### BUILDING COOLING WATER SYSTEM

Water enters the building via a main distribution line from the ground water well pump. Branches off the main line occur at fan room #1, fan room #2, and fan room #3. The branches carry the water through the heat exchange coils in the fan rooms. The water makes a single pass through the coils and exits via a discharge line that carries the water to the pump house sump. The water is discharged from the sump to the American River.
