Subject: Public Input | Drought Activities

Hi Rich -
Hi Chris -

Thank you for giving us the opportunity to give you our public input in regards to the DROUGHT.

Our input:

We highly recommend the mass-deployment of waterless urinals of the latest generation (hydrostatic float prevents sewage gas from entering the restroom area and enzymes/micro-organism keep the urinal and the pipes clean and fresh). One urinal saves on average a medium sized-swimming pool full of water, per year.

Telling people that they have to cut back on water usage is one thing that has not sunk in yet as the latest numbers show. How about we give approximately half of California's citizens (men) a urinal that doesn't use water at all.

It has been proven that a waterless urinal saves a considerable amount of water while being cleaner (less bacteria) than regular water urinals.

We do our best to educate restaurants, bars, fitness centers, property management firms, manufacturing plants, etc. with great success, but still on the very small scale (less than 1% of all the urinals installed in CA are waterless).

We are in an exceptional drought condition that has resulted in chronic shortages in the past few years. We can save billions of gallons of water by deploying waterless urinals on a massive scale.
