1 INTRODUCTION

1.1 Background

The Santa Ana River Watershed is located in Southern California, east of the City of Los Angeles, and includes a small portion of Los Angeles County, a significant portion of Orange County, the northwestern corner of Riverside County, and the southwestern portion of San Bernardino County. Water quality in the Santa Ana River Watershed is regulated by the Santa Ana Regional Water Quality Control Board, which issues National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System (MS4) permits for Orange County, Riverside County, and San Bernardino County and their associated municipalities, also known as Copermitttees.

Within Section XI, New Development of the Area-wide Urban Stormwater Runoff Management Program San Bernardino County MS4 Permit (Order No. R8-2010-0036), the County and the Permittees are required to develop a Watershed Action Plan (WAP). The purpose of the WAP is to address water quality and hydromodification impacts and integrate water quality, stream protection, stormwater management and re-use strategies with land use planning policies, ordinances, and plans within each jurisdiction. This integration is also designed to address cumulative impacts of development on vulnerable streams and to the maximum extent practicable preserve or restore the structure and function of streams and protect surface and groundwater quality. The WAP, Section ix, specifies the development of a system-wide evaluation to identify opportunities to retrofit existing stormwater conveyance systems, parks, and other recreational areas with water quality protection measures and develop recommendations for specific retrofit studies that incorporates opportunities for addressing applicable TMDL implementation plans, hydromodification management, and/or LID implementation within the permitted area.

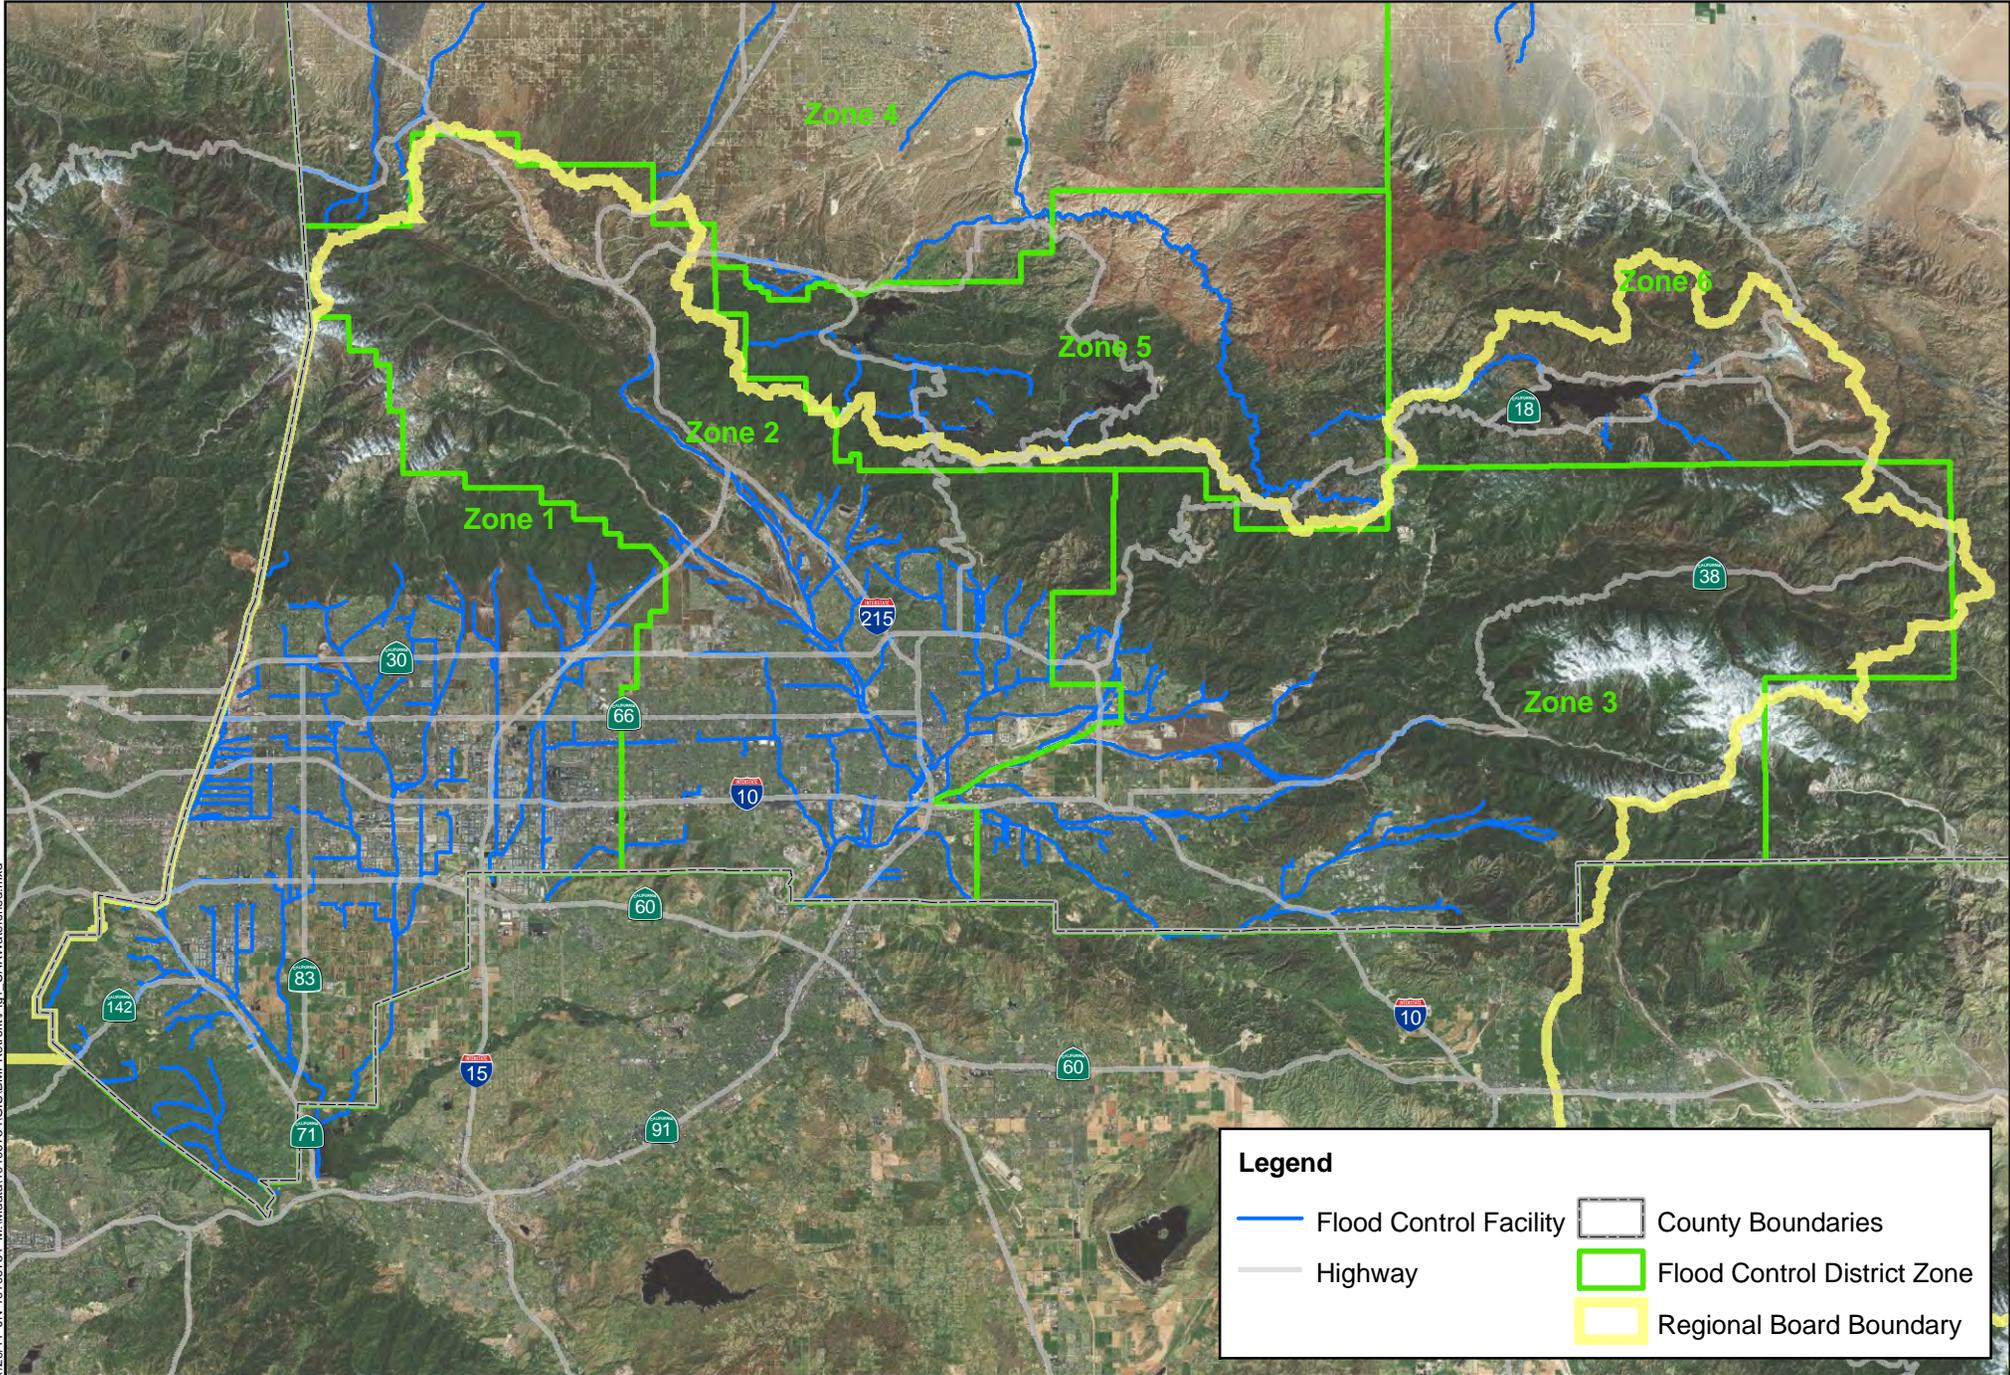

RBF Consulting performed this system-wide evaluation on behalf of the County of San Bernardino and Permittees, and this report describes the study that was performed to meet this permit requirement, including the technical approach, methodology, and the results of the study. Also provided are future steps and recommendations on specific future retrofit studies.

1.2 The Santa Ana River Watershed

The Santa Ana River (SAR) Watershed is located within portions of Los Angeles, Orange, Riverside and San Bernardino County and has an area of approximately 2,650 square miles. The headwaters of the Santa Ana River are in the San Bernardino Mountains with two of its principal tributaries Bear Creek and Mill Creek. Other tributaries include Lytle Creek originating in the San Gabriel Mountains and the San Jacinto River originating in the San Jacinto Mountains. The climate in the watershed is Mediterranean with hot, dry summers and cooler wet winters with a range of 12 inches of rainfall per year in the coastal plain, to 18 inches per year in the inland valleys, to 40 inches per year in the mountains. Due to the climate, there is little natural perennial surface water in the watershed. The upper part of the watershed in the mountains has the highest gradient and water quality is usually of high quality. Flows in the Upper Valley from the Seven Oaks Dam to the City of San Bernardino consist of storm flows and rising groundwater. From the City of San Bernardino to the City of Riverside, the Santa Ana River flow perennially and includes discharges from publicly owned treatment works (POTW). From the City of Riverside to northern part of Orange County, flow consists of POTW discharges, urban runoff, irrigation runoff water and surfacing groundwater. The SAR cuts

through the Santa Ana Mountains, flows on to the Orange coastal plain, and eventually discharges to the ocean in the City of Huntington Beach (SAWPA, 2009). The Santa Ana River Watershed is substantially urbanized with approximately 32% of the land being residential, commercial, or industrial. Agricultural land makes up approximately 10% of the watershed, and the watershed is home to approximately 5 million people. Figure 1 shows the boundaries of the SAR Watershed within San Bernardino County.

1 RETROFIT OPPORTUNITY IDENTIFICATION ANALYSIS

1.3 Summary of Technical Approach

Retrofit opportunities were identified using the Integrated Watershed Assessment Tool for Restoration or iWATR as shown in Figure 2 (RBF Consulting, 2010). Several factors were considered when identifying retrofit opportunity locations in the County of San Bernardino portion of the Santa Ana River Watershed. The Geographic Information Systems (GIS) Watershed Analysis Tool took into account characteristics of the watershed, including public land availability and ownership, aerial photography, topography, hydrology, existing stormwater infrastructure, and areas of anthropogenic sources of pollutants. The tool also evaluated the technical feasibility or site constraints, such as environmental issues, maintenance access, utility interference, and aesthetic considerations. For each retrofit opportunity identified, watershed characteristics and site constraints were considered to provide a preliminary recommendation on the most appropriate BMP types. Based on the extent of the tributary area served, both subregional and regional retrofit opportunities were identified. Subregional retrofit opportunities were preferred for local or neighborhood drainage areas and included BMPs such as bioretention areas, extended detention basins, wet basins/constructed wetlands, and media filters. Regional or watershed retrofit opportunities were selected for larger drainage areas and in locations where there was an opportunity to extract water from a water body or major storm drain, treat the water with a BMP and then discharge back into the water body or storm drain. The regional BMPs included infiltration basins, wet basins/constructed wetlands, subsurface wetlands, and extended detention basins.

This section outlines the technical approach that was used to identify the potential retrofit opportunities during the desktop survey of the upper part of the Santa Ana River Watershed.

Figure 2: Integrated Watershed Assessment Tool for Restoration

1.4 Differentiate Regional and Subregional Sites

Several characteristics of the upper part of the Santa Ana River Watershed, which is located in San Bernardino County, limit the number of retrofit opportunities that include extraction, treatment, and discharge of water from and into creeks or major channels. Major channels in the watershed drain large tributary areas, including significant portions of natural land as they are located downstream of alluvial fans. The amount of available space within Flood Control boundaries remains relatively limited for implementing large BMP sites. The alluvial fans are also associated with large transfers of sediment loads. Finally diverting flows from natural channels and creeks to a treatment site may have some affect on beneficial uses in the creeks but may have significant regulatory hurdles. For these reasons, the identification process focused principally on public parcels, which are in proximity to existing storm drains and infrastructures.

Diverting and treating runoff from municipal storm drains specifically targets runoff produced by urban or developed areas and their associated anthropogenic pollutants. Regional sites are located in proximity to major storm drains or downstream of large developed drainage areas. Subregional sites are identified at the local scale and are intended to treat runoff from neighborhood-size drainage areas.

1.5 Identification Criteria and Methodology

The iWATR GIS Watershed Analysis Tool helped identify retrofit opportunities in the watershed (RBF Consulting, 2010). The GIS tool was used in two steps, each one including a multitude of criteria. The two steps are defined, as follows:

1. The identification of public-owned parcels where structural BMPs could potentially be implemented
2. The assessment of retrofit characteristics and site constraints

1.5.1 Identification of Potential Retrofit Sites

The portion of the Santa Ana River Watershed, which is located in San Bernardino County, was surveyed using the iWATR GIS Watershed Analysis Tool. Several sources of information were integrated into the GIS tool to identify potential retrofit opportunities prior to the initial evaluation of these potential BMP sites. Pieces of information included:

1.1.1.1 *Aerial Imagery Information*

Several aerial photography datasets were accessible through Google Earth: 2009 County of San Bernardino Aerial Photography, 2009 USDA Farm Service Agency Aerial Photography, and 2010 Google Street View Imagery. The datasets were utilized to identify potential BMP locations, as they also provided an understanding of the local land uses, terrain, density of vegetation, physical obstructions, and utilities. The 2010 Google Street View Imagery dataset provided crucial information regarding the general topology of each potential retrofit opportunity site and helped evaluate the slopes for potential BMP placement.

1.1.1.2 *Availability of Publicly Owned Land*

The primary focus of the study was to identify opportunities to retrofit existing conveyance systems, parks, and other recreational areas with water quality protection measures. With this focus and the predominant classification of land in these areas being in the public domain, availability of public parcels were identified. Other concerns included that since the cost of acquiring privately owned land to implement a BMP retrofit project would likely make the project cost-prohibitive, only sites within public ROW or publicly owned land were considered during the identification process. Public parcels including county-owned parcels, municipal parks, and municipal golf courses were provided by the stakeholders in GIS format.

1.1.1.3 *Tributary Area Served*

As discussed previously, the study is focused on sub-regional and regional-level retrofits to take advantage of economies of scale during construction and operation. Public-owned parcels that are adjacent to channels draining for the most part natural tributary drainage area were considered unlikely retrofit opportunities.

1.1.1.4 *Proximity to Existing Drainage Facilities*

A feasibility criterion used in the identification of retrofit opportunities included the minimization of offsite infrastructure improvements, including diversion structures and piping. Thus, sites were limited to those adjacent or close to significant named streams and master planned drainage facilities. Potential sites not directly adjacent to receiving waters or drainage facilities were deemed "close" if there appeared to be sufficient existing public right-of-way to hydraulically connect the site to the nearby drainage facility or receiving water with a modest capital expense. Passive retrofit opportunities were favored in an effort to minimize high operation and maintenance costs associated with the implementation of lift stations. The identification process considered all available storm drain information in GIS or CAD format, which was provided by the different municipalities and agencies in the watershed.

1.1.1.5 *Topography*

The general topography of the drainage area was assessed from the National Geographic Society 20-foot contours. The general topology of each potential retrofit opportunity was evaluated based on the best professional judgment of the actual imagery street view of the considered site, which was accessible from Google Earth. This methodology was considered as the most appropriate since there is a limited amount of large-scale topographic information available in the upper part of the Santa Ana River Watershed. Areas of steep topography could constrain grading and greatly increase the cost of any BMP implemented. Any areas of steep topography on each site were noted, reducing the potential to retain the site as a potential retrofit opportunity.

1.5.2 Retrofit Characteristics and Site Constraints

Upon identification of potential retrofit opportunities with the GIS Watershed Analysis Tool, the GIS tool was also used to determine whether a potential site should be classified as a retrofit opportunity. The GIS Watershed Analysis Tool analyzed several constraints to define an initial list of retrofit opportunities with major constraints eliminating a potential site as a retrofit opportunity. Selection criteria, which were integrated in the initial BMP site selection, include:

1.1.1.6 *Hydraulic Head Constraints*

The general topography of the drainage area was assessed from the National Geographic Society 20-foot contours. The general topology of each potential retrofit opportunity was evaluated based on the best professional judgment of the actual imagery street view of the considered site, which was accessible from Google Earth. This methodology was considered as the most appropriate, since there is a limited amount of large-scale topographic information available in the upper part of the Santa Ana watershed. This methodology was similarly applied to evaluate the available hydraulic head, and thus, the need for a pump station. The available hydraulic head is a critical parameter that determines the applicability of certain types of BMPs, particularly filtration systems.

1.1.1.7 *Environmental Constraints*

Environmental constraints for retrofit opportunities include issues related to endangered species, contaminated soils, sensitive biological areas, and protected habitats. The areas that are concerned by environmental constraints were identified using the corresponding GIS layers that were provided by the County of San Bernardino. The Endangered Species Act may not affect BMP selection as much as design and operation. BMPs, such as sand filters, infiltration basins, and wet ponds, adjacent to designated habitat may require design and operation modifications to prevent potential conflicts between the U.S. Fish and Wildlife Service and the project owner. Certain BMPs, such as wet basins and wetlands, may be very attractive to endangered species, so special care may be needed to discourage the presence of these species or maintenance necessary to proper functioning of the BMP may be prohibited. Each of the proposed sites must be evaluated to identify habitat for threatened and endangered species. If the potential for endangered species exists, the facility design and construction activities need to prevent or minimize impacts to these species or protected habitats.

1.1.1.8 *Utility Interference*

Location of utilities and easements may preclude the construction of a retrofit site even if the surface of the site appears undeveloped. During the desktop survey, a visual assessment of the presence of utilities was made based on the actual imagery street view of the considered site, which was accessible from Google Earth. This assessment relied on observations of the presence of power lines, pipeline markers, and other indications of the presence of buried utilities.

1.1.1.9 *Dual-Use and Aesthetics*

County and city parks play a significant social role in local communities by providing ecological features and entertainment or sport fields in urban environments. Dual-use practices allow the implementation of structural BMPs in such parks while preserving the primary recreational role of the sites. Dual-use practices for parks include, but are not limited to

- (1) grassed extended detention basins providing that the actual field can be excavated or bermed in a cost-effective way while preserving the primary function of the field;
- (2) bioretention areas for landscape purposes; and
- (3) underground media filters.

All county and city parks were evaluated and dual-use retrofit opportunities were noted when available.

Several channels and storm drains in the upper part of the Santa Ana Watershed are located downstream of alluvial fans, hence several existing retarding basins are present in the watershed. Retrofitting some of these retarding basins for water quality is a cost-effective measure that serves both flood control and water quality purposes. Retrofitting retarding basins includes the implementation of a water quality riser and the transformation of the lower geomorphology of the basin for water quality (low-flow channel, multistage basins, and riparian vegetation if needed). All publicly owned retarding basins (except for those located downstream of alluvial fans) were analyzed for potential retrofit opportunities.

Aesthetics are an important criterion for differentiating the use of constructed wetlands and wet basins. Open water is generally considered much more attractive than the dense vegetative growth that occurs in constructed wetlands. Consequently, wet basins are preferred for potential BMP sites that are clearly visible from adjacent neighborhoods, parks, or other public places. Infiltration basins and extended detention basins appear essentially identical to the layman; therefore, aesthetics cannot be used as a selection factor between the two, although these would generally be less aesthetically appealing than wet basins or constructed wetlands.

1.1.1.10 Water Quality Considerations

The purpose for pursuing BMP retrofit opportunities is to address water quality issues that have been identified for a receiving water or watershed. At the identification level of the process, water quality considerations were based on the calculation of the water quality volume (WQV). The volume capacity of each potential retrofit opportunity was compared to the water quality volume as a measure to determine the capacity for the potential BMP site to capture and treat a large portion or the entirety of the tributary drainage area. The water quality volume was computed for each retrofit opportunity based on the Volume-Based BMP Design methodology as defined in Attachment D of the Water Quality Management Plan Template (SBC Stormwater Program, 2005). The water quality is a composite calculation:

$$WQV = \iiint \text{Runoff Coefficient} \circ \text{Drainage Area} \circ \text{Design Rain Event}$$

Composite runoff coefficients integrate the most recent land use layer (SBC, June 2010), as well as the conservative runoff coefficients as defined in the Hydrology Manual (SBC, 1986). For undeveloped areas, a composite runoff coefficient of 0.07 was considered to reflect the steepness of the mountainous undeveloped areas. Similarly, the volume capacity of each retrofit opportunity was computed based on the delineated BMP footprint and an assumed depth of 4 feet. Footprints were drawn based on the best professional judgment to reflect the shape of the recommended BMP. The shape of these footprints is shown in each individual retrofit opportunity exhibit, as listed in Appendix A.

Specific water quality considerations were accounted for when considering each type of treatment BMP. Constructed wetlands and wet basins operate on the same principles and differ primarily in the average depth of water and the amount of vegetation coverage. Water quality performance of the two systems would be expected to be equivalent.

Infiltration basins are clearly superior to extended detention basins for reducing potential impacts of urban runoff to surface waters. Since infiltration basins are “no discharge” systems

for all events up to the design storm, they eliminate all surface water impact. In addition, they help restore the predevelopment hydrology by greatly reducing the runoff volume and frequency of discharges. Infiltration basins, however, have generally limited siting opportunities.

Wet basins, constructed wetlands, and infiltration BMPs provide comparable treatment performance, and provide better treatment performance than extended (dry) detention. Extended detention basins however do provide the additional benefit of flow attenuation.

1.1.1.11 Potential BMPs

A list of potential BMPs for the sites was developed based on the drainage areas for subregional BMPs and regional/watershed BMPs. This list of BMPs is identified in Table 2. For each potential BMP site, specific site information was identified and reviewed. This information encompassed geotechnical information, including hydrologic soil group and depth to groundwater, area available for the BMP footprint, existence of a perennial source of water, existence of woody or dense vegetation, available hydraulic head for certain BMP types, and maintenance access.

Table 2 also identifies the maintenance activities associated with each potential BMP, as well as each BMP's estimated pollutant removal benefit for several common stormwater pollutants: total suspended solids, metals, bacteria, nutrients, and trash.

1.1.1.12 Vector Concerns

The attitudes of local vector control agencies can affect the types of BMPs selected as well as certain design elements. The selection of BMPs that retain a pool of standing water beyond 72 hours in permanent pools or energy dissipation features may be impractical in areas with aggressive mosquito abatement policies. The abatement policies generally differ significantly between even adjacent jurisdictions. Awareness of the potential for mosquito breeding in stormwater control devices and systems currently is not widespread; however, this concern is expanding and needs to be included in the selection and design processes. The desktop survey considered any adjacent residential areas that might be impacted by increased mosquito breeding.

1.1.1.13 Soil Type

Soil type and depth to groundwater are the two primary constraints for siting of infiltration basins. Their use will be limited to those areas underlain by soils of hydrological groups A (sand, loamy sand, or sandy loam soils) and B (silt loam or loam soils), where the groundwater level is at least 10 feet below the proposed basin invert. These devices tend to perform better when there is sufficient dry time between events to allow the system to recover. Consequently, they are not preferred for sites with dry weather flow.

1.1.1.14 Cost

An important consideration in BMP selection is the total cost to construct, operate and maintain the facility (lifecycle cost). Table 1 provides a comparison of the relative costs of the BMP technologies applicable for potential retrofitting, based on a recently completed study by Caltrans to document construction and operation and maintenance costs for BMP sites in Los Angeles and San Diego Counties (Caltrans, 2004). Since the BMPs studied served tributary areas of different sizes, cost data from the study were normalized and adjusted for a drainage area more representative of those considered in this study. Thus, Table 1 provides the relative

construction and operation/maintenance costs (per unit water quality volume) for a hypothetical site of 100 acres with 40% impervious cover. The construction cost does not include land costs or costs associated with design and project administration, as these were not the focus of the Caltrans study. However, for smaller projects (less than \$500,000 construction cost) design/permitting/administration costs are estimated to be about 70% of the project construction cost, and would be about 40% of the project construction cost for larger (greater than \$500,000) projects.

Wet basins were observed to be the most costly facility, especially for maintenance. The much higher maintenance costs were associated with vegetation management to suppress mosquito breeding and that level of maintenance may not be required at every site. This would depend primarily on the visibility of the site from adjacent neighborhoods and the constraints imposed by the local vector control district. Constructed wetlands would be expected to have costs similar to that for the wet basin if land costs are not included, since their footprint would be about twice that required for a wet basin.

Infiltration basins tend to be slightly less expensive than extended detention basins, since, if constructed off-line they have no outlet structure.

Table 1: Relative BMP Construction and Operation Costs

BMP Type	Construction Cost/WQV (\$/ft ³) ^a	Present Value O&M Cost/WQV (\$/ft ³)	Life-Cycle Cost/WQV (\$/ft ³) ^b
Wet Basin ^c	\$ 37	\$13	\$50
Extended Detention	\$17	\$ 2	\$19
Infiltration Basin	\$10	\$ 2	\$12

- a. Adjusted costs are based on the treatment volume from a one-year, 24-hour storm over similar tributary areas of about 5 acres for all BMP types in the table.
- b. Present value of operation and maintenance unit cost (20 years at 4%) plus construction unit cost.
- c. Constructed wetland costs are similar to those for wet basins when land costs are not included, as in this comparison.

1.1.1.15 *Operation and Maintenance Requirements*

Wet Basin

Maintenance requirements of wet basins vary greatly depending on local regulations, aesthetic considerations, the quality of the baseflow that sustains the permanent pool, and climatic considerations. In Southern California, concern about vectors (mosquito breeding, primarily) is a major driver for maintenance. Local vector control agencies typically require annual removal of the majority of the vegetation to allow access to mosquito larvae by mosquito fish. Vegetation harvesting accounted for the vast majority of the 250 hours per year estimated for maintenance activities at a small Caltrans facility that treated runoff from only 4.2 acres (Caltrans, 2004). The vegetation at this site was particularly vigorous because of the high nutrient concentrations in the perennial base flow and the mild climate, which permits growth year round. It should be noted that vegetation harvesting removes nutrients from the system, thus potentially improving the removal of nutrients from stormwater.

Since wet basins are often selected for their aesthetic considerations as well as pollutant removal, they are often sited in areas of high visibility. Consequently, floating litter and debris are removed more frequently than would be required simply to support proper functioning of the pond and outlet, or captured at the basin inlet before reaching the permanent pool.

Operation and maintenance requirements for wet basins and constructed wetlands are similar, and both may require substantial vegetation management to facilitate vector control.

Extended Detention Basin

Routine maintenance activity for an extended detention basin is often thought to consist mostly of sediment and trash and debris removal, and ensuring that the outlet orifices remain free of trash, debris or other blockages. However, these activities may constitute only a small fraction of the maintenance hours. Results from a three-year study by Caltrans (Caltrans, 2004) showed that the largest recurring maintenance activity was vegetation management and routine mowing. The largest absolute number of hours was associated with vector control because of mosquito breeding that occurred in the stilling basins installed as energy dissipaters. Some activities such as major sediment removal were not performed during the study, but based on the amount of sediment accumulation; occurrence of this would be expected only every 10 years or more.

Infiltration Basin

Operation of infiltration basins is subject to more risk than extended detention, despite the similarity in average maintenance cost (Table 1). Changes in soil structure through time can severely reduce infiltration rates and cause failure of the facility. This type of failure can be very difficult to ameliorate. Maintenance of infiltration basins consists primarily of vegetation management, trash/debris, and sediment removal. If clogging occurs, rugging and scarification will be required.

1.6 Potential BMP Types

A preliminary recommendation was provided at each potential retrofit opportunity site based on the evaluation of the criteria defined in Section 2.3. The proposed BMP types for the identified sub-regional and regional sites are listed in the individual Retrofit Site Forms, provided in Appendix B. Recommended BMPs include wet basins, extended detention basins, subsurface wetlands, infiltration basins, bioretention devices, and media filters. If no BMP is listed, a site constraint prevented a BMP from being considered at the site.

Sub-regional BMPs were proposed for sites with the capability of treating neighborhood size areas and regional BMPs were proposed for larger drainage areas and in locations where there was an opportunity to divert water from the major storm drain or channel, treat the water with a BMP, and then discharge back into the storm drain or channel.

Table 2 identifies the maintenance activities associated with each potential BMP, as well as each BMP's estimated pollutant removal benefit for each of the watershed pollutants. The following are descriptions of the BMPs considered and the corresponding prioritized site IDs.

Constructed Wetlands/Wet Basins

Constructed wetlands and wet basins offer wildlife habitat, erosion control, surface water storage, flood control, ground water recharge, and pollutant removal.

Table 2 shows the targeted pollutant removal. Constructed wetlands and wet basins have a permanent pool of water and pollutant removal is achieved through settling and biological uptake of wetland plants. They can be useful in conjunction with other BMPs or they can function independently. Wet ponds or constructed wetlands are more effective for treating drainage areas with substantive perennial flows than the other regional BMPs under consideration. However, there is little or no perennial flow in most channels and creeks of the upper part of the Santa Ana Watershed. Implementation of wet basin opportunities is therefore limited.

Extended Detention Basins

Extended detention basins have outlets designed to detain stormwater runoff from a water quality design storm for a designated period of 48 hours, to allow particles and associated pollutants to settle out of the water column. Unlike wet ponds, these facilities do not have a large permanent pool that is sustained during dry periods. Extended detention ponds can also provide flood control benefits if they are designed to include additional flood detention storage. The upper part of the Santa Ana Watershed contains several flood control basins, which could potentially be retrofitted for water quality by adding an appropriate water quality riser as well as changing the morphology of the lower portion of the basin to mimic the functionality of an extended detention basin.

Bioretention

Bioretention devices function as soil and plant-based filtration devices that remove pollutants through a variety of physical, biological, and chemical treatment processes. The mulch layer is believed to play a significant role in the efficiency of these devices, with nearly all of the metals removal occurring within the top few inches of the bioretention system. Heavy metals accumulate in the organic matter in this layer. In addition, these systems have demonstrated high efficiencies for nutrient removal. Phosphorus removal appears to increase linearly with depth and reaches a maximum of approximately 80% by about 2 to 3 feet in depth. The likely mechanism for phosphorus removal is through sorption onto aluminum, iron, and clay minerals in the soil.

Media Filters

Media filters are structural BMPs designed to remove sediment and other pollutants from the first flush of runoff after a rainfall or storm event. Media filters are usually constructed underground and, as flow-based treatment BMPs, can be implemented in small footprints. Pollutant removal occurs in two acts with a preliminary settling of coarse sediments on the filter bed followed by a filtration of pollutants within the matrix of the media. The media is typically composed of sand mixtures. However, these BMPs are associated with high levels of required maintenance and usually require a minimum hydraulic head of 3 feet, which limits the implementation of such devices in flat areas.

Infiltration Basins

Infiltration basins are structural BMPs used to remove pollutants and to infiltrate stormwater through surrounding soil. Infiltration basin facilities are built within highly permeable soils that provide temporary storage of stormwater runoff and do not typically include a structural outlet. Pollutant removal occurs through filtration, as well as biological and chemical reactions within the soil matrix.

The selection of a particular BMP for an identified retrofit site will depend upon the main purpose for the BMP at that site. Each of the potential retrofit sites will need to be evaluated for their specific purpose, which may include TMDL implementation, hydromodification management, offsite mitigation for Low Impact Development (LID), or general water quality improvement. Because different BMPs are better suited for each of these purposes, the potential BMPs for implementation at each site have been identified without selecting a preferred BMP. The potential BMPs that are feasible for each site are identified in Table 3 as some potential retrofit sites have site constraints that preclude certain BMPs from being implemented at that site.

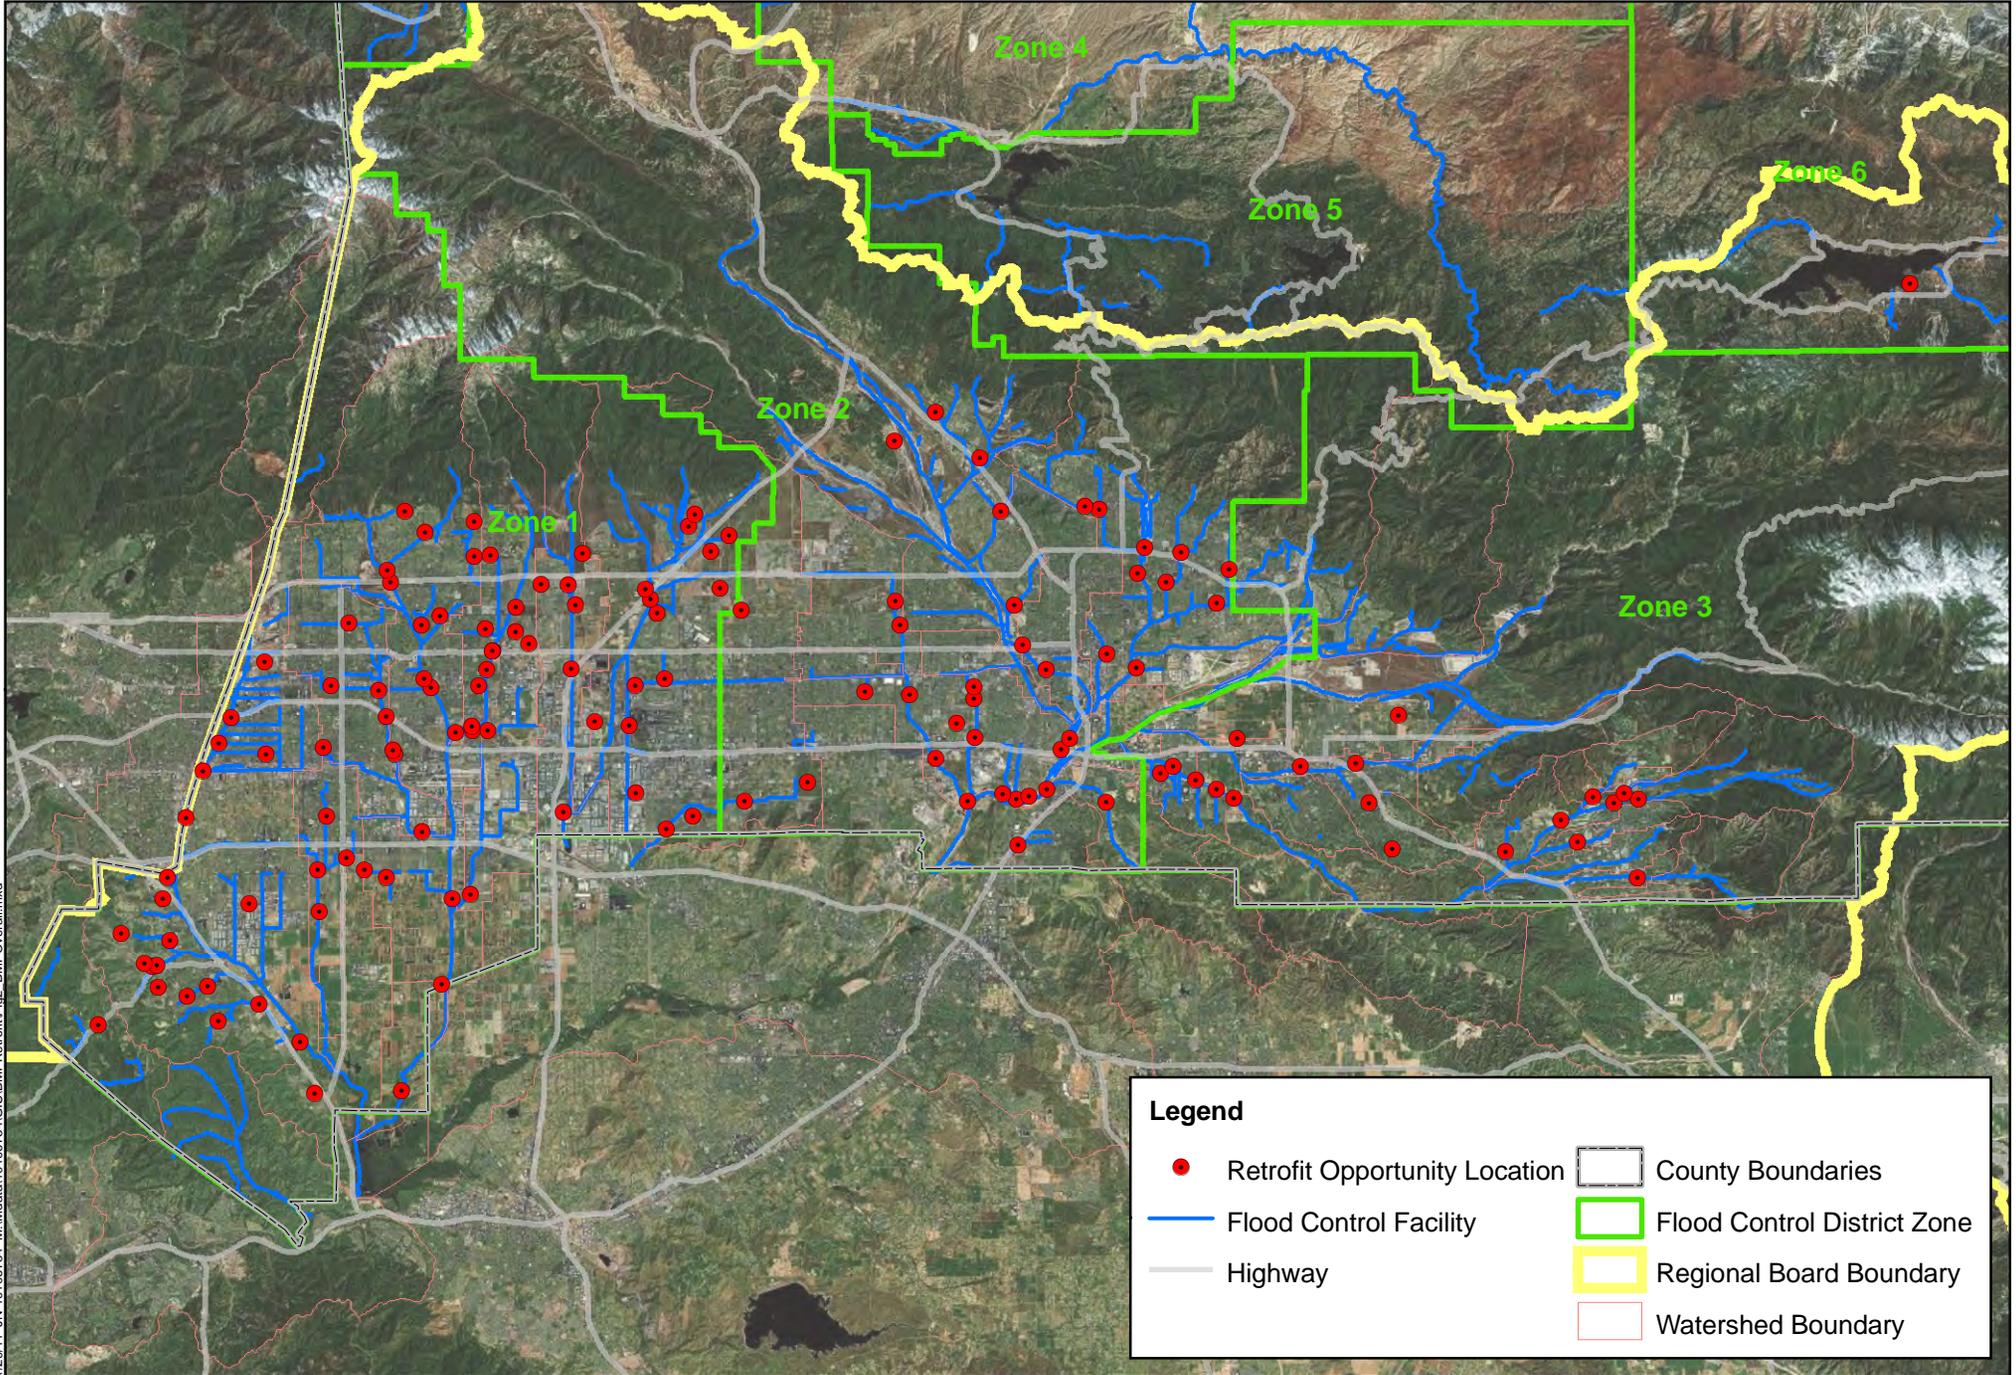

1.7 Results of the Identification Process

The iWATR GIS Watershed Assessment Tool helped identify 142 retrofit opportunities in the portion of Santa Ana River Watershed that is located in San Bernardino County. The GIS tool performed a desktop survey of public-owned parcels that encompass open or available space in proximity to storm drain infrastructures for retrofit opportunities. Publicly owned parcels that were considered included the existing conveyance systems, parks, and recreational areas. The iWATR GIS Watershed Assessment Tool determined the high potential for infiltration in the watershed, as the majority of soils are classified in hydrologic groups A and B. Infiltration basins were only considered for regional sites, as most subregional sites require flow-based BMPs or dual-use practices if implemented in parks. The identification process also integrated the necessity to reduce lifecycle costs and promote cost-effective BMPs for each retrofit opportunity by minimizing the use of pump stations and long conveyance systems. Figure 3 shows the geographic distribution of retrofit opportunities in the Santa Ana River Watershed. Retrofit opportunities are distributed as follows: 84 sites in Zone 1, 37 in Zone 2, 18 in Zone 3, and 1 in Zone 6.

Table 3 lists all the retrofit opportunities that were identified in the watershed, as well as the associated attributes to each potential site. The attributes that are provided for each retrofit opportunity are:

1. Site ID
2. Location information such as longitude and latitude coordinates and flood zone
3. Parcel ownership and jurisdiction
4. Footprint of the potential BMP
5. Tributary drainage area
6. Water quality volume
7. Percentage of treated tributary drainage area considering volume-based BMPs and a detention depth of 4 feet
8. Potential BMP types

Conceptual exhibits that show the conceptual footprint, the inlet and outlet pipes, and an aerial imagery were also created for each identified retrofit opportunity. Site forms were developed for each identified retrofit opportunity and with the noted constraints, as defined in Section 1.5.2 of this report. Conceptual exhibits and site forms are provided in Appendix A and Appendix B, respectively.

2 FUTURE STEPS AND RETROFIT STUDY RECOMMENDATIONS

The purpose of the system-wide evaluation was to identify opportunities to retrofit the existing conveyance systems, parks, and other recreational areas with water quality protection measures. The desktop investigation identified 144 sites potential BMP retrofit sites. The next step in the retrofit process is to evaluate the sites to identify their specific purpose. The purpose of each site will need to be evaluated in the context of the water quality improvement needs of the sub-watershed and watershed. These needs may include TMDL implementation, hydromodification management, offsite mitigation for LID, or general water quality improvement. Evaluation of these needs should come in the form of specific individual retrofit studies focused on 1) TMDLs; 2) Hydromodification Management; and 3) the LID Offset Program.

TMDL Retrofit Study

A study should be developed that assesses the potential retrofit sites that were identified for the ability to help achieve TMDL compliance. TMDLs within the permitted area that have been adopted or that are likely to be adopted within the current permit term should be evaluated to identify if regional structural BMPs will help with meeting wasteload allocations assigned to the Permittees. If structural BMPs are identified to be part of or potentially part of a TMDL Implementation Plan the potential retrofit sites that were identified should be evaluated, and potential BMP implementation scenarios should be developed. These implementation scenarios should be prioritized based on the level of TMDL compliance the scenario would achieve and the feasibility of constructing the BMPs.

Hydromodification Management Retrofit Study

After the development of the Hydromodification Management Plan as part of Phase 2 of the WAP, the development of a study to assess if the identified retrofit sites can assist with hydromodification management should be evaluated. If it is found that a study to assess the retrofit sites for hydromodification management is needed, a study assessing each of the identified retrofit sites for hydromodification management should be performed. This study will assess each identified retrofit site for its ability to assist in reducing the affects of hydromodification in the permitted area of the watershed.

LID Offset Program Retrofit Study

Section XI.E.10 of the San Bernardino MS4 permit identifies that if conditions exist at a development site where infiltration, harvesting and use, and/or evapotranspiration, and or bio-treatment is not feasible LID can be implemented on either a sub-regional or regional basis. A study should be developed to assess each of the identified retrofit sites feasibility to serve as an offset project for LID implementation. This study should incorporate forecasting development for each sub-watershed in the permitted area and the development of regional and sub-regional LID project scenarios for each sub-watershed consistent with the forecast of development. These LID project implementation scenarios should be prioritized based on water quality benefit and feasibility of constructing the LID BMPs.

Once these retrofit studies are performed and the needs of the sub-watersheds and watershed are identified, they can be prioritized. Once the studies are complete, the BMPs that best meet the prioritized need can be selected for the identified BMP retrofit sites. The next step would be to prioritize the identified sites for potential implementation. Suitability, constructability, and

performance of each individual site and the needs assessment may be evaluated during the prioritization process. A non-exhaustive list of factors that may be included in the prioritization process is as follows:

- Ability to accommodate a BMP with best pollutant removal capability for the pollutants of concern
- Ability to accommodate a BMP for the specific needs of the site per the needs assessment
- Tributary drainage area treated
- Pollutant removal
- Planning and constructability
- Reduction of environmental impact
- BMP maintenance considerations
- Lifecycle Cost

Pollutant removal and hydromodification reduction impacts may be evaluated through the development of water quality/watershed modeling to provide a better understanding of the benefits that different BMP placement strategies will have upon receiving waters. The locations that will provide the greatest water quality and watershed benefits can then be identified and prioritized for construction.

Before final selection and implementation of these identified potential retrofit locations can occur, a project-specific detailed design and engineering analysis must be accomplished to demonstrate that the original uses (such as flood control and drainage) of the facility will not be compromised. Cost estimating, environmental assessment, and regulatory permit work must also be conducted, and property or lease restrictions must be investigated to ensure that there are no requirements that would preclude implementation of a potential BMP retrofit project (e.g., a park parcel with narrowly defined recreational use restrictions).

APPENDIX B
RETROFIT OPPORTUNITY SITE FORMS

Site No.	11001310		Acceptable BMP Options
Route	E D St at N Grove Ave		
Member Initials	RC		
Direction	WB		
Cross Street	Grove Ave		
BMP Type	Subregional		EXTENDED DETENTION BASIN
Flood Zone	Zone 1		MEDIA FILTER
Owner	San Bernardino County Flood Control		
Conclusion			BIORETENTION
Requirement	Answer	BMP Criteria No.	Explanation
Regional BMP Being Considered?	N	Infiltration Basin Wet Basin/Constructed Wetland EDB Sub Surface Flow Wetland	
Subregional BMP being Considered?	Y	Wet Basin/Constructed Wetland EDB Media Filter Bioretention	Diversion of SD runoff to concrete channel
Does enough head exist that emergency riser/spillway can tie into a downstream drainage facility?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Does ≥ 2ft of hydraulic head exist?	Y	Bioretention	
Does ≥ 3ft of hydraulic head exist?	Y	Media Filter	
Does the site have 4H:1V slope or flatter?	Y	Infiltration Basin Wet Basin Constructed Wetland	
How much width available?	30 ft	Bioretention	15 ft min for bioretention
How much length available?	70 ft	Bioretention	40 ft min for bioretention
Total Area available	2100 sf	Media Filter Wet Basin Constructed Wetland	minimum 1000 sf needed for media filter, wet basin, constructed wetland
Is BMP footprint at least 100 ft from bridges and wells, and at least 20 ft from buildings, slopes or pavement?	N	Infiltration Basin	
Is site accessible for maintenance?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Is there a permanent Source of Water?	N	Wet Basin Constructed Wetland	to be verified
If IFD is proposed, can dry weather flows be diverted around?	N	Infiltration Basin	
Is GW more than 10 ft Below BMP Invert?	Y	EDB Media Filter Wet Basin Bioretention	Groundwater Level: 375ft
Are there fill materials?		Infiltration Basin	
Are there known environmental issues?	N	Infiltration Basin	
Are restrictive soil layers present?	N	Infiltration Basin	
Is hydrologic soil group A or B?	Y	Infiltration Basin	A or B needed for IFD
Landuse	Mixed		Soil Group is A
Pump Station	Y		depending on grade elevation

Site No.	11005159		Acceptable BMP Options
Route	E D St at N Grove Ave		INFILTRATION BASIN
Member Initials	RC		
Direction	EB		WET BASIN
Parcels	11005159		CONSTRUCTED WETLAND
BMP Type	Regional		EXTENDED DETENTION BASIN
Flood Zone	Zone 1		
Owner	San Bernardino County Flood Control		
Conclusion			
Requirement	Answer	BMP Criteria No.	Explanation
Regional BMP Being Considered?	Y	Infiltration Basin Wet Basin/Constructed Wetland EDB Sub Surface Flow Wetland	Flood Control Park - Enlargement of channel or pump station configuration
Subregional BMP being Considered?	N	Wet Basin/Constructed Wetland EDB Media Filter Bioretention	
Does enough head exist that emergency riser/spillway can tie into a downstream drainage facility?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Does ≥ 2ft of hydraulic head exist?	Y	Bioretention	
Does ≥ 3ft of hydraulic head exist?	Y	Media Filter	
Does the site have 4H:1V slope or flatter?		Infiltration Basin Wet Basin Constructed Wetland	to be verified
How much width available?	265 ft	Bioretention	15 ft min for bioretention
How much length available?	350 ft	Bioretention	40 ft min for bioretention
Total Area available	92750 sf	Media Filter Wet Basin Constructed Wetland	minimum 1000 sf needed for media filter, wet basin, constructed wetland
Is BMP footprint at least 100 ft from bridges and wells, and at least 20 ft from buildings, slopes or pavement?	Y	Infiltration Basin	
Is site accessible for maintenance?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Is there a permanent Source of Water?	Y	Wet Basin Constructed Wetland	to be verified
If IFD is proposed, can dry weather flows be diverted around?	Y	Infiltration Basin	
Is GW more than 10 ft Below BMP Invert?	Y	EDB Media Filter Wet Basin Bioretention	Groundwater Level: 375ft
Are there fill materials?		Infiltration Basin	
Are there known environmental issues?	N	Infiltration Basin	
Are restrictive soil layers present?	N	Infiltration Basin	
Is hydrologic soil group A or B?	Y	Infiltration Basin	A or B needed for IFD
Landuse	Mixed		Soil Group is A
Pump Station	Y		Depending on chosen configuration

Site No.	11031112		Acceptable BMP Options
Route	E 7th St at Virginia Ave		INFILTRATION BASIN
Member Initials	RC		
Direction	EB		
Parcels	011031106_12_29_30_31_42_021016113_14_021040104		
BMP Type	Regional		EXTENDED DETENTION BASIN
Flood Zone	Zone 1		
Owner	San Bernardino County Flood Control		
Conclusion			
Requirement	Answer	BMP Criteria No.	Explanation
Regional BMP Being Considered?	Y	Infiltration Basin Wet Basin/Constructed Wetland EDB Sub Surface Flow Wetland	
Subregional BMP being Considered?	N	Wet Basin/Constructed Wetland EDB Media Filter Bioretention	
Does enough head exist that emergency riser/spillway can tie into a downstream drainage facility?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Does ≥ 2ft of hydraulic head exist?	Y	Bioretention	
Does ≥ 3ft of hydraulic head exist?	Y	Media Filter	
Does the site have 4H:1V slope or flatter?	Y	Infiltration Basin Wet Basin Constructed Wetland	to be verified
How much width available?	670 ft	Bioretention	15 ft min for bioretention
How much length available?	2000 ft	Bioretention	40 ft min for bioretention
Total Area available	1340000 sf	Media Filter Wet Basin Constructed Wetland	minimum 1000 sf needed for media filter, wet basin, constructed wetland
Is BMP footprint at least 100 ft from bridges and wells, and at least 20 ft from buildings, slopes or pavement?	Y	Infiltration Basin	
Is site accessible for maintenance?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Is there a permanent Source of Water?	N	Wet Basin Constructed Wetland	to be verified
If IFD is proposed, can dry weather flows be diverted around?	Y	Infiltration Basin	creation of low-flow channel
Is GW more than 10 ft Below BMP Invert?	Y	EDB Media Filter Wet Basin Bioretention	Groundwater Level: 375ft
Are there fill materials?		Infiltration Basin	
Are there known environmental issues?	N	Infiltration Basin	
Are restrictive soil layers present?	N	Infiltration Basin	
Is hydrologic soil group A or B?	Y	Infiltration Basin	A or B needed for IFD
Landuse	Mixed		A&B soils
Pump Station	N

Requirement	Answer	BMP Criteria No.	Explanation Comments
Regional BMP Being Considered?	Y	Infiltration Basin Wet Basin/Constructed Wetland EDB Sub Surface Flow Wetland	Two options are available: (1) divert/pump flow from channel (2) treat runoff from residential SD
Subregional BMP being Considered?	Y	Wet Basin/Constructed Wetland EDB Media Filter Bioretention	
Does enough head exist that emergency riser/spillway can tie into a downstream drainage facility?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Does ≥ 2ft of hydraulic head exist?	Y	Bioretention	tbd
Does ≥ 3ft of hydraulic head exist?	Y	Media Filter	tbd
Does the site have 4H:1V slope or flatter?	Y	Infiltration Basin Wet Basin Constructed Wetland	to be verified
How much width available?	40 ft	Bioretention	15 ft min for bioretention site-specific
How much length available?	180 ft	Bioretention	40 ft min for bioretention
Total Area available	7200 sf	Media Filter Wet Basin Constructed Wetland	minimum 1000 sf needed for media filter, wet basin, constructed wetland
Is BMP footprint at least 100 ft from bridges and wells, and at least 20 ft from buildings, slopes or pavement?	N	Infiltration Basin	
Is site accessible for maintenance?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Is there a permanent Source of Water?	N	Wet Basin Constructed Wetland	to be verified
If IFD is proposed, can dry weather flows be diverted around?	N	Infiltration Basin	
Is GW more than 10 ft Below BMP Invert?		EDB Media Filter Wet Basin Bioretention	tbd
Are there fill materials?	N	Infiltration Basin	
Are there known environmental issues?	Y/N	Infiltration Basin	Sand Fly
Are restrictive soil layers present?	N	Infiltration Basin	
Is hydrologic soil group A or B?	A	Infiltration Basin	A or B needed for IFD
Landuse	Mixed		
Pump Station	Y		Depending on configuration

Site No.	26203115		Acceptable BMP Options

Requirement	Answer	BMP Criteria No.	Explanation Comments
Regional BMP Being Considered?	Y	Infiltration Basin Wet Basin/Constructed Wetland EDB Sub Surface Flow Wetland	Two options are available: (1) divert/pump flow from channel (2) treat runoff from residential SD
Subregional BMP being Considered?	Y	Wet Basin/Constructed Wetland EDB Media Filter Bioretention	
Does enough head exist that emergency riser/spillway can tie into a downstream drainage facility?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Does ≥ 2ft of hydraulic head exist?	Y	Bioretention	tbd
Does ≥ 3ft of hydraulic head exist?	Y	Media Filter	tbd
Does the site have 4H:1V slope or flatter?	Y	Infiltration Basin Wet Basin Constructed Wetland	to be verified
How much width available?	500 ft	Bioretention	15 ft min for bioretention site-specific
How much length available?	700 ft	Bioretention	40 ft min for bioretention
Total Area available	350000 sf	Media Filter Wet Basin Constructed Wetland	minimum 1000 sf needed for media filter, wet basin, constructed wetland
Is BMP footprint at least 100 ft from bridges and wells, and at least 20 ft from buildings, slopes or pavement?	Y	Infiltration Basin	
Is site accessible for maintenance?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Is there a permanent Source of Water?	N	Wet Basin Constructed Wetland	to be verified
If IFD is proposed, can dry weather flows be diverted around?	Y	Infiltration Basin	
Is GW more than 10 ft Below BMP Invert?	Y	EDB Media Filter Wet Basin Bioretention	tbd
Are there fill materials?	N	Infiltration Basin	tbd
Are there known environmental issues?	N	Infiltration Basin	
Are restrictive soil layers present?	N	Infiltration Basin	
Is hydrologic soil group A or B?	A	Infiltration Basin	A or B needed for IFD
Landuse	Mixed		
Pump Station	N		Depending on configuration

Site No.	30315136		Acceptable BMP Options
Route	Santa Ana River Lateral		INFILTRATION BASIN

Conclusion			BIORETENTION
Requirement	Answer	BMP Criteria No.	Explanation Comments
Regional BMP Being Considered?	Y	Infiltration Basin Wet Basin/Constructed Wetland EDB Sub Surface Flow Wetland	Divert flow from existing SD (W 11th St) to basin. Discharge to Arrow Route SD. Diversion box on SD.
Subregional BMP being Considered?	Y	Wet Basin/Constructed Wetland EDB Media Filter Bioretention	
Does enough head exist that emergency riser/spillway can tie into a downstream drainage facility?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Does ≥ 2ft of hydraulic head exist?	Y	Bioretention	tbd
Does ≥ 3ft of hydraulic head exist?	Y	Media Filter	tbd
Does the site have 4H:1V slope or flatter?	Y	Infiltration Basin Wet Basin Constructed Wetland	
How much width available?	230 ft	Bioretention	15 ft min for bioretention
How much length available?	540 ft	Bioretention	40 ft min for bioretention Footprint can be extended.
Total Area available	124200 sf	Media Filter Wet Basin Constructed Wetland	minimum 1000 sf needed for media filter, wet basin, constructed wetland
Is BMP footprint at least 100 ft from bridges and wells, and at least 20 ft from buildings, slopes or pavement?	Y	Infiltration Basin	
Is site accessible for maintenance?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Is there a permanent Source of Water?	N	Wet Basin Constructed Wetland	unlikely
If IFD is proposed, can dry weather flows be diverted around?	Y	Infiltration Basin	diversion box or low-flow channel
Is GW more than 10 ft Below BMP Invert?	Y	EDB Media Filter Wet Basin Bioretention	Groundwater Level: 550ft
Are there fill materials?		Infiltration Basin	
Are there known environmental issues?	N	Infiltration Basin	
Are restrictive soil layers present?	N	Infiltration Basin	
Is hydrologic soil group A or B?	Y	Infiltration Basin	A or B needed for IFD Soil Group A
Landuse	Residential		
Pump Station	N		Possible / Verify SD invert

Is hydrologic soil group A or B?	Y	Infiltration Basin	A or B needed for IFD
Landuse	Mixed		
Pump Station	N		to be verified - depending on invert elevation

Site No.	103309117		Acceptable BMP Options
Route	Brookwood Ln and Butterfly Ranch Rd		
Member Initials	RC		
Direction	SB		
Parcels	103309117		
BMP Type	Subregional		EXTENDED DETENTION BASIN
Flood Zone	Zone 1		MEDIA FILTER
Owner	County Service Area 70 Imp Zone CH		
Conclusion			BIORETENTION
Requirement	Answer	BMP Criteria No.	Explanation Comments
Regional BMP Being Considered?	N	Infiltration Basin Wet Basin/Constructed Wetland EDB Sub Surface Flow Wetland	
Subregional BMP being Considered?	Y	Wet Basin/Constructed Wetland EDB Media Filter Bioretention	Existing metaswale to be retrofitted / Online structural BMP
Does enough head exist that emergency riser/spillway can tie into a downstream drainage facility?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Does ≥ 2ft of hydraulic head exist?	Y	Bioretention	to be verified
Does ≥ 3ft of hydraulic head exist?	Y	Media Filter	to be verified
Does the site have 4H:1V slope or flatter?	Y	Infiltration Basin Wet Basin Constructed Wetland	
How much width available?	90 ft	Bioretention	15 ft min for bioretention
How much length available?	800 ft	Bioretention	40 ft min for bioretention
Total Area available	72000 sf	Media Filter Wet Basin Constructed Wetland	minimum 1000 sf needed for media filter, wet basin, constructed wetland
Is BMP footprint at least 100 ft from bridges and wells, and at least 20 ft from buildings, slopes or pavement?	N	Infiltration Basin	
Is site accessible for maintenance?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Is there a permanent Source of Water?	N	Wet Basin Constructed Wetland	
If IFD is proposed, can dry weather flows be diverted around?		Infiltration Basin	
Is GW more than 10 ft Below BMP Invert?		EDB Media Filter Wet Basin Bioretention	Unknown
Are there fill materials?		Infiltration Basin	
Are there known environmental issues?	N	Infiltration Basin	
Are restrictive soil layers present?	N	Infiltration Basin	
Is hydrologic soil group A or B?	Y	Infiltration Basin	A or B needed for IFD Soil Group B
Landuse	Mixed		
Pump Station	N

Direction	EB		
Cross Street	De Berry Street		
BMP Type	Regional / Subregional		EXTENDED DETENTION BASIN
Flood Zone	Zone 2		MEDIA FILTER
Owner	San Bernardino County Flood Control		
Conclusion			BIORETENTION
Requirement	Answer	BMP Criteria No.	Explanation
Regional BMP Being Considered?	Y	Infiltration Basin Wet Basin/Constructed Wetland EDB Sub Surface Flow Wetland	Two options are available: (1) divert/pump flow from channel (2) treat runoff from residential SD
Subregional BMP being Considered?	Y	Wet Basin/Constructed Wetland EDB Media Filter Bioretention	
Does enough head exist that emergency riser/spillway can tie into a downstream drainage facility?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Does ≥ 2ft of hydraulic head exist?	Y	Bioretention	tbd
Does ≥ 3ft of hydraulic head exist?	Y	Media Filter	tbd
Does the site have 4H:1V slope or flatter?	Y	Infiltration Basin Wet Basin Constructed Wetland	to be verified
How much width available?	35 ft	Bioretention	15 ft min for bioretention
How much length available?	300 ft	Bioretention	40 ft min for bioretention
Total Area available	10500 sf	Media Filter Wet Basin Constructed Wetland	minimum 1000 sf needed for media filter, wet basin, constructed wetland
Is BMP footprint at least 100 ft from bridges and wells, and at least 20 ft from buildings, slopes or pavement?	Y	Infiltration Basin	
Is site accessible for maintenance?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Is there a permanent Source of Water?	N	Wet Basin Constructed Wetland	to be verified
If IFD is proposed, can dry weather flows be diverted around?	Y	Infiltration Basin	
Is GW more than 10 ft Below BMP Invert?		EDB Media Filter Wet Basin Bioretention	tbd
Are there fill materials?		Infiltration Basin	tbd
Are there known environmental issues?	N	Infiltration Basin	
Are restrictive soil layers present?	Y	Infiltration Basin	
Is hydrologic soil group A or B?	C	Infiltration Basin	A or B needed for IFD
Landuse	Mixed		
Pump Station	Y		Depending on configuration

Site No.	7th Street Park		Acceptable BMP Options
Route	Santa Ana River Lateral		INFILTRATION BASIN

Parcels	Cypress Trails Park - City of Chino		
BMP Type	Regional		EXTENDED DETENTION BASIN
Flood Zone	Zone 1		
Owner	City of Chino		
Conclusion			
Requirement	Answer	BMP Criteria No.	Explanation
Regional BMP Being Considered?	Y	Infiltration Basin Wet Basin/Constructed Wetland EDB Sub Surface Flow Wetland	Pump concentrated flow from Cypress Channel or from Rancho del Chino SD (81-1). Dual use basin with riser. After treatment, discharge to channel. Weather station. Verify TDA/Footprint
Subregional BMP being Considered?	N	Wet Basin/Constructed Wetland EDB Media Filter Bioretention	
Does enough head exist that emergency riser/spillway can tie into a downstream drainage facility?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Does ≥ 2ft of hydraulic head exist?	Y	Bioretention	tbd
Does ≥ 3ft of hydraulic head exist?	Y	Media Filter	tbd
Does the site have 4H:1V slope or flatter?	Y	Infiltration Basin Wet Basin Constructed Wetland	
How much width available?	170 ft	Bioretention	15 ft min for bioretention
How much length available?	420 ft	Bioretention	40 ft min for bioretention
Total Area available	71400 sf	Media Filter Wet Basin Constructed Wetland	minimum 1000 sf needed for media filter, wet basin, constructed wetland
Is BMP footprint at least 100 ft from bridges and wells, and at least 20 ft from buildings, slopes or pavement?	Y	Infiltration Basin	
Is site accessible for maintenance?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Is there a permanent Source of Water?	N	Wet Basin Constructed Wetland	unlikely
If IFD is proposed, can dry weather flows be diverted around?	Y	Infiltration Basin	diversion box / weather-station
Is GW more than 10 ft Below BMP Invert?		EDB Media Filter Wet Basin Bioretention	Groundwater Level: 150ft
Are there fill materials?		Infiltration Basin	
Are there known environmental issues?	N	Infiltration Basin	
Are restrictive soil layers present?	N	Infiltration Basin	
Is hydrologic soil group A or B?	Y	Infiltration Basin	A or B needed for IFD
Landuse	Residential		Soil Group B
Pump Station	Y		Most likely / Verify SD invert

Site No.	DayCreek_RC		Acceptable BMP Options
Route	Day Creek Blvd at Banyan St		
Member Initials	RC		
Direction	NB		
Parcels	Day Creek Park - City of Rancho Cucamonga		
BMP Type	Subregional		EXTENDED DETENTION BASIN
Flood Zone	Zone 1		MEDIA FILTER
Owner	City of Rancho Cucamonga		
Conclusion			BIORETENTION
Requirement	Answer	BMP Criteria No.	Explanation
Regional BMP Being Considered?	N	Infiltration Basin Wet Basin/Constructed Wetland EDB Sub Surface Flow Wetland	
Subregional BMP being Considered?	Y	Wet Basin/Constructed Wetland EDB Media Filter Bioretention	Divert/Pump flow from existing SD (from Day Creek Blvd) - Offline with SD - Verify TDA
Does enough head exist that emergency riser/spillway can tie into a downstream drainage facility?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Does ≥ 2ft of hydraulic head exist?	Y	Bioretention	tbd
Does ≥ 3ft of hydraulic head exist?	Y	Media Filter	tbd
Does the site have 4H:1V slope or flatter?	Y	Infiltration Basin Wet Basin Constructed Wetland	
How much width available?	70 ft	Bioretention	15 ft min for bioretention
How much length available?	190 ft	Bioretention	40 ft min for bioretention
Total Area available	13300 sf	Media Filter Wet Basin Constructed Wetland	minimum 1000 sf needed for media filter, wet basin, constructed wetland
Is BMP footprint at least 100 ft from bridges and wells, and at least 20 ft from buildings, slopes or pavement?	Y	Infiltration Basin	
Is site accessible for maintenance?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Is there a permanent Source of Water?	N	Wet Basin Constructed Wetland	to be verified
If IFD is proposed, can dry weather flows be diverted around?	Y	Infiltration Basin	Weather station
Is GW more than 10 ft Below BMP Invert?		EDB Media Filter Wet Basin Bioretention	Unknown
Are there fill materials?		Infiltration Basin	
Are there known environmental issues?	N	Infiltration Basin	Riversidian Alluvial Sage Scrub ; San Bernardino Kangaroo Rat
Are restrictive soil layers present?	N	Infiltration Basin	
Is hydrologic soil group A or B?	Y	Infiltration Basin	A or B needed for IFD
Landuse	Residential		Soil Group A
Pump Station	N		Possibly / Verify SD invert

Site No.	Elmer Digneo Park		Acceptable BMP Options
Route	Santa Ana River Lateral		INFILTRATION BASIN
Member Initials	JH		
Direction	WB		
Cross Street	Anderson St		
BMP Type	Regional / Subregional		EXTENDED DETENTION BASIN
Flood Zone	Zone 3		MEDIA FILTER
Owner	San Bernardino County Flood Control		
Conclusion			BIORETENTION
Requirement	Answer	BMP Criteria No.	Explanation
Regional BMP Being Considered?	Y	Infiltration Basin Wet Basin/Constructed Wetland EDB Sub Surface Flow Wetland	
Subregional BMP being Considered?	Y	Wet Basin/Constructed Wetland EDB Media Filter Bioretention	Two options are available: (1) divert/pump flow from channel (2) treat runoff from residential SD
Does enough head exist that emergency riser/spillway can tie into a downstream drainage facility?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Does ≥ 2ft of hydraulic head exist?	Y	Bioretention	tbd
Does ≥ 3ft of hydraulic head exist?	Y	Media Filter	tbd
Does the site have 4H:1V slope or flatter?	Y	Infiltration Basin Wet Basin Constructed Wetland	to be verified
How much width available?	150 ft	Bioretention	15 ft min for bioretention
How much length available?	400 ft	Bioretention	40 ft min for bioretention
Total Area available	60000 sf	Media Filter Wet Basin Constructed Wetland	minimum 1000 sf needed for media filter, wet basin, constructed wetland
Is BMP footprint at least 100 ft from bridges and wells, and at least 20 ft from buildings, slopes or pavement?	Y	Infiltration Basin	
Is site accessible for maintenance?	Y	Infiltration Basin Wet Basin EDB Media Filter	to be verified
Is there a permanent Source of Water?	N	Wet Basin Constructed Wetland	to be verified
If IFD is proposed, can dry weather flows be diverted around?	Y	Infiltration Basin	
Is GW more than 10 ft Below BMP Invert?		EDB Media Filter Wet Basin Bioretention	tbd
Are there fill materials?	N	Infiltration Basin	tbd
Are there known environmental issues?	N	Infiltration Basin	
Are restrictive soil layers present?	N	Infiltration Basin	
Is hydrologic soil group A or B?	B	Infiltration Basin	A or B needed for IFD
Landuse	Mixed		
Pump Station	N		Depending on configuration

Site No.	English_CH		Acceptable BMP Options
Route	Chino Hills Pkwy at Grand Ave		
Member Initials	RC		
Direction	SB		
Parcels	English Springs Park		CONSTRUCTED WETLAND
BMP Type	Regional/Subregional		
Flood Zone	Zone 1		
Owner	City of Chino Hills		
Conclusion			
Requirement	Answer	BMP Criteria No.	Explanation
Regional BMP Being Considered?	N	Infiltration Basin Wet Basin/Constructed Wetland EDB Sub Surface Flow Wetland	
Subregional BMP being Considered?	Y	Wet Basin/Constructed Wetland EDB Media Filter Bioretention	Retrofit of existing pond for WQ.
Does enough head exist that emergency riser/spillway can tie into a downstream drainage facility?	N	Infiltration Basin Wet Basin EDB Media Filter	
Does ≥ 2ft of hydraulic head exist?	N	Bioretention	See configuration
Does ≥ 3ft of hydraulic head exist?		Media Filter	See configuration
Does the site have 4H:1V slope or flatter?		Infiltration Basin Wet Basin Constructed Wetland	to be verified
How much width available?	160 ft	Bioretention	15 ft min for bioretention
How much length available?	540 ft	Bioretention	40 ft min for bioretention
Total Area available	86400 sf	Media Filter Wet Basin Constructed Wetland	minimum 1000 sf needed for media filter, wet basin, constructed wetland
Is BMP footprint at least 100 ft from bridges and wells, and at least 20 ft from buildings, slopes or pavement?	Y	Infiltration Basin	
Is site accessible for maintenance?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Is there a permanent Source of Water?	Y	Wet Basin Constructed Wetland	to be verified
If IFD is proposed, can dry weather flows be diverted around?	N	Infiltration Basin	existing pond
Is GW more than 10 ft Below BMP Invert?		EDB Media Filter Wet Basin Bioretention	Unknown
Are there fill materials?		Infiltration Basin	
Are there known environmental issues?	N	Infiltration Basin	
Are restrictive soil layers present?	N	Infiltration Basin	
Is hydrologic soil group A or B?	Y	Infiltration Basin	A or B needed for IFD
Landuse	Residential		Soil Group B
Pump Station	N		Unlikely / to be verified

Site No.	Fern_U		Acceptable BMP Options
Route	W 8th St at San Antonio Ave		INFILTRATION BASIN
Member Initials	RC		
Direction	WB		
Parcels	Fern Reservoir Park - City of Upland		
BMP Type	Regional/Subregional		EXTENDED DETENTION BASIN
Flood Zone	Zone 1		MEDIA FILTER
Owner	City of Upland		
Conclusion			BIORETENTION
Requirement	Answer	BMP Criteria No.	Explanation
Regional BMP Being Considered?	Y	Infiltration Basin Wet Basin/Constructed Wetland EDB Sub Surface Flow Wetland	Divert concentrated flow from existing SD (W 8th St) to Fern Reservoir Park. Add berm to or lower existing field. Diversion box with weather/rainfall - Verify TDA/footprint
Subregional BMP being Considered?	Y	Wet Basin/Constructed Wetland EDB Media Filter Bioretention	
Does enough head exist that emergency riser/spillway can tie into a downstream drainage facility?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Does ≥ 2ft of hydraulic head exist?	Y	Bioretention	tbd
Does ≥ 3ft of hydraulic head exist?	Y	Media Filter	tbd
Does the site have 4H:1V slope or flatter?	Y	Infiltration Basin Wet Basin Constructed Wetland	
How much width available?	100 ft	Bioretention	15 ft min for bioretention
How much length available?	230 ft	Bioretention	40 ft min for bioretention
Total Area available	23000 sf	Media Filter Wet Basin Constructed Wetland	minimum 1000 sf needed for media filter, wet basin, constructed wetland
Is BMP footprint at least 100 ft from bridges and wells, and at least 20 ft from buildings, slopes or pavement?	Y	Infiltration Basin	
Is site accessible for maintenance?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Is there a permanent Source of Water?	N	Wet Basin Constructed Wetland	to be verified
If IFD is proposed, can dry weather flows be diverted around?	Y	Infiltration Basin	low-flow channel or diversion box with weather/rainfall station
Is GW more than 10 ft Below BMP Invert?	Y	EDB Media Filter Wet Basin Bioretention	Groundwater Level: 550ft
Are there fill materials?		Infiltration Basin	
Are there known environmental issues?	N	Infiltration Basin	
Are restrictive soil layers present?	N	Infiltration Basin	
Is hydrologic soil group A or B?	Y	Infiltration Basin	A or B needed for IFD
Landuse	Mixed		Soil Group A
Pump Station	Y		Possibly / Verify SD invert

Site No.	Ford Park		Acceptable BMP Options

Route	Pipeline Ave at Los Serranos Blvd		
Member Initials	RC		
Direction	EB		
Parcels	Chino Hills Hickory Creek Park		
BMP Type	Regional/Subregional		EXTENDED DETENTION BASIN
Flood Zone	Zone 1		MEDIA FILTER
Owner	City of Chino Hills		
Conclusion			BIORETENTION
Requirement	Answer	BMP Criteria No.	Explanation Comments
Regional BMP Being Considered?	Y	Infiltration Basin Wet Basin/Constructed Wetland EDB Sub Surface Flow Wetland	
Subregional BMP being Considered?	Y	Wet Basin/Constructed Wetland EDB Media Filter Bioretention	Divert / Pump concentration flow from creek/SD in Hickory Creek park to OS parcel. Verify TDA / Upstream of Lake Serrano (potential retrofit)
Does enough head exist that emergency riser/spillway can tie into a downstream drainage facility?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Does ≥ 2ft of hydraulic head exist?	Y	Bioretention	If pump used
Does ≥ 3ft of hydraulic head exist?	Y	Media Filter	If pump used
Does the site have 4H:1V slope or flatter?	N	Infiltration Basin Wet Basin Constructed Wetland	to be verified
How much width available?	140 ft	Bioretention	15 ft min for bioretention
How much length available?	250 ft	Bioretention	40 ft min for bioretention
Total Area available	35000 sf	Media Filter Wet Basin Constructed Wetland	minimum 1000 sf needed for media filter, wet basin, constructed wetland
Is BMP footprint at least 100 ft from bridges and wells, and at least 20 ft from buildings, slopes or pavement?	Y	Infiltration Basin	
Is site accessible for maintenance?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Is there a permanent Source of Water?	N	Wet Basin Constructed Wetland	to be verified
If IFD is proposed, can dry weather flows be diverted around?	Y	Infiltration Basin	pump configuration / weather station
Is GW more than 10 ft Below BMP Invert?		EDB Media Filter Wet Basin Bioretention	Unknown
Are there fill materials?		Infiltration Basin	
Are there known environmental issues?	N	Infiltration Basin	
Are restrictive soil layers present?	N	Infiltration Basin	
Is hydrologic soil group A or B?	Y	Infiltration Basin	A or B needed for IFD Soil Group B
Landuse	Mixed		
Pump Station	Y		Most likely / verify invert of creek

Parcels	McDermott Park - City of Fontana		
BMP Type	Regional		EXTENDED DETENTION BASIN
Flood Zone	Zone 1		
Owner	City of Fontana		
Conclusion			
Requirement	Answer	BMP Criteria No.	Explanation
Regional BMP Being Considered?	Y	Infiltration Basin Wet Basin/Constructed Wetland EDB Sub Surface Flow Wetland	Divert concentrated flow from existing SD to McDermott Park. Diversion box with weather/rainfall - Verify TDA/footprint - Lower soccer field or Surround with berm
Subregional BMP being Considered?	N	Wet Basin/Constructed Wetland EDB Media Filter Bioretention	
Does enough head exist that emergency riser/spillway can tie into a downstream drainage facility?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Does ≥ 2ft of hydraulic head exist?	Y	Bioretention	tbd
Does ≥ 3ft of hydraulic head exist?	Y	Media Filter	tbd
Does the site have 4H:1V slope or flatter?	Y	Infiltration Basin Wet Basin Constructed Wetland	to be verified
How much width available?	250 ft	Bioretention	15 ft min for bioretention
How much length available?	400 ft	Bioretention	40 ft min for bioretention
Total Area available	100000 sf	Media Filter Wet Basin Constructed Wetland	minimum 1000 sf needed for media filter, wet basin, constructed wetland
Is BMP footprint at least 100 ft from bridges and wells, and at least 20 ft from buildings, slopes or pavement?	Y	Infiltration Basin	
Is site accessible for maintenance?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Is there a permanent Source of Water?	N	Wet Basin Constructed Wetland	to be verified
If IFD is proposed, can dry weather flows be diverted around?	Y	Infiltration Basin	weather/rainfall station
Is GW more than 10 ft Below BMP Invert?	Y	EDB Media Filter Wet Basin Bioretention	Groundwater Level: 550ft
Are there fill materials?		Infiltration Basin	
Are there known environmental issues?	N	Infiltration Basin	
Are restrictive soil layers present?	N	Infiltration Basin	
Is hydrologic soil group A or B?	Y	Infiltration Basin	A or B needed for IFD
Landuse	Mixed		Soil Group A
Pump Station	N		Possibly / Verify SD invert

Site No.	Meadowbrook Park		Acceptable BMP Options
Route	Santa Ana River Lateral

Conclusion			
Requirement	Answer	BMP Criteria No.	Explanation
Regional BMP Being Considered?	Y	Infiltration Basin Wet Basin/Constructed Wetland EDB Sub Surface Flow Wetland	Lower existing soccer field and/or add surrounding berms. Upstream of existing retarding basin which can be retrofitted. Could treat flow from 2 SDs. Verify TDA/footprint
Subregional BMP being Considered?	N	Wet Basin/Constructed Wetland EDB Media Filter Bioretention	
Does enough head exist that emergency riser/spillway can tie into a downstream drainage facility?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Does ≥ 2ft of hydraulic head exist?	Y	Bioretention	tbd
Does ≥ 3ft of hydraulic head exist?	Y	Media Filter	tbd
Does the site have 4H:1V slope or flatter?	Y	Infiltration Basin Wet Basin Constructed Wetland	
How much width available?	380 ft	Bioretention	15 ft min for bioretention
How much length available?	420 ft	Bioretention	40 ft min for bioretention
Total Area available	159600 sf	Media Filter Wet Basin Constructed Wetland	minimum 1000 sf needed for media filter, wet basin, constructed wetland
Is BMP footprint at least 100 ft from bridges and wells, and at least 20 ft from buildings, slopes or pavement?	Y	Infiltration Basin	
Is site accessible for maintenance?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Is there a permanent Source of Water?	N	Wet Basin Constructed Wetland	tbd
If IFD is proposed, can dry weather flows be diverted around?	Y	Infiltration Basin	low-flow channel
Is GW more than 10 ft Below BMP Invert?	Y	EDB Media Filter Wet Basin Bioretention	Groundwater Level: 375ft
Are there fill materials?		Infiltration Basin	
Are there known environmental issues?	N	Infiltration Basin	
Are restrictive soil layers present?	N	Infiltration Basin

If IFD is proposed, can dry weather flows be diverted around?	Y	Infiltration Basin	
Is GW more than 10 ft Below BMP Invert?		EDB Media Filter Wet Basin Bioretention	tbd
Are there fill materials?	N	Infiltration Basin	tbd
Are there known environmental issues?	N	Infiltration Basin	
Are restrictive soil layers present?	N	Infiltration Basin	
Is hydrologic soil group A or B?	A	Infiltration Basin	A or B needed for IFD
Landuse	Mixed		
Pump Station	N		Depending on configuration

Site No.	Villa_C		Acceptable BMP Options
Route	3rd St at Shaefer Ave		
Member Initials	RC		
Direction	NB		
Parcels	Villa Park - City of Chino		
BMP Type	Subregional		EXTENDED DETENTION BASIN
Flood Zone	Zone 1		MEDIA FILTER
Owner	City of Chino		
Conclusion			BIORETENTION
Requirement	Answer	BMP Criteria No.	Explanation Comments
Regional BMP Being Considered?	N	Infiltration Basin Wet Basin/Constructed Wetland EDB Sub Surface Flow Wetland	
Subregional BMP being Considered?	Y	Wet Basin/Constructed Wetland EDB Media Filter Bioretention	Storm drain 48-6 (3rd St). Diversion box to offline structural BMP.
Does enough head exist that emergency riser/spillway can tie into a downstream drainage facility?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Does ≥ 2ft of hydraulic head exist?	Y	Bioretention	tbd
Does ≥ 3ft of hydraulic head exist?	Y	Media Filter	tbd
Does the site have 4H:1V slope or flatter?	Y	Infiltration Basin Wet Basin Constructed Wetland	
How much width available?	90 ft	Bioretention	15 ft min for bioretention
How much length available?	150 ft	Bioretention	40 ft min for bioretention Footprint can be extended.
Total Area available	13500 sf	Media Filter Wet Basin Constructed Wetland	minimum 1000 sf needed for media filter, wet basin, constructed wetland
Is BMP footprint at least 100 ft from bridges and wells, and at least 20 ft from buildings, slopes or pavement?	Y	Infiltration Basin	
Is site accessible for maintenance?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Is there a permanent Source of Water?	N	Wet Basin Constructed Wetland	unlikely
If IFD is proposed, can dry weather flows be diverted around?	Y	Infiltration Basin	diversion box / weather-station
Is GW more than 10 ft Below BMP Invert?	Y	EDB Media Filter Wet Basin Bioretention	Groundwater Level: 125ft
Are there fill materials?		Infiltration Basin	
Are there known environmental issues?	N	Infiltration Basin	
Are restrictive soil layers present?	N	Infiltration Basin	
Is hydrologic soil group A or B?	Y	Infiltration Basin	A or B needed for IFD Soil Group B
Landuse	Residential		
Pump Station	N		Possible / Verify SD invert

Site No.	Wilderness_M		Acceptable BMP Options
Route	Helena Ave at San Bernardino St		INFILTRATION BASIN
Member Initials	RC		
Direction	SB		
Parcels	Wilderness Park - City of Montclair		
BMP Type	Regional		EXTENDED DETENTION BASIN
Flood Zone	Zone 1		
Owner	City of Montclair		
Conclusion			
Requirement	Answer	BMP Criteria No.	Explanation
Regional BMP Being Considered?	Y	Infiltration Basin Wet Basin/Constructed Wetland EDB Sub Surface Flow Wetland	Retrofit existing retarding basin with perforated riser & WQ features Verify TDA
Subregional BMP being Considered?	N	Wet Basin/Constructed Wetland EDB Media Filter Bioretention	
Does enough head exist that emergency riser/spillway can tie into a downstream drainage facility?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Does ≥ 2ft of hydraulic head exist?	Y	Bioretention	tbd
Does ≥ 3ft of hydraulic head exist?	Y	Media Filter	tbd
Does the site have 4H:1V slope or flatter?	Y	Infiltration Basin Wet Basin Constructed Wetland	
How much width available?	500 ft	Bioretention	15 ft min for bioretention
How much length available?	500 ft	Bioretention	40 ft min for bioretention
Total Area available	250000 sf	Media Filter Wet Basin Constructed Wetland	minimum 1000 sf needed for media filter, wet basin, constructed wetland
Is BMP footprint at least 100 ft from bridges and wells, and at least 20 ft from buildings, slopes or pavement?	Y	Infiltration Basin	
Is site accessible for maintenance?	Y	Infiltration Basin Wet Basin EDB Media Filter	
Is there a permanent Source of Water?	N	Wet Basin Constructed Wetland	tbd
If IFD is proposed, can dry weather flows be diverted around?	Y	Infiltration Basin	
Is GW more than 10 ft Below BMP Invert?	Y	EDB Media Filter Wet Basin Bioretention	Groundwater Level: 475ft
Are there fill materials?		Infiltration Basin	
Are there known environmental issues?	N	Infiltration Basin	
Are restrictive soil layers present?	N	Infiltration Basin	
Is hydrologic soil group A or B?	Y	Infiltration Basin	A or B needed for IFD
Landuse	Mixed		Soil Group A
Pump Station	N		

Site No.	Yuaipa Valley Golf Club		Acceptable BMP Options
Route	Santa Ana River Lateral		INFILTRATION BASIN
Member Initials	JH		
Direction	WB		
Cross Street	Oak Glen Road		
BMP Type	Subregional/Regional		EXTENDED DETENTION BASIN
Flood Zone	Zone 3		MEDIA FILTER
Owner	San Bernardino County Flood Control		
Conclusion			BIORETENTION
