One existing stockpond will be improved and one defunct stockpond will be replaced on an unnamed gully that drains to Juniper Gulch. The existing pond will have some sedimentation removed to allow for cooler summer water temperatures and greater capacity to capture rainfall. Fill will be used to retrofit the existing earthen dam, resulting in a maximum possible capacity of less than or equal to 17 ac-ft of water, with a surface area of about 4.5 acres at capacity. Excavation may occur throughout the proposed basin footprint, but will not exceed 5 vertical feet of soil removal. The second pond will be sited in a rocky gully, downgradient from a failed historic pond. Excavation will occur within the footprint in order to construct a reinforced earthen dam and piped spillway, creating a basin of maximum capacity 23.7 ac-ft and surface area of about 4.5 acres when filled. Depth of excavation will not exceed 7 vertical feet. The water captured by rainfall, runoff or sheetflow to these ponds is intended to provide a year-around water source to wildlife and ranging cattle. Some inflow from irrigation tailings may occur at the existing pond, but this has not proven a sufficient source to supply summer water needs for wildlife or cattle in past

ENVIRONMENTAL INFORMATION

Note: Before a water right permit may be issued for your project, the State Water Board must consider the information contained in an environmental document prepared in compliance with the California Environmental Quality Act (CEQA). This form is not a CEQA document. If a CEQA document has not yet been prepared for your project, a determination must be made of who is responsible for its preparation. If the State Water Board is determined to be responsible for preparing the CEQA document, the applicant will be required to pay all costs associated with the environmental evaluation and preparation of the required documents.
