1. INTRODUCTION

Leviathan Mine is a former sulfur mine that the State of California acquired in the early 1980s to address water quality problems caused by historical mining. Jurisdiction over Leviathan Mine rests with the State Water Resources Control Board, which, in turn, has delegated jurisdiction over clean up work to the California Regional Water Quality Control Board, Lahontan Region (Water Board). On May 11, 2000, the United States Environmental Protection Agency (USEPA) placed Leviathan Mine on the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) National Priorities List, thus making Leviathan Mine a federal Superfund site.

On July 19, 2000, pursuant to its authority under CERCLA, USEPA issued an Administrative Abatement Action (AAA) to the Water Board and directed the Water Board to implement certain pollution abatement and site monitoring activities at Leviathan Mine. With slight modifications, USEPA subsequently reissued the AAA in 2001, 2002, 2003, 2004, and 2005. In its 2005 AAA, USEPA decided, instead of issuing the AAA every year, to allow its Remedial Project Manager to notify Water Board of the necessity to continue the Work for an additional year, for each year that the first phase of Non-Time Critical Removal Action (NTCRA) continues.

This Year-End Report for the 2009 Field Season at Leviathan Mine (Year-End Report) has been prepared by the Water Board for the USEPA. This Year-End Report was prepared to comply with Paragraph No. 50 of USEPA's July 14, 2005 AAA which states:

"Within thirty (30) days after the LRWQCB [Water Board] concludes that the seasonal work on the NTCRA has been fully performed, the LRWQCB shall so notify EPA and shall schedule and conduct a pre-certification inspection to be attended by the LRWQCB and EPA. The pre-certification inspection shall be followed by a written report submitted within ninety (90) days of the inspection by the LRWQCB's Project Coordinator certifying that all work to date on the NTCRA has been completed in full satisfaction of the requirements of this Administrative Action."

The pre-certification inspection occurred on November 9, 2009. In a letter dated January 7, 2010, Water Board staff requested, and the USEPA granted in their e-mail dated February 8, 2010, an extension of the due date for the 2009 Year-End Report until March 9, 2010.

This Year-End Report constitutes the "*written report*" as referenced in Paragraph No. 50 of the AAA, and contains year-end summaries of Water Board field activities performed in 2009. The activities required of the Water Board by the USEPA are described in Paragraph No. 37 of the AAA. These activities consist of:

1. Summer treatment of Acid Mine Drainage (AMD) captured year-round in a series of ponds;
2. Site maintenance of ponds, drainage and diversion channels, and gates and fences; and
3. Site monitoring of water quality, water quantity, and meteorological information.

Water Board staff conducted the above-listed activities in accordance with the *2009 Work Plan for Leviathan Mine, Alpine County, California* (Work Plan) prepared by the Water Board. The Work Plan was transmitted to, and approved by, the USEPA.

This report describes the site activities performed in 2009, and is organized into the following sections:

- A background section that describes the site setting and history; collection and storage of AMD; and the treatment process;
- A sludge removal and pond water treatment section describing the removal and disposal of sludge and treatment of AMD in 2009;
- A site surface water monitoring section; and
- A site maintenance section.

The report summarizes data collected by the Water Board in two appendices. Appendix A summarizes the results of Pond Water Treatment (PWT) monitoring. Appendix B summarizes the results of Surface Water Monitoring (SWM).

2. BACKGROUND

2.1 SITE SETTING AND HISTORY

Leviathan Mine is located on the eastern slope of the Sierra Nevada Mountains in Alpine County, California (Figure 1). The mine is approximately six miles east of Markleeville, California and five miles west of Topaz Lake, Nevada. Based on the Final Title Search and Survey Report conducted by Science Applications International Corporation (SAIC) for the USEPA on January 31, 2000, the Leviathan Mine encompasses thirty-two patented mineral claims and a patented mill site. The majority of land disturbed by mining activities is on state-owned property, with the remainder of the disturbance located on property owned by the United States Department of Agriculture, Forest Service, Humboldt-Toiyabe National Forest (USFS). The USFS owns the majority of land surrounding the mine according to the above mentioned SAIC report, with the exception of ten private parcels along the southern boundary of the mine site.

Leviathan and Aspen Creeks (Figure 2) flow across the mine site and join below the mine. Approximately 1.5 miles downstream of the confluence of Leviathan and Aspen Creeks, Leviathan Creek joins Mountaineer Creek. The combined flow of Leviathan and Mountaineer Creeks forms Bryant Creek. Approximately 3.5 miles downstream of the confluence of Leviathan and Mountaineer Creeks, Bryant Creek flows across the Nevada state line. Approximately 1.8 miles downstream of the Nevada state line, Doud Springs enters Bryant Creek. Just below this confluence, an irrigation ditch seasonally diverts flow from Bryant Creek to the River Ranch property. Approximately 1.5 miles downstream from the irrigation diversion, Bryant Creek joins the East Fork of the Carson River.

Historical mining activities at Leviathan Mine included underground and open pit extraction of sulfur-rich ore. These activities resulted in the exposure of naturally occurring sulfide minerals to air and water. This exposure triggered a series of chemical reactions that caused local groundwater to become acidic and metal-rich. The acidic groundwater discharges from an old mine tunnel as well as seeps at several locations within the Leviathan Mine site. When this AMD enters local surface water bodies, it adversely affects water quality, which in turn affects algae, insect, and fish growth, and damages the in-stream habitat through deposition of metal-rich precipitates.

The Water Board has implemented several projects to abate AMD from entering local surface water bodies. In 1985, the Water Board completed construction of a pollution abatement project at Leviathan Mine to address certain specific problem areas. This project included the construction of AMD storage and evaporation ponds, which are a major component of the Water Board's pond water collection and treatment activities.

2.2 AMD Collection and Storage

The 1985 pollution abatement project included construction of five lined evaporation ponds (Figure 3) to capture and evaporate AMD from remnant underground mine workings. The primary sources of AMD to the pond system are the Adit and the Pit Under-Drain (PUD).

- The Adit is the location where acidic groundwater emanated from a remnant tunnel excavated during underground mining activities in the 1930s. The exact condition of the interior of the tunnel is unknown, but it is likely that portions of the tunnel have collapsed. The approximate location of the tunnel and other site features are shown in Figure 3. As part of the 1985 pollution abatement project, the Water Board contractor installed an underground drain to collect acidic groundwater emanating from the Adit. The underground drain consists of a 12-inch-diameter perforated pipe in a bed of drain rock. The perforated pipe is connected to a non-perforated 12-inch pipe that carries the AMD to a concrete flow control structure (FCS). AMD from the Adit has a pH of less than 3.0 and typically has a discharge rate between 9 and 15 gallons per minute (gpm) with rates as high as approximately 42 gpm (flow data collected from 1999 to present).
- The Water Board's contractor, Mittry-G.E.B. Inc., installed the PUD during construction of the 1985 pollution abatement project to dewater saturated soils in the bottom of the open pit prior to backfilling the pit to its current elevation. The PUD consists of approximately 1,500 linear feet of 12-inch-diameter perforated pipe set in a bed of drain rock beneath the pit bottom, buried in pit backfill material. The perforated pipes connect to a non-perforated 18-inch-diameter pipe that conveys the PUD discharge to the FCS. AMD from the PUD has a pH of less than 3.0 and typically has a flow rate between 0.1 and 4 gpm, with rates as high as approximately 38 gpm (flow data collected from 1999 to present).
- The five evaporation ponds (Ponds 1, 2 South, 2 North, 3, and 4; see Figure 3) cover a combined surface area of approximately 12.8 acres with a cumulative

holding capacity of approximately 16.5 million gallons based on an October 1998 survey conducted by ARCO Environmental Remediation, LLC. AMD from the FCS can be routed directly to Leviathan Creek or to the pond system via a weir gate. When the AMD is directed to the pond system, it can be distributed by gravity to any combination of Ponds 1, 2 South, and 2 North via a series of valves, as these ponds are interconnected and are at the same elevation. These three ponds are commonly called the "upper ponds" and have a combined volume of approximately 14 million gallons. Pond 3 can receive overflow from the upper ponds by gravity via PVC overflow pipes. Overflow from Pond 3 flows in PVC piping and can be directed by gravity, via valves, to either the Leviathan Creek or to Pond 4. Pond 4 overflows directly to the Leviathan Creek via PVC piping.

- In 2009, no AMD was routed directly from FCS to Leviathan Creek and Pond 3 received no overflow from any of the upper ponds.
- Currently, Pond 4 is not receiving any flow from Pond 3 and is utilized by Atlantic Richfield Company (ARCO) for storage and treatment of other AMD sources.

2.3 Pond Water Treatment (PWT) Plant Process

The Water Board treats and discharges treated pond water during the summer months using the PWT Plant (Plant). These activities renew pond storage capacity for the subsequent winter and spring months. The Water Board assembled a lime treatment system (the Plant) during the 1999 field season on the northeast corner of Pond 1 and tested the process at full-scale during the 1999 and 2000 field seasons. The Water Board has continued to operate the lime treatment system during the summer months from 2001 through 2009. The typical Water Board field season at Leviathan Mine runs from mid-June through mid-October.

The Water Board's treatment of AMD contained in the pond system is accomplished through lime neutralization. The neutralization of AMD by the addition of lime has long been accepted as an effective means to raise pH and remove metals in AMD. Lime (calcium hydroxide or $\text{Ca}[\text{OH}]_2$), is mixed into the AMD from the pond system; the addition of lime causes an increase in pH and the precipitation of dissolved constituents, including metals, contained in the AMD. The metals are precipitated out of solution in an earthen clarifier, and the final products are: 1) a nearly metal-free effluent with near neutral pH, and 2) waste sludge.

The Plant treats the AMD stored in the three upper ponds. The process has also been referred to as Pond 1 lime treatment because the treatment system is located on the north side of Pond 1. The Plant draws the AMD from Pond 1 for treatment, thereby lowering the water elevation of Pond 1. The lower water level in Pond 1 causes AMD from Pond 2 North and Pond 2 South to flow by gravity to Pond 1 to be treated by the treatment system. As pond water levels decline towards the end of the treatment season, portable transfer pumps have to be used to move water from Ponds 2N and 2S to Pond 1.

3. 2009 SLUDGE REMOVAL AND POND WATER TREATMENT

3.1 Sludge Removal and Disposal

As the first task of 2009 field season, approximately 484 tons of sludge generated during operation of the 2008 PWT was removed from the Pit Clarifier by the Water Board's contractor, DECON Environmental Services, Inc. (Decon) in late June and early July 2009. The sludge had been sampled, analyzed, and characterized in the fall of 2008; the results were reported in the Water Board's 2008 year-end report. The sludge was hauled to a Class I hazardous waste landfill in Beatty, Nevada for disposal. Hazardous waste manifests are available for review at the Water Board's office in South Lake Tahoe.

3.2 2009 Pond Water Treatment Plant Operation

The Water Board contracted with Decon for Plant operations for the 2009 field season. Decon chose to operate the Plant, with a few exceptions, during daylight hours on weekdays only. As in 2008, Decon used dry lime and made up lime slurry on site to neutralize AMD from the pond system. In 2009, dry lime was delivered to the site in pallets of 50 pound bags. Decon staff mixed an approximately 11% by weight lime slurry (using Leviathan Creek water from upstream of the mine) in a 1000-gallon polyethylene tank during daily operations.

Approximately 20 tons of dry lime remains stored on site following the 2009 treatment season. The lime is stored both in weather proof shipping containers and on pallets covered with tarps within the Plant area. This lime will facilitate efficient startup of the Plant next year. A summary of the treatment process including modifications to lime addition methods and pH monitoring which were used during the 2009 treatment season is described in the following paragraphs.

The primary modification from previous treatment operations was Decon's use of a single point lime addition in 2009. This is a modification from past years where a two-point lime addition was used. The single point lime addition was used in an effort to minimize the number of lime addition points required to operate the treatment plant, thus lowering maintenance requirements for successful plant operation.

A 5-horsepower (hp) electric pump conveyed AMD from Pond 1 to a 10,000-gallon fiberglass Phase 1 reaction tank (R-1). Decon used an in-line manifold with static mixers that combined a pre-set amount of lime slurry with the AMD before the mixture reached tank R-1 during 2009 operations. In previous years initial mixing of AMD and lime slurry took place in R-1. A 3-hp mixer mixed AMD and lime slurry in R-1. The lime slurry raised the pH of the AMD from approximately 2.5 to approximately 8.5 in R-1.

The partially treated AMD flowed by gravity from R-1 through a two-chambered combination flash/flocculation mix tank (FF-1) and into a Lamella clarifier (CL-1). Decon

used two mixers in the flash/flocculation tank and added an additional mixer to CL-1. Two 1.5-inch air diaphragm pumps removed precipitates from the bottom of CL-1. One of the 1.5-inch air diaphragm pumps is used to pump a portion of the precipitates back into the top of R-1. The second 1.5-inch air diaphragm pump is used to pump remaining precipitates from the bottom of CL-1 back into the top of CL-1 in an effort to keep precipitates from settling out and potentially clogging the bottom of CL-1 with solids.

Supernatant and precipitates from CL-1 flowed by gravity to the Phase 2 reaction tank (a second 10,000-gallon fiberglass tank) referred to as R-2. A 7.5-hp mixer in R-2 mixed the partially treated AMD, precipitates, and lime slurry. A pH probe in R-2 measured pH and, if necessary, metered additional lime slurry to R-2. This second lime addition was not needed in 2009.

Treated AMD and precipitates then flowed through the Phase 2 flash/flocculation mix tank (FF-2) and into the Phase 2 Lamella clarifier (CL-2). Two 10-hp mud pumps transferred the water/solid mixture from the bottom of CL-2 to the Pit Clarifier. A polyacrylamide polymer solution was injected into the sludge slurry line just upstream of the two 10-hp mud pumps to promote flocculation and settling in the Pit Clarifier. In 2009, Decon installed a pH probe in FF-2. The pH probe controlled the mud pumps, preventing transfer of treated AMD to the Pit Clarifier if the pH dropped below 7.9. This pH probe, controller, and pump combination provided additional reliability as well as a final confirmation pH measurement.

The Pit Clarifier is an earthen reservoir located in the bottom of the Leviathan Mine open pit. The Pit Clarifier has plan dimensions of approximately 150-feet by 150-feet, and includes a gravel/sand covered perforated pipe under-drain. The sludge slurry from CL-2 was pumped to the Pit Clarifier where solids settled out in near-quiescent conditions. The treated water collected by the Pit Clarifier under-drain piping flowed through a weir box, where stage data was recorded and water quality control samples were collected. The weir box has a 90-degree V-notch weir and stage data were recorded at 15-minute intervals by a combination data logger/pressure transducer system. Using a valve on the Pit Clarifier under-drain piping, the controlled release of treated water from the Pit Clarifier occurred only during the days Decon was treating water.

Decon began treating AMD contained in the upper pond system on July 31, 2009. Discharge of treated water from the Pit Clarifier to Leviathan Creek began on August 6, 2009. The treatment plant was shut down on September 2, 2009 after the AMD contained in the upper ponds was treated. The single point lime addition in conjunction with the approximately 11% by weight lime slurry used by Decon was successful in treating AMD during the 2009 season.

After the pond water was treated and the Plant was shut down on September 2, 2009, treated water continued to be discharged from the Pit Clarifier and the Water Board continued to collect samples of effluent discharging from the Pit Clarifier until September 8, 2009. Effluent flow rates from the Pit Clarifier under-drain dropped to below 5 gpm on September 10, 2009 and effluent sample collection was terminated as per the approved 2009 Work Plan. By mid-September 2009, approximately 2.9 million

gallons of treated pond water had been discharged from the Pit Clarifier to Leviathan Creek.

The 2009 PWT Plant operation consumed approximately 52 standard tons of dry lime, 310 pounds of dry polymer, 4056 gallons of diesel fuel, and 708 gallons of gasoline. The Water Board's treatment effort in 2009 combined with natural evaporation resulted in the upper pond system having the maximum available storage capacity of approximately 14 million gallons.

Sludge generated by the Plant in 2009 is contained in the Pit Clarifier to allow for further dewatering. The Plant operation generated an estimated 550 cubic yards (wet volume) of sludge. Dewatering of the sludge over the winter will increase solids content and reduce both the volume and mass of the sludge. Water Board staff estimates that the 550 cubic yards of wet sludge will result in approximately 300 tons of sludge being disposed in 2010.

3.3 Pond Water Treatment Monitoring

Treatment process monitoring, sampling and analysis were performed in accordance with the Water Board's *Sampling and Analysis Plan for Leviathan Mine Site Pond Water Treatment (April 2009)* (PWT SAP), with a few deviations noted in Section 3.4.4.

Effluent samples were collected for comparison with USEPA Discharge Criteria (Table 1). The USEPA Discharge Criteria are set forth in the September 25, 2008 Non-Time Critical Removal Action for the Leviathan Mine Site. A summary of the monitoring parameters, locations, and frequencies for the 2009 PWT monitoring program is presented in Table 2. Specific details of sample collection and handling are described in the PWT SAP. Both sludge and aqueous samples were analyzed by the Water Board's contracted off-site laboratory, TestAmerica Laboratories.

To characterize discharge water quality, Water Board staff collected grab samples of the treated effluent at least twice weekly while discharge to Leviathan Creek occurred. Water Board staff collected effluent samples from the weir box located near the Pit Clarifier, and pre-treatment influent samples from the line conveying pond water to the treatment plant. As specified in the USEPA-approved 2009 Work Plan, effluent sample collection stopped when the discharge of effluent from the weir dropped below 5 gpm. Between August 6 and September 8, 2009, Water Board staff collected:

- 12 treated effluent samples (at least 2 per week),
- 3 treated effluent duplicate samples (>10% sample rate)
- 5 pre-treatment influent samples (weekly)
- 2 field method blanks (>10% sample rate)

A portion of each grab sample was field filtered, preserved with nitric acid, and submitted to the Water Board's contracted off-site laboratory to be analyzed for the following dissolved metals/metalloids: aluminum (Al), arsenic (As), copper (Cu), chromium (Cr), cadmium (Cd), nickel (Ni), iron (Fe), lead (Pb), and zinc (Zn). An unfiltered portion of the daily grab sample was preserved with nitric acid and submitted for Total Recoverable Selenium (Se). Once per week, in addition to the above

analyses, Water Board staff submitted samples of influent and treated effluent for sulfate (SO_4), total dissolved solids (TDS), and the following dissolved metals: calcium (Ca), cobalt (Co), manganese (Mn), and magnesium (Mg). During influent and effluent sample collection activities, Water Board staff monitored and recorded pH and temperature in the field on sampling record forms. Sample identification tracking forms and sampling record forms will be maintained in files and are available for review at the Water Board office in South Lake Tahoe.

Analytical and field monitoring results of influent and treated effluent samples are summarized in Tables A-1 and A-2 of Appendix A (*Data Summary for 2009 Pond Water Treatment Plant Monitoring*).

To provide real-time information on effluent quality and system operation, treatment plant operators measured the pH and temperature approximately every two hours while the system was operating at four mid-process locations (R-1, R-2, FF-2, and influent to Pit Clarifier) and at one effluent location (weir box). Operators used these data to moderate lime additions, if necessary, and maintain effluent quality. The data collected by the system operators are summarized in Table A-3 of Appendix A.

Sludge generated during the 2009 treatment effort, and contained in the Pit Clarifier, was sampled in October 2009 for waste characterization and disposal purposes. Three sludge samples were collected directly from the Pit Clarifier following partial dewatering of sludge. Sludge samples were collected from three different locations in the Pit Clarifier. Sludge samples were collected from a vertical profile that represented the complete thickness of sludge. Sludge samples were analyzed for comparisons with Total Threshold Limit Concentrations (TTLCs) and Soluble Threshold Limit Concentrations (STLCs) for Title 22 metals, and aluminum and iron. Analytical results for the sludge samples are summarized in Table A-4 of Appendix A.

3.4 Sampling Results from Pond Water Treatment Monitoring

3.4.1 Monitoring Objectives

The overall objective of the monitoring program for PWT was to evaluate the effectiveness of the treatment process in terms of effluent and sludge quality.

Specific monitoring objectives are as follows:

- Identify the chemical characteristics of the treatment plant influent.
- Identify the chemical characteristics of the treated effluent.
- Identify the chemical characteristics of solids generated in the treatment process.
- Monitor the effectiveness in meeting USEPA Discharge Criteria.
- Monitor field pH at critical points within the treatment system and at the discharge point as a means to monitor and control treatment efficiency.

3.4.2 Data Summary

The results of PWT monitoring are summarized in Tables A-1 through A-5 of Appendix A. TestAmerica Laboratories produced laboratory Data Validation Checklists, as described in the *Draft Leviathan Mine Site Site-Wide Sampling and Analysis Plan, Montgomery Watson Harza, April 2002* (Site-Wide SAP), for all of their laboratory reports. They are not included in this report, but can be reviewed at the Water Board office.

Laboratory analytical results for treated effluent are summarized in Table A-1. These data are collected for comparison with the USEPA Daily Maximum Discharge Criteria, also included in Table A-1. No laboratory-confirmed exceedences of the Daily Maximum Discharge Criteria occurred in 2009. Table A-2 summarizes laboratory analytical results for Plant influent samples.

Measurements of pH taken by Water Board staff and system operators confirmed that the discharge of treated effluent to Leviathan Creek was within the Discharge Criteria for pH of 6.0 to 9.0. Results of pH and temperature are included in Tables A-1 (effluent samples) and A-2 (influent samples) for data collected by Water Board staff and in Table A-3 for data collected by Plant operators.

Results of the sludge characterization analyses are presented in Table A-4. The three sludge samples collected from the Pit Clarifier averaged approximately 8.7 percent solids (% solids). With the exception of the total concentrations for arsenic, the sludge did not exceed any other STLC or TTLC limits. The total concentrations for arsenic exceeded TTLC in two of three samples collected from the Pit Clarifier. The arithmetic average arsenic concentration for the three samples was 553 milligrams per kilogram (mg/kg). The TTLC for arsenic is 500 mg/kg.

A summary of daily discharge from the Pit Clarifier is included in Table A-5. Stage data, or the water level above the v-notch of the Pit Clarifier weir, was recorded at 15-minute intervals by a data logger. A rating curve, developed in 2008 by Water Board staff, was used to convert the stage data to flow rate. The mean daily discharge flow rates shown in Table A-5 were calculated from the mean daily stage. Typical treated effluent discharge flow rates during the 2009 treatment season were approximately 100 gallons per minute. A total of 2.9 million gallons of treated effluent was discharged to Leviathan Creek in 2009. The 15-minute stage data are available for review at the Water Board's South Lake Tahoe office.

Effluent, influent, and sludge analytical data will be submitted to ARCO for uploading to the Site-Wide Database. Final laboratory data packages, including results, Chain of Custody forms, and Data Validation Checklists will be retained in the Water Board's project files.

3.4.3 Data Quality Evaluation

Water Board staff reviewed the quality of the PWT monitoring results. Sample collection, handling, preservation, and analysis were conducted as specified in the PWT SAP, and a sampling record form was completed for each sampling event. Field quality

control samples, including Field Method Blanks (FMBs) and field duplicates, were collected as described in the PWT SAP. A Chain of Custody form was completed for each group of samples submitted to the off-site analytical laboratory. Upon receipt of the laboratory report, Water Board staff reviewed the Chain of Custody to assure that details such as the project name, sample ID numbers, sample date, sample times, and requested parameters were properly reported. Water Board staff's data review also included an evaluation of sample holding times, an assessment of precision, an assessment of anomalous data, and a review of FMB results.

Laboratory-assigned data qualifiers are presented with the PWT data in Tables A-1, A-2, and A-4. In 2009, Water Board staff did not assign any additional data qualifiers to pond water treatment data.

Water Board staff assessed the data to confirm that holding times were met. No holding times were exceeded for PWT analyses during the 2009 field season.

Water Board staff submitted field duplicate samples of the treated effluent to the laboratory to measure the precision of the entire measurement system including sampling and analytical procedures. Water Board staff collected three duplicate PWT samples for laboratory analysis in 2009. The relative percent difference (RPD) was calculated for each analyte in the primary sample and corresponding duplicate, as follows:

- If both the sample and duplicate values were equal to or greater than five times the Reporting Limit (RL), then the RPD was calculated by dividing the absolute value of the difference of the two measurements by the average of the two measurements and multiplying by 100. The RPD must be equal to or less than 25% to be within control limits.
- If either the sample or duplicate value was less than five times the RL, then the absolute difference between the sample and duplicate values had to be equal to or less than the RL to be in control limits.

All sets of duplicate data were within the control limits for the RPD detailed above. As per the PWT SAP, the control limit of 25% is based on the analytical precision goals for the laboratory matrix spike duplicate samples.

Two FMBs were collected and submitted to TestAmerica for laboratory analysis of the same parameters as PWT effluent samples. FMBs were collected and processed in the same method as that of effluent samples, except using laboratory-supplied water for each blank.

One dissolved metal was detected in the field method blank samples collected as part of the PWT monitoring program. Dissolved chromium was detected in one blank sample at 0.0039 mg/L. The USEPA Four-Day Average Criteria for chromium is 0.310 mg/L. Chromium concentrations in the treated effluent samples ranged from 0.0015 to 0.0047 mg/L. The dissolved chromium concentration detected in the field method blank sample is not considered as having an effect on the use of effluent sample data for

comparison with the USEPA Maximum or Four-Day Average Discharge Criteria because the value is so low in comparison to the criteria.

3.4.4 Deviations from the PWT SAP

Two deviations from the PWT SAP occurred during the 2009 field season.

Table B-1 of the Water Board's *2009 Work Plan for Leviathan Mine, Attachment B* indicated that the Water Board's contractor would collect daily influent pH and temperature measurements. Decon failed to monitor influent pH and temperature on a daily basis. Water Board staff collected influent pH and temperature data on a weekly basis. These data are presented in Table A-2.

The preparation of two checklists for each laboratory report, the Level A/B Screening Checklist and Data Validation Checklist for Field Quality Control, as contained in the Site-wide SAP and the PWT SAP, was not completed for this Year End Report. The information formerly contained in these forms is discussed in Section 3.4 of this report.

- The Data Validation Checklist for Field Quality Control form documented an assessment of holding times, field blanks, and field duplicates. Water Board staff performed the review and assessment of holding times, field blanks, and field duplicates but no longer use this form to document them.
- The Level A/B Screening Checklist was used to confirm that basic sample collection, handling, shipping, and documentation was performed and to assess the data as Level "A", "B", or "Unusable". The Level "A", "B", and "Unusable" designations were never adopted for use in the Site-Wide Database. The continuing use of this checklist appears to no longer serve any purpose since the designations are not used in the Site-Wide Database.

4. SURFACE WATER MONITORING AND METEOROLOGICAL INFORMATION

As required by the USEPA, the Water Board continued their efforts in 2009 field season to monitor surface water flow and quality, and to collect meteorological information in the vicinity of Leviathan Mine. All monitoring data are forwarded to ARCO for incorporation into the Site-Wide Database.

4.1 Meteorological Monitoring

A weather station is located on the Water Board's construction trailer near Pond 1. It is a Davis Integrated Sensor Suite model and has been operational since its installation in November 2002. The system measures the following conditions hourly: wind speed, wind direction, rainfall, outside temperature, outside humidity, ultraviolet radiation, and

solar radiation. Water Board staff download data from this weather station periodically and transmit the data to ARCO for incorporation into the Leviathan Mine Site-Wide Database.

The weather station has sufficient memory for approximately six months of data. Staff downloaded the weather station on December 10, 2008 and then again on March 17, 2009. Upon review of the data downloaded in March, Staff observed a significant decline in the amount of data recorded by the weather station. For the months of January, February, and March 2009, significant gaps in the data occurred:

- temperature was recorded about 45% of the time,
- humidity was recorded at about 30% of the time,
- solar radiation was collected less than 20% of the time, and
- UV was collected about 20% of the time.

The weather station was removed from the site, sent to Davis Instruments in Hayward, CA for repair, and re-installed in early May 2009. Based on data collected since re-installation, we believe the unit is functioning as designed with 100 percent of potential data recorded.

4.2 Flow Monitoring

Flow data are reported on the basis of water year. The 2009 water year begins October 1, 2008 and ends September 30, 2009. Under contract to the Water Board, the United States Geological Survey (USGS) monitored water flows and pond water level elevations at 15 locations during the 2009 water year. Flow monitoring locations, USGS station numbers, and equipment are detailed in Table 3. Appendix B, *Data Summary for 2009 Surface Water Monitoring*, Tables B-1 to B-13 summarize the daily and monthly average flow data for 11 stations with continuous flow recorders and daily and monthly average stage data for water levels in Pond 1 and Pond 4. Two additional flow monitoring stations do not have continuous records but are monitored only during USGS field visits. Tables B1- B13 (Appendix B) contain the final provisional data for water year 2009. The USGS typically publishes the data by the spring following the completion of the water year. Once published, the data is no longer provisional, and will then be submitted to ARCO by the Water Board for uploading to the Site-Wide Database.

Real-time provisional flow and stage recordings can be viewed on the web for the following seven stations: Adit, PUD, CUD, Station 15, Station 25, Pond 1, and Pond 4. The real-time data can be accessed through the USGS's website at:
<http://waterdata.usgs.gov/ca/nwis/current?type=flow>.

Published data reports can be searched by USGS station number at the USGS website: <http://ca.water.usgs.gov/waterdata/>.

Late in the fall of 2009, the USGS, under contract to the Water Board, installed three new trial stations for continuous flow monitoring, one in the Pit Junction Box (in the open pit), one on the Upper Tributary (just south of Pond 2S) and one on the Lower

Tributary (north of Pond 2N). The three new flow monitoring stations were installed in an effort to provide additional data of surface water flows at Leviathan Mine. Ice buildup in drainage channels containing the new flow monitoring hardware may prove problematic for collecting accurate stage measurements during winter and spring months. It is anticipated that equipment fine-tuning will be required to optimize reliable data collection following a review of the 2010 winter and spring data.

4.3 Surface Water Monitoring

Surface water sampling and analysis was performed in compliance with the *Sampling and Analysis Plan for Leviathan Mine Site Surface Water Monitoring (January 2004)* (SWM SAP), with one deviation noted in Section 4.4.3. The SWM SAP is not included in this report, but copies are available for review at Water Board's South Lake Tahoe office.

The Water Board conducted 12 monthly surface water quality monitoring events and two semiannual events during the 2009 water year. The Water Board's monthly and semiannual surface water quality monitoring stations are shown in Figure 4. Measured parameters and sampling frequencies are summarized in Table 4.

Samples were collected for laboratory analysis of TDS, sulfate, and total and dissolved aluminum, arsenic, calcium, cadmium, chromium, cobalt, copper, iron, magnesium, manganese, nickel, and zinc using a peristaltic pump equipped with new piece of disposable C-Flex® tubing for each sample. Samples collected for analysis of dissolved metals, TDS, and sulfate were field filtered through a new, disposable 0.45-micron filter for each sample. Water Board staff collected all samples in clean, new sample containers provided by the contract laboratory. Sample containers used for metals analyses were pre-preserved with nitric acid. A duplicate sample and a field method blank were collected for each sampling event. Detailed sample collection and handling procedures and QA/QC protocols are described in the SWM SAP.

Basic Laboratory analyzed the surface water samples collected from October 2008 to April 2009. TestAmerica Laboratories analyzed the surface water samples collected from May through September 2009.

4.4 Sampling Results From Surface Water Monitoring

4.4.1 Monitoring Objectives

The monitoring objectives of the SWM program, as outlined in the SWM SAP, were to collect data of sufficient quality to:

- Identify the chemical characteristics of the various surface waters in the vicinity of Leviathan Mine, including AMD sources and creek waters.
- Monitor flows of AMD discharges and selected creeks.

- Track the impacts of remediation projects on downstream surface waters.
- Identify seasonal and annual variations in the chemical characteristics and field parameters of surface waters in the vicinity of Leviathan Mine.
- Calculate the loading of metals to the downstream surface waters from the various discharges at Leviathan Mine.

4.4.2 Data Quality Evaluation and Summary

Surface water data collected for this water year is summarized in the Appendix B, *Data Summary for 2009 Surface Water Monitoring*. The analytical results of the surface water sampling, along with any qualifiers, are presented in Tables B-14 to B-25. The tables also show the field data measurements collected by Water Board staff at the time of sampling, including pH, temperature, electrical conductivity, and specific conductance.

Water Board staff reviewed the quality of the surface water monitoring results. Sample collection, handling, preservation, and analysis were conducted as specified in the SWM SAP. Field quality control samples, including FMBs and field duplicates were collected as described in the SWM SAP. A Chain of Custody form was completed for each group of samples submitted to the off site analytical laboratory. Upon receipt of the laboratory report, Water Board staff reviewed the Chain of Custody to assure that details such as the project name, sample ID numbers, sample date, sample times, and requested parameters were properly reported. Water Board staff's data review also included an evaluation of sample holding times, an assessment of precision, an assessment of anomalous data, and a review of FMB results.

Basic Laboratories and TestAmerica completed Data Validation Checklists for all sample analytical reports. Final laboratory data reports and associated Data Validation Checklists are not included in this report but are available for viewing at the Water Board's South Lake Tahoe office.

An evaluation of the completeness of the required sample collection shows that 138 samples were to be collected during the water-year (eleven stations to be sampled monthly and three stations to be sampled semiannually). The semiannual monitoring station at 4L Creek (just above its confluence with Leviathan Creek) was not sampled during the October 2008 event as the creek had no flow at the time of sampling. Station 15 had no flow in the creek during the July 2009 sampling event, so no sample was collected. All other stations and sampling events were conducted in accordance with the SWM SAP. Per the SWM SAP the completeness goal for the project is 90%. In total, 136 of the planned 138 samples were collected, resulting in a completeness of 98.5%. Of the 136 samples collected, none of the data were rejected.

Water Board staff assessed the data to confirm that holding times were met. Re-analysis for total and dissolved manganese at the Adit from the May 2009 sampling event was requested by the Water Board and performed outside the 6-month holding

time. This result was reported using the H-1 qualifier. No other holding times were exceeded for the surface water samples collected during the 2009 field season.

Laboratory-assigned data qualifiers are presented with the SWM data in Tables B-14 through B-25. In 2009, Water Board staff assigned a data qualifier of "*" for data that did not meet our field duplicate assessment, and an "A" qualifier for anomalous data. Explanations of the Water Board staff-assigned data qualifiers are summarized in Table B-26, and are also included in Tables B-14 through B-25.

Table B-26 summarizes results qualified as "Anomalous" by the Water Board. In total, 21 results were qualified. Nine pairs of total and dissolved results (18 results) were qualified due to the dissolved concentration significantly exceeding the total concentration. Three results were qualified due to the results being significantly less than historical values.

Water Board staff collected one field duplicate per sampling event as required in the SWM SAP. The RPD was calculated for the duplicate and corresponding sample as described in Section 3.4.3. Data with RPD assessment results out of control limits were flagged with "*" qualifier in Appendix B, Tables B-14 to B-26. Out of 312 paired results, six sets of sample and duplicate results were flagged for exceeding the control limits for RPD.

FMBs were also collected once per sampling event (12 total samples this water year) and submitted to the laboratory for analysis of the same parameters evaluated in the surface water monitoring program. FMBs were collected and processed in the same method as surface water samples using either the Water Board's in-house laboratory distilled de-ionized water or laboratory-supplied water for each blank.

Five metals were detected at low levels above the reporting limit (RL) in the FMB samples that were collected as part of the SWM program:

- Dissolved iron was detected in two FMB samples at concentrations of 0.018 and 0.010 mg/L. The RL for iron was 0.010 mg/L. All primary samples contained dissolved iron in greater concentrations than detected in the FMB.
- Total iron was detected in two FMB samples, both at a concentration of 0.010 mg/L. The RL for iron was 0.010 mg/L. All primary samples contained total iron greater than 0.010 mg/L.
- Total manganese was detected in one FMB sample at a concentration of 0.0005 mg/L. The RL for total manganese was 0.0005 mg/L. All primary samples contained total manganese greater than 0.0005 mg/L.
- Dissolved manganese was detected in one FMB sample at a concentration of 0.0005 mg/L. The RL dissolved manganese was 0.0005 mg/L. All primary samples contained dissolved manganese greater than 0.0005 mg/L.
- Total chromium was detected in three FMB samples at concentrations of 0.0005 mg/L, 0.0006 mg/L, and 0.002 mg/L. The reporting limits were 0.0005 mg/L,

0.0006 mg/L, and 0.001 mg/L respectively. Two primary samples from the November 2008 sampling event had total chromium results that were less than the detection in the FMB, all other results were greater than or equal to the detection in the FMB.

No data qualifiers were added by the Water Board based on FMB results.

4.4.3 Deviations from the SWM SAP

There was one deviation from the SWM SAP.

The preparation of two checklists for each laboratory report, the Level A/B Screening Checklist and Data Validation Checklist for Field Quality Control, as contained in the Site-wide SAP and the PWT SAP, was not completed for this Year End Report. The information formerly contained in these forms is discussed in Section 3.4 of this report.

- The Data Validation Checklist for Field Quality Control form documented an assessment of holding times, field blanks, and field duplicates. Water Board staff performed the review and assessment of holding times, field blanks, and field duplicates but no longer use this form to document them.
- The Level A/B Screening Checklist was used to confirm that basic sample collection, handling, shipping, and documentation was performed and to assess the data as Level "A", "B", or "Unusable". The Level "A", "B", and "Unusable" designations were never adopted for use in the Site-wide Database. The continuing use of this checklist appears to no longer serve any purpose.

5. SITE MAINTENANCE

The Water Board conducted site maintenance work during the 2009 field season in accordance with the USEPA-approved Work Plan. Routine maintenance activities include repairing perimeter fencing, removing sediment from storm water ditches, covering exposed pond liners and minor road repair. Additional work conducted during the 2009 field season included concrete culvert disposal and repairs to CUD plumbing near the USGS CUD flow monitoring station.

5.1 Off-site Concrete Culvert Disposal

A written request was received by the Water Board on September 26, 2008 from the USFS, per the 1999 "Road Access and Uses of the National Forest" agreement between the USFS and the Water Board, requesting removal of a concrete culvert being stored on USFS property north of the site. The section of concrete culvert was removed by the Water Board's contractor, Decon, on June 24, 2009.

5.2 CUD Plumbing Refurbishment

CUD plumbing terminating at the USGS V-notch weir adjacent to Leviathan Creek was modified by ARCO's contractors during their summer 2001 field operations. The modifications made to the CUD plumbing discharging into the V-notch weir-box proved to be problematic for USGS staff's monthly weir calibration and periodic weir maintenance. CUD pipe connections used in the 2001 modification were also observed by Water Board staff to be in various states of disrepair during the 2008 field season. CUD pipe connections were replaced and all unused appurtenances were removed from the CUD terminus plumbing by Water Board staff on April 6, 2009.

5.3 Repairing Perimeter Fencing

A barbed-wire fence surrounds the majority of the site. In May and early June 2009 Lahontan Water Board staff inspected the perimeter fence and noted that repairs to the fence were required adjacent to Leviathan Creek between surface water monitoring station 4L Cr and Station 15 (Figure 3). Decon repaired the perimeter fence in June 2009.

5.4 Storm Water Conveyance Clean-out

The Water Board contracted with Ferguson Excavating of South Lake Tahoe, CA to remove accumulated sediment in the concrete-lined, storm water conveyance ditch directly behind the Pit Clarifier. Ferguson utilized a backhoe with a custom-made V-shaped bucket and a hand laborer to accomplish the task. The soil was stockpiled adjacent to the ditch, between the ditch and the Pit Clarifier.

5.5 Covering Exposed Liner

Water Board staff visually inspected cover material around each pond and detected areas where earthen cover had eroded and the pond liner was exposed. Water Board staff covered the exposed liner with fine-grained material removed from storm water conveyances.

5.6 Invasive Plant Control

The El Dorado County, Department of Agriculture (EDCDA) visited Leviathan Mine on August 3, 2009 and applied herbicide (Telar[®]) on invasive plants. This year (2009), as in 2002 through 2008, the EDCDA sprayed to eradicate tall whitetop (*Lepidium latifolium*).

TABLE 1
2009 USEPA DISCHARGE CRITERIA

Water Quality Parameter	Maximum	Four-Day Average
pH	--	Between 6.0 – 9.0 SU ²
Arsenic	0.34 mg/L ¹	0.15 mg/L ⁴
Aluminum	4.0 mg/L ¹	2.0 mg/L ⁴
Cadmium	0.009 mg/L ¹	0.004mg/L ⁴
Chromium	0.97 mg/L ¹	0.31 mg/L ⁴
Copper	0.026 mg/L ¹	0.016 mg/L ⁴
Iron	2.0 mg/L ¹	1.0 mg/L ⁴
Lead	0.136 mg/L ¹	0.005 mg/L ⁴
Nickel	0.84 mg/L ¹	0.094 mg/L ⁴
Selenium (Total Recoverable)	Not Promulgated	0.005 mg/L ^{3, 4}
Zinc	0.21 mg/L ¹	0.21 mg/L ⁴

Notes:

mg/L: milligrams per liter

1: Dissolved concentration in a daily grab sample that has been field-filtered (0.45 micron) and acid fixed promptly after collection.

2: pH measurement based on 24-hour (single day) average discharge.

3: Total recoverable concentration in a daily grab sample that is acid fixed, but not filtered.

4: Concentrations based on the average of four daily grab samples. If the concentration detected by the laboratory is less than the detection limit, one-half of the detection limit shall be used in calculating the average concentration.

TABLE 2
SUMMARY OF 2009 POND WATER TREATMENT MONITORING
LEVIATHAN MINE, ALPINE COUNTY, CALIFORNIA

SAMPLE LOCATION	LOCATION DESCRIPTION	ANALYSES	SCHEDULE	SAMPLER
Influent	Sampling port just prior to Reactor 1	EPA-Required Discharge Criteria ¹ with Additional Analytes ²	weekly	Water Board staff
Mid Process	Reactor 1	pH, temperature (field)	approx. every 2 hours	contractor
Mid Process	Reactor 2	pH, temperature (field)	approx. every 2 hours	contractor
Mid Process	Influent to Pit Clarifier	pH, temperature (field)	approx. every 2 hours	contractor
Effluent	Weir Box	pH, temperature (field)	approx. every 2 hours	contractor
		EPA-Required Discharge Criteria ¹	Tuesday/Thursday	Water Board staff
		EPA-Required Discharge Criteria ¹ with Additional Analytes ²	weekly	Water Board staff
Duplicate Samples	same location as primary sample	EPA-Required Discharge Criteria ¹	minimum of 10%	Water Board staff
Field Method Blank	collected at weir box using distilled water	EPA-Required Discharge Criteria ¹	minimum of 10%	Water Board staff
Sludge	Pit Clarifier	CAM-17 ³ metals plus Al and Fe (for comparison with STLC and TTLC) ⁴	three composite samples collected once per year after treatment	Water Board staff

Notes:

1. Dissolved As, Al, Cd, Cr, Cu, Fe, Pb, Ni, Zn, total recoverable Se (off-site laboratory); pH (field)
2. Ca, Co, Mg, Mn, TDS, sulfate (off-site laboratory analysis)
3. Refers to 22 CCR 66261.24(a)(2)(A); CAM-17 metals: Sb, As, Ba, Be, Cd, Cr, Co, Cu, Pb, Hg, Mo, Ni, Se, Ag, Tl, V, Zn (off-site laboratory analysis)
4. STLC is the Soluble Threshold Limit Concentration and TTLC is the Total Threshold Limit Concentration.

TABLE 3
SUMMARY OF USGS SURFACE WATER FLOW AND STAGE MONITORING LOCATIONS
LEVIATHAN MINE, ALPINE COUNTY, CALIFORNIA

Station Location/Description	USGS Station Number	Equipment	USGS Startup Date
Leviathan Creek above the mine (Station 1)	10308783	Continuous stage/flow recorder and appurtenances, solar power supply.	October-98
Pit Under-Drain at the flow control structure (PUD)	10308785	Continuous stage/flow recorder and appurtenances, solar power supply, telemetry.	February-00
Adit at the flow control structure (Adit)	10308784	Continuous stage/flow recorder and appurtenances, solar power supply, telemetry.	October-98
Pond 1 Stage	103087853	Continuous stage recorder and appurtenances, solar power supply, telemetry.	November-99
Pond 4 Stage	103087887	Continuous stage recorder and appurtenances, solar power supply, telemetry.	October-99
Channel Under-Drain (CUD)	103087885	Continuous stage/flow recorder and appurtenances, solar power supply, telemetry.	November-99
Aspen Creek above the mine (Station 22)	103087891	Continuous stage/flow recorder and appurtenances, solar power supply.	October-03
4L Creek above its confluence with Leviathan Creek (4L Creek)	103087889	Continuous stage/flow recorder and appurtenances, solar power supply.	October-03
Leviathan Creek above its confluence with Aspen Creek (Station 15)	10308789	Continuous stage/flow recorder and appurtenances, solar power supply, telemetry.	October-98
Aspen Creek above its confluence with Leviathan Creek (Station 16)	none	None. Monthly flow measurements to establish relationship w/STA 15.	October-98
Overburden (Aspen) Seep, above the Bioreactors (OS)	103087892	Continuous stage/flow recorder and appurtenances, solar power supply.	November-98
Bryant Creek just below the confluence of Mountaineer and Leviathan Creeks (Station 25)	10308794	Continuous stage/flow recorder and appurtenances, solar power supply.	November-98
Leviathan Creek just above the confluence of Mountaineer and Leviathan Creeks (Station 23)	10308792	Continuous stage/flow recorder and appurtenances, solar power supply	December-99
Mountaineer Creek just above the confluence of Leviathan and Mountaineer Creeks (Station 24)	none	None. Monthly flow measurements to establish relationship w/STA 23.	December-99
Bryant Creek just above confluence with Doud Springs (Station 26)	10308800	Continuous stage/flow recorder and appurtenances, solar power supply	April-94

TABLE 4
SURFACE WATER QUALITY MONITORING STATIONS
LEVIATHAN MINE, ALPINE COUNTY, CALIFORNIA

Station Identification	Site Description	Sampling Frequency
Station 1	Leviathan Creek above Leviathan Mine.	Monthly
Adit	Drainage from Tunnel #5 (the Adit), prior to entering evaporation ponds.	Monthly
Pit Under-Drain (PUD)	Drainage from shallow ground water collection pipes in pit, prior to entering evaporation ponds.	Monthly
Channel Under-Drain (CUD)	Discharge from Channel Under-Drain below Leviathan Creek concrete channel.	Monthly
Delta Seep (DS)	Seepage from the toe of the Delta Slope, located north of Pond 4.	Semi-annual
Station 15	Leviathan Creek above the confluence of Leviathan and Aspen creeks.	Monthly
Station 16	Aspen Creek above the confluence of Leviathan and Aspen creeks.	Monthly
4L Creek	4L Creek just above the confluence of Leviathan Creek.	Semi-annual
Station 22	Aspen Creek above Leviathan Mine.	Monthly
Overburden Seep (OS)	Overburden seepage (a.k.a. Aspen Seep), above the bioreactors.	Monthly
Station 23	Leviathan Creek above the confluence of Leviathan and Mountaineer creeks.	Monthly
Station 24	Mountaineer Creek above the confluence of Leviathan and Mountaineer creeks.	Monthly
Station 25	Bryant Creek below the confluence of Leviathan and Mountaineer creeks.	Monthly
Station 26	Bryant Creek above the confluence of Doud Springs and Bryant Creek.	Semi-annual

Laboratory Analytical and Field Monitoring Parameters for all Stations:

1. Laboratory: Total and Dissolved Metals (aluminum, arsenic, calcium, cadmium, cobalt, chromium, copper, iron, magnesium, manganese, nickel, zinc)
2. Laboratory: Total Dissolved Solids (TDS)
3. Laboratory: Sulfate
4. Field: pH, temperature, electrical conductivity, and specific conductance

Notes:

All values reported in milligrams/liter (mg/L), except pH and temperature which are in Standard Units and degrees Celsius, respectively.

pH and Temperature readings were collected in the field at the time of sample collection.

All parameters are dissolved, except Selenium, which is total recoverable.

Qualifiers:

U - Analyte not detected at the given Method Detection Limit (MDL).

J - Estimated value. Analyte detected at a level less than the Reporting Limit (RL) and greater than or equal to the Method Detection Limit (MDL). The user of this data should be aware that this data is of limited reliability.

B - Analyte was detected in the associated Method Blank.

B-1 - Analyte was detected in the associated method blank. Analyte concentration in the sample is greater than 10x the concentration found in the method blank.

RL1 - Reporting limit raised due to sample matrix effects.

MHA - Due to high levels of analyte in the sample, the MS/MSD calculation does not provide useful spike recovery information. See Blank Spike (LCS).

M-3 - Results exceeded the linear range in the MS/MSD and therefore are not available for reporting. The batch was accepted based on acceptable recovery in the Blank Spike (LCS).

C - Calibration Verification recovery was above the method control limit for this analyte. Analyte not detected, data not impacted.

Notes:

R-1 = Reactor Vessel 1; R-2 = Reactor Vessel 2; FF-2 = Flash Flocculant Vessel 2

Flow rates are in gallons/minute (gpm)

pH in Standard Units; Temperature in degrees Celsius

pH in R-1, R-2, and FF-2 recorded from in-plant pH controllers; pit clarifier and weir pH recorded using hand-held meter.

PC = pit clarifier; samples collected to evaluate treated water quality prior to discharge

INF = influent; samples collected to characterize treatment plant influent water quality

EFF = effluent; samples collected to characterize quality of water discharged to Leviathan Creek

Notes:

TTLC - Total Threshold Limit Concentration

STLC - Soluble Threshold Limit Concentration

NP - Not Promulgated

Qualifiers:

U - Analyte not detected at the given Method Detection Limit (MDL).

J - Estimated value. Analyte detected at a level less than the Reporting Limit (RL) and greater than or equal to the Method Detection Limit (MDL). The user of this data should be aware that this data is of limited reliability.

B-1 - Analyte was detected in the associated method blank. Analyte concentration in the sample is greater than 10x the concentration found in the method blank.

Field Data:

EC: Electrical Conductivity

SpC: Specific Conductance

Units: SU - Standard Units; °C - degrees celsius; uS/cm - micro siemen per centimeter; cfs - cubic feet per second

1: Provisional data provided by the United States Geological Survey

Q - Qualifiers:

A: Anomalous value, see Table B-26, Water Board 2009 Year End Report

B: Analyte was detected in the associated Method Blank.

B-1: Analyte was detected in the associated method blank. Analyte concentration in the sample is greater than 10x the concentration found in the method blank.

J: Analyte detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag). The J Flag is equivalent to the DNQ

Estimated Concentration flag.

H-1: Sample analysis performed past the method-specified holding time per client's approval.

M-3: Results exceeded the linear range in the MS/MSD and therefore are not available for reporting. The batch was accepted based on acceptable recovery in the Blank Spike (LCS).

MHA: Due to high levels of analyte in the sample, the MS/MSD calculation does not provide useful spike recovery information. See Blank Spike (LCS).

QM-4X: The spike recovery was outside of QC acceptance for the MS and/or MSD due to the analyte concentration being greater than 4 times the spike concentration. The QC batch was accepted based on LCS and/or LCSD recoveries within the acceptance limit.

RL1: Reporting limit raised due to sample matrix effects.

R-08: The sample was diluted due to sample matrix resulting in elevated reporting limits.

U: Analyte included in the analysis, but not detected at the given Method Detection Limit (MDL)

Table B-15: Pit Under-Drain Laboratory and Field Results

Field Data:

EC - Electrical Conductivity

SpC - Specific Conductance

Units: SU - Standard Units; °C - degrees celsius; uS/cm - micro siemen per centimeter; cfs - cubic feet per second

1: Provisional data provided by the United States Geological Survey.

Q - Qualifiers:

B: Analyte was detected in the associated Method Blank.

B-1: Analyte was detected in the associated method blank. Analyte concentration in the sample is greater than 10x the concentration found in the method blank.

J: Analyte detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag). The J Flag is equivalent to the DNQ Estimated Concentration flag.

M-3: Results exceeded the linear range in the MS/MSD and therefore are not available for reporting. The batch was accepted based on acceptable recovery in the Blank Spike (LCS).

QM-4X: The spike recovery was outside of QC acceptance for the MS and/or MSD due to the analyte concentration being greater than 4 times the spike concentration. The QC batch was accepted based on LCS and/or LCSD recoveries within the acceptance limit.

R-08: The sample was diluted due to sample matrix resulting in elevated reporting limits.

U: Analyte included in the analysis, but not detected at the given Method Detection Limit (MDL)

Table B-17: Channel Under-Drain Laboratory and Field Results

Field Data:

EC - Electrical Conductivity
 SpC - Specific Conductance
 Units: SU - Standard Units; °C - degrees celsius; uS/cm - micro siemen per centimeter; cfs - cubic feet per second

1: Provisional data provided by the United States Geological Survey.

Q - Qualifiers:

B: Analyte was detected in the associated Method Blank.

B-1: Analyte was detected in the associated method blank. Analyte concentration in the sample is greater than 10x the concentration found in the method blank.

C: Calibration Verification recovery was above the method control limit for this analyte. Analyte not detected, data not impacted.

J: Analyte detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag). The J Flag is equivalent to the DNQ Estimated Concentration flag.

M2: The MS and/or MSD were below the acceptance limits due to sample matrix interference. See Blank Spike (LCS).

M-3: Results exceeded the linear range in the MS/MSD and therefore are not available for reporting. The batch was accepted based on acceptable recovery in the Blank Spike (LCS).

QM-4X: The spike recovery was outside of QC acceptance for the MS and/or MSD due to the analyte concentration being greater than 4 times the spike concentration. The QC batch was accepted based on LCS and/or LCSD recoveries within the acceptance limit.

RL1: Reporting limit raised due to sample matrix effects.

R-08: The sample was diluted due to sample matrix resulting in elevated reporting limits.

U: Analyte included in the analysis, but not detected at the given Method Detection Limit (MDL)

Table B-18: Station 1 Laboratory and Field Results

Field Data:

EC - Electrical Conductivity

SpC - Specific Conductance

Units: SU - Standard Units; °C - degrees celsius; uS/cm - micro siemen per centimeter; cfs - cubic feet per second

Lerr - Instrument reading when instrument cannot compute SpC due to low water temperature.

e - estimated

1: Provisional data provided by the United States Geological Survey.

Q - Qualifiers:

A: Anomalous value, see Table B-26, Water Board 2009 Year End Report

B: Analyte was detected in the associated Method Blank.

B-1: Analyte was detected in the associated method blank. Analyte concentration in the sample is greater than 10x the concentration found in the method blank.

C: Calibration Verification recovery was above the method control limit for this analyte. Analyte not detected, data not impacted.

CONF: Sample was re-analyzed and confirmed.

J: Analyte detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag). The J Flag is equivalent to the DNQ Estimated Concentration flag.

M1: The MS and/or MSD were above the acceptance limits due to sample matrix interference. See Blank Spike (LCS).

MHA: Due to high levels of analyte in the sample, the MS/MSD calculation does not provide useful spike recovery information. See Blank Spike (LCS).

QM-07: The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.

R-08: The sample was diluted due to sample matrix resulting in elevated reporting limits.

U: Analyte included in the analysis, but not detected at the given Method Detection Limit (MDL)

Field Data:

EC - Electrical Conductivity

SpC - Specific Conductance

Units: SU - Standard Units; °C - degrees celsius; uS/cm - micro siemen per centimeter; cfs - cubic feet per second

Lerr - Instrument reading when instrument cannot compute SpC due to low water temperature.

e - estimated

1: Provisional data provided by the United States Geological Survey.

Q - Qualifiers:

B: Analyte was detected in the associated Method Blank.

B-1: Analyte was detected in the associated method blank. Analyte concentration in the sample is greater than 10x the concentration found in the method blank.

C: Calibration Verification recovery was above the method control limit for this analyte. Analyte not detected, data not impacted.

CONF: Sample was re-analyzed and confirmed.

J: Analyte detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag). The J Flag is equivalent to the DNQ Estimated Concentration flag.

QM-07: The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.

R-08: The sample was diluted due to sample matrix resulting in elevated reporting limits.

U: Analyte included in the analysis, but not detected at the given Method Detection Limit (MDL)

Field Data:

EC - Electrical Conductivity

SpC - Specific Conductance

Units: SU - Standard Units; °C - degrees celsius; uS/cm - micro siemen per centimeter;

Lerr - Instrument reading when instrument cannot compute SpC due to low water temperature.

Q - Qualifiers:

A: Anomalous value, see Table B-26, Water Board 2009 Year End Report

B: Analyte was detected in the associated Method Blank.

C: Calibration Verification recovery was above the method control limit for this analyte. Analyte not detected, data not impacted.

CONF: Sample was re-analyzed and confirmed.

J: Analyte detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag). The J Flag is equivalent to the DNQ Estimated Concentration flag.

QM-07: The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.

U: Analyte included in the analysis, but not detected at the given Method Detection Limit (MDL)

*: Result failed the Relative Percent Difference assessment

Field Data:

EC - Electrical Conductivity

SpC - Specific Conductance

Units: SU - Standard Units; °C - degrees celsius; uS/cm - micro siemen per centimeter; cfs - cubic feet per second

Lerr - Instrument reading when instrument cannot compute SpC due to low water temperature.

e - estimated

1: Provisional data provided by the United States Geological Survey.

Q - Qualifiers:

A: Anomalous value, see Table B-26, Water Board 2009 Year End Report

B: Analyte was detected in the associated Method Blank.

B-1: Analyte was detected in the associated method blank. Analyte concentration in the sample is greater than 10x the concentration found in the method blank.

C: Calibration Verification recovery was above the method control limit for this analyte. Analyte not detected, data not impacted.

CONF: Sample was re-analyzed and confirmed.

J: Analyte detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag). The J Flag is equivalent to the DNQ Estimated Concentration flag.

QM-07: The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.

R-08: The sample was diluted due to sample matrix resulting in elevated reporting limits.

U: Analyte included in the analysis, but not detected at the given Method Detection Limit (MDL).

Field Data:
 EC - Electrical Conductivity
 SpC - Specific Conductance
 Units: SU - Standard Units; °C - degrees celsius; uS/cm - micro siemen per centimeter;
 Lerr - Instrument reading when instrument cannot compute SpC due to low water temperature.
Q - Qualifiers:
 A: Anomalous value, see Table B-26, Water Board 2009 Year End Report
 B: Analyte was detected in the associated Method Blank.
 B-1: Analyte was detected in the associated method blank. Analyte concentration in the sample is greater than 10x the concentration found in the method blank.
 C: Calibration Verification recovery was above the method control limit for this analyte. Analyte not detected, data not impacted.
 CONF: Sample was re-analyzed and confirmed.
 J: Analyte detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag). The J Flag is equivalent to the DNQ Estimated Concentration flag.
 QM-07: The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
 U: Analyte included in the analysis, but not detected at the given Method Detection Limit (MDL)
 *: Result failed the Relative Percent Difference assessment

Field Data:

EC - Electrical Conductivity

SpC - Specific Conductance

Units: SU - Standard Units; °C - degrees celsius; uS/cm - micro siemen per centimeter; cfs - cubic feet per second

Lerr - Instrument reading when instrument cannot compute SpC due to low water temperature.

e - estimated

1: Provisional data provided by the United States Geological Survey.

Q - Qualifiers:

A: Anomalous value, see Table B-26, Water Board 2009 Year End Report

B: Analyte was detected in the associated Method Blank.

B-1: Analyte was detected in the associated method blank. Analyte concentration in the sample is greater than 10x the concentration found in the method blank.

C: Calibration Verification recovery was above the method control limit for this analyte. Analyte not detected, data not impacted.

CONF: Sample was re-analyzed and confirmed.

J: Analyte detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag). The J Flag is equivalent to the DNQ Estimated Concentration flag.

QM-07: The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.

U: Analyte included in the analysis, but not detected at the given Method Detection Limit (MDL)

Field Data:

EC - Electrical Conductivity

SpC - Specific Conductance

Units: SU - Standard Units; °C - degrees celsius; uS/cm - micro siemen per centimeter; cfs - cubic feet per second

NA - Not Available

1: Provisional data provided by the United States Geological Survey.

Q - Qualifiers:

B: Analyte was detected in the associated Method Blank.

B-1: Analyte was detected in the associated method blank. Analyte concentration in the sample is greater than 10x the concentration found in the method blank.

J: Analyte detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag). The J Flag is equivalent to the DNQ Estimated Concentration flag.

QM-4X: The spike recovery was outside of QC acceptance for the MS and/or MSD due to the analyte concentration being greater than 4 times the spike concentration. The QC batch was accepted based on LCS and/or LCSD recoveries within the acceptance limit.

U: Analyte included in the analysis, but not detected at the given Method Detection Limit (MDL)
