

Historical amendments of the Water Quality Control Plan for the Central Coastal Basin (Basin Plan) from 1969 to 2015

Compiled by Steven G. Saiz, Environmental Scientist

July 14, 2017

Table of Contents

Summary Table – Central Coast Basin Plan Amendment History 1969 – 2015.

Appendix 1. Basin Plan amendment resolutions adopted by the Central Coast Water Board.

Appendix 2. Basin Plan amendments approved by the California State Water Resources Control Board.

Appendix 3. Basin Plan amendments approved by the United States Environmental Protection Agency.

Summary Table – Central Coast Basin Plan Amendment History 1969 - 2015

Central Coast Basin Plan Amendment History 1969 - 2015 (most recent first)

07/14/2017

RB3 Approval Date	RB3 Resolution No.	SB Approval Date	SB Resolution No.	OAL Approval Date	USEPA Approval Date	Name of Basin Plan Amendment	Section of BP Amended
07/30/15	2015-0004	04/05/16	2016-0018	07/12/16 §3929.14	10/06/16	Amending the Water Quality Control Plan for the Central Coastal Basin to Adopt Total Maximum Daily Loads for Nitrogen Compounds and Orthophosphate in streams of the Pajaro River Basin .	Ch.4- IX. T.
11/13/14	2014-0054	Not Req'd	Not Req'd	Not Req'd	Not Req'd	2014 Triennial Review of the Basin Plan	--
01/30/14	2014-0009	07/02/14	2014-0033	10/29/14 §3929.13	08/31/15	Amending the Water Quality Control Plan for the Central Coastal Basin to Adopt Total Maximum Daily Loads for Toxicity and Pesticides in the Santa Maria Watershed in Santa Barbara, San Luis Obispo, and Ventura Counties, California.	Ch.4- IX. R.

Blue = add to next BP edition. Green = 2016 Basin Plan. Yellow = 2011 Basin Plan.

Appendix 1. Basin Plan amendment resolutions adopted by the Central Coast Water Board

CENTRAL COAST REGIONAL WATER QUALITY CONTROL BOARD
895 Aerovista Place, Suite 101
San Luis Obispo, CA 93401-7906

RESOLUTION NO. R3-2015-0004

**AMENDING THE WATER QUALITY CONTROL PLAN FOR THE CENTRAL COASTAL
BASIN TO ADOPT TOTAL MAXIMUM DAILY LOADS FOR NITROGEN COMPOUNDS AND
ORTHOPHOSPHATE IN STREAMS OF THE PAJARO RIVER BASIN**

The Central Coast Regional Water Quality Control Board (Central Coast Water Board) finds:

1. The Central Coast Water Board adopted the Water Quality Control Plan for the Central Coastal Basin (Basin Plan) on March 14, 1975. The Basin Plan designates beneficial uses and water quality objectives, implementation programs for achieving water quality objectives addressing point source and nonpoint source discharges, prohibitions, and incorporates statewide plans and policies. The Basin Plan is periodically reviewed and revised. The Central Coast Water Board has determined that the Basin Plan requires further revision and amendment.
2. The Central Coast Water Board periodically revises and amends the Basin Plan. The Central Coast Water Board has determined the Basin Plan requires further revision and amendment to incorporate Total Maximum Daily Loads (TMDLs) and an implementation plan for nitrogen compounds (nitrate and un-ionized ammonia) and orthophosphate for streams in the Pajaro River basin, which includes the waterbodies Pajaro River, Llagas Creek, San Juan Creek, Furlong Creek, Watsonville Slough, and other tributary surface waterbodies as identified in Table IX T-1 of the attached Basin Plan amendment.
3. Pursuant to California Water Code section 106.3(a), it is the policy of the State of California that every human being has a right to safe, clean, affordable, and accessible water adequate for human consumption. California Water Code section 106.3(b) requires the Central Coast Water Board to consider how state actions impact the human right to water and creates a state policy that directs the Central Coast Water Board and other state agencies to explicitly consider the human right to water when revising, adopting, or establishing policies, regulations, and grant criteria when those policies, regulations, and grant criteria affect the human right to safe, clean, affordable, and accessible water adequate for human consumption, cooking, and sanitary purposes. This order promotes that policy by establishing nitrate total maximum daily loads for streams in the Pajaro River basin which are designated for protection of human health including municipal and domestic water supply.
4. The geographic scope of these TMDLs encompasses approximately 1,300 square miles of the Pajaro River basin, including parts of Santa Clara, Santa Cruz, San Benito, and Monterey counties. The river basin includes the Pajaro and San Benito rivers, Watsonville Slough, Corralitos, Llagas, Pacheco, San Juan, and Uvas creeks, and all associated tributaries. Agriculture (including irrigated cropland and grazing lands) is the current dominant land use in the Pajaro River basin, with increasing transition to urban use. Urbanized areas account for approximately four percent of the Pajaro River basin's land use. Grassland, chaparral, and oak woodland make up substantial parts of the upland reaches of the watershed.
5. Multiple waterbodies within the Pajaro River basin are listed on California's Clean Water Act Section 303(d) list for water quality impairments due to nitrate, un-ionized ammonia, nutrients,

low dissolved oxygen, and chlorophyll *a* (an algal biomass indicator). Due to the Clean Water Act 303(d) listings, the Central Coast Water Board is required to adopt a TMDL and an associated implementation plan (40 CFR [Code of Federal Regulations] 130.6(c)(1) and 130.7; California Water Code section 13242).

6. Available data indicate: (1) stream water quality violations of the Basin Plan's drinking water standard for nitrate; (2) stream water quality violations of the Basin Plan's un-ionized ammonia general toxicity objective for inland surface waters; and (3) stream water quality violations of the Basin Plan's narrative general objective for biostimulatory substances in inland surface waters and estuaries. In addition, some stream reaches are not meeting non-regulatory recommended guidelines for nitrate in agricultural supply water (AGR) for sensitive crop types, indicating that potential or future designated agricultural supply beneficial uses in these surface waters may be impacted detrimentally.
7. Available data indicate that discharges of nutrients (specifically, nitrogen compounds and orthophosphate) are occurring at levels in surface waters which are impairing a wide range of beneficial uses, including impairments of municipal and domestic drinking water supply beneficial uses, impairments of aquatic habitat beneficial uses, impairments of groundwater recharge beneficial uses, and degradation locally of designated agricultural water supply beneficial uses (irrigation supply for sensitive crops).
8. The Central Coast Water Board's goal for establishing TMDLs in the Pajaro River basin is to rectify the impairment due to un-ionized ammonia, nitrate, and orthophosphate, thereby providing support for the designated beneficial uses of municipal and domestic water supply (MUN), cold and warm fresh water habitat (COLD and WARM), groundwater recharge (GWR), agricultural water supply (AGR), and to support water quality standards attainment with regard to the Basin Plan's general toxicity water quality objective for un-ionized ammonia, and the Basin Plan's water quality objective for biostimulatory substances.
9. The Central Coast Water Board proposes to amend the Basin Plan by inserting amendments into Chapter Four, Section IX (Total Maximum Daily Loads).
10. On May 20, 2004, the State Water Resources Control Board (State Water Board) adopted the Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program (NPS Policy). These TMDLs are consistent with the NPS policy. The NPS Policy requires the Regional Water Quality Control Boards to regulate all nonpoint sources of pollution using the administrative permitting authorities provided by the Porter-Cologne Water Quality Control Act (Porter-Cologne Act, Water Code Division 7). Consistent with the NPS Policy and the Porter-Cologne Act, Regional Water Quality Control Boards regulate nonpoint source discharges with waste discharge requirements, waivers of waste discharge requirements, and/or Basin Plan prohibitions.
11. On May 20, 2004, the State Water Board adopted the Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List (State Water Board Resolution No. 2004-0063), hereafter referred to as the California 303(d) Listing Policy. These TMDLs are consistent with the California 303(d) Listing Policy. The California 303(d) Listing Policy describes the process by which the State Water Board and the Regional Water Quality Control Boards will comply with the listing requirements of the federal Clean Water Act (CWA). The objective of the California 303(d) Listing Policy is to establish a standardized approach for developing California's CWA section 303(d) list and to provide guidance for interpreting data and information to make decisions regarding water quality standards attainment.

12. On June 16, 2005, the State Water Board adopted the Water Quality Control Policy for Addressing Impaired Waters: Regulatory Structure and Options (State Water Board Resolution 2005-0050), hereafter referred to as the Impaired Waters Policy. These TMDLs are consistent with the Impaired Water Policy. The Impaired Waters Policy provides policy and procedures for adopting TMDLs and addressing impaired waters in California. The Impaired Waters Policy states that the Regional Water Quality Control Boards have independent discretion, broad flexibility, numerous options, and some legal constraints that apply when determining how to address impaired waters.
13. The Pajaro River, Carnadero Creek, Furlong Creek, Llagas Creek (below Chesbro Reservoir), San Juan Creek (San Benito County), Beach Road Ditch, and McGowan Ditch are listed on California's 2008-2010 Clean Water Act 303(d) list as impaired due to nitrate. These waterbodies are currently not supporting the municipal and domestic drinking water supply (MUN) beneficial use designated by the Basin Plan.
14. The Pajaro River Estuary and Llagas Creek are not listed on California's 2008-2010 Clean Water Act 303(d) list for un-ionized ammonia impairments, however, newer data indicate these waterbodies are impaired by un-ionized ammonia on the basis of non-attainment of the Basin Plan water quality objective for un-ionized ammonia and on the basis of the listing criteria and methodologies identified in the California 303(d) Listing Policy.
15. The Pajaro River and Llagas Creek (below Chesbro Reservoir) are listed on California's 2008-2010 Clean Water Act 303(d) list as impaired due to nutrients on the basis of non-attainment of the Basin Plan's biostimulatory substances water quality objective. In addition, although not listed on California's 2008-2010 Clean Water Act 303(d) list for nutrients causing biostimulation, available data indicate the following waterbodies are in violation of the Basin Plan's biostimulatory substances objective: Beach Road Ditch, Carnadero Creek, Corralitos Creek, Furlong Creek, Harkins Slough, Llagas Creek, Pajaro River, San Juan Creek, Struve Slough, Tequisquita Slough, Watsonville Slough.
16. A reach of Llagas Creek upstream of Luchessa Avenue at Southside Drive and downstream of Holsclaw Road below Leavesly Road does not meet non-regulatory recommended guidelines for nitrate in agricultural supply water for sensitive crop types, indicating that potential or future designated agricultural supply beneficial uses may be detrimentally impacted.
17. The Pajaro River and Llagas Creek are listed on California's 2008-2010 Clean Water Act 303(d) list as impaired due to nitrate on the basis of non-attainment of the Basin Plan's water quality objective for municipal and domestic drinking water supply (MUN); these waterbodies are also not supporting their designated groundwater recharge (GWR) beneficial use based on the Basin Plan's drinking water objective and specific lines of evidence consistent with the California 303(d) Listing Policy. The stream reaches that do not support designated GWR beneficial uses are: Pajaro River upstream of Watsonville and downstream of Chittenden Gap at Chittenden Road, and lower Llagas Creek upstream of Southside Drive and downstream of Leavesly Road.
18. Low dissolved oxygen is a nutrient-response indicator and represents a primary biological response to excessive nutrient loading in waterbodies which exhibit biostimulatory conditions. The Pajaro River, Carnadero, Llagas, Pacheco, and San Juan creeks, Millers Canal, Beach Road Ditch, and Harkins, Tequisquita, and Watsonville sloughs are on the 2008-2010 Clean Water Act 303(d) list of impaired waters for low dissolved oxygen impairment and are expressing biostimulatory conditions. Reductions in nutrient loading described in the staff report are anticipated to be beneficial in attainment of water quality standards for dissolved

oxygen and restoring the waterbodies to a desired condition. Nutrient concentrations by themselves constitute indirect indicators of biostimulatory conditions and there is an interrelationship between high nutrient loads, excessive algal growth, and the subsequent impacts of excessive algae on dissolved oxygen and aquatic habitat. Further, numeric targets identified for dissolved oxygen in the TMDL report will be used as indicator metrics to assess primary biological response to future nutrient water column concentration reductions and compliance with the Basin Plan's biostimulatory substances objective.

19. Chlorophyll *a* is a nutrient-response indicator and represents a primary biological response to excessive nutrient loading in waterbodies which exhibit biostimulatory conditions. Harkins Slough and Millers Canal are on the 2008-2010 Clean Water Act 303(d) list of impaired waters for chlorophyll *a* impairment and are expressing biostimulatory conditions. Reductions in nutrient loading described in the staff report are anticipated to be beneficial in attainment of water quality standards for chlorophyll *a* and restoring the waterbodies to a desired condition. Further, numeric targets identified for chlorophyll *a* in the TMDL report will be used as an indicator metric to assess primary biological response to future nutrient water column concentration reductions and compliance with the Basin Plan's biostimulatory substances objective.
20. The U.S. Environmental Protection Agency's (USEPA) published TMDL guidance (Guidance for Water Quality-Based Decisions: The TMDL Process – Chapter 1, Policies and Principles, USEPA 404/4-91-001, April 1991) explicitly states that implementation of TMDLs and water quality-based controls should not be delayed due to lack of information and uncertainties about pollution problems, particularly with respect to nonpoint sources. More information about the spatial extent and nature of water quality impairments can be collected during TMDL implementation. At this time, there is sufficient information to develop and implement total maximum daily loads for nitrogen compounds and orthophosphate in streams of the Pajaro River basin.
21. The elements of a TMDL are described in 40 CFR 130.2 and 130.7, section 303(d) of the Clean Water Act, and USEPA guidance documents. A TMDL is defined as "the sum of individual waste load allocations for point sources and load allocations for nonpoint sources and natural background" (40 CFR 130.2). The Central Coast Water Board has determined that the TMDLs for un-ionized ammonia, nitrate, and orthophosphate in streams of the Pajaro River Basin are set at levels necessary to attain and maintain the applicable numeric water quality objectives, taking into account seasonal variations and any lack of knowledge concerning the relationship between effluent limitations and water quality consistent with 40 CFR 130.7 (c) (1). The regulations in 40 CFR 130.7 also state that TMDLs shall take into account critical conditions for stream flow, loading, and water quality parameters. TMDLs are often expressed as a mass load of the pollutant but can be expressed as a unit of concentration if appropriate (40 CFR 130.2(i)). Expressing these TMDLs as units of concentration is appropriate because an existing concentration-based water quality objective is used as the basis for the TMDL numeric target and attaining that concentration-based water quality objective will result in protection of the beneficial uses.
22. Upon establishment of TMDLs by the state or USEPA, the State is required to incorporate the TMDLs, along with appropriate implementation measures, into the State Water Quality Management Plan (40 CFR 130.6(c)(1) and 130.7 and California Water Code sections 13050(j) and 13242). The Basin Plan and applicable statewide plans serve as the State Water Quality Management Plan governing the watersheds under the jurisdiction of the Central Coast Water Board.

23. The TMDLs and Implementation Program are based on sound scientific knowledge, methods, and practices in accordance with Health and Safety Code section 57004. Health and Safety Code section 57004 requires external scientific peer review for certain water quality control policies. Scientific portions of these TMDLs are drawn exclusively from the Total Maximum Daily Loads for Nitrogen Compounds and Orthophosphate in the lower Salinas River and Reclamation Canal Basin, and the Moro Cojo Slough Subwatershed (Resolution No. R3-2013-0008), which received independent scientific peer review in the spring of 2012. As a result, the scientific methodologies used in development of these TMDLs have already undergone external, scientific peer review. As a result, the Central Coast Water Board has fulfilled the requirements of Health and Safety Code section 57004, and the proposed amendment does not require further peer review.
24. Central Coast Water Board staff will conduct a review of implementation activities when monitoring and reporting data are submitted as required by the 2012 Conditional Waiver of Waste Discharge Requirements for Irrigated Lands (Agricultural Order) and existing or future NPDES storm water permits, or when other monitoring data and/or reporting data are submitted outside the requirements of existing permits and orders. Central Coast Water Board staff will pursue modification of Agricultural Order conditions, NPDES storm water permit conditions, or other regulatory means, as necessary, to address remaining impairments resulting from nitrogen compounds or orthophosphate during the TMDL implementation phase.
25. Central Coast Water Board staff implemented a process to inform interested persons about the TMDLs. Central Coast Water Board staff's efforts to inform the public and solicit comment included public meetings with interested persons and a public notice and written comment period. Public notice of the proposed Basin Plan amendment provided the public a 45-day public comment period preceding the Central Coast Water Board hearing. Notice of public hearing was given by advertising in a newspaper of general circulation within the Region and by emailing a copy of the notice to all persons requesting such notice and applicable government agencies. Relevant documents and notices were also made available on the Central Coast Water Board website. Central Coast Water Board staff responded to oral and written comments received from the public. All public comments were considered.
26. Adoption of these TMDLs and Basin Plan amendment will not result in any degradation of water quality; in fact, they are designed to improve water quality. As such, these TMDLs and Basin Plan amendment comply with all requirements of both State and federal anti-degradation requirements (State Board Resolution 68-16, "Statement of Policy with Respect to Maintaining High Quality of Waters in California" and 40 CFR 131.12).
27. The Central Coast Water Board recognizes that certain limited resource farmers (as defined by the U.S. Department of Agriculture) may have difficulty achieving compliance with these TMDLs. The Central Coast Water Board will prioritize assistance for these farmers, including, but not limited to, technical assistance, grant opportunities, and necessary flexibility to achieve compliance (e.g., adjusted monitoring, reporting, or time schedules).
28. Pursuant to Public Resources Code section 21080.5, the Resources Agency has approved the Regional Water Boards' basin planning process as a "certified regulatory program" that adequately satisfies the California Environmental Quality Act (CEQA) (Public Resources Code, Section 21000 et seq.) requirements for preparing environmental documents (14 Cal. Code Regs. §15251(g); 23 Cal. Code Regs. § 3782). Central Coast Water Board staff has prepared "substitute environmental documents" for this project that contain the required environmental documentation as set forth in the State Water Board's CEQA regulations (23 Cal. Code Regs. § 3777). The substitute environmental documents include the TMDL staff

report and several of its attachments, including: (1) this Resolution and the Basin Plan amendment Language (Attachment 1 of the staff report); (2) *Total Maximum Daily Loads Report for Nitrogen Compounds and Orthophosphate in Streams of the Pajaro River Basin, Santa Cruz, Santa Clara, San Benito, and Monterey counties, California* (Attachment 2 of the staff report); (3) the CEQA Substitute Document with environmental checklist (Attachment 3 of the staff report); and (4) the comments and responses to comments (Attachment 5 of the staff report). The staff report also includes the Notice of Public Hearing/Notice of Filing (Attachment 4 of the staff report). The project itself is the establishment of TMDLs for nitrogen compounds and orthophosphate in streams of the Pajaro River basin. The Central Coast Water Board exercises discretion in assigning waste load allocations and load allocations, determining the program of implementation, and setting various milestones in achieving the water quality standards. The CEQA checklist and other portions of the substitute environmental documents contain significant analysis and numerous findings related to impacts and mitigation measures.

29. A CEQA scoping meeting was conducted on December 17, 2013, in the City of Watsonville; a notice of the CEQA scoping meeting was sent to interested persons prior to the scoping meeting on November 21, 2013. The notice included the background of the project, the project purpose, a meeting schedule, and directions for obtaining more detailed information through the Central Coast Water Board website; the notice and project summary were available on the website or by requesting hard copies via telephone.
30. Public Resources Code section 21159 provides that an agency shall perform, at the time of the adoption of a rule or regulation requiring the installation of pollution control equipment or a performance standard or treatment requirement, an environmental analysis of the reasonably foreseeable methods of compliance, and an analysis of the reasonably foreseeable environmental impacts of the methods of compliance, an analysis of reasonably foreseeable mitigation measures to lessen the adverse environmental impacts, and an analysis of reasonably foreseeable alternative means of compliance with the rule or regulation that would have less significant adverse impacts. Section 21159(c) requires that the environmental analysis take into account a reasonable range of environmental, economic, and technical factors; population and geographic areas; and specific sites. The staff report prepared for this Basin Plan amendment, in particular the CEQA Substitute Document Report (Attachment 3), provides the environmental analysis required by Public Resources Code section 21159 and is hereby incorporated as findings in this Resolution.
31. In preparing the substitute environmental documents, the Central Coast Water Board has considered the requirements of Public Resources Code section 21159 and California Code of Regulations, title 14, section 15187, and intends those documents to serve as a Tier 1 environmental review. This analysis is not intended to be an exhaustive analysis of every conceivable impact, but an analysis of the reasonably foreseeable consequences of the adoption of this regulation, from a programmatic perspective. Compliance obligations will be undertaken directly by public agencies that may have their own obligations under CEQA. Project level impacts may need to be considered in any subsequent environmental analysis performed by other public agencies, pursuant to Public Resources Code section 21159.2. To the extent applicable, this Tier 1 substitute environmental document may be used to satisfy subsequent CEQA obligations of those agencies.
32. Consistent with the Water Board's substantive obligations under CEQA, the substitute environmental documents do not engage in speculation or conjecture, and only consider the reasonably foreseeable environmental impacts, including those relating to the methods of compliance, reasonably foreseeable feasible mitigation measures to reduce those impacts,

and the reasonably foreseeable alternative means of compliance, that would avoid or reduce the identified impacts.

33. The staff report, the draft Basin Plan amendment, and the Environmental Checklist and associated analysis provide the necessary information pursuant to state law to conclude that the proposed TMDLs, Implementation Plan, and the associated reasonably foreseeable methods of compliance will not have a significant adverse effect on the environment with the exception of potentially significant impacts associated with Biological Resources CEQA Checklist Category IV(a), potentially significant impacts to habitat of fish or wildlife species associated with Mandatory Findings of Significance CEQA Checklist Category XVIII.(a), and potential adverse impacts resulting from construction noise associated with TMDL implementation activities CEQA Checklist Category XIII. This determination is based on best available information in an effort to fully inform the interested public and the decision makers of potential environmental impacts. "Significant effects" on the environment are defined as "a substantial, or potentially substantial, adverse change within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance" (14 Cal. Code Regs. § 1538). Wide-scale water conservation measures and changing water management practices potentially could result in lower flows to surface waters resulting in potentially substantial adverse changes to aquatic habitat. Reduction in polluted runoff may offset potentially substantial adverse impacts resulting from potential reduced flows. In addition, reduction in tailwater discharge could result in increased groundwater levels that would result in more baseflow to surface waterbodies. Further, maintaining surface flows and circulation may in fact be part of a viable strategy to reduce biostimulatory impacts, since biostimulatory impacts are only partly attributable to elevated nutrients; biostimulatory impacts may be mitigated by increased flow, aeration, and shading of the waterbody. Potential mitigation measures to prevent reduced flows or to reduce the impact of reduced flows include phasing in management practices that could result in reduced flows; and use of riparian buffers and other vegetated treatment systems that will effectively treat the water to remove pollutants, but not necessarily reduce flows. Given the uncertainty associated with evaluating the available information, it is possible that any potentially substantial adverse changes on aquatic habitat associated with the Basin Plan amendment will be less than significant. When the entities and responsible parties responsible for implementing these TMDLs determine how they will proceed, the agencies responsible for those parts of the project can and should incorporate such alternatives and mitigation into any subsequent projects or project approvals. Feasible alternatives and mitigation measures are described in more detail in the substitute environmental documents (14 Cal. Code Regs. § 15091(a)(2)). Legal considerations may make some of the mitigation measures that could be implemented infeasible.
34. Pursuant to CEQA Guidelines section 15093, the Central Coast Water Board hereby finds that the project's benefits override and outweigh its potential significant adverse impacts, for the reasons more fully set forth in the staff report and attachments thereto. Specific environmental benefits justify the adoption of these TMDLs despite the project's potential significant adverse short-term environmental impacts. The Central Coast Water Board has the authority and responsibility to regulate discharges of waste associated with the sources of pollution causing impairment to water quality. Many of those discharges have caused significant widespread degradation and/or pollution of waters of the state as described in the *Total Maximum Daily Loads Report for Nitrogen Compounds and Orthophosphate in Streams of the Pajaro River Basin, Santa Cruz, Santa Clara, San Benito, and Monterey counties, California* and associated reference materials. These TMDLs would result in actions to restore the quality of the waters of the state and protect the beneficial uses, including aquatic habitat. While some impacts could occur due to reduced flows, earth-moving, or from implementing other actions to comply with the TMDLs, the benefits, which include contributing

to the present and future restoration of beneficial water uses, and reducing or eliminating pollution, nuisance and contamination, warrant approval of the TMDLs, despite each and every unavoidable impact.

35. From a program-level perspective, incorporation of the alternatives and mitigation measures outlined in the substitute environmental documents will reduce potential impacts to no impact, or keep the impact at less-than-significant levels.
36. The CEQA Substitute Document Report (staff report Attachment 3) identifies mitigation approaches that should be considered at the project level.
37. The Central Coast Water Board will request that the State Water Board approve the Basin Plan amendments incorporating TMDLs for nitrogen compounds and orthophosphate in streams of the Pajaro River basin. The TMDLs and Implementation Program for the TMDLs will become effective upon approval by the California Office of Administrative Law. The TMDLs must also be approved by USEPA.
38. The Basin Plan amendment may have an effect on fish and wildlife. The Central Coast Water Board will, therefore, forward fee payments to the Department of Fish and Wildlife under the California Fish and Game Code section 711.4.
39. The proposed Basin Plan amendment meet the "Necessity" standard of the Administrative Procedures Act, Government Code, section 11353, subdivision (b). As specified in Finding 22, federal regulations require that TMDLs be incorporated into the Water Quality Management Plan. The Central Coast Water Board's Basin Plan is the Central Coast Water Board's component of the Water Quality Management Plan, and the Basin Plan is how the Central Coast Water Board takes quasi-legislative planning actions. Moreover, these TMDLs are a program of implementation for existing water quality objectives, and is, therefore, appropriately a component of the Basin Plan under the California Water Code, section 13242. The necessity of developing TMDLs is established in the TMDL staff report, the Clean Water Act section 303(d) list, and the data contained in the administrative record documenting the nitrogen compounds and orthophosphate impairments in streams of the Pajaro River basin.
40. Consistent with Water Code section 13141, the Basin Plan amendment includes an estimate of the total cost of implementation of the agricultural related portions of these TMDLs and identifies potential sources of financing.
41. On July 30, 2015, in San Luis Obispo, California, the Central Coast Water Board held a public hearing and heard and considered all public comments and evidence in the record.

THEREFORE, be it resolved that:

1. Pursuant to sections 13240, 13242, 13243, and 13244 of the California Water Code, the Central Coast Water Board, after considering the entire record, including oral testimony at the hearing, hereby adopts the Basin Plan amendment in Attachment A. to Resolution No. R3-2015-0004.
2. The Central Coast Water Board Executive Officer is directed to forward copies of the Basin Plan amendment to the State Water Board in accordance with the requirements of section 13245 of the California Water Code.
3. The Central Coast Water Board requests that the State Water Board approve the Basin Plan amendment in accordance with the requirements of sections 13245 and 13246 of the

California Water Code and forward them to the California Office of Administrative Law and the USEPA for approval.

4. The Executive Officer is authorized to sign a Certificate of Fee Exemption or transmit payment of the applicable fee as may be required to the Resources Agency.
5. If, during the approval process, Central Coast Water Board staff, State Water Board staff, the State Water Board, or the California Office of Administrative Law determines that minor, non-substantive corrections to the language of the Basin Plan amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.
6. The environmental documents prepared by the Central Coast Water Board staff pursuant to Public Resources Code 21080.5 are hereby certified.

I, Kenneth A. Harris Jr., Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of a resolution adopted by the Central Coast Regional Water Quality Control Board on July 30, 2015.

Kenneth A. Harris Jr.
Executive Officer

Attachment: Attachment A to Resolution No. R3-2015-0004: Amendment to the Water Quality Control Plan for the Central Coastal Basin to Incorporate Total Maximum Daily Loads for Nitrogen Compounds and Orthophosphate in Streams of the Pajaro River Basin

**CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, CA 93401-7906**

RESOLUTION NO. R3-2014-0009

**AMENDING THE WATER QUALITY CONTROL PLAN FOR THE CENTRAL COASTAL
BASIN TO ADOPT TOTAL MAXIMUM DAILY LOADS FOR TOXICITY AND PESTICIDES IN
THE SANTA MARIA WATERSHED IN SANTA BARBARA, SAN LUIS OBISPO, AND
VENTURA COUNTIES, CALIFORNIA**

The Regional Water Quality Control Board, Central Coast Region (Central Coast Water Board) finds:

1. The Central Coast Water Board adopted the second edition of the *Water Quality Control Plan for the Central Coastal Basin* (Basin Plan), on September 8, 1994. The Basin Plan designates beneficial uses and water quality objectives, sets forth implementation plans to achieve water quality objectives addressing point source and nonpoint source discharges, establishes prohibitions, and incorporates statewide plans and policies.
2. The Central Coast Water Board periodically revises and amends the Basin Plan. The Central Coast Water Board has determined the Basin Plan requires further revision and amendment to incorporate Total Maximum Daily Loads (TMDLs) and an implementation plan for toxicity and pesticides in the Santa Maria watershed in Santa Barbara, San Luis Obispo and Ventura counties.
3. The geographic scope of this TMDL encompasses the Santa Maria River watershed, which corresponds to Santa Maria Hydrologic Unit 312 in the Basin Plan and is composed of the Cuyama, Sisquoc, and Guadalupe hydrologic areas. The impairments addressed in the TMDL are within the Guadalupe Hydrologic Area (312.10), which is referred to as the Santa Maria valley. The Santa Maria valley is transected by the Santa Maria River, which receives flow from the Cuyama River upstream to the northeast, with flows regulated by the Twitchell Dam. The Santa Maria River also receives flow from the Sisquoc River to the southeast and various smaller tributaries in the lower watershed before discharging through the Santa Maria River Estuary and into the Pacific Ocean. Oso Flaco Lake is a separate, small subwatershed in the northwest corner of the Santa Maria valley with flows originating from Oso Flaco Creek and Little Oso Flaco Creek.
4. Multiple waterbodies within the Santa Maria River watershed are listed on the Clean Water Act section 303(d) list for water quality impairments due to unknown toxicity, sediment toxicity, and the presence of the pesticides chlorpyrifos, diazinon, DDTs, dieldrin, and toxaphene. Additionally, multiple impairments not identified on the current Clean Water Act section 303(d) list were identified during development of the TMDL; the additional impairments are due to the presence of pyrethroid pesticides, chlorpyrifos, diazinon, malathion, chlordane, and DDT. Current Clean Water Act section 303(d) listings and the additional impairments, all of which are addressed in the TMDL, are summarized in the table below. Due to the Clean Water Act section 303(d) listings, the Central Coast Water Board is required to adopt TMDLs and an associated implementation plan (40 CFR 130.6(c)(1), 130.7, California Water Code section 13242).

Waterbody	Clean Water Act Section 303(d) Listed Pollutant	Additional Impairments ²
Blosser Channel	Unknown Toxicity	Chlorpyrifos, Diazinon, pyrethroids, DDT
Bradley Canyon Creek	Unknown Toxicity	--
Bradley Channel	Chlorpyrifos, Sediment Toxicity, Unknown Toxicity	Diazinon, Pyrethroids, DDT
Greene Valley Creek	Chlorpyrifos, Unknown Toxicity	--
Little Oso Flaco Creek	Sediment Toxicity, Unknown Toxicity	--
Main Street Canal	Chlorpyrifos, Diazinon Unknown Toxicity	Pyrethroids, DDT
Orcutt Creek	Chlorpyrifos, DDT, Diazinon, Dieldrin, Sediment Toxicity, Unknown Toxicity	Pyrethroids
Oso Flaco Creek	Sediment Toxicity, Unknown Toxicity	Malathion, DDT
Oso Flaco Lake	Dieldrin	Chlordane, DDT
Santa Maria River	Chlorpyrifos, DDT, Dieldrin, Endrin, Sediment Toxicity, Toxaphene, Unknown Toxicity	Diazinon, Pyrethroids

¹ State Water Resource Control Board Waterbody ID

² Additional impairments are exceedances of water quality objectives in waterbodies identified during TMDL development and subsequent to the current 303(d) list.

5. Waters described as additional impairments in Finding 4 are impaired due to the pollutants described in Finding 4. However, the additional impairments are not waters listed as impaired on the Clean Water Act section 303(d) list until established as such as described in the *Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List* (State Water Board Resolution No. 2004-0063).
6. The Central Coast Water Board's goal for establishing TMDLs as described in the Basin Plan is to protect and restore beneficial uses of surface waters, which rely on established water quality objectives. There are two general narrative water quality objectives that pertain to the pesticide TMDL. One is the general objective for toxicity and the other is the general objective for pesticides. They are described as follows:

General Objective for Toxicity: All waters shall be maintained free of toxic substances in concentrations which are toxic to, or which produce detrimental physiological responses in, human, plant, animal, or aquatic life. Compliance with the objective will be determined by use of indicator organisms, analyses of species diversity, population density, growth anomalies, toxicity bioassays of appropriate duration, or other appropriate methods.

General Objective for Pesticides: No individual pesticide or combination of pesticides shall reach concentrations that adversely affect beneficial uses. There shall be no increase in pesticide concentrations found in bottom sediments or aquatic life.
7. The Central Coast Water Board proposes to amend Chapter Four, section IX (Total Maximum Daily Loads) of the Basin Plan.
8. On May 20, 2004, the State Water Resources Control Board (State Water Board) adopted the *Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program* (NPS Policy). The NPS Policy requires the regional water quality control boards to regulate all nonpoint sources of pollution using the administrative permitting authorities provided by the Porter-Cologne Water Quality Control Act (Porter-Cologne Act, Water Code Div. 7). Consistent

with the NPS Policy and the Porter-Cologne Act, regional water quality control boards regulate nonpoint source discharges with waste discharge requirements, waivers of waste discharge requirements, and/or Basin Plan prohibitions.

9. On May 20, 2004, the State Water Board adopted the *Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List* (State Water Board Resolution No. 2004-0063), hereafter referred to as the *California 303(d) Listing Policy*. The *California 303(d) Listing Policy* describes the process by which the State Water Board and the regional water quality control boards will comply with the listing requirements of the federal Clean Water Act (CWA). The objective of the *California 303(d) Listing Policy* is to establish a standardized approach for developing California's CWA section 303(d) list and to provide guidance for interpreting data and information to make decisions regarding water quality standards attainment.
10. On June 16, 2005, the State Water Board adopted the *Water Quality Control Policy for Addressing Impaired Waters: Regulatory Structure and Options* (State Water Board Resolution 2005-0050), hereafter referred to as the *Impaired Waters Policy*. The *Impaired Waters Policy* provides policy and procedures for adopting Total Maximum Daily Loads and addressing impaired waters in California. The *Impaired Waters Policy* states that the regional water quality control boards have independent discretion, broad flexibility, numerous options, and some legal constraints that apply when determining how to address impaired waters.
11. The U.S. Environmental Protection Agency's (USEPA) published TMDL guidance (*Guidance for Water Quality-Based Decisions: The TMDL Process – Chapter 1, Policies and Principles*, USEPA 404/4-91-001, April 1991) explicitly states that implementation of TMDLs and water quality-based controls should not be delayed because of lack of information and uncertainties about pollution problems, particularly with respect to nonpoint sources. More information about the spatial extent and nature of water quality impairments can be collected during TMDL implementation.
12. The elements of a TMDL are described in 40 CFR 130.2 and 130.7, section 303(d) of the Clean Water Act, and USEPA guidance documents. A TMDL is defined as “the sum of individual waste load allocations for point sources and load allocations for nonpoint sources and natural background” (40 CFR 130.2). The Central Coast Water Board has determined that the TMDLs for unknown toxicity; sediment toxicity; the pesticides chlorpyrifos, diazinon, DDTs, dieldrin, and toxaphene; and pyrethroid pesticides in the Santa Maria watershed are set at levels necessary to attain and maintain the applicable narrative water quality objectives, taking into account seasonal variations and any lack of knowledge concerning the relationship between effluent limitations and water quality (40 CFR 130.7 (c) (1)). The regulations in 40 CFR 130.7 also state that TMDLs shall take into account critical conditions for stream flow, loading, and water quality parameters. TMDLs are often expressed as a mass load of the pollutant but can be expressed as a unit of concentration or toxicity, if appropriate (40 CFR 130.2(i)).
13. Upon establishment of TMDLs by the State or USEPA, the State is required to incorporate the TMDLs, along with appropriate implementation measures, into the state water quality management plan (40 CFR 130.6(c)(1) and 130.7 and California Water Code sections 13050(j) and 13242). The Basin Plan and applicable statewide plans serve as the state water quality management plan governing the watersheds under the jurisdiction of the Central Coast Water Board.
14. The TMDLs are based on sound scientific knowledge, methods, and practices. Health and Safety Code section 57004 requires external scientific peer review for certain water quality control policies. Central Coast Water Board staff submitted the Final Project Report for the

TMDLs to three external scientific reviewers in September 2012. Water Board staff received comments from the reviewers. Central Coast Water Board staff either modified the Final Project Report in accordance with the comments, provided a written response that explained the basis for not incorporating the comments, or made no modifications because the commenter suggested none was needed.

15. Central Coast Water Board staff will conduct a review of implementation activities when monitoring and reporting data are submitted as required by the Agricultural Order and existing or future NPDES storm water permits, or when other monitoring data and/or reporting data are submitted outside the requirements of existing permits and orders. Central Coast Water Board staff will pursue modification of Agricultural Order conditions, NPDES storm water permit conditions, or other regulatory means, as necessary, to address remaining impairments resulting from pesticides during the TMDL implementation phase.
16. The Central Coast Water Board implemented a process to inform interested persons about the TMDLs. Central Coast Water Board efforts to inform the public and solicit comment included public meetings with interested persons and a public notice and a written comment period. Public notice of the proposed Basin Plan amendment provided the public a 60-day public comment period preceding the Central Coast Water Board hearing. Notice of public hearing was given by advertising in newspapers of general circulation within the Region and by emailing a copy of the notice to all persons requesting such notice and applicable government agencies. Relevant documents and notices were also made available on the Central Coast Water Board website. The Central Coast Water Board responded to oral and written comments received from the public. All public comments were considered.
17. Adoption of these TMDLs and Basin Plan amendments will not result in any degradation of water quality; in fact, they are designed to improve water quality. As such, these TMDLs and Basin Plan amendments comply with all State and federal anti-degradation requirements (State Board Resolution 68-16, "Statement of Policy with Respect to Maintaining High Quality of Waters in California" and 40CFR 131.12).
18. Pursuant to Public Resources Code section 21080.5, the Resources Agency has approved the Regional Water Boards' basin planning process as a "certified regulatory program" that adequately satisfies the California Environmental Quality Act (CEQA) (Public Resources Code, Section 21000 et seq.) requirements for preparing environmental documents (14 Cal. Code Regs. §15251(g); 23 Cal. Code Regs. § 3782.). Central Coast Water Board staff has prepared "substitute environmental documents" for this project that contain the required environmental documentation as set forth in the State Water Board's CEQA regulations (23 Cal. Code Regs. § 3777.). The substitute environmental documents include the TMDL Staff Report and its attachments, including 1) this resolution and the Basin Plan amendment language (Attachment 1 of the Staff Report), 2) *Final Project Report for Total Maximum Daily Loads For Toxicity and Pesticides in the Santa Maria Watershed in Santa Barbara, San Luis Obispo and Ventura Counties, California* (Attachment 2 of the Staff Report), 3) the CEQA Checklist and Analysis (Attachment 3 of the Staff Report), and 4) the comments and responses to comments (Attachment 6 of the Staff Report). The Staff Report also includes the Notice of Public Hearing/Notice of Filing (Attachment 4) and the Scientific Peer Review Comment (Attachment 5). The project itself is the establishment of TMDLs for toxicity and pesticides in the Santa Maria watershed. The Central Coast Water Board exercises discretion in assigning waste load allocations and load allocations, determining the program of implementation, and setting various milestones in achieving the water quality standards. The CEQA checklist and other portions of the substitute environmental documents contain significant analysis and findings related to impacts and mitigation measures.

19. A CEQA scoping meeting was conducted on November 9, 2012, at the Central Coast Water Board office; a notice of the CEQA scoping meeting was sent to interested persons on October 29, 2012. The notice included a background of the project, the project purpose, a meeting schedule, and directions for obtaining more detailed information through the Central Coast Water Board website; the notice and project summary were available at the website or by requesting hard copies via telephone.
20. Public Resources Code section 21159 provides that an agency shall perform, at the time of the adoption of a rule or regulation requiring the installation of pollution control equipment or a performance standard or treatment requirement, an environmental analysis of the reasonably foreseeable methods of compliance, and an analysis of the reasonably foreseeable environmental impacts of the methods of compliance, an analysis of reasonably foreseeable mitigation measures to lessen the adverse environmental impacts, and an analysis of reasonably foreseeable alternative means of compliance with the rule or regulation that would have less significant adverse impacts. Section 21159(c) requires that the environmental analysis take into account a reasonable range of environmental, economic, and technical factors; population and geographic areas; and specific sites. The Staff Report and its attachments prepared for this Basin Plan amendment, in particular the CEQA Checklist and Analysis (Attachment 3 of the Staff Report), provides the environmental analysis required by Public Resources Code section 21159 and are hereby incorporated as findings in this Resolution.
21. In preparing the substitute environmental documents, the Central Coast Water Board considered the requirements of Public Resources Code section 21159 and California Code of Regulations, title 14, section 15187, and intends those documents to serve as a Tier 1 environmental review. This analysis is not intended to be an exhaustive analysis of every conceivable impact, but an analysis of the reasonably foreseeable consequences of the adoption of this regulation, from a programmatic perspective. Compliance obligations will be undertaken directly by public agencies that may have their own obligations under CEQA. Project level impacts may need to be considered in any subsequent environmental analysis performed by other public agencies, pursuant to Public Resources Code section 21159.2. To the extent applicable, this Tier 1 substitute environmental document may be used to satisfy subsequent CEQA obligations of those agencies.
22. Consistent with the Central Coast Water Board's substantive obligations under CEQA, the substitute environmental documents do not engage in speculation or conjecture, and only consider the reasonably foreseeable environmental impacts, including those relating to the methods of compliance, reasonably foreseeable feasible mitigation measures to reduce those impacts, and the reasonably foreseeable alternative means of compliance, that would avoid or reduce the identified impacts.
23. The substitute environmental documents, including the the CEQA Checklist and Analysis (Attachment 3 to the Staff Report) provide the necessary information pursuant to state law to conclude that the proposed TMDL, implementation plan, and the associated reasonably foreseeable methods of compliance could potentially have a significant adverse effect on the environment. Potentially significant adverse impacts include impacts to agricultural resources, air quality, biological resources, hydrology, landuse planning, and noise. This determination is based on best available information in an effort to fully inform the interested public and the decision makers of potential environmental impacts. Significant effects on the environment are defined as *"a substantial, or potentially substantial, adverse change within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance"* (14 Cal. Code Regs. § 1538). The Central Coast Water Board may not specify the manner of compliance (California Water code § 13360) so it has insufficient information to evaluate the extent to which dischargers might choose, for example, to use water

conservation to comply. Water conservation, and therefore reduction in toxic runoff, may offset impacts due to the reduced flows that could occur. In addition, reduction in water use could result in increased groundwater levels that would also result in more clean water to surface water. Given the uncertainty associated with evaluating the available information, it is possible that any adverse changes on aquatic habitat associated with the basin plan amendment will be less than substantial. When the agencies and responsible parties responsible for implementing these TMDLs determine how they will proceed, the agencies responsible for those parts of the project can and should incorporate such alternatives and mitigation into any subsequent projects or project approvals so as to minimize adverse environmental impacts. Feasible alternatives and mitigation measures are described in more detail in the substitute environmental documents (14 Cal. Code Regs. § 15091(a)(2)).

24. The substitute environmental documents, including the CEQA Checklist and Analysis (Attachment 3 to the Staff Report), identify mitigation approaches that should be considered at the project level.
25. Pursuant to CEQA Guidelines section 15093 (14 Cal. Code. Regs. § 15093), the Central Coast Water Board hereby finds that the project's benefits override and outweigh its potential significant adverse impacts, for the reasons more fully set forth in the Staff Report and attachments thereto, including the CEQA Checklist and Analysis. Specific economic, social, and environmental benefits justify the adoption of this TMDL despite the project's potential significant adverse environmental impacts. The Central Coast Water Board has the authority and responsibility to regulate discharges of waste associated with the sources of pollution causing impairment to water quality. Many of those discharges have caused significant widespread degradation and/or pollution of waters of the state as described in the Final Project Report for Total Maximum Daily Loads for Toxicity and Pesticides in the Santa Maria Watershed in Santa Barbara, San Luis Obispo and Ventura Counties, California and associated reference materials. This TMDL would result in actions to restore the quality of the waters of the state and protect their beneficial uses. While some impacts could occur due to reduced flows, earth-moving, or from implementing other actions to comply with the TMDL as described in the CEQA Checklist and Analysis, the benefits, which include contributing to the present and future restoration of beneficial water uses, and reducing or eliminating pollution and contamination, warrant approval of the TMDL, despite each and every unavoidable impact. Upon review of the environmental information generated for this TMDL, including the CEQA Checklist and Analysis (Attachment 3 of the Staff Report) and in view of the entire record supporting the need for the TMDL, the Central Coast Water Board determines that specific economic, legal, social, technological, environmental, and other benefits of this TMDL outweigh the unavoidable adverse environmental effects, and that such adverse environmental effects are acceptable under the circumstances.
26. The Central Coast Water Board will request that the State Water Board approve the basin plan amendments incorporating TMDLs for toxicity and pesticides in the Santa Maria watershed. The TMDLs and implementation program for the TMDLs will become effective upon approval by the California Office of Administrative Law. The TMDLs must also be approved by the USEPA.
27. The amendments to the basin plan may have an effect on fish and wildlife. The Central Coast Water Board will, therefore, forward fee payments to the Department of Fish and Wildlife under the California Fish and Game Code section 711.4.
28. Based on relevant future information, data, and research, the Central Coast Water Board has the discretion to conduct a water quality standards review which may potentially include one or more of the following: (1) The Central Coast Water Board may designate critical low-flow conditions below which numerical water quality criteria do not apply, as consistent with federal regulations and policy; (2) The Central Coast Water Board may authorize lowering of water quality to some

degree if and where appropriate, if the Central Coast Water Board finds water quality lowering to be necessary to accommodate important economic or social development. In authorizing water quality lowering the Central Coast Water Board shall make any such authorizations consistent with the provisions and requirements of federal and state anti-degradation policies; and (3) The Central Coast Water Board may authorize revision of water quality standards, if appropriate and consistent with federal and state regulations, to remove a designated beneficial use, establishing subcategories of uses, establishing site specific water quality objectives, or other modification of the water quality standard. When a standards action is deemed appropriate, the Central Coast Water Board shall follow all applicable requirements, including but not limited to those set forth in part 131 of Title 40 of the Code of Federal Regulations and Article 3 of Division 7, Chapter 4 of the California Water Code.

29. The proposed amendments meet the "Necessity" standard of the Administrative Procedures Act, Government Code, section 11353, subdivision (b). As specified in Finding 21, federal regulations require that TMDLs be incorporated into the state's water quality management plan. The Central Coast Water Board's Basin Plan is the Central Coast Water Board's component of California's water quality management plan, and the Basin Plan is how the Central Coast Water Board takes quasi-legislative planning actions. Moreover, the TMDL is a program of implementation for existing water quality objectives, and is, therefore, appropriately a component of the Basin Plan under the California Water Code, section 13242. The necessity of developing TMDLs is established in the TMDL staff report (including attachments), the Clean Water Act section 303(d) list, and the data contained in the administrative record documenting the pesticide and toxicity impairments of the Lower Santa Maria River and Oso Flaco Lake Watersheds.
30. Consistent with Water Code section 13141, the amendment includes an estimate of the total cost of implementation of the agricultural related portions of this TMDL and identifies potential sources of financing.
31. On January 30, 2014, in Watsonville, the Central Coast Water Board held a public hearing and heard and considered all public comments and evidence in the record.

THEREFORE, be it resolved that:

1. Pursuant to sections 13240, 13242, 13243, and 13244 of the California Water Code, the Central Coast Water Board, after considering the entire record, including the oral testimony at the hearing, hereby adopts the amendment in "Attachment-Proposed Basin Plan Amendments."
2. The Executive Officer is directed to forward copies of the Basin Plan amendment to the State Board in accordance with the requirements of section 13245 of the California Water Code.
3. The Central Coast Water Board requests that the State Water Board approve the Basin Plan amendments in accordance with the requirements of sections 13245 and 13246 of the California Water Code and forward them to the California Office of Administrative Law and the USEPA for approval.
4. The Executive Officer is authorized to sign a Certificate of Fee Exemption or transmit payment of the applicable fee as may be required to the Resources Agency.
5. If, during the approval process, Central Coast Water Board staff, State Water Board staff, the State Water Board, or the California Office of Administrative Law determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.

6. The environmental documents prepared by the Central Coast Water Board staff pursuant to Public Resources Code 21080.5 are hereby certified.

I, Kenneth A. Harris Jr., Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of a resolution adopted by the California Regional Water Quality Control Board, Central Coast Region on January 30, 2014.

Kenneth A. Harris Jr.
Executive Officer

RESOLUTION NO. R3-2014-0009

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENTS

Revise the September 8, 1994 Basin Plan as follows:

AMENDMENT NO. 1. TOTAL MAXIMUM DAILY LOADS FOR TOXICITY AND PESTICIDES IN THE SANTA MARIA WATERSHED INCLUDING BLOSSER CHANNEL, BRADLEY CANYON CREEK, BRADLEY CHANNEL, GREENE VALLEY CREEK, LITTLE OSO FLACO CREEK, MAIN STREET CANAL, ORCUTT CREEK, OSO FLACO CREEK, OSO FLACO LAKE, AND SANTA MARIA RIVER.

Add the following to Chapter 4 after IX. Q.:

IX. R. TOTAL MAXIMUM DAILY LOADS FOR TOXICITY AND PESTICIDES IN THE SANTA MARIA WATERSHED (INCLUDING BLOSSER CHANNEL, BRADLEY CANYON CREEK, BRADLEY CHANNEL, GREENE VALLEY CREEK, LITTLE OSO FLACO CREEK, MAIN STREET CANAL, ORCUTT CREEK, OSO FLACO CREEK, OSO FLACO LAKE, AND SANTA MARIA RIVER).

The Regional Water Quality Control Board adopted these TMDLs on January 30, 2014. These TMDLs were approved by:

The State Water Resources Control Board on: _____ (date).

The California Office of Administrative Law on: _____ (date).

The U.S. Environmental Protection Agency on: _____ (date).

Problem Statement

Surface waters in the Santa Maria River watershed are polluted with pesticides that are toxic to aquatic life. This is in violation of the Basin Plan general narrative objectives for toxicity and pesticides. Aquatic life-related beneficial uses are not being protected, including but not limited to the following: cold fresh water habitat, warm fresh water habitat, estuarine habitat, wildlife habitat, rare threatened or endangered species-migration, spawning, reproduction and/or early development, commercial and sport fishing, and shellfish harvesting.

There are three classes of pesticides and several pesticide active ingredients causing impairment in Santa Maria River watershed, including organophosphate (chlorpyrifos, diazinon, and malathion), synthetic pyrethroids (bifenthrin, cyfluthrin, cypermethrin, esfenvalerate, lambda-cyhalothrin, and permethrin), and organochlorine (DDTs, dieldrin, and toxaphene). Additionally, surface waters in the project area are on the Clean Water Act section 303(d) list as impaired for unknown water column toxicity and sediment toxicity to invertebrate test organisms. Organophosphate and pyrethroids concentrations in the surface waters and sediments are at levels associated with toxicity. Surface waters are impaired for organochlorine pesticides due to the levels in fish tissue that exceeded fish consumption criteria.

The following impairments are addressed with these TMDLs:

Blosser Channel: unknown toxicity, chlorpyrifos, diazinon, pyrethroids, DDT
 Bradley Canyon Creek: unknown toxicity
 Bradley Channel: chlorpyrifos, sediment toxicity, unknown toxicity, diazinon, pyrethroids, DDT
 Greene Valley Creek: chlorpyrifos, unknown toxicity
 Little Oso Flaco Creek: sediment toxicity, unknown toxicity
 Main Street Canal: chlorpyrifos, diazinon, unknown toxicity, pyrethroids, DDT
 Orcutt Creek: chlorpyrifos, DDT, diazinon, dieldrin, sediment toxicity, unknown toxicity, pyrethroids
 Oso Flaco Creek: sediment toxicity, unknown toxicity, malathion, DDT
 Oso Flaco Lake: dieldrin, chlordane, DDT
 Santa Maria River: chlorpyrifos, DDT, dieldrin, endrin, sediment toxicity, toxaphene,
 unknown toxicity, diazinon, pyrethroids

Numeric Targets

The following numeric targets are used to ascertain if water quality objectives are achieved and if beneficial uses are protected.

Water Column Numeric Targets

Table 1 Water Column Numeric Targets

Chemical	Concentration µg/L (ppb)	Target Type
Chlorpyrifos	0.025	CMC ¹
Chlorpyrifos	0.015	CCC ²
Diazinon	0.16	CMC
Diazinon	0.10	CCC
Malathion	0.17	CMC
Malathion	0.028	CCC
Bifenthrin	0.004	CMC
Bifenthrin	0.0006	CCC
Cyfluthrin	0.0003	CMC
Cyfluthrin	0.00005	CCC
Lambda-Cyhalothrin	0.001	CMC
Lambda-Cyhalothrin	0.0005	CCC
Chlordane	0.00057	Human Health Consumption
DDD, 4,4- (p,p-DDD)	0.00083	Human Health Consumption
DDE, 4,4- (p,p-DDE)	0.00059	Human Health Consumption
DDT, 4,4-(p,p-DDT)	0.00059	Human Health Consumption
Dieldrin	0.00014	Human Health Consumption
Toxaphene	0.00073	Human Health Consumption

¹ CMC – Criterion Maximum Concentration (Acute: 1- hour average). Not to be exceeded more than once in a three-year period². CCC - Criterion Continuous Concentration (Chronic: 4-day (96-hour) average). Not to be exceeded more than once in a three-year period.

Additive Toxicity Numeric Target for Organophosphate Pesticides

The organophosphate pesticides chlorpyrifos and diazinon have additive toxicity in the water column. Since the TMDL is linked to toxicity and concentrations, additive toxicity must be considered in the TMDL as a numeric target.

The numeric target for additive toxicity for organophosphate pesticides is:

$$\frac{C(\text{diazinon})}{NT(\text{diazinon})} + \frac{C(\text{chlorpyrifos})}{NT(\text{chlorpyrifos})} = S; \text{ where } S \leq 1$$

Where:

C = the concentration of a pesticide measured in the receiving water.

NT = the numeric target for each pesticide present.

S = the sum; a sum exceeding one (1.0) indicates that beneficial uses may be adversely affected.

The additive toxicity numeric target formula shall be applied when both diazinon and chlorpyrifos are present in the water column.

Sediment Numeric Targets

Table 2 Sediment Numeric Targets

Chemical Group	Chemical	Concentration µg/kg o.c. (ppb)	Target Type
Organochlorine	Chlordane	1.7	Human Health-Based
Organochlorine	DDD, 4,4-(p,p-DDD)	9.1	Human Health-Based
Organochlorine	DDE, 4,4-(p,p-DDE)	5.5	Human Health-Based
Organochlorine	DDT, 4,4-(p,p-DDT)	6.5	Human Health-Based
Organochlorine	Total DDT	10	Human Health-Based
Organochlorine	Dieldrin	0.14	Human Health-Based
Organochlorine	Endrin	550	Human Health-Based
Organochlorine	Toxaphene	20	Human Health-Based

Additive Toxicity Numeric Target for Pyrethroid Pesticides

The pyrethroid pesticides have additive toxicity in aquatic sediments. Since the TMDL is linked to toxicity and concentrations, additive toxicity must be considered in the TMDL as a numeric target.

The numeric target for additive toxicity for pyrethroid pesticides is:

$$\frac{C(\text{Pyrethroid 1})}{NLC(\text{Pyrethroid 1})} + \frac{C(\text{Pyrethroid 2})}{NLC(\text{Pyrethroid 2})} = S; \text{ where } S \leq 1$$

Where:

C = the concentration of a pesticide measured in sediment.

NLC = the numeric LC50 for each pesticide present (Table 3).

S = the sum; a sum exceeding one (1.0) indicates that beneficial uses may be adversely affected.

The additive toxicity numeric target formula shall be applied when pyrethroid pesticides are present in the sediment.

Table 3 Pyrethroid Sediment LC50s

Chemical	LC50 ng/g ppb)	LC50 µg/g OC*(ppm)
Bifenthrin	12.9	0.52
Cyfluthrin	13.7	1.08
Cypermethrin	14.87	0.38
Esfenvalerate	41.8	1.54
Lambda-Cyhalothrin	5.6	0.45
Permethrin	200.7	10.83

*Median lethal concentration (LC50) for amphipods (*Hyalella azteca*) organic carbon normalized concentrations (ug/g OC)

Fish Tissue Numeric Targets

Table 4 Fish Tissue Numeric Targets

Chemical Group	Chemical	Concentration ng/g (ppb)	Target Type
Organochlorine	Chlordanes	5.6	Fish Contaminant Goal
Organochlorine	DDTs	21	Fish Contaminant Goal
Organochlorine	Dieldrin	0.46	Fish Contaminant Goal
Organochlorine	Toxaphene	6.1	Fish Contaminant Goal

Aquatic Toxicity Numeric Target:

The aquatic toxicity numeric target is the evaluation of the Basin Plan general objective for toxicity using standard aquatic toxicity tests to determine toxicity in the water column and sediment. The toxic determination is based on a comparison of the test organism's response to the sample and a control. The general objective for toxicity is:

All waters shall be maintained free of toxic substances in concentrations which are toxic to, or which produce detrimental physiological responses in, human, plant, animal, or aquatic life. Compliance with the objective will be determined by use of indicator organisms, analyses of species diversity,

population density, growth anomalies, toxicity bioassays of appropriate duration, or other appropriate methods.

The following standard aquatic toxicity tests will be used to determine compliance with the aquatic toxicity numeric target:

Table 5 Standard Aquatic Toxicity Tests

Parameter	Test	Biological Endpoint Assessed
Water Column Toxicity	Water Flea – <i>Ceriodaphnia</i> (6-8 day chronic)	Survival and reproduction
Sediment Toxicity	<i>Hyalella azteca</i> (10-day chronic)	Survival

Source Analysis

Toxicity in the water column and the sediment toxicity are associated with currently applied organophosphate and pyrethroid pesticides. Organophosphate, pyrethroid, and organochlorine pesticides are all man-made pesticides with human activities as sources of pollution. Therefore, there are no natural sources of these pesticides.

Organophosphate pesticides

Impairments from organophosphate pesticides are the result of applications of these pesticides to agricultural crops. For chlorpyrifos, the specific use causing impairments is pre-plant granular applications to cole crops (broccoli, cauliflower, cabbage). Diazinon is primarily applied on lettuce and cole crops, and malathion is applied on a wide range of crops, including broccoli, celery, lettuce and strawberries.

Synthetic Pyrethroid Pesticides

Impairments from pyrethroid pesticides are resulting from agricultural and urban pesticide applications. Pyrethroids are commonly applied urban pesticides and the highest levels of pollution are in drainages with urban stormwater runoff. Pyrethroids are used by both residential consumers and by professional commercial and residential pest control applicators.

Table 6 Source of Pyrethroid Pesticide Pollution

Chemical	Sources
Bifenthrin	Urban structural and consumer home applications and agricultural applications to strawberries
Cypermethrin	Urban structural and consumer home applications and agricultural applications to cole crops and lettuce.
Cyfluthrin	Urban structural and consumer home applications
Esfenvalerate	Irrigated agricultural applications to broccoli and cauliflower
Lambda-Cyhalothrin	Urban structural and consumer home applications and agricultural applications to lettuce and broccoli
Permethrin	Urban structural and consumer home applications along with

irrigated agricultural applications to lettuce and celery

Organochlorine Pesticides

The organochlorine pesticides included in the TMDL are no longer applied in the watershed but are persistent in the environment. Historic use was widespread in the Santa Maria River watershed and included urban, agricultural, and vector mosquito control uses.

The breakdown products of DDT (DDD, DDE) are broadly present in the Santa Maria River watershed surface waters. Sediments from urban lands and irrigated agricultural lands are sources of DDTs to surface waters. Additionally, contaminated stream and channel sediments are stores of DDT and are sources of DDT to downstream fisheries, such as Oso Flaco Lake, the Santa Maria Estuary, and the coastal confluences. Data from 2008-2009 suggest sediment discharged to Oso Flaco Lake contains DDT in excess of numeric targets.

In addition to DDTs, there are organochlorine pesticide impairments in the watershed for chlordane, dieldrin, endrin and toxaphene. These chemicals were historically broadly used in the watershed and continue to persist in sediment delivered to surface waters throughout the watershed. More recent data showed fewer laboratory detections of dieldrin and toxaphene relative to vintage data prompting Clean Water Act section 303(d) listings. More data will be obtained during the TMDL implementation phase to better understand remaining impairments and source areas. Data from 2007 suggest sediment discharged to Oso Flaco Lake contains chlordane in excess of numeric targets. Additional monitoring of organochlorine pesticides in and to Oso Flaco Lake will be obtained during the TMDL implementation phase.

TMDLs

Organophosphate pesticide TMDLS

TMDLs for chlorpyrifos, diazinon, and malathion are water column concentrations as shown in Table 7.

Table 7 Organophosphate Pesticide Water Column TMDLs

Waterbodies assigned TMDLs ¹	TMDL					
	Chlorpyrifos		Diazinon		Malathion	
	CMC ³ µg/L (ppb)	CCC ⁴ µg/L (ppb)	CMC µg/L (ppb)	CCC µg/L (ppb)	CMC µg/L (ppb)	CCC µg/L (ppb)
Blosser Channel	0.025	0.015	0.16	0.10	0.17 ²	0.028 ²
Bradley Canyon Creek	0.025	0.015	0.16	0.10	0.17 ²	0.028 ²
Bradley Channel	0.025	0.015	0.16	0.10	0.17 ²	0.028 ²

Santa Maria River	0.025	0.015	0.16	0.10	0.17 ²	0.028 ²
Little Oso Flaco Creek	0.025	0.015	0.16	0.10	0.17	0.028

¹ All reaches of all surface waters in the Santa Maria River watershed, including those listed.

² Waterbody is currently achieving the TMDL

³ CMC – Criterion Maximum Concentration (Acute: 1- hour average). Not to be exceeded more than once in a three-year period.

⁴ CCC – Criterion Continuous Concentration (Chronic: 4-day (96-hour) average). Not to be exceeded more than once in a three-year period.

Additive Toxicity TMDL for Organophosphate Pesticides

The additive toxicity TMDL for organophosphate pesticides is based on the additive toxicity targets for organophosphate pesticides.

$$\frac{C(\text{diazinon})}{NT(\text{diazinon})} + \frac{C(\text{chlorpyrifos})}{NT(\text{chlorpyrifos})} = S; \text{ where } S \leq 1$$

Where:

C = the concentration of a pesticide measured in the receiving water.

NT = the numeric target for each pesticide present.

S = the sum; a sum exceeding one (1.0) indicates that beneficial uses may be adversely affected.

The additive toxicity numeric target formula shall be applied when both diazinon and chlorpyrifos are present in the water column and it applies to all surface waters in the Santa Maria River watershed.

Additive Toxicity TMDL for Pyrethroid Pesticide

The additive toxicity TMDL for pyrethroids pesticides is based on the additive toxicity numeric targets for pyrethroid pesticides.

$$\frac{C(\text{Pyrethroid 1})}{NLC(\text{Pyrethroid 1})} + \frac{C(\text{Pyrethroid 2})}{NLC(\text{Pyrethroid 2})} = S; \text{ where } S \leq 1$$

Where:

C = the concentration of a pesticide measured in sediment.

NLC = the numeric LC50 for each pesticide present (Table 3).

S = the sum; a sum exceeding one (1.0) indicates that beneficial uses may be adversely affected.

The additive toxicity numeric shall be applied to all surface waters in the Santa Maria River watershed.

Aquatic Toxicity TMDLs

The TMDLs for water column and sediment toxicity is the aquatic toxicity numeric target as found in Table 5.

Organochlorine pesticide TMDLs

The TMDLs for organochlorine pesticides are sediment and fish tissue concentrations outlined in the following tables. To account for short-term variations, concentrations should be averaged over a three year period.

Table 8 DDT Sediment Chemistry TMDLs

Waterbodies Assigned TMDLs ¹	TMDL			
	DDD, 4,4-(p,p-DDD) o.c. ²	DDE, 4,4-(p,p-DDE) o.c. ²	DDT, 4,4-(p,p-DDT) o.c. ²	Total DDT o.c. ²

Allocations and Responsible Parties

The allocations and parties responsible for the allocations are listed in the following table.

Table 11 Load Allocations

Waste Load Allocations		
Responsible Party	Source	Allocation
City of Santa Maria – NPDES No. CAS000004	Urban Stormwater	3, 4 & 5
County of Santa Barbara – NPDES No. CAS000004	Urban Stormwater	3, 4 & 5
City of Guadalupe	Urban Stormwater	3, 4 & 5
Load Allocations		
Responsible Party	Source	Allocation
Owners/operators of irrigated agricultural lands in the Santa Maria Watershed	Discharges from irrigated lands	1, 2, 3, 4 & 5
San Luis Obispo County Public Works	Roadside drainages	5
Santa Barbara County Public Works	Roadside drainage	5
Santa Barbara County Flood Control District	Flood Control Channels and drainages	5
<u>Allocation-1</u> : Organophosphate Pesticide TMDLs (refer to Table 7)		
<u>Allocation-2</u> : Additive Toxicity TMDL for Organophosphate Pesticides		
<u>Allocation-3</u> : Additive Toxicity TMDL for Pyrethroid Pesticides		
<u>Allocation-4</u> : Aquatic Toxicity TMDLs (refer to Table 5)		
<u>Allocation-5</u> : Organochlorine Pesticide TMDLs (refer to Tables 8, 9, and 10)		

Controllable Water Quality Conditions

In accordance with the *Water Quality Control Plan for the Central Coastal Basin* (Basin Plan), controllable water quality shall be managed to conform or to achieve the water quality objectives and load allocations contained in this TMDL. The Basin Plan defines controllable water quality conditions as follows: “*Controllable water quality conditions are those actions or circumstances resulting from man’s activities that may influence the quality of the waters of the State and that may be reasonably controlled.*” - Chapter 3. Water Quality Objectives, page III-2.

Antidegradation Requirements

State and federal antidegradation policies require, in part, that where surface waters are of higher quality than necessary to protect beneficial uses, the high quality of those waters must be maintained unless otherwise provided by the policies. The federal antidegradation policy, 40 C.F.R. 131.12(a) states, in part. *“Where the quality of waters exceed levels necessary to support propagation of fish, shellfish, and wildlife and recreation in and on the water, that quality shall be maintained and protected unless the State finds, after full satisfaction of the intergovernmental coordination and public participation provisions of the State’s continuing planning process, that allowing lower water quality is necessary to accommodate important economic or social development in the area in which the waters are located...”* Practically speaking, this means that, for example, for stream reaches or waterbodies that have an concentration-based TMDL of 0.025 µg/L chlorpyrifos and where current or future water quality in the stream reach is in fact well under TMDL of 0.025 µg/L chlorpyrifos, the TMDL does not give license for controllable chlorpyrifos sources to degrade water quality all the way up to the maximum TMDL, i.e., 0.025 µg/L chlorpyrifos.

Margin of Safety

A margin of safety is incorporated in these TMDLs implicitly through conservative assumptions. The desired water quality is achieved through allocations and targets equal to desired water quality; hence an implicit conservative approach. If, during the TMDL implementation phase, staff develops numeric targets and TMDLs that better reflect the desired water quality, the allocations will be set equal to these modified targets and TMDLs.

Implementation

DISCHARGES FROM IRRIGATED AGRICULTURAL LANDS:

Implementing parties will comply with the Conditional Waiver of Waste Discharge Requirements for Irrigated Lands (Order R3-2012-0011) and the Monitoring and Reporting Programs in accordance with Orders R3-2012-0011-01, R3-2012-0011-02, and R3-2012-0011-03 to meet load allocations and achieve the TMDL.

Current requirements in the Agricultural Order that will achieve the load allocations include:

1. Implement, and update as necessary, management practices to reduce pesticide loading.
2. Develop and update and implement Farm Plans. The Farm Plans need to incorporate measures designed to achieve load allocations assigned in this TMDL.
3. Implement monitoring and reporting requirements described in the Agricultural Order.

The TMDL implementation plan also utilizes an interagency approach among the California Department of Pesticide Regulation (DPR), the State Water Resources Control Board, and the Central Coast Water Board to address impairments. The approach is described in the California Pesticide Management Plan for Water Quality (California Pesticide Plan), which is an implementation plan of the Management Agency Agreement (MAA) between DPR and the Water Boards. The agricultural commissioners of Santa Barbara and San Luis Obispo counties are also responsible for implementing the California Pesticide Plan.

The Department of Pesticide Regulation, the county agricultural commissioners, and USEPA are taking regulatory steps to address pesticide impairments. In accordance with the MAA, DPR has approved urban pesticide regulations to address pyrethroid pesticide water quality pollution. Also as part of the MAA, the Central Coast Water Board, DPR, and the commissioners are coordinating on county chlorpyrifos use permits. USEPA has recently implemented label restrictions and requirements on agricultural uses of diazinon and pyrethroids to address water quality problems.

The current regulatory programs in the watershed do not specifically address water quality impairments from organochlorine pesticides and the TMDL recommends that stakeholders develop a community-based watershed organochlorine pesticide implementation plan to meet TMDL goals.

Monitoring

Owners and operators of irrigated agricultural lands will perform monitoring and reporting in accordance with Monitoring and Reporting Program Orders R3-2012-0011-01, R3-2012-0011-02, and R3-2012-0011-03, as applicable to the operation.

Determination of Compliance with Load Allocations

Demonstration of compliance with the load allocations is consistent with compliance with the Agricultural Order. Load allocations will be achieved through a combination of implementation of management practices and strategies to reduce pesticide loading, and water quality monitoring. Flexibility to allow owners and operators from irrigated lands to demonstrate compliance with load allocations is a consideration; additionally, staff is aware that not all implementing parties are necessarily contributing to or causing surface water impairments.

To allow for flexibility, Central Coast Water Board staff will assess compliance with load allocations using one or a combination of the following:

- A. Attaining the load allocations in receiving waters.
- B. Implementing management practices that are capable of achieving load allocations identified in this TMDL.
- C. Providing sufficient evidence to demonstrate that they are and will continue to be in compliance with the load allocations; such evidence could include documentation submitted by the owner or operator to the Executive Officer that the owner or operator is not causing waste to be discharged to impaired waterbodies resulting or contributing to violations of the load allocations.

STORM DRAIN DISCHARGES FROM MS4s:

The Central Coast Water Board will require municipal separate storm sewer systems (MS4) entities to develop, submit, and implement a Wasteload Allocation Attainment Program (WAAP). WAAP development, submittal and implementation will be required in the Phase II municipal stormwater permit. The WAAP will be required to include descriptions of the actions that will be taken by the MS4 entity to attain the TMDL waste load allocations, and specifically address:

1. Development of an implementation and assessment strategy.
2. Source identification and prioritization.
3. Best management practice identification, prioritization, implementation scheduling, analysis, and effectiveness assessment.
4. Monitoring and reporting. Monitoring program goals will be required to include:
 - a. assessment of stormwater discharge and/or receiving water quality,
 - b. assessment of best management practice effectiveness, and
 - c. demonstration of progress towards achieving interim goals and waste load allocations.
5. Coordination with stakeholders.
6. Other pertinent factors.

The WAAP will be allowed to include participation in statewide efforts, by organizations such as California Stormwater Quality Association (CASQA), that coordinate with DPR and other organizations taking actions to protect water quality from the use of pesticides in the urban environment, though sole reliance on such statewide efforts may not be adequate.

Monitoring

MS4 entities with operations and storm water conveyance systems in the TMDL project areas will be required to develop and submit monitoring programs as part of their WAAP. The goals of the monitoring programs are described in the requirements of the WAAP.

The MS4s should develop and submit creative and meaningful monitoring programs. Monitoring strategies may be able to use a phased approach, for example, whereby outfall or receiving water monitoring is phased-in after best management practices have been implemented and assessed for effectiveness. Pilot projects where best management practices are implemented in well-defined areas covering a fraction of the MS4 that facilitate accurate assessment of how well the best management practices control pollution sources may be acceptable, with the intent of successful practices then being implemented in other or larger parts of the MS4 jurisdiction.

Determination of Compliance with Waste Load Allocations

Waste load allocations will be achieved through implementation of management practices and strategies to reduce pesticide loading, and wasteload allocation attainment will be demonstrated through water quality monitoring. Implementation can be conducted by MS4s specifically and/or through statewide programs addressing urban pesticide water pollution.

To allow for flexibility, Water Board staff will assess compliance with waste load allocations using one or a combination of the following:

- A. Attaining the waste load allocations in the receiving water.
- B. Demonstrating compliance by measuring pesticide concentrations and toxicity in stormwater outfalls.
- C. Implementation and assessment of pollutant loading reduction projects (BMPs) capable of achieving interim and final waste load allocations identified in this TMDL in combination with water quality monitoring for a balanced approach to determining program effectiveness.
- D. Any other effluent limitations and conditions that are consistent with the assumptions and requirements of the waste load allocations.

Timelines

The target date to achieve the pesticide TMDLs for the organophosphates (chlorpyrifos, diazinon) is October 2016. This estimate is based on apparent decreased use, current implementation of management practices to mitigate loadings, and existing regulatory efforts to reduce loading.

The target date to achieve the TMDL for malathion is ten years after approval of the TMDL by the Office of Administrative Law. This estimate is based on the increase in current usage and current limited regulatory oversight.

The target date to achieve the TMDLs for pyrethroids is 15 years after approval of the TMDL by the Office of Administrative Law. This estimate is based on the widespread availability of pyrethroids, including consumer usage, and current limited regulatory oversight.

The target date to achieve the TMDLs for organochlorine pesticides (DDT, DDD, DDE, chlordane, eldrin, toxaphene, dieldrin) is 30 years after approval of the TMDL by the Office of Administrative

Law. This estimate is based on their persistence in the environment, widespread legacy usage and bioaccumulation in the food web

Tracking and Evaluation

Every three years, beginning three years after TMDLs are approved by the Office of Administrative Law, the Central Coast Water Board will perform a review of implementation actions, monitoring results, and evaluations submitted by responsible parties of their progress toward achieving their allocations, dependent upon staff availability and priorities. The Central Coast Water Board will use annual reports, nonpoint source pollution control implementation programs, evaluations submitted by responsible parties, and other available information to determine progress toward implementing required actions and achieving the allocations and the numeric targets.

Hi SGS,

I've attached the non-substantive changes memo that is going through internal review here. The changes are contained on page 2 in strikeout and underline and I think it is slightly different than what I discussed with you earlier today. I know we corrected the NPDES permit number, but we also need to delete "Storm Water Permit" in the table. Just a heads-up.

Thanks,

Larry M. Harlan

Central Coast Regional Water Quality Control Board

TO: Karen Larsen, Deputy Director
Division of Water Quality
State Water Resources Control Board

FROM: Lisa Horowitz McCann
Interim Executive Officer
**REGIONAL WATER QUALITY CONTROL BOARD CENTRAL COAST
REGION**

DATE: **March 9, 2016**

SUBJECT: MINOR, NON-SUBSTANTIVE CHANGES TO THE BASIN PLAN AMENDMENT
ADOPTED UNDER CENTRAL COAST WATER BOARD RESOLUTION NO. R3-
2013-0013

The Central Coast Water Board adopted an amendment to the Water Quality Control Plan for the Central Coastal Region (Basin Plan) on 30 May 2013 under Resolution No. R3-2013-0013 that establishes Total Maximum Daily Loads for Nitrogen Compounds and Orthophosphate in the Lower Santa Maria River Watershed and Tributaries to Oso Flaco Lake. The State Water Board approved the amendment on 4 February 2014, the Office of Administrative Law approved the amendment on 22 May 2014, and U.S. EPA approved the amendment on 8 March 2016.

Central Coast Water Board Resolution No. R3-2013-0013 grants the Executive Officer the authority to make minor, non-substantive changes to the language of the adopted Basin Plan amendment. U.S. EPA staff determined that minor, non-substantive corrections to the amendment language is needed to correct a typographical error.

I am hereby making minor, non-substantive changes to Basin Plan amendment language included with Resolution No. R3-2013-0013. Attached are changes to the Basin Plan amendment as indicated in strikethrough and underline.

If you have any questions about this matter please contact me at (805) 549-3132 or Jennifer Epp at (805) 594-6181.

Table IX R-2. Interim Allocations

INTERIM WASTE LOAD ALLOCATIONS (WLAs)			
Waterbody the Responsible Party is Discharging to	Party Responsible for Allocation (Source)	First Interim WLA	Second Interim WLA
All waterbodies the responsible party is assigned wasteload allocations (WLAs) in Table IX R-1	City of Santa Maria (Storm drain discharges to MS4s) Storm Water Permit NPDES No. CA00049984 <u>CAS000004</u>	Achieve MUN standard-based and Unionized Ammonia objective-based allocations: Allocation-3 Allocation-4 12 years after effective date of TMDL	Achieve Wet Season (Nov. 1 to Apr. 30) Biostimulatory target-based TMDL allocations: Allocation-1 Allocation-2 20 years after effective date of TMDL
	City of Guadalupe (Storm drain discharges to MS4s) (NPDES Permit Pending)		
	County of San Luis Obispo (Storm drain discharges to MS4s) (NPDES No. CAS000004)		
	County of Santa Barbara (Storm drain discharges to MS4s) (NPDES No. CAS000004)		
INTERIM LOAD ALLOCATIONS (LAs)			
Waterbody	Party Responsible for Allocation (Source)	First Interim LA	Second Interim LA
All waterbodies the responsible party is assigned load allocations (LAs) in Table IX R-1	Owners/operators of irrigated agricultural lands (Discharges from irrigated lands)	Achieve MUN standard-based and Unionized Ammonia objective-based allocations: Allocation-3 Allocation-4 12 years after effective date of TMDL	Achieve Wet Season (Nov. 1 to Apr. 30) or Year-round Biostimulatory target-based TMDL allocations: Allocation-1 Allocation-2 Allocation-5 Allocation-6 20 years after effective date of TMDL

* Responsible parties shall meet allocations in all receiving surface waterbodies of the responsible parties' discharges.

The parties responsible for the allocation to controllable sources are not responsible for the allocation to natural sources.

**CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, CA 93401-7906**

RESOLUTION NO. R3-2013-0013

**AMENDING THE WATER QUALITY CONTROL PLAN FOR THE CENTRAL COASTAL
BASIN TO ADOPT TOTAL MAXIMUM DAILY LOADS FOR NITROGEN COMPOUNDS AND
ORTHOPHOSPHATE IN THE LOWER SANTA MARIA RIVER WATERSHED AND
TRIBUTARIES TO OSO FLACO LAKE**

The Regional Water Quality Control Board, Central Coast Region (Central Coast Water Board) finds:

1. The Central Coast Water Board adopted the second edition of the Water Quality Control Plan for the Central Coastal Basin (Basin Plan), on September 8, 1994. The Basin Plan designates beneficial uses and water quality objectives, sets forth implementation plans to achieve water quality objectives addressing point source and nonpoint source discharges, establishes prohibitions, and incorporates statewide plans and policies.
2. The Central Coast Water Board periodically revises and amends the Basin Plan. The Central Coast Water Board has determined the Basin Plan requires further revision and amendment to incorporate Total Maximum Daily Loads (TMDLs) and an implementation plan for nitrogen compounds (nitrate and unionized ammonia) and orthophosphate in the Lower Santa Maria River watershed and tributaries to Oso Flaco Lake (including Blosser Channel, Bradley Canyon Creek, Bradley Channel, Greene Valley Creek, Main Street Canal, North Main Street Channel, Orcutt Creek, Oso Flaco Creek, Little Oso Flaco Creek, Oso Flaco Lake, Santa Maria River, and Santa Maria River Estuary).
3. The geographic scope of this TMDL encompasses approximately 237 square miles of the lower Santa Maria River watershed and includes tributaries to Oso Flaco Lake. The TMDL Project Area corresponds with the Guadalupe Hydrologic Area (312.10) as contained in the Basin Plan. The Santa Maria River receives flow from the Cuyama River upstream to the northeast, with flows regulated by the Twitchell Dam. The Santa Maria River also receives flow from the Sisquoc River to the southeast and various smaller tributaries in the lower watershed before discharging through the Santa Maria River Estuary and into the Pacific Ocean. Oso Flaco Lake is the receiving water for approximately 16 square miles with flows originating from Oso Flaco Creek and Little Oso Flaco Creek.
4. Multiple waterbodies within the TMDL Project Area are listed on California's Clean Water Act Section 303(d) list for water quality impairments due to unionized ammonia, nitrate, ammonia, and low dissolved oxygen. Due to the Clean Water Act 303(d) listings, the Central Coast Water Board is required to adopt TMDLs and associated implementation plans (40 CFR 130.6(c)(1), 130.7, California Water Code section 13242).
5. Available data indicate 1) widespread violations of the Basin Plan's drinking water standard for nitrate, 2) widespread violations of the Basin Plan's unionized ammonia

general toxicity objective for inland surface waters, and 3) widespread violations of the Basin's Plan's narrative general objective for biostimulatory substances in inland surface waters and estuaries. In addition, some surface waterbodies are locally not meeting non-regulatory recommended guidelines for nitrate in agricultural supply water (AGR) for sensitive crop types, indicating that potential or future designated agricultural supply beneficial uses may locally be detrimentally impacted.

6. Available data indicate that discharges of nutrients (specifically, nitrogen compounds and orthophosphate) are occurring at levels in surface waters which are impairing a wide spectrum of beneficial uses, including impairments of municipal and domestic drinking water supply beneficial uses; impairments of aquatic habitat beneficial uses; impairments of groundwater recharge beneficial uses; and degradation locally of designated agricultural water supply beneficial uses (including irrigation supply for sensitive crops).
7. The Central Coast Water Board's goal for establishing TMDLs in the lower Santa Maria River watershed and tributaries to Oso Flaco Lake is to rectify the impairments due to unionized ammonia, nitrate, and orthophosphate, thereby providing support for the designated beneficial uses of municipal and domestic water supply (MUN), cold and warm fresh water habitat (COLD and WARM), groundwater recharge (GWR), agricultural water supply (AGR), contact and non-contact water recreation (REC-1 and REC-2), and to support water quality standards attainment with regard to the Basin Plan's general water quality objective for unionized ammonia and the Basin Plan's water quality objective for biostimulatory substances.
8. The Central Coast Water Board proposes to amend the Basin Plan by inserting amendments into the following sections (listed in order of Basin Plan contents):
 - a. Chapter Four, section IX (Total Maximum Daily Loads)
9. On May 20, 2004, the State Water Resources Control Board (State Water Board) adopted the *Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program* (NPS Policy). The NPS Policy requires the regional water quality control boards to regulate all nonpoint sources of pollution using the administrative permitting authorities provided by the Porter-Cologne Water Quality Control Act (Water Code Div. 7). Consistent with the NPS Policy and the Porter-Cologne Act, regional water quality control boards regulate nonpoint source discharges with waste discharge requirements, waivers of waste discharge requirements, and/or prohibitions.
10. On May 20, 2004, the State Water Board adopted the *Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List* (State Water Board Resolution No. 2004-0063), hereafter referred to as the *California 303(d) Listing Policy*. The *California 303(d) Listing Policy* describes the process by which the State Water Board and the regional water quality control boards will comply with the listing requirements of the federal Clean Water Act (CWA). The objective of the *California 303(d) Listing Policy* is to establish a standardized approach for developing California's CWA section 303(d) list and to provide guidance for interpreting data and information to make decisions regarding water quality standards attainment.
11. On June 16, 2005, the State Water Board adopted the *Water Quality Control Policy for Addressing Impaired Waters: Regulatory Structure and Options* (State Water Board Resolution 2005-0050), hereafter referred to as the *Impaired Waters Policy*. The *Impaired Waters Policy* provides policy and procedures for adopting Total Maximum Daily

Loads and addressing impaired waters in California. The *Impaired Waters Policy* states that the regional water quality control boards have independent discretion, broad flexibility, numerous options, and some legal constraints that apply when determining how to address impaired waters.

12. Blosser Channel, Bradley Canyon Creek, Bradley Channel, Greene Valley Creek, Main Street Canal, Orcutt Creek, and Oso Flaco Creek are listed on California's 2008-2010 Clean Water Act 303(d) list as impaired due to unionized ammonia. These waterbodies do not meet the Basin Plan toxicity objectives for inland surface waters, enclosed bays, and estuaries.
13. Blosser Channel, Bradley Canyon Creek, Bradley Channel, Greene Valley Creek, Main Street Canal, North Main Street Channel, Orcutt Creek, Oso Flaco Creek, Little Oso Flaco Creek, and Santa Maria River are listed on California's 2008-2010 Clean Water Act section 303(d) list as impaired due to nitrate. These water bodies do not support the following beneficial use designated in the Basin Plan: municipal and domestic drinking water supply (MUN).
14. Orcutt Creek, Oso Flaco Creek, and Santa Maria River do not meet non-regulatory recommended guidelines for nitrate in agricultural supply water for sensitive crop types, indicating that potential or future designated agricultural supply (AGR) beneficial uses may be detrimentally impacted. These waterbodies also do not support their designated groundwater recharge (GWR) beneficial use based on the Basin Plan's drinking water nitrate objective and situation specific lines of evidence consistent with the *California 303(d) Listing Policy*.
15. Oso Flaco Lake is listed on California's 2008-2010 Clean Water Act 303(d) list as impaired due to nitrate on the basis of non-attainment of the Basin Plan's biostimulatory substances water quality objective. Oso Flaco Lake is currently not supporting the following beneficial uses designated by the Basin Plan: aquatic habitat (WARM, SPWN).
16. Nipomo Creek is listed on California's 2008-2010 Clean Water Act 303(d) list as impaired due to nitrate. Available data indicate that Nipomo Creek is not impaired for nitrate on the basis of non-attainment of the Basin Plan's municipal drinking water objective (MUN) or the biostimulatory substances water quality objective. Nipomo Creek is not impaired for nitrate.
17. Bradley Canyon Creek, Greene Valley Creek, Orcutt Creek, Oso Flaco Creek, Little Oso Flaco Creek, Santa Maria River (downstream of Highway 1), and the Santa Maria River Estuary are not listed on California's 2008-2010 Clean Water Act 303(d) list for nutrients causing biostimulation. However, available data indicate these waters are in violation of the Basin Plan's biostimulatory substances objective and are impaired due to excessive levels of nitrate and orthophosphate. These waterbodies do not meet the Basin Plan's biostimulatory substances objective for inland surface waters, enclosed bays, and estuaries.
18. Low dissolved oxygen is a nutrient-response indicator and represents a primary biological response to excessive nutrient loading in waterbodies which exhibit biostimulatory conditions. Bradley Canyon Creek and Greene Valley Creek are on the 2008-2010 Clean Water Act section 303(d) list of impaired waters for low dissolved oxygen impairment and

are expressing biostimulatory conditions. In addition, although not listed on the 2008-2010 Clean Water Act 303(d) list for low dissolved oxygen, available data indicate that Orcutt Creek, Oso Flaco Lake, and Santa Maria River Estuary are impaired due to low dissolved oxygen on the basis of the listing criteria and methodologies identified in the *California 303(d) Listing Policy*. Dissolved oxygen (DO) impairments are not directly addressed in the TMDL in terms of setting waste load or load allocation for DO; however, reductions in nutrient loading are anticipated to be beneficial in attainment of water quality standards for DO and restoring the waterbodies to a desired condition. Further, numeric targets identified for DO in the TMDL will be used as indicator metrics to assess primary biological response to future nutrient water column concentration reductions and compliance with the Basin Plan's biostimulatory substances objective.

19. Microcystins (algal toxins) are a nutrient-response indicator and represents a primary biological response to excessive nutrient loading in waterbodies which exhibit biostimulatory conditions. Currently, there are no identified impairments in the TMDL Project Area on the basis of algal toxins. However, the numeric target identified for microcystins in this TMDL will be used as an indicator metric to assess primary biological response to future nutrient water column concentration reductions and to ensure compliance with Basin Plan general objectives for biostimulatory substances and toxicity, as well as protection of the REC-1 beneficial use.
20. The U.S. Environmental Protection Agency's (USEPA) published TMDL guidance (*Guidance for Water Quality-Based Decisions: The TMDL Process – Chapter 1, Policies and Principles*, USEPA 404/4-91-001, April 1991) explicitly states that implementation of TMDLs and water quality-based controls should not be delayed because of lack of information and uncertainties about pollution problems, particularly with respect to nonpoint sources. More information about the spatial extent and nature of water quality impairments can be collected during TMDL implementation.
21. The elements of a TMDL are described in 40 CFR 130.2 and 130.7, section 303(d) of the Clean Water Act, and USEPA guidance documents. A TMDL is defined as "the sum of individual waste load allocations for point sources and load allocations for nonpoint sources and natural background" (40 CFR 130.2). The Central Coast Water Board has determined that the TMDLs for unionized ammonia, nitrate, and orthophosphate in the lower Santa Maria River and Oso Flaco Lake watersheds are set at levels necessary to attain and maintain the applicable numeric and narrative water quality objectives, taking into account seasonal variations and any lack of knowledge concerning the relationship between effluent limitations and water quality (40 CFR 130.7 (c) (1)). The regulations in 40 CFR 130.7 also state that TMDLs shall take into account critical conditions for stream flow, loading, and water quality parameters. TMDLs are often expressed as a mass load of the pollutant but can be expressed as a unit of concentration if appropriate (40 CFR 130.2(i)). Expressing these TMDLs as units of concentration is appropriate because an existing concentration-based water quality objective is used as the basis for the TMDL numeric target and attaining that concentration-based water quality objective will result in protection of the beneficial uses.
22. Upon establishment of TMDLs by the State or USEPA, the State is required to incorporate the TMDLs, along with appropriate implementation measures, into the State Water Quality Management Plan (40 CFR 130.6(c)(1) and 130.7 and California Water Code sections 13050(j) and 13242). The Basin Plan and applicable statewide plans

serve as the State Water Quality Management Plan governing the watersheds under the jurisdiction of the Central Coast Water Board.

23. Health and Safety Code section 57004 requires external scientific peer review for certain water quality control policies. Scientific portions of this TMDL are drawn exclusively from the Total Maximum Daily Loads for Nitrogen Compounds and Orthophosphate in the lower Salinas River and Reclamation Canal Basin, and the Moro Cojo Slough Subwatershed. As a result, the scientific portions of this TMDL have already undergone external, scientific peer review. Remaining portions of the TMDL, such as the implementation strategy, are not scientifically based, and therefore, not subject to the peer review requirements of section 57004. As a result, the Central Coast Water Board has fulfilled the requirements of Health and Safety Code section 57004, and the proposed amendment does not require further peer review.
24. Central Coast Water Board staff will conduct a review of implementation activities when monitoring and reporting data are submitted as required by the Agricultural Order and existing or future NPDES storm water permits, or when other monitoring data and/or reporting data are submitted outside the requirements of existing permits and orders. Central Coast Water Board staff will pursue modification of Agricultural Order conditions, NPDES storm water permit conditions, or other regulatory means, as necessary, to address remaining impairments resulting from nitrogen compounds or orthophosphate during the TMDL implementation phase.
25. Central Coast Water Board staff implemented a process to inform interested persons about the TMDLs. Central Coast Water Board staff's efforts to inform the public and solicit comment included public meetings with interested persons and a public notice and written comment period. Public notice of the proposed Basin Plan amendment provided the public a 45-day public comment period preceding the Central Coast Water Board hearing. Notice of public hearing was given by advertising in a newspaper of general circulation within the Region and by emailing a copy of the notice to all persons requesting such notice and applicable government agencies. Relevant documents and notices were also made available on the Central Coast Water Board website. Central Coast Water Board staff responded to oral and written comments received from the public. All public comments were considered.
26. Adoption of these TMDLs and Basin Plan amendments will not result in any degradation of water quality; in fact, they are designed to improve water quality. As such, these TMDLs and basin plan amendments comply with all requirements of both State and federal anti-degradation requirements (State Board Resolution 68-16, "Statement of Policy with Respect to Maintaining High Quality of Waters in California" and 40CFR 131.12).
27. The Central Coast Water Board recognizes that certain limited resource farmers (as defined by the U.S. Dept. of Agriculture) may have difficulty achieving compliance with this TMDL. The Central Coast Water Board will prioritize assistance for these farmers, including but not limited to technical assistance, grant opportunities, and necessary flexibility to achieve compliance (e.g., adjusted monitoring, reporting, or time schedules).
28. Pursuant to Public Resources Code section 21080.5, the Resources Agency has approved the Regional Water Boards' basin planning process as a "certified regulatory program" that adequately satisfies the California Environmental Quality Act (CEQA)

(Public Resources Code, Section 21000 et seq.) requirements for preparing environmental documents (14 Cal. Code Regs. §15251(g); 23 Cal. Code Regs. § 3782.). Central Coast Water Board staff has prepared “substitute environmental documents” for this project that contain the required environmental documentation as set forth in the State Water Board’s CEQA regulations (23 Cal. Code Regs. § 3777.). The substitute environmental documents include the TMDL Staff Report and several of its attachments, including 1) this Resolution and the Basin Plan Amendment Language (Attachment 1 of the Staff Report); 2) *Final Project Report for Total Maximum Daily Loads for Nitrogen Compounds and Orthophosphate for the Lower Santa Maria River and Tributaries to Oso Flaco Lake, Santa Barbara and San Luis Obispo Counties, California* (Attachment 2 of the Staff Report); 3) the CEQA Substitute Document with environmental checklist (Attachment 3 of the Staff Report); and 4) the comments and responses to comments (Attachment 6 of the Staff Report). The Staff Report also includes the Notice of Public Hearing/Notice of Filing (Attachment 4) and the Scientific Peer Review Comment (Attachment 5). The project itself is the establishment of TMDLs for nitrogen compounds and orthophosphate in the Lower Santa Maria River and Oso Flaco Lake Watersheds. The Water Board exercises discretion in assigning waste load allocations and load allocations, determining the program of implementation, and setting various milestones in achieving the water quality standards. The CEQA checklist and other portions of the substitute environmental documents contain significant analysis and numerous findings related to impacts and mitigation measures.

29. CEQA scoping meetings were conducted on December 12, 2006, February 26, 2007, and October 16, 2008, at the Central Coast Water Board, 895 Aerovista Place, Suite 101, San Luis Obispo; a notice of the CEQA scoping meeting was sent to interested persons prior to each scoping meeting on December 1, 2006, January 29, 2007, and August 28, 2008, respectively. The notice included a background of the project, the project purpose, a meeting schedule, and directions for obtaining more detailed information through the Central Coast Water Board website; the notice and project summary were available at the website or by requesting hard copies via telephone.
30. Public Resources Code section 21159 provides that an agency shall perform, at the time of the adoption of a rule or regulation requiring the installation of pollution control equipment or a performance standard or treatment requirement, an environmental analysis of the reasonably foreseeable methods of compliance, an analysis of the reasonably foreseeable environmental impacts of the methods of compliance, an analysis of reasonably foreseeable mitigation measures to lessen the adverse environmental impacts, and an analysis of reasonably foreseeable alternative means of compliance with the rule or regulation that would have less significant adverse impacts. Section 21159(c) requires that the environmental analysis take into account a reasonable range of environmental, economic, and technical factors; population and geographic areas; and specific sites. The Staff Report prepared for this Basin Plan amendment, in particular the CEQA Substitute Document Report (Attachment 3), provides the environmental analysis required by Public Resources Code section 21159 and is hereby incorporated as findings in this Resolution.
31. In preparing the substitute environmental documents, the Central Coast Water Board has considered the requirements of Public Resources Code section 21159 and California Code of Regulations, title 14, section 15187, and intends those documents to serve as a Tier 1 environmental review. This analysis is not intended to be an exhaustive analysis of every conceivable impact, but an analysis of the reasonably foreseeable consequences

of the adoption of this regulation, from a programmatic perspective. Compliance obligations will be undertaken directly by public agencies that may have their own obligations under CEQA. Project level impacts may need to be considered in any subsequent environmental analysis performed by other public agencies, pursuant to Public Resources Code section 21159.2. To the extent applicable, this Tier 1 substitute environmental document may be used to satisfy subsequent CEQA obligations of those agencies.

32. Consistent with the Water Board's substantive obligations under CEQA, the substitute environmental documents do not engage in speculation or conjecture, and only consider the reasonably foreseeable environmental impacts, including those relating to the methods of compliance, reasonably foreseeable feasible mitigation measures to reduce those impacts, and the reasonably foreseeable alternative means of compliance, that would avoid or reduce the identified impacts.
33. The Staff Report, the draft Basin Plan amendment, and the Environmental Checklist and associated analysis provide the necessary information pursuant to state law to conclude that the proposed TMDL, Implementation Plan, and the associated reasonably foreseeable methods of compliance will not have a significant adverse effect on the environment with the exception of potentially significant impacts associated with Biological Resources – CEQA Checklist Category IV(a) and potentially significant impacts to habitat of fish or wildlife species associated with Mandatory Findings of Significance – CEQA Checklist Category XVIII.(a). This determination is based on best available information in an effort to fully inform the interested public and the decision makers of potential environmental impacts. “Significant effects” on the environment are defined as *“a substantial, or potentially substantial, adverse change within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance”* (14 Cal. Code Regs. § 1538). California Water Code section 13360 precludes the Central Coast Water Board from dictating the manner in which responsible agencies comply with any of the Central Coast Water Board's regulations or orders. Wide-scale water conservation measure and changing water management practices potentially could result in lower flows to surface waters resulting in potentially substantial adverse changes to aquatic habitat. The Central Coast Water Board may not specify the manner of compliance so it has insufficient information to evaluate the extent to which dischargers would choose to use water conservation to comply and to evaluate potential physical changes to the environment that could result. Reduction in toxic runoff may offset impacts due to the reduced flows that could occur. In addition, reduction in water use could result in increased groundwater levels that would also result in more clean water to surface water. Given the uncertainty associated with evaluating the available information, it is possible that any adverse changes on aquatic habitat associated with the basin plan amendment will be less than substantial. When the agencies and responsible parties responsible for implementing these TMDLs determine how they will proceed then the agencies responsible for those parts of the project can and should incorporate such alternatives and mitigation into any subsequent projects or project approvals. These feasible alternatives and mitigation measures are described in more detail in the substitute environmental documents (14 Cal. Code Regs. § 15091(a)(2)).
34. Pursuant to CEQA Guidelines section 15093 (Cal. Code. Regs., tit. 14., § 15093), the Central Coast Water Board hereby finds that the project's benefits override and outweigh its potential significant adverse impacts, for the reasons more fully set forth in the Staff

Report and attachments thereto. Specific economic, social, and environmental benefits justify the adoption of this TMDL despite the project's potential significant adverse environmental impacts. The Central Coast Water Board has the authority and responsibility to regulate discharges of waste associated with the sources of pollution causing impairment to water quality. Many of those discharges have caused significant widespread degradation and/or pollution of waters of the state as described in the *Final Project Report for Total Maximum Daily Loads for Nitrogen Compounds and Orthophosphate in the Lower Santa Maria River Watershed and Tributaries to Oso Flaco Lake* and associated reference materials. This TMDL would result in actions to restore the quality of the waters of the state and protect the beneficial uses, including aquatic habitat. While some impacts could occur due to reduced flows, earth-moving, or from implementing other actions to comply with the TMDL, the benefits, which include contributing to the present and future restoration of beneficial water uses, and reducing or eliminating pollution, nuisance and contamination, warrant approval of the TMDL, despite each and every unavoidable impact. Upon review of the environmental information generated for this TMDL, including the CEQA Substitute Document with environmental checklist (Attachment 3 of the Staff Report) and in view of the entire record supporting the need for the TMDL, the Central Coast Water Board determines that specific economic, legal, social, technological, environmental, and other benefits of this TMDL outweigh the unavoidable adverse environmental effects, and that such adverse environmental effects are acceptable under the circumstances.

35. From a program-level perspective, incorporation of the alternatives and mitigation measures outlined in the substitute environmental documents will foreseeably reduce impacts to no impact, or keep the impact at less-than-significant levels.
36. The CEQA Substitute Document Report (Staff Report Attachment 3) identifies mitigation approaches that should be considered at the project level.
37. The Central Coast Water Board will request that the State Water Board approve the Basin Plan amendments incorporating TMDLs for nitrogen compounds and orthophosphate in the Lower Santa Maria River watershed and tributaries to Oso Flaco Lake. The TMDLs and Implementation Program for the TMDLs will become effective upon approval by the California Office of Administrative Law. The TMDLs must also be approved by the USEPA.
38. The amendments to the Basin Plan may have an effect on fish and wildlife. The Central Coast Water Board will, therefore, forward fee payments to the Department of Fish and Game under the California Fish and Game Code section 711.4.
39. Based on relevant future information, data, and research, the Central Coast Water Board has the discretion to conduct a water quality standards review which may potentially include one or more of the following: (1) The Water Board may designate critical low-flow conditions below which numerical water quality criteria do not apply, as consistent with federal regulations and policy; (2) The Water Board may authorize lowering of water quality to some degree if and where appropriate, if the Water Board finds water quality lowering to be necessary to accommodate important economic or social development. In authorizing water quality lowering the Water Board shall make any such authorizations consistent with the provisions and requirements of federal and state anti-degradation policies; (3) The Water Board may authorize revision of water quality standards, if appropriate and consistent with federal and state regulations, to remove a designated

beneficial use, establishing subcategories of uses, establishing site specific water quality objectives, or other modification of the water quality standard. When a standards action is deemed appropriate, the Water Board shall follow all applicable requirements, including but not limited to those set forth in part 131 of Title 40 of the Code of Federal Regulations and Article 3 of Division 7, Chapter 4 of the California Water Code.

40. The proposed amendments meet the "Necessity" standard of the Administrative Procedures Act, Government Code, section 11353, subdivision (b). As specified in Finding 22, federal regulations require that TMDLs be incorporated into the Water Quality Management Plan. The Central Coast Water Board's Basin Plan is the Central Coast Water Board's component of the Water Quality Management Plan, and the Basin Plan is how the Central Coast Water Board takes quasi-legislative planning actions. Moreover, the TMDL is a program of implementation for existing water quality objectives, and is, therefore, appropriately a component of the Basin Plan under the California Water Code, section 13242. The necessity of developing TMDLs is established in the TMDL staff report, the Clean Water Act section 303(d) list, and the data contained in the administrative record documenting the nitrogen compounds and orthophosphate impairments of the Lower Santa Maria River and Oso Flaco Lake Watersheds.
41. Consistent with Water Code section 13141, the amendment includes an estimate of the total cost of implementation of the agricultural related portions of this TMDL and identifies potential sources of financing.
42. On May 30, 2013, in San Luis Obispo, California, the Central Coast Water Board held a public hearing and heard and considered all public comments and evidence in the record.

THEREFORE, be it resolved that:

1. Pursuant to sections 13240, 13242, 13243, and 13244 of the California Water Code, the Central Coast Water Board, after considering the entire record, including the oral testimony at the hearing, hereby adopts the amendment in "Attachment-Proposed Basin Plan Amendments."
2. The Executive Officer is directed to forward copies of the Basin Plan amendment to the State Board in accordance with the requirements of section 13245 of the California Water Code.
3. The Central Coast Water Board requests that the State Water Board approve the Basin Plan amendments in accordance with the requirements of sections 13245 and 13246 of the California Water Code and forward them to the California Office of Administrative Law and the USEPA for approval.
4. The Executive Officer is authorized to sign a Certificate of Fee Exemption or transmit payment of the applicable fee as may be required to the Resources Agency.
5. If, during the approval process, Central Coast Water Board staff, State Water Board staff, the State Water Board or the California Office of Administrative Law determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.

6. The environmental documents prepared by the Central Coast Water Board staff pursuant to Public Resources Code 21080.5 are hereby certified.

I, Kenneth A, Harris Jr., Interim Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of the resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region on May 30, 2013.

Kenneth A. Harris Jr.
Interim Executive Officer

RESOLUTION NO. R3-2013-0013

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENTS

Revise the September 8, 1994 Basin Plan as follows:

AMENDMENT NO. 1. TOTAL MAXIMUM DAILY LOADS FOR NITROGEN COMPOUNDS AND ORTHOPHOSPHATE IN THE LOWER SANTA MARIA RIVER WATERSHED AND TRIBUTARIES TO OSO FLACO LAKE (INCLUDING BLOSSER CHANNEL, BRADLEY CHANNEL, BRADLEY CANYON CREEK, GREENE VALLEY CREEK, MAIN STREET CANAL, NORTH MAIN STREET CHANNEL, NIPOMO CREEK, ORCUTT CREEK, OSO FLACO CREEK, LITTLE OSO FLACO CREEK, AND SANTA MARIA RIVER).

Add the following to Chapter 4 after IX. R.:

IX. R. TOTAL MAXIMUM DAILY LOADS FOR NITROGEN COMPOUNDS AND ORTHOPHOSPHATE IN LOWER SANTA MARIA RIVER WATERSHED AND TRIBUTARIES TO OSO FLACO LAKE (INCLUDING BLOSSER CHANNEL, BRADLEY CHANNEL, BRADLEY CANYON CREEK, GREENE VALLEY CREEK, MAIN STREET CANAL, NORTH MAIN STREET CHANNEL, ORCUTT CREEK, OSO FLACO CREEK, LITTLE OSO FLACO CREEK, AND SANTA MARIA RIVER)

The Regional Water Quality Control Board adopted these TMDLs on May 30, 2013. These TMDLs were approved by:

The State Water Resources Control Board on: _____ (date).

The California Office of Administrative Law on: _____ (date).

The U.S. Environmental Protection Agency on: _____ (date).

Problem Statement

Discharges of nitrogen compounds and orthophosphate are occurring at levels in surface waters which are impairing a spectrum of beneficial uses and, therefore, constitute a serious water quality problem. The municipal and domestic drinking water supply (MUN, GWR) beneficial uses and aquatic habitat beneficial uses are currently not protected. Additionally, some waterbodies do not meet non-regulatory recommended guidelines for nitrate in agricultural supply water for sensitive crops indicating that potential or future designated agricultural supply beneficial uses may be detrimentally impacted. A total of 36 waterbody/pollutant combinations are addressed in this TMDL. The pollutants addressed in this TMDL are nitrate, un-ionized ammonia, and orthophosphate—orthophosphate is included as a pollutant contributing to biostimulatory impairments of surface waters. Reducing these pollutants will also address Clean Water Act section 303(d)-listed dissolved oxygen impairments in the TMDL project area.

As a result of these conditions, water quality standards are not being attained. By developing TMDLs for the aforementioned pollutants, the water quality standards violations being addressed in this TMDL include:

- Violations of drinking water standard for nitrate

- Violations of the Basin Plan general toxicity objective for inland surface waters and estuaries (violations of un-ionized ammonia objective)
- Violations of the Basin Plan narrative general objective for biostimulatory substances in inland surface waters and estuaries (as expressed by excessive nutrients, chlorophyll a, algal biomass, and low dissolved oxygen)

The TMDLs protect and restore the municipal and domestic water supply beneficial use (MUN) and aquatic habitat beneficial uses currently being degraded by violations of the toxicity objective and the biostimulatory substances objective, including the following beneficial uses: wildlife habitat (WILD), cold fresh water habitat (COLD), warm fresh water habitat (WARM), migration of aquatic organisms (MIGR), spawning, reproduction, and/or early development (SPWN), preservation of biological habitats of special significance (BIOL), and rare, threatened, or endangered species (RARE). In addition, current or potential future beneficial uses of the agricultural water supply beneficial use (AGR) are not being supported. Nitrate can create problems not only for water supplies and aquatic habitat, but also potentially for nitrogen sensitive crops (grapes, avocado, citrus) by detrimentally impacting crop yield or quality.

For waterbodies that are not expressing biostimulatory impairments, the most stringent relevant water quality objective for nitrate (and therefore the one that is protective of the full range of all nitrate-impaired designated beneficial uses) is the numeric Basin Plan objective for nitrate in municipal and domestic water supply. Reducing nitrate pollution and ultimately achieving the nitrate drinking water quality standard in these waterbodies will therefore restore and be protective of the full range of MUN, GWR and/or AGR designated beneficial uses of the surface waters which are being currently impaired by excess nitrate.

All waterbodies are required to attain the Basin Plan general toxicity objective for unionized ammonia in inland surface waters and estuaries.

For waterbodies that are expressing biostimulatory impairments, the most stringent relevant water quality objective for nitrate-nutrients (and therefore the one that is protective of the full range of all nutrient-impaired designated beneficial uses) is the Basin Plan narrative general objective for biostimulatory substances in inland surface waters and estuaries. These waterbodies must achieve concentration-based TMDLs for nitrate and orthophosphate as identified herein. Reducing nutrient pollution and ultimately achieving the TMDLs for nutrients in these waterbodies will therefore restore and be protective of the full range of Aquatic Habitat, MUN, GWR, and/or AGR designated beneficial uses of the surface waters which are being currently impaired by excess nutrients.

The following impairments are addressed with this TMDL project:

- Blosser Channel: unionized ammonia, nitrate.
- Bradley Canyon Creek: unionized ammonia, nitrate, low dissolved oxygen, biostimulatory substances.
- Bradley Channel: unionized ammonia, nitrate.
- Greene Valley Creek: unionized ammonia, nitrate, low dissolved oxygen, biostimulatory substances.
- Little Oso Flaco Creek: nitrate, biostimulatory substances.
- Main Street Canal: unionized ammonia, nitrate.
- Nipomo Creek: nitrate (Clean Water Act section 303(d) listed but not impaired).
- North Main Street Channel: nitrate.

- Orcutt Creek: unionized ammonia, nitrate, low dissolved oxygen, biostimulatory substances.
- Oso Flaco Creek: unionized ammonia, nitrate, biostimulatory substances.
- Santa Maria River: nitrate (all reaches), biostimulatory substances (downstream of Hwy 1).
- Santa Maria River Estuary: low dissolved oxygen, biostimulatory substances.

Numeric Targets

Numeric targets are water quality targets developed and used to ascertain when and where water quality objectives are achieved, and hence, when beneficial uses are protected.

➤ Target for Nitrate (MUN-GWR standards)

For impaired stream reaches that are required to support drinking water (MUN) and groundwater recharge (GWR) beneficial uses, the nitrate numeric target is 10 mg/L (nitrate as N) for this TMDL, which therefore is equal to the Basin Plan's numeric nitrate water quality objective protective of drinking water beneficial uses.

➤ Target for Unionized Ammonia (toxicity)

For unionized ammonia (a nitrogen compound), the numeric target is 0.025 mg/L (as N) for this TMDL, which therefore is equal to the Basin Plan's unionized ammonia numeric water quality objective protective against toxicity in surface waters.

➤ Targets for Biostimulatory Substances (nitrate and orthophosphate)

The Basin Plan contains the following narrative water quality objectives for biostimulatory substances:

"Waters shall not contain biostimulatory substances in concentrations that promote aquatic growths to the extent that such growths cause nuisance or adversely affect beneficial uses."

To implement this narrative objective, staff developed scientifically peer-reviewed numeric targets, based on established methodologies and approaches. The numeric targets for biostimulatory substances are presented in Table 1.

Table 1. Numeric targets for biostimulatory substances.

<u>Stream Reaches</u>	<u>Nitrate (mg/L-N)</u>	<u>Orthophosphate (mg/L-P)</u>
<u>Lower Santa Maria River from Highway 1 to Santa Maria River Estuary, Santa Maria River Estuary, Orcutt Creek, Greene Valley Creek, Bradley Canyon Creek</u>	<u>4.3</u> <u>Dry Season Samples</u> <u>(May 1-Oct 31)</u>	<u>0.19</u> <u>Dry Season Samples</u> <u>(May 1-Oct 31)</u>
	<u>8.0</u> <u>Wet Season Samples</u> <u>(Nov 1-Apr 30)</u>	<u>0.3</u> <u>Wet Season Samples</u> <u>(Nov 1-Apr 30)</u>
<u>Oso Flaco Creek, Little Oso Flaco Creek</u>	<u>5.7</u> <u>Year Round Samples</u>	<u>0.08</u> <u>Year Round Samples</u>

➤ Targets for Nutrient-Response Indicators (dissolved oxygen, chlorophyll a, and microcystins)

Dissolved oxygen, chlorophyll a, and microcystin numeric targets are identified to ensure that streams do not show evidence of biostimulatory conditions, and to provide primary indicator metrics to assess biological response to future nutrient water column concentration reductions.

For water bodies designated as cold fresh water habitat (COLD) and spawning (SPWN) beneficial uses the dissolved oxygen numeric targets is the same as Basin Plan numeric water quality objective which states that dissolved oxygen concentrations shall not be reduced below 7.0 mg/L at any time.

For water bodies designated as warm fresh water habitat (WARM) beneficial use and for waters not mentioned by a specific beneficial use the dissolved oxygen numeric targets is the same as Basin Plan numeric water quality objective which states that dissolved oxygen concentrations shall not be reduced below 5.0 mg/L at any time.

Additionally, for all inland surface waters, enclosed bays and estuaries, the dissolved oxygen numeric target is the same as the Basin Plan numeric water quality objective which states that median dissolved oxygen should not fall below 85% saturation as a result of controllable water quality conditions.

For water bodies designated as cold fresh water habitat (COLD) and spawning (SPWN) or warm fresh water habitat (WARM) beneficial uses the numeric water quality target indicative of excessive dissolved oxygen saturation conditions dissolved oxygen is 13 mg/L (i.e., water column dissolved oxygen concentrations not to exceed 13 mg/L.)

The numeric water quality target for chlorophyll a is 15 micrograms per liter (µg/L) for all water bodies (i.e., water column chlorophyll a concentrations not to exceed 15 µg/L).

The numeric water quality target for microcystin is 0.8 µg/L for all waterbodies (i.e., water column microcystin concentrations not to exceed 0.8 µg/L includes LA, LR, RR, and YR).

Source Analysis

Discharges of unionized ammonia, nitrate, and orthophosphate originating from irrigated agriculture, urban lands, grazing lands, and natural sources are contributing loads to receiving waters. Irrigated agriculture is the overwhelming majority of controllable water column loads in the TMDL project area and this source category is not currently meeting its proposed load allocation. Urban storm water is a relatively minor source of nitrogen compounds and orthophosphate. Grazing lands are currently meeting proposed load allocations. This source analysis is consistent with source analyses reported by other scientists in previous nutrient-water quality studies in the lower Santa Maria and Oso Flaco Lake watersheds, which provides for a qualitative weight-of-evidence approach.

TMDLs

The following TMDLs will result in resolving impairments described in the Problem Statement.

The unionized ammonia TMDLs for all waters and reaches of the Santa Maria River and Oso Flaco Lake Watersheds, including Blosser Channel, Bradley Channel, Bradley Canyon Creek, Greene Valley Creek, Main Street Canal, North Main Street Channel, Nipomo Creek, Orcutt Creek, Oso Flaco Creek, Little Oso Flaco Creek, Santa Maria River, and the Santa Maria River Estuary is:

- Unionized ammonia concentration shall not exceed 0.025 mg/L-N in receiving waters.

The nitrate TMDL for all waters and reaches of the Santa Maria River and Oso Flaco Lake Watersheds required to support the MUN beneficial use, including, Blosser Channel, Bradley Channel, Nipomo Creek, Main Street Canal, North Main Street Channel, and Santa Maria River (upstream of Highway 1) is:

- Nitrate concentration shall not exceed 10 mg/L-N in receiving waters.

The nitrate and orthophosphate TMDLs for lower Santa Maria River (from Highway 1 to Pacific Ocean), the Santa Maria River Estuary, and all reaches and tributaries of Orcutt Creek, Greene Valley Creek, and Bradley Canyon Creek are:

- For dry season (May 1 to October 31): Nitrate concentration shall not exceed 4.3 mg/L-N in receiving waters; orthophosphate concentration shall not exceed 0.19 mg/L-P in receiving waters, and
- For wet season (November 1 to April 30): Nitrate concentration shall not exceed 8.0 mg/L-N in receiving water; orthophosphate concentration shall not exceed 0.3 mg/L-P in receiving water.

The nitrate and orthophosphate TMDLs for all reaches and tributaries of Oso Flaco Creek and Little Oso Flaco Creek are:

- For all seasons: Nitrate shall not exceed 5.7 mg/L-N in receiving waters; orthophosphate shall not exceed 0.08 mg/L-P in receiving waters.

The TMDLs are considered achieved when water quality conditions meet all regulatory and policy requirements necessary for removing the impaired waters from Clean Water Act section 303(d) list of impaired waters.

Final Allocations and Interim Allocations

Owners and operators of irrigated lands, municipal storm water entities, natural sources, and owners/operators of livestock and domestic animals are assigned unionized ammonia, nitrate, and orthophosphate allocations equal to the TMDL and numeric targets.

The final allocations to responsible parties are shown in Table IX R-1. The final allocations are equal to the TMDLs and should be achieved 30 years after the TMDL effective date. Unlike the load-based TMDL method, the concentration-based allocations do not add up to the TMDL because concentrations of individual pollution sources are not additive.

Recognizing that achievement of the more stringent final dry-season biostimulatory allocations embedded in Table IX R-1 may require a significant amount of time to achieve, interim allocations are identified. Interim allocations will be used as benchmarks in assessing progress towards the final allocations. Interim allocations are shown in Table IX R-2.

Controllable Water Quality Conditions

In accordance with the Water Quality Control Plan for the Central Coastal Basin (Basin Plan), controllable water quality shall be managed to conform or to achieve the water quality objectives and load allocations contained in this TMDL. The Basin Plan defines controllable water quality conditions as follows: “Controllable water quality conditions are those actions or circumstances resulting from man’s activities that may influence the quality of the waters of the State and that may be reasonably controlled.” - Chapter 3. Water Quality Objectives, page III-2.

Compliance with Antidegradation Requirements

State and federal antidegradation policies require, in part, that where surface waters are of higher quality than necessary to protect beneficial uses, the high quality of those waters must be maintained unless otherwise provided by the policies. The federal antidegradation policy, 40 C.F.R. 131.12(a) states, in part. “Where the quality of waters exceed levels necessary to support propagation of fish, shellfish, and wildlife and recreation in and on the water, that quality shall be maintained and protected unless the State finds, after full satisfaction of the intergovernmental coordination and public participation provisions of the State’s continuing planning process, that allowing lower water quality is necessary to accommodate important economic or social development in the area in which the waters are located...”

Compliance with anti-degradation requirements may be determined on the basis of trends in declining water quality in applicable waterbodies, consistent with the methodologies and criteria provided in Section 3.10 of the California 303(d) Listing Policy (adopted, Sept. 20, 2004, SWRCB Resolution No. 2004-0063). Section 3.10 of the California 303(d) Listing Policy explicitly addresses the anti-degradation component of water quality standards as defined in 40 CFR 130.2(j), and provides for identifying trends of declining water quality as a metric for assessing compliance with anti-degradation requirements.

Section 3.10 of the California 303(d) Listing Policy states that pollutant-specific water quality objectives need not be exceeded to be considered non-compliance with anti-degradation requirements “if the water segment exhibits concentrations of pollutants or water body conditions for any listing factor that shows a trend of declining water quality standards attainment”.

Practically speaking, this means that, for example, stream reaches or waterbodies that have a concentration-based TMDL allocation of 10 mg/L nitrate as N, and if current water quality or future water quality assessments in the stream reach indicate nitrate in fact well under 10 mg/L nitrate as N, the allocation does not give license for controllable nitrogen sources to degrade the water resource all the way up to the maximum allocation = 10 mg/L nitrate as N.

Table IX R-1. Final Allocations and Responsible Parties

FINAL WASTE LOAD ALLOCATIONS (WLAs)				
<u>Waterbody the Responsible Party is Discharging to</u> ^{1, 2}	<u>Party Responsible for Allocation & NPDES/WDR number</u>	<u>Receiving Water Nitrate as N WLA (mg/L)</u>	<u>Receiving Water Orthophosphate as P WLA (mg/L)</u>	<u>Receiving Water Unionized Ammonia as N WLA (mg/L)</u>

<u>All waterbodies the responsible party is assigned load allocations (LAs) in Table IX R-1</u>	<u>Owners/operators of irrigated agricultural lands (Discharges from irrigated lands)</u>	<u>Achieve MUN standard-based and Unionized Ammonia objective-based allocations:</u> <u>Allocation-3</u> <u>Allocation-4</u> <u>12 years after effective date of TMDL</u>	<u>Achieve Wet Season (Nov. 1 to Apr. 30) or Year-round Biostimulatory target-based TMDL allocations:</u> <u>Allocation-1</u> <u>Allocation-2</u> <u>Allocation-5</u> <u>Allocation-6</u> <u>20 years after effective date of TMDL</u>

* Responsible parties shall meet allocations in all receiving surface waterbodies of the responsible parties' discharges.

The parties responsible for the allocation to controllable sources are not responsible for the allocation to natural sources.

Margin of Safety

A margin of safety is incorporated implicitly in the TMDLs through conservative model assumptions and statistical analysis. In addition, an explicit margin of safety is incorporated by reserving 20% of the load, calculated on a concentration basis, from wet season allocations.

Implementation

DISCHARGES FROM IRRIGATED AGRICULTURAL LANDS:

Implementing parties will comply with the Conditional Waiver of Waste Discharge Requirements for Irrigated Lands (Order R3-2012-0011) and the Monitoring and Reporting Programs in accordance with Orders R3-2012-0011-01, R3-2012-0011-02, and R3-2012-0011-03 to meet load allocations and achieve the TMDL.

Current requirements in the Agricultural Order that will achieve the load allocations include:

- A. Implement, and update as necessary, management practices to reduce nutrient loading.
- B. Maintain existing, naturally occurring, riparian vegetative cover in aquatic habitat areas.
- C. Develop/update and implement Farm Plans.
- D. Properly destroy abandoned groundwater wells.
- E. Develop, and initiate implementation of an Irrigation and Nutrient Management Plan (INMP) or alternative certified by a Professional Soil Scientist, Professional Agronomist, or Crop Advisor certified by the American Society of Agronomy, or similarly qualified professional.

Monitoring

Owners and operators of irrigated agricultural lands will perform monitoring and reporting in accordance with Monitoring and Reporting Program Orders R3-2012-0011-01, R3-2012-0011-02, and R3-2012-0011-03, as applicable to the operation.

Determination of Compliance with Load Allocations

Load allocations will be achieved through a combination of implementation of management practices and strategies to reduce nitrogen compound and orthophosphate loading, and water quality monitoring. Flexibility to allow owners/operators of irrigated lands to demonstrate compliance with load allocations is a consideration; additionally, staff is aware that not all implementing parties are necessarily contributing to or causing a surface water impairment. However, it is important to recognize that degrading shallow groundwater with nutrients may also degrade surface water quality via baseflow loading contributions to the creek.

To allow for flexibility, Water Board staff will assess compliance with load allocations using one or a combination of the following:

- A. attaining the load allocations in the receiving water;
- B. attaining receiving water TMDL numeric targets for nutrient-response indicators (i.e., dissolved oxygen water quality objectives, chlorophyll a targets and microcystin targets) may constitute a demonstration of attainment of the nitrate, nitrogen and orthophosphate-based seasonal biostimulatory load allocations. Note that implementing

parties are strongly encouraged to maximize overhead riparian canopy, where and if appropriate, using riparian vegetation, because doing so could result in achieving nutrient-response indicator targets before allocations are achieved (resulting in a less stringent allocation);

- C. demonstrating quantifiable receiving water mass load reductions.
- D. owners/operators of irrigated lands may be deemed in compliance with load allocations by implementing management practices that are capable of achieving interim and final load allocations identified in the TMDL;
- E. owners/operators of irrigated lands may provide sufficient evidence to demonstrate that they are and will continue to be in compliance with the load allocations; such evidence could include documentation submitted by the owner/operator to the Executive Officer that the owner/operator is not causing waste to be discharged to impaired waterbodies resulting or contributing to violations of the load allocations.

STORM DRAIN DISCHARGES TO MS4s:

The Central Coast Water Board will require the MS4 entities to develop and submit for Executive Officer approval a Wasteload Allocation Attainment Program (WAAP). The WAAP shall be submitted within one year of approval of the TMDL by the Office of Administrative Law, or within one year of a storm water permit renewal, whichever occurs first. The WAAP shall include descriptions of the actions that will be taken by the MS4 entity to attain the TMDL wasteload allocations, and specifically address:

- 1. Development of an implementation and assessment strategy;
- 2. Source identification and prioritization;
- 3. Best management practice identification, prioritization, implementation schedule, analysis, and effectiveness assessment;
- 4. Monitoring and reporting program development and implementation. Monitoring program goals shall include: 1) assessment of storm water discharge and receiving water discharge quality 2) assessment of best management effectiveness, and 3) demonstration of progress towards achieving interim targets and wasteload allocations;
- 5. Coordination with stakeholders; and
- 6. Other pertinent factors.

Determination of Compliance with Waste Load Allocations

Waste load allocations will be achieved through a combination of implementation of management practices and strategies to reduce nitrogen compound and orthophosphate loading. Water quality monitoring will be included as well.

To be consistent with waste load allocations, Water Board staff will evaluate compliance with waste load allocations using one or a combination of the following:

- A. attaining the waste load allocations in the receiving water;

- B. attaining receiving water TMDL numeric targets for nutrient-response indicators (i.e., dissolved oxygen water quality objectives, chlorophyll a targets and microcystin targets) may constitute a demonstration of the attainment of the nitrate, nitrogen and orthophosphate-based seasonal biostimulatory waste load allocations. Note that implementing parties are strongly encouraged to maximize overhead riparian canopy using riparian vegetation, as appropriate, because doing so could result in achieving nutrient-response indicator targets before allocations are achieved (resulting in a less stringent allocation);
- C. demonstrating reduction of nutrient concentrations in storm water outfalls. Optionally, where storm water is conveyed through managed flood protection facilities that also serve to treat and improve water quality (e.g., treatment wetlands, bioreactors, etc.), compliance may be demonstrated by measuring storm water quality before entering the receiving water body.

In order to achieve attainment of waste load allocations, Water Board staff may additionally consider:

- D. load reductions demonstrations on mass basis at storm drain outfalls and/or downstream of treatment systems;
- E. implementation and assessment of pollutant loading reduction projects (BMPs), capable of achieving interim and final waste load allocations identified in this TMDL in combination with water quality monitoring for a balanced approach to determining program effectiveness;
- F. any other effluent limitations and conditions which are consistent with the assumptions and requirements of the waste load allocations.

Monitoring

The City of Santa Maria, City of Guadalupe, County of San Luis Obispo (Nipomo), and County of Santa Barbara (Orcutt) are required to develop and submit monitoring programs as part of their WAAP. The goals of the monitoring programs are described in the requirements of the WAAP.

Staff encourages the City of Santa Maria, City of Guadalupe, County of San Luis Obispo (Nipomo), County of Santa Barbara (Orcutt) to develop and submit creative and meaningful monitoring programs. Monitoring strategies can use a phased approach, for example, whereby outfall or receiving water monitoring is phased in after best management practices have been implemented and assessed for effectiveness. Pilot projects where best management practices are implemented in well-defined areas covering a fraction of the MS4 that facilitates accurate assessment of how well the best management practices control pollution sources, is acceptable, with the intent of successful practices then being implemented in other or larger parts of the MS4.

DOMESTIC ANIMAL/LIVESTOCK DISCHARGES:

The water quality data available for stream reaches that exclusively drain grazing lands, or lands where grazed animals and farm animals can be expected to occur, indicate the nitrogen compounds and orthophosphate proposed water quality targets, and thus load allocations, are being met in these reaches. Based on available data, this source category is meeting their load allocation. As such, no new regulatory requirements are deemed necessary or are being proposed.

It is important to note that the TMDL project area is subject to the Domestic Animal Waste Discharge Prohibition and are subject to compliance with an approved indicator bacteria TMDL load allocation. Implementation efforts by responsible parties to comply with this prohibition and with indicator bacteria load allocations will, as a practical matter, also reduce the risk of nitrogen and phosphorus loading to surface waters from domestic animal waste. It should be noted that available information does not conclusively demonstrate that all domestic animal operations are currently meeting load allocations; there are potentially unpermitted confined animal facilities, equestrian facilities, or grazing animal operations that do not meet load allocations. More information will be obtained, if merited, during the implementation phase of the TMDL to further assess the level of nutrient contribution from these source categories, and to identify any actions if necessary to reduce loading.

Tracking and Evaluation

Every three years, beginning three years after TMDLs are approved by the Office of Administrative Law, the Central Coast Water Board will perform a review of implementation actions, monitoring results, and evaluations submitted by responsible parties of their progress toward achieving their allocations, dependent upon staff availability and priorities. The Central Coast Water Board will use annual reports, nonpoint source pollution control implementation programs, evaluations submitted by responsible parties, and other available information to determine progress toward implementing required actions and achieving the allocations and the numeric targets.

Responsible parties will continue monitoring and reporting according to this plan for at least three years, at which time the Central Coast Water Board will determine the need for continuing or otherwise modifying the monitoring requirements. Responsible parties may also demonstrate that although water quality objectives are not being achieved in receiving waters, controllable sources of nitrogen compounds and orthophosphate are not contributing to the exceedance. If this is the case, the Central Coast Water Board may re-evaluate the numeric target and allocations. For example, the Central Coast Water Board may pursue and approve a site-specific objective. The site-specific objective would be based on evidence that natural conditions or background sources alone were the cause of exceedances of the Basin Plan water quality objectives.

Three-year reviews will continue until the water quality objectives are achieved. The compliance schedule for achieving this TMDL is 30 years after the date of approval by the Office of Administrative Law.

Optional Special Studies and Reconsideration of the TMDL

Additional monitoring and voluntary optional special studies would be useful to evaluate the uncertainties and assumptions made in the development of this TMDL. The results of special studies may be used to reevaluate waste load allocations and load allocations in this TMDL. Implementing parties may submit work plans for optional special studies (if implementing parties choose to conduct special studies) for approval by the Executive Officer. Special studies completed and final reports shall be submitted for Executive Officer approval. Additionally, eutrophication is an active area of research; consequently ongoing eutrophication and biostimulation scientific research may further inform the Water Board regarding waste load or load allocations that are protective against biostimulatory impairments, implementation timelines, and/or downstream impacts. At this time, staff maintains there is sufficient information to begin to implement the TMDL and make progress towards attainment of water

quality standards and the proposed allocations. However, in recognition of the uncertainties regarding nutrient pollution and biostimulatory impairments, staff proposes that the Water Board reconsider the waste load and load allocations, if merited by optional special studies and new research, ten years after the effective date of the TMDL, which is upon approval by the Office of Administrative Law (OAL). A time schedule for optional studies and Central Coast Water Board reconsideration of the TMDL is presented in Table IX R-3.

Further, the Central Coast Water Board may also reconsider these TMDLs, the nutrient water quality criteria, or other TMDL elements on the basis of potential future promulgation of a statewide nutrient policy for inland surface waters in the State of California.

Table IX R-3. Time schedule for optional studies and Water Board reconsideration of waste load allocations and load allocations

<u>Proposed Actions</u>	<u>Description</u>	<u>Time Schedule-Milestones</u>
<u>Optional studies work plans</u>	<u>Implementing parties shall submit work plans for optional special studies (if implementing parties choose to conduct special studies) for approval by Executive Officer</u>	<u>By five years after the effective date of the TMDL</u>
<u>Final optional studies</u>	<u>Optional studies completed and final report submitted for Executive Officer approval.</u>	<u>By eight years after the effective date of the TMDL</u>
<u>Reconsideration of TMDL</u>	<u>If merited by optional special studies or information from ongoing research into eutrophication issues, the Water Board will reconsider the Wasteload and Load allocations and/or implementation timelines adopted pursuant to this TMDL.</u>	<u>By ten years after the effective date of the TMDL</u>

**CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, CA 93401-7906**

RESOLUTION NO. R3-2013-0008

**AMENDING THE WATER QUALITY CONTROL PLAN FOR THE CENTRAL COASTAL
BASIN TO ADOPT TOTAL MAXIMUM DAILY LOADS FOR NITROGEN COMPOUNDS AND
ORTHOPHOSPHATE IN THE LOWER SALINAS RIVER AND RECLAMATION CANAL
BASIN AND THE MORO COJO SLOUGH SUBWATERSHED**

The Regional Water Quality Control Board, Central Coast Region (Central Coast Water Board) finds:

1. The Central Coast Water Board adopted the second edition of the Water Quality Control Plan for the Central Coastal Basin (Basin Plan), on September 8, 1994. The Basin Plan designates beneficial uses and water quality objectives, sets forth implementation plans to achieve water quality objectives addressing point source and nonpoint source discharges, establishes prohibitions, and incorporates statewide plans and policies.
2. The Central Coast Water Board periodically revises and amends the Basin Plan. The Central Coast Water Board has determined the Basin Plan requires further revision and amendment to incorporate Total Maximum Daily Loads (TMDLs) and an implementation plan for nitrogen compounds (nitrate and unionized ammonia) and orthophosphate in the Lower Salinas River and Reclamation Canal Basin and the Moro Cojo Slough Subwatershed, which include the waterbodies Alisal Creek, Alisal Slough, Blanco Drain, Chualar Creek, Esperanza Creek, Espinosa Slough, Gabilan Creek, Merrit Ditch, Moro Cojo Slough, Natividad Creek, Old Salinas River, Quail Creek, the Reclamation Canal, the Lower Salinas River (downstream of Gonzalez), Santa Rita Creek, and Tembladero Slough.
3. The geographic scope of this TMDL encompasses approximately 405 square miles of the lower Salinas Valley in northern Monterey County and includes the lowermost Salinas River, Moro Cojo Slough, Tembladero Slough, the Reclamation Canal, and associated upstream tributaries; hereafter collectively referred to as the "TMDL Project Area." Agriculture (including irrigated cropland and grazing lands) is the current dominant land use in the TMDL Project Area, with increasing transition to urban use. The City of Salinas and other urbanized areas account for approximately eight percent of the TMDL Project Area's land use. Grassland, chaparral, and oak woodland make up substantial parts of the upland reaches of the watershed.
4. Multiple waterbodies within the TMDL Project Area are listed on California's Clean Water Act Section 303(d) list for water quality impairments due to nitrate, unionized ammonia, nutrients, low dissolved oxygen, and chlorophyll-*a* (an algal biomass indicator). Due to the Clean Water Act 303(d) listings, the Central Coast Water Board is required to adopt a TMDL and an associated implementation plan (40 CFR 130.6(c)(1), 130.7, California Water Code section 13242).
5. Available data indicate 1) widespread violations of the Basin Plan's drinking water standard for nitrate, 2) widespread violations of the Basin Plan's unionized ammonia general toxicity objective for inland surface waters, and 3) widespread violations of the Basin Plan's narrative general objective for biostimulatory substances in inland surface waters and estuaries. In

addition, some surface waterbodies are locally not meeting non-regulatory recommended guidelines for nitrate in agricultural supply water (AGR) for sensitive crop types, indicating that potential or future designated agricultural supply beneficial uses may locally be detrimentally impacted.

6. Available data indicate that discharges of nutrients (specifically, nitrogen compounds and orthophosphate) are occurring at levels in surface waters which are impairing a wide spectrum of beneficial uses, including impairments of municipal and domestic drinking water supply beneficial uses, impairments of aquatic habitat beneficial uses, impairments of groundwater recharge beneficial uses, and degradation locally of designated agricultural water supply beneficial uses (including irrigation supply for sensitive crops and livestock watering).
7. The Central Coast Water Board's goal for establishing TMDLs in the TMDL Project Area is to rectify the impairment due to unionized ammonia, nitrate, and orthophosphate, thereby providing support for the designated beneficial uses of municipal and domestic water supply (MUN), cold and warm fresh water habitat (COLD and WARM), groundwater recharge (GWR), agricultural water supply (AGR), and to support water quality standards attainment with regard to the Basin Plan's general toxicity water quality objective for unionized ammonia, and the Basin Plan's water quality objective for biostimulatory substances.
8. The Central Coast Water Board proposes to amend the Basin Plan by inserting amendments into Chapter Four Section IX (Total Maximum Daily Loads).
9. On May 20, 2004, the State Water Resources Control Board (State Water Board) adopted the *Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program* (NPS Policy). The NPS Policy requires the Regional Water Quality Control Boards to regulate all nonpoint sources of pollution using the administrative permitting authorities provided by the Porter-Cologne Water Quality Control Act (Porter-Cologne Act, Wat. Code Div. 7). Consistent with the NPS Policy and the Porter-Cologne Act, Regional Water Quality Control Boards regulate nonpoint source discharges with waste discharge requirements, waivers of waste discharge requirements, and/or Basin Plan prohibitions.
10. On May 20, 2004, the State Water Board adopted the *Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List* (State Water Board Resolution No. 2004-0063), hereafter referred to as the *California 303(d) Listing Policy*. The *California 303(d) Listing Policy* describes the process by which the State Water Board and the Regional Water Quality Control Boards will comply with the listing requirements of the federal Clean Water Act (CWA). The objective of the *California 303(d) Listing Policy* is to establish a standardized approach for developing California's CWA section 303(d) list and to provide guidance for interpreting data and information to make decisions regarding water quality standards attainment.
11. On June 16, 2005, the State Water Board adopted the *Water Quality Control Policy for Addressing Impaired Waters: Regulatory Structure and Options* (State Water Board Resolution 2005-0050), hereafter referred to as the *Impaired Waters Policy*. The *Impaired Waters Policy* provides policy and procedures for adopting TMDLs and addressing impaired waters in California. The *Impaired Waters Policy* states that the Regional Water Quality Control Boards have independent discretion, broad flexibility, numerous options, and some legal constraints that apply when determining how to address impaired waters.
12. Chualar Creek, Espinosa Slough, Meritt Ditch, Moro Cojo Slough, Natividad Creek, the Reclamation Canal, Quail Creek, and Santa Rita Creek are listed on California's 2008-2010

Clean Water Act 303(d) list as impaired due to unionized ammonia. Consequently, these waterbodies do not meet the Basin Plan toxicity objectives for inland surface waters, enclosed bays, and estuaries. In addition, although not listed on California's 2008-2010 Clean Water Act 303(d) list for unionized ammonia, available data indicate that Alisal Creek and Alisal Slough are impaired due to unionized ammonia on the basis of the listing criteria and methodologies identified in the *California 303(d) Listing Policy*.

13. Alisal Creek, Alisal Slough, Chualar Creek, Esperanza Creek, Gabilan Creek, Merrit Ditch, Natividad Creek, the Old Salinas River, Quail Creek, the Lower Salinas River (below Gonzalez), and Santa Rita Creek [are listed on California's 2008-2010 Clean Water Act 303(d) list as impaired due to nitrate. These water bodies are currently not supporting the following beneficial use designated by the Basin Plan: municipal and domestic drinking water supply (MUN).
14. Blanco Drain, Espinosa Slough, the Reclamation Canal, and Tembladero Slough are listed on California's 2008-2010 Clean Water Act 303(d) list as impaired due to nitrate on the basis of non-attainment of the Basin Plan's biostimulatory substances water quality objective. These water bodies are currently not supporting the following beneficial uses designated by the Basin Plan: aquatic habitat (WARM, COLD, SPWN).
15. The Salinas River Lagoon (North) and Tembladero Slough are listed on California's 2008-2010 Clean Water Act 303(d) list as impaired due to nutrients on the basis of non-attainment of the Basin Plan's biostimulatory substances water quality objective. In addition, although not listed on California's 2008-2010 Clean Water Act 303(d) list for nutrients causing biostimulation, available data indicate the following waterbodies are in violation of the Basin Plan's biostimulatory substances objective: Alisal Creek, Alisal Slough, Blanco Drain, Espinosa Slough, Merrit Ditch, Moro Cojo Slough, Natividad Creek, the Old Salinas River, the Reclamation Canal, the Lower Salinas River (below Gonzalez), and Santa Rita Creek.
16. The lower Salinas River (downstream of Spreckels) and Gabilan Creek (downstream of Crazy Horse Road) do not meet non-regulatory recommended guidelines for nitrate in agricultural supply water for sensitive crop types, indicating that potential or future designated agricultural supply beneficial uses may be detrimentally impacted.
17. Alisal Creek and Gabilan Creek (downstream of Crazy Horse Road) are listed on California's 2008-2010 Clean Water Act 303(d) list as impaired due to nitrate on the basis of non-attainment of the Basin Plan's water quality objective for municipal and domestic drinking water supply (MUN); these waterbodies are also not supporting their designated groundwater recharge (GWR) beneficial use based on the Basin Plan's drinking water objective and specific lines of evidence consistent with the *California 303(d) Listing Policy*.
18. Low dissolved oxygen is a nutrient-response indicator and represents a primary biological response to excessive nutrient loading in waterbodies which exhibit biostimulatory conditions. Alisal Slough, Blanco Drain, Merrit Ditch, Moro Coho Slough, Natividad Creek, the Old Salinas River, Quail Creek, the Reclamation Canal, and Santa Rita are on the 2008-2010 Clean Water Act 303(d) list of impaired waters for low dissolved oxygen impairment and are expressing biostimulatory conditions. In addition, although not listed on California's 2008-2010 Clean Water Act 303(d) list for low dissolved oxygen, available data indicates that Tembladero Slough is impaired due to low dissolved oxygen on the basis of the listing criteria and methodologies identified in the *California 303(d) Listing Policy*. Reductions in nutrient loading described in the Staff Report are anticipated to be beneficial in attainment of water quality standards for DO and restoring the waterbodies to a desired condition. Nutrient concentrations by themselves constitute indirect indicators of biostimulatory conditions and

there is an interrelationship between high nutrient loads, excessive algal growth, and the subsequent impacts of excessive algae on dissolved oxygen and aquatic habitat. Further, numeric targets identified for DO in the TMDL will be used as indicator metrics to assess primary biological response to future nutrient water column concentration reductions and compliance with the Basin Plan's biostimulatory substances objective.

19. Chlorophyll-*a* is a nutrient-response indicator and represents a primary biological response to excessive nutrient loading in waterbodies which exhibit biostimulatory conditions. Alisal Creek, the Old Salinas River, and Tembladero Slough are on the 2008-2010 Clean Water Act 303(d) list of impaired waters for chlorophyll-*a* impairment and are expressing biostimulatory conditions. Reductions in nutrient loading described in the Staff Report are anticipated to be beneficial in attainment of water quality standards for chlorophyll-*a* and restoring the waterbodies to a desired condition. Further, numeric targets identified for chlorophyll-*a* in the TMDL will be used as an indicator metric to assess primary biological response to future nutrient water column concentration reductions and compliance with the Basin Plan's biostimulatory substances objective.
20. Microcystins (algal toxins) are a nutrient-response indicator and represents a primary biological response to excessive nutrient loading in waterbodies which exhibit biostimulatory conditions. Reductions in nutrient loading described in the Staff Report are anticipated to be beneficial in attainment of water quality standards for microcystins and restoring the waterbodies to a desired condition. The numeric target identified for microcystins in this TMDL will be used as an indicator metric to assess primary biological response to future nutrient water column concentration reductions and to ensure compliance with the Basin Plan's biostimulatory substances objective and designated REC-1 beneficial uses. The Old Salinas River is not listed on California's 303(d) list for microcystins, however, available data indicate this waterbody is impaired by microcystins on the basis of public health action levels and listing criteria and methodologies identified in the *California 303(d) Listing Policy*.
21. The U.S. Environmental Protection Agency's (USEPA) published TMDL guidance (*Guidance for Water Quality-Based Decisions: The TMDL Process – Chapter 1, Policies and Principles*, USEPA 404/4-91-001, April 1991) explicitly states that implementation of TMDLs and water quality-based controls should not be delayed because of lack of information and uncertainties about pollution problems, particularly with respect to nonpoint sources. More information about the spatial extent and nature of water quality impairments can be collected during TMDL implementation.
22. The elements of a TMDL are described in 40 CFR 130.2 and 130.7, section 303(d) of the Clean Water Act and USEPA guidance documents. A TMDL is defined as "the sum of individual waste load allocations for point sources and load allocations for nonpoint sources and natural background" (40 CFR 130.2). The Central Coast Water Board has determined that the TMDLs for unionized ammonia, nitrate, and orthophosphate in the Lower Salinas River and Reclamation Canal Basin and the Moro Cojo Slough Subwatershed are set at levels necessary to attain and maintain the applicable numeric water quality objectives, taking into account seasonal variations and any lack of knowledge concerning the relationship between effluent limitations and water quality (40 CFR 130.7 (c) (1)). The regulations in 40 CFR 130.7 also state that TMDLs shall take into account critical conditions for stream flow, loading, and water quality parameters. TMDLs are often expressed as a mass load of the pollutant but can be expressed as a unit of concentration if appropriate (40 CFR 130.2(i)). Expressing these TMDLs as units of concentration is appropriate because an existing concentration-based water quality objective is used as the basis for the TMDL numeric target and attaining that concentration-based water quality objective will result in protection of the beneficial uses.

23. Upon establishment of TMDLs by the State or USEPA, the State is required to incorporate the TMDLs, along with appropriate implementation measures, into the State Water Quality Management Plan (40 CFR 130.6(c)(1) and 130.7 and California Water Code sections 13050(j) and 13242). The Basin Plan and applicable statewide plans serve as the State Water Quality Management Plan governing the watersheds under the jurisdiction of the Central Coast Water Board.
24. The TMDLs and Implementation Program are based on sound scientific knowledge, methods, and practices in accordance with Health and Safety Code section 57004. Central Coast Water Board staff submitted the Project Report for the TMDLs to two external scientific reviewers in March 2012. Central Coast Water Board staff received comments from the reviewers. Central Coast Water Board staff either modified the Project Report in accordance with the comments, provided a written response that explained the basis for not incorporating the comments, or made no modifications because the commenter suggested none was needed.
25. Central Coast Water Board staff will conduct a review of implementation activities when monitoring and reporting data are submitted as required by the Agricultural Order and existing or future NPDES storm water permits, or when other monitoring data and/or reporting data are submitted outside the requirements of existing permits and orders. Central Coast Water Board staff will pursue modification of Agricultural Order conditions, NPDES storm water permit conditions, or other regulatory means, as necessary, to address remaining impairments resulting from nitrogen compounds or orthophosphate during the TMDL implementation phase.
26. Central Coast Water Board staff implemented a process to inform interested persons about the TMDLs. Central Coast Water Board staff's efforts to inform the public and solicit comment included public meetings with interested persons and a public notice and written comment period. Public notice of the proposed Basin Plan amendment provided the public a 50-day public comment period preceding the Central Coast Water Board hearing. Notice of public hearing was given by advertising in a newspaper of general circulation within the Region and by emailing a copy of the notice to all persons requesting such notice and applicable government agencies. Relevant documents and notices were also made available on the Central Coast Water Board website. Central Coast Water Board staff responded to oral and written comments received from the public. All public comments were considered.
27. Adoption of these TMDLs and Basin Plan amendments will not result in any degradation of water quality; in fact, they are designed to improve water quality. As such, these TMDLs and basin plan amendments comply with all requirements of both State and federal anti-degradation requirements (State Board Resolution 68-16, "Statement of Policy with Respect to Maintaining High Quality of Waters in California" and 40CFR 131.12).
28. The Central Coast Water Board recognizes that certain limited resource farmers (as defined by the U.S. Dept. of Agriculture) may have difficulty achieving compliance with this TMDL. The Central Coast Water Board will prioritize assistance for these farmers, including but not limited to technical assistance, grant opportunities, and necessary flexibility to achieve compliance (e.g., adjusted monitoring, reporting, or time schedules).
29. Pursuant to Public Resources Code section 21080.5, the Resources Agency has approved the Regional Water Boards' basin planning process as a "certified regulatory program" that adequately satisfies the California Environmental Quality Act (CEQA) (Public Resources Code, Section 21000 et seq.) requirements for preparing environmental documents (14 Cal. Code Regs. §15251(g); 23 Cal. Code Regs. § 3782.). Central Coast Water Board staff has

prepared “substitute environmental documents” for this project that contain the required environmental documentation as set forth in the State Water Board’s CEQA regulations (23 Cal. Code Regs. § 3777.). The substitute environmental documents include the TMDL Staff Report and several of its attachments, including 1) this Resolution and the Basin Plan Amendment Language (Attachment 1 of the Staff Report); 2) *Final Project Report for Total Maximum Daily Loads for Nitrogen Compounds and Orthophosphate for the Lower Salinas River and Reclamation Canal Basin, and the Moro Cojo Slough Subwatershed, Monterey County, California* (Attachment 2 of the Staff Report); 3) the CEQA Substitute Document with environmental checklist (Attachment 3 of the Staff Report); and 4) the comments and responses to comments (Attachment 6 of the Staff Report). The Staff Report also includes the Notice of Public Hearing/Notice of Filing (Attachment 4) and the Scientific Peer Review Comment (Attachment 5). The project itself is the establishment of TMDLs for nitrogen compounds and orthophosphate in the Lower Salinas River and Reclamation Canal Basin, and the Moro Cojo Slough Subwatershed. The Central Coast Water Board exercises discretion in assigning waste load allocations and load allocations, determining the program of implementation, and setting various milestones in achieving the water quality standards. The CEQA checklist and other portions of the substitute environmental documents contain significant analysis and numerous findings related to impacts and mitigation measures.

30. A CEQA scoping meeting was conducted on October 3, 2011, in the City of Salinas; a notice of the CEQA scoping meeting was sent to interested persons prior to the scoping meeting on September 7, 2011. The notice included a background of the project, the project purpose, a meeting schedule, and directions for obtaining more detailed information through the Central Coast Water Board website; the notice and project summary were available at the website or by requesting hard copies via telephone.
31. Public Resources Code section 21159 provides that an agency shall perform, at the time of the adoption of a rule or regulation requiring the installation of pollution control equipment or a performance standard or treatment requirement, an environmental analysis of the reasonably foreseeable methods of compliance, and an analysis of the reasonably foreseeable environmental impacts of the methods of compliance, an analysis of reasonably foreseeable mitigation measures to lessen the adverse environmental impacts, and an analysis of reasonably foreseeable alternative means of compliance with the rule or regulation that would have less significant adverse impacts. Section 21159(c) requires that the environmental analysis take into account a reasonable range of environmental, economic, and technical factors; population and geographic areas; and specific sites. The Staff Report prepared for this Basin Plan amendment, in particular the CEQA Substitute Document Report (Attachment 3), provides the environmental analysis required by Public Resources Code section 21159 and is hereby incorporated as findings in this Resolution.
32. In preparing the substitute environmental documents, the Central Coast Water Board has considered the requirements of Public Resources Code section 21159 and California Code of Regulations, title 14, section 15187, and intends those documents to serve as a Tier 1 environmental review. This analysis is not intended to be an exhaustive analysis of every conceivable impact, but an analysis of the reasonably foreseeable consequences of the adoption of this regulation, from a programmatic perspective. Compliance obligations will be undertaken directly by public agencies that may have their own obligations under CEQA. Project level impacts may need to be considered in any subsequent environmental analysis performed by other public agencies, pursuant to Public Resources Code section 21159.2. To the extent applicable, this Tier 1 substitute environmental document may be used to satisfy subsequent CEQA obligations of those agencies.

33. Consistent with the Water Board's substantive obligations under CEQA, the substitute environmental documents do not engage in speculation or conjecture, and only consider the reasonably foreseeable environmental impacts, including those relating to the methods of compliance, reasonably foreseeable feasible mitigation measures to reduce those impacts, and the reasonably foreseeable alternative means of compliance, that would avoid or reduce the identified impacts.
34. The Staff Report, the draft Basin Plan Amendment, and the Environmental Checklist and associated analysis provide the necessary information pursuant to state law to conclude that the proposed TMDL, Implementation Plan, and the associated reasonably foreseeable methods of compliance will not have a significant adverse effect on the environment with the exception of potentially significant impacts associated with Biological Resources – CEQA Checklist Category IV(a). and potentially significant impacts to habitat of fish or wildlife species associated with Mandatory Findings of Significance – CEQA Checklist Category XVIII.(a). This determination is based on best available information in an effort to fully inform the interested public and the decision makers of potential environmental impacts. “Significant effects” on the environment are defined as *“a substantial, or potentially substantial, adverse change within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance”* (14 Cal. Code Regs. § 1538). Wide scale water conservation measures and changing water management practices potentially could result in lower flows to surface waters resulting in potentially substantial adverse changes to aquatic habitat. Reduction in polluted runoff may offset potentially substantial adverse impacts resulting from potential reduced flows. In addition, reduction in tailwater discharge could result in increased groundwater levels that would result in more baseflow to surface waterbodies. Further, maintaining surface flows and circulation may in fact be part of a viable strategy to reduce biostimulatory impacts, since biostimulatory impacts are only partly attributable to elevated nutrients; biostimulatory impacts may be mitigated by increased flow, aeration, and shading of the waterbody. Potential mitigation measures to prevent reduced flows or to reduce the impact of reduced flows include phasing in management practices that could result in reduced flows; and use of riparian buffers and other vegetated treatment systems that will effectively treat the water to remove pollutants, but not necessarily reduce flows. Given the uncertainty associated with evaluating the available information, it is possible that any potentially substantial adverse changes on aquatic habitat associated with the basin plan amendment will be less than significant. When the entities and responsible parties responsible for implementing these TMDLs determine how they will proceed the agencies responsible for those parts of the project can and should incorporate such alternatives and mitigation into any subsequent projects or project approvals. Feasible alternatives and mitigation measures are described in more detail in the substitute environmental documents (14 Cal. Code Regs. § 15091(a)(2).). Legal considerations may make some of the mitigation measures that could be implemented infeasible. The Central Coast Water Board may not specify the manner of compliance with its orders and as a result implementation of potential mitigation measures are not under the control or discretion of the Central Coast Water Board.
35. Pursuant to CEQA Guidelines section 15093 (Cal. Code. Regs., tit. 14., § 15093), the Central Coast Water Board hereby finds that the project's benefits override and outweigh its potential significant adverse impacts, for the reasons more fully set forth in the Staff Report and attachments thereto. Specific economic, social, and environmental benefits justify the adoption of this TMDL despite the project's potential significant adverse environmental impacts. The Central Coast Water Board has the authority and responsibility to regulate discharges of waste associated with the sources of pollution causing impairment to water quality. Many of those discharges have caused significant widespread degradation and/or pollution of waters of the state as described in the *Final Project Report for Total Maximum*

Daily Loads for Nitrogen Compounds and Orthophosphate for the Lower Salinas River and Reclamation Canal Basin, and the Moro Cojo Slough Subwatershed, Monterey County, California and associated reference materials. This TMDL would result in actions to restore the quality of the waters of the state and protect the beneficial uses, including aquatic habitat. While some impacts could occur due to reduced flows, earth-moving, or from implementing other actions to comply with the TMDL, the benefits, which include contributing to the present and future restoration of beneficial water uses, and reducing or eliminating pollution, nuisance and contamination, warrant approval of the TMDL, despite each and every unavoidable impact. Upon review of the environmental information generated for this TMDL, including the CEQA Substitute Document with environmental checklist (Attachment 3 of the Staff Report) and in view of the entire record supporting the need for the TMDL, the Central Coast Water Board determines that specific economic, legal, social, technological, environmental, and other benefits of this TMDL outweigh the unavoidable adverse environmental effects, and that such adverse environmental effects are acceptable under the circumstances.

36. From a program-level perspective, incorporation of the alternatives and mitigation measures outlined in the substitute environmental documents will foreseeably reduce impacts to no impact, or keep the impact at less-than-significant levels.
37. The CEQA Substitute Document Report (Staff Report Attachment 3) identifies mitigation approaches that should be considered at the project level.
38. The Central Coast Water Board will request that the State Water Board approve the Basin Plan amendments incorporating TMDLs for nitrogen compounds and orthophosphate in the Lower Salinas River and Reclamation Canal Basin and the Moro Cojo Slough Subwatershed. The TMDLs and Implementation Program for the TMDLs will become effective upon approval by the California Office of Administrative Law. The TMDLs must also be approved by USEPA.
39. The amendments to the Basin Plan may have an effect on fish and wildlife. The Central Coast Water Board will, therefore, forward fee payments to the Department of Fish and Wildlife under the California Fish and Game Code section 711.4.
40. Based on relevant future information, data, and research, the Central Coast Water Board has the discretion to conduct a water quality standards review which may potentially include one or more of the following: (1) The Water Board may designate critical low-flow conditions below which numerical water quality criteria do not apply, as consistent with federal regulations and policy; (2) The Water Board may authorize lowering of water quality to some degree if and where appropriate, if the Water Board finds water quality lowering to be necessary to accommodate important economic or social development. In authorizing water quality lowering the Water Board shall make any such authorizations consistent with the provisions and requirements of federal and state anti-degradation policies; (3) The Water Board may authorize revision of water quality standards, if appropriate and consistent with federal and state regulations, to remove a designated beneficial use, establishing subcategories of uses, establishing site specific water quality objectives, or other modification of the water quality standard. When a standards action is deemed appropriate, the Water Board shall follow all applicable requirements, including but not limited to those set forth in part 131 of Title 40 of the Code of Federal Regulations and Article 3 of Division 7, Chapter 4 of the California Water Code.
41. The proposed amendments meet the "Necessity" standard of the Administrative Procedures Act, Government Code, section 11353, subdivision (b). As specified in Finding 23, federal regulations require that TMDLs be incorporated into the Water Quality Management Plan.

The Central Coast Water Board's Basin Plan is the Central Coast Water Board's component of the Water Quality Management Plan, and the Basin Plan is how the Central Coast Water Board takes quasi-legislative planning actions. Moreover, the TMDL is a program of implementation for existing water quality objectives, and is, therefore, appropriately a component of the Basin Plan under the California Water Code, section 13242. The necessity of developing TMDLs is established in the TMDL staff report, the Clean Water Act section 303(d) list, and the data contained in the administrative record documenting the nitrogen compounds and orthophosphate impairments of the Lower Salinas River and Reclamation Canal Basin, and the Moro Cojo Slough Subwatershed.

42. Consistent with Water Code section 13141, the amendment includes an estimate of the total cost of implementation of the agricultural related portions of this TMDL and identifies potential sources of financing.
43. On January 31 and March 14, 2013, in San Luis Obispo, California, the Central Coast Water Board held public hearings and heard and considered all public comments and evidence in the record.

THEREFORE, be it resolved that:

1. Pursuant to sections 13240, 13242, 13243, and 13244 of the California Water Code, the Central Coast Water Board, after considering the entire record, including oral testimony at the hearing, hereby adopts the amendment in "Attachment-Proposed Basin Plan Amendments."
2. The Executive Officer is directed to forward copies of the Basin Plan amendment to the State Board in accordance with the requirements of section 13245 of the California Water Code.
3. The Central Coast Water Board requests that the State Water Board approve the Basin Plan amendments in accordance with the requirements of sections 13245 and 13246 of the California Water Code and forward them to the California Office of Administrative Law and the USEPA for approval.
4. The Executive Officer is authorized to sign a Certificate of Fee Exemption or transmit payment of the applicable fee as may be required to the Resources Agency.
5. If, during the approval process, Central Coast Water Board staff, State Water Board staff, the State Water Board, or the California Office of Administrative Law determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.
6. The environmental documents prepared by the Central Coast Water Board staff pursuant to Public Resources Code 21080.5 are hereby certified.

I, Kenneth A. Harris Jr., Interim Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of a resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region on March 14, 2013.

Kenneth A. Harris Jr.
Interim Executive Officer

RESOLUTION NO. R3-2013-0008

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENTS

Revise the September 8, 1994 Basin Plan as follows:

AMENDMENT NO. 1. TOTAL MAXIMUM DAILY LOADS FOR NITROGEN COMPOUNDS AND ORTHOPHOSPHATE IN THE LOWER SALINAS RIVER AND RECLAMATION CANAL BASIN, AND THE MORO COJO SLOUGH SUBWATERSHED (INCLUDING ALISAL CREEK, ALISAL SLOUGH, BLANCO DRAIN, CHUALAR CREEK, ESPERANZA CREEK, ESPINOSA SLOUGH, GABILAN CREEK, MERRIT DITCH, MORO COJO SLOUGH, NATIVIDAD CREEK, THE OLD SALINAS RIVER, QUAIL CREEK, THE RECLAMATION CANAL, THE LOWER SALINAS RIVER (DOWNSTREAM OF GONZALEZ), SALINAS RIVER LAGOON (NORTH), SANTA RITA CREEK, AND TEMBLADERO SLOUGH).

Add the following to Chapter 4 after IX. P.:

IX. Q. TOTAL MAXIMUM DAILY LOADS FOR NITROGEN COMPOUNDS AND ORTHOPHOSPHATE IN THE LOWER SALINAS RIVER AND RECLAMATION CANAL BASIN, AND THE MORO COJO SLOUGH SUBWATERSHED (INCLUDING ALISAL CREEK, ALISAL SLOUGH, BLANCO DRAIN, CHUALAR CREEK, ESPERANZA CREEK, ESPINOSA SLOUGH, GABILAN CREEK, MERRIT DITCH, MORO COJO SLOUGH, NATIVIDAD CREEK, THE OLD SALINAS RIVER, QUAIL CREEK, THE RECLAMATION CANAL, THE LOWER SALINAS RIVER (DOWNSTREAM OF GONZALEZ), SALINAS RIVER LAGOON (NORTH), SANTA RITA CREEK, AND TEMBLADERO SLOUGH).

The Regional Water Quality Control Board adopted these TMDLs on March 14, 2013.
These TMDLs were approved by:

The State Water Resources Control Board on: _____ (date).

The California Office of Administrative Law on: _____ (date).

The U.S. Environmental Protection Agency on: _____ (date)

Problem Statement

Discharges of nitrogen compounds and orthophosphate are occurring at levels in surface waters which are impairing a spectrum of beneficial uses and, therefore, constitute a serious water quality problem. The municipal and domestic drinking water supply (MUN, GWR) beneficial uses and the range of aquatic habitat beneficial uses are not protected. Additionally, locally some waterbodies do not meet non-regulatory recommended guidelines for nitrate in agricultural supply water for sensitive crops indicating that potential or future designated agricultural supply beneficial uses may be detrimentally impacted. Further, recreational beneficial use (REC-1) of the Old Salinas River is not being supported on the basis of excessive amounts of algal toxins (microcystins) in surface water. A total of 35 waterbody/pollutant combinations are impaired due to exceedances of water quality objectives. The pollutants addressed in this TMDL are nitrate, unionized ammonia, and orthophosphate – orthophosphate is included as a pollutant contributing to biostimulatory impairments of surface waters. Reducing these pollutants will also address several Clean Water Act section 303(d)-listed dissolved oxygen and chlorophyll a impairments in the TMDL project area.

As a result of these conditions, water quality standards are not being attained. By developing TMDLs for the aforementioned pollutants, the water quality standards violations being addressed in this TMDL include:

- Violations of drinking water standard for nitrate
- Violations of the Basin Plan general toxicity objective for inland surface waters and estuaries (violations of unionized ammonia objective)
- Violations of the Basin Plan narrative general objective for biostimulatory substances in inland surface waters and estuaries (as expressed by excessive nutrients, chlorophyll a, algal biomass, microcystins, and low dissolved oxygen)

The TMDLs protect and restore the municipal and domestic water supply beneficial use (MUN) and aquatic habitat beneficial uses currently being degraded by violations of the toxicity objective and the biostimulatory substances objective; the aquatic habitat beneficial uses current being degraded include the following: wildlife habitat (WILD), cold fresh water habitat (COLD), warm fresh water habitat (WARM), migration of aquatic organisms (MIGR), spawning, reproduction, and/or early development (SPWN), preservation of biological habitats of special significance (BIOL), and rare, threatened, or endangered species (RARE). In addition, current or potential future beneficial uses of the agricultural water supply beneficial use (AGR) are not being supported. Nitrate can create problems not only for water supplies and aquatic habitat, but also potentially for nitrogen sensitive crops (grapes, avocado, citrus) by detrimentally impacting crop yield or quality.

For waterbodies that are not expressing biostimulatory impairments, the most stringent relevant water quality objective for nitrate (and therefore the one that is protective of the full range of all nitrate-impaired designated beneficial uses) is the numeric Basin Plan objective for nitrate in municipal and domestic water supply. Reducing nitrate pollution and ultimately achieving the nitrate drinking water quality standard in these waterbodies will therefore restore and be protective of the full range of MUN, GWR and/or AGR designated beneficial uses of the surface waters which are being currently impaired by excess nitrate.

All waterbodies are required to attain the Basin Plan general toxicity objective for unionized ammonia in inland surface waters and estuaries.

For waterbodies that are expressing biostimulatory impairments, the most stringent relevant water quality objective for nitrate-nutrients (and therefore the one that is protective of the full range of all nutrient-impaired designated beneficial uses) is the Basin Plan narrative general objective for biostimulatory substances in inland surface waters and estuaries. These waterbodies must achieve concentration-based TMDLs for nitrate and orthophosphate as identified herein. Reducing nutrient pollution and ultimately achieving the TMDLs for nutrients in these waterbodies will therefore restore and be protective of the full range of aquatic habitat, MUN, GWR, and/or AGR designated beneficial uses of the surface waters which are being currently impaired by excess nutrients.

The following impairments are addressed with this TMDL:

- Alisal Creek: nitrate, unionized ammonia, chlorophyll a
- Alisal Slough: nitrate, unionized ammonia, low dissolved oxygen
- Blanco Drain: nitrate, low dissolved oxygen
- Chualar Creek: nitrate, unionized ammonia
- Esperanza Creek: nitrate
- Espinosa Slough: nitrate, unionized ammonia
- Gabilan Creek: nitrate, unionized ammonia
- Lower Salinas River: nitrate
- Merrit Ditch: nitrate, unionized ammonia, low dissolved oxygen

- Moro Cojo Slough: unionized ammonia, low dissolved oxygen
- Natividad Creek: nitrate, unionized ammonia, low dissolved oxygen
- Old Salinas River: nitrate, low dissolved oxygen, chlorophyll a, microcystin
- Quail Creek: nitrate, unionized ammonia, low dissolved oxygen
- Reclamation Canal: nitrate, unionized ammonia, low dissolved oxygen
- Salinas River Lagoon (north): nitrate
- Santa Rita Creek: nitrate, unionized ammonia, low dissolved oxygen
- Tembladero Slough: nitrate, nutrients, chlorophyll a

Numeric Targets

Numeric targets are water quality targets developed and used to ascertain when and where water quality objectives are achieved, and hence, when beneficial uses are protected.

➤ Target for Nitrate (MUN-GWR standards)

For impaired stream reaches that are required to support drinking water (MUN) and groundwater recharge (GWR) beneficial uses, the nitrate numeric target is 10 mg/L (nitrate as N) for this TMDL, which therefore is equal to the Basin Plan's numeric nitrate water quality objective protective of drinking water beneficial uses.

➤ Target for Unionized Ammonia (toxicity)

For unionized ammonia (a nitrogen compound), the numeric target is 0.025 mg/L (as N) for this TMDL, which therefore is equal to the Basin Plan's unionized ammonia numeric water quality objective protective against toxicity in surface waters.

➤ Targets for Biostimulatory Substances (nitrate and orthophosphate)

The Basin Plan contains the following narrative water quality objectives for biostimulatory substances:

“Waters shall not contain biostimulatory substances in concentrations that promote aquatic growths to the extent that such growths cause nuisance or adversely affect beneficial uses.”

To implement this narrative objective, staff developed scientifically peer reviewed numeric targets, based on established methodologies and approaches. The numeric targets for biostimulatory substances are presented in Table 1.

Table 1. Numeric targets for biostimulatory substances.

<u>Stream Reaches</u>	<u>Nitrate-N (mg/L)</u>	<u>Orthophosphate-P (mg/L)</u>
<u>Lower Salinas River – downstream of Spreckels to and including Salinas River Lagoon (north)</u>	<u>1.4</u> <u>Maximum</u> <u>Dry Season Samples</u> <u>(May 1-Oct 31)</u>	<u>0.07</u> <u>Maximum</u> <u>Dry Season Samples</u> <u>(May 1-Oct 31)</u>
	<u>8.0</u> <u>Maximum</u> <u>Wet Season Samples</u> <u>(Nov 1-Apr 30)</u>	<u>0.3</u> <u>Maximum</u> <u>Wet Season Samples</u> <u>(Nov 1-Apr 30)</u>

	<u>8.0</u> <u>Maximum</u> <u>Wet Season Samples</u> <u>(Nov 1-Apr 30)</u>	<u>0.3</u> <u>Maximum</u> <u>Wet Season Samples</u> <u>(Nov 1-Apr 30)</u>
<u>Stream Reaches</u>	<u>Total Nitrogen (mg/L)</u>	<u>Orthophosphate-P (mg/L)</u>
<u>Moro Cojo Slough, all reaches</u>	<u>1.7</u> <u>Maximum</u> <u>(total nitrogen)</u> <u>Dry Season Samples</u> <u>(May 1-Oct 31)</u>	<u>0.13</u> <u>Maximum</u> <u>Dry Season</u> <u>(May 1-Oct 31)</u>
	<u>8.0</u> <u>Maximum</u> <u>(total nitrogen)</u> <u>Wet Season Samples</u> <u>(Nov 1-Apr 30)</u>	<u>0.3</u> <u>Maximum</u> <u>Wet Season Samples</u> <u>(Nov 1-Apr 30)</u>

➤ Targets for Nutrient-Response Indicators (dissolved oxygen and chlorophyll a and microcystins)

Dissolved oxygen and chlorophyll a numeric targets are identified to ensure that streams do not show evidence of biostimulatory conditions, and to provide primary indicator metrics to assess biological response to future nutrient water column concentration reductions.

For water bodies designated as cold fresh water habitat (COLD) and spawning (SPWN) beneficial uses the dissolved oxygen numeric targets is the same as Basin Plan numeric water quality objective which states that dissolved oxygen concentrations shall not be reduced below 7.0 mg/L at any time.

For water bodies designated as warm fresh water habitat (WARM) beneficial use the dissolved oxygen numeric targets is the same as Basin Plan numeric water quality objective which states that dissolved oxygen concentrations shall not be reduced below 5.0 mg/L at any time.

Additionally, for all inland surface waters, enclosed bays and estuaries, the dissolved oxygen numeric target is the same as Basin Plan numeric water quality objective which states that the

median dissolved oxygen should not fall below 85% saturation as a result of controllable water quality conditions.

For water bodies designated as cold fresh water habitat (COLD) and spawning (SPWN) or warm fresh water habitat (WARM) beneficial uses the numeric water quality target indicative of excessive dissolved oxygen saturation conditions dissolved oxygen is 13 mg/L (i.e., water column dissolved oxygen concentrations not to exceed 13 mg/L).

The numeric water quality target for chlorophyll a is 15 micrograms per liter ($\mu\text{g/L}$) for all water bodies (i.e., water column chlorophyll a concentrations not to exceed 15 $\mu\text{g/L}$).

The numeric water quality target for microcystins is 0.8 micrograms per liter ($\mu\text{g/L}$) for all waterbodies (i.e., microcystin not to exceed 0.8 $\mu\text{g/L}$ (includes microcystins congeners LA, LR, RR and YR)).

Source Analysis

Discharges of unionized ammonia, nitrate, and orthophosphate originating from irrigated agriculture, urban lands, grazing lands, and natural sources are contributing loads to receiving waters. Irrigated agriculture is the overwhelming majority of controllable water column loads in the TMDL project area and this source category is not currently meeting its proposed load allocation. Urban storm water is a relatively minor source of nitrogen compounds and orthophosphate, but can be locally significant. Grazing lands are currently meeting proposed load allocations. The source analysis for this TMDL project is consistent with source analyses reported by other scientists in previous nutrient-water quality studies in the lower Salinas Valley, which provides for a qualitative weight-of-evidence approach.

TMDLs

The following TMDLs will result in attainment of water quality standards and will rectify impairments described in the Problem Statement.

The unionized ammonia TMDL for all waterbodies and reaches of the TMDL project area including Alisal Creek, Alisal Slough, Chualar Creek, Espinosa Slough, Merrit Ditch, Moro Cojo Slough, Natividad Creek, the Reclamation Canal, Quail Creek, Gabilan Creek and Santa Rita Creek is:

- Unionized ammonia concentration shall not exceed 0.025 mg/L-N in receiving waters.

The nitrate TMDL for all waters and reaches of the TMDL project area required to support MUN beneficial uses, including, Alisal Creek, Alisal Slough, Chualar Creek, Esperanza Creek, Gabilan Creek, Merrit Ditch, Natividad Creek, the Old Salinas River, Quail Creek, the Lower Salinas River (downstream of Gonzalez to Spreckels), Santa Rita Creek is:

- Nitrate concentration shall not exceed 10 mg/L-N in receiving waters.

The nitrate and orthophosphate TMDLs for the lower Salinas River (from downstream of Spreckels to the Salinas River Lagoon) and the Salinas River Lagoon (north) are:

- For dry season (May 1 to October 31): Nitrate-N concentration shall not exceed 1.4 mg/L in receiving waters; orthophosphate-P concentration shall not exceed 0.07 mg/L in receiving waters, and
- For wet season (November 1 to April 30): Nitrate-N concentration shall not exceed 8.0 mg/L in receiving water; orthophosphate-P concentration shall not exceed 0.3 mg/L in receiving water.

The nitrate and orthophosphate TMDLs for Espinosa Slough (all reaches from Espinosa Lake to confluence with Reclamation Canal), for the Reclamation Canal (all reaches downstream of Hartnell Rd to confluence with Tembladero Slough), for Merrit Ditch (all reaches downstream of Merrit Lake), and for all reaches of Alisal Slough, Santa Rita Creek, Blanco Drain and Tembladero Slough are:

- For dry season (May 1 to October 31): Nitrate-N concentration shall not exceed 6.4 mg/L in receiving waters; orthophosphate-P concentration shall not exceed 0.13 mg/L in receiving waters, and
- For wet season (November 1 to April 30): Nitrate-N concentration shall not exceed 8.0 mg/L in receiving water; orthophosphate-P concentration shall not exceed 0.3 mg/L in receiving water.

The nitrate and orthophosphate TMDLs for Gabilan Creek (all reaches downstream of Crazy Horse Road to confluence with Reclamation Canal), and for all reaches of Alisal Creek, and Natividad Creek are:

- For dry season (May 1 to October 31): Nitrate-N concentration shall not exceed 2.0 mg/L in receiving waters; orthophosphate-P concentration shall not exceed 0.07 mg/L in receiving waters, and
- For wet season (November 1 to April 30): Nitrate-N concentration shall not exceed 8.0 mg/L in receiving water; orthophosphate-P concentration shall not exceed 0.3 mg/L in receiving water.

The nitrate and orthophosphate TMDLs for all reaches of the Old Salinas River are:

- For dry season (May 1 to October 31): Nitrate-N concentration shall not exceed 3.1 mg/L in receiving waters; orthophosphate-P concentration shall not exceed 0.07 mg/L in receiving waters, and
- For wet season (November 1 to April 30): Nitrate-N concentration shall not exceed 8.0 mg/L in receiving water; orthophosphate-P concentration shall not exceed 0.3 mg/L in receiving water.

The total nitrogen and orthophosphate TMDLs for all reaches of the Moro Cojo Slough are:

- For dry season (May 1 to October 31): total Nitrogen-N concentration shall not exceed 1.7 mg/L in receiving waters; orthophosphate-P concentration shall not exceed 0.13 mg/L in receiving waters, and
- For wet season (November 1 to April 30): total Nitrogen-N concentration shall not exceed 8.0 mg/L in receiving water; orthophosphate-P concentration shall not exceed 0.3 mg/L in receiving water.

The TMDLs are considered achieved when water quality conditions meet all regulatory and policy requirements necessary for removing the impaired waters from Clean Water Act section 303(d) list of impaired waters.

Final Allocations and Interim Allocations

Owners and operators of irrigated lands, municipal storm water entities, natural sources, and owners/operators of livestock and domestic animals are assigned unionized ammonia, nitrate, and orthophosphate allocations equal to the TMDL and numeric targets.

The final allocations to responsible parties are shown in Table IX P-1. The final allocations are equal to the TMDLs and should be achieved 30-years after the TMDL effective date. Unlike the load-based TMDL method, the concentration-based allocations do not add up to the TMDL because concentrations of individual pollution sources are not additive. Since the TMDLs are concentration-based, the allocations are not additive.

Recognizing that achievement of the more stringent final dry season biostimulatory allocations embedded in Table IX Q-1 may require a significant amount of time to achieve, interim allocations are identified. Interim allocations will be used as benchmarks in assessing progress towards the final allocations. Interim allocations are shown in Table IX P-2.

Controllable Water Quality Conditions

In accordance with the Water Quality Control Plan for the Central Coast Basin (Basin Plan) Controllable water quality shall be managed to conform or to achieve the water quality objectives and load allocations contained in this TMDL. The Basin Plan defines controllable water quality conditions as follows: "Controllable water quality conditions are those actions or circumstances resulting from man's activities that may influence the quality of the waters of the State and that may be reasonably controlled." - Water Quality Control Plan for the Central Coast Basin, Chapter 3. Water Quality Objectives, page III-2.

Compliance with Anti-degradation Requirements

State and federal anti-degradation policies require, in part, that where surface waters are of higher quality than necessary to protect beneficial uses, the high quality of those waters must be maintained unless otherwise provided by the policies. The federal anti-degradation policy, 40 C.F.R. 131.12(a) states, in part. "Where the quality of waters exceed levels necessary to support propagation of fish, shellfish, and wildlife and recreation in and on the water, that quality shall be maintained and protected unless the State finds, after full satisfaction of the intergovernmental coordination and public participation provisions of the State's continuing planning process, that allowing lower water quality is necessary to accommodate important economic or social development in the area in which the waters are located..."

Compliance with anti-degradation requirements may be determined on the basis of trends in declining water quality in applicable waterbodies, consistent with the methodologies and criteria provided in Section 3.10 of the California 303(d) Listing Policy (adopted, Sept. 20, 2004, SWRCB Resolution No. 2004-0063). Section 3.10 of the California 303(d) Listing Policy explicitly addresses the anti-degradation component of water quality standards as defined in 40 CFR 130.2(j), and provides for identifying trends of declining water quality as a metric for assessing compliance with anti-degradation requirements.

Section 3.10 of the California 303(d) Listing Policy states that pollutant-specific water quality objectives need not be exceeded to be considered non-compliance with anti-degradation requirements "if the water segment exhibits concentrations of pollutants or water body conditions for any listing factor that shows a trend of declining water quality standards attainment".

Practically speaking, this means that, for example, stream reaches or waterbodies that have an concentration-based TMDL allocation of 10 mg/L nitrate-N, and if current water quality or future water quality assessments in the stream reach indicate nitrate-N in fact well under 10 mg/L nitrate-N, the allocation does not give license for controllable nitrogen sources to degrade the water resource all the way up to the maximum allocation = 10 mg/L nitrate-N.

^A Federal and State anti-degradation requirements apply to all waste load and load allocations.

^B Achievement of final waste load and load allocations to be determined on the basis of the number of measured exceedances and/or other criteria set forth in Section 4 of the *Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List* (Listing Policy - State Water Resources Control Board, Resolution No. 2004-0063, adopted September 2004). or as consistent with any relevant revisions of the Listing Policy promulgated in the future.

* Responsible parties shall meet allocations in all receiving surface waterbodies receiving the responsible parties' discharges.

¹ Salinas River: all reaches from downstream of Spreckels (downstream of monitoring site 309SSP) to the confluence with the Pacific Ocean including Salinas River Lagoon (North)

- ² Santa Rita Creek: all reaches and tributaries, from the confluence with the Reclamation Canal to the uppermost reach of the waterbody.
- ³ Reclamation Canal: all reaches and tributaries, which includes from confluence with Tembladero Slough, to upstream confluence with Alisal Creek.
- ⁴ Gabilan Creek: all reaches and tributaries downstream of Crazy Horse Rd.
- ⁵ Natividad Creek: all reaches and tributaries, from the confluence with Carr Lake to the uppermost reach of the waterbody.
- ⁶ Alisal Creek: all reaches and tributaries from the confluence with the Reclamation Canal to the uppermost reach of the waterbody.
- ⁷ Merrit Ditch: all reaches and tributaries from the confluence with the Reclamation Canal to the uppermost reach of the waterbody.
- ⁸ Alisal Slough: all reaches and tributaries of the waterbody.
- ⁹ Tembladero Slough: all reaches and tributaries from the confluence with the Salinas Reclamation Canal downstream to its confluence with the Old Salinas River.
- ¹⁰ Blanco Drain: all reaches and tributaries of the waterbody.
- ¹¹ Old Salinas River: all reaches and tributaries from the slide gate at the head of the Old Salinas River adjacent to Mulligan Hill, downstream to Potrero Road.
- ¹² Moro Cojo Slough: all reaches and tributaries, from the confluence with Moss Landing Harbor to the uppermost reach of the waterbody.
- ¹³ Chualar Creek: all reaches and tributaries, from the confluence with the Salinas River to the uppermost reach of the waterbody.
- ¹⁴ Quail Creek: all reaches and tributaries, from the confluence with the Salinas River to the uppermost reach of the waterbody.
- ¹⁵ Esperanza Creek: all reaches and tributaries, from the confluence with the Salinas River to the uppermost reach of the waterbody.
- ¹⁶ Espinosa Slough all reaches and tributaries, from the confluence with the Reclamation Canal to the uppermost reach of the waterbody.
- ¹⁷ Salinas River: all reaches from upstream of Spreckels (upstream of monitoring site 309SSP) to Gonzalez, CA

Table IX Q-2. Interim Allocations

INTERIM WASTE LOAD ALLOCATIONS (WLAs)			
Waterbody	Party Responsible for Allocation (Source)	First Interim WLA	Second Interim WLA
All waterbodies given waste load allocations (WLAs) as identified in Final Waste Load Allocations Table	<p>City of Salinas (Storm drain discharges to MS4s) Storm Water Permit NPDES No. CA00049981</p> <p>County of Monterey (Storm drain discharges to MS4s) Storm Water General Permit NPDES No. CAS000004</p>	<p>Achieve MUN standard-based and Unionized Ammonia objective-based allocations:</p> <p>Allocation-5 Allocation-9</p> <p>12 years after effective date of TMDL</p>	<p>Achieve Wet Season (Nov. 1 to Apr. 30) Biostimulatory target-based TMDL allocations:</p> <p>Wet Season Allocation/Waterbody combinations as identified in Final Waste Load Allocations Table</p> <p>20 years after effective date of TMDL</p>

All waterbodies given load allocations (LAs) as identified in Final Load Allocations Table Error! Reference source not found.	Owners/operators of irrigated agricultural lands (Discharges from irrigated lands)	Achieve MUN standard-based and Unionized Ammonia objective-based allocations: Allocation-5 Allocation-9 12 years after effective date of TMDL	Achieve Wet Season (Nov. 1 to Apr. 30) Biostimulatory target-based TMDL allocations: Wet Season Allocation/Waterbody combinations as identified in Final Load Allocations Table Error! Reference source not found. 20 years after effective date of TMDL

* Responsible parties shall meet allocations in all receiving surface waterbodies of the responsible parties' discharges.

The parties responsible for the allocation to controllable sources are not responsible for the allocation to natural sources.

Margin of Safety

A margin of safety is incorporated implicitly in the TMDLs through conservative model assumptions and statistical analysis. In addition, an explicit margin of safety is incorporated by reserving 20% of the load, calculated on a concentration basis, from wet season allocations.

Implementation

DISCHARGES FROM IRRIGATED AGRICULTURAL LANDS:

Implementing parties must comply with the Conditional Waiver of Waste Discharge Requirements for Irrigated Lands (Order R3-2012-0011) and the Monitoring and Reporting Programs in accordance with Orders R3-2012-0011-01, R3-2012-0011-02, and R3-2012-0011-03., or its renewals or replacements to meet load allocations and achieve the TMDL. The requirements in these orders, and their renewals or replacements in the future, will implement the TMDLs and rectify the impairments addressed in this TMDL.

Current requirements in the Agricultural Order that will achieve the load allocations include:

- a. Implement, and update as necessary, management practices to reduce nutrient loading.
- b. Maintain existing, naturally occurring, riparian vegetative cover in aquatic habitat areas.
- c. Develop/update and implement Farm Plans.
- d. Properly destroy abandoned groundwater wells.
- e. Develop, and initiate implementation of an Irrigation and Nutrient Management Plan (INMP) or alternative certified by a Professional Soil Scientist, Professional Agronomist, or Crop Advisor certified by the American Society of Agronomy, or similarly qualified professional.

Monitoring

Owners and operators of irrigated agricultural lands must perform monitoring and reporting in accordance with Monitoring and Reporting Program Orders R3-2012-0011-01, R3-2012-0011-02, and R3-2012-0011-03, as applicable to the operation.

Determination of Compliance with Load Allocations

Load allocations will be achieved through a combination of implementation of management practices and strategies to reduce nitrogen compound and orthophosphate loading, and water quality monitoring. Flexibility to allow owners/operators from irrigated lands to demonstrate compliance with load allocations is a consideration; additionally, staff is aware that not all implementing parties are necessarily contributing to or causing a surface water impairment. However, it is important to recognize that impacting shallow groundwater with nutrient pollution may also impact surface water quality via baseflow loading contributions to the creek.

To allow for flexibility, Water Board staff will assess compliance with load allocations using one or a combination of the following:

- A. attaining the load allocations in the receiving water;
- B. attaining receiving water TMDL numeric targets for nutrient-response indicators (i.e., dissolved oxygen water quality objectives, chlorophyll a targets and microcystin targets) and mitigation of downstream nutrient impacts to receiving waterbodies may constitute a demonstration of attainment of the nitrate, nitrogen and orthophosphate-based seasonal biostimulatory load allocations. Note that implementing parties are strongly encouraged to maximize overhead riparian canopy, where and if appropriate, using riparian vegetation, because doing so could result in achieving nutrient-response indicator targets before allocations are achieved (resulting in a less stringent allocation);
- C. demonstrating quantifiable receiving water mass load reductions;
- D. owners/operators of irrigated lands may be deemed in compliance with load allocations by implementing management practices that are capable of achieving interim and final load allocations identified in this TMDL;
- E. owners/operators of irrigated lands may provide sufficient evidence to demonstrate that they are and will continue to be in compliance with the load allocations; such evidence could include documentation submitted by the owner/operator to the Executive Officer that the owner/operator is not causing waste to be discharged to impaired waterbodies resulting or contributing to violations of the load allocations.

STORM DRAIN DISCHARGES TO MS4s:

The Central Coast Water Board will require the MS4 entities to develop and submit for Executive Officer approval a Wasteload Allocation Attainment Program (WAAP). The WAAP shall be submitted within one year of approval of the TMDL by the Office of Administrative Law, or within one year of a stormwater permit renewal, whichever occurs first. The WAAP shall include descriptions of the actions that will be taken by the MS4 entity to attain the TMDL waste load allocations, and specifically address:

- 1. Development of an implementation and assessment strategy;
- 2. Source identification and prioritization;
- 3. Best management practice identification, prioritization, implementation schedule, analysis, and effectiveness assessment;
- 4. Monitoring and reporting program development and implementation. Monitoring program goals shall include: 1) assessment of stormwater discharge and receiving water discharge quality 2) assessment of best management effectiveness, and 3) demonstration and progress towards achieving interim goals and waste load allocations.
- 5. Coordination with stakeholders; and
- 6. Other pertinent factors.

Determination of Compliance with Waste Load Allocations

Waste load allocations will be achieved through a combination of implementation of management practices and strategies to reduce nitrogen compound and orthophosphate loading, and water quality monitoring.

To allow for flexibility, Water Board staff will assess compliance with waste load allocations using one or a combination of the following:

- A. attaining the waste load allocations in the receiving water;
- B. attaining receiving water TMDL numeric targets for nutrient-response indicators (i.e., dissolved oxygen water quality objectives, chlorophyll a targets and microcystin targets) and mitigation of downstream nutrient impacts to receiving waterbodies may constitute a demonstration of the attainment of the nitrate, nitrogen and orthophosphate-based seasonal biostimulatory waste load allocations. Note that implementing parties are strongly encouraged to maximize overhead riparian canopy using riparian vegetation, as appropriate, because doing so could result in achieving nutrient-response indicator targets before allocations are achieved (resulting in a less stringent allocation);
- C. demonstrate compliance by measuring concentrations in stormwater outfalls;
- D. demonstrate compliance by demonstrating load reductions on mass basis at stormdrain outfalls;
- E. MS4s may be deemed in compliance with waste load allocations through implementation and assessment of pollutant loading reduction projects (BMPs), capable of achieving interim and final waste load allocations identified in this TMDL in combination with water quality monitoring for a balanced approach to determining program effectiveness;
- F. Any other effluent limitations and conditions which are consistent with the assumptions and requirements of the waste load allocations.

Monitoring

Municipal separate storm sewer systems (MS4) entities with operations and storm water conveyance systems in the TMDL project areas - specifically the City of Salinas, and County of Monterey - are required to develop and submit monitoring programs as part of their WAAP. The goals of the monitoring programs are described in the requirements of the WAAP.

Staff encourages the City of Salinas and County of Monterey to develop and submit creative and meaningful monitoring programs. Monitoring strategies can use a phased approach, for example, whereby outfall or receiving water monitoring is phased in after best management practices have been implemented and assessed for effectiveness. Pilot projects where best management practices are implemented in well-defined areas covering a fraction of the MS4 that facilitates accurate assessment of how well the best management practices control pollution sources, is acceptable, with the intent of successful practices then being implemented in other or larger parts of the MS4.

DOMESTIC ANIMAL/LIVESTOCK DISCHARGES:

The water quality data available from stream reaches that exclusively drain grazing lands, or lands where grazed animals and farm animals can be expected to occur, indicate the nitrogen compounds and orthophosphate proposed water quality targets, and thus load allocations, are being met in these reaches. Based on available data, this source category is meeting their load allocation. As such, no new regulatory requirements are deemed necessary or are being proposed.

It is important to note that the TMDL project area is subject to the Domestic Animal Waste Discharge Prohibition and are subject to compliance with an approved indicator bacteria TMDL load allocation. Implementation efforts by responsible parties to comply with this prohibition and with indicator bacteria load allocations will, as a practical matter, also reduce the risk of nitrogen and phosphorus

loading to surface waters from domestic animal waste. It should be noted that available information does not conclusively demonstrate that all domestic animal operations are currently meeting load allocations; there are potentially unpermitted confined animal facilities, equestrian facilities, or grazing animal operations that do not meet load allocations. More information will be obtained, if merited, during the implementation phase of the TMDL to further assess the level of nutrient contribution from these source categories, and to identify any actions if necessary to reduce loading.

Tracking and Evaluation

Every three years, beginning three years after TMDLs are approved by the Office of Administrative Law, the Central Coast Water Board will perform a review of implementation actions, monitoring results, and evaluations submitted by responsible parties of their progress toward achieving their allocations, dependent upon staff availability and priorities. The Central Coast Water Board will use annual reports, nonpoint source pollution control implementation programs, evaluations submitted by responsible parties, and other available information to determine progress toward implementing required actions and achieving the allocations and the numeric goal.

Responsible parties will continue monitoring and reporting according to this plan for at least three years, at which time the Central Coast Water Board will determine the need for continuing or otherwise modifying the monitoring requirements. Responsible parties may also demonstrate that although water quality objectives are not being achieved in receiving waters, controllable sources of nitrogen compounds and orthophosphate are not contributing to the exceedance. If this is the case, the Central Coast Water Board may re-evaluate the numeric goal and allocations. For example, the Central Coast Water Board may pursue and approve a site-specific objective. The site-specific objective would be based on evidence that natural conditions or background sources alone were the cause of exceedances of the Basin Plan water quality objectives.

Three-year reviews will continue until the water quality objectives are achieved. The compliance schedule for achieving this TMDL is 30 years after the date of approval by the Office of Administrative Law.

Optional Special Studies and Reconsideration of the TMDL

Additional monitoring and voluntary optional special studies would be useful to evaluate the uncertainties and assumptions made in the development of this TMDL. The results of special studies may be used to reevaluate waste load allocations and load allocations in this TMDL. Implementing parties may submit work plans for optional special studies (if implementing parties choose to conduct special studies) for approval by the Executive Officer. Special studies completed and final reports shall be submitted for Executive Officer approval. Additionally, eutrophication is an active area of research; consequently ongoing scientific research on eutrophication and biostimulation may further inform the Water Board regarding waste load or load allocations that are protective against biostimulatory impairments, implementation timelines, and/or downstream impacts. At this time, staff maintains there is sufficient information to begin to implement the TMDL and make progress towards attainment of water quality standards and the proposed allocations. However, in recognition of the uncertainties regarding nutrient pollution and biostimulatory impairments, staff proposes that the Water Board reconsider the waste load and load allocations, if merited by optional special studies and new research, ten years after the effective date of the TMDL, which is upon approval by the Office of Administrative Law (OAL). A time schedule for optional studies and Central Coast Water Board reconsideration of the TMDL is presented in Table IX Q-3.

Further, the Central Coast Water Board may also reconsider these TMDLs, the nutrient water quality criteria, or other TMDL elements on the basis of potential future promulgation of a statewide nutrient policy for inland surface waters in the State of California.

Table IX Q-3. Time schedule for optional studies and Water Board reconsideration of waste load allocations and load allocations

<u>Proposed Actions</u>	<u>Description</u>	<u>Time Schedule-Milestones</u>
<u>Optional studies work plans</u>	<u>Implementing parties shall submit work plans for optional special studies (if implementing parties choose to conduct special studies) for approval by Executive Officer</u>	<u>By five years after the effective date of the TMDL</u>
<u>Final optional studies</u>	<u>Optional studies completed and final report submitted for Executive Officer approval.</u>	<u>By eight years after the effective date of the TMDL</u>
<u>Reconsideration of TMDL</u>	<u>If merited by optional special studies or information from ongoing research into eutrophication issues, the Water Board will reconsider the Wasteload and Load allocations and/or implementation timelines adopted pursuant to this TMDL.</u>	<u>By ten years after the effective date of the TMDL</u>

**STATE OF CALIFORNIA
REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, CA 93401**

RESOLUTION NO. R3-2013-0005

**AMENDING THE WATER QUALITY CONTROL PLAN REGARDING THE ONSITE
WASTEWATER SYSTEM IMPLEMENTATION PROGRAM**

WHEREAS, the California Regional Water Quality Control Board, Central Coast Region (hereafter Central Coast Water Board) finds:

1. The Central Coast Water Board adopted the *Water Quality Control Plan for the Central Coastal Basin* (Basin Plan) on March 14, 1975. The Basin Plan designates beneficial uses and water quality objectives, implementation programs for achieving water quality objectives addressing point source and nonpoint source discharges, prohibitions, and incorporates statewide plans and policies. The Basin Plan is periodically reviewed and revised. The Central Coast Water Board has determined that the Basin Plan requires further revision and amendment.
2. The Basin Plan contains an implementation program setting forth criteria regarding siting and design of onsite wastewater systems. The Central Coast Water Board updated its policy regarding siting and design of onsite wastewater systems on September 16, 1983, by adopting Resolution No. 83-12. The text and requirements specified in Resolution No. 83-12 are included in the Basin Plan as provisions of Chapters 4 and 5.
3. On May 9, 2008, the Central Coast Water Board adopted Resolution No. R3-2008-0005, revising the Basin Plan onsite wastewater system criteria. On March 20, 2009, the Central Coast Water Board adopted Resolution No. R3-2009-0012, revising the Basin Plan onsite implementation program. On May 5, 2011, the Central Coast Water Board adopted Resolution No. R3-2011-0004, revising the Basin Plan onsite implementation program with additional clarifying language and renumbered sections.
4. The State Water Resources Control Board (State Water Board), on June 19, 2012, adopted the *Water Quality Control Policy for Siting, Design, Operation, and Maintenance of Onsite Wastewater Treatment Systems* (OWTS Policy). The OWTS Policy includes a conditional waiver of the requirements to submit a report of waste discharge, obtain waste discharge requirements, and pay fees for discharges from onsite wastewater systems covered by the OWTS Policy. The OWTS Policy was approved by the California Office of Administrative Law on November 13, 2012, and became effective on May 13, 2013.
5. This Resolution No. R3-2013-0005 revises onsite wastewater sections of the Basin Plan; incorporates by reference the *Water Quality Control Policy for Siting, Design, Operation, and Maintenance of Onsite Wastewater Treatment Systems* into the Basin Plan; and rescinds Resolution No. R3-2008-0005, Resolution No. R3-2009-0012, and Resolution No. R3-2011-0004.

6. Area of Applicability - The effect of this amendment will be throughout the Central Coast Region, where onsite systems are used to treat and dispose of wastewater.
7. CEQA - The Central Coast Water Board's discretionary decisions are typically subject to the requirements of CEQA. The Secretary for Natural Resources has certified the basin planning process as an exempt regulatory program, and therefore the Water Boards are exempt from the specific CEQA requirement to prepare an environmental impact report or negative declaration when the Water Board is complying with the procedures identified in the certified regulatory program (Cal. Code Regs., tit. 23, §§3720-3781) [Pub. Res. Code §21080.5; Cal. Code Regs., tit. 14, §15251(g)].
8. A Substitute Environmental Document (SED) was prepared by the State Water Board for the OWTS Policy in accordance with the Water Board's certified regulatory program (Cal. Code Regs., tit. 23 §§3777-3781). The State Water Board approved the OWTS Policy and the SED on June 19, 2012. The proposed amendment removes existing Basin Plan provisions regulating onsite systems and incorporates the OWTS Policy. No substantive changes or modifications to the previously approved OWTS Policy are proposed, no substantial changes with respect to circumstances under which the project will be undertaken have occurred and no new information triggers the need for supplemental or subsequent CEQA analysis.
9. This amendment is completely within the scope of the OWTS Policy as analyzed by the State Water Board in the SED. As such, the recommended actions do not require further environmental review pursuant to the certified regulatory program or CEQA (Pub. Res. Code §21166; Cal. Code Regs. tit. 14, §§15161, 15163).
10. The subject amendment to the Basin Plan will result in no potential for adverse effect, either individually or cumulatively, on wildlife and is therefore exempt from fee payments to the Department of Fish and Wildlife under the California Fish and Game Code.
11. The State Water Board, in adopting the OWTS Policy, considered a wide range of factors affecting water quality and the availability of treatment measures to protect beneficial uses and public health, consistent with the goals and requirements set forth in State Water Board Resolution No. 68-16, Statement of Policy with Respect to Maintaining High Quality of Waters in California. The State Water Board analyzed the potential environmental impacts of reasonably foreseeable methods of compliance with the OWTS Policy, concluding that alternatives to the OWTS Policy do not accomplish the objectives of adopting consistent standards that will ensure public health and protection of beneficial uses of the state's waters while establishing an effective implementation process that considers cost and technological capabilities.
12. The State Water Board found that the OWTS Policy sets standards that could allow potentially significant direct water quality impacts from pathogen or nitrogen contamination, as well as cumulative water quality and public health impacts. The State Water Board also found that available mitigation measures would not meet the goals of the OWTS Policy, and that specific overriding economic, legal, social technological or other benefits outweigh any adverse environmental impacts resulting from new or continuing discharges in compliance with the OWTS Policy. With respect to local agency management programs, the State Water Board rejected mitigation measures that would remove too much local agency flexibility, render too many sites unsuitable for new and replaced OWTS, and/or impose significant costs without corresponding environmental benefit. The State Water Board

concluded that effective implementation of protections to allow continued use of OWTS for wastewater disposal in areas not suitable for centralized treatment systems is an important public benefit, and the protections afforded by the OWTS Policy provide the best treatment to ensure the highest water quality consistent with the maximum benefit to the people of the state. The State Water Board concluded that the OWTS Policy establishes a statewide, risk-based, tiered approach for the regulation and management of OWTS installations and replacements and sets the level of performance and protection expected from OWTS.

13. The OWTS Policy requires local agencies implementing management programs to monitor and assess water quality to ensure that beneficial uses are protected. The assessments must evaluate the impact of OWTS discharges and assess the extent to which groundwater and local surface water quality may be adversely impacted. Local agencies must report the results to the applicable Regional Water Board, and identify any changes in the local agency management program that will be undertaken to address impacts from OWTS. The Regional Water Board may also require modifications to an approved local agency management program as appropriate.
14. Consistent with the State Water Board's findings and the requirements of the OWTS Policy, this amendment is consistent with maximum benefit to the people of the State; will not unreasonably affect present and anticipated beneficial uses; will not result in water quality less than that prescribed in applicable state policies, including the OWTS Policy; and requires OWTS dischargers to use the best practicable treatment or control of the discharge necessary to avoid a pollution or nuisance and to maintain the highest water quality consistent with the maximum benefit to the people of the State.
15. Public Notice - Interested persons and the public have been informed of the Central Coast Water Board's intent to revise the Basin Plan implementation program for onsite wastewater systems. Efforts to inform the public and solicit public comment include a public notice of the amendments providing the public with a comment period in excess of 45 days in advance of the Central Coast Water Board hearing. Notice of public hearing was given by posting on the Water Board website, by mailing a copy of the notice to all persons requesting such notice and applicable government agencies, and by publishing notice in newspapers throughout the Central Coast region. The public also had the opportunity to comment on the OWTS Policy during the State Water Board adoption process.
16. On May 30-31, 2013, the Central Coast Water Board held a public hearing and considered all the evidence and comments concerning this matter. Notice of this hearing was given to all interested persons in accordance with CCR, Title 14, §15072.
17. The Basin Plan amendment must be submitted for review and approval by the State Water Board and the California Office of Administrative Law (OAL). The Basin Plan amendment will become effective upon approval by OAL. This Resolution will become effective upon adoption.

NOW, THEREFORE, BE IT RESOLVED THAT:

1. Pursuant to California Water Code §13240, the Central Coast Water Board, after considering the record, including oral testimony at the hearing, hereby adopts the Basin Plan amendment set forth in Attachments A and B to this Resolution adopting the State OWTS Policy into the Basin Plan.

2. Pursuant to California Water Code §13240, the Central Coast Water Board, after considering the record, including oral testimony at the hearing, hereby rescinds Resolution No. R3-2008-0005, Resolution No. R3-2009-0012, and Resolution No. R3-2011-0004 previously adopted by this Board.
3. The Central Coast Water Board's Executive Officer is directed to forward copies of the Basin Plan amendment to the State Water Board in accordance with the requirements of California Water Code §13245.
4. The Central Coast Water Board requests the State Water Board approve the Basin Plan amendments in accordance with requirements of California Water Code §13246, and forward it to OAL for approval. The State Water Board, on behalf of the Central Coast Water Board, shall file a Notice of Decision with the Secretary of Resources and the Governor's Office of Planning and Research (State Clearinghouse) after approval by OAL.
5. If during the approval process the State Water Board or OAL determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Central Coast Water Board Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.

I, Kenneth A. Harris Jr., Interim Executive Officer of the California Regional Water Quality Control Board, Central Coast Region, do hereby certify that the foregoing is a full, true and correct copy of a resolution adopted by the California Regional Water Quality Control Board, Central Coast Region on May 30, 2013.

Interim Executive Officer

- Attachments: A. Revised Basin Plan Chapters 4 and 5 (onsite sections only)
B. Revisions to Basin Plan Chapters 4 and 5 (onsite sections only)

CHAPTER 4. IMPLEMENTATION PLAN

(onsite wastewater section only)

VIII.D. INDIVIDUAL, ALTERNATIVE, AND COMMUNITY ONSITE WASTEWATER SYSTEMS

VIII.D.1. ONSITE WASTEWATER SYSTEM REQUIREMENTS

Requirements for siting, design, operation, maintenance, and management of onsite wastewater systems are specified in the State Water Resources Control Board's *Water Quality Control Policy for Siting, Design, Operation, and Maintenance of Onsite Wastewater Treatment Systems* (OWTS Policy). The OWTS Policy sets forth a tiered implementation program with requirements based upon levels (tiers) of potential threat to water quality. The OWTS Policy includes a conditional waiver of waste discharge requirements for onsite systems that comply with the policy.

The OWTS Policy, including future revisions, is incorporated into this Basin Plan and shall be implemented according to the policy's provisions.

VIII.D.2. DISCHARGE PROHIBITIONS

In order to achieve water quality objectives, protect present and future beneficial water uses, protect public health, and prevent nuisance, discharges of waste are prohibited in the following areas:

1. Discharges from individual sewage disposal systems are prohibited in portions of the community of Nipomo, San Luis Obispo County, which are particularly described in Appendix A-27.
2. Discharges from individual sewage disposal systems within the San Lorenzo River Watershed shall be managed as follows:

Discharges shall be allowed, providing the County of Santa Cruz, as lead agency, implements the *Wastewater Management Plan for the San Lorenzo River Watershed, County of Santa Cruz, Health Services Agency, Environmental Health Service*, February 1995, and *San Lorenzo Nitrate Management Plan, Phase II Final Report*, February 1995, County of Santa Cruz, Health Services Agency, Environmental Health Service (Wastewater Management Plan) and assures the Regional Board that areas of the San Lorenzo River Watershed are serviced by wastewater disposal systems to protect and enhance water quality, to protect and restore beneficial uses of water, and to abate and prevent nuisance, pollution, and contamination.

In fulfilling the responsibilities identified above, the County of Santa Cruz shall submit annual reports beginning on January 15, 1996. The report shall state the status and progress of the Wastewater Management Plan in the San Lorenzo River Watershed. The County of Santa Cruz annual report shall document the results of:

- a. Existing disposal system performance evaluations,
- b. Disposal system improvements,
- c. Inspection and maintenance of onsite systems,
- d. Community disposal system improvements,
- e. New development and expansion of existing system protocol and standards,
- f. Water quality monitoring and evaluation,
- g. Program administration management, and
- h. Program information management.

The report shall also document progress on each element of the Nitrate Management Plan, including:

- a. Parcel size limit,
- b. Wastewater Management Plan implementation,
- c. Boulder Creek Country Club Wastewater Treatment Plant Upgrade,
- d. Shallow leachfield installation,
- e. Enhanced wastewater treatment for sandy soils,
- f. Enhanced wastewater treatment for large onsite disposal systems,
- g. Inclusion of nitrogen reduction in Waste Discharge Permits,
- h. Livestock and stable management,
- i. Protection of groundwater recharge areas,
- j. Protection of riparian corridors and erosion control,
- k. Nitrate control for new uses,
- l. Scotts Valley nitrate discharge reduction, and
- m. Monitoring for nitrate in surface and ground water.

The County of Santa Cruz shall submit for approval by May 13, 2016, a Local Agency Management Program to be implemented in lieu of the Wastewater Management Plan for the San Lorenzo River Watershed, referenced above. Beginning in 2017 annual reports shall be consistent with the requirements specified in the OWTS Policy and the Regional Board approved Local Agency Management Program in lieu of reporting requirements stated above.

3. Discharges of waste from individual and community sewage disposal systems are prohibited effective November 1, 1988, in the Los Osos/Baywood Park area, and more particularly described as: Groundwater Prohibition Zone. (Prohibition Boundary Map included as

Attachment "A" of Resolution No. 83-13 which can be found in Appendix A-30.)

Failure to comply with any of the compliance dates established by Resolution 83-13 will prompt a Regional Board hearing at the earliest possible date to consider adoption of an immediate prohibition of discharge from additional individual and community sewage disposal systems.

VIII.D.3. SUBSURFACE DISPOSAL EXEMPTIONS

The Regional Board or Executive Officer may grant exemptions to prohibitions of waste discharges from new or existing onsite systems within the specific prohibition areas cited above. Such exemptions may be granted only after presentation by the discharger of sufficient justification, including geologic and hydrologic evidence that the continued operation of such systems in a particular area will not individually or collectively or directly or indirectly result in pollution or nuisance or affect water quality adversely.

Requests for exemptions will not be considered until the local agency has reviewed the system and submitted the proposal for Regional Board review. Dischargers requesting exemptions must submit a Report of Waste Discharge. Exemptions will be subject to filing fees as established by the State Water Code.

Further information concerning individual, alternative, or community onsite sewage disposal systems can be found in Chapter 5 in the Management Principles and Control Actions sections. State Water Resources Control Board plans and policies, discharge prohibitions, and Regional Board policies also apply depending on individual circumstances.

CHAPTER 5. PLANS AND POLICIES

(new onsite wastewater section only)

I.M. ONSITE WASTEWATER POLICY

The *Water Quality Control Policy for Siting, Design, Operation, and Maintenance of Onsite Wastewater Treatment Systems* (OWTS Policy), Resolution No. 2012-0032, was adopted by the State Water Resources Control Board on June 19, 2012. This Policy implements California Water Code, Chapter

4.5, Division 7, §13290-13291.7 by establishing statewide regulations and standards for permitting onsite wastewater systems. The OWTS Policy specifies criteria for existing and new onsite systems and establishes a conditional waiver of waste discharge requirements for onsite systems that comply with the policy.

CHAPTER 4. IMPLEMENTATION PLAN

(onsite wastewater section only)

VIII.D. INDIVIDUAL, ALTERNATIVE, AND COMMUNITY ONSITE WASTEWATER DISPOSAL SYSTEMS

VIII.D.1. ONSITE WASTEWATER SYSTEM REQUIREMENTS

Requirements for siting, design, operation, maintenance, and management of onsite wastewater systems are specified in the State Water Resources Control Board's Water Quality Control Policy for Siting, Design, Operation, and Maintenance of Onsite Wastewater Treatment Systems (OWTS Policy). The OWTS Policy sets forth a tiered implementation program with requirements based upon levels (tiers) of potential threat to water quality. The OWTS Policy includes a conditional waiver of waste discharge requirements for onsite systems that comply with the policy.

The OWTS Policy, including future revisions, is incorporated into this Basin Plan and shall be implemented according to the policy's provisions.

~~On-site sewage disposal systems and other similar methods for liquid waste disposal are sometimes viewed as interim solutions in urbanizing areas, yet may be required to function for many years. On-site systems can be a viable long term waste disposal method with proper siting, design, construction, and management. In establishing on-site system regulations, agencies must consider such systems as permanent, not interim systems to be replaced by public sewers. The reliability of these systems is highly dependent on land and soil constraints, proper design, proper construction, and proper operation and maintenance.~~

~~If on-site sewage treatment facilities are not carefully managed, problems can occur, including:~~

- ~~• odors or nuisance;~~
- ~~• surfacing effluent;~~
- ~~• disease transmission; and,~~
- ~~• pollution of surface and ground waters.~~

~~Odors and nuisance can be objectionable and annoying and may obstruct free use of property. Surfacing effluent (effluent which fails to percolate and rises to the ground surface) can be an annoyance, or health hazard to the resident and neighbors. In some cases, nearby surface waters may be polluted.~~

~~On-site sewage disposal systems are a potential mechanism for disease transmission. Sewage is capable of transmitting diseases from organisms which are discharged by an infected individual. These include dysentery, hepatitis, typhoid, cholera, and gastro-intestinal disorders.~~

~~Pollution of surface or ground waters can result from the discharge of on-site system wastes. Typical problem waste constituents are total dissolved solids, phosphates, nitrates, heavy metals, bacteria, and viruses. Discharge of these wastes will, in some cases, destroy beneficial surface and ground water uses.~~

~~Subsurface disposal systems may be used to dispose of wastewater from: (1) individual residences; (2) multi-unit residences; (3) institutions or places of commerce; (4) industrial sanitary sources; and, (5) small communities. All individual and multi-unit residential developments are subject to criteria in this section of the Basin Plan. Commercial, institutional, and industrial developments with a discharge flow rate less than 2500 gallons per day generally are not regulated by waste discharge requirements;~~

therefore, they must comply with these criteria. Community systems must also comply with criteria relating to this subject within the Basin Plan. Community systems are defined for the purposes of this Basin Plan as: (1) residential wastewater treatment systems for more than 5 units or more than 5 parcels; or, (2) commercial, institutional or industrial systems to treat sanitary wastewater equal to or greater than 2500 gallons per day (average daily flow). Systems of this type and size may be subject to waste discharge requirements.

Alternatives to conventional on-site system designs have been used when site constraints prevent the use of conventional systems. Examples of alternative systems include mound and evapotranspiration systems. Remote subdivisions, commercial centers, or industries may utilize conventional collection systems with community treatment systems and subsurface disposal fields for sanitary wastes. Alternative and community systems can pose serious water quality problems if improperly managed. Failures have been common in the past and are usually attributed to the following:

- Systems are inadequately or improperly sited, designed, or constructed.
- Long-term use is not considered.
- Inadequate operation and maintenance.

VIII.D.1. CORRECTIVE ACTIONS FOR EXISTING SYSTEMS

Individual disposal systems can be regulated with relative ease when they are proposed for a particular site. For new systems, regulations generally provide for good design and construction practices. A more troublesome problem is presented by older septic tank systems where design and construction may have been less strictly controlled or where land development has intensified to an extent that percolation systems are too close together and there is no room left for replacement leaching areas.

Where this situation develops to an extent that public health hazards and nuisance conditions develop, the most effective remedy is usually a sewer system. Where soil percolation rates are particularly fast, ground water degradation is possible, particularly increases in nitrate concentrations.

Sewer system planning should be emphasized in urbanizing areas served by septic tanks. A first step would be a monitoring system involving surface and ground waters to determine whether problems are developing. Where septic tank systems in urbanized areas are not scheduled for replacement by sewers and where public health hazards are not documented, septic tank maintenance procedures are encouraged to lessen the probability that a few major failures might force sewerage of an area which otherwise could be retained on individual systems without compromising water quality. Often a few systems will fail in an area where more frequent septic tank pumping, corrections to plumbing or leach fields, or in-home water conservation measures could help prevent failure. Improvements of this kind should be enforced by a local septic tank maintenance district or local governing jurisdiction.

A septic tank subjected to greater hydraulic load can fail due to washout of solids into percolation areas and plugging of the infiltrative surface. In some cases, excess wash water could be diverted to separate percolation areas by in-home plumbing changes. Dishwashers, garbage grinders, and washing machines could be eliminated. Water saving toilets, faucets, and shower heads are available to encourage low water use. Water use costs may also be structured to encourage more frugal use of water.

VIII.D.2. LOCAL GOVERNING JURISDICTION ACTIONS

VIII.D.2.a. DISCLOSURE AND COMPLIANCE OF EXISTING WASTEWATER DISPOSAL SYSTEM

Local governing jurisdictions should provide programs to assure conformance with this Basin Plan and local regulations. Inspection programs should assure site suitability tests are performed as necessary, and that tests are in accordance with standard procedures. Inspection should also assure proper system installation. Proper design and construction should be certified by the inspector. Concerned homeowners can be a tremendous asset in assuring proper construction. When a septic system permit is issued by the local agency, a handout specifying proper construction techniques should be made available to the general public. Systems must be inspected by the local agency before covering (backfilling).

Local agencies can use either staff inspectors or individuals under contract with the local government. Either way, a standard detailed checklist should be completed by the inspector to certify compliance.

Site suitability determinations should specify: (1) whether approval is for the entire lot or for specific locations of the lot; (2) if further tests are necessary; and, (3) if alternatives are necessary or available.

Where agency approval is necessary from various departments, final sign-offs should be on the same set of plans.

Home owners should be aware of the nature and requirements of their wastewater disposal system. Plans should be available in city or county offices showing placement of soil absorption systems. Since this is only feasible for new construction, local agencies should require septic system as-built plans as a condition of new construction final inspection. Plans would be kept on file for future use of property owners.

Prospective property buyers should be informed of any enforcement action affecting parcels or houses they wish to buy. For example, a parcel in a discharge prohibition area may be unbuildable for an indefinite

period, or a developed parcel may be subject to significant user charges from a future sewer system. Local agencies should have prohibition area terms entered into the county record for each affected parcel. When a prospective buyer conducts a title search, terms of the prohibition would appear in the preliminary title report.

Dual leaching capabilities provide an immediate remedy in the event of system failure. For that reason, dual leachfields are considered appropriate for all systems. Furthermore, should wastewater flows increase, this area can be used until the system is expanded. But system expansion may not be possible if land is not set aside for this purpose. For these reasons, dedicated system expansion areas are also appropriate.

To protect this set aside area from encroachment, the local agency should require restrictions on future use of the area as a condition of land division or building permit approval. For new subdivisions, Covenants, Conditions, and Restrictions (CC&R's) might provide an appropriate mechanism for protecting a set aside area. Future buyers of affected property would be notified of property use restrictions by reading CC&R's.

All on-site system owners need to be aware of proper operation and maintenance procedures. Local governing jurisdictions should mount a continuing public education program to provide home owners with on-site system operation and maintenance guidelines. Basin Plan information should be available at local agency health and building departments.

Local agencies should conduct an on-site system inspection program, particularly in areas where system failures are common or where systems with poor soils are approved. An agency inspector should periodically check each septic tank for pumping need and each system for proper operation. Homeowners should be alerted where

evidence of system failure exists. Where nuisance or a potential public health hazard exists, a followup procedure should insure the situation is corrected. On-site systems should be constructed in a location that facilitates system inspection.

Another approach is periodically to mail homeowners a brochure reminding them how to maintain and inspect their on-site system. Homeowners should be notified that they should periodically check their septic tank for pumping need. Homeowners should also be notified of other problems indicative of system failure. Some examples include wet spots in drainfield area, lush grass growths, slowly draining wastewater, and sewage odors.

Many existing systems do not comply with current or proposed standards. Repairs to failing systems should be done under permit from the local agency. To the extent practicable, the local agency should require failing systems to be brought into compliance with Basin Plan recommendations. This could be a condition of granting a permit for repairs.

Land use changes on properties used for commerce, small institutions, or industries should not be approved by the local agency until the existing on-site system meets criteria of this Basin Plan and local ordinances. A land use permit or business license could be used to alert the local agency of land use changes.

VIII.D.2.b. ON-SITE WASTEWATER MANAGEMENT PLANS

On-site wastewater management should be implemented in urbanizing areas to investigate long term cumulative impacts resulting from continued use of individual, alternative, and community on-site disposal systems. A wastewater disposal study should be conducted to determine the best Wastewater Management Plan that would provide site or basin specific wastewater re-use. This study should identify basin specific criteria to prevent water quality degradation

and public health hazards and provide an evaluation of the effects of existing and proposed developments and changes in land use. These plans should be a comprehensive planning tool to specify on-site disposal system limitations to prevent ground or surface water degradation. Wastewater management plans should:

- Contain a ground/surface water monitoring program.
- Identify sites suitable for conventional septic systems.
- Project on-site disposal system demand.
- Determine sites and methods to best meet demand.
- Project maximum population densities for each subdrainage basin to control degradation or contamination of ground or surface water.
- Recommend establishment of septic tank maintenance districts, as needed.
- Identify alternate means of disposing of sewage in the event of irreversible degradation from on-site disposal systems.

For areas where watershed wide plans are not developed, conditions could be placed on new divisions of land or community systems to provide monitoring data or geologic information to contribute to the development of a Wastewater Management Plan.

Wastewater disposal alternatives should identify costs to each homeowner. A cost-effectiveness analysis, which considers socio-economic impacts of alternative plans, should be used to select the recommended plan.

On-site wastewater disposal zones, as discussed in Section 6950-6981 of the Health and Safety Code, may be an appropriate means of implementing on-site Wastewater Management Plans.

On-site Wastewater Management Plans shall be approved by the Regional Board.

VIII.D.2.c. SEPTIC TANK MAINTENANCE DISTRICTS

It may be appropriate for unsewered community on-site systems to be maintained by local sewage disposal maintenance districts. These special districts could be administered through existing local governments such as County Water Districts, a Community Services District, or a County Service Area.

Septic tank maintenance districts should be responsible for operation and maintenance in conformance with this Water Quality Control Plan. Administrators should insure proper construction, installation, operation, and maintenance of on-site disposal systems. Maintenance districts should establish septic tank surveillance, maintenance and pumping programs, where appropriate; provide repairs to plumbing or leachfields; and encourage water conservation measures.

VIII.D.3. CRITERIA FOR NEW SYSTEMS

On-site sewage disposal system problems can be minimized with proper site location, design, installation, operation, and maintenance. The following section recommends criteria for all new individual subsurface disposal systems and community sewage disposal systems. Local governing jurisdictions should incorporate these guidelines into their local ordinances. These recommendations will be used by the Regional Board for Regional Board regulated systems and exemptions.

Recommendations are arranged in sequence under the following categories: site suitability; system design; construction; individual system maintenance; community system design; and local agencies.

Mandatory criteria are listed in the "Individual, Alternative, and Community Systems

Prohibitions" section.

VIII.D.3.a. SITE SUITABILITY

Prior to permit approval, site investigation should determine on-site system suitability:

1. At least one soil boring or excavation per on-site system should be performed to determine soil suitability, depth to ground water, and depth to bedrock or impervious layer. Soil borings are particularly important for seepage pits. Impervious material is defined as having a percolation rate slower than 120 minutes per inch or having a clay content 60 percent or greater. The soil boring or excavation should extend at least 10 feet below the drainfield¹ bottom at each proposed location.
2. An excavation should be made to detect mottling or presence of underground channels, fissures, or cracks. Soils should be excavated to a depth of 4-5 feet below drainfield bottom.
3. For leachfields, at least three percolation test locations should be used to determine system acceptability. Tests should be performed at proposed subsurface disposal system sites and depths.
4. If no restrictive layers intersect, and geologic conditions permit surfacing, the setback distance from a cut, embankment, or steep slope (greater than 30 percent) should be determined by projecting a line 20 percent down gradient from the sidewall at the highest perforation of the discharge pipe. The leachfields should be set back far enough to prevent this projected line from intersecting the cut within 100 feet, measured horizontally, of the sidewall. If restrictive layers intersect cuts, embankments or steep slopes, and geologic conditions permit surfacing, the setback should be at least 100 feet measured from the top of the cut.

- 5. ~~Natural ground slope of the disposal area should not exceed 20 percent.~~
- 6. ~~For new land divisions, lot sizes less than one acre should not be permitted.~~

VIII.D.3.b. SYSTEM DESIGN

~~On site systems should be designed according to the following recommendations:-~~

- 1. ~~Septic tanks should be designed to remove nearly 100 percent of settleable solids and should provide a high degree of anaerobic decomposition of colloidal and soluble organic solids.~~
- 2. ~~Tank design must allow access for inspection and cleaning. The septic tank must be accessible for pumping.~~
- 3. ~~If curtain drains discharge diverted ground water to subsurface soils, the upslope separation from a leachfield or pit should be 20 feet and the down slope separation should be 50 feet.~~
- 4. ~~Leachfield application rate should not exceed the following:~~

Percolation Rate min./in	Loading Rate g.p.d./sq.ft.
1 - 20	0.8
21 - 30	0.6
31 - 60	0.25
61 - 120	0.10

- 5. ~~Seepage pit application rate should not exceed 0.3 gpd/sq. ft.~~
 - 6. ~~Drainfield¹ design should be based only upon usable permeable soil layers.~~
- ~~1 "Drainfield" refers to either a leachfield or seepage pit~~
- 7. ~~The minimum design flow rate should be 375 gallons per day per dwelling unit.~~

- 8. ~~In clayey soils, systems should be constructed to place infiltrative surfaces in more permeable horizons.~~
- 9. ~~Distance between drainfield trenches should be at least two times the effective trench depth.¹~~

~~1 "Effective trench depth" means depth below the bottom of the trench pipe.~~

- 10. ~~Distance between seepage pits (nearest sidewall to sidewall) should be at least 20 feet.~~
- 11. ~~Dual disposal fields (200 percent of original calculated disposal area) are recommended.~~
- 12. ~~For commercial systems, small institutions, or sanitary industrial systems, design should be based on daily peak flow.~~
- 13. ~~For commercial and institutional systems, pretreatment may be necessary if wastewater is significantly different from domestic wastewater.~~
- 14. ~~Commercial systems, institutional systems, or domestic industrial systems should reserve an expansion area (i.e. dual drainfields must be installed and area for replacement of drainfield must be provided) to be set aside and protected from all uses except future drainfield repair and replacement.~~
- 15. ~~Nutrient and heavy metal removal should be facilitated by planting ground cover vegetation over shallow subsurface drainfields. The plants must have the following characteristics: (1) evergreen, (2) shallow root systems, (3) numerous leaves, (4) salt resistant, (5) ability to grow in soggy soils, and (6) low or no maintenance. Plants downstream of leaching area may also be effective in nutrient removal.~~

VIII.D.3.c. DESIGN FOR ENGINEERED SYSTEMS

- ~~1. Mound systems should be installed in accordance with criteria contained in Guidelines for Mound Systems by the State Water Resources Control Board.~~
- ~~2. Evapotranspiration systems should be installed in accordance with criteria contained in Guidelines for Evapotranspiration Systems by the State Water Resources Control Board. Exceptions are:
 - ~~a. For evapotranspiration systems, each month of the highest precipitation year and lowest evaporation year within the previous ten years of record should be used for design.~~
 - ~~b. Systems shall be designed by a registered civil engineer competent in sanitary engineering.~~~~

VIII.D.3.d. CONSTRUCTION

~~Water quality problems resulting from improper construction can be reduced by following these practices:~~

- ~~1. Subsurface disposal systems should have a slightly sloped finished grade to promote surface runoff.~~
- ~~2. Work should be scheduled only when infiltrative surfaces can be covered in one day to minimize windblown silt or rain clogging the soil.~~
- ~~3. In clayey soils, work should be done only when soil moisture content is low to avoid smeared infiltrative surfaces.~~
- ~~4. Bottom and sidewall areas should be left with a rough surface. Any smeared or compacted surfaces should be removed.~~
- ~~5. Bottom of trenches or beds should be level throughout to prevent localized overloading.~~

- ~~6. Two inches of coarse sand should be placed on the bottom of trenches to prevent compacting soil when leachrock is dumped into drainfields. Fine sand should not be used as it may lead to system failure.~~
- ~~7. Surface runoff should be diverted around open trenches/ pits to limit siltation of bottom area.~~
- ~~8. Prior to backfilling, the distribution system should be tested to check the hydraulic loading pattern.~~
- ~~9. Properly constructed distribution boxes or junction fittings should be installed to maintain equal flow to each trench. Distribution boxes should be placed with extreme care outside the leaching area to insure settling does not occur.~~
- ~~10. Risers to the ground surface and manholes should be installed over the septic tank inspection ports and access ports.~~
- ~~11. Drainfield should include an inspection pipe to check water level.~~

~~Additional construction precautions are discussed within the Environmental Protection Agency's Design Manual: On Site Wastewater Treatment and Disposal Systems.~~

VIII.D.3.e. INDIVIDUAL SYSTEM MAINTENANCE

~~Individual septic tanks should be maintained as follows:~~

- ~~1. Septic tanks should be inspected every two to five years to determine the need for pumping. If garbage grinders or dishwashers discharge into the septic tank, inspection should occur at least every two years.~~
- ~~2. Septic tanks should be pumped whenever: (1) the scum layer is within~~

~~three inches of the outlet device; or (2) the sludge level is within eight inches of the bottom of the outlet device.~~

- ~~3. Drainfields should be alternated when drainfield inspection pipes reveal a high water level.~~
- ~~4. Disposal of septage (solid residue pumped from septic tanks) should be accomplished in a manner acceptable to the Executive Officer. In some areas, disposal may be to either a Class I or Class II solid waste site; in others, septage may be discharged to a municipal wastewater treatment facility.~~

~~VIII.D.3.f. COMMUNITY SYSTEM DESIGN~~

~~Community systems should be designed and maintained to accommodate the following items:~~

- ~~1. Capacities should accommodate build-out population.~~
- ~~2. Design should be based upon peak daily flow estimates.~~
- ~~3. Design should consider contributions from infiltration throughout the collection system.~~
- ~~4. Septic tanks should be pumped when sludge and scum levels are greater than 1/3 of the depth of the first compartment.~~
- ~~5. Operation and maintenance should be in accordance with accepted sanitary practice.~~
- ~~6. Maintenance manuals should be provided to system users and maintenance personnel.~~
- ~~7. Discharge should not exceed 40 grams per day total nitrogen, on the average, per acre of total development overlying ground water recharge areas, unless local governing jurisdictions adopt Wastewater Management Plans subsequently~~

~~approved by the Regional Board.~~

~~VIII.D.3.g. LOCAL AGENCIES~~

~~Recommendations for local governing jurisdictions:~~

- ~~1. Adopt a standard percolation test procedure.~~

~~The California State Water Resources Control Board Guidelines for Evapotranspiration Systems provides a percolation test method recommended for use to standardize test results. A twelve-inch diameter percolation test hole may be used.~~

- ~~2. Percolation tests should be continued until a stabilized rate is obtained.~~
- ~~3. Percolation test holes should be drilled with a hand auger. A hole could be hand augered or dug with hand tools at the bottom of a larger excavation made by a backhoe.~~
- ~~4. Percolation tests should be performed at a depth corresponding to the bottom of the subsurface disposal area.~~
- ~~5. Seepage pits should be utilized only after careful consideration of site suitability. Soil borings or excavations should be inspected either by permitting agency or individual under contract to the permitting agency.~~
- ~~6. Approve permit applications after checking plans for erosion control measures.~~
- ~~7. Inspect systems prior to covering to assure proper construction.~~
- ~~8. Require replacements or repairs to failing systems to be in conformance with Basin Plan recommendations, to the extent practicable.~~

9. ~~For new land divisions, protect on-site disposal systems and expansion areas from encroachment by provisions in covenants, conditions, and restrictions.~~
10. ~~Inform property buyers of the existence, location, operation, and maintenance of on-site disposal systems. Prospective home or property buyers should also be informed of any enforcement action (e.g. Basin Plan prohibitions) through the County Record.~~
11. ~~Conduct public education programs to provide property owners with operation and maintenance guidelines.~~
12. ~~Alternative system owners shall be provided an informational maintenance or replacement document by the appropriate governing jurisdiction. This document shall cite homeowner procedures to ensure maintenance, repair, or replacement of critical items within 48 hours following failure.~~
13. ~~Where appropriate, septic tank systems should be maintained by local septic tank maintenance districts.~~
14. ~~Wastewater Management Plans should be prepared and implemented for urbanizing and high density areas, including applicable portions of San Martin, San Lorenzo Valley, Carmel Valley, Carmel Highland, Prunedale, El Toro, Shandon, Templeton, Santa Margarita/Garden Farms, Los Osos/Baywood Park, Arroyo Grande, Nipomo, upper Santa Ynez Valley, and Los Olivos/Ballard.~~
15. ~~Ordinances should be updated to reflect Basin Plan criteria.~~

VIII.D.3.h. ADDITIONAL CONSIDERATIONS

1. ~~Water conservation and solids reduction practices are recommended. Garbage~~

~~grinders should not be used in homes with septic tanks.~~

2. ~~Metering and water use costs should be used to encourage water conservation.~~
3. ~~Grease and oil should not be introduced into the system. Bleach, solvents, fungicides, and any other toxic material should not be poured into the system.~~
4. ~~Reverse osmosis unit blow-down should not be discharged to on-site wastewater treatment systems overlying usable ground water. Off-site (factory regeneration) practices are recommended for water softeners.~~
5. ~~If on-site water softener regeneration is necessary, minimum salt use in water softeners is recommended. This can be accomplished by minimizing regeneration time or limiting the number of regeneration cycles.~~

VIII.D.3.i. INDIVIDUAL, ALTERNATIVE AND COMMUNITY SYSTEMS PROHIBITIONS

Discharges from new soil absorption systems installed after September 16, 1983 in sites with any of the following conditions are prohibited:

1. ~~Soils or formations contain continuous channels, cracks, or fractures.~~
2. ~~For seepage pits, soils or formations containing 60 percent or greater clay (a soil particle less than two microns in size) unless parcel size is at least two acres.~~
3. ~~Distances between trench bottom and usable ground water, including perched ground water, less than separation specified by appropriate percolation rate:~~

Percolation Rate, min/in	Distance, ft
<1	501

Resolution No. R3-2013-0005 ATTACHMENT B

1-4	201
5-29	8
>30	5

4. For seepage pits, distances between pit bottom and usable ground water, including perched ground water, less than separation specified by appropriate soil type:-

Soil	Distance, ft.
Gravels ²	501
Gravels with few fines ³	201
Other	10

5. Distances between trench/pit bottom and bedrock or other impervious layer less than ten feet.

6. For leachfields, where percolation rates are slower than 120 min/in, unless parcel size is at least two acres.

7. For leachfields, where soil percolation rates are slower than 60 min./in. unless the effluent application rate is 0.1 gpd/ft² or less.

8. Areas subject to inundation from a ten-year flood.

9. Natural ground slope of the disposal area exceeds 30 percent.

10. Setback distances less than:

	Minimum Setback Distance, ft
Domestic water supply wells in unconfined aquifer	100
Watercourse ⁴ where geologic conditions permit water migration	100
Reservoir ⁵ spillway elevation	200
Springs, natural or any part of man-made spring	100

1. Unless a set-back distance of at least 250 feet to any domestic water supply well or surface water is assured.-

2. Gravels - Soils with over 95 percent by weight coarser than a No. 200 sieve and over half of the coarse fraction larger than a No. 4 sieve.

3. Gravels with few fines - Soils with 90 percent to 94 percent coarse fraction larger than a No. 4 sieve.

4. Watercourse - (1) A natural or artificial channel for passage of water. (2) A running stream of water. (3) A natural stream fed from permanent or natural sources, including rivers, creeks, runs, and rivulets. There must be a stream, usually flowing in a particular direction (though it need not flow continuously) in a definite channel, having a bed or banks and usually discharging into some stream or body of water.

5. Reservoir - A pond, lake, tank, basin, or other space either natural or created in whole or in part by the building of engineering structures, which is used for storage, regulation, and control of water, recreation, power, flood control, or drinking.

11. While new septic tank systems should generally be limited to new divisions of land having a minimum parcel size of one acre, where soil and other physical constraints are particularly favorable, parcel size shall not be less than one-half acre.-

12. Within a reservoir¹ watershed where the density for each land division is less than 2.5 acres for areas without approved Wastewater Management Plans.-

13. For individual systems on new land divisions, and commercial, institutional, and sanitary industrial systems without an area set aside for dual leachfields (100 percent replacement area).-

14. Commercial, institutional, or sanitary industrial systems not basing design on daily peak flow estimate.-

1. Reservoir - A pond, lake, tank, basin, or other space either natural or created in whole or in part by the building of engineering structures, which is used for storage, regulation, and control of water, recreation, power, flood control, or drinking.

15. Any site unable to maintain subsurface disposal.-

~~16. Any subdivision unless the subdivider clearly demonstrates the use of the system will be in the best public interest, that beneficial water uses will not be adversely affected, and compliance with all Basin Plan prohibitions is demonstrated.~~

~~17. Lot sizes, dwelling densities or site conditions causing detrimental impacts to water quality.~~

~~18. Any area where continued use of on-site systems constitutes a public health hazard, an existing or threatened condition of water pollution, or nuisance.~~

~~**Discharges from community subsurface disposal systems (serving more than five parcels or more than five dwelling units) are prohibited unless:**~~

~~1. Seepage pits have at least 15 vertical feet between pit bottom and highest usable ground water, including perched ground water.~~

~~2. Sewerage facilities are operated by a public agency. (If a demonstration is made to the Regional Board that an existing public agency is unavailable and formation of a new public agency is unreasonable, a private entity with adequate financial, legal, and institutional resources to assume responsibility for waste discharges may be acceptable).~~

~~3. Dual disposal systems are installed (200 percent of total of original calculated disposal area).~~

~~4. An expansion area is included for replacement of the original system (300 percent total).~~

~~5. Community systems provide duplicate individual equipment components for components subject to failure.~~

~~6. Discharge does not exceed 40 grams per day of total nitrogen, on the average, per 1/2 acre of total development overlying ground water recharge areas excepting where a local governing jurisdiction has adopted a Wastewater Management Plan subsequently approved by the Regional Board.~~

VIII.D.2. DISCHARGE PROHIBITIONS

In order to achieve water quality objectives, protect present and future beneficial water uses, protect public health, and prevent nuisance, discharges of waste are prohibited in the following areas:

1. Discharges from individual sewage disposal systems are prohibited in portions of the community of Nipomo, San Luis Obispo County, which are particularly described in Appendix A-27.

2. Discharges from individual sewage disposal systems within the San Lorenzo River Watershed shall be managed as follows:

Discharges shall be allowed, providing the County of Santa Cruz, as lead agency, implements the *Wastewater Management Plan for the San Lorenzo River Watershed, County of Santa Cruz, Health Services Agency, Environmental Health Service*, February 1995 and *San Lorenzo Nitrate Management Plan, Phase II Final Report*, February 1995, County of Santa Cruz, Health Services Agency, Environmental Health Service (Wastewater Management Plan) and assures the Regional Board that areas of the San Lorenzo River Watershed are serviced by wastewater disposal systems to protect and enhance water quality, to protect and restore beneficial uses of water, and to abate and prevent nuisance, pollution, and contamination.

In fulfilling the responsibilities identified above, the County of Santa Cruz shall

submit annual reports beginning on January 15, 1996. The report shall state the status and progress of the Wastewater Management Plan in the San Lorenzo River Watershed. The County of Santa Cruz annual report shall document the results of:

- a. Existing disposal system performance evaluations,
- b. Disposal system improvements,
- c. Inspection and maintenance of on-site systems,
- d. Community disposal system improvements,
- e. New development and expansion of existing system protocol and standards,
- f. Water quality monitoring and evaluation,
- g. Program administration management, and
- h. Program information management.

The report shall also document progress on each element of the Nitrate Management Plan, including:

- a. Parcel size limit,
- b. Wastewater Management Plan implementation,
- c. Boulder Creek Country Club Wastewater Treatment Plant Upgrade,
- d. Shallow leachfield installation,
- e. Enhanced wastewater treatment for sandy soils,
- f. Enhanced wastewater treatment for large on-site disposal systems,
- g. Inclusion of nitrogen reduction in Waste Discharge Permits,
- h. Livestock and stable management,
- i. Protection of groundwater recharge areas,
- j. Protection of riparian corridors and erosion control,
- k. Nitrate control for new uses,
- l. Scotts Valley nitrate discharge reduction, and
- m. Monitoring for nitrate in surface and ground water.

The County of Santa Cruz shall submit for approval by May 13, 2016, a Local Agency Management Program to be implemented in lieu of the Wastewater Management Plan for the San Lorenzo River Watershed, referenced above. Beginning in 2017 annual reports shall be consistent with the requirements specified in the OWTS Policy and the Regional Board approved Local Agency Management Program in lieu of reporting requirements stated above.

3. Discharges of waste from individual and community sewage disposal systems are prohibited effective November 1, 1988, in the Los Osos/Baywood Park area, and more particularly described as: Groundwater Prohibition Zone, depicted in the (Prohibition Boundary Map included as Attachment "A" of Resolution No. 83-13 which can be found in Appendix A-30.)

Failure to comply with any of the compliance dates established by Resolution 83-13 will prompt a Regional Board hearing at the earliest possible date to consider adoption of an immediate prohibition of discharge from additional individual and community sewage disposal systems.

VIII.D.3.j. SUBSURFACE DISPOSAL EXEMPTIONS

The Regional Board or Executive Officer may grant exemptions to prohibitions of waste discharges from ~~for: (1) engineered new on-site disposal systems for sites unsuitable for standard systems; and (2) new or existing on-site systems within the specific prohibition areas cited above.~~ Such exemptions may be granted only after presentation by the discharger of sufficient justification, including geologic and hydrologic evidence that the continued operation of such system(s) in a particular area will not individually or collectively, directly or indirectly, result in

pollution or nuisance, or affect water quality adversely.

~~Individual, alternative, and community systems shall not be approved for any area where it appears that the total discharge of leachate to the geological system, under fully developed conditions, will cause: (1) damage to public or private property; (2) ground or surface water degradation; (3) nuisance condition; or, (4) a public health hazard. Interim use of septic tank systems may be permitted where alternate parcels are held in reserve until sewer systems are available.~~

Requests for exemptions will not be considered until the local entity agency has reviewed the system and submitted the proposal for Regional Board review. Dischargers requesting exemptions must submit a Report of Waste Discharge. Exemptions will be subject to filing fees as established by the State Water Code.

~~Engineered systems shall be designed only by registered engineers competent in sanitary engineering. Engineers should be responsible for proper system operation.~~

~~Engineers should be responsible for educating system users of proper operation and maintenance. Maintenance schedules should be established. Engineered systems should be inspected by designer during installation to insure conformance with approved plans.~~

~~Some engineered systems may be considered experimental by the Regional Board. Experimental systems will be handled with caution. A trial period of at least one year should be established whereby proper system operation must be demonstrated. Under such an approach, experimental systems are granted a one year conditional approval.~~

Further information concerning individual, alternative, or community on-site sewage disposal systems can be found in Chapter 5 in the Management Principles and Control Actions sections. State Water Resources Control Board Plans and Policies, Discharge Prohibitions, and Regional Board Policies may also apply depending on individual circumstances.

CHAPTER 5. PLANS AND POLICIES

(new onsite wastewater section only)

I.M. ONSITE WASTEWATER POLICY

The Water Quality Control Policy for Siting, Design, Operation, and Maintenance of Onsite Wastewater Treatment Systems (OWTS Policy), Resolution No. 2012-0032, was adopted by the State Water Resources Control Board on June 19, 2012. This Policy implements California Water Code, Chapter

4.5, Division 7, §13290-13291.7 by establishing statewide regulations and standards for permitting onsite wastewater systems. The OWTS Policy specifies criteria for existing and new onsite systems and establishes a conditional waiver of waste discharge requirements for onsite systems that comply with the policy.

**CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, Ca 93401-7906**

RESOLUTION NO. R3-2012-0002

AMENDING THE WATER QUALITY CONTROL PLAN FOR THE CENTRAL COAST BASIN TO (1) ADOPT TOTAL MAXIMUM DAILY LOADS FOR FECAL INDICATOR BACTERIA IN THE SANTA MARIA RIVER WATERSHED AND (2) ADD THE SANTA MARIA RIVER WATERSHED (INCLUDING OSO FLACO CREEK SUBWATERSHED) TO THE DOMESTIC ANIMAL WASTE DISCHARGE PROHIBITION

The Regional Water Quality Control Board, Central Coast Region (Central Coast Water Board) finds:

1. The Central Coast Water Board adopted the second edition of the Water Quality Control Plan for the Central Coastal Basin (Basin Plan), on September 8, 1994. The Basin Plan designates beneficial uses and water quality objectives, sets forth implementation plans to achieve water quality objectives addressing point source and nonpoint source discharges, describes prohibitions, and incorporates statewide plans and policies.
2. The Central Coast Water Board periodically revises and amends the Basin Plan. The Central Coast Water Board has determined the Basin Plan requires further revision and amendment to: (a) incorporate Total Maximum Daily Loads (TMDLs) and an implementation plan for fecal indicator bacteria in the Santa Maria River Watershed including Alamo Creek, Blosser Channel, Bradley Canyon Creek, Bradley Channel, Cuyama River, La Brea Creek, Little Oso Flaco Creek, Main Street Canal, Nipomo Creek, Orcutt Creek, Oso Flaco Creek, Oso Flaco Lake, Santa Maria River Estuary, and the Santa Maria River and (b) add the Santa Maria River Watershed (including Oso Flaco Creek subwatershed) to the Domestic Animal Waste Discharge Prohibition.
3. The Central Coast Water Board proposes to amend the Basin Plan by inserting amendments into the following sections (listed in order of Basin Plan contents):
 - a. Chapter Four, section IX (Total Maximum Daily Loads)
 - b. Chapter Five, section IV.B. (Discharge Prohibitions)
4. On May 20, 2004, the State Water Resources Control Board (State Water Board) adopted the *Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program* (NPS Policy). The NPS Policy requires the Water Boards to regulate all nonpoint sources of pollution using the administrative permitting authorities provided by the Porter-Cologne Water Quality Control Act. The NPS Policy allows Water Boards to regulate nonpoint source discharges with waste discharge requirements, waivers of waste discharge requirements, or Basin Plan prohibitions.
5. Alamo Creek, Blosser Channel, Bradley Canyon Creek, Bradley Channel, Cuyama River (above Twitchell Reservoir), Little Oso Flaco Creek, Main Street Canal, Nipomo Creek, Orcutt Creek, Oso Flaco Creek, Santa Maria River Estuary, and Santa Maria River are listed on 2008-2010 Clean Water Act 303(d) list as impaired due to fecal coliform. Additionally, Main Street Canal, Nipomo Creek, Orcutt Creek, Oso Flaco Creek, Santa Maria River Estuary, and Santa Maria River are impaired due to *E. coli*. These waterbodies do not meet the USEPA

- recommended criteria for *E. coli*. This Resolution establishes TMDLs and associated allocations for these listed waterbodies.
6. The Santa Maria River Estuary is listed on 2008-2010 Clean Water Act 303(d) list as impaired due to total coliform. This waterbody does not meet the Basin Plan water quality objectives for total coliform. This Resolution establishes TMDLs and associated allocations for this listed waterbody.
 7. La Brea Creek and Oso Flaco Lake are not on the 2008-2010 Clean Water Act 303(d) list of impaired waters for fecal coliform or *E. coli*. La Brea Creek does not meet the Basin Plan water quality objectives for fecal coliform and Oso Flaco Lake does not meet the Basin Plan water quality objective for fecal coliform and the USEPA water quality criteria for *E. coli*. La Brea Creek and Oso Flaco Lake are impaired due to exceedances of these water quality objectives and criteria. Therefore, this Resolution establishes TMDLs and associated allocations for these impaired waterbodies.
 8. The Central Coast Water Board's goal for establishing TMDLs in the Santa Maria River Watershed is to rectify the impairment due to fecal coliform and *E. coli*, thereby providing support for the designated beneficial uses of contact and non-contact water recreation. The Central Coast Water Board's goal for establishing TMDLs in the Santa Maria River Estuary is to rectify the impairment due to total coliform, thereby providing support for the designated beneficial use of shellfishing.
 9. The Santa Maria River is the receiving water for approximately 1.2 million acres. The Santa Maria River receives flow from the Cuyama River upstream to the northeast, with flows regulated by the Twitchell Dam. The Santa Maria River also receives flow from the Sisquoc River to the southeast. It also receives flow from various smaller tributaries in the lower watershed before discharging through the Santa Maria River Estuary and into the Pacific Ocean.
 10. The elements of a TMDL are described in 40 CFR 130.2 and 130.7, section 303(d) of the Clean Water Act, and USEPA guidance documents. A TMDL is defined as "the sum of individual waste load allocations for point sources and load allocations for nonpoint sources and natural background" (40 CFR 130.2). The Central Coast Water Board has determined that the TMDLs for fecal indicator bacteria in the Santa Maria River Watershed are set at levels necessary to attain and maintain the applicable numeric water quality objectives, taking into account seasonal variations and any lack of knowledge concerning the relationship between effluent limitations and water quality (40 CFR 130.7 (c) (1)). The regulations in 40 CFR 130.7 also state that TMDLs shall take into account critical conditions for stream flow, loading, and water quality parameters. TMDLs are often expressed as a mass load of the pollutant but can be expressed as a unit of concentration if appropriate (40 CFR 130.2(i)). Expressing these TMDLs as units of concentration is appropriate because an existing concentration-based water quality objective is used as the basis for the TMDL numeric target and attaining that concentration-based water quality objective will result in protection of the beneficial uses.
 11. Upon establishment of TMDLs by the State or USEPA, the State is required to incorporate the TMDLs, along with appropriate implementation measures, into the State Water Quality Management Plan (40 CFR 130.6(c)(1) and 130.7 and California Water Code sections 13050(j) and 13242). The Basin Plan and applicable statewide plans serve as the State Water Quality Management Plan governing the watersheds under the jurisdiction of the Central Coast Water Board.

12. The Central Coast Water Board may specify certain conditions or areas where the discharge of waste, or certain types of waste, will not be permitted pursuant to California Water Code section 13243 (prohibitions). This Basin Plan amendment establishes the Domestic Animal Waste Discharge Prohibition (Prohibition) for discharges in the Santa Maria River Watershed. The implementation plan for the TMDLs for the Santa Maria River Watershed requires compliance with the Prohibition for discharges in the Santa Maria River Watershed. Supporting documentation for adding the Santa Maria River Watershed to the above-named prohibition is provided in *Final Project Report for Total Maximum Daily Loads for Fecal Indicator Bacteria in the Santa Maria River Watershed*. Consistent with California Water Code section 13244, the Central Coast Water Board complied with public notice and hearing requirements for adding the Santa Maria River Watershed (including Oso Flaco Creek subwatershed) to the Domestic Animal Waste Discharge Prohibition.
13. Central Coast Water Board staff submitted the Project Report for the TMDLs to an external scientific reviewer in June 2008. Water Board staff received comments from the reviewer. Central Coast Water Board staff edited the Project Report or provided a written response that explained the basis for not incorporating the comments, or the comments did not result in any changes to the proposed Basin Plan Amendments. The TMDLs and Implementation Program are based on sound scientific knowledge, methods, and practices in accordance with Health and Safety Code section 57004.
14. Central Coast Water Board staff implemented a process to inform interested persons and the public about the TMDLs and Prohibition. Central Coast Water Board staff's efforts to inform the public and solicit comment included public meetings with interested parties and a public notice and comment period. Public notice of the amendment to the Basin Plan provided the public a 45-day public comment period preceding the Central Coast Water Board hearing. Notice of public hearing was given by advertising in a newspaper of general circulation within the Region and by emailing a copy of the notice to all persons requesting such notice and applicable government agencies. Relevant documents and notices were also made available on the Central Coast Water Board website. Central Coast Water Board staff responded to oral and written comments received from the public. All public comments were considered.
15. Adoption of these TMDLs and Basin Plan amendments will not result in any degradation of water quality; in fact, they are designed to improve water quality. As such, these TMDLs and basin plan amendments comply with all requirements of both State and federal anti-degradation requirements (State Board Resolution 68-16, "Statement of Policy with Respect to Maintaining High Quality of Waters in California" and 40CFR 131.12).
16. Pursuant to Public Resources Code section 21080.5, the Resources Agency has approved the Regional Water Boards' basin planning process as a "certified regulatory program" that adequately satisfies the California Environmental Quality Act (CEQA) (Public Resources Code, Section 21000 et seq.) requirements for preparing environmental documents (14 Cal. Code Regs. §15251(g); 23 Cal. Code Regs. § 3782.). Central Coast Water Board staff has prepared "substitute environmental documents" for this project that contain the required environmental documentation as set forth in the State Water Board's CEQA regulations (23 Cal. Code Regs. § 3777.). The substitute environmental documents include the TMDL Staff Report and several of its attachments, including 1) this Resolution and the Basin Plan Amendment Language (Attachment 1 of the Staff Report); 2) *Final Project Report for Total Maximum Daily Loads for Fecal Indicator Bacteria for the Santa Maria River Watershed, San Luis Obispo, Santa Barbara and Ventura Counties, California* (Attachment 2 of the Staff Report); 3) the CEQA Substitute Document with environmental checklist (Attachment 3 of the Staff Report); and 4) the comments and responses to comments (Attachment 6 of the Staff Report). The Staff Report also includes the Notice of Public Hearing/Notice of Filing

(Attachment 4) and the Scientific Peer Review Comment (Attachment 5). The project itself is the establishment of TMDLs for fecal indicator bacteria in the Santa Maria River Watershed. The Water Board exercises discretion in assigning waste load allocations and load allocations, determining the program of implementation, and setting various milestones in achieving the water quality standards. The CEQA checklist and other portions of the substitute environmental documents contain significant analysis and numerous findings related to impacts and mitigation measures.

17. CEQA scoping meetings were conducted on December 12, 2006, and October 16, 2008, at the Central Coast Water Board, 895 Aerovista Place, Suite 101, San Luis Obispo; a notice of the CEQA scoping meeting was sent to interested persons prior to each scoping meeting on December 1, 2006, and August 29, 2008, respectively. The notice included a background of the project, the project purpose, a meeting schedule, and directions for obtaining more detailed information through the Central Coast Water Board website; the notice and project summary were available at the website or by requesting hard copies via telephone.
18. Public Resources Code section 21159 provides that an agency shall perform, at the time of the adoption of a rule or regulation requiring the installation of pollution control equipment or a performance standard or treatment requirement, an environmental analysis of the reasonably foreseeable methods of compliance, and an analysis of the reasonably foreseeable environmental impacts of the methods of compliance, an analysis of reasonably foreseeable mitigation measures to lessen the adverse environmental impacts, and an analysis of reasonably foreseeable alternative means of compliance with the rule or regulation that would have less significant adverse impacts. Section 21159(c) requires that the environmental analysis take into account a reasonable range of environmental, economic, and technical factors; population and geographic areas; and specific sites. The Staff Report prepared for this Basin Plan amendment, in particular the CEQA Substitute Document Report (Attachment 3), provides the environmental analysis required by Public Resources Code section 21159 and is hereby incorporated as findings in this Resolution.
19. In preparing the substitute environmental documents, the Central Coast Water Board has considered the requirements of Public Resources Code section 21159 and California Code of Regulations, title 14, section 15187, and intends those documents to serve as a Tier 1 environmental review. This analysis is not intended to be an exhaustive analysis of every conceivable impact, but an analysis of the reasonably foreseeable consequences of the adoption of this regulation, from a programmatic perspective. Compliance obligations will be undertaken directly by public agencies that may have their own obligations under CEQA. Project level impacts may need to be considered in any subsequent environmental analysis performed by other public agencies, pursuant to Public Resources Code section 21159.2. To the extent applicable, this Tier 1 substitute environmental document may be used to satisfy subsequent CEQA obligations of those agencies.
20. Consistent with the Water Board's substantive obligations under CEQA, the substitute environmental documents do not engage in speculation or conjecture, and only consider the reasonably foreseeable environmental impacts, including those relating to the methods of compliance, reasonably foreseeable feasible mitigation measures to reduce those impacts, and the reasonably foreseeable alternative means of compliance, that would avoid or reduce the identified impacts.
21. These proposed amendments will have a less-than-significant adverse effect on the environment. California Water Code section 13360 precludes the Central Coast Water Board from dictating the manner in which responsible agencies comply with any of the Central Coast Water Board's regulations or orders. When the agencies responsible for implementing these

TMDLs determine how they will proceed, the agencies responsible for those parts of the project can and should incorporate such alternatives and mitigation into any subsequent projects or project approvals. These feasible alternatives and mitigation measures are described in more detail in the substitute environmental documents (14 Cal. Code Regs. § 15091(a)(2)).

22. From a program-level perspective, incorporation of the alternatives and mitigation measures outlined in the substitute environmental documents will foreseeably reduce impacts to no impact, or keep the impact at less-than-significant levels.
23. The CEQA Substitute Document Report (Staff Report Attachment 3) identifies mitigation approaches that should be considered at the project level.
24. The Central Coast Water Board will request that the State Water Board approve the Basin Plan amendments incorporating: (a) the TMDLs for fecal indicator bacteria in the Santa Maria River Watershed, and (b) adding the Santa Maria River Watershed (including Oso Flaco Creek subwatershed) to the Domestic Animal Waste Discharge Prohibition. The TMDLs and Implementation Program for the TMDLs and Prohibition will become effective upon approval by the California Office of Administrative Law. The TMDLs must also be approved by the United States Environmental Protection Agency.
25. The amendments to the Basin Plan may have an effect on fish and wildlife. The Central Coast Water Board will, therefore, forward fee payments to the Department of Fish and Game under the California Fish and Game Code section 711.4.
26. The proposed amendments meet the "Necessity" standard of the Administrative Procedures Act, Government Code, section 11353, subdivision (b). As specified in Finding 13, federal regulations require that TMDLs be incorporated into the Water Quality Management Plan. The Central Coast Water Board's Basin Plan is the Central Coast Water Board's component of the Water Quality Management Plan, and the Basin Plan is how the Central Coast Water Board takes quasi-legislative planning actions. Moreover, the TMDL is a program of implementation for existing water quality objectives, and is, therefore, appropriately a component of the Basin Plan under the California Water Code, section 13242. The necessity of developing TMDLs is established in the TMDL staff report, the Clean Water Act section 303(d) list, and the data contained in the administrative record documenting the fecal indicator bacteria impairments of the Santa Maria River Watershed. The necessity of adding the Prohibition as an implementation mechanism to achieve the TMDL is established in the administrative record documenting the fecal indicator bacteria sources, the load allocations that responsible parties must meet to reduce or eliminate fecal indicator bacteria loading, and implementation strategies that comply with the *Policy For Implementation and Enforcement of the Nonpoint Source Pollution Control Program*.
27. Consistent with Water Code section 13141, the amendment includes an estimate of the total cost of implementation of the agricultural related portions of this TMDL and identifies potential sources of financing.
28. On March 15, 2012, in San Luis Obispo, California, the Central Coast Water Board held a public hearing and heard and considered all public comments and evidence in the record.

THEREFORE, be it resolved that:

1. Pursuant to sections 13240, 13242, 13243, and 13244 of the California Water Code, the Central Coast Water Board, after considering the entire record, including the oral testimony at

the hearing, hereby adopts the amendment in "Attachment-Proposed Basin Plan Amendments."

2. The Executive Officer is directed to forward copies of the Basin Plan amendment to the State Board in accordance with the requirements of section 13245 of the California Water Code.
3. The Central Coast Water Board requests that the State Water Board approve the Basin Plan amendments in accordance with the requirements of sections 13245 and 13246 of the California Water Code and forward them to the California Office of Administrative Law and the USEPA for approval.
4. The Executive Officer is authorized to sign a Certificate of Fee Exemption or transmit payment of the applicable fee as may be required to the Resources Agency.
5. If, during the approval process, Central Coast Water Board staff, State Water Board staff, the State Water Board or the California Office of Administrative Law determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.
6. The environmental documents prepared by the Central Coast Water Board staff pursuant to Public Resources Code 21080.5 are hereby certified.

I, Roger W. Briggs, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of the resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region on March 15, 2012.

Roger W. Briggs
Executive Officer

RESOLUTION NO. R3-2012-0002

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENTS

Revise the September 8, 1994 Basin Plan as follows:

AMENDMENT NO. 1. TOTAL MAXIMUM DAILY LOADS FOR FECAL INDICATOR BACTERIA IN THE SANTA MARIA RIVER WATERSHED (INCLUDING ALAMO CREEK, BLOSSER CHANNEL, BRADLEY CHANNEL, BRADLEY CANYON CREEK, CUYAMA RIVER, LA BREA CREEK, LITTLE OSO FLACO CREEK, MAIN STREET CANAL, NIPOMO CREEK, ORCUTT CREEK, OSO FLACO CREEK, OSO FLACO LAKE, SANTA MARIA RIVER ESTUARY, AND SANTA MARIA RIVER).

Add the following to Chapter 4 after IX. O.:

IX. P. TOTAL MAXIMUM DAILY LOADS FOR FECAL INDICATOR BACTERIA IN SANTA MARIA RIVER WATERSHED (INCLUDING ALAMO CREEK, BLOSSER CHANNEL, BRADLEY CHANNEL, BRADLEY CANYON CREEK, CUYAMA RIVER, LA BREA CREEK, LITTLE OSO FLACO CREEK, MAIN STREET CANAL, NIPOMO CREEK, ORCUTT CREEK, OSO FLACO CREEK, OSO FLACO LAKE, SANTA MARIA RIVER ESTUARY, AND SANTA MARIA RIVER)

The Regional Water Quality Control Board adopted these TMDLs on March 15, 2012.
These TMDLs were approved by:

The State Water Resources Control Board on: _____ (date).

The California Office of Administrative Law on: _____ (date).

The U.S. Environmental Protection Agency on: _____ (date)

Problem Statement

The beneficial use of water contact recreation (REC-1) is not protected in the impaired reaches of the Santa Maria River Watershed, including Alamo Creek, Blosser Channel, Bradley Channel, Bradley Canyon Creek, Cuyama River (upstream of Twitchell reservoir to Highway 33), La Brea Creek, Little Oso Flaco Creek, Main Street Canal, Nipomo Creek, Orcutt Creek, Oso Flaco Creek, Oso Flaco Lake, Santa Maria River Estuary, and Santa Maria River because fecal coliform bacteria concentrations exceed existing Basin Plan numeric water quality objectives and in some instances also exceed USEPA criteria for *E. coli* protecting this beneficial use. All reaches in these waterbodies are impaired, with the exception of Cuyama River which is impaired from Twitchell Dam upstream to Highway 33.

The Ocean Plan and Basin Plan also contain Shellfish Harvesting (SHELL) water quality objectives. The beneficial use of shellfishing is not protected in the Santa Maria River Estuary because total coliform concentrations exceed existing Basin Plan and Ocean Plan numeric water quality objectives.

Numeric Target

The numeric targets used to develop the TMDLs and allocations for REC-1 are:

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

Based on a statistically sufficient number of samples (generally not less than five samples equally spaced over a 30-day period), the geometric mean of *E. coli* densities shall not exceed 126 per 100mL, and no sample shall exceed a one-sided confidence limit (C.L.) calculated using the following as guidance: lightly used for contact recreation (90% C.L.) = 409 per 100mL.

The numeric target used to develop the TMDLs and allocations for SHELL is:

At all areas where shellfish may be harvested for human consumption, the median total coliform concentration throughout the water column for any 30-day period shall not exceed 70/100 mL, nor shall more than ten percent of the samples collected during any 30-day period exceed 230/100mL for a five-tube decimal dilution test or 330/100 mL when a three-tube decimal dilution test is used.

The numeric targets are equal to the water quality objective protecting the water contact recreation and the shellfishing beneficial use as described in Chapter 3 of this Basin Plan as well as USEPA recommended criteria. If these water quality objectives or criteria protecting water contact recreation and/or shellfishing are amended, the numeric targets for this TMDL will be equal to the amended water quality objectives and criteria.

Source Analysis

Natural uncontrollable sources of fecal coliform in the listed waterbodies are present and likely contributing to impairment at varying degrees by season and location.

Alamo Creek: 1) domestic animals/livestock discharges.

Blosser Channel: 1) discharges from Municipal Separate Storm Sewer Systems (MS4s), 2) sanitary sewer collection system leaks.

Bradley Channel: 1) discharges from MS4s, 2) sanitary sewer collection system leaks.

Bradley Canyon Creek: 1) domestic animals/livestock discharges.

Cuyama River (upstream of Twitchell reservoir to Highway 33): 1) domestic animals/livestock discharges.

La Brea Creek: 1) domestic animals/livestock discharges.

Little Oso Flaco Creek: 1) domestic animals/livestock discharges.

Main Street Canal: 1) discharges from MS4s, 2) sanitary sewer collection system leaks.

Nipomo Creek: 1) domestic animals/livestock discharges, 2) discharges from MS4s.

Orcutt Creek: 1) domestic animals/livestock discharges, 2) discharges from MS4s, 3) sanitary sewer collection system leaks.

Oso Flaco Creek: 1) domestic animals/livestock discharges.

Oso Flaco Lake: 1) domestic animals/livestock discharges.

Santa Maria River Estuary: 1) domestic animals/livestock discharges, 2) discharges from MS4s, 3) sanitary sewer collection system leaks.

Santa Maria River: 1) domestic animals/livestock discharges, 2) discharges from MS4s, 3) sanitary sewer collection system leaks.

TMDLs and Allocations

The TMDLs for all waters and reaches of the Santa Maria River Watershed, including Alamo Creek, Blosser Channel, Bradley Channel, Bradley Canyon Creek, Cuyama River, La Brea Creek, Little Oso Flaco Creek, Main Street Canal, Nipomo Creek, Orcutt Creek, Oso Flaco Creek, Oso Flaco Lake, Santa Maria River Estuary and Santa Maria River are concentration-based TMDLs applicable to each day of all seasons, are applicable to all reaches, and are set equal to the following:

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

Based on a statistically sufficient number of samples (generally not less than 5 samples equally spaced over a 30-day period), the geometric mean of *E. coli* densities shall not exceed 126 per 100mL, and no sample shall exceed a one-sided confidence limit (C.L.) calculated using the following as guidance: lightly used for contact recreation (90% C.L.) = 409 per 100mL.

And for the Santa Maria River Estuary only:

At all areas where shellfish may be harvested for human consumption, the median total coliform concentration throughout the water column for any 30-day period shall not exceed 70/100mL, nor shall more than ten percent of the samples collected during any 30-day period exceed 230/100mL for a five-tube decimal dilution test or 330/100 mL when a three-tube decimal dilution test is used.

The TMDLs are equal to the water quality objective or criteria protecting the water contact recreation beneficial use, as described in Chapter 3 of this Basin Plan as well as USEPA recommended criteria. If these water quality objectives or criteria protecting water contact recreation are amended, the TMDLs for the waterbodies subject to the TMDLs will be equal to the amended water quality objectives and criteria.

For the Santa Maria River Estuary only, the TMDLs are also equal to the water quality objective protecting the shellfishing beneficial use, as described in Chapter 3 of this Basin Plan. If this water quality objective protecting shellfishing is amended, the TMDLs for the waterbodies subject to the TMDLs will be equal to the amended water quality objective.

The allocations to responsible parties are shown in Table IX P-1.

Table IX P-1. Allocations and Responsible Parties

“Controllable water quality conditions are those actions or circumstances resulting from man’s activities that may influence the quality of the waters of the State and that may be reasonably controlled” (Water Quality Control Plan: Central Coast Region, page III-2). The allocations identified below are subject to these conditions.

WASTE LOAD ALLOCATIONS		
<u>Waterbody the Responsible Party is Discharging to*</u>	<u>Party Responsible for Allocation (Source)</u>	<u>Receiving Water Allocations*</u>
<u>Santa Maria River, Main Street Canal, Blosser Channel, Bradley Channel,</u>	<u>City of Santa Maria - NPDES No. CAS000004 (Urban Stormwater)</u>	<u>Allocation 1 & 3</u>
<u>Main Street Canal</u>	<u>Santa Maria Fairpark – NPDES No. Pending (Urban Stormwater)</u>	<u>Allocation 1 & 3</u>
<u>Nipomo Creek</u>	<u>County of San Luis Obispo - NPDES No. CAS000004 (Urban Stormwater)</u>	<u>Allocation 1 & 3</u>
<u>Orcutt Creek</u>	<u>County of Santa Barbara - NPDES No. CAS000004 (Urban Stormwater)</u>	<u>Allocation 1 & 3</u>
<u>Santa Maria River</u>	<u>City of Guadalupe – NPDES No. Pending (Urban Stormwater)</u>	<u>Allocation 1 & 3</u>
<u>Blosser Channel, Bradley Channel, Main Street and Santa Maria River</u>	<u>City of Santa Maria -Statewide General WDR for Sanitary Sewer Systems WQO No. 2006-0003 (Wastewater Collection System)</u>	<u>Allocation 2</u>
<u>Orcutt Creek</u>	<u>Laguna County Sanitation District - Statewide General WDR for Sanitary Sewer Systems WQO No. 2006-0003 (Wastewater Collection System)</u>	<u>Allocation 2</u>
<u>Santa Maria River</u>	<u>City of Guadalupe - Statewide General WDR for Sanitary Sewer Systems WQO No. 2006-0003 (Wastewater Collection System)</u>	<u>Allocation 2</u>

LOAD ALLOCATIONS		
<u>Waterbody the Responsible Party is Discharging to*</u>	<u>Responsible Party and Source</u>	<u>Receiving Water Allocations*</u>
<u>Santa Maria River Estuary</u>	<u>Owners/Operators of land used for/containing domestic animals/livestock (Domestic animals)</u>	<u>Allocation 4</u>
<u>All impaired waterbodies</u>	<u>Owners/Operators of land used for/containing domestic animals/livestock (Domestic animals)</u>	<u>Allocation 1 & 3</u>
<u>All impaired waterbodies</u>	<u>No responsible party (Natural and Background Sources)</u>	<u>Allocation 1 & 3</u>

Allocation-1 = Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN/100mL, nor shall more than ten percent of total samples during any 30-day period exceed 400MPN/100 mL.

Allocation-2 = Fecal coliform nor *E. coli* concentration shall not exceed zero; no fecal coliform nor *E. coli* bacteria load originating from human sources of fecal material is allowed.

Allocation-3 = Based on a statistically sufficient number of samples (generally not less than five samples equally spaced over a 30-day period), the geometric mean of *E. coli* densities shall not exceed: 126 per 100mL, and no sample shall exceed a one-sided confidence limit (C.L.) calculated using the following as guidance: lightly used for contact recreation (90% C.L.) = 409 per 100mL.

Allocation-4 = Total coliform concentration, the median throughout the water column for any 30-day period shall not exceed 70MPN/100 mL, nor shall more than ten percent of the samples collected during any 30-day period exceed 230MPN/100 mL for a five-tube decimal dilution test or 330MPN/100 mL when a three-tube decimal dilution test is used.

* Responsible parties shall meet allocations in all receiving surface waterbodies of the responsible parties' discharges.

The parties responsible for the allocation to controllable sources are not responsible for the allocation to natural sources.

The TMDLs are considered achieved when water quality conditions meet all regulatory and policy requirements necessary for removing the impaired waters from Clean Water Act section 303(d) list of impaired waters.

Margin of Safety

A margin of safety is incorporated implicitly in the TMDLs through conservative assumptions.

Implementation

STORM DRAIN DISCHARGES TO MS4s:

The Central Coast Water Board will require the MS4 entities to develop and submit for Executive Officer approval a Wasteload Allocation Attainment Program (WAAP). The WAAP shall be submitted within one year of approval of the TMDL by the Office of Administrative Law, or within one year of a stormwater permit renewal, whichever occurs first. The WAAP shall include descriptions of the actions that will be taken by the MS4 entity to attain the TMDL wasteload allocations, and specifically address:

1. Development of an implementation and assessment strategy;
2. Source identification and prioritization;
3. Best management practice identification, prioritization, implementation schedule, analysis, and effectiveness assessment;
4. Monitoring and reporting program development and implementation. Monitoring program goals shall include: 1) assessment of stormwater discharge and receiving water discharge quality 2) assessment of best management effectiveness, and 3) demonstration and progress towards achieving interim targets and wasteload allocations.

Demonstration of achieving wasteload allocations, interim targets, and progress shall be accomplished quantitatively through a combination of the following:

- a. Assessing discharge water quality.
- b. Assessing receiving water quality.
- c. Assessing mass load reduction.

- d. Best management practices capable of achieving interim targets and wasteload allocations in combination with water quality monitoring for a balanced approach to determine effectiveness.
 - e. Any other effluent limitations and conditions which are consistent with the assumptions and requirements of the wasteload allocations.
5. Coordination with stakeholders; and
 6. Other pertinent factors.

Monitoring

The City of Santa Maria, City of Guadalupe, County of San Luis Obispo (Nipomo), County of Santa Barbara (Orcutt) and the Santa Maria Fairpark are required to develop and submit monitoring programs as part of their WAAP. The goals of the monitoring programs are described in the requirements of the WAAP.

Staff encourages the City of Santa Maria, City of Guadalupe, County of San Luis Obispo (Nipomo), County of Santa Barbara (Orcutt) and the Santa Maria Fairpark to develop and submit creative and meaningful monitoring programs. Monitoring strategies can use a phased approach, for example, whereby outfall or receiving water monitoring is phased in after best management practices have been implemented and assessed for effectiveness. Pilot projects where best management practices are implemented in well-defined areas covering a fraction of the MS4 that facilitates accurate assessment of how well the best management practices control pollution sources, is acceptable, with the intent of successful practices then being implemented in other or larger parts of the MS4.

Interim Targets

The target date to achieve the TMDLs is 15 years from the date of TMDL approval by the Office of Administrative Law. Implementing parties must demonstrate progress towards achieving their allocations. Interim targets are a tool to gauge progress during the 15-year implementation phase. Implementing parties may develop and propose interim targets as part of their WAAP as demonstration of progress. If implementing parties choose not to develop and propose interim targets, the following interim targets are expected as demonstration of progress towards achieving wasteload allocations:

- 20% progress towards achieving wasteload allocations at the end of the fifth year following TMDL approval by OAL.
- 50% progress towards achieving wasteload allocations at the end of the 10th year following TMDL approval by OAL.
- 100% progress towards achieving wasteload allocations at the end of the 15th year following TMDL approval by OAL.

Interim targets are goals and not wasteload allocations.

DOMESTIC ANIMAL/LIVESTOCK DISCHARGES:

After approval of these TMDLs by the Office of Administrative Law, the Executive Officer will notify livestock owners/operators who are not in compliance with the Domestic Animal Waste Discharge Prohibition of the requirement to comply with the Domestic Animal Waste Discharge Prohibition. Pursuant to California Water Code section 13261, 13267 or other applicable authority, the Executive Officer will require livestock owners/operators to submit for approval one the following to the Water Board:

- 1) Sufficient evidence to demonstrate that the livestock owner/operator is and will continue to be in compliance with the Domestic Animal Waste Discharge Prohibition. Such evidence could include documentation (e.g., photo documentation) submitted by the livestock owner/operator that the livestock owner/operator is not causing waste to be discharged to a

- water of the state resulting in violations of the Domestic Animal Waste Discharge Prohibition, or
- 2) A Nonpoint Source Pollution Control Implementation Program (Plan) for compliance with the Domestic Animal Waste Discharge Prohibition. Such a Plan must include a list of specific management practices that will be implemented to control discharges containing fecal material from domestic animals. The Plan must also describe how implementing the identified management practices are likely to progressively achieve the load allocations, with the ultimate goal of achieving the load allocations during the implementation phase of the TMDL. The Plan must include monitoring and reporting to the Central Coast Water Board, demonstrating effectiveness of implemented best management practices and progress toward achieving load allocations, and a self-assessment of this progress. The Plan may be developed by an individual discharger or by a coalition of dischargers in cooperation with a third-party representative, organization, or government agency acting as the agents of livestock owners/operators, or
 - 3) A Report of Waste Discharge pursuant to California Water Code Section 13260 (as an application for waste discharge requirements).

Monitoring

Livestock owners/operators who are not in compliance may be required to implement and report water quality monitoring as part of their Plan for compliance with the Domestic Animal Waste Discharge Prohibition (as described above). Monitoring requirements can be developed individually, i.e., on an operation by operation basis, or by a coalition of dischargers in cooperation with a third-party representative, organization, or government agency acting as the agents of the livestock owners/operators.

Interim Targets

The target date to achieve the TMDLs is 15 years from the date of TMDL approval by the Office of Administrative Law. Livestock owners/operators not in compliance with the Domestic Animal Waste Discharge Prohibition must demonstrate progress towards compliance with the Domestic Animal Waste Discharge Prohibition, as described in their Plan. Interim targets are a tool to gauge progress during the implementation phase. Livestock owner/operators may develop and propose interim targets as part of their Plan as demonstration of progress. If livestock owners/operators choose not to develop and propose interim targets, the following interim targets are expected as demonstration of progress towards compliance with the Domestic Animal Waste Discharge Prohibition:

- 20% progress towards achieving load allocations at the end of the fifth year following TMDL approval by OAL.
- 50% progress towards achieving load allocations at the end of the 10th year following TMDL approval by OAL.
- 100% progress towards achieving load allocations at the end of the 15th year following TMDL approval by OAL.

Interim targets are goals and not wasteload allocations.

SANITARY SEWER COLLECTION SYSTEM LEAKS:

Entities with jurisdiction over sewer collection systems will demonstrate compliance with these TMDL load allocations through waste discharge requirements.

The City of Santa Maria, Laguna County Sanitation District, and the City of Guadalupe must implement their Collection System Management Plans as required by the Statewide General waste discharge requirements for collection agencies. Implementation of their waste discharge requirements ensures that a maintenance and management plan is in place and will reduce or eliminate the number and frequency of sanitary sewer overflows in the project area. Information

regarding sanitary sewer overflows must be provided to the Central Coast Water Board. Wastewater collection agencies will show compliance with the TMDL through complying with the existing statewide general waste discharge requirements.

Implementing parties will monitor and report as required in their waste discharge requirements.

Tracking and Evaluation

Every three years, beginning three years after TMDLs are approved by the Office of Administrative Law, the Central Coast Water Board will perform a review of implementation actions, monitoring results, and evaluations submitted by responsible parties of their progress toward achieving their allocations, dependent upon staff availability and priorities. The Central Coast Water Board will use annual reports, nonpoint source pollution control implementation programs, evaluations submitted by responsible parties, and other available information to determine progress toward implementing required actions and achieving the allocations and the numeric target.

Responsible parties will continue monitoring and reporting according to this plan for at least three years, at which time the Central Coast Water Board will determine the need for continuing or otherwise modifying the monitoring requirements. Responsible parties may also demonstrate that although water quality objectives are not being achieved in receiving waters, controllable sources of pathogens are not contributing to the exceedance. If this is the case, the Central Coast Water Board may re-evaluate the numeric target and allocations. For example, the Central Coast Water Board may pursue and approve a site-specific objective. The site-specific objective would be based on evidence that natural or background sources alone were the cause of exceedances of the Basin Plan water quality objective for fecal coliform or the USEPA recommended criteria for *E. coli*.

Three-year reviews will continue until the water quality objectives are achieved. The compliance schedule for achieving this TMDL numeric target is 15 years after the date of approval by the Office of Administrative Law.

AMENDMENT NO. 2. Revise the September 8, 1994 Basin Plan, Chapter Five, as follows:

Amend Chapter 5, section IV.B. as follows:

Add the following watershed to the end of the bulleted list of applicable areas of the Domestic Animal Waste Discharge Prohibition:

- Santa Maria River Watershed (including Oso Flaco Creek subwatershed)

CHAPTER 4. IMPLEMENTATION PLAN

VIII.D. INDIVIDUAL, ALTERNATIVE AND COMMUNITY ONSITE WASTEWATER SYSTEMS

Onsite wastewater systems may be used to treat and dispose of wastewater from: (1) individual residences; (2) multi-unit residences; (3) institutions or places of commerce; (4) industrial sanitary sources; and (5) small communities. All individual and multi-unit residential, commercial, institutional and industrial developments with a discharge flow rate less than 2,500 gallons per day and community systems not regulated by waste discharge requirements must comply with these criteria. Community systems are defined for the purposes of this Basin Plan as: (1) residential wastewater treatment systems serving more than 5 units or more than 5 parcels; or (2) commercial, institutional or industrial systems treating sanitary wastewater equal to or greater than 2,500 gallons per day (average daily flow).

Conventional onsite wastewater systems consist of septic tanks and leachfield or seepage pits and are typically designed to treat and dispose of domestic wastewater. Alternatives to conventional onsite system designs are used when site constraints prevent the use of conventional systems. Examples of alternative systems include (but are not limited to) enhanced treatment systems, mound or evapotranspiration disposal systems, or at-grade disposal systems.

Conventional, alternative and community systems can pose serious water quality problems if improperly designed, installed, and/or managed. Failures have occurred in the past and are usually attributed to the following:

- Systems are inadequately or improperly sited, designed, or constructed.
- Long term use is not considered.
- Inadequate operation and maintenance.

The following definitions are used throughout this section of the Water Quality Control Plan.

Alternative onsite system consists of additional (beyond conventional) treatment and/or disposal features engineered to overcome site constraints. A conventional onsite system that requires a pump to reach the leach area is not considered "alternative".

Application area shall be calculated no greater than the trench bottom and side walls below the bottom of the leach pipe, minus the first foot on each side. In seepage pits the application area refers to the total gravel depth in a seepage pit, minus any impervious, bedrock or clay lenses encountered in the sidewalls.

At-grade disposal systems consist of distribution pipe and bed at the native ground surface level and cover provided by filled material. At-grade disposal systems are similar to mound systems without the sand layer.

Certified professional is a person who demonstrates special qualifications (through education, experience, exam, etc.) needed to successfully perform the task at hand.

Conventional onsite system consists of a septic tank and leachfield or seepage pit.

Detrimental Water Quality Impact is any significant increase in waste concentrations or impairment of beneficial uses of a water body.

Discharger is the owner and/or operator of an onsite wastewater system.

Drainfield is used interchangeably with leachfield, leach area or disposal area.

Effective trench depth means depth below the bottom of the leach trench distribution piping minus the first foot.

Engineered systems are treatment and disposal systems that require special design features to overcome site limitations (topography, soil conditions, shallow groundwater or setback variances).

Existing onsite system is any onsite system approved and/or installed prior to adoption of these criteria on March 20, 2009 (OAL approval date).

Failed or failing onsite system is any system that displays symptoms of inadequate dispersion, treatment or assimilation of wastewater. These may include, but are not limited to, surfacing effluent, lush growth above the leach area, sluggish house drains, impacts to surface or groundwater from the onsite discharge, odors, frequent pumping, or backflow into tank when pumped. Standard pumping frequency is recommended every five years unless system-specific characteristics support an alternative frequency.

Fill is material deposited to raise the existing or excavated ground level.

Inflow and infiltration refers to non-wastewater (stormwater, groundwater, streams, seawater) entering the wastewater system through cracks, roof drains or other openings.

Low permeability material is defined as having a percolation rate slower than 120 minutes per inch or having a clay content (% passing 200 sieve) of 60 percent or greater.

Local governing jurisdiction shall refer to the local governing jurisdiction, typically city or county, vested with legislative authority for onsite wastewater system permitting.

Monitoring shall refer to any sort of quality or performance assessment, including visual inspections.

New onsite system is an onsite wastewater system placed on property that has not previously been developed, or expansion of an existing onsite system to accommodate an increase in wastewater generation, after adoption of these criteria (March 20, 2009 OAL approval date). Repair or replacement of an existing onsite system does not constitute a new onsite system.

Onsite disposal area shall include the direct application area (trench, pit, bed) and surrounding 100' radius from any point in the application area that may be influenced by discharge from the disposal system.

Reservoir - A pond, lake, basin, or other space either natural or created in whole or in part by the building of engineering structures, which is used for storage, regulation, and control of drinking supply water.

Septage is material removed from a septic tank; usually the accumulated scum, sludge and liquid within the tank.

Sidewall is the side portion of the leach area below the bottom of the distribution piping, or total gravel depth beneath the first hole in the central pipe of a seepage pit.

Threatened condition is one that if left uncorrected may cause or contribute to water quality or public health impacts.

Watercourse - A natural or man-made channel for passage of water. There must be a stream, usually flowing in a particular direction (though it need not flow continuously) usually discharging into some stream or body of water.

VIII.D.31. ONSITE SYSTEM IMPLEMENTATION PROGRAM

California Water Code §13260(a) requires that any person discharging waste or proposing to discharge waste that could affect the quality of the waters of the State, shall file with the appropriate Regional Board a report of waste discharge, unless the Regional Board waives such requirement.

California Water Code §13263 requires the Regional Board to prescribe waste discharge requirements, or waive waste discharge requirements, for the discharge. The waste discharge requirements must implement relevant water quality control plans and the Water Code.

California Water Code §13269 authorizes the Central Coast Water Board to waive the submittal of reports of waste discharge and waste discharge requirements for specific types of discharges where such a waiver is consistent with applicable state

**Water Quality Control Plan, Central Coast Basin
Revisions to Chapter 4
(onsite wastewater sections only)**

**Res. No. R3-2011-0004 amendment, additions
& deletions shown (Res. No. R3-2008-0005 &
No. R3-2009-0012 incorporated in text)**

3

and regional water quality control plans and is in the public interest.

California Water Code §13269 requires that waivers shall be conditional and may be terminated at any time by the Central Coast Water Board. Waivers may be granted for discharges of waste to land, but may not be granted for discharges of waste subject to the NPDES requirements of the federal Clean Water Act. The waiver must also include monitoring unless the Regional Board determines that the discharges do not pose a significant threat to water quality.

On April 15, 1983, the Central Coast Water Board adopted a waiver of waste discharge requirements for onsite systems that was incorporated into the Basin Plan. (1983 Waiver). That 1983 Waiver waived the requirements to submit a report of waste discharge and obtain waste discharge requirements for individual sewage disposal systems and for sanitary waste disposal from certain small community, institutional, commercial, and industrial facilities if the systems met certain specified conditions. In summary, the systems were required to meet standard criteria of the governing local jurisdiction that is implementing the Basin Plan requirements pursuant to a memorandum of understanding with the Water Board or was an individual project that complies with the Basin Plan. On January 1, 2003, the 1983 Waivers terminated by operation of law due to an amendment to Water Code §13269. Since termination of the 1983 Waiver, the Central Coast Water Board has been developing revised Basin Plan criteria and a renewed conditional waiver of waste discharge requirements. Onsite wastewater systems have continued to be permitted by local governing jurisdictions consistent with the 1983 Waiver and the Basin Plan criteria and some have been subject to individual waste discharge requirements or waivers issued by the Central Coast Water Board.

This section of the Basin Plan Amendment sets forth a revised Implementation Program for onsite wastewater systems to ensure protection of waters of the state, including criteria and as a conditional waivers of waste discharge requirements and reports of waste discharge requirements for existing and new onsite wastewater systems. Onsite

wastewater systems covered by these renewed conditional waivers are: individual residences, multi-unit residences, institutions or places of commerce, industrial sanitary sources, and small community systems not regulated by waste discharge requirements.

The Central Coast Water Board finds that the this Conditional Waivers set forth in this Implementation Program comply with Water Code §13269, are in the public interest, and are This Conditional Waiver contains conditions and is consistent with the Basin Plan because:

1. Waivers granted for discharges that do not pose a significant threat to water quality enable staff resources to be used effectively and avoid unnecessary expenditures of limited resources.
2. It was adopted in compliance with Water Code Sections §13242 and §13269 and other applicable law.
3. It requires compliance with the Basin Plan.
4. It includes conditions that are intended to reduce and prevent pollution and nuisance and protect the beneficial uses of the waters of the State.
5. Dischargers may not discharge any waste not specifically regulated by this Conditional Waiver except in compliance with the Water Code.
6. Dischargers who violate the conditions of this Conditional Waiver are subject to enforcement pursuant to Water Code section §13350 and other applicable law.
7. The discharges from onsite wastewater systems all discharge the same type of waste.
8. It provides a method for coordinating regulation with local governing jurisdictions that routinely permit and oversee onsite wastewater systems, thereby reducing overlapping regulation.

It is appropriate to regulate onsite wastewater systems by way of a Conditional Waiver rather than with individual waste discharge requirements

ATTACHMENT A

because there are over 100,000 discharges of the listed categories. Issuing individual waste discharge requirements to each of those would use significant staff resources and is not necessary in most circumstances because such systems are regulated by local governing jurisdictions. The conditions imposed in this Conditional Waiver will be protective of waters of the state. This Conditional Waiver will simplify and streamline the regulatory process without compromising the protection of water quality.

Although a discharge may qualify for waiver enrollment, the Central Coast Water Board retains the right to regulate that discharge through other programs or Central Coast Water Board actions (such as enforcement orders, individual waste discharge requirements, general orders). The Central Coast Water Board may terminate a discharger's enrollment in a waiver at any time and require the discharge to obtain waste discharge requirements or terminate the discharge. Dischargers not eligible for the Conditional Waiver must apply for waste discharge requirements or waiver of waste discharge requirements in accordance with Water Code §13260.

Local governing jurisdictions also regulate onsite systems. The Central Coast Water Board and local governing jurisdictions typically coordinate the regulation of onsite systems. Appropriately developed and implemented memoranda of understanding between the Central Coast Water Board and local governing jurisdiction (e.g., counties and cities) provide practical and enforceable tools to compel compliance with the Basin Plan criteria for onsite systems and ensure water quality protection.

~~The Central Coast Water Board's Executive Officer is authorized to may approve and execute, on behalf of the Central Coast Water Board, individual memoranda of understanding with local governing jurisdiction in the Region based substantially on the requirements specified in Chapter 4, Section VIII.D of the Basin Plan (sections pertaining to onsite wastewater systems). Individual memoranda of understanding shall commit the local governing jurisdiction to amending its municipal code and onsite wastewater system program, if necessary, in~~

order to be substantially equivalent to the Basin Plan. If and when statewide criteria are adopted pursuant to California Water Code §13291, this Basin Plan section and the memoranda of understanding will be reviewed to determine if they need to be modified. Individual memoranda of understanding shall incorporate additional measures to be taken by the local governing jurisdiction to identify and address areas of degraded groundwater or surface water quality, where onsite wastewater systems are a potential source of pollution.

~~This Implementation Program sets forth two types of conditional waivers for the regulation of onsite wastewater systems: (1) a conditional waiver of the requirement to submit reports of waste discharge and to obtain waste discharge requirements for existing onsite systems regulated under the 1983 Waivers, (2) a conditional waiver of the requirement to obtain waste discharge requirements, but not the requirement to submit reports of waste discharges, for those systems regulated directly by the Central Coast Water Board, and (3) a conditional waiver of the requirements to submit reports of waste discharge and obtain waste discharge requirements for those systems that are regulated by local governing jurisdictions that comply with the conditions of this section. Section VIII.D.3.a conditionally waives waste discharge requirements, but not reports of waste discharges, for those systems regulated directly by the Central Coast Water Board. Section VIII.D.3.b conditionally waives waste discharge requirements and reports of waste discharge for those systems that are regulated by local governing jurisdictions that comply with the conditions of this section.~~

In compliance with Water Code §13269, the conditional waivers set forth in this Basin Plan shall expire five years after (OAL approval date) and may be renewed.

VIII.D.1.a. CONDITIONAL WAIVER FOR EXISTING ONSITE WASTEWATER SYSTEMS

**Water Quality Control Plan, Central Coast Basin
Revisions to Chapter 4
(onsite wastewater sections only)**

**Res. No. R3-2011-0004 amendment, additions
& deletions shown (Res. No. R3-2008-0005 &
No. R3-2009-0012 incorporated in text)**

5

~~The Central Coast Water Board waives the requirement to submit reports of waste discharge associated fee and obtain waste discharge requirements to the Central Coast Water Board and to receive enrollment notification for those onsite wastewater systems that existed as of (OAL approval date) that meet all the eligibility criteria and comply with the conditions set forth below regulated by a local governing jurisdiction, provided the following conditions are met.~~

~~As set forth in this Implementation Program, the Water Board expects that local governing jurisdictions will continue to directly regulate most existing onsite wastewater systems. The Water Board will continue to take direct action as appropriate to protect water quality, including enforcement actions and requiring submittal of reports of waste discharge requirements, and/or issuance of individual waste discharge requirements or conditional waivers.~~

ELIGIBILITY CRITERIA

1. The onsite wastewater system existed as of [OAL approval date].
2. The onsite wastewater system is installed at an individual residence, multi-unit residence, institution or place of commerce, industrial sanitary source, or small community not regulated by waste discharge requirements.
3. The onsite wastewater system was required to meet the standard criteria of the local governing jurisdiction that was implementing the Basin Plan criteria or the onsite wastewater system complied with the Basin Plan consistent with the 1983 Waiver. The onsite wastewater system is managed and maintained in a manner consistent with the Water Board or Water Board Executive Officer approved onsite management plan implemented by the local governing jurisdiction.
4. The local governing jurisdiction takes the following actions:
 - a. Ensures site suitability tests are performed prior to repairs and replacements, and that

tests are performed in accordance with standard procedures.

- b. Ensures proper system siting (VIII.D.3.a.), design (VIII.D.3.b.), construction (VIII.D.3.d.), and installation for repairs and replacements; and
- c. Adequately informs property owners regarding proper installation (of repairs and replacement), operation and ongoing maintenance of their onsite wastewater systems.

CONDITIONS

Dischargers to existing systems shall comply with the following conditions.

1. Properly operate and maintain the onsite system to prevent failure.
2. Notify the local governing jurisdiction of system failures.
3. Seek appropriate permits regarding repairs and replacements of failing systems.
4. Ensure that repairs and replacements comply with the Criteria for New Systems (Section VIII.D.>>) to the greatest extent practicable.
5. Manage and maintain the onsite wastewater system in a manner consistent with the Water Board or Water Board Executive Officer approved onsite management plan implemented by the local governing jurisdiction.

RECOMMENDATIONS

The Water Board expects that:

1. Local governing jurisdictions may can use staff inspectors or individuals under contract with the local government. A standard detailed checklist should shall be completed by the inspector to verify the onsite wastewater system was constructed in conformance with the Basin Plan and local governing jurisdiction requirements.

ATTACHMENT A

& deletions shown (Res. No. R3-2008-0005 &
No. R3-2009-0012 incorporated in text)**

6

2. Property owners should be made aware of the nature and requirements of their onsite wastewater system.
3. Prospective property buyers should be informed of any enforcement action affecting parcels or houses they wish to buy. Local governing jurisdictions should ensure the terms of the enforcement action are entered into the county record for each affected parcel. When a prospective buyer conducts a title search, terms of the enforcement action would appear in the preliminary title report.
4. All onsite wastewater system owners ~~should need to~~ be aware of proper operation and maintenance procedures. Local governing jurisdictions ~~should~~ shall mount a continuing public education program to provide home owners with onsite wastewater system operation and maintenance guidelines. Basin Plan information should be available at local governing jurisdiction health and building departments.

VIII.D.1.b3.a. CONDITIONS FOR WAIVER OF WASTE DISCHARGE REQUIREMENTS FOR NEW ONSITE WASTEWATER SYSTEMS REGULATED DIRECTLY BY THE CENTRAL COAST WATER BOARD

The Central Coast Water Board waives the requirement to obtain waste discharge requirements, but not the requirement to submit reports of waste discharge, for new onsite wastewater systems (installed after [OAL approval date]) directly regulated by the Water Board that meet the eligibility criteria and comply with the conditions set forth below. Waste discharge requirements [California Water Code §13263(a)] are conditionally waived as follows:

The Central Coast Water Board's Executive Officer is authorized to enroll applicants in the onsite wastewater system conditional waiver that meet the eligibility criteria and comply with the following

conditions provided the following conditions are met.

ELIGIBILITY CRITERIA

For an onsite wastewater system to be eligible for a conditional waiver of waste discharge requirements:

1. The onsite wastewater system is installed at an individual residence, multi-unit residence, institution or place of commerce, industrial sanitary source, or small community not regulated by waste discharge requirements.
2. The discharger receives enrollment notification from the Executive Officer.

CONDITIONS

1. The onsite wastewater system is sited (VIII.D.3.a.), designed (VIII.D.3.b.), constructed (VIII.D.3.d.) managed and maintained (VIII.D.3.e.) in a manner consistent with criteria specified in the Basin Plan, Chapter 4, Section VIII.D.
2. The applicant submits a report of waste discharge to the Central Coast Water Board that provides documentation of consistency with each Basin Plan criterion.
3. The applicant submits with the report of waste discharge a fee corresponding to the lowest applicable fee for waste discharge requirements (threat and complexity rating of III-C) identified in the State Water Board's fee schedule set forth in Title 23 California Code of Regulations.
4. The applicant enrolled in the Conditional Waiver complies with conditions specified in an approved onsite management plan implemented by the local governing jurisdiction, if available,

The Central Coast Water Board or its Executive Officer may terminate the discharger's enrollment in the Conditional Waiver at any time. Dischargers not eligible for the Conditional Waiver must apply for waste discharge requirements or waiver of

ATTACHMENT A

waste discharge requirements in accordance with Water Code requirements.

Coast Water Board regarding onsite wastewater system management.

VIII.D.1.c3.b. ~~CONDITIONS FOR~~ ~~WAIVER OF WASTE DISCHARGE~~ ~~REQUIREMENTS FOR NEW ONSITE~~ ~~WASTEWATER SYSTEMS REGULATED~~ ~~BY LOCAL GOVERNING~~ ~~JURISDICTIONS~~

CONDITIONS

The Central Coast Water Board waives the requirements to submit a report of waste discharge and associated Water Board fee, and to obtain waste discharge requirements or receive enrollment notification for new systems (installed after [OAL approval date]) that meet the eligibility criteria and comply with the conditions set forth below are waived for onsite wastewater systems regulated by a local governing jurisdiction, provided the following conditions are met.

1. The onsite wastewater system is permitted by a local governing jurisdiction that implements the criteria for new systems (Section VIII.D.3.)
2. The onsite wastewater system is permitted by a local governing jurisdiction that implements an onsite wastewater management plan approved by the Central Coast Water Board or its Executive Officer.
3. The local governing jurisdiction has entered into a memorandum of understanding with the Central Coast Water Board regarding onsite wastewater system management.
4. The onsite wastewater system meets the criteria in Basin Plan Chapter 4, Section VIII.D. for site suitability (VIII.D.3.a.), design (VIII.D.3.b.), alternatives (VIII.D.3.c.), construction (VIII.D.3.d.), maintenance (VIII.D.3.e.), and use considerations (VIII.D.3.f.)
5. The onsite wastewater system is sited, designed, managed and maintained in a manner consistent with the Water Board or Water Board Executive Officer approved onsite management plan implemented by the local governing jurisdiction.
6. The applicant submits any required application and fee to the local governing jurisdiction.

ELIGIBILITY CRITERIA

For an onsite wastewater system to be eligible for a conditional waiver of the requirements to submit a report of waste discharge and obtain waste discharge requirements: For New Discharges (systems installed after March 20, 2009):

1. The onsite wastewater system is installed at an individual residence, multi-unit residence, institution or place of commerce, industrial sanitary source, or small community not regulated by waste discharge requirements.
2. The local governing jurisdiction has adopted or updated local ordinances that incorporate the Criteria for New Systems set forth in Section VIII.D.3. of the Basin Plan. Local ordinances shall be updated to reflect Basin Plan criteria.
3. The local governing jurisdiction implements an onsite wastewater management plan approved by the Water Board or its Executive Officer (VIII.D.2.b.) to ensure conformance with the Basin Plan criteria set forth in Section VIII.D.3. and local regulations, and has entered into a memorandum of understanding with the Central

PROHIBITIONS

1. Local governing jurisdiction approval and discharger installation of new alternative systems are prohibited subsequent to final approval of these criteria on (OAL approval date) unless consistent with either a locally implemented onsite wastewater management plan approved by the Central Coast Water Board, or the Water Board has adopted waste discharge requirements or issued a conditional waiver of waste discharge requirements for the system.

ATTACHMENT A

VIII.D.24. LOCAL GOVERNING JURISDICTION ACTIONS

VIII.D.24.a. DISCLOSURE AND COMPLIANCE OF EXISTING ONSITE WASTEWATER SYSTEMS

The Water Board, on March 20, 2009, adopted a Basin Plan Implementation Program establishing a conditional waiver for onsite wastewater systems that meet specified eligibility criteria and the conditions (Basin Plan Section VIII.D.13.a, b and c). For an onsite wastewater system to be eligible for a conditional waiver of Report of Waste Discharge and Waste Discharge Requirements, local governing jurisdictions must develop and implement programs to ensure conformance with this Basin Plan (as found in the following sections) and local regulations and enter into memorandum of understanding with the Central Coast Water Board. Such programs shall include (but are not limited to) procedures to:

- Ensure site suitability tests are performed as necessary, and that tests are performed in accordance with standard procedures;
- Ensure proper system siting, design, construction and installation; and
- Adequately inform property owners regarding proper installation, operation and ongoing maintenance of their onsite wastewater systems.

Local governing jurisdictions may ~~can~~ use staff inspectors or individuals under contract with the local government. A standard detailed checklist should ~~shall~~ be completed by the inspector to verify the onsite wastewater system was constructed in conformance with the Basin Plan and local governing jurisdiction requirements.

Property owners should be aware of the nature and requirements of their onsite wastewater system. Plans should be available in city or county offices

showing placement of soil absorption systems. Local governing jurisdictions should require onsite wastewater system as-built plans as a condition of new construction final inspection.

Prospective property buyers should be informed of any enforcement action affecting parcels or houses they wish to buy. Local governing jurisdictions should ensure the terms of the enforcement action are entered into the county record for each affected parcel. When a prospective buyer conducts a title search, terms of the prohibition enforcement action would appear in the preliminary title report.

All onsite wastewater system owners need to be aware of proper operation and maintenance procedures. Local governing jurisdictions shall ~~should~~ mount a continuing public education program to provide homeowners with onsite wastewater system operation and maintenance guidelines. Basin Plan information should be available at local governing jurisdiction health and building departments.

Dual leaching capabilities provide an immediate remedy in the event of system failure. For that reason, dual leachfields are considered appropriate for all systems. Furthermore, should wastewater flows increase, this area can be used until the system is expanded. Dedicated system expansion areas are also appropriate. To protect this set-aside area from encroachment, the local governing jurisdiction shall require restrictions on future use of the area as a condition of land division or building permit approval. For new subdivisions, Covenants, Conditions and Restrictions (CC&R's) or additional map sheets recorded with the Parcel or Tract Final Map might provide an appropriate mechanism for protecting a set aside area. Future buyers of affected property would be notified of property use restrictions by reading the CC&R's or Final Map.

Many existing systems do not comply with current or proposed standards. Repairs to failing systems shall be done under permit from the local governing jurisdiction. The local governing jurisdiction shall require failing systems to be brought into compliance with the Basin Plan or repair criteria consistent with locally implemented onsite

ATTACHMENT A

**Water Quality Control Plan, Central Coast Basin

& deletions shown (Res. No. R3-2008-0005 &
No. R3-2009-0012 incorporated in text)**

9

management plan (approved by the Central Coast Water Board ~~or its Executive Officer~~).

Land use changes should not be approved by the local governing jurisdiction until the existing onsite system meets criteria of this Basin Plan and local ordinances.

Within the following sections, criteria are specified for RECOMMENDATIONS, REQUIREMENTS and PROHIBITIONS.

RECOMMENDATIONS

1. Inform property buyers of the existence, location, operation, and maintenance of onsite disposal systems. Prospective home or property buyers should also be informed of any enforcement action (e.g., Basin Plan prohibitions) through the County Record.
2. Conduct public education programs to provide property owners with operation and maintenance guidelines.
3. It may be appropriate for onsite systems to be maintained by local onsite maintenance districts.
4. Standard soil testing procedures should be adopted.
5. Onsite Wastewater Management Plans shall should be prepared and implemented for urbanizing and high density areas served by onsite wastewater systems.

REQUIREMENTS

6. Local governing jurisdictions shall require replacements or repairs to failing systems to be in substantial conformance (to the greatest extent practicable) with the Basin Plan criteria for site suitability (VIII.D.3.a.), design (VIII.D.3.b.), alternatives (VIII.D.3.c.), construction (VIII.D.3.d.), maintenance (VIII.D.3.e.), and use considerations (VIII.D.3.f.) ~~recommendations, requirements and prohibitions~~ or the local onsite wastewater management plan.

7. Local governing jurisdictions shall ensure that alternative onsite system owners are provided an informational maintenance or replacement document by the system designer or installer. This document shall cite homeowner procedures to ensure maintenance, repair, or replacement of critical items within 48 hours following failure.
8. Local ordinances shall be updated to reflect Basin Plan criteria for management plans (VIII.D.2.b.), site suitability (VIII.D.3.a.), design (VIII.D.3.b.), alternatives (VIII.D.3.c.), construction (VIII.D.3.d.), maintenance (VIII.D.3.e.), and use considerations (VIII.D.3.f.)

PROHIBITIONS

9. New alternative systems are prohibited unless consistent with a locally implemented onsite wastewater management plan approved by the Central Coast Water Board ~~or its Executive Officer~~ or waste discharge requirements issued or waived by the Water Board.

**VIII.D.24.b. ONSITE WASTEWATER
MANAGEMENT PLANS**

As set forth in Section VIII.D.1, the Water Board, on March 20, 2009, adopted a Basin Plan Implementation Program that sets forth a conditional waiver of the requirements to submit a report of waste discharge and obtain waste discharge requirements for certain onsite wastewater systems (Basin Plan Section VIII.D.3). For an onsite wastewater system to be eligible for a conditional waiver, where the local governing jurisdiction must adopt, develop and implement an onsite wastewater management plan that complies with this section is approved by the Water Board. This section sets forth the purpose and content of the onsite wastewater management plan that must be included prior to Water Board approval. Approval of onsite system wastewater management plans shall be based upon (but not limited to) the inclusion of the elements set forth below guidance provided in the. A guidance document, titled "Central Coast Water Board Checklist for Developing & Reviewing

ATTACHMENT A

10

Onsite Wastewater Management Plans” is provided to assist local governing jurisdictions in developing the plan (included as Attachment 2 of March 20, 2009 Staff Report).

1. For a conditional waiver to apply to onsite wastewater systems, onsite wastewater management plans shall be implemented in urbanizing areas to investigate and mitigate reduce or prevent long-term cumulative impacts resulting from continued use of individual, alternative, and community onsite wastewater systems. Onsite wastewater management plans should be a comprehensive planning tool to specify onsite disposal system limitations to prevent ground or surface water degradation.
2. Onsite wastewater management plans shall include (but not be limited to) the following elements:
 - Survey and evaluation of information regarding effectiveness of existing onsite systems.
 - Water quality (groundwater and surface water) monitoring evaluation program.
 - Projections of onsite disposal system demand and determination of methods to best meet demand.
 - Recommendations and requirements for existing onsite wastewater system inspection, monitoring, maintenance and repairs including procedures to ensure that replacements or repairs to failing systems are done under permit from the local governing jurisdiction and in substantial conformance (to the greatest extent practicable) with Basin Plan criteria for site suitability (VIII.D.3.a.), design (VIII.D.3.b.), alternatives (VIII.D.3.c.), construction (VIII.D.3.d.), maintenance (VIII.D.3.e.), and use considerations (VIII.D.3.f.) or the local onsite wastewater management plan.
 - Recommendations and requirements for new onsite wastewater systems reflecting Basin Plan conditions and criteria (VIII.D.3).

- Alternative means of disposing of sewage in the event of disposal system failure and/or irreversible degradation from onsite disposal.
- Procedures to assure that land use changes are not approved by the local governing jurisdiction until existing onsite wastewater systems meet criteria of this Basin Plan and local ordinances.
- Education and outreach program including procedures to inform property buyers of the existence, location, operation, and maintenance of onsite disposal systems. Prospective home or property buyers should also be informed of any enforcement action (e.g., Basin Plan prohibitions) through the County Record. The education and outreach program shall also include procedures to ensure that alternative onsite system owners are provided an informational maintenance or replacement document by the system designer or installer. This document shall cite homeowner procedures to ensure maintenance, repair, or replacement of critical items within 48 hours following failure.
- Enforcement options.
- Septage management.
- Program administration, staffing, records keeping, installation and repairs tracking, and financing.
- Consideration of the appropriateness of onsite maintenance districts.
- Adoption of standard soil testing procedures.
- Adoption or update of local ordinances to reflect Basin Plan criteria for management plans (VIII.D.2.b.), site suitability (VIII.D.3.a.), design (VIII.D.3.b.), alternatives (VIII.D.3.c.), construction (VIII.D.3.d.), maintenance (VIII.D.3.e.), and use considerations (VIII.D.3.f.)
- Procedures to assure that onsite wastewater system as-built plans are required as a

ATTACHMENT A

condition of new construction final inspection, and procedures to assure that plans are available in city or county offices showing placement of soil absorption systems.

Consideration of use of onsite wastewater disposal zones, as discussed in Section §6950-6981 of the Health and Safety Code, may be an appropriate means of implementing onsite wastewater management plans.

VIII.D.24.c. ONSITE WASTEWATER SYSTEM MAINTENANCE DISTRICTS

It may be appropriate for community onsite systems to be maintained by local onsite wastewater system maintenance districts. These special districts could be administered through existing local governments such as County Water Districts, Community Services Districts, or County Service Areas

Onsite wastewater system maintenance districts are responsible for onsite system operation and maintenance in conformance with this Water Quality Control Plan. Such districts should ensure proper construction, installation, operation, and maintenance of onsite wastewater systems. Maintenance districts should establish onsite system surveillance, maintenance and pumping programs, provide repairs to plumbing or leachfields, and encourage water conservation measures.

VIII.D.32. CRITERIA FOR NEW SYSTEMS

Onsite wastewater system problems can be minimized with proper site location, design, installation, operation and maintenance. The following section includes criteria for all new onsite wastewater disposal systems. Unless local governing jurisdictions should incorporate these criteria and guidelines into their local ordinances, systems will not be eligible for waivers set forth in VIII.D.1.c. These criteria will be used by the Central Coast Water Board for Water Board regulated systems and exemptions.

Local governing jurisdictions may authorize alternative onsite systems if the agency acts consistent with locally implemented onsite wastewater management plans approved by the Central Coast Water Board or its Executive Officer and with the Basin Plan criteria specified in VIII.D.3.c.

For any onsite system, limited disposal options are available for septage (solids periodically removed from septic tanks). As a component of a wastewater management plan, long-term septage disposal plans shall be considered and developed by local governing jurisdictions.

Onsite wastewater system criteria are arranged in sequence under the following categories: site suitability, onsite system design, design for alternative and engineered systems, construction, onsite system maintenance, use considerations, onsite wastewater system prohibition areas, and subsurface disposal exemptions ~~community system design, and local governing jurisdictions.~~ Within each category, criteria are specified for RECOMMENDATIONS, REQUIREMENTS and PROHIBITIONS.

VIII.D.32.a. SITE SUITABILITY

RECOMMENDATIONS

1. For new land divisions, onsite disposal systems and expansion areas should be protected from encroachment by provisions in covenants, conditions, and restrictions (CC&Rs), recorded in Final Maps or similar mechanisms.
2. Percolation test holes (at least three per system) should be drilled with a hand auger. A hole could be hand augered or dug with hand tools at the bottom of a larger excavation made by a backhoe.
3. Natural ground slope of the disposal area should not exceed 20 percent.
4. An excavation should be made to detect mottling or presence of underground channels,

fissures, or cracks. Soils should be excavated to a depth of 4-5 feet below drain field bottom.

REQUIREMENTS

5. At least one soil boring or excavation per onsite system shall be performed to determine soil suitability, depth to groundwater, and depth to bedrock or impervious layer. Soil borings are particularly important for seepage pits. The soil boring or excavation should extend at least 10 feet below the drain field bottom at each proposed location and be performed during or shortly after the wet season to characterize the most limiting conditions.
6. For leachfields, at least three percolation test locations shall be used to determine system acceptability.
7. Percolation tests shall be continued until a stabilized rate is obtained.
8. Percolation tests shall be performed at a depth corresponding to the bottom of the subsurface disposal area.
9. If no restrictive layers intersect, and geologic conditions permit surfacing, the setback distance from a cut, embankment or steep slope (greater than 30 percent) should be determined by projecting a line 20 percent down gradient from the sidewall at the highest perforation of the discharge pipe. The leachfields shall be set back far enough to prevent this projected line from intersecting the cut within 100 feet, measured horizontally, from the sidewall. If restrictive layers intersect cuts, embankments or steep slopes, and geologic conditions permit surfacing, the setback shall be at least 100 feet measured from the top of the cut.
10. Prior to permit approval, site investigation shall determine onsite system suitability (consistency with recommendations, requirements and prohibitions specified in this section). Seepage pits should be utilized only after careful consideration of site suitability.

11. Distances between trench bottom and highest seasonal usable groundwater, including perched groundwater, shall not be less than the separation specified by appropriate percolation rate:

Percolation Rate (minutes/inch)*	Distance (feet)
1-4	20
5-29	8
>30	5

*Onsite disposal in soils with percolation rates faster than one minute per inch are prohibited without additional (alternative) treatment.

12. Onsite disposal systems on slopes greater than 20 percent shall be designed by a certified professional.

PROHIBITIONS

13. For new land divisions (including lot splits) served by onsite systems, lot sizes less than one acre are prohibited unless authorized under an onsite management plan approved by the Central Coast Water Board or its Executive Officer. For the purpose of this prohibition, secondary units are considered "de-facto" lot splits and shall not be constructed on lots less than two acres in size unless consistent with onsite management plans.
14. Onsite wastewater disposal shall not be located in areas subject to inundation from a 25-year flood.
15. Onsite disposal systems shall not be installed where natural ground slope of the disposal area exceeds 30 percent.
16. Leachfields are prohibited in soils where percolation rates are slower than 120 min/in unless parcel size is at least two acres. Disposal systems designed to accommodate slow percolation rates (such as evapotranspiration systems) shall be evaluated as alternative systems.

- 17. Onsite discharge is prohibited on any site unable to maintain subsurface disposal.
- 18. Onsite discharge is prohibited where lot sizes, dwelling densities or site conditions cause detrimental impacts to water quality.
- 19. Onsite discharge is prohibited within a water supply reservoir watershed where parcel size is less than one acre, unless consistent with an onsite wastewater management plan approved by the Central Coast Water Board ~~or its Executive Officer.~~
- 20. Onsite discharge is prohibited in any area where continued use of onsite systems constitutes a public health hazard, an existing or threatened condition of water pollution, or nuisance.
- 21. Onsite discharge is prohibited where soils or formations with channels, cracks, fractures, or percolation rates allow inadequately treated waste to surface or degrade water quality.*

* Unless a setback distance of at least 250 feet to any domestic water supply well or surface water is ensured.

- 22. Seepage pits are prohibited in soils or formations containing 60 percent or greater clay (a soil particle less than two microns in size) unless parcel size is at least two acres.
- 23. For seepage pits, distances between pit bottom and usable groundwater, including perched groundwater, shall not be less than separation specified by appropriate soil type:

<u>Soil Type</u>	<u>Distance (feet)</u>
Gravels	additional (alternative) treatment required
Gravels with few fines*	20
Other	10

* Gravels with few fines - Soils with 90 percent to 94 percent coarse fraction larger than a No. 4 sieve.

- 24. Onsite discharge in soils with percolation rates faster than one minute per inch is prohibited without additional treatment consistent with an onsite management plan implemented by the

local governing jurisdiction and approved by the Central Coast Water Board ~~or its Executive Officer.~~

- 25. Onsite discharge is prohibited in fill unless specifically engineered as a disposal area.

VIII.D.32.b. ONSITE SYSTEM DESIGN

RECOMMENDATIONS

- 1. Dual disposal fields (200 percent of original calculated disposal area) should be installed.
- 2. For commercial and institutional systems, pretreatment may be necessary if wastewater is significantly different from domestic wastewater.
- 3. Distance between drainfield trenches should be at least two times the effective trench depth. Distance between seepage pits (nearest sidewall to sidewall) should be at least 20 feet.
- 4. Application area used in design calculations should be no greater than defined in section VIII.D. ~~the area calculated using trench bottom and sidewalls minus the first foot below the distribution pipe.~~^{UPC}
- 5. Seepage pit application rate should not exceed 0.3 gallons per day (gpd) per square foot.

REQUIREMENTS

- 6. Onsite wastewater treatment tanks shall be water-tight, and designed to remove settleable solids and should provide a high degree of anaerobic decomposition of colloidal and soluble organic solids.
- 7. The minimum design flow rate shall be 375 gallons per day for a 3-bedroom house, and 75 gpd should be added for each additional bedroom.
- 8. Drainfield design shall be based only upon usable permeable soil layers.

**Water Quality Control Plan, Central Coast Basin
Revisions to Chapter 4
(onsite wastewater sections only)**

**Res. No. R3-2011-0004 amendment, additions
& deletions shown (Res. No. R3-2008-0005 &
No. R3-2009-0012 incorporated in text)**

9. Leachfield loading application rate shall not exceed the following:

<u>Percolation Rate (minutes/inch)</u>	<u>Loading Rate (gpd/sq.ft.)</u>
1 - 20	0.8
21 - 30	0.6
31 - 60	0.25
61 - 120	0.10

Minimum Setback
Distance (feet)

Domestic water supply wells 100

Watercourse 100

Drinking water supply reservoir
spillway elevation 200

Springs, natural or any part
of a man-made spring 100

10. If curtain drains divert groundwater to subsurface soils, the upslope separation from a leachfield or pit shall be at least 20 feet and the down slope separation shall be at least 50 feet.

11. Onsite system design shall allow access for inspection and cleaning. Septic tanks must be accessible for pumping.

12. For commercial, institutional, industrial and community systems, design shall be based on daily peak flow.

13. Dual disposal systems shall be installed (200 percent of original calculated disposal area) for community systems.

14. All onsite disposal systems shall reserve an expansion area (additional 100% disposal capacity) to be set aside and protected from all uses except future drainfield repair and replacement.^{UPC} Community systems shall install dual drainfields (200% disposal capacity) and reserve replacement area (3rd 100% disposal capacity).

15. Community systems shall provide duplicate individual equipment components for components subject to failure (such as pumps).

16. Distances between trench/pit bottom and bedrock or other low permeability material shall be at least ten feet.

17. Where site conditions permit migration of wastewater to water, setback distances from disposal trench/pit shall be at least:

18. Community systems shall be designed with adequate capacity to accommodate the build-out population.

19. Community wastewater treatment and disposal facilities shall be operated by a public agency. If a demonstration is made to the Central Coast Water Board that an existing public agency is unavailable and formation of a new public agency is unreasonable, a private entity with adequate financial, legal, and institutional resources to assume responsibility for waste discharges may be acceptable.

PROHIBITIONS

20. Onsite discharge to leachfields is prohibited where soil percolation rates are slower than 60 minutes per inch unless the system is designed for an effluent application rate of 0.1 gpd per square foot of application area, or less.

21. Discharge shall not exceed 40 grams per day of total nitrogen, on the average, per acre served by onsite system overlying groundwater recharge areas, except where a local governing jurisdiction has adopted a Wastewater Management Plan approved by the Central Coast Water Board or its Executive Officer.

22. Community system seepage pits are prohibited unless additional (alternative) treatment is provided consistent with an onsite management plan implemented by the local governing jurisdiction and approved by the Central Coast Water Board Executive Officer. Such seepage pits shall have at least 15 vertical feet between

ATTACHMENT A

pit bottom and highest usable groundwater, including perched groundwater.

management plan approved by the Central Coast Water Board or its Executive Officer.

23. Inflow and infiltration shall be precluded from the system unless design specifically accommodates such excess flows.
24. Onsite wastewater systems are prohibited in any subdivision unless the subdivider clearly demonstrates the installation, operation and maintenance of the onsite system will be properly functional and in compliance with all Basin Plan criteria for new onsite systems (VIII.D.3.)
25. Curtain drains that discharge to ground surface or surface water are prohibited within 50 feet down slope of onsite system disposal areas.

VIII.D.32.c. DESIGN FOR ALTERNATIVE AND ENGINEERED SYSTEMS

RECOMMENDATIONS

1. Mound systems, evapotranspiration systems, and other alternative onsite systems should be designed and installed in accordance with guidelines available from the State Water Resources Control Board.

REQUIREMENTS

2. Alternative onsite wastewater systems shall be designed by a certified professional competent in alternative onsite wastewater system design.
3. Alternative and engineered onsite wastewater systems shall be located, designed, installed, operated, maintained, and monitored in accordance with a locally implemented onsite management plan approved by the Central Coast Water Board or its Executive Officer.

PROHIBITIONS

4. Alternative and engineered onsite wastewater systems are prohibited, except where consistent with a locally implemented onsite

VIII.D.32.d. CONSTRUCTION

RECOMMENDATIONS

1. Construction activities should follow recommendations and precautions described in the Environmental Protection Agency's Design Manual: Onsite Wastewater Treatment and Disposal Systems.
2. Onsite wastewater systems should have a slightly sloped finished grade to promote surface runoff.
3. Surface runoff should be diverted around open trenches/pits to limit siltation of trench bottom area.
4. Work should be scheduled only when infiltrative surfaces can be covered in one day to minimize windblown silt or rain clogging the soil.
5. In clayey soils, work should be done only when soil moisture content is low enough to avoid smearing of infiltrative surfaces.
6. Bottom and sidewall areas should be left with a rough surface. Any smeared or compacted surfaces should be removed.
7. Bottom of trench or bed distribution piping should be level throughout to prevent localized overloading.
8. Properly constructed distribution boxes or junction fittings should be installed to maintain equal flow to each trench. Distribution boxes should be placed with extreme care outside the leaching area to ensure settling does not occur.
9. Risers to the ground surface and manholes should be installed over the septic tank inspection ports, access ports and distribution boxes.

**Water Quality Control Plan, Central Coast Basin
Revisions to Chapter 4
(onsite wastewater sections only)**

**Res. No. R3-2011-0004 amendment, additions
& deletions shown (Res. No. R3-2008-0005 &
No. R3-2009-0012 incorporated in text)**

16

10. Drainfields should include inspection pipes to check water level.
11. Nutrient and heavy metal removal should be facilitated by planting ground cover vegetation over shallow subsurface drainfields. The plants must have the following characteristics: (1) evergreen, (2) shallow root systems, (3) numerous leaves, (4) salt resistant, (5) ability to grow in soggy soils, and (6) low or no maintenance. Plants downstream of leaching area may also be effective in nutrient removal.

REQUIREMENTS

12. Prior to backfilling, the distribution system shall be tested to check the hydraulic loading pattern.
13. Disposal systems shall be inspected by the permitting agency prior to covering to ensure proper construction. Designers and/or installers of engineered onsite wastewater systems shall provide a letter to the permitting authority stating that the onsite system was installed in conformance with the approved plans.

**VIII.D.32.e. ONSITE SYSTEM
MAINTENANCE**

RECOMMENDATIONS

1. Septic tanks should be inspected every two to five years to determine the need for pumping.
2. Septic tanks should be pumped whenever: (1) the scum layer is within three inches of the outlet device, (2) the sludge level is within eight inches of the bottom of the outlet device, or (3) every five years; whichever is sooner.
3. Drainfields should be alternated when drainfield inspection pipes reveal a high water level or every six months, whichever is sooner.

REQUIREMENTS

4. Onsite wastewater systems shall be maintained in accordance with approved onsite

management plans. Where onsite management plans have not been approved by the Central Coast Water Board or its Executive Officer, onsite systems shall be maintained as described in requirements 5 and 6 below in the following specifications.

5. Disposal of septage (solid residue pumped from septic tanks) shall be accomplished in a manner acceptable to the Central Coast Water Board Executive Officer.
6. Records of maintenance, pumping, septage disposal, etc. shall be maintained by the onsite system owner and available upon request.

VIII.D.32.f. USE CONSIDERATIONS

RECOMMENDATIONS

1. Water conservation and solids reduction practices should be implemented by all onsite system users. Garbage grinders should not be used in homes with septic tanks. Where grinders are used, septic tank capacity and inspection/pumping frequency should be increased.
2. Metering and water use costs should be used to encourage water conservation in areas served by onsite systems.
3. Bleach, solvents, fungicides and any other toxic material, grease and oil should not be discharged into onsite wastewater systems.
4. Self-regenerating water softeners should not be used where discharge is to onsite systems. If water softening is necessary, use of canister-type softeners will protect the treatment and disposal systems and underlying groundwater from unnecessary accumulation of salts.

PROHIBITIONS

5. Self-regenerating water softener brine discharge to onsite wastewater systems is prohibited unless consistent with an onsite wastewater management salts minimization

ATTACHMENT A

plan approved by the Central Coast Water Board ~~Executive Officer~~ and implemented by the local governing jurisdiction.

VIII.D.32.g. ONSITE WASTEWATER SYSTEM PROHIBITION AREAS

In order to achieve water quality objectives, protect present and future beneficial water uses, protect public health, and prevent nuisance, discharges are prohibited in the following areas:

PROHIBITIONS

1. Discharges from individual sewage disposal systems are prohibited in portions of the community of Nipomo, San Luis Obispo County, which are particularly described in Basin Plan Appendix A-27.
2. Discharges from individual sewage disposal systems within the San Lorenzo River Watershed shall be managed as follows: Discharges shall be allowed providing the County of Santa Cruz, as lead agency, implements the "Wastewater Management Plan for the San Lorenzo River Watershed, County of Santa Cruz, Health Services Agency, Environmental Health Service, February 1995 and "San Lorenzo Nitrate Management Plan, Phase II Final Report", February 1995, County of Santa Cruz, Health Services Agency, Environmental Health Service (Wastewater Management Plan) and assures the Central Coast Water Board that areas of the San Lorenzo River Watershed are serviced by wastewater disposal systems to protect and enhance water quality, to protect and restore beneficial uses of water, and to abate and prevent nuisance, pollution, and contamination.
3. Discharges from individual and community sewage disposal systems are prohibited, effective November 1, 1988, in the Los Osos/Baywood Park area depicted in the Prohibition Boundary Map included as Attachment A of Resolution No. 83-13, which can be found in Basin Plan Appendix A-30.

VIII.D.32.h. SUBSURFACE DISPOSAL EXEMPTIONS

The Central Coast Water Board ~~or Executive Officer~~ may grant exemption to prohibitions for: (1) engineered new onsite wastewater systems for sites unsuitable for standard systems; and (2) new or existing onsite systems within the specific prohibition areas cited above in section VIII.D.3.g. To obtain an exemptions, the discharger must submit a report of waste discharge to the Water Board and the local governing jurisdiction that provides ~~Such exemptions may be granted only after presentation of sufficient justification, including geologic and hydrologic evidence that the continued operation of such system(s) in a particular area will not individually or collectively, directly or indirectly, result in pollution or nuisance, or affect water quality adversely.~~

Individual, alternative, and community systems shall not be approved for any area where it appears that the total discharge of leachate to the geological system, under fully developed conditions, will cause: (1) damage to public or private property; (2) ground or surface water degradation; (3) nuisance condition; or, (4) a public health hazard. Interim use of septic tank systems may be permitted where alternate parcels are held in reserve until sewer systems are available.

Requests for exemptions will not be considered until the local entity governing jurisdiction has reviewed the system and submitted the proposal for Central Coast Water Board review. Dischargers requesting exemptions must submit a Report of Waste Discharge, supplementing the local governing jurisdiction's submittal. Exemptions will be subject to filing fees as established by the State Water Code.

Discharges from onsite wastewater systems regulated by waste discharge requirements or a conditional waiver of such requirements may be exempt from the requirements of this chapter. The waste discharge requirements or conditional waiver will act in lieu of exemption, and separate exemption is not required.

ATTACHMENT A

**STATE OF CALIFORNIA
REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, CA 93401**

RESOLUTION No. R3-2011-0004

**AMENDING THE WATER QUALITY CONTROL PLAN REGARDING THE ONSITE
WASTEWATER SYSTEM IMPLEMENTATION PROGRAM**

WHEREAS, the California Regional Water Quality Control Board, Central Coast Region (hereafter Central Coast Water Board) finds:

1. The Central Coast Water Board adopted the second edition of the Water Quality Control Plan, Central Coast Basin (Basin Plan) on September 8, 1994. The Basin Plan designates beneficial uses and water quality objectives, implementation programs for achieving water quality objectives addressing point source and nonpoint source discharges, adopts prohibitions, and incorporates statewide plans and policies.
2. The Basin Plan contains an implementation program setting forth criteria regarding siting and design of onsite wastewater systems. The Central Coast Water Board updated its policy regarding siting and design of onsite wastewater systems on September 16, 1983, by adopting Resolution No. 83-12. The text and requirements specified in Resolution No. 83-12 are included in the Basin Plan as provisions of Chapters 4 and 5.
3. On May 9, 2008, the Central Coast Water Board adopted Resolution No. R3-2008-0005, revising the Basin Plan onsite wastewater system criteria. On March 20, 2009, the Central Coast Water Board adopted Resolution No. R3-2009-0012, revising the Basin Plan onsite implementation program and adopting minor revisions to the onsite wastewater criteria set forth in Resolution No. R3-2008-0005. This Resolution, No. R3-2011-0004, revises the Basin Plan amendments (Resolution No. R3-2008-0005 and Resolution No. R3-2009-0012) with clarifying language and reorganized and renumbered sections. The text and requirements specified in Resolution No. R3-2011-0004, as amended with these revisions, will be incorporated into the Basin Plan after review and approval by the State Water Resources Control Board and the Office of Administrative Law.
4. Section VIII.D.1. of the Basin Plan, as amended by this Resolution, specifies the criteria, conditions, recommendations, and prohibitions of discharges that onsite wastewater systems must meet to be eligible for waivers described in the implementation program. These discharges will not have a significant effect on the quality of waters of the State provided the conditions of the Basin Plan criteria and implementation program are met.
5. Area of Applicability - The effect of this amendment will be throughout the Central Coast Region, where onsite systems are used to treat and dispose of wastewater.

6. Onsite wastewater systems have been used as a form of wastewater treatment and disposal for many decades. Currently, the number of individual residential and small community onsite wastewater systems in the Central Coast Region exceeds 100,000. In most instances, the discharge from onsite wastewater systems does not adversely affect the beneficial uses of groundwater or surface water quality due to favorable site conditions, adequate system design, and ongoing management practices.
7. When improperly sited, improperly designed, or improperly managed, discharges from onsite wastewater systems may cause or contribute to degradation of water quality. The Basin Plan Implementation Program includes criteria to ensure long-term water quality protection in areas where onsite wastewater systems are used. Onsite wastewater systems located, designed, installed and managed in accordance with the Basin Plan criteria are not expected to cause or contribute to water quality impacts.
8. California Water Code (Water Code) Section 13260(a) requires that any person discharging waste or proposing to discharge waste within any region that could affect the quality of the waters of the State, other than into a community sewer system, shall file with the appropriate Regional Board a report of waste discharge containing such information and data as may be required by the Central Coast Water Board, unless the Central Coast Water Board waives such requirement.
9. California Water Code §13263 requires the Central Coast Water Board to prescribe waste discharge requirements, or waive waste discharge requirements, for the discharge. The waste discharge requirements must implement relevant water quality control plans and the Water Code.
10. California Water Code §13269 authorizes the Central Coast Water Board to waive the submittal of reports of waste discharge and waste discharge requirements for specific types of discharges where such a waiver is consistent with applicable state and regional water quality control plans and is in the public interest.
11. California Water Code §13269 requires that waivers shall be conditional and may be terminated at any time by the Central Coast Water Board. Waivers may be granted for discharges of waste to land, but may not be granted for discharges of waste subject to the NPDES requirements of the federal Clean Water Act. The waiver must also include monitoring unless the Regional Board determines that the discharges do not pose a significant threat to water quality.
12. The Basin Plan amendment waives the requirement that certain individual onsite wastewater system dischargers submit a report of waste discharge and obtain waste discharge requirements from the Central Coast Water Board, if the discharge is regulated by a local agency that has an MOU with the Water Board, that develops an onsite management plan, and regulates onsite systems consistent with the conditions of the Basin Plan and complies with the criteria set forth in the Implementation Program for Onsite Wastewater Systems in the Basin Plan. The Basin Plan amendment does not require local agencies to enter into an MOU or develop onsite management plans. Where there is no MOU and onsite management plan, individuals seeking approval for new onsite systems will be required to submit

reports of waste discharge and seek waste discharge requirements or a waiver from the Water Board.

13. The Central Coast Water Board hereby amends the Basin Plan by inserting amendments into Chapter 4 of the Basin Plan. To implement the onsite wastewater system criteria set forth in the Basin Plan, Resolution No. R3-2009-0012 amended the Basin Plan Implementation Program that provides for a conditional waiver of waste discharge requirements. This proposed amendment, Resolution No. R3-2011-0004, is a revision of the Implementation Program for onsite wastewater systems implemented by the Central Coast Water Board throughout the Region. The Implementation Program provides that onsite wastewater systems will be regulated under the California Water Code in one of three ways – (1) through issuance of waste discharge requirements by the Central Coast Water Board, (2) by a conditional waiver of waste discharge requirements for those systems that comply with the Basin Plan criteria and are regulated directly by the Central Coast Water Board, or (3) by a conditional waiver of waste discharge requirements and reports of waste discharge for those systems regulated by local governing agencies where the system complies with the Basin Plan criteria and the agency has entered into a memorandum of understanding (MOU) with the Central Coast Water Board and developed an onsite wastewater management plan.
14. The waiver of waste discharge requirements set forth in the Basin Plan amendment is consistent with the Basin Plan and is in the public interest, if conditioned upon a local agency entering into an individual MOU, developing an onsite management plan, and complying with the Basin Plan criteria. By entering into an MOU, a local agency commits to ensuring that its onsite wastewater system permitting program is substantially equivalent to the Basin Plan and any statewide standards adopted pursuant to California Water Code §13291. The adoption of this Basin Plan amendment and conditional waiver is also in the public interest because: (1) it was adopted in compliance with Water Code Sections 13260, 13263, and 13269 and other applicable law; (2) it requires compliance with the Basin Plan criteria that are developed to be protective of waters of the state; (3) it includes conditions that are intended to reduce and prevent pollution and nuisance and protect the beneficial uses of the waters of the State; (4) it contains more specific and more stringent conditions for protection of water quality compared to the existing Basin Plan criteria; and (5) given the magnitude of the number of persons who operate onsite systems, it provides for an efficient and effective use of limited Central Coast Water Board resources.
15. This Basin Plan amendment and conditional waiver do not impose monitoring and reporting requirements for each discharge. The types of discharges subject to this conditional waiver are not expected to pose a significant threat to water quality if the Basin Plan criteria are properly implemented. The Water Board's Executive Officer may impose monitoring and reporting requirements as authorized pursuant to Water Code section 13267 on any discharger subject to this conditional waiver.
16. At this time, it is appropriate to adopt a Basin Plan amendment conditionally waiving waste discharge requirements for onsite wastewater systems that fit within the Basin Plan criteria because: 1) the discharges have the same or similar waste from the same or similar operations and use the same or similar treatment methods and management practices; and 2) the discharges will be regulated by local agencies in

compliance with the Basin Plan criteria.

17. In addition, it is appropriate to regulate onsite wastewater systems with a conditional waiver rather than individual or general waste discharge requirements in order to simplify and streamline the regulatory process. There are more than 100,000 individual onsite wastewater systems in the Central Coast Region and it would not be practicable for the Water Board to issue individual waste discharge requirements. The issuance of general waste discharge requirements for the individual systems would result in duplicate regulation for most and duplicate fees. These systems have historically been and continue to be regulated by local permitting agencies applying Basin Plan criteria.
18. Anti-Degradation – State Water Board Resolution No. 68-16 *Statement of Policy with Respect to Maintaining High Quality of Waters in California* (Resolution No. 68-16) requires Regional Water Boards, in regulating the discharge of waste, to maintain high quality waters of the State until it is demonstrated that any change in quality will be consistent with maximum benefit to the people of the State, will not unreasonably affect beneficial uses, and will not result in water quality less than that described in a Regional Water Board's policies (e.g., quality that exceeds applicable water quality standards). Resolution No. 68-16 also states, in part:

Any activity which produces or may produce a waste or increased volume or concentration of waste and which discharges or proposes to discharge to existing high quality waters will be required to meet waste discharge requirements which will result in best practicable treatment and control of the discharge necessary to assure that (a) a pollution or nuisance will not occur and (b) the highest water quality consistent with maximum benefit to the people of the State will be maintained.

The Basin Plan implementation program revised by this Resolution is consistent with the provisions of the State Water Board Resolution No. 68-16. Dischargers that could be subject to the conditional waiver established in the implementation program will be required to comply with the Basin Plan criteria that are expected to prevent degradation of waters of the state, prevent pollution or nuisance, and implement best practicable treatment or control. The Basin Plan implementation program will prevent systems that do not meet the criteria.

19. Issuance of a waiver does not override other more stringent local, state, or federal regulations prescribed by other agencies.
20. Although a discharge may qualify for waiver enrollment, the Central Coast Water Board retains the right to regulate that discharge through other programs or Central Coast Water Board actions (such as enforcement orders, individual waste discharge requirements, general orders, etc.). The Central Coast Water Board may terminate a waiver at any time and require the discharger to obtain waste discharge requirements or terminate the discharge. Pursuant to Water Code section 13263(g) no discharge of waste into the waters of the state, whether or not the discharge is made pursuant to waste discharge requirements, shall create a vested right to continue the discharge. All discharges of waste into waters of the state are privileges, not rights.

21. CEQA – The Central Coast Water Board is the lead agency with respect to the California Environmental Quality Act (CEQA). The Secretary of Resources has certified the basin planning process as exempt from the CEQA requirement to prepare an environmental impact report or negative declaration. [PRC 21080.5; Cal. Code Regs., tit. 14, §15251(g)]. The State Water Resources Control Board (State Water Board) has adopted regulations to implement certified regulatory programs that require the regional boards to prepare substitute environmental documents, including a written report and an accompanying CEQA Environmental Checklist. (Cal. Code Regs., tit. 23, §3775 et seq.) The staff of the Central Coast Water Board prepared substitute environmental documents for Resolution No. R3-2008-0005 and Resolution No. R3-2009-0012. Consistent with CEQA Guidelines section 15162, the Central Coast Water Board is not required to prepare a subsequent or supplemental CEQA document because the revisions proposed in this action do not constitute substantial changes from the previously approved projects, do not involve new information, and would not result in any new or more significant environmental effects than those reviewed in the previous CEQA substitute environmental documents. [Cal. Code Regs. tit. 14, § 15162, subd. (a).] This action today revises previously adopted Basin Plan amendments by reorganizing and clarifying, without making significant substantive changes. A detailed explanation of the revisions is contained in the Staff Report for this matter dated May 5, 2011. The substitute environmental documents for this Basin Plan amendment have been made available to the public. The Central Coast Water Board finds that the proposed amendments to the Basin Plan will not have a significant effect on the environment.
22. Public Notice - Interested persons and the public have been informed of the Central Coast Water Board's intent to revise the Basin Plan Implementation Program for onsite wastewater systems. Efforts to inform the public and solicit public comment include a public notice of the amendments providing the public with a comment period in excess of 45 days in advance of the Central Coast Water Board hearing. Notice of public hearing was given by posting on the Water Board website, by mailing a copy of the notice to all persons requesting such notice and applicable government agencies. The Central Coast Water Board has provided responses to timely written comments received from interested persons. The public had the opportunity to comment on proposed amendments in 2008 and 2009, as set forth in Finding 3, above. The administrative record, including comments and responses to comments on those items are included in the record for this action today.
23. On May 5, 2011, the Central Coast Water Board held a public hearing and considered all the evidence and comments concerning this matter. Notice of this hearing was given to all interested persons in accordance with CCR, Title 14, §15072.
24. The Basin Plan amendment must be submitted for review and approval by the State Water Resources Control Board (State Board) and the State Office of Administrative Law (OAL). The Basin Plan amendment will become effective upon approval by OAL. The subject Resolution will become effective immediately.
25. This amendment to the Basin Plan will result in no potential for adverse effect, either individually or cumulatively, on wildlife and is therefore exempt from fee payments to the Department of Fish and Game under the California Fish and Game Code.

THEREFORE, BE IT RESOLVED that:

1. Pursuant to California Water Code §13240, the Water Board, after considering the record, including oral testimony at the hearing, hereby adopts the Basin Plan amendment set forth in Attachment A to this Resolution adopting an implementation program that conditionally waives waste discharge requirements and submittal of reports of waste discharge for onsite wastewater systems.
2. The Central Coast Water Board's Executive Officer is directed to forward copies of the Basin Plan amendment to the State Water Board in accordance with the requirements of California Water Code §13245.
3. The Central Coast Water Board requests the State Water Board approve the Basin Plan amendments in accordance with requirements of California Water Code §13245 and §13246, and forward it to OAL for approval. The State Water Board, on behalf of the Central Coast Water Board, shall file a Notice of Decision with the Secretary of Resources and the Governor's Office of Planning and Research (State Clearinghouse) after approval by OAL.
4. If, during its approval process, the State Water Board or OAL determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Central Coast Water Board Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.

I, Roger W. Briggs, Executive Officer of the California Regional Water Quality Control Board, Central Coast Region, do hereby certify that the foregoing is a full, true, and correct copy of a resolution adopted by the California Regional Water Quality Control Board, Central Coast Region, on May 5, 2011.

Executive Officer

Attachment: A. Revised Basin Plan Chapter 4 (onsite sections only)

S:\WQ Control Planning\Onsite\2011 Revisions\2011-0004 final resolution.doc

**CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, Ca 93401-7906**

RESOLUTION NO. R3-2010-0017

AMENDING THE WATER QUALITY CONTROL PLAN FOR THE CENTRAL COAST BASIN TO (1) ADOPT TOTAL MAXIMUM DAILY LOADS FOR FECAL COLIFORM IN LOWER SALINAS RIVER WATERSHED, (2) ADD THE LOWER SALINAS RIVER WATERSHED TO THE DOMESTIC ANIMAL WASTE DISCHARGE PROHIBITION; AND (3) ADD THE LOWER SALINAS RIVER WATERSHED TO THE HUMAN FECAL MATERIAL DISCHARGE PROHIBITION

The Regional Water Quality Control Board, Central Coast Region (Central Coast Water Board) finds:

1. The Central Coast Water Board adopted the second edition of the Water Quality Control Plan for the Central Coastal Basin (Basin Plan), on September 8, 1994. The Basin Plan designates beneficial uses and water quality objectives, sets forth implementation to achieve water quality objectives addressing point source and nonpoint source discharges, describes prohibitions, and incorporates statewide plans and policies.
2. The Central Coast Water Board periodically revises and amends the Basin Plan. The Central Coast Water Board has determined the Basin Plan requires further revision and amendment to: (a) incorporate Total Maximum Daily Loads (TMDLs) and an Implementation Plan for Fecal Coliform in Lower Salinas River Watershed including Lower Salinas River, Old Salinas River, Tembladero Slough, Salinas Reclamation Canal, Alisal Creek, Gabilan Creek, Natividad Creek, Salinas River Lagoon (North), Santa Rita Creek, Quail Creek, Chualar Creek, and Towne Creek; (b) add the Lower Salinas River Watershed to the Domestic Animal Waste Discharge Prohibition; and (c) add the Lower Salinas River Watershed to the Human Fecal Material Discharge Prohibition.
3. The Central Coast Water Board proposes to amend the Basin Plan by inserting amendments into the following sections (listed in order of Basin Plan contents):
 - a. Chapter Four, section IX (Total Maximum Daily Loads)
 - b. Chapter Five, section IV.B. (Discharge Prohibitions)
4. On May 20, 2004, the State Water Resources Control Board (State Water Board) adopted the *Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program* (NPS Policy). The NPS Policy requires the Water Boards to regulate all nonpoint sources of pollution using the administrative permitting authorities provided by the Porter-Cologne Water Quality Control Act. The NPS Policy allows Regional Water Boards to regulate nonpoint source discharges with waste discharge requirements, waivers of waste discharge requirements, or Basin Plan prohibitions.
5. The Lower Salinas River, Old Salinas River, Tembladero Slough, Salinas Reclamation Canal, Alisal Creek, and Gabilan Creek are listed on Clean Water Act 303(d) list as impaired due to pathogens. The Lower Salinas River, Old Salinas River, Tembladero Slough, Salinas Reclamation Canal, Alisal Creek, and Gabilan Creek do not meet the Basin Plan water quality objectives for fecal coliform. This Resolution establishes TMDLs and associated allocations for these listed water bodies.

Item No. 12
March 18, 2010 Meeting
TMDLs for Fecal Coliform in the
Lower Salinas River Watershed
Attachment 1

6. The Salinas River Lagoon (North), Santa Rita Creek, Natividad Creek, Chualar Creek, Quail Creek and Towne Creek are located in the Lower Salinas River Watershed, are not on the Clean Water Act 303(d) list of impaired waters for pathogens, and do not meet the Basin Plan water quality objectives for fecal coliform and/or USEPA water quality criteria for *E. coli*. The Salinas River Lagoon (North), Santa Rita Creek, Natividad Creek, Chualar Creek, Quail Creek and Towne Creek are impaired due to pathogens. Therefore, this Resolution establishes TMDLs and associated allocations for these impaired water bodies.
7. The Central Coast Water Board's goal for establishing TMDLs in the Lower Salinas River Watershed is to rectify the impairment due to fecal coliform, thereby providing support for the designated beneficial uses of contact and non-contact water recreation.
8. The Salinas River is the receiving water for approximately 4,600 square miles of land. Depending upon seasonal flow conditions, the Salinas River may flow directly into Monterey Bay, or can flow into Moss Landing Harbor via the Old Salinas River. The Lower Salinas River watershed is the lower segment of the Salinas River, comprising approximately 350 square miles, from Gonzales Road near the city of Gonzales to Monterey Bay. Chualar Creek and El Toro Creek flow to the Lower Salinas River and Old Salinas River. Alisal Creek, Gabilan Creek, Towne Creek, Santa Rita Creek, and Salinas Reclamation Canal flow to Tembladero Slough and Old Salinas River.
9. The elements of a TMDL are described in 40 CFR 130.2 and 130.7, section 303(d) of the Clean Water Act, and USEPA guidance documents. A TMDL is defined as "the sum of individual waste load allocations for point sources and load allocations for nonpoint sources and natural background" (40 CFR 130.2). The Central Coast Water Board has determined that the TMDLs for pathogens in the Lower Salinas River Watershed are set at levels necessary to attain and maintain the applicable numeric water quality objectives taking into account seasonal variations and any lack of knowledge concerning the relationship between effluent limitations and water quality (40 CFR 130.7 (c) (1)). The regulations in 40 CFR 130.7 also state that TMDLs shall take into account critical conditions for stream flow, loading, and water quality parameters. TMDLs are often expressed as a mass load of the pollutant but can be expressed as a unit of concentration if appropriate (40 CFR 130.2(i)). Expressing these TMDLs as units of concentration is appropriate because an existing concentration-based water quality objective is used as the basis for the TMDL numeric target and attaining that concentration-based water quality objective will result in protection of the beneficial uses.
10. Upon establishment of TMDLs by the State or USEPA, the State is required to incorporate the TMDLs, along with appropriate implementation measures, into the State Water Quality Management Plan (40 CFR 130.6(c)(1) and 130.7; and California Water Code sections 13050(j) and 13242). The Basin Plan and applicable statewide plans serve as the State Water Quality Management Plan governing the watersheds under the jurisdiction of the Central Coast Water Board.
11. The Central Coast Water Board may specify certain conditions or areas where the discharge of waste, or certain types of waste, will not be permitted pursuant to California Water Code section 13243 (prohibitions). This Basin Plan amendment establishes the Human Fecal Material Discharge Prohibition and the Domestic Animal Waste Discharge Prohibition for discharges in the Lower Salinas River Watershed (Prohibitions). The Implementation Plan for the TMDLs for the Lower Salinas River Watershed requires compliance with the Human Fecal Material Discharge Prohibition and the Domestic Animal Waste Discharge Prohibition for discharges in the Lower Salinas River Watershed. Supporting documentation for adding the Lower Salinas River Watershed to the above-named prohibitions is provided in the Final

Project Reports for Total Maximum Daily Loads for Fecal Coliform in the Lower Salinas River Watershed, including Lower Salinas River, Old Salinas River, Tembladero Slough, Salinas Reclamation Canal, Alisal Creek, Gabilan Creek, Natividad Creek, Salinas River Lagoon (North), Santa Rita Creek, Quail Creek, Chualar Creek, and Towne Creek. Consistent with California Water Code section 13244, the Central Coast Water Board complied with public notice and hearing requirements for adding the Lower Salinas River Watershed to the Human Fecal Material Discharge and the Domestic Animal Waste Discharge Prohibitions

12. Pursuant to California Water Code section 13241, the Central Coast Water Board must consider several factors in developing this Basin Plan amendment, which are evaluated as set forth in the substitute environmental documents for this project. Based on the information provided in the substitute environmental documents, the Central Coast Water Board concludes the following:
 - a. The Prohibitions and the TMDLs will protect present and probable future beneficial uses and prevent nuisance.
 - b. Environmental characteristics of the waterbodies will be protected.
 - c. Improved water quality conditions can reasonably be achieved through the coordinated management of all controllable factors that affect water quality in the area, as provided in the Implementation Plan, including the Prohibitions.
 - d. Economic considerations, including reasonably foreseeable means of compliance and the reasonably foreseeable costs of those means of compliance, have been considered.
 - e. Consideration of the need for developing housing within the region is not relevant to this action.
 - f. Consideration of the need to develop and use recycled water is not relevant to this action.
13. Central Coast Water Board staff also submitted the Project Report for the TMDLs to an external scientific review panel in March 2008. Water Board staff received comments from the panel. Central Coast Water Board staff edited the Project Report or provided a written response that explained the basis for not incorporating the comments, or the comments did not result in any changes to the proposed Basin Plan Amendments. The TMDLs and Implementation Program are based on sound scientific knowledge, methods, and practices in accordance with Health & Safety Code section 57004.
14. Central Coast Water Board staff implemented a process to inform interested persons and the public about the TMDLs and Prohibitions. Central Coast Water Board staff's efforts to inform the public and solicit comment included a public meeting with interested parties and a public notice and comment period. Public notice of the amendment to the Basin Plan provided the public a 45-day public comment period preceding the Central Coast Water Board hearing. Notice of public hearing was given by advertising in a newspaper of general circulation within the Region and by mailing a copy of the notice to all persons requesting such notice and applicable government agencies. Relevant documents and notices were also made available on the Central Coast Water Board website. Central Coast Water Board staff responded to oral and written comments received from the public. All public comments were considered.
15. Adoption of these TMDLs and Basin Plan amendments will not result in any degradation of water quality; in fact, they are designed to improve water quality. As such, these TMDLs and basin plan amendments comply with all requirements of both State and Federal anti-degradation requirements (State Board Resolution 68-16 "Statement of Policy with Respect to Maintaining High Quality of Waters in California, and 40CFR 131.12

16. Pursuant to Public Resources Code section 21080.5, the Resources Agency has approved the Regional Water Boards' basin planning process as a "certified regulatory program" that adequately satisfies the California Environmental Quality Act (CEQA) (Public Resources Code, Section 21000 et seq.) requirements for preparing environmental documents (14 Cal. Code Regs. §15251(g); 23 Cal. Code Regs. § 3782.). Central Coast Water Board staff has prepared "substitute environmental documents" for this project that contain the required environmental documentation as set forth in the State Water Board's CEQA regulations (23 Cal. Code Regs. § 3777.). The substitute environmental documents include the TMDL Staff Report and several of its attachments, including 1) this Resolution and the Basin Plan Amendment Language (Attachment 1 of the Staff Report); 2) "Total Maximum Daily Load for Fecal Coliform for the Lower Salinas River Watershed, Monterey County, California" (Attachment 2 of the Staff Report); 3) the CEQA Substitute Document with environmental checklist (Attachment 3 of the Staff Report); and 4) the comments and responses to comments (Attachment 6 of the Staff Report). The Staff Report also includes the Notice of Public Hearing/Notice of Filing (Attachment 4) and the Scientific Peer Review Comment (Attachment 5). The project itself is the establishment of TMDLs for fecal coliform in the Lower Salinas River Watershed. The Water Board exercises discretion in assigning waste load allocations and load allocations, determining the program of implementation, and setting various milestones in achieving the water quality standards. The CEQA checklist and other portions of the substitute environmental documents contain significant analysis and numerous findings related to impacts and mitigation measures.
17. A CEQA Scoping meeting was conducted on June 20, 2007, at the Salinas Agricultural Commissioner's Office, 1428 Abbot Street, Salinas. A notice of the CEQA Scoping meeting was sent to interested persons on May 23, 2007. The notice included a background of the project, the project purpose, a meeting schedule, and directions for obtaining more detailed information through the Central Coast Water Board website; the notice and project summary were available at the website or by requesting hard copies via telephone.
18. Public Resources Code section 21159 provides that an agency shall perform, at the time of the adoption of a rule or regulation requiring the installation of pollution control equipment, or a performance standard or treatment requirement, an environmental analysis of the reasonably foreseeable methods of compliance, and an analysis of the reasonably foreseeable environmental impacts of the methods of compliance, an analysis of reasonably foreseeable mitigation measures to lessen the adverse environmental impacts, and an analysis of reasonably foreseeable alternative means of compliance with the rule or regulation that would have less significant adverse impacts. Section 21159(c) requires that the environmental analysis take into account a reasonable range of environmental, economic, and technical factors; population and geographic areas; and specific sites. The Staff Report prepared for this Basin Plan amendment, in particular the CEQA Substitute Document Report (Attachment 3), provides the environmental analysis required by Public Resources Code section 21159 and is hereby incorporated as findings in this Resolution.
19. In preparing the substitute environmental documents, the Central Coast Water Board has considered the requirements of Public Resources Code section 21159 and California Code of Regulations, title 14, section 15187, and intends those documents to serve as a Tier 1 environmental review. This analysis is not intended to be an exhaustive analysis of every conceivable impact, but an analysis of the reasonably foreseeable consequences of the adoption of this regulation, from a programmatic perspective. Compliance obligations will be undertaken directly by public agencies that may have their own obligations under CEQA. Project level impacts may need to be considered in any subsequent environmental analysis performed by other public agencies, pursuant to Public Resources Code section 21159.2. To

the extent applicable, this Tier 1 substitute environmental document may be used to satisfy subsequent CEQA obligations of those agencies.

20. Consistent with the Water Board's substantive obligations under CEQA, the substitute environmental documents do not engage in speculation or conjecture, and only consider the reasonably foreseeable environmental impacts, including those relating to the methods of compliance, reasonably foreseeable feasible mitigation measures to reduce those impacts, and the reasonably foreseeable alternative means of compliance, which would avoid or reduce the identified impacts.
21. These proposed amendments will have a less-than-significant adverse effect on the environment. California Water Code section 13360 precludes the Regional Water Board from dictating the manner in which responsible agencies comply with any of the Regional Water Board's regulations or orders. When the agencies responsible for implementing these TMDLs determine how they will proceed, the agencies responsible for those parts of the project can and should incorporate such alternatives and mitigation into any subsequent projects or project approvals. These feasible alternatives and mitigation measures are described in more detail in the substitute environmental documents (14 Cal. Code Regs. § 15091(a)(2)).
22. From a program-level perspective, incorporation of the alternatives and mitigation measures outlined in the substitute environmental documents will foreseeably reduce impacts to no impact, or keep the impact at less-than-significant levels.
23. The CEQA Substitute Document Report (Staff Report Attachment 3) identifies mitigation approaches that should be considered at the project level.
24. The Central Coast Water Board will request that the State Water Board approve the Basin Plan amendments incorporating: (a) the TMDLs for fecal coliform in the Lower Salinas River Watershed, and (b) the Domestic Animal Waste Discharge Prohibition and the Human Fecal Material Discharge Prohibition applicable to the Lower Salinas River Watershed. The TMDLs and Implementation Program for the TMDLs, and Prohibitions, will become effective upon approval by the California Office of Administrative Law. The TMDLs must also be approved by the United States Environmental Protection Agency.
25. The amendments to the Basin Plan may have an effect on fish and wildlife. The Central Coast Water Board will, therefore, forward fee payments to the Department of Fish and Game under the California Fish and Game Code section 711.4.
26. The proposed amendments meet the "Necessity" standard of the Administrative Procedures Act, Government Code, section 11353, subdivision (b). As specified in Finding 13, federal regulations require that TMDLs be incorporated into the Water Quality Management Plan. The Central Coast Water Board's Basin Plan is the Central Coast Water Board's component of the Water Quality Management Plan, and the Basin Plan is how the Central Coast Water Board takes quasi-legislative planning actions. Moreover, the TMDL is a program of implementation for existing water quality objectives, and is, therefore, appropriately a component of the Basin Plan under the California Water Code, section 13242. The necessity of developing TMDLs is established in the TMDL staff report, the Clean Water Act section 303(d) list, and the data contained in the administrative record documenting the pathogen impairments of the Lower Salinas River Watershed. The necessity of adding the Prohibitions as implementation mechanisms to achieve the TMDL is established in the administrative record documenting the pathogen sources, the load allocations that responsible parties must meet to reduce or eliminate pathogen loading, and implementation strategies that comply with the NPS Policy.

27. On March 18, 2010, in Watsonville, California, the Central Coast Water Board held a public hearing and heard and considered all public comments and evidence in the record.

THEREFORE, be it resolved that:

1. Pursuant to sections 13240, 13241, 13242, 13243, and 13244 of the California Water Code, the Central Coast Water Board, after considering the entire record, including the oral testimony at the hearing, hereby adopts the amendment in "Attachment-Proposed Basin Plan Amendments."
2. The Executive Officer is directed to forward copies of the Basin Plan amendment to the State Board in accordance with the requirements of section 13245 of the California Water Code.
3. The Central Coast Water Board requests that the State Water Board approve the Basin Plan amendments in accordance with the requirements of sections 13245 and 13246 of the California Water Code and forward them to the California Office of Administrative Law and the USEPA for approval.
4. The Executive Officer is authorized to sign a Certificate of Fee Exemption or transmit payment of the applicable fee as may be required to the Resources Agency.
5. If, during the approval process, Central Coast Water Board staff, State Water Board staff, the State Water Board or the California Office of Administrative Law determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.
6. The environmental documents prepared by the Central Coast Water Board staff pursuant to Public Resources Code 21080.5 are hereby certified.

I, Roger W. Briggs, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of the resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region, on March 18, 2010.

Roger W. Briggs
Executive Officer

RESOLUTION NO. R3-2010-0017

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENTS

Revise the September 8, 1994 Basin Plan as follows:

AMENDMENT NO. 1. TOTAL MAXIMUM DAILY LOADS FOR FECAL COLIFORM IN LOWER SALINAS RIVER WATERSHED (INCLUDING LOWER SALINAS RIVER, OLD SALINAS RIVER, TEMBLADERO SLOUGH, SALINAS RECLAMATION CANAL, ALISAL CREEK, GABILAN CREEK, NATIVIDAD CREEK, SALINAS RIVER LAGOON (NORTH), SANTA RITA CREEK, QUAIL CREEK, CHUALAR CREEK, AND TOWNE CREEK).

Add the following to Chapter 4 after IX. L.:

IX. M. TOTAL MAXIMUM DAILY LOADS FOR FECAL COLIFORM IN LOWER SALINAS RIVER WATERSHED (INCLUDING LOWER SALINAS RIVER, OLD SALINAS RIVER, TEMBLADERO SLOUGH, SALINAS RECLAMATION CANAL, ALISAL CREEK, GABILAN CREEK, NATIVIDAD CREEK, SALINAS RIVER LAGOON (NORTH), SANTA RITA CREEK, QUAIL CREEK, CHUALAR CREEK, AND TOWNE CREEK)

The Regional Water Quality Control Board adopted these TMDLs on March 18, 2010. These TMDLs were approved by:

The State Water Resources Control Board on: _____ (date).

The California Office of Administrative Law on: _____ (date).

The U.S. Environmental Protection Agency on: _____ (date).

Problem Statement

The beneficial use of water contact recreation is not protected in the impaired reaches of the Lower Salinas River Watershed, including Lower Salinas River (from the Chualar River Road, downstream to the Salinas River Lagoon (North)), Old Salinas River, Tembladero Slough, Salinas Reclamation Canal, Alisal Creek, Gabilan Creek, Natividad Creek, Salinas River Lagoon (North), Santa Rita Creek, Quail Creek, Chualar Creek, and Towne Creek because fecal indicator bacteria concentrations exceed existing Basin Plan numeric water quality objectives and/or USEPA guidelines protecting this beneficial use. All reaches in these waterbodies are impaired.

The Ocean Plan and Basin Plan also contain Shellfish Harvesting (SHELL) and Non-contact Water Recreation (REC-2) water quality objectives. Waterbodies with SHELL beneficial use impaired by bacteria will be addressed in a separate TMDL project and/or standards action.

Numeric Target

The numeric targets used to develop the TMDLs and allocations are as follows:

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

The numeric target is equal to the water quality objective protecting the water contact recreation beneficial use (REC-1), as described in Chapter 3 of this Basin Plan. If this water quality objective protecting REC-1 is amended, the numeric target for this TMDL will be equal to the amended water quality objective.

Source Analysis

Salinas Reclamation Canal, Lower: 1) discharges from Municipal Separate Storm Sewer Systems (MS4s), 2) domestic animals/livestock discharges in areas that do not drain to MS4s, 3) illegal dumping, 4) homeless person/encampment discharges in areas that do not drain to MS4s, 5) sanitary sewer collection system leaks.

Reclamation Canal, Upper/Alisal Creek: 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) illegal dumping, 3) homeless person/encampment discharges in areas that do not drain to MS4s, 4) discharges from MS4s.

Old Salinas River: 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) illegal dumping, 3) discharges from MS4s.

Tembladero Slough: 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) discharges from MS4s, 3) illegal dumping, 4) sanitary sewer collection system leaks.

Santa Rita Creek: 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) discharges from MS4s, 3) illegal dumping, 4) homeless person/encampment discharges in areas that do not drain to MS4s, 5) sanitary sewer collection system leaks.

Salinas River Lagoon (North): 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) illegal dumping 3) discharges from MS4s.

Lower Salinas River: 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) discharges from MS4s, 3) illegal dumping.

Gabilan Creek: 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) discharges from MS4s, 3) illegal dumping, 4) homeless person/encampment discharges in areas that do not drain to MS4s, 5) sanitary sewer collection system leaks.

Natividad Creek: 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) discharges from MS4s, 3) illegal dumping, 4) homeless person/encampment discharges in areas that do not drain to MS4s, 5) sanitary sewer collection system leaks.

Quail Creek: 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) illegal dumping.

Chualar Creek: 1) Domestic animals/livestock discharges 1) in areas that do not drain to MS4s, 2) illegal dumping.

Towne Creek: 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) illegal dumping.

Natural uncontrollable sources of fecal coliform in the listed waterbodies are present and likely contributing to impairment at varying degrees by season and location.

TMDLs and Allocations

The TMDLs for all impaired waters of the Lower Salinas River, Old Salinas River, Tembladero Slough, Salinas Reclamation Canal, Alisal Creek, Gabilan Creek, Natividad Creek, Salinas River Lagoon (North), Santa Rita Creek, Quail Creek, Chualar Creek, and Towne Creek are set equal to the loading capacity of the waterbodies. They are concentration based TMDLs applicable to each day of all seasons and are set equal to the following:

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

The TMDLs are equal to the water quality objective protecting the water contact recreation beneficial use (REC-1), as described in Chapter 3 of this Basin Pln. If this water quality objective protecting REC-1 is amended, the TMDLs for the water bodies subject to the TMDLs will be equal to the amended water quality objective.

The allocations to responsible parties are shown in Table IX M-1.

Table IX M-1. Allocations and Responsible Parties

<u>WASTE LOAD ALLOCATIONS</u>		
<u>Waterbody</u>	<u>Party Responsible for Allocation (Source) NPDES/WDR number</u>	<u>Receiving Water Fecal Coliform (MPN/100mL)</u>
<u>Gabilan Creek¹, Santa Rita Creek³, Salinas Reclamation Canal⁴, Natividad Creek⁵, Lower Salinas River⁶</u>	<u>City of Salinas</u> <u>(Storm drain discharges to MS4s)</u> <u>Storm Water Permit</u> <u>NPDES No. CA00049981</u>	<u>Allocation-1</u>
<u>Gabilan Creek¹, Alisal Creek², Santa Rita Creek³, Salinas Reclamation Canal⁴, Natividad Creek⁵, Lower Salinas River⁶, Tembladero Slough⁷, Old Salinas River⁹, Salinas River Lagoon¹⁰</u>	<u>County of Monterey</u> <u>(Storm drain discharges to MS4s)</u> <u>Storm Water General Permit</u> <u>NPDES No. CAS000004</u>	<u>Allocation-1</u>
<u>Gabilan Creek¹, Santa Rita Creek³, Salinas Reclamation Canal⁴, Natividad Creek⁵</u>	<u>City of Salinas</u> <u>(Sanitary sewer collection system spills and leaks)</u> <u>Statewide General WDR for Sanitary Sewer Systems</u> <u>WQO No. 2006-0003</u>	<u>Allocation-2</u>
<u>Tembladero Slough⁷</u>	<u>Castroville Community Services District</u> <u>(Sanitary sewer collection system spills and leaks)</u> <u>Statewide General WDR for Sanitary Sewer Systems</u> <u>WQO No. 2006-0003</u>	<u>Allocation-2</u>

WASTE LOAD ALLOCATIONS		
<u>Waterbody</u>	<u>Party Responsible for Allocation (Source)</u> <u>NPDES/WDR number</u>	<u>Receiving Water Fecal Coliform (MPN/100mL)</u>
LOAD ALLOCATIONS		
<u>Waterbody</u>	<u>Responsible Party (Source)</u>	<u>Receiving Water Fecal Coliform (MPN/100mL)</u>
<u>All twelve impaired water bodies^a</u>	<u>Owners/operators of land used for/containing domestic animals/livestock</u> <u>(Domestic animals/livestock waste not draining to MS4s)</u>	<u>Allocation-1</u>
<u>Salinas Reclamation Canal, Alisal Creek, Santa Rita Creek, Gabilan Creek, Natividad Creek</u>	<u>Owners and/or Operators of Land that have Homeless Persons/Encampments</u> <u>(Discharges From Homeless Persons/Encampments Not Regulated by a Permit for Storm Water Discharges)</u>	<u>Allocation-2</u>
<u>All twelve impaired water bodies^a</u>	<u>Owners/operators of land used for/containing illegal dumping</u> <u>(Discharges from illegal dumping Not Regulated by a Permit for Storm Water Discharges)</u>	<u>Allocation-1</u>
<u>All twelve impaired water bodies^a</u>	<u>No responsible party</u> <u>(Natural sources)</u>	<u>Allocation-1</u>
<u>Wasteload/Load Allocation 1 (Equal to the TMDL):Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN/100mL, nor shall more than ten percent of total samples during any 30-day period exceed 400 MPN/100 mL.</u>		
<u>Wasteload/Load Allocation 2: Allocation of zero; no fecal coliform bacteria load originating from human sources of fecal material is allowed.</u>		

^a All twelve impaired water bodies: Lower Salinas River, Old Salinas River, Tembladero Slough, Salinas Reclamation Canal, Alisal Creek, Gabilan Creek , Natividad Creek, Salinas River Lagoon (north), Chualar Creek, Santa Rita Creek, Quail Creek, Towne Creek.

¹ Gabilan Creek: all reaches and its tributaries, which includes from the confluence with Carr Lake to the uppermost reaches of the waterbody, including but not limited to Towne Creek¹², Mudd Creek, and un-named creeks tributary to these.

² Alisal Creek : all reaches and its tributaries, which includes from the confluence with the Salinas Reclamation Canal to the uppermost reach of the waterbody.

³Santa Rita Creek: all reaches and its tributaries, which includes from the confluence with the Salinas Reclamation Canal to the uppermost reach of the waterbody.

⁴Salinas Reclamation Canal: all reaches and tributaries, which includes from confluence with Tembladero Slough, to upstream confluence with Carr Lake and Alisal Creek.

⁵Natividad Creek: all reaches and its tributaries, which includes from the confluence with Carr Lake to the uppermost reach of the waterbody.

⁶Lower Salinas River: all reaches and tributaries from Salinas River at Chualar River Road downstream to its confluence with the Salinas River Lagoon at Monte Road.

⁷Tembladero Slough: which includes all reaches and tributaries from the confluence with the Salinas Reclamation Canal downstream to its confluence with the Old Salinas River.

⁸Quail Creek: which includes all reaches and its tributaries, from the confluence with the Salinas River to the uppermost reach of the waterbody.

⁹Old Salinas River: all reaches and tributaries from the slide gate at the head of the Old Salinas River adjacent to Mulligan Hill, downstream to Potrero Road.

¹⁰Salinas River Lagoon (North): From Monte Road downstream to its confluence with Monterey Bay.

¹¹Chualar Creek: which includes all reaches and its tributaries, from the confluence with the Salinas River to the uppermost reach of the waterbody.

¹²Towne Creek: all reaches and tributaries.

The parties responsible for the allocation to controllable sources are not responsible for the allocation to natural sources.

The TMDLs are considered achieved when the allocations assigned to all individual responsible parties are met or when the numeric targets are consistently met in the impaired reaches of the Lower Salinas River Watershed.

Margin of Safety

A margin of safety is incorporated implicitly in the TMDLs through conservative assumptions.

Implementation

STORM DRAIN DISCHARGES TO MS4S:

The Central Coast Water Board will address fecal indicator bacteria (FIB), i.e., fecal coliform and/or other indicators of pathogens, discharged from the City of Salinas's and the County of Monterey's municipal separate storm sewer systems (MS4s) by regulating the MS4 entities under the provisions of an individual municipal stormwater permit, or the State Water Resource Control Board's General Permit for the Discharges of Storm Water from Small Municipal Separate Storm Sewer Systems (General Permit). As enrollees under the an individual municipal stormwater permit or the General Permit, they must develop and implement a Storm Water Management Plan (SWMP) that controls urban runoff discharges into and from their MS4s. To address the MS4 TMDL wasteload allocations, the Central Coast Water Board will require the enrollees to specifically target FIB in urban runoff through incorporation of a Wasteload Allocation Attainment Program in their SWMPs.

The Central Coast Water Board will require the Wasteload Allocation Attainment Program to include descriptions of the actions that will be taken by the MS4 entity to attain the TMDL wasteload allocations, and specifically address:

1. Development of an implementation and assessment strategy;
2. Source identification and prioritization;
3. Best management practice identification, prioritization, implementation schedule, analysis, and effectiveness assessment;
4. Monitoring program development and implementation;
5. Reporting; including evaluation whether current best management practices are progressing towards achieving the wasteload allocations within thirteen years of the date that the TMDLs are approved by the Office of Administrative Law;
6. Coordination with stakeholders; and
7. Other pertinent factors.

The Wasteload Allocation Attainment Program will be required by the Central Coast Water Board to address each of these TMDLs that occur within the MS4 entities' jurisdictions.

The Central Coast Water Board will require the Wasteload Allocation Attainment Program to be submitted at one of the following milestones, whichever occurs first:

1. Within one year of approval of the TMDLs by the Office of Administrative Law;

2. When required by any other Water Board-issued storm water requirements (e.g., when the Phase II Municipal Storm Water Permit is renewed).

For MS4 entities that are enrolled under an individual municipal stormwater permit or the General Permit at the time of Wasteload Allocation Attainment Program submittal, the Wasteload Allocation Attainment Program must be incorporated into the SWMPs when they are submitted. For an MS4 that is not enrolled under the General Permit at the time of Wasteload Allocation Attainment Program submittal, the Wasteload Allocation Attainment Program must be incorporated into the SWMP when the SWMP is approved by the Central Coast Water Board.

The Executive Officer, pursuant to delegated authority, or the Central Coast Water Board will require information that demonstrates implementation of the actions described above, pursuant to applicable sections of the California Water Code and/or pursuant to authorities provided in the General Permit for storm water discharges.

DOMESTIC ANIMAL/LIVESTOCK DISCHARGES:

Owners and/or operators of lands containing domestic animals (including pets, farm animals, and livestock) in the Lower Salinas River watershed must comply with the Domestic Animal Waste Discharge Prohibition; compliance with the Domestic Animal Waste Discharge Prohibition is intended to result in compliance with the load allocation for these TMDLs.

Within three years of approval of these TMDLs by the Office of Administrative Law, the Executive Officer will notify owners and/or operators of lands used for/containing domestic animals of the requirement to comply with the Domestic Animal Waste Discharge Prohibition. In the notification, the Executive Officer will describe the options that owners/operators of lands containing domestic animals have for demonstrating compliance with the Domestic Animal Waste Discharge Prohibition. Within six months of notification by the Executive Officer pursuant to California Water Code section 13261 or 13267, owners/operators of lands containing domestic animals will be required to submit one the following to the Water Board:

- 1) Sufficient evidence to demonstrate that the owner/operator of lands containing domestic animals is and will continue to be in compliance with the Domestic Animal Waste Discharge Prohibition; Such evidence could include documentation submitted by the owner/operator to the Executive Officer that the owner/operator is not causing waste to be discharged to the Creek resulting in violations of the Prohibition, or
- 2) A plan for compliance with the Domestic Animal Waste Discharge Prohibition. Such a plan must include a list of specific management practices that will be implemented to control discharges containing fecal material from domestic animals. The plan must also describe how implementing the identified management practices are likely to progressively achieve the load allocations to domestic animals, with the ultimate goal achieving the load allocations no later than thirteen years after Office of Administrative Law approval of these TMDLs. The plan must include monitoring and reporting to the Central Coast Water Board, demonstrating the progressive progress toward achieving load allocations for discharges from domestic animals, and a self-assessment of this progress. The plan may be developed by an individual discharger or by or for a coalition of dischargers in cooperation with a third-party representative, organization, or government agency acting as the agents of owners/operators of lands containing domestic animals, or
- 3) A Report of Waste Discharge pursuant to California Water Code Section 13260 (as an application for waste discharge requirements).

HOMELESS PERSONS/ENCAMPMENT DISCHARGES

Owners of land that contain homeless persons and/or homeless encampments in the Lower Salinas River watershed must comply with the Human Fecal Material Discharge Prohibition.

Owners of land with homeless persons must demonstrate to the satisfaction of the Executive Officer or the Water Board that they are in compliance with the Human Fecal Material Discharge Prohibition; compliance with the Human Fecal Material Discharge Prohibition implies compliance with the load allocation for these TMDLs.

Within three years of approval of these TMDLs by the Office of Administrative Law, the Executive Officer will notify owners of lands containing homeless persons of the requirement to comply with the Human Fecal Material Discharge Prohibition. In his notification, the Executive Officer will also describe owners' options for demonstrating compliance with the Human Fecal Material Discharge Prohibition; pursuant to California Water Code 13267 and within six months of the notification by the Executive Officer, owners will be required to submit the following for approval by the Executive Officer or the Water Board:

- 1) Clear evidence that the owner/operator is and will continue to be in compliance with the Human Fecal Material Discharge Prohibition; clear evidence could be documentation submitted by the owner to the Executive Officer validating current and continued compliance with the Prohibition, or
- 2) A plan for compliance with the Human Fecal Material Discharge Prohibition. Such a plan must include a list of specific management practices that will be implemented to control discharges containing fecal material from homeless persons. The Plan must also describe how implementing the identified management practices is likely to progressively achieve the load allocation for homeless persons, with the ultimate goal achieving the load allocation no later than three years from the date of the Executive Officer's notification to the owner requiring compliance. The plan must include monitoring and reporting to the Central Coast Water Board, demonstrating the progress towards achieving load allocations for discharges from homeless persons, and self-assessment of this progress, or
- 3) Submittal of a Report of Waste Discharge pursuant to California Water Code Section 13260 (as an application for waste discharge requirements).

SANITARY SEWER COLLECTION SYSTEM LEAKS:

Entities with jurisdiction over sewer collection systems can demonstrate compliance with these TMDL load allocations through waste discharge requirements and/or NPDES permits.

The City of Salinas, the Castroville Community Services District, and the California Utilities Service Wastewater Treatment Plant must continue to implement their Collection System Management Plans as required by waste discharge requirements.

In addition, the City of Salinas, the Castroville Community Services District, and the California Utilities Service Wastewater Treatment Plant (herein referred to as sanitary collection system jurisdictions) are required to improve maintenance of their sewage collection systems, including identification, correction, and prevention of sewage leaks in portions of the collection systems that run through, or adjacent to, impaired surface waters or their tributaries within the Lower Salinas River Watershed.

To this end, within six months following approval of these TMDLs by the Office of Administrative Law, the Executive Officer will issue letters to sanitary collection system jurisdictions pursuant to Section 13267 of the California Water Code requiring: 1) submittal within one year of approval of

these TMDLs by the Office of Administrative Law a technical report that describes how and when the sanitary collection system jurisdictions will conduct improved collection system maintenance in portions of the collection system most likely to affect impaired surface water bodies, with the end result being compliance with its TMDL allocation, 2) stream monitoring for fecal coliform or another fecal indicator bacteria and reporting of these monitoring activities, and 3) annual reporting of self-assessment as to whether the sanitary collection system jurisdictions are in compliance with the TMDL allocation.

ILLEGAL DUMPING:

Owners of lands where illegal dumping occurs are ultimately responsible for achieving the allocation for pathogen loading resulting from illegal dumping. However, the County of Monterey and the City of Salinas currently have programs and ordinances to address illegal dumping, and have been proactive in their effort to control these discharges. Illegal dumping is a violation of California Law and Monterey County Code (California Penal Code 374.3(A) and Monterey County Code, Chapter 10.41.040(A), respectively). The County of Monterey Health Department responds to illegal dumping complaints, prepares reports of investigation for the District Attorney's Office, engages in public outreach and education, and participates in programs that focus on minimizing illegal dumping. The County of Monterey and the City of Salinas actively prosecute individuals who are caught illegally dumping. The City of Salinas has devoted resources to watershed cleanup efforts to remove litter from City creeks. Both the City and the County have reportedly established telephone hotlines for citizens to report illegal dumping and they provide financial rewards for reporting parties.

The Executive Officer anticipates that existing programs and ordinances will achieve the allocation; therefore, no new regulatory mechanisms are warranted. Compliance with the allocation may be demonstrated through effective and proactive implementation and enforcement of existing regulatory authorities. The Executive Officer will assess progress and make changes if necessary during TMDL implementation tracking to achieve allocations for pathogen loading from illegal dumping.

Tracking and Evaluation

Every three years, beginning three years after TMDLs are approved by the Office of Administrative Law, the Central Coast Water Board will perform a review of implementation actions, monitoring results, and evaluations submitted by responsible parties of their progress toward achieving their allocations. The Central Coast Water Board will use annual reports, nonpoint source pollution control implementation programs, evaluations submitted by responsible parties, and other available information to determine progress toward implementing required actions and achieving the allocations and the numeric target.

Responsible parties will continue monitoring and reporting according to this plan for at least three years, at which time the Central Coast Water Board will determine the need for continuing or otherwise modifying the monitoring requirements. Responsible parties may also demonstrate that although water quality objectives are not being achieved in receiving waters, controllable sources of pathogens are not contributing to the exceedance. If this is the case, the Central Coast Water Board may re-evaluate the numeric target and allocations. For example, the Central Coast Water Board may pursue and approve a site-specific objective. The site-specific objective would be based on evidence that natural, or background sources alone were the cause of exceedances of the Basin Plan water quality objective for fecal indicator bacteria.

Three-year reviews will continue until the water quality objectives are achieved. The compliance schedule for achieving this TMDL numeric target is 13 years after the date of approval by the Office of Administrative Law.

AMENDMENT NO. 2. Revise the September 8, 1994 Basin Plan, Chapter Five, as follows:

Amend Chapter Five, section IV.B. as follows:

Add the following watershed to the end of the bulleted list of applicable areas of the Domestic Animal Waste Discharge Prohibition:

- Lower Salinas River Watershed (the watershed area of the Salinas River from Gonzales Road downstream to its confluence with Moss Landing Harbor)

AMENDMENT NO. 3. Revise the September 8, 1994 Basin Plan, Chapter Five, as follows:

Amend Chapter Five, section IV.B. as follows:

Add the following watershed to the end of the bulleted list of applicable areas of the Human Fecal Material Discharge Prohibition:

- Lower Salinas River Watershed (the watershed area of the Salinas River from Gonzales Road downstream to its confluence with Moss Landing Harbor)

**CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, Ca 93401-7906**

RESOLUTION NO. R3-2010-0017

**AMENDING THE WATER QUALITY CONTROL PLAN FOR THE CENTRAL COAST BASIN
TO (1) ADOPT TOTAL MAXIMUM DAILY LOADS FOR FECAL COLIFORM IN LOWER
SALINAS RIVER WATERSHED, (2) ADD THE LOWER SALINAS RIVER WATERSHED TO
THE DOMESTIC ANIMAL WASTE DISCHARGE PROHIBITION; AND (3) ADD THE LOWER
SALINAS RIVER WATERSHED TO THE HUMAN FECAL MATERIAL DISCHARGE
PROHIBITION**

The Regional Water Quality Control Board, Central Coast Region (Central Coast Water Board) finds:

1. The Central Coast Water Board adopted the second edition of the Water Quality Control Plan for the Central Coastal Basin (Basin Plan), on September 8, 1994. The Basin Plan designates beneficial uses and water quality objectives, sets forth implementation to achieve water quality objectives addressing point source and nonpoint source discharges, describes prohibitions, and incorporates statewide plans and policies.
2. The Central Coast Water Board periodically revises and amends the Basin Plan. The Central Coast Water Board has determined the Basin Plan requires further revision and amendment to: (a) incorporate Total Maximum Daily Loads (TMDLs) and an Implementation Plan for Fecal Coliform in Lower Salinas River Watershed including Lower Salinas River, Old Salinas River, Tembladero Slough, Salinas Reclamation Canal, Alisal Creek, Gabilan Creek, Natividad Creek, Salinas River Lagoon (North), Santa Rita Creek, Quail Creek, Chualar Creek, and Towne Creek; (b) add the Lower Salinas River Watershed to the Domestic Animal Waste Discharge Prohibition; and (c) add the Lower Salinas River Watershed to the Human Fecal Material Discharge Prohibition.
3. The Central Coast Water Board proposes to amend the Basin Plan by inserting amendments into the following sections (listed in order of Basin Plan contents):
 - a. Chapter Four, section IX (Total Maximum Daily Loads)
 - b. Chapter Five, section IV.B. (Discharge Prohibitions)
4. On May 20, 2004, the State Water Resources Control Board (State Water Board) adopted the *Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program* (NPS Policy). The NPS Policy requires the Water Boards to regulate all nonpoint sources of pollution using the administrative permitting authorities provided by the Porter-Cologne Water Quality Control Act. The NPS Policy allows Regional Water Boards to regulate nonpoint source discharges with waste discharge requirements, waivers of waste discharge requirements, or Basin Plan prohibitions.
5. The Lower Salinas River, Old Salinas River, Tembladero Slough, Salinas Reclamation Canal, Alisal Creek, and Gabilan Creek are listed on Clean Water Act 303(d) list as impaired due to pathogens. The Lower Salinas River, Old Salinas River, Tembladero Slough, Salinas Reclamation Canal, Alisal Creek, and Gabilan Creek do not meet the Basin Plan water quality objectives for fecal coliform. This Resolution establishes TMDLs and associated allocations for these listed water bodies.

6. The Salinas River Lagoon (North), Santa Rita Creek, Natividad Creek, Chualar Creek, Quail Creek and Towne Creek are located in the Lower Salinas River Watershed, are not on the Clean Water Act 303(d) list of impaired waters for pathogens, and do not meet the Basin Plan water quality objectives for fecal coliform and/or USEPA water quality criteria for *E. coli*. The Salinas River Lagoon (North), Santa Rita Creek, Natividad Creek, Chualar Creek, Quail Creek and Towne Creek are impaired due to pathogens. Therefore, this Resolution establishes TMDLs and associated allocations for these impaired water bodies.
7. The Central Coast Water Board's goal for establishing TMDLs in the Lower Salinas River Watershed is to rectify the impairment due to fecal coliform, thereby providing support for the designated beneficial uses of contact and non-contact water recreation.
8. The Salinas River is the receiving water for approximately 4,600 square miles of land. Depending upon seasonal flow conditions, the Salinas River may flow directly into Monterey Bay, or can flow into Moss Landing Harbor via the Old Salinas River. The Lower Salinas River watershed is the lower segment of the Salinas River, comprising approximately 350 square miles, from Gonzales Road near the city of Gonzales to Monterey Bay. Chualar Creek and El Toro Creek flow to the Lower Salinas River and Old Salinas River. Alisal Creek, Gabilan Creek, Towne Creek, Santa Rita Creek, and Salinas Reclamation Canal flow to Tembladero Slough and Old Salinas River.
9. The elements of a TMDL are described in 40 CFR 130.2 and 130.7, section 303(d) of the Clean Water Act, and USEPA guidance documents. A TMDL is defined as "the sum of individual waste load allocations for point sources and load allocations for nonpoint sources and natural background" (40 CFR 130.2). The Central Coast Water Board has determined that the TMDLs for pathogens in the Lower Salinas River Watershed are set at levels necessary to attain and maintain the applicable numeric water quality objectives taking into account seasonal variations and any lack of knowledge concerning the relationship between effluent limitations and water quality (40 CFR 130.7 (c) (1)). The regulations in 40 CFR 130.7 also state that TMDLs shall take into account critical conditions for stream flow, loading, and water quality parameters. TMDLs are often expressed as a mass load of the pollutant but can be expressed as a unit of concentration if appropriate (40 CFR 130.2(i)). Expressing these TMDLs as units of concentration is appropriate because an existing concentration-based water quality objective is used as the basis for the TMDL numeric target and attaining that concentration-based water quality objective will result in protection of the beneficial uses.
10. Upon establishment of TMDLs by the State or USEPA, the State is required to incorporate the TMDLs, along with appropriate implementation measures, into the State Water Quality Management Plan (40 CFR 130.6(c)(1) and 130.7; and California Water Code sections 13050(j) and 13242). The Basin Plan and applicable statewide plans serve as the State Water Quality Management Plan governing the watersheds under the jurisdiction of the Central Coast Water Board.
11. The Central Coast Water Board may specify certain conditions or areas where the discharge of waste, or certain types of waste, will not be permitted pursuant to California Water Code section 13243 (prohibitions). This Basin Plan amendment establishes the Human Fecal Material Discharge Prohibition and the Domestic Animal Waste Discharge Prohibition for discharges in the Lower Salinas River Watershed (Prohibitions). The Implementation Plan for the TMDLs for the Lower Salinas River Watershed requires compliance with the Human Fecal Material Discharge Prohibition and the Domestic Animal Waste Discharge Prohibition for discharges in the Lower Salinas River Watershed. Supporting documentation for adding the Lower Salinas River Watershed to the above-named prohibitions is provided in the Final

Project Reports for Total Maximum Daily Loads for Fecal Coliform in the Lower Salinas River Watershed, including Lower Salinas River, Old Salinas River, Tembladero Slough, Salinas Reclamation Canal, Alisal Creek, Gabilan Creek, Natividad Creek, Salinas River Lagoon (North), Santa Rita Creek, Quail Creek, Chualar Creek, and Towne Creek. Consistent with California Water Code section 13244, the Central Coast Water Board complied with public notice and hearing requirements for adding the Lower Salinas River Watershed to the Human Fecal Material Discharge and the Domestic Animal Waste Discharge Prohibitions

12. Pursuant to California Water Code section 13241, the Central Coast Water Board must consider several factors in developing this Basin Plan amendment, which are evaluated as set forth in the substitute environmental documents for this project. Based on the information provided in the substitute environmental documents, the Central Coast Water Board concludes the following:
 - a. The Prohibitions and the TMDLs will protect present and probable future beneficial uses and prevent nuisance.
 - b. Environmental characteristics of the waterbodies will be protected.
 - c. Improved water quality conditions can reasonably be achieved through the coordinated management of all controllable factors that affect water quality in the area, as provided in the Implementation Plan, including the Prohibitions.
 - d. Economic considerations, including reasonably foreseeable means of compliance and the reasonably foreseeable costs of those means of compliance, have been considered.
 - e. Consideration of the need for developing housing within the region is not relevant to this action.
 - f. Consideration of the need to develop and use recycled water is not relevant to this action.
13. Central Coast Water Board staff also submitted the Project Report for the TMDLs to an external scientific review panel in March 2008. Water Board staff received comments from the panel. Central Coast Water Board staff edited the Project Report or provided a written response that explained the basis for not incorporating the comments, or the comments did not result in any changes to the proposed Basin Plan Amendments. The TMDLs and Implementation Program are based on sound scientific knowledge, methods, and practices in accordance with Health & Safety Code section 57004.
14. Central Coast Water Board staff implemented a process to inform interested persons and the public about the TMDLs and Prohibitions. Central Coast Water Board staff's efforts to inform the public and solicit comment included a public meeting with interested parties and a public notice and comment period. Public notice of the amendment to the Basin Plan provided the public a 45-day public comment period preceding the Central Coast Water Board hearing. Notice of public hearing was given by advertising in a newspaper of general circulation within the Region and by mailing a copy of the notice to all persons requesting such notice and applicable government agencies. Relevant documents and notices were also made available on the Central Coast Water Board website. Central Coast Water Board staff responded to oral and written comments received from the public. All public comments were considered.
15. Adoption of these TMDLs and Basin Plan amendments will not result in any degradation of water quality; in fact, they are designed to improve water quality. As such, these TMDLs and basin plan amendments comply with all requirements of both State and Federal anti-degradation requirements (State Board Resolution 68-16 "Statement of Policy with Respect to Maintaining High Quality of Waters in California, and 40CFR 131.12

16. Pursuant to Public Resources Code section 21080.5, the Resources Agency has approved the Regional Water Boards' basin planning process as a "certified regulatory program" that adequately satisfies the California Environmental Quality Act (CEQA) (Public Resources Code, Section 21000 et seq.) requirements for preparing environmental documents (14 Cal. Code Regs. §15251(g); 23 Cal. Code Regs. § 3782.). Central Coast Water Board staff has prepared "substitute environmental documents" for this project that contain the required environmental documentation as set forth in the State Water Board's CEQA regulations (23 Cal. Code Regs. § 3777.). The substitute environmental documents include the TMDL Staff Report and several of its attachments, including 1) this Resolution and the Basin Plan Amendment Language (Attachment 1 of the Staff Report); 2) "Total Maximum Daily Load for Fecal Coliform for the Lower Salinas River Watershed, Monterey County, California" (Attachment 2 of the Staff Report); 3) the CEQA Substitute Document with environmental checklist (Attachment 3 of the Staff Report); and 4) the comments and responses to comments (Attachment 6 of the Staff Report). The Staff Report also includes the Notice of Public Hearing/Notice of Filing (Attachment 4) and the Scientific Peer Review Comment (Attachment 5). The project itself is the establishment of TMDLs for fecal coliform in the Lower Salinas River Watershed. The Water Board exercises discretion in assigning waste load allocations and load allocations, determining the program of implementation, and setting various milestones in achieving the water quality standards. The CEQA checklist and other portions of the substitute environmental documents contain significant analysis and numerous findings related to impacts and mitigation measures.
17. A CEQA Scoping meeting was conducted on June 20, 2007, at the Salinas Agricultural Commissioner's Office, 1428 Abbot Street, Salinas. A notice of the CEQA Scoping meeting was sent to interested persons on May 23, 2007. The notice included a background of the project, the project purpose, a meeting schedule, and directions for obtaining more detailed information through the Central Coast Water Board website; the notice and project summary were available at the website or by requesting hard copies via telephone.
18. Public Resources Code section 21159 provides that an agency shall perform, at the time of the adoption of a rule or regulation requiring the installation of pollution control equipment, or a performance standard or treatment requirement, an environmental analysis of the reasonably foreseeable methods of compliance, and an analysis of the reasonably foreseeable environmental impacts of the methods of compliance, an analysis of reasonably foreseeable mitigation measures to lessen the adverse environmental impacts, and an analysis of reasonably foreseeable alternative means of compliance with the rule or regulation that would have less significant adverse impacts. Section 21159(c) requires that the environmental analysis take into account a reasonable range of environmental, economic, and technical factors; population and geographic areas; and specific sites. The Staff Report prepared for this Basin Plan amendment, in particular the CEQA Substitute Document Report (Attachment 3), provides the environmental analysis required by Public Resources Code section 21159 and is hereby incorporated as findings in this Resolution.
19. In preparing the substitute environmental documents, the Central Coast Water Board has considered the requirements of Public Resources Code section 21159 and California Code of Regulations, title 14, section 15187, and intends those documents to serve as a Tier 1 environmental review. This analysis is not intended to be an exhaustive analysis of every conceivable impact, but an analysis of the reasonably foreseeable consequences of the adoption of this regulation, from a programmatic perspective. Compliance obligations will be undertaken directly by public agencies that may have their own obligations under CEQA. Project level impacts may need to be considered in any subsequent environmental analysis performed by other public agencies, pursuant to Public Resources Code section 21159.2. To

the extent applicable, this Tier 1 substitute environmental document may be used to satisfy subsequent CEQA obligations of those agencies.

20. Consistent with the Water Board's substantive obligations under CEQA, the substitute environmental documents do not engage in speculation or conjecture, and only consider the reasonably foreseeable environmental impacts, including those relating to the methods of compliance, reasonably foreseeable feasible mitigation measures to reduce those impacts, and the reasonably foreseeable alternative means of compliance, which would avoid or reduce the identified impacts.
21. These proposed amendments will have a less-than-significant adverse effect on the environment. California Water Code section 13360 precludes the Regional Water Board from dictating the manner in which responsible agencies comply with any of the Regional Water Board's regulations or orders. When the agencies responsible for implementing these TMDLs determine how they will proceed, the agencies responsible for those parts of the project can and should incorporate such alternatives and mitigation into any subsequent projects or project approvals. These feasible alternatives and mitigation measures are described in more detail in the substitute environmental documents (14 Cal. Code Regs. § 15091(a)(2)).
22. From a program-level perspective, incorporation of the alternatives and mitigation measures outlined in the substitute environmental documents will foreseeably reduce impacts to no impact, or keep the impact at less-than-significant levels.
23. The CEQA Substitute Document Report (Staff Report Attachment 3) identifies mitigation approaches that should be considered at the project level.
24. The Central Coast Water Board will request that the State Water Board approve the Basin Plan amendments incorporating: (a) the TMDLs for fecal coliform in the Lower Salinas River Watershed, and (b) the Domestic Animal Waste Discharge Prohibition and the Human Fecal Material Discharge Prohibition applicable to the Lower Salinas River Watershed. The TMDLs and Implementation Program for the TMDLs, and Prohibitions, will become effective upon approval by the California Office of Administrative Law. The TMDLs must also be approved by the United States Environmental Protection Agency.
25. The amendments to the Basin Plan may have an effect on fish and wildlife. The Central Coast Water Board will, therefore, forward fee payments to the Department of Fish and Game under the California Fish and Game Code section 711.4.
26. The proposed amendments meet the "Necessity" standard of the Administrative Procedures Act, Government Code, section 11353, subdivision (b). As specified in Finding 13, federal regulations require that TMDLs be incorporated into the Water Quality Management Plan. The Central Coast Water Board's Basin Plan is the Central Coast Water Board's component of the Water Quality Management Plan, and the Basin Plan is how the Central Coast Water Board takes quasi-legislative planning actions. Moreover, the TMDL is a program of implementation for existing water quality objectives, and is, therefore, appropriately a component of the Basin Plan under the California Water Code, section 13242. The necessity of developing TMDLs is established in the TMDL staff report, the Clean Water Act section 303(d) list, and the data contained in the administrative record documenting the pathogen impairments of the Lower Salinas River Watershed. The necessity of adding the Prohibitions as implementation mechanisms to achieve the TMDL is established in the administrative record documenting the pathogen sources, the load allocations that responsible parties must meet to reduce or eliminate pathogen loading, and implementation strategies that comply with the NPS Policy.

27. Consistent with Water Code section 13141, the amendment includes an estimate of the total cost of implementation of the agricultural related portions of this TMDL and identifies potential sources of financing.
28. On September 2, 2010, in Watsonville, California, the Central Coast Water Board held a public hearing and heard and considered all public comments and evidence in the record.

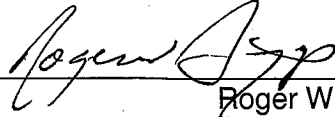

THEREFORE, be it resolved that:

1. Pursuant to sections 13240, 13241, 13242, 13243, and 13244 of the California Water Code, the Central Coast Water Board, after considering the entire record, including the oral testimony at the hearing, hereby adopts the amendment in "Attachment-Proposed Basin Plan Amendments."
2. The Executive Officer is directed to forward copies of the Basin Plan amendment to the State Board in accordance with the requirements of section 13245 of the California Water Code.
3. The Central Coast Water Board requests that the State Water Board approve the Basin Plan amendments in accordance with the requirements of sections 13245 and 13246 of the California Water Code and forward them to the California Office of Administrative Law and the USEPA for approval.
4. The Executive Officer is authorized to sign a Certificate of Fee Exemption or transmit payment of the applicable fee as may be required to the Resources Agency.
5. If, during the approval process, Central Coast Water Board staff, State Water Board staff, the State Water Board or the California Office of Administrative Law determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.
6. The environmental documents prepared by the Central Coast Water Board staff pursuant to Public Resources Code 21080.5 are hereby certified.

Resolution No. RB3-2010-0017
Attachment 1 to Staff Report

September 2, 2010

I, Roger W. Briggs, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of the resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region, on September 2, 2010.

Roger W. Briggs
Executive Officer

RESOLUTION NO. R3-2010-0017

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENTS

Revise the September 8, 1994 Basin Plan as follows:

AMENDMENT NO. 1. TOTAL MAXIMUM DAILY LOADS FOR FECAL COLIFORM IN LOWER SALINAS RIVER WATERSHED (INCLUDING LOWER SALINAS RIVER, OLD SALINAS RIVER, TEMBLADERO SLOUGH, SALINAS RECLAMATION CANAL, ALISAL CREEK, GABILAN CREEK, NATIVIDAD CREEK, SALINAS RIVER LAGOON (NORTH), SANTA RITA CREEK, QUAIL CREEK, CHUALAR CREEK, AND TOWNE CREEK).

Add the following to Chapter 4 after IX. M.:

IX. O. TOTAL MAXIMUM DAILY LOADS FOR FECAL COLIFORM IN LOWER SALINAS RIVER WATERSHED (INCLUDING LOWER SALINAS RIVER, OLD SALINAS RIVER, TEMBLADERO SLOUGH, SALINAS RECLAMATION CANAL, ALISAL CREEK, GABILAN CREEK, NATIVIDAD CREEK, SALINAS RIVER LAGOON (NORTH), SANTA RITA CREEK, QUAIL CREEK, CHUALAR CREEK, AND TOWNE CREEK)

The Regional Water Quality Control Board adopted these TMDLs on September 2, 2010. These TMDLs were approved by:

The State Water Resources Control Board on: _____ (date).

The California Office of Administrative Law on: _____ (date).

The U.S. Environmental Protection Agency on: _____ (date)

Problem Statement

The beneficial use of water contact recreation is not protected in the impaired reaches of the Lower Salinas River Watershed, including Lower Salinas River (from the Chualar River Road, downstream to the Salinas River Lagoon (North)), Old Salinas River, Tembladero Slough, Salinas Reclamation Canal, Alisal Creek, Gabilan Creek, Natividad Creek, Salinas River Lagoon (North), Santa Rita Creek, Quail Creek, Chualar Creek, and Towne Creek because fecal indicator bacteria concentrations exceed existing Basin Plan numeric water quality objectives and/or USEPA guidelines protecting this beneficial use. All reaches in these waterbodies are impaired.

The Ocean Plan and Basin Plan also contain Shellfish Harvesting (SHELL) and Non-contact Water Recreation (REC-2) water quality objectives. Waterbodies with SHELL beneficial use impaired by bacteria will be addressed in a separate TMDL project and/or standards action.

Numeric Target

The numeric targets used to develop the TMDLs and allocations are as follows:

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

The numeric target is equal to the water quality objective protecting the water contact recreation beneficial use (REC-1), as described in Chapter 3 of this Basin Plan. If this water quality objective protecting REC-1 is amended, the numeric target for this TMDL will be equal to the amended water quality objective.

Source Analysis

Salinas Reclamation Canal, Lower: 1) discharges from Municipal Separate Storm Sewer Systems (MS4s), 2) domestic animals/livestock discharges in areas that do not drain to MS4s, 3) illegal dumping, 4) homeless person/encampment discharges in areas that do not drain to MS4s, 5) sanitary sewer collection system leaks.

Reclamation Canal, Upper/Alisal Creek: 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) illegal dumping, 3) homeless person/encampment discharges in areas that do not drain to MS4s, 4) discharges from MS4s.

Old Salinas River: 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) illegal dumping, 3) discharges from MS4s.

Tembladero Slough: 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) discharges from MS4s, 3) illegal dumping, 4) sanitary sewer collection system leaks.

Santa Rita Creek: 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) discharges from MS4s, 3) illegal dumping, 4) homeless person/encampment discharges in areas that do not drain to MS4s, 5) sanitary sewer collection system leaks.

Salinas River Lagoon (North): 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) illegal dumping 3) discharges from MS4s.

Lower Salinas River: 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) discharges from MS4s, 3) illegal dumping.

Gabilan Creek: 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) discharges from MS4s, 3) illegal dumping, 4) homeless person/encampment discharges in areas that do not drain to MS4s, 5) sanitary sewer collection system leaks.

Natividad Creek: 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) discharges from MS4s, 3) illegal dumping, 4) homeless person/encampment discharges in areas that do not drain to MS4s, 5) sanitary sewer collection system leaks.

Quail Creek: 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) illegal dumping.

Chualar Creek: 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) illegal dumping.

Towne Creek: 1) Domestic animals/livestock discharges in areas that do not drain to MS4s, 2) illegal dumping.

Natural uncontrollable sources of fecal coliform in the listed waterbodies are present and likely contributing to impairment at varying degrees by season and location.

TMDLs and Allocations

The TMDLs for all impaired waters of the Lower Salinas River, Old Salinas River, Tembladero Slough, Salinas Reclamation Canal, Alisal Creek, Gabilan Creek, Natividad Creek, Salinas River Lagoon (North), Santa Rita Creek, Quail Creek, Chualar Creek, and Towne Creek are set equal to the loading capacity of the waterbodies. They are concentration based TMDLs applicable to each day of all seasons and are set equal to the following:

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

The TMDLs are equal to the water quality objective protecting the water contact recreation beneficial use (REC-1), as described in Chapter 3 of this Basin Plan. If this water quality objective protecting REC-1 is amended, the TMDLs for the water bodies subject to the TMDLs will be equal to the amended water quality objective.

The allocations to responsible parties are shown in Table IX M-1.

Table IX M-1. Allocations and Responsible Parties

<u>WASTE LOAD ALLOCATIONS</u>		
<u>Waterbody</u>	<u>Party Responsible for Allocation (Source) NPDES/WDR number</u>	<u>Receiving Water Fecal Coliform (MPN/100mL)</u>
Gabilan Creek ¹ , Santa Rita Creek ³ , Salinas Reclamation Canal ⁴ , Natividad Creek ⁵ , Lower Salinas River ⁶	City of Salinas (Storm drain discharges to MS4s) Storm Water Permit NPDES No. CA00049981	Allocation-1
Gabilan Creek ¹ , Alisal Creek ² , Santa Rita Creek ³ , Salinas Reclamation Canal ⁴ , Natividad Creek ⁵ , Lower Salinas River ⁶ , Tembladero Slough ⁷ , Old Salinas River ⁹ , Salinas River Lagoon ¹⁰	County of Monterey (Storm drain discharges to MS4s) Storm Water General Permit NPDES No. CAS000004	Allocation-1
Gabilan Creek ¹ , Santa Rita Creek ³ , Salinas Reclamation Canal ⁴ , Natividad Creek ⁵	City of Salinas (Sanitary sewer collection system spills and leaks) Statewide General WDR for Sanitary Sewer Systems WQO No. 2006-0003	Allocation-2
Tembladero Slough ⁷	Castroville Community Services District (Sanitary sewer collection system spills and leaks) Statewide General WDR for Sanitary Sewer Systems WQO No. 2006-0003	Allocation-2

WASTE LOAD ALLOCATIONS		
Waterbody	Party Responsible for Allocation (Source) NPDES/WDR number	Receiving Water Fecal Coliform (MPN/100mL)
LOAD ALLOCATIONS		
Waterbody	Responsible Party (Source)	Receiving Water Fecal Coliform (MPN/100mL)
All twelve impaired water bodies ^a	Owners/operators of land used for/containing domestic animals/livestock (Domestic animals/livestock waste not draining to MS4s)	Allocation-1
Salinas Reclamation Canal, Alisal Creek, Santa Rita Creek, Gabilan Creek, Natividad Creek	Owners and/or Operators of Land that have Homeless Persons/Encampments (Discharges From Homeless Persons/Encampments Not Regulated by a Permit for Storm Water Discharges)	Allocation-2
All twelve impaired water bodies ^a	Owners/operators of land used for/containing illegal dumping (Discharges from illegal dumping Not Regulated by a Permit for Storm Water Discharges)	Allocation-1
All twelve impaired water bodies ^a	No responsible party (Natural sources)	Allocation-1
<p>Wasteload/Load Allocation 1 (Equal to the TMDL):Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN/100mL, nor shall more than ten percent of total samples during any 30-day period exceed 400 MPN/100 mL.</p> <p>Wasteload/Load Allocation 2: Allocation of zero; no fecal coliform bacteria load originating from human sources of fecal material is allowed.</p>		

^a All twelve impaired water bodies: Lower Salinas River, Old Salinas River, Tembladero Slough, Salinas Reclamation Canal, Alisal Creek, Gabilan Creek , Natividad Creek, Salinas River Lagoon (north), Chualar Creek, Santa Rita Creek, Quail Creek, Towne Creek.

¹ Gabilan Creek: all reaches and its tributaries, which includes from the confluence with Carr Lake to the uppermost reaches of the waterbody, including but not limited to Towne Creek¹², Mudd Creek, and un-named creeks tributary to these.

² Alisal Creek : all reaches and its tributaries, which includes from the confluence with the Salinas Reclamation Canal to the uppermost reach of the waterbody.

³ Santa Rita Creek: all reaches and its tributaries, which includes from the confluence with the Salinas Reclamation Canal to the uppermost reach of the waterbody.

⁴ Salinas Reclamation Canal: all reaches and tributaries, which includes from confluence with Tembladero Slough, to upstream confluence with Carr Lake and Alisal Creek.

⁵ Natividad Creek: all reaches and its tributaries, which includes from the confluence with Carr Lake to the uppermost reach of the waterbody.

⁶ Lower Salinas River: all reaches and tributaries from Salinas River at Chualar River Road downstream to its confluence with the Salinas River Lagoon at Monte Road.

⁷ Tembladero Slough: which includes all reaches and tributaries from the confluence with the Salinas Reclamation Canal downstream to its confluence with the Old Salinas River.

⁸ Quail Creek: which includes all reaches and its tributaries, from the confluence with the Salinas River to the uppermost reach of the waterbody.

⁹ Old Salinas River: all reaches and tributaries from the slide gate at the head of the Old Salinas River adjacent to Mulligan Hill, downstream to Potrero Road.

¹⁰ Salinas River Lagoon (North): From Monte Road downstream to its confluence with Monterey Bay.

¹¹Chualar Creek: which includes all reaches and its tributaries, from the confluence with the Salinas River to the uppermost reach of the waterbody.

¹²Towne Creek: all reaches and tributaries.

The parties responsible for the allocation to controllable sources are not responsible for the allocation to natural sources.

The TMDLs are considered achieved when the allocations assigned to all individual responsible parties are met or when the numeric targets are consistently met in the impaired reaches of the Lower Salinas River Watershed.

Margin of Safety

A margin of safety is incorporated implicitly in the TMDLs through conservative assumptions.

Implementation

STORM DRAIN DISCHARGES TO MS4S:

The Central Coast Water Board will address fecal indicator bacteria (FIB), i.e., fecal coliform and/or other indicators of pathogens, discharged from the City of Salinas's and the County of Monterey's municipal separate storm sewer systems (MS4s) by regulating the MS4 entities under the provisions of an individual municipal stormwater permit, or the State Water Resource Control Board's General Permit for the Discharges of Storm Water from Small Municipal Separate Storm Sewer Systems (General Permit). As enrollees under the an individual municipal stormwater permit or the General Permit, they must develop and implement a Storm Water Management Plan (SWMP) that controls urban runoff discharges into and from their MS4s. To address the MS4 TMDL wasteload allocations, the Central Coast Water Board will require the enrollees to specifically target FIB in urban runoff through incorporation of a Wasteload Allocation Attainment Program in their SWMPs.

The Central Coast Water Board will require the Wasteload Allocation Attainment Program to include descriptions of the actions that will be taken by the MS4 entity to attain the TMDL wasteload allocations, and specifically address:

1. Development of an implementation and assessment strategy;
2. Source identification and prioritization;
3. Best management practice identification, prioritization, implementation schedule, analysis, and effectiveness assessment;
4. Monitoring program development and implementation;
5. Reporting; including evaluation whether current best management practices are progressing towards achieving the wasteload allocations within thirteen years of the date that the TMDLs are approved by the Office of Administrative Law;
6. Coordination with stakeholders; and
7. Other pertinent factors.

The Wasteload Allocation Attainment Program will be required by the Central Coast Water Board to address each of these TMDLs that occur within the MS4 entities' jurisdictions.

The Central Coast Water Board will require the Wasteload Allocation Attainment Program to be submitted at one of the following milestones, whichever occurs first:

1. Within one year of approval of the TMDLs by the Office of Administrative Law;

2. When required by any other Water Board-issued storm water requirements (e.g., when the Phase II Municipal Storm Water Permit is renewed).

For MS4 entities that are enrolled under an individual municipal stormwater permit or the General Permit at the time of Wasteload Allocation Attainment Program submittal, the Wasteload Allocation Attainment Program must be incorporated into the SWMPs when they are submitted. For an MS4 that is not enrolled under the General Permit at the time of Wasteload Allocation Attainment Program submittal, the Wasteload Allocation Attainment Program must be incorporated into the SWMP when the SWMP is approved by the Central Coast Water Board.

The Executive Officer, pursuant to delegated authority, or the Central Coast Water Board will require information that demonstrates implementation of the actions described above, pursuant to applicable sections of the California Water Code and/or pursuant to authorities provided in the General Permit for storm water discharges.

DOMESTIC ANIMAL/LIVESTOCK DISCHARGES:

Owners and/or operators of lands containing domestic animals (including pets, farm animals, and livestock) in the Lower Salinas River watershed must comply with the Domestic Animal Waste Discharge Prohibition; compliance with the Domestic Animal Waste Discharge Prohibition is intended to result in compliance with the load allocation for these TMDLs.

Within three years of approval of these TMDLs by the Office of Administrative Law, the Executive Officer will notify owners and/or operators of lands used for/containing domestic animals of the requirement to comply with the Domestic Animal Waste Discharge Prohibition. In the notification, the Executive Officer will describe the options that owners/operators of lands containing domestic animals have for demonstrating compliance with the Domestic Animal Waste Discharge Prohibition. Within six months of notification by the Executive Officer pursuant to California Water Code section 13261 or 13267, owners/operators of lands containing domestic animals will be required to submit one the following to the Water Board:

- 1) Sufficient evidence to demonstrate that the owner/operator of lands containing domestic animals is and will continue to be in compliance with the Domestic Animal Waste Discharge Prohibition; Such evidence could include documentation submitted by the owner/operator to the Executive Officer that the owner/operator is not causing waste to be discharged to the Creek resulting in violations of the Prohibition, or
- 2) A plan for compliance with the Domestic Animal Waste Discharge Prohibition. Such a plan must include a list of specific management practices that will be implemented to control discharges containing fecal material from domestic animals. The plan must also describe how implementing the identified management practices are likely to progressively achieve the load allocations to domestic animals, with the ultimate goal achieving the load allocations no later than thirteen years after Office of Administrative Law approval of these TMDLs. The plan must include monitoring and reporting to the Central Coast Water Board, demonstrating the progressive progress toward achieving load allocations for discharges from domestic animals, and a self-assessment of this progress. The plan may be developed by an individual discharger or by or for a coalition of dischargers in cooperation with a third-party representative, organization, or government agency acting as the agents of owners/operators of lands containing domestic animals, or
- 3) A Report of Waste Discharge pursuant to California Water Code Section 13260 (as an application for waste discharge requirements).

The estimated total median cost of TMDL implementation in the Lower Salinas River watershed to owners and operators of lands containing domestic animals is \$143,900. This estimated total median cost represents the collective total cost to implement the TMDL by all responsible parties over the 13 year timeline to achieve the TMDL. Sources of financing are described in the Basin Plan, Chapter 4, in section IX. M.

HOMELESS PERSONS/ENCAMPMENT DISCHARGES

Owners of land that contain homeless persons and/or homeless encampments in the Lower Salinas River watershed must comply with the Human Fecal Material Discharge Prohibition.

Owners of land with homeless persons must demonstrate to the satisfaction of the Executive Officer or the Water Board that they are in compliance with the Human Fecal Material Discharge Prohibition; compliance with the Human Fecal Material Discharge Prohibition implies compliance with the load allocation for these TMDLs.

The Executive Officer will notify owners of lands containing homeless persons of the requirement to comply with the Human Fecal Material Discharge Prohibition. In his notification, the Executive Officer will also describe owners' options for demonstrating compliance with the Human Fecal Material Discharge Prohibition; pursuant to California Water Code 13267 and within six months of the notification by the Executive Officer, owners will be required to submit the following for approval by the Executive Officer or the Water Board:

- 1) Clear evidence that the owner/operator is and will continue to be in compliance with the Human Fecal Material Discharge Prohibition; clear evidence could be documentation submitted by the owner to the Executive Officer validating current and continued compliance with the Prohibition, or
- 2) A plan for compliance with the Human Fecal Material Discharge Prohibition. Such a plan must include a list of specific management practices that will be implemented to control discharges containing fecal material from homeless persons. The Plan must also describe how implementing the identified management practices is likely to progressively achieve the load allocation for homeless persons, with the ultimate goal achieving the load allocation no later than three years from the date of the Executive Officer's notification to the owner requiring compliance. The plan must include monitoring and reporting to the Central Coast Water Board, demonstrating the progress towards achieving load allocations for discharges from homeless persons, and self-assessment of this progress, or
- 3) Submittal of a Report of Waste Discharge pursuant to California Water Code Section 13260 (as an application for waste discharge requirements).

In accordance with the Porter-Cologne Water Quality Control Act §13350 (c), responsible parties are shielded from civil liability in certain cases. Pursuant to Porter-Cologne Water Quality Control Act §13350(c)(4) and §13350(c)(5) there is no civil liability for the responsible party if the discharge is an intentional act of a third party, the effects of which could not have been prevented or avoided by the exercise of due care or foresight; or, any other circumstance or event which causes the discharge despite the exercise of every reasonable precaution to prevent or mitigate the discharge.

SANITARY SEWER COLLECTION SYSTEM LEAKS:

Entities with jurisdiction over sewer collection systems can demonstrate compliance with these TMDL load allocations through waste discharge requirements and/or NPDES permits.

The City of Salinas, the Castroville Community Services District, and the California Utilities Service Wastewater Treatment Plant must continue to implement their Collection System Management Plans as required by waste discharge requirements.

In addition, the City of Salinas, the Castroville Community Services District, and the California Utilities Service Wastewater Treatment Plant (herein referred to as sanitary collection system jurisdictions) are required to improve maintenance of their sewage collection systems, including identification, correction, and prevention of sewage leaks in portions of the collection systems that run through, or adjacent to, impaired surface waters or their tributaries within the Lower Salinas River Watershed.

To this end, within six months following approval of these TMDLs by the Office of Administrative Law, the Executive Officer will issue letters to sanitary collection system jurisdictions pursuant to Section 13267 of the California Water Code requiring: 1) submittal within one year of approval of these TMDLs by the Office of Administrative Law a technical report that describes how and when the sanitary collection system jurisdictions will conduct improved collection system maintenance in portions of the collection system most likely to affect impaired surface water bodies, with the end result being compliance with its TMDL allocation, 2) stream monitoring for fecal coliform or another fecal indicator bacteria and reporting of these monitoring activities, and 3) annual reporting of self-assessment as to whether the sanitary collection system jurisdictions are in compliance with the TMDL allocation.

ILLEGAL DUMPING:

Owners of lands where illegal dumping occurs are ultimately responsible for achieving the allocation for pathogen loading resulting from illegal dumping. However, the County of Monterey and the City of Salinas currently have programs and ordinances to address illegal dumping, and have been proactive in their effort to control these discharges. Illegal dumping is a violation of California Law and Monterey County Code (California Penal Code 374.3(A) and Monterey County Code, Chapter 10.41.040(A), respectively). The County of Monterey Health Department responds to illegal dumping complaints, prepares reports of investigation for the District Attorney's Office, engages in public outreach and education, and participates in programs that focus on minimizing illegal dumping. The County of Monterey and the City of Salinas actively prosecute individuals who are caught illegally dumping. The City of Salinas has devoted resources to watershed cleanup efforts to remove litter from City creeks. Both the City and the County have reportedly established telephone hotlines for citizens to report illegal dumping and they provide financial rewards for reporting parties.

The Executive Officer anticipates that existing programs and ordinances will achieve the allocation; therefore, no new regulatory mechanisms are warranted. Compliance with the allocation may be demonstrated through effective and proactive implementation and enforcement of existing regulatory authorities. The Executive Officer will assess progress and make changes if necessary during TMDL implementation tracking to achieve allocations for pathogen loading from illegal dumping.

Tracking and Evaluation

Every three years, beginning three years after TMDLs are approved by the Office of Administrative Law, the Central Coast Water Board will perform a review of implementation actions, monitoring results, and evaluations submitted by responsible parties of their progress toward achieving their allocations. The Central Coast Water Board will use annual reports, nonpoint source pollution control implementation programs, evaluations submitted by responsible parties, and other available information to determine progress toward implementing required actions and achieving the allocations and the numeric target.

Responsible parties will continue monitoring and reporting according to this plan for at least three years, at which time the Central Coast Water Board will determine the need for continuing or otherwise modifying the monitoring requirements. Responsible parties may also demonstrate that although water quality objectives are not being achieved in receiving waters, controllable sources of pathogens are not contributing to the exceedance. If this is the case, the Central Coast Water Board may re-evaluate the numeric target and allocations. For example, the Central Coast Water Board may pursue and approve a site-specific objective. The site-specific objective would be based on evidence that natural, or background sources alone were the cause of exceedances of the Basin Plan water quality objective for fecal indicator bacteria.

Three-year reviews will continue until the water quality objectives are achieved. The compliance schedule for achieving this TMDL numeric target is 13 years after the date of approval by the Office of Administrative Law.

AMENDMENT NO. 2. Revise the September 8, 1994 Basin Plan, Chapter Five, as follows:

Amend Chapter 5, section IV.B. as follows:

Add the following watershed to the end of the bulleted list of applicable areas of the Domestic Animal Waste Discharge Prohibition:

- Lower Salinas River Watershed (the watershed area of the Salinas River from Gonzales Road downstream to its confluence with Moss Landing Harbor)

AMENDMENT NO. 3. Revise the September 8, 1994 Basin Plan, Chapter Five, as follows:

Amend Chapter 5, section IV.B. as follows:

Add the following watershed to the end of the bulleted list of applicable areas of the Human Fecal Material Discharge Prohibition:

- Lower Salinas River Watershed (the watershed area of the Salinas River from Gonzales Road downstream to its confluence with Moss Landing Harbor)

**CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, California**

RESOLUTION NO. R3-2009-0025

**Amending the Water Quality Control Plan for the Central Coast Basin to
(1) Add the Aptos Creek Watershed to the Human Fecal Material Discharge Prohibition
and the Domestic Animal Waste Discharge Prohibition, and (2) Adopt Total Maximum
Daily Loads for Pathogens in Aptos Creek, Valencia Creek, and Trout Gulch**

The Regional Water Quality Control Board, Central Coast Region (Central Coast Water Board) finds:

1. The Central Coast Water Board adopted the Water Quality Control Plan for the Central Coastal Basin (Basin Plan), on September 8, 1994. The Basin Plan includes beneficial use designations, water quality objectives, prohibitions, implementation plans for point source and nonpoint source pollution discharges, and statewide plans and policies.
2. The Central Coast Water Board periodically revises and amends the Basin Plan. The Central Coast Water Board has determined the Basin Plan requires further revision and amendment to (a) add the Aptos Creek Watershed as a named area subject to the Human Fecal Material Discharge Prohibition and the Domestic Animal Waste Discharge Prohibition, and (b) incorporate Total Maximum Daily Loads (TMDLs) and an Implementation Plan for pathogens in Aptos Creek, Valencia Creek, and Trout Gulch.
3. The Central Coast Water Board proposes to amend the Basin Plan by inserting an amendment into the following sections:
 - a. Chapter Four, Section IX (Total Maximum Daily Loads), and
 - b. Chapter Five, section IV.B (Discharge Prohibitions)
4. On May 20, 2004, the State Water Resources Control Board (State Water Board) adopted the *Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program* (NPS Policy). This policy requires the regional water boards to regulate all nonpoint sources of pollution using the administrative permitting authorities provided by the California Water Code. This policy requires regional water boards to regulate nonpoint source pollution discharges with waste discharge requirements, waivers of waste discharge requirements, or Basin Plan prohibitions, or combinations thereof.
5. Aptos Creek and Valencia Creek are listed on Clean Water Act 303(d) list as impaired due to pathogens. Aptos and Valencia Creeks do not meet the Basin Plan water quality objectives for fecal coliform. This Resolution establishes TMDLs and associated allocations for these listed water bodies.
6. Trout Gulch is located in the Aptos Creek Watershed, is not on the Clean Water Act 303(d) list of impaired waters for pathogens, and does not meet Basin Plan water quality objectives for fecal coliform. The Central Coast Water Board finds that Trout Gulch is impaired for fecal coliform. Therefore, this Resolution establishes TMDLs and associated allocations for Trout Gulch.

7. The Central Coast Water Board's goal for establishing TMDLs in the Aptos Creek Watershed is to rectify the fecal coliform impairment, thereby maintaining the water for the beneficial uses of contact and non-contact water recreation.
8. The mouth of Aptos Creek is the receiving water for approximately 13,190 acres of land. Water from the Creek flows into northern Monterey Bay. Trout Gulch flows into Valencia Creek and Valencia Creek flows into Aptos Creek.
9. The elements of a TMDL are described in 40 CFR 130.2 and 130.7 and section 303(d) of the CWA, and USEPA guidance documents. A TMDL is defined as "the sum of individual waste load allocations for point sources and load allocations for nonpoint sources and natural background" (40 CFR 130.2). The Central Coast Water Board has determined that the TMDLs for pathogens in the Aptos Creek Watershed are set at levels necessary to attain and maintain the applicable numeric water quality objectives taking into account seasonal variations and any lack of knowledge concerning the relationship between effluent limitations and water quality (40 CFR 130.7 (c) (1)). The regulations in 40 CFR 130.7 also state that TMDLs shall take into account critical conditions for stream flow, loading, and water quality parameters. TMDLs are often expressed as a mass load of the pollutant but can be expressed as a unit of concentration if appropriate (40 CFR 130.2(i)). Expressing these TMDLs as units of concentration is appropriate because an existing concentration-based water quality objective is used as the basis for the TMDL numeric target.
10. Upon establishment of TMDLs by the State or USEPA, the State is required to incorporate the TMDLs, along with appropriate implementation measures, into the State Water Quality Management Plan (40 CFR 130.6(c)(1) and 130.7; and California Water Code sections 13050(j) and 13242). The Basin Plan and applicable statewide plans serve as the State Water Quality Management Plan governing the watersheds under the jurisdiction of the Central Coast Water Board.
11. The Central Coast Water Board may, pursuant to California Water Code section 13243, specify certain conditions or areas where the discharge of waste, or certain types of waste, will not be permitted (i.e., prohibitions). The Implementation Plan for the TMDLs for the Aptos Creek Watershed requires compliance with the Human Fecal Material Discharge Prohibition and the Domestic Animal Waste Discharge Prohibition (proposed Amendment No. 1 contained herein) for discharges in the Aptos Creek Watershed. Supporting documentation for adding the Aptos Creek Watershed to the above-named prohibitions is provided in the Final Project Reports for Total Maximum Daily Loads for Pathogens in Aptos Creek, Valencia Creek and Trout Gulch. Consistent with California Water Code section 13244, the Central Coast Water Board complied with public notice and hearing requirements for adding the Aptos Creek Watershed to the Human Fecal Material Discharge and the Domestic Animal Waste Discharge Prohibitions.
12. Pursuant to California Water Code section 13241, the Central Coast Water Board considered several factors in developing this Basin Plan amendment. The Central Coast Water Board concluded that the TMDLs and prohibitions established by this Basin Plan amendment will ensure the reasonable protection of beneficial uses of waters of the state and prevent nuisance. As set forth in these substitute environmental documents, the Central Coast Water Board considered
 - a. The past, present and probable future beneficial uses of water in the Watershed.
 - b. Environmental characteristics of the Watershed.

- c. Water quality conditions that can reasonably be achieved through the coordinated management of all controllable factors that affect water quality in the area, as provided in the Implementation Plan.
 - d. Economic considerations, including reasonably foreseeable means of compliance and the reasonably foreseeable costs of those means of compliance
 - e. The need for developing housing within the region, which is not relevant.
 - f. The need to develop and use recycled water, which is not relevant.
13. Central Coast Water Board staff submitted the Project Report for the TMDLs to an external scientific review panel in July 2007. Staff received comments from the scientific review panel. Central Coast Water Board staff edited the Project Report or provided a written response that explained the basis for failing to incorporate the comments, or the comments did not result in any changes to the proposed Basin Plan Amendment. The prohibitions, TMDLs and Implementation Plan are based on sound scientific knowledge, methods, and practices in accordance with Health & Safety Code section 57004.
 14. Central Coast Water Board staff implemented a process to inform interested persons and the public about adding the Aptos Creek Watershed to the Human Fecal Material Discharge Prohibition and the Domestic Animal Waste Discharge Prohibition and adoption of the TMDLs. Central Coast Water Board staff's efforts to inform the public and solicit comment included a public meeting with interested parties and a public notice and comment period. Public notification of the amendment to the Basin Plan provided the public a 45 day public comment period preceding the Central Coast Water Board hearing. Notice of public hearing was given by advertising in newspapers of general circulation within the Region and by mailing a copy of the notice to all persons requesting such notice and applicable government agencies. Relevant documents and notices were also made available on the Central Coast Water Board website. Central Coast Water Board staff responded to oral and written comments received from the public. All public comments were considered.
 15. Adoption of these TMDLs and Basin Plan amendments will not result in any degradation of water quality; in fact, they are designed to improve water quality. As such, these TMDLs and basin plan amendment comply with all requirements of both State and Federal anti-degradation requirements (State Board Resolution 68-16 "Statement of Policy with Respect to Maintaining High Quality of Waters in California", and 40CFR 131.12).
 16. Pursuant to Public Resources Code section 21080.5, the Resources Agency has approved the Regional Water Boards' basin planning process as a "certified regulatory program" that adequately satisfies the California Environmental Quality Act (CEQA) (Public Resources Code, Section 21000 et seq.) requirements for preparing environmental documents (14 Cal. Code Regs. §15251(g); 23 Cal. Code Regs. § 3782.). Central Coast Water Board staff has prepared "substitute environmental documents" for this project that contain the required environmental documentation as set forth in the State Water Resources Control Board's (State Board) CEQA regulations (23 Cal. Code Regs. § 3777.). The substitute environmental documents include the TMDL Staff Report and several of its Attachments, including: 1) this Resolution and the Basin Plan Amendment Language (Attachment 1 of the Staff Report); 2) "Total Maximum Daily Loads for Pathogens in Aptos Creek, Valencia Creek, and Trout Gulch, Santa Cruz County, California" (Attachment 2 of the Staff Report); 3) the CEQA Substitute Document with environmental checklist (Attachment 3 of the Staff Report); and 4) the comments and responses to comments (Attachment6 of the Staff Report). The Staff Report also includes the Notice of Public Hearing/Notice of Filing (Attachment 4) and the Scientific Peer Review comment (Attachment 5). The project itself is the establishment of TMDLs for fecal coliform in the Aptos Creek Watershed. The Board exercises discretion in assigning waste load allocations and load allocations, determining the program of implementation, and

setting various milestones in achieving the water quality standards. The CEQA checklist and other portions of the substitute environmental documents contain significant analysis and numerous findings related to impacts and mitigation measures

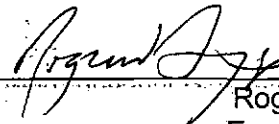

17. A CEQA Scoping meeting was conducted on June 26, 2006 at the Capitola City Hall Community Room, 420 Capitola Avenue, Capitola, Santa Cruz County. A notice of the CEQA Scoping meeting was sent to interested persons on May 30, 2006, including to the City of Capitola and the County of Santa Cruz. The notice included a background of the project, the project purpose, a meeting schedule and directions for obtaining more detailed information through the Central Coast Water Board website; the notice and project summary were available at the website or by requesting hard copies via telephone.
18. Public Resources Code section 21159 provides that an agency shall perform, at the time of the adoption of a rule or regulation requiring the installation of pollution control equipment, or a performance standard or treatment requirement, an environmental analysis of the reasonably foreseeable methods of compliance, and an analysis of the reasonably foreseeable environmental impacts of the methods of compliance, an analysis of reasonably foreseeable mitigation measures to lessen the adverse environmental impacts, and an analysis of reasonably foreseeable alternative means of compliance with the rule or regulation that would have less significant adverse impacts. Section 21159(c) requires that the environmental analysis take into account a reasonable range of environmental, economic, and technical factors; population and geographic areas; and specific sites. The Staff Report prepared for this Basin Plan amendment, in particular the CEQA Substitute Document Report (Attachment 3), provides the environmental analysis required by Public Resources Code section 21159 and is hereby incorporated as findings in this Resolution.
19. In preparing the substitute environmental documents, the Central Coast Water Board has considered the requirements of Public Resources Code section 21159 and California Code of Regulations, title 14, section 15187, and intends those documents to serve as a Tier 1 environmental review. This analysis is not intended to be an exhaustive analysis of every conceivable impact, but an analysis of the reasonably foreseeable consequences of the adoption of this regulation, from a programmatic perspective. Compliance obligations will be undertaken directly by public agencies that may have their own obligations under CEQA. Project level impacts may need to be considered in any subsequent environmental analysis performed by other public agencies, pursuant to Public Resources Code section 21159.2. To the extent applicable, this Tier 1 substitute environmental document may be used to satisfy subsequent CEQA obligations of those agencies.
20. Consistent with the Water Board's substantive obligations under CEQA, the substitute environmental documents do not engage in speculation or conjecture, and only consider the reasonably foreseeable environmental impacts, including those relating to the methods of compliance, reasonably foreseeable feasible mitigation measures to reduce those impacts, and the reasonably foreseeable alternative means of compliance, which would avoid or reduce the identified impacts.
21. The proposed amendment will have a less than significant adverse effect on the environment. California Water Code section 13360 precludes the Regional Board from dictating the manner in which responsible agencies comply with any of the Regional Board's regulations or orders. When the agencies responsible for implementing these TMDLs determine how they will proceed, the agencies responsible for those parts of the project can and should incorporate such alternatives and mitigation into any subsequent projects or project approvals. These feasible alternatives and mitigation measures are described in more detail in the substitute environmental documents (14 Cal. Code Regs. § 15091(a)(2)).

22. From a program-level perspective, incorporation of the alternatives and mitigation measures outlined in the substitute environmental documents will foreseeably reduce impacts to no impact, or keep the impact at less than significant levels.
23. The substitute documents for these TMDLs, and in particular the CEQA Substitute Document and Environmental Checklist (Attachment 3 of the Staff Report) identify mitigation approaches that should be considered at the project level.
24. The Central Coast Water Board will request that the State Water Board approve the Basin Plan amendments incorporating a) Aptos Creek Watershed as subject to the Human Fecal Material Discharge Prohibition and the Domestic Animal Waste Discharge Prohibition, and b) TMDLs for pathogens in the Aptos Creek Watershed. The TMDLs and associated Implementation Plan for the TMDLs will become effective upon approval by the California Office of Administrative Law. The TMDLs must also be approved by the United States Environmental Protection Agency.
25. The amendments to the Basin Plan may have an effect on fish and wildlife. The Central Coast Water Board will, therefore, forward fee payments to the Department of Fish and Game under the California Fish and Game Code section 711.4.
26. The regulatory action meets the "Necessity" standard of the Administrative Procedures Act, Government Code, section 11353, subdivision (b). As specified in Finding-10, federal regulations require that TMDLs be incorporated into the water quality management plan. The Central Coast Water Board's Basin Plan is the Central Coast Water Board's component of the water quality management plan, and the Basin Plan is how the Central Coast Water Board takes quasi-legislative, planning actions. Moreover, the TMDL is a program of implementation for existing water quality objectives, and is, therefore, appropriately a component of the Basin Plan under California Water Code section 13242. The necessity of developing TMDLs is established in the TMDL staff report, the section 303(d) list, and the data contained in the administrative record documenting the pathogen impairments of the Aptos Creek Watershed.
27. On March 21, 2008 in Salinas, California, the Central Coast Water Board held a public hearing and heard and considered all public comments and evidence in the record.
28. On March 21, 2008, the Central Coast Water Board adopted resolution no. R3-2008-0003 and forwarded the record to the State Water Board for adoption.
29. On November 6, 2008, the Central Coast Water Board's Executive Officer withdrew the Total Maximum Daily Loads for Pathogens in Aptos Creek, Valencia Creek, and Trout Gulch from consideration for adoption by the State Water Board. The Executive Officer withdrew the TMDLs for consideration due to State Board staff's recommendation to clarify language in the TMDLs and corresponding amendments before submittal to the State Water Board for approval; this Resolution includes the recommended clarifications.
30. On May 8, 2009, in San Luis Obispo, California, the Central Coast Water Board held a public hearing and heard and considered all public comments and evidence in the record.

THEREFORE, be it resolved that:

1. Pursuant to sections 13240, 13241, 13242, 13243, and 13244 of the California Water Code, the Central Coast Water Board, after considering the entire record, including the oral testimony at the hearing, hereby adopts the amendment in "Attachment-Proposed Basin Plan Amendments."
2. The Executive Officer is directed to forward copies of the Basin Plan amendments to the State Water Board in accordance with the requirements of section 13245 of the California Water Code.
3. The Central Coast Water Board requests that the State Water Board approve the Basin Plan amendments in accordance with the requirements of sections 13245 and 13246 of the California Water Code and forward them to the California Office of Administrative Law and the USEPA for approval.
4. The Executive Officer is authorized to sign a Certificate of Fee Exemption or transmit payment of the applicable fee as may be required to the Resources Agency.
5. If, during the approval process, Central Coast Water Board staff, State Water Board staff, the State Water Board or the California Office of Administrative Law determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.
6. The substitute environmental documents prepared by the Central Coast Water Board staff pursuant to Public Resources Code 21080.5 are hereby certified.

I, Roger W. Briggs, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of the resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region, on May 8, 2009.

Roger W. Briggs
Executive Officer

RESOLUTION NO. R3-2009-0025**ATTACHMENT - PROPOSED BASIN PLAN AMENDMENT**

Revise the September 8, 1994 Basin Plan, as follows:

AMENDMENT NO. 1. Revise the September 8, 1994 Basin Plan, Chapter Five, as follows:

Amend Chapter Five, section IV.B. as follows:

Add the following watershed to the end of the bulleted list of applicable areas of the Human Fecal Material Discharge Prohibition and the Domestic Animal Waste Discharge Prohibition:

- Aptos Creek Watershed

AMENDMENT NO. 2. ADOPT THE APTOS CREEK, VALENCIA CREEK, AND TROUT GULCH TOTAL MAXIMUM DAILY LOADS FOR PATHOGENS

Add the following to Chapter 4 after IX. K.:

IX. L. TOTAL MAXIMUM DAILY LOADS FOR PATHOGENS IN APTOS CREEK, VALENCIA CREEK, AND TROUT GULCH

The Regional Water Quality Control Board adopted these TMDLs on May 8, 2009.

These TMDLs were approved by:

The State Water Resources Control Board on _____ (Insert date)

The California Office of Administrative Law on _____ (Insert date)

The U.S. Environmental Protection Agency on _____ (Insert date)

Problem Statement

The beneficial use of water contact recreation is not being attained in Aptos Creek, Valencia Creek and Trout Gulch because fecal coliform concentrations exceed existing Basin Plan numeric water quality objectives protecting this beneficial use. Staff concluded Aptos Creek was impaired below the confluence with Valencia Creek. The entire reach of Trout Gulch was considered impaired. Staff also considered Valencia Creek impaired from its confluence with Aptos Creek, upstream to both the east and west forks. The east fork was impaired upstream to the intersection of McKay and Cox Roads. The west fork was impaired upstream to its intersection with Valencia Road.

Numeric Targets

The numeric targets used to develop the TMDLs and allocations are as follows:

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

Source Analysis

The relative order of controllable sources, in descending order, contributing pathogens to Aptos Creek, Valencia Creek, and Trout Gulch are: (1) storm drain discharges to municipally owned and operated separate storm sewer systems (MS4s) required to be covered by an NPDES permit, (2) pet waste in areas that do not drain to MS4s, (3) County of Santa Cruz Sanitation District sanitary sewer collection system spills and leaks, (4) private sewer laterals connected to municipal sanitary sewer collection systems, and (5) farm animals and livestock discharges.

TMDLs and Allocations

The TMDLs for all impaired waters of Aptos Creek, Valencia Creek, and Trout Gulch are concentration based TMDLs applicable to each day of all seasons and are equal to the following:

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

The allocations to responsible parties are shown in Table IX-L-1.

Table IX – L - 1. Allocations and Responsible Parties

WASTE LOAD ALLOCATIONS		Receiving Water Fecal Coliform (MPN/100mL)
Waterbody	Responsible Party (Source) NPDES/Order number	
Aptos Creek ¹ Trout Gulch ² Valencia Creek ³	Santa Cruz County (Storm drain discharges to MS4s required to be covered by an NPDES permit) Storm Water General Permit NPDES No. CAS000004	Allocation 1 ^a
Aptos Creek ¹ Trout Gulch ² Valencia Creek ³	Santa Cruz County Sanitation District (Sanitary sewer collection system spills and leaks) Order No. R3-2005-0043	Allocation 2 ^b
LOAD ALLOCATIONS		Receiving Water Fecal Coliform (MPN/100mL)
Waterbody	Responsible Party (Source)	
Aptos Creek ¹ Trout Gulch ² Valencia Creek ³	Owners/Operators of land used for/containing pets (Pet waste not draining to MS4s)	Allocation 1 ^a
Aptos Creek ¹ Trout Gulch ² Valencia Creek ³	Owners/Operators of land used for/containing farm animals and livestock (Farm Animals and Livestock discharges)	Allocation 1 ^a
Aptos Creek ¹ Trout Gulch ² Valencia Creek ³	Natural sources	Allocation 1 ^a

¹ Aptos Creek from the Pacific Ocean to the confluence of Aptos and Valencia Creeks

² All reaches of Trout Gulch

³ Valencia Creek from the confluence with Aptos Creek upstream to the west fork, where it intersects with Valencia Road, and to the east fork at the intersection of McKay and Cox Roads.

^a Allocation 1: Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN/100mL, nor shall more than ten percent of total samples during any 30-day period exceed 400 MPN/100 mL.

^b Allocation 2: Allocation of zero; no loading allowed from this source.

The parties responsible for the allocations to controllable sources are not responsible for the allocation to natural sources.

The TMDLs are considered achieved when the allocations assigned to all individual responsible parties are met, or when the numeric targets are consistently met in Aptos Creek, Valencia Creek, and Trout Gulch.

Margin of Safety

A margin of safety is incorporated implicitly in the TMDLs through conservative assumptions.

Implementation Plan

STORM DRAIN DISCHARGES

The Central Coast Water Board will address fecal indicator bacteria (FIB), e.g. fecal coliform and/or other indicators of pathogens, discharged from the County of Santa Cruz' municipal separate storm sewer system (MS4) by regulating the MS4 under the provisions of the State Water Resource Control Board's General Permit for the Discharges of Storm Water from Small Municipal Separate Storm Sewer Systems (General Permit) (NPDES No. CAS000004). As an enrollee under the General Permit, the MS4 must develop and implement a Storm Water Management Plan (SWMP) that controls urban runoff discharges into and from its MS4. To address the MS4s TMDL wasteload allocations, the Central Coast Water Board will require the MS4 to specifically target FIB in urban runoff through incorporation of a Wasteload Allocation Attainment Program in its SWMP.

The Central Coast Water Board will require the Wasteload Allocation Attainment Program to include descriptions of the actions that will be taken by the MS4 to attain the TMDL wasteload allocations, and specifically address:

1. Development of an implementation and assessment strategy;
2. Source identification and prioritization;
3. Best management practice identification, prioritization, implementation schedule, analysis, and effectiveness assessment;
4. Monitoring program development and implementation;
5. Reporting; including evaluation whether current best management practices are progressing towards achieving the wasteload allocations within thirteen years of the date that the TMDLs are approved by the Office of Administrative Law;
6. Coordination with stakeholders; and
7. Other pertinent factors.

The Wasteload Allocation Attainment Program will be required by the Central Coast Water Board to address each of these TMDLs that occur within the MS4 entities' jurisdictions.

The Central Coast Water Board will require the Wasteload Allocation Attainment Program to be submitted at one of the following milestones, whichever occurs first:

1. Within one year of approval of the TMDLs by the Office of Administrative Law;
2. When required by any other Water Board-issued storm water requirements (e.g., when the Phase II Municipal Storm Water Permit is renewed).

For an MS4 that is enrolled under the General Permit at the time of Wasteload Allocation Attainment Program submittal, the Wasteload Allocation Attainment Program must be incorporated into the SWMPs when they are submitted. For an MS4 that is not enrolled under the General Permit at the time of Wasteload Allocation Attainment Program submittal, the Wasteload Allocation Attainment Program must be incorporated into the SWMP when the SWMP is approved by the Central Coast Water Board.

The Executive Officer or the Central Coast Water Board will require information that demonstrates implementation of the actions described above, pursuant to applicable sections of the California

Water Code and/or pursuant to authorities provided in the General Permit for storm water discharges.

SANITARY SEWER COLLECTION SYSTEM SPILLS AND LEAKS

Entities with jurisdiction over sewer collection systems can demonstrate compliance with these TMDL load allocations through waste discharge requirements and/or NPDES permits.

The Santa Cruz County Sanitation District (SCCSD) must continue to implement its Collection System Management Plan, as required by Waste Discharge Requirements (WDRs) (Order No. R3-2005-0043).

In addition, the SCCSD is required to improve maintenance of their sewage collection system, including identification, correction, and prevention of sewage leaks in portions of the collection systems that run through, or adjacent to, impaired surface waters within the Aptos Creek Watershed.

To this end, within six months following adoption of these TMDLs by the Office of Administrative Law, the Executive Officer will issue a letter pursuant to Section 13267 of the California Water Code requiring: 1) submittal within one year of a technical report that describes how and when the SCCSD will conduct improved collection system maintenance in portions of the collection system most likely to affect impaired surface water bodies, with the end result being compliance with its TMDL allocation, 2) stream monitoring for fecal coliform or another fecal indicator bacteria and reporting of these monitoring activities, and 3) annual reporting of self-assessment as to whether the SCCSD is in compliance with the TMDL allocation.

PRIVATE SEWER LATERAL DISCHARGES

The Central Coast Water Board has identified leaks from private laterals located in the County of Santa Cruz as a source of fecal indicator bacteria in municipal separate storm sewer systems (MS4s). Therefore, enrollees for the County of Santa Cruz' General Permit for the Discharges of Storm Water from Small Municipal Separate Storm Sewer Systems will address fecal indicator bacteria from private lateral leaks in the Wasteload Allocation Attainment Program (as described in the above Storm Drain Discharges section).

PET WASTE, FARM ANIMALS AND LIVESTOCK DISCHARGES

Owners and/or operators of lands containing domestic animals (including pets, farm animals, and livestock) in the Aptos Creek Watershed must comply with the Domestic Animal Waste Discharge Prohibition; compliance with the Domestic Animal Waste Discharge Prohibition implies compliance with the load allocation for these TMDLs.

Within three years of approval of these TMDLs by the Office of Administrative Law, the Executive Officer will notify owners and/or operators of lands used for/containing domestic animals of the requirement to comply with the Domestic Animal Waste Discharge Prohibition. In his notification, the Executive Officer will also describe the options owner's/operator's of lands containing domestic animals have for demonstrating compliance with the Domestic Animal Waste Discharge Prohibition; pursuant to California Water Code section 13267 and within six months of the notification by the Executive Officer, owners/operators of lands containing domestic animals will be required to submit the following for approval by the Executive Officer or the Water Board:

- 1) Clear evidence that the owner/operator of lands containing domestic animals is and will continue to be in compliance with the Domestic Animal Waste Discharge Prohibition; clear evidence could be documentation submitted by the owner/operator to the Executive Officer validating current and continued compliance with the Prohibition, or
- 2) A plan for compliance with the Domestic Animal Waste Discharge Prohibition. Such a plan must include a list of specific management practices that will be implemented to control discharges containing fecal material from domestic animals. The plan must also describe how implementing the identified management practices are likely to progressively achieve the load allocations to domestic animals, with the ultimate goal achieving the load allocations no later than thirteen years after Office of Administrative Law approval of these TMDLs. The plan must include monitoring and reporting to the Central Coast Water Board, demonstrating the progressive progress toward achieving load allocations for discharges from domestic animals, and a self-assessment of this progress. The plan may be developed by an individual discharger or by or for a coalition of dischargers in cooperation with a third-party representative, organization, or government agency acting as the agents of owners/operators of lands containing domestic animals, or
- 3) Submittal of a Report of Waste Discharge pursuant to California Water Code Section 13260 (as an application for waste discharge requirements).

Tracking and Evaluation

Every three years, beginning three years after TMDLs are approved by the Office of Administrative Law, the Central Coast Water Board will perform a review of implementation actions, monitoring results, and evaluations submitted by responsible parties of their progress toward achieving their allocations. The Central Coast Water Board will use annual reports, nonpoint source pollution control implementation programs, evaluations submitted by responsible parties, and other available information to determine progress toward implementing required actions and achieving the allocations and the numeric target.

Responsible parties will continue monitoring and reporting according to this plan for at least three years, at which time the Central Coast Water Board will determine the need for continuing or otherwise modifying the monitoring requirements. Responsible parties may also demonstrate that although water quality objectives are not being achieved in receiving waters, controllable sources of pathogens are not contributing to the exceedance. If this is the case, the Central Coast Water Board may re-evaluate the numeric target and allocations. For example, the Central Coast Water Board may pursue and approve a site-specific objective. The site-specific objective would be based on evidence that natural, or background sources alone were the cause of exceedances of the Basin Plan water quality objective for fecal indicator bacteria.

Three-year reviews will continue until the water quality objectives are achieved. The compliance schedule for achieving this TMDL numeric target is 13 years after the date of approval by the Office of Administrative Law.

Arnold Schwarzenegger
Governor

MEMORANDUM

TO: Darrin Polhemus
Deputy Director, Division of Water Quality
State Resources Control Board

FROM: 
Roger Briggs, Executive Officer

DATE: June 23, 2010

SUBJECT: SOQUEL LAGOON BASIN PLAN AMENDMENT/TMDL

The Regional Water Quality Control Board, Central Coast Region (Central Coast Water Board) adopted an amendment to the Water Quality Control Plan for the Central Coast Region (Basin Plan) on May 8, 2009, in Resolution No. R3-2009-0024. The Basin Plan amendment establishes Total Maximum Daily Loads for Fecal Coliform in the Soquel Lagoon Watershed located in Santa Cruz County, adds a prohibition on domestic animal waste discharge and a prohibition on human fecal material discharge in the Soquel Lagoon Watershed waters, and removes the shellfish harvesting beneficial use for Soquel Lagoon.

Central Coast Water Board Resolution No. R3-2009-0024 grants the Executive Officer the authority to make minor, non-substantive changes to the language of the adopted Basin Plan amendment.

The State Water Resources Control Board intends to consider approval of the Basin Plan amendment at a meeting scheduled for July 6, 2010. It has come to my attention that there are needed wording clarifications requiring corrections to the Basin Plan amendment. The corrections are not substantive; they add consistency, and therefore clarity, to the language of the Basin Plan amendment.

I am hereby making the following minor, non-substantive changes to Attachment-1 (Resolution No. R3-2009-0024) that clarify existing language:

1. Page 10, bullet 1, under the section "Source Analysis," striking the word "from" and replacing with the word "of." The corrected bullet reads:

Storm drain discharges...(including but not limited to discharges of fecal material from domestic animals and humans).

2. Page 12, under "STORM DRAIN DISCHARGES," striking the word "Resource" and replacing it with the word "Resources." The corrected wording reads:

"The Central Coast Water Board will address fecal indicator bacteria...State Water Resources Control Board's..."

3. Page 12, bullet-2, under the section "STORM DRAIN DISCHARGES," adding the following underlined language (the corrected language is consistent with existing language in the section "PRIVATE LATERALS TO THE SANITARY SEWER COLLECTION SYSTEM" on page 13):

"Source identification and prioritization (including leaks to storm sewers from private laterals),"

4. Page 13, third paragraph under the section titled "SANITARY SEWER COLLECTION SYSTEM SPILLS AND LEAKS," striking the word "adoption" and replacing with the word "approval." The corrected wording reads:

"To this end, within six months following approval of these TMDLs by the Office of Administrative Law, the Executive Officer..."

5. Page 14, the first paragraph under the section titled "DOMESTIC ANIMALS NOT REGULATED BY WQ ORDER NO. 2003-0005-DWQ [STORM WATER GENERAL PERMIT," striking the wording "Soquel Creek Watershed and Noble Gulch Watershed" and replacing with the wording "Soquel Lagoon Watershed." The corrected language is consistent with the existing language on page 9, first bullet under the section titled "AMENDMENT NO.2..." The corrected wording reads:

"Owners and/or operators of lands containing domestic animals...in the Soquel Lagoon Watershed must comply with the Domestic Animal Waste Discharge Prohibition..."

If you have any questions about this request, please contact Kim Sanders at (805) 542-4771 or Harvey Packard at (805) 542-4639.

RESOLUTION NO. R3-2009-0024

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENTS

Revise the September 8, 1994 Basin Plan as follows:

AMENDMENT NO. 1.

Amend Chapter 2, Table 2-1. Identified Uses of Inland Surface Waters

Waterbody Names	MUN	AGR	PRO	IND	GWR	REC1	REC2	WILD	COLD	WARM	MIGR	SPWN	BIOL	RARE	EST	FRESH	NAV	POW	COMM	AQUA	SAL	SHELL
Soquel Lagoon						X	X	X	X		X	X		X	X				X			X

AMENDMENT NO. 2. Revise the September 8, 1994 Basin Plan, Chapter Five, as follows:

Amend Chapter Five, section IV.B. as follows:

Add the following watershed to the end of the bulleted list of applicable areas of the Human Fecal Material Discharge Prohibition and the Domesticated Animal Waste Discharge Prohibition.

- Soquel Lagoon Watershed

AMENDMENT NO. 3. ADOPT THE TOTAL MAXIMUM DAILY LOADS FOR PATHOGENS IN SOQUEL LAGOON, SOQUEL CREEK, AND NOBLE GULCH

Add the following to Chapter 4 after IX. J.:

IX. K. TOTAL MAXIMUM DAILY LOADS FOR PATHOGENS IN SOQUEL LAGOON, SOQUEL CREEK, AND NOBLE GULCH

The Regional Water Quality Control Board adopted these TMDLs on May 8, 2009. These TMDLs were approved by:

The State Water Resources Control Board on: _____ (insert date).

The California Office of Administrative Law on: _____ (insert date).

The U.S. Environmental Protection Agency on: _____ (insert date).

Problem Statement

The beneficial use of water contact recreation is not protected in the impaired reaches of Soquel Lagoon, Soquel Creek, and Noble Gulch because fecal coliform concentrations exceed water quality objectives protecting this beneficial use. The impaired reaches are:

- 1) Soquel Lagoon and Soquel Creek: beginning from the mouth of Soquel Lagoon, upstream and along Soquel Creek to the bridge at Porter Street.
- 2) All reaches of Noble Gulch.

Numeric Targets

The numeric targets used to develop the TMDLs and allocations are as follows:

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

Source Analysis

The controllable sources of fecal coliform contributing to impairment in Soquel Lagoon, Soquel Creek, and Noble Gulch are, in decreasing order of contribution:

1. Storm drain discharges to municipally owned and operated separate storm sewer systems (MS4s) required to be covered by an NPDES permit (including but not limited to discharges ~~from~~ fecal material from domestic animals and humans).
2. Sanitary sewer collection system spills and leaks (including but not limited to discharges from private laterals connected to municipal sanitary sewer collection systems).
3. Domestic animal waste discharges in areas that do not drain to MS4s (including but not limited to farm animals, livestock and pets).
4. Homeless person/encampment discharges in areas that do not drain to MS4s.

Total Maximum Daily Load (TMDL)

The TMDLs for the impaired reaches of the following water bodies are concentration based TMDLs applicable for each day for all seasons and are equal to the following:

Soquel Lagoon, Soquel Creek, and Noble Gulch:

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

Allocations and Responsible Parties

The allocations to responsible parties are shown in Table IX K-1.

Table IX K-1. Allocations to Responsible Parties

Waste Load Allocations		
Waterbody Subject to Allocation	Responsible Party (Source) NPDES/ORDER Number	Receiving Water Fecal Coliform (MPN/100mL)
Soquel Lagoon ¹	City of Capitola (Storm drain discharges to MS4s required to be covered by and NPDES permit) Storm Water General Permit NPDES No. CAS000004	Allocation-1 ^a
Soquel Creek ² Noble Gulch ³	County of Santa Cruz and City of Capitola (Storm drain discharges to MS4s required to be covered by and NPDES permit) Storm Water General Permit NPDES No. CAS000004	Allocation-1 ^a
Soquel Lagoon ¹ Soquel Creek ² Noble Gulch ³	Santa Cruz County Sanitation District (Sanitary sewer collection system spills and leaks) Order No. R3-2005-0043	Allocation-2 ^b
Load Allocations		
Waterbody Subject to Allocation	Responsible Party (Source)	Receiving Water Fecal Coliform (MPN/100mL)
Soquel Lagoon ¹ Soquel Creek ² Noble Gulch ³	Owners and operators of land used for/containing pets (Pet waste not draining to MS4s)	Allocation-1 ^a
Noble Gulch ³	Owners and operators of land used for/containing farm animals and livestock (Farm Animals and Livestock discharges)	Allocation-1 ^a
Soquel Lagoon ¹ Soquel Creek ² Noble Gulch ³	Owners/operators of land that include homeless persons/encampments (Homeless person/encampment discharges not draining to MS4s)	Allocation-2 ^b
Soquel Lagoon ¹ Soquel Creek ² Noble Gulch ³	No responsible party (Natural sources)	Allocation-1 ^a

¹ All waters of the Soquel Lagoon

² Beginning and including the downstream most reach of Soquel Creek, up to and including Soquel Creek at the bridge crossing at Porter Street.

³ All reaches of Noble Gulch.

^a Allocation-1: Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

^b Allocation 2: Allocation of zero; no loading allowed from this source.

The parties responsible for the allocations to controllable sources are not responsible for the allocation to natural sources.

The TMDLs are considered achieved when the numeric target is consistently met in the impaired waters of Soquel Lagoon, Soquel Creek, and Noble Gulch.

Margin of Safety

A margin of safety is incorporated implicitly in the TMDLs through conservative assumptions.

Implementation Plan

STORM DRAIN DISCHARGES:

The Central Coast Water Board will address fecal indicator bacteria (FIB), e.g., fecal coliform and/or other indicators of pathogens, discharged from the County of Santa Cruz and the City of Capitola by regulating the MS4 entities under the provisions of the State Water ~~Resource~~ Resources Control Board's General Permit for the Discharges of Storm Water from Small Municipal Separate Storm Sewer Systems (General Permit) (NPDES No. CAS000004). As enrollees under the General Permit, the MS4 entities must develop and implement Storm Water Management Plans (SWMPs) that control urban runoff discharges into and from their MS4s. To address the MS4 entities' TMDL wasteload allocations, the Central Coast Water Board will require the MS4 entities to specifically target FIB in urban runoff through incorporation of Wasteload Allocation Attainment Programs in their SWMPs.

The Central Coast Water Board will require the Wasteload Allocation Attainment Programs to include descriptions of the actions that will be taken by the MS4 entities to attain the TMDL wasteload allocations, and specifically address:

1. Development of an implementation and assessment strategy;
2. Source identification and prioritization (including leaks to storm sewers from private laterals);
3. Best management practice identification, prioritization, implementation schedule, analysis, and effectiveness assessment;
4. Monitoring program development and implementation;
5. Reporting; including evaluation whether current best management practices are progressing towards achieving the wasteload allocations within thirteen years of the date that the TMDLs are approved by the Office of Administrative Law;
6. Coordination with stakeholders; and
7. Other pertinent factors.

The Wasteload Allocation Attainment Program will be required by the Central Coast Water Board to address each of these TMDLs that occur within the MS4 entities' jurisdictions.

The Central Coast Water Board will require the Wasteload Allocation Attainment Program to be submitted at one of the following milestones, whichever occurs first:

1. Within one year of approval of the TMDLs by the Office of Administrative Law;
2. When required by any other Water Board-issued storm water requirements (e.g., when the Phase II Municipal Storm Water Permit is renewed).

For those MS4 entities that are enrolled under the General Permit at the time of Wasteload Allocation Attainment Plan submittal, the Wasteload Allocation Attainment Program must be incorporated into the SWMPs when they are submitted. For those MS4 entities that are not enrolled under the General Permit at the time of Wasteload Allocation Attainment Program submittal, the Wasteload Allocation Attainment Program must be incorporated into the SWMPs when the SWMPs are approved by the Central Coast Water Board.

The Executive Officer or the Central Coast Water Board will require information that demonstrates implementation of the actions described above, pursuant to applicable sections of the California Water Code and/or pursuant to authorities provided in the General Permit for storm water discharges.

SANITARY SEWER COLLECTION SYSTEM SPILLS AND LEAKS:

Entities with jurisdiction over sewer collection systems can demonstrate compliance with these TMDL load allocations through Waste Discharge Requirements and/or NPDES permits.

The Santa Cruz County Sanitation District (SCCSD) must continue to implement their Collection System Management Plan, as required by Waste Discharge Requirements (WDRs) (Order No. R3-2005-0043).

In addition, the SCCSD is required to improve maintenance of their sewage collection system, including identification, correction, and prevention of sewage leaks in portions of the collection systems that run through, or adjacent to, impaired surface waters within the Soquel Creek Watershed.

To this end, within six months following ~~adoption~~approval of these TMDLs by the Office of Administrative Law, the Executive Officer will issue a letter pursuant to Section 13267 of the California Water Code requiring: 1) submittal within one year of, a technical report that describes how and when the SCCSD will conduct improved collection system maintenance in portions of the collection system most likely to affect impaired surface water bodies, with the end result being compliance with its TMDL allocation, 2) stream monitoring for fecal coliform or another fecal indicator bacteria and reporting of these monitoring activities, and 3) annual reporting of self-assessment as to whether the SCCSD is in compliance with the TMDL allocation.

PRIVATE LATERALS TO THE SANITARY SEWER COLLECTION SYSTEM:

The Central Coast Water Board has identified leaks from private laterals located in the City of Capitola and County of Santa Cruz as a source of fecal indicator bacteria in municipal separate storm sewer systems (MS4s). Therefore, enrollees for the City of Capitola and County of Santa Cruz General Permit for the Discharges of Storm Water from Small Municipal Separate Storm Sewer

Systems will address fecal indicator bacteria from private lateral leaks in the Wasteload Allocation Attainment Program (as described in the Storm Drain Discharges section).

DOMESTIC ANIMALS NOT REGULATED BY WQ ORDER NO. 2003-0005-DWQ [STORM WATER GENERAL PERMIT]:

Owners and/or operators of lands containing domestic animals (including pets, farm animals, and livestock) in the ~~Soquel Creek Watershed and Noble Gulch Watershed~~ Soquel Lagoon Watershed must comply with the Domestic Animal Waste Discharge Prohibition; compliance with the Domestic Animal Waste Discharge Prohibition implies compliance with the load allocation for these TMDLs.

Within three years of approval of these TMDLs by the Office of Administrative Law, the Executive Officer will notify owners and/or operators of lands used for/containing domestic animals of the requirement to comply with the Domestic Animal Waste Discharge Prohibition. In his notification, the Executive Officer will also describe the options owners/operators of lands containing domestic animals have for demonstrating compliance with the Domestic Animal Waste Discharge Prohibition; pursuant to California Water Code section 13267 and within six months of the notification by the Executive Officer, owners/operators of lands containing domestic animals will be required to submit the following for approval by the Executive Officer or the Water Board:

- 1) Clear evidence that the owner/operator of lands containing domestic animals is and will continue to be in compliance with the Domestic Animal Waste Discharge Prohibition; clear evidence could be documentation submitted by the owner/operator to the Executive Officer validating current and continued compliance with the Prohibition, or
- 2) A plan for compliance with the Domestic Animal Waste Discharge Prohibition. Such a plan must include a list of specific management practices that will be implemented to control discharges containing fecal material from domestic animals. The plan must also describe how implementing the identified management practices are likely to progressively achieve the load allocations to domestic animals, with the ultimate goal achieving the load allocations no later than thirteen years after Office of Administrative Law approval of these TMDLs. The plan must include monitoring and reporting to the Central Coast Water Board, demonstrating the progressive progress towards achieving load allocations for discharges from domestic animals, and a self-assessment of this progress. The plan may be developed by an individual discharger or by or for a coalition of dischargers in cooperation with a third-party representative, organization, or government agency acting as the agents of owners/operators of lands containing domestic animals, or
- 3) Submittal of a Report of Waste Discharge pursuant to California Water Code Section 13260 (as an application for waste discharge requirements).

HOMELESS PERSON/ENCAMPMENT DISCHARGES NOT REGULATED BY WQ ORDER NO. 2003-0005-DWQ [STORM WATER GENERAL PERMIT]:

Owners of land that contain homeless persons and/or homeless encampments in the Soquel Lagoon Watershed must comply with the Human Fecal Material Discharge Prohibition.

Owners of land with homeless persons must demonstrate to the satisfaction of the Executive Officer or the Water Board that they are in compliance with the Human Fecal Material Discharge Prohibition; compliance with the Human Fecal Material Discharge Prohibition implies compliance with the load allocation for these TMDLs.

Within three years of approval of these TMDLs by the Office of Administrative Law, the Executive Officer will notify owners of land containing homeless persons of the requirement to comply with the Human Fecal Material Discharge Prohibition. In his notification, the Executive Officer will also describe owner's options for demonstrating compliance with the Human Fecal Material Discharge Prohibition; pursuant to California Water Code 13267 and within six months of the notification by the Executive Officer, owners will be required to submit the following for approval by the Executive Officer or the Water Board:

- 1) Clear evidence that the owner is and will continue to be in compliance with the Human Fecal Material Discharge Prohibition; clear evidence could be documentation submitted by the owner to the Executive Officer validating current and continued compliance with the Prohibition, or
- 2) A plan for compliance with the Human Fecal Material Discharge Prohibition. Such a plan must include a list of specific management practices that will be implemented to control discharges containing fecal material from homeless persons. The Plan must also describe how implementing the identified management practices are likely to progressively achieve the load allocation for homeless persons, with the ultimate goal achieving the load allocation no later than three years from the date of the Executive Officer's notification to the owner requiring compliance. The plan must include monitoring and reporting to the Central Coast Water Board, demonstrating the progressive progress towards achieving load allocations for discharges from homeless persons, and self-assessment of this progress, or
- 3) Submittal of a Report of Waste Discharge pursuant to California Water Code Section 13260 (as an application for waste discharge requirements).

Tracking and Evaluation

Every three years, beginning three years after TMDLs are approved by the Office of Administrative Law, the Central Coast Water Board will perform a review of implementation actions, monitoring results, and evaluations submitted by responsible parties of their progress towards achieving their allocations. The Central Coast Water Board will use annual reports, nonpoint source pollution control implementation programs, evaluations submitted by responsible parties, and other available information to determine progress toward implementing required actions and achieving the allocations and the numeric target.

Responsible parties will continue monitoring and reporting according to this plan for at least three years, at which time the Central Coast Water Board will determine the need for continuing or otherwise modifying the monitoring requirements. Responsible parties may also demonstrate that although water quality objectives are not being achieved in receiving waters, controllable sources of pathogens are not contributing to the exceedance. If this is the case, the Central Coast Water Board may re-evaluate the numeric target and allocations. For example, the Central Coast Water Board may pursue and approve a site-specific objective. The site-specific objective would be based on evidence that natural, or background sources alone were the cause of exceedances of the Basin Plan water quality objective for fecal indicator bacteria.

Three-year reviews will continue until the water quality objectives are achieved. The compliance schedule for achieving the allocations and numeric target required under these TMDLs is 13 years after the date of approval by the Office of Administrative Law.

**CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, California**

RESOLUTION NO. R3-2009-0024

- Amending The Water Quality Control Plan for the Central Coast Basin to**
(1) Remove the Shellfish Harvesting Beneficial Use for Soquel Lagoon,
(2) Add the Soquel Lagoon Watershed to the Human Fecal Material Discharge Prohibition and the Domestic Animal Waste Discharge Prohibition, and
(3) Adopt Total Maximum Daily Loads for Pathogens in Soquel Lagoon, Soquel Creek, and Noble Gulch

The Regional Water Quality Control Board, Central Coast Region (Central Coast Water Board) finds:

1. The Central Coast Water Board adopted the Water Quality Control Plan for the Central Coast Basin (Basin Plan), on September 8, 1994. The Basin Plan includes beneficial use designations, water quality objectives, prohibitions, implementation plans for point source and nonpoint source discharges, statewide plans and policies.
2. The Central Coast Water Board periodically revises and amends the Basin Plan. The Central Coast Water Board has determined the Basin Plan requires further revision and amendment to (a) remove the shellfish harvesting beneficial use (SHELL) for Soquel Lagoon; (b) add the Soquel Lagoon Watershed as a named area subject to the Human Fecal Material Discharge Prohibition and the Domestic Animal Waste Discharge Prohibition; and (c) incorporate Total Maximum Daily Loads (TMDLs) and Implementation Plan for pathogens in Soquel Lagoon, Soquel Creek, and Noble Gulch.
3. The Central Coast Water Board proposes to amend the Basin Plan by inserting amendments into the following sections:
 - a. Chapter Two, Table 2-1: "Identified Uses of Inland Surface Waters"
 - b. Chapter Four, section IX (Total Maximum Daily Loads), and
 - c. Chapter Five, section IV.B. (Discharge Prohibitions).
4. The Central Coast Water Board has determined that the shellfish harvesting beneficial use designation should be removed from the Soquel Lagoon.
5. The proposed removal of the shellfish harvesting beneficial use is based on the results of a Use Attainability Analysis (UAA) for shell fishing in the Soquel Lagoon. Central Coast Water Board staff (staff) developed the UAA in 2004 and 2005 to determine the historic, actual, and potential shell fishing activities in Soquel Lagoon. The UAA is necessary to conform to Title 40 of the Code of Federal Regulations (CFR), §131.10(j) because the action involves a designated use specified in section 101(a) (2) of the Clean Water Act. The proposed amendment and the UAA only addresses the fishable goal (protection and propagation of fish, shellfish, and wildlife) as it pertains to shellfish harvesting and does not address other fishable goals or the swimmable goal included in the water contact recreation designation contained in section 101(a)(2) of the Clean Water Act. The fishable goal of the Clean Water Act is also

protected under other beneficial uses (including cold freshwater habitat) designated in the Basin Plan for the Soquel Lagoon.

6. Factors for allowing a state to remove a designated use are listed in 40 CFR section 131.10(g). As determined in the UAA, three factors preclude attainment of the SHELL beneficial use in Soquel Lagoon. These factors are as follows:
 - a. Natural, ephemeral, intermittent, or low flow conditions or water levels prevent the attainment of the beneficial use.
 - b. Diversions, and other types of hydrologic modifications preclude the attainment of the beneficial use, and it is not feasible to restore the water body to its original condition or to operate such modifications in a way that would result in the attainment of the use.
 - c. Physical conditions related to the natural features of the water body, including lack of a proper substrate, preclude attainment of aquatic life protection uses.
7. Pursuant to section 13241 of the California Water Code, the Central Coast Water Board considered several factors in recommending the removal of the shellfish harvesting beneficial use in the Soquel Lagoon. The Central Coast Water Board concluded that shellfish harvesting is not a past, present, or probable future beneficial use of Soquel Lagoon. Additionally, the Central Coast Water Board concluded the following:
 - a. The removed shellfish harvesting beneficial use, adopted TMDLs, and prohibitions will protect past, present, or probable future beneficial uses.
 - b. Environmental characteristics of the waterbodies will not be affected by the removal of the shellfish harvesting beneficial use.
 - c. Water quality conditions that could reasonably be achieved through the coordinated control of all factors that affect water quality in the area will not be affected by the removal of the shellfish harvesting beneficial use.
 - d. Removal of the shellfish harvesting beneficial use does not impose any costs other than the Central Coast Water Board's costs of preparing the amendment.
 - d. The need for developing housing within the region is not relevant.
 - e. The need to develop and use recycled water is not relevant.
8. The Central Coast Water Board's goal in removing the shellfish harvesting beneficial use from the Soquel Lagoon is to assign water quality objectives for indicators of pathogenic organisms that accurately reflect the existing and potential uses of Soquel Lagoon, i.e., those for water-contact and non-contact recreation. For this purpose, "existing uses" mean those uses actually attained on or after November 28, 1975 (40 CFR §131.3(e)).
9. On May 20, 2004, the State Water Resources Control Board (State Board) adopted the *Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program* (NPS Policy). This policy requires the regional water quality control boards to regulate all nonpoint sources of pollution using the administrative permitting authorities provided by the California Water Code. This policy requires the regional water quality control boards to regulate nonpoint source discharges with waste discharge requirements, waivers of waste discharge requirements, Basin Plan prohibitions, or a combination thereof.
10. Soquel Lagoon is listed on the Clean Water Act 303(d) list as impaired due to pathogens. The Soquel Lagoon does not meet the Basin Plan water quality objectives for fecal coliform. This Resolution establishes TMDLs and associated allocations for this listed water body.
11. Soquel Creek and Noble Gulch are located in the Soquel Lagoon Watershed and are not listed on the Clean Water Act section 303(d) list of impaired waters for pathogens, and do not meet the Basin Plan water quality objective for fecal coliform. The Central Coast Water Board

finds that Soquel Creek and Noble Gulch are impaired for fecal coliform. Therefore, this Resolution establishes TMDLs and associated allocations for Soquel Creek and Noble Gulch.

12. The Central Coast Water Board's goal for establishing TMDLs in Soquel Lagoon, Soquel Creek, and Noble Gulch is to rectify the fecal coliform impairment, thereby maintaining the water for the beneficial uses of contact and non-contact water recreation.
13. The Soquel Lagoon drains a watershed area of approximately 27,188 acres. Soquel Creek is a tributary to Soquel Lagoon, and Noble Gulch is a tributary to Soquel Creek. Soquel Lagoon drains into northern Monterey Bay.
14. The elements of a TMDL are described in 40 CFR 130.2 and 130.7, section 303(d) of the Clean Water Act, and USEPA guidance documents. A TMDL is defined as "the sum of individual waste load allocations for point sources and load allocations for nonpoint sources and natural background" (40 CFR 130.2). The Central Coast Water Board has determined that the Soquel Lagoon Watershed TMDLs are set at levels necessary to attain and maintain the applicable numeric water quality objectives, taking into account seasonal variations and any lack of knowledge concerning the relationship between effluent limitations and water quality (40 CFR 130.7 (c) (1)). The regulations in 40 CFR 130.7 also state that TMDLs shall take into account critical conditions for stream flow, loading, and water quality parameters. TMDLs are often expressed as a mass load of the pollutant but can be expressed as a unit of concentration if appropriate (40 CFR 130.2(i)). Expressing these TMDLs as units of concentration is appropriate because an existing concentration-based water quality objective is used as the basis for the TMDL numeric target.
15. Upon establishment of TMDLs by the State or USEPA, the State is required to incorporate the TMDLs, along with appropriate implementation measures, into the State Water Quality Management Plan (40 CFR 130.6 (c)(1) and 130.7 and California Water Code sections 13050(j) and 13242). The Basin Plan and applicable statewide plans serve as the State Water Quality Management Plan governing the watersheds under the jurisdiction of the Central Coast Water Board.
16. The Central Coast Water Board may, pursuant to California Water Code section 13243, specify certain conditions or areas where the discharge of waste, or certain types of waste, will not be permitted (i.e., prohibitions). The Implementation Plan for the TMDLs for the Soquel Lagoon Watershed requires compliance with the Human Fecal Material Discharge Prohibition and the Domestic Animal Waste Discharge Prohibition (proposed Amendment No. 2 contained herein) for discharges in the Soquel Lagoon Watershed. Supporting documentation for adding the Soquel Lagoon Watershed to the above-named prohibitions is provided in the Final Project Reports for Total Maximum Daily Loads for Pathogens in Soquel Lagoon, Soquel Creek, and Noble Gulch. Consistent with California Water Code section 13244, the Central Coast Water Board complied with public notice and hearing requirements for adding the Soquel Lagoon Watershed to the Human Fecal Material Discharge and the Domestic Animal Waste Discharge Prohibitions.
17. Central Coast Water Board staff submitted a Use Attainability Analysis to an external scientific review panel in March 2006 as required by Health & Safety Code section 57004. Central Coast Water Board staff also submitted the Project Report for the TMDLs to an external scientific review panel in July 2007. Staff received comments from the scientific review panel. Water Board staff edited the Project Report or provided a written response that explained the basis for failing to incorporate the comments, or the comments did not result in any changes to the proposed Basin Plan Amendments. The scientific portions of the proposed removal of

the SHELL beneficial use, the prohibitions, the TMDLs and implementation plan, are based on sound scientific knowledge, methods, and practices in accordance with Health & Safety Code section 57004.

18. Central Coast Water Board staff implemented a process to inform interested persons and the public about the removal of the SHELL beneficial use designation for Soquel Lagoon, adding the Soquel Lagoon Watershed to the Human Fecal Material Discharge Prohibition and the Domestic Animal Waste Discharge Prohibition, and adoption of the TMDLs. Central Coast Water Board staff's efforts to inform the public and solicit comment included a public meeting with interested parties and a public notice and comment period. Public notification of the amendment to the Basin Plan provided the public a 45-day public comment period preceding the Central Coast Water Board hearing. Notice of the public hearing was given by advertising in newspapers of general circulation within the Region and by mailing a copy of the notice to all persons requesting such notice and applicable government agencies. Relevant documents and notices were also made available on the Central Coast Water Board website. Central Coast Water Board staff responded to oral and written comments received from the public. All public comments were considered.
19. The removal of the shellfish harvesting beneficial use from Soquel Lagoon and adoption of these TMDLs and Basin Plan amendments will not result in any degradation of water quality; in fact, they are designed to improve water quality. As such, these TMDLs and basin plan amendment comply with all requirements of both State and Federal anti-degradation requirements (State Board Resolution 68-16 "Statement of Policy with Respect to Maintaining High Quality of Waters in California, and 40CFR 131.12).
20. Pursuant to Public Resources Code section 21080.5, the Resources Agency has approved the Regional Water Boards' basin planning process as a "certified regulatory program" that adequately satisfies the California Environmental Quality Act (CEQA) (Public Resources Code, Section 21000 et seq.) requirements for preparing environmental documents (14 Cal. Code Regs. §15251(g); 23 Cal. Code Regs. § 3782.). Central Coast Water Board staff has prepared "substitute environmental documents" for this project that contain the required environmental documentation as set forth in the State Water Resources Control Board's (State Board) CEQA regulations (23 Cal. Code Regs. § 3777.). The substitute environmental documents include the TMDL Staff Report and several of its Attachments, including: 1) this Resolution and the Basin Plan Amendment Language (Attachment 1 of the Staff Report); 2) "Total Maximum Daily Loads for Pathogens in Soquel Lagoon, Soquel Creek, and Noble Gulch, Santa Cruz County, California" (Attachment 2 of the Staff Report), 3) the CEQA Substitute Document with environmental checklist (Attachment 3 of the Staff Report), and 4) the comments and responses to comments (Attachment 6 of the Staff Report). The Staff Report also includes the Notice of Public Hearing/Notice of Filing (Attachment 4) and the Scientific Peer Review Comment (Attachment 5). The project itself is the establishment of TMDLs for fecal coliform in the Soquel Lagoon Watershed. The Board exercises discretion in assigning waste load allocations and load allocations, determining the program of implementation, and setting various milestones in achieving the water quality standards. The CEQA checklist and other portions of the substitute environmental documents contain significant analysis and numerous findings related to impacts and mitigation measures.
21. A CEQA Scoping meeting was conducted on June 26, 2006 at the Capitola City Hall Community Room, 420 Capitola Avenue, Capitola, Santa Cruz County. A notice of the CEQA Scoping meeting was sent to interested persons on May 30, 2006, including to the City of Capitola and the County of Santa Cruz. The notice included a background of the project, the project purpose, a meeting schedule and directions for obtaining more detailed information

through the Central Coast Water Board website; the notice and project summary were available at the website or by requesting hard copies via telephone.

22. Public Resources Code section 21159 provides that an agency shall perform, at the time of the adoption of a rule or regulation requiring the installation of pollution control equipment, or a performance standard or treatment requirement, an environmental analysis of the reasonably foreseeable methods of compliance, and an analysis of the reasonably foreseeable environmental impacts of the methods of compliance, an analysis of reasonably foreseeable mitigation measures to lessen the adverse environmental impacts, and an analysis of reasonably foreseeable alternative means of compliance with the rule or regulation that would have less significant adverse impacts. Section 21159(c) requires that the environmental analysis take into account a reasonable range of environmental, economic, and technical factors; population and geographic areas; and specific sites. The Staff Report prepared for this Basin Plan amendment, in particular the CEQA Substitute Document Report (Attachment 3), provides the environmental analysis required by Public Resources Code section 21159 and is hereby incorporated as findings in this Resolution.
23. In preparing the substitute environmental documents, the Central Coast Water Board has considered the requirements of Public Resources Code section 21159 and California Code of Regulations, title 14, section 15187, and intends those documents to serve as a Tier 1 environmental review. This analysis is not intended to be an exhaustive analysis of every conceivable impact, but an analysis of the reasonably foreseeable consequences of the adoption of this regulation, from a programmatic perspective. Compliance obligations will be undertaken directly by public agencies that may have their own obligations under CEQA. Project level impacts may need to be considered in any subsequent environmental analysis performed by other public agencies, pursuant to Public Resources Code section 21159.2. To the extent applicable, this Tier 1 substitute environmental document may be used to satisfy subsequent CEQA obligations of those agencies.
24. Consistent with the Water Board's substantive obligations under CEQA, the substitute environmental documents do not engage in speculation or conjecture, and only consider the reasonably foreseeable environmental impacts, including those relating to the methods of compliance, reasonably foreseeable feasible mitigation measures to reduce those impacts, and the reasonably foreseeable alternative means of compliance, which would avoid or reduce the identified impacts.
25. The proposed amendment will have a less than significant adverse effect on the environment. California Water Code section 13360 precludes the Regional Board from dictating the manner in which responsible agencies comply with any of the Regional Board's regulations or orders. When the agencies responsible for implementing these TMDLs determine how they will proceed, the agencies responsible for those parts of the project can and should incorporate such alternatives and mitigation into any subsequent projects or project approvals. These feasible alternatives and mitigation measures are described in more detail in the substitute environmental documents (14 Cal. Code Regs. § 15091(a) (2)).
26. From a program-level perspective, incorporation of the alternatives and mitigation measures outlined in the substitute environmental documents will foreseeably reduce impacts to no impact, or keep the impact at less than significant levels.
27. The substitute documents for these TMDLs, and in particular the CEQA Substitute Document and Environmental Checklist (Attachment 3 of the Staff Report), identify mitigation approaches that should be considered at the project level.

28. The Central Coast Water Board will request that the State Water Board approve the Basin Plan amendments incorporating: a) the removal the SHELL beneficial use for Soquel Lagoon, b) Soquel Lagoon Watershed as subject to the Human Fecal Material Discharge Prohibition and the Domestic Animal Waste Discharge Prohibition, and c) TMDLs for pathogens in the Soquel Lagoon Watershed.. The TMDLs and associated Implementation Plan for the TMDLs will become effective upon approval by the California Office of Administrative Law. Removal of the shellfish harvesting beneficial use will become effective upon approval by USEPA.
29. The amendments to the Basin Plan may have an effect on fish and wildlife. The Central Coast Water Board will, therefore, forward fee payments to the Department of Fish and Game under the California Fish and Game Code section 711.4.
30. The regulatory action meets the "Necessity" standard of the Administrative Procedures Act, Government Code, section 11353, subdivision (b). As specified in Finding-15, federal regulations require that TMDLs be incorporated into the Water Quality Management Plan. The Central Coast Water Board's Basin Plan is the Central Coast Water Board's component of the Water Quality Management Plan, and the Basin Plan is how the Central Coast Water Board takes quasi-legislative, planning actions. Moreover, the TMDL is a program of implementation for existing water quality objectives, and is, therefore, appropriately a component of the Basin Plan under California Water Code section 13242. The necessity of developing a TMDL is established in the TMDL staff report, the Clean Water Act section 303(d) list, and the data contained in the administrative record documenting the pathogen impairments of the Soquel Lagoon, Soquel Creek, and Noble Gulch.
31. On March 21, 2008, in Salinas, California, the Central Coast Water Board held a public hearing and heard and considered all public comments and evidence in the record.
32. On March 21, 2008, the Central Coast Water Board adopted resolution no. R3-2008-0002 and forwarded the record to the State Water Board for adoption.
33. On November 6, 2008, the Central Coast Water Board's Executive Officer withdrew the Total Maximum Daily Loads for Pathogens in Soquel Lagoon, Soquel Creek, and Trout Gulch from consideration for adoption by the State Water Board. The Executive Officer withdrew the TMDLs for consideration due to State Board staff's recommendation to clarify language in the TMDLs and corresponding amendments before submittal to the State Water Resources Control Board for approval; this Resolution includes the recommended clarifications.
34. On May 8, 2009, in San Luis Obispo, California, the Central Coast Water Board held a public hearing and heard and considered all public comments and evidence in the record.

THEREFORE, be it resolved that:

1. Pursuant to sections 13240, 13241, 13242, 13243, and 13244 of the California Water Code, the Central Coast Water Board, after considering the entire record, including the oral testimony at the hearing, hereby adopts the amendments in "Attachment-Proposed Basin Plan Amendments".
2. The Executive Officer is directed to forward copies of the Basin Plan amendments to the State Board in accordance with the requirements of section 13245 of the California Water Code.

3. The Central Coast Water Board requests that the State Board approve the Basin Plan amendments in accordance with the requirements of sections 13245 and 13246 of the California Water Code and forward them to the California Office of Administrative Law and the USEPA for approval.
4. The Executive Officer is authorized to sign a Certificate of Fee Exemption or transmit payment of the applicable fee as may be required to the Resources Agency.
5. If, during the approval process, Central Coast Water Board staff, State Board staff, the State Board or Office of Administrative Law determines that minor, non-substantive corrections to the language of the amendments are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.
6. The substitute environmental documents prepared by the Central Coast Water Board staff pursuant to Public Resources Code 21080.5 are hereby certified.

I, Roger W. Briggs, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of the resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region, on May 8, 2009.

Roger W. Briggs
Executive Officer

RESOLUTION NO. R3-2009-0024

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENTS

Revise the September 8, 1994 Basin Plan as follows:

AMENDMENT NO. 1.

Amend Chapter 2, Table 2-1. Identified Uses of Inland Surface Waters

Waterbody Names	MUN	AGR	PRO	IND	GWR	REC1	REC2	WILD	COLD	WARM	MIGR	SPWN	BIOL	RARE	EST	FRESH	NAV	POW	COMM	AQUA	SAL	SHELL	
Soquel Lagoon						X	X	X	X		X	X		X	X				X				X

AMENDMENT NO. 2. Revise the September 8, 1994 Basin Plan, Chapter Five, as follows:

Amend Chapter Five, section IV.B. as follows:

Add the following watershed to the end of the bulleted list of applicable areas of the Human Fecal Material Discharge Prohibition and the Domesticated Animal Waste Discharge Prohibition.

- Soquel Lagoon Watershed

AMENDMENT NO. 3. ADOPT THE TOTAL MAXIMUM DAILY LOADS FOR PATHOGENS IN SOQUEL LAGOON, SOQUEL CREEK, AND NOBLE GULCH

Add the following to Chapter 4 after IX. J.:

IX. K. TOTAL MAXIMUM DAILY LOADS FOR PATHOGENS IN SOQUEL LAGOON, SOQUEL CREEK, AND NOBLE GULCH

The Regional Water Quality Control Board adopted these TMDLs on May 8, 2009. These TMDLs were approved by:

The State Water Resources Control-Board on: _____ (insert date).

The California Office of Administrative Law on: _____ (insert date).

The U.S. Environmental Protection Agency on: _____ (insert date).

Problem Statement

The beneficial use of water contact recreation is not protected in the impaired reaches of Soquel Lagoon, Soquel Creek, and Noble Gulch because fecal coliform concentrations exceed water quality objectives protecting this beneficial use. The impaired reaches are:

- 1) Soquel Lagoon and Soquel Creek: beginning from the mouth of Soquel Lagoon, upstream and along Soquel Creek to the bridge at Porter Street.
- 2) All reaches of Noble Gulch.

Numeric Targets

The numeric targets used to develop the TMDLs and allocations are as follows:

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

Source Analysis

The controllable sources of fecal coliform contributing to impairment in Soquel Lagoon, Soquel Creek, and Noble Gulch are, in decreasing order of contribution:

1. Storm drain discharges to municipally owned and operated separate storm sewer systems (MS4s) required to be covered by an NPDES permit (including but not limited to discharges from fecal material from domestic animals and humans).
2. Sanitary sewer collection system spills and leaks (including but not limited to discharges from private laterals connected to municipal sanitary sewer collection systems).
3. Domestic animal waste discharges in areas that do not drain to MS4s (including but not limited to farm animals, livestock and pets).
4. Homeless person/encampment discharges in areas that do not drain to MS4s.

Total Maximum Daily Load (TMDL)

The TMDLs for the impaired reaches of the following water bodies are concentration based TMDLs applicable for each day for all seasons and are equal to the following:

Soquel Lagoon, Soquel Creek, and Noble Gulch:

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

Allocations and Responsible Parties

The allocations to responsible parties are shown in Table IX K-1.

Table IX K-1. Allocations to Responsible Parties

Waste Load Allocations		
Waterbody Subject to Allocation	Responsible Party (Source) NPDES/ORDER Number	Receiving Water Fecal Coliform (MPN/100mL)
<u>Soquel Lagoon</u> ¹	<u>City of Capitola</u> (Storm drain discharges to MS4s required to be covered by and NPDES permit) Storm Water General Permit NPDES No. CAS000004	<u>Allocation-1^a</u>
<u>Soquel Creek</u> ² <u>Noble Gulch</u> ³	<u>County of Santa Cruz and City of Capitola</u> (Storm drain discharges to MS4s required to be covered by and NPDES permit) Storm Water General Permit NPDES No. CAS000004	<u>Allocation-1^a</u>
<u>Soquel Lagoon</u> ¹ <u>Soquel Creek</u> ² <u>Noble Gulch</u> ³	<u>Santa Cruz County Sanitation District</u> (Sanitary sewer collection system spills and leaks) Order No. R3-2005-0043	<u>Allocation-2^b</u>
Load Allocations		
Waterbody Subject to Allocation	Responsible Party (Source)	Receiving Water Fecal Coliform (MPN/100mL)
<u>Soquel Lagoon</u> ¹ <u>Soquel Creek</u> ² <u>Noble Gulch</u> ³	<u>Owners and operators of land used for/containing pets</u> (Pet waste not draining to MS4s)	<u>Allocation-1^a</u>
<u>Noble Gulch</u> ³	<u>Owners and operators of land used for/containing farm animals and livestock</u> (Farm Animals and Livestock discharges)	<u>Allocation-1^a</u>
<u>Soquel Lagoon</u> ¹ <u>Soquel Creek</u> ² <u>Noble Gulch</u> ³	<u>Owners/operators of land that include homeless persons/encampments</u> (Homeless person/encampment discharges not draining to MS4s)	<u>Allocation-2^b</u>
<u>Soquel Lagoon</u> ¹ <u>Soquel Creek</u> ² <u>Noble Gulch</u> ³	<u>No responsible party</u> (Natural sources)	<u>Allocation-1^a</u>

¹ All waters of the Soquel Lagoon.

² Beginning and including the downstream most reach of Soquel Creek, up to and including Soquel Creek at the bridge crossing at Porter Street.

³ All reaches of Noble Gulch.

^a Allocation-1: Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

^b Allocation 2: Allocation of zero; no loading allowed from this source.

The parties responsible for the allocations to controllable sources are not responsible for the allocation to natural sources.

The TMDLs are considered achieved when the numeric target is consistently met in the impaired waters of Soquel Lagoon, Soquel Creek, and Noble Gulch.

Margin of Safety

A margin of safety is incorporated implicitly in the TMDLs through conservative assumptions.

Implementation Plan

STORM DRAIN DISCHARGES:

The Central Coast Water Board will address fecal indicator bacteria (FIB), e.g., fecal coliform and/or other indicators of pathogens, discharged from the County of Santa Cruz and the City of Capitola by regulating the MS4 entities under the provisions of the State Water Resource Control Board's General Permit for the Discharges of Storm Water from Small Municipal Separate Storm Sewer Systems (General Permit) (NPDES No. CAS000004). As enrollees under the General Permit, the MS4 entities must develop and implement Storm Water Management Plans (SWMPs) that control urban runoff discharges into and from their MS4s. To address the MS4 entities' TMDL wasteload allocations, the Central Coast Water Board will require the MS4 entities to specifically target FIB in urban runoff through incorporation of Wasteload Allocation Attainment Programs in their SWMPs.

The Central Coast Water Board will require the Wasteload Allocation Attainment Programs to include descriptions of the actions that will be taken by the MS4 entities to attain the TMDL wasteload allocations, and specifically address:

1. Development of an implementation and assessment strategy;
2. Source identification and prioritization;
3. Best management practice identification, prioritization, implementation schedule, analysis, and effectiveness assessment;
4. Monitoring program development and implementation;
5. Reporting; including evaluation whether current best management practices are progressing towards achieving the wasteload allocations within thirteen years of the date that the TMDLs are approved by the Office of Administrative Law;
6. Coordination with stakeholders; and
7. Other pertinent factors.

The Wasteload Allocation Attainment Program will be required by the Central Coast Water Board to address each of these TMDLs that occur within the MS4 entities' jurisdictions.

The Central Coast Water Board will require the Wasteload Allocation Attainment Program to be submitted at one of the following milestones, whichever occurs first:

1. Within one year of approval of the TMDLs by the Office of Administrative Law;
2. When required by any other Water Board-issued storm water requirements (e.g., when the Phase II Municipal Storm Water Permit is renewed).

For those MS4 entities that are enrolled under the General Permit at the time of Wasteload Allocation Attainment Plan submittal, the Wasteload Allocation Attainment Program must be incorporated into the SWMPs when they are submitted. For those MS4 entities that are not enrolled under the General Permit at the time of Wasteload Allocation Attainment Program submittal, the Wasteload Allocation Attainment Program must be incorporated into the SWMPs when the SWMPs are approved by the Central Coast Water Board.

The Executive Officer or the Central Coast Water Board will require information that demonstrates implementation of the actions described above, pursuant to applicable sections of the California Water Code and/or pursuant to authorities provided in the General Permit for storm water discharges.

SANITARY SEWER COLLECTION SYSTEM SPILLS AND LEAKS:

Entities with jurisdiction over sewer collection systems can demonstrate compliance with these TMDL load allocations through Waste Discharge Requirements and/or NPDES permits.

The Santa Cruz County Sanitation District (SCCSD) must continue to implement their Collection System Management Plan, as required by Waste Discharge Requirements (WDRs) (Order No. R3-2005-0043).

In addition, the SCCSD is required to improve maintenance of their sewage collection system, including identification, correction, and prevention of sewage leaks in portions of the collection systems that run through, or adjacent to, impaired surface waters within the Soquel Creek Watershed.

To this end, within six months following adoption of these TMDLs by the Office of Administrative Law, the Executive Officer will issue a letter pursuant to Section 13267 of the California Water Code requiring: 1) submittal within one year of, a technical report that describes how and when the SCCSD will conduct improved collection system maintenance in portions of the collection system most likely to affect impaired surface water bodies, with the end result being compliance with its TMDL allocation, 2) stream monitoring for fecal coliform or another fecal indicator bacteria and reporting of these monitoring activities, and 3) annual reporting of self-assessment as to whether the SCCSD is in compliance with the TMDL allocation.

PRIVATE LATERALS TO THE SANITARY SEWER COLLECTION SYSTEM:

The Central Coast Water Board has identified leaks from private laterals located in the City of Capitola and County of Santa Cruz as a source of fecal indicator bacteria in municipal separate storm sewer systems (MS4s). Therefore, enrollees for the City of Capitola and County of Santa Cruz General Permit for the Discharges of Storm Water from Small Municipal Separate Storm Sewer

Systems will address fecal indicator bacteria from private lateral leaks in the Wasteload Allocation Attainment Program (as described in the Storm Drain Discharges section).

DOMESTIC ANIMALS NOT REGULATED BY WQ ORDER NO. 2003-0005-DWQ [STORM WATER GENERAL PERMIT]:

Owners and/or operators of lands containing domestic animals (including pets, farm animals, and livestock) in the Soquel Creek Watershed and Noble Gulch Watershed must comply with the Domestic Animal Waste Discharge Prohibition; compliance with the Domestic Animal Waste Discharge Prohibition implies compliance with the load allocation for these TMDLs.

Within three years of approval of these TMDLs by the Office of Administrative Law, the Executive Officer will notify owners and/or operators of lands used for/containing domestic animals of the requirement to comply with the Domestic Animal Waste Discharge Prohibition. In his notification, the Executive Officer will also describe the options owners/operators of lands containing domestic animals have for demonstrating compliance with the Domestic Animal Waste Discharge Prohibition; pursuant to California Water Code section 13267 and within six months of the notification by the Executive Officer, owners/operators of lands containing domestic animals will be required to submit the following for approval by the Executive Officer or the Water Board:

- 1) Clear evidence that the owner/operator of lands containing domestic animals is and will continue to be in compliance with the Domestic Animal Waste Discharge Prohibition; clear evidence could be documentation submitted by the owner/operator to the Executive Officer validating current and continued compliance with the Prohibition, or
- 2) A plan for compliance with the Domestic Animal Waste Discharge Prohibition. Such a plan must include a list of specific management practices that will be implemented to control discharges containing fecal material from domestic animals. The plan must also describe how implementing the identified management practices are likely to progressively achieve the load allocations to domestic animals, with the ultimate goal achieving the load allocations no later than thirteen years after Office of Administrative Law approval of these TMDLs. The plan must include monitoring and reporting to the Central Coast Water Board, demonstrating the progressive progress towards achieving load allocations for discharges from domestic animals; and a self-assessment of this progress. The plan may be developed by an individual discharger or by or for a coalition of dischargers in cooperation with a third-party representative, organization, or government agency acting as the agents of owners/operators of lands containing domestic animals, or
- 3) Submittal of a Report of Waste Discharge pursuant to California Water Code Section 13260 (as an application for waste discharge requirements).

HOMELESS PERSON/ENCAMPMENT DISCHARGES NOT REGULATED BY WQ ORDER NO. 2003-0005-DWQ [STORM WATER GENERAL PERMIT]:

Owners of land that contain homeless persons and/or homeless encampments in the Soquel Lagoon Watershed must comply with the Human Fecal Material Discharge Prohibition.

Owners of land with homeless persons must demonstrate to the satisfaction of the Executive Officer or the Water Board that they are in compliance with the Human Fecal Material Discharge Prohibition; compliance with the Human Fecal Material Discharge Prohibition implies compliance with the load allocation for these TMDLs.

Within three years of approval of these TMDLs by the Office of Administrative Law, the Executive Officer will notify owners of land containing homeless persons of the requirement to comply with the Human Fecal Material Discharge Prohibition. In his notification, the Executive Officer will also describe owner's options for demonstrating compliance with the Human Fecal Material Discharge Prohibition; pursuant to California Water Code 13267 and within six months of the notification by the Executive Officer, owners will be required to submit the following for approval by the Executive Officer or the Water Board:

- 1) Clear evidence that the owner is and will continue to be in compliance with the Human Fecal Material Discharge Prohibition; clear evidence could be documentation submitted by the owner to the Executive Officer validating current and continued compliance with the Prohibition, or
- 2) A plan for compliance with the Human Fecal Material Discharge Prohibition. Such a plan must include a list of specific management practices that will be implemented to control discharges containing fecal material from homeless persons. The Plan must also describe how implementing the identified management practices are likely to progressively achieve the load allocation for homeless persons, with the ultimate goal achieving the load allocation no later than three years from the date of the Executive Officer's notification to the owner requiring compliance. The plan must include monitoring and reporting to the Central Coast Water Board, demonstrating the progressive progress towards achieving load allocations for discharges from homeless persons, and self-assessment of this progress, or
- 3) Submittal of a Report of Waste Discharge pursuant to California Water Code Section 13260 (as an application for waste discharge requirements).

Tracking and Evaluation

Every three years, beginning three years after TMDLs are approved by the Office of Administrative Law, the Central Coast Water Board will perform a review of implementation actions, monitoring results, and evaluations submitted by responsible parties of their progress towards achieving their allocations. The Central Coast Water Board will use annual reports, nonpoint source pollution control implementation programs, evaluations submitted by responsible parties, and other available information to determine progress toward implementing required actions and achieving the allocations and the numeric target.

Responsible parties will continue monitoring and reporting according to this plan for at least three years, at which time the Central Coast Water Board will determine the need for continuing or otherwise modifying the monitoring requirements. Responsible parties may also demonstrate that although water quality objectives are not being achieved in receiving waters, controllable sources of pathogens are not contributing to the exceedance. If this is the case, the Central Coast Water Board may re-evaluate the numeric target and allocations. For example, the Central Coast Water Board may pursue and approve a site-specific objective. The site-specific objective would be based on evidence that natural, or background sources alone were the cause of exceedances of the Basin Plan water quality objective for fecal indicator bacteria.

Three-year reviews will continue until the water quality objectives are achieved. The compliance schedule for achieving the allocations and numeric target required under these TMDLs is 13 years after the date of approval by the Office of Administrative Law.

**CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, California**

RESOLUTION NO. R3-2009-0023

**Amending The Water Quality Control Plan for The Central Coast Basin to
(1) Remove The Shellfish Harvesting Beneficial Use for San Lorenzo River Estuary,
(2) Add the San Lorenzo River Watershed to the Human Fecal Material Discharge
Prohibition and the Domestic Animal Waste Discharge Prohibition, and (3) Adopt Total
Maximum Daily Loads For Pathogens in San Lorenzo River Estuary, San Lorenzo River,
Branciforte Creek, Camp Evers Creek, Carbonera Creek, and Lompico Creek**

The Regional Water Quality Control Board, Central Coast Region (Central Coast Water Board) finds:

1. The Central Coast Water Board adopted the Water Quality Control Plan for the Central Coastal Basin (Basin Plan), on September 8, 1994. The Basin Plan designates beneficial uses and water quality objectives, sets forth programs of implementation to achieve water quality objectives addressing point source and nonpoint source discharges, adopts prohibitions, and incorporates statewide plans and policies.
2. The Central Coast Water Board periodically revises and amends the Basin Plan. The Central Coast Water Board has determined the Basin Plan requires further revision and amendment to (a) remove the shellfish harvesting (SHELL) beneficial use for San Lorenzo River Estuary (also known as San Lorenzo River Lagoon), (b) add the San Lorenzo River Watershed as a named area subject to the Human Fecal Material Discharge Prohibition and the Domestic Animal Waste Discharge Prohibition, and (c) incorporate Total Maximum Daily Loads (TMDLs) and Implementation Plan for pathogens in San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Camp Evers Creek, Carbonera Creek, and Lompico Creek.
3. The Central Coast Water Board proposes to amend the Basin Plan by inserting amendments into the following sections (listed in order of Basin Plan contents):
 - a. Chapter Two, Table 2-1: "Identified Uses of Inland Surface Waters"
 - b. Chapter Four, section IX (Total Maximum Daily Loads), and
 - c. Chapter Five, section IV.B. (Discharge Prohibitions).
4. The Central Coast Water Board has determined that the SHELL beneficial use designation should be removed from the San Lorenzo River Estuary.
5. The federal regulations at 40 CFR 131.10(g) allow the Central Coast Water Board to remove a designated use, which is not an "existing" use, if the state can demonstrate that achieving the use is not feasible based on the factors set forth in 40 CFR 131.10(g). Shellfish harvesting is not an "existing use" as that term is defined in 40 CFR 131.3 because shellfish harvesting use has not been attained in the water body on or after November 28, 1975. The proposed removal of the SHELL beneficial use is based on the results of a Use Attainability Analysis (UAA) in the San Lorenzo River Estuary. Central Coast Water Board staff (staff) developed the UAA in 2004 and 2005 to determine the historic, actual, and potential shell fishing activities in the San Lorenzo River Estuary. The UAA is necessary to conform to Title 40 of the Code of Federal Regulations (CFR), §131.10(j) because the action involves a

- designated use specified in Clean Water Act section 101(a) (2). The proposed amendment and the UAA only addresses the fishable goal ("protection and propagation of fish, shellfish, and wildlife") as it pertains to shellfish harvesting and does not address other fishable goals or the swimmable goal included in the water contact recreation designation contained in section 101(a)(2) of the Clean Water Act. The fishable goal of the Clean Water Act is also protected under other beneficial uses (including cold fresh water habitat) designated in the Basin Plan for the San Lorenzo River Estuary.
6. Factors for allowing a state to remove a designated use are listed in 40 CFR section 131.10(g). As determined in the UAA, three factors preclude attainment of the SHELL beneficial use in San Lorenzo River Estuary. These factors are as follows:
 - a. Natural, ephemeral, intermittent, or low flow conditions or water levels prevent the attainment of the beneficial use.
 - b. Diversions and other types of hydrologic modifications preclude the attainment of the beneficial use, and it is not feasible to restore the water body to its original condition or to operate such modifications in a way that would result in the attainment of the use.
 - c. Physical conditions related to the natural features of the water body, including lack of a proper substrate, preclude attainment of aquatic life protection uses.
 7. Pursuant to California Water Code section 13241, the Central Coast Water Board considered several factors in developing this Basin Plan amendment. The Central Coast Water Board concluded that the TMDLs and prohibitions established by this Basin Plan amendment will ensure the reasonable protection of beneficial uses of waters of the state and prevent nuisance. As set forth in these substitute environmental documents, the Central Coast Water Board considered
 - a. The past, present and probable future beneficial uses of water in the Watershed.
 - b. Environmental characteristics of the Watershed.
 - c. Water quality conditions that can reasonably be achieved through the coordinated management of all controllable factors that affect water quality in the area, as provided in the Implementation Plan.
 - d. Economic considerations, including reasonably foreseeable means of compliance and the reasonably foreseeable costs of those means of compliance.
 - e. The need for developing housing within the region, which is not relevant.
 - f. The need to develop and use recycled water, which is not relevant.
 8. The Central Coast Water Board's goal in removing the SHELL beneficial use from the San Lorenzo River Estuary is to assign pathogen indicator organism water quality objectives that accurately reflect the existing and potential uses of the San Lorenzo River Estuary, i.e., those for water-contact and non-contact recreation. For this purpose, "existing uses" mean those uses actually attained on or after November 28, 1975 (40 CFR §131.3(e)).
 9. On May 20, 2004, the State Water Resources Control Board (State Board) adopted the *Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program* (NPS Policy). This policy requires regional water quality control boards to regulate all nonpoint sources of pollution using the administrative permitting authorities provided by the California Water Code (codified in Division 7 of the California Water Code). This policy requires regional water quality control boards to regulate nonpoint source pollution discharges with waste discharge requirements, waivers of waste discharge requirements, Basin Plan prohibitions, or combinations thereof.
 10. The San Lorenzo River Estuary, San Lorenzo River, Carbonera Creek, and Lompico Creek are listed on the Clean Water Act 303(d) list as impaired due to pathogens. San Lorenzo River Estuary, San Lorenzo River, Carbonera Creek, and Lompico Creek do not meet the

Basin Plan water quality objectives for fecal coliform. This Resolution establishes TMDLs and associated allocations for these listed water bodies.

11. Branciforte Creek and Camp Evers Creek are located in the San Lorenzo River Watershed, are not on the Clean Water Act 303(d) list of impaired waters for pathogens, and do not meet Basin Plan water quality objectives for fecal coliform. The Central Coast Water Board finds that Branciforte Creek and Camp Evers Creek are impaired for fecal coliform. Therefore, this Resolution establishes TMDLs and associated allocations for Branciforte Creek and Camp Evers Creek.
12. The Central Coast Water Board's goal for establishing TMDLs in the San Lorenzo River Watershed is to rectify the fecal coliform impairment, thereby maintaining the water for the beneficial uses of contact and non-contact water recreation.
13. San Lorenzo River Estuary (also known as the San Lorenzo River Lagoon) is the receiving water for approximately 87,800 acres of land and flows into northern Monterey Bay. Camp Evers Creek flows into Carbonera Creek. Carbonera Creek flows into Branciforte Creek, and Branciforte Creek flows into San Lorenzo River Estuary. Lompico Creek flows into San Lorenzo River, and San Lorenzo River flows into San Lorenzo River Estuary.
14. The elements of a TMDL are described in 40 CFR 130.2 and 130.7, section 303(d) of the Clean Water Act, and USEPA guidance documents. A TMDL is defined as "the sum of individual waste load allocations for point sources and load allocations for nonpoint sources and natural background" (40 CFR 130.2). The Central Coast Water Board has determined that the San Lorenzo River Watershed TMDLs are set at levels necessary to attain and maintain the applicable numeric water quality objectives taking into account seasonal variations and any lack of knowledge concerning the relationship between effluent limitations and water quality (40 CFR 130.7 (c) (1)). The regulations in 40 CFR 130.7 also state that TMDLs shall take into account critical conditions for stream flow, loading, and water quality parameters. TMDLs are often expressed as a mass load of the pollutant but can be expressed as a unit of concentration if appropriate (40 CFR 130.2(i)). Expressing these TMDLs as units of concentration is appropriate because an existing concentration-based water quality objective is used as the basis for the TMDL numeric target.
15. Upon establishment of TMDLs by the State or USEPA, the State is required to incorporate the TMDLs, along with appropriate implementation measures, into the State Water Quality Management Plan (40 CFR 130.6(c)(1) and 130.7; and California Water Code sections 13050(j) and 13242). The Basin Plan and applicable statewide plans serve as the State Water Quality Management Plan governing the watersheds under the jurisdiction of the Central Coast Water Board.
16. The Central Coast Water Board may, pursuant to California Water Code section 13243, specify certain conditions or areas where the discharge of waste, or certain types of waste, will not be permitted (i.e., prohibitions). The Implementation Plan for the TMDLs for the San Lorenzo River Watershed requires compliance with the human fecal material discharge prohibition and the domestic animal waste discharge prohibition (proposed Amendment No. 2 contained herein) for discharges in the San Lorenzo River Watershed. Supporting documentation for adding the San Lorenzo River Watershed to the above-named prohibitions is provided in the Final Project Report for Total Maximum Daily Load for Pathogens in San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Camp Evers Creek, Carbonera Creek, and Lompico Creek. Consistent with California Water Code section 13244, the Central Coast Water Board complied with public notice and hearing requirements for adding

- the San Lorenzo River Watershed to the human fecal material discharge and the domestic animal waste discharge prohibitions.
17. Central Coast Water Board staff submitted a Use Attainability Analysis to an external scientific review panel in March 2006 as required by Health & Safety Code section 57004. Central Coast Water Board staff also submitted the Project Report for the TMDLs to an external scientific review panel in July 2007. The staff received comments from the panel. Water Board staff edited the Project Report or provided a written response that explained the basis for failing to incorporate the comments, or the comments did not result in any changes to the proposed Basin Plan Amendments. The scientific portions of the proposed removal of the SHELL beneficial use, the prohibitions, the TMDLs and Implementation Plan are based on sound scientific knowledge, methods, and practices in accordance with section Health & Safety Code section 57004.
 18. Central Coast Water Board staff implemented a process to inform interested persons and the public about the removal of the SHELL beneficial use designation for the San Lorenzo River Estuary, adding the San Lorenzo River Watershed to the human fecal material discharge prohibition and the domestic animal waste discharge prohibition, and adoption the TMDLs. Central Coast Water Board staff's efforts to inform the public and solicit comment included a public meeting with interested parties and a public notice and comment period. Public notification of the amendment to the Basin Plan provided the public a 45-day public comment period preceding the Central Coast Water Board hearing. Notice of the public hearing was given by advertising in newspapers of general circulation within the Region and by mailing a copy of the notice to all persons requesting such notice and applicable government agencies. Relevant documents and notices were also made available on the Central Coast Water Board website. Central Coast Water Board staff responded to oral and written comments received from the public. All public comments were considered.
 19. The removal of the shellfish harvesting beneficial use from the San Lorenzo River Estuary and adoption of these TMDLs and Basin Plan amendments will not result in any degradation of water quality; in fact, they are designed to improve water quality. As such, these TMDLs and basin plan amendments comply with all requirements of both State and Federal anti-degradation requirements (State Board Resolution 68-16 "Statement of Policy with Respect to Maintaining High Quality of Waters in California, and 40CFR 131.12).
 20. Pursuant to Public Resources Code section 21080.5, the Resources Agency has approved the Regional Water Boards' basin planning process as a "certified regulatory program" that adequately satisfies the California Environmental Quality Act (CEQA) (Public Resources Code, Section 21000 et seq.) requirements for preparing environmental documents (14 Cal. Code Regs. §15251(g); 23 Cal. Code Regs. § 3782.). Central Coast Water Board staff has prepared "substitute environmental documents" for this project that contain the required environmental documentation as set forth in the State Water Resources Control Board's (State Board) CEQA regulations (23 Cal. Code Regs. § 3777.). The substitute environmental documents include the TMDL Staff Report and several of its Attachments, including 1) this Resolution and the Basin Plan Amendment Language (Attachment 1 of the Staff Report); 2) "Total Maximum Daily Loads for Pathogens In San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Camp Evers Creek, Carbonera Creek, And Lompico Creek, Santa Cruz County, California" (Attachment 2 of the Staff Report); 3) the CEQA Substitute Document with environmental checklist (Attachment 3 of the Staff Report); and 4) the comments and responses to comments (Attachment 6 of the Staff Report). The Staff Report also includes the Notice of Public Hearing/Notice of Filing (Attachment 4) and the Scientific Peer Review Comment (Attachment 5). The project itself is the establishment of TMDLs for fecal coliform in the San Lorenzo River Watershed. The Board exercises discretion in

assigning waste load allocations and load allocations, determining the program of implementation, and setting various milestones in achieving the water quality standards. The CEQA checklist and other portions of the substitute environmental documents contain significant analysis and numerous findings related to impacts and mitigation measures.

21. A CEQA Scoping meeting was conducted on June 26, 2006, at the Capitola City Hall Community Room, 420 Capitola Avenue, Capitola, Santa Cruz County. A notice of the CEQA Scoping meeting was sent to interested persons on May 30, 2006, including to the City of Capitola and the County of Santa Cruz. The notice included a background of the project, the project purpose, a meeting schedule and directions for obtaining more detailed information through the Central Coast Water Board website; the notice and project summary were available at the website or by requesting hard copies via telephone.
22. Public Resources Code section 21159 provides that an agency shall perform, at the time of the adoption of a rule or regulation requiring the installation of pollution control equipment, or a performance standard or treatment requirement, an environmental analysis of the reasonably foreseeable methods of compliance, and an analysis of the reasonably foreseeable environmental impacts of the methods of compliance, an analysis of reasonably foreseeable mitigation measures to lessen the adverse environmental impacts, and an analysis of reasonably foreseeable alternative means of compliance with the rule or regulation that would have less significant adverse impacts. Section 21159(c) requires that the environmental analysis take into account a reasonable range of environmental, economic, and technical factors; population and geographic areas; and specific sites. The Staff Report prepared for this Basin Plan amendment, in particular the CEQA Substitute Document Report (Attachment 3), provides the environmental analysis required by Public Resources Code section 21159 and is hereby incorporated as findings in this Resolution.
23. In preparing the substitute environmental documents, the Central Coast Water Board has considered the requirements of Public Resources Code section 21159 and California Code of Regulations title 14, section 15187, and intends those documents to serve as a Tier 1 environmental review. This analysis is not intended to be an exhaustive analysis of every conceivable impact, but an analysis of the reasonably foreseeable consequences of the adoption of this regulation, from a programmatic perspective. Compliance obligations will be undertaken directly by public agencies that may have their own obligations under CEQA. Project level impacts may need to be considered in any subsequent environmental analysis performed by other public agencies, pursuant to Public Resources Code section 21159.2. To the extent applicable, this Tier 1 substitute environmental document may be used to satisfy subsequent CEQA obligations of those agencies.
24. Consistent with the Water Board's substantive obligations under CEQA, the substitute environmental documents do not engage in speculation or conjecture, and only consider the reasonably foreseeable environmental impacts, including those relating to the methods of compliance, reasonably foreseeable feasible mitigation measures to reduce those impacts, and the reasonably foreseeable alternative means of compliance, which would avoid or reduce the identified impacts.
25. The proposed amendment will have a less than significant adverse effect on the environment. California Water Code section 13360 precludes the Regional Board from dictating the manner in which responsible agencies comply with any of the Regional Board's regulations or orders. When the agencies responsible for implementing these TMDLs determine how they will proceed, the agencies responsible for those parts of the project can and should incorporate such alternatives and mitigation into any subsequent projects or project approvals. These

feasible alternatives and mitigation measures are described in more detail in the substitute environmental documents (14 Cal. Code Regs. § 15091(a)(2)).

26. From a program-level perspective, incorporation of the alternatives and mitigation measures outlined in the substitute environmental documents will foreseeably reduce impacts to no impact, or keep the impact at less than significant levels.
27. The substitute documents for these TMDLs, and in particular the CEQA Substitute Document and Environmental Checklist (Attachment 3 of the Staff Report), identify mitigation approaches that should be considered at the project level.
28. The Central Coast Water Board will request that the State Water Board approve the Basin Plan amendments incorporating: a) the removal of the SHELL beneficial use for San Lorenzo River Estuary, b) San Lorenzo River Watershed as subject to the Domestic Animal Waste Discharge Prohibition and the Human Fecal Material Discharge Prohibition, and c) TMDLs for pathogens for the San Lorenzo River Watershed. The TMDLs and associated Implementation Plan and prohibitions will become effective upon approval by the California Office of Administrative Law. The removal of the SHELL beneficial use will become effective upon approval by USEPA.
29. The amendments to the Basin Plan may have an effect on fish and wildlife. The Central Coast Water Board will, therefore, forward fee payments to the Department of Fish and Game under the California Fish and Game Code section 711.4.
30. The regulatory action meets the "Necessity" standard of the Administrative Procedures Act, Government Code, section 11353, subdivision (b). As specified in Finding 15, federal regulations require that TMDLs be incorporated into the Water Quality Management Plan. The Central Coast Water Board's Basin Plan is the Central Coast Water Board's component of the Water Quality Management Plan, and the Basin Plan is how the Central Coast Water Board takes quasi-legislative planning actions. Moreover, the TMDL is a program of implementation for existing water quality objectives, and is, therefore, appropriately a component of the Basin Plan under the California Water Code, section 13242. The necessity of developing TMDLs is established in the TMDL staff report, the Clean Water Act section 303(d) list, and the data contained in the administrative record documenting the pathogen impairments of the San Lorenzo River Watershed.
31. On March 21, 2008, in Salinas, California, the Central Coast Water Board held a public hearing and heard and considered all public comments and evidence in the record.
32. On March 21, 2008, the Central Coast Water Board adopted resolution no. R3-2008-0001 and forwarded the record to the State Water Board for adoption.
33. On November 6, 2008, the Central Coast Water Board's Executive Officer withdrew the Total Maximum Daily Loads for Pathogens in San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Camp Evers Creek, Carbonera Creek, And Lompico Creek from consideration for adoption by the State Water Board. The Executive Officer withdrew the TMDLs for consideration due to State Board staff's recommendation to clarify language in the TMDLs and prohibitions before submittal to the State Water Board for approval; this Resolution includes the recommended clarifications.
34. On May 8, 2009, in San Luis Obispo, California, the Central Coast Water Board held a public hearing and heard and considered all public comments and evidence in the record.

THEREFORE, be it resolved that:

1. Pursuant to sections 13240, 13241, 13242, 13243, and 13244 of the California Water Code, the Central Coast Water Board, after considering the entire record, including the oral testimony at the hearing, hereby adopts the amendment in "Attachment-Proposed Basin Plan Amendments."
2. The Executive Officer is directed to forward copies of the Basin Plan amendment to the State Board in accordance with the requirements of section 13245 of the California Water Code.
3. The Central Coast Water Board requests that the State Board approve the Basin Plan amendments in accordance with the requirements of sections 13245 and 13246 of the California Water Code and forward them to the California Office of Administrative Law and the USEPA for approval.
4. The Executive Officer is authorized to sign a Certificate of Fee Exemption or transmit payment of the applicable fee as may be required to the Resources Agency.
5. If, during the approval process, Central Coast Water Board staff, State Board staff, the State Board or Office of Administrative Law determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.
6. The substitute environmental documents prepared by the Central Coast Water Board staff pursuant to Public Resources Code 21080.5 are hereby certified.

I, Roger W. Briggs, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of the resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region, on May 8, 2009.

Roger W. Briggs
Executive Officer

RESOLUTION NO. R3-2009-0023

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENTS

Revise the September 8, 1994 Basin Plan as follows:

AMENDMENT NO. 1.

Amend Chapter 2, Table 2-1. Identified Uses of Inland Surface Waters

Waterbody Names	MUN	AGR	PRO	IND	GWR	REC1	REC2	WILD	COLD	WARM	MIGR	SPWN	BIOL	RARE	EST	FRESH	NAV	POW	COMM	AQUA	SAL	SHELL	
San Lorenzo River Estuary						X	X	X	X		X	X	X	X	X				X				X

AMENDMENT NO. 2. Revise the September 8, 1994 Basin Plan, Chapter Five, as follows:

Amend Chapter Five, section IV.B. as follows:

Add the following watershed to the end of the bulleted list of applicable areas of the Human Fecal Material Discharge Prohibition and the Domestic Animal Waste Discharge Prohibition:

- San Lorenzo River Watershed

AMENDMENT NO. 3. ADOPT THE TOTAL MAXIMUM DAILY LOADS FOR PATHOGENS IN SAN LORENZO RIVER ESTUARY, SAN LORENZO RIVER, BRANCIFORTE CREEK, CAMP EVERS CREEK, CARBONERA CREEK, AND LOMPICO CREEK

Add the following to Chapter 4 after IX. I.:

IX. J. TOTAL MAXIMUM DAILY LOADS FOR PATHOGENS IN SAN LORENZO ESTUARY, SAN LORENZO RIVER, BRANCIFORTE CREEK, CAMP EVERS CREEK, CARBONERA CREEK, AND LOMPICO CREEK

The Regional Water Quality Control Board adopted these TMDLs on May 8, 2009.

These TMDLs were approved by:

The State Water Resources Control Board on: _____ (insert date)

The California Office of Administrative Law on: _____ (insert date)

The U.S. Environmental Protection Agency on: _____ (insert date):

Problem Statement

The beneficial use of water contact recreation is not protected in the impaired reaches of the San Lorenzo River Estuary (also known as San Lorenzo River Lagoon), San Lorenzo River, Branciforte Creek, Camp Evers Creek, Carbonera Creek, and Lompico Creek because fecal coliform concentrations exceed existing Basin Plan numeric water quality objectives protecting this beneficial use. All reaches in these waterbodies are impaired with the exception of Carbonera Creek, where the impairment extends from the mouth of Carbonera Creek upstream to its intersection with Bethany Road.

Numeric Targets

The numeric targets used to develop the TMDLs and allocations are as follows:

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

Source Analysis

San Lorenzo River Estuary

The relative order of controllable sources, in descending order, is:

1) City of Santa Cruz sanitary sewer collection system spills and leaks (including private laterals connected to municipal sanitary sewer collection systems), 2) storm drain discharges to municipally owned and operated separate storm sewer systems (MS4s) required to be covered by an NPDES permit, 3) pet waste in areas that do not drain to MS4s, 4) homeless person/encampment discharges in areas that do not drain to MS4s, 5) onsite wastewater disposal system discharges, and 6) farm animal and livestock discharges.

San Lorenzo River, and Lompico Creek

The relative order of controllable sources, in descending order, is:

1) Onsite wastewater disposal system discharges, 2) storm drain discharges to MS4s required to be covered by an NPDES permit, 3) City of Santa Cruz sanitary sewer collection system spills and leaks (including private laterals connected to municipal sanitary sewer collection systems) within the City limits of Santa Cruz [does not include Lompico Creek], 4) pet waste in areas that do not drain to MS4s, 5) homeless person/encampment discharges in areas that do not drain to MS4s, and 6) farm animal and livestock discharges.

Branciforte Creek

The relative order of controllable sources, in descending order, is:

1) Storm drain discharges to MS4s required to be covered by an NPDES permit, 2) pet waste in areas that do not drain to MS4s, 3) City of Santa Cruz sanitary sewer collection system spills and leaks (including private laterals connected to municipal sanitary sewer collection systems) within the City limits of Santa Cruz, 4) homeless person/encampment discharges in areas that do not drain to MS4s, 5) onsite wastewater disposal system discharges, and 6) farm animal and livestock discharges.

Carbonera and Camp Evers Creeks:

The relative order of controllable sources, in descending order, is:

1) Storm drain discharges to MS4s required to be covered by an NPDES permit, 2) pet waste in areas that do not drain to MS4s, 3) homeless person/encampment discharges in areas that do not drain to MS4s, 4) onsite wastewater disposal system discharges (only for Carbonera Creek) 5) farm animal and livestock discharges, and 6) City of Santa Cruz sanitary sewer collection system spills and leaks (including private laterals connected to municipal sanitary sewer collection systems; only for Carbonera Creek).

TMDLs and Allocations

The TMDLs are for the impaired reaches of the following water bodies, and are applicable for each day for all seasons:

San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Camp Evers Creek, Carbonera Creek, and Lompico Creek. TMDLs:

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

The allocations to responsible parties are shown in Table IX J-1.

Table IX J-1. Allocations and Responsible Parties

WASTE LOAD ALLOCATIONS		
Waterbody Assigned Allocation	Responsible Party (Source) NPDES/Order number	Receiving Water Fecal Coliform (MPN/100mL)
<u>San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, and Carbonera Creek</u>	<u>City of Santa Cruz</u> (Storm drain discharges to MS4s required to be covered by an NPDES permit) NPDES No. CAS000004	<u>Allocation-1^a</u>
<u>Camp Evers Creek and Carbonera Creek</u>	<u>City of Scotts Valley</u> (Storm drain discharges to MS4s required to be covered by an NPDES permit) NPDES No. CAS000004	<u>Allocation-1^a</u>
<u>San Lorenzo River, Branciforte Creek, Lompico Creek, and Carbonera Creek</u>	<u>Santa Cruz County</u> (Storm drain discharges to MS4s required to be covered by an NPDES permit) NPDES No. CAS000004	<u>Allocation-1^a</u>
<u>San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, and Carbonera Creek</u>	<u>City of Santa Cruz</u> (Sanitary sewer collection system spills and leaks) NPDES No. CA 0048194, Order R3-2005-003	<u>Allocation-2^b</u>
<u>San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Carbonera Creek, and Lompico Creek</u>	<u>Owners of onsite wastewater disposal systems residing in the County of Santa Cruz</u> (Onsite wastewater disposal system discharges)	<u>Allocation-2^b</u>
LOAD ALLOCATIONS		
Waterbody	Responsible Party (Source)	Receiving Water Fecal Coliform (MPN/100mL)
<u>San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Carbonera Creek, and Lompico Creek</u>	<u>Owners of onsite wastewater disposal systems residing in the County of Santa Cruz</u> (Onsite wastewater disposal system discharges)	<u>Allocation-2^b</u>
<u>San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Camp Evers Creek, Carbonera Creek, and Lompico Creek</u>	<u>Owners/operators of land used for/containing pets</u> (Pet waste not draining to MS4s)	<u>Allocation-1^a</u>
<u>San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Carbonera Creek, Camp Evers Creek, and Lompico Creek</u>	<u>Owners/operators of land used for/containing farm animals and livestock</u> (Farm Animals and Livestock discharges)	<u>Allocation-1^a</u>
<u>San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Lompico Creek, Camp Evers Creek, and Carbonera Creek</u>	<u>Owners and/or operators of land that include homeless persons/encampments</u> (Discharges from homeless persons/encampments not regulated by a permit for storm water discharges)	<u>Allocation-2^b</u>

<p><u>San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Lompico Creek, Camp Evers Creek, and Carbonera Creek</u></p>	<p><u>No responsible party</u> <u>(Natural sources)</u></p>	<p><u>Allocation-1^a</u></p>
<p>¹ <u>All reaches of the following water bodies are assigned allocations, excepting Carbonera Creek, where the allocations are assigned from the mouth to the intersection with Bethany Road.</u></p>		
<p>^a <u>Allocation-1 = Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN/100mL; nor shall more than ten percent of total samples during any 30-day period exceed 400 MPN/100 mL.</u></p>		
<p>^b <u>Allocation-2= Allocation of zero; no loading allowed from this source.</u></p>		

The parties responsible for the allocation to controllable sources are not responsible for the allocation to natural sources.

The TMDLs are considered achieved when the allocations assigned to all individual responsible parties are met or when the numeric targets are consistently met in the San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Camp Evers Creek, Carbonera Creek, and Lompico Creek.

Margin of Safety

A margin of safety is incorporated implicitly in the TMDLs through conservative assumptions.

Implementation Plan

SANITARY SEWER COLLECTION SYSTEM-LEAKS

Entities with jurisdiction over sewer collection systems can demonstrate compliance with these TMDL load allocations through Waste Discharge Requirements and/or NPDES permits.

The City of Santa Cruz and City of Scotts Valley must continue to implement their sewer Collection System Management Plans as required by their respective NPDES permits and Waste Discharge Requirements (WDR) (City of Santa Cruz NPDES No. CA 0048194 and WDR Order R3-2005-003; City of Scotts Valley NPDES No. CA 0048828, WDR Order R3 2002-0016).

In addition, the City of Santa Cruz is required to improve maintenance of their sewage collection system, including identification, correction, and prevention of sewage spills and leaks in portions of the collection systems that run through or adjacent to, impaired surface waters within the San Lorenzo River Estuary or San Lorenzo River. To this end, within six months following adoption of these TMDLs by the Office of Administrative Law, the Executive Officer will issue a letter pursuant to Section 13267 of the California Water Code requiring: 1) submittal within one year of, a technical report that describes how and when the City of Santa Cruz will conduct improved collection system maintenance in portions of the collection system most likely to affect impaired surface water bodies, with the end result being compliance with its TMDL allocation, 2) stream monitoring for fecal coliform or another fecal indicator bacteria and reporting of these monitoring activities, and 3) annual reporting of self-assessment as to whether the City of Santa Cruz is in compliance with the TMDL allocation.

PRIVATE LATERALS TO THE SANITARY SEWER COLLECTION SYSTEMS

The Central Coast Water Board has identified leaks from private laterals located in the City of Santa Cruz as a source of fecal indicator bacteria in municipal separate storm sewer systems (MS4s). Therefore, enrollees for the City of Santa Cruz' General Permit for the Discharges of Storm Water from Small Municipal Separate Storm Sewer Systems will address fecal indicator bacteria from private lateral leaks in the Wasteload Allocation Attainment Program (as described in the following section).

STORM DRAIN DISCHARGES TO MUNICIPALLY OWNED AND OPERATED SEPARATE STORM SEWER SYSTEMS

The Central Coast Water Board will address fecal indicator bacteria (FIB), e.g., fecal coliform and/or other indicators of pathogens, discharged from the County of Santa Cruz and the Cities of Santa Cruz and Scotts Valley municipal separate storm sewer systems (MS4 entities) by regulating the MS4 entities under the provisions of the State Water Resource Control Board's General Permit for the Discharges of Storm Water from Small Municipal Separate Storm Sewer Systems (General Permit) (NPDES No. CAS000004). As enrollees under the General Permit, the MS4 entities must develop and implement Storm Water Management Plans (SWMPs) that control urban runoff discharges into and from their MS4s. To address the MS4 entities' TMDL wasteload allocations, the Central Coast Water Board will require the MS4 entities to specifically target FIB in urban runoff through incorporation of Wasteload Allocation Attainment Programs in their SWMPs.

The Central Coast Water Board will require the Wasteload Allocation Attainment Program to include descriptions of the actions that will be taken by the MS4 entities to attain the TMDL wasteload allocations, and specifically address:

1. Development of an implementation and assessment strategy;
2. Source identification and prioritization;
3. Best management practice identification, prioritization, implementation schedule, analysis, and effectiveness assessment;
4. Monitoring program development and implementation;
5. Reporting, including evaluation whether current best management practices are progressing towards achieving the wasteload allocations within thirteen years of the date that the TMDLs are approved by the Office of Administrative Law.
6. Coordination with stakeholders; and
7. Other pertinent factors.

The Wasteload Allocation Attainment Program will be required by the Central Coast Water Board to address each of these TMDLs that occur within the MS4 entities' jurisdictions.

The Central Coast Water Board will require the Wasteload Allocation Attainment Program to be submitted at one of the following milestones, whichever occurs first:

1. Within one year of approval of the TMDLs by the Office of Administrative Law;
2. When required by any other Water Board-issued storm water requirements (e.g., when the Phase II Municipal Storm Water Permit is renewed).

For those MS4 entities that are enrolled under the General Permit at the time of Wasteload Allocation Attainment Program submittal, the Wasteload Allocation Attainment Program must be incorporated into the SWMPs when they are submitted. For those MS4 entities that are not enrolled under the General Permit at the time of Wasteload Allocation Attainment Program submittal, the

Wasteload Allocation Attainment Program must be incorporated into the SWMPs when the SWMPs are approved by the Central Coast Water Board.

The Executive Officer or the Central Coast Water Board will require information that demonstrates implementation of the actions described above, pursuant to applicable sections of the California Water Code and/or pursuant to authorities provided in the General Permit for storm water discharges.

PET WASTE, FARM ANIMALS AND LIVESTOCK DISCHARGES

Owners and/or operators of lands containing domestic animals (including pets, farm animals, and livestock) in the San Lorenzo River Watershed must comply with the Domestic Animal Waste Discharge Prohibition; compliance with the Domestic Animal Waste Discharge Prohibition implies compliance with the load allocation for these TMDLs.

Within three years of approval of these TMDLs by the Office of Administrative Law, the Executive Officer will notify owners and/or operators of lands used for/containing domestic animals of the requirement to comply with the Domestic Animal Waste Discharge Prohibition. In his notification, the Executive Officer will also describe the options owners/operators of lands containing domestic animals have for demonstrating compliance with the Domestic Animal Waste Discharge Prohibition; pursuant to California Water Code section 13267 and within six months of the notification by the Executive Officer, owners/operators of lands containing domestic animals will be required to submit the following for approval by the Executive Officer or the Water Board:

- 1) Clear evidence that the owner/operator of lands containing domestic animals is and will continue to be in compliance with the Domestic Animal Waste Discharge Prohibition; clear evidence could be documentation submitted by the owner/operator to the Executive Officer validating current and continued compliance with the Prohibition, or
- 2) A plan for compliance with the Domestic Animal Waste Discharge Prohibition. Such a plan must include a list of specific management practices that will be implemented to control discharges containing fecal material from domestic animals. The plan must also describe how implementing the identified management practices are likely to progressively achieve the load allocations to domestic animals, with the ultimate goal achieving the load allocations no later than thirteen years after Office of Administrative Law approval of the TMDL. - The plan must include monitoring and reporting to the Central Coast Water Board, demonstrating the progressive progress towards achieving load allocations for discharges from domestic animals, and a self-assessment of this progress. The plan may be developed by an individual discharger or by or for a coalition of dischargers in cooperation with a third-party representative, organization, or government agency acting as the agents of owners/operators of lands containing domestic animals, or
- 3) Submittal of a Report of Waste Discharge pursuant to California Water Code Section 13260 (as an application for waste discharge requirements).

ONSITE WASTEWATER DISPOSAL SYSTEM DISCHARGES

Owners of onsite wastewater disposal systems in the San Lorenzo River Watershed must comply with the Human Fecal Material Discharge Prohibition.

Owners of onsite wastewater disposal systems must demonstrate to the satisfaction of the Executive Officer or the Water Board that they are in compliance with the Human Fecal Material Discharge Prohibition; compliance with the Human Fecal Material Discharge Prohibition implies compliance

with the load allocation for these TMDLs.

Within three years of approval of these TMDLs by the Office of Administrative Law, the Executive Officer will either 1) determine that the County of Santa Cruz, or similar, is making adequate progress towards implementing an approved Santa Cruz County Onsite Wastewater Management Plan (or another Implementation Program to address onsite wastewater disposal systems) as it pertains to controlling the waste loads from onsite wastewater disposal systems in the San Lorenzo River Watershed, or 2) notify owners of onsite wastewater disposal systems (owners) in the area described above of the requirement to comply with the Human Fecal Material Discharge Prohibition. In his notification, the Executive Officer will also describe owners' options for demonstrating compliance with the Human Fecal Material Discharge Prohibition; pursuant to California Water Code 13267 and within six months of the notification by the Executive Officer, owners will be required to submit the following for approval by the Executive Officer or the Water Board:

- 1) Clear evidence that the owner is and will continue to be in compliance with the Human Fecal Material Discharge Prohibition; clear evidence could be verification by the County of Santa Cruz, or similar, that the owners onsite wastewater disposal system is in compliance with the Human Fecal Material Discharge Prohibition, or
- 2) A schedule for compliance with the Human Fecal Material Discharge Prohibition. The compliance schedule must include a monitoring and reporting program and milestone dates demonstrating progress towards compliance with the Human Fecal Material Discharge Prohibition, with the ultimate milestone being compliance with the Human Fecal Material Discharge Prohibition no later than three years from the date of the Executive Officer's notification to the owner requiring compliance, or
- 3) Submittal of a Report of Waste Discharge pursuant to California Water Code Section 13260 (as an application for waste discharge requirements; WDRs), or
- 4) Clear evidence of current or scheduled compliance with the Human Fecal Material Discharge Prohibition (as described in number 1 and number 2 above, respectively) through the submittal of the required information by County of Santa Cruz, acting as the voluntary agents of owners of onsite wastewater disposal systems. Note that an owner of an onsite wastewater disposal system cannot demonstrate compliance with the Human Fecal Material Discharge Prohibition through this option if: 1) the County of Santa Cruz is not their voluntary agent, 2) if the owner of the onsite wastewater disposal system does not choose the County of Santa Cruz as their agent, or 3) the Executive Officer or Water Board does not approve the evidence submitted by the County of Santa Cruz on behalf of the owners of onsite wastewater disposal systems.

HOMELESS PERSONS/ENCAMPMENT DISCHARGES NOT REGULATED BY A PERMIT FOR STORM WATER DISCHARGES

Owners of land that contain homeless persons and/or homeless encampments in the San Lorenzo River Watershed must comply with the Human Fecal Material Discharge Prohibition.

Owners of land with homeless persons must demonstrate to the satisfaction of the Executive Officer or the Water Board that they are in compliance with the Human Fecal Material Discharge Prohibition; compliance with the Human Fecal Material Discharge Prohibition implies compliance with the load allocation for these TMDLs.

Within three years of approval of these TMDLs by the Office of Administrative Law, the Executive Officer will notify owners of land containing homeless persons of the requirement to comply with the Human Fecal Material Discharge Prohibition. In his notification, the Executive Officer will also describe owners' options for demonstrating compliance with the Human Fecal Material Discharge

Prohibition; pursuant to California Water Code 13267 and within six months of the notification by the Executive Officer, owners will be required to submit the following for approval by the Executive Officer or the Water Board:

- 1) Clear evidence that the owner is and will continue to be in compliance with the Human Fecal Material Discharge Prohibition; clear evidence could be documentation submitted by the owner to the Executive Officer validating current and continued compliance with the Prohibition, or
- 2) A plan for compliance with the Human Fecal Material Discharge Prohibition. Such a plan must include a list of specific management practices that will be implemented to control discharges containing fecal material from homeless persons. The Plan must also describe how implementing the identified management practices are likely to progressively achieve the load allocation for homeless persons, with the ultimate goal achieving the load allocation no later than three years from the date of the Executive Officer's notification to the owner requiring compliance. The plan must include monitoring and reporting to the Central Coast Water Board, demonstrating the progressive progress towards achieving load allocations for discharges from homeless persons, and self-assessment of this progress, or
- 3) Submittal of a Report of Waste Discharge pursuant to California Water Code Section 13260 (as an application for waste discharge requirements).

Tracking and Evaluation

Every three years, beginning three years after TMDLs are approved by the Office of Administrative Law, the Central Coast Water Board will perform a review of implementation actions, monitoring results, and evaluations submitted by responsible parties of their progress towards achieving their allocations. The Central Coast Water Board will use annual reports, nonpoint source pollution control implementation programs, evaluations submitted by responsible parties, and other available information to determine progress toward implementing required actions and achieving the allocations and the numeric target.

Responsible parties will continue monitoring and reporting according to this plan for at least three years, at which time the Central Coast Water Board will determine the need for continuing or otherwise modifying the monitoring requirements. Responsible parties may also demonstrate that although water quality objectives are not being achieved in receiving waters, controllable sources of pathogens are not contributing to the exceedance. If this is the case, the Central Coast Water Board may re-evaluate the numeric target and allocations. For example, the Central Coast Water Board may pursue and approve a site-specific objective. The site-specific objective would be based on evidence that natural, or background sources alone were the cause of exceedances of the Basin Plan water quality objective for fecal indicator bacteria.

Three-year reviews will continue until the water quality objectives are achieved. The compliance schedule for achieving the TMDL numeric target is 13 years after the date of approval by the Office of Administrative Law.

CHAPTER 4. IMPLEMENTATION PLAN

VIII.D. INDIVIDUAL, ALTERNATIVE AND COMMUNITY ONSITE WASTEWATER SYSTEMS

~~On-site sewage disposal wastewater systems and other similar methods for liquid waste disposal are sometimes viewed as interim solutions in urbanizing areas, yet may be required to function for many years. On-site systems can be a viable long-term waste disposal method with proper siting, design, construction, and management. In establishing on-site system regulations, agencies must consider such systems as permanent, not interim systems to be replaced by public sewers. The reliability of these systems is highly dependent on land and soil constraints, proper design, proper construction, and proper operation and maintenance.~~

~~If on-site sewage treatment facilities are not carefully managed, problems can occur, including:~~

- ~~• odors or nuisance;~~
- ~~• surfacing effluent;~~
- ~~• disease transmission; and,~~
- ~~• pollution of surface and groundwaters.~~

~~Odors and nuisance can be objectionable and annoying and may obstruct free use of property. Surfacing effluent (effluent which fails to percolate and rises to the ground surface) can be an annoyance, or health hazard to the resident and neighbors. In some cases, nearby surface waters may be polluted.~~

~~On-site sewage disposal systems are a potential mechanism for disease transmission. Sewage is capable of transmitting diseases from organisms which are discharged by an infected individual. These include dysentery, hepatitis, typhoid, cholera, and gastro-intestinal disorders.~~

~~Pollution of surface or groundwaters can result from the discharge of on-site system wastes. Typical~~

~~problem waste constituents are total dissolved solids, phosphates, nitrates, heavy metals, bacteria, and viruses.~~

~~Subsurface disposal~~ Onsite wastewater systems may be used to treat and dispose of wastewater from: (1) individual residences; (2) multi-unit residences; (3) institutions or places of commerce; (4) industrial sanitary sources; and, (5) small communities. All individual and multi-unit residential, ~~developments are subject to criteria in this section of the Basin Plan.~~ commercial, institutional and industrial developments with a discharge flow rate less than 2,500 gallons per day and community systems not regulated by waste discharge requirements must comply with these criteria. ~~Community systems must also comply with criteria relating to this subject within the Basin Plan.~~ Community systems are defined for the purposes of this Basin Plan as: (1) residential wastewater treatment systems for servicing more than 5 units or more than 5 parcels; or, (2) commercial, institutional or industrial systems ~~to treat~~ treating sanitary wastewater equal to or greater than 2,500 gallons per day (average daily flow). Community systems of this type and size may be subject to waste discharge requirements.

Conventional onsite wastewater systems consist of septic tanks and leachfield or seepage pits and are typically designed to treat and dispose of domestic wastewater.^{EPA} Alternatives to conventional onsite system designs ~~have been~~ are used when site constraints prevent the use of conventional systems. Examples of alternative systems include (but are not limited to) enhanced treatment systems, mound and or evapotranspiration disposal systems, or at-grade disposal systems. Remote subdivisions, commercial centers, or industries may utilize conventional collection systems with community treatment systems and subsurface disposal fields for sanitary wastes.

Conventional, alternative and community systems can pose serious water quality problems if improperly designed, installed, and/or managed. Failures have occurred in the past and are usually attributed to the following:

- Systems are inadequately or improperly sited, designed, or constructed.

**Water Quality Control Plan, Central Coast Basin
Revisions to Chapter 4
(onsite wastewater sections only)**

- Long term use is not considered.
- Inadequate operation and maintenance.

The following definitions are used throughout this section of the Water Quality Control Plan.

Alternative onsite system consists of additional (beyond conventional) treatment and/or disposal features engineered to overcome site constraints. A conventional onsite system that requires a pump to reach the leach area is not considered "alternative".^{EPA}

Application area shall be calculated no greater than the trench bottom and side walls below the bottom of the leach pipe, minus the first foot on each side. In seepage pits the application area refers to the total gravel depth in a seepage pit, minus any impervious, bedrock or clay lenses encountered in the sidewalls.^{UPC}

At-grade disposal systems consist of distribution pipe and bed at the native ground surface level and cover provided by filled material. At-grade disposal systems are similar to mound systems without the sand layer.^{UCD}

Conventional onsite system consists of a septic tank and leachfield or seepage pit.^{EPA}

Detrimental Water Quality Impact is any significant increase in waste concentrations or impairment of beneficial uses of a water body.

Drainfield is used interchangeably with leachfield, leach area or disposal area.

Effective trench depth means depth below the bottom of the leach trench distribution piping minus the first foot.

Engineered systems are treatment and disposal systems that require special design features to overcome site limitations (topography, soil conditions, shallow groundwater or setback variances).^{EPA}

Existing onsite system is any onsite system approved and/or installed prior to adoption of these criteria on March 20, 2009.

**Resolution No. R3-2008-0005 and
Resolution No. R3-2009-0012 changes**

2

Failed or failing onsite system is any system that displays symptoms of inadequate dispersion, treatment or assimilation of wastewater. These may include, but are not limited to, surfacing effluent, lush growth above the leach area, sluggish house drains, impacts to surface or groundwater from the onsite discharge, odors, frequent pumping, or backflow into tank when pumped.^{EPA}

Fill is material deposited to raise the existing or excavated ground level.

Inflow and infiltration refers to non-wastewater (stormwater, groundwater, streams, seawater) entering the wastewater system through cracks, roof drains or other openings.

Impervious Low permeability material is defined as having a percolation rate slower than 120 minutes per inch or having a clay content (% passing 200 sieve) of 60 percent or greater.

Local governing jurisdiction shall refer to the local governing jurisdiction, typically city or county, vested with legislative authority for onsite wastewater system permitting.

Monitoring shall refer to any sort of quality or performance assessment, including visual inspections.

New onsite system is an onsite wastewater system placed on property that has not previously been developed, or expansion of an existing onsite system to accommodate an increase in wastewater generation, after adoption of these criteria (March 20, 2009). Repair or replacement of an existing onsite system does not constitute a new onsite system.

Onsite disposal area shall include the direct application area (trench, pit, bed) and surrounding 100' radius from any point in the application area that may be influenced by discharge from the disposal system.

Reservoir - A pond, lake, ~~lake~~, basin, or other space either natural or created in whole or in part by the building of engineering structures, which is used for storage, regulation, and control of drinking supply water ~~recreation, power, flood control, or drinking~~.

Septage is material removed from a septic tank; usually the accumulated scum, sludge and liquid within the tank.

Sidewall is the side portion of the leach area below the bottom of the distribution piping, or total gravel depth beneath the first hole in the central pipe of a seepage pit.^{UPC}

Threatened condition is one that if left uncorrected may cause or contribute to water quality or public health impacts.

Watercourse - A natural or man-made artificial channel for passage of water. A running stream of water. A natural stream fed from permanent or natural sources, including rivers, creeks, runs, and rivulets. There must be a stream, usually flowing in a particular direction (though it need not flow continuously) usually discharging into some stream or body of water.

~~VIII.D.1. CORRECTIVE ACTIONS FOR EXISTING SYSTEMS~~

~~Individual disposal systems can be regulated with relative ease when they are proposed for a particular site. For new systems, regulations generally provide for good design and construction practices. A more troublesome problem is presented by older septic tank systems where design and construction may have been less strictly controlled or where land development has intensified to an extent that percolation systems are too close together and there is no room left for replacement leaching areas. Where this situation develops to an extent that public health hazards and nuisance conditions develop, the most effective remedy is usually a sewer system. Where soil percolation rates are particularly fast, groundwater degradation is possible, particularly increases in nitrate concentrations.~~

~~Sewer system planning should be emphasized in urbanizing areas served by septic tanks. A first step would be a monitoring system involving surface and groundwaters to determine whether problems are developing. Where septic tank systems in urbanized areas are not scheduled for replacement by sewers and where public health hazards are not documented, septic tank~~

~~maintenance procedures are encouraged to lessen the probability that a few major failures might force sewerage of an area which otherwise could be retained on individual systems without compromising water quality. Often a few systems will fail in an area where more frequent septic tank pumping, corrections to plumbing or leach fields, or in-home water conservation measures could help prevent failure. Improvements of this kind should be enforced by a local septic tank maintenance district or local governing jurisdiction.~~

~~A septic tank subjected to greater hydraulic load can fail due to washout of solids into percolation areas and plugging of the infiltrative surface. In some cases, excess wash water could be diverted to separate percolation areas by in-home plumbing changes. Dishwashers, garbage grinders, and washing machines could be eliminated. Water saving toilets, faucets, and shower heads are available to encourage low water use. Water use costs may also be structured to encourage more frugal use of water.~~

VIII.D.1. LOCAL GOVERNING JURISDICTION ACTIONS

VIII.D.1.a. DISCLOSURE AND COMPLIANCE OF EXISTING ONSITE WASTEWATER SYSTEMS

The Water Board, on March 20, 2009, adopted a Basin Plan Implementation Program establishing a conditional waiver for onsite wastewater systems that meet the conditions (Basin Plan Section VIII.D.3). For an onsite wastewater system to be eligible for a conditional waiver. It is incumbent upon Local governing jurisdictions must to should provide develop and implement programs to ensure conformance with this Basin Plan and local regulations. Such programs shall include (but are not be limited to) inspection programs-procedures to:

- ~~• should~~ Ensure site suitability tests are performed as necessary, and that tests are performed in accordance with standard procedures;

**Water Quality Control Plan, Central Coast Basin
Revisions to Chapter 4
(onsite wastewater sections only)**

- ~~Inspections should also~~ Ensure proper system siting, design, construction and installation; and
- Adequately inform ~~home~~ property owners regarding proper installation, operation and ongoing maintenance of their onsite wastewater systems.

~~Proper design and construction should be certified by the inspector. Concerned homeowners can be a tremendous asset in assuring proper construction. When a septic system permit is issued by the local agency, a handout specifying proper construction techniques should be made available to the general public. Systems must be inspected by the local agency before covering (backfilling).~~

~~Local governing jurisdictions agencies can use staff inspectors or individuals under contract with the local government. Either way A standard detailed checklist should shall be completed by the inspector to verify the onsite wastewater system was constructed in conformance with the Basin Plan and local governing jurisdiction requirements.~~

~~Site suitability determinations should specify: (1) whether approval is for the entire lot or for specific locations of the lot; (2) if further tests are necessary; and (3) if alternatives are necessary or available.~~

~~Where agency approval is necessary from various departments, final sign-offs should be on the same set of plans.~~

~~Property owners should be aware of the nature and requirements of their onsite wastewater disposal system. Plans should be available in city or county offices showing placement of soil absorption systems. Since this is only feasible for new construction, Local governing jurisdictions agencies should require onsite wastewater system as-built plans as a condition of new construction final inspection. Plans would be kept on file for future use of property owners.~~

~~Prospective property buyers should be informed of any enforcement action affecting parcels or houses they wish to buy. For example, a parcel in a discharge prohibition area may be unbuildable for an indefinite period, or a developed parcel may be subject to significant user charges from a future sewer system. Local governing jurisdictions agencies should have ensure the terms of the enforcement action prohibition area are entered into~~

**Resolution No. R3-2008-0005 and
Resolution No. R3-2009-0012 changes**

4

the county record for each affected parcel. When a prospective buyer conducts a title search, terms of the prohibition would appear in the preliminary title report.

All onsite wastewater system owners need to be aware of proper operation and maintenance procedures. Local governing jurisdictions shall mount a continuing public education program to provide homeowners with onsite wastewater system operation and maintenance guidelines. Basin Plan information should be available at local governing jurisdiction health and building departments.

Dual leaching capabilities provide an immediate remedy in the event of system failure. For that reason, dual leachfields are considered appropriate for all systems. Furthermore, should wastewater flows increase, this area can be used until the system is expanded. ~~But system expansion may not be possible if land is not set aside for this purpose. For these reasons,~~ Dedicated system expansion areas are also appropriate. To protect this set-aside area from encroachment, the local governing jurisdiction ~~should~~ shall require restrictions on future use of the area as a condition of land division or building permit approval. For new subdivisions, Covenants, Conditions and Restrictions (CC&R's) or additional map sheets recorded with the Parcel or Tract Final Map might provide an appropriate mechanism for protecting a set aside area. Future buyers of affected property would be notified of property use restrictions by reading the CC&R's or Final Map.

~~Local agencies should conduct an on-site system inspection program, particularly in areas where system failures are common or where systems with poor soils are approved. An agency inspector should periodically check each septic tank for pumping need and each system for proper operation. Homeowners should be alerted where evidence of system failure exists. Where nuisance or a potential public health hazard exists, a followup procedure should insure the situation is corrected. On-site systems should be constructed in a location that facilitates system inspection.~~

~~Another approach is periodically to mail homeowners a brochure reminding them how to maintain and inspect their on-site system. Homeowners should be notified that they should periodically check their septic tank for pumping need. Homeowners should also be notified of other problems indicative of system failure. Some~~

**Water Quality Control Plan, Central Coast Basin
Revisions to Chapter 4
(onsite wastewater sections only)**

**Resolution No. R3-2008-0005 and
Resolution No. R3-2009-0012 changes**

5

~~examples include wet spots in drainfield area, lush grass growths, slowly draining wastewater, and sewage odors.~~

Many existing systems do not comply with current or proposed standards. Repairs to failing systems ~~should~~ shall be done under permit from the local governing jurisdiction. ~~To the extent practicable~~ The local governing jurisdiction ~~should~~ shall require failing systems to be brought into compliance with ~~the Basin Plan recommendations, requirements and prohibitions;~~ or repair criteria consistent with locally implemented onsite management plan (approved by the Central Coast Water Board or its Executive Officer). ~~This could be a condition of granting a permit for repairs.~~

~~Land use changes on properties with commercial, institutional or industrial uses should not be approved by the local governing jurisdiction until the existing onsite system meets criteria of this Basin Plan and local ordinances. A land use permit or business license could be used to alert the local agency of land use changes.~~

Within the following sections, criteria are specified for RECOMMENDATIONS, REQUIREMENTS and PROHIBITIONS.

RECOMMENDATIONS

1. Inform property buyers of the existence, location, operation, and maintenance of onsite disposal systems. Prospective home or property buyers should also be informed of any enforcement action (e.g., Basin Plan prohibitions) through the County Record.
2. Conduct public education programs to provide property owners with operation and maintenance guidelines.
3. It may be appropriate for onsite systems to be maintained by local onsite maintenance districts.
4. Standard soil percolation testing procedures should be adopted. ~~Approve permit applications after checking plans for erosion control measures. Inspect systems prior to covering to assure proper construction.~~

REQUIREMENTS

5. Onsite Wastewater Management Plans ~~should~~ shall be prepared and implemented for urbanizing and high density areas served by

onsite wastewater systems. ~~Areas that should be addressed immediately include (but are not limited to): portions of San Martin, San Lorenzo Valley, Carmel Valley, Carmel Highland, Prunedale, El Toro, Shandon, Templeton, Santa Margarita, Garden Farms, Los Osos/Baywood Park, Arroyo Grande, Nipomo, upper Santa Ynez Valley, and Los Olivos/Ballard.~~

6. Local governing jurisdictions ~~should~~ shall require replacements or repairs to failing systems to be in substantial conformance (to the greatest extent practicable) with Basin Plan recommendations, requirements and prohibitions or the local onsite wastewater management plan.
7. Local governing jurisdictions shall ensure that alternative onsite system owners are provided an informational maintenance or replacement document by the system designer or installer. This document shall cite homeowner procedures to ensure maintenance, repair, or replacement of critical items within 48 hours following failure.
8. Local ordinances shall be updated to reflect Basin Plan criteria.

PROHIBITIONS

9. Alternative systems are prohibited unless consistent with a locally implemented onsite wastewater management plan approved by the Central Coast Water Board Executive Officer or waste discharge requirements issued or waived by the Water Board.^{UPC, EPA}

VIII.D.2 1.b. ONSITE WASTEWATER MANAGEMENT PLANS

The Water Board, on March 20, 2009, adopted a Basin Plan Implementation Program that sets forth a conditional waiver for onsite wastewater systems (Basin Plan Section VIII.D.3). For an onsite wastewater system to be eligible for a conditional waiver, the local governing jurisdiction must adopt and implement an onsite wastewater management plan that complies with this section.

Onsite wastewater management plans ~~should~~ shall be implemented in urbanizing areas to investigate and mitigate long-term cumulative impacts resulting

**Water Quality Control Plan, Central Coast Basin
Revisions to Chapter 4
(onsite wastewater sections only)**

from continued use of individual, alternative, and community onsite wastewater systems.^{EPA} A wastewater disposal study should be conducted to determine the best Wastewater Management Plan that would provide site or basin specific wastewater re-use. This study should identify basin specific criteria to prevent water quality degradation and public health hazards and provide an evaluation of the effects of existing and proposed developments and changes in land use. Onsite wastewater management plans should be a comprehensive planning tool to specify onsite disposal system limitations to prevent ground or surface water degradation. Onsite wastewater management plans should shall include (but not be limited to) the following elements:

- Survey and evaluation of existing onsite systems.
- Contain a Water quality (groundwater and surface water) monitoring program.^{EPA}
- ~~Identify sites suitable for conventional septic systems.~~
- Projections of onsite disposal system demand and determination of sites and methods to best meet demand.
- Project maximum population densities for each subdrainage basin to control degradation or contamination of ground or surface water.
- Recommend establishment of septic tank maintenance districts, as needed.
- Recommendations and requirements for existing onsite wastewater system inspection, monitoring, maintenance and repairs.^{EPA}
- Recommendations and requirements for new onsite wastewater systems.^{EPA}
- Identify Alternative means of disposing of sewage in the event of disposal system failure and/or irreversible degradation from onsite disposal systems.
- Education and outreach program.^{EPA}
- Enforcement options.^{EPA}

**Resolution No. R3-2008-0005 and
Resolution No. R3-2009-0012 changes**

6

- Septage management.^{EPA}
- Program administration, staffing, records keeping, installation and repairs tracking, and financing.^{EPA}

~~For areas where watershed-wide plans are not developed, conditions could be placed on new divisions of land or community systems to provide monitoring data or geologic information to contribute to the development of a Wastewater Management Plan.~~

~~Wastewater disposal alternatives should identify costs to each homeowner. A cost-effectiveness analysis, which considers socio-economic impacts of alternative plans, should be used to select the recommended plan.~~

Onsite wastewater disposal zones, as discussed in Section 6950-6981 of the Health and Safety Code, may be an appropriate means of implementing onsite wastewater management plans.

Onsite wastewater management plans shall be approved by the Central Coast Water Board or its Executive Officer. Approval of onsite wastewater management plans shall be based upon guidance provided in the Central Coast Water Board Checklist for Developing & Reviewing Onsite Wastewater Management Plans (included as Attachment 2 of March 20, 2009 Staff Report).

**VIII.D.2 1.c. SEPTIC-TANK ONSITE
WASTEWATER SYSTEM
MAINTENANCE DISTRICTS**

It may be appropriate for community onsite systems to be maintained by local ~~sewage disposal onsite wastewater system~~ maintenance districts. These special districts could be administered through existing local governments such as County Water Districts, Community Services Districts, or County Service Areas

~~Septic tank~~ Onsite wastewater system maintenance districts are responsible for onsite system operation and maintenance in conformance with this Water Quality Control Plan. ~~Administrators~~ Such districts should ensure proper construction, installation, operation, and maintenance of onsite wastewater systems. Maintenance districts should establish

**Water Quality Control Plan, Central Coast Basin
Revisions to Chapter 4
(onsite wastewater sections only)**

**Resolution No. R3-2008-0005 and
Resolution No. R3-2009-0012 changes**

7

~~septic tank onsite system~~ surveillance, maintenance and pumping programs, ~~where appropriate~~; provide repairs to plumbing or leachfields, and encourage water conservation measures.

VIII.D.2. CRITERIA FOR NEW SYSTEMS

Onsite wastewater system problems can be minimized with proper site location, design, installation, operation and maintenance. The following section ~~recommends~~ includes criteria for all new ~~individual subsurface onsite wastewater disposal systems and community sewage disposal systems~~. Local governing jurisdictions should incorporate these criteria and guidelines into their local ordinances. These ~~recommendations~~ criteria will be used by the Central Coast Water Board for Water Board regulated systems and exemptions.

Local governing jurisdictions ~~agencies~~ may authorize alternative onsite systems if the agency acts consistent with locally implemented onsite wastewater management plans approved by the Central Coast Water Board or its Executive Officer and with the Basin Plan criteria.^{UPC, EPA}

For any onsite system, limited disposal options are available for septage (solids periodically removed from septic tanks). As a component of a wastewater management plan, long-term septage disposal plans shall be considered and developed by local onsite governing jurisdictions ~~system management districts~~.^{EPA}

Onsite wastewater system criteria are arranged in sequence under the following categories: site suitability, system design, construction, ~~individual system~~ maintenance, community system design, and local governing jurisdictions agencies. Mandatory criteria are listed in the "Individual, Alternative, and Community Systems Prohibitions" section. Within each category, criteria are specified for RECOMMENDATIONS, REQUIREMENTS and PROHIBITIONS.

VIII.D.2.a. SITE SUITABILITY

~~Prior to permit approval, site investigation should determine on-site suitability:~~

RECOMMENDATIONS

1. For new land divisions, onsite disposal systems and expansion areas should be protected from encroachment by provisions in covenants, conditions, and restrictions (CC&Rs), recorded in Final Maps or similar mechanisms.
2. Percolation test holes (at least ~~one~~ three per system) should be drilled with a hand auger. A hole could be hand augered or dug with hand tools at the bottom of a larger excavation made by a backhoe.
3. Natural ground slope of the disposal area should not exceed 20 percent.
4. An excavation should be made to detect mottling or presence of underground channels, fissures, or cracks. Soils should be excavated to a depth of 4-5 feet below drain field bottom.

REQUIREMENTS

5. At least one soil boring or excavation per onsite system shall be performed to determine soil suitability, depth to groundwater, and depth to bedrock or impervious layer. Soil borings are particularly important for seepage pits. The soil boring or excavation should extend at least 10 feet below the drain field bottom at each proposed location and be performed during or shortly after the wet season to characterize the most limiting conditions.
6. For leachfields, at least three percolation test locations ~~should~~ shall be used to determine system acceptability.
7. Percolation tests shall be continued until a stabilized rate is obtained.
8. Percolation tests ~~should~~ shall be performed at a ~~proposed subsurface disposal system sites~~ and depth corresponding to the bottom of the subsurface disposal area.
9. If no restrictive layers intersect, and geologic conditions permit surfacing, the setback distance from a cut, embankment or steep slope (greater than 30 percent) should be determined by projecting a line 20 percent down gradient from the sidewall at the highest perforation of the discharge pipe. The leachfields ~~should~~ shall be set back far enough to prevent this projected line from intersecting

**Water Quality Control Plan, Central Coast Basin
Revisions to Chapter 4
(onsite wastewater sections only)**

**Resolution No. R3-2008-0005 and
Resolution No. R3-2009-0012 changes**

8

the cut within 100 feet, measured horizontally, from the sidewall. If restrictive layers intersect cuts, embankments or steep slopes, and geologic conditions permit surfacing, the setback shall be at least 100 feet measured from the top of the cut.

10. Prior to permit approval, site investigation shall determine onsite system suitability (consistency with recommendations, requirements and prohibitions specified in this section). Seepage pits should be utilized only after careful consideration of site suitability. ~~Soil borings or excavations should be inspected either by permitting agency or individual under contract to the permitting agency~~
11. Distances between trench bottom and highest seasonal usable groundwater, including perched groundwater, shall not be less than the separation specified by appropriate percolation rate:

Percolation Rate (minutes/inch)	Distance (feet)
<1	50 ¹
1-4	20 ¹
5-29	8
>30	5

¹Unless a set-back distance of at least 250 feet to any domestic well or subsurface water is assured.

Onsite disposal in soils with percolation rates faster than one minute per inch are prohibited without additional treatment.

12. ~~Natural ground slope of the disposal area should not exceed 20 percent. Onsite disposal systems on slopes greater than 20% shall be designed by a certified professional.~~

PROHIBITIONS

13. For new land divisions (including lot splits) served by onsite systems, lot sizes less than one acre ~~should not be permitted~~ are prohibited unless authorized under an onsite management plan approved by the Central Coast Water Board or its Executive Officer. While new septic tank systems should generally be limited to new divisions of land having a minimum parcel size of one acre, where soil and other physical constraints are particularly favorable, parcel size shall not be less than one half acre. For the purpose of this prohibition, secondary

units are considered "de-facto" lot splits and shall not be constructed on lots less than two acres in size unless consistent with onsite management plans. ^{LO 1994}

14. Onsite wastewater disposal shall not be located in areas subject to inundation from a ~~40~~ 25-year flood.
15. Onsite disposal systems shall not be installed where natural ground slope of the disposal area exceeds 30 percent. ^{EPA}
16. Leachfields are prohibited in soils where percolation rates are slower than 120 min/in unless parcel size is at least two acres. Disposal systems designed to accommodate slow percolation rates (such as evapotranspiration systems) shall be evaluated as alternative systems.
17. Onsite discharge is prohibited on any site unable to maintain subsurface disposal.
18. Onsite discharge is prohibited where lot sizes, dwelling densities or site conditions cause detrimental impacts to water quality.
19. Onsite discharge is prohibited within a water supply reservoir watershed where parcel size is less than ~~2.5~~ one acre, unless consistent with an onsite wastewater management plan approved by the Central Coast Water Board Executive Officer.
20. Onsite discharge is prohibited in any area where continued use of onsite systems constitutes a public health hazard, an existing or threatened condition of water pollution, or nuisance.
21. Onsite discharge is prohibited where soils or formations with channels, cracks, fractures, or percolation rates allow inadequately treated waste to surface or degrade water quality.*
* Unless a setback distance of at least 250 feet to any domestic water supply well or surface water is ensured.
22. Seepage pits are prohibited in soils or formations containing 60 percent or greater clay (a soil particle less than two microns in size) unless parcel size is at least two acres.
23. For seepage pits, distances between pit bottom and usable groundwater, including perched

**Water Quality Control Plan, Central Coast Basin
Revisions to Chapter 4
(onsite wastewater sections only)**

**Resolution No. R3-2008-0005 and
Resolution No. R3-2009-0012 changes**

9

groundwater, shall not be less than separation specified by appropriate soil type:

Soil Type	Distance (feet)
Gravels ²	50 ⁺ additional treatment required
Gravels with few fines*	20 ⁺
Other	10

¹—Unless a setback distance of at least 250 feet to any domestic water supply well or surface water is ensured.

²—Gravels - Soils with over 95 percent by weight coarser than a No. 200 sieve and over half of the coarse fraction larger than a No. 4 sieve.

* Gravels with few fines - Soils with 90 percent to 94 percent coarse fraction larger than a No. 4 sieve.

24. Onsite discharge in soils with percolation rates faster than one minute per inch is prohibited without additional treatment consistent with an onsite management plan implemented by the local governing jurisdiction and approved by the Central Coast Water Board Executive Officer.

25. Onsite discharge is prohibited in fill unless specifically engineered as a disposal area.

VIII.D.2.b. ONSITE SYSTEM DESIGN

RECOMMENDATIONS

1. Dual disposal fields (200 percent of original calculated disposal area) ~~are recommended~~ should be installed.^{EPA}
2. For commercial and institutional systems, pretreatment may be necessary if wastewater is significantly different from domestic wastewater.
3. Distance between drainfield trenches should be at least two times the effective trench depth. Distance between seepage pits (nearest sidewall to sidewall) should be at least 20 feet.
4. Application area should be no greater than the area calculated using trench bottom and sidewalls minus the first foot below the distribution pipe.^{UPC} ~~In clayey soils, systems should be constructed to place infiltrative surfaces in more permeable horizons.~~
5. Seepage pit application rate should not exceed 0.3 gallons per day (gpd) per square foot.

REQUIREMENTS

6. Onsite wastewater treatment tanks shall be water-tight, and designed to remove ~~nearly 100 percent of~~ settleable solids and should provide a high degree of anaerobic decomposition of colloidal and soluble organic solids.^{EPA}
7. The minimum design flow rate ~~should~~ shall be 375 gallons per day for a 3-bedroom house, and 75 gpd should be added for each additional bedroom.
8. Drainfield design ~~should~~ shall be based only upon usable permeable soil layers.
9. Leachfield loading application rate ~~should~~ shall not exceed the following:

Percolation Rate (minutes/inch)	Loading Rate (gpd/sq.ft.)
1 - 20	0.8
21 - 30	0.6
31 - 60	0.25
61 - 120	0.10

10. If curtain drains divert groundwater to subsurface soils, the upslope separation from a leachfield or pit ~~should~~ shall be at least 20 feet and the down slope separation shall be at least 50 feet.
11. Onsite system ~~tank~~ design ~~must~~ shall allow access for inspection and cleaning. Septic tanks must be accessible for pumping.
12. For commercial, institutional, industrial and community systems, design ~~should~~ shall be based on daily peak flow.
13. Dual disposal systems shall be installed (200 percent of original calculated disposal area) for community systems.
14. ~~Dual disposal fields (200 percent of original calculated disposal area) are recommended. Commercial systems, institutional systems, or domestic industrial systems should~~ All onsite disposal systems shall reserve an expansion area (additional 100% disposal capacity) to be set aside and protected from all uses except future drainfield repair and replacement.^{UPC} ~~Community systems shall install dual drainfields (200% disposal capacity) and reserve replacement area (3rd 100% disposal capacity).~~

**Water Quality Control Plan, Central Coast Basin
Revisions to Chapter 4
(onsite wastewater sections only)**

**Resolution No. R3-2008-0005 and
Resolution No. R3-2009-0012 changes**

10

- 15. Community systems shall provide duplicate individual equipment components for components subject to failure (such as pumps).
- 16. Distances between trench/pit bottom and bedrock or other low permeability material impermeable layer shall be at least ten feet.
- 17. Where site conditions permit migration of wastewater to water, setback distances from disposal trench/pit shall be at least:

	<u>Minimum Setback Distance (feet)</u>
Domestic water supply wells in unconfined aquifer	100
Watercourse (where geologic conditions permit water migration)	100
<u>Drinking water supply</u> reservoir spillway elevation	200
Springs, natural or any part of a man-made spring	100

- 18. Community systems shall be designed with adequate capacity to accommodate the build-out population.
- 19. Community wastewater treatment and disposal facilities shall be operated by a public agency. If a demonstration is made to the Central Coast Water Board that an existing public agency is unavailable and formation of a new public agency is unreasonable, a private entity with adequate financial, legal, and institutional resources to assume responsibility for waste discharges may be acceptable.

PROHIBITIONS

- 20. Onsite discharge to leachfields is prohibited where soil percolation rates are slower than 60 minutes per inch unless the system is designed for an effluent application rate of 0.1 gpd per square foot of application area, or less.
- 21. Discharge ~~should~~ shall not exceed 40 grams per day of total nitrogen, on the average, per acre served by onsite system overlying groundwater recharge areas, except where a local governing jurisdiction has adopted a

Wastewater Management Plan ~~subsequently~~ approved by the Central Coast Water Board Executive Officer.

- 22. Community system seepage pits are prohibited unless additional treatment is provided consistent with an onsite management plan implemented by the local governing jurisdiction and approved by the Central Coast Water Board Executive Officer. Such seepage pits shall have at least 15 vertical feet between pit bottom and highest usable groundwater, including perched groundwater.
- 23. Inflow and infiltration shall be precluded from the system unless design specifically accommodates such excess flows.
- 24. Onsite wastewater systems are prohibited in any subdivision unless the subdivider clearly demonstrates the installation, operation and maintenance of the onsite system will be properly functional and in compliance with all Basin Plan criteria.
- 25. Curtain drains that discharge to ground surface or surface water are prohibited within 50 feet down slope of onsite system disposal areas.

VIII.D.2.c. DESIGN FOR ALTERNATIVE AND ENGINEERED SYSTEMS

RECOMMENDATIONS

- 1. Mound systems, evapotranspiration systems, and other alternative onsite systems should be designed and installed in accordance with guidelines available from the State Water Resources Control Board. ~~For evapotranspiration systems, each month of the highest precipitation year and lowest evaporation year within the previous ten years of record should be used for design.~~

REQUIREMENTS

- 2. Alternative onsite wastewater systems shall be designed by a ~~registered civil engineer~~ certified professional competent in ~~sanitary engineering~~ alternative onsite wastewater system design.^{EPA}
- 3. Alternative and engineered onsite wastewater systems shall be located, designed, installed, operated, maintained, and monitored in accordance with a locally implemented onsite

**Water Quality Control Plan, Central Coast Basin
Revisions to Chapter 4
(onsite wastewater sections only)**

**Resolution No. R3-2008-0005 and
Resolution No. R3-2009-0012 changes**

11

management plan approved by the Central Coast Water Board Executive Officer.^{UPC, EPA}

should be placed with extreme care outside the leaching area to ensure settling does not occur.

PROHIBITIONS

4. Alternative and engineered onsite wastewater systems are prohibited, except where consistent with a locally implemented onsite management plan approved by the Central Coast Water Board Executive Officer.^{UPC, EPA}

10. Risers to the ground surface and manholes should be installed over the septic tank inspection ports, access ports and distribution boxes.

11. Drainfields should include inspection pipes to check water level.

12. Nutrient and heavy metal removal should be facilitated by planting ground cover vegetation over shallow subsurface drainfields. The plants must have the following characteristics: (1) evergreen, (2) shallow root systems, (3) numerous leaves, (4) salt resistant, (5) ability to grow in soggy soils, and (6) low or no maintenance. Plants downstream of leaching area may also be effective in nutrient removal.

VIII.D.2.d. CONSTRUCTION

RECOMMENDATIONS

1. Construction activities should follow recommendations and precautions described in the Environmental Protection Agency's Design Manual: Onsite Wastewater Treatment and Disposal Systems.^{EPA}
2. ~~Subsurface disposal~~ Onsite wastewater systems should have a slightly sloped finished grade to promote surface runoff.
3. Surface runoff should be diverted around open trenches/pits to limit siltation of trench bottom area.
4. Work should be scheduled only when infiltrative surfaces can be covered in one day to minimize windblown silt or rain clogging the soil.
5. In clayey soils, work should be done only when soil moisture content is low enough to avoid smearing of infiltrative surfaces.
6. Bottom and sidewall areas should be left with a rough surface. Any smeared or compacted surfaces should be removed.
7. Bottom of trench or bed ~~leach~~ distribution piping should be level throughout to prevent localized overloading.
8. ~~Two inches of coarse sand should be placed on the bottom of trenches to prevent compacting soil when leachrock is dumped into drainfields. Fine sand should not be used as it may lead to system failure.~~
9. Properly constructed distribution boxes or junction fittings should be installed to maintain equal flow to each trench. Distribution boxes

REQUIREMENTS

13. Prior to backfilling, the distribution system ~~should~~ shall be tested to check the hydraulic loading pattern.
14. Disposal systems ~~should~~ shall be inspected by the permitting agency prior to covering to ensure proper construction. Designers and/or installers of engineered onsite wastewater systems shall provide a letter to the permitting authority stating that the onsite system was installed in conformance with the approved plans.

**VIII.D.2.e. ONSITE SYSTEM
MAINTENANCE**

RECOMMENDATIONS

1. Septic tanks should be inspected every two to five years to determine the need for pumping.
2. Septic tanks should be pumped whenever: (1) the scum layer is within three inches of the outlet device, (2) the sludge level is within eight inches of the bottom of the outlet device, or (3) every 5 years; whichever is sooner.^{EPA}
3. Drainfields should be alternated when drainfield inspection pipes reveal a high water level or every six months, whichever is sooner.

REQUIREMENTS

**Water Quality Control Plan, Central Coast Basin
Revisions to Chapter 4
(onsite wastewater sections only)**

4. Onsite wastewater systems shall be maintained in accordance with approved onsite management plans. Where onsite management plans have not been approved by the Central Coast Water Board Executive Officer, onsite systems shall be maintained as described in the following specifications.^{EPA}
5. Disposal of septage (solid residue pumped from septic tanks) shall be accomplished in a manner acceptable to the Central Coast Water Board Executive Officer.
6. Records of maintenance, pumping, septage disposal, etc. shall be maintained by the onsite system owner and available upon request.^{EPA}

VIII.D.2.f. USE CONSIDERATIONS

RECOMMENDATIONS

1. Water conservation and solids reduction practices should be implemented by all onsite system users. Garbage grinders should not be used in homes with septic tanks. Where grinders are used, septic tank capacity and inspection/pumping frequency should be increased.^{EPA}
2. Metering and water use costs should be used to encourage water conservation in areas served by onsite systems.
3. Bleach, solvents, fungicides and any other toxic material, grease and oil should not be discharged into onsite wastewater systems.
4. Self-regenerating water softeners should not be used where discharge is to onsite systems. If water softening is necessary, use of canister-type softeners will protect the treatment and disposal systems and underlying groundwater from unnecessary accumulation of salts.

PROHIBITIONS

5. Self-regenerating water softener brine discharge to onsite wastewater systems is prohibited unless consistent with a salts minimization plan approved by the Water Board Executive Officer and implemented by the local governing jurisdiction.

**Resolution No. R3-2008-0005 and
Resolution No. R3-2009-0012 changes**

12

**VIII.D.2.g. ONSITE WASTEWATER
SYSTEM PROHIBITION AREAS**

In order to achieve water quality objectives, protect present and future beneficial water uses, protect public health, and prevent nuisance, discharges are prohibited in the following areas:

PROHIBITIONS

1. Discharges from individual sewage disposal systems are prohibited in portions of the community of Nipomo, San Luis Obispo County, which are particularly described in Basin Plan Appendix A-27.
2. Discharges from individual sewage disposal systems within the San Lorenzo River Watershed shall be managed as follows: Discharges shall be allowed providing the County of Santa Cruz, as lead agency, implements the "Wastewater Management Plan for the San Lorenzo River Watershed, County of Santa Cruz, Health Services Agency, Environmental Health Service., February 1995 and "San Lorenzo Nitrate Management Plan, Phase II Final Report", February 1995, County of Santa Cruz, Health Services Agency, Environmental Health Service (Wastewater Management Plan) and assures the Central Coast Water Board that areas of the San Lorenzo River Watershed are serviced by wastewater disposal systems to protect and enhance water quality, to protect and restore beneficial uses of water, and to abate and prevent nuisance, pollution, and contamination.
3. Discharges from individual and community sewage disposal systems are prohibited, effective November 1, 1988, in the Los Osos/Baywood Park area depicted in the Prohibition Boundary Map included as Attachment A of Resolution No. 83-13, which can be found in Basin Plan Appendix A-30.

**VIII.D.2.h. SUBSURFACE DISPOSAL
EXEMPTIONS**

The Central Coast Water Board or Executive Officer may grant exemption to prohibitions for: (1) engineered new onsite disposal wastewater systems for sites unsuitable for standard systems; and (2) new or existing onsite systems within the

**Water Quality Control Plan, Central Coast Basin
Revisions to Chapter 4
(onsite wastewater sections only)**

specific prohibition areas cited above. Such exemptions may be granted only after presentation by the discharger of sufficient justification, including geologic and hydrologic evidence that the continued operation of such system(s) in a particular area will not individually or collectively, directly or indirectly, result in pollution or nuisance, or affect water quality adversely.

Individual, alternative, and community systems shall not be approved for any area where it appears that the total discharge of leachate to the geological system, under fully developed conditions, will cause: (1) damage to public or private property; (2) ground or surface water degradation; (3) nuisance condition; or, (4) a public health hazard. Interim use of septic tank systems may be permitted where alternate parcels are held in reserve until sewer systems are available.

Requests for exemptions will not be considered until the local entity has reviewed the system and submitted the proposal for Central Coast Water Board review. Dischargers requesting exemptions must submit a Report of Waste Discharge. Exemptions will be subject to filing fees as established by the State Water Code.

Discharges from onsite wastewater systems regulated by waste discharge requirements or waiver of such requirements may be exempt from the requirements of this chapter. The waste discharge requirements order or waiver will act in lieu of exemption, and separate exemption is not required.

Further information concerning individual, alternative, or community onsite sewage disposal systems can be found in Chapter 5 in the Management Principals and Control Actions sections. State Water Resources Control Board Plans and Policies, Discharge Prohibitions, and Central Coast Water Board Policies may also apply depending on individual circumstances.

**VIII.D.3. ONSITE SYSTEM
IMPLEMENTATION PROGRAM**

California Water Code § 13260(a) requires that any person discharging waste or proposing to discharge waste that could affect the quality of the waters of the State, shall file with the appropriate Regional

**Resolution No. R3-2008-0005 and
Resolution No. R3-2009-0012 changes**

13

Board a report of waste discharge, unless the Regional Board waives such requirement.

California Water Code §13263 requires the Regional Board to prescribe waste discharge requirements, or waive waste discharge requirements, for the discharge. The waste discharge requirements must implement relevant water quality control plans and the Water Code.

California Water Code §13269 authorizes the Central Coast Water Board to waive the submittal of reports of waste discharge and waste discharge requirements for specific types of discharges where such a waiver is consistent with applicable state and regional water quality control plans and is in the public interest.

California Water Code §13269 requires that waivers shall be conditional and may be terminated at any time by the Central Coast Water Board. Waivers may be granted for discharges of waste to land, but may not be granted for discharges of waste subject to the NPDES requirements of the federal Clean Water Act. The waiver must also include monitoring unless the Regional Board determines that the discharges do not pose a significant threat to water quality.

This Basin Plan Amendment sets forth an Implementation Program to ensure protection of waters of the state as a conditional waiver of waste discharge requirements and reports of waste discharge requirements. This Conditional Waiver contains conditions and is consistent with the Basin Plan.

The Central Coast Water Board finds that this Conditional Waiver is in the public interest and consistent with the Basin Plan because:

1. Waivers granted for discharges that do not pose a significant threat to water quality enable staff resources to be used effectively and avoid unnecessary expenditures of limited resources.
2. It was adopted in compliance with Water Code Sections 13242 and 13269 and other applicable law;
3. It requires compliance with the Basin Plan;
4. It includes conditions that are intended to reduce and prevent pollution and nuisance and

**Water Quality Control Plan, Central Coast Basin
Revisions to Chapter 4
(onsite wastewater sections only)**

**Resolution No. R3-2008-0005 and
Resolution No. R3-2009-0012 changes**

14

protect the beneficial uses of the waters of the State.

5. Dischargers may not discharge any waste not specifically regulated by this Conditional Waiver except in compliance with the Water Code.
6. Dischargers who violate the conditions of this Conditional Waiver are subject to enforcement pursuant to Water Code section 13350 and other applicable law.
7. The discharges from onsite wastewater systems all discharge the same type of waste.
8. It provides a method for coordinating regulation with local governing jurisdictions, that routinely permit and oversee onsite wastewater systems, thereby reducing overlapping regulation.

It is appropriate to regulate onsite wastewater systems by way of a Conditional Waiver rather than with individual waste discharge requirements because there are over a hundred thousand discharges of the listed categories. Issuing individual waste discharge requirements to each of those would use significant staff resources and is not necessary in most circumstances because such systems are regulated by local governing jurisdictions. The conditions imposed in this Conditional Waiver will be protective of waters of the state. This Conditional Waiver will simplify and streamline the regulatory process without compromising the protection of water quality.

Although a discharge may qualify for waiver enrollment, the Central Coast Water Board retains the right to regulate that discharge through other programs or Central Coast Water Board actions (such as enforcement orders, individual waste discharge requirements, general orders). The Central Coast Water Board may terminate a waiver at any time and require the discharge to obtain waste discharge requirements or terminate the discharge.

Appropriately developed and implemented memoranda of understanding between the Central Coast Water Board and local governing jurisdiction (e.g., counties and cities) provide practical and enforceable tools to compel compliance with the Basin Plan criteria for onsite systems and ensure water quality protection.

The Central Coast Water Board's Executive Officer is authorized to approve and execute, on behalf of the Central Coast Water Board, individual memoranda of understanding with local governing jurisdiction in the Region based substantially on the requirements specified in Chapter 4, Section VIII.D of the Basin Plan (sections pertaining to onsite wastewater systems). Individual memoranda of understanding shall commit the local governing jurisdiction to amending its municipal code and onsite wastewater system program, if necessary, in order to be substantially equivalent to the Basin Plan. If and when statewide criteria are adopted pursuant to California Water Code §13291, the memoranda of understanding will be reviewed to determine if they need to be modified. Individual memoranda of understanding shall incorporate additional measures to be taken by the local governing jurisdiction to identify and address areas of degraded groundwater or surface water quality, where onsite wastewater systems are a potential source of pollution.

This Implementation Program sets forth two types of conditional waivers for the regulation of onsite wastewater systems. Section VIII.D.3.a. conditionally waives waste discharge requirements, but not reports of waste discharges, for those systems regulated directly by the Central Coast Water Board. Section VIII.D.3.b conditionally waives waste discharge requirements and reports of waste discharge for those systems that are regulated by local governing jurisdictions that comply with the conditions of this section.

**VIII.D.3.a.CONDITIONS FOR WAIVER OF
WASTE DISCHARGE REQUIREMENTS
FOR SYSTEMS REGULATED DIRECTLY
BY THE CENTRAL COAST WATER
BOARD**

Waste discharge requirements [California Water Code §13263(a)] are conditionally waived as follows:

The Central Coast Water Board's Executive Officer is authorized to enroll applicants in the onsite wastewater system conditional waiver, provided the following conditions are met.

1. The onsite wastewater system is sited, designed, managed and maintained in a

**Water Quality Control Plan, Central Coast Basin
Revisions to Chapter 4
(onsite wastewater sections only)**

manner consistent with criteria specified in the Basin Plan, Chapter 4, Section VIII.D.

2. The applicant submits a report of waste discharge to the Central Coast Water Board for approval that provides documentation of consistency with each Basin Plan criterion.
3. The applicant submits with the report of waste discharge a fee corresponding to the lowest applicable fee for waste discharge requirements (threat and complexity rating of III-C) identified in the State Water Board's fee schedule set forth in Title 23 California Code of Regulations.
4. The applicant enrolled in the Conditional Waiver complies with conditions specified in a Water Board Executive Officer-approved onsite management plan implemented by the local governing jurisdiction, if available,

The Central Coast Water Board or its Executive Officer may terminate the discharger's enrollment in the Conditional Waiver at any time.

**VIII.D.3.b. CONDITIONS FOR WAIVER
OF WASTE DISCHARGE
REQUIREMENTS AND REPORTS OF
WASTE DISCHARGE FOR SYSTEMS
REGULATED BY LOCAL GOVERNING
JURISDICTIONS**

The requirement to submit a report of waste discharge, associated fee, and waste discharge requirements to the Central Coast Water Board and to receive enrollment notification are waived for

**Resolution No. R3-2008-0005 and
Resolution No. R3-2009-0012 changes**

15

onsite wastewater systems regulated by a local governing jurisdiction, provided the following conditions are met.

For New Discharges (systems installed after March 20, 2009):

1. The onsite wastewater system is permitted by a local governing jurisdiction that implements an onsite management plan approved by the Central Coast Water Board or its Executive Officer.
2. The local governing jurisdiction has entered into a memorandum of understanding with the Central Coast Water Board regarding onsite wastewater system management.
3. The onsite wastewater system meets the criteria in Basin Plan Chapter 4, Section VIII.D.
4. The onsite wastewater system is sited, designed, managed and maintained in a manner consistent with the Water Board or Water Board Executive Officer-approved onsite management plan implemented by the local governing jurisdiction.

For Existing Discharges (systems installed before March 20, 2009):

5. The onsite wastewater system is managed and maintained in a manner consistent with the Water Board or Water Board Executive Officer-approved onsite management plan implemented by the local governing jurisdiction.

**STATE OF CALIFORNIA
REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, CA 93401**

RESOLUTION No. R3-2009-0012

**AMENDING THE WATER QUALITY CONTROL PLAN
REGARDING ONSITE WASTEWATER SYSTEM IMPLEMENTATION
PROGRAM**

WHEREAS, the California Regional Water Quality Control Board, Central Coast Region (hereafter Central Coast Water Board) finds:

1. The Central Coast Water Board adopted the second edition of the Water Quality Control Plan, Central Coastal Basin (Basin Plan) on September 8, 1994. The Basin Plan designates beneficial uses and water quality objectives, implementation programs for achieving water quality objectives addressing point source and nonpoint source discharges, adopts prohibitions, and incorporates statewide plans and policies.
2. The Basin Plan contains an Implementation Program setting forth criteria regarding siting and design of onsite wastewater systems. The Central Coast Water Board updated its policy regarding siting and design of onsite wastewater systems on September 16, 1983, by adopting Resolution No. 83-12. The text and requirements specified in Resolution No. 83-12 are included in the Basin Plan as provisions of Chapters 4 and 5.
3. On May 9, 2008, the Central Coast Water Board adopted Resolution No. R3-2008-0005, revising the Basin Plan onsite wastewater system criteria. In this Resolution No. R3-2009-0012, the Central Coast Water Board is adopting minor revisions to the onsite wastewater criteria set forth in Resolution No. R3-2008-0005. The text and requirements specified in Resolution No. R3-2008-0005 and Resolution No. R3-2009-0012, as amended with these revisions, will be incorporated into the Basin Plan after review and approval by the State Water Resources Control Board and the Office of Administrative Law.
4. The Central Coast Water Board proposes to amend the Basin Plan by inserting amendments into Chapter 4 of the Basin Plan. To implement the onsite wastewater system criteria set forth in the Basin Plan, this Resolution No. R3-2009-0012 adopts amendments to the Basin Plan Implementation Program that provide for a conditional waiver of waste discharge requirements. The proposed amendment is a revision of the Implementation Program for onsite wastewater systems implemented by the Central Coast Water Board throughout the Region. The revisions to Chapter 4 of the Basin Plan are shown on Attachment A to this Resolution. Attachment A identifies significant additions/deletions shown with underline/strikeout. Text that is simply moved is not identified as a proposed change. The Implementation Program provides that onsite wastewater systems will be regulated under the California Water Code in one of three ways – (1) through issuance of waste discharge requirements

by the Central Coast Water Board, (2) by a conditional waiver of waste discharge requirements for those systems that comply with the Basin Plan criteria and are regulated directly by the Central Coast Water Board, or (3) by a conditional waiver of waste discharge requirements and reports of waste discharge for those systems regulated by local governing agencies where the system complies with the Basin Plan criteria and the agency has entered into a memorandum of understanding (MOU) with the Central Coast Water Board.

5. Appropriately developed and implemented MOUs between the Central Coast Water Board and local permitting agencies (e.g., counties and cities) provide practical and enforceable tools to compel compliance with the Basin Plan criteria for onsite systems and ensure water quality protection.
6. Onsite wastewater systems have been used as a form of wastewater treatment and disposal for many decades. Currently, the number of individual residential and small community onsite wastewater systems in the Central Coast Region exceeds 100,000. In many instances, the discharge from onsite wastewater systems does not adversely affect the beneficial uses of groundwater or surface water quality due to favorable site conditions, adequate system design, and ongoing management practices.
7. When improperly sited, improperly designed, or improperly managed, discharges from onsite wastewater systems may cause or contribute to degradation of water quality. The Basin Plan Implementation Program includes criteria to ensure long-term water quality protection in areas where onsite wastewater systems are used. Onsite wastewater systems located, designed, installed and managed in accordance with the Basin Plan criteria are not expected to cause or contribute to water quality impacts.
8. Section VIII.D.3. of the Basin Plan, as amended by this Resolution, identifies the types and conditions of discharges for which waivers are granted by this Resolution. These discharges will not have a significant effect on the quality of waters of the State provided the conditions of this waiver are met.
9. Area of Applicability - The effect of this amendment will be throughout the Central Coast Region, where onsite systems are used for treatment and disposal of wastewater.
10. California Water Code (Water Code) Section 13260(a) requires that any person discharging waste or proposing to discharge waste within any region that could affect the quality of the waters of the State, other than into a community sewer system, shall file with the appropriate Regional Board a report of waste discharge containing such information and data as may be required by the Central Coast Water Board, unless the Central Coast Water Board waives such requirement.
11. California Water Code §13263 requires the Central Coast Water Board to prescribe waste discharge requirements, or waive waste discharge requirements, for the discharge. The waste discharge requirements must implement relevant water quality control plans and the Water Code.

12. California Water Code §13269 authorizes the Central Coast Water Board to waive the submittal of reports of waste discharge and waste discharge requirements for specific types of discharges where such a waiver is consistent with applicable state and regional water quality control plans and is in the public interest.
13. California Water Code §13269 requires that waivers shall be conditional and may be terminated at any time by the Central Coast Water Board. Waivers may be granted for discharges of waste to land, but may not be granted for discharges of waste subject to the NPDES requirements of the federal Clean Water Act. The waiver must also include monitoring unless the Regional Board determines that the discharges do not pose a significant threat to water quality.
14. This Resolution waives the requirement that certain individual onsite wastewater system dischargers submit a report of waste discharge and obtain waste discharge requirements from the Central Coast Water Board, if the discharge is regulated by a local agency that has an MOU with the Water Board that meets the conditions of the Basin Plan and complies with the criteria set forth in the Implementation Program for Onsite Wastewater Systems in the Basin Plan.
15. Such a waiver is consistent with the Basin Plan and is in the public interest, if conditioned upon a local agency entering into an individual MOU and compliance with the criteria. By entering into an MOU, a local agency commits to ensuring that its onsite wastewater system permitting program is substantially equivalent to the Basin Plan and any statewide standards adopted pursuant to California Water Code §13291. The adoption of this Basin Plan amendment and conditional waiver is also in the public interest because: (1) it was adopted in compliance with Water Code Sections 13260, 13263, and 13269 and other applicable law; (2) it requires compliance with the Basin Plan criteria that are developed to be protective of waters of the state; (3) it includes conditions that are intended to reduce and prevent pollution and nuisance and protect the beneficial uses of the waters of the State; (4) it contains more specific and more stringent conditions for protection of water quality compared to the existing Basin Plan criteria; and (5) given the magnitude of the number of persons who operate onsite systems, it provides for an efficient and effective use of limited Central Coast Water Board resources.
16. This Basin Plan amendment and conditional waiver do not impose monitoring and reporting requirements for each discharge. The types of discharges subject to this conditional waiver are not expected to pose a significant threat to water quality if the Basin Plan criteria are properly implemented. The Water Board's Executive Officer may impose monitoring and reporting requirements as authorized pursuant to Water Code section 13267 on any discharger subject to this conditional waiver.
17. At this time, it is appropriate to adopt a Basin Plan amendment conditionally waiving waste discharge requirements for onsite wastewater systems that fit within the Basin Plan criteria because: 1) the discharges have the same or similar waste from the same or similar operations and use the same or similar treatment methods and management practices; and 2) the discharges will be regulated by local agencies in compliance with the Basin Plan criteria.
18. In addition, it is appropriate to regulate onsite wastewater systems with a conditional waiver rather than individual waste discharge requirements in order to simplify and

streamline the regulatory process. There are more than 100,000 individual onsite wastewater systems in the Central Coast Region and it would not be practicable for the Water Board to issue individual waste discharge requirements. These systems are already being regulated by local permitting agencies applying Basin Plan criteria.

19. The Central Coast Water Board will evaluate local permitting agencies at least once every five years to ensure their onsite wastewater system approval practices consistently implement Basin Plan criteria for onsite wastewater systems and ensure water quality protection.
20. Anti-Degradation – State Water Board Resolution No. 68-16 *Statement of Policy with Respect to Maintaining High Quality of Waters in California* (Resolution No. 68-16) requires Regional Water Boards, in regulating the discharge of waste, to maintain high quality waters of the State until it is demonstrated that any change in quality will be consistent with maximum benefit to the people of the State, will not unreasonably affect beneficial uses, and will not result in water quality less than that described in a Regional Water Board's policies (e.g., quality that exceeds applicable water quality standards). Resolution No. 68-16 also states, in part:

Any activity which produces or may produce a waste or increased volume or concentration of waste and which discharges or proposes to discharge to existing high quality waters will be required to meet waste discharge requirements which will result in best practicable treatment and control of the discharge necessary to assure that (a) a pollution or nuisance will not occur and (b) the highest water quality consistent with maximum benefit to the people of the State will be maintained.

This Resolution is consistent with the provisions of the State Water Board Resolution No. 68-16. Dischargers that could be subject to this conditional waiver will be required to comply with the Basin Plan criteria that are expected to prevent degradation of waters of the state, prevent pollution or nuisance, and implement best practicable treatment or control. The Basin Plan Implementation Program prohibits systems that do not meet the criteria.

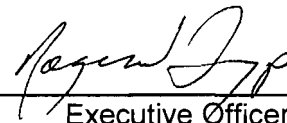

21. Waivers granted for discharges that do not pose a significant threat to water quality, and where such waivers are in the public interest, enable staff resources to be used more effectively and avoid unnecessary expenditures of limited resources.
22. Central Coast Water Board staff will develop and implement a waiver tracking and compliance program.
23. Issuance of a waiver does not override other more stringent local, state, or federal regulations prescribed by other agencies.
24. Although a discharge may qualify for waiver enrollment, the Central Coast Water Board retains the right to regulate that discharge through other programs or Central Coast Water Board actions (such as enforcement orders, individual waste discharge requirements, general orders, etc.) The Central Coast Water Board may terminate a waiver at any time and require the discharger to obtain waste discharge requirements or terminate the discharge.

25. CEQA – The Central Coast Water Board is the lead agency with respect to the California Environmental Quality Act (CEQA). The action proposed in this Resolution is an amendment to the Basin Plan. The Secretary of Resources has certified the basin planning process as exempt from the CEQA requirement to prepare an environmental impact report or negative declaration. (PRC 21080.5; Cal. Code Regs., tit. 14, §15251(g)). The State Water Resources Control Board (State Water Board) has adopted regulations to implement certified regulatory programs that require the regional boards to prepare substitute environmental documents, including a written report and an accompanying CEQA Environmental Checklist. (Cal. Code Regs., tit. 23, §3775 et seq.) The staff of the Central Coast Water Board has prepared substitute environmental documents. The Central Coast Water Board concurs with the analysis contained in the Substitute Environmental Document, including the Environmental Checklist, the staff report, and the responses to comments and finds that the analysis complies with the requirements of CEQA and the State Water Board's regulations with respect to certified regulatory programs. The Central Coast Water Board finds that, as described in the staff report and the CEQA Checklist, the proposed amendments to the Basin Plan will not have a significant effect on the environment.
26. Central Coast Water Board staff followed appropriate procedures to satisfy the environmental documentation requirements of the California Environmental Quality Act [in accordance with §15307 and §15308 of the California Code of Regulations (CCR)].
27. Public Notice - Interested persons and the public have been informed of the Central Coast Water Board's intent to revise the Basin Plan Implementation Program for onsite wastewater systems. Efforts to inform the public and solicit public comment include a public meeting/workshop and meetings with interested persons. Public notice of the amendments provided the public with a public comment period in excess of 45 days in advance of the Central Coast Water Board hearing. Notice of public hearing was given by advertising in newspapers of general circulation within the region, by posting on the Water Board website, and by mailing a copy of the notice to all persons requesting such notice and applicable government agencies. Central Coast Water Board staff responded to oral and written comments received from interested persons.
28. On March 20, 2009, the Central Coast Water Board held a public hearing and considered all the evidence and comments concerning this matter. Notice of this hearing was given to all interested parties in accordance with CCR, Title 14, §15072.
29. The Basin Plan amendment must be submitted for review and approval by the State Water Resources Control Board (State Board) and the State Office of Administrative Law (OAL). The Basin Plan amendment will become effective upon approval by OAL. The subject Resolution will become effective immediately.
30. This amendment to the Basin Plan will result in no potential for adverse effect, either individually or cumulatively, on wildlife and is therefore exempt from fee payments to the Department of Fish and Game under the California Fish and Game Code.

THEREFORE, BE IT RESOLVED that:

1. Pursuant to California Water Code §13240, the Water Board, after considering the record, including oral testimony at the hearing, hereby adopts the Basin Plan amendments shown in Attachments A to this Resolution that waive waste discharge requirements and reports of waste discharge as set forth in the Resolution.
2. The Central Coast Water Board's Executive Officer is directed to forward copies of the Basin Plan amendments to the State Water Board in accordance with the requirements of California Water Code §13245.
3. The Central Coast Water Board requests that the State Water Board approve the Basin Plan amendments in accordance with the requirements of California Water Code §13245 and §13246, and forward it to OAL for approval. The Central Coast Water Board shall file a Notice of Decision with the Secretary of Resources and the Governor's Office of Planning and Research (State Clearinghouse) after approval by OAL.
4. The Central Coast Water Board Executive Officer is authorized to sign a Certificate of Fee Exemption (included as Attachment B to this Resolution).
5. If, during its approval process, the State Water Board or OAL determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Central Coast Water Board Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.

I, Roger W. Briggs, Executive Officer of the California Regional Water Quality Control Board, Central Coast Region, do hereby certify that the foregoing is a full, true, and correct copy of a resolution adopted by the California Regional Water Quality Control Board, Central Coast Region, on March 20, 2009.

**STATE OF CALIFORNIA
CENTRAL COAST REGIONAL WATER QUALITY CONTROL BOARD
895 Aerovista Place, Suite 101
San Luis Obispo, CA 93401-7906**

RESOLUTION NO. R3-2009-0009

**AMENDING THE WATER QUALITY CONTROL PLAN FOR
THE CENTRAL COAST BASIN TO
(1) ADD THE CORRALITOS/SALSIPUEDES CREEK WATERSHED TO
THE DOMESTIC ANIMAL WASTE DISCHARGE PROHIBITION AND
THE HUMAN FECAL MATERIAL DISCHARGE PROHIBITION, AND
(2) ADD THE TOTAL MAXIMUM DAILY LOADS FOR FECAL COLIFORM
IN CORRALITOS AND SALSIPUEDES CREEKS**

WHEREAS, the Central Coast Regional Water Quality Control Board, hereby finds that:

1. The Regional Water Quality Control Board, Central Coast Region, (Central Coast Water Board), adopted the second edition of the Water Quality Control Plan for the Central Coastal Basin (Basin Plan), on September 8, 1994. The Basin Plan designates beneficial uses and water quality objectives, sets forth implementation to achieve water quality objectives addressing point source and nonpoint source discharges, describes prohibitions, and incorporates statewide plans and policies.
2. The Central Coast Water Board periodically revises and amends the Basin Plan. The Central Coast Water Board has determined the Basin Plan requires further revision and amendment to: (a) incorporate the Total Maximum Daily Loads and Implementation Program for fecal coliform in Corralitos and Salsipuedes Creeks, and (b) add the Corralitos Creek Watershed (including its subwatershed, Salsipuedes Creek Watershed) as a named area subject to the Domestic Animal Waste Discharge Prohibition and the Human Fecal Material Discharge Prohibition.
3. The Central Coast Water Board proposes to amend the Basin Plan by inserting amendments into the following sections:
 - a. Chapter Four, Section IX (Total Maximum Daily Loads)
 - b. Chapter Five, Section IV.B. (Discharge Prohibitions)
4. On May 20, 2004, the State Water Resources Control Board (State Water Board) adopted the *Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program* (NPS Policy). The NPS Policy requires the Water Boards to regulate all nonpoint sources of pollution using the administrative permitting authorities provided by the Porter-Cologne Water Quality Control Act. The NPS Policy allows Regional Water Boards to regulate nonpoint source discharges with Waste Discharge Requirements, Waivers of Waste Discharge Requirements, or Basin Plan Prohibitions.
5. Corralitos Creek is listed on Clean Water Act 303(d) list as impaired due to fecal coliform. Therefore, this resolution established TMDLs and associated allocations for this listed waterbody.
6. Corralitos Creek is tributary to Salsipuedes Creek. Salsipuedes Creek is not listed as impaired on the Clean Water Act 303(d) list of impaired waters and is not meeting the Basin Plan water

quality objectives for fecal indicator bacteria. The Central Coast Water Board finds that this water body is impaired due to non-attainment of Basin Plan water quality objectives for fecal coliform. Therefore, this Resolution establishes TMDLs and associated allocations for this waterbody.

7. The Corralitos/Salsipuedes Creek watershed is approximately 53 square miles of land. Corralitos Creek is tributary to Salsipuedes Creek, an approximately 6.5 mile long waterbody. The two waterbodies have a confluence approximately 2.25 miles upstream of the Pajaro River. Salsipuedes Creek has a confluence with the Pajaro River, which drains into Monterey Bay.
8. The Central Coast Water Board's goal for establishing TMDLs in the Corralitos/Salsipuedes Creek watershed is to rectify the impairment due to fecal coliform, thereby providing support for the designated beneficial uses of contact and non-contact water recreation.
9. The elements of a TMDL are described in 40 CFR 130.2 and 130.7 and section 303(d) of the Clean Water Act, and USEPA guidance documents. A TMDL is defined as "the sum of individual waste load allocations for point sources and load allocations for nonpoint sources and natural background" (40 CFR 130.2). The Central Coast Water Board has determined that the TMDLs for fecal coliform in the Corralitos/Salsipuedes Creek watershed are set at levels necessary to attain and maintain the applicable numeric water quality objectives taking into account seasonal variations and any lack of knowledge or uncertainty concerning the relationship between effluent limitations and water quality (40 CFR 130.7 (c) (1)). The regulations in 40 CFR 130.7 also state that TMDLs shall take into account critical conditions for stream flow, loading, and water quality parameters. TMDLs are often expressed as a mass load of the pollutant but can be expressed as a unit of concentration if appropriate (40 CFR 130.2(i)). Expressing these TMDLs as units of concentration is appropriate because an existing concentration-based water quality objective is used as the basis for the TMDL numeric target.
10. Upon establishment of TMDLs by the State or USEPA, the State is required to incorporate the TMDLs, along with appropriate implementation measures, into the State Water Quality Management Plan (40 CFR 130.6 (c)(1) and 130.7; and California Water Code sections 13050(j) and 13242). The Basin Plan and applicable statewide plans serve as the State Water Quality Management Plan governing the watersheds under the jurisdiction of the Central Coast Water Board.
11. The Central Coast Water Board may specify certain conditions or areas where the discharge of waste, or certain types of waste, will not be permitted pursuant to California Water Code section 13243. The implementation plan for the TMDLs for the Corralitos/Salsipuedes Creeks Watershed requires compliance with the Human Fecal Material Discharge Prohibition and the Domestic Animal Waste Discharge Prohibition (Prohibitions) for discharges in the Corralitos/Salsipuedes Creeks Watershed. Supporting documentation for adding the Corralitos/Salsipuedes Creeks Watershed to the above-named prohibitions is provided in the Final Project Report: Total Maximum Daily Loads for Fecal Coliform in Corralitos and Salsipuedes Creeks. Consistent with California Water Code section 13244, the Central Coast Water Board complied with public notice and hearing requirements for adding the Corralitos/Salsipuedes Creeks Watershed to the Human Fecal Material Discharge and the Domestic Animal Waste Discharge Prohibitions.
12. Pursuant to California Water Code section 13241, the Central Coast Water Board considered several factors in developing these Basin Plan amendments. The Central Coast Water Board concludes the following.
 - a. The TMDLs and Basin Plan Amendment will protect present and probable future beneficial uses.

- b. Environmental characteristics of the waterbodies will be protected.
 - c. Improved water quality conditions can reasonably be achieved through the coordinated management of all controllable factors that affect water quality in the area, as provided in the Implementation Plan, including the addition of the watershed to the Prohibitions.
 - d. Costs to achieve compliance with the TMDLs are reasonable relative to the benefit of improved water quality.
 - e. The need for developing housing within the region is not relevant.
 - f. The need to develop and use recycled water is not relevant.
13. Central Coast Water Board staff submitted the Project Report for the TMDLs and Basin Plan Amendment to an external scientific review panel in April 2008. Central Coast Water Board staff edited the Project Report or provided a written response that explained the basis for failing to incorporate the comments, or the comments did not result in any changes to the proposed Basin Plan Amendments. The TMDLs and Implementation Program are based on sound scientific knowledge, methods, and practices in accordance with Health & Safety Code section 57004.
14. Central Coast Water Board staff implemented a process to inform interested persons and the public about the TMDLs and Basin Plan Amendment. Central Coast Water Board staff's efforts to inform the public and solicit comment included a scoping meeting, meetings with interested persons, and a public notice and comment period. Public notice of the amendments provided the public a 45-day public comment period in advance of the Central Coast Water Board hearing. Notice of public hearing was given by advertising in newspapers of general circulation within the Region and by mailing a copy of the notice to appropriate government agencies and all persons requesting such notice. Relevant documents and notices were also made available on the Central Coast Water Board website. The Central Coast Water Board responded to all oral and written comments received from the public. All public comments were considered.
15. Adoption of these TMDLs and Basin Plan amendment will not result in any degradation of water quality; in fact, they are designed to improve water quality. As such, these TMDLs and Basin Plan amendment comply with all requirements of both State and Federal anti-degradation requirements (State Board Resolution 68-16 "Statement of Policy with Respect to Maintaining High Quality of Waters in California, and 40CFR 131.12).
16. Pursuant to Public Resources Code section 21080.5, the Resources Agency has approved the Regional Water Quality Control Boards' basin planning process as a "certified regulatory program" that adequately satisfies the California Environmental Quality Act (CEQA) (Public Resources Code, Section 21000 et seq.) requirements for preparing environmental documents (14 Cal. Code Regs. §15251(g); 23 Cal. Code Regs. § 3782.). Central Coast Water Board staff has prepared "substitute environmental documents" for this project that contain the required environmental documentation under the State Water Resources Control Board's (State Board) CEQA regulations (23 Cal. Code Regs. § 3777.). The substitute environmental documents consist of the TMDL Staff Report and Attachments, including: this Resolution with the Basin Plan Amendment Language (Attachment 1), Final Project Report entitled "Total Maximum Daily Loads for Fecal Coliform in the Corralitos/Salsipuedes Creeks Watershed" (Attachment 2), the CEQA Substitute Document Report containing the Environmental Checklist and Alternatives Analysis (Attachment 3), the comments and responses to comments (Attachment 6). The Staff Report also includes the Notice of Public Hearing/Notice of Filing (Attachment 4) and the Scientific Peer Review Comment (Attachment 5). The project itself is the establishment of TMDLs for fecal coliform in the Corralitos/Salsipuedes Creeks Watershed. The Water Board exercises discretion in assigning waste load allocations and load allocations, determining the program of implementation, and setting various milestones in achieving the water quality standards. The CEQA Substitute Document Report (Staff Report Attachment 3)

and other portions of the substitute environmental documents contain significant analysis and numerous findings related to environmental impacts and mitigation measures.

17. A CEQA Scoping meeting was conducted on June 26, 2006 at the Capitola City Hall Community Room, 420 Capitola Avenue, Capitola, CA 95010. A notice of the CEQA Scoping meeting was sent to interested persons on May 30, 2006, including to the City of Watsonville and the County of Santa Cruz. The notice included a background of the project, the project purpose, a meeting schedule and directions for obtaining more detailed information through the Central Coast Water Board website; the notice and project summary was available at the website or by requesting hard copies via telephone.
18. Public Resources Code section 21159 provides that an agency shall perform, at the time of the adoption of a rule or regulation requiring the installation of pollution control equipment, or a performance standard or treatment requirement, an environmental analysis of the reasonably foreseeable methods of compliance, and an analysis of the reasonably foreseeable environmental impacts of the methods of compliance, an analysis of reasonably foreseeable mitigation measures to lessen the adverse environmental impacts, and an analysis of reasonably foreseeable alternative means of compliance with the rule or regulation that would have less significant adverse impacts, Section 21159(c) requires that the environmental analysis take into account a reasonable range of environmental, economic, and technical factors; population and geographic areas, and specific sites. The Staff Report prepared for this Basin Plan amendment, in particular the CEQA Substitute Document Report (Attachment 3) provides the environmental analysis required by Public Resources Code section 21159 and is, hereby incorporated as findings in this Resolution.
19. In preparing the substitute environmental documents, the Central Coast Water Board has considered the requirements of Public Resources Code section 21159 and California Code of Regulations, title 14, section 15187, and intends those documents to serve as a Tier 1 environmental review. This analysis is not intended to be an exhaustive analysis of every conceivable impact, but an analysis of the reasonably foreseeable consequences of the adoption of this regulation, from a programmatic perspective. Compliance obligations will be undertaken directly by public agencies that may have their own obligations under CEQA. Project level impacts may need to be considered in any subsequent environmental analysis performed by other public agencies, pursuant to Public Resources Code section 21159.2. To the extent applicable, this Tier 1 substitute environmental document may be used to satisfy subsequent CEQA obligations of those agencies.
20. Consistent with the Regional Board's substantive obligations under CEQA, the substitute environmental documents do not engage in speculation or conjecture, and only consider the reasonably foreseeable environmental impacts, including those relating to the methods of compliance, reasonably foreseeable feasible mitigation measures to reduce those impacts, and the reasonably foreseeable alternative means of compliance, which would avoid or reduce the identified impacts.
21. The proposed amendments will have a less than significant adverse effect on the environment. California Water Code section 13360 precludes the Regional Board from dictating the manner in which responsible agencies comply with any of the Regional Board's regulations or orders. When the agencies responsible for implementing these TMDLs determine how they will proceed, the agencies responsible for those parts of the project can and should incorporate such alternatives and mitigation into any subsequent projects or project approvals. These feasible alternatives and mitigation measures are described in more detail in the substitute environmental document (14 Cal. Code Regs. § 15091(a)(2)).

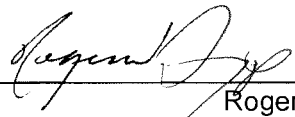

22. From a program-level perspective, incorporation of the alternatives and mitigation measures outlined in the substitute environmental documents will foreseeably reduce impacts to no impact, or keep the impact at less than significant levels.
23. The CEQA Substitute Document Report (Staff Report Attachment 3) identifies mitigation approaches that should be considered at the project level.
24. The Central Coast Water Board will request that the State Water Board approve the Basin Plan amendments incorporating the TMDLs for fecal coliform in the Corralitos/Salsipuedes Creek watershed, and adding the Corralitos/Salsipuedes Creek watershed to the Domestic Animal Waste Discharge Prohibition and the Human Fecal Material Discharge Prohibition. The TMDLs and Implementation Program for the TMDLs will become effective upon approval by The California Office of Administrative Law. The TMDLs must also be approved by the United States Environmental Protection Agency.
25. The amendments to the Basin Plan may have an effect on fish and wildlife. The Central Coast Water Board will, therefore, forward fee payments to the Department of Fish and Game under the California Fish and Game Code section 711.4.
26. The proposed amendments meet the "Necessity" standard of the Administrative Procedure Act, Government Code, section 11353, subdivision (b). As specified in Finding-10, federal regulations require that TMDLs be incorporated into the water quality management plan. The Central Coast Water Board's Basin Plan is the Central Coast Water Board's component of the water quality management plan, and the Basin Plan is how the Central Coast Water Board takes quasi-legislative, planning actions. Moreover, the TMDL is a program of implementation for existing water quality objectives, and is, therefore, appropriately a component of the Basin Plan under California Water Code section 13242. The necessity of developing TMDLs is established in the staff report, the section 303(d) list, and the data contained in the administrative record documenting the fecal coliform impairments of the Corralitos/Salsipuedes Creeks Watershed. The necessity of adding the watershed to the Prohibitions is established in the administrative record documenting the pathogen sources, the load allocations that responsible parties must meet to reduce or eliminate pathogen loading, and implementation strategies that comply with the NPS Policy.
27. On March 20, 2009 in Watsonville, California, the Central Coast Water Board held a public hearing and heard and considered all public comments and evidence in the record.

THEREFORE, be it resolved that:

1. Pursuant to sections 13240, 13241, 13242, 13243, and 13244 of the California Water Code, the Central Coast Water Board, after considering the entire record, including the oral testimony at the hearing, hereby adopts the amendment in "Attachment-Proposed Basin Plan Amendments."
2. The Executive Officer is directed to forward copies of the Basin Plan amendments to the State Water Board in accordance with the requirements of section 13245 of the California Water Code.
3. The Central Coast Water Board requests that the State Water Board approve the Basin Plan amendments in accordance with the requirements of sections 13245 and 13246 of the California Water Code and forward them to the California Office of Administrative Law and the USEPA for approval.

4. The Executive Officer is authorized to transmit payment of the applicable fee as may be required to the Resources Agency.
5. If, during its approval process, Central Coast Water Board staff, State Water Board staff, the State Water Board or the California Office of Administrative Law determines that minor, non-substantive corrections to the language of the amendments are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.
6. The environmental documents prepared by the Central Coast Water Board staff pursuant to Public Resources Code 21080.5 are hereby certified.

I, Roger W. Briggs, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of the resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region, on March 20, 2009.

Roger W. Briggs
Executive Officer

RESOLUTION NO. R3-2009-0009

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENTS

Revise the September 8, 1994 Basin Plan, as follows:

AMENDMENT NO. 1. ADD THE CORRALITOS/SALSIPUEDES CREEK WATERSHED TO THE HUMAN FECAL MATERIAL DISCHARGE PROHIBITION AND THE DOMESTIC ANIMAL WASTE DISCHARGE PROHIBITION.

Amend Chapter V, section IV.B., by adding the following watershed to the end of the bulleted list of applicable areas of the Domestic Animal Waste Discharge Prohibition, and the Human Fecal Material Discharge Prohibition.

- Corralitos/Salsipuedes Creek watershed

AMENDMENT NO. 2. ADD THE TOTAL MAXIMUM DAILY LOADS FOR FECAL COLIFORM IN CORRALITOS AND SALSIPUEDES CREEKS

Add the following to Chapter IV, after IX.M:

IX. N. TOTAL MAXIMUM DAILY LOADS FOR FECAL COLIFORM IN CORRALITOS AND SALSIPUEDES CREEKS

The Regional Water Quality Control Board adopted these TMDLs on March 20, 2009.

These TMDLs were approved by:

<u>The State Water Resources Control Board on</u>	<u>(Insert date).</u>
<u>The California Office of Administrative Law on</u>	<u>(Insert date).</u>
<u>The U.S. Environmental Protection Agency on</u>	<u>(Insert date).</u>

Problem Statement

The Central Coast Water Board concludes that the beneficial use of water contact recreation is not being protected in Corralitos and Salsipuedes Creeks because fecal coliform concentrations exceed existing Basin Plan numeric water quality objectives designed to protect this beneficial use. The impaired reaches are: (1) All reaches of Corralitos Creek downstream of Browns Valley Bridge, and (2) All reaches of Salsipuedes Creek.

Numeric Target

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

Source Analysis

The relative order of controllable sources contributing fecal coliform to Corralitos and Salsipuedes Creeks, in decreasing order of contribution, are: (1) storm drain discharges to municipally owned and operated storm sewer systems required to be covered by an NPDES permit (MS4s), (2) homeless person/encampment discharges (not regulated by a permit for storm water discharges), (3) pet waste (not regulated by a permit for storm water discharges), (4) farm animal and livestock discharges, (5) onsite wastewater system discharges, (6) sanitary sewer collection system spills and leaks, and (7) private sewer laterals connected to municipal sanitary sewer collection systems. Natural, uncontrollable sources also contribute fecal coliform in the Corralitos/Salsipuedes Creek watershed.

TMDLs and Allocations

The TMDLs for all impaired waters of Corralitos and Salsipuedes Creeks are concentration-based TMDLs applicable to each day of all seasons equal to the following:

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

The allocations to responsible parties are shown in Table IX.N-1.

Table IX – N-1. Allocations and Responsible Parties

<u>Waterbody Assigned Allocation</u>	<u>Responsible Party (Source Organism or Source Category)</u>	<u>Receiving Water Fecal Coliform Allocation</u>
<u>WASTE LOAD ALLOCATIONS</u>		
<u>Corralitos¹ and Salsipuedes Creeks²</u>	Santa Cruz County and City of Watsonville (Storm Drain Discharges to Ms4s Required to be Covered by an Npdes Permit)	<u>Wasteload Allocation 1</u>
<u>Corralitos¹ and Salsipuedes Creeks²</u>	Freedom County Sanitation District (Corralitos Creek only) and Salsipuedes Sanitary District (Salsipuedes Creek only) (Sanitary Sewer Collection System Spills and Leaks Required to be Covered by WDR Order No. R3-2003-0041)	<u>Wasteload Allocation 2</u>
<u>Corralitos¹ and Salsipuedes Creeks²</u>	Owners of Private Sewer Laterals (Private Sewer Laterals Connected to Municipal Sanitary Sewer Collection System)	<u>Wasteload Allocation 2</u>
<u>LOAD ALLOCATIONS</u>		
<u>Corralitos¹ and Salsipuedes Creeks²</u>	Owners and/or Operators of Land that have Homeless Persons/Encampments (Discharges From Homeless Persons/Encampments Not Regulated by a Permit for Storm Water Discharges)	<u>Load Allocation 2</u>
<u>Corralitos¹ and Salsipuedes Creeks²</u>	Owners/Operators of Land Used for/Containing Pets (Pet Waste Not Regulated by a Permit for Storm Water Discharges)	<u>Load Allocation 1</u>
<u>Corralitos¹ and Salsipuedes Creeks²</u>	Owners of Land Used for/Containing Farm Animals/Livestock (Farm Animals and Livestock Waste Discharges)	<u>Load Allocation 1</u>
<u>Salsipuedes Creek (upstream of confluence with Corralitos Creek)</u>	Owners of Onsite Wastewater Systems Whose Systems are Within the Specified Area ³ (Onsite Wastewater System Discharges)	<u>Load Allocation 2</u>
<u>Corralitos¹ and Salsipuedes Creeks²</u>	Natural Sources	<u>Load Allocation 1</u>
<p><u>Wasteload/Load Allocation 1: Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN/100mL, nor shall more than ten percent of total samples during any 30-day period exceed 400 MPN/100 mL.</u></p> <p><u>Wasteload/Load Allocation 2: Allocation of zero; no fecal coliform bacteria load originating from human sources of fecal material is allowed.</u></p>		

¹ All reaches of Corralitos Creek downstream of Browns Valley Bridge

² All reaches of Salsipuedes Creek

³ The specified area is within the boundaries of State Highway 152 to the southeast, Foothill Road to the northeast (excluding assessor parcel numbers 05155107 and 05155106), Salsipuedes Creek to the northwest, and up to, but not including The County Fairgrounds to the southwest.

The parties responsible for the allocations to controllable sources are not responsible for the allocation to natural sources.

Margin of Safety

A margin of safety is incorporated implicitly in the TMDLs through conservative assumptions.

Implementation Program

STORM DRAIN DISCHARGES

The Central Coast Water Board will address fecal indicator bacteria (FIB), e.g., fecal coliform and/or other indicators of pathogens, discharged from the County of Santa Cruz's and City of Watsonville's municipal separate storm sewer system by regulating the County of Santa Cruz and City of Watsonville under the provisions of the State Water Resource Control Board's General Permit for the Discharges of Storm Water from Small Municipal Separate Storm Sewer Systems (General Permit) (NPDES No. CAS000004). The proposed enrollment date for the County of Santa Cruz and City of Watsonville under the General Permit as a small municipal separate storm sewer system (MS4) is March 2009. As enrollees, the County of Santa Cruz and City of Watsonville must develop and implement a Storm Water Management Plan (SWMP) that controls urban runoff discharges into and from its MS4. To address the County of Santa Cruz's and City of Watsonville's TMDL waste load allocation, the Central Coast Water Board will require the County of Santa Cruz and City of Watsonville to specifically target FIB in urban runoff through incorporation of a Wasteload Allocation Attainment Program in its SWMP.

The Central Coast Water Board will require that the Wasteload Allocation Attainment Programs describe the actions that will be taken by the County of Santa Cruz and City of Watsonville to attain the TMDL wasteload allocations, and specifically address:

1. Development of an implementation and assessment strategy;
2. Source identification and prioritization;
3. Best management practice identification, prioritization, implementation, analysis, and effectiveness assessment;
4. Monitoring program development and implementation;
5. Reporting; including evaluation whether current best management practices are progressing towards achieving the wasteload allocations by thirteen years after the TMDLs are approved by the Office of Administrative Law.
6. Coordination with stakeholders; and
7. Other pertinent factors.

The Wasteload Allocation Attainment Program will be required by the Central Coast Water Board to address each of these TMDLs that occur within the County of Santa Cruz's and City of Watsonville's jurisdiction.

The Central Coast Water Board will require that the Wasteload Allocation Attainment Program be submitted at one of the following milestones, whichever occurs first:

1. Within one year of approval of the TMDLs by the Office of Administrative Law;
2. When required by any other Water Board-issued storm water requirements (e.g., when the Phase II Municipal Storm Water Permit is renewed).

For an MS4 that is enrolled under the General Permit at the time of Wasteload Allocation Attainment Program submittal, the Wasteload Allocation Attainment Program must be incorporated into the

SWMP when the Wasteload Allocation Attainment Program is submitted. For an MS4 entity that is not enrolled under the General Permit at the time of the Wasteload Allocation Attainment Program submittal, the Wasteload Allocation Attainment Program must be incorporated into the SWMP when the SWMP is approved by the Central Coast Water Board.

The Executive Officer or the Central Coast Water Board will require information that demonstrates implementation of the actions described above, pursuant to applicable sections of the California Water Code and/or pursuant to authorities provided in the General Permit for storm water discharges.

HOMELESS PERSON/ENCAMPMENT DISCHARGES NOT REGULATED BY A PERMIT FOR STORM WATER DISCHARGES

Owners of land that contain homeless persons and/or homeless encampments in the Corralitos/Salsipuedes Creeks watershed must comply with the Human Fecal Material Discharge Prohibition.

Owners of land with homeless persons must demonstrate to the satisfaction of the Executive Officer or the Water Board that they are in compliance with the Human Fecal Material Discharge Prohibition; compliance with the Human Fecal Material Discharge Prohibition implies compliance with the load allocation for these TMDLs.

Within three years of approval of these TMDLs by the Office of Administrative Law, the Executive Officer will notify owners of lands containing homeless persons of the requirement to comply with the Human Fecal Material Discharge Prohibition. In his notification, the Executive Officer will also describe owner's options for demonstrating compliance with the Human Fecal Material Discharge Prohibition; pursuant to California Water Code 13267 and within six months of the notification by the Executive Officer, owners will be required to submit the following for approval by the Executive Officer or the Water Board:

- 1) Clear evidence that the owner/operator is and will continue to be in compliance with the Human Fecal Material Discharge Prohibition; clear evidence could be documentation submitted by the owner to the Executive Officer validating current and continued compliance with the Prohibition, or A plan for compliance with the Human Fecal Material Discharge Prohibition. Such a plan must include a list of specific management practices that will be implemented to control discharges containing fecal material from homeless persons. The Plan must also describe how implementing the identified management practices is likely to progressively achieve the load allocation for homeless persons, with the ultimate goal achieving the load allocation no later than three years from the date of the Executive Officer's notification to the owner requiring compliance. The plan must include monitoring and reporting to the Central Coast Water Board, demonstrating the progress towards achieving load allocations for discharges from homeless persons, and self-assessment of this progress, or
- 2) Submittal of a Report of Waste Discharge pursuant to California Water Code Section 13260 (as an application for waste discharge requirements; WDRs).

DOMESTIC ANIMAL DISCHARGES NOT REGULATED BY A PERMIT FOR STORM WATER DISCHARGES

Owners and/or operators of lands containing domestic animals in the Corralitos/Salsipuedes Creeks watershed must comply with the Domestic Animal Waste Discharge Prohibition; compliance with the

Domestic Animal Waste Discharge Prohibition implies compliance with the load allocation for these TMDLs.

Within three years of approval of these TMDLs by the Office of Administrative Law, the Executive Officer will notify owners and/or operators of lands used for/containing domestic animals of the requirement to comply with the Domestic Animal Waste Discharge Prohibition. In his notification, the Executive Officer will also describe the owner's/operator's of lands containing domestic animals options for demonstrating compliance with the Domestic Animal Waste Discharge Prohibition; pursuant to California Water Code section 13267 and within six months of the notification by the Executive Officer, owners/operators of lands containing domestic animals will be required to submit the following for approval by the Executive Officer or the Water Board:

- 1) Clear evidence that the owner/operator of lands containing domestic animals is and will continue to be in compliance with the Domestic Animal Waste Discharge Prohibition; clear evidence could be documentation submitted by the owner/operator to the Executive Officer validating current and continued compliance with the Prohibition, or
- 2) A plan for compliance with the Domestic Animal Waste Discharge Prohibition. Such a plan must include a list of specific management practices that will be implemented to control discharges containing fecal material from domestic animals. The plan must also describe how implementing the identified management practices is likely to progressively achieve the load allocations to domestic animals, with the ultimate goal achieving the load allocations no later than thirteen years after Office of Administrative Law approval of these TMDLs. The plan must include monitoring and reporting to the Central Coast Water Board, demonstrating the progress toward achieving load allocations for discharges from domestic animals, and a self-assessment of this progress. The plan may be developed by an individual discharger or by or for a coalition of dischargers in cooperation with a third-party representative, organization, or government agency acting as the agents of owners/operators of lands containing domestic animals, or
- 3) Submittal of a Report of Waste Discharge pursuant to California Water Code Section 13260 (as an application for waste discharge requirements; WDRs or National Pollutant Discharge Elimination System (NPDES permit).

ONSITE WASTEWATER SYSTEM DISCHARGES

Owners of onsite wastewater systems within the following described area must comply with the Human Fecal Material Discharge Prohibition. The subject area is within the boundaries of State Highway 152 to the southeast, Foothill Road to the northeast (excluding assessor parcel numbers 05155107 and 05155106), Salsipuedes Creek to the northwest, and up to but not including The County Fairgrounds to the southwest.

Owners of onsite wastewater systems must demonstrate to the satisfaction of the Executive Officer or the Water Board that they are in compliance with the Human Fecal Material Discharge Prohibition; compliance with the Human Fecal Material Discharge Prohibition implies compliance with the load allocation for these TMDLs.

Within three years of approval of these TMDLs by the Office of Administrative Law, the Executive Officer will either 1) determine that the County of Santa Cruz is making adequate progress towards implementing an approved Santa Cruz County Onsite Wastewater Management Plan as it pertains to controlling the waste loads from onsite wastewater systems in Corralitos and Salsipuedes Creeks, or 2) notify owners of onsite wastewater systems (owners) in the area described above of the requirement to comply with the Human Fecal Material Discharge Prohibition. In his notification, the Executive Officer will also describe owner's options for demonstrating compliance with the Human Fecal Material Discharge Prohibition; pursuant to California Water Code 13267 and within six

months of the notification by the Executive Officer, owners will be required to submit the following for approval by the Executive Officer or the Water Board:

- 1) Clear evidence that the owner is and will continue to be in compliance with the Human Fecal Material Discharge Prohibition; clear evidence could be certification by the County of Santa Cruz, or similar, that the owners onsite wastewater system is in compliance with the Human Fecal Material Discharge Prohibition, or
- 2) A schedule for compliance with the Human Fecal Material Discharge Prohibition. The compliance schedule must include a monitoring and reporting program and milestone dates demonstrating progress towards compliance with the Human Fecal Material Discharge Prohibition, with the ultimate milestone being compliance with the Human Fecal Material Discharge Prohibition no later than three years from the date of the Executive Officer's notification to the owner requiring compliance, or
- 3) Submittal of a Report of Waste Discharge pursuant to California Water Code Section 13260 (as an application for waste discharge requirements; WDRs).
- 4) Clear evidence of current or scheduled compliance with the Human Fecal Material Discharge Prohibition (as described in number-1 and number-2 above, respectively) through the submittal of the required information, e.g. by the County of Santa Cruz, acting as the voluntary agents of owners/operators of onsite wastewater systems. Note that an owner of an onsite wastewater system cannot demonstrate compliance with the Human Fecal Material Discharge Prohibition through this option if: 1) the County of Santa Cruz is not their voluntary agent, or 2) if the owner/operator of the onsite wastewater system does not choose the County of Santa Cruz as their agent, or, 3) the Executive Officer or Water Board does not approve the evidence submitted by the County of Santa Cruz on behalf of the owners/operators of onsite wastewater systems.

SALSIPUEDES SANITARY DISTRICT AND FREEDOM COUNTY SANITATION DISTRICT SEWER COLLECTION SYSTEM SPILLS AND LEAKS

The Freedom County Sanitation District (FCSD) and the Salsipuedes Sanitary District (SSD) in the Corralitos/Salsipuedes Creeks watershed must comply with the Human Fecal Material Discharge Prohibition; compliance with the Human Fecal Material Discharge Prohibition implies compliance with their load allocation for this TMDL.

To comply with the Human Fecal Material Discharge Prohibition, the FCSD and the SSD must continue to implement their Collection System Management Plan and Infiltration/Inflow and Spill Prevention Program (herein referred to as the Plan and Program), respectively, as required by Waste Discharge Requirements (WDRs) (Order No. R3-2003-0041).

In addition, the FCSD and SSD are required to improve maintenance of their sewage collection systems, including identification, correction, and prevention of sewage leaks in portions of the collection systems that run through or adjacent to, impaired surface waters within the Corralitos/Salsipuedes Creek Watershed.

To this end, within six months following adoption of this TMDL by the Office of Administrative Law, the Executive Officer will issue a letter pursuant to Section 13267 of the California Water Code requiring: 1) submittal within one-year, a technical report that describes how and when FCSD and SSD will conduct improved collection system maintenance in portions of the collection system most likely to affect impaired surface water bodies, with the end result being compliance with the Human Fecal Material Discharge Prohibition, and 2) stream monitoring for fecal coliform or another fecal indicator bacteria, and reporting of these monitoring activities, and 3) annual reporting of self-assessment as to whether the FCSD and SSD are in compliance with the Human Fecal Material Discharge Prohibition.

PRIVATE SEWER LATERALS CONNECTED TO MUNICIPAL SANITARY SEWER COLLECTION SYSTEMS

Individual owners and operators of private laterals to sanitary sewer collection systems are ultimately responsible for maintenance of their private laterals and are, therefore, responsible for complying with the Human Fecal Material Discharge Prohibition; compliance with the Human Fecal Material Discharge Prohibition implies compliance with their load allocation for these TMDLs.

The Central Coast Water Board requires immediate cessation of spills from private laterals. Within three years of approval of these TMDLs by the Office of Administrative Law, the Executive Officer will notify owners and/or operators of private laterals to sanitary sewer collection systems (owners/operators of private laterals), in suspected problem areas, of this requirement and of the requirement to comply with the Human Fecal Material Discharge Prohibition. In his notification, the Executive Officer will also describe the owner's/operator's of private laterals options for demonstrating compliance with the Human Fecal Material Discharge Prohibition; pursuant to California Water Code section 13267 and within six months of the notification by the Executive Officer, owners/operators of private laterals will be required to submit the following for approval by the Executive Officer or the Water Board:

- 1) Clear evidence that the owner/operator of private lateral is and will continue to be in compliance with the Human Fecal Material Discharge Prohibition; clear evidence could be certification by the County of Santa Cruz or City of Watsonville that owner/operator of private lateral is in compliance with the Human Fecal Material Discharge Prohibition, or
- 2) A schedule for compliance with the Human Fecal Material Discharge Prohibition. The compliance schedule must include a monitoring and reporting program and milestone dates demonstrating progress towards compliance with the Human Fecal Material Discharge Prohibition, with the ultimate milestone being compliance with the Human Fecal Material Discharge Prohibition no later than three years (the exact timeframe at the discretion of the Executive Officer) from the date of the Executive Officer's notification to the owner/operator requiring compliance, or
- 3) Submittal of a Report of Waste Discharge pursuant to California Water Code Section 13260 (as an application for waste discharge requirements; WDRs or National Pollutant Discharge Elimination System (NPDES permit)) or,
- 4) Clear evidence of current or scheduled compliance with the Human Fecal Material Discharge Prohibition (as described in number-1 and number-2 above, respectively) through the submittal of the required information by County of Santa Cruz or the City of Watsonville, acting as the voluntary agents of owners/operators of private laterals. Note that an owner/operator of a private lateral cannot demonstrate compliance with the Human Fecal Material Discharge Prohibition through this option if: 1) the County of Santa Cruz or the City of Watsonville is not their voluntary agent, or 2) if the owner/operator of the private lateral does not choose the County of Santa Cruz or the City of Watsonville as their agent, or, 3) the Executive Officer or Water Board does not approve the evidence submitted by the County of Santa Cruz or the City of Watsonville on behalf of the owners/operators of private laterals.

Tracking and Evaluation

Every three years, beginning three years after TMDLs are approved by the California Office of Administrative Law, the Central Coast Water Board will perform a review of implementation actions, monitoring results, and evaluations submitted by responsible parties of their progress toward achieving their allocations. The Central Coast Water Board will use annual reports, nonpoint source pollution control implementation programs, evaluations submitted by responsible parties, and other available information to determine progress toward implementing required actions and achieving the allocations and numeric target.

Responsible parties will continue monitoring and reporting according to this plan for at least three years, at which time the Central Coast Water Board will determine the need for continuing or otherwise modifying the monitoring requirements. Responsible parties may also demonstrate that although water quality objectives are not being achieved in receiving waters, controllable sources of fecal indicator bacteria are not contributing to the exceedance. If this is the case, the Central Coast Water Board may re-evaluate the numeric target and allocations. For example, the Central Coast Water Board may pursue and approve a site-specific objective. The site-specific objective would be based on evidence that natural, or background sources alone were the cause of exceedances of the Basin Plan water quality objective for fecal indicator bacteria.

Three-year reviews will continue until the water quality objectives are achieved. The compliance schedule for achieving the TMDLs and numeric target is 13 years after the date of approval by the California Office of Administrative Law.

**CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, California**

**RESOLUTION NO. R3-2009-0008
MARCH 20, 2009**

AMENDING THE WATER QUALITY CONTROL PLAN FOR THE CENTRAL COAST BASIN TO (1) ADD TOTAL MAXIMUM DAILY LOADS FOR FECAL COLIFORM IN THE PAJARO RIVER WATERSHED (INCLUDING PAJARO RIVER, SAN BENITO RIVER, LLAGAS CREEK, TEQUISQUITA SLOUGH, SAN JUAN CREEK, CARNADERO/UVAS CREEK, BIRD CREEK, PESCADERO CREEK, TRES PINOS CREEK, FURLONG (JONES) CREEK, SANTA ANA CREEK, AND PACHECHO CREEK); (2) ADD A DOMESTIC ANIMAL WASTE DISCHARGE PROHIBITION; AND (3) ADD A HUMAN FECAL MATERIAL DISCHARGE PROHIBITION

The Regional Water Quality Control Board, Central Coast Region (Central Coast Water Board) finds:

1. The Regional Water Quality Control Board, Central Coast Region (Central Coast Water Board) adopted the second edition of the Water Quality Control Plan for the Central Coastal Basin (Basin Plan) on September 8, 1994. The Basin Plan designates beneficial uses and water quality objectives, sets forth programs of implementation to achieve water quality objectives addressing point source and nonpoint source discharges, adopts prohibitions, and incorporates statewide plans and policies.
2. The Central Coast Water Board periodically revises and amends the Basin Plan. The Central Coast Water Board has determined the Basin Plan requires further revision and amendment to: (1) incorporate the Total Maximum Daily Loads (TMDLs) and Implementation Program for fecal coliform in the Pajaro River Watershed, including the Pajaro River, San Benito River, Llagas Creek, Tequisquita Slough, San Juan Creek, Carnadero/Uvas Creek, Bird Creek, Pescadero Creek, Tres Pinos Creek, Furlong (Jones) Creek, Santa Ana Creek, and Pachecho Creek, (2) add a Domestic Animal Waste Discharge Prohibition applicable to the Pajaro River Watershed, and (3) add a Human Fecal Material Discharge Prohibition applicable to the Pajaro River Watershed.
3. The Central Coast Water Board proposes to amend the Basin Plan by inserting amendments into the following sections:
 - a. Chapter Four, Section IX (Total Maximum Daily Loads).
 - b. Chapter Five, Section IV.B. (Discharge Prohibitions)

4. On May 20, 2004, the State Water Resources Control Board (State Water Board) adopted the *Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program* (NPS Policy). This Policy requires the Water Boards to regulate all nonpoint sources of pollution using the administrative permitting authorities provided by the California Water Code. This Policy requires Regional Water Boards to regulate nonpoint source discharges with Waste Discharge Requirements, Waivers of Waste Discharge Requirements, Basin Plan Prohibitions, or a combination thereof.
5. Pajaro River, San Benito River, Llagas Creek, and Tequisquita Slough are listed on the Clean Water Act 303(d) list as impaired due to pathogens. Therefore, this Resolution establishes TMDLs and associated allocations for these listed water bodies.
6. San Juan Creek, Carnadero/Uvas Creek, Bird Creek, Pescadero Creek, Tres Pinos Creek, Furlong (Jones) Creek, Pechecho Creek, and Santa Ana Creek are located in the Pajaro River Watershed, are currently not listed on the Clean Water Act 303(d) list of impaired waters, and are not meeting the Basin Plan water quality objectives for fecal indicator bacteria. The Central Coast Water Board finds that these water bodies are impaired due to non-attainment of Basin Plan water quality objectives for fecal coliform. Therefore, this Resolution establishes TMDLs and associated allocations for these water bodies.
7. The Central Coast Water Board's goal for establishing TMDLs in the Pajaro River Watershed is to rectify the impairment due to fecal coliform, thereby providing support for the designated beneficial uses of contact and non-contact water recreation.
8. The mouth of Pajaro River is the receiving water for approximately 1,253 square miles of land. Water from Pajaro River flows into Monterey Bay.
9. The elements of a TMDL are described in 40 CFR 130.2 and 130.7, section 303(d) of the Clean Water Act, and USEPA guidance documents. A TMDL is defined as "the sum of individual waste load allocations for point sources and load allocations for nonpoint sources and natural background" (40 CFR 130.2). The Central Coast Water Board has determined that the TMDLs for fecal coliform in the Pajaro River Watershed are set at levels necessary to attain and maintain the applicable numeric water quality objectives taking into account seasonal variations and any lack of knowledge or uncertainty concerning the relationship between effluent limitations and water quality (40 CFR 130.7 (c) (1)). The regulations in 40 CFR 130.7 also state that TMDLs shall take into account critical conditions for stream flow, loading, and water quality parameters. TMDLs are often expressed as a mass load of the pollutant but can be expressed as a unit of concentration if appropriate (40 CFR 130.2(i)). Expressing these TMDLs as units of concentration is appropriate because an existing concentration-based water quality objective is used as the basis for the TMDL numeric target.

10. Upon establishment of TMDLs by the State or USEPA, the State is required to incorporate the TMDLs, along with appropriate implementation measures, into the State Water Quality Management Plan (40 CFR 130.6 (c)(1) and 130.7; California Water Code sections 13050(j) and 13242). The Basin Plan and applicable statewide plans serve as the State Water Quality Management Plan governing the watersheds under the jurisdiction of the Central Coast Water Board.
11. The Central Coast Water Board may specify certain conditions or areas where the discharge of waste, or certain types of waste, will not be permitted pursuant to California Water Code section 13243. This Basin Plan amendment establishes the Human Fecal Material Discharge Prohibition and the Domestic Animal Waste Discharge Prohibition for discharges in the Pajaro River Watershed (Prohibitions). The implementation plan for the TMDLs for the Pajaro River Watershed requires compliance with the Human Fecal Material Discharge Prohibition and the Domestic Animal Waste Discharge Prohibition for discharges in the Pajaro River Watershed. Supporting documentation supporting the establishment of these Prohibitions for the Pajaro River Watershed is provided in the Final Project Report: Total Maximum Daily Loads for Pathogens in the Pajaro River Watershed. Consistent with California Water Code section 13244, the Central Coast Water Board complied with public notice and hearing requirements for establishing the Human Fecal Material Discharge and the Domestic Animal Waste Discharge Prohibitions for the Pajaro River Watershed.
12. Pursuant to California Water Code section 13241, the Central Coast Water Board considered several factors in developing this Basin Plan amendment. The Central Coast Water Board concludes the following.
 - a. The Prohibitions and the TMDLs will protect present and probable future beneficial uses.
 - b. Environmental characteristics of the waterbodies will be protected.
 - c. Improved water quality conditions can reasonably be achieved through the coordinated management of all controllable factors that affect water quality in the area, as provided in the Implementation Plan, including the Prohibitions.
 - d. Costs to achieve compliance with the TMDLs are reasonable relative to the benefit of improved water quality.
 - e. The need for developing housing within the region is not relevant.
 - f. The need to develop and use recycled water is not relevant.
13. Central Coast Water Board staff submitted the Project Report for the TMDLs and the Prohibitions to an external scientific review panel in February 2008. Central Coast Water Board staff edited the Project Report or provided a written response that explained the basis for failing to incorporate the comments, or the comments did not result in any changes to the proposed Basin Plan amendments. The TMDLs and Implementation Program are based on sound scientific knowledge, methods, and practices in accordance with Health & Safety Code section 57004.

14. Central Coast Water Board staff implemented a process to inform interested persons and the public about the TMDLs and Prohibitions. Central Coast Water Board staff's efforts to inform the public and solicit comment included, a scoping meeting, meetings with interested persons, and a public notice and comment period. Public notice of the amendments provided the public a 45-day public comment period in advance of the Central Coast Water Board hearing. Notice of public hearing was given by advertising in newspapers of general circulation within the Region and by mailing a copy of the notice to appropriate government agencies and all persons requesting such notice. Relevant documents and notices were also made available on the Central Coast Water Board website. The Central Coast Water Board responded to oral and written comments received from the public. All public comments were considered.

15. Adoption of these TMDLs and Basin Plan amendment will not result in any degradation of water quality; in fact, they are designed to improve water quality. As such, these TMDLs and Basin Plan amendment comply with all requirements of both State and Federal anti-degradation requirements (State Board Resolution 68-16 "Statement of Policy with Respect to Maintaining High Quality of Waters in California, and 40CFR 131.12).

16. Pursuant to Public Resources Code section 21080.5, the Resources Agency has approved the Regional Water Quality Control Boards' basin planning process as a "certified regulatory program" that adequately satisfies the California Environmental Quality Act (CEQA) (Public Resources Code, Section 21000 et seq.) requirements for preparing environmental documents (14 Cal. Code Regs. §15251(g); 23 Cal. Code Regs. § 3782.). Central Coast Water Board staff has prepared "substitute environmental documents" for this project that contain the required environmental documentation under the State Water Resources Control Board's (State Board) CEQA regulations (23 Cal. Code Regs. § 3777.). The substitute environmental documents consist of the TMDL Staff Report and Attachments, including: this Resolution with the Basin Plan Amendment Language (Attachment 1), Final Project Report entitled "Total Maximum Daily Loads for Fecal Coliform in the Pajaro River Watershed" (Attachment 2), the CEQA Substitute Document Report containing the Environmental Checklist and Alternatives Analysis (Attachment 3), the comments and responses to comments (Attachment 6),. The Staff Report also includes the Notice of Public Hearing/Notice of Filing (Attachment 4) and the Scientific Peer Review Comment (Attachment 5). The project itself is the establishment of TMDLs for fecal coliform in the Pajaro River Watershed. The Water Board exercises discretion in assigning waste load allocations and load allocations, determining the program of implementation, and setting various milestones in achieving the water quality standards. The CEQA Substitute Document Report (Staff Report Attachment 3) and other portions of the substitute environmental documents contain significant analysis and numerous findings related to environmental impacts and mitigation measures.

17. A CEQA Scoping meeting was conducted on June 20, 2007 at the Gilroy City Hall, Gilroy CA 95020. A notice of the CEQA Scoping meeting was sent to interested persons on May 23, 2007, including to the Cities of Gilroy, Hollister, Morgan Hill, Watsonville and the Counties of Monterey, Santa Clara, San Benito, and Santa Cruz. The notice included a background of the project, the project purpose, a meeting schedule and directions for obtaining more detailed information through the Central Coast Water Board website; the notice and project summary was available at the website or by requesting hard copies via telephone.
18. Public Resources Code section 21159 provides that an agency shall perform, at the time of the adoption of a rule or regulation requiring the installation of pollution control equipment, or a performance standard or treatment requirement, an environmental analysis of the reasonably foreseeable methods of compliance, and an analysis of the reasonably foreseeable environmental impacts of the methods of compliance, an analysis of reasonably foreseeable mitigation measures to lessen the adverse environmental impacts, and an analysis of reasonably foreseeable alternative means of compliance with the rule or regulation that would have less significant adverse impacts, Section 21159(c) requires that the environmental analysis take into account a reasonable range of environmental, economic, and technical factors; population and geographic areas, and specific sites. The Staff Report prepared for this Basin Plan amendment, in particular the CEQA Substitute Document Report (Attachment 3) provides the environmental analysis required by Public Resources Code section 21159 and is, hereby incorporated as findings in this Resolution.
19. In preparing the substitute environmental documents, the Central Coast Water Board has considered the requirements of Public Resources Code section 21159 and California Code of Regulations, title 14, section 15187, and intends those documents to serve as a Tier 1 environmental review. This analysis is not intended to be an exhaustive analysis of every conceivable impact, but an analysis of the reasonably foreseeable consequences of the adoption of this regulation, from a programmatic perspective. Compliance obligations will be undertaken directly by public agencies that may have their own obligations under CEQA. Project level impacts may need to be considered in any subsequent environmental analysis performed by other public agencies, pursuant to Public Resources Code section 21159.2. To the extent applicable, this Tier 1 substitute environmental document may be used to satisfy subsequent CEQA obligations of those agencies.
20. Consistent with the Regional Board's substantive obligations under CEQA, the substitute environmental documents do not engage in speculation or conjecture, and only consider the reasonably foreseeable environmental impacts, including those relating to the methods of compliance, reasonably foreseeable feasible mitigation measures to reduce those impacts, and the reasonably foreseeable

alternative means of compliance, which would avoid or reduce the identified impacts.

21. The proposed amendment will have a less than significant adverse effect on the environment. California Water Code section 13360 precludes the Regional Board from dictating the manner in which responsible agencies comply with any of the Regional Board's regulations or orders. When the agencies responsible for implementing these TMDLs determine how they will proceed, the agencies responsible for those parts of the project can and should incorporate such alternatives and mitigation into any subsequent projects or project approvals. These feasible alternatives and mitigation measures are described in more detail in the substitute environmental documents (14 Cal. Code Regs. § 15091(a)(2)).
22. From a program-level perspective, incorporation of the alternatives and mitigation measures outlined in the substitute environmental documents will foreseeably reduce impacts to no impact, or keep the impact at less than significant levels.
23. The CEQA Substitute Document Report (Staff Report Attachment 3) identifies mitigation approaches that should be considered at the project level.
24. The Central Coast Water Board will request that the State Water Board approve the Basin Plan amendments incorporating: (a) the TMDLs for fecal coliform in the Pajaro River Watershed, and (b) the Domestic Animal Waste Discharge Prohibition and the Human Fecal Material Discharge Prohibition applicable to the Pajaro River Watershed. The TMDLs and Implementation Program for the TMDLs, and Prohibitions, will become effective upon approval by the California Office of Administrative Law. The TMDLs must also be approved by the United States Environmental Protection Agency.
25. The amendments to the Basin Plan may have an effect on fish and wildlife. The Central Coast Water Board will, therefore, forward fee payments to the Department of Fish and Game under the California Fish and Game Code section 711.4.
26. The proposed amendments meet the "Necessity" standard of the Administrative Procedure Act, Government Code, section 11353, subdivision (b). As specified in Finding-10, federal regulations require that TMDLs be incorporated into the water quality management plan. The Central Coast Water Board's Basin Plan is the Central Coast Water Board's component of the water quality management plan, and the Basin Plan is how the Central Coast Water Board takes quasi-legislative, planning actions. Moreover, the TMDL is a program of implementation for existing water quality objectives, and is, therefore, appropriately a component of the Basin Plan under California Water Code section 13242. The necessity of developing TMDLs is established in the TMDL staff report, the section 303(d) list, and the data contained in the administrative record documenting the pathogen impairments of the Pajaro River Watershed. The necessity of adding the

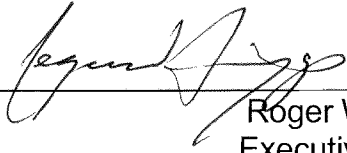

Prohibitions as implementation mechanisms to achieve the TMDL is established in the administrative record documenting the pathogen sources, the load allocations that responsible parties must meet to reduce or eliminate pathogen loading, and implementation strategies that comply with the NPS Policy.

27. On March 20, 2009, in Watsonville, California, the Central Coast Water Board held a public hearing and heard and considered all public comments and evidence in the record.

THEREFORE, be it resolved that:

1. Pursuant to sections 13240, 13241, 13242, 13243, and 13244 of the California Water Code, the Central Coast Water Board, after considering the entire record, including the oral testimony at the hearing, hereby adopts the amendments in "Attachment-Proposed Basin Plan Amendments."
2. The Executive Officer is directed to forward copies of the Basin Plan amendments to the State Water Board in accordance with the requirements of section 13245 of the California Water Code.
3. The Central Coast Water Board requests that the State Water Board approve the Basin Plan amendments in accordance with the requirements of sections 13245 and 13246 of the California Water Code and forward them to the California Office Of Administrative Law and the USEPA for approval.
4. The Executive Officer is authorized to transmit payment of the applicable fee as may be required to the Resources Agency.
5. If, during its approval process, Central Coast Water Board staff, State Water Board staff, the State Water Board or the California Office of Administrative Law determines that minor, non-substantive corrections to the language of the amendments are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.
6. The environmental documents prepared by the Central Coast Water Board staff pursuant to Public Resources Code 21080.5 are hereby certified.

I, Roger W. Briggs, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of the resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region, on March 20, 2009.

Roger W. Briggs
Executive Officer

RESOLUTION NO. R3-2009-0008

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENTS

Revise the September 8, 1994 Basin Plan, as follows:

AMENDMENT NO. 1. ADD TOTAL MAXIMUM DAILY LOADS FOR FECAL COLIFORM IN PAJARO RIVER WATERSHED WATERS (INCLUDING PAJARO RIVER, SAN BENITO RIVER, LLAGAS CREEK, TEQUISQUITA SLOUGH, SAN JUAN CREEK, CARNADERO/UVAS CREEK, BIRD CREEK, PESCADERO CREEK, TRES PINOS CREEK, FURLONG (JONES) CREEK, SANTA ANA CREEK, AND PACHECHO CREEK)

Add the following to Chapter IV. after IX. L.:

IX. M. TOTAL MAXIMUM DAILY LOADS FOR FECAL COLIFORM IN PAJARO RIVER WATERSHED WATERS (INCLUDING PAJARO RIVER, SAN BENITO RIVER, LLAGAS CREEK, TEQUISQUITA SLOUGH, SAN JUAN CREEK, CARNADERO/UVAS CREEK, BIRD CREEK, PESCADERO CREEK, TRES PINOS CREEK, FURLONG (JONES) CREEK, SANTA ANA CREEK, AND PACHECHO CREEK)

The Regional Water Quality Control Board adopted these TMDLs on March 20, 2009. These TMDLs were approved by:

The State Water Resources Control Board on _____
The California Office of Administrative Law on _____ (date)
The U.S. Environmental Protection Agency on _____ (date)

Problem Statement

The beneficial use of water contact recreation is not being protected in Pajaro River Watershed (including the following water bodies: Pajaro River, San Benito River, Llagas Creek, Tequisquita Slough, San Juan Creek, Carnadero/Uvas Creek, Bird Creek, Pescadero Creek, Tres Pinos Creek, Furlong (Jones) Creek, Santa Ana Creek, and Pachecho Creek) because fecal coliform concentrations exceed Basin Plan numeric water quality objectives designed to protect this beneficial use.

Numeric Target

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

Source Analysis

The relative order of controllable sources contributing fecal coliform in the Pajaro River Watershed, in decreasing order of contribution are: (1) storm drain discharges to municipally owned and operated storm sewer systems required to be covered by an NPDES permit (MS4s); (2) domestic animal discharges that do not discharge to MS4s; (3) spills and leaks from Sanitary Sewer Collection and Treatment Systems; and (4) private sewer laterals connected to municipal sanitary sewer collection systems. Natural, uncontrollable sources also contribute fecal coliform in the Pajaro River Watershed.

TMDLs and Allocations

The TMDLs for the impaired waters of Pajaro River, San Benito River, Llagas Creek, Tequisquita Slough, San Juan Creek, Carnadero/Uvas Creek, Bird Creek, Pescadero Creek, Tres Pinos Creek, Furlong (Jones) Creek, Santa Ana Creek, and Pachecho Creek are concentration-based TMDLs applicable to each day of all seasons equal to the following:

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

The allocations to responsible parties are shown in Table IX-M1.

Table IX – M - 1. Allocations and Responsible Parties

<u>Waterbody Assigned Allocation</u>	<u>Responsible Party [NPDES and/or WDR number] (Source)</u>	<u>Receiving Water Fecal Coliform Allocation</u>
WASTE LOAD ALLOCATIONS		
<u>Pajaro River¹</u> <u>San Benito River²</u> <u>Llagas Creek³</u> <u>Tequisquita Slough⁴</u>	Santa Cruz, Santa Clara, and Monterey Counties. Cities of Hollister, Morgan Hill, Gilroy, and Watsonville [NPDES No. CAS000004] (Storm Drain Discharges To MS4s Required to be covered by an NPDES Permit)	<u>Allocation 1</u>
<u>Pajaro River¹</u> <u>San Benito River²</u> <u>Llagas Creek³</u> <u>Tequisquita Slough⁴</u>	<u>City of Hollister [WDR 87-47]</u> (Sanitary Sewer Collection and Treatment Systems Spills and Leaks) <u>City of Watsonville [WDR Order R3-2003-0040, NPDES No. CA0048216]</u> (Sanitary Sewer Collection and Treatment Systems Spills and Leaks) <u>Cities of Gilroy and Morgan Hill via South County Regional Wastewater Authority (SCRWA) [WDR Order R3-2004-0099, NPDES No. CA0049964]</u> (Sanitary Sewer Collection and Treatment Systems Spills and Leaks) <u>San Juan Bautista Wastewater Treatment Facility [WDR Order R3-2003-0087, NPDES No. CA0047902]</u> (Sanitary Sewer Collection and Treatment Systems Spills and Leaks) <u>Sunnyslope County Water District [WDR Order R3-2004-0065]</u> (Sanitary Sewer Collection and Treatment Systems Spills and Leaks) <u>Tres Pinos County Water District [WDR Order 99-101]</u> (Sanitary Sewer Collection and Treatment Systems Spills and Leaks) <u>Pajaro County Sanitation District [WDR Order R3-2003-0041]</u> (Sanitary Sewer Collection and Treatment Systems Spills and Leaks)	<u>Allocation 2</u>
<u>Pajaro River¹</u> <u>San Benito River²</u> <u>Llagas Creek³</u> <u>Tequisquita Slough⁴</u>	<u>Owners of Private Sewer Laterals</u> (Private Laterals Connected to Municipal Sanitary Sewer Collection and Treatment Systems)	<u>Allocation 2</u>
LOAD ALLOCATIONS		
<u>Waterbody</u>	<u>Responsible Party (Source)</u>	
<u>Pajaro River¹</u> <u>San Benito River²</u> <u>Llagas Creek³</u> <u>Tequisquita Slough⁴</u>	<u>Owners/Operators of Land Used for/Containing Domestic Animals</u> (Domestic Animal Discharges)	<u>Allocation 1</u>

<u>Pajaro River¹</u> <u>San Benito River²</u> <u>Llagas Creek³</u> <u>Tequisquita Slough⁴</u>	<u>Natural Sources</u>	<u>Allocation 1</u>
<p><u>Allocation 1: Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200/100mL, nor shall more than ten percent of total samples during any 30-day period exceed 400/100 mL.</u></p> <p><u>Allocation 2: Allocation of zero; no loading allowed from this source.</u></p>		

¹ The entire Pajaro River from the Pacific Ocean to San Felipe Lake outflow via the Miller’s Canal drain. Including the entire San Juan Creek tributary from the uppermost reach of the waterbody to the confluence with Pajaro River, and Carnadero/Uvas Creek tributary from Hollister Road crossing to the confluence with Pajaro River.

² San Benito River from confluence with Pajaro River to three miles above Old Hernandez Road at Arizona Crossing. Including Bird Creek tributary from the uppermost reach of the waterbody to the confluence with San Benito River, the Pescadero Creek tributary from the uppermost reach of the waterbody to the confluence with San Benito River, and Tres Pinos Creek tributary from the uppermost reach of the waterbody to the confluence with San Benito River.

³ Llagas Creek from confluence with Pajaro River to Oak Glen Avenue. Including Furlong (Jones) Creek tributary from the uppermost reach of the waterbody to confluence with Llagas Creek.

⁴ Tequisquita Slough from confluence with San Felipe Lake to the uppermost reach of the waterbody. Including Santa Ana Creek tributary from the uppermost reach of the waterbody to Tequisquita Slough, and Pechecho Creek tributary from the uppermost reach of the waterbody to San Felipe Lake.

The parties responsible for the allocations to controllable sources are not responsible for the allocation to natural sources.

The TMDLs are considered achieved when the allocations assigned to all individual responsible parties are met, or when the numeric targets are consistently met.

Margin of Safety

A margin of safety is incorporated implicitly in the TMDLs through conservative assumptions.

Implementation Program

MUNICIPAL SEPARATE STORM SEWER SYSTEM DISCHARGES

The Central Coast Water Board will address fecal indicator bacteria (FIB), e.g. fecal coliform and/or other indicators of pathogens, discharged from the Counties of Santa Cruz, Santa Clara, and Monterey, and the Cities of Hollister, Gilroy, Morgan Hill, and Watsonville municipal separate storm sewer systems (MS4 entities) by regulating the MS4 entities under the provisions of the State Water Resource Control Board’s General Permit for the Discharges of Storm Water from Small Municipal Separate Storm Sewer Systems (General Permit) (NPDES No. CAS000004). As enrollees under the General

Permit, the MS4 entities must develop and implement Storm Water Management Program (SWMPs) that control urban runoff discharges into and from their MS4s. To address the MS4 entities' TMDL wasteload allocations, the Central Coast Water Board will require the MS4 entities to specifically target FIB in urban runoff through incorporation of Wasteload Allocation Attainment Program in their SWMPs.

The Central Coast Water Board will require the Wasteload Allocation Attainment Program describe the actions that will be taken by the MS4 entities to attain the TMDL wasteload allocations, and specifically address:

1. Development of an implementation and assessment strategy;
2. Source identification and prioritization;
3. Best management practice identification, prioritization, implementation, analysis, and effectiveness assessment;
4. Monitoring program development and implementation;
5. Reporting; including evaluation whether current best management practices are progressing towards achieving the wasteload allocations by thirteen years after the TMDLs are approved by the Office of Administrative Law.
6. Coordination with stakeholders; and
7. Other pertinent factors.

The Wasteload Allocation Attainment Program will be required by the Central Coast Water Board to address each of these TMDLs that occur within the MS4 entities' jurisdictions.

The Central Coast Water Board will require the Wasteload Allocation Attainment Program to be submitted at one of the following milestones, whichever occurs first:

1. Within one year of approval of the TMDLs by the Office of Administrative Law;
2. When required by any other Water Board-issued storm water requirements (e.g., when the Phase II Municipal Storm Water Permit is renewed).

For an MS4 that is enrolled under the General Permit at the time of Wasteload Allocation Attainment Program submittal, the Wasteload Allocation Attainment Program must be incorporated into the SWMP when the Wasteload Allocation Attainment Program is submitted. For an MS4 entity that is not enrolled under the General Permit at the time of the Wasteload Allocation Program submittal, the Wasteload Allocation Attainment Program must be incorporated into the SWMP when the SWMP is approved by the Central Coast Water Board.

The Executive Officer or the Central Coast Water Board will require information that demonstrates implementation of the actions described above, pursuant to applicable sections of the California Water Code and/or pursuant to authorities provided in the General Permit for storm water discharges.

SANITARY SEWER COLLECTION AND TREATMENT SYSTEMS SPILLS AND LEAKS

Entities with jurisdiction over sewer collection systems in the Pajaro River Watershed must comply with the Human Fecal Material Discharge Prohibition; compliance with the Human Fecal Material Discharge Prohibition implies compliance with their load allocation for this TMDL.

To comply with the Human Fecal Material Discharge Prohibition, the Hollister Domestic Wastewater Treatment Facility (WDR Order 87-47), Sunnyslope County Water District, Ridgemark Estates Subdivision, Wastewater Treatment Plant (WDR Order R3-2004-0065), Tres Pinos County Water District (WDR Order 99-101), San Juan Bautista Wastewater Treatment Facility (WDR Order R3-2003-0087, NPDES CA0047902), South County Regional Wastewater Authority (SCRWA), Cities of Gilroy and Morgan Hill, (WDR Order R3-2004-0099, NPDES CA0049964), City of Watsonville Wastewater Treatment Facility (WDR Order R3-2003-0040, NPDES CA0048216), and Pajaro County Sanitation District (WDR Order R3-2003-0041) (herein referred to as sanitary collection system jurisdictions) must continue to implement their Collection System Management Plans, as required by their Waste Discharge Requirements (WDRs) and National Pollutant Discharge Elimination System (NPDES) permits.

In addition, the sanitary collection system jurisdictions identified above and in Table IX-M-1 are required to improve maintenance of their sewage collection systems, including identification, correction, and prevention of sewage leaks in portions of the collection systems that run through or adjacent to, impaired surface waters within the Pajaro River Watershed.

To this end, within six months following adoption of this TMDL by the Office of Administrative Law, the Executive Officer will issue a letter pursuant to Section 13267 of the CWC requiring: 1) submittal within one-year, a technical report that describes how and when the jurisdictions of the collection systems will conduct improved collection system maintenance in portions of the collection system most likely to affect impaired surface water bodies, with the end result being compliance with the Human Fecal Material Discharge Prohibition, and 2) stream monitoring for fecal coliform or another fecal indicator bacteria, and reporting of these monitoring activities, and 3) annual reporting of self-assessment as to whether the sanitary collection system jurisdiction is in compliance with the Human Fecal Material Discharge Prohibition.

PRIVATE SEWER LATERAL DISCHARGES

Individual owners and operators of private laterals to sanitary sewer collection systems are ultimately responsible for maintenance of their private laterals and are, therefore, responsible for complying with the Human Fecal Material Discharge Prohibition; compliance with the Human Fecal Material Discharge Prohibition implies compliance with their load allocation for these TMDLs.

The Central Coast Water Board requires immediate cessation of spills from private laterals. Within three years of approval of these TMDLs by the Office of Administrative Law, the Executive Officer will notify owners and/or operators of private laterals to sanitary sewer

collection systems (owners/operators of private laterals), in suspected problem areas, of this requirement and of the requirement to comply with the Human Fecal Material Discharge Prohibition. In his notification, the Executive Officer will also describe the owner's/operator's of private laterals options for demonstrating compliance with the Human Fecal Material Discharge Prohibition; pursuant to California Water Code section 13267 and within six months of the notification by the Executive Officer, owners/operators of private laterals will be required to submit the following for approval by the Executive Officer or the Water Board:

- 1) Clear evidence that the owner/operator of private lateral is and will continue to be in compliance with the Human Fecal Material Discharge Prohibition; clear evidence could be certification by a sanitary collection system jurisdiction that owner/operator of private lateral is in compliance with the Human Fecal Material Discharge Prohibition, or
- 2) A schedule for compliance with the Human Fecal Material Discharge Prohibition. The compliance schedule must include a monitoring and reporting program and milestone dates demonstrating progress towards compliance with the Human Fecal Material Discharge Prohibition, with the ultimate milestone being compliance with the Human Fecal Material Discharge Prohibition no later than three years (the exact timeframe at the discretion of the Executive Officer) from the date of the Executive Officer's notification to the owner/operator requiring compliance, or
- 3) Submittal of a Report of Waste Discharge pursuant to California Water Code Section 13260 (as an application for waste discharge requirements; WDRs or National Pollutant Discharge Elimination System (NPDES permit)), or
- 4) Clear evidence of current or scheduled compliance with the Human Fecal Material Discharge Prohibition (as described in number-1 and number-2 above, respectively) through the submittal of the required information by a sanitary collection system jurisdiction, acting as the voluntary agents of owners/operators of private laterals. Note that an owner/operator of a private lateral cannot demonstrate compliance with the Human Fecal Material Discharge Prohibition through this option if: 1) a sanitary collection system jurisdiction is not their voluntary agent, or 2) if the owner/operator of the private lateral does not choose the sanitary collection system jurisdiction as their agent, or, 3) the Executive Officer or Water Board does not approve the evidence submitted by the sanitary collection system jurisdictions on behalf of the owners/operators of private laterals.

DOMESTIC ANIMAL DISCHARGES NOT REGULATED BY A PERMIT FOR STORM WATER DISCHARGES

Owners and/or operators of lands containing domestic animals in the Pajaro River Watershed must comply with the Domestic Animal Waste Discharge Prohibition; compliance with the Domestic Animal Waste Discharge Prohibition implies compliance with the load allocation for these TMDLs.

Within three years of approval of these TMDLs by the Office of Administrative Law, the Executive Officer will notify owners and/or operators of lands used for/containing

domestic animals of the requirement to comply with the Domestic Animal Waste Discharge Prohibition. In his notification, the Executive Officer will also describe the owner's/operator's of lands containing domestic animals options for demonstrating compliance with the Domestic Animal Waste Discharge Prohibition; pursuant to California Water Code section 13267 and within six months of the notification by the Executive Officer, owners/operators of lands containing domestic animals will be required to submit the following for approval by the Executive Officer or the Water Board:

- 1) Clear evidence that the owner/operator of lands containing domestic animals is and will continue to be in compliance with the Domestic Animal Waste Discharge Prohibition; clear evidence could be documentation submitted by the owner/operator to the Executive Officer validating current and continued compliance with the Prohibition, or
- 2) A plan for compliance with the Domestic Animal Waste Discharge Prohibition. Such a plan must include a list of specific management practices that will be implemented to control discharges containing fecal material from domestic animals. The plan must also describe how implementing the identified management practices is likely to progressively achieve the load allocations to domestic animals, with the ultimate goal achieving the load allocations no later than thirteen years after Office of Administrative Law approval of these TMDLs. The plan must include monitoring and reporting to the Central Coast Water Board, demonstrating the progressive progress toward achieving load allocations for discharges from domestic animals, and a self-assessment of this progress. The plan may be developed by an individual discharger or by or for a coalition of dischargers in cooperation with a third-party representative, organization, or government agency acting as the agents of owners/operators of lands containing domestic animals, or
- 3) Submittal of a Report of Waste Discharge pursuant to California Water Code Section 13260 (as an application for waste discharge requirements; WDRs or National Pollutant Discharge Elimination System (NPDES permit).

TRACKING AND EVALUATION

Every three years, beginning three years after TMDLs are approved by the Office of Administrative Law, the Central Coast Water Board will perform a review of implementation actions, monitoring results, and evaluations submitted by responsible parties of their progress towards achieving their allocations. The Central Coast Water Board will use annual reports, nonpoint source pollution control implementation programs, evaluations submitted by responsible parties, and other available information to determine progress toward implementing required actions and achieving the allocations and the numeric target.

Responsible parties will continue monitoring and reporting according to this plan for at least three years, at which time the Central Coast Water Board will determine the need for continuing or otherwise modifying the monitoring requirements. Responsible parties

may also demonstrate that although water quality objectives are not being achieved in receiving waters, controllable sources of pathogens are not contributing to the exceedance. If this is the case, the Central Coast Water Board may re-evaluate the numeric target and allocations. For example, the Central Coast Water Board may pursue and approve a site-specific objective. The site-specific objective would be based on evidence that natural, or background sources alone were the cause of exceedances of the Basin Plan water quality objective for fecal indicator bacteria.

Three-year reviews will continue until the water quality objectives are achieved. The compliance schedule for achieving the TMDLs and numeric target is 13 years after the date of approval by the Office of Administrative Law.

AMENDMENT NO. 2. ADD THE DOMESTIC ANIMAL WASTE DISCHARGE PROHIBITON

Add the following prohibition to the Basin Plan at the top of Section IV.B, Chapter V, page V-8:

Domestic Animal Waste Discharge Prohibition:

Discharges containing fecal material from domestic animals to the waters of the State that cause or contribute to exceedance of water quality objectives in the areas listed below are prohibited. Examples of domestic animals include, but are not limited to, horses, cattle, goats, sheep, dogs, cats or any other animal(s) in the care of any person(s).

1. Pajaro River Watershed

AMENDMENT NO. 3. ADD THE HUMAN WASTE DISCHARGE PROHIBITON

Add the following prohibition to the Basin Plan at the top of Section IV.B, Chapter V, page V-8:

Human Fecal Material Discharge Prohibition:

Discharges containing fecal material from humans to the waters of the State in the areas listed below are prohibited. Exceptions to this prohibition include discharges in accordance with Waste Discharge Requirements or other provisions of the California Water Code, Division 7, as amended:

1. Pajaro River Watershed

**STATE OF CALIFORNIA
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, CA 93401**

RESOLUTION NO. R3-2008-0005

**AMENDING THE WATER QUALITY CONTROL PLAN
REVISING ONSITE WASTEWATER SYSTEM CRITERIA**

WHEREAS, the California Regional Water Quality Control Board, Central Coast Region (hereafter Central Coast Water Board) finds:

1. The Central Coast Water Board updated its policy regarding siting and design of onsite wastewater systems on September 16, 1983, by adopting Resolution No. 83-12.
2. The Central Coast Water Board adopted the current Water Quality Control Plan, Central Coastal Basin (Basin Plan) on September 8, 1994. The Basin Plan includes beneficial use designations, water quality objectives, implementation plans for point source and nonpoint source discharges, prohibitions, and statewide plans and policies. The text and requirements specified in Resolution No. 83-12 are included in the Basin Plan as provisions of Chapters 4 and 5.
3. The Central Coast Water Board periodically revises and amends the Basin Plan. The Central Coast Water Board determined that the Basin Plan requires further revision and amendment to clarify and strengthen criteria for onsite wastewater systems throughout the region. The Central Coast Water Board will regulate discharges from onsite wastewater systems using waste discharge requirements (WDRs) or waiver of WDRs, in conjunction with memoranda of understanding with local jurisdictions.
4. In December 2007, Water Board staff contacted State Water Resources Control Board (State Water Board) staff to inquire if the proposed amendment to the Basin Plan required external scientific review to comply with Health and Safety Code Section 57004. Due to the limited nature of the proposed revisions (primarily incorporating language from external documents subjected to scientific review) additional external scientific review of these proposed revisions is not required.
5. Public Notice - Interested persons and the public have been informed of the Central Coast Water Board's intent to revise the Basin Plan criteria for onsite wastewater systems. Efforts to inform the public and solicit public comment include a public meeting/workshop, several individual meetings with vested stakeholders, and a number of telephone conversations with interested parties. Notice of public hearing was given by advertising in newspapers of general circulation within the Region, by posting on the Water Board website, and by mailing a copy of the notice to all persons requesting such notice and applicable government agencies. Central Coast Water Board staff responded to oral and written comments received from the public.

6. Economic Considerations - The Central Coast Water Board considered costs associated with implementing the revised criteria specified in this Basin Plan amendment, Resolution No. R3-2008-0005.
7. Anti-Degradation – State Water Board Resolution No. 68-16 *Statement of Policy with Respect to Maintaining High Quality of Waters in California* (Resolution No. 68-16) requires Regional Water Boards, in regulating the discharge of waste, to maintain high quality waters of the State until it is demonstrated that any change in quality will be consistent with maximum benefit to the people of the State, will not unreasonably affect beneficial uses, and will not result in water quality less than that described in a Regional Water Board's policies (e.g., quality that exceeds applicable water quality standards). Resolution No. 68-16 also states, in part:

Any activity which produces or may produce a waste or increased volume or concentration of waste and which discharges or proposes to discharge to existing high quality waters will be required to meet waste discharge requirements which will result in best practicable treatment and control of the discharge necessary to assure that (a) a pollution or nuisance will not occur and (b) the highest water quality consistent with maximum benefit to the people of the State will be maintained.

This Resolution is consistent with the provisions of the State Water Board Resolution No. 68-16. The regulation of discharges from onsite wastewater systems has been a component of the Water Board's regulatory oversight for several decades, and the clarifying and strengthening language provided in this resolution provides more regulatory oversight compared to that described in Resolution No. 83-12. Compliance with the Basin Plan criteria will result in the best practicable treatment or control of the discharges. Therefore, the Basin Plan amendment will result in improved water quality protection throughout the region and maintains the level of water quality necessary to protect existing and anticipated beneficial uses.

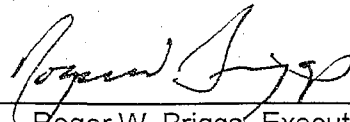

8. CEQA - The Central Coast Water Board concurs with the analysis contained in the Supplemental Environmental Documents, including the Environmental Checklist, the staff report, and the responses to comments and finds that the analysis complies with the requirements of the California Environmental Quality Act and the State Water Board's regulations, as set forth in the California Code of Regulations (CCR), Title 23, §3775 et seq. with respect to certified regulatory programs. The Central Coast Water Board finds that the proposed amendments to the Basin Plan will not have a significant effect on the environment. The project (adopting this Resolution) consists of amending an existing regulatory program implemented by a regulatory agency by making the existing program more stringent and providing greater environmental protection.
9. The proposed amendment is a revision of onsite wastewater system criteria specified in the Basin Plan (Chapters 4 and 5) and applicable throughout the Region. The revisions to Chapters 4 and 5 of the Basin Plan are shown on Attachments A and B (respectively) to this Resolution. Attachments A and B identify significant additions/deletions shown with underline/strikeout. Text that is simply moved is not identified as a proposed change.
10. Area of Applicability - The effect of this amendment will be throughout the Region, where onsite systems are used for treatment and disposal of wastewater.

11. The Basin Plan amendment must be submitted for review and approval by the State Water Resources Control Board (State Board) and the State Office of Administrative Law (OAL). The Basin Plan amendment will become effective upon approval by OAL. The subject Resolution will become effective immediately.
12. The amendment to the Basin Plan will result in no potential for adverse effect, either individually or cumulatively, on wildlife and is therefore exempt from fee payments to the Department of Fish and Game under the California Fish and Game Code.
13. On May 9, 2008, in San Luis Obispo, California, the Central Coast Water Board held a public hearing and heard and considered all public comments and evidence in the record.

THEREFORE, BE IT RESOLVED that:

1. Pursuant to California Water Code §13240, the Water Board, after considering the entire record, including oral testimony at the hearing, hereby adopts the Basin Plan amendments shown in Attachments A and B to this Resolution.
2. The Central Coast Water Board's Executive Officer is directed to forward copies of the Basin Plan amendments to the State Water Board in accordance with the requirements of California Water Code §13245.
3. The Central Coast Water Board requests that the State Water Board approve the Basin Plan amendments in accordance with the requirements of California Water Code §13245 and §13246, and forward it to OAL for approval. The Central Coast Water Board shall file a Notice of Decision with the Secretary of Resources and the Governor's Office of Planning and Research (State Clearinghouse) after approval by OAL.
4. The Central Coast Water Board Executive Officer is authorized to sign a Certificate of Fee Exemption (included as Attachment C to this Resolution).
5. If, during its approval process, the State Water Board or OAL determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Central Coast Water Board Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.

I, Roger W. Briggs, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of the Resolution adopted by the Central Coast Water Board, on May 9, 2008.

Roger W. Briggs, Executive Officer

CHAPTER 4. IMPLEMENTATION PLAN

VIII.D. INDIVIDUAL, ALTERNATIVE AND COMMUNITY ONSITE WASTEWATER SYSTEMS

~~On site sewage disposal wastewater systems and other similar methods for liquid waste disposal are sometimes viewed as interim solutions in urbanizing areas, yet may be required to function for many years. On site systems can be a viable long term waste disposal method with proper siting, design, construction, and management. In establishing on-site system regulations, agencies must consider such systems as permanent, not interim systems to be replaced by public sewers. The reliability of these systems is highly dependent on land and soil constraints, proper design, proper construction, and proper operation and maintenance.~~

~~If on-site sewage treatment facilities are not carefully managed, problems can occur, including:~~

- ~~• odors or nuisance;~~
- ~~• surfacing effluent;~~
- ~~• disease transmission; and,~~
- ~~• pollution of surface and groundwaters.~~

~~Odors and nuisance can be objectionable and annoying and may obstruct free use of property. Surfacing effluent (effluent which fails to percolate and rises to the ground surface) can be an annoyance, or health hazard to the resident and neighbors. In some cases, nearby surface waters may be polluted.~~

~~On site sewage disposal systems are a potential mechanism for disease transmission. Sewage is capable of transmitting diseases from organisms which are discharged by an infected individual. These include dysentery, hepatitis, typhoid, cholera, and gastro intestinal disorders.~~

~~Pollution of surface or groundwaters can result from the discharge of on-site system wastes. Typical problem waste constituents are total dissolved solids, phosphates, nitrates, heavy metals, bacteria, and viruses.~~

~~Subsurface disposal Onsite wastewater systems may be used to treat and dispose of wastewater from: (1) individual residences; (2) multi-unit residences; (3) institutions or places of commerce; (4) industrial sanitary sources; and, (5) small communities. All individual and multi-unit residential, developments are subject to criteria in this section of the Basin Plan. commercial, institutional and industrial developments with a discharge flow rate less than 2,500 gallons per day and community systems not regulated by waste discharge requirements must comply with these criteria. Community systems must also comply with criteria relating to this subject within the Basin Plan. Community systems are defined for the purposes of this Basin Plan as: (1) residential wastewater treatment systems for serving more than 5 units or more than 5 parcels; or, (2) commercial, institutional or industrial systems to treat treating sanitary wastewater equal to or greater than 2,500 gallons per day (average daily flow). Community systems of this type and size may be subject to waste discharge requirements.~~

~~Conventional onsite wastewater systems consist of septic tanks and leachfield or seepage pits and are typically designed to treat and dispose of domestic wastewater.^{EPA} Alternatives to conventional onsite system designs have been are used when site constraints prevent the use of conventional systems. Examples of alternative systems include (but are not limited to) enhanced treatment systems, mound and or evapotranspiration disposal systems, or at-grade disposal systems. Remote subdivisions, commercial centers, or industries may utilize conventional collection systems with community treatment systems and subsurface disposal fields for sanitary wastes.~~

~~Conventional, alternative and community systems can pose serious water quality problems if improperly designed, installed, and/or managed. Failures have occurred in the past and are usually attributed to the following:~~

- Systems are inadequately or improperly sited, designed, or constructed.
- Long term use is not considered.
- Inadequate operation and maintenance.

The following definitions are used throughout this section of the Water Quality Control Plan.

Alternative onsite system consists of additional (beyond conventional) treatment and/or disposal features engineered to overcome site constraints. A conventional onsite system that requires a pump to reach the leach area is not considered "alternative".^{EPA}

Application area shall be calculated no greater than the trench bottom and side walls below the bottom of the leach pipe, minus the first foot on each side. In seepage pits the application area refers to the total gravel depth in a seepage pit, minus any impervious, bedrock or clay lenses encountered in the sidewalls.^{UPC}

At-grade disposal systems consist of distribution pipe and bed at the native ground surface level and cover provided by filled material. At-grade disposal systems are similar to mound systems without the sand layer.^{UCD}

Conventional onsite system consists of a septic tank and leachfield or seepage pit.^{EPA}

Detrimental Water Quality Impact is any significant increase in pollutant concentrations or impairment of beneficial uses of a water body.

Drainfield is used interchangeably with leachfield, leach area or disposal area.

Effective trench depth means depth below the bottom of the leach trench distribution piping minus the first foot.

Engineered systems are treatment and disposal systems that require special design features to overcome site limitations (topography, soil conditions, shallow groundwater or setback variances).^{EPA}

Existing onsite system is any onsite system approved and/or installed prior to adoption of these criteria on May 9, 2008.

Failed or failing onsite system is any system that displays symptoms of inadequate dispersion, treatment or assimilation of wastewater. These may include, but are not limited to, surfacing effluent, lush growth above the leach area, sluggish house drains, impacts to surface or groundwater from the onsite discharge, odors, frequent pumping, or backflow into tank when pumped.^{EPA}

Fill is material deposited to raise the existing or excavated ground level.

Inflow and infiltration refers to non-wastewater (stormwater, groundwater, streams, seawater) entering the wastewater system through cracks, roof drains or other openings.

Impervious Low permeability material is defined as having a percolation rate slower than 120 minutes per inch or having a clay content (% passing 200 sieve) of 60 percent or greater.

Local governing jurisdiction shall refer to the local governing jurisdiction, typically city or county, vested with legislative authority for onsite wastewater system permitting.

Monitoring shall refer to any sort of quality or performance assessment, including visual inspections.

New onsite system is an onsite wastewater system placed on property that has not previously been developed, or expansion of an existing onsite system to accommodate an increase in wastewater generation, after adoption of these criteria (May 9, 2008). Repair or replacement of an existing onsite system does not constitute a new onsite system.

Onsite disposal area shall include the direct application area (trench, pit, bed) and surrounding 100' radius from any point in the application area that may be influenced by discharge from the disposal system.

Reservoir - A pond, lake, tank, basin, or other space either natural or created in whole or in part by the building of engineering structures, which is used

for storage, regulation, and control of drinking supply water recreation, power, flood control, or drinking.

Septage is material removed from a septic tank; usually the accumulated scum, sludge and liquid within the tank.

Sidewall is the side portion of the leach area below the bottom of the distribution piping, or total gravel depth beneath the first hole in the central pipe of a seepage pit.^{UPC}

Threatened condition is one that if left uncorrected may cause or contribute to water quality or public health impacts.

Watercourse - A natural or man-made artificial channel for passage of water. A running stream of water. A natural stream fed from permanent or natural sources, including rivers, creeks, runs, and rivulets. There must be a stream, usually flowing in a particular direction (though it need not flow continuously) usually discharging into some stream or body of water.

~~VIII.D.1. CORRECTIVE ACTIONS FOR EXISTING SYSTEMS~~

~~Individual disposal systems can be regulated with relative ease when they are proposed for a particular site. For new systems, regulations generally provide for good design and construction practices. A more troublesome problem is presented by older septic tank systems where design and construction may have been less strictly controlled or where land development has intensified to an extent that percolation systems are too close together and there is no room left for replacement leaching areas. Where this situation develops to an extent that public health hazards and nuisance conditions develop, the most effective remedy is usually a sewer system. Where soil percolation rates are particularly fast, groundwater degradation is possible, particularly increases in nitrate concentrations.~~

~~Sewer system planning should be emphasized in urbanizing areas served by septic tanks. A first step would be a monitoring system involving surface and groundwaters to determine whether~~

~~problems are developing. Where septic tank systems in urbanized areas are not scheduled for replacement by sewers and where public health hazards are not documented, septic tank maintenance procedures are encouraged to lessen the probability that a few major failures might force sewerage of an area which otherwise could be retained on individual systems without compromising water quality. Often a few systems will fail in an area where more frequent septic tank pumping, corrections to plumbing or leach fields, or in-home water conservation measures could help prevent failure. Improvements of this kind should be enforced by a local septic tank maintenance district or local governing jurisdiction.~~

~~A septic tank subjected to greater hydraulic load can fail due to washout of solids into percolation areas and plugging of the infiltrative surface. In some cases, excess wash water could be diverted to separate percolation areas by in-home plumbing changes. Dishwashers, garbage grinders, and washing machines could be eliminated. Water saving toilets, faucets, and shower heads are available to encourage low water use. Water use costs may also be structured to encourage more frugal use of water.~~

~~VIII.D.1. LOCAL GOVERNING JURISDICTION ACTIONS~~

~~VIII.D.1.a. DISCLOSURE AND COMPLIANCE OF EXISTING ONSITE WASTEWATER SYSTEMS~~

~~It is incumbent upon local governing jurisdictions to should provide develop and implement programs to ensure conformance with this Basin Plan and local regulations. Such programs shall include (but are not be limited to) inspection programs-procedures to:~~

- ~~• should Ensure site suitability tests are performed as necessary, and that tests are performed in accordance with standard procedures;~~
- ~~• Inspections should also Ensure proper system siting, design, construction and installation; and~~

- Adequately inform home property owners regarding proper installation, operation and ongoing maintenance of their onsite wastewater systems.

~~Proper design and construction should be certified by the inspector. Concerned homeowners can be a tremendous asset in assuring proper construction. When a septic system permit is issued by the local agency, a handout specifying proper construction techniques should be made available to the general public. Systems must be inspected by the local agency before covering (backfilling).~~

Local agencies can use staff inspectors or individuals under contract with the local government. ~~Either way~~ A standard detailed checklist ~~should~~ shall be completed by the inspector to verify the onsite wastewater system was constructed in conformance with the Basin Plan and local governing jurisdiction requirements.

~~Site suitability determinations should specify: (1) whether approval is for the entire lot or for specific locations of the lot; (2) if further tests are necessary; and (3) if alternatives are necessary or available.~~

~~Where agency approval is necessary from various departments, final sign-offs should be on the same set of plans.~~

Property owners should be aware of the nature and requirements of their onsite wastewater disposal system. Plans should be available in city or county offices showing placement of soil absorption systems. ~~Since this is only feasible for new construction,~~ Local agencies should require onsite wastewater system as-built plans as a condition of new construction final inspection. Plans would be kept on file for future use of property owners.

Prospective property buyers should be informed of any enforcement action affecting parcels or houses they wish to buy. ~~For example, a parcel in a discharge prohibition area may be unbuildable for an indefinite period, or a developed parcel may be subject to significant user charges from a future sewer system.~~ Local agencies should have ensure the terms of the enforcement action prohibition area are entered into the county record for each affected parcel. When a prospective buyer conducts a title search, terms of the prohibition would appear in the preliminary title report.

All onsite wastewater system owners need to be aware of proper operation and maintenance procedures. Local governing jurisdictions shall mount a continuing public education program to provide homeowners with onsite wastewater system operation and maintenance guidelines. Basin Plan information should be available at local governing jurisdiction health and building departments.

Dual leaching capabilities provide an immediate remedy in the event of system failure. For that reason, dual leachfields are considered appropriate for all systems. Furthermore, should wastewater flows increase, this area can be used until the system is expanded. ~~But system expansion may not be possible if land is not set aside for this purpose.~~ For these reasons, Dedicated system expansion areas are also appropriate. To protect this set-aside area from encroachment, the local governing jurisdiction ~~should~~ shall require restrictions on future use of the area as a condition of land division or building permit approval. For new subdivisions, Covenants, Conditions and Restrictions (CC&R's) or additional map sheets recorded with the Parcel or Tract Final Map might provide an appropriate mechanism for protecting a set aside area. Future buyers of affected property would be notified of property use restrictions by reading the CC&R's or Final Map.

~~Local agencies should conduct an on-site system inspection program, particularly in areas where system failures are common or where systems with poor soils are approved. An agency inspector should periodically check each septic tank for pumping need and each system for proper operation. Homeowners should be alerted where evidence of system failure exists. Where nuisance or a potential public health hazard exists, a followup procedure should insure the situation is corrected. On-site systems should be constructed in a location that facilitates system inspection.~~

~~Another approach is periodically to mail homeowners a brochure reminding them how to maintain and inspect their on-site system. Homeowners should be notified that they should periodically check their septic tank for pumping need. Homeowners should also be notified of other problems indicative of system failure. Some examples include wet spots in drainfield area, lush grass growths, slowly draining wastewater, and sewage odors.~~

Many existing systems do not comply with current or proposed standards. Repairs to failing systems should ~~shall~~ be done under permit from the local governing jurisdiction. ~~To the extent practicable~~ The local governing jurisdiction should ~~shall~~ require failing systems to be brought into compliance with Basin Plan recommendations, requirements and prohibitions; or repair criteria consistent with locally implemented onsite management plan (approved by the Central Coast Water Board Executive Officer). ~~This could be a condition of granting a permit for repairs.~~

~~Land use changes on properties with commercial, institutional or industrial uses should not be approved by the local governing jurisdiction until the existing onsite system meets criteria of this Basin Plan and local ordinances. A land use permit or business license could be used to alert the local agency of land use changes.~~

Within the following sections, criteria are specified for RECOMMENDATIONS, REQUIREMENTS and PROHIBITIONS.

RECOMMENDATIONS

1. Inform property buyers of the existence, location, operation, and maintenance of onsite disposal systems. Prospective home or property buyers should also be informed of any enforcement action (e.g., Basin Plan prohibitions) through the County Record.
2. Conduct public education programs to provide property owners with operation and maintenance guidelines.
3. It may be appropriate for onsite systems to be maintained by local onsite maintenance districts.
4. Standard soil percolation testing procedures should be adopted. ~~Approve permit applications after checking plans for erosion control measures. Inspect systems prior to covering to assure proper construction.~~

REQUIREMENTS

5. Wastewater Management Plans should ~~shall~~ be prepared and implemented for urbanizing and high density areas served by onsite wastewater systems. ~~Areas that should be addressed immediately include (but are not limited to):~~

~~portions of San Martin, San Lorenzo Valley, Carmel Valley, Carmel Highland, Prunedale, El Toro, Shandon, Templeton, Santa Margarita, Garden Farms, Los Osos/Baywood Park, Arroyo Grande, Nipomo, upper Santa Ynez Valley, and Los Olivos/Ballard.~~

6. Local governing jurisdictions should ~~shall~~ require replacements or repairs to failing systems to be in substantial conformance (to the greatest extent practicable) with Basin Plan recommendations, requirements and prohibitions or the local onsite wastewater management plan.
7. Local governing jurisdictions shall ensure that alternative onsite system owners are provided an informational maintenance or replacement document by the system designer or installer. This document shall cite homeowner procedures to ensure maintenance, repair, or replacement of critical items within 48 hours following failure.
8. Local ordinances shall be updated to reflect Basin Plan criteria.

PROHIBITIONS

9. Alternative systems are prohibited unless consistent with a locally implemented onsite wastewater management plan approved by the Central Coast Water Board Executive Officer or waste discharge requirements issued or waived by the Water Board.^{UPC, EPA}

VIII.D.2 1.b. ONSITE WASTEWATER MANAGEMENT PLANS

Onsite wastewater management plans ~~should shall~~ be implemented in urbanizing areas to investigate and mitigate long-term cumulative impacts resulting from continued use of individual, alternative, and community onsite wastewater systems.^{EPA} ~~A wastewater disposal study should be conducted to determine the best Wastewater Management Plan that would provide site or basin specific wastewater re-use. This study should identify basin specific criteria to prevent water quality degradation and public health hazards and provide an evaluation of the effects of existing and proposed developments and changes in land use. Onsite wastewater management plans should be a comprehensive~~

planning tool to specify onsite disposal system limitations to prevent ground or surface water degradation. Onsite wastewater management plans should shall include (but not be limited to) the following elements:

- Survey and evaluation of existing onsite systems.
- Contain a Water quality (ground and surface water) monitoring program.^{EPA}
- ~~Identify sites suitable for conventional septic systems.~~
- Projections of onsite disposal system demand and determination of sites and methods to best meet demand.
- Project maximum population densities for each subdrainage basin to control degradation or contamination of ground or surface water.
- ~~Recommend establishment of septic tank maintenance districts, as needed.~~
- Recommendations and requirements for existing onsite wastewater system inspection, monitoring, maintenance and repairs.^{EPA}
- Recommendations and requirements for new onsite wastewater systems.^{EPA}
- ~~Identify Alternative means of disposing of sewage in the event of disposal system failure and/or irreversible degradation from onsite disposal systems.~~
- Education and outreach program.^{EPA}
- Enforcement options.^{EPA}
- Septage management.^{EPA}
- Program administration, staffing, records keeping, installation and repairs tracking, and financing.^{EPA}

~~For areas where watershed wide plans are not developed, conditions could be placed on new divisions of land or community systems to provide monitoring data or geologic information to~~

~~contribute to the development of a Wastewater Management Plan.~~

~~Wastewater disposal alternatives should identify costs to each homeowner. A cost effectiveness analysis, which considers socio-economic impacts of alternative plans, should be used to select the recommended plan.~~

Onsite wastewater disposal zones, as discussed in Section 6950-6981 of the Health and Safety Code, may be an appropriate means of implementing onsite wastewater management plans.

Onsite wastewater management plans shall be approved by the Central Coast Water Board Executive Officer.

VIII.D.2 1.c. SEPTIC TANK ONSITE WASTEWATER SYSTEM MAINTENANCE DISTRICTS

It may be appropriate for community onsite systems to be maintained by local sewage disposal onsite wastewater system maintenance districts. These special districts could be administered through existing local governments such as County Water Districts, Community Services Districts, or County Service Areas

Septic tank Onsite wastewater system maintenance districts are responsible for onsite system operation and maintenance in conformance with this Water Quality Control Plan. Administrators should ensure proper construction, installation, operation, and maintenance of onsite wastewater systems. Maintenance districts should establish septic tank onsite system surveillance, maintenance and pumping programs, ~~where appropriate;~~ provide repairs to plumbing or leachfields, and encourage water conservation measures.

VIII.D.2. CRITERIA FOR NEW SYSTEMS

Onsite wastewater system problems can be minimized with proper site location, design, installation, operation and maintenance. The following section ~~recommends~~ includes criteria for all new individual subsurface onsite wastewater

disposal systems and community sewage disposal systems. Local governing jurisdictions should incorporate these criteria and guidelines into their local ordinances. These recommendations criteria will be used by the Central Coast Water Board for Water Board regulated systems and exemptions.

Local agencies may authorize alternative onsite systems consistent with locally implemented onsite wastewater management plans approved by the Central Coast Water Board Executive Officer.^{UPC, EPA}

For any onsite system, limited disposal options are available for septage (solids periodically removed from septic tanks). As a component of a wastewater management plan, long-term septage disposal plans shall be considered and developed by local onsite system management districts.^{EPA}

Onsite wastewater system criteria are arranged in sequence under the following categories: site suitability, system design, construction, individual system maintenance, community system design, and local agencies. Mandatory criteria are listed in the "Individual, Alternative, and Community Systems Prohibitions" section. Within each category, criteria are specified for RECOMMENDATIONS, REQUIREMENTS and PROHIBITIONS.

VIII.D.2.a. SITE SUITABILITY

~~Prior to permit approval, site investigation should determine on-site suitability:~~

RECOMMENDATIONS

1. For new land divisions, onsite disposal systems and expansion areas should be protected from encroachment by provisions in covenants, conditions, and restrictions (CC&Rs), recorded in Final Maps or similar mechanisms.
2. Percolation test holes (at least ~~one~~ three per system) should be drilled with a hand auger. A hole could be hand augered or dug with hand tools at the bottom of a larger excavation made by a backhoe.
3. Natural ground slope of the disposal area should not exceed 20 percent.

4. An excavation should be made to detect mottling or presence of underground channels, fissures, or cracks. Soils should be excavated to a depth of 4-5 feet below drain field bottom.

REQUIREMENTS

5. At least one soil boring or excavation per onsite system shall be performed to determine soil suitability, depth to groundwater, and depth to bedrock or impervious layer. Soil borings are particularly important for seepage pits. The soil boring or excavation should extend at least 10 feet below the drain field bottom at each proposed location and be performed during or shortly after the wet season to characterize the most limiting conditions.
6. For leachfields, at least three percolation test locations ~~should~~ shall be used to determine system acceptability.
7. Percolation tests shall be continued until a stabilized rate is obtained.
8. Percolation tests ~~should~~ shall be performed at a proposed subsurface disposal system sites and depth corresponding to the bottom of the subsurface disposal area.
9. If no restrictive layers intersect, and geologic conditions permit surfacing, the setback distance from a cut, embankment or steep slope (greater than 30 percent) should be determined by projecting a line 20 percent down gradient from the sidewall at the highest perforation of the discharge pipe. The leachfields ~~should~~ shall be set back far enough to prevent this projected line from intersecting the cut within 100 feet, measured horizontally, from the sidewall. If restrictive layers intersect cuts, embankments or steep slopes, and geologic conditions permit surfacing, the setback shall be at least 100 feet measured from the top of the cut.
10. Prior to permit approval, site investigation shall determine onsite system suitability (consistency with recommendations, requirements and prohibitions specified in this section). Seepage pits should be utilized only after careful consideration of site suitability. ~~Soil borings or excavations should be inspected either by~~

~~permitting agency or individual under contract to the permitting agency~~

11. Distances between trench bottom and highest seasonal usable groundwater, including perched groundwater, shall not be less than the separation specified by appropriate percolation rate:

Percolation Rate (minutes/inch)	Distance (feet)
<1	50 ⁴
1-4	20 ⁴
5-29	8
>30	5

⁴Unless a set-back distance of at least 250 feet to any domestic well or subsurface water is assured.

Onsite disposal in soils with percolation rates faster than one minute per inch are prohibited without additional treatment.

12. ~~Natural ground slope of the disposal area should not exceed 20 percent. Onsite disposal systems on slopes greater than 20% shall be designed by a certified professional.~~

PROHIBITIONS

13. ~~For new land divisions (including lot splits) served by onsite systems, lot sizes less than one acre should not be permitted are prohibited unless authorized under an onsite management plan approved by the Central Coast Water Board Executive Officer. While new septic tank systems should generally be limited to new divisions of land having a minimum parcel size of one acre, where soil and other physical constraints are particularly favorable, parcel size shall not be less than one-half acre. For the purpose of this prohibition, secondary units are considered "de-facto" lot splits and shall not be constructed on lots less than two acres in size unless consistent with onsite management plans.~~ ^{LO 1994}

14. Onsite wastewater disposal shall not be located in areas subject to inundation from a 40 25-year flood.
15. Onsite disposal systems shall not be installed where natural ground slope of the disposal area exceeds 30 percent. ^{EPA}

16. Leachfields are prohibited in soils where percolation rates are slower than 120 min/in unless parcel size is at least two acres. Disposal systems designed to accommodate slow percolation rates (such as evapotranspiration systems) shall be evaluated as alternative systems.

17. Onsite discharge is prohibited on any site unable to maintain subsurface disposal.

18. Onsite discharge is prohibited where lot sizes, dwelling densities or site conditions cause detrimental impacts to water quality.

19. Onsite discharge is prohibited within a water supply reservoir watershed where parcel size is less than 2.5 one acre, unless consistent with an onsite wastewater management plan approved by the Central Coast Water Board Executive Officer.

20. Onsite discharge is prohibited in any area where continued use of onsite systems constitutes a public health hazard, an existing or threatened condition of water pollution, or nuisance.

21. Onsite discharge is prohibited where soils or formations with channels, cracks, fractures, or percolation rates allow inadequately treated waste to surface or degrade water quality.*

* Unless a setback distance of at least 250 feet to any domestic water supply well or surface water is ensured.

22. Seepage pits are prohibited in soils or formations containing 60 percent or greater clay (a soil particle less than two microns in size) unless parcel size is at least two acres.

23. For seepage pits, distances between pit bottom and usable groundwater, including perched groundwater, shall not be less than separation specified by appropriate soil type:

Soil Type	Distance (feet)
Gravels ²	50 ⁴ <u>additional treatment required</u>
Gravels with few fines*	20 ⁴
Other	10

⁴Unless a setback distance of at least 250 feet to any domestic water supply well or surface water is ensured.

²Gravels — Soils with over 95 percent by weight coarser

than a No. 200 sieve and over half of the coarse fraction larger than a No. 4 sieve.

* Gravels with few fines - Soils with 90 percent to 94 percent coarse fraction larger than a No. 4 sieve.

24. Onsite discharge in soils with percolation rates faster than one minute per inch is prohibited without additional treatment consistent with an onsite management plan implemented by the local governing jurisdiction and approved by the Central Coast Water Board Executive Officer.
25. Onsite discharge is prohibited in fill unless specifically engineered as a disposal area.

VIII.D.2.b. ONSITE SYSTEM DESIGN

RECOMMENDATIONS

1. Dual disposal fields (200 percent of original calculated disposal area) ~~are recommended~~ should be installed.^{EPA}
2. For commercial and institutional systems, pretreatment may be necessary if wastewater is significantly different from domestic wastewater.
3. Distance between drainfield trenches should be at least two times the effective trench depth. Distance between seepage pits (nearest sidewall to sidewall) should be at least 20 feet.
4. Application area should be no greater than the area calculated using trench bottom and sidewalls, minus the first foot below the distribution pipe.^{UPC} ~~In clayey soils, systems should be constructed to place infiltrative surfaces in more permeable horizons.~~
5. Seepage pit application rate should not exceed 0.3 gallons per day (gpd) per square foot.

REQUIREMENTS

6. Onsite wastewater treatment tanks shall be water-tight, and designed to remove nearly 100 percent of settleable solids and should provide a high degree of anaerobic decomposition of colloidal and soluble organic solids.^{EPA}
7. The minimum design flow rate shall be 375 gallons per day for a 3-bedroom house, and 75 gpd should be added for each additional

bedroom.

8. Drainfield design ~~should~~ shall be based only upon usable permeable soil layers.
9. Leachfield loading application rate ~~should~~ shall not exceed the following:

Percolation Rate (minutes/inch)	Loading Rate (gpd/sq.ft.)
1 - 20	0.8
21 - 30	0.6
31 - 60	0.25
61 - 120	0.10

10. If curtain drains divert groundwater to subsurface soils, the upslope separation from a leachfield or pit ~~should~~ shall be at least 20 feet and the down slope separation shall be at least 50 feet.
11. Onsite system ~~tank~~ design ~~must~~ shall allow access for inspection and cleaning. Septic tanks must be accessible for pumping.
12. For commercial, institutional, industrial and community systems, design ~~should~~ shall be based on daily peak flow.
13. Dual disposal systems shall be installed (200 percent of original calculated disposal area) for community systems.
14. ~~Dual disposal fields (200 percent of original calculated disposal area) are recommended. Commercial systems, institutional systems, or domestic industrial systems should~~ All onsite disposal systems shall reserve an expansion area (additional 100% disposal capacity) to be set aside and protected from all uses except future drainfield repair and replacement.^{UPC} Community systems shall install dual drainfields (200% disposal capacity) and reserve replacement area (3rd 100% disposal capacity).
15. Community systems shall provide duplicate individual equipment components for components subject to failure (such as pumps).
16. Distances between trench/pit bottom and bedrock or other low permeability material impermeable layer shall be at least ten feet.

17. Where site conditions permit migration of wastewater to water, setback distances from disposal trench/pit shall be at least:

	<u>Minimum Setback Distance (feet)</u>
Domestic water supply wells in unconfined aquifer	100
Watercourse (where geologic conditions permit water migration)	100
<u>Drinking water supply</u> reservoir spillway elevation	200
Springs, natural or any part of a man-made spring	100

18. Community systems shall be designed with adequate capacity to accommodate the build-out population.
19. Community wastewater treatment and disposal facilities shall be operated by a public agency. If a demonstration is made to the Central Coast Water Board that an existing public agency is unavailable and formation of a new public agency is unreasonable, a private entity with adequate financial, legal, and institutional resources to assume responsibility for waste discharges may be acceptable.

PROHIBITIONS

20. Onsite discharge to leachfields is prohibited where soil percolation rates are slower than 60 minutes per inch unless the system is designed for an effluent application rate of 0.1 gpd per square foot of application area, or less.
21. Discharge ~~should~~ shall not exceed 40 grams per day of total nitrogen, on the average, per acre served by onsite system overlying groundwater recharge areas, except where a local governing jurisdiction has adopted a Wastewater Management Plan subsequently approved by the Central Coast Water Board Executive Officer.
22. Community system seepage pits are prohibited unless additional treatment is provided consistent with an onsite management plan

implemented by the local governing jurisdiction and approved by the Central Coast Water Board Executive Officer. Such seepage pits shall have at least 15 vertical feet between pit bottom and highest usable groundwater, including perched groundwater.

23. Inflow and infiltration shall be precluded from the system unless design specifically accommodates such excess flows.
24. Onsite wastewater systems are prohibited in any subdivision unless the subdivider clearly demonstrates the installation, operation and maintenance of the onsite system will be properly functional and in compliance with all Basin Plan criteria.
25. Curtain drains that discharge to ground surface or surface water are prohibited within 50 feet down slope of onsite system disposal areas.

VIII.D.2.c. DESIGN FOR ALTERNATIVE AND ENGINEERED SYSTEMS

RECOMMENDATIONS

1. Mound systems, evapotranspiration systems, and other alternative onsite systems should be designed and installed in accordance with guidelines available from the State Water Resources Control Board. ~~For evapotranspiration systems, each month of the highest precipitation year and lowest evaporation year within the previous ten years of record should be used for design.~~

REQUIREMENTS

2. Alternative onsite wastewater systems shall be designed by a registered ~~civil engineer~~ certified professional competent in sanitary engineering ^{EPA} alternative onsite wastewater system design.
3. Alternative and engineered onsite wastewater systems shall be located, designed, installed, operated, maintained, and monitored in accordance with a locally implemented onsite management plan approved by the Central Coast Water Board Executive Officer. ^{UPC, EPA}

PROHIBITIONS

4. Alternative and engineered onsite wastewater systems are prohibited, except where

consistent with a locally implemented onsite management plan approved by the Central Coast Water Board Executive Officer.^{UPC, EPA}

VIII.D.2.d. CONSTRUCTION

RECOMMENDATIONS

1. Construction activities should follow recommendations and precautions described in the Environmental Protection Agency's Design Manual: Onsite Wastewater Treatment and Disposal Systems.^{EPA}
2. ~~Subsurface disposal~~ Onsite wastewater systems should have a slightly sloped finished grade to promote surface runoff.
3. Surface runoff should be diverted around open trenches/pits to limit siltation of trench bottom area.
4. Work should be scheduled only when infiltrative surfaces can be covered in one day to minimize windblown silt or rain clogging the soil.
5. In clayey soils, work should be done only when soil moisture content is low enough to avoid smearing of infiltrative surfaces.
6. Bottom and sidewall areas should be left with a rough surface. Any smeared or compacted surfaces should be removed.
7. Bottom of trench or bed ~~leach~~ distribution piping should be level throughout to prevent localized overloading.
8. ~~Two inches of coarse sand should be placed on the bottom of trenches to prevent compacting soil when leachrock is dumped into drainfields. Fine sand should not be used as it may lead to system failure.~~
9. Properly constructed distribution boxes or junction fittings should be installed to maintain equal flow to each trench. Distribution boxes should be placed with extreme care outside the leaching area to ensure settling does not occur.
10. Risers to the ground surface and manholes should be installed over the septic tank

inspection ports, access ports and distribution boxes.

11. Drainfields should include inspection pipes to check water level.
12. Nutrient and heavy metal removal should be facilitated by planting ground cover vegetation over shallow subsurface drainfields. The plants must have the following characteristics: (1) evergreen, (2) shallow root systems, (3) numerous leaves, (4) salt resistant, (5) ability to grow in soggy soils, and (6) low or no maintenance. Plants downstream of leaching area may also be effective in nutrient removal.

REQUIREMENTS

13. Prior to backfilling, the distribution system ~~should~~ shall be tested to check the hydraulic loading pattern.
14. Disposal systems ~~should~~ shall be inspected by the permitting agency prior to covering to ensure proper construction. Designers and/or installers of engineered onsite wastewater systems shall provide a letter to the permitting authority stating that the onsite system was installed in conformance with the approved plans.

VIII.D.2.e. ONSITE SYSTEM MAINTENANCE

RECOMMENDATIONS

1. Septic tanks should be inspected every two to five years to determine the need for pumping.
2. Septic tanks should be pumped whenever: (1) the scum layer is within three inches of the outlet device, (2) the sludge level is within eight inches of the bottom of the outlet device, or (3) every 5 years; whichever is sooner.^{EPA}
3. Drainfields should be alternated when drainfield inspection pipes reveal a high water level or every six months, whichever is sooner.

REQUIREMENTS

4. Onsite wastewater systems shall be maintained in accordance with approved onsite management plans. Where onsite management plans have not been approved by

the Central Coast Water Board Executive Officer, onsite systems shall be maintained as described in the following specifications.^{EPA}

5. Disposal of septage (solid residue pumped from septic tanks) shall be accomplished in a manner acceptable to the Central Coast Water Board Executive Officer.
6. Records of maintenance, pumping, septage disposal, etc. shall be maintained by the onsite system owner and available upon request.^{EPA}

VIII.D.2.f. USE CONSIDERATIONS

RECOMMENDATIONS

1. Water conservation and solids reduction practices should be implemented by all onsite system users. Garbage grinders should not be used in homes with septic tanks. Where grinders are used, septic tank capacity and inspection/pumping frequency should be increased.^{EPA}
2. Metering and water use costs should be used to encourage water conservation in areas served by onsite systems.
3. Bleach, solvents, fungicides and any other toxic material, grease and oil should not be discharged into onsite wastewater systems.
4. Self-regenerating water softeners should not be used where discharge is to onsite systems. If water softening is necessary, use of canister-type softeners will protect the treatment and disposal systems and underlying groundwater from unnecessary accumulation of salts.

PROHIBITIONS

5. Self-regenerating water softener brine discharge to onsite wastewater systems is prohibited unless consistent with a salts minimization plan approved by the Water Board Executive Officer and implemented by the local governing jurisdiction.

VIII.D.2.g. ONSITE WASTEWATER SYSTEM PROHIBITION AREAS

In order to achieve water quality objectives, protect present and future beneficial water uses, protect public health, and prevent nuisance, discharges are prohibited in the following areas:

PROHIBITIONS

1. Discharges from individual sewage disposal systems are prohibited in portions of the community of Nipomo, San Luis Obispo County, which are particularly described in Basin Plan Appendix A-27.
2. Discharges from individual sewage disposal systems within the San Lorenzo River Watershed shall be managed as follows: Discharges shall be allowed providing the County of Santa Cruz, as lead agency, implements the "Wastewater Management Plan for the San Lorenzo River Watershed, County of Santa Cruz, Health Services Agency, Environmental Health Service; February 1995 and "San Lorenzo Nitrate Management Plan, Phase II Final Report", February 1995, County of Santa Cruz, Health Services Agency, Environmental Health Service (Wastewater Management Plan) and assures the Central Coast Water Board that areas of the San Lorenzo River Watershed are serviced by wastewater disposal systems to protect and enhance water quality, to protect and restore beneficial uses of water, and to abate and prevent nuisance, pollution, and contamination.
3. Discharges from individual and community sewage disposal systems are prohibited, effective November 1, 1988, in the Los Osos/Baywood Park area depicted in the Prohibition Boundary Map included as Attachment A of Resolution No. 83-13, which can be found in Basin Plan Appendix A-30.

VIII.D.2.h. SUBSURFACE DISPOSAL EXEMPTIONS

The Central Coast Water Board or Executive Officer may grant exemption to prohibitions for: (1) engineered new onsite disposal wastewater systems for sites unsuitable for standard systems;

and (2) new or existing onsite systems within the specific prohibition areas cited above. Such exemptions may be granted only after presentation by the discharger of sufficient justification, including geologic and hydrologic evidence that the continued operation of such system(s) in a particular area will not individually or collectively, directly or indirectly, result in pollution or nuisance, or affect water quality adversely.

Individual, alternative, and community systems shall not be approved for any area where it appears that the total discharge of leachate to the geological system, under fully developed conditions, will cause: (1) damage to public or private property; (2) ground or surface water degradation; (3) nuisance condition; or, (4) a public health hazard. Interim use of septic tank systems may be permitted where alternate parcels are held in reserve until sewer systems are available.

Requests for exemptions will not be considered until the local entity has reviewed the system and submitted the proposal for Central Coast Water

Board review. Dischargers requesting exemptions must submit a Report of Waste Discharge. Exemptions will be subject to filing fees as established by the State Water Code.

Discharges from onsite wastewater systems regulated by waste discharge requirements or waiver of such requirements may be exempt from the requirements of this chapter. The waste discharge requirements order or waiver will act in lieu of exemption, and separate exemption is not required.

Further information concerning individual, alternative, or community onsite sewage disposal systems can be found in Chapter 5 in the Management Principals and Control Actions sections. State Water Resources Control Board Plans and Policies, Discharge Prohibitions, and Central Coast Water Board Policies may also apply depending on individual circumstances.

CHAPTER 5. PLANS AND POLICIES

III. REGIONAL WATER QUALITY CONTROL BOARD MANAGEMENT PRINCIPLES

III.F. INDIVIDUAL, ALTERNATIVE AND COMMUNITY ONSITE DISPOSAL SYSTEMS

The Regional Board intends to discourage high-density development on septic tank disposal systems and generally will require increased size of parcels with increasing slopes and slower percolation rates. Consideration of development will be based upon the percolation rates and engineering reports supplied. In any questionable situation, engineer-designed systems will be required.

Further information concerning onsite disposal systems can be found in Chapter Four.

V.D. INDIVIDUAL, ALTERNATIVE AND COMMUNITY SEWAGE ONSITE DISPOSAL SYSTEMS

Unsewered areas having high density (one acre lots or smaller) should be organized into septic tank management districts and sewerage feasibility studies should be encouraged completed in potential problem areas. Local implementation should be encouraged by Regional Board action.

V.H.3. SEPTIC TANK MANAGEMENT AGENCIES

1. Local governing jurisdictions County governments should revise septic tank ordinances to ~~conform~~ be consistent with Basin Plan recommendations and requirements, and State Board guidelines.
2. Formation of septic tank management districts within existing local agencies should be accomplished in areas where directed by Regional Board action.

VI. REGIONAL BOARD POLICIES

Formal specific policies adopted by the Regional Board are presented below according to various categories.

VI.A. SEWERAGE FACILITIES AND SEPTIC TANKS IN URBANIZING AREAS IN THE CENTRAL COAST REGION

Resolution 69-01: Adopting Policy Statement Regarding Sewerage Facilities and Septic Tanks in Urbanizing Areas in the Central Coast Region. This policy prohibits septic tank or community systems unless particular criteria are satisfied. Resolution 69-01 states Regional Board policy to support local jurisdictions in their efforts to prohibit subdivisions using onsite wastewater disposal, unless water quality protection is demonstrated by the implementation of specified onsite system criteria. The Resolution also states Regional Board intention to take enforcement actions, if local jurisdictions fail

to manage onsite wastewater systems in a water quality protective manner.

VI.J. INTERPRETATION OF MINIMUM PARCEL SIZE REQUIREMENTS FOR ONSITE SEWAGE SYSTEMS

Resolution No. 91-04 – Interpretation of Basin Plan's Minimum Parcel Size for Onsite Sewage Systems. This policy clarifies Regional Board minimum parcel size requirements for onsite systems contained in Chapter Four of this document. A copy of this policy is shown in the appendix.

Project Title/Location Name and Address of Project Proponent:

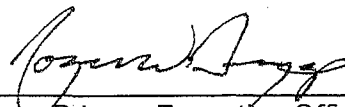

AMENDMENT OF "WATER QUALITY CONTROL PLAN - CENTRAL COASTAL BASIN"
REGARDING REVISED ONSITE WASTEWATER SYSTEM CRITERIA

Central Coast Regional Water Quality Control Board
895 Aerovista Place, Suite 101
San Luis Obispo, California 93401
San Luis Obispo County
Contact: Sorrel Marks (805/549-3695 or smarks@waterboards.ca.gov)

Project Description: The California Regional Water Quality Control Board, Central Coast Region (Central Coast Water Board), will hold a public hearing to receive comments and consider adoption of a resolution amending the Water Quality Control Plan, Central Coast Basin (Basin Plan). The proposed amendment to the Basin Plan includes revisions to onsite wastewater system criteria specified in Chapters 4 and 5 of the Basin Plan.

Findings of Exemption: Please see the attached Environmental Checklist for description and findings.

Certification: I hereby certify that the California Regional Water Quality Control Board, Central Coast Region, has made the above findings of fact and that based upon the Environmental Checklist, written report, and record of hearing finds that the project will not individually or cumulatively have an adverse effect on wildlife resources, as defined in Section 711.2 of the Fish and Game Code.

Roger Briggs, Executive Officer
Regional Water Quality Control Board

5-22-08

Date

**CALIFORNIA ENVIRONMENTAL QUALITY ACT
SUBSTITUTE ENVIRONMENTAL DOCUMENT
REPORT FOR BASIN PLAN AMENDMENT
REGARDING ONSITE WASTEWATER SYSTEMS
(RESOLUTION NO. R3-2008-0005)**

The Central Coast Regional Water Quality Control Board (Central Coast Water Board) is proposing an amendment to the *Water Quality Control Plan, Central Coast Basin* (Basin Plan). The Basin Plan serves as the cornerstone for protection of waters of the State through identification of beneficial uses of surface and ground waters, establishment of water quality objectives to protect beneficial uses, and establishment of an implementation plan to achieve those objectives.

The California Resources Agency has certified the Basin Planning process as an exempt regulatory program for the purposes of complying with the California Environmental Quality Act (CEQA) and the CEQA Guidelines [§15251, Title 14, California Code of Regulation (CCR)]. The Water Board is exempt from the requirement to prepare an environmental impact report or negative declaration. Any Regional Board exempt regulatory program must satisfy the documentation requirements of §3775(a), Title 23, CCR. This report constitutes a substitute environmental document as set forth in §3775(a), Title 23, CCR. It contains the following:

1. A description of proposed activity and proposed alternatives,
2. An environmental checklist and a description of the proposed activity,
3. An environmental evaluation, and
4. A determination with respect to significant environmental impacts.

The environmental analysis contained in this Report for Basin Plan Amendment and accompanying documents, including the Environmental Checklist, the staff report and the responses to comments complies with the requirements of the State Water Board's certified regulatory process, as set forth in CCR, Title 23, §3775 et seq. All public comments were considered.

I. DESCRIPTION OF PROPOSED ACTIVITY

The purpose of this Resolution is to update and revise the Basin Plan sections pertaining to onsite wastewater system requirements. This section describes the changes proposed and alternatives to this proposal.

Chapters IV and V of the Water Quality Control Plan, Central Coast Basin (Basin Plan) specify criteria for siting, design and ongoing management of individual and community onsite wastewater disposal systems (commonly called septic systems). The Basin Plan criteria also recommend a variety of management measures intended to ensure long-term success of properly functioning systems and prevent water quality impacts from such systems. The existing Basin Plan criteria for onsite wastewater systems were last updated in 1983. During the past 25 years, implementation of those criteria has

demonstrated revisions are needed to clarify vague language and, in some cases, strengthen language from recommendations to requirements. The proposed project (adoption of Resolution No. R3-2008-0005) will update and revise existing Basin Plan criteria for onsite wastewater systems. Most of the proposed revisions provide clarifying language to existing requirements without substantially changing such requirements. However, some revisions replace discretionary language of recommendations (should) with mandatory language of requirements (shall). By adopting the proposed resolution, language in the Basin Plan will be strengthened and clarified in a manner expected to result in improved long-term water quality protection in areas served by onsite wastewater systems. The proposed revisions are also expected to improve consistency and customer service by reducing the need for subjective interpretation of imprecise language. Updating the Basin Plan criteria for onsite wastewater systems will complete a Triennial Review list priority task, which has been backlogged for more than a decade.

Alternatives to this Project

1. Incomplete adoption of the proposed amendment

The Central Coast Water Board could amend only a portion of the existing Basin Plan criteria for onsite wastewater systems. The Basin Plan criteria could be amended with some of the proposed revisions or amended with different revisions. This alternative is not recommended as it would result in addressing only some of the needed clarifications or strengthening of the existing Basin Plan language and would not achieve the goals of effective long-term water quality protection in a clear and efficient manner. Adoption of different criteria can only be addressed relative to specified alternate criteria, such discussion is included in the response to comments included in the staff report. This alternative is not recommended.

2. Take no action

The proposed revisions to the Basin Plan criteria for onsite wastewater systems are needed to clarify vague and imprecise requirements and to strengthen requirements needed to protect water quality. Updating the onsite criteria has been prioritized on the Central Coast Water Board's Triennial Review List for many years. Failing to take action would result in ongoing confusion regarding requirements, utilization of staff time to individually clarify and interpret requirements, and inadequate long-term water quality protection in areas served by onsite wastewater systems. This alternative is not recommended.

II. APPLICABLE INFORMATION

1. Lead Agency Name and Address

Central Coast Water Board
895 Aerovista Place, Suite 101
San Luis Obispo, CA 93401-7906

2. Contact Person and Phone Number: Sorrel Marks (805) 549-3595

3. Project Location: Central Coast Region

4. Project Sponsor's Name and Address

Central Coast Water Board
895 Aerovista Place, Suite 101
San Luis Obispo, CA 93401-7906

5. Other Public Agencies whose Approval is Required

State Water Resources Control Board approval is required for this Basin Plan amendment. Although formal approval by local jurisdictions is not required for Basin Plan amendments, cooperative implementation by local permitting authorities (cities, counties, community services districts) is necessary to effectively protect water quality. Local jurisdictions likely to be affected by the proposed project include: Monterey, San Benito, San Luis Obispo, Santa Barbara, Santa Clara, Santa Cruz, and Ventura Counties, and the cities and special districts therein.

ENVIRONMENTAL CHECKLIST

III. EVALUATION OF ENVIRONMENTAL IMPACTS

	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
1. AESTHETICS -- Would the project:				
a) Have a substantial adverse effect on a scenic vista?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Substantially damage scenic resources, including, But not limited to, trees, rock outcroppings, and historic buildings with a state scenic highway?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Substantially degrade the existing visual character or quality of the site and its surroundings?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
2. AGRICULTURE RESOURCES -- Would the project:				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
3. AIR QUALITY -- Would the project:				

a) Conflict with or obstruct implementation of the applicable air quality plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is not attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Expose sensitive receptors to substantial pollutant concentrations?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Create objectionable odors affecting a substantial number of people?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
4. BIOLOGICAL RESOURCES -- Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
5. CULTURAL RESOURCES -- Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Disturb any human remains, including those interred outside of formal cemeteries?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
6. GEOLOGY AND SOILS -- Would the project:				
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
ii) Strong seismic ground shaking?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
iii) Seismic-related ground failure, including liquefaction?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
iv) Landslides?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Result in substantial soil erosion or the loss of topsoil?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
7. HAZARDS AND HAZARDOUS MATERIALS -- Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code §65962.5 and, as a result, would it create a significant hazard to the public or the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
h) Expose people or structures to a significant risk of loss injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
8. HYDROLOGY AND WATER QUALITY --Would the project:				
a) Violate any water quality standards or waste discharge requirements?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner, which would result in substantial erosion or siltation on or off-site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner, which would result in flooding on- or off-site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Create or contribute runoff water, which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Otherwise substantially degrade water quality?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

j) Inundation by seiche, tsunami, or mudflow?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
9. LAND USE AND PLANNING -- Would the project:				
a) Physically divide an established community?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Conflict with any applicable habitat conservation plan or natural community conservation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
10. MINERAL RESOURCES -- Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
11. NOISE -- Would the project result in:				
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
12. POPULATION AND HOUSING -- Would the project:				
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

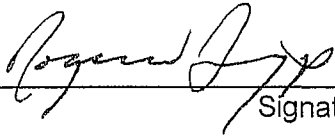

c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
13. PUBLIC SERVICES --Would the project result in:				
a) Substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Fire protection?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Police protection?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Schools?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Parks?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Other public facilities?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
14. RECREATION:				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
15. TRANSPORTATION/TRAFFIC -- Would the project:				
a) Cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on roads, or congestion at intersections)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Result in inadequate emergency access?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Result in inadequate parking capacity?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

16. UTILITIES AND SERVICE SYSTEMS --Would the project:				
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Comply with federal, state, and local statutes and regulations related to solid waste?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
17. MANDATORY FINDINGS OF SIGNIFICANCE				
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

IV. ENVIRONMENTAL EVALUATION (of checklist questions answered Potentially Significant Impact, Less than Significant with Mitigation Incorporation, or Less than Significant Impact): Not applicable.

V. PRELIMINARY STAFF DETERMINATION

- The proposed project COULD NOT have a significant effect on the environment, and, therefore, no alternatives or mitigation measures are proposed.
- The proposed project MAY have a significant or potentially significant effect on the environment, and therefore alternatives and mitigation measures have been evaluated.

**CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, California**

**RESOLUTION NO. R3-2008-0003
MARCH 20-21, 2008**

**Amending the Water Quality Control Plan for The Central Coast Basin to Adopt Total
Maximum Daily Loads for Pathogens in
Aptos Creek, Valencia Creek, and Trout Gulch**

The Regional Water Quality Control Board, Central Coast Region (Central Coast Water Board) finds:

1. The Central Coast Water Board, adopted the Water Quality Control Plan for the Central Coastal Basin (Basin Plan), on September 8, 1994. The Basin Plan includes beneficial use designations, water quality objectives, prohibitions, implementation plans for point source and nonpoint source pollution discharges, and statewide plans and policies.
2. The Central Coast Water Board periodically revises and amends the Basin Plan. The Central Coast Water Board has determined the Basin Plan requires further revision and amendment to incorporate Total Maximum Daily Loads (TMDLs) and Implementation Plan for pathogens in Aptos Creek, Valencia Creek, and Trout Gulch. The term Aptos Creek Watershed elsewhere in this document refers only to these water bodies.
3. The Central Coast Water Board proposes to amend the Basin Plan by inserting an amendment into the following sections:
 - a. Chapter Four, Section IX (Total Maximum Daily Loads).
4. On May 20, 2004, the State Water Resources Control Board (State Water Board) adopted the *Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program* (NPS Policy). This policy requires the Water Boards to regulate all nonpoint sources of pollution using the administrative permitting authorities provided by the California Water Code. This policy requires Regional Water Boards to regulate nonpoint source pollution discharges with Waste Discharge Requirements, Waivers of Waste Discharge Requirements, or Basin Plan Prohibitions.
5. Section 303(d) of the Clean Water Act requires states to identify and prepare a list of water bodies that do not meet water quality standards. Water bodies on the 303(d) list are referred to as listed water bodies, or impaired waters. Section 303(d) of the Clean Water Act requires states to establish TMDLs for listed waterbodies.
6. Aptos Creek and Valencia Creek are listed on Clean Water Act 303(d) list as impaired due to non-attainment of existing Basin Plan water quality objectives for pathogens. Trout Gulch is not yet listed, but this water body is also impaired, as it was not meeting the Basin Plan water quality objective for fecal coliform. TMDLs and associated allocations are being established for the Aptos Creek Watershed.

7. The Central Coast Water Board's goal for establishing TMDLs in the Aptos Creek Watershed is to rectify the impairment due to pathogens, thereby providing support for the beneficial uses of contact and non-contact water recreation.
8. The mouth of Aptos Creek is the receiving water for approximately 13,190 acres of land. Water from the Creek flows into northern Monterey Bay. Trout Gulch flows into Valencia Creek and Valencia Creek flows into Aptos Creek.
9. The elements of a TMDL are described in 40 CFR 130.2 and 130.7 and section 303(d) of the CWA, and USEPA guidance documents. A TMDL is defined as "the sum of individual waste load allocations for point sources and load allocations for nonpoint sources and natural background" (40 CFR 130.2). The Central Coast Water Board has determined that the TMDLs for pathogens in the Aptos Creek Watershed are set at levels necessary to attain and maintain the applicable numeric water quality objectives taking into account seasonal variations and any lack of knowledge concerning the relationship between effluent limitations and water quality (40 CFR 130.7 (c) (1)). The regulations in 40 CFR 130.7 also state that TMDLs shall take into account critical conditions for stream flow, loading, and water quality parameters. TMDLs are often expressed as a mass load of the pollutant but can be expressed as a unit of concentration if appropriate (40 CFR 130.2(i)). Expressing these TMDLs as units of concentration is appropriate because an existing concentration-based water quality objective is used as the basis for the TMDL numeric target.
10. Upon establishment of TMDLs by the State or USEPA, the State is required to incorporate the TMDLs, along with appropriate implementation measures, into the State Water Quality Management Plan (40 CFR 130.6(c)(1) and 130.7; and California Water Code sections 13050(j) and 13242). The Basin Plan and applicable statewide plans serve as the State Water Quality Management Plan governing the watersheds under the jurisdiction of the Central Coast Water Board.
11. Pursuant to California Water Code section 13241, the Central Coast Water Board considered several factors in developing this Basin Plan amendment. The Central Coast Water Board concluded the following.
 - a. The TMDLs will protect present and probable future beneficial uses.
 - b. Environmental characteristics of the waterbody will be protected.
 - c. Improved water quality conditions can reasonably be achieved through the coordinated management of all controllable factors that affect water quality in the area, as provided in the Implementation Plan.
 - d. Costs to achieve compliance with the TMDLs are reasonable relative to the benefit of improved water quality.
 - e. The need for developing housing within the region is not relevant.
 - f. The need to develop and use recycled water is not relevant.
12. Central Coast Water Board staff submitted the Project Report for the TMDLs to an external scientific review panel in July 2007. Staff received comments from the scientific review panel. Central Coast Water Board staff edited the Project Report or provided a written response that explained the basis for not incorporating the comments, or the comments did not result in any changes to the proposed Basin Plan Amendment. The TMDLs and implementation plan are based on sound scientific knowledge, methods, and practices in accordance with Health & Safety Code section 57004.
13. Central Coast Water Board staff implemented a process to inform interested persons and the public about the TMDLs. Central Coast Water Board staff's efforts to inform the public and

solicit comment included a public meeting and numerous telephone conversations with interested parties. Public notification of the amendment to the Basin Plan occurred for a 45 day period preceding the Central Coast Water Board hearing. Notice of public hearing was given by advertising in newspapers of general circulation within the Region and by mailing a copy of the notice to all persons requesting such notice and applicable government agencies. Central Coast Water Board staff responded to oral and written comments received from the public. All public comments were considered.

14. The Central Coast Water Board considered costs of implementing measures to comply with the TMDLs. The costs will be incurred by identified responsible parties. These costs are reasonable relative to the water quality benefits to be derived from the amendment.
15. Anti-Degradation — The adoption of these TMDLs are consistent with the provisions of the State Water Board Resolution No. 68-16, "Statement of Policy with Respect to Maintaining High Quality of Waters in California" and 40 CFR 131.12. Adoption of these TMDLs will result in improved water quality throughout the region and maintain the level of water quality necessary to protect present and potential beneficial uses.
16. The Central Coast Water Board concurs with the analysis contained in the Final Project Report, the California Environmental Quality Act "Substitute Environmental Document" for the Basin Plan Amendment, including the CEQA Checklist, the staff report and the responses to comments, and finds that these analyses comply with the requirements of the State Board's certified regulatory CEQA process, as set forth in California Code of Regulations, Title 23, section 3775 et seq. Furthermore, the Central Coast Water Board finds that these analyses fulfill the Central Coast Water Board's obligations attendant with the adoption of regulations "requiring the installation of pollution control equipment, or a performance standard or treatment requirement," as set forth in section 21159 of the Public Resources Code.
17. The Central Coast Water Board will request that the State Water Board approve the Basin Plan amendment incorporating the TMDLs for pathogens in the Aptos Creek Watershed. The TMDLs and Implementation Plan for the TMDLs will become effective upon approval by the California Office of Administrative Law.
18. The amendment to the Basin Plan will result in no potential adverse effect, either individually or cumulatively, on wildlife and is, therefore, exempt from fee payments to the Department of Fish and Game under the California Fish and Game Code.
19. On March 21, 2008 in Salinas, California, the Central Coast Water Board held a public hearing and heard and considered all public comments and evidence in the record.
20. The regulatory action meets the "Necessity" standard of the Administrative Procedures Act, Government Code, section 11353, subdivision (b). As specified in Finding-15, federal regulations require that TMDLs be incorporated into the water quality management plan. The Central Coast Water Board's Basin Plan is the Central Coast Water Board's component of the water quality management plan, and the Basin Plan is how the Central Coast Water Board takes quasi-legislative, planning actions. Moreover, the TMDL is a program of implementation for existing water quality objectives, and is, therefore, appropriately a component of the Basin Plan under California Water Code section 13242. The necessity of developing a TMDL is established in the TMDL staff report, the section 303(d) list, and the data contained in the administrative record documenting the pathogen impairments of the Aptos Creek Watershed.

21. The proposed amendment meets the "Necessity" standard of the Administrative Procedure Act, Government Code, section 11352, subdivision (b).

THEREFORE, be it resolved that:

1. Pursuant to sections 13240, 13241, 13242, 13243, and 13244 of the California Water Code, the Central Coast Water Board, after considering the entire record, including the oral testimony at the hearing, hereby adopts the amendment in "Attachment-Proposed Basin Plan Amendment".
2. The Executive Officer is directed to forward copies of the Basin Plan amendment to the State Water Board in accordance with the requirements of section 13245 of the California Water Code.
3. The Central Coast Water Board requests that the State Water Board approve the Basin Plan amendment in accordance with the requirements of sections 13245 and 13246 of the California Water Code and forward them to the California Office Of Administrative Law and the USEPA.5
4. The Executive Officer is authorized to sign a Certificate of Fee Exemption or transmit payment of the applicable fee as may be required to the Resources Agency.
5. If, during its approval process, Central Coast Water Board staff, State Board staff, the State Water Board or the California Office of Administrative Law determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.
6. The environmental documents prepared by the Central Coast Water Board staff pursuant to Public Resources Code 21080.5 are hereby certified.

I, Roger W. Briggs, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of the resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region, on March 21, 2008.

Roger W. Briggs
Executive Officer

RESOLUTION NO. R3-2008-0003

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENT

Revise the September 8, 1994 Basin Plan, as follows:

AMENDMENT NO. 1. ADOPT THE APTOS CREEK, VALENCIA CREEK, AND TROUT GULCH TOTAL MAXIMUM DAILY LOADS FOR PATHOGENS

Add the following to Chapter 4 after IX. K.:

IX. L. TOTAL MAXIMUM DAILY LOADS FOR PATHOGENS IN APTOS CREEK, VALENCIA CREEK, AND TROUT GULCH

The Regional Water Quality Control Board adopted these TMDLs on March 21, 2008.

These TMDLs were approved by:

The State Water Resources Control Board on _____.
The California Office of Administrative Law on _____, (Effective date)
The U.S. Environmental Protection Agency on _____, (Effective date)

Problem Statement

The beneficial use of water contact recreation is not being attained in Aptos Creek, Valencia Creek and Trout Gulch because fecal coliform concentrations exceed existing Basin Plan numeric water quality objectives protecting this beneficial use. Staff concluded Aptos Creek was impaired below the confluence with Valencia Creek. The entire reach of Trout Gulch was considered impaired. Staff also considered Valencia Creek impaired from its confluence with Aptos Creek, upstream to both the east and west forks. The east fork was impaired upstream to the intersection of McKay and Cox Roads. The west fork was impaired upstream to its intersection with Valencia Road.

Numeric Target

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

Source Analysis

The relative order of controllable sources contributing pathogens to Aptos Creek, Valencia Creek and Trout Gulch (from largest to smallest source) is: (1) storm drain discharges to municipally owned and operated storm sewer systems required to be covered by an NPDES permit (MS4s), (2) pet waste in areas that do not drain to MS4s, (3) County of Santa Cruz Sanitation District sanitary sewer collection system spills and leaks, (4) private sewer laterals connected to municipal sanitary sewer collection systems, and (5) farm animals/livestock discharges.

TMDLs and Allocations

The TMDLs for all impaired waters of Aptos Creek, Valencia Creek, and Trout Gulch are concentration based TMDLs applicable to each day of all seasons and are equal to the following:

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

The allocations to responsible parties are shown in Table IX-K-1.

Table IX – K - 1. Allocations and Responsible Parties

<u>WASTEWATER ALLOCATIONS</u>		<u>Receiving Water: Fecal Coliform (MPN/100ml)</u>
<u>Waterbody</u>	<u>Responsible Party (Source)</u>	
<u>Aptos Creek¹ Trout Gulch² Valencia Creek³</u>	<u>Santa Cruz County (Storm drain discharges to municipally owned and operated storm sewer systems required to be covered by an NPDES permit (MS4s))</u>	<u>Allocation 1</u>
<u>LEAKAGE ALLOCATIONS</u>		<u>Receiving Water: Fecal Coliform (MPN/100ml)</u>
<u>Waterbody</u>	<u>Responsible Party (Source)</u>	
<u>Aptos Creek¹ Trout Gulch² Valencia Creek³</u>	<u>Owners/Operators of land used for/containing pets (Pet waste in areas that do not drain to MS4s)</u>	<u>Allocation 1</u>
<u>Aptos Creek¹ Trout Gulch² Valencia Creek³</u>	<u>Santa Cruz County Sanitation District (Sanitary sewer collection system spills and leaks)</u>	<u>Allocation 1</u>
<u>Aptos Creek¹ Trout Gulch² Valencia Creek³</u>	<u>Owners of private sewer laterals (Private laterals connected to municipal sanitary sewer collection system)</u>	<u>Allocation 1</u>
<u>Aptos Creek¹ Trout Gulch² Valencia Creek³</u>	<u>Owners/Operators of land used for/containing farm animals/livestock (Farm animals and livestock discharges)</u>	<u>Allocation 1</u>
<u>Aptos Creek¹ Trout Gulch² Valencia Creek³</u>	<u>Natural sources</u>	<u>Allocation 1</u>

¹ Aptos Creek from the Pacific Ocean to the confluence of Aptos and Valencia Creeks

² All reaches of Trout Gulch

³ Valencia Creek from the confluence with Aptos Creek upstream to the west fork, where it intersects with Valencia Road, and to the east fork at the intersection of McKay and Cox Roads.

Allocation 1: Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200/100mL, nor shall more than ten percent of total samples during any 30-day period exceed 400/100 mL.

The parties responsible for the allocations to controllable sources are not responsible for the allocation to natural sources.

The TMDLs are considered achieved when the allocations assigned to all individual responsible parties are met, or when the numeric targets are consistently met in Aptos Creek, Valencia Creek, and Trout Gulch.

Margin of Safety

A margin of safety is incorporated implicitly in the TMDLs through conservative assumptions.

Implementation

STORM DRAIN DISCHARGES

Enrollees of the State Water Resources Control Board's General Permit for the Discharges of Storm Water from Small Municipal Separate Storm Sewer Systems (General Permit for storm water discharges) must control discharges of pathogens to and in storm drains (currently NPDES No. S000004).

The County of Santa Cruz must control discharges of pathogens to and in storm drains when enrolled in the General Permit for stormwater discharges.

Within one year following approval by the Office of Administrative Law (OAL) of these TMDLs, or if enrolled in the General Permit for stormwater discharge, then when the next annual report is due, or to meet any other Water Board-issued storm water requirements (e.g. when the State General Permit for stormwater discharges is renewed), the County of Santa Cruz will be required to:

1. Submit for approval a management program that identifies pathogen-specific best management practices targeting pathogen sources from:
 - a. Birds, pets, rodents and wildlife, dumpster leachate, and humans.
The best management practices should include, but not be limited to: those identified in a Storm Water Management Plan (if existing or being developed), public education, participation and outreach regarding sources of pathogens in surface waters, health risks associated pathogens in surface waters, and specific actions the public can take to reduce pathogen loading into surface waters.
2. Submit for approval a fecal indicator bacteria (e.g. fecal coliform) monitoring and reporting plan. Receiving water and storm water outfall monitoring will be required.
3. Incorporate a description of implementation and monitoring activities in any existing or developing Storm Water Management Plan, and corresponding reporting, associated with a General Permit for storm water discharges.

The Executive Officer or the Central Coast Water Board will require information that demonstrates implementation of the actions described above, pursuant to applicable sections of the California Water Code and/or pursuant to authorities provided in the General Permit for storm water discharges.

COUNTY OF SANTA CRUZ SANITARY SEWER COLLECTION SYSTEM SPILLS AND LEAKS

The Santa Cruz County Sanitation District (SCCSD) must continue to implement its Collection System Management Plan, as required by Waste Discharge Requirements (WDRs) (Order No. R3-2005-0043).

Staff will continue to assess the effectiveness of the SCCSD Collection System Management Plan. Staff will utilize annual reporting associated with the SCCSD WDR, and other information, to make this assessment. If staff determines that the SCCSD is not satisfactorily implementing their Collection System Management Plan, or the Collection System Management Plan is not likely to result in the SCCSD achieving their allocation, the Executive Officer or the Central Coast Water Board may require modifications to the Collection System Management Plan (e.g. through revisions of WDRs), and/or require actions pursuant to applicable sections of the California Water Code.

Within one year following approval of these TMDLs by the California Office of Administrative Law, the Executive Officer or the Central Coast Water Board will amend the Monitoring and Reporting Program of the SCCSDs WDRs to incorporate stream monitoring for fecal coliform and reporting of such stream monitoring activities.

PRIVATE SEWER LATERAL DISCHARGES

Individual owners of private laterals to sanitary sewer collection systems are responsible for maintenance of their private laterals. However, the County of Santa Cruz has the authority to require private lateral upgrades. The County of Santa Cruz may choose to implement a program to detect and require repair of leaks from private laterals. The Central Coast Water Board would consider implementation (by the County of Santa Cruz) of such a program, as proof of compliance by owners with private laterals with the Aptos-Soquel Subbasin prohibition. If the County of Santa Cruz implements such a program, the Central Coast Water Board will request and use reporting from the County of Santa Cruz to evaluate individual private lateral owner compliance with the Aptos-Soquel Subbasin prohibition.

Within one year following approval of these TMDLs by the California Office of Administrative Law, if the County of Santa Cruz does not submit an approved program to detect and repair leaks from private laterals, or if the Central Coast Water Board or Executive Officer determines that such an existing or proposed program is insufficient, then landowners with private laterals must demonstrate compliance individually with the Aptos-Soquel Subbasin prohibition.

If landowners with private laterals must demonstrate compliance individually with the Aptos-Soquel Subbasin prohibition, then within one year following approval of the TMDLs by the California Office of Administrative Law, the Executive Officer will notify owners and/or operators of land that have private lateral connections to the sanitary sewer system of the County of Santa Cruz, of the Aptos-Soquel Subbasin prohibition and conditions for compliance with the prohibition. Compliance with the Aptos-Soquel Subbasin prohibition is described in Chapter Five, section IV.B. of the Water Quality Control Plan.

DOMESTICATED ANIMAL DISCHARGES

Owners and/or operators of land used for/containing domesticated animals (including, but not limited to: horses, cattle, goats, sheep, dogs, cats, or any other animals in the care of owners/operators) in the Aptos Subbasin must comply with the Aptos-Soquel Subbasin prohibition.

Within one year following approval of the TMDLs by the California Office of Administrative Law, the Executive Officer will notify owners and/or operators of lands used for/containing domesticated

animals of the Aptos-Soquel Subbasin prohibition and conditions for compliance with the prohibition, as described in Chapter Five, section IV.B. of the Water Quality Control Plan.

Tracking and Evaluation

Every three years beginning three years after TMDLs are approved by the California Office of Administrative Law, Central Coast Water Board staff will perform a review of implementation actions and monitoring results. Central Coast Water Board staff will use annual reports, nonpoint source pollution control implementation programs, and other available information, to review implementation progress toward achieving the allocations and the numeric target.

Central Coast Water Board staff may conclude that ongoing implementation efforts are insufficient to ultimately achieve the allocations and numeric target. If staff makes this determination, staff will recommend that additional reporting, monitoring, or implementation efforts be required either through approval by the Executive Officer or by the Central Coast Water Board. Central Coast Water Board staff may conclude, at the time of review, that they expect implementation efforts to result in achieving the allocations and numeric target. In that case, staff will recommend that existing and anticipated implementation efforts should continue.

Responsible parties will continue monitoring according to this plan for at least three years, at which time Central Coast Water Board staff will determine the need for continuing or otherwise modifying the monitoring requirements. Responsible parties may also demonstrate that controllable sources of pathogens are not contributing to exceedance of water quality objectives in receiving waters. If this is the case, staff may propose a re-evaluation of the numeric target and allocations. For example, staff may propose a site-specific objective to be approved by the Central Coast Water Board. The site-specific objective would be based on evidence that natural, or background sources alone were the cause of exceedances of the Basin Plan water quality objective for pathogen indicator organisms.

Three-year reviews will continue until the TMDLs are achieved. The target date to achieve the TMDLs is 13 years after the date of approval by the California Office of Administrative Law.

**CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, California**

**RESOLUTION NO. R3-2008-0002
MARCH 20-21, 2008**

**Amending the Water Quality Control Plan For The Central Coast Basin to
(1) Remove The Shellfish Harvesting Beneficial Use for Soquel Lagoon and (2) Adopt The
Total Maximum Daily Loads for Pathogens in Soquel Lagoon, Soquel Creek, and Noble
Gulch, Santa Cruz, California**

The Regional Water Quality Control Board, Central Coast Region (Central Coast Water Board) finds:

1. The Central Coast Water Board adopted the Water Quality Control Plan for the Central Coast Basin (Basin Plan), on September 8, 1994. The Basin Plan includes beneficial use designations, water quality objectives, prohibitions, implementation plans for point source and nonpoint source discharges, statewide plans and policies.
2. The Central Coast Water Board periodically revises and amends the Basin Plan. The Central Coast Water Board has determined the Basin Plan requires further revision and amendment to (a) remove the shellfish harvesting beneficial use (SHELL) for Soquel Lagoon; and (b) incorporate Total Maximum Daily Loads (TMDLs) and Implementation Plan for pathogens in Soquel Lagoon, Soquel Creek, and Noble Gulch.
3. The Central Coast Water Board proposes to amend the Basin Plan by inserting amendments into the following sections:
 - a. Chapter Two, Table 2-1: "Identified Uses of Inland Surface Waters"
 - b. Chapter Four, section IX (Total Maximum Daily Loads).
4. The Central Coast Water Board has determined that the shellfish harvesting beneficial use designation should be removed from the Soquel Lagoon.
5. The proposed removal of the shellfish harvesting beneficial use is based on the results of a Use Attainability Analysis (UAA) for shell fishing in the Soquel Lagoon. Central Coast Water Board staff (staff) developed the UAA in 2004 and 2005 to determine the historic, actual, and potential shell fishing activities in Soquel Lagoon. The UAA is necessary to conform to Title 40 of the Code of Federal Regulations (CFR), §131.10(j) because the action involves a designated use specified in section 101(a) (2) of the Clean Water Act. The proposed amendment and the UAA only addresses the fishable goal (protection and propagation of fish, shellfish, and wildlife) as it pertains to shellfish harvesting and does not address other fishable goals or the swimmable goal included in the water contact recreation designation contained in section 101(a)(2) of the Clean Water Act. The fishable goal of the Clean Water Act is also protected under other beneficial uses (including cold freshwater habitat) designated in the Basin Plan for the Soquel Lagoon.

001179

081100

6. The federal regulations at 40 CFR 131.10(g) allow the Central Coast Water Board to remove a designated use, which is not an “existing” use if the state can demonstrate that achieving the use is not feasible based on the factors set forth in 40 CFR 131.10(g). Shellfish harvesting is not an “existing use” as that term is defined in 40 CFR 131.3 because shellfish harvesting use has not been attained in the water body on or after November 28, 1975. Factors for removing a designated use are described in 40 CFR 131.10(g). Based on the results of the UAA, three factors preclude attainment of shellfish harvesting beneficial use in Soquel Lagoon. These factors are as follows:
 - a. Natural, ephemeral, intermittent, or low flow conditions or water levels prevent the attainment of the beneficial use.
 - b. Diversions, and other types of hydrologic modifications preclude the attainment of the beneficial use, and it is not feasible to restore the water body to its original condition or to operate such modification in a way that would result in the attainment of the use.
 - c. Physical conditions related to the natural features of the water body, including lack of a proper substrate, preclude attainment of aquatic life protection uses.
7. Pursuant to section 13241 of the California Water Code, the Central Coast Water Board considered several factors in recommending the removal of the shellfish harvesting beneficial use in the Soquel Lagoon. The Central Coast Water Board concluded that shellfish harvesting is not a past, present, or probable future beneficial use of the Soquel Lagoon. Additionally, the Central Coast Water Board concluded the following:
 - a. Environmental characteristics of the waterbodies will not be affected by the removal of the shellfish harvesting beneficial use.
 - b. Water quality conditions that could reasonably be achieved through the coordinated control of all factors that affect water quality in the area will not be affected by the removal of the shellfish harvesting beneficial use.
 - c. Removal of the shellfish harvesting beneficial use does not impose any costs other than the Central Coast Water Board’s costs of preparing the amendment.
 - d. The need for developing housing within the region is not relevant.
 - e. The need to develop and use recycled water is not relevant.
8. The Central Coast Water Board’s goal in removing the shellfish harvesting beneficial use from the Soquel Lagoon is to assign water quality objectives for indicators of pathogenic organisms that accurately reflect the existing and potential uses of Soquel Lagoon, i.e., those for water-contact and non-contact recreation. For this purpose, “existing uses” mean those uses actually attained on or after November 28, 1975 (40 CFR §131.3(e)).
9. On May 20, 2004, the State Water Resources Control Board (State Board) adopted the *Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program* (NPS Policy). This policy requires the Regional Water Quality Control Boards to regulate all nonpoint sources of pollution using the administrative permitting authorities provided by the Porter-Cologne Water Quality Control Act. The NPS Policy requires the Regional Water Quality Control Boards to regulate nonpoint source discharges with Waste Discharge Requirements, Waivers of Waste Discharge Requirements, or Basin Plan prohibitions.
10. Clean Water Act section 303(d) requires states to identify and prepare a list of water bodies that do not meet water quality standards. Water bodies on the 303(d) list are often referred to as listed water bodies, or impaired waters. Clean Water Act section 303(d) requires states to establish TMDLs for listed waterbodies.
11. Soquel Lagoon is listed as impaired due to pathogens. The Soquel Lagoon is not attaining the Basin Plan water quality objective for fecal coliform, and is not attaining the United States Environmental Protection Agency (USEPA) recommended water quality criteria for

001180

Escherichia coli (*E. coli*). Soquel Creek and Noble Gulch are not listed on the Clean Water Act section 303(d) list of impaired waters, but these water bodies are also not meeting the Basin Plan water quality objective for fecal coliform or the USEPA recommended criteria for *E. coli*. TMDLs and associated allocations are being established for Soquel Lagoon, Soquel Creek and Noble Gulch.

12. The Central Coast Water Board's goal for establishing TMDLs in Soquel Lagoon, Soquel Creek, and Noble Gulch is to rectify the impairment due to pathogens, thereby providing support for the beneficial uses of contact and non-contact water recreation.
13. The Soquel Lagoon drains a watershed area of approximately 27,188 acres. Soquel Creek is a tributary to Soquel Lagoon, and Noble Gulch is a tributary to Soquel Creek. Soquel Lagoon drains into northern Monterey Bay.
14. The elements of a TMDL are described in 40 CFR 130.2 and 130.7, section 303(d) of the Clean Water Act, and USEPA guidance documents. A TMDL is defined as "the sum of individual waste load allocations for point sources and load allocations for nonpoint sources and natural background" (40 CFR 130.2). The Central Coast Water Board has determined that the TMDLs for Soquel Lagoon, Soquel Creek, and Noble Gulch are set at levels necessary to attain and maintain the applicable numeric water quality objectives, taking into account seasonal variations and any lack of knowledge concerning the relationship between effluent limitations and water quality (40 CFR 130.7 (c) (1)). The regulations in 40 CFR 130.7 also state that TMDLs shall take into account critical conditions for stream flow, loading, and water quality parameters. TMDLs are often expressed as a mass load of the pollutant but can be expressed as a unit of concentration if appropriate (40 CFR 130.2(i)). Expressing these TMDLs as units of concentration is appropriate because an existing concentration-based water quality objective is used as the basis for the TMDL numeric target.
15. Upon establishment of TMDLs by the State or USEPA, the State is required to incorporate the TMDLs, along with appropriate implementation measures, into the State Water Quality Management Plan (40 CFR 130.6 (c)(1) and 130.7 and California Water Code sections 13050(j) and 13242). The Basin Plan and applicable statewide plans serve as the State Water Quality Management Plan governing the watersheds under the jurisdiction of the Central Coast Water Board.
16. Pursuant to the California Water Code section 13241, the Central Coast Water Board considered several factors in developing these Basin Plan amendments. The Central Coast Water Board concludes the following:
 - a. Removal of the shellfish harvesting beneficial use and adoption of the TMDLs will protect past, present, and probable future beneficial uses.
 - b. Environmental characteristics of the waterbody will be protected.
 - c. Improved water quality conditions can reasonably be achieved through the coordinated management of all controllable factors that affect water quality in the area, as provided in the Implementation Plan.
 - d. Costs to achieve compliance with the TMDLs are reasonable relative to the benefit of improved water quality.
 - e. The need for developing housing within the region is not relevant.
 - f. The need to develop and use recycled water is not relevant.
17. The Use Attainability Analysis is the scientific justification for the proposed removal of the shellfish harvesting beneficial use from the Soquel Lagoon. Central Coast Water Board staff submitted a Use Attainability Analysis to an external scientific review panel in March 2006 as required by Health & Safety Code section 57004. Central Coast Water Board staff also

001181

submitted the Project Report for the TMDLs to an external scientific review panel in July 2007. Staff received comments from the scientific review panel. Central Coast Water Board staff edited the Project Report or provided a written response that explained the basis for not incorporating the comments, or the comments did not result in any changes to the proposed Basin Plan Amendments. The scientific portions of the proposed removal of the shellfish harvesting beneficial use, the TMDLs and implementation plan, are based on sound scientific knowledge, methods, and practices in accordance with Health & Safety Code section 57004.

18. Central Coast Water Board staff implemented a process to inform interested persons and the public about the TMDLs and the removal of the shellfish harvesting beneficial use from the Soquel Lagoon. Efforts of Central Coast Water Board staff to inform the public and solicit comment included a public meeting and telephone conversations with interested parties. Public notification of the amendment to the Basin Plan occurred for a 45-day period preceding the Central Coast Water Board hearing. Notice of the public hearing was given by advertising in newspapers of general circulation within the Region and by mailing a copy of the notice to all persons requesting such notice and applicable government agencies. Central Coast Water Board staff responded to oral and written comments received from the public.
19. The Central Coast Water Board considered costs of implementing measures to comply with the removal of the shellfish harvesting beneficial use designation and achieving the TMDLs. The costs will be incurred by identified responsible parties. These costs are reasonable relative to the water quality benefits to be derived from the two amendments. All public comments were considered.
20. Anti-Degradation — The removal of the shellfish harvesting beneficial use from the Soquel Lagoon and the adoption of the TMDLs for Soquel Creek Lagoon, Soquel Creek, and Noble Gulch, are consistent with the provisions of State Board Resolution No. 68-16, "Statement of Policy with Respect to Maintaining High Quality of Waters in California" and 40 CFR 131.12. Adoption of these TMDLs will result in improved water quality throughout the region and maintain the level of water quality necessary to protect present and potential beneficial uses. As concluded in the Use Attainability Analysis, shellfish harvesting is not an existing use, so removal of the beneficial use from the Basin Plan will not result in degradation of water quality.
21. The Central Coast Water Board concurs with the Use Attainability Analysis and the analysis contained in the Final Project Report, the California Environmental Quality Act "Substitute Environmental Document" for the Basin Plan Amendments, including the CEQA Checklist, the staff report and the responses to comments, and finds that these analyses comply with the requirements of the State Board's certified regulatory CEQA process, as set forth in California Code of Regulations, Title 23, section 3775 et seq. Furthermore, the Central Coast Water Board finds that these analyses fulfill the Central Coast Water Board's obligations attendant with the adoption of regulations "requiring the installation of pollution control equipment, or a performance standard or treatment requirement," as set forth in section 21159 of the Public Resources Code.
22. The Central Coast Water Board will request that the State Water Board approve the Basin Plan amendment incorporating the TMDLs for pathogens in the Soquel Lagoon, Soquel Creek, and Noble Gulch, and the removal the shellfish harvesting beneficial use for Soquel Lagoon. The TMDLs and Implementation Plan for the TMDLs will become effective upon approval by the California Office of Administrative Law. Removal of the shellfish harvesting beneficial use will become effective upon approval by USEPA.

001182

181100

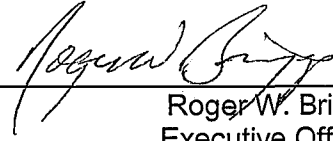

23. The amendment to the Basin Plan will result in no potential adverse effect, either individually or cumulatively, on wildlife and is, therefore, exempt from fee payments to the Department of Fish and Game under the California Fish and Game Code.
24. On March 21, 2008 in Salinas, California, the Central Coast Water Board held a public hearing and heard and considered all public comments and evidence in the record.
25. The regulatory action meets the "Necessity" standard of the Administrative Procedures Act, Government Code, section 11353, subdivision (b). As specified in Finding-15, federal regulations require that TMDLs be incorporated into the Water Quality Management Plan. The Central Coast Water Board's Basin Plan is the Central Coast Water Board's component of the Water Quality Management Plan, and the Basin Plan is how the Central Coast Water Board takes quasi-legislative, planning actions. Moreover, the TMDL is a program of implementation for existing water quality objectives, and is, therefore, appropriately a component of the Basin Plan under California Water Code section 13242. The necessity of developing a TMDL is established in the TMDL staff report, the Clean Water Act section 303(d) list, and the data contained in the administrative record documenting the pathogen impairments of the Soquel Lagoon, Soquel Creek, and Noble Gulch.
26. The proposed amendment meets the "Necessity" standard of the Administrative Procedure Act, Government Code, section 11352, subdivision (b).

THEREFORE, be it resolved that:

1. Pursuant to sections 13240, 13241, 13242, 13243, and 13244 of the California Water Code, the Central Coast Water Board, after considering the entire record, including the oral testimony at the hearing, hereby adopts the amendment in "Attachment-Proposed Basin Plan Amendments".
2. The Executive Officer is directed to forward copies of the Basin Plan amendment to the State Board in accordance with the requirements of section 13245 of the California Water Code.
3. The Central Coast Water Board requests that the State Board approve the Basin Plan amendments in accordance with the requirements of sections 13245 and 13246 of the California Water Code and forward them to the California Office of Administrative Law and the USEPA.
4. The Executive Officer is authorized to sign a Certificate of Fee Exemption or transmit payment of the applicable fee as may be required to the Resources Agency.
5. If, during its approval process, Central Coast Water Board staff, State Board staff, the State Board or Office of Administrative Law determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.
6. The environmental documents prepared by the Central Coast Water Board staff pursuant to Public Resources Code 21080.5 are hereby certified.

001183

I, Roger W. Briggs, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of the resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region, on March 21, 2008.

Roger W. Briggs
Executive Officer

RESOLUTION NO. R3-2008-0002

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENTS

Revise the September 8, 1994 Basin Plan as follows:

AMENDMENT NO. 1.

Amend Chapter 2, Table 2-1. Identified Uses of Inland Surface Waters

Waterbody Names	MUN	AGR	PRO	IND	GWR	REC1	REC2	WILD	COLD	WARM	MIGR	SPWN	BIOL	RARE	EST	FRESH	NAV	POW	COMM	AQUA	SAL	SHELL	
Soquel Lagoon						X	X	X	X		X	X		X	X				X				X

001185

AMENDMENT NO. 2. ADOPT THE TOTAL MAXIMUM DAILY LOADS FOR PATHOGENS IN SOQUEL LAGOON, SOQUEL CREEK, AND NOBLE GULCH

Add the following to Chapter 4 after IX. J.:

IX. K. TOTAL MAXIMUM DAILY LOADS FOR PATHOGENS IN SOQUEL LAGOON, SOQUEL CREEK, AND NOBLE GULCH

The Regional Water Quality Control Board adopted these TMDLs on March 21, 2008. These TMDLs were approved by:

The State Water Resources Control Board on _____

The California Office of Administrative Law on _____
(Effective date)

The U.S. Environmental Protection Agency on _____
(Effective date)

Problem Statement

The beneficial use of water contact recreation is not protected in the impaired reaches of Soquel Lagoon, Soquel Creek, and Noble Gulch because fecal coliform concentrations exceed water quality objectives protecting this beneficial use. The impaired reaches are:

- 1) Soquel Lagoon and Soquel Creek: beginning from the mouth of Soquel Lagoon, upstream and along Soquel Creek to the bridge at Porter Street.
- 2) All reaches of Noble Gulch.

Numeric Targets for Soquel Lagoon, Soquel Creek and Noble Gulch

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

Source Analysis

The controllable sources of fecal coliform contributing to impairment in Soquel Lagoon, Soquel Creek, and Noble Gulch are, in decreasing order of contribution:

1. Storm drain discharges to municipally owned and operated storm sewer systems (MS4s) required to be covered by an NPDES permit (including but not limited to discharges from fecal material from domesticated animals and humans).
2. Sanitary sewer collection system spills and leaks (including but not limited to discharges from private laterals connected to municipal sanitary sewer collection systems).
3. Domesticated animal waste discharges in areas that do not drain to MS4s (including but not limited to farm animals, livestock and pets).
4. Homeless person/encampment discharges in areas that do not drain to MS4s.

081100

001186

Total Maximum Daily Load (TMDL)

The TMDL for all impaired waters of Soquel Lagoon, Soquel Creek, and Noble Gulch is a concentration based TMDL applicable to each day of all seasons and is equal to the following:

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

Allocations and Responsible Parties

Allocations are assigned to the waterbody and responsible party listed in Table IX K-1.

281100

001187

Table IX K-1. Allocations to Responsible Parties

<u>Waste Load Allocations</u>		
<u>Waterbody Subject to Allocation</u>	<u>Responsible Party (Source)</u>	<u>Receiving Water Fecal Coliform (MPN/100mL)</u>
<u>Soquel Lagoon</u> ¹	<u>City of Capitola</u> (Storm drain discharges)	<u>Allocation-1</u>
<u>Soquel Creek</u> ² <u>Noble Gulch</u> ³	<u>County of Santa Cruz and City of Capitola</u> (Storm drain discharges)	<u>Allocation-1</u>
<u>Load Allocations</u>		
<u>Waterbody Subject to Allocation</u>	<u>Responsible Party (Source)</u>	<u>Receiving Water Fecal Coliform (MPN/100mL)</u>
<u>Soquel Lagoon</u> ¹ <u>Soquel Creek</u> ² <u>Noble Gulch</u> ³	<u>Santa Cruz County Sanitation District</u> (Sanitary sewer collection system spills and leaks)	<u>Allocation-1</u>
<u>Soquel Lagoon</u> ¹	<u>Owners of private sewer laterals</u> (Private laterals connected to municipal sanitary sewer collection system)	<u>Allocation-1</u>
<u>Soquel Lagoon</u> ¹ <u>Soquel Creek</u> ²	<u>Owners and operators of land used for/containing pets</u> (Domesticated animals not regulated by WQ Order No. 2003-0005-DWQ [Storm Water General Permit]. Including but not limited to dogs, cats, or any other animals in the care of owners/operators)	<u>Allocation-1</u>
<u>Noble Gulch</u> ³	<u>Owners and operators of land used for/containing domesticated animals</u> (Domesticated animals not regulated by WQ Order No. 2003-0005-DWQ [Storm Water General Permit]. Including, but not limited to, farm animals, livestock, and pets)	<u>Allocation-1</u>
<u>Soquel Lagoon</u> ¹ <u>Soquel Creek</u> ² <u>Noble Gulch</u> ³	<u>Owners/operators of land that include homeless persons/encampments</u> (Homeless person/encampment discharges not regulated by WQ Order No. 2003-0005-DWQ [General permit for storm water])	<u>Allocation-1</u>
<u>Soquel Lagoon</u> ¹ <u>Soquel Creek</u> ² <u>Noble Gulch</u> ³	<u>No responsible party</u> (Natural sources)	<u>Allocation-1</u>

¹ All waters of the Soquel Lagoon

² Beginning and including the downstream most reach of Soquel Creek, up to and including Soquel Creek at the bridge crossing at Porter Street.

³ All reaches of Noble Gulch.

781100

001188

Allocation-1: Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

The parties responsible for the allocations to controllable sources are not responsible for the allocation to natural sources.

The TMDL is achieved when the numeric target is consistently met in the impaired waters of Soquel Lagoon, Soquel Creek, and Noble Gulch.

Margin of Safety

A margin of safety is incorporated implicitly in the TMDLs through conservative assumptions.

Implementation

STORM DRAIN DISCHARGES:

Enrollees of the State Water Resources Control Board's General Permit for the Discharges of Storm Water from Small Municipal Separate Storm Sewer Systems (General Permit for storm water discharges) must control discharges of pathogens to and in storm drains (currently NPDES No. S000004).

The County of Santa Cruz and City of Capitola must control discharges of pathogens to and in storm drains when enrolled in the General Permit for stormwater discharges.

Within one year following approval by the Office of Administrative Law (OAL) of these TMDLs, or if enrolled in the General Permit for stormwater discharge, then when the next annual report is due, or to meet any other Water Board-issued storm water requirements (e.g. when the State General Permit for stormwater discharges is renewed), the County of Santa Cruz and City of Capitola will be required to:

1. Submit for approval a management program that identifies pathogen-specific best management practices targeting pathogen sources from:
 - a. Birds, pets, rodents and wildlife, dumpster leachate, and humans.The best management practices should include, but not be limited to: those identified in a Storm Water Management Plan (if existing or being developed), public education, participation and outreach regarding sources of pathogens in surface waters, health risks associated pathogens in surface waters, and specific actions the public can take to reduce pathogen loading into surface waters.
2. Submit for approval a fecal indicator bacteria (e.g. fecal coliform) monitoring and reporting plan. Receiving water and storm water outfall monitoring will be required.
3. Incorporate a description of implementation and monitoring activities in any existing or developing Storm Water Management Plan, and corresponding reporting, associated with a General Permit for storm water discharges.

The Executive Officer or the Central Coast Water Board will require information that demonstrates implementation of the actions described above, pursuant to applicable sections of the California

001189

001189

Water Code and/or pursuant to authorities provided in the General Permit for storm water discharges.

SANITARY SEWER COLLECTION SYSTEM SPILLS AND LEAKS:

The Santa Cruz County Sanitation District (SCCSD) must continue to implement its Collection System Management Plan, as required by Waste Discharge Requirements (WDRs) (Order No. R3-2005-0043).

Staff will continue to assess the effectiveness of the SCCSD Collection System Management Plan. Staff will utilize annual reporting associated with the SCCSD WDR, and other information, to make this assessment. If staff determines that the SCCSD is not satisfactorily implementing their Collection System Management Plan, or the Collection System Management Plan is not likely to result in the SCCSD achieving their allocation, the Executive Officer or the Central Coast Water Board may require modifications to the Collection System Management Plan (e.g. through revisions of WDRs), and/or require actions pursuant to applicable sections of the California Water Code.

Within one year following approval of these TMDLs by the California Office of Administrative Law, the Executive Officer or the Central Coast Water Board will amend the Monitoring and Reporting Program of the SCCSDs WDRs to incorporate stream monitoring for fecal coliform and reporting of such stream monitoring activities.

PRIVATE LATERALS TO THE SANITARY SEWER COLLECTION SYSTEM:

Individual owners of private laterals to sanitary sewer collection systems are responsible for maintenance of their private laterals. However, the County of Santa Cruz has the authority to require private lateral upgrades. The County of Santa Cruz may choose to implement a program to detect and require repair of leaks from private laterals. The Central Coast Water Board would consider implementation (by the County of Santa Cruz) of such a program, as proof of compliance by owners with private laterals with the Aptos-Soquel Subbasin prohibition. If the County of Santa Cruz implements such a program, the Central Coast Water Board will request and use reporting from the County of Santa Cruz to evaluate individual private lateral owner compliance with the Aptos-Soquel Subbasin prohibition.

Within one year following approval of these TMDLs by the California Office of Administrative Law, if the County of Santa Cruz does not submit an approved program to detect and repair leaks from private laterals, or if the Central Coast Water Board or Executive Officer determines that such an existing or proposed program is insufficient, then landowners with private laterals must demonstrate compliance individually with the Aptos-Soquel Subbasin prohibition.

If landowners with private laterals must demonstrate compliance individually with the Aptos-Soquel Subbasin prohibition, then within one year following approval of the TMDLs by the California Office of Administrative Law, the Executive Officer will notify owners and/or operators of land that have private lateral connections to the sanitary sewer system of the County of Santa Cruz, of the Aptos-Soquel Subbasin prohibition and conditions for compliance with the prohibition. Compliance with the Aptos-Soquel Subbasin prohibition is described in Chapter Five, section IV.B. of the Water Quality Control Plan.

DOMESTICATED ANIMALS:

081100

001190

Owners and/or operators of land used for/containing domesticated animals (including, but not limited to: horses, cattle, goats, sheep, dogs, cats, or any other animals in the care of owners/operators) in the Noble Gulch and Soquel Creek Subbasins, must comply with the Aptos-Soquel Subbasin prohibition.

Within one year following approval of the TMDLs by the California Office of Administrative Law, the Executive Officer will notify owners and/or operators of lands used for/containing domesticated animals of the Aptos-Soquel Subbasin prohibition and conditions for compliance with the prohibition, as described in Chapter Five, section IV.B. of the Water Quality Control Plan.

HOMELESS PERSON/ENCAMPMENT DISCHARGES:

Owners/operators of land that includes homeless persons/encampments in the Soquel Subbasin must comply with the Aptos-Soquel Subbasin prohibition.

Within one year following approval of the TMDLs by the California Office of Administrative Law, the Executive Officer will notify owners of lands underlying homeless persons/encampments of the Aptos-Soquel Subbasin prohibition and conditions for compliance with the prohibition, as described in Chapter Five, section IV.B. of the Water Quality Control Plan.

Tracking and Evaluation

Every three years beginning three years after TMDLs are approved by the California Office of Administrative Law, Central Coast Water Board staff will perform a review of implementation actions and monitoring results. Central Coast Water Board staff will use annual reports, nonpoint source pollution control implementation programs, and other available information, to review implementation progress toward achieving the allocations and the numeric target.

Central Coast Water Board staff may conclude that ongoing implementation efforts are insufficient to ultimately achieve the allocations and numeric target. If staff makes this determination, staff will recommend that additional reporting, monitoring, or implementation efforts be required either through approval by the Executive Officer or by the Central Coast Water Board. Central Coast Water Board staff may conclude, at the time of review, that they expect implementation efforts to result in achieving the allocations and numeric target. In that case, staff will recommend that existing and anticipated implementation efforts should continue.

Responsible parties will monitor for at least three years, at which time Central Coast Water Board staff will determine the need for continuing or otherwise modifying the monitoring requirements. Responsible parties may also demonstrate that controllable sources of pathogens are not contributing to exceedance of water quality objectives in receiving waters. If this is the case, staff may propose a re-evaluation of the numeric target and allocations. For example, staff may propose a site-specific objective to be approved by the Central Coast Water Board. The site-specific objective would be based on evidence that natural or background sources alone were the cause of exceedances of the Basin Plan water quality objective for pathogen indicator organisms.

Three-year reviews will continue until the TMDLs are achieved. The target date to achieve the TMDLs is 13 years after the date of approval by the California Office of Administrative Law.

001191

101100

**CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, California**

**RESOLUTION NO. R3-2008-0001
March 20-21, 2008**

**Amending The Water Quality Control Plan for The Central Coast Basin to
(1) Remove The Shellfish Harvesting Beneficial Use for San Lorenzo River Estuary, (2)
Modify San Lorenzo River Subbasin and Aptos-Soquel Subbasin Prohibition, and (3)
Adopt The Total Maximum Daily Loads For Pathogens in San Lorenzo River Estuary, San
Lorenzo River, Branciforte Creek, Camp Evers Creek, Carbonera Creek, and Lompico
Creek**

The Regional Water Quality Control Board, Central Coast Region (Central Coast Water Board) finds:

1. The Central Coast Water Board adopted the Water Quality Control Plan for the Central Coastal Basin (Basin Plan), on September 8, 1994. The Basin Plan includes beneficial use designations, water quality objectives, prohibitions, implementation plans for point source and nonpoint source pollution discharges, and statewide plans and policies.
2. The Central Coast Water Board periodically revises and amends the Basin Plan. The Central Coast Water Board has determined the Basin Plan requires further revision and amendment to (a) remove the shellfish harvesting (SHELL) beneficial use for San Lorenzo River Estuary (also known as San Lorenzo River Lagoon), (b) modify an existing discharge prohibition for the San Lorenzo River Subbasin and Aptos-Soquel Subbasin, and (c) incorporate Total Maximum Daily Loads (TMDLs) and Implementation Plan for pathogens in San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Camp Evers Creek, Carbonera Creek, and Lompico Creek. The term San Lorenzo River Watershed elsewhere in this document refers only to these waterbodies.
3. The Central Coast Water Board proposes to amend the Basin Plan by inserting amendments into the following sections (listed in order of Basin Plan contents):
 - a. Chapter Two, Table 2-1: "Identified Uses of Inland Surface Waters"
 - b. Chapter Four, section IX (Total Maximum Daily Loads), and
 - c. Chapter Five, section IV.B. (Discharge Prohibitions Inland Waters).
4. The Central Coast Water Board has determined that the SHELL beneficial use designation should be removed from the San Lorenzo River Estuary.
5. The federal regulations at 40 CFR 131.10(g) allow the Central Coast Water Board to remove a designated use, which is not an "existing" use, if the state can demonstrate that achieving the use is not feasible based on the factors set forth in 40 CFR 131.10(g). Shellfish harvesting is not an "existing use" as that term is defined in 40 CFR 131.3 because shellfish harvesting use has not been attained in the water body on or after November 28, 1975. The proposed removal of the SHELL beneficial use is based on the results of a Use Attainability Analysis (UAA) in the San Lorenzo River Estuary. Central Coast Water Board staff (staff) developed the UAA in 2004 and 2005 to determine the historic, actual, and potential shell

fishing activities in the San Lorenzo River Estuary. The UAA is necessary to conform to Title 40 of the Code of Federal Regulations (CFR), §131.10(j) because the action involves a designated use specified in Clean Water Act section 101(a) (2). The proposed amendment and the UAA only addresses the fishable goal ("protection and propagation of fish, shellfish, and wildlife") as it pertains to shellfish harvesting and does not address other fishable goals or the swimmable goal included in the water contact recreation designation contained in section 101(a)(2) of the Clean Water Act. The fishable goal of the Clean Water Act is also protected under other beneficial uses (including cold fresh water habitat) designated in the Basin Plan for the San Lorenzo River Estuary.

6. Factors for allowing a state to remove a designated use are listed in section 40 CFR 131.10(g). Based on the UAA, three factors preclude attainment of the SHELL beneficial use in San Lorenzo River Estuary. These factors are as follows:
 - a. Natural, ephemeral, intermittent, or low flow conditions or water levels prevent the attainment of the beneficial use.
 - b. Diversions, and other types of hydrologic modifications preclude the attainment of the beneficial use, and it is not feasible to restore the water body to its original condition or to operate such modification in a way that would result in the attainment of the use.
 - c. Physical conditions related to the natural features of the water body, including lack of a proper substrate, preclude attainment of aquatic life protection uses.
7. Pursuant to the California Water Code section 13241, the Central Coast Water Board considered several factors in deciding to remove the SHELL beneficial use in the San Lorenzo River Estuary. The Central Coast Water Board concluded that shellfish harvesting is not a past, present, or probable future beneficial use of the San Lorenzo River Estuary. Additionally, the Central Coast Water Board concluded the following:
 - a. Environmental characteristics of the waterbodies will not be affected by the removal of the beneficial use.
 - b. Water quality conditions that could reasonably be achieved through the coordinated control of all factors that affect water quality in the area will not be affected by the removal of the beneficial use.
 - c. Removal of the SHELL beneficial use does not impose any costs other than the Central Coast Water Board's costs of preparing the amendment.
 - d. The need for developing housing within the region is not relevant.
 - e. The need to develop and use recycled water is not relevant.
8. The Central Coast Water Board's goal in removing the SHELL beneficial use from the San Lorenzo River Estuary is to assign pathogen indicator organism water quality objectives that accurately reflect the existing and potential uses of the San Lorenzo River Estuary, i.e., those for water-contact and non-contact recreation. For this purpose, "existing uses" mean those uses actually attained on or after November 28, 1975 (40 CFR §131.3(e)).
9. The Basin Plan contains a prohibition adopted by the Central Coast Water Board in 1975. The prohibition states, "Waste discharges to the following inland waters are prohibited:...All surface waters within the San Lorenzo River, Aptos-Soquel, and San Antonio Creek Subbasins and all water contact recreation areas except where benefits can be realized from direct discharge of reclaimed water." The original prohibition was written to control point source discharges from degrading water quality. To serve as an effective prohibition for control of nonpoint source pollution, the prohibition must be modified (modified prohibition).
10. On May 20, 2004, the State Water Resources Control Board (State Board) adopted the *Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program* (NPS Policy). This policy requires Regional Water Quality Control Boards to regulate all nonpoint

sources of pollution using the administrative permitting authorities provided by the California Water Code (codified in Division 7 of the California Water Code). This policy requires Regional Water Quality Control Boards to regulate nonpoint source pollution discharges with Waste Discharge Requirements, Waivers of Waste Discharge Requirements, or Basin Plan Prohibitions.

11. Clean Water Act section 303(d) requires states to identify and prepare a list of water bodies that do not meet water quality standards. Water bodies on the 303(d) list are referred to as listed water bodies, or impaired waters. Clean Water Act section 303(d) requires states to establish TMDLs for listed waterbodies.
12. The San Lorenzo River Estuary, San Lorenzo River, Carbonera Creek, and Lompico Creek are listed on the Clean Water Act 303(d) list of impaired waters as impaired due to non-attainment of existing Basin Plan water quality objectives and United States Environmental Protection Agency (USEPA) water quality criteria for pathogens. Branciforte Creek and Camp Evers Creek are not on the Clean Water Act section 303(d) list of impaired waters, but these waters are also impaired.
13. The Central Coast Water Board's goal for establishing TMDLs in the San Lorenzo River Watershed is to rectify the impairment due to pathogens, thereby providing support for the beneficial uses of contact and non-contact water recreation.
14. San Lorenzo River Estuary (also known as the San Lorenzo River Lagoon) is the receiving water for approximately 87,800 acres of land and flows into northern Monterey Bay. Camp Evers Creek flows into Carbonera Creek. Carbonera Creek flows into Branciforte Creek, and Branciforte Creek flows into San Lorenzo River Estuary. Lompico Creek flows into San Lorenzo River, and San Lorenzo River flows into San Lorenzo River Estuary.
15. The elements of a TMDL are described in 40 CFR 130.2 and 130.7, section 303(d) of the Clean Water Act, and USEPA guidance documents. A TMDL is defined as "the sum of individual waste load allocations for point sources and load allocations for nonpoint sources and natural background" (40 CFR 130.2). The Central Coast Water Board has determined that the San Lorenzo River Watershed TMDLs are set at levels necessary to attain and maintain the applicable numeric water quality objectives taking into account seasonal variations and any lack of knowledge concerning the relationship between effluent limitations and water quality (40 CFR 130.7 (c) (1)). The regulations in 40 CFR 130.7 also state that TMDLs shall take into account critical conditions for stream flow, loading, and water quality parameters. TMDLs are often expressed as a mass load of the pollutant but can be expressed as a unit of concentration if appropriate (40 CFR 130.2(i)). Expressing these TMDLs as units of concentration is appropriate because an existing concentration-based water quality objective is used as the basis for the TMDL numeric target.
16. Upon establishment of TMDLs by the State or USEPA, the State is required to incorporate the TMDLs, along with appropriate implementation measures, into the State Water Quality Management Plan (40 CFR 130.6(c)(1) and 130.7; and California Water Code sections 13050(j) and 13242). The Basin Plan and applicable statewide plans serve as the State Water Quality Management Plan governing the watersheds under the jurisdiction of the Central Coast Water Board.
17. The Central Coast Water Board may prohibit certain types of waste discharge pursuant to California Water Code section 13243. The implementation plan for the TMDLs for the San Lorenzo River Watershed requires compliance with a modified prohibition (proposed Amendment No. 2 contained herein) for nonpoint source pollution discharges in the San

Lorenzo River Subbasin. Supporting documentation for modifying the San Lorenzo River Subbasin and Aptos-Soquel Subbasin prohibition is provided in the Final Project Reports for (1) Total Maximum Daily Load for Pathogens in San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Camp Evers Creek, Carbonera Creek, and Lompico Creek, (2) Total Maximum Daily Load for Pathogens in Aptos Creek, Valencia Creek, and Trout Gulch, and (3) Total Maximum Daily Load for Pathogens in Soquel Lagoon, Soquel Creek, and Noble Gulch. Consistent with California Water Code section 13244, the Central Coast Water Board complied with public notice and hearing requirements for the proposed modified prohibition.

18. Pursuant to the California Water Code section 13241, the Central Coast Water Board considered several factors in developing these Basin Plan amendments. The Central Coast Water Board concludes the following:
 - a. The removed shellfish harvesting beneficial use, adopted TMDLs, and modified prohibition will protect past, present, or probable future beneficial uses.
 - b. Environmental characteristics of the waterbody will be protected.
 - c. Improved water quality conditions can reasonably be achieved through the coordinated management of all factors that affect water quality in the area, as provided in the Implementation Plan.
 - d. Costs to achieve compliance with the modified prohibition are reasonable relative to the benefit of improved water quality.
 - e. The need for developing housing within the region is not relevant.
 - f. The need to develop and use recycled water is not relevant.
19. Central Coast Water Board staff submitted a Use Attainability Analysis to an external scientific review panel in March 2006 as required by Health & Safety Code section 57004. Central Coast Water Board staff also submitted the proposed modified prohibition and the Project Report for the TMDLs to an external scientific review panel in July 2007. The staff received comments from the panel. Water Board staff edited the Project Report or provided a written response that explained the basis for not incorporating the comments, or the comments did not result in any changes to the proposed Basin Plan Amendments. The scientific portions of the proposed removal of the SHELL beneficial use, the modified prohibition, the TMDLs and implementation plan are based on sound scientific knowledge, methods, and practices in accordance with section Health & Safety Code section 57004.
20. Central Coast Water Board staff implemented a process to inform interested persons and the public about the removal of the SHELL beneficial use designation for the San Lorenzo River Estuary, the modified prohibition, and the TMDLs. Central Coast Water Board staff's efforts to inform the public and solicit comment included a public meeting and telephone conversations with interested parties. Public notification of the amendment to the Basin Plan occurred for a 45-day period preceding the Central Coast Water Board hearing. Notice of the public hearing was given by advertising in newspapers of general circulation within the Region and by mailing a copy of the notice to all persons requesting such notice and applicable government agencies. Central Coast Water Board staff responded to oral and written comments received from the public. All public comments were considered.
21. The Central Coast Water Board considered costs of implementing measures to comply with the removal of the SHELL beneficial use designation, comply with the modified prohibition and the TMDLs. The costs will be incurred by identified responsible parties. These costs are reasonable relative to the water quality benefits to be derived from the three amendments.
22. Anti-Degradation — The removal of the shellfish harvesting beneficial use from the San Lorenzo River Estuary, the modification of the prohibition for the San Lorenzo River Subbasin

and Aptos-Soquel Subbasin, and the adoption of these TMDLs for the San Lorenzo River Watershed are consistent with the provisions of State Board Resolution No. 68-16, "Statement of Policy with Respect to Maintaining High Quality of Waters in California" and 40 CFR 131.12. Modification of the existing prohibition and adoption of these TMDLs will result in improved water quality throughout the region and maintain the level of water quality necessary to protect present and potential beneficial uses. As concluded in the Use Attainability Analysis, shellfish harvesting is not an existing use, and removal of the beneficial use from the Basin Plan will not result in degradation of water quality.

23. The Central Coast Water Board concurs with the Use Attainability Analysis, rationale for modifying the prohibition, and the analysis contained in the Final Project Report, the California Environmental Quality Act "Substitute Environmental Document" for the Basin Plan Amendments (including the CEQA Checklist), the staff report, responses to comments, and finds that these analyses comply with the requirements of the State Board's certified regulatory CEQA process, as set forth in California Code of Regulations, Title 23, section 3775 et seq. Furthermore, the Central Coast Water Board finds that these analyses fulfill the Central Coast Water Board's obligations attendant with the adoption of regulations "requiring the installation of pollution control equipment, or a performance standard or treatment requirement," as set forth in section 21159 of the Public Resources Code.
24. The Central Coast Water Board will request that the State Water Board approve the Basin Plan amendment incorporating the removal of the SHELL beneficial use for San Lorenzo River Estuary, the modified prohibition and the TMDLs for pathogens for the San Lorenzo River Watershed. The TMDLs, Implementation Plan and modified prohibition will become effective upon approval by the California Office of Administrative Law. The removal of the SHELL beneficial use will become effective upon approval by USEPA.
25. The amendment to the Basin Plan will result in no potential adverse effect, either individually or cumulatively, on wildlife and is, therefore, exempt from fee payments to the Department of Fish and Game under the California Fish and Game Code.
26. On March 21, 2008 in Salinas, California, the Central Coast Water Board held a public hearing and heard and considered all public comments and evidence in the record.
27. The regulatory action meets the "Necessity" standard of the Administrative Procedures Act, Government Code, section 11353, subdivision (b). As specified in Finding-16, federal regulations require that TMDLs be incorporated into the Water Quality Management Plan. The Central Coast Water Board's Basin Plan is the Central Coast Water Board's component of the Water Quality Management Plan, and the Basin Plan is how the Central Coast Water Board takes quasi-legislative, planning actions. Moreover, the TMDL is a program of implementation for existing water quality objectives, and is, therefore, appropriately a component of the Basin Plan under the California Water Code, section 13242. The necessity of developing a TMDL is established in the TMDL staff report, the Clean Water Act section 303(d) list, and the data contained in the administrative record documenting the pathogen impairments of the San Lorenzo River Watershed.
28. The proposed amendment meets the "Necessity" standard of the Administrative Procedure Act, Government Code, section 11352, subdivision (b).

THEREFORE, be it resolved that:

1. Pursuant to sections 13240, 13241, 13242, 13243, and 13244 of the California Water Code, the Central Coast Water Board, after considering the entire record, including the oral

testimony at the hearing, hereby adopts the amendment in "Attachment-Proposed Basin Plan Amendments".

2. The Executive Officer is directed to forward copies of the Basin Plan amendment to the State Board in accordance with the requirements of section 13245 of the California Water Code.
3. The Central Coast Water Board requests that the State Board approve the Basin Plan amendments in accordance with the requirements of sections 13245 and 13246 of the California Water Code and forward them to the California Office of Administrative Law and the USEPA.
4. The Executive Officer is authorized to sign a Certificate of Fee Exemption or transmit payment of the applicable fee as may be required to the Resources Agency.
5. If, during its approval process, Central Coast Water Board staff, State Board staff, the State Board or Office of Administrative Law determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.
6. The environmental documents prepared by the Central Coast Water Board staff pursuant to Public Resources Code 21080.5 are hereby certified.

I, Roger W. Briggs, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of the resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region, on March 21, 2008.

Roger W. Briggs
Executive Officer

RESOLUTION NO. R3-2008-0001

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENTS

Revise the September 8, 1994 Basin Plan as follows:

AMENDMENT NO. 1.

Amend Chapter 2, Table 2-1. Identified Uses of Inland Surface Waters

Waterbody Names	MUN	AGR	PRO	IND	GWR	REC1	REC2	WILD	COLD	WARM	MIGR	SPWN	BIOL	RARE	EST	FRESH	NAV	POW	COMM	AQUA	SAL	SHELL	
San Lorenzo River Estuary						X	X	X	X		X	X	X	X	X				X				X

AMENDMENT NO. 2. Revise the September 8, 1994 Basin Plan, Chapter Five, as follows:

Amend Chapter Five, section IV.B. as follows:

Waste discharges to the following inland waters are prohibited:...(2) All surface waters within the San Lorenzo River, Aptos-Soquel, and San Antonio Creek Subbasins and all water contact recreation areas except where benefits can be realized from direct discharge of reclaimed water.

Owners and/or operators of lands used for/containing non-regulated activities and/or infrastructure that could discharge or contain a discharge of human waste (including, but not limited to homeless persons/encampments, private laterals to public sewage collection systems, or any other activity or infrastructure in the care of said owners/operators), and owners and/or operators of land used for/containing domesticated animals (including, but not limited to: horses, cattle, goats, sheep, dogs, cats, or any other animals in the care of said owners/operators), in the San Lorenzo River Subbasin and Aptos-Soquel Subbasin must comply with this prohibition. However, this prohibition does not apply to said owners and/or operators if they:

1. Submit documentation demonstrating, to the satisfaction of the Executive Officer, that there are no discharges of, or containing, fecal sources by humans and/or domesticated animals into waters of the San Lorenzo River Subbasin or Aptos-Soquel Subbasin, or
2. Submit a nonpoint source pollution control implementation program for approval by the Executive Officer that is consistent with the *Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program, May 20, 2004*; such a program must include management practices that control pollution discharges, monitoring and reporting to Central Coast Regional Water Quality Control Board, or
3. Comply with Waste Discharge Requirements or an NPDES permit, or a conditional waiver of waste discharge requirements that explicitly addresses compliance with the:
 - a. Total Maximum Daily Loads for Pathogens in San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Camp Evers Creek, Carbonera Creek and Lompico Creek (R3-2008-0001)
 - b. Total Maximum Daily Loads for Pathogens in Soquel Lagoon, Soquel Creek, and Noble Gulch (R3-2008-0002)
 - c. Total Maximum Daily Loads for Pathogens in Aptos Creek, Valencia Creek, and Trout Gulch (R3-2008-0003).

This amendment to the prohibition takes effect three years after the Total Maximum Daily Loads are approved by the California Office of Administrative Law.

AMENDMENT NO. 3. ADOPT THE TOTAL MAXIMUM DAILY LOADS FOR PATHOGENS IN SAN LORENZO RIVER ESTUARY, SAN LORENZO RIVER, BRANCIFORTE CREEK, CAMP EVERS CREEK, CARBONERA CREEK, AND LOMPICO CREEK

Add the following to Chapter 4 after IX. I.:

IX. J. TOTAL MAXIMUM DAILY LOADS FOR PATHOGENS IN SAN LORENZO ESTUARY, SAN LORENZO RIVER, BRANCIFORTE CREEK, CAMP EVERS CREEK, CARBONERA CREEK, AND LOMPICO CREEK

The Regional Water Quality Control Board adopted these TMDLs on March 21, 2008. These TMDLs were approved by:

The State Water Resources Control Board on _____.

The California Office of Administrative Law on _____.
(Effective date)

The U.S. Environmental Protection Agency on _____.
(Effective date)

Problem Statement

The beneficial use of water contact recreation is not protected in the impaired reaches of the San Lorenzo River Estuary (also known as San Lorenzo River Lagoon), San Lorenzo River, Branciforte Creek, Camp Evers Creek, Carbonera Creek, and Lompico Creek because fecal coliform concentrations exceed existing Basin Plan numeric water quality objectives protecting this beneficial use. All reaches in these waterbodies are impaired with the exception of Carbonera Creek, where the impairment extends from the mouth of Carbonera Creek upstream to its intersection with Bethany Road.

Numeric Target

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100 mL, nor shall more than 10 percent of samples collected during any 30-day period exceed 400 MPN per 100 mL.

Source Analysis

San Lorenzo River Estuary

The relative order of controllable sources, in descending order, are:

- 1) City of Santa Cruz sanitary sewer collection system leaks (including private laterals connected to municipal sanitary sewer collection systems),
- 2) storm drain discharges to municipally owned and operated storm sewer systems (MS4s) required to be covered by an NPDES permit,
- 3) pet waste in areas that do not drain to MS4s,
- 4) homeless person/encampment discharges in areas that do not drain to MS4s,
- 5) onsite wastewater treatment system discharges, and
- 6) domesticated animals/livestock discharges.

San Lorenzo River, and Lompico Creek

The relative order of controllable sources, in descending order, are:

1) Onsite wastewater disposal system discharges, 2) storm drain discharges to municipally owned and operated storm sewer systems (MS4s) required to be covered by an NPDES permit, 3) City of Santa Cruz sanitary sewer collection system leaks (including private laterals connected to municipal sanitary sewer collection systems) within the City limits of Santa Cruz [does not include Lompico Creek], 4) pet waste in areas that do not drain to MS4s, 5) homeless person/encampment discharges in areas that do not drain to MS4s, and 6) domesticated animals/livestock discharges.

Branciforte Creek,

The relative order of controllable sources, in descending order, are:

1) Storm drain discharges to municipally owned and operated storm sewer systems (MS4s) required to be covered by an NPDES permit, 2) pet waste in areas that do not drain to MS4s, 3) City of Santa Cruz sanitary sewer collection system leaks (including private laterals connected to municipal sanitary sewer collection systems) within the City limits of Santa Cruz, 4) homeless person/encampment discharges in areas that do not drain to MS4s, 5) onsite wastewater disposal system discharges, and 6) domesticated animals/livestock discharges.

Carbonera and Camp Evers Creek:

The relative order of controllable sources, in descending order, are:

1) Storm drain discharges to municipally owned and operated storm sewer systems (MS4s) required to be covered by an NPDES permit, 2) pet waste in areas that do not drain to MS4s, 3) homeless person/encampment discharges in areas that do not drain to MS4s, 4) onsite wastewater disposal system discharges, 5) domesticated animals/livestock discharges, and 6) City of Scotts Valley sanitary sewer collection system leaks (including private laterals connected to municipal sanitary sewer collection systems).

TMDLs and Allocations

The following TMDLs are for the impaired reaches of the following water bodies, and are applicable for each day for all seasons:

The TMDLs for pathogens in the San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Camp Evers Creek, Carbonera Creek, and Lompico Creek are the water quality objective for fecal coliform protecting the water contract recreation beneficial use.

The allocations to responsible parties are shown in Table IX J-1.

Table IX J-1. Allocations and Responsible Parties

WASTE LOAD ALLOCATIONS		
Waterbody Assigned Allocation	Responsible Party (Source)	Receiving Water Fecal Coliform (MPN/100mL)
<u>San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, and Carbonera Creek</u>	<u>City of Santa Cruz</u> (Storm drain discharges)	<u>Allocation-1</u>
<u>Camp Evers Creek and Carbonera Creek</u>	<u>City of Scotts Valley</u> (Storm drain discharges)	<u>Allocation-1</u>
<u>San Lorenzo River, Branciforte Creek, Lompico Creek, and Carbonera Creek</u>	<u>Santa Cruz County</u> (Storm drain discharges)	<u>Allocation-1</u>
<u>San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, and Carbonera Creek</u>	<u>City of Santa Cruz</u> (Sanitary sewer collection system leaks)	<u>Allocation-1</u>
<u>Carbonera Creek, Camp Evers Creek</u>	<u>City of Scotts Valley</u> (Sanitary sewer collection system leaks)	<u>Allocation-1</u>
LOAD ALLOCATIONS		
Waterbody	Responsible Party (Source)	Receiving Water Fecal Coliform (MPN/100mL)
<u>San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Carbonera Creek, and Camp Evers Creek</u>	<u>Owners of private sewer laterals residing in the Cities of Santa Cruz and Scotts Valley</u> (Private laterals connected to municipal sanitary sewer collection system)	<u>Allocation-1</u>
<u>San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Carbonera Creek, Camp Evers Creek and Lompico Creek</u>	<u>Owners of onsite wastewater treatment systems residing in the County of Santa Cruz and the City of Scotts Valley</u> (Onsite wastewater treatment system discharges)	<u>Allocation-1</u>
<u>San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Camp Evers Creek, Carbonera Creek, and Lompico Creek</u>	<u>Owners/operators of land used for/containing pets</u> (Pet waste not regulated by WQ Order No. 2003-0005-DWQ [storm water general permit])	<u>Allocation-1</u>
<u>San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Carbonera Creek, Camp Evers Creek, and Lompico Creek</u>	<u>Owners/operators of land used for/containing domesticated animals/livestock</u> (Domesticated animals/livestock)	<u>Allocation-1</u>
<u>San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Lompico Creek, Camp Evers Creek, and Carbonera Creek</u>	<u>Owners and/or operators of land that include homeless persons/encampments</u> (Discharges from homeless persons/encampments not regulated by WQ Order No. 2003-0005-DWQ [storm water general permit])	<u>Allocation-1</u>
<u>San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Lompico Creek, Camp Evers Creek, and Carbonera Creek</u>	<u>No responsible party</u> (Natural sources)	<u>Allocation-1</u>

1 All reaches of the following water bodies are assigned allocations, excepting Carbonera Creek, where the allocations are assigned from the mouth to the intersection with Bethany Road.

Allocation-1 = Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200/100mL, nor shall more than ten percent of total samples during any 30-day period exceed 400/100 mL.

The parties responsible for the allocation to controllable sources are not responsible for the allocation to natural sources.

The TMDLs are considered achieved when the allocations assigned to all individual responsible parties are met or when the numeric targets are consistently met in the San Lorenzo River Estuary, San Lorenzo River, Branciforte Creek, Camp Evers Creek, Carbonera Creek, and Lompico Creek.

Margin of Safety

A margin of safety is incorporated implicitly in the TMDLs through conservative assumptions.

Implementation

SANITARY SEWER COLLECTION SYSTEM LEAKS:

The City of Santa Cruz Sanitary Sewer Collection System is required to prevent spills and leaks pursuant to NPDES Permit No. CA 0048194 (current number) and WDR Order R3-2005-0003 (current number). The City of Santa Cruz must comply with this permit by improving maintenance of their sewage collection system. Improved maintenance includes identification, correction, and prevention of sewage leaks in portions of the collection systems that intersect, or could impact the water quality, of the San Lorenzo River Estuary or San Lorenzo River. The NPDES permit requires an annual technical report that describes how and when the City of Santa Cruz will conduct improved system maintenance in portions of the system most likely to affect the San Lorenzo Estuary and San Lorenzo River. Within one year following adoption of these TMDLs by the Office of Administrative Law, the Executive Officer will evaluate the results of the annual technical report submitted by the City of Santa Cruz to determine compliance with the requirement to prevent spills and leaks. The Executive Officer and/or the Central Coast Water Board will determine whether modifications to the City of Santa Cruz NPDES Permit No. CA 0048194 and/or WDR Order R3-2005-003 are necessary to address sewer collection system spills and leaks.

The City of Scotts Valley Sanitary Sewer Collection System is required to prevent spills and leaks pursuant to NPDES Permit No. CA 0048828 (current number) and WDR R3-2002-0016 (current number). The City of Scotts Valley is currently (March 21, 2008) in compliance with their existing NPDES permit and WDR and the Water Board is not requiring additional implementation measures (associated with sanitary sewer collection system leak prevention) of the City of Scotts Valley at this time (with the exception of monitoring as mentioned in the following paragraph). However, during the Central Coast Water Board's three-year implementation evaluations, should the Executive Officer determine additional maintenance needs to be performed, the Executive Officer and/or the Central Coast Water Board will determine whether modifications to the City of Santa Cruz NPDES Permit No. CA 0048828 and/or WDR Order R3-2002-0016 are necessary to address sewer collection system spills and leaks.

The Executive Officer or the Central Coast Water Board will amend the Monitoring and Reporting Program of the Cities of Santa Cruz and Scotts Valley NPDES permits to incorporate monitoring for fecal coliform and reporting results.

PRIVATE LATERALS TO THE SANITARY SEWER COLLECTION SYSTEMS:

Individual owners of private laterals to sanitary sewer collection systems are responsible for maintenance of their private laterals. However, the Cities of Santa Cruz and Scotts Valley have the authority to require private lateral upgrades. The Cities of Santa Cruz and Scotts Valley may choose to implement a program to detect and require repair of leaks from private laterals. The Central Coast Water Board would consider implementation (by the Cities of Santa Cruz and/or Scotts Valley) of such a program, as proof of compliance by owners with private laterals with the San Lorenzo River Subbasin prohibition. If the Cities of Santa Cruz and/or Scotts Valley implement such a program, the Central Coast Water Board will request and use reporting from the Cities of Santa Cruz and/or Scotts Valley to evaluate individual private lateral owner compliance with the San Lorenzo River Subbasin prohibition.

Within one year following approval of these TMDLs by the California Office of Administrative Law, if the Cities of Santa Cruz and/or Scotts Valley do not submit an approved program to detect and repair leaks from private laterals, or if the Central Coast Water Board or Executive Officer determines that such an existing or proposed program is insufficient, then landowners with private laterals must demonstrate compliance individually with the San Lorenzo Subbasin prohibition.

If landowners with private laterals must demonstrate compliance individually with the San Lorenzo River Subbasin prohibition, then within one year following approval of the TMDLs by the California Office of Administrative Law, the Executive Officer will notify owners and/or operators of land that have private lateral connections to the sanitary sewer system of the City of Santa Cruz and/or Scotts Valley, of the San Lorenzo River Subbasin prohibition and conditions for compliance with the prohibition. Compliance with the San Lorenzo River Subbasin prohibition is described in Chapter Five, section IV.B. of the Water Quality Control Plan.

STORM DRAIN DISCHARGES TO MUNICIPALLY OWNED AND OPERATED STORM SEWER SYSTEMS REQUIRED TO BE COVERED BY AN NPDES PERMIT (MS4S):

Enrollees of the State Water Resources Control Board's General Permit for the Discharges of Storm Water from Small Municipal Separate Storm Sewer Systems (General Permit for storm water discharges) must control discharges of pathogens to and in storm drains (currently NPDES No. S000004).

The Cities Santa Cruz and Scotts Valley and the County of Santa Cruz must control discharges of pathogens to and in storm drains when enrolled in the General Permit for storm water discharges.

Within one year following approval by the Office of Administrative Law (OAL) of these TMDLs, or if enrolled in the General Permit for stormwater discharge, then when the next annual report is due, or to meet any other Water Board-issued storm water requirements (e.g. when the State General Permit for stormwater discharges is renewed) the Cities Santa Cruz and Scotts Valley and the County of Santa Cruz will be required to:

1. Submit for approval a management program that identifies pathogen-specific best management practices targeting pathogen sources from:
 - a. Birds, pets, rodents and wildlife, dumpster leachate, and humans.The best management practices should include, but not be limited to: those identified in a Storm Water Management Plan (if existing or being developed), public education, participation and outreach regarding sources of pathogens in surface waters, health risks associated pathogens in surface waters, and specific actions the public can take to reduce pathogen loading into surface waters.

2. Submit for approval a fecal indicator bacteria (e.g. fecal coliform) monitoring and reporting plan. Receiving water and storm water outfall monitoring will be required.
3. Incorporate a description of implementation and monitoring activities in any existing or developing Storm Water Management Plan, and corresponding reporting, associated with a General Permit for storm water discharges.

The Executive Officer or the Central Coast Water Board will require information that demonstrates implementation of the actions described above, pursuant to applicable sections of the California Water Code and/or pursuant to authorities provided in the General Permit for storm water discharges.

PET WASTES AND DOMESTICATED ANIMAL/LIVESTOCK DISCHARGES:

Owners and/or operators of land used for/containing domesticated animals (including, but not limited to: horses, cattle, goats, sheep, dogs, cats, or any other animals in the care of owners/operators) in the San Lorenzo River Subbasin must comply with the San Lorenzo River Subbasin prohibition.

Within one year following approval of these TMDLs by the California Office of Administrative Law, the Executive Officer will notify owners and/or operators of lands used for/containing domesticated animals, of the San Lorenzo River Subbasin prohibition and conditions for compliance with the prohibition, as described in Chapter Five, section IV.B. of the Water Quality Control Plan.

ONSITE WASTEWATER DISPOSAL SYSTEM DISCHARGES:

Owners of onsite wastewater disposal systems (OSDS) are ultimately responsible for assuring their OSDSs are not degrading water quality.

Within one year of approval of these TMDLs by the California Office of Administrative Law, the Executive Officer or the Central Coast Water Board will:

Require owners of OSDS in the county areas of the San Lorenzo River Watershed to submit evidence that their OSDS are not degrading water quality. Or, in lieu of/or addition to these submittals by owners of OSDS, will determine if the County of Santa Cruz is making adequate progress towards implementing the San Lorenzo River Management Plan, or an updated plan, as it pertains to reducing pollution sources from OSDS.

Require owners of OSDS in the City of Scotts Valley to submit evidence demonstrating they are in compliance with the City of Scotts Valley's program that requires failed OSDS to connect to the sanitary sewer collection system. The Central Coast Water Board will request this information triennially until all onsite wastewater disposal systems with the potential to impact surface water have connected to the City of Scotts Valley sanitary sewer collection system. Or, in lieu of/or addition to these submittals by owners of onsite wastewater disposal systems, will consult with the City of Scotts Valley to determine if the number of remaining unconnected systems is approaching zero at a rate necessary to achieve the TMDLs by the target date (described in Tracking and Evaluation below).

HOMELESS PERSONS/ENCAMPMENT DISCHARGES

Owners/operators of land that contains homeless persons/encampments in the San Lorenzo River Subbasin must comply with the San Lorenzo River Subbasin prohibition.

Within one year following approval of these TMDLs by the California Office of Administrative Law, the Executive Officer will notify owners/operators of lands that contain homeless persons/encampments of the San Lorenzo River Subbasin prohibition and conditions for compliance with the prohibition, as described in Chapter Five, section IV.B. of the Water Quality Control Plan.

Tracking and Evaluation

Every three years beginning three years after TMDLs are approved by the Office of Administrative Law, Central Coast Water Board staff will perform a review of implementation actions and monitoring results. Central Coast Water Board staff will use annual reports, nonpoint source pollution control implementation programs, and other available information, to review implementation progress toward achieving the allocations and the numeric target.

Central Coast Water Board staff may conclude that ongoing implementation efforts are insufficient to ultimately achieve the allocations and numeric target. If staff makes this determination, staff will recommend that additional reporting, monitoring, or implementation efforts be required either through approval by the Executive Officer or by the Central Coast Water Board. Central Coast Water Board staff may conclude, at the time of review, that they expect implementation efforts to result in achieving the allocations and numeric target. In that case, staff will recommend that existing and anticipated implementation efforts should continue.

Responsible parties will monitor for at least three years, at which time Central Coast Water Board staff will determine the need for continuing or otherwise modifying the monitoring requirements. Responsible parties may also demonstrate that controllable sources of pathogens are not contributing to exceedance of water quality objectives in receiving waters. If this is the case, staff may propose a re-evaluation of the numeric target and allocations. For example, staff may propose a site-specific objective to be approved by the Central Coast Water Board. The site-specific objective would be based on evidence that natural or background sources alone were the cause of exceedances of the Basin Plan water quality objective for pathogen indicator organisms.

Three-year reviews will continue until the TMDLs are achieved. The target date to achieve the TMDLs is 13 years after the date of approval by the California Office of Administrative Law.

**CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
San Luis Obispo, California**

**RESOLUTION NO. R3-2006-044
JULY 7, 2006
ADOPTING A TOTAL MAXIMUM DAILY LOAD
AND IMPLEMENTATION PLAN
FOR NUTRIENTS AND DISSOLVED OXYGEN
IN CHORRO CREEK**

**The California Regional Water Quality Control Board, Central Coast Region,
hereby finds:**

1. The California Regional Water Quality Control Board, Central Coast Region (Central Coast Water Board), adopted the Water Quality Control Plan for the Central Coastal Basin (Basin Plan), on September 8, 1994. The Basin Plan includes beneficial use designations, water quality objectives, implementation plans for point source and nonpoint source discharges, and statewide plans and policies.
2. Section 303(d) of the Clean Water Act requires states to identify and prepare a list of water bodies that do not meet water quality standards and establish a Total Maximum Daily Load (TMDL) for the listed water bodies. A TMDL is the loading capacity of a pollutant that a water body can assimilate while protecting beneficial uses. TMDLs can be expressed in terms of either mass per time, concentration, or other appropriate measure [40 CFR §130.2(i)].
3. Chorro Creek was identified as impaired by nutrients and included on the 1998 Clean Water Act Section 303(d) list of impaired water bodies. Chorro Creek is identified as impaired due to low dissolved oxygen on the draft 2006 Clean Water Act Section 303(d) list of impaired water bodies. Due to the 303(d) listings, the Central Coast Water Board is required to adopt a TMDL and associated Implementation Plan (40 CFR 130.6(c)(1), 130.7, Water Code section 13242).
4. The Chorro Creek watershed is located along the central coast of California in San Luis Obispo County. Chorro Creek watershed drains approximately 30,000 acres, ultimately draining to the Morro Bay Estuary. The United States Environmental Protection Agency (USEPA) has included Morro Bay Estuary as part of the National Estuary Program (NEP). USEPA elevates NEP designated waterbodies to national importance and are often the recipients of funding aimed at environmental protection.
5. The Final Project Report contains a Problem Statement, Numeric Targets, Source Analysis, Total Maximum Load, Linkage Analysis, Load Allocations, Margin of Safety, an Implementation Plan, and a Monitoring Plan. The Final Project Report addresses the nutrient and dissolved oxygen impairments.
6. The Central Coast Water Board has determined that the TMDLs for nutrients and dissolved oxygen in Chorro Creek are set at levels necessary to attain and maintain the applicable numeric water quality objectives, taking into account seasonal

variations and any lack of knowledge concerning the relationship between effluent limitations and water quality (40 CFR 130.7(c)(1)).

7. The Central Coast Water Board finds that the TMDL for nutrients and dissolved oxygen for Chorro Creek will be achieved through adoption of the National Pollutant Discharge Elimination System (NPDES) permit for the discharge of wastewater from the California Men's Colony (CMC), and through water quality improvements that will result from the existing Chorro Flats riparian restoration project along lower Chorro Creek. The Coastal San Luis Resource Conservation District owns, implemented, and monitors the Chorro Flats restoration project. The NPDES permit establishes effluent limits that implement the wasteload allocations described in the Final Project Report. The Chorro Flats project will increase stream shading, thereby reducing stream temperature. The Central Coast Water Board further finds that compliance with the NPDES permit, along with the water quality improvements from the riparian restoration project, will correct the impairments in Chorro Creek. Therefore, these existing actions implement the TMDL.
8. The Central Coast Water Board further finds that monitoring during the implementation phase of the TMDL is necessary to track progress toward achieving the TMDL numeric targets and allocations.
9. The CMC monitors nitrate-N, orthophosphorus, total dissolved solids, sodium, temperature, and dissolved oxygen in their effluent and in Chorro Creek pursuant to the Monitoring and Reporting Program associated with the NPDES permit regulating this discharge. Volunteer and employed monitors associated with Morro Bay National Estuary Program's Volunteer Monitoring Program (VMP) monitor stream temperature, shading, algal cover, and dissolved oxygen in Chorro Creek. The combined monitoring efforts of the CMC and VMP will provide the information necessary to determine whether and when the TMDL for Chorro Creek is achieved.
10. Central Coast Water Board staff will conduct a review of implementation activities every three years, beginning three years after TMDL approval by the Central Coast Water Board, unless funding is unavailable. Central Coast Water Board staff will utilize reports associated with the NPDES permit, Volunteer Monitoring Programs, as well as other available information, to review water quality data and implementation efforts of implementing parties and progress being made towards achieving the allocations and the numeric targets. Central Coast Water Board staff may conclude that ongoing implementation efforts are insufficient to ultimately achieve the allocations and numeric targets. If staff makes this determination, staff will recommend that additional reporting, monitoring, or implementation efforts be required either through approval by the Executive Officer (e.g. pursuant to CWC section 13267 or section 13383) or by the Central Coast Water Board (e.g. through revisions of existing permits and/or a Basin Plan Amendment). Central Coast Water Board staff may conclude that to date, implementation efforts are likely to result in achieving the allocations and numeric targets, in which case existing implementation efforts will continue.
11. Central Coast Water Board staff (staff) mailed a public draft version of the Final Project Report for the TMDL directly to the CMC. Staff also provided a forty-five day public review and comment period before the Central Coast Water Board hearing held on July 7, 2006. Notice of public hearing was given through newspapers of

general circulation within the Chorro Creek watershed. In addition, a copy of the notice of public hearing was mailed to interested government agencies as well as persons requesting such notice.

12. The Central Coast Water Board finds that existing actions by the Central Coast Water Board and the Coastal San Luis Resource Conservation District make any further regulatory action (i.e. any 'project') unnecessary. Therefore, this action is not a "project" that requires compliance with the California Environmental Quality Act (California Public Resources Code §21000 et seq.). The Water Board is not directly undertaking an activity, funding an activity, or issuing a permit or other entitlement for use (Public Resources Code section 21065; 14 Cal. Code of Regs. §15378).
13. The TMDL and associated Implementation and Monitoring Plan do not allow degradation or a decrease in water quality, and do not approve an activity that produces or may produce a waste or increased volume or concentration of waste or an activity that discharges or proposes to discharge to existing high quality waters. This resolution therefore complies with Resolution 68-16 and 40 CFR §131.12.
14. This TMDL will become effective upon approval by the Central Coast Water Board.
15. On July 7, 2006, in San Luis Obispo, California, the Central Coast Water Board held a public hearing and heard and considered all public comments and evidence in the record.

THEREFORE, BE IT RESOLVED,

1. The Central Coast Water Board, after considering the entire record, including oral testimony, adopts the Total Maximum Daily Load for Nutrients and Dissolved Oxygen in Chorro Creek, as shown in the Final Project Report.
2. The Central Coast Water Board finds that the existing actions taken by the Central Coast Water Board adopting the NPDES permit for the discharge of wastewater from the CMC, and by the Coastal San Luis Resource Conservation District through the existing and implemented Chorro Flats riparian restoration project along Chorro Creek, are appropriate for implementation of the TMDL, are adequate to correct the impairments, and are expected to result in attainment of water quality objectives for nutrients and dissolved oxygen in Chorro Creek. At this time, any further regulatory action to create another program of implementation by the Central Coast Water Board would be redundant and unnecessary.
3. These findings shall remain valid as long as Chorro Creek attains nutrient and dissolved oxygen objectives no later than July 7, 2016.
4. The Central Coast Water Board may revoke these findings if it finds that the discharge modifications of the California Men's Colony wastewater treatment plant, and/or the Chorro Flats riparian restoration project along Chorro Creek, are not adequately implemented or are no longer adequate to resolve the impairments.

5. The Central Coast Water Board's Executive Officer is directed to submit the TMDL to the U.S. Environmental Protection Agency (USEPA) for review. If during its approval process the USEPA determines that minor, non-substantive corrections to the language of the TMDL are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.

I, Roger W. Briggs, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of the Resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region, on **July 7, 2006.**

Executive Officer

S:\TMDLs & Watershed Assessment\TMDL and Related Projects- Region 3\Chorro Creek\Nutrients\7 State Board_USEPA Approval\USEP Approval Docs\ATT-1 - CHORRO NUT&DO TMDL RESOLUTION (14June06)FINAL.doc

STATE OF CALIFORNIA
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, CA 93401-7906

RESOLUTION NO. R3-2006-0025
AMENDING THE WATER QUALITY CONTROL PLAN
FOR THE CENTRAL COAST BASIN TO INCLUDE
WATSONVILLE SLOUGH TOTAL MAXIMUM DAILY LOAD
AND IMPLEMENTATION PLAN FOR PATHOGENS,
WATSONVILLE SLOUGH WATERSHED LIVESTOCK WASTE DISCHARGE PROHIBITION,
AND REMOVAL OF THE SHELLFISH HARVESTING BENEFICIAL USE FROM
WATSONVILLE SLOUGH AND TRIBUTARIES

WHEREAS, the California Regional Water Quality Control Board, Central Coast Region hereby finds that:

1. The California Regional Water Quality Control Board, Central Coast Region (Water Board), adopted the Water Quality Control Plan for the Central Coastal Basin (Basin Plan), on September 8, 1994. The Basin Plan includes beneficial use designations, water quality objectives, implementation plans for point source and nonpoint source discharges, and statewide plans and policies.
2. The Water Board periodically revises and amends the Basin Plan. The Water Board has determined the Basin Plan requires further revision and amendment to incorporate a Total Maximum Daily Load (TMDL) and Implementation Plan for Pathogens for Watsonville Slough.
3. The Water Board proposes to amend the Basin Plan by inserting amendments into the following section:
 - a. Chapter Two, Table 2-1: "Identified Uses of Inland Surface Waters"
 - b. Chapter Four, Sections VIII (Nonpoint Source Measures) and IX (Total Maximum Daily Loads)
 - c. Chapter Five, Section IV.E (Other Specific Prohibition Subjects)
4. Section 303(d) of the Clean Water Act (CWA) requires states to identify and prepare a list of water bodies that do not meet water quality standards and to establish TMDLs for listed waterbodies.
5. Watsonville Slough is listed on California's 303(d) list as impaired due to non-attainment of existing Basin Plan water quality objectives for pathogens.
6. Watsonville Slough is located in Santa Cruz County, California. The watershed area drains approximately 13,000 acres generally north of the Slough itself, which flows into the mouth of the Pajaro River at Monterey Bay, ultimately draining into the Pacific Ocean. Tributaries to Watsonville Slough include Struve Slough, Hanson Slough, and Harkins Slough. Gallighan Slough flows into Harkins Slough.
7. The elements of a TMDL are described in 40 CFR 130.2 and 130.7 and section 303(d) of the CWA, as well as USEPA guidance documents. A TMDL is defined as "the sum of individual waste load allocations for point sources and load allocations for nonpoint sources and natural background" (40 CFR 130.2). The Water Board has determined that the Watsonville Slough Pathogen TMDL is set at levels necessary to attain and maintain the applicable numeric water quality objectives taking into account seasonal variations and any lack of knowledge concerning the relationship between effluent limitations and water quality (40

- CFR 130.7(c)(1)). The regulations in 40 CFR 130.7 also state that TMDLs shall take into account critical conditions for stream flow, loading and water quality parameters. TMDLs are often expressed as a mass load of the pollutant but can be expressed as a unit of concentration if appropriate (40 CFR 130.2(i)). Expressing this TMDL as units of concentration is appropriate because an existing concentration based water quality objective is used as the basis for the numeric target.
8. Upon establishment of TMDLs by the State or USEPA, the state is required to incorporate the TMDLs, along with appropriate implementation measures, into the State Water Quality Management Plan (40 CFR 130.6 (c)(1), 130.7; California Water Code (CWC) sections 13050(j), 13242). The Basin Plan, and applicable statewide plans, serve as the State Water Quality Management Plan governing the watersheds under the jurisdiction of the Water Board.
 9. The TMDL implementation plan requires compliance with a new livestock waste discharge prohibition within the Watsonville Slough Watershed. The Water Board may prohibit certain types of waste discharge pursuant to CWC 13243. Consistent with CWC 13244, the Water Board conducted public notice and hearing requirements for the proposed waste discharge prohibition.
 10. Pursuant to CWC section 13241, the Water Board considered several factors in developing the livestock waste discharge prohibition in Watsonville Sloughs. The Board concludes the following:
 - a. The prohibition will not affect past, present, or probable future beneficial uses of Watsonville Sloughs.
 - b. Environmental characteristics of the waterbody will not be affected.
 - c. Improved water quality conditions can reasonably be achieved through the coordinated control of all factors that affect water quality in the area, as provided in the Implementation Plan.
 - d. Costs to achieve compliance with the prohibition are reasonable relative to the benefit of improved water quality.
 - e. The need for developing housing within the region is not relevant.
 - f. The need to develop and use recycled water is not relevant.
 11. The Water Board's goal for establishing the above mentioned TMDL is to protect the contact and non-contact water recreation beneficial uses (REC-1 and REC-2, respectively) as defined in the Basin Plan.
 12. The Water Board has determined that the shellfish harvesting (SHELL) beneficial use designation as it pertains to Watsonville, Harkins, Gallighan, Struve, and Hanson Sloughs should be removed.
 13. The proposed removal of the SHELL beneficial use is based on the results of a Use Attainability Analysis (UAA) of this beneficial use in Watsonville Slough and its tributaries, performed by Water Board staff. Staff conducted this analysis in Spring 2005 to determine actual and potential SHELL use of the Sloughs. The UAA is necessary to conform to 40 Code of Federal Regulations, section 131.10(j) because the action involves a designated use specified in CWA section 101(a)(2). The proposed amendment and the UAA only address the fishable goal ("protection and propagation of fish, shellfish, and wildlife") as it pertains to shellfish harvesting and do not address other fishable goals or the swimmable goal included in the REC-1 designation contained in section 101(a)(2) of the CWA. The fishable goal of the CWA is also protected under other beneficial uses (including WARM) designated in the Basin Plan for the affected waterbodies.
 14. CWA factors for allowing a State to remove a designated use are listed in Section 131.10(g). Based on staff's UAA, three factors preclude attainment of SHELL in Watsonville Slough and its tributaries. These factors are as follows:
 - a. Natural, ephemeral, intermittent, or low flow conditions or water levels prevent the attainment of the beneficial use.

- b. Diversions, and other types of hydrologic modifications preclude the attainment of the beneficial use, and it is not feasible to restore the water body to its original condition or to operate such modification in a way that would result in the attainment of the use.
 - c. Physical conditions related to the natural features of the water body, including lack of a proper substrate, preclude attainment of aquatic life protection uses.
15. Pursuant to CWC section 13241, the Water Board considered several factors in deciding to remove the SHELL beneficial use in Watsonville Sloughs. Staff concluded that shellfish harvesting is not a past, present, or probable future beneficial use of Watsonville Sloughs. In removing the SHELL beneficial use, staff concluded the following:
 - a. Environmental characteristics of the waterbody will not be affected.
 - b. Water quality conditions that could reasonably be achieved through the coordinated control of all factors that affect water quality in the area will not be affected.
 - c. De-designation of the SHELL beneficial use does not impose any costs other than the Water Board's costs of preparing the amendment.
 - d. The need for developing housing within the region is not relevant.
 - e. The need to develop and use recycled water is not relevant.
16. The removal of the SHELL beneficial use is consistent with the Antidegradation Policy, as it will not lower the water quality of the Watsonville Slough and its tributaries relative to existing conditions. In assigning water quality objectives to the uses that exist, the Basin Plan Amendment fulfills the requirement of protecting the level of water quality necessary to protect existing and anticipated beneficial uses.
17. The Water Board's goal in de-designating the SHELL beneficial use is to assign bacterial water quality objectives that accurately reflect the existing and potential uses of Watsonville Slough and tributaries. For this purpose, "existing uses" means those uses actually attained on or after November 28, 1975 (40 CFR §131.3(e)).
18. Water Board staff submitted a TMDL report, including the proposed waste discharge prohibition and proposed removal of the SHELL beneficial use in Watsonville Slough and tributaries, to an external scientific review panel in October of 2005 as required by Health & Safety Code Section 57004. Water Board staff edited the Project Report or provided a written response that explained the basis for not incorporating the comments, or the comments did not result in any changes to the proposed Basin Plan Amendment. The scientific portions of the TMDL and implementation plan, the waste discharge prohibition, and the proposed removal of the SHELL beneficial use, are based on sound scientific knowledge, methods, and practices in accordance with Section 57004.
19. Water Board staff implemented a process to inform interested persons and the public about the TMDL, the waste discharge prohibition, and removal of the SHELL beneficial use designation for Watsonville Slough and tributaries. Water Board staff's efforts to inform the public and solicit comment include public meetings, presentations to special interest groups, individual meetings with vested stakeholders, and numerous telephone conversations with interested parties. Public notification of the amendment to the Basin Plan occurred 45 days preceding the Board hearing. Notice of public hearing was given by advertising in newspapers of general circulation within the Region and by mailing a copy of the notice to all persons requesting such notice and applicable government agencies. Water Board staff responded to oral and written comments received from the public.
20. The Water Board considered costs of implementing measures to achieve the TMDL. The costs to implement the TMDL will be incurred by identified responsible parties. These costs are reasonable relative to the water quality benefits to be derived from implementing the TMDL.

21. Anti-Degradation — This order is consistent with the provisions of the State Water Resources Control Board (State Board) Resolution No. 68-16, "Statement of Policy with Respect to Maintaining High Quality of Waters in California" and 40 CFR 131.12. The TMDL will result in improved water quality throughout the region and maintains the level of water quality necessary to protect existing and anticipated beneficial uses.
22. The Water Board concurs with the analysis contained in the Final Project Report, including the Use Attainability Analysis, the California Environmental Quality Act "Substitute Document" Report for Basin Plan Amendment, including the CEQA Checklist, the staff report and the responses to comments, and finds that these analyses comply with the requirements of the State Board's certified regulatory CEQA process, as set forth in California Code of Regulations, Title 23, section 3775 et seq. Furthermore, the Water Board finds that these analyses fulfill the Water Board's obligations attendant with the adoption of regulations "requiring the installation of pollution control equipment, or a performance standard or treatment requirement," as set forth in section 21159 of the Public Resources Code. All public comments were considered.
23. The Water Board must submit the Basin Plan amendment incorporating a TMDL for pathogens for Watsonville Slough, the livestock waste discharge prohibition, and the removal of the SHELL beneficial use for Watsonville Slough and tributaries to the State Board, the State Office of Administrative Law (OAL), and the US Environmental Protection Agency (USEPA), for approval. The TMDL and Implementation Plan will become effective upon approval by OAL. The prohibition and the de-designation of the SHELL beneficial use will become effective upon approval by USEPA.
24. The amendment to the Basin Plan will result in no potential adverse effect, either individually or cumulatively, on wildlife and is therefore exempt from fee payments to the Department of Fish and Game under the California Fish and Game Code.
25. On March 24, 2006 in San Luis Obispo, California, the Water Board held a public hearing and heard and considered all public comments and evidence in the record.

THEREFORE, be it resolved that:

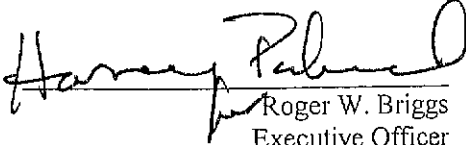

1. Pursuant to sections 13240, 13242, 13243, and 13244 of the CWC, the Water Board, after considering the entire record, including the oral testimony at the hearing, hereby adopts the amendment in "Attachment-Proposed Basin Plan Amendments."
2. The Executive Officer is directed to forward copies of the Basin Plan amendment to the State Board in accordance with the requirements of section 13245 of the CWC.
3. The Water Board requests that the State Board approve the Basin Plan amendment in accordance with the requirements of sections 13245 and 13246 of the CWC and forward it to OAL and the USEPA. The Water Board shall file a Notice of Decision with the Secretary of Resources and the Governor's Office of Planning and Research (State Clearinghouse) after approval by OAL and USEPA.
4. The Executive Officer is authorized to sign a Certificate of Fee Exemption.
5. If, during its approval process, the State Board or OAL determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Water Board of any such changes.

000725

Resolution No. R3-2006-0025
Attachment 1

March 24, 2006

I, **Roger W. Briggs, Executive Officer**, do hereby certify the foregoing is a full, true, and correct copy of the resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region, on March 24, 2006.

Roger W. Briggs
Executive Officer

000726

March 24, 2006

RESOLUTION NO. R3-2006-0025

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENTS

AMENDMENT NO. 1. Revise the September 8, 1994 Basin Plan, Chapter Four, as follows:

Add the following to Chapter 4 after IX. H.:

IX. I. TOTAL MAXIMUM DAILY LOAD FOR PATHOGENS FOR WATSONVILLE SLOUGH

The Regional Water Quality Control Board adopted this TMDL on March 24, 2006.

This TMDL was approved by:

The State Water Resources Control Board on _____.

The California Office of Administrative Law on _____, (*Effective date*)

The U.S. Environmental Protection Agency on _____.

Problem Statement

The beneficial uses of water contact recreation (REC-1) and non-contact water recreation (REC-2) are not supported in Watsonville Slough or its tributaries, Struve, Hanson, Harkins and Gallighan Sloughs, because fecal coliform concentrations there exceed existing Basin Plan numeric water quality objectives protecting these beneficial uses.

Numeric Target

Fecal coliform concentration, based on a minimum of five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100mL, nor shall more than ten percent of total samples collected during any 30-day period exceed 400 MPN per 100mL.

Source Analysis

Controllable sources of fecal coliform bacteria in Watsonville Slough and its tributaries include humans, pets, livestock, and land-applied non-sterile manure in irrigated agriculture. Genetic data indicate that the major sources of fecal coliform causing exceedance of the REC-1 standard are natural avian populations. Genetic analysis of Watsonville Slough water samples from both winter and summer periods confirmed birds, cows, and dogs (with birds contributing the most and dogs the least); human fecal coliform bacteria was confirmed in Harkins and Struve Sloughs, but in lower amounts than cow, bird and dog fecal coliform.

TMDL and Allocations

The TMDL for pathogens in Watsonville Slough is a receiving water concentration equal to the numeric target for fecal coliform. The allocation to each responsible party is the receiving water fecal coliform concentration equal to the TMDL. These allocations focus on reducing or eliminating the controllable sources of fecal coliform. The table below shows the allocations with respect to responsible party and waterbody.

The allocation to background (including natural sources from birds) is also the receiving water fecal coliform concentration equal to the TMDL. The parties responsible for the allocation to controllable sources are not responsible for the allocation to natural sources.

000727

ALLOCATIONS AND RESPONSIBLE PARTIES

WASTE LOAD ALLOCATIONS		Receiving Water Fecal Coliform (MPN/100mL) ¹
Waterbody	Responsible Party	
Watsonville, Struve, Harkins Sloughs	Santa Cruz County (Urban Stormwater)	≤ 200
Watsonville, Struve, Harkins, Gallighan, Hanson Sloughs	City of Watsonville (Urban Stormwater)	≤ 200
Harkins Slough	Santa Cruz Co. Freedom Sanitation District (Sanitary Sewer Collection System)	≤ 200
Watsonville & Struve Sloughs	City of Watsonville (Sanitary Sewer Collection System)	≤ 200
Gallighan Slough	Santa Cruz County (Landfill Stormwater)	≤ 200
LOAD ALLOCATIONS		Receiving Water Fecal Coliform (MPN/100mL) ¹
Watsonville & Harkins Sloughs	Operators or owners of irrigated lands who land-apply non-sterile manure	≤ 200
Watsonville & Harkins Sloughs	Operators or owners of livestock facilities and animals	≤ 200
¹ As log mean of five (5) samples taken in a 30-day period occurring within each season.		

The TMDL is considered achieved when the allocations assigned to the controllable and natural sources are met, or when the numeric targets are consistently met in all tributaries and Watsonville Slough.

Margin of Safety

A margin of safety is incorporated in the TMDL through conservative assumptions.

Implementation and Monitoring

Landfill Stormwater Monitoring

Within six months following adoption of this TMDL by the Office of Administrative Law, the Executive Officer will require the County of Santa Cruz to include fecal coliform monitoring in the Buena Vista Landfill Waste Discharge Requirements (Order No. 94-29), per Section 13267 of the CWC.

THE FOLLOWING ACTIONS WILL REDUCE FECAL COLIFORM BACTERIA LOADING FROM HUMANS AND PETS:

Urban Stormwater

The City of Watsonville (City) and County of Santa Cruz (County) must revise their Stormwater Management Plans to indicate how and when they will conduct public participation and outreach regarding specific actions that individuals can take to reduce pathogen loading and to indicate how and when they will develop and implement an enforceable means of reducing fecal coliform loading from pet waste (e.g., an ordinance). Within six months following adoption of this TMDL by the Office of Administrative Law, the Executive Officer will (i) issue a letter pursuant to Section 13383 of the California Water Code (CWC), requiring these changes to be described in the annual report required by the Small MS4 Permit (State Board Order No. 2003-005, NPDES General Permit No.CAS000004 for Municipal Separate Storm Sewer Systems) and (ii) require appropriate modifications to the Stormwater Management Plans pursuant to Section G of the General Permit.

The City and County public participation and outreach efforts must include the following tasks:

- a. Educating the public about sources of fecal coliform and its associated health risks in surface waters.

- b. Identifying and promoting specific actions that responsible parties can implement to reduce pathogen loading from sources such as homeless encampments, agricultural field workers, and homeowners who contribute waste from domestic pets.

The City and County must monitor receiving water and stormwater outfalls that may be contributing fecal coliform to the sloughs. Within six months following adoption of this TMDL by the Office of Administrative Law, the Executive Officer will issue a letter pursuant to Section 13267 and/or 13383 of the CWC, requiring a technical report that describes a monitoring plan and schedule that includes sampling sites in receiving water and at stormwater outfalls. The City and County may submit the monitoring results in subsequent annual reports already required by the Small MS4 Permit or submit them in a separate technical report.

Sanitary Sewer Collection System

The City and County are required to improve maintenance of their sewage collection systems, including identification, correction, and prevention of sewage leaks, in portions of the collection systems that run through, or adjacent to, tributaries to Watsonville Slough (Action 1B, Table 1). Within six months following adoption of this TMDL by the Office of Administrative Law, the Executive Officer will issue a letter pursuant to Section 13267 of the CWC, requiring a technical report that describes how and when they will conduct improved system maintenance in portions of the system most likely to affect the Sloughs. One year following adoption of this TMDL by the Office of Administrative Law, Water Board staff will evaluate proposed sewer system maintenance for the City and the County of Santa Cruz Freedom Sanitation District as described in the technical report and determine whether appropriate changes to the maintenance have been made or whether any changes to the Waste Discharge Requirements (currently, Order No. R3-2003-0041, and No. R3-2003-0040, respectively) are warranted.

THE FOLLOWING ACTIONS WILL REDUCE FECAL COLIFORM BACTERIA LOADING FROM LIVESTOCK AND LAND-APPLIED NON-STERILE MANURE:

Livestock Sources

Operators or owners of livestock facilities and animals must comply with the proposed Watsonville Slough Watershed Livestock Waste Discharge Prohibition to implement their load allocations. Within one year following approval of the TMDL by the Office of Administrative Law, the Executive Officer will notify the owners and operators of livestock facilities, and the owners of animals, of the proposed Watsonville Slough Watershed Livestock Waste Discharge Prohibition and conditions for compliance with the prohibition. The Executive Officer will review and approve, or request modification of, the Nonpoint Source Pollution Control Implementation Program (Program) or documentation submitted in compliance with the prohibition within six months of the submittal date. Should the Program or documentation require modification, or if a party fails to submit a Program or documentation, the Executive Officer may issue a civil liability complaint pursuant to section 13268 or 13350 of the CWC, or alternatively, propose individual or general waste discharge requirements to assure compliance with the prohibition. Alternatively, dischargers may comply by immediately ceasing all discharges in violation of the Prohibition.

Responsible parties must submit monitoring data or other evidence that demonstrates compliance with the Watsonville Slough Watershed Livestock Waste Discharge Prohibition. The Executive Officer will determine whether the information submitted demonstrates compliance.

Irrigated Land Sources

Operators or owners of irrigated lands where non-sterile manure is applied must comply with the Conditional Waiver of Waste Discharge Requirements for Discharges from Irrigated Lands to implement their load allocations. Staff expects management measures implemented pursuant to this waiver for irrigated lands will be adequate to reduce or eliminate pathogen discharges where farmers apply non-sterile manure to the land. However, compliance with the conditions in the waiver does not meet all of the requirements of the proposed Watsonville Slough Watershed Livestock Waste Discharge Prohibition. Since the Conditional Waiver does

March 24, 2006

not include any regulation or monitoring of pathogen discharges, operators or owners of irrigated lands where non-sterile manure is applied must also submit reports that demonstrate that they do not discharge pathogens, or explain how pathogen discharges are being addressed.

Within six months following approval of the TMDL by the Office of Administrative Law, the Executive Officer will notify responsible parties of the proposed Watsonville Slough Watershed Livestock Waste Discharge Prohibition and conditions for compliance with the prohibition. The Executive Officer will review and approve, or request modification of, the Nonpoint Source Pollution Control Implementation Program (Program), or other documentation submitted in compliance with the prohibition, within six months of the submittal date. Should the Program or documentation require modification, or if a responsible party fails to submit a Program or documentation, the Executive Officer may issue an administrative civil liability complaint pursuant to section 13268 or 13350 of the CWC, or alternatively, propose individual or general waste discharge requirements or conditional waivers to assure compliance with the prohibition. Alternatively, dischargers may comply by immediately ceasing all discharges in violation of the Prohibition.

Tracking and Evaluation

Water Board staff will conduct a review every three years beginning three years after TMDL approval by the Office of Administrative Law. Water Board staff will use Annual Reports and any other available information to determine progress toward compliance. Water Board staff may conclude that ongoing implementation efforts are insufficient to ultimately achieve the allocations and numeric target. If staff makes this determination, staff will recommend that additional reporting, monitoring, or implementation efforts be required either through authority of the Executive Officer (e.g. pursuant to CWC section 13267 or section 13383) or the Water Board (e.g. through revisions of existing permits and/or a Basin Plan Amendment). Water Board staff may also conclude that implementation efforts are likely to achieve compliance, and therefore existing implementation efforts should continue.

Responsible parties will continue monitoring according to this plan for at least three years, at which time Water Board staff will determine the need for continuing or otherwise modifying the monitoring requirements. Responsible parties may also demonstrate that controllable sources of pathogens are not contributing to exceedance of water quality objectives in receiving waters. If this is the case, staff may consider re-evaluating the targets and allocations. For example, staff may propose a site-specific objective for Watsonville Sloughs, to be approved by the Water Board. The site-specific objective would be based on evidence that natural, or "background" sources alone were the cause of exceedances of the Basin Plan water quality objective for fecal coliform.

Three-year reviews will continue until the TMDL is achieved. The target date to achieve the TMDL is ten years after implementation commences.

000730

Table 1 IMPLEMENTATION ACTIONS OF RESPONSIBLE PARTIES

Responsible Party	Source Category	Management Measure	Action
County of Santa Cruz and City of Watsonville	1A Human	Public Participation and Outreach	Educate the public, including the homeless, regarding sources of fecal coliform and associated health risks of fecal coliform in surface waters of the Watsonville Slough Watershed. Educate the public regarding actions that individuals can take to reduce pathogen loading in the Watershed. Revise Stormwater Management Plan and submit to Water Board for approval, monitor, and report.
	1B Human	Human Source Elimination and Prevention	Maintain the sewage collection system, including identification, correction, and prevention of sewage leaks into tributaries to Watsonville Slough. Revise Sewer System Management Plan and submit to Water Board for approval, monitor, and report.
	1C Pets	Pet Waste Management	Develop and implement enforceable means (e.g., an ordinance) of reducing/eliminating fecal coliform loading from pet waste. Educate the public regarding actions that individuals can take to reduce loading in the Watershed. Revise Stormwater Management Plan and submit to Water Board for approval, monitor, and report.
Operators or owners of livestock facilities and animals	2A Livestock	Farm Animal and Livestock Facilities Management	Develop and implement strategies to reduce/eliminate fecal coliform loading from farm animal and livestock facilities (e.g., pens, corrals, barns) into surface waters of the Watsonville Slough Watershed. Submit <i>Nonpoint Source Control Implementation Program</i> to the Executive Officer of the Water Board and monitor and report, or, document and report to the Water Board that no discharge is occurring from animal facilities.
	2B Livestock	Grazing Management	Protect sensitive areas (including streambanks, sloughs, wetlands, and riparian zones) by reducing direct loadings of animal wastes from grazing areas into surface waters of the Watsonville Slough Watershed. Submit <i>Nonpoint Source Control Implementation Program</i> to the Executive Officer of the Water Board and monitor and report, or, document and report to the Water Board that no discharge is occurring from grazing activities.
Operators or owners of irrigated lands who land-apply non-sterile manure	3 Land-Applied Non-Sterile Manure on Irrigated lands	Irrigated Land Management	Develop, implement and report on measures to reduce/eliminate fecal coliform loading from land-applied non-sterile manure into surface waters of the Watsonville Slough Watershed. Document and report to the Water Board that measures are in place and monitor to demonstrate effectiveness.

AMENDMENT NO. 2. Revise the September 8, 1994 Basin Plan as follows:

Add the following at the end of Chapter 4

R3-2006-0025, 3/24/06
SB-2006-0067, 9/21/06
OAL, 11/20/06

VIII.E.6. WATSONVILLE SLOUGH WATERSHED LIVESTOCK WASTE DISCHARGE PROHIBITION

1. The direct or indirect discharge of livestock animal waste from any grazing operations, non-sterile manure application, farm animal and livestock facilities including paddocks, pens, corrals, barns, sheds, or other activity of whatever nature into waters of the State within the Watsonville Slough Watershed is prohibited.

The above prohibition does not apply to any farm animal or livestock facility and/or any facility where non-sterile manure is applied if the owner or operator:

000731

- i. Submits a Nonpoint Source Pollution Control Implementation Program, consistent with the *Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program*, that is approved by the Executive Officer, or
- ii. Demonstrates to the satisfaction of the Executive Officer that its activities do not cause livestock waste to pass into waters of the state within the Watsonville Slough Watershed, or
- iii. Is regulated under Waster Discharge Requirements or an NPDES permit, or a conditional waiver of waste discharge requirements that explicitly addresses compliance with the Watsonville Slough TMDL for Pathogens.

This Livestock Waste Discharge Prohibition takes effect two years following approval by the U.S. Environmental Protection Agency.

Add the following at the end of Chapter 5, IV.E. Other Specific Prohibition Subjects:

Watsonville Slough Watershed Livestock Waste Discharge Prohibition

R3-2006-0025, 3/24/06
SB-2006-0067, 9/21/06
OAL, 11/20/06

AMENDMENT NO. 3. Revise the September 8, 1994 Basin Plan, Chapter Two, as follows:

Amend portion of Table 2-1. Identified Uses of Inland Surface Waters, pertaining to Watsonville Slough and tributaries:

**STATE OF CALIFORNIA
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, CA 93401-7906**

RESOLUTION NO. R3-2005-0132

**AMENDING THE WATER QUALITY CONTROL PLAN FOR THE CENTRAL COAST BASIN
TO INCLUDE PAJARO RIVER TOTAL MAXIMUM DAILY LOADS AND IMPLEMENTATION
PLAN FOR SEDIMENT INCLUDING LLAGAS CREEK, RIDER CREEK, AND SAN BENITO
RIVER AND A LAND DISTURBANCE PROHIBITION**

WHEREAS, the California Regional Water Quality Control Board, Central Coast Region hereby finds that:

1. The California Regional Water Quality Control Board, Central Coast Region (Water Board), adopted the Water Quality Control Plan for the Central Coastal Basin (Basin Plan), on September 8, 1994. The Basin Plan includes beneficial use designations, water quality objectives, implementation plans for point source and nonpoint source discharges, and statewide plans and policies.
2. The Water Board periodically revises and amends the Basin Plan. The Water Board has determined the Basin Plan requires further revision and amendment to incorporate Pajaro River Total Maximum Daily Loads (TMDL) and Implementation Plan for Sediment, including Llagas Creek, Rider Creek, and San Benito River and a Land Disturbance Prohibition.
3. The Water Board proposes to amend the Basin Plan by inserting amendments into Chapter Four, Section IX (Total Maximum Daily Loads) and Chapter Four, Section VIII.E.1 (Land Disturbance Prohibitions).
4. Section 303(d) of the Clean Water Act (CWA) requires states to identify and prepare a list of water bodies that do not meet water quality standards and to establish TMDLs for listed waterbodies.
5. The Pajaro River, Llagas Creek, Rider Creek, and San Benito River were identified on California's 2002 303(d) list as impaired by sedimentation/siltation.
6. The Pajaro River watershed lies within the central coast of California and includes the counties of San Benito, Santa Clara, Santa Cruz, and Monterey. Major tributaries to the Pajaro River are the San Benito River, Tres Pinos Creek, Santa Ana Creek, Pacheco Creek, Llagas Creek, Uvas Creek, and Corralitos Creek. Rider Creek is tributary to Corralitos Creek. The Pajaro River watershed encompasses approximately 1,300 square miles and drains into Monterey Bay.
7. The elements of a TMDL are described in 40 CFR 130.2 and 130.7 and section 303(d) of the CWA, as well as USEPA guidance documents. A TMDL is defined as "the sum of individual waste load allocations for point sources and load allocations for nonpoint sources and natural background" (40 CFR 130.2). The Water Board has determined that the Pajaro River TMDL for Sediment is set at levels necessary to attain and maintain the applicable narrative water quality objectives taking into account seasonal variations and any lack of knowledge concerning the relationship between effluent limitations and water quality (40 CFR 130.7(c)(1)). The regulations in 40 CFR 130.7 also state that TMDLs shall take into account critical conditions for stream flow, loading and water quality

parameters. TMDLs are often expressed as a mass load of the pollutant but can be expressed as a unit of concentration if appropriate (40 CFR 130.2(i)).

8. Upon establishment of TMDLs by the State or USEPA, the state is required to incorporate the TMDLs, along with appropriate implementation measures, into the State Water Quality Management Plan (40 CFR 130.6 (c)(1), 130.7; CWC sections 13050(j), 13242). The Basin Plan, and applicable statewide plans, serves as the State Water Quality Management Plan governing the watersheds under the jurisdiction of the Water Board.
9. The TMDL implementation plan requires compliance with a new land disturbance prohibition for sediment within the Pajaro River watershed. The Water Board may prohibit certain types of waste discharge pursuant to CWC 13243. Dischargers may demonstrate compliance with the prohibition by submitting and implementing a Nonpoint Source Pollution Control Implementation Program that is consistent with the Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program or documentation that demonstrates there is no activity that may cause discharges of sediment. Consistent with CWC 13244, the Water Board conducted public notice and hearing requirements for the proposed land disturbance prohibition.
10. Pursuant to CWC section 13241, the Water Board considered, in adopting the Land Disturbance Prohibition in the Pajaro River watershed: (a) past, present, and probable future beneficial uses of water. (b) Environmental characteristics of the hydrographic unit under consideration, including the quality of water available thereto. (c) Water quality conditions that could reasonably be achieved through the coordinated control of all factors which affect water quality in the area. (d) Economic considerations. (e) The need for developing housing within the region. (f) The need to develop and use recycled water. The Water Board finds that: the prohibition will protect and enhance present and probable future beneficial uses of the Pajaro River watershed; the prohibition is a reasonable and necessary part of coordinated actions to achieve improved water quality conditions in the area; considering all cost information that the Water Board has received, costs to achieve compliance with the prohibition are reasonable relative to the benefit of improved water quality; the need for developing housing within the region is not relevant; and the need to develop and use recycled water is not relevant.
11. The Water Board's goal for establishing these TMDLs is to protect cold fresh water habitat, migration of aquatic organisms, and spawning, reproduction, and/or early development beneficial uses (COLD, MIGR, and SPWN, respectively) as defined in the Basin Plan.
12. The suspended sediment numeric targets are based on concentration and duration, which provides an exposure-based approach. This numeric target approach is new for Sediment TMDLs in California and has not been used before.
13. Water Board staff submitted a TMDL report to an external scientific review panel on April 12, 2005, as required by Health & Safety Code Section 57004. Water Board staff edited the Project Report or provided a written response that explained the basis for not incorporating the comments, or the comments did not result in any changes to the proposed Basin Plan Amendment. The scientific portions of the TMDL and implementation plan are based on sound scientific knowledge, methods, and practices in accordance with Section 57004.
14. Interested persons and the public have been informed of TMDL progress from the early stages of TMDL development. Efforts to inform the public and solicit public comment included public meetings, presentations to special interest groups, several individual meetings with vested stakeholders, and a number of telephone conversations with interested parties. Public notification of

the amendment to the Basin Plan occurred 45 days preceding the Board hearing. Notice of public hearing was given by advertising in newspapers of general circulation within the Region and by mailing a copy of the notice to all persons requesting such notice and applicable government agencies. Water Board staff responded to oral and written comments received from the public.

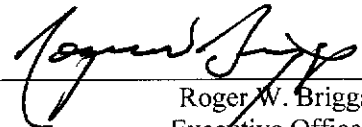

15. The Water Board considered costs of implementing measures to achieve these TMDLs. The costs to implement these TMDLs will be incurred by identified responsible parties. These costs are reasonable relative to the water quality benefits to be derived from implementing the TMDLs.
16. Implementation of this TMDL will require the identification of numerous landowners and operators across a diverse landscape and subsequent notification to comply with the conditional prohibition or submit nonpoint source implementation program plans. The Water Board intends to identify and notify these parties. However, the level of effort and a schedule to complete the identification and notification remains uncertain at this time, and will depend on staff availability, budget, and relationship to other water quality priorities.
17. Anti-Degradation – This order is consistent with the provisions of the State Water Resources Control Board Resolution No. 68-16, “Statement of Policy with Respect to Maintaining High Quality of Waters in California” and 40 CFR 131.12. The TMDL will result in improved water quality throughout the region and maintains the level of water quality necessary to protect existing and anticipated beneficial uses.
18. The Water Board concurs with the analysis contained in the Final Project Report; the California Environmental Quality Act “Substitute Document” Report for Basin Plan Amendment, including the CEQA Checklist; the staff report and responses to comments; and finds that the analysis complies with the requirements of the State Water Resources Control Board’s (State Board) certified regulatory CEQA process, as set forth in California Code of Regulations, Title 23, section 3775 et seq. Furthermore, the Water Board finds that the analysis fulfills the Water Board’s obligations attendant with the adoption of regulations “requiring the installation of pollution control equipment, or a performance standard or treatment requirement,” as set forth in section 21159 of the Public Resources Code. All public comments were considered.
19. The Basin Plan amendment incorporating TMDLs for sediment for the Pajaro River including, Llagas Creek, Rider Creek, and San Benito River and a Land Disturbance Prohibition must be submitted for review and approval by the State Board, the State Office of Administrative Law (OAL), and the US Environmental Protection Agency (USEPA). The Basin Plan amendment will become effective upon approval by OAL.
20. The amendment to the Basin Plan will result in no potential adverse effect, either individually or cumulatively, on wildlife and is therefore exempt from fee payments to the Department of Fish and Game under the California Fish and Game Code.
21. On December 2, 2005 in San Luis Obispo, California, the Water Board held a public hearing and heard and considered all public comments and evidence in the record.

THEREFORE, be it resolved that:

1. Pursuant to sections 13240, 13242, 13243, and 13244 of the California Water Code, the Water Board, after considering the entire record, including the oral testimony at the hearing, hereby adopts the amendment on “Attachment-Proposed Basin Plan Amendments.”

2. The Executive Officer is directed to forward copies of the Basin Plan amendment to the State Board in accordance with the requirements of section 13245 of the California Water Code.
3. The Water Board requests that the State Board approve the Basin Plan amendment in accordance with the requirements of sections 13245 and 13246 of the California Water Code and forward it to OAL and the USEPA. The Water Board shall file a Notice of Decision with the Secretary of Resources and the Governor's Office of Planning and Research (State Clearinghouse) after approval by OAL and USEPA.
4. The Executive Officer is authorized to sign a Certificate of Fee Exemption.
5. If, during its approval process, the State Board or OAL determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Water Board of any such changes.

I, Roger W. Briggs, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of the resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region, on December 2, 2005.

Roger W. Briggs
Executive Officer

RESOLUTION NO. R3-2005-0132

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENTS

AMENDMENT NO. 1. Revise the September 8, 1994 Basin Plan, Chapter 4 as follows:

Add the following to Chapter 4 after IX. G.:

IX. H. PAJARO RIVER TOTAL MAXIMUM DAILY LOADS FOR SEDIMENT INCLUDING LLAGAS CREEK, RIDER CREEK, AND SAN BENITO RIVER

The Regional Water Quality Control Board adopted this TMDL on December 2, 2005.

This TMDL was approved by:

The State Water Resources Control Board on _____.

The California Office of Administrative Law on _____. (*Effective date*)

The U.S. Environmental Protection Agency on _____. **5/3/07**

Problem Statement

Anthropogenic watershed disturbances have accelerated the natural processes of erosion and sedimentation in the Pajaro River, including Llagas Creek, Rider Creek, and San Benito River. Special studies have identified a variety of watershed conditions that have lead to excessive sedimentation. Excessive sedimentation has caused an exceedance of the narrative, general water quality objective for sediment because sediment load and rate have interfered with the beneficial uses of these waterbodies including, fish and wildlife (COLD, MIGR, and SPWN).

The narrative objective states, "the suspended sediment load and suspended sediment discharge rate of surface waters shall not be altered in such a manner as to cause nuisance or adversely affect beneficial uses."

Numeric Targets (interpretation of the narrative water quality objective)

This TMDL establishes numeric targets as indicators of the narrative, general water quality objective for sediment. This TMDL uses two types of numeric targets: suspended sediment concentration-duration and streambed characteristics. Numeric targets for suspended sediment concentration-duration are presented in Table 1. Numeric targets for streambed characteristics are presented in Table 2.

Table 1 - Numeric Targets for Suspended Sediment Concentrations

Major Subwatershed ^b	Duration (Days)	Maximum Concentration of Exposure Category Range (mg/L)	Numeric Targets ^a	
			Number of Instances Greater than Maximum Concentration.	Maximum Duration of Instances (days)
Tres Pinos	1	1808	15	22
	2	665	42	44
	6	244	36	51
	14	244	20	51
	49	90	5	108
San Benito	1	1808	9	9
	2	665	30	21
	6	244	29	35
	14	244	14	35
	49	90	2	60
Llagas	1	1808	0	0
	2	665	0	1
	6	244	9	15
	14	244	1	15
	49	90	0	28
Uvas	1	1808	1	3
	2	665	12	8
	6	244	12	15
	14	244	1	15
	49	90	0	18
Upper Pajaro	1	1808	0	1
	2	665	3	3
	6	244	2	9

	49	90	0	33
Corralitos (includes Rider Creek)	1	1808	0	1
	2	665	0	2
	6	244	8	11
	14	244	0	11
	49	90	0	36
Mouth of Pajaro	1	1808	0	1
	2	665	0	2
	6	244	8	11
	14	244	0	11
	49	90	0	36

^a Targets based on a 15-year model run for the period from 1986 to 2000.

^b Major subwatersheds of the Pajaro River.

SB-2006-0068 required non-substantive amendments to Footnote 'c' of Table 1 to ensure consistency with Finding 6. In the amendment to Table I, Footnote c, the first sentence should read: Numeric targets are comprised of two components: a maximum number of exceedance events that may occur in any consecutive 15 years after development of the monitoring program and the maximum duration (consecutive days) in which the maximum SSC value for each range can be exceeded in 15 years."

Table 2 - Numeric Targets for Streambed Characteristics

Parameter	Numeric Target ¹
Residual Pool Volume ²	V* = Mean values ≤ 0.21 Max values ≤ 0.45
Median Diameter (D ₅₀) of Sediment Particles in Spawning Gravels	D ₅₀ = Mean values ≥ 69 mm Minimum values ≥ 37 mm
Percent of Fine Fines (< 0.85 mm) in Spawning Gravels	Percent fine fines $\leq 21\%$
Percent of Coarse Fines (< 6.0 mm) in Spawning Gravels	Percent coarse fines $\leq 30\%$

¹ Target values are for sampling reach(es) within an individual waterbody.

² Residual Pool Volume refers to the portion of a pool in a stream that is available for fish to occupy. Pool habitat is the primary habitat for steelhead in summer. Overwintering habitat requirements include deeper pools, undercut banks, side channels, and especially large, unembedded rocks, which provide shelter for fish against the high flows of winter. V* gives a direct measurement of the impact of sediment on pool volume. It is the ratio of the amount of *pool volume filled by fine, mobile sediment*, to *total pool volume*. Qualifying pools are defined by Regional Board sampling protocol (2002).

Source Analysis

Sources of sediment include the following nonpoint and point source discharge activities occurring within the respective land use source categories. Nonpoint sources include irrigated agriculture activities upon crop, fallow and orchard lands; timber harvesting activities upon forested lands; grazing activities upon pasture and range lands; urban and rural residential development, roads, farm animal and livestock boarding upon urban lands; unpaved roads in the San Benito watershed, and paved and unpaved roads in the Corralitos Creek and Rider Creek watersheds upon lands in the roads landuse category; hydromodification-related activities upon all types of land use; off-road recreational vehicle areas; sand and gravel mining; as well as natural erosion and landslides. Point sources include the small Municipal Separate Storm Sewer Systems (MS4s) of Watsonville, Hollister, Gilroy, and Morgan Hill.

TMDLs and Allocations

TMDLs and load allocations are assigned to sources for seven watersheds as represented in Table 3. These allocations are modeled load values that are necessary to meet the suspended sediment concentration-duration targets. The Regional Board will determine that the TMDL is attained when the numeric targets are achieved. When numeric targets are achieved, the Regional Board will assume that these loads are met.

Margin of Safety

The total load includes an implicit margin of safety that was derived through conservative assumptions.

Table 3 – TMDLs and Load Allocations

Major Subwatershed	Allocations ¹ (LA/WLA)	Source Category							Total Load
		Crop, Fallow, and Orchard	Forest ²	Pasture and Range	Urban Lands ³	Roads	Barren ²	Sand and Gravel Mining	
Tres Pinos	LA	477	352	41085	312		11551		53,778
	WLA				1				
San Benito	LA	1971	2083	19863	327	1180	14128	27	39,679
	WLA				100				
Llagas	LA	596	326	6978	354		144	0	9,185
	WLA				787				
Uvas	LA	946	989	12454	280		369		15,177
	WLA				139				
Upper Pajaro	LA	4114	1228	37664	356		425	3	43,951
	WLA				161				
Corralitos (including Rider Creek)	LA	3544	4536	2427	443	79	73	2	11,389 ⁴
	WLA				284				
Mouth of Pajaro	LA	3047	58	3055	383		500	35	7,268 ⁴
	WLA				191				

Notes:

¹ Annual load allocations (LA) and waste load allocations (WLA) expressed in metric tones (1 metric ton equals 1,000 kilograms). Blank cells indicate no allocations for specified source category.

² Forest includes loads from natural sources and from timber harvesting operations; Barren includes loads from natural sources only.

³ Load allocations for urban lands outside of NPDES Phase 2 urban boundaries. Waste load allocations for urban lands within NPDES Phase 2 urban boundaries.

⁴ Number rounded.

Implementation

The following actions will be taken to reduce sediment discharges from activities that occur within each of the land use source categories (headings) below. Regional Board staff intends to identify and notify the parties responsible for the activities according to the schedule below; however, if staff resources are insufficient or other water quality priorities emerge, this schedule will be modified.

Crop, Fallow, and Orchard Lands

Landowners and operators of crop, fallow, and orchard lands, where irrigated agricultural activities are conducted, will implement agricultural management measures and perform monitoring and reporting pursuant to the Conditional Waiver of Waste Discharge Requirements for Discharges from Irrigated

Lands and the Monitoring and Reporting Program, Order No. R3-2004-0117. This is an existing, on-going activity.

Forest Lands

Landowners and operators of forest lands, where timber harvest activities are conducted, will implement timber harvest management measures and perform monitoring and reporting pursuant to the General Conditional Waiver of Waste Discharge Requirements for Timber Harvest Activities and the Monitoring and Reporting Program, Order No. R3-2005-0066. This is an existing, on-going activity.

Pasture and Range

Owners and operators of pasture and range lands, where grazing activities occur, must comply with the land disturbance prohibition.

Within one year following approval of the TMDLs by the Office of Administrative Law, the Executive Officer will notify the owners and operators of pasture and range lands of the prohibition and conditions for compliance with the prohibition. The Executive Officer will review and approve, or request modification of, the Nonpoint Source Pollution Control Implementation Program (Program) or documentation submitted in compliance with the prohibition within six months of the submittal date. Should the Program or documentation require modification, or if a party fails to submit a Program or documentation, the Executive Officer may issue a civil liability complaint pursuant to section 13268 or 13350 of the CWC, or alternatively, propose individual or general waste discharge requirements to assure compliance with the prohibition.

Urban Lands

Urban lands include the small communities of Watsonville, Hollister, Gilroy, and Morgan Hill (cities), rural properties throughout the watershed with farm animals or livestock boarding (rural properties), and roads throughout the watershed. These lands do not include unpaved roads in San Benito River watershed, and paved and unpaved roads within the Corralitos Creek and Rider Creek subwatersheds (See Roads below).

The cities must obtain a Municipal Separate Storm Sewer System (MS4) permit. Their Storm Water Management Programs must include specific actions to reduce sediment discharges pursuant to Clean Water Act Section 402(p)(3)(B) and Section D of State Board Order No. 2003-005, NPDES General Permit No. CAS000004 for Storm Water Discharges from Small Municipal Separate Storm Sewer Systems. The cities will then describe the actions taken as part of their annual report. If necessary, the Regional Board's Executive Officer can require more stringent sediment controls. This is an existing requirement and an on-going activity.

Owners and operators of rural properties and roads must comply with the land disturbance prohibition.

Within one year following approval of the TMDLs by the Office of Administrative Law, the Executive Officer will notify the owners and operators of rural properties and roads of the prohibition and conditions for compliance with the prohibition. The Executive Officer will review and approve, or request modification of, the Program or documentation submitted in compliance with the prohibition within six months of the submittal date. Should the Program or documentation require modification, or if a party fails to submit a Program or documentation, the Executive Officer may issue a civil liability complaint pursuant to section 13268 or 13350 of the CWC, or alternatively, propose individual or general waste discharge requirements to assure compliance with the prohibition.

Roads

Within one year following approval of the TMDLs by the Office of Administrative Law, the Executive Officer will notify the owners and operators of unpaved roads within the San Benito River watershed and paved and unpaved roads within the Corralitos Creek and Rider Creek watersheds of the prohibition and conditions for compliance with the prohibition. The Executive Officer will review and approve, or request modification of, the Program or documentation submitted in compliance with the prohibition within six months of the submittal date. Should the Program or documentation require modification, or if a party fails to submit a Program or documentation, the Executive Officer may issue a civil liability complaint pursuant to section 13268 or 13350 of the CWC, or alternatively, propose individual or general waste discharge requirements to assure compliance with the prohibition.

Sand and Gravel Mining

Within six months following approval of the TMDLs by the Office of Administrative Law and pursuant to Section 13263(e) of the CWC, Regional Board staff will review existing waste discharge requirements (WDRs) for sand and gravel mining operations and revise or require activities to: 1) assess cumulative impacts, including fluvial geomorphic impacts, upon the beneficial uses of the San Benito River; 2) mitigate the impacts identified; and 3) monitor the effectiveness of mitigation activities. One year following approval of the TMDLs by the Office of Administrative Law, pursuant to Section 13267 of the CWC, the Executive Officer will require owners and operators of sand and gravel mining operations to submit a plan to assess cumulative impacts, including fluvial geomorphic impacts, upon the beneficial uses of the San Benito River. The Executive Officer will comply with the requirements of section 13267 when issuing the orders. Regional Board staff will encourage sand and gravel mining operators to conduct the cumulative impacts assessment cooperatively.

Streambank Erosion

Owners and operators of properties where hydromodification activities occur must comply with the land disturbance prohibition.

Within one year following approval of the TMDLs by the Office of Administrative Law, the Executive Officer will notify the owners and operators of properties where hydromodification activities occur of the prohibition and conditions for compliance with the prohibition. The Executive Officer will review and approve, or request modification of, the Program or documentation submitted in compliance with the prohibition within six months of the submittal date. Should the Program or documentation require modification, or if a party fails to submit a Program or documentation, the Executive Officer may issue a civil liability complaint pursuant to section 13268 or 13350 of the CWC, or alternatively, propose individual or general waste discharge requirements to assure compliance with the prohibition.

Monitoring

Regional Board staff will develop a monitoring program to measure in-stream numeric targets within five years following TMDL approval. The program will be consistent with other Central Coast Region sediment TMDLs, regional sediment monitoring programs, and in cooperation with implementing parties. If Regional Board staff concludes that sediment contributions from individual landowners should be monitored in addition to in-stream numeric targets, the Executive Officer will establish such monitoring requirements in compliance with section 13267.

Tracking and Evaluation

Regional Board staff will conduct a review every three years beginning three years after TMDL approval by the Office of Administrative Law. Regional Board staff will utilize required reports, as well as other available information, to review implementation efforts of responsible parties and progress being made towards achieving the allocations. Regional Board staff will also review numeric target monitoring (see above) to determine progress towards TMDL achievement in the waterbody. The numeric targets, not

actual loads or reductions in loads, will be measured, as they are a more direct indicator of beneficial use protection. Regional Board staff may conclude and articulate that ongoing implementation efforts may ultimately be insufficient to achieve the allocations and numeric targets. If staff makes this determination, staff will recommend that additional reporting, monitoring, or implementation efforts be required either by the Executive Officer (e.g. pursuant to CWC section 13267 or section 13383) or by the Regional Board (e.g. through revisions of existing permits and/or a Basin Plan Amendment). At any particular date, Regional Board staff may conclude and articulate that implementation efforts and results are likely to result in achieving the allocations and numeric target, in which case existing and anticipated implementation efforts should continue.

Three-year reviews will continue until the TMDLs are achieved. The target date to achieve the TMDLs is forty-five years after implementation commences.

R3-2005-0132, 12/2/05
SB-2006-0069, 9/12/06
OAL, 11/27/06

AMENDMENT NO. 2. Revise the September 8, 1994 Basin Plan, Chapter 4 as follows:

Add the following to the end of Chapter 4 in VIII.E.1, Land Disturbance Prohibitions:

The controllable discharge of soil, silt, or earthen material from any grazing, farm animal and livestock, hydromodification, road, or other activity of whatever nature into waters of the State within the Pajaro River watershed is prohibited.

The controllable discharge of soil, silt, or earthen material from any grazing, farm animal and livestock, hydromodification, road, or other activity of whatever nature to a location where such material could pass into waters of the State within the Pajaro River watershed is prohibited.

The above two prohibitions do not apply to any discharge regulated by National Pollutant Discharge Elimination System permits, Waste Discharge Requirements or waivers of Waste Discharge Requirements.

The above two prohibitions do not apply to any grazing, farm animal and livestock, hydromodification, or road activity if the owner or operator:

- i. Submits a Nonpoint Source Pollution Control Implementation Program, consistent with the *Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program, May 20, 2004*, that is approved by the Executive Officer, or
- ii. Demonstrates there is no activity that may cause soil, silt, or earthen material to pass into waters of the state within the Pajaro River watershed, as approved by the Executive Officer.

This Land Disturbance Prohibition takes effect three years following approval by the U.S. Environmental Protection Agency.

**STATE OF CALIFORNIA
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place Suite 101
San Luis Obispo, Ca 93401-7906**

**CALIFORNIA ENVIRONMENTAL QUALITY ACT
"SUBSTITUTE DOCUMENT" REPORT FOR BASIN PLAN AMENDMENT**

(RESOLUTION NO. RB-2005-0132)

The California Regional Water Quality Control Board, Central Coast Region intends to adopt the **Pajaro River Total Maximum Daily Loads for Sediment (including Llagas Creek, Rider Creek, and San Benito River) and Land Disturbance Prohibition** into the Water Quality Control Plan (Basin Plan), Central Coast Region. All basin plan amendments are subject to the California Environmental Quality Act (CEQA). However, the State Board's water quality planning process has been certified by the Secretary for Resources as exempt from, CEQA's requirement for preparation of an environmental impact report or negative declaration and initial study (California Public Resources Code Section 21080.5, California Code of Regulation (CCR) Title 14, §15251(g)). State Board Regulations [23 CCR 3720 et seq.] describe the environmental documents required for planning actions. These documents are: a written report (Attachment B of this Basin Plan Amendment Package), a draft of the amendment (Attachment A of this Basin Plan Amendment Package), an Environmental Checklist Form [23 CCR 3776], and an alternatives analysis [23 CCR 3777].

This attachment includes the Environmental Checklist Form. Following the Environmental Checklist is an Environmental Evaluation of "Less than Significant Impacts" identified in the checklist, an alternatives analysis, and a Determination of no impact relative to this action.

ENVIRONMENTAL CHECKLIST AND A DESCRIPTION OF THE PROPOSED ACTIVITY

	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
a. AESTHETICS -- Would the project:				
a) Have a substantial adverse effect on a scenic vista?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Substantially damage scenic resources, including, But not limited to, trees, rock outcroppings, and historic buildings with a state scenic highway?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Substantially degrade the existing visual character or quality of the site and its surroundings	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b. AGRICULTURE RESOURCES: In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. -- Would the project:				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c. AIR QUALITY -- Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is not attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Expose sensitive receptors to substantial pollutant concentrations?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Create objectionable odors affecting a substantial number of people?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

d. BIOLOGICAL RESOURCES -- Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or US Fish and Wildlife Service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e. CULTURAL RESOURCES -- Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Disturb any human remains, including those interred outside of formal cemeteries?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

f. GEOLOGY AND SOILS -- Would the project:				
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
ii) Strong seismic ground shaking	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
iii) Seismic-related ground failure, including liquefaction?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
iv) Landslides?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Result in substantial soil erosion or the loss of topsoil?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of waste water?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g. HAZARDS AND HAZARDOUS MATERIALS Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
h) Expose people or structures to a significant risk of loss injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
h. HYDROLOGY AND WATER QUALITY -Would the project:				
a) Violate any water quality standards or waste discharge requirements?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Substantially deplete ground water supplies or interfere substantially with ground water recharge such that there would be a net deficit in aquifer volume or a lowering of the local ground water table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Otherwise substantially degrade water quality?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
j) Inundation by seiche, tsunami, or mudflow?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
i. LAND USE AND PLANNING Would the project:				
a) Physically divide an established community?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Conflict with any applicable habitat conservation plan or natural community conservation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
j. MINERAL RESOURCES -- Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Result in the loss of availability of a locally – important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
k. NOISE Would the project result in:				
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
i. POPULATION AND HOUSING -- Would the project:				
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
m. PUBLIC SERVICES				
a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Fire protection?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Police protection?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Schools?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Parks?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Other public facilities?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
n. RECREATION –				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

o. TRANSPORTATION/TRAFFIC -- Would the project:				
a) Cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on roads, or congestion at intersections)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Result in inadequate emergency access?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Result in inadequate parking capacity?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
p. UTILITIES AND SERVICE SYSTEMS -Would the project:				
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Comply with federal, state, and local statutes and regulations related to solid waste?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
q. MANDATORY FINDINGS OF SIGNIFICANCE	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

ENVIRONMENTAL EVALUATION

No impacts are noted for all items in the environmental checklist. It is therefore unlikely that there will be negative environmental impacts resulting from the project.

ALTERNATIVES ANALYSIS DISCUSSION

The following section discusses the preferred alternative (i.e., this proposed Total Maximum Daily Loads (TMDLs), a No Action Alternative, and other alternatives.

a. Preferred Alternative

The Preferred Alternative is the adoption of the Pajaro River Total Maximum Daily Loads for Sediment (including Llagas Creek, Rider Creek, and San Benito River) and Land Disturbance Prohibition as a Basin Plan Amendment. In addition to the TMDLs, the Basin Plan Amendment

includes load allocations, numeric targets, and an implementation plan. The TMDL monitoring plan will be developed within a five-year period following approval of the TMDLs by the Office of Administrative Law. Sediment load is allocated to nine source categories and represents reductions ranging from 100% to 20%. Numeric targets for suspended sediment concentrations and duration and targets for streambed conditions are established as indicators of reduced loading. A 45-year period of implementation is expected to be necessary to achieve load reductions and numeric targets. Significant adverse environmental effects are not anticipated from this preferred alternative.

b. Alternative - No Action

The No Action alternative means that the Regional Board would not adopt the TMDLs, Land Disturbance Prohibition, numeric targets, TMDL implementation plan, or monitoring program. The No Action alternative does not comply with the Clean Water Act requiring the development of TMDLs for impaired waters, nor does it meet the purpose of the proposed action, which is to comply with Basin Plan water quality objectives and restore beneficial uses affected by sedimentation.

c. Alternative – Increased Regulatory Oversight

The Increased Regulatory Oversight Alternative is defined as the proposed project with an Implementation Plan of greater regulatory oversight, including the option of adopting Waste Discharge Requirements or Waiver of Waste Discharge Requirements for responsible parties within the Pajaro River watershed. This alternative would result in similar improvements to biological resources as the proposed project (Preferred Alternative), but could be unnecessarily burdensome on the regulated community and unnecessarily exhaustive of limited Regional Board staff resources.

d. Alternative – Longer Implementation Period

An implementation period longer than the proposed 45 years would not be acceptable, since it would fail to resolve water quality impacts at the earliest practicable date, thereby offering less protection of beneficial uses within the Pajaro River watershed.

e. Alternative – Shorter Implementation Period

An implementation period shorter than the proposed 45 years would not be acceptable, since the feasibility of reducing loads within a shorter time frame is unlikely, based on past experience with management practices to reduce erosion and sedimentation.

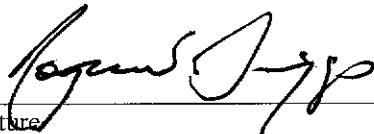

DETERMINATION

On the basis of this initial evaluation:

 X I find the proposed project COULD NOT have a significant effect on the environment.

 I find that the proposed project may have a significant adverse impact on the environment. However, there are feasible alternatives and/or feasible mitigation measures available which would substantially lessen any significant adverse impact. These alternatives and mitigation measures are discussed in the attached written report.

____ I find that the proposed project MAY have a significant effect on the environment. There are no feasible alternatives and/or feasible mitigation measures available which would substantially lessen any significant adverse impacts. See the attached written report for a discussion of this determination.

De Minimis Impact Finding

Project Title: Pajaro River Total Maximum Daily Loads (TMDLs) for Sediment (including Llagas Creek, Rider Creek, and San Benito River) and Land Disturbance Prohibition

Location: Pajaro River Watershed in San Benito, Santa Clara, Santa Cruz, and Monterey Counties, California

Project Proponent: Central Coast Regional Water Quality Control Board, Region 3
895 Aerovista Place, Suite 101, San Luis Obispo, CA 93401-7906

Project Description:

Pajaro River, Llagas Creek, Rider Creek, and San Benito River are listed as "impaired waters" under the federal Clean Water Act, Section 303(d). The Central Coast Regional Water Quality Control Board (CCRWQCB) has prepared a Pajaro River Total Maximum Daily Loads for Sediment (including Llagas Creek, Rider Creek, and San Benito River) to determine the assimilative capacity of the water bodies and to allocate sediment discharges so that they do not exceed this capacity, thus ensuring beneficial uses are protected and water quality objectives met. The Total Maximum Daily Load includes a technical report that describes sediment impacts to Beneficial Uses in these waterbodies, evaluates sources of sediment, establishes numeric targets, and calculates total loads that would protect Beneficial Uses. It includes an Implementation Plan with a Land Disturbance Prohibition and also proposes the development of a Monitoring Plan within five-years of TMDL approval. Together, these comprise the "project" in this finding.

The present rate of sediment production in the Pajaro River Watershed is accelerated due to anthropogenic disturbances associated with human settlement and resource extraction. Biological resource impacts are varied, but anadromous fisheries have experienced a well-documented decline over the past century. Known sediment impacts to fish habitat include filling of pools and spawning areas by fine sediment and excessive suspended sediment concentrations. The TMDLs seek to address sediment-related impacts to these resources through a program of erosion control, which would reduce the average annual sediment load of the watershed by approximately 65 percent. This reduction in loads is expected to produce improved conditions in streambed sediment conditions and suspended sediment concentrations as measured by numeric targets identified in the TMDL.

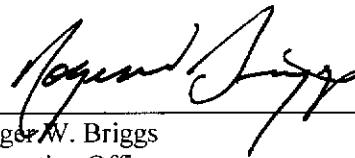

Because the sediment objectives in the Basin Plan are narrative, rather than numeric, the TMDLs establish numeric targets as indicators of water quality that are supportive of beneficial uses. The numeric targets serve to interpret the narrative water quality objectives and provide a measure with which to determine if the objectives and the TMDLs are being met. The TMDLs use two types of numeric targets; suspended sediment concentration and streambed characteristics. Numeric targets for suspended sediment concentration and duration are derived from Newcombe

and Jensen Severity of Ill Effects (SEV) model. These suspended sediment numeric targets represent water quality conditions for seven (7) major subwatersheds with the Pajaro River system. Numeric targets for streambed characteristics include residual pool volume targets, as well as size and composition of sediment within spawning gravels.

The numeric targets, not actual loads or reductions in loads, will be measured, as they are a more direct indicator of beneficial use protection. They provide a more comprehensive method in which to evaluate progress regarding load reductions and the attainment of water quality objectives and protection of beneficial uses. Relationships between individual targets and water quality improvements will be examined over time.

Certification:

I hereby certify that the California Regional Water Quality Control Board, Central Coast Region, has made the above findings of fact and that based upon the Environmental Checklist, written report and hearing record, the project will not individually or cumulatively have an adverse effect on wildlife resources, as defined in Section 711.2 of the Fish and Game Code.

Roger W. Briggs
Executive Officer
Regional Water Quality Control Board
December 2, 2005

Attachment: Environmental Checklist: Staff Report Attachment C: California Environmental Quality Act "Functional Equivalent" Report for Basin Plan Amendment (Resolution No. R3-2005-0132)

September 9, 2005

**STATE OF CALIFORNIA
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, CA 93401-7906**

**RESOLUTION NO. R3-2005-0106
AMENDING THE WATER QUALITY CONTROL PLAN
FOR THE CENTRAL COAST BASIN TO INCLUDE THE
SAN LUIS OBISPO CREEK TOTAL MAXIMUM DAILY LOAD AND
IMPLEMENTATION PLAN FOR NITRATE-NITROGEN**

WHEREAS, the California Regional Water Quality Control Board, Central Coast Region hereby finds that:

The California Regional Water Quality Control Board, Central Coast Region (Central Coast Water Board), adopted the Water Quality Control Plan for the Central Coast Basin (Basin Plan), on September 8, 1994. The Basin Plan includes beneficial use designations, water quality objectives, implementation plans for point source and nonpoint source discharges, and statewide plans and policies.

2. The Central Coast Water Board periodically revises and amends the Basin Plan. The Central Coast Water Board has determined the Basin Plan requires further revision and amendment to incorporate the San Luis Obispo Creek Total Maximum Daily Load (TMDL) for Nitrate-Nitrogen (Nitrate-N).
3. The Central Coast Water Board proposes to amend the Basin Plan by inserting amendments into Chapter Four, Section IX (Total Maximum Daily Loads).
4. Section 303(d) of the Clean Water Act (CWA) requires states to identify and prepare a list of water bodies that do not meet water quality standards and to establish TMDLs for listed waterbodies.
5. San Luis Obispo Creek was identified on California's 1994 303(d) list as impaired by nutrients due to exceedence of the existing Basin Plan objective protecting the municipal and domestic supply (MUN) beneficial use.
6. San Luis Obispo Creek is located in San Luis Obispo County, California. The headwaters are located immediately north-east of the City of San Luis Obispo and flow southwest for approximately 17 miles towards Avila Beach, California, ultimately draining into the Pacific Ocean at Avila Bay.

7. The Final Project Report contains a Problem Statement, Numeric Targets, Source Analysis, Total Maximum Load, Linkage Analysis, Load Allocations, Margin of Safety, an Implementation Plan, and a Monitoring Plan.
8. The elements of a TMDL are described in 40 CFR 130.2 and 130.7 and section 303(d) of the CWA, as well as USEPA guidance documents. A TMDL is defined as "the sum of individual waste load allocations for point sources and load allocations for nonpoint sources and natural background" (40 CFR 130.2). The Central Coast Water Board has determined that the San Luis Obispo Creek Nitrate-N TMDL is set at levels necessary to attain and maintain the applicable numeric water quality objectives taking into account seasonal variations and any lack of knowledge concerning the relationship between effluent limitations and water quality (40 CFR 130.7(c)(1)). The regulations in 40 CFR 130.7 also state that TMDLs shall take into account critical conditions for stream flow, loading and water quality parameters. TMDLs are often expressed as a mass load of the pollutant but can be expressed as a unit of concentration if appropriate (40 CFR 130.2(i)).
9. Upon establishment of TMDLs by the State or US Environmental Protection Agency (USEPA), the State is required to incorporate the TMDLs, along with appropriate implementation measures, into the State Water Quality Management Plan (40 CFR 130.6 (c)(1), 130.7; CWC sections 13050(j), 13242). The Basin Plan, and applicable statewide plans, serves as the State Water Quality Management Plan governing the watersheds under the jurisdiction of the Central Coast Water Board.
10. The Central Coast Water Board's goal for establishing the above mentioned TMDL is to protect the municipal and domestic water supply beneficial use (MUN) as defined in the Basin Plan.
11. Central Coast Water Board staff submitted a TMDL Project Report to an external scientific review panel on March 16, 2005 as required by Health & Safety Code Section 57004. Central Coast Water Board staff edited the Project Report or provided a written response that explained the basis for not incorporating the comments, or the comments did not result in any changes to the proposed Basin Plan Amendment. The scientific portions of the TMDL and implementation plan are based on sound scientific knowledge, methods, and practices in accordance with Section 57004.
12. Interested persons and the public have been informed of TMDL progress from the early stages of TMDL development. Efforts to inform the public and solicit public comment include public meetings, presentations to special interest groups, several individual meetings with vested stakeholders, and a number of telephone conversations with interested parties. Water Board staff provided public notification of the amendment to the Basin Plan 45 days preceding the Board hearing. Notice of public hearing was given by advertising in newspapers of general circulation within the Region and by mailing a copy of the notice to all persons requesting such notice and applicable government agencies. Central Coast Water Board staff responded to oral and written comments received from the public.

13. The Central Coast Water Board considered costs of implementing measures to achieve the TMDL. The costs to implement the TMDL will be incurred by identified responsible parties. These costs are reasonable relative to the water quality benefits to be derived from implementing the TMDL.
14. Anti-Degradation – This Resolution is consistent with the provisions of the State Water Resources Control Board Resolution No. 68-16, “Statement of Policy with Respect to Maintaining High Quality of Waters in California” and 40 CFR 131.12. The TMDL will result in improved water quality and maintains the level of water quality necessary to protect existing and anticipated beneficial uses.
15. The Central Coast Water Board concurs with the analysis contained in the Final Project Report, California Environmental Quality Act “Substitute Document” Report for Basin Plan Amendment, including the CEQA Checklist, the staff report and the responses to comments and finds that the analysis complies with the requirements of the State Water Resources Control Board’s (State Water Board) certified regulatory CEQA process, as set forth in California Code of Regulations, Title 23, section 3775 et seq. Furthermore, the Central Coast Water Board finds that the analysis fulfills the Central Coast Water Board’s obligations attendant with the adoption of regulations “requiring the installation of pollution control equipment, or a performance standard or treatment requirement,” as set forth in section 21159 of the Public Resources Code. All public comments were considered.
16. The Basin Plan amendment incorporating a TMDL for nitrate-N for San Luis Obispo Creek must be submitted for review and approval by the State Water Board, the State Office of Administrative Law (OAL), and the USEPA. The Basin Plan amendment will become effective upon approval by OAL.
17. The amendment to the Basin Plan will result in no potential adverse effect, either individually or cumulatively, on wildlife and is therefore exempt from fee payments to the Department of Fish and Game under the California Fish and Game Code.
18. On September 9, 2005, in San Luis Obispo, California, the Central Coast Water Board held a public hearing and heard and considered all public comments and evidence in the record.

THEREFORE, be it resolved that:

- 1 Pursuant to sections 13240 and 13242 of the California Water Code, the Central Coast Water Board, after considering the entire record, including the oral testimony at the hearing, hereby adopts the amendment: “Attachment A: Attachment -Proposed Basin Plan Amendments.”
2. The Executive Officer is directed to forward copies of the Basin Plan amendment to the State Water Board in accordance with the requirements of section 13245 of the California Water Code.
3. The Central Coast Water Board requests that the State Water Board approve the Basin Plan amendment in accordance with the requirements of sections 13245 and 13246 of the

September 9, 2005

California Water Code and forward it to OAL and the USEPA. The Central Coast Water Board shall file a Notice of Decision with the Secretary of Resources and the Governor's Office of Planning and Research (State Clearinghouse) after approval by OAL and USEPA.

4. The Executive Officer is authorized to sign a Certificate of Fee Exemption.
5. If, during its approval process, the State Water Board or OAL determines that minor, non-substantive corrections to the language of the amendment are needed, the Executive Officer may make such changes, and shall inform the Central Coast Water Board of any such changes.

I, **Roger W. Briggs, Executive Officer**, do hereby certify the foregoing is a full, true, and correct copy of the resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region, on September 9, 2005.

for Roger W. Briggs
Executive Officer

RESOLUTION NO. R3-2005-0106

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENTS

1. Revise the September 8, 1994 Basin Plan, Chapter Four, as follows:

Add the following to Chapter 4 after IX. F.

IX. G. SAN LUIS OBISPO CREEK TOTAL MAXIMUM DAILY LOAD AND IMPLEMENTATION PLAN FOR NITRATE-NITROGEN

The Regional Water Quality Control Board adopted this TMDL on September 9, 2005.

This TMDL was approved by:

The State Water Resources Control Board on _____

The California Office of Administrative Law on _____ (Effective date)

The U.S. Environmental Protection Agency on _____ 1/10/07

Problem Statement

The municipal and domestic supply of water beneficial use (MUN) is not being supported because nitrate-N concentrations in San Luis Obispo Creek exceed the existing Basin Plan numeric objective protecting the MUN beneficial use.

Numeric Target

The numeric target used to calculate the TMDL is a nitrate-N concentration of 10 mg/L-N.

Source Analysis

Nitrate-N sources contributing to the problem identified in the Problem Statement are, in decreasing order of contribution: City of San Luis Obispo Water Reclamation Facility (WRF), croplands, background, reservoirs, and residential areas.

TMDL and Allocations

The TMDL is a receiving water nitrate-N concentration equal to the numeric target. The following allocations are necessary to achieve the TMDL.

Wasteload Allocations:

City of San Luis Obispo WRF effluent: The monthly mean nitrate-N concentration of effluent shall not exceed 10 mg/L-N.

Load Allocations:

- Croplands in Prefumo Creek Watershed: shall not cause nitrate-N concentration in receiving waters to exceed 10 mg/L-N.
- Background: Nitrate concentration of 0.1 mg/L-N.

Load and wasteload allocations to sources currently meeting water quality standards:

- The following wasteload and load allocations ensure that the receiving water will achieve compliance with water quality standards at the earliest possible date, continue to meet

water quality standards after the above wasteload and load allocations are attained, and comply with state and federal anti-degradation requirements.

- Residential Sources Wasteload Allocation:
 - Storm water discharge shall not cause an increase in receiving water nitrate-N concentration greater than the current increase in nitrate-N concentration resulting from the discharge.
- Reservoir Sources Load Allocation (Laguna Lake):
 - Reservoir discharge shall not cause an increase in receiving water nitrate-N concentration greater than the current increase in nitrate-N concentration resulting from the discharge.

Margin of Safety: Nitrate concentration of 2.2 mg/L-N.

IMPLEMENTATION

The following actions will be taken to implement the TMDL.

WRF Source:

The Central Coast Water Board will incorporate an effluent limit for nitrate-N in the City of San Luis Obispo's National Pollutant Discharge Elimination System permit (NPDES permit) for the WRF, consistent with the allocations described in the Wasteload Allocations section above. The effluent limit will be incorporated in the NPDES permit at the first permit renewal following TMDL approval by the Central Coast Water Board (expected in May 2007).

The Central Coast Water Board intends to issue a Cease and Desist Order (CDO) or Time Schedule Order to the WRF concurrently with the NPDES permit, requiring the WRF to reduce nitrate-N concentration in the effluent. The CDO will contain a time schedule establishing the time allowed to comply with the order.

The Central Coast Water Board will consider a revision of the wasteload allocation and corresponding effluent limit for the WRF if an amendment to the Basin Plan removing or revising the MUN beneficial use and corresponding numeric objective for nitrate is approved by USEPA.

Residential Source (Storm water):

- The City of San Luis Obispo, the County of San Luis Obispo, and Cal Poly State University will implement management practices consistent with and required by Small MS4 Permits regulating storm water discharge in San Luis Obispo Creek watershed, and will submit annual reports as required by such permits. If implementation actions are insufficient to achieve the TMDL, additional implementation actions will be required through approval by the Executive Officer (e.g., pursuant to CWC section 13267 or section 13383) or by the Central Coast Water Board (e.g., by requiring revisions of existing storm water management plans and/or a Basin Plan Amendment).

Reservoir Source

- Implementation measures to achieve the allocation to the reservoir source are carried out through the Residential Source (Storm water) implementation actions.

Cropland Source:

- Landowners and operators of irrigated lands in Prefumo Creek watershed will implement actions needed to achieve the allocations to croplands pursuant to the Conditional Waiver of Waste Discharge Requirements for Discharges to Irrigated Lands (Conditional Waiver). Implementation and monitoring requirements for parties engaged in agricultural activities are consistent with, and rely upon, the Conditional Waiver.
- Monitoring reports and data associated with the Conditional Waiver, as well as other information, will be used to determine whether management measures being taken are sufficient to achieve the TMDL by the year 2012. Central Coast Water Board staff will make this determination every three years as described in the Tracking and Monitoring section below. If implementation actions are insufficient to achieve the TMDL, additional implementation actions will be required through approval by the Executive Officer (e.g., pursuant to CWC section 13267 or section 13383) or by the Central Coast Water Board; the Executive Officer or the Central Coast Water Board will approve of additional actions as soon as practicable.

Monitoring

The following actions will be taken to implement monitoring requirements.

The Executive Officer (EO) or the Central Coast Water Board will amend the Monitoring and Reporting Program (M&RP) of the City's NPDES permit for the WRF to incorporate effluent and stream monitoring for nitrate-N, and to incorporate reporting of these monitoring activities. The City of San Luis Obispo will comply with the amended M&RP as soon as the EO or the Water Board issues the revised program (anticipated to occur at the next permit renewal following TMDL approval by the Central Coast Water Board [expected in May 2007]).

Implementation and monitoring requirements for parties engaged in agricultural activities are consistent with, and rely upon, the Conditional Waiver.

Tracking and Monitoring

- Central Coast Water Board staff will conduct a review of implementation activities every three years, beginning three years after TMDL approval by the Office of Administrative Law, unless funding is unavailable. Central Coast Water Board staff will utilize annual reports associated with Small MS4 permits, as well as other available information, to review water quality data and implementation efforts of implementing parties and progress being made towards achieving the allocations and the numeric target. Central Coast Water Board staff may conclude that ongoing implementation efforts may be insufficient to ultimately achieve the allocations and numeric target. If staff makes this determination, staff will recommend that additional reporting, monitoring, or implementation efforts be required either through approval by the Executive Officer (e.g.,

pursuant to CWC section 13267 or section 13383) or by the Central Coast Water Board (e.g., through revisions of existing permits and/or a Basin Plan Amendment). Central Coast Water Board staff may conclude that to date, implementation efforts and results are likely to result in achieving the allocations and numeric target, in which case existing and anticipated implementation efforts will continue.

Three-year reviews will continue until the TMDL is achieved, unless funding is unavailable. The target date to achieve the TMDL is during or before the year 2012.

STATE OF CALIFORNIA
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION

STAFF REPORT FOR REGULAR MEETING OF SEPTEMBER 9, 2005
Prepared on July 27, 2005

ITEM NUMBER: 25

SUBJECT: Resolution No. R3-2005-0013; Proposed Amendment to the Water Quality Control Plan, Central Coast Region (Basin Plan) – Repeal Basin Plan Resolution No. 73-05 and Section 5(f) of Basin Plan Resolution No. 89-04

KEY INFORMATION:

Location: Central Coast Region
Type of Waste: All Oil Field Wastes, including “Clean, Fresh-Water Drilling Mud” and “Clean Oil”

SUMMARY

Central Coast Water Board (Water Board) staff proposes amendment of its Water Quality Control Plan (Basin Plan) by adopting Resolution No. R3-2005-0013. Adoption of this resolution is a ministerial act for two reasons: a) no one can legally discharge or beneficially reuse oil field materials under the old program (pursuant to the Executive Officer’s letter dated October 22, 2002) and b) all waivers of waste discharge requirements expired on January 1, 2003 (pursuant to California Water Code Section 13269). By adopting this resolution, outdated language in the Basin Plan will be eliminated.

Also on September 9, 2005, Water Board staff proposed a general waiver to regulate waste piles (Waste Pile Waiver), and a general waiver to regulate beneficial reuse of oily waste (Reuse Waiver). The general waivers will supercede the outdated Resolutions and the new program will protect water quality.

Background

On December 14, 1973, the Water Board adopted Resolution No. 73-05, a policy regarding beneficial use of oil field waste materials in the Santa Maria Valley.

Subsequently, on November 17, 1989, the Water Board adopted Resolution No. 89-04, which expanded that policy to apply throughout the region. Resolution Nos. 73-05 and 89-04 are included as Attachments 1 and 2 of the staff report.

Resolution No. 73-05 limits oil field waste material reuse to: (a) clean, fresh-water drilling mud removed from the drilling of an oil well prior to the time that the first production string of casing is installed, and (b) clean oil, not mixed with contaminants such as salt brines or toxic materials. Provisions in Resolution No. 73-05 include:

- (1) Approval of sites suitable for disposal of different kinds of liquid waste;
- (2) A mandate that all oil field waste be disposed of at Class I or Class II facilities; and
- (3) Identification of a specific procedure under which the Executive Officer may waive Waste Discharge Requirements (WDRs) for beneficial use of fresh-water drilling mud and clean oil.

The purpose of this Basin Plan amendment is to repeal text referring to the oil field

beneficial reuse policies, repeal Resolution No. 73-05 (Appendix A-16), and repeal section 5(f) of Resolution No. 89-04 (Appendix A-17) immediately. Water Board staff will regulate discharges of petroleum-impacted soils to waste piles, treatment and/or processing areas on oil-field properties via waivers of WDRs. At the September 9, 2005 meeting, the Water Board will consider issuance of WDR waivers pertaining to the regulation of oil field wastes. The Basin Plan amendment, Resolution No. R3-2005-0013, is included as Attachment 3. In compliance with the Basin Planning process, the Basin Plan Environmental Checklist is included as Attachment 4.

Adoption of this resolution is a ministerial act that is not subject to the California Environmental Quality Act (CEQA). Adoption of this resolution is also not a "project" that requires compliance with CEQA (California Public Resources Code §21000 et seq.). The Water Board is not directly undertaking an activity, funding an activity or issuing a permit or other entitlement for use (Public Resources Code section 21065; 14 California Code of Regulations [CCR]. §15378).

Due to the Executive Officer's October 22, 2002 letter, no one can legally discharge pursuant to Resolution Nos. 73-05 and 89-04]. The Water Board is not approving any activity (14 CCR §15352). This is a clerical amendment to bring the Basin Plan into compliance with current law (see "Why Update the Basin Plan?" section below).

Water Board staff has also prepared a general waiver to regulate waste piles (Waste Pile Waiver), and a general waiver to regulate beneficial reuse of oily waste (Reuse Waiver). The Waste Pile and Reuse Waivers supercede the outdated Resolutions. Water Board staff has prepared documentation to comply with the CEQA for those two projects.

DISCUSSION

Why Update the Basin Plan?

The specific reasons that a repeal of Resolution No. 73-05 and section 5(f) of Resolution No. 89-04 is necessary are as follows:

1. An important part of the findings in Resolution No. 73-05 is based on repealed statutes, California Water Code (CWC) sections 14040 and 14041. These statutes mandate water boards to identify sites for disposal of hazardous waste. This requirement appears to be an important basis for the Water Board's determination that all oil field waste must go to Class I and Class II facilities. This regulatory mandate no longer exists. Extensive amendments to then-Sub-chapter 15 of Title 23 of the CCR provided a method for case-by-case determinations of which types of waste, including liquid wastes, had to be disposed at which class of facility. Additionally, the Toxic Pits Cleanup Act stringently regulates storage or disposal of liquid hazardous wastes in surface impoundments.
2. The requirement to dispose of all oilfield waste to Class I or Class II units is more stringent than necessary to reasonably protect water quality. Today, regulations regarding the disposal of waste to land are found in Title 23, CCR, Chapter 15 (hazardous waste) and CCR Title 27 (non-hazardous waste). These regulations provide for flexibility necessary for management, treatment and disposal of the wide range of wastes found at oil fields. For example, soils containing refined petroleum products may be treated in waste piles or land treatment units after which they may be clean enough for reuse or disposal in Class III waste management units.

3. The limited exemption only for fresh-water drilling mud and clean oil is too narrow. Other types of oil field waste may be reused without significant risk of harming water quality, such as sands containing crude oil. Repeal of this broad prohibition with such a narrow exception would allow the Water Board flexibility needed to regulate oil field waste reuse and disposal while protecting water quality.
 4. Amendments to CWC section 13269 mandated that all waivers of waste discharge requirements would expire on January 1, 2003. Thus the waiver provisions of Resolution No. 73-05 are no longer in effect. Thus, only the provision mandating disposal of all oil field waste to Class I and Class II facilities is still effective. The exception for certain drilling mud and clean oil still exists but Resolution 73-05 as a whole appears to condition reuse of those wastes on its detailed waiver procedure. That procedure is now void. In order to avoid confusion in the future, Resolution No. 73-05 should be repealed.
 5. If Resolution No. 73-05 is repealed, adequate water quality protection from discharges of oil field waste is provided under other provisions of the Basin Plan, laws and regulations. Basin Plan provisions must be implemented in WDRs or waivers of WDRs, and the Waste Pile and Reuse Waivers that Water Board staff are proposing. Some Basin Plan water quality objectives that protect ground water and fresh surface waters from oil field waste include prohibition of discharge of toxic chemicals in toxic amounts, discharge of hazardous wastes in excess of maximum contaminant levels and discharge of chemicals imparting undesirable tastes and odors. Ocean Water Quality is protected by water quality objectives in the State Water Board's Ocean Plan, which is incorporated into the Basin Plan. The Basin Plan contains other water quality protections, including a prohibition against the discharge of oil or any residual products of petroleum except in accordance with waste discharge requirements or other provisions of the Porter-Cologne Act. (Basin Plan, Chapter V., section IV.A.)
 6. As previously noted in Paragraph 1 above, the Toxic Pits Cleanup Act stringently regulates discharges of liquid hazardous wastes to surface impoundments. CCR Title 23, Chapter 15 and CCR Title 27 provide detailed regulation for storage and disposal of hazardous and non-hazardous wastes to land.
 7. In the case of reuse of oil field materials, the intent is that there not be a disposal or discharge to ground or surface waters. The Waste Pile and Reuse Waivers are drafted to ensure that reuse is carried out so that there will be no discharges in violation of water quality objectives and prohibitions.
- In conclusion, Resolution No. 73-05 should be repealed because its waiver portion has already been repealed by statute. The remaining requirement that all oil field waste be disposed at a Class I or Class II facility is too rigid and is not necessary to reasonably protect water quality. In addition, adequate protection is provided by other Basin Plan provisions as well as other laws and regulations.

Economic Effects of the Amendment

The effect of the amendment will be throughout the Central Coast Region. However, over 30 oil companies (ranging from large to small oil producers) currently operate oil production facilities in San Luis Obispo and Santa Barbara Counties. There are less significant oil field operations in southern Monterey County. These oil field operations will be most affected by repeal of Resolution

No. 73-05 and Section 5(f) of Resolution No. 89-04.

As part of its implementation of the Resolution Nos. 73-05 and 89-04, the Water Board entered into an interagency coordination agreement with the Santa Barbara County Fire Protection Division (FPD) regarding oil field decommissioning in December 1998.

For unknown reasons, a few oil field operators did not comply with the criteria used to determine if petroleum wastes were appropriate for reuse. The operators' noncompliance resulted in unauthorized discharges of petroleum wastes to land, groundwater, and surface water. In order to prevent recurrence of these incidents, the Executive Officer's letter dated October 22, 2002, withdrew any reuse approval granted in the past to oil field operations in Santa Barbara County. In addition, the Water Board's approval of Santa Barbara County FPD's oil field re-use program was postponed until further update and review of the re-use material acceptance criteria was performed and the program re-instated. Since October 2002, oil field operators have had to dispose of petroleum wastes at landfills and not beneficially reuse the petroleum materials (such as for road materials).

In September 2005, the Water Board will consider adopting general WDR waivers for soils containing crude oil at oil field properties. Dischargers will be required to submit a Report of Waste Discharge and appropriate filing fee, based on the level of complexity and threat to water quality.

In addition, in June and July 2005, Water Board staff met with Santa Barbara County FPD, Santa Barbara County Energy Division, and Division of Oil and Gas and Geothermal Resources staff. The agencies plan to develop an interagency coordination agreement for oil field waste pile and reuse program oversight management and coordination.

ENVIRONMENTAL SUMMARY

A Notice of Public Hearing has been circulated (Attachment 4). A Notice of Filing,

this staff report, and Environmental Checklist were prepared and circulated by Water Board staff to interested agencies and persons prior to consideration of the Basin Plan Amendment by the Central Coast Water Board. This will satisfy the environmental documentation requirements of the Basin Planning process and the Federal Clean Water Act.

COMMENTS

On June 3, June 22, and July 12, 2005, Water Board staff hosted three workshops to discuss the Basin Plan Amendment and Waste Pile and Reuse Waivers, all pertaining to oil field wastes.

Verbal comments during the workshops pertained solely to the Waste Pile and Reuse Waivers. Written public comments were due by July 27, 2005. No written comments were received pertaining to the Basin Plan Amendment.

On September 9, 2005, the Water Board will consider adoption of the Basin Plan Amendment, Waste Pile and Reuse Waivers, pertaining to oil field wastes.

RECOMMENDATIONS

Adopt Resolution No. R3-2005-0013, as proposed.

ATTACHMENTS

 - Attachment 4, Report for Basin Plan Amendment (including the Environmental Checklist)
4. Hearing Notice dated June 16, 2005

STATE OF CALIFORNIA
 CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
 CENTRAL COAST REGION
 895 Aerovista Place, Suite 101
 San Luis Obispo, CA 93401

RESOLUTION NO. R3-2005-0013
 AMENDING THE WATER QUALITY CONTROL PLAN
 REPEAL BASIN PLAN RESOLUTION NO. 73-05 AND SECTION 5(F) OF
 BASIN PLAN RESOLUTION NO. 89-04

WHEREAS, the California Regional Water Quality Control Board, Central Coast Region (hereafter Water Board) finds:

1. The Water Board adopted a policy regarding beneficial use of oil field waste materials in the Santa Maria Valley (Resolution No. 73-05) on December 14, 1973.
2. The Water Board expanded the beneficial use of oil field waste materials policy to apply throughout the region (Resolution No. 89-04) on November 17, 1989.
3. The Water Board adopted the current Water Quality Control Plan, Central Coastal Basin (Basin Plan) on September 8, 1994. The Basin Plan includes beneficial use designations, water quality objectives, implementation plans for point source and nonpoint source discharges, and statewide plans and policies. Resolution Nos. 73-05 and 89-04 are included in the Basin Plan as Appendix A-16 and A-17, respectively.
4. The Water Board periodically revises and amends the Basin Plan. Water Board staff determined the Basin Plan requires further revision and amendment to repeal the reuse policy for oil field waste materials throughout the region. The Water Board will regulate oil field waste materials using waste discharge requirements (WDRs) or waiver of WDRs on oil field leases and fee-properties. The Water Board will consider regulation of oil field waste materials on oil field lease and fee properties using waivers of WDRs at the September 9, 2005 Water Board meeting in San Luis Obispo.
5. In January 2005, Water Board staff contacted State Water Resources Control Board (State Water Board) staff to inquire if repeal of Appendix A-16 and Section 5(f) of Appendix A-17 of the Basin Plan required external scientific review to comply with Health and Safety Code Section 57004. State Water Board staff indicated that external scientific review was not required for repeal of the Water Board policy for reuse of oil field wastes.
6. Interested persons and the public have been informed of the Water Board's intent to repeal Appendix A-16 and Section 5(f) of Appendix A-17 of the Basin Plan. Efforts to inform the public and solicit public comment include a public meeting/ workshop, several individual meetings with vested stakeholders, and a number of telephone conversations with interested parties. Notice of public hearing was given by advertising in newspapers

requesting such notice and applicable government agencies. Water Board staff responded to oral and written comments received from the public.

7. The Water Board considered costs of repealing Resolution No. 73-05 and Section 5(f) of Resolution No. 89-04. If repealed, the Water Board will need to adopt waivers of WDRs for the storage and re-use of petroleum waste materials. Dischargers will be required to submit a Report of Waste Discharge and appropriate filing fee, based on the level of complexity and threat to water quality. The Water Board has considered the costs of implementing the amendment to dischargers, and finds these costs to be reasonable relative to the water quality benefits derived from implementing the Basin Plan amendment.
8. Anti-Degradation – This Resolution is consistent with the provisions of the State Water Board Resolution No. 68-16, “Statement of Policy with Respect to Maintaining High Quality of Waters in California” and 40 Code of Federal Regulations (CFR) 131.12. Regulation of oil field wastes using WDRs or a WDR waiver provides more regulatory oversight compared to the re-use policy described in Resolution No. 73-05 and Section 5(f) of Resolution No. 89-04. Therefore, the Basin Plan amendment will result in improved water quality throughout the region and maintains the level of water quality necessary to protect existing and anticipated beneficial uses.
9. The Water Board concurs with the analysis contained in the Environmental Checklist, the staff report, and the responses to comments and finds that the analysis complies with the requirements of the State Board’s regulations, as set forth in the California Code of Regulations (CCR), Title 23, section 3775 et seq. Adoption of this Resolution is a ministerial act that is not subject to the California Environmental Quality Act (CEQA). Adoption of this Resolution is also not a “project” that requires compliance with the CEQA (California Public Resources Code §21000 et seq.). The Water Board is not directly undertaking an activity, funding an activity or issuing a permit or other entitlement for use (Public Resources Code section 21065; 14 CCR. §15378). Due to the Executive Officer’s October 22, 2002 letter, no one can legally discharge pursuant to Resolution Nos. 73-05 or 89-04. The Water Board is not approving any activity (14 CCR. §15352). This is a clerical amendment to bring the Basin Plan into compliance with current law. Water Board staff has also prepared a general waiver to regulate waste piles (Waste Pile Waiver), and a general waiver to regulate beneficial reuse of oily waste (Reuse Waiver). The general waivers supercede the outdated Resolutions. Water Board staff has prepared documentation to comply with the CEQA for those two projects (Waste Pile and Reuse Waivers).
10. The proposed amendment will be to repeal Resolution No. 73-05 and section 5(f) noted in Resolution No. 89-04, which amended Resolution No. 73-05 to apply throughout the Region. References to the above-noted resolutions will be deleted in the Basin Plan’s Table of Contents and text. The strikethrough version of the Basin Plan text, which references Resolutions Nos. 73-05 and 89-04 (Section VI.C, page V-17), is included as Attachment 1. The strikethrough version of Resolution No. 73-05 is included as

Attachment 2. The strikethrough version of Resolution No. 89-04 is included as Attachment 3.

11. The effect of the amendment will be throughout the Region, but more specifically in Monterey, San Luis Obispo and Santa Barbara Counties, where active oil fields that generate petroleum waste materials are located.
12. The Basin Plan amendment must be submitted for review and approval by the State Water Resources Control Board (State Board) and the State Office of Administrative Law (OAL). The Basin Plan amendment will become effective upon approval by OAL. The subject Resolution will become effective immediately.
13. The amendment to the Basin Plan will result in no potential for adverse effect, either individually or cumulatively, on wildlife and is therefore exempt from fee payments to the Department of Fish and Game under the California Fish and Game Code.
14. On September 9, 2005 in San Luis Obispo, California, the Water Board held a public hearing and heard and considered all public comments and evidence in the record.

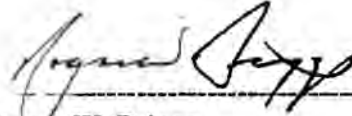

THEREFORE, BE IT RESOLVED, that:

- 1 Pursuant to CWC sections 13240, the Water Board, after considering the entire record, including oral testimony at the hearing, hereby adopts the Basin Plan amendments attached as Attachments 1, 2, and 3.
2. The Water Board's Executive Officer is directed to forward copies of the Basin Plan amendments to the State Water Board in accordance with the requirements of CWC Section 13245.
3. The Water Board requests that the State Water Board approve the Basin Plan amendments in accordance with the requirements of CWC sections 13245 and 13246, and forward it to OAL for approval. The Water Board shall file a Notice of Decision with the Secretary of Resources and the Governor's Office of Planning and Research (State Clearinghouse) after approval by OAL.
4. The Executive Officer is authorized to sign a Certificate of Fee Exemption.
5. If, during its approval process, the State Water Board or OAL determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Water Board of any such changes.

Resolution No. R3-2005-0013

September 9, 2005

I, Roger W. Briggs, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of the Resolution adopted by the Central Coast Water Board, on September 9, 2005.

Roger W. Briggs
Executive Officer

~~CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION~~

~~RESOLUTION NO. 73-5~~

~~ADOPTING POLICY REGARDING BENEFICIAL USE OF
OIL FIELD WASTE MATERIALS IN THE SANTA
MARIA VALLEY OIL FIELDS, SANTA BARBARA COUNTY~~

~~WHEREAS, Water Code Section 13224 states:~~

~~“Each Regional Board may issue policy statements relating to any water quality matter within its jurisdiction.”; and~~

~~WHEREAS, oil field waste materials, including but not limited to “drilling muds”, oily wastes and brines, generally contain toxic substances and materials which could significantly impair the quality of usable waters and generally constitute Group I wastes as defined by California Administrative Code, Title 23, Chapter 3, Subchapter 15, Article 3, Section 2520; and~~

~~WHEREAS, Group I wastes, such as oil field waste materials, may ordinarily be deposited only at a Class I or Class II 1 disposal site; and~~

~~WHEREAS, California Administrative Code, Title 23, Chapter 3, Subchapter 15, Article 5, Section 2540, provides:~~

~~“The Regional Board may waive the reporting of solid waste discharges, or approval and classification of disposal sites or types of sites, or the establishment of waste discharge requirements as provided by Section 13269 of the Water Code when an operation will not unreasonably affect water quality because of the type of waste and disposal operation, or an operation is in compliance with ordinances or regulations of other governmental agencies which adequately protect water quality. Such waivers shall be conditional and may be terminated by the Regional Board at any time.”; and~~

~~WHEREAS, Water Code Sections 14040 and 14041 state:~~

~~“Each Regional Board shall approve sites suitable for the disposal of different kinds of liquid wastes, consistent with the classifications that shall be adopted by the state board, and may adopt regulations for disposal of liquid waste at such approved sites that it deems are necessary for the protection of the quality of the waters of the state.”~~

~~“The hauler of liquid waste shall dispose of liquid waste in accordance with the regulations adopted by the Regional Board and shall dispose of only such type of waste as was designated for a particular site.”; and~~

Draft Resolution No. R3-2005-0013, Attachment 2

~~WHEREAS, under appropriate circumstances, certain clean fresh water “drilling muds” may be usable for beneficial purposes such as sealing of agricultural reservoir sites, improving tillability of certain solids, and stabilizing sandy soils without causing water quality problems or nuisance conditions; and,~~

~~WHEREAS, under appropriate circumstances, certain oily wastes may be usable for beneficial purposes such as dust control, weed abatement and road construction without causing water quality problems or nuisance conditions; and~~

~~WHEREAS, in the Santa Maria Valley oil fields, it appears possible, with appropriate care, to separate these oil field waste materials which may be appropriate for beneficial uses from those materials not suitable for beneficial uses;~~

~~NOW THEREFORE BE IT RESOLVED that the following shall constitute the policy of this Board regarding beneficial use of oil field waste materials in the Santa Maria Valley oil fields, Santa Barbara County:~~

- ~~1. Except as hereafter expressly provided, all oil field waste materials, including but not limited to “drilling muds”, oily wastes, and brines, shall be deposited at an appropriate and approved Class I or Class II 1 disposal site.~~
- ~~2. The following oil field waste materials may be deposited for an appropriate beneficial use at sites other than a Class I or Class II 1 disposal site provided that such site has been approved in advance by the Executive Officer of this Board, the amount of oil field waste material to be deposited and used at such site is reasonable, and adequate use practices for the control of oil field waste materials on such site are assured:
 - ~~(a) Clean, fresh water drilling mud removed from the drilling of an oil well prior to the time that the first production string of casing is installed.~~
 - ~~(b) Clean oil, not mixed with contaminants such as salt brines or toxic materials.~~~~
- ~~3. The Executive Officer may, upon written request, approve a site for a specified use or uses of those oil field waste materials specified in Paragraph 2 above, when the Executive Officer is reasonably assured that use of such site in the manner and for the purpose proposed will not adversely affect water quality or lead to nuisance conditions. Requests for site approval shall contain such information as may be required by the Executive Officer, and at a minimum shall contain:
 - ~~(a) A description of the site at which deposit and use of oil field waste materials will be made, and assurance that such materials will be used solely at and retained on such site~~
 - ~~(b) A description of the type of oil field waste material which will be used, the purpose or purposes for which it will be used, and the maximum quantity or quantities which will be used.~~~~

Draft Resolution No. R3-2005-0013, Attachment 2

- ~~(c) Assurance that the applicant or a competent agent, will be present at the time of each delivery of oil field waste material.~~
 - ~~(d) A proposed plan of use, specifically including cultivation practices and/or other appropriate control uses and measures, which will be taken to protect water quality and prevent nuisance.~~
 - ~~(e) Certification that the proposed use or uses of oil field waste materials comply with all city, county, or other local use and zoning requirements and that all necessary use permits will be obtained and maintained.~~
 - ~~(f) Certification that the applicant will submit such monitoring and technical reports as may be required by the Executive Officer.~~
 - ~~(g) Certification that the applicant is the owner of the site at which deposit and use of oil field waste materials will be made, or written consent of the owner of such site to the proposed use.~~
- ~~4. In the event that the Executive Officer determines that there is reasonable assurance that the use of oil field waste materials at the site proposed and in the manner proposed will not adversely affect water quality or lead to nuisance conditions, the Executive Officer may, in writing, approve such site. The approval shall be contingent upon full and exact compliance with all statements, representations and assurances contained in the request, and shall further provide that:~~
- ~~(a) Site approval may be withdrawn at any time, in the discretion of the Executive Officer, upon a determination that further use of the site for deposit or use of oil field waste materials will or may adversely affect water quality or create nuisance conditions.~~
 - ~~(b) Site approval does not relieve the landowner, or any other person, from otherwise complying with all state and local laws, rules, regulations and ordinances, and specifically does not constitute a license for use of oil field waste materials except in strict accord with the request and approval.~~
- ~~5. The Executive Officer shall remove site approval in the event of violation of any of the statements, representations, and assurances contained in the request.~~

~~I, Kenneth R. Jones, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of a resolution adopted by the California Regional Water Quality Control Board, Central Coast Region, on December 14, 1973.~~

Resolution No. R3-2005-0013, Attachment 3:
Amending the Water Quality Control Plan, Central Coast Region (Basin Plan) –

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION

RESOLUTION NO. 89-04

ADOPTING AMENDMENTS TO THE WATER QUALITY CONTROL PLAN
AND REQUESTING APPROVAL FROM
THE STATE WATER RESOURCES CONTROL BOARD

WHEREAS:

The Water Quality Control Plan, Central Coastal Basin (Basin Plan) was approved by the State Water Resources Control Board (State Board) on March 20, 1975.

2. Since March 20, 1975, thirty-seven Basin Plan amendments have been approved by the Regional Water Quality Control Board (Regional Board) and the State Board.
- 3 Since 1975, several changes in water quality regulations and administrative procedures have occurred.
4. An updated Basin Plan incorporating all previously approved amendments, updated regulations, and procedures is needed.
5. Several significant new Basin Plan amendments are needed:
 - a. Revise PCB and Phthalate Ester objective for all Inland Surface Waters, Enclosed Bays, and Estuaries in the Water Quality Objectives chapter.
 - b. Update "Municipal Wastewater Management Plans" in the Implementation Plan chapter.
 - c. Update "Solid Waste Management" in the Implementation Plan Chapter.
 - d. Add "Water Quality Limited Segments" designation in the Plans and Policies chapter.
 - e. Add general toxic or hazardous materials discharge prohibition to all waters in the Plans and Policies chapter.
 - f. ~~Amend Resolution 73-05, "Adopting Policy Regarding beneficial Use of Oil Field Waste Materials in the Santa Maria Valley Oil Fields, Santa Barbara county" to apply Regionwide.~~

Draft Resolution No. R3-2005-0013, Attachment 3

- g. Add Regional Board policy for Highway Grooving Residues in the Plans and Policies chapter.
 - h. Add Regional Board Policy for Waiver of Regulation of Specific Types of Waste Dischargers in the Plans and Policies chapter.
 - i. Add Water Bodies Needing Intensive surveillance in the Surveillance and Monitoring chapter.
6. Several additional changes (as described in Attachment "A") are necessary to update the 1975 Basin Plan.
7. Several minor wording changes are necessary to improve the readability of the Basin Plan.
8. Drafts of the proposed Basin Plan have been prepared and distributed to interested persons and agencies for review and comment.
9. Regional Board staff has followed appropriate procedures to satisfy the environmental documentation requirements of both the California Environmental Quality Act, under Public Resources Code Section 21080.5 (Functional Equivalent) and the Federal Clean Water Act of 1977 (PL 92-500 and PL 95-217). The Regional Board finds adoption of these objectives will not have a significant adverse effect on the environment.
10. Due notice of public hearing was given by advertising in newspapers of general circulation within the Region.
11. On September 8, 1989, and November 17, 1989, in the Salinas City Council Chamber Rotunda, 200 Lincoln Avenue, Salinas, California, and in the Embassy Suites-Edna Room, 333 Madonna Road, San Luis Obispo, California, respectively, after due public notice, the Regional Board received evidence and considered all factors concerning the proposed revisions and amendments to the Plan.

THEREFORE BE IT RESOLVED:

1. All amendments mentioned above and in Attachment "A", will not have a significant adverse impact on the environmental and the Executive Officer of the Regional Board is hereby directed to file a Notice of Decision to this effect with the Secretary of the Resources Agency.
2. All amendments mentioned above and in Attachment "A" are adopted.

Resolution No. R3-2005-0013, Attachment 3

3. Any minor editorial changes to correct data or grammar and/or clarify meaning in the final copy which may not be included in Attachment "A", are also adopted.
4. Staff responses which propose specific Basin Plan changes provided in the Regional Water Quality Control Board letter dated October 12, 1989, are adopted.
5. The State Board is requested to approve the proposed updated Basin Plan with amendments in accordance with Sections 13245 and 13246 of the California Water Code.
6. Upon approval, the State Board is requested to transmit the updated Basin Plan to the U.S. Environmental Protection Agency for approval.

I, WILLIAM R. LEONARD, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of a resolution adopted by the California Regional Water Quality Control Board, Central Coast Region, on November 17, 1989.

(ORIGINAL SIGNED BY WILLIAM R. LEONARD)

Resolution No. R3-2005-0013, Attachment 4

REPORT FOR BASIN PLAN AMENDMENT

(RESOLUTION NO. R3-2005-0013)

The Central Coast Regional Water Quality Control Board (Water Board) is proposing an amendment to the Water Quality Control Plan (Basin Plan). The Basin Plan serves as the cornerstone for water quality protection through identification of beneficial uses of surface and groundwaters, establishment of water quality objectives to protect beneficial uses, and establishment of an implementation plan to achieve those objectives.

The project consists of a ministerial clerical amendment and is exempt from the California Environmental Quality Act (CEQA). The environmental analysis contained in this Report for Basin Plan Amendment and accompanying documents, including the Environmental Checklist, the staff report and the responses to comments complies with the requirements of the State Water Board's certified regulatory process, as set forth in California Code of Regulations (CCR), Title 23, section 3775 et seq. All public comments were considered.

DESCRIPTION OF PROPOSED ACTIVITY

This section describes the changes proposed and alternatives to this proposal. The purpose of this amendment is to rescind Resolution No. 73-5 and the applicable section of Resolution No. 84-04.

On December 14, 1973, the Central Coast Water Board adopted a policy regarding beneficial use of oil field waste materials in the Santa Maria Valley (Resolution No. 73-5, Basin Plan Appendix A-16). Subsequently, on November 17, 1989, the Water Board expanded that policy to apply throughout the region (Resolution No. 89-04, Basin Plan Appendix A-17).

Resolution No. 73-5 limited oil field waste material reuse to:

- (a) clean, fresh-water drilling mud removed from the drilling of an oil well prior to the time that the first production string of casing is installed, and
- (b) clean oil, not mixed with contaminants such as salt brines or toxic materials.

More than a waiver of waste discharge requirements (WDRs), provisions in Resolution No. 73-05 included (1) requiring regional boards to approve sites suitable for disposal of different kinds of liquid waste (based on former, now repealed, California Water Code [CWC] sections 14040 and 14041); (2) a mandate that all oil field waste be disposed of at Class I or Class II facilities; and (3) identification of a specific procedure under which the Executive Officer may waive waste discharge requirements for beneficial use of fresh-water drilling mud and clean oil.

Staff recommends repealing Resolution No. 73-05 and the applicable portion of Resolution No. 89-04, because staff is proposing adoption of updated general waiver of waste discharge requirements that supercede the older resolutions. The key findings of the old resolutions are out of date and conflict with newer laws and regulations. The subject Basin Plan resolutions limit the reuse of oil field waste more stringently than needed to protect water quality. Additionally, other provisions of the Basin Plan, as well as other applicable laws and regulations, provide the water quality protection provided by Resolution No. 73-05.

Resolution No. R3-2005-0013, Attachment 4

Alternatives to this proposal include:

1. Incomplete adoption of the proposed amendment.

For example, the Water Board could amend only a portion of Resolution No. 73-05, such as deleting references to the now repealed, former CWC sections 14040 and 14041. This alternative is not recommended, because adequate water quality protection from discharges of oil field waste is provided under other provisions of the Basin Plan, laws and regulations. Basin Plan provisions must be implemented in waste discharge requirements and waivers of waste discharge requirements. Some Basin Plan water quality objectives that protect ground water and fresh surface waters from oil field waste include prohibition of discharge of toxic chemicals in toxic amounts, discharge of hazardous wastes in excess of maximum contaminant levels and discharge of chemicals imparting undesirable tastes and odors. Ocean Water Quality is protected by water quality objectives in the State Water Board's Ocean Plan, which is incorporated into the Basin Plan. The Basin Plan contains other water quality protections, including a prohibition against the discharge of oil or any residual products of petroleum except in accordance with waste discharge requirements or other provisions of the Porter-Cologne Act. (Basin Plan, Chapter V., section IV.A.)

In addition, the Toxic Pits Cleanup Act stringently regulates discharges of liquid hazardous wastes to surface impoundments. CCR Title 23, Chapter 15 and Title 27 provide detailed regulation for storage and disposal of hazardous and non-hazardous wastes to land.

In the case that the Water Board would authorize the reuse of specific kinds of petroleum wastes, the intent is that there not be a disposal or discharge to ground or surface waters. Any waste discharge requirements or waiver would be drafted to assure that reuse is carried out so that there will be no discharges in violations of water quality objectives and prohibitions.

2. Take no action.

This alternative is not recommended, because Resolution No. 73-05 is sorely outdated and conflicts with newer laws and regulations, and the proposed waste discharge requirements and waiver that Water Board staff is separately recommending. Staff has prepared appropriate CEQA documents for those actions. In addition, Resolution No. 73-05 should be repealed because its waiver portion has already be repealed by statute. The remaining requirement that all oil field waste be disposed at a Class I or Class II facility is too rigid and is not necessary to reasonably protect water quality.

II. APPLICABLE INFORMATON:

1. Lead Agency Name and Address:

Central Coast Water Board
895 Aerovista Place, Suite 101
San Luis Obispo, CA 93401-7906

2. Contact Person and Phone Number:

Sheila Soderberg (805) 549-3592

3. Project Location:

Central Coast Region

Resolution No. R3-2005-0013, Attachment 4

4. Project Sponsor's Name and Address:

Central Coast Water Board
895 Aerovista Place, Suite 101
San Luis Obispo, CA 93401-7906

5. Other Public Agencies whose Approval is Required:

U.S. Environmental Protection Agency; U.S. Fish and Wildlife Service; U.S. Army Corps of Engineers, Interstate Oil and Gas Compact Commission; California Department of Fish & Game; California Department of Conservation, Division of Oil, Gas and Geothermal Resources Santa Maria and Coalinga Offices; California Department of Transportation; California Department of Toxic Substances Control; California Office of Health Hazard Assessment; California Air Resources Board; Santa Barbara County Planning and Development; Santa Barbara County Energy Division; Santa Barbara County Petroleum Division; Santa Barbara County Fire Protection Division; Santa Barbara County Health Department; Santa Barbara County Air Pollution Control District; San Luis Obispo County Planning and Building; San Luis Obispo County Fire Department; San Luis Obispo County Health Department; San Luis Obispo County Air Pollution Control District; Monterey County Planning and Building; Monterey County Fire Department; Monterey County Health Department; Monterey County Air Pollution Control District; Santa Clara County Planning and Building; Santa Clara County Fire Department; Santa Clara County Health Department; Santa Clara County Air Pollution Control District; San Benito County Planning and Building; San Benito County Fire Department; San Benito County Health Department; San Benito County Air Pollution Control District; City of Santa Maria Planning Department; City of Santa Maria Fire Department; City of Goleta Planning Department; City of Goleta Fire Department; Santa Barbara City Planning Department and Santa Barbara City Fire Department.

ENVIRONMENTAL CHECKLIST

II. EVALUATION OF ENVIRONMENTAL IMPACTS:

	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
1. AESTHETICS -- Would the project:				
a) Have a substantial adverse effect on a scenic vista?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Substantially damage scenic resources, including, But not limited to, trees, rock outcroppings, and historic buildings with a state scenic highway?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Substantially degrade the existing visual character or quality of the site and its surroundings	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
2. AGRICULTURE RESOURCES: In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. Would the project				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Resolution No. R3-2005-0013, Attachment 4

3. AIR QUALITY -- Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project				
a) Conflict with or obstruct implementation of the applicable air quality plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is not attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Expose sensitive receptors to substantial pollutant concentrations?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Create objectionable odors affecting a substantial number of people?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
4. BIOLOGICAL RESOURCES -- Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Resolution No. R3-2005-0013, Attachment 4

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
5. CULTURAL RESOURCES -- Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Disturb any human remains, including those interred outside of formal cemeteries?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
6. GEOLOGY AND SOILS -- Would the project:				
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
ii) Strong seismic ground shaking	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
iii) Seismic-related ground failure, including liquefaction?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
iv) Landslides?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Result in substantial soil erosion or the loss of topsoil?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
7. HAZARDS AND HAZARDOUS MATERIALS Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
h) Expose people or structures to a significant risk of loss injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
8. HYDROLOGY AND WATER QUALITY - Would the project:				
a) Violate any water quality standards or waste discharge requirements?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Resolution No. R3-2005-0013, Attachment 4

b) Substantially deplete ground water supplies or interfere substantially with ground water recharge such that there would be a net deficit in aquifer volume or a lowering of the local ground water table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner, which would result in substantial erosion or siltation on- or off-site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner, which would result in flooding on- or off-site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Create or contribute runoff water, which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Otherwise substantially degrade water quality?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
j) Inundation by seiche, tsunami, or mudflow?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
9. LAND USE AND PLANNING Would the project:				
a) Physically divide an established community?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Resolution No. R3-2005-0013, Attachment 4

c) Conflict with any applicable habitat conservation plan or natural community conservation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
10. MINERAL RESOURCES -- Would the project				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Result in the loss of availability of a locally -important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
11. NOISE Would the project result in				
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
12. POPULATION AND HOUSING -- Would the project:				
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

13. PUBLIC SERVICES				
a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Fire protection?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Police protection?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Schools?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Parks?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Other public facilities?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
14. RECREATION --				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
15. TRANSPORTATION/TRAFFIC -- Would the project:				
a) Cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on roads, or congestion at intersections)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Result in inadequate emergency access?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Result in inadequate parking capacity?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Resolution No. R3-2005-0013, Attachment 4

g) Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
16. UTILITIES AND SERVICE SYSTEMS - Would the project:				
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Comply with federal, state, and local statutes and regulations related to solid waste?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
17. MANDATORY FINDINGS OF SIGNIFICANCE				
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Resolution No. R3-2005-0013, Attachment 4

b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

III. **ENVIRONMENTAL EVALUATION** (of checklist questions answered Potentially Significant Impact, Less than Significant with Mitigation Incorporation, or Less than Significant Impact): not applicable.

See Resolution No. R3-2005-0013 attached.

**STATE OF CALIFORNIA
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 Aerovista Place, Suite 101
San Luis Obispo, CA 93401-7906**

**RESOLUTION NO. R3-2004-0142
AMENDING THE WATER QUALITY CONTROL PLAN
FOR THE CENTRAL COAST BASIN TO INCLUDE
SAN LUIS OBISPO CREEK TOTAL MAXIMUM DAILY LOAD
AND IMPLEMENTATION PLAN FOR PATHOGENS**

WHEREAS, the California Regional Water Quality Control Board, Central Coast Region hereby finds that:

1. The California Regional Water Quality Control Board, Central Coast Region (Regional Board), adopted the Water Quality Control Plan for the Central Coastal Basin (Basin Plan), on September 8, 1994. The Basin Plan includes beneficial use designations, water quality objectives, implementation plans for point source and nonpoint source discharges, and statewide plans and policies.
2. The Regional Board periodically revises and amends the Basin Plan. The Regional Board has determined the Basin Plan requires further revision and amendment to incorporate a Total Maximum Daily Load (TMDL) and Implementation Plan for Pathogens for San Luis Obispo Creek.
3. The Regional Board proposes to amend the Basin Plan by inserting amendments into Chapter Four, Section IX (Total Maximum Daily Loads).
4. Section 303(d) of the Clean Water Act (CWA) requires states to identify and prepare a list of water bodies that do not meet water quality standards and to establish TMDLs for listed waterbodies.
5. San Luis Obispo Creek was identified on California's 1996 303(d) list as impaired by pathogens due to exceedence of existing Basin Plan objectives protecting water contact and non-contact water recreation beneficial uses.
6. San Luis Obispo Creek is located in San Luis Obispo County, California. The headwaters are located immediately north-east of the City of San Luis Obispo and flow southwest for approximately 17 miles towards Avila Beach, California, ultimately draining into the Pacific Ocean at Avila Bay.
7. The elements of a TMDL are described in 40 CFR 130.2 and 130.7 and section 303(d) of the CWA, as well as USEPA guidance documents. A TMDL is defined as "the sum of individual waste load allocations for point sources and load allocations for nonpoint sources and natural background" (40 CFR 130.2). The Regional Board has determined that the San Luis Obispo Creek Pathogen TMDL is set at levels necessary to attain and maintain the applicable numeric water quality objectives taking into account seasonal variations and any lack of knowledge concerning the relationship between effluent limitations and water quality (40 CFR 130.7(c)(1)). The regulations in 40 CFR 130.7 also state that TMDLs shall take into account critical conditions for stream flow, loading and water quality parameters. TMDLs are often expressed as a mass load of the pollutant but can be expressed as a unit of concentration if appropriate (40 CFR 130.2(i)). Expressing this TMDL as units of concentration is appropriate because an existing concentration based water quality objective is used as the basis for the numeric target.

8. Upon establishment of TMDLs by the State or USEPA, the state is required to incorporate the TMDLs, along with appropriate implementation measures, into the State Water Quality Management Plan (40 CFR 130.6 (c)(1), 130.7; CWC sections 13050(j), 13242). The Basin Plan, and applicable statewide plans, serves as the State Water Quality Management Plan governing the watersheds under the jurisdiction of the Regional Board.
9. The Regional Board's goal for establishing the above mentioned TMDL is to protect the contact and non-contact water recreation beneficial uses (REC-1 and REC-2, respectively) as defined in the Basin Plan.
10. Regional Board staff submitted a TMDL report to an external scientific review panel on May 25, 2004 as required by Health & Safety Code Section 57004. Regional Board staff edited the Project Report or provided a written response that explained the basis for not incorporating the comments, or the comments did not result in any changes to the proposed Basin Plan Amendment. The scientific portions of the TMDL and implementation plan are based on sound scientific knowledge, methods, and practices in accordance with Section 57004.
11. Interested persons and the public have been informed of TMDL progress from the early stages of TMDL development. Efforts to inform the public and solicit public comment include public meetings, presentations to special interest groups, several individual meetings with vested stakeholders, and a number of telephone conversations with interested parties. Public notification of the amendment to the Basin Plan occurred 45 days preceding the Board hearing. Notice of public hearing was given by advertising in newspapers of general circulation within the Region and by mailing a copy of the notice to all persons requesting such notice and applicable government agencies. Regional Board staff responded to oral and written comments received from the public.
12. The Regional Board considered costs of implementing measures to achieve the TMDL. The costs to implement the TMDL will be incurred by identified responsible parties. These costs are reasonable relative to the water quality benefits to be derived from implementing the TMDL.
13. Anti-Degradation – This order is consistent with the provisions of the State Water Resources Control Board Resolution No. 68-16, "Statement of Policy with Respect to Maintaining High Quality of Waters in California" and 40 CFR 131.12. The TMDL will result in improved water quality throughout the region and maintains the level of water quality necessary to protect existing and anticipated beneficial uses.
14. The Regional Board concurs with the analysis contained in the Final Project Report, California Environmental Quality Act "Substitute Document" Report for Basin Plan Amendment, including the CEQA Checklist, the staff report and the responses to comments and find that the analysis complies with the requirements of the SWRCB's certified regulatory CEQA process, as set forth in California Code of Regulations, Title 23, section 3775 et seq. Furthermore, the Regional Board finds that the analysis fulfills the Regional Board's obligations attendant with the adoption of regulations "requiring the installation of pollution control equipment, or a performance standard or treatment requirement," as set forth in section 21159 of the Public Resources Code. All public comments were considered.
15. The Basin Plan amendment incorporating a TMDL for pathogens for San Luis Obispo Creek must be submitted for review and approval by the State Water Resources Control Board (State Board), the State Office of Administrative Law (OAL), and the US Environmental Protection Agency (USEPA). The Basin Plan amendment will become effective upon approval by OAL.

December 3, 2004

16. The amendment to the Basin Plan will result in no potential adverse effect, either individually or cumulatively, on wildlife and is therefore exempt from fee payments to the Department of Fish and Game under the California Fish and Game Code.
17. On December 3, 2004 in San Luis Obispo, California, the Regional Board held a public hearing and heard and considered all public comments and evidence in the record.

THEREFORE, be it resolved that:

Pursuant to sections 13240 and 13242 of the California Water Code, the Regional Board, after considering the entire record, including the oral testimony at the hearing, hereby adopts the amendment on "Attachment-Proposed Basin Plan Amendments."

2. The Executive Officer is directed to forward copies of the Basin Plan amendment to the State Board in accordance with the requirements of section 13245 of the California Water Code.
3. The Regional Board requests that the State Board approve the Basin Plan amendment in accordance with the requirements of sections 13245 and 13246 of the California Water Code and forward it to OAL and the USEPA. The Regional Board shall file a Notice of Decision with the Secretary of Resources and the Governor's Office of Planning and Research (State Clearinghouse) after approval by OAL and USEPA.
4. The Executive Officer is authorized to sign a Certificate of Fee Exemption.
5. If, during its approval process, the State Board or OAL determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Regional Board of any such changes.

I, **Roger W. Briggs, Executive Officer**, do hereby certify the foregoing is a full, true, and correct copy of the resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region, on December 3, 2004.

Roger W. Briggs
Executive Officer

RESOLUTION NO. R3-2004-0142

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENTS

1. Revise the September 8, 1994 Basin Plan, Chapter Four, as follows:

Add the following to Chapter 4 after IX. F.

IX. G. TOTAL MAXIMUM DAILY LOAD FOR PATHOGENS FOR SAN LUIS OBISPO CREEK

The Regional Water Quality Control Board adopted this TMDL on December 3, 2004.

This TMDL was approved by:

The State Water Resources Control Board on _____
The California Office of Administrative Law on _____ (Effective date)
The U.S. Environmental Protection Agency on _____ **9/23/05**

Problem Statement

The beneficial uses of non-contact water recreation and water contact recreation are not being supported because fecal coliform concentration in San Luis Obispo Creek exceeds existing Basin Plan numeric objectives protecting these beneficial uses.

Numeric Target

Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100mL, nor shall more than ten percent of total samples collected during any 30-day period exceed 400 MPN per 100mL.

Source Analysis

The fecal coliform sources contributing to the problems identified in the Problem Statement are, in decreasing order of contribution: urban, human, birds and bats roosting in the tunnel, livestock, and background. DNA analysis of samples drawn between sites 10.3 and 10.9 (see map in Figure-1) in San Luis Obispo Creek indicate that the following sources and corresponding frequencies are present: human (41%), avian (17%), combined sewer overflow (15%), canine (11%), rodent (5%), dog (4%), raccoon (3%), feline (3%), opossum (1%).

TMDL and Allocations

The TMDL is a receiving water concentration equal to the numeric target. The TMDL is considered achieved when the allocations assigned to individual reaches are consistently met or numeric targets are consistently met in all reaches.

Allocations are expressed as receiving water fecal coliform concentration. Table-1 shows the allocations with respect to location and responsible party. The reaches referred to in Table-1 are illustrated in Figure-1.

Locations of the sites illustrated in Figure-1 are described as follows:

- Site 10.0: located along the main stem of San Luis Obispo Creek (Creek) at the bridge crossing the Creek on Marsh Street. This location is downstream of the confluence of the main stem of the Creek with Stenner Creek.
- Site 10.3: located along the main stem of the Creek at Mission Plaza, immediately downstream of the downstream end of the tunnel.
- Site 10.9: located along the main stem of the Creek at the upstream end of the tunnel.
- STEN0.0: located at the mouth of Stenner Creek before its confluence with San Luis Obispo Creek.
- STEN1.5: located in Stenner Creek at its crossing with Highland Drive on the campus of Cal Poly.
- BRIZ1.0: located in Brizziolari Creek at its crossing with Via Carte Drive on Cal Poly campus; this site is located downstream of the bull-test animal unit.

- **Site 12.5:** located along the main stem of the Creek at Cuesta Park near the Highway 101 bridge.

Waste Load Allocations: Allocations to the City of San Luis Obispo are waste load allocations (WLAs). The WLAs will be implemented by the City's NPDES permit for the Water Reclamation Facility for control of sewer sources. The WLAs will also be implemented by the City's General Municipal Stormwater permit for the control of urban sources as well as animal sources from the tunnelized area of the Creek.

Allocations to the County of San Luis Obispo are WLAs. The WLAs will be implemented by the County's General Municipal Stormwater permit for the control of urban sources.

A portion of the total allocation to California Polytechnic State University, San Luis Obispo (Cal Poly) is a WLA. The allocation at site STEN1.5 shown in Table-1 is a WLA. The WLA will be implemented by Cal Poly's General Municipal Stormwater permit for the control of urban sources.

Load Allocations: Cal Poly is allocated a load allocation (LA) for the livestock sources along Brizzolari Creek. The LA will be implemented by Cal Poly's WDR permit for the control of animal sources (see site BRIZ1.0 in Table-1).

Allocation for Background: The allocation to Background is included in the WLAs and LA. The background allocation is a receiving water concentration of 81 MPN/100 mL. Therefore, the allocations in Table-1 include the allocation to background.

Figure-1: Allocation Sites

Table-1 ALLOCATIONS AND RESPONSIBLE PARTIES				
Allocations in San Luis Obispo Creek				Receiving Water Fecal Coliform Concentration (MPN/100mL)¹
From Site:	To Upstream Site:	Responsible Party^{2,3,4}	Allocation Type⁵	
12.5	All upstream sites	County	WLA	≤ 200
10.9	12.0	City	WLA	≤ 200
10.0	10.9	City	WLA	≤ 200
Allocations in Stenner and Brizzolari Creeks				Receiving Water Fecal Coliform Concentration (MPN/100mL)¹
From Site:	To Upstream Site:	Responsible Party^{2,3,4}	Allocation Type⁵	
STEN1.5	All upstream sites	Cal Poly	WLA	≤ 200
STEN0.0	STEN1.5	City	WLA	≤ 200
BRIZI.0	All upstream sites	Cal Poly	LA	≤ 200
Allocations for reaches not specifically noted above:				
For stream reaches not specifically noted above, the allocation for any discharge loading fecal coliform into San Luis Obispo Creek or any of its tributaries is as follows:				
<ul style="list-style-type: none"> Fecal coliform concentration, based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 MPN per 100mL, nor shall more than 10% of the total samples during any 30-day period exceed 400 MPN per 100mL. 				
¹ As log mean of 5 samples taken in a 30-day period occurring within each season. ² County implies County of San Luis Obispo ³ City implies City of San Luis Obispo ⁴ Cal Poly implies California Polytechnic State University, San Luis Obispo Campus ⁵ WLA implies Waste Load Allocation, LA implies Load Allocation				

Margin of Safety

A margin of safety is incorporated in the TMDL through conservative assumptions. The conservative assumptions include: 1) assumption of zero bacterial die-off, 2) TMDL and allocation calculations are predominantly based on data collected during low-flow conditions, which, in the case of San Luis Obispo Creek, skews towards a worst-case scenario.

IMPLEMENTATION

The following actions will occur within one year of TMDL approval by the Office of Administrative Law.

HUMAN SOURCES

The City will implement actions described in Table 3, item 1F, to control human sources as currently required by the NPDES permit for the Water Reclamation Facility (WRF).

The Executive Officer (EO) or the Regional Board will amend the Monitoring and Reporting Program (M&RP) of the City's NPDES permit for the WRF to incorporate stream monitoring for fecal coliform. The EO or Regional Board will also amend the M&RP to incorporate reporting of such stream monitoring activities.

URBAN SOURCES

The City will amend its Storm Water Management Plan (SWMP) to include actions described in Table-3, items 1A, 1B, 1C, 1D, and 1E, pursuant to Section D of State Board Order No. 2003-005, NPDES General Permit No. CAS000004 for Storm Water Discharges from Small Municipal Separate Storm Sewer Systems (Small MS4 Permit). The City will then describe the actions taken in Table-3 as part of its annual report

required by the Small MS4 Permit. If the City does not make these changes by submittal of the next annual report, the Executive Officer will require such changes.

The Executive Officer or the Regional Board will amend the Monitoring and Reporting Program of the City's small MS4 Permit to incorporate stream monitoring of fecal coliform and reporting of such monitoring, if additional monitoring-beyond that amended to the Monitoring and Reporting Program for the City's NPDES Permit for the WRF-is necessary.

Cal Poly will amend their SWMP to include specific actions described in Table-3, items 3A, 3B, and 3D. Cal Poly will then describe actions taken in Table-3 as part of their annual report required by the Small MS4 Permit. If Cal Poly does not make these changes by submittal of next annual report for this permit, the Executive Officer will require such changes.

The County of San Luis Obispo (County) will amend its SWMP to include specific actions described in Table-3, items 2A, 2B, 2C, and 2D, pursuant to Section D of the Small MS4 Permit. The County will then describe actions taken in Table-3 as part of its annual report required by the Small MS4 Permit. If the County does not make these changes by submittal of next annual report for this permit, the Executive Officer will require such changes.

LIVESTOCK SOURCES

Cal Poly will eliminate discharges of animal waste from seepage to surface waters from irrigated wastewater and flow to surface waters from confined animal operations, as currently required by Cal Poly's Waste Discharge Requirements.

Cal Poly has agreed to use management practices described in Table-3, item 3C, as described in its Water Quality Management Plan.

Cal Poly will conduct stream monitoring and report results as currently required by the M&RP of Cal Poly's Waste Discharge Requirements.

Additionally, the EO will amend the M&RP associated with Cal Poly's Waste Discharge Requirements to require annual reporting of specific measures that have been identified in the Water Quality Management Plan and have been and/or will be taken to reduce fecal coliform loading from livestock and urban sources.

THREE-YEAR REVIEWS

Regional Board staff will conduct a review every three years beginning three years after TMDL approval by the Office of Administrative Law. Regional Board staff will utilize Annual Reports, as well as other available information, to review water quality data and implementation efforts of responsible parties and progress being made towards achieving the allocations and the numeric target. Regional Board staff may conclude and articulate that ongoing implementation efforts may be insufficient to ultimately achieve the allocations and numeric target. If staff makes this determination, staff will recommend that additional reporting, monitoring, or implementation efforts be required either through approval by the Executive Officer (e.g. pursuant to CWC section 13267 or section 13383) or by the Regional Board (e.g. through revisions of existing permits and/or a Basin Plan Amendment). Regional Board staff may conclude and articulate that to date, implementation efforts and results are likely to result in achieving the allocations and numeric target, in which case existing and anticipated implementation efforts should continue.

Three-year reviews will continue until the TMDL is achieved. The target date to achieve the TMDL is ten years after implementation commences.

Table-3 IMPLEMENTATION ACTIONS OF RESPONSIBLE PARTIES			
Responsible Party	Item	Best Management Practice	Discussion
City of San Luis Obispo	1A	Public Participation and Outreach	Educate the public regarding sources of fecal coliform and associated health risks of fecal coliform in surface waters. Educate the public regarding actions that individuals can take to reduce loading.
	1B	Pet Waste Management	Develop and implement enforceable means (e.g. an ordinance) of reducing/eliminating fecal coliform loading from pet waste.
	1C	Wild Animal Waste Management	Develop and implement strategies to reduce/eliminate fecal coliform loading from wild animals inhabiting the tunnelized area of the Creek.
	1D	Illicit Discharge Detection and Elimination	Develop and implement strategies to detect and eliminate illicit discharges (whether mistaken or deliberate) of sewage to the Creek.
	1E	Pollution Prevention and Good Housekeeping	Develop and implement strategies to reduce/eliminate fecal coliform loading from streets, parking lots, sidewalks, and other urban areas potentially collecting and discharging fecal coliform to the Creek.
	1F	Human Source Elimination and Prevention	Maintain the sewage collection system, including identification of sewage leaks, the correction of sewage leaks, and prevention of sewage leaks.
County of San Luis Obispo	2A	Public Participation and Outreach	Educate the public regarding sources of fecal coliform and associated health risks of fecal coliform in surface waters. Educate the public regarding actions that individuals can take to reduce loading.
	2B	Pet Waste Management	Develop and implement enforceable means (e.g. an ordinance) of reducing/eliminating fecal coliform loading from pet waste.
	2C	Illicit Discharge Detection and Elimination	Develop and implement strategies to detect and eliminate illicit discharges (whether mistaken or deliberate) of sewage to the Creek.
	2D	Pollution Prevention and Good Housekeeping	Develop and implement strategies to reduce/eliminate fecal coliform loading from streets, parking lots, sidewalks, and other urban areas potentially collecting and discharging fecal coliform to the Creek.
Cal Poly State University	3A	Public Participation and Outreach	Educate the public regarding sources of fecal coliform and associated health risks of fecal coliform in surface waters. Educate the public regarding actions that individuals can take to reduce loading.
	3B	Pet Waste Management	Develop and implement enforceable means of reducing/eliminating fecal coliform loading from pet waste.
	3C	Grazing Management	Develop and implement strategies to reduce/eliminate fecal coliform loading from livestock grazing.
	3D	Pollution Prevention and Good Housekeeping	Develop and implement strategies to reduce/eliminate fecal coliform loading from streets, parking lots, sidewalks, and other urban areas potentially collecting and discharging fecal coliform to the Creek.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD

CENTRAL COAST REGION

San Luis Obispo, California

**RESOLUTION NO. R3-2002-0117
REVISED MAY 16, 2003
AMENDING THE WATER QUALITY CONTROL PLAN
FOR THE CENTRAL COAST BASIN
TO INCLUDE
A TOTAL MAXIMUM DAILY LOAD AND IMPLEMENTATION PLAN
FOR PATHOGENS FOR MORRO BAY AND CHORRO AND LOS OSOS CREEKS**

The California Regional Water Quality Control Board Central Coast Region hereby finds:

1. The California Regional Water Quality Control Board, Central Coast Region (Regional Board), adopted the Water Quality Control Plan for the Central Coastal Basin (Basin Plan), on September 8, 1994. The Basin Plan includes beneficial use designations, water quality objectives, implementation plans for point source and nonpoint source discharges, and statewide plans and policies.
2. The Regional Board periodically revises and amends the Basin Plan. The Regional Board has determined the Basin Plan requires further revision and amendment to incorporate a Total Maximum Daily Load (TMDL) and Implementation Plan for Pathogens for Morro Bay and Chorro and Los Osos Creeks.
3. The Regional Board proposes to amend the Basin Plan by inserting amendments into Chapter Four, Section IX (Total Maximum Daily Loads).
4. Section 303(d) of the Clean Water Act requires States to identify and to prepare a list of water bodies that do not meet water quality objectives and to establish TMDLs for the listed water bodies. A TMDL is the pollutant loading that a water body can accept while protecting the identified beneficial uses.
5. Morro Bay was identified as impaired by pathogens on the 1998 Clean Water Act Section 303(d) list of impaired water bodies. Therefore, the Regional Board is required to adopt a TMDL for this water body and incorporate the TMDL and associated Implementation Plan into the Basin Plan (40 CFR 130.6(c)(1), 130.7, Water Code section 13242).
6. Morro Bay, Chorro and Los Osos Creeks are located entirely within San Luis Obispo County.
7. The TMDL Report contains a Problem Statement, Numeric Targets, Source Analysis, Total Maximum Load, Linkage Analysis, Load Allocations, Margin of Safety, an Implementation Plan, and a Monitoring Plan.

8. The problem is as follows: Numeric water quality objectives for fecal coliform bacteria set by the Regional Board and standards set by the United States Department of Health Services Food and Drug Administration's National Shellfish Sanitation Program and implemented by California Department of Health Services (DHS) have been exceeded for shellfish harvesting and water contact recreation in Morro Bay. Elevated levels of fecal coliform bacteria in Morro Bay and Chorro and Los Osos Creeks indicate that pathogens are impairing the beneficial use of water contact recreation and shellfish harvesting (in Morro Bay only). High levels of pathogens may cause disease in humans and may also adversely affect marine animals, such as sea otters. Portions of Morro Bay have been closed by DHS for commercial shellfish harvesting since 1996, and advisories have been posted in the past to warn the public to avoid water contact activities.
9. The numeric targets are as follows: Pathogenic input to Chorro and Los Osos Creeks shall not exceed the geometric mean of 200 Most Probable Number (MPN)/100 milliliter (mL) concentration of fecal coliform bacteria based on not less than five samples in any 30-day period and no more than 10% of the samples shall exceed 400 MPN/100 mL fecal coliform bacteria in any 30-day period; at all areas of Morro Bay, the geometric mean of fecal coliform bacteria shall not exceed 14 MPN/100 mL based on monthly sampling evaluated over an annual and triennial basis and not more than 10% of the samples shall exceed 43 MPN/100 mL of fecal coliform evaluated over an annual and triennial basis. These numeric targets will be protective of the beneficial uses of both shellfishing and recreational contact (shellfishing beneficial use being more sensitive than recreational contact).
10. The sources appear to be coming mainly from birds, humans, livestock and domestic animals, in that order. There is also a small percent contribution from wild animals (non-bird wild animals). These sources were identified based on a study that used a DNA fingerprinting technique. Fecal matter most likely enters Morro Bay from Chorro and Los Osos Creeks, groundwater seeps, rangeland runoff, leaking/failing septic systems, stormwater, wastewater treatment plant failures, and direct deposition.
11. A TMDL is the loading capacity of a pollutant that a water body can accept while protecting beneficial uses. Normally, TMDLs are expressed as loads (pollutant concentration multiplied by the volumetric flow rate), but in the case of pathogens, it is more logical for the TMDL to be based only on concentration. TMDLs can be expressed in terms of either mass per time, toxicity or other appropriate measure [40 CFR §130.2(I)]. A concentration based TMDL makes more sense in this situation because the public health risks associated with recreating in, or eating shellfish from, contaminated waters scales with organism concentration, and pathogens are not readily controlled on a mass basis. Therefore, as other regional boards have done, we are establishing a concentration based TMDL for pathogens in Morro Bay.
12. The TMDL will be implemented as follows: The bacterial load to Morro Bay derives from nonpoint sources (NPS) and point sources. As such, implementation will rely on the State Plan for NPS pollution control and continued implementation of regulatory controls as appropriate on point sources, including storm water. For the point source, the implementation relies on the National Pollutant Discharge Elimination System (NPDES) permit in place for the California Men's Colony wastewater treatment plant and the City of Morro Bay/Cayucos wastewater treatment plant, Waste Discharge requirements and on the implementation and enforcement of Section 13267 of the California Water Code.

13. The TMDL will be monitored as follows: Monitoring will take place to ensure that numeric targets are met and implementation actions are taking place.
14. Regional Board Staff has conducted TMDL outreach by coordinating the TMDL with the Morro Bay Shellfish Technical Advisory Committee and presenting status reports at the Morro Bay National Estuary Program's committee meetings. In addition, public review and comment through this board hearing process provides another formal opportunity for public input for adoption of this TMDL as a Basin Plan amendment.
15. The Morro Bay National Estuary Program's Comprehensive Conservation and Management Plan for Morro Bay Estuary advocates Total Maximum Daily Loads for pathogens, as a means to protect the beneficial uses of Morro Bay, Chorro and Los Osos Creeks.
16. The Regional Board submitted the TMDL Report to an external scientific review panel. On July 24 & 25, 2002, the review panel submitted its responses to the Regional Board, which stated that in general, the TMDL Report presented a sound and scientifically justifiable program for [reducing pathogens...]. In addition, the review panel identified several specific areas of concern. The Regional Board revised the proposed Basin Plan amendment in response to the comments submitted by the review panel, or provided a written response which explained the basis for not incorporating their comments.
17. Staff considered costs of preventing pathogen discharges via implementation of Best Management Practices. The cost of implementing actions to reduce pathogens will be incurred by the implementers and offset with grants, loans, in-kind donations, and matching funds as much as possible.
18. This Basin Plan amendment must be submitted for review and approval by the State Water Resources Control Board and the State Office of Administrative Law (OAL). The Basin Plan amendment will become effective upon approval by the State Board OAL. The TMDL must further be approved by the United States Environmental Protection Agency (USEPA).
19. This amendment meets the "Necessity" standard of the Administrative Procedure Act, Government Code §11353(b).
20. The Regional Board has determined that the TMDL for pathogens for Morro Bay and Chorro and Los Osos Creeks is set at levels necessary to attain and maintain the applicable numeric water quality objectives taking into account seasonal variations and any lack of knowledge concerning the relationship between effluent limitations and water quality (40 CFR 130.7(c)(1)).
21. The basin planning process has been certified as functionally equivalent to the California Environmental Quality Act requirements for preparing environmental documents (Public Resources Code, Section 21000 et seq.) and as such, the required environmental documentation has been prepared. Drafts of the Notice of Filing, staff report, environmental checklist, alternatives analysis and proposed amendment have been prepared and distributed to interested persons and agencies for review and comment in accordance with Title 23 California Code of Regulations section 3777. All public comments were considered. No significant environmental impacts will result from approval of this Basin Plan amendment.

22. The proposed amendments to the Basin Plan were developed in accordance with CWC Section 13240 et seq.
23. Notice of public hearing was given by advertising in newspapers of general circulation within the Region and by mailing a copy of the notice to all persons requesting such notice and applicable government agencies.
24. The amendment to the Basin Plan will result in no potential adverse effect, either individually or cumulatively, on wildlife and so is exempt from fee payments to the Department of Fish and Game under the California Fish and Game Code
25. On December 13, 2002 in San Luis Obispo, California, the Regional Board held a public hearing and heard and considered all public comments and evidence in the record.
26. On December 13, 2002, the Regional Board adopted resolution no. R3-2002-0117.
27. On March 17, 2003, State Board returned the Administrative Record to the Regional Board with a memo stating that Regional Board adoption procedures did not comply with section 3777 of Title 23 California Code of Regulations which requires consideration of reasonable alternatives to the proposed amendment that would achieve the stated goal.
28. On May 16, 2003, in Watsonville, California, the Regional Board held a public meeting and re-heard this item to correct the omission stated above (45 days public notice were given). The Regional Board heard and considered all public comments and evidence in the record.

THEREFORE, BE IT RESOLVED,

1. The Regional Board, after considering the entire record, including oral testimony, adopts the Basin Plan amendment shown on "Attachment-Proposed Basin Plan Amendments." The amendment will not take effect until approved by the State Board and OAL.
2. The Regional Board's Executive Officer is authorized to submit the amendment to the State Board. The State Board is requested to approve the Basin Plan Amendment in accordance with requirements of Sections 13245 and 13246 of the California Water Code, and upon approval, the State Board is requested to transmit the amendment to the OAL and USEPA for approval.
3. The environmental document prepared by Regional Board staff pursuant to Public Resource Code Section 21080.5 is hereby certified. Following approval of the revised Basin Plan by the State Board, the Regional Board shall file a Notice of Decision with the Resources Agency following USEPA approval.
4. The Regional Board's Executive Officer is authorized to sign a Certificate of Fee Exemption.
5. If during the approval process the State Board or OAL determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Regional Board's Executive Officer may make such changes, and shall inform the Regional Board of any such changes.

I, **ROGER W. BRIGGS, Executive Officer**, do hereby certify the foregoing is a full, true, and correct copy of the resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region, on **May 16, 2003**.

Executive Officer

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENTS

1. Revise the September 8, 1994 Basin Plan, Chapter Four, as follows:

R3-2002-0117, 5/16/03
SB-2003-0060, 9/16/03
OAL, 11/19/03

Add the following to chapter 4 after IX. D.:

RESOLUTION NO. R3-2002-0117

IX. E. TOTAL MAXIMUM DAILY LOAD FOR PATHOGENS FOR MORRO BAY AND CHORRO AND LOS OSOS CREEKS

The Regional Water Quality Control Board adopted this TMDL on insert date.

This TMDL was approved by:

The State Water Resources Control Board on insert date.

The California Office of Administrative Law on insert date. (*Effective date*)

The U.S. Environmental Protection Agency on insert date. 1/20/04

TMDL Elements

Element													
Problem Statement	Numeric water quality objectives for fecal coliform set by the Regional Board and standards enforced by the California Department of Health Services (DHS) pursuant to the United States Department of Health Services Food and Drug Administration's National Shellfish Sanitation Program have been exceeded for shellfish harvesting and water contact recreation in Morro Bay. Elevated levels of fecal coliform in Morro Bay and Chorro and Los Osos Creeks indicate that pathogens are impairing water contact recreation and shellfish harvesting in these water bodies. High levels of pathogens may cause disease in humans and may also adversely affect marine animals. Portions of Morro Bay have been closed by DHS for commercial shellfish harvesting since 1996, and advisories have been posted to warn the public to avoid water contact activities. Morro Bay was identified as impaired for pathogens on the 1998 Clean Water Act Section 303(d) list of impaired water bodies.												
Numeric Targets	<p>Numeric targets for <u>Morro Bay</u>, based on regulations¹ that DHS follows</p> <table border="1" style="margin-left: 40px;"> <tr> <th colspan="2" style="text-align: center;">Fecal Coliform</th> </tr> <tr> <th style="text-align: center;">Geometric Mean</th> <th style="text-align: center;">Maximum</th> </tr> <tr> <td style="text-align: center;">14 MPN/100 mL^a</td> <td style="text-align: center;">43 MPN/100 mL^b</td> </tr> </table> <p>a: Based on the geometric mean of monthly sampling b: No more than 10% of total samples may exceed this number</p> <p>Numeric targets for Chorro and Los Osos Creeks and fresh water seeps² to Morro Bay, based on Basin Plan objective</p> <table border="1" style="margin-left: 40px;"> <tr> <th colspan="2" style="text-align: center;">Fecal Coliform</th> </tr> <tr> <th style="text-align: center;">Geometric Mean</th> <th style="text-align: center;">Maximum</th> </tr> <tr> <td style="text-align: center;">200 MPN/100 mL^a</td> <td style="text-align: center;">400 MPN/100 mL^b</td> </tr> </table> <p>a: Geometric mean of not less than five samples over a period of 30 days b: Not more than 10% of total samples during a period of 30 days exceed</p>	Fecal Coliform		Geometric Mean	Maximum	14 MPN/100 mL ^a	43 MPN/100 mL ^b	Fecal Coliform		Geometric Mean	Maximum	200 MPN/100 mL ^a	400 MPN/100 mL ^b

14 MPN/100 mL ^a	43 MPN/100 mL ^b												
Fecal Coliform													
Geometric Mean	Maximum												
200 MPN/100 mL ^a	400 MPN/100 mL ^b												

¹ National Shellfish Sanitation Program, Model Ordinance, Chapter IV, 0.02, D

² Seeps are defined as any surfacing ground water flowing into Morro Bay from the east shore of the Bay, south of Los Osos Creek.

Element	
Allocations and TMDL	<p>This TMDL is expressed as concentrations that are equal to the numeric targets. For Bay waters, a geometric mean of 14 MPN/100 mL must be achieved and no more than 10% of the samples may be over 43 MPN/100 mL for <u>fecal coliform</u>. For tributaries (Chorro and Los Osos Creeks and fresh water seeps) to the Bay, the geometric mean shall not exceed 200 MPN/100 mL over a 30-day period nor shall 10% of the samples exceed 400 MPN/100 mL over any 30-day period for <u>fecal coliform</u>. Point and nonpoint sources cannot exceed the concentrations specified above. Therefore, the wasteload allocations and load allocations, which include background levels, are also equal to the numeric targets.</p>
Margin of Safety	<p>A margin of safety has been established implicitly through the use of protective numeric targets.</p>
Linkage Analysis	<p>Allocations are equal to the numeric targets which equal the water quality objectives.</p>
Implementation	<p>The bacterial load to Morro Bay derives from nonpoint sources (NPS) and point sources. As such, implementation will rely on the State's Plan for NPS pollution control (CWC §13369) and continued implementation of existing regulatory controls as appropriate for point sources, including storm water pursuant to NPDES surface water discharge regulations and Waste Discharge Requirements (Porter Cologne).</p> <p>Implementation emphasizes the activities of the Morro Bay National Estuary Program, Coastal San Luis Resources Conservation District, Farm Bureau, University of California Cooperative Extension, Natural Resources Conservation Service, Public/Private Landowners, Morro Bay Harbor Department, California Department of Fish and Game, City of Morro Bay, United States Coast Guard, San Luis Obispo County, Division of Animal Services, all of whom are not currently identified as dischargers responsible for bacterial loading, to implement self-determined activities (see Table: Trackable Implementation Actions (self-determined)). Other actions, currently required because of another Regional Water Quality Control Board (Regional Board) regulatory program, will be evaluated to make sure progress is taking place (see Table: Trackable Implementation Actions identified under existing regulatory programs). Regional Board Staff will meet annually with the implementing parties identified in the list of Trackable Implementation Actions Tables to provide technical assistance and to evaluate and track progress (see Table: Morro Bay TMDL for Pathogens Implementation Schedule for details). If at the end of year three, implementing parties fail to initiate these self-determined activities and/or resulting management practices fail to reduce bacterial loads and/or the numeric targets are not being met, then Regional Board staff will conduct inspections and investigations to identify individual responsible dischargers (e.g., landowners or public agencies). Regional Board staff may rely on Section 13267 of the California Water Code and other appropriate authorities for investigation and identification of individual responsible dischargers. Regional Board staff will also rely on Section 13267 of the California Water Code to require reporting and/or monitoring to determine the level of implementation of identified activities to reduce bacteria. If necessary, the Regional Board may rely on enforcement authority, pursuant to California Water Code Section 13304, to require dischargers to clean-up and abate bacterial discharges and/or prevent the threat of discharges on a case-by case basis. Additionally, Implementation Actions (in the Table of Implementation Actions) may be identified as conditions of compliance with storm water permits and Waste Discharge Requirements.</p> <p>If at the end of the third year, self-determined actions have not been initiated, staff will develop a regulatory approach (rather than a self-determined approach) and present a revised implementation plan to the Regional Board as a Basin Plan Amendment.</p>
Monitoring	<p>Monitoring will be performed and evaluated by the DHS according to their regulations, the Morro Bay National Estuary Volunteer Program and the Regional Board to ensure that numeric targets are met and implementation actions are taking place. Should the Morro Bay National Estuary Volunteer Program be unable to sample, the Regional Board will sample to the extent practicable. Regional Board staff will review data on a triennial basis, at a minimum, and determine if progress towards fecal coliform reduction is adequate and whether changes to implementation actions are warranted (as described above).</p>

Trackable Implementation Actions (self-determined)

PROJECT NAME	ACTION	SCHEDULE	IMPLEMENTING PARTIES
Grazing Management	Implement grazing management measures that reduce bacterial levels	Ongoing - 2012	MBNEP, CSLRCD, Farm Bureau, UCCE, NRCS, Public/Private Landowners
Boat Management, Pump-outs	Upgrade pump-out facilities, provide new facilities, improve accessibility	2002-2005	MBHD
Remove unpermitted moorings	Remove illegal moorings and prevent future ones	Ongoing - 2007	CDFG, MBNEP
Remove derelict boats	Remove abandoned, derelict boats and vessels in back bay	Ongoing - 2007	CDFG, MBNEP
Manage live aboard boating situation	Continue issuing permits to live aboards, continue with inspections	Ongoing - 2012	City of Morro Bay, USCG, CDFG, MBHD
Educate Public about proper boat waste disposal	Educate public about proper waste disposal	Ongoing - 2012	MBNEP, MBHD
Pet waste management	Create an off leash dog park, provide supplies to pick-up pet waste, ordinance	Ongoing -2012	MBNEP, City of Morro Bay, San Luis Obispo County
Septic System Maintenance	Inspect and maintain all septic systems throughout the watershed	2004 - continuous	San Luis Obispo County, LOCSO
Spay/neuter pets	Educate public to promote spaying and neutering pets	Ongoing -2012	Division of animal services
Reduce the number of feral dogs/cats	Reduce the number of feral dogs/cats	Ongoing - 2012	Division of animal services, feral cat caretakers

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD

CENTRAL COAST REGION

San Luis Obispo, California

**RESOLUTION NO. R3-2002-0107
AMENDING THE WATER QUALITY CONTROL PLAN
FOR THE CENTRAL COAST BASIN
TO INCLUDE
LAS TABLAS CREEK AND LAKE NACIMIENTO TOTAL MAXIMUM DAILY LOAD FOR
MERCURY AND IMPLEMENTATION PLAN**

The California Regional Water Quality Control Board Central Coast Region hereby finds:

1. The California Regional Water Quality Control Board, Central Coast Region (Regional Board), adopted the Water Quality Control Plan for the Central Coastal Basin (Basin Plan), on September 8, 1994. The Basin Plan includes beneficial use designations, water quality objectives, implementation plans for point source and nonpoint source discharges, and statewide plans and policies.
2. The Regional Board periodically revises and amends the Basin Plan. The Regional Board has determined the Basin Plan requires further revision and amendment to incorporate a Las Tablas Creek and Lake Nacimiento Total Maximum Daily Load (TMDL) for Mercury and Implementation Plan.
3. The Regional Board proposes to amend the Basin plan by inserting amendments into Chapter Four, Section IX Total Maximum Daily Loads.
4. Section 303(d) of the Clean Water Act requires States to identify and to prepare a list of water bodies that do not meet water quality objectives and then to establish load and waste load allocations, or a total maximum daily load, for each water body which will ensure attainment of water quality objectives and then to incorporate those allocations into their Basin Plans.
5. Lake Nacimiento and Las Tablas Creek were identified as impaired by metals on the 1998 Clean Water Act Section 303(d) list of impaired water bodies. Therefore, the Regional Board is required to adopt a TMDL for those water bodies and incorporate the TMDL and associated Implementation Plan into the Basin Plan. (40 CFR 130.6(c)(1), 130.7, Water Code section 13242).
6. Lake Nacimiento watershed is located partly in Monterey County and partly in San Luis Obispo County. Las Tablas Creek is located entirely within San Luis Obispo County.
7. The TMDL contains a Problem Statement, Source Analysis, Numeric Targets, Total Maximum Load, Load Allocation, an Implementation Plan, and a Monitoring Plan.
8. The Problem identified in the TMDL is summarized as follows: Mercury impairments have been identified in Lake Nacimiento and Las Tablas Creek. Reported mercury levels are considered an impact to the Freshwater Habitat (warm and cold water) and Municipal Supply beneficial uses designated for Las Tablas Creek and Lake Nacimiento. In addition, mercury-rich sediment is

associated with mercury in fish tissue at levels that pose a nuisance for fish consumers and therefore impacts the Commercial and Sport Fishing beneficial use designated for these waters. No other metals were identified as impairing beneficial uses in Lake Nacimiento or Las Tablas Creek.

9. The Source analysis in the TMDL is summarized as follows: Using a model of estimated sediment fluxes in the watershed, it was determined that approximately 88% of the total mercury loading to Lake Nacimiento is from Las Tablas Creek. Sampling data support this model in the sense that the only exceedences of appropriate objectives for water (or guidance values for sediment) occur in the Las Tablas arm of the lake and not in the main body of the lake. Las Tablas Creek delivers an estimated 46 kilograms (kg) per year of sedimentary mercury into Lake Nacimiento. The majority of this mercury loading (38 kg of the 46 kg per year) is estimated to come from two adjacent mines, the Klau Mine and Buena Vista Mine, both of which are owned by Buena Vista mines, Inc. These mines are point sources which require regulation under NPDES or Waste Discharge Requirements. Some additional mercury is coming from a County Road. Control of this mercury loading is required to achieve the beneficial uses of Las Tablas Creek and Lake Nacimiento with regard to metals.
10. The TMDL is: an annual mercury load for Las Tablas Creek of 13.54 kg/yr, a 71 percent reduction in the estimated current loading.
11. The numeric targets are as follows: The load was calculated using an estimated 1000 kilograms of sediment runoff per square mile per year from the 30.65 square mile Las Tablas creek drainage area with an average mercury concentration of 0.486 milligrams mercury per kilogram of sediment. Because the load is from mercury-rich sediment and sediment objectives in the Basin Plan are narrative, rather than numeric, this TMDL establishes a numeric sediment target (0.486 mg/kg) as an indicator of long-term conditions anticipated to be able to support the designated beneficial uses. The numeric sediment target serves to interpret the narrative water quality objectives and provides a measure with which to determine if the objectives and the TMDL are being met. This TMDL also uses a numeric water quality target for total mercury in water. The combination of total mercury in sediment and total mercury in water is considered an effective approach in lieu of directly measuring mercury-rich sediment loading to Las Tablas Creek. Furthermore, direct measurement of sediment loads may not characterize the *effect* of those loads on beneficial uses. A monitoring guidance value, mercury in largemouth bass fish tissue, is suggested as a means of evaluating progress of the TMDL to restore the listed beneficial uses for Lake Nacimiento and Las Tablas Creek. The selection of the water and sediment targets does not preclude efforts to directly measure loading, however the natural variability inherent in annual sediment loads in this region is large enough to suggest that clear trends could not readily be identified by data collection in the near term.
12. The TMDL will be achieved by implementing Regional Water Quality Control Board's regulatory authority to regulate point source discharges. The plan guides the Regional Board in its control of point source pollution by requiring specific actions of responsible dischargers in the Las Tablas Creek watershed. Specifically, the Regional Board will be requiring San Luis Obispo County to address mercury-rich sediment runoff from a particular section of unpaved roadway (Cypress Mountain Road) pursuant to authority of the California Water Code. The Regional Board will also be requiring Buena Vista Mines, Inc. (owner of the two mine properties) to operate and maintain an effective mercury runoff control system and monitor the effectiveness of that system through appropriate permit conditions and compliance.
13. The TMDL will be evaluated by monitoring the numeric targets specified in finding 10 above, as well as tracking progress in implementation of required implementation actions. Responsibility for reporting status and effectiveness of required implementation actions and monitoring of numeric targets rests with the responsible dischargers and the Regional Board (San Luis Obispo County for roadways and Buena Vista Mines, Inc. for mined areas, along with monitoring data collected by the Regional Board). The Regional Board will review reports submitted by the responsible dischargers

and, in the event required actions are not implemented or numeric targets are not achieved, Regional Board staff may identify appropriate regulatory actions to achieve the targets.

14. Public review and comment were solicited after completion of the TMDL report and during the public meeting of this Regional Board on November 1, 2002.
15. The Regional Board submitted the TMDL Report to an external scientific review panel. On June 26, 2002 and July 10, 2002, the reviewers submitted their responses to the Regional Board, which stated that in general, the TMDL and proposed Basin Plan amendment presented a sound and scientifically justifiable program for reducing mercury loading. In addition, the review panel identified several specific areas of concern. The Regional Board revised the proposed Basin Plan amendment in response to the comments submitted by the review panel, or provided a written response which explained its basis for not incorporating their comments.
16. Public Resources Code section 21159 (a)(3),(c) mandates that prior to implementation of this regulatory action, an estimate of the total cost of such a program shall be indicated in any regional water quality control plan. The TMDL and Implementation Plan, in Chapter 8.7, contains an estimate of the cost of preventing mercury loading to Las Tablas Creek via implementation of required actions. The cost of implementing the required actions in the TMDL implementation Plan will be incurred by the responsible parties.
17. This Basin Plan amendment must be submitted for review and approval by the State Water Resources Control Board and the State Office of Administrative Law (OAL). The TMDL must further be approved by the USEPA. The Basin Plan amendment will become effective upon approval by the State Board and OAL.
18. This amendment meets the "Necessity" standard of the Administrative Procedure Act, Government Code §11353(b).
19. The Regional Board has determined that the Las Tablas Creek and Lake Nacimiento TMDL for Mercury is set at levels necessary to attain and maintain the applicable numeric and narrative water quality objectives with seasonal variations and margin of safety that takes into account any lack of knowledge concerning the relationship between effluent limitations and water quality (40 CFR 130.7(c)(1)). The TMDL also takes into account critical conditions for stream flow, loading and water quality parameters.
20. The basin planning process has been certified as functionally equivalent to the California Environmental Quality Act requirements for preparing environmental documents (Public Resources Code, Section 21000 et seq.) and as such, the required environmental documentation ~~and CEQA environmental checklist~~ hasve been prepared. Drafts of the Notice of Filing, staff report, environmental checklist, alternatives analysis and proposed amendment have been prepared and distributed to interested persons and agencies for review and comment in accordance with Title 23 California Code of Regulations section 3777. All public comments were considered. No significant environmental impacts will result from approval of this Basin Plan amendment.
21. The proposed amendments to the Basin Plan were developed in accordance with California Water Code Section 13240 et seq.
22. Notice of public hearing was given by advertising in newspapers of general circulation within the Region and by mailing a copy of the notice to all persons requesting such notice and applicable government agencies.

23. The amendment to the Basin Plan will result in no potential adverse effect, either individually or cumulatively, on wildlife and so is exempt from fee payments to the Department of Fish and Game under the California Fish and Game Code.

24. On November 1, 2002 in San Luis Obispo, California, the Regional Board held a public hearing and heard and considered all public comments and evidence in the record.

25. On November 1, 2002, the Regional Board adopted resolution no. R3-2002-0107.

26. On March 17, 2003, State Board returned the Administrative Record to the Regional Board with a memo stating that Regional Board adoption procedures did not comply with section 3777 of Title 23 California Code of Regulations which requires consideration of reasonable alternatives to the proposed amendment that would achieve the stated goal.

27. On May 16, 2003, in Watsonville, California, the Regional Board held a public meeting and re-heard this item to correct the omission stated above. The Regional Board heard and considered all public comments and evidence in the record.

THEREFORE, BE IT RESOLVED,

1. The Regional Board, after considering the entire record, including oral testimony, adopts the Basin Plan amendment shown on "Attachment-Proposed Basin Plan Amendments." The amendment will not take effect until approved by the State Board and the Office of Administrative Law (OAL).
2. The Board's Executive Officer is authorized to submit the amendment to the State Water Resources Control Board. Upon approval, the State Board is requested to approve the Basin Plan Amendment in accordance with requirements of Sections 13245 and 13246 of the California Water Code, and upon approval, the State Board is requested to transmit the amendment to the OAL for approval.
3. The environmental document prepared by Regional Board staff pursuant to Public Resource Code Section 21080.5 is hereby certified. The Regional Board shall file a CEQA Notice of Decision with the Secretary for Resources, following approval of the revised Basin Plan by the State Board and OAL. A Certificate of Fee Exemption will be included with the Notice of Decision.
4. The Board's Executive Officer is authorized to sign a Certificate of Fee Exemption, since no adverse effect on wildlife results from adoption of this Basin Plan Amendment.
5. If during approval process the State Board or OAL determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Board of any such changes.

I, ROGER W. BRIGGS, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of the resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region, on ~~November 1, 2002, and re-adopted on~~ May 16, 2003.

Executive Officer

RESOLUTION NO. R3-2002- 0107

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENTS

~~+~~ Revise the September 8, 1994 Basin Plan, Chapter Four, as follows:

Add the following to chapter 4 ~~under IX..B.~~~~under IX. B.~~

IX. C. LAS TABLAS CREEK AND LAKE NACIMIENTO TOTAL MAXIMUM DAILY LOAD FOR MERCURY

This TMDL was adopted by the Regional Water Quality Control Board on ~~May~~November 16, 20023.

This TMDL was approved by:

The State Water Resources Control Board on insert date.

The California Office of Administrative Law on insert date.

The U.S. Environmental Protection Agency on insert date.

Table IX.C.1 - TMDL Elements

Element		
Problem Statement	The historic processes of mining have caused mercury impairments in Lake Nacimiento and Las Tablas Creek. Water samples from these waterbodies consistently show mercury at levels in excess of Basin Plan objectives for “freshwater habitat” (cold and warm waters) beneficial uses. In addition, fish tissue samples collected from fish in Lake Nacimiento between 1981 and 1994 exceed US Food and Drug Administration levels for human consumption. This is an impairment of narrative standards for suspended and settleable materials and indicates impact to the beneficial use of “commercial and sport fishing”.	
Numeric Targets (numeric objective or interpretation of a narrative water quality objective)	Parameter	Numeric Target
	Mercury (in water)	0.05 micrograms per Liter (µg g/L), total
	Mercury (in sediment)	0.486 milligrams per kilogram (mg/kg)
Total Load and Loading Allocations (TMDL expressed as annual load)	Source Area Category (size-sq.mi)	Projected target mercury load (kg/yr)
	General Soils (30.14)	7.67
	Roads (0.01)	0
	Mines (0.5)	4.52
	Total	13.54*
* = projected total includes 1.35 kg/yr margin of safety, total load estimated as 12.19 kg/yr+1.35 kg/yr= 13.54 kg/yr		
Implementation	The TMDL will be implemented by reducing mercury-rich sediment loading into Lake Nacimiento and Las Tablas Creek (and its tributaries). Because the sediment load of the Las Tablas Creek watershed derives primarily from point sources (mines and roads), this Implementation Plan will rely upon the control of these identifiable sources. <u>Unpaved Road Areas:</u> Loading from the unpaved segment of Cypress Mountain road between Chimney Rock Road and Klau Mine Road will be addressed through existing regulatory authority of the Regional Board. San Luis Obispo County will be asked to provide to the Regional Board a	

Element	
	<p>schedule for eliminating the loading (paving or equivalent method) from the specified road segment and progress satisfactorily along that schedule. The Regional Board will use its authority under the California Water code to implement the sediment runoff reductions from the road identified in this TMDL. Paving of the roadway (or equivalent control) will be considered compliance with the requirements of the TMDL. Costs associated with this action have been estimated to be approximately \$980,000 (one-time) pursuant to Public resources Code section 21159 (a)(3), (c).</p> <p><u>Mined Areas:</u> The Buena Vista and Klau mines are within the permitting authority of the Regional Board in the National Pollutant Discharge Elimination System (NPDES) program or through the issuance of Waste Discharge Requirements (WDRs). Upon adoption approval of this TMDL, the owner of the mines must apply for either a new NPDES permit or a WDR for the properties (NPDES if the owner seeks a discharge directly to waterways or WDR if to lands near the waters). The permit will then include specific permit conditions to limit the sediment runoff from the properties in accordance with the targets set forth in this TMDL.</p> <p>Several erosion control measures were implemented at the mines as part of US EPA’s Emergency Response Action at the site in 2000- 2001, which may be anticipated to achieve the needed 88 % reduction of mercury loading to the creek. Although these practices were implemented in 2000-2001 (RWQCB, 2001), the treatment has not been evaluated to verify that discharges have been eliminated, nor have ongoing operation and maintenance measures been planned or implemented to ensure no future discharges will occur. For these reasons, the remaining anticipated actions to reduce mercury loading from the mined areas are:</p> <ul style="list-style-type: none"> • plan and propose maintenance, monitoring, and operation of the land management practices implemented by USEPA in 2000-2001, • submit application for an appropriate permit, • comply with permit conditions, and, • implement control practices and discharge requirements. <p>Costs associated with maintaining mined-land management practices and monitoring the mined lands have been estimated to be approximately \$1500 per year pursuant to Public Resources Code section 21159 (a)(3), (c). The cost estimate includes only costs of maintaining a vegetated buffer and monitoring listed in this TMDL. It does not include any other costs that would be incurred by the responsible party under any regulatory or enforcement action</p> <p>This Implementation Plan goes into effect on the date that this Basin Plan Amendment is approved by the Office of Administrative Law.</p>
Margin of Safety	<p>A margin of safety of 10% has been included in the annual load equation presented in the section titled “Total Maximum Annual Mercury Load for Las Tablas Creek” because of:</p> <p>Uncertainty associated with the selection of an appropriate sediment target, and the relationship between sediment targets and water column or fish tissue concentrations;</p> <p>Conservative usage of only largemouth bass (no lower trophic levels) fish tissue in evaluation of potential human health exposures;</p> <p>Uncertainty associated with Regional Board Lake Nacimiento Model calculations (extrapolations of data points to unsampled areas);</p> <p>Uncertainty associated with the small area sedimentation rate incorporated into the Estimated Source Load Calculations;</p> <p>Conservative estimation of mine area size in the Estimated Source Load Calculations and uncertainty about acid mine drainage,</p> <p>The existence of other smaller mines (currently estimated to contribute less than 5 % of the total mercury load) in the drainage area; and,</p> <p>The use of an adaptive management approach in the TMDL which allows refinement of targets as additional data become available.</p>

Table IX.C.2 - Implementation Compliance Schedule

By End of Implementation Year	Implementation Action (Milestone)	Responsible Party or Discharger	Monitoring Activity (Responsible party for that monitoring)	Numeric Target <u>indicator of associated with</u> Load Allocation
1 (baseline data)	Maintain Buena Vista (BV) and Klau Mine slope/vegetated <u>buffer</u> , and sediment control measures. Submit complete application for discharge permits	Buena Vista Mines, Inc. <u>(BV Mines, Inc.)</u>		
1	Require schedule <u>for eliminating mercury-containing runoff from segment of Cypress Mountain Road between Klau Mine Road and Chimney Rock Road of County Road load elimination</u>	Regional Board	Notify San Luis Obispo County <u>(County)</u> of adoption of TMDL and track response (Regional Board).	
2	Maintain BV and Klau Mine slope/vegetation <u>buffer</u>	BV Mines, Inc.		
2	Review permit application(s) for mined areas	Regional Board	<u>The Regional Board will e</u> Establish discharge permit(s) for mines. If permit application not submitted, Regional Board staff will issue Cleanup and Abatement Order (CAO) or other	

By End of Implementation Year	Implementation Action (Milestone)	Responsible Party or Discharger	Monitoring Activity (Responsible party for that monitoring)	Numeric Target <u>indicator of associated with Load Allocation</u>
	Receive County <u>Cypress Mountain</u> Road load elimination schedule.		appropriate regulatory action (Regional Board). If Road load elimination Schedule not received, Regional Board staff will issue CAO or similar regulatory action. (Regional Board)	
3	Maintain BV and Klau Mine slope /vegetation <u>buffer</u>	BV Mines, Inc.	3 Storm Events and twice/year sampling for total mercury in water. Once per year for total mercury in sediment (<u>to establish baseline data</u>) (BV Mines, Inc.)	Water: Mercury = 0.05 $\mu\text{g/L}$ Sediment: establish baseline data
3	Review progress and data to date	Regional Board	Review data for completeness; adjust sampling program as needed (<u>Regional Board</u>)	
By End of Implementation Year	Implementation Action (Milestone)	Responsible Party or Discharger	Monitoring Activity (Responsible party for that monitoring)	Numeric Target associated with Load Allocation
4	Maintain BV and Klau Mine slope /vegetation <u>buffer</u>	BV Mines, Inc.	3 Storm Events and twice/year sampling for total mercury in water. Once per year for total mercury in sediment (<u>to confirm baseline data</u>). (BV Mines, Inc.)	Water: Mercury = 0.05 $\mu\text{g/L}$ Sediment: confirm baseline data
5	Maintain BV and Klau Mine slope /vegetation <u>buffer</u> <u>Sample Lake Nacimiento conditions</u>	BV Mines, Inc. Regional Board	3 Storm Events and twice/year sampling for total mercury in water. Once per year for total mercury in sediment (may be modified if permits renewed or re-adopted in year 5) (BV Mines, Inc.) Lake Nacimiento: Dissolved oxygen, Total mercury and methylmercury in water, total mercury in sediment and fish tissue (largemouth bass, as a guide) near where Las Tablas Creek enters lake	Water: Mercury = 0.05 $\mu\text{g/L}$ Sediment: Mercury = 0.486 mg/kg Fish Tissue Guide: < 0.37 mg/kg, or decreasing trend from existing data

By End of Implementation Year	Implementation Action (Milestone)	Responsible Party or Discharger	Monitoring Activity (Responsible party for that monitoring)	Numeric Target <u>indicator of associated with Load Allocation</u>
			(Regional Board)	
<u>5</u>		<u>Regional Board</u>	<u>Sample Lake Nacimiento near where Las Tablas Creek enters lake. Sample for: Dissolved oxygen, total mercury and methylmercury in water, total mercury in sediment and fish tissue (largemouth bass)</u> <u>(Regional Board)</u>	
5	Perform 5-year review of TMDL and Progress; <u>Review Tracked Actions</u>	Regional Board	Review tracked actions; Review data of initial program years for trends showing TMDL will be achieved; report and document any changes needed to TMDL or plans (e.g., acid mine drainage control if monitoring data indicates a quantifiable impediment to achieving TMDL) (Regional Board)	
By End of Implementation Year	Implementation Action (Milestone)	Responsible Party or Discharger	Monitoring Activity (Responsible party for that monitoring)	Numeric Target associated with Load Allocation
6	Eliminate load from 3-mile segment of Cypress Mountain Road (between Chimney Rock Road and Klau Mine Road)	SLO County	Per schedule submitted by County or by CAO or other action of Regional Board. (SLO County)	Tracking/ Reporting of completed action (including photo documentation).

By End of Implementation Year	Implementation Action (Milestone)	Responsible Party or Discharger	Monitoring Activity (Responsible party for that monitoring)	Numeric Target <u>indicator of associated with Load Allocation</u>
6 - 10	Review Monitoring Data	Regional Board	Review data from required Permit monitoring for total mercury in water (Regional Board)	Water: Mercury = 0.05 $\mu\text{g/L}$;
7 - 10	Maintain load control method for specified segment of Cypress Mountain Road	SLO County	Inspect general operation and perform necessary maintenance of load prevention method. Submit annual letter/report of inspection and any maintenance performed. (SLO County)	Tracking/Reporting of completed actions.
10	Maintain BV and Klau Mine slope/vegetation buffer Sample Lake Nacimiento conditions	BV Mines, Inc. Regional Board	Regular sampling for total mercury in water; total mercury in sediment (regularity of sampling as specified in permits – e.g., by storm event, quarterly, seasonally, or combination of these) (BV Mines, Inc.) Lake Nacimiento: Dissolved oxygen, Total mercury and methylmercury in water, total mercury in sediment and fish tissue (largemouth bass, as a guide) near where Las Tablas Creek enters lake. (Regional Board)	Water: Mercury = 0.05 $\mu\text{g/L}$; Sediment: Mercury = 0.486 mg/kg Fish Tissue Guide: < 0.37 mg/kg
<u>10</u>		<u>Regional Board</u>	<u>Sample Lake Nacimiento near where Las Tablas Creek enters lake. Sample for: Dissolved oxygen, total mercury and methylmercury in water, total mercury in sediment and fish tissue (largemouth bass) (Regional Board)</u>	
<u>11—30</u>	<u>Repeat as above with 5 and 10 year milestones and annual permit requirements</u>			

Note: Implementation begins on the date this TMDL is approved by the Office of Administrative Law.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD

CENTRAL COAST REGION

San Luis Obispo, California

**RESOLUTION NO. R3-2002-0107
AMENDING THE WATER QUALITY CONTROL PLAN
FOR THE CENTRAL COAST BASIN
TO INCLUDE
LAS TABLAS CREEK AND LAKE NACIMIENTO TOTAL MAXIMUM DAILY LOAD FOR
MERCURY AND IMPLEMENTATION PLAN**

The California Regional Water Quality Control Board Central Coast Region hereby finds:

1. The California Regional Water Quality Control Board, Central Coast Region (Regional Board), adopted the Water Quality Control Plan for the Central Coastal Basin (Basin Plan), on September 8, 1994. The Basin Plan includes beneficial use designations, water quality objectives, implementation plans for point source and nonpoint source discharges, and statewide plans and policies.
2. The Regional Board periodically revises and amends the Basin Plan. The Regional Board has determined the Basin Plan requires further revision and amendment to incorporate a Las Tablas Creek and Lake Nacimiento Total Maximum Daily Load (TMDL) for Mercury and Implementation Plan.
3. The Regional Board proposes to amend the Basin plan by inserting amendments into Chapter Four, Section IX Total Maximum Daily Loads.
4. Section 303(d) of the Clean Water Act requires States to identify and to prepare a list of water bodies that do not meet water quality objectives and then to establish load and waste load allocations, or a total maximum daily load, for each water body which will ensure attainment of water quality objectives and then to incorporate those allocations into their Basin Plans.
5. Lake Nacimiento and Las Tablas Creek were identified as impaired by metals on the 1998 Clean Water Act Section 303(d) list of impaired water bodies. Therefore, the Regional Board is required to adopt a TMDL for those water bodies and incorporate the TMDL and associated Implementation Plan into the Basin Plan. (40 CFR 130.6(c)(1), 130.7, Water Code section 13242).
6. Lake Nacimiento watershed is located partly in Monterey County and partly in San Luis Obispo County. Las Tablas Creek is located entirely within San Luis Obispo County.
7. The TMDL contains a Problem Statement, Source Analysis, Numeric Targets, Total Maximum Load, Load Allocation, an Implementation Plan, and a Monitoring Plan.
8. The Problem identified in the TMDL is summarized as follows: Mercury impairments have been identified in Lake Nacimiento and Las Tablas Creek. Reported mercury levels are considered an impact to the Freshwater Habitat (warm and cold water) and Municipal Supply beneficial uses

designated for Las Tablas Creek and Lake Nacimiento. In addition, mercury-rich sediment is associated with mercury in fish tissue at levels that pose a nuisance for fish consumers and therefore impacts the Commercial and Sport Fishing beneficial use designated for these waters. No other metals were identified as impairing beneficial uses in Lake Nacimiento or Las Tablas Creek.

9. The Source analysis in the TMDL is summarized as follows: Using a model of estimated sediment fluxes in the watershed, it was determined that approximately 88% of the total mercury loading to Lake Nacimiento is from Las Tablas Creek. Sampling data support this model in the sense that the only exceedences of appropriate objectives for water (or guidance values for sediment) occur in the Las Tablas arm of the lake and not in the main body of the lake. Las Tablas Creek delivers an estimated 46 kilograms (kg) per year of sedimentary mercury into Lake Nacimiento. The majority of this mercury loading (38 kg of the 46 kg per year) is estimated to come from two adjacent mines, the Klau Mine and Buena Vista Mine, both of which are owned by Buena Vista mines, Inc. These mines are point sources which require regulation under NPDES or Waste Discharge Requirements. Some additional mercury is coming from a County Road. Control of this mercury loading is required to achieve the beneficial uses of Las Tablas Creek and Lake Nacimiento with regard to metals.
10. The TMDL is: an annual mercury load for Las Tablas Creek of 13.54 kg/yr, a 71 percent reduction in the estimated current loading.
11. The numeric targets are as follows: The load was calculated using an estimated 1000 kilograms of sediment runoff per square mile per year from the 30.65 square mile Las Tablas creek drainage area with an average mercury concentration of 0.486 milligrams mercury per kilogram of sediment. Because the load is from mercury-rich sediment and sediment objectives in the Basin Plan are narrative, rather than numeric, this TMDL establishes a numeric sediment target (0.486 mg/kg) as an indicator of long-term conditions anticipated to be able to support the designated beneficial uses. The numeric sediment target serves to interpret the narrative water quality objectives and provides a measure with which to determine if the objectives and the TMDL are being met. This TMDL also uses a numeric water quality target for total mercury in water. The combination of total mercury in sediment and total mercury in water is considered an effective approach in lieu of directly measuring mercury-rich sediment loading to Las Tablas Creek. Furthermore, direct measurement of sediment loads may not characterize the *effect* of those loads on beneficial uses. A monitoring guidance value, mercury in largemouth bass fish tissue, is suggested as a means of evaluating progress of the TMDL to restore the listed beneficial uses for Lake Nacimiento and Las Tablas Creek. The selection of the water and sediment targets does not preclude efforts to directly measure loading, however the natural variability inherent in annual sediment loads in this region is large enough to suggest that clear trends could not readily be identified by data collection in the near term.
12. The TMDL will be achieved by implementing Regional Water Quality Control Board's regulatory authority to regulate point source discharges. The plan guides the Regional Board in its control of point source pollution by requiring specific actions of responsible dischargers in the Las Tablas Creek watershed. Specifically, the Regional Board will be requiring San Luis Obispo County to address mercury-rich sediment runoff from a particular section of unpaved roadway (Cypress Mountain Road) pursuant to authority of the California Water Code. The Regional Board will also be requiring Buena Vista Mines, Inc. (owner of the two mine properties) to operate and maintain an effective mercury runoff control system and monitor the effectiveness of that system through appropriate permit conditions and compliance.
13. The TMDL will be evaluated by monitoring the numeric targets specified in finding 10 above, as well as tracking progress in implementation of required implementation actions. Responsibility for reporting status and effectiveness of required implementation actions and monitoring of numeric targets rests with the responsible dischargers and the Regional Board (San Luis Obispo County for roadways and Buena Vista Mines, Inc. for mined areas, along with monitoring data collected by the

Regional Board). The Regional Board will review reports submitted by the responsible dischargers and, in the event required actions are not implemented or numeric targets are not achieved, Regional Board staff may identify appropriate regulatory actions to achieve the targets.

14. Public review and comment were solicited after completion of the TMDL report and during the public meeting of this Regional Board on November 1, 2002.
15. The Regional Board submitted the TMDL Report to an external scientific review panel. On June 26, 2002 and July 10, 2002, the reviewers submitted their responses to the Regional Board, which stated that in general, the TMDL and proposed Basin Plan amendment presented a sound and scientifically justifiable program for reducing mercury loading. In addition, the review panel identified several specific areas of concern. The Regional Board revised the proposed Basin Plan amendment in response to the comments submitted by the review panel, or provided a written response which explained its basis for not incorporating their comments.
16. Public Resources Code section 21159 (a)(3),(c) mandates that prior to implementation of this regulatory action, an estimate of the total cost of such a program shall be indicated in any regional water quality control plan. The TMDL and Implementation Plan, in Chapter 8.7, contains an estimate of the cost of preventing mercury loading to Las Tablas Creek via implementation of required actions. The cost of implementing the required actions in the TMDL implementation Plan will be incurred by the responsible parties.
17. This Basin Plan amendment must be submitted for review and approval by the State Water Resources Control Board and the State Office of Administrative Law (OAL). The TMDL must further be approved by the USEPA. The Basin Plan amendment will become effective upon approval by the State Board and OAL.
18. This amendment meets the "Necessity" standard of the Administrative Procedure Act, Government Code §11353(b).
19. The Regional Board has determined that the Las Tablas Creek and Lake Nacimiento TMDL for Mercury is set at levels necessary to attain and maintain the applicable numeric and narrative water quality objectives with seasonal variations and margin of safety that takes into account any lack of knowledge concerning the relationship between effluent limitations and water quality (40 CFR 130.7(c)(1)). The TMDL also takes into account critical conditions for stream flow, loading and water quality parameters.
20. The basin planning process has been certified as functionally equivalent to the California Environmental Quality Act requirements for preparing environmental documents (Public Resources Code, Section 21000 et seq.) and as such, the required environmental documentation and CEQA environmental checklist have been prepared. Drafts of the Notice of Filing, staff report, environmental checklist, and proposed amendment have been prepared and distributed to interested persons and agencies for review and comment in accordance with Title 23 California Code of Regulations section 3777. All public comments were considered. No significant environmental impacts will result from approval of this Basin Plan amendment.
21. The proposed amendments to the Basin Plan were developed in accordance with California Water Code Section 13240 et seq.
22. Notice of public hearing was given by advertising in newspapers of general circulation within the Region and by mailing a copy of the notice to all persons requesting such notice and applicable government agencies.

23. The amendment to the Basin Plan will result in no potential adverse effect, either individually or cumulatively, on wildlife and so is exempt from fee payments to the Department of Fish and Game under the California Fish and Game Code.
24. On November 1, 2002 in San Luis Obispo, California, the Regional Board held a public hearing and heard and considered all public comments and evidence in the record.

THEREFORE, BE IT RESOLVED,

1. The Regional Board, after considering the entire record, including oral testimony, adopts the Basin Plan amendment shown on "Attachment-Proposed Basin Plan Amendments." The amendment will not take effect until approved by the State Board and the Office of Administrative Law (OAL).
2. The Board's Executive Officer is authorized to submit the amendment to the State Water Resources Control Board. Upon approval, the State Board is requested to approve the Basin Plan Amendment in accordance with requirements of Sections 13245 and 13246 of the California Water Code, and upon approval, the State Board is requested to transmit the amendment to the OAL for approval.
3. The environmental document prepared by Regional Board staff pursuant to Public Resource Code Section 21080.5 is hereby certified. The Regional Board shall file a CEQA Notice of Decision with the Secretary for Resources, following approval of the revised Basin Plan by the State Board and OAL. A Certificate of Fee Exemption will be included with the Notice of Decision.
4. The Board's Executive Officer is authorized to sign a Certificate of Fee Exemption, since no adverse effect on wildlife results from adoption of this Basin Plan Amendment.
5. If during approval process the State Board or OAL determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Board of any such changes.

I, **ROGER W. BRIGGS, Executive Officer**, do hereby certify the foregoing is a full, true, and correct copy of the resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region, on November 1, 2002.

Executive Officer

RESOLUTION NO. R3-2002- 0107

ATTACHMENT - PROPOSED BASIN PLAN AMENDMENTS

1. Revise the September 8, 1994 Basin Plan, Chapter Four, as follows:

Add the following to chapter 4 under IX. B.

IX. C. LAS TABLAS CREEK AND LAKE NACIMIENTO TOTAL MAXIMUM DAILY LOAD FOR MERCURY

This TMDL was adopted by the Regional Water Quality Control Board on **November 1, 2002**.

This TMDL was approved by:

The State Water Resources Control Board on insert date.

The California Office of Administrative Law on insert date.

The U.S. Environmental Protection Agency on insert date.

TMDL Elements

Element		
Problem Statement	The historic processes of mining have caused mercury impairments in Lake Nacimiento and Las Tablas Creek. Water samples from these waterbodies consistently show mercury at levels in excess of Basin Plan objectives for "freshwater habitat" (cold and warm waters) beneficial uses. In addition, fish tissue samples collected from fish in Lake Nacimiento between 1981 and 1994 exceed US Food and Drug Administration levels for human consumption. This is an impairment of narrative standards for suspended and settleable materials and indicates impact to the beneficial use of "commercial and sport fishing".	
Numeric Targets (numeric objective or interpretation of a narrative water quality objective)	Parameter	Numeric Target
	Mercury (in water)	0.05 micrograms per Liter (ug/L), total
	Mercury (in sediment)	0.486 milligrams per kilogram (mg/kg)
Total Load and Loading Allocations (TMDL expressed as annual load)	Source Area Category (size-sq.mi)	Projected target mercury load (kg/yr)
	General Soils (30.14)	7.67
	Roads (0.01)	0
	Mines (0.5)	4.52
	Total	13.54*
* = projected total includes 1.35 kg/yr margin of safety, total load estimated as 12.19 kg/yr+1.35 kg/yr= 13.54 kg/yr		
Implementation	The TMDL will be implemented by reducing mercury-rich sediment loading into Lake Nacimiento and Las Tablas Creek (and its tributaries). Because the sediment load of the Las Tablas Creek watershed derives primarily from point sources (mines and roads), this Implementation Plan will rely upon the control of these identifiable sources. <u>Unpaved Road Areas</u> : Loading from the unpaved segment of Cypress Mountain road between Chimney Rock Road and Klau Mine Road will be addressed through existing regulatory authority	

Element	
	<p>of the Regional Board. San Luis Obispo County will be asked to provide to the Regional Board a schedule for eliminating the loading (paving or equivalent method) from the specified road segment and progress satisfactorily along that schedule. The Regional Board will use its authority under the California Water code to implement the sediment runoff reductions from the road identified in this TMDL. Paving of the roadway (or equivalent control) will be considered compliance with the requirements of the TMDL. Costs associated with this action have been estimated to be approximately \$980,000 (one-time) pursuant to Public Resources Code section 21159 (a)(3), (c).</p> <p><u>Mined Areas:</u> The Buena Vista and Klau mines are within the permitting authority of the Regional Board in the National Pollutant Discharge Elimination System (NPDES) program or through the issuance of Waste Discharge Requirements (WDRs). Upon adoption of this TMDL, the owner of the mines must apply for either a new NPDES permit or a WDR for the properties (NPDES if the owner seeks a discharge directly to waterways or WDR if to lands near the waters). The permit will then include specific permit conditions to limit the sediment runoff from the properties in accordance with the targets set forth in this TMDL.</p> <p>Several erosion control measures were implemented at the mines as part of US EPA's Emergency Response Action at the site in 2000- 2001, which may be anticipated to achieve the needed 88 % reduction of mercury loading to the creek. Although these practices were implemented in 2000-2001 (RWQCB, 2001), the treatment has not been evaluated to verify that discharges have been eliminated, nor have ongoing operation and maintenance measures been planned or implemented to ensure no future discharges will occur. For these reasons, the remaining anticipated actions to reduce mercury loading from the mined areas are:</p> <ul style="list-style-type: none"> • plan and propose maintenance, monitoring, and operation of the land management practices implemented by USEPA in 2000-2001, • submit application for an appropriate permit, • comply with permit conditions, and, • implement control practices and discharge requirements. <p>Costs associated with maintaining mined-land management practices and monitoring the mined lands have been estimated to be approximately \$1500 per year pursuant to Public Resources Code section 21159 (a)(3), (c). The cost estimate includes only costs of maintaining a vegetated buffer and monitoring listed in this TMDL. It does not include any other costs that would be incurred by the responsible party under any regulatory or enforcement action</p> <p>This Implementation Plan goes into effect on the date that this Basin Plan Amendment is approved by the Office of Administrative Law.</p>
<p>Margin of Safety</p>	<p>A margin of safety of 10% has been included in the annual load equation presented in the section titled "Total Maximum Annual Mercury Load for Las Tablas Creek" because of:</p> <p>Uncertainty associated with the selection of an appropriate sediment target, and the relationship between sediment targets and water column or fish tissue concentrations;</p> <p>Conservative usage of only largemouth bass (no lower trophic levels) fish tissue in evaluation of potential human health exposures;</p> <p>Uncertainty associated with Regional Board Lake Nacimiento Model calculations (extrapolations of data points to unsampled areas);</p> <p>Uncertainty associated with the small area sedimentation rate incorporated into the Estimated Source Load Calculations;</p> <p>Conservative estimation of mine area size in the Estimated Source Load Calculations and uncertainty about acid mine drainage; and,</p> <p>The existence of other smaller mines (currently estimated to contribute less than 5 % of the total mercury load) in the drainage area.</p> <p>The use of an adaptive management approach in the TMDL which allows refinement of targets as additional data become available.</p>

Implementation Compliance Schedule

By End of Implementation Year	Implementation Action (Milestone)	Responsible Party or Discharger	Monitoring Activity (Responsible party for that monitoring)	Numeric Target associated with Load Allocation
1 (baseline data)	Maintain BV and Klau Mine slope/vegetation, and sediment control measures. Submit complete application for discharge permits	BV Mines, Inc.		
1	Require schedule of County Road load elimination	Regional Board	Notify San Luis Obispo County of adoption of TMDL and track response (Regional Board).	
2	Maintain BV and Klau Mine slope/vegetation	BV Mines, Inc.		
2	Review permit application(s) for mined areas Receive County Road load elimination schedule.	Regional Board	Establish discharge permit(s) for mines. If permit application not submitted, Regional Board staff will issue Cleanup and Abatement Order (CAO) or other appropriate regulatory action (Regional Board) If Road load elimination Schedule not received, Regional Board staff will issue CAO or similar regulatory action. (Regional Board)	
3	Maintain BV and Klau Mine slope/vegetation	BV Mines, Inc.	3 Storm Events and twice/year sampling for total mercury in water. Once per year for total mercury in sediment (BV Mines)	Water: Mercury = 0.05 ug/L Sediment: establish baseline data
3	Review progress and data to date	Regional Board	Review data for completeness; adjust sampling program as needed	

By End of Implementation Year	Implementation Action (Milestone)	Responsible Party or Discharger	Monitoring Activity (Responsible party for that monitoring)	Numeric Target associated with Load Allocation
4	Maintain BV and Klau Mine slope/vegetation	BV Mines, Inc.	3 Storm Events and twice/year sampling for total mercury in water. Once per year for total mercury in sediment. (BV Mines)	Water: Mercury = 0.05 ug/L Sediment: confirm baseline data
5	Maintain BV and Klau Mine slope/vegetation Sample Lake Nacimiento conditions	BV Mines, Inc. Regional Board	3 Storm Events and twice/year sampling for total mercury in water. Once per year for total mercury in sediment (may be modified if permits renewed or re-adopted in year 5) (BV Mines) Lake Nacimiento: Dissolved oxygen, Total mercury and methylmercury in water, total mercury in sediment and fish tissue (largemouth bass, as a guide) near where Las Tablas Creek enters lake (Regional Board)	Water: Mercury = 0.05 ug/L Sediment: Mercury = 0.486 mg/kg Fish Tissue Guide: < 0.37 mg/kg, or decreasing trend from existing data
5	Perform 5 year review of TMDL and Progress	Regional Board	Review tracked actions; review data of initial program years for trends showing TMDL will be achieved; report and document any changes needed to TMDL or plans (e.g., acid mine drainage control if monitoring data indicates a quantifiable impediment to achieving TMDL) (Regional Board)	

By End of Implementation Year	Implementation Action (Milestone)	Responsible Party or Discharger	Monitoring Activity (Responsible party for that monitoring)	Numeric Target associated with Load Allocation
6	Eliminate load from 3 mile segment of Cypress Mountain Road (between Chimney Rock Road and Klau Mine Road)	SLO County	Per schedule submitted by County or by CAO or other action of Regional Board. (SLO County)	Tracking/ Reporting of completed action (including photo documentation).
6 - 10	Review Monitoring Data	Regional Board	Review data from required Permit monitoring for total mercury in water (Regional Board)	Water: Mercury = 0.05 ug/L;
7 - 10	Maintain load control method for specified segment of Cypress Mountain Road	SLO County	Inspect general operation and perform necessary maintenance of load prevention method. Submit annual letter/report of inspection and any maintenance performed. (SLO County)	Tracking/ Reporting of completed actions.
10	Maintain BV and Klau Mine slope/vegetation Sample Lake Nacimiento conditions	BV Mines, Inc. Regional Board	Regular sampling for total mercury in water; total mercury in sediment (regularity of sampling as specified in permits – e.g., by storm event, quarterly, seasonally, or combination of these) (BV Mines) Lake Nacimiento: Dissolved oxygen, Total mercury and methylmercury in water, total mercury in sediment and fish tissue (largemouth bass, as a guide) near where Las Tablas Creek enters lake. (Regional Board)	Water: Mercury = 0.05 ug/L; Sediment: Mercury = 0.486 mg/kg Fish Tissue Guide: < 0.37 mg/kg
11 – 30	Repeat as above with 5 and 10 year milestones and annual permit requirements			

Note: Implementation begins on the date this TMDL is approved by the Office of Administrative Law.

STATE OF CALIFORNIA
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
81 Higuera Street, Suite 200
San Luis Obispo, California 93401-5427

RESOLUTION NO. R3-2002-0094

Amending the Water Quality Control Plan (Basin Plan) for the Central Coast Region to include a revised and updated Monitoring and Assessment Chapter (Chapter 6)

And requesting approval from the State Water Resources Control Board

The California Regional Water Quality Control Board, Central Coast Region (hereafter Regional Board) finds:

1. *WHEREAS, the California Regional Water Quality Control Board, Central Coast Region (Regional Board), adopted the Water Quality Control Plan, Central Coastal Region (Basin Plan), on September 8, 1994;*
2. *The Regional Board periodically revises and amends the Basin Plan; and*
3. *The proposed amendment to the Basin Plan was developed in accordance with section 13240 et seq. of the California Water Code, and the Regional Board considered the appropriate factors identified therein;*
4. *The amendment will replace the existing Surveillance and Monitoring Chapter of the Basin Plan,*
5. *The Basin Plan amendment incorporating a revised and updated Monitoring and Assessment Chapter must be submitted for review and approval by the State Water Resources Control Board.*
6. *The amendment meets the "Necessity" standard of the Administrative Procedure Act, Government Code §11353(b); and*
7. *Staff has made the finding that the proposed amendment is an administrative update of editorial nature only and contains no new or altered regulatory provisions; therefore, CEQA requirements do not apply; and*
8. *Drafts of the staff report and proposed amendment have been prepared and distributed to interested persons and agencies for review and comment; and*
9. *Notice of public hearing was given by advertising in newspapers of general circulation within the Region; and*
10. *On December 13, 2002, in San Luis Obispo, California, the Regional Board held a public hearing and heard and considered all public testimony; and*
11. *The proposed amendments to the Basin Plan were developed in accordance with Water Code Section 13240 et seq.; and*

000142

12. *The amendment results in no potential for adverse effect, either individually or cumulatively, on wildlife;*

THEREFORE, BE IT RESOLVED, that

1. *Pursuant to sections 13240 and 13241 of the California Water Code, the Regional Board, after considering the entire record, including oral testimony, adopts the Basin Plan amendment shown in "Attachment B - Proposed Basin Plan Amendment". The amendment will not take effect until approved by the State Board.*

The Regional Board's Executive Officer is authorized to submit the amendment to the State Water Resources Control Board in accordance with the requirements of section 13245 of the California Water Code.

3. *The Regional Board requests that the State Water Resources Control Board approve the Basin Plan amendment in accordance with the requirements of sections 13245 and 13246 of the California Water Code.*
4. *The environmental document prepared by Regional Board staff pursuant to Public Resource Code Section 21080.5 is hereby certified following approval of the revised Basin Plan by the State Board.*
5. *The Regional Board's Executive Officer is authorized to sign a Certificate of Fee Exemption, since no adverse effect on wildlife results in a "De Minimus" impact finding.*
6. *If during the approval process, the State Board determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Board of any such changes.*

I, Roger W. Briggs, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of the resolution adopted by the California Regional Water Quality Control Board, Central Coastal Region.

Adopted on 12-24-02
Date

Roger W. Briggs
Executive Officer

I. INTRODUCTION

The effectiveness of a water quality control program cannot be judged without the information supplied by a comprehensive and systematic surveillance and monitoring and assessment program. This chapter describes statewide and regional monitoring and assessment programs designed to provide scientific information on water quality in the Central Coast Region. The Regional Board uses information produced by these programs to satisfy requirements of both the federal Clean Water Act

(<http://www.swrcb.ca.gov/rwqcb3/>) and applicable portions of the state's Porter-Cologne Water Quality Control Act.

Historically, a wide variety of interested State, federal, and local agencies have sampled, analyzed, and tracked water quality. The State Board monitoring program coordinates existing information, gathering and supplementing it where necessary to meet data needs.

The State Board is the lead agency in California directing surveillance and monitoring of water

~~quality. A routine program of systematic sampling of the State's waters is now in existence. The activity is coordinated through and assisted by the California Department of Water Resources (DWR) and Health Services (DOHS) as well as the United States Geologic Survey (USGS) and the Environmental Protection Agency (EPA).~~

~~This chapter contains a discussion of the objectives and various elements of the State and Regional Boards' programs.~~

Monitoring information is presented for both regulatory and ambient monitoring programs at the State and Regional level. Regulatory monitoring programs address compliance issues related to discharges to waters of the State. Ambient monitoring programs address overall quality of waters of the State, generally without regard to specific dischargers.

II. PROGRAM OBJECTIVES

~~The overall~~General objectives of an adequate surveillance and of statewide and regional monitoring and assessment programs are:

- ~~To measure the achievement of water quality goals and objectives specified in this plan.~~
2. To measure specific effects of water quality changes on the established beneficial uses.
3. To measure background conditions of water quality and long-term trends in water quality.
4. To locate and identify sources of water pollution that pose an acute, accumulative, and/or chronic threat to the environment.
5. To provide information needed to correlate receiving water quality to mass emissions of pollutants by waste dischargers.
6. To provide data for determining waste discharger compliance with permit conditions.
7. To measure waste loads discharged to receiving waters and to identify the limits of their effect, and in water quality limited segments to, prepare

waste load allocations necessary to achieve water quality control.

8. To provide documentation necessary to support enforcement of permit conditions and waste discharge requirements.
9. To provide data needed to carry on the continuing planning process.
10. To measure the effects of water rights decisions on water quality and to guide the State Board in its responsibility to regulate unappropriated water for the control of quality.
11. To provide a clearinghouse for the collection and dissemination of water quality data gathered by other agencies and private parties cooperating in the program.
12. To prepare reports on water quality conditions as required by federal and State regulations and other users requesting water quality data.

III. QUALITY CONTROL AND DATA MANAGEMENT

Federal regulations and State policy require the preparation and implementation of Quality Assurance/Quality Control Plans for most monitoring carried out by the Regional Board's staff or its contractors. Regional Board monitoring activities are usually conducted under the Quality Assurance Program Plan developed for the Surface Water Ambient Monitoring Program (SWAMP).

Sample analysis Dischargers generally must be conducted by use a State-certified laboratoryies approved by the Regional Board's Executive Officer and/or Regional Board's laboratory. The ;the laboratory must have an approved Quality Assurance/Quality Control program and must be certified under the California Department of Health Services (DHS) Accreditation Program. In some instances, DHS certification may not be required, provided the laboratory has appropriate performance based standards.

~~Discharger monitoring reports are kept in the Regional Board's files; older files are microfiched.~~

~~The Board has increasingly sophisticated computer facilities for analysis of data collected in special studies. "Raw" data are periodically made available to the State Board for entry into the statewide Water Quality Information System database for use by other agencies.~~

~~The results of special studies are generally summarized in the Regional Board staff reports and are discussed at public meetings of the Regional Board. The results of complaint monitoring are provided to the person or agency submitting the complaint. Copies of the Regional Board planning documents and special studies reports are provided to public and university libraries.~~

~~III. STATE WATER RESOURCES CONTROL BOARD PROGRAM TASKS~~

IV. REGULATORY MONITORING AND ASSESSMENT

IV.A. COMPLIANCE MONITORING

~~A significant component of the State's regulatory monitoring relates specifically to discharges of pollutants from known sources. All entities holding Regional Board Discharge Orders must conduct regular sampling and analysis of waste released to surface and ground waters. Entities granted a discharge waiver may also be subject to monitoring requirements as a condition of the waiver.~~

~~The specific chemical and physical parameters to monitor, types of sampling and analyses (e.g., waste stream sampling, toxicity tests, etc.), frequency, and other specific requirements are determined on a case-by-case basis according to the nature of the discharge and potential environmental effects. Each Order or waiver issued by the Regional Board describes the specific compliance monitoring requirements for that Order or waiver holder.~~

~~Monitoring data collected by point source dischargers and nonpoint pollution control programs are used to:~~

- ~~• Determine compliance with and provide documentation to support enforcement of Order or waiver conditions;~~
- ~~• Provide information needed to relate receiving water quality to mass emission of pollutants by dischargers.~~

~~Discharger self-monitoring reports, generated as a result of an Order, are collected and reviewed by Regional Board staff for compliance. Any necessary enforcement actions are the responsibility of, and are carried out by, the Regional Board. Self-monitoring reports are normally submitted by the discharger on a regular basis (monthly, quarterly, or semi-annually) as specified by the Order conditions.~~

~~Compliance monitoring includes a control procedure whereby Regional Board personnel periodically visit each discharger on both an announced and unannounced "Facility Inspection" basis. The intent of announced visits is to work with the discharger to review his procedures in order to assure quality control. The intent of the unannounced inspections is to survey the operation, inspect the discharge area, and collect, check, or reference samples. Data from self-monitoring may also be supplemented with information obtained by Regional Board staff through special studies, such as those characterizing the variability of the discharge, pollutant levels in nearby receiving water and biota, and characterization of pollutant loads attributable to urban runoff.~~

IV.B. COMPLAINT INVESTIGATION

~~Complaint Monitoring involves investigation of complaints of citizens and public or governmental agencies on the discharge of pollutants or creation of nuisance conditions. It is the responsibility of the Regional Board to address the complaint, including preparation of reports, letters, or other follow-up actions, to document the observed conditions, and to inform the State Board, complainant, and discharger of the observed conditions.~~

IV.C. AERIAL SURVEILLANCE

Aerial surveillance is used primarily to gather photographic records of discharges, water quality conditions, and conditions at solid waste disposal sites in the Region. Aerial surveillance is particularly effective because of the overall view of a facility that is obtained and because many facilities can be observed in a short period of time.

V. AMBIENT MONITORING AND ASSESSMENT

III.AV.A. STATE-WIDE SURFACE WATER MONITORING PROGRAMS

Section 13160 of the Porter-Cologne Water Quality Control Act delegates primary responsibility for coordination and control of water quality in California to the State Board. Section 13163 of the Act states that in conducting this mission, the State Board is to coordinate water quality investigations, recognizing that other State agencies may have primary statutory responsibility for such investigations.

~~Pursuant to these mandates, the State Board developed and in April 1976 established a coordinated Primary Water Quality Monitoring Network for California~~ has established multiple water quality monitoring programs for California. Other agencies that conduct water-quality monitoring include Participants in the Coordinated Network included the California Departments of Health Services (DHS), California Department of Water Resources (DWR), and California Department of Fish and Game (DFG), California Department of Pesticide Regulation (DPR), California Department of Toxic Substances Control (DTSC), and the United States Department of the Interior, Federal Bureau of Reclamation; the U.S. United States Geological Survey (USGS); and, the United States Environmental Protection Agency (USEPA).

V.A.1. SURFACE WATER AMBIENT MONITORING PROGRAM

The Porter-Cologne Water Quality Control Act and the federal Clean Water Act (CWA) direct water quality programs to implement efforts intended to protect and restore the integrity of waters of the State. Ambient monitoring is independent of regulatory water quality programs and serves as a measure of the overall quality of water resources and the overall effectiveness of the Regional Board's prevention, regulatory, and remedial actions.

The Surface Water Ambient Monitoring Program (SWAMP) is designed as an ongoing program to assess the effectiveness of State and Regional Board regulatory water quality programs, to develop a statewide picture of the status and trends in surface water quality, and to develop site-specific information in areas that are known or suspected to have water quality problems. In particular, SWAMP is intended to meet four goals:

1. Identify specific problems preventing the State Board, the Regional Board, and the public from realizing beneficial uses in targeted watersheds.
2. Create an ambient monitoring program that addresses all hydrologic units of the state using consistent and objective monitoring, sampling and analysis methods; consistent data quality and assurance protocols; and centralized data management.
3. Document ambient water quality conditions in potentially clean and polluted areas.
4. Provide data to evaluate the effectiveness of water quality regulatory programs in protecting beneficial uses of waters of the State.

In achieving these goals, each of the State and Regional Board monitoring programs (e.g., State Mussell Watch, Toxic Substances Monitoring) are incorporated into SWAMP to ensure a coordinated approach without duplication. Fiscal Year (FY) 00-01 marked the first year of implementation of the SWAMP Program. The Central Coast Ambient Monitoring Program (CCAMP), which has been underway since 1997, represents the Central Coast Region's participation in the statewide SWAMP Program. More detailed information on the SWAMP program can be found at the State Board website (<http://www.swrcb.ca.gov>). A summary of the CCAMP program is contained in this chapter.

~~The goal of the Primary Network is to provide an overall, continuing assessment of water quality in the State. This goal is to be achieved by statewide~~

monitoring of water quality parameters that can affect beneficial uses of State waters. Among such parameters, toxic substances have received increasing attention in federal and State water pollution control activities; accordingly, Toxic Substances Monitoring and the State Mussel Watch program are included in the Primary Network.

III.A.1.V.A.2. TOXIC SUBSTANCE MONITORING PROGRAM

One alternative in monitoring for toxic substances (toxic elements and organic compounds) is to collect and analyze water samples. A major problem with this approach is that toxic discharges are likely to occur in an intermittent fashion and are thus likely to be missed with "grab" sampling of the water. Another limitation to analyzing water samples is that, generally, harmful toxicants are present in low concentrations in the water. The process of bioaccumulation acts to concentrate toxicants through the aquatic food web. Therefore, in the Toxic Substances Monitoring Program the flesh of fish and other aquatic organisms is analyzed for toxic metals and synthetic organic compounds.

The Toxic Substance Monitoring (TSM) Program was initiated in 1976 by the State Board to provide a uniform statewide approach to the detection and evaluation of toxic substances in organisms found in fresh, estuarine, and marine waters of the State. The TSM program uses resident fish and other aquatic organisms (primarily crayfish) to monitor pollutant levels through tissue analysis. Results of tissue analyses reflect exposure to contaminants over extended periods of time and therefore provide a field-based estimate for long-term exposure of people, fish, and other wildlife to pollutants in the food chain. This approach also allows for capture of potentially toxic discharges that occur on an intermittent basis that might otherwise be missed with "grab" sampling of water.

The Toxic Substances Monitoring (TSM) portion of the Primary Network has been integrated with other Primary Network Monitoring. Streams and lakes were ranked according to various criteria established to indicate their importance to the State in terms of water quality. From this process, the water bodies ranked Priority 1, or highest priority, were included in the Primary Network; routine chemical and biological water monitoring is performed by DWR and/or the USGS; and toxic substances monitoring of resident

organisms is performed by the Department of Fish and Game.

The primary objectives of the Primary Network TSM program are:

- To develop statewide baseline data and to demonstrate trends in the occurrence of toxic elements and organic substances in the aquatic biota.
- To assess impacts of accumulated toxicants upon the usability of State waters by man.
- To assess impacts of accumulated toxicants upon the aquatic biota.
- Where problem concentrations of toxicants are detected, to attempt to identify sources of toxicants and to relate concentrations found in the biota to concentrations found in the water.

TSM reports have been published periodically since 1977. The samples collected in the TSM program are benthic invertebrates and predator fish. Tissue samples are analyzed for important metals, including arsenic, cadmium, chromium, copper, lead, nickel, silver, and zinc and fish flesh is analyzed for mercury. In addition, both invertebrate and fish flesh tissue samples are analyzed for 55 synthetic organic compounds, most of which are pesticides (Table 6VI-1). TSM reports have been published annually since 1977. Both TSM and State Mussel Watch (SMW) Program publications and data can be found at the State Board website (<http://www.swrcb.ca.gov>).

TABLE 6-1. SYNTHETIC ORGANIC COMPOUNDS ANALYZED IN THE TOXIC SUBSTANCES MONITORING AND STATE MUSSEL WATCH PROGRAMS

<u>COMPOUND</u>	<u>COMPOUND</u>	<u>COMPOUND</u>
Aldrin	DDMU pp	Nitrofen (TOK)
Benefin	DDT pp	Oxychlorance
BHC α	Dialifor	Parathion, ethyl
BHC β	Diazinon	Parathion, methyl
BHC γ (lindane)	Dichlofenthion	PCB 1248
BHC δ	Dicofol (Kelthane)	PCB 1254
Carbophenothion	Dieldrin	PCB 1260
CDEC (Vege dex)	Endosulfan I (Thiodan I)	PCNB (Quintozene)
Chlorbenside	Endrin	Perthane
cis-Chlordane	EPN	Phenkapton
trans-Chlordane	Ehtion	Phorate (Thimet)
Chloroneb	Fenitrothion	Ronnel
Chlorpyrifos (Dursban)	Fonofos (Dyfonate)	Strobane
Dacthal	Heptachlor	Tetradifon (Tedion)
DDE op	Heptachlor epoxide	Toxaphene
DDE pp	Hexachlorobenzene (HCB)	2,4-D isopropyl ester
DDD op	Methoxychlor pp '	2,4-D isobutyl ester
DDMS pp	Mirex	2,4-D n-butyl ester

III.A.2.V.A.3. STATE MUSSEL WATCH PROGRAM

The State Mussel Watch (SMW) program has been integrated with the Primary Network Monitoring to provide documentation of the quality of coastal marine and estuarine waters. The SMW program fulfills the goal of providing the State with long-term trends in the quality of these waters. is a long-term marine water-quality monitoring program initiated in 1977. The SMW program uses resident and transplanted bivalves (e.g., mussels and clams) to monitor pollutant levels at coastal reference stations and selected sites in bays and estuaries to identify or confirm potential toxic substance pollution.

Mussels were chosen are used as the indicator-sentinel organisms for trace metals and synthetic organic compounds in the coastal and estuarine waters. Although the mussel populations of bays and estuaries are of a different species than those found in the open coast, their suitability as sentinels for monitoring the presence of toxic pollutants stems from several factors including: (1) their ubiquity along the California coast; (2) their ability to concentrate pollutants above ambient sea water levels and to provide a time-averaged sample; and (3) their non-motile nature which permits a localized measurement of water quality.

The primary goals of the SMW program are as follows:

1. To provide long-term monitoring of selected toxic substances in coastal waters;
2. To provide an important element in a comprehensive water quality monitoring strategy;
3. To identify on a year-to-year basis specific areas where concentrations of toxic materials are higher than naturally occurring background levels.

Tissue samples are analyzed for The trace metals analyzed for in mussel tissues including aluminum, cadmium, chromium, copper, lead, manganese, mercury, nickel, silver and zinc. and for sSynthetic organic compounds analyzed for are summarized listed in Table 6VI-1. When compared with alternative sampling designs, such as seawater and sediment sampling, SMW is a more cost effective

~~program. Reports have been published annually since 1978.~~

During the 1977 and 1978 sampling periods, the focus of the SMW program was, for the most part, on open coast monitoring of sites outside the vicinity of known pollutant point sources. Monitoring water quality in the State Board's designated Water Quality Protection Areas (formerly known as Areas of Special Biological Significance (ASBS)), to establish baseline conditions relating to the range of typical conditions in water, sediment and biota, was given prime importance in the early years of the program.

Based on identification of "hot spot" areas during 1977 and 1978, intensive sampling of these areas was implemented in 1979. Such a sampling strategy was intended to confirm previous findings, establish the magnitude of the potential problem and identify pollutant sources. The program has since evolved to include transplanting M. californianus mussels into selected California bays and estuaries at specific sites to confirm potential toxic substance pollution, i.e.g., in the vicinity of dischargers. In some cases the SMW program deploys freshwater clams or other organisms into fresh water streams and rivers to provide information about toxic substance pollution in watershed systems.

As with the TSM, statewide SMW reports are published periodically, available at the State Board website (<http://www.swrcb.ca.gov>).

III.B. LAKE SURVEILLANCE

~~This element is responsive to the requirements set forth in Section 314 of PL 92-500 and applicable federal regulations. The State is required to identify and determine the present trophic condition of all publicly owned fresh water lakes. The lakes inventory is updated on a two-year cycle to include additional data as it becomes available and to indicate changes in trophic conditions.~~

V.A.4. GROUNDWATER AMBIENT MONITORING AND ASSESSMENT

The State Board, pursuant to provisions of the 1999 Budget Act, has developed a statewide Groundwater Ambient Monitoring and Assessment (GAMA) Program, which includes the collaborative efforts of

other state and federal agencies also charged with groundwater monitoring responsibilities. The goal of GAMA is to provide information on the quality of California's groundwater and assess relative susceptibility of groundwater resources in California, especially those used as a drinking water supply. The GAMA program has two primary components: the California Aquifer Susceptibility (CAS) Assessment, which addresses public drinking water wells, and the Voluntary Domestic Well Assessment Project which addresses private domestic drinking water wells.

V.A.4.a. CALIFORNIA AQUIFER SUSCEPTIBILITY ASSESSMENT

The State Board, in coordination with the DHS, DWR, and local water districts and purveyors, is implementing the California Aquifer Susceptibility (CAS) Assessment to determine water quality and relative susceptibility of groundwater that serves as a source for public water supplies to possible contaminants. CAS employs a groundwater age dating technique (tritium-helium analysis) and low-level detection (microgram/liter range) of volatile organic compounds (VOCs) to assess aquifer susceptibility. A fundamental premise of the CAS assessment is that groundwater age can be used as a guide for assessing aquifer susceptibility, i.e., young groundwater age implies relatively rapid recharge of surface water to the aquifer, and therefore potentially rapid migration of surface contaminants to the aquifer. Low-level VOC detection is used to corroborate age-dating data and to also identify public supply wells that are already impacted by contaminants, but are still below action levels. This provides an "early warning system" for potentially significant VOC contamination.

In coordination with the USGS and Lawrence Livermore National Laboratory (LLNL), the CAS assessment is designed to sample the approximately 16,000 public supply wells statewide, beginning with more urbanized areas. Sampling began in September 2000 and will continue for the next several years over the entire state, depending on the availability of funding. General constituents sampled by the USGS and LLNL for low-level VOC analysis are available at the State Board website (<http://www.swrcb.ca.gov>). Additional constituents may be chosen based upon specific site or land-use conditions.

Groundwater quality, age-dating, and hydrogeologic data collected as part of the CAS assessment are managed utilizing the Geographical and

Environmental Information Management System (GEIMS)/GeoTracker system, an internet-accessible geographic information system (GIS) that provides access to water quality data. GeoTracker can be found at <http://geotracker.swrcb.ca.gov/>.

V.A.4.b. VOLUNTARY DOMESTIC WELL ASSESSMENT

The Voluntary Domestic Well Assessment Program consists of sampling domestic wells for various constituents that may be found in domestic well water, including nitrates, total and fecal coliform bacteria, Methyl tert-Butyl Ether (MTBE), and various minerals. This information is provided to domestic well owners and groundwater agencies. The Voluntary Domestic Well Assessment Program focuses on specific areas, as resources permit and are chosen based upon existing knowledge of water quality and land use, in coordination with local environmental agencies. The State Board incurs the costs of sampling and analysis.

V.A.5. GROUNDWATER QUALITY MONITORING ACT OF 2001

Assembly Bill 599 (AB 599), effective January 1, 2002, established the Groundwater Quality Monitoring Act of 2001 (sections 10780-10782.3 of the California Water Code). The Act requires the State Board to integrate existing monitoring programs with new program elements, as necessary, for the purpose of establishing a comprehensive groundwater monitoring program capable of assessing each groundwater basin in the state, either through direct or other statistically reliable sampling approaches. A second fundamental component of this Act is to increase the availability of water quality data and information to the public.

AB 599 requires the State Board to create an Interagency Task Force (ITF) to identify actions necessary to establish a groundwater-quality monitoring program, and to identify measures that would increase coordination among agencies that collect groundwater quality information. In addition, the State Board is also to convene a Public Advisory Committee (PAC) to the ITF. The AB 599 PAC is to consist of representatives from federal agencies, public water systems, environmental organizations, local water agencies, agriculture, groundwater

management entities, and the business community. In coordination with the ITF and the PAC, the State Board must submit to the Governor and the Legislature, on or before March 1, 2003, a report that includes a description of a comprehensive groundwater-quality monitoring program for the State.

V.B. REGIONAL MONITORING PROGRAMS

V.B.1 CENTRAL COAST AMBIENT MONITORING PROGRAM

In 1998, the Central Coast Ambient Monitoring Program (CCAMP) was formally established by the Regional Board to provide integrated and systematic information on surface water quality in the Region, in order to evaluate the effectiveness of Regional Board efforts to meet Basin Plan water quality objectives and protect beneficial uses. CCAMP's general program objectives are to:

- 1) Acquire and evaluate existing monitoring data and other information, from agencies, volunteer programs, and other sources.
- 2) Collect ambient monitoring data for the Region's watersheds, coastal confluences, and nearshore areas.
- 3) Conduct periodic detailed assessments of the Region's watersheds, groundwater basins, coastal confluences, and nearshore areas.
- 4) Utilize monitoring data and other information to maintain and update the Region's Water Quality Assessments and list of impaired waterbodies and beneficial uses.
- 5) Provide information presentations through the use of geographic information systems technology and other forms of graphic visualization.
- 6) Provide data and information dissemination services through the Internet.
- 7) Conduct periodic assessments of other programs' activities to eliminate gaps, overlaps, and duplications of effort, and utilize external information whenever possible as a component of the Ambient Monitoring Program.

- 8) Work with other monitoring programs, including volunteer programs, to develop consistent monitoring protocols and methods, quality control standards, data management procedures, and to encourage efforts consistent with regionwide monitoring goals.
- 9) Coordinate data management activities with other programs to maximize accessibility and usability of data.

The CCAMP monitoring strategy calls for dividing the Region into five watershed rotation areas and conducting synoptic, tributary-based sampling each year in one of the areas. Over a five-year period, each of the major Hydrologic Units in the Region are monitored and evaluated. In addition to the tributary-based site selection approach, additional monitoring sites are established in each rotation area to provide focused attention on watersheds and waterbodies known to have water quality impairments or other issues of interest.

The CCAMP strategy for establishing and maintaining permanent long-term monitoring sites provides a framework for trend analysis and detection of emergent water quality problems. CCAMP uses a variety of monitoring approaches to characterize water quality conditions and trends in coastal watersheds, including:

- Rapid bioassessment using benthic invertebrates
- Conventional water quality analysis
- Analysis of tissue, water, and sediment for organic chemicals and metals
- Toxicity evaluations
- Habitat assessments

To develop a broad picture of the overall health of waters in the Region, a similar baseline monitoring study design is applied in each rotation area. This provides for compatibility across the Region and allows for prioritization of problems across a relatively large spatial scale. The CCAMP strategy also allows for incorporation of watershed-specific knowledge so that questions which are narrower in focus can be addressed. For example, in watersheds where TMDL assessments are being conducted, additional information is collected as necessary to support development of the analysis. Special studies are undertaken as funding and staffing permits to further focus monitoring on questions of interest specific to individual watersheds.

Coastal Confluences monitoring is another CCAMP program component that focuses on monitoring "integrator sites" at the lower ends of rivers and creeks at their outflow to the ocean. Sampling at these sites is conducted continuously, rather than in a five-year rotation. These sites aid in long-term trend detection, regional priority setting, and understanding inputs to the nearshore environment.

CCAMP nearshore monitoring activities are varied. In the Monterey Bay area, CCAMP has worked with ocean dischargers to redesign and combine receiving water monitoring programs to form the Central Coast Long-term Environmental Assessment Network (CCLEAN). This program characterizes loading of organic pollutants, nutrients and pathogen indicators from discharges and river mouths to the ocean. It also documents associated nearshore conditions, including chemical concentrations in mussel tissue, and nearshore nutrient and toxic phytoplankton concentrations. The CCAMP program directs funding and other support to other marine monitoring activities, including sand crab, mussel, and sea otter tissue analysis for organic chemicals, polynuclear aromatic hydrocarbons, metals, toxic phytoplankton and specific pathogens. CCAMP staff are also working with the local research community to expand the network of instrumented moorings in nearshore areas, with particular focus on nitrate, chlorophyll, and toxic phytoplankton.

More information on the CCAMP program can be found at <http://www.swrcb.ca.gov/rwqcb3/>. The CCAMP program is conducted in coordination with the TSM and SMW monitoring programs, and satisfies Regional Board requirements for participation in the statewide SWAMP program.

V.C. ASSESSMENTS

III.C. V.C.1. BIENNIAL WATER QUALITY INVENTORY STATE WATER QUALITY INVENTORY (305(b)) REPORT

Pursuant to Section 305(b) of the Federal Clean Water Act (PL 92-500), the State Board is required to submit a report on the status of the State's water quality to the USEPA at least every two years. The CWA establishes a process for States to use to develop information on the quality of their water

resources (see USEPA 305(b) reporting guidelines). Specific requirements for this process are also found in Sections 106(e), 204(a), 303(d), and 314(a) of the CWA. Section 305(b) of the CWA specifies that each state must develop a program to monitor the quality of its surface waters and prepare a report describing the status of its water quality; Section 106(e) requests, but does not require, that each state also include the status of ground waters of the state in the report.

Section 305(b) of PL 92-500 requires the State to prepare and submit biennially to EPA the Water Quality Inventory. This report includes: The 305(b) process is the principal means by which the USEPA, Congress, and the public evaluate: 1) whether U.S. waters meet water quality standards; 2) progress made in maintaining and restoring water quality; and 3) the extent of remaining problems. Water quality assessment information from California's nine Regional Boards is compiled and presented in conformance with USEPAs 305(b) reporting guidelines through tabulation of a description of the general water quality of major navigable waters in of the State during the preceding years, including (b) an analysis of the extent to which significant navigable waters provide for the protection and propagation of a balanced population of shellfish, fish and wildlife, and allow recreational activities in and on the water; a summary of current designated use support, individual beneficial use support, major causes and sources impacting designated beneficial uses, and associated public health concerns. The Report also contains (e) an analysis of the extent to which elimination of the discharge of pollutants is being employed or will be needed; and (d) an estimate of the environmental impact, the economic, and social costs necessary to achieve the "no discharge" objective of PL 92-500, the economic and social benefits of such achievement and estimate of the date of such achievement. Recommendations as to the programs which must be taken to control them are provided, along with estimates of the cost, a brief description of water pollution control policies and programs designed to manage water quality.

Data collection and analyses already being carried out by the State in the permits, planning, facilities, monitoring and enforcement programs is utilized in preparing the reports on the quality of the waters of California. The first report was published in 1975 with subsequent reports in 1977 and 1979. The next biennial report is due in 1990. Assessment information used for compiling and reporting the

305(b) report is contained in the State's Geospatial Waterbody System (GeoWBS) database, structured for the purpose of producing the 305(b) Report.

IV.V.C.2. STATE WATER QUALITY ASSESSMENT REPORT

~~The State Board has been preparing "Section 305(b) Reports" since the mid 1970's. Most of these reports have been fairly general in nature, highlighting a few significant problem areas and estimating total area or stream mileage of waters statewide which were classified as "good", "medium", or "poor" quality. In 1989, the State Board began a more detailed Water Quality Assessment process to fulfill U.S. EPA reporting requirements and to provide the basis for prioritizing funding under the State's Clean Water Strategy.~~

~~The Water Quality Assessment is a computer database. It includes a table which lists water bodies of each region alphabetically by water body type (lakes, streams, ground water, etc). Initially, Regional Boards were directed to include at least all water bodies mentioned by name in their Basin Plans in the Water Quality Assessment table. Additional water bodies are to be added in future updates of the Water Quality Assessment, with the eventual goal of including all waters of the region. The 1992 Water Quality Assessment for the Central Coast Region includes approximately 400 entries.~~

~~For each water body, the Water Quality Assessment table identifies the wetland, lake, or ground water basin area or the stream mileage classified as having "good", "intermediate", "impaired", or "unknown" water quality. The table includes space for brief narrative problem descriptions. It identifies problem sources as point, nonpoint, or both. It also indicates whether the water body is included on one or more of the following federal "lists" (numbers refer to sections of the Clean Water Act):~~

~~131.11 Segments which may be affected by toxic pollutants, or segments with concentrations of toxic pollutants that warrant concern.~~

~~303(d) List of Water Quality Limited Segments where objectives or goals of the Clean Water Act are not attainable with the Best~~

~~Available Treatment/Best Control Technology.~~

~~304(M) A "mini list" of waters not meeting State adopted numeric water quality objectives due to toxic point sources and/or nonpoint sources after implementation of Best Available Treatment/Best Control Technology.~~

~~304(S) A "short list" of waters not achieving water quality standards due to point source implementation of Best Available Treatment/Best Control Technology.~~

~~304(L) A "long list" of waters not meeting water quality goals of the Clean Water Act after implementation of Best Available Treatment/Best Control Technology due to either point sources or nonpoint source discharges.~~

~~314 A list of lake priorities for restoration.~~

~~319 A list of impaired surface water bodies from nonpoint source problems due to both toxic and nontoxic pollutants.~~

~~The information used by Regional Board staff in compiling and revising the Water Quality Assessment table includes the type of monitoring data discussed in this chapter, records of past Regional Board enforcement actions, professional judgment of Regional Board scientists and engineers, and public comments.~~

~~The Water Quality Assessment database also includes the capability to print out a more detailed "Fact Sheet" for each water body in the table. Fact Sheets can include longer problem descriptions, information on threatened or impaired beneficial uses, and summaries of current and projected remedial actions by the State Board and/or the Regional Board. Due to time constraints and, in many cases, lack of information, detailed Fact Sheets have not been prepared for all water bodies in the Central Coast Region's Water Quality Assessment table. Additional Fact Sheets will be added during the ongoing Water Quality Assessment update process.~~

~~The Water Quality Assessments adopted by the nine Regional Boards were combined into a statewide Water Quality Assessment which was formally adopted by the State Board. The State Board is using the system to print out statewide "reports", statistical~~

~~tables, graphs, and charts summarizing the total numbers or percentages of water bodies affected by different types of water quality problems. The State Board also uses information in the Water Quality Assessment to prioritize proposals affecting specific water bodies.~~

The Water Quality Assessment (WQA) report is a biennial compilation of water quality information similar to the biennial Water Quality Inventory (305(b)) report; however, the WQA report contains specific information for individual water bodies of the region rather than generalized summaries for water-body types of the region. Specifically, the WQA categorizes the water quality of each water body by reporting the degree to which beneficial uses are supported (see Basin Plan Chapter 2 for beneficial uses). The levels of beneficial use support are described as: fully supporting, fully supporting but threatened, partially supporting, not supporting, and not assessed. In addition to a description of the level of beneficial use support for each water body, the WQA contains narrative assessment (comments) for selected water bodies of the Region and identifies water bodies included on the Federal 303(d) "list" (numbers refer to sections of the Clean Water Act). The 303(d) list is a list of impaired waters where objectives or goals of the Clean Water Act are not attainable through standard regulatory controls. States are required to prioritize these water bodies for Total Maximum Daily Load (TMDL) development.

As with the 305(b) report, the information used by Regional Board staff in compiling and revising the WQA includes the type of monitoring data discussed in this chapter, records of past Regional Board enforcement actions, professional judgment of Regional Board scientists and engineers, and public comment. WQA information is stored in the GeoWBS database system.

V.C.3. CLEAN WATER ACT SECTION 303(d) LIST OF IMPAIRED WATERS

Section 303(d) of the Federal Clean Water Act requires states to identify waterbodies that do not meet water quality objectives and are not supporting their beneficial uses. Each state must submit an updated list, called the 303(d) list, to the USEPA every two years. In addition to identifying the waterbodies that are not supporting beneficial uses, the list also identifies the pollutant or stressor causing

impairment, and establishes a schedule for developing a control plan to address the impairment.

To develop the list of impaired waters, Regional Board staff relies on data and information collected in the Central Coast Ambient Monitoring Program and other State monitoring programs, along with data and information available from local government or citizen organizations. Staff consider the quality, quantity, timing, and location of data and information for each specified waterbody and the pollutant or stressor potentially causing impairment in that waterbody. Typically, staff compares the levels of the pollutant or stressor to established legal water quality limits (e.g., water quality objectives or other criteria indicating acceptable water quality conditions).

If a waterbody is found to be impaired for a particular pollutant or stressor, it is placed on the list. Once a waterbody and associated stressor pollutant are placed on the list, specific and focused monitoring and assessment efforts are conducted to more fully characterize the nature of the impairment, including identification of the pollutant source(s), and to develop solutions to address the impairment.

V.C.4. CENTRAL COAST AMBIENT MONITORING PROGRAM ASSESSMENTS

Water quality data collected in the CCAMP program is compiled and analyzed to produce watershed assessment reports for the Region. Reports are generated for both surface waters and groundwaters in each watershed, following the CCAMP 5-year rotation monitoring schedule discussed above.

V.C.4.a. SURFACE WATER ASSESSMENTS

Surface water assessments are developed using data collected through the CCAMP program and other available information sources, including water quality data from the California Department of Health Services (DHS), United States Geological Survey (USGS), Department of Fish and Game (DFG), Department of Pesticide Regulation (DPR), Toxic Substance Monitoring (TSM) program, National Pollutant Discharge Elimination System (NPDES) discharge data, county data, city data, relevant water quality reports, and any other available literature. Water quality data is also combined with

hydrogeomorphic data, land use data, etc., to develop watershed scale assessments, which are, in turn, used to update the 305(b) report and support TMDL development.

V.C.4.b. GROUNDWATER ASSESSMENTS

CCAMP does not actively collect groundwater data, but uses existing sources of data and other available water quality information to develop assessments of groundwater conditions. Data and other information are compiled from the DHS, USGS, California Department of Water Resources (DWR), DPR, and city or county information sources.

Data for both surface and groundwater assessments are evaluated for pollutants of concern, water quality standards exceedances, pollutant levels that warrant attention, beneficial use impairment, spatial and temporal trends, data gaps, and other pertinent information. General evaluations of relationships between surface water and groundwater pollutants are also included in the assessments. Assessment information is then used to develop recommendations for action, to assess future research and monitoring needs, to update the 305(b) report and support TMDL development, and to support permit review activities.

Watershed assessment reports and associated water quality data are available at the CCAMP website (see <http://www.swrcb.ca.gov/rwqcb3/> and click on CCAMP).

V. REGIONAL WATER QUALITY CONTROL BOARD PROGRAM TASKS

V.A. COMPLIANCE MONITORING

This task determines permit compliance, validates self monitoring reports, checks receiving water standards compliance, and provides data for enforcement actions. Data obtained are added to the water quality supply data for regulation, enforcement,

planning, and facilities development activities. Discharger compliance monitoring and enforcement actions are the responsibility of, and will normally be carried out wholly by, the Regional Board staff. Standards Compliance Monitoring will be coordinated by the State Board and use data available from other program tasks.

The scope of the Waste Discharger Compliance Monitoring Program for the basin will be dependent on the number and complexity of Waste Discharger Requirements (NPDES and other Permits) issued by the Regional Board. Waste discharge requirements may or may not include a specific discharger self-monitoring and reporting requirement on the effluent and receiving water.

The program includes a specific procedure whereby each discharger is regularly visited by Regional Board staff on both an announced and an unannounced "Facility Inspection" basis. The intent of announced visits is to work with the discharger through personal contact and communication to review his procedures in order to assure quality control. The intent of the unannounced inspections is to survey the operation, inspect the discharge area, and collect, check, or reference samples.

V.B. SELF-MONITORING REPORT REVIEW

Discharger self monitoring reports generated as a result of permits and waste discharge requirements are collected and reviewed by the Regional Board for obvious errors or omissions and entered into the data bank for checking. Significant reports of noncompliance are made immediately upon detection. Other data desired by the Regional or State Board will be rendered on a routine basis. Self monitoring reports are normally submitted by the discharger on a monthly or quarterly basis as required by the permit conditions.

V.C. COMPLAINT INVESTIGATION

The Complaint Monitoring task involves investigation of complaints received from the general public and other agencies. It is a Regional Board responsibility which includes preparation of

reports, letters, or taking other follow up actions to document observed conditions and to inform the State Board and complainant and discharger of the observed conditions.

V.D. AERIAL SURVEILLANCE

Aerial surveillance is used primarily to obtain photographic records of discharge conditions and to identify discharge sources. Aerial surveillance is particularly effective because of the overall view of a facility that is obtained and because many facilities can be observed in a short period of time.

V.E. V.D. NONPOINT SOURCE INVESTIGATIONS, OTHER MONITORING AND ASSESSMENT ACTIVITIES

The objective in this task is Nonpoint source investigations are conducted to (a) identify the location and nature of the sources of nonpoint pollutants; (b) develop information on the quantity, strength, character, and variability of nonpoint source pollutants; (c) evaluate impacts on receiving water quality and biota; (d) provide information useful in management of nonpoint source pollution; and (e) monitor results of any control plan. Investigations will be typically undertaken on a statewide priority basis through local agency and watershed group efforts, funded by Federal Clean Water Act grants and other sources.

V.F. INTENSIVE SURVEYS

Special studies and intensive monitoring surveys are conducted to provide obtain detailed information about a specific water quality problem which, in turn, can be used to data to locate and evaluate violations of receiving water standards, and make waste load allocations. They These studies usually involve are usually localized, intermittent sampling at a higher than normal frequency. These surveys are specially designed to evaluate problems in impaired

waterbodies water quality class segments, areas of special biological significance Water Quality Protection Areas (formerly known as Areas of Special Biological Significance), or hydrologic units requiring sampling in addition to routine monitoring programs. Surveys are repeated at appropriate intervals depending on parameters involved, variability of conditions, and changes in hydrologic or effluent regimes. Results from these special studies may be used for addressing impairments identified on the 303(d) List, including Total Maximum Daily Load development, Water Quality Assessment and 305(b) Report updates, and other waterbody assessment activities.

Intensive surveys are needed for several water bodies. The data are needed for one or more of the following reasons:

- a. A water quality problem is suspected, however, little data is available to substantiate the existence or degree of a problem;
- b. A water quality screening is needed to verify the Regional Board's judgment of the water quality status, or;
- c. A water body is suspected to be water quality limited.

Table 6-2 lists each water body, the constituent needing sampling, and the reason it should be sampled. The Regional Board urgently requests the State Board to make money available for intensive surveys.

SUMMARY OF THE NECESSITY FOR THE REGULATORY PROVISIONS

REGIONAL WATER QUALITY CONTROL BOARD RESOLUTION NO. R3-2002-0093

ADOPTING AMENDMENTS TO THE WATER QUALITY CONTROL PLAN AND REQUESTING APPROVAL FROM THE STATE WATER RESOURCES CONTROL BOARD

AUTHORITY AND REFERENCE

Water Code Section 1300 declares that activities and factors that may affect the quality of the waters of the state shall be regulated to attain the highest water quality reasonable.

Water Code Section 13240 mandates each Regional Water Quality Control Board (Regional Board) to formulate water quality control plans for all areas within the region and to review the plans periodically. Section 13240 also authorizes Regional Water Boards to revise the plans. A water quality control plan or a revision of a plan becomes effective upon approval by the State Water Resources Control Board (State Board) (Water Code Section 13245).

Water Code Section 13050(j) provides that a water quality control plan consists of a designation or establishment for the waters within a specific area of all of the following:

- (1) Beneficial uses to be protected.
- (2) Water quality objectives.
- (3) A program of implementation needed for achieving water quality objectives.

Each Regional Board must establish water quality objectives in each water quality control plan that will ensure the reasonable protection of beneficial uses and the prevention of nuisance (Water Code Section 13241). Additionally, the Regional Board, in a water quality control plan, may specify certain conditions or areas where the discharge of waste, or certain types of waste will be prohibited (Water Code Section 13243).

NECESSITY FOR REGULATORY PROVISIONS

Resolution No. R3-2002-0093 supplements past regulatory actions. The following describes the reasons that these supplements are necessary.

In November 1988, the State Water Resources Control Board adopted a Nonpoint Source Management Plan that outlined steps to initiate the systematic management of nonpoint sources in California. The Nonpoint Source Management Plan was revised to the Nonpoint Source Pollution Control Program (January 2000) in December 1999. Resolution 99-114, revising the Nonpoint Source Pollution Control Program, was adopted by the State Water Resources Control Board on December 14, 1999 pursuant to Section 319 of the Clean Water Act.

Resolution No. 99-114 directs regional boards to implement the state Nonpoint Source Pollution Control Program. The Water Quality Control Plan for the Regional Water Quality Control Board, Central Coast Region includes the state November 1988, Nonpoint Source Management Plan. This amendment updates the Basin Plan to comply with Resolution No. 99-114.

ECONOMIC AND FISCAL ANALYSIS:

**ADOPTION OF REVISED STATE WATER RESOURCES CONTROL BOARD
NONPOINT SOURCE POLLUTION CONTROL PROGRAM AND REFORMATTING
EXISTING NONPOINT SOURCE PLANS, POLICIES, AND MANAGEMENT
PRACTICES - AMENDMENT OF THE CENTRAL COAST BASIN WATER QUALITY
CONTROL PLAN (BASIN PLAN)**

No new economic impacts are expected to result from an editorial revision of Central Coast Water Quality Control Plan (Basin Plan) Chapter 4 Implementation Plan, Chapter 5 Plans and Policies, and Plans and Policies Appendix.

STATE OF CALIFORNIA
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION

STAFF REPORT FOR REGULAR MEETING OF DECEMBER 13, 2002

Prepared on November 20, 2002

ITEM NUMBER: 10

SUBJECT: PROPOSED AMENDMENT OF "WATER QUALITY CONTROL PLAN - CENTRAL COASTAL BASIN" (BASIN PLAN) REGARDING REFERENCE OF THE STATE WATER RESOURCES CONTROL BOARD "NONPOINT SOURCE POLLUTION CONTROL PROGRAM" AND RESTRUCTURING THE BASIN PLAN NONPOINT SOURCE INFORMATION, FINDINGS, AND REQUIREMENTS.

SUMMARY

The Central Coast Regional Water Quality Control Board (Regional Board) Staff is proposing an amendment to its Water Quality Control Plan - Central Coastal Basin, 1994 (Basin Plan). The Basin Plan serves as the cornerstone water quality protection policy and legal standards for the Central Coast. It identifies beneficial uses of surface and ground waters, establishes water quality objectives to protect beneficial uses, and provides an implementation plan to achieve those objectives.

The purpose of this amendment is to:

1. Reference the State Water Resources Control Board January 2000 Nonpoint Source Pollution Control Program.
2. Emphasize information and management actions contained in the January 2000 Nonpoint Source Pollution Control Program for the protection and restoration of riparian areas.
3. Restructure sections of the Basin Plan to move appropriate nonpoint source information, requirements, and prohibitions into one designated section of the Basin Plan. The section is titled Control of Nonpoint Source Pollutants.

4. Add a new section for currently adopted and future Total Maximum Daily Loads and associated Implementation Plans.

This amendment is presented to the Board for review and consideration.

DISCUSSION

In November 1988, the State Water Resources Control Board adopted a Nonpoint Source Management Plan that outlined steps to initiate the systematic management of nonpoint sources in California. The Nonpoint Source Management Plan was revised to the Nonpoint Source Pollution Control Program (January 2000) in December 1999. Resolution 99-114, revising the Nonpoint Source Pollution Control Program was adopted by the State Water Resources Control Board on December 14, 1999 pursuant to Section 319 of the Clean Water Act.

The 2000 Nonpoint Source Pollution Control Program is a coordinated statewide approach to managing nonpoint source pollution structured around 61 management measures. Management measures serve as goals for the control and prevention of polluted runoff. Site-specific management practices are used to achieve the goals of each management measure. Management measures will be implemented using a fifteen-year strategy with three nested five-year implementation plans. The fifteen-year strategy and each five-year implementation plan use an iterative program process.

State Board Resolution No. 99-114 directs regional boards to implement the Nonpoint Source Pollution Control Program. The Basin Plan for the Regional Water Quality Control Board, Central Coast Region includes the state November 1988, Nonpoint Source Management Plan. This amendment updates the Basin Plan to comply with Resolution No. 99-114.

This revision proposes to reference the Nonpoint Source Pollution Control Program and emphasize information and management actions for the protection and restoration of riparian areas; and restructure sections of the Basin Plan to move appropriate nonpoint source information, requirements, and prohibitions into one designated section of the Basin Plan. The section is titled Control of Nonpoint Source Pollutants.

Below is a summary of all edits, additions, and changes in Chapter Four (4), Chapter Five (5), and Appendices of the Basin Plan. Chapter 4 edits, additions, and changes are shown in Attachment B. Chapter 5 edits, additions, and changes are shown in Attachment C. Appendices edits are shown in Attachment D.

Chapter 4

1. Page IV-1, edited Table of Contents.
2. Pages IV-5 and IV-6, Section V.A.7. BEST MANAGEMENT PRACTICES, moved to page IV-45, Section VIII. CONTROL OF NONPOINT SOURCE POLLUTANTS. Made minor clerical edits, then deleted Section V.A.7. BEST MANAGEMENT PRACTICES, on Pages IV-5 and IV-6 of Chapter 4.
3. Pages IV-7 and IV-8, Section V.B. NONPOINT SOURCE PROGRAM, moved to page IV-44, Section VIII. Made major edits using language from "Nonpoint Source Pollution Control Program (January 2000)", then deleted Section V.B. NONPOINT SOURCE PROGRAM, on Pages IV-7 and IV-8 of Chapter 4.
4. Pages IV-44 and IV-45, Section VIII. NONPOINT SOURCE MEASURES - Title of Section VIII. changed to CONTROL OF NONPOINT SOURCE POLLUTANTS.

Major edits to Section VIII using language from "Nonpoint Source Pollution Control Program (January 2000)".

Added section titled BEST MANAGEMENT PRACTICES, using information from Pages IV-5 and IV-6, Section V.A.7. BEST MANAGEMENT PRACTICES. Minor clerical edits made to the new Section.

5. Pages IV-45 and IV-46, Section VIII.A. COASTAL ZONE ACT REAUTHORIZATION AMENDMENTS, deleted information contained in the Coastal Zone Act Reauthorization Amendment section. The Coastal Zone Act Reauthorization Amendments are addressed in the "Nonpoint Source Pollution Control Program (January 2000)".
6. Pages IV-45 and IV-46, Renamed Section VIII.A. Wetlands, Riparian Areas, and Vegetated Treatment Systems, using information from "Nonpoint Source Pollution Control Program (January 2000)", Page 152, Section G Wetlands, Riparian Areas, and Vegetated Treatment Systems. Minor clerical edits made to the new Section.

Three headings added: "Recommended Actions", "Control Actions", and "Prohibitions". Under "Recommended Actions", stated recommended actions (management measures) are found in the 2000 Nonpoint Source Pollution Control Program. Under "Control Actions", repeated three items found in Chapter V, Management Principles, Section III.A. GENERAL, three items found in Chapter V, Management Principles, Section III.C. DISCHARGE TO SURFACE WATERS, and one item found in Chapter V, Section V.G. EROSION AND SEDIMENTATION. Under "Prohibitions" repeated one item found in Chapter IV Section VIII.E. LAND DISTURBANCE ACTIVITIES and added reference, "For additional prohibitions see Chapter Five (5), Page V-7, Section IV. DISCHARGE PROHIBITIONS."

7. Pages IV-68 and IV-69, Section VIII.E. LAND DISTURBANCE ACTIVITIES, added

header "Recommended Actions". Under "Recommended Actions" added sub-headers "Erosion Study Recommendations" and "Actions By Other Authorities".

Under "Recommended Actions" repeated three items found in Chapter V, Management Principles, Section III.A. General, repeated one item found in Chapter V, Management Principles, Section III.G EROSION AND SEDIMENTATION CONTROL, and repeated one item found in Chapter V, Management Principles, Section V.G EROSION AND SEDIMENTATION. Also added headers Erosion Study Recommendations and Actions By Other Authorities.

8. Pages IV-68 and IV-69, Section VIII.E. LAND DISTURBANCE ACTIVITIES, added header "Control Actions" and repeated three items found in Chapter V, Management Principles, Section III.C. Discharge to Surface Waters, moved items 1 through 7 from Section V.G. EROSION AND SEDIMENTATION, and moved items 3 through 7 from Section III.G. EROSION AND SEDIMENTATION CONTROL.
 9. Page IV-70, Section VIII.E.1. LAND DISTURBANCE PROHIBITIONS, made minor edits. Added reference, "For additional prohibitions see Chapter Five (5), Page V-7, Section IV. DISCHARGE PROHIBITIONS."
 10. Page IV-75, after all other text, added "Section IX. TOTAL MAXIMUM DAILY LOADS" and introductory paragraph.
3. Page V-7, Section III.G. EROSION AND SEDIMENTATION CONTROL – Delete Item 1, moved Item 2 to Pages IV-68 and IV-69, Section VIII.E. LAND DISTURBANCE ACTIVITIES, under header "Recommendations", moved Items 3 through 7 to Pages IV-68 and IV-69, Section VIII.E. LAND DISTURBANCE ACTIVITIES, under header "Control Actions", and deleted last paragraph. Once the appropriate Items were moved to Chapter 4, made minor edits to Items 2 through 7, then deleted Section III.G. EROSION AND SEDIMENTATION CONTROL on Page V-7 of Chapter 5.
 4. Pages V-13 and 14, Section V.G. EROSION AND SEDIMENTATION –, moved Items 1 through 7 to Pages IV-68 and IV-69, Section VIII.E. LAND DISTURBANCE ACTIVITIES, under header "Control Actions" and moved Item 8 to Pages IV-68 and IV-69, Section VIII.E. LAND DISTURBANCE ACTIVITIES, under header "Recommendations", and deleted last paragraph of Section V.G. Page V-14. Once the appropriate Items were moved to Chapter 4, made minor edits to Items 1 through 7, then deleted Section V.G. EROSION AND SEDIMENTATION on Pages V-13 and 14 of Chapter 5.
 5. Pages V-15 and V-16, Section V.H.10. EROSION AND SEDIMENTATION CONTROL– Moved Items 1 through 8 to Pages IV-68 and IV-69, Section VIII.E. LAND DISTURBANCE ACTIVITIES, under header "Recommendations" (ACTIONS BY OTHER AUTHORITIES). Once the appropriate Items were moved to Chapter 4, deleted Section V.H.10. EROSION AND SEDIMENTATION CONTROL on Pages V-15 and V-16 of Chapter 5.

Chapter 5

1. Page V-1, Section I. STATE WATER RESOURCES CONTROL BOARD PLANS AND POLICIES - Updated section to reflect "Nonpoint Source Pollution Control Program (January 2000)".
2. Page V-3, Section I.J. NONPOINT SOURCE MANAGEMENT PLAN - Updated section adding additional language to reflect "Nonpoint Source Pollution Control Program (January 2000)".

Appendices

1. Revised Plans and Policies Appendix "Table of Contents" to show deletion of Appendix A-10, Nonpoint Source Management Plan.
2. Deleted Appendix A-10, Nonpoint Source Management Plan (November 1988). This appendix references an outdated version of the

State Nonpoint Source Pollution Control Program.

ENVIRONMENTAL SUMMARY

A Notice of Public Hearing has been circulated. A Notice of Filing, Written Report, and Environmental Checklist (Attachment E) will be prepared and circulated to interested agencies and persons prior to consideration of the Basin Plan amendment. This will satisfy the environmental documentation requirements of both the California Environmental Quality Act, under Public Resources Code Section 21080.5 and the Federal Clean Water Act of 1977 (PL 92-500 and PL 95-217).

COMMENTS

Deborah Johnston, Department of Fish and Game (phone call)

1. **Comment:** Section VIII.E. Land Disturbance, Control Actions, Item 3 states, The discharge of pollutants into surface waters shall be discontinued. The item specifies "surface fresh waters." Modify the item to address saline surface waters.

Response: Staff agrees. The item has been revised to read, "The discharge of pollutants into surface fresh waters shall be discontinued."

2. **Comment:** Section VIII.E. Land Disturbance, Control Actions, Item 14 states, Cover crops shall be established by seeding and/or mulching, or other equally effective measures, for all disturbed areas not otherwise protected from excessive erosion. Replace "Cover crops" with "Cover crops (using native plant species)."

Response: Staff has revised item 14 as follows, "Cover crops shall be established by seeding and/or mulching, or other equally effective measures, for all disturbed areas not otherwise protected from excessive erosion. The use of native plant species is recommended.

Regional Board Staff

3. **Comment:** Add a new section to the Basin Plan that will include currently adopted and future Total Maximum Daily Loads and associated Implementation Plans.

Response: Staff agrees. On Page IV-75, add "Section IX. TOTAL MAXIMUM DAILY LOADS" and the introductory paragraph.

4. **Comment:** Section VIII., Item 3., Use the term "Management Options" in place of "Three Tiered Approach".

Response: Staff has modified the section to read, "Continues use of Management Options (the "Three-Tiered Approach") for addressing NPS polluted problems".

RECOMMENDATION

The Regional Board should adopt the attached Resolution R3-2002-0093 (Attachment A), as proposed. Resolution R3-2002-0093 approves revision of the Basin Plan.

RESOLUTION R3-2002-0093

**CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
895 AEROVISTA PLACE, SUITE 101
SAN LUIS OBISPO, CALIFORNIA 93401-7906**

**RESOLUTION R3-2002-0093
(Drafted November 18, 2002)**

**Adopting Revised State Water Resources Control Board
Nonpoint Source Pollution Control Program and Reformatting Existing Nonpoint Source
Plans, Policies, and Management Practices in an
Amendment of the Central Coast Basin Water Quality Control Plan (Basin Plan)
Requesting Approval from State Water Resources Control Board**

The California Regional Water Quality Control Board, Central Coast Region (hereafter Regional Board) finds:

1. The California Regional Water Quality Control Board, Central Coast Region, adopted the *Water Quality Control Plan, Central Coastal Basin* (hereafter Basin Plan), on September 8, 1994.
2. The Regional Board periodically revises and amends the Basin Plan. The most recently finalized amendment to the Basin Plan was in April 1995.
3. The Regional Board is responsible for reviewing water quality standards and implementation plans as appropriate and for modifying and adopting standards contained in the Plans under provisions set forth in section 303(c) of the Federal Clean Water Act and Section 13240, Division 7 of the California Water Code.
4. The State Water Resources Control Board revised the State Nonpoint Source Management Plan to the "Nonpoint Source Pollution Control Program" (January 2002).
5. State Water Resources Control Board Resolution 99-114, revising the Nonpoint Source Pollution Control Program was adopted on December 14, 1999, pursuant to Section 319 of the Clean Water Act.
6. The Nonpoint Source Pollution Control Program (dated January 2000) includes a coordinated statewide approach to managing nonpoint source pollution structured around 61 management measures. Management measures serve as goals for the control and prevention of polluted runoff. Site-specific management practices are used to achieve the goals of each management measure. Management measures will be implemented using a fifteen-year strategy with three nested five-year implementation plans. The fifteen-year strategy and each five-year implementation plan use an iterative program process.

7. The Nonpoint Source Pollution Control Program process includes: Assessing Program activities, targeting efforts, planning activities based on Program goals and objectives, coordinating the efforts of federal, State, and local agencies and stakeholders, implementing coordinated actions, tracking and monitoring the results of implemented actions, and reporting on Program results. The Program Plan is designed to be flexible and adaptable over time.
8. The Basin Plan contains existing nonpoint source information distributed throughout the document.
9. The Basin Plan requires restructuring in order to have appropriate nonpoint source information, findings, and requirements in a designated section of the Basin Plan (Section VIII. CONTROL OF NONPOINT SOURCE POLLUTANTS).
10. Section 303(d) of the Clean Water Act requires States to establish total maximum daily loads for waterbodies that do not meet water quality objectives that will insure attainment of water quality objectives, and then to incorporate those allocations into their Basin Plans.
11. Regional Board consulted with the Department of Fish and Game regarding potential impacts of proposed Basin Plan revisions on fish and wildlife resources, and threatened and endangered plants and animal species. The Department of Fish and Game has made a determination of "no jeopardy" pursuant to the California Endangered Species Act.
12. A draft notice of filing, staff report, the proposed amendment, and environmental checklist have been prepared and distributed to interested persons and agencies for review and comment in accordance with state and federal environmental regulations (23 CCR § 3775, 40 CFR 25 and 40 CFR 131).
13. Regional Board staff has followed appropriate procedures to satisfy the environmental documentation requirements of the California Environmental Quality Act of 1977 (Public Resources Code 21000 et seq.).
14. The Regional Board finds adoption of these amendments will have no potential for adverse effect, either individually or cumulatively, on wildlife. The Regional Board finds adoption of these amendments will not have a significant adverse effect on the environment.
15. Due notice of public hearing was given by advertising in newspapers of general circulation within the Region.
16. On December 13, 2002 in San Luis Obispo California, the Regional Board held a public hearing and considered all public testimony.

THEREFORE, BE IT RESOLVED:

1. Pursuant to section 13240 of the California Water Code, the Regional Board, after considering the entire record, including oral testimony, adopts the Basin Plan amendment **Nonpoint Source Pollution Control Program and Reformatting Existing Nonpoint Source Plans, Policies, and Management Practices in an Amendment of the Central Coast Basin Water Quality Control Plan (Basin Plan)** as shown in Attachments B "Revised Chapter 4. Implementation Plan", C "Revised Chapter 5. Plans and Policies", and D "Revised Basin Plan Appendix". The amendment will not take effect until approved by the State Board, the Office of Administrative Law, and the United States Environmental Protection Agency.
2. The Regional Board's Executive Officer is authorized to submit the amendment to the State Water Resources Control Board in accordance with the requirements of section 13245 of the California Water Code.
3. The Regional Board requests that the State Water Resources Control Board approve the Basin Plan amendment in accordance with the requirements of sections 13245 and 13246 of the California Water Code, and that upon approval, the State Board is requested to transmit the amendment to the California Office of Administrative Law and the U.S. Environmental Protection Agency for approval.
4. That the environmental document prepared by Regional Board staff pursuant to Public Resource Code Section 21080.5 is hereby certified. Following approval of the revised Basin Plan by the State Board, the State Board shall file a Notice of Decision with the State Clearinghouse.
5. That the Regional Board's Executive Officer is authorized to sign a Certificate of Fee Exemption, since no adverse effect on wildlife results in a "*De Minimus*" impact finding.
6. That if during the approval process, the State Board or OAL determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the Board of any such changes.

I, Roger W. Briggs, Executive Officer of the California Regional Water Quality Control Board, Central Coast Region, do hereby certify that the foregoing is a full, true, and correct copy of the Resolution adopted by the California Regional Water Quality Control Board, Central Coast Region, on December 13, 2002.

Executive Officer

REVISED CHAPTER 4. IMPLEMENTATION PLAN

Notes for reading the proposed Basin Plan amendment:

1. New or edited text is underlined.

Example: The effectiveness of a water quality control program cannot be judged without the information supplied by

2. Removed text is crossed out.

Example: ~~The effectiveness of a water quality control program cannot be judged without the information supplied by~~

3. Moved text is highlighted.

Example: **The effectiveness of a water quality control program cannot be judged without the information supplied by**

4. Original text is unmarked.

Example: The effectiveness of a water quality control program cannot be judged without the information supplied by

CHAPTER 4. IMPLEMENTATION PLAN

A program of implementation to protect beneficial uses and to achieve water quality objectives is an integral component of this Basin Plan. The program of implementation is required to include, but is not limited to:

- A description of the nature of actions which are necessary to achieve the objectives, including recommendations for appropriate action by any entity, public or private.
- A time schedule for the actions to be taken.
- A description of surveillance to be undertaken to determine compliance with objectives.

Additional surveillance activities to determine compliance with objectives are described in Chapter Six, "Surveillance and Monitoring".

This chapter includes discussions of:

- Regional Water Quality Control Board Goals;
- General Control Actions and Related Issues;
- Waste Discharge Regulation;
- Hazardous Waste Compliance Issues; and
- Nonpoint Source Measures.

~~Detailed descriptions of waterbodies with their specific water quality problems and recommended control actions are included in the Region's Water Quality Assessment database and Fact Sheets.~~

This chapter is organized in the following manner:

- I. Regional Water Quality Control Board Goals
- II. General Control Actions and Related Issues
- III. Control Actions under State Board Authority
- IV. Control Actions to be Implemented by Other Agencies with Water Quality or Related Authority
- V. Control Actions under Regional Board Authority
 - A. ~~Waste Discharge Restrictions~~ Control of Point Source Pollutants
 1. Water Quality Certification
 2. National Pollutant Discharge Elimination System
 3. Waste Discharge Requirements
 4. Waivers

5. Prohibitions and Prohibition Exemptions
 6. Enforcement Actions
 7. ~~Best Management Practices~~
 8. Compliance Schedules
- ~~B. Nonpoint Source Program~~
- VI. Waste Discharge Program Implementation
 - A. Effluent Limits
 1. Stream Disposal
 2. Estuarine Disposal
 3. Ocean Disposal
 4. Land Disposal
 5. Reclamation and Reuse
 6. Pretreatment Programs
 7. Sludge Treatment
 - B. Municipal Wastewater Management Plans (arranged by hydrologic subarea)
 - C. Industrial Wastewater Management
 - D. Solid Waste Management
 - E. Storm Water Management
 - F. Bay Protection and Toxic Cleanup Program
 - G. Military Installations
 - H. Spills, Leaks, Investigations, and Cleanup Program
 - I. Underground Tank Storage Tank Program
 - J. Aboveground Petroleum Storage Tanks
 - K. California Code of Regulations, Title 23, Chapter 15
 1. Solid and Liquid Waste Requirements (Landfills and Surface Impoundments)
 2. Wastewater Sludge (Septage Management)
 3. Mining Activities (Nonfuel Commodities)
 4. Other Industrial Activities
 - L. Resource Conservation and Recovery Act (Subtitle D)
 - M. Solid Waste Water Quality Assessment Test
 - VII. Hazardous Waste Compliance Issues
 - A. Reportable Quantities of Hazardous Waste and Sewage Discharges
 - B. Proposition 65
 - VIII. Control of Nonpoint Source Measures Pollutants
 - A. ~~Coastal Zone Act Reauthorization Amendments~~ Wetlands, Riparian Areas, and Vegetated Treatment Systems
 - B. Urban Runoff Management
 - C. Agricultural Water and Wastewater Management
 - D. Individual, Alternative, and Community Disposal Systems
 - E. Land Disturbance Activities

Revise the September 8, 1994 Basin Plan,
Chapter 4, Page IV-3, Section V.A. Waste
Discharge Restrictions as follows:

**V.A. WASTE
DISCHARGE
RESTRICTIONS
CONTROL OF POINT
SOURCE
POLLUTANTS**

Revise the September 8, 1994 Basin Plan, Chapter 4, Pages IV-5 and IV-6, Section V.A.7. BEST MANAGEMENT PRACTICES as follows (Moved to page IV-45, Section VIII.A.):

V.A.7. BEST MANAGEMENT PRACTICES

Property owners, managers, or other dischargers may implement "Best Management Practices" to protect water quality. (Implementation and enforcement of Best Management Practices are discussed below under the "Nonpoint Source Measures" section of this chapter). The term "Best Management Practices" is used in reference to control measures for nonpoint source water pollutants and is analogous to the terms "Best Available Technology/Best Control Technology" used for control of point source pollutants. The U.S. EPA (40 Code of Federal Regulations Section 103.2[m]) defines Best Management Practices as follows:

"Methods, measures, or practices selected by an agency to meet its nonpoint source control needs. Best Management Practices include, but are not limited to structural and nonstructural controls and operation and maintenance procedures. Best Management Practices can be applied before, during, and after pollution producing activities to reduce or eliminate the introduction of pollutants into receiving waters."

U.S. EPA regulations (40 Code of Federal Regulations Section 103.6[b][4][i]) provide that Basin Plans:

"...shall describe the regulatory and nonregulatory programs, activities, and Best Management Practices which the agency has selected as the means to control nonpoint source pollution where necessary to protect or achieve approved water uses. Economic, institutional, and technical factors shall be considered in a continuing process of identifying control needs and evaluating and modifying the Best Management Practices as necessary to achieve water quality goals."

Best Management Practices fall into two general categories:

1. Source controls which prevent a discharge or threatened discharge.

These may include measures such as recycling of used motor oil, fencing stream banks to prevent livestock entry, fertilizer management, street cleaning, revegetation and other erosion controls, and limits on total impervious surface coverage. Because the effectiveness of Best Management Practices is often uncertain, source control is generally preferable to treatment. It is also often less expensive.

2. Treatment practices which remove pollutants from a discharge before it reaches surface or ground waters.

Examples include infiltration facilities, oil/water separators, and constructed wetlands.

Several important points about Best Management Practices must be emphasized;

Best Management Practices are not officially considered "best" practices for use in California unless they have been certified by the State Board.

The use of Best Management Practices does not necessarily ensure compliance with effluent limitations or with receiving water objectives. Because nonpoint source control has been a priority only since the 1970's, the long term effectiveness of some Best Management Practices has not yet been documented. Some source control Best Management Practices (e.g., waste motor oil recycling) may be 100 percent effective if implemented properly. Monitoring and evaluation of Best Management Practice effectiveness is an important part of nonpoint source control programs.

The selection of individual Best Management Practices must take into account specific site conditions (e.g., depth to ground water, quality of runoff, infiltration rates). Not all Best Management Practices are applicable at every location. High ground water levels may preclude the use of runoff infiltration facilities, while steep slopes may limit the use of wet ponds.

To be effective, most Best Management Practices must be implemented on a long term basis. Structural Best Management Practices (e.g., wet ponds and infiltration trenches) require periodic maintenance, and may eventually require replacement.

- The "state of the art" for Best Management Practices design and implementation is expected to change over time. The State planning process will include periodic review and update of Best Management Practices certifications.

□ General information on nonpoint source management practices is provided under different water quality problem categories throughout this chapter. For detailed information on the design, implementation, and effectiveness of specific Best Management Practices, the reader should consult the appropriate Best Management Practices Handbook for the project type or location.

Text Moved

Revise the September 8, 1994 Basin Plan, Chapter 4, Pages IV-7 and IV-8, Section V.B., NONPOINT SOURCE PROGRAM as follows (Moved to page IV-44, Section VIII.):

V.B. NONPOINT SOURCE PROGRAM

Nonpoint source pollution has been identified as a major cause of water pollution throughout the United States, and the California Central Coast Region is no exception. Nonpoint sources of water pollution are generally defined as sources which are diffuse (spread out over a large area). These sources are not as easily regulated or controlled as are point sources. Nonpoint source pollution is caused by land use activities or anthropomorphic activities. Deposition of pollutants may occur in lakes, rivers, wetlands, coastal waters, or ground waters.

In order to address the nonpoint source pollution problem nationwide, the U.S. Congress incorporated Section 319 into the 1987 amendments to the Clean Water Act. By amending the Clean Water Act, Congress shifted the federal emphasis from nonpoint source pollution planning and problem identification to a new nonpoint source action program. Section 319 of the federal Clean Water Act required each state to develop a State Nonpoint Source Management Program describing the measures the State would take to address nonpoint sources of pollution. In November 1988, the State Water Resources Control Board adopted a Nonpoint Source Management Plan which outlined steps to initiate the systematic management of nonpoint sources in California. For effective management of nonpoint sources the Management Plan required:

- An explicit long term commitment by the State Board and Regional Boards;
- More effective coordination of existing State Board and Regional Board nonpoint source related programs;
- Greater use of Regional Board regulatory authority coupled with nonregulatory Regional Board programs;

Stronger links between the local, State, and federal agencies which have authority to manage nonpoint sources; and

Development of new funding sources.

The 1988 State Board Nonpoint Source Management Plan advocates three approaches for addressing nonpoint source management:

1. Voluntary implementation of Best Management Practices

Property owners or managers may volunteer to implement Best Management Practices. Implementation could occur for economic reasons and/or through awareness of environmental benefits.

2. Enforcement of Best Management Practices

Although the California Porter Cologne Water Quality Control Act constrains Regional Boards from specifying the manner of compliance with water quality standards, there are two ways in which Regional Boards can use their regulatory authority to encourage implementation of Best Management Practices.

The Regional Board may encourage Best Management Practices by waiving adoption of waste discharge requirements on condition that discharges comply with Best Management Practices. Alternatively, the Regional Board may enforce Best Management Practices indirectly by entering into management agency agreements with other agencies which have the authority to enforce Best Management Practices.

The Regional Board will generally refrain from imposing effluent requirements on discharges that are implementing Best Management Practices in accordance with a waiver of waste discharge requirements, and approved Management Agency Agreements, or other State or Regional Board formal action.

3. Adoption of Effluent Limitations

The Regional Board can adopt and enforce requirements on the nature of any proposed or existing waste discharge, including discharges from nonpoint sources. Although the Regional Board is precluded from specifying the manner of compliance with waste discharge limitations, in appropriate cases, limitations

Text Moved

may be set at a level which, in practice, requires implementation of Best Management Practices.

Not all of the categories of nonpoint source pollution follow this three tiered approach. For example, silviculture activities or nonpoint source pollution administered by the California Department of Forestry. The State Board has worked into the Interagency Agreement with the California Department of Forestry which allows the Regional Board to review and inspect timber harvest plans and operations for implementation of Best Management Practices for protection of water quality.

The Regional Board approach to addressing or regulating categories of nonpoint source pollution is discussed in various sections throughout this chapter.

Text Moved

Revise the September 8, 1994 Basin Plan, Chapter 4, Page IV-44 and Page IV-45, Section VIII. NONPOINT SOURCE MEASURES as follows:

VIII. NONPOINT SOURCE PROGRAM CONTROL OF NONPOINT SOURCE MEASURES POLLUTANTS

Nonpoint source pollution has been identified as a major cause of water pollution throughout the United States, and the California Central Coast Region is no exception. Nonpoint sources of water pollution are generally defined as diffuse discharges of waste without a single point of origin sources which are diffuse (spread out over a large area). These sources are not as easily regulated or controlled as are point sources. Nonpoint source pollution is typically caused by land use activities or anthropomorphic activities. Deposition of pollutants may occur in lakes, rivers, wetlands, coastal waters, or ground waters.

To address the nonpoint source pollution problem nationwide, the U.S. Congress incorporated Section 319 into the 1987 amendments to the Clean Water Act. By a Amendments to the Clean Water Act (www.swrcb.ca.gov/rwqcb3/), Congress shifted the federal emphasis from nonpoint source pollution planning and problem identification to a new nonpoint source action program. Section 319 of the federal Clean Water Act required each state to develop a State Nonpoint Source Management Program describing the measures the State would take to address nonpoint sources of pollution. In November 1988, the State Water Resources Control Board adopted a Nonpoint Source Management Plan which that outlined steps to initiate the systematic management of nonpoint sources in California. The Nonpoint Source Management Plan was revised to become the "Nonpoint Source Pollution Control Program (January 2000)" in December 1999 (www.swrcb.ca.gov/rwqcb3/). The State Water Resources Control Board adopted Resolution 99-114, revising the Nonpoint Source Pollution Control Program on December 14, 1999, pursuant to Section 319 of the

Clean Water Act. For effective management of nonpoint sources the Management Plan required:

- An explicit long-term commitment by the State Board and Regional Boards;
- More effective coordination of existing State Board and Regional Board nonpoint source related programs;
- Greater use of Regional Board regulatory authority coupled with nonregulatory Regional Board programs;
- Stronger links between the local, State, and federal agencies which have authority to manage nonpoint sources; and
- Development of new funding sources.

The 2000 Nonpoint Source Pollution Control Program is a coordinated statewide approach to managing nonpoint source pollution structured around 61 management measures. Management measures serve as goals for the control and prevention of polluted runoff. Site-specific management practices are used to achieve the goals of each management measure. Implementation of management measures will occur using a fifteen-year strategy with three nested five-year implementation plans. The fifteen-year strategy and each five-year implementation plan use an iterative program process. The program process includes:

- (1) Assessing Program activities
- (2) Targeting efforts
- (3) Planning activities based on Program goals and objectives
- (4) Coordinating the efforts of federal, State, and local agencies and stakeholders
- (5) Implementing coordinated actions
- (6) Tracking and monitoring the results of implemented actions
- (7) Reporting on Program results. The Program Plan is designed to be flexible and adaptable over time.

Specifically, the 2000 Nonpoint Source Pollution Control Program:

1. Adopts 61 management measures as goals for six nonpoint source categories (agriculture, forestry, urban areas, marinas and recreational boating, hydromodification, and wetlands/riparian areas/vegetated treatment systems)

2. Provides a fifteen-year strategy for implementing Management Measures
3. Continues use of Management Options (the "Three-Tiered Approach") for addressing NPS pollution problems:
 - a) Tier 1: Self-Determined Implementation of Management Practices (formerly referred to as "voluntary" implementation)
 - b) Tier 2: Regulatory Based Encouragement of Management Practices (e.g. Management Agency Agreements, established waivers, etc.)
 - c) Tier 3: Effluent Limitations and Enforcement Actions (e.g., Basin Plan prohibitions, Waste Discharge Requirements, etc.)
4. Provides the first of three five-year implementation plans targeting activities for specific management measures consistent with state and regional priorities in specific watersheds and also establishes mechanisms for: (a) coordination among agencies; (b) participation by the public; (c) assistance technically and financially; (d) adoption of additional management measures as goals, if needed; and: (e) monitoring and reporting of program effectiveness
5. Promotes long-term interagency coordination among State agencies of the California Environmental Protection Agency and Resources Agency as well as other local, State, and federal agencies
6. Identifies back-up authorities and enforceable policies and mechanisms for the 61 management measures adopted by the State
7. Relies on the use of existing authorities and regulatory processes (see page IV-3, Section V, Control Actions Under Regional Board Authority) to achieve implementation but allows for the adoption of the management measures as regulation after each five-year cycle if adequate progress in NPS pollution control has not been demonstrated.

The 1988 State Board Nonpoint Source Management Plan advocates three approaches for addressing nonpoint source management:

1. Voluntary implementation of Best Management Practices

Property owners or managers may volunteer to implement Best Management Practices. Implementation could occur for economic reasons and/or through awareness of environmental benefits.

2. Enforcement of Best Management Practices

Although the California Porter-Cologne Water Quality Control Act constrains Regional Boards from specifying the manner of compliance with water quality standards, there are two ways in which Regional Boards can use their regulatory authorities to encourage implementation of Best Management Practices.

First, the Regional Board may encourage Best Management Practices by waiving adoption of waste discharge requirements on condition that discharges comply with Best Management Practices. Alternatively, the Regional Board may enforce Best Management Practices indirectly by entering into management agency agreements with other agencies which have the authority to enforce Best Management Practices.

The Regional Board will generally refrain from imposing effluent requirements on discharges that are implementing Best Management Practices in accordance with a waiver of waste discharger requirements, and approved Management Agency Agreements, or other State or Regional Board formal action.

3. Adoption of Effluent Limitations

The Regional Board can adopt and enforce requirements on the nature of any proposed or existing waste discharge, including discharges from nonpoint sources. Although the Regional Board is precluded from specifying the manner of compliance with waste discharge limitations, in appropriate cases, limitations may be set at a level which, in practice, requires implementation of Best Management Practices.

Not all of the categories of nonpoint source pollution follow this three-tiered approach. For example, silviculture activities on non-federal lands are administered by the California Department of Forestry. The State Board has entered into a Management Agency Agreement with California Department of Forestry which allows the Regional Boards to review and inspect timber harvest plans and operations for implementation of Best Management Practices for protection of water quality.

The Regional Board approach to addressing or regulating categories of nonpoint source pollution is discussed in various sections throughout this chapter: the Basin Plan and the Central Coast Region Watershed Management Initiative Chapter (www.swrcb.ca.gov/rwqcb3/).

The Nonpoint Source Pollution Control Program has State Nonpoint Source Management Plan initiated

development implements of specific program objectives to be implemented at the State and Regional level. Currently, Regional Board staff are implementing the following State Board program objectives:

A. Control of Nonpoint Source pollution (urban runoff; agriculture; land disturbance activities such as road construction/maintenance, land construction, timber harvesting, and mining; hydrologic modification; and individual disposal systems). These activities include outreach, education, public participation, technical assistance, financial assistance, interagency coordination, demonstration projects, and regulatory activities such as imposing septic tank area prohibitions.

B. Preparation of contracts for projects selected for grant funding. Regional Board staff also participate in these projects by providing technical assistance and publicizing their results.

C. Implementation of the 1990 Coastal Zone Act Reauthorization Amendments, as developed by the State Board and the California Coastal Commission. This shall be an enforceable Nonpoint Source Management Program to control land use and anthropomorphic activities impacts that have a significant affect on coastal waters. (Further discussion of the Amendments is provided later.)

D. Initiation of nonpoint source watershed pilot programs.

Using State program objectives, Regional Board staff annually developed task-specific workplans work plans to address nonpoint sources of pollution. For the Central Coastal Region, the following Nonpoint Source Program tasks activities are managed and implemented by the Nonpoint Source Program staff are documented in the Central Coast Region Watershed Management Initiative Chapter (January 2002 WMI at www.swrcb.ca.gov/rwqcb3/).

Task 1: Water Quality Assessment

Regional Board staff reviewed and updated the nonpoint source portion of the Water Quality Assessment and prepared water body fact sheets. (The Water Quality Assessment and water body fact sheets are discussed in Chapter Six.)

Task 2: Watershed Studies/Planning

Three impaired watersheds (Morro Bay Watershed, San Luis Obispo Creek Watershed, and San Lorenzo River Watershed) have been targeted for intensive activity. Major activities for San Luis Obispo Creek watershed include:

1. Develop a Demonstration "Total Maximum Daily Load" model.
2. Create a "San Luis Obispo Creek Riparian Task Force".
3. Implement a riparian corridor restoration project.
4. Identify major nonpoint pollutants and sources.
5. Develop a watershed management program.

For Morro Bay watershed, the activities include:

1. Develop a long term monitoring program to assess water quality improvements associated with the implementation of nonpoint source pollution control measures.
2. Develop funding for the long term monitoring program.
3. Implement a sediment reduction program using best management practices.
4. Participate in the Morro Bay Task Force.

For San Lorenzo River watershed, the activities include:

1. Develop a detailed assessment of Nonpoint Source impacts in the watershed.
2. Develop a wastewater management plan for on/off site wastewater disposal.
3. Develop of a nutrient objective for the river.
4. Conduct experimental on-site wastewater treatment to reduce nitrogen discharge into the environment.

Task 3: Outreach Program

Staff meets regularly with individuals and local government agencies to promote education and solutions on Nonpoint Source problems. Additionally, the use of

grant and loan resources to correct Nonpoint Source problems is emphasized during outreach activities.

Specific outreach activities include participation on the San Luis Obispo Creek Riparian Task Force, Morro Bay Task Force, and various 319(h)/205(j)/Basin Planning Technical Advisory Committees, and development of grant applications with local agencies.

Task 4: Project Tracking and Participation

Regional Board staff prepare contracts, coordinate with project proponents, track project progress, review and approve invoices, and provide technical support for Nonpoint Source grant funded projects.

Examples of additional management actions are documented in the following:

California Rangeland Water Quality Management Plan

Salinas River Watershed Management Action Plan

Water Quality Protection Program for Monterey Bay National Marine Sanctuary, Action Plan IV: Agriculture and Rural Lands

Central Coast Region Watershed Management Initiative Chapter

These documents are located on the Regional Board website at (www.swrcb.ca.gov/rwqcb3/).

BEST MANAGEMENT PRACTICES

Property owners, managers, or other dischargers may implement "Best Management Practices" to protect water quality. (Implementation and enforcement of Best Management Practices are discussed below under the "Nonpoint Source Measures" section of this chapter). The term "Best Management Practices" is used in references to control measures for nonpoint source water pollutants and is analogous to the terms "Best Available Technology/Best Control Technology" used for control of point source pollutants. The U.S. EPA (40 Code of Federal Regulations Section 103.2[m]) (www.swrcb.ca.gov/rwqcb3/) defines Best Management Practices as follows:

"Methods, measures, or practices selected by an agency to meet its nonpoint source control needs. Best Management Practices include, but are not

limited to structural and nonstructural controls and operation and maintenance procedures. Best Management Practices can be applied before, during, and after pollution producing activities to reduce or eliminate the introduction of pollutants into receiving waters."

U.S. EPA regulations (40 Code of Federal Regulations Section 103.6[b][4][i]) (www.swrcb.ca.gov/rwqcb3/) provide that Basin Plans:

"...shall describe the regulatory and nonregulatory programs, activities, and Best Management Practices which the agency has selected as the means to control nonpoint source pollution where necessary to protect or achieve approved water uses. Economic, institutional, and technical factors shall be considered in a continuing process of identifying control needs and evaluating and modifying the Best Management Practices as necessary to achieve water quality goals."

Best Management Practices fall into two general categories:

1. Source controls which that prevent a discharge or threatened discharge.

These may include measures such as recycling of used motor oil, fencing stream banks to prevent livestock entry, fertilizer management, street cleaning, revegetation and other erosion controls, and limits on total impervious surface coverage. Because the effectiveness of Best Management Practices is often uncertain, source control is generally preferable to treatment. It is also often less expensive.

2. Treatment controls which remove pollutants from a discharge before it reaches surface or ground waters.

Examples include infiltration facilities, oil/water separators, and constructed wetlands.

Several important points about Best Management Practices must be emphasized:

- Best Management Practices are not officially considered "best" practices for use in California unless they have been certified by the State Board.
- The use of Best Management Practices does not necessarily ensure compliance with effluent

limitations or with receiving water objectives. Because nonpoint source control has been a priority only since the 1970's, the long-term effectiveness of some Best Management Practices has not yet been documented. Some source control Best Management Practices (e.g., waste motor oil recycling) may be 100 percent effective if implemented properly. Monitoring and evaluation of Best Management Practice effectiveness is an important part of nonpoint source control programs.

- The selection of individual Best Management Practices must take into account specific site conditions (e.g., depth to ground water, quality of runoff, infiltration rates). Not all Best Management Practices are applicable at every location. High ground water levels may preclude the use of runoff infiltration facilities, while steep slopes may limit the use of wet ponds.
- To be effective, most Best Management Practices must be implemented on a long-term long-term basis. Structural Best Management Practices (e.g., wet ponds and infiltration trenches) require periodic maintenance, and may eventually require replacement.
- The "state-of-the-art" for Best Management Practices design and implementation is expected to change over time. The State planning process will include periodic review and update of Best Management Practices certifications.

General information on recommended nonpoint source management practices is provided under different water quality problem categories throughout this chapter for urban, agriculture, onsite wastewater disposal, and other land disturbance activities are described in the following sections (also see "Nonpoint Source Pollution Control Program (January 2000)"). For detailed information on the design, implementation, and effectiveness of specific Best Management Practices, the reader should consult the appropriate Best Management Practices Handbook for the project type or location.

Revise the September 8, 1994 Basin Plan, Chapter 4, Page IV-45 and Page IV-46, Section VIII.A. COASTAL ZONE ACT REAUTHORIZATION AMENDMENTS as follows:

VIII.A. COASTAL ZONE ACT REAUTHORIZATION AMENDMENTS Wetlands, Riparian Areas, and Vegetated Treatment Systems

The State has identified four Management Measures (MMs) to promote the protection and restoration of wetlands and riparian areas and the use of vegetated treatment systems as means to control nonpoint sources of pollution. Wetlands and riparian areas reduce polluted runoff by filtering out runoff-related contaminants, such as sediment, nitrogen, and phosphorus, thus maintaining the water quality benefits of these areas is important. These areas also help to attenuate flows from higher-than-average storm events. This attenuation protects downstream areas from adverse impacts, such as channel scour, erosion, and temperature and chemical fluctuations. Changes in hydrology, substrate, geochemistry, or species composition can impair the ability of wetland or riparian areas to filter out excess sediment and nutrients and therefore can result in deteriorated water quality. The following activities can cause such impairment: drainage of wetlands for cropland, overgrazing, hydromodification, highway construction, deposition of dredged material, and excavation for ports and marinas.

RECOMMENDED ACTIONS

Recommended actions (management measures) are found in the 2000 Nonpoint Source Pollution Control Program.

CONTROL ACTIONS

1. All discharges to the aquatic environment shall be considered temporary unless it is demonstrated that no undesirable change will occur in natural receiving water quality.

2. The quality of all surface waters of the basin shall be such as to permit unrestricted recreational use.
3. The discharge of pollutants into surface waters shall be discontinued.
4. Erosion from nonpoint pollution sources shall be minimized through implementation of Best Management Practices.
5. All necessary control measures for minimizing erosion and sedimentation, whether structural or vegetal, shall be properly established prior to November October 15 each year.
6. All structural and vegetal measures taken to control erosion and sedimentation shall be properly maintained.
7. A filter strip of appropriate width, and consisting of undisturbed soil and riparian vegetation or its equivalent, shall be maintained wherever possible, between significant land disturbance activities and watercourses, lakes, bays, estuaries, marshes, and other water bodies. For construction activities, minimum width of the filter strip shall be thirty feet, wherever possible as measured along the ground surface to the highest anticipated water line.

PROHIBITIONS

1. The discharge or threatened discharge of soil, silt, bark, slash, sawdust, or other organic and earthen materials into any stream in the basin in violation of best management practices for timber harvesting, construction, and other soil disturbance activities and in quantities deleterious to fish, wildlife, and other beneficial uses is prohibited.
2. As specified in Chapter Five (5), Page V-7, Section IV. DISCHARGE PROHIBITIONS.

In November 1990, Congress enacted Section 6217 of the Coastal Zone Act Reauthorization Amendments to help address the problem of nonpoint source pollution in coastal waters. Section 6217 requires that coastal states with federally approved coastal management programs develop Coastal Nonpoint Pollution Control Programs. The legislative history indicates that the central purpose of section 6217 is to strengthen the links between federal and State coastal zone management and water quality programs in order to enhance efforts to manage land use

activities that degrade coastal beneficial uses. The State coastal zone management agency designated under Section 306 of the Amendments and nonpoint source management agency designated under section 319 of the Clean Water Act will have a dual and co-equal role and responsibility in developing and implementing the coastal nonpoint program.

The program gives the U.S. Environmental Protection Agency (U.S. EPA) and the National Oceanic and Atmospheric Administration joint authority to approve programs developed by the State to address 6217 requirements.

The State agencies chosen to develop California's Coastal Nonpoint Pollution Control Program are the State Board and the Coastal Commission. The statute requires that the State program be "coordinated closely with State and local water quality plans and programs." This means that the State's nonpoint source programs under Sections 208 and 319 of the Clean Water Act and the coastal program must be examined to determine if they comprehensively address land use activities and anthropomorphic effects that have a significant effect on coastal waters. In addition, the State agencies are charged with developing a coordinated program that:

- identifies categories of nonpoint sources that adversely impact coastal waters;
- describes management measures to be implemented;
- identifies the land uses and critical coastal areas that will require more stringent or additional management measures;
- describes the State developed additional management measures to be implemented in critical areas;
- documents the authorities the State will use to implement both the guidance and additional management measures, including designation of a lead agency for each source category and/or subcategory; and
- sets forth a schedule to achieve full implementation of the guidance management measures within three years of program approval by U.S. EPA and National Oceanic and Atmospheric Administration, and full implementation of additional management measures within six years of program approval.

The Coastal Commission and the State Board staff have been working on a strategy to develop the required

Coastal Nonpoint Pollution Control Program plan. Recently, the State Board directed staff to review and revise the statewide Nonpoint Source Management Plan to include a strong coastal component. Revision of the Plan is intended to satisfy the requirements of Section 6217 within the existing framework of current nonpoint source activities.

On a Regional Board level, staff has been involved with the statewide program since 1991. A pilot project, "The New Coastal Nonpoint Pollution Control Program using the Morro Bay Watershed as a Model" was performed to assess the feasibility of establishing the Coastal Nonpoint Pollution Control Program in California. Regional Board staff supplied technical information and reviewed reports. Concerted planning and implementation efforts on target coastal watersheds such as Morro Bay will be major accomplishments to satisfy Coastal Nonpoint Pollution Control Program requirements. As the program goes statewide, Regional Board staff will attend technical advisory committee meetings and will work closely with staff of the State Board and other Regional Boards, as well as staff of other relevant local, State, and federal agencies to develop a workable Coastal Nonpoint Pollution Control Program.

Wastewater originating from nonpoint sources includes those from urban runoff, agricultural activities, on-site sewage disposal systems, and land disturbance activities. Management of these types of nonpoint source discharges are discussed in the following section. The Regional Board will be developing management practices for marinas and recreational boating; hydromodification facilities; and wetlands, riparian areas, and vegetated treatment systems at a future date.

Revise the September 8, 1994 Basin Plan, Chapter 4, Page IV-68 and Page IV-69, Section VIII.E.1. LAND DISTURBANCE ACTIVITIES as follows:

VIII.E. LAND DISTURBANCE ACTIVITIES

Construction, mining, and other soil disturbance activities which that may disturb or expose soil or otherwise increase susceptibility of land areas to erosion are difficult to regulate effectively. Construction projects or timber harvesting activities may often begin and end with no obvious impairment of stream quality; however, erosion or land slides landslides the following winter may be directly related to earlier land disturbance or tree cutting. Mining and quarrying activities are generally longer in duration.

Under contract with the Regional Board, the California Association of Resource Conservation Districts completed a study entitled, "Erosion and Sediment in California Central Coast Watersheds - A study of Best Management Practices" (Erosion Study), dated June, 1979. This Erosion Study, funded under Section 208 of the Clean Water Act, assesses impacts of erosion and sedimentation on water quality and beneficial uses in nondesignated planning areas (San Benito, San Luis Obispo, and Santa Barbara Counties) of the Central Coast Region. This Erosion Study and supporting documents have been used by the Regional Board in developing erosion and sedimentation control policy.

Nonpoint source pollution in the remainder of the Region is addressed by designated planning agencies through their respective Area wide Waste Treatment Management Plans. Designated agencies and the areas affected within this Region include: Association of Bay Area Governments (portions of San Mateo and Santa Clara Counties), Association of Monterey Bay Area Governments (Santa Cruz and Monterey Counties), and Ventura County Board of Supervisors (portion of Ventura County). The policy herein described is compatible with those plans and is within the scope of the Regional Board authority.

The Erosion Study and Area wide Waste Treatment Management Plans identify examples of accelerated erosion resulting from insufficient land management of soil cultivation, grazing, silviculture, construction, and off-road vehicle activities, as well as wildfires.

Adverse impacts of sediment are identified, in part, as: impairment of water supplies and ground water recharge, siltation of streams and reservoirs, impairment of navigable waters, loss of fish and wildlife habitat, degradation of recreational waters, transport of pathogens and toxic substances, increased flooding, increased soil loss, and increased costs associated with maintenance and operation of water storage and transport facilities. Recommendations based on conclusions of the Erosion Study and practices recommended in Area wide Waste Treatment Management Plans are a means to reduce unnecessary soil loss due to erosion and to minimize adverse water quality impacts resulting from sediment.

When a practice or combination of practices is found to be the most effective, practical (including technological, economic, and institutional considerations) means of preventing or reducing the amount of pollution generated by nonpoint sources to a level compatible with water quality goals, it is designated a Best Management Practice (BMP). BMPs are determined only after problem assessment, examination of alternative practices, and appropriate public participation in the BMP development process.

RECOMMENDED ACTIONS

1. Land use practices should assure protection of beneficial water uses and aquatic environmental values.
2. There shall be no waste discharged into areas that possess unique or uncommon cultural, scenic, aesthetic, historical or scientific values. The Regional Board will define such areas.
3. Property owners are considered ultimately responsible for all activities and practices that could result in adverse affects on water quality from waste discharges and surface runoff.
4. Local units of government should have the lead role in controlling land use activities that cause erosion and may, as necessary, impose further conditions, restrictions, or limitations on waste disposal and other activities that might degrade the quality of waters of the State.
5. Use of soil sterilants is discouraged and should be minimized.

Erosion Study Recommendations

General recommendations based on conclusions of the Erosion Study are discussed below. These recommendations are considered to be Best Management Practices (BMPs) by the Regional Board as are the Area wide approved water quality management plans.

1. Soil conservation control measures should be used to minimize impacts that would otherwise result from soil erosion. Control measures are identified according to systems, which are then broken down into subsystems of erosion control techniques or component measures.

For example, a system for control of erosion from construction sites would identify component measures such as debris basins, access roads, hillside ditches, etc. Other conservation control systems include: conservation cropping, conservation irrigation, roadside erosion control, critical area treatment, diversions and ditches, grade stabilization, pasture and range management, runoff and sediment control ponds and basins, stream bank and channel protection, and watershed, wildlife, and recreation land improvement. These control measures are comparable to the USDA Soil-Natural Resources Conservation Services' Resource Management Subsystem approach as referenced in AMBAG's "Water Quality Management Plan for the Monterey Bay Region," dated July 1978, and in ABAG's, "Handbook of Best Management Practices," dated October 1977.

Experience has shown that no one control measure best solves an existing, or prevents a potential, pollution problem - especially in the area of soil erosion and sedimentation. As land use, the land user, and various situations change, so does the need for control measures. Before application, an on-site investigation with the land user is necessary to determine which practice or set of practices will be most effective and acceptable.

2. Erosion control should be implemented in a reasonable manner with as much implementation responsibility remaining with existing local entities and programs as is possible and consistent with water quality goals.
3. The Regional Board and local units of government should establish a clear policy for control of erosion, including consideration of off-site and cumulative impacts and the imposition of performance standards

according to the sensitivity of the area where land is to be disturbed.

4. Effective ordinances and regulatory programs should be adopted by local units of government. Effective programs would allow only land disturbance actions consistent with the waste load capacity of the watershed, require preparation of erosion and sediment control plans with specific contents and with attention to both offsite/on-site impacts, identify performance standards, be at least comparable to the model ordinance in the "Erosion and Sediment Control Handbook," dated May 1978, and have provisions for inspection follow-up, enforcement, and referral.
5. Watersheds with critical erosion and sediment problems should be identified by one or more concerned agencies such as the California Department of Fish and Game, the Regional Board, the local Environmental Health, Planning, or Engineering Departments, the local Flood Control District, or the local Resource Conservation District, and then referred to the remaining agencies by a designated local coordinating agency for determining the scope, nature, and significance of the identified problem. The designated local agency would evaluate the adequacy and appropriateness of the total assessment, including an assessment of the problem and causes, alternatives considered, recommended interim and permanent control measures, and the amount and sources of funding. The evaluation would then be submitted as an Impact Findings Report for consideration and decision by the local governing body.
6. Comprehensive and continuous training should be mandatory for building and grading inspectors, engineers, and planners involved in approving, designing, or inspecting erosion control plans and on-site control measures. The training program would preferably be conducted on an inter-county/agency basis and be administered through a USDA Natural Resources Soil Conservation Service cooperative training arrangement or ~~through seminars~~ through seminars conducted by the USDA Natural Resources Soil Conservation Service and the University of California Cooperative Extension seminars. The Soil Conservation Society of America should be requested to assist in establishing an effective training program, including public education to heighten awareness of the adverse affects of erosion and sediment on soil and water resources.

7. More intensive erosion controls should be considered within four watersheds (Lauro Reservoir and Devereaux Ranch Slough in Santa Barbara County and Pismo Lake and Morro Bay in San Luis Obispo County) with apparent critical erosion and sediment problems. Alternative practices that may be implemented to effect the necessary level of control are assigned a relative priority.

Actions By Other Authorities

1. The federal government should increase its support of erosion and sediment control programs by increasing its technical staff, increasing cost-share funds, increasing the availability of low-interest loans, and changing its income tax laws to encourage the use of Best Management Practices for erosion and sediment control.
2. The State of California should establish an erosion and sediment control program that includes incentives for the individual - such as cost-sharing, changes in State law that would reduce property taxes for enduring erosion and sediment control practices, and incentives through state income taxes.
3. Resource Conservation Districts within the Central Coast Region should develop management agency agreements with the Regional Board agreeing to work jointly with the Regional Board to integrate soil and water resource programs in the application of Best Management Practices to correct existing erosion and sediment problems and to prevent new problems from occurring.
4. Local units of government should improve land use plans to establish a clear policy, and shall adopt or improve ordinances to include definitive performance standards, for the control of erosion and sedimentation, including consistency with this Basin Plan and Best Management Practices. ~~identified under Regional Board "Management Principles."~~
5. Local units of government developing Local Coastal Programs shall establish a clear policy on erosion and sedimentation and adopt an ordinance consistent with Best Management Practices for their land areas within the Coastal Zone.
6. Resource Conservation Districts, the U.S.D.A. Soil Natural Resources Conservation Service, the

California Department of Transportation, and the U.C. Cooperative Extension Service, in conjunction with the cities and counties, should develop and carry out an erosion and sediment control training program for employees who check erosion and sediment control plans and who enforce local ordinances and regulations relating to erosion and sediment control practices.

7. Counties and cities should work with the Regional Board to identify priorities, time schedules, and limitations and to negotiate management agency agreements concerning implementation of Best Management Practices for control of erosion and sedimentation.
8. Review and assessment of erosion and sediment control plans for new land developments in those counties and cities that have signed management agency agreements with the Board will be processed entirely by that county or city.

CONTROL ACTIONS

1. All discharges to the aquatic environment shall be considered temporary unless it is demonstrated that no undesirable change will occur in the natural receiving water quality.
2. The quality of all surface waters of the basin shall be such as to permit unrestricted recreational use.
3. The discharge of pollutants into surface waters shall be discontinued.
4. In implementing BMP's through local units of government, or through State and federal agencies for lands under their control, working relationships, priorities, and time schedules will be defined in management agency agreements between the area wide waste treatment planning agency and the local management agency. Agreements will be reviewed and updated annually to reflect recent achievements, new information and new concerns.
5. Regional Board participation in sediment control programs shall include assistance in the establishment of local control programs, participation in the determination of water quality problems, and a cooperative program evaluation with local units of government. Regional Board enforcement authority will be exercised where local volunteer programs fail to correct sediment problems within a reasonable period.

6. Emergency projects undertaken or approved by a public agency and necessary to prevent or mitigate loss of, or damage to, life, health, property, or essential public services from an unexpected occurrence involving a clear and imminent danger are exempt from this chapter providing such exemption is in the public interest.

7. Regulation of sediment discharges from routine annual non-irrigated agricultural operations, such as tilling, grazing, and land grading and from construction of agricultural buildings is waived except where such activity is causing severe erosion and causing, or threatening to cause, a pollution or nuisance.

8. Regulation of discharges from State and federal lands managed by agencies operating in accordance with approved management agency agreements is waived except where such activity is causing, or threatening to cause, a pollution or nuisance.

9. Erosion from nonpoint pollution sources shall be minimized through implementation of Best Management Practices.

10. All necessary control measures for minimizing erosion and sedimentation, whether structural or vegetal, shall be properly established prior to ~~November~~ October 15 each year.

11. All structural and vegetal measures taken to control erosion and sedimentation shall be properly maintained.

12. A filter strip of appropriate width, and consisting of undisturbed soil and riparian vegetation or its equivalent, shall be maintained, wherever possible, between significant land disturbance activities and watercourses, lakes, bays, estuaries, marshes, and other water bodies. For construction activities, minimum width of the filter strip shall be thirty feet, wherever possible as measured along the ground surface to the highest anticipated water line.

13. Design and maintenance of erosion and sediment control structures, (e.g., debris and settling basins, drainage ditches, culverts, etc.) shall comply with accepted engineering practices.

14. Cover crops shall be established by seeding and/or mulching, or other equally effective measures, for all disturbed areas not otherwise protected from

excessive erosion. The use of native plant species is recommended.

15. Land shall be developed in increments of workable size that can be completed during a single construction season. Graded slope length shall not be excessive and erosion and sediment control measures shall be coordinated with the sequence of grading, development, and construction operations.

Revise the September 8, 1994 Basin Plan, Chapter 4, Page IV-68 through Page IV-69, Section VIII.E.1. LAND DISTURBANCE PROHIBITIONS as follows:

VIII.E.1. LAND DISTURBANCE PROHIBITIONS PROHIBITIONS

The discharge or threatened discharge of soil, silt, bark, slash, sawdust, or other organic and earthen materials into any stream in the basin in violation of best management practices for timber harvesting, construction, and other soil disturbance activities and in quantities deleterious to fish, wildlife, and other beneficial uses is prohibited.

The placing or disposal of soil, silt, bark, slash, sawdust, or other organic and earthen materials from timber harvesting, construction, and other soil disturbance activities at locations above the anticipated high water line of any stream in the basin where they may be washed into said waters by rainfall or runoff in quantities deleterious to fish, wildlife, and other beneficial uses is prohibited.

Soil disturbance activities not exempted pursuant to Regional Board Management Principles in Chapter Five and Control Actions contained in this Chapter Five are prohibited:

1. In geologically unstable areas,
2. On slopes in excess of thirty percent (excluding agricultural activities), and
3. On soils rated a severe erosion hazard by soil specialists (as recognized by the Executive Officer) where water quality may be adversely impacted;

Unless,

- a. In the case of agriculture, operations comply with, a Farm Conservation or Farm Management Plan, approved by a Resource Conservation District or the ~~USDA-Soil Conservation Service~~ Natural Resources Conservation Service;
- b. In the case of construction and land development, an erosion and sediment control plan or its equivalent (e.g., EIR, local ordinance) prescribes best

management practices to minimize erosion during the activity, and the plan is certified or approved, and will be enforced by a local unit of government through persons trained in erosion control techniques; or,

- c. There is no threat to downstream beneficial uses of water, as certified by the Executive Officer of the Regional Board.

4. As specified in Chapter Five (5), Page V-7, Section IV. DISCHARGE PROHIBITIONS.

IX. TOTAL MAXIMUM DAILY LOADS

The goal of setting a Total Maximum Daily Load (TMDL) is to attain state water quality standards for waterbodies identified to be impaired by a pollutant and, therefore, not meeting water quality standards. Development of a TMDL typically involves a quantitative assessment of water quality problems, contributing pollutant sources, and numeric goals that indicate if and when water quality standards are met. The TMDL value specifies the maximum amount of pollutant that can be discharged (or the amount of a pollutant that needs to be reduced) to meet water quality standards. Components of a TMDL include load allocations for nonpoint source and background pollution, waste load allocations for point source pollution, and a margin of safety that accounts for the uncertainty about the relationship between the pollutant loads and the quality of the receiving waterbody. This section includes the TMDLs calculated for the specified waterbody identified to be impaired by a pollutant, the numeric targets set for the waterbody/pollutant combination that serve as indicators of water quality standards, and allocations of pollutant loads among sources contributing the pollutant to the waterbody. Associated with each TMDL is an implementation plan and a monitoring plan. The implementation plan describes how the water quality standards will be achieved for the waterbody/pollutant combination. These implementation plans typically include actions to be taken, requirements to be imposed through regulatory authorities, and a time schedule for actions and requirements to be implemented. The monitoring plans typically include monitoring parameters, collection methods, analysis methods, and sample collection locations. Monitoring data is used to track

implementation efforts and make informed decisions
about water quality conditions and standards.

REVISED CHAPTER 5. PLANS AND POLICIES

CHAPTER 5. PLANS AND POLICIES

In addition to the Implementation Plan, many other plans and policies direct State and Regional Board actions or clarify the Regional Board's intent. The following pages contain brief descriptions of State Board plans and policies and numerous Regional Board plans and policies. ~~Copies of the State and Regional Board policies are contained in the Appendix.~~

Nonpoint Source Pollution Control Program (January 2000)~~Nonpoint Source Management Plan~~

Ocean Plan

Discharges of Municipal Solid Waste Policy

Should any of these policies be amended by the State Board, the Regional Board will implement the amended version.

The following sections summarize the adopted policies. ~~The complete policy is available in the "Attachments" section of this document.~~

I. STATE WATER RESOURCES CONTROL BOARD PLANS AND POLICIES

The State Water Resources Control Board (State Board) has adopted a number of plans and policies for Statewide water quality management including:

State Policy for Water Quality Control (1972)

Anti-degradation Policy

Thermal Plan

Bays and Estuaries Policy

Power Plant Cooling Policy

Reclamation Policy

Shredder Waste Disposal Policy

Underground Storage Tank Pilot Program

Sources of Drinking Water Policy

Revise the September 8, 1994 Basin Plan, Chapter 5, Pages V-3 and V-4, Section I.J. NONPOINT SOURCE MANAGEMENT PLAN as follows:

I.J. NONPOINT SOURCE MANAGEMENT PLAN

Resolution R3-2002-0093: Adopting policy regarding the State Nonpoint Source Pollution Control Program (January 2000).

~~The "Nonpoint Source Management Plan", Resolution 88-123, was adopted by the State Water Resources Control Board on November 15, 1988 pursuant to Section 319 of the Clean Water Act. The Plan identifies nonpoint source control programs and milestones for their accomplishment. It emphasizes cooperation with local governments and other agencies to promote the implementation of Best Management Practices and remedial projects.~~

In November 1988, the State Water Resources Control Board adopted a Nonpoint Source Management Plan that outlined steps to initiate the systematic management of nonpoint sources in California. The Nonpoint Source Management Plan was revised to the "Nonpoint Source Pollution Control Program (January 2000)" in December 1999 (www.swrcb.ca.gov/rwqcb3/). Resolution 99-114, revising the Nonpoint Source Pollution Control Program was adopted by the State Water Resources Control Board on December 14, 1999 pursuant to Section 319 of the Clean Water Act.

The 2000 Nonpoint Source Pollution Control Program is a coordinated statewide approach to managing nonpoint source pollution structured around 61 management measures. Management measures serve as goals for the control and prevention of polluted runoff. Site-specific management practices are used to achieve the goals of each management measure. Implementation of management measures will occur using a fifteen-year strategy with three nested five-year implementation plans. The fifteen-year strategy and each five-year implementation plan use an iterative program process.

Revise the September 8, 1994 Basin Plan,
Chapter 5, Page V-7, Section III.G.
EROSION AND SEDIMENTATION
CONTROL as follows:

III.G. EROSION AND SEDIMENTATION CONTROL

1. General recommendations for erosion control, numbered one through six under "Land Disturbance Activities" in the Implementation Plan, Chapter Four, are considered by the Regional Board to be Best Management Practices (BMP's), as are those BMP's identified in approved areawide Water Quality Management Plans.
2. Local units of government should have the lead role in controlling land use activities that cause erosion and may, as necessary, impose further conditions, restrictions, or limitations on waste disposal and other activities that might degrade the quality of waters of the State.
3. In implementing BMP's through local units of government, or through State and federal agencies for lands under their control, working relationships, priorities, and time schedules will be defined in management agency agreements between the areawide waste treatment planning agency and the local management agency. Agreements will be reviewed and updated annually. They receive achievements, new information, and recommendations.
4. Regional Board participation in sediment control programs shall include assistance in the establishment of local control programs, participation in the determination of water quality problems, and a cooperative program evaluation with local units of government. Regional Board enforcement authority will be exercised where local volunteer programs fail to correct sediment problems within a reasonable period.
5. Emergency projects undertaken or approved by a public agency and necessary to prevent or mitigate loss of, or damage to, life, health, property, or essential public services from an unexpected occurrence involving a clear and imminent danger

are exempt from this chapter providing such exemption is in the public interest.

6. Regulation of sediment discharges from routine annual agricultural operations, such as tilling, grazing, and land grading and from construction of agricultural buildings is waived except where such activity is causing severe erosion and causing, or threatening to cause, a pollution or nuisance.
7. Regulation of discharges from State and federal lands managed by agencies operating in accordance with approved management agency agreements is waived except where such activity is causing, or threatening to cause, a pollution or nuisance.

"Control Actions" and "Actions by Other Authorities" in this chapter and the Implementation Plan, Chapter Four, contain further information regarding erosion and sedimentation control.

CEQA CHECKLIST

CALIFORNIA ENVIRONMENTAL QUALITY ACT
“FUNCTIONAL EQUIVALENT” REPORT FOR BASIN PLAN AMENDMENT

(RESOLUTION NO. R3-2002-0093)

The Central Coast Regional Water Quality Control Board (Regional Board) is proposing an amendment to its Water Quality Control Plan - Central Coastal Basin (Basin Plan). The Basin Plan serves as the cornerstone water quality protection policy for the Central Coast. It identifies beneficial uses of surface and ground waters, establishes water quality objectives to protect beneficial uses, and provides an implementation plan to achieve those objectives.

The Basin Planning process has been certified as “functionally equivalent” to the preparation of the Environmental Impact report (EIR) for the purposes of complying with the California Environmental Quality Act (CEQA) (Section 15251, Title 4, California Code of Regulation ((CCR)). Based on the certification, this Basin Plan Amendment Report is used in lieu of an EIR or a Negative Declaration.

Any Regional Board regulatory program certified as functionally equivalent, however, must satisfy the documentation requirements of Section 377 (a), Title 23, CCR. This report satisfies part (a) of that section. It contains the following:

1. A Description of Proposed Activity and Proposed Alternatives,
2. An Environmental Checklist and a Description of the Proposed Activity,
3. An Environmental Evaluation, and
4. A determination with respect to significant Environmental Impacts.

I. DESCRIPTION OF PROPOSED ACTIVITY

This section describes the changes proposed and alternatives to this proposal. The purpose of this amendment is to:

1. Incorporate the State Water Resources Control Board January 2000 Nonpoint Source Program Strategy and Implementation Plan.
2. Emphasize information and management actions contained in the January 2000 Nonpoint Source Program Strategy and Implementation Plan for the protection and restoration of riparian areas.
3. Restructure sections of the Basin Plan to have appropriate nonpoint source information, requirements, and prohibitions in a designated section of the Basin Plan. The section is titled Control of Nonpoint Source Pollutants.

Alternatives to this proposal include:

1. Require a higher level of nonpoint source protection than identified in the Nonpoint Source Program Strategy and Implementation Plan.

This alternative is not recommended because the Nonpoint Source Program Strategy and Implementation Plan as proposed already requires the highest level of nonpoint source protection feasible.

2. Require a less stringent Nonpoint Source Program Strategy and Implementation Plan.

This alternative is not recommended because it does not protect water quality and associated beneficial uses.

3. Take no action.

This alternative is not recommended because it does not protect water quality and associated beneficial uses.

4. Modify amendment

This alternative is recommended if it does not modify the Nonpoint Source Program Strategy and Implementation Plan. This alternative is recommended only if beneficial uses are protected and water quality objectives are attained.

5. Create additional amendments

The Regional Board may consider additional alternatives, but will limit its action to a logical outgrowth of the proposed amendment. Other alternatives will be subject to public notice and comment at the time those changes are proposed.

CALIFORNIA ENVIRONMENTAL QUALITY ACT REQUIREMENTS

II. EVALUATION OF ENVIRONMENTAL IMPACTS:

	Potentially Significant Impact	Less Than Significant With Mitigation Incorporation	Less Than Significant Impact	No Impact
1. AESTHETICS – Would the project:				
a) Have a substantial adverse effect on a scenic vista?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Substantially damage scenic resources, including, But not limited to, trees, rock outcroppings, and historic buildings with a state scenic highway?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Substantially degrade the existing visual character or quality of the site and its surroundings	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
2. AGRICULTURE RESOURCES: In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. Would the project				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

<p>3. AIR QUALITY -- Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project</p>				
<p>a) Conflict with or obstruct implementation of the applicable air quality plan?</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is not attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>d) Expose sensitive receptors to substantial pollutant concentrations?</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>e) Create objectionable odors affecting a substantial number of people?</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>4. BIOLOGICAL RESOURCES -- Would the project:</p>				
<p>a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

III. ENVIRONMENTAL EVALUATION (of checklist questions answered Potentially Significant Impact, Less than Significant with Mitigation Incorporation, or Less than Significant Impact)

2a and 2c Less than Significant Impact: The Environmental Evaluation associated with this amendment (Regional Board Resolution R3-2002-0093) has less than significant impacts listed for items 2a and 2c, the conversion of prime farmland to non-agricultural use and the conversion of farmland to non-agricultural use respectively. Prime agriculture areas that would be converted are likely to be land that is only marginally sustaining its agricultural value and/or use. Implementation of nonpoint source management on agricultural land would likely result in net benefit by reducing soil and fertilizer loss into the creek. Additionally, Buffer strips (protection of riparian corridor) that would replace agricultural land could possibly provide flood protection to adjacent agricultural land uses, resulting in a net benefit. If necessary, impacts can be mitigated by assessing existing "loss" of agricultural value or land areas due to erosion and sedimentation, and by designing best management practices to compensate for this loss.

IV. DETERMINATION: (To be completed by the Lead Agency)

On the basis of this initial evaluation:

I find the proposed project COULD NOT have a significant effect on the environment.

I find that the proposed project may have a significant adverse impact on the environment. However, there are feasible alternatives and/or feasible mitigation measures available which would substantially lessen any significant adverse impact. These alternatives and mitigation measures are discussed in the attached written report.

I find that the proposed project MAY have a significant effect on the environment. There are no feasible alternatives and/or feasible mitigation measures available which would substantially lessen any significant adverse impacts. See the attached written report for a discussion of this determination.

NOTICE OF PUBLIC HEARING NOTICE OF FILING A DRAFT ENVIRONMENTAL DOCUMENT

**CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL COAST REGION
81 Higuera Street, Ste. 200, San Luis Obispo, CA 93401**

**NOTICE OF PUBLIC HEARING
NOTICE OF FILING A DRAFT ENVIRONMENTAL DOCUMENT**

TO CONSIDER ADOPTION OF REVISED STATE WATER RESOURCES CONTROL BOARD NONPOINT SOURCE POLLUTION CONTROL PROGRAM AND REFORMATTING EXISTING NONPOINT SOURCE PLANS, POLICIES, AND MANAGEMENT PRACTICES - AMENDMENT OF THE CENTRAL COAST BASIN WATER QUALITY CONTROL PLAN (BASIN PLAN) AND REQUESTING APPROVAL FROM STATE WATER RESOURCES CONTROL BOARD

NOTICE IS HEREBY GIVEN that the California Regional Water Quality Control Board, Central Coast Region (Regional Board), will hold a public hearing to hear comments and consider adoption of a resolution amending the Water Quality Control Plan (Basin Plan) for the Central Coast Region. The proposed amendment to the Basin Plan includes:

1. Reference the State Water Resources Control Board January 2000 Nonpoint Source Pollution Control Program.
2. Emphasize information and management actions contained in the January 2000 Nonpoint Source Pollution Control Program for the protection and restoration of riparian areas.
3. Restructure sections of the Basin Plan to have appropriate nonpoint source information, requirements, and prohibitions in a designated section of the Basin Plan. The section is titled Control of Nonpoint Source Pollutants.

Copies of the proposed amendment to the Basin Plan (in the form of a draft amendment for adoption, staff report, and a functionally equivalent document which includes an Environmental Checklist) are available on the Internet at www.swrcb.ca.gov/rwqcb3/. At the website, on the first page you will see a staff report **"PROPOSED AMENDMENT OF "WATER QUALITY CONTROL PLAN - CENTRAL COASTAL BASIN" (BASIN PLAN) REGARDING INCORPORATION OF THE STATE WATER RESOURCES CONTROL BOARD "NONPOINT SOURCE POLLUTION CONTROL PROGRAM" AND RESTRUCTURING THE BASIN PLAN NONPOINT SOURCE INFORMATION, FINDINGS, AND REQUIREMENTS."** The proposed amendments to the Basin Plan are also available by request at the office of the Regional Board. You may also request a mailed copy of these documents by contacting Howard Kolb at 805-549-3332 or hkolb@rb3.swrcb.ca.gov.

Copies of the existing Basin Plan are located at libraries in major cities throughout the region, at the office of the Regional Board, and on the Internet at www.swrcb.ca.gov/rwqcb3/.

Actions to amend the Water Quality Control Plan for Region Three will be taken in accordance with a regulatory program exempt under Section 21080.5 of the Public Resources Code from the requirement to prepare an environmental impact report under the California Environmental Quality Act (Public Resources Code, Section 21000 et seq.) and with other applicable laws and regulations. At the conclusion of the meeting the Regional Board will consider approval of the proposed amendment or a revised amendment consistent with the intent of the amendment. At

the conclusion of the public hearing, the Regional Board will consider certification of the environmental document an approval of the proposed amendments.

The public comment period will occur from **August 8, 2002 through September 23, 2002**. We would appreciate any comments, preferably in writing, or other evidence sent in advance to Howard Kolb at the address listed above. Your timely submittal will allow staff to analyze your comments and the Regional Board to consider your comments before taking final action at the meeting to be held on December 6, 2002. Please note that all exhibits, charts, graphs, and other testimony presented, as evidence must be left with the Regional Board as part of the administrative record.

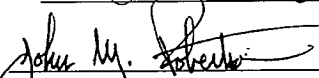

Time limits may be imposed on oral presentations at the hearing. Additional or alternative rules or regulations consistent with the general purpose of the amendment and complementary to the specific proposed rules may be developed at the hearing as a logical outgrowth of this hearing.

The public hearing is scheduled as follows:

Date: December 6, 2002
Time: 8:30 A.M.
Place: Conference Room
Regional Water Quality Control Board
895 Aerovista Place, SUITE 101
San Luis Obispo, CA 93401-5427

The location of the hearing is described on the attached map and is accessible to persons with disabilities. Individuals who require special accommodations are requested to contact **Cyndee Jones** at **805-549-3372** at least 5 working days prior to December 6, 2002. TTY users may contact the California Relay Service at 1-800-735-2929 or voice line at 1-800-735-2922.

For additional information on this Basin Plan review, please call Howard Kolb at 805-549-3332 or hkolb@rb3-swrcb.ca.gov.

SUBJECT: NOTICE OF FILING SUBMITTED IN COMPLIANCE WITH §21080.5
OF THE PUBLIC RESOURCES CODE

PROPONENT: California Regional Water Quality Control Board, Central Coast Region

PROJECT TITLE: Proposed Amendment of "Water Quality Control Plan - Central Coast Region" (Basin Plan) Regarding Incorporation of the State Water Resources Control Board "Nonpoint Source Pollution Control Program" and Restructuring the Basin Plan Nonpoint Source Information, Findings, and Requirements.

CONTACT: Howard Kolb at 805-549-3332 or hkolb@rb3.swrcb.ca.gov.

LOCATION: Central Coast Region

DESCRIPTION: The Central Coast Regional Water Quality Control Board (Regional Board) is proposing an amendment to its Water Quality Control Plan - Central Coastal Basin (Basin Plan). The Basin Plan serves as the cornerstone water quality protection policy for the Central Coast. It identifies beneficial uses of surface and ground waters, establishes water quality objectives to protect beneficial uses, and provides an implementation plan to achieve those objectives.

A draft copy of the proposed amendments is enclosed for your review. The purpose of this amendment is to:

1. Reference the State Water Resources Control Board January 2000 Nonpoint Source Pollution Control Program.
2. Emphasize information and management actions contained in the January 2000 Nonpoint Source Pollution Control Program for the protection and restoration of riparian areas.
3. Restructure sections of the Basin Plan to have appropriate nonpoint source information, requirements, and prohibitions in a designated section of the Basin Plan. The section is titled Control of Nonpoint Source Pollutants.

The Regional Board will hold a hearing to identify and prioritize water quality issues. The public hearing is scheduled as follows:

SUBJECT: WATER QUALITY CONTROL PLAN AMENDMENT REFERENCING THE STATE WATER RESOURCES CONTROL BOARD'S "NONPOINT SOURCE POLLUTION CONTROL PROGRAM" AND RESTRUCTURING THE BASIN PLAN NONPOINT SOURCE (NPS) INFORMATION, FINDINGS, AND REQUIREMENTS (NPS BASIN PLAN AMENDMENT)

2003 JUL -9 AM 10:55
81 HIGUERA STE. 200
SAN LUIS OBISPO, CA 93401
CENTRAL COAST REGIONAL
WATER QUALITY CONTROL BOARD

This memorandum confirms an agreement made during a June 16, 2003 teleconference between staffs of the State Water Resources Control Board (State Board) and Central Coast Regional Water Quality Control Board (Regional Board) regarding the NPS Basin Plan Amendment. Based on our telephone conversation, Brad Hagemann of your staff requested that State Board staff return the administrative record for this amendment.

On December 13, 2002, the Central Coast Regional Board (Regional Board) adopted a Water Quality Control Plan (Basin Plan) amendment (R3-2002-093) referencing the State Board's "Nonpoint Source (NPS) Pollution Control Program" and restructuring the basin plan's nonpoint source information, findings, and requirements. Since the receipt of the Regional Board's administrative record by State Board staff on April 9, 2003, State Board staff has been working with NPS program and Regional Board staff on possible conflicts and inconsistencies between the NPS Basin Plan Amendment and the pending *Nonpoint Source Program Implementation Policy* (Policy). The Policy, required under California Water Code section 13369(a)(2)(B), is designed to assist in the consistent statewide implementation and enforcement of the State's NPS Pollution Control Program.

This action is being taken to ensure that the Regional Board's basin plan amendment will be up to date and consistent with the new Policy. We expect the State Board to adopt the Policy in September 2003. After adoption, State Board NPS and Basin Planning staff will work closely with your staff to expedite the processing of the Regional Board's NPS Basin Plan Amendment.

Roger Briggs

SUBJECT: PROPOSED AMENDMENT OF "WATER QUALITY CONTROL PLAN - CENTRAL COASTAL BASIN" (BASIN PLAN) REGARDING INCORPORATION OF THE STATE WATER RESOURCES CONTROL BOARD "NONPOINT SOURCE PROGRAM STRATEGY AND IMPLEMENTATION PLAN" AND RESTRUCTURING THE BASIN PLAN NONPOINT SOURCE INFORMATION, FINDINGS, AND REQUIREMENTS

The Central Coast Regional Board held a Public Hearing on December 13, 2002. We are forwarding documents generated as a result of this process.

Enclosed is a summary of the necessity for the regulatory provisions and an administrative record. The administrative record includes all documents generated and relied on during the preparation of this amendment. If you have any questions, please contact Howard Kolb at 805-549-3332.

Task: 401-01
File: Basin Plan

SUMMARY OF THE NECESSITY FOR THE REGULATORY PROVISIONS

REGIONAL WATER QUALITY CONTROL BOARD RESOLUTION NO. R3-2002-0093

ADOPTING AMENDMENTS TO THE WATER QUALITY CONTROL PLAN AND REQUESTING APPROVAL FROM THE STATE WATER RESOURCES CONTROL BOARD

AUTHORITY AND REFERENCE

Water Code Section 1300 declares that activities and factors that may affect the quality of the waters of the state shall be regulated to attain the highest water quality reasonable.

Water Code Section 13240 mandates each Regional Water Quality Control Board (Regional Board) to formulate water quality control plans for all areas within the region and to review the plans periodically. Section 13240 also authorizes Regional Water Boards to revise the plans. A water quality control plan or a revision of a plan becomes effective upon approval by the State Water Resources Control Board (State Board) (Water Code Section 13245).

Water Code Section 13050(j) provides that a water quality control plan consists of a designation or establishment for the waters within a specifies area of all of the following:

- (1) Beneficial uses to be protected.
- (2) Water quality objectives.
- (3) A program of implementation needed for achieving water quality objectives.

Each Regional Board must establish water quality objectives in each water quality control plan that will ensure the reasonable protection of beneficial uses and the prevention of nuisance (Water Code Section 13241). Additionally, the Regional Board, in a water quality control plan, may specify certain conditions or areas where the discharge of waste, or certain types of waste will be prohibited (Water Code Section 13243).

NECESSITY FOR REGULATORY PROVISIONS

Resolution No. R3-2002-0093 supplements past regulatory actions. The following describes the reasons that these supplements are necessary.

In November 1988, the State Water Resources Control Board adopted a Nonpoint Source Management Plan that outlined steps to initiate the systematic management of nonpoint sources in California. The Nonpoint Source Management Plan was revised to the Nonpoint Source Pollution Control Program (January 2000) in December 1999. Resolution 99-114, revising the Nonpoint Source Pollution Control Program, was adopted by the State Water Resources Control Board on December 14, 1999 pursuant to Section 319 of the Clean Water Act.

Resolution No. 99-114 directs regional boards to implement the state Nonpoint Source Pollution Control Program. The Water Quality Control Plan for the Regional Water Quality Control Board, Central Coast Region includes the state November 1988, Nonpoint Source Management Plan. This amendment updates the Basin Plan to comply with Resolution No. 99-114.

CHAPTER 4. IMPLEMENTATION PLAN

A program of implementation to protect beneficial uses and to achieve water quality objectives is an integral component of this Basin Plan. The program of implementation is required to include, but is not limited to:

- A description of the nature of actions which are necessary to achieve the objectives, including recommendations for appropriate action by any entity, public or private.
- A time schedule for the actions to be taken.
- A description of surveillance to be undertaken to determine compliance with objectives.

Additional surveillance activities to determine compliance with objectives are described in Chapter 6, "Surveillance and Monitoring".

This chapter includes discussions of:

- Regional Water Quality Control Board Goals;
- General Control Actions and Related Issues;
- Waste Discharge Regulation;
- Hazardous Waste Compliance Issues; and
- Nonpoint Source Measures.

Detailed descriptions of waterbodies with their specific water quality problems and recommended control actions are included in the Region's Water Quality Assessment database and Fact Sheets.

This chapter is organized in the following manner:

- I. Regional Water Quality Control Board Goals
- II. General Control Actions and Related Issues
- III. Control Actions under State Board Authority
- IV. Control Actions to be Implemented by Other Agencies with Water Quality or Related Authority
- V. Control Actions under Regional Board Authority
 - A. Waste Discharge Restrictions
 1. Water Quality Certification
 2. National Pollutant Discharge Elimination System

3. Waste Discharge Requirements
4. Waivers
5. Prohibitions and Prohibition Exemptions
6. Enforcement Actions
7. Best Management Practices
8. Compliance Schedules
- B. Nonpoint Source Program
- VI. Waste Discharge Program Implementation
 - A. Effluent Limits
 1. Stream Disposal
 2. Estuarine Disposal
 3. Ocean Disposal
 4. Land Disposal
 5. Reclamation and Reuse
 6. Pretreatment Programs
 7. Sludge Treatment
 - B. Municipal Wastewater Management Plans (arranged by hydrologic subarea)
 - C. Industrial Wastewater Management
 - D. Solid Waste Management
 - E. Storm Water Management
 - F. Bay Protection and Toxic Cleanup Program
 - G. Military Installations
 - H. Spills, Leaks, Investigations, and Cleanup Program
 - I. Underground Tank Storage Tank Program
 - J. Aboveground Petroleum Storage Tanks
California Code of Regulations, Title 23, Chapter 15
 1. Solid and Liquid Waste Requirements (Landfills and Surface Impoundments)
 2. Wastewater Sludge (Septage Management)
 3. Mining Activities (Nonfuel Commodities)
 4. Other Industrial Activities
 - L. Resource Conservation and Recovery Act (Subtitle D)
 - M. Solid Waste Water Quality Assessment Test
- VII. Hazardous Waste Compliance Issues
 - A. Reportable Quantities of Hazardous Waste and Sewage Discharges
 - B. Proposition 65
- VIII. Nonpoint Source Measures
 - A. Coastal Zone Act Reauthorization Amendments
 - B. Urban Runoff Management
 - C. Agricultural Water and Wastewater Management
 - D. Individual, Alternative, and Community Disposal Systems
 - E. Land Disturbance Activities

CENTRAL COAST REGIONAL
WATER QUALITY CONTROL BOARD

September 8, 1994

IV-1

000001

I. REGIONAL WATER QUALITY CONTROL BOARD GOALS

To insure that the water resources of the Central Coastal Basin are preserved for future generations of Californians, the California Regional Water Quality Control Board, Central Coast Region, determined it was desirable to establish certain planning goals. These goals pertain to utilization of the basin's water resources and guidelines for control of waste discharges, as follows:

1. Protect and enhance all basin waters, surface and underground, fresh and saline, for present and anticipated beneficial uses, including aquatic environmental values.
2. The quality of all surface waters shall allow unrestricted recreational use.
3. Manage municipal and industrial wastewater disposal as part of an integrated system of fresh water supplies to achieve maximum benefit of fresh water resources for present and future beneficial uses and to achieve harmony with the natural environment.
4. Achieve maximum effective use of fresh waters through reclamation and recycling.
5. Continually improve waste treatment systems and processes to assure consistent high quality effluent based on best economically achievable technology.
6. Reduce and prevent accelerated (man-caused) erosion to the level necessary to restore and protect beneficial uses of receiving waters now significantly impaired or threatened with impairment by sediment.

II. GENERAL CONTROL ACTIONS AND RELATED ISSUES

The Regional Water Quality Control Board (Regional Board) regulates the sources of water quality related problems which could result in actual or potential impairment or degradation of beneficial uses or degradations of water quality. The Regional Board regulates both point and nonpoint source discharge activities. A point source discharge generally originates from a single identifiable source, while a nonpoint source discharge comes from diffuse sources. To regulate the point and nonpoint sources, control actions are required for effective water quality protection and management. Such control actions are set forth for implementation by the State Water Resources Control Board (State Board), by other agencies with water quality or related authority, and by the Regional Board.

III. CONTROL ACTIONS UNDER STATE WATER RESOURCES CONTROL BOARD AUTHORITY

The State Board has adopted several water quality plans and policies which complement or may supersede portions of the Water Quality Control Plan. These plans and policies may include specific control measures. See Chapter Five, "Plans and Policies" for summaries of the most significant State Board plans and policies which do affect the Central Coast Region.

IV. CONTROL ACTIONS TO BE IMPLEMENTED BY OTHER AGENCIES WITH WATER QUALITY OR RELATED AUTHORITY

Water quality Management Plans prepared under Section 208 of the federal Water Pollution Control Act (Clean Water Act) have been prepared by various public agencies. These Section 208 plans, as well as other plans adopted by federal, State, and local agencies, may affect the Regional Board's water quality management and control activities. A summary of relevant water quality management plans is included in Chapter Five, "Plans and Policies".

V. CONTROL ACTIONS UNDER REGIONAL BOARD AUTHORITY

Control measures implemented by the Regional Board must provide for the attainment of this Basin Plan's beneficial uses and water quality objectives. These uses and objectives can be found in Chapters Two and Three, respectively. In addition the control measures must be consistent with State Board and Regional Board plans, policies, agreements, prohibitions, guidance, and other restrictions and requirements contained within this document.

To prevent water quality problems, waste discharge restrictions are often used. The waste discharge restrictions can be implemented through Water Quality Certification, National Pollutant Discharge Elimination System (NPDES) permits, waste discharge requirements/permits (WDRs), discharge prohibitions, enforcement actions, and/or "Best Management Practices".

V.A. WASTE DISCHARGE RESTRICTIONS

V.A.1. WATER QUALITY CERTIFICATION

Clean Water Act Section 401 Water Quality Certification gives the State extremely broad authority to review proposed federal activities in and/or affecting the Region's waters. The Regional Board can recommend to the State Board that it grant, deny, or condition certification of federal permits or licenses that may result in a discharge to "waters of the United States".

V.A.2. NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES)

NPDES permits are issued to regulate discharges of waste from point sources to "waters of the United States" including discharges of storm waters from urban separate storm sewer systems and certain categories of industrial activity. Waters of the United States are surface waters such as rivers, intermittent streams, dry stream beds, lakes, bays, estuaries, oceans, etc. The permits are authorized by Section 402 of the Clean Water Act and Section 13370 of the California Porter-Cologne Water Quality Control Act. The permit content and the issuance process are contained in 40 Code of Federal Regulations Part 122 and Chapter 9 of the California Code of Regulations. Regional Water Boards are authorized to take a variety of enforcement actions to obtain compliance with an NPDES permit. Enforcement actions the Regional Board may take are described below.

The U.S. Environmental Protection Agency (U.S. EPA) has approved the State's program to regulate discharges of waste water from point sources to "waters of the United States". The State, through the Regional Water Boards, issues the NPDES permits, reviews discharger self-monitoring reports,

performs independent compliance checking, and takes enforcement actions as needed.

NPDES permits are required to prescribe conditions of discharge which will ensure protection of beneficial uses of the receiving water. The Regional Board uses this Basin Plan, The Ocean Plan, and water quality control policies adopted by the State Board to develop permits for specific types of discharges or uses of waste water.

In addition to regulating discharges of waste water to surface waters, NPDES permits also require municipal sewage treatment systems to conduct pretreatment programs if their design capacity is greater than five million gallons per day. Smaller municipal treatment systems may be required to conduct pretreatment programs if there are significant industrial users of their systems. The pretreatment programs must comply with 40 Code of Federal Regulations Part 403. The pretreatment program is further described under separate heading in the "Waste Discharge Regulation" Section further in this chapter.

V.A.3. WASTE DISCHARGE REQUIREMENTS (WDRs)

The California Porter-Cologne Water Quality Control Act authorizes Regional Boards to regulate discharges to protect ground and surface water quality. Regional Boards issue WDRs in accordance with Section 13263 of the California Porter-Cologne Water Quality Control Act. Regional Boards are required to review WDRs periodically based on the complexity and threat to water quality. WDRs seek to protect the beneficial uses of ground and surface water. Regional Boards issue WDRs, review self-monitoring reports submitted by the discharger, perform independent compliance checking, and take necessary enforcement action. The California Porter-Cologne Water Quality Control Act authorizes Regional Boards to issue enforcement actions (see below) ranging from orders requiring relatively simple corrective action to monetary penalties in order to obtain compliance with WDRs.

V.A.4. WAIVERS

Regional Boards may waive issuance of WDRs pursuant to California Porter-Cologne Water Quality Control Act Section 13269 if the Regional Board determines that such waiver is in the public interest. The requirement to submit a Report of Waste Discharge can also be waived. WDRs can be waived for a specific discharge or types of discharges. A waiver of WDRs is conditional and may be terminated at any time by the Regional Board. Regional Boards may delegate their power to waive WDRs to the Regional Board Executive Officer in accordance with policies adopted by the Regional Board and approved by the State Board. The Regional Board's general policy regarding waivers is described in Chapter Five, "Plans and Policies". Regional Boards may not waive NPDES permits.

V.A.5. PROHIBITIONS AND PROHIBITION EXEMPTIONS

The Regional Board can prohibit specific types of discharges to certain areas (California Porter-Cologne Water Quality Control Act Section 13243). These discharge prohibitions may be revised, rescinded, or adopted as necessary. Discharge prohibitions are described in pertinent sections of Chapter Four, "Implementation Plan" and Chapter Five, "Plans and Policies" in the Regional Board Discharge Prohibition Section. Prohibitions can be found by referring to the Table of Contents.

V.A.6. ENFORCEMENT ACTIONS

To facilitate water quality problem remediation or Basin Plan violation remediation, the Regional Board can use different types of enforcement measures. These measures can include:

Notice of Violation

A Notice of Violation is a letter formally advising the discharger that the facility is in noncompliance and

that additional enforcement actions may be necessary, if appropriate actions are not taken.

Time Schedule

A Time Schedule (California Porter-Cologne Water Quality Control Act Section 13300) is a time schedule for specific actions a discharger shall take to correct or prevent violations of requirements. A Time Schedule is issued by the Regional Board for situations in which the Regional Board is reasonably confident that the problem will be corrected.

Cleanup or Abatement Order

A Cleanup or Abatement Order (California Porter-Cologne Water Quality Control Act Section 13304) is an order requiring a discharger to clean up a waste or abate its effects or, in the case of a threatened pollution or nuisance, take other necessary remedial action. A Cleanup or Abatement Order can be issued by the Regional Board or by the Regional Board Executive Officer. Cleanup or Abatement Orders are issued for situations when action is needed to correct a problem caused by regulated or unregulated discharges which are creating or threatening to create a condition of pollution or nuisance. A Cleanup or Abatement Order is also used by the Regional Board to establish the acceptable level of cleanup.

Cease and Desist Order

A Cease and Desist Order (California Porter-Cologne Water Quality Control Act Section 13301) is an order requiring a discharger to comply with Waste Discharge Requirements or prohibitions according to a time schedule. If the violation is threatening water quality, a Cease and Desist Order can be used to require appropriate remedial or preventative action. A Cease and Desist Order is issued by the Regional Board when violations of requirements or prohibitions are threatened, are occurring, or have occurred and probably will continue in the future. Issuance of a Cease and Desist Order requires a public hearing.

Administrative Civil Liabilities

Administrative Civil Liabilities (monetary liabilities or fines) may also be imposed administratively by the Regional Board after a public hearing.

State Attorney General Referral

State Attorney General referral is used under certain circumstances. Enforcement actions may be referred to either the General or District Attorney.

V.A.7. BEST MANAGEMENT PRACTICES

Property owners, managers, or other dischargers may implement "Best Management Practices" to protect water quality. (Implementation and enforcement of Best Management Practices are discussed below under the "Nonpoint Source Measures" section of this chapter). The term "Best Management Practices" is used in reference to control measures for nonpoint source water pollutants and is analogous to the terms "Best Available Technology/Best Control Technology" used for control of point source pollutants. The U.S. EPA (40 Code of Federal Regulations Section 103.2[m]) defines Best Management Practices as follows:

"Methods, measures, or practices selected by an agency to meet its nonpoint source control needs. Best Management Practices include, but are not limited to structural and nonstructural controls and operation and maintenance procedures. Best Management Practices can be applied before, during, and after pollution producing activities to reduce or eliminate the introduction of pollutants into receiving waters."

U.S. EPA regulations (40 Code of Federal Regulations Section 103.6[b][4][i]) provide that Basin Plans:

"...shall describe the regulatory and nonregulatory programs, activities, and Best Management Practices which the agency has selected as the means to control nonpoint source pollution where necessary to protect or achieve approved water uses. Economic, institutional, and technical factors shall be considered in a continuing process of identifying control needs and evaluating and modifying the Best Management Practices as necessary to achieve water quality goals."

September 8, 1994

IV-5

000005

Best Management Practices fall into two general categories:

1. Source controls which prevent a discharge or threatened discharge.

These may include measures such as recycling of used motor oil, fencing stream banks to prevent livestock entry, fertilizer management, street cleaning, revegetation and other erosion controls, and limits on total impervious surface coverage. Because the effectiveness of Best Management Practices is often uncertain, source control is generally preferable to treatment. It is also often less expensive.

2. Treatment controls which remove pollutants from a discharge before it reaches surface or ground waters.

Examples include infiltration facilities, oil/water separators, and constructed wetlands.

Several important points about Best Management Practices must be emphasized;

- Best Management Practices are not officially considered "best" practices for use in California unless they have been certified by the State Board.
- The use of Best Management Practices does not necessarily ensure compliance with effluent limitations or with receiving water objectives. Because nonpoint source control has been a priority only since the 1970's, the long-term effectiveness of some Best Management Practices has not yet been documented. Some source control Best Management Practices (e.g., waste motor oil recycling) may be 100 percent effective if implemented properly. Monitoring and evaluation of Best Management Practice effectiveness is an important part of nonpoint source control programs.
- The selection of individual Best Management Practices must take into account specific site conditions (e.g., depth to ground water, quality of runoff, infiltration rates). Not all Best Management Practices are applicable at every location. High ground water levels may preclude the use of runoff infiltration facilities, while steep slopes may limit the use of wet ponds.

- To be effective, most Best Management Practices must be implemented on a long term basis. Structural Best Management Practices (e.g., wet ponds and infiltration trenches) require periodic maintenance, and may eventually require replacement.
- The "state-of-the-art" for Best Management Practices design and implementation is expected to change over time. The State planning process will include periodic review and update of Best Management Practices certifications.

General information on recommended nonpoint source management practices is provided under different water quality problem categories throughout this chapter. For detailed information on the design, implementation, and effectiveness of specific Best Management Practices, the reader should consult the appropriate Best Management Practices Handbook for the project type or location.

V.A.8. COMPLIANCE SCHEDULES

The California Porter-Cologne Water Quality Control Act (Section 13242[b]) requires a Basin Plan's implementation program for achieving water quality objectives to include a "time schedule for the actions to be taken". Regional Board prohibitions are effective upon adoption, unless specifically mentioned otherwise. The Regional Board issues discharge permits. Each includes an effective date. (Often compliance is effective upon Regional Board adoption). Waste discharge permits for construction projects generally require implementation of Best Management Practices during and immediately after construction. Long-term maintenance of permanent Best Management Practices is expected. Regional Board enforcement orders for specific problems also generally include compliance schedules.

The 1975 Basin Plans included recommendations that specific studies be carried out by specific dates on community wastewater collection and treatment facilities needs in certain areas of the Central Coast Region. These plans also recommended that some communities construct specific facilities by the given dates. Most of these schedules were not met. Because expected year-to-year changes in availability of and priorities for funding will ensure that long term schedules are unrealistic, this Basin Plan does

not include such recommendations. Priorities are set on a short term basis for studies through the State Board's use of the Clean Water Strategy ranking system various grant programs, and for facilities construction through the State Board Division of Clean Water Programs needs assessment process for loans and grants. Once funding is allocated, completion schedules are set through the contract process.

V.B. NONPOINT SOURCE PROGRAM

Nonpoint source pollution has been identified as a major cause of water pollution throughout the United States, and the California Central Coast Region is no exception. Nonpoint sources of water pollution are generally defined as sources which are diffuse (spread out over a large area). These sources are not as easily regulated or controlled as are point sources. Nonpoint source pollution is caused by land use activities or anthropomorphic activities. Deposition of pollutants may occur in lakes, rivers, wetlands, coastal waters, or ground waters.

In order to address the nonpoint source pollution problem nationwide, the U.S. Congress incorporated Section 319 into the 1987 amendments to the Clean Water Act. By amending the Clean Water Act, Congress shifted the federal emphasis from nonpoint source pollution planning and problem identification to a new nonpoint source action program. Section 319 of the federal Clean Water Act required each state to develop a State Nonpoint Source Management Program describing the measures the State would take to address nonpoint sources of pollution. In November 1988, the State Water Resources Control Board adopted a Nonpoint Source Management Plan which outlined steps to initiate the systematic management of nonpoint sources in California. For effective management of nonpoint sources the Management Plan required:

- An explicit long-term commitment by the State Board and Regional Boards;
- More effective coordination of existing State Board and Regional Board nonpoint source related programs;

September 8, 1994

- Greater use of Regional Board regulatory authority coupled with nonregulatory Regional Board programs;
- Stronger links between the local, State, and federal agencies which have authority to manage nonpoint sources; and
- Development of new funding sources.

The 1988 State Board Nonpoint Source Management Plan advocates three approaches for addressing nonpoint source management:

1. Voluntary implementation of Best Management Practices

Property owners or managers may volunteer to implement Best Management Practices. Implementation could occur for economic reasons and/or through awareness of environmental benefits.

2. Enforcement of Best Management Practices

Although the California Porter-Cologne Water Quality Control Act constrains Regional Boards from specifying the manner of compliance with water quality standards, there are two ways in which Regional Boards can use their regulatory authorities to encourage implementation of Best Management Practices.

First, the Regional Board may encourage Best Management Practices by waiving adoption of waste discharge requirements on condition that discharges comply with Best Management Practices. Alternatively, the Regional Board may enforce Best Management Practices indirectly by entering into management agency agreements with other agencies which have the authority to enforce Best Management Practices.

The Regional Board will generally refrain from imposing effluent requirements on discharges that are implementing Best Management Practices in accordance with a waiver of waste discharge requirements, and approved Management Agency Agreements, or other State or Regional Board formal action.

3. Adoption of Effluent Limitations

The Regional Board can adopt and enforce requirements on the nature of any proposed or existing waste discharge, including discharges from

IV-7

000007

nonpoint sources. Although the Regional Board is precluded from specifying the manner of compliance with waste discharge limitations, in appropriate cases, limitations may be set at a level which, in practice, requires implementation of Best Management Practices.

Not all of the categories of nonpoint source pollution follow this three-tiered approach. For example, silviculture activities on non-federal lands are administered by the California Department of Forestry. The State Board has entered into a Management Agency Agreement with California Department of Forestry which allows the Regional Boards to review and inspect timber harvest plans and operations for implementation of Best Management Practices for protection of water quality.

The Regional Board approach to addressing or regulating categories of nonpoint source pollution is discussed in various sections throughout this chapter.

VI. WASTE DISCHARGE PROGRAM IMPLEMENTATION

Water Quality Control Plans to regulate wasteloads in the Central Coastal Basin have been developed to insure protection of beneficial uses of water described in Chapter Two, as well as water quality objectives described in Chapter Three.

VI.A. EFFLUENT LIMITS

Effluent limitations for disposal of wastes are based on water quality objectives for the area of effluent disposal and applicable State and federal policies and effluent limits. Water quality objectives and policies are based on beneficial uses established for receiving waters. Decisions in treatment process selection are discussed for four general disposal modes

considered: stream disposal; estuarine disposal; ocean disposal; and land disposal. There is no discussion provided for disposal to lakes or confined sloughs since these water bodies are protected by discharge prohibitions. Separate discussions of treatment for wastewater reclamation and reuse and sludge processing and disposal are also provided.

Management Principles and Regional Board Policies contained in Chapter Five should be reviewed for further information concerning discharge to surface waters.

VI.A.1. STREAM DISPOSAL

Most streams in the Central Coastal Basin are ephemeral in character. During summer months, there is little or no flow in stream channels. In several instances, flow during the dry season is composed of irrigation runoff or, in a very few cases, wastewater treatment plant effluent. Usually, these flows infiltrate into the stream bed a short distance downstream of discharges. In such instances, the concept of receiving water assimilative capacity has little meaning. Disposal of wastewater in ephemeral streams must be accomplished in a manner that safeguards public health and prevents nuisance conditions. Where possible, discharges should be beneficial as stream flow augmentation. When recharge of a useful ground water basin occurs through stream channel recharge, impacts on ground water quality must be considered.

There are a few streams in the basin which flow on a year-round basis and support an inland fishery. Disposal of wastewater to such streams requires that essentially all oxygen demanding substances and toxicity be removed.

Principal factors governing treatment process selection for stream disposal are federal effluent limits, State public health regulations, and water quality requirements for beneficial use protection. As a minimum, secondary treatment, as defined by the Environmental Protection Agency (EPA), is required in all cases. Where rapid percolation occurs, conventional secondary treatment is currently adequate. EPA guidelines for best practicable treatment would also apply in these cases. Where water contact recreational use is to be protected, the

California Department of Health Services (DOHS) recommends coagulation, filtration, and disinfection providing a median coliform MPN of 2.2/100 ml. Detoxification is required where fishery protection is a concern. Detoxification would include effluent limits for identified toxicants, pursuant to Section 307 of the federal Water Pollution Control Act. Source control of specific toxicants may be necessary to comply with the Act.

VI.A.2. ESTUARINE DISPOSAL

Water quality objectives applying to estuaries are contained in Chapter Three.

Receiving waters considered estuaries are one of two groups: (1) shallow waters of an open bay, and (2) confined tidal estuaries or lagoons. Flushing action is usually present in a shallow open bay and natural dispersion and dilution is available on a limited scale. In confined waters, flushing action is limited or nonexistent except during high stream inflow or storms. Since these shorelines frequently are heavily developed and waters are extensively used, requirements for wastewater disposal into such areas are the most stringent of any for marine receiving waters. The "Water Quality Control Policy for Enclosed Bays and Estuaries of California," adopted by the State Water Resources Control Board, prohibits discharge of waste to most enclosed bays and estuaries in the State, unless the discharge will enhance water quality.

Water quality objectives in Chapter Three prevent discharges that could raise natural nutrient levels to an extent that nuisance algal blooms or other aquatic growths occur. Excessive eutrophication in coastal estuaries of California often is characterized by floating and stranded mats of green marine seaweeds Enteromorpha and Ulva. These algae generally grow on mud or other substrates in estuarine water and can produce nuisance conditions along shorelines. These algae have a high sulfur content and emit foul smelling hydrogen sulfide and mercaptans during decomposition. Caution should be given in determining control measures for estuaries, as many of the seasonal algal growths that occur on mud flats are natural and may not be significantly affected by waste discharges in the watershed. Where eutrophication problems are apparent, secondary treatment with denitrification,

or phosphorus removal and disinfection should be provided prior to discharge.

VI.A.3. OCEAN DISPOSAL

Water quality objectives applicable to ocean waters are contained in Chapter Three.

Federal guidelines for secondary treatment apply to ocean discharges. The State Water Resources Control Board's Water Quality Control Plan for Ocean Waters of California (Ocean Plan) establishes effluent limits achievable by alternative processes, such as advanced primary treatment. The Ocean Plan contains water quality objectives, requirements for effluent quality and management of waste discharges, and discharge prohibitions (including Areas of Special Biological Significance). Effluent quality requirements establish limitations for grease and oil, solids, turbidity, pH, and toxicity. Limits are also established for heavy metals, chlorine residual, various chlorinated pesticides, PCBs, toxaphene and radioactivity outside the zone of initial dilution.

For municipal discharges, the Clean Water Act allows waiver of secondary treatment standards on a case-by-case basis. Secondary treatment waivers are further discussed as they apply to specific discharges in the following section on Municipal Wastewater Management. If full secondary treatment is required but funding is inadequate, treatment levels should be achieved through staged construction. Ocean Plan objectives can be achieved as an interim measure. Secondary treatment must be added later if a waiver is not issued, or if receiving water monitoring indicates additional treatment is necessary to protect ocean waters. Industrial wastewater management is discussed later in this chapter.

VI.A.4. LAND DISPOSAL

To protect ground water resources, the Regional Board allows few waste discharges to land. Those that are permitted are closely regulated under existing laws and regulations to maintain and to protect ground water quality and beneficial uses.

Disposal of waste to land in the Central Coast Region is regulated by California Code of Regulations, Title 23, Chapter 15; the federal Resource Conservation and Recovery Act; the Toxic Pits Cleanup Act; the Porter-Cologne Water Quality Control Act; and State Health Department Regulations. Types of land disposal operations being regulated by the Central Coast Region include landfills, surface impoundments, septage and sludge disposal, mining operations, confined animal facilities, and some oil field exploration and production facilities.

California Code of Regulations, Title 23, Chapter 15

All land disposal operations are regulated by Chapter 15. Formerly called Subchapter 15, this is the most significant regulation used by the Regional Board in regulating hazardous and nonhazardous waste treatment, storage, and disposal. These regulations include very specific siting, construction, monitoring, and closure requirements for all existing and new waste treatment, storage, and disposal facilities. Chapter 15 requires operators to provide assurances of financial responsibility for initiating and completing corrective action for all known or reasonably foreseeable releases from waste management units. Detailed technical criteria are provided for establishing water quality protection programs, and corrective action programs are mandated for releases from waste management units.

Resource Conservation and Recovery Act

The State implements Resource Conservation and Recovery Act's Subtitle C (Hazardous Waste Regulations for Treatment, Storage, and Disposal) through the Department of Toxic Substances Control and the Regional Boards. In August 1992, the U.S. EPA formally delegated the Act program implementation authority to Department of Toxic Substances Control. As described above, regulation of hazardous waste discharges is also included in California Code of Regulations, Title 23, Chapter 15. (Chapter 15 monitoring requirements were also amended in August 1991 so as to be equivalent to Act requirements). These will be implemented through the adoption of Waste Discharge Requirements for hazardous waste sites covered by the Act. The discharge requirements will then become part of a State Resource Conservation and

Recovery Act permit issued by Department of Toxic Substances Control.

Federal regulations required by Resource Conservation and Recovery Act Subtitle D have been adopted for Municipal Solid Waste landfills (40 Code of Federal Regulations Parts 257 & 258). The California Integrated Waste Management Board is the State lead agency for Subtitle D implementation. The State Board and the California Integrated Waste Management Board received U.S. EPA State program approval. Delegation of authority for the State Board to implement Subtitle I (Underground Storage Tanks) will occur after U.S. EPA approval of the State's program application. (The Underground Storage Tank Section is discussed later in this chapter).

Toxic Pits Cleanup Act

The Toxic Pits Cleanup Act of 1984 required all impoundments containing liquid hazardous wastes or free liquids containing hazardous waste be retrofitted with a liner/leachate collection system, or dried out by July 1, 1988. Impoundments "dried out" were closed to remove all contaminants and/or to stabilize any residual contamination.

VI.A.4.a. WASTEWATER DISPOSAL

Principal factors affecting treatment process selection for land disposal are the nature of soils and ground waters in the disposal areas and, where irrigation is involved, the nature of crops. Wastewater characteristics of particular concern are total salt content, nitrate, boron, pathogenic organisms, and toxic chemicals. Where percolation alone is considered, the nature of underlying ground waters is of particular concern. Treatment processes should be tailored to insure that local ground waters are not degraded.

Nitrate removal is required in many cases where percolation is to usable ground water basins. Percolation basins operated in alternating wet and dry cycles can provide significant nitrogen removal through nitrification/denitrification processes in the soil column. Finer textured soils are more effective than coarse soils. Nitrate removal would not necessarily be required, and secondary treatment

may be adequate where recharge is for other purposes such as prevention of seawater intrusion or where soil percolation constraints do not require further treatment. Monitoring in the immediate vicinity of the disposal site is required in either case. Where the need for nitrate removal is not clear, removal could be considered at a possible future stage depending on monitoring results. Where well controlled irrigation is practiced, nitrate problems in the dry season will be controlled. Vegetative uptake will utilize soluble nitrates which would otherwise move into ground water under a percolation operation. Demineralization techniques or source control of total dissolved solids may be necessary in some inland areas where ground waters have been or may be degraded. Presence of excessive salinity, boron, or sodium could be a basis for rejection of crop irrigation with effluent.

State Health Department regulations, described in Title 22 of the California Code of Regulations, stipulate disinfection levels required for specific crops. In some cases, such as pasture for milking animals, the California Code of Regulations requires oxidation with disinfection to a median number of coliform organisms of 23 MPN/100 ml. Environmental Protection Agency guidelines for secondary treatment do not apply to land disposal cases. However, municipal treatment facilities must provide effective solids removal and some soluble organic removal for percolation bed operations and for reduction of nuisance in wastewater effluent irrigation operations. Disinfection requirements are dictated by the disposal method. Oxidation ponds may be cost-effective in some remote locations and may be equivalent to secondary treatment.

VI.A.5. RECLAMATION AND REUSE

Water shortages in California are resulting in increased demand for reclamation. Reclamation and reuse is encouraged where feasible and beneficial. Where practicable, land disposal by spray irrigation shall be accomplished by proper reclamation techniques rather than by over-irrigation. This will aid water shortages and maximize nutrient removal.

Treatment process selection for reclamation of wastewater is dependent upon the intended reuse. Where irrigation reuse or ground water recharge is intended, treatment requirements will depend on conditions described under land disposal. Clearly, the nature of the crop to be irrigated, soil percolation, and water characteristics are important considerations. Title 22 of the California Code of Regulations provides wastewater reclamation criteria to regulate specific uses of reclaimed water. Where reuse is extended to water contact recreation, secondary treatment with coagulation, filtration, and disinfection is required. Where golf course irrigation is practiced, this level of treatment minus coagulation and filtration may be adequate. More stringent measures may be necessary with increased risk of public exposure (for example, residents adjacent to fairways). However, where more complete reclamation is envisioned, such as creation of recreational lakes for fishing, swimming, and water skiing, nutrient removal may also be required to minimize algae growths and to encourage fish propagation. Comparable treatment may also be needed for industrial water supplies used for cooling and uses where algae growth in transfer channels or cooling towers is of concern. Nitrogen removal and demineralization processes may also be necessary for selected reclamation projects as discussed under land disposal.

To meet the increased demand for reclamation, existing regulations contained in the California Code of Regulations, Title 22, are being expanded. California Code of Regulations, Title 22, are hereby incorporated as applicable reclamation requirements.

Dual water systems may be feasible in some instances. Reclaimed wastewater should be investigated as an alternative water source for toilets.

Management Principles contained in Chapter Five should be reviewed for further reclamation information. This section is located after the "Recommended State Water Resources Control Board Actions" section.

September 8, 1994

IV-11

000011

VI.A.6. PRETREATMENT PROGRAMS

State and federal regulations require certain municipalities to develop and administer pretreatment programs to control the discharge of industrial wastes to the treatment plant. All municipal plants discharging to navigable waters with design flows greater than 5.0 mgd are required to develop and implement a pretreatment program. Other municipalities may be required to develop a pretreatment program if circumstances warrant such a program. The Environmental Protection Agency has established specific industrial subcategories of industries which discharge certain quantities or concentrations of pollutants to municipal systems. Pretreatment is required to meet effluent standards established for each industrial category. The objectives of a pretreatment program are to: (1) prevent introduction of pollutants into publicly-owned treatment works which will interfere with treatment operations and/or use or disposal of municipal sludge, (2) prevent introduction of pollutants into publicly owned treatment works which will pass through treatment works or be incompatible with treatment techniques, (3) increase feasibility of recycling and reclaiming municipal and industrial wastewaters and sludges, and (4) enforce applicable EPA Categorical Standards.

A pretreatment program must include: (1) a local pretreatment ordinance, (2) a use permit system, (3) a program of monitoring and inspection to insure compliance with the ordinance and use permit, and (4) an enforcement program sufficient to obtain compliance with provisions of the ordinance or use permit. Pretreatment programs are further discussed as they apply to specific dischargers in the section on Municipal Wastewater Management.

Municipalities required to comply with federal pretreatment regulations in the Central Coast Region are:

City of Santa Cruz,
Cities of Gilroy/Morgan Hill,
City of Watsonville,
Monterey Regional Wastewater Treatment Plant,
City of Salinas Industrial Plant,

City of San Luis Obispo,
City of Santa Maria,
City of Lompoc, and
City of Santa Barbara

VI.A.7. SLUDGE TREATMENT

Sludge management is a difficult aspect of wastewater treatment. The methods used for sludge disposal or reuse tend to determine the sludge processing methods. Major goals of sludge treatment include pathogen destruction, vector attraction reduction, odor reduction, moisture removal, and contaminant removal. Treated sludge is commonly referred to as "Biosolids."

Solids removed during wastewater treatment include grit, primary sludge, and biological sludges. Grit is typically removed in a grit chamber and is usually inert and easily dewatered, so landfilling is usually the preferred management option. Primary sludges are generally solids that readily float or sink, whereas biological sludges are suspended organic materials and necessitate biological treatment (e.g., trickling filter, activated sludge, or oxidation pond) to float or sink. Polymers are widely used to increase settling and thickening efficiencies and to reduce chemical sludge handling problems. Primary and biological sludges are usually combined prior to final treatment. Anaerobic digestion and lagoon stabilization are common sludge treatment methods, but methods which can render sludge pathogen and odor free, such as lime stabilization, composting, thermophilic aerobic digestion, and heat treatment, are becoming increasingly popular. Public acceptance of beneficial sludge uses, such as spreading on farm land and reclamation of strip mines, may be improved by advanced sludge treatment technologies.

Sludge treatment methods are evolving as disposal is discouraged and beneficial reuse is encouraged. Ocean disposal of sludge is prohibited by the California Ocean Plan. Landfilling of sludge is generally allowed if the sludge is nonhazardous and meets specific moisture content requirements. Sludge may be disposed in Class I and Class II waste management units, but this practice is uncommon

due to its high cost. Disposal of sludge is becoming less attractive as landfill capacity decreases, recycling mandates (Assembly Bill 939) must be met, and society becomes aware that sludge can be a valuable resource as a soil amendment/fertilizer.

VI.B. MUNICIPAL WASTEWATER MANAGEMENT

Municipal wastewater conveyance, treatment, and disposal facilities recommended for the Central Coastal Basin are described in the following pages. Recommended plans for municipal facilities are described in geographic sequence by hydrographic units. Hydrographic units are identified in Chapter Two, Figure 2-1. Numbers in parentheses throughout the chapter refer to design capacity unless otherwise stated. Pretreatment programs and modifications to secondary treatment are discussed as part of the recommended plan where applicable. Further discussion of these topics can be found under the subheadings "Ocean Disposal" and "Pretreatment Programs" at the beginning of this chapter.

Further specific municipal management information can be found in the Management Principles section of Chapter Five. General municipal wastewater management information is also included in the State Water Resources Control Board Plans and Policies section, Discharge Prohibitions section, Control Actions section and Regional Board Policies section.

VI.B.1. BIG BASIN HYDROLOGIC UNIT

The Big Basin Hydrologic Unit includes discharges from the City of Santa Cruz and the City of Scotts Valley, in addition to unsewered areas and several small waste dischargers. Table 4-1 displays summarized Big Basin Hydrologic Unit dischargers.

September 8, 1994

Table 4-1. Big Basin Hydrologic Unit Summarized Municipal Dischargers

Davenport County Sanitation District
California Department of Parks and Recreation - Big Basin State Park
California Department of Forestry - Ben Lomond Conservation Facility
City of Santa Cruz
City of Scotts Valley
Santa Cruz County Service Area No. 7 - Boulder Creek Golf and Country Club
Santa Cruz County Service Area No. 10 - Rolling Woods Subdivision
San Lorenzo Valley Water District - Bear Creek Estates
Big Basin Woods
Santa Cruz County Service Area No. 5 - Sand Dollar Beach and Canon del Sol
Santa Cruz County Service Area No. 20 - Trestle Beach
Individual Septic Tank Systems

The City of Santa Cruz operates a wastewater collection, primary treatment, and ocean disposal system with a capacity of 21 mgd. Sewerage service is provided to the City of Santa Cruz, Santa Cruz County Sanitation District (SCCSD), and the City of Scotts Valley. The SCCSD serves East Cliff, Capitola, Aptos, and Seacliff areas. The recommended plan for the City is to upgrade the existing treatment plant at Neary's Lagoon to secondary level treatment. A new outfall was completed in 1988. The new outfall is 12,250 feet long terminating in 100 feet of water about one mile offshore. It replaces a 2,000 foot outfall which was a source of many complaints due to its proximity to the shore water-contact recreation area.

Mitigation measures to offset environmental impacts to Neary's Lagoon and an adjacent park must be resolved before the plant can proceed. The City has implemented a pretreatment program affecting the City of Santa Cruz, and Santa Cruz County Sanitation District.

Wastewaters from sewered areas of the City of Scotts Valley are transported to Scotts Valley's secondary treatment plant. Effluent is transported through a land outfall to the City of Santa Cruz marine outfall for disposal to the Pacific Ocean. A recommended plan for Scotts Valley includes: (1) increasing wastewater treatment capacity from 0.65

IV-13

000013

mgd to 0.95 mgd, (2) providing reclaimed water to Pasatiempo Golf Course and other green belt areas for irrigation purposes, and (3) transporting excess wastewater through the Scotts Valley land outfall to the City of Santa Cruz ocean outfall. An alternative plan is to transport raw wastewater through the Scotts Valley land outfall to the Santa Cruz wastewater treatment plant for treatment and disposal through the ocean outfall. Local water agencies (Scotts Valley Water District and San Lorenzo Valley Water District) may benefit from reclamation efforts and should be involved in reuse planning.

Davenport County Sanitation District (DCSD) was created in 1979 to provide sewer and water services to the Davenport-Newtown area located on the coast north of Santa Cruz. Davenport-Newtown area has interceptors and an aerated wastewater lagoon on property owned by Lone Star Industries. Disposal is through evaporation/ percolation and industrial reuse. DCSD is responsible for wastewater collection, treatment, and disposal.

The State Department of Parks and Recreation is responsible for Big Basin State Park facilities (.04 mgd). Discharge provides stream flow augmentation. The wastewater treatment plant includes secondary treatment with sand filtration and coagulation. This stream discharge qualifies as an acceptable wastewater reclamation project. The discharge is upstream from a popular swimming hole, so this plan emphasizes the need to enhance water quality and protect beneficial uses in Waddell Creek. The Department of Parks and Recreation must correct wastewater system deficiencies in order to protect public health and the beneficial uses of Waddell Creek and tributaries.

The recommended plan for the Ben Lomond Conservation Facility is to retain the existing septic tank, evaporation/percolation ponds, and spray field. Existing facilities are adequate so long as operation and maintenance are effective.

Wastewater management in San Lorenzo Valley (SLV) is provided by three community treatment and disposal facilities (Bear Creek Estates, Big Basin Woods, and Boulder Creek Golf and Country Club). Remaining areas are served by individually owned septic tank and soil absorption systems. Bear Creek Estates uses septic tank treatment with disposal to

a soil absorption system. This facility is the responsibility of San Lorenzo Valley Water District and Bear Creek Estates.

The recommended plan for Big Basin Woods Subdivision is to retain the existing extended aeration treatment facility with leachfield disposal, presently operating at approximately ten percent of total capacity (.35 mgd). Flow from County Service Area No. 7 has been diverted to Big Basin Woods' leachfield during equipment repair periods. Leachfield capacity is adequate to serve both Big Basin Woods and CSA No. 7. Existing facilities are adequate so long as operation and maintenance are effective. This plan will be implemented by Big Basin Sanitation Company, Big Basin Woods Subdivision, and the San Lorenzo Valley Water District.

The recommended plan for Boulder Creek Golf and Country Club is to retain the existing activated sludge treatment facility with leachfield disposal and add filtration for golf course irrigation. Existing facilities are adequate so long as operation and maintenance are effective. Operation and maintenance of the system is the responsibility of the Santa Cruz County Department of Public Works. This plan will be implemented by Santa Cruz County Service Area No. 7 through Santa Cruz County Department of Public Works and San Lorenzo Valley Water District.

Rolling Woods Subdivision, Santa Cruz County Service Area No. 10, provides treatment with a redwood bark biofilter and disposes treated effluent through percolation pits. This facility should be replaced with an interceptor that would convey wastes to the City of Santa Cruz for treatment and disposal.

Individually owned septic tank leachfield systems in the San Lorenzo Valley are being studied closely to identify problem areas and determine the suitability of these problem areas for the continued use of septic systems. Alternatives will be proposed and evaluated to reduce septic system problems and to respond to this Plan's discharge prohibition in certain areas of the valley. Specific design criteria for conventional and modified septic systems will be developed as part of on-going county studies.

Dischargers in the Aptos-Soquel area include Santa Cruz County Service Area No. 5 (Sand Dollar Beach and Canon del Sol), SCCSA No. 20 (Trestle Beach), and Monterey Bay Academy. Flows from Aptos and East Cliff are conveyed through interceptors and pumping stations for treatment at the City of Santa Cruz Wastewater Treatment Plant.

The recommended plan for SCCSA No. 5 is to retain the existing extended aeration package treatment plant and disposal to seepage pits. Wastewater treatment and disposal at Canon del Sol will be by the same methods as Sand Dollar Beach. Facilities will be adequate so long as operation and maintenance are effective. This plan will be implemented by SCCSA No. 5 through Santa Cruz County Department of Public Works.

Wastewater treatment at Trestle Beach (SCCSA No. 20) will be provided by an extended aeration package treatment plant with disposal to seepage pits. This plan will be implemented by SCCSA No. 20 through the Santa Cruz County Department of Public Works. It is recommended that CSA No. 5 and No. 20 be connected to regional collection systems when service is extended to adjacent areas.

The recommended plan for the Monterey Bay Academy is to retain the existing settling pond with disposal to a series of evaporation-percolation ponds.

VI.B.2. PAJARO RIVER HYDROLOGIC UNIT

Summarized municipal dischargers in the Pajaro River Hydrologic Unit include the City of Gilroy/ Morgan Hill, City of Hollister, City of San Juan Bautista and the City of Watsonville. Table 4-2 displays dischargers summarized for the Pajaro River Hydrologic Unit.

September 8, 1994

Table 4-2. Pajaro River Hydrologic Unit Summarized Municipal Dischargers

Unsewered San Martin
 City of Gilroy/Morgan Hill
 San Benito County Facilities
 Sunnyslope County Water District
 Tres Pinos County Water District
 City of Hollister
 City of San Juan Bautista
 City of Watsonville

The Gilroy area includes the unsewered San Martin area and the City of Gilroy's advanced primary treatment and land disposal facilities serving the Cities of Gilroy and Morgan Hill. The Cities are currently attempting to develop facilities to resolve disposal capacity deficiencies. Primary treatment provided via two oxidation ponds with surface aeration. Effluent disposal is to a series of evaporation/percolation ponds. Wastewater reclamation facilities were constructed in 1977 to alleviate water shortages during drought conditions. When reclamation facilities are in use (seasonally), primary effluent is provided further treatment in an aeration pond. Effluent is then screened, chlorinated, and pumped through nine miles of distribution pipe to various users (for irrigation purposes). The reclamation system's economics have not been favorable. Industrial flows of 6.3 mgd are treated and disposed of in a separate series of sedimentation, oxidation, and percolation ponds.

The recommended plan for the Gilroy-Morgan Hill wastewater treatment facilities is to continue geohydrological assessments to determine impacts of continued effluent disposal by percolation at the Gilroy site. If beneficial uses of surface and ground waters are not adequately protected, other treatment and/or disposal methods must be used. Disposal will continue to be by percolation, evaporation and reclamation. Before a discharge to surface waters is considered, the City will be required to evaluate feasible land disposal options. If current percolation practices are not causing receiving water problems, feasibility of existing disposal area expansion should be considered. The Cities are also evaluating stream disposal. Currently, the Cities of Gilroy and Morgan Hill are responsible for collection, treatment, and disposal of wastewater. They are also responsible for operating the wastewater reclamation facilities. Santa Clara Valley Water District is responsible for

IV-15

000015

administrative tasks for the reclamation system. In addition, the Cities of Gilroy and Morgan Hill have implemented a pretreatment program since 1983.

Individual on-site systems are used for sewage disposal in the San Martin area. Twenty percent of the area's wells exceed the nitrate drinking water objective. This is a significant problem since this area serves as the sole recharge area for the Santa Clara Valley. Methods of providing a water supply that is free of excessive nitrate concentration should be investigated and implemented. Nitrate loadings from various sources should be calculated for the area to determine the contribution from various sources. The need for on-site system restrictions should be determined.

Small discharges (less than 0.10 mgd) in the Hollister area include flows from San Benito County Facilities, Sunnyslope County Water District, and Tres Pinos County Water District. City of Hollister wastewater is treated at the City of Hollister Wastewater Treatment Facilities (1.2 mgd). San Juan Bautista wastewater is treated at the City of San Juan Bautista Wastewater Treatment Facilities (0.15 mgd).

The recommended plan for Tres Pinos is to retain the existing evaporation/percolation ponds. The recommended plan for San Benito County Hospital Facilities and Sunnyslope County Water District is to study the feasibility of constructing interceptors to the Hollister facilities or consolidating into a single subregional system. Existing facilities consisting of aerated pond treatment followed by land disposal to evaporation/percolation ponds may be maintained if project level studies determine this to be the more feasible method of wastewater treatment and disposal. Sunnyslope County Water District owns and operates a wastewater treatment and disposal system serving approximately 300 homes in Ridgemark Estates subdivision located approximately 2-1/2 miles south-east of Hollister. Wastewater is treated in two aerated ponds and disposed of in evaporation/percolation ponds. Effluent may be used in the future to irrigate a golf course.

The recommended plan for the City of Hollister is to retain the existing advanced primary treatment facilities and percolation ponds which started operating in 1979. The Hollister industrial system is to be maintained separately to receive seasonal

flows from the spinach and tomato processing operations. The recommended plan for the City of San Juan Bautista is development of a land disposal system. The City currently discharges secondary effluent to a drainage ditch tributary to Pajaro River.

Land disposal of wastewaters in the Hollister region must be monitored carefully to assure ground water quality is protected. Source control of salt must be stressed to reduce effluent salinity to levels acceptable for disposal to local ground waters.

Wastewaters in the Watsonville area are transported to regional treatment facilities in the City of Watsonville with a design capacity of 13.4 mgd. Collection, primary treatment, and disposal to Monterey Bay are provided for the City of Watsonville, and the local sewerage entities of Freedom County Sanitation District, Pajaro County Sanitation District and Salsipuedes Sanitary District. The City submitted an application to EPA for waiver of secondary treatment requirements and the Regional Board has approved a waiver permit. Project level studies determined ocean disposal to be the most feasible method of waste disposal. Ocean outfall improvements and a phased approach to secondary treatment are included in Watsonville's Clean Water Grant Project. If a waiver from secondary treatment is granted, the project will provide advanced primary treatment. Local sewerage entities retain ownership and direct responsibility for wastewater collection and transport systems up to the point of discharge to interceptors owned and operated by Watsonville. The City is implementing a pretreatment program and the Regional Board has approved a waiver permit.

VI.B.3. CARMEL RIVER HYDROLOGIC UNIT

Summarized municipal dischargers in the Carmel River Hydrologic Unit include Carmel Sanitary District. Table 4-3 displays dischargers summarized for the Carmel River Hydrologic Unit.

Table 4-3. Carmel River Hydrologic Unit Summarized Municipal Dischargers

Carmel Sanitary District
 Carmel Valley Sanitation District
 Village Green
 White Oaks
 Carmel Valley Ranch
 Carmel Highlands Inn
 Carmel Sanitary Association

The Carmel Sanitary District operates a secondary wastewater treatment plant with ocean disposal serving Carmel-by-the-Sea, Del Monte Forest, and a few adjacent areas. The outfall system terminates within a portion of Carmel Bay that is designated an Area of Special Biological Significance (ASBS). The District is developing a reclamation project for irrigation of Monterey Peninsula Golf Courses. A high concentration of golf courses in a water short area makes reclamation particularly desirable and attractive.

Carmel Valley Sanitation District operates three facilities in Carmel Valley. These include community septic tank/subsurface disposal systems at Village Green and White Oaks and a tertiary type treatment plant with golf course reclamation at Carmel Valley Ranch. No changes are recommended unless public health or water quality problems develop. Should the need arise for specific septic system maintenance in Carmel Valley, local agencies should be considered for management responsibilities.

Comprehensive studies to determine the feasibility of establishing separate treatment plants have been completed for the Carmel Valley area. These studies conclude that on-site septic systems should remain operational until further ground water monitoring data shows sewers are necessary. Wastewater treatment and reuse on the Carmel Valley Ranch Golf Course provides an optimal way of managing waste generated in the area.

Carmel Highlands wastewaters should continue to be treated in on-site wastewater systems except at the Highlands Inn and the Carmel Highlands Sanitary Association. Both of these systems will continue to discharge treated secondary quality effluent to the Pacific Ocean.

September 8, 1994

VI.B.4. SANTA LUCIA HYDROLOGIC UNIT

The U.S. Navy's Point Sur wastewater facilities and the State Department of Parks and Recreation Pfeiffer Big Sur State Park facilities are the only significant facilities in this hydrologic unit. Ocean discharge from the U. S. Navy is being discontinued and is being replaced with a subsurface land disposal system. The subsurface land disposal system at Pfeiffer Big Sur State Park also seems adequate. If expansion to this facility is considered or if ground or surface water degradation from this discharge is detected, other means of disposal, such as reclamation, are recommended.

VI.B.5. SALINAS RIVER HYDROLOGIC UNIT

The extensive Salinas River Hydrologic Unit includes the Monterey Peninsula and southern coastal area of Monterey Bay, the City of Salinas, agricultural and small urban centers of the Salinas Valley, and recreational developments in the upper watersheds. Major dischargers in the Salinas River Hydrologic Unit include the Monterey Regional Water Pollution Agency (MRWPCA). Table 4-4 displays dischargers summarized below for the Salinas River Hydrologic Unit.

Table 4-4. Salinas River Hydrologic Unit Summarized Municipal Dischargers

Monterey Regional Water Pollution Control Agency (MRWPCA)
 U. S. Army Fort Hunter Liggett
 California Army National Guard - Camp Roberts
 King City
 City of Paso Robles
 City of Atascadero
 San Luis Obispo County Service Area No. 7A Oak Shores
 San Luis Obispo County Service Area No. 19 Heritage Ranch Development

The recommended plan for the Monterey Peninsula-Salinas area calls for consolidation of

IV-17

000017

Monterey Peninsula, Salinas, Castroville, and other Monterey Bay municipal wastewater flows into a regional wastewater treatment plant and outfall. Discharge is to central Monterey Bay outside the prohibition zone described in Chapter 5 "Discharge Prohibitions" under "Waters Subject to Tidal Action." Upon completion of the regional plant, wastewater treatment plants in Monterey, Salinas (2), Castroville, and Fort Ord will be taken out of service. The Monterey Regional Water Pollution Control Agency (MRWPCA) was established to manage and implement regional consolidation.

It is recommended MRWPCA implement wastewater reclamation. MRWPCA plans to provide reclaimed water to the Castroville Irrigation Project which involves irrigating food crops in the Castroville area with water reclaimed at the regional plant blended with water diverted from the Salinas River.

New major residential developments proposed within the service area of the Regional Project should connect to the regional system unless studies can show that water quality and public health concerns can be properly mitigated. Sewerage feasibility studies and aerial ground water studies should continue in this sub-basin to assure that adequate sewage treatment and disposal capabilities are maintained for both existing and proposed development.

Recommended plans for Salinas Valley communities, the U. S. Army's Fort Hunter Liggett, the California Army National Guard's Camp Roberts, and recreational areas in the upper watershed involve separate wastewater treatment and disposal facilities.

Dischargers along the Salinas River should remain as separate treatment facilities with land disposal to evaporation/percolation systems and land application (irrigation) systems where possible. Disposal should be managed to provide maximum nitrogen reduction (e.g., through crop irrigation or wet and dry cycle percolation). Facility expansions shall include means for nitrogen reduction. Shallow ground water monitoring at these facilities will determine if additional improvements are necessary. King City should consider expanding its service area to include Pine Canyon if development continues in that area.

The City of Paso Robles owns and operates a secondary treatment plant (4.9 mgd) utilizing trickling filtration followed by oxidation ponds. Disposal is by evaporation and percolation from the oxidation ponds and by discharging from the last pond to the Salinas River channel. Use of reclaimed water should be investigated and implemented, if feasible. A reduction of inorganic salt in the effluent would increase its desirability to potential users. A report, "Water Quality in the Paso Robles Area," published by the California Department of Water Resources in 1981 made water quality control recommendations, including a recommendation for more stringent control of total dissolved solids and sodium in the City's wastewater treatment plant discharge. A Regional Board Salt Balance Study is planned to further define the need and methods of salt reduction.

The City of Paso Robles also owns and operates the wastewater facility serving the California Youth Authority and Paso Robles Airport Wastewater treatment plant (0.10 mgd). Disposal is to a series of oxidation-percolation ponds located adjacent to Huerhuero Creek. Wastewater reclamation uses should be investigated. An effluent pump exists at the plant in case wastewater reclamation potential develops. The City is planning an interceptor sewer to eliminate this facility and provide all treatment and disposal at its main City facility.

The City of Atascadero (1.67 mgd) owns and operates a wastewater collection, treatment, and disposal system serving part of the City. Pond treatment is provided followed by land disposal to percolation ponds and by irrigation of a golf course. San Luis Obispo County Health Department has documented public health problems and water quality problems arising from failing on-site sewage disposal systems in areas within the City. The City was seweraged in the most significant problem areas, but additional sewerage is needed.

Dischargers in the Nacimiento Reservoir area include San Luis Obispo County Service Area No. 7A, Oak Shores Development (0.1 mgd); and, San Luis Obispo County Service Area No. 19, Heritage Ranch Development (0.40 mgd). Wastewater facilities for the Oak Shores Development consist of two aerated treatment ponds and spray disposal. Part of the collection system is located below the spillway elevation of Nacimiento Reservoir. This has been a

source of excessive infiltration in the past and the problem has been corrected. This area should be watched closely as reservoir level rises and wastewater flows increase to insure infiltration and/or exfiltration do not reoccur. Major expansion of wastewater facilities is expected in the future. As the development grows, new disposal facilities should be relocated well away from Nacimiento Lake.

Wastewater at Heritage Ranch is treated in aerated lagoons at the development. Discharge is to a holding pond, filtered, and then discharged to a drainageway located outside the Nacimiento Reservoir watershed.

Camp Roberts is a U. S. Army installation that is leased by the California National Guard as a major training site. Wastewater flows that vary from 3000 gpd in winter to nearly 1.0 mgd in summer are treated to secondary levels prior to disposal in a series of percolation/evaporation ponds located near the Salinas River. The facility was upgraded in 1980 and there are no additional recommendations.

Dischargers in the San Antonio Reservoir watershed include Monterey County's Department of Parks and Recreation and the U.S. Army's Fort Hunter Liggett. There are no recommended changes to facilities operated by the Monterey County Department of Parks and Recreation. The U.S. Army, Fort Hunter Liggett operates wastewater treatment facilities located adjacent to the San Antonio River. The recommended plan is to maintain the existing facilities with improvement of the spray disposal area.

VI.B.6. ESTERO BAY HYDROLOGIC UNIT

Municipal wastewater management plans for the Estero Bay Hydrologic Unit are described for each of these four areas: North Coast, Morro Bay, San Luis Obispo Creek, and South County Regions. Table 4-5 displays dischargers summarized below.

September 8, 1994

Table 4-5. Estero Bay Hydrologic Unit Summarized Dischargers

Cambria Community Services District
 San Simeon Acres Community Services District
 City of Morro Bay and Cayucos Sanitary District
 California Men's Colony
 Los Osos septic tank/leachfield systems
 City of San Luis Obispo
 Avila Beach County Water District
 San Luis Obispo County Service Area No. 18-
 Country Club Estates
 City of Pismo Beach
 South San Luis Obispo County Sanitation District
 Lopez Recreation Area Wastewater Treatment Plant

Dischargers in the North San Luis Obispo Coast include Cambria Community Services District (1.0 mgd) and San Simeon Acres Community Services District (0.2 mgd).

Secondary treatment facilities at Cambria have a design capacity of 1.0 mgd and include a land outfall and spray irrigation system for effluent disposal, and an effluent holding reservoir. Excess effluent that cannot be spray-irrigated is pumped to the reservoir for later land disposal or discharged during wet weather through a sand filter bed to Van Gordon Creek. The District is evaluating land disposal improvements. Implementation of this plan is the responsibility of Cambria Community Services District.

San Simeon Acres Community Services District owns and operates a secondary treatment (activated sludge) plant with design capacity of 0.2 mgd. Wastewater visitor complex generated at Hearst Castle and within the community is treated and discharged to the Pacific Ocean through an ocean outfall. The recommended plan is to retain the treatment plant.

Dischargers in the Morro Bay area include the City of Morro Bay and Cayucos Sanitary District (2.1 mgd), California Men's Colony (CMC) (1.2 mgd), and Los Osos- Baywood septic tank leachfield systems.

The City of Morro Bay and the Cayucos Sanitary District jointly own treatment facilities with ocean outfall disposal. Wastewater is being treated by a newly constructed plant and discharged through a newly constructed ocean outfall. In order to

IV-19

000019

maximize plant capacity and meet Ocean Plan requirements, part of the effluent receives primary treatment only and part receives secondary treatment. Primary and secondary quality effluents are blended before disposal to the Pacific Ocean in compliance with a secondary treatment waiver.

Recently renovated wastewater treatment facilities at California Men's Colony also serve the California National Guard Camp, Cuesta College, the County Educational Center, and the County Operational Facility. Secondary treatment with coagulation/filtration, and subsequent disposal to Chorro Creek (stream flow augmentation) are provided. Effluent is also used to irrigate fodder crops on nearby lands owned by California State Polytechnic University.

Development on small lots in Los Osos-Baywood has resulted in one of the most densely populated areas without public sewers on the central coast. Septic tank effluent is discharged in predominantly sandy soil over a ground water basin which is the sole source of water for the area. Some shallow wells have approached and exceeded the public health maximum nitrate concentration limit. The County of San Luis Obispo conducted a Clean Water Grant funded study of this situation. Study findings resulted in a Basin Plan Prohibition of discharges effective November 1, 1988. The County has not implemented the recommended project of sewerage the area. (A new septic system discharge prohibition now exists for the area).

Dischargers in the San Luis Obispo Creek area include the City of San Luis Obispo (5.1 mgd), Avila Beach County Water District (0.1 mgd), and San Luis Obispo County Service Area (CSA) No. 18, Country Club Estates (0.12 mgd).

The City of San Luis Obispo wastewater treatment facilities serve as a regional plant for the City and certain proximal unincorporated county areas. Trickling filters provide secondary treatment before disposal to San Luis Obispo Creek. Infiltration and inflow in the wastewater collection system causes excessive wet weather flows and intermittent discharges to San Luis Obispo Creek of partially treated wastewater. The recommended plan for San Luis Obispo is improving the collection and treatment facilities capacity to eliminate these discharges. The City's Wastewater Management Plan should be

implemented to provide treatment necessary to comply with stringent permit requirements.

The small community of Avila Beach is served by a small advanced primary trickling filter wastewater treatment facility owned and operated by the Avila Beach County Water District. Design capacity of the plant was originally 0.18 mgd, but was downgraded in 1986 to 0.1 mgd as the NPDES permit was revised to include secondary treatment standards for trickling filters. Current average flow is only 0.07 mgd. Wastewater disposal is through an ocean outfall to the Pacific Ocean. Additional treatment and/or outfall modification will be necessary as flow increases. Oceanographic studies would be required to determine appropriate modifications (e.g., lengthen the outfall and add a multiport diffuser).

Country Club Estates (CSA No. 18) is a small subdivision in South San Luis Obispo County that historically relied on septic tank systems for wastewater treatment and disposal. A septic tank system performance survey completed in January, 1981, identified significant public health hazards from numerous failing septic tank systems in the subdivision. The septic systems were replaced in 1988 by a small secondary treatment plant (0.12 mgd) with effluent disposal via golf course irrigation at the San Luis Obispo Golf and Country Club.

Dischargers in the South San Luis Obispo County Region include the City of Pismo Beach (1.2 mgd), South San Luis Obispo County Sanitation District (3.0 mgd) (serving the City of Arroyo Grande, City of Grover City, and Ocean Community Services District), and Lopez Recreation Area wastewater treatment plant (0.10 mgd). These dischargers provide secondary treatment of wastewater through three separate facilities. Pismo Beach has a land outfall to the South San Luis Obispo County Sanitation District ocean outfall. Plant reliability improvements were made in 1987. Future treatment plant enlargements should provide duplicate process units for improved operation and maintenance. A long range solids management plan must be developed and implemented.

South San Luis Obispo County Sanitation District disposes of secondary effluent through an ocean outfall to the Pacific Ocean. The District has enlarged its facilities to 3.0 mgd and changed from activated sludge to fixed film reactor. A long range

solids management plan is also needed for this plant.

The Lopez Recreation Area treatment facilities serve County facilities adjacent to Lopez Lake. Lopez Lake serves as a municipal water supply for downstream coastal communities. It is recommended land disposal of wastes be continued. Ground water quality monitoring should be used to provide warning of any potential ground water problems downstream of the disposal area. Implementation of this plan is the responsibility of the County of San Luis Obispo.

VI.B.7. CARRIZO PLAIN HYDROLOGIC UNIT

There are no municipal sewerage systems in the Carrizo Plain Hydrologic Unit; recommended practices for individual disposal systems will pertain to this area.

VI.B.8. SANTA MARIA RIVER HYDROLOGIC UNIT

The municipal wastewater management plans for the Santa Maria Valley and the Cuyama Valley are described separately for the City of Guadalupe, the City of Santa Maria, the Laguna County Sanitation District, Nipomo, and the New Cuyama wastewater treatment plant.

It is recommended that separate wastewater treatment and disposal/reclamation facilities be maintained by the City of Guadalupe (0.5 mgd), the City of Santa Maria (7.8 mgd), and the Laguna County Sanitation District (3.2 mgd). Discharge will be to land in each case.

The City of Guadalupe provides primary treatment followed by mechanically aerated lagoons. An unincorporated neighborhood known as the Gularte Tract is located adjacent to Guadalupe. A lift station and interceptor have been constructed to transport Gularte's wastewater to the City's collection system.

September 8, 1994

The recommended plan for Guadalupe is to complete additional storage ponds and disposal facilities to insure containment of wastewaters during wet weather and accommodate planned growth and to continue effluent discharge to land. Use of reclaimed water to irrigate nearby pasture lands is encouraged and should be maximized. Implementation of this plan is the responsibility of the City of Guadalupe. The County of Santa Barbara will be responsible for wastewater collection and transport systems for Gularte Tract up to the point of discharge to interceptors owned and operated by Guadalupe.

The City of Santa Maria provides wastewater collection, treatment, and disposal services to the City of Santa Maria, Santa Maria Airport District, and part of Laguna County Sanitation District. Biological secondary treatment is provided with disposal to percolation ponds and irrigation lands. The recommended plan for Santa Maria is to retain the existing treatment and disposal facilities. Since the Santa Maria ground water basin is in a state of adverse dissolved solids balance, it is imperative that quantities of total dissolved solids, sodium, chloride, nitrogen, and nitrogen compounds be kept to a minimum by implementing a strict source control ordinance. Additional measures -- importing better quality water, drilling new wells, partial desalting, etc. - may be required in the future to provide a suitable water supply for the area. Laguna County Sanitation District retains ownership and direct responsibility for wastewater collection and transport systems up to the point of discharge into interceptors owned and operated by the City of Santa Maria.

A secondary wastewater treatment plant owned and operated by Laguna County Sanitation District treats most of the wastewater generated within the District. Wastewater is discharged to approximately 2,250 acres of private lands located adjacent to the facility. The landowners and the County have a 30-year agreement for irrigation of fodder, fiber, and seed crops. The recommended plan for Laguna is to improve plant performance and increase capacity through a staged construction plan. Enough land is available to allow expansion and continue reclamation. Recommended improvements include increasing capacity and reliability of the Orcutt Lift Station, increasing sludge drying bed area, and expanding effluent, pumping, storage, and conveyance facilities. Funding of future

IV-21

000021

improvements and plant expansions would be through connection and user charges. Laguna County Sanitation District is responsible for implementation of the recommended plan. Impact of salts must be minimized by implementing a strict source control ordinance and discharging to areas outside the main ground water recharge area.

Failing individual on-site sewage disposal systems in the community of Nipomo resulted in a treatment facility being completed in 1987. Treatment is by aerated lagoons and disposal is by percolation beds. Sewer service is provided to downtown Nipomo and County operated systems of Nipomo Palms, Black Lake Estates and Galaxy Subdivisions. The recommended plan is to extend the sewer system to small lot areas as growth allows.

Existing facilities at the New Cuyama Wastewater Treatment Plant provide primary treatment of wastewater, with some aeration. Effluent is chlorinated before discharge to Salisbury Creek. The recommended plan for New Cuyama is to study existing facilities, determine future needs of the community, and, since water is in short supply, explore wastewater reclamation alternatives. Cuyama Community Services District is the responsible party for wastewater and water supply facilities in New Cuyama. It is recommended that exploratory wells be drilled to find a higher quality water supply. If a lower salt content water is not available, the existing water supply should be partially demineralized.

VI.B.9. SAN ANTONIO CREEK HYDROLOGIC UNIT

Los Alamos Community Services District owns and operates a wastewater treatment and disposal facility to serve the Los Alamos community. Wastewater (0.1 mgd) is treated in mechanically aerated ponds and discharged to disposal ponds and a spray reclamation area.

VI.B.10. SANTA YNEZ RIVER HYDROLOGIC UNIT

Municipal wastewater management plans for the Santa Ynez River Hydrologic Unit are described below. Table 4-6 displays dischargers discussed below.

Table 4-6. Santa Ynez River Hydrologic Unit Summarized Municipal Dischargers

City of Lompoc
Mission Hills Community Services District
Vandenberg Air Force Base
U. S. Department of Justice, Bureau of Prisons
Buellton Community Services District
City of Solvang
Cachuma County Sanitation District

Parts of Lompoc Valley ground water basin are in a state of adverse salt balance because of municipal and agricultural discharges. It is imperative that impacts of point source waste discharges to land be reduced by continuing to implement strict salt limitations, source control programs, and other salt management practices.

The City of Lompoc operates a secondary treatment facility (5.0 mgd) and discharges treated effluent to Santa Ynez River. The City also provides service to Vandenberg Village Community Services District and sewer areas of Vandenberg Air Force Base. The recommended plan for Lompoc is to control mineral concentrations in the effluent by enforcing strict limits on discharges to the sewer system and to continue to implement a pretreatment program. Implementation of this plan is the responsibility of the City of Lompoc. Vandenberg Air Force Base and Vandenberg Village Community Services District retain ownership and direct responsibility for wastewater collection and transport systems up to the point of discharge into the wastewater treatment plant and/ or interceptors owned and operated by the City of Lompoc.

In 1980, the Mission Hills Community Services District (0.4 mgd) was formed, assuming ownership and responsibility for water supply and sewage disposal in Mission Hills. The District expanded and

upgraded its La Purisima Plant and eliminated the Rucker Road Plant. Wastewater is treated in mechanically aerated ponds and discharged to a series of evaporation/percolation ponds and reclamation areas. Separate water reclamation requirements were adopted for Mission Belle Dairy as a primary user of reclaimed water for pasture and fodder crop irrigation.

There are isolated areas of Vandenberg Air Force Base that are not served by the Base's collection system. Separate treatment and disposal systems exist to serve these areas. Due to the isolation of these systems, it is recommended that they be retained. Efficient operation and maintenance of these systems will protect public health and water quality.

The United States Department of Justice, Bureau of Prisons, owns and operates existing facilities at the U.S. Penitentiary (0.6 mgd) which provide secondary treatment of wastewater. Treated wastewater is reclaimed for irrigation of forage crop land.

It is recommended that facilities be maintained separately at Buellton Community Services District (0.65 mgd), City of Solvang (1.0 mgd), and Cachuma County Sanitation District (0.22 mgd). Secondary treatment prior to land disposal coupled with a strict source control program will be necessary to protect local ground waters in these three areas.

The City of Solvang operates a secondary wastewater treatment facility to serve the City and Santa Ynez Community Services District with effluent disposal to evaporation/percolation ponds. Since the disposal ponds are located in a flood-prone area, it is imperative that sufficient disinfection capacity be available to disinfect effluent during wet weather. Expansion of capacity should be considered for ongoing growth in areas adjacent to present City and District boundaries. Implementation of this plan is the responsibility of both the City of Solvang and Santa Ynez Community Services District. Need for, and feasibility of providing, sewerage facilities for the Los Olivos-Ballard areas should be investigated by the County of Santa Barbara. Treatment and disposal service for this area be contracted with the City of Solvang.

The recommended plan for Cachuma County Sanitation District is to continue to treat and dispose of wastewater in percolation ponds and spray fields outside the Cachuma Reservoir watershed. Since ground waters downgradient from the spray field are used for domestic water supply, sampling of the nearest downgradient well is recommended to insure that water supply quality is not adversely affected by the discharge.

VI.B.11. SOUTH COAST HYDROLOGIC UNIT

Summarized municipal wastewater treatment and disposal agencies in the South Coast Hydrologic Unit are described separately for the Goleta Sanitary District (9.7 mgd), City of Santa Barbara (11.0 mgd), Montecito Sanitary District (1.5 mgd), Summerland Sanitary District (0.20 mgd), and, Carpinteria Sanitary District (2.0 mgd) wastewater treatment plants.

Goleta Sanitary District operates a wastewater collection system within the District and a treatment and ocean disposal system to provide service to Goleta Sanitary District, Isla Vista Sanitary District, University of California at Santa Barbara, Santa Barbara Municipal Airport, and facilities of Santa Barbara County. EPA granted the District a waiver from secondary treatment requirements. The waiver permit limits flow to 7.9 mgd provided mass emission rates do not exceed limits based on a flow of 7.3 mgd. In order to meet EPA's conditions and Ocean Plan criteria, part of the effluent receive primary treatment only and part receives secondary treatment. Primary and secondary effluent are blended before disposal to the Pacific Ocean. The District implements a pretreatment program. Isla Vista Sanitary District, University of California at Santa Barbara, Santa Barbara Municipal Airport, and Santa Barbara County retain ownership and direct responsibility for wastewater collection and transport systems up to the point of discharge into interceptors owned and operated by Goleta Sanitary District. A long range solids management plan is needed to assure sludge disposal needs are met.

September 8, 1994

IV-23

The recommended plan for the City of Santa Barbara is to retain El Estero Wastewater Treatment Plant, with disposal to the Pacific Ocean, along with implementation of the City of Santa Barbara wastewater reclamation project. The City could consider implementing a cost-effective composting program to reduce transportation costs. The City implements a pretreatment program and also provides service to an unincorporated community in Mission Canyon located above the City.

The recommended plan for Montecito Sanitary District is to continue secondary treatment with disposal to the Pacific Ocean.

The recommended plan for Summerland Sanitary District is to expand and upgrade existing facilities to insure reliable plant operations and to accommodate planned growth. Recommended improvements are addition of standby power, dual processes, and continuous monitoring of total chlorine residual.

The recommended plan for Carpinteria Sanitary District is to retain existing secondary treatment facilities with disposal to the Pacific Ocean.

VI.C. INDUSTRIAL WASTEWATER MANAGEMENT

In general, the alternatives available to industrial discharges are the following: (1) ocean discharge and compliance with the State Ocean Plan, the State Thermal Plan and Public Law 92-500; (2) containment of nonsaline and non-toxic wastes on land; (3) reinjection of oil and gas production brines; (4) inland surface water discharge, if other alternatives are proved infeasible; and, (5) abandonment of the treatment facility and connection to a publicly owned treatment works. In most cases, alternatives will be limited by standards of performance and pretreatment standards being developed by EPA. It should also be noted that federal guidelines will be subject to regional considerations such as important fishery resources or wildlife areas which could necessitate making regional industrial discharge requirements more stringent than national performance standards.

Specific effluent limitations are being promulgated for existing industrial waste discharges together with standards of performance and pretreatment standards of performance for new sources pursuant to sections 304(b), 306 (b), and 307(b), of the federal Water Pollution Control Act. Effluent limitations were being circulated for comment by the EPA. Waste source categories of particular interest in the basin which will be covered by those sections of the federal law include:

Meat product and rendering processing

Dairy product processing

Canned and preserved fruits and vegetables processing

Canned and preserved seafood processing

Cement Manufacturing

Feedlots

Electroplating

Beet sugar processing

Petroleum production and refining

Steam electric power plants

Leather tanning and finishing

Further information pertaining to industrial discharges can be found in the Management Principles and Control Actions Section of Chapter 5. The State Water Resources Control Board Plans and Policies Section, Discharge Prohibition Section, and Regional Board Policies Section are likely to apply (depending on site specific circumstances).

VI.D. SOLID WASTE MANAGEMENT

The protection and maintenance of water resources requires consideration and regulation of solid waste management practices. This section discusses present and future solid waste production, existing disposal practices and their effect on water quality, and proposed plans for solid waste disposal within the study area.

Land disposal is regulated by the California Code of Regulations, Title 23, Chapter 15 (Chapter 15). In the vernacular of Chapter 15, wastes are classified as either hazardous waste, designated waste, nonhazardous solid waste, or inert waste. Waste Management Units (WMUs) are classified as either Class I, II or III depending on the type of waste to be disposed of in the unit. Class I WMUs have the most restrictive siting criteria and must be constructed to provide optimum conditions for isolation of wastes from waters of the State. A double liner and a leachate collection and removal system (LCRS) is required for all Class I units. Class II WMUs also have relatively restrictive siting and construction standards and are designed to totally isolate wastes from the environment. Double liners and LCRSs are typical, but not always, required for Class II units. Class III WMUs must be sited and constructed such that no impairment of beneficial uses of surface or ground water beneath or adjacent to the site occurs. Siting and construction standards for Class III units are the least restrictive of the three, but the requirements are still considerable.

Wastes are considered hazardous if they meet the criteria defined in CCR Title 22, Section 66300. Examples of wastes that are considered hazardous include: waste solvents, waste pesticides, and waste electroplating solutions, to name a few. Hazardous wastes must be discharged only at Class I WMU.

Wastes are classified as designated if, under ambient conditions at the WMU, they may be released in concentrations in excess of applicable water quality objectives or cause degradation of waters of the State. Some examples of designated waste include, wet sewage treatment plant sludge, oil field wastes,

and some drilling muds. Designated wastes must be disposed of only at Class I WMU's, or at Class II WMU's which are approved for that particular type of waste.

Nonhazardous solid wastes consist of the more typical household and industrial wastes including: trash, rubbish, ashes, demolition and construction wastes, discarded home and industrial appliances, manure, and vegetable or animal solid or semi-solid wastes provided they do not meet the criteria mentioned above for hazardous or designated wastes. Nonhazardous solid waste may be disposed of at any classified WMU, but normally it is disposed of only at Class III WMUs to conserve the diminishing volume in the few operating Class I and Class II WMUs.

Inert waste does not contain hazardous waste or soluble pollutants at concentrations in excess of applicable water quality objectives and does not contain significant quantities of decomposable waste. Some examples of inert wastes include: broken up concrete rubble and excess clean earth fill. Inert wastes do not necessarily need to be disposed of at classified waste management units (i.e., Class I, II or III), but waste discharge requirements may be issued for the discharge at the discretion of the Regional Board.

There are 28 authorized active waste disposal sites regulated by the Central Coast Regional Board. Of the 28 sites, 26 are Class III landfills, with one Class I landfill, and one Class II surface impoundment. Additional information regarding a specific waste management unit can be found in the respective County Waste Management Plan in which the unit is located.

In recent years, data indicates municipal solid waste landfills may be having a greater impact on water resources than was previously anticipated. Legislation was passed in 1984 which requires all owners of active, inactive, or former landfills to initiate a study to determine if the landfilling operation has had an impact on waters of the State. Approximately 150 sites are evaluated per year throughout the State, with approximately nine sites per year coming from the Central Coastal Region. Further studies and/or corrective actions are initiated at all sites impacting State waters.

September 8, 1994

IV-25

000025

A recent report from the Assembly Office of Research has documented California's dwindling remaining landfill capacity. In general, remaining landfill capacity within the Central Coastal Region is higher than most areas of the State. However, the ratio of landfill closures to landfill expansions or opening of new landfills within the region for the last five years is approximately 4:1. This ratio will probably remain the same or increase with the more stringent regulatory requirements and the time consuming permitting process required for siting of new waste management units. In order to avoid a landfill capacity crisis similar to the situation on the East Coast, our solid waste handling and disposal practices should be reevaluated and a more environmentally sound management practice should be developed.

The Toxic Pits Cleanup Act of 1984 (TPCA) declares that discharges of liquid hazardous wastes or hazardous wastes containing free liquids into lined or unlined impoundments pose a serious threat to the quality of the waters of the State. Therefore, the legislature enacted TPCA as Article 9.5 (Surface Impoundments) of Chapter 6.5 (Hazardous Waste Control) of Division 20 of the California Health and Safety Code with the intent of insuring that existing surface impoundments were either made safe or were closed.

The effect of TPCA was to prohibit discharge (defined to include storage) of liquid hazardous wastes and hazardous wastes containing free liquids to surface impoundments, which did not satisfy specific construction and monitoring standards, by June 30, 1988, or December 31, 1988, depending on the location and characteristics of the impoundment. TPCA allows specific exemptions with varying application and granting deadlines. However, on and after January 1, 1989, all discharge of liquid hazardous wastes and of hazardous wastes containing free liquids to surface impoundments which had not been granted exemptions, and which did not meet specific construction and monitoring standards, was prohibited. There is a rare set of circumstances which may exempt a surface impoundment from the January 1, 1989, deadline.

TPCA is fulfilling its goal of reducing the threat of liquid hazardous wastes to the waters of the State.

VI.D.1. SOLID WASTE DISCHARGE PROHIBITIONS

Discharge is prohibited as follows:

1. Any Class I solid waste material to any location other than Class I solid waste disposal site.
2. Any Class II solid waste materials to any location other than Class I or II solid waste disposal sites.
3. Solid wastes shall not be discharged to rivers, streams, creeks, or any natural drainage ways or flood plains of the foregoing.

VI.E. STORM WATER MANAGEMENT

Storm water runoff can be a significant pollution source. The United States Environmental Protection Agency (U.S. EPA) estimates that at least 33% of all contamination in lakes and estuaries and 10% of all river contamination are caused by storm water runoff. Sources of pollution include runoff from industrial facilities, construction sites, and urban municipalities.

Federal regulations (40 Code of Federal Regulations 122.26) require certain industrial facility owners and/or operators to obtain storm water discharge permits. The specific types of facilities that need coverage is dependent upon the facility's Standard Industrial Classification Code. The program is primarily directed at manufacturing facilities, oil and gas extraction facilities, transportation maintenance facilities (trucking and mass transit), and construction sites (with greater than five acres of land disturbance). In addition, municipalities with populations greater than 100,000 must participate in a municipal storm water permitting program.

In August and September 1992, the State Water Resources Control Board (State Board) adopted the statewide General Construction Activity Storm Water

Permit and amended the statewide General Industrial Activities Storm Water Permit. The statewide permits expire five years after adoption. At that time, Regional Boards will most likely adopt Region specific General Permits.

The storm water program objectives include identification and elimination of pollutant contact with storm water by implementation of Best Management Practices. To obtain coverage under a General Permit, an applicant (i.e., those facilities required under 40 Code of Federal Regulations 122.26) must submit a Notice of Intent and the appropriate fee. The Notice of Intent is an agreement accepting the discharge specifications and monitoring requirements of the General Permit.

General Industrial Permit Requirements include the development of a Storm Water Pollution Prevention Plan and storm water runoff monitoring. The Storm Water Pollution Prevention Plan is a facility specific document which includes: a site description, facility processes, pollutant sources, storm water management system, employee education and training program, and measures proposed to eliminate non-storm water discharges. Minimum monitoring and reporting requirements include: sampling and analysis of four pollutant indicator parameters, wet and dry weather storm water conveyance system inspections, and annual reporting. The Regional Board can recommend additional monitoring parameters based on the presence of specific pollutant sources.

The Construction Permit has similar requirements regarding development of a storm water pollution prevention plan, but mainly deals with reducing pollutant sources associated with erosion and sediment transfer and chemicals used at construction sites. The monitoring requirements are less stringent and no sampling is required.

Annual monitoring reports required by the Industrial permit are due July 1 of each year. Sampling results and annual report information will be used to prioritize Regional Board staff education and enforcement efforts and to develop future group general permits. Compliance is measured through implementation of pollution prevention Best Management Practices, reduction in pollutant loadings, and accurate and timely report submittal.

September 8, 1994

VI.F. BAY PROTECTION AND TOXIC CLEANUP PROGRAM

The State Water Resources Control Board (State Board) established the Bay Protection and Toxic Cleanup Program in response to legislation enacted in 1989 (Chapter 269; Senate Bill 475 Torres) which added Chapter 5.6, Sections 13390 through 13396, to the California Porter-Cologne Water Quality Control Act. The Bay Protection and Toxic Cleanup Program is a statewide program that is coordinated with the California Department of Fish and Game and California Environmental Protection Agency's Office of Environmental Health Hazard Assessment. The Water Code requires the State and Regional Water Quality Control Boards to do the following to attain the goals of the Bay Protection and Toxic Cleanup Program:

1. Develop and maintain a program to identify toxic hot spots, plan for their cleanup or mitigation, and amend Water Quality Control Plans/Policies to abate toxic hot spots;
2. Formulate and adopt a Water Quality Control Plan for enclosed bays and estuaries;
3. Review and, if necessary, revise Waste Discharge Requirements to conform to the Plan;
4. Develop a database of toxic hot spots;
5. Develop an ongoing monitoring and surveillance program;
6. Develop sediment quality objectives;
7. Develop criteria for assessment and priority ranking of toxic hot spots; and
8. Fund the program through fees on point and nonpoint dischargers. (California Code of Regulations, Title 17, Section 2236, authorizes the fee program).

Funds for the Bay Protection and Toxic Cleanup Program will come from user fees, as proposed by State Board staff. User fees have been drafted for the following:

IV-27

1. All NPDES and WDR dischargers to the ocean, bays, or estuaries;
2. Counties or cities which operate a storm drain system which discharges to the ocean, a bay, or estuary;
3. Dischargers of agricultural drainage to the ocean, bays, or estuaries;
4. Boat construction and repair facilities;
5. Boat marinas and recreational facilities;
6. Operators of commercial harbors and ports; and
7. Operators of dredging discharges.

The fees are based on threat to water quality, as defined by the Waste Discharge System (WDS) ranking system (threat to water quality and complexity criteria).

The Central Coast Regional Board has identified 17 potential toxic hot spots to be addressed under this program. These 17 sites are identified in the Appendix. An assessment/monitoring plan has been developed for potential toxic hot spots. Potential hot spots are ranked according to threat to beneficial uses. The assessment/monitoring plan includes the following:

1. Definition of the extent of degradation;
2. Analysis of existing point and nonpoint discharges in the area;
3. Identification of contaminant sources; and
4. Development of options for removing the threat to beneficial uses, including consideration of additional effluent limits on point and nonpoint discharges and actual cleanup.

VI.G. MILITARY INSTALLATIONS

Military installations throughout the country include some of the largest and most complex contamination problems. In 1987, President Reagan signed into law Executive Order No. 12580 directing all federal facilities to investigate and remediate areas of environmental contamination. As a result, the U.S. Department of Defense has assumed responsibility for investigation and remediation at military bases. Certain environmental restoration projects involving hazardous materials and wastes from past military activities are being addressed through what is known as the U.S. Department of Defense Program. Although U.S. Department of Defense has assumed environmental restoration responsibility, the Regional Board is an active oversight participant.

From its inception, the Regional Board has been involved with a variety of military installation activities. Since 1990, this Regional Board has been actively and extensively involved in U.S. Department of Defense Program investigations and remedial activities at numerous military facilities within its jurisdiction. Active military installations in the Region addressed by the U.S. Department of Defense Program (current as of 1993) include Fort Ord, Presidio of Monterey, Monterey Naval Post Graduate School, Fort Hunter Liggett, Camp Roberts, Estero Bay Defense Fuel Supply Point, and Vandenberg Air Force Base. Fort Ord is unique since it is a closing base and has been identified as a federal superfund site. Four formerly used defense sites in the Region undergoing U.S. Department of Defense remediation (as of 1993) include: Camp San Luis Obispo - California National Guard, Camp San Luis Obispo - San Luis Obispo County, Paso Robles Airport, and Santa Barbara Airport. Potentially additional military facilities can be added to the U.S. Department of Defense Program.

Program Background

Decades of intense military activities have generated significant quantities of hazardous waste. As a result of insufficient internal control, improper handling and disposal practices, and inadequate regulation, military installations are now considered one of the

Nation's most significant environmental polluters. Pollution problems are exacerbated by the large base size, the complex and varying missions, as well as routine personnel changes and inconsistent regulation and control. Many bases are actually small to midsize, totally contained communities providing complete services for base operations. Services vary from base to base, but range from aircraft, vehicle, or shop maintenance and repair facilities to laundry services, photo shops, gas stations, and other typical municipal services (e.g., utilities, streets, water supply, sewerage, and solid waste disposal).

Past waste disposal practices in both government and private industries were insufficient to protect public health and the environment. Environmental laws and regulation developed in the 1970s addressed many deficiencies, but federal operations, especially the military, remained inadequately addressed. The military was adamant that sovereign immunity protected them from State and local environmental regulation. Enforcement actions to force the military to comply with State and federal regulation were often protracted or disregarded. In 1976, U.S. Department of Defense developed its Installation-Restoration Program to help identify, investigate, and cleanup contamination from past operations. Due to funding and timing, Program activities were initiated at most military facilities in the early 1980s.

In 1980, the federal Comprehensive, Environmental Response, Compensation, and Liability Act (CERCLA), which is also referred to as "Superfund" was enacted to address cleanup of hazardous substance disposal and spill sites. The Superfund Amendments and Reauthorization Act was enacted in 1986 to enhance hazardous waste cleanup. The Superfund Amendments and Reauthorization Act, in part, mandated the Defense Environmental Restoration Program specifically to address cleanups at U.S. Department of Defense facilities. The Defense Environmental Restoration Program included an Inland Restoration Program as a component. To carry out required environmental restoration at its military facilities, U.S. Department of Defense established the Defense Environmental Restoration Account as the funding mechanism.

Executive Order No. 12580 was enacted in 1987 to intensify investigation and remediation of

September 8, 1994

environmental problems. The Executive Order directed all federal agencies to ensure environmental restoration. To comply with this Executive Order, U.S. Department of Defense has assumed lead responsibility to cleanup military bases throughout the world. California has the largest number of active military bases covered by the military cleanup plan.

As a result of Executive Order No. 12580 and growing public awareness, U.S. Department of Defense is now actively pursuing environmental restoration at military facilities. U.S. Department of Defense has demonstrated its restoration sincerity by providing oversight reimbursement to the State. The Defense/State Memorandum of Agreement signed by U.S. Department of Defense and State of California officials, provides State oversight cost reimbursement to a maximum of one percent (1%) of the total cleanup cost. The Memorandum of Agreement requires preparation and administration of a cooperative agreement between the State and Corp of Engineers to verify funding and services for remedial responses. The Memorandum of Agreement lists specific sites for which the State will receive federal funding for its oversight and regulatory involvement. In California, Regional Boards and the Department of Toxic Substances Control share State regulatory responsibility and reimbursement dollars allocated to the U.S. Department of Defense Program.

To ensure proper regulatory compliance and environmental restoration, Executive Order No. 12580 requires all federal agencies to complete cleanup pursuant to "Superfund." This means cleanups at all military installations must comply with the stringent federal CERCLA requirements, whether or not the base is a listed Superfund site. The Act requires federal facilities which are placed on the Superfund National Priorities List by the U.S. Environmental Protection Agency (U.S. EPA), to conduct cleanup following the National Contingency Plan and U.S. EPA procedures and standards. In this Region, Fort Ord is the only currently listed U.S. Department of Defense Superfund National Priority List site.

In addition to following federal CERCLA requirements, Superfund National Priority List sites must be conducted pursuant to agreements called Federal Facility Agreements. These agreements are

IV-29

000029

between the federal agency owning the base (e.g., Department of the Army at Fort Ord) and the U.S. EPA. The agreements may include certain State agencies. The Fort Ord Federal Facility Agreement includes the Regional Board and Department of Toxic Substances Control as signatories.

By federal law non-Superfund military sites must cleanup hazardous waste releases pursuant to federal Comprehensive, Environmental Response, Compensation, and Liability Act requirements and to State laws. Federal non-Superfund facilities may enter into a State compliance agreement. Such an agreement is called a Federal Facility Site Remediation Agreement. At Vandenburg Air Force Base (a non-Superfund site), a Federal Facility Site Remediation Agreement was signed by the Department of the Air Force, the Regional Board, and Department of Toxic Substances Control in June 1991. Both Federal Facility Agreements and Federal Facility Site Remediation Agreements identify roles, responsibilities, dispute resolution procedures, and schedules.

By signing an agreement (Federal Facility Agreement and Federal Facility Site Remediation Agreement), and following federal CERCLA requirements, site remediation is modified from typical State procedures. The modification eliminates the need for State and local permits and enforcement action. Generally, Waste Discharge Requirements, Cleanup of Abatement Orders, and local agency permits are not imposed. Such provisions were included to ensure compliance with stringent federal cleanup standards, while limiting permit and enforcement involvement by local or State Agencies. In some parts of the Country, local and State involvement slowed or obstructed cleanup efforts.

The federal CERCLA (Section 121) does require compliance with State and federal laws and regulations which are more stringent than the CERCLA, and which are necessary to ensure site-specific environmental and public health protection. This compliance process is referred to as "Applicable" or "Relevant and Appropriate" requirements, because it allows consideration of either "Applicable" or "Relevant and Appropriate" requirements pursuant to State or federal law and regulations. At Superfund sites, U.S. EPA has final authority to approve "Applicable" or "Relevant and Appropriate" requirements. At non-Superfund sites,

the lead State agency is responsible to ensure "Applicable" or "Relevant and Appropriate" requirements are identified.

Federal Comprehensive, Environmental Response, Compensation, and Liability Act (Superfund) Response Process

Although cleanup pursuant to the federal CERCLA is quite complex, it was developed with the intent of simplifying regulatory requirements in a uniform manner and expediting environmental cleanup and restoration. The Act, although similar, is significantly more complex than the Regional Board's typical cleanup procedures pursuant to the California Porter-Cologne Water Quality Control Act. Following is a very simplified summary of the basic "Superfund" response process.

Many initial past military installation investigations included a Preliminary Assessment/Site Inspection. The Preliminary Assessment is an assessment based on existing, readily available information. The Preliminary Assessment attempts to evaluate the magnitude of a potential hazard and identify the source and nature of hazard release. The Site Inspection includes a site visit and possibly sample collection, soil borings, and well installation. The Site Inspection is intended to better characterize the problem and determine the need for further action. Often, information from the Preliminary Assessment/Site Inspection is used to place a site on the Superfund list.

Once a site has been Superfund listed, or has been identified as requiring remedial activities, more in-depth characterization is required. The next phase of remedial activities-site characterization is called the Remedial Investigation/Feasibility Study. The Remedial Investigation is the mechanism for collecting detailed site data to define fully the nature and extent of contamination. During the Remedial Investigation, treatability studies may be conducted to evaluate available treatment technologies in support of remedy selection. The Feasibility Study focuses on developing and screening specific remedial alternatives. The Feasibility Study goal is to identify preferred cleanup alternatives. The Remedial Investigation/Feasibility Study includes risk assessment, identifies "Applicable" or "Relevant and Appropriate" requirements, and develops cleanup goals.

The next phase is the Proposed Plan, which presents the preferred cleanup alternatives and allows public input. After public comments are considered, a Record of Decision is prepared at Superfund sites. The Record of Decision establishes cleanup levels and discharge standards and is based, in part, on identified "Applicable" or "Relevant and Appropriate" requirements. When the Record of Decision is complete and acceptable, the selected remedy is administratively approved by the military department, U.S. EPA, and the State (Regional Boards and Department of Toxic Substances Control). The final cleanup levels are established and "frozen" in the Record of Decision. Agencies that signed the Federal Facility Agreements also sign the Final Record of Decision. At non-Superfund sites in California, the typical document establishing the cleanup levels and discharge standards is called the Remedial Action Plan. The Remedial Action Plan is signed by the agencies that signed the Federal Facility Site Remediation Agreement. Decision Documents are used sometimes to identify cleanup levels for individual sites at non-Superfund installations. Agencies and the public can petition U.S. EPA to change the Record of Decision levels (or the State to change the Remedial Action Plan), if substantial evidence is available demonstrating that an established cleanup level is not protective of human health and the environment.

Once the Record of Decision (or Remedial Action Plan) is signed, Remedial Design plans are prepared to implement the Record of Decision. Remedial Action, the long-term remediation, begins when Remedial Design and construction are complete. Operation and maintenance, including monitoring, evaluate long term performance and ensure that the Remedial Action is carried out as intended. Long term remediation (e.g., ground water cleanup) continues until conditions of the Record of Decision (or Remedial Action Plan) have been met. Remediation progress must be evaluated at least every five years.

The federal CERCLA includes the Removal Action process to allow remediation of small/limited areas of contamination or time critical cleanups. A Removal Action may be undertaken at any time to address problems that do not require a full scale remediation project. Removal Actions are short term activities that remove immediate threats to public health or that can be implemented in a timely manner.

September 8, 1994

Generally, Removal Actions are limited to \$2 million and are completed in twelve months or less (e.g., removal and proper disposal of a small volume of surface soil contamination).

It is worthy to note that environmental assessment is addressed during the Remedial Investigation/Feasibility Study process. All military installations must comply with the National Environmental Policy Act by preparing an Environmental Impact Statement or Finding of No Significant Impact. An Environmental Impact Statement is similar to an Environmental Impact Report and a Finding of No Significant Impact is similar to a Negative Declaration in California. In California, National Environmental Policy Act compliance may not be sufficient to address all environmental impacts; thus, environmental assessment must also comply with the California Environmental Quality Act.

Regional Board Responsibility

The federal Clean Water Act and the California Porter-Cologne Water Quality Control Act give the Regional Board regulatory responsibility and authority to protect water quality, including waters within and beneath federal lands. The primary role of the Regional Board and its staff, relative to military installations (U.S. Department of Defense Program) is to ensure that waters of the State are adequately protected. Involvement includes review and direction of all investigation and remediation documents, site visits to guide field activities, and oversight to ensure that cleanup/remediation is carried out properly to protect beneficial uses of water resources. Identification of "Applicable" or "Relevant and Appropriate" requirements and direction on cleanup level establishment require considerable involvement by the Regional Board and its staff.

Typically, the U.S. EPA is the lead regulatory agency at Superfund sites (e.g., Fort Ord). The Regional Board and Department of Toxic Substances Control are responsible State agencies. In the past, at non-Superfund sites (all other military installations in the Region) either the Regional Board or Department of Toxic Substances Control has been the lead regulatory agency. At military installations where water quality and public health is threatened or impacted due to the release of hazardous

IV-31

000031

substances, the Regional Board and Department of Toxic Substances Control may have overlapping jurisdiction. A Memorandum of Understanding exists between the State Water Resources Control Board, the Regional Boards, and Department of Toxic Substances Control specifying roles and responsibilities in hazardous waste cleanups where overlap may occur. In September 1993, the California Environmental Protection Agency requested the overall State "lead" become Department of Toxic Substance Control's responsibility. This transition should not impact the basic responsibilities. In general, Regional Boards have primary regulatory responsibility for water and soils directly related to water quality protection. Department of Toxic Substances Control has primary regulatory responsibility for public health protection, soil (where waters are not involved), air, and hazardous waste treatment and storage.

In this Region, the Regional Board has been the lead State agency at six of the currently active (1993) U.S. Department of Defense facilities (Vandenberg Air Force Base, Estero Bay Defense Fuel Supply Point, Camp Roberts, Fort Hunter Liggett, Monterey Naval Post-Graduate School, and Presidio of Monterey). These sites are shown in Figure 4-1. The lead may be shared with Department of Toxic Substances Control at Fort Hunter Liggett, since there are several federal Resource Conservation and Recovery Act sites requiring investigation. In California, U.S. EPA has authorized Department of Toxic Substances Control to implement Resource Conservation and Recovery Act program compliance.

Agreements have been signed only at Fort Ord and Vandenberg Air Force Base in this Region. The Federal Facility Agreements for Fort Ord identifies the Regional Board as a support agency since the U.S. EPA is the lead regulatory agency. The current Federal Facility Site Remediation Agreement identifies the Regional Board as the lead agency at Vandenberg Air Force Base. Agreements could be negotiated at other military installations, or renegotiated when they currently exist, if and when it becomes necessary to clarify roles and responsibilities. Changes are being considered in California to streamline regulatory processes associated with military installation cleanup, particularly at closing bases. The California Environmental Protection Agency has recently designated (September 1993) Department of Toxic

Substances Control as the overall State lead at military installations. This designation will impact program activities, roles, and responsibilities.

VI.H. SPILLS, LEAKS, INVESTIGATIONS AND CLEANUP PROGRAM

The Spills, Leaks, Investigations, and Cleanup program was established to allow Regional Boards to address water quality problems and potential problems resulting from discharges not covered by other State programs. Investigations and cleanups of Spills, Leaks, Investigations, and Cleanup program sites proceed as described in State Board Resolution No. 92-49 explained in the "Hazardous Waste Compliance Issues" section later in this chapter.

Spill, Leak, and Complaint Responses

Regional Board staff responds to complaints of nuisance conditions (e.g., odors from sewage treatment plants) and discharges or threatened discharges of substances which may impact ground and/or surface water quality. Complaints are followed up as soon as feasible. Proper response to a complaint includes the following:

- * Completion of a Central Coast Region spill report form.
- * Notification to other responsible agencies, or interested parties, as needed.

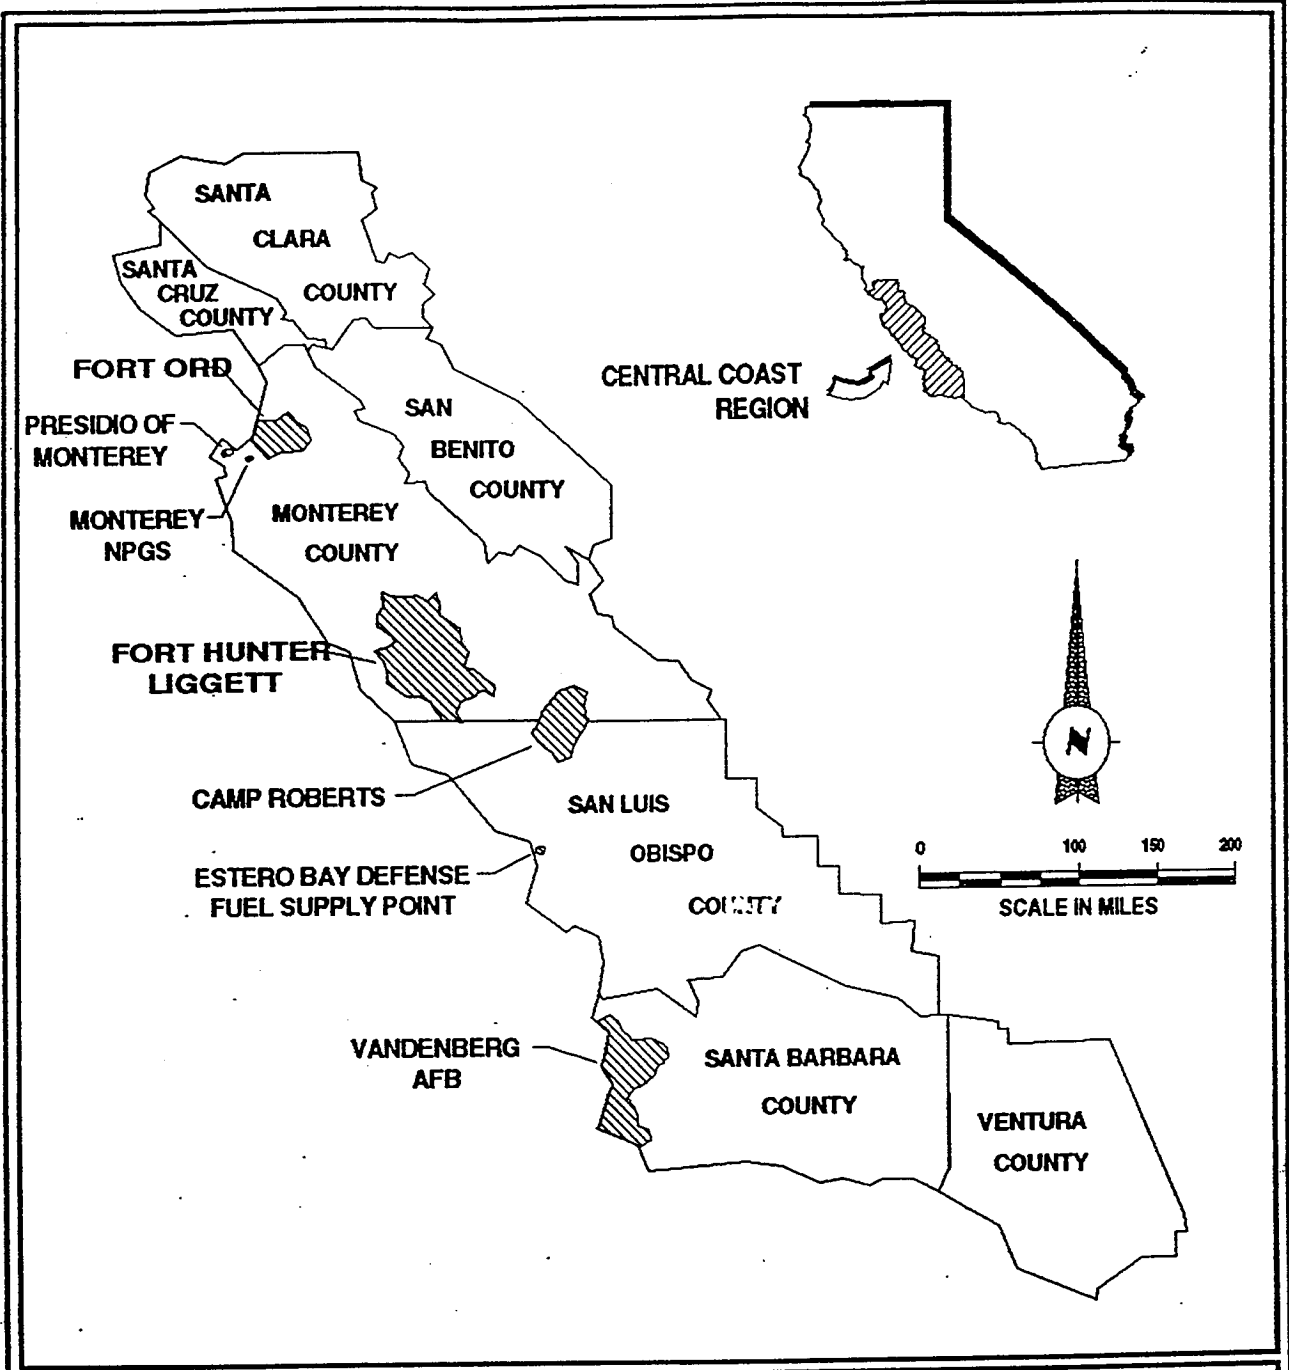

FIGURE 4-1. ACTIVE MILITARY INSTALLATIONS IN THE CENTRAL COAST REGION

- * Site inspection to determine validity of the complaint and to assess the situation, including determination of responsible party/parties.
- * Written follow-up as needed (letters, cleanup or abatement orders, and/or waste discharge requirements).
- * Except in cases where anonymity is requested, notification to complainant of findings and subsequent actions, if any.

Except for a discharge in compliance with waste discharge requirements, any person who causes or permits any reportable quantity of hazardous substance or sewage to be discharged in or on any waters of the State, or discharged or deposited where it is or probably will be discharged into or on any waters of the State, shall, as soon as possible, notify the Office of Emergency Services of the discharge in accordance with the spill reporting provision of the State toxic disaster contingency plan. The person shall also immediately notify the State Board or the appropriate Regional Board of the discharge (California Porter-Cologne Water Quality Control Act Section 13271).

Similarly any person who discharges any oil or petroleum product under the above stated conditions shall, as soon as possible, notify the Office of Emergency Services of the discharge in accordance with the spill reporting provision of the State oil spill contingency plan. Immediate notification of an appropriate agency of the federal government, or of the appropriate Regional Board (in accordance with the reporting requirements set under California Porter-Cologne Water Quality Control Act Section 13267 or 13383) shall satisfy the oil spill notification requirements of this paragraph (California Porter-Cologne Water Quality Control Act Section 13272).

The Regional Board staff will assist other agencies and work cooperatively at large-scale hazardous material releases resulting from surface transportation accidents. The Regional Board staff's role is primarily to provide immediate, on-site technical assistance concerning water quality in order to minimize the potential damage to the public health and safety, and the environment. In cases of railroad incidents, Regional Board staff will work with other agencies pursuant to the Office of Emergency Services Railroad Accident Prevention

IV-34

and Immediate Deployment Plan. Specifically, Regional Board staff are required to:

- * Provide information on existing downstream beneficial uses and potential impacts from released substances.
- * Provide toxicity information about released substances.
- * Set up water sediment monitoring program.
- * Collect water samples or provide technical assistance for others to collect samples.
- * Coordinate available resources and equipment.

VI.I. UNDERGROUND STORAGE TANK PROGRAM

In 1981, citizens of Santa Clara County determined the cause of numerous birth defects to be polluted ground water. The source of pollution was traced to underground storage tanks leaking chlorinated solvents. This revelation prompted the San Francisco Bay Regional Water Quality Control Board to investigate numerous other underground storage tanks, the majority of which were found to be leaking. The Santa Clara County Fire Chiefs Association then sponsored a task force which developed, in 1982, a Model Hazardous Material Storage Permit Ordinance. The Ordinance addressed materials regulated, secondary containment, permits, inspections, and so forth.

Recognizing the problem was a statewide problem, the Legislature passed the initial State underground storage tank law in 1983, and numerous counties and cities followed with local ordinances to regulate underground storage of hazardous materials. The State law contains a sunset provision with a termination date of January 1, 1998.

Since 1985, over 21,000 leaking tank sites have been reported statewide and over 1250 have been reported within the Central Coast Region. Of the reported cases, approximately 90% are petroleum

September 8, 1994

000034

product cases and one-third have impacted ground water. As one might expect, Regions with the larger cities (thus more gasoline stations) have the largest number of reported leaks. The same holds true in the Central Coast Region. Santa Barbara County has almost fifty percent of the cases in this Region (up from 37% a few years ago) and San Benito County has only four percent; Monterey County has about twenty percent.

The Health and Safety Code gives both Regional Boards and local agencies authority to oversee investigation and cleanup of leaky Underground Petroleum Storage Tank sites. The California Code of Regulations, Title 23, Chapter 16, Article 11 requires local agencies to oversee leak reporting and tank closures. Two agencies within the Central Coast Region, Santa Clara and Santa Barbara Counties, also provide oversight for cleanup of leaky Tank sites under a Local Oversight Program contract with the State Board.

Unauthorized releases from underground tanks are reported to the Regional Board by local agencies or private parties. Generally, investigation and cleanup of leaky Underground Petroleum Storage Tank sites is shared between the Regional Board and local agencies. Typically the Regional Board oversees cases involving impact to surface and ground water and local agencies oversee impacts to soil. However, in some circumstances the Regional Board oversees both soil and ground water cleanup, and, in Santa Barbara and Santa Clara Counties, Local Oversight Programs oversee both soil and ground water cleanup.

Investigations and cleanup of leaky Tanks are carried out in a manner similar to investigations and cleanups in the Spills, Leaks, Investigations, and Cleanup Program mentioned earlier.

To assist responsible parties to pay for cleanups and to meet federal financial responsibility requirements, the State has established a Tank Cleanup Fund. Money for the fund is generated by a fee paid for each gallon of petroleum delivered to Tanks. Owners and operators of Tanks may draw upon the fund after paying for the initial \$10,000 in cleanup costs. The Fund will pay up to \$990,000 per cleanup.

Underground Petroleum Storage Tank regulations regarding construction, monitoring, repair, release

September 8, 1994

reporting, and corrective action are found in the California Code of Regulations, Title 23, Division 3, Chapter 16. Regulations regarding the State's Underground Petroleum Storage Tank Cleanup fund are found in California Code of Regulations, Title 23, Division 3, Chapter 18, and regulations regarding underground testers are found in California Code of Regulations Title 23, Division 3, Chapter 17.

VI.J. ABOVEGROUND PETROLEUM STORAGE TANKS

Above ground petroleum storage tanks and associated piping leaks have been found to cause impacts to surface and ground water. Prior to 1990, above ground tank sites were regulated by the United States "Environmental Protection Agency Regulations on Oil Pollution Prevention", 40 Code of Federal Regulations Section 112, as amended. On January 1, 1990, the Above Ground Petroleum Storage Act became effective as Chapter 6.67 (commencing with Section 25270), Division 20, of the Health and Safety Code and amendment to Section 7106 of the Public Resources Code. The regulations require:

- Regional Boards to inspect above ground storage tanks used for crude oil and its fractions;
- Owners or operators of tank facilities to prepare and initiate a spill prevention control and countermeasure plan in accordance with Part 112, Subchapter D, Chapter I, Title 40 of the Code of Federal Regulations by January 1, 1991 and any required monitoring program within 180 days later;
- Tank facility owners or operators to report releases of crude oil and its fractions in excess of one barrel; and
- Owners or operators of tank facilities to submit a storage statement and appropriate filing fee every two years.

IV-35

000035

The Above Ground Petroleum Storage Act provides for recovery of cost incurred by Regional Board staff for oversight of above ground tank site cleanups.

VI.K. CALIFORNIA CODE OF REGULATIONS, TITLE 23, CHAPTER 15

The California Code of Regulations, Title 23, Chapter 15 (Chapter 15) contains minimum, prescriptive standards for proper management of applicable wastes. Landfills, surface impoundments, septage and sludge disposal, mining operations, confined animal facilities, and some oil field exploration and production facilities are regulated according to Chapter 15. Regional Boards may impose more stringent requirements to accommodate regional and/or site-specific conditions. Factors affecting site specific considerations include: depth to ground water, permeability of underlying soils, geologic structure, importance of underlying ground water uses, waste characteristics, ability to remediate leaks, adequacy of the monitoring system, proximity of beneficial uses such as aquatic life, and others.

Dischargers may propose engineering alternatives to the construction or prescriptive standards contained in Chapter 15 if they can show the prescriptive standard is not feasible (i.e., too difficult or costly to implement, or not likely to perform adequately under the given circumstances). The proposed alternative must be able to provide equivalent management of the waste, and must not be less stringent than the prescribed standards.

Discharges to land which may be exempt from Chapter 15 are listed in the Basin Plan Waiver Policy in Chapter Five.

Wastes fall into four categories under the current classification system. These four categories are: Hazardous, Designated, Non-Hazardous, and Inert, and are defined in Article 2 of Chapter 15. Hazardous and Designated wastes can often be generated by the same source and may differ only by their concentrations of given constituents.

Wastes must be disposed of differently depending on their liquids content and the waste category into which they fall. A table containing the Summary of Waste Management Strategies for Discharge of Waste to Land is provided in the appendix.

Receiving water monitoring is required at all waste management units. Article 5 discusses the monitoring requirements for the various classes of waste management units, and describes the progressive phases of monitoring.

The routine ground water monitoring conducted during the entire compliance period of a project's life is referred to as "detection monitoring". If a release (leak) is detected during the course of detection monitoring, an "evaluation monitoring" program must be established. If the evaluation monitoring verifies the presence of a leak, a decision must be made as to whether the release represents a significant enough threat to water quality and the environment to warrant corrective action. If the leak is a significant water quality threat, a "corrective action program" must be established, including monitoring of the effectiveness of corrective action, and conducted until the problem has been successfully corrected.

Vadose zone monitoring must be conducted at all waste management units where feasible. Article 5 discusses the minimum requirements for an acceptable vadose zone monitoring program.

Special requirements for confined animal facilities are discussed in Article 6 of Chapter 15 and in Chapter 5 of this Basin Plan. These facilities are also subject to other portions of Chapter 15 as applicable.

Under Chapter 15, mining waste discharges are only subject to the requirements of Article 7, or other portions of Chapter 15 as referenced by Article 7. (Mining wastes are also subject to regulation under the Surface Mining and Reclamation Act, Public Resources Code Title 14, Division 2, Chapter 9).

Discharges of hazardous and nonhazardous waste, and the waste management units at which the wastes are discharged (e.g., landfills, surface impoundments), are regulated by the Regional Board through Waste Discharge Requirements to properly contain the wastes, and to ensure effective monitoring is undertaken to protect water resources

of the Region. These waste discharges are also concurrently regulated by other State and local agencies. Local agencies implement the State's solid waste management programs as well as local ordinances governing the siting, design, and operation of solid waste disposal facilities (usually landfills) with the concurrence of the California Integrated Waste Management Board.

The California Integrated Waste Management Board also has direct responsibility for review and approval of plans for closure and post-closure maintenance of solid waste landfills. The Department of Toxic Substance Control issues permits for all hazardous waste management, treatment, storage, and disposal facilities. The State Board, Regional Boards, California Integrated Waste Management Board, and Department of Toxic Substances Control have entered into Memorandums of Understanding to coordinate their respective roles in the concurrent regulation of these discharges.

The laws and regulations governing both hazardous and nonhazardous solid waste disposal have been revised and strengthened in recent years.

An inactive waste management unit can still pose a threat to water quality. In fact, due to the nature of some wastes and the characteristics of some disposal sites, sometimes water quality problems do not become evident until years after a site has closed. Therefore, Chapter 15 requires all waste management units have a plan for acceptable closure procedures and post-closure maintenance and monitoring.

VI.K.1. SOLID AND LIQUID WASTE REQUIREMENTS (LANDFILLS AND SURFACE IMPOUNDMENTS)

Solid wastes are usually disposed of in a landfill or Solid Waste Disposal Site. A landfill, as defined in Chapter 15, is a waste management unit at which waste is discharged in or on land for disposal. A landfill may be classified as Class I, II, or III, depending on the type of waste being accepted, but the term "landfill" typically refers to a Class III

municipal solid waste landfill which accepts only inert or non-hazardous, municipal solid waste. Class I units are for hazardous wastes, Class II units are for designated wastes, and Class III landfills are for nonhazardous wastes as defined in Chapter 15, Article 3. Landfills are an integral component of many communities in the Central Coast Region. Hazardous and/or designated solid wastes must be disposed of in Class I or II landfills or waste piles, respectively, also referred to as Resource Conservation and Recovery Act or non-Resource Conservation and Recovery Act solid waste management units.

Liquid wastes may not be disposed of to Class III waste management units. Rather, liquid wastes must be discharged to Class I or II surface impoundments, depending on the waste classification.

Discharges from solid and liquid waste management units can impact both ground and surface waters. The receiving water most likely to be at risk from a waste management unit is the ground water beneath the site. Precipitation or runoff may enter the unit and contact the waste, percolate through it, and travel to ground water, carrying constituents of the waste with it to the vadose zone or ground water beneath the unit. Solid waste may contain enough free liquids to form a leachate which can migrate to ground water. Vapors may migrate from a waste management unit into the soils and ground water below the unit. Gases forming in a closed waste management unit may pressurize the unit and force contaminants into the ground water. A liquid waste impoundment may leak its content into the soils and ground water beneath the unit. Liquids may exit a waste management unit and travel to nearby surface waters. Uncontained solid waste may also be transported to surface waters by wind.

The Regional Board regulates all the active waste management units and some of the closed units in the Region under Waste Discharge Requirements which contain pertinent Chapter 15 regulations. Some of the applicable requirements include:

1. Waste management units must be sited in locations where they will not extend over a known Holocene fault, other areas of rapid geologic change or into areas with inadequate separation from ground water.

September 8, 1994

IV-37

000037

2. Waste management units must be constructed to minimize (Class III) or prevent (Class I and II) the possibility of leachate contacting ground water. The probability of accomplishing this goal may be improved by siting the unit in an area where the depth to ground water is very great or where natural geologic features will provide containment. A Class III waste management unit is required to have a composite clay and synthetic liner with a leachate collection and removal system, in accordance with federal Subtitle D requirements. New Class I and II units must also be lined. A discharger may propose engineered alternatives to the Chapter 15 and Subtitle D containment requirements, but the alternatives must provide equal or greater protection to the receiving waters at the site, per Article One.
3. To minimize or prevent the formation of leachate, solid waste management units shall be covered periodically (typically daily) with soil or other approved materials. The importance of effective interim cover is illustrated by recent improvements to some landfill interim covers which resulted in an apparent cessation of ground water degradation. Rainwater surface flow from offsite should be prevented from entering a waste management unit and contacting the wastes in the unit.
4. The potential receiving waters shall be monitored. A waste management unit shall have sufficient ground water monitoring wells at appropriate locations and depths to yield ground water samples from the uppermost water bearing strata with continued saturation at depth, to provide the best assurance of the earliest possible detection of a release from the waste management unit. Perched ground water zones shall also be monitored. Background monitoring should be conducted for at least one year prior to opening a new waste management unit.

Chapter 15 requires vadose zone monitoring at all new sites and at any existing site, unless it can be shown to the satisfaction of the Regional Board no vadose zone monitoring devices would work at the site, or that installation of vadose zone monitoring devices would require unreasonable dismantling or relocating of permanent structures.

IV-38

5. All operating waste management units must have an approved closure/post-closure monitoring and maintenance plan and their operators must provide the Regional Board with assurance sufficient funds are irrevocably committed to ensure the site will be properly reclaimed and maintained.
6. The operator of a waste management unit must obtain and maintain assurances of financial responsibility for known and foreseeable releases from the unit.

VI.K.2. WASTEWATER SLUDGE/SEPTAGE MANAGEMENT

Wastewater sludge (biosolids) is a by-product of wastewater treatment. Treated domestic sludge is now referred to as biosolids to encourage using this material for fertilizer and soil amendment. Raw sludge usually contains 93 to 99.5 percent water with the balance being solids present in the wastewater and added to or cultured by wastewater treatment processes. Most Publically Owned Treatment Works treat the sludge prior to ultimate use or disposal. Normally, this treatment consists of dewatering and/or digestion.

Treated and untreated sludges may contain high concentrations of heavy metals, organic pollutants, pathogens, and nitrates. Improper storage and disposal of municipal sludges on land can result in degradation of ground and surface water. Therefore, sludge handling and disposal must be regulated.

Septage and grease are usually considered liquid waste, so landfill disposal is usually restricted. Septage, the residual solids periodically pumped from septic tanks, is commonly applied to farm land as fertilizer. Grease waste is usually recycled, but grease trap pumpings are commonly rejected by grease recyclers. Grease and septage usually must be disposed in a Class I or II waste management unit.

The Regional Board will regulate disposal of sludge and septage pursuant to Chapter 15 and Department

September 8, 1994

000038

of Health Services standards for sludge management.

Sludge containing less than 50% solids by weight may be placed in a Class III landfill (see section on Chapter 15) if it can meet the following requirements, otherwise it must be placed in a Class II surface impoundment:

1. The landfill is equipped with a leachate collection and removal system;
2. The sludge must contain at least 20 percent solids if primary sludge, or at least 15 percent solids if secondary sludge, mixtures of primary and secondary sludges, or water treatment sludge; and
3. A minimum solids-to-liquid ratio of 5:1 by weight must be maintained to ensure that the co-disposal will not exceed the initial moisture-holding capacity of the nonhazardous solid waste. The Regional Board may require that a more stringent solids-to-liquid ratio be maintained, based on site-specific conditions.
4. Non-hazardous sludge containing greater than 50% solids by weight is generally considered solid waste.

Beneficial reuse of sludge/septage is increasing in popularity. Sludges and septage, (including composted, liquid, dewatered and dried sludges) have been successfully used as a soil amendment/fertilizer on farmland, orchards, forest lands, pasture, land reclamation projects (e.g., strip mines and landfills), parks and home gardens. As the concentrations of heavy metals has dropped in municipal sludge, and as advanced sludge treatment methods are utilized, the public's acceptance of beneficial reuse projects has improved. However, improper land application of sludge/septage can cause significant odor nuisance, attract flies, contain high levels of pathogens and heavy metals, and be aesthetically offensive due to the presence of plastics.

Currently, regulation of sludge and septage management projects is under the jurisdiction of the Regional Board. Handling and disposal of sludge/septage can be regulated under Chapter 15 of Title 23, California Code of Regulations and

September 8, 1994

California Department of Toxic Substance Control Standards for hazardous waste management. If sludge is used beneficially, the project may be exempted from Chapter 15, but the Regional Board may issue waste discharge requirements.

The U.S. Environmental Protection Agency (U.S. EPA) has promulgated a policy of promoting those municipal sludge management practices that provide for the beneficial use of sludge and septage while maintaining or improving environmental quality and protecting public health. On February 19, 1993, the U.S. EPA published final sewage sludge regulations in 40 Code of Federal Regulations 503. The 503 regulations are intended to assure that use and disposal of sewage sludges and septage comply with federal sludge use and disposal criteria developed by the U.S. EPA. The State Board or the California Integrated Waste Management Board may develop a State sludge management program consistent with the U.S. EPA's policy and criteria for land application, surface disposal, and incineration of sludge to seek federal authorization to implement the 40 Code of Federal Regulations 503 sludge regulations.

VI.K.3. MINING ACTIVITIES (NONFUEL COMMODITIES)

The Central Coast has had a rich and varied mining history. Currently extracted products include asbestos, decomposed granite, diatomite, dimension stone, dolomite, gypsum, limestone, sand and gravel, shale, specialty sand and stone. The hundreds of inactive metal mines and prospects appear to be the worst polluters though. Mercury, used partly to amalgamate gold ore, was mined from the Little Bonanza deposit, San Luis Obispo County, as early as 1862. The Buena Vista Mine, which ceased production in 1970 or 1971, is believed to have been the last mercury producer in the Central Coast Region. Chromite deposits have been mined in San Luis Obispo County since about 1870. By 1944, and probably until the demise of production possibly 20 years ago, San Luis Obispo County produced more chromite than any other California county. Other products mined or prospected for historically include gold, silver, manganese,

IV-39

000039

magnesium, antimony, copper, nickel, iron, barite, coal, feldspar, gemstones, biotite, molybdenum, peat, phosphate, sodium sulfate, sulfur, titanium, uranium, zircon, and possibly platinum.

The extent of environmental degradation by all mining ventures is not yet known. Active operations are regulated individually pursuant to the California Code of Regulations, Chapter 15, the Porter-Cologne Water Quality Control Act, the California Surface Mining and Reclamation Act and/or the federal Clean Water Act (including the NPDES permit program). About 25 active mines currently hold Waste Discharge Requirements and/or NPDES surface water discharge permits and a few operations have been granted waivers. Chapter 15 land disposal requirements are imposed as required.

Inactive operations with responsible parties fall under the same purview, as warranted. Inactive mines, with or without responsible parties (those without are considered abandoned) may be remediated as federal Superfund sites pursuant to federal Comprehensive, Environmental Response, Compensation, and Liability Act, or as State Board Cleanup and Abatement Account sites. Low interest loans or government or academic grants may, in rare cases, be applied to inactive mine remediation.

Mines are subject to the Resource Conservation and Recovery Act, although comprehensive regulations have not yet been written. If hazardous constituents are present, Resource Conservation and Recovery Act, Subtitle C, and California Code of Regulations Title 22 may apply to active and inactive sites.

VI.K.4. OTHER INDUSTRIAL ACTIVITIES

Cement Industry -- Concrete manufacturing operations generate two significant types of solid waste, kiln dust and "off-specification" concrete. The first, kiln dust, is classified as a designated waste under Title 22 and is typically disposed of in Class II or III landfills operated by the concrete manufacturers. The second waste, "off-spec" concrete, is generated in much greater quantities and, while classified as a hazardous waste due to its

very high pH (often ranging from 12.5 to 13.5 pH units), is frequently dumped on-site at the concrete plants and spread.

Cement batch plants generate large quantities of liquid and semi-solid wastes from rinsing of cement trucks and/or cement covered equipment. This waste, referred to as "washout" is very alkaline (pH may be as high as 12.5 in fresh cement), is high in total dissolved solids, and may contain assorted heavy metals. Washout may also contain various air-entrainment additives or other chemicals.

The Regional Board regulates cement kiln dust disposal and all ready mix cement plants where water quality could be impacted. Wastewater from cement batch plants is considered to be a designated waste, and may need to be discharged to a lined impoundment, if site-specific characteristics (e.g., soil type, depth to ground water, ground water quality, etc.) will not protect ground water from degradation. The Regional Board will consider, on a case-by-case basis, the need to line cement wastewater ponds. Solid or semi-solid wastes should be deposited in landfills or other legal points of disposal unless the discharger can demonstrate the waste will not pose a threat to water quality if deposited onsite.

Asphalt production -- Asphalt batch plants generally involve mixing heavy long chain hydrocarbons with aggregates. Occasionally other hydrocarbon sources (diesel and gasoline contaminated soil) are mixed with asphalt as a beneficial reuse. Diesel fuel and other solvents are used to clean equipment and as "lubricants" to prevent asphalt from sticking to equipment. Large quantities of these materials are generally stored on-site. Water quality can be significantly degraded if these materials reach water courses. Waste control measures are fairly straightforward at such sites. Petroleum products should be stored in tanks, and the tanks placed in lined holding areas. If spillage to soil occurs, contaminated soils should be scraped up, stored on a liner, and incorporated into asphalt as soon as possible. A berm (or other runoff control) should be placed downgradient from earthen material stockpiles.

Oil Field Exploration and Production Facilities -- Oil exploration and production is a thriving business in the Central Coast Region. Although drilling muds

are exempt from Resource Conservation and Recovery Act, Oil Exploration and Production Operations are often subject to the requirements of Chapter 15 because they represent a threat to water quality. Due to the significant Chapter 15 workload, remote oil operations may not reach the top of the regulatory priority list. The Interstate Oil and Gas Compact Commission recently recommended:

"The review team recommends State Board obtain the resources necessary to fully discharge its responsibilities...seek adequate resources from the legislature or use some other mechanism to enable Regional Boards to process applications for WDRs in a timely manner...One option is to remove or raise the statutory cap on discharger fees so that State Board may restructure its fee system to improve its equity and cure substantial resource shortcomings."

The Interstate Oil and Gas Compact Commission also commended the Central Coast Regional Board for having a road spreading policy. This policy, Resolutions No. 73-05 and 89-04, is located in the appendix.

VI.1. RESOURCE CONSERVATION RECOVERY ACT (SUBTITLE D)

Policy for Regulation of Discharges of Municipal Solid Waste

On June 17, 1993, the State Water Resources Control Board (State Board) adopted Resolution 93-62, entitled Policy For Regulations Of Discharges Of Municipal Solid Waste. A copy of this policy is available in the appendix.

The Policy implements the State Board's regulations governing the discharge of waste to land, California Code of Regulations, Title 23, Chapter 15 (23 California Code of Regulations Section 2510 et seq., "Chapter 15"), and implements those water quality related portions of the federal regulations governing

the discharge of municipal solid waste at landfills (40 Code of Federal Regulations Section 258.1 et seq., "federal municipal solid waste regulations") that are not addressed by Chapter 15. The federal municipal solid waste regulations apply to all landfills that receive waste on or after October 9, 1991; the majority of the federal provisions become effective on October 9, 1993 (federal deadline).

The Policy directs Regional Boards to revise or adopt, as appropriate prior to the Federal Deadline, the waste discharge requirements (WDRs) for each landfill subject to the federal municipal solid waste regulations. The revised WDRs must implement those regulations in the manner described in the Policy and must implement the Chapter 15 regulations as well.

Landfills are subject to Subtitle D in California beginning October 9, 1993 or October 9, 1995 depending on landfill size and whether it is within one mile of a drinking water intake.

These federal regulations apply to municipal solid waste landfills (Class III landfills, under Chapter 15). The Subtitle D regulations outline the classification of municipal landfills, siting criteria, design criteria, operation procedures, water quality monitoring parameters and standards, closure and post-closure care requirements, and financial assurance guidelines similar to Chapter 15. U.S. EPA considers Subtitle D to be minimum standards for landfill operation. States may have equal or more stringent requirements, but may not have less stringent requirements. If a state's landfill regulation program meets U.S. EPA's approval, that state may apply to become an U.S. EPA "approved state" for landfill regulation.

California received Subtitle D approval in October 1993 and will be able to consider engineering alternatives to certain provisions of Subtitle D.

September 8, 1994

IV-41

000041

VI.M. SOLID WASTE WATER QUALITY ASSESSMENT TEST

In 1984, California Porter-Cologne Water Quality Control Act Section 13273 was adopted to require operators (and/or owners) of active and inactive solid waste disposal sites to perform a Solid Waste Assessment Test investigation. About 150 sites per year are to be analyzed statewide. The State Board has approved a statewide ranked list including 2,242 sites in 15 ranks. It has prioritized all sites on the basis of the potential threat to water quality and has established schedules for Investigation Workplan (Workplan) and Solid Waste Assessment Test report's submittals. The Central Coast Region's 15 ranks include 131 sites. Test reports are due the first day of July each year, depending on their ranking. Rank One sites were due July 1, 1987.

If monitoring information conclusively demonstrates hazardous waste is migrating, or has migrated to State waters, the site owner/operator may request a waiver of the Test reporting requirements pursuant to Water Code Section 13273(c). Waiver requests are usually requested within 120 days of the notification date. Water Code Section 13273.1 allows the site operator to request an exemption from Test reporting requirements by submitting a Solid Waste Assessment Questionnaire. Questionnaires may be submitted if a site contains less than 50,000 cubic yards of waste and is not known nor suspected of containing hazardous substances, other than household hazardous wastes. Based on this Questionnaire, the Regional Board may exempt the Operator from all or part of the Solid Waste Assessment reporting requirements.

Solid Waste Assessment Test reports are required to contain:

1. An analysis of the surface and ground water on, under, and within one mile of the solid waste disposal site to provide a reliable indication whether there is any leakage of hazardous waste.
2. A chemical characterization of the soil-pore liquid in those areas which are likely to be affected if the solid waste disposal site is leaking, as compared to geologically similar areas near the

solid waste disposal site which have been affected by leakage or waste discharge (Porter-Cologne §13273(b)).

3. A finding whether hazardous waste is leaching into surface or ground water on, under, and within one mile of the disposal site.

If hazardous waste has migrated, the Regional Board must notify the Department of Health Services and the Integrated Waste Management Board, and take appropriate remedial action (Porter-Cologne §13273(e)).

More than eighty percent of Test sites (mostly unlined) evaluated in all climates and geologic terrain in California have been found to impact ground water quality as part of the Solid Waste Assessment Test program.

From the beginning, the Test program was supported by the California General Fund. In recent years, agencies with programs with such funding have been under increasing pressure to find alternative funding or face elimination. These pressures resulted in the Test Program being understaffed and, in the summer of 1991, eliminated. At that time, almost 200 Test Reports had been accepted and reviewed by the Regional Water Boards. However, a backlog of nearly 300 additional Test Reports had been submitted and had not been reviewed. The Central Coast Region had reviewed and accepted 29 reports, however 14 were backlogged.

In 1992, the Legislature adopted Assembly Bill 3348 (Eastin) which allocated \$2,500,000 from the Integrated Waste Management Board's "Solid Waste Disposal Site Cleanup and Maintenance Account" to the State and Regional Boards to fund the review of the above backlog. This law restricted these funds to the review of Solid Waste Assessment Reports from Ranks One through Five only and required the work be in accordance with a Memorandum of Understanding between the Regional Boards and the California Integrated Waste Management Board. This Memorandum of Understanding was signed by the Executive Directors of the two agencies in January 1993.

VII. HAZARDOUS WASTE COMPLIANCE ISSUES

The Regional Board obtains information regarding hazardous waste discharge through two reporting programs. These programs are "Reportable Qualities of Hazardous Waste and Sewage Discharges" and the "Proposition 65" program. These mechanisms are discussed below:

VII.A. REPORTABLE QUANTITIES OF HAZARDOUS WASTE AND SEWAGE DISCHARGES

California Porter-Cologne Water Quality Control Act Section 13271 requires the State Board and the Department of Health Services to adopt regulations establishing reportable quantities for substances listed as hazardous wastes or hazardous materials pursuant to Section 25140 of the Health and Safety Code. Reportable quantities are those which should be reported because they may pose a risk to public health or the environment if discharged to ground or surface water.

Similarly, the State Board was required to adopt regulations establishing reportable quantities for sewage. These requirements for reporting the discharge of sewage and hazardous materials do not supersede waste discharge requirements or water quality objectives.

The regulations for reportable quantities adopted by the State Board are included in Subchapter 9.2 of the California Code of Regulations.

VII.B. PROPOSITION 65

The Safe Drinking Water and Toxic Enforcement Act of 1986 (Proposition 65) went into effect January 1, 1987. Proposition 65 is found in the Health and Safety Code, Section 25249.5, et seq.. It prohibits discharges of chemicals known to the State to cause cancer or reproductive toxicity to a potential source of drinking water, with certain exceptions. The Governor is required to publish a list of such chemicals. The list must be updated yearly. The current list is found in 22 California Code of Regulations, Section 12000.

Section 25180 of the Health and Safety Code requires designated governmental employees to disclose information to the local Board of Supervisors and local health officer regarding an illegal discharge of hazardous waste if the discharge is likely to cause substantial injury to the public. A designated employee is one who is required to sign a conflict of interest statement. Any designated employee who knowingly or intentionally fails to report information, as required by Proposition 65, is subject to fines and imprisonment (Section 25180.7). The following information should be reported:

- * Discharge type
- * How discharge was discovered
- * Location of discharge
- * Probable discharger
- * Possible contacts
- * Concentration of contaminant in soil and/or water.

VIII. NONPOINT SOURCE MEASURES

The State Nonpoint Source Management Plan initiated development of specific program objectives to be implemented at the State and Regional level. Currently, Regional Board staff are implementing the following State Board program objectives:

- A. Control of Nonpoint Source pollution (urban runoff; agriculture; land disturbance activities such as road construction/maintenance, land construction, timber harvesting, and mining; hydrologic modification; and individual disposal systems). These activities include outreach, education, public participation, technical assistance, financial assistance, interagency coordination, demonstration projects, and regulatory activities such as imposing septic tank area prohibitions.
- B. Preparation of contracts for projects selected for grant funding. Regional Board staff also participate in these projects by providing technical assistance and publicizing their results.
- C. Implementation of the 1990 Coastal Zone Act Reauthorization Amendments, as developed by the State Board and the California Coastal Commission. This shall be an enforceable Nonpoint Source Management Program to control land use and anthropomorphic activities impacts that have a significant affect on coastal waters. (Further discussion of the Amendments is provided later.)
- D. Initiation of nonpoint source watershed pilot programs.

Using State program objectives, Regional Board staff developed task-specific workplans to address nonpoint sources of pollution. For the Central Coastal Region, the following tasks are managed and implemented by the Nonpoint Source Program staff:

Task 1: Water Quality Assessment

Regional Board staff reviewed and updated the nonpoint source portion of the Water Quality Assessment and prepared water body fact sheets. (The Water Quality Assessment and water body fact sheets are discussed in Chapter Six.)

Task 2: Watershed Studies/Planning

Three impaired watersheds (Morro Bay Watershed, San Luis Obispo Creek Watershed, and San Lorenzo River Watershed) have been targeted for intensive activity. Major activities for San Luis Obispo Creek watershed include:

1. Develop a Demonstration "Total Maximum Daily Load" model.
2. Create a "San Luis Obispo Creek Riparian Task Force".
3. Implement a riparian corridor restoration project.
4. Identify major nonpoint pollutants and sources.
5. Develop a watershed management program.

For Morro Bay watershed, the activities include:

1. Develop a long term monitoring program to assess water quality improvements associated with the implementation of nonpoint source pollution control measures.
2. Develop funding for the long term monitoring program.
3. Implement a sediment reduction program using best management practices.
4. Participate in the Morro Bay Task Force.

For San Lorenzo River watershed, the activities include:

1. Develop a detailed assessment of Nonpoint Source impacts in the watershed.
2. Develop a wastewater management plan for on/off-site wastewater disposal.

3. Develop of a nutrient objective for the river.
4. Conduct experimental on-site wastewater treatment to reduce nitrogen discharge into the environment.

Task 3: Outreach Program

Staff meets regularly with individuals and local government agencies to promote education and solutions on Nonpoint Source problems. Additionally, the use of grant and loan resources to correct Nonpoint Source problems is emphasized during outreach activities.

Specific outreach activities include participation on the San Luis Obispo Creek Riparian Task Force, Morro Bay Task Force, and various 319(h)/205(j)/Basin Planning Technical Advisory Committees, and development of grant applications with local agencies.

Task 4: Project Tracking and Participation

Regional Board staff prepare contracts, coordinate with project proponents, track project progress, review and approve invoices, and provide technical support for Nonpoint Source grant funded projects.

VIII.A. COASTAL ZONE ACT REAUTHORIZATION AMENDMENTS

In November 1990, Congress enacted Section 6217 of the Coastal Zone Act Reauthorization Amendments to help address the problem of nonpoint source pollution in coastal waters. Section 6217 requires that coastal states with federally approved coastal management programs develop Coastal Nonpoint Pollution Control Programs. The legislative history indicates that the central purpose of section 6217 is to strengthen the links between federal and State coastal zone management and water quality programs in order to enhance efforts to manage land use activities that degrade coastal beneficial uses. The State coastal zone management

agency designated under Section 306 of the Amendments and nonpoint source management agency designated under section 319 of the Clean Water Act will have a dual and co-equal role and responsibility in developing and implementing the coastal nonpoint program.

The program gives the U.S. Environmental Protection Agency (U.S. EPA) and the National Oceanic and Atmospheric Administration joint authority to approve programs developed by the State to address 6217 requirements.

The State agencies chosen to develop California's Coastal Nonpoint Pollution Control Program are the State Board and the Coastal Commission. The statute requires that the State program be "coordinated closely with State and local water quality plans and programs." This means that the State's nonpoint source programs under Sections 208 and 319 of the Clean Water Act and the coastal program must be examined to determine if they comprehensively address land use activities and anthropomorphic effects that have a significant effect on coastal waters. In addition, the State agencies are charged with developing a coordinated program that:

- identifies categories of nonpoint sources that adversely impact coastal waters;
- describes management measures to be implemented;
- identifies the land uses and critical coastal areas that will require more stringent or additional management measures;
- describes the State-developed additional management measures to be implemented in critical areas;
- documents the authorities the State will use to implement both the guidance and additional management measures, including designation of a lead agency for each source category and/or subcategory; and
- sets forth a schedule to achieve full implementation of the guidance management measures within three years of program approval by U.S. EPA and National Oceanic and

Atmospheric Administration, and full implementation of additional management measures within six years of program approval.

The Coastal Commission and the State Board staff have been working on a strategy to develop the required Coastal Nonpoint Pollution Control Program plan. Recently, the State Board directed staff to review and revise the statewide Nonpoint Source Management Plan to include a strong coastal component. Revision of the Plan is intended to satisfy the requirements of Section 6217 within the existing framework of current nonpoint source activities.

On a Regional Board level, staff has been involved with the statewide program since 1991. A pilot project, "The New Coastal Nonpoint Pollution Control Program using the Morro Bay Watershed as a Model" was performed to assess the feasibility of establishing the Coastal Nonpoint Pollution Control Program in California. Regional Board staff supplied technical information and reviewed reports. Concerted planning and implementation efforts on target coastal watersheds such as Morro Bay will be major accomplishments to satisfy Coastal Nonpoint Pollution Control Program requirements. As the program goes statewide, Regional Board staff will attend technical advisory committee meetings and will work closely with staff of the State Board and other Regional Boards, as well as staff of other relevant local, State, and federal agencies to develop a workable Coastal Nonpoint Pollution Control Program.

Wastewater originating from nonpoint sources includes those from urban runoff, agricultural activities, on-site sewage disposal systems, and land disturbance activities. Management of these types of nonpoint source discharges are discussed in the following section. The Regional Board will be developing management practices for marinas and recreational boating; hydromodification facilities; and wetlands, riparian areas, and vegetated treatment systems at a future date.

IV-46

VIII.B. URBAN RUNOFF MANAGEMENT

The effect of urban runoff on receiving water quality is a problem which has only recently come to be recognized. Most of the work up to the present has centered on characterizing urban runoff: concentrations of various constituents have been measured, attempts to relate these to such factors as land use type and rainfall intensity have been made, and studies concerning the amounts of these constituents present on street surfaces have been conducted. It appears that considerable quantities of contaminants, heavy metals in particular, may enter the receiving waters through urban runoff. The federal Water Pollution Control Act Amendments of 1972 stress future "control of treatment of all point and nonpoint sources of pollution." Thus the federal government has concluded that nonpoint sources, such as urban runoff, are indeed deleterious to the aquatic environment and that measures should be taken to control such emissions.

There are four basic approaches to controlling pollution from urban runoff: (1) prevent contaminants from reaching urban land surfaces, (2) improve street cleaning and cleaning of other areas where contaminants may be present, (3) treat runoff prior to discharge to receiving waters, and (4) control land use and development. Which approach or combination of approaches is most effective or economical has not yet been studied extensively. Thus only the basic characteristics of each approach can be discussed. In addition to these direct approaches, measures to reduce the volume of runoff from urban areas are also available.

VIII.B.1. SOURCE CONTROLS

The first approach, which emphasizes source control, has many aspects. Tough effective air pollution laws can probably aid in reducing the amount of certain materials deposited on the land. An obvious example is lead in automobile exhaust emissions. Effective anti-litter ordinances and

September 8, 1994

000046

campaigns can aid in reducing floatable materials washed to surface waters. These materials are objectionable primarily from an aesthetics viewpoint, although water fowl can be affected by plastics. New construction techniques may reduce emissions to receiving waters. Erosion can be decreased by seeding, sodding, or matting excavated areas as quickly as practicable. Construction in certain critical areas can be limited to the dry season. Stockpiling of excavated material can be regulated to minimize erosion. Control of chlorinated hydrocarbon pesticide usage would reduce the amounts found on urban land surfaces and thus reduce the amounts washed to natural waters.

VIII.B.2. STREET CLEANING

The second approach to reducing pollution from urban runoff involves improving street cleaning techniques. Generally, street cleaning as presently practiced is intended to remove large pieces of litter which are aesthetically objectionable. The removal of fine material which may account for most of the important contaminants is minimal. It may be possible to design mechanical sweepers to remove a greater fraction of the fine material. Alternatively, vacuum-type street cleaners could produce better results.

In addition to streets, sidewalks and roofs contribute large amounts of runoff. Controlling contaminants present on these surfaces would be more difficult and would be up to individuals. Advertising campaigns would probably be unproductive and legislation would be unworkable except perhaps in specific, localized situations. Therefore, contaminant removal will probably be limited to street surfaces.

In many areas, streets are cleaned by flushing with water from a tank truck. If catch basins are present, this material may be trapped in them. If catch basins do not exist, the material will be simply washed to the storm sewers where subsequent rainfall will carry them to surface waters. Where catch basins are regularly cleaned out, they can be effective in removing materials during runoff. Where they are allowed to fill up with material, they add to the pollution loading during a storm by discharging

septic material. In any case, catch basins usually exist in older urban areas and have a rather low efficiency in removing contaminants from storm water.

VIII.B.3. TREATMENT

The third approach to reducing the effects of urban runoff on receiving water quality involves collecting and treating the runoff. Physical or physical-chemical treatment would be required; the intermittent nature of storm flows precludes biological treatment. Examples of possible treatment processes are simple sedimentation, sedimentation with chemical clarification, and dissolved air flotation. In addition to cost, a principal problem with this approach is collection. Present storm sewerage systems generally drain to open creeks and rivers or directly to tidal waters. Even if treatment facilities were located at various sites in the Basin, a massive collection system would have to be built.

The economic question of "treatment vs. transport" would have to be studied with specific regard to storm water runoff. Local sewage treatment plants abandoned in favor of regional facilities could possibly be utilized in such a program. One method of cutting down the peak flow capacity required is to provide storage volume in the collection system.

Solutions to the problem of preventing water quality degradation by urban runoff are only in the earliest stages of development and consist mostly of plausible hypothesis on how to deal with the problem. Therefore, it is not possible at this time to present a definite plan with regard to this subject. It is probable that research and study which up to now has emphasized defining and characterizing the problem, will turn to developing methods of control. The federal Water Pollution Control Act Amendments of 1972 state specifically that the EPA is authorized to conduct and assist studies "which will demonstrate a new or improved method of preventing, reducing, and eliminating the discharge into any waters of pollutants from sewers which carry storm water..." Considerable progress will be made during the next few years.

Information should be collected and studied so that a workable plan can be implemented in the future.

VIII.B.4. CONTROL OF URBANIZATION

A fourth approach is to encourage controls on urbanization which will either reduce the volume of runoff or at least not cause runoff to increase as a result of urban growth. The usual pattern is that increased urbanization leads to higher runoff coefficients, reflecting the many impervious surfaces associated with development. Roof drains to storm sewers, paved parking lots and streets, installation of storm sewers, filling of natural recharge areas, and increased efficiency in realigned and resurfaced stream channels all are characteristics of urban growth. Development near streams and on steep slopes is deleterious to water resources; it is less disruptive to develop the lower portions of a watershed than the headwater areas, both from the standpoint of the length of channel affected and the extent of channel enlargement necessary to convey storm water. Use of porous pavements and less reliance on roof connections to storm drains and more emphasis on local recharge would reduce the peak volume of runoff from storms. Areal mass emissions of urban drainage constituents should be quantified. Urban planning should be more cognizant of land constraints to permit greater natural recharge where possible and feasible and to discourage intensive development of steep land particularly in headwater areas.

VIII.C. AGRICULTURAL WATER AND WASTEWATER MANAGEMENT

Agricultural wastewaters and the effect of agricultural operations are a result of land use practices; controls should ultimately be developed from land use plans. Controls are required to

minimize adverse effects from agricultural practices. The following discussion is confined to recommended improvements in practices and to the scope of federal-state permit programs which will regulate certain agricultural activities. The discussion of practices is limited here to animal confinement and irrigation practices. Although PL 92-500 defines a confined animal operation as a point source, this plan presents it in the traditional manner of dispersed nonpoint sources. Pesticide use and limits on fertilizer applications are not specifically considered; these materials are covered by appropriate water quality objectives.

VIII.C.1. FEDERAL-STATE PERMITS GOVERNING AGRICULTURAL OPERATIONS

Dischargers of wastes are managed in part by the NPDES permit program. Any person proposing to discharge waste that could affect the quality of the waters of the State must file a report of waste discharge with the appropriate regional board. The Regional Board will prescribe discharge requirements. The requirements implement water quality control plans and take into consideration beneficial uses to be protected.

Public Law 92-500 directed the Environmental Protection Agency to set up a permit system for all dischargers. Agriculture is specifically considered and permits are required for:

1. Feed lots with 1,000 or more slaughter steers and heifers.
2. Dairies with 700 head or more, including milkers, pregnant heifers, and dry mature cows, but not calves.
3. Swine facilities with 2,500 or more swine weighing 55 pounds or more.
4. Sheep feedlots with 10,000 head or more.

5. Turkey lots with 55,000 birds, unless the facilities are covered and dry.
6. Laying hens and broilers, with continuous flow watering, and 100,000 or more birds.
7. Laying hens and broilers, with liquid manure handling systems, and 30,000 or more birds.
8. Irrigation return flow from 3,000 or more continuous acres of land when conveyed to navigable waters from one or more point sources.

The law also provides that the State may administer its own permit program if EPA determines such program is adequate to carry out the objective of the Law. On March 26, 1973, this authority was transferred from the EPA to the State of California for waters within the State. Thus, the Regional Board issues discharge requirements to the agricultural operations covered under the aforementioned guidelines. The State may require discharge permits from any discharger, regardless of size.

VIII.C.2. ANIMAL CONFINEMENT OPERATIONS

Animal confinements such as feedlots and dairy corrals present a surface runoff problem during wet winter flows. Runoff water passes through hillside operations to sometimes contribute manure loads to the surface streams. Stockpiled manure may also add to the problem. Disposing of washwater and manures from dairies in such a manner that ground waters are not degraded can be a problem. Most dairies have some associated land for waste disposal. The land is devoted to crops and pasture and its assimilative capacity will depend upon the size, crop, crop yield, and the season. During intensive growth periods, crops can utilize more nutrients than in slow growth period. Small dairies with adequate crop land in close proximity may be able to use washwaters year round as a source of nutrients. Large dairies with smaller acreage will view the slurry wastes as a disposal problem, not a resource. Thus, there theoretically exists a threshold

September 8, 1994

size for waste disposal. Regulations to achieve this size would be impractical and unenforceable. Crop land is expensive in the basin and would be difficult to acquire. However, a combination of crop patterns and pasture land best suited for each size operation should be determined and the dairymen should be encouraged to follow such a pattern. Where acreage is not available, mutually advantageous agreements between the dairymen and a neighbor cultivator could be formed for disposal of dairy wastes.

Sumps, holding ponds, and reservoirs holding manure wastes should be protected from flood flows. No pipes, drains or ditches from the milk barn should be allowed to drain in or near a stream channel.

Specific Regional Board policies pertaining to animal confinement operations can be found under "Control Actions" in Chapter Five.

VIII.C.3. IRRIGATION OPERATIONS - NEED FOR SALT MANAGEMENT

Salts originate by dissolution of the more soluble portions of rocks and soil particles in rain water (weathering). Such salts are transported in solution, but are concentrated in soils, waters, and so-called salt sinks due to evaporation from soil and water surfaces and transpiration (use) by crops (plants). This removal of water by evaporation or transpiration leaves salts behind. Salts are concentrated by each successive evaporative loss of water. In time, accumulations of salt can go from no- problem to extreme-problem levels unless some controls are applied.

For irrigated agriculture to continue production into the foreseeable future, this problem of gradual accumulation of salts in soils and waters must be faced and kept under control at acceptable levels. Otherwise, production will decline even under the best management, and no added amount of good management will be able to continue production of the quantities of food crops needed. In most of California's water basins, the rate of export or removal of salts from the basin will need to be

IV-49

000049

increased to more closely match or exceed the rate of salt accumulation. For each basin, not only do the rates of import and export of salts need to be in reasonably close balance, but the balance must also be maintained at a sufficiently low level of salinity to meet the quality demands of the various designated beneficial uses. This is often referred to as maintenance of a "favorable salt balance."

The rate of water quality degradation within a basin which results from inadequate salt exports is slow. It may be so slow that the need for control of salts is believed to be far into the future and of no concern to present planning. However, just as degradation may be a slow process, correction of a critical basin-wide salinity problem is also an extremely slow process. Good planning, now, to control this long-term, slow degradation of our soil and water resources seems the better course of action, rather than to wait until the problem becomes critical. Decisions made, or not made, now can be critical to control in the future.

Agriculture's need for salt management is both for on-farm management and for off-farm (basin-wide) management. The absolute need for discharge of salts by agriculture will create conflicts with other water users -even other agricultural water users.

Compromises and trade-offs will be necessary to reconcile these conflicts; however, necessary motivation for change in management at the farm level will need to be tied to dollars and the economic consequences of "no-change." If required agricultural management changes for essential pollution control result in added costs to the farmer, he has the same hard choices of any other businessman:

1. Absorb the cost with reduced profit
2. Pass on the cost in increased prices to consumers
3. Accept some form of public subsidy to off-set cost
4. Go out of business
5. Change crops grown

In coastal higher rainfall areas, irrigated agriculture could probably continue almost indefinitely, since

irrigation would be used primarily during dry summer periods to supplement winter rainfall. Rainfall would be sufficient to flush salts through soils and provide adequate recharge and outflow from the underground water basin toward the ocean for salt control. There is more cause for concern in the drier inland areas such as the Salinas River Sub-basin and in the naturally mineralized ground water areas such as the Santa Maria Valley.

VIII.C.4. IMPROVED SALT MANAGEMENT TECHNIQUES

A concept of minimal degradation should be considered in some areas, but this will need to be coupled with management of the surface and ground water supplies to minimize and correct the effects of degradation that may occur. If complete correction is not possible, improved management will delay the time when salts reach critical levels. Several options available to correct degradation through improved salt management follow.

Improved irrigation efficiency would reduce both potential and actual pollutants in the water moving from surface to ground. Improved efficiency would also reduce total quantities of salts leaching to the water table and cut down on withdrawals or diversions from the limited water supply. Present statewide efficiency of water use may average 50 to 60 percent, but individual uses will vary from an estimated low of 30 percent where water is plentiful and inexpensive to a high of 95 percent where water quantity is limited and/or the price is high.

Implementation of the Leaching Requirement reported by U. S. Salinity Laboratory, Riverside, will help improve efficiency of irrigation. Other research data by this same laboratory has been reported on the effects of low leaching fractions in reduction of salt loads leaching to water tables. The new data offers real incentives to agriculture to improve irrigation efficiency in the form of real dollars saved by the farmer. Real water saved by agriculture can then be used for dilution, recharge, or nonagricultural uses. True, the salts moving to the water table under these low leaching fractions will be more concentrated, but due to low solubilities of

certain salts, a progressive precipitation and removal from solution occurs as the salt concentration in the percolating soil solution rises. As the concentration rises, considerable portions of the low solubility salts come out of solution, e.g., the relatively insoluble lime, dolomite, and slightly soluble gypsum.

With these low leaching fractions, salt load to the underground may be reduced as much as 50 percent in some cases. Sodium salts (sodium chloride, and sulfate) are not affected, so in relation to calcium and magnesium salts these sodium salts in the percolating waters increase. The compounds which precipitate are deposited in the lower root zone or below and cause no problem to agriculture except for a few specialized situations which are correctable (lime induced chlorosis). The increased proportions of sodium salts (higher SAR) will not reduce permeabilities of subsoils since salinity remains high enough to continue normal permeabilities of subsoils. The higher sodium (SAR) reaching water tables may reduce hardness slightly, but is not expected to be a problem to users of the underground waters.

Crop production can continue into the foreseeable future in the low rainfall areas if the minimal degradation that almost inevitably will occur is offset (a) by recharge and replenishment of the underground which will furnish dilution water for the added salts and (b) by drainage or removal of degraded waters at a sufficient rate to maintain low salt levels and achieve a satisfactory balance between salts coming into the basin and salts leaving the basin.

To help in recharge and dilution, additional winter runoff can be stored in surface reservoirs for later use for either surface stream or underground water quantity/quality enhancement or maintenance, e.g., Nacimiento and Twitchell reservoirs. Possible future reservoirs may be located on the Arroyo Seco and Carmel rivers. Or winter runoff could be used directly for ground water recharge to enhance flushing and flow-through dilution of salts and pollutants.

Drainage wells which discharge to drains leading to salt sinks are a possibility in removing salty waters, but these have had only limited success in draining high water table areas. However, they might be well adapted to ground water quality maintenance. Such wells could be drilled and operated to recover the

salty top layers of water tables where salts are believed to accumulate as a layer of poorer quality water over the better quality deeper layers. Since most of the movement within water tables is thought to be horizontal and downslope, and vertical mixing is relatively slow, the possibility of recovering polluted upper layers of water tables should be explored as a quality maintenance tool or rejuvenation procedure for degraded water supplies.

Underdrains (tile systems) can aid in both water and salt management. Perched water tables intercept percolating salts, nutrients, and other pollutants and offer real possibilities as an aid in management and protection of the overall water quality of a basin. A "perched" water table is held up and separated from deeper aquifers by a relatively impermeable barrier (soil, rock, hardpan). This barrier often protects the deeper waters from pollution by preventing leakage of polluted waters from above. Perched water tables exist in portions of several basins. Salts and nutrients collected in these perched water tables may be tapped by underdrains (tile systems) and transported through the basin drainage system to disposal sites.

Basin-wide or area-wide drainage systems will be needed in order to move unusable wastewaters to acceptable temporary or permanent disposal sites (salt sinks). On-farm drainage problems will normally be solved at individual farmer expense because of the economics involved--the cost is not prohibitive and the costs of "not-solving" the problem (reduced yields, changing cropping patterns, or going out of business) are unacceptable. The off-farm part of drainage, however, is too big for individual farmers to solve, and some form of collective, organized large scale action is needed. The off-farm problems include collection of discharges, rights-of-way for conveyance, building and maintenance of a drainage system, disposal site acquisition, and management for compliance with discharge requirements.

Acceptable temporary or permanent salt disposal sites (salt sinks) must be designated and used. The Pacific Ocean is the only acceptable sink for most of the Central Coastal Basin; however, Soda Lake and certain highly mineralized ground water basins may be acceptable. To be able to remove salts as required to maintain a low salinity level in any one basin, there must be some other basin or site that will accept the salts. These acceptor areas are

September 8, 1994

IV-51

known as salt sinks. Without acceptable salt sinks, salt management becomes a long-term losing battle and a frustrating exercise in futility.

Other salt inputs to a basin can be reduced by improved management of other salt sources such as fertilizer, animal wastes, and soil amendments. Regulation may be required but an appreciable improvement can be expected by education of farmers to better understand and better utilize existing information and guidelines. A salt routing approach could be used in areas such as Pancho Rico Creek to permit discharge of highly mineralized wastewater during periods of high flow.

VIII.C.5. MUSHROOM FARM OPERATIONS

Mushroom farm operations present surface or ground water problems if not properly managed.

VIII.C.5.a. TYPICAL MUSHROOM FARM OPERATION

Compost is needed as a growing base medium to produce mushrooms. Typically compost is produced on-site from straw, horse manure, cottonseed meal, or other organic matter. During composting, the organic material breaks down into a useable protein source for mushrooms. Water, added to assist the composting process, is constantly leaching through compost piles. Once compost is ready for use, it is placed in mushroom growing trays. After mushroom harvesting, steaming and fumigation sterilize the growing house and spent compost. Spent compost is then removed to "spent compost storage areas" and marketed as a soil additive or disposed of in some other manner.

VIII.C.5.b. TYPES OF WASTES DISCHARGED

Composting operations are typically carried out on concrete composting slabs. Compost is frequently sprayed with water. Excess water typically drains into a sump. Normally, excess water is recycled by pumping it back to spray the pile. In summer very little runoff or leachate is produced from composting. During the rainy season the sump collects more runoff from the compost slab than is recycled. Discharge to drainage ways or containment sumps may result.

When mushroom beds are irrigated, excess water drains from concrete floors to drainage ways or disposal sumps. This water contains peat moss, soluble substances from beds, salt from salt pans (used to "sanitize" the footwear of persons entering the cultivating room), and whatever is on the floor, such as pesticide residues and mushroom stems, at the time the floor is washed.

Steam is used for tray sterilization and to heat and sterilize growing houses. Prior to entering boilers, water is softened and treated with an organic or inorganic corrosion and scale inhibitors. Salt is used as a water softener regenerant. Discharge of water softener regenerant and boiler blowdown to drainage ways or disposal sumps may occur.

Solid wastes consisting of pesticide bags, mushroom roots and stumps, cardboard boxes, spent compost, and general debris are generated by mushroom farms.

Some of the disinfectants, fungicides, and pesticides being sprayed on the floor, walls, and mushrooms are occasionally washed off during washdown of the facility. Generally, pesticides used in this business have a relatively short life.

VIII.C.5.c. POSSIBLE WATER QUALITY PROBLEMS

Compost leachate and irrigation/ washwater is high in biochemical oxygen demand (BOD). BOD is

generally considered high if the concentration exceeds 30 mg/l, but this can vary from situation to situation. If discharged to surface waters, these wastes may depress dissolved oxygen to a critical level, and provide a nutrient source for undesirable aquatic growth. Improper disposal may also cause impacts on ground water. Nitrates are a particular concern.

Discharges of water softener regenerant and boiler blowdown may degrade surface and ground waters if improperly disposed. These wastes are high in Total Dissolved Solids, Sodium, and Chloride concentrations. Boiler blow-down may also contain organic or inorganic corrosion and scale inhibitors which could present toxicity problems if improperly disposed. Solid wastes can be a problem if improperly disposed.

Disinfectants, fungicides, and pesticides do not appear to present water quality problems based on inspections and limited sampling. These biocides can be a problem if handled improperly. Surface water runoff entering mushroom farm operations can become contaminated if runoff contacts any of the sources described above.

VIII.C.5.d. ADDITIONAL CONCERNS

Wastes can create a nuisance. Public health can be jeopardized if vectors develop among solid wastes. Further, odors resulting from storage of wastes can become offensive and may obstruct the free use of neighboring property.

VIII.C.5.e. RECOMMENDATIONS

1. Spent irrigation/washwater and compost leachate may be reused to spray compost piles.
2. Spent irrigation/washwater, compost leachate, and contaminated surface water runoff should be collected for treatment, storage, and disposal in lined ponds, unless shown by geohydrologic analysis that ground water will

not be affected. If needed, aeration should be provided to stabilize organic substances and prevent odor problems. Dissolved oxygen of 1.0 mg/l or more is recommended for storage ponds.

3. Mushroom farm wastes, excluding water softener regenerant, may be used to irrigate farm crops during dry weather months. When salt is properly handled, the sodium and chloride content of these waters should be suitable for this purpose. The discharger must demonstrate to the Regional Board that irrigation water will not degrade beneficial water uses.
4. When irrigation is utilized, application rates and irrigation practices should be suitable to the crops irrigated.
5. Water softener regenerant and boiler blowdown should be disposed of separately from spent irrigation/washwater. Since its volume is small and concentration of pollutants is high, it is best to evaporate the liquid on a lined drying bed, or provide a documented test by a registered Engineer or laboratory that the soils permeability in the disposal area is 10^{-6} cm/sec or less. Two drying beds should be used for the purpose of holding salt/regenerant liquid and boiler blowdown waste. Discharges to beds are alternated to allow sufficient drying time.
6. Drying bed residue from any disposal pond should be disposed at a suitable solid waste disposal site.
7. As an alternative, water softener regenerant and boiler blowdown can be hauled in liquid form to a suitable disposal site, or discharged to the ocean through a suitable outfall.
8. Chemical alternatives for sanitizing footwear to replace salt pans should be investigated by farm operators.
9. If used, salt sanitation pans should be at least 4 inches deep and elevated to prevent contact between salt and water. Salt solution should remain in pans until disposed. Spent salt

September 8, 1994

IV-53

000053

should be dumped into a sealed container and disposed at a suitable site.

10. Solid waste should be routinely collected and disposed at a suitable site.

VIII.C.5.f. PROHIBITIONS

The following activities are prohibited at mushroom farms:

1. Discharge of inadequately treated waste, including leachate, high BOD, high nutrient waste, and contaminated surface water runoff to drainage ways, surface waters, and ground waters.
2. Discharge of untreated water softener regenerant and boiler blowdown waste in a manner that pollutes any non-saline surface or ground water.
3. Discharge and/or storage of waste, including spent compost, in a manner promoting nuisance and vector development.
4. Disposal of sludges, salt residues, pesticide residues, and solid waste in a manner not accepted by the Regional Board.

VIII.C.6. RANGE MANAGEMENT

Rangeland is the most extensive land use type in California, accounting for more than 40 million acres of the State's 101 million acres. As most of the rangelands are located between forested areas and major river systems, nearly all surface waters in the State flow through rangelands. Thus, rangeland activities can greatly impact water quality. In this section, grazing activities are discussed.

VIII.C.6.a. GRAZING

Grazing activities (particularly overgrazing), by contributing excessive sediment, nutrients, and pathogens, can adversely impact water quality and impair beneficial uses. Soil erosion and sedimentation are the primary causes of lowered water quality from rangelands. When grazing removes most of the vegetative cover from pastures and rangelands, the soil surface is exposed to erosion from wind and water. With runoff, eroded soil becomes sediment which can impair stream uses and alter stream channel morphology and results in decreased recharge capacity through clogging of channel bottoms. With steep slopes, highly erodible soils and interim storm events, the sediment delivery ratio (a measure of the amount of eroded soil delivery to a waterbody) on rangeland can be very high. Streambank erosion and lakeshore erosion are other sources of sediment on rangelands. Lakeshores, streambanks, and associated riparian zones are often subjected to heavy livestock use. Trampling and grazing of vegetation contribute to lakeshore and streamside instability as well as accelerated erosion.

Sediments can contribute large amounts of nutrients to surface water. Nutrients, mainly nitrogen and phosphorous, from manure and decaying vegetation also enter surface waters, particularly during runoff periods. Very critical nutrient problems can develop where livestock congregate for water, feed, salt, and shade. Pasture fertilization can also be a source of nutrients to surface waters, as well as a source of pesticides, particularly if flood irrigation techniques are used on rangelands.

Stream zone and lakeshore areas are important for water quality protection in that they can "buffer" (intercept and store nutrients which have entered surface and ground waters from upgradient areas). These "buffer zones" are more sensitive to processes which can increase nutrient discharges such as soil compaction, soil erosion, and vegetation damage than other areas of the rangeland.

Localized contamination by pathogens that could impact human health in surface water, ground water, and soils can result from livestock in pastures and rangelands. Rangeland streams can show

increased coliform bacterial levels with fecal coliform levels tending to increase as intensity of livestock use increases. Fecal coliform serve as indicators that pathogens could exist and flourish. The extent of contamination is usually determined by livestock density, sizing, and frequency of grazing, and access to the surface waters.

GRAZING CONTROL MEASURES

Grazing activities occur on both public and private lands in the Central Coast Region. Regulation of grazing on federal lands differs from that on private lands.

Federal lands -- Grazing activities on federal lands are regulated by the responsible land management agency, such as the U. S. Bureau of Land Management or the U. S. Forest Service. Through Memorandum of Understandings and Management Agency Agreements, the Regional Board recognizes the water quality authority of the U.S. Forest Service and U.S. Bureau of Land Management in range management activities on federal lands. Both these agencies require allotment management plans to be prepared for a specific area and for an individual permittee. The Regional Board relies on the water quality expertise of these agencies to include appropriate water quality measures in the allotment management plans. Most allotment management plans include specific Best Management Practices to protect water quality and existing and potential beneficial uses.

Non-federal (private) lands -- The Range Management Advisory Committee is a statutory committee which advises the California Board of Forestry on rangeland resources. The Committee has identified water quality protection as a major rangeland issue and has assumed a lead role in developing a Water Quality Management Plan for private rangelands in California. Regional Board staff is participating in the Plan's development. Sections proposed for inclusion in the Plan are status of water quality and soil stability on State rangelands, authority, mandates, and programs for water quality and watershed protection, local water quality planning guidelines, sources of assistance, development of management measures (Best Management Practices), State agency water quality

responsibilities, and monitoring guidelines. Upon its completion, the Plan will be submitted to the State Board. On private lands whose owners request assistance, the U.S. Soil Conservation Service, in cooperation with the local Resource Conservation Districts, can provide technical and financial assistance for range and water quality improvement projects. A Memorandum of Understanding is in place between the U.S. Soil Conservation Service and the State Board for planning and technical assistance related to water quality actions and activities undertaken to resolve nonpoint source problems on private lands.

On both public and private lands, the Regional Board encourages grazing strategies that maintain adequate vegetative cover to reduce erosion and sedimentation. The Regional Board promotes dispersal of livestock away from surface waters as an effective means of reducing nutrient and pathogen loading. The Regional Board encourages use of Best Management Practices to improve water quality, protect beneficial uses, protect stream zone and lakeshore areas, and improve range and watershed conditions including:

- Implementing rest-rotation grazing strategies,
- Changing the season of use (on/off dates),
- Limiting the number of animals,
- Increasing the use of range riders to improve animal distribution and use of forage,
- Fencing to exclude grazing in sensitive areas,
- Developing non-lakeshore and non-stream zone watering sites,
- Constructing physical improvement projects such as check dams, and
- Restoring riparian habitat.

These same Best Management Practices may result in improved range and increased forage production, resulting in increased economic benefit to the rancher and land owner. The Regional Board also encourages land owners to develop appropriate site-specific Best Management Practices using the

September 8, 1994

IV-55.

000055

technical assistance of the U.S. Soil Conservation Service and the U.S. EPA.

In addition to relying on the grazing management expertise of agencies such as the U.S. Forest Service, U.S. Bureau of Land Management, or Range Management Advisory Committee, the Regional Board can directly regulate grazing activities to protect water quality. Actions available to the Regional Board include:

1. Require that a Report of Waste Discharge be filed, that allotment management plans for specific federal lands be prepared, or that a Coordinated Resource Management Plan be adopted within one year of problem documentation. Such problems indicate impairment of beneficial uses or violation or threatened violation of water quality objectives.
2. Require that all allotment management plans (utilized for federal lands) and Coastal Resource Management Plans contain Best Management Practices necessary to correct existing water quality problems or to protect water quality so as to meet all applicable beneficial uses and water quality objectives contained in Chapters Two and Three, respectively, of this Basin Plan. Corrective measures would have to be implemented within one year of submittal of the allotment management plan or Coastal Resource Management Plan, except where staged Best Management Practices are appropriate. Implementation of a staged Best Management Practice must commence within one year of submittal of the allotment management plan or Coastal Resource Management Plan.
3. Require that each allotment management plan (utilized for federal lands) or Coastal Resource Management Plan include specific objectives, actions, and monitoring and evaluation procedures. The discussion of actions must establish the seasons of use, number of livestock permitted, grazing system(s) to be used, a schedule for rehabilitation of ranges in unsatisfactory condition, a schedule for initiating range improvements, and a schedule for maintenance of range improvements must include priorities and planned completion dates. The discussion of monitoring and evaluation must propose a method and timetable for reporting of livestock forage conditions, watershed condition, and surface and ground water quality.
4. Require that all allotment management plans and Coastal Resource Management Plans be circulated to interested parties, organizations, and public agencies.
5. Consider adoption of waste discharge requirements if an allotment management plan or Coastal Resource Management Plan is not prepared or if the Executive Officer and the landowner do not agree on Best Management Practices proposed in an allotment management plan or Coastal Resource Management Plan.
6. Decide that allotment management plans and Coastal Resource Management Plans prepared to address a documented watershed or water quality problem may be accepted by the Regional Board's Executive Officer in lieu of adoption of Waste Discharge Requirements.
7. Oversee monitoring of water quality variables and beneficial uses. Provide data interpretation.
8. Encourage the U.S. Bureau of Land Management, U.S. Forest Service, Resource Conservation District, and private landowners to develop watering sites for livestock away from lakeshores, stream zones, and riparian areas.
9. Encourage private landowners to request technical and financial assistance from U.S. Soil Conservation Service, in cooperation with the local Resource Conservation Districts, in the preparation of allotment management plans and the implementation or construction of grazing and water quality improvements.
10. Continue to coordinate with the Range Management Advisory Committee in the development of a water quality management plan for private rangelands.

VIII.D. INDIVIDUAL, ALTERNATIVE, AND COMMUNITY DISPOSAL SYSTEMS

On-site sewage disposal systems and other similar methods for liquid waste disposal are sometimes viewed as interim solutions in urbanizing areas, yet may be required to function for many years. On-site systems can be a viable long-term waste disposal method with proper siting, design, construction, and management. In establishing on-site system regulations, agencies must consider such systems as permanent, not interim systems to be replaced by public sewers. The reliability of these systems is highly dependent on land and soil constraints, proper design, proper construction, and proper operation and maintenance.

If on-site sewage treatment facilities are not carefully managed, problems can occur, including:

- odors or nuisance;
- surfacing effluent;
- disease transmission; and,
- pollution of surface and ground waters.

Odors and nuisance can be objectionable and annoying and may obstruct free use of property. Surfacing effluent (effluent which fails to percolate and rises to the ground surface) can be an annoyance, or health hazard to the resident and neighbors. In some cases, nearby surface waters may be polluted.

On-site sewage disposal systems are a potential mechanism for disease transmission. Sewage is capable of transmitting diseases from organisms which are discharged by an infected individual. These include dysentery, hepatitis, typhoid, cholera, and gastro-intestinal disorders.

Pollution of surface or ground waters can result from the discharge of on-site system wastes. Typical problem waste constituents are total dissolved

solids, phosphates, nitrates, heavy metals, bacteria, and viruses. Discharge of these wastes will, in some cases, destroy beneficial surface and ground water uses.

Subsurface disposal systems may be used to dispose of wastewater from: (1) individual residences; (2) multi-unit residences; (3) institutions or places of commerce; (4) industrial sanitary sources; and, (5) small communities. All individual and multi-unit residential developments are subject to criteria in this section of the Basin Plan. Commercial, institutional, and industrial developments with a discharge flow rate less than 2500 gallons per day generally are not regulated by waste discharge requirements; therefore, they must comply with these criteria. Community systems must also comply with criteria relating to this subject within the Basin Plan. Community systems are defined for the purposes of this Basin Plan as: (1) residential wastewater treatment systems for more than 5 units or more than 5 parcels; or, (2) commercial, institutional or industrial systems to treat sanitary wastewater equal to or greater than 2500 gallons per day (average daily flow). Systems of this type and size may be subject to waste discharge requirements.

Alternatives to conventional on-site system designs have been used when site constraints prevent the use of conventional systems. Examples of alternative systems include mound and evapotranspiration systems. Remote subdivisions, commercial centers, or industries may utilize conventional collection systems with community treatment systems and subsurface disposal fields for sanitary wastes. Alternative and community systems can pose serious water quality problems if improperly managed. Failures have been common in the past and are usually attributed to the following:

- Systems are inadequately or improperly sited, designed, or constructed.
- Long-term use is not considered.
- Inadequate operation and maintenance.

September 8, 1994

IV-57

000057

VIII.D.1. CORRECTIVE ACTIONS FOR EXISTING SYSTEMS

Individual disposal systems can be regulated with relative ease when they are proposed for a particular site. For new systems, regulations generally provide for good design and construction practices. A more troublesome problem is presented by older septic tank systems where design and construction may have been less strictly controlled or where land development has intensified to an extent that percolation systems are too close together and there is no room left for replacement leaching areas. Where this situation develops to an extent that public health hazards and nuisance conditions develop, the most effective remedy is usually a sewer system. Where soil percolation rates are particularly fast, ground water degradation is possible, particularly increases in nitrate concentrations.

Sewer system planning should be emphasized in urbanizing areas served by septic tanks. A first step would be a monitoring system involving surface and ground waters to determine whether problems are developing. Where septic tank systems in urbanized areas are not scheduled for replacement by sewers and where public health hazards are not documented, septic tank maintenance procedures are encouraged to lessen the probability that a few major failures might force sewerage of an area which otherwise could be retained on individual systems without compromising water quality. Often a few systems will fail in an area where more frequent septic tank pumping, corrections to plumbing or leach fields, or in-home water conservation measures could help prevent failure. Improvements of this kind should be enforced by a local septic tank maintenance district or local governing jurisdiction.

A septic tank subjected to greater hydraulic load can fail due to washout of solids into percolation areas and plugging of the infiltrative surface. In some cases, excess wash water could be diverted to separate percolation areas by in-home plumbing changes. Dishwashers, garbage grinders, and washing machines could be eliminated. Water saving toilets, faucets, and shower heads are available to encourage low water use. Water use

costs may also be structured to encourage more frugal use of water.

VIII.D.2. LOCAL GOVERNING JURISDICTION ACTIONS

VIII.D.2.a. DISCLOSURE AND COMPLIANCE OF EXISTING WASTEWATER DISPOSAL SYSTEM

Local governing jurisdictions should provide programs to assure conformance with this Basin Plan and local regulations. Inspection programs should assure site suitability tests are performed as necessary, and that tests are in accordance with standard procedures. Inspection should also assure proper system installation. Proper design and construction should be certified by the inspector. Concerned homeowners can be a tremendous asset in assuring proper construction. When a septic system permit is issued by the local agency, a handout specifying proper construction techniques should be made available to the general public. Systems must be inspected by the local agency before covering (backfilling).

Local agencies can use either staff inspectors or individuals under contract with the local government. Either way, a standard detailed checklist should be completed by the inspector to certify compliance.

Site suitability determinations should specify: (1) whether approval is for the entire lot or for specific locations of the lot; (2) if further tests are necessary; and, (3) if alternatives are necessary or available.

Where agency approval is necessary from various departments, final sign-offs should be on the same set of plans.

Home owners should be aware of the nature and requirements of their wastewater disposal system. Plans should be available in city or county offices showing placement of soil absorption systems. Since this is only feasible for new construction, local agencies should require septic system as-built plans

as a condition of new construction final inspection. Plans would be kept on file for future use of property owners.

Prospective property buyers should be informed of any enforcement action affecting parcels or houses they wish to buy. For example, a parcel in a discharge prohibition area may be unbuildable for an indefinite period, or a developed parcel may be subject to significant user charges from a future sewer system. Local agencies should have prohibition area terms entered into the county record for each affected parcel. When a prospective buyer conducts a title search, terms of the prohibition would appear in the preliminary title report.

Dual leaching capabilities provide an immediate remedy in the event of system failure. For that reason, dual leachfields are considered appropriate for all systems. Furthermore, should wastewater flows increase, this area can be used until the system is expanded. But system expansion may not be possible if land is not set aside for this purpose. For these reasons, dedicated system expansion areas are also appropriate.

To protect this set-aside area from encroachment, the local agency should require restrictions on future use of the area as a condition of land division or building permit approval. For new subdivisions, Covenants, Conditions, and Restrictions (CC&R's) might provide an appropriate mechanism for protecting a set aside area. Future buyers of affected property would be notified of property use restrictions by reading CC&R's.

All on-site system owners need to be aware of proper operation and maintenance procedures. Local governing jurisdictions should mount a continuing public education program to provide home owners with on-site system operation and maintenance guidelines. Basin Plan information should be available at local agency health and building departments.

Local agencies should conduct an on-site system inspection program, particularly in areas where system failures are common or where systems with poor soils are approved. An agency inspector should periodically check each septic tank for pumping need and each system for proper operation. Homeowners should be alerted where evidence of system failure

exists. Where nuisance or a potential public health hazard exists, a followup procedure should insure the situation is corrected. On-site systems should be constructed in a location that facilitates system inspection.

Another approach is periodically to mail homeowners a brochure reminding them how to maintain and inspect their on-site system. Homeowners should be notified that they should periodically check their septic tank for pumping need. Homeowners should also be notified of other problems indicative of system failure. Some examples include wet spots in drainfield area, lush grass growths, slowly draining wastewater, and sewage odors.

Many existing systems do not comply with current or proposed standards. Repairs to failing systems should be done under permit from the local agency. To the extent practicable, the local agency should require failing systems to be brought into compliance with Basin Plan recommendations. This could be a condition of granting a permit for repairs.

Land use changes on properties used for commerce, small institutions, or industries should not be approved by the local agency until the existing on-site system meets criteria of this Basin Plan and local ordinances. A land use permit or business license could be used to alert the local agency of land use changes.

VIII.D.2.b. ON-SITE WASTEWATER MANAGEMENT PLANS

On-site wastewater management should be implemented in urbanizing areas to investigate long-term cumulative impacts resulting from continued use of individual, alternative, and community on-site disposal systems. A wastewater disposal study should be conducted to determine the best Wastewater Management Plan that would provide site or basin specific wastewater re-use. This study should identify basin specific criteria to prevent water quality degradation and public health hazards and provide an evaluation of the effects of existing and proposed developments and changes in land use. These plans should be a comprehensive planning tool to specify on-site disposal system limitations to prevent ground or surface water

September 8, 1994

IV-59

000059

degradation. Wastewater management plans should:

- Contain a ground/surface water monitoring program.
- Identify sites suitable for conventional septic systems.
- Project on-site disposal system demand.
- Determine sites and methods to best meet demand.
- Project maximum population densities for each subdrainage basin to control degradation or contamination of ground or surface water.
- Recommend establishment of septic tank maintenance districts, as needed.
- Identify alternate means of disposing of sewage in the event of irreversible degradation from on-site disposal systems.

For areas where watershed-wide plans are not developed, conditions could be placed on new divisions of land or community systems to provide monitoring data or geologic information to contribute to the development of a Wastewater Management Plan.

Wastewater disposal alternatives should identify costs to each homeowner. A cost-effectiveness analysis, which considers socio-economic impacts of alternative plans, should be used to select the recommended plan.

On-site wastewater disposal zones, as discussed in Section 6950-6981 of the Health and Safety Code, may be an appropriate means of implementing on-site Wastewater Management Plans.

On-site Wastewater Management Plans shall be approved by the Regional Board.

VIII.D.2.c. SEPTIC TANK MAINTENANCE DISTRICTS

It may be appropriate for unsewered community on-site systems to be maintained by local sewage disposal maintenance districts. These special districts could be administered through existing local governments such as County Water Districts, a Community Services District, or a County Service Area.

Septic tank maintenance districts should be responsible for operation and maintenance in conformance with this Water Quality Control Plan. Administrators should insure proper construction, installation, operation, and maintenance of on-site disposal systems. Maintenance districts should establish septic tank surveillance, maintenance and pumping programs, where appropriate; provide repairs to plumbing or leachfields; and encourage water conservation measures.

VIII.D.3. CRITERIA FOR NEW SYSTEMS

On-site sewage disposal system problems can be minimized with proper site location, design, installation, operation, and maintenance. The following section recommends criteria for all new individual subsurface disposal systems and community sewage disposal systems. Local governing jurisdictions should incorporate these guidelines into their local ordinances. These recommendations will be used by the Regional Board for Regional Board regulated systems and exemptions.

Recommendations are arranged in sequence under the following categories: site suitability; system design; construction; individual system maintenance; community system design; and local agencies.

Mandatory criteria are listed in the "Individual, Alternative, and Community Systems Prohibitions" section.

VIII.D.3.a. SITE SUITABILITY

Prior to permit approval, site investigation should determine on-site system suitability:

1. At least one soil boring or excavation per on-site system should be performed to determine soil suitability, depth to ground water, and depth to bedrock or impervious layer. Soil borings are particularly important for seepage pits. Impervious material is defined as having a percolation rate slower than 120 minutes per inch or having a clay content 60 percent or greater. The soil boring or excavation should extend at least 10 feet below the drainfield¹ bottom at each proposed location.
2. An excavation should be made to detect mottling or presence of underground channels, fissures, or cracks. Soils should be excavated to a depth of 4-5 feet below drainfield bottom.
3. For leachfields, at least three percolation test locations should be used to determine system acceptability. Tests should be performed at proposed subsurface disposal system sites and depths.
4. If no restrictive layers intersect, and geologic conditions permit surfacing, the setback distance from a cut, embankment, or steep slope (greater than 30 percent) should be determined by projecting a line 20 percent downgradient from the sidewall at the highest perforation of the discharge pipe. The leachfields should be setback far enough to prevent this projected line from intersecting the cut within 100 feet, measured horizontally, of the sidewall. If restrictive layers intersect cuts, embankments or steep slopes, and geologic conditions permit surfacing, the setback should be at least 100 feet measured from the top of the cut.
5. Natural ground slope of the disposal area should not exceed 20 percent.
6. For new land divisions, lot sizes less than one acre should not be permitted.

VIII.D.3.b. SYSTEM DESIGN

On-site systems should be designed according to the following recommendations:

1. Septic tanks should be designed to remove nearly 100 percent of settleable solids and should provide a high degree of anaerobic decomposition of colloidal and soluble organic solids.
2. Tank design must allow access for inspection and cleaning. The septic tank must be accessible for pumping.
3. If curtain drains discharge diverted ground water to subsurface soils, the upslope separation from a leachfield or pit should be 20 feet and the downslope separation should be 50 feet.
4. Leachfield application rate should not exceed the following:

<u>Percolation Rate</u> <u>min./in</u>	<u>Loading Rate</u> <u>g.p.d./sq.ft.</u>
1 - 20	0.8
21 - 30	0.6
31 - 60	0.25
61 - 120	0.10

5. Seepage pit application rate should not exceed 0.3 gpd/sq. ft.
6. Drainfield¹ design should be based only upon usable permeable soil layers.
7. The minimum design flow rate should be 375 gallons per day per dwelling unit.
8. In clayey soils, systems should be constructed to place infiltrative surfaces in more permeable horizons.

¹ "Drainfield" refers to either a leachfield or seepage pit.

September 8, 1994

IV-61

000061

9. Distance between drainfield trenches should be at least two times the effective trench depth.¹
10. Distance between seepage pits (nearest sidewall to sidewall) should be at least 20 feet.
11. Dual disposal fields (200 percent of original calculated disposal area) are recommended.
12. For commercial systems, small institutions, or sanitary industrial systems, design should be based on daily peak flow.
13. For commercial and institutional systems, pretreatment may be necessary if wastewater is significantly different from domestic wastewater.
14. Commercial systems, institutional systems, or domestic industrial systems should reserve an expansion area (i.e. dual drainfields must be installed and area for replacement of drainfield must be provided) to be set aside and protected from all uses except future drainfield repair and replacement.
15. Nutrient and heavy metal removal should be facilitated by planting ground cover vegetation over shallow subsurface drainfields. The plants must have the following characteristics: (1) evergreen, (2) shallow root systems, (3) numerous leaves, (4) salt resistant, (5) ability to grow in soggy soils, and (6) low or no maintenance. Plants downstream of leaching area may also be effective in nutrient removal.

VIII.D.3.c. DESIGN FOR ENGINEERED SYSTEMS

1. Mound systems should be installed in accordance with criteria contained in Guidelines for Mound Systems by the State Water Resources Control Board.
2. Evapotranspiration systems should be installed in accordance with criteria contained in Guidelines for Evapotranspiration Systems by

the State Water Resources Control Board. Exceptions are:

- a. For evapotranspiration systems, each month of the highest precipitation year and lowest evaporation year within the previous ten years of record should be used for design.
- b. Systems shall be designed by a registered civil engineer competent in sanitary engineering.

VIII.D.3.d. CONSTRUCTION

Water quality problems resulting from improper construction can be reduced by following these practices:

1. Subsurface disposal systems should have a slightly sloped finished grade to promote surface runoff.
2. Work should be scheduled only when infiltrative surfaces can be covered in one day to minimize windblown silt or rain clogging the soil.
3. In clayey soils, work should be done only when soil moisture content is low to avoid smeared infiltrative surfaces.
4. Bottom and sidewall areas should be left with a rough surface. Any smeared or compacted surfaces should be removed.
5. Bottom of trenches or beds should be level throughout to prevent localized overloading.
6. Two inches of coarse sand should be placed on the bottom of trenches to prevent compacting soil when leachrock is dumped into drainfields. Fine sand should not be used as it may lead to system failure.
7. Surface runoff should be diverted around open trenches/ pits to limit siltation of bottom area.

¹ "Effective trench depth" means depth below the bottom of the trench pipe.

8. Prior to backfilling, the distribution system should be tested to check the hydraulic loading pattern.
9. Properly constructed distribution boxes or junction fittings should be installed to maintain equal flow to each trench. Distribution boxes should be placed with extreme care outside the leaching area to insure settling does not occur.
10. Risers to the ground surface and manholes should be installed over the septic tank inspection ports and access ports.
11. Drainfield should include an inspection pipe to check water level.

Additional construction precautions are discussed within the Environmental Protection Agency's Design Manual: On-Site Wastewater Treatment and Disposal Systems.

VIII.D.3.e. INDIVIDUAL SYSTEM MAINTENANCE

Individual septic tanks should be maintained as follows:

1. Septic tanks should be inspected every two to five years to determine the need for pumping. If garbage grinders or dishwashers discharge into the septic tank, inspection should occur at least every two years.
2. Septic tanks should be pumped whenever: (1) the scum layer is within three inches of the outlet device; or (2) the sludge level is within eight inches of the bottom of the outlet device.
3. Drainfields should be alternated when drainfield inspection pipes reveal a high water level.
4. Disposal of septage (solid residue pumped from septic tanks) should be accomplished in a manner acceptable to the Executive Officer. In some areas, disposal may be to either a

Class I or Class II solid waste site; in others, septage may be discharged to a municipal wastewater treatment facility.

VIII.D.3.f. COMMUNITY SYSTEM DESIGN

Community systems should be designed and maintained to accommodate the following items:

1. Capacities should accommodate build-out population.
2. Design should be based upon peak daily flow estimates.
3. Design should consider contributions from infiltration throughout the collection system.
4. Septic tanks should be pumped when sludge and scum levels are greater than 1/3 of the depth of the first compartment.
5. Operation and maintenance should be in accordance with accepted sanitary practice.
6. Maintenance manuals should be provided to system users and maintenance personnel.
7. Discharge should not exceed 40 grams per day total nitrogen, on the average, per acre of total development overlying ground water recharge areas, unless local governing jurisdictions adopt Wastewater Management Plans subsequently approved by the Regional Board.

VIII.D.3.g. LOCAL AGENCIES

Recommendations for local governing jurisdictions:

1. Adopt a standard percolation test procedure.

The California State Water Resources Control Board Guidelines for Evapotranspiration Systems provides a percolation test method recommended for use to standardize test

September 8, 1994

IV-63

000063

results. A twelve-inch diameter percolation test hole may be used.

2. Percolation tests should be continued until a stabilized rate is obtained.
3. Percolation test holes should be drilled with a hand auger. A hole could be hand augered or dug with hand tools at the bottom of a larger excavation made by a backhoe.
4. Percolation tests should be performed at a depth corresponding to the bottom of the subsurface disposal area.
5. Seepage pits should be utilized only after careful consideration of site suitability. Soil borings or excavations should be inspected either by permitting agency or individual under contract to the permitting agency.
6. Approve permit applications after checking plans for erosion control measures.
7. Inspect systems prior to covering to assure proper construction.
8. Require replacements or repairs to failing systems to be in conformance with Basin Plan recommendations, to the extent practicable.
9. For new land divisions, protect on-site disposal systems and expansion areas from encroachment by provisions in covenants, conditions, and restrictions.
10. Inform property buyers of the existence, location, operation, and maintenance of on-site disposal systems. Prospective home or property buyers should also be informed of any enforcement action (e.g. Basin Plan prohibitions) through the County Record.
11. Conduct public education programs to provide property owners with operation and maintenance guidelines.
12. Alternative system owners shall be provided an informational maintenance or replacement document by the appropriate governing jurisdiction. This document shall cite homeowner procedures to ensure

maintenance, repair, or replacement of critical items within 48 hours following failure.

13. Where appropriate, septic tank systems should be maintained by local septic tank maintenance districts.
14. Wastewater Management Plans should be prepared and implemented for urbanizing and high density areas, including applicable portions of San Martin, San Lorenzo Valley, Carmel Valley, Carmel Highland, Prunedale, El Toro, Shandon, Templeton, Santa Margarita/Garden Farms, Los Osos/Baywood Park, Arroyo Grande, Nipomo, upper Santa Ynez Valley, and Los Olivos/Ballard.
15. Ordinances should be updated to reflect Basin Plan criteria.

VIII.D.3.h. ADDITIONAL CONSIDERATIONS

1. Water conservation and solids reduction practices are recommended. Garbage grinders should not be used in homes with septic tanks.
2. Metering and water use costs should be used to encourage water conservation.
3. Grease and oil should not be introduced into the system. Bleach, solvents, fungicides, and any other toxic material should not be poured into the system.
4. Reverse osmosis unit blow-down should not be discharged to on-site wastewater treatment systems overlying usable ground water. Off-site (factory regeneration) practices are recommended for water softeners.
5. If on-site water softener regeneration is necessary, minimum salt use in water softeners is recommended. This can be accomplished by minimizing regeneration time or limiting the number of regeneration cycles.

VIII.D.3.i. INDIVIDUAL, ALTERNATIVE AND COMMUNITY SYSTEMS PROHIBITIONS

Discharges from new soil absorption systems installed after September 16, 1983 in sites with any of the following conditions are prohibited:

1. Soils or formations contain continuous channels, cracks, or fractures.¹
2. For seepage pits, soils or formations containing 60 percent or greater clay (a soil particle less than two microns in size) unless parcel size is at least two acres.
3. Distances between trench bottom and usable ground water, including perched ground water, less than separation specified by appropriate percolation rate:

<u>Percolation Rate, min/in</u>	<u>Distance, ft</u>
<1	50 ¹
1-4	20 ¹
5-29	8
>30	5

4. For seepage pits, distances between pit bottom and usable ground water, including perched ground water, less than separation specified by appropriate soil type:

<u>Soil</u>	<u>Distance,ft.</u>
Gravels ²	50 ¹
Gravels with few fines ³	20 ¹
Other	10

5. Distances between trench/pit bottom and bedrock or other impervious layer less than ten feet.
6. For leachfields, where percolation rates are slower than 120 min/in, unless parcel size is at least two acres.

7. For leachfields, where soil percolation rates are slower than 60 min./in. unless the effluent application rate is 0.1 gpd/ft² or less.
8. Areas subject to inundation from a ten-year flood.
9. Natural ground slope of the disposal area exceeds 30 percent.
10. Setback distances less than:

	<u>Minimum Setback Distance, ft</u>
Domestic water supply wells in unconfined aquifer	100
Watercourse ⁴ where geologic conditions permit water migration	100
Reservoir ⁵ spillway elevation	200
Springs, natural or any part of man-made spring	100

¹ Unless a set-back distance of at least 250 feet to any domestic water supply well or surface water is assured.

² Gravels - Soils with over 95 percent by weight coarser than a No. 200 sieve and over half of the coarse fraction larger than a No. 4 sieve.

³ Gravels with few fines - Soils with 90 percent to 94 percent coarse fraction larger than a No. 4 sieve.

⁴ Watercourse - (1) A natural or artificial channel for passage of water. (2) A running stream of water. (3) A natural stream fed from permanent or natural sources, including rivers, creeks, runs, and rivulets. There must be a stream, usually flowing in a particular direction (though it need not flow continuously) in a definite channel, having a bed or banks and usually discharging into some stream or body of water.

⁵ Reservoir-A pond, lake, tank, basin, or other space either natural or created in whole or in part by the building of engineering structures, which is used for storage, regulation, and control of water, recreation, power, flood control, or drinking.

11. While new septic tank systems should generally be limited to new divisions of land having a minimum parcel size of one acre, where soil and other physical constraints are particularly favorable, parcel size shall not be less than one-half acre.
12. Within a reservoir¹ watershed where the density for each land division is less than 2.5 acres for areas without approved Wastewater Management Plans.
13. For individual systems on new land divisions, and commercial, institutional, and sanitary industrial systems without an area set aside for dual leachfields (100 percent replacement area).
14. Commercial, institutional, or sanitary industrial systems not basing design on daily peak flow estimate.
15. Any site unable to maintain subsurface disposal.
16. Any subdivision unless the subdivider clearly demonstrates the use of the system will be in the best public interest, that beneficial water uses will not be adversely affected, and compliance with all Basin Plan prohibitions is demonstrated.
17. Lot sizes, dwelling densities or site conditions causing detrimental impacts to water quality.
18. Any area where continued use of on-site systems constitutes a public health hazard, an existing or threatened condition of water pollution, or nuisance.

Discharges from new community subsurface disposal systems (serving more than five parcels or more than five dwelling units) are prohibited unless:

1. Seepage pits have at least 15 vertical feet between pit bottom and highest usable ground water, including perched ground water.
2. Sewerage facilities are operated by a public agency. (If a demonstration is made to the Regional Board that an existing public agency is unavailable and formation of a new public

agency is unreasonable, a private entity with adequate financial, legal, and institutional resources to assume responsibility for waste discharges may be acceptable).

3. Dual disposal systems are installed (200 percent of total of original calculated disposal area).
4. An expansion area is included for replacement of the original system (300 percent total).
5. Community systems provide duplicate individual equipment components for components subject to failure.
6. Discharge does not exceed 40 grams per day of total nitrogen, on the average, per 1/2 acre of total development overlying ground water recharge areas excepting where a local governing jurisdiction has adopted a Wastewater Management Plan subsequently approved by the Regional Board.

In order to achieve water quality objectives, protect present and future beneficial water uses, protect public health, and prevent nuisance, discharges are prohibited in the following areas:

1. Discharges from individual sewage disposal systems are prohibited in portions of the community of Nipomo, San Luis Obispo County, which are particularly described in Appendix A-27.
2. Discharges from individual sewage disposal systems within the San Lorenzo Valley north of Henry Cowell State Park shall be managed as follows:
 - a. Discharges within five major communities are prohibited where the affected area (Class I Area) is defined by the Santa Cruz County Assessor's Parcel Numbers as described in Appendix A-28.

¹ Reservoir-A pond, lake, tank, basin, or other space either natural or created in whole or in part by the building of engineering structures, which is used for storage, regulation, and control of water, recreation, power, flood control, or drinking.

b. To preclude prohibition of discharges outside the Class I Area, the County of Santa Cruz shall act as lead agency in coordinating and establishing a program that will assure the Regional Board that:

- additional systems in these areas will be designed, sized, located, spaced, and constructed in a manner that will protect water quality, protect beneficial uses of water, and prevent nuisance, pollution, and contamination.
- existing systems within specific communities are systematically evaluated and redesigned, resized, relocated, and reconstructed as appropriate to protect and enhance water quality, protect and restore beneficial uses of water, and abate and prevent nuisance, pollution and contamination, where the specific communities (Class II Area) are defined by the Santa Cruz County Assessor's Parcel Numbers as described in Appendix A-29.
- systems within the Class II Area are regularly inspected and maintained in a manner that will protect water quality, protect beneficial uses of water, and prevent nuisance, pollution, and contamination.

3. Discharges from individual and community sewage disposal systems are prohibited effective November 1, 1988, in the Los Osos/Baywood Park area depicted in the Prohibition Boundary Map included as Attachment "A" of Resolution No. 83-13 which can be found in Appendix A-30.

VIII.3.j. SUBSURFACE DISPOSAL EXEMPTIONS

The Regional Board or Executive Officer may grant exemption to prohibitions for: (1) engineered new on-site disposal systems for sites unsuitable for standard systems; and (2) new or existing on-site systems within the specific prohibition areas cited above. Such exemptions may be granted only after presentation by the discharger of sufficient

justification, including geologic and hydrologic evidence that the continued operation of such system(s) in a particular area will not individually or collectively, directly or indirectly, result in pollution or nuisance, or affect water quality adversely.

Individual, alternative, and community systems shall not be approved for any area where it appears that the total discharge of leachate to the geological system, under fully developed conditions, will cause: (1) damage to public or private property; (2) ground or surface water degradation; (3) nuisance condition; or, (4) a public health hazard. Interim use of septic tank systems may be permitted where alternate parcels are held in reserve until sewer systems are available.

Requests for exemptions will not be considered until the local entity has reviewed the system and submitted the proposal for Regional Board review. Dischargers requesting exemptions must submit a Report of Waste Discharge. Exemptions will be subject to filing fees as established by the State Water Code.

Engineered systems shall be designed only by registered engineers competent in sanitary engineering. Engineers should be responsible for proper system operation. Engineers should be responsible for educating system users of proper operation and maintenance. Maintenance schedules should be established. Engineered systems should be inspected by designer during installation to insure conformance with approved plans.

Some engineered systems may be considered experimental by the Regional Board. Experimental systems will be handled with caution. A trial period of at least one year should be established whereby proper system operation must be demonstrated. Under such an approach, experimental systems are granted a one year conditional approval.

Further information concerning individual, alternative, or community on-site sewage disposal systems can be found in Chapter 5 in the Management Principals and Control Actions sections. State Water Resources Control Board Plans and Policies, Discharge Prohibitions, and Regional Board Policies may also apply depending on individual circumstances.

000067

VIII.E. LAND DISTURBANCE ACTIVITIES

Construction, mining, and other soil disturbance activities which may disturb or expose soil or otherwise increase susceptibility of land areas to erosion are difficult to regulate effectively. Construction or timber harvesting may often begin and end with no obvious impairment of stream quality; however, erosion or land slides the following winter may be directly related to earlier land disturbance or tree cutting. Mining and quarrying activities are generally longer in duration.

Under contract with the Regional Board, the California Association of Resource Conservation Districts completed a study entitled, "Erosion and Sediment in California Central Coast Watersheds - A study of Best Management Practices" (Erosion Study), dated June, 1979. This Erosion Study, funded under Section 208 of the Clean Water Act, assesses impacts of erosion and sedimentation on water quality and beneficial uses in nondesignated planning areas (San Benito, San Luis Obispo, and Santa Barbara Counties) of the Central Coast Region. This Erosion Study and supporting documents have been used by the Regional Board in developing erosion and sedimentation control policy.

Nonpoint source pollution in the remainder of the Region is addressed by designated planning agencies through their respective Areawide Waste Treatment Management Plans. Designated agencies and the areas affected within this Region include: Association of Bay Area Governments (portions of San Mateo and Santa Clara Counties), Association of Monterey Bay Area Governments (Santa Cruz and Monterey Counties), and Ventura County Board of Supervisors (portion of Ventura County). The policy herein described is compatible with those plans and is within the scope of the Regional Board authority.

The Erosion Study and Areawide Waste Treatment Management Plans identify examples of accelerated erosion resulting from insufficient land management of soil cultivation, grazing, silvaculture, construction, and off-road vehicle activities, as well as wildfires.

Adverse impacts of sediment are identified, in part, as: impairment of water supplies and ground water recharge, siltation of streams and reservoirs, impairment of navigable waters, loss of fish and wildlife habitat, degradation of recreational waters, transport of pathogens and toxic substances, increased flooding, increased soil loss, and increased costs associated with maintenance and operation of water storage and transport facilities. Recommendations based on conclusions of the Erosion Study and practices recommended in Areawide Waste Treatment Management Plans are a means to reduce unnecessary soil loss due to erosion and to minimize adverse water quality impacts resulting from sediment.

When a practice or combination of practices is found to be the most effective, practical (including technological, economic, and institutional considerations) means of preventing or reducing the amount of pollution generated by nonpoint sources to a level compatible with water quality goals, it is designated a Best Management Practice (BMP). BMPs are determined only after problem assessment, examination of alternative practices, and appropriate public participation in the BMP development process.

General recommendations based on conclusions of the Erosion Study are discussed below. These recommendations are considered to be Best Management Practices (BMPs) by the Regional Board as are the areawide approved water quality management plans.

1. Soil conservation control measures should be used to minimize impacts that would otherwise result from soil erosion. Control measures are identified according to systems, which are then broken down into subsystems of erosion control techniques or component measures.

For example, a system for control of erosion from construction sites would identify component measures such as debris basins, access roads, hillside ditches, etc. Other conservation control systems include: conservation cropping, conservation irrigation, roadside erosion control, critical area treatment, diversions and ditches, grade stabilization, pasture and range management, runoff and sediment control ponds and basins, streambank and channel protection, and watershed, wildlife, and recreation land

improvement. These control measures are comparable to the USDA Soil Conservation Services' Resource Management Subsystem approach as referenced in AMBAG's "Water Quality Management Plan for the Monterey Bay Region," dated July 1978, and in ABAG's, "Handbook of Best Management Practices," dated October 1977.

Experience has shown that no one control measure best solves an existing, or prevents a potential, pollution problem - especially in the area of soil erosion and sedimentation. As land use, the land user, and various situations change, so does the need for control measures. Before application, an on-site investigation with the land user is necessary to determine which practice or set of practices will be most effective and acceptable.

2. Erosion control should be implemented in a reasonable manner with as much implementation responsibility remaining with existing local entities and programs as is possible and consistent with water quality goals.
3. The Regional Board and local units of government should establish a clear policy for control of erosion, including consideration of off-site and cumulative impacts and the imposition of performance standards according to the sensitivity of the area where land is to be disturbed.
4. Effective ordinances and regulatory programs should be adopted by local units of government. Effective programs would allow only land disturbance actions consistent with the waste load capacity of the watershed, require preparation of erosion and sediment control plans with specific contents and with attention to both offsite/on-site impacts, identify performance standards, be at least comparable to the model ordinance in the "Erosion and Sediment Control Handbook," dated May 1978, and have provisions for inspection follow-up, enforcement, and referral.
5. Watersheds with critical erosion and sediment problems should be identified by one or more concerned agencies such as the California Department of Fish and Game, the Regional

Board, the local Environmental Health, Planning, or Engineering Departments, the local Flood Control District, or the local Resource Conservation District, and then referred to the remaining agencies by a designated local coordinating agency for determining the scope, nature, and significance of the identified problem. The designated local agency would evaluate the adequacy and appropriateness of the total assessment, including an assessment of the problem and causes, alternatives considered, recommended interim and permanent control measures, and the amount and sources of funding. The evaluation would then be submitted as an Impact Findings Report for consideration and decision by the local governing body.

6. Comprehensive and continuous training should be mandatory for building and grading inspectors, engineers, and planners involved in approving, designing, or inspecting erosion control plans and on-site control measures. The training program would preferably be conducted on an inter-county/agency basis and be administered through a USDA Soil Conservation Service cooperative training arrangement or through seminars conducted by the USDA Soil Conservation Service and the University of California Cooperative Extension seminars. The Soil Conservation Society of America should be requested to assist in establishing an effective training program, including public education to heighten awareness of the adverse affects of erosion and sediment on soil and water resources.
7. More intensive erosion controls should be considered within four watersheds (Lauro Reservoir and Devereaux Ranch Slough in Santa Barbara County and Pismo Lake and Morro Bay in San Luis Obispo County) with apparent critical erosion and sediment problems. Alternative practices that may be implemented to effect the necessary level of control are assigned a relative priority.

September 8, 1994

IV-69

000069

VIII.E.1. LAND DISTURBANCE PROHIBITIONS

The discharge or threatened discharge of soil, silt, bark, slash, sawdust, or other organic and earthen materials into any stream in the basin in violation of best management practices for timber harvesting, construction, and other soil disturbance activities and in quantities deleterious to fish, wildlife, and other beneficial uses is prohibited.

The placing or disposal of soil, silt, bark, slash, sawdust, or other organic and earthen materials from timber harvesting, construction, and other soil disturbance activities at locations above the anticipated high water line of any stream in the basin where they may be washed into said waters by rainfall or runoff in quantities deleterious to fish, wildlife, and other beneficial uses is prohibited.

Soil disturbance activities not exempted pursuant to Regional Board Management Principles contained in Chapter Five are prohibited:

1. In geologically unstable areas,
2. On slopes in excess of thirty percent (excluding agricultural activities), and
3. On soils rated a severe erosion hazard by soil specialists (as recognized by the Executive Officer) where water quality may be adversely impacted;

Unless,

- a. In the case of agriculture, operations comply with a Farm Conservation or Farm Management Plan approved by a Resource Conservation District or the USDA Soil Conservation Service;
- b. In the case of construction and land development, an erosion and sediment control plan or its equivalent (e.g., EIR, local ordinance) prescribes best management practices to minimize erosion during the activity, and the plan is certified or approved, and will be enforced by a local unit of government through persons trained in erosion control techniques; or,

- c. There is no threat to downstream beneficial uses of water, as certified by the Executive Officer of the Regional Board.

VIII.E.2. CONSTRUCTION ACTIVITIES

Road construction is often a cause of water quality impairment; all too often roads are located near streams, estuaries, or ocean waters where side fills may be eroded by flood waters. Construction within stream beds will inevitably cause turbidity; however, the timing of such activities should be established with reference to environmental sensitivity factors such as fish migrations, spawning or hatching, and minimum stream flow conditions. Sediment loads can be reduced by proper timing, bank and channel protection, and use of settling ponds to catch silt.

Construction debris should not be left in the flood plain; revegetation of cuts and fills should be encouraged. California Department of Transportation (CALTRANS) has prepared a document entitled "Best Management Practices for Control of Water Pollution (Transportation Activities)," that sets forth procedures used by CALTRANS to address transportation activities which might impact water quality. These procedures are summarized under "Control Actions" in the Plans and Policies chapter. Past and potential impacts from CALTRANS activities may result from the above problems and may include impacts resulting from questionable maintenance practices, chemical spills, and discharges of silt and cement.

Land development projects in sensitive areas should be scheduled so as to minimize the areal extent of land exposed to erosive forces. Where water quality impairment is likely, permits should be issued by the Regional Water Quality Control Board which will insure against water quality degradation. Cooperation of local approving agencies should be obtained in order that approvals of significant subdivisions in environmentally sensitive areas, particularly the upper reaches of watersheds and lands near riparian habitats, are appropriately conditioned. For example, proposed subdivisions of

50 lots or more in such areas should be (1) covered by environmental impact reports on the development and its impact on waste loads and water quality, (2) be in conformance with regional or county master plans, and (3) include provisions for establishment of a public agency responsible for environmental monitoring and maintenance where such subdivisions are outside other appropriate public jurisdictions.

VIII.E.3. MINING ACTIVITIES

Pollution control at the hundreds of inactive mine sites riddling the Coast Ranges is in its infancy. Accurate regional inventories are being compiled, isolated mine cases are addressed individually, and several polluting mines are under direct regulation. Regional Board assistance and consultation are aiding several proactive responsible parties and focused study of inactive mine effects on four Central Coast watersheds has been funded by the Clean Water Act, Water Quality Planning Program.

About a decade ago Toxic Substances Monitoring Program data revealed elevated mercury concentrations in Lake Nacimiento, a high priority municipal and agricultural water storage reservoir in San Luis Obispo County. The Lake is fed by the Las Tablas Creek system (among others), which receives discharge water from the Buena Vista Mine, a mercury mine inactive since 1970 or 1971. An academic study (conducted by respected Cal Poly scientists -- team leader, Dr. Thomas J. Rice) of Lake Nacimiento mercury sources recently concluded up to 78% of the fluvial mercury transport to the Lake is contributed by the Las Tablas Creek system. Further, the inactive Buena Vista and Klau Mines were identified as the primary point sources of Las Tablas Creek mercury. Based on these conclusions and other independent supporting data, the Regional Board on May 14, 1993, adopted four orders requiring strict implementation of NPDES surface water discharge standards and California Code of Regulations Title 23 mine waste management and mine closure standards at the Buena Vista Mine and the adjacent Klau Mine.

The U. S. Bureau of Land Management and Forest Service are addressing several inactive mercury mines on their properties pursuant to the federal "Superfund" process. Sample analyses data generated by Regional Board staff have been instrumental in aiding these investigations.

Two sequential studies of inactive mines in four watersheds of northwest San Luis Obispo County are underway. Funded partially by the Clean Water Act Water Quality Planning Program, the studies address all inactive mines in the Las Tablas Creek, Santa Rosa Creek, San Simeon Creek (all primarily mercury mines), and Chorro Creek (primarily chromium) watersheds. The primary goals of the watershed studies are:

- identification of all inactive mines
- attribution of specific water quality problems to specific mines, and
- determinations of the best methods of abating contaminant sources and remediating already emplaced surface contamination, based on field and possibly lab experiments.

These are considered pilot studies and the Regional Board ultimately plans to conduct such studies for the complete Region and to implement the findings, resulting in abatement of inactive mines as surface and ground water contaminant sources and remediation of contaminated media.

VIII.E.4. TIMBER HARVESTING ACTIVITIES

The Regional Board has regulatory responsibility to prevent adverse water quality impacts from timber harvest activities. Impacts usually consist of temperature, turbidity, and siltation effects caused by logging and associated activities. These can have deleterious impacts on fish and water flow.

Sensitivity of all watercourses, lakes, estuaries, or ocean waters in the basin to timber harvesting operations should be identified following rigorous

September 8, 1994

IV-71

analysis of geological, pedological, hydrological, and biological data as confirmed by field inspections. Relative sensitivity could then be portrayed on a large map. The sensitivity would also reflect beneficial uses which are not directly associated with ecological systems.

Upon receiving a timber harvest plan, the Regional Board staff could locate the operation on the sensitivity map and determine the relative risk involved. This information could enable the board to better evaluate the proposed method of operation and the adequacy of proposed mitigation actions or other special considerations. The success of this process depends upon the degree of cooperation provided by the Department of Forestry. Timber harvest plans must contain sufficient detail for evaluation, and the Regional Board must be allowed an ample amount of time for review before start of timber harvesting operations.

The timber yarding and road building methods used at each operation is a function of the terrain, soils, species and other timber considerations including economics. The aforementioned are usually compatible with water quality management, but in cases where water quality may be degraded, mitigating measures to preserve the character and quality of the water course must be taken. Since the Department of Forestry is familiar with the limitations and relative degradation potential of the various harvest methods, it has the lead role in incorporating necessary mitigation measures into the permits and seeing that they are enforced.

The Department of Forestry administers provisions of the Z'berg-Nejedly Forest Practice Act of 1973. The Act provides an opportunity for Regional Boards involved with timber harvesting activities to participate on the Timber Harvest Plan permit process review team. A 1987 Clean Water Act amendment requires States to implement Water Quality Management Plans to control nonpoint sources of pollution, including silviculture. As part of that directive, the State Board has executed a Management Agency Agreement (MAA) with the Board of Forestry and Department of Forestry. It provides a better opportunity for water quality concerns to be incorporated into timber harvesting practices and regulations.

Several possibilities exist to deal with negligent or incompetent operators. The Department of Forestry can revoke the Registered Professional Foresters or Licensed Timber Operator's License. The Regional Board can also implement enforcement action. While these actions can be necessary and effective, they are after-the-fact methods rather than for deterring roles. Thus, the major emphasis must be placed on control measures rather than enforcement actions.

VIII.E.5. AGENCY ACTIVITIES

To insure that impacts on water quality from nonpoint sources of pollution are held to a minimum and that goals and management principles of the Regional Board are met, water quality management programs for implementation by land managing agencies have been developed through the areawide planning process. For nonpoint sources of pollution, this required identification of Best Management Practices (BMP's).

Within the Central Coast Region, federal and State agencies control substantial portions of land. All retain their own land management programs, but are required by regulation to cooperate and give support to State planning agencies in formulating and implementing water quality management plans. Federal law also directs federal agencies to comply with requirements formulated to meet the objectives of the federal act.

Practices and procedures in the U. S. Forest Service's, U. S. Bureau of Land Management's (BLM's) and California Department of Transportation's (CALTRANS') 208 reports described below constitute proper management for water quality protection and are considered BMP's. Further, these agencies have expressed a willingness and capability to implement practices and to revise practices which are currently inadequate. Management agency agreements have been prepared between the State Board and each of these agencies which designates the Forest Service, the BLM, and CALTRANS as management agencies responsible for implementing BMPs for water quality protection on lands under the control of each of

these respective agencies. The management agency agreement further provides for State/Regional Board working relationships with each agency and establishes a mechanism by which the State and Regional Boards will, on a continuing basis and in conjunction with each of these agencies, identify and address water quality management issues of concern to all parties.

The management agency agreements, as approved by the State Water Resources Control Board and each of the agencies, are a part of this Water Quality Control Plan by reference. Management agency agreements will be reviewed and updated periodically to reflect recent achievements, new information, and new concerns.

VIII.E.5.a. UNITED STATES FOREST SERVICE

The United States Forest Service has prepared a report entitled, "Water Quality Management Plan for the National Forest Systems Lands Within the Non-designated Planning Areas of California," dated April, 1979. The report assesses water quality problems, evaluates current practices, and sets forth procedures used by the Forest Service to address activities that might affect water quality. About 72 percent of Los Padres National Forest (which encompasses 1,964,408 gross acres) is within the Central Coast Region. Water and watershed protection were the chief reasons the forest was established. Approximately 1.5 million acre feet of water per year are used by people living adjacent to the forest for domestic and agricultural purposes. Less than five percent of the area is commercial forest land and most wood production is fuel wood sales.

A qualitative assessment of water quality problems on National Forest lands within the Central Coast Region was conducted primarily from information gathered by Forest Service and Regional Board staff. Fire management and recreation are activities with the greatest influence on water quality. Other major activities with potential impact on water quality include road construction, road maintenance, and grazing. Fire management can cause degradation from sediments, nutrients, and bacteria, but the

September 8, 1994

major cause might well be off-road vehicles and misuse of unimproved roads by all vehicles. Road construction has been a source of problems along the Cuyama River. No significant effects from overgrazing or silvacultural practices were noted.

During preparation of the Forest Service's "Water Quality Management Plan for the National Forest Systems Lands Within the Nondesignated Planning Area of California," adopted April, 1979, Forest Service manuals, guidelines, regulations, etc., were reviewed for identification of those practices which are directly or indirectly for the purpose of protecting water quality. The report identifies and discusses ninety-eight such practices in eight activity categories (i.e., timber harvesting, road and building site construction, mining, recreation, vegetative manipulation, fire supervision and prescribed burning, watershed management, and grazing). Ninety-four of the practices are presented as BMPs, while four practices need improvement, and four practices need development. A course of action for improving inadequacies of current practices and for development of new practices is identified.

The practices/procedures contained in the Forest Service 208 plan are at a level of detail appropriate for all Forest Service operations statewide. These practices must be flexible to account for varying geographic conditions. The plan also includes a description of the "decision-making" process which leads to the actual selections of management solutions on a project-specific basis. There are several steps in this process at which Regional Boards can be involved and there is a public involvement program to identify and respond to concerns of interested public. The most critical point of involvement is Step 1, identification of issues, concerns, and opportunities. Once this step is completed, the need for and time of future involvement in subsequent steps can be identified.

VIII.E.5.b. UNITED STATES BUREAU OF LAND MANAGEMENT

The United States Department of the Interior, Bureau of Land Management (BLM), has management responsibility for approximately 320,000 acres within the Central Coast Region. Management

IV-73

000073

activities occurring on this land have potential for significantly affecting water quality (e.g., mining, grazing, recreation, road construction, off-road vehicles, etc.). The BLM prepared and submitted to the State a report entitled, "BLM California 208 Report." The report includes: (a) a discussion of existing or potential water quality problems on BLM lands, (b) a discussion of current BLM practices and policies including a description of the BLM planning process, (c) a description of the "decision-making process" which leads to the actual selection of management solutions on a project-specific basis, and (d) general policies.

The problem assessment identifies nonpoint sources of water pollution originating on lands administered by the BLM. Problems were qualitatively assessed by BLM with information provided primarily by Regional Board staff. Most of the identified water quality problems on BLM lands within the Central Coast Region result from recreation.

There is improper grazing management on the Temblor range in east San Luis Obispo County (BLM's Bakersfield District) that is causing sedimentation of retention structures for beneficial uses.

The process for determining management practices on a site-specific basis applies to all BLM activities and is divided into three major phases; (1) consideration of site characteristics and water quality concerns, (2) definition and application of BMP's through contract clauses, leases, stipulations, etc., and (3) evaluation of BMP effectiveness and practice modification, if necessary.

VIII.E.5.c. CALIFORNIA DEPARTMENT OF TRANSPORTATION

WATER QUALITY STUDIES

In developing control measures for CALTRANS projects, three basic types of studies are conducted for water quality protection:

1. Transportation System Planning - Emphasizes broad scale water quality problems. The focus is

1V-74

on regional factors such as variations in regional surface and ground water hydrology, existing water quality, and land use. Such studies are not site-specific.

2. Project Level Planning - Emphasis is on runoff associated problems (erosion and sedimentation). Detailed hydrologic and hydraulic analyses are made where warranted. Information is used in selecting project alternatives.
3. Construction - This type is usually associated with waste discharge requirements (issued by Regional Board). The intent is to monitor and control the contractor's operations.

CONSTRUCTION CONTROL

Standard specifications for water pollution control have been prepared by CALTRANS, are set forth in CALTRANS' BMP document, and are incorporated as part of project design. Where warranted, special specifications are prepared by CALTRANS on a project-by-project basis. For every project, contractors must submit a plan for water pollution control to the CALTRANS resident engineer. During the course of any construction project, operations may be temporarily halted if inadequate provision has been made for water quality protection. Remedial work may be required.

In addition to CALTRANS specifications, federal and State permits (including waste discharge requirements) are made a part of project requirements.

OPERATION AND MAINTENANCE

1. Accidental Chemical Spills - A procedural manual has been developed by each CALTRANS district to standardize cleanup procedures. CALTRANS maintenance personnel are equipped and trained to handle such situations.
2. Erosion Control - Where slopes show evidence of erosion, remedial stabilization measures must be taken. Debris is disposed of at approved disposal site.

September 8, 1994

000074

VIII.E.5.d. OTHER AGENCIES PROGRAMS

Resource Conservation Districts (RCD's) and the U.S.D.A. Soil Conservation Service are organizations that assist property owners in applying effective conservation and land management practices. The program includes technical, educational, and planning services to property owners and local governments who request assistance. It has been relatively successful considering its voluntary nature and resource limitations. The Soil Conservation Service has a major role in the Rural Clean Water Program.

The U.S.D.A. Agricultural Stabilization and Conservation Service administers the cost-sharing aspects of the Agricultural Conservation Program, allocating available monies to farmers and ranchers for erosion and sedimentation control and water conservation projects.

Cities and Counties, as general purpose governments, have broad powers to adopt specific and general plans; to regulate land use, subdividing, grading, and private construction; and to construct and operate public works facilities. Local authority to regulate existing and potential discharges of sediment has been exercised to varying degrees throughout the region.

Many cities and counties within the coastal zone have developed Local Coastal Programs. These programs may include land use and grading restrictions designed to protect long-term productivity of soils and waters within the coastal zone. Regulation by the California Coastal Commission provides this protection where Local Coastal Programs are inadequate.

The State Department of Fish and Game promotes the protection and improvement of streams, lakes, and natural habitat areas for fish and wildlife. It also regulates stream alteration and compels cleanup of fouled streams.

September 8, 1994

IV-75

000075

CHAPTER 5. PLANS AND POLICIES

In addition to the Implementation Plan, many other plans and policies direct State and Regional Board actions or clarify the Regional Board's intent. The following pages contain brief descriptions of State Board plans and policies and numerous Regional Board plans and policies. Copies of the State and Regional Board policies are contained in the Appendix.

I. STATE WATER RESOURCES CONTROL BOARD PLANS AND POLICIES

The State Water Resources Control Board (State Board) has adopted a number of plans and policies for Statewide water quality management including:

State Policy for Water Quality Control (1972)

Anti-degradation Policy

Thermal Plan

Bays and Estuaries Policy

Power Plant Cooling Policy

Reclamation Policy

Shredder Waste Disposal Policy

Underground Storage Tank Pilot Program

Sources of Drinking Water Policy

Nonpoint Source Management Plan

Ocean Plan

Discharges of Municipal Solid Waste Policy

Should any of these policies be amended by the State Board, the Regional Board will implement the amended version.

The following sections summarize the adopted policy. The complete policy is available in the "Attachments" section of this document.

I.A. STATE POLICY FOR WATER QUALITY CONTROL

The State Board has developed a set of twelve general principles to implement the provisions and intent of the Porter-Cologne Act. These principles, listed below, are contained in a document called the State Policy for Water Quality Control, adopted on July 6, 1972.

1. Water rights and quality control decisions must assure protection of fresh and marine waters for maximum beneficial use.
2. Wastewaters must be considered a part of the total available fresh water resource.
3. Management of supplies and wastewaters shall be on a regional basis for efficient utilization of the resource.
4. Efficient wastewater management requires a balanced program of source control of hazardous substances, treatment, reuse and proper disposal of effluents and residuals.
5. Substances not amenable to removal in treatment plants must be prevented from entering the system.

September 8, 1994

V-1

000076

6. Treatment systems must provide sufficient removals to protect beneficial uses and aquatic communities.
7. Institutional and financial programs of consolidated systems must serve each area equitably.
8. Sewerage facilities must be consolidated for long-range economic and water quality benefits.
9. Reclamation and reuse for maximum benefit shall be encouraged.
10. Systems must be designed and operated for maximum benefit from expended funds.
11. Control methods must be based on the latest information.
12. Monitoring programs must be provided.

I.B. ANTI-DEGRADATION POLICY

On October 28, 1968, the State Water Resources Control Board adopted Resolution No. 68-16, "Statement of Policy with Respect to Maintaining High Quality of Waters in California." While requiring continued maintenance of existing high quality waters, the policy provides conditions under which a change in water quality is allowable. A change must:

1. be consistent with maximum benefit to the people of the State;
2. not unreasonably affect present and anticipated beneficial uses of water; and
3. not result in water quality less than that prescribed in water quality control plans or policies.

V-2

I.C. THERMAL PLAN

The "Water Quality Control Plan for the Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries of California," adopted by the State Water Resources Control Board on May 18, 1972, and amended September 18, 1975, specifies water quality objectives, effluent quality limits, and discharge prohibitions related to thermal characteristics of enclosed bay and estuary waters and waste discharges.

I.D. BAYS AND ESTUARIES POLICY

The "Water Quality Control Policy for the Enclosed Bays and Estuaries of California," Resolution No. 74-43, was adopted by the State Water Resources Control Board on May 16, 1974. Commonly referred to as the "Bays and Estuaries Policy," it was adopted specifically to provide water quality principles and guidelines for the affected waters.

Decisions by the Regional Boards are required to be consistent with the provisions designed to prevent water quality degradation and to protect beneficial uses. The policy lists principles of management that include a statement of the desirability of phasing out all discharges (exclusive of cooling waters) as soon as practicable. Quality requirements state conformability with other plans and policies. Discharge prohibitions are placed on:

1. new dischargers (other than those that would enhance the receiving waters);
2. untreated waste and waste products;
3. refuse;

September 8, 1994

000077

4. consequential effects of mining, construction, agriculture, and timber harvesting;
5. materials of petroleum origin;
6. radiological, chemical, or high-level radioactive waste; or
7. discharge or by-pass of untreated waste.

I.E. POWER PLANT COOLING POLICY

The "Water Quality Control Policy on the Use and Disposal of Inland Waters Used for Power Plant Cooling" indicates the State Board's position on power plant cooling, specifying that fresh inland waters should be used for cooling only when other alternatives are environmentally undesirable or economically unsound.

I.F. RECLAMATION POLICY

The "Policy with Respect to Water Reclamation in California" requires the Regional Boards to conduct reclamation surveys and specifies reclamation actions to be implemented by the State and Regional Boards as well as other agencies.

I.G. SHREDDER WASTE DISPOSAL POLICY

The "Policy on the Disposal of Shredder Waste" designates specific conditions to be enforced by the Regional Board by which mechanically destructed car bodies, old appliances, or other

similar castoffs can be disposed at certain landfills.

I.H. UNDERGROUND STORAGE TANK PILOT POLICY

The "Policy Regarding the Underground Storage Tank Pilot Program" implements a pilot program to fund oversight of remedial action at leaking underground storage tank sites, in cooperation with the California Department of Health Services. Over-sight may be deferred to the Regional Boards.

I.I. SOURCES OF DRINKING WATER POLICY

The "Sources of Drinking Water" policy specifies which ground and surface waters are considered to be suitable or potentially suitable for the beneficial use of water supply (MUN). It allows the Regional Board some discretion in making MUN determinations.

I.J. NONPOINT SOURCE MANAGEMENT PLAN

The "Nonpoint Source Management Plan", Resolution 88-123, was adopted by the State Water Resources Control Board on November 15, 1988 pursuant to Section 319 of the Clean Water Act. The Plan identifies nonpoint source control programs and milestones for their accomplishment. It emphasizes cooperation with

September 8, 1994

V-3

000078

local governments and other agencies to promote the implementation of Best Management Practices and remedial projects.

I.K. OCEAN PLAN

The "Water Quality Control Plan for Ocean Waters of California," Resolution No. 90-27 was adopted by the State Water Resources Control Board on March 22, 1990. This 1990 plan establishes beneficial uses and water quality objectives for waters of the Pacific Ocean adjacent to the California Coast outside of enclosed bays, estuaries, and coastal lagoons. Also, the Ocean Plan prescribes effluent quality requirements and management principles for waste discharges and specifies certain waste discharge prohibitions.

The Ocean Plan also provides that the State Water Resources Control Board shall designate Areas of Special Biological Significance (ASBS) and requires wastes to be discharged a sufficient distance from these areas to assure maintenance of natural water quality conditions.

The State Water Resources Control Board declared its intent to periodically revise the Plan to reflect water quality objectives that are necessary to protect beneficial uses of ocean waters and to be consistent with current technology.

I.L. DISCHARGES OF MUNICIPAL SOLID WASTE POLICY

The "Policy for Regulation of Discharges of Municipal Solid Waste", Resolution No. 93-62, was adopted by the State Water Resources Control Board on June 17, 1993. This policy implements State regulations of waste discharge to land (California Code of Regulations, Title 23, Chapter

15) and Federal Regulations related to municipal solid waste disposal (40 Code of Federal Regulations Sections 257 and 258). The policy directs Regional Water Quality Control Boards to revise or adopt, prior to the Federal deadline (currently October 9, 1993), Waste Discharge Requirements for all municipal solid waste landfills subject to State and federal regulations. A detailed description of this policy is provided in Chapter Four under the Resources Conservation and Recovery Act section.

II. RECOMMENDED STATE WATER RESOURCES CONTROL BOARD CONTROL ACTIONS

1. State policies for surface waters and for bays and estuaries should be further considered in light of the revised Ocean Plan of 1988.
2. State policies for water quality control should place increasing emphasis on water quality monitoring to determine compliance with water quality objectives in order to provide a firm basis for classification of receiving waters relative to Section 303(e) of Public Law 92-500.
3. Erosion and sedimentation control policies should be established based on (a) pilot studies conducted by the U. S. Soil Conservation Service which recommended best management practices for erosion problems, (b) a statewide study by the California Association of Resource Conservation Districts on institutional solutions to sedimentation problems, and (c) findings of erosion studies conducted in the Central Coast Region as part of nondesignated area 208 planning.

4. Land use planning relative to nonpoint pollution sources should be considered as a future activity, possibly as a multiagency effort; initial control efforts and means for effective control should be from local agencies.
5. Water quality control programs should continue to include emphasis on total water management in order to permit enhancement of naturally degraded surface and ground waters.
6. The State Water Resources Control Board should consider water quality effects when reviewing water rights permits.
7. Policies affecting water rights should reinforce water quality goals particularly as related to long-term ground water salinity changes. Adjudication of degraded ground water basins should be considered as a tool for implementation of water quality goals to be utilized only if other measures fail.
8. Water supply improvements to reduce influent wastewater salinity made in the interest of total water quality management should be considered for partial eligibility for Clean Water Grants. Increased costs for grant eligibility could be in lieu of costs for wastewater effluent demineralization where such measures are required.
9. Water reclamation and reuse programs for supplementing agricultural irrigation supplies should be given increased emphasis. Grant support should be available for water short areas where such water demand can be demonstrated.

III. REGIONAL WATER QUALITY CONTROL BOARD MANAGEMENT PRINCIPLES

III.A. GENERAL

1. Land use practices should assure protection of beneficial water uses and aquatic environmental values.
2. There shall be no waste discharged into areas which possess unique or uncommon cultural, scenic, aesthetic, historical or scientific values. Such areas will be defined by the Regional Board.
3. Property owners are considered ultimately responsible for all activities and practices that could result in adverse affects on water quality from waste discharges and surface runoff.

III.B. WASTEWATER RECLAMATION

1. Water quality management systems throughout the basin shall provide for eventual wastewater reclamation, but may discharge wastes to the aquatic environment (with appropriate discharge requirements) when wastewater reclamation is precluded by processing costs or lack of demand for reusable water.
2. The number of waste sources and independent treatment facilities shall be minimized and the consolidated systems

September 8, 1994

V-5

000080

shall maximize their capacities for wastewater reclamation, assure efficient management of, and meet potential demand for reclaimed water.

Further wastewater reclamation guidance is available in the Implementation Plan, Chapter Four.

III.C. DISCHARGE TO SURFACE WATERS

1. All discharges to the aquatic environment shall be considered temporary unless it is demonstrated that no undesirable change will occur in the natural receiving water quality.
2. The quality of all surface waters of the basin shall be such as to permit unrestricted recreational use.
3. The discharge of pollutants into surface fresh waters shall be discontinued.

III.D. MUNICIPAL AND INDUSTRIAL SEWERING ENTITIES

1. Municipal and industrial sewerage entities should implement comprehensive regulations to prohibit the discharge to the sewer system of substances listed below which may be controlled at their source:

Chlorinated hydrocarbons;

Toxic substances;

Harmful substances that may concentrate in food webs;

Excessive heat ;

Radioactive substances;

Grease, oil, and phenolic compounds;

Mercury or mercury compounds;

Excessively acidic and basic substances:

Heavy metals such as lead, copper, zinc, etc.; and

Other known deleterious substances.

2. Sewering entities should implement comprehensive industrial waste ordinances to control the quantity and quality of organic compounds, suspended and settleable substances, dissolved solids, and all other materials which may cause overloading of the municipal waste treatment facility.

III.E. GROUND WATER

1. Ground water recharge with high quality water shall be encouraged.
2. In all ground water basins known to have an adverse salt balance, total salt content of the discharge shall not exceed that which normally results from domestic use, and control of salinity shall be required by local ordinances which effectively limit municipal and industrial contributions to the sewerage system.
3. Wastewaters percolated into the ground waters shall be of such quality at the point where they enter the ground so as to assure the continued usability of all ground waters of the basin.

III.F. INDIVIDUAL, ALTERNATIVE, AND COMMUNITY SYSTEMS

The Regional Board intends to discourage high density development on septic tank disposal systems and generally will require increased size of parcels with increasing slopes and slower percolation rates. Consideration of development will be based upon the percolation rates and engineering reports supplied. In any questionable situation, engineer-designed systems will be required.

Further information concerning on-site systems can be found in Chapter Four.

III.G. EROSION AND SEDIMENTATION CONTROL

1. General recommendations for erosion control, numbered one through six under "Land Disturbance Activities" in the Implementation Plan, Chapter Four, are considered by the Regional Board to be Best Management Practices (BMP's), as are those BMP's identified in approved areawide Water Quality Management Plans.
2. Local units of government should have the lead role in controlling land use activities that cause erosion and may, as necessary, impose further conditions, restrictions, or limitations on waste disposal and other activities that might degrade the quality of waters of the State.
3. In implementing BMP's through local units of government, or through State and federal agencies for lands under their control, working relationships, priorities, and time schedules will be defined in management agency agreements

between the areawide waste treatment planning agency and the local management agency. Agreements will be reviewed and updated annually to reflect recent achievements, new information and new concerns.

4. Regional Board participation in sediment control programs shall include assistance in the establishment of local control programs, participation in the determination of water quality problems, and a cooperative program evaluation with local units of government. Regional Board enforcement authority will be exercised where local volunteer programs fail to correct sediment problems within a reasonable period.
5. Emergency projects undertaken or approved by a public agency and necessary to prevent or mitigate loss of, or damage to, life, health, property, or essential public services from an unexpected occurrence involving a clear and imminent danger are exempt from this chapter providing such exemption is in the public interest.
6. Regulation of sediment discharges from routine annual agricultural operations, such as tilling, grazing, and land grading and from construction of agricultural buildings is waived except where such activity is causing severe erosion and causing, or threatening to cause, a pollution or nuisance.
7. Regulation of discharges from State and federal lands managed by agencies operating in accordance with approved management agency agreements is waived except where such activity is causing, or threatening to cause, a pollution or nuisance.

"Control Actions" and "Actions by Other Authorities" in this chapter and the Implementation Plan, Chapter Four, contain further information regarding erosion and sedimentation control.

September 8, 1994

V-7

000082

IV. DISCHARGE PROHIBITIONS

Due to unique cultural, scenic, aesthetic, historical, scientific, and ecological values of the Central Coastal Basin, and the necessity to protect the public health and the desire to achieve water quality objectives, the Regional Water Quality Control Board has established certain discharge prohibitions.

IV.A. ALL WATERS

Waste discharges shall not contain materials in concentrations which are hazardous to human, plant, animal, or aquatic life.

The discharge of oil or any residual products of petroleum to the waters of the State, except in accordance with waste discharge requirements or other provisions of Division 7 of the California Water Code, is prohibited.

Discharge of elevated temperature wastes into COLD intrastate waters is prohibited where it may cause the natural temperature of the receiving water to exceed limits specified in Chapter Three, Water Quality Objectives.

IV.A.1. TOXIC OR HAZARDOUS POLLUTANTS

Discharge of toxic or hazardous material that violates: 1) the toxicity objective for all waters as designated in the Ocean Plan [See Appendix A-5] and Objectives for All Inland Surface Waters, Enclosed Bays, and Estuaries [See Chapter Three], or 2) Proposition 65 limitations for

municipal/domestic water supply waters is prohibited.

Discharge to publicly owned treatment works is prohibited in concentrations that:

1. Exceeds applicable federal pretreatment standards;
2. Endangers safe and continuous operation of wastewater treatment facilities;
3. Endangers public health and safety; and
4. Causes violation of applicable water quality objectives.

IV.B. INLAND WATERS

Wastes discharged to surface waters shall be essentially free of toxic substances, grease, oil, and phenolic compounds.

Waste discharges to the following inland waters are prohibited:

1. All surface freshwater impoundments and their immediate tributaries.
2. All surface waters within the San Lorenzo River, Aptos-Soquel, and San Antonio Creek Subbasins and all water contact recreation areas except where benefits can be realized from direct discharge of reclaimed water.
3. All deadend sloughs receiving little flushing action from land drainage or natural runoff.
4. All coastal surface streams and natural drainageways that flow directly to the ocean within the Santa Cruz Coastal, Monterey Coastal, San Luis Obispo Coastal from the Monterey County line to the northern boundary of San Luis Obispo Creek drainage, and the Santa Barbara Coastal Subbasins except where discharge is

associated with an approved wastewater reclamation program.

5. The Santa Maria River downstream from the Highway One bridge.
6. The Santa Ynez River downstream from the salt water barrier.

IV.C. WATERS SUBJECT TO TIDAL ACTION

The discharge of any radiological, chemical, or biological warfare agent or high level radioactive waste into the ocean is prohibited.

Waste discharges to the following areas are prohibited.

1. In the northern extreme of Monterey Bay, inshore from an imaginary line extending from Santa Cruz Point (36°-57.0'N, 122°-01.5'W) to the mouth of the Pajaro River (36°-51.0'N, 121°-48.6'W) and in ocean waters within a three (3) mile radius of Point Pinos (36°-38.3'N, 121°-56.0'W), excepting the area described in No. 2 below.
2. In the southern extreme of Monterey Bay, inshore from an imaginary line extending from Point Pinos (36°-38.3'N, 121°-56.0'W) to the mouth of the Salinas River (36°-44.9'N, 121°-48.3'W).

Discharges to the Monterey Bay Prohibition Zone from desalinization units and circulating seawater system discharges may be permitted after each proposal satisfies California Environmental Quality Act requirements and completes the National Pollutant Discharge Elimination System process.

IV.C.1. AREAS OF SPECIAL BIOLOGICAL SIGNIFICANCE

Discharge of waste is prohibited where it will alter natural water quality conditions in Areas of Special Biological Significance. Areas of Special Biological Significance are:

1. Ano Nuevo Point and Island, San Mateo County, including ocean waters within three (3) nautical miles offshore and defined by extensions of Cascade Creek on the north and the Santa Cruz-San Mateo County line on the south.
2. Pacific Grove Marine Gardens Fish Refuge and Hopkins Marine Life Refuge, Monterey County, including Monterey Bay waters bounded by Point Alones on the east, by Point Pinos on the west, and extending offshore to the 60-foot depth contour (about 0.7 miles).
3. Carmel Bay, Monterey County, including all bay waters enclosed by an imaginary line extending between Pescadero Point and Granite Point.
4. Point Lobos Ecological Reserve, Monterey County, including ocean waters within one-quarter (0.25) mile offshore from Granite Point southerly to the southernmost boundary of Point Lobos Reserve State Park.
5. Julia Pfeiffer Burns Underwater Park, Monterey County, including ocean waters within an area extending about one (1.0) mile offshore and about two and one-half (2.5) miles south of Partington Point.
6. Salmon Creek, Monterey County, including ocean waters within one-thousand (1000) feet or more offshore, bounded on the south by an extension of the Monterey-San Luis Obispo County line, and extending northward about three (3) miles.

September 8, 1994

V-9

000084

7. San Miguel, Santa Rosa, and Santa Cruz Islands, Santa Barbara County, including ocean waters within about one (1) nautical mile offshore.

The discharge of municipal and industrial waste sludge and sludge digester supernatant directly to the ocean, or into a waste stream that discharges to the ocean without further treatment, is prohibited.

The bypassing of untreated waste to the ocean is prohibited.

Excepting vessel washdown waters, disposal of waste matter or untreated waste from vessel to tidal water is prohibited.

The discharge of oil or grease, from other than natural sources, which produces a visible or measurable effect to tidal waters of the basin is prohibited.

New thermal waste discharges to coastal waters, enclosed bays and estuaries having a maximum temperature greater than 4°F above the natural temperature of the receiving water are prohibited.

IV.D. GROUND WATERS

Wastes discharged to ground waters shall be free of toxic substances in excess of accepted drinking water standards; taste, odor, or color producing substances; and nitrogenous compounds in quantities which could result in a ground water nitrate concentration above 45 mg/l.

IV.E. OTHER SPECIFIC PROHIBITION SUBJECTS

Other prohibitions exist which pertain to the following topics. These prohibitions can be found under the respective heading in the Implementation Plan.

Mushroom Farms Operation Prohibitions

Individual, Alternative, and Community Sewage Disposal Systems Prohibitions

Land Disturbance Prohibitions

Solid Waste Discharge Prohibitions

IV.F. EXCEPTIONS TO BASIN PLAN REQUIREMENTS

The Regional Board may, subsequent to a public hearing, grant exceptions to any provision of this Plan where the Regional Board determines:

1. The exception will not compromise protection of waters for beneficial uses; and
2. The public interest will be served.

Regional Board exceptions will be effective upon State Board approval, unless exceptions involve surface water beneficial use designations or surface water quality objectives (i.e., federally accepted water quality standards). Such water quality standard related exceptions will also require Environmental Protection Agency approval to become effective.

V. CONTROL ACTIONS

Specific actions can be taken to control water quality. These are specified below.

V.A. WASTE DISCHARGE REQUIREMENTS

1. The Regional Water Quality Control Board will implement water quality control plan provisions through establishment of requirements and timetables for compliance with plan actions.
2. Waste discharge requirements will be established for all (operating) solid waste sites and where inactivated sites may contribute to water quality impairment.
3. Waste discharge requirements will be established for all existing oil well fields, mines, or other well fields which threaten water quality.
4. Waste discharge requirements will be established for all irrigation, feedlot, dairy, and poultry operations which are so located as to pose a clear and direct threat to water quality; such operations need not be so large as to require a permit under NPDES.

V.B. STATE CLEAN WATER GRANTS OR LOANS

1. Priorities for State Clean Water Grants or Loans will be ordered by the Regional Water Quality Control Board and provide ever increasing emphasis toward correction of basin water quality problems.
2. Water supply improvements (which encourage cost-effective water quality management) beyond normal source control measures (i.e., water supply quality enhancement by treatment or other means in lieu of effluent demineralization) will be recommended for funding.

V.C. SALT DISCHARGE

1. Emphasize control of brine disposal into public sewer systems by requiring affected dischargers to comply with normal salt increments, to adopt salt source control ordinances, and to conduct wastewater monitoring programs.
2. Minimize degradation of water during transport from points of use; minimize leakage of poor quality water during transport from salt affected areas through salt free lands to salt sinks for disposal.
3. Regulate importation of water into any basin or subbasin and regulate the reuse of waters in upstream portions of subbasins which is of poorer quality than existing or imported supplies. If such import or transport to up-slope areas for reuse is allowed, take suitable steps to mitigate short and long term adverse effects of increased salt load resulting from this recycling.

September 8, 1994

V-11

4. Increase recharge of underground water storage basins (where recharge is possible) using surplus winter or spring runoff waters.
5. Actively support measures designed to protect and to improve quality of waters imported into areas with unfavorable or poor salt balance.
6. Regulate reclamation of new lands which would contribute large quantities of salts or pollutants to water supplies.
7. Where water supplies are limited, restrict use of reclaimed waters to existing irrigated acreage rather than develop new irrigated acreage to utilize the reclaimed water.

V.D. INDIVIDUAL, ALTERNATIVE, AND COMMUNITY SEWAGE DISPOSAL SYSTEMS

Unsewered areas having high density (one acre lots or smaller) should be organized into septic tank management districts and sewerage feasibility studies should be encouraged in potential problem areas. Local implementation should be encouraged by Regional Board action.

V.E. AGENCY COORDINATION

The Regional Water Quality Control Board will initiate coordination with the appropriate Coastal Commission, as well as other State, federal, and local agencies which possess related or overlapping planning responsibilities.

V.F. ANIMAL CONFINEMENT OPERATIONS

The California Code of Regulations, Title 23, Chapter 15, Section 2601 defines a confined animal facility as "any place where cattle, calves, sheep, swine, horses, mules, goats, fowl, or other domestic animals are corralled, penned, tethered, or otherwise enclosed or held and where feeding is by means other than grazing."

1. Animal confinement facilities plus adjacent crop land under the control of the operator shall have the capacity to retain surface drainage from manure storage areas plus any washwater during a 25-year 24-hour storm.
2. Surface drainage, including water from roofed areas, shall be prevented from running through manure storage areas.
3. Animal confinement facilities, including retention ponds shall be protected from overflow to stream channels during 20-year peak stream flows for existing facilities and 100-year peak stream flows for new facilities.
4. Retention ponds shall be lined with or underlain by soils containing at least ten percent clay and not more than ten percent gravel or artificial material of equivalent impermeability.
5. Washwater and surface drainage from manure storage areas shall be contained, applied to crop lands, or discharged to treatment systems subject to approval by the Regional Water Quality Control Board.
6. Animals in confinement shall be prevented from entering any surface waters within the confined area.

7. Lands that have received animal wastes shall be managed to minimize erosion and runoff. Dry manures applied to cultivated crop lands should be incorporated into the soil soon after application.
8. Animal wastes shall be managed to prevent nuisances in manure storage areas.
9. Manure storage areas shall be managed to minimize percolation of water into underlying soils; this may be accomplished by routing drainage to impervious storage areas, land applications, relocation of existing lots and, in the case of new locations, by selecting more impervious soils for manure storage areas.
10. Animal confinement facilities shall have adequate surface drainage to prevent continuous accumulation of surface waters in corrals and feed yards; drainage should be routed to impervious storage areas or applied to land.
11. Application of manures and washwaters to crop lands shall be at rates which are reasonable for crop, soil, climate, special local situations, management system and type of manure.
12. A monitoring program may be required by the Regional Water Quality Control Board as a condition to issuance or waiver of waste discharge requirements.

Further animal confinement information can be found in Chapter Four in the Nonpoint Source Measures section under Agricultural Water and Wastewater Management.

V.G. EROSION AND SEDIMENTATION

1. Erosion from nonpoint pollution sources shall be minimized through implementation of BMP's (identified under "Management Principles" and

described under "Land Disturbance Activities" in Chapter Four's "Nonpoint Source Measures" section.

2. All necessary control measures for minimizing erosion and sedimentation, whether structural or vegetal, shall be properly established prior to November 15 each year.
3. All structural and vegetal measures taken to control erosion and sedimentation shall be properly maintained.
4. A filter strip of appropriate width, and consisting of undisturbed soil and riparian vegetation or its equivalent, shall be maintained, wherever possible, between significant land disturbance activities and watercourses, lakes, bays, estuaries, marshes, and other water bodies. For construction activities, minimum width of the filter strip shall be thirty feet, wherever possible as measured along the ground surface to the highest anticipated water line.
5. Design and maintenance of erosion and sediment control structures, (e.g., debris and settling basins, drainage ditches, culverts, etc.) shall comply with accepted engineering practices.
6. Cover crops shall be established by seeding and/or mulching, or other equally effective measures, for all disturbed areas not otherwise protected from excessive erosion.
7. Land shall be developed in increments of workable size that can be completed during a single construction season. Graded slope length shall not be excessive and erosion and sediment control measures shall be coordinated with the sequence of grading, development, and construction operations.
8. Use of soil sterilants is discouraged and should be minimized.

September 8, 1994

V-13

Further erosion and sedimentation information can be found in other areas of this chapter as well as the Implementation Plan, Chapter Four, under "Land Disturbance Activities."

V.H. ACTIONS BY OTHER AUTHORITIES

V.H.1. FEDERAL AGENCIES

1. Federal agencies directly affected by the facility plans involving consolidation with other communities should comply with applicable provisions of the Basin Plan (e.g., Fort Ord on the Monterey Peninsula is shown as part of municipal wastewater sewerage consolidation plans); agency policies favoring plan recommendations are encouraged.
2. Federal agencies otherwise affected by plan provisions should signify their compliance or concern with plan recommendations; time at public hearings will be provided for this purpose.

V.H.2. ASSOCIATION OF MONTEREY BAY AREA GOVERNMENTS

The Association of Monterey Bay Area Governments (AMBAG) should coordinate with local agencies and the Regional Board relative to implementation of water quality control plans in that area.

V.H.3. SEPTIC TANK MANAGEMENT AGENCIES

1. County governments should revise septic tank ordinances to conform with basin plan recommendations and State Board guidelines.
2. Formation of septic tank management districts within existing local agencies should be accomplished in areas where directed by Regional Board action.

V.H.4. WATER MANAGEMENT AGENCIES

Conjunctive ground water-surface water management should continue to be encouraged by water management agencies, both in terms of storage and recharge operations and containment and routing of highly mineralized surface waters to prevent recharge. Examples in the Salinas Subbasin include storage of wet weather flows and recharge from a reservoir on Arroyo Seco and containment to prevent recharge of highly mineralized surface waters in streams such as Pancho Rico Creek.

V.H.5. SOLID WASTE MANAGEMENT

Preparation of solid waste management plans by all counties in the basin should be accomplished as required by the Nejedly-Z'berg-Dills Solid Waste Management and Resource Recovery Act of 1972.

V.H.6. AGRICULTURAL MANAGEMENT

Local agricultural representatives and the University of California extension service should maintain liaison with the Regional Water Quality Control Board and the State Board relative to agricultural wastewater management.

V.H.7. OFFSHORE OIL

Water quality in offshore oil lease areas should be monitored by State and federal agencies preferably by arrangements with independent oceanographic institutions.

V.H.8. SALINITY MANAGEMENT

Salt source control measures should be implemented by municipalities having excessive mineral quality in wastewaters discharged to land or inland waters; control of salinity through water supply improvements is recommended.

V.H.9. SEAWATER INTRUSION

Water Management Plans should be prepared and adopted by Monterey County for the Salinas ground water basin and the Pajaro Valley Water Management Agency for the Pajaro ground water basin. These management plans should include immediate actions these agencies can take to help alleviate seawater intrusion as well as measures to stop seawater intrusion from advancing. These agencies should remediate seawater intrusion as a long-term goal.

Local and State agencies having jurisdiction to help control seawater intrusion should assist in implementing seawater intrusion remedies.

V.H.10. EROSION AND SEDIMENTATION CONTROL

1. The federal government should increase its support of erosion and sediment control programs by increasing its technical staffs, increasing cost-share funds, increasing the availability of low-interest loans, and changing its income tax laws to encourage the use of Best Management Practices for erosion and sediment control.
2. The State of California should establish an erosion and sediment control program that includes incentives for the individual - such as cost-sharing, changes in State law that would reduce property taxes for enduring erosion and sediment control practices, and incentives through state income taxes.
3. Resource Conservation Districts within the Central Coast Region should develop management agency agreements with the Regional Board agreeing to work jointly with the Regional Board to integrate soil and water resource programs in the application of Best Management Practices to correct existing erosion and sediment problems and to prevent new problems from occurring.
4. Local units of government should improve land use plans to establish a clear policy, and shall adopt or improve ordinances to include definitive performance standards, for the control of erosion and sedimentation, including consistency with this Basin Plan and Best Management Practices identified under Regional Board "Management Principles."

5. Local units of government developing Local Coastal Programs shall establish a clear policy on erosion and sedimentation and adopt an ordinance consistent with Best Management Practices for their land areas within the Coastal Zone.
6. Resource Conservation Districts, the U.S.D.A. Soil Conservation Service, the California Department of Transportation, and the Extension Service, in conjunction with the cities and counties, should develop and carry out an erosion and sediment control training program for employees who check erosion and sediment control plans and who enforce local ordinances and regulations relating to erosion and sediment control practices.
7. Counties and cities should work with the Regional Board to identify priorities, time schedules, and limitations and to negotiate management agency agreements concerning implementation of Best Management Practices for control of erosion and sedimentation.
8. Review and assessment of erosion and sediment control plans for new land developments in those counties and cities that have signed management agency agreements with the Regional Board will be processed entirely by that county or city.

VI. REGIONAL BOARD POLICIES

Formal specific policies adopted by the Regional Board are presented below according to various categories.

VI.A. SEWERAGE FACILITIES AND SEPTIC TANKS IN URBANIZING AREAS IN THE CENTRAL COAST REGION

Resolution 69-01: Adopting Policy Statement Regarding Sewerage Facilities and Septic Tanks in Urbanizing Areas in the Central Coast Region

This policy prohibits septic tank or community systems unless particular criteria are satisfied.

VI.B. SEPTIC TANKS

1. Resolution 86-02: Acceptance of Monterey County Board of Supervisor's Ordinance Applying Development Restrictions to the Bay Hills (Bay Farms/Hillcrest) Area.

This policy accepts Monterey County's moratorium in lieu of a Regional Board prohibition. Further, the policy requested a compliance schedule to eliminate discharge from individual sewage disposal systems and the State Water Resources Control Board is requested to rank this project Class "A" on the Clean Water Grant project priority list.

2. Resolution 87-05: Acceptance of Monterey County Board of Supervisor's Ordinance Applying Development Restrictions to the area within the San Lucas County Water District.

This policy accepts Monterey County's moratorium in lieu of a Regional Board prohibition. Further, the policy requested a compliance schedule to eliminate discharge from individual sewage disposal systems and the State Water Resources Control Board is requested to rank this project Class "A" on the Clean Water Grant project priority list.

Further information concerning on-site system development restrictions can be found in Chapter Four.

VI.C. OIL FIELD WASTES

1. a. Resolution 73-05: Adopting Policy Regarding Beneficial Use of Oil Field Waste Materials in the Santa Maria Oil Fields, Santa Barbara County

b. Resolution 89-04: Adopting Policy Regarding Beneficial Use of Oil Field Waste Materials in the Central Coast Region

The above policies require oil field waste materials to be deposited at an appropriate and approved Class I or Class II disposal site. Other disposal sites may be used for disposal under certain conditions. Executive Officer approval is necessary for other sites. A procedure to obtain Executive Officer approval is specified.

VI.D. AREA OF SPECIAL BIOLOGICAL SIGNIFICANCE (ASBS)

Resolution 76-10: Recommendation to the State Water Resources Control Board Concerning the Designation of Terrace Point in Santa Cruz County as an Area of Special Biological Significance.

This policy recommended the State Water Resources Control Board to not designate Terrace Point as an Area of Special Biological Significance. The State Board concurred with the Regional Board in Resolution 77-21.

Further information concerning ASBS areas can be found in Chapter Two.

VI.E. LEGISLATIVE MATTERS

Resolution 78-04: Supporting Approval of the Clean Water and Water Conservation Bond Law of 1978.

This policy expressed support for Proposition Two and urged California voters to support the proposition.

VI.F. PROHIBITION ZONES

Resolution 79-06: Resolution Regarding Marina County Water District's Petition to Delete the Southern Monterey Bay Discharge Prohibition Zone from the Basin Plan.

This policy considers Marina County Water District challenge to the Southern Monterey Bay prohibition zone. This policy resolves the Southern Monterey Bay prohibition zone is appropriate.

Regional Board adopted prohibition zones for tidal waters can be found under "Waters Subject to Tidal Action" under "Discharge Prohibitions" in this chapter.

VI.G. SAN LORENZO VALLEY

Resolution 87-04: Certification of Santa Cruz County's Wastewater Management Program for the San Lorenzo River Watershed.

This policy certifies Santa Cruz County's Wastewater Management Program for the San Lorenzo Valley is adequate to satisfy the loan condition authorized by Chapter 962 of the 1986 State Statues.

VI.H. HIGHWAY GROOVING RESIDUES

Resolution 89-04: Adopting Policy Regarding Disposal of Highway Grooving Residues.

This policy specifies conditions for highway grooving residue disposal.

VI.I. WAIVER OF WASTE DISCHARGE REQUIREMENTS

Resolution 89-04: Waiver of Regulation of Specific Types of Waste Dischargers.

State law allows Regional Boards to waive waste discharge requirements (WDRs) for a specific discharge or types of discharges where it is not against the public interest (California Water Code Section 13269). These waivers are conditional and may be terminated at any time.

On April 15, 1983, the Regional Board held a public hearing regarding the types and nature of waste discharges considered for waiver. Following this hearing, the Regional Board established certain discharges which waived WDRs. The types of dischargers which may be waived are shown in the appendix.

VI.J. INTERPRETATION OF MINIMUM PARCEL SIZE REQUIREMENTS FOR ON-SITE SEWAGE SYSTEMS

This policy clarifies Regional Board minimum parcel size requirements for on-site systems contained in Chapter Four of this document.

A copy of this policy is shown in the appendix.

VI.K. APPRECIATION FOR DISCHARGER COMPLIANCE

Resolution 93-04: Appreciation for Discharger Compliance.

This policy addresses the manner in which the Regional Board will protect water quality protection and improvement at the most cost effective manner to society. A copy of the policy is shown in the appendix.

Plan for California's Nonpoint Source Pollution Control Program

Edward Anton, Acting Executive Director
State Water Resources Control Board
901 P Street
Sacramento, California 95814

Dear Messrs. Douglas and Anton:

The National Oceanic and Atmospheric Administration (NOAA) and the U.S. Environmental Protection Agency (EPA) are pleased to inform you of our full approval of the *Plan for California's Nonpoint Source Pollution Control Program* (Program Plan), submitted in accordance with §6217 of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) and §319 of the Clean Water Act (CWA §319). We commend you for developing a nonpoint source pollution control program to address both the requirements of CZARA and the CWA §319. We congratulate you on your efforts to successfully complete development of this comprehensive program, while recognizing the most challenging work awaits us.

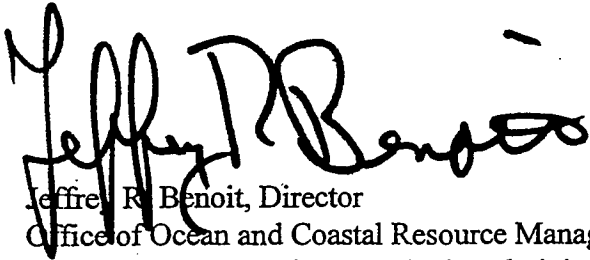

Nonpoint source pollution, caused by a wide range of activities including agriculture, mining, urban development and forestry, is the leading cause of water quality impairment in California. The restoration of California's waters will depend on a wide range of regulatory and non-regulatory actions. We fully support the Program Plan's stress on cooperation and local stewardship to resolve nonpoint source problems, but vitally important are your assurances of applicable State regulatory authorities available to protect and restore water quality degraded by nonpoint source discharges. We recognize success will ultimately rely on your ability to use these programs and authorities to foster the widespread implementation of practices that will restore and maintain the chemical, physical and biological integrity of California's waters.

NOAA and EPA find that California has satisfied all conditions of program approval pursuant to CZARA set forth in the *Findings on the California Coastal Nonpoint Program*, transmitted to the State on June 30, 1998. These conditions have been addressed in the Program Plan. Furthermore, EPA finds that the Program Plan successfully incorporates the nine key elements pursuant to CWA §319 that characterize an effective and dynamic state nonpoint source program (EPA, May 1996). Consequently, the California Nonpoint Source Pollution Control Program is now fully approved pursuant to CZARA and CWA §319. As a result, California will receive \$10.6 million this year to implement the nonpoint source program. This includes \$5.2 million of "new" funds that the Clean Water Action Plan (February 1998) has earmarked for those States that have upgraded their nonpoint source programs.

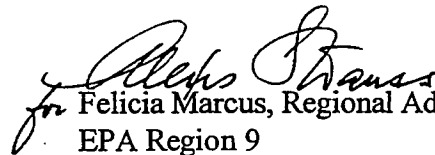

000095

We greatly appreciate the effort and commitment your agencies and staff have shown in completing development of your nonpoint source program. We look forward to working closely with you to implement fully the management measures by 2013, and will be working with you to monitor your progress in achieving this goal. If you have any questions regarding the enclosed decision documents, please call Jeff Benoit (NOAA) (301-713-3155), Felicia Marcus (EPA Region 9) (415-744-1001), or Alexis Strauss (EPA Region 9) (415-744-1860), or refer staff to Keelin Kuipers (NOAA) (301-713-3121, ext. 175) or Sam Ziegler (EPA Region 9) (415-744-1990).

Yours,

Jeffrey R. Benoit, Director
Office of Ocean and Coastal Resource Management
National Oceanic and Atmospheric Administration

Felicia Marcus, Regional Administrator

STATE WATER RESOURCES CONTROL BOARD
RESOLUTION NO. 99 - 114

APPROVAL OF A RESOLUTION ADOPTING THE PLAN FOR CALIFORNIA'S NONPOINT SOURCE POLLUTION CONTROL PROGRAM (PROGRAM PLAN) AND AUTHORIZING THE EXECUTIVE DIRECTOR TO SUBMIT THE PROGRAM PLAN TO THE U.S. ENVIRONMENTAL PROTECTION AGENCY AND NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION FOR APPROVAL AND TO IMPLEMENT THE PROGRAM PLAN

WHEREAS:

1. The State Water Resources Control Board (SWRCB) and Regional Water Quality Control Boards (RWQCBs) are committed to and are ultimately responsible for nonpoint source (NPS) pollution management to protect and restore water quality in California.
2. In February 1987, the federal Clean Water Act (CWA) was amended to include section 319 which required each state to address NPS pollution by: (a) assessing NPS pollution problems and causes within the state; (b) adopting management programs to control the NPS pollution; and (c) implementing the management programs.
3. In accordance with the requirements of CWA section 319, on November 15, 1988, the SWRCB adopted and, on January 4, 1990, the U. S. Environmental Protection Agency (USEPA) approved *California's Nonpoint Source Management Plan*.
4. On November 5, 1990, the Coastal Zone Act Reauthorization Amendments (CZARA) were enacted to address concerns with NPS pollution of coastal waters not adequately considered in the Coastal Zone Management Act of 1972.
5. Section 6217 of CZARA requires coastal states to develop Coastal Nonpoint Pollution Control Programs (CNPCP) that: (a) identify and adopt management measures to prevent and control NPS pollution; (b) ensure that enforceable mechanisms exist where self-determined efforts are insufficient to restore and protect water quality; (c) enhance cooperation among the states' land and water use agencies; (d) identify land uses which individually or cumulatively may cause or contribute significantly to a degradation of coastal waters; (e) identify "critical coastal areas" and identify and implement additional measures where necessary to achieve and maintain water quality in the such areas; (f) provide technical assistance to local governments and the public to implement the management measures;

000097

- (g) provide opportunities for public participation in CNPCP development and implementation; and (h) monitor management measure implementation. The CNPCP must be approved by USEPA and the National Oceanic and Atmospheric Administration (NOAA).
6. The lead agencies designated for upgrading the State's NPS Program to conform to the requirements of the CWA and CZARA are the SWRCB, the RWQCBs, and the California Coastal Commission (CCC).
 7. In September 1995, the SWRCB and the CCC submitted to USEPA and NOAA the State's response to the CZARA requirements. In lieu of a separate program for the coastal zone, the SWRCB and the CCC applied the CZARA requirements on a statewide basis.
 8. In July 1998, USEPA and NOAA issued their findings and conditional approval of the State's submittal. For final approval of the CNPCP, the State was required, consistent with the August 1997 Action Plan, to (a) adopt management measures; (b) identify back-up and enforceable policies and mechanisms for the management measures; and (c) demonstrate the ability for widespread implementation of the management measures.
 9. The Program Plan is the State's final submittal to satisfy the requirements specified by USEPA and NOAA for CNPCP approval and NPS Program Upgrade. The Program Plan is composed of two volumes -- *Volume I: Nonpoint Source Program Strategy and Implementation Plan for 1998-2013* (PROSIP) and *Volume II: California Management Measures for Polluted Runoff (CAMMPR)* (Attachments 1 and 2, respectively).
 10. SWRCB and CCC staffs held public workshops to receive comments on the Program Plan, and the Program Plan has been revised to incorporate pertinent comments.

THEREFORE BE IT RESOLVED THAT:

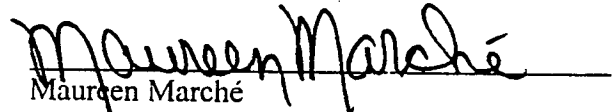

The SWRCB:

1. Adopts the Program Plan;
2. Authorizes the Executive Director to submit the Program Plan to the USEPA and NOAA for approval;
3. Authorizes the Executive Director to execute the Memorandum of Understanding between the SWRCB and CCC;
4. Directs the Executive Director in coordination with CCC to request the Secretaries of the California Environmental Protection Agency and Resources Agency to jointly transmit a memorandum directing all departments and boards within their agencies to use their respective authorities to implement the Program Plan; and

5. Directs the Executive Director in coordination with CCC to request the Secretaries of the California Environmental Protection Agency and Resources Agency to jointly transmit a memorandum asking the California Department of Transportation, Department of Food and Agriculture, and Department Health Services to use their respective authorities to implement the Program Plan;
6. Directs the Executive Director to work with the Executive Officers of each RWQCB and directors of the State agencies to implement the Program Plan; and
7. Directs staff to initiate activities described in the Program Plan.

CERTIFICATION

The undersigned, Administrative Assistant to the Board, does hereby certify that the foregoing is a full, true, and correct copy of a resolution duly and regularly adopted at a meeting of the State Water Resources Control Board held on December 14, 1999.

Maureen Marché
Administrative Assistant to the Board

Subject: Adoption of the *Plan for California's Nonpoint Source Pollution Control Program*

Dear Mr. Benoit and Ms. Marcus:

On January 11, 2000, by a vote of 9 in favor, 0 opposed, and 1 abstention, the California Coastal Commission adopted the *Plan for California's Nonpoint Source Pollution Control Program* (Plan). The Plan provides a framework to focus, expand, and coordinate actions to prevent and control nonpoint source pollution Statewide.

By a vote of 8 in favor, 0 opposed, and 1 abstention, the Coastal Commission also directed me to enter into a Memorandum of Understanding with the State Water Resources Control Board to promote the continued close collaboration between the two State lead agencies that developed and are implementing the Plan.

Sincerely,

Peter M. Douglas
Executive Director

000100

Plan for California's Nonpoint Source Pollution Control Program

**NONPOINT SOURCE PROGRAM
STRATEGY AND IMPLEMENTATION
PLAN, 1998-2013 (PROSIP)**

**State Water Resources Control Board
California Coastal Commission**

JANUARY 2000

000102

EXECUTIVE SUMMARY

The *Plan for California's Nonpoint Source Pollution Control Program* (Program Plan) is the first significant upgrade of California's Nonpoint Source (NPS) Pollution Control Program (NPS Program) since its inception in 1988. California is required to have its Program conform to the Clean Water Act (CWA) and section 6217 of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA). The lead State agencies for upgrading the Program are the State Water Resources Control Board (SWRCB) (designated lead water quality agency), the nine Regional Water Quality Control Boards (RWQCBs), and the California Coastal Commission (CCC) (designated lead coastal zone management agency). The Program Plan will be submitted for approval to the U.S. Environmental Protection Agency (USEPA) and the National Oceanic and Atmospheric Administration (NOAA), the lead federal agencies that administer the CWA and the Coastal Zone Management Act (CZMA) respectively.

Finding solutions to NPS pollution poses unique challenges. Although the SWRCB and CCC have lead roles in developing and coordinating the implementation of the Program, they are not solely responsible for solving the problem. Over 20 other State agencies have authorities, programs, or responsibilities relating to the control of NPS pollution. Coordinating and focusing such a large number of entities to produce an effective NPS program in a state as large and geomorphologically diverse as California poses unique and difficult challenges. While increased use of regulatory authorities can help to address certain categories of NPS pollution (such as the relatively recent effort to issue permits for the most significant municipal storm water discharges), California will need to rely on a wide range of tools, activities, and authorities to address NPS pollution statewide. Initially, implementation will focus significant resources on management measures (MMs) identified as primary and secondary in Table 8, on retooling the Program's infrastructure, and on institutionalizing Program processes and mechanisms to make certain the State meets the commitments made in the Program Plan.

The State is committed to implementing the 61 NPS MMs by 2013 consistent with Federal Administrative Guidance (USEPA and NOAA, 1998), the Three-Tiered Approach adopted in the Nonpoint Source Management Plan, November 1988 (1988 Plan), and priorities identified in the Watershed Management Initiative (WMI) Chapters. The WMI, approved by the SWRCB in 1995, is used to help the SWRCB meet its goal to provide water resource protection, enhancement, and restoration. WMI uses an integrated planning approach to create and implement unique solutions for each watershed. Each RWQCB and the SWRCB revises its WMI Chapter annually to reflect changing priorities and conditions in the State's watersheds. Revisions currently underway will ensure that the WMI chapters and RWQCBs' actions are consistent with the Program Plan's goal of implementing all MMs by 2013.

Total Maximum Daily Loads (TMDLs) are another implementation planning tool that will enhance the State's ability to foster implementation of appropriate NPS MMs. By providing watershed-specific information, TMDLs will help target specific sources and corresponding corrective measures and will provide a framework for using more stringent approaches that may be necessary to achieve water quality goals and maintain beneficial uses.

Approximately 1,500 water body-pollutant combinations requiring TMDL development have been identified in the CWA section 303(d) list. During the Fifteen-Year Strategy, the RWQCBs are committed to the development of 500 to 800 individual TMDLs which will account for all 1,500 water body-pollutant combinations. The commitment of financial and staff resources to this effort will be influential in addressing the State's effectiveness in controlling NPS problems.

NPS pollution, also known as polluted runoff, is the leading cause of water quality impairments in California and in the Nation. NPSs, including natural sources, are the major contributors of pollution to impacted streams, lakes, wetlands, estuaries, marine waters, and ground water basins in California and are important contributors of pollution to harbors and bays (SWRCB, 1998). Unlike pollution from distinct, identifiable point sources (e.g., industrial or waste water treatment plant discharge pipes), NPS pollution comes from many diffuse sources. Rainfall, snowmelt, or irrigation water that moves over and through the ground results in NPS pollution. As the runoff moves, it picks up and carries away natural and human-made pollutants and deposits them into lakes, rivers, wetlands, ground water, and other inland and coastal waters.

The Program's roots were established in 1988 when the SWRCB adopted and the USEPA approved the original plan for the 1988 Plan (SWRCB, 1988) in response to CWA section 319. In 1990 Congress identified NPS pollution as a significant factor contributing to coastal water degradation, noting the link between coastal water quality and land use activities. In response, Congress amended the CZMA by passing CZARA. CZARA requires the lead water quality agency and coastal zone management agencies to jointly develop and submit a coastal nonpoint pollution control program (CNPCP).

In February 1994, the SWRCB initiated a comprehensive review of the Program using technical advisory committees (TACs) for ten categories of NPS pollution. Over 150 people participated in the TACs as public and private representatives for irrigated agriculture, nutrient application, pesticide application, confined animal facilities, grazing, urban runoff, on-site sewage disposal systems, boating and marinas, hydromodification and wetlands, and abandoned mines. The TACs presented their recommendations to the SWRCB in 1995 (SWRCB, 1994 a-i).

In lieu of a separate program for the coastal zone, the State decided to satisfy CZARA requirements on a statewide basis. As required by statute, in September 1995, the SWRCB and CCC submitted California's initial CZARA response to USEPA and NOAA. The response included two documents: *California's Coastal Nonpoint Pollution Control Submittal*, detailing the State's existing programs related to NPS pollution management, and the *Initiatives in Nonpoint Source Management*, based on the recommendations of the TACs.

USEPA and NOAA released draft findings and conditions for the State's September 1995 submittal in October 1996. In August 1997, the SWRCB, CCC, USEPA Region 9, and USEPA and NOAA headquarters staffs negotiated the *Action Plan* which outlined a framework and activities for the State to achieve both an approvable program consistent with CZARA and an "enhanced status" Program by addressing the nine key elements in the USEPA's *Nonpoint Source Program and Grants Guidance of 1997 and Future Years*. In July 1998, USEPA and NOAA issued their Final Findings and Conditional Approval for California's submittal. Consistent with the *Action Plan* and final administrative changes to CNPCP guidance issued in October 1998, for final approval the State must: (1) adopt MMs consistent with the *Guidance Specifying Management Measures for*

Sources of Nonpoint Pollution to Coastal Waters (USEPA, 1993); (2) identify back-up and enforceable policies and mechanisms for the MMs; (3) demonstrate the ability for widespread implementation of the MMs; and (4) address the nine key elements.

The Program Plan is the State's final submittal intended to satisfy the CWA section 319(h) requirements for "an upgraded program" and the CZARA requirements for a CNPCP. The Program Plan achieves this goal by providing a single unified, coordinated statewide approach to dealing with NPS pollution structured around 61 MMs. MMs serve as general goals for the control and prevention of polluted runoff. Site-specific management practices (MPs) are then used to achieve the goals of each management measure. Implementation of MMs will occur using a fifteen-year strategy with three nested five-year implementation plans. The fifteen-year strategy and each five-year implementation plan use an iterative program process. The program process includes: (1) assessing Program activities; (2) targeting efforts; (3) planning activities based on Program goals and objectives; (4) coordinating the efforts of federal, State, and local agencies and stakeholders; (5) implementing coordinated actions; (6) tracking and monitoring the results of implemented actions; and (7) reporting on Program results. The Program Plan is designed to be flexible and adaptable over time.

Specifically, the Program Plan:

1. Adopts 61 MMs as goals for six NPS categories (agriculture, forestry, urban areas, marinas and recreational boating, hydromodification, and wetlands/riparian areas/vegetated treatment systems);
2. Provides a fifteen-year strategy for fully implementing the MMs;
3. Continues use of the "Three-Tiered Approach" for addressing NPS pollution problems (Tier 1: Self-Determined Implementation of Management Practices [formerly referred to as "voluntary" implementation]; Tier 2: Regulatory Based Encouragement of Management Practices; and Tier 3: Effluent Limitations and Enforcement Actions). Senate Bill 227 (California Water Code [CWC] section 13369) requires the SWRCB to develop by February 1, 2001, guidance for describing the process by which the SWRCB and RWQCBs will enforce the Program Plan;
4. Provides the first of three five-year implementation plans targeting activities for specific MMs consistent with State and regional priorities in specific watersheds and also establishes mechanisms for: (a) coordination among agencies; (b) participation by the public; (c) assistance technically and financially; (d) adoption of additional MMs as goals, if needed; and; (e) monitoring and reporting of program effectiveness;
5. Promotes long-term interagency coordination among State agencies of the California Environmental Protection Agency and Resources Agency as well as other local, State, and federal agencies;
6. Identifies back-up authorities and enforceable policies and mechanisms for the 61 MMs adopted by the State; and
7. Relies on the use of existing authorities and regulatory processes to achieve implementation but allows for the adoption of the MMs as regulation after each five-year cycle if adequate progress in NPS pollution control has not been demonstrated.

Program accountability is critical to reassure the public of the State's commitment to deal with the NPS pollution problem. The Program Plan contains actions that will result in consistent and timely evaluation and reporting of the Program's progress in effectively dealing with NPS pollution. This

includes annual, biennial, and five-year reporting cycles and the use of Internet-based interactive information tools. Also important is greater public participation through: (1) development of the five-year implementation plans; (2) tracking the implementation of and assessing effectiveness of MMs; (3) use of public reports; (4) expanded volunteer monitoring and education programs; (5) use of the Internet; and, (6) expansion of public outreach workshops.

The Program Plan also contains a Memorandum of Understanding (MOU) between the SWRCB and CCC. Although the two agencies have worked side-by-side to complete this document, the MOU commits the agencies to continue implementing the Program Plan after it is adopted by the SWRCB and CCC and approved by the federal agencies. Actions in the first five-year implementation plan require the SWRCB and CCC to review and update existing Management Agency Agreements and MOUs as appropriate and to develop others as needed. This aspect is important because the success of this Program Plan is dependent on the active participation of other government agencies with NPS responsibilities and private partners with significant influences over land use practices.

TABLE ES-1

SUMMARY OF MAJOR TASKS THAT THE NPS PROGRAM LEAD AGENCIES SEEK TO COMPLETE AS OF 2003

	Plan section
<p>A. Assess Program Activities</p> <ul style="list-style-type: none"> The State will continue use of the State's Water Quality Assessment (WQA) as the primary tool for assessing NPS pollution statewide. By August 1, 2001, the SWRCB will provide WQA data prepared pursuant to CWA sections 305(b) and 303(d) on the Internet for public reference and to help monitor and track the effectiveness of the NPS Program. The data, included on the Geographically-based Water Body System (GeoWBS) database, will identify water body size, degree to which beneficial uses are supported, affected beneficial uses, pollutants, and pollution sources. By August 1, 2001, the State with the assistance of University of California, Davis's Information Center for the Environment (UCD ICE) will complete development of a database that will enable State agencies to geographically track implementation of MMs and MPs. 	<p>II-B</p> <p>II-G</p>
<p>B. Target Efforts</p> <ul style="list-style-type: none"> On even-numbered years or as required by the USEPA, the SWRCB will prepare the CWA section 303(d) and TMDL priority lists that will assist the State in targeting priorities by water body, geographic region, pollutant, etc. By December 31, 2000, the Critical Coastal Area (CCA) Committee will develop an initial list of CCAs where targeted implementation of MMs will occur. 	<p>II-C</p>
<p>C. Plan Activities Based on Program Goals and Objectives</p> <ul style="list-style-type: none"> By July 1, 2000 and annually thereafter, the SWRCB, CCC, and RWQCBs will prepare joint annual workplans for NPS Program activities to include information on use of funding sources (including bond funds). By July 1, 2000, the CCC will update its in-house Procedural Guidance Manual to reflect newest development of NPS MMs and to provide guidance for updates and amendments to local coastal programs (LCPs) and development of new LCPs. Pursuant to the schedules listed in Appendix C, the RWQCBs will develop TMDLs. 	<p>II-D & Apx C</p>
<p>D. Coordinate Efforts of Federal, State, and Local Agencies and Stakeholders</p> <ul style="list-style-type: none"> By January 31, 2000, the SWRCB and CCC will sign an MOU designed to enhance coordination between these agencies. By July 1, 2000, the SWRCB and CCC will convene the initial meeting of the Interagency Coordinating Committee (IACC). By September 30, 2000 the CCC and SWRCB will convene the initial meeting of the CCA Committee. By July 1, 2000, the SWRCB and CCC will initiate the development of five-year implementation plans for the California Environmental Protection Agency (Cal/EPA), California Resources Agency (Cal/RA), and other agencies with a goal of completing 50 to 100 percent of these plans by December 31, 2000. By July 1, 2000, the SWRCB and CCC will begin the process to update existing Memorandums of Understanding/Management Agency Agreements (MOUs/MAAs) (e.g., agreements with the State Board of Forestry/Department of Forestry, Department of Pesticide Regulation, and Department of Food and Agriculture) and develop new MOUs/MAAs with other agencies as needed. By December 31, 2001, the SWRCB and CCC will prepare a schedule for completing any necessary remaining MOUs/MAAs. 	<p>II-E</p>

	Plan section
<p>E. Implement Coordinated Actions</p> <ul style="list-style-type: none"> • By July 1999 and each year thereafter, the SWRCB and RWQCBs will support activities using CWA section 319(h) funds to implement the CAMMPR MMs. • By February 2001, the SWRCB will develop guidance to be used by the SWRCB and RWQCBs in establishing the process by which the SWRCB and RWQCBs will enforce their authorities as outlined in this Program Plan (CWC §13369). • By July 1, 2002, the State will prepare California MM implementation guidance. Links to existing guidance for implementation of MMs and MPs will be provided on the NPS Program website(s) in the interim (examples of existing guidance used in California include Natural Resources Conservation Service (NRCS) technical guides and Storm Water Quality Task Force Manuals). • Pursuant to the schedules listed in Appendix C, the RWQCBs will begin implementation of TMDL implementation plans. 	II-F
<p>F. Track and Monitor Results of Implemented Actions</p> <ul style="list-style-type: none"> • By November 30, 2000, the SWRCB will assess and report to the Legislature on the SWRCB's and RWQCBs' current surface water quality monitoring programs for the purpose of designing a proposal for a comprehensive surface water quality monitoring program for the State (as provided for in CWC §13192). • By January 1, 2001, the SWRCB will prepare and submit to the Legislature a report that proposes the implementation of a comprehensive program to monitor the quality of State coastal watersheds, bays, estuaries, and coastal waters and their marine resources for pollutants (as provided for in CWC §13181[c]). 	II-G
<p>G. Report on Program Results</p> <ul style="list-style-type: none"> • By August 1, 2000 and annually thereafter, the SWRCB will submit to the Legislature and make available to the public, copies of and a summary of information in all SWRCB and RWQCB reports that contain information related to NPS pollution and that the SWRCB or RWQCB are required to prepare in the previous fiscal year pursuant to CWA sections 303, 305(b), and 319 and CZARA section 6217. (CWC §13369[b]) • By August 1, 2001 and August 1, 2003, the SWRCB and CCC will complete biennial reports, for evaluation by USEPA and NOAA as well as other agencies and the public, regarding the State's progress in implementing the NPS Program.* 	II-G

* The reports to be produced in 2001 and 2003 will provide details to address questions such as:

1. Have the activities identified in the five-year plans been completed and have the associated performance measures been achieved?
2. Has an MM implementation tracking system been established? Based on that system, what is the extent of MM implementation for all source categories throughout the State?
3. Has the IACC become active and successful in fostering implementation?
4. Has the SWRCB/RWQCBs published NPS enforcement guidance in 2001 as per CWC section 13369(a)(2)(B)?
5. Has the technical assistance to land owners and managers been improved through the issuance of technical guides, information sharing, "field-level" assistance and/or other activities?
6. Have other State and federal agencies and non-governmental entities become involved in implementing the NPS Program? Where necessary, have formal agreements been established to enhance the effectiveness of these partnerships?
7. Has the planning process for the next five-year plan (2003-2008) been established to achieve more specific plans that include measurable objectives and that involve a wide range of key stakeholders?
8. Have adequate efforts been made to identify funding needs and mechanisms to ensure continuing MM implementation and Program Plan success?

NONPOINT SOURCE PROGRAM STRATEGY AND IMPLEMENTATION PLAN, 1998-2013 (PROSIP)

I. NONPOINT SOURCE PROGRAM OVERVIEW

A. Vision and Goals

Since 1991, staffs of the State Water Resources Control Board (SWRCB), California Coastal Commission (CCC), and nine Regional Water Quality Control Boards (RWQCBs), in coordination with other agency staffs and the public, have conducted a comprehensive inquiry into the future direction of California's Nonpoint Source Pollution Control Program (Program). This inquiry shows clearly that Californians have invested significant resources to address nonpoint source (NPS) pollution and improve water quality; however, NPSs continue to be a major contributor of pollution to State waters.

The *Plan for California's Nonpoint Source Pollution Control Program* (Program Plan) is intended to focus and expand the State's efforts over the next 15 years to prevent and control NPS pollution. The vision of the NPS Program is to reduce and prevent NPS pollution so that the waters of California support a diversity of biological, educational, recreational, and other beneficial uses. The NPS Program addresses both surface and ground water quality. The goals of California's NPS Program are the following:

Track, Monitor, Assess, and Report Program Activities

- Improve monitoring and assessment of State water quality and the effectiveness of management practices (MPs) that are implemented to prevent and control NPS pollution.
- Ensure consistent, accurate reporting and dissemination of information related to water quality and related environmental data, sources of NPS pollutants, and pollution control and prevention activities.

Target Program Activities

- Manage NPS pollution, where feasible, at the watershed level—including pristine areas and watersheds that contain water bodies on the Clean Water Act (CWA) section 303(d) list—where local stewardship and site-specific MPs can be implemented through comprehensive watershed protection or restoration plans.
- Apply previous experiences to future decisions (e.g., through the use of pilot projects and the incorporation of "lessons learned").

Coordinate with Public and Private Partners in All Aspects of the Program

- Build the NPS Program upon a foundation of public involvement and support and encourage public participation throughout all stages of the NPS Program.
- Encourage innovative approaches to NPS pollution control and prevention through interagency, interdisciplinary, and volunteer activities.

000111

- Strive to make regulatory, planning, and monitoring processes and programs more effective, efficient, and user-friendly and to coordinate related programs to avoid duplication where possible.

Provide Financial and Technical Assistance and Education

- Enhance the leadership roles of the SWRCB, RWQCBs, CCC, and other agencies in providing local governments and the public with technical and financial assistance and educational programs related to NPS pollution control, land use management, and watershed management.
- Support applied research to expand NPS Program implementation (e.g., development of improved, cost-effective MPs, and environmentally friendly products).

Implement Management Measures

- Ensure the protection and restoration of State's water quality, existing and potential beneficial uses, critical coastal areas (CCAs), and pristine areas by implementing management measures (MMs) to prevent and control NPS pollution. All MMs will be implemented, where needed, by 2013.¹ MMs serve as general goals for the control and prevention of polluted runoff. Site-specific MPs are then used to achieve the goals of each MM.
- Target implementation of MMs using a combination of non-regulatory activities and enforceable policies and mechanisms with self-determined cooperation preferred over prescriptive measures.

To ensure that the NPS Program goals are met, the SWRCB, CCC, and RWQCBs have already taken the following steps: (1) developed MMs that are appropriate for implementation in California and (2) prepared an iterative Fifteen-Year Program Strategy (Strategy) and Five-Year Implementation Plan (1998-2003) (Implementation Plan).

Additional steps in California's long-term strategy and initial short-term plan that are needed are:

- Adoption of NPS MMs by the SWRCB and CCC as goals or through a rulemaking process, as necessary, to ensure that they are implemented statewide by the year 2013;
- Establish and enter into the first five-year plan all relevant information for each process element for primary and secondary MMs by July 1, 2000, with the exception of numeric program performance measures. Numeric program performance measures will be established for each primary and secondary MM in the first five-year plan by October 1, 2000. The revised five-year plan will be distributed to the public by November 1, 2000.

¹ MMs are identified in Volume II of this Program Plan: *California's Management Measures for Polluted Runoff* (CAMMPR). CAMMPR identifies MMs for five land-use categories: (1) agriculture, (2) forestry (silviculture), (3) urban areas, (4) marinas and recreational boating, and (5) hydromodification. MMs specific to wetlands, riparian areas, and vegetated treatment systems are also identified. CAMMPR has been reviewed by other agencies with authorities and programs that are critical to addressing NPS pollution. Additional workshops were held in Southern and Northern California to solicit public input.

- Publication of an MMs Guidance document that includes examples of MPs that achieve the goals of each MM;
- Building a foundation for agencies with authorities related to the NPS Program to coordinate and collaborate in problem solving, implementing MMs, monitoring, and assessing program success (e.g., review and revise existing agency agreements or develop new agency agreements; convene an interagency committee or similar working forum);
- Increased funding and enhanced education to foster implementation of MMs statewide; and
- Conducting a workshop and reporting every two years (biennially) on the status of the NPS Program.

B. History

Nonpoint Source Water Quality Issues in California

California is a geomorphologically diverse state with 1,609 miles of shoreline and more than 200,000 miles of rivers and streams; 1.6 million acres of lakes and reservoirs; 645,000 acres of estuaries, harbors, and bays; and 275,000 acres of wetlands. California also contains more than 100 million acres of land, almost half of which (44.6 percent) is owned and/or overseen by the federal government (e.g., the U.S. Forest Service [USFS] and Bureau of Land Management [BLM]).

NPS pollution, also known as polluted runoff, is the leading cause of water quality impairments in California and nationally. NPSs, including natural sources, are the major contributors of pollution to impacted streams, lakes, wetlands, estuaries, marine waters, and ground water basins in California and are important contributors of pollution to harbors and bays (SWRCB, 1998). Unlike pollution from distinct, identifiable point sources (e.g., a discharge pipe), NPS pollution comes from many diffuse sources. It is caused by rainfall, snowmelt, or irrigation water that moves over and through the ground. As the runoff moves, it picks up and carries away natural and human-made pollutants and deposits them into lakes, rivers, wetlands, ground water, and other inland and coastal waters.

Adverse effects of point sources of pollution (e.g., those subject to National Pollutant Discharge Elimination System [NPDES] or Waste Discharge Permits [WDRs]) and NPSs of pollution on coastal areas include closures of beaches and shellfish harvest areas due to contamination (see Table 1). In 1998, causes of California beach closings or advisories included: (1) elevated bacteria levels—1,395 events; (2) sewage spills—1,607 events; and (3) rain related events—2,222 events (rain events include combined sewer overflows, storm water runoff, storm drains, and floods) (Natural Resources Defense Council [NRDC], 1999). Data from the *National Shellfish Register* reveal that in 1995, the most recent year that data are available, shellfish harvesting was prohibited at 9,000 out of 24,000 acres (38 percent) of harvesting areas in California due to water quality concerns (National Oceanic and Atmospheric Administration [NOAA], 1997). Table 2 contains 1995 pollution source data for harvesting waters in the State of California and in the Nation.

TABLE 1. CALIFORNIA BEACH CLOSING AND ADVISORY (C/A) COMPARISONS: 1991-1998 (NRDC, 1999)

Year	Beach days affected by C/A lasting less than 6 weeks	Number of Extended C/A (lasting 6-12 weeks)	Number of Permanent C/A (lasting more than 12 weeks)
1998	at least 3,273	30	12
1997	at least 1,141	1	37
1996	at least 1,061	7	9
1995	at least 1,305	3	11
1994	at least 910	2	6
1993	at least 1,397	2	2
1992	at least 609	2	1
1991	at least 745	1	5

TABLE 2. PRINCIPAL OR CONTRIBUTING FACTORS IN HARVEST-LIMITED SHELLFISH GROWING AREAS NATIONALLY, 1995 (NOAA, 1997)

Type	% (total is > 100% as areas can be affected by a combination of sources)
Urban runoff	40
Unidentified sources upstream of coastal watersheds	39
Wildlife	38
Individual waste water treatment systems (e.g., septic tanks)	32
Waste water treatment plants	24
Agricultural runoff	17
Marinas	17
Boating	13
Industrial facilities	9
Combined sewer overflows	7
Direct discharges	4
Feedlots	3

The major sources of NPS pollution in California are related to land use activities that occur throughout watersheds and include: (1) agriculture, (2) forestry (silviculture), (3) urban runoff, (e.g., from construction sites, roads and highways, septic systems), (4) marinas and boats, (5) hydromodification activities, and (6) resource extraction (e.g., mining) (see Table 3). Atmospheric deposition is also a source of NPS pollution. Examples of pollutants associated with specific land use activities include:

- Excess pesticides and fertilizers from agricultural lands, urban lawns, and parks;
- Oil, grease, heavy metals, and chemicals from urban streets, parking lots, and industrial sites;
- Sediment from improperly managed construction sites, crop and forest lands, abandoned roads, and eroding streambanks;
- Bacteria and nutrients from livestock, pet wastes, and faulty septic systems; and
- Other pollutants (e.g., salt from irrigation practices, acid from abandoned mines).

Agency Roles in Program Development and Implementation

The NPS Program's roots were established in 1988 when the SWRCB adopted and the U.S. Environmental Protection Agency (USEPA) approved the original plan, the NPS Management Plan, November 1988 (1988 Plan) (SWRCB, 1988), in response to CWA section 319. CWA section 319 required states to develop assessment reports that described the state's NPS problems and to establish an NPS management program to control or prevent the problems. The 1988 Plan identified projected and proposed activities to initiate the NPS Program and both to measurably improve water quality and the implementation of best MPs.

After passage of CWA section 319, Congress determined that additional efforts were needed to protect coastal waters from NPS pollution and subsequently enacted the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA). In passing CZARA, Congress noted the link between coastal water quality and land use activities and directed states to improve state and local efforts to manage land use activities that degrade coastal waters and coastal habitats (USEPA and NOAA, 1993). CZARA section 6217 requires coastal states to: (1) identify land uses which individually or cumulatively may cause or contribute significantly to a degradation of coastal waters; (2) identify "Critical Coastal Areas" and identify and implement additional measures where necessary to achieve and maintain water quality in such areas; (3) identify and adopt MMs to prevent and control NPS pollution; (4) provide technical assistance to local governments and the public to implement the MMs; (5) provide opportunities for public participation in Coastal Nonpoint Source Pollution Control Program (CNPCP) development and implementation; (6) enhance cooperation between the states' land and water use agencies; and (7) identify a program area sufficient to control NPS pollution affecting coastal waters. In addition, CZARA amended section 306 of the Coastal Zone Management Act (CZMA) requiring that "... the management program contains enforceable policies and mechanisms to implement the applicable requirements of the Coastal Nonpoint Pollution Control Program of the State required by section 6217" (CZMA section 306[d][16]).

TABLE 3. EXTENT OF CALIFORNIA WATER BODIES AFFECTED BY VARIOUS LAND PRACTICES

	Surface water (SW) bodies (acres)										rivers/ streams (miles)	ground water (square miles)*
	bays/ harbors	estuaries	lakes/ reservoirs	saline lakes	wetlands fresh	wetlands tidal	Total SW bodies

Source: 1998 California CWA Section 305(b) Report on Water Quality. Extent of SW bodies that are partially or not supporting beneficial uses (figures rounded to nearest thousand, where appropriate). (nd) = no data or unknown.

*The 1998 CWA Section 305(b) Report states that 22,053 of 63,581 square miles of ground water (35 percent) are impaired (note: a ground water basin may be polluted by more than one source).

In February 1994, the SWRCB initiated a comprehensive review of the NPS Program using technical advisory committees (TACs) for ten NPS categories. Over 150 people participated in the TACs as public and private representatives for irrigated agriculture, nutrient application, pesticide application, confined animal facilities, grazing, urban runoff, on-site sewage disposal systems (OSDSs), boating and marinas, hydromodification and wetlands, and abandoned mines. The TACs presented their recommendations to the SWRCB in 1995. Common themes expressed in the TAC Reports include the following:

- Self-determined cooperation is preferred over prescriptive measures;
- Public education should be enhanced so that individuals can take responsibility for preventing and controlling NPS pollution;
- NPS pollution should be managed on a watershed scale where local stewardship and problem-responsive measures can be devised through comprehensive watershed protection plans;
- The State should provide for comprehensive and directed technical assistance to local groups and individuals; and
- Activities of resource management agencies should be better coordinated.

In September 1995, the SWRCB and CCC submitted California's initial response to CZARA to USEPA and NOAA—the lead federal agencies that administer the CWA and CZMA, respectively. California's submittal package included two documents: *California's Coastal Nonpoint Pollution Control Submittal* (SWRCB and CCC, 1995) and *Initiatives in Nonpoint Source Management* (Initiatives Document) (SWRCB, 1995).² In July 1998, USEPA and NOAA issued their Final Findings and Conditional Approval for California's submittal.

The SWRCB, RWQCBs, and CCC are committed to enhancing the NPS Program to further protect water quality and to address the federal findings and conditions. The revised NPS Program incorporates MMs into the Program Plan to help coordinate agency and individual actions. Volume II of the Program Plan—*California Management Measures for Polluted Runoff* (CAMMPR)—identifies 61 MMs with related State authorities for NPS pollution prevention and control in California (Table 4).³ Staffs from the SWRCB, CCC, USEPA, and other agencies held initial meetings to review and refine CAMMPR and to identify actions to implement MMs over the next five to 15 years. Staff workshops to solicit public input were also held in Southern and Northern California in December 1998 and July 1999.

The SWRCB and CCC, in coordination with the nine RWQCBs, are the lead State agencies in California for the development and implementation of the Program Plan.

² *California's Coastal Nonpoint Pollution Control Submittal* (SWRCB and CCC, 1995) details California's existing programs related to the management of NPS pollution. The *Initiatives in Nonpoint Source Management* (SWRCB, 1995), which is based on the TACs' recommendations, recognizes the need to continue and build upon the collaborative work initiated by the TACs.

³ These MMs are based on the *Guidance Specifying Management Measures for Sources of Nonpoint Pollution in Coastal Waters* (g-Guidance) (USEPA, 1993).

The roles of the SWRCB and CCC are outlined in the Memorandum of Understanding (MOU) between those two agencies. The role of all of the State and federal partners is to:

- Implement the 61 MMs by 2013. Activities to support implementation will be included by the RWQCBs in the WMI chapters and by the State agencies in their five year implementation plans. Implementation of the MMs will also be incorporated into the NPS updates of the basin plans and other enforceable policy tools.
- Track implementation and effectiveness by MM and source category and provide this information to the SWRCB as part of the monitoring and assessment strategy.
- Actively participate in biennial and five-year program reviews, as well as new goal-setting activities, including the development of five-year implementation plans.
- Coordinate with the SWRCB in developing guidance as required by section 13369 of the California Water Code (CWC) to be used by the SWRCB and the RWQCBs to enforce the Program Plan.
- Coordinate NPS-related planning, assessment, and regulatory activities.
- Support statewide initiatives to implement the MMs.

California must enhance the NPS Program to remain eligible for funding for water quality and coastal protection by USEPA and NOAA. Implementation of the NPS Program is primarily supported by grants from USEPA under CWA section 319(h), approximately \$10.6 million in Federal Fiscal Year (FFY) 1999. To continue to receive this level of funding--an increase of about \$5.3 million from FFY 1998--the State must continue to protect and restore water quality and develop an effective NPS Program that complies with both the CWA and CZMA. Implementation of the Program Plan will occur through 2013 (within 15 years of the July 1998 federal conditional approval by USEPA and NOAA pursuant to CZARA).

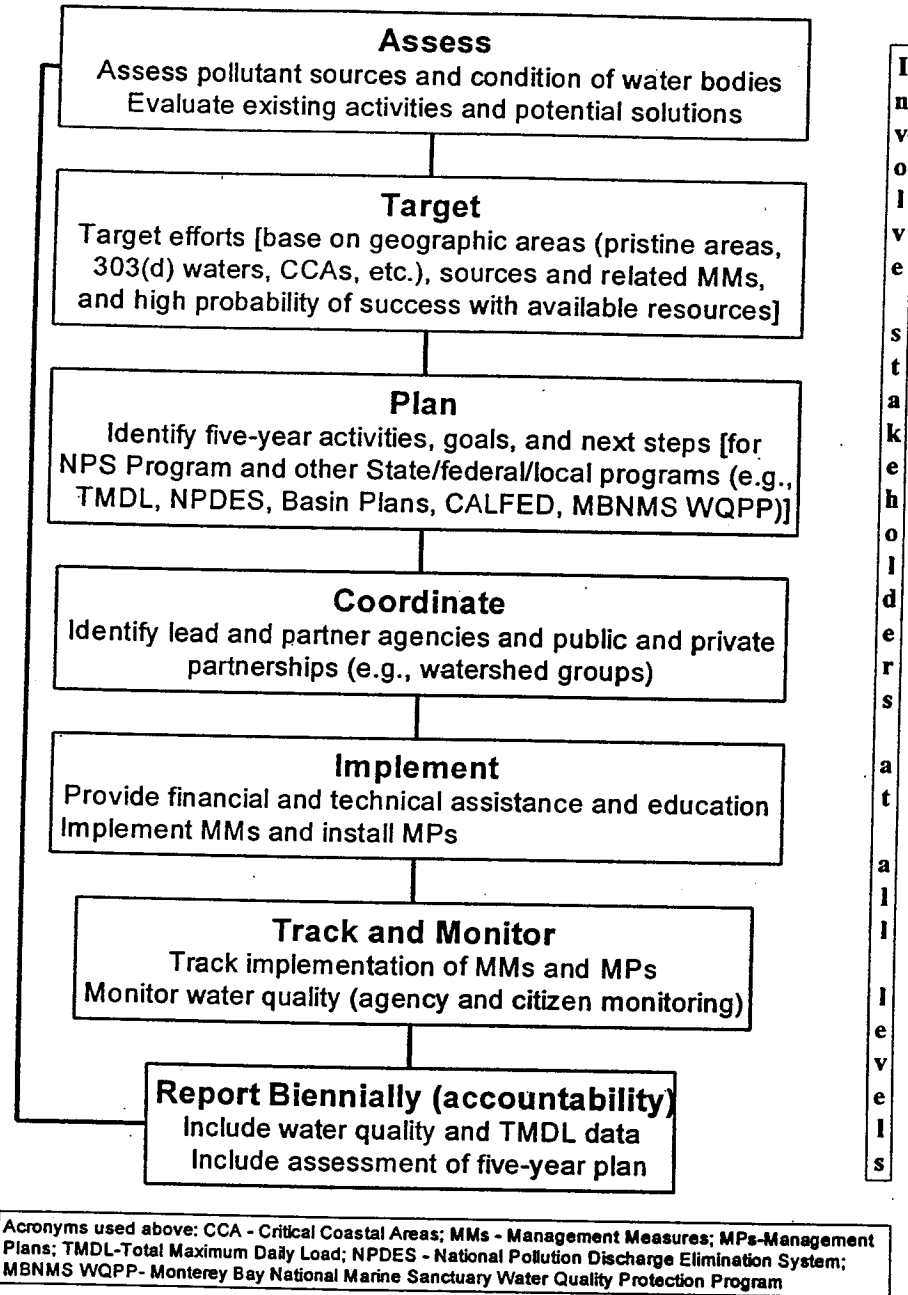

C. Program Infrastructure

Program infrastructure refers to the structure of the program, its components, and how they interact in a systematic process to achieve the program's goals. The Program Plan has three major components: (1) an overall long-term Fifteen-Year Program Strategy (Strategy); (2) three five-year implementation plans nested within the Strategy; and (3) 61 MMs. Running through and connecting these major components is a sequential iterative process that begins with assessing the program, identifying pollutant sources, and determining condition of water bodies and ends with reporting program results. It begins again with assessment activities (see Figure 1). The Program Plan infrastructure is designed to produce a dynamic program that is responsive to changing conditions during its fifteen-year life.

Program Process

For the Program Plan to produce a living, responsive program that is useful throughout its fifteen-year duration, previous experience (e.g., in implementing MMs) must be integrated into present and future planning and implementation efforts. Figure 1 depicts the Program Plan's iterative model. At any time during the fifteen-year life of the

FIGURE 1. NPS PROGRAM PROCESS

Program Plan, agencies and other stakeholders should be able to: (1) assess the present Program's activities; (2) target efforts; (3) plan future actions based on past and present goals and objectives; (4) coordinate federal, State, and local agencies' and stakeholders' efforts; (5) implement collaborated actions; (6) obtain data on water quality and implementation effectiveness from tracking and assessment documentation, Total Maximum Daily Loads (TMDLs), and other agency and citizen monitoring programs; and (7) return to Step 1 to reassess the NPS Program's progress and effectiveness.

Fifteen-Year Program Strategy

The Strategy, described later in this document, outlines how California will seek to achieve the vision and goals of the NPS Program. Specifically, the State will use the "Three-Tiered Approach" of broad-based local stewardship backed up by regulatory authority under the Porter-Cologne Water Quality Control Act (Porter-Cologne Act) with other local, State, and federal authorities serving as additional enforceable and/or back-up authorities. Recommendations from the TACs and from additional agency and stakeholder meetings convened by the SWRCB and CCC in 1998 and 1999 are a central part of the NPS Program.

The Strategy includes elements prescribed in federal guidance (NOAA and USEPA, 1993 and USEPA, 1996), including:

- A process to implement MMs to help coordinate agency and individual actions rather than focus on individual practices or separate programs;
- Actions related to administrative coordination, technical and financial assistance, public participation, critical coastal areas (CCAs), additional MMs as goals, and monitoring;
- A strategy for and evaluation of back-up authorities;
- A process to track implementing actions to assess Program progress and effectiveness; and
- The "nine key elements" of a dynamic and effective NPS management program. (See Appendix A.)

Five-Year Implementation Plans

Nested within the Strategy are three five-year implementation plans that describe the who, what, where, when and how of Program implementation. In each five-year implementation plan, California will target implementation actions where the NPS Program can make a difference in correcting current and potential problems.

Targeting involves a balance between the need to implement NPS controls broadly and the need to address priority water quality problems in specific watersheds. Targeting also allows the State to use limited resources efficiently and to ensure that actions are tailored to match the diversity of California's climate and land use activities. With climate ranging from rain forest in the north to desert in the south, different approaches are needed to manage NPS pollution in the State. In establishing

targets, the State will address both pollution prevention and water quality improvement goals, including the protection of exceptional inland and coastal areas that are threatened by reasonably predictable increases in pollution loadings from new or expanding NPSs.

Each implementation plan will identify a set of MMs on which to target NPS Program efforts during the five-year time period. The implementation plans will also identify a series of actions related to (1) assessing water quality conditions and/or institutional efforts; (2) targeting implementation based on geographic regions or other criteria; (3) performing planning activities; (4) coordinating public and private efforts; (5) implementing the targeted MMs; and (6) obtaining data on water quality and implementation effectiveness. The Plans will also identify agencies responsible for MM implementation and will include actions, performance measures, and milestones.

Phased Approach to Managing Nonpoint Source Pollution

The State is committed to implementing the 61 NPS MMs by 2013, consistent with Federal Administrative Guidance (USEPA and NOAA, 1998) and the Three-Tiered Approach adopted in the 1988 Plan. The implementing agencies will increase the use of regulatory authorities as necessary to ensure implementation is achieved. In accordance with CWC section 13369, the SWRCB will develop on or before February 1, 2001 guidance to be used by the SWRCB and RWQCBs in establishing the process by which the SWRCB and RWQCBs will enforce their authorities as outlined in this Program Plan.

Initially the State is adopting the 61 MMs contained in CAMMPR as goals. MM implementation will be achieved through a set of activities outlined in each five-year implementation plan and will rely on existing local, State, and federal authorities and private efforts. At the end of each five-year implementation cycle, the State will evaluate and report on the effectiveness of the Program Plan to achieve the stated goals. Success will be determined by (1) the degree to which the performance measures have been met; (2) geographic extent of MM implementation; (3) selected evaluation of MPs used to implement MMs; and (4) analysis of available water quality information in those areas where implementation has occurred. Based on this evaluation, the SWRCB and CCC, in coordination with the RWQCBs and other appropriate agencies, will make public their findings and recommendations for the next five-year cycle. Depending on the degree of success, the State may choose to maintain the in-place efforts, modify, or add MMs and/or actions for each target MM. In cases where adequate progress is clearly not being made, the State will consider rulemaking to ensure successful implementation of specific MMs. Implementation of MMs in additional watersheds and water bodies will also take place as new geographic areas with NPS pollution are identified and targeted.

D. Legal Framework

Introduction

This section describes California's legal framework for implementing the NPS Program. The framework is based on two primary federal laws—the CWA and CZMA—and State and local law. In California, the Porter-Cologne Act is the principal State law governing water quality in California, and it provides the primary back-up authority to implement the NPS MMs. However, other State and local authorities are also critical components of the legal framework that address NPS pollution in California. In addition to the Porter-Cologne Act, this section describes the California Coastal Act (Coastal Act), the California Environmental Quality Act (CEQA), and the California Planning, Zoning and Development Law. Additional details on these and other authorities that are part of this framework are identified in Volume II: CAMMPR. Details on the SWRCB's and CCC's statutory authority for addressing NPSs are included in Appendix B—Legal Opinions.

Federal Laws

The Federal Water Pollution Control Act Amendments of 1972 and 1987, known as the CWA (33 United States Code [USC] §§1251 et seq.), are the principal federal statutes for water quality protection. In California, the SWRCB and nine RWQCBs administer many of the CWA's provisions. The CWA requires the State to adopt water quality standards and to submit those standards for approval by the USEPA. For point source discharges to surface water, the CWA authorizes USEPA or approved states to administer the NPDES Program. CWA section 303(d) requires states to list surface waters not attaining (or not expected to attain) water quality standards after the application of technology-based effluent limits, and states must perform a TMDL for all waters on the CWA section 303(d) list. The CWA also establishes a loan program—the State Revolving (SRF)—for the construction of water quality projects, including NPS projects.

In the 1987 CWA Amendments, Congress added CWA section 319 (33 USC §1329) which required states (1) to develop Assessment Reports that described the states' NPS problems, (2) to establish Management Programs to address these problems, and (3) to provide funding to support implementation of the Programs. California's *Nonpoint Source Management Plan* (SWRCB, 1988) outlined a general approach to address persistent NPS problems using education and outreach, financial and technical assistance, and regulatory authorities when necessary. To enhance activities to address NPS water pollution, states are currently encouraged to upgrade their NPS programs. In 1996, USEPA issued CWA section 319 program guidance that identified "nine key elements" that must be addressed to receive USEPA approval for upgraded NPS Plans (See Appendix A). Pursuant to the 1998 Clean Water Action Plan (CWAP), states with upgraded NPS Programs will receive increased funding based on a federal appropriation for State NPS Programs above \$100 million. For California to receive additional funding in FFY 2000 and beyond, USEPA must certify that California's NPS Program has been upgraded consistent with the "nine key elements."

The CZMA of 1972 (16 USC §§1451 et seq.) established a national framework for effective management, protection, development, and beneficial use of the coastal zone. Pursuant to the CZMA, California prepared the California Coastal Management Program (CCMP) which was approved by NOAA. The bulk of California's coast is within the jurisdiction of the CCC pursuant to the Coastal Act of 1976 (Public Resources Code [PRC] §§30000 et seq.), while the San Francisco Bay Conservation and Development Commission (SFBCDC) has jurisdiction in San Francisco Bay (SFB) pursuant to the McAteer-Petris Act (MPA) (Government Code §§66600 et seq.). The State Coastal Conservancy (SCC) is a third partner agency in the CCMP.

Recognizing that the CZMA did not specifically mention water quality, in 1990 Congress amended CZMA section 306(d)(16)(16 USC §1455[d][16]) and added section 6217 (16 USC §1455b) to focus on NPS pollution problems and the protection of coastal waters. CZARA section 6217 requires state coastal zone management (CZM) agencies, in coordination with state water quality agencies, to develop and implement MMs to restore and protect coastal waters from adverse impacts of NPS pollution. Similarly, CZMA section 306(d)(16)(16 USC §1455[d][16]) requires that state CZM programs contain enforceable policies and mechanisms to implement applicable requirements of CZARA section 6217. To achieve these goals, states were directed to coordinate and integrate their existing CZM and water quality plans and programs, including the states' NPS management plans.

Porter-Cologne Water Quality Control Act (Porter-Cologne Act)

The Porter-Cologne Act is the principal law governing water quality regulation in California. It establishes a comprehensive program to protect water quality and the beneficial uses of water. The Porter-Cologne Act applies to surface waters, wetlands, and ground water and to both point and NPSs of pollution. Pursuant to the Porter-Cologne Act (CWC section 13000), it is the policy of the State:

- That the quality of all the waters of the State shall be protected,
- That all activities and factors affecting the quality of water shall be regulated to attain the highest water quality within reason, and
- That the State must be prepared to exercise its full power and jurisdiction to protect the quality of water in the State from degradation.

The Porter-Cologne Act established nine RWQCBs and the SWRCB which are charged with implementing its provisions and which have primary responsibility for protecting water quality in California. The SWRCB provides program guidance and oversight, allocates funds, and reviews RWQCB decisions. In addition, the SWRCB allocates rights to the use of surface water. The RWQCBs have responsibility for individual permitting, inspection, and enforcement actions within each of nine hydrologic regions. The SWRCB and RWQCBs have numerous NPS-related activities, including problem monitoring and assessment, planning, financial assistance, and regulatory and non-regulatory management.

The RWQCBs regulate discharges under the Porter-Cologne Act primarily through issuance of NPDES and WDR permits. Anyone discharging or proposing to discharge

materials that could affect water quality (other than to a community sanitary sewer system regulated by an NPDES permit) must file a report of waste discharge. The SWRCB and the RWQCBs can make their own investigations or may require dischargers to carry out water quality investigations and report on water quality issues. The Porter-Cologne Act provides several options for enforcing WDRs and other orders, including cease and desist orders, cleanup and abatement orders, administrative civil liability orders, civil court actions, and criminal prosecutions.

The Porter-Cologne Act also implements many provisions of the federal CWA, such as the NPDES permitting program. Section 401 of the CWA gives the SWRCB the authority to review any proposed federally permitted or federally licensed activity which may impact water quality and to certify, condition, or deny the activity if it does not comply with State water quality standards. If the SWRCB imposes a condition on its certification, those conditions must be included in the federal permit or license.

Except for dredge and fill activities, injection wells, and solid waste disposal sites, WDRs may not "specify the design, location, type of construction or particular manner in which compliance may be had" (Porter-Cologne Act section 13360). Thus, WDRs ordinarily specify the allowable discharge concentration or load or the resulting condition of the receiving water, rather than the manner by which those results are to be achieved. However, RWQCBs may impose discharge prohibitions and other limitations on the volume, characteristics, area, or timing of discharges and can set discharge limitations such that the only practical way to comply is to use MPs. RWQCBs can also waive WDRs for a specific discharge or category of discharges on the condition that MMs identified in an SWRCB or RWQCB approved water quality management plan are followed.

The Porter-Cologne Act also requires adoption of water quality control plans (WQCPs) which contain the guiding policies of water pollution management in California. There are a number of statewide WQCPs adopted by the SWRCB. In addition, regional WQCPs, commonly referred to as basin plans, have been adopted by each of the RWQCBs. All basin plans identify the existing and potential beneficial uses of waters of the State and establish water quality objectives to protect these uses. The basin plans also contain implementation, surveillance, and monitoring plans. WQCPs include enforceable prohibitions against certain types of discharges, including those that may pertain to NPSs. Basin plans have been adopted for each of the nine RWQCBs as delineated in Table 5.

1	North Coast
2	San Francisco Bay
3	Central Coast
4	Los Angeles
5	Central Valley
6	Lahontan
7	Colorado River Basin
8	Santa Ana
9	San Diego

Portions of WQCPs are also subject to review by USEPA. When approved by USEPA, the water quality objectives and beneficial use designations become water quality standards under the CWA. In most cases, water quality objectives contained in a WQCP are not directly enforceable unless implemented through WDRs or water right permits.

California Coastal Act

The State Legislature enacted the California Coastal Act (PRC §30000 et seq.) (Coastal Act) to provide for the conservation and planned development of the State's coastline. The Coastal Act mandates the protection and restoration of coastal waters pursuant to several sections in the PRC. Mandated activities include:

- To carry out a public education program to promote coastal conservation.
- To maintain, enhance, and, where feasible, restore marine resources.
- To maintain and, where feasible, restore biological productivity and the quality of coastal waters, streams, wetlands, estuaries, and lakes through, among other means, minimizing adverse effects of wastewater discharges and entrainment, controlling runoff, preventing depletion of ground water supplies and substantial interference with surface water flow, encouraging wastewater reclamation, maintaining natural vegetation buffer areas that protect riparian habitats, and minimizing alteration of natural streams.
- To protect against spillage of crude oil, gas, petroleum products, or hazardous wastes.
- To limit the alteration of wetlands, coastal waters, and estuaries and provide for feasible mitigation measures to minimize adverse environmental effects.
- To phase out or upgrade, where feasible, existing marine structures causing water stagnation contributing to pollution problems and fish kills.
- To limit hydromodification of rivers and streams. Channelization, dams, and other substantial alterations of rivers and streams shall incorporate best mitigation measures feasible.
- To protect environmentally sensitive habitat areas (ESHAs). Site and design new development in areas adjacent to ESHAs to prevent significant adverse impacts.
- To protect long-term productivity of soils and timberlands.
- To site and design new development so as to not have significant adverse impacts either individually or cumulatively on coastal resources.
- To minimize alteration of natural landforms.
- To assure that new development is stable, has structural integrity, and does not contribute significantly to erosion.
- To control impacts of dredging in specified port areas.
- To minimize harmful effects to coastal waters, including water quality, from fill within ports.
- To locate, design, and construct port-related development to minimize substantial environmental impacts and protect beneficial uses.

In carrying out the mandates of the Coastal Act, the CCC certifies local coastal programs (LCPs) prepared by local governments (§30500). The CCC also certifies plans prepared by port districts (§30711 et seq.), colleges and universities (§30605), and proponents of public works projects (§30605). In addition, the CCC approves coastal development permits (CDPs), energy projects, and federal (federally approved, conducted, or funded)

projects consistent with the Coastal Act policies. The Coastal Act also contains several means to deter and discipline violators of its provisions. In order to prevent imminent or further damage of coastal resources, the Executive Director of the SWRCB or the CCC can issue a cease and desist order to any party that is undertaking a development without a permit or in a manner inconsistent with the terms of a previously issued permit (§§ 30809 and 30810). The CCC can also order the restoration of a site (§ 30811). Civil liability fines for violations of the Coastal Act are specified in sections 30820, 30821.6, and 30822. In practice, the CCC protects water quality primarily through: (1) managing coastal development that generates runoff or creates spills; (2) assisting local coastal governments and other agencies to address land-use and development activities that may produce NPS pollution; and (3) implementing educational and technical assistance programs.

California Environmental Quality Act (CEQA)

California is one of 20 states with an environmental impact assessment law modeled after the National Environmental Policy Act (NEPA). The SWRCB, RWQCBs, and all State and local government agencies must comply with CEQA. CEQA applies to discretionary activities proposed to be carried out by government agencies, including approval of permits and other entitlements. CEQA has six objectives: (1) to disclose to decision-makers and the public the significant environmental effects of proposed activities; (2) to identify ways to avoid or reduce environmental damage; (3) to prevent environmental damage by requiring implementation of feasible alternatives or mitigation measures; (4) to disclose to the public reasons for agency approvals of projects with significant environmental effects; (5) to foster interagency coordination; and 6) to enhance public participation.

CEQA sets forth procedural requirements to ensure that the objectives are accomplished and also contains substantive provisions requiring agencies to avoid or mitigate, when feasible, impacts disclosed in an Environmental Impact Report (EIR). In addition, CEQA sets forth a series of sweeping policy statements encouraging environmental protection. These policies have led the courts to interpret CEQA "so as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language." (*Friends of Mammoth v. Board of Supervisors* [1972] 8 Cal 3d 247, 259, 104 Cal. Rptr. 761.)

Planning, Zoning, and Development Laws

The legal framework within which California cities and counties exercise local planning and land use functions that can play a critical role in addressing NPS pollution is provided in the California Planning and Zoning Law (Government Code §§65000 et seq.) and the Subdivision Map Act (SbMA) (Government Code §§66410 et seq.), as well as in the Coastal Act.

Under State planning law, each city or county must adopt a comprehensive, long-term general plan for the physical development of the city or county and any land outside its jurisdiction which bears relation to its planning. Pursuant to Government Code section 65302, general plans must contain seven elements: (1) land use, (2) circulation,

(3) housing, (4) conservation, (5) open space, (6) noise, and (7) safety. The following elements are the most relevant to NPS pollution prevention and control:

- Land Use. Designates categories such as housing, industry, and natural resources, including density and intensity of use.
- Conservation. Applies to conservation, development, and use of natural resources (e.g., soils, forests, rivers and other water bodies, and harbors). May also cover watershed protection, land or water reclamation, prevention or control of the pollution of streams and other coastal waters, regulation of land uses along stream channels and in other areas required to implement the conservation plan (e.g., buffer areas), to control or correct soil erosion, and for flood control.
- Open Space. Applies to preservation of natural resources, including fish and wildlife habitat, rivers, streams, bays and estuaries, and open space.
- Circulation. Plans infrastructure, including water, sewage, and storm drainage.

While the general plan is a long-range look at the future of a community, a zoning ordinance spells out the immediate allowable uses for each property in the community. Each property in the community is assigned a "zone" listing the kinds of uses that will be allowed on that land (e.g., single family residential, multi-family residential, neighborhood commercial, light industrial, agricultural, etc.) and setting development standards (e.g., minimum lot size, maximum building height, minimum front-yard depth). The distribution of residential, commercial, industrial, and other zones is based on the pattern of land uses established in the community's general plan. Zoning is adopted by ordinance and carries the weight of local law. All local governments use some form of a permitting process whereby a permit is issued for a specific project and can be conditioned based on conformance with the zoning ordinance.

Subdivision regulation, like zoning, is an exercise of police power and is a principal instrument for implementing a general plan. The SbMA (Government Code §§66410 et seq.) sets forth other mandates that must be followed for subdivision processing.

The local government's corporate and police powers and zoning and subdivision ordinances are tools commonly used to implement general plans. Preferential assessment of real property can also offer landowners an economic incentive for keeping their land in agricultural, timber, or open space uses. This can serve to implement the land use, open space, and conservation elements of a general plan by reserving areas designated for agriculture, timber, open space, scenic resources, and natural resource use.

The Coastal Act also requires cities and counties that are located wholly or partially in the coastal zone to have an "eighth element" (the LCP) for that portion of the local government's jurisdiction in the coastal zone. When an LCP is certified by the CCC as being consistent with the goals and policies of the Coastal Act, coastal permit authority for that area is delegated to the local government. However, development in State tidelands, submerged lands, and public trust lands continues to require a permit from the CCC, and certain types of local government decisions on coastal permits made under certified LCPs may be appealed to the CCC.

SWRCB Antidegradation Policy

A key policy of California's water quality program is the State's Antidegradation Policy. This policy, formally known as the *Statement of Policy with Respect to Maintaining High Quality Waters in California* (SWRCB Resolution No. 68-16), restricts degradation of surface and ground waters. In particular, this policy protects water bodies where existing quality is higher than necessary for the protection of beneficial uses.

Under the Antidegradation Policy, any actions that can adversely affect water quality in all surface and ground waters must: (1) be consistent with maximum benefit to the people of the State; (2) not unreasonably affect present and anticipated beneficial use of the water; and (3) not result in water quality less than that prescribed in water quality plans and policies. Furthermore, any actions that can adversely affect surface waters are also subject to the Federal Antidegradation Policy (40 Code of Federal Regulations [CFR], § 131.12) developed under the CWA.

E. Stakeholder Roles in Program Development and Implementation

NPS pollution control is the shared responsibility of both public and private interests. Ultimately all of us—agencies, landowners and land operators, and the general public—contribute to and must help to control NPS pollution.

The CWA and CZARA are the legal foundation for California's current strategy to prevent and control NPS pollution. Therefore, the SWRCB, RWQCBs, and the CCC are the lead agencies for developing the program and coordinating its implementation.

However, the management of land and water uses in California is conducted by numerous local, State, and federal agencies with independent or, in some cases, overlapping authorities and programs. These agencies may be broadly categorized as management agencies, regulatory agencies, land use agencies, or assistance agencies (Table 6). Some agencies' authorities and programs are limited to specific NPS categories (e.g., Department of Boating and Waterways [DBW], Board of Forestry [BOF]); other agencies have broad authority to protect resources (Table 7).

F. Scope and Schedule

California intends to implement a comprehensive statewide program under the CWA and CZMA rather than develop a separate new program for the coastal zone. This will allow the State (1) to protect water quality through a single upgraded NPS program, (2) to use resources more effectively, (3) to eliminate the potential for regulatory inequities that might occur if special zones are created, and (4) to enhance agency coordination. The Strategy is based on implementation of MMs through regulatory and non-regulatory activities including education and outreach, public participation, and technical and financial assistance and the use and coordination of enforceable authorities and programs where self-determined efforts are insufficient to restore and protect State waters.

TABLE 6. CATEGORIES OF IMPLEMENTING AGENCIES

<p>Federal and State Land Management and Regulatory Agencies</p>	<p>This category comprises federal and State agencies that have the authority to implement MPs statewide. Such authority derives either from the agency's management responsibility for publicly owned or controlled land or its regulatory authority. For example, large portions of the State are managed by federal regulators or land and water managers (e.g., USEPA, NOAA, BLM, National Park Service, U.S. Army Corps of Engineers [USACOE], U.S. Fish and Wildlife Service [USFWS], U.S. Forest Service [USFS], and Federal Energy Regulatory Commission[FERC]). When such agencies have the capability to act effectively in their areas of jurisdiction as a lead NPS management agency, the SWRCB may seek formal agreements—e.g., Management Agency Agreements, Memoranda of Agreement (MAA), or MOU—that contain NPS controls.</p>
<p>Federal and State Assistance Agencies</p>	<p>This category comprises agencies that can provide technical or financial assistance to support implementation of MPs. These agencies include the Natural Resources Conservation Service (NRCS), SCC, and University of California Cooperative Extension (UCCE). They assist landowners and land managers to voluntarily implement MPs and help identify appropriate MPs for RWQCB or management agency enforcement. For example, SCC programs are directed at preserving coastal agriculture, resolving coastal land use issues, restoring and enhancing natural resources, developing urban water fronts, acquiring significant coastal sites, providing public access to and along the shoreline, and assisting local governments and nonprofit organizations. One action of the Program is for the SWRCB to seek agreement with these agencies so that they could target technical and financial resources to high priority NPS problems. Currently, the CCC works with the SCC to ensure that the watershed protection work reflects priorities of the Program Plan.</p>
<p>Local Land Use Agencies</p>	<p>This category comprises agencies (e.g., counties, cities, and some special districts) that have the authority to enforce implementation of MPs locally. Local government is the principal land use planning authority in the State. County and city government and special districts often institute the first tier of management requirements for a specific parcel of land. When such agencies have the capability of acting effectively in their jurisdictional areas as lead NPS management agencies, RWQCBs may seek formal agreements that provide for NPS control.</p>
<p>Local Assistance Agencies</p>	<p>This category comprises local agencies and special districts that provide technical or financial assistance to support implementation of MPs. These agencies assist landowners and land managers to voluntarily implement MPs and to help identify appropriate MPs for RWQCB or management agency enforcement. One action of the Program is for the RWQCBs to seek agreements with these agencies so that they can target technical and financial resources to high priority NPS problems.</p>

The assessment of implementation efforts conducted pursuant to each five-year implementation plan will occur on a regular basis in three distinct stages, with the SWRCB and CCC reporting on these efforts every two years (biennially). This process is detailed below and shown in Figure 2.

FIGURE 2. CALIFORNIA NPS POLLUTION CONTROL PROGRAM: A FIFTEEN-YEAR STRATEGY WITH THREE FIVE-YEAR IMPLEMENTATION PLANS

First Five-Year Implementation Plan (1998 - 2003) (Implementation Plan)

This document contains the first implementation plan which identifies an initial set of targeted MMs and describes NPS Program activities through June 2003 (five years after the July 1998 USEPA and NOAA Conditional Approval of the State's submittal pursuant to CZARA). In this Implementation Plan, the SWRCB and CCC have developed a plan to implement the MMs and achieve Program goals. In 2001, the SWRCB, RWQCBs, and CCC, in coordination with other agencies and the public, will begin reviewing implementation actions to assess the State's progress and effectiveness. At this time, the State will also start developing the next five-year implementation plan. Achieving designated milestones and meeting identified objectives will serve as a basis for evaluating progress. In 2003, California will report on the State's progress in meeting its milestones and objectives for the first five-year period.

Second Five-Year Implementation Plan (2003 - 2008)

Implementation of the second five-year implementation plan will occur from July 2003 through June 2008. The second five-year implementation plan will: (1) provide for the continued implementation of the initial set of actions and MMs, including increasing use

of regulatory actions if necessary; (2) outline steps to improve and expedite program implementation determined to be appropriate in light of the review and evaluation; (3) target approximately half of the remaining NPS MMs, plus any additional MMs deemed necessary; and (4) include actions and milestones to ensure implementation of these MMs. In 2006, the State will again review and evaluate implementation to assess progress and effectiveness.

Third Five-Year Implementation Plan (2008 – 2013)

Implementation of the third five-year implementation plan is expected to begin in July 2008 and continue through June 2013. The third five-year implementation plan will: (1) provide for continued implementation of actions and NPS MMs as necessary; (2) target the remaining NPS MMs for implementation, plus any additional MMs deemed necessary; and (3) include actions and milestones to ensure implementation of these MMs.

II. FIFTEEN YEAR PROGRAM STRATEGY

A. Introduction

The Strategy describes how the vision and goals of NPS pollution prevention and control will be realized by utilizing the components of the Program process. The Program process begins with "assessing" the impact of NPS pollution on water quality. NPS issues are identified for waters across the State either individually or collectively. A thorough assessment allows the State to proceed to the second component, "targeting" appropriate human, financial, and technical resources into geographic areas and NPS MMs requiring immediate attention.

The State will fully address the NPS issues from multiple fronts. The "planning" component will take advantage of the numerous programs and tools already in place. Use of existing programs reduces duplicative efforts and benefits from the expertise already accumulated at different institutional levels. Based on previous success stories and lessons learned, the State can begin to identify and plan to use new approaches to address remaining NPS problems.

The complexity of the issues makes effective "coordination" of the various activities imperative. The State will therefore foster interagency cooperation and facilitate public participation through the establishment of formal agreements and formation of an Interagency Coordinating Committee (IACC).

Effective "implementation" of NPS MMs will rely on a "three-tiered approach," with an emphasis on self-determined cooperation of the stakeholders. Applicable regulatory programs and authorities will be invoked in the case of persistent NPS water quality problems and/or stakeholder resistance to self-determined implementation of MMs.

The final element of the Program process consists of "tracking" implementation of MMs, "monitoring" MP effectiveness, "assessing" program success, and "reporting" program progress. Again, participation of the stakeholders at this step will ensure the dissemination of lessons learned and will continue program success. These lessons learned will become the backbone of future decisions both within the Strategy and the subsequent five-year implementation plan.

These components make up an evolving and iterative process repeated in each of the three five-year implementation plan cycles. It is expected that by the end of the fifteen year duration of the Program Plan all the identified MMs for the prevention and control of NPS pollution will have been implemented in the appropriate watersheds and will have improved the quality of the State's waters.

B. Assessing the Problem

California will continue to use the State's Water Quality Assessment (WQA) as the primary tool for assessing NPS pollution statewide.⁴ Pursuant to CWA section 305(b), this information is reported to USEPA every two years and is used to develop the CWA section 303(d) list of waters that do not meet water quality standards with technology-based pollution controls.⁵ Assessment of waters used as drinking water will also be enhanced by the DHS's new Drinking Water Source Assessment and Protection (DWSAP) Program.⁶

These assessment systems support the NPS Program by identifying, individually and collectively, which waters are impacted by NPS pollution. This assists the NPS Program in targeting future actions and determining their effectiveness. To improve the usefulness of these assessment systems, the NPS Program will:

- Ensure that monitoring data from the Program is incorporated into the WQA,
- Support the development and improvement of a geographically-based assessment system, Geo Water Body System (GeoWBS)⁷,
- Support efforts to provide consistency in listing impairments,
- Improve consistency in the definitions of specific sources of pollution,
- Promote public access to the WQA and its underlying data, and
- Seek funding to increase the quality and quantity of water quality monitoring.

These assessment systems also will be utilized to monitor and track the effectiveness of the NPS Program and are discussed in that context in subsequent sections of the Strategy (see Part II, Section G—*Track, Monitor, Assess, and Report*).

C. Targeting Efforts

Introduction

High quality water resources are of significant economic, social, and ecological value in California; however, the amount of available public funds is inadequate to address all the

⁴ This compilation of water quality information, provided by the RWQCBs, synthesizes the results of monitoring programs conducted by dischargers, landowners, community members, and local, State, and federal agencies. The WQA reports on the degree to which these waters support their beneficial uses, such as municipal drinking water supply, recreational activities, or cold water fisheries.

⁵ A total of 1,700 water bodies was assessed in the 1998 CWA section 305(b) Report. Of these, 509 surface waters did not meet water quality standards. The RWQCBs specified 392 water bodies (77 percent) as directly impacted by NPS pollution. The categorical sources (e.g., agriculture, urban, forestry, marinas) of the NPS pollution were identified for 173 surface water bodies. The categorical sources were not identified by the Los Angeles and San Diego RWQCBs. The identification of sources is not required by the CWA when listing waters as impaired.

⁶ DHS, as required by the Safe Drinking Water Act Amendment of 1996, recently submitted to USEPA and received approval (April 1999) for the DWSAP Program. DHS will identify and assess all potential sources of contaminants, including NPS pollutants, for public drinking water systems in California. A report outlining the findings will be provided to customers of each system.

⁷ The information in the WQA is stored in the SWRCB's GeoWBS database. The GeoWBS database identifies the water body size, the degree to which beneficial uses are supported, the affected beneficial uses, the pollutants, and the pollution sources.

existing water pollution sources all at once at every location in the State. The concept of targeting focuses State resources on specific actions or pollutants within limited geographic regions and improves the likelihood of achieving measurable water quality improvements. Actions that lead to water quality benefits can in turn increase public support of NPS pollution control programs and ensure that the public is more closely attuned to overall water quality goals. Such a change in attitude with a corresponding increase in pollution control knowledge and skill is a primary ingredient of lasting water resource protection.

In order to make the Strategy most effective, efforts must be targeted from both a water resources (e.g., water quality, geographic, or watershed area) and economic resources perspective. To achieve the overall objective to improve water quality, the Program Plan will target efforts towards accomplishing the following goals:

- Coordinate NPS pollution control implementation efforts to target both:
 1. MMs for agriculture, forestry, urban areas, marinas and recreational boating, and hydromodification in riparian corridors and wetlands, and
 2. Geographic regions, with a focus on the most impaired areas, areas most in need of protection, and areas where significant existing efforts or increased stakeholder participation are underway to prevent and control NPS pollution.
- Apply project resources to clearly specified, realistic goals and objectives (e.g., to efforts that will result in a high probability of success with available resources and funding).
- Protect and restore valuable resources from increased NPS pollution associated with changes in land use.

All targeting efforts will coordinate with existing State and federal programs that focus on water resources in general and NPS problems in particular. To increase stakeholder support of the prioritized efforts, public involvement needs to be directly incorporated into the targeting process. The following sources of information were used for targeting resources and priorities within the first five-year plan:

- Stakeholder interpretation of NPS priorities;
- Impaired waters as identified on the CWA section 303(d) list and TMDL priority lists; and
- Delineation of critical coastal areas and identification of additional MMs.

Stakeholder Involvement in Prioritization

In order to receive direct input from stakeholders concerning current and future efforts of the NPS Program, staffs of the SWRCB and the CCC held workshops in December 1998 and July 1999 (each series consisting of one workshop in the northern and southern parts of the State). In addition, a questionnaire was sent to over 200 stakeholders (including the RWQCBs and 17 other State agencies) requesting identification of "priority" MMs and program categories (e.g., administrative coordination, public participation, monitoring, and technical assistance) that need to be addressed during the first five-year

implementation plan. The questionnaire results and comments from these opportunities for stakeholder involvement were used to target the initial activities outlined in the first five-year implementation plan.

The targeting efforts were also supplemented through the use of the reports developed by the NPS TACs (SWRCB, 1994a-i; SWRCB, 1995 a-b). The active involvement of the different representatives in the TACs ensured that priorities were given to the MMs and geographic areas with which those most intimately familiar with the NPS pollution issues, the stakeholders, expressed the most concern. For example, all the identified MMs for agriculture, the single most significant contributor of NPS pollution to the Nation's water bodies, have been targeted for implementation during the first five years. On the other hand, the recommendation for installation of pumpout facilities, during the first implementation cycle, at marinas on the Tomales Bay, an important shellfish production location, demonstrates the Program's focus on protecting areas with critical coastal-dependent industries.

Target Impaired Waters

CWA section 303(d)(1)(A) requires states to identify surface waters within their boundaries where numeric or narrative water quality objectives are not being maintained and/or beneficial uses are not fully protected after application of technology-based controls. Each state is also required to establish a priority ranking for such waters, taking into account the severity of the pollution and the beneficial uses to be made of the waters.

For those surface water bodies identified and prioritized above, section 303(d)(1)(C) requires that each state establish TMDLs for those pollutants identified under CWA section 304(a)(2) as suitable for TMDL development correlated with the achievement of water quality objectives. A TMDL is a numeric target which when achieved will result in attainment of water quality standards. The TMDL includes allocations (e.g., allowable pollutant loading) for both point and NPSs. The loadings are established with consideration given to seasonal variations of pollutant loadings and a margin of safety which takes into account any lack of knowledge concerning the relationship between effluent limitations and water quality.

The CWA section 303(d) and TMDL priority lists are developed biennially on even-numbered years. The RWQCBs first assess available data to develop the list. The assessment includes: (1) re-examining the water bodies previously listed under CWA section 303(d); (2) reviewing existing monitoring information; (3) soliciting additional information from other State and federal agencies; and (4) encouraging public participation. The CWA section 303(d) and TMDL priority lists are approved through a public noticing and hearing process at each RWQCB and the SWRCB. USEPA reviews the State's CWA section 303(d) and TMDL priority lists and either approves or disapproves them. If the lists are disapproved, USEPA proposes a modified list with a 30-day comment period. The USEPA's final list then becomes the State's list for the next two years.

The first five-year implementation plan made extensive use of the CWA section 303(d) list to prioritize its tasks. Several impaired water bodies have been targeted for TMDL development. Examples are abundant in the agriculture and forestry categories. Specifically, 33 water bodies have been targeted for nutrient (agriculture – nutrient management) TMDL development by 2003. The load allocations determined for NPSs at the end of the TMDL development process will help guide the selection of best management practices (BMPs) for implementation in the future to ensure NPS pollution prevention and control.

Critical Coastal Area Designation

Special coastal habitats (e.g., wetlands, tide pools, creeks, and lagoons) continue to be threatened from the impacts to water quality that accompany new and existing development. California recognizes that special coastal resources require special care and attention. The intent of CCA designation, therefore, is to direct needed attention to coastal areas of special biological, social, and environmental significance and to provide an impetus for these areas to receive special support and resources.

Pursuant to federal guidance (NOAA and USEPA, 1993), factors in identifying CCAs include:

- The nature and proximity of contaminant sources to the coastal area;
- Physical and biological characteristics of adjacent lands that will cause NPS problems;
- Important biological features;
- Characteristics of land use changes; and
- Extent to which the above effects can be prevented or reduced by implementation of additional MMs.

Federal guidance provides the states with flexibility in their approach to identifying CCAs.⁸ California will use a combination of approaches in delineating CCAs. First, the State will designate special sections within the California coastal zone as CCAs. These include ESHAs currently designated in California's CZM program, as well as areas adjacent to Areas of Special Biological Significance (ASBS), California's National Estuarine Research Reserves (NERRs), NEPs, and National Marine Sanctuaries. Within these areas the CCC will use its existing authority under the CCMP to ensure that all appropriate MMs are implemented and, where appropriate, that additional MMs are

⁸ A state can take one or both of the following approaches:

1. A state can establish the CCA as a strip of land along the portion(s) of the shoreline adjacent to threatened or impaired coastal waters. Within this area, special controls such as setbacks and low-density zoning can be employed to protect coastal waters.
2. A state can rely on site specific evaluations to determine the extent of a CCA. Under this approach, states may include broader geographic areas in the CCA designation, starting with shoreline segments adjacent to threatened or impaired coastal waters and extending inland to encompass significant coastal features or resources further inland. These broader areas may include entire watersheds or portions of watersheds adjacent to coastal waters and may encompass significant biological features such as wetlands.

developed to protect these coastal waters. Second, agency and public actions will be coordinated to protect the adjacent portions of the inland watersheds that impact the environmental processes within the coastal zone.

To coordinate the actions within the CCAs, the Program Plan will establish an interagency committee (CCA Committee)--led by the CCC in coordination with the SCC, SWRCB, six coastal RWQCBs, and the public--to identify CCAs and develop additional MMs necessary to protect these areas. The CCC and SWRCB have identified several initial goals for CCA designation and implementation.

First, the CCA Committee will evaluate the need for and the implementation of additional MMs to protect and restore coastal waters within CCAs. The Committee will work closely with appropriate agencies and researchers to develop additional MMs that address the issues that threaten or impact the designated CCAs. For the portions of CCAs within the coastal zone, the CCC will include additional MMs, when appropriate, in future coastal development permits and future Local Coastal Program (LCP) amendments associated with these areas. Further discussion of the development of additional MMs for CCAs is provided in Part II, Section H: *Overall Program Assessment—Refining the Program*.

Second, the CCA Committee will seek to channel appropriate NPS Program and agency resources to areas of special concern that may not fall within the initial stages of the Program Plan's other NPS activities. The Committee will act as an advocate for the prioritization, funding, and implementation of projects that can achieve measurable water quality improvements within and in watershed areas adjacent to CCAs. For example, the CCC will support and coordinate the implementation of additional MMs in the watersheds impacting CCAs by: (1) working directly with the appropriate agencies; (2) identifying and targeting resources for implementation in sensitive coastal habitats that can achieve prescribed water quality goals and in sensitive coastal habitats that are of regional concern but not a priority under other water quality designations (threatened or impaired); and (3) expanding participation in education and restoration programs.

This designation will help the State to protect pristine, threatened, and impaired waters that may be degraded by new or substantially expanding land use near the coastal zone by coordinating additional agencies and initiating special programs. Because CCA designation is a continuing process, sensitive coastal habitats that may become threatened by new or expanding development can be targeted as a priority in the future.

Finally, CCA designation will provide resources to special coastal areas which do not achieve priority ranking within other sections of this plan and will therefore provide solutions to program deficits rather than create an additional designation using the same review criteria.

Results of Targeting Efforts

One of the goals of the Program is to implement all of the MMs over the next fifteen years. Although the Strategy targets specific MMs during each five-year

implementation plan, in any given year efforts will be ongoing for each MM throughout the State. Some of the MMs implemented during the first implementation cycle will undoubtedly require continued attention long past the initial five years. Similarly, sustained NPS pollution prevention and control efforts may be needed for certain geographic areas beyond the first five years. During the assessment processes in 2001 and 2006, these MMs and areas will be identified and incorporated into the subsequent implementation cycle.

In targeting MMs and geographic areas during the first five-year implementation cycle, special consideration was also given to dovetailing with existing programs. For example, in providing technical support to cities in the development of urban runoff plans, the State will build upon and expand upon the use of the Model Urban Runoff Program (MURP). MURP was originally developed for the Cities of Monterey and Santa Cruz. Taking advantage of existing NPS programs such as MURP will avoid duplicative efforts.

Depending on its relative priority, each MM for each five-year implementation cycle was targeted as either primary, secondary, or tertiary. In designating the targeting level for each MM, consideration was given also to the extent that specific actions are currently being implemented to address the NPS source. For example, urban runoff poses a considerable problem in California but was designated at the secondary and tertiary targeting level because of the existing NPDES Stormwater Program. At the conclusion of each five-year implementation cycle, the MMs targeted at the primary level will be evaluated using the following criteria: (1) the degree to which performance measures have been met; (2) geographic extent of MM implementation; (3) selected evaluation of MPs to implement the MMs; and (4) analysis of available water quality information in those areas where implementation has occurred. Depending on the degree of success, the State will determine whether to: (1) maintain the in-place efforts; (2) modify or add MMs and/or actions for each primary level MM; or (3) consider whether rulemaking is necessary to ensure successful implementation. The targeted MMs for the Strategy and each five-year implementation plan are presented in Table 8.

D. Planning

Introduction

To maintain the Program Plan as a working document, it will be continually updated, decisions will be re-evaluated, and priorities will be re-targeted based on updated information, pilot projects, and lessons learned. An important part of the updating process is integrating the Program Plan with existing federal and State plans and programs that impact NPS pollution control. The following sections provide a brief description of these plans and programs and how the Program Plan will integrate with them.

1988 NPS Plan

The CWA was amended in 1987 to include a new section 319 titled "Nonpoint Source Management Program." CWA section 319 required states to develop a management program describing the measures the State will take to address NPS pollution. Pursuant

TABLE 8 – SUMMARY OF TARGETED MANAGEMENT MEASURES FOR FIFTEEN-YEAR STRATEGY AND FIVE-YEAR IMPLEMENTATION PLANS

Management Measures	Targeting Level for Each Five Year Implementation Plan		
	1998-2003	2003-2008	2008-2013
1. Agriculture			
A. Erosion and Sediment Control	P	P	P
B. Confined Animal Facilities Wastewater and Runoff	P	P	P

D. Education/Outreach	P	P	P

Legend:

- P – primary
- S – secondary
- T – tertiary

* The Program Plan will implement the Urban MMs through the coordination and expansion of in-place activities including the Phase I and Phase II Storm Water Programs, the Cal/Trans Stormwater Permit, LCP amendments, CDPs and/or MURP.

to these requirements, the SWRCB developed the 1988 Plan which outlined the steps to initiate systematic management of NPS pollution in California. The 1988 Plan emphasized the following characteristics of an effective management program: (1) developing an explicit long-term commitment by the SWRCB and RWQCBs; (2) coordinating existing SWRCB and RWQCB NPS related programs; (3) using more effectively RWQCB regulatory authorities coupled with non-regulatory programs; (4) improving the linkages among local, State, and federal agencies that have authorities to address NPS pollution; and (5) enhancing funding sources. Key elements of the 1988 Plan were the: (1) development of management options to address NPS pollution (the three-tiered approach); (2) establishment of the NPS Management Information System (NPSMIS); and (3) phased implementation of the 1988 Plan.

The Strategy builds on the lessons learned in the implementation of the 1988 Plan by maintaining and/or expanding those elements that were successful and deleting or altering those that did not achieve the goals of the 1988 Plan. The Strategy maintains the "three-tiered approach" and commits to expanding application of the "tiers" pursuant to the requirements of section 13369(a)(2)(B) of the CWC. The NPSMIS will be expanded through contracts with the University of California at Davis-Information Center for the Environment (UCD-ICE) to develop relational databases and geography-based information systems. The phased implementation program in the 1988 Plan was expanded to include a commitment from the SWRCB to consider adopting the MMs as regulation if clear progress is not being made in their implementation.

Water Quality Control Plans

In California, the RWQCBs and SWRCB are responsible for the development of statewide and regional WQCPs, respectively. Pursuant to section 13240 of the Porter-Cologne Act, each of the State's nine RWQCBs must formulate and adopt regional WQCPs (basin plans) for all surface and ground waters within their respective regions. Porter-Cologne Act section 13170 allows the SWRCB to adopt statewide WQCPs for waters for which water quality standards are required by the CWA. The statewide plans, when adopted, supersede any basin plan requirements for the same waters to the extent of any conflict.

Basin Plans

Section 13241 of the Porter-Cologne Act requires that each basin plan: (1) designate beneficial uses; (2) establish water quality objectives that protect the designated beneficial uses; and (3) provide an implementation plan for achieving the water quality objectives. The implementation plan for achieving water quality objectives must include, but is not limited to: (1) a description of the nature of the actions which are necessary to achieve the water quality objectives; (2) a time schedule for the actions to be taken; and (3) a description of the monitoring and surveillance to be undertaken to determine compliance with objectives.

As part of the "continuing planning process," components of the basin plan are reviewed as new information and data become available or as specific needs arise. Comprehensive updates of the basin plan occur in response to State and federal

legislative requirements and as funding becomes available. All of the RWQCB basin plans were completely updated in 1995. In addition, the basin plan provides consistent long term standards and program guidance for the RWQCB.

Section 13240 of the Porter-Cologne Act directs the SWRCB and the RWQCBs to periodically review and update basin plans. Furthermore, CWA section 303(c) directs states to review water quality standards every three years (triennial review) and, as appropriate, modify and adopt new standards. In the triennial review process, basin planning issues are formally identified and ranked during the public hearing process. These and other modifications to the basin plan are implemented through basin plan amendments which must be reviewed by the RWQCB and the SWRCB in a public review process specified. Following adoption by the RWQCB, basin plan amendments and supporting documents are submitted to the SWRCB for review and approval. All basin plan amendments approved by the SWRCB after June 1, 1992 must also be reviewed by the State Office of Administrative Law (OAL). In addition, the USEPA must review and approve those basin plan amendments that involve changes in State standards for surface water quality to ensure such changes do not conflict with federal regulations.

The basin plans will be one of the most effective instruments for integrating the Program Plan. Many of the critical elements for implementing the NPS Program are required by statute to be incorporated into the basin plan. The SWRCB and RWQCBs can use their planning authority to prevent NPS pollution and implement MMs. Implementation programs within the basin plan can implement MMs through several approaches. The implementation plans can recommend that NPS dischargers carry out specific BMPs in order to achieve water quality standards. The implementation programs can also waive regulation of categories of NPS pollution discharges on condition that the dischargers implement specific MMs or BMPs. Alternatively, an implementation program can prohibit NPS discharges either entirely or partially, in certain areas or under certain conditions. The conditions can include compliance with appropriate MMs and applicable BMPs.

Inland Surface Waters Plan/Enclosed Bays and Estuaries Plan

The SWRCB is in the process of developing a new Inland Surface Waters Plan (ISWP) and Enclosed Bays and Estuaries Plan (EBEP) to reinstate the two plans it rescinded in response to an adverse court ruling in 1994. The SWRCB is generally authorized to adopt WQCPs under the Porter-Cologne Act (§13170) and is specifically mandated to adopt the EBEP (CWC §13391). Once adopted and in effect, the ISWP and EBEP will complement the California Ocean Plan (Ocean Plan) by establishing statewide water quality standards and implementation measures for controlling discharges of toxic pollutants to non-ocean surface waters of the State.

The SWRCB is developing the ISWP and EBEP in two phases. In Phase 1, the SWRCB will adopt the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (Policy). The Policy (adopted pursuant to CWC §13140) will establish statewide toxicity requirements and provisions to implement water quality standards for priority toxic pollutants in waste

discharges. The adoption of water quality standards for priority toxic pollutants for all waters of the United States is mandated by federal CWA section 303(c)(2)(B) in accordance with implementing regulations (40 CFR 131). The vast majority of these standards will be promulgated for the State in the USEPA California Toxics Rule (CTR). Together, the CTR and the Policy will be the basis for establishing water quality-based effluent limitations and other permit requirements for priority pollutants and whole effluent toxicity in NPDES permits and other WDRs. Thus, the standards and implementation provisions established by the CTR and the Policy will function as replacements for the ISWP and EBEP until they are established in their entirety in Phase 2. In Phase 2, the SWRCB will combine the Policy provisions with State-adopted water quality standards for priority pollutants and other pollutants of concern to produce a new ISWP and EBEP. Other issues, such as toxicity testing and the evaluation of standards for effluent-dependent and agricultural drainage-dominated water bodies, will also be addressed in the future.

Currently, the USEPA expects to promulgate the CTR in December 1999. In November 1999, the SWRCB released a revised draft of the Policy and supporting documents for a second public review prior to an SWRCB workshop in December 1999. The Policy will be considered for adoption at a SWRCB meeting in early 2000. The Policy will become effective upon approval by the OAL in the spring of 2000. After the ISWP and EBEP are adopted, the plans will be periodically reviewed and, as appropriate, revised (generally every three years) in accordance with CWC section 13240 and CWA section 303(c)(1). These triennial reviews involve public hearings prior to adoption of amendments by the SWRCB.

California Ocean Plan

The 1997 Ocean Plan states that the SWRCB "finds and declares that protection of the quality of the ocean waters for use and enjoyment by the people of the State requires control of the discharge of waste to ocean waters in accordance with the provisions contained" in the Ocean Plan. State law (CWC §13170.2) requires that the Ocean Plan be reviewed at least every three years to guarantee that current standards are adequate and are not allowing degradation to marine species or posing a threat to public health. As defined by the Ocean Plan, "waste includes a discharger's total discharge, of whatever origin, *i.e.*, gross, not net, discharge." Section 13170.2 of the CWC requires the SWRCB to adopt and review the Ocean Plan.

The Ocean Plan applies in its entirety to point source discharges to the ocean. NPS discharges are subject to the sections of the Ocean Plan covering beneficial uses, water quality objectives, general requirements, and discharge prohibitions. For NPSs of waste discharge to the ocean, "compliance with water quality objectives, in all cases, shall be determined by direct measurements in the receiving waters." The Ocean Plan is not applicable to discharges to enclosed bays and estuaries, inland waters, vessel wastes, or control of dredging materials. The SWRCB may make exceptions to the Ocean Plan in compliance with CEQA and a public hearing and in concurrence with the USEPA, provided that two conditions are met: (1) the exception will not compromise protection of ocean waters for beneficial uses and (2) the public interest will be served.

The Ocean Plan was established in 1972 and has been amended in 1978, 1983, 1988, 1990, and 1997. Draft amendments were made public in October 1998, public hearings on the draft were held in December 1998, and staff is currently responding to comments made during the hearings. It is anticipated that revised draft amendments will be submitted for SWRCB approval in May 2000. As part of the required review of current standards, a triennial review of the Ocean Plan, public hearings were held in September and October 1998. The public identified 35 specific issues that needed review. Staff subsequently prepared a Triennial Review Workplan, describing 22 high priority issues that the SWRCB approved on July 15, 1999 and submitted to the USEPA. The issue "Regulatory Control of Nonpoint Source Control" was reviewed by staff of the Division of Water Quality's NPS Section prior to SWRCB approval of the Workplan.

Bays and Estuaries Toxic Hot Spot Cleanup Plan

The purpose of this program was to implement the Bay Protection and Toxic Cleanup Program (BPTCP), which was established by the State Legislature in 1989. The BPTCP had four major goals: (1) to provide protection of present and future beneficial uses of the bays and estuarine waters of California; (2) to identify and characterize toxic hot spots; (3) to plan for toxic hot spot cleanup or other remedial or mitigation actions; and (4) to develop prevention and control strategies for toxic pollutants that will prevent creation of new toxic hot spots or the perpetuation of existing toxic hot spots in the bays and estuaries of the State.

The six coastal RWQCBs involved in the BPTCP conducted extensive water and sediment quality monitoring in the enclosed bays and estuaries of the State over a period of eight years. The monitoring data provided information on the chemistry (types and amounts of toxicants), toxicity, and benthic integrity of sediments. An assessment of monitoring data using a weight-of-evidence approach resulted in the designation of 48 toxic hot spots, 22 of which were ranked as high priority based on the guidance developed by the SWRCB. The RWQCBs developed regional toxic hot spot cleanup plans for the high priority hot spots.

The BPTCP concluded in June 1999 with the adoption of the statewide Toxic Hot Spot Cleanup Plan by the SWRCB. The Cleanup Plan includes: (1) a priority listing of all toxic hot spots; (2) description of each toxic hot spot including a characterization of the pollutants present at the site; (3) assessment of the most likely source or sources of pollutants; (4) estimate of the total costs to implement the cleanup plan; (5) estimate of the costs that can be recovered from parties responsible for the discharge of pollutants that have accumulated in sediments; (6) preliminary assessment of the actions required to remedy or restore a toxic hot spot; (7) a two-year expenditure schedule plan; and (8) findings on the need to establish a toxic hot spot cleanup program.

Depending on the source and areal extent of the known hot spot, the actions to remediate the sites include: (1) better characterization of the sites and problem, (2) institutional controls/education, (3) dredging, capping, a combination of dredging and capping, (4) source control watershed management, and (5) implementation of a no-action alternative. In order to prevent the further pollution or creation of known toxic hot spots, the cleanup plan requires RWQCBs to reevaluate WDRs in compliance with CWC section 13395. The re-evaluation consists of: (1) an assessment of whether the discharge may influence the creation or further pollution of the known toxic hot spot, (2) an assessment of which WDRs need to be modified to improve environmental conditions at the known toxic hot spot, and (3) a schedule for completion of any WDR modifications deemed appropriate.

Development of Total Maximum Daily Loads

Section 303(d)(1)(C) of the CWA requires the State to establish TMDLs for "303(d) listed water bodies" for those pollutants determined by USEPA to be suitable for TMDL measurement. The TMDL program provides an assessment and planning framework for identifying load reductions or other actions needed to attain water quality standards. The planning process for TMDL development is divided into two parts. Part 1 establishes and apportions the allowable level(s) of pollution in the water body (or watershed) necessary to achieve water quality standards. The recommended methods for achieving the necessary reductions in pollutant loadings are detailed in the second part of this process--the TMDL implementation plan.

Part 1 – Developing the TMDL

This process establishes the maximum allowable amount of pollution (for parameters of concern) and allocates this among the existing and potential sources. The allocation of pollutants is distributed among both point source and NPS discharges. This quantitative assessment includes determining the following components:

- Loading capacity--The greatest amount of loading that a water body can receive without violating water quality standards.
- Load allocation--The portion of a receiving water's loading capacity that is attributed either to one of its existing or future NPSs of pollution or to natural background sources.
- Wasteload allocation--The portion of a receiving water's loading capacity that is allocated to one of its existing or future point sources of pollution.
- Margin of safety--The portion of a receiving water's loading capacity that accounts for the uncertainty of the relationship between the pollutant loads and the quality of the receiving water.
- Seasonal variation--The influence of seasonally-dependent factors (e.g., flow volume) on the receiving water's loading capacity.
- TMDL--The sum of the individual wasteload allocations for point sources, load allocations for NPSs and natural background, and the margin of safety. The TMDL can be expressed in terms of either mass per time, toxicity, or other appropriate measures that relate to the State's water quality standard. In practice, allocations are not typically assigned on a daily basis but instead are

monthly, seasonal, or annual. In most cases mass load is utilized as the metric for the allocations. In some cases (e.g., pathogen problems), other measurable features are used to express the allowable amount of pollution.
