Subject: Tentative Order No. R9-2013-0007 - Support

Dear Darren Bradford,

I am writing in support of the Transportation Corridor Agencies request (TCA) for a Waste Discharge Requirement permit, as described in Tentative Order No. R9-2013-0007.

The TCA s planned extension the SR-241 (the Tesoro Extension) is a much-needed transportation project that would enhance our local economy, public safety and quality of life. But it does so with incredible attention to natural resource protection and enhancement throughout and beyond its project area.

In fact, after reading about the TCA s measures to protect water quality, it is clear that they go well above what is required and would be an asset to the natural environment. Measures like the porous asphalt would help ensure that unavoidable pollutants, like brake dust and motor oil, are captured before reaching waterways. It is my understanding that this is an innovative solution that is not required of the TCA but is nevertheless being implemented to ensure the utmost care for our environment. This is in addition to other water quality mitigation measures including Extended Detention Basins (EDBs) and bioswales. The water runoff from this roadway extension will mimic pre-construction conditions in both flow and water quality.

The avoidance, restoration and creation of new wetland habitat is also a testament to the TCA s commitment to our natural surroundings. These wetlands will not only attract wildlife, but also serve as a natural source of water treatment to preserve local watersheds. Together with the planned water treatment facilities, the TCA s strategy to capture and treat runoff before reaching local watersheds is a critical element to their plan and will improve the health of our local ecosystems.

These measures closely align with the Water Board s mission to preserve, enhance and restore the quality of California s water resources, and ensure their proper allocation and efficient use for the benefit of present and future generations. Therefore, I urge you and your colleagues to support Tentative Order No. R9-2013-0007 and grant the TCA its Waste Discharge Requirement Permit at your hearing on March 13.

Sincerely,

Jim Leach

But it does so with incredible attention to natural resource protection and enhancement throughout and beyond its project area.

In fact, after reading about the TCA s measures to protect water quality, it is clear that they go well above what is required and would be an asset to the natural environment. Measures like the porous asphalt would help ensure that unavoidable pollutants, like brake dust and motor oil, are captured before reaching waterways. It is my understanding that this is an innovative solution that is not required of the TCA but is nevertheless being implemented to ensure the utmost care for our environment. This is in addition to other water quality mitigation measures including Extended Detention Basins (EDBs) and bioswales. The water runoff from this roadway extension will mimic pre-construction conditions in both flow and water quality.

The avoidance, restoration and creation of new wetland habitat is also a testament to the TCA s commitment to our natural surroundings. These wetlands will not only attract wildlife, but also serve as a natural source of water treatment to preserve local watersheds. Together with the planned water treatment facilities, the TCA s strategy to capture and treat runoff before reaching local watersheds is a critical element to their plan and will improve the health of our local ecosystems.

These measures closely align with the Water Board s mission to preserve, enhance and restore the quality of California s water resources, and ensure their proper allocation and efficient use for the benefit of present and future generations. Therefore, I urge you and your colleagues to support Tentative Order No. R9-2013-0007 and grant the TCA its Waste Discharge Requirement Permit at your hearing on March 13.

Sincerely,

Jody Vaughn
