5 deg C for 24±2 hours.
4. Brownish-black colonies with brown halos confirm the presence of fecal streptococcus.

Calculation: See Calculation: Estimation of Bacterial Density

1178

Confirmed Test for the Enterococcus Group

Reagent: Brain Heart Infusion Broth tubes containing 6.5% Sodium Chloride.

Procedures:

1. Transfer brownish-black colonies with brown halos to a tube of brain heart infusion broth containing 6.5% NaCl.
2. Incubate at 45 deg C for 24 hours.
3. Periodically check the tubes during incubation for growth.
4. Growth in 6.5% NaCl broth indicates that the colony belongs to the enterococcus group.

Calculation: See Calculation: Estimation of Bacterial Density

Membrane Filter Procedure for Fecal Streptococcus

Reagents: KF Streptococcus Agar

Quality Control:

Run a sterile control at the beginning and end of the analytical batch and a positive control after the last sample.

Procedure:

1. Assemble filtration apparatus according to manufacturer's instructions.
2. Filter 100ml of sample under partial vacuum.
3. Remove membrane filter with a sterile forcep and place it on directly to KF Streptococcus agar medium in petri dish with a rolling motion to prevent entrapment of air.
4. Invert culture plates and incubate at 35±0.5 deg C for 48 hours.
5. Count colonies that have dark red to pink color using a low power binocular, wide field dissecting microscope.

Calculation:

$$\frac{\text{Total Colonies}}{\text{100ml}} = \frac{\text{Colonies Counted X 100}}{\text{ml sample filtered}}$$

For 95% Confidence Limits using 100ml sample, check Standard Method 909A.6.
