

Hi Jessica

We work for a number of small water agencies with a variety of users, but by far, the greatest amount of water is used by the hotels and restaurants in our districts. Also, in one agency, calculating the number of residents is complicated by the fact there is no census tract for our small area. So how will the target % reduction be calculated for these situations? I presume we will look at the residential consumption only to compare to 2013. The restaurants and motels will be issued advisory cards for not changing linens unless requested as well as not being served water without requesting it in our restaurants, but their consumption will not be counted in our analysis for gcpd.

Can you shed any light on these questions?

Thanks

John Wallace
