

# Using Lysimeters to Evaluate Subsurface Nitrogen Concentrations in Macrotunnel Post Rows

## A Study of Post Row Treatment Practices

# Management Practices to Minimize Stormwater Pollution from Macrotunnel Production Systems

Project compares effect of post-row treatments on stormwater-generated outflows

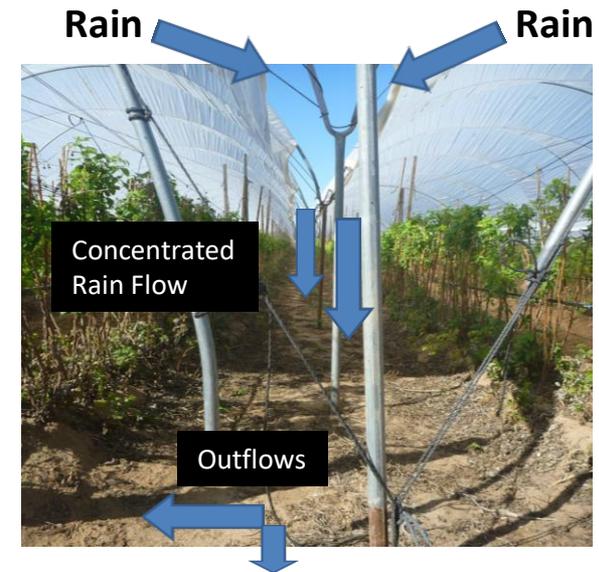

- Outflows - **Surface** (Runoff/Effluent) and **Subsurface** (Soil Water)
- Outflow **Quantity** - Relative impact on Outflow volumes
- Outflow **Quality** - Total Nitrogen (TN), Total Phosphorus (TP), Turbidity (NTU)
  - Surface - Passive and Grab samples
    - TN, TP, NTU
  - Subsurface - Lysimeter samples
    - Nitrate & Ammonium

Macrotunnel

Production System

# Project Design and Treatments

- 2 project sites, Santa Barbara and Ventura County
- Both sites are Raspberry Macrotunnel Production Systems
- 5 Treatments/Replicate and 3 Replicates/Site

Barley

Mulch

PAM

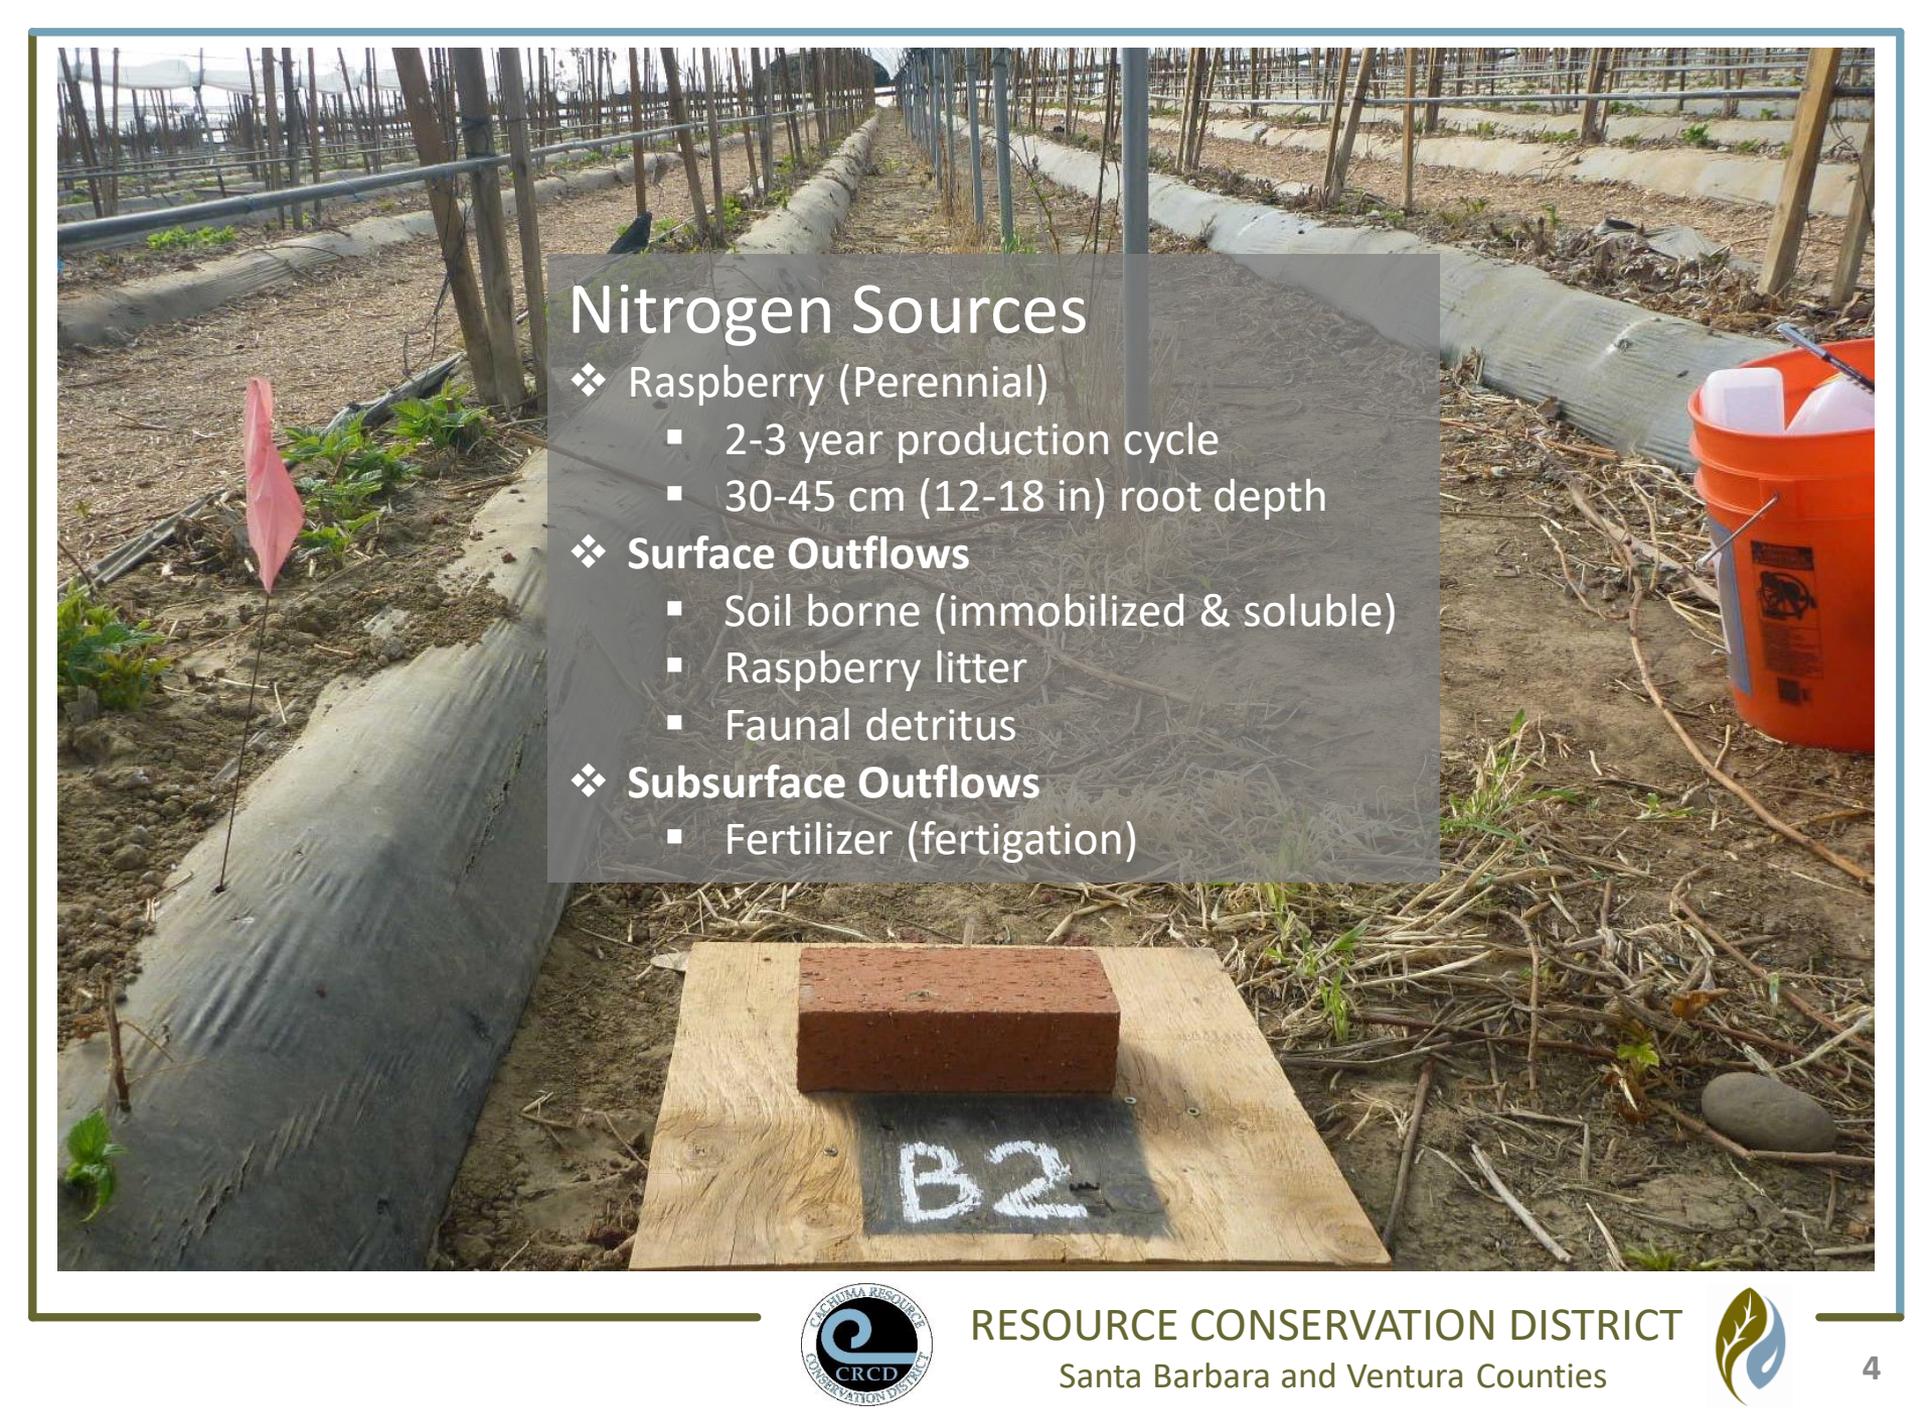

Fabric

Untreated

- 3 Replicates/Site (Tripllicated) Random Block Design (i.e., 15 unordered treated post rows)
- **Surface** outflow (runoff water) data - **passive collectors**
- **Subsurface** outflow (soil water) data - **lysimeters**

A photograph of a raspberry field. The plants are in rows, with black plastic mulch between them. A wooden board is placed on the ground in the foreground, with a brick on top of it. The board has the letters 'B2' written on it in white chalk. A red flag is visible in the background. A semi-transparent text box is overlaid on the center of the image.

## Nitrogen Sources

- ❖ Raspberry (Perennial)
  - 2-3 year production cycle
  - 30-45 cm (12-18 in) root depth
- ❖ **Surface Outflows**
  - Soil borne (immobilized & soluble)
  - Raspberry litter
  - Faunal detritus
- ❖ **Subsurface Outflows**
  - Fertilizer (fertigation)

# Lysimeters – Placement and Sampling

- Lysimeters are at both sites
  - Ventura - 20 cm and 60 cm lengths, in all 3 replicates (30 lysimeters total)
  - Santa Barbara - 20 cm, in only 2 replicates (10 lysimeters total)
- No standardized sampling frequency
  - Rainy season, usually before and after rain event
  - Dry season, usually about every other week

**Prime Lysimeters**

**Extract Samples**

**Collect Samples**

**Analyze Samples**

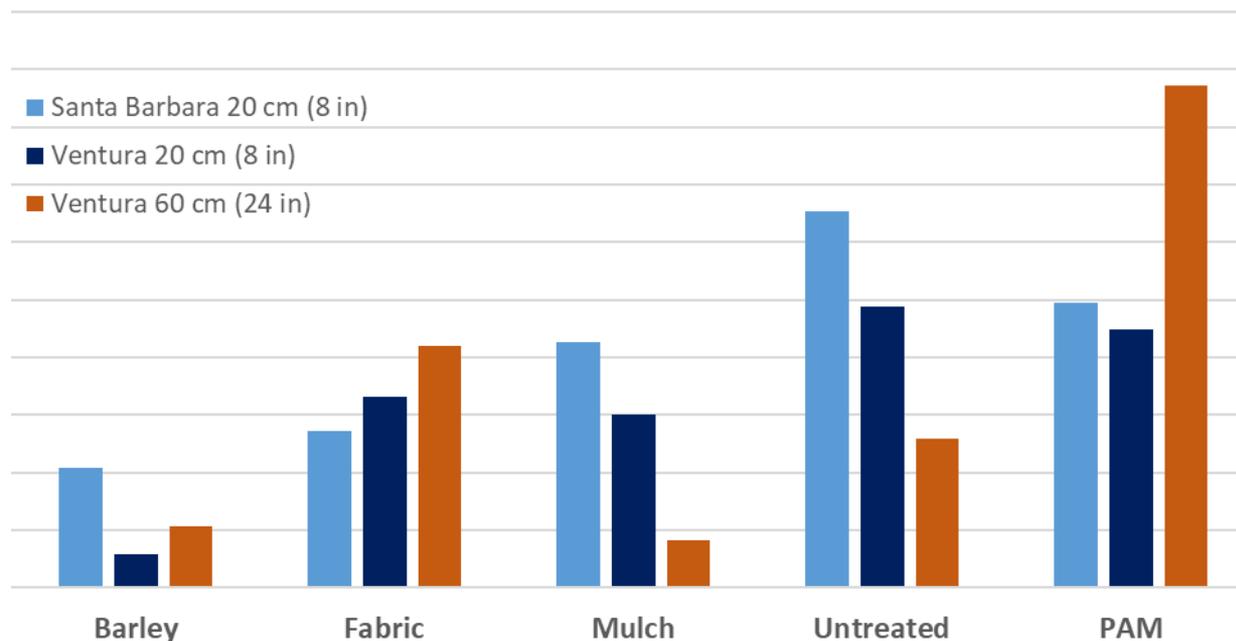

# Lysimeter Nitrate Data – Project Contributions

Did Treatments lead to statistically significant changes on subsurface outflows?

- Indicates Treatment differences - specifically Barley & Mulch vs Untreated
- Indicates Two population pools - 20 cm vs 60 cm depth (varies by treatment)
- Indicates Mode of Action differences - Infiltration vs Uptake (ex, Fabric vs PAM & Barley)

Nitrate (mg/L) versus Treatment  
20 cm and 60 cm Lysimeter Data

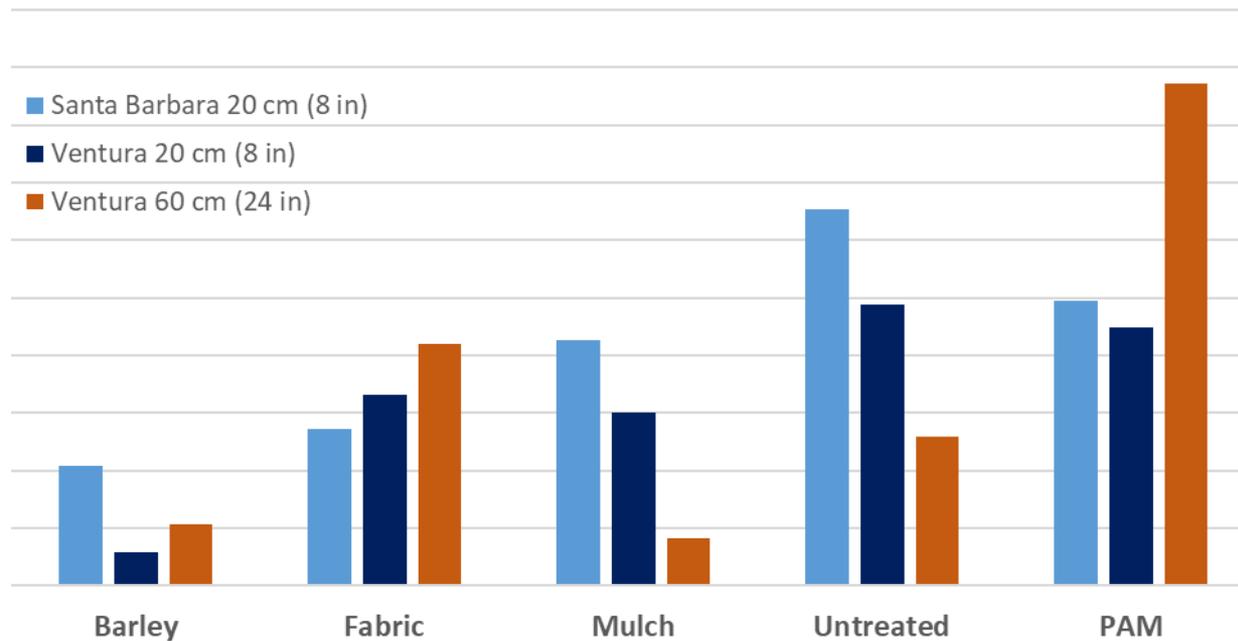

# Lysimeter Nitrate Data – Additional Project Insights

Did lysimeters demonstrate that we need additional information?

- Confirm Nitrate soil profile - add 40 cm (15 in) lysimeter
- Verify infiltration differences - soil moisture sensors
- Standardize sampling - relate pools to uptake vs leaching

Nitrate (mg/L) versus Treatment  
20 cm and 60 cm Lysimeter Data

# Lysimeter Nitrate Data – Conclusions

- ❖ Barley and Mulch - Subsurface Outflows differ from Untreated
- ❖ Barley and Mulch - Uptake Rates need to be Quantified
  - Barley Seasonal vs. Mulch/Raspberry Suckers Continuous
- ❖ Mulch Uptake Mechanism(s) - needs to be Determined
  - Raspberry Suckers/Fungi/Microbial
- ❖ Standardize Sampling - Relate pools to Uptake vs Leaching
  - Set Sampling Intervals to Fertigation & Rainfall events
- ❖ Soil Moisture Sensors - Monitor wetting front
  - Continuous & at Depths consistent with Lysimeters

Thanks to our Funder  and Partners

CALIFORNIA DEPARTMENT OF  
FOOD & AGRICULTURE

A HUGE THANKS to our project Contributors

  
Only the Finest Berries™

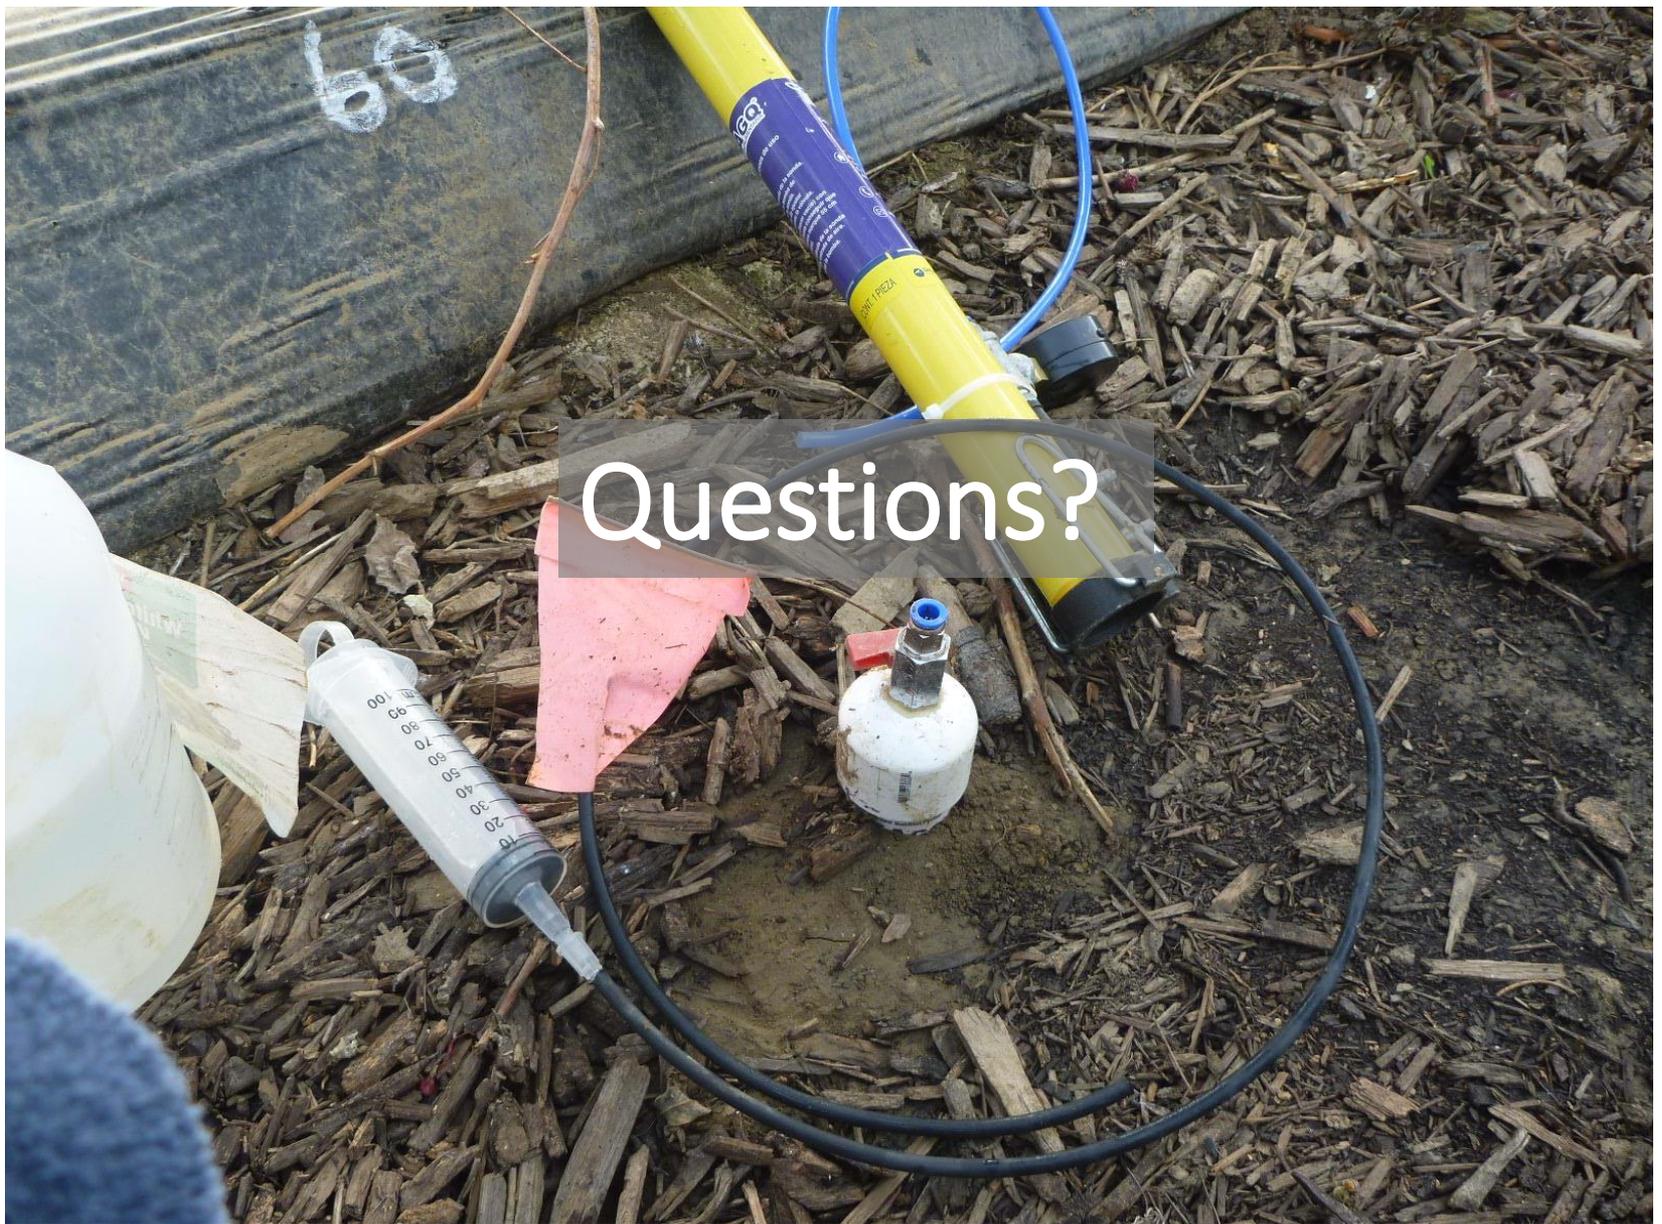

And Thank YOU for your attention.
