The California Regional Water Quality Control Board, Central Valley Region (hereafter Central Valley Water Board or Board) finds that:

Background

1. The Beverage Source, Inc., a division of Erly Industries Inc., owned the Sanger Winery (Winery) at 2916 South Reed Avenue in Sanger. The discharge was regulated under Waste Discharge Requirements (WDRs) Order 92-120, National Pollutant Discharge Elimination System (NPDES) Permit CA0081019, which authorized a daily discharge of 0.2 million gallons per day (mgd) of condenser cooling wastewater to Fink Ditch (discharge 001), and the discharge of two waste streams to a 150-acre land application area (LAA) of up to 0.3 mgd (34 million gallons per year (mgy)) of winery wastewater (discharge 002) and 0.3 mgd (11.3 mgy) of stillage wastewater (discharge 003) produced at the Winery. In mid-1992, The Wine Group LLC, (Discharger) purchased the Winery.

2. The Discharger ceased stillage discharges (discharge 003) following the 2000 crush season. The Discharger also ceased discharging condenser cooling water to Fink Ditch (discharge 001) in 2001 by reportedly internally recycling its condenser cooling water as boiler makeup water.

3. On 2 May 2001, the Central Valley Water Board adopted Revised Monitoring and Reporting Program (MRP) 92-120 to add constituents to the effluent monitoring to characterize ion-exchange regeneration waste and boiler blowdown wastewater streams.

4. On 27 June 2011, Kennedy/Jenks Consultants submitted a Report of Waste Discharge (RWD) on behalf of the Discharger for a proposed increase in wastewater flow and LAA acreage. According to the RWD, the Discharger is proposing to increase its wastewater flows from 49 mgy up to 70 mgy and increase its current 150-acre LAA by an additional 53 acres for a total of 203 acres.
Wastewater Generation, Treatment, and Disposal

5. The Winery now produces wine and grape juice concentrate products. The Winery operates year round with the harvest/crush season from August to October. Wastewater from the Winery operations consists of cleaning and sanitation wastewater, ion-exchange regeneration waste, boiler blowdown, refrigeration unit condenser cooling water that is reused through multiple cycles before comingling, and filter backwash water.

6. The RWD indicates that chemicals used at the Winery for cleaning and sanitizing tanks, wine lines, and other equipment include: sodium hydroxide (10,750 lbs/year), chlorinated trisodium phosphate (2,200 lbs/year), citric acid (7,000 lbs/year), and calcium hypochlorite (1,200 lbs/year). Sodium chloride (2,450 lbs/year) is used for brine regeneration of the water softener. The Discharger is in the process of reexamining its use of chemicals at the Winery with the intent of eliminating specific types of chemicals and reducing the overall quantities of chemicals used.

7. Wastewater is collected in trench drains throughout the Winery and conveyed to a sump where wastewater currently gravity flows through a 24-inch diameter pipeline that is then reduced to an 18-inch diameter pipeline at the 150-acre LAA. The 150-acre LAA is divided into long checks (1,250 ft to 2,500 ft). Wastewater and supplemental water are applied by flood irrigation to the 150-acre LAA. Crops currently grown in the 150-acre LAA include corn and forage crops. Crops grown in the new 53-acre LAA are vineyards and will include a cover crop planted between the vines. Wastewater will be applied to the vineyards by flood irrigation and supplemental water will be applied using a drip irrigation system. The cover crop will be flood irrigated with both wastewater and supplemental water. A site map of the Winery (APN 333-130-22 & 34), 150-acre LAA (APN 333-130-23 & 333-061-21), and the new 53-acre LAA (APN 333-090-29 & 333-130-35) are shown on Attachment A, which is incorporated by reference and considered a part of this Order.

8. Solids generated from the Winery include stems and leaves removed at the staging area. Pomace (seeds, pulp, skins) is generated from the crushing of grapes. Spent diatomaceous earth is generated from the filters and staged onsite near the effluent sump before being hauled off site. According to the Discharger, all of the solids generated at the Winery are hauled offsite.

This Order requires the Discharger to prepare a Solids Management Plan to characterize solids removed during the grape processing and determine appropriate disposal methods. This Order also requires the Discharger to report the amount of solids produced, disposal method used, and ultimate disposal site.
Wastewater Characteristics

9. Based on Discharger’s self-monitoring reports (SMRs) from January 2008 through June 2013, monthly average wastewater flows range from 0.016 mgd to 0.46 mgd. Total annual wastewater flows generated at the winery have increased from 34 mgy in 2009 to 46 mgy in 2010, 63 mgy in 2011, and 69 mgy in 2012.

10. Monthly average comingled wastewater quality based on data contained the Discharger’s SMRs from January 2008 to June 2013 are tabulated in Table 1.

</table>

\(^1\) BOD denotes Biochemical Oxygen Demand
\(^2\) EC denotes Electrical Conductivity
\(^3\) TDS denotes Total Dissolved Solids
\(^4\) FDS denotes Fixed Dissolved Solids
\(^5\) TN denotes Total Nitrogen
\(^6\) K denotes Potassium
\(^7\) Na denotes Sodium
\(^8\) SO\(_4\) denotes Sulfate

11. Data from 2012, indicates that approximately 65 percent of the TDS is a result of organic compounds based on an annual average FDS of 925 mg/L and an annual average TDS of 2,636 mg/L.

Land Application Area Practices

12. Excessive application of food processing wastewater to land can create objectionable odors, soil conditions that are harmful to crops, and degradation of underlying groundwater by overloading the soil profile and causing waste constituents (i.e., organic carbon, nitrates, other salts, and metals) to percolate below the root zone.
Irrigation with high-strength wastewater can result in high BOD loading on the day of application, which can deplete oxygen in the soil and lead to anoxic conditions. When insufficient oxygen is present below the ground surface, anaerobic decay of organic matter can create reducing conditions that convert metals naturally present in the soil as relatively insoluble (oxidized) forms to more soluble (reduced) forms. This condition can be exacerbated by acidic soils and/or acidic wastewater. If reducing conditions do not reverse as the percolate travels through the vadose zone, these dissolved metals (primarily iron, manganese, and arsenic) can degrade shallow groundwater quality. Excessive organic loading can also increase groundwater bicarbonate concentrations which cause increases in groundwater EC and total dissolved solids.

13. It is reasonable to expect some oxidation of BOD at the ground surface, within the evapotranspiration zone and below the root zone within the vadose (unsaturated) zone. The maximum BOD loading rate that can be applied to land without creating nuisance conditions or causing unreasonable degradation of groundwater can vary significantly depending on soil conditions and operation of the land application system.

14. Pollution Abatement in the Fruit and Vegetable Industry, published by the United States Environmental Protection Agency, cites BOD loading rates associated with crop irrigation in the range of 36 to 100 lbs/acre/day to prevent nuisance, but indicates that loading rates can be even higher under certain conditions. The studies that support this report did not evaluate actual or potential groundwater degradation associated with those loading rates. There are few studies that have attempted to determine maximum BOD loading rates for protection of groundwater quality. Those that have are not readily adapted to varying soil, groundwater, and climate conditions that are prevalent throughout the region.

15. The California League of Food Processors Manual of Good Practice for Land Application for Food Processing/Rinse Water proposes risk categories associated with particular BOD loading rate ranges as follows:

   a. Risk Category 1: (less than 50 lb/ac/day; depth to groundwater greater than 5 feet) Indistinguishable from good farming operations with good distribution important.

   b. Risk Category 2: (less than 100 lb/ac/day; depth to groundwater greater than 5 feet) Minimal risk of unreasonable groundwater degradation with good distribution more important.

   c. Risk Category 3: (greater than 100 lb/ac/day; depth to groundwater greater than 2 feet) Requires detailed planning and good operation with good distribution very important to prevent unreasonable degradation, as well as use of oxygen transfer
design equations that consider site-specific application cycles and soil properties and special monitoring.

The _Manual of Good Practice_ recommends allowing a 50 percent increase in the BOD loading rates in cases where sprinkler irrigation is used, but recommends that additional safety factors be used for sites with heavy and/or compacted soils. The Manual of Good Practice also states that the use of surface irrigation (border check method) makes uniform application difficult, especially for coarse textured soils.

16. Although it has not been subject to a scientific peer review process, the Manual of Good Practice provides science-based guidance for BOD loading rates that, if fully implemented, may be considered management practices to prevent groundwater degradation due to reduced metals.

17. The 150-acre LAA is surface irrigated (border check method) via flood irrigation and is divided into four areas. Each area contains several checks that are separated by berms. Each check is 3 feet wide when corn is planted and 53 feet wide when grain is planted, and the current check lengths typically range from approximately 1,250 to 2,500 feet.

On any given day during the processing season, multiple checks within the irrigation areas may be receiving water at the same time. The number of checks receiving wastewater at any one time depends on processing wastewater flow rates, which vary from day to day. Because of the long check lengths, the application of wastewater alone does not reach the lower end of each of the checks without the aid of supplemental irrigation water. Based on crop needs, supplemental water is added to reach crops at the lower end of the checks.

Fields with long check lengths may not be able to ensure irrigation uniformity, due to higher application rates and longer infiltration period at the top end of the field in comparison to the bottom end of the field.

18. In 2012, the Discharger applied wastewater to the 150-acre LAA for several days consecutively without a rest period. The upper section of the 150-acre LAA (approximately 33 acres) near monitoring well MW-1 received wastewater continuously from 1 January 2012 to 21 March 2012 (81 days) without a rest period between applications. The 2013 self-monitoring reports indicate the Discharger continues to apply wastewater for several consecutive days to the 150 acre LAA. Due to the coarse nature of the soils and the long check lengths, wastewater loading at the upper end of the checks is significantly higher than at the lower end of the checks. This uneven distribution of waste in combination with the shallow depth to groundwater has resulted in groundwater degradation and pollution, as described in
further detail in the Groundwater Considerations and Antidegradation Analysis sections below.

19. The water balance in the RWD assumes a 30 percent irrigation loss of wastewater. Because wastewater is distributed by pipe to the LAA’s delivery losses are considered to be negligible for waste load calculations. Adding the wastewater loss in the RWD back into the calculations results in the following annual application rates.

Based on average year rainfall and a proposed wastewater flow of 70 mgy, approximately 60 mgy (1.2 ft) of wastewater and approximately 134 mgy (2.7 ft) of supplemental water will be applied to the 150-acre LAA. The new 53-acre LAA will receive approximately 10 mgy (0.6 ft) of wastewater and approximately 40 mgy (2.3 ft) of supplemental water. Based on a 100-year return period rainfall, the amount of supplement water would be reduced to approximately 65 mgy (1.3 ft) for the 150-acre LAA and approximately 36 mgy (2 ft) for the new 53-acre LAA.

Actual distribution of wastewater and supplemental water will vary upon wastewater rotation practices and annual availability of supplemental water from applicable irrigation districts. This Order requires the Discharger to submit a Nutrient and Wastewater Management Plan and implement management practices to evenly distribute the applied wastes, ensures application of nutrients at reasonable agronomic rates, and determine an appropriate discharge cycle.

20. The total nitrogen loading rate to the 150-acre LAA based on 60 mgy and annual average (2012 data) total nitrogen concentration of 59 mg/L is 197 lbs/acre/year, less than the annual nitrogen uptake for corn of 240 lbs/acre/year and greater than the annual nitrogen uptake for winter wheat of 175 lbs/acre/year for crops grown at the 150-acre LAA. The total nitrogen loading rate to the new 53-acre LAA based on 10 mgy and a yearly average (2012 data) total nitrogen concentration of 59 mg/L is 93 lbs/acre/year, less than the annual nitrogen uptake for vineyards grown at the new 53-acres of 125 lbs/acre/year according to the Western Fertilizer Handbook, Eighth Edition.

Source Water

21. The Winery has two supply wells (Well 1 and Well 2). Both wells have granular activated carbon treatment systems to remove Dibromochloropropane, which is a regional problem. Well 1 has experienced intermittent exceedances of State drinking water primary Maximum Contaminant Level (MCL) for nitrate. The Department of Public Health issued a Compliance Order requiring the Discharger to submit a Corrective Action Plan to evaluate and correct well exceedances for nitrate in Well 1 and increasing nitrate levels in Well 2. The Discharger is evaluating alternatives for
the mitigation of nitrate levels in Wells 1 and 2. Analytical data for Well 2 has been provided based on monthly SMRs from August 2001 through September 2013. Average EC, TDS, sodium, and chloride concentrations for Well 2 are tabulated below:

Table 2. Source Water Quality for Well 2

Site-Specific Conditions

22. Land uses in the vicinity of the 150-acre LAA are primarily agricultural. Crops grown in the area of the 150-acre LAA are almonds, bush berries, mixed pasture, peaches, and nectarines. Crops grow in the vicinity of the Winery and the new 53-acre LAA are plums, vineyards, peaches, and nectarines, according to the Eastern Fresno County 2009 Land Use Map published by the Department of Water Resources.

23. The Winery and LAA’s are in an arid climate characterized by dry summers and mild winters. The rainy season generally extends from October through April. Average annual pan evaporation is about 108 inches according to data in the *National Oceanic and Atmospheric Administration Technical Report NWS 34, Mean Monthly, Seasonal, and Annual Pan Evaporation for the United States*, published by the U.S. Department of Commerce National Oceanic and Atmospheric Administration. The average annual precipitation is about 11 inches according to data obtained from the Western Regional Climate Center.

24. Soils below the 150-acre LAA are predominately Hanford Fine Sandy Loam and Grangeville Fine Sandy Loam with gravelly substratum. Soil near the Winery and in the new 53-acre LAA is Hanford Sandy Loam with gravelly substratum, according to the Web Soil Survey published by the United States Department of Agriculture, Natural Resources Conservation Service. Hanford Sandy Loam and Grangeville Fine Sandy Loam have land capacity classification of 2s. Soils with “Class 2” have moderate limitations that restrict the choice of plant or that require moderate conservation practices. The subclass “s” indicates that soils have limitations within the root zone, such as shallowness of the root zone, a high content of stones, a low available water capacity, low fertility, and excessive salinity or sodicity. Overcoming these limitations is difficult.
25. According to the Federal Emergency Management Agency maps (Map Numbers 06019C2180F and 06019C2190F) the Winery, the 150-acre LAA, and the new 53-acre LAA are all in Zone X. This area is outside the 500-year floodplain.

**Basin Plan, Beneficial Uses, and Water Quality Objectives**

27. The Winery, the 150-acre LAA, and the new 53-acre LAA are all in Detailed Analysis Unit (DAU) No. 236, within the Kings Basin hydrologic unit. The Basin Plan identifies the beneficial uses of groundwater in the DAU as municipal and domestic supply, agricultural supply, industrial service supply, and industrial process supply.

28. The Winery, the 150-acre LAA, and the new 53-acre LAA are all in the Consolidated Hydrologic Area No. 551.70 of the South Valley Floor Hydrologic Unit, as depicted on hydrologic maps prepared by State Water Resources Control Board in August 1986.

29. The Basin Plan includes narrative water quality objectives for chemical constituents that, at a minimum, require water designated as domestic or municipal supply to meet the Maximum Contaminant Levels specified in Title 22 of the California Code of Regulations (hereafter Title 22). The Basin Plan recognizes that the Central Valley Water Board may apply limits more stringent than MCLs to ensure that waters do not contain chemical constituents in concentrations that adversely affect beneficial uses.

30. The Basin Plan establishes narrative water quality objectives for chemical constituents, taste and odors, and toxicity. The toxicity objective, in summary, requires that groundwater be maintained free of toxic substances in concentrations that produce detrimental physiological responses in human, plant, animal, or aquatic life associated with designated beneficial uses. Quantifying a narrative water quality objective requires a site-specific evaluation of those constituents that have the potential to impact water quality and beneficial uses.

31. The Basin Plan states that when compliance with a narrative objective is required to protect specific beneficial uses, the Central Valley Water Board will, on a case-by-case basis, adopt numerical limitation in order to implement the narrative objective.
32. The Basin Plan identifies the greatest long-term problem facing the entire Tulare Lake Basin as the increase in salinity in groundwater, which has accelerated due to the intensive use of soil and water resources by irrigated agriculture. The Basin Plan recognizes that degradation is unavoidable until there is a long-term solution to the salt imbalance. Until then, the Basin Plan establishes several salt management requirements, including:

   a. The increase in EC of a point source discharge to surface water or land must be controlled to a maximum of 500 umhos/cm.

   b. For municipal discharges to area that may recharge to good quality groundwater, the Basin Plan states that they shall not exceed an EC of 1,000 umhos/cm, a chloride of 175 mg/L, or a boron content of 1.0 mg/L. The Basin Plan generally applies these limits to industrial discharges to land.

33. The Basin Plan authorizes an exemption to the incremental EC increase limit in Finding 32.a. for food processing industries that discharge to land and exhibit a disproportionate increase in EC of the discharge over the EC of the source water due to unavoidable concentrations of organic dissolved solids from the raw food product, provided that beneficial uses are protected. Exceptions must be based on demonstration of best available technology and best management practices that control inorganic dissolved solids to the maximum extent feasible.

**Groundwater Considerations**

34. The proposed Carmelita Mine, is immediately adjacent to both the 150-acre LAA and the new 53-acre LAA. Groundwater below the Carmelita Mine is found at approximately 15 feet below ground surface (bgs) and flows to the southeast.

35. The proposed Carmelita Mine has a groundwater monitoring well network consisting of three monitoring wells (MW-A, MW-B, and MW-C) that have a total depth of 50 feet. Monitoring well MW-A is the upgradient well and MW-B and MW-C are the downgradient wells. Groundwater quality below the Carmelita Mine based on a sample collected on 10 June 2009, is tabulated in Table 3 below.
Table 3. Groundwater Quality below the Carmelita Mine

¹ NO₃ denotes Nitrate as Nitrogen, converted from Nitrate as Nitrate

37. The 150-acre LAA is a mile and a half west of the Winery. The 150-acre LAA has a groundwater monitoring well network of four wells (MW-1 through MW-4). Groundwater in the 150-acre LAA is shallow, 7 to 10 feet bgs, and flow is generally to the southeast. Monitoring well MW-1 was installed as the upgradient well and MW-2, MW-3, and MW-4 as downgradient wells. Groundwater below the 150-acre LAA shows EC, TDS, and bicarbonate increasing as groundwater moves downgradient from MW-1 to MW-4. Annual average groundwater EC ranges from 161 to 335 umhos/cm in MW-1, 248 to 434 umhos/cm in MW-2, 544 to 1,037 umhos/cm in MW-3, and 353 to 923 umhos/cm in MW-4 (based on data from January 2008 through June 2013). Groundwater TDS also increases as groundwater moves from MW-1 towards MW-4. Annual average TDS concentrations range from 108 to 196 mg/L in MW-1, 170 to 256 mg/L in MW-2, 351 to 652 in MW-3, and 233 to 539 mg/L in MW-4.
(based on data from January 2008 through June 2013). TDS concentrations in MW-3 and MW-4 occasionally exceed the State drinking water recommended secondary MCL of 500 mg/L, with bicarbonate being a large contributor to the TDS. Annual average bicarbonate concentrations in groundwater range from 90 to 193 mg/L in MW-1, 167 to 243 mg/L in MW-2, 345 to 682 mg/L in MW-3, and 224 to 604 mg/L in MW-4 (based on data from January 2008 through June 2013). The data also show elevated levels of TOC and ammonia and a lack of nitrate nitrogen. These results all point to organic overloading as the cause of groundwater degradation with respect to EC, TDS, and bicarbonate. Average concentrations for selected constituents in groundwater below the 150-acre LAA are presented in Table 9A of the Information Sheet.

38. Iron and manganese concentrations in groundwater underlying the current 150-acre LAA consistently exceed their respective secondary MCLs of 0.3 mg/L and 0.05 mg/L for MW-1 through MW-4 by several orders of magnitude. Arsenic also exceeds the primary MCL of 10 ug/L consistently in MW-1 and MW-3, relatively consistently in MW-4, and sporadically in MW-2.

39. MW-1, the updrgradient well on the northeast corner and immediately adjacent to the 150-acre LAA (wastewater is applied from east to west), appears to be impacted by the discharge as it contains iron, manganese, and arsenic concentrations exceeding MCLs. Elevated concentrations of iron, manganese, and arsenic in MW-1 are likely due to reducing conditions. Monitoring well MW-1 does not represent background groundwater conditions. This Order includes a Provision requiring the Discharger to evaluate background groundwater conditions and replace MW-1 so that it represents background groundwater quality conditions.

40. TOC concentrations (based on data from 2008 through 2012) in groundwater below the 150-acre LAA increase as groundwater moves downgradient from MW-1 to MW-4. Concentrations of TOC range from 1.83 to 2.57 mg/L in MW-1, 2.83 to 10.56 mg/L in MW-2, 5.34 to 8.23 mg/L in MW-3, and 7.88 to 11.31 mg/L in MW-4. Elevated TOC concentrations in groundwater deplete oxygen creating anoxic conditions and mobilizing naturally occurring metals is soil such as iron, manganese, and arsenic. The increase in TOC concentrations as the groundwater moves downgradient across the site is another indication of organic overloading.

41. Groundwater from Carmelita Mine monitoring wells MW-A, MW-B, and MW-C and groundwater from MW-5 near the new 53-acre LAA represent groundwater unaffected by the discharge and, therefore, background water quality. The higher EC and TDS values in MW-6 and MW-7 indicate they may have not been properly developed or may be affected by other discharges.
Antidegradation Analysis

42. State Water Board Resolution 68-16, the *Statement of Policy with Respect to Maintaining High Quality of Waters in California (Anti-Degradation Policy)*, generally prohibits the Central Valley Water Board from authorizing activities that will result in the degradation of high-quality waters unless it has been shown that:

a. The degradation will not result in water quality less than that prescribed in state and regional policies, including violation of one or more water quality objectives;

b. The degradation will not unreasonably affect present and anticipated future beneficial uses;

c. The discharger will employ Best Practicable Treatment or Control (BPTC) to minimize degradation; and

d. The degradation is consistent with the maximum benefit to the people of the state.

43. Constituents of concern that have the potential to degrade and pollute groundwater include organics and iron, manganese and arsenic; salts; and nitrogen, as discussed below:

*Organics, Iron, Manganese and Arsenic*

a. While reported BOD loading rates to the 150-acre LAA have been relative low compared to other facilities, the data presented in Findings 34 through 41 indicate that first encountered groundwater below the 150-acre LAA contains concentrations of arsenic, iron, and manganese that exceed those associated with groundwater that is unaffected by the discharge and the applicable State primary and secondary drinking water MCLs resulting in a condition of pollution. Groundwater data also show elevated ammonia concentrations, a lack of nitrate as nitrogen, and increasing TOC concentrations as groundwater moves across the site in the downgradient direction. These are symptoms of reducing conditions in groundwater caused by organic overloading of the site. The overloading is due to the uneven application of relatively high strength wastewater to long checks having coarse grained soils overlaying shallow groundwater. As a result of application practices, much more wastewater is applied to the head of the checks resulting in high organic matter loading rates over relatively small area.

The reducing conditions that create excess concentrations of arsenic, iron, and manganese in groundwater are reversible; arsenic, iron, and manganese will precipitate out of solution when organic overloading ceases and oxygen is
reintroduced to groundwater. This can be accomplished by the implementation of management practices to promote the even distribution of organic materials at rates that do not overwhelm the treatment capacity of the soils. To ensure the ongoing discharge does not result in further impermissible degradation, this Order sets a cycle average BOD loading limit of 100 lbs/acre/day to the 150-acre LAA and the new 53-acre LAA, over the course of an appropriate discharge cycle. This Order also requires the Discharger to implement measures to ensure the even application of wastes, and groundwater monitoring to confirm that water percolating to groundwater will not exacerbate existing groundwater pollution.

**Salts**

b. Groundwater levels of EC and TDS increase as groundwater moves across the 150-acre LAA in the downgradient direction. As noted in Finding 37, EC and TDS levels in MW-3 and MW-4 occasionally exceed the State drinking water recommended secondary MCLs of 900 umhos/cm and 500 mg/L, respectively. Bicarbonate is a large contributor to the EC and TDS levels and is another indicator of organic overloading. At a minimum the discharge has unreasonably degraded underlying groundwater with EC, TDS, and bicarbonate.

The Basin Plan limits the increase in EC of a discharge to land to 500 umhos/cm. The Basin Plan allows exceptions to the EC limit where the discharge exhibits a disproportionate increase in EC over the EC of the source water due to concentrations of organic dissolved solids from the raw food products, provided water quality objectives are met. With an annual average FDS of 925 mg/L and an annual average TDS of 2,636 mg/L, approximately 65 percent of the discharge TDS concentration is a result of organic compounds. The discharge meets the incremental EC limit exception. Under these conditions, it is not appropriate to apply the Basin Plan EC limit of 1,000 umhos/cm.

This Order requires the Discharger to submit a Salinity Management Plan to identify and implement additional methods to further reduce the salinity of the discharge to the maximum extent feasible. This Order also requires the Discharger to submit a Nutrient and Wastewater Management Plan that proposes measures to evenly distribute the applied wastes, ensures application of nutrients at reasonable agronomic rates, and determine an appropriate discharge cycle. Implementation of these plans and the measures described above to prevent organic overloading of the LAA’s should result in a reduction mass of salts discharged to the LAA’s and the bicarbonate concentration in groundwater at the 150-acre LAA, which in turn, should result in lower levels of EC and TDS. This, along with the implementation of a Salinity Management Plan should prevent the discharge from causing
degradation with salts of the groundwater beneath the LAA’s to the extent that it exceeds water quality objectives or adversely affects beneficial uses.

c. Nitrogen beneath the 150-acre LAA appears to be in the ammonia form in concentrations, that if converted to nitrate as nitrogen, would not exceed the State primary MCL of 10 mg/L. The RWD indicates the Discharger will maximize nitrogen uptake by double cropping the 150-acre LAA with corn and forage crops and planting a cover crop between the vineyards at the new 53-acre LAA. This Order includes groundwater limits that proscribe the discharge from causing groundwater beneath the LAA’s to contain nitrate as nitrogen in excess of the primary MCL of 10 mg/L or natural background quality, whichever is greater. The application of wastewater at agronomic rates for nitrogen loading should preclude degradation of groundwater beneath the LAA’s to the extent that it exceeds water quality objectives.

44. The Discharger provides control of the discharge or will provide control of the discharge as required by this Order, control of the discharge that incorporates:

a. Internal recycling of cooling water within the condenser cooling towers through as many cycles as is feasible before comingling with the winery process discharge;

b. Removal of pomace (seeds, pulp, skins) and spent diatomaceous earth offsite and implementation of a Solids Management Plan;

c. Double cropping at the 150-acre LAA, and vineyard and cover crop in the new 53-acre LAA to maximize uptake rates for nitrogen, other nutrients, and salts;

d. Application of supplemental irrigation water to meet agronomic requirements for crop growth;

e. A cycle average BOD loading rate of 100 lb/acre/day;

f. Even distribution of wastewater to the LAA’s;

g. Soil monitoring at the LAA’s;

h. Preparation and implementation of a Salinity Management Plan and a Nutrient and Wastewater Management Plan;

i. Groundwater monitoring; and

j. Groundwater limitations.
These control practices are reflective of BPTC of the discharge.

45. With respect to EC, TDS, bicarbonate, iron, manganese, and arsenic, an unacceptable degree of groundwater degradation/pollution has occurred. This Order establishes terms and conditions to ensure that the authorized discharge will not further degrade groundwater, contribute to existing pollution, or unreasonably affect present and anticipated future beneficial uses of groundwater.

46. Economic prosperity of valley communities and associated industry is of maximum benefit to the people of the State and, therefore, sufficient reason exists to accommodate growth and limited groundwater degradation around the Winery, provided that the terms of the Basin Plan are met. The Discharger aids in the economic prosperity of the region by the direct employment of about 30 full time and 45 seasonal employees. The Winery also provides additional benefits to California by purchasing material and services from approximately 175 vendors, contractors, and companies. Annually, the Winery purchases about $24 million worth of grapes grown in California, $2.5 million on purchasing local or California goods and services to operate the Winery, and pays $110,000 in property taxes.

47. This Order is consistent with the Anti-Degradation Policy since: (a) the Discharger has or will implement BPTC to minimize degradation, (b) the limited degradation allowed by this Order will not unreasonably affect present and anticipated future beneficial uses of groundwater, or result in water quality less than water quality objectives, and (c) the limited degradation is of maximum benefit to the people of the State.

Other Regulatory Considerations

48. Based on the threat and complexity of the discharge, the Winery is determined to be classified as 2B as defined below:

   a. Category 2 threat to water quality: “Those discharges of waste that could impair the designated beneficial uses of the receiving water, cause short-term violations of water quality objectives, cause secondary drinking water standards to be violated, or cause a nuisance.”

   b. Category B complexity: “Any discharger not included in Category A that has physical, chemical, or biological treatment systems (except for septic systems with subsurface disposal), or any Class 2 or Class 3 waste management units.”

49. California Code of Regulations, Title 27 (“Title 27”) contains regulatory requirements for the treatment, storage, processing, and disposal of solid waste, which includes designated waste, as defined by Water Code section 13173. However, Title 27
exempts certain activities from its provisions. Discharges regulated by this Order are exempt from Title 27 pursuant to provisions that exempt wastewater discharges. The exemption, found at Title 27, section 20090, is described below:

(b) Wastewater – Discharges of wastewater to land, including but not limited to evaporation ponds, percolation ponds, or subsurface leachfields if the following conditions are met:

1. The applicable regional water quality control board has issued WDRs, reclamation requirements, or waived such issuance;
2. The discharge is in compliance with applicable water quality control plan; and
3. The wastewater does not need to be managed according to Chapter 11, Division 4.5, Title 22 of this code as a hazardous waste.

50. The discharge authorized herein is exempt from the requirements of Title 27 in accordance with Title 27, section 20090(b) because:

a. The Central Valley Water Board is issuing WDRs.
b. The discharge authorized herein will comply with the Basin Plan, and;
c. The treated effluent discharged to the LAA’s does not need to be managed as hazardous waste.

51. Water Code section 13267(b) states that:

In conducting an investigation specified in subdivision (a), the Central Valley Water Board may require that any person who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge waste within its region... that could affect the quality of waters within its region shall furnish, under penalty of perjury, technical or monitoring program reports which the Central Valley Water Board requires. The burden, including costs, of these reports shall bear a reasonable relationship to the need for the report and the benefits to be obtained from the reports. In requiring those reports, the Central Valley Water Board shall provide the person with a written explanation with regard to the need for the reports, and shall identify the evidence that supports requiring that person to provide the reports.

52. The technical reports required by this Order and monitoring reports required by the attached MRP R5-2014-0094 are necessary to assure compliance with these waste discharge requirements. The Discharger operates the wastewater treatment facility that discharges the waste subject to this Order.

53. In compliance with Water Code section 106.3, it is the policy of the State of California that every human being has the right to safe, clean, affordable, and accessible water adequate for human consumption, cooking, and sanitary purposes. This Order
promotes that policy by requiring discharges to meet maximum contaminant levels designed to protect human health and ensure that water is safe for domestic use.

54. The California Department of Water Resources sets standards for the construction and destruction of groundwater wells (hereafter DWR Well Standards), as described in California Well Standards Bulletin 74-90 (June 1991) and Water Well Standards: State of California Bulletin 94-81 (December 1981). These standards, and any more stringent standards adopted by the state or county pursuant to Water Code section 13801, apply to all monitoring wells used to monitor the impacts of wastewater storage or disposal governed by this Order.

55. Fresno County, as lead agency, adopted an Initial Study and Mitigated Negative Declaration. On 29 April 2010, Fresno County filed a Notice of Determination (E201010000133) with Fresno County Clerk for a flow increase from 30 mgy to 70 mgy and an increase in LAA by 53 acres for a total of 203 acres of LAA at the Winery.

56. To mitigate potential impacts to water quality, the CEQA document included a mitigation measure requiring the Discharger to submit a complete RWD prior to initiating any operation that would increase flows over the current permitted limits prescribed in WDRs Order 92-120.

57. Pursuant to Water Code section 13263(g), discharge is a privilege, not a right, and adoption of this Order does not create a vested right to continue the discharge.

**Public Notice**

58. All the above and the supplemental information and details in the attached Information Sheet, which is incorporated by reference herein, were considered in establishing the conditions of discharge of this Order.

59. The Discharger and interested agencies and persons have been notified of the Central Valley Water Board’s intent to prescribe waste discharge requirements for this discharge, and they have been provided an opportunity to submit written comments and an opportunity for a public hearing.

60. All comments pertaining to the discharge were heard and considered in a public meeting.
IT IS HEREBY ORDERED that Waste Discharge Requirements Order 92-120, National Pollutant Discharge Elimination System (NPDES) Permit No. CA0081019, and Revised Monitoring and Reporting Program 92-120 are rescinded except for enforcement purposes. Pursuant to Water Code sections 13263 and 13267, The Wine Group, LLC, its agents, successors, and assigns, in order to meet the provisions contained in Division 7 of the Water Code and regulations adopted thereunder, shall comply with the following:

A. Discharge Prohibitions

1. Discharge of waste to surface waters or surface water drainage courses is prohibited.

2. Discharge of waste classified as ‘hazardous’, as defined in California Code of Regulations, title 23, section 2521(a), is prohibited.

4. Discharge of wastewater in a manner or location other than that described herein or in the RWD is prohibited.

5. Application of residual solids to the LAA’s is prohibited.

6. Discharge of domestic wastewater to the LAA’s or any surface water is prohibited.

B. Effluent and Mass Loading Limitations

1. The monthly average daily discharge flow shall not exceed 0.459 mgd and the total annual flow shall not exceed 70 mgy. [Compliance shall be determined at EFF-001]

2. The cycle average BOD loading rates to the 150-acre LAA and the new 53-acre LAA shall not exceed 100 lbs/acre/day over the course of any discharge cycle (i.e., the time between successive applications).

C. Discharge Specifications

1. No waste constituent shall be released, discharged, or placed where it will be released or discharged, in a concentration or in a mass that causes violation of Groundwater Limitations of this Order.
2. Wastewater treatment, storage, and disposal shall not cause pollution or a nuisance as defined by Water Code section 13050.

3. The discharge shall remain within the permitted waste treatment/containment structures and LAA’s at all times.

4. The Discharger shall operate all systems and equipment to optimize the quality of the discharge.

5. All conveyance, treatment, storage, and disposal units shall be designed, constructed, operated, and maintained to prevent inundation or washout due to floods with a 100-year return frequency.

6. Objectionable odors shall not be perceivable beyond the limits of the Winery or LAA’s at an intensity that creates or threatens to create nuisance conditions.

7. Storage of residual solids, including pomace and/or diatomaceous earth on areas not equipped with means to prevent storm water infiltration is prohibited.

8. Application of pomace and/or diatomaceous earth to the LAA’s is prohibited.

D. Land Application Area Specifications

1. Application of waste constituents to the LAA’s shall be at reasonable agronomic rates to preclude creation of a nuisance and degradation of groundwater, considering the crop, soil, climate, and irrigation management system. The annual nutritive loading of the LAA’s, including the nutritive value of organic and chemical fertilizers and of the wastewater shall not exceed the annual crop demand.

2. The Discharger shall ensure that water, BOD, and nitrogen are applied and distributed uniformly across each LAA field. The Discharger shall implement change to the irrigation system and/or operational practices as needed to ensure compliance with this requirement.

3. Wastewater shall not be discharged to the LAA’s in a manner that causes wastewater to stand for greater than 48 hours after irrigation ceases.

4. Any irrigation runoff shall be confined to the LAA’s and shall not enter any surface water drainage course or stormwater drainage system.
5. The perimeter of the LAA’s shall be graded to prevent ponding along public roads or other public areas and prevent runoff onto adjacent properties not owned or controlled by the Discharger.

6. The volume of wastewater applied to the LAA’s on any single day shall not exceed reasonable agronomic rates based on the vegetation grown, soil moisture, and weather conditions.

7. Hydraulic loading of wastewater and supplemental irrigation water shall be at reasonable agronomic rates designed to:
   a. Maximize crop nutrient uptake;
   b. Maximize breakdown of organic waste constituents in the root zone; and
   c. Minimize the percolation of waste constituents below the root zone.

8. Tailwater runoff and spray of wastewater shall not be discharged outside of the LAA’s.

9. Land application of wastewater shall be managed to minimize erosion.

10. The LAA’s shall be managed to prevent breeding of mosquitoes. In particular:
    a. All applied irrigation water must infiltrate within 48 hours;
    b. Tailwater ditches shall be maintained essentially free of emergent, marginal, and floating vegetation; and
    c. Low-pressure and unpressurized pipelines and ditches accessible to mosquitoes shall not be used to store recycled water.

11. Irrigation of the LAA’s shall occur only when appropriately trained personnel are on duty.

12. LAA’s shall be inspected as frequently as necessary to ensure continuous compliance with the requirements of this Order.

E. Solids Specifications

Solids, as used in this document, includes all residual solids, including but not limited to, grape stems and pomace, diatomaceous earth, and semisolid residues removed during grape processing, wine making, or cleaning of wine making equipment.
1. Any handling and storage of solids and sludge shall be temporary, and controlled and contained in a manner that minimizes leachate formation and precludes infiltration of waste constituent into soils in a mass or concentration that will violate groundwater limitations of this Order.

2. Collected screenings, sludge’s and other solids removed from the liquid waste shall be disposed of in a manner approved by the Executive Officer and consistent with Title 27. Removal for further treatment, disposal, or reuse at sites (i.e., landfill, composting sites, soil amendment sites) operated in accordance with valid waste discharge requirements issued by a regional water quality control board or as proposed in a Solids Management Plan approved by the Executive Officer will satisfy this specification.

3. Any proposed change in solids use or disposal practice shall be reported to the Executive Officer at least 90 days in advance of the change.

F. Groundwater Limitations

Release of waste constituents from any treatment, reuse, or storage component associated with the Winery or LAA’s shall not cause or contribute to groundwater containing constituent concentrations in excess of the concentrations specified below or natural background quality, whichever is greater:

1. Nitrate as Nitrogen of 10 mg/L

2. For constituents identified in Title 22, the MCLs quantified therein.

G. Provisions

1. The Discharger shall comply with the Standard Provisions and Reporting Requirements for Waste Discharge Requirements, dated 1 March 1991 (Standard Provisions), which are part of this Order.

2. The Discharger shall comply with MRP R5-2014-0094, which is part of this Order, and any revisions thereto as adopted by the Central Valley Water Board or approved by the Executive Officer.

3. The Discharger must comply with all conditions of this Order, including timely submittal of technical and monitoring reports. On or before each report due date, the Discharger shall submit the specified documents to the Central Valley Water Board or, if appropriate, a written report detailing compliance or noncompliance
with the specific schedule date and task. If noncompliance is being reported, then the Discharger shall state the reasons for such noncompliance and provide an estimate of the date when the Discharger will be in compliance. The Discharger shall notify the Central Valley Water Board in writing when it returns to compliance with the time schedule. Violations may result in enforcement action, including Central Valley Water Board or court orders requiring corrective action or imposing civil monetary liability, or in revision or rescission of this Order.

4. The Discharger must at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) that are installed or used by the Discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also include adequate laboratory controls and appropriate quality assurance procedures. This Provision requires the operation of back-up or auxiliary facilities or similar systems that are installed by the Discharger only when the operation is necessary to achieve compliance with the conditions of this Order.

5. As described in the Standard Provisions, the Discharger shall report promptly to the Central Valley Water Board any material change or proposed change in the character, location, or volume of the discharge.

6. At least 90 days prior to termination or expiration of any lease, contract, or agreement involving disposal or recycling areas or off-site reuse of effluent, used to justify the capacity authorized herein and assure compliance with this Order, the Discharger shall notify the Central Valley Water Board in writing of the situation and of what measures have been taken or are being taken to assure full compliance with this Order.

7. In the event of any change in control or ownership of the Winery, the Discharger shall notify the succeeding owner or operator of the existence of this Order by letter, a copy of which shall be immediately forwarded to the Central Valley Water Board.

8. To assume operation as a Discharger under this Order, the succeeding owner or operator must apply in writing to the Executive Officer requesting transfer of the Order. The request must contain the requesting entity’s full legal name, the state of incorporation if a corporation, the address and telephone number of the persons responsible for contact with the Central Valley Water Board, and a statement. The statement shall comply with the signatory paragraph of Standard Provision B.3 and state that the new owner or operator assumes full responsibility for compliance with this Order. Failure to submit the request shall be considered a discharge without requirements, a violation of the Water Code. If approved by the Executive Officer,
the transfer request will be submitted to the Central Valley Water Board for its
consideration of transferring the ownership of this Order at one of its regularly
scheduled meetings.

9. A copy of this Order, including its MRP, Information Sheet, Attachments, and
Standard Provisions, shall be kept at the discharge facility for reference by
operating personnel. Key operating personnel shall be familiar with its contents.

10. **By 8 December 2014**, the Discharger shall submit a Salinity Management Plan,
which identifies additional methods, and projected costs, that could potentially be
used to reduce the salinity of the discharge to the maximum extent feasible. The
Salinity Management Plan shall include a proposed implementation schedule and
shall be subject to review and approval of the Executive Officer.

11. **By 4 February 2015**, the Discharger shall submit a Nutrient and Wastewater
Management Plan for the LAA’s for Executive Officer approval. The Plan must
include procedures of daily monitoring of the LAA’s and proposed management
practices that will be implemented to ensure wastewater and the nutrients
contained therein are applied evenly at agronomic rates. The objective of the Plan
shall be to identify and utilize site specific data to demonstrate that wastewater
loading will occur at reasonable agronomic rates that will preclude degradation of
groundwater that will exceed Water Quality Objectives or adversely affect
Beneficial Uses.

12. **By 4 February 2015**, the Discharger shall submit a Solids Management Plan. The
Plan shall characterize the various solids removed at the Winery with respect to
organic matter, nutrients, salts, and metals; identify any practicable beneficial uses
(i.e., soil supplement, animal feed, biomass fuel, etc.); provide a description of the
tasks, costs, and time required to investigate and implement various beneficial
reuse elements in the Plan; and provide an implementation time schedule for
Executive Officer approval. The Discharger shall implement the approved plan in
accordance with the approved schedule.

13. The Discharger shall comply with the following schedule to replace MW-1.

<table>
<thead>
<tr>

14. In accordance with California Business and Professions Code sections 6735, 7835, and 7835.1, engineering and geologic evaluations and judgments shall be performed by or under the direction of registered professionals competent and proficient in the fields pertinent to the required activities. All technical reports specified herein that contain work plans for investigations and studies, that describe the conduct of investigations and studies or that contain technical conclusions and recommendations concerning engineering and geology shall be prepared by or under the direction of appropriately qualified professional(s), even if not explicitly stated. Each technical report submitted by the Discharger shall bear the professional’s signature and stamp.

15. The Central Valley Water Board is currently implementing the CV-SALTS initiative to develop a Basin Plan amendment that will establish a salt and nitrate management plan for the Central Valley. Through this effort the Basin Plan will be amended to define how the narrative water quality objectives are to be interpreted for the protection of agricultural use. If new information or evidence indicates that groundwater limitations are different that those prescribed herein are appropriate, this Order will be reopened to incorporate such limits.

16. The Central Valley Water Board will review this Order periodically and will revise requirements when necessary.

If, in the opinion of the Executive Officer, the Discharger fails to comply with the provisions of this Order, the Executive Officer may refer this matter to the Attorney General for judicial enforcement, may issue a complaint for administrative civil liability, or may take other enforcement actions. Failure to comply with this Order may result in the assessment of Administrative Civil Liability of up to $10,000 per violation, per day, depending on the violation, pursuant to the Water Code, including sections 13268, 13350 and 13385. The Central Valley Water Board reserves its right to take any enforcement actions authorized by law.

Any person aggrieved by this action of the Central Valley Water Board may petition the State Water Board to review the action in accordance with Water Code section 13320 and
California Code of Regulations, title 23, section 2050 and following. The State Water Board must receive the petition by 5:00 p.m., 30 days after the date of this Order, except that if the thirtieth day following the date of this Order falls on a Saturday, Sunday, or state holiday, the petition must be received by the State Water Board by 5:00 p.m. on the next business day. Copies of the law and regulations applicable to filling petitions may be found on the Internet at:

http://www.waterboards.ca.gov/public_notices/petitions/water_quality/

or will be provided upon request.

I, PAMELA C. CREEDON, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, Central Valley Region, on 8 August 2014.

A  Site Location Map
B  Standard Requirements for Monitoring Well Installation
   Work Plans and Monitoring Well Installation Reports
Monitoring and Reporting Program R5-2014-0094
Information Sheet
This monitoring and Reporting Program (MRP) is required pursuant to Water Code section 13267.

The Discharger shall not implement any changes to this MRP unless and until the Central Valley Water Board adopts or the Executive Officer issues a revised MRP. Changes to sample location shall be established with concurrence of Central Valley Water Board staff, and a description of the revised stations shall be submitted for approval by the Executive Officer. All samples shall be representative of the volume and nature of the discharge or matrix of material sampled. All analyses shall be performed in accordance with Standard Provisions and Reporting Requirements for Waste Discharge Requirements, dated 1 March 1991 (Standard Provisions).

Field test instruments (such as pH) may be used provided that the operator is trained in the proper use of the instrument and each instrument is serviced and/or calibrated at the recommended frequency by the manufacturer and in accordance with manufacturer instructions.

Analytical procedures shall comply with the methods and holding times specified in the following: Methods for Organic Chemical Analysis of Municipal and Industrial Wastewater (EPA); Test Methods for Evaluating Solid Waste (EPA); Methods for Chemical Analysis of Water and Wastes (EPA); Methods for Determination of Inorganic Substances in Environmental Samples (EPA); Standard Methods for the Examination of Water and Wastewater (APHA/AWWA/WEF); and Soil, Plant and Water Reference Methods for the Western Region (WREP 125). Approved editions shall be those that are approved for use by the United States Environmental Protection Agency or the California Department of Public Health’s Environmental Laboratory Accreditation Program. The Discharger may propose alternative methods for approval by the Executive Officer.

If monitoring consistently shows no significant variation in magnitude of a constituent concentration or parameter after at least 12 months of monitoring, the Discharger may request this MRP be revised to reduce monitoring frequency. The proposal must include adequate technical justification for the requested reduction in monitoring frequency.

A glossary of terms used within this MRP is included on page 11.
The Discharger shall monitor the following locations to demonstrate compliance with the requirements of this Order:

<table>
<thead>
<tr>
<th>Monitoring Location Name</th>
<th>Monitoring Location Description</th>

**SOURCE WATER MONITORING**

The Discharger shall monitor supply wells SPL-001 and SPL-002. For each source (either well or surface water supply), the Discharger shall calculate the flow-weighted average concentrations for the specified constituents utilizing monthly flow data and the most recent chemical analysis conducted in accordance with Title 22 drinking water requirements.

</tbody>
</table>

$^1$ With the exception of wastewater samples, samples must be filtered. If field filtering is not feasible, samples shall be collected in unpreserved containers and submitted to the laboratory within 24 hours with a request (on the chain-of-custody form) to immediately filter then preserve the sample.

$^2$ See glossary on page 11 for list of general mineral constituents.

**GROUNDWATER MONITORING**

After measuring water levels and prior to collecting samples, each monitoring well (MW-1 through MW-7) shall be adequately purged to remove water that has been standing within the well screen and casing that may not be chemically representative of formation water. Depending on the hydraulic conductivity of the geologic setting, the volume removed during purging is typically 3 to 5 volumes of the standing water within the well casing and screen, or additionally the filter pack pore volume.

The Discharger shall monitor monitoring wells MW-1 through MW-4 at the 150-acre LAA and MW-5 through MW-7 at the new 53-acre LAA, and any subsequent additional wells, for the following:
The Discharger shall maintain its groundwater monitoring well network. If a groundwater monitoring well(s) are dry for more than four consecutive sampling events, the Discharger shall submit a work plan and proposed time schedule to replace the well(s). The well(s) shall be replaced following written Executive Officer approval of the work plan and time schedule.

### SOIL MONITORING

The Discharger shall establish with concurrence of Central Valley Water Board staff, at least six soil profile monitoring locations within the LAA’s and at least two representative background location(s) (i.e., that historically have not received process wastewater). The Discharger shall submit a map to the Central Valley Water Board with the identified sample locations no fewer than **30 days** prior to the first sampling event in October following adoption of this Order. The samples shall be collected and analyzed for the constituents and frequencies specified below:

¹ Samples shall be collected at 6-inches, 2.5, 5, 7.5, and 10 feet below ground surface (bgs).

LAND APPLICATION AREA MONITORING

The Discharger shall perform the following routine monitoring and loading calculations for the 150-acre (LAA-001) and new 53-acre (LAA-002) LAA’s. In addition the Discharger shall keep a log of routine monitoring observations (e.g. areas of ponding, broken irrigation pipes, odors and/or flies within the LAA’s, etc.). Data shall be collected and presented in tabular format and shall include the following:

<table>

¹ Report to the nearest 0.01 inch.
2 National Weather Service data from the nearest weather station is acceptable.
3 Loading rates to be calculated using the applied volume of wastewater, applied acreage, and average of the four most recent concentrations for BOD$_5$.
4 The cycle average BOD$_5$ loading rates shall be calculated using applied volume of wastewater, applied acreage, and average of the four most recent concentrations for BOD$_5$ and divided by the number of days between applications.
5 Nitrogen and salt shall be calculated using the applied volume of wastewater, applied acreage, and average of the four most recent concentrations for total nitrogen and Fixed Dissolved Solids.
6 Additional nitrogen loading to the land application area from other sources (i.e. organic matter and manure).

REPORTING

All monitoring results shall be reported in Quarterly Monitoring Reports which are due by the first day of the second month after the calendar quarter. Therefore, monitoring reports are due as follows:

- First Quarter Monitoring Report: 1 May
- Second Quarter Monitoring Report: 1 August
- Third Quarter Monitoring Report: 1 November
- Fourth Quarter Monitoring Report: 1 February

A transmittal letter shall accompany each monitoring report. The transmittal letter shall discuss any violations that occurred during the reporting period and all actions taken or planned for correcting violations, such as operation or facility modifications. If the Discharger has previously submitted a report describing corrective actions or a time schedule for implementing the corrective actions, reference to the previous correspondence is satisfactory.

The following information is to be included on all monitoring and annual reports, as well as report transmittal letters, submitted to the Central Valley Water Board:

- Discharger Name
- Facility Name
- MRP Number
- Contact Information (telephone number and email)

In reporting monitoring data, the Discharger shall arrange the data in tabular form so that the date, the constituents, and the concentrations are readily discernible. The data shall be summarized in such a manner that illustrates clearly, whether the Discharger complies with waste discharge requirements.

In addition to the details specified in Standard Provision C.3, monitoring information shall include the method detection limit (MDL) and the reporting limit (RL) or practical quantitation limit (PQL). If the regulatory limit for a given constituent is less than the RL (or
PQL), then any analytical results for that constituent that are below the RL (or PQL) but above the MDL shall be reported and flagged as estimated.

Laboratory analysis reports do not need to be included in the monitoring reports; however, the laboratory reports must be retained for a minimum of three years in accordance with Standard Provision C.3.

All monitoring reports shall comply with the signatory requirements in Standard Provision B.3.

All monitoring reports that involve planning, investigation, evaluation, or design, or other work requiring interpretation and proper application of engineering or geologic sciences, shall be prepared by or under the direction of persons registered to practice in California pursuant to California Business and Professions Code sections 6735, 7835, and 7835.1.

At any time henceforth, the State or Central Valley Water Board may notify the Discharger to electronically submit monitoring reports using the State Water Board’s California Integrated Water Quality System (CIWQS) Program Web site (http://www.waterboards.ca.gov/ciwqs/index.html) or similar system. Until such notification is given, the Discharger shall submit hard copy monitoring reports.

A. All Quarterly Monitoring Reports shall include the following:

Wastewater Reporting

1. The results of Effluent Monitoring specified on page 2 and 3.

2. For each month of the quarter, calculation of the maximum daily flow and the monthly average flow.

3. For each month of the quarter, calculation of the monthly average effluent EC and BOD$_5$ concentrations.

Source Water Reporting

1. The results of Source Water Monitoring specified on page 3.

Groundwater Reporting

1. The results of Groundwater Monitoring specified on page 3 and 4. If there is insufficient water in the well(s) for sampling the monitoring well(s) shall be reported as dry for the quarter.
2. For each monitoring well, a table showing groundwater depth, elevation, and constituent concentrations for the five previous years, up through the current quarter.

3. A groundwater contour map based on groundwater elevations for that quarter. The map shall show the gradient and flow direction of groundwater flow. The map shall also include the locations of all monitoring wells and wastewater storage and/or disposal areas.

**Land Application Area Reporting**

1. The results of the routine monitoring and loading calculations specified on page 5 and 6.

2. Provide a Site Map of the LAA’s showing predominant features, and include field numbers (if applicable) and acreage where wastewater was applied.

3. For each month that wastewater is applied to the LAA’s, calculation of the monthly hydraulic load for wastewater and supplemental irrigation water (in million gallons) to each discrete irrigation area.

4. A summary of the notations made in the LAA’s monitoring log during each quarter. The entire contents of the log do not need be submitted.

**B. Fourth Quarter Monitoring Reports**, in addition to the above, shall include the following:

**Facility Information**

1. The names and general responsibilities of all persons in charge of wastewater management.

2. The names and telephone numbers of persons to contact regarding the facility for emergency and routine situations.

3. A statement certifying when the flow meter and other monitoring instruments and devices were last calibrated, including identification of who performed the calibrations (Standard Provision C.4).

4. A summary of any changes in processing that might affect waste characterization and/or discharge flow rates.
Solids Reporting

1. Annual production total solids (excluding trash and recyclables) in dry tons or cubic yards.

2. A description of disposal methods, including the following information related to the disposal methods used. If more than one method is used, include the percentage disposed of by each method.
   a. For landfill disposal, include: the name and location of the landfill, and the Order number of WDRs that regulate it.
   b. For land application, include: the location of the site, and the Order number of any WDRs that regulate it.
   c. For incineration, include: the name and location of the site where incineration occurs, the Order number of WDRs that regulate the site, the disposal method of ash, and the name and location of the facility receiving ash (if applicable).
   d. For composting, include: the location of the site, and the Order number of any WDRs that regulate it.
   e. For beneficial reuse at locations and by entities not operating under a WDRs, and as approved by the Executive Officer, include: the name and location of the site where the beneficial reuse occurs and/or solids are sent for beneficial reuse.

Soil Reporting

1. The tabulated results of Soil Monitoring as specified on page 4 and 5.

Land Application Area Reporting

1. The type of crop(s) grown in the LAA’s, planting and harvest dates, and the quantified nitrogen and fixed dissolved solids uptakes (as estimated by technical references or, preferably, determined by representative plant tissue analysis).

2. The monthly and annual discharge volume during the reporting year expressed in million gallons and inches.

3. A monthly balance for the reporting year that includes:
   a. Monthly crop uptake
i. Crop water utilization rates are available from a variety of publications available from the local University of California Davis extension office.

ii. Irrigation efficiency – Frequently, engineers include a factor for irrigation efficiency such that the application rate is slightly greater than the crop utilization rate. A conservative design does not include this value.

(a) Monthly average precipitation – this data is available at http://www.cimis.water.ca.gov/ or at http://www.ncdc.noaa.gov

(b) Monthly average and annual average discharge flow rates.

(c) Monthly estimates of the amount of wastewater percolating below the root zone (i.e., amount of wastewater applied in excess of crop requirements)

4. A summary of average and cycle BOD\textsubscript{5} loading rates.

5. The total pounds of nitrogen applied to the LAA’s, as calculated from the sum of the monthly loadings, and the total annual nitrogen loading to the LAA’s in lbs/acre-year.

6. The total pounds of fixed dissolved solids that have been applied to the LAA’s in lbs/acre-year, as calculated from the sum of the monthly loadings.

The Discharger shall implement the above monitoring program on the first day of the month following adoption of this Order.

(Date)
GLOSSARY

BOD$_5$  Five-day biochemical oxygen demand
CBOD  Carbonaceous BOD
DO  Dissolved oxygen
EC  Electrical conductivity at 25° C
FDS  Fixed dissolved solids
NTU  Nephelometric turbidity unit
TKN  Total Kjeldahl nitrogen
TDS  Total dissolved solids
TSS  Total suspended solids
Continuous  The specified parameter shall be measured by a meter continuously.
24-Hour Composite  Samples shall be a flow-proportioned composite consisting of at least eight aliquots.
Daily  Samples shall be collected at least every day.
Twice Weekly  Samples shall be collected at least twice per week on non-consecutive days.
Weekly  Samples shall be collected at least once per week.
Twice Monthly  Samples shall be collected at least twice per month during non-consecutive weeks.
Monthly  Samples shall be collected at least once per month.
Bimonthly  Samples shall be collected at least once every two months (i.e., six times per year) during non-consecutive months.
Quarterly  Samples shall be collected at least once per calendar quarter. Unless otherwise specified or approved, samples shall be collected in January, April, July, and October.
Semiannually  Samples shall be collected at least once every six months (i.e., two times per year). Unless otherwise specified or approved, samples shall be collected in April and October.
Annually  Samples shall be collected at least once per year. Unless otherwise specified or approved, samples shall be collected in October.
mg/L  Milligrams per liter
mL/L  milliliters [of solids] per liter
ug/L  Micrograms per liter
umhos/cm  Micromhos per centimeter
mgd  Million gallons per day
MPN/100 mL  Most probable number [of organisms] per 100 milliliters
General Minerals Analysis for General Minerals shall include at least the following:

General Minerals analyses shall be accompanied by documentation of cation/anion balance.
Background

Waste Discharge Requirements (WDRs) Order 92-120, National Pollutant Discharge Elimination System (NPDES) Permit No. CA0081019, adopted on 26 June 1992 authorize a daily discharge of 0.2 million gallons per day (mgd) of condenser cooling wastewater to Fink Ditch (discharge 001), and discharge of two waste streams to a 150-acre land application area (LAA): (1) up to 0.3 mgd (34 million gallons per year (mgy)) of winery wastewater (discharge 002), and (2) 0.3 mgd (11.3 mgy) of stillage wastewater (discharge 003) produced at the Sanger Winery (Winery) at 2916 South Reed Avenue in Sanger.

The Winery was formerly owned by The Beverage Source, Inc., a division of Erly Industries Inc., and in mid-1992, was sold to The Wine Group LLC (Discharger).

On 12 December 2000, a Notice of Violation issued to the Discharger indicated that there were additional waste streams other than those described in WDRs 92-120 being discharged. The Discharger was discharging regeneration water from an ion exchange unit and boiler blowdown water to a common sump where it was being comingled with the winery and stillage wastewaters before being applied to the LAA. On 2 May 2001, the Central Valley Water Board adopted Revised Monitoring and Reporting Program (MRP) 92-120 to include additional effluent monitoring constituents and monitoring requirements for the ion-exchange regenerant and boiler blowdown wastewaters streams.

Following the 2000 crush season, distillation operations (discharge 003) were terminated. NPDES Permit No. CA0081019 expired on 1 June 1997. The Discharger ceased discharging condenser cooling water to Fink Ditch (discharge 001) in 2001 by internally recycling its cooling water which, after use, becomes comingled with the process wastewater discharge. The Central Valley Water Board has not formally rescinded the NPDES requirements of NPDES Permit No. CA0081019 contained in WDRs 92-120.

On 27 June 2011, Kennedy/Jenks Consultants submitted a Report of Waste Discharge (RWD) on behalf of the Discharger for a proposed increase in wastewater flow, and land application area. The Discharger is proposing to increase its wastewater flows from 49 mgy up to 70 mgy. To accommodate the increase in flow, the RWD proposes to increase the current LAA acreage by an additional 53 acres for a total of 203 acres.

The 150-acre LAA is in sections 29 and 32 or Township 14 South, Range 23 East, Mount Diablo Base and Meridian (MDB&M). The Winery and the new 53-acre LAA are in sections
22 and 27 or Township 14 South, Range 23 East, MDB&M. The Discharger has not discharged any wastewater to the new 53-acre LAA.

**Discharge**

The Discharger produces wine and grape juice concentrate at the Winery. Wastewater at the Winery consists of cleaning and sanitation wastewater, ion-exchange regeneration waste, boiler blowdown and refrigeration units, condenser cooling water that is reused through multiple cycles before comingling, and filter backwash.

Wastewater is collected in trench drains throughout the Winery and conveyed to a sump where wastewater currently gravity flows to the 150-acre LAA. The 150-acre LAA is divided into long checks (1,250 ft to 2,500 ft). Wastewater is applied from east to west at the 150-acre LAA. Table 1 shows total annual wastewater flows generated at the winery.

<table>
<thead>
<tr>
<th>Year</th>
<th>Total Annual Wastewater (mgy)</th>

<td>46</td>
</tr>
<tr>
<td>2011</td>
<td>63</td>
</tr>
<tr>
<td>2012</td>
<td>69</td>
</tr>
</tbody>
</table>

The volume of wastewater generated at the Winery has increased since 2009 as follows: from 34 mgy in 2009 to 46 mgy in 2010 (35% increase), from 46 mgy in 2010 to 63 mgy in 2011 (37% increase), and from 63 mgy in 2011 to 69 mgy in 2012 (9% increase).

**Wastewater Characteristics**

The annual average quality of comingled wastewater is tabulated in Table 2 below.

</tbody>
</table>

FDS loading rates have increased from 1,380 lbs/acre/yr in 2009 to 3,528 lbs/acre/yr in 2012. TN loading rates have increased from 90 lbs/acre/yr in 2009 to 225 lbs/acre/yr in 2012.

The increase in total annual wastewater flows from 2009 to 2012 as shown in Table 1 have resulted in the increase in FDS, and TN loading rates to the 150-acre LAA as shown in Table 3.

Historical BOD loading rates to the 150-acre LAA during the processing season are tabulated in Table 4 below.

At a proposed total annual flow of 70 mgy, the distribution of wastewater to the 150-acre and the new 53-acre LAA’s was calculated as approximately 60 mgy and 10 mgy, respectively, based on monthly distribution patterns presented in the RWD. The FDS and TN loading rates to the 150-acre LAA and the new 53-acre LAA, based on the above distribution of wastewater flow to each of the LAA’s and an annual average (2012 data) constituent concentrations for FDS and TN are tabulated in Table 5.

Table 5. Proposed FDS and TN Loading Rates to the 150-acre and 53-acre LAA’s

</tr>
</tbody>
</table>

The Discharger does not have a consistent rest period between applications of wastewater at the 150-acre LAA. This Order requires the Discharger to submit a Nutrient and Wastewater Management Plan and determine an appropriate discharge cycle to meet the cycle average BOD limit of 100 lbs/acre/day at the 150-acre and the new 53-acre LAA’s. The estimated monthly average daily BOD loading rates to the 150-acre and new 53-acre LAA’s based on given worst case scenario wastewater application rates in the water balance and an average BOD concentration (from August through October of 2008 to 2012) of 3,036 mg/L are tabulated in Table 6.
Table 6. Estimated Monthly Average Daily BOD Loading Rates to the 150-acre and 53-acre LAA

</tbody>
</table>

The instantaneous and cycle average BOD loading rates to the 150-acre and new 53-acre LAA’s are much higher than the estimated monthly average daily and threatens to violate Effluent and Mass Loading Limitation B.2, Discharge Specifications C.1 and C.2, Land Application Area Specifications D.1 and D.2, and Groundwater Limitations of this Order.

Soil and Groundwater Conditions
Soils in the 150-acre LAA are coarse grained and consist of Hanford Fine Sandy Loam and Grangeville Fine Sandy Loam. Groundwater is shallow at 7 to 10 feet below ground surface (bgs) and flows in the southeast direction.

Soils in the new 53-acre LAA are primarily sandy loams and consist of Hanford Sandy Loam. Groundwater below the new 53-acre LAA is about 30 feet bgs and flows in the south direction.

The proposed Carmelita Mine, is immediately adjacent to both the 150-acre LAA and the new 53-acre LAA. Groundwater below the Carmelita Mine is approximately 15 to 30 feet bgs and flows in the southeast direction.

The Carmelita Mine has a groundwater monitoring well network consisting of three monitoring wells (MW-A, MW-B, and MW-C) that have a total depth of 50 feet. Groundwater quality below the Carmelita Mine, based on a single sampling event, is generally of good quality. Electrical conductivity in groundwater ranges from 98 to 571 umhos/cm, TDS ranges from 80 to 370 mg/L, bicarbonate ranges from 50 to 160 mg/L, calcium ranges from 9 to 48 mg/L, iron ranges from <0.05 to 0.11 mg/L, manganese ranges from less than 0.01 to 0.02 mg/L, and arsenic is less than 0.002 mg/L.

The Discharger installed three new groundwater monitoring wells (MW-5 through MW-7) in the new 53-acre LAA a mile and a half east of the 150-acre LAA. The three new groundwater monitoring wells were installed in August 2013 by Westex, Inc., utilizing air rotary method. Monitoring well MW-5 is the upgradient well and MW-6 and MW-7 are the downgradient wells.
The new monitoring wells have a 4-inch schedule 40 PVC pipe casing and screen. The wells have 30 feet of screen with a 0.02-inch slot size and a filter pack of Cemex #3 sand with bentonite-cement grout sanitary seal. The total depth below ground surface of the wells, screen interval, and depth to groundwater for each well are tabulated below.

*After well development

Groundwater below the new 53-acre LAA, based on a single sampling event, has an EC ranging from 510 to 990 umhos/cm, TDS from 310 to 670 mg/L, bicarbonate from 170 to 260 mg/L, calcium from 55 to 97 mg/L, iron from less than 0.05 to 0.11 mg/L, manganese from less than 0.01 to 0.02 mg/L, and arsenic less than 0.002 mg/L.

The 150-acre LAA has a groundwater monitoring well network of four wells (MW-1 through MW-4) that were installed in October 1985. Monitoring well MW-1 was installed as the upgradient well and MW-2 through MW-4 are the downgradient wells. The four monitoring wells have steel casing with a screen interval of approximately 30 feet. The total depth of the wells and screen interval is tabulated below.

Arsenic exceeds the primary MCL of 0.010 mg/L consistently in MW-1 and MW-3, relatively consistently in MW-4, and sporadically in MW-2, as shown in Table 9B. Arsenic in MW-1 exceeds the MCL 11 out of 18 sampling events; arsenic in MW-2 exceeds the MCL 2 out of 18 sampling events; arsenic in MW-3 exceeds the MCL 14 out of 18 sampling events; and MW-4 exceeds the MCL 7 out of 18 sampling events.

Figures 1 through 12 depict the quality of groundwater below the 150-acre LAA for EC, TDS, bicarbonate, iron, manganese, and arsenic.
Figure 1. EC in groundwater below the 150-acre LAA

Figure 2. TDS concentrations in groundwater below the 150-acre LAA
Groundwater EC, TDS, and bicarbonate increase as groundwater moves in the downgradient direction from MW-1 to MW-4 as shown in Figures 1, 2, and 3. EC and TDS concentrations in MW-3 and MW-4 occasionally exceed the EC MCL of 900 umhos/cm and the TDS MCL of 500 mg/L, with bicarbonate being a large contributor to TDS. Groundwater EC and TDS concentrations shown in Figures 1 and 2 follow a similar pattern as bicarbonate concentrations shown in Figure 3.

Iron concentrations in all of the groundwater monitoring wells (MW-1 through MW-4) at the 150-acre LAA have exceeded the iron MCL of 0.30 mg/L the majority of the time, based on 144 sampling events from June 2001 through June 2013.
Figure 4. Iron Concentrations in MW-1

Monitoring well MW-1, the upgradient well immediately adjacent to the 150-acre LAA, appears to have been impacted by the discharge. As shown in Figure 4, iron concentrations in MW-1 exceed the MCL 141 out 144 sampling events and show an increasing trend over time.

Figure 5. Iron Concentrations in MW-2

Monitoring well MW-1, the upgradient well immediately adjacent to the 150-acre LAA, appears to have been impacted by the discharge. As shown in Figure 4, iron concentrations in MW-1 exceed the MCL 141 out 144 sampling events and show an increasing trend over time.
Iron concentrations in MW-2 exceed the MCL 136 out of 144 sampling events and also show an increasing trend over time as shown in Figure 5.

Figure 6. Iron Concentrations in MW-3

For graphing purposes, half of the detection limit of 0.10 mg/L was utilized for sampling events reported as less than the detection limit.

Iron concentrations in MW-3 exceed the MCL 127 out of 144 sampling events and show an increasing trend over time as shown in Figure 6.

Figure 7. Iron Concentrations in MW-4

For graphing purposes, half of the detection limit of 0.10 mg/L was utilized for sampling events reported as less than the detection limit.
Iron concentrations in MW-4 exceed the MCL 128 out 144 sampling events and show an increasing trend over time as shown in Figure 7.

Manganese has also been detected in concentrations above the MCL of 0.050 mg/L in groundwater below the 150-acre LAA (see Figure 8).

As shown in Figure 8, manganese in groundwater exceeds the MCL of 0.050 mg/L by several orders of magnitude for all the monitoring wells at the 150-acre LAA. All of the 144 sampling events taken over a thirteen year period after stillage ceased in 2000 have detected manganese at levels above the MCL. Manganese concentrations in MW-1 are elevated exceeding their respective MCL of 0.050 mg/L with a gradual increase over time (see Figure 8).

Because monitoring data showed iron and manganese degradation/pollution of groundwater by the discharge, Central Valley Water Board staff recommended groundwater monitoring for arsenic. The Discharger began monitoring groundwater for arsenic in 2009. Figures 9 through 12 show arsenic in groundwater based on data from May 2009 through June 2013 (49 sampling events).
From May 2009 through June 2013, arsenic in MW-1 exceeded the MCL of 0.010 mg/L 19 out of 49 sampling events (see Figure 9).
Arsenic in MW-2 exceeds the MCL 2 out of 49 sampling events from May 2009 through June 2013, as shown in Figure 10.

Figure 11. Arsenic in Groundwater Monitoring Well MW-3

![Arsenic in MW-3](image1)

1 For graphing purposes, half of the detection limit of 0.010 mg/L was utilized for sampling events reported as less than the detection limit.

Arsenic in MW-3 exceeds the MCL 30 out of 49 sampling events from May 2009 through June 2013 as shown in Figure 11. Monitoring well MW-3 shows the greatest impacts to groundwater with respect arsenic.

Figure 12. Arsenic in Groundwater Monitoring Well MW-4

![Arsenic in MW-4](image2)

1 For graphing purposes, half of the detection limit of 0.010 mg/L was utilized for sampling events reported as less than the detection limit.
Arsenic in MW-4 has exceeded the MCL 12 out of 49 sampling events from May 2009 through June 2013 as shown in Figure 12.

The increase in groundwater EC, TDS, bicarbonate, total organic carbon, and ammonia levels in groundwater as it moves in the down gradient direction across the 150-acre LAA and iron, manganese, and arsenic pollution are symptoms of organic overloading of the site associated with wastewater discharges. Although calculated BOD loading rates are low compared to other sites, site specific conditions and application methods have resulted in unpermissable groundwater degradation and pollution.

As previously described, site soils are coarse grained and very permeable and groundwater is shallow. Wastewater is applied using border check irrigation to very long irrigation checks of 1,250 feet to 2,500 feet. Because of the coarse grained soils and long check lengths, large volumes of wastewater and/or long irrigation times are necessary to push applied water to the end of the irrigation checks. In 2012, the Discharger applied wastewater to the 150-acre LAA for several days consecutively without a rest period. The upper section of the 150-acre LAA (approximately 33 acres) near monitoring well MW-1 received wastewater continuously from 1 January 2012 to 21 March 2012 (81 days) without a rest period between applications. The 2013 self-monitoring reports indicate the Discharger continues to apply wastewater for several consecutive days to the 150 acre LAA. As a result, wastewater loading at the upper end of the checks is significantly higher than at the lower end of the checks. This uneven distribution of waste is not reflected in average BOD loading calculations, and in combination with coarse site soils and shallow depth to groundwater has resulted in reducing conditions in groundwater and concentrations of several constituents that exceed State drinking water MCLs.

**Basin Plan, Beneficial Uses, and Regulatory Considerations**

The beneficial uses of the underlying groundwater are municipal and domestic supply, agricultural supply, industrial service and industrial process.

The Basin Plan identifies the greatest long-term water quality problem facing the entire Tulare Lake Basin is increasing salinity in groundwater, a process accelerated due to the intensive use of soil and water resources by irrigated agriculture. The Basin Plan recognizes that degradation is unavoidable until there is a long-term solution to the salt.
imbalance. Until then, the Basin Plan establishes several salt management requirements, including:

a. The increase in EC of a point source discharge to surface water or land must be controlled to a maximum of 500 umhos/cm.

b. Discharges to areas that may recharge to good quality groundwater shall not exceed an EC of 1,000 umhos/cm, a chloride content of 175 mg/L, or a boron content of 1.0 mg/L. The Basin Plan generally applies these limits to industrial discharges to land.

The Basin Plan authorizes an exemption to the incremental increase limit for food processing industries that discharge to land and exhibit a disproportionate increase in EC of the discharge over the EC of the source water due to unavoidable concentrations of organic dissolved solids from the raw food product, provided that beneficial uses are protected. Exceptions shall be based on demonstration of best available technology and best management practices that control inorganic dissolved solids to the maximum extent feasible.

Antidegradation
State Water Board Resolution 68-16, the Statement of Policy with Respect to Maintaining High Quality of Waters in California (Anti-Degradation Policy), requires the regional water boards to maintain high quality water of the State until it is demonstrated that any change in quality will not result in water quality less than that described in State and Regional Water Board policies or exceed water quality objectives, will not unreasonably affect beneficial uses and is consistent with the maximum benefit to the people of the State.

The constituents of concern in the discharge from the Winery that have the potential to degrade and pollute groundwater are salinity (EC, TDS, sodium, and chloride), nitrates, organics, iron, manganese, and arsenic. Groundwater from nearby monitoring wells indicates groundwater in the area is generally of good quality with respect to EC, TDS, iron, manganese, and arsenic. Groundwater under the 150-acre LAA is degraded with respect to EC, TDS, and bicarbonate and polluted with iron, manganese, and arsenic. The degradation and pollution is due to the shallow depth to groundwater, the coarse grained permeable soils of the 150-acre LAA, and historic discharge practices that resulted in the uneven application of wastes. These waste discharge requirements and an accompanying Time Schedule Order require the Discharger to implement measures to abate discharge conditions that have resulted in groundwater pollution.

Specifically, the Discharger provides control of the discharge or will provide control of the discharge that incorporates or will incorporate:
1. Internal recycling of cooling water within the condenser cooling towers through as many cycles as is feasible before comingling with the winery process discharge;
2. Removal of pomace (seeds, pulp, skins) and spent diatomaceous earth offsite and the implementation of an approved Solids Management Plan;
3. Double cropping at of the LAA’s to maximize uptake rates for nitrogen, other nutrients, and salts;
4. Application of supplemental irrigation water to meet agronomic requirements for crop growth;
5. A cycle average BOD loading rate of 100 lbs/acre/day;
6. Even distribution of wastewater to the LAA’s;
7. Preparation and implementation of a Salinity Management Plan and a Nutrient and Wastewater Management Plan;
8. Groundwater monitoring; and

This Order establishes terms and conditions to ensure that the authorized discharge will not further degrade groundwater, contribute to existing pollution, or unreasonably affect present and anticipated future beneficial uses of groundwater. This Order is consistent with the Anti-Degradation Policy since: (a) the Discharger has or will implement Best Practicable Treatment or Control to minimize degradation, (b) the degradation will not unreasonably affect present and anticipated beneficial uses of groundwater, or result in water quality less than water quality objectives, and (c) the limited degradation is of maximum benefit to the people of the State, due to the economic benefits provided by the operation of the Winery.

CEQA
Fresno County, as lead agency, adopted Initial Study and Mitigated Negative Declaration. On 29 April 2010, filed a Notice of Determination (E201010000133) with Fresno County Clerk for a flow increase from 30 mgy to 70 mgy and an increase in LAA by 53 acres for a total of 203 acres of LAA.

To mitigate potential impact to water quality, the CEQA document includes a mitigation measure requiring the Discharger to submit a complete Report of Waste Discharge prior to initiating any operation that would increase flows over the current permitted limits prescribed in WDRs Order 92-120.

Title 27
Unless the Board finds that the discharge of designated waste is exempt from Title 27 of the California Code of Regulations, the release of designated waste is subject to full containment requirements. Here, the discharge is exempt from the requirements of Title 27 pursuant to the wastewater exemptions found at Title 27, sections 20090 (b).
Proposed Order Terms and Conditions

Discharge Prohibitions, Specifications and Provisions
The proposed Order prohibits the discharge of waste to surface waters and to surface water drainage courses. The proposed Order restricts the discharge to a monthly average daily flow limit of 0.459 mgd and a total annual flow limit of 70 mgy.

This Order sets cycle average BOD₅ loading rate limits of 100 lbs/acre/day at the 150-acre and at the new 53-acre LAA over the course of any discharge cycle. The proposed Order includes Provisions requiring the Discharger to submit a Salinity Management Plan, Nutrient and Wastewater Management Plan, Solids Management Plan, and a background groundwater quality investigation.

The accompanying Time Schedule Order R5-2014-0095 includes a time schedule for the Discharger to comply with the cycle average BOD loading rate at the LAA’s and assess the extent of the groundwater pollution and implement measures to bring groundwater back into compliance with water quality objectives.

The proposed Order prescribes groundwater limitations that ensure the discharge does not affect present and anticipated beneficial uses of groundwater. The limitations require that the discharge not cause or contribute to exceedances of water quality objectives or natural background water quality, whichever is greater. The proposed Order sets specific groundwater limits for nitrates as nitrogen at the primary MCL of 10 mg/L.

Monitoring Requirements
Section 13267 of the Water Code authorizes the Central Valley Water Board to require the Discharger to submit monitoring and technical reports as necessary to investigate the impact of a waste discharge on waters of the State.

The proposed Order includes effluent monitoring, source water monitoring, groundwater monitoring, soil monitoring, and land application area monitoring. This monitoring is necessary to characterize the discharge, evaluate compliance with effluent and mass loading limitations prescribed by the Order, and evaluate groundwater quality and the extent of degradation, if any, caused by the discharge.

Reopener
The conditions of discharge in the proposed Order were developed based on currently available technical information and applicable water quality laws, regulations, policies, and plans, and are intended to assure conformance with them. It may be appropriate to reopen the Order if new technical information is received or if applicable laws and regulations change.
Prior to installation of groundwater monitoring wells, the Discharger shall submit a work plan containing, at minimum, the information listed in Section 1, below. Wells may be installed after staff approves the work plan. Upon installation, the Discharger shall submit a well installation report that includes the information contained in Section 2, below. All work plans and reports must be prepared under the direction of, and certified by, a California registered geologist or civil engineer.

**SECTION 1 - Monitoring Well Installation Work Plan and Groundwater Sampling and Analysis Plan**

The monitoring well installation work plan shall contain, at minimum, the following information:

A. General Information:
   - Purpose of the well installation project
   - Brief description of local geologic and hydrogeologic conditions
   - Proposed monitoring well locations and rationale for well locations
   - Topographic map showing facility location, roads, and surface water bodies
   - Large-scaled site map showing all existing on-site wells, proposed wells, surface water bodies and drainage courses, buildings, waste handling facilities, utilities, and major physical and man-made features

B. Drilling Details:
   - On-site supervision of drilling and well installation activities
   - Description of drilling equipment and techniques
   - Equipment decontamination procedures
   - Cuttings disposal methods
   - Soil sampling intervals (if appropriate); logging methods; number and location of soil samples and rationale; and sample collection, preservation, and analytical methods

C. Monitoring Well Design (in graphic form with rationale provided in narrative form):
   - Diagram of proposed well construction details
     - Borehole diameter
     - Casing and screen material, diameter, and centralizer spacing (if needed)
     - Type of well caps (bottom cap either screw on or secured with stainless steel screws)
- Anticipated depth of well, length of well casing, and length and position of perforated interval
- Thickness, position and composition of surface seal, sanitary seal, and sand pack
- Anticipated screen slot size and filter pack

D. Well Development (not to be performed until at least 48 hours after sanitary seal placement):
   Method of development to be used (i.e., surge, bail, pump, etc.)
   Parameters to be monitored during development and record keeping technique
   Method of determining when development is complete
   Disposal of development water

E. Well Survey (precision of vertical survey data shall be at least 0.01 foot):
   Identify the Licensed Land Surveyor or Civil Engineer that will perform the survey
   Datum for survey measurements
   List well features to be surveyed (i.e., top of casing, horizontal and vertical coordinates, etc.)

F. Schedule for Completion of Work

G. Appendix: Groundwater Sampling and Analysis Plan (SAP)
   The Groundwater SAP, a guidance document that is referred to by individuals responsible for conducting groundwater monitoring and sampling activities, shall contain, at a minimum, a detailed written description of standard operating procedures for:
   - Equipment to be used during sampling
   - Equipment decontamination procedures
   - Water level measurement procedures
   - Well purging (include a discussion of procedures to follow if three casing volumes cannot be purged)
   - Monitoring and record keeping during water level measurement and well purging (include copies of record keeping logs to be used)
   - Purge water disposal
   - Analytical methods and required reporting limits
   - Sample containers and preservatives
   - Sampling
     - General sampling techniques
     - Record keeping during sampling (include copies of record keeping logs)
SECTION 2 - Monitoring Well Installation Report

The monitoring well installation report must provide the information listed below. In addition, the report must also clearly identify, describe, and justify any deviations from the approved work plan.

A. General Information:
   - Purpose of the well installation project
   - Number of monitoring wells installed and identifying label(s) for each
   - Brief description of geologic and hydrogeologic conditions encountered during well installation
   - Topographic map showing facility location, roads, surface water bodies
   - Large-scaled site map showing all previously existing wells, newly installed wells, surface water bodies and drainage courses, buildings, waste handling facilities, utilities, and other major physical and man-made features.

B. Drilling Details (in narrative and/or graphic form):
   - On-site supervision of drilling and well installation activities
   - Drilling contractor and driller’s name
   - Description of drilling equipment and techniques
   - Equipment decontamination procedures
   - Well boring log (provide for each well)
     - Well boring number and date drilled
     - Borehole diameter and total depth
     - Total depth of open hole (i.e., total depth drilled if no caving or back-grouting occurs)
     - Depth to first encountered groundwater and stabilized groundwater depth
     - Detailed description of soils encountered, using the Unified Soil Classification System

C. Well Construction Details (provide for each well):
   - Well construction diagram including:
     - Monitoring well number and date constructed
     - Casing and screen material, diameter, and centralizer spacing (if needed)
     - Length of well casing
     - Length and position of slotted casing and size of perforations
- Thickness, position and composition of surface seal, sanitary seal, and sand pack
- Type of well caps (bottom cap either screw on or secured with stainless steel screws)

E. Well Development (provide for each well):
   Date(s) and method of development
   How well development completion was determined
   Volume of water purged from well and method of development water disposal

F. Well Survey (provide for each well):
   Reference elevation at the top rim of the well casing with the cap removed (feet above mean sea level to within 0.01 foot)
   Ground surface elevation (feet above mean sea level to within 0.01 foot)
   Horizontal geodetic location, where the point of beginning shall be described by the California State Plane Coordinate System, 1983 datum, or acceptable alternative (provide rationale)
   Present the well survey report data in a table

G. Water Sampling:
   Date(s) of sampling
   Sample identification
   How well was purged
   Analytical methods used
   How many well volumes purged
   Laboratory analytical data sheets
   Levels of temperature, EC, and pH at stabilization
   Water level elevation(s)
   Sample collection, handling, and preservation methods
   Groundwater contour map

H. Soil Sampling (if applicable):
   Date(s) of sampling
   Sample collection, handling, and preservation methods
   Sample identification
   Analytical methods used
   Laboratory analytical data sheets
   Present soil sampling data in a table

I. Well Completion Report(s) (as defined in California Water Code §13751). Blank forms are available from California Department of Water Resources’ website www.water.ca.gov. Submit this section under separate cover.
J. Appendix - include, at a minimum, copies of the following:
   County-issued well construction permits
   Registered engineer or licensed surveyor’s report and field notes
   Field notes from well development
A. General Provisions:

1. The requirements prescribed herein do not authorize the commission of any act causing injury to the property of another, or protect the Discharger from liabilities under federal, state, or local laws. This Order does not convey any property rights or exclusive privileges.

2. The provisions of this Order are severable. If any provision of this Order is held invalid, the remainder of this Order shall not be affected.

3. After notice and opportunity for a hearing, this Order may be terminated or modified for cause, including, but not limited to:
   a. Violation of any term or condition contained in this Order;
   b. Obtaining this Order by misrepresentation, or failure to disclose fully all relevant facts;
   c. A change in any condition that results in either a temporary or permanent need to reduce or eliminate the authorized discharge;
   d. A material change in the character, location, or volume of discharge.

4. Before making a material change in the character, location, or volume of discharge, the discharger shall file a new Report of Waste Discharge with the Regional Board. A material change includes, but is not limited to, the following:
   a. An increase in area or depth to be used for solid waste disposal beyond that specified in waste discharge requirements.
   b. A significant change in disposal method, location or volume, e.g., change from land disposal to land treatment.
   c. The addition of a major industrial, municipal or domestic waste discharge facility.
   d. The addition of a major industrial waste discharge to a discharge of essentially domestic sewage, or the addition of a new process or product by an industrial facility resulting in a change in the character of the waste.
5. Except for material determined to be confidential in accordance with California law and regulations, all reports prepared in accordance with terms of this Order shall be available for public inspection at the offices of the Board. Data on waste discharges, water quality, geology, and hydrogeology shall not be considered confidential.

6. The discharger shall take all reasonable steps to minimize any adverse impact to the waters of the state resulting from noncompliance with this Order. Such steps shall include accelerated or additional monitoring as necessary to determine the nature and impact of the noncompliance.

7. The discharger shall maintain in good working order and operate as efficiently as possible any facility, control system, or monitoring device installed to achieve compliance with the waste discharge requirements.

8. The discharger shall permit representatives of the Regional Board (hereafter Board) and the State Water Resources Control Board, upon presentations of credentials, to:
   a. Enter premises where wastes are treated, stored, or disposed of and facilities in which any records are kept,
   b. Copy any records required to be kept under terms and conditions of this Order,
   c. Inspect at reasonable hours, monitoring equipment required by this Order, and
   d. Sample, photograph and video tape any discharge, waste, waste management unit, or monitoring device.

9. For any electrically operated equipment at the site, the failure of which would cause loss of control or containment of waste materials, or violation of this Order, the discharger shall employ safeguards to prevent loss of control over wastes. Such safeguards may include alternate power sources, standby generators, retention capacity, operating procedures, or other means.

10. The fact that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with this Order shall not be a defense for the discharger’s violations of the Order.

11. Neither the treatment nor the discharge shall create a condition of nuisance or pollution as defined by the California Water Code, Section 13050.

12. The discharge shall remain within the designated disposal area at all times.

B. General Reporting Requirements:

1. In the event the discharger does not comply or will be unable to comply with any prohibition or limitation of this Order for any reason, the discharger shall notify the Board by telephone at (916) 464-3291 [Note: Current phone numbers for all three Regional Board offices may be found on the internet at http://www.swrcb.ca.gov/rwqcb5/contact_us.] as soon as it or its agents
have knowledge of such noncompliance or potential for noncompliance, and shall confirm this notification in writing within **two weeks**. The written notification shall state the nature, time and cause of noncompliance, and shall include a timetable for corrective actions.

2. The discharger shall have a plan for preventing and controlling accidental discharges, and for minimizing the effect of such events.

   This plan shall:

   a. Identify the possible sources of accidental loss or leakage of wastes from each waste management, treatment, or disposal facility.

   b. Evaluate the effectiveness of present waste management/treatment units and operational procedures, and identify needed changes of contingency plans.

   c. Predict the effectiveness of the proposed changes in waste management/treatment facilities and procedures and provide an implementation schedule containing interim and final dates when changes will be implemented.

   The Board, after review of the plan, may establish conditions that it deems necessary to control leakages and minimize their effects.

3. All reports shall be signed by persons identified below:

   a. **For a corporation:** by a principal executive officer of at least the level of senior vice-president.

   b. **For a partnership or sole proprietorship:** by a general partner or the proprietor.

   c. **For a municipality, state, federal or other public agency:** by either a principal executive officer or ranking elected or appointed official.

   d. A duly authorized representative of a person designated in 3a, 3b or 3c of this requirement if;

      (1) the authorization is made in writing by a person described in 3a, 3b or 3c of this provision;

      (2) the authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity, such as the position of plant manager, operator of a waste management unit, superintendent, or position of equivalent responsibility. (A duly authorized representative may thus be either a named individual or any individual occupying a named position); and

      (3) the written authorization is submitted to the Board.
Any person signing a document under this Section shall make the following certification:

“I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of the those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.”

4. Technical and monitoring reports specified in this Order are requested pursuant to Section 13267 of the Water Code. Failing to furnish the reports by the specified deadlines and falsifying information in the reports, are misdemeanors that may result in assessment of civil liabilities against the discharger.

5. The discharger shall mail a copy of each monitoring report and any other reports required by this Order to:

California Regional Water Quality Control Board
Central Valley Region
11020 Sun Center Drive, #200
Rancho Cordova, CA 95670-6114

Note: Current addresses for all three Regional Board offices may be found on the internet at http://www.swrcb.ca.gov/rwqcb5/contact_us.
or the current address if the office relocates.

C. Provisions for Monitoring:

1. All analyses shall be made in accordance with the latest edition of: (1) *Methods for Organic Chemical Analysis of Municipal and Industrial Wastewater* (EPA 600 Series) and (2) *Test Methods for Evaluating Solid Waste* (SW 846-latest edition). The test method may be modified subject to application and approval of alternate test procedures under the Code of Federal Regulations (40 CFR 136).

2. Chemical, bacteriological, and bioassay analysis shall be conducted at a laboratory certified for such analyses by the State Department of Health Services. In the event a certified laboratory is not available to the discharger, analyses performed by a noncertified laboratory will be accepted provided a Quality Assurance-Quality Control Program is instituted by the laboratory. A manual containing the steps followed in this program must be kept in the laboratory and shall be available for inspection by Board staff. The Quality Assurance-Quality Control Program must conform to EPA guidelines or to procedures approved by the Board.

Unless otherwise specified, all metals shall be reported as Total Metals.

3. The discharger shall retain records of all monitoring information, including all calibration and maintenance records, all original strip chart recordings of continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to
complete the application for this Order. Records shall be maintained for a minimum of three years from the date of the sample, measurement, report, or application. This period may be extended during the course of any unresolved litigation regarding this discharge or when requested by the Regional Board Executive Officer.

Record of monitoring information shall include:

a. the date, exact place, and time of sampling or measurements,
b. the individual(s) who performed the sampling of the measurements,
c. the date(s) analyses were performed,
d. the individual(s) who performed the analyses,
e. the laboratory which performed the analysis,
f. the analytical techniques or methods used, and
g. the results of such analyses.

4. All monitoring instruments and devices used by the discharger to fulfill the prescribed monitoring program shall be properly maintained and calibrated at least yearly to ensure their continued accuracy.

5. The discharger shall maintain a written sampling program sufficient to assure compliance with the terms of this Order. Anyone performing sampling on behalf of the discharger shall be familiar with the sampling plan.

6. The discharger shall construct all monitoring wells to meet or exceed the standards stated in the State Department of Water Resources Bulletin 74-81 and subsequent revisions, and shall comply with the reporting provisions for wells required by Water Code Sections 13750 through 13755.22

D. Standard Conditions for Facilities Subject to California Code of Regulations, Title 23, Division 3, Chapter 15 (Chapter 15)

1. All classified waste management units shall be designed under the direct supervision of a California registered civil engineer or a California certified engineering geologist. Designs shall include a Construction Quality Assurance Plan, the purpose of which is to:

a. demonstrate that the waste management unit has been constructed according to the specifications and plans as approved by the Board.

b. provide quality control on the materials and construction practices used to construct the waste management unit and prevent the use of inferior products and/or materials which do not meet the approved design plans or specifications.

2. Prior to the discharge of waste to any classified waste management unit, a California registered civil engineer or a California certified engineering geologist must certify that the waste management unit meets the construction or prescriptive standards and performance goals in Chapter 15, unless an engineered alternative has been approved by the Board. In the case of an engineered alternative, the registered civil engineer or a certified engineering geologist must
certify that the waste management unit has been constructed in accordance with Board-approved plans and specifications.

3. Materials used to construct liners shall have appropriate physical and chemical properties to ensure containment of discharged wastes over the operating life, closure, and post-closure maintenance period of the waste management units.

4. Closure of each waste management unit shall be performed under the direct supervision of a California registered civil engineer or a California certified engineering geologist.

E. Conditions Applicable to Discharge Facilities Exempted from Chapter 15 Under Section 2511

1. If the discharger’s wastewater treatment plant is publicly owned or regulated by the Public Utilities Commission, it shall be supervised and operated by persons possessing certificates of appropriate grade according to California Code of Regulations, Title 23, Division 4, Chapter 14.

2. By-pass (the intentional diversion of waste streams from any portion of a treatment facility, except diversions designed to meet variable effluent limits) is prohibited. The Board may take enforcement action against the discharger for by-pass unless:

   a. (1) By-pass was unavoidable to prevent loss of life, personal injury, or severe property damage. (Severe property damage means substantial physical damage to property, damage to the treatment facilities that causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a by-pass. Severe property damage does not mean economic loss caused by delays in production); and

   (2) There were no feasible alternatives to by-pass, such as the use of auxiliary treatment facilities or retention of untreated waste. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a by-pass that would otherwise occur during normal periods of equipment downtime or preventive maintenance; or

   b. (1) by-pass is required for essential maintenance to assure efficient operation; and

   (2) neither effluent nor receiving water limitations are exceeded; and

   (3) the discharger notifies the Board ten days in advance.

The permittee shall submit notice of an unanticipated by-pass as required in paragraph B.1. above.

3. A discharger that wishes to establish the affirmative defense of an upset (see definition in E.6 below) in an action brought for noncompliance shall demonstrate, through properly signed, contemporaneous operating logs, or other evidence, that:
a. an upset occurred and the cause(s) can be identified;

b. the permitted facility was being properly operated at the time of the upset;

c. the discharger submitted notice of the upset as required in paragraph B.1. above; and

d. the discharger complied with any remedial measures required by waste discharge requirements.

In any enforcement proceeding, the discharger seeking to establish the occurrence of an upset has the burden of proof.

4. A discharger whose waste flow has been increasing, or is projected to increase, shall estimate when flows will reach hydraulic and treatment capacities of its treatment, collection, and disposal facilities. The projections shall be made in January, based on the last three years’ average dry weather flows, peak wet weather flows and total annual flows, as appropriate. When any projection shows that capacity of any part of the facilities may be exceeded in four years, the discharger shall notify the Board by 31 January.

5. Effluent samples shall be taken downstream of the last addition of wastes to the treatment or discharge works where a representative sample may be obtained prior to disposal. Samples shall be collected at such a point and in such a manner to ensure a representative sample of the discharge.

6. Definitions

a. Upset means an exceptional incident in which there is unintentional and temporary noncompliance with effluent limitations because of factors beyond the reasonable control of the Discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper action.

b. The monthly average discharge is the total discharge by volume during a calendar month divided by the number of days in the month that the facility was discharging. This number is to be reported in gallons per day or million gallons per day.

Where less than daily sampling is required by this Order, the monthly average shall be determined by the summation of all the measured discharges by the number of days during the month when the measurements were made.

c. The monthly average concentration is the arithmetic mean of measurements made during the month.

d. The “daily maximum” discharge is the total discharge by volume during any day.
The “daily maximum” concentration is the highest measurement made on any single discrete sample or composite sample.

A “grab” sample is any sample collected in less than 15 minutes.

Unless otherwise specified, a composite sample is a combination of individual samples collected over the specified sampling period;

(1) at equal time intervals, with a maximum interval of one hour

(2) at varying time intervals (average interval one hour or less) so that each sample represents an equal portion of the cumulative flow.

The duration of the sampling period shall be specified in the Monitoring and Reporting Program. The method of compositing shall be reported with the results.

7. Annual Pretreatment Report Requirements:

Applies to dischargers required to have a Pretreatment Program as stated in waste discharge requirements.)

The annual report shall be submitted by 28 February and include, but not be limited to, the following items:

a. A summary of analytical results from representative, flow-proportioned, 24-hour composite sampling of the influent and effluent for those pollutants EPA has identified under Section 307(a) of the Clean Water Act which are known or suspected to be discharged by industrial users.

The discharger is not required to sample and analyze for asbestos until EPA promulgates an applicable analytical technique under 40 CFR (Code of Federal Regulations) Part 136. Sludge shall be sampled during the same 24-hour period and analyzed for the same pollutants as the influent and effluent sampling analysis. The sludge analyzed shall be a composite sample of a minimum of 12 discrete samples taken at equal time intervals over the 24-hour period. Wastewater and sludge sampling and analysis shall be performed at least annually. The discharger shall also provide any influent, effluent or sludge monitoring data for nonpriority pollutants which may be causing or contributing to Interference, Pass Through or adversely impacting sludge quality. Sampling and analysis shall be performed in accordance with the techniques prescribed in 40 CFR Part 136 and amendments thereto.

b. A discussion of Upset, Interference, or Pass Through incidents, if any, at the treatment plant which the discharger knows or suspects were caused by industrial users of the system. The discussion shall include the reasons why the incidents occurred, the corrective actions taken and, if known, the name and address of the industrial user(s) responsible. The discussion shall also include a review of the applicable pollutant limitations to determine whether any
additional limitations, or changes to existing requirements, may be necessary to prevent Pass Through, Interference, or noncompliance with sludge disposal requirements.

c. The cumulative number of industrial users that the discharger has notified regarding Baseline Monitoring Reports and the cumulative number of industrial user responses.

d. An updated list of the discharger’s industrial users including their names and addresses, or a list of deletions and additions keyed to a previously submitted list. The discharger shall provide a brief explanation for each deletion. The list shall identify the industrial users subject to federal categorical standards by specifying which set(s) of standards are applicable. The list shall indicate which categorical industries, or specific pollutants from each industry, are subject to local limitations that are more stringent that the federal categorical standards. The discharger shall also list the noncategorical industrial users that are subject only to local discharge limitations. The discharger shall characterize the compliance status through the year of record of each industrial user by employing the following descriptions:

(1) Complied with baseline monitoring report requirements (where applicable);

(2) Consistently achieved compliance;

(3) Inconsistently achieved compliance;

(4) Significantly violated applicable pretreatment requirements as defined by 40 CFR 403.8(f)(2)(vii);

(5) Complied with schedule to achieve compliance (include the date final compliance is required);

(6) Did not achieve compliance and not on a compliance schedule;

(7) Compliance status unknown.

A report describing the compliance status of any industrial user characterized by the descriptions in items (d)(3) through (d)(7) above shall be submitted quarterly from the annual report date to EPA and the Board. The report shall identify the specific compliance status of each such industrial user. This quarterly reporting requirement shall commence upon issuance of this Order.

e. A summary of the inspection and sampling activities conducted by the discharger during the past year to gather information and data regarding the industrial users. The summary shall include but not be limited to, a tabulation of categories of dischargers that were inspected and sampled; how many and how often; and incidents of noncompliance detected.
f. A summary of the compliance and enforcement activities during the past year. The summary shall include the names and addresses of the industrial users affected by the following actions:

(1) Warning letters or notices of violation regarding the industrial user’s apparent noncompliance with federal categorical standards or local discharge limitations. For each industrial user, identify whether the apparent violation concerned the federal categorical standards or local discharge limitations;

(2) Administrative Orders regarding the industrial user’s noncompliance with federal categorical standards or local discharge limitations. For each industrial user, identify whether the violation concerned the federal categorical standards or local discharge limitations;

(3) Civil actions regarding the industrial user’s noncompliance with federal categorical standards or local discharge limitations. For each industrial user, identify whether the violation concerned the federal categorical standards or local discharge limitations;

(4) Criminal actions regarding the industrial user’s noncompliance with federal categorical standards or local discharge limitations. For each industrial user, identify whether the violation concerned the federal categorical standards or local discharge limitations;

(5) Assessment of monetary penalties. For each industrial user identify the amount of the penalties;

(6) Restriction of flow to the treatment plant; or

(7) Disconnection from discharge to the treatment plant.

g. A description of any significant changes in operating the pretreatment program which differ from the discharger’s approved Pretreatment Program, including, but not limited to, changes concerning: the program’s administrative structure; local industrial discharge limitations; monitoring program or monitoring frequencies; legal authority of enforcement policy; funding mechanisms; resource requirements; and staffing levels.

h. A summary of the annual pretreatment budget, including the cost of pretreatment program functions and equipment purchases.

i. A summary of public participation activities to involve and inform the public.

j. A description of any changes in sludge disposal methods and a discussion of any concerns not described elsewhere in the report.

Duplicate signed copies of these reports shall be submitted to the Board and:
