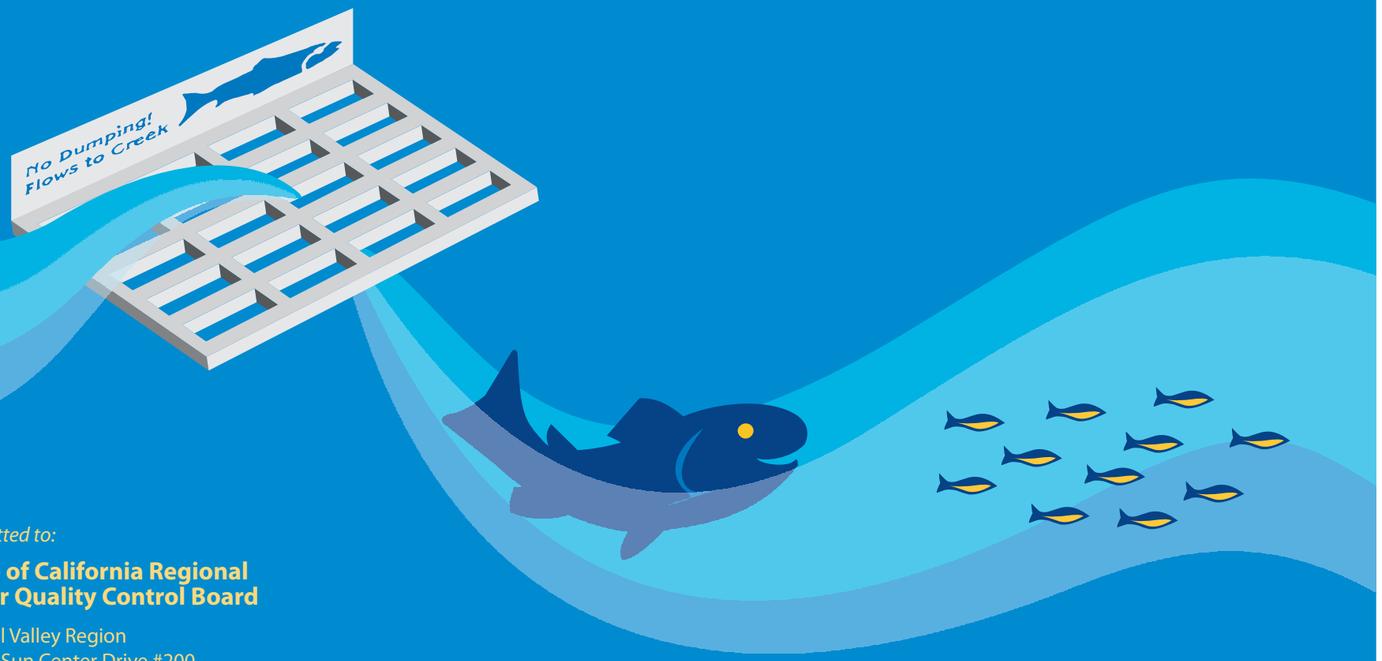
SQIP

STORMWATER QUALITY IMPROVEMENT PLAN



FOR THE COUNTY OF SACRAMENTO AND THE CITIES OF CITRUS HEIGHTS, ELK GROVE, FOLSOM, GALT, AND RANCHO CORDOVA

SQIP

Stormwater Quality Improvement Plan

FOR THE COUNTY OF SACRAMENTO AND THE CITIES OF
SACRAMENTO, CITRUS HEIGHTS, ELK GROVE, FOLSOM, GALT, AND RANCHO CORDOVA

APRIL 2009

Submitted to:

State of California Regional Water Quality Control Board

Central Valley Region
11020 Sun Center Drive #200
Rancho Cordova, CA 95670-6114

Municipal Services Agency

Department of Water Resources
Keith DeVore, Director

Terry Schutten, County Executive

Paul J. Hahn, Administrator

County of Sacramento

CERTIFICATION

for the

Sacramento Stormwater Quality Improvement Plan

April 30, 2009

In accordance with Title 40, Section 122.22, Paragraphs (a)(3), (b)(1) and (d) of the Code of Federal Regulations:

I certify under penalty of law that the Sacramento Stormwater Quality Improvement Plan (regional and Sacramento County-specific activities), dated April 30, 2009, and all associated attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Executed on the 28th day of April, 2009 in Sacramento, California.

Stormwater Quality Improvement Plan (SQIP)

For Sacramento County and cities of Sacramento,
Citrus Heights, Elk Grove, Folsom, Galt and Rancho Cordova

APRIL 2009

Table of Contents

Glossary

Executive Summary

Chapter 1 – Introduction

1.1 Overview 1–1
1.2 Background 1–1
1.3 Overall Goals and Strategy 1–11
1.4 Overview of SQIP Implementation 1–12

Chapter 2 – Partnership Activities

2.1 Introduction 2.1–1
2.2 Program Management 2.2–1
2.3 Program Effectiveness 2.3–1
2.4 Monitoring Program 2.4–1
2.5 Target Pollutant Program 2.5–1
2.6 Regional Public Outreach Program 2.6–1
2.7 Regional Commercial/Industrial Program 2.7–1

Chapter 3 – Sacramento County SQIP

3.1 Overview 3.1–1
3.2 Program Management 3.2–1
3.3 Construction Element 3.3–1
3.4 Commercial/Industrial Element 3.4–1
3.5 Municipal Operations Element 3.5–1
3.6 Illicit Discharge Element 3.6–1
3.7 Public Outreach Element 3.7–1
3.8 New Development Element 3.8–1

Chapter 4 – City of Sacramento SQIP

4.1 Introduction 4.1–1
4.2 Program Management 4.2–1
4.3 Construction Element 4.3–1
4.4 Commercial/Industrial Element 4.4–1
4.5 Municipal Operations Element 4.5–1
4.6 Illicit Discharge Element 4.6–1
4.7 Public Outreach Element 4.7–1
4.8 New Development Element 4.8–1

Chapter 5 – Citrus Heights SQIP

5.1 Introduction 5–1
5.2 Program Management and Training 5–5
5.3 Construction Element 5–19
5.4 Commercial/Industrial Element 5–25
5.5 Municipal Operations Element 5–29
5.6 Illicit Discharge Element 5–37
5.7 Public Outreach Element 5–43
5.8 New Development Element 5–47

Chapter 6 – Elk Grove SQIP

6.1 Introduction 6–1
6.2 Program Management and Realted Activities..... 6–4
6.3 Construction Element 6–17
6.4 Commercial/Industrial Element 6–21
6.5 Municipal Operations Element 6–25
6.6 Illicit Discharge Element 6–30
6.7 Public Outreach Element 6–34
6.8 New Development Element 6–37

Chapter 7 – Folsom SQIP

7.1 Introduction 7–1
7.2 Program Management 7–5
7.3 Construction Element 7–15
7.4 Commercial/Industrial Element 7–19
7.5 Municipal Operations Element 7–23
7.6 Illicit Discharge and Detection Element 7–30
7.7 Public Outreach Element 7–34
7.8 New Development Element 7–40

Chapter 8 – Galt SQIP

8.1 Introduction 8-1
8.2 Program Management and Related Activities 8-4
8.3 Construction Element 8-14
8.4 Commercial/Industrial Element 8-17
8.5 Municipal Operations Element 8-20
8.6 Illicit Discharge Element 8-23
8.7 Public Outreach Element 8-28
8.8 New Development Element 8-30

Chapter 9 – Rancho Cordova SQIP

9.1 Introduction 9–1
9.2 Program Management 9–5
9.3 Construction Element 9–19
9.4 Commercial/Industrial Element 9–25
9.5 Municipal Operations Element 9–29
9.6 Illicit Discharge Element 9–35
9.7 Public Outreach Element 9–39
9.8 New Development Element 9–43

List of Tables *(Chapters 1 and 2 only)*

1.2-1 Typical Pollutants Associated with Urban Land Use Activities 1–2
1.2-2 Sacramento Area Watersheds 1–7
1.4-1 Examples of Partnership and Permittee-Specific Activities in the SQIP 1–15
2.2-1 Regional Program Managmement Activity Work Plan 2.2–4
2.3-1 Summary of Outcome Types 2.3–3
2.3-2 Assessment Methods Suitable for Various Outcome Levels 2.3–4
2.4-1 Monitoring Program Manag. Questions and Outcome Levels... 2.4–2
2.4-2 Monitoring Program 2008-2013 Activities and Strategey 2.4–2
2.4-3 Historic Monitoring Activities 2.4–3
2.4-4 Water Quality Monitoring Consistuent List 2.4–9
2.4-5 Regional Monitoring Program Activites Work Plan..... 2.4–17
2.5-1 Priotorized Target Pollutant Groups 2.5–2
2.5-2 Regional Target Pollutant Activites Work Plan..... 2.5–14
2.6-1 Watershed and Enviromental Groups 2.6–7
2.6-2 Regional Public Outreach Activites Work Plan..... 2.6–18
2.7-1 Regional Commercial/Industrial Activites Work Plan 2.7–11

List of Figures *(Chapters 1 and 2 only)*

1.2-1 Permit Area Map 1–6
1.2-2 Sacramento Area Watershed Map 1–9
2.2-1 Permittee Share of Regional Activity Cost 2.2–2

2.3-1 Stormwater Program Iterative Process 2.3–1
2.3-2 General Classification of Outcome Types 2.3–2
2.4-1 2008-2013 Term Monitoring Sites 2.4–8
2.5-1 Target Pollutant Identifiifaction and Control Process 2.5–4

List of Appendices

Appendix 1 Introduction & Joint Activities
1A Sacramento Areawide NPDES Municipal Stormwater Permit (NPDES No. CAS082597; Order NO. R5-2008-0142)
1B Regulatory Background and Requirements
1C History of the Sacramento Stormwater Management Program

Appendix 2 Joint Activities
2A Memorandum of Understanding for the Sacramento Stormwater Quality Partnership
2B Sacramento Stormwater Quality Partnership Hydromodification Management Work Plan
2C Pilot Watershed - New Development BMP Effectiveness Evaluation Work Plan
2D 2009 Target Pollutant Update
2E Environmental Management Department Regulatory Fee Ordinance
2F Referral Process for Industrial General Permit Non-Filers

Appendix 3 County of Sacramento
3A Statement of Legal Authority
3B IPM Policy
3C Procedures for Manhole and Pump Station Sump Inspection and Cleaning
3D Guidelines for Operating and Maintaining Creeks and Channels
3E Street Sweeping Prioritization
3F Detention Basin Maintenance
3G Application Standards Herbicides and Pesticides
3H Procedures for Conducting On Going Screening for Illicit Connection
3I Hazardous Materials Program
3J Emergency Response To Hazardous Materials Incidents

Appendix 4 City of Sacramento
4A Program Element Accomplishments
4B City Stormwater Ordinance (13.16)
4C City Grading Ordinance (15.88)
4D Statement of Legal Authority
4E Sacramento City and County EMD MOU (2003)
4F City Organization Chart
4G City of Sacramento Standard Specifications (June 2007) Section 16 Water Quality Control

4H Administration Penalty Guidelines for Prohibited Non-Stormwater Discharges
4I Wastewater Collection Standard Operating Procedure (SOP)
4J 2004 Facility Audit
4K Storm Water Pollution Prevention Plan (SWPPP) example
4L Facility Pollution Prevention Plan (FPPP) example
4M Integrated Pest Management (IPM) Policy and "adoption mechanism"
4N Structural IPM Contract

Glossary

Commonly Used Acronyms and Terms for the Stormwater Quality Improvement Plan

COMMONLY USED ACRONYMS

Acronym/Term	*Full Name*
AGC	Associated General Contractors of California
AIA	American Institute of Architects
ALEER	Action Level Exceedance Evaluation Report
ALs	Technology -based numeric action levels
ASCE	American Society of Civil Engineers
ASLA	American Society of Landscape Architects
ATS	Active Treatment System
BASMAA	Bay Area Stormwater Management Agencies Association
BAT	Best Available Technology
BCT	Best Conventional Pollutant Control Technology
BERC	Business Environment Resource Center (for Sacramento area)
BIA	Building Industry Association
BLM	Biotic Ligand Model
BMP	Best Management Practice
BOD	Biochemical Oxygen Demand
CABs	Compliance Assistance Bulletins
Cal Fed	California Bay-Delta Authority
CAQ	Conservation Air Quality
CASQA	California Association of Stormwater Quality Agencies
CaWaLUP	California Water and Land Use Partnership
CBSCP	Complaint-Based Stormwater Compliance Program
CCC	California Conservation Corps
CCSD	Cosumnes Community Service District
CELSOC	Consulting Engineers and Land Surveyors of California

CEQA	California Environmental Quality Act
CFR	Code of Federal Regulations
CIP	Capital Improvement Project
CISCP	Commercial and Industrial Stormwater Compliance Program
CMP	Sacramento Coordinated Monitoring Program
COC	Constituents of Concern
COD	Chemical Oxygen Demand
CSWMP	Comprehensive Stormwater Management Plan
CTR	California Toxics Rule
CUPA	Certified Unified Program Agency
CWA	Clean Water Act
CWBP	Clean Water Business Partner
DDT	Dichlorodiphenyl-trichloroethane
DI	Storm Drain Inlet
DO	Dissolved Oxygen
DOC	Dissolved Organic Carbon
DPR	California Department of Pesticide Regulation
DQEP	Data Quality Evaluation Plan
DQO	Data Quality Objective
DSP	Development Standards Plan
EHD	Environmental Health Division of the Environmental Management Department (Sacramento County)
EIR	Environmental Impact Report
EMD	Environmental Management Department (Sacramento County)
EPA	U.S. Environmental Protection Agency
ESC	Erosion and Sediment Control
FPPP	Facility Pollution Prevention Plan
FTE	Full Time Equivalent
GIS	Geographic Information System
HHW	Household Hazardous Waste
HMD	Hazardous Materials Division of the Environmental Management Department (Sacramento County)
HMP	Hydromodification Management Plan
ICBO	International Conference of Building Officials

IPM	Integrated Pest Management
ISAT	Impervious Surface Analysis
L&L	Landscaping & Lighting
LAFCo	(Sacramento) Local Area Formation Commission
LCWC	Laguna Creek Watershed Council
LID	Low Impact Development
LTE	Long Term Effectiveness
MCL	Maximum Contaminant Level
MDL	Method Detection Limit
MEP	Maximum Extent Practicable
mg/L	milligrams per liter
µg/L	micrograms per liter
MOU	Memorandum of Understanding
MS4	Municipal Separate Storm Sewer System
N/A	Not Applicable
NAWQA	National Water Quality Assessment
NEC	No Exposure Certificiation
NEL	Technology-based Numeric Effluent Limitations
NEMDC	Natomas East Main Drainage Canal
NEPA	National Environmental Policy Act
NOI	Notice of Intent
NONA	Notice of Non-Applicability
NOTs	Notice of Termination
NOV	Notice of Violation
NPDES	National Pollutant Discharge Elimination System
NR	Natural Resources
NWQE	Notice of Water Quality Exceedance
OP	Organophosphorus (e.g., OP Pesticides)
OWOW	Our Water Our World
PAHs	Polycyclic Aromatic Hydrocarbons
PCO	Pest Control Operator
PCSWQCP	Post Construction Stormwater Quality Control Plans
REAP	Rain Event Action Plan
RGO	Retail Gasoline Outlet

RMP	Risk Management Plan
ROWD	Report of Waste Discharge
RWA	Regional Water Authority
RWLs	Receiving Water Limitations
RWQE	Report of Water Quality Exceedance
SACOG	Sacramento Area Council of Governments
SASD	Sacramento Area Sanitation District
SCS	Stormwater Compliance Section within the Water Protection Division of the Environmental Management Department (Sacramento County)_
SIC	Standard Industrial Classification
SMUD	Sacramento Municipal Utility District
SPLASH	Students Protection Lake and Stream Habitats
SQIP	Stormwater Quality Improvement Plan
SRCSD	Sacramento Regional County Sanitation District SRWP Sacramento River Watershed Program
SUSMP	Standard Urban Stormwater Mitigation Plan
SWAMP	Surface Water Ambient Monitoring Program
SWPPP	Stormwater Pollution Prevention Plan
SYRCL	South Yuba River Citizens League
TDS	Total Dissolved Solids
TIE	Toxicity Identification Evaluation
TMDL	total maximum daily load
TOC	Total Organic Carbon
TRE	Toxicity Reduction Evaluation
TSS	Total Suspended Solids
UPC	Urban Pesticide Committee
USBR	US Bureau of Reclamation District
USGS	United States Geological Survey
WDID	Waste Discharge Identification
WEF	Water Environment Federation
WPD	Water Protection Division of the Environmental Management Department (Sacramento County)
WQOs	Water Quality Objectives
WRAPP	Wetland and Riparian Area Protection Policy

WSCS	Wastewater Source Control Section of the Sacramento Regional County Sanitation District
WWPC	Water Wise Pest Control

COMMONLY USED TERMS

303(d) List : Section 303(d) of the Clean Water Act requires that each State in the U.S. create and maintain a list of Waters of the State that are not attaining water quality standards after technology-based limits are put into place. This list is commonly referred to as the "303(d) List". In California, 303(d) Lists are developed and updated on an approximately triennial basis by the nine Regional Water Quality Control Boards (Regional Water Boards). For waters on this list (and where the EPA administrator deems they are appropriate) each Regional Board is to develop total maximum daily loads (TMDLs). EPA is required to review and approve updates to each 303(d) List, or establish an alternative list.

Adverse Impact: a detrimental effect upon water quality or beneficial uses caused by a discharge or loading of a pollutant or pollutants.

Authorized Discharge: any discharge that is authorized pursuant to a National Pollutant Discharge Elimination System (NPDES) permit or meets the conditions set forth inCalifornia Regional Water Quality Control Board Central Valley Region, Order No. R5-2008-0142, NPDES No. CAS082597...

Bacteria: Single-celled microorganisms that lack chlorophyll; some cause disease, others are necessary to sustain life.

Baseflow: Portion of stream flow that is not due to storm runoff and is supported by groundwater seepage into a channel.

Basin Plan: The *Water Quality Control Plan, Fourth Edition, for the Sacramento and San Joaquin River Basins*. The Basin Plan designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve water quality objectives for all waters of the Basin.

Best management practice (BMP): Methods, measures, or practices designed and selected to reduce or eliminate the discharge of pollutants to surface waters from point and nonpoint source discharges including stormwater. BMPs include structural and nonstructural controls, and operation and maintenance procedures, which can be applied before, during, and/or after pollution producing activities.

Best Available Technology Economically Achievable (BAT) and Best Conventional Pollutant Control Technologies (BCT) or Best Practicable Treatment or Control (BPTC): Requirement of State Water Resources Control Board Resolution 68-16 – "Statement of Policy with Respect to Maintaining High Quality of Waters in California" (referred to as the "Antidegradation Policy"). BPTC is the treatment or control of a discharge necessary to assure that "(a) a pollution or nuisance will not occur and (b) the highest water quality consistent with maximum benefit to the people of the State will be maintained."

Bioassessment (biological assessment): The use of biological community information, along with the measure of the physical/habitat quality, to determine the integrity of a water body. The EPA defines biological integrity as "*the ability of an aquatic ecosystem to support and maintain a balanced, integrated, adaptive community of organisms having a species composition, diversity and functional organization comparable to that of the natural habitats of a region."*

Biochemical oxygen demand (BOD): Quantity of dissolved oxygen used by microorganisms (e.g., bacteria) during the biochemical oxidation of matter (both organic and oxidizable inorganic matter) over a specified period of time.

Biofiltration: Use of natural materials and vegetation to trap and remove pollutants from stormwater.

California Environmental Quality Act (CEQA) – Process of informing governmental agencies and the public about the potential significant environmental effects of proposed activities. CEQA applies to projects undertaken, funded or requiring an issuance of a permit by a public agency.

Channel: Natural or artificial waterway that periodically or continuously contains moving water. Channels have a definite bed and banks that confine the water.

Channel erosion: Widening, deepening, and headward cutting of small channels and waterways due to erosion caused by moderate to larger floods.

Check dam: Small dam placed perpendicular to a stream to enhance aquatic habitat or placed perpendicular in swales to reduce runoff velocities, promote sediment deposition, and enhance infiltration.

Chemical oxygen demand (COD): Quantity of maximum oxidizable matter in a sample.

Clean Water Act (CWA): (33 U.S.C. 1251 et seq.) Requirements of the National Pollutant Discharge Elimination System (NPDES) program are defined under Sections 307, 402, 318, and 405 of the CWA.

Commercial Facilities/Development: Related to the Commercial/Industrial Element, refer to the Environmental Management Department's Fee Ordinance (Appendix F) and related to the New Development Element, refer to the Stormwater Quality Design Manual for Sacramento and South Placer Regions.

Construction: Clearing, grading, excavating, etc. that result in soil disturbance. Construction includes structure teardown. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility; emergency construction activities required to immediately protect public health and safety; interior remodeling with no outside exposure of construction material or construction waste to storm water; mechanical permit work; or sign permit work.

Control: To minimize, reduce, eliminate, or prohibit by technological, legal, contractual or other means, the discharge of pollutants from an activity or activities.

Culvert: Covered channel or a large diameter pipe that crosses under a road, sidewalk, etc.

Debris: Any material, organic or inorganic, floating or submerged, moved by a flowing stream.

Design storm: Rainfall event of specified size and return frequency that is used to calculate the runoff volume and peak flows to a stormwater quality treatment facility.

Detention basin: Constructed basin that temporarily stores stormwater runoff and releases it at controlled rates.

Detention time: Time required for detention of stormwater runoff in a stormwater quality facility.

Development: Any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail and other non-residential projects, including public agency projects; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

Development Standards: standards that the Permittees must develop and implement for new development and significant redevelopment projects to control the discharge of stormwater pollutants.

Discharge: Release or flow of stormwater or other substance from a conveyance system or storage container.

Dissolved oxygen: Oxygen that is present (dissolved) in water and available for use by fish and other aquatic animals.

Disturbed Area: An area that is altered as a result of clearing, grading and/or excavation.

Diversion: Channel, embankment or other man-made structure constructed to divert water from one area to another (Soil Conservation Society of America, 1982).

Drawdown: Gradual reduction in water level in a detention facility due to discharge by the outfall or combined effect of infiltration and evaporation.

Drop inlet: Entrance to the piped storm drain system designed to collect runoff from streets and pavements.

Dry weather flow: Flow occurring during the dry season (generally considered to be May through September) that may be associated with reservoir releases or releases of water from industrial, commercial, or residential activities.

Environmental Impact Report (EIR) - An EIR is an environmental document produced during the CEQA process to assess the significant environmental impacts of a project.

End-of-pipe control: Water quality control technologies suited for control of urban stormwater at the point of stormwater discharge to a waterway.

Energy dissipation: Loss of kinetic energy of moving water due to internal turbulence, boundary friction, change in flow direction, contraction, or expansion.

Erosion: Wearing away of land surface by wind or water. Occurs naturally from weather or runoff, but can be intensified by land-clearing practices relating to farming, residential or industrial development, road building, or timber cutting.

Floodplain: Any low land that borders a stream or waterway and is inundated periodically by its waters.

Freeboard: Vertical distance between design water surface elevation and elevation of the bank, levee or revetment that contains the water.

General Permit for Stormwater Discharges Associated with Construction Activities (Construction General Permit): the general NPDES permit adopted by the State Board, which authorizes the discharge of stormwater from construction activities under certain conditions.

General Permit for Stormwater Discharges Associated with Industrial Activities (Industrial General Permit): the general NPDES permit adopted by the State Water Board which authorizes the discharge of stormwater from certain industrial activities under certain conditions.

Grading: Cutting and/or filling of land surface to a desired slope or elevation.

Gravitational settling: Tendency of particulate matter to "drop out" of stormwater runoff as it flows downstream when runoff velocities are moderate and/or slopes are not too steep.

Groundwater table: Level below which the soil is saturated (i.e., where pore spaces between individual soil particles are filled with water).

Habitat: Place where a biological organism lives. Describes the organic and non-organic surroundings that provide life requirements such as food and shelter.

Hazardous material or substance:

1. Any material that poses a threat to human health and/or the environment. Typical hazardous substances are toxic, corrosive, ignitable, explosive, or chemically reactive.
2. Any substance named by EPA to be reported if a designated quantity of the substance is spilled in the waters of the United States or otherwise emitted into the environment.

Hazardous waste: By-products of industrial processes or society that can pose a substantial or potential hazard to human health or the environment when improperly managed. Possesses at least one of four characteristics (flammable, corrosive, reactive, or toxic) or appears on special EPA lists.

Heavy metals: Metals of relatively high atomic weight, including but not limited to chromium, copper, lead, mercury, nickel, and zinc. These metals are found in minimal quantities in stormwater, but can be highly toxic even at trace levels.

Hydrology: A scientific discipline concerned with the waters of the Earth, including their occurrence, distribution, and circulation via the hydrologic cycle and interactions with living things. It also deals with the chemical and physical properties of water in all its phases.

Hydromodification: The change in the natural watershed hydrologic processes and runoff characteristics (i.e., interception, infiltration, overland flow, interflow and groundwater flow) caused by urbanization or other land use changes that result in increased stream flows and sediment transport. In addition, alteration of stream and river channels, installation of dams and water impoundments, and excessive stream bank and shoreline erosion are also considered hydromodification, due to their disruption of natural watershed hydrologic processes.

Illicit Connection: Any man-made conveyance that is connected to the storm drain system without a permit, excluding roof drains and other similar type connections. Examples include channels, pipelines, conduits, inlets, or outlets that are connected directly to the storm drain system.

Illicit Discharge: Any discharge to the storm drain system that is prohibited under local, state, or federal statutes, ordinances, codes, or regulations. The term illicit discharge includes all non stormwater discharges except discharges pursuant to an NPDES permit, discharges that are identified in **Discharge Prohibitions** of California Regional Water Quality Control Board Central Valley Region, Order No. R5-2008-0142, NPDES No. CAS082597, and discharges authorized by the Regional Water Board.

Impermeable: Properties that prevent the movement of water through the material.

Impervious surface: Material that resists or blocks the passage of water.

Industrial Facilities/Development: Related to the Commercial/Industrial Element, refer to the Environmental Management Department's Fee Ordinance (Appendix F) and related to the New Development Element, refer to the Stormwater Quality Design Manual for Sacramento and South Placer Regions.

Infiltration: The downward entry of water into the surface of the soil.

Infiltration basin: A basin where incoming stormwater runoff is stored until it gradually infiltrates through the soil of the basin floor.

Inlet: Entrance into a ditch, storm drain system, stormwater treatment facility, or other waterway.

Inspection: entry and the conduct of an on-site review of a facility and its operations, at reasonable times, to determine compliance with specific municipal or other legal requirements. The steps involved in performing an inspection, include, but are not limited to:

a. Pre-inspection documentation research;
b. Request for entry;
c. Interview of facility personnel;
d. Facility walk-through.
e. Visual observation of the condition of facility premises;
f. Examination and copying of records as required;
g. Sample collection if necessary or required;
h. Exit conference to discuss preliminary evaluation; and,
i. Report preparation, and if appropriate, recommendations for coming into compliance.

Level spreader: Device used to spread out stormwater runoff uniformly over the ground surface as sheet flow (i.e., not through channels). The purpose of level spreaders is to prevent concentrative, erosive flows from occurring and to enhance infiltration.

Low Impact Development (LID): A stormwater management and land development strategy that emphasizes conservation and the use of on-site natural features integrated with engineered, small-scale hydrologic controls to more closely reflect pre-development hydrologic functions.

Maximum Extent Practicable (MEP): The technology-based standard established by Congress in CWA section 402(p)(3)(B)(iii) that operators of MS4s must meet. Technology-based standards establish the level of pollutant reductions that dischargers must achieve; typically by treatment or by a combination of source control and treatment control BMPs. MEP generally emphasizes pollution prevention and source control BMPs primarily (as the first line of defense) in combination with treatment methods serving as a backup (additional line of defense). MPE considers economics and is generally, but not necessarily, less stringent than BAT. A definition for MEP is not provided either in the statute or in the regulations. Instead the municipalities propose their definition of MEP by way of their storm water management plans (SWMP). The Permittees' total collective and individual activities conducted pursuant to the storm water management plans (i.e. Stormwater Quality Improvement Plan or SQIP) becomes their proposal for MEP as it applies both to their overall effort, as well as to specific activities (e.g., MEP for street sweeping, or MEP for MS4 maintenance). For a fuller discussion of this standard see California Regional Water Quality Control Board Central Valley Region, Order No. R5-2008-0142, NPDES No. CAS082597.

Method Detection Limit (MDL): The minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in 40 CFR 136, Appendix B.

Monitoring Program: Sacramento Stormwater Monitoring Program

Municipal Separate Storm Sewer System (MS4): A conveyance or system of conveyances (including roads with drainage systems, municipal streets, alleys, catch basins, curbs, gutters, ditches, manmade channels, or storm drains) owned by a State, city, county, town or other public body that is designed or used for collecting or conveying stormwater, which is not a combined sewer, and which is not part of a publicly owned treatment works, and which discharges to Waters of the United States.

Natural buffer: Low sloping area of maintained grassy or woody vegetation located between a pollutant source and a waterbody. A natural buffer is formed when a designated portion of a developed piece of land is left unaltered from its natural state during development.

National Pollutant Discharge Elimination System (NPDES): The national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits under CWA §307, 402, 318, and 405.

Natural Drainage Systems: Unlined or unimproved (not engineered) creeks, streams, rivers or similar waterways.

New Development: Land disturbing activities; structural development, including construction or installation of a building or structure, and creation of impervious surfaces.

Non-stormwater discharge: Any discharge to a storm drain that is not composed entirely of stormwater. Certain non-stormwater discharges are authorized per the Sacramento NPDES Municipal Stormwater Permit.

Non-structural source control measure: Low-technology, low-cost activity, procedure or management practice designed to prevent pollutants associated with site functions and activities from being discharged with stormwater runoff. Examples include good housekeeping practices, employee training, standard operating practices, inventory control measures, etc.

Notice of Intent (NOI): Formal notice to State Water Resources Control Board submitted by the owner/developer that a construction project is about to begin. The NOI provides information on the owner, location and type of project, while certifying that the permittee will comply with the conditions of the construction general permit.

NPDES Permit: Authorization, license or equivalent control document issued by EPA or an approved state agency to implement requirements of the NPDES program. An NPDES stormwater permit relates to discharge of stormwater runoff to waters of the United States.

Nutrients: Elements or substances such as nitrogen or phosphorous that are necessary for the growth and development of living things (e.g., plants). Large amounts of these substances reaching water bodies can lead to reduced water quality and eutrophication by promoting excessive aquatic algae growth. Some nutrients can be toxic at high concentrations.

Outfall: Point where stormwater discharges from a pipe, channel, ditch, or other conveyance to a waterway.

Partnership: Sacramento Stormwater Quality Partnership

Partnership Activities: Activities done regionally by the Sacramento Stormwater Quality Partnership. Also called *regional activities*.

Partnership Program: Sacramento Stormwater Quality Partnership Program including regional activities implemented jointly by the permittees.

Performance Standard: A narrative or measurable number specifying the minimum acceptable outcome for a pollution control practice.

Permeability: Quality of a soil horizon that enables water or air to move through it.

Permittees: Co-Permittees and any agency named in California Regional Water Quality Control Board Central Valley Region, Order No. R5-2008-0142, NPDES No. CAS082597 as being responsible for permit conditions within its jurisdiction. Permittees to California Regional Water Quality Control Board Central Valley Region, Order No. R5-2008-0142, NPDES No. CAS082597 include the County of Sacramento, and the cities of Citrus Heights, Elk Grove, Folsom, Galt, Rancho Cordova and Sacramento.

Pesticide Plan: Pesticide Toxicity Control Plan

Pollutants: Those substances defined in CWA §502(6) (33.U.S.C.§1362(6)), and incorporated by reference into California Water Code §13373.

Pollution: Impairment of water quality caused by man-made waste discharges or natural processes.

Precipitation: Any form of rain or snow.

Pretreatment: Treatment of wastewater before it is discharged to a wastewater collection system.

Priority Projects: Those projects that are required to incorporate appropriate stormwater mitigation measures into the design for their respective project. Refer to the Stormwater Quality Design Manual for the Sacramento and South Placer Regions for more details.

Process wastewater: Wastewater that has been used in one or more industrial processes.

Project: All development, redevelopment, and land disturbing activities.

Rain Event or Storm Event: Any rain event greater than 0.1 inch in 24 hours except where specifically stated otherwise

Receiving Waters: All surface water bodies in the Central Valley Region that are identified in the Basin Plan.

Receiving Water Limitations (RWLs): Waste discharge requirements issued by the Regional Board typically include both: (1) "Effluent Limitations" (or "Discharge Limitations") that specify the technology-based or water-quality-based effluent limitations; and (2) "Receiving Water Limitations" that specify the water quality objectives in the Basin Plan as well as any other limitations necessary to attain those objectives. In summary, the "Receiving Water Limitations" provision is the provision used to implement the requirement of CWA section 301(b)(1)(c) that NPDES permits must include any more stringent limitations necessary to meet water quality standards.

Redevelopment: Land-disturbing activity that results in the creation, addition, or replacement of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of a routine maintenance activity; and land disturbing activities related to structural or impervious surfaces.

Regional Water Board: Central Valley Regional Water Quality Control Board

Restaurant: A facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC Code 5812).

Retail Gasoline Outlet (RGO): Any facility engaged in selling gasoline and lubricating oils.

Retention: Temporary or permanent storage of stormwater to prevent it from leaving the development site.

Retrofit: Creation/modification of stormwater management systems in developed areas through construction of water quality basins, stream plantings, stream bank stabilization, and other techniques for improving water quality and creating aquatic habitat. A retrofit can mean construction of a new stormwater quality treatment facility in the developed area, enhancement of an older stormwater management structure, or a combination of improvement and new construction.

Riparian: Relatively narrow strip of land that borders a stream or river, which often coincides with the maximum water surface elevation of the one-hundred year storm.

Riprap: Combination of large stones, cobbles, and boulders used to line channels, stabilize banks, reduce runoff velocities, or filter out sediment.

Run-off: Any runoff including stormwater and dry weather flows from a drainage area that reaches a receiving water body or subsurface. During dry weather it is typically comprised of base flow either contaminated with pollutants or uncontaminated, and nuisance flows.

Run-on: Stormwater or other surface flow which enters property other than that where it originated.

Scour: Concentrated erosive action of flowing water in streams that removes material from the bed and banks.

Sedimentation: Process of sand and mud settling and building up on the bottom of a creek, river, lake, or wetland.

Sediments: Soil, sand and minerals washed from land into water, usually after rain, that accumulate in reservoirs, rivers and harbors, destroying aquatic animal habitat and clouding the water so that adequate sunlight might not reach aquatic plants.

Sheet flow: Water, usually storm runoff, flowing in a thin layer over the ground surface (Soil Conservation Society of America, 1982).

Slope: Degree of deviation of a surface from the horizontal, measured as a percentage, a numerical ratio, or in degrees (Soil Conservation Society of America, 1982).

Source control BMP: Any schedules of activities, prohibitions of practices, maintenance procedures, managerial practices or operational practices that aim to prevent stormwater pollution by reducing the potential for contamination at the source of pollution.

State Water Board: State Water Resources Control Board (California)

Storm drains: Above and below ground structures for transporting stormwater to streams or outfalls for flood control purposes.

Stormwater: Stormwater runoff, snow melt runoff, surface runoff, and drainage.

Stormwater conveyance system or storm drain system: Any channel or pipe for collecting and directing stormwater.

Stormwater discharge associated with industrial activity: Discharge from any conveyance that is used for collecting and conveying stormwater which is directly related to manufacturing processing or raw materials storage areas at an industrial plant [40 CFR 122.26(b)(14)].

Stormwater Permit: Sacramento Area-wide MS4 NPDES Stormwater Permit

Stormwater runoff: Excess precipitation that is not retained by vegetation, surface depressions or infiltration, which thereby collects on the surface and drains into a surface water body.

Stormwater treatment: Detention, retention, filtering, or infiltration of a given volume of stormwater to remove urban pollutants.

Stream buffer: Variable width strip of vegetated land adjacent to a stream that is preserved from development activity to protect water quality, aquatic, and terrestrial habitats.

Structural BMP: Any structural facility designed and constructed to mitigate the adverse impacts of stormwater and urban runoff pollution (e.g. canopy, structural enclosure). The category may include both Treatment Control BMPs and Source Control BMPs.

Sump: Sediment trap used as pretreatment upstream of a filtration or infiltration device. Sump can have many configurations. The word "sump" has also been used in reference to drywells.

Target Pollutants : Pollutants identified by the permittees as most likely to impair local receiving waters, based on evaluation of available monitoring data and other information that describe its surface configuration (Soil Conservation Society of America, 1982).

Total Maximum Daily Load (TMDL): The sum of the individual waste load allocations for point sources and load allocations for nonpoint sources and natural background. A TMDL is the maximum pollutant load a waterbody can assimilate each day from all sources combined and still maintain applicable water quality standards for that pollutant.

Toxic: Related to or caused by a poison, hazardous waste or toxin.

Toxicity Identification Evaluation (TIE): a set of procedures to identify the specific chemical(s) responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.

Toxicity Reduction Evaluation (TRE): a study conducted in a step-wise process to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity.

Treatment: The application of engineered systems that use physical, chemical, or biological processes to remove pollutants. Such processes include, but are not limited to, filtration, gravity settling, media absorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

Treatment Control BMP: Any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media absorption or any other physical, biological, or chemical process.

Urban runoff: Stormwater that passes through and out of developed areas to a stream or other body of water.

Vegetated filter strip: Vegetated section of land designed to accept runoff as overload sheet flow from upstream development. A vegetated filter strip differs from a natural buffer in that the strip is not "natural;" rather, it is designed and constructed specifically for pollutant removal.

Vegetated swale: An earthen conveyance system in which the filtering action of grass and soil infiltration are utilized to remove pollutants from urban stormwater. An enhanced grass swale, or biofilter, utilizes check dams and wide depressions to increase runoff storage and promote greater settling of pollutants.

Velocity: Distance that water travels in a given direction in a stream during an interval of time.

Watershed or drainage basin: Geographic area within which all surface water drains into a particular body of water (e.g., a river or stream).

Water Quality Standards and Water Quality Objectives: Water quality criteria contained in the Basin Plan, the National Toxics Rule, the California Toxics Rule, and other state or federally approved surface water quality plans. Such plans are used by the Regional Board to regulate all discharges, including stormwater discharges.

Waters of the State: any surface water or groundwater, including saline waters, within boundaries of the state.

Waters of the United States:

a. All waters that are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;

b. All interstate waters, including interstate wetlands;

c. All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters:

    1. Which are or could be used by interstate or foreign travelers for recreational or other purposes;

    2. From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or

    3. Which are used or could be used for industrial purposes by industries in interstate commerce;

d. All impoundments of waters otherwise defined as waters of the United States under this definition;

e. Tributaries of waters identified in paragraphs (a) through (d) of this definition;

f. The territorial sea; and

g. Wetlands adjacent to waters (other than waters that are themselves wetlands) identified in paragraph (a) through (f) of this definition.

Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR 423.22(m), which also meet the criteria of this definition) are not waters of the United States. This exclusion applies only to man-made bodies of water, which neither were originally created in waters of the United States (such as disposal area in wetlands) nor resulted from the impoundment of waters of the United States. Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the CWA, the final authority regarding CWA jurisdiction remains with U.S. EPA.

Wet Season: The calendar period beginning October 1 and ending April 30.

Weir: Structure that extends across the width of a channel and is intended to impound, delay or in some way alter the flow of water through the channel. Dams of any kind, including check dams, are considered weirs.

Wet weather flow: Water derived primarily from rain, melting snow or irrigation during the wet season (generally considered to be October through April) that flows over the ground surface.

Executive Summary

to be included in final SQIP
(anticipated Summer 2009)

Chapter 1
Introduction

1.1 Overview

This Stormwater Quality Improvement Plan (SQIP) describes the stormwater pollution prevention efforts to be implemented either jointly or individually by the County of Sacramento and the Cities of Sacramento, Citrus Heights, Elk Grove, Folsom, Galt and Rancho Cordova. Those agencies, collectively referred to as the Sacramento Stormwater Quality Partnership (Partnership), developed the SQIP to protect local waterways and fulfill regulatory requirements, as described later in this chapter.

The SQIP outlines Partnership priorities and activities planned for the 2008-2013 permit term. It also includes background information to provide readers with an understanding of the environmental and regulatory context as well as the Partnership's past accomplishments.

This SQIP supercedes and replaces all previous management plans developed for the Partnership, including the 1994 Comprehensive Stormwater Management Plan, the 1995 Effectiveness Evaluation Plan, the July 2003 SQIPs and their amendments, and the draft 2007 SQIPs.

1.2 Background

This section briefly discusses background for the SQIP, including the environmental need and regulations driving the effort, information on the Sacramento Stormwater Quality Partnership, and a description of the area subject to the regulations. Additional details are included in the appendices.

Environmental Need

Creeks and rivers are a vital environmental and community resource, and their health depends on good water quality. One of the ways that pollutants can enter water bodies is through stormwater runoff. When land is developed, vegetation is replaced with impervious surfaces such as streets and rooftops; when it rains, water can no longer soak into the ground to the extent it previously could, and instead becomes stormwater runoff. Urban areas also generate what is referred to as dry-weather urban runoff (also called nuisance flows)—runoff from irrigation water and wash water, rather than from rain.

Runoff collects pollutants as it flows along the ground surface. Streets and other auto-related areas accumulate sediments and other contaminants such as metals, oils and petroleum hydrocarbons. Urban runoff itself may also contain pollutants. For example, runoff from lawn or garden watering may carry pesticides, fertilizers or sediment. Runoff from vehicle and equipment washing typically carries detergents and other pollutants. The pollutants that are potentially exposed to/picked up by runoff vary

depending on land use and activities. Table 1.2-1 shows the typical pollutants associated with different land uses and associated activities.

In developed areas, runoff flows into gutters, stormwater pipes (called storm drains) and channels, which—in the Sacramento area, discharge directly into creeks and rivers, along with any pollutants washed away with the runoff. Development also affects creeks by changing the volume and flow rate of water that flows into the creeks; the increased flows can cause erosion, degrade the creek habitat and also increase flood risks. Studies have demonstrated that runoff from the frequent small storms can cause downstream erosion, sedimentation and habitat impairment. Conventional flood detention approaches seek to manage (detain and slowly release) runoff associated with major storms, but do not address the runoff flows that cause chronic erosion and habitat impacts.

Table 1.2–1
Typical Pollutants Associated with Urban Land Use Activities

Land Use Type	Activities	Typical Pollutants
Residential	• Landscape/yard maintenance • Car washing • Car maintenance (e.g., oil changing) • Painting and remodeling • Contaminants, storage and disposal of household chemicals and hazardous/non-hazardous wastes • Pet management	Pesticides, herbicides, fertilizers, concrete waste, landscape debris, detergents, oil and grease, solvents, paints, and other household wastes Note: Excess runoff from over watering is a problem, since this water carries additional pollutants to local creeks and rivers
Commercial/ Light Industrial	• Landscape maintenance • Outdoor (exposed) loading areas • Outdoor (exposed) material and equipment storage • Public parking areas • Painting and remodeling • Contaminants, storage and disposal of household chemicals and hazardous/non-hazardous wastes	Pesticides, herbicides, fertilizers, detergents, oil and grease, solvents, paints, metals, sediments/gravels (from landscape and parking areas) and other wastes
Heavy Industrial	• Outdoor (exposed) loading areas • Outdoor (exposed) material and equipment storage (including aboveground storage tanks) • Outdoor (exposed) manufacturing/ processing areas • Fueling areas • Facility Maintenance • Vehicle and equipment washing, maintenance, and/or parking areas • Contaminants, storage and disposal of household chemicals and hazardous/non-hazardous wastes	Oil and grease, hydraulic fluids, petroleum hydrocarbons, solvents, metals, sediment/gravel, detergents and other materials, and wastes used at the facility
Construction Sites	• Clearing and grading • Concrete and asphalt work • Painting • Dewatering activities • Exposed storage of materials on-site • Landscaping • Pool construction/repair	Sediment/gravel (from eroded surfaces or stored materials), concrete slurry, paints, oil and grease, hydraulic fluids, petroleum hydrocarbons, pesticides, herbicides and fertilizers, contaminated pumped groundwater, and other waste materials

Land Use Type	Activities	Typical Pollutants
Transportation Corridors	• Continuous automobile, truck, and bus use • Utility company trenching and construction activities • Road repair and resurfacing activities • Roadside vegetation maintenance • Truck spills	Oil and grease, hydraulic fluids, petroleum hydrocarbons, metals (e.g., copper, lead, zinc) sediment/gravel, pesticides, herbicides and fertilizers, spilled waste materials
Parks and Recreational Areas (includes golf courses)	• Landscape maintenance • Use by pets and livestock	Fertilizers, herbicides, pesticides, sediment/gravel, landscape debris, fecal waste (bacteria/pathogens)

Regulatory Background and the Stormwater Permit

The federal Clean Water Act (CWA) makes municipalities responsible for regulating and managing the quality of stormwater runoff throughout their jurisdictions, since municipalities own and operate the storm drain pipes and drainage channels that collect runoff prior to its discharge into creeks, rivers, and other water bodies.

Under the CWA, stormwater discharges are regulated through National Pollutant Discharge Elimination System (NPDES) stormwater permits. In California, the State Water Board Control and its nine Regional Water Boards have been authorized by U.S. EPA to oversee implementation of the Clean Water Act. The Central Valley Regional Water Quality Board (Regional Water Board) issues and enforces NPDES municipal stormwater permits in the Sacramento area.

The County of Sacramento and the cities of Sacramento, Citrus Heights, Elk Grove, Folsom, Galt and Rancho Cordova are subject to the Sacramento Areawide NPDES Municipal Stormwater Permit (NPDES No. CAS082597; Order NO. R5-2008-0142) (Stormwater Permit), issued by the Regional Water Board in September 2008 and covering the period November 2008 –September 2013. The Stormwater Permit was issued originally in 1990 and has been reissued several times since. The Stormwater Permit (Provision A) states:

1. Discharges from municipal separate storm sewer systems (MS4s) in a manner causing, or threatening to cause, a condition of pollution, contamination, or nuisance as defined in § 13050 of the California Water Code are prohibited.

2. Discharges from MS4s which cause or contribute to exceedances of receiving water quality standards and water quality objectives (designated beneficial uses of the Basin Plan and water quality objectives developed to protect beneficial uses) for surface water or ground water are prohibited.

3. Discharges from MS4s containing pollutants that have not been reduced to the maximum extent practicable (MEP) are prohibited.

In addition, the Stormwater Permit contains specific requirements related to:

- Reporting and other project management functions
- Reducing specific target pollutants
- Monitoring and conducting special studies

- Reducing stormwater impacts from new development projects, construction projects, municipal operations and commercial/industrial businesses
- Conducting public outreach and watershed stewardship
- Preventing illicit discharges
- Assessing program effectiveness

This SQIP proposes compliance activities to be conducted during the five-year term of the Stormwater Permit. As specified in the permit, once the SQIP is approved by the Regional Water Board Executive Officer, it is considered part of the permit and is enforceable as such.

The current Stormwater Permit differs from the prior one in several notable ways:

- Many of the requirements are more general (less prescriptive) than in the prior permit; this SQIP provides the details.
- The permit includes requirements pertaining to protecting creeks from erosion and other harm caused by increased runoff volume and flow rate (hydromodification) due to new development and redevelopment. The permit requires that the Partnership develop a plan to mitigate hydromodification impacts associated with new development/redevelopment, and this is expected to result in new requirements for some new development projects (see sections 2.2 and 3.8 for additional details).
- It requires a modest amount of additional monitoring (in addition to the existing extensive monitoring program) to learn more about discharges of pyrethroid insecticides and mercury, which are impairing water quality in various local waterways. The data could lead to new understanding on how to control these pollutants and eventually to additional requirements amended to the Stormwater Permit.

The Stormwater Permit is attached to this SQIP as Appendix 1A, and a more complete discussion of the regulatory background is included in Appendix 1B.

Sacramento Stormwater Quality Partnership

The Sacramento Stormwater Quality Partnership (Partnership) is a collaboration of all the agencies subject to the Sacramento areawide Stormwater Permit. The Partnership's main charge is to oversee compliance with the Stormwater Permit, and it works to protect and improve water quality in local waterways for the benefit of the community and the environment. Refer to Appendix 1C for a complete history of the permit and the Partnership's efforts to manage urban runoff quality over the years. This SQIP describes the Partnership's planned activities for the 2008-2013 permit term.

Permit Area and Associated Waterways and Watersheds

The Stormwater Permit does not apply to all areas within Sacramento County. Rather, it applies to all the land inside the Sacramento County Urban Service Area boundary, as well as the City of Galt and the Sacramento International Airport, as shown on Figure 1.2-1. Land within the Urban Service Area includes the cities of Folsom, Citrus Heights, Elk Grove, Rancho Cordova, and Sacramento, and parts of unincorporated Sacramento County.

Sacramento County lands outside of the Urban Service Area, to which the Stormwater Permit does not apply, include Isleton (very small community not subject to NPDES regulations) and Rancho Murieta (covered by a separate Phase II NPDES permit). The Yolo, El Dorado, and Placer County urban areas, which are contiguous with the greater Sacramento area, are permitted separately by the Regional Water Board (also under a Phase II NPDES permit).

The storm drain system within the stormwater permit area includes a constructed system of storm drain inlets, pipelines, open channels, detention basins, and roadside ditches that discharge for the most part into various local creeks and the American and Sacramento Rivers. For the City of Galt, the storm drain system discharges to various local creeks which flow to the Cosumnes River, a tributary to the Mokelumne River. All the rivers ultimately drain to the Sacramento-San Joaquin Delta and from there to the San Francisco Bay and the Pacific Ocean.

As shown on Figure 1.2-1, 1.2-2 and listed in Table 1.2-2, the permit area includes all or part of a number of watersheds. A watershed is defined as the land area that drains into a given body of water. The size of a watershed depends on the water body; large watersheds (for example for a river) include smaller watersheds (for example for tributary streams) within them. The permit area is largely contained within the American and Sacramento Rivers watersheds, described below:

American River Watershed – The permit area includes part of the watershed for the American River, which begins in the Sierra Nevada Mountains and eventually flows into the Sacramento River. The cities of Folsom, Rancho Cordova and Sacramento and parts of unincorporated Sacramento County are in this watershed.

Sacramento River Watershed – The majority of the permitted area is located within a portion of the Sacramento River watershed, the largest watershed entirely in California. The 447-mile long Sacramento River flows south from near Mount Shasta until it empties into the San Joaquin River in the Sacramento River Delta. .

1.3 Overall Goals and Strategy

The overall goals of the SQIP, as identified in the Stormwater Permit are to: a) reduce the degradation of waters of the State and waters of the United States (U.S.) by urban runoff and protect their beneficial uses; and b) develop and implement an effective SQIP that is well understood and broadly supported by regional stakeholders. The core objectives of the SQIP are to:

- Identify and control those pollutants in urban runoff that pose significant threats to the waters of the State and waters of the U.S. and their beneficial uses;
- Comply with the federal regulations to eliminate or control, to the MEP, the discharge of pollutants from urban runoff associated with the storm drain system;
- Achieve compliance with water quality standards;
- Develop a cost-effective program which focuses on pollution prevention of urban stormwater;
- Seek cost-effective alternative solutions where prevention is not a practical solution for a significant problem; and
- Coordinate implementation of control measures with other agencies.

This SQIP outlines the strategies that will be utilized by the Partnership to meet these objectives. Chapter 2.3 describes the effectiveness assessments that will be completed by the permittees to determine progress toward permit compliance and meeting SQIP goals.

1.4 Overview of SQIP Implementation

Partnership and Individual Agency Activities

This SQIP includes Partnership (regional) activities that are implemented collectively by all the permittees as well as activities conducted by each permittee within its own jurisdiction (permittee-specific or individual activities). Each permittee helps fund Partnership activities and also provides staff and funding to conduct its own individual activities.

Partnership (Regional) Activities

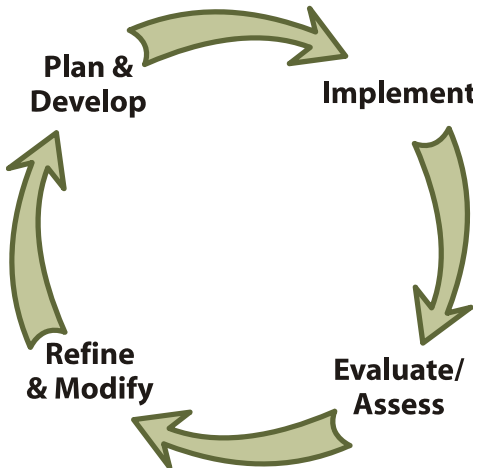
Activities are implemented by the Partnership on a regional basis when that is most cost effective or is necessary to ensure a consistent approach to urban runoff management in the greater Sacramento area. Typically either the County or City of Sacramento (the two largest permittees) take the lead in implementing regional activities on behalf of the other permittees; the lead permittee serves as the main point of contact with the Regional Water Board and other regulators (e.g., EPA, State Water Resources Control Board). The permittees have entered into a memorandum of understanding (MOU) which defines responsibilities and cost-share arrangements for Partnership activities, as discussed in Chapter 2, Section 2.2

The following major categories of activities are conducted jointly; refer to Chapter 2 for details about each:

- Program Management (under the leadership of a Steering Committee)
- Program Effectiveness
- Target Pollutant Program
- Monitoring Program (including Special Studies)
- Regional Public Outreach
- Regional Commercial/Industrial Program

Permittee-Specific (Individual) Activities

SQIP activities implemented by individual permittees primarily involve those related to the following seven program elements, presented here and in this SQIP in the order presented in the Stormwater Permit:



- Program Management
- Construction
- Commercial/Industrial
- Municipal Operations
- Illicit Discharges
- Public Outreach
- New Development

Specific program element activities differ from one agency to another according to each agency's internal structure, resources, and individual priorities and goals. However, the permittees strive for areawide consistency through inter-agency coordination and through joint development of brochures, manuals, and certain training programs. See Table 1.4-1 for examples of joint and individual activities.

Chapters 3-9 of this SQIP describe the individual permittees' activities for the County of Sacramento and the cities of Sacramento, Citrus Heights, Elk Grove, Folsom, Galt, and Rancho Cordova.

Planning and Implementation Cycle

New and evolving regulations, knowledge from local and national studies and programs, and changes within the participating agencies' organizations and programs affect stormwater management priorities and direction. The SQIP, which serves as the blueprint for Partnership activities, must therefore also be dynamic. This SQIP is intentionally general in some areas to allow this flexibility. Decisions regarding funding and priorities will be made by the Partnership and the individual permittees on an annual basis and reported in the annual work plans and annual reports.

SQIP implementation is a dynamic, iterative process, based on the following annual sequence of events:

In the first step **(Plan and Develop)**, the Partnership and individual permittees plan and develop activities by describing them in the SQIP and annual work plans, which include priorities, schedules, and budgets for the upcoming fiscal year.

The second step **(Implement)** involves conducting the activities as outlined in the SQIP and annual work plans, including tracking and recording data to be used in the next step.

The third step **(Evaluate/Assess)** involves evaluating the effectiveness of the implemented activities. Chapter 2.3 describes the Partnership's effectiveness assessment approach.

In the fourth step **(Refine and Modify)**, activities are refined and modified as needed based on the results of the effectiveness assessment. Some activities may get dropped off, or new activities adopted, during this phase. As specified in the stormwater permit, the annual reports submitted on October 1 each year will serve as the mechanism for proposing modifications to this SQIP for review and approval by the Regional Water Board.

Coordination with Other Agencies and Groups

Through the Steering Committee, the Partnership will continue to coordinate with other agencies and groups when implementing the SQIP. This chapter and each Permittee's SQIP (Chapters 3-9) describe coordination that will be undertaken as part of specific program elements/activities. There are many stakeholders in the permit area, including public agencies, environmental groups, business groups and others. The following is a non-exhaustive list of the main stakeholders (more complete lists can be found in applicable chapters where element/activities coordinate with non-Partnership stakeholders):

Federal Agency

- United States Environmental Protection Agency (USEPA), Region 9

National Organizations

- American Institute of Architects (AIA)
- American Society of Landscape Architects (ASLA)
- American Society of Civil Engineers (ASCE)

State Agencies

- State Water Resources Control Board (State Water Board)
- Central Valley Regional Water Quality Control Board (Regional Water Board)
- California Department of Pesticide Regulation (DPR)
- California Integrated Waste Management Board (CIWMB)
- California Structural Pest Control Board

State Organizations

- Associated General Contractors of California (AGC)
- California Stormwater Quality Association (CASQA)
- Consulting Engineers and Land Surveyors of California (CELSOC)
- California Building Industry Association (CBIA)

Local Organizations

- Local Watershed/Environmental Groups (see Section 2.6 for detailed list)
- Regional Water Authority (RWA)
- Parks Districts
- Sacramento Area Council of Government (SACOG)
- Local Utility Companies
- Schools/School Districts/Universities

Table 1.4–1
Examples of Partnership and Permittee-Specific Activities in the SQIP

Program Element	Objective	Primary Area of Responsibility/ Target Audiences	Examples of Permittee-Specific (Individual) Activities*	Examples of Partnership (Regional) Activities
Construction	Prevent sediment and other construction-related pollutants from entering the storm drain system and local waterways	• Construction sites at all stages of development from plan development to initial grading and through to the final close of construction • Contractors • Developers • Engineers • Erosion and Sediment Control Specialists • Agency inspectors, design engineers, and project managers	• Update and enforce ordinances for erosion and sediment control • Inspect construction sites to ensure compliance • Train and provide ongoing education for public agency inspectors, plan reviewers, and project managers • Coordinate with Regional Water Board regarding local construction projects	• Continue multi-agency coordination to review local use of new techniques for erosion and sediment control • Co-sponsor training workshops for construction community
Commercial/ Industrial	Reduce the discharge of stormwater pollutants to the maximum extent practicable and effectively eliminate illegal non-stormwater discharges from commercial and industrial facilities	• Retail and service businesses • Commercial/Industrial facilities • Activities conducted by public agencies and special districts	• Complaint-based investigation and enforcement of illicit discharges from Commercial/Industrial facilities • Development and distribution of outreach to local businesses • Coordination with public agencies and special districts	• Priority industry identification for categories of businesses subject to inspection and outreach • Inspect priority industries (conducted by County inspectors with fees paid by regulated industries) • Develop brochures and BMP guidance materials for industries and businesses • Conduct outreach to priority industries
Municipal Operations	Control potential stormwater pollutants generated by agency-owned facilities and set an example of model pollution prevention to the public	Operation and maintenance of: • Agency- owned buildings, associated parking lots • Corporation yards • Transportation corridors and associated facilities • Stormwater and drainage pipelines, channels, detention basins, pump stations and other facilities • Agency-owned water supply facilities	• Maintain inventory of agency-owned facilities • Conduct annual refresher training for targeted agency staff • Provide technical assistance • Evaluate permit compliance of facility conditions and field activities	• Generally none

Program Element	Objective	Primary Area of Responsibility/ Target Audiences	Examples of Permittee-Specific (Individual) Activities*	Examples of Partnership (Regional) Activities
Illicit Discharge	Reduce the discharge of stormwater pollutants to the maximum extent practicable and effectively eliminate illicit non-stormwater discharges from non-commercial sources	• Non-commercial dischargers (residential primarily).	• Complaint-based investigation and enforcement of illicit discharges • Respond to, contain and cleanup/abate illicit discharges and connections • Conduct ongoing field screening for illicit connections through routine maintenance activities being conducted by field crews • Conduct annual refresher training for affected agency staff	• Maintain public hotline for reporting of illicit discharges and connections • Conduct outreach to public by distributing educational materials • Conduct regional coordination as needed to respond to releases and illegal discharges
Public Outreach	Educate the public on the impacts of stormwater and urban runoff pollution and encourage stewardship to protect local creeks and rivers	• Residents • Public officials and agency managers • Schools, including school districts, teachers, and school children • Businesses	• Sponsor stormwater booths at local community events • Install signs discouraging illegal dumping • Support environmental and water-based educational programs to increase awareness of pollution prevention, water conservation and watershed issues.	• Distribute brochures and other educational materials in local communities • Conduct public awareness surveys • Conduct mixed media campaigns focusing on specific messages (e.g., pet waste, fundraiser carwashes, pesticides, household hazardous waste, etc.) • Conduct outreach to schools through SPLASH and classroom presentations • Maintain partnership website • Establish and maintain partnerships with groups and agencies to further public outreach mission
New Development	Mitigate urban runoff pollution and other stormwater impacts associated with new development and redevelopment	• Development and redevelopment projects • Developers • Engineers • Architects • Landscape Architects and Designers • Agency Staff, including planners, environmental analysts, field inspectors and design engineers	• Review and evaluate existing development standards, General Plan and CEQA procedures • Establish and enforce development standards and requirements for on-site and regional stormwater quality control measures • Conduct training and provide ongoing education for public agency staff, such as planners and engineers	• Prepare and update technical guidance manuals • Educate and provide technical guidance to the development community, including presentations and workshops to local professional organizations • Conduct special studies to assess local effectiveness of selected new development BMPs (see Monitoring Section in Chapter 2) • Investigate new and innovative treatment control measures as needed.

**See Chapters 3-9 for a full listing of activities for each permittee*

Chapter 2

Partnership Activities

2.1 Introduction

This chapter describes Partnership activities (or regional activities) that will be conducted collectively by all the permittees in the Sacramento Stormwater Quality Partnership (Partnership). Permittee-specific activities (or individual activities) for the 2008-2013 permit term are described in Chapters 3 through 9.

Tasks will continue to be implemented regionally throughout the Partnership jurisdictions when doing so provides the permittees with an opportunity for efficient use of limited funds and a consistent approach to managing urban runoff quality in Sacramento County. Regional activities will generally be conducted under the leadership of either the County or City of Sacramento, the two largest permittees.

The following major categories of activities will be implemented regionally, as described in this chapter:

- Program Management (Section 2.2)
- Program Effectiveness (Section 2.3)
- Monitoring Program (Section 2.4)
- Target Pollutant Program (Section 2.5)
- Regional Public Outreach Program (Section 2.6)
- Regional Commercial/Industrial Program (Section 2.7)

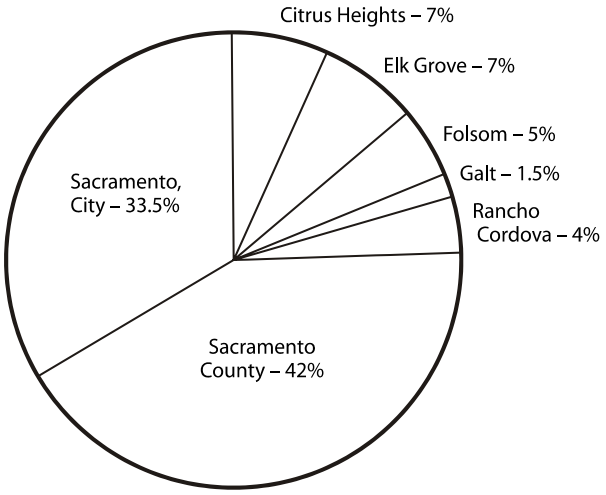
2.2 Program Management

As described in Chapter 1, the Partnership was established to coordinate Stormwater Permit compliance activities throughout the permittees' jurisdictional areas with the objective of improving water quality in receiving waters identified in the Permit including urban creeks, the Sacramento River and the American River. The permittees entered into a memorandum of understanding (MOU; described later in this section) that formalizes the manner in which the permittees address common issues, promote consistency among each permittees' stormwater programs, coordinate resources in regional activities, and plan and coordinate activities required to comply with the Stormwater Permit. A Steering Committee, consisting of representatives designated by each permittee, was established to provide a forum for making decisions and providing guidance to the permittees relative to the implementation of regional activities. The responsibilities and activities of the Steering Committee for the 2008-2013 permit term will include, but are not limited to, the following:

- Oversight and leadership
- Assignment of roles and cost-sharing
- Coordination of compliance reporting and regulatory liaison communication

Table 2.2-1, Regional Program Management Activities Work Plan describes tasks and schedules of activities for the 2008-2013 permit term.

2.2.1 Oversight and Leadership



The Steering Committee will oversee Partnership permit compliance activities and provide leadership for implementation of the regional activities t. The permittees will coordinate and make decisions primarily through regular meetings of this committee, although they also plan to coordinate via electronic mail and telephone. Decisions will be made by consensus or by majority vote when no strong objections are voiced. When consensus is not reached, no regional action will be taken and each permittee may then pursue individual action, if desired.

2.2.2 Assignment of Roles and Cost-Sharing

The MOU describes the roles and responsibilities and cost-share arrangements for managing and implementing regional activities. The Permittees currently operate under a MOU that was approved in 2003 and is included in Appendix 2A. This MOU was evaluated and was found to be consistent with the requirements listed in provision 3.e.i of the Stormwater Permit. The MOU will be revised to update the cost share percentages and the joint activities list as needed and the executed MOU will be submitted to Regional Water Board in the applicable Annual Report.

The MOU cost-share percentage (based on population) for each permittee is shown on Figure 2.2–1. This cost-share arrangement applies to regional activities only. Additional permittee-specific activities are conducted over and above the regional ones and are described in the permittees' SQIPs (Chapters 3 through 9).

Figure 2.2-1
Permittee Share of Regional Activity Costs

Refer to the individual permittee SQIPs (Chapters 3 through 9) for information about each Permittee's funding sources.

The Steering Committee will identify the scope of work and resource needs for regional activities and will explore cost-saving ideas and grant opportunities. The committee will continue to assign a lead agency (usually the County or City of Sacramento) to administer and manage consultant contracts for the work. Through the committee, the permittees will execute joint authorizations for specific activities to describe the work or services, budget and cost apportionment. A sample joint authorization form is included as an exhibit attached to the MOU in the appendix. The committee is responsible for executing and updating any agreements necessary to ensure continued interagency coordination for overall stormwater permit compliance.

2.2.3 Coordination of Regulatory Liaison Communication and Compliance Reporting

The Steering Committee will be the forum for coordination of regulatory liaison communication and permit compliance reporting. In most cases, either the County or the City of Sacramento will take the lead in these efforts on behalf of the Partnership.

Regulatory Liaison

The County or the City of Sacramento will take the lead in providing liaison with the Regional Water Board and other regulatory agencies (e.g., EPA Region 9) on behalf of the Partnership. However, individual agencies may also contact the Regional Water Board at any time.

Regulatory Compliance Reporting

The following work plan is being submitted as a part of this SQIP as required by the Stormwater Permit:

Hydromodification Management Plan (HMP)

The Stormwater Permit requires that the permittees develop a plan to mitigate hydromodification impacts associated with new development where the runoff could cause erosion or other harm. This will result in new requirements for some development and redevelopment projects. To comply with the permit requirements, the permittees are submitting a work plan for the HMP as part of this document describing the proposed activities that will be taken to develop the HMP (please refer to Appendix 2B for the proposed HMP Work Plan). One year after the Regional Water Board approves the HMP work plan, the permittees will submit the HMP.

The Permittees will prepare and submit the following reports to the Regional Water Board during the 2008-2013 permit term, as required by the Stormwater Permit:

Annual Work Plan – May 1

The work plan will be submitted by May 1st each year to describe proposed activities for the coming fiscal year (July 1- June 30). It will also include the performance standards and targets to be used to assess and report progress and accomplishment. The Steering Committee will assign a lead agency to coordinate preparation and submittal of the work plans describing regional activities such as the monitoring and target pollutant programs. Each permittee will submit its own separate work plan to describe its individual activities.

Annual Report – October 1

An annual report will be submitted by October 1 each year to describe accomplishments for the preceding fiscal year (July 1 – June 30). The report will document the status of the SQIP and the activities completed by the permittees during the previous year, including a compilation of deliverables and milestones completed. The annual report will also include the results of the effectiveness assessments (described in Section 2.3) and recommended modifications or improvements to the SQIP based on those results. Each annual report will build upon the previous years' efforts.

A single annual report will be prepared and submitted each year to describe regional activities such as the monitoring and target pollutant programs. As with the work plan, each permittee will submit its own annual report to describe its individual activities and accomplishments, using a standardized reporting form for consistency.

Long Term Effectiveness Assessment – March 15, 2013

A Long Term Effectiveness Assessment (LTEA) will be submitted by March 15, 2013 (180 days before permit expiration). The LTEA, described in more detail in Section 2.3, will summarize the effectiveness of the overall Partnership Program in raising awareness, reducing pollutant discharges and improving environmental conditions. The LTEA will build on the results of the annual reports.

Report of Waste Discharge (ROWD) – March 15, 2013

A Report of Waste Discharge (ROWD) will be filed on March 15, 2013 (180 days before permit expiration) in accordance with Title 23 of the California Code of Regulations. The ROWD will serve as an application for reissuance of waste discharge requirements and renewal of the NPDES Stormwater Permit. It will identify any proposed changes or improvements to the SQIP, an assessment of the effectiveness of the Partnership Program (LTEA) and the proposed monitoring activities for the upcoming five year term of the permit.

Table 2.2-1

Regional Program Management Activities Work Plan (2008-2013)

Activity/Task	Permit Ref	Key Indicator?	Performance Standard / Target	Assessment Method	Baseline Data	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Revise SQIP based on adopted Stormwater Permit	D.2					♦						April 30, 2009 (6 months after Permit effective date)
Finalize SQIP based on the Regional Water Board comments	D.3.c						♦					
Review and revise existing Permittee MOU	D.3.e					⇔	⇔♦					
Conduct Steering Committee Meetings as needed	D.3.e					⇔	⇔	⇔	⇔	⇔	⇔

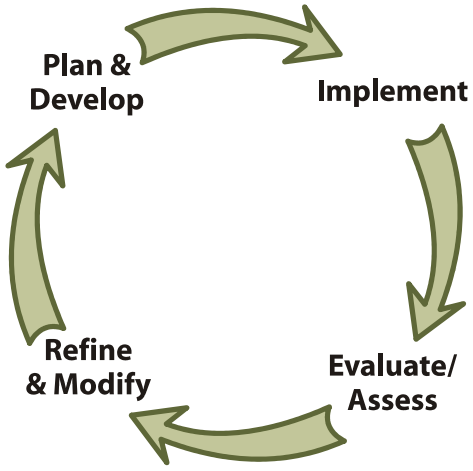
Review and update standardized formats for all reports	D.3.e.ii					⇔	⇔					
Prepare and submit a Permittee Long Term Effectiveness Assessment (LTEA)	D.29.d									⇔♦		March 15, 2013 (180 days before Permit expiration)
File a Report of Waste Discharge (ROWD)	D.33									⇔♦		March 15, 2013 (180 days before Permit expiration)

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

2.3 Program Effectiveness

2.3.1 Introduction



The Sacramento Stormwater Quality Partnership (Partnership) will assess program effectiveness as required by the Stormwater Permit (Provision 29) in order to:

- Demonstrate compliance with the Stormwater Permit in reducing pollutants in stormwater discharges to the maximum extent practicable (MEP) and ensuring that these discharges do not cause or contribute to violations of water quality standards established for local rivers and creeks
- Track the long-term progress of the SQIP toward achieving improvements in receiving water quality
- Provide the data and feedback needed to improve the SQIP and identify new activities or modify existing activities in order to continuously improve upon meeting the above MEP and water quality standard goals

The effectiveness assessment will be conducted annually as required by the Stormwater Permit. Annual reports will include assessments of the overall program, Partnership (regional) activities, and permittee-specific activities. In addition, as required by the Stormwater Permit, a long-term effectiveness assessment (LTEA) will be conducted and included with the Report of Waste Discharge/NPDES stormwater permit renewal application due to the Regional Water Board in March 2013. This approach is described in more detail in Section 2.3.3.

The Partnership will use the annual assessments and LTEA as part of the iterative process to continually improve its program, whereby actions are planned, implemented, assessed and refined in repeated cycles as illustrated in Figure 2.3-1 until a certain accomplishment or goal is achieved. This process of continuous improvement also ensures the most effective use of public funds in developing improvements to the program.

Figure 2.3-1
Stormwater Program Iterative Process

2.3.2 CASQA Effectiveness Guidance

The Partnership's effectiveness assessment approach was developed using guidance provided in the CASQA *Municipal Stormwater Program Effectiveness Assessment Guidance* manual (CASQA guidance manual) (CASQA, 2007). The manual was created by a committee of experienced stormwater professionals and provides statewide guidance and recommended tools for assessing the effectiveness of stormwater programs, program elements and activities. This section summarizes some of the key concepts and terms presented in the manual that were adapted for use in the Partnership's approach.

Outcome Levels

A program, program element or activity is considered effective if it is producing a desired outcome. The CASQA guidance manual proposes six outcome levels, as shown in Figure 2.3-2. Each outcome level category has value in informing management decisions; however not all outcome levels area used in every assessment and are not necessarily assessed in sequence. The goal of the program, element, activity or BMP being evaluated is identified before determining the corresponding outcome level anticipated and subsequently assessed. Performance standards are described in the following section.

For example, most management/administration-type activities (e.g., producing a report, conducting a meeting, revising an ordinance) will be assessed as an outcome of level 1. Training and outreach activities will be assessed as a level 2 or 3 outcome (changing awareness or behavior of the target audience). The data collected by the monitoring program will be utilized in assessing outcome level 4 (reducing loads), and levels 5 and 6 (improving/protecting discharge and receiving water quality). Table 2.3-1 provides additional information about each outcome level.

It should be recognized that linking a program or activity to a positive environmental outcome (i.e., levels 5 or 6) can be elusive because water quality changes in response to program or activity implementation are likely to be very slow. Also, establishing a link between receiving water condition and program activities is difficult at the watershed scale when activities are being implemented incrementally.

Figure 2.3-2
General Classification of Outcome Levels *(adapted from CASQA, 2007)*

Table 2.3-1
Summary of Outcome Levels (adapted from CASQA, 2007)

Outcome Level	Description	Goal	Performance Standard
1	Documenting Activities	Program development and implementation and basic compliance with the NPDES stormwater permit.	• Number of training events • Number of media impressions • Ordinance revised • Brochure created or translated • Number of brochures distributed
2	Raising Awareness	Raise a target audience's awareness and understanding of an issue.	• Percentage of residents who know that stormwater runoff is not treated • Percentage of inspectors who understood concepts presented in a training workshop
3	Changing Behavior	Change a target audience's behavior which results in the implementation of actions related to stormwater pollution prevention.	• Percentage of construction sites with erosion and sediment controls in place following a verbal warning • Percentage of businesses with BMPs in place as observed in a follow-up inspection • Adoption of new agency policies and standards re: WQ protection
4	Reducing Loads from Sources	Reduce the load of pollutants from sources into the municipal storm drain system. Can be real (measured) or estimated.	• Amount of material (sediment) removed from streets by street sweepers • Quantity of used oil collected at the regional transfer facilities • Estimates of sediment kept on site due to use of erosion controls
5	Improving Runoff Quality	Improve the quality of stormwater/urban runoff discharges from the municipal storm drain system to the receiving water.	• Decrease in pollutant levels measured at a particular urban runoff outfall
6	Protecting Receiving Water Quality	Protect receiving water from adverse impacts caused by discharges from the municipal storm drain system.	• Decrease in pollutant levels (typically associated with urban runoff) in rivers/creeks • Healthy creek biota

Performance Standards

A performance standard quantifies the progress of program implementation or performance of an activity or BMP (CASQA 2007). This is consistent with the stormwater permit, which defines a performance standard as "a narrative or measurable number specifying the minimum acceptable outcome for a pollution control practice." A performance standard can also establish a baseline against which future progress in either directly or indirectly reducing pollutants can be measured (CASQA 2007).

Effectiveness assessments beyond outcome level 1 require the establishment of baseline conditions. Thereafter, effectiveness can be determined by comparisons of successive years (or other defined periods) of results against the baseline data. This will not be possible for the first few years of a new program or activity, whereby there is no data (or insufficient data) to establish the baseline condition.

Assessment Methods

The CASQA guidance manual identifies six methods (see Table 2.3-2) for obtaining or evaluating assessment information. Reasons indicated in the manual for selecting a particular method include cost, ease of use, need for statistical rigor, applicability for a program vs. activity/BMP assessment, and clarity in communicating progress to the general public. The Partnership's effectiveness assessment approach described in Section 2.3.3 generally employs these methods; however, a permittee may choose to use other methods not shown on this table in assessing its individual activities.

Table 2.3-2
Assessment Methods Suitable for Various Outcome Levels (adapted from CASQA, 2007)

Assessment Method	Description	1 – Documenting Activities	2 – Raising Awareness	3 – Changing Behavior	4 – Reducing Loads	5 – Improving Discharge Quality	6 – Protecting Receiving Waters
Confirmation	Document that an activity has been completed.	•					
Tabulation	Track the number of actions or items associated with an activity.	•	•	•			
Surveys	Gain specific information about a group or representative sample of the group.		•	•			
Inspections/ Observations	Determine if desired actions are being taken/outcomes are being achieved.	•	•	•	•		
Quantification	Track quantities or estimate pollutant loadings.				•	•	•
Monitoring	Collect representative environmental samples and analyze to measure changes.				•	•	•

Key Indicators

The key indicators were developed by the permittees for evaluation of Partnership Program effectiveness and are a further refinement of the methods provided in the CASQA guidance manual. The indicators are the metrics or representative activities used to define and assess the effectiveness of a program, program element or activity in producing outcomes. The key indicators are selected based on their ability to (1) show progress toward meeting the program or element goal and (2) are specific, measurable and achievable. Some key indicators may be common partnership-wide activities and others will be permittee-specific activities. The key indicators are included in the work plan tables at the end of each element in chapters 3 through 9.

2.3.3 Effectiveness Assessment Approach

The Partnership will conduct and report on effectiveness assessments during the 2008-2013 stormwater permit term as described in this section. Assessments of permittee-specific and Partnership (regional) activities will be conducted annually and a long-term effectiveness assessment for the whole program will be conducted for the Report of Waste Discharge submittal in March 2013.

Annual Permittee-Specific Program Effectiveness Assessment

Each permittee will conduct an effectiveness assessment of its permittee-specific program, for submittal with its annual report each year. The permittee-specific assessments will describe progress towards producing outcomes categorized by levels 1 through 4 and will include recommendations for modifying or adding activities and improving the programs where necessary.

Each permittee-specific SQIP in this document identifies a few key indicators for each program element that will be used in the assessment for the element. As described previously, the key indicators are the measurable and achievable metrics for representative activities that will be used to evaluate the effectiveness of a particular program element in producing outcomes and demonstrate progress towards meeting the program element goals. Because they are tailored to an individual permittee's goals and situation, key indicators may differ between the agencies.

These individual indicator results will also be utilized by the Partnership in conducting annual assessments of the overall Partnership Program, as described in the next section.

Annual Partnership Program Effectiveness Assessment

An annual assessment of Partnership Program effectiveness will be completed that includes documentation of Stormwater Permit compliance as described generally by outcome levels 1 through 3, reduction of pollutants from sources and in discharges (where possible) as described by outcome levels 4 and 5, and protection of receiving water quality (where possible) as described by outcome level 6. The assessment will be submitted each year with the annual report, will build upon the results of the preceding years, and will include:

- A discussion of the effectiveness of the Partnership Program and SQIP in reducing stormwater pollution from discharges to the MEP and in achieving compliance with water quality standards in receiving waters
- An assessment of whether Partnership Program discharges caused or contributed to an exceedance of water quality standards
- A discussion of water quality improvements in or degradation of, urban runoff
- A discussion of monitoring data analysis (the monitoring program is described in Section 2.4)
- An assessment of the Target Pollutant Program. (described in Section 2.5)
- A discussion of the effectiveness of individual BMPs (e.g., a water quality detention basin or a new development BMP) in reducing urban runoff pollutants and/or runoff flow/volume. (These special studies are described in Section 2.4)
- An effectiveness assessment for each permittee-specific program element and Partnership (regional) Program element as defined in the SQIP, building upon each consecutive year
- Recommendations to improve the SQIP, including the monitoring program, activities/BMPs, and performance standards to address potential receiving water quality exceedances and potential pollutant sources, and to meet the MEP standard

Additionally, the Partnership will take selected key indicator results for the various program elements (representing both regional and permittee-specific activities), summarize the results, and use the information to assess the effectiveness of the overall Partnership Program in producing outcomes categorized by levels 1 through 4.

Data and other information from the Monitoring (Section 2.4) and Target Pollutant (Section 2.5) Programs will be used to assess the effectiveness of the Partnership Program in producing outcomes categorized by levels 4 through 6. Monitoring and target pollutant data analysis will include load removal calculations based on a watershed inventory, BMP effectiveness assessments and where possible, trend analysis. These annual snapshots will provide the building blocks for the future analyses as well as guidance for the direction of future Partnership Program activities.

Long Term Effectiveness Assessment (LTEA)

The stormwater permit requires the Partnership to develop a LTEA of the Partnership Program as part of the Report of Waste Discharge due to the Regional Water Board 180 days prior to the expiration of the Stormwater Permit, in March 2013. This LTEA will build on the results of the annual effectiveness assessments as presented in the preceding years' annual reports. As stated in the Stormwater Permit, the LTEA "shall identify the stormwater program long term effectiveness in achieving both programmatic goals (raising awareness, changing behavior) and environmental goals (reducing pollutant discharges, improving environmental conditions)" over the permit term.

The LTEA will include documentation of the Partnership Program effectiveness over the permit term in complying with the permit as described by outcome levels 1 through 3, reducing pollutant discharges as described by outcome levels 4 through 5, and protection of receiving water quality as described by outcome level 6.

The LTEA will use data and information from the annual assessments described previously to answer the following management questions (discussed further in Section 2.4):

- What is the existing condition of receiving water quality and is it protective of beneficial uses?
- What is the trend of urban discharge quality?
- What is the relative urban runoff contribution to receiving water quality?
- Are conditions in receiving waters getting better or worse?

The results of the LTEA will help determine recommended stormwater program activities for the updated SQIP that is required for submittal with the Report of Waste Discharge.

2.3.4 Future Updates to the Effectiveness Assessment Approach

Assessing program effectiveness is recognized as a key challenge for stormwater program managers across California. As various tools are applied and tested over the next few years, it is expected that effectiveness assessment approaches and tools will continue to evolve, and in turn, CASQA will likely publish updated statewide guidance. The Partnership will continue to support this effort and will consider CASQA's recommendations in refining its own approach during the 2008-2013 stormwater permit term. Any modifications to the Partnership's approach will also be based on the permittees' local experience, testing methods on the various program elements/activities and Regional Water Board feedback. Modifications will be reported in the annual work plans and annual reports submitted to the Regional Water Board.

2.4 Monitoring Program

2.4.1 Introduction

The Sacramento Stormwater Quality Partnership (Partnership) Monitoring Program (Monitoring Program) was initiated to comply with the requirements of the National Pollutant Discharge Elimination System (NPDES) area-wide municipal separate storm sewer system permit (Stormwater Permit) Monitoring and Reporting Program (MRP) and to demonstrate the effectiveness of the overall Partnership Program. Specifically, the Partnership uses monitoring data to achieve the following objectives:

- Assess water quality in urban runoff and receiving waters (rivers and creeks) and identify potential problems
- Identify pollutants and help identify key pollutant sources
- Investigate observed and reported problems in local waterways and help identify sources of the problems
- Evaluate the effectiveness of selected Best Management Practices (BMPs) and control measures
- Assess the effectiveness of the overall Partnership Program by tracking water quality changes and evaluating trends over time
- Adjust future monitoring efforts, as needed, to provide the most useful data in the most cost-effective manner

This section of the SQIP describes the monitoring activities proposed to meet permit requirements and achieve Monitoring Program objectives planned for 2008 through 2013.

2.4.2 Strategy

The Partnership designed the Monitoring Program to answer the management questions listed in Table 2.4-1 and to assess Partnership Program effectiveness in producing outcomes categorized by levels 4 through 6, refer to section 2.3 for a discussion of outcome levels. The Partnership collects water quality, sediment quality, aquatic toxicity and other types of environmental data as described in Table 2.4-2 for use in answering the management questions and assessing program effectiveness in producing the anticipated outcomes. The Partnership quantifies outcome levels 4 through 6 with loads discharged, loads averted, changes in urban runoff and changes in receiving water quality. Additionally, the Partnership analyzes the collected data to help guide selection of program and permittee-specific activities including for the Target Pollutant Program (see Section 2.5).

Table 2.4-1
Monitoring Program Management Questions and Outcome Levels

Management Questions	Outcome Level
A - What is the existing condition of receiving water quality and is it protective of beneficial uses?	6 – Protecting Receiving Water Quality
B - What is the quality of urban discharge in new developed areas?	5 – Improving Discharge Quality
C - What is the trend of urban discharge quality?	5 – Improving Discharge Quality
D - What is the relative urban runoff contribution to receiving water quality?	5 – Improving Discharge Quality
E - What are the sources to urban runoff that affect receiving water quality?	4 – Reducing Loads From Sources
F - Are conditions in receiving waters getting better or worse?	6 – Protecting Receiving Water Quality
G - How can changes in urban water quality affect receiving water quality?	6 – Protecting Receiving Water Quality

Table 2.4-2
Monitoring Program 2008-2013 Activities and Strategy

Monitoring Activity	Description of Assessment	Outcome Levels	Management Questions Addressed
River Monitoring	• Upstream - downstream comparisons • Trend analysis • Water quality objective comparisons	1 & 6	A, F
Urban Tributary Monitoring	• Trend analysis • Water quality objective comparisons • Comparisons of watersheds	1 & 6	A, F
Urban Runoff Monitoring	• Load modeling • Trend analysis using multi-variate analysis • Comparisons of land uses	1, 4 & 5	C, D, E, G
Water Column Toxicity	• Trend analysis	1 & 6	A, E, F, G
Sediment Monitoring	• Trend analysis	1 & 6	A, E, F, G
Bioassessment Monitoring	• Trend analysis	1 & 6	A, E, F, G
Wet Detention Basin	• Inlet and outlet comparisons • Mass balance	1, 4 & 5	B, C, D, E, F, G
Pilot Watershed	• Inlet and outlet comparisons • BMP load removal	1, 4	B, D, E, G

Historic Monitoring Program Activities

The Partnership initiated the Monitoring Program in 1990 with both urban runoff (discharge) monitoring and urban tributary (creek) monitoring. River monitoring of the Sacramento and American Rivers upstream and downstream of the urban area began in 1991 with the creation of the Coordinated Monitoring Program (CMP), a joint effort at that time between the City of Sacramento, County of Sacramento and Sacramento Regional County Sanitation District (SRCSD). The Partnership has modified the Monitoring Program to include river, urban tributary and urban runoff water quality characterization, as well as water column toxicity, bioassessment, and BMP performance evaluation studies. The results of these activities have been included in the Partnership's Annual Monitoring Reports (AMR) submitted with the Partnership annual reports. Table 2.4-3 summarizes Monitoring Program activities over the past 20 years (Appendix 1C also provides a summary history of the Monitoring Program).

2.4.3 Monitoring Program 2008-2013 Activities

The Partnership will complete the monitoring activities included in Table A of the Stormwater Permit MRP. These activities are described below and in Table 2.4-5, Regional Monitoring Program Activities Work Plan following this section of the SQIP. A map of planned monitoring locations is included as Figure 2.4-1. Additionally, the Partnership is required to complete data analysis in support of Regional Water Board efforts to develop Total Maximum Daily Load (TMDL) limits for pesticides and mercury in area receiving waters. The TMDL data analysis will include recommendations for additional monitoring where necessary to comply with the proposed TMDLs.

As stated in the Stormwater Permit the Partnership monitoring requirements can be modified in this SQIP, pending approval from the Regional Water Board Executive Officer. The Partnership requests some minor modifications that are specifically noted in a "strike-through/underline" mark-up of permit language in the Water Column Toxicity and Pilot Watershed-Special Study subsection.

Baseline Monitoring

Baseline monitoring characterizes urban runoff and receiving water constituent concentrations and quantifies long-term trends for larger watershed areas. The Partnership conducts river monitoring, urban tributary monitoring, urban runoff monitoring and water column toxicity as part of baseline monitoring activities. The Partnership describes specific monitoring protocols in the annually prepared sampling and analysis plans for each of the monitoring activities. The Partnership submits these sampling and analysis plans to the Regional Water Board along with the annual report.

River Monitoring

The SRCSD and Partnership manage the CMP through the CMP Steering Committee. The Steering Committee designed the CMP to provide long-term ambient river water quality characterization data, satisfy NPDES permit monitoring requirements, and complete as-needed special studies. The CMP collects water column samples for the constituents listed in Table 2.4-4 at four sites on the Sacramento and American Rivers for three wet weather events and one dry weather event every year. The CMP collects river cross section composite samples from a boat, except at the upstream American River (at Nimbus) location where a CMP collects a mid-depth grab sample by wading into the river. These characterization data are useful for threshold comparisons, assessing changes between upstream and downstream sites and long-term water quality trend evaluations.

Urban Tributary Monitoring

The Partnership collects urban tributary water column samples for the constituents listed in Table 2.4-4 at three locations (Arcade, Willow and Laguna creeks) for three wet weather events and one dry weather event every year. The Morrison Creek monitoring location sampled during the previous permit term was replaced with a site representative of newer development (Laguna Creek). The Partnership collects storm event flow composite samples, if possible, for the first flush event and grab samples are collected for the remaining events.

Urban Runoff Monitoring

The Partnership collects urban runoff (discharge) water column samples for the constituents listed in Table 2.4-4 at three locations (Sump 111, Strong Ranch Slough and Natomas Basin No. 4) for three wet weather events and one dry weather event each year, with no monitoring every third year. The Partnership replaced the historically monitored Sump 104 location in 2008 with a site representative of new development (Natomas Basin No. 4). The Partnership collects flow composite samples for all storm events and 24 hour time composites for dry weather events. The Partnership targets the first flush event each active monitoring year.

A principal use of the urban runoff data is to evaluate the overall long-term effectiveness (LTE) of the Partnership Program. In 1995/96, the Partnership performed a power analysis to determine data requirements necessary to assess LTE. This work concluded that at least 20 years of data would be needed to provide statistically valid conclusions about program effectiveness.[1] In 1997/98, the Partnership further evaluated the amount of data needed to assess LTE. As a result, the Partnership adopted a still-used strategy of monitoring urban runoff on a cycle of two years on and one year off.

Water Column Toxicity

The Partnership will perform short-term (acute) aquatic toxicity analyses at all receiving water locations in two wet weather events and one dry weather event in FY 2009/10 and 2011/12. The Partnership will collect samples as mid-depth grab samples or cross-sectional composite samples. The acute toxicity testing species will be fathead minnow (*Pimephales promelas*) and water flea (*Ceriodaphnia dubia*). The Partnership will contract a qualified laboratory to perform the analysis in accordance with U.S. EPA's method 821-R-02-012 (U.S. EPA 2002, 5th Edition). The Stormwater Permit allows a modification[2] for *Pimephales promelas* to remove previously observed toxicity caused by pathogen interference.

If acute mortality is significant compared to the laboratory control sample and is greater than 50% for the fathead minnow or the water flea, a toxicity identification evaluation (TIE) will be conducted. A TIE consists of a series of sample treatments that alter specific sources of toxicity. Toxicity "responses" from the treatments can then be used to identify the cause of toxicity. A standard TIE includes ammonia removal and aeration, but does not include treatments for metabolically activated pesticides using Piperonyl Butoxide (PBO). Historically, pesticides, rather than ammonia or lack of dissolved oxygen, are the primary cause of aquatic life toxicity in receiving waters impacted by urban runoff. A targeted TIE focuses sample treatments on expected toxicants (i.e., pesticides for urban runoff) that cannot be identified by other means. The Partnership will perform pesticide-targeted TIEs, if necessary.

The following modifications to the Stormwater Permit MRP section II.D. (Water Column Toxicity) clarify the Stormwater Permit requirements (inserted language is underlined, deleted language is struck-through):

Page nine, last paragraph, last sentence:

The testing shall be conducted in accordance with U.S.. EPA's method 821-R-02-1~~3~~2 (U.S. EPA 2002, ~~4th Edition~~ 5th Edition).

Page 10, first paragraph:

If 100% mortality to *Pimephales promelas* or *Ceriodaphnia dubia* is detected within 24 hours of test initiation, then a dilution series shall be initiated (0.5x steps) ranging from the undiluted sample (or the highest concentration that can be tested within the limitations of the test methods or sample type) to less than or equal to 6.25 percent of the sample. Further, if statistically significant toxicity is detected and a greater than or equal to 50% increase in *Pimephales promelas* or *Ceriodaphnia dubia* mortality compared to the laboratory control is observed, then targeted TIEs will be conducted on the initial sample that caused toxicity.

1. Toxicity Identification Evaluation (TIE)

   The Permittees shall begin a Phase I targeted TIE immediately on all samples that cause statistically significant toxicity and greater than or equal to 50% increase in *Pimephales promelas* or *Ceriodaphnia dubia* mortality compared to the laboratory control. If mortality of both test species exceeds the 50% trigger, then TIEs shall be conducted using both species. TIEs are required until the cause of toxicity is determined. TIE shall be conducted by qualified personnel. Specially, the following TIE treatments will be performed:

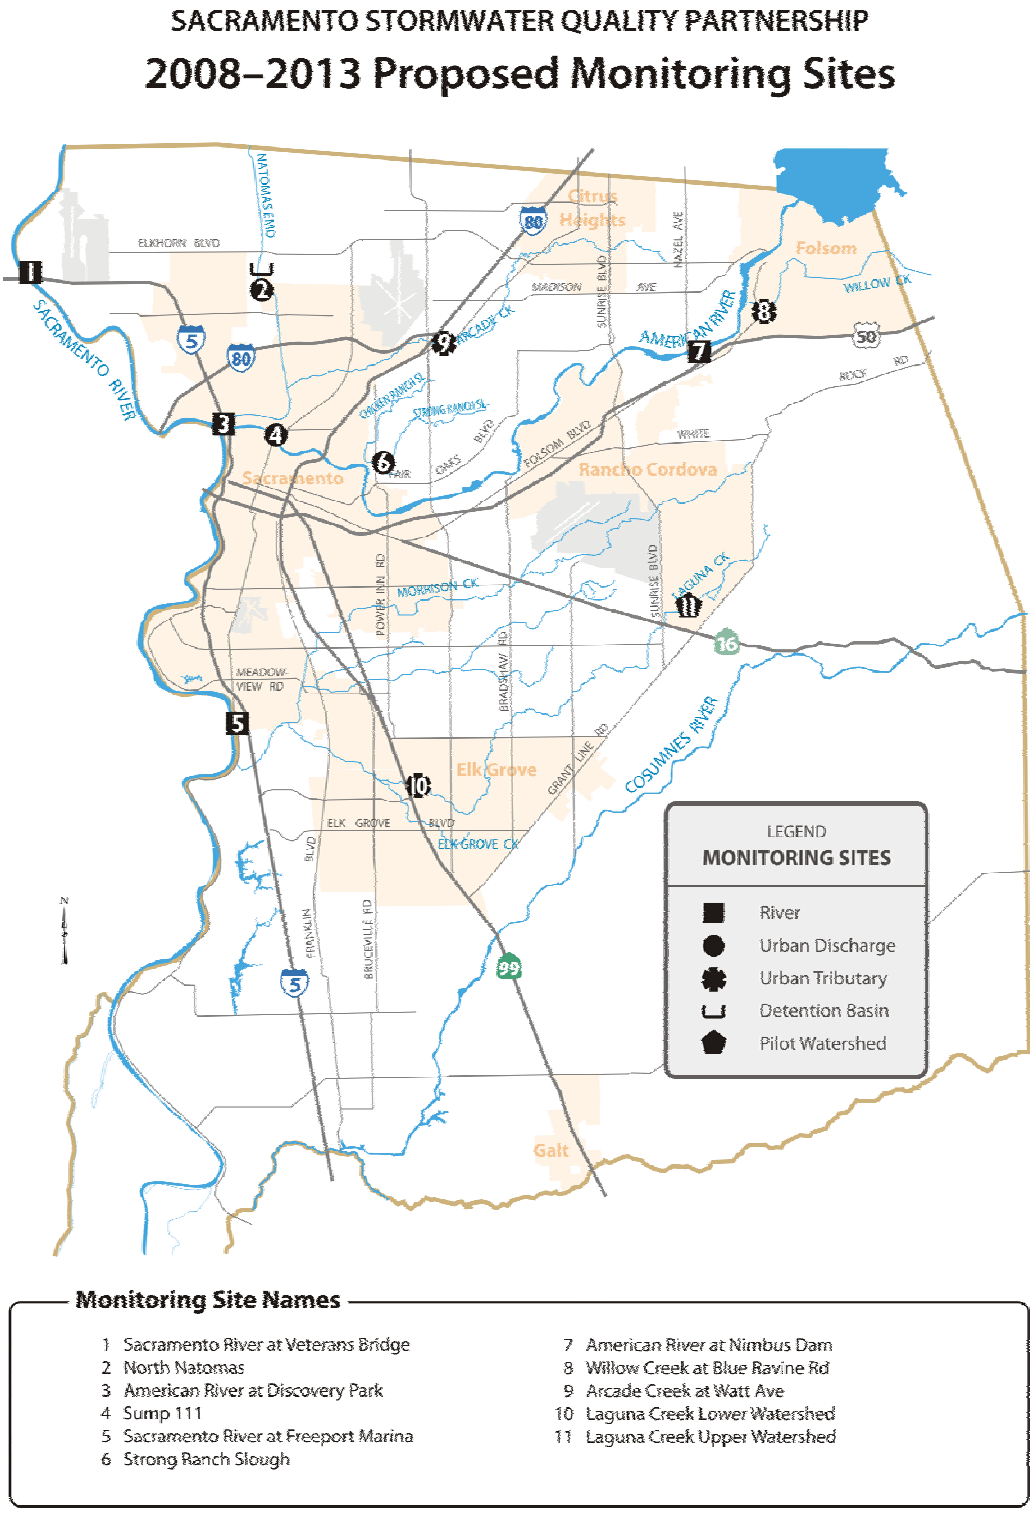
   - Chelex for divalent metals (potential cross-reactivity with some polar non-metals)
   - C18 or C8 SPE column for non-polar organics (includes pesticides)
   - Centrifugation for particulates and associated toxins (less problematic than filtration)
   - PBO for metabolically activated pesticides and other organics. This is primarily targeted at previously used organophosphorus pesticides such as diazinon, chlorpyrifos and malathion, which are deactivated by PBO. PBO enhances pyrethroid toxicity.

The Partnership will conduct a Toxicity Reduction Evaluation (TRE) whenever the TIE process successfully identifies a toxicant and the toxicant is not already being addressed in Section 2.5, Target Pollutant Program. A maximum of two TREs per year are required. A TRE includes all reasonable steps to identify the source(s) of toxicity and discuss appropriate BMPs to eliminate them. Once the Partnership identifies the source of toxicity and appropriate BMPs, the Partnership will submit a TRE Corrective Action Plan as part of the annual report to the Regional Water Board Executive Officer for approval. If a toxicant is already in the Target Pollutant Program, the toxicity found shall be noted and addressed through on-going implementation of that pollutant control strategy.

Sediment and Bioassessment Monitoring

Sediment and bioassessment monitoring can characterize long-term trends for larger watershed areas. The Partnership describes specific monitoring protocols in the sampling and analysis plans and submits them annually to the Regional Water Board.

Sediment Monitoring



The Partnership will perform pyrethroid sediment sampling at the three urban tributary monitoring locations during one wet season (from October 1 through April 15) and one dry season event. The wet event will be performed directly following a wet weather urban tributary event and no later than April.

Researchers recently identified toxicity resulting from pyrethroid pesticides in a study[3] performed through Statewide Ambient Monitoring Program (SWAMP) monitoring in Sacramento area (Roseville, CA) urban tributaries. These studies found that toxicity to the benthic invertebrate species *Hyalella azteca* was caused by pyrethroid pesticides in the sediments.

Bioassessment

The Partnership does not anticipate bioassessment monitoring in the Stormwater Permit term, although the Partnership will submit an analysis of data collected to date as part of the 2008-09 AMR.

Figure 2.4-1
2008-2013-Term Monitoring Sites

Note: In addition to baseline monitoring, water column toxicity and sediment monitoring will occur at urban tributary and urban discharge (runoff) sites.

Table 2.4-4
Water Quality Monitoring Constituent List

Constituent Class	Constituent
Field/Lab Measurements	• Water Temperature • pH • Dissolved Oxygen • Turbidity • Electrical Conductivity (EC)
Bacteria	• Fecal coliform • E. coli (fresh waters)
General	• Total Petroleum Hydrocarbons • Total Suspended Solids (TSS)/Total Dissolved Solids (TDS) • Total Organic Carbon/ Dissolved Organic Carbon • Biochemical Oxygen Demand/Chemical Oxygen Demand • Total Kjeldahl Nitrogen • Alkalinity • Nitrate-Nitrite • Total Phosphorus • Specific Conductance • Total Hardness • Methylmercury
Metals	• Copper, Dissolved and Total • Iron, Total • Lead, Dissolved and Total • Mercury, Total • Zinc, Dissolved and Total
Organophosphate Pesticides	• Chlorpyrifos • Diazinon • Malathion
Semi- and Non-volatile Organics	• PAHs
Pyrethroid Pesticides in Sediment	• Bifenthrin • Cyfluthrin • Cypermethrin • Deltamethrin/Tralomethrin • Esfenvalerate/Fenvalerate • Fenpropathrin • Lambda-cyhalothrin • Permethrin

Constituent Class	Constituent
The following analysis are not required but will be performed in coordination with aquatic toxicity monitoring at receiving water and urban runoff locations.	
Pyrethroid Pesticides in Water	• Bifenthrin • Cyfluthrin • Cypermethrin • Deltamethrin/Tralomethrin • Esfenvalerate/Fenvalerate • Fenpropathrin • Lambda-cyhalothrin • Permethrin
Carbamate Pesticides in Water	
Organochlorine Pesticides in Water	

Water Quality Based Programs

As listed in the Water Quality Based Programs section of the Stormwater Permit, the Partnership is required to complete data analysis in support of Regional Water Board efforts to develop TMDL limits for pesticides and mercury in area receiving waters. TMDLs are stakeholder-based regulatory programs intended to address receiving water impairments and typically require monitoring, data analysis and source reductions by stakeholders.

Pesticide Monitoring

The Partnership will conduct additional pesticide monitoring to comply with Basin Plan amendments or TMDLs as required during the Stormwater Permit term. Currently there are no additional pesticide monitoring activities required to comply with Basin Plan amendments or TMDLs, however, the Partnership will collect additional pesticide samples during aquatic toxicity sampling events to provide data potentially needed for TIE preparation.

Mercury Monitoring Analysis

The Partnership will evaluate urban runoff discharge loading from the Sacramento area that contributes to Clean Water Act section 303(d) listed mercury-impaired receiving waters. The Partnership will base the discharged load model on total mercury and methylmercury data collected in recent years. The Partnership will summarize this load modeling analysis in the 2008/2009 Annual Report and will include the following:

- An evaluation of load modeling approaches
- Estimates of the average annual methylmercury and total mercury urban runoff concentrations and loads
- Estimates of the amount of total mercury using readily available data of sediment prevented from discharging to receiving waters by existing BMPs such as street cleaning and detention basins
- An evaluation of whether the available concentration data represent a range of storm conditions (i.e. various intensity, duration and antecedent dry hours) and water years
- An evaluation of whether sampling locations sufficiently represent urban runoff throughout the Sacramento urban area

- An evaluation of representativeness of current sampling methods
- An evaluation of methods to estimate urban runoff flow volume

Special Studies

Special studies are targeted investigations that can provide additional information on BMP effectiveness or information regarding direct impacts on receiving waters. The Partnership performs these studies to evaluate specific source control or treatment control measures and they are not intended as long-term characterization studies. The Partnership submits these sampling and analysis plans for each special study that describes study objectives and specific monitoring protocols. The Special Studies completed during the permit term will include:

- A wet detention basin study to measure the effectiveness of new development standards in protecting receiving water quality and target pollutant removal effectiveness
- A pilot watershed study to measure the effectiveness of new development standards in protecting receiving water quality
- Proprietary treatment BMP effectiveness evaluations to measure the pollutant removal effectiveness of proprietary devices that are options for treatment measures in the development standards

Wet Detention Basin Monitoring

The Partnership will complete the wet detention basin effectiveness study initiated in 2007 intended to assess the pollutant removal performance of a typical new development facility. The Partnership is currently completing year two of the study and is expected to finish the study by July 2010. The study includes inlet and outlet monitoring at North Natomas Basin No. 4 for a minimum nine storm events and three dry weather events over the course of the study period. Water column monitoring includes total mercury, methylmercury, TSS, bacteria, turbidity, TDS, OP pesticides and pyrethroids. The Partnership will submit the monitoring results in the 2010/11 annual report along with recommendations for additional grab sampling at two other wet detention basins at different locations in the permitted area. The Partnership will report the results of monitoring at the two additional wet detention basins in the 2012/13 annual report.

Pilot Watershed – New Development BMP Evaluation

The Partnership is required to conduct an evaluation of the effectiveness of new development best management practices (BMPs) within the upper Laguna Creek watershed. The Partnership developed a work plan (see Appendix 2C) to meet this requirement. The work plan describes three study options for an effectiveness assessment that meets the intent of the Stormwater Permit requirement given the potential lack of new land development during the permit term. The three options include:

1. Monitoring of a new development BMP within the Upper Laguna Creek watershed
2. Monitoring of a Low Impact Development (LID)-type BMP outside of the Upper Laguna Creek watershed
3. Monitoring of a receiving water site within the Upper Laguna Creek watershed to establish baseline conditions on which future post-development conditions can be compared

As proposed in Appendix 2C, the Partnership will monitor a BMP or a receiving water site during FY 2012/13 or FY 2013/14. If a BMP is selected, the Partnership will monitor the inlet and outlet during three storm events each year for a total of six storm events during the permit term. Additionally, the Partnership will assess the ability of the BMP to reduce runoff volume as this has an impact on the overall pollutant load. If the Partnership selects a receiving water site, the monitoring schedule will match that of the other Partnership receiving water monitoring sites (three storm events and one dry event per year).

The Partnership will submit a technical report at the study conclusion in the final annual report of the Stormwater Permit term to describe the results of the water quality monitoring, BMP effectiveness and runoff reduction. The report will document installation and maintenance costs and make recommendations regarding future use and applicability of the BMP within the Sacramento Partnership area.

The Partnership is requesting the following modification to the Stormwater Permit requirements in consideration of the current slower rate of land development (new language is underlined):

MRP Section III.C., page 21, Pilot Watershed – New Development BMP Effectiveness Evaluation

1. The Permittees shall prepare and implement a work plan over the permit term for monitoring a receiving water site within the Upper Laguna Creek Collaborative project area. <u>If there is insufficient new development in this study area prior to 2011, the study may be moved to an alternate location and/or be modified to consider a specific new development BMP.</u> The work plan shall be submitted as part of the revised SQIP.

Proprietary Treatment BMP Effectiveness Evaluation

The Partnership will continue to research the effectiveness of proprietary structural treatment BMPs. Guidelines for reviewing and evaluating the performance of these devices will follow the protocol developed in the *Comprehensive Protocol for Performance Evaluation of Proprietary Stormwater Control Products* (performance protocol) found at the Partnership web site http://www.sacramentostormwater.org/SSQP/development/proprietary.asp. The Partnership will research the following activities during the Stormwater Permit term:

- Review of current proprietary treatment BMP monitoring studies and assessment of product effectiveness, including the following devices:
  - CONTECH Storm Filter, 15 gpm/cartridge or 2 gpm/ft^2 unit
  - BayFilter pilot
- Review and where necessary revise the performance protocol. Minimum criteria (from the protocol) will be established for submittals. The revised protocol will be posted on the Partnership website.
- Once the Partnership revises the performance protocol, the Partnership will provide outreach to proprietary device manufacturers and solicit field performance data to demonstrate effectiveness of their products. The outreach will include meeting with vendors, posting the information on the Partnership website, and sending submittal request to the Stormwater Equipment Manufacturers Association (SWEMA) and its members.
- Conduct a comprehensive review of the lab and field data from the proprietary treatment BMPs. The Partnership will update the list of approved devices as needed.

Monitoring Coordination

The Partnership has coordinated with and supported other monitoring efforts, some of which are described below:

- Central Valley Regional Water Quality Control Board – The Regional Water Board oversees monitoring specific to TMDL development and region-specific support of the Statewide Ambient Monitoring Program (SWAMP). Most recently, the Regional Water Board has initiated a stakeholder-driven Regional Monitoring Program (RMP) for the Central Valley that includes the Delta, the Sacramento River watershed and the San Joaquin River watershed. The Regional Water Board has prioritized the Delta effort, but efforts in all watersheds are ongoing.
- The Sacramento River Watershed Program (SRWP) is a stakeholder effort that is concerned with Sacramento River watershed resources and conducts various monitoring activities within the watershed. Currently, the effort is developing a funding plan in coordination with other monitoring efforts, including the RMP initiative.
- The U.S. Geological Survey (USGS) National Water Quality Assessment (NAWQA) Program provides consistent and long-term comparable information on rivers and streams nationally. The second cycle of monitoring in the Sacramento River watershed is underway until 2014. Monitoring is focused on two locations that coincide closely with the Monitoring Program's locations: Sacramento River at Freeport and Arcade Creek near Del Paso Heights (Watt Avenue). Currently NAWQA is monitoring on the Sacramento River only.
- The California Department of Water Resources oversees the CALFED Bay-Delta Program monitoring project funds related to source control for the statewide protection of drinking water supply. Numerous efforts are ongoing related to urban runoff BMPs and characterization of sources.

2.4.4 Effectiveness Assessment

The Partnership annually assesses the effectiveness of the Monitoring Program in collecting high quality data that supports program objectives. The Partnership adjusts field sampling techniques as a result of this assessment in order to maintain the collection of high quality data. Additionally, the Partnership annually completes the Monitoring Program reporting and data analysis needed to complete the effectiveness assessments described in Chapter 2.3 and Section 2.4.2.

Notice of Water Quality Exceedances (NWQE)

The Partnership is required to compare the monitoring data collected in receiving waters against a prescribed set of water quality objectives. If monitoring data exceed water quality objectives, the Partnership must submit a NWQE to the Regional Water Board within 90 days of the monitoring event. The Partnership summarizes these reports within the annual reports.

This approach helps identify potential impacts to beneficial uses, but does not consider site-specific conditions, the extent to which urban runoff caused the problem, or the presence/absence of specific beneficial uses downstream.

Report of Water Quality Exceedances (RWQE)

The Partnership submits an annual RWQE that identifies constituents that exceed the water quality objectives for receiving water where urban runoff may cause or contribute to the exceedance and proposes changes to the SQIP as needed.

The year-end RWQE considers the extent to which urban runoff causes or contributes to the exceedances. The Stormwater Permit does not specify a method for this assessment, and the Partnership has developed an assessment process. The Partnership updates and reports the process flow chart in the AMR.

Data Analysis Approach

The Stormwater Permit requires data analysis for the purpose of characterizing discharged loads and assessing the effectiveness of the Partnership Program in removing loads and improving receiving water quality. The objectives of the effectiveness assessments are discussed further in Section 2.3 of this SQIP. The final annual report of the Stormwater Permit term and/or the Report of Waste Discharge (ROWD) will contain additional analyses for the target pollutant list, found in Section 2.5. Some of the expected analysis are discussed below and are summarized by monitoring type in Table 2.4-2.

Trend Analysis

Trend analysis measures a change in the condition of stormwater or a receiving water body over time. The analysis ranges in level of complexity from comparisons of medians from different periods and time series analysis to the more detailed regression-based analysis. The Partnership will perform trend analysis incrementally throughout the permit term and report progress annually and in the final long term effectiveness assessment (LTEA) submitted with the Report of Waste Discharge/NPDES Permit application. The Partnership will annually prepare a comparison of different period medians and time series plots. The Partnership will evaluate trends of discharges and receiving water quality and consider several factors, such as changes in sample collection methods, data quality differences and changes in analytical methods.

The LTEA will include a trend analysis that includes a more detailed regression-based analysis. The Partnership has developed and analyzed regressions with a power analysis to determine the necessary monitoring period, data points and statistical power necessary to detect long-term trends in urban runoff. The Partnership will then complete the long-term effectiveness assessment for target pollutants and include an evaluation of significant correlations of target pollutants to other factors and constituents. It is expected that trends can be identified for some constituents; however, the precise cause of changes may not be apparent.

Upstream-Downstream Comparisons

Comparisons of upstream and downstream concentrations provide an assessment of changes in water quality between the two locations. There are other influences beside urban runoff discharge, and impacts may not be directly attributable to urban runoff. The Partnership will consider impacts on the rivers with statistical paired comparisons of upstream and downstream data. The Partnership will perform the analysis on recently collected target pollutant data in both the Sacramento and American Rivers.

Urban Runoff (Discharge) Load Modeling

An estimate of total pollutant loads attributable to urban runoff for target pollutants at each urban runoff (discharge) monitoring station will be reported in the final annual report of the Stormwater Permit. The Partnership previously performed a regression-based continuous simulation of discharge loads of specific constituents from the entire permitted area. The Partnership will update these regressions as part of the long-term effectiveness assessment, and will consider a similar model for all target constituents. The Partnership will also consider alternate load calculation methods ranging from a simple approach (median concentration and median flow) to other commonly used approaches (e.g., LOADEST).

An initial study of mercury and methyl mercury that is due to the Regional Board in the October 2009 annual report will review the different load calculation methods (see the Mercury Monitoring Analysis paragraph above). The model results will estimate discharged loads from the monitoring stations and the permitted area and consider data from newly developed areas.

BMP Effectiveness Assessments

The Partnership measures the effectiveness of new development standards and specific BMPs through evaluations of programmatic and monitoring data. The Partnership approach considers multiple information sources to perform this effectiveness assessment. The Partnership will perform the approach described below for target pollutants over the course of the Stormwater Permit term.

- *Watershed Inventory*

  The watershed inventory is an "accounting" (rather than statistical) model approach that summarizes known BMP performance (from Permittee and literature data) and estimates the load removed by summing the performance data of all the known BMPs in the permitted area. The Partnership can compare the inventory to both the discharge load model estimates and the observed loads in receiving waters to estimate the relative impact of Permittee BMPs on urban runoff and receiving water quality. The Partnership will conduct this inventory using a simple spreadsheet model[4] that will estimate primary and secondary pollutant sources and the pollutant removal benefit of current program activities.

- *Comparison of New Development vs. Older (pre-1990) Development*

  In 2008, the Partnership initiated urban runoff monitoring in the newly developed North Natomas (Basin No. 4) area. Data from this new development discharge can be directly compared to ongoing monitoring of older development discharges to evaluate the effectiveness of new development standards, including wet detention basins.

- *BMP Effectiveness Studies*

  The Partnership will measure BMP effectiveness directly with detention basin monitoring, Laguna Creek watershed monitoring and proprietary treatment device studies.

  The Partnership pairs North Natomas Basin No. 4 discharge (outlet) monitoring with inlet monitoring to assess the effectiveness of reducing constituent concentrations. The Partnership will perform paired (inlet-outlet) statistical comparisons to determine if the sites have statistically different water quality. The Partnership will estimate the discharge concentration and/or discharged load reduced to characterize the basins removal effectiveness.

  The Partnership intends to utilize the upper Laguna Creek pilot watershed project to quantify changes in water quality and ideally attribute changes to watershed development activities. If significant development does not occur in the proposed study area, the study will focus on monitoring the pollutant- removal effectiveness of a low impact development practice elsewhere in the Permittee area.

  The Partnership will utilize information from the Proprietary Treatment BMP Effectiveness Evaluation to guide the use and selection of Proprietary Treatment BMPs.

Target Pollutant Program Coordination

The Target Pollutant Program is based on an iterative process of monitoring, data evaluation, issue prioritization, and work plan development and is discussed in detail in the next chapter. The Partnership analyzes monitoring data jointly through Monitoring Program and Target Pollutant Programs. The Partnership coordinates these activities closely, and the results of effectiveness evaluations in either program element often directly affect activities in the other program element.

2.5 Target Pollutant Program

2.5.1 Introduction

The Sacramento Stormwater Quality Partnership (Partnership) implements the Target Pollutant Program to identify priority pollutants and focus resources on the pollutants most likely to impair local receiving waters. The Partnership prioritizes constituents through an evaluation process that considers stormwater monitoring data, sources of pollutants, pathways into local waterways, and impacts to the waterways. The Partnership develops reduction strategies for priority pollutants and identifies control strategies to reduce the discharge. To date, the Partnership has established reduction strategies for pesticides, mercury, copper, lead and pathogen indicators. The strategies are evaluated annually. Table 2.5-2, Regional Target Pollutant Program Activities Work Plan follows this section of the SQIP.

The target pollutant identification and control process is summarized below and illustrated in Figure 2.5-1.

Step 1 - Identification and Ranking of Target Pollutants

The Partnership begins the ranking of target pollutants by comparing monitoring data to indicators of actual or potential water quality impacts following the *Target Pollutant Prioritization Procedure*[1]. The Partnership collects most of the necessary monitoring data including water chemistry, aquatic toxicity and sediment data (see Table 2.4-2 and 2.4-4). Partnership data are complemented by other readily available and reliable regional study data that characterize toxicity identification or bioaccumulation potential. The indicators used in the comparisons are threshold values (i.e., water quality objectives) from the California Toxics Rule (CTR), Water Quality Control Plan for the Sacramento and San Joaquin River Basins (Basin Plan), U.S. EPA Safe Drinking Water Maximum Contaminant Levels (MCLs), and other applicable thresholds. Additional scoring categories are based on observed aquatic toxicity, bioaccumulation and the existence of specific regulatory programs for the constituent. The constituents are ranked using a weighted scoring scheme based on best available science and professional judgment.

A "program implementation" processing step was added to the previously developed protocol in March 2009 to consider controllability, treatability and the impact of urban runoff on beneficial uses[2].The target pollutants are categorized and grouped based on the following considerations:

- Report of Water Quality Exceedance (RWQE) status – is the constituent included in a previous RWQE?
- Source controllability – can the constituent sources be identified and reduced?
- Urban runoff treatability – what level of treatment is necessary to remove the constituent from urban runoff prior to discharge?
- Urban runoff impact on beneficial use – do concentrations of the constituent in urban runoff directly impact an established beneficial use, including consideration of the following:
    - Regulatory factors such as the tributary rule[3] and U.S. EPA drinking water maximum contaminant levels[4]
    - Beneficial use analysis
    - Recalculation of applicable site specific water quality objectives using advanced analytical tools such as the Biotic Ligand Model (BLM) and pathogen source identification

A description of the revised target pollutant identification and ranking process and analysis results are included in Appendix 2D. The individual constituents were evaluated as a group and prioritized as shown in Table 2.5-1:

Table 2.5-1
Prioritized Target Pollutant Groups

2009 Target Pollutant Group	Priority
Sediment Erosion Surrogates	High
Pathogen Indicators	Medium
Pesticides	Medium
Mercury	Medium
PAHs	Medium
Unquantified Sources (e.g., Bis(2-ethylhexyl)phthalate)	Medium
Drinking Water Issues (e.g., TOC, TDS, and nutrients)	Medium
Metals	Medium
Petroleum Products	Low
Legacy Pollutants	Low

Step 2 - Identification and Prioritization of Sources

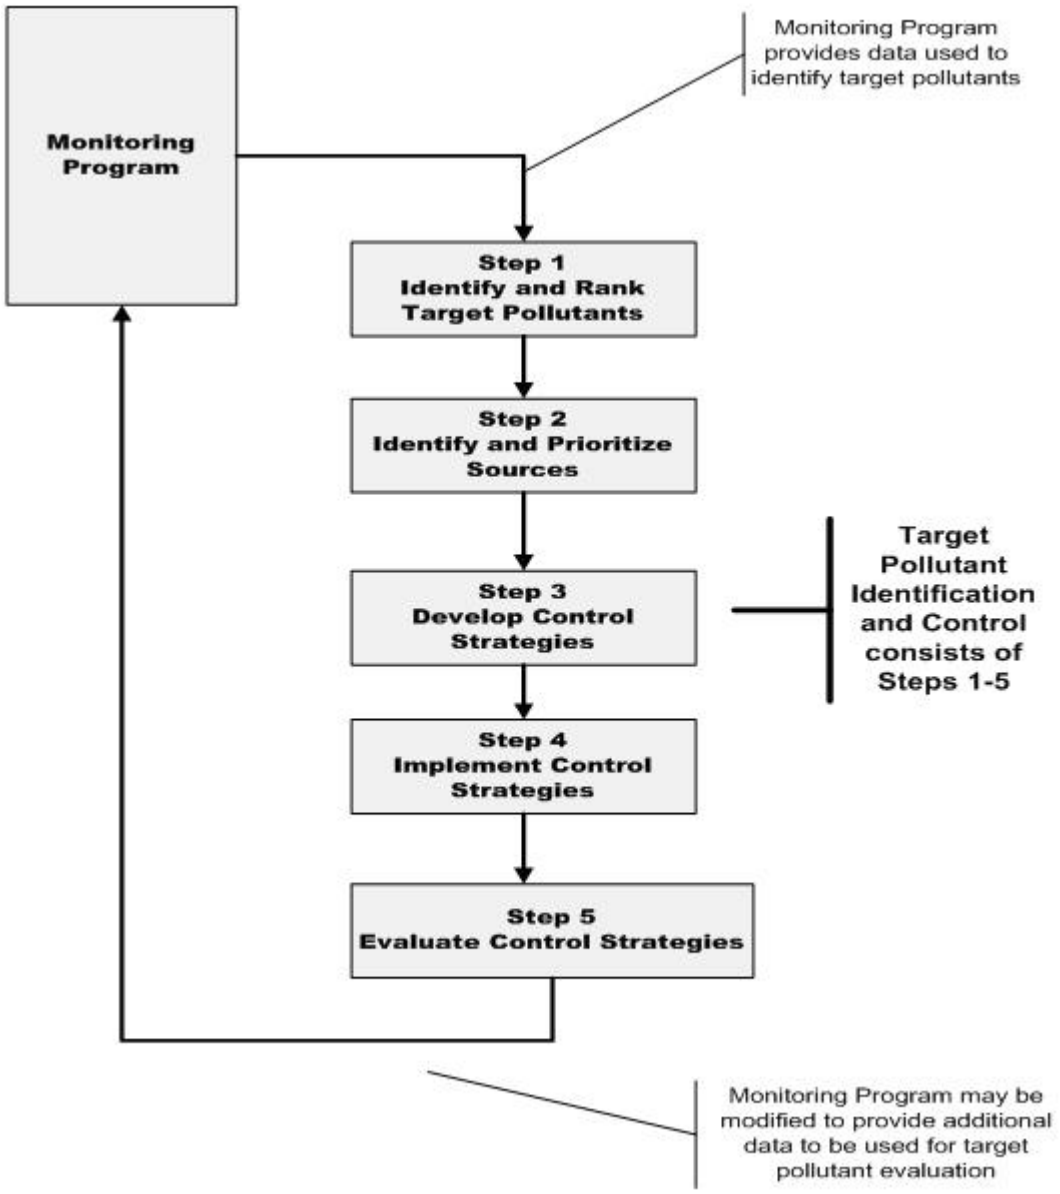
The Partnership identifies and ranks likely pollutant sources for identified target pollutant groups, based on available local, statewide, and national literature. Sources include specific products, materials, and activities that contain or are likely to contribute target pollutants to urban runoff. The Partnership ranks sources for each target pollutant group to focus on those sources with the greatest potential for reducing local pollutant levels. The Partnership evaluates and reprioritizes these sources as needed during the annual effectiveness evaluation of the Target Pollutant Program.

Step 3 - Development of Target Pollutant Control Strategies

The Partnership develops and periodically updates area-wide strategies for controlling the top-ranked sources of each target pollutant. This involves selecting the most technically effective, practical and cost-effective combination of control measures, and therefore begins with a review of potentially applicable ones. The Partnership evaluates control measures with pilot studies, technical studies, and extensive literature reviews.

For sources that cannot be effectively controlled with local programs, the Partnership actively seeks ways to influence regional policy, participate in State and Federal regulatory processes, or to support other agency or stakeholder efforts to achieve pollution reduction. For example, Partnership staff led the effort of the California Stormwater Quality Association (CASQA) to influence State and Federal pesticide registration and evaluation activities, with a goal of establishing adequate regulatory processes for preventing and responding to urban water quality issues caused by pesticides.

Step 4 - Implementation of Target Pollutant Control Strategies



The Partnership implements control strategies as part of other Permittee program elements (such as Municipal Operations), when appropriate; otherwise, they are implemented under the Target Pollutant Program. Selected control strategies and activities may be implemented under one program element or several program elements, and may be completed jointly by the Partnership or by the individual Permittees. The Partnership identifies pollutant sources, control strategies and responsible parties with annual workplans.

Step 5 - Effectiveness Assessment of Target Pollutant Control Strategies

The Partnership utilizes the California Stormwater Quality Association (CASQA) methodology to assess the effectiveness of the Partnership Program (see Section 2.3), including control strategies for target pollutants. The Partnership annually evaluates the Target Pollutant Program and strategies as described later in Section 2.5.3.

The assessments will help determine needed changes to the Target Pollutant Program strategies, specific activities or the overall Partnership Program. The evaluations and any subsequent changes to programs or activities will be included in the annual reports submitted to the Regional Water Board.

Figure 2.5-1
Target Pollutant Identification and Control Process

2.5.2 Target Pollutant Strategies

This section describes the target pollutant control strategies planned for the permit term summarized in the Target Pollutant Activities Work Plan.

Sediment Erosion Control Strategies

In March 2009, the Partnership identified sediment erosion as a high priority target pollutant group. Previously the Partnership included target pollutant listings for turbidity and total suspended solids, but at a slightly lower priority level. The revised March 2009 target pollutant prioritization process now considers controllability and treatability directly which greatly increases the priority of sediment-related pollutants, although there are no Partnership receiving waters that are listed as impaired due to sediment.

Historically, the Partnership has recognized that sediment erosion can cause impairment to aquatic life and drinking water beneficial uses in receiving waters and that erosion of urban tributary banks due to peak urban runoff flows can also impact general water quality and riparian habitat. The Partnership has historically addressed sediment erosion control through several programs and new development policies. In fact, nearly all the Partnership Program elements already address sediment erosion control.

Specifically, the Partnership has performed and will continue to perform where appropriate the following activities:

- Implementation of revised new development standards to require LID strategies
- Review, inspection and enforcement of construction BMP standards
- Street sweeping and Partnership-owned parking facility maintenance
- Catch basin, sumps, and open channels cleaning
- Turbidity sampling in several urban tributaries to characterize potential impacts and changes over time

Although the Partnership has implemented these sediment erosion control strategies, these efforts have not been formally documented as part of the Target Pollutant Program. The Partnership will develop such a plan in the upcoming Permit term.

Pathogen Indicator Control Strategies

Fecal coliform and *E. coli* have been used to indicate the potential presence of fecal matter and by extension, of pathogenic microorganisms associated with fecal matter, in receiving waters. Although coliform levels have not been shown to correlate well with pathogenic microorganisms, they continue to be used as indicators due to the lack of affordable and reliable analytical methods for detecting pathogens directly. When the pathogens such as *Giardia* and *Cryptosporidium* have been directly tested in Sacramento receiving waters, they are generally non-detect or present at low concentrations. [5,6]

Despite the lack evidence of the presence of pathogens, the Partnership finalized a Fecal Waste Reduction Strategy in 2003/2004. Potential sources of observed fecal coliform bacteria in urban receiving waters include *in situ* growth, wild animals, domesticated pets, live stock, aquatic recreation, domestic wastewater overflows, and lack of sanitation facilities for homeless persons. A principal finding of the strategy is that some sources of coliform/pathogens, such as wildlife, are not readily amenable to source control. The reduction strategies therefore focus on controllable sources to reduce the discharge of fecal material to the storm drain and creeks. The strategy also includes periodic review of source identification technology which might have the potential to identify additional controllable sources.

The Partnership will implement the Fecal Waste Reduction Strategy that includes the control strategies shown below in the 2008-13 permit term.

Specifically, the Partnership has performed and will continue to perform where appropriate the following activities:

- Prohibit cross-connections from sewer system to the storm drain
- Prohibit discharges of pet waste into the MS4
- Inspect kennels for appropriate waste handling procedures
- Conduct outreach promoting appropriate disposal of boating wastewater
- Conduct outreach and support practical alternatives to increase appropriate disposal of pet waste
- Conduct outreach promoting appropriate livestock manure management
- Maintain coverage, as needed, under the State Water Resources Control Board General Waste Discharge Requirements for sewer overflows
- Conduct three Coliform/Pathogens Workgroup meetings to review current status of coliform/pathogen control efforts in the state and identify additional actions, if any

Pesticide Control Strategies

The Partnership recognized in 1995 that the pesticides diazinon and chlorpyrifos were present in toxic levels in stormwater discharges and local receiving waters. Since then, the Partnership has worked to proactively address this problem as pesticides continue to be a significant priority pollutant.

Studies conducted in Northern California have since shown that pesticide applications made by private residents may be responsible for approximately one-half of the pesticides applied in urban areas. [7] These studies also indicate that the large volume of pesticides applied in urban areas by both residents and Pest Control Operators (PCOs) could account for the observed levels of pesticide contamination of stormwater, even if the pesticides are legally applied. [8]

Accordingly, the Partnership pesticide control strategies emphasize efforts to influence state and federal pesticide policies as well as outreach for residents and PCOs.

During the next permit term, the Partnership will implement the comprehensive Pesticide Plan approved by the Regional Water Board in 2006 as indicated in the Permit. The plan's pesticide control strategies for the next permit term are shown below. The Permittees will implement the strategies as appropriate for the individual agency.

Specifically, the Partnership has performed and will continue to perform where appropriate the following activities:

- Document and evaluate municipal pesticide use
- Require oversight of municipal use by Certified Pesticide Applicator
- Establish and conduct training program for public agency pesticide applicators
- Establish Permittee-specific IPM policies or ordinances
- Begin and/or continue establishment of department specific IPM plans and procedures
- Ensure that Permittees have coverage under Aquatic Pesticide Permit, if required

- Coordinate structural BMP design and maintenance with Sacramento-Yolo Mosquito and Vector Control District as needed
- Support local IPM outreach and education programs, such as Water Wise Program and Our Water Our World
- Support Household Hazardous Waste (HHW) programs
- Include pesticide information in stormwater media campaign
- Encourage incorporation of IPM in design of new development landscaping and buildings
- Provide training and promote implementation of IPM by Institutional Pesticide Users
- Continue regulation by the County Agricultural Commissioner
- Enforce local prohibitions against illegal discharges
- Promote IPM implementation by PCOs
- Conduct water quality monitoring
- Track relevant monitoring programs by other agencies
- Conduct residential pesticide sales and use surveys once per permit term and utilize in outreach efforts
- Evaluate PCO pesticide use data
- Track and comment on State and Federal regulatory activities that pertain to pesticides of significance to urban stormwater discharges
- Provide input for pesticide product risk assessments for surface water quality
- Participate in the development of TMDLs for pesticides in Sacramento urban creeks
- Support improvements in State and Federal pesticide regulations
- Revise Pesticide Plan as needed to incorporate pyrethroid sediment monitoring activities

Mercury Control Strategies

The Partnership identified mercury as a top-ranked target pollutant in 2002. Mercury is a problem due to the high levels of methylmercury measured in several species of edible fish in the Delta. Methylmercury content poses a threat to humans and wildlife that consume the fish, and thus impairs fisheries. This led to the listing of the Delta as a high priority impaired water body on the State's 303(d) list, and a draft Total Maximum Daily Load (TMDL) for mercury in the Delta has been released for public comment.

The dominant sources of mercury now found in the Delta are historical and gold mining upstream of Sacramento, as well as geologic sources such as soils and springs located throughout the Coast Ranges. Atmospheric deposition from remote sources such as coal fired power plants and volcanoes are believed to be a significant contributor to mercury levels in the Delta.

It is unlikely that even complete removal of all mercury from urban runoff would have a significant effect on the levels of mercury in the water column and sediment, or on the levels of methylmercury in fish tissues of the Delta. This is because of two main factors. The first is that mass loading of mercury discharged from the Partnerships' storm drain systems to local waterways is very small, when compared to the amount of mercury being discharged by other sources in the watershed and the amount already present in sediments of the Delta and the rivers. The second factor is that the amount of mercury discharged by the Partnership is greatly overshadowed by biogeochemical processes occurring in the river and the Delta that generate methylmercury from mercury already present in water and sediments.

Despite these limitations, the Partnership submitted and subsequently began implementing a comprehensive Mercury Plan in 2004. The reduction strategies included in the plan focus on controllable sources and generally include activities associated with municipal operations, industrial inspections, public outreach, participation in initiatives to increase mercury recycling, and participation in efforts to address mercury on a regional or watershed basis. A number of these strategies are general stormwater BMPs such as street cleaning and detention basins that are not designed to specifically address mercury; however they are effective at removing a wide variety of pollutants, including mercury, from urban runoff. The pollutant control strategies to be implemented during the next permit term are shown below. In addition, the Partnership actively participates in the stakeholder groups for the Delta Methylmercury Total Maximum Daily Load (TMDL). The Partnership will continue working with the Regional Water Board through this stakeholder process to confirm initial TMDL allocations and evaluate actions that can be implemented to meet allocations. The Permittees will implement the strategies as appropriate for the individual agency.

Specifically, the Partnership has performed and will continue to perform where appropriate the following activities:

- Conduct street cleaning
- Maintain detention basin operations
- Conduct drainage facility maintenance
- Require erosion and sediment control BMPs
- Continue new development requirements for on-site and regional stormwater treatment BMPs
- Update Mercury Plan for consistency with final TMDL, include methodology for calculating mercury load reductions
- Participate in the Delta Tributary Mercury Council (DTMC) on mercury watershed programs
- Track HHW mercury reduction programs
- Track mercury air deposition and emission studies relevant to the Sacramento area
- Review and provide input for Delta and Sacramento River TMDL
- Incorporate mercury recycling messages into general materials and events
- Develop fact sheet for distribution to County EMD staff
- Conduct outreach to other commercial/ industrial businesses, as appropriate
- Incorporate coordination with the countywide universal waste management strategy into the Mercury Plan

- Evaluate and summarize 2004 and 2007 public awareness/opinion survey data related to mercury, and develop recommendations for amending Partnership source control programs and implement accordingly
- Evaluate total mercury and methylmercury data collected to date
- Estimate amount of total mercury and sediment prevented from discharging to receiving waters by existing BMPs
- Consider including monitoring in the design of future BMP studies

Metals Control Strategies

Metals such as copper, zinc and lead can be toxic to the aquatic environment if present in significant bio-available concentrations. The Partnership will continue to implement control strategies that address these constituents during the next permit term. The control strategies are generally incorporated into other program elements and primarily include sediment control and removal, waste diversion and public outreach and are listed below.

Specifically, the Partnership has performed and will continue to perform where appropriate the following activities:

- Conduct street cleaning
- Maintain detention basin operations
- Conduct drainage facility maintenance
- Require erosion and sediment control Best Management Practices (BMPs) for construction projects
- Continue new development requirements for on-site and regional stormwater treatment BMPs
- Implement an industrial inspection program
- Support HHW collection
- Continue financial support of the Brake Pad Partnership

Information about the specific constituents follows.

Copper

Copper occurs naturally in local soil and water and its release to the urban environment is a by-product of human activities. Copper can cause aquatic life toxicity if it is in a bio-available form (i.e., usually a dissolved form) at a sufficiently high concentration and a sufficient length of exposure occurs.

In 1997, the Partnership identified and prioritized sources of copper, as well as potentially effective control strategies.[9,10,11] This effort identified several potential sources of copper: rainfall, potable water used outdoors, naturally occurring copper in soils, brake pad wear, and possibly pesticide use.

In the 1990's, Bay Area stormwater programs estimated that approximately 80% of copper in urban runoff may originate from brake pad wear. Therefore, reducing the content of copper in manufactured brake pads was hypothesized to be a likely effective control measure for copper. Subsequently, brake pad industry representatives and water quality interests (environmental organizations; and state, federal, and local government agencies) voluntarily formed the Brake Pad Partnership. The Partnership contributes financial support to this effort, which examined the link between copper in automotive brake pads and copper in surface waters. The Brake Pad Partnership's rigorous analysis has confirmed that brake pads are the largest source of copper in urban runoff. This has led to proposed legislation in California, supported by stormwater agencies, to reduce the copper content of brake pads.

Through the Notice of water Quality Exceedance (NWQE) process for local receiving water quality data (discussed in more detail in Section 2.4, the Monitoring Program), the Partnership reported a number of exceedances of copper in urban creeks, in both dissolved and total recoverable forms. These exceedances were based on the California Toxics Rule objective, which allows for a hardness adjustment but does not consider other significant site-specific receiving water conditions that affect copper aquatic toxicity. Through application of the U.S. EPA's recently adopted Biotic Ligand Model (BLM)-based water quality objective, the Partnership has determined that copper toxicity occurs much less frequently than previously believed.[12]

Lead

Historically, lead had numerous uses in the urban environment. This resulted in a legacy reservoir of lead. The largest historical sources of lead in urbanized areas were gasoline and lead paint. Many buildings painted before 1978 include lead paint, which remains on the houses and thus continues to be a source of lead in urban runoff. Lead gasoline was phased out in the 1970s and 1980s, but lead levels in soil in urban areas continue to exceed background levels. Lead contained in soils and subsequently mobilized in urban runoff may contribute to the amount of lead observed in local waterways.

The Partnership identified lead as a target pollutant in 1996. The Partnership subsequently conducted studies to identify and prioritize sources of lead and identify potentially effective control strategies. Local potential sources of lead that were identified included weathering and erosion of lead-painted structures, small aircraft and vehicle exhaust emissions, tire wear, use of leaded pavement marking paints, erosion of soil with past accumulation of lead, shooting ranges, and several types of industries (auto and radiator repair shops; airports; auto dismantlers; machinery, electrical, and transportation equipment manufacturers; landfills and transfer stations; rail yards; and metal recyclers). The control strategy identification work led to a list of good housekeeping practices, structural controls, and education and training activities for the identified sources.

In 1998/99, a joint Lead/Copper Workshop was held with Permittee staff to integrate the results of the source and control strategy identification work into the activities of the various program elements.[11]

Zinc

Zinc occurs naturally in local soil and water and like copper is also a by-product of everyday human activities. Zinc can also cause toxic effects to aquatic life if it is in a bio-available form (i.e., usually a dissolved form) at a sufficiently high concentration and a sufficient length of exposure.

The Partnership has reported a number of exceedances of zinc concentrations in urban creeks through the NWQE process, in both dissolved and recoverable forms. These exceedances were based on the California Toxics Rule objective, which allows for a hardness adjustment but does not consider other significant water quality parameters that affect zinc aquatic toxicity. Through application of the U.S. EPA's Biotic Ligand Model, the Partnership has determined that zinc toxicity occurs much less frequently than previously believed.[12] When adjusted to consider site specific conditions using the BLM, zinc observed concentrations generally do not exceed WQOs or site specific LC50s even in cases where the observed concentrations exceeded the CTR WQO. However, the BLM has not been approved yet by U.S. EPA for these types of zinc evaluations.

Based on work conducted on copper and lead sources, the Partnership currently believes that likely sources of zinc in urban runoff is tire tread wear and outdoor metal structures with galvanized metal surfaces such as fences, flashing, and rain gutters. Other sources include used motor oil discharges (leaks and illegal discharges) and soil erosion.

Other Target Pollutant Control Strategies

The Partnership will begin work to address new top-ranked target pollutants identified in the re-evaluation process, as resources allow. The Partnership will document the sediment and erosion control strategies as part of the Target Pollutant Program during the Permit term.

2.5.3 Effectiveness Assessment

The Partnership assesses Target Pollutant Program effectiveness through an evaluation of monitoring data analyses provided by the Monitoring Program and evaluation of activities conducted under the Target Pollutant Program and other Program elements (e.g. Municipal Operations or Industrial elements). The data analyses provided by the Monitoring Program described in section 2.4 include:

- Statistically based load modeling that considers relationships between multiple variables and urban runoff concentrations; correlations between constituents such as total suspended solids are also considered
- Trend summaries in the receiving waters
- Wet detention basin removal efficiency evaluations
- Upstream to downstream receiving water quality comparisons
- Report of Water Quality Exceedances preparation
- Long term statistical assessments of urban runoff concentrations

The near term evaluation of Target Pollutant Program effectiveness includes both assessment of behavior changes achieved (outcome level 3) and quantification of load reductions achieved (outcome level 4). The Long Term Effectiveness Assessment (LTEA), which will be conducted near the end of the Permit term will summarize and build on the effectiveness assessments in the annual reports and will provide an evaluation of the achievement of outcome levels 4 through 6.

The Partnership identifies and ranks likely pollutant sources for identified target pollutant groups and dedicates resources on those sources with the greatest potential for reducing local pollutant levels. As mentioned previously, the control strategies are implemented as Partnership (regional) activities such as providing funding for the Brake Pad Partnership or as a permittee-specific activity such as street sweeping. Some control activities for key sources may be very direct and are expected to achieve measurable results in the short term, such as street sweeping. Other control activities, such as outreach programs, are less direct and may take longer to achieve the desired changes. Finally, some control activities are, in effect, long term strategies that may have little or no effect on pollutant loads in the short term, but have the potential to achieve systemic changes that will result in significant, long term source control.

An example of this approach in assessing Target Pollutant control tasks is the Partnership's focus on Federal pesticide regulatory processes that contributed to the withdrawal of diazinon and chlorpyrifos from urban markets, which clearly resulted in a dramatic decrease in receiving water concentrations of these key pollutants. Typically pursued through changes in state and federal regulation of pollutant sources, pesticide long term strategies are expected to take years to achieve pollutant reduction. Therefore, near and mid-term interim assessment of these pesticide control activities focuses on programmatic aspects, such as participation in advisory groups and submitting comment letters on regulatory actions (outcome levels 1 and 2). Desired regulatory changes, when achieved, will typically result in behavior changes (outcome level 3) under the control of other agencies and stakeholders, such as pesticide mitigation measures or market restrictions imposed by US EPA or the State. These changes are in turn expected to lead to pollutant discharge reductions and improvements in receiving water quality (outcome levels 5 and 6).

In addition to the near term and long term assessments, the Partnership will also complete the five-step target pollutant prioritization process during the permit term. As described previously, the outcome of this process, a numerical score indicating the importance of various pollutants observed in Permittee discharges, provides additional perspective on the effectiveness of the Target Pollutant Program as changes are observed in target pollutant scores and their relative priority. The Partnership will also assess Pesticide and Mercury Plan effectiveness using the key indicators and performance standards included in Table 2.5-2, Regional Target Pollutant Activities Work Plan following this section of the SQIP. The assessments will include outcome level 3 and 4 type activities and will include recommendations for plan improvements, as needed.

Ultimately observing improvements in urban runoff quality may require extended monitoring periods (decades) because of the variable nature of pollutant sources, and of stormwater discharges. Due to the difficulty of measuring water quality improvements, it is often not possible to isolate the effect of specific control activities, but the aggregate effect of all control measures will be observable if it is of sufficient magnitude. In addition, the effect of local control programs may be obscured by ongoing pollutants from other areas (e.g., atmospheric deposition) and legacy sources (e.g., mercury, certain organochlorine pesticides, etc.) that are slow to degrade in the environment even after they have been banned or replaced. When sufficient data are collected, as determined by a statistical power analysis, the Partnership has planned a detailed statistical assessment of the Program's historical (1990-current) data that is intended to identify constituent concentration trends.

2.6 Regional Public Outreach Program

2.6.1 Introduction

The Partnership conducts regional public outreach programs to educate the public about the harmful effects of stormwater pollution and to motivate people to prevent pollution; it also creates and promotes opportunities for public participation in creek and river stewardship projects. The ultimate purpose is to improve the quality of urban runoff and protect local creeks and rivers.

The outreach efforts target the following three main audiences in the urbanized portions of Sacramento County.

- *Public Outreach* - Broad public awareness campaigns serve as a first step in the continuum from education to a call-to-action, including, but not limited to, the groups listed below:
  - Homeowners and renters
  - Community and watershed groups
  - Public officials
- *School Outreach* - Through its work with schools, the Partnership empowers children to become environmental stewards by providing a basic understanding of the importance of water quality and explaining simple steps children can take to reduce stormwater pollution. The Partnership works with the following groups in order to teach the next generation about the importance of water quality and how to protect it:
  - School districts
  - Teachers
  - Students
- *Business/Industrial Outreach* - Outreach staff focus on mobile businesses that generate wastewater, and work with other element staff to address the following:
  - Fixed location EMD facilities
  - Non-EMD facilities
  - Developers/home builders
  - Engineer/design professionals
  - Contractors and subcontractors

The permit requires the permittees to ensure that the Regional Public Outreach Program uses appropriate media to measurably increase the knowledge of target communities regarding the impacts of urban runoff on receiving waters and to provide potential BMP solutions for the target audience that lead to behavioral change and reduce pollutant releases to the municipal storm drain systems and the environment.

Public outreach activities are coordinated with activities related to other program elements to ensure consistent and integrated messages. The Partnership maintains relationships with other groups and agencies to share ideas and experiences, and jointly implement outreach where possible. Many of the Partnership's outreach activities are conducted regionally, as a collaborative effort among the permittees to prevent duplication, share resources and reach a broader segment of the population. In general, collaborative, county-wide efforts can be more cost-effective; however, in some cases, localized public outreach by individual permittees is more appropriate or cost-effective. This section describes both regional activities and individual activities.

2.6.2 Strategy

The Partnership's Regional Public Outreach Program strategy depends on the target audience. The Partnership's outreach strategy for the general public is to:

- Use research such as public surveys and focus groups to identify what various segments of the public know, and don't know, about storm drains and stormwater pollution, and what actions they are and are not likely to take to prevent pollution.
- Prioritize activities based on needs identified in the public outreach research and through the Partnership's Target Pollutant Program.
- Identify target audiences and messages based on those priorities.
- Choose outreach methods that are most effective given the target audience and message content (i.e., television, radio, print materials and websites).
- Translate messages into languages other than English depending on the target audience.

The Partnership's outreach strategy for school children is to:

- Measure students' awareness of stormwater pollution through tests or quizzes and focus on priorities based on needs identified in tests or quizzes.
- Develop message content for selected age groups or grade levels.
- Choose outreach methods that are most effective for school children, such as:
  - Brochures and materials distributed during classroom presentations and assemblies
  - Website
  - Outreach events
  - Online interactive games
- Translate messages into languages other than English depending on the target audience.
- Provide technical support or educational resources to teachers.
- Develop stormwater educational content that meets state educational standards.
- Work with other agencies or organizations with similar messages to reach a wider student population.

The Partnership's outreach strategy for businesses is to:

- Target businesses that can cause stormwater pollution, but are not easily reached through the Regional Commercial/Industrial Program (Section 2.7), such as mobile businesses.
- Focus on priority industries/businesses based on those identified through the Regional Commercial/Industrial Program.
- Choose outreach methods that are most effective given the target business and message content.
- Explore incentives for businesses to join the Clean Water Business Partners (CWBP) program or other business recognition program. The CWBP program is described below in 2.6.3 and 2.6.4.
- Explore partnership opportunities with other agencies to help leverage business outreach activities.
- Translate messages into languages other than English depending on the target audience.

As previously mentioned, the Partnership seeks to maintain and establish partnerships with other groups in order to maximize resources and further the public outreach mission. The Partnership's strategy for establishing relationships with other groups includes:

- Identify other agencies and groups with similar missions and messages.
- Identify networking opportunities by attending regional conferences and workshops.
- Determine the most appropriate method to reach out to groups.
- Research private funding sources to fund long-term outreach efforts.
- Identify private retailers, businesses, or corporations that are looking for community involvement opportunities and stewardship roles.

2.6.3 Accomplishments to Date

Major Partnership accomplishments to date related to regional public outreach include:

- Developed and promoted a hotline for the public to report stormwater-related issues (e.g. clogged drains, illicit discharges/dumping, general stormwater questions and faded or missing drain inlet stencils).
- Developed and implemented a regional media campaign, including television, radio, billboards and other media. Throughout the 2002-2007 permit term, the Partnership far exceeded the annually required 2.3 million media impressions.
- Translated several brochures into Spanish and Russian to reach out to multicultural communities.
- Published a stormwater brochure designed for adults. This brochure describes steps residents can take in and around their homes to prevent urban runoff pollution. The brochure has a tear-out card for residents to request specific brochures (e.g. landscaping, paint, pool, etc.) and/or to receive a presentation by the Partnership.
- Coordinated with other agencies and organizations on outreach efforts, including the Sacramento Area Creeks Council (formerly known as the Sacramento Urban Creeks Council), Sacramento County Business Environmental Resource Council (BERC), Sacramento Regional County Sanitation District (SRCSD), Regional Water Authority (RWA), Bay Area Stormwater Management Agencies Association (BASMAA), and the Sacramento River Watershed Program (SRWP).
- Participated in community outreach events to educate the public on the impacts of stormwater pollution and how individuals play a role in protecting local waterways. Through experience, the Partnership learned which events draw the most people and are best suited for targeted audiences to maximize resources and efficiency.
- In partnership with the RWA, the Partnership awarded a contract to the South Yuba River Citizens League (SRYCL) to deliver school assembly presentations (using professional actors and comedians) about stormwater quality, watershed protection and water conservation.
- Several of the permittees sponsored SPLASH, a year long watershed education curriculum that will be discussed in detail under activities for 2008-13 term.
- Participated in the statewide Our Water Our World (OWOW) program, which educates consumers (and trains retailers that sell to consumers) to manage home and garden pests in less-toxic ways. The OWOW program produces fact sheets and other outreach materials that provide customers with a list of products that are less-toxic.

- Collaborated with SRCSD and the University of California Cooperative Extension State Integrated Pest Management program, local Master Gardeners, and local nurseries on the Water Wise Pest Control (WWPC) program. The WWPC is an education program that provides information to residents on effective and less-toxic methods of handling pests and encourages the proper use, storage and disposal of pesticides.
- Established the CWBP program in 1998 to educate businesses about appropriate best management practices (BMPs) and provide an incentive for businesses to protect stormwater quality and pass along stormwater and urban runoff information to their customers.
- Conducted two rounds of business outreach mailings (over 8,000 pieces of mail each round) to eleven high priority business categories identified in the 2002 Stormwater Permit. The Partnership developed (and continues to update quarterly) a database of businesses based on phone book yellow page ads and business license information from local jurisdictions. BERC assists the Partnership with updates to the database.
- Developed the *River-Friendly Landscape Guidelines: Sustainable Practices for the Landscape Professional* publication to aid landscape professionals in the protection and conservation of Sacramento's waterways and in the reuse and reduction of plant debris, and to support an integrated approach to environmentally-friendly landscaping. In addition, the Partnership developed the *Choosing a Landscape Professional for Your River-Friendly Garden* to help residents find a landscape professional who practices River-Friendly landscaping. The Partnership has received numerous requests for both publications.

2.6.4 Research Conducted During 2002-2007 Permit Term

To effectively plan the next steps in its ongoing outreach efforts, the Partnership conducted qualitative and quantitative research through public awareness surveys and focus group sessions to analyze current public awareness and identify areas for improvement for the 2008-13 permit term.

Prior to the 2002-2007 permit term, the permittees used separate public awareness and behavior surveys focused on particular jurisdictions. During the 2002-2007 permit term, the Partnership conducted a regional combined survey for consistency. Some historical trending data was lost; however, the new format allowed for better regional program development. All future surveys will be conducted on a regional basis to maximize outreach programs and effectiveness.

To supplement survey findings, the Partnership conducted five focus group sessions. Two sessions targeted the Hispanic and Slavic communities and the remaining three involved the general public. Focus groups provided additional insight and richer data regarding current views and the public's willingness to play an active role in preventing urban runoff pollution.

The following major research findings from the regional survey and focus group sessions will be considered and used as a guide to develop and implement future outreach efforts:

- There is still a lack of awareness among some audiences (particularly non-English speakers) regarding stormwater and urban runoff pollution. Information translation and dissemination appear to be the major issues. Traditional media outlets do not reach very far into some of the more insular communities, especially the Slavic and Asian populations, where distrust of government is still prevalent. Also, many of these populations view local waterways as 'pristine' compared to the countries from which they immigrated.
- One in five respondents gave an incorrect answer when asked where they thought everything that goes into the gutters finally ends up.

- Respondents think that government, rather than residents, is most responsible for preventing water pollution.
- Residents are more likely to participate in environmentally-friendly activities if there is a personal incentive.
- Pet waste and fluorescent lights were identified as materials most likely to be disposed of improperly.
- Television and signage (i.e., storm drain signs and creek signs) are best for conveying basic messages, but internet and telephone information lines are the best source for more detailed information.

2.6.5 Regional Public Outreach Activities

This section describes the Partnership's regional outreach activities for the 2008-13 permit term. Section 2.6.6 describes additional locally-focused activities conducted by the individual permittees.

Stormwater Permit Requirements

The Stormwater Permit requires that permittees implement a public outreach program using appropriate media to measurably increase the knowledge of target communities regarding municipal storm drain systems, impacts of urban runoff on receiving waters and potential BMP solutions for the target audience; and to change behavior of target communities and thereby reduce pollutant releases to storm drain systems and the environment. The permit also requires that the effectiveness of the Regional Public Outreach Program be assessed to identify any necessary modifications. The current permit requirements pertaining to public outreach are not substantially different from those in the prior permit.

Overview of Proposed Activities

Table 2.6-2, Regional Public Outreach Program Activities Work Plan (2008-2013) summarizes the activities that will be conducted under the Regional Public Outreach Program during the 2008-13 permit term. The proposed activities build on the work already accomplished during the first 17 years of the Program, and many activities are continuing. This table presents planned activities, associated performance standards and effectiveness assessment methods, as well as a five-year implementation schedule. The following describes the major activities in more detail:

Public Participation

The Partnership will continue to encourage the public to volunteer or participate in organized community stewardship activities to minimize stormwater pollution. These activities benefit neighborhoods and watersheds in the Sacramento area.

Specifically, the Partnership will:

- Engage the public in cleaning up creeks. The Partnership supports County-wide and neighborhood creek cleanups such as Creek Week.
- Encourage the public to volunteer in the community stewardship pet waste reduction program called "Scoop the Poop." Originally started as a County program, the "Scoop the Poop" program aims at reducing improper disposal of pet waste in parks. The Partnership works with local park districts and volunteer groups to install pet waste stations at designated locations. Individuals can either leave their plastic grocery bags at the pet waste bag stations for others or take a bag to use for picking up and disposing of pet waste. The program is cost-effective, reduces pet waste discharges and gives neighborhood residents a sense of making a difference in the community.

- Encourage the public to participate in watershed management groups. The Partnership coordinates with several watershed and environmental advocacy groups in the Sacramento region (see Table 2.6-1 for details).

Table 2.6-1
Established Watershed and Environmental Advocacy Groups in the Sacramento Area

Organization	Description	Affected Permittees
Alder Creek Watershed Group	The City of Folsom initiated the Alder Creek Watershed Project in 2007 with funding provided by a CALFED/State Department of Water Resources Grant (Proposition 50). The project will characterize biological, hydrologic, and geomorphic conditions in the 11-square mile watershed and prepare a watershed management plan to protect the creek and its resources as development occurs over the next 10 to 20 years. A stakeholder group guides these efforts. See the City of Folsom's website for additional information: *http://www.folsom.ca.us/depts/public_works/stormwater*	City of Folsom, County of Sacramento
Amador/Dry Creek Watershed Council (ADCWC)	Dry Creek originates in Amador County in the foothills of Central Sierra, flowing between the Mokelumne and Cosumnes Rivers and through the city of Galt to the Cosumnes River before merging with the Mokelumne near the Cosumnes River Preserve, and then into the lower San Joaquin River. Established in 2005 through a CALFED/State Department of Water Resources Grant (Proposition 50) the ADCWC assists watershed residents with project implementation, capacity building, watershed awareness and education, and sustainability of the volunteer program in the 388 square mile watershed. The Council's long-term goal is to conduct an assessment and inventory, and complete and implement a watershed plan. See the Water Board's website for more information. *www.waterboards.ca.gov/water_issues/programs/grants_loans/project_summaries/docs/**d**rycreek_watershed.doc*	County of Sacramento, City of Galt
American Basin Council of Watersheds	The American Basin Council of Watersheds (ABCW) evolved from three separate watershed groups with interests in western Placer County, including the Dry Creek Watershed Council, the Auburn Ravine/Coon Creek Watershed Group, and the Pleasant Grove/Curry Creek Watershed Group. In recent years, partner projects for ABCW included water quality monitoring, stream bank stabilization, habitat restoration, flood control, erosion control, invasive weed removal and public outreach. Dry Creek Conservancy, the non-profit group which coordinates ABCW, facilitates watershed conservation, restoration, and education in the watersheds of Dry Creek, Pleasant Grove Creek, Auburn Ravine Creek, Coon Creek and surrounding areas in Placer, Sutter, and Sacramento counties. The goal is to preserve, protect, and restore the resources of the 100-square-mile Dry Creek Watershed, and to promote a continuous trail and open space greenway, connecting with the American River Parkway at Discovery Park and Folsom Lake, forming a 70-mile loop. For more information visit: *http://www.drycreekconservancy.org* and *http://placercountyrcd.org/group/americanbasin/*	County of Sacramento

Organization	Description	Affected Permittees
American River Parkway Foundation and American River Watershed Group	The American River Parkway Foundation is a non profit agency with a goal to care for the 23- miles of the American River's shoreline between the Natomas Fish Hatchery and the confluence with the Sacramento River. The group's mission is to foster environmental stewardship, facilitate volunteer opportunities and fund projects and programs on the American River Parkway that support the preservation, protection, enhancement and appreciation of the parkway natural resources. The American River Watershed Group (ARWG) was founded in 1996 with interests centered on five themes: 1) safety of life, property, and resources; 2) healthy forests; 3) abundant and high quality water; 4) sustainable economics; 5) and education. ARWG succeeded in knitting together the agency, business, education, non-profit and citizen communities. Several members of the Partnership support ARWG's collaborative efforts by attending outreach events and partner in programs such as the *Pups in the Parkway* Program. For more information visit: *http://www.theamericanriver.com*	County of Sacramento, and the cities of Citrus Heights, Rancho Cordova, and Sacramento,
Arcade Creek Watershed Group	The Arcade Creek Watershed Group formed in 2002, with initial support from the City of Sacramento, EPA and CALFED, and major funding through a Prop 50 CALFED watershed grant. Watershed Group members include local residents, environmental organizations, representatives from the cities of Sacramento and Citrus Heights, the County of Sacramento, and other interested stakeholders. The mission is to improve water quality, reduce flood damage, enhance habitat, increase recreational opportunities, and encourage local participation in protection efforts for the 38-square mile watershed. The watershed group identifies and prioritizes projects that restore, improve, and/or preserve habitat; enhance water quality; improve flood control; and increase recreational opportunities. See Arcade Creek Watershed's website for more information at *http://www.arcadecreek.org/*	City of Sacramento, County of Sacramento, City of Citrus Height
Laguna Creek Watershed Council	The Laguna Creek Watershed Council (LCWC) is a grass-roots nonprofit organization founded in 2002 and incorporated in 2009. Their mission is to protect and restore the many benefits Laguna Creek and neighboring waterways provide, including flood risk reduction, fish and wildlife habitat, recreational opportunities, and open space. They accomplish this mission by working cooperatively with all stakeholders in the watershed. In 2005, the LCWC received a CALFED Grant (Proposition 50) to conduct a watershed assessment, prepare a watershed management action plan, engage the schools, and implement several watershed stewardship projects. Sacramento County managed and administered the grant on behalf of the LCWC. Various local agencies provided in-kind services, notably the City of Elk Grove and the two parks districts. For more information about the many accomplishments and activities of the LCWC, including their watershed management plan, visit the website: *http://www.lagunacreek.org*.	County of Sacramento, and cities of Elk Grove, Rancho Cordova and Sacramento

Organization	Description	Affected Permittees
Sacramento River Watershed Program	Founded in 1996, the Sacramento River Watershed Program (SRWP) is a California Not-for-profit corporation that received 501(c) (3) status in 2003. It serves as an umbrella agency bringing together environmental organizations, agencies, private businesses and agricultural interests, and universities to share information and resources that address water-related issues within the Sacramento River watershed. The SRWP functions through several committees and workgroups that support local and regional public education, monitoring, and watershed management. Partnership's interests are supported in each committee and working group. For more information, visit *http://www.srwp.org/*	County of Sacramento and the City of Sacramento
Sloughhouse Resource Conservation District	The Sloughhouse Resource Conservation District (RCD) has been working to protect watershed health in its 80,000 acre service area portion of the Cosumnes River watershed for over ten years. After the flood of 1997, the RCD formed the Cosumnes River Task Force, which has since completed two watershed assessments and released a management plan based on those assessments (available at www.cosumneswatershed.org). Through various grants, donations, and volunteer efforts, the RCD has accomplished watershed education, workshops for agriculturists, created conservation plans for over 15 local agricultural operations, monitored water quality, participated in local planning efforts, and conducted watershed tours. For more information, visit www.cosumneswatershed.org	County of Sacramento, City of Elk Grove

Organization	Description	Affected Permittees
Stone Lakes National Wildlife Refuge Association	In 1994, the U.S. Fish & Wildlife Service (Service) established the 18,200-acre Stone Lakes NWR in Elk Grove, Sacramento County, California. Stone Lakes National Wildlife Refuge Association is a nonprofit corporation dedicated to the preservation, protection, enhancement, and promotion of the NWR and its efforts to provide a unique wildlife viewing experience for the enjoyment and educational benefit of the public while protecting and restoring critical habitat for special interest and endangered plant and animal species dependent upon the Pacific Flyway, the Sacramento-San Joaquin Delta, and the Central Valley's complex web of permanent and seasonal wetlands, riparian forests, oak woodlands, and annual grasslands. All storm water run-off and drainage from the communities of West Laguna, Lakeside, the Stone Lake development, East Franklin Plan, and Laguna Ridge in Elk Grove either currently flows to the Refuge or will when construction is completed. For more information, visit *http://www.stonelakes.org/*	County of Sacramento, City of Elk Grove
Upper Laguna Creek Collaborative	In June 2003, the Upper Laguna Creek Collaborative (ULCC) began planning for anticipated future growth on a watershed scale by exploring ways to create a multi-functional corridor along Upper Laguna Creek. Using an open, inclusive approach to planning, the ULCC seeks representation from all parties that affect or are effected by development in this watershed. Interested government agencies, special districts, environmental groups, and landowners participate in the ULCC process. The Collaborative's goal is to create a multi-functional corridor along Upper Laguna Creek that preserves the surrounding stream habitat, manages stormwater from new development, and provides an easement for future sewer infrastructure. For more information, visit *http://upperlagunacreek.org/*	County of Sacramento, and cities of Rancho Cordova and Elk Grove

Hotline

The Partnership will continue to promote the use of the 24-hour public education and illicit discharge reporting hotline (916-808-4H20) through brochures, television ads, websites and print advertising.

Public Outreach Implementation

The Partnership will continue to educate the general public in the Sacramento area about the harmful effects of stormwater pollution and promote behavioral change through a variety of methods and strategies:

- Update and implement the public outreach strategy plan to account for changes in public awareness and behavior based on survey results and other research data.
- Continue to develop educational/informational materials, such as brochures, as needed. The Partnership will determine the need for new or updated materials through a variety of ways, such as feedback from the permittees, surveys of participants at public events and follow-up requests for materials from schools and the regulated community. The messages featured on the materials will supplement and be consistent with messages being spread through all other outreach efforts. In addition, advertisements and brochures will direct audiences to a new and improved Partnership website for more information.

- Implement a targeted, "problem/solution-oriented" mixed media campaign. The approach will focus on specific messages (e.g. pesticide use, home auto repair, pet waste, etc.) and will include strong visuals and targeted messages that emphasize personal responsibility for preventing stormwater pollution and protecting local waterways. Many of these specific messages will be conveyed through radio, print ads, television and signage.
- Implement educational programs that focus on specific target pollutants or activities. These programs include:
  - Fundraiser carwash discharges: The Partnership will implement a strategy to address fundraiser carwash discharges. The Partnership will educate those who hold carwashes and the general public about stormwater regulations and the impacts of fundraiser carwashes on stormwater quality. In addition, the Partnership will encourage the public to use discharge methods that eliminate the impacts of these events.
  - Home and Garden Care (pesticides and fertilizers): The Partnership encourages residents to consider alternative less-toxic strategies for specific pests. The Partnership supports several pesticide-related programs:
    - WWPC: The WWPC is collaboration between the Partnership, SRCSD, University of California Cooperative Extension State Integrated Pest Management program, local Master Gardeners and local nurseries. The WWPC is an education program that provides outreach materials such as fact sheets and utility bill inserts to residents on effective and less-toxic methods of handling pests and encourages the proper use, storage, and disposal of pesticides. The UC Master Gardeners host several dozen IPM seminars throughout the community each year and distributed materials to many thousands of visitors to the annual California State Fair at Cal Expo.
    - OWOW: This program provides point-of-sale information to consumers on how to manage home and garden pests using less toxic methods. In addition, fact sheets that provide integrated pest management are displayed in participating stores and distributed during outreach events. The program provides training for professional staff about IPM principles, successful application strategies and sales techniques for less-toxic products.
    - River-Friendly Landscaping Guidelines: The River-Friendly landscaping guidelines are a holistic approach to the design, construction and maintenance of landscapes to support the integrity of the Sacramento River Watershed. The guidelines provide direction on water and energy conservation, green waste reduction and pollution prevention. The principles are promoted through brochures and workshops.
  - Household Hazardous Waste: The Partnership provides information on proper household hazardous waste disposal and waste collection centers in outreach materials and on the website. Detailed reporting of specific household hazardous waste materials is reported in the Illicit Discharge Element.
  - Pet Waste: The Partnership will encourage the public to properly dispose of pet waste at public outreach events and through its multicultural, mixed media campaign, in addition to the "Scoop the Poop" public participation program.
- The Partnership will maintain existing public-public and public-private relationships and explore opportunities to maximize resources, send consistent messages and further the public outreach mission. Existing and potential new partnerships include those with:
  - Private retailers

  - Non-profit and neighborhood organizations and associations and environmental groups (includes groups that coordinate community outreach events with Partnership support)
  - Multicultural organizations
  - Educational institutions

- Continue to support community outreach events
- Continue to conduct public opinion surveys as needed to gauge the level of awareness and behavior change within a target audience, and to determine if activities or outreach efforts are effective in conveying stormwater messages. The Partnership will continue to conduct periodic (both qualitative and quantitative) surveys. The surveys will be measured against previous surveys to compare results and examine awareness and behavior change. The Partnership will consider other methods to assess public awareness and behavior as research suggests that fewer people use land-line telephones. More cellular phone-based and Internet-based methods may be necessary to achieve statistical valid results.

Public School Education

The Partnership will educate and promote behavioral change in school children by continuing to:

- Implement science-based educational programs such as Splash. Splash provides a year-long curriculum for students to explore the diversity of life in our local creeks, vernal pools and lakes, both in the classroom and in the field. By studying the organisms that inhabit our local aquatic ecosystems, students gain awareness of water quality and watershed issues.
- Conduct interactive school assemblies and presentations that stress the importance of stormwater quality, watersheds and water conservation.
- Provide schools with educational materials (e.g. brochures, activity books, online interactive games etc.) and resources.

Business Outreach

The Partnership will continue to provide outreach to businesses to increase awareness of stormwater pollution and regulations, educate business owners and operators about applicable best management practice (BMPs) and encourage environmental stewardship. The business outreach conducted as part of the Regional Public Outreach Program will continue to focus on mobile businesses that generate waste water and are not easily reached by the Regional Commercial/Industrial Program (section 2.7).

Specifically, the Partnership will:

- Continue to partner with BERC to implement the CWBP Program, that to-date has targeted mobile carpet cleaning companies and pressure washers. However, the program will be re-evaluated for effectiveness and efficiency. Changes to the program will be reported in annual reports and annual work plans. The Partnership aims to create a public demand for CWBP businesses to motivate more business participation, and increase the customer base for CWBP program participating companies by conducting drawings and distributing incentives and prizes for customers who hire a CWBP business.
- Work with the commercial/industrial elements to maintain the upkeep of the business outreach database. For additional information, please see section 2.7 Regional Commercial/Industrial Program.

- Conduct outreach to all businesses in the database at least twice during the permit term. Outreach may include, but is not limited to, letters, surveys, brochures and workshops. For additional information, please see section 2.7 Regional Commercial/Industrial Program.
- Continue to distribute educational materials to priority industries and construction companies, including businesses with languages other than English.
- Work with the River-Friendly Landscaping Coalition, a collaboration of public agencies, non-profit organizations, designers, private landscape architects and contractors to encourage landscape professionals to follow the *River-Friendly Landscaping Guidelines*. The guidelines promote a holistic approach to the design, construction and maintenance of landscapes that support the integrity of the Sacramento River watershed.
- Continue to work with local businesses and train their staff to promote the OWOW and WWPC IPM programs (described in Public Outreach Implementation, above).

Watershed Stewardship

Various permittees in the Partnership will continue to support and work with established watershed and environmental advocacy groups in their jurisdictions to assess conditions and develop and implement regional solutions to urban runoff and water quality problems in the Sacramento area watersheds. The goal is to protect and enhance water quality and beneficial uses in local creeks and rivers and to encourage watershed residents and other stakeholders to actively participate in watershed stewardship. Figure 1.2-2 in Chapter 1 is a map showing the locations of the various watersheds with respect to the permit area and the permittees' jurisdictional boundaries. Table 2.6-1 summarizes the active watershed and environmental advocacy groups in the Sacramento permit area and the permittees working with these groups. Additional details about permittee-specific activities are provided in the next section.

2.6.6 Individual Permittee Public Outreach Activities

Each permittee conducts its own outreach and education activities within its jurisdiction in addition to the regional activities outlined above. The following describes permittee-specific activities:

County of Sacramento (these activities reach or benefit audiences in the unincorporated County and the cities of Citrus Heights and Rancho Cordova unless otherwise noted):

- The County will continue to collaborate with SRCSD's *Be Mercury Free* program to promote proper disposal of fluorescent light bulbs. This comprehensive effort educates Sacramento residents and businesses about the sources and effects of mercury and how to reduce the amount of mercury entering the Sacramento River watershed. The program staffs a booth at several local community events and disseminates utility bill inserts to residents.
- The County plans to install new signs, as needed, discouraging illegal dumping along creeks and parkways ("No dumping" and "Respect, protect, and enjoy our creeks and rivers" signs) in coordination with County Recreation and Park District and County Department of Transportation.
- The County will continue to financially support community outreach events such as Creek Week and Earth Day to further educate the public about water quality and the importance of preserving our creeks and rivers.

- The County will continue to financially support the Effie Yeaw Nature Center that provides interpretive environmental and water-based educational programs to increase awareness of pollution prevention, water conservation and watershed issues. The various programs offered at the Effie Yeaw Nature Center are designed to lead children to make appropriate choices in their own lives that will help improve water quality and restore the ecosystem. These programs include in-class presentations, hands-on activities and field trips that provide a basic understanding of how our choices can impact water quality in local creeks and how water quality is linked to overall environmental problems.
- The County will continue to offer a Watershed Educational Grant program that provides financial assistance to schools to fund projects that educate students and the public about the importance of preserving, protecting, and enhancing local waterways. Past recipients have used the funds for creek and river clean up activities, field trips to nature centers and environmental facilities, water-quality testing projects and planting native vegetation in creek areas. The grants will be available to schools located within the Sacramento County Stormwater Utility boundaries and the cities of Citrus Heights and Rancho Cordova.
- The County will continue to financially support the American River Parkway Foundation's 'Pups on the Parkway' program. This program involves the installation of pet waste bag dispenser stations along the American River Parkway to promote a stewardship ethic among dog owners.
- County staff will continue to support established watershed programs, including reviewing and commenting on work products, providing advice and assistance as requested, and attending meetings and events hosted by the watershed councils and groups (described in Table 2.6-1).The County will continue to administer the Laguna Creek Watershed Prop 50 Grant program on behalf of the Laguna Creek Watershed Council, including providing in-kind services to the grant.
- The County will work with Resource Conservation Districts and others to educate and promote watershed stewardship and pollution prevention in rural County areas.
- The County will assist in identifying and pursuing grant funding for watershed stewardship work, including providing in-kind services.

City of Sacramento:

- The City of Sacramento (Sacramento City) will continue to financially support community outreach events such as Creek Week and Earth Day to further educate the public about water quality and the importance of preserving our creeks and rivers.
- Sacramento City will continue to award Community Action Grants to schools, environmental organizations, and other groups for projects whose goal is to improve the quality of local creeks, rivers and watersheds within Sacramento City. Projects include physical improvements to a water body, education and outreach, or a combination of both.
- Sacramento City will continue to fund Splash in the Class, now in its tenth year of offering a classroom presentation on stormwater pollution to elementary schools throughout Sacramento. Nearly 2,500 students annually participate in the presentation.
- Sacramento City staff will continue to review and comment on work products, provide advice and assistance as requested, and attend meetings and events hosted by the watershed councils and groups, as described in Table 2.6-1.

- Sacramento City will remain active with the Sacramento River Watershed Program (SRWP), including serving on the Board of Trustees; to promote SRWP activities throughout the Sacramento River watershed.

City of Citrus Heights:

Refer to the Citrus Heights SQIP (Section 5.7) for additional outreach activities conducted by the City of Citrus Heights.

Elk Grove:

Refer to the Elk Grove SQIP (Section 6.7) for additional outreach activities conducted by the City of Elk Grove.

Folsom:

Refer to the Folsom SQIP (Section 7.7) for additional outreach activities conducted by the City of Folsom.

Galt:

Refer to the Galt SQIP (Section 8.7) for additional outreach activities conducted by the City of Galt.

Rancho Cordova

Refer to the Rancho Cordova SQIP (Section 9.7) for additional outreach activities conducted by the City of Rancho Cordova.

2.6.7 Effectiveness Assessment

The Permittees' general approach to assessing the effectiveness of its stormwater programs is described in Section 2.3, Program Effectiveness. This section specifically describes assessment activities relevant to the Regional Public Outreach Program, including proposed methods for evaluating effectiveness during the 2008–13 permit term. Activities from the 2002-2007 permit term were evaluated to identify modifications necessary to demonstrate effectiveness and baseline data requirements for 2008-2013 permit term activities.

The Regional Public Outreach Activities Work Plan (Table 2.6-2) presents effectiveness assessment information for this program. Each performance standard associated with an activity has an anticipated effectiveness outcome level of between one and six, as described in Section 2.3. An outcome level of one is assumed for each performance standard, unless otherwise indicated. Table 2.6-2 shows the years in which focused assessments will be conducted to determine if higher outcome levels have been attained.

The Partnership will compile and evaluate data to demonstrate changes in awareness and behavior (Outcome Levels 2 and 3), where possible, to assess the effectiveness of its outreach from surveys and focus groups, direct interaction at public events, feedback from children and teachers and other media as opportunities arise. This data will be evaluated to identify potential programmatic enhancement opportunities. Assessing effectiveness of performance standards may be limited pending availability of baseline data.

The Partnership selected the key indicators for public outreach based on their ability to (1) show progress toward meeting the element goal and (2) are specific, measurable and achievable. Table 2.6-2 identifies key indicators that will be used to assess the effectiveness of individual permittee programs and those of the partnership as a whole in the Long-Term Effectiveness Assessment (LTEA) required by the stormwater permit.

2.6.8 Relationship to Other Program Elements

The staff who manage the Partnership's public outreach efforts coordinate with staff implementing other program element activities to ensure accurate and consistent messaging for all the target audiences. Whenever possible, multiple messages are conveyed in a single integrated product such as a brochure or activity such as a classroom presentation. The following summarizes the regional public outreach associated with the other elements.

Construction Element

As part of the construction element, the Partnership provides outreach to contractors and permittee inspection personnel, primarily through training workshops, informational brochures and guidance manuals. A secondary audience is the do-it-yourselfer, whose activities are typically targeted through general outreach. Do-it-yourselfers have access to brochures that explain proper use and disposal of materials typically used in home construction projects.

Commercial/Industrial Element

Outreach associated with this element increases awareness of stormwater pollution and regulations, educates business owners and operators about applicable BMPs, and encourages environmental stewardship. The Partnership outreaches to businesses through the CWBP program, BERC, industrial inspections and enforcement actions conducted by individual permittees, industry-specific workshops, seminars and direct mailings. Industry-specific brochures include information on auto body, auto repair, commercial auto washing and detailing and landscaping. The Partnership translated and printed several of these brochures into Spanish and Russian.

Illicit Discharge Element

In addition to the existing County of Sacramento hotline (875-RAIN), the Partnership established a permittee-wide hotline (808-4H20) for the public to get general stormwater information, report stormwater-related problems or file complaints (e.g., clogged drains, illicit discharges/dumping, faded or missing drain inlet stencils, etc.). The hotline number is printed on every educational piece produced by the permittees (i.e., billboards, brochures, and utility bill inserts).

New Development Element

New development projects must incorporate control measures that reduce pollutants in project runoff to the maximum extent practicable. The development community, including developers, property owners, planners, engineers, design professionals (landscape architects) and environmental consultants, must understand how to design projects to comply with stormwater quality requirements. The Partnership educates the development community about design approaches and requirements primarily through technical guidance manuals and workshops, coordinated with local organizations such as the Building Industry Association (BIA) and Civil Engineers and Land Surveyors of California (CELSOC) to the extent possible.

2.6.9 Coordination with Other Agencies and Groups

The Partnership coordinates with other agencies and groups to jointly implement outreach, share ideas and experience, and/or promote consistent messages. The following are some of the groups the Partnership works with:

- SRCSD: Sacramento City and County of Sacramento coordinate with SRCSD on several educational and outreach activities (e.g., Splash, OWOW, WWPC) to ensure that consistent messages related to stormwater pollution prevention are delivered to Sacramento residents.

- The Sacramento Area Creeks Council: The County and City of Sacramento participate and support the Council's annual *Creek Week Splash-Off* and *Creek Week* events each year, serve on the organizing committee, provide supplies and equipment for refuse collection at cleanup sites, assist with event publicity and provide educational booths.
- Business Environmental Resource Center (BERC): BERC is a non-regulatory assistance center that provides confidential assistance to help Sacramento County businesses understand and comply with federal, state and local environmental regulations. The Partnership works with BERC to provide workshops for target industries and disseminate outreach materials via BERC's on-site inspections. Because BERC offers confidential, non-regulatory assistance, businesses that would not contact a regulatory agency for fear of reprisal still receive much needed assistance.
- SRWP: The Partnership partners with SRWP to conduct school outreach and participates in local meetings to discuss the state of the watershed.
- River-Friendly Landscaping (RFL) Coalition: The Partnership is an active member of the coalition. The Coalition is a wide-range group of local agencies and organizations that supports the River-friendly landscaping guidelines and provides individuals, businesses and institutions access to information, resources and ideas so that landscapes are designed, built and maintained according to the sustainable practices of the River-Friendly Landscaping principles.
- California Stormwater Quality Association (CASQA): Partnership staff participates at all levels of CASQA, including the Public Information and Public Participation (PIPP) committee. The PIPP shares information regarding successful outreach campaigns from around the State and country and offers assistance to Phase II communities.
- Watershed Councils and Groups: Various permittees in the Partnership support and work with established watershed groups in their jurisdictions to develop and implement regional solutions to stormwater pollution problems in the Sacramento area watersheds, as described previously in this section.

Table 2.6-2

Regional Public Outreach Activities Work Plan (2008-2013)

Activity/Task	Permit Ref	Key indicators	Performance Standard/Target	Assessment Method	Baseline Data	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other Notes
Public Participation												
Participate in clean up events	12.ai.,bi.c.		Engage the public in cleaning up creeks	Tabulation- track number of volunteers per year	Baseline data will be FY08/09 number of volunteers	⇔	⇔	⇔	⇔	⇔	⇔	
		✓	Remove trash and debris from waterways	Quantification- quantify the amount of trash and debris removed	Baseline data will be FY08/09 quantity of trash and debris removed	⇔	⇔ 4	⇔ 4	⇔ 4	⇔ 4	⇔ 4	
Implement community stewardship pet waste reduction program, "Scoop the Poop"	12.ai., aiv., bi., biv., c.		Engage the public to install stations that encourage proper pet waste disposal	Tabulation-track number of volunteers	Previous year's Annual Report	⇔	⇔	⇔	⇔	⇔	⇔	
			Increase number of stations installed	Tabulation-track number of station installations	Number of stations	⇔	⇔	⇔	⇔	⇔	⇔	
Encourage the public to participate in watershed management groups	12.ai.,bi.,c.		Document participating watershed management groups	Tabulation - track number of groups	NA	⇔	⇔	⇔	⇔	⇔	⇔	
Hotline												
Maintain hotline number for illicit discharges	12.aii,bii.		Continue to promote the use of the hotline	Tabulation-track number of calls received	Number of calls received in previous years	⇔	⇔	⇔	⇔	⇔	⇔	
Public Outreach Implementation												
Update the public outreach strategy to account for changes in public awareness and behavior based on survey results, as needed	12.aiii, biii.		Identify areas in the public outreach strategy that need improvement or modification	Confirmation- identify what modifications were made during the update	NA		⇔	⇔	⇔	⇔	⇔	
Continue to develop and distribute brochures and promotional materials, including translating materials in languages other than English	12.aii., biii.		Document/quantify materials distributed	Tabulation-track number of materials distributed	Number of materials distributed in previous years	⇔	⇔	⇔	⇔	⇔	⇔	
			Document/quantify materials developed	Confirmation- identify new materials distributed, if any.	Previous year's Annual Report	⇔	⇔	⇔	⇔	⇔	⇔	
Conduct a mixed media campaign (radio, print ads, television, signage, etc.)	12.aiii., biii.		Document/quantify impressions made	Tabulation-track number of impressions made	Number of impressions made in previous years	⇔	⇔	⇔	⇔	⇔	⇔	
Implement a program that addresses fundraiser carwash discharges	12.ai.,aiv., bi., biv., c.	✓	Increase awareness on the impact of fundraiser carwash discharges in waterways	Tabulation-track number of visitors on River-Friendly Fundraiser Carwash website	Baseline data will be FY08/09 number of visitors to the River-Friendly fundraiser carwash website	⇔	⇔ 2	⇔ 2	⇔ 2	⇔ 2	⇔ 2	
		✓	Increase number of River-Friendly Carwashes	Tabulation-track number of River-Friendly Carwashes	Baseline data will be FY09/10 number of River-Friendly Carwashes	⇔	⇔	⇔ 3	⇔ 3	⇔ 3	⇔ 3	
Implement home and garden care programs, including the distribution of educational materials (i.e., Our Water Our World, Waterwise, and River-Friendly Landscaping)	12.aiii., biii.	✓	Reduction in pesticide use and increase public's use of alternative home and garden care.	Survey- identify change in awareness/behavior levels	Previous term's surveys	⇔	⇔	⇔	⇔ 3	⇔	⇔	

⇔ Ongoing activity/task ◆ Deliverable or key milestone 2 Effectiveness assessment activity (expected outcome level indicated)

Refer to the Galt SQIP (Section 8.7) for additional outreach activities conducted by the City of Galt												
City of Rancho Cordova Agency-specific Activities												
Refer to the Rancho Cordova SQIP (Section 9.7) for additional outreach activities conducted by the City of Rancho Cordova												

Notes:

1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated

2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

2.7 Regional Commercial/Industrial Program

2.7.1 Introduction

The primary goal of the Regional Commercial/Industrial Program is to reduce the discharge of stormwater pollutants to the maximum extent practicable and effectively eliminating illegal non-stormwater discharges from Permittee-identified priority commercial and industrial facilities and businesses within the boundaries of the stormwater permit area.

As required by the Stormwater Permit, the Regional Commercial/Industrial Program works to address these conditions by conducting regular compliance inspections at priority commercial and industrial facilities, combined with enforcement when necessary, as well as through outreach targeted at business operators and their employees.

The Sacramento County Environmental Management Department (EMD) conducts triennial stormwater compliance inspections and associated enforcement on behalf of all the Permittees in order to make efficient use of Permittee resources, provide regional consistency, and to minimize impacts to businesses through consolidation of inspections with other environmental compliance programs.

The permit also requires that the effectiveness of the Regional Commercial/Industrial Program be assessed, the findings from which must be used to identify necessary modifications to the program such as guiding the priority industry identification process.

2.7.2 Pollutants Addressed

Permittee activities and requirements under the Regional Commercial/Industrial Program address a wide range of pollutants associated with commercial and industrial activities, including metals such as copper, lead, and mercury, three of the Program's target pollutants (see Section 2.5).

2.7.3 Strategy

The Regional Commercial/Industrial Program employs a variety of strategies to effectively meet the requirement of the Stormwater Permit. The primary activities conducted by this element include:

- Identification of priority industries and industrial pollutants
- Commercial and Industrial Stormwater Compliance Program (CISCP) implementation
- Educational outreach

A core strategy of the Regional Commercial/Industrial Program is to utilize knowledge gained through implementation of these activities to assess the Permittees' effectiveness. The results of such assessments are used to refine element activities. For example, inspection and enforcement-related data collected during the first two rounds of CISCP inspections (first round completed in June of 2007 and second round to be completed in June of 2010) and through Complaint-Based Stormwater Compliance Programs (CBSCP), described in Permittees' respective chapters of the SQIP, will be used to refine the priority industries subject to inspection under the CISCP and targeted outreach.

Another strategy is to efficiently use Permittee staff and resources and minimize inconvenience to regulated businesses by building upon existing environmental compliance programs. The County's Environmental Management Department (EMD) agreed to conduct triennial stormwater inspections on behalf of all the Permittees, in accordance with this strategy. Partnering with EMD has the following advantages:

- EMD has traditionally conducted environmental compliance inspections in the county, with trained staff, policies and procedures in place. Only modest training and enhancement was required to accommodate stormwater compliance inspections.

- EMD can recover costs for their activities without impacting the Permittees' limited funding sources, through their Fee Ordinance.
- Impacts to businesses are minimized by conducting stormwater compliance inspections by the same inspector and at the same time as other EMD compliance program inspections at many facilities. This also minimizes the fees charged to businesses.
- Using EMD to conduct stormwater compliance inspections on behalf of all the permittees results in a uniform county-wide program where businesses are regulated consistently and equitably.

2.7.4 Accomplishments to Date

The following highlights the major accomplishments of the Regional Commercial/Industrial Program since the start of the program in 2002:

- The Permittees adopted stormwater ordinances providing legal authority for regulating commercial businesses and industries with respect to stormwater pollution. The Permittees updated their ordinances twice during the 2002–07 permit term to clarify and enhance enforcement authority. EMD stormwater inspectors are authorized to enforce this ordinance county-wide; ensuring consistent treatment of regulated industries.
- The permittees developed a list of priority commercial businesses and industry categories subject to either routine inspections or targeted outreach and definitions for each. EMD refined the definitions of the priority industries based on field inspection observations.
    - EMD developed and implements the program county-wide on behalf of the permittees. This program is innovative in its use of a pre-existing regulatory compliance program structure and trained inspection staff. EMD established a Fee Ordinance in 2003, and updated it in 2007, in order to recover costs from inspected facilities, minimizing impacts on the permittees' limited stormwater utility or general funds. A copy of the Fee Ordinance is included in Appendix 2E.
- The successful CISCP program is now being referred to by regulators and others in the State as a model for those developing similar programs. EMD is authorized to conduct the CISCP on behalf of the permittees through a Memorandum of Understanding (MOU) executed by each permittee in 2003. Local stormwater ordinances were revised by the Permittees in 2004 to provide EMD with billing and enforcement authority county-wide.
- EMD completed the first three-year cycle of CISCP inspections (July 2004 - June 2007) at approximately 4700 businesses, on time.
- EMD conducted progressive enforcement to ensure that facilities included in the CISCP are in compliance with the Permittee stormwater ordinances.
- The permittees and EMD created industry-specific educational materials, including brochures, guidance manuals and Compliance Assistance Bulletins (CABs). These are distributed by direct mail, in training workshops, by way of BERC, during inspections, and in conjunction with enforcement actions. CABs and other CISCP-related compliance assistance materials are also made available on EMD's web site (http://www.emd.saccounty.net/WP/EMDstormwater.htm). Several outreach brochures were translated into Spanish, Russian, and Chinese.
- The permittees and EMD developed and maintained a comprehensive database to track and document inspection and outreach efforts, for annual reporting and progressive enforcement purposes.

- EMD and the permittees coordinated with the Regional Water Board by referring over 110 Industrial General Permit non-filers , reporting significant violations, promptly investigating Regional Water Board referrals, and assisting with coordinated inspections and outreach to selected industries upon request.
- EMD received the *Outstanding Source Control/Programmatic BMP Implementation* award from the California Stormwater Quality Association (CASQA) in 2007 for implementation of the CISCP.
- The Permittees conducted two rounds of outreach to priority industries.

2.7.5 Regional Commercial/Industrial Activities

This section describes Stormwater Permit requirements applicable to the Regional Commercial/Industrial Program and the activities to be conducted during the 2008–13 permit term.

Table 2.7-1, Regional Commercial/Industrial Activities Work Plan located at the end of this section outlines the planned activities, associated performance standards and effectiveness assessment methods, as well as a five-year implementation schedule.

The following describes the major activities in more detail:

Legal Authority

The Permittees' stormwater ordinances provide legal authority for regulating commercial businesses and industries with respect to stormwater pollution. Stormwater ordinances will be amended as needed during the 2008–13 permit term to ensure that pollutant sources from commercial and industrial activities are effectively addressed.

Priority Industry and Industrial Pollutant Identification

Assessing data collected through implementation of Regional Commercial/Industrial Program activities to focus Permittee resources on industries that pose the most significant threat to stormwater quality is key to demonstrating the effectiveness of this element. Effectiveness assessments will guide priority industry identification processes, including identification of business categories subject to stormwater compliance inspections and those subject to outreach.

The industries initially subject to stormwater compliance inspections and targeted outreach are listed in the sections below. These lists will be refined during this permit term, as needed, based on results of the effectiveness assessments.

Priority industrial pollutants will be identified by taking into consideration monitoring-related benchmark exceedances for facilities covered under the State Industrial General Permit. Monitoring results received by the Regional Water Board from facilities covered by the Industrial General Permit will be evaluated and compiled into table form by the Regional Water Board, after which the Regional Water Board will transmit the table of compiled data to the Permittees. The data included in the table provided by the Regional Water Board shall be limited to the boundaries of the stormwater permit area and exceedances shall be categorized as either "high", "medium" or "low" priority. The table will be evaluated to identify overlaps between benchmark exceedances and the pollutants identified in the Target Pollutant Program described in Section 2.5. Overlapping constituents will be considered priority industrial pollutants. Additional priority industrial pollutants may be identified by the Permittees using alternative criteria. The Permittees will update the list of priority industrial pollutants within three months of receipt of compiled State Industrial General Permit benchmark exceedance tables from the Regional Water Board, but not more frequently than annually. Outreach material will be distributed to targeted businesses having problems addressing the priority industrial pollutants. See Outreach below for more information.

Commercial and Industrial Stormwater Compliance Program (CISCP)

EMD will continue to implement the CISCP on behalf of all Permittees. This program is described in the following sections.

CISCP Legal Authority

The EMD's Fee Ordinance authorizes EMD to recover costs for inspection, enforcement and outreach activities by assessing/collecting fees from facilities inspected. The Fee Ordinance was last updated in 2007 and will be updated again as needed during the 2008–13 permit term.

CISCP Inspections

EMD will continue to conduct triennial inspections at identified priority commercial and industrial facilities. The first cycle of inspections was completed in June 2007 and the second cycle will be completed in June 2010. The following priority commercial and industrial facilities will be inspected:

- Facilities with coverage under the State Industrial General Permit
- Auto body shops
- Auto repair shops
- Auto dealers
- Equipment rental facilities
- Kennels
- Nurseries
- Retail gasoline outlets (i.e., gas stations)
- Restaurants

EMD's Fee Ordinance (Appendix 2E) includes definitions for these commercial and industrial categories.

The permittees may refine this list as they evaluate inspection and enforcement data to better identify significant threats to stormwater quality. At a minimum, the list will be evaluated and revised, as needed, by the end of the permit term.

EMD may de-list certain facilities found during inspection(s) to have no exposure of pollutants from their commercial/industrial activities. EMD will report these "de-listed" businesses in the annual reports and continue to track such facilities in its database.

EMD inspectors will continue to use standardized inspection checklists when conducting stormwater compliance inspections. This will help ensure consistency of inspections county-wide, and maximize efficiency. Checklists will be refined as needed during the permit term.

Stormwater compliance inspections conducted at businesses covered under the State Industrial General Permit will verify that each facility:

- Has a current Waste Discharge Identification (WDID) number
- Has an up to date Stormwater Pollution Prevention Plan (SWPPP) available on-site
- Is effectively implementing BMPs in compliance with the Permittees' stormwater ordinances

EMD inspectors will distribute educational materials to the operators of these facilities during inspections. EMD will also refer suspected Industrial General Permit non-filers to the Regional Water Board, as described later in this section.

CISCP Enforcement

EMD will continue to conduct progressive enforcement to obtain compliance in accordance with Permittees' stormwater ordinances and will maintain a progressive enforcement policy, if needed,

to compliment the enforcement-related procedures contained therein. The Permittees' general approach is to take appropriate administrative enforcement actions in all cases that do not involve criminal behavior, indicate patterns of activity that extend beyond Sacramento County or require significant infrastructure modification. All other cases will be referred to either District Attorneys or the State Attorney General's Office, as appropriate. In addition, significant violations will be reported to the Regional Water Board as described in more detail later in this section.

CISCP Outreach

EMD will continue to develop and refine Compliance Assistance Bulletins (CABs) for distribution to businesses during inspections, in training workshops, through BERC, and on the EMD web site.

EMD will coordinate with others, such as BERC and the Permittees, to assist with stormwater compliance training workshops for regulated industries.

EMD will provide annual training for inspectors. New inspectors will receive field training by Stormwater Compliance Section (SCS) staff. SCS staff will also continue to conduct quality control reviews of stormwater compliance inspection forms submitted by inspectors and conduct follow-up one-on-one training, as needed, based on findings of quality control reviews.

CISCP Data Management

EMD will continue to manage and track data on inspections and enforcement using a computer-based system. Permittee stormwater staff will have access to the database for programmatic evaluation and reporting purposes.

At a minimum, the following information will continue to be tracked for each regulated facility:

- Name and address of owner and operator
- Coverage under Industrial General Permit, or other individual or general NPDES permits
- Narrative description and SIC code that best reflects the commercial or industrial activities at, and principal products of, each facility or business.

The database will be refined as needed during the permit term.

CISCP Interagency Coordination

EMD will continue to coordinate and cooperate with the Regional Water Board in the following ways:

- All significant violations and suspected Industrial General Permit non-filers will be referred to the Regional Water Board in writing or by electronic mail within 30 days of discovery. A tracking spreadsheet will be updated and submitted to the Regional Water Board monthly by EMD that will include any new referrals of non-filers. Within two weeks of receipt of EMD's monthly submittal, the Regional Water Board will update information in the tracking spreadsheet related to status of coverage, enforcement actions, etc. The Regional Water Board will also copy EMD and the permittees on all enforcement actions, and correspondence related to permit status changes or exemptions, such as Notices of Termination (NOTs), Notices of Non-Applicability (NONAs), and No Exposure Certifications (NECs), for all facilities listed. Appendix 2F includes a flowchart of the responsibilities of the Permittees, EMD and the Regional Water Board related to referring and processing non-filers.
- EMD will initiate investigation of complaints referred by the Regional Water Board within three business days of receipt associated with industries included in the CISCP.

- Upon request, EMD will support Regional Water Board enforcement actions targeting facilities included in the CISCP. For example, EMD can provide facility and historical information and EMD staff, when available and appropriate, will participate in joint inspections with the Regional Water Board.

Permittee Evaluations

CISCP Enforcement Data Evaluation

Enforcement-related data will be evaluated to assess the program effectiveness and to refine the list of priority industries subject to inspection and targeted outreach.

Priority Industrial Pollutant Industrial General Permit Benchmark Exceedance Evaluation

Within three months of receipt of compiled State Industrial General Permit benchmark exceedances tables from the Regional Water Board, but not more frequently than annually, the Permittees will update the list of State Industrial General Permit facilities requiring distribution of outreach materials for those facilities with significant priority industrial pollutant benchmark exceedances. Significant exceedances are defined as those classified as priority industrial pollutants that fall into the Regional Water Board's "high" and "medium" priority exceedance criteria.

Outreach

Permittees will continue to conduct outreach to the following priority industries:

- Automotive washing and detailing businesses
- Carpet cleaning businesses
- Commercial pesticide applicators
- Concrete contractors
- Concrete cutting contractors and businesses
- General building contractors
- Landscape installation contractors and maintenance businesses
- Painting contractors
- Portable toilet rental businesses
- Pressure washing businesses
- Street sweeping businesses
- Swimming pool contractors
- Swimming pool maintenance businesses

Businesses included in priority industries subject to outreach are considered potential temporary or intermittent sources of unauthorized non-stormwater discharges and/or stormwater pollution. Most of the businesses are mobile operations without a single base of operation, and for these reasons are difficult to regulate.

The Permittees will conduct outreach to priority industries at least twice during the five-year term of the stormwater permit. The objectives of the outreach are to increase awareness of stormwater pollution and applicable regulations, educate business owners and operators about BMPs for addressing pollution, and encourage environmental stewardship.

BERC will continue to manage the outreach database and coordinate direct mailing of educational materials to businesses on behalf of the permittees. As with past years, it is anticipated that two types of outreach materials will be distributed:

- *General brochures and fact sheets*: These publications detail what types of activities may result in illicit discharges to the storm drain system as well as acceptable means of performing typical activities. The brochure entitled “Only Rain Down the Storm Drain” is an example of this type of outreach material.

- *Industry-specific brochures and fact sheets*: These publications provide information on source and treatment control BMPs targeted to specific industries. Source controls prevent the pollutant(s) from contacting site runoff or stormwater, and treatment controls remove pollutant(s) already contained in the runoff. The booklet entitled *BMPs for Pressure Washing and Surface Cleaning* is an example of this type of outreach material.

In addition to direct mail, educational brochures and other information will be distributed at displays at Permittee public counters, by inspectors, through trade associations and industry suppliers, and during workshops and other events.

The Permittees will continue to partner with BERC and other organizations to provide industry-specific BMP workshops for businesses and special districts (e.g. fire and water districts) as needs are identified.

Priority industrial pollutant-specific outreach materials will be developed, as needed, and distributed within six months of receipt of compiled State Industrial General Permit benchmark exceedance tables from the Regional Water Board, but not more frequently than annually.

2.7.6 Effectiveness Assessment

The Permittees' general approach to assessing the effectiveness of its stormwater programs is described in Section 2.3, Program Effectiveness. This section specifically describes the assessment activities and associated methods for evaluating the effectiveness of the Regional Commercial/Industrial Program.

Activities from the last permit term were evaluated to identify modifications necessary to demonstrate effectiveness and baseline data requirements for the 2008-2013 permit term activities.

Table 2.7-1, Regional Commercial/Industrial Activities Work Plan presents planned activities for the program. Each activity or task has an anticipated effectiveness outcome level of between one and four, as described in Section 2.3. An outcome level of one is assumed for each activity or task, unless otherwise indicated. Table 2.7-1 shows the years in which focused assessments will be conducted to determine if a higher outcome levels have been attained.

Compiling and evaluating data to demonstrate changes in awareness and behavior (Outcome Levels 2 and 3), where possible, as a result of the inspection, enforcement and outreach efforts, will be conducted to identify potential programmatic enhancement opportunities.

Key Indicators have been selected for the Regional Commercial/Industrial Program that are a subset of element performance standards which are:

- Intended to demonstrate progression towards goals
- Easily understandable
- Common throughout the Partnership

Key Indicators are identified in Table 2.7-1 and will be used to assess the effectiveness of individual permittee programs as well as that of the partnership as a whole in the Long-Term Effectiveness Assessment (LTEA) required by the stormwater permit.

Evaluations may result in recommended changes to the list of priority commercial/industrial facility categories included in the CISCP, targeted outreach, or other mid-course program refinements.

2.7.7 Relationship to Other Program Elements

The Regional Commercial/Industrial Program relates to other Permittee program elements as follows:

Municipal Operations Element

Many Permittee-owned facilities such as corporation yards, airports, and waste management facilities, are covered under the State Industrial General Permit. Therefore, many of the brochures and BMP guidance materials created through the Regional Commercial/Industrial Program for private industries can also be used to educate and inform managers and staff who maintain and operate Permittee facilities. The Municipal Operations and Regional Commercial/Industrial Program staff work together to provide annual refresher stormwater BMP and awareness training for Permittee employees.

Illicit Discharge Element

There are many businesses addressed by the Regional Commercial/Industrial Program that provide home-related services to residential customers. Examples include carpet cleaning companies, and landscape and concrete contractors. Activities by such businesses could result in illicit discharges to the storm drain system. Commercial/Industrial and Permittee Illicit Discharge Element staff work together to conduct inspections and enforcement in response to complaints and to promote pollution prevention awareness. Common problems include erosion of landscape material stockpiles in public streets and gutters, discharge of concrete and paint wastes into the storm drain and washing dirt and debris from paved surfaces into the drain.

Public Outreach Element

Regional Commercial/Industrial Program staff coordinate regularly with experienced public outreach professionals to assist with the development of high-quality educational and informational materials for targeted businesses. Materials are distributed by inspectors during facility inspections, by direct mail (e.g., with enforcement actions or through targeted outreach), during training workshops, at public events and at Permittee permit counters. Brochures and other guidance materials are updated and translated into other languages as needed. Educational materials are also distributed through BERC.

2.7.8 Coordination between the Permittees and Internal to Permittees

Successful implementation of the Regional Commercial/Industrial Program requires close coordination between the Permittees, EMD, and other entities that regulate or provide assistance to local industries, as described below.

Permittee Coordination

Permittees coordinate with one another on a number of efforts related to the Regional Commercial/Industrial Program, including:

- Revising stormwater ordinances to comply with the stormwater permit
- Identifying priority industries to include in stormwater compliance inspections and targeted outreach activities
- Indentifying priority industrial pollutants and State Industrial General Permit businesses with significant benchmark exceedances
- Providing guidance to EMD on implementation of the CISCP to provide regional consistency
- Conducting coordinated enforcement and/or outreach to individual businesses with multi-jurisdiction locations or services, or entire business categories to address stormwater quality on a regional basis
- Preparing and distributing industry and priority industrial pollutant-specific outreach

Local Sewer Providers

Local sewer providers review and inspect the operations of industrial dischargers to area collection systems. They also work with businesses such as dry cleaners, photo processors and radiator repair shops to help them understand local sewer use regulations and wastewater pollution prevention options. Local sewer providers are responsible for ensuring adequate pre-treatment prior to discharging a waste stream to the sanitary sewer. Lastly, some local sewer providers administer permits that allow short-term discharges to the sanitary sewer. Local sewer providers are also responsible for issuing permits for long-term discharges to their sewer systems. Permittee and EMD staff refer businesses that want to discharge to the sanitary sewer to local sewer providers for guidance.

Coordination with local sewer providers helps to keep commercial and industrial wastes out of the storm drain system.

County Environmental Management Department (EMD)

EMD, under agreement with the permittees, conducts routine stormwater compliance inspections and complaint response at priority commercial and industrial facilities listed in the stormwater permit. Two divisions within EMD participate in the implementation of the CISCP, as follows:

- The Environmental Compliance Division (ECD) contains the Stormwater Compliance Section (SCS), which leads the implementation of the county-wide CISCP. In addition to providing support and training to hazardous materials and environmental health division inspectors (described below), SCS inspectors conduct stormwater compliance inspections at many of the commercial and industrial facilities in the program. They also conduct complaint response and follow-up stormwater compliance re-inspections at Hazmat and Environmental Health Division (EHD) facilities. SCS maintains a database and generates monthly and annual reports to document activities and inform the permittees and Regional Water Board about non-compliant industries. ECD also implements the septic program, as well as other water-related programs.
- The Environmental Compliance Division's Hazardous Materials program (Hazmat) is the State designated Certified Unified Program Agency (CUPA) for Sacramento County and inspects commercial and industrial facilities that generate hazardous waste, store or use hazardous materials, or store hazardous materials (i.e fuel) in underground storage tanks (UST) in quantities above statutory thresholds. Examples of businesses inspected for stormwater compliance by Hazmat include retail gasoline outlets (RGOs). EHD enforces provisions of the California Health and Safety Code at restaurants and public swimming pools, and other facilities. EHD conducts stormwater compliance inspections at restaurants and sends data and/or refers problems to SCS for follow-up. RGOs and restaurants are one of nine categories of businesses regulated by EMD for stormwater compliance.

The Permittees coordinate with EMD in many areas, including: providing guidance on implementation of the CISCP, partnering on outreach events, and conducting coordinated enforcement to address facilities comprehensively (since in many situations EMD may regulate a specific tenant in a complex but not the owner of the complex or other businesses within the complex).

County Business Environmental Resource Center (BERC)

BERC's main mission is to provide confidential environmental compliance assistance and guidance to local businesses in the county upon request. Permittee stormwater staff work with BERC to ensure that appropriate stormwater pollution prevention information is provided to local businesses by BERC. Assistance is provided by BERC to develop and distribute guidance materials for selected industries and to work with Industrial General Permit industries to ensure they have ample opportunity to understand and comply with the regulations. BERC conducts a

variety of commercial and industrial training workshops each year to inform the regulated community about compliance with local and state stormwater laws, at which Permittee staff are often presenters. BERC also developed and regularly updates a database of businesses in priority industries subject to targeted outreach. The Permittees contribute funding to BERC each year.

2.7.9 Coordination with Other Agencies and Groups

Permittee stormwater staff coordinates with various outside agencies and groups that have regulatory and/or economic interests in industries in Sacramento County. This coordination allows for information sharing and ensures that a uniform, consistent message about stormwater pollution prevention is distributed to the regulated community.

- ***Regional Water Board*** — The Permittees coordinate with the Regional Water Board on issues related to Industrial General Permitted industries as well as other businesses. The Permittees initiate investigations of all stormwater problems at businesses referred by the Regional Water Board. The Permittees inform the Regional Water Board of all discovered significant violations and of potential General Permit non-filers. The Permittees also support Regional Water Board actions upon request, by allocating staff, providing documentation of observed problems, etc.
- ***Trade and Business Associations*** — The Permittees cooperates with commercial and industrial businesses through associations and organizations. These associations are provided with outreach materials, information on Industrial General Permit requirements and information on BERC's compliance assistance program.

Table 2.7-1

Regional Commercial/Industrial Activities Work Plan (2008-2013)

Activity/Task	Permit Ref	Key Indicators	Performance Standard (Target)	Assessment Method	Baseline Data	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Legal Authority												
Revise stormwater ordinance as needed	9.a.i		Revised stormwater ordinance (if needed)	Confirmation - report revisions in AR	NA	⇔	⇔	⇔◆	⇔	⇔	⇔	one year from SQIP approval
Priority Industry and Industrial Pollutant Identification												
Update priority industry inspection list based on evaluation of enforcement-related data	9.a.ii		Updated list of priority industries for inspection	Confirmation - report revisions in AR	NA					②		
Update priority industry outreach list C29 based on evaluation of enforcement-related data	9.a.ii		Updated list of priority industries for outreach	Confirmation - report revisions in AR	NA					②		
Develop and update list of priority industrial pollutants considering overlaps between benchmark exceedances (compiled data provided by Regional Water Board) and Target Pollutant constituents	9.b.iii		Updated list of priority pollutants at a frequency of no greater than annually and within 3 months of receipt of compiled data tables from the Regional Water Board	Confirmation - report list and revisions in AR	NA	⇔	⇔	⇔	⇔	⇔	⇔	
Commercial and Industrial Stormwater Compliance Program (CISCP) – EMD												
Revise fee ordinance as needed	9.a.iii-viii		Revised fee ordinance (if needed)	Confirmation – report program/ordinance revisions in AR	NA	⇔	⇔	⇔	⇔	⇔	⇔	
Implement enforcement policy as needed	9.a.iii-viii		Implement enforcement policy (if needed)	Confirmation - report any formally adopted policy in AR	NA	⇔	⇔	⇔	⇔	⇔	⇔	
Inspect priority industries once every 3 years	9.a.iii-viii		100% of priority industries inspected during 3-yr cycle	Confirmation - report on completion of next cycle, 2007-10	NA	⇔	⇔◆	⇔	⇔	⇔◆	⇔	
Track violations during 3 year cycle	9.a.iii-viii	✓	Decrease in violations observed from one 3-yr cycle to the next	Tabulation – track number of violations observed and inspections conducted	No. of violations per facility inspection observed during previous inspection cycle					②		
Track follow-up inspections during 3 year cycle	9.a.iii-viii	✓	Decrease in follow-up inspections required from one 3-yr cycle to the next	Tabulation – track the percentage of follow-up inspections conducted	Percentage of follow-up inspections in previous inspection cycle					②		
Track number of businesses with significant priority industrial pollutant exceedances using Regional Water Board compiled data	9.a.iii-viii		Decrease in Industrial General Permit facilities with significant priority industrial pollutant exceedances from one permit cycle to the next	Tabulation – track number of facilities by priorty pollutant	Percentage of Industrial General Permit facilities with significant priority pollutant exceedances in previous inspection cycle					②		
De-list with no exposure of pollutants to stormwater	9.a.iii-viii		Document facilties de-listed and no longer requiring inspection	Tabulation – track number of industries de-listed due to no exposure	NA	⇔	⇔	⇔	⇔	⇔	⇔	

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Chapter 3

County of Sacramento Stormwater Quality Improvement Plan

3.1 Overview

This chapter presents the Sacramento County Stormwater Quality Improvement Plan (SQIP) for the portion of the permit area in unincorporated Sacramento County. Other permittees' SQIPs are presented separately in Chapters 4-9.

This chapter describes the County of Sacramento's SQIP. The County's activities described in this chapter are conducted ***in addition*** to those the County implements jointly with the other Permittees (see Chapter 2).

Characteristics of Sacramento County

Sacramento County was incorporated in 1850 as one of the original 27 counties of the State of California. The County is the major component of the Sacramento Metropolitan Statistical Area which includes Sacramento, El Dorado, and Placer Counties.

Sacramento County encompasses approximately 994 square miles in the middle of the 400-mile long Central Valley, which is California's prime agricultural region. The County is bordered by Contra Costa and San Joaquin Counties on the south, Amador and El Dorado Counties on the east, Placer and Sutter Counties on the north, and Yolo and Solano Counties on the west. Sacramento County extends from the low delta lands between the Sacramento and San Joaquin rivers north to about ten miles beyond the State Capitol and east to the foothills of the Sierra Nevada Mountains. The southernmost portion of Sacramento County has direct access to the San Francisco Bay. The County includes the cities of Sacramento, Elk Grove, Rancho Cordova, Galt, Citrus Heights, Folsom and Isleton.

Most of the county is at an elevation close to sea level, with some areas below sea level. Hills along the eastern boundary rise to several hundred feet. Major watercourses in the county include the American River, Sacramento River and Dry Creek, a tributary of the Sacramento River.

See chapters 1 and 2 for a detailed discussion on Sacramento County watersheds and waterways.

Additional County facts include:

- experiences an average annual rainfall of 19.6 inches
- includes 14 Regional Parks Districts
- boasts 6 million trees (the City of Sacramento has been called the "City of Trees")

- contains 19 major public & private colleges and universities and 16 public school districts

As discussed in Chapter 1, the stormwater permit does not apply to all areas within Sacramento County. Rather, it applies to all the land inside the Sacramento County Urban Service Area boundary, as well as the City of Galt and the Sacramento International Airport, as shown on Figure 1.3-1. Land within the Urban Service Area includes the cities of Folsom, Citrus Heights, Elk Grove, Rancho Cordova, and Sacramento, and unincorporated Sacramento County. The City of Isleton is not included. The unincorporated portion (the area addressed by this County SQIP) is 232 square miles.

The County has a charter form of government. It is governed by a five-member *Board of Supervisors* elected on a non-partisan basis to serve four-year terms. Each is elected from one of the five supervisorial districts of the County. District boundaries are adjusted after every federal census to equalize district population.

Other elected officials include the *Assessor*, *District Attorney* and *Sheriff*. A *County Executive* appointed by the Board of Supervisors runs the day-to-day business of the County.

Three agencies and a number of departments within these agencies support the delivery of countywide services to the unincorporated County and several cities. Figure 3.1-1 illustrates the County's organizational structure.

SQIP Organization

The following describes the organization of the County SQIP in this chapter:

Section 3.2 — Program Management and Training

This section describes the activities conducted by the County (such as legal authority, funding, inter and intra-agency coordination and training) related to implementation of the Stormwater Program and compliance with the stormwater permit.

Section 3.3 — Construction Element

This section describes activities designed to prevent sediment and other construction-related pollutants from entering the storm drain system and local creeks and rivers.

Section 3.4 — Commercial/Industrial Element

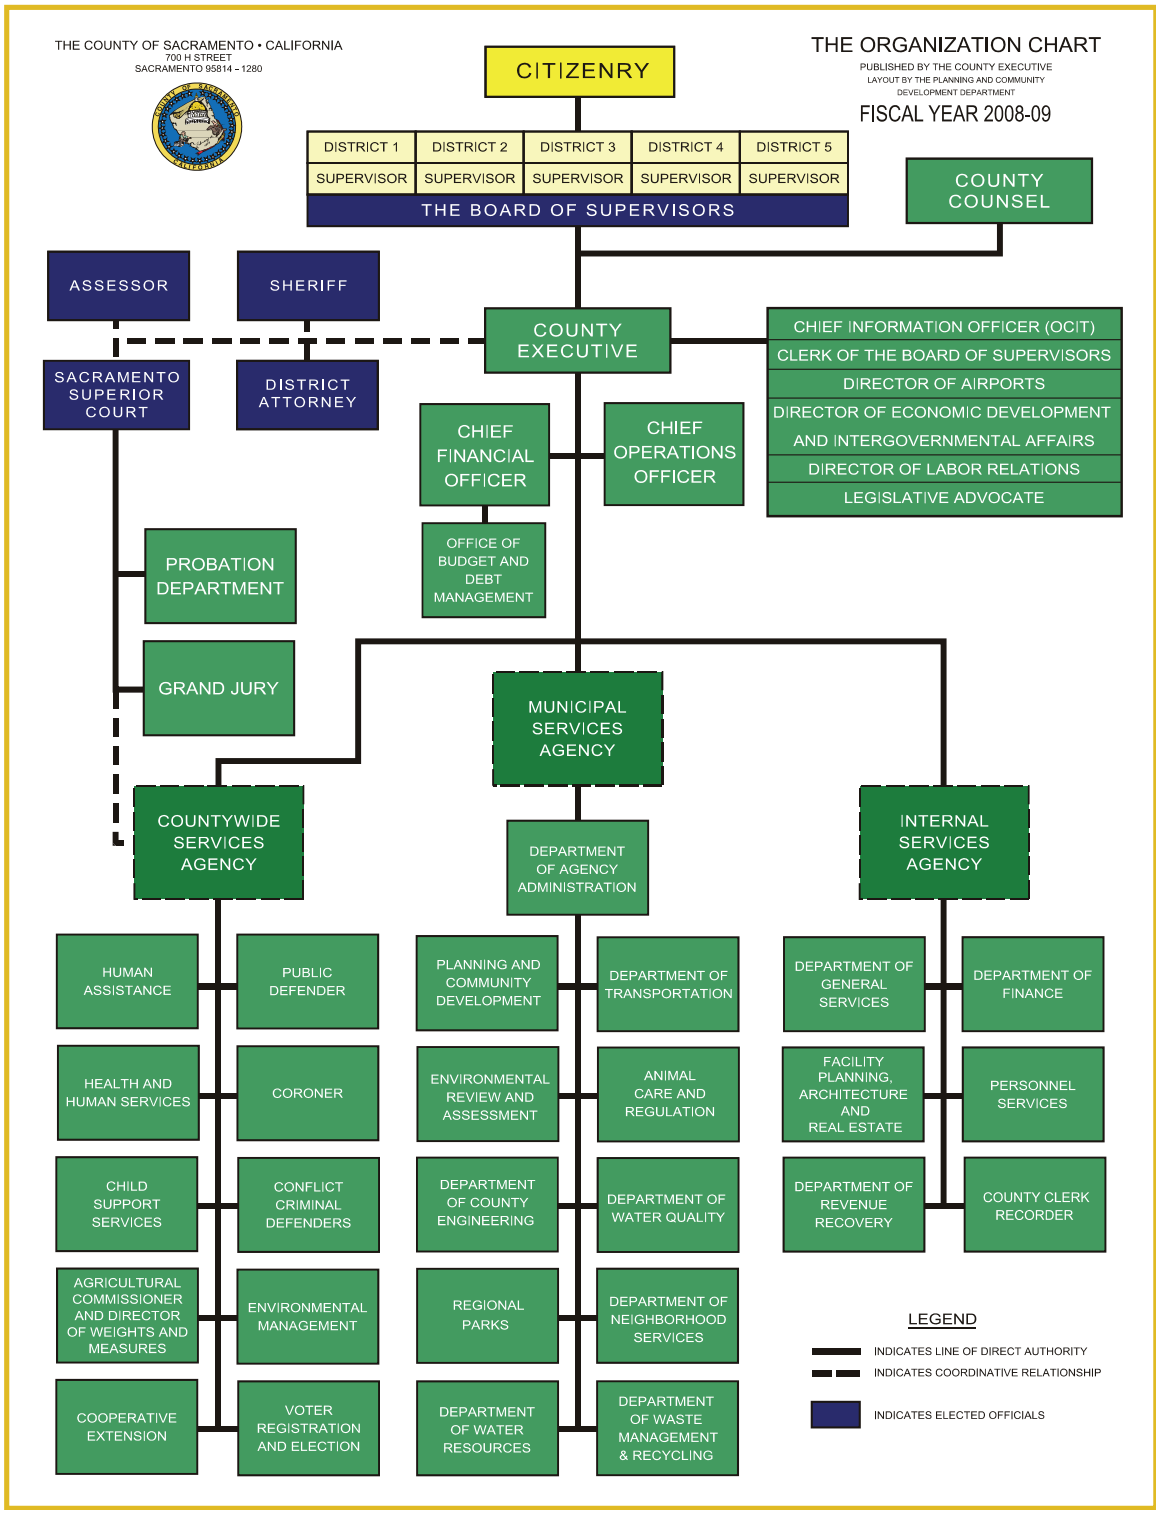
This section describes activities designed to reduce the discharge of pollutants in runoff from commercial and industrial sites and eliminate non-stormwater discharges associated with commercial and industrial activities.

Section 3.5 — Municipal Operations Element

This section describes activities designed to control stormwater pollution resulting from the operation and maintenance of County-owned facilities.

Section 3.6 — Illegal Discharge Element

This section describes activities designed to eliminate illegal non-stormwater discharges to the storm drain system and local creeks and rivers.



Section 3.7 — Public Outreach Element

This section describes activities designed to raise awareness and foster community stewardship to promote pollution prevention and protect local creeks and rivers.

Section 3.8 — New Development Element

This section describes activities designed to reduce pollutants in runoff from new development and significant redevelopment projects.

Figure 3.1-1 — Sacramento County Organization Chart

3.2 Program Management

Introduction

This section of the SQIP describes activities that will be conducted by the County during the 2008-13 permit term to administer and manage the County's Stormwater Quality Program (County Program) to ensure continued compliance with the stormwater permit. In addition to managing designated stormwater personnel assigned to conduct the activities and prepare the compliance deliverables described in this plan, the County's Program Manager coordinates with internal and external groups, ensures that adequate funding and legal authority is in place, and confirms that annual employee training is conducted.

Table 3.2–3 at the end of this section provides a summary of major tasks and associated five-year implementation schedule.

County Program Organization and Staffing

The County Program is administered and managed by the Stormwater Quality Section within the Municipal Services Agency's Department of Water Resources (see Figure 3.1-1 of the previous section, Sacramento County Organizational Chart). The Department Director provides oversight and certifies all compliance deliverables on behalf of the County.

Eleven qualified full-time equivalent (FTE) staff members are assigned to work on the program within the Department of Water Resources Stormwater Quality Section as listed below:

- Stormwater Program Manager (1 FTE)
- Associate Civil Engineers (4 FTE)
- Principal Engineering Technician (1 FTE)
- Engineering Technician (1 FTE)
- Environmental Specialists (4 FTE)

In addition, Table 3.2–1 lists the various other county agencies and departments that provide staff and resources to implement the County Program.

The County Program Manager periodically conducts briefings with senior managers to keep them apprised of the County Program and the role of their staff in ensuring compliance with the stormwater permit.

The County retains consultants as needed, mainly to help with specialized technical tasks such as monitoring, engineering design standards and regulatory and legal assistance.

Table 3.2–1
County of Sacramento Responsibilities for Compliance with Sacramento NPDES Municipal Stormwater Permit

Program Element	Agency/Department/(Group)	Responsibility
Program Management (Section 3.2)	**Municipal Services Agency** Dept. of Water Resources (Stormwater Quality Section)	Administers and manages the County Stormwater Quality Program on behalf of the County, provides liaison with the Regional Water Board, prepares/submits compliance reports, and provides annual refresher training to affected County staff. Also conducts many of the Program activities.
	County Executive	Oversees County-wide compliance with stormwater permit and authorizes County staff to enforce Stormwater Ordinance.
	County Counsel	Conducts legal reviews, prepares legal certifications, and oversees revisions to ordinances, codes, and other standards.
Construction (Section 3.3)	**Municipal Services Agency** Dept. of County Engineering and Administration (Land Development and Site Improvement Review (LDSIR))	Issues grading permits and checks for NOI, for all sites subject to State General Construction Permit.
	Municipal Services Agency Dept. of Water Resources (Drainage Development and Stormwater Quality Sections)	Reviews erosion and sediment control plans and SWPPPs, as needed.
	Municipal Services Agency Dept. of County Engineering (Construction Management and Inspection Division- Building Inspection)	Provides inspection services during the building phase of construction of private developer facilities. Designated stormwater inspectors provide oversight of contractor erosion and sediment control, construction site housekeeping practices.
	Municipal Services Agency Dept. of County Engineering (Construction Management and Inspection Division)	Provides inspection services during grading phase and installation of public infrastructure (utilities, roads, sidewalks, detention basins, and channels). Stormwater inspection responsibilities include oversight of contractor erosion and sediment control and Construction General Permit compliance.
	Municipal Services Agency Dept. of Water Resources (Drainage Design)	Designs new storm drain facilities and provides oversight during construction activities, including approval of change orders and SWPPP amendments, as applicable. Responsibilities include oversight of contractor erosion and sediment control and Construction General Permit compliance.
	Municipal Services Agency Dept. of Water Resources (Water Supply Planning and Engineering)	Designs, and oversees construction and repair/replacement of all water supply infrastructure, including associated wells, pumps and treatment facilities. Responsibilities include oversight of contractor erosion and sediment control and Construction General Permit compliance.
	Municipal Services Agency Dept. of Transportation	Oversees construction and repair/replacement of all street and highway improvements, including associated lighting, landscaping and signals. Responsibilities include oversight of contractor erosion and sediment control and Construction General Permit compliance.

Program Element	Agency/Department/(Group)	Responsibility
Commercial/ Industrial (Section 3.4)	**Countywide Services Agency** Environmental Management Department, Environmental Health and Hazardous Materials Divisions (HMD)	Conducts compliance inspections for the nine required industries. During inspections, considers exposure of pollutants to contact with stormwater, prohibited non-stormwater discharges, illicit connections and other conditions that may be violations of local stormwater ordinances and conducts progressive enforcement as necessary to obtain compliance.
	Municipal Services Agency Department of Water Quality	Issues discharge permits for the sanitary sewer system to all industrial users. Conducts plan review and issues permits for connections to the sanitary sewer.
	Municipal Services Agency Department of Water Resources (Stormwater Quality Section)	Conducts complaint-based inspections and enforcement related to reported stormwater pollution issues associated with business activities not covered under the EMD Commercial/ Industrial Stormwater Inspection Program (CISCP). Coordinates with EMD on implementation of CISCP. Conducts business outreach activities businesses in unincorporated Sacramento County.
Municipal Operations (Section 3.5)	**Municipal Services Agency** Dept. of Water Resources (Drainage Maintenance Engineering Section)	Maintains stormwater quality treatment facilities and the storm drain system owned and/or operated by the County in a manner that protects water quality.
	Municipal Services Agency Dept. of Transportation	Maintains all street and highway improvements, including lighting, landscaping, and signals. Responsible for ensuring that stormwater quality and erosion/sediment controls are incorporated where required.
	Municipal Services Agency Department of General Services	Manages County-owned buildings, parking lots, and other facilities. Responsible for ensuring that activities at these facilities do not contribute to stormwater pollution.
	Municipal Services Agency Regional Parks	Maintains county parks and recreational facilities in a manner which considers stormwater quality impacts.
	Municipal Services Agency Department of Waste Management and Recycling	Provides solid waste management services for residents and businesses in Sacramento County. Program emphasis is placed on waste prevention, recycling, and composting that support the stormwater quality program.
	Municipal Services Agency Department of Water Resources (Stormwater Quality Section)	Conducts training to targeted County employees and ensures that County activities are in compliance with the stormwater permit.
	Internal Services Agency Department of General Services (Fleet Services Division)	Maintains a fleet of heavy-duty vehicles, heavy equipment, light cars, and trucks for use by County Agencies and Departments. Services include maintaining, repairing, fueling, washing, and storing vehicles and equipment. Responsible for ensuring that stormwater quality controls/BMPs are incorporated where required. Some facilities may require coverage under State General Industrial stormwater permit.
	Sacramento County Airport System	Maintains Sacramento International Airport, Mather Airport, Executive Airport, and Franklin Field.

Program Element	Agency/Department/(Group)	Responsibility
Illicit Discharges (Section 3.6)	**Countywide Services Agency** Environmental Management Department , Hazardous Materials Division (HMD)	Responds to hazardous materials spills that may impact stormwater quality and receiving waters, including clean-up, reporting, and referral of problems as appropriate.
	Municipal Services Agency Department of Water Resources (Drainage Maintenance Engineering)	Conducts ongoing field screening for illicit discharges and connections through routine maintenance activities being conducted by field crews. Responds to non-hazardous spills outside of the right of way, including cleanup and proper disposal.
	Municipal Services Agency Dept. of Transportation	Responds to hazardous and non-hazardous spills in the right of way, including cleanup and proper disposal.
	Municipal Services Agency Department of Water Resources (Stormwater Quality Section)	Conducts investigations and enforcement of the Stormwater Ordinance to eliminate illicit discharges/connections detected by way of reports from the public and/or County maintenance crews. Distributes educational materials to the public. Maintains database to track investigations and enforcement conducted by Stormwater Quality staff. Provides County employee training to field screening and illicit discharge response crews annually.
Public Outreach (Section 2.6)	**Municipal Services Agency** Department of Water Resources (Stormwater Quality Section and Public Information staff)	Conducts all public outreach required by the stormwater permit, including working with the City of Sacramento and other permittees to conduct a regional media campaign to address all residents in the County. Oversees development and periodic updating of public education materials such as brochures.
New Development (Section 3.8)	**Municipal Services Agency** Planning and Community Development Department	Processes applications for private developments. Implements General Plan and Zoning code. Routes plans to Department of Water Resources to ensure that stormwater quality controls are incorporated as required. Participates in creation of new stormwater quality standards, including review, evaluation, and modification of County polices, codes, and standards.
	Municipal Services Agency Department of Environmental Review and Assessment	Implements provisions of the California Environmental Quality Act (CEQA) as they apply to Sacramento County, including thorough consideration of stormwater quality impacts. Routes documents to Water Resources Department to ensure that stormwater quality controls are incorporated as required.
	Municipal Services Agency Department of Water Resources (Drainage Development Review Section and Stormwater Quality Section)	Conditions development projects to ensure compliance with County drainage and stormwater quality standards, including the use of on-site and regional stormwater quality treatment facilities. Reviews improvement plans to ensure proper design of stormwater quality measures per the latest stormwater quality development standards.

Legal Authority

Legal authority for the County Stormwater Quality Program is provided in several ways:

- The General Plan contains water quality protection policies.
- The County Code (Sections 15.12 and 16.44) provides the legal authority to implement the County Program and enforce the local regulations.
- Written agreements with other County departments and/or other Permittees provide a means of assigning responsibilities and establishing cost-sharing to implement various components of the County Program.
- The County Improvement Standards, Standard Construction Specifications, Stormwater Quality Design Manual and other County documents specify standards and specifications for the regulated community related to the Construction and New Development Elements of the County Program.

The County's Legal Counsel prepared a statement certifying that the County possesses the legal authority necessary to comply with the stormwater permit (see Appendix 3A).

The following sections describe in more detail, the various legal authority mechanisms held by the County.

General Plan

Two main sections of the Conservation Element of the County's 1993 General Plan contain provisions and policies that lay the framework for water quality protection:

- *Section I, Water Resources Policies, B. Surface Water Quality*
  This section includes policies related to urban runoff controls, erosion control, water quality monitoring, and hazardous materials disposal.
- *Section V, C. Urban Streams*
  This section outlines policies related to floodplain fills, channel modifications, land use adjacent to streams, stream maintenance, and stream restoration.

The 1993 General Plan is undergoing revision and the revision should be completed in 2009. The revised General Plan will incorporate water quality and watershed protection language that is consistent with principles outlined in the stormwater permit.

County Code

The County adopted two ordinances that added sections to the County Code and established legal authority for the County Stormwater Quality Program:

- The Stormwater Management and Discharge Control Ordinance, also known as "The Stormwater Ordinance" *(Chapter 15.12 of County Code)* prohibits most non-stormwater discharges and lists non-stormwater discharges conditionally allowable (e.g., water from fire-fighting activities) pursuant to NPDES federal regulations. It also provides legal authority for inspections and enforcement related to the control of illegal and industrial discharges to the County storm drain system and local receiving waters.

- The Land Grading and Erosion Control Ordinance *(Chapter 16.44 of County Code)* requires projects disturbing 350 cubic yards or more of soil or one or more acres of land to have an erosion and sediment control plan. It also gives the County legal authority to inspect projects and enforce the ordinance's requirements.

Agency Agreements

The County Department of Water Resources executes intra-agency agreements with other County agencies, departments, divisions and sections to facilitate compliance with the stormwater permit. These agreements can be either formal (written) or informal (verbal).

A Memorandum of Understanding (MOU) was executed by the permittees to provide the legal authority for jointly administering and implementing certain aspects of the program, including cost-sharing for joint activities. This MOU is discussed in more detail in Chapter 2.

Standard Specifications and Improvement Standards

The County's Standard Construction Specifications and Improvement Standards apply to all new public facilities and to private projects connecting to the County storm drain system or impacting the right of way. These standards include requirements and details for erosion and sediment control and control of other potential stormwater pollutants on development and construction projects in the unincorporated parts of Sacramento County.

Other County Standards and Guidance Manuals

The County's development standards related to post-construction stormwater quality control were adopted in May 2006. The standards are presented, along with technical guidance, in the *Stormwater Quality Design Manual for Sacramento and South Placer Regions*, published in May 2007. This manual includes the sizing and design criteria for regional detention basins as well as the design and maintenance criteria for on-site stormwater quality source, treatment and runoff reduction measures.

Additional stormwater pollution control guidance has been produced and is made available through County EMD and Business Environmental Resource Center (BERC) for selected types of commercial/industrial businesses, such as mobile pressure washers.

Funding

The Program budget consists of two parts: funds allocated for joint program activities, described in Chapter 2, and funds allocated for County-specific activities described in this chapter.

The costs of joint activities are generally shared among the Permittees according to the Permittee MOU (described in Chapter 2). Under this agreement, the County contributes 44 percent of the joint Program funding, primarily through Stormwater Utility revenues described below.

Funding for County-specific activities is provided by a combination of funds, as described below:

- **Stormwater Utility revenues** support the Stormwater Quality Section and outside consultants hired to help implement the County Program. The Stormwater Utility also covers the cost of operating and maintaining the County's storm drain system, which includes pipes, channels, and associated structures; creeks; and regional stormwater quality facilities. A portion of each county resident's bimonthly utility bill is designated to the Stormwater Utility.
- **User-based Development Fees** provide funding for plan reviewers, engineers, and inspectors within the Municipal Services Agency's Construction Management and Inspection Division (CMID). These revenues also support planning staff within the Planning and Community Development Division and environmental staff within the Department of Environmental Review and Assessment (DERA). DERA staff ensures compliance with the California Environmental Quality Act (CEQA) and also implements County stormwater quality protection policies. User-based development fees are collected as part of the application processes for grading and building permits.
- **User-based Industrial/Business Fees** provide funding for Environmental Management Department inspectors who routinely inspect industrial establishments to ensure compliance with the Stormwater Ordinance through the Industrial/Commercial Stormwater Inspection Program that was developed during the previous Permit term.

Implementation Priorities

The County SQIP sets out the basic goals and activities for the County Program. The overall goal is to comply with the stormwater permit in implementing a program to reduce pollutants in urban stormwater discharges to the maximum extent practicable (MEP). For the most part, what constitutes "MEP" is defined by the activities (e.g., "performance standards") established by the stormwater permit.

In areas of the permit where the level of effort is not prescribed, the definition of MEP can vary slightly from year to year based on various factors, some of which are outside the County's control. For instance, if the Sacramento area were to experience an extreme flood, the first priority for the Department of Water Resources would be to protect the public and property. Other activities would be postponed or abbreviated for a short period. For example, during the 1995 and 1997 floods, Stormwater Quality Section staff was temporarily diverted from their regular duties during and immediately after the events; in both cases, regular work resumed in less than a month.

County Stormwater Quality Program priorities are also influenced from year to year by the amount of time and resources needed to respond to the public, environmental groups, and regulatory agencies on various issues of concern. These response activities are impossible to predict, but become a top priority for the County.

Another factor that can affect the County Stormwater Quality Program priorities is staff turnover. The County has found it difficult to find qualified staff with experience working with stormwater issues. For this reason, during years of high turnover, priorities may get shifted slightly to allow time for staff to become educated about the Program and its many activities.

The County evaluates priorities each year as part of its budgeting process. Prioritized activities are proposed in the Work Plan for the coming fiscal year, which is submitted to the Regional Water Board on May 1 each year. Priorities and associated activities are then finalized before the start of the fiscal year on July 1.

In the Annual Report (due October 1 each year), the County reports on its ability to meet its goals and stated priorities for the reporting fiscal year.

Training

Regular training keeps county staff and the regulated community abreast of the constantly evolving stormwater field and regulations. This section describes the County's stormwater training activities for the 2008-13 permit term.

Training for County Staff

Ongoing training and education of county staff and managers is necessary to help ensure continued countywide compliance with the stormwater permit.

The County staff that require stormwater quality training are listed in Table 3.2-2 by program element. Each element manager in the County's Stormwater Quality Section is responsible for working with managers of the targeted staff to plan and facilitate the appropriate type and frequency of refresher training. For the most part, training will be conducted annually. Training and education can be delivered in various formats, such as workshops, presentations, informational meetings and written training materials (e.g., employee handbooks, manuals and brochures). Training accomplishments will be tracked and reported each year in the Annual Report. Additional information about specific training may be found in the individual element sections of this chapter.

Training for Outside Groups

In addition to training employees, the County continues to provide training opportunities for the regulated community. Many of these training events have been done in partnership with the other permittee agencies and/or other local groups. Some examples include:

- Construction stormwater pollution prevention plan (SWPPP) training workshops for local building and engineering community;
- Permittee-sponsored low impact development training for the development community;
- "River friendly landscaping practices" workshops for landscape contractors and residents; and
- Industry-specific stormwater pollution control training workshops for industrial facility owners.

Additional information for these trainings and others can be found in the individual element sections of this chapter.

Table 3.2-2
County of Sacramento Stormwater Quality Training Program Targeted Employees

Program Element	Department/(Group) to be Trained	Objective	Training Frequency
Program Management	Sacramento County Board of Supervisors, County Executive and staff	Make fiscal and programmatic decisions in support of Permit and stormwater ordinance.	Several times/year
	Agency Administrators (3), Various Department Directors	Manage County programs and staff in a manner that complies with Permit and stormwater ordinance.	Several times/year
Municipal Operations	Department of Water Resources (Drainage Maintenance Engineering)	Maintain storm drain system in compliance with Permit and stormwater ordinance. Stormwater pollution prevention, BMP identification and implementation, proper housekeeping practices, as well as identification and reporting of illicit discharges and connections.	Annual
	Department of Transportation (Transportation Maintenance and Operations)	Maintain County-owned roads and respond to hazardous or unidentified pollutant discharges to the storm drain system in compliance with Permit and stormwater ordinance. Identification and reporting of illicit discharges/connections.	Annual
	Department of General Services (Facilities Management Division)	Maintain County facilities in compliance with Permit and stormwater ordinance.	Annual
	Department of General Services (Fleet Services Division)	Maintain County-owned vehicles in compliance with Permit and stormwater ordinance.	Annual
	Department of General Services (Parking Services Division)	Maintain County parking facilities in compliance with Permit and Parking Lot Inspection and Maintenance Program.	Annual
	Operators of County-owned facilities subject to State Industrial General Permit	Individual facility operators are responsible for providing training in compliance with Industrial General Permit – SWQ Program provides support as requested.	Annual
	Regional Parks, Recreation and Open Space	Maintain County facilities in compliance with Permit and stormwater ordinance. Identification and reporting of illicit discharges/connections.	As needed
	Department of Waste Management and Recycling	Conduct waste collection activities in compliance with Permit and stormwater ordinance. Identification and reporting of illicit discharges/connections.	As needed
	Animal Care and Regulation	Operate County animal care facility in compliance with Permit and stormwater ordinance. Identification and reporting of illicit discharges/connections.	As needed
	Department of Water Quality	Conduct sewer related maintenance activities in compliance with Permit and stormwater ordinance.	As needed

Program Element	Department/(Group) to be Trained	Objective	Training Frequency
Commercial/ Industrial	Environmental Management Department (EMD)	Conduct Industrial Inspection Program in compliance with Permit and stormwater ordinance.	As needed, based on QC of reports by EMD
Illicit	Department of Planning and Community Development (Code Enforcement)	Identification and reporting of illicit discharges and connections	As needed
	Department of Water Quality (Wastewater Source Control Section)	Identification and reporting of illicit discharges and connections	As needed
	Department of Water Resources (Drainage Maintenance Engineering)	Identification and reporting of illicit discharges and connections.	Annual
Construction	Dept. of County Engineering (Construction Management and Inspection Division)	Conduct public and private construction site inspections in compliance with Permit, stormwater ordinance and Erosion and Sediment Control Plans.	Annual
	All department staff, contractors and consultants engaging in County construction activities (DWR, Water Quality, Transportation)	Conduct construction activities in compliance with Permit, SWPPP and stormwater ordinance.	As required (Project Specific Training Program)
New Development	Dept. of Water Resources (Drainage Development)	Condition and review project plans in compliance with current stormwater design standards.	On-going
	Department of Planning and Community Development	Condition development applications in compliance with current stormwater design standards.	On-going
	Department of Environmental Review and Assessment	Condition environmental documents in compliance with current stormwater design standards.	On-going
	Dept. of County Engineering (Architectural Services Division)	Design County projects to comply with current stormwater design standards.	Annual
	Dept. of Transportation	Design transportation facilities in compliance with current stormwater design standards and review landscaping plans to ensure consistency between stormwater requirements and other County codes.	Annual

Record Keeping and Reporting

Recordkeeping is an integral part of the County Stormwater Quality Program, since documentation is needed to demonstrate continued compliance with the stormwater permit. The Stormwater Quality Section within the Department of Water Resources maintains the stormwater compliance files, as well as an extensive stormwater library. Files are retained for at least five years from the date of generation, as required by the stormwater regulations.

Other County staff with stormwater permit compliance responsibilities also keeps records and logs. These records are summarized every year and submitted to the Stormwater Quality Section for incorporation into the Annual Report. To facilitate easy retrieval of information, each Annual Report is designed to include a separate binder of appendices containing all work products completed in the applicable fiscal year.

Activities for the 2008-13 Permit Term

Program management element activities for the 2008-13 permit term will focus on continued stormwater permit compliance with an increased focus on the demonstration of effectiveness for all activities. In addition to those activities listed in Table 3.2-3 that were implemented starting in the 2002-07 permit term, the following activities are new to the program:

- **Coordination with newly designated NPDES Phase II municipal general permit entities** - As school districts, parks districts and other non-traditional NPDES Phase II entities are designated by the State or Regional Water Board, the County will work with these groups to ensure that activities are consistent and not redundant.
- **Training program effectiveness** – Surveys and other assessment tools will be used in the County's training program to ensure that the program is effective and able to adjust as necessary improvements are identified.
- **Overall program effectiveness** – The overall program will be evaluated each year in the Annual Report to demonstrate effectiveness. Indicator tasks will be identified within each element to help assess effectiveness and these will be discussed in the Annual Report.

Effectiveness Assessment

The County works with the City of Sacramento and other permittees to assess the effectiveness of the overall stormwater program as described in Chapter 2. In addition, the County evaluates the effectiveness of its individual activities related to permit compliance. For this program management element, most activities have Level 1 effectiveness outcomes, which require annual documentation that activities have been conducted as required by the permit. The exception to this is training.

During the 2008-13 permit term the County will use surveys and follow-up meetings with selected groups to assess the knowledge level of trained staff with a goal of increasing awareness (outcome level 2). In some cases, subsequent surveys and field verification may then be used to assess if behaviors have changed (outcome level 3).

Table 3.2-3 lists the program management element tasks for the 2008-13 permit term and summarizes and proposed effectiveness outcome levels for those tasks.

Coordination within the County

To coordinate with various departments within the County, Stormwater Quality Section staff conducts the following types of tasks:

- Develop and distribute educational materials;

- Provide workshops and presentations to educate County staff;
- Provide technical assistance on how to select and implement best management practices (BMPs) for reducing stormwater pollution;
- Interpret and clarify regulations and permit requirements;
- Provide guidance on how to keep records that provide useful data for evaluating the Program and preparing compliance reports; and
- Help communicate with regulators, environmental groups, and the public as necessary.

Coordination with Other Agencies and Programs

Sacramento Stormwater Quality Partnership

On-going permittee coordination is necessary to share information, ensure the most cost-effective use of permittee resources, and avoid duplication. The County and the City of Sacramento are the two largest permittees and assume a shared leadership role in the Sacramento Stormwater Quality Partnership (Partnership). In this role, the County has been active in coordinating and managing the overall program since its inception in 1990. The City and County of Sacramento typically share the following work on behalf of the entire permittee group:

- Leadership and facilitation of Permittee Committee meetings;
- Preparation and updating of task authorizations and MOUs between permittees;
- Planning, development, implementation, reporting and evaluation of joint program work described in Chapter 2;
- Execution and administration of consultant contracts for joint program activities;
- Liaison with and program representation to the Regional Water Board and outside groups such as the California Association of Stormwater Quality Agencies (CASQA);
- Preparation and submittal to the Regional Water Board of the joint program Annual Work Plan and Annual Report; and
- Preparation (and submittal to the Regional Water Board if required) of other joint program studies and compliance reports.

The County also represents on occasion, and/or provides some stormwater services to some of the smaller cities in the program: Citrus Heights and Rancho Cordova.

Outside Agencies

The County coordinates with several local and regional agencies in efforts related to implementation of the County Stormwater Quality Program:

- **Sacramento Regional County Sanitation District (SRCSD) —** The County's Stormwater Quality Section staff coordinates closely with SRCSD on several common projects. Funds from the Stormwater Utility pay a portion of the Coordinated Monitoring Program (monitoring in local rivers), a function also performed by SRCSD.
- **Special Districts** such as Metro Fire District, Regional Transit, and schools, parks, reclamation and irrigation districts — The County coordinates with special districts on a project-specific basis to implement stormwater controls. As some school districts obtain coverage under the NPDES Phase II municipal stormwater general permit, County staff will coordinate with district staff in order to assist them in complying with the new requirements cost-effectively.
- **Sacramento-Yolo Mosquito and Vector Control District** — The County coordinates with the vector control district as needed in efforts related to vector control issues in local water bodies.
- **Caltrans** — The County coordinates with Caltrans on a project-specific basis to implement stormwater controls.

Other Stormwater Programs

The County coordinates with other stormwater programs within California to share information and identify opportunities to work together. This effort is facilitated through CASQA. The County's participation in CASQA also keeps staff apprised of changing regulations and provides an opportunity to work with members to influence state and national stormwater policy and regulations.

Table 3.2-1 – Sacramento County SQIP
Program Management Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key Indic	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Stormwater Quality Improvement Plan (SQIP)											
Modify SQIP to reflect the requirements of Stormwater Permit	2		Revised SQIP		♦						4/30/2009
Revise SQIP as needed to reflect permit revisions, respond to Regional Water Board requests, etc.	3.c		Revised SQIP	Confirmation- submit SQIP to Regional Water Board	⇔	⇔	⇔	⇔	⇔	⇔	As needed
Annual Work Plan											
Prepare and submit Annual Workplan	3.a		Annual Workplan submitted	Confirmation- submit work plan to Regional Water Board	♦	♦	♦	♦	♦	♦	May 1 each year
Annual Report											
Describe completed activities and budget expended for previous fiscal year in AR	3.b		AR submitted to Regional Water Board	Confirmation - submit AR to Regional Water Board	♦	♦	♦	♦	♦	♦	October 1 each year
Memorandum of Understanding (MOU)											
Review and revise existing permittee memorandum of understanding	3.e		MOU submitted to Regional Water Board		♦						Submit with SQIP 4/30/2009
Legal Authority											

⇔ Ongoing activity/task ♦ Deliverable or key milestone (2) Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Once a permit term: Estimate pollutant loads and evaluate water quality trends in receiving waters	?		Submit information in final AR for permit term (October 1, 2013)	Confirmation- submit ROWD and final AR to Regional Water Board						♦	Submit in final AR 10/1/2013
Long Term Effectiveness Assessment (LTEA)											
Describe proposed LTEA for programmatic and environmental goals	29.a		Submit LTEA Plan to Regional Water Board with SQIP		♦						Submit with SQIP 4/30/2009
Perform LTEA on program tasks for permit term	29.d		Submit LTEA results to Regional Water Board	Confirmation - LTEA submitted to Regional Water Board by specified date					♦		Submit with ROWD 3/15/2013

NA: Not Applicable; AR: Annual Report; ROWD: Report of Waste Discharge

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

3.3 Construction Element

If not properly managed, construction activities can result in erosion and the discharge of sediment and other construction-related pollutants with harmful environmental effects. For example:

> The primary mission of the Construction Element is to prevent sediment and other construction-related pollutants from entering the storm drain system and local creeks and rivers.

- Site grading exposes soil to the erosive effects of rainfall and wind unless the disturbed areas are stabilized as soon as possible after grading and before rain.
- If loose sediments are not adequately retained on the construction site, they can be transported to creeks and rivers where they can harm or destroy aquatic habitat.
- Unless good housekeeping and waste management techniques are used to keep litter, concrete, stucco, paint, and other pollutants on-site, these pollutants can be carried in runoff to creeks and rivers, where they impair the beneficial uses of those water bodies.

Although the rate of land development in the Sacramento region has slowed down recently, it is expected to increase during the 2008-2013 permit term. Current and projected growth in the area is concentrated in the southern and eastern portions of unincorporated Sacramento County. There are several key challenges for this program element:

- Projects are constructed year-round in the Sacramento area due to the climate and there are typically many active grading projects occurring during intense storm events
- There is a myriad of County agencies and departments involved in the design, construction, and administration of projects, and these activities must be coordinated to achieve overall compliance with the Stormwater Permit.
- The state of the practice with respect to erosion and sediment control BMPs is rapidly evolving. To stay abreast of changing technology and learn from the experiences of others, County staff meet with vendors, subscribe to and circulate technical newsletters and journals, attend workshops and conferences, and network with other permittees and stormwater programs.

Pollutants Addressed

The main pollutant addressed by the Construction Element is sediment. Controlling the discharge of sediment from construction sites also reduces the discharge of other pollutants that tend to attach to sediments, such as copper, lead, and other metals that naturally occur in Sacramento's soils. Copper and lead are two of the Program's target pollutants (see Chapter 2, Section 2.5). Sediment itself is also considered a pollutant since excess amounts can harm or destroy aquatic habitat. Construction controls also reduce the discharge of litter, debris, concrete and slurry (high pH), paints (metals) and other construction-related pollutants to local creeks and rivers.

Construction Element Strategy

The County requires that private and public construction sites be managed to reduce the potential for erosion and discharge of sediments and other construction-related pollutants to the County's storm drain system or local creeks. The County's continued approach to ensure compliance includes the following tasks:

- Create and update ordinances and codes to provide continued legal authority to the County for control of construction-related discharges
- Authorize and empower County inspectors and other staff to enforce ordinances and codes; develop and update enforcement policies and procedures as needed
- Provide improvement standards and specifications to the construction community; update as needed
- Conduct plan review and permitting to ensure compliance starting at the earliest possible stage of project design and approval
- Inspect construction sites based on a prioritized threat to water quality and conduct enforcement to ensure compliance
- Help ensure compliance with the State's Construction General Permit
- Educate and inform the construction community about local ordinances and state laws and provide guidance to help ensure compliance with the regulations

Each of these strategies is explained more in the following paragraphs.

Develop and Update Ordinances and Related Documents

In 1993 the County established the Land Grading and Erosion Control Ordinance (*http://municipalcodes.lexisnexis.com/codes/sacramento_co/_DATA/TITLE16/Chapter_16_44_LAND_GRADING_AND.html*) and has updated it since that time. The Erosion Control Ordinance requires projects disturbing one or more acres or moving 350 cubic yards or more of soil to prepare an Erosion and Sediment Control (ESC) Plan as part of the grading permit application process. In addition, the County's Stormwater Ordinance (*http://municipalcodes.lexisnexis.com/codes/sacramento_co/_DATA/TITLE15/Chapter_15_12_STORMWATER_MANAG.html*) prohibits the discharge of sediment and other construction-related pollutants from entering the County's storm drain system. This ordinance was updated in 2005 and applies to all projects, including those not subject to the Erosion Control Ordinance.

Authorize and Empower County Staff to Enforce Ordinances

All County staff, including construction and building inspectors, were authorized by the County Executive in 2000 to enforce the County's Stormwater Ordinance. The County inspectors are also authorized to enforce the Erosion Control Ordinance and issue notices of non-compliance as needed.

Conduct Plan Review and Permitting

The County's Erosion Control Ordinance requires a grading permit and erosion and sediment controls on all private projects, disturbing one acre or more or exceeding 350 cubic yards or more of fill.

Private and public projects in the County disturbing one or more acres of land are required to obtain coverage under the State's Construction General Permit, in addition to satisfying all applicable local permitting requirements. Prior to issuing a grading permit, the County will verify that a State-required Notice of Intent (NOI) was filed and will check the SWPPP for six items required by the Stormwater Permit.

Develop Standards, Specifications, and Guidance Materials

The County prepares and updates standards and specifications that provide engineering details and specifications for use in preparing ESC plans. Most of the permittees in the Partnership have opted to use the County's standards and specifications to promote county-wide consistency for the construction community. The ESC plans must specify which BMPs will be used throughout the construction project to minimize pollution risk, given the site conditions. Implementation of the ESC plans requires regular inspection and maintenance of BMPs to prevent pollution at all times.

The County will continue to modify the standards and specifications as newer, innovative, more cost-effective and proven approaches become available.

Inspect Construction Sites According to Water Quality Threat and Conduct Enforcement

Beginning July 1, 2003, the County began inspecting construction sites disturbing one or more acres at a frequency commensurate with the potential threat to water quality. As required by the Stormwater Permit, the County created and regularly updated a prioritized list of sites for inspection. The following factors are used, at a minimum, to determine if sites should be prioritized as "high" or "moderate" threat to water quality:

- *Project size*: All construction sites disturbing five acres or more shall be considered a "high" threat.
- *Erosive or colloidal clay soils*: Projects with sediment-laden runoff which requires filtration (chemical or mechanical), shall be considered a "high" threat.
- *Proximity to Waters of the State*: Any construction site located adjacent to and/or discharging directly into a Water of the State shall be considered a 'high" threat.
- *Previous known violations*: Sites with a project owner or general contractor known to have received one or more stormwater-related enforcement actions from the County, another local agency or the Regional Water Board within the previous two years shall be considered a "high" threat.
- *BMP Status*: Any project site which demonstrates improper installation or maintenance of BMPs or the lack of BMPs shall be considered a "high" threat.

High priority sites are inspected once every two weeks during the wet season (October 1 – April 30) and monthly thereafter. Moderate priority sites are inspected monthly throughout the year.

Progressive enforcement action will be taken by the construction inspectors when violations of local ordinances are observed, including discharge of sediments and other construction-related pollutants to the storm drain system.

Help Ensure Compliance with State's Construction General Permit

Although the County has no authority to enforce the State's Construction General Permit, the County is required by the stormwater permit to conduct several tasks to help the regulators ensure compliance for private construction projects disturbing one or more acres:

- County staff must require proof of filing of a Notice of Intent (NOI) to comply with the Construction General Permit prior to issuing a County grading permit for a project.
- County plan checkers must verify that a stormwater pollution prevention plan (SWPPP) has been prepared, including six items specified in the stormwater permit, prior to issuing a County grading permit for a project.
- County stormwater staff will refer verified non-filers to the Regional Water Board.

The County will continue to ensure that County-owned construction projects disturbing one acre or more comply with the Construction General Permit by educating and training staff and reviewing SWPPPs prior to construction. The Directors of various County departments (e.g., Water Resources, Transportation, Water Quality) are responsible for ensuring General Permit compliance for projects conducted by their department, including designating authority for certification of documents required by the General Permit.

Educate and Inform Construction Community

The construction community includes internal County personnel and the external regulated construction community of contractors and their subcontractors. The internal audience includes county construction/project managers responsible for design and construction of county-owned jobs and county inspectors who inspect public and private jobs.

The County provides annual refresher training to staff about proper selection, design, installation, and maintenance of erosion and sediment controls. Typically this training is provided in late summer, just prior to the start of the wet season (October 1). The County also collaborates with the other permittees and organizations such as the Building Industry Association (BIA) to co-sponsor training workshops and informational sessions for the construction community. The County prepares and distributes brochures related to proper use and disposal of paint and concrete wastes, and refers to guidance developed by others, such as the CASQA manual.

The target audience for outreach includes developers, engineers, contractors, plan reviewers, and inspectors working on both public and private projects. These educational

efforts also keep staff and others informed of new and changing regulations, technology, and practices.

Accomplishments To Date

The County has made significant progress in eliminating illegal discharges and controlling erosion and sediment at construction sites in the unincorporated county since the program began in 1990. Key accomplishments include:

- Developed and modified the Stormwater Ordinance and delegated enforcement authority to County inspection staff
- Developed and modified standards and specifications for construction BMPs and hosted a training workshop for permittee staff in cooperation with the City of Sacramento; these standards are now used by all permittees
- Developed and implemented procedures to require proof of Notice of Intent (NOI) to comply with the Construction General Permit as a condition of obtaining grading permits for applicable projects
- Hired designated erosion control staff in the Construction Management Inspection Division and supported stormwater inspection supervisors becoming Certified Professionals in Erosion and Sediment Control (CPESC)
- Consulted with the Building Industry Association (BIA) to develop an Inspectors Checklist for use during construction inspections
- Developed and conducted numerous training workshops for the construction community in coordination with the other permittees in the Partnership, and groups such as the BIA
- Developed and distributed various brochures in several languages
- Required project specific coordination meetings to discuss stormwater issues for all County construction projects
- Developed small construction site brochure
- Provided feedback to the State on new Construction General Permit
- Developed and continually update training for County inspection staff
- All County construction inspection staff trained annually

Activities for the 2008-13 Permit Term

Table 3.3-1 at the end of this section summarizes the activities that will be conducted for the Construction Element during the 2008-13 permit term, along with associated performance standards, effectiveness assessment methods and a five-year implementation schedule. The table was developed to demonstrate compliance with Provision 8 of the Stormwater Permit.

This section describes the planned activities in more detail.

Legal Authority

Following adoption of the new State Construction General Permit (anticipated 2009-10); the County will evaluate any necessary changes to this element and related codes and standards, to promote consistency.

Plan Review and Permitting

The County's Land Grading & Erosion Control Ordinance requires a grading permit and erosion and sediment controls on all private projects, disturbing one acre or more or exceeds 350 cubic yards or more of fill.

Private and public projects in the County disturbing one or more acres of land are required to obtain coverage under the State's Construction General Permit, in addition to satisfying all applicable local permitting requirements. Prior to issuing a grading permit, the County will verify that a State-required Notice of Intent (NOI) was filed and will check the SWPPP for six items required by the Stormwater Permit. The County will track grading permits using an electronic database. This is a continuation of activities conducted during the 2002-07 permit term.

Inventory and Prioritization

The City will continue to maintain a database to track public and private active construction sites and will use this information to schedule/prioritize inspections and develop annual reports.

Inspections and Enforcement

The Construction Management Inspection Division will continue to be responsible for day-to-day inspection at project sites and for enforcing the County's erosion and sediment control requirements and the Stormwater Ordinance. Projects will be inspected to ensure compliance with local ordinances, verify that sites adequately address erosion, sediment, and pollution control, and ascertain that SWPPPs and monitoring plans are on-site for applicable projects. The County inspector will give verbal warnings and issue Notices of Violations.

As required by the Stormwater Permit, if a contractor on a project disturbing one acre or more cannot demonstrate that the developer/owner has submitted an NOI or received a Waste Discharge Identification (WDID) number from the state, staff will notify the Regional Water Board within five business days of discovery. Non-filer referrals shall include the project location, developer, estimated project size and records of communication with the developer regarding filling requirements.

New projects will be assumed to be high priority until successive inspections demonstrate that they can be downgraded to moderate priority. The criteria for making this determination will include factors such as: project size, amount and nature of site activity, sensitive site conditions (e.g., proximity to a creek, steep slopes or erosive soils), and history of prior violations by the contractor(s).

A database of active construction projects and their priorities will be maintained by the County at all times.

Progressive enforcement action will be taken by the construction inspectors when violations of local ordinances are observed, including discharge of sediments and other construction-related pollutants to the storm drain system or local creeks or rivers.

Education and Training for County staff and the Construction Community

The County will continue to provide education and guidance to both County staff (at least annually) and the local construction and development community (periodically), covering topics such as: current regulations and changes, local procedures and standards, BMPs, new technology, and inspection and maintenance practices.

The County will support Partnership training events for the construction community (developers, contractors, engineers, designers) as well as those hosted by local groups such as the BIA. This coordinated training helps ensure consistency for the local construction community (which works throughout the Sacramento area, across various municipal lines), promotes stronger ties with professional organizations, and is cost-effective.

Various forms of educational materials will be distributed in different methods, depending on the target audience and message. Typical formats include training workshops, brochures, and guidance documents and standards. Education will also be provided through the entitlement and plan check process, building permit process, preconstruction meetings, and inspection.

The County (along with the other co-permittees) will continue to develop and produce outreach materials such as brochures for concrete and painting, printed in English and Spanish.

The County will work with county departments that construct Capital Improvement Projects to develop a policy to address stormwater issues earlier in the planning process.

The County will assess the permitting process which allows Special Districts to construct projects within the County.

Effectiveness Assessment

The County's general approach to assessing the effectiveness of its stormwater program is described in Chapter 2. This section specifically describes assessment activities related to the Construction Element, including proposed methods for evaluating effectiveness during the 2008–13 permit term.

Activities from the 2002-2007 permit term were evaluated to identify modifications necessary to demonstrate effectiveness and baseline data requirements for 2008-2013 permit term activities.

Table 3.3-1 presents planned activities for the 2008-13 permit term. Each performance standard associated with an activity has an anticipated effectiveness outcome level of between one and six, as described in Chapter 2. An outcome level of one is assumed for each performance standard, unless otherwise indicated. Table 3.3-1 shows the years in which focused assessments will be conducted to determine if a higher outcome levels have been attained.

Relationship to Other Program Elements

The Construction Element relates to other program elements as follows:

Commercial/Industrial Element (Section 3.4)

Both the Construction Element and the Commercial/Industrial Element target the construction and building trades. County staff working on the two elements collaborate on the development of consistent BMP guidance materials, common educational materials, and training workshops. A mutual enforcement policy and database are shared by the Construction Element, Commercial/Industrial Element, and the Illicit Discharge Element.

Municipal Operations (Section 3.5)

The County requires that County construction projects and construction activities at County facilities follow the same stormwater rules established for private jobs. County staff working on the Construction and Municipal Operations Elements coordinate on annual refresher training for County staff in various different departments to help facilitate continued compliance.

The County conducts site and project-specific training for employees and contractors working on County-owned construction projects.

Illicit Discharge Element (Section 3.6)

County staff implementing the Illicit Discharge Element have developed notification and referral procedures for use by construction inspectors and field maintenance crews when illicit discharge problems are observed at construction projects. These procedures are discussed in Section 3.6. A mutual enforcement policy and database are shared by the Construction Element, Commercial /Industrial Element, and the Illicit Discharge Element.

Public Outreach Element (Chapter 2, Section 2.6)

Effectively educating the construction community about erosion control requires the expertise and help of those implementing the Public Outreach Element. Assistance is needed to identify and develop messages for target audiences, identify and establish focus groups, develop and implement training, and create effective educational and informational materials.

Brochures have been developed for specific building trades in several languages.

New Development Element (Section 3.8)

County staff implementing the Construction and New Development Elements work closely to:

- Coordinate outreach efforts where possible since both elements target common members of the construction and development communities (e.g., engineers, developers)
- Provide education and guidance to help ensure that post-construction stormwater quality control measures required by the County for development projects are

properly installed and protected from receiving excessive sediment loads during construction

- Ensure that "No Dumping-Drains to Creek" messages are permanently stamped on new storm drain inlets during construction

Coordination within the County of Sacramento

Stormwater staff in the County's Department of Water Resources provide training and informational materials to staff in other County departments/groups involved in design, construction, and/or administration of public and private construction jobs. Relationships are established and maintained with project managers, designers, plan reviewers, inspectors, and their managers to achieve and document compliance.

Most interdepartmental coordination is done on an informal basis through written correspondence and regular meetings. For example, stormwater staff participate in routine meetings with the following groups related to Stormwater Permit compliance on private construction projects:

- Plan reviewers in Land Development and Site Improvement Review (LDSIR) who are responsible for reviewing erosion and sediment control plans and issuing grading permits
- Stormwater construction inspectors in the Construction Management Inspection Division who are responsible for ensuring stormwater compliance on grading projects and construction of public utilities and roadways
- Stormwater building inspectors in the Construction Management Inspection Division who are responsible for ensuring stormwater compliance for construction of buildings on private jobs

Coordination with Other Agencies and Groups

The County coordinates with the other permittees as much as possible to present a consistent, uniform message to the construction and development communities, since construction work is often multi-jurisdictional. This coordination is also helpful for other purposes.

The County relies heavily on several existing forums for reaching and receiving feedback from the construction and development communities. For example, the County has worked with the BIA, Consulting Engineers and Land Surveyors of California (CELSOC), International Conference of Building Officials (ICBO), and Associated General Contractors of California (AGC) to provide outreach and receive feedback on various issues. County manager(s) attend meetings with the BIA and special presentations are made as needed, such as a presentation made to BIA in March 2003 regarding the Phase II NPDES impacts to local construction projects. The BIA also helped develop the stormwater inspection checklist used by the County's building inspectors.

The County assists the Regional Water Board in its enforcement of the Construction General Permit by enforcing compliance with comparable local ordinances, verifying NOI filings, spot checking SWPPPs, and referring site operators who have not complied

with the State regulations. Through participation in the California Association of Stormwater Agencies (CASQA), the County tracks and comments on periodic revisions to the Construction General Permit and other regulations by the State Water Board.

Table 3.3-1 – Sacramento County SQIP
Construction Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Legal Authority											
Revise Stormwater Ordinance	8.a.i		Adopt revisions as needed	Confirmation - report revisions in AR			♦				1 YR following Regional Board Approval os SQIP
Revise Land Grading and Erosion Control Ordinance	8.a.i		Adopt revisions after Construction General Permit is issued	Confirmation - report revisions in AR		♦					
Plan Review and Permitting											
Review Grading and Improvement Plans	8.a.ii		Document number of Grading Permits issued	Confirmation - report in AR	⇔	⇔	⇔	⇔	⇔	⇔	
Track Improvement Plans	8.a.ii		Document number of sites subjected to erosion & sediment controls	Confirmation - report in AR	⇔	⇔	⇔	⇔	⇔	⇔	
Review Grading Plans and applications	8.a.ii	✓	Document percentage of sites incorporating erosion and sediment controls	Tabulation	⇔	⇔	⇔ ③	⇔ ③	⇔ ③	⇔ ③	
Track Grading Permits that require coverage under the State C.G.P.	8.a.ii		Document number of sites greater than or equal to one acre that submitted proof of an NOI and that a SWPPP has been developed.	Confirmation - report list in AR	⇔	⇔	⇔	⇔	⇔	⇔	
Standards, specifications & guidance materials											
Implement and as necessary amend standards and specifications	8.a.ii		Adopt revisions after Construction General Permit is issued	Confirmation – report revisions in AR			♦				
Inventory and Prioritization for active construction sites											

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 3.3-1 – Sacramento County SQIP
Construction Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Prioritize construction sites	8.a.iii		Document prioritization method/schedule and sites with high, moderate, low priorities.	Tabulation –record data in AR	⇔	⇔	⇔	⇔	⇔	⇔	
Inventory construction sites	8.a.iii		Document number and location of public and private sites subject to Construction General Permit as well as local erosion and sediment controls.	Confirmation – identify that the inventory was developed	⇔	⇔	⇔	⇔	⇔	⇔	
Inspections											
Conduct routine inspections	8.a.vi		Update/revise inspection checklist as needed	Conformation – indetify that checklist was updated	⇔	⇔	⇔	⇔	⇔	⇔	
Track sites subject to inspection	8.a.v		Document number of sites subject to inspections	Tabulation –record data in AR	⇔	⇔	⇔	⇔	⇔	⇔	
Track sites inspected	8.a.vi		Document number of inspections completed	Tabulation – track number of brochures distributed	⇔	⇔	⇔	⇔	⇔	⇔	
Enforcement											
Develop progressive Enforcement Policy	8.a.vii		Evaluate & revise enforcement policy as needed	Conformation - report revisions in AR	⇔	⇔◆	⇔	⇔	⇔	⇔	
Conduct enforcement	8.a.vii		Document number and types of corrective and enforcement actions	Tabulation – record data in AR	⇔	⇔	⇔	⇔	⇔	⇔	
Notify Regional Water Board about CGP non-filers and when 3 or more local violations at a site	8.a.vii		Document number of referrals made to RWQCB	Tabulation – record data in AR	⇔	⇔	⇔	⇔	⇔	⇔	
Track enforcment actions	8.a.vii	✓	Decrease in number of chronic violations, repeat offenders and/or non-filer referrals	Tabulation - track decrease in enforcement as indicator of changed behavior	⇔	⇔	⇔	⇔③	⇔	⇔	
Capital Improvement Projects											

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated

2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

3.4 Commercial/ Industrial Element

> The goal of the Commercial/Industrial Element is to comply with the requirements of the stormwater permit by reducing the discharge of stormwater pollutants to the maximum extent practicable and effectively eliminating illegal non-stormwater discharges from commercial and industrial facilities and operations

The goal of the Commercial/Industrial Element is to comply with the requirements of the stormwater permit by reducing the discharge of stormwater pollutants to the maximum extent practicable and effectively eliminating illegal non-stormwater discharges from commercial and industrial facilities and operations within the urbanized area of the unincorporated County. The Commercial/Industrial Element works to address these conditions through complaint-based inspection and enforcement as well as through outreach targeted at business operators and their employees.

The County's Commercial/Industrial Element compliments the Regional Commercial/Industrial Program (presented in Section 2.7) by coordinating inspections and enforcement, working together to identify priority industries for stormwater compliance inspections and targeted outreach, developing new (and updating existing outreach) materials, and conducting shared presentations at outreach events.

Pollutants Addressed

The County's activities and requirements under the Commercial/Industrial Element address a wide range of pollutants associated with commercial and industrial activities, including metals such as copper, lead, and mercury, three of the Program's target pollutants (see Section 2.5).

For commercial operations such as carpet cleaning companies and landscape contractors, potential pollutants include chemicals, detergents, sediment, fertilizers, and pesticides such as pyrethroid insecticides. Although not yet formally ranked as a target pollutant, the Permittees recognize that pyrethroids have essentially replaced diazinon and chlorpyrifos in the urban market. The Permittees have begun to address pyrethroids as if they were a high ranking target pollutant based on the results of recent studies in local creeks. Due to the mobile nature of these types of businesses, the pollutants can be discharged into the County's storm drain system or local creeks and rivers either directly, or by way of urban runoff from residential areas where the work is done.

The type and amount of pollutants addressed depend on the specific activities taking place at a commercial or industrial facility or by a mobile business operation and the BMPs employed by the operators and their employees to prevent pollution and/or treat site runoff.

Commercial/Industrial Element Strategy

The County's Commercial/Industrial Element employs a variety of strategies to effectively meet the requirement of the stormwater permit. The primary activities conducted by this element include:

- Priority industry and industrial pollutant identification (described in Section 2.7 of the SQIP)
- Commercial and Industrial Stormwater Compliance Program (CISCP) implementation (described in Section 2.7 of the SQIP)
- Complaint-Based Stormwater Compliance Program (CBSCP) implementation
- Educational outreach

A core strategy of the Commercial/Industrial Element is to utilize knowledge gained through implementation of these activities to assess the County's effectiveness. The results of such assessments are used to refine element activities. For example, enforcement-related data collected during the first two rounds of CISCP inspections (first round completed in June of 2007 and second round to be completed in June of 2010) and the CBSCP will be used to refine the priority industries subject to inspections under the CISCP and targeted outreach.

Another strategy is to efficiently use County staff and resources and minimize inconvenience to regulated businesses by building upon existing environmental compliance programs. The County's Environmental Management Department (EMD) agreed to conduct triennial stormwater inspections on behalf of all the permittees, pursuant this strategy.

Accomplishments to Date

The following highlights the major accomplishments of the Commercial/Industrial Element since 1990:

- The County Board of Supervisors adopted the County Stormwater Ordinance in 1998, which provides legal authority for regulating commercial businesses and industries with respect to stormwater pollution. The County updated the ordinance twice during the 2002–07 permit term to clarify and enhance enforcement authority. EMD stormwater inspectors are authorized to enforce this ordinance county-wide; ensuring consistent treatment of regulated industries.
- The permittees developed a list of priority commercial businesses and industry categories subject to either routine inspections or targeted outreach, and definitions for each. EMD refined the definitions of the priority industries based on field inspection observations.
- The permittees and EMD created industry-specific educational materials, including brochures, guidance manuals and Compliance Assistance Bulletins (CABs). These are distributed by direct mail, in training workshops, by way of BERC, during inspections, and in conjunction with enforcement actions. CABs and other CISCP-related compliance assistance materials are also made available on EMD's web site (http://www.emd.saccounty.net/WP/EMDstormwater.htm). Several outreach brochures were translated into Spanish, Russian, and Chinese.
- The permittees and EMD developed and maintained comprehensive databases to track and document inspection and outreach efforts, for annual reporting and progressive enforcement purposes.

- EMD and the permittees coordinated with the Regional Water Board by referring over 110 Industrial General Permit non-filers , reporting significant violations, promptly investigating Regional Water Board referrals, and assisting with coordinated inspections and outreach to selected industries upon request.

Activities for the 2008–13 Stormwater Permit Term

This section describes stormwater permit requirements applicable to the Commercial/ Industrial Element and the activities to be conducted during the 2008–13 permit term.

Table 3.4–1 at the end of this section outlines the activities that will be conducted under the Commercial/Industrial Element during the 2008–13 permit term. This table presents planned activities, associated performance standards and effectiveness assessment methods, as well as a five-year implementation schedule.

The following describes the major activities in more detail:

Legal Authority

The County's Stormwater Ordinance provides legal authority for regulating commercial businesses and industries with respect to stormwater pollution. The Stormwater Ordinance will be amended as needed during the 2008–13 permit term to ensure that pollutant sources from commercial and industrial activities are effectively addressed.

Priority Industry and Industrial Pollutant Identification

Refer to Section 2.7 for a description of priority industry and industrial pollutant identification activities of the CBSCP for the 2008–13 permit term.

Commercial and Industrial Stormwater Compliance Program (CISCP)

Refer to Section 2.7 for a description of CISCP activities of the CBSCP for the 2008–13 permit term. Evaluation of data collected through this program may result in changes to priority industries subject to inspection and outreach.

Complaint-Based Stormwater Compliance Program (CBSCP)

County stormwater staff will inspect businesses within the unincorporated County not addressed through EMD's CISCP program on a complaint basis. Complaints are referred by the public, other County agencies and departments, the Regional Water Board, and other sources. Stormwater staff will refer any complaints related to businesses included in the CISCP to EMD for investigation. All other complaints will be investigated, and associated progressive enforcement will be conducted, by County stormwater staff to ensure compliance with the Stormwater Ordinance. Complaints related to businesses in other permittee jurisdictions will be referred to the respective permittee.

CBSCP Inspections

Inspections of businesses will verify compliance with the County Stormwater Ordinance, including that there are neither illicit connections nor prohibited non-stormwater discharges evident, and that the potential for discharge of pollutants from on-site sources is reduced to the maximum extent practicable.

CBSCP Enforcement

The County will continue to conduct progressive enforcement to obtain compliance in accordance with the County Stormwater Ordinance and will maintain a progressive enforcement policy, if needed, to compliment the enforcement-related procedures contained therein.

CBSCP Outreach

County stormwater staff will provide relevant educational materials, including BMP guidance materials, to businesses during inspections, in conjunction with enforcement actions, through trade associations and industry suppliers, during workshops and other events, through BERC and through the County's website (*http://www.sactostormwater.org/industry.asp*).

CBSCP Data Management

County stormwater staff will maintain a database of reported cases including associated findings and enforcement actions. Data will be evaluated and findings will be used to guide the priority industry identification process.

CBSCP Interagency Coordination

The County stormwater staff will continue to coordinate and cooperate with the Regional Water Board related to non-compliant facilities and suspected Industrial General Permit non-filers, as indicated by the flowchart in Appendix 2F.

Outreach

Refer to Section 2.7 for a description of CISCP activities of the CBSCP for the 2008–13 permit term. Evaluation of data collect through this program may result in changes to priority industries subject to inspection and outreach.

As with past years, it is anticipated that two primary types of outreach materials will be distributed:

- *General brochures and fact sheets*: These publications detail what types of activities may result in illegal discharges to the storm drain system as well as acceptable means of performing typical activities. The brochure entitled "Only Rain Down the Storm Drain" is an example of this type of outreach material.
- *Industry-specific brochures and fact sheets*: These publications provide information on source and treatment control BMPs targeted to specific industries. Source controls prevent the pollutant(s) from contacting site runoff or stormwater, and treatment controls remove pollutant(s) already contained in the runoff. The booklet entitled *BMPs for Pressure Washing and Surface Cleaning* is an example of this type of outreach material.

In addition to direct mail, as described in Section 2.7, educational brochures and other information will be distributed at displays at County public counters, by inspectors, in conjunction with enforcement, through trade associations and industry suppliers, and during workshops and other events.

The County will continue to partner with BERC, the other permittees, and other organizations to provide industry-specific BMP workshops for businesses and special districts (e.g. fire and water districts) as needs are identified.

Effectiveness Assessment

The County's general approach to assessing the effectiveness of its stormwater program is described in Chapter 2. This section specifically describes assessment activities relevant to the Commercial/Industrial Element, including proposed methods for evaluating effectiveness during the 2008–13 permit term.

Activities from the 2002-2007 permit term were evaluated to identify modifications necessary to demonstrate effectiveness and baseline data requirements for 2008-2013 permit term activities.

Table 3.4-1 presents planned activities for the 2008-13 permit term. Each activity or task has an anticipated effectiveness outcome level of between one and six, as described in Section 2.3. An outcome level of one is assumed for each performance standard, unless otherwise indicated. Table 3.4-1 shows the years in which focused assessments will be conducted to determine if a higher outcome levels have been attained.

Compiling and evaluating data to demonstrate changes in awareness and behavior (Outcome Levels 2 and 3), where possible, as a result of the inspection, enforcement and outreach efforts, will be conducted to identify potential programmatic enhancement opportunities.

Key Indicators have been selected for the Commercial/Industrial Element that are a subset of element performance standards which are:

- Intended to demonstrate progression towards goals,
- Easily understandable, and
- Common throughout the Partnership.

Key Indicators are identified in Table 3.4-1 and will be used to assess the effectiveness of individual permittee programs as well as that of the partnership as a whole in the Long-Term Effectiveness Assessment (LTEA) required by the stormwater permit.

Evaluations may result in recommended changes to the list of priority commercial/industrial facility categories included in the CISCP, targeted outreach, or other mid-course program refinements.

Relationship to Other Program Elements

The Commercial/Industrial Element relates to other program elements as follows:

Construction Element (Section 3.3)

Coordination between the Commercial/Industrial and Construction Elements helps ensure that commercial and industrial facility owners and operators adhere to applicable local and state regulations for erosion and sediment control when engaging in remodeling and

other on-site construction activities. Element staff collaborate to provide outreach materials and activities, such as brochures and informational workshops, to construction-related businesses in the county. Permittee staff work with the County's Business Environmental Resource Center (BERC; discussed more later in this section) to provide training workshops for pressure washers and other targeted businesses. Brochures have been developed (in English and Spanish) for concrete, swimming pool, and paint-related businesses. These brochures and other educational materials are distributed at construction workshops and in the field by County construction inspectors.

Municipal Operations Element (Section 3.5)

Many County-owned facilities such as corporation yards, airports, and waste management facilities, are covered under the State's Industrial General Permit, as discussed in Section 3.5. Therefore, many of the brochures and BMP guidance materials created through the Commercial/Industrial Element for private industries and businesses in the county can also be used to educate and inform managers and staff who maintain and operate County facilities. The Municipal Operations and Commercial/Industrial Element staff work together to provide annual refresher stormwater BMP and awareness training for County employees.

Illicit Discharge Element (Section 3.6)

There are many businesses addressed by the Commercial/Industrial Element that provide home-related services to residential customers. Examples include carpet cleaning companies, and landscape and concrete contractors. Activities by such businesses could result in illicit discharges to the storm drain system. Commercial/Industrial and Illicit Discharge Element staff work together to conduct inspections and enforcement in response to complaints and to promote pollution prevention awareness. Common problems include erosion of landscape material stockpiles in public streets and gutters, discharge of concrete and paint wastes into the storm drain and washing dirt and debris from paved surfaces into the drain.

Public Outreach Element (Section 3.7)

Commercial/Industrial Element staff coordinate regularly with experienced public outreach professionals to assist with the development of high-quality educational and informational materials for targeted businesses. Materials are distributed by inspectors during facility inspections, by direct mail (e.g., with enforcement actions or through targeted outreach), during training workshops, at public events and at County permit counters. Brochures and other guidance materials are updated and translated into other languages as needed. Educational materials are also distributed through BERC.

New Development Element (Section 3.8)

Developers of commercial and industrial properties and facilities are required to implement stormwater quality control measures in their projects, as required by the New Development Element. County staff reviews environmental impact reports, proposed improvement plans, and various use applications for commercial and industrial projects, to ensure that control measures are integrated into project design as appropriate.

County development plan review also helps ensure that non-stormwater sources are not plumbed from new commercial and industrial facilities to the storm drain system unless specifically allowed by the County's Stormwater Ordinance.

Coordination within the County of Sacramento

Successful implementation of the Commercial/Industrial Element requires close coordination with several County entities that regulate or provide assistance to local industries, as described below.

County Department of Water Quality

- *The Wastewater Source Control Section (WSCS)* reviews and inspects the operations of industrial dischargers to the Sacramento Area Sewer District's collection system. They also work with businesses such as dry cleaners, photo processors and radiator repair shops to help them understand local sewer use regulations and wastewater pollution prevention options. WSCS is responsible for ensuring adequate pre-treatment prior to discharging a waste stream to the sanitary sewer. Lastly, they administer short term discharge permits to the sanitary sewer.

Stormwater staff refers businesses that want to discharge to the sanitary sewer to WSCS for guidance.

- *The Water Quality Permit Services Section* is responsible for issuing permits for long term discharges to the Sacramento Area Sewer District's collection system. Stormwater staff refers businesses that want to discharge to the sanitary sewer to Permit Services for guidance.

Coordination with WSCS and Permit Services Section helps to keep commercial and industrial wastes out of the storm drain system.

County Environmental Management Department (EMD)

EMD implements the CISCP on behalf of the Permittees.

The Permittees coordinate with EMD in many areas, including: providing guidance on implementation of the CISCP, partnering on outreach events, and conducting coordinated enforcement to address facilities comprehensively (since in many situations EMD may regulate a specific tenant in a complex but not the owner of the complex or other businesses within the complex).

Refer to Section 2.7 for more details on coordination with EMD.

County Business Environmental Resource Center (BERC)

BERC's main mission is to provide confidential environmental compliance assistance and guidance to local businesses in the county upon request. County stormwater staff work with BERC to ensure that appropriate stormwater pollution prevention information is provided to local businesses by BERC. Assistance is provided by BERC to develop and distribute guidance materials for selected industries and to work with Industrial

General Permit industries to ensure they have ample opportunity to understand and comply with the regulations. BERC conducts a variety of commercial and industrial training workshops each year to inform the regulated community about compliance with local and state stormwater laws, at which County staff are commonly presenters. BERC also developed and regularly updates a database of businesses in priority industries subject to targeted outreach. The County contributes funding through the Stormwater Utility and EMD to BERC each year.

Coordination with Other Agencies and Groups

County stormwater staff coordinate with various outside agencies and groups that have regulatory and/or economic interests in industries in Sacramento County. This coordination allows for information sharing and ensures that a uniform, consistent message about stormwater pollution prevention is distributed to the regulated community.

- ***Regional Water Board*** — The County coordinates with the Regional Water Board on issues related to Industrial General Permitted industries as well as other businesses. The County initiates investigations of all stormwater problems at businesses referred by the Regional Water Board, within three business days of referral. The County informs the Regional Water Board of all discovered significant violations and of potential General Permit non-filers within 30 days of discovery. The County also supports Regional Water Board actions upon request, by allocating staff, providing documentation of observed problems, etc.
- ***Trade and Business Associations*** — The County cooperates with commercial and industrial businesses through associations and organizations. These associations are provided with outreach materials, information on Industrial General Permit requirements and information on BERC's compliance assistance program.

2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

3.5 Municipal Operations Element

The primary mission of the Municipal Operations Element is to control stormwater pollution resulting from the operation and maintenance of County-owned facilities. A secondary mission is to set an example of model pollution prevention for the public.

The Municipal Operations Element addresses operation and maintenance of County-owned facilities within urbanized Sacramento County. The County's operation and maintenance activities take place at either fixed facilities, at a specific location, or are part of field programs that take place over a broader, non-specific area. The Municipal Operations Element goal is to prevent County facilities and operations from causing or contributing to stormwater pollution.

Examples of County-owned fixed facilities include: buildings (e.g. structures, parking lots, and landscaping), corporation yards (e.g. vehicle and equipment maintenance and parking, and materials storage), solid waste facilities (e.g. landfills and transfer stations), and recreational facilities (e.g. regional parks). Examples of County-owned facilities addressed by field programs include transportation facilities (e.g., roads, roadside ditches, medians, and shoulders); drainage collection, transmission, and detention systems (e.g., drain inlets, manholes, pipes, channels, flood control basins, and stormwater pump stations); water quality facilities (e.g., water quality detention basins).

Various Sacramento County agencies operate facilities that are covered by the State General Industrial Permit. Additionally, some operations and maintenance activities are covered by the Aquatic Pesticide General Permit or the Limited Threat Discharges General Permit. County construction projects disturbing one or more acres are subject to the Construction General Permit. Kiefer Landfill is also covered by an Individual NPDES Permit. County agencies and departments with facilities and activities covered under state permits are not only responsible for ensuring compliance with those permits but are also responsible for complying with the requirements of the County's Municipal Separate Storm Sewer System (MS4) Permit.

The Municipal Operations Element does not address facilities operated by or operations conducted by special districts (e.g., fire, parks, reclamation, sanitation, school, vector control, water) or federal or state government agencies (e.g., California Department of Transportation, U.S. Bureau of Reclamation) that are outside the County's jurisdictional control. Special districts within the unincorporated County are addressed through the Commercial / Industrial Element.

Pollutants Addressed

The County's activities and requirements under the Municipal Operations Element address a wide variety of pollutants typically found in urban runoff, including the target pollutants previously identified by the Partnership Program (See Chapter 3, Section 3.5.) For the most part, the activities are designed to remove pollutants from the storm drain system, or reduce the contribution of pollutants. However, if not properly conducted, some routine maintenance activities may have the potential to contribute pollutants to stormwater runoff, as described below.

Examples of activities with potential stormwater pollutant sources include: materials storage and handling; waste collection, storage, and disposal; vehicle and equipment parking, maintenance, and washing; road maintenance and street sweeping; drainage pipe, channel, and detention basin repair and cleaning; vegetation control; and construction and retrofit of County facilities.

These activities are properly managed and continually evaluated to reduce the potential for pollutants to be discharged to the storm drain system and/or local receiving waters. Pollutants addressed will vary, depending on the activity. For example:

- Outdoor materials and waste storage and handling areas at County facilities have the potential to contribute oils, greases and sediments to site runoff. Therefore, staff that design, construct, operate, and maintain these public facilities are trained and evaluated on their knowledge, implementation, and management of stormwater Best Management Practices (BMPs).
- Vehicle and equipment maintenance and washing facilities can contribute oils, grease, solvents, petroleum hydrocarbons, and detergents to the storm drain system. These activities are conducted in areas that are not exposed to stormwater contact and do not result in non-stormwater discharges to the storm drain system.
- Vehicle and equipment parking areas can accumulate automotive fluids, sediments and debris. Sweeping and oil stain removal are Source Control BMPs implemented prior to each rainy season in parking areas exposed to stormwater contact.
- Construction of new and retrofit of existing County facilities can contribute sediments and construction related pollutants to local receiving waters. Erosion, sediment, and other pollution control measures are installed, inspected and maintained through all phases of construction.
- Cleaning and maintenance of County-owned facilities such as buildings, parking lots, streets, pipes, channels, and detention basins could cause a non-stormwater discharge. BMPs such as protecting storm drain inlets, minimizing the use and capturing of wash water during street and parking lot cleaning, and using integrated pest management techniques that minimize the use and/or toxicity of herbicides for removing vegetation, are implemented.
- Management of vegetation along roadsides and in drainage channels can contribute to pesticides and fertilizers in runoff. BMPs are employed to reduce the amount of chemicals used and training is provided to staff related to proper application and handling methods.

Municipal Operations Strategies

The County employs the following strategies to minimize potential adverse environmental impacts:

- Conduct targeted employee training, provide technical assistance for managers and contractors, and create/implement Municipal Storm Water Pollution Prevention Plan (Municipal SWPPP) at selected facilities.

- Periodically evaluate Municipal SWPPPs, facilities and field activities in order to recommend new or improved BMPs; and
- Create and maintain record keeping tools that provide data for effectiveness assessments and continuous improvement.

These combined efforts help ensure countywide compliance with the stormwater permit in order to reduce stormwater pollution to the maximum extent practicable.

Each of these strategies are explained in greater detail in the following paragraphs.

Educate County Employees and Contractors

Outreach and training targets several audiences:

- County designers and design consultants are provided guidance related to the selection and design of stormwater quality controls for new and redevelopment public projects.
- Contractors working on County projects are required to comply with the County's Land Grading and Erosion Control Ordinance (Grading Ordinance) and the State Construction General Permit. Information is presented through training workshops and other educational materials. Refer to Section 3.3 for more details.
- Targeted employees are educated about proper housekeeping practices and the selection and implementation of appropriate stormwater quality BMPs through presentations at staff meetings and site visits by County stormwater staff (discussed later in this section). Guidance materials are developed or obtained from other agencies (e.g., statewide BMP guidance manuals, Caltrans, etc.) and distributed to demonstrate proper techniques. Technical assistance is also provided through periodic evaluations of work-sites or Municipal SWPPPs to identify problems and adjust BMPs.
- Maintenance personnel are educated about conducting maintenance in a way that prevents discharges to the storm drain system and protects local creeks and rivers. This education is done primarily through staff meetings, annual training, one-on-one correspondence and written guidance materials.

Evaluate and Continuously Improve Operations

Evaluations are conducted periodically by collecting and reviewing records and data, evaluating Municipal SWPPPs, conducting site and field evaluations, or conducting surveys of County staff to assess employee awareness and program effectiveness. The goal is to continuously improve stormwater pollution prevention.

Maintain Records and Documentation

Recordkeeping and reporting helps demonstrate compliance with the stormwater permit and provides data for evaluating and improving activities. Each department and group in the County maintains their own recordkeeping system and supplies data and information to the County stormwater staff at least annually for incorporation into the October 1 Annual Report. County stormwater staff maintains records related to employee training and evaluations conducted. Every attempt is made to quantify efforts in ways that relate to protection of water quality. For example, records of the tonnage or volume of wastes removed from street sweeping and storm drain system maintenance are recorded in order to demonstrate the County's goal to reduce the amount of such material discharged downstream to local creeks and rivers.

Accomplishments To Date

Since the inception of the Program in 1990, the County has made the following accomplishments related to the Municipal Operations Element:

- Provided education and outreach to various designers of County projects who now include specific requirements intended to ensure compliance with local and State stormwater quality regulations in their project specifications
- Established routines for collecting and compiling data to assess activities and document regulatory compliance (e.g., County maintenance staff routinely log the quantity of pipes, channels, basins, sumps, drop inlets, manholes, and roadways cleaned)
- Worked with local environmental groups to determine alternative environmentally-friendly ways to conduct overbank cleaning of natural creeks and streams
- Evaluated priority facility operations and maintenance activities to identify improved BMPs and provided outreach and training to staff in targeted positions
- Provided assistance to County facilities subject to the Industrial General Permit relative to reviewing SWPPPs, evaluation of facility operations, and recommendation of improved BMPs, as requested
- Provided assistance to County agencies, departments, divisions, and sections related to compliance with the State's Aquatic Pesticides General Permit
- Implemented cleaning and maintenance programs for prioritized streets and parking lots
- Stenciled 95% of all storm drain inlets located within the County's boundaries with a "No Dumping – Drains to Creek" message
- Stormwater staff developed and distributed door hangers to be used by stormwater staff and field crews to educate the public about stormwater quality and to elicit reporting in the vicinity of illicit discharges

- Implemented the Parking Lot Inspection and Maintenance Program. Assisted County agencies with establishing inspection procedures and maintenance activities
- Implemented the County-wide Integrated Pest Management Policy
- Coordinated with Sacramento County Aircraft Rescue Fire Fighting (ARFF) to establish BMPs for non-emergency fire fighting flows
- Created and maintained Municipal SWPPPs at County corporation yards, and other facilities conducting vehicle maintenance or material storage that have the potential to discharge pollutants to the storm drain system or local waterways

Activities for the 2008–13 Stormwater Permit Term

This section describes the stormwater permit requirements applicable to the Municipal Operations Element and the activities to be conducted during the 2008–13 permit term. Additional details are provided about the effectiveness methods (introduced in Table 3.5-1) that the County plans to use to demonstrate effectiveness during the 2008–13 term. County documents outlining maintenance procedures, programs and policies are updated as needed to reflect current practices. Revised documents pertaining to Municipal Operations will be submitting in Annual Reports as they occur.

Tasks

Provision 10 of the stormwater permit pertains to the Municipal Operations Element. The requirements of this provision are described in detail in Table 3.5–1 at the end of this section and can be summarized as follows:

Illicit Discharge Response

County crews will respond to reported illegal discharges and conduct first response activities, containment, cleanup, and disposal of materials for non-hazardous and hazardous pollutant discharges to the storm drain system.

New Development and Construction Requirements for Municipal Projects

The County will continue to implement New Development Standards at applicable Municipal projects. The County will comply with the Construction Program Element requirements during Municipal Capital Improvement Projects, and will obtain coverage under the General Construction Permit when applicable.

Facility Management

Municipal SWPPPs were developed during the 2002 – 2007 permit term for all County facilities not covered under the General Industrial Permit that are vehicle maintenance facilities, material storage facilities and corporation yards having the potential to discharge pollutants to the storm drain system. Municipal SWPPPs will be evaluated during the 2008-2013 permit term in order to assess the effectiveness of the Municipal SWPPP implementation. BMPs will be adjusted if identified to be inadequate and the Municipal SWPPP will be updated to address any BMP modifications. A database will be used to track the number and types of facilities, operating agency, evaluations performed, including the frequency of evaluations.

Landscape and Integrated Pest Management

The County will continue to implement the Integrated Pest Management (IPM) Policy and conduct pesticide storage, usage and disposal procedures as described in the Sacramento County Pesticide Plan. Pest management activities associated with County operations, and County-owned facilities and property shall be in accordance with the principles of IPM Policy, State and Federal pesticide use laws and regulations, and the Municipal Stormwater Permit. Stormwater staff will continue to oversee the implementation of pesticide management and other IPM strategies as part of the landscape management activities and operation of recreational facilities. Refer to appendix 3B for a copy of the County-wide Integrated Pest Management Policy.

Storm Drain Operations and Maintenance

The County will conduct storm drain operation and maintenance in accordance to the manhole and pump station sump maintenance program provided in 2003 SQIP.

Catch basin and sump cleaning will continue to be based upon the following criteria:

- The manhole's proximity to sensitive receiving waters
- The manhole's proximity to regional stormwater quality BMPs (e.g., water quality detention basin)
- The presence or absence or downstream manholes or sumps.
- High priority manhole sumps will be inspected annually, prior to the rainy season, and cleaned, as needed, based upon inspection. The remainder will be cleaned during regular maintenance program activities.

Refer to appendix 3C for a copy of the Sacramento County Procedures for Manhole and Pump Station Sump Inspection and Cleaning.

County of Sacramento maintains creeks and channels within the unincorporated portions of the County, and in the Cities of Citrus Heights and Rancho Cordova. Visual inspections are performed annually of all creeks and channels to check for erosion, vegetation, debris, illicit connections and flow obstructions. Refer to appendix 3D for a copy of the Sacramento County Guidelines for Operating and Maintaining Creeks and Channels.

Stormwater staff will continue to evaluate the storm drain operation and maintenance activities to ensure that proper BMPs are implemented, storm drain inlet markers are replaced when illegible, and that adequate record keeping capturing overall maintenance activities and quantities of waste removed is performed.

Storm Drain Stenciling

The County labeled 95% of storm drain inlets with the "No Dumping" message during 2002 - 2007 permit term. As part of the drainage system maintenance activities, the County will continue to ensure that drain inlets are labeled and existing labels replaced if illegible.

Street and Road Maintenance

The County of Sacramento Department of Transportation sweeps prioritized streets according to the street prioritization requirements established during 2002-2007 permit. Stormwater staff will annually review the total amount of pollutants removed from street sweeping activities. Refer to appendix 3E for a copy of the Sacramento County Street Sweeping Prioritization Guidelines.

Stormwater staff will conduct evaluations ensure that BMPs are implemented during street cleaning and roadway maintenance operations. Evaluations of street and road maintenance activities will be performed to ensure that BMPs are implemented to prevent street sweeper rinse out water, concrete chute rinse water, and saw cut slurry from entering the storm drain system.

Parking Facilities Management

The County will continue to perform its Parking Lot Inspection and Maintenance Program established during the 2002-2007 permit. The primary objective of the Parking Lot Inspection Program is to inspect parking facilities to assess maintenance needs, and perform the necessary maintenance prior to October 1st of each year in order to reduce source pollutants.

Stormwater staff will continue to evaluate procedures to ensure that BMPs are implemented during maintenance activities and annually collect data related to the type of maintenance activities performed.

Non-Emergency Fire Fighting Flows

Stormwater staff will continue to assist Sacramento County ARFF staff with preventing non-emergency flows from entering the storm drain system during training and maintenance activities. ARFF staff will continue to implement the BMPs established during the 2002 – 2007 permit.

Employee Outreach and Training

Stormwater staff provides annual stormwater pollution prevention training for employees in targeted positions. Targeted employees will receive training related to stormwater pollution prevention, BMP identification and implementation, proper housekeeping practices, as well as identification and reporting of illicit discharges and connections. Stormwater staff will continue to provide annual training and will conduct employee awareness surveys during the 2008 – 2013 permit to assess employee awareness levels and training effectiveness. Survey results will be submitting in the annual report at the end of the permit term.

Detention Basin Maintenance

The County will continue to maintain detention basins within its jurisdiction according to the Sacramento County Detention Basin Maintenance Manual. Stormwater staff will continue to evaluate, and adjust as needed, guidelines for operation and maintenance of water quality detention basins, catch basins and sumps in order to minimize the discharge of pollutants during maintenance activities. Refer to appendix 3F for a copy of the Sacramento County Detention Basin Maintenance Guidelines, and appendix 3G to view a

copy of the County's Standard Protocol for Application of Herbicides and Pesticides for use at Creeks, Channels and Detention Basins.

Emergency Procedures

Stormwater staff will continue to work with targeted departments to ensure that during emergency responses to repair essential public services and infrastructures, that stormwater BMPs are implemented to the extent that measures do not compromise public health and safety.

Municipal Operations Effectiveness Assessment

Stormwater staff will conduct effectiveness assessment throughout the permit term to establish permit compliance, areas of success, and any necessary modifications. Assessment results will be reported in the Annual Reports. Proposed effectiveness methods were addressed earlier in this chapter.

Effectiveness Assessment

The County's general approach to assessing the effectiveness of its stormwater program is described in Chapter 2. This section specifically describes assessment activities related to the Municipal Operations Element, including proposed methods for evaluating effectiveness during the 2008–13 permit term.

Activities from the 2002-2007 permit term were evaluated to identify modifications necessary to demonstrate effectiveness and baseline data requirements for 2008-2013 permit term activities.

Table 3.5-1 presents planned activities for the 2008-13 permit term. Each performance standard associated with an activity has an anticipated effectiveness outcome level of between one and six, as described in Chapter 2. An outcome level of one is assumed for each performance standard, unless otherwise indicated. Table 3.5-1 shows the years in which focused assessments will be conducted to determine if a higher outcome levels have been attained.

The key challenge for the 2008–13 permit term will be to identify ways to compile, analyze and report data to demonstrate changes in awareness and behavior (Outcome Levels 2 & 3) as a result of training and facility/activity BMP evaluations.

Key Indicators have been selected for the Municipal Operations Element that are a subset of element performance standards which are:

- Intended to demonstrate progression towards goals,
- Easily understandable, and
- Common throughout the Partnership.

Key Indicators are identified in Table 3.5-1 and will be used to assess the effectiveness of individual permittee programs as well as that of the partnership as a whole in the Long-Term Effectiveness Assessment (LTEA) required by the stormwater permit.

Evaluations may result in recommended changes to maintenance activities, corporation yard management, and training materials or topics.

Relationship to other Program Elements

The Municipal Operations Element relates to other elements as follows:

Construction Element (Section 3.3)

State regulations require that County construction projects disturbing one acre or more of land be covered under the State's Construction General Permit. The Construction General Permit calls for preparation and implementation of SWPPPs to describe erosion and other stormwater controls at the site, including inspection and maintenance for the BMPs. Typically the SWPPPs are prepared and implemented by the County's prime contractor or his/her subcontractor, but SWPPP certification, review and oversight is provided by a County official and the responsible County project manager.

County inspectors, however, are not authorized to enforce the State Construction General Permit. For this reason, the County may also require separate erosion and sediment control plans for its projects, which are enforceable by the County inspectors.

Project specific training about construction stormwater pollution prevention requirements is provided to County designers, project managers, inspectors, and contractors, as described in Section 3.3.

Commercial/Industrial Element (Section 3.4)

The County operates industrial-like facilities such as the corporation yard, therefore, the educational materials developed for the commercial/industrial target audiences described in Section 3.4 would apply to some County managers and staff as well. The County strives to set an example for local businesses and industries by ensuring that County facilities comply with the same requirements that apply to private commercial and industrial facilities in unincorporated Sacramento County.

Illicit Discharge Element (Section 3.6)

If not properly controlled, accidental or illegal non-stormwater discharges and spills could end up in the County's storm drain system. From here, the pollutants could migrate to local creeks and rivers. Designated staff in the Transportation and Water Quality Departments respond to reports of possible illicit discharges. These specially trained staff will investigate and cleanup the materials and report the incident to the stormwater staff in the Department of Water Resources for further investigation and enforcement.

Other County maintenance personnel are also trained about how to identify potential illicit discharges and refer the problem for investigation and cleanup (see Section 3.6).

Public Outreach Element (Section 3.7)

The County retains staff and consultants with the experience and expertise needed to conduct meaningful outreach to various County audiences through workshops, correspondence, and educational materials so that all targeted staff receives the important message of protecting stormwater quality.

New Development Element (Section 3.8)

County planners, designers and their consultants are educated about stormwater quality and flow control requirements applicable to redevelopment of County facilities and are provided guidance such as the Stormwater Quality Design Manual discussed in Section 3.8.

Coordination within the County of Sacramento

The Municipal Operations Element regularly coordinates with the other agencies, departments, divisions, and sections listed in Table 3.2-1 located in Section 3.2.

Coordination with Other Agencies and Groups

The County coordinates with the other Permittees, stormwater programs, and local, state, and federal agencies to share information and strategies related to operation and maintenance of County facilities.

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

3.6 Illicit Discharge Element

The primary mission of the Illicit Discharge Element is to effectively eliminate illegal non-stormwater discharges to the County's storm drain system and local creeks and rivers.

The goal of the Illicit Discharges Element is to comply with the requirements of Provision 11 of the Stormwater Permit by reducing the discharge of stormwater pollutants to the maximum extent practicable and to effectively eliminate illicit non-stormwater discharges from non-commercial sources.

The storm drain system consists of a network of drain inlets, manholes and pipes, as well as streets, sidewalks, gutters and roadside ditches, which discharge to local creeks and rivers. Stormwater runoff from driveways, parking lots, roof drains and other surfaces typically discharge into this system.

Illicit discharges can result from dumping of liquid or solid wastes into the storm drain system, or from allowing pollutants to come into contact with stormwater (or stormwater runoff) where they are then transported into the storm drain system.

Examples of illicit discharges include:

- Draining used motor oil or other automotive fluids into the gutter or storm drain inlet
- Washing off paint brushes or concrete tools without containing the wastewater
- Dumping garbage or other wastes into drainage channels and creeks
- Allowing leaking automotive fluids to accumulate on a driveway or street and get washed into the nearest drain inlet during the next rain event

Many sources of illicit discharges can be readily observed by the trained eye. Illicit connections, however, are sources of illicit discharges that are often not visible to the passer by. An illicit connection occurs when a wastewater or process water source is illegally plumbed directly to the storm drain system (often underground to a drain inlet, manhole or pipe). In order to detect illicit connections it is often necessary to enlist the help of the County crews that operate and maintain the storm drain system. Examples of illicit connections include:

- Washing machine wastewater plumbed to a roadside ditch
- Septic system plumbed to a drainage channel
- Indoor floor drain connected to a drain inlet
- Outdoor wash area connected to a manhole

Any material dumped or discharged into the County's storm drain system eventually makes its way to a local creek and/or river, where it can impair beneficial uses. This is true whether the material is classified as hazardous or not. Water quality, habitat, and aesthetics are all examples of benefits that can be impacted.

Pollutants Addressed

The County's activities and requirements under the Illicit Discharge Element address virtually every pollutant commonly found in urban runoff. The type and amount of pollutants addressed will depend on the source(s) of the pollutants. For example, detergents would be addressed in cases where County staff identified and eliminated illicit discharges created by a household discharging washing machine wastewater to the County's storm drain system.

Illicit Discharges Element Strategy

The three major components to the County's strategy for eliminating illicit discharges are as follows:

- Maintain an effective Stormwater Ordinance and other local regulation to prohibit illicit discharges
- Educate County staff and the public about how to identify and report illicit discharge problems and maintain a hotline for public reporting of problems
- Conduct investigations and enforcement of the Stormwater Ordinance to eliminate illicit discharges/connections detected by way of reports from the public and/or County maintenance crews conducting ongoing screening for illicit discharges/connections

Each of these strategy components is explained in the following paragraphs.

Maintain an Effective Stormwater Ordinance

In 1998, the County adopted a Stormwater Ordinance that prohibits discharges of pollutants into the County's storm drain system (Sacramento County Code 15.12; see Section 3.2). The term "pollutants" is widely defined to include a range of materials and wastes. Most non-stormwater discharges and all illicit connections are prohibited. The County Executive issued a memorandum in 2000 authorizing all County employees to enforce the Stormwater Ordinance.

The Stormwater Ordinance was updated twice during the 2002–07 permit term and will be updated, as needed, during the 2008–13 permit term.

Educate County Staff and the Public

The County provides education at many levels — with the general public, contractors, business owners, and County maintenance crews — regarding ways to prevent and report potential illicit discharges and connections to the County for investigation. Most informational materials (e.g., brochures) developed by the County and all media pieces include the County's hotline number (875-RAIN) for reporting of problems. All joint program outreach uses a joint reporting hotline number (808-4H2O), which forwards the caller to 875-RAIN for the unincorporated county. Response and notification procedures are followed to facilitate quick response and cleanup to protect the storm drain system and local waterways.

Investigate Reports of Illicit Discharges/Connections and Enforce the Stormwater Ordinance

County staff that conducts routine maintenance of the storm drain system is trained to look for, identify, and report suspicious discharges to County responders and the stormwater staff. Following cleanup by response personnel, County stormwater staff conducts investigations to try to determine the source(s) of the pollutants. If a commercial/industrial site is suspected, inspections may be conducted at the facility to further investigate and verify the source. If the facility is one the priority industries included in the County Environmental Management Department's (EMD's) stormwater compliance program, EMD inspectors then conduct follow-up investigations. Once source(s) have been verified, progressive enforcement is conducted to eliminate the illicit discharge and pollutant sources.

To prevent the installation of new illicit connections during new development and redevelopment activities, County building inspectors check that selected areas of facilities are properly connected to the sanitary sewer system, rather than the storm drain system. This includes waste storage areas, vehicle and equipment wash areas, maintenance shops/bays, etc.

Accomplishments to Date

The following highlights major accomplishments of the Illicit Discharge Element since 1990:

- During the early part of the Program (1990-1995), the County conducted a field screening program. Outfalls to channels were investigated in the field for possible illicit discharges/connections, and follow-up was conducted to eliminate problems. No illicit connections were identified through this program; however, one ongoing illicit discharge was identified and eliminated.
- In 1998 the County Board of Supervisors adopted the County's Stormwater Ordinance, which makes most discharges to the storm drain system illegal (some exceptions are noted). Additional details about the Stormwater Ordinance are provided in Section 3.2. The County also delegated responsibility for enforcement of the Stormwater Ordinance to other County agencies outside of the Municipal Services Agency. The Stormwater Ordinance was revised twice during the 2002–07 permit term.
- Ninety-five percent of storm drain inlets in existing areas of the County were stenciled with the "No Dumping — Drains to Creek" message, primarily using volunteers. As required by the County's Improvement Standards, permanent "No Dumping" stamps were applied to all new concrete storm drain inlets, beginning in the mid 1990's.
- In 1999, the County Consolidated Utilities Billing System (CUBS) Nuisance Abatement Hotline began accepting calls from the public to report illicit discharges. This number is still in operation and the public also has the option of submitting online reports. Calls related to illicit discharges are forwarded to stormwater staff.

- In 2000, operators of the County's drainage complaint hotline (875-RAIN) began accepting and referring public reports of illicit discharges and other stormwater problems to the stormwater staff.
- In 2005, the permittees began using 808-4H2O for all joint outreach efforts. Illicit discharge complaints from the unincorporated county received through this hotline are directed to 875-RAIN.
- In 2006, stormwater staff began accepting calls on the internal county Stormwater Quality Hotline (874-4SWQ) which is advertised to crews during training workshops as the number to call for investigation and enforcement support related to Stormwater Ordinance violations.
- During the 2002-07 permit term, stormwater staff developed and distributed door hangers. The door hangers were designed to be used by stormwater staff and field crews to help educate the public about stormwater quality and to elicit reporting in the vicinity of illicit discharges, or a response and mitigation by a culpable party. The door hangers contain pockets where outreach brochures can also be provided where appropriate. Re-sealable envelopes that are printed with guidance to field crews on how to properly use the door hangers, illicit discharge response procedures, and information on reporting requirements are also distributed with the door hangers.

Activities for the 2008–13 Permit Term

This section describes Stormwater Permit requirements applicable to the Illicit Discharge Element and the activities to be conducted during the 2008–13 permit term.

Table 3.6–1 at the end of this section outlines the activities that will be conducted for the Illicit Discharge Element during the 2008–13 permit term. This table presents planned activities, associated performance standards and effectiveness assessment methods, as well as a five-year implementation schedule.

The following describes the major activities in more detail:

Legal Authority

The County's Stormwater Ordinance provides legal authority for regulating pollutant discharges to the storm drain system. The Stormwater Ordinance will be amended as needed during the 2008–13 permit term to ensure that it contains adequate legal authority to prohibit pollutant discharges from non-commercial activities.

Reporting of Potential Stormwater Ordinance Violations

Both 875-RAIN and the CUBS Nuisance Abatement Hotlines will be maintained for reporting by the public of potential illicit discharges/connections. The internal 874-4SWQ hotline for crews to access stormwater staff for investigation and enforcement support will also be maintained.

Screening for Illicit Connections

Maintenance crews will continue to screen for illicit connections to the storm drain system as part of their regular maintenance activities. Screening will be conducted according to the procedures developed and implemented during the 2002–07 permit term, and will be amended as needed. These procedures are provided in Appendix 3H.

Investigation

Stormwater staff will continue to investigate, with the support of maintenance crews, as needed, reports of illicit discharges/connections. Reports of non-hazardous discharges will be investigated within five days and discharges suspected of being hazardous within one day of discovery. Reports of illicit connections and suspected illicit connections indicated by evaluations of dry weather monitoring data will be investigated within twenty-one days.

Response, Containment and Cleanup

County crews will continue to provide response, containment and cleanup of illicit discharges to the storm drain system. Whenever possible, the discharger and/or property owner will be required to immediately cease any discharges and will be required to conduct cleanup of pollutants discharged and/or pollutant sources. When this cannot be accomplished, and in urgent situations, County crews will cleanup the pollution, take steps to eliminate the pollutant source and pursue cost recovery on behalf of the department(s) providing response. The procedures for the County's Department of Transportation's response and cleanup of hazardous or unknown material and waste spills and the Area Plan for Emergency Response to Hazardous Materials Incidents are provided in Appendix 3I and 3J, respectively. Response, containment and cleanup procedures will be amended as needed throughout the stormwater permit term.

Enforcement

The County will continue to conduct progressive enforcement to obtain compliance in accordance with the County Stormwater Ordinance and will maintain a progressive enforcement policy, if needed, to compliment the enforcement-related procedures contained therein.

Data Management

Stormwater staff will maintain a database that tracks complaints, referrals, inspections and enforcement actions. Locations of illicit discharges and connections will be plotted on a map which may be used to help identify targeted areas for outreach or to support investigations of potential illicit connections indicated by evaluation of dry weather monitoring data. A copy of this map will be provided in Annual Reports.

Outreach

Stormwater staff will continue to develop and distribute educational brochures and other materials to educate the public on how to conduct their activities in accordance with the Stormwater Ordinance and to encourage public reporting of those responsible for violating the Stormwater Ordinance. Outreach materials will be distributed in conjunction with investigation and enforcement actions as well as at outreach events.

Training

County staff involved in response, containment cleanup and reporting of illicit discharges/connections and ongoing screening for illicit connections will continue to be trained annually during the 2008–13 permit term.

Provide Disposal Options for Disposal of Toxic Substances

The County will continue to maintain its household hazardous waste drop-off center located at the North Area Recovery Station and provide links on our website for other toxic waste disposal facilities within the County. The Department of Waste Management and Recycling will continue their program for curbside collection of used motor oil. Quantities of toxic substances collected will be presented in annual reports.

Effectiveness Assessment

The County's general approach to assessing the effectiveness of its stormwater program is described in Chapter 2. This section specifically describes assessment activities related to the Illicit Discharge Element, including proposed methods for evaluating effectiveness and baseline data requirements for 2008-13 permit term.

Activities from the 2002-07 permit term were evaluated to identify modifications necessary to demonstrate effectiveness and baseline data requirements for the 2008-13 permit term activities.

Table 3.6-1 presents planned activities for the 2008-13 permit term. Each performance standard associated with an activity has an anticipated effectiveness outcome level of between one and six, as described in Chapter 2. An outcome level of one is assumed for each performance standard, unless otherwise indicated. Table 3.6-1 shows the years in which focused assessments will be conducted to determine if a higher outcome level has been attained.

Compiling and evaluating data to demonstrate changes in awareness and behavior (Outcome Levels 2 and 3), where possible, as a result of the inspection, enforcement and outreach efforts, will be conducted to identify potential programmatic enhancement opportunities.

Key Indicators have been selected for the Illicit Element that are a subset of element performance standards which are:

- Intended to demonstrate progression towards goals
- Easily understandable
- Common throughout the Partnership

Key Indicators are identified in Table 3.6-1 and will be used to assess the effectiveness of individual permittee programs as well as that of the partnership as a whole in the Long-Term Effectiveness Assessment (LTEA) required by the Stormwater Permit.

Evaluations may result in identification of targeted outreach opportunities or other mid-course program refinements.

Relationship to Other Program Elements

The Illicit Discharge Element relates to the other program elements as follows:

Industrial Element (Section 3.4)

County stormwater staff and EMD inspectors are trained to look for evidence of illicit connections and discharges during their inspections of local commercial and industrial facilities (see Section 3.4). In addition, stormwater staff review reports of illicit discharges furnished by the public or County field crews, conduct field investigations if needed, and notify EMD if it is suspected that an industrial facility is the source of the discharge. The two groups then collaborate on a course of action to eliminate the discharge.

Municipal Operations Element (Section 3.5)

County personnel responsible for operating and maintaining County facilities and the storm drain system are required to attend annual training. The training educates them about ways to minimize pollutant discharges to the storm drain system during operation and maintenance activities, as well as procedures for detecting, reporting and clean-up of spills, illicit discharges, and illicit connections to the County's storm drain system. County facility operators are educated about how to employ BMPs to effectively address pollutant sources associated with their activities. Examples include information about the use of appropriate BMPs during vehicle washing and maintenance and proper storage and disposal of materials and waste products. The County's goal is to be a model of pollution prevention for the rest of the community.

The Municipal Operations Element includes an activity to ensure that 95% of the County's storm drain inlets are stenciled with "No Dumping" messages. This activity helps to educate the public that pollutants do not belong in storm drains and over time will hopefully help to reduce the number of illicit discharge incidents.

Public Outreach Element (Section 3.7)

Stormwater staff working on the Illicit Discharge Element assists the County's public outreach staff to design educational materials which include information on how to identify and report suspected illicit discharges to the County's hotline number. The materials also include information on alternatives for safe disposal of household hazardous wastes and recycling programs. Illicit Discharge Element staff also attends public events and demonstrate — using tools such as the educational watershed model for kids— how illicit discharges and connections in the urban environment can impair water quality.

New Development Element (Section 3.8)

The County development plan review process ensures that non-stormwater sources are not connected to the storm drain system unless specifically allowed by the County's Stormwater Ordinance. Such discharges are typically discharged to the sanitary sewer under agreement with the Sacramento Regional County Sanitation District (SRCSD) and Sacramento Area Sanitation District (SASD).

Coordination within the County of Sacramento

Almost all Illicit Discharge Element activities involve partnership with other County Departments. The Illicit Discharge Element relies heavily on the activities of other County groups to carry out its mission. Relationships with other County departments are maintained largely on an informal basis, although intra-agency agreements can be established if needed. The following describes the interaction of the Illicit Discharge Element with activities of other County entities:

Maintenance and Operations Crews

County maintenance crews and other personnel within the Departments of Water Resources, Transportation, Waste Management and Recycling, and Water Quality may encounter spills and other illicit discharges during their routine maintenance activities. Water Resources and Transportation crews conduct first response activities, containment, cleanup, and disposal of materials for non-hazardous and hazardous pollutant discharges to the storm drain system, respectively. Their activities are followed up with reports to stormwater staff for tracking, investigation and enforcement purposes.

County Environmental Management Department (EMD)

EMD implements a number of programs that address a wide array of pollutant sources. Staff from three EMD divisions is trained to identify and refer stormwater violations:

- The Water Protection Division (WPD) and the Hazardous Materials Division (HMD) were recently merged into a single branch, and activities of both divisions are now conducted under the HMD branch. HMD staff is responsible for implementing the Commercial and Industrial Stormwater Compliance Program (CISCP), the county's septic program and regulates solid waste facilities. Stormwater staff coordinate with HMD, as needed, to address specific situations related to these programs. HMD is also the lead agency for enforcement of hazardous materials regulations for the County. Stormwater staff coordinated with HMD, as needed, to address specific situations related to hazardous materials storage, handling, etc.
- The Environmental Health Division (EHD) enforces provisions of the California Health and Safety Code at restaurants and public swimming pools. Stormwater staff coordinate with EHD, as needed, to address specific situations related to EHD programs.

Plan Reviewers

Plan reviewers in various County departments and County building inspection staff may also detect proposed or newly constructed illicit connections. Following action to eliminate the connection, such findings are reported to County stormwater staff.

Waste Management and Recycling

County solid waste programs provide various disposal options to the general public that help reduce illegal dumping into the storm drain system and local creeks and rivers. These programs include household hazardous waste events and collection centers; battery, oil, and paint recycling centers; and curbside recycling of used motor oil. The

County also has a Conditionally Exempt Small Quantity Generator Program to allow small businesses to dispose of their hazardous waste, since they are not allowed to use residential household hazardous waste events. County stormwater staff collects data on the quantity of recycled material or hazardous waste collected as a result of these programs.

Coordination with Other Agencies and Groups

The County coordinates with the other permittees to maintain the 808-4H2O reporting hotline and to develop outreach materials.

The County contracts with the Sacramento Metro Fire District and City of Sacramento Fire Department to provide emergency response for major hazardous materials spills that cannot be easily handled by the Department of Transportation's Hazmat Team. Coordination is also important in the event of a spill that impacts multiple jurisdictions and/or threatens a major waterway in the Sacramento area.

Table 3.6-1 – Sacramento County SQIP
Illicit Discharge Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Legal Authority											
Adopt stormwater ordinance revisions as needed	11.a.i		Revised stormwater ordinance (if needed)	Confirmation - report revisions in AR			♦				One year following Regional Board approval of SQIP
Reporting of Illicit Discharges and Connections											
Maintain public hotline for reporting of illicit discharges and connections	11.a.ii ; 11.b.v		Revisions of hotline or its uses (if needed)	Confirmation/Tabulation - track no. of complaints received through 875-RAIN and CUBS Nuisance Abatement	⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly
Maintain hotline for County crews to report illicit discharges and connections	11.a.ii		Decrease in no. of reports of illicit discharges and connections received from County crews	Tabulation - track no. of reports from County crews received through 874-4SWQ and other mechanisms	⇔	⇔	⇔	⇔	⇔ ③	⇔	Reported in AR yearly, EA due 12/13
Screening for Illicit Connections											
Conduct ongoing field screening for illicit connections through routine maintenance activities being conducted by field crews	11.a.ii ; 11.b.ii		Decrease in no. of illicit connections detected by field screening activities since last permit term	Tabulation - include no. of illicit connections detected by way of field screening activities in AR	⇔	⇔	⇔	⇔	⇔ ③	⇔	Reported in AR yearly, EA due 12/13
Investigations of Illicit Discharges and Connections											
Investigate illicit discharges	11.a.iv ; 11.b.iii		Non-hazardous illicit discharges investigated within 5 days of discovery or report, hazardous illicit discharges investigated within 1 day of discovery or report	Confirmation - include no. of non-hazardous and hazardous illicit discharge investigations conducted in AR	⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Provide County employee training to field screening and illicit discharge response crews annually	11.b.vi		Track no. of County employees trained	Tabulation - track no. of workshops held, number of people reached	⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly
			Maintained/Increased employee awareness as measured by quizzes during annual training	Surveys – measure raised awareness based on quizzes at training events		②	②	②	②	②	
Facillitation of Proper Household Hazardous Waste Disposal											
Maintain operation of the County's household hazardous waste drop-off centers and curbside used motor oil collection program		✓	Increase in the quantities of household hazardous waste and used motor oil collected from public since previous permit term	Tabulation - track amounts of HHW collected at County sites	⇔	⇔	⇔	⇔	⇔ ③	⇔	Reported in AR yearly, EA due 12/13

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

3.7 Public Outreach Element

The County's Public Outreach Element tasks are described in Section 2.6, the Regional Public Outreach Program.

3.8 New Development Element

The primary mission of the New Development Element is to mitigate urban stormwater impacts associated with new development and redevelopment.

Urbanization and land development can harm Sacramento creeks and rivers in several ways:

- Replacing natural ground with impervious surfaces (such as roofs and pavement) increases the volume and peak flow rate of stormwater runoff. Those changes to hydrology can lead to stream bank erosion, flooding, and habitat impairment.
- Adding impervious surfaces such as parking lots, streets, and roofs increase the temperature of the water discharged to creeks, potentially harming aquatic life.
- Converting land uses from rural to urban increases pollutant load from activities such as automobile and landscape maintenance.

The permit requires the permittees to ensure that new development and redevelopment projects mitigate their stormwater impacts. The County works closely with other permittees to ensure that all permittees approach development mitigation in a consistent way, and the County is in charge of regulating development within the unincorporated areas of the County. Through its development standards, *Stormwater Quality Design Manual for Sacramento and South Placer Regions (Stormwater Quality Design Manual),* and permit review process, the County ensures that new development and redevelopment projects in the unincorporated areas of the County are designed to mitigate their associated stormwater impacts. The mitigation strategies are discussed in the section on *New Development Strategy*.

To date, the focus of the New Development Element has been on mitigating stormwater quality impacts. However, the new permit contains requirements to also address impacts to runoff volume and rate (hydromodification impacts) where those impacts could cause creek erosion or otherwise harm the creek. The new requirements are discussed in the section on *Activities for the 2008-2013 Term*.

Pollutants and other Stormwater Impacts Addressed

The New Development Element is designed to reduce development-related pollution, which can include virtually every pollutant commonly found in urban runoff. The type and quantity of pollutants associated with development differ depending on the land use.

Pollutants Associated with Various Land Uses

Industrial and commercial sites typically have activities that can affect stormwater quality if not controlled at the source. Runoff from roadways and outdoor parking areas typically contains oil, grease, and total petroleum hydrocarbons from cars, and sediments from air deposition.

Runoff from single-family and multi-family residential land uses typically contains pollutants generated from cars and everyday household activities. For example, landscaping activities can contribute pesticides, herbicides, and phosphorus from

fertilizers into stormwater runoff; home and auto maintenance can also result in illegal dumping of pollutants such as paints, solvents, and used motor oil.

The County encourages developers to select control measures that are most appropriate for the pollutants associated with the planned land use.

Pollutants Addressed by Various Control Measures

Once the pollutants associated with a certain project are identified based on the land use, appropriate stormwater quality measures should be incorporated. Stormwater quality treatment control measures are engineered technologies designed to remove pollutants from site runoff. The treatment control measures are sized and configured using either a volume-based or flow-based design approach. Volume based measures depend on storage and gravitational settling for pollutant removal (e.g., detention basins, vaults); therefore they are designed for the water quality volume. Flow-based measures are designed for the water quality flow because they depend on filtering the runoff through vegetation and do not require long detention times for pollutant removal (e.g., vegetated swales).

National studies have shown that volume-based treatment control measures such as wet detention basins are effective at reducing total suspended solids (TSS), total and dissolved phosphorus, and total and dissolved metals, including copper and lead. Basins are not designed to remove pesticides, but may result in some removal when pesticides adhere to sediment.

Flow-based treatment control measure such as grassy swales and filter strips have been shown to be effective in reducing TSS, total phosphorus, metals (including copper and lead), and total petroleum hydrocarbons.[1] Coliform results for these devices are highly variable.[2] As with detention basins, these measures may remove some pesticides through sedimentation.

Underground vaults and other types of proprietary devices have varying degrees of predicted removals, depending on the unit and vendor laboratory/field tests. Many are designed to remove litter and coarse sediments, and some of the total metals (e.g., copper and lead) that attach to sediment. They can also reduce oil and grease if they contain oil-absorbing pillows in the first chamber. But most proprietary measures cannot remove fine particulates.

Other Stormwater Impacts Addressed by the New Development Element

Historically, the County of Sacramento and other permittees have sought to control stormwater runoff from urban development in order to protect the quality of the receiving water bodies. In recent years, it became apparent that managing the runoff volume and duration changes caused by new development in ways that prevent/reduce the erosion of these receiving bodies (hydromodification management) is just as important. The US EPA defines hydromodification as: “Alteration of the hydrologic characteristics of coastal and non-coastal waters, which in turn could cause degradation of water resources.

[1] American Society of Civil Engineers, National Stormwater Best Management Practices (CONTROL MEASURES) Database, Version 1.0, June 1999.

[2] Municipality of Seattle and Richard Horner, *Biofiltration Swale Performance, Recommendations and Design Considerations (Publication No. 657)*, Seattle, Washington, October 5, 1992.

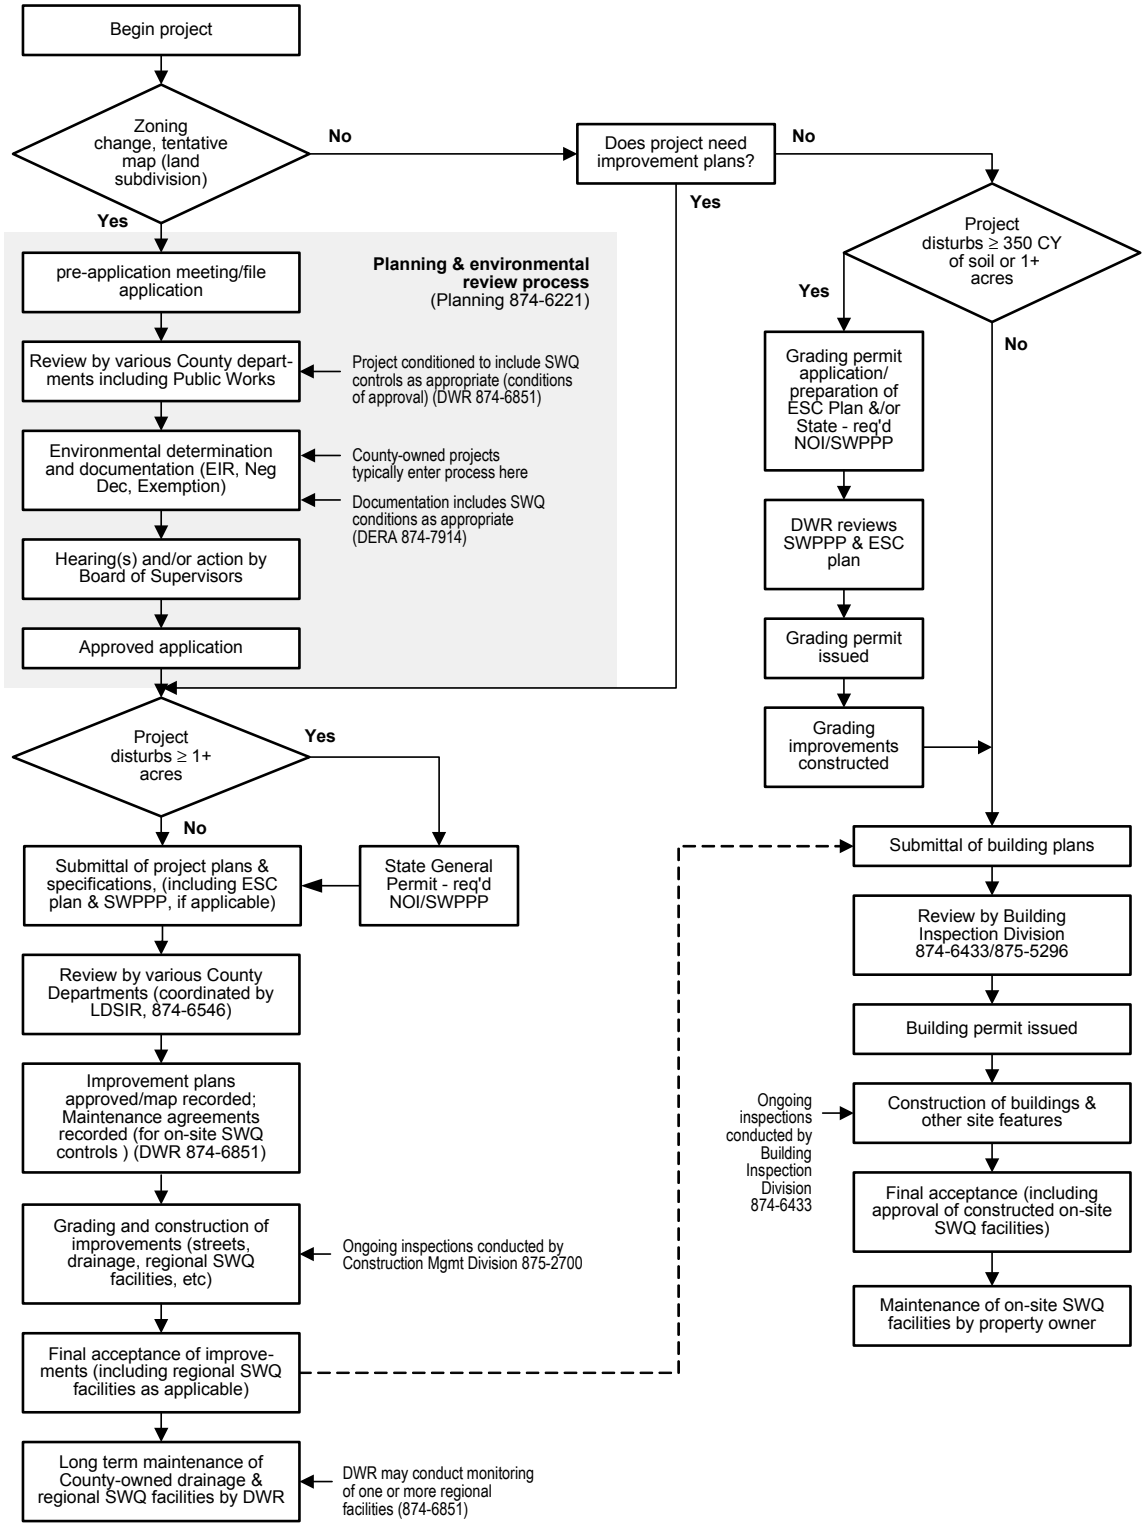
In the case of a stream channel this is the process whereby a stream bank is eroded by flowing water. This typically results in the suspension of sediments in the water course."

The new permit requires the permittees to address hydromodification. Please refer to table 3.8-1 for more details on the proposed activities to deal with this requirement.

New Development Strategy

The County seeks to mitigate the potential harmful stormwater impacts from development and redevelopment with the following approach:

- Integrate stormwater quality considerations and requirements as early as possible into the planning, initial site design, and environmental review processes.
- Provide technical guidance and training opportunities and conduct ongoing outreach to the development community.
- Require site design features that help control pollution at its source.
- Require stormwater quality treatment control measures (preferably aboveground, vegetated) that cleanse runoff before it reaches creeks and rivers.
- Adopt quantitative and qualitative development standards to require implementation of Low Impact Development (LID) strategies.



Each of these strategies is explained more in the following paragraphs.

Address Stormwater Impacts Early in the Design Process

The County's goal is to consider stormwater impacts of proposed projects early in the design process. The planning review processes ensure that the project applicant considers appropriate stormwater quality control methods at the site layout and design stage of development. The County stormwater staff works closely with Planning Department staff and attends regular pre-application meetings hosted by the County planners to educate engineers and developers about stormwater quality requirements. In addition, most development projects are conditioned to include stormwater quality control measures through the environmental review process conducted by the County's Department of Environmental Review and Assessment (DERA) in conformance with the California Environmental Quality Act (CEQA)

Figure 3.8–1 presents the County's typical review and approval process for new and redevelopment projects. The flowchart indicates steps in the process where stormwater quality reviews and approvals are required/ conducted.

Figure 3.8–1.
Typical County of Sacramento Development & Review Process
for incorporating Stormwater Quality (SWQ) & Erosion & Sediment Control (ES) Controls

Provide Technical Guidance to the Development Community

The County provides technical guidance to the development community through the *Stormwater Quality Design Manual,* which was published in May 2007. In addition, information related to development standards and guidance is posted on the joint program web site: *www.sacramentostormwater.org*. The County will continue working with other permittees to make information available to the development community about locally-accepted stormwater quality control measures.

Control Pollution at Its Source

This strategy can be one of the most cost-effective ways to protect local creeks and rivers. New development projects can control pollution at its source through site design features that limit contact of pollutants with stormwater runoff. For example, such design features include:

- Designing trash collection areas in commercial and multi-family residential developments to minimize contact of runoff with pollutants.
- Providing a central car wash area for apartment complexes and draining the wash area to the sanitary sewer instead of the storm drain system.
- Applying "No Dumping — Flows to Creek" messages to storm drain inlets to educate the public that dumping pollutants can harm local creeks and rivers.

Refer to the *Stormwater Quality Design Manual* for information on selecting source control measures.

Require Stormwater Treatment Control Measures

Treating runoff is required for projects above certain size thresholds, which vary with respect to project category (please refer to table 3-2 in the *Stormwater Quality Design Manual*). Treatment control measures are intended to filter and settle pollutants out of runoff before it travels off the site. Information needed to select and size treatment control measures is detailed in the *Stormwater Quality Design Manual.*

Require Incorporation of LID Measures

The *Stormwater Quality Design Manual* encourages the use of LID measures by incorporating runoff reduction and vegetated treatment measures into development projects. Runoff reduction measures, such as permeable pavement and disconnected down spouts, manage runoff close to its source by promoting infiltration by minimizing impervious surfaces. Other runoff reduction measures such as tree canopy interception provide shade (which reduces runoff temperatures) and allow for infiltration and evapotranspiration thus reducing the runoff volume. It is anticipated that these runoff reduction measures will be required as part of the revisions to the development standards to comply with the stormwater permit LID requirements.

Accomplishments to Date

Since the inception of the Program in the early 1990s, the County has made significant progress in controlling urban runoff pollution from new development. Among its major accomplishments, the County:

- Prepared and submitted a Development Standards Plan (DSP) on December 1, 2003.
- Within one year of approval of the DSP by the Regional Water Board, adopted development standards in May of 2006 and began applying them to new and redevelopment projects.
- Partnered with the City of Sacramento to develop City/County stormwater quality design standards, including methods for selecting, sizing and configuring water quality detention basins. These standards were in place from 2000 until the new design manual was published in May 2007.
- Partnered with Cities of Sacramento, Folsom, Rancho Cordova, Citrus Heights, Elk Grove, Galt, and Roseville to create the *Stormwater Quality Design Manual for the Sacramento and South Placer Regions*, first published in draft form in December 2006, updated in February 2007 and finalized in May 2007. This two-year process entailed outreach with the development community and meetings with a newly formed stormwater committee of the local Building Industry Association.
- Amended the California Environmental Quality Act (CEQA) review process to provide additional stormwater quality protection language in July of 2003.
- Added stormwater quality and watershed protection principles to the County General Plan during the 2006-2010 update process.

Activities for the 2008-2013 Permit Term

This section describes the stormwater permit requirements applicable to the New Development Element and the activities to be conducted during the 2008-2013 permit term.

Stormwater Permit Requirements

The stormwater permit requires that the permittees regulate new development and redevelopment projects so that they incorporate measures to mitigate associated stormwater quality impacts. In addition, the new permit requires mitigating the hydromodification impacts associated with new development. When development occurs, it increases the volume and rate of runoff and therefore stream flow; these hydromodification impacts, in turn, can cause creek erosion and other harm.

The permit now requires that the permittees develop a plan to mitigate hydromodification impacts associated with new development where the runoff could cause erosion or other harm to the local creeks. This will result in new requirements for some development and redevelopment projects.

In addition, the stormwater permit requires the permittees to develop quantitative and qualitative LID standards to require all priority new development and redevelopment projects to incorporate LID measures. The developed criteria will be incorporated into the *Stormwater Quality Design Manual.*

Overview of Proposed Activities

Table 3.8–1 outlines the activities that will be conducted for the New Development Element during the 2008–13 permit term. This table presents planned activities, associated performance standards and effectiveness assessment methods, as well as a five-year implementation schedule.

The following sections describe the major activities in more detail.

Development-Related Standards, Policies and Codes

The County will continue to periodically evaluate and amend the standards to incorporate new permit requirements as needed during the 2008–13 permit term**.** The *Stormwater Quality Design Manual* will be revised to incorporate detailed LID criteria and hydromodification mitigation criteria 6 months after the amendment of the development ordinances and standards. The County will convene meetings of the steering committee (which includes representatives from each permittee) periodically during the 2008–13 permit term to update the *Stormwater Quality Design Manual* as needed.

Stormwater quality requirements need to be coordinated with other County and other agency codes and standards (such as those related to tree preservation/landscaping, water conservation, sanitary sewer and solid waste) in order to avoid conflict and overlap. The County stormwater staff will continue to work with the County Planning Department, Department of Transportation and other departments, as well as with outside agencies such as County Sanitation District-1 and Metro Fire District, to evaluate and amend policies and codes as needed for consistency.

The County General Plan is being updated and the final draft is expected to be adopted in winter of 2009. Stormwater quality and watershed protection principles were integrated into the General Plan during the update process. Further updates to the General Plan are not expected during the 2008–13 permit term.

Waiver Program

The County will work with other permittees to develop a waiver program for development projects where it is demonstrated that installing stormwater quality control measures is not feasible. The owners of projects that qualify for a waiver would pay into an in-lieu fund; the applicable local permitting agency would use the fund to conduct other stormwater quality control programs elsewhere in the affected watershed.

It is anticipated that the waiver program will be used where stormwater requirements conflict with other County objectives, particularly those reflected in “Smart Growth Projects”. There is an inherent conflict between achieving the “Smart Growth” densification objectives and using space on these dense projects for above-ground stormwater conveyance, runoff reduction measures and stormwater quality treatment features. The County will continue to work with other organizations, such as the Sacramento Area Council of Governments (SACOG) to identify and resolve issues between stormwater requirements and Smart Growth objectives.

Hydromodification Management Plan (HMP)

The County will work with other permittees to meet the requirements of the stormwater permit with regards to hydromodification management (see the prior section on permit requirements). As a first step, the permittees will determine where the requirements would apply in Sacramento County based on which waterways have the potential for erosion and habitat degradation. For those areas where it is determined that hydromodification management measures apply, geomorphic studies will be conducted as needed to assess the degree of susceptibility to erosion and degradation. Based on the outcome of those studies, approaches and tools will be recommended for future development and redevelopment projects to retain/detain flows at the specified erosion susceptibility level. Once the requirements are in place, the County will condition projects to comply.

To comply with the permit requirements, the permittees are submitting a work plan for the HMP as part of this document. Please refer to Appendix **2B** for the proposed HMP Work Plan. One year after the Regional Board approves the work plan, the permittees will submit the HMP document.

Treatment Strategies for Roadway Projects

Roadway projects of five or more acres must include stormwater quality treatment control measures. This is a challenge since few treatment options work for these types of projects, given space constraints and the difficulty in isolating the drainage for a portion of a roadway. The challenge is even greater with public road projects because of safety and maintenance concerns about the treatment control measures. The County stormwater staff will continue to work with the Department of Transportation to identify solutions. It is anticipated that ongoing research results from Caltrans' demonstration projects will help in this effort.

Maintenance of Stormwater Quality Control Measures

The County will continue to evaluate the best approach for educating owners of private treatment control facilities about their maintenance responsibilities.

The County will ensure long-term maintenance of treatment control measures by requiring maintenance covenants to be executed before the approval of the project. Also, the County stormwater staff will require property owners to certify that the treatment measures on their sites are properly maintained. In addition, the County will continue training construction inspectors to ensure proper installation of the treatment control measures. The stormwater staff will review and update the maintenance procedures for publicly owned facilities as needed.

Control Measures Effectiveness Studies

The County will continue to work with other permittees to conduct several studies of the effectiveness of local stormwater control measures and will publish results in the Annual Monitoring Report. See Chapter 2.4 for more details.

Outreach to Educate the Development Community

The Sacramento area development community includes developers, property owners, engineers, landscape architects, architects, environmental specialists, and others who plan and design projects in the public and/or private sectors. The County's effectiveness in reducing stormwater pollution depends on the level of knowledge and understanding this community has regarding mitigation methods and stormwater requirements. The County therefore works collaboratively with the other permittees to share information with the development community and promote consistency across municipal boundaries. The County also provides technical guidance and design support to help the development community comply with stormwater quality requirements.

The permittees post information related to development standards and guidance on the joint program web site: *www.sacramentostormwater.org*, and will update that website as needed.

Employee Training

The County conducts ongoing internal education with its various agencies and departments to make sure that staff consistently applies new development policies to private developments as well as to the design of County buildings and facilities.

Each year, stormwater quality staff will continue to train County employees in the Planning, Development Review, and Environmental Review departments regarding stormwater quality requirements. Training will also be provided to other employees in targeted positions as needed.

Effectiveness Assessment

The County's general approach to assessing the effectiveness of its stormwater program is described in Chapter 2. This section specifically describes assessment activities related to the New Development Element, including proposed methods for evaluating effectiveness during the 2008–13 permit term.

Activities from the 2002-2007 permit term were evaluated to identify modifications necessary to demonstrate effectiveness and baseline data requirements for 2008-2013 permit term activities.

Table 3.8-1 presents planned activities for the 2008-13 permit term. Each performance standard associated with an activity has an anticipated effectiveness outcome level of between one and six, as described in Chapter 2. An outcome level of one is assumed for each performance standard, unless otherwise indicated. Table 3.8-1 shows the years in which focused assessments will be conducted to determine if a higher outcome levels have been attained.

Relationship to Other Program Elements

The New Development Element relates to other Program elements as follows:

Construction Element (Section 3.3)

The County requires temporary erosion and other pollution controls to be applied during the construction phase of development projects. The County also requires that permanent stormwater-quality control measures be protected from excessive sediment loading. If the permanent facilities are not adequately protected during construction, the County requires that the contractor clean and/or repair them before the new stormwater facilities will be accepted for County ownership. In addition, the County requires engineers to certify in the development submittals that the stormwater-quality control measures on the site were installed properly.

Commercial/Industrial Element (Section 3.4)

The County's requirements for stormwater quality treatment apply to development and redevelopment of commercial and industrial properties/facilities (as well as other types of development). The County's guidance manuals and standards call for selection of control measures best suited for the land use and pollutants anticipated to be present in site runoff.

Finally, through the multi-departmental plan review process for new industrial and commercial facilities, the County ensures that unauthorized non-stormwater flows are directed to the sanitary sewer system or otherwise treated, rather than connected to the storm drain system.

Municipal Operations Element (Section 3.5)

The County owns, operates and maintains the regional detention basins that are constructed to treat runoff from newly developed areas. The County Stormwater Program Staff provide facility guidelines and procedures to County maintenance crews for inspection and maintenance. The goal is to ensure that the facilities are operating optimally to remove pollutants from stormwater runoff.

The County makes every effort to include on-site stormwater quality control measures at new County-owned buildings and facilities. The County is responsible for long-term maintenance of those control measures once construction is complete.

Illicit Discharge Element (Section 3.6)

If not properly controlled, accidental or illegal non-stormwater discharges and spills could end up in regional detention basins or on-site stormwater quality control measures. From here, the pollutants could migrate to local creeks and rivers. The County's notification and referral procedures discussed in Section 3.6 would be implemented if spills were to impact a stormwater treatment facility. The County response team would notify the stormwater staff and follow-up investigations would be conducted to verify that receiving waters were not impacted.

Additionally, as noted above for the Commercial/Industrial element, the County's plan review process for newly developing properties ensures that unauthorized non-

stormwater flows are plumbed to the sanitary sewer system or otherwise treated, rather than connected to the storm drain system.

Public Outreach Element (Section 3.7)

The County retains staff and consultants with the experience and expertise needed to conduct meaningful outreach to the development community. Public information experts help identify target audiences and associated messages and tools, conduct training and outreach, and collaborate on the design of educational materials.

Coordination within the County of Sacramento

Due to the many phases of project design, approval and construction, coordination within the County of Sacramento is critical to the success of the New Development Element. Coordination is needed to ensure that pollution prevention occurs on County projects as well as those in the private sector.

The stormwater staff within the Department of Water Resources manages the New Development Element. This section coordinates with the following other agencies and departments:

- Municipal Services Agency — Department of Water Resources (Development Review, Design and Maintenance Sections), Department of Transportation (Engineering/Planning Section), Department of Water Quality, Department of County Engineering and Administration.
- Community Development and Neighborhood Assistance Agency — Department of Environmental Review and Assessment, Department of Planning and Community Development.

Coordination with Other Agencies and Groups

As previously explained, the County works closely with the other permittees, especially the City of Sacramento, regarding several New Development Element Activities. Notably, the County works with other permittees to create design criteria and guidance materials, study the effectiveness of stormwater quality treatment control measures, and conduct outreach to the development community. The coordinated approach ensures that the development community is receiving a consistent, uniform message.

Special districts that fall outside the County's jurisdiction and control (e.g., regional transit and fire, water, school, park, and reclamation districts) generally follow different review processes than private projects. It is more difficult to ensure that these projects include stormwater quality controls at the earliest review stage possible, but the County strives to have stormwater quality control measures included on each site as applicable. Outreach to and education of these special districts is an important goal.

The County provides information to the development community through several organizations with local Sacramento chapters. These include: the Business Industry Association (BIA), Associated General Contractors of California (AGC), Consulting Engineers and Land Surveyors of California (CELSOC), American Society of Civil Engineers (ASCE), American Institute of Architects (AIA), and American Society of Landscape Architects (ASLA).

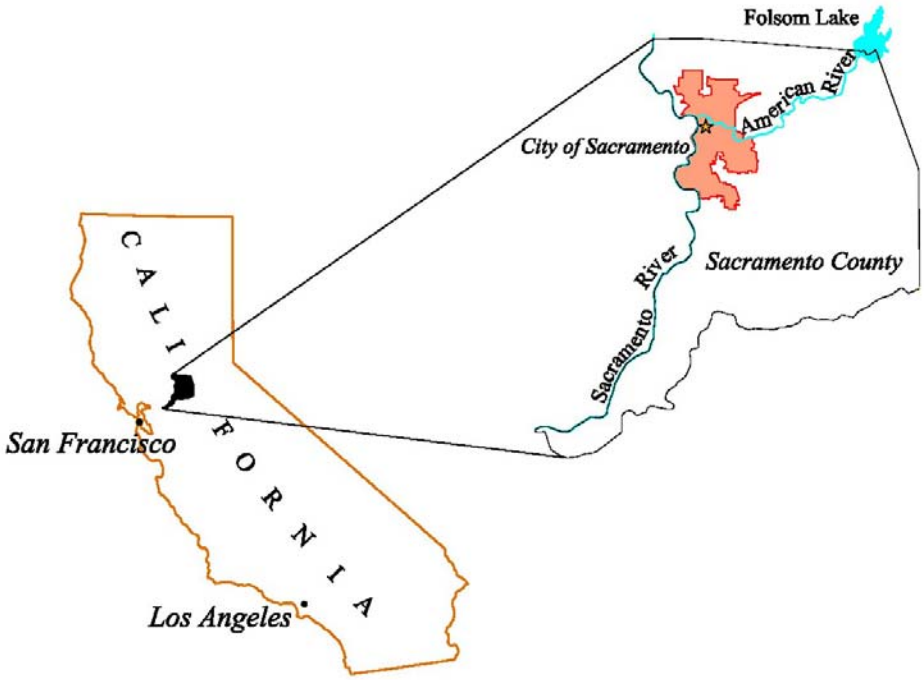
Chapter 4

City of Sacramento SQIP

4.1 Introduction

4.1.1 Plan Organization

This chapter presents the City of Sacramento Stormwater Quality Improvement Plan (Sacramento City SQIP). The activities described in this chapter are conducted by Sacramento City in addition to the Partnership (Regional) Activities described in Chapter 2. The Sacramento City SQIP provides a comprehensive plan to direct the Sacramento City Stormwater Management Program (Sacramento City Stormwater Program) and its priorities and activities through the 2008-2013 permit term. The Sacramento City SQIP also includes information on the Sacramento City Stormwater Program's history and accomplishments.



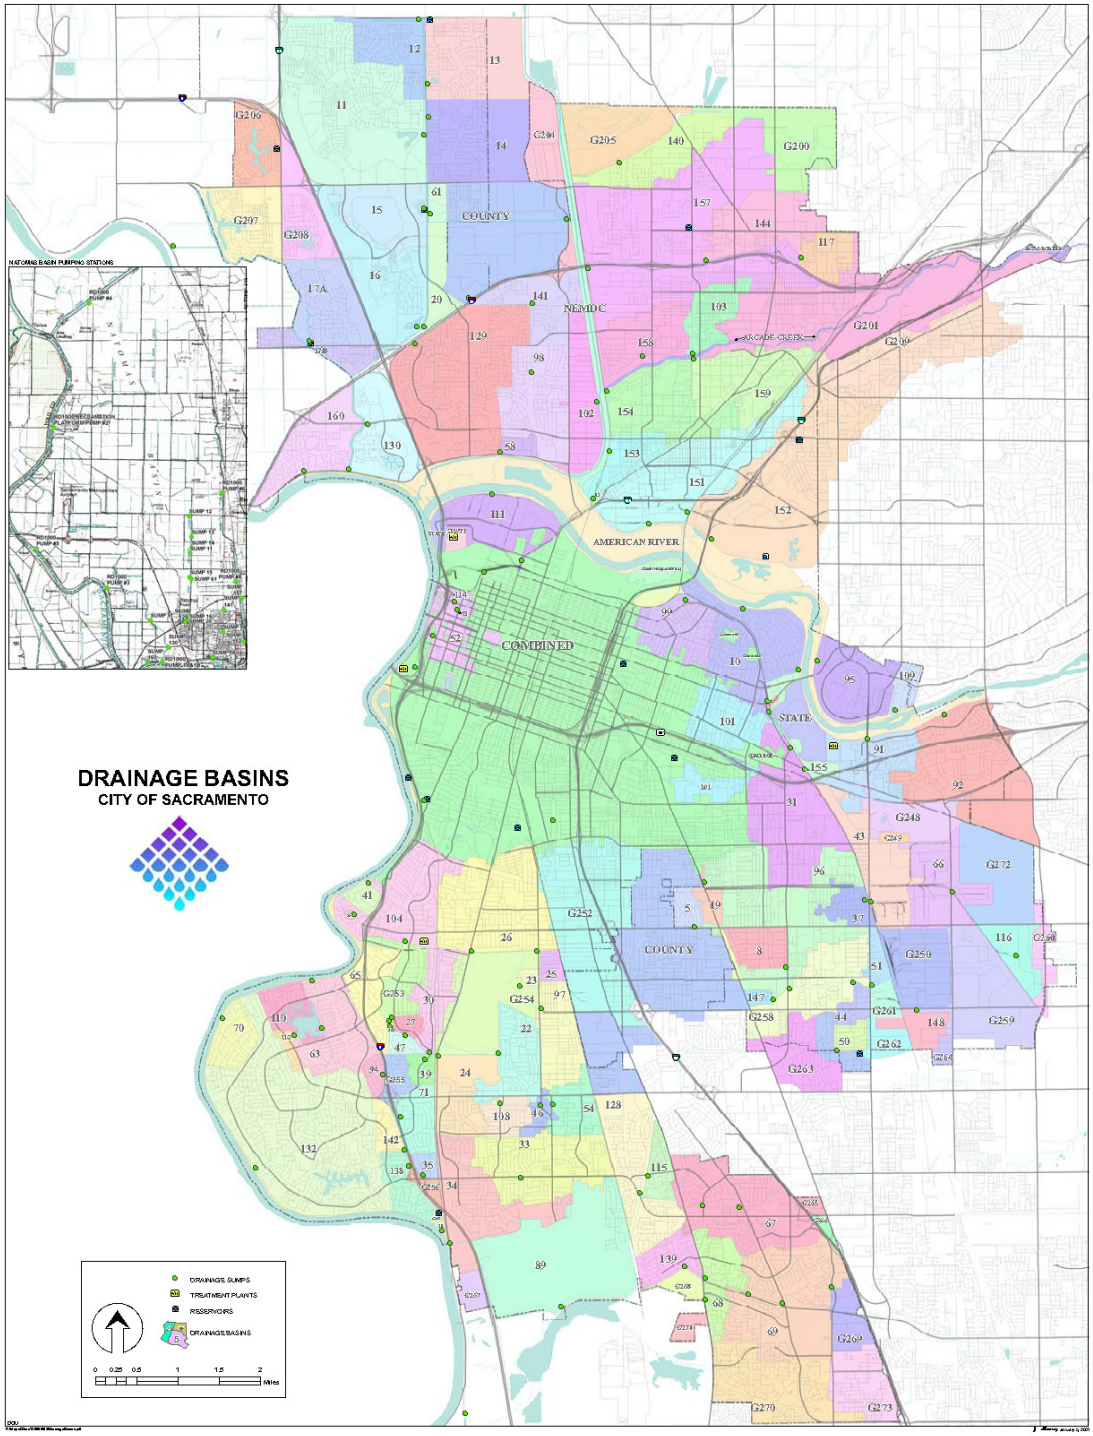
This chapter describes Sacramento City's specific activities for the 2008-2013 permit term and includes the following sections:

- Section 4.1 Introduction
- Section 4.2 Program Management
- Section 4.3 Construction Element
- Section 4.4 Commercial/Industrial Element
- Section 4.5 Municipal Operations Element
- Section 4.6 Illicit Discharge Element
- Section 4.7 Public Outreach Element
- Section 4.8 New Development Element

4.1.2 City Overview

Sacramento City has a population of approximately 476,000 as of January 2008 and encompasses approximately 63,360 acres. Sacramento City is located at the confluence of the lower American River and the Sacramento River (see Figure 4.1-1 on the next page). The lower American River is a high-quality waterway that flows from the Folsom Reservoir westward through Sacramento City. The larger Sacramento River defines Sacramento City's western boundary, flowing south on its way to the Delta and the San Francisco Bay. These rivers provide Sacramento City's primary drinking water supply and support extensive recreational use, fisheries, and salmon and steelhead migration. The Sacramento River is also the major drinking and agricultural water supply source for the State of California.

Figure 4.1-1
Vicinity Map of Sacramento, California



Sacramento City operates and maintains a large municipal storm drainage system that consists of 104 pump stations, hundreds of miles of pipe, and numerous detention basins. For almost two decades, Sacramento City has committed to improving the quality of urban runoff through the development and implementation of a proactive, comprehensive stormwater management program that recognizes Sacramento's unique position in the Sacramento River and the American River watersheds and the need to protect these important resources.

City of Sacramento Storm Drainage System

- 65 miles of canals and ditches
- 100 miles of roadside ditches
- 970 miles of pipeline
- 104 storm drainage pump stations
- 40,000 drain inlets
- 26 detention basins

Drainage facilities include gutters, swales, ditches, culverts, storm drain inlets, catch basins, storm drainage pipes, canals, detention basins, and pump stations. Since much of Sacramento City is in low lying areas protected by flood control levees, most of the storm runoff in Sacramento City must be pumped from the collection system to discharge into the rivers and urban creeks. Runoff from the central area of Sacramento City is collected by a combined storm and sanitary sewer system and conveyed to the Sacramento County Regional Sanitation District for treatment. The combined sewer system is regulated under a separate National Pollution Discharge Elimination System (NPDES) permit and not by the Stormwater Permit for Sacramento's City urban stormwater. Figure 4.1-2 on the next page provides a map of the City that shows the combined sewer area, and stormwater drainage areas.

Table 4.1-2
City of Sacramento Drainage Basins and Facilities

4.1.3 Program Overview

The City of Sacramento Stormwater Management Program is a federally mandated, municipal effort that has proactively addressed local urban runoff water quality issues and worked to reduce pollutants to the maximum extent practicable through innovative, cost-effective measures and strategies.

Sacramento City's initial emphasis for its stormwater program was to develop a comprehensive program, secure political support and stable funding, and design the basic program structure under which activities would be implemented. Many innovative programs and activities have been initiated since the program's inception. A core program has evolved to implement activities that are essential, innovative and cost effective.

Established Core Program

- *Meets state/federal regulations.*
- *Improves understanding of local creek and river water quality concerns.*
- *Creates strategies to identify and control problematic pollutants.*
- *Utilizes innovative and cost-effective BMPs.*
- *Increases integration with other programs with related objectives.*

After nineteen years, the Sacramento City Stormwater Program has become a mature, established effort that effectively reduces pollutants to the MEP by continuing to implement successful control measures and develop and utilize new, innovative best management practices (BMPs).

In 1997 and again in 2004, the Program was honored with the U.S. Environmental Protection Agency (EPA) National Storm Water Control Program Excellence Award for its cost-effective, proactive approach to identifying and controlling pollutants in Sacramento City's urban runoff.

The Sacramento City Stormwater Program core elements are: Construction, Commercial/Industrial, Municipal Operations, Illicit Discharge, Public Outreach, and New Development. Other major Sacramento City Stormwater Program activities also include Regional Activities, such as the Sacramento Stormwater Monitoring Program (Monitoring Program) and the Target Pollutant Program.

The Sacramento City Stormwater Program recognizes the importance of effective stormwater management and has allocated resources to ensure adequate administration and implementation of program activities. Management of the Sacramento City Stormwater Program is provided by the Department of Utilities (DOU) Engineering Services Division, Water Quality Section.

4.1.4 Summary of Program Accomplishments

As the Sacramento City Stormwater Program has progressed, many stormwater activities have been successfully integrated into Sacramento City activities, leaving Sacramento City Stormwater Program staff available to further develop BMPs, provide training and guidance, and develop monitoring and other special studies. Examples of activities integrated with other Sacramento City efforts include master planning, development review, inspection of drainage facilities, spill response, oversight of municipal construction activities, and solid waste management alternatives for illegal dumping.

In addition to coordination with other Sacramento City activities, interagency agreements have been formed with some County of Sacramento agencies for efforts such as the Sacramento Coordinated Monitoring Program (CMP); Business Environmental Resource Center (BERC); the Water Wise Integrated Pest Management Program; and the Splash Program. Other coordination efforts include the County Industrial Waste Division (sewer pretreatment), Hazardous Materials Division, and Environmental Management Division (food service facility) inspections. Some of these activities are conducted as joint efforts with the other Permittees. More details on some of these activities can be found in Section 4.2, Program Management, of this Chapter.

A comprehensive summary list of Sacramento City Stormwater Program accomplishments by Program Elements is included in Appendix 4A. A complete history of the permit and the Partnership's efforts to manage urban runoff quality over the years is included in Appendix 1C.

This page left intentionally blank.

4.2 Program Management

4.2.1 INTRODUCTION

This section presents the City of Sacramento Stormwater Management Program's (Sacramento City Stormwater Program) strategy, management priorities, legal authority, organization, interrelationships, planning and reporting activities, budget and staff resources, and staff training.

4.2.2 PROGRAM STRATEGY

The Sacramento City Stormwater Program strategy is to develop and implement programs to reduce or eliminate discharge of pollutants and eliminate prohibited non-stormwater discharges to the Sacramento City's storm drainage system to the maximum extent practicable (MEP), thereby protecting local receiving waters and complying with federal and state laws and regulations.

This strategy supports the following Sacramento City Program vision and mission statements:

Program Management

- *Provides direction for the Sacramento City Stormwater Program activities.*
- *Ensures that Sacramento City complies with both state and federal regulations.*
- *Pursues innovative programs and technology.*
- *Coordinates efforts with other local, regional, statewide, and national programs.*

VISION

Establish behaviors and attitudes that contribute to the reduction of urban runoff pollution and that help promote community stewardship of local creeks and rivers, thus improving the health of local waterways.

MISSION

Provide resources and direction toward achieving:

- Reduction of stormwater pollution to the maximum extent practicable (MEP)
- Elimination of non-stormwater discharges in accordance with the Sacramento Stormwater Permit
- Ultimately, protection of beneficial uses to include meeting applicable water quality objectives

Sacramento City Stormwater Program activities encourage environmental stewardship and continue to build partnerships with other agencies and with the community to foster active participation in accomplishing the Sacramento City Stormwater Program mission. One of the goals of the Sacramento City Stormwater Program in accomplishing the mission is for all of Sacramento City's employees to be concerned and knowledgeable as well as responsible stewards for protecting the quality of local water resources.

Stormwater Quality Improvement Plan (Sacramento City SQIP)

The Sacramento City Stormwater Program strategy is pursued through the Sacramento City SQIP described in this chapter as well as through the implementation of regional activities described in Chapter 2, Partnership Activities, which are implemented collectively by the Permittees. The Sacramento City SQIP is an enforceable part of the Stormwater Permit that undergoes periodic modifications as part of the program implementation cycle to ensure the mission is effectively accomplished.

Program Implementation Cycle

As discussed in Chapter 1, the following 4-step cycle allows for effective implementation and provides a continuous feedback loop.

Step 1: Plan and Develop

The SQIP programs, elements and activities are planned and developed to meet regulatory and local needs to address stormwater pollution. The SQIP and annual work plans are prepared to identify specific activities, tasks and performance standards.

Step 2: Implement Activities

The activities included in the SQIP and annual work plans are implemented.

Step 3: Evaluate and Assess

Progress is documented, program effectiveness is assessed, and feedback is obtained for future improvements to the program. See Section 2.3, Program Effectiveness and the individual elements for the Sacramento City effectiveness assessment approach

Step 4: Refine and Modify

New or revised activities are developed based on the results of the effectiveness assessments, input from regulators, and new identified needs. Some activities may also be eliminated during this step. As specified in the Stormwater Permit, the annual reports submitted on October 1 of each year will serve as the mechanism for proposing modifications to this SQIP for review and approval by the Regional Water Board.

4.2.3 Program Management Priorities

Sacramento City Stormwater Program priorities for the 2008-2013 permit term include implementing the Sacramento City SQIP and the Partnership activities. The Sacramento City Stormwater Program Management Activities and schedule are listed in Table 4.2-4, City of Sacramento Program Management Activities Work Plan.

A summary of the Sacramento City Stormwater Program Management priorities are as follows:

Achieve regulatory compliance:

- Submit annual work plans, annual reports and other documentation to the Regional Water Board.
- Complete permit-required activities.
- Ensure adequate staffing and resources to carry out Sacramento City Stormwater Program activities.
- Ensure adequate legal authority
- Seek and administer grants.
- Modify Sacramento City SQIP as needed.
- Implement enforcement procedures.

Focus Program activities on target pollutant reduction:

- Seek and participate in partnerships to conduct studies and implement target pollutant reduction programs.
- Seek new, effective target pollutant control measures and strategies.

- Continue to implement target pollutant control measures and strategies.
- Participate in regional, state, and national efforts to reduce target pollutants.

Ensure the Program is effective and innovative:

- Consider new technology for program improvements.
- Continue coordination with internal and external partners.
- Participate in local and regional committees and work groups.
- Utilize data management tools to improve the evaluation of water quality data.
- Evaluate activities, elements and program for effectiveness in meeting outcome levels.
- Make changes to activities, elements and program as needed based on effectiveness evaluations.
- Look for and report measurable results.
- Emphasize higher outcome levels for key indicators.

Conduct watershed stewardship and monitoring activities to assess and improve beneficial uses of local creeks and rivers:

- Implement the Arcade Creek Watershed grant.
- Continue to incorporate watershed stewardship activities into Sacramento City Stormwater Program Elements.
- Manage the Regional Monitoring Program in partnership with County of Sacramento.
- Identify monitoring needs.
- Coordinate with other local monitoring programs and Sacramento City's own drinking water and source water protection studies and efforts.
- Incorporate the best available analytical monitoring and sampling techniques as appropriate.

4.2.4 Program Effectiveness Assessment

The Partnership's effectiveness assessment approach is discussed in Section 2.3, Program Effectiveness. The Partnership activities will be assessed as outlined in Section 2.4 through 2.7. Assessments of Sacramento City-specific and Partnership (regional) activities will be conducted annually.

Sacramento City will document the work plan activities conducted during the year in the annual reports. This confirmation will demonstrate compliance with the Stormwater Permit requirements (outcome level 1 – Documenting Activities).

Each program element has identified several key indicators used in assessments to demonstrate progress towards meeting the program element goals. The Sacramento City SQIP includes Element key indicators as representative activities used to define and assess the effectiveness of a program element in producing outcome levels ranging from outcome level 2 – Raising Awareness to outcome level 4 – Reducing Loads from Sources. See the work plan tables found at the end of each element's section in this Chapter for the specific element key indicators (indicated by a checkmark) and their assessment method, baseline data, and targeted outcome level).

Sacramento City will modify the planned schedule and execution of tasks (including key indicators) during the permit term as program priorities change. Any change to the planned activities as currently outlined in the work plan tables will be documented in subsequent annual work plan(s) and reported upon in the appropriate annual report(s).

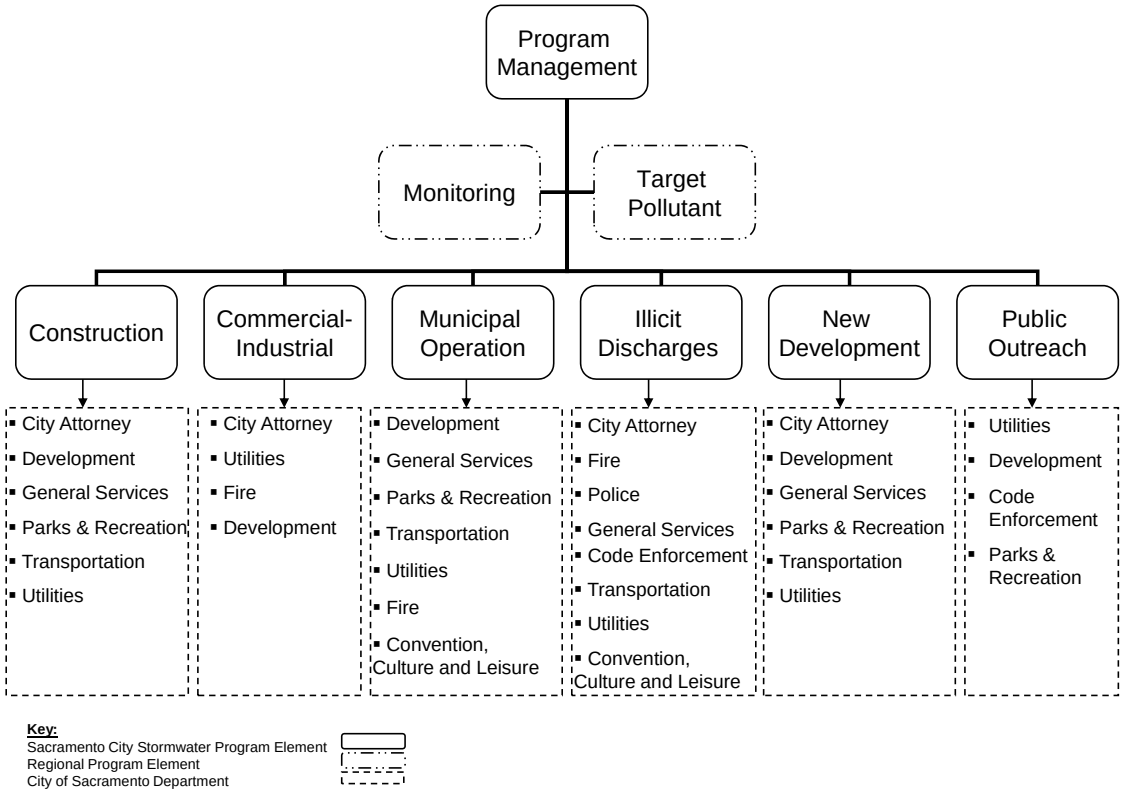
4.2.5 Legal Authority

The principal regulatory vehicles for protection of water quality in California are the federal Clean Water Act and the State of California Porter-Cologne Water Quality Control Act. This legislation and implementing regulations require the Sacramento City reduce or eliminate pollutant stormwater discharges. Sacramento City derives its legal authority to implement a municipal stormwater management program from the California Water Code and the California Environmental Quality Act and Subdivision Map Act that provides municipalities with authority to establish conditions for development projects. This legislation, coupled with Sacramento City's local ordinances, provides sufficient legal authority to implement the SQIP. The City of Sacramento Stormwater Management and Discharge Control Ordinance No. 98-007 and Grading and Erosion and Sediment Control Ordinance No. 93-068 are provided in Appendix 4B and 4C respectively. Sacramento City ordinances are reviewed and revised as necessary throughout the permit term.

Appendix 4D includes the statement certified by the City of Sacramento Attorney's Office that Sacramento City has adequate legal authority to implement and enforce the Stormwater Permit.

As discussed in Section 2.2, the Permittees entered into a memorandum of understanding (MOU) that formalizes the manner in which the Permittees coordinate and fund regional activities required in the Stormwater Permit. See Appendix 2A for a copy of the Permittee MOU. Sacramento City also entered into an MOU in 2003with Sacramento County's Environmental Management Division (EMD), authorizing EMD to conduct inspections on behalf of Sacramento City. See Appendix 4E for a copy of the EMD MOU.

4.2.6 Program Organization



The Sacramento City Stormwater Program includes the Construction, Commercial/Industrial, Municipal Operations, Illicit Discharge, Public Outreach, New Development Elements and regional activities. The regional activities, such as the monitoring and target pollutant programs, are discussed in Chapter 2. The Sacramento City Stormwater Program organization and structure is shown on Figure 4.2-1. The figure includes a list of the various departments within Sacramento City that implement components of the Stormwater Permit or are affected by the stormwater requirements. Some City departments have direct responsibilities for pollution prevention programs (for example, the Department of Utilities provides recycling, household hazardous waste collection, and street sweeping programs through its Solid Waste Division).

Sacramento City as a whole, including elected officials, department heads and city employees, is responsible for compliance with the Stormwater Permit requirements and the Sacramento City SQIP. The organizational structure for the City is provided in Appendix 4F.

Sacramento City owns the municipal separate storm drain system subject to federal and state regulations, which is described in Section 4.1.1 of this chapter. The Department of Utilities (DOU) is Sacramento City's agency responsible for construction, maintenance and operation of the storm drainage system as well as the administrative and management functions of the Sacramento City Stormwater Program. Direct management of the Sacramento City Stormwater Program is provided by the DOU Engineering Services Division, Water Quality Section.

The Supervising Engineer for the Water Quality Section is the Sacramento City Stormwater Program Manager, and is responsible for the Sacramento City Stormwater Program development and implementation. Water Quality Section staff assignments include responsibilities associated with the Program Elements; Partnership Activities such as the Monitoring Program and the Target Pollutant Program; as well as assistance with other program management activities (e.g., coordination with other agencies).

Figure 4.2-1
City of Sacramento Stormwater Management Program Organization and Interdepartmental Relationships

4.2-6 Program Interrelationships

Since program implementation effectiveness and cost savings are enhanced by integrating the Sacramento City Stormwater Program with existing resources, programs and functions whenever possible; other staff from the five divisions of the DOU - Engineering Services, Field Services, Plant Services, Solid Waste and Business Services - as well as staff from several other Sacramento City departments and regional agencies also provide significant levels of resources and support services to ensure successful citywide implementation of the Sacramento City Stormwater Program. The Program Management Element ensures coordination between program elements and allocates resources accordingly in order to complete tasks as specified in this SQIP. Table 4.2-1 provides a comprehensive list of Sacramento City Stormwater Program interrelationships with other agencies and departments.

Table 4.2-1

City of Sacramento Stormwater Management Program Coordination with City Departments and Other Agencies

City Departments / Other Local Agencies	Summary of Activities	Major Related Stormwater Management Program Elements
City Department		
City Attorney	Guidance on legal authority and enforcement, approval of maintenance agreements for new development control measures	Construction, Illegal Discharge, Commercial/Industrial, New Development, Program Management
Fire	Hazardous material spill response	Illegal Discharge, Industrial
Code Enforcement	Code enforcement, support for illegal discharge, neighborhood clean-up events and other community programs	Illegal Discharge, Public Education, Watershed Stewardship
Parks and Recreation	Pollution prevention activities, joint-use detention basins, storm drain stenciling and creek restoration projects, construction of park facilities	Construction, Illegal Discharge, New Development, Public Education, Watershed Stewardship
Police	Enforcement, referrals and investigations as needed	Illegal Discharge
Development • Building and Engineering	Issuance of grading permits, collection of fees, private construction inspections, distribution of stormwater pollution prevention brochures	Construction, New Development, Commercial/Industrial, Municipal Operations, Public Outreach
• Planning (including environmental review)	Incorporation of construction mitigation and new development criteria into CEQA reviews and entitlements, issuance of entitlements, participation in creek restoration planning	Construction, New Development, Commercial/Industrial, Municipal Operations, Watershed Stewardship
General Services • Facility leases or construction	Incorporation of pollution prevention into site planning and activities	Municipal Operations, New Development, Construction, Industrial
• Maintenance Services	Administration and implementation of pollution prevention at City facilities, corporation yards	

City Departments / Other Local Agencies	Summary of Activities	Major Related Stormwater Management Program Elements
Transportation • Capital Improvements	Inspection of public projects for construction and new development controls, public facilities design, issuance of grading permits	Construction, New Development, Illicit Discharge
• Maintenance Services	Administration and implementation of pollution prevention at City corporation yards	Construction, New Development, Municipal Operations
Utilities • Solid Waste	Curbside recycling (including Curb Your Crude Program), recycling and household hazardous waste programs, operation of household hazardous waste collection center, composting program, educational programs, street sweeping	Illicit Discharge, Municipal Operations, Public Outreach
• Engineering Services	Incorporation of construction and post construction control measures not City Projects, development project review, inspection of private development and City Projects, administration of City's NPDES Stormwater Permit	Construction, Commercial/Industrial, Municipal Operations, New Development, Watershed Stewardship
• Plant Services	Pump station sediment cleaning and sample collection, illegal discharge reporting, street wash inspection program	Illicit Discharge, Commercial/Industrial, Public Outreach, Target Pollutant
• Field Services	Maintenance of MS4 system including detention basins	Illicit Discharge, New Development, Construction, Target Pollutant
• Business Services	24-hour clearing house for spills and illegal dumping complaints	Illicit Discharge, Construction, Municipal Operations
Convention, Culture and Leisure	Incorporate public outreach messages into facility displays and events. This includes the zoo, Fairy Tale Town, Old Sacramento, Convention Center, marinas, museums, etc.	Public Outreach
<u>Local Agencies</u>		
Business Environmental Resource Center (BERC)	Outreach to and regulatory consultation for private industry	Construction, Illicit Discharge, Commercial/Industrial, Municipal Operations, New Development, Public Outreach, Target Pollutant
District Attorney	Enforcement of pollution prevention laws, Environmental Task Force meetings	Illicit Discharge, Commercial/Industrial, Target Pollutant
Sacramento Public Library Authority	Exhibit displays and points of distribution for volunteer storm drain stenciling program brochures	Illicit Discharge, Public Outreach

City Departments / Other Local Agencies	Summary of Activities	Major Related Stormwater Management Program Elements
Sacramento County Environmental Management Division	Food service and industrial facility inspection program, illegal discharge referrals	Illicit Discharge, Commercial/Industrial
Sacramento Regional County Sanitation District	Industrial facility inspection, coordination of post construction controls, general permit outreach	Illicit Discharge, Commercial/Industrial, New Development, Public Outreach
State and Federal Agencies/Organizations		
State Department of Fish and Game	Spill response, and enforcement and investigation	Illicit Discharge, Commercial/Industrial, Public Outreach, Watershed Stewardship
UC Extension IPM Program	Water Wise Pest Control Program	Public Outreach , Target Pollutant
UC Extension Master Gardeners	Water Wise Pest Control Program	Public Outreach, Target Pollutant
Bay Area Stormwater Management Agencies Association	Implement outreach such as Our Water Our World outreach in local hardware stores and the EcoWise IPM certification program for professional pest control applicators.	Public Outreach, Target Pollutant
Sacramento-Yolo Mosquito and Vector Control District	Conduct public outreach regarding pest control activities.	Public Outreach, Target Pollutant
County Agricultural Commission	Compiles pesticide use information for the Partnership area.	Target Pollutant
Department of Pesticide Regulations	Implement pesticide use regulations	Target Pollutant
Delta Tributary Mercury Council	Coordinates regional mercury control strategies and public outreach activities.	Target Pollutant
Mercury TMDL Stakeholder group	Coordinates development of regional mercury control strategies.	Target Pollutant
CALFED Bay Delta Program	This federal and state interagency organization is dedicated to restring the ecological health of the Bay-Delta system. Sacrament urban runoff is one of many pollutant sources to the Bay-Delta and CALFED has significant grant opportunities for activities that would result in Bay-Delta improvements.	Program Management

City Departments / Other Local Agencies	Summary of Activities	Major Related Stormwater Management Program Elements
Central Valley Drinking Water Policy Work Group	Coordinates development of Regional Water Board policies for drinking water constituent of concern. Urban runoff is one of many pollutant sources affected by the policy.	Program Management
California Stormwater Quality Association	The association is a non-profit corporation that includes California stormwater program, state, and federal regulatory agencies, and environmental groups. CASQA discusses and shapes stormwater policy.	Program Management

Collaboration on activities across Sacramento City Stormwater Program Elements ensures consistency in program task implementation. This collaboration also ensures that compliance is achieved in a cost effective manner. Therefore, most Sacramento City Stormwater Program Elements interrelate with each other. Additionally, Partnership activities, such as the Monitoring Program (Section 2.4), Target Pollutant Program (Section 2.5), Regional Public Outreach Program (Section 2.6), and Regional Commercial/Industrial Program (Section 2.7) also coordinate with Sacramento City Stormwater Program Elements to ensure reduction of pollutants discharged into the waterways.

Sacramento City's relationships with the other Permittees are described in Chapter 1 and 2. A discussion of the various agencies and groups that the Partnership and Sacramento City coordinate with is also included in Chapter 1 and Table 4.2-1.

Participation in Regional, Statewide and National Activities

Since 1990, Sacramento City has taken a leadership role in stormwater management programs by closely tracking national activities, developing regulations and forming stormwater management programs. Sacramento City continues to be involved in state and regional stormwater management activities, as demonstrated by its involvement in the California Stormwater Quality Association (CASQA), a statewide nonprofit corporation comprised of stormwater NPDES permit holders and other interested stakeholders. Sacramento City was also instrumental in founding the Urban Pesticide Committee (UPC) an open forum for exchange of information on water quality, toxicity impacts of pesticide use in urban areas, and discussions of potential control measures.

Sacramento City Stormwater Program staff continue to participate in several statewide and regional efforts to share information on topics related to stormwater quality issues, stormwater program implementation, and urban runoff within the context of the watershed as a whole, including UPC and CASQA activities; the Sacramento River Watershed Program (SRWP), which seeks to improve the health of the watershed by identifying problems and implementing solutions; refer to Table 4.2-1 for a listing of additional efforts.

4.2.8 Annual Planning and Reporting Activities

A list of annual planning and reporting activities can be found in Table 4.2-4, at the end of this section. Additionally, the Sacramento City annual work plan is implemented in the fiscal year (July 1 through June 30) following the May 1st submittal of the work plans to the Regional Water Board. The budget development for the work plans is initiated in the December prior to the May 1st submittals.

4.2.9 Budget/Staff Resources

As described above and Table 4.2-1, other Sacramento City departments provide significant resources and support services to the Sacramento City Stormwater Program. This includes resources for a full range of municipal activities that implement pollution prevention measures such as street sweeping, detention basin operation and maintenance, inlet cleaning, hazardous waste pick up, spill response, etc. Resources are also provided to implement pollution prevention measures such as at corporation yards or for chemical weed control activities. The costs for completing these Sacramento City Stormwater Program activities are included in the existing department budgets for these activities and are not quantified.

As described previously, the DOU Water Quality Section oversees the Sacramento City compliance effort for the Stormwater Permit. The Sacramento City Stormwater Program budget for activities conducted by DOU Water Quality Section is approximately $2.8 million, including staff salaries, implementation costs and monitoring activities costs. These costs are funded by an existing stormwater utility fee and by development fees.

The Sacramento City Stormwater Program staff resources include one Supervising Engineer, two Senior Engineers, an Associate Engineer, an Assistant Engineer, two Program Analysts, and two Stormwater Program Inspectors (one currently vacant). This staff complete work for the Stormwater Program and for other National Pollutant Discharge Elimination System (NPDES) permits and Waste Discharge Requirements for Sacramento City and therefore are not fully allocated to the Stormwater Program. The Sacramento City Stormwater Program also utilizes students on a part-time basis. Resources equal to approximately 9 full-time equivalent positions (FTEs) are committed to the Sacramento City Stormwater Program. Table 4.2-2 provides a breakdown of the estimated staffing needed to accomplish all annual work plan goals and to ensure the Sacramento City Stormwater Program's continued progress.

Table 4.2-2
Staff Resource Allocations (2009)

Program Function/Element	Staff FTEs
Stormwater Program Management	0.7
Construction	2.7
Commercial/Industrial	0.8
Municipal Operations	0.9
Illicit Discharge	0.6
Public Outreach (including Watershed Stewardship)	1.1
New Development	.0.8
Monitoring Program (including Special Studies)	1.0
Target Pollutant Program	0.4
TOTAL	9.0

4.2.9 City Employee Training

Sacramento City Stormwater Program staff implements training requirements for various Program Elements and provides outreach to other Sacramento City staff. Training and outreach includes topics such as current regulations; changes in regulations or procedures; program-specific requirements; and new practices and control measures. Outreach and training may take the form of training sessions during staff meetings, enrollment in classes offered through City University (a training curriculum unique to the City of Sacramento), fact sheets, workshops, tailgate meetings, and/or brochures.

Table 4.2-3 lists the sections and groups targeted for training, the Sacramento City Stormwater Program Elements addressed and the frequency of training sessions. Additional groups and training frequencies will be added to this table as new training sessions are developed. The Training Summary Table will be included in the annual reports and updated annually as new groups and messages are identified.

Table 4.2-3
City Employee Training

Department	Section/Group	Element/Program Addressed	Frequency

4.3 CONSTRUCTION ELEMENT

4.3.1 Goal

The goal of the Construction Element is to reduce the discharge of stormwater pollutants to the maximum extent practicable (MEP) by requiring construction sites to reduce both sediment in site runoff and other pollutants such as litter and concrete wastes through good housekeeping procedures and proper waste management. Excessive discharge of sediment can cause erosion and harm creek habitat through both scour and smothering of spawning areas.

POLLUTANTS ADDRESSED BY THIS ELEMENT

- **Sediment***
- **Metals***
- Nutrients
- **Pesticides***
- Construction waste
- Other non-stormwater discharges

***Target pollutant for Sacramento area**

4.3.2 Evolution

During past permit terms, activities under the Construction Element were concentrated on developing ordinances and standards, incorporating these requirements into the development review process and project management procedures. Currently, the development review process successfully incorporates stormwater requirements for private development projects from the planning process to the completion of construction.

In the last permit term, the Sacramento City began to:

- Verify that the stormwater pollution prevention plans (SWPPPs) submitted to Sacramento City contained specific required State Construction General Permit components
- Prioritize construction sites as a high or moderate threat to water quality
- Inspect construction sites at minimum inspection frequencies
- Annually train Sacramento City employees who are engaged in construction related activities on stormwater runoff prevention procedures

A comprehensive list of accomplishments to date for the Construction Element is provided in Appendix 4A.

In this permit term, the Construction Element will concentrate on updating:

- Existing standards, procedures and specifications such as Sacramento City's Administrative and Technical Procedures Manual for Grading, Erosion and Sediment Control (Grading Manual)
- Control measures with current, innovative Erosion and Sediment Control (ESC) measures and housekeeping practices

If necessary, City codes will be revised to comply with any new requirements in the upcoming reissued State Construction General Permit. Resources will also focus on providing annual training of Sacramento City staff on both local and state requirements.

A detailed list of tasks and schedules for implementation can be found in Table 4.3-1 – City of Sacramento Construction Element Activities Work Plan (2008-2013).

4.3.3 Strategy

The Construction Element strategy includes the following components:

- Ensure that plan review and approval procedures, standards and field requirements are clear and effective.
- Ensure that the development and construction community:
  - Comply with local grading, erosion and sediment control requirements
  - Properly implement the required BMPs associated with construction activities
  - Maintain good housekeeping practices associated with construction activities
  - Obtain the State Construction General Permit if applicable
- Ensure that City project managers:
  - Obtain coverage under the State Construction General Permit for all applicable municipal improvement projects
  - Comply with local erosion and sediment control requirements
- Provide plan review, inspections and enforcement.
- Evaluate and incorporate new technologies and alternative control measures.
- Provide training and technical support to Sacramento City staff on local and state stormwater quality requirements and procedures.
- Conduct outreach and provide guidance to the development and construction community on stormwater quality requirements related to construction activities.
- Conduct periodic meetings with Sacramento City Stormwater Program Inspectors to evaluate current and proposed ESC requirements and good housekeeping practices.

4.3.4 Activities

A list of tasks and their associated schedule is presented in Table 4.3-1 – City of Sacramento Construction Element Activities Work Plan (2008-2013), located at the end of this section.

Legal Authority

The City of Sacramento Grading, Erosion and Sediment Control Ordinance (Grading Ordinance) available in Appendix 4C will be evaluated periodically and updated as necessary to include new requirements from the State Construction General Permit.

Erosion, sediment and pollution control standards and specifications will also be evaluated and revised as necessary based on construction practices and on the latest technology. Alternative and innovative control measures may be identified and evaluated through networking with other programs, product research, literature reviews, and BMP performance studies. Water quality control requirements and standards drawings are included within with Sacramento City's Standard Specifications. See Appendix 4G for the City of Sacramento Standard Specifications (June 2007), Section 16 Water Quality Control.

After reissuance of the State Construction General Permit, components of the Construction Element will be re-evaluated to identify any standards and/or procedures that should be revised to effectively reduce construction site-related pollution to the MEP.

Permitting, Inspection and Enforcement

Developers, contractors, and/or project managers are notified of Sacramento City erosion, sediment and pollution control and State Construction General Permit requirements during the entitlement and plan review process. Local and state requirements are incorporated into environmental documents such as Environmental Impact Reports (EIRs), Mitigation Monitoring Plans (MMPs), and standard conditions for entitlements such as tentative maps and special permits.

Development projects must adequately address city and state requirements through the entitlement and plan approval process as well as municipal procedures, by ensuring that each project includes an adequate ESC plan and, if applicable, obtains a State Construction General Permit. Prior to issuing a grading or a building permit for projects requiring a State Construction General Permit, Sacramento City Department of Utilities Development Review staff will require the submittal of a completed SWPPP and the project's State-issued Waste Discharge Identification (WDID) number to verify that a State Permit was obtained.

SWPPPs submitted to the City must contain the following items at a minimum:

- Vicinity map
- Site map
- List of potential sources of stormwater pollution
- Type and location of ESC BMPs
- Name and number of the person responsible for implementing the SWPPP
- Signed landowner certification

Municipal project managers must ensure that ESC plan(s) are prepared and that State General Construction Permit(s) are obtained and implemented for all applicable municipal projects. Municipal construction projects are also briefly discussed in Section 4.5, the Municipal Operations Element.

Construction projects are inspected to ensure that sites comply with City of Sacramento Grading Ordinance. Inspection staff ensures that control measures are implemented, properly installed and maintained throughout the entire construction phase of a project.

Minimum construction inspection frequencies will be established for construction projects disturbing one acre or more, by prioritizing sites as a high threat or moderate threat to water quality. Factors utilized to rate these construction projects inspection frequencies include:

- The project size, including all aspects of the construction phase (i.e., grading, improvements and structures), the activity level and the type of land use
- Whether the site is located in the area of a previous project with known erosive soils that was required to use mechanical and/or chemical filtration systems
- Whether the site borders and/or discharges directly to a water of the State and/or a 303(d)-listed water body that is sediment-impaired
- The number of previous violations of local stormwater ordinances, including recent State Construction General Permit violations obtained by the developer and/or the contractor(s) in Sacramento City's jurisdiction
- The quality of the site's BMP implementation and housekeeping practices

Projects designated as a high threat to water quality will be inspected a minimum of once every two weeks during the wet season (from October 1 to April 30) and once a month during the remainder of the year. Development sites designated as a moderate threat to water quality will be inspected a minimum of once a month throughout the entire year. These inspection frequency schedules are minimum standards and, when possible, Sacramento City Stormwater Program staff will meet the Construction Element goal of inspecting each private development project every two weeks.

Inspection and enforcement of private development projects is conducted by Sacramento City Stormwater Program Inspectors, and inspection and enforcement of municipal projects is conducted by Sacramento City Construction Inspectors from the responsible department (e.g., Departments of Parks and Recreation, General Services, Transportation, and Utilities). Municipal Construction Inspectors will regularly enforce local stormwater requirements and document actions in their daily logs.

Sacramento City Stormwater Program inspectors will enforce the local stormwater requirements at private development projects. Enforcement actions include verbal warnings, notices to comply, stop work orders and administrative penalties. The Sacramento City Stormwater Program Inspector will also assist the Municipal Construction Inspectors when needed.

Sacramento City's enforcement authority is contained in the Grading Ordinance and the Stormwater Ordinance (Stormwater Ordinance is attached in Appendix 4B). In addition to these ordinances, Sacramento City Stormwater Program staff utilizes the Administrative Penalty Guidelines for Prohibited Non-Stormwater Discharges **(**attached in Appendix 4H) when issuing administrative penalties. Sacramento City Stormwater Program staff will formalize the Sacramento City progressive enforcement procedures used by the Sacramento City Stormwater Program.

If Sacramento City Stormwater Program staff cannot determine whether the developer/owner has submitted a Notice of Intent (NOI) or received a Waste Discharge Identification (WDID) number, Sacramento City Stormwater Program staff will notify the Central Valley Regional Water Quality Control Board (Regional Water Board) within 5 business days of discovery. Such non-filer referrals will include the project location, the developer, the estimated project size, and any records of communication between Sacramento City Stormwater Program staff and the developer regarding filing requirements.

The Sacramento City Stormwater Program utilizes a Microsoft Access database to track grading permits issued, WDID numbers, SWPPPs submitted, site prioritization, inspections conducted, and enforcement actions issued for private development projects.

Training and Outreach

Sacramento City Stormwater Program staff will educate and provide guidance to Sacramento City staff (engineers, CIP project managers, building and construction inspectors, etc.) and to the construction and development communities on local and state requirements and procedures, as well as new technologies and practices, to ensure effective implementation of stormwater quality construction standards for municipal and private development projects. Outreach will include topics such as current regulations; changes in regulations, procedures or requirements; and new practices and control measures. Outreach may take the form of fact-sheets on regulations, workshops, staff meetings, preconstruction meetings, boilerplate ESC plans, brochures for specific practices (e.g., landscaping), etc.

Sacramento City staff who are engaged in construction activities, including the Sacramento City Department of Utilities Development Review staff, project managers, and inspectors, will be trained annually. See Table 4.2-1 in Section 4.2 – Program Management for a summary table of the various Sacramento City departments identified for training and for their training frequency. Outreach to the construction and development community will be conducted as needed.

Sacramento City Stormwater Program staff will coordinate bi-weekly meetings with Sacramento City Stormwater Program Inspectors to resolve issues identified from inspections and ensure effective and consistent enforcement.

4.3.5 Effectiveness Assessment

The Permittees' general approach to assessing the effectiveness of its stormwater programs is described in Section 2.3, Program Effectiveness. This section specifically describes the assessment activities and associated methods for evaluating the effectiveness of the Construction Element.

Activities discussed above and listed in Table 4.3-1 will be documented and reported in the annual report(s). Activities have the outcome level of 1 – Documenting Activities unless otherwise specified in Table 4.3-1. Element key indicators, indicated by checkmarks in Table 4.3-1, have outcome levels of 2 through 3, and will be used to demonstrate progress towards meeting the element goal. The work plan table also shows the schedule for the effectiveness assessment and the progression of the outcome levels.

Any change, if necessary, to the planned activities will be documented in annual work plan(s) and reported in the appropriate annual report(s). Results of the effectiveness assessment will be used to focus and modify activities for maximum environmental benefit.

The Construction Element is currently implementing effectiveness assessments at outcome level 1 – Documenting Activities. Activities used in the past to assess the element's effectiveness included:

- A special study on the effectiveness of inlet protection
- Plan quality and field implementation assessments conducted by Stormwater Program staff
- An independent third party audit and observations and feedback on improvements in knowledge and field implementation

The focus during this permit term will be on assessing the effectiveness of plan review, field implementation and staff training. Selected ESC plans will be regularly assessed to ensure the plans meet stormwater quality requirements, selected construction sites will be evaluated to ensure BMPs are implemented and properly maintained, and surveys will be developed to assess staff's understanding of training concepts.

Table 4.3-1

City of Sacramento Construction Element Activities Work Plan (2008-2013)

Element Goal: The goal of the Construction Element is to reduce the discharge of stormwater pollutants at construction sites to the maximum extent practicable (MEP) by requiring erosion, sediment and pollution controls .

4.4 COMMERCIAL/INDUSTRIAL ELEMENT

4.4.1 Goal

The goal of the Commercial/Industrial Element is to reduce or eliminate the discharge of pollutants into the City of Sacramento (Sacramento City) storm drainage system that are produced from all types of business activities to the MEP.

POLLUTANTS ADDRESSED BY THIS ELEMENT

- **Sediment***
- Metals:
  - **Copper***
  - **Lead***
  - **Mercury***
  - Other Metals
- **Pesticides***
- Concrete
- Other non-stormwater discharges

***Target pollutant for Sacramento area**

4.4.2 Evolution

One of the first tasks of the Commercial/Industrial Element was to inform the industrial community about stormwater regulations and the State Industrial General Permit. Sacramento City staff conducted outreach, including a workshop in 1996, for industries that staff thought would need coverage under the Industrial General Permit; however, industry participation was low. In July 2004, the County of Sacramento Environmental Management Department (EMD) began conducting inspections under the Commercial and Industrial Stormwater Compliance Program (CISCP). Since 2004, the Commercial/Industrial Element has been more successful at identifying industries that need coverage under the Industrial General Permit and reporting non-filers to the Regional Water Board.

In 1996, the Sacramento City Stormwater Program staff prioritized 40 common industrial and commercial business types based on their potential to impact water quality using five different descriptive categories. The 2004 Stormwater Permit required that the industry list be updated using additional criteria specified by the Regional Water Quality Control Board (Regional Water Board). The following industries were chosen for inspection: auto repair shops and body shops; auto sales, lease and rental dealerships; gas stations; restaurants; nurseries; kennels; equipment rental businesses; and, facilities with coverage under the State General Industrial Stormwater Permit.

In the spring of 2007, EMD updated the industrial category definitions in order to clarify which industries would be included in the CISCP. The industry list was also used to identify industries that should be targeted for educational outreach. The Partnership conducted outreach twice during the last permit term for industries that ranked in the top 20 of the prioritization list. See Section 2.7 - Regional Commercial/Industrial Program for more information on the inspection program, industry outreach, and the CISCP.

In the last permit term, Sacramento City Program staff conducted investigations on industries that did not fall under the CISCP program; instead, they were covered under the Complaint-Based Stormwater Compliance Program (CBSCP). Complaints from the public, other businesses, or referrals from EMD initiated these investigations. Program staff worked with industries to comply with the Stormwater Ordinance by implementing progressive enforcement actions, cost recovery assessments, and providing educational materials. Appendix 4A provides a comprehensive list of accomplishments for this Element.

In this permit term, the Permittees will continue implementing the CISCP discussed in Section 2.7 - Regional Commercial/Industrial Program and the CBSCP discussed in this section, and will implement outreach to targeted businesses that exceed the Regional Water Board Benchmarks discussed in Section 2.7.

A more specific list of tasks and schedules is presented in Table 4.4-1 – Commercial/Industrial Activities Work Plan (2008-2013).

4.4.3 Strategy

The Commercial/Industrial Element strategy includes the following components:

- Continue implementation of the CISCP.
- Continue implementation of Sacramento City's CBSCP.
- Continue efforts to identify and notify industries in the City that may need coverage under the State Industrial General Permit.
- Continue to encourage increased industry participation in the Clean Water Business Partner (CWBP) Program.
- Continue to encourage industries to use other industry assistance programs such as the Business Environmental Resource Center (BERC).
- Continue to conduct outreach to priority and targeted industries/businesses; particularly those that have a history of significant violations.

4.4.4 Activities

The Commercial/Industrial Element includes Regional Commercial/Industrial Program activities, described in Section 2.7 and Table 2.7-1, and Sacramento City activities, described below and in Table 4.4-1. The regional activities include:

- Priority industry and industrial pollutant identification
- The Commercial and Industrial Stormwater Compliance Program (CISCP)
- Permittee evaluations
- Outreach

A list of Sacramento City tasks and their associated schedules is presented in Table 4.4-1, Commercial/Industrial Activities Work Plan (2008-2013), at the end of this section.

Legal Authority

Sacramento City's Stormwater Ordinance attached in Appendix 4B provides legal authority for regulating pollutant discharges to the storm drain system. This Stormwater Ordinance will be reviewed and amended as needed to ensure that pollutant sources from commercial businesses and industrial facilities are effectively addressed.

Complaint-Based Stormwater Compliance Program (CBSCP)

Sacramento City Program staff investigates complaints involving discharges of prohibited non-stormwater or other pollutants from industrial facilities within five days of the initial report; if the report involves a suspected hazardous substance, the investigation begins within one day of the initial report. CBSCP complaints involve industries not covered by the CISCP inspections. Any complaints received that fall under the CISCP are referred to EMD for investigation. Sacramento City first responder crews respond immediately to any complaint involving a non-stormwater discharge that may need immediate abatement and clean up.

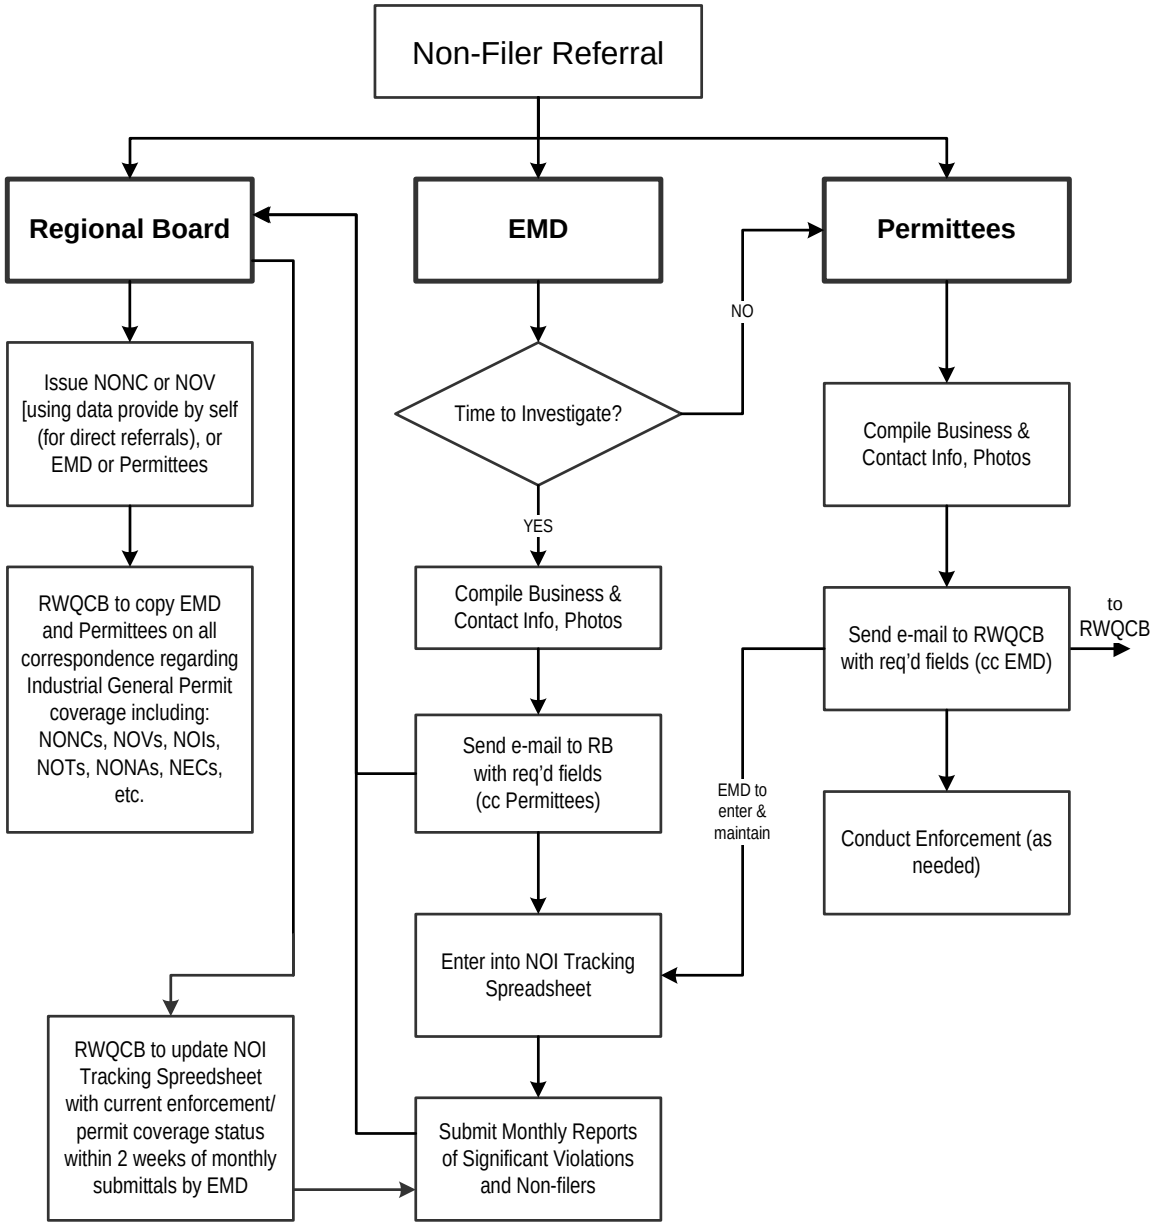
Industrial investigations will verify that each facility and/or activity conducted is in compliance with the Sacramento City Stormwater Ordinance. The progressive enforcement process will be continued, as needed, to issue verbal warnings, notices to comply, notices of violations, and/or administrative penalties. See Appendix 4H for a copy of the Sacramento City Administrative Penalty guidelines for Prohibited Non-Stormwater Discharges. Cost recovery will be used when the City has to clean up a non-stormwater discharge and the discharger is known. City staff will provide relevant educational material to industries during investigations.

Sacramento City Stormwater Program staff will formalize the Sacramento City progressive enforcement procedures used by the Sacramento City Stormwater Program to enforce requirements in the Construction, Illicit Discharge and Commercial/Industrial Elements.

In conjunction with the Illicit Discharge Element, a database will be used to track the investigations and enforcement actions associated with the complaints. The database will be used to determine trends in violations among industries, response time, repeat offenders, and industries requiring outreach.

Sacramento City Stormwater Program staff will continue to coordinate with the Regional Water Board related to non-compliant facilities and suspected Industrial General Permit non-filers. The process used to report non-filers to the Regional Water Board is shown in Figure 4.4-1 on the next page. All referrals from the Regional Water Board will be investigated within three working days.

Outreach



Compliance assistance and information is made available through a variety of outlets and types of media. Brochures, flyers, fact sheets, workshops, site visits, television, and radio all contribute to inform the business community. Commercial/Industrial Element staff routinely work with Public Outreach Element staff and BERC to produce and distribute compliance information.

BERC provides confidential assistance for local industries seeking stormwater compliance information. Sacramento City staff coordinates with BERC to distribute stormwater pollution prevention information to local industries. Also, BERC conducts various stormwater compliance seminars every year targeting specific industries. Sacramento City contributes funds to BERC each year.

The CWBP Program uses a different and more positive approach to achieve compliance, relying on education, not enforcement. Participating businesses agree to: (1) conduct their activities in a manner that prevents stormwater pollution; and (2) provide outreach materials to their customers. In return, the businesses receive promotion and acknowledgement for being Program members. The Business Outreach portion of the Regional Public Outreach Activities section (in Section 2.6.5) provides detailed information on the CWBP Program.

Along with the other Permittees, Sacramento City will continue to conduct outreach twice during the permit term to targeted industries known to potentially cause significant non-stormwater discharges. The goal of the outreach is to increase awareness of stormwater pollution and applicable regulations, educate industry owners and operators about BMPs for addressing pollution, and encourage environmental stewardship. See the Outreach activity under Section 2.7 – Regional Commercial/Industrial Program for more information on the targeted outreach.

Figure 4.4.1
Referral Process for Industrial General Permit Non-Filers

Effectiveness Assessment

The Permittees' general approach to assessing the effectiveness of its stormwater programs is described in Section 2.3, Program Effectiveness. This section specifically describes the assessment activities and associated methods for evaluating the effectiveness of the Commercial/Industrial Element. Additional activities and effectiveness assessments are included in Section 2.7, Regional Commercial/Industrial Program and Table 2.7-1.

Activities discussed above and listed in Table 4.4-1 will be documented and reported in the annual report(s). Activities have the outcome level of 1 – Documenting Activities unless otherwise specified in Table 4.4-1. Element key indicators, indicated by checkmarks in Table 4.4-1, have an outcome level of 3, and will be used to demonstrate progress towards meeting the element goal. The work plan table also shows the schedule for the effectiveness assessment and the progression of the outcome levels.

Any change, if necessary, to the planned activities will be documented in annual work plan(s) and reported in the appropriate annual report(s). Results of the effectiveness assessment will be used to focus and modify activities for maximum environmental benefit.

Sacramento City Commercial/Industrial Element is currently implementing effectiveness assessments at outcome level 1 – Documenting Activities. The key indicator will measure the reduction in the number of repeat violations in the CBSCP within a two year period.

Table 4.4-1

City of Sacramento Commercial/Industrial Element Activities Work Plan (2008-2013)

Element Goal: The goal of the Commercial/Industrial Element is to reduce or eliminate the discharge of pollutants into the storm drainage system that are produced from all types of business activities to the MEP .

4.5 MUNICIPAL OPERATIONS ELEMENT

4.5.1 Goal

The goal of the Municipal Operations Element is to mitigate potential pollutants generated by municipal facilities and activities to the maximum extent practicable (MEP), to continue pollutant reduction efforts performed by Sacramento City Department of Utilities (DOU) staff, and to set an example of model pollution prevention for the public.

POLLUTANTS ADDRESSED BY THIS ELEMENT

- **Sediment***
- Vegetation waste clippings
- **Metals***
- Nutrients
- **Pesticides***
- Organic Carbon
- Bacteria/Pathogens
- Construction waste
- Maintenance waste
- **Hydrocarbon Products***
- Other non-stormwater discharges

***Target pollutant for Sacramento area**

4.5.2 Evolution

During past permit terms, the Municipal Operations Element has:

- Implemented a spill response program
- Complied with the State Construction General Permit for municipal construction projects
- Begun auditing existing municipal facilities having the potential to discharge pollutants into urban runoff, and identified targeted facilities for written pollution prevention plans
- Conducted prioritized storm drain system maintenance activities based upon accumulation of debris, customer complaints, and seasonal concerns
- Performed street sweeping for all curbed streets at least once per month
- Marked Sacramento City storm drain inlets with either long-term markers, stenciling, or permanent concrete stamps
- Trained Sacramento City staff on the impacts of stormwater pollution and associated prevention activities.

A comprehensive list of accomplishments for this Element is provided in Appendix 4A.

During the upcoming permit term, the Municipal Operations Element will continue implementing these activities, but staff will also develop and implement other activities, including:

- Facility Pollution Prevention Plans (FPPPs) including tracking of BMP implementation for facilities and corporation yards involved with vehicle/equipment maintenance and material storage
- Integrated Pest Management strategies for all Sacramento City departments involved with pesticide applications
- Inspection frequencies and maintenance procedures for Sacramento City-owned parking lots exposed to rainfall
- Adaptive Management Plans (AMPs) or Lake Management Plans (LMPs) for water quality detention basins
- Response plan for emergency and non-emergency fire-flow discharges

A more specific list of tasks and schedules is presented in Table 4.5-1, Municipal Operations Element Activities Work Plan (2008-2013).

4.5.3 Strategy

Existing Sacramento City inspections and cleanings of the drainage collection system and monthly sweeping of curbed streets provides for a substantial reduction in stormwater pollutant discharges into receiving waters. Additionally, the Municipal Operations Element will implement new or continue to enhance existing municipal services and mitigate potential pollutant generating activities in order to meet its goal. The strategy will include activities in the following categories:

- Spill response
- New Development and Construction Requirements for Municipal Capital Improvement Projects
- Pollution Prevention at City Facilities
- Landscape and Pest Management
- Storm Drain System Maintenance
- Street Cleaning and Maintenance
- Curbside Green Waste Collection
- Parking Facilities Maintenance
- Detention Basin Maintenance
- Emergency Procedures
- Non-Emergency Fire Fighting Flows
- Training

4.5.4 Activities

A list of tasks and their associated schedule is presented in Table 4.5-1, Municipal Operations Element Activities Work Plan (2008-2013), located at the end of this section.

Spill Response

Sacramento City implements an extensive Supervisory Control And Data Acquisition system (SCADA) that is used to remotely monitor and manage flows of the drainage and sanitary sewer pumping stations (Sumps). The SCADA system provides real-time information regarding Sump volumes and associated pumping activities, and its remote monitoring of Sumps is conducted at all times without interruption. The SCADA system monitoring of the sanitary-sewer Sumps provides for effective prevention, identification and correction of sanitary sewer overflows (SSOs) to the drainage system, and is also utilized in the mitigation of reported illicit discharges into the drainage system. In the event of a SSO or of an illicit discharge entering the drainage system, the pumps at the associated drainage Sump are shut off until proper clean-up procedures have been implemented. The SCADA system and the associated spill response procedures routinely prevent non-stormwater discharges and sewage from reaching receiving waters. See Appendix 4I for the Wastewater Collection Standard Operating Procedure (SOP). This SOP outlines procedures pertaining to the sanitary sewer system, combined sewer system and weather related events.

Sacramento City's DOU Field Services Division's Drainage Section (Drainage Section) first responders will continue responding to reported illicit discharges and spills entering, or threatening to enter, the drainage collection system. The first responders will abate the hazard, clean the impacted drainage lines and associated appurtenances, and arrange for proper disposal of the discharged substance. Sacramento City's drainage first responders coordinate with Sacramento County and Sacramento City HAZMAT crews, outside contractors and other regulatory agencies when necessary. See Section 4.6, Illicit Discharge Element, for further details.

Sacramento City also has coverage under the recently adopted Statewide General Waste Discharge Requirements (WDR), Order No. 2006-0003, for all publicly owned sanitary sewer collection systems. The purpose of the WDR is to prevent SSOs and requires Sacramento City to develop and implement a Sewer System Management Plan (SSMP) to eliminate SSOs. The Sacramento City Council certified the City's SSMP on April 21, 2009.

New Development and Construction Requirements for Municipal Capital Improvement Projects

Sacramento City Stormwater Program staff will review and if necessary revise the procedures for design and construction of public capital improvement projects to ensure that post-construction requirements are implemented, where applicable, for public construction projects. Sacramento City staff will continue to obtain coverage under the State Construction General Permit for applicable Sacramento City construction sites. See Section 4.3, Construction Element and Section 4.8, New Development Element for further details.

Pollution Prevention at City Facilities

The Sacramento City Stormwater Program staff have audited existing facilities that have the potential for discharging pollutants to Sacramento City's drainage system and/or receiving waters. These audits identified potential pollutant discharges resulting from the activities conducted at these sites and the existing BMPs implemented to reduce the potential discharges. Plumbing of wash areas were investigated (except for fire stations) to ensure that all connections were either self-contained, equipped with a clarifier, equipped with an alternative pre-treatment device, or plumbed to the sanitary sewer system. During these audits, additional BMPs, guidance materials and training required to further reduce potential pollutant discharges from Sacramento City facilities were identified and will be addressed in facility-specific pollution prevention plans. See Appendix 4J for the initial facility audit report.

Sacramento City Stormwater Program staff will review and update existing Storm Water Pollution Prevention Plans (SWPPPs) for General Industrial permitted facilities, and develop similar Facility Pollution Prevention Plans (FPPPs) for targeted, non-permitted facilities with the potential of discharging pollutants into the drainage system. These pollution prevention plans will include good housekeeping practices, material storage control and leak and/or spill control. SWPPPs and FPPPs will be reviewed and revised every year for the first three years after implementation, and subsequent reviews will be conducted at least once per permit term. See Appendix 4K for an example of an existing SWPPP and Appendix 4L for an example of a newly developed FPPP. Additionally, inspection frequencies will be established to ensure adequate BMP implementation and maintenance. A database will be developed to track site-specific BMP selection, inspections and effectiveness rankings.

Maintenance of Sacramento City-maintained ornamental ponds and ponds at City-maintained golf courses will be further evaluated during FPPP inspections to ensure that no discharge of contaminated pond water enters the storm drainage system. As FPPPs for Golf Courses are being updated, documentation of pond maintenance will be included in the updated FPPPs and in the associated database. Currently, none of the ponds associated with Sacramento City-maintained golf courses are ever routinely drained.

Landscape and Pest Management

Sacramento City Stormwater Program staff will continue developing and implementing Integrative Pest Management (IPM) policies and procedures that apply to all of Sacramento City's pest management activities (see Appendix 4M for Sacramento City's current IPM Policy). IPM, which focuses on long-term prevention of pests or their damage through a combination of techniques such as biological control, habitat manipulation and modification of cultural practices, ensures that:

- Pesticides are used only after monitoring indicates they are needed and according to established guidelines
- Treatments are made with the goal of removing only the target organism
- Pest control materials are selected and applied in a manner that minimizes risks to human health, to beneficial and non-target organisms, to water quality, and to the environment

In addition to adopting IPM management strategies, Sacramento City staff will continue implementing standardized protocols for chemical applications of pesticides (including pre-emergents) and fertilizers that:

- Prohibit application or storage of banned or unregistered pesticides
- Require staff applying pesticides to be certified by the California Department of Pesticide Regulation, or under the direct supervision of a certified pesticide applicator
- Require the storage of fertilizers and pesticides indoors or under cover on paved surfaces, or the use of secondary containment
- Minimize the use, the storage and the handling of pesticides to reduce the potential for spills
- Require the regular inspection of storage areas

Pest management decisions for each specific Sacramento City owned and/or operated facilities will follow an IPM Implementation Plan, and include contract provisions for Pest Control Operators requiring IPM services. In addition, training and guidance materials will be developed, where necessary, to support the effective implementation of IPM strategies at these facilities. See Appendix 4N for a sample of the current contract language associated with structural pest control.

Storm Drain System Maintenance

Sacramento City staff will continue to remove accumulated debris and sediment from the storm drainage system (i.e., pumping stations, underground drainage lines, drainage inlets, manholes, and drainage channels). By following prescribed maintenance procedures, Sacramento City staff ensures removal of pollutants to the MEP and protection of the habitat within the improved and/or natural drainage facility. Sacramento City staff will also continue to implement existing storm drain maintenance procedures that minimize the discharge of pollutants during maintenance of the drainage channels, ditches and creeks. Sacramento City staff will also continue to measure the quantity of waste removed, to properly dispose of material removed, and to keep accurate records of maintenance operations. Sacramento City's drainage Sumps are maintained by the DOU Plant Services Division, and the remaining drainage infrastructure is maintained by the Drainage Section field crews.

The drainage system for Sacramento City is broken up into several drainage sheds, and drainage from the majority of these sheds is collected at Sumps. Sump designs incorporate flood control features as well as sedimentation features within their wet wells. Furthermore, drainage Sumps are considered "downstream BMPs" because of the ability to trap litter and sediment. Large screens will contain litter and prevent it from entering the pump intake location, helping to minimize damage to pumping mechanisms. Litter is removed from screens during normal cleaning operations and disposed of properly.

All drainage Sumps are visually inspected on a weekly basis for evidence of contamination and preventative maintenance needs. Key factors for cleaning frequencies of Sumps include the amount of rainfall, the accumulation of debris, and the land use within the drainage shed. Of the 104 drainage Sumps within Sacramento City, approximately 75 are scheduled to be cleaned each year. If it is determined that there is an unusually high level of sediment and debris, then the Sump is placed on an accelerated cleaning cycle.

Sacramento City staff will continue implementing maintenance procedures for drainage channels, ditches and creeks as specified in the existing maintenance agreements with the California Department of Fish and Game. These agreements identify the environmental character of each drainage facility and appropriate maintenance activities and schedules to adequately address flood control needs within that facility.

Chemicals are sometimes used for weed control during channel maintenance. This type of chemical application adheres to strict oversight and guidelines as required by federal, state, and local regulations. All chemical applications are overseen by certified staff, and further guidance and oversight is performed by a contracted Pest Control Advisor (PCA). The DOU Field Services' contracted PCA provides regular training and recommendations for weed control; demonstrates knowledge of Integrated Pest Management (IPM) principles; provides guidance to all staff involved with chemical applications on the recommended use, the recommended application techniques, required safety practices, and on required disposal guidelines associated with the weed control chemicals. According to California State law, all PCAs require licensing by the California Department of Pesticide Regulation. In order to obtain such licensing, the PCA must show expertise in identifying and appropriately managing pests within an appropriate pest category, and the PCA can only make recommendations for that category.

Drainage Section field crews have been implementing a comprehensive maintenance and inspection program for the underground collection system for several decades which has met the Stormwater Permit requirements. Routine maintenance includes the inspection of mains, manholes, and drain inlets. Crews are typically inspecting for structural integrity, for flood related issues (which includes accumulation of debris), and for signs of illicit discharges and/or connections. All storm lines, drain-inlet leads and manholes are on a 3, 6, 12, 24, or 36-month cleaning schedule depending on the priority of the drainage facility. Priority is based on accumulation of waste, customer complaints, and flood control issues.

Another component of the storm drain system maintenance includes marking of the drain inlets with the "No Dumping" message to discourage illicit discharges. During the first two permit terms, Sacramento City used volunteers to mark drain inlets with the spray painted message, "No Dumping Drains to River." In the third permit term, Sacramento City Stormwater Program staff oversaw completion of a project to attach a more permanent curb marker conveying more information than the prior spray-painted message. The new markers include the river or creek name, the regional 916-808-4H20 public hotline number to report suspected spills and illegal dumping activities, and the Sacramento City Stormwater Program website internet address; thus establishing a stewardship between Sacramento City and its community to protect water quality. Initially, listing the river or creek name on the marker will educate the public about the specific receiving water being impacted by discharges in the specific inlets. These curb markers also match signs placed at creek crossings to discourage illegal dumping along creeks. When a marker needs to be replaced, a more general marker that does not designate a specific water body will be placed in order to simplify tracking and maintenance. At least 95 percent of the City's MS4 drain inlets associated with curb and gutter now have a no dumping message with either a concrete stamp or a curb marker; consequently, the volunteer stenciling program is no longer necessary and will be discontinued. Sacramento City Stormwater Program staff will oversee maintenance of the curb markers as needed either through field staff, volunteers or consultant services, replacing the affected curb markers.

Pollutant discharges into Sacramento City drainage facilities or into receiving waters will also be minimized by continuing to implement existing procedures for special events which requires special-use permits that require proper management of trash and litter.

Street Cleaning and Maintenance

Fine particles and pollutants naturally tend to accumulate along the curbs of roads in between rainfall events. Street sweeping is a source-control BMP employed by Sacramento City. Each year, Sacramento City street sweepers collect and dispose of sediment and debris that would otherwise be transported into the drainage collection system. The presence of downstream BMPs (i.e., drainage Sumps and their associated cleaning schedule) provide further defense against potential roadway-pollutants entering local receiving waters. Additionally, potential roadway-pollutants that have entered the drainage collection system may also be removed during cleaning of the underground pipes and appurtenances provided by Drainage Section field crews.

Sacramento City Solid Waste Division staff have categorized all city streets with a curb as Priority A, which are swept at least once per month, including curbed streets in the Sacramento City downtown area, which are on an accelerated schedule and are swept once per week. Wash water and solid waste collected as part of the street sweeping activities will continue to be disposed of properly, following applicable solid waste disposal requirements.

During this permit term, Sacramento City Stormwater Program staff will work with the DOU Solid Waste Division to evaluate Sacramento City's street sweeping program to determine if practices could be adjusted to capture additional amounts of accumulated sediments. The evaluation process will consider economic feasibility in order to justify any changes that may impact utility rates.

Sacramento City Stormwater Program staff has coordinated with the Street Maintenance Section of the Sacramento City Department of Transportation (DOT) to evaluate routine maintenance practices. Standardized BMP implementation practices specific to that section's activities were identified, and the appropriate supervisors assisted in the development of written standard procedures (see Appendix 4O for the Street Maintenance BMP Standard Operating Procedures). BMP practices are regularly implemented on all routine paving and concrete maintenance projects, and training specific to these routine activities is conducted annually. Any complaints received pertaining to street maintenance activities are addressed. The maintenance supervisors are very responsive to implementing corrective measures.

Various street-maintenance activities require sawcutting in the streets or in the right-of-way. Sawcut slurry is recovered with an on-site vacuum system and is disposed of properly. There are five Sacramento City Construction Inspectors dedicated to inspection of concrete activities that ensure proper BMP implementation of contracted sawcutting and concrete work. Also, all concrete wash water from Sacramento City's DOT In-Source Concrete crews is handled and disposed of appropriately; and any complaints received regarding improper disposal of concrete wash water is directed to the Concrete Supervisor who is responsive to implementing corrective measures.

Sacramento City Stormwater Program staff will continue to audit street maintenance practices and revise them, as needed, to ensure recovery and proper disposal of sawcutting waste; proper management of concrete and other street maintenance materials and wastes; and use of designated areas for concrete washout.

Curbside Green Waste Collection

On September 27, 1977, city voters approved Measure A, which adopted an ordinance to prohibit Sacramento City from requiring the mandatory containerization of yard and garden refuse within Sacramento City limits, unless this prohibition is repealed or amended by a vote of the majority of the electors of Sacramento City at any municipal election. The deposit and collection of garden refuse in the city streets results in various impacts that have resulted in numerous Sacramento City residents requesting that Sacramento City provide an option to subscribe to a containerized collection service as an alternative. Measure A prohibits mandatory containerization, but does not prohibit Sacramento City from providing an optional containerization collection service. Since the property owner's decision to participate in the program would be voluntary, Sacramento City would not be mandating or requiring containerization.

In 2004, Sacramento City's City Council approved an ordinance and associated resolutions amending Sacramento City's City Code to allow a voluntary containerization component to the lawn and garden collection services (see Appendix 4P for those resolutions and ordinance). Lawn and Garden Services include the collection of garden refuse from city streets, the disposal of garden refuse, and the periodic sweeping of those streets. The voluntary containerized collection service also provides collection and disposal of refuse placed in containers on Sacramento City streets and periodic street sweeping of those streets.

The voluntary containerized collection schedule includes weekly collection of containerized yard waste, and bi-weekly collection of loose material during the following seasons: Leaf Season (months of November and December), Pruning Season (end of February thru March), and Growth Season (end of April thru August). Sacramento City residents can learn more about the program and submit a request for participation through the DOU public website at the following internet address: www.cityofsacramento.org/utilities/solid-waste-recycling/residential/residential_voluntary_containerization.cfm. When enough residents from a particular neighborhood show interest in participating, the entire neighborhood will be offered the program. When a neighborhood has been targeted for green waste cans, Sacramento City staff send out a letter prior to container delivery and conducts a community meeting ten days before collection begins. This letter and accompanying community meeting provide information pertaining to the details of the program. Upon delivery of the container, additional outreach material is provided. See Appendix 4Q for examples of the letter mailed and of the outreach material distributed.

At the end of the third permit term, approximately 50,000 Solid Waste Division customers were participating in the voluntary containerization program. Sacramento City's City Council approved a proposal to offer 20,000 green-waste cans per year for five years to customers. By the end of 2014, all Sacramento City DOU Solid Waste Division customers (approximately 113,000) should have the option to participate in the voluntary containerization program.

Parking Facilities Maintenance

Most Sacramento City facilities are properly maintained with regularly scheduled maintenance. Typical maintenance activities include sweeping, trash pickup, and leaf blowing. This maintenance is primarily done by Sacramento City staff though some is contracted out. Downtown parking garages, which are all located within Sacramento City's combined drainage and sewer system, are maintained at the highest level adding power scrubbing to regularly scheduled maintenance.

During this permit term, Sacramento City Stormwater Program staff will evaluate and document inspection and maintenance practices for Sacramento City-owned and maintained parking lots exposed to rainfall. The evaluation will identify prioritized categories of parking facilities and corresponding inspection and maintenance frequencies to prevent build-up of debris and excessive oil to the MEP. Only parking facilities discharging into the drainage collection system will be evaluated.

Detention Basin Maintenance

Adaptive Management Plans (AMPs) provide guidance for the long-term maintenance and operations for water-quality detention basins, with unique features for each detention basin. Key maintenance issues include, but are not limited to:

- Algae control
- Vegetation management
- Fuel load management and fire control
- Pond sediment removal,
- Irrigation system operation
- Inlet maintenance
- Water quality control
- Mosquito control

Each basin is divided into separate maintenance zones based on a variety of factors, including slope, topography, hydrology, and anticipated use. Maintenance activities prescribed for each of these zones address the target condition of the area, the types of management activities needed to maintain the target condition, and the frequency of these management activities. Recommended visual-monitoring activities are included as a type of maintenance activity to support the adaptive approach to basin management. See Appendix 4R for an example of an AMP.

During this permit term, Sacramento City Stormwater Program staff will review and revise existing AMPs to address current regulatory standards. Chemical and fertilizer activities will be evaluated and adjusted to ensure permit compliance. Revised AMPs will serve as a developmental model for additional plans to be developed and implemented for targeted and newly constructed water-quality detention basins.

Additional water-quality basins within the North Natomas community of Sacramento City that are maintained by Home Owner Associations (HOAs) have Lake Management Plans (LMPs) similar to the AMPs. Drainage agreements between the HOAs and Sacramento City include language requiring these LMPs to address water quality concerns, and specify responsibilities and obligations relative to the maintenance of the detention basin and all of its related facilities. As part of the LMPs, the HOAs collect water quality data on a quarterly basis, implement BMPs, and maintain the aesthetics (i.e., algae, trash, invasive plants) of the lakes. Water quality monitoring reports are submitted to Sacramento City Stormwater Program staff for review. Sacramento City Stormwater Program staff will coordinate with HOA managers to revise LMPs to address identified inadequacies, if any, identified discovered in the submitted monitoring reports. See Appendix 4S & 4T for examples of a drainage agreement, an LMP and a HOA-submitted monitoring report.

Emergency Procedures

Sacramento City staff has identified principal hazards that are potentially threatening to its infrastructure, and has developed a City of Sacramento Emergency Operations Plan in April 2005. Hazards identified in this plan include floods, dam failures, earthquakes, hazardous materials incidents, major transportation accidents, multi-casualty incidents, urban-wildland interface fires, power outages, weather-related hazards, and homeland security hazards. Initial emergency response in this plan focuses on the preservation of life and property. Environmental protection is implemented once life and property issues have been addressed.

The Sacramento Regional Fire/EMS Communications Center dispatches appropriate personnel and equipment during emergency situations. Dispatch for fire-related calls includes notification of the DOU's Plant Services Division staff if there is a potential threat to the intake structures of the water treatment plants (which usually only occurs on a 3rd alarm fire or greater), or if there is a need for an increase of pressure to the water distribution system for the fire suppression activities. A call to this division alerts them to the location of the fire so that pumps at Sump stations in that area can be shut down. Experienced fire captains directly notify DOU's Field Services Division Drainage crews of fire runoff impacting the drainage collection system regardless of the level of alarm, and DOU's Plant Services and Field Services Drainage crews coordinate with each other. If hazardous materials are suspected to be involved within a fire, then such fire-debris are handled the same way as waste is handled during a hazardous material response. The cost for capture and disposal of all fire-suppression-waste water may be cost prohibitive; however, floatables can be affordably cleaned out of Sumps. Sacramento City Stormwater Program staff will coordinate with appropriate agencies to evaluate existing BMP implementation practices and develop written procedures.

Non-emergency Fire Fighting Flows

Sacramento City fire crews typically utilize porous, open areas for fire hose manipulation training. Additionally, these crews do much of their training with other fire agencies at the McClellan facility which has incorporated water quality BMPs. Non-emergency fire activities will be evaluated and written BMP implementation practices will be developed.

Training

Training of Sacramento City staff and contracted employees is an integral part of the Municipal Operations Element strategy. Various groups are targeted to address Stormwater Permit requirements, to promote a clear understanding of the potential for municipal activities to pollute stormwater, and to identify and select appropriate BMPs. Training may include information and requirements for other Elements as well. See Table 4.2-1 in Section 4.2, Program Management for a summary table of the various City departments identified for training and for the frequency of the training provided.

4.5.5 Effectiveness Assessment

The Permittees' general approach to assessing the effectiveness of its stormwater programs is described in Section 2.3, Program Effectiveness. This section specifically describes the assessment activities and associated methods for evaluating the effectiveness of the Municipal Operations Element.

Activities discussed above and listed in Table 4.5-1 will be documented and reported in the annual report(s). Activities have the outcome level of 1, Documenting Activities, unless otherwise specified in Table 4.5-1. Element key indicators, indicated by checkmarks in Table 4.5-1, have outcome levels of 2 through 4, and will be used to demonstrate progress towards meeting the element goal. The work plan table also shows the schedule for the effectiveness assessment and the progression of the outcome levels.

Any change, if necessary, to the planned activities will be documented in annual work plan(s) and reported in the appropriate annual report(s). Results of the effectiveness assessment will be used to focus and modify activities for maximum environmental benefit.

The Municipal Operations Element is currently implementing effectiveness assessments at outcome levels 1 through 4. During past permit terms, the focus of this element had been on reviewing/documenting activities and training (outcome level 1) and quantifying amount of waste removed (outcome level 4) from the drainage collection system and from street sweeping operations.

During this permit term, the Municipal Operations Element will continue to utilize an implementation assessment approach in order evaluate the effectiveness of select activities to meet the element goal. An implementation assessment approach focuses on activities such as inspections, training, street sweeping, debris collection, and the development/implementation of pollution prevention plans. In order to advance other Municipal Operations Element key indicators from an outcome level 1, Documenting Activities, to higher outcome levels, the following key indicators will be used to assess effectiveness:

- Track the number of developed pollution prevention plans that are signed by authorized representatives acknowledging responsibility for implementation.
- Inspect Sacramento City facilities with pollution prevention plans to determine the effectiveness of BMP implementation by utilizing an effectiveness ranking system.
- Quantify the total amount of accumulated waste removed during street sweeping operations and cleaning operations of the drainage collection system.

- Track the increase in participation of Solid Waste customers in the voluntary green waste collection program.
- Survey staff's awareness of available BMPs and pollution prevention practices by utilizing results of quizzes conducted during training.

During this permit term, assessing the effectiveness of training activities and the development and implementation of pollution prevention plans will be emphasized. Surveys will be developed to assess staff's increase in awareness associated with training on applicable stormwater topics. The survey will be conducted twice in the permit term, and the first survey will be utilized as the baseline for effectiveness assessment. Site-specific pollution prevention plans for targeted facilities will also be developed and implemented. A database will be developed to track site-specific BMPs, inspections and the newly developed ranking system. This ranking system will consider the effectiveness of a particular BMP implementation practice and an evaluation of the potential for a discharge. BMPs implemented for activities associated with a higher potential of discharge will be weighted more than BMPs implemented for activities associated with a lower potential of discharge. For example, material storage inside a fixed structure will be given less weight than material storage exposed to rainfall.

Table 4.5-1

City of Sacramento Municipal Operations Element Activities Work Plan (2008-2013)

Element Goal: The goal of the Municipal Operations Element is to mitigate potential pollutants generated by municipal facilities and activities to the MEP.

4.6 ILLICIT DISCHARGE ELEMENT

4.6.1 Goal

The goal of the Illicit Discharge Element is to abate, contain and/or clean up reported illicit discharges and connections to the storm drainage system.

POLLUTANTS ADDRESSED BY THIS ELEMENT

- **Hydrocarbon Products ***
- Automotive fluids
- **Sediment***
- Paint
- Concrete
- Other non-stormwater discharges

***Target pollutant for Sacramento area**

4.6.2 Evolution

During past permit terms, the Illicit Discharge Element:

- Established the legal authority of Sacramento City to prohibit illicit discharges and enforce those prohibitions;
- Established illicit discharge response and reporting procedures;
- Responded to reports of illicit discharges;
- Performed field work to clean and abate illicit discharges;
- Implemented household hazardous waste collection programs.

In 2004, Sacramento City revised the 1997 ordinance previously used for enforcement of stormwater regulations for use in Illicit Discharge enforcement.

Between FY 95/96 and FY96/97, Sacramento City conducted an extensive illicit connection screening program for all Sacramento City drainage basins. This investigation found only two illicit connections, subsequently removing both. Until FY06/07, Sacramento City conducted ongoing screening in several selected drainage basins during the dry season to identify any illicit connections but none were located. In FY07/08, Sacramento City ended specific illicit connection screening due to the lack of illicit connections found during previous years and the high cost of the screening program.

During the last permit term, Sacramento City Stormwater Program Inspection staff conducted enforcement response in support of First Responder activities. Sacramento City staff also developed a database to track reports of illicit discharges and enforcement response to these reports.

A comprehensive list of accomplishments for this Element is provided in Appendix 4A.

In the 2008-2013 permit term, the database will be modified to allow for specific report queries to identify, where possible, high-priority areas within the City or high-priority groups of dischargers for future outreach efforts. Once the areas are identified, Sacramento City Stormwater Program staff will coordinate outreach and, if necessary, enforcement activities to address specific illicit discharge issues.

Sacramento City Stormwater Program staff will continue to provide annual training for Department of Utilities (DOU) Field Services staff regarding illicit discharge response activities and identification of potential illicit connections.

A more specific list of tasks and schedules is presented in Table 4.6-1, Illicit Discharge Element Activities Work Plan (2008-2013).

4.6.3 Strategy

The Illicit Discharge Element strategy includes the following components to achieve the goal of abating, containing and cleaning up reported illicit discharges and connections to the storm drainage system:

- Use an Illicit Discharge and Illicit Connection Communication and Response Plan as illustrated in Figure 4.6-1 on the next page.
- Annually evaluate complaints of illicit discharges to determine the most common types of discharges.
- Develop outreach materials to address these activities.
- Provide annual training to spill response personnel on their job duties.

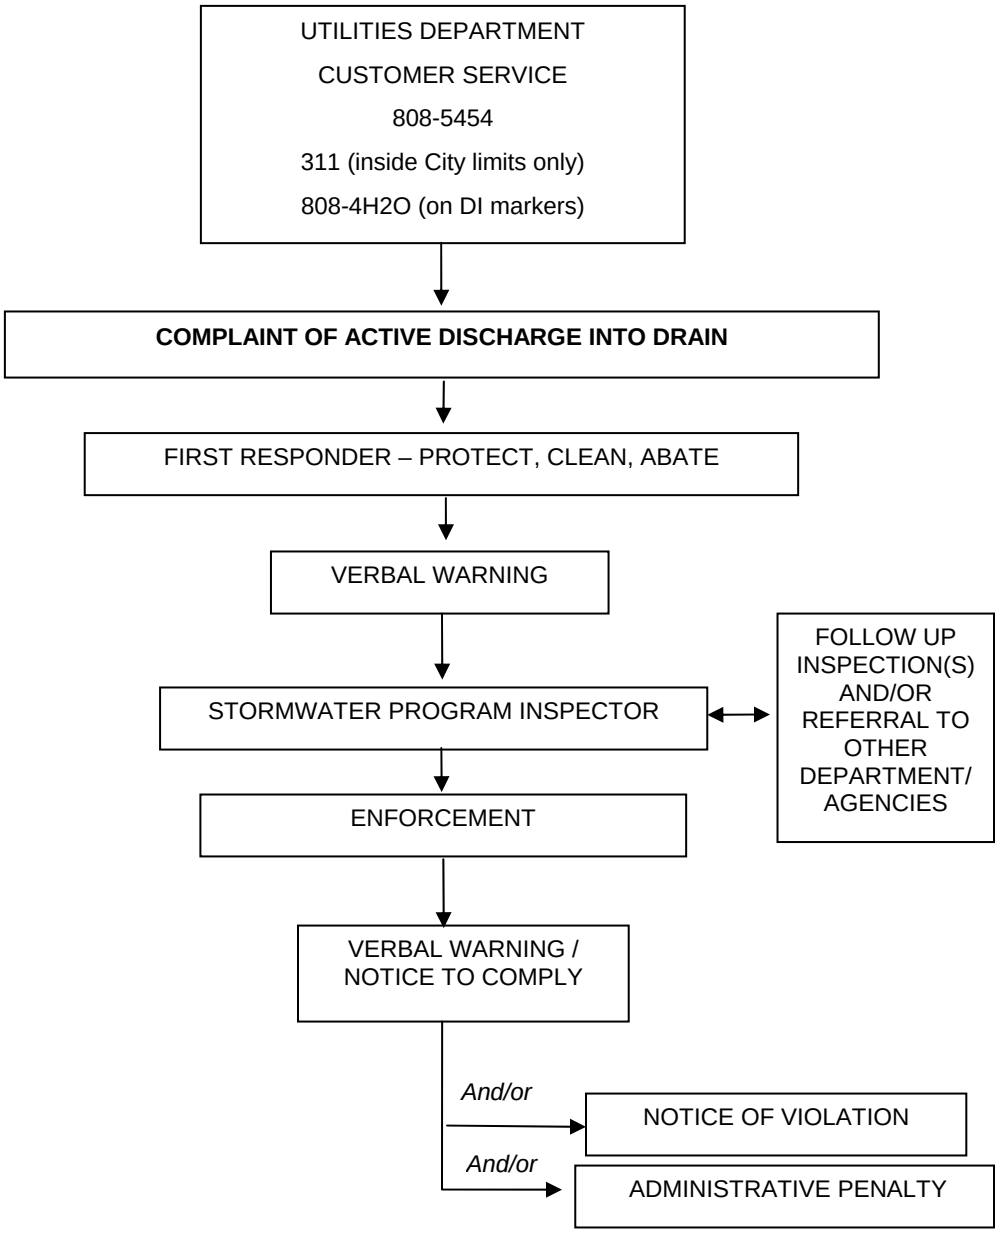
4.6.4 Activities

A list of tasks and their associated schedule is presented in the Table 4.6-1 – Illicit Discharge Element Activities Work Plan (2008-2013), located at the end this section.

Legal Authority

Sacramento City's Stormwater Ordinance provides legal authority for regulating pollutant discharges to the storm drain system. This Stormwater Ordinance will be amended as needed during the 2008–2013 permit term to ensure that pollutant sources from non-commercial activities are effectively addressed. Sacramento City Stormwater Program staff continues to provide enforcement of Sacramento City's Stormwater Ordinance using the Illicit Discharge and Illicit Connection Communication and Response Plan shown in Figure 4.6-1.

Illicit Connections and Discharges Response and Enforcement



Sacramento City's outreach and maintenance practices are key components in the detection of illicit discharges and connections. Inspection, enforcement, and outreach efforts of the Commercial/Industrial, Construction, Public Outreach, and Municipal Operations programs all contribute to raising awareness about the prevention, detection and reporting of illicit discharges. When Sacramento City's DOU Field and Plant Services crews perform routine maintenance and inspections on the drainage collection system and the pumping stations, they investigate anything that looks out of the norm for possible illicit discharge and/or connection. During manhole inspections or any closed-circuit television (CCTV) surveillance of the drainage system, crews inspect for illicit discharges and illicit connections. If Sacramento City crews identify a new illicit connection, it is immediately eliminated. Drainage crews can plug the connection and initiate remediation and enforcement actions.

The Sacramento City DOU provides 24-hour, on-call, drainage maintenance staff and Sacramento City Fire Department Hazmat staff who respond to reports of illicit discharges draining into the storm drain system. DOU Field Services' Drainage Section has two First Responder teams responsible for investigating and containing illicit discharges. First Responders coordinate investigation and enforcement efforts with the Sacramento County Environmental Management Department (EMD), the Sacramento County District Attorney's investigator, Sacramento City's Fire Department, Sacramento City Stormwater Program inspection staff and/or other Sacramento City staff depending on the specific needs of the situation.

If the discharge is small and non-hazardous, then First Responders abate the discharge, clean the lines, and arrange for proper disposal of the discharged substance. If the discharge requires additional resources, then the First Responders contacts appropriate personnel, including outside contractors if necessary. If the discharger is identified, the Sacramento City Stormwater Program Inspector conducts follow-up education and/or enforcement within five days of receiving the initial report.

Figure 4.6-1

2009 Illicit Discharge and Illicit Connection Communication and Response Plan

First Responders carry Sacramento City's Drainage/Sewer Mapbook in their vehicles to assist them in tracking a discharge to its source. This mapbook identifies the location of all drainage inlets, pipes, manholes, pump stations, outfalls, ditches, and all water bodies. Since many miles of drainage channels and underground pipes exist, staff also uses additional resources that further identify the drainage system's division into sub-drainage sheds. Drainage crews access the Computerized Maintenance Management System (CMMS). The CMMS contains the entire drainage infrastructure mapped using digital Graphical Information System (GIS) tools, allowing crews to look at any page in the Mapbook and electronically trace the flow. The CMMS enhances the crews' ability to perform inspections, do a condition assessment analysis, collect data electronically, and create Proposition 65 forms with attached work order numbers for ease of reference.

When a hazardous material emergency occurs, multiple resources are available. The Sacramento City Fire Department leads the response activities under the direction of the Sacramento County EMD. The Fire incident Commander-on-Scene directs the Sacramento Regional Fire/Emergency Medical Services Communications Center to dispatch City crews to contain and abate the illicit discharge. Also, the City's Environmental Health and Safety Office (EH&S Office) is notified if City crews have neither the training nor equipment necessary to handle the release. The EH&S Office contracts with a hazardous materials response contractor and can authorize its response as needed. If the discharger is identified, the Sacramento City Stormwater Program Inspector conducts follow-up education and/or enforcement. Enforcement actions include verbal warnings, notices to comply, notices of violation and administrative penalties.

Once the discharge is abated and cleaned up, the Sacramento City Stormwater Program Inspector may conduct follow-up inspections if there is concern of possible repeated discharges. The number of follow-up inspections and the length of time between follow-up inspections vary depending on the individual situation and the risk of possible repeat discharges. All initial and follow-up actions are entered into a Microsoft Access database used by the Illicit Discharge, Commercial/Industrial and Public Outreach Elements. During the 2008-2013 permit term, the database will be modified to allow element managers to identify geographic areas of the City, particular pollutants, or specific types of businesses that are repeat dischargers. Targeted outreach and/or enforcement campaigns will then be implemented to address these situations.

Public Outreach and Reporting

Sacramento City staff conducts several activities in addition to standard public outreach to help prevent illicit discharges, including:

- Promoting the City of Sacramento 311 Call Center, designed to provide a single point of contact for many Sacramento City services. "311" calls reporting an illicit discharge are routed to the proper department for a Sacramento City crew to respond, 24-hours a day, seven days a week.
- Maintaining the Public Stormwater Hotline at (916) 808-4H2O. Calling the hotline supplies them with general outreach information and also can connect them immediately to a Sacramento City operator to report an illicit discharge. The Hotline number is publicized on all stormwater outreach materials, including printed items, websites, stormdrain inlet permanent markers, and TV and radio media campaigns.
- Promoting and providing alternatives to the public for waste disposal such as the household hazardous waste (HHW) collection center located on Fruitridge Boulevard. This facility accepts waste from the public and from small quantity generators.
- Promoting and providing biweekly curbside pickup of used automotive oil and filters.

- Providing outreach materials on proper disposal of the types of hazardous wastes typically involved in illicit discharge reports at several Sacramento City public service counters, from Sacramento City Inspectors in the field, and from the Business Environmental Resource Center (BERC).

Training

Sacramento City Stormwater Program staff annually trains staff involved in the reporting, spill response, and clean-up of illicit discharges. Training covers the proper methods for receiving reports from the public and from other agency staff, initiating spill response and clean-up, and coordinating with other agency staff (e.g., Sacramento County EMD, Sacramento Fire Hazmat, etc).

Trained staff include:

- Sacramento City Operators
- Sacramento City Department of Utilities Customer Service Representatives
- Sacramento City Department of Utilities Field Service First Responders
- Sacramento City Department of Utilities Stormwater Inspectors
- Sacramento City Department of Utilities Water Quality Section staff
- Sacramento City Code Enforcement staff

4.6.5 Effectiveness Assessment

The Permittees' general approach to assessing the effectiveness of its stormwater programs is described in Section 2.3, Program Effectiveness. This section specifically describes the assessment activities and associated methods for evaluating the effectiveness of the Illicit Discharge Element.

Activities discussed above and listed in Table 4.6-1 will be documented and reported in the annual report(s). Activities have the outcome level of 1 – Documenting Activities unless otherwise specified in Table 4.6-1. Element key indicators, indicated by checkmarks in Table 4.6-1, have outcome levels of 2 and 4, and will be used to demonstrate progress towards meeting the element goal. The work plan table shows the schedule for the effectiveness assessment and the progression of the outcome levels.

Any change, if necessary, to the planned activities will be documented in annual work plan(s) and reported in the appropriate annual report(s). Staff will use the results of the effectiveness assessment to focus and modify activities for maximum environmental benefit.

The Illicit Discharge Element is currently implementing effectiveness assessments at outcome level 1 – Documenting Activities and level 4-Reducing Loads from Sources.

The focus during this permit term will be on assessing the effectiveness through the use of the following key indicators: preventing discharges to receiving waters, quantifying material prevented from entering receiving waters, quantifying the amount of oil collected and amounts of other HHW disposed of at Collection Centers, and increasing awareness of illicit response procedures through training surveys.

Table 4.6-1

City of Sacramento Illicit Discharge Element Activities Work Plan (2008-2013)

Element Goal: The goal of the Illicit Discharge Element is to abate, contain, and/or clean up reported illicit discharges to the storm drain system.

Legend: C-Confirmation, T-Tabulation, S-Survey, I-Inspection, Q-Quantification, M-Monitoring; ⇔ Ongoing task; ♦ Permit Deliverable; # Outcome level

Activity/Task	Permit Ref	Key Indicator?	Performance Standard / Target	Assessment Method	Baseline Data	Schedule/Target Outcome Level						Due Date/ Status/Other Notes
						FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	
Legal Authority												
Review and if necessary revise existing Stormwater Ordinance	D.11.a.i					N/A	⇔				⇔	twice per permit term (including one year after SQIP approval)
Reporting of Illicit Connections and Discharges Response and Enforcement												
Investigate reports of illicit connections and eliminate identified connections	D.11.a.ii-iv, 11.b.ii-iv					⇔	⇔	⇔	⇔	⇔	⇔	
Continue providing illicit discharge response and clean-up	D.11.a.ii-iv, 11.b.ii-iv	✓	Prevent discharges to receiving bodies to the MEP and quantify material prevented from entering receiving waters	C, T, I, Q	Percentage of potential discharges, and total amount, prevented from entering receiving waters during previous year	⇔	⇔4	⇔4	⇔4	⇔4	⇔4	
Investigate reports of illicit discharges (non-hazardous)	D.11.a.ii-iv, 11.b.ii-iv	✓	Initiate investigation within five (5) days of initial report	C, T	Percentage of potential discharges investigated within five (5) days of report during previous year	⇔1	⇔1	⇔1	⇔1	⇔1	⇔1	
Investigate reports of illicit discharges (hazardous)	D.11.a.ii-iv, 11.b.ii-iv	✓	Initiate investigation within one (1) day of initial report	C, T	Percentage of potential discharges investigated within one (1) day of report during previous year	⇔1	⇔1	⇔1	⇔1	⇔1	⇔1	
Issue enforcement actions as appropriate	D.11.a.ii-iv, 11.b.ii-iv					⇔	⇔	⇔	⇔	⇔	⇔	
Maintain database of illicit discharge inspections and enforcement actions	D.11.a.ii-iv, 11.b.ii-iv					⇔	⇔	⇔	⇔	⇔	⇔	
Maintain map of illicit discharges to identify areas for targeted outreach	D.11.a.ii-iv, 11.b.ii-iv					⇔	⇔	⇔	⇔	⇔	⇔	
Public Outreach and Reporting												
Maintain public hotline (916) 808-4H2O for public reporting of illicit discharges	D.11.b.v					⇔	⇔	⇔	⇔	⇔	⇔	
Promote used oil curbside pickup program and use of Household Hazardous Waste (HHW) Collection Centers	D.11.b.v	✓	Quantify amount of oil collected and amounts of other HHW disposed of at Collection Centers	C, Q	Previous year's data	⇔4	⇔4	⇔4	⇔4	⇔4	⇔4	
Training												
Train City staff annually in proper methods for receiving and responding to illicit discharge reports to ensure minimum response time and maximum response effectiveness	D.11.b.vi	✓	Increase awareness of illicit responses procedures through training surveys	C, T, S	First survey (FY 10/11)	⇔1	⇔1	⇔2	⇔1	⇔2	⇔2	

4.7 Public Outreach Element

Public Outreach activities for Sacramento City are mostly conducted in conjunction with other Permittees.

Description of the Public Outreach element can be found in Chapter 2 – Partnership Activities, Section 2.6 – Regional Public Outreach.

Effectiveness Assessment of the Public Outreach Element is also included in Section 2.6.

This page left intentionally blank.

4.8 NEW DEVELOPMENT ELEMENT

4.8.1 Goal

The goal of the New Development Element is to protect local creeks and rivers by reducing the discharge of stormwater pollutants that can result from new developments to the Maximum Extent Practicable (MEP) and by mitigating increased flows that can cause erosion and degrade habitat. Generally, new developments may result in an increase in the total urbanized area, with an attendant increase in the overall load of pollutants discharged into local creeks and rivers; and an increased impervious area, with an attendant increase in the volume of stormwater runoff flows.

POLLUTANTS ADDRESSED BY THIS ELEMENT

- **Sediment***
- **Metals***
- Nutrients
- **Pesticides***
- **Hydrocarbon products***

***Target pollutant for Sacramento area**

4.8.2 Evolution

In past permit terms, the emphasis of the New Development Element has been to develop ordinances, design standards, guidance manuals, and maintenance protocols; and to incorporate these requirements into the development review process. Currently, the development review process successfully integrates stormwater quality requirements into environmental documents, conditions projects during the entitlement process, incorporates control measures during the plan approval process, and requires maintenance agreements for privately maintained treatment control measures.

A comprehensive evaluation of the stormwater quality development standards, numeric sizing criteria, and planning procedures and policies was conducted in 2003 and submitted to the Central Valley Regional Water Quality Control Board (Regional Water Board) in the *Sacramento Stormwater Management Program Development Standards Plan* (DSP), which was approved by the Regional Water Board in May 2005. The updated development standards went into effect on May 18, 2006, and include eight categories of new development and redevelopment projects, corresponding source and treatment control thresholds, and revised numeric sizing criteria.

In addition, a regional *Stormwater Quality Design Manual for the Sacramento and South Placer Regions* (Stormwater Design Manual, available on the internet at http://www.sacramentostormwater.org/SSQP/documents/DesignManual/SWQ_DesignManual_May07_062107.pdf) was completed in May 2007, which replaces the *City of Sacramento Guidance Manual for On-Site Stormwater Quality Control Measures (January 2000)*. The regional Stormwater Design Manual was a collaborative effort between the County of Sacramento and the cities of Sacramento, Citrus Heights, Elk Grove, Folsom, Galt, Rancho Cordova, and Roseville. This manual includes the stormwater quality requirements for new development and redevelopment projects; low impact development strategies (i.e., runoff reduction control measures); and guidance for selecting, designing and maintaining stormwater source control, runoff reduction, and treatment control measures.

A comprehensive list of accomplishments for this Element is provided in Appendix 4A.

Currently, the New Development Element mitigates the effects of new development on stormwater quality with the installation and maintenance of source controls and structural control measures on both a regional scale, such as detention basins, and on individual properties, such as vegetated swales. Control measures referred to as treatment control measures in this report are essentially pollutant removal best management practices (BMPs).

Redevelopments are also part of this Element, because they offer opportunities to incorporate on-site controls using the same procedures established for new developments. The current stormwater quality requirements for new development and redevelopment are outlined in Table 3-2: Stormwater Quality Control Measure Selection Matrix in the Stormwater Design Manual.

In this permit term, Sacramento City Stormwater Program staff will continue implementing the revised development standards, resolving conflicts in City codes, conducting training and outreach, and improving the development review process to ensure that stormwater treatment controls are properly constructed and maintained. Sacramento City Stormwater Program staff will continue to improve the process requiring maintenance agreements for privately-maintained treatment control measures and ensure long-term performance of these measures through annual maintenance verification.

In addition, Sacramento City Stormwater Program staff will explore ways to integrate Low Impact Development (LID) principles into the planning and plan review process. Sacramento City Stormwater Program staff will work with the Permittees to develop a hydromodification management plan (HMP) and quantitative LID design criteria and implement these criteria for applicable new development and redevelopment projects. Sacramento City Stormwater Program staff will also work with Permittees staff to develop a waiver program for new development and redevelopment projects where structural treatment control measures are infeasible.

A detailed list of tasks and schedules is presented in Table 4.8-1 – New Development Element Activities Work Plan (2008-2013).

4.8.3 Strategy

The New Development Element strategy includes the following components:

- Incorporate water quality and watershed protection principles into Sacramento City procedures and policies.
- Improve the development review process to ensure effective implementation of the development standards for new development and redevelopment projects.
- Implement stormwater quality development standards for all regulated new development and redevelopment projects.
- Ensure that standards and maintenance requirements are clear and effective.
- Require maintenance provisions for all privately maintained treatment control measures.
- Develop the hydromodification management plan and update the Stormwater Design Manual with new design criteria for hydromodification measures.
- Evaluate new technology and alternative control measures.
- Provide training and technical assistance to Sacramento City staff (planners, engineers, CIP project managers, building and construction inspectors, etc) on stormwater quality requirements and procedures to ensure effective implementation of stormwater quality development standards for municipal projects and private development projects.
- Provide training and outreach to the development community on the stormwater quality development standards.

4.8.4 Activities

A list of tasks and their associated schedule is presented in Table 4.8-1 – New Development Element Activities Work Plan, located at the end of Section 4.8.

Legal Authority

Sacramento City Stormwater Program staff will work to resolve conflicts in city codes as they are identified. Upon development of the Hydromodification Management Plan, the Stormwater Ordinance will be revised to include new requirements for development projects if necessary.

Policy and Standards

Development standards include policies, ordinances and codes; planning practices; site design; source, treatment and runoff reduction controls; and maintenance requirements. Activities in those areas include:

- General Plan: On March 3, 2009, the City of Sacramento's City Council adopted the Sacramento 2030 General Plan (available on the internet at http://www.sacgp.org/). Sacramento City Stormwater Program staff will provide updates of any new requirements and criteria for water quality in future updates to the 2030 General Plan. Sacramento City Stormwater Program staff will continue to review the community plans to ensure implementation of the General Plan water quality protection policy.
- California Environmental Quality Act (CEQA) process: Sacramento City Stormwater Program staff will review and, if necessary, work with Sacramento City Planning Department staff to revise the environmental review procedures to ensure stormwater quality requirements are incorporated into environmental documents such as environmental impact reports (EIRs) and mitigation monitoring plans.
- Hydromodification: Sacramento City Stormwater Program staff will work with the Permittees to develop the Hydromodification Management Plan (HMP). As part of this HMP requirement, the HMP Work Plan was completed and is attached in Appendix 2B. Upon completion of the HMP, the Permittees will develop the design criteria for the hydromodification measures and quantitative and qualitative LID requirements for new development and redevelopment projects.
- Design standards and manual: The Stormwater Design Manual was completed in May 2007. Future updates to the standards and manual will be conducted upon approval of the HMP and new HMP standards and quantitative LID criteria will be included in the Stormwater Design Manual. Alternative and innovative control measures will be identified and evaluated through networking with other programs, product research, literature reviews, and BMP performance studies. The Stormwater Design Manual will be updated as needed based on new technical information, new innovative technologies, and control measure effectiveness.
- Waiver Program: Sacramento City Stormwater Program staff will continue to work with the Permittees to develop a waiver program for projects where structural treatment control measures are infeasible. The Permittees will obtain Regional Water Board approval prior to implementation of the waiver program.

Development Standards Implementation

Development projects are required to address stormwater quality requirements during the entitlement process. Post-construction stormwater quality requirements are incorporated into environmental documents such as initial studies, environmental impact reports (EIRs), and mitigation monitoring plans; and standard conditions for entitlements such as tentative maps and special permits. Source controls and treatment controls are required to be incorporated in all new development and redevelopment projects as specified in Table 3-2 of the Stormwater Design Manual. Regional facilities will be incorporated as a part of large master-planned developments and, where feasible, will be integrated into new drainage basins and into retrofit projects constructed by the City of Sacramento. In areas without regional controls, treatment controls will be incorporated into the project and will be privately maintained.

Sacramento City Stormwater Program staff and/or Department of Utilities Development Review staff will continue to participate in the review of and comment on CEQA documents. Development review staff condition private development projects through the entitlement process. They will continue to require stormwater quality development standards including source control, runoff reduction and treatment control measures for applicable projects. They will also continue to require regional facilities to be incorporated when applicable. Sacramento City Stormwater Program staff will update the development review standard conditions to include new requirements on HMP and LID upon approval of the HMP.

Municipal project managers will be required to ensure that all regulated municipal projects incorporate source and treatment control measures through the development approval process and/or other municipal procedures. Construction inspection staff will ensure that regional control measures are properly constructed. Implementation of control measures and proper installation of treatment controls for municipal projects will be improved through annual staff training and cooperative efforts with the Municipal Operation Element.

Sacramento City Stormwater Program staff will provide technical assistance to the development community and other Sacramento City staff in selection and design of stormwater treatment control measures.

The Partnership website (www.sacramentostormwater.org) and Sacramento City's Stormwater website (www.sacstormwater.org) will be updated to include the new HMP and LID requirements when these requirements are completed and/or approved.

Maintenance Verification for Treatment Control Measures

Development review staff requires maintenance agreements for all privately maintained treatment control measures during the entitlement process and/or before issuing a permit. Private property owners are required to sign maintenance agreements with the City of Sacramento for all treatment control measures installed on their property.

Program staff will develop a self-verification checklist for proper construction of privately maintained stormwater treatment control measures. The design engineers will be required to provide a verification letter as proof of proper construction or installation of stormwater treatment control measures. Sacramento City Stormwater Program staff may conduct inspections during the installation and construction of the on-site treatment control measures or devices.

Sacramento City Stormwater Program staff will send out annual maintenance request letters to private property owners with stormwater treatment control measures and require maintenance documentation. Staff will review the maintenance reports, document maintenance information in the database and compile pollutant removal data if any is available. Staff will also follow up with non-respondents and with sites that send insufficient data to the annual maintenance survey. If maintenance problems are identified through inspection, notices will be sent out to the property owner(s) to address the issues and follow-up inspections will be conducted to ensure compliance.

Regional treatment facilities (i.e. water quality detention basins) are operated and maintained by Sacramento City. Detention basin maintenance is discussed in Section 4-5 Municipal Operations Element.

Sacramento City Stormwater Program staff maintains a Microsoft Access database of the on-site treatment control measures constructed by new development and redevelopment projects. This current database is designed to include the following information:

- Project address
- APN and property owner information
- Property contact for maintenance
- BMP information (type of device/measure, numbers of device(s)/measure(s))
- Agreement document information
- Annual maintenance request and reply tracking
- Maintenance verification tracking

This database will be improved to include additional information required under D.22.C.i of the Stormwater Permit. This database will also be expanded to include tools that can be used for effectiveness assessment of the Element.

The Sacramento City's Stormwater Program website will be updated with additional information on maintenance including photos, maintenance guidelines and illustrations.

Training and Outreach

Sacramento City Stormwater Program staff will conduct training and serve as a technical resource for municipal staff on proper design, construction, inspection, and maintenance of stormwater quality control measures and new technology. Sacramento City staff who are engaged in development planning, including development review staff, planners and project managers, will be trained annually on the stormwater quality standards. Sacramento City inspectors will be trained annually on how to inspect stormwater treatment control measures. See Table 4.2-1 in Section 4.2 – Program Management for a summary table of the various Sacramento City departments identified for staff training and the training frequency. Sacramento City Stormwater Program staff will improve department and inter-department communications by participating in regular staff meetings and being involved in the review process of large projects.

Sacramento City Stormwater Program staff will continue to improve the effectiveness of other Sacramento City staff training. Surveys and training questionnaires will be developed for targeted groups (i.e., Development review staff) to evaluate the effectiveness of the training and solicit comments for future training-focused areas.

Sacramento City Stormwater Program staff will conduct outreach to the development community to provide information and serve as a technical resource on policies, requirements, and new technology and practices. This will be accomplished through one or more of the following: workshops, presentations at professional organizations, newsletters, fact sheets. Upon completion and approval of the HMP and LID criteria, a workshop will be conducted with the development communities and design/consulting engineers to provide information and education on the new requirements.

4.8.5 Effectiveness Assessment

The Permittees' general approach to assessing the effectiveness of its stormwater programs is described in Section 2.3, Program Effectiveness. This section specifically describes the assessment activities and associated methods for evaluating the effectiveness of the New Development Element.

Activities discussed above and listed in Table 4.8-1 will be documented and reported in the annual report(s). Activities have the outcome level of 1 – Documenting Activities unless otherwise specified in Table 4.8-1. Element key indicators, indicated by checkmarks in Table 4.8-1, have outcome levels of 2 through 4, and will be used to demonstrate progress towards meeting the element goal. The work plan table also shows the schedule for the effectiveness assessment and the progression of the outcome levels.

Any change, if necessary, to the planned activities will be documented in annual work plan(s) and reported in the appropriate annual report(s). Results of the effectiveness assessment will be used to focus and modify activities for maximum environmental benefit.

The New Development Element is currently implementing effectiveness assessments at outcome level 1 – Documenting Activities. Activities used in the past to assess the New Development Element's effectiveness included documentation of implementation activities such as the number of projects conditioned and treatment controls constructed, assessment of workshops through feedback on evaluation forms, and extensive research on treatment control measure performance. Some of the special studies conducted include the following:

- Stormwater interceptor and catch basin insert effectiveness study
- Dry extended detention basin effectiveness study (Brown Road Detention Basin)
- Vegetated swale effectiveness study
- Proprietary device effectiveness investigation
- Wet water quality detention basin study (North Natomas Basin 4) (ongoing)

Section 2.4 contains more information on the special studies conducted. Additional research will be conducted on proprietary treatment devices to investigate the performance and effectiveness of these alternative measures, see Section 2.4 Monitoring Program, Special Studies for more details.

During this permit term, the effectiveness assessment will focus on trainings and/or workshops (by utilizing results of quizzes); percentage of plans incorporating accepted treatment controls; percent of on-site treatment measures with design engineer's verifications; and/or the estimated load of pollutants removed by the installed treatment controls. Some of the baseline data will be developed from the existing New Development database.

Table 4.8-1

City of Sacramento New Development Element Activities Work Plan (2008-2013)

Element Goal: The goal of New Development Element is to protect local creeks and rivers by reducing the discharge of stormwater pollutants that can result from new developments to the MEP.

Chapter 5

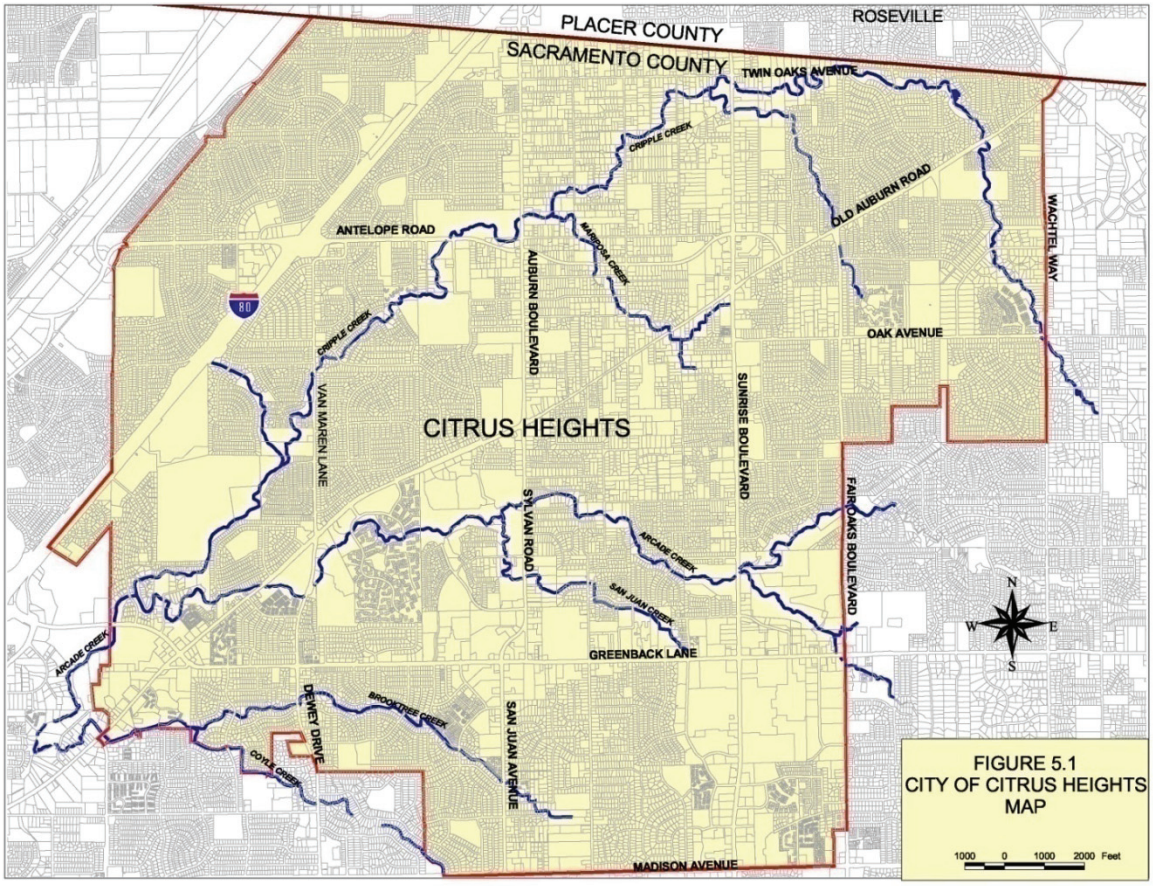
City of Citrus Heights Stormwater Quality Improvement Plan

5.1 Introduction

The Citrus Heights (City) Stormwater Quality Improvement Plan (SQIP) provides information about the City's Stormwater Management Program, including a description of activities conducted to ensure compliance with the Sacramento Areawide NPDES Municipal Stormwater Permit (Stormwater Permit), of which Citrus Heights is a permittee. The required certfication for the SQIP is presented in the front of the entire SQIP document.

Implementation of the activities described in the SQIP is intended to satisfy the provisions of the Stormwater Permit. Those provisions were established to reduce pollutants in stormwater discharges to the maximum extent practicable and comply with receiving water objectives.

The City-specific activities described and referenced in this chapter are conducted in addition to monitoring, special studies, target pollutant reduction and regional public outreach activities that are implemented jointly with the other permittees as described in Chapter 2. The City contracts with the County of Sacramento (County) and other organizations for some of its stormwater services, as explained in this chapter.



Background

Citrus Heights incorporated on July 1, 1997. The City was officially named as a Permittee to the Stormwater Permit when it was reissued in December 2002. For 12 years before that, the area within the City limits was covered under the County of Sacramento's Stormwater Permit. However, the City has been proactively involved in the Sacramento Stormwater Quality Partnership (Partnership) since incorporation. The Stormwater Permit is issued to Citrus Heights and six other co-permittees (Sacramento County and the Cities of Elk Grove, Folsom, Galt, Rancho Cordova and Sacramento) by the Central Valley Regional Water Quality Control Board (Regional Water Board). The original Stormwater Permit was issued in 1990 (first permit term) has been renewed three times since: in 1996, 2002 and most recently in 2008 (2008-13 permit term).

City of Citrus Heights Characteristics

Citrus Heights is located in the northern portion of Sacramento County (County), just south of the Placer County line. The city boundaries are shown in Figure 5.1-1.

Figure 5.1-1. City of Citrus Heights and Creeks In the City

The City has a population of approximately 90,000 and is 14.1 square miles in size. Citrus Heights is made up primarily of residential and commercial land uses. Nearly built-out, Citrus Heights has about 150 acres of remaining vacant land with the largest at approximately 20 acres.

The City is traversed by approximately 26 miles of stream groups comprised of natural and man-made facilities, including Arcade Creek, Cripple Creek, San Juan Creek, Mariposa Creek, Brooktree Creek, Coyle Creek, and various unnamed tributaries. As shown on Figure 5.1-1, these stream groups generally originate within the Citrus Heights boundaries and eventually all drain to Arcade Creek near the southern limits of Citrus Heights. Arcade Creek then flows through portions of Sacramento County and the City of Sacramento before it discharges into the Natomas East Main Drainage Canal (also known as Steelhead Creek) near the confluence of the American and Sacramento Rivers at Discovery Park.

Overview of Citrus Height's SQIP

This SQIP describes activities that Citrus Heights will conduct in compliance with the Stormwater Permit. Modifications to the program may be necessary as the program evolves, and will be proposed in Annual Reports submitted to the Regional Water Board on October 1 each year.

Following this introduction, there are seven sections in the chapter, to describe activities related to six major program elements, as follows:

Section 5.2: Program Management and Training — A description of how Citrus Height's Stormwater Management Program is organized, legal authority, priorities and funding, and coordination both within the city and externally with other programs and agencies.

Section 5.3: Construction Program Element —Activities designed to control the runoff of sediment and other pollutants from construction sites.

Section 5.4: Commercial/Industrial Program Element — Activities and control programs intended to reduce pollutants in discharges and effectively eliminate non-stormwater discharges associated with industry.

Section 5.5: Municipal Operations Program Element —Activities designed to control stormwater pollution resulting from operation of City facilities and to set an example of model pollution prevention for the public.

Section 5.6: Illicit Discharge and Detection Program Element —Activities intended to effectively eliminate illegal non-stormwater discharges to the storm drainage system and receiving waters.

Section 5.7: Public Outreach Program Element —Activities designed to raise awareness and foster community stewardship to promote pollution prevention in the urban area and protection of local creeks and rivers.

Section 5.8: New Development Program Element — Activities intended to mitigate water quality and quantity impacts from newly developing and redeveloping areas for the life of the project, after construction is complete.

5.2 Program Management and Training

Program Organization and Staffing

The City of Citrus Heights is a Council-Manager form of government. The Stormwater program is under the direction of the General Services Director and City Engineer, as shown in Figure 5.2-1. The City has assigned a Senior Civil Engineer to manage the Stormwater Program and participate in permittee meetings and other joint Program activities as needed. Assistance is provided by an Associate Engineer, construction inspector and drainage coordinator. Additionally, building inspection, administration, and contract services staffing is provided by other City departments. The approximate staffing breakdown is shown in Table 5.2-1.

Figure 5.2-1. City of Citrus Heights Organizational Chart

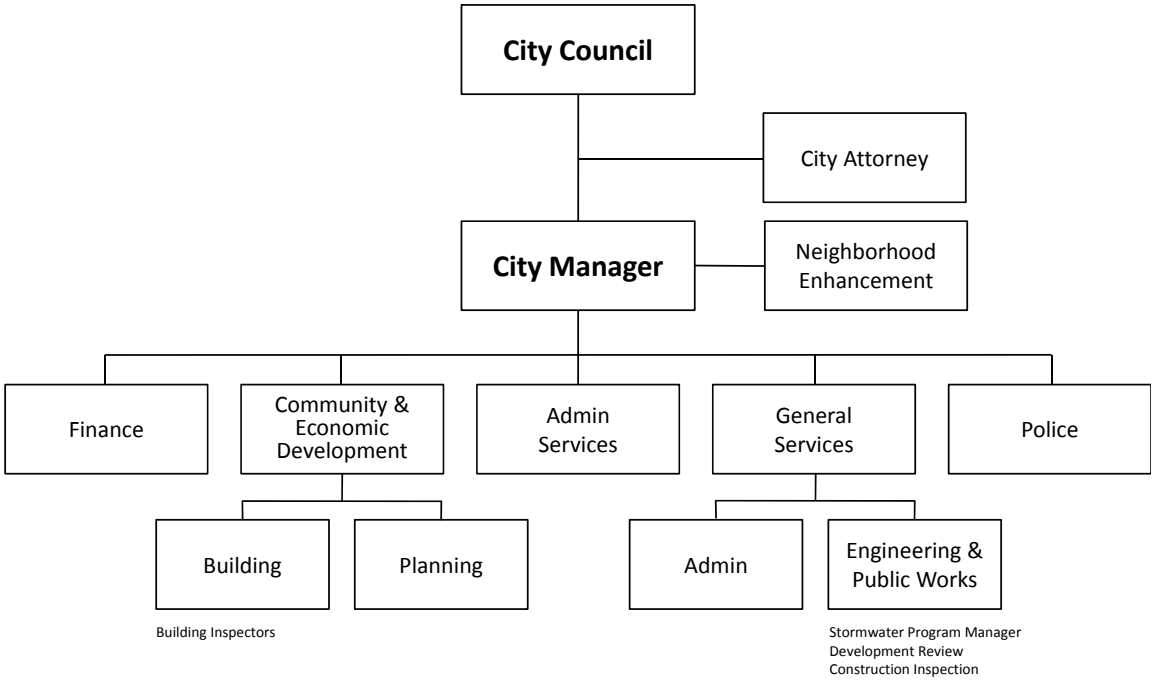

Table 5.2-2 indicates roles and responsibilities of various city departments for implementation of activities designed to comply with the Stormwater Permit. In addition, the table describes services that are contracted to the County of Sacramento. When the City incorporated in 1997, it entered into an agreement with Sacramento County that specified that the County would provide Citrus Heights the same level of and type of drainage and flood control services as provided in the unincorporated area. This has continued, with the exception that the City conducts creek and channel maintenance, largely through contracts with the Sacramento Local Conservation Corps.

Table 5.2-1

Staffing for the Citrus Heights Stormwater Program (2009-10 figures)

Staff	FTE*
Principal Civil Engineer	0.30
Associate Civil Engineers	0.70
Administrative Assistant	0.30
Construction Inspector	0.30
Maintenance Coordinators	0.20
Building Inspection/permits	0.30
Total	2.1

*Full time equivalent

Table 5.2-2. Responsibilities for Compliance with NPDES Stormwater Permit in Citrus Heights

Program Element	Department/Group	Major Responsibilities
Program Management and Training (Section 5.2)	Engineering/Public Works	Administers and manages the City Stormwater Program on behalf of the City. Provides liaison with the Regional Water Board and prepares/submits compliance reports.
	Admin Services	Conducts legal reviews, prepares legal certifications and oversees revisions to ordinances, codes and other standards.
	County Dept. of Water Resources/Stormwater Staff (under contract to City)	Assists with preparation of Permit compliance deliverables; represents Citrus Heights at permittee coordination meetings.
Construction (Section 5.3)	Engineering/Public Works	Issues grading permits and checks for NOI/SWPPP for all sites subject to State General Construction Permit.
	Community & Economic Development/Building Division	Provides inspection services for public infrastructure, public buildings and private development. Inspection services include oversight of contractor compliance with City Stormwater and Grading Ordinances and State Construction General Permit.
	Consultant Contracts & City Inspectors	Constructs and inspects all street and highway improvements located in the City, including lighting, landscaping and signals. Inspection services include oversight of contractor compliance with City Stormwater and Grading Ordinances and State Construction General Permit.
Commercial/ Industrial (Section 5.4)	County Environmental Management Department (under contract to City)	Conducts inspections of all Permit-required industries in Citrus Heights once every 3 years, and conducts outreach, database management and reporting. Also see Chapter 2, Section 2.7 for more details.
	County Environmental Health Division (under contract to City)	Conducts plan review, issues permits for and inspects food-related facilities in Citrus Heights. Considers drainage issues that may be of concern to stormwater quality in all reviews and inspections.
	County Hazardous Materials Division (under contract to City)	Conducts plan review, issues permits for and inspects facilities that handle or store hazardous materials in Citrus Heights. Considers drainage issues that may be of concern to stormwater quality in all reviews and inspections.
	County Dept. of Water Resources/Stormwater Staff (under contract to City)	Works with Business Environmental Resource Center (BERC) to conduct business outreach activities required by the Permit for businesses in the City. Also see Chapter 2, Section 2.7 for more details.
Municipal Operations (Section 5.5)	Engineering/Public Works	Oversees maintenance of stormwater drainage system to ensure that system is maintained in manner that minimizes water quality impacts. Maintains creeks and channels within the City to remove accumulated debris and obstructions in order to make them hydraulically efficient to minimize over-bank flooding, bank erosion, and transport of pollutants.
	County Dept. of Water Resources/Drainage O&M (under contract to City)	Performs maintenance of the City's storm drain system, except non-concrete lined channels and creeks. Also see Chapter 3, Section 3.5 for more details.

Program Element	Department/Group	Major Responsibilities
	Public Works/Engineering (Through contracts with various private vendors)	Maintains all street and highway improvements located in the City, including lighting, roadside ditches and signals. Responsible for ensuring that stormwater quality and erosion/sediment controls are incorporated where required.
	General Services/Facilities & Fleet (Public Works)	Manages City-owned buildings, parking lots and other facilities. Responsible for ensuring that activities at these facilities do not add to stormwater pollution.
	Sunrise Parks and Recreation District	Constructs and maintains City parks and recreational facilities in a manner which complies with applicable water quality laws.
	Allied Waste Management	Provides solid waste services to the City under contract.
Illicit Discharges (Section 5.6)	County EMD Hazardous Materials Division (under contract to City) Parc Environmental (under contract to City) Metro Fire District	Responds to hazardous materials spills in the City that may impact stormwater quality and receiving waters, including cleanup and proper disposal.
	Parc Environmental (under contract to City) Metro Fire District	Respond to non-hazardous spills, including cleanup and proper disposal.
	County Dept. of Water Resources/Drainage O&M (under contract to City)	Conducts ongoing field screening activities during routine maintenance of the storm drain system in Citrus Heights. May respond to non hazardous spills, including cleanup and proper disposal.
	County Dept. of Water Resources/Stormwater Staff (under contract to City)	Conducts follow-up investigations as needed to confirm/eliminate illicit discharges. Responds to calls from the public for situations in Citrus Heights.
	Allied Waste Management	Provides solid waste management services for residents and businesses in the City. Program emphasis is placed on waste prevention, recycling, and composting, which support the stormwater quality program goals.
Public Outreach (Section 5.7)	Engineering/Public Works	Provides public outreach to individual property owners and developers and handles calls from the public routed to the City. Provides volunteers to work in Partnership booths at some regional public events. Also contributes funds to the Sacramento Urban Creeks Council to support annual Creek Week activities.
	County Dept. of Water Resources/Stormwater Staff (under contract to City)	Works with City of Sac to manage/conduct regional public outreach required by the Stormwater Permit, including a regional media campaign that addresses Citrus Heights residents and businesses. Also see Chapter 2, Section 2.6 for more details.
New Development (Section 5.8)	Community & Economic Development/Planning	Processes applications for private developments. Conducts CEQA reviews. Implements General Plan and Zoning code. Routes plans to Engineering/Public Works to ensure that stormwater quality controls are incorporated as required.
	Engineering	Conditions development projects to ensure compliance with City drainage and stormwater quality standards, including establishing requirements for stormwater quality control measures.

Program Element	Department/Group	Major Responsibilities
	Engineering	Ensures that stormwater quality control measures are incorporated into design/construction of public projects, as applicable.
	Engineering/Public Works (w/consultant contracts)	Provides planning and design for all street and highway improvements located in the City, including addressing stormwater quality requirements, where applicable.
Monitoring, Special Studies and Target Pollutant Reduction (Chapter 2)	Engineering/Public Works	Reviews and certifies reports and compliance submittals; approves consultant contract decisions; processes payments to the City/County of Sacramento for consultant services according to the cost-share MOU.
	County Dept. of Water Resources/Stormwater Staff (under contract to City)	Represents Citrus Heights in permittee work group meetings to discuss these joint Program activities; reviews draft reports and compliance submittals; administers consultant contracts for the technical studies.

Legal Authority

Legal authority for Citrus Heights' Stormwater Management Program is provided in several ways:

- The City's Municipal Code provides the basic legal authority to implement the program and enforce the local regulations,
- The General Plan and Zoning Ordinance contains water quality protection policies
- The City uses the County Standard Construction Specifications and Improvement Standards which describe requirements for development projects, and
- Agreements with the County and other permittees provide for a means of cost sharing to implement various portions of the program.

The City's certification of legal authority for implementation of the program is included in Appendix 5A.

City Code

The Citrus Heights Municipal Code is the primary basis for the legal authority for the City's Stormwater Management Program. The code constitutes a codification of the general and permanent ordinances of the city. The source materials used in the preparation of the code were the Sacramento County Code adopted by the City shortly after incorporation in 1997 and ordinances subsequently adopted by the City Council.

The predominant municipal code provision is in Chapter 98 - Utilities, Article V Stormwater Discharge (also known as the "Stormwater Ordinance"), adopted by the City in September 22, 2004 (Ordinance No.2004-08). It prohibits most non-stormwater discharges and lists non-stormwater discharges conditionally allowable (e.g., flows from emergency fire-fighting activities) pursuant to NPDES federal regulations. The Stormwater Ordinance provides legal authority to Citrus Heights and the County for inspections and enforcement related to control of illicit (unauthorized non-stormwater) discharges to the City storm drainage system and local creeks.

A number of other code sections also provide Citrus Heights with additional legal authority related to stormwater pollution control and water quality/watercourse protection. Those include:

- Chapter 1 General Provisions (various sections related to authority to issues violations and assess penalties, right to appeal)
- Chapter 18 – Building and Building Regulations (Article XII – Land Grading and Erosion Control)
- Chapter 34 – Environment (Article IV - Water Pollution)
- Chapter 42 – Floods (various sections designed to protect floodways and erosion-prone areas)
- Chapter 78 – Streets, Sidewalks and Other Public Places (Article II – Watercourses)
- Chapter 82 – Subdivisions and Land Development (Article XV – Design and Improvement Standards)
- Chapter 98 - Utilities (Article IV Storm Drainage Fee)
- Chapter 106 – Zoning (Ordinance No. 2006-02, adopted by the City Council on October 5, 2006)

General Plan

Citrus Heights adopted the County's General Plan upon incorporation in 1997. The City completed its own General Plan in November 2000. The General Plan and other development codes and standards can be accessed on the City's web site:

http://www.citrusheights.net (see Community Development, Planning Division)

The General Plan is the long-term policy guide for the physical, economic, and environmental growth of the City. It is composed of goals, policies, and implementation programs, all based on an assessment of current and future needs and available resources. The General Plan contains the provisions that lay the framework for protection of water quality and implementation of the Stormwater Management Program. Some of the adopted General Plan policies that best apply to the Stormwater Management Program are listed by Element as follows:

Community Development Element

> *Policy 6.3* – **"**Enhance and improve the City's tree cover as a valuable community resource."
>
> *Policy 7.3* – **"**Require new development to preserve and enhance significant natural features (such as creeks, wetlands and trees) and retain the existing topography...."

Resource Conservation Element

> *Policy 35.1* – **"**Preserve continuous riparian corridors and adjacent habitat along the City's creeks and waterways."
>
> *Policy 35.2* – **"**Achieve and maintain a balance between conservation, development and utilization of open space."

Policy 35.3 – **"**Provide for "no net loss" of sensitive habitats such as aquatic and riparian areas."

Policy 37.1 **–** **"**Incorporate existing trees into development projects. Avoid adverse effects on health and longevity of native oaks or other significant trees through appropriate design measures and construction practices."

Policy 38.3 – "Consider potential impacts to natural habitat areas when establishing links between developed areas. Identify alternative sites for linkages where sensitive habitat areas have the potential to be adversely impacted."

Policy 39.3 – **"**Require buildings to conform to existing natural topography, and minimize cutting and filling."

Policy 39.4 – *"*Utilize the services and expertise of organizations involved in resource conservation and open space protection."

Community Health Element

Policy 48.8 – **"**Reduce pollutants being discharged into the drainage system to the maximum extent feasible to meet required federal National Pollution Discharge Elimination System standards."

Policy 50.3 - Work with Sacramento County and other public agencies to inform businesses and consumers about the proper use and disposal of hazardous materials and waste.

As required by the 2002 Stormwater Permit, during the next update process, the General Plan will be evaluated and amended as needed to include additional water quality protection language.

Standard Specifications and Improvement Standards

The City has adopted the County's Improvement Standards and Standard Construction Specifications which are applicable to all projects citywide, private or public. These standards are periodically reviewed and updated to reflect evolving industry standards and regulations.

Guidance for design, construction and maintenance of post-construction stormwater quality control measures is provided in the *Stormwater Quality Design Manual for Sacramento and South Placer Regions* (May 2007).

Intra and Inter-Agency Agreements

Intra-agency agreements between City departments and groups will be executed if needed as the program progresses to ensure cooperation within the City for compliance with the Stormwater Permit. Because the City is so small and all departments are housed in the same building, coordination is not an issue and such agreements are not warranted at this time.

Legal authority for administering and implementing the Sacramento Stormwater Quality Partnership jointly with the other permittees is provided by a memorandum of understanding (MOU). The MOU describes administrative roles and responsibilities for management of the program and performance of joint activities, as well as cost-share arrangements. Costs for joint activities are based on population of each permittee and are therefore may be subject to change during the term of the Stormwater Permit. More details about the MOU and Citrus Heights' percentage cost share are included in Chapter 2, Section 2.2.

A MOU was executed between the City and the County Environmental Management Department (EMD) in 2004, for provision of industrial and commercial inspection and enforcement services required by the Stormwater Permit within the city limits. This MOU authorizes the EMD to conduct inspections and issue enforcement actions, using the legal authority provided by the County's Stormwater Ordinance. EMD also passed a fee ordinance in 2004 which authorizes the agency to recover costs from the industrial and commercial facilities inspected so that the City's other funding sources are not unduly burdened. More details about the MOU with EMD and EMD's enforcement policy and procedures are included in Chapter 2, Section 2.7.

Agreements with other agencies will be executed as needed. Such agreements are not warranted at this time.

Funding

Funding for Citrus Heights' stormwater program comes primarily from Stormwater Utility fees collected and administered by the County. Each year, the City works with the County to develop an annual work plan to describe revenues that will be reimbursed to the City for drainage and stormwater services it provides. The actual and projected revenues and program expenditures are detailed each year in the City's Annual Work Plans and Annual Reports, submitted to the Regional Water Board. Stormwater Utility revenues are used to fund City-specific stormwater activities as well as the Partnership activities described in Chapter 2.

In addition to revenues derived from Stormwater Utility fees, Citrus Heights collects development impact fees from developers to fund some stormwater-related activities. This would include items such as plan checking for drainage and stormwater-related features, erosion and sediment control inspections during construction, and inspecting installation of stormwater quality facilities by the developer.

The City is also using some Measure A and gas tax funds to rehabilitate and maintain streets and associated drainage structures, including drain inlets, culverts, and roadside drainage ditches.

Recordkeeping and Reporting

The City prepares and submits the following documents to the Regional Water Board each year, in compliance with the Stormwater Permit:

- Annual Work Plan (May 1) – describes proposed activities and budget for coming fiscal year (July 1 – June 30).

- Annual Report (October 1) – describes activities conducted during the previous fiscal year, including compliance with performance standards and the Stormwater Permit. Proposes revisions to the Stormwater Quality Improvement Plan, if needed.

Records and data are collected from all responsible City departments and groups each summer to prepare the Annual Report. The County also assists in compiling and describing information for the activities it conducts on the City's behalf.

The City's stormwater program staff maintains NPDES Stormwater Permit compliance files at City Hall, including all documentation necessary to demonstrate compliance with the permit. As required, the City will retain copies of all records and reports from the date of generation for at least five years.

Training for City Staff

The City ensures that all affected City staff and County contract staff receive annual refresher training as required by the Stormwater Permit. Staff are informed and educated about the Stormwater Permit and its impacts on their positions and responsibilities. Training typically covers the following types of topics:

- General stormwater quality awareness objectives: where stormwater goes, how it becomes polluted, and how to prevent pollution.
- Background regulatory information appropriate to the audience.
- How to report/refer observed problems in the field.
- Information about enforcement and penalties appropriate to the audience.

The City trains the inspectors and engineers once a year in the fall, prior to the wet weather season. Training for City staff is also accomplished through courses offered by Caltrans, Sacramento County, and other agencies.

Training for County contract staff is described in Chapter 3, Section 3.2.

Coordination with Other Agencies and Programs

Sacramento Stormwater Quality Partnership

The City is a member of the Partnership Steering Committee and participates in regular (approximately monthly) permittee coordination meetings to discuss topics such as:

- Implementation of regional Partnership activities, such as monitoring, target pollutant reduction, industrial stormwater compliance inspections, and regional public outreach.
- Status of consultant contracts and work products related to monitoring and development standards.
- Funding of activities conducted by others that benefit the Partnership, such as the development of statewide BMP manuals by the California Stormwater Quality Association (CASQA).
- Overall program evaluation and assessment.

- Proposed modifications to the SQIPs and/or stormwater permit.

Outside Agencies

The City coordinates with the following local and regional agencies in order to ensure City-wide compliance with the Stormwater Permit:

- Sunrise Parks & Recreation District – owns and operates 15 parks in the city
- Sacramento Waste Management
- Sacramento Area Sewer District (formerly CSD-1) – owns and operates the sanitary sewer collection system in the City.
- Sacramento Regional County Sanitation District (SRCSD) - owns and operates the interceptor collection system and wastewater treatment plant, to which the City's sanitary sewage is delivered. Also, a portion of the funds from the City's Stormwater Utility is paid to the SRCSD to help fund continued Sacramento and American River monitoring in compliance with the Stormwater Permit (see Chapter 2, Section 2.4)
- Citrus Heights, Cal American and Sacramento Suburban Water Districts- own water pipes and associated structures in the public right of way and have utility easements and obtain encroachment permits to repair/replace facilities as needed
- Sacramento Municipal Utility District (SMUD), Pacific Gas & Electric and other local utilities (e.g., Roseville Telephone, Comcast Cable) - own private utilities in the public right of way and have utility easements and obtain encroachment permits to repair/replace facilities as needed
- Sacramento Metropolitan Fire District – conducts fire and hazardous materials spill response operations in the city

Other Stormwater Programs

The City supports coordination and networking with other stormwater programs within California in order to share information and identify opportunities to work together. This effort is facilitated by the City and County of Sacramento, through their active participation in the California Stormwater Quality Association (CASQA).

Activities for the 2008-13 Stormwater Permit Term

Table 5.2-3 at the end of this chapter summarizes the activities that will be conducted for this program element during the 2008-13 permit term, along with associated performance standards, effectiveness assessment methods and a five-year implementation schedule. The table was developed to demonstrate compliance with various provisions of the Stormwater Permit, as indicated on the table.

This section describes the planned activities in more detail.

Recordkeeping and Reporting

SQIP

Following the submittal of this April 2009 SQIP, the City will revise the SQIP based on Regional Water Board comments and/or comments received during the 30-day public review process conducted by the Regional Water Board. From then on, proposed modifications to the SQIP will be included in the annual reports, as required by the stormwater permit.

Annual Report and Annual Work Plan

As required by the stormwater permit, the City will submit an Annual Report by October 1st of each year detailing the activities accomplished and the quantitative data compiled during the previous fiscal year (July 1 -June 30). The report will be prepared using a standardized reporting format created in coordination with the other permittees.

By May 1st of each year, the City will submit an Annual Work Plan that details the activities proposed for the coming fiscal year.

The City and County of Sacramento will take the lead in submitting Regional Partnership Work Plans and Annual Reports to describe activities such as monitoring conducted jointly by all the permittees in the Partnership. Refer to Chapter 2 for additional information about regional Partnership activities.

Permittee Memorandum of Understanding (MOU)

The City will participate in the process to finalize the updated MOU in 2009 (see Chapter 2, Section 2.2 for more details). If needed based on population growth or other factors, the City will work with the other permittees to prepare additional updates for the MOU during the 2008-13 permit term.

Legal Authority

Update Codes and Standards As Needed

The City will amend its Stormwater Ordinance if necessary to reflect changes in the program and ensure compliance with the 2008 Stormwater Permit. This will be done if needed within one year of the Regional Water Board's adoption of the 2009 SQIP. The City will also automatically adopt any changes made by the County during the 2008-13 permit term to other applicable ordinances (e.g., Land Grading and Erosion Control) and the Standard Construction Specifications and the Improvement Standards, as discussed elsewhere in this SQIP.

The City will continue to require the local development community to utilize the May 2007 *Stormwater Quality Design Manual for Sacramento and South Placer Regions* and will ensure that City planners and engineers attend training workshops related to implementation of the new manual. It is likely that as the design manual comes into more use, conflicts may arise between the criteria in the manual and the City's codes. In such cases, the City will amend codes as needed or recommend adjustments to the manual.

Incorporate Water Quality Principles into General Plan Update

The City will begin the process to update the General Plan in 2009, with completion anticipated by the end of 2010. As required by the Stormwater Permit, additional water quality and watershed protection principles will be incorporated as needed during the update process.

Legal Authority Certifications

The legal authority certification by Citrus Heights's legal counsel is included in this SQIP as Appendix 5A. Another certification will be prepared for submittal with the ROWD in March 2013, as required by the stormwater permit.

Fiscal Analysis

Each year, through the City budgeting process, a fiscal analysis will be performed to ensure resources are available and allocated to carry out the proposed activities necessary for Stormwater Permit compliance. Projected budgets for each coming fiscal year will be presented in the Annual Work Plans (May 1), and actual expenditures for the previous fiscal year will be reported in the Annual Reports (October 1).

Report of Waste Discharge (ROWD)

As required by the stormwater permit, the City will work with the other permittees to prepare a Report of Waste Discharge for submittal to the Regional Water Board 180 days prior to expiration of the current permit (submittal date March 2013). The ROWD will include a revised SQIP.

Training for City Staff

Training is an important aspect of Citrus Heights' Stormwater Program. Each year, all affected personnel and managers will be educated on the requirements of the Stormwater Permit relevant to their daily work. The training may be in the form of in-house meetings and briefings or external training conducted by the Partnership or others. See Sections 5.3 - 5.8 for additional information about training that will be conducted related to each of the program elements.

City elected officials and managers will be kept apprised of Stormwater Program activities and issues through briefings and interoffice memoranda as needed.

Intra and Interagency Coordination

The City will coordinate internally to ensure all necessary City staff, management and elected officials are aware of Stormwater Permit requirements and related program efforts. If needed, the City will develop agreements to define roles and responsibilities between the various City departments responsible for compliance with the Stormwater Permit. This was not necessary during the last permit term.

As discussed previously, the City will work with the other permittees to update the MOU which defines cost-sharing and agency roles. The City will also work with EMD as needed to update the MOU which defines responsibilities for the industrial inspection program.

Citrus Heights will attend Steering Committee meetings (approximately monthly) or will make arrangements for the County to represent the City at such meetings.

The City will continue to participate with other permittees on various work groups and subcommittees that have been formed to address specific activities, such as monitoring, target pollutants, and special studies. The City may make arrangements for the County to represent the City at these meetings.

The City will continue to coordinate with other outside agencies during the 2008-13 permit term, as needed when multi-jurisdictional issues arise. These agencies may include Caltrans, Placer County, US Army Corps of Engineers, US Fish and Wildlife Service, and the California Department of Fish and Game, among others. A complete list of agencies was presented earlier in this section.

Effectiveness Assessment

The City will work with the other permittees to assess the effectiveness of the overall stormwater program as described in Chapter 2, Section 2.3. This approach is based on guidance provide by CASQA in its *Effectiveness Assessment Guidance* document (2007). In addition, the City will evaluate the effectiveness of its own program management activities related to permit compliance, as described in Table 5.2-3. This assessment will be done each summer during preparation of the annual report, and recommendations for program improvements or modifications will be made based on the results.

For this program management element, most activities have Level 1 effectiveness outcomes; this requires annual documentation that activities have been conducted as required by the stormwater permit. Level of effort (e.g., number of meetings attended) and resources expended (staff hours or costs) may also be tracked (also outcome level 1). The exception to this is training. During the 2008-2013 permit term, the City (or the County, on the City's behalf) will use quizzes, surveys and/or follow-up meetings with selected groups to assess the knowledge level of trained staff with a goal of increasing awareness (outcome level 2).

The City will contribute resources (per the permittee cost-share MOU) to the long term effectiveness assessment required by the stormwater permit (due with ROWD in March 2013).

This page intentionally left blank.

5.3 Construction Element

The goal of the Construction Element is to reduce the discharge of sediment and construction-related pollutants to the City's storm drain system and local creeks (e.g., Arcade Creek) to the maximum extent practicable.

Citrus Heights has relatively little new construction underway or planned for the future, since most of the City is already built out. Following completion of a few large commercial sites and the Stock Ranch residential project in 2003, construction will consist mainly of redevelopment and roadway improvement projects.

Construction Element Strategy

The City has established ordinances that provide the authority necessary for the city inspectors to address threatened and actual discharges of pollutants from construction operations. With this as a foundation, the City's strategy includes outreach and education, plan review and permitting, inspection and enforcement. The program applies to private as well as public construction projects, including those also requiring coverage under the State's Construction General Permit.

For the most part, the focus for inspection and enforcement activities is on land disturbing activities of one acre or more. However, smaller sites must comply with the City's Stormwater Ordinance (discussed in Chapter 5.2) and smaller site operators are educated and informed about ways to prevent erosion and pollution problems. As discussed previously, since it is built-out, the City's work in this area is expected to focus on redevelopment activities during the 2008-13 permit term.

Intra and Interagency Coordination

The two city departments most directly involved in construction activities are General Services (Engineering/Public Works) and Community Development (Building). Most interdepartmental coordination is done on an informal basis through written correspondence and regular meetings related to specific projects. All city staff meets bi-weekly in the Council Chambers to discuss City Council items and management meets every other month to discuss projects. Development staffs in Building, Planning and Engineering as well as SMUD, Metro Fire and Citrus Heights Water meet bi-monthly to discuss all the development projects.

The City coordinates with the other permittees as much as possible to present a consistent, uniform message to the construction and development communities, since construction work is often multi-jurisdictional. For example, the City utilizes the same standard construction specifications and improvement standards as the County and other permittees.

The City meets quarterly with Sacramento Regional County Sanitation District (SRCSD) and Sacramento Area Sewer District (SASD) representatives to discuss upcoming projects and issues such as sewage spill response.

The Citrus Heights Water District attends the City's bimonthly development meetings. The district has also sent their construction inspectors and managers to the City's annual NPDES training.

Lastly, the City attends monthly construction coordination meetings with all the utility agencies in the region. This forum includes a discussion of upcoming major projects and attempts to coordinate construction within the public right-of-way. This helps minimize the traffic and stormwater impacts.

The City assists the Regional Water Board in its enforcement of the State Construction General Permit by enforcing compliance with comparable local ordinances, verifying Notice of Intent (NOI) filings to obtain general permit coverage, spot checking the Stormwater Pollution Prevention Plans (SWPPPs) required by the general permit, and referring site operators who are suspected of not complying with the State regulations.

Accomplishments to Date

Since becoming a permittee to the Stormwater Permit in 2002, Citrus Heights has made several notable accomplishments related to the construction element:

- Adopted the Citrus Heights Municipal Code, including Chapter 18 (Building and Building Regulations, Article XII – Land Grading and Erosion Control) and Chapter 98 (Utilities, Article V - Stormwater Discharge) to provide the City legal authority to eliminate construction-related pollutant discharges into its storm drain system.
- Adopted the County's standards and specifications for construction, including standard erosion and sediment control drawings.
- Developed and implemented procedures to require proof of NOI to comply with the Construction General Permit as a condition of obtaining grading permits for applicable projects
- As of June 1, 2007, hired City employees to issue building permits and conduct building inspection. The outside vendor had limited contract obligations which affected their ability to resolve stormwater issues at construction sites. City employees in the building department have no contract restrictions on enforcing and inspecting for stormwater violations.

Activities for the 2008-2013 Stormwater Permit Term

Table 5.3-1 at the end of this chapter summarizes the activities that will be conducted for the Construction Element during the 2008-13 permit term, along with associated performance standards, effectiveness assessment methods and a five-year implementation schedule. The table was developed to demonstrate compliance with Provision 8 of the Stormwater Permit.

This section describes the planned activities in more detail.

Legal Authority

The City's Land Grading and Erosion Control Ordinance (Municipal Code Chapter 18, Article XII) requires a grading permit and erosion and sediment controls on all private projects disturbing 50 cubic yards or more of soil or one or more acres of land. All projects, including those disturbing less than one acre and public projects, are subject to the City's Stormwater Ordinance, which prohibits the discharge of sediments and other construction-related pollutants to the City storm drainage system. All projects that disrupt or modify the drainage pattern are subject to review and permitting.

During the 2008-13 permit term, the City will revise its Land Grading and Erosion Control Ordinance for consistency with the State's new Construction General Permit, based on changes made by the County to its ordinances.

Plan Review and Permitting

The City will continue to conduct plan review and issue grading permits for construction projects in Citrus Heights for conformance with applicable ordinances, codes and standards described previously. Improvement plans will be checked for inclusion of erosion and sediment control (ESC) plan sheet(s) to satisfy the requirements. This ESC plan will be checked in the field by the City inspector during construction. During the planning stage, projects will also be checked to verify that any other applicable environmental permits have been obtained from Dept. of Fish and Game (1600 Streambed Alteration Agreement), US Army Corps of Engineers (404 permit) and Regional Water Board (401 Certification).

In addition to satisfying all applicable local permitting requirements, private and public projects in Citrus Heights disturbing one or more acres of land are required to obtain coverage under the State's Construction General Permit. Prior to issuing a grading permit, the City will continue to verify that a State-required NOI was filed and will check the SWPPP for six items required by the stormwater permit.

The City plans to continue using standards and specifications adopted by the County to describe requirements for BMPs at construction projects to control sediment and other pollutants. All erosion and sediment control plans for projects in Citrus Heights will be checked for conformance with the standards and specifications. The County may update these documents during the 2008-13 permit term following the update of the Land Grading and Erosion Control Ordinance to reflect the State's new Construction General Permit.

Pollution Control at City-Owned Construction Projects and Other Projects Not Subject to City's Permitting Process

All City construction projects will be subject to the same ordinances and standards as private projects. Provisions will be included in design and construction contract specifications to require compliance. City project managers or their consultants will obtain coverage under the State's Construction General Permit as required. City inspectors will inspect and conduct enforcement for these projects as described later in this section.

The City lacks jurisdictional control over projects that may be constructed in Citrus Heights by utilities, special districts (e.g., water, sewer, schools, parks) and other agencies; therefore, such projects are not subject to the City's plan review and permitting process. However, the projects will be subject to the City's Stormwater Ordinance. The City will coordinate with these agencies on a project basis to ensure compliance with the Stormwater Ordinance and to ensure coverage as required by the State's Construction General Permit. In addition, the City will continue to:

- meet quarterly with SRCSD and SASD representatives to discuss upcoming projects and issues such as sewage spill response
- invite the Citrus Heights Water District to attend the City's bimonthly development meetings

- Invite water district construction inspectors and managers to attend the City's annual NPDES training
- Attend monthly construction coordination meetings with all the utility agencies in the region to discuss upcoming major projects and coordinate construction within the public right-of-way (this helps minimize traffic and stormwater impacts)

Track/Inventory Active Construction Projects

The City will continue to maintain a database to track public and private active construction sites and will use this information to schedule/prioritize inspections and develop annual reports.

Inspection and Enforcement

Citrus Heights' Engineering/Public Works Department inspectors will continue to conduct inspections of all construction projects in the City to ensure compliance with the requirements set forth in the City's ordinances. This includes checking sediment and erosion control measures and verifying that a site has obtained coverage under the State's Construction General Permit if applicable. General Permit non-filers and repeat offenders (3 or more violations) will be referred to the Regional Water Board as required by the Stormwater Permit.

The City will continue to prioritize sites as either "high" or "moderate" threat to water quality and inspect according to this schedule:

- High priority sites – inspected twice monthly during the wet season (October 1 – April 30) and monthly thereafter.
- Moderate priority sites – inspected monthly throughout the year.

New projects will be assumed to be high priority until successive inspections demonstrate that they can be downgraded to moderate priority. The criteria for making this determination will include factors such as: project size, amount and nature of site activity, sensitive site conditions (e.g., proximity to a creek, steep slopes or erosive soils), and history of prior violations by the contractor(s).

Progressive enforcement action will be taken by the construction inspectors when violations of local ordinances are observed, including discharge of sediments and other construction-related pollutants to the storm drain system or local creeks.

Education and Training

The City will continue to provide education and guidance to both City staff (annually) and the local construction and development community (periodically), covering topics such as: current regulations and changes, local procedures and standards, BMPs, new technology, and inspection and maintenance practices. City staff will be encouraged to attend events sponsored by the Partnership, as described below.

The City will support Partnership-sponsored pre-wet season and other training events for the construction community (developers, contractors, engineers, designers) as well as those hosted by local groups such as the Building Industry Association (BIA). This coordinated training helps ensure consistency for the local construction community (which works throughout the Sacramento area, across various municipal lines), promotes stronger ties with professional organizations, and is cost-effective.

Various forms of educational materials will be distributed in different methods, depending on the target audience and message. Typical formats might include training workshops, brochures, and guidance documents and standards. Education will also be provided through the entitlement and plan check process, preconstruction meetings, and example documents. Citrus Heights will continue to contribute funding (through the cost-share MOU) for the development and production of outreach materials such as brochures for concrete and painting, printed in English and Spanish.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Table 5.3-1 describes the assessment methods the City will use to more specifically evaluate the construction program element activities during the 2008-13 permit term. The goal will be to move toward outcome levels 2 and 3 (changing awareness and behavior, respectively, of the regulated construction community) for some tasks. The remaining tasks will continue to be evaluated at outcome level 1 (documenting and confirming permit compliance).

Key indicators have been selected for various tasks to demonstrate progression towards overall stormwater program goals for this particular element. A summary of the status of key indicators will be used to assess overall program effectiveness in the annual reports.

Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

This page intentionally left blank.

5.4 Commercial/Industrial Element

The goal of the Commercial/Industrial Element is to reduce the discharge of stormwater pollutants to the maximum extent practicable and to effectively eliminate illegal non-stormwater discharges from commercial and industrial facilities and operations in Citrus Heights.

Commercial/Industrial Element Strategy

Citrus Heights contracts with others to most effectively perform some of the activities required for this program element.

The City has a MOU with Sacramento County EMD to conduct triennial inspections as required by the stormwater permit of over 270 commercial/industrial facilities in Citrus Heights. The types of facilities are described in Table 5.4-1 to characterize the make-up of the City's commercial and industrial sectors. The majority of these facilities are restaurants, and there a quite a few gas stations and auto repair shops, but virtually no industry. The EMD MOU authorizes trained and qualified EMD inspectors to conduct inspections and issue enforcement actions, using the legal authority provided by the City's Stormwater Ordinance. EMD also passed a fee ordinance in 2004 which authorizes the agency to recover costs from the industrial and commercial facilities inspected so that the City's other funding sources are not unduly burdened. The work performed by EMD on the City and other permittees' behalf is described in Chapter 2 (Section 2.7).

Table 5.4-1. Commercial/Industrial Facilities in Citrus Heights Subject to EMD Inspections

Commercial/Industrial Category	No. Facilities (2008)
Auto body shops	8
Auto repair shops	31
Auto dealers	5
Equipment rental facilities	0
Kennels	4
Nurseries	2
Retail gasoline outlets (i.e., gas stations)	22
Restaurants	198
Facilities covered by the State's Industrial General Permit	1
Total	**271**

The City contracts with Sacramento County to conduct complaint-based inspections of other businesses within the city. See Chapter 3, Section 3.4 for details. Citrus Heights and other permittees contract with the Business Environmental Resource Center (BERC) to conduct outreach to targeted local businesses in each of their jurisdictions. This work, which is described in Chapter 2 (Section 2.7), includes maintaining and updating a database of businesses receiving the outreach materials each year.

Intra and Interagency Coordination

The City signed an MOU with EMD to conduct stormwater compliance inspections on its behalf as described previously. The City participates in periodic (approximately biannual) meetings with the other permittees and EMD to discuss the permit-required inspection program, resolve problems and identify improvements as needed. EMD coordinates with the other permittees, BERC and various business groups and trade associations during the course of implementing the program. Additional details about this coordination are contained in Chapter 2, Section 2.7.

The County takes care of all other coordination needed for conducting the activities described in this section on the City's behalf; this work is covered by the City/County agreement for services that was executed when the City incorporated.

Accomplishments To Date

Refer to Chapter 2, Section 2.7 for a description of accomplishments to date.

Activities for the 2008-2013 Stormwater Permit Term

The following information briefly describes the activities conducted by County EMD, County DWR and BERC on the City's behalf. Refer to Chapter 2 (Section 2.7) and Chapter 3 (Section 3.4) for additional details, including tables that show proposed activities, performance standards, assessment methods and the five-year implementation schedule.

Legal Authority

The County's Stormwater Ordinance will continue to provide legal authority to the EMD and the County for regulating commercial businesses and industries in Citrus Heights with respect to stormwater pollution. The Stormwater Ordinance and EMD's Fee Ordinance will be amended as needed during the 2008-13 permit term.

Priority Industry Identification

The industries and commercial business categories subject to EMD stormwater compliance inspections were listed in Table 5.4-1. The businesses subject to targeted outreach by BERC are mainly mobile operations without a fixed base of operation. These are the same business categories that were targeted during the 2002-08 permit term. These lists will be refined if needed during the 2008-13 permit term. See Chapter 2, Section 2.7 for more details.

Triennial Industrial Stormwater Compliance Inspections

EMD will continue to conduct triennial inspections at priority industrial facilities in Citrus Heights (see Table 5.4-1) and conduct associated enforcement and education, on the City's behalf. The first cycle of inspections was completed in June 2007 and the second cycle will be completed in June 2010. EMD will continue to maintain its database and generate monthly violation reports, as well as all the required information for the Citrus Heights Annual Reports.

Refer to Chapter 2, Section 2.7 for more information.

Complaint-Based Stormwater Compliance Inspections

County DWR stormwater staff will inspect other businesses not addressed by EMD's program described above within the City of Citrus Heights on a complaint basis. Refer to Chapter 3, Section 3.4 for more information.

Educational Outreach

BERC will conduct outreach to targeted businesses within Citrus Heights, under contract to the Partnership. Outreach will be conducted with businesses considered potential temporary or intermittent sources of unauthorized non-stormwater discharges and/or stormwater pollution. Most of the businesses (e.g., carpet cleaners, pressure washers) are mobile operations without a single base of operation, so they are difficult to track. Educational materials will also be distributed via City and County public counters, through trade associations and industry suppliers, and at workshops and other events.

Refer to Chapter 2, Section 2.7 for more information.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Section 2.7 in Chapter 2 and Section 3.4 in the County's SQIP describe the assessment methods EMD, the County (on the City's behalf) and BERC will use to more specifically evaluate the commercial/industrial program element activities conducted during the 2008-13 permit term. Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

This page intentionally left blank.

5.5 Municipal Operations Element

The Municipal Operations Element specifies activities for controlling stormwater pollution which may occur during operation of city-owned facilities in Citrus Heights, to keep pollutants from entering storm drains and local creeks. City-owned facilities include public buildings, parking lots, roads, bridges, landscape medians, storm drains and drainage ways. The City is not responsible for facilities and operations managed by parks and school districts, the sewer district, water purveyors and private utilities.

Typical municipal activities include solid waste hauling and disposal; hazardous and recycling waste collection, storage and disposal; vehicle and equipment washing and maintenance, pipe, channel and basin maintenance and repair/replacement, street cleaning, street overlays and repairs, vegetation management and graffiti abatement. Municipal operations activities will be conducted in a manner that does not inadvertently contribute pollution to local waterways. Another important goal is to set the example of model pollution prevention for the public.

Inventory of City Operations and Related Stormwater Activities

The Municipal Operations Element addresses operation of City-owned facilities within the Stormwater Permit area (urbanized areas), not already covered by the State NPDES General Permit for Stormwater Discharges Associated with Industrial Activity (Industrial General Permit).

The following is an inventory of the City-owned facilities and operations addressed by this element:

Buildings – The City owns and operates the City Hall complex and the Police Service Center. Vehicle maintenance and parking lot maintenance is contracted to offsite vendors. There are no known stormwater issues with this complex. The City does not own a corporation yard.

City parks – 15 parks within the City are operated and maintained (including vegetation and waste management) by the Sunrise Recreation and Parks District, a separate agency within the City. The District follows the County's guidelines for stormwater quality.

Storm Drain System

Piped storm drain system – Approximately 150 miles of storm drain pipe and 2,900 associated manholes (as reported in the 2007/08 annual report) are maintained by the County Department of Water Resources under contract. See Chapter 3, Section 3.5 for a description of County maintenance practices.

Storm drain inlets – The City has almost 6,000 storm drain inlets within its jurisdiction that are maintained by County DWR (as reported in the 2007/08 annual report). Most storm drain inlets were marked with "no dumping" messages in previous years through the City's contract with the Sacramento Local Conservation Corps. The remaining inlets will be marked during the 2008-13 permit term and County crews will replace any illegible markings observed during routine storm drain maintenance activities.

Channels and creeks – Over 40 miles of manmade drainage channels and natural creeks are maintained by the City (as reported in the 2007/08 annual report), including portions of Arcade, Cripple, San Juan, Mariposa, Brooktree, Coyle, and Sunrise Branch Creeks, and various unnamed tributaries.

The City contracts with the Sacramento Local Conservation Corps to maintain the vegetated channels and creeks. The supervising field managers are taught the proper methods for clearing vegetation without exposing the slopes to excessive erosion. All cropped vegetation is removed from the creek and taken to the landfill.

Detention basins – The City has no water quality detention basins in its jurisdiction.

Transportation Facilities

Curbed Streets – About 710 curb miles of curbed streets are cleaned by a vendor under contract with Public Works (as reported in the 2007/08 annual report). The frequency schedule is:

- Priority A streets – Once a month, March through October, Twice a month, during leaf drop
- Priority B streets – Once a month, March through October, Twice a month, during leaf drop
- Priority C streets – Once a month, year round

Roads and Roadside Vegetation – Various contractors retained by Public Works maintain and repair roads and roadside vegetation. This work is performed in a manner that minimizes erosion and protects stormwater quality. Roadside ditches are hand-trimmed by the Local Conservation Corps. A section of Old Auburn is sprayed with Round-up after the rainy season has ended and the weeds have stopped growing.

City-owned parking lots – The City owns a 2-acre parking lot exposed to rainfall (associated with the City Hall complex and Police Center); this is cleaned by a maintenance contractor hired by the City's Public Works Department. For budgeting purposes the City Public Works conducts a detailed inspection of the entire facility on yearly basis.

State, Federal and Special District Agency Facilities and Activities

The City's activities under the Municipal Operations Element do not address facilities operated by federal or state governmental agencies or special districts (e.g., San Juan Unified School District). City stormwater inspectors are authorized to issue enforcement actions to the operators of such facilities if discharges from the facilities contribute pollution to the City-owned storm drain system or local creeks.

Municipal Operations Element Strategy

In order to minimize potential adverse environmental effects associated with constructing, operating, and maintaining city facilities, the City has adopted these strategies for the Municipal Operations Element:

- Provide training and technical assistance to target employees and facilities.
- Evaluate activities, facilities, employee training and any available Municipal SWPPPs to improve procedures and BMPs to address stormwater quality concerns; and
- Conduct record keeping and documentation of processes to allow for continuous assessment evaluations in order to achieve improvements with Stormwater Permit compliance.

These combined efforts help ensure that City and contractor operations and maintenance staff understand, implement, and demonstrate compliance with the Stormwater Permit in order to reduce stormwater pollution to the maximum extent practicable.

Intra and Interagency Coordination

The City coordinates with the other permittees to share information, strategies, and recommended practices related to operation and maintenance of City-owned facilities.

The City coordinates with special districts (listed previously in Section 5.2) to make sure that measures are in place to protect the City's storm drain system and local creeks and rivers.

Accomplishments To Date

Since becoming a permittee to the Stormwater Permit in 1997, Citrus Heights has made several notable accomplishments related to the Municipal Operations Element:

- Compiled the inventory of City-owned facilities and operations. The inventory helps with tracking activities and the City updates the inventory each year for the annual report.
- Established contracts needed to complete municipal operations activities, including contracts with Sacramento County DWR, a waste hauler, a street cleaning contractor and various maintenance vendors.
- Worked with local environmental groups to determine alternative environmentally-friendly ways to conduct overbank cleaning of natural creeks and streams
- Established routines for collecting and compiling data to assess activities and document regulatory compliance (e.g., County and City staff routinely log the quantity of pipes, channels, basins, storm drain inlets, manholes, and roadways cleaned.) This information is tallied and presented in annual reports.
- Through the Partnership, supported the County's development of the *River Friendly Landscaping Guidelines* (2007) and associated *Homeowners' Guide (2008)*. This program won the 2008 Environmental Leadership award from the Sacramento Environmental Commission.

Activities for the 2008-2013 Stormwater Permit Term

Table 5.5-1 at the end of this chapter summarizes the activities that will be conducted for the Construction Element during the 2008-13 permit term, along with associated performance standards, effectiveness assessment methods and a five-year implementation schedule. The table was developed to demonstrate compliance with Provision 10 of the Stormwater Permit.

This section describes the planned activities in more detail. The City contracts with County DWR to conduct some of the activities for this program element. Those activities are summarized very briefly below; see Chapter 3, Section 3.5 for more details about County activities.

Illicit Discharge Response

The County, on behalf of the City, will respond quickly to all incidents where an illicit discharge threatens to enter or enters the storm drain system. See Section 5.6 and Chapter 3, Section 3.6 for a description of these activities.

Stormwater Pollution Control for Construction and Development of City-Owned Projects

Construction and development of City projects (e.g., new facilities, widened roadways) will be subject to the same requirements applying to private construction and development projects, as described in Sections 5.3 and 5.8.

Facility Management

Maintenance of Buildings

The buildings owned by the City at the City Hall complex will be maintained by maintenance contractors and a couple staff members. Maintenance will include vegetation management, pest control, and parking lot cleaning. Weeding and parking lot cleaning will be accomplished by volunteers and juveniles sent by the Police Department for minor infractions. Power washing or mechanical sweeping is required on the City campus. See the pest management and parking lot maintenance activities described later in this section, which are designed to minimize discharge of pollutants to the storm drains and creeks

The City does not own a corporation yard or any other buildings. The City does not have any leased facilities at this time.

Integrated Pest Management

The City and its contractors will implement IPM procedures in compliance with the Pesticide Plan developed by the Partnership and approved by the Regional Water Board. The following is a summary of the activities:

- Pest control operations contracted by the City relate to City-owned buildings will be done only when ant problems arise; cats in the area have controlled any rodent issues.
- City will continue to use pesticides on its rose garden as little as possible.

- Herbicides will continue to be applied by City maintenance contractors for weed control at City's direction but never in the creek areas. Use varies by rain pattern and growth.
- The landscape contractors will not use chemicals in the medians and roadside ditches.
- A section of Old Auburn will continue to receive a dose of Round-up once a year at the end of the rainy season; the work will be conducted by licensed pest applicators.
- The City will promote and distribute the award-winning River Friendly Landscaping Guidelines and associated Homeowners' Guide to residents and landscape contractors doing work in the City.

The City is not responsible for pest control or other maintenance activities conducted at parks and open space in the city.

Storm Drain System Maintenance

Maintenance of the Piped Storm Drain System

The City will continue to contract with the County DWR to conduct these services on the City's behalf. The County will employ the same procedures they use for cleaning their own system. Refer to Chapter 3, Section 3.5 for this information.

Maintenance of Creeks and Channels

The City will continue to contract with the Sacramento Local Conservation Corps to maintain the creeks and channels in the city. Hand methods will continue to be used for this cleaning and vegetation is retained on slopes to prevent erosion.

Storm Drain Inlet Marking

Because storm drain inlet stenciling does not last long, the City now uses glue-down permanent decals. The new decals used on inlets have handling restrictions on the glue that preclude volunteers from doing the work.

County maintenance crews will continue to check the legibility of existing storm drain stencils and markings during routine maintenance activities and replace any that are noted as damaged or missing as soon as practicable. The city planners, engineers and field inspectors will continue to verify that new storm drain inlets installed in new developments include a permanent "No Dumping" message.

Operation and Maintenance of Transportation Facilities

Prioritized Street Sweeping for Curbed Streets

The City will continue to contract with a vendor for street sweeping on curbed streets, to follow the prioritized schedule described at the beginning of Section 5.5.

Maintenance of Roads and Roadside Vegetation

The City will continue to contract with vendors to conduct these services on the City's behalf.

Road maintenance contractors that apply paints, therma-plastic, bituminous materials, crack seal compound, slurry seal and other products are required to provide wet-street brooming when they disturb the base rock, shoulder soils, or apply a rock chip. If a water truck is required to help scrub the pavement, rock bags and DI filters are required.

Roadside vegetation is hand trimmed and the vegetation is removed and dumped into green waste receptacles. The crews are trained and supervised on the proper trimming methods to minimize future erosion.

Inspection and Maintenance of City-Owned Parking Lots

The City owns two acres of parking lot exposed to rainfall (associated with the City Hall complex and Police Center); these will be cleaned by a vendor under contract to the City's Public Works Department at least annually prior to the wet season, but likely much more frequently. Maintenance activities will include trash/debris removal, sweeping, and pressure washing of oil stains (involving collection and proper disposal of the waste water.)

Waste Management Services

The City will continue to contract with a waste collection contractor for residential solid and green waste and general recycling collection and hauling services in the city. Waste oil is also collected curbside as well as paints and a limited amount of household hazardous wastes. The contractor does not have any storage/staging yards or facilities within the city. Wastes are taken to a transfer facility located outside the city limits, and from there the wastes are transported to appropriate landfills/disposal sites.

Citrus Heights residents will be able to continue to take household hazardous wastes to one of the two regional transfer stations operated by the City and County of Sacramento. The City pays for this service (set fee per vehicle) to make it free and as convenient as possible for residents. See Chapter 3, Section 3.5 and Chapter 4, Section 4.5 for descriptions of the facilities.

Operation and Maintenance of City Parks

The Sunrise Recreation and Park District will continue to manage the 15 parks within the city limits. The City of Citrus Heights will coordinate with the district during the 2008-13 permit term to ensure that pollutants are not discharged to the City's storm drain system or local creeks due to the Park District's operations.

Employee and Contractor Training

Training for County employees conducting work in the city is described in Chapter 3, Section 3.5. City contractors are responsible for training their own personnel to comply with all applicable regulations, including the City's stormwater ordinance.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Table 5.5-1 describes the assessment methods the City will use to more specifically evaluate the municipal operations program element activities which it conducts. Assessment activities to be conducted by the County on the City's behalf are described in Chapter 3, Section 3.5. The goal will be to move toward outcome levels 2 and 3 (changing awareness and behavior, respectively, of the city and County employees and contractors) for some tasks. The remaining tasks will continue to be evaluated at outcome level 1 (documenting and confirming permit compliance).

Key indicators have been selected for various tasks to demonstrate progression towards overall stormwater program goals for this particular element. A summary of the status of key indicators will be used to assess overall program effectiveness in the annual reports.

Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

This page intentionally left blank.

5.6 Illicit Discharge Element

The goal of the Illicit Discharge Element is to reduce the discharge of stormwater pollutants to the maximum extent practicable and to effectively eliminate prohibited non-stormwater (illicit) discharges. Any material dumped or discharged into the City's storm drain system eventually makes its way to a local creek and rivers, where it can impair beneficial uses. This is true whether the material is classified as hazardous or not. Water quality, habitat, recreation and aesthetics are all examples of benefits that can be impacted.

The storm drain system consists of a network of drain inlets, manholes and piping, as well as streets, sidewalks, gutters and roadside ditches, which discharge to local creeks and rivers. Stormwater runoff from driveways, parking lots, roof drains and other surfaces typically discharge into this system.

Two kinds of discharges are addressed by this element:

- *Illegal dumping* – Dumping of liquid or solid wastes into the storm drain system. Examples include mobile carpet cleaning companies discharging dirty rinse water into a storm drain manhole, a homeowner dumping used motor oil into a storm drain inlet, or a person dumping garbage or other wastes into drainage channels and creeks.
- *Illicit connection* – A piped connection allowing sanitary sewage to flow into the storm drain system. For example, a washing machine plumbed into the storm drain system rather than the sanitary sewer.

Illicit Discharge Element Strategy

The City's strategy for eliminating illicit discharges to the storm drain system and local waterways is essentially the same as the County's. It includes:

- Maintaining adequate legal authority to prohibit illicit discharges. This is accomplished through the City Stormwater Ordinance. Since Citrus Heights adopted the County Stormwater Ordinance into its municipal code, prohibitions of illicit discharges apply within city in the same manner as they do in the county. City and County staff are authorized to enforce the ordinance within the City limits.
- Conducting ongoing field screening to detect illicit discharges and connections as a part of routine maintenance and repair of the storm drain system and local creeks, and enforcing against dischargers. The City contracts with County DWR for these services for the piped system, and with Sacramento Local Conservation Corps for the natural creek system.
- Providing convenient means for residents to dispose of solid and household hazardous wastes.
- Educating City staff, contractors and the public about how to identify and report illicit discharge problems. This effort includes educational materials, signage and training.

- Providing a hotline for public reporting of problems and responding in a timely manner. The City supports the regional stormwater hotline 808-4H20 for this purpose.

Intra and Interagency Coordination

The City coordinates with the County for maintenance of the storm drain system in Citrus Heights. County crews conduct ongoing field screening for illicit discharges and connections as part of this work. They, in turn, will coordinate with other appropriate County departments or the City to clean up and dispose of any polluted wastewater. If progressive enforcement action against the discharger does not eliminate the problem, the County will then coordinate with legal counsel.

The City coordinates with field crews from the Sacramento Local Conservation Corps to make sure that they have the education and training needed to detect and report illicit discharges to the creeks in the city.

The City coordinates with the other permittees in the Partnership to produce educational materials and messages designed to eliminate illicit discharges.

The City contracts with Allied Waste for solid waste management and curbside pickup of used oil for residents of Citrus Heights. Allied also collects limited household hazardous waste, which is manifested to the proper landfill.

Accomplishments To Date

The following highlights major accomplishments for the Illicit Discharge Element:

- In 1998 the City adopted the County's Stormwater Ordinance (Citrus Heights Municipal Code Chapter 98, Article V), which makes most discharges to the storm drain system illegal and in recent years the City revised the ordinance to strengthen its legal authority.
- 95% of storm drain inlets in the City were stenciled with the "No Dumping — Drains to Creek" message, primarily using volunteers.
- As required by the County's Improvement Standards (used by the City), permanent "No Dumping" stamps were applied to all new concrete storm drain inlets installed as part of development projects such as Stock Ranch.
- In 2006, the Partnership set up a new hotline, 808-4H20, which allows callers to report incidents of illegal dumping and illicit discharges. The hotline is now widely advertised on all Partnership educational materials, media spots, and on the web site.
- The City contracted with the County to conduct field screening of its storm drain system. Open channels, priority piped outfalls and outfalls larger than 36 inches were all inspected in a phased program over a two-year period. No illicit discharges or connections were discovered during these investigations.

- Starting in 2004, the County created and annually updated an illicit discharges map to identify "hot spot" problem areas in Citrus Heights requiring additional or more frequent investigations. To date, no such areas have been identified.

Activities for the 2008-2013 Stormwater Permit Term

Table 5.6-1 at the end of this chapter summarizes the activities that will be conducted for the this program element during the 2008-13 permit term, along with associated performance standards, effectiveness assessment methods and a five-year implementation schedule. The table was developed to demonstrate compliance with Provision 11 of the Stormwater Permit.

This section describes the planned activities in more detail. The City contracts with County DWR to conduct some of the activities for this program element. Those activities are summarized very briefly below; see Chapter 3, Section 3.6 for more details about County activities.

Update Stormwater Ordinance and Improve Enforcement Authority as Needed

The City has adopted the County's Stormwater Ordinance into its code, therefore, amendments made by the County during the permit term to enhance legal authority will also apply to the City.

Reporting of Illicit Discharges

Through the contract with the County, the City will continue to contribute funding to the Partnership's 808-4H20 hotline to facilitate public reporting of problems in the City. Also, County crews will distribute doorhangers and other educational materials in neighborhoods where they observe illicit discharge problems.

Ongoing Field Screening to Detect Illicit Discharges and Connections

Activities to prevent and reduce illicit discharges to the piped storm drain system and creeks within the City of Citrus Heights will continue as a coordinated activity by Citrus Heights, the County and the Sacramento Local Conservation Corps.

County, City and Sacramento Local Conservation Corps crews responsible for inspecting and maintaining the piped storm drain system, creeks and channels, and roads/roadside ditches in the City will continue to be trained how to identify, clean up and/or refer and report observed incidents of illicit discharges. Follow-up will be conducted for any observed flows suspected of containing pollutants to attempt to trace the flow to its source and eliminate any unauthorized non-stormwater discharges.

County and City crews will also respond to complaints from the public and referrals from County industrial inspectors, the Regional Water Board and others. Problems will be addressed on an individual basis depending on the nature of the discharge.

Illicit Discharge Response, Containment and Clean-up

The County will continue to conduct response, containment and clean-up activities on behalf of the City as needed to eliminate illicit discharges in Citrus Heights. See Chapter 3, Section 3.6.

Enforcement

City staff in the Neighborhood Enhancement and Building Divisions or County DWR staff will continue to use the Stormwater Ordinance to conduct enforcement against illicit dischargers. The County's activities are described in Chapter 3, Section 3.6.

Data Management

The County will continue to track data and update the Citrus Heights illicit discharge map that shows the location of illicit discharges for identifying potential needs for further investigation or possibly outreach. See Chapter 3, Section 3.6. A new Geographical Information System (GIS)-based computer maintenance management system, Cityworks, is being implemented in May 2009 to track work orders and service requests. The City's maintenance coordinators will open work orders for the city vendors, to include the Conservation Corps. Vendors will return the work orders with the quantities of work as well as quantities of waster or debris collected. This system will allow the City to identify and better focus future maintenance efforts on the problem areas.

Solid Waste and Household Hazardous Waste Programs

Citrus Heights will continue to contract with a private waste hauler to provide waste, recycling and green waste collection and disposal services for the city residents, as a means of deterring illegal dumping. This program includes curbside pickup of used motor oil. Residents must take household hazardous waste to the North Area County transfer station. Refer to Section 5.5 for more details.

Education and Outreach

To educate the public and to minimize illegal discharges of waste into the storm drain system, County maintenance crews will continue to mark or re-label storm drain inlets with "No Dumping" decals. Additional "No Dumping" signage along the creeks may be installed based on future recommendations from the public or maintenance crews.

Employee and Contractor Training

Training for County employees conducting work in the city is described in Chapter 3, Section 3.6. City contractors are responsible for training their own personnel to comply with all applicable regulations, including the City's stormwater ordinance.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Table 5.6-1 describes the assessment methods the City will use to more specifically evaluate the illicit discharge program element activities which it conducts. Assessment activities to be conducted by the County on the City's behalf are described in Chapter 3, Section 3.6. The goal will be to move toward outcome levels 2 and 3 (changing awareness and behavior, respectively, of the city and County employees and contractors) for some tasks. The remaining tasks will continue to be evaluated at outcome level 1 (documenting and confirming permit compliance).

Key indicators have been selected for various tasks to demonstrate progression towards overall stormwater program goals for this particular element. A summary of the status of key indicators will be used to assess overall program effectiveness in the annual reports.

Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

This page intentionally left blank.

5.7 Public Outreach Element

The goal of the Public Outreach Element is to raise awareness and foster community stewardship to help prevent pollution and protect local creeks and rivers.

Public Outreach Element Strategy

The City contracts with Sacramento County to conduct most of the public outreach activities for Citrus Heights residents. For details about the County's public outreach activities, refer to Chapter 3, Section 3.7. Citrus Heights also contributes to regional public outreach (discussed in Chapter 2, Section 2.6) through the permittee cost-share MOU.

In addition, the City conducts these types of public outreach activities on its own, as discussed in more detail later in this section:

- Educating City Council and department managers about the stormwater program and impacts to the city, and garnering support for Partnership efforts.
- Responding to local resident and business phone calls received by 808-4H20.
- Making Partnership outreach publications such as brochures available to the general public and development project applicants at the public counter.
- Working with community groups and neighborhood associations on various efforts.

Public Outreach Target Audiences in Citrus Heights

There are approximately 90,000 residents in the City of Citrus Heights. The San Juan Unified School District operates 11 schools within the City limits, including 2 high schools, 1 middle school and 11 elementary schools, with a combined total student population of about 10,945. About 3,700 students are enrolled in grades 3-6 (this has traditionally been a target age range for stormwater pollution prevention messages).

There are numerous community organizations, 11 homeowner associations and environmental groups represented in Citrus Heights; the most influential being the neighborhood associations. Each neighborhood is represented on the Resident's Empowerment Association of Citrus Heights (REACH), a non-profit umbrella organization which can apply for grants to fund neighborhood activities, projects, and improvements. Staff has used these neighborhood meetings in the past to discuss flooding and water quality issues.

The Sacramento Bee is the major newspaper serving the region and the City of Citrus Heights. The City publishes its own *Citrus Heights Connections* community newsletter about four times a year. Other media includes television and radio stations that serve the greater Sacramento area.

Intra and Interagency Coordination

The City's Engineering Dept. in General Services coordinates with City Council, the City Manager's office and other departments as needed throughout the year to educate and share information.

Citrus Heights coordinates with the other cities in the County on regional public outreach issues through the Partnership. Activities such as the regional media campaign are generally discussed, and agreements made, during permittee steering committee meetings, described in Chapter 2, Section 2.2.

Accomplishments To Date

Chapter 2, Section 2.6 describes major Partnership accomplishments related to public outreach. In addition, the following describes several major accomplishments made by the City:

- The City helped coordinate and host the Partnership stormwater informational booth at various annual local community events, such as the Harvest Festival, the Community Campout and the Safety Fair.
- The City annually contributed funding to the Urban Creek Council's Creek Week program and hosted a creek week clean up event in Citrus Heights.
- Working through a school network program called "Building Bridges", City staff provided articles in the school paper and promotional materials to classrooms, some of which focused on the environment and storm drain protection.
- City staff initiated and coordinated volunteer stenciling of storm drain inlets in the city as an educational activity. Through this program, community and civic organizations were encouraged to apply "No Dumping" messages to storm drain inlets using City-supplied materials and instructions.
- The City participated in the Arcade Creek watershed project, an effort spearheaded by the City of Sacramento. The project is designed to assess/restore the health of Arcade Creek and its tributaries.

Activities for the 2008-2013 Stormwater Permit Term

Partnership Activities

See Chapter 2, Section 2.6 for detailed information about activities that will be conducted by the Partnership related to regional public outreach. Residents, businesses and students attending Citrus Heights schools are addressed through those efforts.

City-Specific Activities

Table 5.7-1 at the end of this chapter summarizes the City-specific activities that will be conducted for the this program element during the 2008-13 permit term, along with associated performance standards, effectiveness assessment methods and a five-year implementation schedule. The table was developed to demonstrate compliance with portions of Provision 12 of the Stormwater Permit.

This section describes the planned activities in more detail.

- Meet with City managers periodically throughout the Stormwater Permit term to keep them informed about the Program. Presentations will be made to the City Council and/or Planning Commission upon request. City leaders will also be invited to participate in community events to demonstrate support for the stormwater pollution prevention effort.
- Improve the "Drainage, Stormwater and Sewer" Page on the City's web site to better address the stormwater pollution prevention program and provide links to Partnership web site. The web address is: *http://www.citrusheights.net/home/index.asp?page=814*
- Include an article regarding stormwater pollution prevention in the City's "Connections" newsletter
- Continue to work with the County to sponsor and staff a stormwater booth at the following types of community events:
    - Citrus Heights Harvest Festival – October
    - Urban Creeks Council Creek Week Splash Off Event
    - Citrus Heights Community Campout
    - Safety Fair
- Continue to annually contribute funding to the Urban Creek Council's Creek Week program and host a creek week clean up event in Citrus Heights.
- Continue to support and participate in the Arcade Creek watershed project, an effort facilitated by the City of Sacramento. Sponsor meeting facility as needed.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Table 5.7-1 describes the assessment methods the City will use to more specifically evaluate its City-specific public outreach program element activities during the 2008-13 permit term. Assessments of regional public outreach activities will be conducted by the Partnership as described in Chapter 2, Section 2.6. In general, the goal will be to move toward outcome levels 2 and 3 (changing awareness and behavior, respectively, of dischargers and the public) for some tasks. The remaining tasks will continue to be evaluated at outcome level 1 (documenting and confirming permit compliance).

Key indicators have been selected for various City-specific and regional public outreach tasks to demonstrate progression towards overall stormwater program goals for this particular element. A summary of the status of key indicators will be used to assess overall program effectiveness in the annual reports.

Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

This page intentionally left blank.

5.8 New Development Element

The goal of the New Development Element is to mitigate urban runoff pollution and other water quality impacts associated with new development and redevelopment.

New development within the City of Citrus Heights is generally associated with redevelopment as there is very little vacant developable land remaining in the City. Redevelopment projects with substantial tenant improvements will be required to re-work the site to capture the water on-site and improve runoff quality. Many older sites currently sheet-flow directly into the city streets.

New Development Element Strategy

Potential impacts from development and redevelopment within Citrus Heights will be mitigated with a combination of strategies such as: early site planning to limit sources of pollution, requiring installation of permanent post-construction stormwater quality facilities to treat runoff before it reaches the drainage system, and ongoing outreach activities through education and training.

The City believes that the best way to make in-roads on new development water quality is to improve planning guidance. The recently adopted Citrus Heights Zoning Code provides guidelines for improving the site design to address water quality. With up-front information and requirements to address water quality, the architect and developer will not be so reluctant to address these issues. Most of the reluctance to incorporate BMPs stems from the need to re-design the existing new designs.

Intra and Interagency Coordination

The City's Engineering and Planning Division share responsibilities in coordinating new development. This group meets with the developer at the planning stage. This meeting provides an opportunity to interact with the local neighborhood.

Engineering provides a development services manager to meet with the public and attend all planning commission meetings.

The City also coordinates with the other permittees regarding regional activities such as the new Design Manual and hydromodification and low impact development (LID) standards, described more later in this section.

Accomplishments To Date

County Activities Prior to Incorporation

The area now served by the City of Citrus Heights has been covered by the Sacramento Stormwater Permit since the permit was first adopted in 1990. Prior to incorporation of the City in 1997, the County established and implemented stormwater controls for newly developing projects in this area.

The County maintained a proactive role in this regard, requiring regional water quality detention basins for new development via the master drainage planning process. Redevelopment projects and other newly developing sites where runoff does not get directed to regional basins typically require on-site stormwater quality treatment devices. Long-term maintenance of these devices is the responsibility of the property owners in accordance with maintenance agreements recorded with the deeds for the properties.

Accomplishments Since 1997

- The City significantly increased public awareness of stormwater quality and subsequently added more internal and field inspection staff in the Building Department. The City increased the Building Division's duties to include stormwater quality. This in turn, increased the frequency and number of inspections possible.
- The Sacramento Local Conservation Corps was hired to provide the City with better visibility in the creek area and to monitor encroachments associated with development.
- On the City's behalf, the County worked with the other permittees in the Partnership to create the new *Stormwater Quality Design Manual for the Sacramento and South Placer Regions*, continued to conduct special studies of BMP effectiveness, and conducted other activities. These accomplishments are described in more detail in Chapter 3, Section 3.8.
- Since 2006, the City has been requiring and establishing maintenance agreements with property owners to ensure long-term maintenance of new stormwater quality facilities.

Activities for the 2008-2013 Stormwater Permit Term

The stormwater permit requires that the permittees continue to regulate new development and redevelopment projects so that they incorporate measures to mitigate stormwater quality impacts. The 2008 stormwater permit includes new provisions to require a plan for mitigating the hydromodification impacts associated with new development in the permit area. (As described in more detail in Section 3.8, when development occurs, it increases the volume and rate of runoff and therefore stream flow; these hydromodification impacts, in turn, can cause creek erosion and degrade habitat.) In addition, the 2008 stormwater permit includes a new provision specifying that the permittees require all priority new development and redevelopment projects to incorporate low impact development (LID) measures. Both new hydromodification and enhanced LID criteria will be incorporated into the updated *Stormwater Quality Design Manual for the Sacramento and South Placer Regions* by the Partnership.

Table 5.8-1 at the end of this chapter summarizes the activities that will be conducted for this program element during the 2008-13 permit term, along with associated performance standards, effectiveness assessment methods and a five-year implementation schedule. The table was developed to demonstrate compliance with Provisions 13-26 of the Stormwater Permit.

This section summarizes the planned activities. The City contracts with County DWR and the Partnership to conduct many of the activities for this program element; therefore, see Chapter 3, Section 3.8 for more details.

Development-Related Ordinances, Plans, Policies and Procedures

Ordinances/Municipal Code

The City's stormwater ordinances provide adequate authority to establish new requirements for development projects; no revisions to the ordinance are warranted.

Plans, Policies and Procedures

The City plans to do a major update to the 2000 General Plan starting in 2009, with completion anticipated at the end of 2010. As part of that process, water quality and watershed protection goals and policies will be incorporated or strengthened as needed.

Development Standards and Technical Guidance

Standards, Codes and Technical Guidance

Development projects in Citrus Heights will be conditioned to comply with City stormwater quality and drainage development standards. Currently, developers may use any California Stormwater Quality Improvement Design Manual. Many times, Bay area developers utilize those found in their jurisdiction. The City will evaluate and amend its stormwater quality development standards to comply with new permit requirements during the 2008–13 permit term**.**

Working with the Partnership, the *Stormwater Quality Design Manual* will be updated to include additional/enhanced criteria for hydromodification mitigation and LID following the amendment of the development ordinances and standards. The hydromodification criteria are discussed in the next section. Citrus Heights will contribute funding through the permittee cost-share agreement for the update of the design manual. The City will also continue to contribute to the Partnership's efforts to update the protocol for acceptance of proprietary control measures; see Chapter 2, Section 2.4 for more details about that effort.

Stormwater quality requirements need to be coordinated with the City's zoning and building codes (such as those related to tree preservation/landscaping, water conservation, sanitary sewer and solid waste) in order to avoid conflict and overlap. The City planning staff will review and update as needed, various City codes (Zoning, Building, etc.) that may conflict with the development standards and Design Manual. Alternatively, changes will be proposed to the Design Manual to achieve better consistency. This work will be built on lessons learned from similar County activities.

Hydromodification Management Plan (HMP)

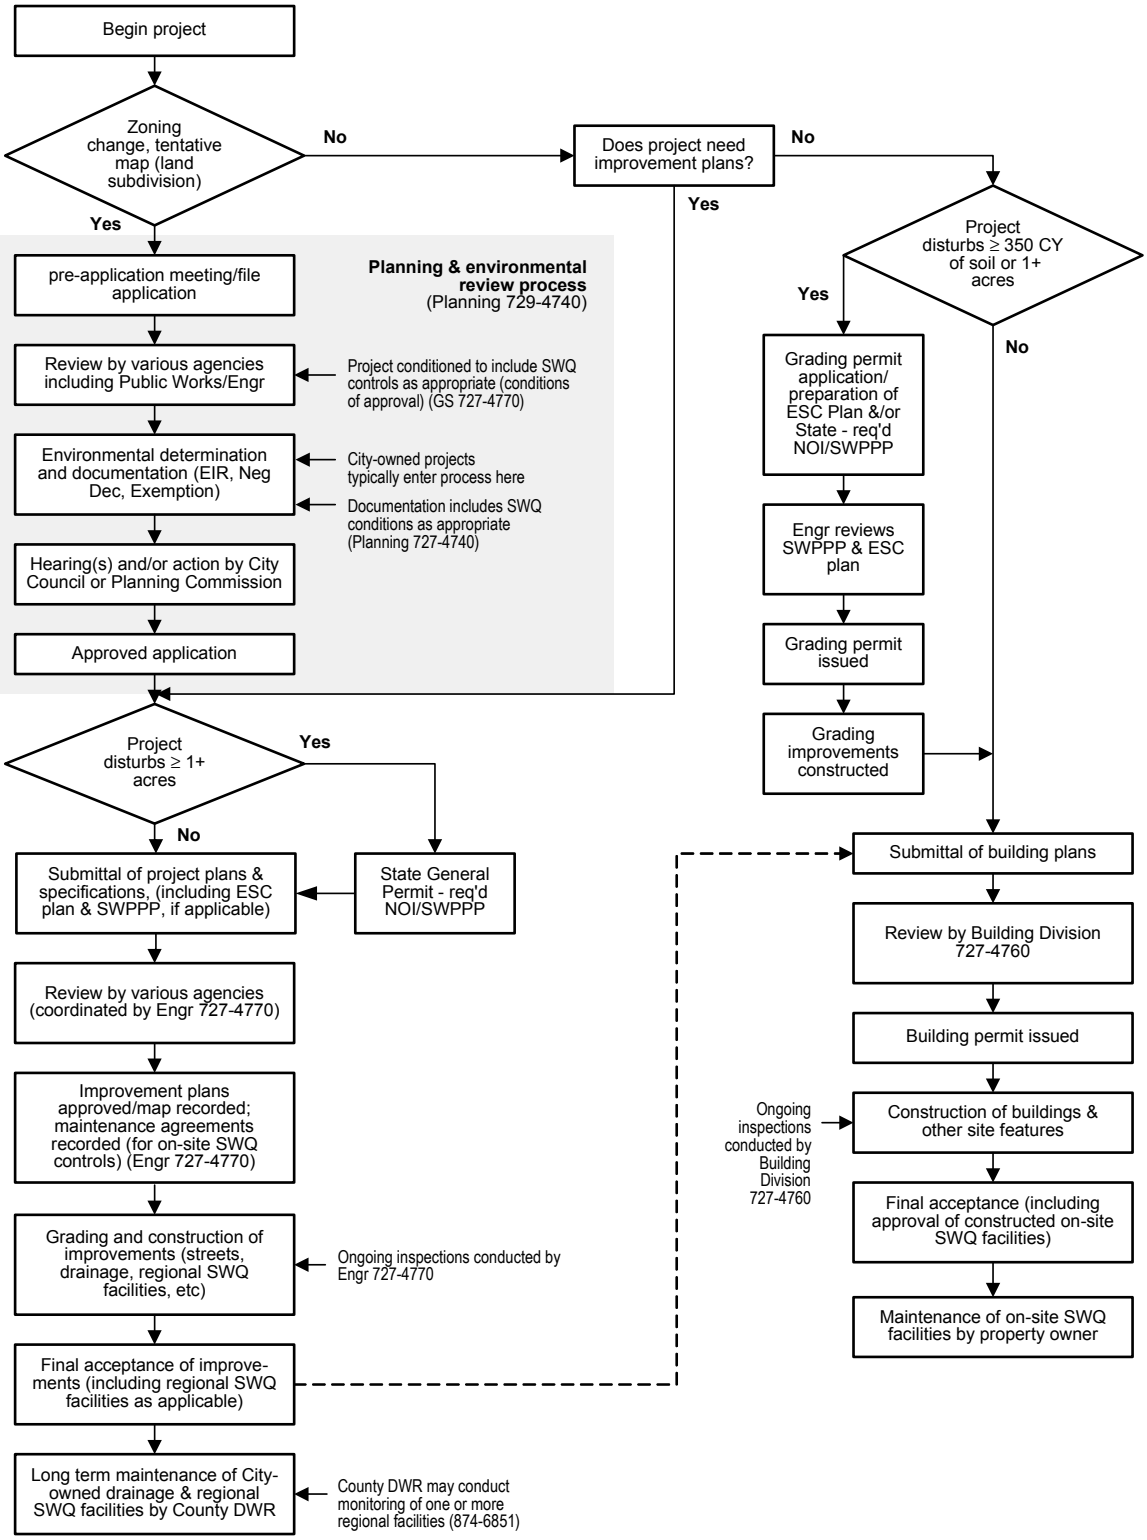
The City will work with other permittees to meet the requirements of the stormwater permit with regards to hydromodification management. However, due to build-out status, it is uncertain how these requirements will apply to development projects in Citrus Heights. Additional details about proposed work are provided in the County's SQIP, Chapter 3, Section 3.8.

To comply with the stormwater permit requirements, the permittees are submitting a Hydromodifcation Management Plan (HMP) work plan as part of this SQIP (see reference in Chapter 3, Section 3.8). One year after the Regional Water Board approves the work plan, the permittees will submit the HMP document.

Waiver Program/Mitigation Fund

The stormwater permit allows the permittees to develop a waiver program/mitigation fund alternative for development projects where it is demonstrated that installing stormwater quality control measures is not feasible. The County is taking the first step to develop initial parameters for their potential waiver program. The City will review the results of the County's work and consider application to future development projects in Citrus Heights.

Permitting and Plan Review (Entitlement) Process



Development and redevelopment projects in Citrus Heights will be conditioned for mitigation of receiving water impacts from urban runoff quality and quantity in the same manner as projects are conditioned in Sacramento County. See Figure 5.8-1 for a flowchart depicting the City's development review/entitlement process and indicating how stormwater quality is addressed in the process.

City staff will review initial development applications for conformance with the *Stormwater Quality Design Manual for the Sacramento and South Placer Regions*. Compliance with the development standards and the design manual will be a standing discussion item on the agenda for all pre-application meetings.

City planning staff will promote the voluntary use of runoff reduction (LID) control measures on development projects as a means of mitigating downstream habitat and erosion impacts until such measures become mandatory for projects in certain areas in compliance with the Stormwater Permit.

The City will make sure that the same development standards applied to private development projects are adhered to for public projects.

Figure 5.8-1
City of Citrus Heights Development Process Flowchart

GS - City General Services Dept.; Engr - City Engineering/Public Works Division; DWR — Department of Water Resources; ESC — Erosion and Sediment Control; NOI — Notice of Intent; SWPPP — Stormwater Pollution Prevention Plan; SWQ — stormwater quality

Maintenance of Stormwater Quality Control Measures

The City will continue to ensure long-term maintenance of treatment control measures on private development by requiring maintenance agreements to be executed before the final approval of the project. The new Cityworks system will track the properties with these devices. Letters will be sent to these properties requiring a re-certification of the device by either the manufacturer or a certified inspection company. Properties that do not provide the necessary re-certification will be fined and a lien placed on the property based on the City ordinances.

Through the annual refresher training and other opportunities, the City will train its construction inspectors to check for proper installation/operation of stormwater control measures before final acceptance of the project.

Outreach to Educate the Development Community

The City planners and engineers will continue to work collaboratively with the County and other permittees to share information with the development community and promote consistency across municipal boundaries. The City and County will continue to provide technical guidance and design support to help the development community working in Citrus Heights to comply with stormwater quality requirements. Refer to Chapter 3, Section 3.8 for more information on work that will be conducted by the County in this regard.

Employee Training

The City's planners and engineers will receive annual training related to hydromodification, LID and other evolving development standards, including how such standards will impact development in Citrus Heights. It is anticipated that this will entail one or a few staff members attending an outside training seminar and then providing an internal class based on this training.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Table 5.8-1 describes the assessment methods the City or County will use to more specifically new development element activities during the 2008-13 permit term. In general, the goal will be to move toward outcome levels 2 and 3 (changing awareness and behavior, respectively, of dischargers and the public) for some tasks. The remaining tasks will continue to be evaluated at outcome level 1 (documenting and confirming permit compliance).

Key indicators have been selected for various tasks to demonstrate progression towards overall stormwater program goals for this particular element. A summary of the status of key indicators will be used to assess overall program effectiveness in the annual reports.

Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

Table 5.2-3 – City of Citrus Heights SQIP
Program Management Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key Indic	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Stormwater Quality Improvement Plan (SQIP)											
Modify 2007 draft SQIP to reflect the requirements of Stormwater Permit and Public Review Process	2		Revised SQIP submitted to Regional Water Board by April 30, 2009.	Confirmation- submit SQIP to Regional Water Board	♦						4/30/2009
Revise SQIP as needed to reflect permit revisions, respond to Regional Water Board requests, etc.	3.c, 3d		Proposed SQIP modifications (as needed) submitted to Regional Water Board as part of Annual Report	Confirmation- submit AR to Regional Water Board	⇔	⇔	⇔	⇔	⇔	⇔	As needed; Oct 1 each year
Annual Work Plan											
Prepare and submit Annual Workplan	3.a		Annual Workplan submitted to Regional Water Board	Confirmation- submit work plan to Regional Water Board	♦	♦	♦	♦	♦	♦	May 1 each year
Annual Report											
Describe completed activities and budget expended for previous fiscal year in AR	3.b		AR submitted to Regional Water Board	Confirmation - submit AR to Regional Water Board	♦	♦	♦	♦	♦	♦	October 1 each year
Memorandum of Understanding (MOU)											
Review and revise existing permittee memorandum of understanding	3.e		MOU submitted to Regional Water Board	Confirmation	♦						Submit with SQIP 4/30/2009

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Respond quickly and appropriately if an illicit discharge threatens to enter or enters the storm drain system	10.a.i.		Refer to Illicit Discharge Element, Section 5.6		⇔	⇔	⇔	⇔	⇔	⇔	
New Development and Construction Requirements for Municipal Capital Improvements Projects											
Implement standards that require BMPs to reduce pollutants from Permittee owned development and construction projects as specified in the New Development and Construction Elements	10.a.ii., 10.b.i		Refer to Construction (Section 5.3) and New Development (Section 5.8) Elements		⇔	⇔	⇔	⇔	⇔	⇔	
Facility Management											
Implement pollution prevention BMPs for public facilities (e.g., corporation yards, material storage facilities, and vehicle/equipment maintenance facilities) having the potential to discharge pollutants to the storm drain system.	10.a.iii. , 10.b.ii.		The City of Citrus Heights does not own or operate any such facility. If new facilities meeting these criteria are brought on-line in the future, Municipal SWPPPs shall be prepared and implemented in accordance with this requirement.	NA	⇔	⇔	⇔	⇔	⇔	⇔	

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 5.5-1 – City of Citrus Heights SQIP
Municipal Operations Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Integrated Pest Management Program											
Implement pesticides storage, usage, and disposal procedures as described in the Partnership's Pesticide Plan	10.a.iv. , 10.b.iii.		Restrict pesticide and herbicide used by City staff and contractors	Confirmation - Track IPM and pest control activities	⇔	⇔	⇔	⇔	⇔	⇔	
Implement integrated pest management (IPM) as described in the Pesticide Plan	10.a.iv. , 10.b.iii.		Decrease amount of pesticides and herbicides used by City staff and contractors	Confirmation - Track IPM and pest control activities	⇔	⇔	⇔	⇔	⇔	⇔	
Storm Drain System Maintenance											
Maintain the storm drain system (e.g., drain inlets, ditches/channels, detention basins and pump stations) to remove debris accumulation and prevent flooding	10.a.v. , 10.b.iv.	✓	Decrease amount of sediment discharged to waters of the State. County of Sacramento performs this activity on behalf of the City of Citrus Heights and will document the amount of sediment removed	Quantification - Track quantities of sediment removed annually	⇔ 4	⇔ 4	⇔ 4	⇔ 4	⇔ 4	⇔ 4	
Clean prioritized catch basins and sumps			County of Sacramento performs this task on behalf of the City of Citrus Heights. County of Sacrametno will document amount of sediment removed	Quantification - Track quantities of sediment removed annually	⇔	⇔	⇔	⇔	⇔	⇔	
Visually monitor permittee owned open channels and perform maintenance as needed based upon sediment and trash accumulation			County of Sacramento and contracted staff will document amount of sediment removed	Quantification - Track quantities of sediment removed annually	⇔	⇔	⇔	⇔	⇔	⇔	

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 5.5-1 – City of Citrus Heights SQIP
Municipal Operations Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Detention Basin Maintenance											
Implement Detention Basin Operation and Maintenance Program	10.b.vii.		The City of Citrus Heights currently has no detention basins.	NA	⇔	⇔	⇔	⇔	⇔	⇔	
Storm Drain Inlet Marking Program											
Ensure that storm drain inlets are properly and legibly marked to discourage illicit discharges into the storm drain system	10.a.vi		Document number of storm drain inlets labeled by volunteers and County of Sacramento Crews	Confirmation - Document Stenciling Program	⇔	⇔	⇔	⇔	⇔	⇔	
			County of Sacramento will replace illegible storm drain markers with new markers as needed	Tabulation - Track number of inlets marked each year	⇔	⇔	⇔	⇔	⇔	⇔	
Operation and Maintenance of Transportation Facilities											
Street Sweeping for Curbed Streets											
Conduct street sweeping activities	10.a.vii. , 10.b.v.	✓	Decrease amount of sediment discharged to Waters of the State.	Quantification - Track quantities of sediment removed annually	⇔ 4	⇔ 4	⇔ 4	⇔ 4	⇔ 4	⇔ 4	
Maintenance for Roads and Roadside Vegetation											
Implement BMPs during road maintenance and construction activities to prevent road maintenance materials, street sweeper rinse out water, concrete chute rinse water, and saw cutting slurry from discharging to the storm drain system.	10.a.vii. , 10.b.v.		Decrease amount of sediment discharged to Waters of the State.	Quantification - Track quantities of sediment removed annually	⇔	⇔	⇔	⇔	⇔	⇔	

⇔ Ongoing activity/task ◆ Deliverable or key milestone 2 Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Maintenance of City-Owned Parking Lots											
Maintain City-owned parking facilities to minimize the build-up and discharge of pollutants to the storm drain system	10.a.viii., 10.b.vi.		Document acres maintained and type of maintenance annually	Tabulation - Track number/acres of facilities and activities performed	⇔	⇔	⇔	⇔	⇔	⇔	
Waste Management Services											
Continue to provide weekly curbside pickup of residential solid and green waste, recyclables and waste oil			Document quantities properly disposed of.	Quantification - Track quantities of waste removed annually	⇔	⇔	⇔	⇔	⇔	⇔	
Fire Emergency and Non-Emergency Operations/Response											
Permittees having a fire protection agency within their jurisdictional control shall develop and implement a response plan to minimize the impacts of fire fighting flows to the environment. BMPs must be implemented to reduce pollutants from non-emergency fire fighting flows (i.e., flows from controlled or practice blazes) identified by the Permittees to be significant source of pollutants to waters of the State.	10.a.ix. , 10.b.ix.		Sacramento Metro Fire District (special district; outside of City's jurisdictional control) is fire agency for Citrus Heights.	NA							
Employee Training											
Conduct training to targeted employees to increase awareness of BMPs/pollution prevention practices	10.a.x. , 10.b.x		Conduct annual refresher training	Tabulation - Track number of employees trained and training activities	♦	♦	♦	♦	♦	♦	

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Legal Authority											
Adopt stormwater ordinance revisions as recommended by the County	11.a.i		Revised stormwater ordinance (if recommended) - also see Section 5.2	Confirmation - report revisions in AR			♦				One year following Regional Board approval of SQIP
Reporting of Illicit Discharges and Connections											
Continue to utilize Partnership public hotline (808-4H20) for reporting of illicit discharges and connections, and route callers to the County for assistance on City-related issues or complaints	11.a.ii ; 11.b.v		Revisions of hotline or its uses (if needed)	Confirmation/Tabulation - The County will track number of complaints received through 808-4H20 and CUBS Nuisance Abatement	⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly
The County, City and Sacramento Local Conservation Corps crews will continue to report illicit discharges and connections within the City to the County for response	11.a.ii		Decrease in number of reports of illicit discharges and connections reported by County crews	Tabulation - The County will track number of reports from County crews received through 874-4SWQ and other mechanisms	⇔	⇔	⇔	⇔	⇔ ③	⇔	Reported in AR yearly, EA due 12/13 before ROWD
Screening for Illicit Connections											
The County, City and Sacramento Local Conservation Corps crews will continue to conduct ongoing field screening for illicit connections through routine maintenance activities being conducted by field crews	11.a.ii ; 11.b.ii		Decrease in number of illicit connections detected by field screening activities since last permit term	Tabulation - The County will include number of illicit connections detected via field screening activities in AR	⇔	⇔	⇔	⇔	⇔ ③	⇔	Reported in AR yearly, EA due 12/13 before ROWD

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

The activities described in this table are in addition to regional Public Outreach activities described in Chapter 2 (Section 2.6).											
Public Outreach											
Educate and inform City managers and elected officials through presentations and other means; invite to public community events	12.a.iii, b.iii		Document/quantify impressions made in annual report	Tabulation-track no. of people educated each year		⇔	⇔	⇔	⇔	⇔	Report in AR (Oct 1 ea yr)
Update and continue to maintain stormwater web page on City's web site to educate and inform general public; advertise public reporting hotline; and provide links for resources.	12.a.iii, b.iii		Submit updated web page link with annual report.	Confirmation		♦ ⇔	⇔	⇔	⇔	⇔	Update web site during 09-10 FY
Periodically publish articles regarding stormwater pollution prevention in City "Connections" newsletter or other appropriate local media.	12.a.iii, b.iii		Describe articles and provide copies with annual rpeort	Confirmation	⇔	⇔	⇔	⇔	⇔	⇔	Report in AR (Oct 1 ea yr)
Continue to sponsor annual Urban Creeks Council Creek Week events to address clean up local creeks in Citrus Heights.	12.a.i and iii, b.i and iii		Quantify waste/debris collected during cleanup events (partial measure of amount of materials prevented from polluting local creeks)	Tabulation - provide numbers in annual report		⇔	⇔	⇔	⇔	⇔	Report in AR (Oct 1 ea yr)
	12.a.vi, 12.b.vi	✓	Document increases in number of volunteers engaged in the cleanup activities from year to year	Tabulation - track increased numbers as measure of changed behavior		②	②	②	②	②	Report in AR (Oct 1 ea yr)
Sponsr and staff stormwater booth at local community events (e.g., Harvest Festival, Community Campout)	12.a.i and iii, b.i and iii		Document approximate number of residents and others reached at each event; track quantities of literature distributed	Tabulation - provide numbers in annual report		⇔	⇔	⇔	⇔	⇔	Report in AR (Oct 1 ea yr)
Watershed Stewardship											
Attend Arcade Watershed Group Meetings. Sponsor meeting location.	63b, 12.ai&iii., 12.bi&iii.		Document meeting attendance.	Tabulation - track number of meetings attended, outcomes	⇔	⇔	⇔	⇔	⇔	⇔	Report in AR (Oct 1 ea yr)

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 5.8-1 – City of Citrus Heights SQIP
New Development Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Incorporation of Water Quality Protection Principles into Plans, Policies and Procedures											
Update stormwater quality language in the General Plan	13.a, 16		Update applicable sections of the General Plan to include stormwater quality protection principles as needed.	Confirmation – report revisions in AR		⇔	♦				GP update anticipated complete end of 2010
Development of Standards and/or Guidance											
Develop Low Impact Development (LID) design criteria	15.b		Amend development standards to require implementation of LID strategies.	Confirmation - report revisions in AR	⇔	⇔	⇔ ♦				6 months after approval of HMP.
	15.b, 26		Include LID criteria in the Stormwater Quality Design Manual and revise it as needed.	Confirmation - report revisions in AR	⇔	⇔	⇔	♦			6 months after amending the development standards.
Develop HMP Work plan as part of the revised SQIP.	15.c		Partnership will outline the proposed steps to develop the HMP and possible technical methodologies to design the mitigation measures.	Confirmation - develop HMP work plan and pilot project. Submit work products to Regional Water Board.	⇔	♦					30-Apr-09
Develop HMP	15.c		Partnership will develop an applicability and susceptibility map showing where hydromodification management measures will apply in Sacramento. Then develop the HMP Decision Tool.	Confirmation - Submit work products to Regional Water Board **1 year** after approval of the HMP work plan.		⇔	♦				1 year after approval of the HMP work plan
Develop design criteria for hydromodidfiaction management measures.	15.c, 26		Partnership will include criteria in the Stormwater Quality Design Manual and revise it as needed.	Confirmation - report revisions in AR			⇔	♦			6 months after amending the development standards
Develop a mitigation fund if needed	19		The City will develop a mitigation fund framework to support regional stormwater projects, if needed.	Confirmation – develop framework when needed and submit to Regional Board.							

⇔ Ongoing activity/task ♦ Deliverable or key milestone (2) Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Develop a waiver program	20		County will propose a waiver program that would require developers with qualified projects to transfer the savings in cost to a stormwater mitigation fund. Waivers shall be granted only when structural treatment control measures are infeasible; City will consider application in Citrus Heights when available.	Confirmation - develop a waiver program and describe activities in revised SQIP.	⇔	⇔	⇔	♦			
Protect groundwater quality	23		Partnership will integrate restrictions regarding the use of infiltration facilities in areas of high groundwater table into design criteria.	Confirmation - identify restrictions and incorporate into the design criteria.	⇔	⇔	⇔	⇔	⇔	⇔	
Conditions of Approval and Plan Review											
Condition projects to comply with stormwater quality development standards at various stages of the approval process (see Fig 5.8-1)	13.b-d, 13.f, 14, 15, 17		Track and record number of projects conditioned to comply with stormwater quality development standards	Tabulation - track number of projects conditioned and report in Annual Report.	⇔	⇔	⇔	⇔	⇔	⇔	
Condition projects to comply with LID requirements	15.b		Condition priority development projects to incorporate low impact development strategies.	Tabulation – track number of projects conditioned and report in Annual Report.				♦⇔	⇔	⇔	
Condition projects to comply with HMP requirements	15.c		Condition priority development projects located in susceptible areas to incorporate hydromodification management measures.	Tabulation – track number of projects conditioned and report in Annual Report.				♦⇔	⇔	⇔	

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated

Chapter 6

City of Elk Grove Stormwater Quality Improvement Plan

6.1 Introduction

The City of Elk Grove Stormwater Quality Improvement Plan (SQIP) provides information about the City's Stormwater Management Program, including a description of activities conducted to protect waterways and ensure compliance with the Sacramento Areawide NPDES Municipal Stormwater Permit (Stormwater Permit), of which Elk Grove is a permittee. The required certfication for the SQIP is presented in the beginning of this document.

Background

The City of Elk Grove (City) was incorporated on July 1, 2000. The new City was officially named as a Permittee to the Stormwater Permit when the permit was reissued in December 2002. Prior to the City being incorporated, the area within the City limits was covered under the County of Sacramento's stormwater permit. The activities outlined in this chapter are intended to ensure that the City complies with all requirements of the Stormwater Permit.

The City of Elk Grove is a member of The Sacramento Stormwater Quality Partnership (Partnership). The Partnership is a collaboration of all the agencies subject to the Sacramento areawide stormwater permit. The Partnership's main charge is to oversee compliance with the stormwater permit, and it works to protect and improve water quality in local waterways for the benefit of the community and the environment.

The storm drain system within the City of Elk Grove, which includes storm drain inlets, pipes, channels, detentions basins, and roadside ditches, primarily discharges to local creeks which discharge to the Sacramento River. All the rivers ultimately drain to the Sacramento-San Joaquin Delta and from there to the San Francisco Bay and the Pacific Ocean.

The City-specific activities described and referenced in this chapter are conducted in addition to monitoring, special studies, target pollutant reduction and regional public outreach activities that are implemented jointly with the other Permittees as described in Chapter 2.

The original stormwater permit was issued in 1990 (first permit term) and has been renewed three time since then: in 1996, 2002, and most recently in 2008 (2008-2013 permit term).

City Characteristics

Elk Grove is located in the southern part of the Sacramento metropolitan area, to the west of the Cosumnes River, east of freeway I-5 and south of Calvine Road, Figure 6-1. This area is approximately 27,000 acres and serves a population of over 139,000. Tremendous growth occurred in the past few years, particularly with residential and commercial land uses. Most of the land within the City is urban or destined for urban land use in the future.

There are nine major natural creek or open channels that convey runoff within the City including Deer Creek, Elk Grove Creek, the Grant Line Channel, Laguna Creek, the Laguna West Channel, the Shed A Channel, the Shed B Channel, the Shed C Channel and Strawberry Creek. Four of the creeks convey runoff that originates outside of the City limits including Deer Creek, Elk Grove Creek, Laguna Creek and Strawberry Creek. All of the City watersheds ultimately drain into the Stone Lakes National Wildlife Refuge area of Sacramento County with the exception of Deer Creek and Grant Line Channel watersheds, which drain to Deer Creek and ultimately into the Cosumnes River.

The City owns and maintains four stormwater pump stations to discharge runoff from four different watersheds in the City. Three of the four pump stations are located west of Franklin Boulevard to serve the Laguna West, Lakeside and Laguna Stonelakes watersheds. The runoff pumped from these three stations eventually reaches the Stone Lakes National Wildlife Refuge. The fourth station is located at the southern most point of the City and serves the Grant Line Channel watershed. The pump station discharges accumulated runoff from the detention basin south of Emerald Gold Golf Course and pumps it across the UPRR into an outlet channel that continues east for approximately 1,500 feet before joining Deer Creek.

During the rainy season, the City expects to see creeks and channels convey storm drain runoff, however, City personnel have seen and noted smaller flows during the dry periods of the year known as dry weather flows which are normally associated with releases from industrial, commercial or residential activities (i.e. landscape irrigation). With the exception of Laguna Creek and certain portions of Elk Grove Creek, most of the streams and channels located in Elk Grove were considered perennial but lately new residential development in the City has placed structures near channel and creeks facilities. In the rural areas, large lots are being developed with expansive landscaping. Over watering of landscaping in residential and rural lots is the main cause of the smaller flows. Since these flows are not large enough to effectively travel the length of the creek and channel and discharge into a basin, they begin to settle in the small depressions along the conveyance route. This causes a variety of issues including algae blooms, water quality degradation and becomes a breeding site for mosquitoes. For such reasons, the City has labeled these nuisance flows. The City discourages over watering of lawns and has contacted over watering occupants to promote wise irrigation practices.

SQIP Contents

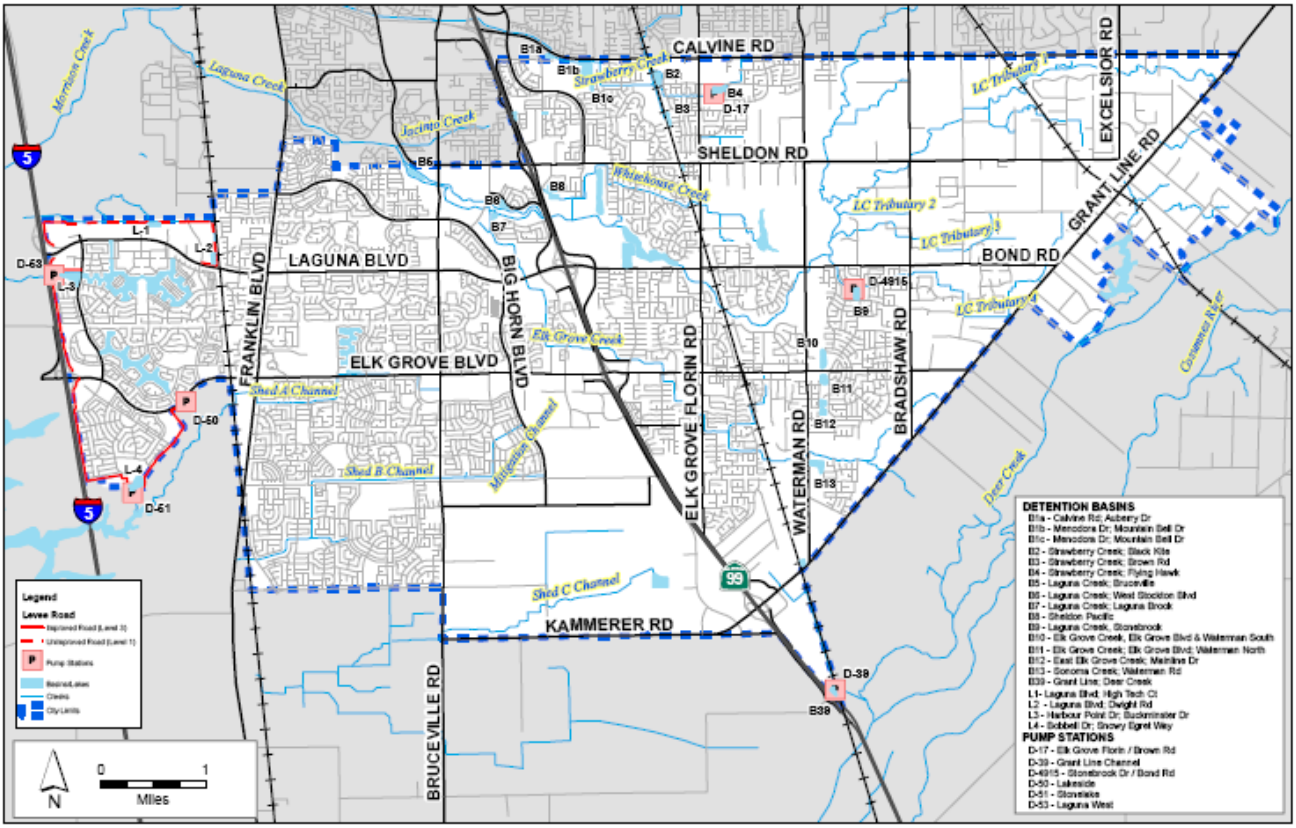
This SQIP describes activities that the City of Elk Grove will conduct in compliance with the Stormwater Permit. Modifications to the program may be necessary as the program evolves, and will be proposed in Annual Reports submitted to the Regional Board on October 1st of each year.

Following this introduction, there are seven sections in the chapter, to describe activities related to six major program elements, as follows:

Section 6.2: Program Management — A description of how the City of Elk Grove's Stormwater Management Program is organized, legal authority, priorities and funding, and coordination both within the City and externally with other programs and agencies.

Section 6.3: Construction Program Element —Activities designed to control the runoff of sediment and other pollutants from construction sites.

Section 6.4: Commercial/Industrial Program Element — Activities and control programs designed to reduce pollutants in discharges and effectively eliminate non-stormwater discharges associated with industry.



Section 6.5: Municipal Operations Program Element —Activities designed to control stormwater pollution resulting from operation of City facilities and to set an example of model pollution prevention for the public.

Section 6.6: Illicit Discharge Program Element —Activities designed to effectively eliminate illegal non-stormwater discharges to the storm drainage system and receiving waters.

Section 6.7: Public Outreach Program Element —Activities designed to raise awareness and foster community stewardship to promote pollution prevention in the urban area and protection of local creeks and rivers.

Section 6.8: New Development Program Element —Activities designed to reduce pollutants in urban runoff discharges from newly developing and redeveloping areas for the life of the project, after construction is complete.

Figure 6.1 City of Elk Grove

6.2 Program Management and Related Activities

Organization and Staffing of the Elk Grove Program

The City of Elk Grove is governed by a five-member City Council which has also appointed a five-member Planning Commission. It has retained a City Manager, Assistant City Manager, and City Attorney, as well as a Public Works Director, Planning Director, and Building Official. Within Development Services, there is a designated staff for management of Stormwater Drainage Program. Its responsibilities include management of a stormwater drainage program and compliance with the NPDES Permit. Figure 6.2 illustrates the City of Elk Grove's organizational chart.

Table 6.1 outlines the various departments and groups within the City that play a role in compliance with the Stormwater Permit.

Figure 6.2 City of Elk Grove Organizational Chart

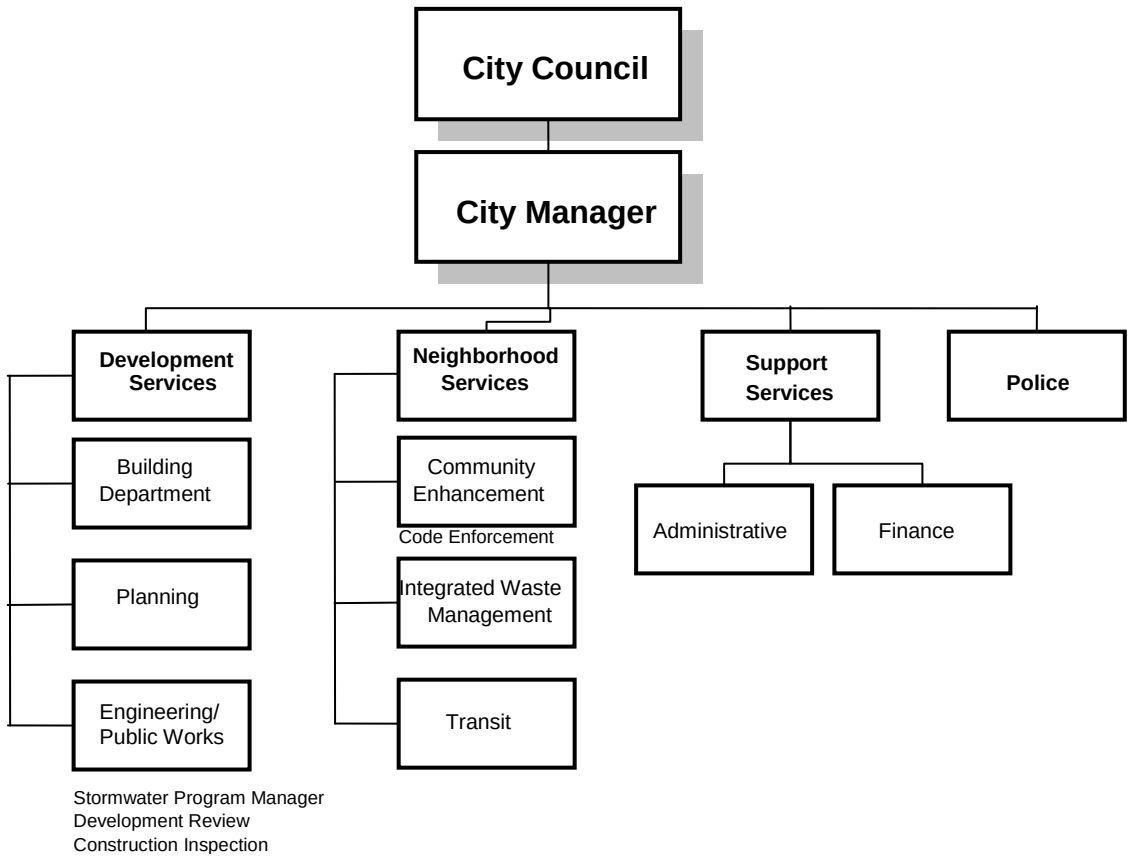


Table 6.1 (below) indicates roles and responsibilities of various City of Elk Grove departments for implementation of activities designed to comply with the Stormwater Permit.

Table 6.1

City of Elk Grove NPDES Stormwater Permit Program Responsibilities

Group/Department/Entity	Responsibilities for Compliance with City NPDES Stormwater Permit
Program Management (Section 6.2)	
Public Works Director	Oversees City-wide compliance with Stormwater Permit and authorizes City staff to enforce Stormwater Ordinance.
Water Resources	Administers and manages the City Stormwater Program on behalf of the City. Provides liaison with the Regional Board and prepares/submits compliance reports. Coordinates participation in joint permittee activities including the Stormwater Quality Partnership. Also conducts many program activities. Processes payments to the City of Sacramento /County of Sacramento for joint permittee activities including consultant services according to the cost-share MOU.
City Attorney	Conducts legal reviews, prepares legal certifications, and oversees revisions to ordinances, codes and other standards.
Construction (Section 6.3)	
Development Support	Issues grading permits and conducts initial review of erosion and sediment control plans and SWPPPs
Water Resources	Provides technical assistance on erosion and sediment controls to other sections of Public Works.
Capital Projects	Design new public facilities and provide oversight during construction activities, including approval of change orders and SWPPP amendments. Oversee public works contracts, including contractor compliance with City ordinances and the State General Construction Permit compliance.
Construction Inspection	Conducts pre-construction review of erosion and sediment control plans and SWPPPs
Construction Inspection	Provides inspection services during the site work phase of construction of City facilities and public improvements. Inspection responsibilities include oversight of contractor erosion and sediment control and State General Construction Permit compliance.
Building Department	Provides inspection services during the building phase of construction of private developer facilities. Inspection responsibilities include oversight of contractor erosion and sediment control, construction site housekeeping practices, and State General Construction Permit compliance.
Capital Improvements /Public Works/ Development Services	Follows City requirements for inclusion of stormwater quality treatment controls on design projects, as applicable.
Traffic Engineering/Public Works/Development Services	Provides planning, design, construction, and ongoing maintenance for all street and highway improvements located in the City, including lighting, landscaping and signals. Responsible for ensuring that stormwater quality and erosion/sediment controls are incorporated where required. Projects one or more acres would require coverage under State Construction General Permit.
Commercial/Industrial (Section 6.4)	
Water Resources	Coordinates with County Environmental Health for plan review, permitting and conducting inspection of food-related facilities in the City. In all reviews, and inspections, drainage issues are considered that may affect stormwater quality.
Water Resources	Develops and maintains an inventory of businesses addressed by the Commercial/Industrial Element of the Stormwater Permit and coordinates with the County's Environmental Management Department (EMD) to conduct the required facility stormwater inspections, including enforcement and follow-up inspections to resolve problems, as warranted.
Water Resources Construction Inspection	Maintains an inventory of businesses with on-site stormwater treatment facilities. Fort those businesses/sites with on-site stormwater treatment facilities not inspected by County EMD, conducts periodic facility stormwater inspections, including enforcement and follow-up inspections to resolve problems, as warranted.

Municipal Operations (Section 6.5)	
Maintenance Operations	Oversees maintenance of stormwater drainage system, including stormwater quality treatment facilities owned and/or operated by the City. Responsible for ensuring that system is maintained in a manner which protects water quality.
Integrated Waste Management	Provides solid waste management services for residents and businesses in the City. Programs and conducts activities promoting waste prevention, recycling, and composting, helping to keep these trash, debris, and hazardous materials out of the storm drainage system and local creeks and rivers.
Maintenance Operations	Provides ongoing maintenance for all street and highway improvements located in the City, including lighting, landscaping and signals. Responsible for ensuring that stormwater quality and erosion/sediment controls are incorporated where required.
Maintenance Operations / Police Department / Transit	Updates and executes the Corporation Yard SWPPP. Performs maintenance, repair, fueling, washing and storage of vehicles and equipment in accordance with the requirements of the Corporation Yard SWPPP.
Facilities	Manages City-owned buildings, parking lots and other facilities. Responsible for ensuring that activities at these facilities follow proper stormwater quality practices.
Construction Inspection	Develops and conducts training for City staff on proper maintenance practices to protect stormwater quality.
Maintenance Operations	Acts as liaison with the Cosumnes Community Services District (CCSD) which operates parks and maintains landscaping within the City and the Elk Grove Unified School District to coordinate activities that protect creeks and channels and prevents non-stormwater discharges into the storm sewer system.
Maintenance Operations	Acts as liaison with the Sacramento Area Sewer District (SASD) which operates the sanitary sewer collections systems and Sacramento Regional Sanitation District (SRCSD) which operates wastewater conveyance pipelines within the City limits.
Illicit Discharges (Section 6.6)	
Maintenance Operations	Operates a hotline phone number to facilitate public reporting of illicit discharge problems.
Construction Inspection	Conducts investigations as needed to confirm/eliminate illicit discharges, including enforcement and follow-up inspections to resolve problems, as warranted.
Maintenance Operations	Conducts ongoing field screening activities. Responds to non-hazardous and hazardous spills on public property or in the right-of-way. Removes and cleans up non-hazardous materials. Obtains assistance form CCSD Fire Department and /or County EMD as necessary for cleanup and proper disposal of hazardous materials. Refers hazardous materials spills on private property to Sacramento County EMD for action.
Water Resources	Operates the education-oriented volunteer storm drain inlet stencil program.
Public Outreach (Section 6.7)	
Water Resources	Coordinates with the County to implement a county wide media campaign as required by the Stormwater Permit. This includes the purchase, production, and distribution brochures developed by the Sacramento Stormwater Program. Plans and conducts local outreach activities including participation in community activities.
Construction Inspection	Develops and conducts outreach activities on proper construction practices protecting stormwater quality. Solicits participation of local developers, construction contractors. Invites participation by Stormwater Partnership members and internal City staff. Participates in local outreach activities including community activities.
Integrated Waste Management	Programs and conducts outreach activities promoting waste prevention, recycling, and composting. Conducts local outreach activities including publishing regular newsletters and participation in community activities.

New Development (Section 6.8)	
Planning Department	Conducts Environmental review to implement provisions of the California Environmental Quality Act (CEQA) as they apply to the City, including consideration of water quality impacts, to ensure that stormwater quality controls are incorporated as required.
Planning Department	Processes applications for private developments. Implements City Zoning Code and performs comprehensive planning for a variety of specific geographic areas within the City.
Development Support	Conditions development projects to ensure compliance with City drainage and stormwater quality standards, including use of post construction source and treatment controls and compliance with Regional Water Quality Control Board 401 Certification requirements, if applicable. Reviews Post Construction Storm Water Quality Control Plans (PCSWQCP) for compliance with design manual requirements and allocation of land for construction.
Construction Inspection	Provides inspection services during the site work phase of the construction of public improvements and private on-site stormwater quality source and treatment controls.
Capital Projects	Follows City requirements for inclusion of stormwater quality source and treatment controls, as applicable.

Legal Authority

Certification by Legal Counsel

The Stormwater Permit requires the City Attorney to certify that adequate legal authority exists to implement and enforce the stormwater program. This certified statement is provided as Appendix 6A.

City Code

When the City of Elk Grove incorporated in July 2000, it adopted Ordinance No. 2000-1 "An Urgency Ordinance of the City Council of the City Providing for Sacramento County Ordinances to Remain in Effect After Incorporation". By passing this ordinance, the City in effect adopted two important County ordinances which provide legal authority for the stormwater program:

- Chapter 15.12: Stormwater Management and Discharge Control Ordinance, also known as "The Stormwater Ordinance" Prohibits most non-stormwater discharges and lists non-stormwater discharges conditionally allowable (e.g., water from fire-fighting activities) pursuant to NPDES federal regulations. Provides legal authority to Elk Grove for inspections and enforcement related to control of illegal and industrial discharges to the City storm drainage system and local receiving waters.
- Chapter 16.44: Land Grading and Erosion Control Ordinance Requires projects in Elk Grove disturbing 350 cubic yards or more of soil or one or more acres of land to prepare an erosion and sediment control plan specifying best management practices (BMPs) for erosion and sediment control. Provides legal authority to Elk Grove for inspections and enforcement needed to ensure compliance with the ordinance.

Chapter 15.12 and Chapter 16.44 are attached as Appendix 6B. The entire City of Elk Grove Municipal Code can be found by visiting the following website:

http://www.elkgrovecity.org/documents/agendas/attachments/municipal-code/mc_entirecode.pdf#search='municipal%20code'

A number of other code sections also provide Elk Grove with additional legal authority related to stormwater pollution control and water quality/watercourse protection. Those include:

- Title 1- General Provisions (various sections related to authority to issues violations and assess penalties, right to appeal)
- Title 15 - Water and Sewer (Storm Drainage Fee)
- Title 16 - Buildings and Construction (Nuisance Code)
- Title 20 - Environmental Protection (Environmental Impact Reports and Mitigation)
- Title 22 – Land Development (Design and Improvement Standards)

General Plan

The City of Elk Grove adopted its own General Plan in November of 2003. The City's General Plan ensures the protection and enhancement of groundwater and surface water by requiring new developments to comply with the water quality elements within the plan. Some of the adopted General Plan policies that best apply to the Stormwater Management Program are listed by Element as follows and are attached as Appendix 6C, to view the full version of the General Plan please visit: http://www.egplanning.org/gp_zoning/general_plan/

Conservation Air Quality

CAQ-7: Encourage development clustering where clustering would facilitate on-site protection of woodlands, grasslands, wetlands, stream corridors, scenic areas, or other appropriate natural features as open space.

CAQ-8: Trees which function as an important part of the City's or a neighborhood's aesthetic character or as natural habitat should be retained to the extent possible during the development of new structures, roadways (public and private, including roadway widening), parks, drainage channels and other uses and structures.

CAQ-12: The City shall seek to ensure that the quality of groundwater and surface water is protected to the extent possible.

CAQ-13: Implement the City's NPEDS permit through the review and approval of development projects and other activities regulated by the permit.

CAQ-14: The City shall seek to minimize the amount of impervious surfaces and directly connected impervious surfaces in areas of new development and redevelopment and us on-site infiltration of runoff in areas with appropriate soils where the infiltration of storm water would not pose a potential threat to groundwater quality.

CAQ-15: The City shall encourage water supply service providers and County Sanitation District 1 to design water supply and recycled water supply facilities in a manner that avoids and/or minimizes significant environmental effects. The City shall specifically encourage the Sacramento County Water Agency to design well facilities and operation to minimize surface flow effects to the Cosumnes River.

CAQ-16: Future land uses that are anticipated to utilize hazards materials or waste shall be required to provide adequate containment facilities to ensure that surface water and groundwater resources are protected from accidental releases. This shall include double containment, levees, to contain spills, and monitoring wells for underground storage tanks, as required by local, state and federal standards.

CAQ-17: The City recognizes the value of naturally vegetate stream corridors, commensurate with flood control and public acceptance, to assist in removal of pollutants, provide native and endangered species habitat and provide community amenities.

CAQ-18: Post-development peak storm water runoff discharge rates and velocities shall be designed to prevent or reduce downstream erosion, and to protect stream habitat.

CAQ-19: Encourage the retention of natural stream corridors and the creation of natural stream channels where improvements to drainage capacity are required.

CAQ-21: Development adjacent to a natural stream(s) shall provide a "stream buffer zone" along the stream.

CAQ-22: Stream crossings shall be minimized and be aesthetically compatible with the natural appearance of the stream channel. The use of bridges and other stream crossings with natural (unpaved) bottoms shall be encouraged to minimize impacts to natural habitat.

Parks Trails and Open Space

PTO-15: To the extent possible, lands protected in accordance with this policy should be in proximity to Elk Grove, to facilitate use of these areas by Elk Grove residents, assist in mitigation of habitat loss within the city, and provide an open space resource close to the urbanized areas of Elk Grove.

PTO-18: To the extent possible, retain natural drainage courses in all cases where preservation of natural drainage is physically feasible and consistent with the need to provide flood protection.

Public Facilities

PF-6: The City shall seek to protect the quality and quantity of groundwater resources, including those which serve households and business which rely on private walks.

PF-12: To reduce the potential for health problems and groundwater contamination resulting from the use of septic systems, the City shall take the following actions:

- The City shall prepare and implement a public information campaign aimed at homeowners in area with septic systems on the proper design, use, and care of septic systems
- The City shall consider adopting Plumbing Code revisions to allow the use of updated technologies which offer an alternative to septic systems for the treatment of sewage on individual sites.

Standard Specifications and Improvement Standards

The City has developed Improvement Standards and Standard Construction Specifications which are applicable to all projects citywide, private or public. These standards are periodically reviewed and updated to reflect evolving industry standards and regulations. To view the City's Improvement Standards, Standard Construction Specifications and Standard Drawings please visit the following websites:

http://www.egpublicworks.org/improvement-standards-10-11.asp
http://www.egpublicworks.org/standard-construction-specifications-10-11.asp
http://www.egpublicworks.org/standard-drawings-10-11.asp

Guidance for design, construction and maintenance of post-construction stormwater quality control measures is provided in the *Stormwater Quality Design Manual for Sacramento and South Placer Regions*. Through the Sacramento Stormwater Quality Partnership, the City contributed to the production of this document in May 2007.

Agreements and Memoranda of Understanding

Legal authority for administering and implementing the Sacramento Stormwater Program jointly with the other Permittees is provided by a memorandum of understanding (MOU). The MOU describes administrative roles and responsibilities for management of the Program and performance of joint activities, as well as cost-share arrangements. Costs for joint activities are based on population of each permittee and are therefore subject to change during the term of the Stormwater Permit. A copy of the Permittee MOU is presented in Appendix 2A.

An agreement is executed with the County's Environmental Management Department (EMD) for provision of industrial and commercial inspection and enforcement services required by the Stormwater Permit. The City Stormwater Ordinance has been modified to allow full execution of the provisions of this agreement. On August 18, 2004 the City adopted the modified Ordinance to accommodate the agreement with the County EMD. Please find a copy of the Ordinance attached to this document, Appendix 6D.

Enforcement Process

The enforcement process, which is addressed in detail in the City Ordinance No. 22-2003 (Article 5 Section 15.12.400-15.12.480) attached as Appendix 6B, begins with "Notice of Corrections" which is for minor/low threat violations and eventually escalates to "Criminal Penalties", which is issued to blatant violators. The following is a summary of the City's enforcement process related to Stormwater Compliance:

- Notice of Correction – This level of enforcement is for minor site violations and is issued by inspectors after visiting each site. Violations are identified and a time frame for rectification is established. The Notice is in written form and is delivered to the Construction Superintendent or representative or the Stormwater Pollution Prevention Manager responsible for overseeing the SWPPP program.
- Notice of Non-Compliance – This level of enforcement is issued when a Notice of Correction has not been addressed or site conditions require immediate attention (i.e. illicit connection, prohibited discharge, maintenance of a threatened prohibited discharge, failure to implement BMPs in accordance with Section 15.12.200(b) within the City Ordinance. The Notice is in written form and is delivered to the Construction Superintendent or representative or the Stormwater Pollution Prevention Manager responsible for overseeing the SWPPP program.
- Manager to Manager Phone Call/Site Visit- Since 2006, The City of Elk Grove has added this step in its enforcement action. The manager of construction services will discuss the non-compliance situation with the highest ranking official of the offender and give them 24-48 hours to comply or they face a cease and desist order. This methodology has proven to be highly effective.
- Cease and Desist Orders – This method of enforcement is issued when any activity causes any prohibited discharge to the City stormwater conveyance system and/or may lead to a violation of Receiving Water Limitations. This Order prompts the owner or occupant to take immediate action on resolving a stormwater violation as precedent over all other construction related activities. This Order allows for the Administrator to exercise immediate enforcement.

- Administrative Civil Penalties – This method of enforcement is issued for a continuing violation that does not immediately affect health and safety. The penalty could impose up to $5,000 for each violation. Prior to being issued a Civil Penalty, the violator is granted a reasonable time to correct/remedy the violation as determined by the Administrator. Enforcement of the administrative civil penalty is administered by written order issued via a hearing officer following notice and opportunity for hearing.
- Criminal Penalties – This method of enforcement is exercised on any person who negligently or knowingly violates any stormwater provision within the Ordinance, knowingly conceals or continues violations that includes failure to comply with previous enforcement actions, or fails to implement BMPs in accordance with the Ordinance. Upon conviction, this enforcement level entails potential monetary fines and/or imprisonment.

Funding

The City funds its stormwater program in two ways: 1) funds are allocated for joint activities, previously described in Chapter 2, and 2) funds are allocated for City-specific activities described in this chapter.

The costs for implementing joint activities are generally shared between the Permittees according to the cost-sharing MOU (noted above and in Chapter 2 of this Plan). Under this agreement, the City contributes 8.25% of the Joint Program funding, primarily through Stormwater Utility revenues described below.

Funding for City-specific activities is provided by a combination of funds:

Stormwater Utility

Stormwater Utility (SWU) revenues support the administration and management of the stormwater program. The Stormwater Utility also covers the cost to operate and maintain the City's storm drainage system, which includes maintenance of pipes, channels and associated structures, creeks, and regional stormwater quality facilities. Every owner of an improved parcel of land in the City limits is charged a storm water maintenance fee. This fee is billed bimonthly on the City's utility bill and is used to cover the maintenance costs of the City's storm water system.

The SWU revenue comes not only from the monthly utility billing collections but also from a portion of the twice-yearly property tax collection. Prior to the creation of the SWU in 1995, there were portions of the County (and areas now in the City) that were part of the Metropolitan Storm Drainage Maintenance District. Formed in 1964, this district was the only mechanism for providing storm drain maintenance at the time. For property within this district a portion of the property tax was dedicated to funding storm drain maintenance. While this district has since been closed, the old district boundary is still used to identify areas where a portion of property taxes collected by the County are dedicated to the storm drain maintenance.

Stormwater Utility revenues are used to fund City-specific stormwater activities as well as the joint Program activities described in Chapter 2. The City's contribution to the Joint Program is 8.25% based on population, as described in the permittee memorandum of understanding (Appendix 2A).

Development Fees

These fees provide funding for city planners, engineers and plan checkers working on development review and permitting. They are the primary source of funding for SWPPP Inspectors that provide enforcement of water quality violations by developers, contractors, and City's residents. Planners

are responsible for ensuring compliance with California Environmental Quality Act (CEQA) and implementing city stormwater quality protection policies.

User-based Industrial/business Fees

Fees are charged directly to businesses for industrial inspectors provided by the County's Environmental Management Division. These inspectors routinely conduct inspections of industries and food establishments in compliance with the Stormwater Permit, health and safety and hazardous materials laws.

Other Funding

Some costs for stormwater-related activities in the City are borne directly by the regulated community. For example, design, installation and long-term maintenance of permanent on-site privately owned stormwater quality facilities are the responsibility of the property owner through maintenance agreements.

Recordkeeping and Reporting

The City will prepare and submit the following documents to the Regional Board each year, in compliance with the Stormwater Permit:

- Annual Work Plan (May 1) – describes proposed activities and budget for coming fiscal year (July 1 – June 30).
- Annual Report (October 1) – describes activities conducted during the previous fiscal year, including compliance with performance standards and the Stormwater Permit. Proposes revisions to the Stormwater Quality Improvement Plan, if needed.

Records and data will be collected from all responsible City Departments each summer to prepare the Annual Report.

The City's stormwater program staff will maintain NPDES Stormwater Permit compliance files, including all documentation necessary to demonstrate compliance with the permit. As required by the permit standard conditions, the City will retain copies of all records and reports from the date of generation for at least five years. Since the City assumed the responsibilities for the Stormwater Drainage Program effective July 2003, past records are retained by the County. In addition to retaining paper copies of all documentation, The City will also be putting all records and reports on the City's internal network.

Training for City Staff

The City provides training for the City SWPPP Inspector staff, planning, maintenance, drainage engineering, construction and development staff. All affected City staff and contractors are regularly informed and updated concerning the Stormwater Permit and its impacts on their positions and responsibilities.

The City provides targeted employee training in compliance with the Stormwater Permit. City staff receiving targeted training are those identified with storm water quality responsibilities in Table 6.1. Annual training in the following subject matter of the Stormwater Permit sections is conducted at a minimum to cover requirements of the Stormwater Permit:

- Construction (Permit Provision 8) – Targeted employees includes Program Management staff and Construction staff including those responsible for permit approval, SWPPP and erosion control plan review, construction inspection and SWPPP inspection.
- Municipal Operations (Permit Provision 10) to promote a clear understanding of the potential for maintenance activities to pollute storm water, and identify and select appropriate BMPs. – Targeted employees includes the Municipal Operations staff including those responsible for road and street maintenance, facility maintenance, maintenance yard, park maintenance, design, construction and maintenance contract oversight, storm drain system maintenance, vehicle and equipment maintenance, pesticide application and material and waste management.
- Illicit Discharges (Permit Provision 11) – Targeted employees include Water Resources staff, and Municipal Operations staff. Construction, Municipal and Development Planning courses will include training on identification, investigation, termination, cleanup, and reporting of illicit connections and discharges.
- Development Planning (Permit Provision 25) – Targeted employees include the Planning Department responsible for review and approval of new development and redevelopment. The training will include review of the Development Standards Plan.

Training courses will generally cover the following topics:

- General storm water quality awareness objectives: where storm water goes, how it becomes polluted, and how to prevent pollution.
- Background regulatory information appropriate to the audience.
- How to report/refer observed problems in the field.
- Information about enforcement and penalties appropriate to the audience.

The City prepares and schedules this Training Program annually. Updates to the Training Plan will be presented each year in the Annual Report and/or Annual Work Plan. Training progress will also be documented in the Annual Report.

Coordination with Other Agencies and Programs

Sacramento Stormwater Quality Partnership

The City participates in regular (approximately monthly) permittee coordination meetings to discuss topics such as:

- Implementation of joint activities, such as monitoring, target pollutant reduction and some public outreach.
- Status of consultant contracts and work products related to monitoring and development standards.
- Funding of activities conducted by others that benefit the City program, such as the Brake Pad Partnership and the development of statewide BMP manuals.
- Overall program evaluation and assessment.
- Proposed modifications to the Stormwater Quality Improvement Plans and/or Stormwater Permit.

Outside Agencies

The City coordinates with several local and regional agencies (over which it lacks jurisdictional control) in order to ensure city-wide compliance with the Stormwater Permit:

- Sacramento County Regional Sanitation District —A portion of the funds from the City's Stormwater Utility paid through the cost sharing activities of the permittees to the SCRSD to help fund continued Sacramento and American River monitoring in compliance with the Stormwater Permit. This is part of the Coordinated Monitoring Program (CMP) which is the program coordinating the river monitoring staffed by SRCSD.
- Cosumnes Community Services District– Even though the CCSD is covered separately under their own permit, the City coordinates with them to ensure compliance with NPDES Permit requirements for special events and other related activities.
- Caltrans — The City coordinates with Caltrans upcoming freeway interchange projects to ensure that stormwater controls are implemented.
- Elk Grove Unified School District – The Elk Grove Unified School District is now separately covered under their own NPDES permit but the City coordinates with them to ensure compliance with NPDES Permit requirements for special events and other related activities.
- SMUD/PG&E and other local utilities own private facilities in the public right –of-way, and have maintenance easements or get encroachment permits to repair/replace facilities as needed.

Other Stormwater Programs

The City supports coordination and networking with other stormwater programs within California in order to share information and identify opportunities to work together. This effort is facilitated by the City and County of Sacramento, through their active participation in the California Association of Stormwater Quality Agencies (CASQA). Also selected members of the City's staff are members of CASQA.

Activities for the 2008-2013 Stormwater Permit Term

The main goal of the Program Management Element for the 2008-2013 permit term will be to continue to ensure that all the requirements of the Stormwater Permit are met, by conducting the various administrative and coordination activities described below.

Legal Authority

Update Codes and Standards As Needed
The City will amend its Stormwater Ordinance if necessary to reflect changes in the program. The City will also adopt needed changes to the Standard Construction Specifications and the Improvement Standards. This will be done if needed within one year of the Regional Water Board's adoption of the 2009 SQIP.

The City will continue to require the local development community to utilize the May 2007 *Stormwater Quality Design Manual for Sacramento and South Placer Regions* and will ensure that City planners and engineers attend training workshops related to implementation of the new manual. It is possible that conflicts may arise between the criteria in the manual and the City's codes. In such cases, the City will amend codes as needed or recommend adjustments to the manual.

Update Agreements As Needed

The City will work with the other permittees to update the MOU that outlines joint responsibilities, cost sharing based on Sacramento Area Council of Governments (SACOG) population data, decision making, and information management and reporting. Elk Grove's current cost share (8.25%) may change, as well as roles and responsibilities.

Report of Waste Discharge (ROWD)

As required by the stormwater permit, the City will work with the other permittees to prepare a ROWD for submittal to the Regional Water Board, at least 180 days prior to expiration of the current permit (submittal date March 15, 2013). The ROWD will include a revised SQIP.

Fiscal Analysis

Each year, through the City budgeting process, a fiscal analysis will be performed to ensure resources are available and allocated to carry out the proposed activities necessary for Stormwater Permit compliance. Projected budgets for each coming fiscal year will be presented in the Annual Work Plans (May 1), and actual expenditures for the previous fiscal year will be reported in the Annual Reports (October 1).

Recordkeeping and Reporting

SQIP

Following the submittal of this SQIP on April 30, 2009, the City will revise the SQIP based on comments provided by the Regional Water Board or comments received during the 30-day public review process conducted by the Regional Water Board.

Annual Report and Annual Work Plan

As required by the Stormwater Permit, the City will submit an Annual Report by October 1st of each year detailing the activities accomplished and the quantitative data compiled during the previous fiscal year (July 1 -June 30). The report will be prepared using a standardized reporting format consistent with the other permittees and approved by the Regional Board. By May 1st of each year, Elk Grove will submit an Annual Work Plan that details the activities proposed for the coming fiscal year.

The City of Sacramento and County of Sacramento will take the lead in submitting Joint Program Work Plans and Annual Reports to describe activities such as monitoring conducted jointly by all the permittees in the Partnership. Refer to Chapter 2 for additional information about joint activities.

City elected officials and managers will be kept apprised of Stormwater Program activities and issues through briefings and interoffice memoranda as needed.

Training for City Staff

Training is an important aspect of Elk Grove's Stormwater Program. Each year, all affected personnel and managers will be educated on the requirements of the Stormwater Permit relevant to their daily work. The training may be in the form of in-house meetings and briefings or external training conducted by the Partnership or others. Details of regular training are listed above. For example, each year, City construction inspectors will be required to attend one of the pre-wet season training workshops conducted by the Partnership.

Intra and Interagency Coordination

As discussed previously, the City will work with the other permittees to update the MOU which defines cost-sharing and agency roles. The City will also work with EMD as needed to update the MOU which defines responsibilities for the industrial inspection program. The City will continue to coordinate internally to ensure that all required City staff, management, and City Council Members are aware of Stormwater Permit requirements and related efforts. City staff will attend regular permittee coordination meetings (held approximately monthly).

The City will continue to participate with other permittees on various work groups and subcommittees that have been formed to address specific activities, such as monitoring, target pollutants, and special studies.

The City will continue to coordinate with other outside agencies during the 2008-2013 permit term, as needed when multi-jurisdictional issues arise. These agencies may include Caltrans, US Army Corps of Engineers, US Fish and Wildlife Service, and the California Department of Fish and Game, among others.

Effectiveness Assessment

The City will work with the other permittees to assess the effectiveness of the overall stormwater program as described in Chapter 2, Section 2.3. This section describes assessment activities relevant to the Program Management Element, including proposed methods for evaluating effectiveness during the 2008-2013 permit term. This approach is based on guidance provide by CASQA in its *Effectiveness Assessment Guidance* document (2007). In addition, the City will evaluate the effectiveness of its own program management activities related to permit compliance, as described in Table 6.2-1. This assessment will be done annually during preparation of the annual report, and recommendations for program improvements or modifications will be made based on the results.

For this program management element, most activities have Level 1 effectiveness outcomes; this requires annual documentation that activities have been conducted as required by the stormwater permit. Level of effort (e.g., number of meetings attended) and resources expended (staff hours or costs) may also be tracked (also outcome level 1). The exception to this is training.

The City will contribute resources (per the permittee cost-share MOU) to the long term effectiveness assessment required by the stormwater permit (due with ROWD on March 15, 2003).

6.3 Construction Element

The main goal of the Construction Element for the 2008-2013 permit term will be to continue to ensure that all the requirements of the Stormwater Permit are met, by reducing sediment discharge and construction related pollutants to the City storm drain system to the maximum extent practicable.

Construction Element Strategy

The Stormwater Permit (Provision 8) requires a number of tasks related to regulation, enforcement and inspection of construction sites in Elk Grove to reduce the discharge of construction-related sediment and pollutants to the maximum extent practicable. The requirements apply to private as well as public construction projects, including those also requiring coverage under the State's Construction General Permit. For the most part, the focus for inspection and enforcement activities is on land disturbing activities of 350 cubic yards or more and/or one acre or more. However, smaller sites also must comply with the City's Stormwater Ordinance and smaller site operators are educated and informed about ways to prevent erosion and pollution problems.

Overview of City Inspection Activities

Construction is virtually a year-round activity and is occurring in many areas of the City. The City employs a team of about 12 inspectors (including 5 Construction Services Inspectors, 5 Building Inspectors and 2 SWPPP Inspectors) to ensure that construction sites are in compliance with the City requirements Progressive enforcement action is taken when local requirements are not adhered to or sediments and other pollutants are allowed to reach the storm drainage system or local creeks. The following highlights some of the activities:

- The City's Land Grading and Erosion Control Ordinance requires erosion and sediment controls on all projects disturbing 350 cubic yards or more of soil or one or more acres of land.
- The City's Erosion and Sediment Control Standards and Specifications are applied on all projects in Elk Grove subject to the erosion control ordinance. These standards are updated as needed.
- City construction inspectors conduct inspections of all site improvements that will eventually be owned by the City (e.g., roads, curb and gutter, pipes and channels, public buildings and facilities) to ensure compliance with applicable erosion and sediment control requirements. City inspectors do not inspect construction of special district, state or federal projects or buildings, except insofar as the site encroaches upon and connects to City-owned facilities (e.g., roads, drainage system).
- City building inspectors conduct inspections of private and public projects during the building construction phase. Stormwater pollution and erosion problems are referred to the SWPPP inspectors for follow-up.
- The City has two SWPPP inspectors dedicated solely to stormwater inspection and compliance issues. All SWPPP issues are referred to them from construction and building inspectors for enforcement action.
- Projects in Elk Grove disturbing one or more acres of land are required to obtain coverage under the State's General Construction Permit, in addition to satisfying all applicable local permitting requirements. Prior to issuing a grading permit, the City verifies that a State-required Notice of Intent (NOI) was filed and checks the Stormwater Pollution Prevention Plan (SWPPP). City inspectors inspect these jobs and look for proper erosion and sediment controls, as they do for any other project in Elk Grove. Non-filers and repeat offenders will be referred to the Regional Board as required by the Stormwater Permit.

Accomplishments to Date

Since becoming a permittee to the Stormwater Permit in 2002, the City of Elk Grove has made several notable accomplishments related to the construction element:

- Adopted the City of Elk Grove Municipal Code, including Chapter 15.12 (Stormwater Management and Discharge Control, including the Urgency Ordinance 26-2004) to provide the City legal authority to eliminate construction-related pollutant discharges into its storm drain system.
- Adopted the County's standards and specifications for construction, including standard erosion and sediment control drawings.
- Developed and implemented procedures to require proof of Notice of Intent (NOI) to comply with the Construction General Permit as a condition of obtaining grading permits for applicable projects

Activities for the 2008-2013 Stormwater Permit Term

The main goal of the Construction Element for the 2008-2013 permit term will be to continue to ensure that all the requirements of the Stormwater Permit are met, by conducting the various administrative and coordination activities described below. Table 6.3-1 summarizes the activities that are proposed for the 2008-2013 permit term. This section describes these activities in greater detail.

Legal Authority

Currently the City's Land Grading and Erosion Control Ordinance (Municipal Code Chapter 16.44) requires a grading permit and erosion and sediment controls on all private projects disturbing 350 cubic yards or more of soil or one or more acres of land. Public projects are subject to the City's Stormwater Ordinance, which prohibits the discharge of sediments and other construction-related pollutants to the City storm drainage system. All projects that disrupt or modify the drainage pattern on a site are subject to review and permitting by the Public Works Department.

During the 2008-13 stormwater permit term, the City will revise its Land Grading and Erosion Control Ordinance for consistency with the State's new Construction General Permit.

Outreach and Education

The City will continue to provide education and guidance to both City staff (annually) and the local construction and development community (periodically), covering topics such as: current regulations and changes, local procedures and standards, BMPs, new technology, and inspection and maintenance practices. City staff training was covered previously in Section 6.2.

The City will support Partnership training events for the construction community (developers, contractors, engineers, designers) as well as those hosted by local groups such as the Building Industry Association (BIA). This coordinated training helps ensure consistency for the local construction community (which works throughout the Sacramento area, across various municipal lines), promotes stronger ties with professional organizations, and is cost-effective.

Various forms of educational materials will be distributed in different methods, depending on the target audience and message. Typical formats might include training workshops, brochures, and guidance documents and standards. Education will also be provided through the entitlement and plan check process, preconstruction meetings, and example documents.

Elk Grove will continue to contribute funding (through the cost-share MOU) for the development and production of outreach materials such as brochures for concrete and painting, printed in English and Spanish. This material will be presented in the annual reports.

Plan Review and Permitting

The City's Land Grading and Erosion Control Ordinance (Municipal Code Chapter 16.44,) requires a grading permit and erosion and sediment controls on all projects disturbing 350 cubic yards or more of soil or one or more acres of land. All projects regardless of scope are subject to the City's Stormwater Ordinance, which prohibits the discharge of sediments and other construction-related pollutants to the City storm drainage system. See Figure 6.8-1 for more information.

Projects are also required to obtain coverage under the State's Construction General Permit, in addition to satisfying all applicable local permitting requirements. Prior to issuing a grading permit, the City will verify that a State-required Notice of Intent (NOI) was filed and will check the Stormwater Pollution Prevention Plan (SWPPP) for compliance of items required by the Stormwater Permit.

The City will also continue to check all erosion and sediment control plans for conformance with the City's standards and specifications which describe requirements for BMPs at construction sites to control sediment and pollutant discharge. The City may update the standards and specification during the 2008-2013 permit term following the update of the Land Grading and Erosion Control Ordinance to reflect the State's new Construction General Permit.

Inspection and Enforcement

The City of Elk Grove's Public Works Department inspectors will continue to conduct inspections of all construction projects in the City to ensure compliance with the requirements set forth in the City's ordinances. This includes checking sediment and erosion control measures and verifying that a site has obtained coverage under the State's Construction General Permit if applicable. General Permit non-filers and repeat offenders will be referred to the Regional Water Board as required by the Stormwater Permit.

As with the last permit term, the City will continue to prioritize sites as either "high" or "moderate" threat to water quality and inspects according to this schedule:

- High priority sites – inspected twice monthly during the wet season (October 1 – April 30) and monthly thereafter.
- Moderate priority sites – inspected monthly throughout the year.

New projects will be assumed to be high priority until successive inspections demonstrate that they can be downgraded to moderate priority. The criteria for making this determination will include factors such as: project size, amount and nature of site activity, sensitive site conditions (e.g., proximity to a creek, steep slopes or erosive soils), and history of prior violations by the contractor(s).

Progressive enforcement action will be taken by the construction inspectors when violations of local ordinances are observed, including discharge of sediments and other construction-related pollutants to the storm drain system or local creeks.

All City construction projects will be subject to the same ordinances and standards as private projects. City inspectors will inspect and conduct enforcement for these projects.

The City of Elk Grove lacks jurisdictional control over certain projects that may be constructed in the City by special districts (Elk Grove Unified School District and Cosumnes Community Services District) and other agencies. These projects are subject to the City's Stormwater Ordinance. The City will coordinate with these agencies on a project by project basis to ensure compliance with the Stormwater Ordinance.

Track Active Construction Projects

The City will continue to maintain a database of active construction projects and their priorities will be maintained by the City at all times.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. This chapter describes assessment activities relevant to the Construction Element, including proposed methods for evaluating effectiveness during the 2008-2013 permit term. Table 6.3-1 describes the assessment methods the City will use to evaluate the construction program element activities during the 2008-13 permit term. The desired outcome will be to move toward outcome levels 2 and 3 for some tasks; report if the program element or BMP raised the target audience's awareness and behavior of an issue. The remaining tasks will continue to be evaluated at outcome level 1 (documenting and confirming permit compliance).

Key indicators have been selected for various tasks to demonstrate progression towards overall stormwater program goals for this particular element. A summary of the status of each key indicator will be provided annually or periodically through the annual reports.

Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

6.4 Commercial/Industrial Element

The goal of the Commercial/Industrial Element for the 2008-2013 permit term will be to continue to ensure that all the requirements of the Stormwater Permit are met, by conducting the various administrative and coordination activities described below. The main goal is to reduce the discharge of stormwater pollutants to the maximum extent practicable and to eliminate illegal stormwater discharges from commercial and industrial facilities.

Commercial/Industrial Element Strategy

The Stormwater Permit (Provision 9) requires inspection of many industries and educational outreach to others to effectively prohibit unauthorized non-storm water discharges and to reduce pollutants in site runoff to the maximum extent practicable. The Stormwater Permit requires that the City develop and maintain an inventory of businesses addressed by the Commercial/Industrial Element and submit an updated inventory each year in the Annual Report.

The City of Elk Grove contracts with other agencies to conduct selected activities related to this program element within the City. The City has executed an MOU with the County of Sacramento Environmental Management Department (EMD) to conduct triennial inspections of facilities within Elk Grove. The types of facilities that are inspected by EMD are listed in Table 6.4-2 below. An advantage of having EMD inspect these facilities in the City of Elk Grove is that EMD conducts all inspections countywide which ensures consistent and equitable treatment of the regulated community. The work performed by EMD on the City's behalf is described in Chapter 2 (Section 2.7)

The City conducts periodic and complaint-based inspections of other businesses within the city.

Table 6.4-2. Commercial/Industrial Facilities in Elk Grove Subject to EMD Inspections

Commercial/Industrial Category	No. Facilities (July,2008)
• Auto body shops	6
• Auto repair shops	39
• Auto dealers	15
• Equipment rental facilities	3
• Kennels	2
• Nurseries	2
• Retail gasoline outlets (i.e., gas stations)	27
Restaurants	270
Facilities covered by the State's Industrial General Permit	16
Total	**380**

Intra and Interagency Coordination

As previously stated, the City has signed an MOU with EMD to conduct stormwater compliance inspections on its behalf. The City meets with EMD and other permittees to discuss the inspection program and resolve problems encountered by EMD staff. The Regional Commercial/Industrial Program is discussed in greater detail in Chapter 2 (Section 2.7).

The City conducts periodic and complaint-based inspections of other business in the City of Elk Grove.

Accomplishments to Date

Refer to Chapter 2 (Section 2.7) for a description of EMD Regional Commercial/Industrial Program accomplishments to date.

Activities for the 2008-2013 Stormwater Permit Term

The main goal of the Commercial/Industrial Element for the 2008-2013 permit term will be to continue to ensure that all the requirements of the Stormwater Permit are met, by conducting the various administrative and coordination activities described below.

Legal Authority

The City's Stormwater Ordinance will continue to provide legal authority to the County EMD for regulating selected commercial businesses and industries in Elk Grove with respect to stormwater pollution. The City's Stormwater Ordinance and EMD's Fee Ordinance will be amended as needed during the 2008-2013 permit term.

Priority Industry Inspections

The industries and commercial businesses subject to stormwater compliance inspections and targeted outreach for the 2008-2013 permit term are identified in the sections below. These are the same businesses that were targeted during the previous permit term. These lists will be refined during the 2008-2013 permit term as needed. See Chapter 2 (Section 2.7) for more details.

Businesses to Be Inspected Once Every Three Years

- Auto Body Shops
- Auto Dealer
- Auto Repair Shops
- Equipment Rental Companies
- Nurseries
- Kennels
- Restaurants
- Retail Gasoline Outlets
- Industries with State Industrial General Permit Coverage

The City contracts with the County's Environmental Management Department (EMD) to conduct the required stormwater inspections, including enforcement and follow-up inspections to resolve problems, as warranted. These services will be paid for through direct billing to the regulated

businesses by the County. Additionally, treatment structures at EMD inspected facilities are included in EMD inspections.

Business to Receive Educational Outreach during Permit Term

- Automotive Washing/Detailing
- Carpet Cleaning
- Commercial Pesticide Application
- Concrete Pouring Contractors
- Concrete Cutting
- General Building Contractors
- Landscape Installation/Maintenance
- Paint Contractors
- Portable Toilet Rental/Maintenance
- Pressure Washing
- Street Sweeping
- Swimming Pool Contractors
- Swimming Pool Maintenance

The City will conduct the required educational outreach to the above-listed businesses and report activities each year in the Annual Report. The City will purchase, produce, and distribute brochures developed by the Sacramento Stormwater Program, such as those for food handling facilities, concrete and paint wastes, and swimming pool discharges. The City will also contribute funding to creation of new educational materials in collaboration with the other permittees.

Treatment structure inspections for other commercial and industrial sites

The city will maintain a regular inspection program for treatment facilities at commercial and industrial sites not covered by County EMD inspections.

Complaint-Based Stormwater Compliance Inspections

County EMD and City staff will collaborate to inspect any site within the City of Elk Grove on a complaint basis. Complaints can be referred by the public, other agencies and departments, the Regional Board, and other sources. City stormwater staff will refer to EMD any complaints related to businesses included in the triennial inspection program. All other complaints will be investigated, and associated progressive enforcement will be conducted to ensure that the stormwater pollution problem(s) are eliminated.

County EMD or City staff will distribute educational materials during these inspections and will keep a database for annual reporting purposes.

The City may consider contributing some funding through the Permittee cost-share MOU to help support the County Business Environmental Resource Center (BERC). BERC is a confidential resource agency serving businesses and industries in the County. BERC hosts workshops and provides guidance materials free of charge to businesses upon request. Refer to Chapter 2 (Section 2.7) for more information.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Table 2.7-1 in Chapter 2 describes the assessment methods EMD and BERC will use to more specifically evaluate the commercial/industrial program element activities conducted during the 2008-13 permit term. Table 6.4-1 describes the assessment methods used by the City to respond to complaint-based inspections. Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

6.5 Municipal Operations Element

The Stormwater Permit (Provision 10) requires a variety of activities to prevent or reduce pollutant in runoff from all municipal land use areas, facilities and activities. Municipal facilities include buildings, transportation facilities (e.g., roads, roadsides, parking lots and fleet service areas), storm drainage collection and storage systems (e.g., pipes, open channels, stormwater detention basins and roadside ditches). Municipal activities include materials storage and handling, waste storage and disposal, vehicle and equipment washing and maintenance, pipe, channel and basin maintenance, street cleaning, vegetation management and repair/construction. Routine management and operations and maintenance of the storm drain system, streets and public areas must be conducted in a manner that does not inadvertently contribute pollution to local creeks and rivers. Additionally, the City must strive to be a model of pollution prevention for the community.

The Municipal Operations Element addresses operation of City-owned facilities within the NPDES Permit area (urbanized areas), not covered by the State NPDES General Permit for Stormwater Discharges Associated with Industrial Activity (Industrial General Permit).

An outline of the municipal operations activities to be conducted by the City in compliance with the Stormwater Permit, including performance measures and a 5-year schedule will be provided in the annual report. Also, the approximate numbers of facilities, miles of storm drainage system, miles of streets, etc will be included in the annual report.

Municipal Operations Element Strategy

In order to minimize potential adverse environmental effects associated with constructing, operating, and maintaining city facilities, the City has adopted these strategies for the Municipal Operations Element:

- Provide training and technical assistance to target employees and facilities.
- Evaluate activities, facilities, employee training and any available Municipal SWPPPs to improve procedures and BMPs to address stormwater quality concerns; and
- Conduct record keeping and documentation of processes to allow for continuous assessment evaluations in order to achieve improvements with Stormwater Permit compliance.

These combined efforts help ensure that City designers, contract administrators, and operations and maintenance staff understand, implement, and demonstrate compliance with the Stormwater Permit in order to reduce stormwater pollution to the maximum extent practicable.

Intra and Interagency Coordination

The City's activities under the Municipal Operations Element do not address federal or state governmental agencies and facilities (e.g., Caltrans), which are out of the City's jurisdictional control. Facilities owned by the Elk Grove Unified School District and Cosumnes Community Services District (Parks, trails and fire facilities) are also outside the City's jurisdictional control, but activities at these facilities are still subject to the City's Stormwater Ordinance. City stormwater inspectors are authorized to issue enforcement actions to the operators of such facilities if discharges from the facilities contribute pollution to the City-owned storm drain system or local creeks. The City does not operate water production and distribution facilities. Additionally, the City does not have jurisdiction over the sanitary sewer system and associated facilities operated by the Sacramento Regional County Sanitation District or the Sacramento Area Sewer District within the City limits.

Inventory of City Operations and Related Stormwater Activities

The Municipal Operations Element addresses operation of City-owned facilities within the NPDES Permit area (urbanized areas), not already covered by the State NPDES General Permit for Stormwater Discharges Associated with Industrial Activity (Industrial General Permit).
The following is an inventory of the City-owned facilities and operations addressed by this element:

Buildings and Parking Lots – The City owns and operates the City Hall complex and the Police Service Center, and a Corporation yard. The corporation yard has transit and maintenance facilities. Selected vehicle maintenance is performed on site at the Corporation yard. The Corporation yard has a SWPPP which is fully implemented. There are no known stormwater issues with this complex.

City parks – The 86 parks located within the City of Elk Grove are operated and maintained (including vegetation and waste management) by the Cosumnes Community Service District (CCSD), a separate agency. The District follows the City's guidelines for stormwater quality.

Storm Drain System

Piped storm drain system – Approximately 450 miles of storm drain pipe and associated drain inlets and manholes are maintained by the City (as reported in the 2007/08 annual report).

Storm drain inlets – As of July 2008 (as reported in the 2007/08 annual report), the City had about 15,350 storm drain inlets. The City has marked its storm drain inlets within its jurisdiction. The City was required by the 2002 Stormwater Permit to mark 95% of storm drain inlets by the end of 2007 which has already been accomplished. As stated in the 2007/2008 Annual Report 100% of existing storm drain inlets have been stenciled.

Channels, creek and Basins – About 65 miles of manmade drainage channels, natural creeks and 22 basins are maintained by City crews (as reported in the 2007/08 annual report). This includes Deer Creek, Elk Grove Creek, the Grant Line Channel, Laguna Creek, the Laguna West Channel, the Shed A Channel, the Shed B Channel, the Shed C Chanel and Strawberry Creek.

The supervising field managers are taught the proper methods for clearing vegetation without exposing the slopes to excessive erosion. All cropped vegetation is removed from the creek and taken to the landfill.

Transportation Facilities

Curbed Streets – About 512 curb miles of curbed streets are cleaned by a vendor under contract with Public Works (as reported in the 2007/08 annual report). The frequency schedule is:

- Priority A streets – Twice a month, year round.
- Priority B streets – Once a month, March through October, Twice a month, November through February
- Priority C streets – 6 times a year, year round

Roads, Roadside Vegetation and Landscaping - The City repairs roads and maintains roadside vegetation. The City and the CCSD maintain landscaping in the City. The City currently maintains approximately 1.2 million square feet of landscaping.

Accomplishments to Date

Since becoming a permittee to the Stormwater Permit in 2002, the City of Elk Grove has made several accomplishments related to the Municipal Operations Element:

- The City has established routines for collecting and compiling data to assess activities and document regulatory compliance. City maintenance crews routinely log the quantity of pipes, channels, basins, storm drain inlets, manholes, and roadways cleaned and quantity of waste removed. This information is presented in the annual reports.
- By utilizing GIS software, the city has compiled the inventory of City-owned facilities. This data will be used in GIS and HTE for asset management purposes. This data is also used by maintenance crews for scheduled maintenance purposes.
- The city has been successful in establishing contracts with a street cleaning contractor in addition to various maintenance contractors to ensure that routine maintenance is conducted on all storm drain infrastructure in addition to transportation facilities and City owned buildings.
- The Public Works Department in collaboration with the GIS Department has successfully completed the updating of the city's storm drain facility maps. The storm drain facility maps are used by various agency departments in addition to outside agencies (i.e. SMUD, PG&E, etc.).

Activities for the 2008-2013 Stormwater Permit Term

The main goal of the Municipal Operations Element for the 2008-2013 permit term is to continue to ensure that all the requirements of the Stormwater Permit are met, by conducting the various administrative and coordination activities described below. Table 6.5-1 summarizes the activities proposed for the 2008-2013 permit term.

Facility Management

Maintenance of Buildings

The main potential for stormwater pollution at administrative building sites is the parking lot runoff. See the parking lot maintenance activities described later in this section, which are designed to minimize discharge of pollutants.

The operations and maintenance of the Corporation yard is regulated in accordance with the requirements of the Corporation yard SWPPP.

Inspection and Maintenance of City-Owned Parking Lots

Parking lots exposed to rainfall will be inspected and maintained at least annually at a minimum prior to the wet season. Maintenance activities will include trash/debris removal, sweeping and removal of oil stains involving collection and proper disposal of the waste water.

New Development and Construction Requirements for Municipal CIP Projects

Development and construction of City projects will be subject to the same requirements which apply to private construction and development projects as described in Section 6.3 and 6.8.

Operation and Maintenance of City Parks

The CCSD will continue to maintain the 86 parks located within the city limits. The City of Elk Grove has no jurisdictional control over the CCSD, but will coordinate with the district during the 2008-2013 permit term to ensure that pollutants are not discharged to the City's storm drain system or local creeks due to the CCSD's operations.

Integrated Pest Management

The City and its contractors will implement IPM procedures as detailed in the Pesticide Plan developed by the Partnership and approved by the Regional Water Board. The City has no jurisdiction over pest control or other maintenance activities conducted at parks in the City which are specifically maintained by CCSD.

The City will promote and distribute the River Friendly Landscaping Guidelines and associated Homeowner's Guide to residents and landscape contractors. Much of the outreach material is distributed to the general public during various outreach efforts that the City is involved with.

Storm Drain System Maintenance

Maintenance of the Piped Storm Drain System

The City will continue its utilization of a maintenance contractor to provide these services using proper maintenance procedures. If this changes during the 2008-2013 permit term it will be noted in the appropriate annual work plan and/or annual report.

Maintenance of Creeks and Channels

The city will continue to use the current methods it is employing to clean and remove vegetation along creeks and channels. The City will continue its utilization of a maintenance contractor to provide these services using proper maintenance procedures. If this changes during the 2008-2013 permit term it will be noted in the appropriate annual work plan and/or annual report.

Storm Drain Inlet Marking

City maintenance crews will continue to check the condition of existing storm drain markers and stencils and replace those that are damaged or missing. City Engineers and inspectors will also continue to verify that storm drain inlets installed in new developments include a permanent "No Dumping! Flows to Creek" message as illustrated in the City's Standard Drawing SQ-10.1

Operation and Maintenance of Transportation Facilities

Prioritized Street Sweeping for Curbed Streets

The City will continue to contract with a vendor for street sweeping on curbed streets, to follow the prioritized schedule as previously described in this section.

Maintenance of Roads, Roadside Vegetation and Landscaping

The City will continue its utilization of a maintenance contractor to provide these services using proper maintenance procedures. If this changes during the 2008-2013 permit term it will be noted in the appropriate annual work plan and/or annual report.

Inspection and Maintenance of City-Owned Parking Lots

Parking lots exposed to rainfall will be inspected and maintained annually at a minimum prior to the wet season. Maintenance activities will include trash/debris removal, sweeping and removal of oil stains involving collection and proper disposal of the waste water.

Waste Management Services

The City will continue to contract with a waste collection contractor for residential solid and green waste and general recycling collection and hauling services in the city. Waste oil and limited household hazardous materials may also be collected curbside.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Table 6.5-1 describes the assessment methods that the City will use to more specifically evaluate the municipal operations program element activities which it conducts. The goal that the City desires to attain is to move toward outcome Levels 2 and 3 for some tasks (raising awareness and behavior, of city employees and contractors). The remaining tasks will continue to be evaluated at outcome level 1 (documenting and confirming permit compliance).

Key indicators have been selected for various tasks to demonstrate progression towards overall stormwater program goals for this particular element. A summary of the status of each key indicator will be provided annually or periodically through the annual reports.

Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

6.6 Illicit Discharge Element

The goal of the Illicit Discharges Element is to reduce the discharge of stormwater pollutants to the maximum extent practicable and to effectively eliminate illicit non-stormwater discharges.

The storm drain system consists of a network drain inlets, manholes and pipes, as well as streets, sidewalks, gutters and roadside ditches, which discharges to local creeks and rivers. Stormwater runoff from driveways, parking lots, roof drains and other surfaces typically discharge into this system.

Two kinds of discharges are addressed by this element:

- *Illegal dumping* – Dumping of liquid or solid wastes into the storm drain system. Examples include mobile carpet cleaning companies discharging dirty rinse water into a storm drain manhole, a homeowner dumping used motor oil into a storm drain inlet, or a person dumping garbage or other wastes into drainage channels and creeks.
- *Illicit connection* – A piped connection allowing sanitary sewage to flow into the storm drain system. For example, a washing machine plumbed into the storm drain system rather than the sanitary sewer.

Any material dumped or discharged into the City's storm drain system eventually makes its way to a local creek and/or river, where it can impair beneficial uses. This is true whether the material is classified as hazardous or not. Water quality, habitat, and aesthetics are all examples of benefits that can be impacted.

Illicit Discharge Element Strategy

The City's strategy for eliminating illicit discharges to the storm drain system and local waterways includes:

- Maintaining adequate legal authority to prohibit illicit discharges. This is accomplished through the City Stormwater Ordinance. City staff is authorized to enforce the ordinance within the City limits.
- Conducting ongoing field screening to detect illicit discharges and connections as a part of routine maintenance and repair of the storm drain system and local creeks, and enforcing against dischargers.
- Providing convenient means for residents to dispose of solid and household hazardous wastes.
- Educating City staff, contractors and the public about how to identify and report illicit discharge problems. This effort includes educational materials, signage and training.
- Providing a hotline for public reporting of problems and responding in a timely manner. The City supports a stormwater hotline 687-3005 for this purpose.

Intra and Interagency Coordination

City maintenance crews conduct ongoing field screening for illicit discharges and connections as part of their routine maintenance practices. When an illicit discharge is encountered depending on the severity of the spill (i.e. hazardous material), the County of Sacramento's HazMat crew may be dispatched for clean-up.

The Public Works Department communicates with field crews as to the necessary steps to be taken during an illicit discharge report. If progressive enforcement action against the discharger does not eliminate the problem, the City may coordinate with the City's legal counsel.

The City also coordinates with the other permittees in the Partnership to produce educational materials and messages designed to eliminate illicit discharges.

Accomplishments to Date

Since becoming a permittee to the Stormwater Permit in 2002, the City of Elk Grove has made several accomplishments related to the Illicit Discharge Element:

- The City adopted the Stormwater Ordinance (City of Elk Grove Municipal Code Chapter 15.12, Articles 2-3) in, which makes most discharges to the storm drain system illegal and in 2004 the City revised the ordinance to strengthen its legal authority.
- 100% of storm drain inlets in the City have been stenciled with the "No Dumping — Drains to Creek" message.
- As required by the City's Improvement Standards, permanent "No Dumping! Flows to Creek" stamps were applied to all new concrete storm drain inlets installed as part of development projects.
- On an on-going basis, maintenance crews field screen the storm drain system, including storm drain outfalls along creeks and channels to look for illegal connections.
- In 2006, the Partnership set up a new hotline, 808-4H20, which allows callers to select Elk Grove and be routed to City Hall to report incidents of illegal dumping and illicit discharges. The hotline is now widely advertised on all Partnership educational materials, media spots, and on the web site. The City also supports a stormwater hotline 687-3005 for this purpose.
- The City also utilizes the Community Enhancement Department to enforce illicit discharges and illegal connections.

Activities for the 2008-2013 Stormwater Permit Term

The main goal of the Illicit Discharge Element for the 2008-2013 permit term will be to continue to ensure that all the requirements of the Stormwater Permit are met, by conducting the various administrative and coordination activities described below. Table 6.6-1 summarizes the activities proposed for the 2008-2013 permit term.

Update Stormwater Ordinance and Improve Enforcement Authority as Needed

The City will periodically evaluate the Stormwater Ordinance and amend as needed to enhance legal authority. The City will also continue to use the Stormwater Ordinance and Community Enhancement Department to enforce illicit discharges.

Reporting of Illicit Discharges

The City will continue to operate a stormwater hotline 687-3005, to facilitate public reporting of problems in the City.

Ongoing Field Screening to Detect Illicit Discharges and Connections

Activities to prevent and reduce illicit discharges to the piped storm drain system and creeks within the City of Elk Grove will continue.

City crews responsible for inspecting and maintaining the piped storm drain system, creeks and channels, and roads/roadside ditches in the City will continue to be trained on how to identify, clean up and/or refer and report observed incidents of illicit discharges.

City crews will also respond to complaints from the public and referrals from County EMD inspectors, the Regional Board and others. Problems are addressed on an individual basis depending on the nature of the discharge.

Solid Waste and Household Hazardous Waste Programs

The City of Elk Grove's Integrated Waste Management section will continue to conduct solid waste management and recycling and household hazardous waste collection for residents of Elk Grove.

Illicit Discharge Response, Containment and Clean-Up

The City will continue to respond, contain and clean-up illicit discharges in the City of Elk Grove. If necessary, the City will contact the County of Sacramento's HazMat team for clean-up of hazardous material spills.

Data Management

The City will continue to track data for illicit discharges within the City. The City will also update an illicit discharge map that will show the locations of illicit discharges.

Education and Outreach

To educate the public, and to minimize illegal discharges of waste into the storm drain system, Elk Grove will continue to promote marking of storm drain inlets with "No Dumping" messages, using volunteer groups as available or City maintenance crews.

The City will continue to operate the 687-3005 hotline to facilitate public reporting of problems in the City. Also, City crews will distribute door hangers and other educational materials in neighborhoods where they observe illicit discharge problems.

In addition "No Dumping" signage may be installed along creeks and channels based on recommendations by maintenance crews and the Public Works Department.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Table 6.6-1 describes the methods that the City will employ to evaluate the illicit discharge program element activities which it conducts. The goal will be to move toward outcome levels 2 and 3 (changing awareness and behavior, respectively, of city employees and contractors) for some tasks. The remaining tasks will continue to be evaluated at outcome level 1 (documenting and confirming permit compliance).

Key indicators have been selected for various tasks to demonstrate progression towards overall stormwater program goals for this particular element. A summary of the status of each key indicator will be provided annually or periodically through the annual reports.

Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

6.7 Public Outreach Element

The goal of the Public Outreach Element is to raise awareness and foster community stewardship to help prevent pollution and protect local creeks and rivers.

The City coordinates with the Partnership to implement a wide range of activities to increase the knowledge of the community regarding the City' storm drain system, impacts of urban runoff on local creeks and rivers, and potential pollution prevention solutions for the targeted audiences

Public Outreach Element Strategy

The City conducts most of the public outreach activities for Elk Grove residents. Elk Grove also contributes to regional public outreach (discussed in Chapter 2.6) through the permittee cost-share MOU.

Elk Grove Community Characteristics

As of 2008, there were approximately 136,000 residents in the City. The Elk Grove Unified School District operates 35 schools within the City limits, including 6 High Schools, 6 middle schools and 23 elementary schools, with a combined total student population of about 41,000. About 10,000 students are enrolled in grades 3-6 (this has traditionally been a target age range for stormwater pollution prevention messages).

There are numerous community organizations, homeowner associations and environmental groups represented in the City. Activities such as the Western Festival and Harvest Festival help to build a stronger sense of community.

In terms of watershed stewardship and water quality protection, the Cosumnes Community Services District (CCSD) Parks and Recreation Department continues to sponsor programs, events and activities that promote community involvement in creeks:

- Creek Week – In conjunction with Earth day the City helps sponsor a large scale clean up of creeks located in Elk Grove.

Prior to incorporation of Elk Grove, the CCSD also spearheaded the protection of parts of Laguna Creek and Elk Grove Creek, with establishment of wide natural buffers, trails and interpretive signage. Residents can enjoy these natural resources in the Fallbrook, Camden, and Laguna Springs residential areas.

The Laguna Creek Watershed Council (LCWC) is a diverse group of watershed residents, community group leaders, and local government agency representatives established in the fall of 2002. The LCWC's mission is to protect the health of Laguna Creek and its tributary streams by educating residents, promoting active community participation, and fostering partnerships and projects that achieve long-term, balanced solutions with mutual benefits to all stakeholders. The City supports the LCWC and maintains an active role in the LCWC by sending a representative to each of the meetings to voice the City's concerns.

The Sacramento Bee is the major newspaper serving the region, with a special "Elk Grove Neighbors" section circulated twice a week. The Laguna Citizen and Elk Grove Citizen are locally-produced papers circulated twice a week to subscribers. The City also publishes its own news letter monthly. Other media includes T.V and radio stations that serve the greater Sacramento area.

Intra and Interagency Coordination

The City of Elk Grove coordinates with the other cities in the County on regional public outreach issues through the Partnership. Activities such as the regional media campaign are generally discussed, and agreements made, during permittee coordination meetings. See Chapter 2, Section 2.6 for more information.

Accomplishments to Date

Several major community events are held in the City each year. The City continues to sponsor a stormwater booth at many of these activities. The City plans to continue this practice for the 2008-2013 stormwater permit term. In addition Chapter 2, Section 2.6 describes major accomplishments related to public outreach by the Partnership since 1990. The following are some of the events that City of Elk Grove staff is involved with:

- Elk Grove Annual Creek Cleanup Day – conducted by the Cosumnes Community Services District in conjunction with Creek Week.
- Elk Grove Western Festival – Spring
- Elk Grove Harvest Festival – Fall
- "Walk on the Wildside" – Spring
- City staff visits classes on an individual basis as requested by instructors.

Additionally, City staff will meet with managers periodically throughout the year to keep them informed about the Program. Presentations will be made to the City Council and/or Planning Commission upon request. The City leaders will also be invited to participate in community events to demonstrate support for the stormwater pollution prevention effort.

Activities for the 2008-2013 Stormwater Permit Term

Partnership Activities

See Chapter 2, Section 2.6 for detailed information about activities that will be conducted by the Partnership related to regional public outreach.

City-Specific Activities

The main goal of the Public Outreach Element for the 2008-2013 permit term will be to continue to ensure that all the requirements of the Stormwater Permit are met, by conducting the various administrative and coordination activities described below. Table 6.7-1 summarizes the activities proposed for the 2008-2013 permit term.

Continue to promote volunteer stenciling of storm drain inlets as an educational activity. Supply all necessary materials and supplies to community groups upon request.

Continue to sponsor and staff a stormwater booth at the following types of community events:

Creek Week Cleanup-April

Western Festival-May

Elk Grove Harvest Festival – October

Walk on the Wildside - May

Meet with City management periodically throughout the Stormwater Permit term to keep them informed about the Program. Presentations will be made to the City Council and/or Planning Commission upon request. City leaders will also be invited to participate in community events to demonstrate support for the stormwater pollution prevention effort.

- Including articles regarding stormwater pollution prevention in the City's community newsletter
- Maintaining updated stormwater quality protection information on the city website and continue to distribute partnership outreach material and update the City's stormwater brochure.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Table 6.7-1 describes the assessment methods the City will use to more specifically evaluate its City-specific public outreach program element activities during the 2008-13 permit term. Assessments of regional public outreach activities will be conducted by the Partnership as described in Chapter 2, Section 2.6. In general, the goal will be to move toward outcome levels 2 and 3 (changing awareness and behavior, respectively, of dischargers and the public) for some tasks. The remaining tasks will continue to be evaluated at outcome level 1 (documenting and confirming permit compliance).

Key indicators have been selected for various tasks to demonstrate progression towards overall stormwater program goals for this particular element. A summary of the status of each key indicator will be provided annually or periodically through the annual reports.

Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

6.8 New Development Element

The goal of the New Development Element is to mitigate urban runoff pollution and other water quality impacts associated with new development and redevelopment.

New Development Element Strategy

Specific development and redevelopment within the City of Elk Grove will be mitigated with a combination of tactics:

- Limit sources of pollution.
- Incorporate stormwater quality requirements as early as possible into the development review process.
- Reduction of run-off / low impact development techniques.
- On-site treatment of runoff before entering the storm drainage system.
- Area treatment of run-off prior to entering creeks and channels.
- Conduct ongoing outreach to the development community through monthly development seminars.

To apply these tactics, they must be well integrated into the steps of the development process:

Planning: General and specific plans need to incorporate low impact development and water quality mitigation measures on a holistic basis; primary goals would be to reduce changes to run-off by using low impact development techniques and to look at area-wide treatment which can be better controlled and maintained in the long term.

CEQA: The CEQA process is a primary opportunity to reduce development impacts and view mitigation measures on an area-wide basis. Good CEQA work can set up projects for easier navigation through the federal Section 404 permitting process

Design Standards: The City of Elk Grove requires full implementation of requirements for source and treatment controls and application of design standards using the "*Stormwater Quality Design Manual for Sacramento and South Placer Regions"*. The Post Construction Storm Water Quality Control Plan (PCSWQCP) is reviewed early during the entitlement process and again, in detail, during the plan check process.

Construction: Inspection is a key to insuring correct construction of the designed source and treatment controls so that they function properly.

Maintenance: Ensuring adequate maintenance of the post construction source and treatment controls in perpetuity is essential to ensuring continued effectiveness in the protection of stormwater quality. This is accomplished by passing oversight of the controls into sustainment activities under the Commercial/Industrial or Municipal Operations element after construction.

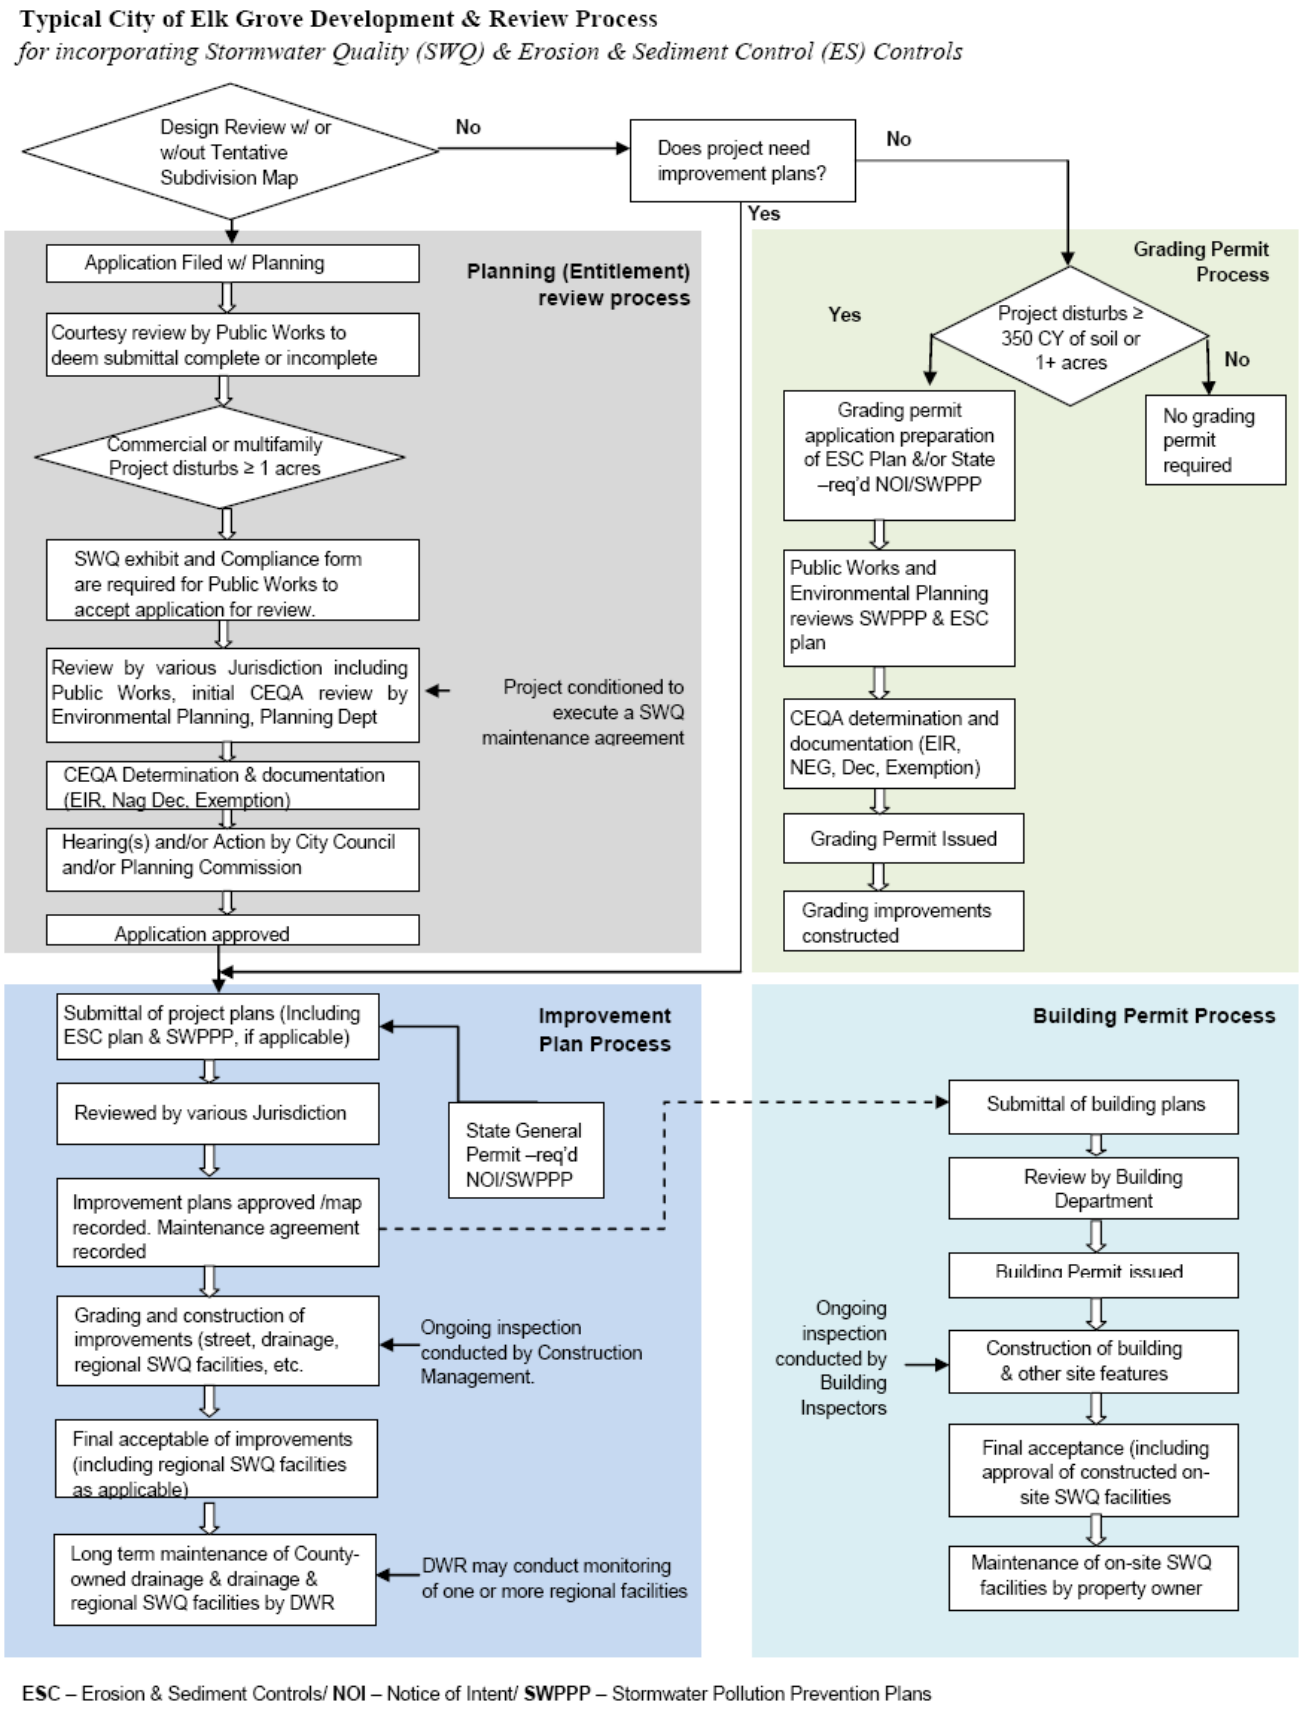
Intra and Interagency Coordination

The City has established a process for reviewing, conditioning, and permitting projects, as illustrated in Figure 6.8-1. Upon submitting a complete planning project application to the City Planning Department, a planner is assigned to the project. The project is then routed to numerous departments and agencies including Public Works. It is the responsibility of each department and agency to review the project against all applicable standards and submit comments and/or conditions to the Planning Division within designated timeframe, usually 2-3 weeks from the project route date.

Planning is then responsible for ensuring that comments are passed onto the developer and that all required conditions of approval are incorporated into the consolidated conditions of approval. Conditions are placed on the project to meet all new development standards of the City and those requirements of the Regional Water Quality Control Board that may be applied through the Section 404 permitting process. To review the Planning Application Form which includes the submittal requirement checklist, please visit: http://www.egplanning.org/misc/app_forms/2009/development-services-planning-application-form.pdf

The City also coordinates with other permittees regarding regional activities such as the new Design Manual and Hydromodification and Low Impact Development (LID) standards.

Development Standards



In May of 2007 the Stormwater Quality Design Manual developed by the Joint Permittees for the Sacramento Region was completed and published. The City of Elk Grove's Improvement Standards require that all new development meet the requirements specified in this design manual. Conditions are placed on proposed projects to direct developers and engineers to Volume 2 of the City/County of Sacramento Drainage Manual (Hydrology Standards) for design of detention basins.

For new development requirements and design of source and treatment controls developers and engineers are directed to the "*Stormwater Quality Design Manual for the Sacramento and South Placer Regions."*

Accomplishments to Date

The City has taken several steps to ensure that new development and redevelopment projects mitigate for their stormwater impacts. The City uses several methods to accomplish this goal, including using its development standards, the "*Stormwater Quality Design Manual for the Sacramento and South Placer Regions."*, and the permit review process. As shown in Figure 6.8-1, the City has a well established Development Review Process. Historically the focus of the New Development Element has been on mitigating stormwater quality impacts. The new permit contains requirements that address impacts to runoff volume (hydromodification impacts). The City currently does not allow post-project flows from developments to exceed pre-project runoff.

Figure 6.8-1

ESC – Erosion & Sediment Controls/ **NOI** – Notice of Intent/ **SWPPP** – Stormwater Pollution Prevention Plans

Activities for the 2008-2013 Stormwater Permit Term

The stormwater permit requires that the permittees regulate new development and redevelopment projects so that they incorporate measures to mitigate associated stormwater quality impacts. In addition, the new permit also requires a plan for mitigating the hydromodification impacts associated with new development. When development occurs, it increases the volume and rate of runoff and therefore stream flow; these hydromodification impacts, in turn, can cause creek erosion and other harm.

The permit now requires that the permittees must develop a plan to mitigate hydromodification impacts associated with new development where the runoff flows to creeks and storm drains where it could cause erosion or other harm. This will result in new requirements for some development projects.

In addition, the stormwater permit requires the permittees to require all priority new development and redevelopment projects to incorporate low impact development (LID) measures. The developed criteria will be incorporated into the *Stormwater Quality Design Manual for the Sacramento and South Placer Regions.*

Table 6.8-1 summarizes the activities that will be conducted by the City during the 2008-13 permit term to comply with the stormwater permit, along with the five-year implementation schedule. This section describes those activities in more detail.

Update Environmental Review Documents as Needed

The City will periodically evaluate and revise as needed, the CEQA initial study checklist and mitigation measure language used by City planners to condition development projects. Revised checklists and mitigation language will be submitted with Annual Reports.

Update Ordinances, Codes, Plans and Policies As Needed

The City planning staff will review and update as needed, various City codes that may conflict with the development standards and Design Manual. Alternatively, changes will be proposed to the Design Manual to achieve better consistency.

Ensure Compliance with Development Standards and the Design Manual

Development and redevelopment projects in Elk Grove will be conditioned for mitigation of receiving water impacts from urban runoff. The City will evaluate and amend its stormwater quality development standards to comply with new requirements during the 2008-2013 permit term. Staff will continue to ensure that development and redevelopment proposals comply with City's standards.

Working with the Partnership, the *Stormwater Quality Design Manual for the Sacramento and South Placer Regions."* will be updated to include additional criteria for low impact development (LID) and hydromodification mitigation following the amendment of the development ordinances and standards. Hydromodification criteria is discussed in the next section. The City of Elk Grove will contribute funding through the permittee cost-share agreement for the update of the design manual. The City will also continue to contribute to the Partnership's efforts to update the protocol for acceptance of proprietary control measures; see Chapter 2, Section 2.4 for more details.

City staff will review initial development applications for conformance with the *Stormwater Quality Design Manual for the Sacramento and South Placer Regions*.

City planning staff will promote the use of runoff reduction, or LID, control measures on development projects as a means of mitigating downstream habitat and erosion impacts. Such measures are expected to become mandatory for projects in certain areas when the permittees' hydromodification management approach is defined to comply with the 2008 Stormwater Permit. There are a few projects in the City that have already incorporated LID measures into their site plans.

Hydromodification Management Plan (HMP)

The City will work with other permittees to meet the requirements of the stormwater permit with regards to hydromodification management.

To comply with the stormwater permit requirements, the permittees are submitting a Hydromodification Management Plan (HMP) work plan as part of this SQIP (see Appendix 2B). One year after the Regional Water Board approves the work plan, the permittees will submit the HMP document.

Waiver Program

The stormwater permit allows the permittees to develop a waiver program/mitigation fund alternative for development projects where it is demonstrated that installing stormwater quality control measures is not feasible. The City will participate in efforts with the other permittees to develop a waiver program for the permit area, whereby project applicants may pay into an in-lieu fund when it is determined that runoff reduction and/or stormwater quality control measures are infeasible for their site.

Contribute to Regional Special Studies

The City will contribute funds via the Permittee cost-share MOU to conduct special studies of selected stormwater quality control measures to verify their local pollutant removal effectiveness (see Chapter 2). Some of these studies are continued from the last permit term. The City will also continue to contribute to the Partnership's efforts to update the protocol for acceptance of proprietary control measures.

Maintenance of Stormwater Quality Control Measures

The City will continue to evaluate the best method of educating owners of private treatment-control facilities about maintenance responsibilities. The City will continue to ensure long-term maintenance of treatment control measures on private development by requiring maintenance agreements to be executed before the final approval of the project. In addition the City stormwater staff will require property owners to certify that the treatment devices on their property are routinely maintained.

Through the annual refresher training and other opportunities, the City will train its construction inspectors to check for proper installation/operation of stormwater control measures before final acceptance of the project.

Outreach to Educate the Development Community

City staff will continue to work collaboratively with permittees to share information with the development community and promote consistency across municipal boundaries. The City will continue to provide technical guidance and design support to help the development community working in Elk Grove to comply with stormwater quality requirements. The City holds Development Seminar meetings where they share information and convey new requirements to the Development Community.

Employee Training

Each year the stormwater quality staff will continue to train individuals in the Planning, Development Review and Environmental Review departments regarding stormwater quality requirements. These employees will receive annual training related to hydromodification, LID and other evolving development standards, including how such standards will impact development in Elk Grove.

Effectiveness Assessment

The City's general approach to assessing the effectiveness of its stormwater program is described in Chapter 2. This section specifically describes assessment activities related to the New Development Element, including proposed methods for evaluating effectiveness during the 2008–13 permit term.

Table 6.8-1 presents planned activities for the 2008-13 permit term. Each performance standard associated with an activity has an anticipated effectiveness outcome level of between one and six, as described in Chapter 2. An outcome level of one is assumed for each performance standard, unless otherwise indicated.

Table 6.2-1 – City of Elk Grove SQIP
Program Management Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indic	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Stormwater Quality Improvement Plan (SQIP)											
Modify SQIP to reflect the requirements of Stormwater Permit	2		Revised SQIP submitted to Regional Water Board on April 30, 2009.	Confirmation- submit SQIP to Regional Water Board	♦						4/30/2009
Revise SQIP as needed to reflect permit revisions, respond to Regional Water Board requests, etc.	3.c		Proposed SQIP modifications, submitted to Regional Water Board as part of Annual Report.	Confirmation- submit SQIP and AR to Regional Water Board	⇔	⇔	⇔	⇔	⇔	⇔	As needed
Annual Work Plan											
Prepare and submit Annual Workplan	3.a		Annual Workplan submitted	Confirmation- submit work plan to Regional Water Board	♦	♦	♦	♦	♦	♦	May 1 each year
Annual Report											
Describe completed activities and budget expended for previous fiscal year in AR	3.b		AR submitted to Regional Water Board	Confirmation - submit AR to Regional Water Board	♦	♦	♦	♦	♦	♦	October 1 each year
Memorandum of Understanding (MOU)											
Review and revise existing permittee Memorandum of Understanding	3.e		MOU submitted to Regional Water Board		♦						Submit with SQIP on 4/30/2009
Legal Authority											

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Commercial/Industrial Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Investigate Regional Water Board referrals within 3 working days of receipt of referral	9.a.iii-viii		Document/quantify Regional Water Board referrals investigated within specified timeframe	Tabulation – Track number of Regional Water Board referrals investigated	⇔	⇔	⇔	⇔	⇔	⇔	
Provide enforcement support to Regional Water Board related to, including providing staff for joint inspections when available and appropriate	9.a.iii-viii		Document/quantify support efforts	Tabulation – Track number of cases where support was provided to the Regional Water Board	⇔	⇔	⇔	⇔	⇔	⇔	
Outreach											
Develop industry and pollutant-specific educational materials	9.b.iii		Quantify industry and pollutant-specific educational materials developed in collaboration with EMD.	Tabulation - track number of revised/new materials; number materials distributed in AR	⇔	⇔	⇔	⇔	⇔	⇔	
Track industry and pollutant-specific materials distributed	9.b.iii		Document/quantify industry and pollutant-specific materials distributed in collaboration with EMD.	Tabulation - track number of revised/new materials; number materials distributed in AR	⇔	⇔	⇔	⇔	⇔	⇔	

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 6.5-1 – City of Elk Grove SQIP
Municipal Operations Element Activities for 2008-2013

Activity/Task	Permit Ref	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Illicit Discharge Response										
Respond quickly and appropriately if an illicit discharge threatens to enter or enters the storm drain system	10.a.i.	Refer to Illicit Discharge Element		⇔	⇔	⇔	⇔	⇔	⇔	
New Development and Construction Requirements for Municipal Capital Improvements Projects										
Implement standards that require BMPs to reduce pollutants from Permittee owned development and construction projects as specified in the New Development and Construction Elements	10.a.ii., 10.b.i	Refer to Construction and New Development Elements		⇔	⇔	⇔	⇔	⇔	⇔	
Facility Management										
Implement pollution prevention BMPs for public facilities (e.g., corporation yards, material storage facilities, and vehicle/equipment maintenance facilities) having the potential to discharge pollutants to the storm drain system.	10.a.iii. , 10.b.ii.	Continue to implement Municipal SWPPPs at facilities not covered under the State General Industrial Permit.	Confirmation / Tabulation- Track number of Municipal SWPPPs	⇔	⇔	⇔	⇔	⇔	⇔	
Evaluate SWPPP implementation and effectiveness at municipal facilities		Document evaluations performed	Inspection and Tabulation - Track number of evaluations performed, identify BMPs implemented and activities modified as a result of evaluations.	⇔ 3	⇔ 3	⇔ 3	⇔ 3	⇔ 3	⇔ 3	

⇔ Ongoing activity/task ◆ Deliverable or key milestone 2 Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. The ability to assess effectiveness of identified performance standards may be limited pending availability of baseline data

Table 6.5-1 – City of Elk Grove SQIP
Municipal Operations Element Activities for 2008-2013

Activity/Task	Permit Ref	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Integrated Pest Management Program										
Implement integrated pest management (IPM) and pesticides storage, usage, and disposal procedures as described in the Pesticide Plan	10.a.iv. , 10.b.iii.			⇔	⇔	⇔	⇔	⇔	⇔	
Storm Drain System Maintenance										
Maintain the storm drain system (e.g., drain inlets, ditches/channels, detention basins and pump stations) to remove debris accumulation and prevent flooding	10.a.v. , 10.b.iv.	Decrease amount of sediment discharged to waters of the State. Document amount of sediment removed	Quantification - Track quantities of sediment removed annually	⇔	⇔	⇔	⇔	⇔	⇔	October 1, each year
Clean prioritized basins		Decrease amount of sediment discharged to waters of the State. Document amount of sediment removed	Quantification - Track quantities of sediment removed annually	⇔ 4	⇔ 4	⇔ 4	⇔ 4	⇔ 4	⇔ 4	October 1, each year
Visually monitor permittee owned open channels and perform the necessary maintenance.		Decrease amount of sediment discharged to waters of the State. Document amount of sediment removed	Quantification - Track quantities of sediment removed annually	⇔	⇔	⇔	⇔	⇔	⇔	October 1, each year
Drain Inlet Stenciling Program										
Ensure that storm drain inlets are properly and legibly marked to discourage illicit discharges into the storm drain system	10.a.vi	Document number of storm drain inlets labeled by City Crews	Tabulation - Track number of inlets marked each year	⇔	⇔	⇔	⇔	⇔	⇔	October 1, each year
Street Sweeping Program										
Conduct street sweeping activities	10.a.vii. , 10.b.v.			⇔	⇔	⇔	⇔	⇔	⇔	

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. The ability to assess effectiveness of identified performance standards may be limited pending availability of baseline data

Table 6.5-1 – City of Elk Grove SQIP
Municipal Operations Element Activities for 2008-2013

Activity/Task	Permit Ref	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Clean prioritized streets according to prioritization requirements established in 2002-2007 Permit Term		Decrease amount of sediment discharged to waters of the State. Document amount of sediment removed	Quantification - Track quantities of sediment removed annually	⇔ 4	⇔ 4	⇔ 4	⇔ 4	⇔ 4	⇔ 4	October 1, each year
Prevent road maintenance materials, street sweeper rinse out water, concrete chute rinse water, and sawcutting slurry from discharging to the storm drain system.		Implement BMPs during road maintenance and construction activities	Confirmation / Inspection - Identify BMPs implemented	⇔	⇔	⇔	⇔	⇔	⇔	
Parking Lot Maintenance										
Maintain Permittee-owned parking facilities to minimize the build-up and discharge of pollutants to the storm drain system	10.a.viii., 10.b.vi.	Evaluate Parking lot maintenance programs and adjust as needed	Confirmation / Inpection - Identify BMPs implemented	⇔	⇔	⇔	⇔	⇔	⇔	
Non-Emergency Fire Fighting Flows										
Permittees having a fire protection agency within their jurisdictional control shall develop and implement a response plan to minimize the impacts of fire fighting flows to the environment. BMPs must be implemented to reduce pollutants from non-emergency fire fighting flows (i.e., flows from controlled or practice blazes) identified by the Permittees to be significant source of pollutants to waters of the State. The response plan and BMPs shall be updated and submitted with the Annual Reports.	10.a.ix. , 10.b.ix.	Implement BMPs for non-emergency flows	Confirmation - Document that BMPs are implemented	⇔	⇔	⇔	⇔	⇔	⇔	
Employee Training										

⇔ Ongoing activity/task ◆ Deliverable or key milestone (2) Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. The ability to assess effectiveness of identified performance standards may be limited pending availability of baseline data

Table 6.5-1 – City of Elk Grove SQIP
Municipal Operations Element Activities for 2008-2013

Activity/Task	Permit Ref	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Provide regular internal training on applicable components of the SQIP	10.a.x. , 10.b.x	Increase awareness of available BMPs and pollution prevention practices	Tabulation / Survey - Track number of employees trained and monitor changes in awareness	⇔ ❸	⇔ ❸	⇔ ❸	⇔ ❸	⇔ ❸	⇔ ❸	
Detention Basin Maintenance										
Implement Detention Basin Operation and Maintenance Program	10.b.vii.	Evaluate program to ensure that adequate BMPs are implemented	Confirmation / Tabulation- Track number of activities modified	⇔	⇔	⇔	⇔	⇔	⇔	
Emergency Procedures										
BMPs shall be implemented during emergency responses to minimize pollutants discharged to the storm drain system as long as it does not compromise public health and safety.	10.b.viii.	Increase awareness of BMP implementation during emergency responses	Confirmation	⇔	⇔	⇔	⇔	⇔	⇔	
Municipal Operations Element Effectiveness Assessment (Key Indicators)										
Conduct and assessment as a part of the annual reporting process, determine the effectiveness of the Program Element and identify any necessary modifications.	10.a.xi.			⇔	⇔	⇔	⇔	⇔	⇔	October 1,

⇔ Ongoing activity/task ◆ Deliverable or key milestone ❷ Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. The ability to assess effectiveness of identified performance standards may be limited pending availability of baseline data

Table 6.6-1 – City of Elk Grove SQIP
Illicit Discharge Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Legal Authority											
Adopt stormwater ordinance revisions as recommended	11.a.i		Revised stormwater ordinance (if recommended) - also see Section 6.2	Confirmation - report revisions in AR	⇔	◆⇔	⇔	⇔	⇔	⇔	Revisions reported as needed, update due 9/10
Reporting of Illicit Discharges and Connections											
Continue to operate a public hotline (687-3005) for reporting of illicit discharges and connections, and route callers to the appropriate department.	11.a.ii ; 11.b.v		Revisions of hotline or its uses (if needed)	Confirmation/Tabulation - The City will track number of complaints received through 687-3005 and Contact Management Software	⇔	⇔	⇔	⇔	⇔	⇔	October 1, each year
The City maintenance crews will continue to report illicit discharges and connections within the City	11.a.ii	✓	Decrease in number of reports of illicit discharges and connections reported by City crews	Tabulation - The City will continue to track reports from crews	⇔	⇔	⇔	⇔	⇔ ③	⇔	October 1, each year, EA due 12/13
Screening for Illicit Connections											
The City maintenance crews will continue to report illicit discharges and connections within the City	11.a.ii ; 11.b.ii	✓	Decrease in number of illicit connections detected by field screening activities since last permit term	Tabulation - The City will include number of illicit connections detected via field screening activities in AR	⇔	⇔	⇔	⇔	⇔ ③	⇔	October 1, each year, EA due 12/13
Investigations of Illicit Discharges and Connections											
The City will continue to conduct investigations of illicit discharges (hazardous and non-hazardous)	11.a.iv ; 11.b.iii		Non-hazardous illicit discharges investigated within 5 days of discovery or report; hazardous illicit discharges investigated within 1 day of discovery or report	Confirmation - The City will include number of investigations conducted in AR	⇔	⇔	⇔	⇔	⇔	⇔	October 1, each year
		✓	Decrease in number of illicit discharges investigated since last permit term	Tabulation					③		EA due 12/13
The City will continue to conduct investigations of illicit connections	11.a.iii ; 11.b.ii		Illicit connections investigated within 21 days of discovery or report	Confirmation - The City will include number of illicit connection investigations conducted in AR	⇔	⇔	⇔	⇔	⇔	⇔	October 1, each year

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 6.6-1 – City of Elk Grove SQIP
Illicit Discharge Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
		✓	Decrease in number of illicit connections investigated since last permit term	Tabulation					③		EA due 12/13
Illicit Discharge and Connection Response, Containment and Cleanup											
The City will develop response, containment and cleanup procedures, revise as needed			Revised response, containment and clean up procedures (if needed)	Confirmation - Report revisions in AR	⇔	⇔◆	⇔	⇔	⇔	⇔	October 1, each year, update due 09/10
The City will continue to respond to, contain and clean up illicit discharges	11.a.iv ; 11.b.iii	✓	Decrease in number of responses, containment and cleanup of illicit discharges since last permit term	Tabulation - The City will track number of illicit discharge responses	⇔	⇔	⇔	⇔	⇔③	⇔	October 1, each year, EA due 12/13
The City will continue to respond to and abate illicit connections	11.a.iii ; 11.b.ii	✓	Decrease in number of responses and abatements of illicit connections since last permit term	Tabulation - The City will track number of illicit connections abated	⇔	⇔	⇔	⇔	⇔③	⇔	October 1, each year, EA due 12/13
Enforcement											
The City will revise enforcement policy as needed			Revised enforcement policy (if needed)	Confirmation - The City will report revisions in AR	⇔	⇔	⇔	⇔	⇔	⇔	October 1, each year
The City will continue to conduct enforcement (e.g., warnings, NOVs, Cease and Desist Orders, ACPs, and Cost Recoveries)	11.b.iv	✓	Decrease in number of enforcement actions since last permit term	Tabulation - The City will track number of enforcement actions conducted	⇔	⇔	⇔	⇔	⇔③	⇔	October 1, each year, EA due 12/13
Data Management											
The City will continue to maintain database to track its investigations, enforcement actions and outreach materials distributed	11.a.v		Completed revisions of database or its uses (if needed)	Confirmation - The City will report revisions in AR	⇔	⇔	⇔	⇔	⇔	⇔	October 1, each year
The City will continue to map the locations of confirmed illicit discharges and connections to help identify areas of targeted outreach			Completed revisions of map or its uses (if needed)	Confirmation - The City will submit map and report revisions in AR	⇔	⇔	⇔	⇔	⇔	⇔	October 1, each year
Outreach/Training											

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 6.6-1 – City of Elk Grove SQIP
Illicit Discharge Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
The City will continue to distribute educational materials to public, and document/quantify materials distributed	11.b.vi		Completed revisions of outreach materials (if needed) and tabulations of number of individuals that received outreach materials	Confirmation/Tabulation - The City will track number of brochures distributed	⇔	⇔	⇔	⇔	⇔	⇔	October 1, each year
Conduct annual training Re: field screening and illicit discharge response for crews	11.b.vi		Track number of employees trained (City engineers and City construction inspectors, etc.)	Tabulation - Track number of workshops held, number of people reached	⇔	⇔	⇔	⇔	⇔	⇔	October 1, each year
			Increase in awareness among employees regarding illicit discharges and connections since previous permit term	Survey - Quiz employees annually to assess changes in awareness	⇔	⇔	⇔	⇔	⇔ ③	⇔	EA due 12/13
Facilitation of Proper Household Hazardous Waste Disposal											
Continue to provide pickup services for used motor oil, and maintain satellite facilities for universal waste disposal using contract services with private hauling company			Increase in the quantities of household hazardous waste collected from public since previous permit term	Tabulation - Track amounts of HHW collected in City by hauling contractor; provide information to City for inclusion in AR	⇔	⇔	⇔	⇔	⇔ ③	⇔	October 1, each year, EA due 12/13
The City will continue to maintain operation of the City's household hazardous waste drop-off centers		✓	Increase in the quantities of household hazardous waste collected from public since previous permit term	Tabulation - The City will track amounts of HHW collected at City sites	⇔	⇔	⇔	⇔	⇔ ③	⇔	October 1, each year, EA due 12/13

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 6.7-1 – City of Elk Grove SQIP
Public Outreach Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
The activities described in this table are in addition to regional Public Outreach activities described in Chapter 2 (Section 2.6).											
Public Outreach											
Educate and inform City managers and elected officials through presentations and other means; invite to public community events	12.a.iii, b.iii		Document/quantify impressions made in annual report	Tabulation-track no. of people educated each year		⇔	⇔	⇔	⇔	⇔	October 1, each year
Update and continue to maintain stormwater web page on City's web site to educate and inform general public, advertise public reporting hotline, and provide links for resources.	12.a.iii, b.iii		Submit completed web page link with annual report.	Confirmation		♦ ⇔	⇔	⇔	⇔	⇔	Update web site during 09-10 FY and provide link with AR.
Periodically publish articles regarding stormwater pollution prevention in City newsletter or other appropriate local media.	12.a.iii, b.iii		Describe articles and provide copies with annual report	Confirmation	⇔	⇔	⇔	⇔	⇔	⇔	October 1, each year
Continue to sponsor annual Creek Week events hosted by CCSD.	12.a.i and iii, b.i and iii		Quantify waste/debris collected during cleanup events (partial measure of amount of materials prevented from polluting local creeks)	Tabulation - provide numbers in annual report		⇔	⇔	⇔	⇔	⇔	October 1, each year
			Document number of volunteers engaged in the cleanup activities	Tabulation - provide numbers in annual report		⇔	⇔	⇔	⇔	⇔	October 1, each year
Continue to promote volunteer stenciling of storm drain inlets.	12.a.i and iii, b.i and iii		Track activities along with work done by City crews during routine maintenance								
Continue to coordinate with school district to deliver stormwater message to schoolchildren	12.a.iv		Track number of students who attend classroom presentations in addition to materials distributed.	Tabulation - provide numbers in annual report		⇔	⇔	⇔	⇔	⇔	October 1, each year
Sponsor and staff stormwater booth at local community events (e.g., Western Festival, Harvest Festival, Walk on the Wildside)	12.a.i and iii, b.i and iii		Document approximate number of residents and others reached at each event; track quantities of literature distributed	Tabulation - provide numbers in annual report		⇔	⇔	⇔	⇔	⇔	October 1, each year

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 6.8-1 – City of Elk Grove SQIP
New Development Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Incorporation of Water Quality Protection Principles into Plans, Policies and Procedures											
Update stormwater quality language in the General Plan	13.a, 16		Update applicable sections of the General Plan to include stormwater quality protection principles as needed.	Confirmation – report revisions in AR	⇔	⇔	⇔	⇔	⇔	⇔	October 1,
Condition priority development projects through CEQA to include stormwater quality control measures as applicable.	13.b-d, 13.g, 21		Update list of priority development project conditioned.	Tabulation - track number of projects conditioned and report in Annual Reports.	⇔	⇔	⇔	⇔	⇔	⇔	October 1, each year
Conduct an assessment as described in the SQIP to determine the effectiveness of the program and identify any necessary modifications	13.i	✓	Track the incorporation of stormwater quality measures from the planning phase until completion of project.	Tabulation - compare # of projects that submitted Pre-Application forms to # of projects that implemented the stormwater quality measures correctly.	⇔	⇔	⇔	⇔	⇔	⇔ ③	
Development of Standards and/or Guidance											
Develop Low Impact Development (LID) design criteria	15.b		Amend development standards to require implementation of LID strategies.	Confirmation - report revisions in AR	⇔	⇔	⇔ ♦				6 months after approval of HMP.
Technical Guidance and Information for Developers	15.b, 26		Include LID criteria in the Stormwater Quality Design Manual and revise it as needed.	Confirmation - report revisions in AR	⇔	⇔	⇔	♦			6 months after amending the development standards.

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 6.8-1 – City of Elk Grove SQIP
New Development Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Develop HMP Work plan as part of the revised SQIP.	15.c		Partnership will outline the proposed steps to develop the HMP and possible technical methodologies to design the mitigation measures.	Confirmation - develop HMP work plan and pilot project. Submit work products to Regional Water Board.	⇔	♦					April 30, 2009, with this SQIP.
Develop HMP	15.c		Partnership will develop an applicability and susceptibility map showing where hydromodification management measures will apply in Sacramento. Then develop the HMP Decision Tool.	Confirmation - Submit work products to Regional Water Board **1 year** after approval of the HMP work plan.		⇔	♦				1 year after approval of the HMP work plan
Develop design criteria for hydromodification management measures.	15.c, 26		Partnership will include criteria in the Stormwater Quality Design Manual and revise it as needed.	Confirmation - report revisions in AR			⇔	♦			6 months after amending the development standards
Develop a mitigation fund if needed	19		The City will develop a mitigation fund framework to support regional stormwater projects, if needed.	Confirmation – develop framework when needed and submit to Regional Board.							
Develop a waiver program	20		The City will participate in efforts with the other permittees to develop a waiver program for the permit area, whereby project applicants may pay into an in-lieu fund when it is determined that runoff reduction and/or stormwater quality control measures are infeasible for their site.	Confirmation - develop a waiver program and describe activities in revised SQIP.	⇔	⇔	⇔	♦			

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 6.8-1 – City of Elk Grove SQIP
New Development Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Protect groundwater quality	23		Partnership will integrate restrictions regarding the use of infiltration facilities in areas of high groundwater table into design criteria.	Confirmation - identify restrictions and incorporate into the design criteria.	⇔	⇔	⇔	⇔	⇔	⇔	
Conditions of Approval and Plan Review											
Condition projects to comply with stormwater quality development standards at various stages of the approval process.	13.b-d, 13.f, 14, 15, 17		Track and record number of projects conditioned.	Tabulation - track number of projects conditioned and report in Annual Report.	⇔	⇔	⇔	⇔	⇔	⇔	October 1,
Condition projects to comply with LID requirements	15.b		Condition priority development projects to incorporate low impact development strategies.	Tabulation – track number of projects conditioned and report in Annual Report.				♦ ⇔	⇔	⇔	
Condition projects to comply with HMP requirements	15.c		Condition priority development projects located in susceptible areas to incorporate hydromodification management measures.	Tabulation – track number of projects conditioned and report in Annual Report.				♦ ⇔	⇔	⇔	
Develop a database to track priority projects that have been issued a permit to construct treatment control measures.	22		Update database of priority projects	Tabulation - track number of projects that completed the construction of treatment control measures and report in Annual Reports.	⇔	⇔	⇔	⇔	⇔	⇔	October 1, each year

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 6.8-1 – City of Elk Grove SQIP
New Development Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Conduct an assessment as described in the SQIP to determine the effectiveness of the program and identify any necessary modifications	13.i	✓	Increase in number of priority projects that incorporated treatment measures.	Tabulation - Compare # of acreage treated to total acreage developed and report in Annual Report.			③	③	③	③	
Stormwater Maintenance Agreement											
Verify maintenance of treatment measures	13.b, 13.e, 18		Require applicable developments to provide verification of maintenance provisions for post-construction structural and treatment control measures.	Tabulation and Confirmation – track number of executed maintenance agreements and report in Annual Report.	⇔	⇔	⇔	⇔	⇔	⇔	October 1, each year
Require property owners to self-certify the maintenance of the treatment measures on their sites annually			Track number of self certification requests.	Tabulation – track number of responses to self-certification requests.							
	13.i	✓	Increase awareness of proper maintenance procedures.	Tabulation - track response time to demonstrate proper maintenance.	⇔	⇔③	⇔③	⇔③	⇔③	⇔③	
	13.i	✓	Reduction of sediment from stormwater runoff treated in manufactured devices.	Quantification - track depth of sediment removed from manufactured devices.	⇔	⇔	⇔	⇔	⇔	⇔④	
Outreach and Training											

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 6.8-1 – City of Elk Grove SQIP
New Development Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Conduct outreach to the development community about the latest stormwater quality policies and requirements.	24		Continue outreach about the Planning and New Development Program Element	Tabulation - track number of revised/new materials; number materials distributed in AR	⇔	⇔	⇔	⇔	⇔	⇔	October 1, each year
	13.i	✓	Increased awareness of stormwater quality requirements and criteria.	Tabulation – Estimate raised awareness based on surveys or available research data.	⇔	⇔	⇔	⇔ ②	⇔	⇔	
Provide annual training to employees in targeted positions.	13.h, 25		Conduct annual refresher training to required staff.	Tabulation – track number of employees trained and report outcome in the Annual Report.	⇔	⇔	⇔	⇔	⇔	⇔	October 1, each year
	13.i	✓	Increase awareness of targeted employees about stormwater quality requirements.	Tabulation – Estimate raised awareness based on surveys or available research data	⇔	⇔	⇔	⇔ ②	⇔	⇔	

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Chapter 7

City of Folsom Stormwater Quality Improvement Plan

7.1 Introduction

The Folsom Stormwater Quality Improvement Plan (SQIP) provides information about the City's Stormwater Management Program, including a description of activities conducted to ensure compliance with the Sacramento Areawide NPDES Municipal Stormwater Permit (Stormwater Permit), of which Folsom is a permittee. The city-specific activities described in this chapter are conducted in addition to the regional activities implemented jointly with the other permittees as described in Chapter 2. The required certfication for the SQIP is presented at the front of the entire SQIP document.

Background

Folsom became a permittee to the Stormwater Permit when it was first issued in 1990 and has been an active partner in the Sacramento Stormwater Quality Partnership (Partnership) since that time. The Stormwater Permit is issued to Folsom and six other co-permittees (Sacramento County and the cities of Citrus Heights, Elk Grove, Galt, Rancho Cordova and Sacramento) by the Central Valley Regional Water Quality Control Board (Regional Water Board). The Stormwater Permit has been renewed three times: in 1996, 2002, and most recently in 2008 (2008-13 permit term).

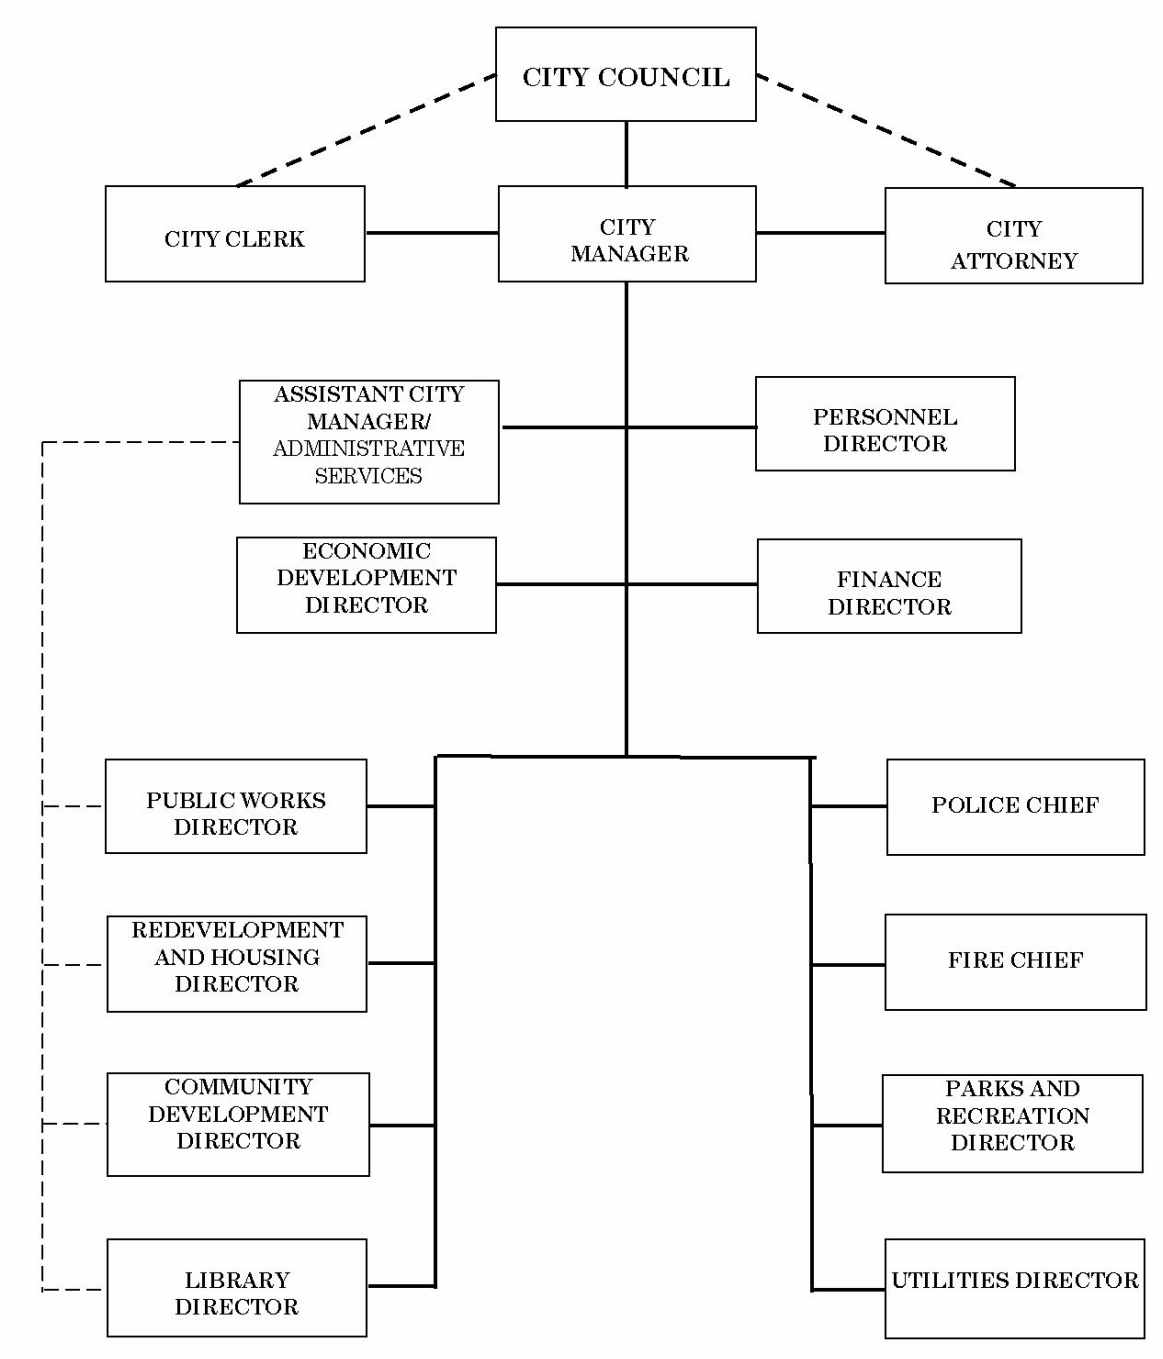
Implementation of the activities described in the SQIP is intended to satisfy the provisions of the Stormwater Permit. Those provisions were established to reduce pollutants in stormwater discharges to the maximum extent practicable and comply with receiving water objectives.

City of Folsom Characteristics

The City of Folsom (population about 72,000) is a full service City with a council-manager form of government. Major City-provided services include Public Works, Redevelopment and Housing, Community Development, Police, Fire, Parks and Recreation, and Utilities, as illustrated on Figure 7.1-1. The Stormwater Program is administered by the Public Works Department.

Folsom, rich in California gold rush history, was founded in 1856 and incorporated in 1946. Folsom lies 22 miles northeast of Sacramento along the Highway 50 corridor (see Figure 7.1-2). Folsom straddles the wooded and historic banks of the American River. Folsom Lake and Lake Natoma are at Folsom's border, offering many recreational activities.

Folsom is primarily a residential community with an abundance of parks and open space and diverse commercial and retail establishments which offer a vibrant economic center. The City is also home to several major regional employers such as Intel, Kikkoman Foods, Mercy Hospital, and Kaiser-Permanente.



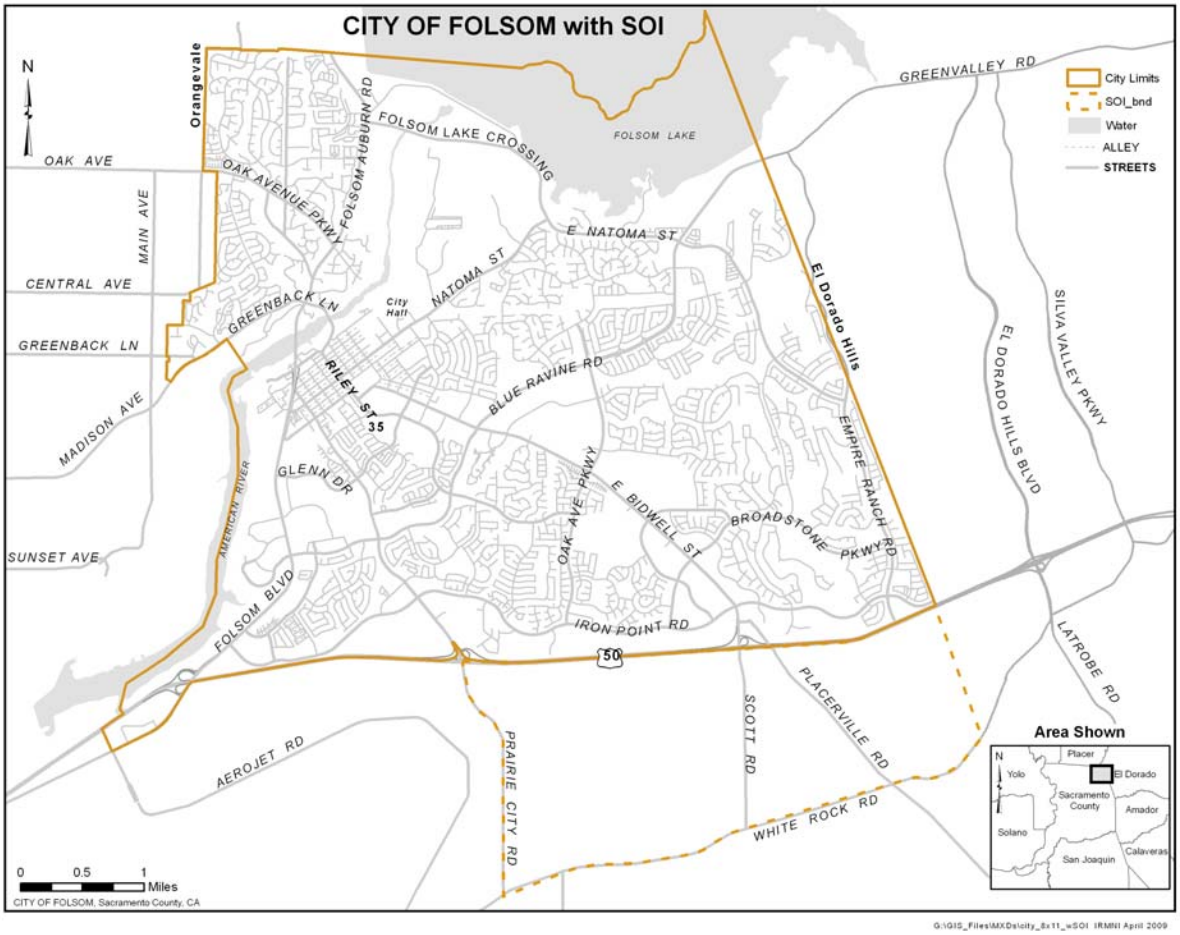


Figure 7.1-1. City of Folsom Organization Chart

Figure 7.1-2 City Map

Folsom State Prison is located in Folsom, but the City has no jurisdiction over the prison operation. The prison discharges stormwater runoff directly to the American River and wastewater is directed to the City's sanitary sewer collection system which directs wastewater to the Sacramento Area Sewer District (SASD) system and from there to the regional wastewater treatment plant in Elk Grove.

In addition to the American River, there are a number of waterways that traverse Folsom, including Hinkle, Alder, Willow and Humbug Creeks. The Willow and Humbug Creek corridor is a natural 11-mile urban parkway with connected recreational trails traversing the City. Folsom takes pride in its waterways and strives to integrate them into the community lifestyle that is uniquely Folsom. The City's stormwater web page (http://creeks.folsom.ca.us) includes a copy of the City's creek awareness brochure with an artist's graphic illustration of Folsom's creeks.

The City of Folsom Sphere of Influence, located south of U.S. Highway 50 (see Figure 7.1-2), was approved by the Sacramento Local Area Formation Commission (LAFCo) in 2001. The Sphere of Influence area is about 5.6 square miles (3,600 acres) in size. The City is proceeding with the environmental review process that is required for formal annexation. After annexation of the SOI (anticipated in 2010) the City will grow to approximately 15,470 acres in size and the population is expected to grow by about 26,500 following build out in that area.

Overview of Folsom's SQIP

This SQIP describes activities that Folsom will conduct in compliance with the Stormwater Permit. Modifications to the program may be necessary as the program evolves, and will be proposed in Annual Reports submitted to the Regional Water Board on October 1 each year.

Following this introduction, there are sections to describe activities related to seven major program elements, presented below in the order in which they appear in the Stormwater Permit:

Section 7.2: Program Management — An overview of Folsom's Stormwater Management Program, including how the program is organized, legal authority, priorities and funding, and coordination both within the City and externally with other programs and agencies.

Section 7.3: Construction Program Element —Activities designed to control the runoff of sediment and other pollutants from construction sites.

Section 7.4: Commercial/Industrial Program Element — Activities and control programs designed to reduce pollutants in stormwater discharges from priority industrial and commercial facilities and effectively eliminate non-stormwater discharges associated with these facilities.

Section 7.5: Municipal Operations Program Element — Activities designed to control stormwater pollution resulting from operation of City facilities and utilities and to set an example of model pollution prevention for the public.

Section 7.6: Illicit Discharge and Detection Program Element — Activities designed to effectively eliminate illegal non-stormwater discharges to the storm drainage system and receiving waters by the general public and facilities not addressed in Section 7.4.

Section 7.7: Public Outreach Program Element — Activities designed to raise awareness and foster community stewardship to promote pollution prevention in the urban area and protection of local creeks and rivers.

Section 7.8: New Development Program Element — Activities designed to reduce pollutants in urban runoff discharges from newly developing and redeveloping areas for the life of the project, after construction is complete.

7.2 Program Management

This section of the SQIP describes the organization, legal authority and funding arrangements for the City's program, as well as program management activities for the 2008-13 permit term to ensure continued compliance with the stormwater permit. The City's Stormwater Program Manager conducts the activities and prepares the compliance deliverables described in this plan, coordinates with internal and external groups, ensures that adequate funding and legal authority is in place, and confirms that annual employee training is conducted.

Program Organization and Staffing

The City of Folsom Stormwater Management Program resides within the Department of Public Works, and the Director of Public Works is responsible for overseeing the program and certifying all compliance deliverables. The City has designated staff in the following departments to conduct the management, engineering, planning and maintenance activities required by the Stormwater Permit:

- Department of Public Works (PW)
- Department of Utilities (UT)
- Department of Community Development (CD)
- Department of Parks and Recreation (PR)
- Department of Finance (F)
- City Attorney's Office

Table 7.2-1 summarizes the roles and responsibilities of the various City Departments for implementation of the stormwater program and also includes estimated allocation of resources for the 2009-10 fiscal year. Staff resources are shown in full time equivalent (FTE) increments. FTE staff estimates for staff in other departments related to Stormwater Permit compliance tasks are not shown on this table because these costs are not currently tracked in a separate charge/project number.

Due to the many departments involved, the City formed an intradepartmental Stormwater Committee, with at least one representative from each affected department, to ensure program success and dissemination of information. The Committee meets periodically throughout the year to discuss current issues and ensure all required activities are being performed in compliance with the Stormwater Permit and this SQIP.

Legal Authority

Legal authority for Folsom's Stormwater Management Program is provided in several ways:

- The City's Municipal Code provides the basic legal authority to implement the program and enforce the local regulations.
- The General Plan contains water quality protection policies.
- City improvement standards and other City adopted documents specify standards and specifications as needed.
- Agreements with the County and other permittees provide for a means of cost sharing to implement various portions of the program.

The City Attorney's legal certification of adequate legal authority for controlling urban runoff pollution and implementing the activities described in this SQIP is presented in Appendix 7A.

Table 7.2–1. City of Folsom Responsibilities for Compliance with Stormwater Permit

Department/Group	Responsibilities for Compliance with NPDES Stormwater Permit	FTE[1]
Public Works		
Administration/ Engineering	Administers and manages Folsom's Stormwater Management Program. Provides liaison with the Regional Water Board and coordinates regional activities with permittees and County EMD. Oversees training for targeted City employees. Conditions City projects to ensure compliance with stormwater management program. Conducts stormwater inspections (construction, illicit discharge, some commercial sites) to ensure compliance with Stormwater Ordinance.	2
Street Maintenance	Provides staff to clean storm drains, sweep streets and perform streambed maintenance each year. Provides on going maintenance of storm drainage facilities. Monitors for illegal connections and illicit discharges and is responsible for the storm drain stenciling program.	*
Utilities		
Engineering	Ensures that Utility projects and maintenance practices are incompliance with stormwater quality requirements.	*
Sewer Maintenance	Field and video inspections for illegal connections and illicit discharges, responds to spill clean ups.	*
HazMat	Responsible for the household hazardous waste collection program. Administers solid waste recycling program. Assists in enforcement and response to illicit discharges.	*
Water Conservation	Provides a variety of water efficiency services for residents and businesses to reduce water use, including more efficient irrigation practices to reduce runoff.	
Community Development		
Support Staff, Engineering and Planning	Conditions development and improvement plans, implements California Environmental Quality Act requirements and General Plan amendments, and reviews improvement plans for stormwater management program compliance.	*
Code Enforcement	Responsible for enforcement of City Code violations including Stormwater Management and Discharge Control Ordinance.	*
Building Inspection	Performs inspections and monitors for compliance of private development construction projects from the meter to the building.	*
Construction Inspection	Performs inspections and monitors for compliance of private development and major public works construction projects within the public right of way.	*
Parks and Recreation		
Planning & Maintenance	Development of park plans and trails projects consistent with stormwater management program. Optimize application of fertilizers, herbicides, and pesticides to prevent runoff.	*
Zoo Division	Maintain public education displays at zoo.	*
Fire		
	Development/rehab of fire station projects consistent with stormwater management program. Ensures that permit provisions related to emergency and non-emergency fire fighting flows are addressed. Responsible for response to hazardous and after hour illicit discharges.	*
Finance		
	Provides budget support and assists with the Stormwater Program Funding Project.	*
City Attorney's Office		
	Answers legal questions posed by Stormwater Program, interprets regulations, prepares and reviews agreements, possible future changes to SW Ordinance, etc.	*

[1] FTE: Full Time Equivalent, based on 2080 hours per year. Capital/operating costs are not included.

*Time spent by staff in other departments on Stormwater Permit compliance tasks is not currently tracked in a separate charge/project number.

City Codes

The City of Folsom Municipal Code and adopted ordinances form the basis for the legal authority for Folsom's Stormwater Management Program. The Folsom Municipal Code can be accessed at:

http://www.folsom.ca.us/government/default.asp

The predominant municipal code provision is in Title 8 - Health, Sanitation and Welfare, Chapter 8.7 - Stormwater Management and Discharge Control (also know as the "Stormwater Ordinance"). It prohibits most non-stormwater discharges and lists non-stormwater discharges conditionally allowable (e.g., flows from emergency fire-fighting activities) pursuant to NPDES federal regulations. The Stormwater Ordinance provides legal authority to Folsom and Sacramento County for inspections and enforcement related to control of illicit (unauthorized non-stormwater) discharges to the City storm drainage system and local creeks. In addition, the ordinance provides legal authority to Sacramento County (Environmental Management Department) +to conduct stormwater compliance inspections and enforcement at many types of industrial and commercial facilities in Folsom..

A number of other code sections also provide Folsom with additional legal authority. Those include:

- Title 1 General Provision - Chapter 1.08 Enforcement of Folsom Municipal Code and other Applicable Laws, Chapter 1.09 Administrative Violations and Administrative Enforcement Procedures, Chapter 1.10 Additional Remedies.
- Title 9 Public Peace, Morals and Safety – Chapter 9.34 Hazardous Materials Disclosures.
- Title 12 Street and Sidewalks – Chapter 12.20 Use of City Property (encroachment requirements and watercourse protection).
- Title 13 Water and Sewer – Chapter 13.16 Septic Tanks, Cesspools and Privies – Definition, Chapter 13.20 Septic Tanks, Cesspools and Privies – Regulations.
- Title 14 Building and Construction – Chapter 14.29 Grading (drainage plans, erosion control and flood prevention), Chapter 14.33 Hillside Development Standards.

General Plan

The City of Folsom adopted its General Plan in 1988 and has had a number of subsequent amendments. A copy of the current General Plan can be found in Appendix 7B.

The General Plan is the long-term policy guide for the physical, economic, and environmental growth of the City. It is composed of goals, policies, and implementation programs, all based on an assessment of current and future needs and available resources. The General Plan contains the provisions that lay the framework for protection of water quality and implementation of the Stormwater Management Program. The adopted General Plan policies that apply to the Stormwater Management Program are listed by Element as follows:

Land Use Element

Policy 1.9 — "Development proposed along streams shall be in conformance with a comprehensive development and management plan to be prepared for stream waterbeds prior to project approval."

Policy 2.2 — "The City will prepare area or specific plans as appropriate to further refine the standards and regulations for development."

Open Space and Conservation Element

Policy 25.1 — "The surface and groundwater quality of Folsom shall not be degraded from City Standards."

Policy 28.2 — "The quality and quantity of surface water runoff from a property shall not exceed existing flows or existing quality or shall comply with City standards for off-site drainage. The City shall implement a surface-runoff water quality monitoring program to insure compliance with City standards."

Safety Element

Policy 29.3 — "The City shall develop standards for building within the 100 year floodway to assure that the water flows above stream and downstream from a property will not be altered from existing levels."

Public Facilities Element

Policy 40.2 — "The City shall require the preparation of a facilities plan for an identified area…"

Policy 40.3 — "An area facilities plan shall include, but not be limited to the following:

1) A statement of the plan's consistency with the Folsom General Plan and the City's Urban Development Policy.

2) Identification of the nature and extent of facilities necessary to serve the area and a schedule of estimated time within which facilities must be constructed…"

In addition to Folsom's General Plan policy requirements which address protection of water quality, the City may require Area, Specific or Facilities Plans for each new development that directly address drainage and water quality issues. These documents discuss the NPDES permitting requirements and the City of Folsom's Stormwater Management Program. Each development must identify how it intends to be in compliance and describe mitigation measures it will take if it cannot comply. Typical drainage plans minimize the total amount of additional surface runoff and limit the flows released to existing pre-development levels. Other mitigation measures usually include stormwater quality control measures such as detention basins, channel protection, and maintenance plans. Temporary construction best management practices (BMPs) such as erosion and sediment controls, are also required.

Standards

Folsom's *Design and Procedures Manual* and *Improvement Standards and Standard Construction Specifications* (including Standard Construction Drawings) are applicable to all projects citywide, private or public. See Section 7.8 for more details.

The City uses the County's erosion and sediment control standards and specifications; see Section 7.3 for more information.

Guidance for design, construction and maintenance of post-construction stormwater quality control measures is provided in the *Stormwater Quality Design Manual for Sacramento and South Placer Regions*. The City of Folsom was an active participant in the interagency steering committee that produced this document in May 2007. In addition, the City requires a standard maintenance agreement to ensure long term maintenance of post-construction stormwater quality treatment facilities. See Section 7.8 for additional details.

Funding

Revenue for administrating Folsom's stormwater program are derived from many different City sources. Since the City does not have a separate stormwater utility fee like some of the other permittees, it must rely on a combination of General Fund revenue, special revenue and miscellaneous fees. General Fund revenue derives primarily from property and sales taxes. Special revenue and miscellaneous fees include development impact fees, park development fees, and other capital project revenue. Other possible sources of funding include sewer, water and solid waste utility funds.

Portions of these revenues pay for staff positions responsible for conducting activities in compliance with the Stormwater Permit.

During the 2008-13 permit term, the City will continue working towards establishment of a dedicated funding source for stormwater services, including NPDES permit compliance and operation and maintenance of the storm drain system. The challenges in this endeavor are the Proposition 218 restrictions[1] and the need for property owner approval of any new stormwater management-related fee. Over the last few years, other cities in California have tried to set up such a fund and failed due to lack of public support. The City completed an initial funding feasibility study, further studies and a strategy for implementation are still needed. The City is waiting for the state of the economy and its own budget situation to improve to move forward.

Implementation Priorities

Folsom's SQIP sets out the basic goals and activities for the program, with the ultimate goal being protection of water quality and compliance with the stormwater permit by implementing a program to reduce pollutants in urban stormwater discharges to the maximum extent practicable (MEP). For the most part, what constitutes "MEP" is defined by the activities (e.g., "performance standards") established by the stormwater permit.

In areas of the permit where the level of effort is not prescribed, the definition of MEP can vary slightly from year to year based on various factors, some of which (e.g., natural disasters, extreme flood events) are outside the City's control. Program priorities are also influenced by the amount of time and resources needed to respond to the public, environmental groups, and regulatory agencies on various issues of concern. These response activities are impossible to predict, but become a top priority for the City.

The City evaluates priorities each year as part of its budgeting process. Prioritized activities are proposed in the Work Plan for the coming fiscal year, which is submitted to the Regional Water Board on May 1 each year. Priorities and associated activities are then finalized before the start of the fiscal year on July 1.

In the Annual Report (due October 1 each year), the City reports on its ability to meet its goals and stated priorities for the reporting fiscal year.

Training for City Staff

The City provides training for the City stormwater construction inspector, as well as planning, maintenance, engineering, construction and development staff from the various departments listed on Table 7.2-1. All affected City staff and contractors are regularly informed and updated concerning the Stormwater Permit and its impacts on their positions and responsibilities. City specifications require contractors to provide their own training.

The following compliance areas are covered in annual refresher training:

Construction Element

Main Objective: To promote proper use of erosion and sediment control and other construction-related pollution prevention for private and City-owned construction projects.

[1] The general intent of Proposition 218 – passed by the voters of California in 1996 - is to ensure that all taxes and most charges on property owners (including fees for stormwater pollution control services) are subject to voter approval. http://www.lao.ca.gov/1996/120196_prop_218/understanding_prop218_1296.html

Targeted employees: Public Works and Community Development staff responsible for permit approval, stormwater pollution prevention plan (SWPPP) and erosion control plan review, and construction and stormwater compliance inspections.

Municipal Operations and Illicit Discharge Elements

Main Objective: To promote a clear understanding of the potential for maintenance activities (including vehicle wash water) to pollute storm water, and identify and select appropriate BMPs. Courses will include training on identification, investigation, termination, cleanup, and reporting of illicit connections and discharges.

Targeted employees: Public Works (Streets and Drainage), Utilities (Sewer/Water), Parks, Fire and Police Department staff responsible for road and street maintenance, facility maintenance, maintenance yard, park maintenance, design, construction and maintenance contract oversight, storm drain system maintenance, vehicle and equipment maintenance, pesticide application and material and waste management.

New Development Element

Main Objective: To educate and inform about the various departments' roles in implementing the City's development standards applicable to stormwater quality control measures to prevent pollution, reduce runoff and treat runoff. The standards apply to both private and City-owned development projects.

Targeted employees: Public Works, Community Development, Parks and Fire Department staff responsible for design/redevelopment of City-owned facilities, and review and approval of private new development and redevelopment projects.

Training courses will generally cover the following topics:

- General stormwater/urban runoff quality awareness objectives: where runoff goes, how it becomes polluted, and how to prevent pollution.
- Background regulatory information appropriate to the audience.
- Information about enforcement and penalties appropriate to the audience.
- How to report/refer observed problems in the field.
- Public outreach materials that can be distributed by City crews to the public, and how to refer the public to stormwater program staff for answers.

Training accomplishments will be documented in the Annual Reports.

Recordkeeping and Reporting

The City's stormwater program staff maintains NPDES Stormwater Permit compliance files in the Public Works Department, including all documentation necessary to demonstrate compliance with the permit. As required, the City retains copies of all records and reports from the date of generation for at least five years.

The City prepares and submits the following documents to the Regional Water Board each year, in compliance with the Stormwater Permit:

- Annual Work Plan (May 1) – describes proposed activities and budget for coming fiscal year (July 1 – June 30).
- Annual Report (October 1) – describes activities conducted during the previous fiscal year, including compliance with performance standards and the Stormwater Permit. Proposes revisions to the SQIP, if needed.

Records and data are collected from all responsible City departments and groups each summer to prepare the Annual Report. Other groups (e.g., County EMD) will assist in compiling and describing information for the activities it conducts on the City's behalf.

Coordination with Other Agencies and Programs

Sacramento Stormwater Quality Partnership

As described in Chapter 2, Section 2.2, the City is a party to the Partnership's memorandum of understanding (MOU) which describes cost sharing arrangements for support of regional program activities which benefit all permittees. In addition, Folsom participates in regular (approximately bimonthly) Steering Committee coordination meetings to discuss topics such as:

- Implementation of regional program activities (described in Chapter 2 of this plan), such as monitoring, target pollutant reduction and regional public outreach.
- Status of consultant contracts and work products.
- Funding of mutually beneficial activities conducted by others, such as the Brake Pad Partnership and the development of CASQA statewide BMP handbooks.
- Overall program evaluation and effectiveness assessment.
- Proposed modifications to the SQIPs and/or Stormwater Permit.
- Regulatory changes/evolution and potential impacts to the Partnership and individual permittees.

Outside Agencies

The City coordinates with various local and regional agencies (over which it lacks jurisdictional control) in order to ensure City-wide compliance with the Stormwater Permit:

- Sacramento Regional County Sanitation District (SRCSD) - owns and operates the interceptor collection system and wastewater treatment plant, to which the City's sanitary sewage is delivered
- Regional Transit - owns and operates the Light Rail spur in Folsom and one of the park and ride lots
- Folsom Cordova Unified School District - owns and operates various schools in the City (see list in Section 7.7) and will construct new schools in the future
- El Dorado and Placer County - neighboring counties which are not permittees to the Sacramento municipal stormwater permit
- US Bureau of Reclamation (USBR) - owns the American River Parkway and lower portion of Alder Creek
- California State Parks - contracted by USBR to manage open space and park lands
- Sacramento Municipal Utility District (SMUD), Pacific Gas & Electric and other local utilities - own private utilities in the public right of way and have maintenance easements to repair/replace facilities as needed
- Caltrans - owns and maintains several Hwy 50 interchanges and will work with City in the future to construct new interchanges to service the SOI area

Other Stormwater Programs in the State

The City supports coordination and networking with other stormwater programs within California in order to share information and identify opportunities to work together. This City is a member of the California Association of Stormwater Quality Agencies (CASQA) and attends annual conferences and general meetings whenever possible.

Activities for 2008-13 Permit Term

Table 7.2-2 at the end of this chapter summarizes the activities that will be conducted for this program element during the 2008-13 permit term, along with associated performance standards, effectiveness assessment methods and a five-year implementation schedule. The table was developed to demonstrate compliance with various provisions of the Stormwater Permit, as indicated on the table.

This section describes the planned activities in more detail.

Legal Authority

Update Codes and Standards As Needed

The City will amend its Stormwater Ordinance if necessary to reflect changes in the program within one year of the Regional Water Board's approval of the SQIP, as required by the Stormwater Permit. The City will also adopt needed changes to the Standard Construction Specifications and the Design and Procedures Manual, as well as the *Stormwater Quality Design Manual for Sacramento and South Placer Regions* (see Section 7.8 for more details).

Incorporate Water Quality Principles into General Plan Update

The City anticipates updating its General Plan starting with a visioning process during the 2008-13 permit term. Water quality and watershed protection principles will be incorporated as appropriate (see Section 7.8).

Update Agreements As Needed

The City will sign the updated Sacramento Stormwater Quality Partnership MOU that outlines joint responsibilities, cost sharing based on Sacramento Area Council of Governments (SACOG) population data, decision making, and information management and reporting. Refer to Chapter 2, Section 2.2 for more information and a reference to the appendix.

Funding

Annual Planning and Reporting

Each year, through the City budgeting process, a fiscal analysis will be performed to ensure resources are available and allocated to carry out the proposed activities necessary for Stormwater Permit compliance. This analysis will consist of detailing program costs, percentage expenditures by program, anticipated staff time, resource type, and funding and any associated restrictions on the use of the funds.

Fiscal information will be reported in the Annual Work Plans (May 1) and Annual Reports (October 1).

Stormwater Fee

The City will continue working towards securing new sources of dedicated funding for its Stormwater Management Program. As mentioned earlier, the City is waiting for the state of the economy and its own budget situation to improve before moving forward.

Training

Training is an extremely important aspect of Folsom's Stormwater Program and annual refresher training for all affected City staff will continue as in previous years for targeted employees. Details about the training were presented previously in this section. Sections 7.3-7.8 describe training activities planned for the individual program elements. Each year, training accomplishments will be described in the October 1 Annual Reports.

Reporting

Compliance Reporting

As required by the Stormwater Permit, the City will submit an Annual Report by October 1st of each year detailing the activities accomplished during the previous fiscal year (July 1 -June 30). The report will be prepared using a standardized reporting format consistent with the other permittees.

By May 1st of each year, Folsom will submit an Annual Work Plan that details the activities proposed for the following fiscal year.

The City and County of Sacramento will take the lead on behalf of the Partnership in submitting Regional Program Work Plans and Annual Reports to describe regional program activities such as monitoring conducted jointly by all the permittees. Refer to Chapter 2 for additional information.

The City and County of Sacramento will also take the lead in preparing the Report of Waste Discharge (ROWD) for submittal to the Regional Water Board in March 2013. The City will participate in that process and will prepare an updated SQIP for submittal with the ROWD, as required by the Stormwater Permit.

Internal Reporting

The City's Stormwater Program Manager will keep Folsom elected officials and managers apprised of Stormwater Program activities and issues through written memos and submittals, and presentations as needed.

Coordination

The City of Folsom will continue to work closely with the other permittees and agencies involved or affected by the various stormwater activities. This will include attendance at Steering Committee meetings held approximately monthly (see Chapter 2, Section 2.2). The City will also continue to participate with other permittees on various committees that have been formed to address specific activities, such as target pollutants and monitoring (see Chapter 2).

Coordination efforts with other agencies (previously listed in this section) will continue during the current Stormwater Permit term, as needed when multi-jurisdictional issues arise, such as on development projects.

Internal city coordination will also be conducted to ensure all necessary City staff, management and elected officials are aware of Stormwater Permit requirements and related program efforts. Periodic meetings will be held with the Intradepartmental Stormwater Committee to share information and guide the decision-making process.

Effectiveness Assessment

The City will work with the other permittees to assess the effectiveness of the overall stormwater program as described in Chapter 2, Section 2.3. This approach is based on guidance provide by CASQA in its *Effectiveness Assessment Guidance* document (2007). In addition, the City will evaluate the effectiveness of its own program management activities related to permit compliance, as described in Table 7.2-2. This assessment will be done each summer during preparation of the annual report, and recommendations for program improvements or modifications will be made based on the results.

For this program management element, most activities have Level 1 effectiveness outcomes; this requires annual documentation that activities have been conducted as required by the stormwater permit. Level of effort (e.g., number of meetings attended) and resources expended (staff hours or costs) may also be tracked (also outcome level 1). The exception to this is training. During the 2008-2013 permit term, the City (or the County, on the City's behalf) will use quizzes, surveys and/or follow-up meetings with selected groups to assess the knowledge level of trained staff with a goal of increasing awareness (outcome level 2).

The City will contribute resources (per the permittee cost-share MOU) to the long term effectiveness assessment required by the stormwater permit (due with ROWD in March 2013).

7.3 Construction Program Element

The mission of the Construction Program Element is to prevent erosion and reduce pollutants in stormwater runoff from construction activities in Folsom.

Folsom places a high emphasis on reducing pollution of stormwater runoff due to construction activities, as a means of protecting the community's valuable creek and river resources. Some areas undergoing development in the city are on slopes and hillsides, and are therefore very susceptible to erosion during rain storms. Controlling erosion reduces the potential for discharge of sediment and other construction-related pollutants to the City's storm drain system and local creeks, to the maximum extent practicable.

Construction Element Strategy

The City has established ordinances that provide the authority necessary for the city inspectors to address threatened and actual discharges of pollutants from construction operations. With this as a foundation, the City's strategy for controlling pollution from construction sites relies on three basic components: plan review and permitting, inspection and enforcement and outreach and education.

The program applies to private as well as public construction projects, including those required to obtain coverage under the State's NPDES Construction Stormwater General Permit. For the most part, the focus for inspection and enforcement activities is on land disturbing activities of one acre or more. However, smaller sites must comply with the City's Grading and Stormwater Ordinances (discussed in Section 7.2).

Intra and Interagency Coordination

Most interdepartmental coordination (between Public Works and Community Development) related to stormwater quality controls for construction projects is done on an informal basis through written correspondence and regular meetings related to specific projects. The City has a full time Stormwater Pollution Prevention Inspector that works directly for the City's Stormwater Program Manager, this arrangement is very effective and reduces the need for much intradepartmental coordination in terms of inspection.

The City coordinates with the other permittees as much as possible to present a consistent, uniform message to the construction and development communities, since construction work is often multi-jurisdictional. For example, the City utilizes the same erosion and sediment control standard construction specifications as the County.

The City assists the Regional Water Board in its enforcement of the Construction General Permit by enforcing compliance with comparable local ordinances, verifying NOI filings, spot checking State-required Stormwater Pollution Prevention Plans (SWPPPs,) and referring site operators who have not complied with the State regulations.

Accomplishments to Date

Folsom has made several notable accomplishments related to the construction element:

- Assigned a dedicated inspector solely for stormwater inspection and compliance issues. Other city construction and building inspectors refer stormwater issues to him for follow-up inspections and enforcement action as needed.
- The City's Stormwater inspector became a Certified Erosion, Sediment and Storm Water Inspector™ in 2008.

- Created a database to track all active construction sites and associated inspections and enforcement actions.
- Adopted Sacramento County's standard drawings for erosion and sediment control to promote areawide consistencyy, and informed local Folsom development/construction community during project-specific reviews.
- Developed and implemented procedures to require proof of Notice of Intent (NOI) to comply with the State's Construction General Permit as a condition of obtaining grading permits for applicable projects.

Activities for the 2008-13 Permit Term

Table 7.3-1 at the end of this chapter summarizes the activities that will be conducted for this program element during the 2008-13 permit term, along with associated performance standards, effectiveness assessment methods and a five-year implementation schedule. The table was developed to demonstrate compliance with Provision 8 of the Stormwater Permit.

This section describes the planned activities in more detail.

Legal Authority

The Folsom Municipal Code contains three ordinances that relate to stormwater enforcement, as discussed in Section 7.2: Stormwater Management and Discharge Control, Grading, and Hillside Development ordinances. These ordinances provide the legal authority to enforce standards and conditions and ensure that unauthorized non-stormwater discharges are prevented to the maximum extent practicable.

Following adoption of the new State NPDES Construction General Permit (anticipated 2009), the City will work with the County and other permittees to evaluate any necessary changes to this element and related codes and standards, to promote consistency. The City will also consider revisions to its legal authority whenever the County of Sacramento revises its legal authority, since the City's stormwater ordinance was modeled after the County's.

Plan Review and Permitting

The City's Grading Ordinance (FMC 14.29) requires a grading permit and erosion and sediment controls on all private projects, disturbing 5,000 square feet or more or exceeds 50 cubic yards or more of fill. All private and public projects are subject to the City's Stormwater Ordinance (FMC 8.70), which prohibits the discharge of sediments and other construction-related pollutants to the City storm drainage system.

Engineers and planners in the City's Community Development Department receive, review and approve all grading permit and building permit applications. The planning staff check that all environmental permits are obtained from agencies such as Department of Fish and Game (1600 series permit), US Army Corps of Engineers (404 permit) and the Regional Water Board (401 Certification). Plans are routed to the Public Works Department for verification that erosion and sediment controls are specified in the plans.

Private and public projects in Folsom disturbing one or more acres of land are required to obtain coverage under the State's Construction General Permit, in addition to satisfying all applicable local permitting requirements. Prior to issuing a grading permit, the City will verify that a State-required NOI was filed and will check the SWPPP for six items required by Provision 8.b.v.a of the Stormwater Permit. The City will track grading permits using an electronic database. This is a continuation of activities conducted during the 2002-07 permit term.

Inspections and Enforcement

The Community Development Department Inspectors are responsible for day-to-day enforcement at project sites and the Public Works Department stormwater inspector is responsible for enforcing the City's erosion and sediment control requirements and the Stormwater Ordinance. The two groups of inspectors work together, referring issues to each other and conferring as needed until resolution is reached. Projects are inspected to ensure compliance with local ordinances, verify that sites adequately address erosion, sediment, and pollution control, and ascertain that SWPPPs and monitoring plans are on-site and updated for applicable projects. The City stormwater inspector will give verbal warnings and issue notices of non-compliance. If response is not effective, the inspector will refer cases to the Code Enforcement Division, which is charged with enforcing city codes. Code Enforcement will issue non-compliance letters, initiate fines and refer cases to the City Attorney's office if needed. Violations of the City's ordinances are considered Level E violations and could include a fine up to $10,000.

As with the previous 2002-07 permit term, the City will continue to prioritize sites as either "high" or "moderate" threat to water quality and inspect according to this schedule:

- High priority sites – inspected twice monthly during the wet season (October 1 – April 30) and monthly thereafter.
- Moderate priority sites – inspected monthly throughout the year.

New projects will be assumed to be high priority until successive inspections demonstrate that they can be downgraded to moderate priority. The criteria for making this determination will include factors such as: project size, amount and nature of site activity, sensitive site conditions (e.g., proximity to a creek, steep slopes or erosive soils), and history of prior violations by the contractor(s).

Progressive enforcement action will be taken by the construction inspectors when violations of local ordinances are observed, including discharge of sediments and other construction-related pollutants to the storm drain system or local creeks. Finally, a database of active construction projects, their priorities and inspection and enforcement activities will be maintained by the City at all times.

Notifications to the Regional Water Board

If the City inspectors observe chronic (e.g., three or more) violations of the City's stormwater ordinance at a given construction site, they will notify the City's Stormwater Program Manager who will in turn notify the Regional Water Board, in compliance with the stormwater permit.

As required by the Stormwater Permit, if a contractor on a project disturbing one acre or more cannot demonstrate that the developer/owner has submitted an NOI or received a Waste Discharge Identification (WDID) number from the state, staff will notify the Regional Water Board within five business days of discovery. Non-filer referrals shall include the project location, developer, estimated project size and records of communication with the developer regarding filing requirements.

Pollution Control at City-Owned Construction Projects and Other Projects by Special Districts and Others out of the City's Jurisdiction

All City-owned construction projects will be subject to the same standards, State General Permit filing requirements and inspection frequencies as private development projects. In cases where a City project is not subject to the State General Permit, but there is a potential for stormwater pollution, a Stormwater Pollution Control Plan will be prepared and implemented.

Internal communication and training is critical to verify compliance at all city construction jobs. Interdepartmental meetings, committees and other communication forums will help ensure that standards and best available practices are followed.

The City lacks jurisdictional control over projects that may be constructed in Folsom by utilities, special districts (e.g., schools, RT, State Parks) and other agencies, and such projects are not subject to the City's plan review and permitting process. However, the projects will be subject to the City's Stormwater Ordinance. The City will coordinate with these agencies on a project basis to ensure compliance with the Stormwater Ordinance and to ensure coverage as required by the State's Construction General Permit.

Education and Training for City Personnel and the Construction Community

The City will continue to provide education and guidance to both City staff (see Section 7.2) and the local construction and development community, covering topics such as: current regulations and changes, local procedures and standards, BMPs, new technology, and inspection and maintenance practices. The City will support Partnership training events (such as pre wet season forums) for the construction community (developers, contractors, engineers, designers) as well as those hosted by local groups such as the Building Industry Association (BIA). This coordinated training helps ensure consistency for the local construction community (which works throughout the Sacramento area, across various municipal lines), promotes stronger ties with professional organizations, and is cost-effective.

Various forms of educational materials will be distributed in different methods, depending on the target audience and message. Typical formats include training workshops, brochures, and guidance documents and standards. Education will also be provided through the entitlement and plan check process, building permit process, preconstruction meetings, and inspection. Folsom will continue to contribute funding (through the cost-share MOU) for the development and production of outreach materials such as brochures for concrete and painting, printed in English and Spanish.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Table 7.3-1 describes the assessment methods the City will use to more specifically evaluate the construction program element activities during the 2008-13 permit term. The goal will be to move toward outcome levels 2 and 3 (changing awareness and behavior, respectively, of the regulated construction community) for some tasks. The remaining tasks will continue to be evaluated at outcome level 1 (documenting and confirming permit compliance).

Key indicators have been selected for various tasks to demonstrate progression towards overall stormwater program goals for this particular element. A summary of the status of key indicators will be used to assess overall program effectiveness in the annual reports.

Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

7.4 Commercial/Industrial Program Element

The mission of the Commercial/Industrial Element is to reduce the discharge of stormwater pollutants and to effectively eliminate illegal non-stormwater discharges from commercial and industrial facilities and operations in Folsom.

The goal of the Commercial/Industrial Element is to reduce the discharge of stormwater pollutants to the maximum extent practicable and to effectively eliminate illegal non-stormwater discharges from commercial and industrial facilities and operations in Folsom.

Commercial/Industrial Element Strategy

Folsom contracts with others to most effectively perform some of the activities required for this program element. The City has a MOU with Sacramento County EMD to conduct triennial inspections as required by the stormwater permit of over 300 commercial/industrial facilities in Folsom (see Table 7.4-1). The MOU authorizes trained and qualified EMD inspectors to conduct inspections and issue enforcement actions, using the legal authority provided by the City's Stormwater Ordinance. EMD also passed a fee ordinance in 2004 which authorizes the agency to recover costs from the industrial and commercial facilities inspected so that the City's other funding sources are not unduly burdened. The work performed by EMD on the City and other permittees' behalf is described in Chapter 2 (Section 2.7).

Folsom and other permittees contract with the Business Environmental Resource Center (BERC) to conduct outreach to targeted local businesses in each of their jurisdictions. This work, which is described in Chapter 2 (Section 2.7), includes maintaining and updating a database of businesses receiving the outreach materials each year.

The City itself conducts complaint-based inspections of all other businesses within the city; those activities are described in this section.

Table 7.4-1. Commercial/Industrial Facilities in Folsom Subject to EMD Inspections

Commercial/Industrial Category	No. in Folsom (2008)
Auto body shops	3
Auto repair shops	13
Auto dealers	12
Equipment rental facilities	0
Kennels	3
Nurseries	0
Retail gasoline outlets (i.e., gas stations)	15
Restaurants	249
Facilities covered by the State's Industrial General Permit	6

Total	**301**

Intra and Interagency Coordination

The City participates in periodic (approximately biannual) meetings with EMD and the other permittees to discuss the permit-required inspection program, resolve problems and identify improvements as needed. The City also takes referrals from EMD for problems observed at businesses not included on their inspection program; the City investigates these cases as described later in this section. EMD coordinates with all permittees, BERC and various business groups and trade associations during the course of implementing the program.

The City coordinates with BERC and EMD to develop policies and outreach material that is regionally applicable. The City coordinates with EMD on inspections that require further investigation, provides support for progressive enforcement and for follow up and enforcement for facilities referred by EMD that are not within EMD's MOU to inspect and enforce.

Accomplishments To Date

The County EMD program was the recipient of two awards for outstanding program implementation: the CASQA 2007 Excellence Award and the U.S. EPA 2008 Industrial Stormwater Program Excellence Award. Other accomplishments are noted in Chapter 2 (Section 2.7).

Activities for the 2008-13 Permit Term

Table 7.4-2 at the end of this chapter summarizes the activities that will be conducted for this program element during the 2008-13 permit term, along with associated performance standards, effectiveness assessment methods and a five-year implementation schedule. The table was developed to demonstrate compliance with Provision 9 of the Stormwater Permit. This section describes the planned activities in more detail. Some activities are conducted by the County EMD and BERC on the City's behalf. Refer to Chapter 2 (Section 2.7) for additional details about those regional activities.

Legal Authority and Enforcement Policy

The City's Stormwater Ordinance will continue to provide legal authority to the County EMD for regulating commercial businesses and industries in Folsom with respect to stormwater pollution. The Stormwater Ordinance and EMD's Fee Ordinance will be amended as needed during the 2008-13 permit term.

EMD has developed a progressive enforcement policy to apply to its work; see Chapter 2, Section 2.7. The enforcement policies for the City related to inspections of businesses not addressed by EMD are covered in the Folsom Municipal Code, Title I, Chapter 1.08.

Priority Industry Identification for Compliance Inspections

The nine categories of industrial and commercial businesses subject to stormwater compliance inspections for the 2008-13 permit term were specified by the Regional Water Board in the stormwater permit. These are the same business categories that were targeted during the 2002-07 permit term, although ownership and status has likely changed for some of the facilities.

Triennial Industrial Stormwater Compliance Inspections

Refer to Chapter 2 (Section 2.7) for EMD's continued activities related to inspections, enforcement, database management and reporting, and education/training. EMD refers significant violations of the Folsom stormwater ordinance and potential general permit non-filers to the Regional Water Board as required by the stormwater permit.

Complaint-Based Stormwater Compliance Inspections

The City Public Works Department stormwater inspector will inspect other businesses not addressed by EMD's program described above within the City of Folsom on a complaint basis. Complaints can be referred by the public, other City agencies and departments, the Regional Water Board, and other sources. The inspectors will refer to EMD any complaints related to businesses included in the triennial inspection program. All other complaints will be investigated, and associated progressive enforcement will be conducted to ensure that the stormwater pollution problem(s) are eliminated.

The City will distribute educational materials during these inspections and will keep a database for annual reporting purposes.

Educational Outreach for Businesses

The businesses to receive targeted outreach were initially identified during the 2002-07 permit term and have since been refined as listed below. Businesses in these priority categories are considered potential temporary or intermittent sources of unauthorized non-stormwater discharges and/or stormwater pollution. Most of the businesses are mobile operations without a single base of operation, so they are difficult to track.

- Automotive washing and detailing businesses
- Carpet cleaning businesses
- Commercial pesticide applicators
- Concrete contractors
- Concrete cutting contractors and businesses
- General building contractors
- Landscape installation contractors and maintenance businesses
- Painting contractors
- Portable toilet rental businesses
- Pressure washing businesses
- Street sweeping businesses
- Swimming pool contractors
- Swimming pool maintenance businesses

Refer to Chapter 2 (Section 2.7) for a description of activities that will be conducted by BERC (under contract to the Partnership) to outreach to these businesses during the 2008-13 permit term.

Training for Industrial Inspection Staff

Refer to Chapter 2 for a description of training provided to EMD industrial inspection staff. The City's stormwater inspector and Hazmat personnel will continue to receive annual refresher training as described in Section 7.2.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Table 7.4-2 describes the assessment methods the City will use to more specifically evaluate the commercial/industrial program element activities it conducts during the 2008-13 permit term. Chapter 2 (Section 2.7) describes the assessment activities to be conducted on the City's behalf by EMD or BERC. The goal will be to move toward outcome levels 2 and 3 (changing awareness and behavior, respectively, of the regulated community) for some tasks. The remaining tasks will continue to be evaluated at outcome level 1 (documenting and confirming permit compliance).

Key indicators have been selected for various tasks to demonstrate progression towards overall stormwater program goals for this particular element. A summary of the status of key indicators will be used to assess overall program effectiveness in the annual reports.

Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

7.5 Municipal Operations Program Element

> The mission of the Municipal Operations Element is to reduce stormwater pollution resulting from the construction, operation and maintenance of City-owned facilities in a manner that sets an example of model pollution prevention for the Folsom community.

The Municipal Operations Element specifies activities for controlling stormwater pollution which may occur during operation of city-owned facilities in Folsom. These include public buildings, parks and open space, the City corporation yard, transportation facilities, storm drains and drainage ways, the sewer collection system and pump stations, and the water distribution system and water treatment plant. The City is not responsible for facilities and operations managed by special districts (e.g., school district) and federal and state facility operators (e.g., Bureau of Reclamation, Folsom State Prison).

Municipal Operations Element Strategy

The City's strategy for controlling stormwater pollution from City facilities and operations involves maintaining a good inventory of the operations, training affected employees, and ensuring good communication/coordination between City departments and with contractors to provide technical assistance, evaluate program effectiveness, and resolve issues in a collaborative way.

These combined efforts help ensure that City designers, contract administrators, and operations and maintenance staff understand, implement, and demonstrate compliance with the Stormwater Permit in order to reduce stormwater pollution to the maximum extent practicable.

Inventory of Folsom's Facilities and Operations

The following is an inventory of the City-owned facilities and operations addressed by this element:

Buildings and Yards

Buildings – The City owns and operates City Hall, the Folsom Library, Folsom Police Department, four fire stations, a Senior Arts and Cultural Center, Folsom Community Center, Folsom Rotary Club House, and the R.G. Smith Club House. Various City departments manage these facilities. Building and parking lot maintenance is conducted by city personnel and contractors.

Corporation and Maintenance Yards – The City's main corporation yard is used by the Departments of Public Works and Utilities. It includes various buildings (offices, storage buildings and maintenance shops), a wash rack, and is covered by an NPDES Industrial Stormwater General Permit enforced by the Regional Water Board. The City Parks Department also owns and operates two maintenance yards (Kemp and Rodeo Park). A stormwater pollution prevention plan has been prepared to address stormwater pollution prevention at the Kemp facility, but one is not required for Rodeo Park because there is no potential for pollutants to enter the storm drain system at this location.

Parks and Recreational Facilities and Open Space

City parks and recreational facilities – The City Parks and Recreation Department operates and maintains 38 parks in Folsom (including vegetation and waste management). The City also owns and manages several recreational facilities with outdoor spaces, including the Folsom Sports Complex, Aquatic Center, Folsom Zoo and Dan Russell Arena.

Trails and Open Space – The City of Folsom has an extensive system of Class I Bike / Pedestrian trails. There are approximately 32 miles developed and available to enjoy. The trails are primarily along Humbug Creek and Willow Creek. Collectively this part of the trail system is referred to as the Humbug-Willow Creek Trail (HBWC). There are several other significant trails within the system including the Folsom Rail Trail (along Folsom Boulevard), the Folsom Lake Trail (to connect to El Dorado Hills and Lake Natoma), and the Oak Parkway Trail. There is approximately 4,200 acres of open space in Folsom which includes, federal and state property as well as parks. Approximately 1,100 acres of this open space is managed by the City of Folsom.

Parking Lots

City-owned parking lots – The City owns several parking lots amongst the various departments and City facilities (i.e., parks and recreation facilities, fire, police, light rail park and ride lots, City Hall, and three public parking lots, one of which is the City's new Historic District parking structure). Most parking lot maintenance is conducted by the department which manages the facility. In some cases the Public Works Department provides parking lot sweeping for other department's facilities.

Storm Drain System

The City's Public Works Department plans, constructs, operates and maintains the various components of the City storm drain system:

Piped storm drain system – In fall 2006 there were 178 miles of piped storm drain in the city. Due to new development, there are new facilities being added all the time. The Annual Reports will provide an updated inventory each year. Storm drain pipe and associated drain inlets and manholes in the city are maintained by the City's Public Works Department.

Storm drain inlets – There are about 5276 storm drain inlets and 3652 manholes within the city's public property and ROW. Due to new development, there are new facilities being added all the time. The Annual Reports will provide an updated inventory each year. All private and public storm drain inlets in the city are required to be marked with "No Dumping-Drains to Creek" messages. City maintenance crews check the City-owned drain inlets during routine maintenance activities and replace any found to be damaged or missing. New storm drain inlets installed in the city as part of development projects are required to have a permanent "No Dumping" message; this is verified by the city inspectors during construction.

Channels and creeks – Almost 23 miles of manmade drainage channels and natural creeks are maintained by the City. This includes portions of Willow, Humbug, Alder and Hinkle Creeks, and various unnamed tributaries.

Detention basins –There are about 61 water quality and/or flood control detention basins located throughout the city. Additional basins and other types of stormwater quality control measures are expected in the future, due to new development. The Annual Reports will provide an updated inventory each year. The basins are operated by either a private property owner, homeowners' association or the City.

Sanitary Sewer Collection System

The City's Department of Utilities is responsible for managing and maintaining the City's sanitary sewer (wastewater) collection system, which ultimately discharges into the Sacramento Regional County Sanitation District interceptor sewer system. Wastewater is then carried to the Sacramento Regional Wastewater Treatment Plant in Elk Grove for treatment.

The Utilities Department's Waste Water Division inspects, cleans, repairs and maintains the 267 miles of pipeline and 9 lift stations in the City of Folsom. The City's sanitary sewer collection system is covered by an individual NPDES Permit.

Water Supply System

The City's Department of Utilities manages the City's water supply system. The City's Water Division inspects, repairs and maintains 250 miles of pipelines, 10 water storage reservoirs, 20 pressure reducing valve stations, and its own Water Treatment Plant.

Transportation Facilities

Streets, Signals, Signs and Streetlights – The City's Public Works Department plans, constructs and operates the City's road system. There are about 260 miles of streets in the City, including over 420 curb miles of curbed streets. The City coordinates with Caltrans on new construction or improvements to Highway 50 interchanges, and with Regional Transit on Light Rail extension and improvement projects. The City also owns and operates 4 major bridges: Folsom Lake Crossing, Rainbow Bridge, Orangevale Bridge and Lake Natoma Crossing.

Roads and Roadside Vegetation - About 67 miles of roadside vegetation is maintained by the City Public Works Department and approximately another 40 acres of right-of-way landscape is also maintained by the City Public Works Department. Also, in the City of Folsom, there are 23 Landscaping and Lighting (L&L) Districts. In these Districts, the City maintains and services the public improvements; such improvements generally consist of landscape corridors and median islands as well as streetlights. In some instances, L&L Districts maintain walls, fences, open space areas, and/or other public improvements such as art work.

Intra and Interagency Coordination

Internally, Public Works coordinates with the Community Development, Utilities and Parks Departments and Lighting and Landscaping District on specific projects, through the city's stormwater quality committee and annual training workshops.

Externally, the City coordinates with the other permittees, stormwater programs, and local, state, and federal agencies to share information, strategies, and recommended practices related to operation and maintenance of City-owned facilities.

The City will coordinate with special districts (e.g., school district, Sacramento-Yolo Mosquito & Vector Control District) and federal and state facility operators (e.g., Bureau of Reclamation, Folsom State Parks) on a project-specific basis to make sure that measures are in place to protect the City's storm drain system. The City is not responsible for such facilities and operations.

Accomplishments to Date

Folsom has made several notable accomplishments related to the Municipal Operations Element:

- Established a GIS-based asset management system which provides for effective and efficient operation of the City's transportation, storm drain, sanitary sewer and water distribution systems.
- Completed the inventory of detention basins, developed maintenance guidelines, and completed 2008 pilot project on two basins to test and refine the procedures, including investigating disposal methods for sediment and vegetative debris.
- Contributed to the development of the *River Friendly Landscaping Guidelines* (2007) and associated *Homeowners' Guide (2008)*. This program won the 2008 Environmental Leadership award from the Sacramento Environmental Commission. Based on the success of *River Friendly*, in 2008 the City took a leadership role in developing and implementing the *Green Gardener* education and training program for agency staff and private landscape contractors.
- Completed inspection of all drain inlets on public property for proper "no dumping" markers.

Activities for the 2008-13 Permit Term

Table 7.5-1 at the end of this chapter summarizes the activities that will be conducted for this program element during the 2008-13 permit term, along with associated performance standards, effectiveness assessment methods and a five-year implementation schedule. The table was developed to demonstrate compliance with Provision 10 of the Stormwater Permit.

This section describes the planned activities in more detail.

Illicit Discharge Response

The City stormwater inspector and/or maintenance crews will be dispatched quickly to respond to all incidents where an illicit discharge threatens to enter or enters the storm drain system. In cases involving hazardous materials, the Folsom Fire Department will get involved. See Section 7.6 for a description of these activities.

Stormwater Pollution Control for Construction and Development of City-Owned Projects

The City will comply with the Construction Program Element requirements during Municipal Capital Improvement Projects, and will obtain coverage under the General Construction Permit when applicable. See Section 7.3 for more details.

The City will continue to implement New Development Standards at applicable Municipal projects, including construction of source control and treatment control measures as required. See Section 7.8 for more details.

Facility Management

Maintenance of Buildings

The buildings that are owned by the City are operated and maintained by the various departments in which they reside. The operations and maintenance of the Corporation yard is regulated in accordance with the requirements of its Industrial General Permit and SWPPP. The Public Works Department is the lead for this permit and will update the SWPPP as needed. The City owns and operates two materials storage yards. Only one of them, the Kemp Facility, was determined to have the potential to discharge to the storm drain system therefore that site has a SWPPP. The other site is not connected to/in proximity of the storm drain system or a waterway therefore does not have a SWPPP however training of proper BMP's is provided annually.

Operation and Maintenance of City Parks and Public Facilities

The City's Parks and Recreation Department will continue to manage the 38 parks and public facilities within the city limits and any new parks built as the city develops. The Public Works Department will continue to provide training to park maintenance staff and supervisors during the 2008-13 permit term to ensure that pollutants are not discharged to the City's storm drain system or local creeks due to the Park Department's operations.

For special events that can be reasonably expected to generate substantial quantities of trash and litter, the City has provisions, as part of the special use permit issued for the event, requiring the proper management of trash and litter and/or the City will provide the clean up services after very large events.

Integrated Pest Management (IPM)

The City will implement IPM procedures as described in the Pesticide Plan developed by the Partnership and approved by the Regional Water Board. Pest control operations conducted or contracted by the City relate to parks, trails and open spaces, lighting and landscaping districts and City-owned buildings. The City will continue to employ several licensed pesticide applicators to oversee and ensure training for

Parks maintenance staff responsible for applying pesticides at City-owned park and recreational facilities in accordance with the Parks Department's written IPM procedures. Chemicals for park pesticide operations will be stored according to regulations at the Kemp Maintenance Facility. The City will continue to contract with various licensed pesticide applicators for pest control in public landscaped areas managed by the L&L District and at other City buildings and facilities. Early in the 2008-13 permit term, the City will complete a review of procedures used by the L&L District staff and contractors and other City departments (other than Parks) and make recommendations for incorporating IPM protocols into purchasing and contracting activities.

The City's Arborist will continue to oversee tree species selection and location for City-owned and private development projects to encourage native species, minimize the need for water, pesticides and fertilizers, and ensure longer term survival. In addition, the City Water Conservation Coordinator will continue performing audits of residential, commercial and City-owned irrigation systems to increase water use efficiency and prevent runoff which could carry pesticides to the storm drain system and local creeks.

The City will continue to promote and distribute the award-winning *River Friendly Landscaping Guidelines* and associated *Homeowners' Guide* to residents and landscape contractors during work in the City. The City will also continue its leadership role in implementing the Green Gardener education and training program for agency staff and private landscape contractors.

Storm Drain System Maintenance

The City's Public Works Street Maintenance Division will continue to systematically inspect and clean the storm drain system and associated drainage and treatment systems, including creek and channel maintenance. The intent is to remove accumulated debris (and associated pollutants), prevent flooding and eliminate nuisance problems (e.g., odor, vectors). Sediment and vegetative debris collected during these operations will be managed and disposed of in accordance with regulatory requirements. The City's Stormwater Program Manager and Maintenance Supervisors will continue to evaluate the storm drain operation and maintenance activities to ensure that proper BMPs are implemented during maintenance activities, storm drain inlet markers are replaced when illegible, and that adequate record keeping capturing overall maintenance activities and quantities of waste removed is performed. The annual refresher training will include activities and facilitated group discussion intended to evaluate the effectiveness of these activities and identify and resolve issues.

The City Public Works Street Maintenance Division will inspect and maintain most City-owned basins; some basins are managed by a City L & L district or the City's Parks and Recreation department. The City will continue to utilize and update its GBA asset management database to track inventory, inspection and maintenance activities. Maintenance practices will be reviewed and updated as necessary. Several of the detention basins within the City are privately owned by an HOA or other entity. The City will provide support to these private entities to ensure proper maintenance practices are in place. Maintenance agreements will be required for all newly planned and constructed basins.

Storm Drain Inlet Marking

City maintenance crews will continue to check the legibility of existing storm drain stencils and markings during routine maintenance activities and replace any that are noted as damaged or missing as soon as practicable. The city planners, engineers and field inspectors will continue to verify that new storm drain inlets installed in new developments include a permanent "No Dumping" message.

Operation and Maintenance of Transportation Facilities

Prioritized Street Sweeping for Curbed Streets

The City Public Works Department will continue to sweep about 420 curb miles of curbed streets using two vacuum and one mechanical sweeper. The City will follow this prioritized schedule:

- Priority A: Arterials – Quarterly, year round, weather permitting.
- Priority B: Collectors – Quarterly, year round, weather permitting.
- Priority C: Residential – As needed.

City staff will annually quantify the total amount of pollutants removed from street sweeping activities. Annual training will be performed to ensure that BMPs are implemented during street cleaning and roadway maintenance operations. Training of maintenance activities will also ensure that BMPs are implemented to prevent street sweeper rinse out water, concrete chute rinse water, and saw cut slurry from entering the storm drain system.

Implement BMPs for Road Maintenance Activities

The City's Public Works Department will continue to repair and improve roads to safely accommodate vehicle traffic, pedestrians and bicyclists. Annual training will be performed to ensure that BMPs are implemented during sidewalk and roadway maintenance operations. Training of maintenance activities will also ensure that BMPs are implemented to prevent concrete chute rinse water and saw cut slurry from entering the storm drain system.

The annual refresher training will include activities and facilitated group discussion intended to evaluate the effectiveness of these activities and identify and resolve issues.

Inspection and Maintenance of City-Owned Parking Lots

Parking lots exposed to rainfall will be inspected and maintained at least annually prior to the wet season by the responsible City department (in most cases the department occupying the adjacent building/facility). Maintenance activities will include trash/debris removal, sweeping and removal of oil stains involving collection and proper disposal of the waste water.

Roads and Roadside Vegetation

The City Public Works Department will continue to operate and maintain almost 70 miles of roads and associated roadside vegetation and will also continue to maintain approximately 40 acres of landscaping in the public right-of-way. The City's L&L District Manager and her staff will continue to maintain landscaping in 23 L&L Districts. Such improvements in these districts generally consist of landscape corridors and median islands as well as streetlights. In some instances, L&L Districts include maintenance of walls, fences, open space areas, and/or other public improvements such as art work. All landscaping practices will be conducted following the River Friendly Landscaping and Green Gardener principles to the extent possible, in order to minimize water, pesticide and fertilizer use, curb greenhouse gas emissions, and reduce green waste sent to the landfill. All City green waste is sent to Sacramento County's green waste processing facility. IPM protocols will be incorporated as recommended by the review completed early in the 2008-13 permit term (see previous IPM discussion).

Stormwater Pollution Control During Fire Emergency and Non Emergency Operations

The City's Stormwater Program Manager will continue to work with targeted departments (including Fire) to ensure that during emergency responses to repair essential public services and infrastructures, that stormwater BMPs are implemented to the extent that measures do not compromise public health and safety and also that during training and maintenance activities BMP's are implemented to prevent stormwater pollution from entering the storm drain system.

The City will develop a response plan for pollution prevention during emergency procedures and a list of BMP guidelines for non-emergency maintenance and training activities.

Operation of the Sanitary Sewer Collection and Water Distribution Systems

The City has an individual NPDES Permit for capacity, monitoring, operation and maintenance of its sanitary sewer collection system. This permit requires quarterly reports documenting maintenance, capital projects and public education efforts as well as maintenance of emergency procedures and documentation and reporting of overflows. The City's Stormwater Program Manager and Utilities Supervisors will continue to evaluate the operation and maintenance activities to ensure that proper BMPs are implemented; the annual refresher training will address this as well.

Waste Collection

The City's waste collection operations include weekly pick up of garbage, recyclables and green waste, a door to door household hazardous waste pick up program and a program that picks up bulk items, as requested, triennially. This convenient program helps to keep the wastes out of storm drains and local creeks.

Maintenance of Fleet Vehicles

All fleet vehicles will continue to be washed and maintained at the Corporation Yard, which is covered under the State's Industrial General Permit. The wash rack is plumbed to the sanitary sewer system and the crews using the rack are trained in proper procedures via the annual refresher training.

City Employee Training

The City's Stormwater Program Manager will continue to provide technical assistance to facility operators and maintenance crews as requested and needed to promote proper implementation of BMPs in routine City operations and to response to illicit discharge incidents, public complaints or Regional Water Board referrals. Annual refresher training will continue for affected employees in Parks, Utilities and Public Works Departments related to stormwater pollution prevention and the requirements of the permit, as discussed in Section 7.2.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Table 7.5-1 describes the assessment methods the City will use to more specifically evaluate the municipal operations program element activities during the 2008-13 permit term. The goal will be to move toward outcome levels 2 and 3 (changing awareness and behavior, respectively, of the County employees) for some tasks. The remaining tasks will continue to be evaluated at outcome level 1 (documenting and confirming permit compliance).

Key indicators have been selected for various tasks to demonstrate progression towards overall stormwater program goals for this particular element. A summary of the status of key indicators will be used to assess overall program effectiveness in the annual reports.

Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

7.6 Illicit Discharge and Detection Program Element

The mission of the Illicit Discharge and Detection Program Element is to effectively eliminate all illegal non-stormwater discharges to Folsom's storm drain system and receiving waters.

Any material dumped or discharged into the City's storm drain system eventually makes its way to a local creek and/or river, where it can impair beneficial uses. This is true whether the material is classified as hazardous or not; even sediment can harm the creeks. Water quality, habitat, and aesthetics are all examples of benefits that can be impacted. This section addresses the activities that the City of Folsom conducts to ensure that non-stormwater (illicit discharges) are prohibited, as well as reported, investigated and eliminated as soon as possible.

The storm drain system in Folsom consists of a network of drain inlets, manholes and piping, as well as streets, sidewalks, gutters and roadside ditches, and many detention/water quality basins which discharge to local creeks and rivers. Urban runoff from driveways, parking lots, roof drains and other surfaces typically discharge directly into this system.

Two kinds of discharges are addressed by this element:

- *Illegal dumping* – Dumping of liquid or solid wastes into the storm drain system. Examples include mobile carpet cleaning companies discharging dirty rinse water into a storm drain manhole, a homeowner dumping used motor oil into a storm drain inlet, or a person dumping garbage or other wastes into drainage channels and creeks.
- *Illicit connection* – A piped connection allowing sanitary sewage to flow into the storm drain system. For example, a washing machine plumbed into the storm drain system rather than the sanitary sewer.

Illicit Discharge Element Strategy

The City works toward eliminating illicit discharges to its storm drain system and receiving waters through its legal authority, response and investigation, proactive household hazardous waste program and educational activities, as discussed below.

Maintain adequate legal authority to prohibit illicit discharges. The City of Folsom Stormwater Management and Discharge Control Ordinance (FMC 8.70) prohibits the discharge of non-stormwater into Folsom's storm drain system and local receiving waters. An exception is provided for certain discharges (e.g., springs, water line flushing, landscape irrigation, residential car washing and street wash water), which are allowed by the stormwater permit (Discharge Prohibition B2) unless such discharges are identified as a source of pollutants to receiving waters. Designated city staff and County EMD are authorized to enforce the ordinance within the city limits.

Response and investigations. The City has conducted a system-wide field screening for illicit discharges and continues to screen for illicit discharges and connections as a part of routine maintenance of the storm drain system. Enforcement action is taken against dischargers. A public reporting hotline is provided to make it easy for residents to report problems. The City responds to all reports quickly and conducts investigations, working collaboratively between City departments as needed, and conducting enforcement until the discharge is eliminated.

Proactive HHW collection program. The City implements a unique HHW program, whereby residents may call for a pickup from their residential driveway. This deters illegal dumping of hazardous and universal wastes into storm drains and local creeks.

Educational activities. The City has created incident response procedures and educates its staff, contractors and the public about how to identify and report illicit discharge problems. This effort includes educational materials, signage and training.

Intra and Interagency Coordination

The City Public Works Department Stormwater Pollution Prevention Inspector is the primary point of contact for illicit discharge referrals and response. The City Public Works Department inspector and Stormwater Program Manager coordinate with the Utilities Department's Solid Waste, Sewer and Hazardous Materials Divisions to conduct the activities described in this section. Public Works crews conduct ongoing field screening for illicit discharges and connections as part of their work and in turn, coordinate with the Utilities Department to clean up and dispose of any polluted or hazardous wastewater. If progressive enforcement action against the discharger does not eliminate the problem, the City will then coordinate with City Code Enforcement.

The City coordinates with the other permittees in the Partnership to share information, but for the most part, activities are conducted on a permittee-specific basis.

Accomplishments to Date

The following highlights some major accomplishments related to this program element:

- In 2006, a new hotline, 808-4H20, began allowing callers to select Folsom and be routed to the City for assistance on City-related issues or complaints. The hotline is administered by the City of Sacramento on behalf of the permittees and is now widely advertised on all Partnership educational materials, media spots, and on the web site.
- Completed field screening for illicit connections for all open channels, underground pipes in priority areas and all underground pipes with a diameter of 36 inches or greater.
- The City has established and annually updates an illicit discharges map to identify "hot spot" problem areas requiring additional or more frequent investigations. The map is included in each annual report.
- The City Public Works Department developed a database which tracks and documents illicit discharge referrals, inspection and enforcement action activity.
- The City Public Works Department developed a door hanger to be used and distributed by City staff, such as Maintenance Workers, Inspectors and others who are often in the field. The door hanger was designed to be used as educational outreach when potential stormwater pollution issues are observed. A copy of the doorhanger can be found on the City's stormwater web page: http://creeks.folsom.ca.us

Activities for the 2008-13 Permit Term

Table 7.6-1 at the end of this chapter summarizes the activities that will be conducted for this program element during the 2008-13 permit term, along with associated performance standards, effectiveness assessment methods and a five-year implementation schedule. The table was developed to demonstrate compliance with Provision 11 of the Stormwater Permit.

This section describes the planned activities in more detail.

Legal Authority

The City of Folsom Stormwater Management and Discharge Control Ordinance (FMC 8.70) prohibits the discharge of non-stormwater into Folsom's storm drain system and local receiving waters. An exception is provided for certain discharges, which are allowed by the stormwater permit (Discharge Prohibition B2) unless such discharges are identified as a source of pollutants to receiving waters.

The stormwater ordinance will be updated within one year of Regional Water Board approval of the SQIP if needed to ensure adequate coverage and authority.

Reporting of Illicit Discharges

The City will continue to work with the Partnership to sponsor and advertise the stormwater hotline number (808-4H20). The City's stormwater inspector, maintenance crews and/or Fire Department (depending on the type of spilled material) will be dispatched as soon as possible to investigate all reports received via the hotline, permittee/other agency referrals or Regional Water Board referrals. A flowchart describing the City's stormwater incident response procedures was developed collaboratively by the City's Stormwater Committee. The City recently reorganized certain departments, divisions and activities. The flow chart will be updated to reflect these changes and will be discussed during employee annual refresher trainings. The update will be submitted with an annual report.

Ongoing Field Screening for Illicit Discharges and Connections

As part of the normal drainage system maintenance procedures, crews will routinely inspect all areas of the drainage system for evidence of illicit connections and illegal discharges. When discharges are found, crews will investigate and conduct follow-up activities as needed to identify the source and eliminate any verified non-authorized, non-stormwater discharge. The City's doorhanger will be distributed in neighborhoods by City crews, in cases where their appears to be a potential stormwater pollution issue or discharger cannot be identified. A copy of the doorhanger can be found on the City's stormwater web page: http://creeks.folsom.ca.us

Investigation of Illicit Discharges and Connections

Upon discovery of an illicit connection, the City will initiate an investigation within 21 days to determine the source, nature and volume of discharge, and potential responsible party. Upon confirmation of the illicit connection, the City will take enforcement action to terminate the connection as soon as possible, but not longer than 180 days after confirmation.

The Hazardous Material Division will continue its program to collect household hazardous waste from City customers. These efforts help to eliminate or reduce dumping of pollutants into the City storm drain system.

Illicit Discharge Response, Containment and Cleanup

The City on-call maintenance crew and the City Fire Department will continue to provide 24-hour spill response services. All staff involved in spill response are thoroughly trained according to State regulations and a spill response plan is maintained and followed that includes procedures and reporting requirements. When a report is issued, response personnel work to identify, contain and dispose of any waste as quickly and safely as possible. The Code Enforcement Division will follow up with any fines and case referrals as necessary.

For illicit discharges that are known or suspected to contain hazardous substances, the City will respond within one (1) business day to abate, contain, and cleanup any illicit discharge.

Overflows, spills and infiltration of the sanitary sewer system (including the response and elimination procedures employed) are covered under the City's NPDES Permit for the operation of the sanitary sewer collection system.

Enforcement

The City's stormwater inspector and designated other City staff are authorized to enforce the stormwater ordinance as needed to ensure that problems are quickly eliminated. All investigated violations are referred to the Code Enforcement Division to ensure proper documentation for progressive enforcement, including the possibility of recovering cleanup costs. In some instances, cases are referred to the City Attorney's Office.

Data Management

The City will continue to track data and update the illicit discharge map that shows the location of illicit discharges for identifying potential needs for further investigation or possibly outreach material. Each year, this information, along with any investigations underway or completed, will be reported in the Annual Report.

Waste Collection Programs

See section 7.5 Municipal Operations Program Element for a description of the City's Waste and Household Hazardous Waste Collection programs and activities which help to keep pollutants out of the storm drains and local creeks.

Education and Outreach

As with many other control programs, education is the key to successful implementation. The maintenance crews are the eyes and ears of the City and are responsible for responding to a majority of the illegal discharge calls. These crews will be trained annually (as part of their routine refresher training) about steps to take when an illicit discharge is discovered or reported, including containment and cleanup, if appropriate, or referral to another department or agency for cleanup (e.g., Fire Department), and interacting with the public in the vicinity of the discharge (including using the doorhanger and other outreach material as needed).

Employee and Contractor Training

All storm drain maintenance crews will continue to receive annual refresher training related to illegal discharge and illicit connection detection and elimination. Hazardous Materials Division personnel and the Sewer Division personnel will be trained to properly respond to, contain and dispose of waste from unintentional spills or intentional dumping of waste. Refer to Section 7.2 for more information about Folsom's annual refresher training for all employees affected by the stormwater permit.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Table 7.6-1 describes the assessment methods the City will use to more specifically evaluate the illicit discharges program element activities during the 2008-13 permit term. For a period of time, the City expects and increase in reports, inspections, etc as public outreach efforts are stepped up via the new doorhanger, etc. At some point in the future it's expected to show a decrease as a indicator of effectiveness of outreach efforts that change awareness/behaviors. The goal will be to move toward outcome levels 2 and 3 (changing awareness and behavior, respectively, of dischargers and the public) for some tasks. The remaining tasks will continue to be evaluated at outcome level 1 (documenting and confirming permit compliance).

Key indicators have been selected for various tasks to demonstrate progression towards overall stormwater program goals for this particular element. A summary of the status of key indicators will be used to assess overall program effectiveness in the annual reports.

Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

7.7 Public Outreach Program Element

The mission of the Public Outreach Program Element is to raise awareness, encourage behavioral change and foster community stewardship to promote stormwater pollution prevention in Folsom.

Public education is an important element of the City of Folsom's stormwater program. Through this element, the City informs the general public and targeted audiences about pollution prevention, encourages behavioral change, and fosters community stewardship to protect the creeks and watersheds within the city. In compliance with the stormwater permit, the ultimate goal is to reduce pollutants discharged in urban runoff to the storm drain system and local waterways to the maximum extent practicable.

Public Outreach Strategy

The City contributes to the multi-faceted regional public outreach efforts described in Chapter 2 (section 2.6) according to the Sacramento Stormwater Quality Partnership's cost-share agreement. The Partnership's regional activities are typically administered and managed by Sacramento County and the City of Sacramento, the two largest permittees. Joint funding for projects with a regional benefit provides an economy of scale which is important in times of diminishing resources, particularly given the fact that regional outreach (e.g., media campaign) is typically very expensive. Regional collaboration ensures that consistent messages can be conveyed to a wider audience, touching residents, schools and businesses across the county. Folsom is in the same radio and television markets as the other permittees and is in the distribution area for the *Sacramento Bee* newspaper. In addition, with combined reosurces, the permittees can hire experts to conduct surveys and analyze effectiveness data which can be used to refine the program over time.

In addition to contributing funds, the City provides in kind services to support regional outreach. For example, Folsom provides staff for the Partnership's stormwater booth at various public events each year, such as the Salmon Festival held at the nearby Nimbus Hatchery on the American River. The City also distributes educational materials produced by the Partnership to the local population.

Finally, the City independently provides local, targeted outreach to Folsom residents, schools, community groups and businesses, and involves the public in meaningful community stewardship projects, as described in this section. The key target audiences in Folsom include:

- Residential households (about 20,000)
- Schools: 11 elementary, 2 middle, 2 high schools and 1 community college)
- Businesses and industrial facilities (see Section 7.4 for profile; almost 300 businesses are inspected by the County EMD every 3 years on behalf of the City and there are many more retail/commercial businesses)
- Community groups such as the Boy/Girl/Cub Scouts
- Environmental and recreational advocates such as the Friends of the Folsom Parkway
- Development community (developers, contractors, engineers and design professionals)
- Local elected officials, City managers and employees

Demographics for the City are as follows (2005 Data):

Population 67,906

Median age 34.3

Percentage High School Graduate or Higher 91.9%

Percentage Batchelor's Degree or Higher 44.5%

Median Household Income $78,317

Mean Family Income $112,121

Racial Diversity: White 80.5%, Black 2.5%, American Indian/Alaskan 0.1%, Asian 8.6%, Native Hawaiian/Islander 0.1%, Other 5%, Two or more races 3.2%

Intra and Interagency Coordination

Folsom coordinates with the other permittees on regional public outreach issues primarily through the Steering Committee meetings. This includes review of work products, consultant scopes of work and other items. In about January of each year, Folsom requests and reviews the projected regional outreach budget from the County and City of Sacramento so that adequate funds may be set aside in the new fiscal year budget to cover Folsom's contribution according to the cost-share agreement.

Internally, the work is managed by the City's Stormwater Program Manager in the Public Works Department, who coordinates efforts with the Parks and Utilities Departments as well as the City Manager's Office.

Accomplishments To Date

Chapter 2 (section 2.6) describes major accomplishments related to regional public outreach by the Partnership and the County of Sacramento since 1990. In addition, the following describes several key accomplishments made by the City itself:

- Established a stormwater quality page on the City's web site to better address the stormwater pollution prevention program and provide links to the Partnership web site and periodically included informative articles about the stormwater program in the monthly City newsletter, which reaches approximately 20,000 households.
- Created a creek awareness brochure with fold-out creeks map for public distribution and a doorhanger for distribution by City crews to homes and businesses in areas where stormwater pollution concerns are discovered.
- Worked with the Friends of the Folsom Parkway and local scouts' troops to establish and support the Folsom Creek Watchers Program. This program is a grass-roots effort which began during the April 2008 Creek Cleanup on Alder Creek, when a local Cub Scouts troop approached the City about conducting cleanup and educational activities year-round along Folsom's creeks. During 2008-09, three major segments of Humbug Creek were adopted by several troops and cleanups and associated educational events with expert guest speakers were conducted throughout the year. These efforts reached about 165 scouts and their parents and resulted in over 500 pounds of trash and debris removed. The Creek Watchers made a presentation to the Folsom City Council in April 2009 and secured grant funds to expand the program in 2009-10. Additional details will be provided in the City's October 2009 Annual Report.
- Sponsored and staffed several annual outreach events in Folsom for many years, notably the April Folsom Creek Cleanup Day (combined with City Trails Day event) and the public works celebration in Rodeo Park, which includes an interactive stormwater education booth. Each year, these events reach a combined audience of about 600 people.

- Secured grant funding to conduct the Alder Creek Watershed Management Program, a 3-year, $400K effort which entails engaging a diverse group of stakeholders in the process to conduct a watershed assessment and prepare a management plan for the 11-square mile watershed. Over half of this watershed is slated for future development in the next ten years, and the grant program will help ensure protection of the creek and watershed resources as development proceeds.
- Developed a Wholesome Folsom, Less Toxic Pesticide Campaign which is grant funded and provides free education and products to residents to encourage use of IPM practices.
- Continued the door to door Household Hazardous Waste Pickup Program and provided educational presentations to middle school and high school students regarding this program and less toxic alternatives.
- Developed BMP Guidelines for carwash fundraisers. City staff continued to work with various groups and businesses in the community to educate and inform them about the potential pollution problems associated with car wash fundraisers. Organizations are required to notify and comply with the City's BMP guidelines for car wash fundraisers.
- Included articles in the City of Folsom Newsletter on topics such as proper household hazardous waste disposal, creek awareness and pollution prevention, river friendly landscaping and getting ready for the wet season. These articles were included in the COF Newsletter approximately 2 to 3 times a year and reach approximately 22,000 households.
- Continued implementation of the Park & Recreation Department's Pet Waste Program. Folsom has 30 pet waste bag dispensers and disposal containers installed in several City parks and residential areas.

Activities for the 2008-13 Permit Term

Partnership Activities

See Chapter 2, Section 2.6 for detailed information about activities that will be conducted by the Partnership related to regional public outreach. Residents, businesses and students attending Folsom schools are addressed through those efforts.

City-Specific Activities

Table 7.7-1 at the end of this chapter summarizes the City-specific activities that will be conducted for the this program element during the 2008-13 permit term, along with associated performance standards, effectiveness assessment methods and a five-year implementation schedule. The table was developed to demonstrate compliance with portions of Provision 12 of the Stormwater Permit.

This section describes the planned activities in more detail.

Public Participation

Folsom encourages the public to actively participate in all the outreach events and activities it sponsors, via the City web site, City newsletters, Utility bill inserts and other means. See the discussion on public outreach implementation, below, for more information.

Public Reporting Outline

The City will continue to support and promote the Partnership's 24-hour 808-4H20 hotline number for public reporting, as described in Section 7.6. This phone number transfers Folsom callers to the City's Public Works Department for follow-up investigation.

Public Outreach Implementation

Distribution of Educational Materials to Various Audiences

The City will continue to distribute its own creek awareness brochure, as well as educational materials produced by the Partnership, to target audiences in the city as generally described in the Regional Public Outreach section of this SQIP (Chapter 2, section 2.6).

Outreach to General Public

The City will outreach to the general public in multiple ways; most of these are a continuation of activities conducted for many years by the City:

- Provide information via the City website to address activities specified by the Stormwater Permit: auto repair, maintenance and washing; home and garden product use and water conservation; disposal of household hazardous waste, pet waste and green waste; and any additional pollutant source identified as significant.
- Prepare stormwater-related outreach articles for the public and city employees in the City's newsletter and will look for similar opportunities for articles in the local community newspaper: *The Folsom Telegraph*.
- Attend and promote stormwater pollution prevention at annual community events including Public Works Day (May) and the Urban Creek Council's Creek Clean Up Day (April).
- Explore and secure opportunities to partner with other departments (e.g., Utilities, Parks) to cost-effectively combine messages and advertise events; for example via utility bill inserts, the Parks Department's activity schedule and through the City's household hazardous waste collection and water conservation audit/outreach programs.
- Maintain the stormwater education display at the Folsom Zoo to educate zoo patrons about stormwater pollution and the need for prevention.
- Folsom has completed the stenciling and placard program for existing storm drain inlets using volunteer groups in addition to City crews. The City will continue to identify, and place signs along key waterways with a history of dumping problems, to discourage illegal dumping. The signs will be maintained throughout the permit term.

Outreach to Community Groups

The City will continue to sponsor and provide in kind services to the Folsom Creek Watchers Program, which is expected to evolve into the Folsom Adopt-a-Creek/Trail (ACT) program in 2009-10. Support may also include continued payment for outside experts to speak at events and educate the scouts and their parents. Additional details about this evolving program will be provided in the annual report.

Outreach to City employees, managers and elected officials

Folsom will maintain its CASQA membership in order to keep the City's stormwater program manager and other managers apprised of stormwater-related issues and regulations and enable cost-effective information and resource sharing. The City will send key managers to conferences and workshops as needed and will provide annual refresher stormwater training for all affected City employees, as described in Section 7.2.

Additionally, City staff will meet with managers periodically throughout the year to keep them informed about the Program. Updates will be provided to the City Manager, and/or presentations will be made to the City Council or Planning Commission upon request. The City leaders will also be invited to participate in community events (e.g., Creek Week Clean up) to demonstrate support for the stormwater pollution prevention effort.

Public School Education

The City will continue to support education for school children, their teachers and parents, through the following activities:

- Support watershed assemblies performed by SYRCL, vernal pool/stream educational programs for 4-6th graders through the SPLASH program, as described in Chapter 2 (section 2.6).
- Conduct classroom presentations about household hazardous waste, stormwater pollution prevention and water conservation each spring to Folsom Middle School and Folsom High School students.
- Sponsor an interactive stormwater educational booth at the Public Works Week event in Rodeo Park each May.

Business Outreach

Development Community

As discussed in Section 7.3, the City will educate and engage contractors, engineers and design professionals through workshops conducted jointly with the other permittees, as well as the City's entitlement process, pre-application and pre-construction meetings, and on-site training provided in the field by the City's designated stormwater inspector.

Commercial and Industrial Community

The City will continue to work with the permittees to ensure outreach is provided to businesses in Folsom through the County EMD inspection and BERC's outreach programs, as described in Section 7.4. The City will work with commercial car washes and other businesses interested in sponsoring *River Friendly* car wash fundraisers at their facilities; this may include investigating the facility to determine its appropriateness in preventing illicit discharges to the storm drain system. In addition, the City's stormwater inspector will distribute industry-specific brochures and BMP guidance materials to businesses in Folsom during illicit discharge investigations and enforcement.

Watershed Stewardship

The City will continue its involvement and support of watershed stewardship projects and activities.

In late 2006 the City received a CALFED/State Department of Water Resources Grant (Proposition 50) to conduct the Alder Creek Watershed project. This project entails using an interest-based stakeholder-driven approach to conduct a watershed assessment and prepare a watershed management plan for the 11-square mile Alder Creek Watershed in Sacramento County. The vision is a protected, healthy creek and riparian corridor with recreational, educational and interpretive opportunities for existing and future community residents and local schools. The project budget is approximately $400,000. Originally the project was scheduled for completion in June 2009 however due to suspension of State funding the completion date is uncertain. The City is unable to move forward on the project with out State funding, therefore is hoping it becomes available again very soon. The project is currently approximately 60% complete.

A smaller project example was the City's assistance to the Sacramento County Conservation Corps to prepare a small REI grant proposal to clean up stretch of Alder Creek near Broadstone Racquet club. The City would have provided in-kind services as match; however, the project unfortunately was not funded.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Table 7.7-1 describes the assessment methods the City will use to more specifically evaluate the public outreach program element activities during the 2008-13 permit term. Assessments of regional public outreach activities will be conducted by the Partnership as described in Chapter 2, Section 2.6. In general, the goal will be to move toward outcome levels 2 and 3 (changing awareness and behavior, respectively, of dischargers and the public) for some tasks. The remaining tasks will continue to be evaluated at outcome level 1 (documenting and confirming permit compliance).

Key indicators have been selected for various tasks to demonstrate progression towards overall stormwater program goals for this particular element. A summary of the status of key indicators will be used to assess overall program effectiveness in the annual reports.

Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

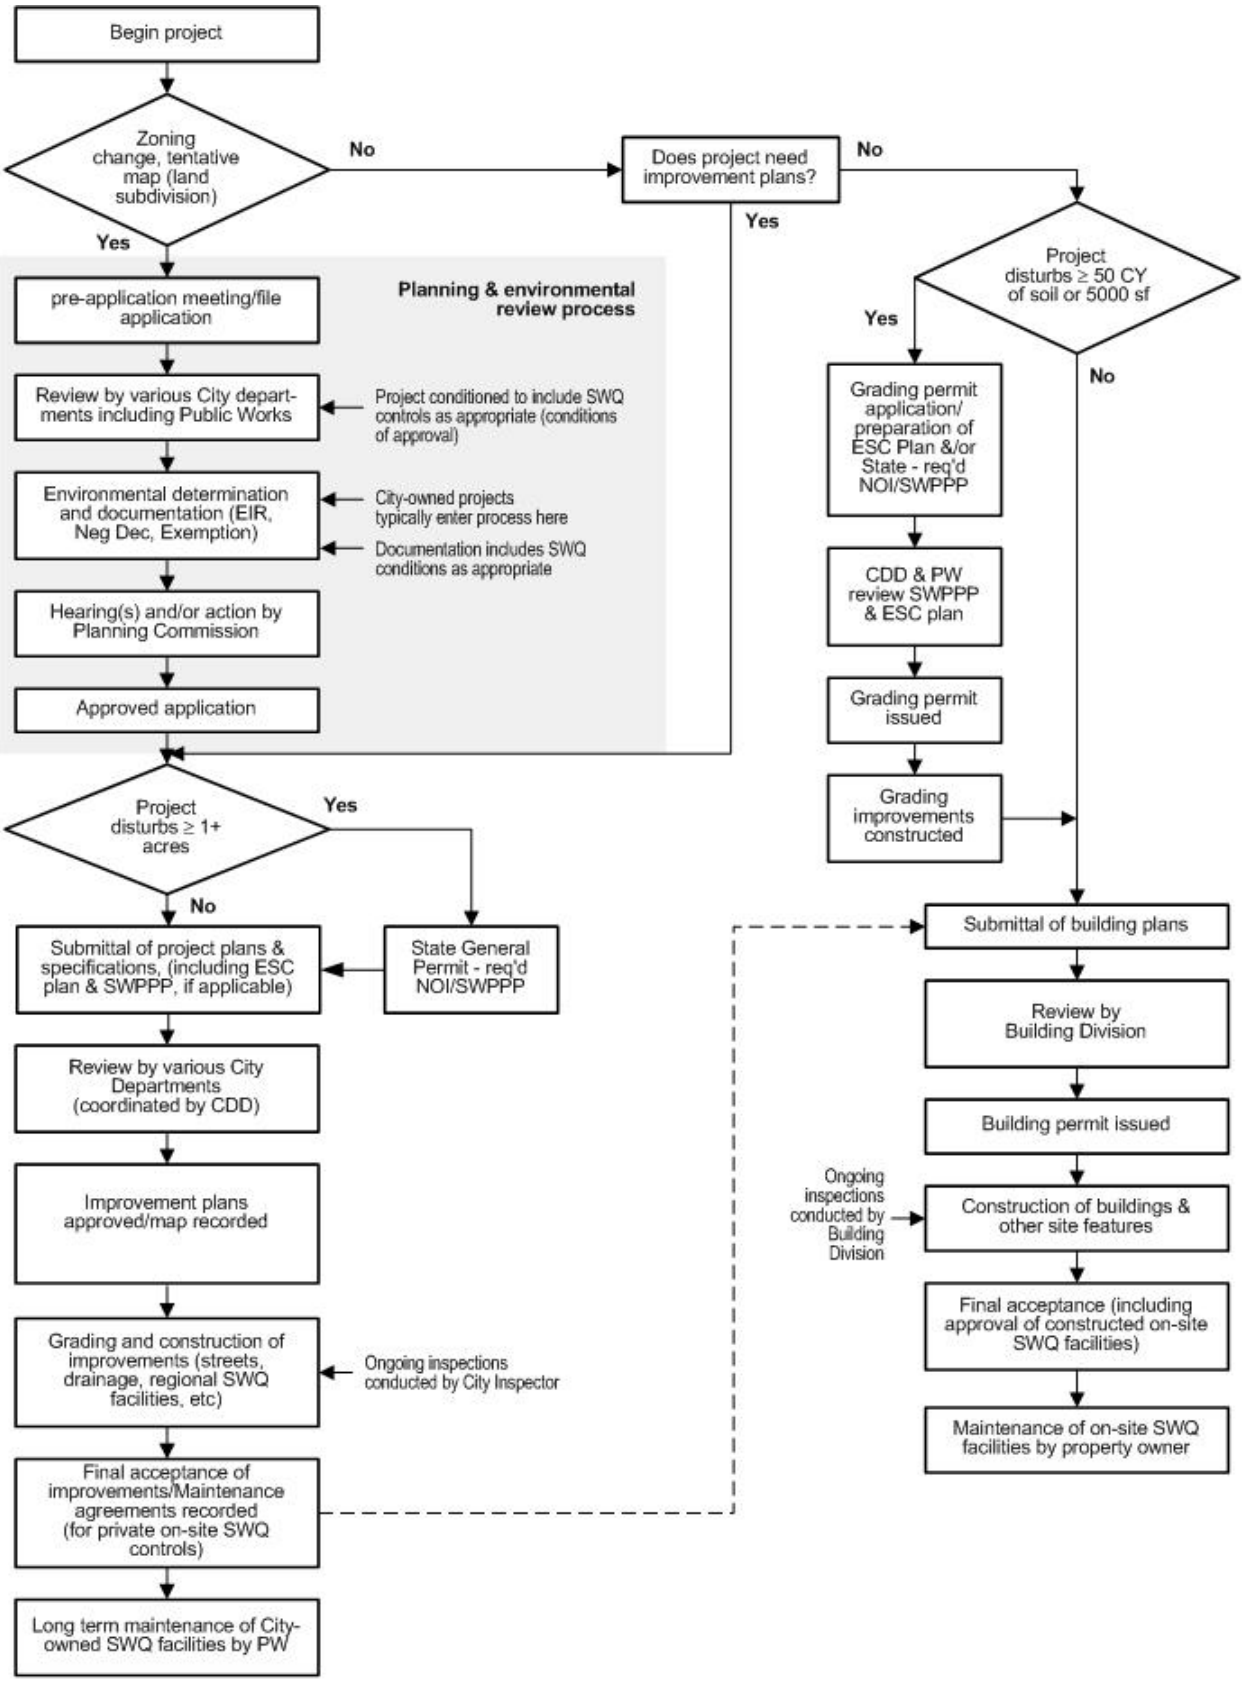
7.8 New Development Program Element

The mission of the New Development Program Element is to mitigate urban runoff impacts associated with new development and significant redevelopment projects in the City of Folsom.

This section of the Folsom SQIP addresses actions that Folsom will take to mitigate potentially harmful environmental impacts of development in Folsom.

Urbanization and land development can harm local creeks and rivers in several ways:

- Replacing natural ground with impervious surfaces (such as roofs and pavement) increases the volume and peak flow rate of stormwater runoff. Those changes to hydrology can lead to stream bank erosion, flooding, and habitat impairment.
- Adding impervious surfaces such as parking lots, streets, and roofs increase the temperature of the water discharged to creeks, potentially harming aquatic life.
- Converting land uses from rural to urban increases pollutant load from activities such as automobile and landscape maintenance.



The stormwater permit requires Folsom and the other permittees to ensure that new development and significant redevelopment projects mitigate these impacts. Since 1990, the focus of the New Development Element has been on mitigating stormwater quality impacts. However, the 2008 stormwater permit contains new requirements to also address impacts to runoff volume and rate (hydromodification impacts) where those impacts could cause creek erosion and degrade creek habitat. This section describes actions to address these new requirements for the 2008-13 permit term.

New Development Element Strategy

The City's stormwater ordinance (FMC 8.70) provides the authority necessary for the City to require stormwater quality and hydromodification management control measures as conditions of approval for new and redevelopment projects. With this as a foundation, the City seeks to mitigate the potential harmful stormwater impacts from development and redevelopment with the following approach:

- Integrate stormwater quality considerations and requirements as early as possible into the planning, initial site design, and environmental review processes of both public and private projects. Figure 7.8-1 presents the City's review process for development projects.
- Provide technical guidance (such as the *Stormwater Quality Design Manual for Sacramento and South Placer Regions*), training opportunities and conduct ongoing outreach to the development community. Much of this work is done in concert with the other permittees, as described more fully in the County's SQIP (Chapter 4).
- Require site design features that help control pollution at its source, stormwater quality treatment control measures (preferably aboveground, vegetated) that cleanse runoff before it reaches creeks and rivers, and runoff reduction measures (low impact development, LID) to reduce the volume of runoff from developed projects. Runoff reduction measures are currently encouraged, but will become mandatory during the 2008-13 permit term.

Figure 7.8-1 – Folsom Development Review Process, see next page

CDD — Community Development Dept.; PW — Public Works Dept.; SWQ — stormwater quality; NOI — Notice of Intent; SWPPP — Stormwater Pollution Prevention Plan; ESC — Erosion and Sediment Control

The City of Folsom has been rapidly developing since the mid 1990s. In the last fifteen years or so, the City's population has grown 55% primarily due to the build out of areas such as Broadstone, the Parkway and Empire Ranch. The City's population is expected to grow by about 26,500 following annexation and build out in the City's Sphere of Influence (3600 acres planned for annexation south of Hwy 50). Alder Creek meanders through this agricultural grazing area and the City is working with stakeholders on a grant-funded project to prepare a watershed management plan for the area that will protect the creek's natural resources as development proceeds.

Intra and Interagency Coordination

The City's Public Works and Community Development Departments work together to provide drainage and stormwater review services for development applications in Folsom.

The City was an active participant in the permittee process to prepare the *Stormwater Quality Design Manual* in 2006-07 and will continue this role during the 2008-13 permit period related to development of new requirements for hydromodification management.

The City is leading the effort to prepare a watershed management plan for the Alder Creek Watershed in coordination with various stakeholders, including landowners and developers in the SOI, Gencorp (which owns the Easton Development property on the western end of the watershed), Sacramento County, the Bureau of Reclamation, State Parks, environmental groups and affected businesses such as the Folsom Auto Mall.

Accomplishments To Date

- Updated the stormwater ordinance (FMC 8.70) in 2004 to strengthen authority for requiring development-related control measures.
- Updated the City's CEQA initial study checklist and mitigation measure language to better address water quality protection and stormwater pollution prevention.
- Created a stormwater feature form for completion and submittal by new development project applicants, to document and track the type of stormwater features to be included on the project.
- Contributed to regional projects with other permittees to prepare the December 2003 Development Standards Plan (DSP). Within one year of approval of the DSP by the Regional Water Board, adopted development standards in May of 2006 and began applying them to new and redevelopment projects in the City of Folsom.
- Partnered with the County and the Cities of Sacramento, Rancho Cordova, Citrus Heights, Elk Grove, Galt, and Roseville to create the *Stormwater Quality Design Manual for the Sacramento and South Placer Regions*, finalized in May 2007. This two-year development process entailed outreach with the development community and meetings with a newly formed stormwater committee of the local Building Industry Association.
- Within one year of approval of the DSP by the Regional Water Board, adopted development standards in May of 2006 and began applying them to new and redevelopment projects in the City of Folsom.
- Executed maintenance agreements with property owners to ensure long-term maintenance of stormwater quality facilities (since 2006).

Activities for the 2008-13 Permit Term

The stormwater permit requires that the permittees continue to regulate new development and redevelopment projects so that they incorporate measures to mitigate stormwater quality impacts. The 2008 stormwater permit includes new provisions to require a plan for mitigating the hydromodification impacts associated with new development in the permit area. (As described in more detail in Chapter 3, Section 3.8, when development occurs, it increases the volume and rate of runoff and therefore stream flow; these hydromodification impacts, in turn, can cause creek erosion and degrade habitat.) In addition, the 2008 stormwater permit includes a new provision specifying that the permittees require all priority new development and redevelopment projects to incorporate low impact development (LID) measures. Both new hydromodification and enhanced LID criteria will be incorporated into the updated *Stormwater Quality Design Manual for the Sacramento and South Placer Regions* by the Partnership.

Table 7.8-1 at the end of this chapter summarizes the activities that will be conducted for this program element during the 2008-13 permit term, along with associated performance standards, effectiveness assessment methods and a five-year implementation schedule. The table was developed to demonstrate compliance with Provisions 13-26 of the Stormwater Permit. This section describes the planned activities in more detail.

Development-Related Ordinances, Policies, Codes, Standards and Technical Guidance

Ordinances/Municipal Code

The City's stormwater ordinance (FMC 8.70) provides adequate authority to establish new requirements for development projects; no revisions to the ordinance are warranted.

Policies

The update of the City's General Plan is not currently scheduled, but will likely occur during the 2008-13 permit term. Water quality and watershed protection principles will be integrated into the General Plan during the update process as required by the stormwater permit. The City will also periodically evaluate and revise as needed, the CEQA initial study checklist and mitigation measure language used by City planners to condition development projects. Revised checklists and mitigation language will be submitted with annual reports as available.

Standards, Codes and Technical Guidance

The City will evaluate and amend its stormwater quality development standards to comply with new permit requirements during the 2008–13 permit term. The City will also complete its update of the City's Design and Procedures Manual and Standard Construction Specifications during 2009-10; these documents will make reference to the *Stormwater Quality Design Manual* as appropriate. The City's standards are being updated to reflect evolving industry standards and regulations; copies of the updated documents wlll be submitted (or web links provided) in a future annual report when available.

The City will work with the Partnership to revise the *Stormwater Quality Design Manual* to include additional criteria for low impact development (LID) and hydromodification mitigation following the amendment of the development ordinances and standards. The hydromodification criteria are discussed in the next section. The City will contribute funding through the permittee cost-share agreement for the update of the design manual, and will provide staff to participate in steering committee meetings, review work products and attend meetings with/presentations to the development community. The City will also continue to contribute to the Partnership's efforts to update the protocol for acceptance of proprietary control measures; see Chapter 2 (Section 2.4) for more details.

Stormwater quality requirements need to be coordinated with other City and other agency codes and standards (such as those related to tree preservation/landscaping, water conservation, sanitary sewer and solid waste) in order to avoid conflict and overlap. The City stormwater manager will work with other local agencies through the Design Manual steering committee, and with Community Development and other affected city departments as needed, to evaluate and amend policies and codes as needed for consistency.

Hydromodification Management Plan (HMP)

The City will work with other permittees to meet the requirements of the stormwater permit with regards to hydromodification management (see the prior section on permit requirements). As a first step, the permittees will determine where the requirements would apply in the permit area based on which waterways have the potential for erosion and habitat degradation. It is likely that these new requirements will be applicable to the Folsom Sphere of Influence area.

For those areas where it is determined that hydromodification management measures apply, it is expected that representative analysis will be conducted as needed to assess the degree of susceptibility to erosion and degradation. Based on the outcome of those studies, approaches and tools will be recommended for future development and redevelopment projects to retain/detain flows at the specified erosion susceptibility level. Once the requirements are in place, the City will amend development standards as discussed previously, update the *Stormwater Quality Design Manual* and begin conditioning projects to comply.

To comply with the permit requirements, the permittees are submitting a Hydromodifcation Management Plan (HMP) work plan as part of this SQIP; see Chapter 3, Section 3.8 for more details (the work plan is included as an appendix to this SQIP). One year after the Regional Water Board approves the work plan, the permittees will submit the HMP document.

Waiver Program/Mitigation Fund

The City will work with other permittees to develop a waiver program/mitigation fund alternative for development projects where it is demonstrated that installing stormwater quality control measures is not feasible. The owners of projects that qualify for a waiver would pay into an in-lieu fund; the applicable local permitting agency would use the fund to conduct other stormwater quality control programs elsewhere in the affected watershed.

It is anticipated that the waiver program will be used where stormwater requirements conflict with other City objectives, particularly those reflected in “Smart Growth Projects”. There is an inherent conflict between achieving the “Smart Growth” densification objectives and using space on these dense projects for above-ground stormwater conveyance, runoff reduction measures and stormwater quality treatment features. The City will continue to work with other organizations, such as the Sacramento Area Council of Governments (SACOG) to identify and resolve issues between stormwater requirements and Smart Growth objectives. The County is taking the first step to develop initial parameters for their potential waiver program. The City will review the results of the County’s work and consider application to future development projects in Folsom.

Permitting and Plan Review (Entitlement) Process

Development and redevelopment projects in Folsom will continue to be conditioned for mitigation of stormwater impacts as shown on Figure 7.8-1 (Development Review Process). Community Development planning staff will continue to coordinate with Public Works engineers to ensure that development and redevelopment proposals comply with the adopted development standards. City staff will review initial development applications for conformance with the *Stormwater Quality Design Manual for the Sacramento and South Placer Regions*. Compliance with the development standards and the design manual will be a standing discussion item on the agenda for all pre-application meetings.

City planning staff will promote the voluntary use of runoff reduction, or LID, control measures on priority development projects as a means of mitigating downstream habitat and erosion impacts. Such measures will become mandatory for projects during the 2008-13 permit term.

The City will make sure that the same development standards applied to private development projects are adhered to for public projects.

Maintenance of Stormwater Quality Control Measures

The City will continue to ensure long-term maintenance of treatment control measures on private development by requiring maintenance agreements to be executed before the final approval of the project. A copy of the City's maintenance agreement can be found in Appendix 7C. Through the annual refresher training and other opportunities, the City will train its stormwater inspector and other construction inspectors to check for proper installation/operation of stormwater control measures before final acceptance of the project. For publicly-owned treatment facilities the City will continue to update its asset management GBA database to track inventory and inspection and maintenance activities. Generally the department who operates the facility is responsible for onsite maintenance otherwise the City Public Works Streets Division conducts the maintenance.

Outreach to Educate the Development Community

The Sacramento area development community includes developers, property owners, engineers, landscape architects, architects, environmental specialists, and others who plan and design projects in the public and/or private sectors. The City's effectiveness in reducing stormwater pollution from development in Folsom depends on the level of knowledge and understanding this community has regarding mitigation methods and stormwater requirements. The City therefore will continue to work collaboratively with the other permittees to share information with the development community and promote consistency across municipal boundaries. The City will continue to provide technical guidance and design support to help the development community comply with stormwater quality requirements.

The City will work with the other permittees to inform and engage the development community during the process to amend the development standards and update the *Stormwater Quality Design Manual*. This may include training/informational workshops and meetings with interested parties such as the BIA's stormwater committee. Throughout the 2008-13 permit term, the County, on behalf of the permittees, will continue to post information related to development standards and guidance on the Partnership web site: *www.sacramentostormwater.org*, and will update that website as needed.

Employee Training

The City's stormwater manager and consultants provide annual refresher training with its various agencies and departments to make sure that staff consistently applies new development policies to private developments as well as to the design of City buildings and facilities and improvements in the public right of way.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Table 7.8-1 describes the assessment methods the City will use to more specifically evaluate the new development program element activities during the 2008-13 permit term. The goal will be to move toward outcome levels 2 and 3 (changing awareness and behavior, respectively, of agency staff and the private development/design community) for some tasks. The remaining tasks will continue to be evaluated at outcome level 1 (documenting and confirming permit compliance).

Key indicators have been selected for various tasks to demonstrate progression towards overall stormwater program goals for this particular element. A summary of the status of key indicators will be used to assess overall program effectiveness in the annual reports.

In addition to what is shown on Table 7.8-1, the City will continue to work with other permittees to fund several studies of the effectiveness of local stormwater control measures; see Chapter 2, Section 2.4 for more details.

Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

Table 7.2-2 – City of Folsom SQIP
Program Management Element Work Plan for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Stormwater Quality Improvement Plan (SQIP)											
Modify SQIP to reflect the requirements of Stormwater Permit	2		Revised SQIP submitted to Regional Water Board	Confirmation	♦						4/30/2009
Revise SQIP as needed to reflect permit revisions, respond to Regional Water Board requests, etc.	3.c, 3.d		Revised SQIP (as needed) submitted to Regional Water Board	Confirmation		⇔	⇔	⇔	⇔	⇔	As needed
Legal Authority											
Establish and maintain legal authority to control pollutant discharges	4, 5		Updated Stormwater Ordinance, as necessary	Confirmation-include revised ordinance in AR			♦				1 year following RB approval of SQIP
Submit statement of legal authority from chief legal counsel to Regional Water Board	6		Submit statement of legal authority from chief legal counsel to Regional Water Board	Confirmation-include statement in 2009 SQIP	♦				♦		Submit with SQIP 4/30/09 and ROWD 3/2013
Funding											
Secure resources necessary to meet Stormwater Permit requirements	7		Secure sufficient budget to conduct all activities, fiscal summary submitted to Regional Water Board with Annual Work Plan	Confirmation- submit work plan to Regional Water Board	♦	♦	♦	♦	♦	♦	Submit with Work Plan, May 1 each year

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 7.2-2 – City of Folsom SQIP
Program Management Element Work Plan for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Training											
Continue to implement and make improvements to training program as necessary			Track training events and number of people participating	Confirmation – describe training accomplishments in AR	⇔	⇔	⇔	⇔	⇔	⇔	
Conduct surveys of training participants to assess effectiveness			See individual program elements, Sections 7.3-7.8								
Reporting											
Annual Work Plan											
Submit Annual Workplan	3a.		Prepare and submit workplan to Regional Water Board.	Confirmation- submit work plan to Regional Water Board	♦	♦	♦	♦	♦	♦	May 1 each year
Annual Report											
Describe completed activities and budget expended for previous fiscal year in AR	3.b		AR submitted to Regional Water Board	Confirmation - submit AR to Regional Water Board	♦	♦	♦	♦	♦	♦	October 1 each year

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 7.2-2 – City of Folsom SQIP
Program Management Element Work Plan for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Report of Waste Discharge											
File a report of waste discharge (ROWD) 180 days before permit expiration	33		Submit ROWD to Regional Water Board	Confirmation- ROWD submitted to Regional Water Board by specified date					♦		ROWD due 3/2013
Coordination											
Coordinate on program element basis with other City departments and outside agencies	1.b		Track coordination and intra-agency agreements		⇔	⇔	⇔	⇔	⇔	⇔	
Coordinate as necessary with outside groups and agencies outside of jurisdictional control	1.c		Track coordination efforts	Tabulation – Track number of meetings and groups with which the City collaborated during the year	⇔	⇔	⇔	⇔	⇔	⇔	
Review and revise permittee MOU as necessary	3e.		Revised permittee MOU submitted with SQIP; revised as necessary thereafter	Confirmation- include revised MOU in SQIP/AR	♦						Submit with SQIP 4/30/2009
Program Effectiveness											
Once a permit term: Estimate pollutant loads and evaluate water quality trends in receiving waters	29		Submit information with ROWD (see Chapter 2, Section 2.3 for more details)	Confirmation- submit ROWD and final AR to Regional Water Board					♦		Submit with ROWD 3/2013
			Submit information in final AR for permit term							♦	Submit with Final AR 10/1/2013
Annually: Measure and report program element and activity effectiveness	29		Submit effectiveness Assessment results with AR each year	Confirmation- include effectiveness assessment results in AR	♦	♦	♦	♦	♦	♦	Oct 1 each year

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 7.2-2 – City of Folsom SQIP
Program Management Element Work Plan for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Long Term Effectiveness Assessment (LTEA)											
Describe proposed LTEA for programmatic and environmental goals	29.d		Submit LTEA to Regional Water Board (see Chapter 2, Section 2.3 for more details)	Confirmation - LTEA submitted to Regional Water Board by specified date					♦		Submit with ROWD 3/2013

NA: Not Applicable; AR: Annual Report; ROWD: Report of Waste Discharge

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 7.3-1 – City of Folsom SQIP
Construction Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Legal Authority											
Revise Stormwater Ordinance	8.a.i		Adopt revisions as needed	Confirmation - report revisions in AR			♦				1 year following SQIP approval
Revise Grading and Hillside Development Ordinance	8.a.i		Adopt revisions after Construction General Permit is adopted	Confirmation - report revisions in AR		♦					after CGP adoption
Plan Review and Permitting											
Review Improvement Plans and issue grading permits consistent with City requirements	8.a.ii, 8.a.ii, 8.c.v	✓	Track number of Grading permits issued; document no. of plans which incorporated ESC controls	Tabulation - no. plans incorporating ESC properly is measure of changed behavior of contractors/engineers	⇔	⇔ ③	⇔ ③	⇔ ③	⇔ ③	⇔ ③	
Verify that environmental permits have been obtained from agencies such as DFG (1600), U.S. Army Corps (404), and Regional Water Board (401 Cert)	8.d		Verify prior to issuance of grading permit all applicable development projects obtain required permits from other agencies.	Confirmation	⇔	⇔	⇔	⇔	⇔	⇔	
Track Grading Permits that require coverage under the State C.G.P.	8.a.ii, 8.c.v.a		Document number of sites greater than or equal to one acre that submitted proof of an NOI and that a SWPPP has been developed.	Tabulation - report in AR	⇔	⇔	⇔	⇔	⇔	⇔	
Standards and Specifications/BMPs for Controlling Sediment and Pollutants											
Implement standards and specifications to require BMPs for construction sites	8.a.iii, 8.c.i-iv		Evaluate, and if needed, adopt revisions to standards after Construction General Permit is issued	Confirmation – report revisions in AR	⇔	⇔ ♦	⇔	⇔	⇔	⇔	after CGP adoption

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 7.3-1 – City of Folsom SQIP
Construction Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Inspections and Enforcement											
Track active construction sites and conduct routine inspections according to prioritized threat to water quality	8.a.iii - vi, 8.e		Document number and location of public and private sites subject to Construction General Permit as well as local erosion and sediment controls.	Confirmation - track number of sites and inspections, report in AR's	⇔	⇔	⇔	⇔	⇔	⇔	
Conduct enforcement actions for sites in violation of City and/or Regional Water Board requirements	8.a.vii		Track and document number and types of corrective and enforcement actions	Confirmation - track and report in AR	⇔	⇔	⇔	⇔	⇔	⇔	
Notifications to the Regional Water Board											
Refer projects to RWQCB that are disturbing 1 acre or more and can not verify NOI or WDID	8.a.vii		Report non-filers to RWQCB within five business days.	Confirmation - document referrals made to RWQCB	⇔	⇔	⇔	⇔	⇔	⇔	
Track and report repeat offenders (3 or more violations) to Regional Water Board	8.a.vii	✓	Decrease in number of repeat offenders/chronic violations to Regional Water Board	Confirmation - track referrals; record in AR	⇔	⇔	⇔	⇔	⇔ ③	⇔	Conduct EA in 12/13 before ROWD

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Construction Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Pollution Control at City Construction Projects and Other Projects by Special Districts and Others out of the City's Jurisdiction											
Obtain coverage under the State General Construction Permit for all applicable City Construction Projects	8.c.v.a, 10.a.ii			Confirmation - track and report in AR	⇔	⇔	⇔	⇔	⇔	⇔	
Include provisions in contract specifications to ensure stormwater pollution prevention for all applicable City construction projects	8.c, 10.a.ii		Review existing contract language, update and revise as needed, discuss requirements in annual refresher training.	Confirmation - report updates in AR	⇔	⇔	⇔	⇔	⇔	⇔	
Conduct inspection and enforcement at all applicable City construction projects	8.a.iii - vi, 8.e, 10.a.ii		Track and document projects and types of corrective and enforcement actions	Confirmation - track and report in AR	⇔	⇔	⇔	⇔	⇔	⇔	
Develop interdepartmental agreement to address stormwater requirements on Capital Improvement Projects	8.f, 10.a.ii		Review existing practices and if needed, develop interdepartmental agreement	Confirmation - report revisions in AR		♦					
Coordinate with utilities, special districts (e.g., schools, RT, parks) and others to ensure compliance with Stormwater Ordinance			Document coordination activities	Confirmation	⇔	⇔	⇔	⇔	⇔	⇔	

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Commercial/Industrial Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Legal Authority											
Revise stormwater ordinance as needed	9.a.i		Revised stormwater ordinance (if needed)	Confirmation - report revisions in AR			♦				1 year following SQIP approval
Complaint-Based Stormwater Compliance Inspections											
Update enforcement policy as needed	9.a.iii-viii		Updated enforcement policy (if needed)	Confirmation - report revisions in AR		♦					
Investigate business-related complaints	9.a.iii-viii		Document/quantify business-related complaints received and investigated	Tabulation – track number of complaints investigated each year	⇔	⇔	⇔	⇔	⇔	⇔	
Conduct enforcement (incl. warnings, NOVs, Cease and Desist Orders, ACPs, and Cost Recoveries)	9.a.iii-viii		Increase in incidents addressed from one permit cycle to the next	Tabulation – track number of enforcement actions issued	⇔	⇔	⇔	⇔	❸	⇔	Conduct EA in 12/13 before ROWD
CBSCP database - track inspections, enforcement and outreach materials distributed, businesses by category	9.a.iii-viii		Use data adjust and improve program	Confirmation/Tabulation – evaluate data to identify whether to add or remove new business categories to CISCP or Educational Outreach					❸		Conduct EA in 12/13 before ROWD
Investigate Regional Water Board referrals within 3 working days of receipt of referral	9.a.iii-viii		Document/quantify Regional Water Board referrals investigated within specified timeframe	Tabulation – Track number of Regional Water Board referrals investigated	⇔	⇔	⇔	⇔	⇔	⇔	
Refer significant violations and/or non-filers to the Regional Water Board. Coordinate inspections and enforcement with Regional Water Board.	9.a.iii-viii		Document/quantify no. referrals and no. cases where support was provided to the Regional Water Board	Tabulation – Report quantities in AR	⇔	⇔	⇔	⇔	⇔	⇔	
Educational Outreach											
Track industry and pollutant-specific materials distributed by stormwater inspector in Folsom	9.b.iii		Document/quantify industry and pollutant-specific materials distributed	Tabulation - track number of revised/new materials; number materials distributed in AR	⇔	⇔	⇔	⇔	⇔	⇔	

⇔ Ongoing activity/task ♦ Deliverable or key milestone ❷ Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 7.5-1 – City of Folsom SQIP
Municipal Operations Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Illicit Discharge Response											
Respond quickly and appropriately if an illicit discharge threatens to enter or enters the storm drain system	10.a.i.		Refer to Illicit Discharge (Section 7.6) Element		⇔	⇔	⇔	⇔	⇔	⇔	
Stormwater Pollution Control for Construction and Development of City-Owned Projects											
Implement standards that require BMPs to reduce pollutants from Permittee owned development and construction projects as specified in the New Development and Construction Elements	10.a.ii., 10.b.i		Refer to Construction (Section 7.3) and New Development (Section 7.8) Elements		⇔	⇔	⇔	⇔	⇔	⇔	
Facility Management											
Implement pollution prevention BMPs for public facilities (e.g., corporation yards, material storage facilities, and vehicle/equipment maintenance facilities) having the potential to discharge pollutants to the storm drain system.	10.a.iii. , 10.b.ii.		Continue to ensure compliance with municipal SWPPP at Kemp Facility (Parks); update SWPPP as needed; discuss at annual training	Confirmation	⇔	⇔	⇔	⇔	⇔	⇔	

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 7.5-1 – City of Folsom SQIP
Municipal Operations Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Integrated Pest Management											
Implement integrated pest management (IPM) and pesticides storage, usage, and disposal procedures as described in the Pesticide Plan	10.a.iv. , 10.b.iii.		Decrease amount of pesticides and herbicides used by City staff and contractors	Confirmation - Track IPM activities	⇔	⇔	⇔	⇔	⇔	⇔	
Storm Drain System Maintenance											
Maintain the storm drain system (e.g., drain inlets, ditches/channels, detention basins and pump stations) to remove debris accumulation and prevent flooding	10.a.v. , 10.b.iv.	✓	Decrease amount of sediment discharged to waters of the State.	Quantification - Track quantities of sediment removed annually as measure of pollution abated	⇔ 4	⇔ 4	⇔ 4	⇔ 4	⇔ 4	⇔ 4	
Maintain detention basins to maintain performance, remove debris and prevent flooding	10.a.v, 10.b.vii		Continue maintenance of City owned water quality/detention basins as needed based on crews' observations/other	Track activities; report in AR	⇔	⇔	⇔	⇔	⇔	⇔	
			Review, update and improve existing detention basin maintenance guidelines and practices for City-owned basins. Consider assigning priorities and adding inlet/outlet inspection to zones	Confirmation - Provide copy of guidelines, verification of maintenance and any updates with the Annual Reports.		♦					
			Provide support in the development of maintenance practices for new and existing water-quality detention basins that are managed by Home Owner Associations (HOAs), or other private entity, as needed	Confirmation - Track and report in Annual Reports	⇔	⇔	⇔	⇔	⇔	⇔	
			Require Maintenance Agreements for all newly planned and constructed water quality/detention basins owned by others.	Confirmation - Track and report in Annual Reports	⇔	⇔	⇔	⇔	⇔	⇔	

⇔ Ongoing activity/task ♦ Deliverable or key milestone 2 Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 7.5-1 – City of Folsom SQIP
Municipal Operations Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Storm Drain Inlet Marking											
Ensure that storm drain inlets are properly marked to discourage illicit discharges; Replace illegible markers with new markers as needed	10.a.vi		Document number of storm drain inlets labeled/replaced by City Crews and number marked by private development	Tabulation - Track number of inlets marked each year	⇔	⇔	⇔	⇔	⇔	⇔	
Operation and Maintenance of Transportation Facilities											
Street Sweeping for Curbed Streets											
Continue to implement street sweeping program	10.a.vii. , 10.b.v.	✓	Decrease amount of sediment discharged to waters of the State. Document amount of sediment removed	Quantification - Track quantities of sediment removed annually as measure of pollution abated	⇔ 4	⇔ 4	⇔ 4	⇔ 4	⇔ 4	⇔ 4	
BMP's for Roads Maintenance Activities											
Prevent road maintenance materials, street sweeper rinse out water, concrete chute rinse water, and saw cutting slurry from discharging to the storm drain system.	10.a.vii. , 10.b.v.		Implement BMPs during road maintenance and construction activities	Confirmation / Inspection - Identify BMPs implemented	⇔	⇔	⇔	⇔	⇔	⇔	
Maintenance of City-Owned Parking Loat											
Maintain City-owned parking facilities to minimize the build-up and discharge of pollutants to the storm drain system	10.a.vii. , 10.b.v.		Document number of parking lots maintained and type of maintenance performed	Tabulation - Track number of facilities and activities performed	⇔	⇔	⇔	⇔	⇔	⇔	
Roadside Vegetation Maintenance											
Continue to maintain roadside vegetation, public ROW landscaping and L&L's using proper BMP's to prevent stormwater pollution			Implement River Friendly Landscaping and Green Gardner Principles into maintenance practices	Confirmation / Inspection - Identify BMPs implemented	⇔	⇔	⇔	⇔	⇔	⇔	

⇔ Ongoing activity/task ◆ Deliverable or key milestone 2 Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 7.5-1 – City of Folsom SQIP
Municipal Operations Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Fire Emergency and Non-Emergency Response and Operations											
Permittees having a fire protection agency within their jurisdictional control shall develop and implement a response plan to minimize the impacts of fire fighting flows to the environment.	10.a.ix. , 10.b.ix.		Review existing practices for non-emergency training and maintenance activities, report written guidelines for BMP implementation to minimize the impacts of non emergency firefighting flows to the environment.	Confirmation - Provide copy of BMP guidelines, verification of training and any updates with the Annual Reports.		⇔ ♦					
			Review existing emergency response practices and develop a response plan for emergency fire fighting discharges into the MS4.	Confirmation - Provide copy of response plan, verification of training and any updates with the Annual Reports.		⇔ ♦					
Employee Training											
Provide regular internal training on applicable components of the SQIP	10.a.x. , 10.b.x		Conduct training annually to targeted City employees	Tabulation - Track training activities performed	♦	♦	♦	♦	♦	♦	
	10.a.xi.	✓	Maintained/Increased awareness of available BMPs and pollution prevention practices, as measured by quizzes during training	Surveys - Measure raised awareness based on quizzes		②	②	②	②	②	

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 7.6-1 – City of Folsom SQIP
Illicit Discharge Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Legal Authority											
Review and if necessary revise existing Stormwater Ordinance	11.a.i		Revised stormwater ordinance (if needed)	Confirmation - report revisions in AR			♦				1 year following SQIP approval
Reporting of Illicit Discharges											
Continue to utilize Partnership public hotline (808-4H20) for reporting of illicit discharges and connections, and route callers to the City for assistance on City-related issues or complaints	11.a.ii ; 11.b.v		Revisions of hotline or its uses (if needed)	Confirmation/Tabulation - The City will track number of complaints received	⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly
Ongoing Field Screening for Illicit Discharges and Connections											
Continue to conduct ongoing field screening for illicit connections through routine maintenance activities being conducted by field crews	11.a.ii ; 11.b.ii	✓	Decrease in number of illicit connections detected by field screening activities since last permit term	Tabulation - Report number of illicit connections detected via field screening activities in AR	⇔	⇔	⇔	⇔	⇔ ③	⇔	Reported in AR yearly, EA due 12/13
Investigations of Illicit Discharges and Connections											
Investigate illicit discharges	11.a.iv ; 11.b.iii		Non-hazardous illicit discharges investigated within 5 days of discovery or report, hazardous illicit discharges investigated within 1 day of discovery or report	Confirmation - Include number of illicit connection investigations conducted in AR	⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly
	11.a.vi, 11.b.vii	✓	Increase in number of illicit discharges investigated since last permit term	Tabulation - increase in invest. is measure of increased awareness of City staff					③		EA due 12/13

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 7.6-1 – City of Folsom SQIP
Illicit Discharge Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Investigations of illicit connections	11.a.iii ; 11.b.ii		Illicit connections investigated within 21 days of discovery or report	Confirmation - Include number of illicit connection investigations conducted in AR	⇔	⇔	⇔	⇔	⇔	⇔	Reported in Are yearly
Illicit Discharge Response, Containment and Cleanup											
Investigation/Inspection and Follow-up procedures	11.b.iii		Review and update intradepartmental illicit discharge response procedures/flow chart as needed	Confirmation - provide updates in AR	⇔◆	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly, update due 09/10
Respond to, contain and clean up illicit discharges & conncections	11.a.iv ; 11.b.ii, 11.b.iii	✓	Increase in number of responses, containment and cleanup of illicit discharges since last permit term	Tabulation - track number of illicit discharge responses	⇔	⇔	⇔	⇔	⇔ ③	⇔	Reported in AR yearly, EA due 12/13
Enforcement											
Conduct enforcement (e.g., warnings, NOVs, Cease and Desist Orders, ACPs, and Cost Recoveries)	11.b.iv	✓	Decrease in level of progressive enforcement needed. number of enforcement actions since last permit term	Track number and type of enforcement actions	⇔	⇔	⇔	⇔	⇔ ③	⇔	Reported in AR yearly, EA due 12/13

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 7.6-1 – City of Folsom SQIP
Illicit Discharge Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Data Management											
Continue to maintain database to track investigations, enforcement actions and outreach materials distributed	11.a.v		Regularly update database and revise or update its uses (if needed)	Confirmation - Submit data and report updates in AR	⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly
Map the locations of confirmed illicit discharges and connections to help identify areas of targeted outreach			Completed revisions of map or its uses (if needed)	Confirmation - Submit map and report revisions in AR	♦	♦	♦	♦	♦	♦	Reported in AR yearly
Outreach/Training											
Continue to distribute educational materials to public, and document/quantify materials distributed			Completed revisions of outreach materials (if needed) and tabulations of number of individuals that received outreach materials	Confirmation/Tabulation - Track number of brochures distributed	⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly
Provide training to storm drain system maintenance crews and illicit discharge response crews annually	11.b.vi		Track number of City employees trained	Tabulation - Track number of workshops held, number of people reached	⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly
			Maintained/Increased employee awareness as measured by quizzes during annual training	Surveys – measure raised awareness based on quizzes at training events		②	②	②	②	②	EA due 12/13
Facilitation of Proper Household Hazardous Waste Disposal											
Maintain operation of the City's household hazardous waste pickup program		✓	Increase in the quantities of household hazardous waste collected from public since previous permit term	T	⇔	⇔	⇔	⇔	⇔ ③	⇔	Reported in AR yearly, EA due 12/13

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Public Outreach Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
This table describes City-specific activities only. Refer to Chapter 2 (Section 2.6) for additional activities conducted on regional basis by the Partnership.											
Public Outreach Implementation											
Outreach to General Public	12.a.i, iii; 12b.i,iii										
Maintain Folsom stormwater web site; update as needed			Submit updated web page link with annual reports	Confirmation	⇔	⇔	⇔	⇔	⇔	⇔	
Publish stormwater-related articles in City newsletter and newspaper; include City stormwater contact number/web site			Increase in public awareness as determined by public inquiries following publication	Tabulation - track numbers of callers; types of information provided	⇔	⇔	⇔	⇔	⇔	⇔	
Promote stormwater pollution prevention at annual Folsom community events			Document activities and no. people reached	Tabulation- report no. people reached each year	⇔	⇔	⇔	⇔	⇔	⇔	
Partner with other city departments to combine messages and co-sponsor events			to be determined based on activity; see annual reports	to be determined							
Maintain stormwater display at Folsom Zoo.			Educate about 1000 zoo visitors annually (primarily children, students, parents)	Tabulation- report no. visitors each year	⇔	⇔	⇔	⇔	⇔	⇔	
Identify new potential sites for "no dumping" signage along creeks and other areas prone to illegal dumping			Place signs at all new problem areas identified by City maintenance crews	Tabulation - track locations/numbers of signs; Inspections - observe decrease in dumping	⇔	⇔	⇔	⇔	⇔	⇔	
Outreach to Community Groups	12.a.i, iii; 12b.i,iii										
Sponsor and support the Adopt-a-Creek/Trail (ACT; formerly Folsom Creek Watchers) program to engage local scout troops and the Friends of Folsom Parkway volunteers			Document activities and no. people reached	Tabulation- # events, # participants, weight of trash removed, $ amount of grants received	⇔	⇔	⇔	⇔	⇔	⇔	
		✓	Support adoption of 25% of Folsom creeks/trail system over the course of the permit	Tabulation- # miles adopted					❸		Coduct EA in 12/13 before ROWD

⇔ Ongoing activity/task ◆ Deliverable or key milestone ❷ Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

New Development Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Incorporation of Water Quality Protection Principles into Plans, Policies and Procedures											
Update stormwater quality language in the General Plan	13.a, 16		Update applicable sections of the General Plan to include stormwater quality protection principles.	Confirmation – report revisions in AR		⇔	⇔	⇔	⇔	⇔	Date for GP update is uncertain
Development of Standards and/or Guidance											
Develop Low Impact Development (LID) design criteria	15.b		Amend development standards to require implementation of LID strategies.	Confirmation - report revisions in AR	⇔	⇔	⇔ ♦				6 months after approval of HMP.
	15.b, 26		Include LID criteria in the Stormwater Quality Design Manual and revise it as needed.	Confirmation - report revisions in AR	⇔	⇔	⇔	♦			6 months after amending the development
Develop HMP Work plan as part of the revised SQIP.	15.c		Outline the proposed steps to develop the HMP and possible technical methodologies to design the mitigation measures.	Confirmation - develop HMP work plan and pilot project. Submit work products to Regional Water Board.	⇔	♦					30-Apr-09
Develop HMP	15.c		Develop an applicability and susceptibility map showing where hydromodification management measures will apply in Sacramento.	Confirmation - Submit work products to Regional Water Board **1 year** after approval of the HMP work plan.		⇔	♦				1 year after approval of the HMP work plan
Develop design criteria for hydromodidfiaction management measures.	15.c, 26		Include criteria in the Stormwater Quality Design Manual and revise it as needed.	Confirmation - report revisions in AR			⇔	♦			6 months after amending the development standards.
Develop a mitigation fund if needed	19		Develop a mitigation fund framework to support regional stormwater projects.	Confirmation – develop framework when needed and submit to regional Board.							

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Chapter 8

City of Galt Stormwater Quality Improvement Plan

8.1 Introduction

Introduction and Background

The Galt (City) Stormwater Quality Improvement Plan (SQIP) provides information about the City's Stormwater Management Program, including a description of activities conducted to ensure compliance with the Sacramento Areawide NPDES Municipal Stormwater Permit (Stormwater Permit), of which Galt is a permittee. The required certfication for the SQIP is presented in Appendix J.

SACRAMENTO STORMWATER QUALITY PARTNERSHIP

Galt is the smallest city of the permittees that comprise the Sacramento Stormwater Quality Partnership (formerly known as the Sacramento Stormwater Management Program) The Stormwater Permit is issued to the City of Galt and six other co-permittees (Sacramento County and the Cities of Elk Grove, Folsom, Citrus Heights, Rancho Cordova and Sacramento). Galt voluntarily joined Sacramento Stormwater Management Program on June 22, 1990, although Galt would have been considered a Phase II NPDES community. Galt differs from the other permittees in that the City is non-contiguous with other agencies and is influenced by agricultural run-off.

This chapter describes the City of Galt's Stormwater Management Program. The permittee-specific activities described in this chapter are conducted in addition to those implemented jointly with the other permittees as described in Chapter 2.

The original Stormwater Permit was issued in 1990 (first permit term) and has been renewed three times: in 1996, 2002 and most recently in 2008 (fourth permit term).

This SQIP, originally published in July 2003, has been updated for the fourth term of the Stormwater Permit (2008-2013). Implementation of the activities described in the SQIP is intended to satisfy the provisions of the Stormwater Permit. Those provisions were established to reduce pollutants in stormwater discharges to the maximum extent practicable and comply with receiving water objectives.

The City-specific activities described and referenced in this chapter are conducted in addition to monitoring, special studies, target pollutant reduction and regional public outreach activities that are implemented jointly with the other Permittees as described in Chapter 2. The City contracts with the County of Sacramento (County) for many of its stormwater services.

City of Galt Characteristics

The City of Galt is a small city located on State Route 99 in southern Sacramento County approximately 26 miles south of the City of Sacramento and approximately 10 miles north of the City of Lodi. Extensive agricultural lands used mainly for dairy and feed crop purposes surround Galt. Within the City boundaries, the greatest use of land is for residential purposes housing a current population of approximately 24,000 with an expected build out population of 30,000 within the current city limits. In April 2009, the City estimated that there were 468 acres of undeveloped land within the City limits for single family and multifamily residential development, and 288 acres of undeveloped land for Commercial and Industrial land uses. In April 2009 the City of Galt adopted a new 2030 General Plan with a projected build out population of 51,291 and a proposed expansion of its current sphere of influence north of Twin Cities Road. Approximately eight percent (8%) of the total land area encompassed by the 2030 General Plan is proposed to be Light Industrial to accommodate a growing number of industrial users and improve the City's jobs-housing balance. Commercial, Office Professional and Mixed Use land use designations together constitute just over eleven percent (11%) of the total land area. These land uses are intended to provide essential goods and services for the city's residential population as well as the agricultural community surrounding Galt.

Overview of Watersheds

The City of Galt is located within the tributary watersheds of Dry Creek, Deadman Gulch, and Hen Creek. Dry Creek, a tributary of the Mokelumne River, flows along the southern boundary of Galt and forms the boundary between Sacramento County and San Joaquin County. Deadman Gulch, a relatively small local tributary of the Cosumnes River, runs east to west thru the center of the northern portion of Galt. Hen Creek, a relatively small local tributary of Deadman Gulch, runs east to west thru the City and then northwest. Hen Creek drains a majority of the residential development that is approximately 20 years old along the west side of the City between Elm/Orr Rd and New Hope Rd. The majority of the runoff from the southwest section of the City is regulated by the Greer detention basin near West A St/Harvey Rd and Fumasi Ave. Each of the three creeks flows during the winter rainy season. Generally Dry Creek has minimal flows and both Deadman Gulch and Hen Creek are completely dry during the summer months. Both the Cosumnes River and the Mokelumne eventually flow to the Sacramento River approximately 20 miles west of the City boundaries.

Overview of Galt's SQIP

This SQIP describes activities that Galt will conduct in compliance with the Stormwater Permit. Modifications to the program may be necessary as the program evolves, and will be proposed in Annual Reports submitted to the Regional Board on October 1st of each year during the permit term.

Following this introduction, there are seven sections in the chapter, to describe activities related to six major program elements, as follows:

Section 8.2: Program Management — A description of how Galt's Stormwater Management Program is organized, legal authority, priorities and funding, and coordination both within the City and externally with other programs and agencies. See Table 8.2 - 1.

Section 8.3: Construction Program Element — Activities designed to control the runoff of sediment and other pollutants from construction sites. See Table 8.3 - 1.

Section 8.4: Commercial/Industrial Program Element — Activities and control programs designed to reduce pollutants in discharges and effectively eliminate non-stormwater discharges associated with industry.

See Table 8.3 – 1.

Section 8.5: Municipal Operations Program Element — Activities designed to control stormwater pollution resulting from operation of City facilities and to set an example of model pollution prevention for the public. See Table 8.5 – 1.

Section 8.6: Illicit Discharge and Detection Program Element — Activities designed to effectively eliminate illegal non-stormwater discharges to the storm drainage system and receiving waters. See Table 8.6 – 1.

Section 8.7: Public Outreach Program Element — Activities designed to raise awareness and foster community stewardship to promote pollution prevention in the urban area and protection of local creeks and rivers. See Table 8.7 -1.

Section 8.8: New Development Program Element — Activities designed to reduce pollutants in urban runoff discharges from newly developing and redeveloping areas for the life of the project, after construction is complete.

See Table 8.8- 1.

8.2 Program Management and Related Activities

Organization and Staffing of the Galt Stormwater Program

The City of Galt is a Council-Manager form of government. The Stormwater program is part of the Department of Public Works under the direction of the Director of Public Works, as shown in Figure 8-2. The City has assigned an Associate Civil Engineer to manage the Stormwater Program and participate in permittee meetings and other joint Program activities as needed. Assistance is provided by a Senior Civil Engineer, Engineering Assistant, and a Construction Inspector. Additionally, building inspection and administration staffing is provided by other City departments.
The approximate staffing breakdown is shown in Table 8-1.

Table 8-1 - Staffing for the Galt Stormwater Program

Staff	**FTE***
Director of Public Works	0.05
City Engineer	0.05
Senior Civil Engineer (PW)	0.15
Associate Civil Engineer (PW)	0.40
Engineering Assistant (PW)	0.15
Construction Inspector (PW)	0.15
Engineering Staff (PW)	0.10
Street Division (PW)	1.15
Street Superintendent (PW)	0.05
Street Field Supervisor(PW)	0.05
Code Enforcement (CD)	0.05
Planning and Building Department (CD)	0.05
Total	**2.40**

*Full time equivalent
(PW) = Public Works
(CD) = Community Development

Figure 8-2
City of Galt Organizational Chart

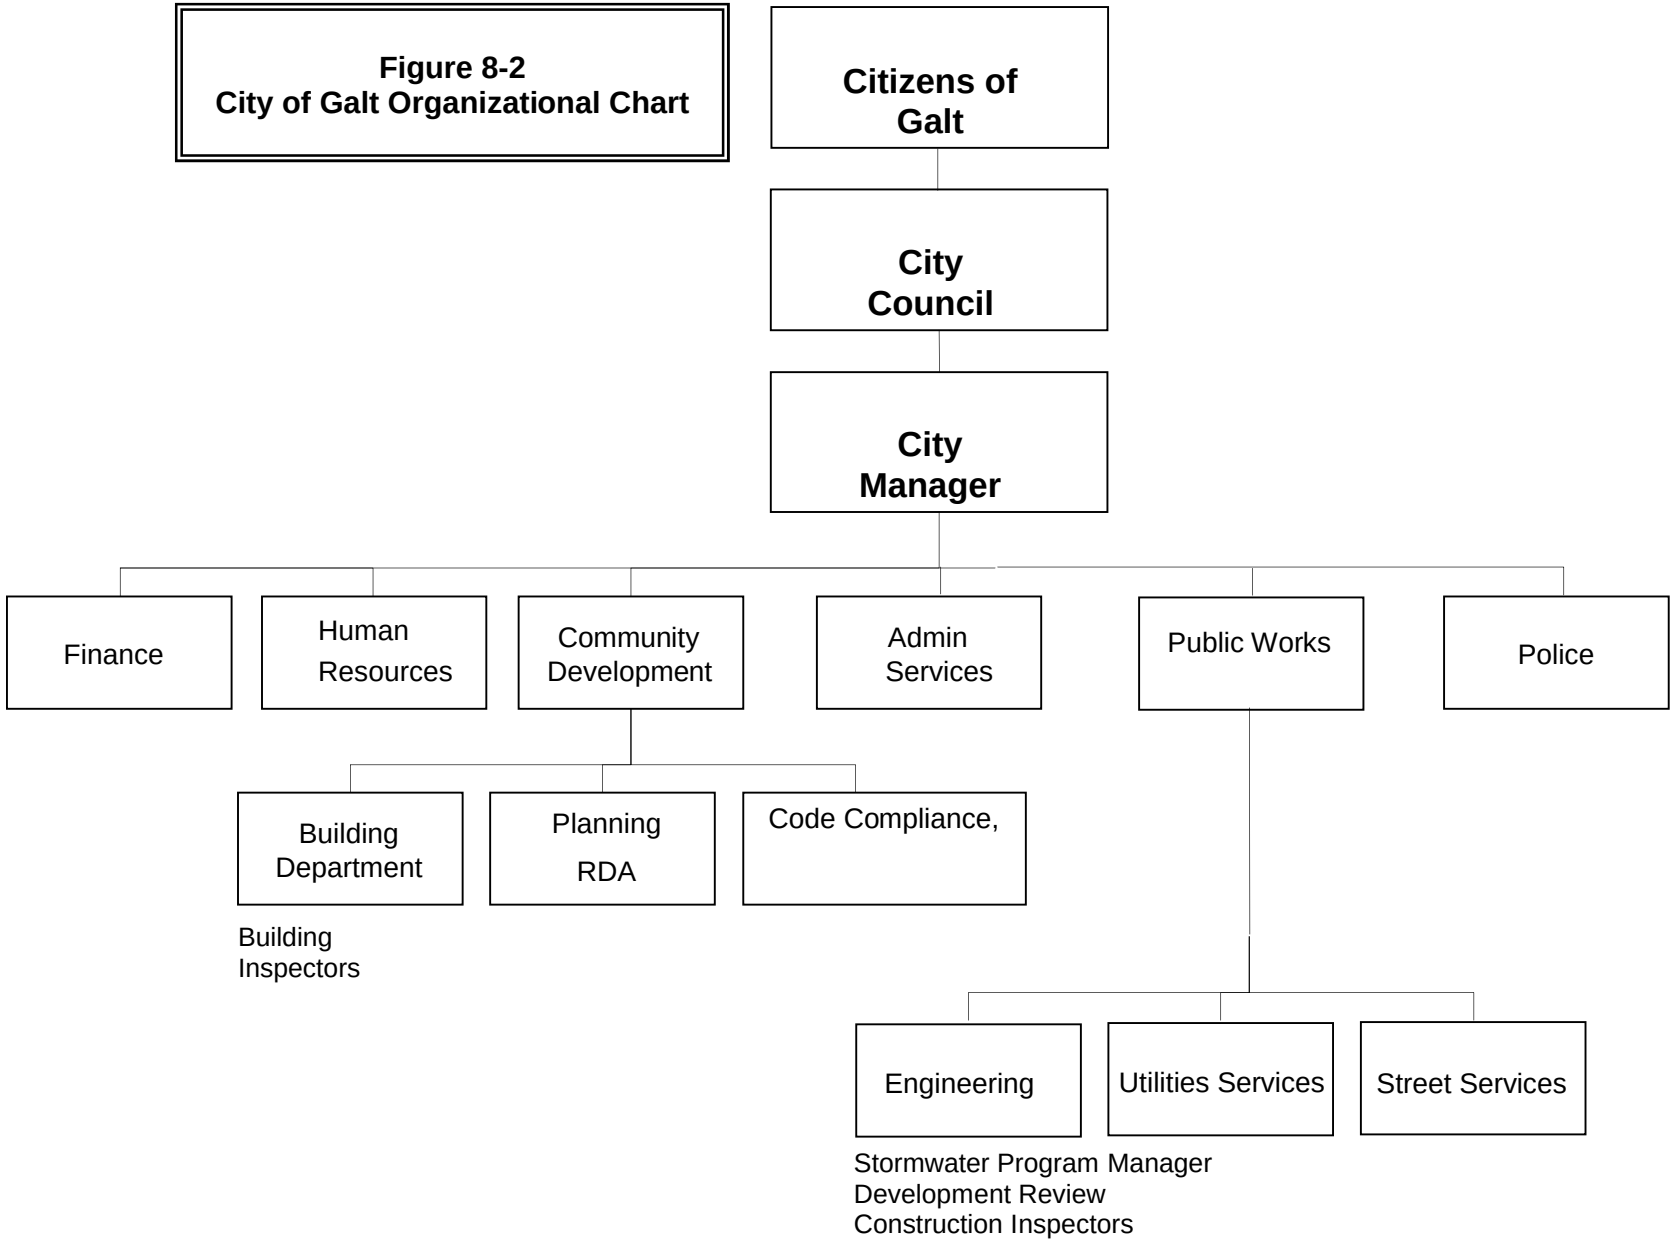

Table 8–2 indicates roles and responsibilities of various city departments for implementation of activities designed to comply with the Stormwater Permit.

Table 8–2

Responsibilities for Compliance with NPDES Stormwater Permit in Galt

Program Element	Department/Group	Major Responsibilities
Program Management (Section 8.2)	Public Works	Administers and manages the City Stormwater Program on behalf of the City. Provides liaison with the Regional Board and prepares/submits compliance reports.
	Admin Services	Conducts legal reviews, prepares legal certifications and oversees revisions to ordinances, codes and other standards.
	County Dept. of Water Resources/Stormwater Staff (under contract to City)	Assists with preparation of Permit compliance deliverables
Construction (Section 8.3)	Public Works	Issues development permits (grading, improvement plans, and encroachment permits) and checks for NOI/SWPPP for all sites subject to State General Construction Permit.
	Public Works	Provides inspection services for public infrastructure, public buildings and private development. Inspection services include oversight of contractor compliance with City Stormwater and Grading Ordinances and State Construction General Permit.
Commercial/Industrial (Section 8.4)	County Environmental Management Dept (under contract to City)	Conducts inspections of all Permit-required industries in Galt once every 3 years, and conducts outreach, database management and reporting. Also see Chapter 4, Section 4.4 for more details.
	County Environmental Health Division (under contract to City)	Conducts plan review, issues permits for and inspects food-related facilities in Galt. Considers drainage issues that may be of concern to stormwater quality in all reviews and inspections.

Table 8–2. Responsibilities for Compliance with NPDES Stormwater Permit in Galt (cont'd)

Program Element	Department/Group	Major Responsibilities
	County Environmental Management Dept (under contract to City)	Conducts plan review, issues permits for and inspects facilities that handle or store hazardous materials in Galt. Considers drainage issues that may be of concern to stormwater quality in all reviews and inspections.
Municipal Operations (Section 8.5)	Public Works	Oversees maintenance of stormwater drainage system to ensure that system is maintained in manner that minimizes water quality impacts.
	Public Works/Parks and Recreation Dept	Manages City-owned buildings, parking lots and other facilities. Responsible for ensuring that activities at these facilities do not add to stormwater pollution
	City of Galt Parks and Recreation Dept	Constructs and maintains City parks and recreational facilities in a manner which complies with applicable water quality laws.
	California Waste Recovery Systems	Provides solid waste services to the City under contract.
Illicit Discharges (Section 8.6)	County Environmental Management Dept Cosumnes Community Service District- Fire Dept	Responds to hazardous materials spills in the City that may impact stormwater quality and receiving waters, including cleanup and proper disposal.
	County Environmental Management Dept Cosumnes Community Service District- Fire Dept	May respond to non-hazardous spills, including cleanup and proper disposal.
Public Outreach (Section 8.7)	Public Works	Provides public outreach to individual property owners and developers and handles calls from the public routed to the City. Provides volunteers to work in Partnership booths at some regional public events. Also contributes funds to the Sacramento Urban Creeks Council to support annual Creek Week activities.
	County Dept. of Water Resources/Stormwater	Conducts most of the public outreach required by the Stormwater Permit, including a regional media campaign that addresses Galt residents and businesses.

Table 8–2. City of Galt Responsibilities (cont'd)

Program Element	Department/Group	Major Responsibilities
New Development (Section 8.8)	Community Development/Planning & Public Works	Processes applications for private developments. Conducts CEQA reviews. Implements General Plan and Zoning code. Routes plans to Engineering/Public Works to ensure that stormwater quality controls are incorporated as required.
	Public Works	Conditions development projects to ensure compliance with City drainage and stormwater quality standards, including establishing requirements for stormwater quality control measures.
	Public Works	Ensures that stormwater quality control measures are incorporated into design/construction of public projects, as applicable.
Monitoring, Special Studies and Target Pollutant	Public Works	Reviews and certifies reports and compliance submittals; approves consultant contract decisions; processes payments to the City/County of Sacramento for consultant services according to the cost-share MOU. Represents Galt in permittee work group meetings to discuss these joint Program activities; reviews draft reports and compliance submittals; administers consultant contracts for the technical studies

Legal Authority

Legal authority for Galt Stormwater Management Program is provided in several ways:

- The City's Municipal Code provides the basic legal authority to implement the program and enforce the local regulations.
- The City uses the County Standard Construction Specifications and Improvement Standards which describe requirements for new development projects.
- The City utilizes adopted Partnerships' manuals, such as "Stormwater Quality Design Manual for Sacramento and South Placer Regions" which describe requirements for new development projects.
- Agreements with the County and other permittees provide for a means of cost sharing to implement various portions of the program.

The City's certification of legal authority for implementation of the program is included in Appendix J.

City Code

The Galt Municipal Code Chapter 16 is the primary basis for the legal authority for the City's Stormwater Management Program. The code constitutes a codification of the general and permanent ordinances of the city.

The predominant municipal code provision is in Chapter 16 - Stormwater Protection was adopted by the City in June 18, 2002 (Ordinance No. 2002-05) and amended in October 2002, October 2003, August 2004 and July 2006. It prohibits most non-stormwater discharges and lists non-stormwater discharges conditionally allowable (e.g., flows from emergency fire-fighting activities) pursuant to NPDES federal regulations. The Stormwater Ordnance provides legal authority to Galt and the County for inspections, enforcement actions, and cost recovery fees related to control of illicit (unauthorized non-stormwater) discharges to the City storm drainage system and local creeks.

General Plan

The City of Galt just adopted the General Plan update on April 2009. The General Plan is the long-term policy guide for the physical, economic, and environmental growth of the City. It is composed of goals, policies, and implementation programs, all based on an assessment of current and future needs and available resources. The General Plan update contains the provisions that lay the framework for protection of water quality and implementation of the Stormwater Management Program.

Memorandums of Understanding

Legal authority for administering and implementing the Sacramento Stormwater Quality Partnership jointly with the other permittees is provided by a memorandum of understanding (MOU). The MOU describes administrative roles and responsibilities for management of the program and performance of joint activities, as well as cost-share arrangements. Costs for joint activities are based on population of each permittee and are therefore subject to change during the term of the Stormwater Permit. Galt's cost share percentage is 1.5%.

A MOU was executed between the City and the County Environmental Management Department (EMD) in 2004, for provision of industrial and commercial inspection and enforcement services required by the Stormwater Permit within the city limits. This MOU authorizes the EMD to conduct inspections and issue enforcement actions, using the legal authority provided by the County's Stormwater Ordinance. EMD also passed a fee ordinance in 2004 which authorizes the agency to recover costs from the industrial and commercial facilities inspected so that the City's other funding sources are not unduly burdened.

Agreements with other agencies will be executed as needed.

Funding

Funding for Galt's stormwater program comes primarily from Stormwater Utility fees, development impact fees, Measure A funds, and gas tax funds. Each year, the City works with the County to develop an annual work plan to describe revenues that will be reimbursed to the City for drainage and stormwater services it provides. The actual and projected revenues and program expenditures are detailed each year in the City's Annual Work Plans and Annual Reports, submitted to the Regional Board.

Stormwater Utility revenues are used to fund City-specific stormwater activities as well as the joint Program activities described in Chapter 2. The City's contribution to the Joint Program is 1.5% based on population, as described in the permittee memorandum of understanding.

In addition to revenues derived from Stormwater Utility fees, Galt collects development impact fees from developers to fund some stormwater-related activities. This would include items such as plan checking for drainage and stormwater-related features, erosion and sediment control inspections during construction, and inspecting installation of stormwater quality facilities by the developer.

The City is also using some Measure A and gas tax funds to rehabilitate and maintain streets and associated drainage structures, including drain inlets, culverts, and roadside drainage ditches.

Recordkeeping and Reporting

The City will prepare and submit the following documents to the Regional Board each year, in compliance with the Stormwater Permit:

- Annual Work Plan (May 1st) – describes proposed activities and budget for coming fiscal year (July 1st – June 30th).
- Annual Report (October 1st) – describes activities conducted during the previous fiscal year, including compliance with performance standards and the Stormwater Permit. Proposes revisions to the Stormwater Quality Improvement Plan, if needed.

Records and data will be collected from all responsible City departments and groups each summer to prepare the Annual Report. The County will assist in compiling and describing information for the activities it conducts on the City's behalf.

The City's stormwater program staff will maintain NPDES Stormwater Permit compliance files at Public Works, including all documentation necessary to demonstrate compliance with the permit. As required, the City will retain copies of all records and reports from the date of generation for at least five years.

Training for City Staff

All affected City staff receive annual refresher training as required by the Stormwater Permit. Staff will be informed and educated about the Stormwater Permit and its impacts on their positions and responsibilities. Training will cover the following types of topics:

- General storm water quality awareness objectives: where storm water goes, how it becomes polluted, and how to prevent pollution.
- Background regulatory information appropriate to the audience.
- How to report/refer observed problems in the field.
- Information about enforcement and penalties appropriate to the audience.

Training for City staff is done through courses offered by Caltrans, Sacramento County, and other agencies. The City will train the inspectors and engineers once a year in the Fall, prior to the wet weather season.

Coordination with Other Agencies and Programs

SACRAMENTO STORMWATER QUALITY PARTNERSHIP

Sacramento Stormwater Quality Partnership

The City participates in regular (approximately monthly) permittee coordination meetings to discuss topics such as:

- Implementation of joint activities, such as monitoring, target pollutant reduction and some public outreach.
- Status of consultant contracts and work products related to monitoring and development standards.
- Funding of activities conducted by others that benefit the Sacramento Program, such as the Brake Pad Partnership and the development of statewide BMP manuals.
- Overall program evaluation and assessment.
- Proposed modifications to the Stormwater Quality Improvement Plans and/or Stormwater Permit.

Outside Agencies

The City coordinates with several local and regional agencies (over which it lacks jurisdictional control) in order to ensure City-wide compliance with the Stormwater Permit:

- Cosumnes Community Services District – Fire Dept
- Sacramento Municipal Utility District (SMUD), Pacific Gas & Electric, AT&T, Comcast and other local utilities.
- Caltrans- owns and maintains several Hwy 99 interchanges/ ramps as well as CA 104, which forms the City's north border east of Hwy 99.

Other Stormwater Programs

The City supports coordination and networking with other stormwater programs within California in order to share information and identify opportunities to work together. This effort is facilitated by the City and County of Sacramento, through their active participation in the California Association of Stormwater Quality Agencies (CASQA).

Effectiveness Assessment

The City's general approach to assessing the effectiveness of its stormwater program is described in Chapter 2. The approach is based on direction provide by CASQA in its Effectiveness Assessment Guidance document.

This section describes assessment activities specific to the program management element, including an evaluation of work done during this permit term and proposed assessment methods for evaluating this permit term activities.

Assessment Methods for Current Permit Activities

Table 8-3 at the end of this chapter proposes assessment methods that the City will use to evaluate the program during this permit term. The City will evaluate its efforts on two levels, using the CASQA-based approach described in Chapter 2:

1) Individual activities and programs, and

2) Program element - *For example, how effective are the combined efforts in the construction element at reducing erosion problems on local construction sites?*

This assessment will be done each summer during preparation of the Annual Report, and recommendations for program improvements or modifications will be made based on these assessments.

Evaluation of the overall Program will be done by the permittees as a group, as described in Chapter 2.

Activities for the Current Stormwater Permit Term

The main goal of the Program Management Element for this permit term will be to continue to ensure that all the requirements of the Stormwater Permit are met, by conducting the various administrative and coordination activities described below.

Legal Authority

Update Codes and Standards As Needed

See Appendix 8B. The City will amend its Stormwater Ordinance (See Appendix 8C) if necessary to reflect changes in the program. The City will also adopt any changes made by the County to the Standard Construction Specifications and the Improvement Standards. It is anticipated that the County will make stormwater quality-related changes to these documents during the fourth permit term.

The City will require the local development community to utilize the May 2007 *Stormwater Quality Design Manual for Sacramento and South Placer Regions* and will ensure that City planners and engineers attend training workshops related to implementation of the new manual. It is likely that as the design manual comes into more use, conflicts may arise between the criteria in the manual and the City's codes. In such cases, the City will amend codes as needed or recommend adjustments to the manual.

Incorporate Water Quality Principles into General Plan Update

Please see attached Appendix 8D applicable sections relating to Stormwater Quality from the City of Galt General Plan Policies Document and Environmental Impact Report)

Update Agreements As Needed

The City will work with the other permittees to update the MOU that outlines joint responsibilities, cost sharing based on Sacramento Area Council of Governments (SACOG) population data, decision making, and information management and reporting. Galt' current cost share (1.5 %) is not expected to change, but roles and responsibilities may.

Fiscal Analysis

Each year, through the City budgeting process, a fiscal analysis will be performed to ensure resources are available and allocated to carry out the proposed activities necessary for Stormwater Permit compliance. Projected budgets for each coming fiscal year will be presented in the Annual Work Plans (May 1st), and actual expenditures for the previous fiscal year will be reported in the Annual Reports (October 1st).

Recordkeeping and Reporting

As required by the Stormwater Permit, the City will submit an Annual Report by October 1st of each year detailing the activities accomplished and the quantitative data compiled during the previous fiscal year (July 1 -June 30). The report will be prepared using a standardized reporting format consistent with the other permittees and approved by the Regional Board. By May 1st of each year, Galt will submit an Annual Work Plan that details the activities proposed for the coming fiscal year.

The City and County of Sacramento will take the lead in submitting Joint Program Work Plans and Annual Reports to describe activities such as monitoring conducted jointly by all the permittees in the Partnership. Refer to Chapter 2 for additional information about joint activities.

City elected officials and managers will be kept apprised of Stormwater Program activities and issues through briefings and interoffice memoranda as needed.

Training for City Staff

Training is an important aspect of Galt's Stormwater Program. Each year, all affected personnel and managers will be educated on the requirements of the Stormwater Permit relevant to their daily work. The training may be in the form of in-house meetings and briefings or external training conducted by the Partnership or others. For example, each year, City construction inspectors will be encouraged to attend one of the pre-wet season training workshops conducted by the Partnership.

Intra and Interagency Coordination

The City will coordinate internally to ensure all necessary City staff, management and elected officials are aware of Stormwater Permit requirements and related program efforts. If needed, the City will develop agreements to define roles and responsibilities between the various City departments responsible for compliance with the Stormwater Permit. This was not necessary during the last permit term.

As discussed previously, the City will work with the other permittees to update the MOU which defines cost-sharing and agency roles. The City will also work with EMD as needed to update the MOU which defines responsibilities for the industrial inspection program.

Galt will attend regular permittee coordination meetings (approximately monthly) or will make arrangements for the County to represent the City at such meetings.

The City will continue to participate with other permittees on various work groups and subcommittees that have been formed to address specific activities, such as monitoring, target pollutants, and special studies. The City may make arrangements for the County to represent the City at these meetings.

The City will continue to coordinate with other outside agencies during the fourth permit term, as needed when multi-jurisdictional issues arise. These agencies may include Caltrans, San Joaquin County, US Army Corps of Engineers, US Fish and Wildlife Service, and the California Department of Fish and Game, among others.

8.3 Construction Element

The goal of the Construction Element is to reduce the discharge of sediment and construction-related pollutants to the City's storm drain system and local creeks to the maximum extent practicable.

With the economic downturn, Galt has relatively little new construction underway or planned for the near future. New development areas in the General Plan update will have to specific plans done, which is typically a two to five year entitlement process. Construction activity within the City is usually characterized by disturbance of small size sites, typically 1-5 acres in size. Disturbance of 20-acres or more in construction activity would be on the large end

Construction Element Strategy

The City has established ordinances that provide the authority necessary for the city inspectors to address threatened and actual discharges of pollutants from construction operations. With this as a foundation, the City's strategy includes outreach and education, plan review and permitting, inspection and enforcement. The program applies to private as well as public construction projects, including those also requiring coverage under the State's Construction General Permit. For the most part, the focus for inspection and enforcement activities is on land disturbing activities of one acre or more. However, smaller sites must comply with the City's Stormwater Protection Ordinance (discussed in Chapter 8.2) and smaller site operators are educated and informed about ways to prevent erosion and pollution problems. As discussed previously, since it is nearly built-out, the City's work in this area is expected to focus on redevelopment activities and continuation of efforts aimed at disturbance of small size sites during the fourth permit term.

Intra and Interagency Coordination

The two city departments most directly involved in construction activities are Public Works and Community Development. Most interdepartmental coordination is done on an informal basis through written correspondence and meetings related to specific projects.

The City coordinates with the other permittees as much as possible to present a consistent, uniform message to the construction and development communities, since construction work is often multi-jurisdictional. For example, the City utilizes the same standard construction specifications and improvement standards as the County.

The City assists the Regional Board in its enforcement of the Construction General Permit by enforcing compliance with comparable local ordinances, verifying NOI filings, spot checking SWPPPs, and referring site operators who have not complied with the State regulations.

Accomplishments to Date

Since becoming a permittee to the Stormwater Permit, Galt has made several notable accomplishments related to the construction element:

- Adopted the Galt Municipal Code, including Chapter 16 (Storm Water) to provide the City legal authority to eliminate construction-related pollutant discharges into its storm drain system.
- Adopted the County's standards and specifications for construction, including standard erosion and sediment control drawings.
- Developed and implemented procedures to require proof of Notice of Intent (NOI) to comply with the Construction General Permit as a condition of obtaining development permits (grading, improvement plans, and encroachment permits) for applicable projects

Effectiveness Assessment

Table 8-3 at the end of this chapter presents the results of the effectiveness assessment conducted for this permit term for the Construction Element. For the most part, activities showed compliance with the Stormwater Permit at Outcome Level 1. These results were used to help identify program improvements and appropriate actions for the fourth term. The goal will be to move more toward Outcome Levels 2 and 3 (changing awareness and behavior, respectively, of the regulated construction community).

Activities for the Current Permit Term

The following information describes in greater detail the activities identified on Table 8-3.

Outreach and Education

The City will continue to provide education and guidance to both City staff (annually) and the local construction and development community (periodically), covering topics such as: current regulations and changes, local procedures and standards, BMPs, new technology, and inspection and maintenance practices. City staff training was covered previously in Section 8.2.

The City will support Partnership training events for the construction community (developers, contractors, engineers, designers) as well as those hosted by local groups such as the Building Industry Association (BIA). This coordinated training helps ensure consistency for the local construction community (which works throughout the Sacramento area, across various municipal lines), promotes stronger ties with professional organizations, and is cost-effective.

Various forms of educational materials will be distributed in different methods, depending on the target audience and message. Typical formats might include training workshops, brochures, and guidance documents and standards. Education will also be provided through the entitlement and plan check process, preconstruction meetings, and example documents.

Galt will continue to contribute funding (through the cost-share MOU) for the development and production of outreach materials such as brochures for concrete and painting, printed in English and Spanish.

Plan Review and Permitting

The City's Stormwater Protection Ordinance (Municipal Code Chapter 16.30) requires a grading permit and erosion and sediment controls on all private projects excavating or filling 50 cubic yards or more of soil or disturbing one or more acres of land. Public projects are subject to the City's Stormwater Protection Ordinance, which prohibits the discharge of sediments and other construction-related pollutants to the City storm drainage system.

Private and public projects in Galt disturbing one or more acres of land are required to obtain coverage under the State's Construction General Permit, in addition to satisfying all applicable local permitting requirements. Prior to issuing a development permit, the City will verify that a State-required Notice of Intent (NOI) was filed and will check the Stormwater Pollution Prevention Plan (SWPPP) for six items required by the Stormwater Permit

Inspection and Enforcement

Galt Public Works Department inspectors will continue to conduct inspections of all construction projects in the City to ensure compliance with the requirements set forth in the City's ordinances. This includes checking sediment and erosion control measures and verifying that a site has obtained coverage under the State's Construction General Permit if applicable. General Permit non-filers and repeat offenders will be referred to the Regional Board as required by the Stormwater Permit.

As with the last permit term, the City will continue to prioritize sites as either "high" or "moderate" threat to water quality and inspects according to this schedule:

- High priority sites – inspected twice monthly during the wet season (October 1 – April 30) and monthly thereafter.
- Moderate priority sites – inspected monthly throughout the year.

New projects will be assumed to be high priority until successive inspections demonstrate that they can be downgraded to moderate priority. The criteria for making this determination will include factors such as: project size, amount and nature of site activity, sensitive site conditions (e.g., proximity to a creek, steep slopes or erosive soils), and history of prior violations by the contractor(s). A log of active construction projects and their priorities will be maintained by the City at all times.

Progressive enforcement action will be taken by the construction inspectors when violations of local ordinances are observed, including discharge of sediments and other construction-related pollutants to the storm drain system or local creeks.

8.4 Commercial/Industrial Element

The goal of the Commercial/Industrial Element is to reduce the discharge of stormwater pollutants to the maximum extent practicable and to effectively eliminate illegal non-stormwater discharges from commercial and industrial facilities and operations in Galt.

Commercial/Industrial Element Strategy

The City of Galt contracts with other agencies to conduct activities related to this program element within the city. The City has executed a MOU with County EMD to conduct triennial inspections of facilities within Galt that were identified in the Stormwater Permit. Partnering with EMD has a few advantages:

- EMD has traditionally conducted environmental compliance inspections in the county, with trained staff, structure, policies and procedures in place. Only modest training and enhancement was required to accommodate stormwater compliance inspections, and use of the existing resource helps minimize inconvenience to the regulated businesses.
- EMD has established a Fee Ordinance which allows them to recover costs for their activities without impacting the City's limited funding sources, such as the County Stormwater Utility.
- Having a single entity (EMD) conduct all the inspections countywide ensures consistent and equitable treatment of the regulated community.

The City contracts with the County to conduct complaint-based inspections of all other businesses within the city. The City also relies on the County to conduct targeted outreach to targeted local businesses.

Intra and Interagency Coordination

A MOU was executed between the City and the County Environmental Management Department (EMD) in 2004, for provision of industrial and commercial inspection and enforcement services required by the Stormwater Permit within the city limits. This MOU authorizes the EMD to conduct inspections and issue enforcement actions, using the legal authority provided by the County's Stormwater Ordinance. EMD also passed a fee ordinance in 2004 which authorizes the agency to recover costs from the industrial and commercial facilities inspected so that the City's other funding sources are not unduly burdened.

The City or its County representative participates in periodic (approximately biannual) meetings with EMD to discuss the program, resolve problems and identify improvements as needed. EMD coordinates with the other permittees and business groups such as Business Environmental Resource Center (BERC) to implement the inspection program. See Chapter 4.4 for additional details.

Accomplishments To Date

Refer to Chapter 4.4 for a complete list of accomplishments during the first 17 years of the program.

Effectiveness Assessment

Table 4.4-1 in Chapter 4.4 presents the results of the effectiveness assessment conducted for this permit term for the Commercial/Industrial Element. For the most part, activities showed compliance with the Stormwater Permit at Outcome Level 1. These results were used to help identify program improvements and appropriate actions for the fourth term.

Table 4.4-1 also proposes assessment methods that the County will use to evaluate the program during the fourth permit term. The goal will be to move more toward Outcome Levels 2 and 3 (changing awareness and behavior, respectively, of the regulated business community).

Activities for the Current Permit Term

The following information briefly describes the activities conducted by County EMD and County DWR on the City's behalf. Refer to Chapter 4.4 for additional details.

Legal Authority

The City's Stormwater Protection Ordinance will continue to provide legal authority to the County for regulating commercial businesses and industries in Galt with respect to stormwater pollution. The Stormwater Ordinance and EMD's Fee Ordinance will be amended as needed during the fourth permit term.

Priority Industry Identification

The industries and commercial businesses subject to stormwater compliance inspections and targeted outreach for the fourth permit term are identified in the sections below. These are the same businesses that were targeted during the third permit term. These lists will be refined during the fourth permit term as needed.

Triennial Industrial Stormwater Compliance Inspections

EMD will continue to conduct triennial inspections at priority industrial facilities. The first cycle of inspections was completed in June 2007 and the second cycle will be completed in June 2010. The following priority industrial facilities in the Galt 95632 zip code area (includes facilities in the unincorporated County area) will be inspected by EMD; the numbers given in parentheses are the number of facilities within the city zip code area in that category for the 2006/07 fiscal year:

- Facilities with coverage under the State's Industrial General Permit (7)
- Auto body shops (3)
- Auto repair shops (9)
- Auto dealers (1)
- Equipment rental facilities (0)
- Kennels (0)
- Nurseries (3)
- Retail gasoline outlets (i.e., gas stations) (6)
- Restaurants (47)

This list and the associated definitions of industrial categories in Appendix F will be evaluated and revised as needed by the end of the fourth permit term.

EMD inspectors will distribute educational materials to the operators of these facilities during inspections. They will also refer suspected Industrial General Permit non-filers to the Regional Board.

EMD will continue to follow their enforcement policy that emphasizes compliance of facilities with the County Stormwater Ordinance through progressive enforcement actions. Fines will be assessed as necessary for repeat violations that remain unresolved.

EMD will continue to maintain its database and generate monthly violation reports, as well as all the required information for the Galt Annual Reports.

Complaint-Based Stormwater Compliance Inspections

City staff will inspect other businesses not addressed by EMD's program described above within the City of Galt on a complaint basis. Complaints can be referred by the public, other County agencies and departments, the Regional Board, and other sources. City stormwater staff will refer to EMD any complaints related to businesses included in the triennial inspection program. All other complaints will be investigated, and associated progressive enforcement will be conducted to ensure that the stormwater pollution problem(s) are eliminated.

County EMD will distribute educational materials during these inspections and will keep a database for annual reporting purposes.

Educational Outreach

During the fourth permit term, County stormwater staff will continue to conduct outreach to the targeted businesses within the city, on behalf of Galt. Outreach will be conducted with the following priority business operations.

- Automotive washing and detailing businesses
- Carpet cleaning businesses
- Commercial pesticide applicators
- Concrete contractors
- Concrete cutting contractors and businesses
- General building contractors
- Landscape installation contractors and maintenance businesses
- Painting contractors
- Portable toilet rental businesses
- Pressure washing businesses
- Street sweeping businesses
- Swimming pool contractors
- Swimming pool maintenance businesses

Businesses in these priority categories are considered potential temporary or intermittent sources of unauthorized non-stormwater discharges and/or stormwater pollution. Most of the businesses are mobile operations without a single base of operation, so they are difficult to track.

The County will conduct targeted outreach to the listed business types at least twice during the five-year term of the Stormwater Permit. BERC will continue to manage the business outreach database and coordinate direct mailing of educational materials on behalf of the permittees. Educational materials will also be distributed via City and County public counters, through trade associations and industry suppliers, and at workshops and other events.

The City and County of Sacramento will continue to implement the Clean Water Business Partners (CWBP) Program, and will expand the program as appropriate and necessary to target other businesses.

8.5 Municipal Operations Element

The primary goal of the Municipal Operations Element is to control stormwater pollution resulting from the operation and maintenance of City-owned facilities and areas, including buildings, yards, parks and open space, parking lots, landscape medians, roadways and utilities such as water, sewer and storm drain systems. Routine management and operations and maintenance of theses facilities and areas must be conducted in a manner that does not inadvertently contribute pollution to local creeks and rivers. Another goal is to set an example of model pollution prevention for the public.

Inventory of City Operations and Related Stormwater Activities

The Municipal Operations Element addresses operation of City-owned facilities within the NPDES Permit area (urbanized areas), not already covered by the State NPDES General Permit for Stormwater Discharges Associated with Industrial Activity (Industrial General Permit).

The following is an inventory of the City-owned facilities and operations addressed by this element:

Buildings – The City owns and operates the City Hall complex, Park and Recreation Building, Municipal Services Center and the Police Service Center. There are no known stormwater issues with these complexes.

City parks – 15 parks within the City are operated and maintained (including vegetation and waste management) by the City's Parks and Recreation Department.

Storm Drain System

Piped storm drain system – Approximately 72 miles of storm drain pipe and associated drain inlets and manholes are maintained by the Street Division under the City's Public Works Department.

Storm drain inlets – The City has approximately 1450 storm drain inlets within its jurisdiction. The City was required by the 2002 Stormwater Permit to mark 95% of storm drain inlets by the end of 2007. This was accomplished through the City Staff and Boy Scout volunteers. In the fourth permit term, the remaining 5% of the inlets will be marked and City crews will replace any illegible markings observed during routine storm drain maintenance activities.

Channels and creeks – Manmade drainage channels and natural creeks are maintained by City crews.

Transportation Facilities

Curbed Streets – Streets are cleaned by City staff in the Street Division in the Public Works Department. The frequency schedule is:

- Arterials – Once a week, year round
- Collectors – twice a month, year round
- Residential – twice a month, year round

Roads and Roadside Vegetation – Public Works Department repairs roads and maintains roadside vegetation.

City-owned parking lots – The City Parks and Recreation Department maintains the City owned parking lots on an as needed basis.

The City corporation yard is under the Industrial general permit and inspected by EMD. Monitoring reports are submitted twice a year to Regional Water Quality Control Board.

The City's activities under the Municipal Operations Element do not address facilities operated by federal or state governmental agencies (e.g., Caltrans) and special districts (e.g., Galt Elementary and High School Districts) which are out of the County and City jurisdictional control. City stormwater inspectors are authorized to issue enforcement actions to the operators of such facilities if discharges from the facilities contribute pollution to the City-owned storm drain system or local creeks.

Municipal Operations Element Strategy

In order to minimize potential adverse environmental effects associated with constructing, operating, and maintaining city facilities, the City has adopted these strategies for the Municipal Operations Element:

- Provide training and technical assistance to target employees and facilities.
- Evaluate activities, facilities, employee training and any available Municipal SWPPPs to improve procedures and BMP's to address stormwater quality concerns; and
- Conduct record keeping and documentation of processes to allow for continuous assessment evaluations in order to achieve improvements with Stormwater Permit compliance.

These combined efforts help ensure that City designers, contract administrators, and operations and maintenance staff understand, implement, and demonstrate compliance with the Stormwater Permit in order to reduce stormwater pollution to the maximum extent practicable.

Intra and Interagency Coordination

The City coordinates with the other permittees, stormwater programs, and local, state, and federal agencies to share information, strategies, and recommended practices related to operation and maintenance of County facilities.

The City does not have legal jurisdiction over certain entities and special districts within the City's permit boundaries such fire and school districts as well as state and federal agencies. Because in many cases these entities discharge runoff to the City's storm drain system, the City expects and enforces compliance with local codes, regulations, and ordinances as in the case of any private business or entity. The City coordinates with these districts as needed, to protect the City's storm drain system and local creeks and rivers.

Accomplishments To Date

Since becoming a permittee to the Stormwater Permit, Galt has made several notable accomplishments related to the Municipal Operations Element:

- Established routines for collecting and compiling data to assess activities and document regulatory compliance (e.g., staff routinely log the quantity of pipes, channels, basins, sumps, drop inlets, manholes, and roadways cleaned. This information is tallied and presented in Annual Reports). Compiled the inventory of City-owned facilities and operations. The inventory helps with tracking activities and the City updates the inventory each year for the Annual Report.

Effectiveness Assessment

Table 8-3 at the end of this chapter presents the results of the effectiveness assessment conducted for this permit term for the Municipal Operations Element. Activities showed compliance with the Stormwater Permit at Outcome Level 1 and raised awareness by municipal staff through training (Outcome Level 3). These results were used to help identify program improvements and appropriate actions for the fourth term.

Table 8-3 also proposes assessment methods that the City will use to evaluate the program during the fourth permit term. The goal will be to move more toward Outcome Levels 2 and 3 (changing awareness and behavior, respectively, of the regulated construction community).

Activities for Fourth Stormwater Permit Term

The following information describes in greater detail the activities identified on Table 8-3.

Maintenance of Buildings

The main potential for stormwater pollution at City owned buildings are parking lot runoff. See the parking lot maintenance activities described later in this section, which are designed to minimize discharge of pollutants.

Operation and Maintenance of City Parks

The Parks and Recreation Department will continue to manage the 15 parks within the city limits.

Maintenance of the Piped Storm Drain System

The Street Division within Public Works Department will continue to service and maintain the Storm Drain System.

Maintenance of Creeks and Channels

The Street Division within Public Works Department will continue to service and provide maintenance to the local creeks and channels. Hand methods are used for this cleaning and vegetation is retained on slopes to prevent erosion.

Inspection and Maintenance of City-Owned Parking Lots

The City owned parking lots exposed to rainfall will be maintained by Parks and Recreation Department. Service will be provided on an as-needed base.

Prioritized Street Sweeping for Curbed Streets

The Street Division within Public Works will continue to provide street sweeping on curbed streets, to follow the prioritized schedule described at the beginning of this Chapter.

Maintenance of Roads and Roadside Vegetation

The Street Division within Public Works will continue to provide maintenance to roadside vegetation.

8.6 Illicit Discharge Element

The goal of the Illicit Discharges Element is to reduce the discharge of stormwater pollutants to the maximum extent practicable and to effectively eliminate illicit non-stormwater discharges.

The storm drain system consists of a network drain inlets, manholes and piping, as well as streets, sidewalks, gutters and roadside ditches, which discharges to local creeks and rivers. Please see Figure 8-6 for map and legend for city storm drain outfalls to local creeks (i.e. waters of the State) Stormwater runoff from driveways, parking lots, roof drains and other surfaces typically discharge into this system.

Two kinds of discharges are addressed by this element:

- *Illegal dumping* – Dumping of liquid or solid wastes into the storm drain system. Examples include mobile carpet cleaning companies discharging dirty rinse water into a storm drain manhole, a homeowner dumping used motor oil into a storm drain inlet, or a person dumping garbage or other wastes into drainage channels and creeks.
- *Illicit connection* – A piped connection allowing sanitary sewage to flow into the storm drain system. For example, a washing machine plumbed into the storm drain system rather than the sanitary sewer.

Any material dumped or discharged into the City's storm drain system eventually makes its way to a local creek and/or river, where it can impair beneficial uses. This is true whether the material is classified as hazardous or not. Water quality, habitat, and aesthetics are all examples of benefits that can be impacted.

Illicit Discharge Element Strategy

The City's strategy for eliminating illicit discharges to the storm drain system and local waterways is the same as the County's. It includes:

- Maintaining adequate legal authority to prohibit illicit discharges. This is accomplished through the City Stormwater Protection Ordinance. City and County staff are authorized to enforce the ordinance within the City limits.
- Conducting ongoing field screening to detect illicit discharges and connections as a part of routine maintenance and repair of the storm drain system and local creeks, and enforcing against dischargers.
- Providing convenient means for residents to dispose of solid and household hazardous wastes.
- Educating City staff, contractors and the public about how to identify and report illicit discharge problems. This effort includes educational materials, signage and training.
- Providing a hotline for public reporting of problems and responding in a timely manner. The City supports the regional stormwater hotline 808-4H20 for this purpose.

Intra and Interagency Coordination

The Street Division within Public Works provides maintenance of the storm drain system in Galt. City crews conduct ongoing field screening for illicit discharges and connections as part of this work.

The City Public Works Department coordinates with field crews to make sure that they have the education and training needed to detect and report illicit discharges to the creeks in the city.

The City coordinates with the other permittees in the Partnership to produce educational materials and messages designed to eliminate illicit discharges.

Galt contracts with the California Waste Recovery System to conduct solid waste management and recycling and household hazardous waste collection for residents of Galt.

Accomplishments To Date

The following highlights major accomplishments of the Illicit Discharge Element since 1990:

- In 2002 the City adopted Stormwater Ordinance within the Galt Municipal Code, Chapter 16, which makes most discharges to the storm drain system illegal (some exceptions are noted).
- 95% of storm drain inlets in the City were stenciled with the "No Dumping — Drains to Creek" message, primarily using volunteers.
- As required by the County's Improvement Standards (used by the City), permanent "No Dumping" stamps were applied to all new concrete storm drain inlets.
- In 2006, a new hotline was set up to supplement the County's 875-RAIN hotline. This new hotline, 808-4H20, allows callers to select Galt and be routed to Public Works for assistance. The hotline is now widely advertised on all Partnership educational materials, media spots, and on the web site.
- Open channels, priority piped outfalls and outfalls larger than 36 inches were all inspected in a phased program over a two-year period. No illicit discharges or connections were discovered during these investigations.
- The City created and annually updated an illicit discharges map. The goal of the mapping work is to identify "hot spot" problem areas requiring additional or more frequent investigations. To date, no such areas have been identified.

Effectiveness Assessment

Table 8-3 at the end of this chapter presents the results of the effectiveness assessment conducted for this permit term for the Illicit Discharge Element. Activities showed compliance with the Stormwater Permit at Outcome Level 1 and raised awareness by municipal staff through training (Outcome Level 2). These results were used to help identify program improvements and appropriate actions for the fourth term.

Table 8-3 also proposes assessment methods that the City will use to evaluate the program during the fourth permit term. The key challenge for the fourth permit term will be to investigate ways to compile, analyze and report data to demonstrate changes in awareness and behavior (Outcome Levels 2 and 3) as a result of the inspection, enforcement and outreach efforts. This evaluation will take place near the end of the fourth permit term to coincide with the Report of Waste Discharge application for the fifth permit term.

Activities for the Current Stormwater Permit Term

The following information describes in greater detail the activities identified on Table 8-3.

Update Stormwater Ordinance and Improve Enforcement Authority as Needed

The City will periodically evaluate the Stormwater Ordinance and amend as needed to enhance legal authority.

Ongoing Field Screening to Detect Illicit Discharges and Connections

Activities to prevent and reduce illicit discharges to the piped storm drain system and creeks within the City of Galt will continue as a coordinated activity by Galt

City crews responsible for inspecting and maintaining the piped storm drain system, creeks and channels, and roads/roadside ditches in the City will continue to be trained how to identify, clean up and/or refer and report observed incidents of illicit discharges.

City crews will also respond to complaints from the public and referrals from County industrial inspectors, the Regional Board and others. Problems are addressed on an individual basis depending on the nature of the discharge.

Solid Waste and Household Hazardous Waste Programs

Galt will continue to contract with the California Waste Recovery System to conduct solid waste management and recycling and household hazardous waste collection for residents of Galt.

Education and Outreach

To educate the public, and to minimize illegal discharges of waste into the storm drain system, Galt will continue to promote marking of storm drain inlets with “No Dumping” messages, using volunteer groups as available or County maintenance crews.

The City will continue to contribute funding to the County’s 808-4H20 hotline to facilitate public reporting of problems in the City.

Figure 8-6

City of Galt Major Storm Drain Outfall Map

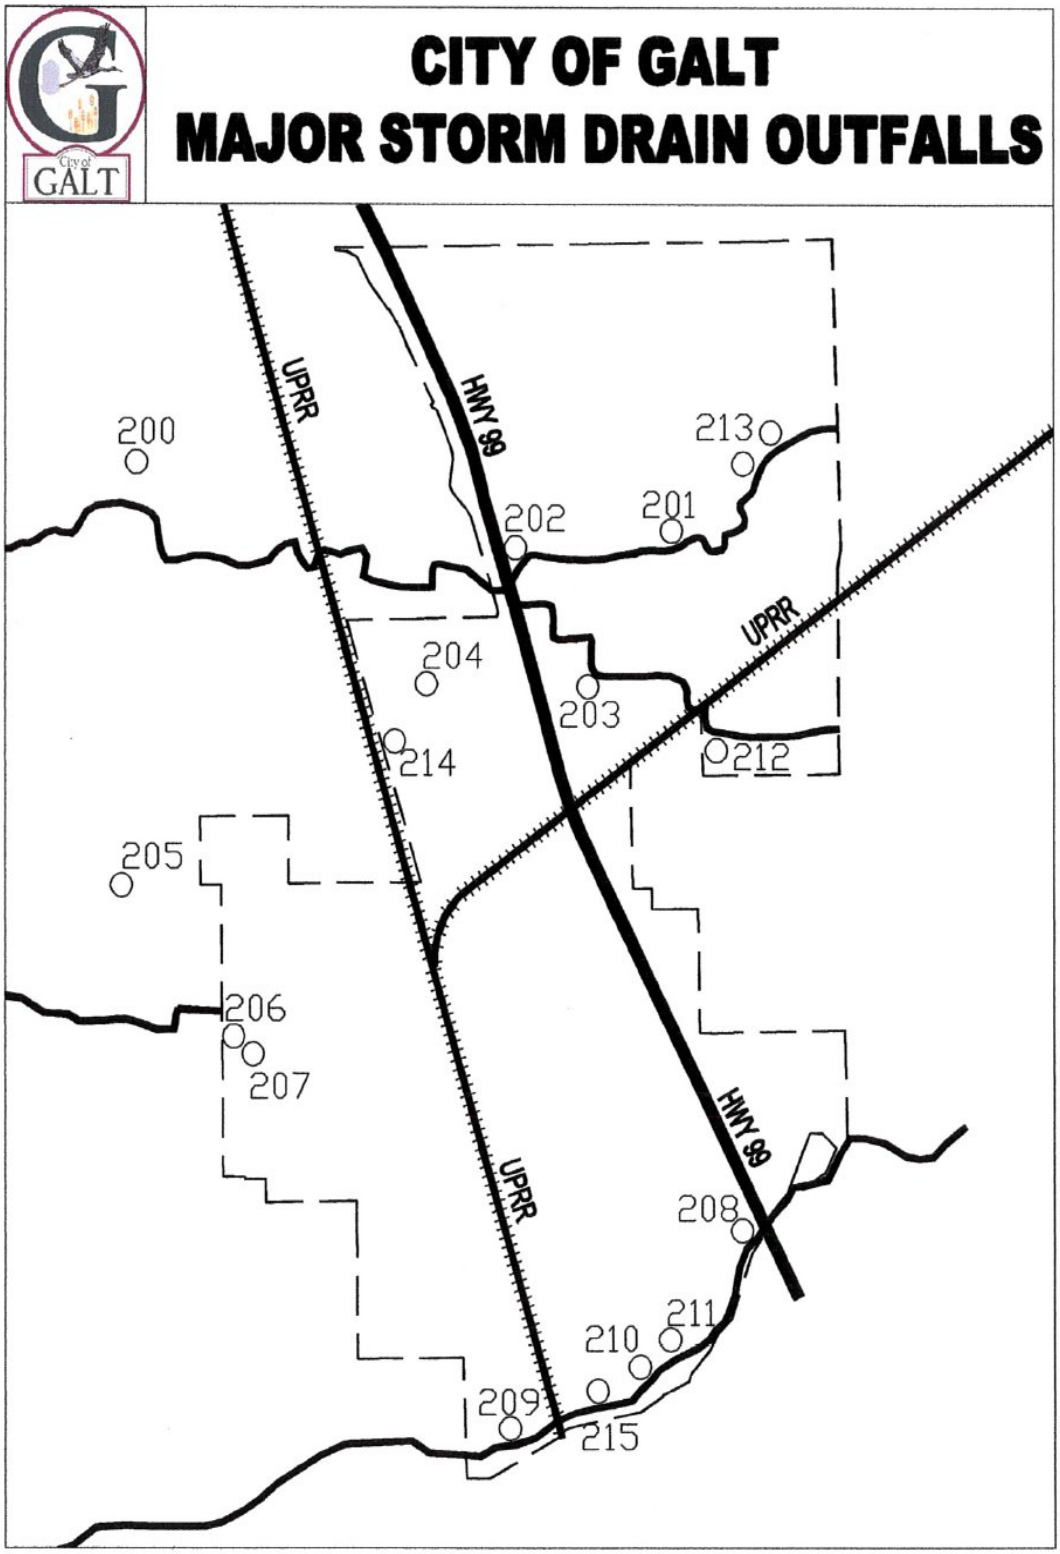

Figure 8-6, cont.

City of Galt Major Storm Drain Outfall Map Legend

City of Galt
Major Storm Drain Outfalls

200	54" @ Spring Street to Laguna Creek
201	2 – 72" @ Carillion Blvd to Dead Man's Gulch (North Tributary)
202	60" @ Winn Drive to Dead Man's Gulch (North Tributary)
203	48" @ Lyonia Drive to Dead Man's Gulch (North Tributary)
204	48" @ Industrial Drive to ditch tributary
205	48" @ Orr Road / Elm Drive to Hen Creek
206	2 – 48" @ A Street to Hen Creek
207	Greer Pump Station to Hen Creek
208	48" @ Fairway Drive to Dry Creek
209	84" @ First Street to Dry Creek
210	60" @ South Lincoln Way to Dry Creek
211	42" @ Chase Drive to Dry Creek
212	36" @ Trafalgar Circle to Dead Man's Gulch (South Tributary)
213	2 – 72" @ Walnut Avenue to Dead Man's Gulch (North Tributary)
214	2 – 72" @ Pringle Avenue to City Ditch
215	48" @ Wilder Way to Dry Creek

8.7 Public Outreach Element

The goal of the Public Outreach Element is to raise awareness and foster community stewardship to help prevent pollution and protect local creeks and rivers.

The City coordinates with the Partnership to implement a wide range of activities to increase the knowledge of the community regarding the City' storm drain system, impacts of urban runoff on local creeks and rivers, and potential pollution prevention solutions for the targeted audiences.

Galt Community Characteristics

There are 22,355 residents in the City of Galt. The Galt Union Joint High School District operates Galt High School with approximately 2000 students. Construction of a new high school is nearly completed with the completion date expected in August 2009. The Galt Joint Union Elementary School District serves approximately 4,292 students K-8 with 5 elementary schools and 2 middle schools.

The Sacramento Bee is the major newspaper serving the region and the City of Galt. In addition, the Galt Herald, a local newspaper, is published once a week on Wednesday. The Lodi News-Sentinel provides daily coverage of the Galt area also. City publishes its own *Galt Connections* community newsletter about four times a year. Other media includes television and radio stations that serve the greater Sacramento area.

Public Outreach Element Strategy

The City contracts with Sacramento County to conduct most of the public outreach activities for Galt residents. For details about the County's public outreach activities, refer to Chapter 4.7. Galt also contributes to regional public outreach (discussed in Chapter 2) through the permittee cost-share MOU.

In addition, the City conducts these types of public outreach activities on its own:

- Educating City Council and department managers about the stormwater program and impacts to the city, and garnering support for Partnership efforts.
- Responding to local resident and business phone calls received by 808-4H20 and forwarded to City Hall.
- Making Partnership outreach publications such as brochures available to the general public and development project applicants at the public counter.
- Working with community groups and neighborhood associations on various efforts. For example, the volunteer storm drain stenciling program.

Intra and Interagency Coordination

The City's Public Works Dept. is responsible for administering the stormwater program and overseeing Stormwater Permit compliance. Public Works coordinates with City Council, the City Manager's office and other departments as needed throughout the year to share information.

Galt coordinates with the other cities in the County on regional public outreach issues through the Partnership. Activities such as the regional media campaign are generally discussed, and agreements made, during permittee coordination meetings.

Accomplishments To Date

Chapters 3.7 and 4.7 describe major accomplishments related to public outreach by the Partnership and the County of Sacramento since 1990. In addition, the following describes several major accomplishments made by the City:

- The City helped coordinate and host the Partnership stormwater informational booth at various annual community events, such as several "I Love My Park" events.
- The City annually contributed funding to the Urban Creek Council's Creek Week program.
- City staff initiated and coordinated volunteer stenciling of storm drain inlets in the city as an educational activity. Community and civic organizations are encouraged to apply "No Dumping" messages to storm drain inlets using City-supplied materials and instructions.

Effectiveness Assessment

Table 8-3 at the end of this chapter presents the results of the effectiveness assessment conducted for this permit term for the Public Outreach Element. Activities showed compliance with the Stormwater Permit at Outcome Level 1 and raised awareness by municipal staff through training (Outcome Level 3). These results were used to help identify program improvements and appropriate actions for the fourth term.

Table 8-3 also proposes assessment methods that the City will use to evaluate the program during the fourth permit term. The goal will be to move more toward Outcome Levels 2 and 3 (changing awareness and behavior, respectively, of the regulated construction community).

Activities for the Current Stormwater Permit Term

The following information describes in greater detail the activities identified on Table 8-3.

Continue to promote volunteer stenciling of storm drain inlets as an educational activity, until all existing inlets in the community have been stenciled. Supply all necessary materials and supplies to community groups upon request.

Continue to work with the County to sponsor and staff a stormwater booth at the following types of community event:

- I Love My Park events

Continue to annually contribute funding to the Urban Creek Council's Creek Week program.

In 2009, the City of Galt hosted and assisted with a local Creek Week program along Deadman Gulch in the city limits.

Meet with the City manager periodically throughout the Stormwater Permit term to keep him informed about the Program. Presentations will be made to the City Council and/or Planning Commission upon request. City leaders will also be invited to participate in community events to demonstrate support for the stormwater pollution prevention effort.

8.8 New Development Element

The goal of the New Development Element is to mitigate urban runoff pollution and other water quality impacts associated with new development and redevelopment.

> The primary mission of the New Development Program Element is to reduce pollutants in urban runoff discharges to the storm drain system from newly developed and significantly redeveloped sites, including post-construction to the maximum extent practicable (MEP).

New Development Element Strategy

Through the New Development Element, the potential adverse effects of development can be mitigated with a combination of strategies. Such strategies include:

- Implementing a regional Design Manual for stormwater quality controls;
- conducting ongoing outreach and education to the development community and City staff;
- ensuring early site planning to limit sources of pollution and implement development standards;
- requiring the installation of permanent BMP's to treat runoff before it reaches creeks and rivers, and
- insuring that post-construction BMP's are maintained properly.

Intra and Interagency Coordination

The Public Works Department coordinates conditioning of development projects with Community Development Dept. The City also coordinates with the other permittees regarding the new Design Manual and implementation of standards.

Accomplishments To Date

- In the mid 1990s, the City established and began implementing stormwater controls for newly developing projects within the City limits.
- Since 2004, the City has been executing maintenance agreements with property owners to ensure long-term maintenance of stormwater quality facilities.
- The City worked with the other permittees in the Partnership to create the new *Stormwater Quality Design Manual for the Sacramento and South Placer Regions*, continued to conduct special studies of BMP effectiveness, and conducted other activities. These accomplishments are described in more detail in the County's SQIP, Chapter 4, (Section 4.8).
- The City updated its CEQA initial study checklist and mitigation measure language to better address water quality protection and stormwater pollution prevention.

Effectiveness Assessment

Table 8-3 at the end of this chapter presents the results of the effectiveness assessment conducted for this permit term for the New Development Element. Activities showed compliance with the Stormwater Permit at Outcome Level 1 and raised awareness by municipal staff through training (Outcome Level 3). These results were used to help identify program improvements and appropriate actions for the current permit term. The goal will be to move more toward Outcome Levels 2 and 3 (changing awareness and behavior, respectively, of the agency staff and regulated development community).

Activities for the Current Permit Term

Impacts from development and redevelopment within Galt will be mitigated with a combination of strategies such as: early site planning to limit sources of pollution, requiring installation of permanent post-construction stormwater quality facilities to treat runoff before it reaches the drainage system, and ongoing outreach activities through education and training. These activities and more are described in this section. Most residential development projects in Galt fall below the threshold requiring stormwater quality treatment of runoff, but the City will implement Low Impact Development (LID) strategies to the maximum extent practicable.

Update Environmental Review Documents as Needed

The City will periodically evaluate and revise as needed, the CEQA initial study checklist and mitigation measure language used by City planners to condition development projects. Revised checklists and mitigation language will be submitted with Annual Reports.

Ensure Compliance with Development Standards and the Design Manual

Development and redevelopment projects in Galt will be conditioned for mitigation of receiving water impacts from urban runoff quality and quantity in the same manner as projects are conditioned in Sacramento County.

Community Development planning staff will continue to coordinate with Public Works engineers to ensure that development and redevelopment proposals comply with the regional design standards as adopted by the permittees.

Other significant permit requirements include revision of the City's General Plan when it is next updated. Revised General Plan elements will be submitted to the Regional Board as attachments to Annual Reports when available.

Development and redevelopment within Galt will be mitigated with a combination of strategies such as: early site planning to limit sources of pollution, installation of permanent BMP's to treat runoff before it reaches the drainage system, and ongoing outreach activities through education and training.

The City will contribute funds via the Permittee cost-share MOU to conduct special studies of selected stormwater quality BMP's to verify their local pollutant removal effectiveness (see Chapter 2). For example, the operation and effectiveness of a wet water quality detention basin will be studied.

City staff will review initial development applications for conformance with the *Stormwater Quality Design Manual for the Sacramento and South Placer Regions*. Compliance with the development standards and the design manual will be a standing discussion item on the agenda for all pre-application meetings.

City staff will promote the voluntary use of runoff reduction, or LID, control measures on development projects as a means of mitigating downstream habitat and erosion impacts. Such measures are expected to become mandatory for projects in certain areas when the permittees' hydromodification management approach is defined to comply with the 2008 Stormwater Permit.

The City will make sure that the same development standards applied to private development projects are adhered to for public projects.

Update Codes As Needed

The City planning staff will review and update as needed, various City codes that may conflict with the development standards and Design Manual. Alternatively, changes will be proposed to the Design Manual to achieve better consistency.

Hydromodification Management Program

The City will actively participate in efforts with the other permittees to develop a hydromodification management plan for the permit area, in compliance with the 2008 Stormwater Permit. Additional details about this work will be defined in future amendments to this SQIP.

Waiver Program

The City will actively participate in efforts with the other permittees to develop a waiver program for the permit area, whereby project applicants may pay into an in-lieu fund when it is determined that runoff reduction and/or stormwater quality control measures are infeasible for their site.

Contribute to Regional Special Studies

The City will contribute funds via the Permittee cost-share MOU to conduct special studies of selected stormwater quality control measures to verify their local pollutant removal effectiveness (see Chapter 2). Some of these studies are continued from the last permit term, for example, the study of a wet water quality detention basin. The City will also continue to contribute to the Partnership's efforts to update the protocol for acceptance of proprietary control measures.

Training for Planners and Development Engineers

Refer to Section 8.5 for details on Galt's annual refresher training for all employees affected by the stormwater permit.

Table 8.3 Effectiveness Assessment – City of Galt Stormwater Management Program

Element Activity/Task	Performance Standard (Goal)		3rd Permit Term		4th Permit Term	
		OUT-COME LEVEL	Effectiveness Assessment	OUT-COME LEVEL	Baseline Information	Effectiveness Method
Program Management (8.2)						
Update Codes and Standards	Adopt revisions as needed	1	SWO revised 2004 and 2006	1	No modifications necessary yet.	Confirmation - report revisions in AR
Fiscal Analysis	Review Budget	1	Mid-year Budget Review completed May 2007	1	Budget continually being assessed. Mid-term budget adjustments to be completed May 2009.	Confirmation - report revisions in AR
Recordkeeping and Reporting	Annual Report & Annual Work Plan	1	Annual Report submitted by Oct 1, 2006	1	Annual work plan to be submitted May 2009. Annual Report submitted October 2008.	Confirmation - report revisions in AR
Construction (8.3)						

Element Activity/Task	Performance Standard (Goal)		3rd Permit Term		4th Permit Term	
		OUT-COME LEVEL	Effectiveness Assessment	OUT-COME LEVEL	Baseline Information	Effectiveness Method
Outreach	Produce/distribute educational materials (work with Partnership)	1	Comment on material and contribute to the Partnership funding to purchase material. Distribute materials.	1	Same, no change	Confirmation/ Reporting-Include revised/new materials in AR; report no. materials distributed
Plan Review	Review development plans for consistency w/ NPDES permit	1	Reviewed Erosion and Sediment Control Plans and SWPPP	1	Reviewed Erosion and Sediment Control Plans and SWPPP	Confirmation - report revisions in AR
Inspections & Enforcement	Conduct Inspections. Issue NOVs to non-compliant sites	1	Inspections are occurring as required by permit. Issued 15 NOVs during 2003-07. Assessed $750 in fines during 2003-07	1	Conduct inspections. No NOV issued for current permit term.	Confirmation - report revisions in AR
Commercial/Industrial (8.4)						
See Table 4.4-1						

Element Activity/Task	Performance Standard (Goal)		3rd Permit Term		4th Permit Term	
		OUT-COME LEVEL	Effectiveness Assessment	OUT-COME LEVEL	Baseline Information	Effectiveness Method
Municipal Operations (8.5)						
Maintenance of City facilities and utilities	Develop and improve program as needed	1	All programs ongoing. City acted promptly to requested improvements at City Corp Yard.	1	No change	Confirmation - report program/ordinance revisions in AR
Illicit Discharge (8.6)						
Ongoing field screening of City facilities for illicit discharges & connections	Cease illicit discharge and connections, and if any reported, act promptly.	1	One case of illegal dumping reported within City. No findings of illicit connections to the City's facilities	1	No findings of illicit connections to the City's facilities	Confirmation - report program/ordinance revisions in AR
Solid Waste and Hazardous Waste Programs		1	City sponsors in partnership w/ California Waste Recovery Systems a Galt Clean-up Day. April 20, 2007 was last clean-up day.	1	California Waste Recovery has gone to an appointment based pick-up of materials. They still hold hazardous materials collection days.	Confirmation - report program/ordinance revisions in AR

Element Activity/Task	Performance Standard (Goal)		3rd Permit Term		4th Permit Term	
		OUT-COME LEVEL	Effectiveness Assessment	OUT-COME LEVEL	Baseline Information	Effectiveness Method
Education & Outreach	Educate public	1	Ongoing marking of DI's. Annual reminder in utility flyer.	1	Approx. 95% of the drain inlets in the City have been marked.	Confirmation - report program/ordinance revisions in AR
Public Outreach (8.7)						
Produce/distribute educational materials (work with Partnership)	Document/ Quantify materials	1	Distribute on average 6 pamphlets to local residents each event. Total of approx. 50 since program started.	1	Informational pamphlets are available on the first floor of the Municipal Services Center.	Confirmation/ Reporting-Include revised/new materials in AR; report no. materials distributed
New Development (8.8)						
Update environmental review documents	As needed	1	Completed prior to July 2003	1	No changes required, yet.	Confirmation/ Reporting-Include revised/new materials in AR; report no. materials distributed

Element Activity/Task	Performance Standard (Goal)		3rd Permit Term		4th Permit Term	
		OUT-COME LEVEL	Effectiveness Assessment	OUT-COME LEVEL	Baseline Information	Effectiveness Method
Ensure compliance w/ standards and design manual	Condition development appropriately	1	4 stormwater quality treatment devices consistent with Partnership standards have been installed and declarations recorded. Conditioned 8 projects in planning for SWQ treatment or LID	1	Two new proprietary SWQ treatment devices have and/or will be installed. Two vegetated bio-swales have and/or will be installed.	Confirmation/ Reporting-Include revised/new materials in AR; report no. materials distributed
Update codes	As needed	1	SWQ treatment matrix from Design Manual adopted May 18, 2006. Complete design manual completed by Partnership, and will be adopted by permittees.	1	Design manual completed by Partnership, and adopted by permittees.	Confirmation/ Reporting-Include revised/new materials in AR; report no. materials distributed

Municipal Operations Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Implement integrated pest management (IPM) and pesticides storage, usage, and disposal procedures as described in the Pesticide Plan	10.a.iv. , 10.b.iii.		Decrease amount of pesticides and herbicides used by City staff and contractors	Confirmation - Track IPM activities	⇔	⇔	⇔	⇔	⇔	⇔	
Storm Drain System Maintenance											
Maintain the storm drain system (e.g., drain inlets, ditches/channels, detention basins and pump stations) to remove debris accumulation and prevent flooding	10.a.v. , 10.b.iv.	✓	Decrease amount of sediment discharged to waters of the State. Document amount of sediment removed	Quantification - Track quantities of sediment removed annually	⇔	⇔	⇔	⇔	⇔	⇔	
Maintain detention basins to remove debris and prevent flooding	10.a.v, 10.b.vii		Continue maintenance of City owned water quality/detention basins.								
			Review, update and improve existing detention basin maintenance guidelines and tracking practices for City owned basins.	Confirmation - Provide copy of guidelines, verification of maintenance and any updates with the Annual Reports.							
			Provide support in the development of maintenance practices for new and existing water-quality detention basins that are managed by Home Owner Associations (HOAs), or other private entity, as needed	Confirmation - Track and report in Annual Reports							
			Require Maintenance Agreements for all newly planned and constructed water quality/detention basins.	Confirmation - Track and report in Annual Reports							
Storm Drain Inlet Marking											

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 8.5-1 City of Galt SQIP
Municipal Operations Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Ensure that storm drain inlets are properly and legibly marked to discourage illicit discharges into the storm drain system	10.a.vi		Document number of storm drain inlets labeled/replaced by City Crews and number marked by private development	Confirmation - Document Stenciling Program	⇔	⇔	⇔	⇔	⇔	⇔	
			Replace illegible storm drain markers with new markers as needed	Tabulation - Track number of inlets marked each year	⇔	⇔	⇔	⇔	⇔	⇔	
Operation and Maintenance of Transportation Facilities											
Street Sweeping	10.a.vii. , 10.b.v.										
Continue to implement street sweeping program		✓	Decrease amount of sediment discharged to waters of the State. Document amount of sediment removed	Quantification - Track quantities of sediment removed annually	⇔	⇔	⇔	⇔	⇔	⇔	
Implement BMP's for Roads Maintenance Activities											
Prevent road maintenance materials, street sweeper rinse out water, concrete chute rinse water, and saw cutting slurry from discharging to the storm drain system.			Implement BMPs during road maintenance and construction activities	Confirmation / Inspection - Identify BMPs implemented	⇔	⇔	⇔	⇔	⇔	⇔	
Parking Lot Maintenance											
Maintain City-owned parking facilities to minimize the build-up and discharge of pollutants to the storm drain system			Document number of parking lots maintained and type of maintenance performed	Tabulation - Track number of facilities and activities performed	⇔	⇔	⇔	⇔	⇔	⇔	
			Evaluate Parking lot maintenance programs and adjust as needed	Confirmation / Inspection - Identify BMPs implemented	⇔	⇔	⇔	⇔	⇔	⇔	
Roadside Vegetation											
Continue to maintain roadside vegetation, public ROW landscaping and L&L's using proper BMP's to prevent stormwater pollution			Implement River Friendly Landscaping and Green Gardner Principles into maintenance practices	Confirmation / Inspection - Identify BMPs implemented	⇔	⇔	⇔	⇔	⇔	⇔	

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 8.5-1 City of Galt SQIP
Municipal Operations Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Fire Emergency and Non-Emergency Response and Operations											
Permittees having a fire protection agency within their jurisdictional control shall develop and implement a response plan to minimize the impacts of fire fighting flows to the environment.	10.a.ix. , 10.b.ix.		Review existing practices for non-emergency training and maintenance activities, report written guidelines for BMP implementation to minimize the impacts of non emergency firefighting flows to the environment.	Confirmation - Provide copy of BMP guidelines, verification of training and any updates with the Annual Reports.	⇔	⇔	⇔	⇔	⇔	⇔	
			Review existing emergency response practices and develop a response plan for emergency fire fighting discharges into the MS4.	Confirmation - Provide copy of response plan, verification of training and any updates with the Annual Reports.							
Employee Training											
Provide regular internal training on applicable components of the SQIP	10.a.x. , 10.b.x	✓	Conduct training annually to targeted City employees	Tabulation - Track training activities performed	⇔	⇔	⇔	⇔	⇔	⇔	
			Increase awareness of available BMPs and pollution prevention practices	Tabulation / Survey - Track number of employees trained and monitor changes in awareness	⇔	⇔ ♦	⇔	⇔	⇔ ♦	⇔	
Municipal Operations Element Effectiveness Assessment											
Conduct and assessment as a part of the annual reporting process, determine the effectiveness of the Program Element and identify any necessary modifications.	10.a.xi.		Submit effectiveness Assessment results in AR each year (October)	Confirmation- include effectiveness assessment results in AR	♦	♦	♦	♦	♦	♦	

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 8.6-1 City of Galt SQIP
Illicit Discharge Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Legal Authority											
Review and if necessary revise existing Stormwater Ordinance	11.a.i		Revised stormwater ordinance (if needed)	Confirmation - report revisions in AR	⇔	⇔	⇔	⇔	⇔	⇔	
Reporting of Illicit Discharges											
Continue to utilize Partnership public hotline (808-4H20) for reporting of illicit discharges and connections, and route callers to the City for assistance on City-related issues or complaints	11.a.ii ; 11.b.v		Revisions of hotline or its uses (if needed)	Confirmation/Tabulation - The City will track number of complaints received	⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly
Ongoing Field Screening for Illicit Discharges and Connections											
Continue to conduct ongoing field screening for illicit connections through routine maintenance activities being conducted by field crews	11.a.ii ; 11.b.ii	✓	Decrease in number of illicit connections detected by field screening activities since last permit term	Tabulation - Report number of illicit connections detected via field screening activities in AR	⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly, EA due 12/13
Investigations of Illicit Discharges and Connections											
Investigate illicit discharges	11.a.iv ; 11.b.iii		Non-hazardous illicit discharges investigated within 5 days of discovery or report, hazardous illicit discharges investigated within 1 day of discovery or report	Confirmation - Include number of illicit connection investigations conducted in AR	⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly
		✓	Increase in number of illicit discharges investigated since last permit term	Tabulation							EA due 12/13
Investigations of illicit connections	11.a.iii ; 11.b.ii		Illicit connections investigated within 21 days of discovery or report	Confirmation - Include number of illicit connection investigations conducted in AR	⇔	⇔	⇔	⇔	⇔	⇔	Reported in Are yearly
		✓	Decrease in number of illicit connections investigated since last permit term	Tabulation							EA due 12/13
Illicit Discharge Response, Containment and Cleanup											

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 8.6-1 City of Galt SQIP
Illicit Discharge Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Investigation/Inspection and Follow-up procedures	11.b.iii		Review and update intradepartmental illicit discharge response procedures/flow chart as needed	Confirmation - provide updates in AR	⇔♦	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly, update due 09/10
Respond to, contain and clean up illicit discharges	11.a.iv ; 11.b.iii	✓	Increase in number of responses, containment and cleanup of illicit discharges since last permit term	Tabulation - track number of illicit discharge responses	⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly, EA due 12/13
Respond to and abate illicit connections	11.a.iii ; 11.b.ii	✓	Increase in number of responses and abatements of illicit connections since last permit term	Tabulation - track number of illicit connection responses	⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly, EA due 12/13
Enforcement											
Conduct enforcement (e.g., warnings, NOVs, Cease and Desist Orders, ACPs, and Cost Recoveries)	11.b.iv	✓	Decrease in level of progressive enforcement needed. number of enforcement actions since last permit term	Track number and type of enforcement actions	⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly, EA due 12/13
Data Management											
Continue to maintain database to track investigations, enforcement actions and outreach materials distributed	11.a.v		Regularly update database and revise or update its uses (if needed)	Confirmation - Submit data and report updates in AR	⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly
Map the locations of confirmed illicit discharges and connections to help identify areas of targeted outreach			Completed revisions of map or its uses (if needed)	Confirmation - Submit map and report revisions in AR	⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly
Outreach/Training											
Continue to distribute educational materials to public, and document/quantify materials distributed			Completed revisions of outreach materials (if needed) and tabulations of number of individuals that received outreach materials	Confirmation/Tabulation - Track number of brochures distributed	⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly
Provide City employee training to field screening and illicit discharge response crews annually	11.b.vi		Track number of City employees trained	Tabulation - Track number of workshops held, number of people reached	⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly
			Increase in awareness among employees regarding illicit discharges and connections since previous permit term	Survey - Quiz employees to assess changes in awareness							EA due 12/13
Facilitation of Proper Household Hazardous Waste Disposal											

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 8.6-1 City of Galt SQIP
Illicit Discharge Element Activities for 2008-2013

Maintain operation of the City's household hazardous waste pickup program		✓	Increase in the quantities of household hazardous waste collected from public since previous permit term		⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly, EA due 12/13

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 8.7-1 City of Galt SQIP
Public Outreach Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
This table describes City-specific activities only. Refer to Chapter 2 for additional activities conducted on regional basis.											
Public Outreach Implementation											
Outreach to General Public	12.a.i, iii; 12b.i,iii						♦				
Publish stormwater-related articles in City newsletter			Increase in public awareness as determined by public inquiries following publication	Tabulation - track numbers of callers; types of information provided	⇔	⇔	⇔	⇔	⇔	⇔	
Promote stormwater pollution prevention at community events				Tabulation- report no. people reached each year	⇔	⇔	⇔	⇔	⇔	⇔	
Partner with other city departments to combine messages and co-sponsor events			to be determined based on activity; see annual reports	to be determined							
Identify new potential sites for "no dumping" signage along creeks and other areas prone to illegal dumping			Place signs at all new problem areas identified by City maintenance crews	Tabulation - track locations/numbers of signs; Inspections - observe decrease in dumping	⇔	⇔	⇔	⇔	⇔	⇔	
Outreach to City Employees, Managers and Elected Officials	12.a.i, iii; 12b.i,iii										
Provide external and internal training to City employees and managers			Educate 100% affected employees annually.	Tabulation- # employees trained, total # training hours per year	⇔	⇔	⇔	⇔	⇔	⇔	
Provide presentations and informational memos to City Manager's Office, City Council and Planning Commission as needed			Educate City management and elected/appointed officials whenever necessary.	Confirmation of activity completed each year	⇔	⇔	⇔	⇔	⇔	⇔	
Public School Education											
Encourage schools to participate in the SYRCL school assembly and SPLASH educational programs	12.a.iv., 12.b.iv.		Increase awareness of stormwater/watershed issues with students and teachers	Tabulation-track # students participating in program .	⇔	⇔	⇔	⇔	⇔	⇔	
Business Outreach											
Development Community	12.a.v., 12.b.v.										

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 8.8-1 City of Galt SQIP
New Development Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Incorporation of Water Quality Protection Principles into Plans, Policies and Procedures											
Update stormwater quality language in the General Plan	13.a, 16		Update applicable sections of the General Plan to include stormwater quality protection principles.	Confirmation – report revisions in AR	⇔	⇔	⇔	⇔	⇔	⇔	
Condition priority development projects through CEQA to include stormwater quality control measures as applicable.	13.b-d, 13.g, 21		Update list of priority development projects conditioned.	Tabulation - track number of projects conditioned and report in Annual Reports.	⇔	⇔	⇔	⇔	⇔	⇔	
	13.i	✓	Track the incorporation of stormwater quality		⇔	⇔	⇔	⇔	⇔	⇔	
Development of Standards and/or Guidance											
Develop Low Impact Development (LID) design criteria	15.b		Amend development standards to require implementation of LID strategies.	Confirmation - report revisions in AR	⇔	⇔	⇔♦				6 months after approval of HMP.
	15.b, 26		Include LID criteria in the Stormwater Quality Design Manual and revise it as needed.	Confirmation - report revisions in AR	⇔	⇔	⇔	♦			6 months after amending the development
Develop HMP Work plan as part of the revised SQIP.	15.c		Outline the proposed steps to develop the HMP and possible technical methodologies to design the mitigation measures.	Confirmation - develop HMP work plan and pilot project. Submit work products to Regional Water Board.	⇔♦						30-Apr-09
Develop HMP	15.c		Develop an applicability and susceptibility map showing where hydromodification management measures will apply in Sacramento.	Confirmation - Submit work products to Regional Water Board 1 year after approval of the HMP work plan.		⇔	♦				1 year after approval of the HMP work plan

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 8.8-1 City of Galt SQIP
New Development Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Develop design criteria for hydromodidfiaction management measures.	15.c, 26		Include criteria in the Stormwater Quality Design Manual and revise it as needed.	Confirmation - report revisions in AR			⇔	♦			6 months after amending the development standards.
Develop a mitigation fund if needed	19		Develop a mitigation fund framework to support regional stormwater projects.	Confirmation – develop framework when needed and submit to regional Board.							
Develop a waiver program	20		Propose a waiver program that would require developers with qualified projects to transfer the savings in cost to a stormwater mitigation fund. Waivers shall be granted only when structural treatment control measures are infeasible.	Confirmation - develop a waiver program and describe activities in revised SQIP.	⇔	⇔	⇔	♦			
Protect groundwater quality	23		Apply restrictions to the use of structural treatment measures which are designed to function infiltration devices in areas of high ground water table.	Confirmation - identify restrictions and incorporate into the design criteria.	⇔	⇔	⇔	⇔	⇔	⇔	
Conditions of Approval and Plan Review											
Condition projects to comply with stormwater quality development standards at various stages of the approval process.	13.b-d, 13.f, 14, 15, 17		Track and record number of projects conditioned.	Tabulation - track number of projects conditioned and report in Annual Report.	⇔	⇔	⇔	⇔	⇔	⇔	
Condition projects to comply with LID requirements	15.b		Condition priority development projects to incorporate low impact development strategies.	Tabulation – track number of projects conditioned and report in Annual Report.				♦⇔	⇔	⇔	

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 8.8-1 City of Galt SQIP
New Development Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Condition projects to comply with HMP requirements	15.c		Condition priority development projects located in susceptible areas to incorporate hydromodification management measures.	Tabulation – track number of projects conditioned and report in Annual Report.				♦⇔	⇔	⇔	
Develop a database to track priority projects that have been issued a permit to construct treatment control measures.	22		Update database of priority projects	Tabulation - track number of projects that completed the construction of treatment control measures and report in Annual Reports.	⇔	⇔	⇔	⇔	⇔	⇔	
	13.i	✓	Increase in number of priority projects that incorporated treatment stormwater quality measures.								
Stormwater Maintenance Agreement											
Verify maintenance of treatment measures	13.b, 13.e, 18		Require applicable developments to provide verification of maintenance provisions for post-construction structural and treatment control measures.	Tabulation and Confirmation – track number of executed maintenance agreements and report in Annual Report.	⇔	⇔	⇔	⇔	⇔	⇔	
				Tabulation – track number of responses to self-certification requests.							
	13.i	✓	Increase awareness of proper maintenance procedures.		⇔	⇔	⇔	⇔	⇔	⇔	
	13.i	✓	Reduction of sediment		⇔	⇔	⇔	⇔	⇔	⇔	
Outreach and Training											

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

New Development Element Activities for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Conduct outreach to the development community about the latest stormwater quality policies and	24		Continue outreach about the Planning and New Development Program Element	Tabulation - track number of revised/new materials; number materials distributed in AR	⇔	⇔	⇔	⇔	⇔	⇔	
	13.i	✓	Increased awareness of stormwater quality requirements and criteria.		⇔	⇔	⇔	⇔	⇔	⇔	
Provide annual training to employees in targeted positions.	13.h, 25		Conduct annual refresher training to affected staff.	Tabulation – track number of employees trained and report outcome in the Annual Report.	⇔	⇔	⇔	⇔	⇔	⇔	
	13.i	✓	Increase awareness of targeted employees about stormwater quality requirements.		⇔	⇔	⇔	⇔	⇔	⇔	

⇔ Ongoing activity/task ◆ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Chapter 9

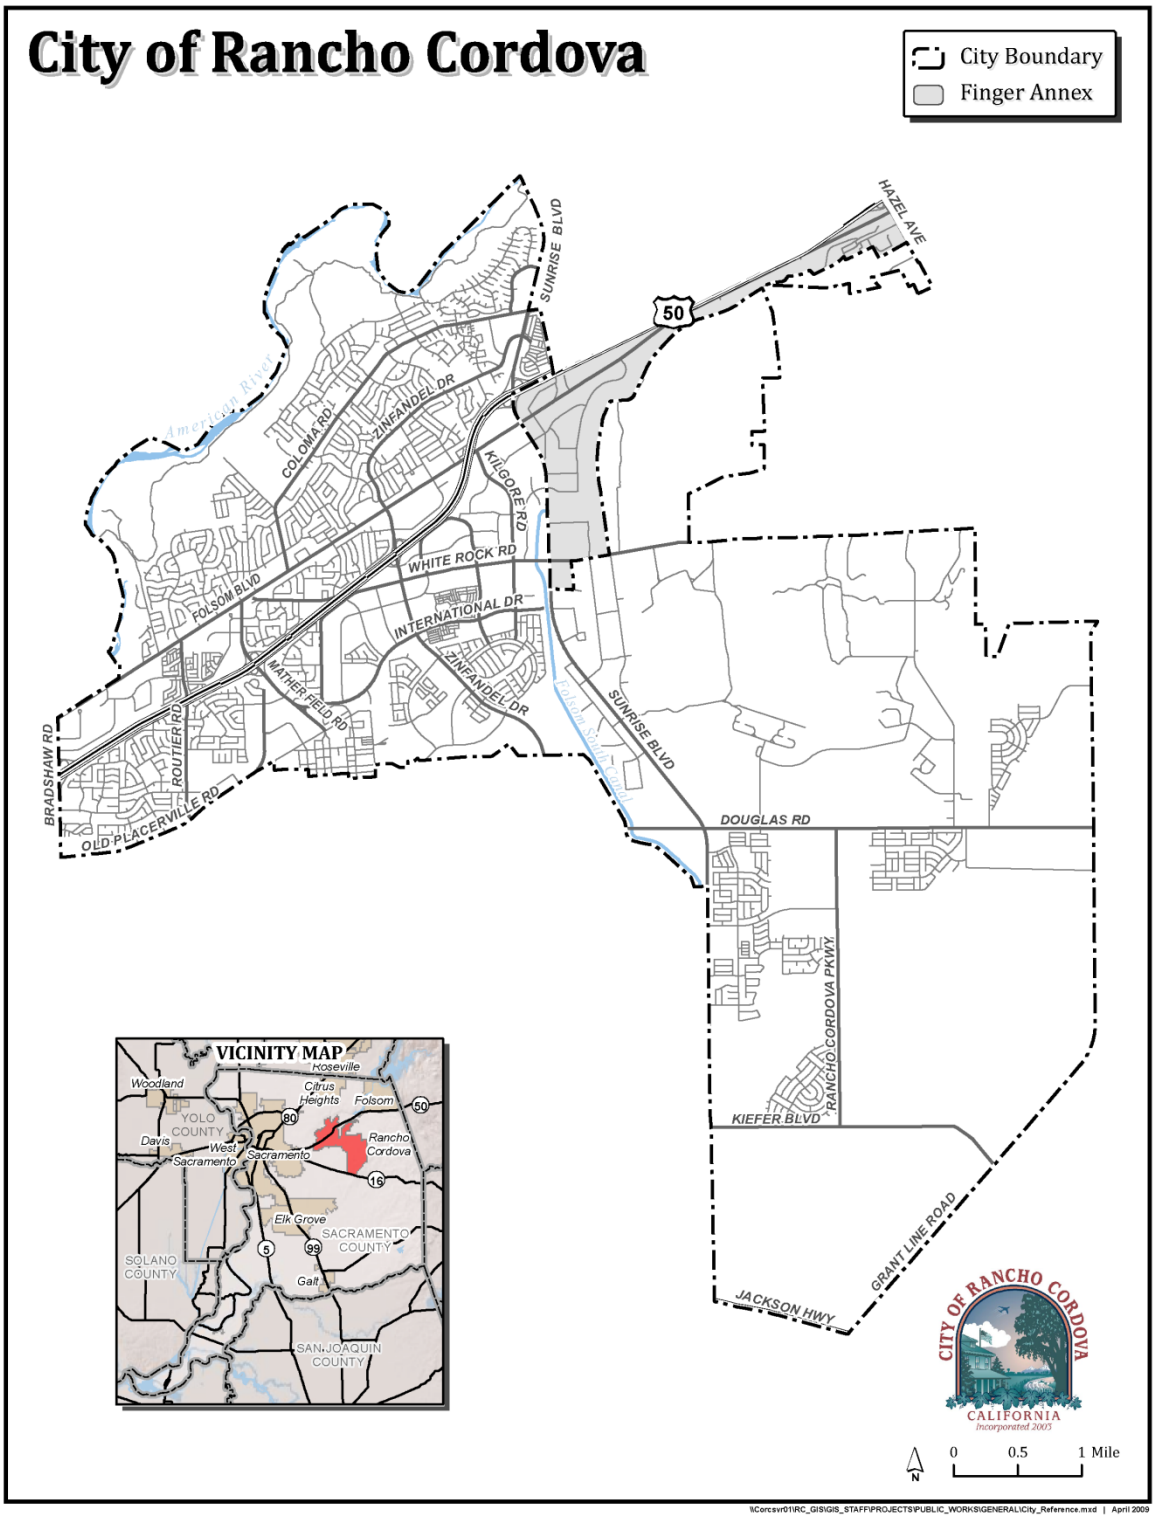
City of Rancho Cordova Stormwater Quality Improvement Plan

9.1 Introduction

The Rancho Cordova (City) Stormwater Quality Improvement Plan (SQIP) provides information about the City's Stormwater program (stormwater program), including a description of activities conducted to ensure compliance with the Sacramento Areawide NPDES Municipal Stormwater Permit (stormwater permit), of which Rancho Cordova is a permittee. The City's activities described in this chapter are conducted in addition to the regional Partnership activities implemented jointly with the other permitees as described in Chapter 2. The required certfication for the SQIP is presented in the front of this entire document.

Background

Rancho Cordova incorporated on July 1, 2003 and soon thereafter became a permittee to the stormwater permit. Before that, the unincorporated area within the present City limits was covered under the County of Sacramento's stormwater permit.



The stormwater permit is issued to Rancho Cordova and six other co-permittees (Sacramento County and the Cities of Citrus Heights, Elk Grove, Folsom, Galt and Sacramento) by the Central Valley Regional Water Quality Control Board (Regional Water Board). Collectively, the group is known as the Sacramento Stormwater Quality Partnership (Partnership). The Stormwater Permit was originally issued in 1990 and has been renewed three times since then: in 1996, 2002, and most recently in 2008 (2008-13 permit term).

Implementation of the activities described in the SQIP is intended to satisfy the provisions of the Stormwater Permit. Those provisions were established to reduce pollutants in stormwater discharges to the maximum extent practicable and comply with receiving water objectives.

City of Rancho Cordova Characteristics

Rancho Cordova is located in Sacramento County, along Highway 50 approximately 12 miles east of downtown Sacramento. The city boundaries are shown in Figure 9.1-1.

Figure 9.1-1
City of Rancho Cordova Map

The City's population was noted as just over 68,975 by the 2008 California Department of Finance, and is projected to grow to 310,568 when the General Plan area is built out in many years.

The City is approximately 33 square miles in size and is comprised of lands designated as residential (53%), commercial (14%), industrial (6%), agriculture (0%), open space (21%), and public (6%), according to the City's 2006 General Plan. Of these lands, more than half is currently in an undeveloped condition. A portion of the north boundary of the city is the American River, so a portion of the city in that area drains into the river. Land within the city also drains to two forks of Morrison Creek as well as Upper Laguna Creek.

Overview of Rancho Cordova's SQIP

This SQIP describes activities that Rancho Cordova will conduct in compliance with the stormwater permit. Modifications to the program may be necessary as the program evolves, and will be proposed in Annual Reports submitted to the Regional Water Board on October 1 each year. Following this introduction, there are seven sections in the chapter, to describe activities related to six major program elements, as follows:

Section 9.2: Program Management — A description of how Rancho Cordova's stormwater program is organized, legal authority, priorities and funding, and coordination both within the City and externally with the County and other programs and agencies.

Section 9.3: Construction Program Element —Activities designed to control the runoff of sediment and other pollutants from construction sites.

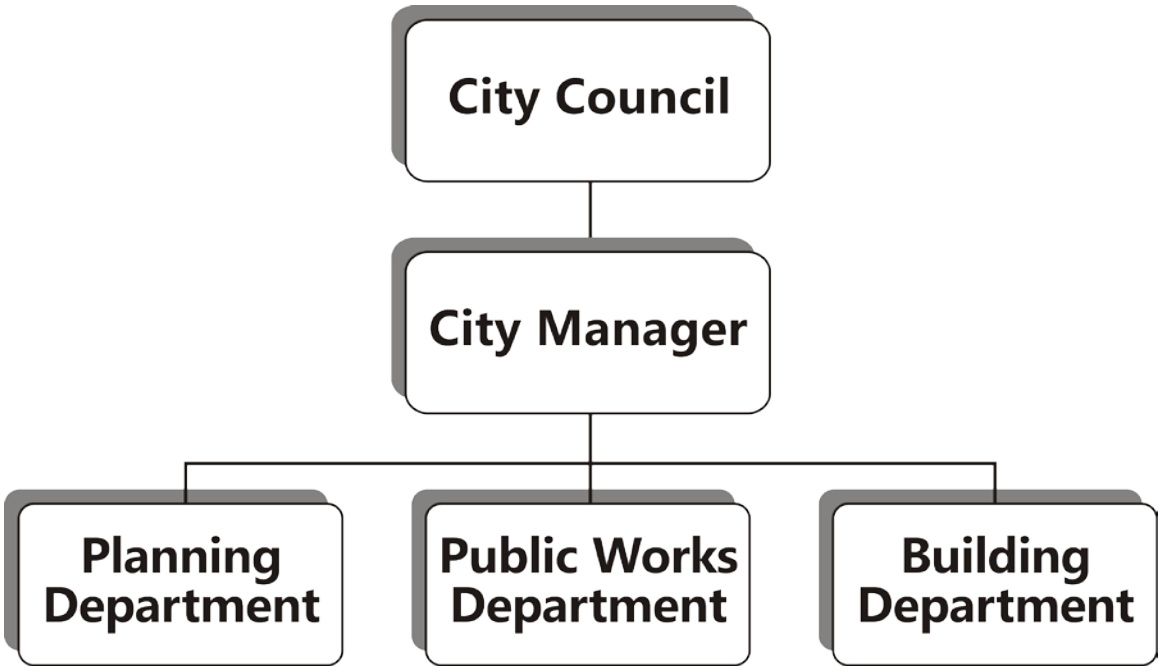
Section 9.4: Commercial/Industrial Program Element — Activities and control programs intended to reduce pollutants in discharges and effectively eliminate non-stormwater discharges associated comercial and industrial land uses.

Section 9.5: Municipal Operations Program Element — Activities intended to control stormwater pollution resulting from operation of City facilities and to set an example of model pollution prevention for the public.

Section 9.6: Illicit Discharge and Detection Program Element — Activities designed to effectively eliminate illegal non-stormwater discharges to the storm drainage system and receiving waters.

Section 9.7: Public Outreach Program Element — Activities intended to raise awareness and foster community stewardship to promote pollution prevention in the urban area and protection of local creeks and rivers.

Section 9.8: New Development Program Element — Activities mitigate water quality and quantity impacts from newly developing and redeveloping areas for the life of the project, after construction is complete.



This page intentionally left blank.

9.2 Program Management

Program Organization and Staffing

The City of Rancho Cordova is a Council-City Manager form of government. As shown in Figure 9.2-1, there are three main departments involved in implementation of the City's Stormwater Management Program (stormwater program).

Figure 9.2-1
Rancho Cordova General Organization Related to Stormwater Management

The City of Rancho Cordova Stormwater Management Program resides within the Department of Public Works, and the Public Works Director is responsible for overseeing the program and certifying all compliance deliverables. The City Public Works Department has designated staff to conduct the management, engineering and maintenance activities required by the Stormwater Permit. The City's Planning Department provides planning and environmental review services for development projects, and the Building and Safety Department provides construction permitting and inspection services. Figure 9.2-2 shows the organizational structure of the stormwater program.

Due to the many aspects of the Stormwater Program, one representative from Public Works is responsible to ensure program success and dissemination of information to all affected managers and employees. The representative meets periodically throughout the year with departments and staff throughout the city to discuss current issues and ensure all required activities are being performed in compliance with the Stormwater Permit and this SQIP.

* Contractor

Table 9.2-1 provides the estimated allocation of City staff resources for the 2009-10 fiscal year in full time equivalent (FTE) increments. FTE staff estimates for staff in other departments related to Stormwater Permit compliance tasks are not shown on this table because these costs are not currently tracked in a separate charge/project number. Future changes to this information will be tracked in annual reports.

Table 9.2-1

Staffing for the Rancho Cordova Stormwater Program
(2009-10 fiscal year estimates)

Staff	FTE*
Principal Civil Engineer	0.30
Associate Civil Engineers	0.70
Administrative Assistant	0.30
Construction Inspector	0.30
Maintenance Coordinators	0.20
Building Inspection/permits	0.30
Total	2.1

*Full time equivalent

Figure 9.2-2 and Table 9.2-2 show and describe the division of responsibilities between the City and contractors for the various types of work required to comply with the Stormwater Permit. The City contracts various stormwater quality services to Sacramento County. When the City incorporated in 2003, it entered into an agreement with Sacramento County (Local Agency Formation Commission [LAFCo] Resolution 1243), that requires the County to provide Rancho Cordova the same level of and type of drainage and flood control services as provided in the unincorporated area. The City also contracts with others as shown on Figure 9.2-2 and Table 9.2-2.

Table 9.2-2. Responsibilities for Compliance with NPDES Stormwater Permit in Rancho Cordova

Program Element	Department/Group	Major Responsibilities
Program Management and Training **(Section 9.2)**	Public Works	Administers and manages the City Stormwater Program on behalf of the City. Provides liaison with the Regional Water Board and prepares/submits compliance reports.
	Admin Services	Conducts legal reviews, prepares legal certifications and oversees revisions to ordinances, codes and other standards.
	County Dept. of Water Resources/Stormwater Staff (under contract to City)	Assists with preparation of Permit compliance deliverables; represents Rancho Cordova at permittee coordination meetings.
Construction **(Section 9.3)**	Public Works	Issues grading permits and checks for NOI/SWPPP for all sites subject to State General Construction Permit.
	Community & Economic Development/Building Division	Provides inspection services for public infrastructure, public buildings and private development. Inspection services include oversight of contractor compliance with City Stormwater and Grading Ordinances and State Construction General Permit.
	Consultant Contracts - City Inspectors	Constructs and inspects all street and highway improvements located in the City, including lighting, landscaping and signals. Inspection services include oversight of contractor compliance with City Stormwater and Grading Ordinances and State Construction General Permit.
Commercial/ Industrial **(Section 9.4)**	County Environmental Management Department (under contract to City)	Conducts inspections of all Permit-required industries in Rancho Cordova once every 3 years, and conducts outreach, database management and reporting. Also see Chapter 2, Section 2.7 for more details.
	County Environmental Health Division (under contract to City)	Conducts plan review, issues permits for and inspects food-related facilities in Rancho Cordova. Considers drainage issues that may be of concern to stormwater quality in all reviews and inspections.
	County Hazardous Materials Division (under contract to City)	Conducts plan review, issues permits for and inspects facilities that handle or store hazardous materials in Rancho Cordova. Considers drainage issues that may be of concern to stormwater quality in all reviews and inspections.

Program Element	Department/Group	Major Responsibilities
	County Dept. of Water Resources/Stormwater Staff (under contract to City)	Conducts complaint-based inspections in Rancho Cordova for businesses not covered by EMD. Works with BERC to conduct business outreach activities required by the Permit. Also see Chapter 2, Section 2.7 for more details.
Municipal Operations (Section 9.5)	County Dept. of Water Resources/Drainage O&M (under contract to City)	Oversees maintenance of stormwater drainage system to ensure that system is maintained in manner that minimizes water quality impacts. Maintains creeks and channels within the City to remove accumulated debris and obstructions in order to make them hydraulically efficient to minimize over-bank flooding, bank erosion, and transport of pollutants.
	Public Works (Through contracts with various private vendors)	Maintains all street and highway improvements located in the City, including lighting, roadside ditches and signals. Responsible for ensuring that stormwater quality and erosion/sediment controls are incorporated where required.
	General Services/Facilities & Public Works	Manages City-owned buildings, parking lots and other facilities. Responsible for ensuring that activities at these facilities do not add to stormwater pollution.
	Cordova Parks and Recreation District	Constructs and maintains parks and recreational facilities within the city in a manner that complies with applicable water quality laws.
	Allied Waste Management	Provides solid waste services to the City under contract.
Illicit Discharges (Section 9.6)	County EMD Hazardous Materials Division (under contract to City) Metro Fire District	Responds to hazardous materials spills in the City that may impact stormwater quality and receiving waters, including cleanup and proper disposal.
	Metro Fire District	Respond to non-hazardous spills, including cleanup and proper disposal.
	County Dept. of Water Resources/Drainage O&M (under contract to City)	Conducts ongoing field screening activities during routine maintenance of the storm drain system in Rancho Cordova. May respond to non hazardous spills, including cleanup and proper disposal.
	County Dept. of Water Resources/Stormwater Staff (under contract to City)	Conducts follow-up investigations as needed to confirm/eliminate illicit discharges. Responds to calls from the public for situations in Rancho Cordova.

Program Element	Department/Group	Major Responsibilities
	Allied Waste Management	Provides solid waste management services for residents and businesses in the City. Program emphasis is placed on waste prevention, recycling, and composting, which support the stormwater quality program goals.
Public Outreach (Section 9.7)	Public Works	Provides public outreach to individual property owners and developers and handles calls from the public routed to the City. Provides volunteers to work in Partnership booths at some regional public events.
	County Dept. of Water Resources/Stormwater Staff (under contract to City)	Works with City of Sac to manage/conduct regional public outreach required by the Stormwater Permit, including a regional media campaign that addresses Rancho Cordova residents and businesses. Also see Chapter 2, Section 2.6 for more details.
New Development (Section 9.8)	Economic Development/Planning	Processes applications for private developments. Conducts CEQA reviews. Implements General Plan and Zoning code. Routes plans to Public Works to ensure that stormwater quality controls are incorporated as required.
	Public Works	Conditions development projects to ensure compliance with City drainage and stormwater quality standards, including establishing requirements for stormwater quality control measures.
	Public Works	Ensures that stormwater quality control measures are incorporated into design/construction of public projects, as applicable.
	Public Works (w/consultant contracts)	Provides planning and design for all street and highway improvements located in the City, including addressing stormwater quality requirements, where applicable.
Monitoring, Special Studies and Target Pollutant Reduction (Chapter 2)	Public Works	Reviews and certifies reports and compliance submittals; approves consultant contract decisions; processes payments to the City/County of Sacramento for consultant services according to the cost-share MOU.
	County Dept. of Water Resources/Stormwater Staff (under contract to City)	Represents Rancho Cordova in permittee work group meetings to discuss these joint Program activities; reviews draft reports and compliance submittals; administers consultant contracts for the technical studies.

Legal Authority

Legal authority for Rancho Cordova's stormwater program is provided in several ways:

- The City's Municipal Code provides the basic legal authority to implement the program and enforce the local regulations,
- The General Plan contains water quality protection policies,
- The City uses the Sacramento County Standard Construction Specifications and Improvement Standards which describe requirements for development projects, and
- Agreements with the County and other permittees provide for a means of cost sharing to implement various portions of the program.

Additional detail about each form of legal authority is provided in this section. In addition, the City's legal counsel has certified that adequate legal authority exists to implement and enforce the stormwater program in compliance with the stormwater permit. This certified statement is provided in Appendix 9A.

City Code

When the City incorporated in July 2003, it adopted the County ordinances in effect at the time, including any future amendments until the City otherwise adopts its own unique legal authority. Two County ordinances provide the main legal authority for the City's stormwater program:

- Stormwater Management and Discharge Control Ordinance, also known as "The Stormwater Ordinance" (Chapter 15.12 of County Code) — Prohibits most non-stormwater discharges and lists non-stormwater discharges conditionally allowable (e.g., water from fire-fighting activities) pursuant to NPDES federal regulations. Provides legal authority to the County for inspections and enforcement related to control of illicit (unauthorized non-stormwater) discharges to the City storm drainage system and Morrison/Laguna Creeks.
- Land Grading and Erosion Control Ordinance (Chapter 16.44 of County Code) — Requires projects disturbing 350 cubic yards or more of soil or one or more acres of land to prepare an erosion and sediment control plan specifying best management practices (BMPs) for erosion and sediment control. Provides legal authority for inspections and enforcement needed on local construction sites to ensure compliance with the ordinance.

The full text of the City's Municipal Code can be accessed at:

http://www.codepublishing.com/CA/RanchoCordova/html/RanchoCordovaNT.html

General Plan

Rancho Cordova's General Plan, adopted in June 2006, includes a Natural Resources Element with various goals which result in direct or indirect protection of watershed resources and water quality. The General Plan and other development-related codes and standards can be accessed on the City's web site:

http://www.cityofranchocordova.org/ (see Planning Dept.)

Relevant sections of the City's General Plan are summarized below:

Natural Resources Element

Goal NR.2: Preserve the City's rich and diverse natural wetlands.

Goal NR.3: Preserve and maintain creek corridors and wetland preserves with useable buffer zones throughout the new development areas as feasible.

Goal NR.4: Encourage the planting and preservation of high-quality trees throughout the City.

Goal NR.5: Protect the quantity and quality of the City's water resources.

Goal NR.8: Promote waste reduction, reuse, recycling, and composting efforts.

Each of the above goals has related policies and actions designed to implement that goal. For example:

Goal NR.3: Preserve and maintain creek corridors and wetland preserves with useable buffer zones throughout the new development areas as feasible.

- *Policy NR.3.1* - Coordinate with property owners and local interest groups, such as the Sacramento Urban Creeks Council, to restore, enhance, and preserve creeks in Rancho Cordova.
- *Policy NR.3.2* - In general, the City will encourage the preservation of existing location, topography, and meandering alignment of creeks. Where necessary, and if consistent with other City policies, the creation and realignment of creek corridors shall be constructed to recreate the character of the natural creek corridor. Channelization and the use of concrete within creek corridors shall not be supported.
- *Action NR.3.2.1* – Develop guidelines for channel creation or modification that will ensure channel meander, naturalized side slope, and varied channel bottom elevation are considered in design.
- *Action NR.3.2.2* – Adopt and implement improvement standards for soft bottom channels.

Intra and Interagency Agreements

Intra-agency agreements between City departments will be executed if needed as the program progresses to ensure cooperation within the City for compliance with the stormwater permit. Such agreements are not warranted at this time.

Legal authority for administering and implementing the Sacramento Stormwater Quality Partnership Program (Partnership Program) jointly with the other permittees will be provided through the Permittee Memorandum of Understanding (MOU). The MOU describes administrative roles and responsibilities for management of the Program and performance of regional activities, as well as cost-share arrangements. Costs for regional Partnership activities are based on population of each permittee and are therefore subject to change during the term of the stormwater permit. Refer to Chapter 2, Section 2.2 for more details on the MOU and Rancho Cordova's percentage share.

An MOU was executed in 2004 between the City and the County Environmental Management Department (EMD) for conducting industrial and commercial inspection and enforcement services required by the stormwater permit. This agreement is discussed in more detail in Chapter 2, Section 2.7.

Agreements with other external agencies will be executed as needed; such agreements are not warranted at this time.

Funding

Funding for Rancho Cordova's stormwater program comes primarily from Stormwater Utility fees collected and administered by the County on behalf of the City. The County will continue to use utility revenues to fund the activities it conducts on the City's behalf and to pay Rancho Cordova's share of the regional Partnership activities described in Chapter 2. The County will continue to reimburse the City for stormwater quality services performed by City staff or outside contractors. Budget details will be provided each year in the annual report.

In addition to revenues derived from Stormwater Utility fees, the County collects fees from developers through development impact fees, some of which are used to fund stormwater-related activities. For example, development impact fees fund plan checking for drainage and stormwater-related features, erosion and sediment control inspections during construction, and are used to reimburse developers for the construction of stormwater infrastructure, including stormwater quality facilities such as detention basins. The County will continue to collect these fees during the 2008-2013 permit term on the City's behalf, for development projects in Rancho Cordova.

Fees are also collected by County EMD from most industries and businesses in the City to fund inspection services. Inspections are conducted to verify compliance with environmental and health laws, including stormwater quality regulations.

Finally, the City uses its developer fees, Road Fund and building permit fees to cover salaries and other administrative activities which are required to ensure compliance with the stormwater permit.

Any changes to these funding arrangements will be described in annual reports.

Recordkeeping and Reporting

The City will prepare and submit the following documents to the Regional Water Board each year, in compliance with the stormwater permit:

- Annual Work Plan (May 1) – describes proposed activities and budget for coming fiscal year (July 1 – June 30).
- Annual Report (October 1) – describes activities conducted during the previous fiscal year, including compliance with performance standards and the stormwater permit. Proposes revisions to the Stormwater Quality Improvement Plan, if needed.

Records and data will be collected from all responsible City departments and groups each summer to prepare the Annual Report. The County will assist in compiling and describing information for the activities it conducts on the City's behalf.

The City's stormwater program staff will maintain stormwater permit compliance files at City Hall, including all documentation necessary to demonstrate compliance with the permit. As required, the City will retain copies of all records and reports from the date of generation for at least five years.

Training for City Staff and Contractors

The City will ensure that all City staff and contractors involved in or affected by stormwater permit compliance activities receive annual refresher training as required by the stormwater permit. County staff working on the City's program are trained as described in Chapter 3, Section 3.2.

Staff will be informed and educated about the stormwater permit and its impacts on their positions and responsibilities. Training will cover the following types of topics:

- General storm water quality awareness objectives: where storm water goes, how it becomes polluted, and how to prevent pollution.
- Background regulatory information appropriate to the audience.
- Information on stormwater quality compliance targeted to the staff's area of specialty, e.g., inspection, planning, engineering.
- How to report/refer observed problems in the field.
- Information about enforcement and penalties appropriate to the audience.

Coordination with Other Agencies and Programs

Sacramento Stormwater Quality Partnership

Regular permittee Steering Committee meetings are held approximately monthly to discuss topics such as:

- Implementation of regional Partnership activities, such as monitoring, target pollutant reduction and some public outreach.
- Status of consultant contracts and work products related to monitoring and development standards.
- Funding of activities conducted by others that benefit the Partnership, such as the development of statewide BMP manuals by the California Stormwater Quality Association (CASQA).
- Overall program evaluation and assessment.
- Proposed modifications to the SQIPs and/or stormwater permit.

The City Engineer, his designee, or the County Stormwater Program Manager will attend these meetings on behalf of Rancho Cordova.

Outside Agencies

The City coordinates with several local and regional agencies (over which it lacks jurisdictional control) in order to ensure city-wide compliance with the stormwater permit:

- Caltrans - owns and maintains several Hwy 50 interchanges impacting the City
- Cordova Parks & Recreation District – owns and operates almost 30 parks, 16 of which are in the city
- Folsom Cordova and Elk Grove Unified School Districts - own and operate various schools in the City (see list in Section 9.7) and will construct new schools in the future.
- Regional Transit - owns and operates the Light Rail line that travels through Rancho Cordova.
- Sacramento Area Sewer District (formerly CSD-1) – owns and operates the sanitary sewer collection system in the City.
- Sacramento Regional County Sanitation District (SRCSD) - owns and operates the interceptor collection system and wastewater treatment plant, to which the City's sanitary sewage is delivered.
- Sacramento Metropolitan Fire District – conducts fire and hazardous materials spill response operations in the city
- Sacramento Municipal Utility District (SMUD), Pacific Gas & Electric and other local utilities - own private utilities in the public right of way and have maintenance easements to repair/replace facilities as needed
- Three local water districts: Golden State Water Agency, Cal American Water Agency and Sacramento County Water Agency (Zone 40) - own and operate drinking water treatment and distribution system for City residents.
- Sacramento County (Regional Parks) - owns the portion of the American River Parkway bordering the northern border of the City.
- US Bureau of Reclamation (USBR) - owns and operates the Folsom South Canal.

Other Stormwater Programs

The city supports coordination and networking with other stormwater programs within California in order to share information and identify opportunities to work together. This effort is facilitated by the City and County of Sacramento, through their active participation in CASQA.

Activities for the 2008-13 Stormwater Permit Term

Table 9.2-3 at the end of this chapter summarizes the activities that will be conducted for this program element during the 2008-13 permit term, along with associated performance standards, effectiveness assessment methods and a five-year implementation schedule. The table was developed to demonstrate compliance with various provisions of the Stormwater Permit, as indicated on the table.

This section describes the planned activities in more detail.

Recordkeeping and Reporting

SQIP

Following the submittal of this April 2009 SQIP, the City will revise the SQIP based on Regional Water Board comments and/or comments received during the 30-day public review process conducted by the Regional Water Board. From then on, proposed modifications to the SQIP will be included in the annual reports, as required by the Stormwater Permit.

Annual Report and Annual Work Plan

As required by the stormwater permit, the City will submit an Annual Report by October 1st of each year detailing the activities accomplished and the quantitative data compiled during the previous fiscal year (July 1 -June 30). The report will be prepared using a standardized reporting format created in coordination with the other permittees.

By May 1st of each year, the City will submit an Annual Work Plan that details the activities proposed for the coming fiscal year.

The City and County of Sacramento will take the lead in submitting Regional Partnership Work Plans and Annual Reports to describe activities such as monitoring conducted jointly by all the permittees in the Partnership. Refer to Chapter 2 for additional information about regional Partnership activities.

Permittee Memorandum of Understanding (MOU)

The MOU has been revised for the new permit term; see Chapter 2, Section 2.2 for more details. If needed based on population growth and other factors, the City will work with the other permittees to update the permittee cost-share MOU during the 2008-13 permit term.

Legal Authority

Update Codes and Standards As Needed

The City will amend its Stormwater Ordinance if necessary to reflect changes in the program and ensure compliance with the 2008 Stormwater Permit. This will be done if needed within one year of the Regional Water Board's adoption of the 2009 SQIP, as required by the Stormwater Permit. The City will also automatically adopt any changes made by the County during the 2008-13 permit term to other applicable ordinances (e.g., Land Grading and Erosion Control) and the Standard Construction Specifications and the Improvement Standards, as discussed elsewhere in this SQIP.

The City will continue to require the local development community to utilize the May 2007 *Stormwater Quality Design Manual for Sacramento and South Placer Regions* and will ensure that City planners and engineers attend training workshops related to implementation of the new manual. It is likely that as the design manual comes into more use, conflicts may arise between the criteria in the manual and the City's codes. In such cases, the City will amend codes as needed or recommend adjustments to the manual.

Incorporate Water Quality Principles into General Plan Update

The City's new General Plan was adopted in 2006 and water quality protection policies were added (see discussion earlier in this section). Major updates are not anticipated during the 2008-13 permit term.

Legal Authority Certifications

The legal authority certification by Rancho Cordova's legal counsel is included in this SQIP as Appendix 9A. Another certification will be prepared for submittal with the Report of Waste Discharge (ROWD) in March 2013, as required by the Stormwater Permit.

Fiscal Analysis

Each year, through the City budgeting process, a fiscal analysis will be performed to ensure resources are available and allocated to carry out the proposed activities necessary for stormwater permit compliance. Projected budgets for each coming fiscal year will be presented in the Annual Work Plans (May 1), and actual expenditures for the previous fiscal year will be reported in the Annual Reports (October 1).

Report of Waste Discharge (ROWD)

As required by the stormwater permit, the City will work with the other permittees to prepare a Report of Waste Discharge for submittal to the Regional Water Board 180 days prior to expiration of the current permit (submittal date March 15, 2013). The ROWD will include a revised SQIP, legal authority certification and long term effectiveness assessment, as required by the Stormwater Permit.

Intra and Interagency Coordination

The City will coordinate internally to ensure all necessary City staff, management and elected officials are aware of Stormwater Permit requirements and related program efforts. If needed, the City will develop agreements to define roles and responsibilities between the various City departments responsible for compliance with the Stormwater Permit. This was not deemed necessary during the last permit term.

As discussed previously, the City will work with the other permittees to update the MOU which defines cost-sharing and agency roles. The City will also work with EMD as needed to update the MOU which defines responsibilities for the industrial inspection program.

Rancho Cordova will attend regular permittee Steering Committee meetings (approximately monthly) or will make arrangements for the County to represent the City at such meetings.

The City will continue to participate with other permittees on various work groups and subcommittees that have been formed to address specific activities, such as monitoring, target pollutants, and special studies. The City may make arrangements for the County to represent the City at these meetings.

The City will continue to coordinate as needed with other outside agencies during the 2008-13 permit term when multi-jurisdictional issues arise. These agencies may include Caltrans, US Army Corps of Engineers, US Fish and Wildlife Service, and the California Department of Fish and Game, among others.

Training for City Staff

Training is an important aspect of Rancho Cordova's Stormwater Program. Each year, all affected personnel and managers will be educated on the requirements of the Stormwater Permit relevant to their daily work. The training may be in the form of in-house meetings and briefings or external training conducted by the Partnership or others. For example, each year, City construction inspectors will be encouraged to attend one of the pre-wet season training workshops conducted by the Partnership.

City elected officials and managers will be kept apprised of Stormwater Program activities and issues through briefings and interoffice memoranda as needed.

Effectiveness Assessment

The City will work with the other permittees to assess the effectiveness of the overall stormwater program as described in Chapter 2, Section 2.3. This approach is based on guidance provide by CASQA in its *Effectiveness Assessment Guidance* document (2007). In addition, the City will evaluate the effectiveness of its own program management activities related to permit compliance, as described in Table 9.2-3. This assessment will be done each summer during preparation of the annual report, and recommendations for program improvements or modifications will be made based on the results.

For this program management element, most activities have Level 1 effectiveness outcomes; this requires annual documentation that activities have been conducted as required by the stormwater permit. Level of effort (e.g., number of meetings attended) and resources expended (staff hours or costs) may also be tracked (also outcome level 1). The exception to this is training. During the 2008-2013 permit term, the City (or the County, on the City's behalf) will use quizzes, surveys and/or follow-up meetings with selected groups to assess the knowledge level of trained staff with a goal of increasing awareness (outcome level 2). These tasks are described in the various program element sections (9.3-9.8) of this chapter.

The City will contribute resources (per the permittee cost-share MOU) to the long term effectiveness assessment required by the stormwater permit (due with ROWD on March 15, 2003).

9.3 Construction Element

The goal of the Construction Element is to reduce the discharge of sediment and construction-related pollutants to the City's storm drain system and local creeks (e.g., Upper Morrison and Upper Laguna) to the maximum extent practicable.

A great deal of new construction has been taking place in Rancho Cordova in recent years, but has slowed in 2009 due to economic conditions. However, building is expected to pick up again at some point during the 2008-13 permit term. It is anticipated that growth will continue mainly in residential and commercial land uses, with construction of associated parks and schools.

Construction Element Strategy

The construction element applies to private as well as public construction projects, including those also requiring coverage under the State's Construction General Permit. For the most part, the focus for inspection and enforcement activities is on land disturbing activities of one acre or more. However, smaller sites must also comply with the City's Stormwater Ordinance (discussed in Chapter 9.2) and smaller site operators are educated and informed about ways to prevent erosion and pollution problems.

The City has adopted the County's Land Grading and Erosion Control Ordinance, which requires a grading permit and erosion and sediment controls on all private projects disturbing 350 cubic yards or more of soil or one or more acres of land. Public projects not subject to the grading ordinance are subject to the City's Stormwater Ordinance, which prohibits the discharge of sediments and other construction-related pollutants to the City storm drainage system. Collectively, these ordinances provide the authority necessary for the city and county inspectors to address threatened and actual discharges of pollutants from construction operations.

With adequate legal authority as a foundation, the City's strategy for controlling discharge of construction-related pollutants includes plan review and permitting, inspection and enforcement and outreach and education. The City contracts with the County and several consulting firms to provide trained staff to implement these activities in Rancho Cordova. The City coordinates with the County and the other permittees to conduct education and outreach for the local construction community.

Intra and Interagency Coordination

The City's Engineering and Building and Safety Divisions within Public Works conduct formal biweekly meetings during the wet season and monthly meetings during the dry season to discuss stormwater issues. Coordination between Public Works and other departments (e.g., Planning) related to stormwater quality controls for construction projects is done on an informal basis through written correspondence and regular meetings related to specific projects. Since the City is small and staff are located in the same building, formal agreements are not necessary.

The City coordinates with the other permittees as much as possible to present a consistent, uniform message to the construction and development communities, since construction work is often multi-jurisdictional. For example, the City utilizes the same standard construction specifications and improvement standards as the County.

City inspectors assist the Regional Water Board in its enforcement of the Construction General Permit by enforcing compliance with comparable local ordinances, checking SWPPPs for the permit-required items during permit application, following up on referrals by the Regional Water Board, and referring site operators who do not have coverage under the Construction General Permit, but appear to need coverage.

Accomplishments to Date

Since becoming a permittee to the stormwater permit in 2003, Rancho Cordova has made several notable accomplishments related to the construction element:

- Adopted the Rancho Cordova Municipal Code, including the adopted County ordinances discussed previously, to provide the City legal authority to eliminate construction-related pollutant discharges into its storm drain system.
- Adopted the County's standards and specifications for construction, including standard erosion and sediment control drawings.
- Developed and implemented procedures to require proof of Notice of Intent (NOI) to comply with the Construction General Permit as a condition of obtaining grading permits for applicable projects.

Activities for the 2008-13 Permit Term

Table 9.3-1 at the end of this chapter summarizes the activities that will be conducted for the Construction Element during the 2008-13 permit term, along with associated performance standards, effectiveness assessment methods and a five-year implementation schedule. The table was developed to demonstrate compliance with Provision 8 of the Stormwater Permit.

This section describes the planned activities in more detail.

Legal Authority

During the 2008-13 permit term, the County will revise its Land Grading and Erosion Control Ordinance for consistency with the State's new Construction General Permit.

Plan Review and Permitting

The City's Building and Safety Division will continue to conduct plan review and issue grading permits for construction projects in Rancho Cordova for conformance with applicable County ordinances, codes and standards described previously. Improvement plans will be checked for inclusion of erosion and sediment control (ESC) plan sheet(s) to satisfy the requirements. This ESC plan will be checked in the field by the City inspector during construction. During the planning stage, projects will also be checked to verify that any other applicable environmental permits have been obtained from Dept. of Fish and Game (1600 Streambed Alteration Agreement), US Army Corps of Engineers (404 permit) and Regional Water Board (401 Certification).

In addition to satisfying all applicable local permitting requirements, private and public projects in Rancho Cordova disturbing one or more acres of land are required to obtain coverage under the State's Construction General Permit. Prior to issuing a grading permit, the City will continue to verify that a State-required Notice of Intent (NOI) was filed and will check the Stormwater Pollution Prevention Plan (SWPPP) for six items required by the stormwater permit.

The City uses standards and specifications adopted by the County to describe requirements for BMPs at construction projects to control sediment and other pollutants. All erosion and sediment control plans for projects in Rancho Cordova are checked for conformance with the standards and specifications. The County may update these documents during the 2008-13 permit term following the update of the Land Grading and Erosion Control Ordinance to reflect the State's new Construction General Permit.

Pollution Control at City-Owned Construction Projects and Other Projects Not Subject to City's Permitting Process

All City construction projects will be subject to the same ordinances and standards as private projects. Provisions will be included in design and construction contract specifications to require compliance. City project managers or their consultants will obtain coverage under the State's Construction General Permit as required. City inspectors will inspect and conduct enforcement for these projects as described later in this section.

The City lacks jurisdictional control over projects that may be constructed in Rancho Cordova by utilities, special districts (e.g., schools, RT, parks) and other agencies; therefore, such projects are not subject to the City's plan review and permitting process. However, the projects will be subject to the City's Stormwater Ordinance. The City will coordinate with these agencies on a project basis to ensure compliance with the Stormwater Ordinance and to ensure coverage as required by the State's Construction General Permit.

Track/Inventory Active Construction Projects

The City will continue to maintain a database to track public and private active construction sites and will use this information to schedule/prioritize inspections and develop annual reports.

Inspection and Enforcement

Rancho Cordova will continue to conduct inspections of all construction projects in the City to ensure compliance with the requirements set forth in the City's ordinances and applicable standards and specifications. Inspection services may be contracted out to the County and/or private firms. This work includes checking erosion and sediment control BMPs for compliance with the ESC plan in the improvement plans and verifying that sites have coverage under the State's Construction General Permit if applicable. General Permit non-filers and repeat offenders will be referred to the Regional Water Board.

The City will continue to prioritize sites as either "high" or "moderate" threat to water quality and inspects according to this schedule:

- High priority sites – inspected twice monthly during the wet season (October 1 – April 30) and monthly thereafter.
- Moderate priority sites – inspected monthly throughout the year.

New projects will be assumed to be high priority until successive inspections demonstrate that they can be downgraded to moderate priority. The criteria for making this determination will include factors such as: project size, amount and nature of site activity, sensitive site conditions (e.g., proximity to a creek, steep slopes or erosive soils), and history of prior violations by the contractor(s).

Progressive enforcement action will be taken by the construction inspectors when violations of local ordinances are observed, including discharge of sediments and other construction-related pollutants to the storm drain system or local creeks. Rancho Cordova uses the enforcement procedures described in the stormwater and land grading ordinances.

Outreach and Education

The City will continue to provide education and guidance to both City staff (annually) and the local construction and development community (periodically), covering topics such as: current regulations and changes, local procedures and standards, BMPs, new technology, and inspection and maintenance practices.

The City will support Partnership-sponsored pre-wet season and other training events for the construction community (developers, contractors, engineers, designers) as well as those hosted by local groups such as the Building Industry Association (BIA). This coordinated training helps ensure consistency for the local construction community (which works throughout the Sacramento area, across various municipal lines), promotes stronger ties with professional organizations, and is cost-effective.

Various forms of educational materials will be distributed in different methods, depending on the target audience and message. Typical formats include training workshops, brochures, and guidance documents and standards. Education will also be provided through the entitlement and plan check process, building permit process, preconstruction meetings, and inspection.

Rancho Cordova will continue to contribute funding (through the cost-share MOU) for the development and production of Partnership outreach materials such as brochures for concrete and painting, printed in English and Spanish.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Table 9.3-1 describes the assessment methods the City will use to more specifically evaluate the construction program element activities during the 2008-13 permit term. The goal will be to move toward outcome levels 2 and 3 (changing awareness and behavior, respectively, of the regulated construction community) for some tasks. The remaining tasks will continue to be evaluated at outcome level 1 (documenting and confirming permit compliance).

Key indicators have been selected for various tasks to demonstrate progression towards overall stormwater program goals for this particular element. A summary of the status of key indicators will be used to assess overall program effectiveness in the annual reports.

Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

This page intentionally left blank.

9.4 Commercial/Industrial Element

The goal of the Commercial/Industrial Element is to reduce the discharge of stormwater pollutants to the maximum extent practicable and to effectively eliminate illegal non-stormwater discharges from commercial and industrial facilities and operations in Rancho Cordova.

Commercial/Industrial Element Strategy

Rancho Cordova contracts with others to most effectively perform some of the activities required for this program element.

The City has a MOU with Sacramento County EMD to conduct triennial inspections as required by the stormwater permit of over 300 commercial/industrial facilities in Rancho Cordova (see Table 9.4-1). The majority of these facilities are restaurants; however, Rancho Cordova is fairly industrialized, as shown on Table 9.4-1, compared to other small cities in the Partnership such as nearby Folsom. The EMD MOU authorizes trained and qualified EMD inspectors to conduct inspections and issue enforcement actions, using the legal authority provided by the City's Stormwater Ordinance. EMD also passed a fee ordinance in 2004 which authorizes the agency to recover costs from the industrial and commercial facilities inspected so that the City's other funding sources are not unduly burdened. The work performed by EMD on the City and other permittees' behalf is described in Chapter 2 (Section 2.7).

Table 9.4-1. Commercial/Industrial Facilities in Rancho Cordova Subject to EMD Inspections (2008 data)

Commercial/Industrial Category	No. Facilities (2008)
Auto body shops	16
Auto repair shops	43
Auto dealers	8
Equipment rental facilities	0
Kennels	2
Nurseries	0
Retail gasoline outlets (i.e., gas stations)	18
Restaurants	155
Facilities covered by the State's Industrial General Permit	60
Total	**302**

The City contracts with the County to conduct complaint-based inspections of other businesses within the city. See Chapter 3, Section 3.4 for details. Rancho Cordova and other permittees contract with the Business Environmental Resource Center (BERC) to conduct outreach to targeted local businesses in each of their jurisdictions. This work, which is described in Chapter 2 (Section 2.7), includes maintaining and updating a database of businesses receiving the outreach materials each year.

Intra and Interagency Coordination

The City signed an MOU with EMD to conduct stormwater compliance inspections on its behalf as described previously. The City participates in periodic (approximately biannual) meetings with the other permittees and EMD to discuss the permit-required inspection program, resolve problems and identify improvements as needed. EMD coordinates with the other permittees, BERC and various business groups and trade associations during the course of implementing the program. Additional details about this coordination are contained in Chapter 2, Section 2.7.

The County takes care of all other coordination needed for conducting the activities described in this section on the City's behalf; this work is covered by the City/County agreement for services that was executed when the City incorporated in 2003.

Accomplishments To Date

Refer to Chapter 2, Section 2.7 for a description of accomplishments to date.

Activities for the 2008-13 Permit Term

The following information briefly describes the activities conducted by County EMD, County DWR and BERC on the City's behalf. Refer to Chapter 2 (Section 2.7) and Chapter 3 (Section 3.4) for additional details, including tables that show proposed activities, performance standards, assessment methods and the five-year implementation schedule.

Legal Authority

The County's Stormwater Ordinance will continue to provide legal authority to the EMD and the County for regulating commercial businesses and industries in Rancho Cordova with respect to stormwater pollution. The Stormwater Ordinance and EMD's Fee Ordinance will be amended as needed during the 2008-13 permit term.

Priority Industry Identification

The industries and commercial business categories subject to EMD stormwater compliance inspections were listed in Table 9.4-1. The businesses subject to targeted outreach by BERC are mainly mobile operations without a fixed base of operation. These are the same business categories that were targeted during the 2002-08 permit term. These lists will be refined if needed during the 2008-13 permit term. See Chapter 2, Section 2.7 for more details.

Triennial Industrial Stormwater Compliance Inspections

EMD will continue to conduct triennial inspections at priority industrial facilities in Rancho Cordova (see Table 9.4-1) and conduct associated enforcement and education, on the City's behalf. The first cycle of inspections was completed in June 2007 and the second cycle will be completed in June 2010. EMD will continue to maintain its database and generate monthly violation reports, as well as all the required information for the Rancho Cordova Annual Reports.

Refer to Chapter 2, Section 2.7 for more information.

Complaint-Based Stormwater Compliance Inspections

County DWR stormwater staff will inspect other businesses not addressed by EMD's program described above within the City of Rancho Cordova on a complaint basis. Refer to Chapter 3, Section 3.4 for more information.

Educational Outreach

BERC will conduct outreach to targeted businesses within Rancho Cordova, under contract to the Partnership. Outreach will be conducted with businesses considered potential temporary or intermittent sources of unauthorized non-stormwater discharges and/or stormwater pollution. Most of the businesses (e.g., carpet cleaners, pressure washers) are mobile operations without a single base of operation, so they are difficult to track. Educational materials will also be distributed via City and County public counters, through trade associations and industry suppliers, and at workshops and other events.

Refer to Chapter 2, Section 2.7 for more information.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Chapter 2 (Section 2.7) and Section 3.4 in the County's SQIP describe the assessment methods EMD, the County (on the City's behalf) and BERC will use to more specifically evaluate the commercial/industrial program element activities conducted during the 2008-13 permit term. Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

This page intentionally left blank.

9.5 Municipal Operations Element

The Municipal Operations Element specifies activities for controlling stormwater pollution which may occur during operation of city-owned facilities in Rancho Cordova, to keep pollutants from entering storm drains and local creeks and rivers. City-owned facilities include public buildings, parking lots, roads, bridges, landscape medians, storm drains and drainage ways. The City has no jurisdictional control over facilities and operations managed by parks and school districts, the sewer district, water purveyors and private utilities.

Typical municipal activities include solid waste hauling and disposal; hazardous and recycling waste collection, storage and disposal; vehicle and equipment washing and maintenance, pipe, channel and basin maintenance and repair/replacement, street cleaning, street overlays and repairs, vegetation management and graffiti abatement. Municipal operations activities will be conducted in a manner that does not inadvertently contribute pollution to local waterways. Another important goal is to set the example of model pollution prevention for the public.

Municipal Operations Element Strategy

The City's strategy for controlling stormwater pollution from City facilities and operations involves maintaining a good inventory of the operations, training affected employees, and ensuring good communication/coordination between City departments and with contractors to provide technical assistance, evaluate program effectiveness, and resolve issues in a collaborative way.

These combined efforts help ensure that City designers, contract administrators, and operations and maintenance staff understand, implement, and demonstrate compliance with the stormwater permit in order to reduce stormwater pollution to the maximum extent practicable.

Inventory of City Operations and Related Stormwater Activities

The following is an inventory of the City-owned facilities and operations addressed by this element:

Buildings– The City owns and operates City Hall, the Killgore Cemetery and building, and associated parking lots. Building and parking lot maintenance is contracted to offsite vendors. The City does not own a fleet storage or corporation yard.

Corporation Yard - The City does not own a corporation yard. County crews conducting maintenance on behalf of the City use the County Bradshaw Corporation Yard, as discussed in Chapter 3, Section 3.5.

Storm Drain System

Piped storm drain system – As of summer 2008 there are over 100 miles of piped storm drains and 5 associated pumps in the city (as reported in the 2007/08 annual report). Due to new development, there are new facilities being added all the time. The annual reports will provide an updated inventory each year. Storm drain pipe and associated drain inlets

and manholes in the city are maintained by the County DWR, as described in Chapter 3, Section 3.5.

Storm drain inlets – As of summer 2008 there were 5020 storm drain inlets and 2552 manholes in the city (as reported in the 2007/08 annual report). Due to new development, there are new facilities being added all the time. The annual reports will provide an updated inventory each year. Older storm drain inlets in the city have been marked with "No Dumping-Drains to Creek" messages. County maintenance crews check the legibility of the markings during routine maintenance activities and replace any that are damaged or missing (see Chapter 3, Section 3.5). New storm drain inlets installed in the city are required to have a permanent "No Dumping" message; this is verified by the City inspectors during construction.

Channels and creeks – 35 miles of manmade drainage channels and natural creeks are maintained by the County on the City's behalf (as reported in the 2007/08 annual report). This includes portions of Morrison and Laguna Creeks, and various unnamed tributaries.

Detention basins – As of summer 2008, there are three water quality/flood control detention basins in the city. The basins are operated and maintained by the County on behalf of the City. According to drainage master plans, as many as 18 additional detention basins could be constructed as the areas develops. More basins, and other types of stormwater quality control measures are expected in the future as well, due to new development. The annual reports will provide an updated inventory each year.

Transportation Facilities

Curbed Streets – Approximately 8880 curb miles of curbed streets are cleaned by a vendor under contract with Public Works (as reported in the 2007/08 annual report).

Roads and Roadside Vegetation - About 190 centerline miles of roads and associated roadside vegetation are maintained in the City by the County Department of Transportation (as reported in the 2007 Draft SQIP).

City-owned parking lots – The City owns about 4.5-acres of parking lots exposed to rainfall at City Hall and the Killgore Cemetery; parking lot maintenance is contracted to offsite vendors. There are no other City-owned parking lots.

Animal services – the City's Animal Services Department uses the County facility in the Bradshaw area.

Finally, the city contracts with County Sheriff for staffing of the City's Police Department. There is one nearby command center near Mather, but no fleet maintenance or washing is performed there.

City parks – 16 parks within the City are operated and maintained (including vegetation and waste management) by the Cordova Parks and Recreation District.

State, Federal and Special District Agency Facilities and Activities

The city's activities under the Municipal Operations Element do not address facilities or operations by federal or state governmental agencies (e.g., Caltrans), private utilities (e.g., SMUD), the sewer and water districts, school districts, and other special districts and agencies listed in Section 9.2. These agencies and activities are outside of the City's jurisdictional control and are not covered by the City's stormwater permit. City stormwater inspectors are authorized to issue enforcement actions to the operators of such facilities if discharges from the facilities contribute pollution to the city-owned storm drain system or local creeks within the city.

Intra and Interagency Coordination

The City coordinates with the other permittees to share information, strategies, and recommended practices related to operation and maintenance of City-owned facilities.

The City coordinates with special districts (listed previously in Section 9.2) on a project basis to make sure that measures are in place to protect the City's storm drain system and local creeks and rivers.

Accomplishments To Date

Since becoming a permittee to the stormwater permit in 2003, Rancho Cordova has made several notable accomplishments related to the Municipal Operations Element:

- Compiled the inventory of City-owned facilities and operations. The inventory helps with tracking activities and the City updates the inventory each year for the annual report.
- Established contracts needed to complete municipal operations activities, including contracts with Sacramento County DWR, a waste hauler, a street cleaning contractor and various maintenance vendors.
- Established routines for collecting and compiling data to assess activities and document regulatory compliance (e.g., County and City staff routinely log the quantity of pipes, channels, basins, storm drain inlets, manholes, and roadways cleaned.) This information is tallied and presented in annual reports.
- Through the Partnership, supported the County's development of the *River Friendly Landscaping Guidelines* (2007) and associated *Homeowners' Guide (2008)*. This program won the 2008 Environmental Leadership award from the Sacramento Environmental Commission.

Activities for 2008-13 Permit Term

Table 9.5-1 at the end of this chapter summarizes the activities that will be conducted for the Construction Element during the 2008-13 permit term, along with associated performance standards, effectiveness assessment methods and a five-year implementation schedule. The table was developed to demonstrate compliance with Provision 10 of the Stormwater Permit.

This section describes the planned activities in more detail. The City contracts with County DWR to conduct some of the activities for this program element. Those activities are summarized very briefly below; see Chapter 3, Section 3.5 for more details about County activities.

Illicit Discharge Response

The County, on behalf of the City, will respond quickly to all incidents where an illicit discharge threatens to enter or enters the storm drain system. See Section 9.6 and Chapter 3, Section 3.6 for a description of these activities.

Stormwater Pollution Control for Construction and Development of City-Owned Projects

Construction and development of City projects (e.g., new facilities, widened roadways) will be subject to the same requirements applying to private construction and development projects, as described in Sections 9.3 and 9.8.

Facility Management

Maintenance of Buildings

The only facilities owned by the City are City Hall and the Killgore Cemetery building, and the only potential for stormwater pollution at those locations is the parking lot runoff. The parking lot maintenance activities described later in this section are designed to minimize discharge of pollutants.

The City's activities do not address leased facilities and associated parking areas.

Integrated Pest Management

The City's contractors (including the County) will implement IPM procedures as described in the Pesticide Plan developed by the Partnership and approved by the Regional Water Board. Pest control operations contracted by the City relate to City-owned buildings (City Hall and Killgore Cemetery; maintained by private maintenance contractors) and vegetated roadside medians in the City (maintained by the County). The City has no jurisdiction over pest control associated with maintenance of parks and open space in the city.

The City intends to follow the County's IPM policy; see Chapter 3, Section 3.5 for more discussion about the County policy.

The City will promote and distribute the award-winning River Friendly Landscaping Guidelines and associated Homeowners' Guide to residents and landscape contractors doing work in the City.

Storm Drain System Maintenance

Maintenance of the Piped Storm Drain System

The City will continue to contract with the County DWR to conduct these services on the City's behalf. The County will employ the same procedures they use for cleaning their own system. Refer to Chapter 3, Section 3.5 for this information.

Maintenance of Creeks and Channels

The City will continue to contract with the County DWR to conduct these services on the City's behalf. The County will employ the same procedures they use for cleaning their own system. Refer to Chapter 3, Section 3.5 for this information.

Maintenance of Detention Basins

The County will continue to operate and maintain detention basins in Rancho Cordova on behalf of the City. The County will employ the same procedures they use for cleaning their own basins. Refer to Chapter 3, Section 3.5 for this information.

Storm Drain Inlet Marking

County maintenance crews will continue to check the legibility of existing storm drain stencils and markings during routine maintenance activities and replace any that are noted as damaged or missing as soon as practicable. The city planners, engineers and field inspectors will continue to verify that new storm drain inlets installed in new developments include a permanent "No Dumping" message.

Operation and Maintenance of Transportation Facilities

Prioritized Street Sweeping for Curbed Streets

The City will continue to contract with a vendor for street sweeping of curbed streets. The City has created four zones for street sweeping All zones are considered Priority "A" and are swept once per month, and more frequently during the leaf drop periods (Nov/Dec). A copy of the street sweeping map is provided as Appendix 9B.

Inspection and Maintenance of City-Owned Parking Lots

The City will continue to contract with a vendor for cleaning of City-owned parking lots associated with City Hall and Killgore Cemetery. Monthly maintenance activities will include trash/debris removal, vacuum sweeping; and pressure washing of oil stains as needed, involving collection and proper disposal of the waste water.

Maintenance of Roads and Roadside Vegetation

The City will continue to contract with the County Department of Transportation to conduct these services on the City's behalf. The County will employ the same procedures they use for maintaining their own roadway system. Refer to Chapter 3, Section 3.5 for this information.

Waste Management Services

The City will continue to contract with a contractor for curbside collection of residential solid and green waste, general recycling and used motor oil in the city. The contractor does not have any storage/staging yards or facilities within the city. They take wastes to a central transfer facility located outside the city limits, and from there the wastes are transported to a Class III landfill.

Rancho Cordova residents will be able to continue to take household hazardous wastes to one of the two regional transfer stations operated by the City and County of Sacramento. The City pays for this service (set fee per vehicle) to make it free and as convenient as possible for residents. See Chapter 3, Section 3.5 and Chapter 4, Section 4.5 for descriptions of the facilities.

Operation and Maintenance of City Parks

The Cordova Recreation and Park District will continue to manage the 16 parks within the city limits and plan, construct and maintain any new parks built as the city develops. The City has no jurisdictional control over this special district, but will coordinate with the district to ensure that pollutants are not discharged to the City's storm drain system or local creeks due to the Park District's operations.

Employee and Contractor Training

Training for County employees conducting work in the city is described in Chapter 3, Section 3.5. City contractors are responsible for training their own personnel to comply with all applicable regulations, including the City's stormwater ordinance.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Table 9.5-1 describes the assessment methods the City will use to more specifically evaluate the municipal operations program element activities which it conducts. Assessment activities to be conducted by the County on the City's behalf are described in Chapter 3, Section 3.5. The goal will be to move toward outcome levels 2 and 3 (changing awareness and behavior, respectively, of the city and County employees and contractors) for some tasks. The remaining tasks will continue to be evaluated at outcome level 1 (documenting and confirming permit compliance).

Key indicators have been selected for various tasks to demonstrate progression towards overall stormwater program goals for this particular element. A summary of the status of key indicators will be used to assess overall program effectiveness in the annual reports.

Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

9.6 Illicit Discharge Element

The goal of the Illicit Discharges Element is to reduce the discharge of stormwater pollutants to the maximum extent practicable and to effectively eliminate prohibited non-stormwater discharges. Any material dumped or discharged into the City's storm drain system eventually makes its way to a local creek and/or river, where it can impair beneficial uses. This is true whether the material is classified as hazardous or not. Water quality, habitat, recreation and aesthetics are all examples of benefits that can be impacted.

The storm drain system consists of a network of drain inlets, manholes and piping, as well as streets, sidewalks, gutters and roadside ditches, which discharge to local creeks and rivers. Stormwater runoff from driveways, parking lots, roof drains and other surfaces typically discharge into this system.

Two kinds of discharges are addressed by this element:

- *Illegal dumping* – Dumping of liquid or solid wastes into the storm drain system. Examples include mobile carpet cleaning companies discharging dirty rinse water into a storm drain manhole, a homeowner dumping used motor oil into a storm drain inlet, or a person dumping garbage or other wastes into drainage channels and creeks.
- *Illicit connection* – A piped connection allowing sanitary sewage to flow into the storm drain system. For example, a washing machine plumbed into the storm drain system rather than the sanitary sewer.

Illicit Discharge Element Strategy

The City of Rancho Cordova contracts with Sacramento County to implement this program element within the city. The County's strategy includes legal authority, field screening, waste collection programs and outreach as follows:

- Maintain adequate legal authority to prohibit illicit discharges. Since Rancho Cordova adopted all County ordinances, prohibitions of illicit discharges such as oils, greases, paints, chemicals, dry cleaning waste, etc. into the storm drain system apply within the city in the same manner as they do in the County. City and County staff are authorized to enforce the ordinance within the city limits.
- Conduct ongoing field screening to detect illicit discharges and connections as a part of routine maintenance and repair of the storm drain system and local creeks, and enforcing against dischargers. The City contracts with County DWR for these services for the piped system, and with California Conservation Corps for the natural creek system.
- Provide convenient means for residents to dispose of solid and household hazardous wastes, to deter illegal dumping.
- Educate City staff, contractors and the public about how to identify and report illicit discharge problems. This effort includes educational materials, signage and training.

- Provide a hotline for public reporting of problems and responding in a timely manner. The City supports the regional stormwater hotline 808-4H20 for this purpose. In addition, the public can report illegal dumping on-line through the City's web site.

Intra and Interagency Coordination

The City coordinates with the County through its contract with DWR for this program element. County crews conduct ongoing field screening for illicit discharges and connections as part of this work. They, in turn, will coordinate with other appropriate County departments to clean up and dispose of any polluted wastewater. If progressive enforcement action against the discharger does not eliminate the problem, the County will then coordinate with legal counsel.

The City coordinates with the other permittees in the Partnership to produce educational materials and messages designed to eliminate illicit discharges.

The City has a contract with a private waste hauler to provide solid waste collection services in the city, including curbside pickup of used motor oil. This helps reduce the amount of pollutants dumped into the storm drains. These activities were previously described in Section 9.5.

Accomplishments To Date

The following briefly describes accomplishments since 1990 related to this element. Refer to the County's SQIP, Chapter 3, Section 3.6, for more information.

- In 2003 the City adopted the County's Stormwater Ordinance, which makes most discharges to the storm drain system illegal (some exceptions are noted).
- 95% of storm drain inlets in the City were stenciled with the "No Dumping — Drains to Creek" message and all new inlets were permanently stamped with this message.
- In 2006, a new hotline, 808-4H20, began allowing callers to select Rancho Cordova and be routed to the County for assistance on City-related issues or complaints. The hotline is now widely advertised on all Partnership educational materials, media spots, and on the web site.
- Starting in 2004, the County created and annually updated an illicit discharges map to identify "hot spot" problem areas in Rancho Cordova requiring additional or more frequent investigations.

Activities for 2008-13 Permit Term

Table 9.6-1 at the end of this chapter summarizes the activities that will be conducted for the this program element during the 2008-13 permit term, along with associated performance standards, effectiveness assessment methods and a five-year implementation schedule. The table was developed to demonstrate compliance with Provision 11 of the Stormwater Permit.

This section describes the planned activities in more detail. The City contracts with County DWR to conduct some of the activities for this program element. Those activities are summarized very briefly below; see Chapter 3, Section 3.6 for more details about County activities.

Legal Authority

As recommended by the County, the City will amend the Stormwater Ordinance as needed to enhance legal authority. The County will enhance its enforcement authority as needed.

Reporting of Illicit Discharges

The City will continue to contribute funding to the Partnership's 808-4H20 hotline to facilitate public reporting of problems in the City.

Ongoing Field Screening to Detect Illicit Discharges and Connections

County maintenance crews will continue to be responsible for inspecting and maintaining the piped storm drain system, creeks and channels, and roads/roadside ditches in the City as part of routine maintenance activities. They will continue to be trained how to identify, clean up and/or refer and report observed incidents of illicit discharges. Follow-up will be conducted for any observed flows suspected of containing pollutants to attempt to trace the flow to its source and eliminate any unauthorized non-stormwater discharges. County crews will also respond to complaints from the public and referrals from County industrial inspectors, the Regional Water Board and others. Problems are addressed on an individual basis depending on the nature of the discharge. See Chapter 3, Section 3.6 for additional details.

Illicit Discharge Response, Containment and Clean-up

The County will continue to conduct response, containment and clean-up activities on behalf of the City as needed to eliminate illicit discharges in Rancho Cordova. See Chapter 3, Section 3.6.

Enforcement

The County will continue to conduct enforcement on behalf of the City as needed to eliminate illicit discharges in Rancho Cordova. See Chapter 3, Section 3.6.

Data Management

The County will continue to track data and update the Rancho Cordova illicit discharge map that shows the location of illicit discharges for identifying potential needs for further investigation or possibly outreach material. See Chapter 3, Section 3.6.

Solid Waste and Household Hazardous Waste Programs

Rancho Cordova will continue to contract with a private waste hauler to provide waste, recycling and green waste collection and disposal services for the city residents, as a means of deterring illegal dumping. This program includes curbside pickup of used motor oil and residents can also take household hazardous waste to one of two regional transfer facilities. See Section 9.5 for more detail. The City will continue to accept certain universal wastes (batteries, cell phones) at City Hall for disposal.

Education and Outreach

To educate the public, and to minimize illegal discharges of waste into the storm drain system, County maintenance crews will continue to maintain "no dumping-drains to creek" messages on all storm drain inlets in Rancho Cordova. Based on public and maintenance crew recommendations and the illicit discharges map, the County will recommend locations for signage at high priority areas and will create and install the signage.

Employee and Contractor Training

Training for County employees conducting work in the city is described in Chapter 3, Section 3.6. City contractors are responsible for training their own personnel to comply with all applicable regulations, including the City's stormwater ordinance.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Table 9.6-1 describes the assessment methods the City will use to more specifically evaluate the illicit discharge program element activities which it conducts. Assessment activities to be conducted by the County on the City's behalf are described in Chapter 3, Section 3.6. The goal will be to move toward outcome levels 2 and 3 (changing awareness and behavior, respectively, of the city and County employees and contractors) for some tasks. The remaining tasks will continue to be evaluated at outcome level 1 (documenting and confirming permit compliance).

Key indicators have been selected for various tasks to demonstrate progression towards overall stormwater program goals for this particular element. A summary of the status of key indicators will be used to assess overall program effectiveness in the annual reports.

Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

9.7 Public Outreach Element

The goal of the Public Outreach Element is to raise awareness and foster community stewardship to help prevent pollution and protect local creeks and rivers.

Public Outreach Element Strategy

The City coordinates with the Partnership and the County to implement a wide range of activities to increase the knowledge of the community regarding the City' storm drain system, impacts of urban runoff on local creeks and rivers, and potential pollution prevention solutions for the targeted audiences. Refer to Chapter 2, Section 2.6 for this information. In addition, the City conducts a few activities locally as described in this section.

Target Audiences in Rancho Cordova

There are an estimated 68,875 residents in the City of Rancho Cordova. The City is served by two school districts: Folsom-Cordova and Elk Grove Unified. Together, these districts operate 12 elementary, three middle and two high school within the city. For the 2008-09 school year, the combined total student population in the city was estimated to be 8,800, with 3,200 students enrolled in grades 3-6 (this is a target audience for stormwater education).

In 2008 there were six homeowner associations in the city, although that number will grow as the city grows. There are also numerous faith-based, community and business associations represented in Rancho Cordova, including the Chamber of Commerce. The Cordova Community Council, founded in 1959, serves as a citizens' forum for discussing the future of Rancho Cordova. The group operates an informational web site for the public.

The local newspaper is called "The Grapevine" and the Sacramento Bee is the major newspaper serving the region and the City of Rancho Cordova. Other media includes T.V and radio stations that serve the greater Sacramento area.

Intra and Interagency Coordination

Managers in the City's Engineering Department in Public Works are responsible for administering the stormwater program and overseeing stormwater permit compliance. This group coordinates with City Council, the City Manager's office and other departments as needed throughout the year to educate and share information.

Rancho Cordova coordinates with the other cities in the County on regional public outreach issues through the Partnership. Activities such as the regional media campaign are generally discussed, and agreements made, during permittee coordination meetings.

Accomplishments To Date

Chapter 2, Section 2.6, describes major accomplishments related to regional public outreach by the Partnership since 1990. In addition, the following describes a couple of key accomplishments made by the City since incorporation in 2003:

- The City participated in the Upper Laguna Creek Collaborative, a watershed-based planning process involving all the stakeholders in the upper watershed, and the Laguna Creek Watershed Council.
- The City launched the Strong Neighborhoods Initiative in January 2007, to foster City pride, increase property values and encourage residents to enhance their homes, streets and community. One activity conducted through this program is the Spring Neighborhood Cleanup, where City staff and volunteers work with a neighborhood on a beautification project.

Activities for 2008-13 Permit Term

Partnership Activities

See Chapter 2, Section 2.6 for detailed information about activities that will be conducted by the Partnership related to regional public outreach. Residents, businesses and students attending Rancho Cordova schools are addressed through those efforts.

City-Specific Activities

Table 9.7-1 at the end of this chapter summarizes the City-specific activities that will be conducted for the this program element during the 2008-13 permit term, along with associated performance standards, effectiveness assessment methods and a five-year implementation schedule. The table was developed to demonstrate compliance with portions of Provision 12 of the Stormwater Permit.

This section describes the planned activities in more detail.

- City Public Works staff will meet with City managers periodically throughout the permit term to keep them informed about the stormwater program. Presentations will be made to the City Council and/or Planning Commission upon request or as needed. City leaders will also be invited to participate in community events (described below and in Chapter 2, Section 2.6) to demonstrate support for the stormwater pollution prevention effort.
- The City will create a stormwater quality page on the City's web site to better address the stormwater pollution prevention program and provide links to the Partnership web site. Tell the public how to report illegal dumping, etc.
- The City will continue to periodically include articles regarding stormwater pollution prevention in the Rancho Cordova "City Views" newsletter. In addition to being posted on the City's web site, it will be distributed via direct mail to every resident.
- Through the Strong Neighborhoods Initiative Program, the City will continue to target neighborhoods bordering creeks for the Spring Neighborhood Cleanup. The City will consider partnering this with Urban Creeks council's annual Creek Week creek cleanup days in April each year.
- The City will work with the County to sponsor and staff a stormwater booth at the annual Fourth of July city celebration.

- The City will continue to support and participate in the Upper Laguna Creek Collaborative. This group is preparing a master plan for protection of the creek in the undeveloped portion of the Laguna Creek Watershed as development proceeds.
- The City will continue to support and participate in the Laguna Creek Watershed Council events and meetings as budget allows.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Table 9.7-1 describes the assessment methods the City will use to more specifically evaluate its City-specific public outreach program element activities during the 2008-13 permit term. Assessments of regional public outreach activities will be conducted by the Partnership as described in Chapter 2, Section 2.6. In general, the goal will be to move toward outcome levels 2 and 3 (changing awareness and behavior, respectively, of dischargers and the public) for some tasks. The remaining tasks will continue to be evaluated at outcome level 1 (documenting and confirming permit compliance).

Key indicators have been selected for various tasks to demonstrate progression towards overall stormwater program goals for this particular element. A summary of the status of key indicators will be used to assess overall program effectiveness in the annual reports.

Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

This page intentionally left blank.

9.8 New Development Element

The goal of the New Development Element is to mitigate urban runoff pollution and other water quality impacts associated with new development and redevelopment.

The City of Rancho Cordova is positioned for rapid urban development upon lands generally located south of White Rock Road and east of Sunrise Boulevard. Approved prior to incorporation of the City, the Sunrise Douglas Community Plan, currently under construction proposes up to 22,000 homes at build out. The Rio del Oro, Suncreek, Westborough and The Preserve projects collectively propose an additional 43,000 homes and a variety of supporting and employment generating uses. As currently proposed, these projects would include 6,743 acres of residential uses, 920 acres of employment generating uses, 1,067 acres of public uses and 1,249 acres of habitat reserves.

The residential component of the Villages of Zinfandel project has been constructed and has also increasing the city's population. Development of the non-residential component is expected to continue for the next several years in the commercial and industrial sectors, with projects expected in the Mather Business Park, the Capital Center business park, and along major roads such as Folsom Boulevard and Sunrise Boulevard.

New Development Element Strategy

Development and redevelopment within Rancho Cordova will be mitigated with a combination of strategies such as: early site planning to limit sources of pollution, requiring installation of permanent post-construction stormwater quality facilities to treat runoff before it reaches the drainage system, and ongoing outreach activities through education and training. These activities and more are described in this section.

The City contracts with Sacramento County to provides some of the services described in this section (see Chapter 3, Section 3.8), and the City's Planning Department provides planning and environmental review services.

Intra and Interagency Coordination

The City contracts with the County for drainage and stormwater review services. The City also coordinates with the other permittees regarding regional activities such as the new Design Manual and hydromodification and low impact development (LID) standards, described more later in this section.

Accomplishments To Date

County Activities Prior to Incorporation

The area now served by the City of Rancho Cordova was covered by the Sacramento stormwater permit from 1990 until the City incorporated in 2003. Prior to incorporation, the County conducted planning and established and implemented stormwater controls for new development in this unincorporated area. Starting in the mid 1990s, the County began conditioning future projects via the master drainage planning process and development approvals to include water quality detention basins and other stormwater facilities.

Accomplishments Since 2003

- Upon incorporation, the City established a planning department to handle processing of development applications and environmental review. The City established a work plan agreement with the County to provide drainage and stormwater review services.
- In June 2006, the City adopted its first General Plan. The Plan includes a Natural Resources Element which features various goals, policies and actions intended to protect creek and water quality resources. The General Plan is discussed in more detail in Section 9.2.The City updated its CEQA initial study checklist and mitigation measure language to better address waters quality protection and stormwater pollution prevention.
- On the City's behalf, the County worked with the other permittees in the Partnership to create the new *Stormwater Quality Design Manual for the Sacramento and South Placer Regions*, continued to conduct special studies of BMP effectiveness, and conducted other activities. These accomplishments are described in more detail in Chapter 3, Section 3.8.
- Since about 2004, the County has been requiring and establishing maintenance covenants with property owners in Rancho Cordova to ensure long-term maintenance of new stormwater quality facilities.

Activities for 2008-13 Stormwater Permit Term

The stormwater permit requires that the permittees regulate new development and redevelopment projects so that they incorporate measures to mitigate associated stormwater quality impacts. In addition, the new permit requires a plan for mitigating the hydromodification impacts associated with new development in the permit area. When development occurs, it increases the volume and rate of runoff and therefore stream flow; these hydromodification impacts, in turn, can cause creek erosion and degrade habitat.

In addition, the stormwater permit requires the permittees to require all priority new development and redevelopment projects to incorporate low impact development (LID) measures. The developed criteria will be incorporated into the *Stormwater Quality Design Manual for the Sacramento and South Placer Regions.*

Table 9.8-1 at the end of this chapter summarizes the activities that will be conducted for this program element during the 2008-13 permit term, along with associated performance standards, effectiveness assessment methods and a five-year implementation schedule. The table was developed to demonstrate compliance with Provisions 13-26 of the Stormwater Permit.

This section summarizes the planned activities. The City contracts with County DWR and the Partnership to conduct many of the activities for this program element; therefore, see Chapter 3, Section 3.8 for more details.

Development-Related Ordinances, Plans, Policies and Procedures

Ordinances/Municipal Code

The City and County's stormwater ordinances provide adequate authority to establish new requirements for development projects; no revisions to the ordinance are warranted.

Plans, Policies and Procedures

The City's 2006 General Plan, described in Section 9.2, contains all the necessary policies to protect water quality in the City. The City Planning staff and Planning Commission will continue to ensure that these policies are applied to new and redevelopment projects approved in the city. Updates to the General Plan are not anticipated during the 2008-13 permit term.

The City planners will periodically evaluate and revise as needed, the CEQA initial study checklist and mitigation measure language used by City planners to condition development projects. Revised checklists and mitigation language will be submitted with Annual Reports.

Development Standards and Technical Guidance

Standards, Codes and Technical Guidance

Development projects in Rancho Cordova are conditioned by the County to comply with County stormwater quality and drainage development standards. The County will evaluate and amend its stormwater quality development standards to comply with new permit requirements during the 2008–13 permit term**.** The *Stormwater Quality Design Manual* will be updated to include additional criteria for low impact development (LID) and hydromodification mitigation following the amendment of the development ordinances and standards. The hydromodification criteria are discussed in the next section. Rancho Cordova will contribute funding through the permittee cost-share agreement for the update of the design manual. The City will also continue to contribute to the Partnership's efforts to update the protocol for acceptance of proprietary control measures; see Chapter 2, Section 2.4 for more details.

Stormwater quality requirements need to be coordinated with the City's zoning and building codes (such as those related to tree preservation/landscaping, water conservation, sanitary sewer and solid waste) in order to avoid conflict and overlap. The City's planners will evaluate and amend policies and codes as needed for consistency with the amended development standards and updated design manual.

Hydromodification Management Plan (HMP)

The City will work with other permittees to meet the requirements of the stormwater permit with regards to hydromodification management. It is likely that these new requirements will be applicable to developing areas in Rancho Cordova. Additional details about proposed work are provided in the County's SQIP, Chapter 3, Section 3.8.

To comply with the stormwater permit requirements, the permittees are submitting a Hydromodifcation Management Plan (HMP) work plan as part of this SQIP (see Chapter 3, Section 3.8). One year after the Regional Water Board approves the work plan, the permittees will submit the HMP document.

Waiver Program/Mitigation Fund

The stormwater permit allows the permittees to develop a waiver program/mitigation fund alternative for development projects where it is demonstrated that installing stormwater quality control measures is not feasible. The County is taking the first step to develop initial parameters for their potential waiver program. The City will review the results of the County's work and consider application to future development projects in Rancho Cordova.

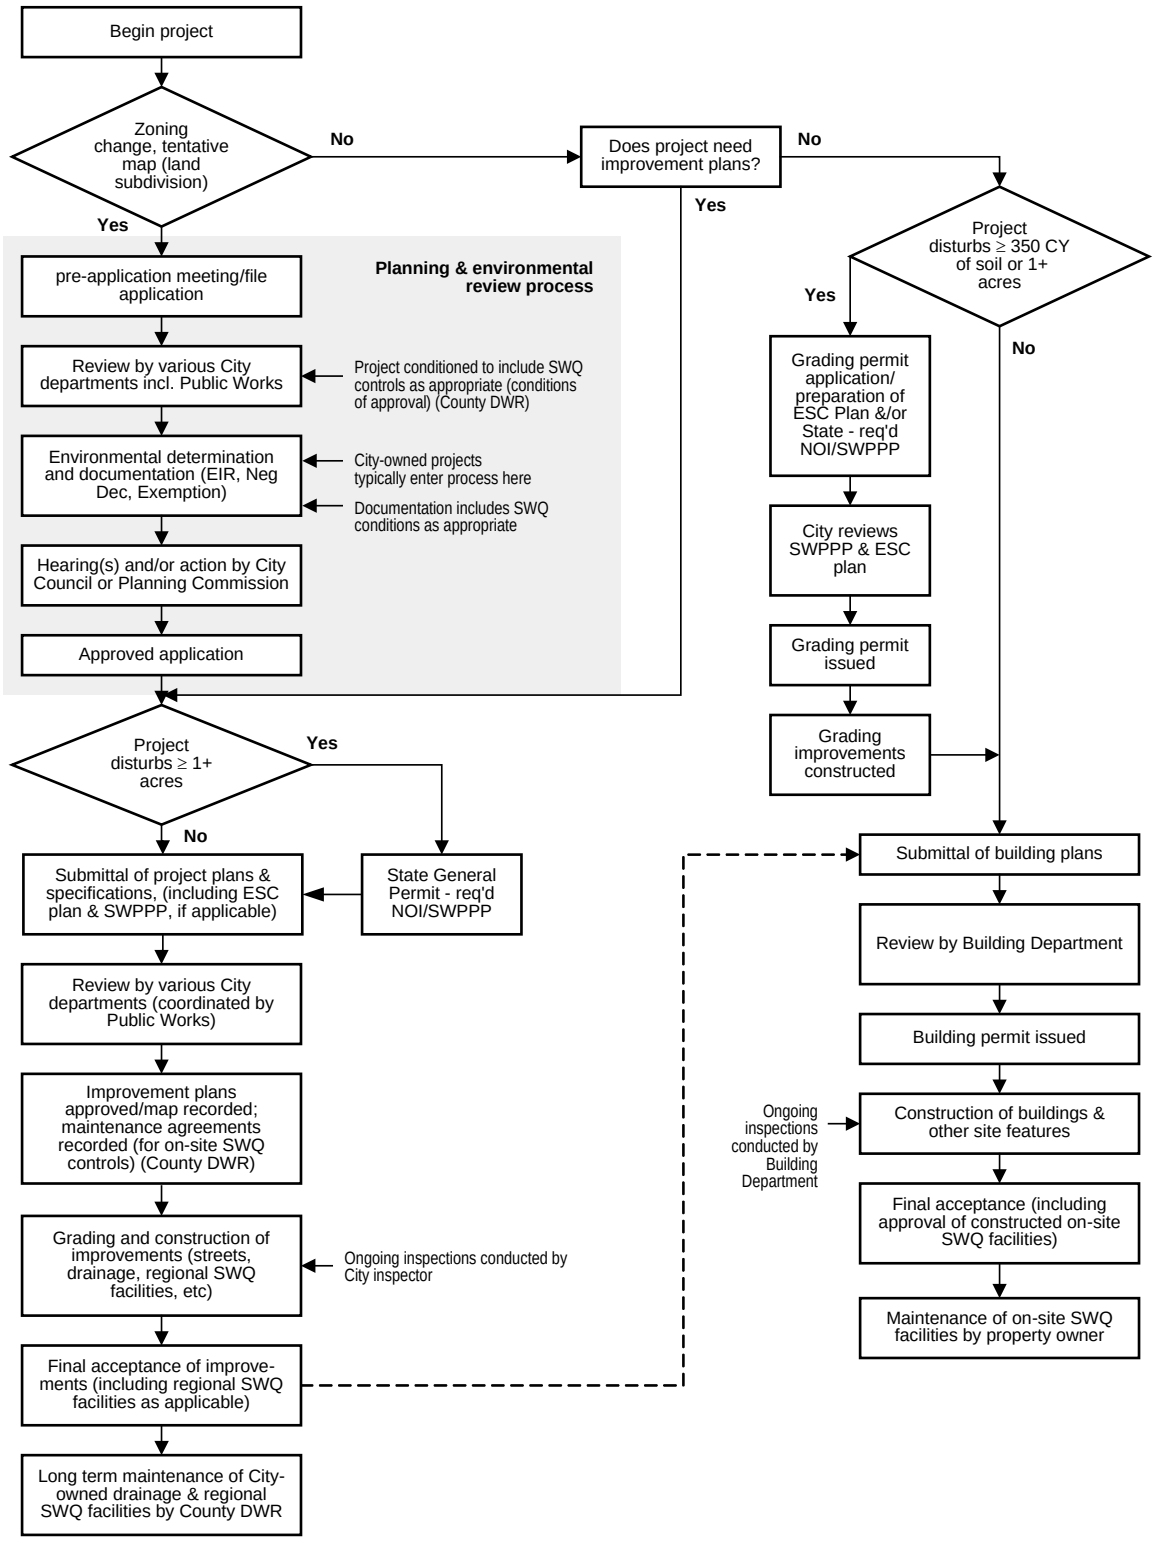
Permitting and Plan Review (Entitlement) Process

Development and redevelopment projects in Rancho Cordova will be conditioned for mitigation of receiving water impacts from urban runoff quality and quantity in the same manner as projects are conditioned in Sacramento County. Figure 9.8-1 is a development review process flowchart which depicts the process followed on projects in Rancho Cordova. The City will continue to route project plans to the County DWR drainage development section for review and approval of drainage and stormwater quality-related features. This process will ensure that development and redevelopment proposals comply with County standards as adopted by the City of Rancho Cordova.

City planning staff will review projects for compliance with other City codes and standards. Compliance with the development standards and the design manual will be a standing discussion item on the agenda for all pre-application meetings conducted by the City.

The City will make sure that the same development standards applied to private development projects are adhered to for public projects.

Maintenance of Stormwater Quality Control Measures



The County, on behalf of the City, will continue to ensure long-term maintenance of treatment control measures on private development by requiring maintenance agreements to be executed before the final approval of the project.

Through the annual refresher training and other opportunities, the City will train its construction inspectors to check for proper installation/operation of stormwater control measures before final acceptance of the project.

Outreach to Educate the Development Community

The City planners and engineers will continue to work collaboratively with the County and other permittees to share information with the development community and promote consistency across municipal boundaries. The City and County will continue to provide technical guidance and design support to help the development community working in Rancho Cordova to comply with stormwater quality requirements. Refer to Chapter 3, Section 3.8 for more information on work that will be conducted by the County on the City's behalf related to outreach.

Figure 9.8-1
City of Rancho Cordova Development Review Process

DWR — County Department of Water Resources; ESC — Erosion and Sediment Control; NOI — Notice of Intent; SWPPP — Stormwater Pollution Prevention Plan; SWQ — stormwater quality

Employee Training

The County drainage engineers involved in Rancho Cordova's new development activities will receive annual refresher training as described in Chapter 3, Section 3.8. In addition, the City's planners and engineers will receive annual training related to hydromodification, LID and other evolving development standards, including how such standards will impact development in Rancho Cordova.

Effectiveness Assessment

The general approach to assessing the effectiveness of the stormwater program and individual program elements is described in Chapter 2. Chapter 3, Section 3.8 describes the assessment methods the County plans to use to evaluate its new development activities, and Table 9.8-1 describes the assessment methods the City will use for its planning activities. The goal will be to move toward outcome levels 2 and 3 (changing awareness and behavior, respectively, of agency staff and the private development/design community) for some tasks. The remaining tasks will continue to be evaluated at outcome level 1 (documenting and confirming permit compliance).

Key indicators have been selected for various tasks to demonstrate progression towards overall stormwater program goals for this particular element. A summary of the status of key indicators will be used to assess overall program effectiveness in the annual reports.

In addition to what is shown on Table 9.8-1, the City will continue to work with other permittees to fund several studies of the effectiveness of local stormwater control measures; see Chapter 2, Section 2.4 for more details.

Effectiveness assessment results will be presented in the annual reports and may be used to recommend modifications to the SQIP.

Table 9.2-3 – City of Rancho Cordova SQIP
Program Management Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key Indic	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Stormwater Quality Improvement Plan (SQIP)											
Modify 2007 draft SQIP to reflect the requirements of Stormwater Permit and Public Review Process	2		Revised SQIP submitted to Regional Water Board by April 30, 2009.	Confirmation- submit SQIP to Regional Water Board	♦						4/30/2009
Revise SQIP as needed to reflect permit revisions, respond to Regional Water Board requests, etc.	3.c, 3d		Proposed SQIP modifications (as needed) submitted to Regional Water Board as part of Annual Report	Confirmation- submit AR to Regional Water Board	⇔	⇔	⇔	⇔	⇔	⇔	As needed; Oct 1 each year
Annual Work Plan											
Prepare and submit Annual Workplan	3.a		Annual Workplan submitted to Regional Water Board	Confirmation- submit work plan to Regional Water Board	♦	♦	♦	♦	♦	♦	May 1 each year
Annual Report											
Describe completed activities and budget expended for previous fiscal year in AR	3.b		AR submitted to Regional Water Board	Confirmation - submit AR to Regional Water Board	♦	♦	♦	♦	♦	♦	October 1 each year
Memorandum of Understanding (MOU)											
Review and revise existing permittee memorandum of understanding	3.e		MOU submitted to Regional Water Board		♦						Submit with SQIP 4/30/2009

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 9.2-3 – City of Rancho Cordova SQIP
Program Management Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key Indic	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Legal Authority											
Evaluate, and amend if needed, legal authority to control pollutant discharges	4, 5		Updated Stormwater Ordinance as needed *(note, necessary updates to other codes and standards are discussed in other sections of this SQIP)*	Confirmation-include revised ordinance in AR			♦				1 year following RB approval of SQIP
Submit statement of legal authority from chief legal counsel with revised SQIPs	6		Submit statement of legal authority from chief legal counsel to Regional Water Board	Confirmation-include statement in SQIP	♦				♦		Submit with SQIP 4/30/2009 and ROWD/SQIP 3/15/13
Fiscal Analysis											
Secure resources necessary to meet Stormwater Permit requirements	7		Fiscal summary submitted to Regional Water Board as part of Annual Report		♦	♦	♦	♦	♦	♦	October 1 each year
Report of Waste Discharge											
File a report of waste discharge (ROWD) 180 days before permit expiration	33		Submit ROWD to Regional Water Board. This is a Partnership activity; see Chapter 2, Section 2.2.	Confirmation- ROWD submitted to Regional Water Board by specified date					♦		ROWD due 3/15/2013

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Municipal Operations Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Storm Drain Inlet Marking Program											
Ensure that storm drain inlets are properly and legibly marked to discourage illicit discharges into the storm drain system	10.a.vi		County will document number of storm drain inlets labeled or re-labeled by County crews	Tabulation - Track number of inlets marked each year	⇔	⇔	⇔	⇔	⇔	⇔	
			County will replace illegible markers as needed	Tabulation - Track number of inlets marked each year	⇔	⇔	⇔	⇔	⇔	⇔	
Operation and Maintenance of Transportation Facilities											
Street Sweeping for Curbed Streets											
Conduct street sweeping activities as described in Section 9.5 and Appendix 9B	10.a.vii. , 10.b.v.	✓	Decrease amount of sediment discharged to Waters of the State.	Quantification - Track quantities of sediment removed annually	⇔ 4	⇔ 4	⇔ 4	⇔ 4	⇔ 4	⇔ 4	
Maintenance for Roads and Roadside Vegetation											
Implement BMPs during road maintenance and construction activities to prevent road maintenance materials, street sweeper rinse out water, concrete chute rinse water, and saw cutting slurry from discharging to the storm drain system.	10.a.vii. , 10.b.v.		Decrease amount of sediment discharged to Waters of the State.	Quantification - Track quantities of sediment removed annually	⇔	⇔	⇔	⇔	⇔	⇔	
Maintenance of City-Owned Parking Lots											
Maintain City-owned parking facilities to minimize the build-up and discharge of pollutants to the storm drain system	10.a.viii., 10.b.vi.		Document acres maintained and type of maintenance annually	Tabulation - Track number/acres of facilities and activities performed	⇔	⇔	⇔	⇔	⇔	⇔	
Waste Management Services											
Continue to provide weekly curbside pickup of residential solid and green waste, recyclables and waste oil.			Document quantities properly disposed of.	Quantification - Track quantities of waste removed annually	⇔	⇔	⇔	⇔	⇔	⇔	

⇔ Ongoing activity/task ◆ Deliverable or key milestone (2) Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Fire Emergency and Non-Emergency Operations/Response											
Permittees having a fire protection agency within their jurisdictional control shall develop and implement a response plan to minimize the impacts of fire fighting flows to the environment. BMPs must be implemented to reduce pollutants from non-emergency fire fighting flows (i.e., flows from controlled or practice blazes) identified by the Permittees to be significant source of pollutants to waters of the State. The response plan and BMPs shall be updated and submitted with the Annual Reports.	10.a.ix. , 10.b.ix.		Sacramento Metro Fire District (special district; outside of City's jurisdictional control) is the fire agency for the City of Rancho Cordova.	NA							
Employee Training											
Provide training to targeted employees to increase awareness of BMPs/pollution prevention practices	10.a.x. , 10.b.x		Conduct training annually to targeted County agencies	Tabulation - Track number of employees trained and training activities	♦	♦	♦	♦	♦	♦	
Assess effectiveness of employee training	10.a.xi, 10.b.xi	✓	Maintained/Increased employee awareness as measured by quizzes during annual training	Surveys – measure raised awareness based on quizzes at training events		②	②	②	②	②	

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Table 9.6-1 – City of Rancho Cordova SQIP
Illicit Discharge Element Workplan for 2008-2013

Activity/Task	Permit Ref	Key Indica	Performance Standard (Target)	Assessment Method	Schedule FY 08/09	FY 09/10	FY 10/11	FY 11/12	FY 12/13	FY 13/14	Due Date/ Status/Other
Legal Authority											
Adopt stormwater ordinance revisions as recommended by the County	11.a.i		The City has adopted the County's stormwater ordinance. Revised stormwater ordinance (if recommended)	Confirmation - report revisions in AR			♦				1 year after approval of SQIP by RB
Reporting of Illicit Discharges and Connections											
Continue to utilize Partnership public hotline (808-4H20) for reporting of illicit discharges and connections, and route callers to the County for assistance on City-related issues or complaints	11.a.ii ; 11.b.v		Revisions of hotline or its uses (if needed)	Confirmation/Tabulation - The County will track number of complaints received through 808-4H20 and CUBS Nuisance Abatement	⇔	⇔	⇔	⇔	⇔	⇔	Reported in AR yearly
The County will continue to maintain a hotline for County crews to report illicit discharges and connections within the City	11.a.ii		Decrease in number of reports of illicit discharges and connections reported by County crews	Tabulation - The County will track number of reports from County crews received through 874-4SWQ and other mechanisms	⇔	⇔	⇔	⇔	⇔ ③	⇔	Reported in AR yearly, EA due 12/13 before ROWD
Screening for Illicit Connections											
The County will continue to conduct ongoing field screening for illicit connections through routine maintenance activities being conducted by field crews	11.a.ii ; 11.b.ii		Decrease in number of illicit connections detected by field screening activities since last permit term	Tabulation - The County will include number of illicit connections detected via field screening activities in AR	⇔	⇔	⇔	⇔	⇔ ③	⇔	Reported in AR yearly, EA due 12/13 before ROWD

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

Incorporation of Water Quality Protection Principles into Plans, Policies and Procedures											
Continue to implement General Plan policies and update language if needed (Rancho Cordova GP already addresses WQ protection)	13.a, 16		City will evaluate need for further revisions to General Plan when Natural Resources Element is next updated.	Confirmation – report revisions in AR	⇔	⇔	⇔	⇔	⇔	⇔	
Development Standards and Technical Guidance											
Develop Low Impact Development (LID) design criteria	15.b		*County development standards and guidance apply to projects in Rancho Cordova.* Amend development standards to require implementation of LID strategies.	Confirmation - report revisions in AR	⇔	⇔	⇔ ♦				6 months after approval of HMP.
	15.b, 26		Include LID criteria in the Stormwater Quality Design Manual and revise it as needed.	Confirmation - report revisions in AR	⇔	⇔	⇔	♦			6 months after amending the development standards.
Develop HMP Work plan as part of the revised SQIP.	15.c		Partnership will outline the proposed steps to develop the HMP and possible technical methodologies to design the mitigation measures.	Confirmation - develop HMP work plan and pilot project. Submit work products to Regional Water Board.	⇔	♦					30-Apr-09
Develop HMP	15.c		Partnership will develop an applicability and susceptibility map showing where hydromodification management measures will apply in Sacramento. Then develop the HMP Decision Tool.	Confirmation - Submit work products to Regional Water Board **1 year** after approval of the HMP work plan.		⇔	♦				1 year after approval of the HMP work plan

⇔ Ongoing activity/task ♦ Deliverable or key milestone ② Effectiveness assessment activity (expected outcome level indicated)

Notes: 1. Performance standards achieve effectiveness outcome level 1 unless otherwise indicated
2. Assessing effectiveness of performance standards may be limited pending availability of baseline data

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL VALLEY REGION

ORDER NO. R5-2008-0142

NPDES NO. CAS082597

WASTE DISCHARGE REQUIREMENTS

CITIES OF CITRUS HEIGHTS, ELK GROVE, FOLSOM, GALT, RANCHO CORDOVA, SACRAMENTO, AND COUNTY OF SACRAMENTO
STORM WATER DISCHARGES FROM
MUNICIPAL SEPARATE STORM SEWER SYSTEM
SACRAMENTO COUNTY

The California Regional Water Quality Control Board, Central Valley Region, (hereafter Regional Water Board) finds that:

1. The Cities of Citrus Heights, Elk Grove, Folsom, Galt, Rancho Cordova, Sacramento and the County of Sacramento, hereafter jointly referred to as Permittees, submitted a completed Report of Waste Discharge (ROWD) on 1 June 2007, requesting reissuance of waste discharge requirements under the National Pollutant Discharge Elimination System (NPDES) area-wide municipal separate storm sewer system (MS4) permit to discharge storm water runoff from storm drains within their jurisdictions. Included with the ROWD was the Permittees' Stormwater Quality Improvement Plans (SQIPs, a.k.a. Storm Water Management Plan (SWMP)). The SQIP is required as part of the ROWD pursuant to 40 CFR 122.26(d)(2)(iv); therefore it is an integral and enforceable component of the MS4 permit. In addition, the California Superior Court ruled, *"Because the Storm water Management Plan is incorporated and is deemed an integral part of the Permits…any changes to the Plan are actually changes to the Permits. Because these are changes to the Permits, the notice and comment requirements must be complied with."* (*San Francisco Baykeeper vs. Regional Water Quality Control Board, San Francisco Bay Region,* Consolidated Case No. 500527, California Superior Court, 14 November 2003).

2. The Permittees have chosen the title of Stormwater Quality Improvement Plan (SQIP) to refer to any SWMP requirements or references in this Order.

3. Prior to issuance of this Order, the Permittees were covered under the NPDES area-wide MS4 permit, Order No. R5-2002-0206 (NPDES No. CAS082597), adopted on 6 December 2002. The MS4 permit was originally issued in 1990 and this will be the Permittees fourth permit term.

4. The County and the City of Sacramento (population approximately 1.4 million) are defined as large municipalities (i.e., those with populations greater than 250,000) in the Code of Federal Regulations (40 CFR 122.26(b)(7)). As such, the County and the City of

Appendix 1B

Regulatory Background and Requirements Relevant to the Sacramento Stormwater Quality Partnership

REGULATIONS DIRECTLY RELEVANT TO THE SACRAMENTO STORMWATER MANAGEMENT PROGRAM

The principal regulatory vehicles for protection of water quality in California are the federal Clean Water Act and the State of California Porter-Cologne Water Quality Control Act. Figure C-1 in Appendix C shows regulatory milestones in the 19-year history of the Sacramento Stormwater Management Program.

FEDERAL NPDES PROGRAM

In 1972, the US Congress enacted the Clean Water Act (CWA), a landmark piece of legislation intended to restore the nation's waterways to "fishable and swimmable" conditions. The United States Environmental Protection Agency (USEPA) is the federal agency charged with implementation of the CWA. The CWA includes a "zero discharge" goal, in which discharges of pollutants to waters of the United States from any point source are effectively prohibited, unless the discharge complies with a National Pollutant Discharge Elimination System (NPDES) permit. The 1987 amendments to the CWA added Section 402(p), which established a framework for regulating municipal, industrial, and construction site stormwater discharges under the NPDES program. Section 402(p) also established the NPDES permit program goals for the municipal stormwater programs, which are to reduce the discharge of pollutants to the "maximum extent practicable" and to eliminate non-stormwater discharges. To meet these requirements the municipality uses "management practices, control techniques and systems, design and engineering methods and such other provisions … appropriate for the control of such pollutants" (CWA Section 402(p)). These measures are commonly referred to as best management practices (BMPs).

On November 16, 1990, USEPA published the Phase I stormwater regulations[1], which established application requirements for stormwater NPDES permits for municipal separate storm sewer systems (MS4s). The Phase I regulations required municipalities with a population greater than 100,000 and selected industries (including construction sites greater than five acres) to obtain a NPDES permit for their stormwater discharges. In 1999, USEPA promulgated the Phase II regulations[2], which established permit application requirements for communities with a population between 50,000 and 100,000, and construction sites that disturb an area from one to five acres in size.

In California, the State Water Resources Control Board (SWRCB) administers the NPDES stormwater permitting program through the nine Regional Water Quality Control Boards (Regional Boards).

2 National Pollutant Discharge Elimination System – Regulations for Revision of the Water Pollution Control Program – Additional Stormwater Discharges; Final Rule. 40 CFR Parts 9, 122, 123 and 124, U.S. Environmental Protection Agency (USEPA), December 9, 1999.

STATE OF CALIFORNIA BASIN PLANS, NPDES PROGRAM

The Porter-Cologne Water Quality Control Act requires the development of water quality management plans for drainage basins within California ("basin plans"). The basin plans serve as the regional policy for protecting water quality within each watershed, defined as the area of land draining to a particular water body. The basin plans include identification of the beneficial uses of each receiving water, establishment of water quality objectives necessary to protect these beneficial uses, and development of an implementation plan to ensure long-term protection of the water body and its beneficial uses. In establishing water quality objectives, the regulatory agencies must consider: (1) past, present, and probable future beneficial uses, (2) environmental characteristics of the watershed, (3) water quality conditions that could reasonably be achieved, (4) economic considerations, (5) the need for developing housing in the area, and (6) the need to develop and use recycled water. The Regional Boards principally implement basin plans through Waste Discharge Requirements (WDRs).

The SWRCB issues statewide permits, including categorical "general permits" for construction sites and industrial facilities, and Phase II municipalities. The nine Regional Boards issue individual permits to specific dischargers within their geographic areas of jurisdiction. Regional Boards may also issue general permits for construction or industrial activities in their regions. Municipalities, including the Sacramento Stormwater Quality Partnership permittees (Partnership), obtain individual NPDES permits from the Regional Boards. It should be noted that even though construction sites and industries are covered under the general permits, the Phase I municipalities, including the Partnership, are also required to address construction and industrial activities in their own programs. USEPA intended this intentional overlap to induce more local regulation and enforcement and enable the municipalities to control construction and industrial discharges into their own storm drainage systems.

The SWRCB and Regional Boards issue NPDES permits by including Waste Discharge Requirements in conformance with the state's Porter-Cologne requirements. The state waste discharge program is broader than the NPDES Program, covering nonpoint sources and groundwater in addition to point sources and surface waters. The Regional Water Quality Control Board, Central Valley Region (referred to hereafter as "the Regional Board") issues and administers the Sacramento NPDES municipal stormwater permit for the County of Sacramento and the Cities of Citrus Heights, Elk Grove, Folsom, Galt, Rancho Cordova and Sacramento.

As part of Phase II, the State Water Resources Control Board adopted a General Permit for the Discharge of Storm Water from Small MS4s (WQ Order No. 2003-0005-DWQ) to provide permit coverage for smaller municipalities, including non-traditional small MS4s, which include governmental facilities such as military bases, public campuses, and prison and hospital complexes.

In California, stormwater NPDES Permits include standard requirements to the effect that discharges "shall not cause or contribute to violations of water quality objectives nor shall they cause certain conditions to occur which create a condition of nuisance or water quality impairment in receiving waters." The SWRCB requires permittees to address these standard requirements through the implementation of control measures to reduce pollutants in storm water discharges.

SACRAMENTO NPDES MUNICIPAL STORMWATER PERMIT

The original Phase I municipal permits were issued between 1991 and 1994, following development and submittal of an extensive two-part application by each permittee or group of permittees. The Sacramento NPDES stormwater permit was one of the first permits to be issued in the nation, in 1990 (Order No. 90-158). This early permit preceded promulgation of the Phase I regulations (in December 1990) and did not require the development of the formal two-part application, although similar information was generally required of the Partnership during the first permit term. The Regional Boards try to reissue NPDES permits every five years. The Regional Board issued the second Sacramento NDPES permit in 1996 (Order No. 96-105), the third NPDES permit in December 2002 (Order No. R5-2002-0206), and the fourth and current permit in September 2008 (Order No. R5-2008-0142). The Regional Board made the current permit effective in late October 2008. The smaller municipalities, such as the cities of Folsom and Galt, were individually brought into the Phase I program as permittees along with larger municipalities. The Regional Board considers all Partnership municipalities as part of the Phase I regulated community, regardless of size.

The Partnership has subsequently developed Stormwater Quality Improvement Plans (SQIP) in conformance with the Phase I regulations. However, for planning purposes, the Partnership also reviewed and considered the Phase II regulations in developing the Stormwater Quality Improvement Plans, to account for advances in stormwater programs made in the ten years between the Phase I and Phase II regulations. Table 1, at the end of this appendix, is a summary of the pertinent points of the Phase I and II regulations.

Receiving Water Quality Objectives

The Sacramento Stormwater NPDES Permit requires comparison of receiving water monitoring data to receiving water quality objectives (WQOs), and submittal of a Notice of Water Quality Exceedance (NWQE) to the Regional Board within 90 days of an exceedance of a water quality objective in a receiving water monitoring event. A Report of Water Quality Exceedance (RWQE) is then required on determination by either the Partnership or Regional Board that municipal stormwater discharges are causing or contributing to an exceedance of an applicable receiving water specific water quality objective. The RWQE "describes BMPs that are currently being implemented and additional BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedance of Water Quality Standards." These evaluations consider water quality objectives for the Sacramento River, American River and their tributaries. The Partnership derives the applicable water quality objectives from the California Toxics Rule (CTR), the Water Quality Control Plan for the Sacramento River and San Joaquin River Basins (Basin Plan), and objectives specified in the NPDES Permit (e.g., mercury).

The NPDES Permit also requires Regional Board notification within 48 hours of receiving water column toxicity results for receiving water samples with greater than 50% mortality.

"Maximum Extent Practicable" Standard

Section 402(p)(3)(B) of the CWA requires the Regional Boards to issue NPDES municipal stormwater permits that require dischargers to develop and implement programs with the goal of reducing the discharge of pollutants in stormwater runoff to the maximum extent practicable (MEP). Although the CWA established the permit requirement of MEP for municipal permittees,

neither the CWA nor subsequent regulations provide a specific definition. It is clear, however, that MEP is a requirement to reduce the discharge of pollutants, not to prohibit such discharge. The stormwater regulations state that MEP is to be achieved through implementation of control measures that involve public outreach, illegal discharge elimination, construction site controls, new development controls, pollution prevention and good housekeeping for municipal operations, and industrial site controls. The Phase II regulations provide additional insight into MEP by linking the implementation of BMPs with the achievement of measurable goals. The SWRCB's Senior Counsel, in a 1993 memorandum[3], further made the point that achieving the MEP standard requires a meaningful, rather than a perfunctory, program. The 1993 memorandum interprets the meaning of MEP to include *technical feasibility, cost and benefit derived with the burden being on the municipality to demonstrate compliance with MEP by showing that a BMP is not technically feasible in the locality or that BMP costs would exceed any benefit to be derived*. The SWRCB further discusses the term in two Water Quality Orders: WQ 1000-11 and 91-03.

The Sacramento Stormwater Management Program defines MEP in a functional way, as an iterative process of (1) developing a sound and thorough program of BMPs commensurate with available resources, (2) implementing the program, and (3) evaluating and refining the program over time. These steps are briefly described below:

- ***Development*** of the program relies on stormwater program guidance from USEPA, applicable regulations, best professional judgment, information gained from implementation and evaluation of the program, information learned from other municipal stormwater programs, evolving local conditions, communication with regulators, and public input. This is consistent with the SWRCB's expressed opinion that compliance with MEP requires a meaningful program.
- ***Implementation*** activities, including BMPs, are the foundation of the program. Considerations in selecting appropriate BMPs include technical feasibility, pollutant removal effectiveness, legal authority, compatibility with other agency programs and goals, economic factors (including the ability to capitalize on existing opportunities and cost effectiveness), public acceptance and whether the BMP focuses on Sacramento's target pollutants.
- The ***evaluation*** process for the program addresses both the overall program and its individual program elements through assessment of effectiveness measures and performance measures. Effectiveness measures are those intended to directly measure the effect that certain activities have on making a difference in water quality, the public's behavior, etc. Performance measures are intended to measure the level of effort that the Partnership is expending to satisfy the NPDES permit requirements in reducing stormwater pollution. See Chapter 2.3 of the Stormwater Quality Improvement Plan for more information.

The effectiveness of the iterative program outlined above is enhanced by the Partnership "target pollutant" process, in which target pollutants are identified in urban runoff discharges and priority-ranked according to a comprehensive set of criteria. The Partnership then investigates

[3] Elizabeth Miller Jennings, "Definition of Maximum Extent Practicable", State Water Resources Control Board Memorandum, February 11, 1993.

sources of high-ranking target pollutants, and identifies control measures for the reduction of significant sources of the high-priority pollutants.

Consequences of Noncompliance

The NPDES Permit is federally enforceable, which means that if a permittee does not comply with the terms of the permit, it may be subject to CWA authorized enforcement actions and penalties by the Regional Board, US EPA and private third parties. Penalties for noncompliance with the CWA can be up to $37,500[4] per incident per day. Moreover, federal enforceability includes the right of interested parties to sue under the CWA Section 405 citizen suit provision. Environmental advocacy groups have brought numerous lawsuits against NPDES permittees, various state regulatory agencies and the EPA since the early 1990's.

STATEWIDE/GENERAL PERMITS

Within the NPDES program, the State of California has adopted several statewide general permits, covering stormwater discharges from specific types of activities. Those wishing to engage in the specified activities must conform to the requirements of the relevant general permit. The state administers and enforces the general permits even when the activities take place in a municipality covered by an individual MS4 NPDES permit. The general permits are therefore generally of benefit to the permitted MS4s, as they provide an additional level of regulatory oversight and responsibility for the covered categories of discharges. The most pertinent statewide/general permits are discussed below.

Construction General Permit

Construction projects that disturb one or more acres of soil are required to obtain coverage under the General Permit for Discharges of Storm Water Associated with Construction Activity (*Construction General Permit*, SWRCB Order #99-08-DWQ). Construction activity subject to this permit includes clearing, grading and disturbances to the ground such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade or capacity of the facility. The SWRCB reissued the Construction General Permit on August 19, 1999. The SWRCB circulated a preliminary review draft of the revised Construction General Permit on March 2, 2007 and subsequently circulated a second draft on March 18, 2008. The SWRCB recently released a third draft of the revised Construction General Permit.

To obtain coverage under the Construction General Permit, applicants must submit a Notice of Intent (NOI), Site Map, and the appropriate permit fee to the SWRCB. The discharger files a Notice of Termination with the Regional Board upon project completion.

The SWPPP must contain a site map(s), which shows the construction site perimeter, existing and proposed buildings, lots, roadways, storm water collection and discharge points, general topography both before and after construction, and drainage patterns across the project. The SWPPP must list Best Management Practices (BMPs) the applicant will use to protect storm water runoff and the placement of those BMPs. Additionally, the SWPPP must contain a visual monitoring program, a chemical monitoring program for "non-visible" pollutants to be implemented if there is a failure of BMPs, and a sediment monitoring plan if the site discharges directly to a water body listed on the 303(d) list for sediment.

[4]Current penalty as of January 12, 2009, regularly adjusted for inflation.

Based upon the previous drafts of the Construction General Permit, the final revised Construction General Permit will likely differ from Order 99-08-DWQ in several significant ways. Some of the more significant projected changes include:

- Electronic submittal of NOIs and SWPPP to allow greater public access
- Specific qualification requirements for construction SWPPP developers and those responsible for implementing the SWPPPs
- Categorization of the risk of sediment discharge from sites into at least three risk levels
- Permit requirements tiered to the risk level of the site
- Numeric Action Levels and Numeric Effluent Limitations for construction site runoff
- Runoff monitoring to assess performance and compliance with the action levels and effluent limits
- Receiving water monitoring for some sites
- Annual reporting of visual and water quality monitoring results through an electronic system.

From the standpoint of the municipal stormwater program, the net effect of this General Permit is to assist MS4s in the implementation of the construction element of the stormwater management program, by providing an independent means of ensuring compliance with stormwater regulations at construction sites.

Industrial General Permit

The Industrial Storm Water General Permit (*Industrial General Permit*, SWRCB Order #97-03-DWQ) regulates discharges associated with 10 broad categories of industrial activities. Facilities that discharge storm water associated with industrial activity requiring a General Permit are listed by category in 40 CFR Section 122.26(b)(14). For the most part, these facilities are identified in the federal regulations by a Standard Industrial Classification (SIC). The SWRCB adopted this permit in 1999. The SWRCB circulated, but did not adopt, a draft revised permit in 2005.

To obtain coverage for stormwater discharges and authorized non-stormwater discharges pursuant to the Industrial General Permit, facility operators must submit a Notice of Intent (NOI), a site maps, and annual fee to the SWRCB. This General Permit requires facility operators to:

- Eliminate unauthorized non-storm water discharges;
- Develop and implement a Storm Water Pollution Prevention Plan (SWPPP); and
- Perform monitoring of storm water discharges and authorized non-storm water discharges.

The Industrial General Permit requires the implementation of management measures that will achieve the performance standard of best available technology economically achievable (BAT) and best conventional pollutant control technology (BCT). Through the SWPPP, sources of pollutants are identified and the means to manage the sources to reduce storm water pollution (i.e., BMPs) are described.

This General Permit does not preempt or supersede the authority of local agencies (e.g., municipal NPDES Permit-holders) to prohibit, restrict, or control storm water discharges and authorized non-storm water discharges to storm drain systems or other water-courses within their jurisdictions as allowed by state and federal law. The net effect of this General Permit for local

agencies is to assist MS4s in the implementation of the municipal stormwater program, by providing an independent means of ensuring compliance with stormwater regulations at industrial facilities.

Caltrans Statewide Stormwater Permit

The SWRCB regulates runoff discharges from Caltrans facilities under a statewide NPDES permit issued to Caltrans in 1999 (Order # 99-06-DWQ). Currently the SWRCB is drafting this permit renewal.

Caltrans discharges consist of stormwater and non-storm runoff generated from (a) maintenance and operation of state-owned highways, freeways, and roads; (b) maintenance facilities; (c) other properties, facilities, activities, and construction projects; (d) permanent discharges from subsurface dewatering, and (e) temporary construction related dewatering activities which discharge directly to surface waters or through municipal storm water conveyance systems to surface water bodies in the state. Some stormwater discharges from Caltrans-owned rights-of-way, properties, facilities and activities discharge to stormwater conveyances managed by NPDES-permitted municipalities. On the other hand, some stormwater discharges from these municipalities discharge to storm water conveyances managed by Caltrans.

The Regional Boards have issued stormwater NPDES Permits for the discharge of stormwater from MS4s to municipalities in California that require such permits. Caltrans operates highways and highway-related properties, activities, and facilities that cross through all of these permitted areas. This statewide Caltrans permit covers all municipal stormwater activities by Caltrans in California, both in areas that require an MS4 permit and areas that do not currently require a permit, and all Caltrans construction activities that require a permit under the federal stormwater regulations.

This NPDES Permit does not preempt or supersede the authority of local municipal agencies to prohibit, restrict, or control storm water discharges and authorized non-storm water discharges to storm drain systems or other watercourses within their jurisdictions as allowed by state and federal law. However, the principal responsibility for management of stormwater discharges from state transportation facilities in the Sacramento urban area rests with Caltrans.

Aquatic Pesticides General Permits

In response to court cases and guidance, in 2004 the SWRCB adopted two general permits for discharges of aquatic pesticides into waters of the United States. One permit regulates the use of aquatic weed killers (WQO 2004-0009-DWQ for aquatic weed control) and the other regulates aquatic pesticides used to control mosquitoes and other vectors (WQO 2004-0008-DWQ for vector control). In adopting these permits, the SWRCB found that Ninth Circuit Court decisions (beginning in 2001 with the “Headwaters” decision) appeared to require these permits and that relevant USEPA guidance documents might not be a legal basis for a lack of coverage under an NPDES permit. According to the Ninth Circuit Court, the application of pesticides into waters of the United States, or onto aquatic plants growing in waters of the United States, results in discharges of pollutants and requires coverage under a National Pollutant Discharge Elimination System (NPDES) permit.

On November 20, 2006, USEPA issued its final rule on aquatic pesticides (40 C.F.R. § 122.3(h)(1)). This rule was intended to eliminate the need for a NPDES permit for the

application of pesticides to waters, if the application is made in accordance with Federal Insecticide, Fungicide and Rodenticide Act (FIFRA) labels. USEPA's regulation took effect on January 26, 2007. However a Sixth Circuit Court decision filed on January 7, 2009, determined that USEPA's final rule is not a reasonable interpretation of the CWA and vacated the final rule. The current status of the Aquatic Pesticide is still uncertain, as federal court actions are under appeal, and US EPA has requested a two year extension to develop the permit.

Low Threat and Limited Threat Discharges

Low threat discharges are those with low potential for causing or contributing to water quality impairment. Regional Boards issue general permits on a regional basis for such discharges, rather than on a statewide basis by the SWRCB. For the Central Valley Region, the relevant orders are Regional Board Orders:

- R5-2008-0081 Waste Discharge Requirements for Dewatering and Other Low Threat Discharges to Surface Waters
- R5-2008-0082 Waste Discharge Requirements For Limited Threat Discharges of Treated/Untreated Groundwater from Cleanup Sites, Wastewater from Superchlorination Projects and Other Limited Threat Wastewaters.

R5-2008-0081 covers discharges by individuals, public agencies, private businesses and other legal entities of clean or relatively pollutant-free wastewaters that pose little or no threat to the quality of waters of the United States. Discharges covered by this General Order are either four months or less in duration or have an average dry weather flow less than 0.25 million gallons per day (MGD).

To obtain coverage under this Order, the Discharger must submit a complete Notice of Intent including (1) information concerning its discharge location; (2) a map showing the location of the site, treatment system (if applicable), discharge point(s), and receiving water; (3) an evaluation of reclamation options; (4) narrative and schematic descriptions of the existing or proposed treatment system, including blueprints signed by a Registered Engineer or Geologist (if applicable); (5) analysis of the proposed effluent for specified pollutants; and (6) the appropriate fee.

R5-2008-0082 covers dischargers of treated or untreated groundwater from cleanup sites, including groundwater extracted during short-term and long-term pumping/aquifer tests, and equipment decontamination water, dischargers of wastewater from superchlorination projects, and dischargers of other limited threat wastewaters. Dischargers of wastewaters containing sewage of human origin or containing significant oxygen demanding substances prior to treatment are not covered by this Order.

To obtain coverage under this Order, the Discharger must submit a complete application, which includes USEPA Application Forms 1 and 2D; State Water Board Form 200, a map of the location of the project, discharge point(s), and receiving water; a full description of the proposed project on official letterhead; blueprints of the proposed treatment system signed by a Registered Engineer or Geologist (if applicable); analysis of the proposed effluent for specified pollutants; an evaluation of reclamation options; public notice requirements; and the appropriate fee.

This Order does not preempt or supersede the authority of state or local agencies to prohibit, restrict or control the discharge of wastewater subject to their jurisdiction.

OTHER REGULATIONS THAT MAY AFFECT THE SACRAMENTO STORMWATER MANAGEMENT PROGRAM

CWA Section 303(d) - Total Maximum Daily Loads

Section 303(d) of the CWA requires the states to identify waters that are not attaining water quality standards. The identified water bodies comprise the state's "303(d) list," also referred to as the "impaired waters" list. The CWA requires the states to establish priority rankings for listed water bodies and to establish the total maximum daily load (TMDL) for pollutants impairing those waters. According to USEPA, a TMDL is a numerical calculation of the amount of a pollutant – or load – that a water body can assimilate and still meet standards. A TMDL includes one or more numerical targets calculated to represent attainment of the applicable standards, considering seasonal variations and a margin of safety, and allocation of the target or load among the various sources of the pollutant. The states must incorporate TMDLs and load reduction requirements into the basin plans.

USEPA Region IX (which includes Sacramento) developed guidance for California on minimum requirements to meet TMDL regulations, the application of water quality standards, and how NPDES permits are to be written for discharges to listed water bodies.

The State of California subsequently adopted two policies related to the TMDL process:

- ***The Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List*** (SWRCB Resolution 2004-0063, September 2004). The "Listing Policy" describes the process by which the State Water Resources Control Board and Regional Water Quality Control Boards will comply with the listing requirements of section 303(d) of the federal Clean Water Act (CWA). The Policy establishes a standardized approach for developing California's section 303(d) list.
- ***The Water Quality Control Policy for Addressing Impaired Waters*** (SWRCB Resolution 2005-0050, June 2005). The "TMDL Policy" is intended to ensure that the impaired waters of the state are addressed in a timely and meaningful fashion. The majority of TMDLs are established through an implementation plan adopted as a Basin Plan amendment (BPA), but the TMDL Policy allows a TMDL to be established through alternative regulatory actions. For the Amendment to become final, it must be approved by the State Water Resources Control Board, the California Office of Administrative Law, and USEPA.

TMDLs affect NPDES permit holders that discharge into 303(d) listed water bodies by, as Regional Boards develop source load allocations to support each TMDL. Listed water bodies on the 2006 303(d) list[5] into which Sacramento urban runoff ultimately flows include: Arcade Creek, Chicken Ranch Slough, Strong Ranch Slough, Elder Creek, Elk Grove Creek, Morrison Creek, the Natomas East Main Drain, Lake Natoma, the lower American River, the Sacramento River from Red Bluff to the Delta, and Delta waterways. The Sacramento Stormwater Management Program addresses pollutants for pertinent listed water bodies through its target

[5] The SWRCB adopted the 2006 Clean Water Act section 303(d) list of water quality limited segments at a October 25, 2006 Board Meeting.

pollutant reduction activities and monitoring program. The Regional Board issued a draft 303(d) list for public comment in January 2009 that includes new listings for pyrethroids and other constituents for water bodies that receive Sacramento urban runoff.

The following TMDLs are currently in effect or proceeding through the TMDL/BPA adoption and approval process.

Sacramento/Feather River Diazinon and Chlorpyrifos TMDL/BPA

The Regional Board originally adopted this TMDL and Basin Plan Amendment in 2003 and then readopted in them in 2007. The 2007 amendment revised the water quality objectives and control program for diazinon originally adopted in 2003 and adds water quality objectives and a control program for chlorpyrifos for the Sacramento and Feather River. The 2007 Basin Plan Amendment was fully approved and effective as of August 11, 2008. The pesticide objectives specified in the 2008 amendments are:

Diazinon Water Quality Objective:

0.16 µg/L 1-hour average (acute); 0.10 µg/L 4-day average (chronic), not to be exceeded more than once in a three-year period

Chlorpyrifos Water Quality Objective:

0.025 µg/L 1-hour average (acute); 0.015 µg/L 4-day average (chronic), not to be exceeded more than once in a three-year period

The Waste Load Allocations (WLA) for all NPDES-permitted dischargers, Load Allocations (LA) for nonpoint source discharges, and the Loading Capacity of the Sacramento and Feather Rivers shall not exceed the sum (S) of one (1) as defined below.

$$S = C_D/WQO_D + C_C/WQO_C \leq 1.0$$

where C_D = concentration of diazinon, WQO_D = diazinon water quality objective, C_C = concentration of chlorpyrifos, WQO_C = chlorpyrifos water quality objective,

Sacramento Urban Creeks TMDL – Diazinon/Chlorpyrifos

This TMDL was implemented in 2004 without a Basin Plan amendment, via provisions in the Sacramento Stormwater NPDES Permit. The TMDL contains the former California Department of Fish and Game criteria as objectives for diazinon and chlorpyrifos. The TMDL targets and load allocations are concentration based, and account for the additive effects of diazinon and chlorpyrifos. The requirements of the TMDL are addressed by the NPDES Permit requirement for development of a pesticide control plan. The TMDL is due to be reviewed for possible revision, and the Partnership has commented directly to the Regional Board that the TMDL is completed since the withdrawal by 2004 of Federal registration ofthese pesticides for most urban uses has led to greatly reduced concentrations in discharges, and attainment of the TMDL goals.

Sacramento/San Joaquin Delta TMDL/BPA for Diazinon and Chlorpyrifos

The "Basin Plan Amendment for the Control of Diazinon and Chlorpyrifos Runoff into the Sacramento-San Joaquin Delta" established water quality objectives for diazinon and chlorpyrifos in Delta waterways. The Basin Plan Amendment is fully approved and effective as

of October 10, 2007. The adopted diazinon objectives/TMDL targets are equal to the revised CA DF&G objectives (160 ng/L acute and 100 ng/L chronic).

Central Valley Pesticides TMDL/BPA

This ongoing TMDL project covers most of the Central Valley Regional Water Quality Control Board jurisdiction, i.e. the Sacramento and San Joaquin River watersheds, and is much broader in technical scope than any of the other previous or ongoing TMDLs. The project includes:

- all natural streams below major reservoirs that could receive agricultural or urban runoff (not constructed drains unless listed in Basin Plan)
- comprehensive coverage of current-use pesticides (not just diazinon and chlorpyrifos); excludes legacy pesticides (such as DDT)
- preparation of a risk assessment for pesticides in Sacramento Valley
- evaluation and development of water quality criteria for selected pesticides
- evaluation and development of sediment quality criteria for selected pesticides (likely including pyrethroids)
- a perfunctory aquatic life beneficial use assessment for selected streams
- monitoring for pesticides identified in the risk assessment

Pyrethroid Re-evaluation and Registration Review

Based on reported pyrethroid aquatic toxicity, including a signficant number of urban areas, the California Department of Pesticide Regulation (DPR) in 2006 initiated a re-evaluation of pyrethroid pesticide registrations. This process is intended to identify and effectively mitigate toxicity sources, which may include pesticide use restrictions or even removal of certain products from the market. USEPA is also preparing to address the observed toxicity as part of its registration review process which is scheduled to begin in 2010. As a result of comments by California water quality agencies, including the Permittees and CASQA, US EPA has begun incorporating improved urban surface water quality protection in pyrethroid product label language.

Structural Pest Control Board IPM regulations

The California Structural Pest Control Board (SPCB), which is the lead agency for regulation of professional structural pest control operators, in 2008 adopted regulations to establish Integrated Pest Management (IPM) training requirements for new licensees and as continuing education requirements for license renewal. These requirements, established largely in response to concerns expressed by California Water Boards and CASQA, became effective in April 2009. In addition, the SPCB has adopted regulations (pending final approval by the Office of Administrative Law) to allow its regulated community to more effectively market the environmental benefits of IPM, and has begun the process to establish statewide standards for certification of IPM services

Delta Mercury/Methylmercury TMDL/BPA

The TMDL and Basin Plan Amendment "For the Control of Methylmercury in the Sacramento-San Joaquin Delta Estuary" are currently in development using a facilitated stakeholder process in which the Permittees are participants. This TMDL will be precedent setting, as the Regional Board intends to work upstream from the Delta in developing mercury TMDLs for the American, Sacramento and Feather Rivers, building on the precedents/loadings set in the Delta TMDL. Proposed Delta water quality objectives include three fish tissue objectives for mercury,

covering different size classes/trophic levels of fish, to protect both human health and wildlife. Allocations for known mercury sources are proposed to limit fish mercury exposure and assimilation. The February 2008 draft TMDL/BPA includes wasteload allocations for urban runoff equivalent to a 44% reduction in current methylmercury concentrations, effective four years from the Basin Plan Amendment. This can be achieved through source reduction, treatment, or an offset program.

Related mercury policies under development:

- *Proposed CTR Objective for Methylmercury*
  The SWRCB has begun the process to develop "Proposed Methylmercury Objectives for Inland Surface Waters, Enclosed Bays, and Estuaries in California" (December 2006). The elements of the proposed policy may include methylmercury fish tissue objectives, total mercury water quality objectives, methylmercury water quality objectives, or some combination.
- *Proposed Mercury Offset Policy for SF Bay and Delta*
  The SWRCB's "Proposed State Policy for Water Quality Control, San Francisco Bay, Sacramento-San Joaquin River Delta and Tributaries Mercury Discharge Offset Policy" (January 2007) would allow mercury dischargers (especially those subject to NPDES permits) to offset some mercury TMDL loading allocations by taking other actions, such as removing mercury from Delta sediments. This policy, if properly constructed, has the potential to provide regulatory mechanisms that would allow NPDES dischargers, including urban runoff discharge agencies in the TMDL area, to apply resources within the watershed to most effectively address mercury and methyl mercury sources.

Central Valley Drinking Water Policy

To address drinking water treatment challenges and potential public health concerns in the crucial Sacramento/San Joaquin River Delta region, a multi-year effort is currently underway to develop a drinking water policy for surface waters in the Central Valley. The goal is to develop a policy that provides clear guidance to ensure consistent source water protection. This policy may include provisions that affect municipal stormwater dischargers upstream of the Delta. The policy considers pathogen indicators, organic carbon, nutrients, and salinity with a project horizon of 2030. Currently the City of Sacramento participates in the effort that is primary CalFed and stakeholder funded. Efforts include developing source control program alternatives and cost projections, comprehensive load modeling, and drinking water treatment requirement cost projections.

Wetlands and Riparian Area Protection Policy

A statewide Wetland and Riparian Area Protection Policy (WRAPP) is under development by the SWRCB to provide additional protection for wetlands and riparian areas, which are considered critical to the protection and enhancement of water quality throughout California's diverse watersheds. Additional regulatory attention to these areas is affirmed by statewide policies such as the Wetlands Conservation Policy (Executive Order W-59-93), also known as the state's "No Net Loss" Policy for Wetlands; and the Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program (State Water Board Resolution No. 2004-0030).

Special protections are considered warranted for wetlands, riparian areas, and headwaters because these areas have high resource value, are vulnerable to filling, and are not systematically protected by other programs. Insufficient protections for wetlands and riparian areas in the past led to significant historic losses of these resources in California. As a result, the remaining wetlands and riparian areas in the state are considered to be extremely valuable resources. The WRAPP policy will encourage basin-level analysis and protection, because some functions of wetlands, riparian areas and headwater streams - including pollutant removal, flood water retention and habitat connectivity - are manifest at the watershed level.

This new policy is primarily intended to address the following three areas:

- Provide clarity in the existing regulatory framework for protecting those wetlands and riparian areas that are no longer regulated under the CWA, due to recent federal court cases that have limited federal jurisdiction and increased the relative role and importance of the state's water quality programs and authorities.
- Provide statewide consistency in the definition of wetlands and riparian areas, to ensure protection of beneficial uses under the California Water Code.
- Provide statewide consistency in definitions of beneficial uses for wetland and riparian area functions (e.g., pollutant removal, floodwater retention, and habitat connectivity) and lack of consistent statewide requirements for evaluating the condition of wetland and riparian area resources. Condition assessments are necessary for determining potential impacts from discharges and other activities on wetland and riparian area water quality and associated beneficial uses; and for determining the actions that are necessary to avoid, minimize, and mitigate any potential impacts to protect wetland and riparian resources.

Upon adoption, this Policy may expand the areas covered as regulated receiving waters of the state beyond those covered by the federal definition.

LOW IMPACT DEVELOPMENT/SUSTAINABILITY

On January 20, 2005, the SWRCB adopted sustainability as a core value for all California Water Boards' activities and programs, and directed Regional Board staff to consider sustainability in all future policies, guidelines and regulatory actions.

An emerging tool of sustainability that is directly applicable to urban stormwater management is Low Impact Development (LID), which uses site design and storm water management practices to maintain, as nearly as possible, a site's pre-development runoff rates and volumes. Design techniques are employed to infiltrate, filter, store, evaporate and detain runoff close to the source of rainfall. The Water Boards are encouraging the use of LID in California in various ways:

- Regulation through site-specific and general permits;
- Providing advocacy and outreach to local governments through the Water Board's Training Academy and regional workshops;
- Researching how to incorporate LID language in to Standard Urban Storm Water Mitigation Plan (SUSMP) requirements;
- Funding LID-related projects through the consolidated grants program; and

- Funding through CWA 319 funds to provide for researching the applicability of the Impervious Surface Analysis Tool (ISAT) for land use planners.
- Participation in the California Water and Land Use Partnership (CaWaLUP) Center at U.C. Davis, a collaborative effort made up of representative staff from government agencies, non-profit organizations, and academia, which aims to improve consideration of the water resource implications of land use in California's local government decisions.

LID design tools present promise for assisting local stormwater agencies in meeting SUSMP requirements and reducing potential discharges of pollutants from areas of new and re-development.

Table 1. Summary of the Phase I and Phase II Stormwater Regulations

Phase I	Phase II
Promulgated in 1990	*Promulgated in 1999*
• Regulated community: municipal separate storm sewer systems serving populations of 100,000 or more, construction sites over 5 acres, and specified industrial activities	• Regulated community: municipal urban systems under 100,000 and construction sites of 1 acre or more • Also provides for a "no exposure" exemption for any Phase I industrial facility.
Goals: eliminate illegal discharges and reduce discharges of stormwater pollutants to the MEP	Goals: reduce the discharge of stormwater pollutants to the MEP and protect water quality
Application Process: • Two-part permit application • Individual municipal permits, which incorporate, by reference, the Partnership's management program. • General Permits are issued by the SWRCB to cover construction and industrial activities.	Application Process: • General Permit (SWRCB, 2003) • Application includes NOI, SWMP, and fee.
The proposed management program must address the following elements: • Commercial and residential area source control (includes municipal operations, new development, and pesticides control) • Illicit discharges and improper disposal (includes illicit connections, illegal dumping, and public education) • Industrial facilities • Construction sites The application must also specify proposed: • Monitoring • Assessment and reporting activities The two-part permit application also requires: • Statement of legal authority • Discharge characterization • Map of the system • Identification of industries • Field screening for illegal discharges • Identification of outfalls	Minimum control measures to be included in SWMP: • Public education • Public participation • Illicit discharge detection and elimination • Construction site stormwater runoff control • Post-construction stormwater management • Pollution prevention and good housekeeping for municipal operations BMPs and measurable goals must be specified in SWMP for each control measure. Must include assessment of effectiveness of SWMP and revision as necessary.

Sacramento must obtain an NPDES municipal storm water permit. The City of Sacramento has a population of approximately 468,000.

5. The City of Folsom is an urbanized area with a population of about 71,000. Because of its proximity to the urbanized areas of the County, and the location of its storm sewer system discharges relative to discharges from the County's system, Folsom was designated in 1990 as part of the large MS4 (40 CFR 122.26(b)(4)(iii)).

6. The City of Galt is an urbanized area with a population of about 24,000. Galt is unlike the other Permittees in that its MS4 is non-contiguous with the other MS4s; it is also surrounded by rural and agricultural areas that are not subject to the NPDES regulations. Galt became part of the Phase I Sacramento Storm Water Management Program voluntarily in 1990.

7. The Cities of Citrus Heights and Rancho Cordova have a population of less than 100,000 with contiguous urbanized areas within the County. Therefore, the Cities of Citrus Heights and Rancho Cordova are designated as part of the large MS4.

8. The City of Elk Grove has a population of approximately 137,000 and has the nation's fastest growth rate among large cities (100,000 or more population) between July 1, 2004, and July 1, 2005, according to new U.S. Census Bureau population estimates. The City is a contiguous urbanized area within the County. Therefore, the City of Elk Grove is designated as part of the large MS4.

9. Additional cities located in Sacramento County may be incorporated during the life of this Order. If that occurs, the Order may be reopened to consider designating those cities as part of the large MS4, and subject to the requirements of the Order.

10. The MS4 Permit does not apply to all areas within Sacramento County. The MS4 permit covers the land within the Sacramento County Urban Service Area boundary, as well as the City of Galt and the Sacramento International Airport. Land designated within the Urban Service Area includes the Cities of Citrus Heights, Elk Grove, Folsom, Rancho Cordova, Sacramento and unincorporated Sacramento County.

11. The Permittees have jurisdiction over and/or maintenance responsibilities for their respective MS4s that they own and operate in the Sacramento Urbanized Area. The storm water discharge consists of urban runoff generated from various land uses discharging from MS4s into smaller tributary watercourses and the primary rivers flowing through the area. The quality and quantity of these discharges varies considerably due to the effects of land use, season, geology, and the sequence and duration of hydrologic events.

12. Development which is not guided by water quality planning policies and principles can result in increased pollutant load discharges, flow rates, and flow durations, which can impact receiving water beneficial uses. Construction sites without adequate best management practices (BMPs) implementation result in sediment runoff rates which can

greatly exceed natural erosion rates of undisturbed lands, causing siltation and impairment of receiving waters. Existing development without adequate BMPs can generate substantial pollutant loads, which can be discharged in urban runoff to receiving waters.

13. The Permittees' land use authority allows urban developments that may generate pollutants and runoff that could impair receiving water quality and beneficial uses. The Permittees are therefore responsible for considering potential storm water impacts when making planning decisions in order to fulfill the Clean Water Act (CWA) requirement to reduce the discharge of pollutants in municipal storm water to the MEP from new development and redevelopment activities. In addition, the Permittees must exercise their legal authority to ensure that the increased pollutant loads and flows do not degrade the beneficial uses of the receiving water.

14. This Order is not intended to prohibit the inspection for or abatement of vectors by the State Department of Health Services or local vector agencies in accordance with California Health and Safety Code § 2270 et seq. and §116110 et seq. Certain Treatment Control Best Management Practices (BMPs) if not properly designed, operated or maintained may create habitats for vectors (e.g. mosquito and rodents). This Order expects that the Permittees will closely cooperate and collaborate with local vector control agencies and the State Department of Health Services for the implementation, operation, and maintenance of Treatment Control BMPs in order to minimize the risk to public health from vector borne diseases.

15. There are portions of the Sacramento MS4 that are rural, and open space lands. It is not the intent of the federal storm water regulations to regulate storm water discharges from land uses of these types. Therefore, these areas are exempt from the requirements of this Order. However, discharges from these sources may be subject to TMDL allocations and control programs.

16. When natural vegetated pervious ground cover is converted to impervious surfaces such as paved highways, streets, rooftops, and parking lots, the natural absorption and infiltration abilities of the land are lost. Therefore, runoff leaving a developed urban area is significantly greater in runoff volume, velocity, and peak flow rate than pre-development runoff from the same area. Runoff durations can also increase as a result of flood control and other efforts to control peak flow rates. Increased volume, velocity, rate, and duration of runoff can accelerate the erosion of downstream natural channels. Significant declines in the biological integrity and physical habitat of streams and other receiving waters have been found to occur with as little as a 10% conversion from natural to impervious surfaces. The increased runoff characteristics from new development must be controlled to protect against increased erosion of channel beds and banks, sediment pollutant generation, or other impacts to beneficial uses and stream habitat due to increased erosive forces. [1]

[1] USEPA, 1999. Part II. 40 CFR Parts 9, 122, 123, and 124. National Pollutant Discharge Elimination System –Regulations for Revision of the Water Pollution Control Program Addressing Storm Water Discharges; Final Rule. Federal Register.

17. Urban development creates new pollution sources as human population density increases and brings with it proportionately higher levels of car emissions, car maintenance wastes, municipal sewage, pesticides, household hazardous wastes, pet wastes, trash, etc. which can be washed or directly dumped into the MS4. As a result, the runoff leaving the developed urban area may be significantly greater in pollutant load than the pre-development runoff from the same area. These increased pollutant loads must be controlled to protect downstream receiving water quality.

18. Development and urbanization may threaten environmentally sensitive areas (ESAs), which are water bodies supporting a rare beneficial use (supporting rare, threatened or endangered species) and CWA 303(d) impaired water bodies. These waters have a reduced capacity to withstand certain pollutant loads. In essence, development that is ordinarily insignificant in its impact on the environment may be significant in a particular sensitive environment. Therefore, additional control to reduce pollutants from new and existing development may be necessary for areas adjacent to or discharging directly to an ESA.

19. Infiltration is a technique that can be used to treat and reduce site runoff in areas with appropriate soils where the infiltration of storm water would not pose a potential threat to groundwater quality. Precautions must be taken to avoid damage to structures, roadways and utilities. The risks associated with infiltration can be managed by various techniques, such as: (1) designing landscape drainage features that promote infiltration of runoff, but do not “inject” runoff (injection bypasses the natural processes of filtering and transformation that occur in the soil); (2) taking reasonable steps to prevent the illegal disposal of wastes; (3) requiring setbacks and other features to protect footings and foundations; and (4) ensuring that each drainage feature is adequately maintained in perpetuity.

20. The Permittees implement New Development Standards to mitigate potential urban run-off pollution and other water quality impacts associated with new development and redevelopment. As indicated by the anti-degradation analysis submitted in October 2007, and the 2005 Discharge Characterization study, the Permittee New Development Standards have been implemented to mitigate water quality impacts with new development and redevelopment.

DISCHARGE CHARACTERISTICS

21. The quality and quantity of MS4 discharges vary considerably because of the effects of hydrology, geology, land use, season, and sequence and duration of precipitation events. Urban storm water runoff may contain pollutants that may lower the quality of receiving waters and adversely impact beneficial uses of the Lower Sacramento and American River watersheds. Studies indicate there may be increases in pollutant levels and aquatic toxicity in receiving waters as a result of urban storm water discharges.

22. Pollutants that may be contained in storm water include, but are not limited to, certain heavy metals; sediments; petroleum hydrocarbons from sources such as used motor oil;

microbial pathogens; pesticides; sources of acute and chronic aquatic toxicity; and nutrients that cause or contribute to the depletion of dissolved oxygen and/or toxic conditions in the receiving water. Excessive flow rates of storm water may cause or contribute to downstream erosion and/or excessive sediment discharge and deposition in stream channels.

23. The discharge of wash waters and polluted storm water from industries and businesses is an environmental threat, and can also adversely impact public health and safety. The pollutants of concern in such wash waters include food waste, oil and grease, and toxic chemicals (Washtenaw County Statutory Drainage Board – 1987 Huron River Pollution Abatement Program). Other storm water/industrial waste programs in California have reported similar observations and have identified illicit discharges from automotive and food service facilities as a major cause of contamination and water quality problems.

24. Certain pollutants present in storm water and/or urban runoff may be derived from extraneous sources that Permittees have no or limited jurisdiction over. Examples of such pollutants and their respective sources are: polyaromatic hydrocarbons which are products of internal combustion engine operation, nitrates, bis (2-ethylhexyl) phthalate, pesticides, metals, and mercury from wet and dry atmospheric deposition; lead from fuels, copper from brake pad wear; zinc from tire wear; bacteria from natural sources including wildlife; dioxins as products of combustion, and natural-occurring minerals from local geology. However, the implementation of the measures set forth in this Order is intended to reduce the entry of these pollutants into storm water and their discharge to receiving waters to the MEP.

25. The Permittees have been monitoring storm water discharges since inception of the program in 1990. The Permittees have conducted various types of monitoring and maintain a database that includes data from river, creek and urban run-off discharge quality characterization, as well as water column toxicity and bioassessment monitoring.

26. The previous permit required under Discharge Prohibition. B. Receiving Water Limitations, the submittal of a report of water quality exceedance (RWQE) upon determination by either the Permittee or Regional Water Board that discharges are causing or contributing to an exceedance of applicable Water Quality Standards. As a result, the Permittees initiated studies for pesticide and metals persistence, and assessment of metals toxicity, and follow-up monitoring related to exceedances for pH, temperature, and dissolved oxygen in urban tributaries and pathogen source identification efforts.

27. In addition, the Permittees have developed and implemented a Target Pollutant Program (referred to as Water Quality Based Programs in this Order) to target specific pollutants that have been identified to cause or contribute to exceedances of water quality standards and potential impairment of beneficial uses. During the third permit term these programs included:

- Pesticide Plan (including organophosphate pesticides);

- Mercury Plan
- Fecal Waste Reduction Strategy
- Lead and Copper Control Strategies

The progress in implementing these plans has been reported in the Permittees' annual reports.

STATUTORY AND REGULATORY CONSIDERATIONS

28. The CWA authorizes the U.S. Environmental Protection Agency (U.S. EPA) to permit a state to serve as the NPDES permitting authority in lieu of the U.S. EPA. The State of California has in-lieu authority for the NPDES program. The Porter-Cologne Water Quality Control Act or California Water Code (CWC) authorizes the State Water Resources Control Board (State Board), through the Regional Water Boards, to regulate and control the discharge of pollutants into waters of the State. On 22 September 1989, the State Board entered into a memorandum of agreement with the U.S. EPA to administer the NPDES Program governing discharges to waters of the United States.

29. This Order does not constitute an unfunded local government mandate subject to subvention under Article XIIIB, Section (6) of the California Constitution for several reasons, including, but not limited to, the following. First, this Order implements federally mandated requirements under federal Clean Water Act section 402, subdivision (p)(3)(B). (33 U.S.C. § 1342(p)(3)(B).) This includes federal requirements to effectively prohibit non-storm water discharges, to reduce the discharge of pollutants to the maximum extent practicable, and to include such other provisions as the Administrator or the State determines appropriate for the control of such pollutants. Federal cases have held these provisions require the development of permits and permit provisions on a case-by-case basis to satisfy federal requirements. (*Natural Resources Defense Council, Inc. v. U.S. E.P.A.* (9th Cir. 1992) 966 F.2d 1292, 1308, fn. 17.) The authority exercised under this Order is not reserved state authority under the Clean Water Act's savings clause (*cf. Burbank v. State Water Resources Control Bd.* (2005) 35 Cal.4th 613, 627-628 [relying on 33 U.S.C. § 1370, which allows a state to develop requirements which are not "less stringent" than federal requirements]), but instead, is part of a federal mandate to develop pollutant reduction requirements for municipal separate storm sewer systems. To this extent, it is entirely federal authority that forms the legal basis to establish the permit provisions. (See, *City of Rancho Cucamonga v. Regional Water Quality Control Bd.-Santa Ana Region* (2006) 135 Cal.App.4th 1377, 1389; *Building Industry Ass'n of San Diego County v. State Water Resources Control Bd.* (2004) 124 Cal.App.4th 866, 882-883.)

Likewise, the provisions of this Order to implement total maximum daily loads (TMDLs) are federal mandates. The federal Clean Water Act requires TMDLs to be developed for water bodies that do not meet federal water quality standards. (33 U.S.C. § 1313(d).) Once the U.S. Environmental Protection Agency or a state develops a TMDL, federal law requires that permits must contain effluent limitations consistent with the assumptions of any applicable waste load allocation. [(40 C.F.R. § 122.44(d)(1)(vii)(B))]

Second, the local agency permittees' obligations under this Order are similar to the obligations of non-governmental dischargers who are issued NPDES permits for storm water discharges. With a few inapplicable exceptions, the Clean Water Act regulates the discharge of pollutants from point sources (33 U.S.C. § 1342) and the Porter-Cologne regulates the discharge of waste (Wat. Code, § 13263), both without regard to the source of the pollutant or waste. As a result, the "costs incurred by local agencies" to protect water quality reflect an overarching regulatory scheme that places similar requirements on governmental and nongovernmental dischargers. (See *County of Los Angeles v. State of California* (1987) 43 Cal.3d 46, 57-58 [finding comprehensive workers compensation scheme did not create a cost for local agencies that was subject to state subvention].)

Third, the local agency permittees have the authority to levy service charges, fees, or assessments sufficient to pay for compliance with this Order. The fact sheet demonstrates that numerous activities contribute to the pollutant loading in the municipal separate storm sewer system. Local agencies can levy service charges, fees, or assessments on these activities, independent of real property ownership. (See, e.g., *Apartment Ass'n of Los Angeles County, Inc. v. City of Los Angeles* (2001) 24 Cal.4th 830, 842 [upholding inspection fees associated with renting property].) The ability of a local agency to defray the cost of a program without raising taxes indicates that a program does not entail a cost subject to subvention. (*County of Fresno v. State of California* (1991) 53 Cal.3d 482, 487-488.)

Fourth, the permittees have requested permit coverage in lieu of compliance with the complete prohibition against the discharge of pollutants contained in federal Clean Water Act section 301, subdivision (a) (33 U.S.C. § 1311(a)) and in lieu of numeric restrictions on their discharges. To the extent, the local agencies have voluntarily availed themselves of the permit, the program is not a state mandate. (Accord *County of San Diego v. State of California* (1997) 15 Cal.4th 68, 107-108.) Likewise, the permittees have voluntarily sought a program-based municipal storm water permit in lieu of a numeric limits approach. (See *City of Abilene v. U.S. E.P.A.* (5th Cir. 2003) 325 F.3d 657, 662-663 [noting that municipalities can choose between a management permit or a permit with numeric limits].) The local agencies' voluntary decision to file a report of waste discharge proposing a program-based permit is a voluntary decision not subject to subvention. (See *Environmental Defense Center v. USEPA* (9th Cir. 2003) 344 F.3d 832, 845-848.)

Fifth, the local agencies' responsibility for preventing discharges of waste that can create conditions of pollution or nuisance from conveyances that are within their ownership or control under state law predates the enactment of Article XIIIB, Section (6) of the California Constitution.

30. The Water Quality Act of 1987 added Section 402(p) to the Clean Water Act (CWA 33 U.S.C. § 1251-1387). This section requires the U.S. EPA to establish regulations setting forth NPDES requirements for storm water discharges in two phases.

- The U.S. EPA Phase I storm water regulations were directed at MS4s serving a population of 100,000 or more, including interconnected systems and storm water discharges associated with industrial activities, including construction activities. The Phase I Final Rule was published on November 16, 1990 (55 *Fed. Reg*. 47990).

- The U.S. EPA Phase II storm water regulations are directed at storm water discharges not covered in Phase I, including small MS4s (serving a population of less than 100,000), small construction projects (one to five acres), municipal facilities with delayed coverage under the Intermodal Surface Transportation Efficiency Act of 1991, and other discharges for which the U.S. EPA Administrator or the State determines that the storm water discharge contributes to a violation of a water quality standard, or is a significant contributor of pollutants to waters of the United States. The Phase II Final Rule was published on December 8, 1999 (64 *Fed. Reg*. 68722).

31. This Order specifies requirements necessary for the Permittees to reduce the discharge of pollutants in urban runoff to the maximum extent practicable (MEP).[2] However, since MEP is a dynamic performance standard which evolves over time as urban runoff management knowledge increases, the Permittees' storm water programs must continually be assessed and modified to incorporate improved programs, control measures, and best management practices (BMPs), etc. in order to achieve the evolving MEP standard. MEP is a technology-based standard established by Congress in CWA section 402(p)(3)(B)(iii) that operators of MS4s must meet. Technology-based standards establish the level of pollutant reductions that dischargers must achieve. Factors that must be considered when defining MEP include, but is not limited to; effectiveness, regulatory compliance, public acceptance, cost and technical feasibility. This continual assessment, revision, and improvement of storm water management program implementation is expected to ultimately achieve compliance with water quality standards.

32. This Order contains requirements based on assessments by Regional Water Board staff. Those assessments found that modifications were necessary to improve the Permittees efforts to reduce the discharge of pollutants in urban runoff to the MEP and achieve water quality standards.

33. This Order is intended to develop, achieve, and implement a timely, comprehensive, cost-effective storm water pollution control program to reduce the discharge of pollutants in storm water runoff to the MEP from the permitted areas in the Sacramento Urbanized Area subject to the Permittees' jurisdiction to receiving waters.

34. Section 402(p)(3)(B)(ii) of the CWA requires that NPDES permits effectively prohibit non-storm water discharges into MS4s. Federal regulation 40 CFR 122.26(d)(2)(iv)(B)(1) requires control programs to prevent illicit discharges to MS4s and allows certain categories of non-storm water discharges to MS4s, provided that the Permittees

[2] A definition of MEP may be found in Attachment C.

eliminate such discharges once they are identified as sources of pollutants to waters of the United States. Illicit discharges can include low levels of chlorine if they originate from potable water sources.

35. The State Board has issued two statewide general NPDES permits for storm water discharges: one for storm water from industrial sites [NPDES No. CAS000001, General Industrial Activity Storm Water Permit (General Industrial Permit)] and the other for storm water from construction sites [NPDES No. CAS000002, General Construction Activity Storm Water Permit (General Construction Permit)]. These two General Permits are scheduled for renewal during this 5-year term of this Order. In addition, the Regional Water Board has issued General Permit Order No. R5-2008-0081 for dewatering and other low threat discharges, which authorizes such discharges to the MS4s owned and operated by Permittees. This Order requires the Permittees to conduct compliance inspections at industries and construction sites that discharge to their MS4s. Many of these sites are currently covered under State NPDES General Permits.

36. The Permittees have adopted their own respective storm water ordinances. These ordinances provide the Permittees the authority to protect and enhance the water quality of watercourses, water bodies, and wetlands in the Sacramento Urbanized Area in a manner pursuant to and consistent with the CWA and the Porter-Cologne Water Quality Control Act.

37. Federal regulations 40 CFR 122.26(d)(2)(iv)(A) and 40 CFR 122.26(d)(2)(iv)(C) require that MS4 Permittees implement a program to monitor and control pollutants in discharges to the municipal system from industrial and commercial facilities that contribute a substantial pollutant load to the MS4. Federal regulations require that Permittees establish priorities and procedures for inspection of industrial facilities and priority commercial establishments. This permit, consistent with the U.S. EPA policy, incorporates a cooperative partnership, including the specifications of minimum expectations, between the Regional Water Board and the Permittees for the inspection of industrial facilities and priority commercial establishments to control pollutants in storm water discharges (58 Fed. Reg. 61157).

38. When industrial or construction site discharges occur in violation of local permits and ordinances, the Regional Water Board defers first to the municipality where the discharge occurs for appropriate actions. If the municipality has demonstrated a good faith effort to educate and enforce but remains unsuccessful, the Regional Water Board may assist the municipality and conduct a cooperative investigation and/or enforcement effort including enforcement of the applicable statewide General Permit. If the municipality has not demonstrated a good faith enforcement effort, the Regional Water Board may initiate enforcement action against both the industrial or construction discharger under the statewide General Permits, as well as against the authorizing municipal Permittee for violations of this Order. Each Permittee must also provide the first level of enforcement against illegal discharges from other land uses it has authorized, such as commercial and residential developments.

39. This Order shall assure compliance with water quality standards. This Order therefore includes requirements to the effect that discharges shall not cause or contribute to violations of water quality standards that would cause or create a condition of nuisance, pollution, or water quality impairment in receiving waters. The Regional Water Board is requiring that these requirements be addressed through the effective implementation of Best Management Practices (BMPs) to reduce pollutants in storm water.

40. Regulations in 40 CFR 122.26(d)(2)(iv) require that the SQIP be implemented during the entire duration of the permit, which is five years. The Permittees shall demonstrate substantial compliance with the SQIP and this Order through the information and data supplied in the Annual Report. The SQIP shall remain in effect as an integral and enforceable part of this Order until revised and approved by the Regional Water Board. If there are conflicts between the SQIP and this Order, then the Order supercedes the SQIP.

41. Federal, state, regional, or local entities within the Permittees' boundaries, not currently named in this Order, operate storm drain facilities and/or discharge storm water to the storm drains covered by this Order. The Permittees may lack legal jurisdiction over these entities under applicable state and federal authorities. Consequently, the Regional Water Board recognizes that the Permittees should not be held responsible for such facilities and/or discharges. However, Permittees should notify the Regional Water Board upon recognition of discharges, which are a threat to storm water quality protection.

42. The State and Regional Water Boards may consider issuing separate NPDES storm water permits to other federal, state, or regional entities operating and discharging within the Permittees' boundaries that may not be subject to direct regulation by the Permittees. Federal agencies are not subject to municipal storm water requirements although they may be permitted as industrial dischargers.

43. The State Water Resources Control Board adopted an NPDES General Permit for the Discharge of Storm Water from Small MS4s (WQ Order No. 2003-0005-DWQ) to provide permit coverage for smaller municipalities, including non-traditional Small MS4s, which are governmental facilities such as military bases, public campuses, and prison and hospital complexes. Currently the following entities have been designated to have a separate NPDES Small MS4 General Permit located within the Sacramento County Urbanized area:

- California Exposition and Fair;
- California State University at Sacramento;
- Cosumnes Community Services District; and
- Elk Grove Unified School District under the purview of Sacramento County Office of Education

The Permittees should work cooperatively with these entities for the purpose of maintaining mutually beneficial storm water management program coordination,

cooperation and communication. This will help provide consistency of storm water regulations throughout each Permittee's jurisdiction.

44. The Regional Water Board adopted the *Water Quality Control Plan, Fourth Edition, for the Sacramento and San Joaquin River Basins* (hereafter Basin Plan). The Basin Plan designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve water quality objectives for all waters of the Basin. This Order implements the Basin Plan.

45. The beneficial uses of the American River, Cosumnes River, Mokelumne River, Sacramento River, and the Delta downstream of the discharge as identified in Table II-1 of the Basin Plan are municipal, domestic, industrial and agricultural supply; water contact and non-contact recreation; aesthetic enjoyment; navigation; groundwater recharge; fresh water replenishment; and preservation and enhancement of fish, wildlife and other aquatic resources. Tributaries of the waters may have similar beneficial uses.

46. The beneficial uses of the underlying ground water beneath the Sacramento Urbanized Area as identified in the Basin Plan are municipal and domestic water supply, industrial service, industrial process, and agricultural supply.

47. Congress has determined that it is not feasible at this time to establish numeric effluent limits for pollutants in storm water discharges from MS4s [Clean Water Act (CWA)[3] Section 402(p)(3)(B)(iii)[4]]. In addition, the California Superior Court ruled; *"Water quality-based effluent limitations are not required for municipal Stormwater discharges [33 USC §1342(p)(3)(B)] and [40 CFR §122.44(k)(3)]. For municipal stormwater discharges, the Permits must contain best management practices (BMPs), which reduce pollutants to the maximum extent practicable [33 USC §1342(p)(3)(B)]. These Permits do contain these through the Stormwater Management Plan which is incorporated into the Permits by reference."* (*San Francisco Baykeeper vs. Regional Water Quality Control Board, San Francisco Bay Region,* Case No. 500527, 14 November 2003). Therefore, the effluent limitations in this Order are narrative, and include the requirement to reduce pollutants in storm water discharges to the MEP. In lieu of numeric effluent limitations, this Order requires the implementation of BMPs identified in the Permittees' SQIP to control and abate the discharge of pollutants in storm water discharges. Implementation of BMPs, compliance with long-term performance standards in accordance with the Permittees' SQIP and its schedules, an established maintenance program with enforcement procedures, constitutes compliance with the MEP standard.

[3] The U.S. Environmental Protection Agency (EPA) published the regulation entitled "National Pollutant Discharge Elimination System - Regulations for Revision of the Water Pollution Control Program Addressing Storm Water Discharges" (Federal Register, Volume 64, Number 235, pages 68722-68852) on December 8, 1999 as required by Section 402(p) of the Clean Water Act (CWA).

[4] CWA Section 402(p)(3)(B)(iii): "…controls to reduce pollutants to the maximum extent practicable, including management practices, control techniques, and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants."

48. 40 CFR 122.26(d)(2)(iv)(B)(1)][5] lists types of non-storm water flows that are not required to be prohibited unless such discharges are specifically identified by the Phase I MS4 Permittees as sources of pollutants to waters of the United States.

49. The State Water Resources Control Board (SWRCB) convened a Storm Water Panel (Blue Ribbon Panel) of experts to address the issue of numeric effluent limits[6]. The study concluded that it is not feasible at this time to set enforceable numeric effluent criteria for storm water and non-storm water discharges from MS4s.

50. The U.S. EPA published an 'Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits' on August 26, 1996 (61 Fed. Reg. 43761). This policy discusses the appropriate kinds of water quality-based effluent limitations to be included in NPDES storm water permits to provide for the attainment of water quality standards.

51. On 12 March 2001, the U.S. Court of Appeals ruled that it is necessary to obtain an NPDES permit for application of aquatic pesticides to waterways [Headwaters, Inc. vs. Talent Irrigation District, 243 F.3d. 526 (Ninth Cir., 2001)]. The U.S. EPA issued a Final Rule on 17 October 2006, that exempts the application of a pesticide to or over, including near, waters of the United States if conducted consistent with all relevant requirements under the Federal Insecticide and Fungicide Rodenticide Act (FIFRA), from an NPDES permit under the Clean Water Act in the following two circumstances: (a) the application of pesticides directly to waters of the United States in order to control pests, and (b) The application of pesticides to control pests that are present over waters of the United States, including near such waters, that results in a portion of the pesticides being deposited to waters of the United States (40 CFR 122.3(h)).

52. On 17 June 1999, the State Board adopted Order No. WQ 99-05 (SBO 99-05), a precedent setting-decision, which identifies acceptable receiving water limitations language to be included in municipal storm water permits issued by the State and Regional Water Boards. The receiving water limitations included herein are consistent with the State Board Order, U.S. EPA policy, and the U.S. Court of Appeals decision in Defenders of Wildlife v. Browner (Ninth Cir., 1999). The State Board's OCC has determined that the federal court decision did not conflict with SBO 99-05 (memorandum dated October 14, 1999).

---

[5]40 CFR 122.26(d)(2)(iv)(B)(1) A description of a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal separate storm sewer system; this program description shall address all types of illicit discharges, however the following category of non-storm water discharges or flows shall be addressed where such discharges are identified by the municipality as sources of pollutants to waters of the United States: water line flushing, landscape irrigation, diverted stream flows, rising ground waters, uncontaminated ground water infiltration (as defined at 40 CFR 35.2005(20)) to separate storm sewers, uncontaminated pumped ground water, discharges from potable water sources, foundation drains, air conditioning condensation, irrigation water, springs, water from crawl space pumps, footing drains, lawn watering, individual residential car washing, flows from riparian habitats and wetlands, dechlorinated swimming pool discharges, and street wash water (program descriptions shall address discharges or flows from fire fighting only where such discharges or flows are identified as significant sources of pollutants to waters of the United States).

[6] Recommendations of the Blue Ribbon Panel were finalized as *The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities,* dated 19 June 2006.

53. Federal regulation 40 CFR 122.42(c)(7) requires the Permittees to submit an annual report that identifies water quality improvements or degradation.

54. The action to adopt an NPDES permit is exempt from the provisions of Chapter 3 of the California Environmental Quality Act (Public Resources Code, Section 21100, et. seq.) in accordance with Section 13389 of the California Water Code.

55. This Order serves as an NPDES permit, pursuant to Section 402 of the CWA, and amendments thereto, and shall take effect 50 days from the date of hearing, provided that U.S. EPA has no objections.

56. This Order does not authorize any take of endangered species. To ensure that endangered species issues have been raised to the responsible agencies, the Regional Water Board notified the U.S. Fish and Wildlife Service, National Marine Fisheries Service, and the California Department of Fish and Game of Regional Water Board consideration of this Order.

57. State law pre-empts local storm water programs from regulating pesticide sales and use. Regulatory activities by state and federal agencies, especially the state Department of Pesticide Regulation DPR and the United States Environmental Protection Agency (USEPA), are critical for achieving adequate control of pesticide uses that result in pesticide discharges in storm water. Pesticide registration and re-registration activities, which are very active areas of pesticide regulation, are especially important in the control of pesticide use.

58. Individually, and through California Stormwater Quality Association (CASQA), the Permittees have actively participated in State and Federal organizations and processes to address regulatory issues. This includes the Urban Pesticide Committee (UPC) and Department of Pesticide Regulation's (DPR) Pest Management Advisory Committee (PMAC) and Pesticide Registration and Evaluation Committee (PREC), and various committees convened by the State Structural Pest Control Board. These committees provide forums in which USEPA, DPR, and the Regional Water Boards participate, and have been effective in bringing water quality concerns to the attention of state and federal pesticide regulators. Ongoing support and participation in these efforts by the Regional Water Boards is an important factor for continued progress. Progress in these efforts has been documented in reports submitted to the San Francisco Bay Regional Water Board by the San Francisco Estuary Project.

STORM WATER QUALITY IMPROVEMENT PLAN

59. The Permittees submitted a Report of Waste Discharge (ROWD), as well as a proposed SQIP on 1 June 2007. The ROWD evaluated the effectiveness of the Permittees' storm water programs over the third permit term, identified which BMPs should continue to be implemented, and, as part of the iterative process, determined what additional efforts may be necessary in order to improve the storm water program and reduce the discharge

of pollutants to the MEP. Based on the evaluation, the ROWD and proposed SQIP propose a wide range of continuing, enhanced and new BMPs, control measures, and performance standards to be implemented during the fourth term Permit period (2008-2013).

60. Federal regulation 40 CFR 122.26(d)(2)(iv) requires the Permittees to submit a SQIP to reduce the discharge of pollutants in storm water to the MEP, and to effectively prohibit non-storm water discharges into municipal storm drain systems within the Permittees' jurisdictions during the five-year duration of the permit. During the fourth term permit period, the Permittees shall continue to demonstrate substantial compliance with their respective SQIP and this Order through the information and data supplied in the Annual Reports. The SQIP shall remain in effect, as an enforceable component of this Order, until revised and approved by the Regional Water Board. If there are conflicts between the SQIP and this Order, then the Order supersedes the SQIP.

61. This Order requires evaluation of water quality impacts of storm water discharges from existing urbanized areas and new developments. This Order also requires implementation and evaluation of the SQIP and related programs to reduce the discharge of pollutants in storm water runoff to MEP and to improve water quality and protect beneficial uses.

62. The Permittees are required to submit a revised SQIP by **11 March 2009** (or 6 months after the effective date of this Order, whichever is later). The SQIP fulfills the Regional Water Board's permit application requirements subject to the condition that it will be improved and revised in accordance with the provisions of this Order. The SQIP includes program elements and control measures that each Permittee will implement to reduce the discharge of pollutants in storm water to the MEP, and to effectively prohibit non-storm water discharges into MS4s and watercourses within each Permittees jurisdiction. The Permittee's SQIP is a site-specific modification of the existing Storm Water Management Plan required under the previous MS4 permit Order No. R5-2002-0206. The various components of the SQIP, taken as a whole rather than individually, are expected to reduce pollutants in storm water and urban runoff to the MEP.

63. The SQIP describes the framework for management of storm water discharges during the term of this Order. The Permittees' SQIPs contain comprehensive activities that provide the framework and direction for each Permittee to implement BMPs. The Permittees' SQIPs include joint program and individual Permittee activities as described below.

    a. Joint Program Activities:

        i. Program Management – Planning, cost-sharing and coordination activities.

        ii. Target Pollutant Program – Based on the Permittees methodologies, Target Pollutants have been identified and prioritized that have the potential to cause exceedances of water quality standards and impairment of beneficial uses. Some of these Target Pollutants are also 303(d) listed constituents. Pollutant

sources and control measures are identified and strategies developed to focus joint program resources and activities.

iii. Monitoring Program - This program includes extensive monitoring to provide data used to characterize storm water discharge and receiving water quality, evaluate BMP performance and assess SQIP effectiveness.

iv. Special Studies – Includes effectiveness evaluations for various new development storm water quality control measures, such as a wet detention basin and proprietary treatment control devices.

v. Regional Public Outreach – The Permittees conduct regional public outreach programs to educate residents, school children, and businesses about the harmful effects of storm water pollution and create opportunities for public involvement. The Permittee's public outreach implementation strategy includes, but is not limited to, developing and distributing educational materials, conducting media campaigns, and participating in public outreach events.

vi. Program Effectiveness Assessment - Evaluation activities are a required and important aspect of the Program. Conducting assessments and evaluating performance standards and BMP studies allow for modification and continued improvement of program activities.

b. Individual Permittee-Specific Activities

The Permittees' SQIPs include a description of each Permittee's program organization, legal authority and funding. The following implementation activities are also described:

i. Program Management (includes planning, staffing and fiscal analysis)
ii. Construction
iii. Illicit Discharge
iv. Commercial/Industrial
v. Municipal Operations and Facilities
vi. Planning and New Development
vii. Public Education and Outreach
viii. Watershed Stewardship
xi. Program Effectiveness Assessment and Reporting

64. The overall goals of the Permittees' SQIP are to: a) reduce the degradation of waters of the State and Waters of the United States (U.S.) by urban runoff and protect their beneficial uses; and b) develop and implement an effective SQIP that is well understood and broadly supported by regional stakeholders.

The core objectives are to:

a. Identify and control those pollutants in urban runoff that pose significant threats to the waters of the State and waters of the U.S. and their beneficial uses;
b. Comply with the federal regulations to eliminate or control, to the MEP, the discharge of pollutants from urban runoff associated with the storm drain system;
c. Achieve compliance with water quality standards;
d. Develop a cost-effective program which focuses on pollution prevention of urban storm water;
e. Seek cost effective alternative solutions where prevention is not a practical solution for a significant problem; and
f. Coordinate implementation of control measures with other agencies.

65. This Order includes a Monitoring Program that incorporates analytical Minimum Levels (MLs) established under the State Board's Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (SIP). The SIP's MLs represent the lowest quantifiable concentration for priority toxic pollutants that is measurable with the use of proper method-based analytical procedures and factoring out matrix interference. The SIP's MLs therefore represent the best available science for determining MLs and are appropriate for a storm water monitoring program. The use of MLs allows the detection of toxic priority pollutants at concentrations of concern using recent advances in chemical analytical methods.

66. The Permittees' proposed SQIPs contain control measures that identify the specific BMPs that each Permittee will implement to reduce the discharge of pollutants from their respective MS4s to the MEP. The SQIPs also include performance standards for each Control Measure to establish the level of effort required to comply with this Order and the federal MEP standard and an implementation schedule to identify when certain activities must be completed. Each Program Element also identifies how effectiveness assessments will be utilized to ensure that the program is resulting in the desired outcomes and that the resources that are expended are providing commensurate benefit and are protective of water quality.

67. The SQIPs and modifications or revisions to the SQIPs that are approved in accordance with this Order, are an integral and enforceable component of this Order. USEPA Phase I Final Rule and Regulations states the Clean Water Act contemplated MS4 permit conditions requiring storm water management programs to be developed and implemented or required specific practices, those program elements were enforceable in accordance with the terms of permit.

68. The State Water Board established California's antidegradation policy in State Water Board Resolution 68-16. Resolution 68-16 incorporates the federal antidegradation policy (40 CFR 131.12) where the federal policy applies under federal law. The proposed discharge complies with the antidegradation provisions of 40 CFR 131.12 and State Water Board Resolution 68-16. Resolution 68-16 requires in part:

1) High quality waters be maintained until it has been demonstrated that any change will be consistent with maximum benefit to the people of the State, will not unreasonably affect present and anticipated beneficial use of such water and will not result in water quality less than that prescribed in the policies; and

2) Any activity, which produces or may produce a waste or increased volume or concentration of waste and which discharges or proposes to discharge to existing high quality waters will be required to meet waste discharge requirements which will result in the best practicable treatment or control of the discharge necessary to assure that (a) a pollution or nuisance will not occur and (b) the highest water quality consistent with maximum benefit to the people of the State will be maintained.

The Permittees submitted an antidegradation analysis in October 2007. The report demonstrates that the proposed increase in discharge as a result of continued urban development will result in some minimal degradation of waters of the State and navigable waters of the United States, but in this case, such degradation is consistent with the maximum benefit to the people of the state. Limited degradation that does not cause exceedance of water quality objectives is warranted to allow for the economic benefit stemming from local growth. There is a need in Sacramento to accommodate growth. The Regional Water Board does not have the jurisdiction to control growth in the Sacramento Urbanized Area, but is required to assure that the receiving waters are adequately protected as a result of urban discharges. The proposed Order allows the service necessary to accommodate housing and economic expansion in the area and is considered to be a benefit to the people of the State. The Fact Sheet contains additional information regarding the antidegradation analysis and constituents of concern in the waste discharge. The run-off concentrations for all constituents are based on water quality objectives and an increase in mass for some constituents, if any, will be insignificant. While the accommodation of the development can in some circumstances justifies lowering of receiving water quality, in this case, the proposed Order would authorize, very minimal, if any lowering of receiving water quality given the requirement to meet MEP by this Order.

These requirements implement best management practices and reduce pollutants to the maximum extent practicable to assure that pollution or nuisance will not occur and that the highest water quality consistent with maximum benefit to the people of the State will be maintained. Due to the high level of source and treatment control measures to prevent and reduce discharges to surface waters, the proposed order will result in maintenance of existing in-stream uses.

DEVELOPMENT STANDARDS

69. The primary purpose of the New Development Standards is to mitigate urban run-off pollution and other water quality impacts associated with new development and redevelopment.

70. On 5 October 2000, the State Board adopted Order WQ 2000-11, a precedent setting decision concerning the use of Standard Urban Storm Water Mitigation Plans (hereafter Development Standards) in municipal storm water permits for new developments and significant redevelopments. The State Board recognized that the decision includes significant legal or policy determinations that are likely to recur (Gov. Code §11425.60). Due to the precedent setting nature of Order WQ 2000-11, the Regional Water Board's MS4 permits must be consistent with applicable portions of the State Board's decision and include Development Standards.

71. Federal regulation 40 CFR 131.10(a) prohibits states from designating waste transport or waste assimilation as a use for any water of the United States. Authorizing the construction of a storm water/urban runoff treatment facility in a jurisdictional water body would be tantamount to accepting waste assimilation as an appropriate use for that water body. Furthermore, the construction and operation of a pollution control facility in a water body can impact the physical, chemical, and biological integrity as well as the beneficial uses of the water body. Therefore, storm water treatment in accordance with Development Standards and any other requirements of this Order must occur prior to the discharge of storm water into a water of the United States.

72. The Permittees are implementing programs consistent with their Development Standards Plan (DSP), which was approved by the Regional Water Board on 18 May 2005. The DSP requires the Permittees to have development standards related to storm water quality management for eight categories of new development and significant redevelopment and consistent with State Board adopted Order WQ 2000-11. Each Permittee amended its development standards (effective 18 May 2006) to conform to the DSP. Compliance with the Permittees' development standards requires the selection of post-construction storm water quality controls (BMPs) to reduce pollutants from new development and significant redevelopment to the MEP.

73. The Permittees published updated technical design guidelines on 18 May 2007 to help the development community understand and comply with the Permittees' amended development standards. Use of the guidelines requires a thoughtful process to select from the menu of BMPs those that are most appropriate for the site's land use (expected pollutant loadings) and unique site conditions. The Permittees consider potential storm water impacts when making planning decisions in order to fulfill the Clean Water Act (CWA) requirement to reduce the discharge of pollutants in municipal storm water to the maximum extent practicable (MEP) from new development and redevelopment projects within their local jurisdiction. In doing so, each Permittee exercises their legal authority to ensure that the increased pollutant loads and flows do not degrade the beneficial uses of their local receiving waters. This was demonstrated by the Antidegradation Analysis completed by the Permittees in 2007.

74. Urbanization is defined as the transformation of land into residential, commercial and industrial properties, and associated drainages, roads, sewers and other community planned infrastructure. Urbanization modifies natural watershed and stream processes by altering the terrain, modifying the vegetation and soil characteristics, introducing

impervious surfaces such as pavement and buildings, installing drainage and flood control infrastructure and altering the condition of stream channels through straightening, deepening, and armoring. These changes affect hydrologic characteristics in the watershed (rainfall interception, infiltration, runoff and stream flows) and affect the supply and transport of sediment in the stream system. The change in runoff characteristics from a watershed caused by changes in land use conditions (i.e., urbanization) is defined as hydrograph modification, or hydromodification.[7] When development projects do not address and mitigate for this change in runoff characteristics, a variety of problems can result, such as: excess sediment flowing into streams; downstream erosion and sedimentation; flooding; disruption of natural drainage patterns, stream flows and riparian habitat; and elevated water temperatures**.**

75. Urban development includes both new development and redevelopment of existing properties. These development projects may be undertaken by either private or public entities. Policies governing review and approval of development projects for compliance with this Order vary among the Permittees.

76. The quality and quantity of storm water runoff must be considered early during project planning to identify permanent (post-construction) BMPs that will be included in project design, constructed as part of the project, and ultimately implemented and maintained for the life of each category of urban development in order to protect storm water quality.

77. On January 20, 2005, the State Water Resources Control Board adopted sustainability as a core value for all California Water Boards' activities and programs, and directed California Water Boards' staff to consider sustainability in all future policies, guidelines, and regulatory actions.

78. Low Impact Development (LID) sometimes referred to as Low Impact Design, is a sustainable practice that benefits water supply and contributes to water quality protection. LID uses site design and storm water management to maintain the site's pre-development runoff rates and volumes. The goal of LID is to mimic a site's predevelopment hydrology by using de-centralized design techniques that infiltrate, filter, store, evaporate, and detain runoff close to the source of rainfall. LID has been a proven approach in other parts of the country and is seen in California as an alternative to traditional storm water management. The Water Boards are advancing LID in California in various ways, specifically through regulation of site-specific (Phase I MS4) and general permits (Phase II MS4).

79. In a study conducted for the San Diego region, it was concluded that LID substantially preserves pre-development hydrologic conditions and prevents most or all pollutant transport to receiving waters from urbanization.[8] Further, it was concluded that LID reduces storm water run-off and contaminants by decreasing their generation at sources,

[7] Santa Clara Valley Urban Runoff Pollution Prevention Program. March 2005. Hydromodification Management Report. (Chapter 1, Problem Statement).
[8] Horner, Richard R., Ph.D., "Investigation of the feasibility and benefits of Low Impact Design (LID) practices for the San Diego Region," University of Washington.

infiltrating into the soil or evaporating storm flows before they can enter surface receiving waters, treating flow remaining on surface through contact with vegetation and soil, or a combination of these strategies.[9] LID practices maintain and restore the natural hydrologic functions of a site to achieve natural resource protection objectives.

80. During the initial site layout and design planning of new development or re-development for LID integration, there is a higher probability for preservation/integration of existing natural resource features (trees and other vegetation, creek buffers, wetlands, vernal pools, and open space).

81. In November 2005, under the direction of EPA Assistance Agreement funded by the Office of Water, The Low Impact Development Center prepared a document titled, "Low Impact Development for Big Box Retailers."[10] The document provides recommendations to large building and site footprint high volume retailers with strategies that integrate innovative and highly effective LID storm water management techniques into their site designs for regulatory compliance and natural resource protection at the local levels.

82. Studies indicate that facilities with paved surfaces subject to frequent motor vehicle traffic (such as parking lots and fast food restaurants), or facilities that perform vehicle repair, maintenance, or fueling (automotive service facilities) are potential sources of pollutants of concern in storm water. [References: Pitt et al., Urban Storm Water Toxic Pollutants: Assessment, Sources, and Treatability, Water Environment Res., 67, 260 (1995); Results of Retail Gas Outlet and Commercial Parking Lot Storm Water Runoff Study, Western States Petroleum Association and American Petroleum Institute, (1994); Action Plan Demonstration Project, Demonstration of Gasoline Fueling Station Best Management Practices, Final Report, County of Sacramento (1993); Source Characterization, R. Pitt, In Innovative Urban Wet-Weather Flow Management Systems (2000) Technomic Press, Field, R et al. editors; Characteristics of Parking Lot Runoff Produced by Simulated Rainfall, L.L. Tiefenthaler et al. Technical Report 343, Southern California Coastal Water Research Project (2001)].

83. Retail Gasoline Outlets (RGOs) are significant sources of pollutants in urban runoff. RGOs are points of convergence for motor vehicles for automotive related services such as repair, refueling, tire inflation, and radiator fill-up and consequently produce significantly higher loadings of hydrocarbons and trace metals (including copper and zinc) than other urban areas. To meet MEP, source control and treatment control BMPs are needed at RGOs.

[9] Ibid.
[10] "Low Impact Development for Big Box Retailers," EPA Office of Water, November 2005

84. The Los Angeles and San Diego Regional Water Quality Control Boards have jointly prepared a Technical Report on the applicability of new development BMP design criteria for RGOs, [Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts, (June 2001)]. RGOs in Washington, Oregon, and other parts of the United States are already subject to numerical BMP design criteria under the MS4 program.

85. Each Permittee is individually responsible for adopting and enforcing local ordinances necessary to implement effective BMPs to prevent or reduce pollutants in storm water, and for providing funds for capital, operation, and maintenance expenditures necessary to implement such BMPs for the storm drain system that it owns and/or operates. Enforcement actions concerning this Order will, whenever necessary, be pursued only against the individual Permittee responsible for specific violations of this Order.

IMPAIRED WATER BODIES

86. Section 303(d)(1)(A) of the CWA requires that "Each state shall identify those waters within its boundaries for which the effluent limitations…are not stringent enough to implement any water quality standard (WQS) applicable to such waters." The CWA also requires states to establish a priority ranking of impaired waterbodies known as Water Quality Limited Segments and to establish Total Maximum Daily Loads (TMDLs) for such waters. This priority list of impaired waterbodies is called the Section 303(d) List.

87. CWA Section 303(d) and 40 CFR 130.7 require states to identify water quality-impaired water bodies and pollutants of concern, and develop Total Maximum Daily Loads (TMDLs). A TMDL is a quantitative assessment of the total pollutant load that can be discharged from all sources each day while still meeting water quality objectives. The Regional Water Board is currently in the process of developing TMDLs for listed water bodies within the Region. Prior to TMDL's being adopted and approved, Permittees must implement actions to address their contribution to the water quality impairments. Once the Regional Water Board and U.S. EPA approve TMDLs, this Order may be amended to incorporate provisions consistent with waste load allocations established under the TMDLs.

88. The Regional Water Board considers storm water discharges from the Sacramento Urbanized Area to be significant sources of pollutants. The CWA Section 303(d) Listed Waterbodies in the Sacramento Urbanized Area include the following. These impairments are based on identified exceedances of water quality standards.

Waterbody	Reach	Estimated Size Affected	Pollutant/Stressor(s)
Sacramento San Joaquin Delta		41,746 acres	Chlordane DDT Dieldrin Dioxin Compounds (including 2,3,7,8-TCDD) Exotic Species Furan Compounds Mercury Nickel PCBs (Polychlorinated biphenyls) PCBs (Polychlorinated biphenyls (dioxin-like) Selenium
American River (Nimbus Dam to confluence with Sacramento River)	Lower	27 miles	Mercury
Arcade Creek		9.9 miles	Chlorpyrifos Diazinon Copper
Morrison Creek	Morrison Creek from Elk Grove-Florin Rd to Beach Lake	26 miles	Chlorpyrifos Diazinon
Elder Creek		11 miles	Chlorpyrifos Diazinon
Elk Grove Creek		6.9 miles	Chlorpyrifos Diazinon
Strong Ranch Slough		6.4 miles	Chlorpyrifos Diazinon

Waterbody	Reach	Estimated Size Affected	Pollutant/Stressor(s)
Chicken Ranch Slough		8 miles	Chlorpyrifos Diazinon
Natoma, Lake		485 acres	Mercury
Natomas East Main Drainage Canal	(aka Steelhead Creek, downstream of confluence with Arcade Creek)	3.5 miles	Diazinon PCBs (Polychlorinated biphenyls)
Natomas East Main Drainage Canal	(aka Steelhead Creek, upstream of confluence with Arcade Creek)	12 miles	PCBs (Polychlorinated biphenyls)
Sacramento River	Knights Landing to the Delta	16 miles	Mercury Diazinon Unknown Toxicity

TMDLs for these water bodies are in various stages of completion. NPDES permits must be consistent with approved TMDL waste load allocations. To implement adopted TMDLs, this Order implements control programs developed to attain waste load allocations.

89. The Permittees submitted to the Regional Water Board a Pesticide Plan (in 2004) to fulfill the need for a pesticide toxicity control plan as required by the urban creeks pesticide TMDL. The Pesticide Plan was subsequently approved by the Regional Water Board. The plan addresses their own use of pesticides including diazinon, chlorpyrifos, and other lower priority pesticides and use of such pesticides by other sources within their jurisdiction.

90. The Regional Water Board Toxic Hot Spots Clean-up Plan (California Water Code section 13394) identified the following hot spots that are applicable to this discharge:

    a. Mercury in the Delta; and
    b. Diazinon and Chlorpyrifos in Morrison Creek in the City of Sacramento.

91. The Porter-Cologne Act (§ 13395) requires the reevaluation of waste discharge requirements for dischargers who have discharged pollutants causing all or part of the toxic hot spot. The waste discharge requirements must be revised to include requirements that “prevent the maintenance or further pollution of existing toxic hot spots.” Further “(t)he Regional Water Board may determine it is not necessary to revise a

waste discharge requirement only if it finds that the toxic hot spot resulted from practices no longer being conducted by the discharger... or that the discharger's contribution to the creation or maintenance of the toxic hot spot is not significant."

a. The data are not available to determine the relative contribution of the Permittee's discharge (compared to upstream and atmospheric contributions from non-urban sources) to the diazinon and chlorpyrifos levels in 303(d) listed waters and toxic hot spots. The provisions in the previous Order that addressed pesticide toxicity were intended to satisfy the toxic hot spot requirements for waste discharge requirement revisions. In compliance with those provisions, the Permittees submitted a Pesticide Plan, which was subsequently approved by the Regional Water Board. Implementation of the approved Pesticide Plan will continue under this Order, and satisfies the Permittee's toxic hot spot requirement to establish a control plan for pesticide toxicity.

b. The phase-out of the sale of diazinon and chlorpyrifos for most residential and commercial uses was expected to reduce or eliminate the contribution of the Permittees' discharge to the non-attainment of water quality standards in the 303(d) listed waters and the maintenance of the diazinon and chlorpyrifos hot spots.

c. The monitoring of diazinon and chlorpyrifos was conducted to determine the significance of the Permittees' contribution to diazinon and chlorpyrifos levels in 303(d) listed waters and the toxic hot spots. The monitoring was also conducted to determine the effectiveness of the phase-out of urban uses of diazinon and chlorpyrifos; to assess whether the hot spots are maintained; and to assess whether water quality objectives are met. The monitoring results were submitted in the June 2007 ROWD as well as prior years' annual reports.

   Since the 2005 phase-out of urban uses, diazinon concentrations in receiving waters, when detected, have been consistently below water quality objectives and chlorpyrifos has been rarely detected in receiving waters. Diazinon and chlorpyrifos monitoring of the six additional pesticide locations and the Morrison Creek at Brookfield is no longer necessary. The data indicated that the seven creeks sampled had similar concentrations and those concentrations were reduced to non-detectable levels by 2005 once the phase-out went into effect. Analysis of the data shows that these sites are sufficiently characterized by the Arcade Creek at Watt Avenue and Willow Creek at Blue Ravine Road locations, which are part of the monitoring and reporting program of this Order.[11]

[11] *Evaluation of Additional Pesticide Monitoring Data – 2007 Update.* May 25, 2007 memorandum by Larry Walker Associates to Delia McGrath, City of Sacramento and Janet Parris, Sacramento County.

d. The Regional Water Board has adopted water quality objectives for:

i. Diazinon: 160 nanograms per liter (ng/L or parts per trillion), one-hour average, not to be exceeded more than once in a three-year period and 100 ng/L, four-day average, not to be exceeded more than once in a three-year period, which apply to Sacramento-San Joaquin Delta Waterways (Delta Waterways) (Basin Plan[12]);

ii. Diazinon: 80 nanograms per liter (ng/L or parts per trillion), one-hour average, not to be exceeded more than once every three years on average and 50 ng/L, four-day average, not to be exceeded more than once every three years on average (Sacramento River from the Colusa Basin Drain to I Street Bridge); and[13]

iii. Chlorpyrifos: 25 ng/L, one-hour average, not to be exceeded more than once in a three-year period and 15 ng/L, four-day average, not to be exceeded more than once in a three-year period, which apply to Delta Waterways (Basin Plan).[14]

e. The Regional Water Board has also established in the Basin Plan the Loading Capacity for the Delta Waterways and Sacramento River[15], Waste Load Allocations, and Load Allocations for discharges to the Delta Waterways and Sacramento River, which are equal to:

$$S = \frac{C_D}{WQO_D} + \frac{C_C}{WQO_C} \leq 1.0$$

where:

C_D = diazinon concentration in μg/L of point source discharge for the WLA; nonpoint source discharge for the LA; or a Delta Waterway for the LC.
C_C = chlorpyrifos concentration in μg/L of point source discharge for the WLA; nonpoint source discharge for the LA; or a Delta Waterway for the LC.
WQO_D = acute or chronic diazinon water quality objective in μg/L.
WQO_C = acute or chronic chlorpyrifos water quality objective in μg/L.

[12] Sacramento-San Joaquin Delta Waterways, Central Valley Regional Water Quality Control Board, *Water Quality Control Plan (Basin Plan), Central Valley Region, Sacramento River and San Joaquin River Basins (Fourth Edition, revised Oct. 2007)* including Appendix 42 –
[13] Amended by Regional Water Board Resolution R5-2007-0034 to 160 nanograms per liter (ng/L or parts per trillion), one-hour average, not to be exceeded more than once every three years on average and 100 ng/L, four-day average, not to be exceeded more than once every three years on average. Pending California's Office of Administrative Law and U.S. EPA approval.
[14] Amended by Regional Water Board Resolution R5-2007-0034 to include the Sacramento and Feather Rivers. Pending U.S. EPA approval.
[15] Revised requirements for Diazinon and Chlorpyrifos discharges into the Sacramento River were adopted by the Regional Water Board by Resolution R5-2007-0034 and will become effective upon U.S. EPA approval.

Compliance with the waste load allocation is required by December 1, 2011 (Basin Plan).

f. Regional Water Board's Basin Plan requires dischargers of diazinon and chlorpyrifos to Delta Waterways and the Sacramento River to submit a management plan (i.e., BMPs, BMP implementation plan, effectiveness assessment, schedule) that describes actions that will be taken to reduce diazinon and chlorpyrifos discharges and meet the applicable allocations.

g. The approved Pesticide Plan and any modifications to it, as proposed in the SQIP, meet the requirements for a management plan as described in the Basin Plan.

h. This Order includes Provisions consistent with the TMDL waste load allocations and the Basin Plan implementation program. This Order specifies monitoring and assessment requirements to implement these Provisions.

92. The Delta, Sacramento River, American River, and Lake Natoma are on the Clean Water Act Section 303(d) List as mercury impaired because of elevated methylmercury levels in fish. In addition, as stated above, the State Water Resources Control Board (State Water Board) designated the Delta as a toxic hot spot for mercury under the Bay Protection and Toxic Hot Spot Cleanup Program. Urban runoff from the Sacramento area contributes total (inorganic) mercury and methylmercury to these mercury-impaired water bodies.

93. This Order requires an evaluation of total mercury and methylmercury data collected under the previous Order and additional urban discharge monitoring to determine how much methylmercury and total mercury loading urban lands within the Sacramento Area contribute to the individual impaired water bodies (Delta, Sacramento River, American River, and Lake Natoma). In addition, the Order also requires that the Permittees estimate the amount of total mercury and sediment prevented from discharging to receiving waters by existing BMPs such as (but not limited to) street cleaning, detention basins, and erosion and sediment controls. This Order also requires that the Permittees consider including monitoring in the design of future BMP studies to estimate the extent to which existing and new BMPs reduce total mercury transport and reduce and/or increase methylmercury discharges. The Monitoring and Reporting Program (MRP) portion of this Order specifies monitoring and assessment requirements that must be implemented to gather information for mercury control programs for impaired water bodies. Once the Delta mercury control program is approved, there may be additional monitoring requirements to identify the sources of, and controls for, the methylmercury and total mercury in urban runoff.

94. The Permittees identified mercury as a top ranked target pollutant in 2002. The Permittees submitted to the Regional Water Board a Mercury Plan in 2004 that outlined the Permittees' strategy to reduce mercury in Sacramento area urban runoff. The Mercury Plan also included background information on mercury pollution in local waters, a summary of key regulations, and a description of related mercury control efforts and

studies. Adequate progress was made on all Mercury Plan commitments during the term of the previous Order.

95. Ambient water and sediment quality monitoring by the Surface Water Ambient Monitoring Program (SWAMP - Sacramento Basin) identified a high incidence of sediment toxicity in several urban creeks that drain the suburbs of Roseville (Weston et al., 2005[16]). Nearly all creek sediments sampled caused toxicity to the resident aquatic amphipod *Hyalella azteca*, and about half the samples (10 of 21) caused nearly complete mortality (>90%). Another study by the Sacramento River Watershed Program (SRWP) observed sediment toxicity in almost every Sacramento area urban creek that was tested (Amweg et al., 2006[17]). Several pyrethroid pesticides were present in sediment samples from both studies at acutely toxic concentrations. Pyrethroid pesticides are persistent, hydrophobic, and rapidly sorb to sediments in aquatic environments. The sediment toxicity observed was localized to within tens to hundreds of meters downstream of storm water outfalls draining residential areas.

    The phase-out of the sale of diazinon and chlorpyrifos for most residential and commercial uses resulted in an increase in the use of pyrethroid pesticide use in urban and residential areas. Monitoring of pyrethroid concentrations in sediment is needed to characterize sediment quality conditions, determine the significance of the increase in urban pyrethroid usage, and assess management practice effectiveness.

96. The Permittees have performed bioassessment monitoring at selected urban creek sites, in compliance with the Monitoring and Reporting Program requirements of previous Orders. The purpose of the bioassessment requirement is to assess the biological integrity of receiving waters, to detect biological responses to pollution, and to identify probable causes of impairment not detected by chemical and physical water quality analysis. The State Water Resources Control Board (State Board) has developed a statewide strategy for the Surface Water Ambient Monitoring Program (SWAMP), with an emphasis on utilizing bioassessment to assess biological integrity in waters of the state. Characterizing the chemical (water quality), physical (sediment quality) and biological (bioassessment) processes of the waterways provides a holistic approach to designing BMPs. This Order requires the Permittees to evaluate the bioassessment data collected during previous years.

PUBLIC PROCESS

97. The Regional Water Board has notified the Permittees and interested parties of its intent to prescribe waste discharge requirements for this discharge. These parties have been given an opportunity to address the Regional Water Board at a public hearing and an opportunity to submit their written views and recommendations to the Regional Water Board.

[17] Amweg, E.L., D.P. Weston, J. You, and M.J. Lydy. 2006. Pyrethroid insecticides and sediment toxicity in urban creeks from California and Tennessee. *Environ. Sci. & Technol*. Published on web 1/31/2006.

98. The Regional Water Board has considered the information in the attached Fact Sheet in developing the Findings of this Order. The attached Fact Sheet is in informational part of this Order.

99. The Regional Water Board, in a public meeting, has heard and considered all comments pertaining to the discharge.

IT IS HEREBY ORDERED that Order No. R5-2002-0206 is rescinded, and that the Permittees, their agents, successors and assigns, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Clean Water Act and regulations and guidelines adopted thereunder, shall comply with the following:

A. Discharge Prohibitions – Storm Water Discharges

1. Discharges from MS4s in a manner causing, or threatening to cause, a condition of pollution, contamination, or nuisance as defined in Section 13050 of the California Water Code are prohibited.

2. Discharges from MS4s, which cause or contribute to exceedances of receiving water quality standards and water quality objectives (designated beneficial uses of the Basin Plan[18] and water quality objectives developed to protect beneficial uses) for surface water or ground water are prohibited.

3. Discharges from MS4s containing pollutants, which have not been reduced to the MEP, are prohibited.

B. Discharge Prohibitions – Non-Storm Water Discharges

1. Each Permittee shall effectively prohibit all types of non-storm water discharges into its MS4s unless such discharges are either authorized by a separate NPDES permit, or not prohibited in accordance with this Order.

2. Pursuant to 40 CFR 122.26(d)(2)(iv)(B)(1), the following categories of non-storm water discharges need only be prohibited from entering a MS4 if such categories of discharges are identified as a source of pollutants to waters of the United States:

    a. Diverted stream flows;
    b. Rising ground waters;
    c. Uncontaminated ground water infiltration as defined by 40 CFR 35.2005(20);
    d. Uncontaminated pumped ground water;
    e. Foundation drains;

[18] California Water Code Section 13243 provides that a Regional Water Board, in a water quality control plan, may specify certain conditions or areas where the discharge of waste, or certain types of waste is not permitted. The discharge prohibitions are applicable to any person, as defined by Section 13050(c) of the California Water Code, who is a citizen, domiciliary, or political agency or entity of California whose activities in California could affect the quality of waters of the state within the boundaries of the Central Valley Region.

f. Springs;
g. Water from crawl space pumps;
h. Footing drains;
i. Air conditioning condensation;
j. Flows from riparian habitats and wetlands;
k. Water line flushing;
l. Landscape irrigation;
m. Discharges from potable water sources;
n. Irrigation water;
o. Individual residential car washing;
p. De-chlorinated swimming pool discharges;
q. Lawn watering; and
r. Street wash water.

3. When a non-storm water discharge category above is identified as a source of pollutants to waters of the United States, the Permittees shall either:

   a. Prohibit the discharge category from entering its MS4s; or

   b. Not prohibit the discharge category and implement, or require the responsible parties to implement, BMPs which will reduce pollutants to the MEP. In addition, permittees shall submit the following information to the Regional Water Board as part of the Annual Report:

      i. The non-storm water discharge category listed above that the Permittee elects not to prohibit; and

      ii. The BMPs for each discharge category listed above that the Permittee will implement, or require the responsible parties to implement, to prevent or reduce pollutants to the MEP.

4. Emergency fire fighting flows (i.e., flows necessary for the protection of life or property) do not require immediate implementation of BMPs and are not prohibited.

5. Each Permittee shall examine all dry weather analytical monitoring results collected in accordance with the Monitoring and Reporting Program of this Order to identify water quality problems that may be the result of any non-storm water discharge, including any non-prohibited discharge category(ies). Follow-up investigations shall be conducted to identify and control any non-storm water discharges that are sources of pollutants. Non-prohibited discharges listed above containing pollutants that cannot be reduced to the MEP by the implementation of BMPs shall be prohibited on a categorical or case-by-case basis.

C. Receiving Water Limitations

1. Receiving water limitations are site-specific interpretations of water quality standards from applicable water quality control plans. As such they are required as part of the permit. However, a receiving water condition not in conformance with the limitation is not necessarily a violation of this Order. The Regional Water Board may require an investigation to determine cause and culpability prior to asserting a violation has occurred.

   Discharges from MS4s shall not cause the following in receiving waters:

   a. Concentrations of dissolved oxygen to fall below 6.0 mg/l from 1 September through 30 November and 5.0 mg/l the remainder of the year.

   b. Oils, greases, waxes, or other materials to form a visible film or coating on the water surface or on the stream bottom.

   c. Oils, greases, waxes, floating material (liquids, solids, foams, and scums) or suspended material to create a nuisance or adversely affect beneficial uses.

   d. Aesthetically undesirable discoloration.

   e. Fungi, slimes, or other objectionable growths.

   f. The 30-day average for turbidity to increase as follows:

      i. More than 1 Nephelometric Turbidity Units (NTUs) where natural turbidity is between 0 and 5 NTUs.
      ii. More than 20 percent where natural turbidity is between 5 and 50 NTUs.
      iii. More than 10 NTUs where natural turbidity is between 50 and 100 NTUs.
      iv. More than 10 percent where natural turbidity is greater than 100 NTUs.

   g. The normal ambient pH to fall below 6.5, exceed 8.5, or change by more than 0.5 unit.

   h. Deposition of material that causes nuisance or adversely affects beneficial uses.

   i. Taste or odor-producing substances to impart undesirable tastes or odors to fish flesh or other edible products of aquatic origin or to cause nuisance or adversely affect beneficial uses.

j. Radionuclides to be present in concentrations that exceed maximum contaminant levels specified in the California Code of Regulations, Title 22; that harm human, plant, animal or aquatic life; or that result in the accumulation of Radionuclides in the food web to an extent that presents a hazard to human, plant, animal, or aquatic life.

k. Aquatic communities and populations, including vertebrate, invertebrate, and plant species, to be degraded.

l. Toxic pollutants to be present in the water column, sediments, or biota in concentrations that produce detrimental physiological responses in human, plant, animal, or aquatic life; or that bioaccumulate in aquatic resources at levels which are harmful to human health.

m. In waters designated for contact recreation (REC-1), the fecal coliform concentration based on a minimum of not less than five samples for any 30-day period shall not exceed a geometric mean of 200/100 ml, nor shall more than ten percent of the total number of samples taken during any 30-day period exceed 400/100 ml.

n. Violation of any applicable water quality standard for receiving waters adopted by the Regional Water Board or the State Board pursuant to the CWA and regulations adopted thereunder.

2. The discharge shall not cause or contribute to an exceedance of any applicable water quality standards.

3. The Permittees shall comply with Discharge Prohibition A.2 and Receiving Water Limitations C.1 and C.2 through timely implementation of control measures and other actions to reduce pollutants in the discharges in accordance with the SQIP and other requirements of this Order, including any modifications. The SQIP shall be designed to achieve compliance with Receiving Water Limitations C.1 and C.2. If exceedance(s) of water quality objectives or water quality standards (collectively, WQS) persist notwithstanding implementation of the SQIP and other requirements of this Order, the Permittees shall assure compliance with Discharge Prohibition A.2 and Receiving Water Limitations C.1 and C.2 by complying with the following procedure:

a. The Permittees shall prepare Notification of Water Quality Exceedances (NWQE) pursuant to notification requirements set forth in the Monitoring and Reporting Program of this Order.

b. The Permittees shall submit a Report of Water Quality Exceedance (RWQE) annually to the Executive Officer for reporting discharges that cause or contribute to an exceedance of applicable water quality standards. The RWQE shall describe BMPs that are currently being implemented and additional BMPs

that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedance of WQSs. The Report of Water Quality Exceedance (RWQE) shall be incorporated in the Annual Report. The report shall include proposed revisions to the SQIP and an implementation schedule containing milestones and performance standards for new or improved BMPs, if applicable. The RWQE shall also include a monitoring program and the rationale for new or improved BMPs, including a discussion of expected pollutant reductions and how implementation of additional BMPs will prevent future exceedance of WQSs. The Regional Water Board may require modifications to the RWQE.

c. Within **30 days** following approval of the RWQE by the Executive Officer, the Permittees shall revise the SQIP and monitoring program to incorporate the approved modified BMPs that have been and will be implemented, implementation schedule, and any additional monitoring required.

d. The Permittees shall implement the revised SQIP and monitoring program in accordance with the approved schedule after Regional Water Board approval of the revised SQIP.

So long as the Permittees have complied with the procedures set forth above and are implementing the revised SQIP, the Permittees do not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the Executive Officer to develop additional BMPs.

D. Provisions

1. Within its geographic jurisdiction, each Permittee shall:

   a. Comply with the requirements of this Order, the SQIP, any modifications to the SQIP, and directives of the Executive Officer concerning this Order;

   b. Coordinate among its internal departments and agencies, as appropriate, to facilitate the implementation of the requirements of the SQIP applicable to such Permittee in an efficient and cost-effective manner;

   c. Participate in intra-agency coordination with agencies outside of its jurisdictional control (e.g. Federal and State agencies and special districts such as utility, sanitation, fire, park and recreation and school) necessary to successfully implement the provisions of this Order and the SQIP.

STORM WATER QUALITY IMPROVEMENT PLAN

2. Upon the effective date of this Order, the Permittees shall modify their SQIPs to address the requirements of this Order and submit the revised SQIPs by **11 March 2009** (or six months after the Order is effective, whichever is later), for

public review and comment, and Regional Water Board approval. The SQIPs shall include an implementation schedule containing identifiable milestones, performance standards, and a compliance monitoring and reporting program. The Permittees shall incorporate newly developed or updated BMPs and assessment tools/Performance Standards into applicable annual revisions to the SQIPs and adhere to implementation of the new/revised BMPs. The approved SQIPs shall serve as the framework for identification, assignment, and implementation of BMPs. The Permittees shall implement or require implementation of BMPs in the approved SQIPs to ensure that pollutant discharges from the MS4 are prevented or reduced to the MEP. The SQIPs shall contain the following components:

a. Program Management
   i. Legal Authority
   ii. Fiscal Analysis

b. Program Effectiveness Assessment

c. Program Elements
   i. Construction
   ii. Commercial/Industrial
   iii. Municipal Operations
   iv. Illicit (Illegal) Discharges
   v. Public Education and Outreach
   vi. Planning and New Development
   vii. Monitoring Program (including Special Studies)
   viii. Water Quality Based Program (Target Pollutant Program)

Each Permittee's SQIP shall include a section that identifies all departments within the jurisdiction that conduct activities that may potentially impact urban runoff quality, and their roles and responsibilities under this Order. The annual report shall include an up-to-date organizational chart specifying these departments and key personnel responsible for issuance of enforcement actions.

PROGRAM MANAGEMENT

3. Program management involves ensuring that all elements of the SQIP are implemented on schedule and all requirements of this Order are complied with.

   a. **Annual Work Plan**: The Permittees shall submit an Annual Work Plan by **1 May** of each year. The Annual Work Plan shall provide the Permittee's proposed activities for the upcoming fiscal year beginning 1 July of the current year and ending 30 June the following year. The Permittees may submit combined Annual Work Plans that cover more than one Permittee's jurisdiction, or they may submit separate Annual Work Plans.

   b. **Annual Report**: The Permittees shall submit an Annual Report by **1 October** of each year. The Annual Report shall document the status of the SQIPs and the

Permittees' activities during the previous fiscal year, including the results of a qualitative and quantitative assessment of activities implemented by the Dischargers, and the performance of tasks contained in the SQIP. The Annual Report shall include a compilation of deliverables and milestones completed during the previous 12-month period, as described in the SQIP and Annual Work Plan. The Annual Report shall include a program effectiveness assessment and recommended modifications for each Program Element. Each Annual Report shall build upon the previous year's efforts. In each Annual Report, the Permittees may propose pertinent updates, improvements, or revisions to the SQIP, which shall be complied with under this Order.

c. **SQIP Implementation**: Each Permittee shall continue implementation of their current SQIP until such time that the SQIP has been modified to be consistent with this Order and approved by the Regional Water Board. Once approved, the Permittees shall implement the modified SQIP consistent with the schedule specified within this Order. The SQIP, with modifications, revisions, or amendments as may be approved by the Executive Officer or Regional Water Board, is an enforceable part of this Order.

d. **SQIP Modification**: The Permittees' SQIP may need to be modified, revised, or amended from time to time to respond to a change in conditions and to incorporate more effective approaches to pollutant control. Provisions of this Order require review and/or revision of the certain components of the Permittees' SQIP. Proposed SQIP revisions will be part of the annual review process and incorporated in the Annual Report.

In addition, the Permittees shall revise their SQIP to comply with regional or watershed-specific requirements, and/or waste load allocations developed and approved pursuant to the process for the designation and implementation of TMDLs for impaired water bodies.

A thirty-day public notice and comment period shall apply to all proposed significant revisions to the SQIP. Significant revisions include the Hydromodification Management Plan (HMP) and *The Stormwater Quality Design Manual for Sacramento and South Placer Regions* required under this Order. SQIP revisions which are significant in terms of the magnitude of public interest, as evidenced by public comments, shall be brought before the Regional Water Board for review and approval. Minor, non-substantive changes to the SQIP are not significant and therefore are not subject to the thirty-day public notice and comment period. Minor SQIP revisions may be approved by the Executive Officer.

e. **Memorandum of Understanding**: The Permittees shall collaborate with each other to address common issues, promote consistency between SQIPs and Monitoring Programs, and to plan and coordinate activities required under this Order.

i. The Permittees shall review and revise their existing Memorandum of Understanding (MOU) to ensure that it provides for a management structure that includes the items below, and submit the updated MOU to the Regional Water Board no later than **11 March 2009** (or six months after the effective date of this Order, whichever is later), The MOU should address the following:

a) Designation of Joint Responsibilities;
b) Decision making;
c) Cost sharing;
d) Information management of data and reports, including the requirements under this Order; and
e) Any and all other collaborative arrangements for compliance with this Order.

ii. The Permittees shall jointly develop and/or update the standardized format(s) for all reports required under this Order (e.g., annual reports, monitoring reports, fiscal analysis reports, and program effectiveness reports, etc.). The standardized reporting format(s) shall be used by all Permittees and shall include protocols for electronic reporting, specifically data reporting.

4. **Legal Authority:** The Permittees shall review, revise, maintain, and enforce adequate legal authority to control pollutant discharges from their MS4s through ordinance, statute, permit, contract, or similar means. This legal authority must, at a minimum, authorize the Permittees to:

a. Control the contribution of pollutants in discharges of runoff associated with industrial and construction activity to their MS4s. This requirement applies both to industrial and construction sites, which have coverage under the statewide general industrial or construction storm water permits, as well as to those sites that do not require permit coverage;

b. Effectively prohibit identified illegal discharges (e.g., discharges consisting of or resulting from the following: surface cleaning wastewater from gas stations (RGOs) and parking lots; wastewater from mobile business activities; commercial vehicle and equipment washing wastewater; discharges of pool water containing chlorine or bromine; discharges/dumping of sediment, construction debris, pet waste, vegetation or food related wastes; pesticide dumping and rinsate; charitable car washes, etc.).

c. Prohibit and eliminate illicit connections to the MS4s;

d. Prohibit the discharge of spills, dumping, or disposal of materials other than storm water and permitted non-storm water discharges to its MS4s;

e. Use enforcement mechanisms to require compliance with the Permittees storm water ordinances, permits, contracts, or orders;

f. Carry out all inspections, surveillance, and monitoring necessary to determine compliance and noncompliance with local ordinances and permits, including the prohibition on illicit discharges to the MS4s;

g. Require the use of BMPs to prevent or reduce the discharge of pollutants from MS4s to the MEP; and

h. Require that Treatment Control BMPs be properly operated and maintained.

5. Each Permittee shall amend its existing ordinances to enforce all the requirements of this Order within **one year** after Regional Water Board approval of the SQIP. The ordinance(s) shall contain implementable and progressive enforcement procedures.

6. Each Permittee shall provide to the Executive Officer a statement certified by its chief legal counsel that it has adequate legal authority to implement and enforce each of the requirements contained in 40 CFR 122.26(d)(2)(i)(A-F) and this Order, including any modifications thereto in effect when the certified statement is provided. This statement shall be included in Permittees' revised SQIP(s), which shall describe the following:

a. Citation of urban runoff related ordinances adopted by the Permittees and the reasons they are enforceable;

b. Progressive enforcement policy and how it will be effectively implemented;

c. Identification of the local administrative and legal procedures available to mandate compliance with urban runoff related ordinances and therefore with the conditions of this Order;

d. Description of how these ordinances are implemented and how enforcement actions under these ordinances may be appealed; and

e. Description of whether the municipality can issue administrative orders and injunctions or if it must go through the court system for enforcement actions.

f. Description of the Permittee's storm water management structure. There might be different departments that are to develop, implement, and enforce various components of the program. Summarize how the various departments communicate and coordinate activities.

7. **Fiscal Analysis:** Each Permittee shall secure the resources necessary to meet the requirements of this Order and shall prepare an annual fiscal summary as part of the SQIP Annual Report. This summary shall, for each fiscal year covered by

this Order, identify the expenditures for the previous fiscal year and the budget for the following year necessary to accomplish the activities of the SQIP Such summary shall include a description of the source(s) of funds that are proposed to meet the necessary expenditures, including legal restrictions on the use of such funds.

PROGRAM ELEMENTS

8. **Construction Program Element**

a. The objectives of the Construction Program are to:

i. Provide adequate legal authority to control pollutants from construction sites with land disturbance greater than or equal to one acre in size;

ii. Review construction plans and issue grading permits consistent with Permittee requirements;

iii. Require BMPs to control sediment and pollutants from construction sites;

iv. Maintain a tracking systems (inventory) of active construction sites;

v. Maintain tracking system of inspections and enforcement data;

vi. Inspect construction sites to ensure proper BMP implementation and compliance with Permittee requirements (e.g., Erosion and Sediment Control Plan [ESC plan]) and applicable Provisions of this Order;

vii. Bring forth enforcement actions for sites in violation of Permittee requirements and advise the Regional Water Board of violations of Construction General Permit requirements;

viii. Provide regular internal and external training on applicable components of the SQIP and related Permits; and

ix. Conduct an assessment as a part of the annual reporting process, determine the effectiveness of the Program Element and identify any necessary modifications.

b. Each Permittee shall update and continue to implement the Construction Program Element of its SQIP to reduce pollutants in runoff from construction sites during all construction phases to the MEP. At a minimum, the Construction Program Element shall address the objectives listed above, as well as the following control measures:

- Pollutant Source Identification
- Threat to Water Quality Prioritization

- Reporting of Non-compliant Sites

c. Each Permittee shall continue to implement and enforce a program to control runoff from all construction sites subject to the NPDES General Construction Permit. The program shall ensure the following minimum requirements are effectively implemented at these construction sites:

i. Sediments generated on the project site shall be retained using adequate Source Control BMPs;

ii. Construction-related materials, wastes, spills, or residues shall be retained at the project site to avoid discharge to streets, drainage facilities, receiving waters, or adjacent properties by wind or runoff;

iii. Non-storm water runoff from equipment and vehicle washing and any other activity shall be contained at the project site;

iv. Erosion from slopes and channels shall be controlled by implementing an effective combination of BMPs such as but not limited to; inspecting graded areas during rain events; limiting grading during the wet season; planting and maintenance of vegetation on slopes; and covering erosion susceptible slopes.

v. Prior to issuing a grading permit for a construction site, each Permittee must require submittal of an erosion and sediment control plan to the permitting agency that meets Permittee requirements.

(a) Prior to issuing a grading permit for a construction site, each Permittee shall require proof that a State General Construction Permit has been obtained, if applicable. Permittees shall verify that the State Storm Water Pollution Prevention Plan (SWPPP) contains, at a minimum, the following:

(i) If applicable to the site, a certification or proof that a Notice of Intent has been submitted to the State Water Board.

(ii) A vicinity map showing nearby roadways, the construction site perimeter, and the geographic features and general topography surrounding the site;

(iii) A site map showing the construction project in detail, including the existing and planned paved areas and buildings; general topography both before and after construction; drainage patterns across the project area; and anticipated storm water discharge locations (i.e., the receiving water, a conduit to receiving water, and/or drain inlets);

(iv) A description of BMPs to address contractor activities that generates pollutants including, at a minimum, vehicle washing, equipment maintenance, and waste handling.

(v) A description of the type and general location of erosion and sediment control BMPs, such as but not limited to, limited grading during the wet season, and planting and maintenance of vegetation on slopes, to be employed at the site; and

(vi) The name and telephone number of the qualified person responsible for implementing the Storm Water Pollution Prevention Plan (SWPPP).

d. If applicable, all environmental permits must be obtained from agencies such as Department of Fish and Game, U.S. Army Corp of Engineers, and the Regional Water Board's 401 Water Quality Certification.

e. Inspections

The Permittees shall include the inspection frequency for construction sites for compliance with local ordinances in the SQIP and shall continue to inspect each site until construction activities are completed and the site has been stabilized. The inspections shall occur at a frequency determined to be effective by the Permittees and shall include a higher inspection frequency during the winter months (wet season) than during the summer months (dry season).

The Permittees shall inspect these sites for compliance with the local ordinances and the ESC plan described above and as prescribed in the SQIP. In addition, if the Permittees observe chronic (e.g., three or more) violations of their respective storm water ordinances at a given construction site, they shall notify the Regional Water Board as described in the SQIP. Each Permittee shall use its legal authority to promptly and effectively enforce its storm water ordinance to correct any violations observed during inspections.

f. Interdepartmental Coordination and Agreement

i. Each Permittee shall enter into an agreement with other departments/entities charged with compliance of this section of the Order.

ii. The agreement shall describe policies and procedures and relationships of each interdepartmental coordination, in compliance of this Order.

9. **Industrial/Commercial Program:**

a. The objectives of the Industrial/Commercial Program are to:

i. Provide adequate legal authority to control pollutants from industrial and commercial facilities;

ii. Develop and maintain an inventory of priority industrial and commercial facilities located within the Permittee's jurisdiction;

iii. Prioritize the industrial and commercial facilities within the inventory based on their threat to water quality;

iv. Conduct inspections of the priority industrial and commercial facilities that pose a significant threat to water quality with an inspection frequency based on the prioritization of the facility. Conduct follow-up inspections to verify compliance;

v. Implement a progressive enforcement policy to ensure that adequate enforcement is conducted;

vi. Refer significant violations of the Permittees' storm water ordinances and potential General Industrial Permit non-filers to the Regional Water Board. Coordinate inspections and enforcement with the Regional Water Board.

vii. Provide regular internal and external training on components of the SQIP and related Permits; and

viii. Conduct an assessment as described in the SQIP to determine the effectiveness of the Program Element and identify any necessary modifications.

b. Each Permittee shall update and continue to implement the existing Industrial and Commercial Program component of its SQIP. At a minimum, the Industrial and Commercial Program shall address the objectives listed above, as well as to the following control measures:

i. Priority Facility Inventory/Tracking
ii. Prioritization and Inspection
iii. Industrial/Commercial Outreach
iv. Enforcement
v. Training
vi. Effectiveness Assessment

The program shall address the following priority commercial and industrial businesses: auto body shops, auto dealers, auto repair shops, equipment rental companies, nurseries, kennels, restaurants, retail gasoline outlets and

those covered by the General Industrial Permit. The list of industries may be revised based on further prioritization or results of effectiveness assessment as reported in the annual reports.

c. Each Permittee shall require implementation of pollutant reduction and control measures for activities associated with priority industrial and commercial businesses, with the objective of effectively prohibiting non-storm water runoff and reducing pollutants in storm water runoff to the MEP. Except as specified in other sections of this Order, pollutant reduction and control measures can be used alone or in combination, and can include Structural and Source Control BMPs, and operation and maintenance procedures, which can be applied before, during, and/or after pollution generating activities. The Regional Board recognizes that property owners are responsible for selecting and implementing BMPs since the Permittees do not have the authority to specify BMPs.

10. **Municipal Program**

a. The objectives of the Municipal Program are to:

i. Respond quickly and appropriately if an illicit discharge threatens to enter or enters the storm drain system;

ii. Implement standards that require BMPs to reduce pollutants from Permittee owned development and construction projects as specified in the New Development and Construction Elements;

iii. Implement pollution prevention BMPs for public facilities (e.g., corporation yards, material storage facilities, and vehicle/equipment maintenance facilities) having the potential to discharge pollutants to the storm drain system;

iv. Implement integrated pest management (IPM) and pesticide storage, usage, and disposal procedures as described in the Pesticide Plan;

v. Maintain the storm drain system (e.g., drain inlets, ditches/channels, detention basins and pump stations) to remove debris accumulation and prevent flooding;

vi. Ensure that storm drain inlets are properly and legibly marked to discourage illicit discharges into the storm drain system.

vii. Conduct street sweeping activities;

viii. Maintain Permittee-owned parking facilities to minimize the build-up and discharge of pollutants to the storm drain system;

ix. Permittees having a fire protection agency within their jurisdictional control shall develop and implement a response plan to minimize the impact of

fire fighting flows to the environment. BMPs must be implemented to reduce pollutants from non-emergency fire fighting flows (i.e., flows from controlled or practice blazes) identified by the Permittees to be significant sources of pollutants to waters of the State. The response plan and BMPs shall be updated and submitted with the Annual Reports.

x. Provide regular internal training on applicable components of the SQIP; and

xi. Conduct an assessment as a part of the annual reporting process, determine the effectiveness of the Program Element and identify any necessary modifications.

b. Each Permittee shall update and continue to implement a Municipal Program in its SQIP to effectively prohibit non-storm water discharges and prevent or reduce pollutants in runoff from all municipal land use areas, facilities, and activities to the MEP. At a minimum, the Municipal Program shall address the objectives listed above, as well as include the following control measures:

i. New Development and Construction Requirements for Municipal Capital Improvement Projects;
ii. Pollution Prevention at Permittee Facilities;
iii. Landscape and Pest Management;
iv. Storm Drain System Maintenance;
v. Street Cleaning and Maintenance;
vi. Parking Facilities Maintenance;
vii. Detention Basin Maintenance;
viii. Emergency Procedures;
ix. Non-emergency Fire Fighting Flows;
x. Training; and
xi. Effectiveness Assessment.

11. **Illicit Discharge Program**

a. The objectives of the Illicit Discharge Program are to:

i. Provide adequate legal authority to control and/or prohibit pollutants from being discharged to the municipal storm drain system;

ii. Proactively detect illicit discharges and illegal connections through a variety of mechanisms including, but not limited to, public reporting, dry weather monitoring, and field crew inspections;

iii. Upon identification of an illegal connection, investigate and eliminate the connection through a variety of mechanisms including, but not limited to, permitting or plugging the connection;

iv. Upon identification of an illicit discharge, investigate the discharge and conduct any necessary follow up actions to mitigate the impacts of the discharge;

v. Maintain a database for recording the information related to illicit discharges and illegal connections and, to the extent possible, use mapping to assist in evaluating the data; and

vi. Conduct an assessment as described in the SQIP to determine the effectiveness of the Program Element and identify any necessary modifications.

b. Each Permittee shall update and continue to implement an Illicit Discharge Program component of the SQIP to actively seek and eliminate illicit discharges and connections. At a minimum, the Illicit Discharge Detection and Elimination Component shall address the objectives listed above and include the following control measures:

i. Detection of Illicit Discharges and Illegal Connections;

ii. Illegal Connection Identification and Elimination;

iii. Investigation/Inspection and Follow-up Procedures;

iv. Enforcement of Local Codes and Ordinances;

v. Public Reporting of Illicit Discharges and Connections – Public Hotline;

vi. Training; and

vii. Effectiveness Assessment.

12. **Public Outreach and Public Education (Collectively Public Outreach Program):**

a. Each Permittee shall implement a Public Outreach Program using appropriate media to (1) measurably increase the knowledge of target communities regarding MS4s, impacts of urban runoff on receiving waters, and potential BMP solutions for the target audience; and (2) to change the behavior of target communities and thereby reduce pollutant releases to MS4s and the environment. To accomplish these goals, the following objectives shall be addressed:

i. Encourage the public to actively participate in the implementation of the storm water program as well as the various outreach events;

ii. Promote the use of the 24-hour public education and illicit discharge reporting hotline;

iii. Implement a public outreach strategy for the overall program that includes developing and distributing materials, conducting a mixed media campaign, participating in community outreach events, and conducting public opinion surveys to gauge the level of awareness and behavior change within a community and/or target audience;

iv. Coordinate with local school districts to deliver storm water education messages to schoolchildren;

v. Implement a business outreach program; and

vi. Conduct an assessment as described in the SQIP to determine the effectiveness of the Program Element and identify any necessary modifications.

b. Each Permittee shall update and continue to implement the Public Outreach Component of its SQIP to educate the public and encourage their participation in the implementation of the SQIP. At a minimum, the Public Outreach Program shall address the objectives listed above and include the following control measures:

i. Public Participation;

ii. Hotline;

iii. Public Outreach Implementation;

iv. Public School Education;

v. Business Outreach; and

vi. Effectiveness Assessment.

c. Each Permittee shall incorporate a mechanism for public participation in the implementation of the SQIP (i.e., programs that engage the public in cleaning up creeks, removal of litter in river embankments, etc.).

PLANNING AND NEW DEVELOPMENT PROGRAM

13. The objectives of the Planning and New Development Element are as follows:

a. Provide a framework and a process to incorporate watershed protection/storm water quality management principles into the Permittees' General Plan

process, environmental review process, and development permit approval process;

b. Develop a program that covers initial project planning through design, construction and completion, including requirements for long-term maintenance of post-construction storm water controls;

c. Incorporate water quality and watershed protection principles into the Permittee's policies and into the planning procedures early in the development process;

d. Ensure storm water quality components have been addressed during the entitlement and CEQA process and verified as completed during the development plan process;

e. Ensure that selected post-construction storm water controls will remain effective upon project completion by requiring appropriate maintenance provisions for all priority development projects;

f. Ensure that storm water quality controls are properly selected and required during the development plan review process to minimize storm water quality impacts to the MEP;

g. Ensure that appropriate selected post-construction storm water controls are chosen on the basis of project- and site-specific conditions and land use characteristics, as well as receiving water impacts;

h. Provide regular internal training on applicable components of the SQIP; and

i. Conduct an assessment as described in the SQIP to determine the effectiveness of the Program Element and identify any necessary modifications.

14. Each Permittee shall ensure the Planning and New Development Program of its SQIP includes requirements to minimize the short and long-term impacts on receiving water quality from new development and redevelopment. At a minimum, the Planning and New Development Program shall address the objectives listed above, as well as the following:

a. Incorporation of Water Quality Protection Principles into Permittee Procedures and Policies;

b. New/Revised Development Standards: Each Permittee shall continue to implement existing development standards as identified in the Permittees Development Standards Plan (a.k.a. *The Stormwater Quality Design Manual for Sacramento and South Placer Regions*) approved by Regional Water Board in May 2005. The plan identifies measures to reduce pollutant discharges from eight categories of new development and redevelopment (referred to as the Priority Development Project Categories);

c. Plan Review and Approval Process;

d. Maintenance Agreement and Transfer;

e. Training; and

f. Effectiveness Assessment.

15. **Water Quality Planning and Design Principles** - In order to reduce pollutants and runoff flows from new development and redevelopment to the MEP, each Permittee shall address the following concepts:

a. Each Permittee shall incorporate water quality and watershed protection principles into planning procedures and policies or requirements to direct land-use decisions and require implementation of consistent water quality protection measures for priority development projects. These principles and policies shall be designed to protect natural water bodies and shall consider, at a minimum, the following:

i. Minimize the amount of impervious surfaces and directly connected impervious surfaces in areas of new development and redevelopment to maximize on-site infiltration of runoff (low impact development practices).

ii. Implement pollution prevention methods supplemented by pollutant source controls and treatment. Use strategies that control the sources of pollutants or constituents (i.e., the point where water initially meets the ground) to minimize the transport of urban runoff and pollutants offsite and into MS4s.

iii. Preserve and create or restore areas that provide important water quality benefits, such as riparian corridors, wetlands, and buffer zones (e.g., levees).

iv. Minimize disturbances of natural water bodies and natural drainage systems caused by development including roads, highways, and bridges.

v. Require incorporation of structural and non-structural BMPs to mitigate the projected increases in pollutant loads from future development.

vi. Identify and avoid development in areas that are susceptible to erosion and sediment loss; and establish and implement development standards that protects areas from erosion and sediment loss.

vii. Coordinate with local traffic management programs to minimize pollutants associated with vehicles and increased traffic resulting from development.

viii. Implement source and/or treatment controls to protect downstream receiving water quality from increased pollutant loads in runoff flows from new development and significant redevelopment.

ix. Control the post-development peak storm water run-off discharge rates and velocities to prevent or reduce downstream erosion and to protect stream habitat (hydromodification concepts).

b. **Low Impact Development Strategies:** Priority new development and redevelopment projects shall integrate Low Impact Development (LID) principles early in the project planning and design process. LID is a storm water management and land development strategy that emphasizes conservation and the use of existing natural site features integrated with engineered, small-scale hydrologic controls to more closely reflect predevelopment hydrologic functions in residential, commercial, and industrial settings. When developing the LID Program the Permittees shall consider and incorporate all appropriate and applicable LID components and measures that have been successfully and effectively implemented in other municipal areas. Other programs include, but are not limited to, USEPA's "Managing Wet Weather with Green Infrastructure, Action Strategy, 2008" and LID program elements specified in the permits or Storm Water Management Plans of other MS4s throughout the state.

The Stormwater Quality Design Manual for Sacramento and South Placer Regions currently promotes LID principles such as conservation and use of natural site features; site specific, lot scale source and treatment control measures that keep pollutants from contacting run-off and leaving the site; and run-off reduction control measures integrated into site design.

i. Each Permittee shall amend, revise or adopt quantitative and qualitative development standards (including policies, codes, ordinances and/or regulations) to require implementation of LID strategies at priority new development and redevelopment projects **no later than six months** after approval of the HMP by the Regional Water Board.

c. **Hydromodification Management Plan (HMP)**

The Permittees shall submit a HMP Work Plan as part of their SQIPs for approval by the Regional Water Board One year after Regional Board approval of the SQIP/HMP Work Plan, the HMP shall be submitted for approval. The Permittees shall amend their development standards to implement the HMP **no later than six months** after Regional Water Board approval of the HMP.

i. The HMP shall require controls to manage the increases in the magnitude (e.g., flow control), frequency, volume and duration of runoff from development projects in order to protect receiving waters from increased potential for erosion and other adverse impacts with consideration towards maintaining (or reproducing) the pre-development hydrology. The HMP shall address, but not be limited to, the following:

(a) Requires incorporation of controls, including structural and non-structural BMPs, to mitigate the projected increases in flows;

(b) Controls post-development runoff rates and velocities from a site to avoid adverse impact on downstream erosion, flooding and stream habitat;

(c) Minimizes the quantity of storm water directed to impermeable surfaces and the MS4s (municipal storm drain);

(d) Maximizes the percentage of permeable surfaces to allow more percolation of storm water into the ground;

(e) Considers the full range of BMPs in the *Stormwater Quality Design Manual*; and

(f) Considers various assessment methodologies designed to evaluate the existing geomorphic condition of receiving waters, along with the expected susceptibility of these receiving waters to erosion/change as a result of hydromodification from land development and other land uses.

ii. This requirement does not apply to new development and redevelopment projects where the project discharges storm water runoff into creeks or storm drains where the potential for erosion, or other impacts to beneficial uses, is minimal. The HMP shall describe the criteria used in determining the site-specific conditions applied to this

requirement. Such situations may include, but not limited to the following:

(a) Discharges into creeks that are concrete-lined or significantly armored;

(b) Underground storm drain systems discharging directly to the rivers;

(c) Construction of infill projects in highly developed watersheds, where the potential for single-project and/or cumulative impacts is minimal; and

(d) Projects that do not create an increase in impervious surfaces over pre-project conditions.

16. **General Plan Update**

a. Each Permittee's General Plan or equivalent plan (e.g., Comprehensive, Master, or Community Plan) shall include water quality and watershed protection principles and policies applicable to land use decisions and require implementation of consistent water quality protection measures for development projects paying special attention to water quality protection from urban runoff and storm water pollution.

b. Each Permittee shall include principles and policies if the following are present in a Permittee's jurisdiction;

i. Sensitive water resources (e.g 303d-listed water bodies) in, or immediately downstream of, their jurisdiction;

ii. Existing Total Maximum Daily Loads (TMDLs) or other such regulations pertaining to receiving waters within their jurisdiction;

iii. Major new development or significant redevelopment expected; and

iv. Major new infrastructure projects anticipated (e.g. roads, sewer, flood control, storm drains).

c. Each Permittee shall provide the Regional Water Board with the draft amendment or revision when a listed General Plan element or the General Plan is noticed for comment in accordance with California Government Code § 65350 et seq.

d. Each Permittee shall amend, revise, or update its General Plan to include watershed and storm water quality and quantity management considerations and policies when any of the following General Plan elements are updated or amended: (i) Land Use, (ii) Housing, (iii) Conservation, (iv) Open Space (v) Circulation and Infrastructure (i.e. transportation), (vi) Safety, and (vii) and Public Facilities.

e. Each Permittee shall review and modify the development goals and policies, open space goals and policies including preservation or integration with natural features, and when defined the need for specific urban runoff and storm water pollution protection policies (i.e., low impact development policies, hydromodification management plans) if they are determined deficient. Each Permittee shall provide the Regional Water Board with the draft amendment or revision when a listed General Plan element or the General Plan is noticed for comment in accordance with California Government Code § 65350 *et seq*. The Permittees shall also provide the Regional Water Board a written summary identifying how the draft amendment or revision complies with this Order.

17. **Entitlement Process:**

a. Private Development: Each Permittee shall incorporate into its entitlement process standard procedures in order to consider potential storm water quality impacts early in the planning process of any new development and redevelopment project. The Permittees' shall clearly demonstrate the developer and Permittee considered storm water quality site issues before the facilities/projects are final designed. The Permittees must demonstrate involvement in the conceptual storm water quality design in either two different points in project planning and permitting process:

i. During Discretionary action[19] approval process (land use permit) of a proposed project, when the Permittee must exercise judgment or deliberation in order to approve or disapprove a development or significant redevelopment project, or

ii. During Ministerial action[20] approval process of issuing a grading, building, demolition, or similar "construction" permits in which only fixed standards or objective measures are applied.

[19] A "discretionary action" under CEQA is defined as "an activity which requires the public agency to exercise judgment in deciding whether to approve or disapprove the particular activity, as distinguished from situations where the public agency merely has to determine whether there has been conformity with applicable ordinances or other laws." (California Public Resources Code § 21080(a); CEQA Guidelines § 15357)

[20] "Ministerial actions" under CEQA are those where little or no judgment or deliberation by a Permittee is required.

b. Permittee Development: The process for planning and reviewing Permittee-owned new development and redevelopment projects differs from the private sector development process. However, Permittee-owned new development and redevelopment projects must consider potential storm water quality impacts early in the planning process. The Permittees shall develop an equivalent approach to ensure development process procedures consider storm water quality site issues before the facilities/projects are final designed.

18. **Maintenance Agreement and Transfer**

Each Permittee shall require that all developments subject to Development Standards and site specific plan requirements provide verification of maintenance provisions for Structural Treatment Control BMPs, including but not limited to legal agreements, covenants, California Environmental Quality Act (CEQA) mitigation requirements, and or conditional use permits. Verification at a minimum shall include:

a. The developer's signed statement accepting responsibility for maintenance until the responsibility is legally transferred; or

b. Written conditions in the sales or lease agreement, which requires the recipient to assume responsibility for maintenance; or

c. Written text in project conditions, covenants and restrictions for residential properties assigning maintenance responsibilities to the Home Owners Association for maintenance of the Structural Treatment Control BMPs; or

d. Any other legally enforceable agreement that assigns responsibility for the maintenance of post-construction Structural Treatment Control BMPs.

19. **Mitigation Funding**

The Permittees may propose a management framework, for endorsement by the Regional Water Board Executive Officer, to support regional or sub-regional solutions to storm water pollution, where any of the following situations occur:

a. A waiver for impracticability is granted;

b. Legislative funds become available;

c. Off-site mitigation is required because of loss of environmental habitat; or an approved watershed management plan or a regional storm water mitigation plan exists that incorporates an equivalent or improved strategy for storm water mitigation.

20. **Waiver Program:** A Permittee may develop a waiver program that would require a developer to pay into an in-lieu fund or storm water mitigation fund instead of incorporating a structural treatment control measure into a development project. A waiver may be used for projects where accepted structural treatment control measures have been considered and rejected as infeasible. Infeasibility criteria may include items such as extreme space limitations in redevelopment projects or infill areas, unfavorable soil conditions for infiltration, potential groundwater contamination, or topographic and hydraulic head limitations. The storm water mitigation funds shall be used for regional or alternative solutions within the Sacramento River watershed. The Permittee shall obtain approval from the Executive Officer prior to implementation of a waiver program and shall notify the Regional Water Board annually of waivers granted in that year.

21. **California Environmental Quality Act (CEQA) Document Update**

Each Permittee shall incorporate into its CEQA process, procedures for considering potential storm water quality impacts and providing for appropriate mitigation when preparing and reviewing CEQA documents. The procedures shall require consideration of the following:

a. Potential impact of project construction on storm water runoff;

b. Potential impact of project post-construction activity on storm water runoff;

c. Potential for discharge of storm water from areas for material storage, vehicle or equipment fueling, vehicle or equipment maintenance (including washing), waste handling, hazardous materials handling or storage, delivery areas or loading docks, or other outdoor work areas;

d. Potential for discharge of storm water to impair the beneficial uses of the receiving waters or areas that provide water quality benefit;

e. Potential for the discharge of storm water to cause significant harm on the biological integrity of the waterways and water bodies;

f. Potential for significant changes in the flow velocity or volume of storm water runoff that can cause environmental harm; and

g. Potential for significant increases in erosion of the project site or surrounding areas.

22. **Coordination, Enforcement and Tracking**

a. Each Permittee shall provide for the review of proposed project plan and require measures to ensure that all applicable development will be in compliance with their storm water ordinances, local permits, and all other applicable ordinances and requirements.

b. Each Permittee shall develop a process by which Development Standards will be implemented. The process shall identify at what point in the planning process development projects will be required to meet Development Standards. The process shall also include identification of the roles and responsibilities of various municipal departments in implementing the Development Standards, as well as any other measures necessary for the implementation of Development Standards.

c. Each Permittee shall develop and implement (no later than one year after Regional Water Board approval of the SQIP) the following:

i. A GIS or other electronic system for tracking projects that have been issued a permit for the construction of post-construction treatment control BMPs. The electronic system, at a minimum, shall contain the following information:
   a) Municipal Project ID.
   b) State WDID No.
   c) Project Acreage.
   d) BMP Type and Description.
   e) BMP Location.
   f) Date of Acceptance.

23. **Infiltration and Groundwater Protection –** To protect groundwater quality, each Permittee shall consider the type of development and resulting storm water discharge and, if appropriate, apply restrictions to the use of structural BMPs which are designed to primarily function as infiltration devices (such as infiltration trenches and infiltration basins).

24. **Development Standards Outreach –** Each Permittee shall continue to implement outreach and training associated with the Planning and New Development Program Element.

25. **Targeted Employee Training**

Each Permittee shall periodically train its employees in targeted positions (whose jobs or activities are engaged in development planning) to ensure they can adequately implement the Planning and New Development Program requirements.

26. **Technical Guidance and Information for Developers**

The Permittees shall submit updated technical guidance consistent with the requirements of Provisions 15b and c of this Order, no later than 6 months following amendment of development standards. The updated technical guidance shall include and encourage low impact development/ hydromodification strategies for the development community in the Sacramento urbanized area. The strategies shall be based on the existing site design control measures identified in the existing Development Standards. Prior to approval of the Development Standards, the early implementation of measures likely to be included in the Development Standards shall be encouraged by the Permittees.

WATER QUALITY BASED PROGRAMS

27. The Permittees shall continue to implement the Target Pollutant identification and prioritization processes described in the SQIP. These processes shall continue to include as key evaluation criteria, pollutants that cause or contribute to exceedances of water quality standards and known or probable impairment of beneficial uses. The Permittees shall develop and/or implement target pollutant control programs for pollutants that have been identified as top priorities. Target pollutant control programs shall be incorporated into each Permittee's SQIP and revised in accordance with the directives of this Order. At a minimum, these control programs shall include the following:

a. **Pesticides:** To address pesticide impairment of urban streams, the Permittees shall continue to implement the Regional Water Board-approved Pesticide Plan that addresses their own use of pesticides including diazinon and chlorpyrifos, and to the extent authorized by law, the use of such pesticides by other sources within their jurisdictions. The goal of the Pesticide Plan is to reduce the discharge of pesticides from municipal storm water systems to urban creeks within the Sacramento urbanized area. The Permittees shall identify and promote, within the context of integrated pest management (IPM) programs, the use of pest management practices that minimize the risk of pesticide impacts on surface water quality resulting from urban runoff discharges.

IPM shall be integrated into the Permittee municipal operations and promoted to residents, businesses and public agencies through the public outreach program.

i. For municipal operations, the Permittees shall implement the action items listed under the "Permittee Pest Control" section of the Pesticide Plan

ii. For public outreach, the Permittees shall implement the action items listed in the "Public Education and Outreach" section of the Pesticide Plan.

iii. The Permittees shall conduct the following studies of the local or regional sales and use of residential and commercial pest control products potentially found in storm water runoff:

a) A telephone survey of residential pesticide use
b) A review of structural and landscape pesticide use based on Pesticide Use Reports available from the DPR
c) A shelf survey of pesticides available to the public at retail settings

The studies may be based on the study design used for previous studies conducted by the Permittees, and shall be conducted by 1 August 2011 (or three years after the effective date of this Order, whichever is later). The survey may be conducted in conjunction with other municipalities in the Central Valley or San Francisco Bay Area as long as residences and retailers located with Sacramento urbanized area are adequately represented.

iv. **No later than the end of year 4 of the Permit term,** the Permittees shall complete an assessment to determine if urban storm water is causing or contributing to an exceedance of water quality standards for diazinon and chlorpyrifos. If urban storm water is causing or contributing to an exceedance, then the Permittees shall determine the relative contribution of urban storm water runoff to diazinon and chlorpyrifos levels in waters within its jurisdiction that are identified as a toxic hot spot (per § 13394 of Porter-Cologne) or are on the CWA 303(d) list.

v. The Permittees, either separately or through organizations such as CASQA, shall continue to support or participate in efforts to influence pesticide regulatory activities by state and federal agencies, especially DPR, the Structural Pest Control Board, and the USEPA Office of Pesticides, with respect to promoting adequate evaluation and regulation of pesticide uses that have significant potential to impact receiving waters through discharges of urban runoff.

vi. The Permittees shall coordinate with the Pesticide Plan component of the SQIP, to the extent that pesticides in sediments are identified as causing or contributing to receiving water impacts. The Permittees shall incorporate a Sediment Monitoring program into the Pesticide Plan as part of the SQIP. The Sediment Monitoring

program shall include information as specified in the Monitoring and Reporting Program of this Order.

b. **Mercury:** To address the mercury impairment of the Delta, Sacramento River, American River, and Lake Natoma, the Permittees shall continue to implement the mercury reduction strategy (Mercury Plan) that was submitted in 2004. Compliance with the Mercury Plan shall be assessed by data and information submitted in the Annual Reports.

In addition, the Permittees shall incorporate the following into their mercury reduction strategy.

i. For public outreach and municipal operations, the Permittees' mercury control programs shall coordinate with the countywide universal waste (U-waste) management strategy, described in the "Sacramento Countywide U-Waste Collection Strategy Letter Report" (R3 Consulting Group Inc., 2007, pages 9 and 10), and describe in the Annual Reports specific coordination efforts related to mercury control (e.g., fluorescent lamp collections, public outreach, sustainable funding mechanisms, and U-waste tonnage tracking).

ii. For public outreach, the Permittees shall evaluate and summarize the 2004 and 2007 public awareness/opinion survey data related to mercury (e.g., fluorescent lamps disposal). In the 2008/2009 Annual Report, provide recommendations for amending Permittees' mercury source control programs and amend the mercury source control programs in accordance with those recommendations.

iii. As components of the Monitoring Program, the Permittees shall complete the following efforts, which are further described in the MRP:

a) Evaluate total mercury and methylmercury data collected under the previous Order and continue urban discharge monitoring to determine the amount of total mercury and methylmercury loading that urban lands within the Sacramento area contribute to individual impaired water bodies (the Delta, Sacramento River, American River, and Lake Natomas).

b) Estimate the amount of total mercury and sediment prevented from discharging to receiving waters by existing BMPs such as (but not limited to) street cleaning, detention basins, and erosion and sediment controls.

c) Consider including monitoring in the design of future BMP studies to estimate the extent to which existing and new BMPs reduce total mercury and methylmercury discharges.

Based on the results of the above mercury-related evaluations and Permittee recommendations, the Executive Officer may require additional mercury monitoring, BMPs, and SQIP revisions.

28. In support of the Water Quality Based Programs, the Permittees shall develop and implement the storm water monitoring program as defined in the Monitoring and Reporting Program No. R5-2008-0142, which is part of this Order, and any revisions thereto adopted by the Regional Water Board.

29. **Program Effectiveness Assessment**

a. The Permittees shall describe their approach to program effectiveness assessment in their SQIPs and report the results of the assessment in their Annual Reports. The assessment shall identify the direct and indirect measurements that the Permittees used to track the effectiveness of their programs as well as the outcome levels at which the assessment is occurring consistent with this Order. Direct and indirect measurements such as the following shall be included: conformance with established performance standards, quantitative monitoring to assess the effectiveness of representative control measures, measurements or estimates of pollutant load reductions or increases from identified sources where feasible, measurements of raised awareness of the public, and/or detailed accounting/documentation of SQIP accomplishments.

b. The Permittees shall track the long-term progress of their SQIPs towards achieving improvements in receiving water quality.

c. The Permittees shall use the information gained from the program effectiveness assessment to improve their SQIPs and identify new BMPs, or modification of existing BMPs. This information shall be reported within the Annual Reports consistent with this Order.

d. Long Term Effectiveness Assessment (LTEA): Each Permittee shall collaborate with the other Permittees to develop the LTEA of the program, which shall build on the results of the Permittees' Annual Reports and the initial program effectiveness assessments. The LTEA shall be submitted to the Regional Water Board **no later than 180 days prior to the permit expiration date** and shall identify the storm water program long term effectiveness in achieving both programmatic goals (raising awareness, changing behavior) and environmental goals (reducing pollutant discharges, improving environmental conditions).

ADDITIONAL REQUIREMENTS

30. Monitoring and Reporting Program: The Permittees shall comply with Monitoring and Reporting Program No. R5-2008-0142, which is part of this Order, and any revisions thereto approved by the Board. Because the Permittees operate facilities which discharge waste subject to this Order, the Monitoring and Reporting Program is necessary to ensure compliance with these waste discharge requirements.

31. This Order may be modified, or alternatively, revoked or reissued, prior to the expiration date as follows: a) to address significant changed conditions identified in the technical reports required by the Regional Water Board which were unknown at the time of the issuance of this Order; b) to incorporate applicable requirements of statewide water quality control plans adopted by the State Board or amendments to the Basin Plan approved by the State Board; or c) to comply with any applicable requirements, guidelines, or regulations issued or approved under Section 402(p) of the CWA, if the requirement, guideline, or regulation so issued or approved contains different conditions or additional requirements not provided for in this Order. The Order as modified or reissued under this paragraph shall also contain any other requirement of the CWA when applicable.

32. Each Permittee shall comply with all applicable items of the "Standard Provisions and Monitoring Requirements for Waste Discharge Requirements (NPDES)," dated February 2004 (Attachment D), which are part of this Order. This attachment and its individual paragraphs are referred to as "Standard Provisions."

33. This Order expires on **11 September 2013**. The Permittees must file a Report of Waste Discharge (ROWD) in accordance with Title 23, California Code of Regulations, not later than 180 days in advance of such date as application for re-issuance of waste discharge requirements. U.S. EPA 40 CFR Part 122 Interpretive Policy Memorandum on Reapplication Requirements for Municipal Separate Storm Sewer Systems states the fourth year annual report may be used as the ROWD reapplication package. The reapplication package must identify any proposed changes or improvement to the SQIPs, an assessment of the effectiveness of the program, and monitoring activities for the upcoming five year term of the permit, if those proposed changes have not already been submitted pursuant to 40 CFR 122.42 (c).

I, PAMELA C. CREEDON, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Central Valley Region, on **11 September 2008**.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL VALLEY REGION

ORDER NO. R5-2008-0142

NPDES NO. CAS082597

MONITORING AND REPORTING PROGRAM

CITIES OF CITIRUS HEIGHT, ELK GROVE, FOLSOM, GALT, RANCHO CORDOVA, SACRAMENTO, AND COUNTY OF SACRAMENTO
STORM WATER DISCHARGES FROM
MUNICIPAL SEPARATE STORM SEWER SYSTEM
SACRAMENTO COUNTY

I. MONITORING AND REPORTING PROGRAM REQUIREMENTS

This Monitoring Reporting Program (MRP) is issued pursuant to the California Water Code Section 13267 and 13383. This MRP is necessary to determine compliance with Order No. R5-2008-0142 and to determine the effectiveness of the storm water program.

The Permittees shall not implement any changes to this MRP unless and until the Regional Water Board or Executive Officer issues a revised MRP. Attachment A shows the individual Permittee municipal separate storm water system (MS4) limits known as the Sacramento urbanized area, which are covered under this Order. To save time and money, and avoid duplication of efforts, the Permittees shall coordinate their monitoring program with local, state, and federal agencies whenever possible.

A. **Annual Monitoring Plan:** The Permittees shall submit by **1 May** of each year a proposed joint-Permittee Annual Monitoring Plan that includes clearly defined tasks, responsibilities, and schedules for implementation of monitoring activities for the next fiscal year. The Annual Monitoring Plan shall be deemed to be final and enforceable under this Order as of **1 July** of each year unless determined to be unacceptable by the Executive Officer. Each Permittee shall address any comments or conditions of acceptability received from the Executive Officer on the Permittees' Annual Monitoring Plan.

B. **Annual Report:** The Permittees shall submit, in both electronic and paper formats and no later than **1 October** of each year, an Annual Report documenting the progress of the Permittees' implementation of the Storm Water Quality Improvement Plan (SQIP) and the requirements of this Order. The Annual Report shall discuss each Permittee's status of compliance with this Order and the SQIPs, including implementation dates for all time-specific deadlines should be included for each program area. If permit deadlines are

not met, the Permittees shall report the reasons why the requirement was not met and how the requirements will be met in the future, including projected implementation dates. It shall include a compilation of deliverables and milestones completed during the previous fiscal year, and a discussion of program effectiveness relative to performance standards defined in the SQIPs. In each Annual Report, the Permittees may propose pertinent updates, improvements, or revisions to the SQIPs, which shall be complied with under this Order unless disapproved by the Executive Officer or acted upon in accordance with this Order. A comparison of program implementation results to performance standards established in the SQIP and Order No. R5-2007-0173 shall be included for each program area. Specific requirements that must be addressed in the Annual Reports are listed below.

1. An Executive Summary discussing the effectiveness of the SQIP to reduce storm water pollution to the maximum extent practicable (MEP) and to achieve compliance with water quality standards in receiving waters;

2. Summary of activities conducted by the Permittees;

3. Identification of best management practices (BMPs) and a discussion of their effectiveness at reducing urban runoff pollutants and flow, where applicable; and

4. Summary of the monitoring data and an assessment of each component of the MRP. To comply with Provisions C.1 and C.2 of the Order No. R5-2008-0142 the Permittees shall compare receiving water data with applicable water quality standards. The lowest applicable standard from the Basin Plan, California Toxics Rule (CTR), and California Title 22 (Title 22), and constituent specific concentrations limits (e.g., mercury) shall be used for comparison. The Permittees shall additionally provide a summary of monitoring data for the discharges to assess the effectiveness of BMPs in reducing pollutants in the discharge and in assessing whether a discharge may have caused or contributed to an exceedance of water quality standards.

   When the data indicate that discharges are causing or contributing to exceedances of applicable water quality standards or constituent specific concentrations limits, the Permittees shall prepare a Report of Water Quality Exceedance (RWQE), prepared pursuant to Receiving Water Limitations C.3 of this Order, and identify potential sources of the problems, and recommend future monitoring and BMP implementation measures to identify and address the sources.

Raw data shall be submitted in electronic format.

5. Effectiveness assessment for each program element, as defined in the SQIP, shall be conducted annually, shall be built upon each consecutive year, and shall identify any necessary modifications. The SQIP shall describe, in detail, the performance standards or goals to use to gauge the effectiveness of the storm water management program. The primary questions that must be assessed for each program element include the following:

   a. Level 1 Outcome: Was the Program Element or BMP implemented in accordance with the Permit Provisions, SQIP Control Measures and Performance Standards?

   b. Level 2 Outcome: Did the Program Element or BMP raise the target audience's awareness of an issue?

   c. Level 3 Outcome: Did the Program Element or BMP change a target audience's behavior, resulting in the implementation of recommended BMPs?

   d. Level 4 Outcome: Did the Program Element or BMP reduce the load of pollutants from the sources to the storm drain system?

   e. Level 5 Outcome: Did the Program Element or BMP enhance or change the urban runoff and discharge quality?

   f. Level 6 Outcome: Did the Program Element or BMP enhance or change receiving water quality?

   Annually, the Permittees shall evaluate Water Quality Based Programs and shall include consideration of applicable physical, chemical and biological data water quality data. Such evaluation may include graphs, charts, statistics, modeling, and any other analyses in support of the Permittees' evaluation of the data and conclusions derived from that analysis. Documentation shall include quality assurance and control procedures (QA/QC).

6. Pursuant to 40 CFR 122.42(c)(7), the Permittees shall identify water quality improvements in, or degradation of, urban storm water;

7. For each monitoring component, photographs and maps of all monitoring station locations and descriptions of each location; and

8. Recommendations to improve the monitoring program, BMPs, Performance Standards, and the SQIP to address potential receiving water quality exceedances and potential pollutant sources, and to meet the MEP standard.

9. Provide operating data from all pump stations as an appendix in electronic format as necessary and estimate discharge volumes unless other technically defensible means to estimate urban runoff discharge volumes can be substituted. Historically, the Permittees have estimated runoff volumes based on rainfall-runoff volume empirical relationships.

10. In addition to the requirements listed above, the final Annual Report of this Order's permit term shall include:

    a. An estimate of total pollutant loads attributable to urban runoff for target pollutants at each discharge monitoring station;

    b. An evaluation of the long-term trends in MS4 discharges and receiving water quality. Several factors need to be considered when evaluating trends, such as changes in sample collection methods, data quality differences, and changes in analytical methods.

    c. An evaluation of significant correlations of target pollutants with other constituents, such as total suspended solids (TSS).

11. The SQIP shall include separate sections for specific program elements, as well as separate sections for Plans required by the Order (i.e., Sediment Monitoring, Mercury Plan).

C. **Notification of Water Quality Exceedances (NWQE):** The Permittees shall notify the Regional Water Board, in writing, of any exceedance in receiving waters of applicable water quality standards within **90 days** of the monitoring event from which the exceedance was detected. The Permittees shall notify the Regional Water Board electronically within **48 hours** of receiving Water Column Toxicity monitoring data in receiving waters that indicates 50% mortality.

D. **Certification**: All work plans and reports submitted to the Regional Water Board shall be signed and certified pursuant to federal regulations at 40 CFR 122.41 (k). Each report shall contain the following completed declaration:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system

designed to assure that qualified personnel properly gather and evaluate the information submitted.

Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility, of a fine and imprisonment for knowing violations."

Executed on the ___ day of, 200__, at _____.

(Signature)_____(Title)_____.

The Permittees shall mail the original of each annual report to:

CALIFORNIA REGIONAL WATER QUALITY
CONTROL BOARD – CENTRAL VALLEY REGION
11020 SUN CENTER DRIVE, #200
RANCHO CORDOVA, CA 95670

A copy of the annual report shall also be mailed to:

REGIONAL ADMINISTRATOR
ENVIRONMENTAL PROTECTION AGENCY
REGION 9
75 Hawthorne Street
San Francisco, CA 94105

II. MONITORING PROGRAM

The primary objectives of the Monitoring Program are:

- Assessing compliance with this Order;
- Measuring and improving the effectiveness of the SQIPs;
- Assessing the chemical, physical, and biological impacts on receiving waters resulting from urban runoff;
- Characterization of urban runoff;
- Identifying sources of pollutants; and
- Assessing the overall health and evaluating long-term trends in receiving water quality.

Ultimately, the results of the monitoring requirements should be used to refine the SQIP to reduce pollutant loadings, and to protect and enhance the beneficial uses of the receiving waters in the Sacramento Urbanized Area.

The monitoring program shall address:

- Baseline Monitoring
  - Receiving Water Monitoring, including river and urban tributaries
  - Urban Discharge Monitoring
  - Water Column Toxicity Monitoring

- Sediment and Bioassessment Monitoring

- Water Quality Based Programs
  - Pesticide Monitoring
  - Mercury Monitoring

- Special Studies
  - Detention Basin Effectiveness Evaluation Monitoring
  - Pilot Watershed – New Development BMP Effectiveness Evaluation
  - Proprietary Treatment BMP Effectiveness Evaluation

The Permittees shall implement the Monitoring Program as follows:

A. **Sampling Protocol**

1. Sampling events should be coordinated with monitoring activities such as receiving water monitoring (river and urban tributary), and urban discharge.

2. The Permittees shall collect flow data at the time of sampling for all monitoring stations sampled. Receiving water or urban discharge flow may be estimated using U.S. EPA methods[1] at sites where flow measurement devices are not in place.

3. All sample collection and analyses shall follow standard USEPA protocol.

4. To meet a monitoring requirement, the Permittees may support (financially or otherwise) another agency or monitoring program that will conduct the monitoring.

[1] NPDES Storm Water Sampling Guidance Document, U.S. EPA 833-B-92-001, July 1992

B. **Receiving Water Monitoring**

The new receiving water monitoring requirements described herein will require the Permittees to establish new monitoring stations, develop new operating procedures, and train personnel as described in the SQIP.

The proposed locations of receiving water monitoring stations for rivers and urban tributaries shall be presented in the revised SQIP and presented in the Annual Reports. If additional monitoring stations are needed, they shall be established under the direction of Regional Water Board staff. A description of any additional stations shall be attached to this MRP. Receiving water monitoring may be postponed if a given monitoring station cannot be safely accessed.

Each year (annually), samples shall be collected **during three storm events**[2] and **one monitoring event during the dry season**.[3] The Permittees shall target monitoring the first rain event of the year forecasted for at least 0.25 inch in a twenty-four hour period that is preceded by at least 30 days of dry weather. The second and third rain events to be monitored shall be selected by the Permittees to fill data gaps for different types of rain events in the region. These rain event selection criteria shall be included in the sampling and analysis plans.

Receiving water monitoring for Rivers and Urban Tributaries shall be consistent with the attached Table B list of constituents of concern, except for pyrethroid pesticides in water.

1. **River Monitoring:** Monitoring of river receiving water stations shall be conducted at: American River at Nimbus, American River at Discovery Park, Sacramento River at Veteran's Bridge, and Sacramento River at Freeport Bridge, as shown on Attachment B. Monitoring shall be conducted in a manner that best measures the maximum anticipated water quality impacts from MS4 discharges. However, because of safety reasons, samples will be collected during daylight hours, only when conditions are safe for boat operations.

   Samples collected at the American River at Nimbus location shall be collected as grab samples. All other river samples shall be cross-sectional depth-composite samples, unless a particular parameter analysis requires grab samples, or if flow and safety conditions warrant the collection of grab samples.

[2] Storm Event means any rain event greater than 0.25 inch in 24 hours except where specifically stated otherwise.
[3] Dry weather day means a day with a rain event too small to generate runoff (typically 0.1 inches or less) shall be considered a dry weather day.

2. **Urban Tributary Monitoring:**

a. Monitoring of urban tributary receiving waters shall be conducted at: Arcade Creek, Willow Creek and Laguna Creek, as shown on Attachment B.

i. If a given tributary is dry or has only standing water during a scheduled sampling event, then sampling is not required; however, Permittees shall attempt to sample tributaries at times when water flows are more likely, such as the early part of the dry season.

ii. Tributary receiving water samples shall be either grab, time-composited, or flow-composited and collected at mid-depth and mid-stream.

iii. Samples shall be taken just upstream of the tributary's confluence with the main stem of creeks or rivers.

iv. Sample collection can be limited to daylight hours, when conditions are safe.

b. Report of Water Quality Exceedance (RWQE) preparation during the previous permit term included development of a work plan to address the cause and nature of dissolved oxygen (DO), pH, and temperature exceedances in several urban tributaries. Multiple steps in the work plan have been completed.[4] [5] [6] The Permittees shall continue to implement the work plan elements and begin Phase II upon adoption of this Order. Much of the work shall be performed in Morrison Creek, other creeks may be identified. The work plan and any updates to the plan shall be included in the SQIP.

C. **Urban Discharge Monitoring**

The Permittees shall monitor urban discharges from the following monitoring stations: Sump 111, Strong Ranch Slough, and the North Natomas Development, as shown on Attachment B, for those constituents listed in Table B. The change from monitoring at the long term Sump 104 site to the

[4] Larry Walker Associates, September 20, 2006. Memorandum from Brian Laurenson, *Assessment Strategy for Dissolved Oxygen, Temperature and pH in Sacramento Urban Tributaries.*
[5] Larry Walker Associates, November 13, 2006. Memorandum from Brian Laurenson. *Urban Tributary Dissolved Oxygen, pH and Temperature Investigation Sampling and Analysis Plan – Phase 1.*
[6] Larry Walker Associates, May 2007. Memorandum from Iain Clark. *Phase 1 Investigation Results – Willow Creek and Morrison Creek pH, Dissolved Oxygen, and Temperature.*

North Natomas Development site will be evaluated to determine effects on long term effectiveness evaluations. Following this evaluation and the finalization of the new location, if an alternate location is identified to replace Sump 104, the Permittees may request such a change through modification of the SQIP.

Sampling of pyrethroids in water as listed in Table B shall be conducted if required by Regional Water Board staff after evaluating the results and recommendations from the sampling of Permittee discharges currently being conducted by Dr. Donald Weston through Statewide Ambient Monitoring Program (SWAMP).

In coordination with Receiving Water Monitoring, in two of every three years, samples shall be collected **during three storm events** and **one dry season monitoring event.** The Permittees shall target for monitoring the first storm event of the year preceded by at least 30 days of dry weather.[7] The second and third storm events to be monitored shall be selected by the Permittees to fill data gaps for different types of storm events in the region.

Samples shall be flow-weighted composites collected for the duration of the storm, with a maximum composite period of 24 hours. Because of the inherent difficulty in fully capturing an entire storm event, the Permittees shall report the portion of the storm event "captured" or during which samples were collected.

D. **Water Column Toxicity**

The Permittees shall conduct short-term toxicity analyses to evaluate the extent and causes of toxicity in receiving waters, and to provide information to support identification of practices that eliminate sources of toxicity or remove them to the MEP.

The Permittees shall conduct toxicity testing at each receiving water monitoring station during two of the five fiscal years (July 1 of the current year to June 30 of the following year) of the Order; this testing shall not be done in consecutive years. Toxicity testing includes (1) analysis of samples from two storm events (including the first storm of the year) and one during the dry season from each receiving water monitoring station; and (2) analysis of at least the following two freshwater test species for each storm event: Fathead minnow (*Pimephales promelas*) and water flea (*Ceriodaphnia dubia*). The testing shall be conducted in accordance with U.S. EPA's method 821-R-02-

[7] A day with a rain event too small to generate runoff (typically 0.1 inches or less) shall be considered a dry weather day.

013 (U.S. EPA 2002, 4th Edition). A modification[8] to this method is allowed for *Pimephales promelas* to address previously observed pathogen interference. A minimum sample volume of 5 gallons for each test species shall be provided with a sample storage (holding time) not to exceed 36 hours.

If 100% mortality to *Pimephales promelas* or *Ceriodaphnia dubia* is detected within 24 hours of test initiation, then a dilution series shall be initiated (0.5x steps) ranging from the undiluted sample (or the highest concentration that can be tested within the limitations of the test methods or sample type) to less than or equal to 6.25 percent of the sample. Further, if statistically significant toxicity is detected and a greater than or equal to 50% increase in *Pimephales promelas* or *Ceriodaphnia dubia* mortality compared to the laboratory control is observed, then TIEs shall be conducted on the initial sample that caused toxicity.

1. Toxicity Identification Evaluations (TIE)

   The Permittees shall begin a Phase I TIE immediately on all samples that cause statistically significant toxicity and greater than or equal to 50% increase in *Pimephales promelas* or *Ceriodaphnia dubia* mortality compared to the laboratory control. If mortality of both test species exceeds the 50% trigger, then TIEs shall be conducted using both species. TIEs are required until the cause of toxicity is determined. TIE shall be conducted by qualified personnel.

2. Toxicity Reduction Evaluations (TRE)

   a. A TRE shall be conducted whenever a toxicant is successfully identified through the TIE process. The TRE shall include all reasonable steps to identify the source(s) of toxicity and discuss appropriate BMPs to eliminate the causes of toxicity. Once the source of toxicity and appropriate BMPs are identified, the Permittees shall submit the TRE Corrective Action Plan as part of the Annual Report to the Executive Officer for approval. At a minimum, the TRE shall include a discussion of the following items:

      i. A description of the investigation and evaluation techniques that would be used to identify potential causes and sources of toxicity;

[8] Geis, Stephen W., et al., *Modifications to the Fathead Minnow (Pimephales promelas) chronic Test Method to Remove Mortality Due to Pathogenic Organisms.* Environmental Toxicology and Chemistry. Vo.. 22 No. 10. Pg. 2400-2404. April 2003.

ii. The potential sources of pollutant(s) causing toxicity;

iii. A list of Permittees having jurisdiction over sources of pollutant(s) causing toxicity;

iv. Recommended BMPs to reduce the pollutant(s) causing toxicity;

v. Proposed changes to the SQIP to reduce the pollutant(s) causing toxicity; and

vi. Suggested follow-up monitoring to demonstrate BMP effectiveness in reducing the pollutant causing toxicity.

b. The Permittee's do not need to prepare a TRE if the identified pollutant is already being addressed in the Permittee's Target Pollutant Program. If this is the case, the toxicity found shall be noted and addressed through on-going implementation of that pollutant control strategy.

c. If TRE implementation for a specific pollutant coincides with Total Maximum Daily Load (TMDL) implementation for that pollutant, the efforts may be coordinated.

d. Upon approval by the Executive Officer, the Permittees(s) having jurisdiction over sources causing or contributing to toxicity shall implement the recommended BMPs and take all reasonable steps necessary to eliminate toxicity.

e. The Permittees shall develop a maximum of two TREs per year. If applicable, the Permittees may use the same TRE for the same toxic pollutant or pollutant class in different watersheds or basins. The TRE process shall be coordinated with TMDL development and implementation to avoid overlap.

The Permittees shall include a monitoring plan, which shall include a sampling and analysis plan and an implementation schedule in the SQIP for approval by the Executive Officer. Subsequent information (e.g., all data (electronic format), assessment of the data, conclusions, proposed BMPs to be implemented, and assessment of program effectiveness) shall be included in the Annual Reports as required in this MRP Order.

E. **Sediment Monitoring**

1. Sediment toxicity resulting from pyrethroid pesticides was recently identified in a study[9] performed through Statewide Ambient Monitoring Program (SWAMP) monitoring in the Sacramento area (Roseville, CA) urban tributaries. The Permittees will conduct pyrethroid sediment sampling as part of the urban tributary monitoring and as part of any bioassessment sampling. Sampling of sediment shall be consistent with SWAMP Quality Assurance Management Plan (QAMP) protocols. Specifically, **one wet season[10] and one dry season** sample will be collected annually at least five years at each of the three urban tributaries. Reporting limits in sediment will conform to Table B. Sediment toxicity sampling is not required under this Order. These requirements may change based on an evaluation of data performed by the Permittees.

2. The Permittees shall review and amend the Pesticide Plan component of the SQIP, if pesticides in sediments are identified as causing or contributing to receiving water impacts.

   The Pesticide Plan shall address the following elements:

   a. Identification, development, implementation and assessment of BMPs to address controllable discharges of sediment-bound contaminants that may be linked to sediment toxicity to the MEP;

   b. Development and adoption of policies, procedures, and/or ordinances to implement BMPs;

   c. A time schedule for implementation and assessment.

F. **Bioassessment Monitoring**

The purpose of this requirement is to fully evaluate biological data collected under the previous MRP in order to assess the biological integrity of receiving waters, detect biological responses to pollution, and identify probable causes of impairment not detected by chemical and physical water quality analysis.

Further bioassessment monitoring activities will not be required under this Order until the evaluation with recommendations is complete, and the monitoring effort is adapted in consultation with SWAMP's bioassessment

[9] Weston, D. P., Holmes, R. W., et.al. Aquatic Toxicity Due to Residential Use of Pyrethroid Insecticides. Environmental Science and Technology. 2005, 39, 9778-9784.
[10] Wet Season means the calendar period beginning October 1 through April 15.

workgroup. If applicable, an updated bioassessment monitoring plan shall be included in the SQIP.

1. The following results and information shall be included in the 2008-09 Annual Report:

    a. All physical, chemical and biological data collected in the assessment;
    b. Photographs and GPS locations of all stations;
    c. Documentation of quality assurance and control procedures;
    d. Analysis that shall include calculation of the metrics used in the CSBP;
    e. Comparison of mean biological and habitat assessment metric values between stations and year-to-year trends;
    f. Electronic data formatted to the DFG Aquatic Bioassessment Laboratory for inclusion in the Statewide Access Bioassessment Database; and
    g. Copies of all QA/QC documents from laboratories.

2. The Permittees shall participate in and coordinate with the SWAMP to identify the most appropriate locations for future bioassessment stations within the Sacramento urbanized area and determine coordinated needs for the initial development of an Index of Biological Integrity for the region.

G. Water Quality-Based Programs

The following minimum requirements shall apply to the specified programs:

1. **Additional Pesticide Monitoring.** Additional pesticide monitoring shall be developed to comply with the Basin Plan amendments or TMDLs developed during the Permit term and will be proposed in the Permittees Annual Work Plans submitted to the Regional Water Board.

2. **Additional Total Mercury and Methylmercury Analyses.** Previous monitoring included the analysis of total mercury and methylmercury at a variety of urban tributaries and urban discharge stations during a range of weather conditions and storm events. The Permittees shall fully evaluate total mercury and methylmercury data collected under the previous MRP in order to determine average annual methylmercury and total mercury concentrations and loads discharged to the CWA 303(d) Listed mercury-impaired waterways by urban lands in the Sacramento Urbanized Area during a range of wet and dry years.

The following results and information shall be included in the **2008/2009 Annual Report**:

a. A summary of all total mercury, methylmercury and TSS water column data collected at urban tributaries and urban discharge stations by previous MRPs.

b. GPS locations of all tributary and urban discharge stations;

c. Documentation of sample collection and analytical methods;

d. Documentation of quality assurance and control procedures;

e. Evaluation of whether the (1) available concentration data represents a range of storm conditions and normal, above- and below-average wet and dry years (as determined by the DWR Water Year Hydrologic Classification Indices[11] for the Sacramento River Basin or other comparable methods); and (2) sampling locations represent runoff from urban lands throughout the Sacramento Urbanized Area that contribute discharge to each of the mercury-impaired waterways (Delta, Sacramento River, American River, and Lake Natoma).

f. Evaluation of available data and methods to estimate dry- and wet-weather discharge volume (flow) from urban lands in the Sacramento Urbanized Area (e.g., LWA, 1996;[12] Ruby, 2005[13]) that will be needed to calculate the annual average total mercury and methylmercury loads in urban runoff contributed to each of the mercury-impaired waterways. Evaluation shall include the identification of a preferred method for estimating runoff volume, calculation of annual average discharge volumes contributed by urban lands within the Sacramento Urbanized Area to each of the mercury-impaired waterways using the preferred and alternative methods, and identification of any needs for additional data to better estimate annual runoff volumes.

---

[11] DWR. 2006. Chronological Reconstructed Sacramento and San Joaquin Valley Water Year Hydrologic Classification Indices. DWR California Cooperative Snow Surveys. Sacramento, CA. Available at: http://cdec.water.ca.gov/cgi-progs/iodir/WSIHIST.

[12] LWA. 1996. Sacramento NPDES Stormwater Discharge Characterization Program 1996 DCP Update Report. Prepared by Larry Walker Associates (LWA) for the County of Sacramento, the City of Sacramento, the City of Folsom, and the City of Galt. September 1996.

[13] Ruby, A. 2005. Sacramento Urban Runoff Discharge Characterization 2005. Prepared for: The Sacramento Stormwater Quality Partnership. Prepared by: Armand Ruby, Armand Ruby Consulting, in association with Larry Walker Associates Inc. August 2005.

g. Evaluation of different methods to estimate total mercury and methylmercury loads contributed to each of the mercury-impaired waterways by Sacramento Urbanized Area urban runoff (e.g., Ruby, 2005; Laurenson, 2007[14]; Wood et al., 2008[15]) and identification of a preferred method.

h. Identification of data gaps and recommendations for additional monitoring or weather-specific sampling events necessary to fully characterize annual average total mercury and methylmercury concentrations and loads in runoff from established urban areas and new urban developments that contribute discharge to each of the mercury-impaired waterways. Recommendations may include a monitoring time schedule (e.g., when the monitoring will begin and its frequency) and will be developed in coordination with TMDL development and implementation for the Delta, Sacramento River, American River, and Lake Natoma.

i. Estimates of the amount of total mercury and sediment prevented from discharging to receiving waters by existing BMPs in the Sacramento Urbanized Area such as, but not limited to, street cleaning, detention basins, and erosion and sediment controls.

j. Recommendations for including total mercury and methylmercury monitoring in the design of future BMP studies to estimate the extent to which existing and new BMPs reduce total mercury and reduce and/or increase methylmercury discharges.

The baseline monitoring described in Section II.B of this MRP includes total mercury and methylmercury for three urban tributaries: Arcade Creek, Willow Creek and Laguna Creek. In addition, the monitoring described in Section II.C includes total mercury and methylmercury for three urban discharge stations: Sump 111, Strong Ranch Slough, and North Natomas Development Sump. Section III.A of this MRP also requires monitoring of methylmercury and total mercury in water in a special study to assess the pollutant removal performance of representative detention basins.

[14] Laurenson, B.M. 2007. Report of Waste Discharge – Discharge and Receiving Water Characterization. Memorandum and summary statistics prepared by Brian M. Laurenson, P.E. (Larry Walker Associates) for Delia McGrath (City of Sacramento) and Janet Parris (Sacramento County).

[15] Wood, M.L., C.G. Foe, J. Cooke, S.J. Louie, and D.H. Bosworth. 2008. Sacramento – San Joaquin Delta Estuary TMDL for Methylmercury – Draft Report for Public Review. Central Valley Regional Water Quality Control Board staff report, February 2008.

Total mercury and methylmercury monitoring activities may be modified pending the Permittees' evaluation in the 2008/09 Annual Report. Any changes to the Monitoring Program will be made in consultation with Regional Water Board MS4 and Mercury TMDL staff, and in coordination with the final Delta TMDL and TMDL development efforts for the American River, Sacramento River, and Lake Natomas. The Executive Officer may require SQIP revisions based on the results of the above mercury-related evaluations and Permittee and Regional Water Board staff recommendations.

III. SPECIAL STUDIES

A. Wet Detention Basin Monitoring

1. The Permittees shall complete the Water Quality Detention Basin Effectiveness study initiated in the last permit term to assess the pollutant removal performance of a representative wet water quality detention basin.

2. As described in Table B, the Permittees shall conduct monitoring for the following constituents in the water column at the inlet and outlet: pyrethroids, total mercury, and methylmercury, total suspended solids (TSS), turbidity, and bacteria. All samples will be analyzed using the methods and minimum levels as described in Table B. Other constituents that shall be sampled include: bacteria, total dissolved solids (TDS), and organophosphate pesticides (chlorpyrifos and diazinon), as described in Table B.

3. The study shall be designed to perform inflow and outflow monitoring to measure removal effectiveness, which is representative of typical conditions within the Sacramento urban watershed. Monitoring shall be designed to evaluate the effectiveness of the detention basin in removing pollutants of concern.

4. For a minimum of three years (annually), inlet and outlet samples shall be collected during **three storm events** and **one dry season event** for a total of nine storm events and three dry events. The study may be completed sooner if more storm events can be sampled in a given year.

5. Monitoring summaries will be reported in each Annual Report.

6. The monitoring results shall be evaluated and submitted with the FY 2010/2011 Annual Report. The report shall include an evaluation of basin effectiveness in removing pollutants of concern, including methylmercury. The report shall include a recommendation for collecting

inlet and outlet grab samples at two other detention basins. The two additional detention basins shall be located in watersheds outside the North Natomas area. The results will be submitted to the Regional Water Board in the final Annual Report of the permit term.

7. If the detention basins are found to be ineffective, the Study shall be updated to include recommendations on how to manage or design detention basins differently (i.e., redesign new basins, reconfigure existing basins, periodic dredging).

8. An addendum to the 2010/2011 Wet Detention Basin Effectiveness Report, including the results of the additional detention basin monitoring, shall be submitted in the final Annual Report of the permit term.

B. **Sampling Schedule**

The monitoring program shall implement the sampling schedule shown in Table A;

TABLE A. SAMPLING SCHEDULE

MRP Section Reference	Type	Sites	No. Sites	Permit Years Monitored	Total Events Over 5 Year Permit Term at Each Site	Constituent List [1]	Management Goals Addressed [2]	Notes
II.B.1.	River	Sacramento River (2) and American River (2)	4	Years 1 through 5	15 Wet, 5 Dry	Table B. No pyrethroids in water column, pending evaluation.	A, F	3 Wet, 1 Dry per year Sites located upstream and downstream of Sacramento urban area.
II.B.2.	Urban Tributary	Arcade Creek, Willow Creek, and Laguna Creek	3	Years 1 through 5	15 Wet, 5 Dry	Table B. No pyrethroids in water column, pending evaluation. Sediment monitoring described in MRP section II.E.	A, F	3 Wet, 1 Dry per year The long term Laguna Creek urban tributary monitoring site will be within an existing developed area of the watershed.
II.C.	Urban Discharge Monitoring	Sump 111, Strong Ranch Slough, North Natomas	3	Years 1, 2, 4, & 5	12 Wet, 4 Dry	Table B. No pyrethroids in water column, pending evaluation.	C, D, E, G	3 Wet, 1 Dry per year North Natomas site replaces Sump 104 pending data review and site selection. Monitoring in two of every three years.

TABLE A. SAMPLING SCHEDULE

MRP Section Reference	Type	Sites	No. Sites	Permit Years Monitored	Total Events Over 5 Year Permit Term at Each Site	Constituent List [1]	Management Goals Addressed [2]	Notes

II.E.	Sediment	Urban Tributary Monitoring Sites	3	Years 1 through 5	5 Wet, 5 Dry	Pyrethroids	A, E, F, G	1 Wet, 1 Dry per year Wet event to be performed directly following a wet weather urban tributary event, and no later than April
II.F.	Bioassessment	Arcade Creek, Willow Creek, and Laguna Creek	3	None Required. See Notes.	None Required. See Notes.	None Required. See Notes.	A, C, F, G	May be added at Permittee's discretion.
III.A.	Wet Detention Basin	North Natomas	2	Years 1, 2, & 3	9 Wet, 3 Dry	Water column monitoring includes total mercury, methylmercury, TSS, bacteria, turbidity, TDS, OP pesticides, and pyrethroids.	B, C, D, E, F, G	3 Wet, 1 Dry per year Monitoring initiated in 2007/08. Water column monitoring at inlet and outlet. Additional sampling of two more basins post 2010/2011 report.
III.B.	Pilot Watershed	Laguna Creek New Development BMP Effectiveness Evaluation	1	After year 2	None Required. See Notes.	None Required. See Notes.	B, D, E, G	Monitoring frequency, constituents, and sites to be determined during development of monitoring work plan in 2008/09.

Notes:
[1] “Table B” refers to the MRP constituent list that includes, among other constituents, total mercury, methyl mercury, and TSS.
[2] Management Goals
A. What is the existing condition of receiving water quality and is it protective of beneficial uses?
B. What is the quality of urban discharge in new developed areas?
C. What is the trend of urban discharge quality?
D. What is the relative urban runoff contribution to receiving water quality?
E. What are the sources to urban runoff that affect receiving water quality?
F. Are conditions in receiving waters getting better or worse?
G. How can changes in urban water quality affect receiving water quality?

C. **Pilot Watershed – New Development BMP Effectiveness Evaluation**

1. The Permittees shall prepare and implement a work plan over the permit term for monitoring a receiving water site within the Upper Laguna Creek Collaborative project area. The work plan shall be submitted as part of the revised SQIP.

   The objective of the study shall include the following:

   a. Monitor the reduction of pollutants of concern in storm water including, but not limited to, pathogen indicators, nutrients, heavy metals (including total mercury and methylmercury), and pesticides from a minimum of one BMP (e.g., low impact development) to determine BMP effectiveness;

   b. Evaluate the requirements for and installation and maintenance cost of each BMP; and

   c. Develop recommendations for appropriate BMPs for the reduction of pollutants of concern in storm water in the Sacramento urbanized area.

D. **Proprietary Treatment BMP Effectiveness Evaluation**

The Permittees shall continue to research the effectiveness and applicability of proprietary structural treatment BMPs for use in the Sacramento urbanized area. This study will include the review of manufacturer's field test data to verify their claims of product performance. This study shall be conducted a minimum of once per permit term.

IV. Standard Monitoring Provisions

All monitoring activities shall meet the following requirements:

A. Monitoring and Records [40 CFR 122.41(j)(1)]

Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.

B. Monitoring and Records [40 CFR 122.41(j)(2)] [California Water Code §13383(a)]

The Permittees shall retain records of all monitoring information, including all calibration and maintenance of monitoring instrumentation, copies of all

reports required by this Order, and records of all data used to complete the Report of Waste Discharge and application for this Order, for a period of at least five (5) years from the date of the sample, measurement, report, or application. This period may be extended by request of the Regional Water Board or U.S. EPA at any time and shall be extended during the course of any unresolved litigation regarding this discharge.

C. Monitoring and Records [40 CFR 122.41(j)(3)]. Records of monitoring information shall include:

1. Date, location, and time of sampling or measurements;
2. Individual(s) who performed the sampling or measurements;
3. Date analyses were performed;
4. Individual(s) who performed the analyses;
5. The analytical techniques or methods used; and
6. Results of such analyses.

D. Monitoring and Records [40 CFR 122.41(j)(4)]

All sampling, sample preservation, and analyses must be conducted according to test procedures approved under 40 CFR Part 136, unless otherwise specified in this Order.

E. Monitoring and Records [40 CFR 122.41(j)(5)]

The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this Order shall, upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than two years, or both. If a conviction is for a violation committed after a first conviction under this paragraph, punishment shall be a fine of not more than $20,000 per day of violation, or by imprisonment for not more than two years, or both.

F. All chemical, bacteriological, and toxicity analyses shall be conducted at a laboratory certified for such analyses by an appropriate governmental regulatory agency.

G. For priority toxic pollutants that are identified in the CTR (65 Fed. Reg. 31682), the MLs published in Appendix 4 of the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California - 2000 (SIP) shall be used for all analyses, unless otherwise specified. Appendix 4 of the SIP is included in Table B. For pollutants not contained in Appendix 4 of the SIP, the test method and method detection limit (MDL) listed in Table B shall be used for all analyses, and the ML for these parameters shall be lower than or equal to the lowest applicable water quality criteria from the Basin Plan and/or the Inland Surface Waters Plan.

H. The Monitoring Report shall specify the analytical method used, the MDL and the ML for each pollutant. For the purpose of reporting compliance with numerical limitations, performance goals, and receiving water limitations, analytical data shall be reported with one of the following methods, as appropriate:

1. An actual numerical value for sample results greater than or equal to the ML;

2. "Not-detected (ND)" for sample results less than the laboratory's MDL with the MDL indicated for the analytical method used; or

3. "Detected, but Not Quantified (DNQ)" if results are greater than or equal to the laboratory's MDL but less than the ML. The estimated chemical concentration of the sample shall also be reported. This is the concentration that results from the confirmed detection of the substance by the analytical method below the ML value.

4. For priority toxic pollutants, if the Permittees can demonstrate that a particular ML is not attainable, in accordance with procedures set forth in 40 CFR 136, the lowest quantifiable concentration of the lowest calibration standard analyzed by a specific analytical procedure (assuming that all the method specified sample weights, volumes, and processing steps have been followed) may be used instead of the ML listed in Appendix 4 of the SIP. The Permittees must submit documentation from the laboratory to the Executive Officer for approval prior to raising the ML for any constituent.

I. Monitoring Reports [40 CFR 122.41(l)(4)(ii)]

If the Permittees monitor any pollutant more frequently than required by the permit using test procedures approved under this Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the Annual Report.

J. Monitoring Reports [40 CFR 122.41(l)(4)(iii)]

Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order.

K. If no flow occurred during the reporting period, the Monitoring Report shall so state.

L. The Executive Officer or the Regional Water Board, consistent with 40 CFR 122.41, may approve changes to the Monitoring Program, after providing the opportunity for public comment, either:

1. By petition of the Permittees, or by petition of interested parties, after the submittal of the Annual Report (such petition shall be filed not later than 60 days after the Annual Report submittal date), or

2. As deemed necessary by the Executive Officer following notice to the Permittees.

SACRAMENTO STORMWATER QUALITY PARTNERSHIP

2008–2013 Proposed Monitoring Sites

Monitoring Site Names

1 Sacramento River at Veterans Bridge
2 North Natomas
3 American River at Discovery Park
4 Sump 111
5 Sacramento River at Freeport Marina
6 Strong Ranch Slough
7 American River at Nimbus Dam
8 Willow Creek at Blue Ravine Rd
9 Arcade Creek at Watt Ave
10 Laguna Creek Lower Watershed
11 Laguna Creek Upper Watershed

DEFINITIONS
ORDER NO. R5-2008-0142
CITIES OF CITRUS HEIGHTS, ELK GROVE, FOLSOM, GALT, RANCHO CORDOVA, SACRAMENTO AND COUNTY OF SACRAMENTO
MUNICIPAL SEPARATE STORM SEWER SYSTEM
SACRAMENTO COUNTY

Adverse Impact means a detrimental effect upon water quality or beneficial uses caused by a discharge or loading of a pollutant or pollutants.

Anti-degradation Policy means the *Statement of Policy with Respect to Maintaining High Quality Water in California* (State Board Resolution No. 68-16), which protects surface and ground waters from degradation. In particular, this policy protects water bodies where existing quality is higher than that necessary for the protection of beneficial uses including the protection of fish and wildlife propagation and recreation on and in the water.

Applicable Standards and Limitations means all state, interstate, and federal standards and limitations to which a discharge or a related activity is subject under the Clean Water Act (CWA), including effluent limitations, water quality standards, standards of performance, toxic effluent standards or prohibitions, best management practices, and pretreatment standards under CWA Sections 301, 302, 303, 304, 306, 307, 308, 403 and 404.

Authorized Discharge means any discharge that is authorized pursuant to a National Pollutant Discharge Elimination System (NPDES) permit or meets the conditions set forth in this Order.

Automotive Service Facilities means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 5511, 7532-7534, or 7536-7539.

Basin Plan means the *Water Quality Control Plan, Fourth Edition, for the Sacramento and San Joaquin River Basins*. The Basin Plan designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve water quality objectives for all waters of the Basin.

Beneficial Uses means the existing or potential uses of receiving waters in the permit area as designated by the Regional Board in the Basin Plan.

Best Management Practices (BMPs) means methods, measures, or practices designed and selected to reduce or eliminate the discharge of pollutants to surface waters from point and nonpoint source discharges including storm water. BMPs include structural and nonstructural controls, and operation and maintenance procedures, which can be applied before, during, and/or after pollution producing activities.

Best Available Technology Economically Achievable (BAT) and Best Conventional Pollutant Control Technologies (BCT) or Best Practicable Treatment or Control (BPTC): is a requirement of State Water Resources Control Board Resolution 68-16 - “Statement of Policy with Respect to Maintaining High Quality of Waters in California” (referred to as the

"Antidegradation Policy"). BPTC is the treatment or control of a discharge necessary to assure that, "(a) a pollution or nuisance will not occur and (b) the highest water quality consistent with maximum benefit to the people of the State will be maintained." Pollution is defined in CWC Section 13050(l). In general, an exceedance of a water quality objective in the Basin Plan constitutes "pollution".

Commercial Development means any development on private land that is not heavy industrial or residential. The category includes, but is not limited to hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, car wash facilities, mini-malls, business complexes, shopping malls, hotels, office buildings, public warehouses, and light industrial complexes.

Commercial/Industrial Facility means any facility involved and/or used in the production, manufacture, storage, transportation, distribution, exchange or sale of goods and/or commodities, and any facility involved and/or used in providing professional and non-professional services. This category of facilities includes, but is not limited to, any facility defined by the SIC Code. Facility ownership (federal, state, municipal, private) and profit motive of the facility are not factors in this definition.

Construction means clearing, grading, excavating, etc. that results in soil disturbance. Construction includes structure teardown. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility; emergency construction activities required to immediately protect public health and safety; interior remodeling with no outside exposure of construction material or construction waste to storm water; mechanical permit work; or sign permit work.

Control means to minimize, reduce, eliminate, or prohibit by technological, legal, contractual or other means, the discharge of pollutants from an activity or activities.

Dechlorinated/Debrominated Swimming Pool Discharge means swimming pool discharges which have no measurable chlorine or bromine and do not contain any detergents, wastes, or additional chemicals not typically found in swimming pool water. The term does not include swimming pool filter backwash.

Development means any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail and other non-residential projects, including public agency projects; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

Director means the Director of a municipality and Person(s) designated by and under the Director's instruction and supervision.

Discharge means when used without qualification the discharge of a pollutant.
Discharging Directly means outflow from a drainage conveyance system that is composed entirely or predominantly of flows from the subject, property, development, subdivision, or industrial facility, and not commingled with the flows from adjacent lands.

Discharge of a Pollutant means any addition of any pollutant or combination of pollutants to waters of the United States from any point source or, any addition of any pollutant or combination of pollutants to the waters of the contiguous zone or the ocean from any point source other than a vessel or other floating craft which is being used as a means of transportation. The term discharge includes additions of pollutants into waters of the United States from: surface runoff which is collected or channeled by man; discharges through pipes, sewers, or other conveyances owned by a State, municipality, or other person which do not lead to a treatment works; and discharges through pipes, sewers, or other conveyances, leading into privately owned treatment works.

Disturbed Area means an area that is altered as a result of clearing, grading, and/or excavation.

Dry weather day means a day with a rain event too small to generate runoff (typically 0.1 inches or less) shall be considered a dry weather day.

Construction Activities Storm Water General Permit (GCP) means the general NPDES permit adopted by the State Board which authorizes the discharge of storm water from construction activities under certain conditions.

Industrial Activities Storm Water General Permit (IGP) means the general NPDES permit adopted by the State Board which authorizes the discharge of storm water from certain industrial activities under certain conditions.

Hydrology is a scientific discipline concerned with the waters of the Earth, including their occurrence, distribution, and circulation via the hydrologic cycle and interactions with living things. It also deals with the chemical and physical properties of water in all its phases.

Hydromodification means the change in the natural watershed hydrologic processes and runoff characteristics (i.e., interception, infiltration, overland flow, interflow and groundwater flow) caused by urbanization or other land use changes that result in increased stream flows and sediment transport. In addition, alteration of stream and river channels, installation of dams and water impoundments, and excessive stream bank and shoreline erosion are also considered hydromodification, due to their disruption of natural watershed hydrologic processes.

Illicit Connection means any man-made conveyance that is connected to the storm drain system without a permit, excluding roof drains and other similar type connections. Examples include channels, pipelines, conduits, inlets, or outlets that are connected directly to the storm drain system.

Illicit Discharge means any discharge to the storm drain system that is prohibited under local, state, or federal statutes, ordinances, codes, or regulations. The term "illicit discharge" includes all non storm-water discharges except discharges pursuant to an NPDES permit, discharges that are identified in **Discharge Prohibitions** of this Order, and discharges authorized by the Regional Board.

Illicit Disposal means any disposal, either intentionally or unintentionally, of materials or wastes that can pollute storm water.

Infiltration means the downward entry of water into the surface of the soil.

Inspection means entry and the conduct of an on-site review of a facility and its operations, at reasonable times, to determine compliance with specific municipal or other legal requirements. The steps involved in performing an inspection, include, but are not limited to:

a. Pre-inspection documentation research.;
b. Request for entry;
c. Interview of facility personnel;
d. Facility walk-through.
e. Visual observation of the condition of facility premises;
f. Examination and copying of records as required;
g. Sample collection if necessary or required;
h. Exit conference to discuss preliminary evaluation; and,
i. Report preparation, and if appropriate, recommendations for coming into compliance.

In the case of restaurants, a Permittee may conduct an inspection from the curbside, provided that such curbside inspection provides the Permittee with adequate information to determine an operator's compliance with BMPs that must be implemented per requirements of this Order and the SWMP.

Medium Municipal Separate Storm Sewer System (MS4) means all MS4s that serve a population less than 250,000 (1990 Census) as defined in 40 CFR 122.26 (b)(4).

Local SWPPP means the Storm Water Pollution Prevention Plan required by the local agency for a project that disturbs one or more acres of land.

Low Impact Development (LID) – A storm water management and land development strategy that emphasizes conservation and the use of on-site natural features integrated with engineered, small-scale hydrologic controls to more closely reflect pre-development hydrologic functions.

Maximum Extent Practicable (MEP) – The technology-based standard established by Congress in CWA section 402(p)(3)(B)(iii) that operators of MS4s must meet. Technology-based standards establish the level of pollutant reductions that dischargers must achieve;

typically by treatment or by a combination of source control and treatment control BMPs. MEP generally emphasizes pollution prevention and source control BMPs primarily (as the first line of defense) in combination with treatment methods serving as a backup (additional line of defense). MEP considers economics and is generally, but not necessarily, less stringent than BAT. A definition for MEP is not provided either in the statute or in the regulations. Instead the definition of MEP is dynamic and will be defined by the following process over time: municipalities propose their definition of MEP by way of their storm water management programs (SWMP). The Permittees' total collective and individual activities conducted pursuant to the storm water management programs (SWMP) becomes their proposal for MEP as it applies both to their overall effort, as well as to specific activities (e.g., MEP for street sweeping, or MEP for MS4 maintenance).

In the absence of a proposal acceptable to the Regional Board, the Regional Board defines MEP. In a memo dated February 11, 1993, entitled *"Definition of Maximum Extent Practicable,"* Elizabeth Jennings, Senior Staff Counsel, SWRCB addressed the achievement of the MEP standard as follows:

> "*To achieve the MEP standard, municipalities must employ whatever Best Management Practices (BMPs) are technically feasible (i.e., are likely to be effective) and are not cost prohibitive. The major emphasis is on technical feasibility. Reducing pollutants to the MEP means choosing effective BMPs, and rejecting applicable BMPs only where other effective BMPs will serve the same purpose, or the BMPs would not be technically feasible, or the cost would be prohibitive. In selecting BMPs to achieve the MEP standard, the following factors may be useful to consider:*
>
> *a. Effectiveness: Will the BMPs address a pollutant (or pollutant source) of concern?*
>
> *b. Regulatory Compliance: Is the BMP in compliance with storm water regulations as well as other environmental regulations?*
>
> *c. Public Acceptance: Does the BMP have public support?*
>
> *d. Cost: Will the cost of implementing the BMP have a reasonable relationship to the pollution control benefits to be achieved?*
>
> *e. Technical Feasibility: Is the BMP technically feasible considering soils, geography, water resources, etc?*
>
> *The final determination regarding whether a municipality has reduced pollutants to the maximum extent practicable can only be made by the Regional or State Water Boards, and not by the municipal discharger. If a municipality reviews a lengthy menu of BMPs and chooses to select only a few of the least expensive, it is likely that MEP has not been met. On the other hand, if a municipal discharger employs all applicable BMPs except those where it can show that they are not technically feasible in the locality, or whose cost would exceed any benefit derived, it would have met the standard. Where a*

choice may be made between two BMPs that should provide generally comparable effectiveness, the discharger may choose the least expensive alternative and exclude the more expensive BMP. However, it would not be acceptable either to reject all BMPs that would address a pollutant source, or to pick a BMP base solely on cost, which would be clearly less effective. In selecting BMPs the municipality must make a serious attempt to comply and practical solutions may not be lightly rejected. In any case, the burden would be on the municipal discharger to show compliance with its permit. After selecting a menu of BMPs, it is the responsibility of the discharger to ensure that all BMPs are implemented."

Method Detection Limit (MDL) means the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in 40 CFR 136, Appendix B.

Minimum Level (ML) means the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

Municipal Separate Storm Sewer System (MS4) means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, alleys, catch basins, curbs, gutters, ditches, manmade channels, or storm drains) owned by a State, city, county, town or other public body, that is designed or used for collecting or conveying storm water, which is not a combined sewer, and which is not part of a publicly owned treatment works, and which discharges to Waters of the United States.

National Pollutant Discharge Elimination System (NPDES) means the national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under CWA §307, 402, 318, and 405.

Natural Drainage Systems means unlined or unimproved (not engineered) creeks, streams, rivers or similar waterways.

New Development means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.

Non-Storm Water Discharge means any discharge to a storm drain that is not composed entirely of storm water.

Nuisance means anything that meets all of the following requirements: (1) is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property; (2) affects at the same time an entire community or neighborhood, or any considerable number of persons, although

the extent of the annoyance or damage inflicted upon individuals may be unequal.; (3) occurs during, or as a result of, the treatment or disposal of wastes.

Parking Lot means land area or facility for the parking or storage of motor vehicles used for businesses, commerce, industry, or personal use, with a lot size of 5,000 square feet or more of surface area, or with 25 or more parking spaces.

Performance Standard means a narrative or measurable number specifying the minimum acceptable outcome for a pollution control practice.

Permittees means Co-Permittees and any agency named in this Order as being responsible for permit conditions within its jurisdiction. Permittees to this Order include the County of Sacramento, and the Cities of Citrus Heights, Elk Grove, Folsom, Galt, Rancho Cordova and Sacramento.

Planning Priority Projects means those projects that are required to incorporate appropriate storm water mitigation measures into the design plan for their respective project. These types of projects include:

a. Ten or more unit homes including single family homes, multifamily homes, condominiums, and apartments;
b. A 100,000 or more square feet of impervious surface area industrial/ commercial development (1 acre starting March 2003);
c. Automotive service facilities (SIC 5013, 5014, 5541, 7532-7534, and 7536-7539);
d. Retail gasoline outlets;
e. Restaurants (SIC 5812);
f. Parking lots 5,000 square feet or more of surface area or with 25 or more parking spaces;
g. Redevelopment projects in subject categories that meet Redevelopment thresholds;
h. Projects located in or directly adjacent to or discharging directly to an ESA, which meet thresholds; and
i. Those projects that require the implementation of a site-specific plan to mitigate post-development storm water for new development not requiring a SUSMP but which may potentially have adverse impacts on post-development storm water quality, where the following project characteristics exist:

    1) Vehicle or equipment fueling areas;
    2) Vehicle or equipment maintenance areas, including washing and repair;
    3) Commercial or industrial waste handling or storage;
    4) Outdoor handling or storage of hazardous materials;
    5) Outdoor manufacturing areas;
    6) Outdoor food handling or processing;
    7) Outdoor animal care, confinement, or slaughter; or
    8) Outdoor horticulture activities.

Pollutants means those substances defined in CWA §502(6) (33.U.S.C.§1362(6)), and incorporated by reference into California Water Code §13373.

Potable Water Distribution Systems Releases means sources of flows from drinking water storage, supply and distribution systems including flows from system failures, pressure releases, system maintenance, distribution line testing, fire hydrant flow testing; and flushing and dewatering of pipes, reservoirs, vaults, and minor non-invasive well maintenance activities not involving chemical addition(s). It does not include wastewater discharges from activities that occur at wellheads, such as well construction, well development (i.e., aquifer pumping tests, well purging, etc.), or major well maintenance.

Project means all development, redevelopment, and land disturbing activities. The term is not limited to "Project" as defined under CEQA (Pub. Resources Code §21065).

Receiving Waters means all surface water bodies in the Central Valley Region that are identified in the Basin Plan.

Receiving Water Limitations (RWLs) - Waste discharge requirements issued by the Regional Board typically include both: (1) “Effluent Limitations” (or “Discharge Limitations”) that specify the technology-based or water-quality-based effluent limitations; and (2) “Receiving Water Limitations” that specify the water quality objectives in the Basin Plan as well as any other limitations necessary to attain those objectives. In summary, the “Receiving Water Limitations” provision is the provision used to implement the requirement of CWA section 301(b)(1)(C) that NPDES permits must include any more stringent limitations necessary to meet water quality standards.

Redevelopment means land-disturbing activity that results in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of a routine maintenance activity; and land disturbing activities related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

Regional Administrator means the Regional Administrator of the Regional Office of the U.S. Environmental Protection Agency (EPA) or the authorized representative of the Regional Administrator.

Restaurant means a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC Code 5812).

Retail Gasoline Outlet means any facility engaged in selling gasoline and lubricating oils.

Runoff means any runoff including storm water and dry weather flows from a drainage area that reaches a receiving water body or subsurface. During dry weather it is typically comprised of base flow either contaminated with pollutants or uncontaminated, and nuisance flows.

Screening means using proactive methods to identify illicit connections through a continuously narrowing process. The methods may include: performing baseline monitoring of open channels, conducting special investigations using a prioritization approach, analyzing maintenance records for catch basin and storm drain cleaning and operation, and verifying all permitted connections into the storm drains. Special investigation techniques may include: dye testing, visual inspection, smoke testing, flow monitoring, infrared, aerial and thermal photography, and remote control camera operation.

Sidewalk Rinsing means pressure washing of paved pedestrian walkways with average water usage of 0.006 gallon per square foot, with no cleaning agents, and properly disposing of all debris collected.

Significant Natural Area (SNA) means an area defined by the California Department of Fish and Game (DFG), Significant Natural Areas Program, as an area that contains an important example of California's biological diversity. The most current SNA maps, reports, and descriptions can be downloaded from the DFG website at ftp://maphost.dfg.ca.gov/outgoing/whdab/sna/. These areas are identified using the following biological criteria only, irrespective of any administrative or jurisdictional considerations:

a. Areas supporting extremely rare species or habitats;
b. Areas supporting associations or concentrations of rare species or habitats; and
c. Areas exhibiting the best examples of rare species and habitats in the state.

Site means the land or water area where any facility or activity is physically located or conducted, including adjacent land used in connection with the facility or activity.

Source Control BMP means any schedules of activities, prohibitions of practices, maintenance procedures, managerial practices or operational practices that aim to prevent storm water pollution by reducing the potential for contamination at the source of pollution.

State Storm Water Pollution Prevention Plan (State SWPPP) means a plan, as required by a State General Permit, identifying potential pollutant sources and describing the design, placement and implementation of BMPs, to effectively prevent non-stormwater Discharges and reduce Pollutants in Stormwater Discharges during activities covered by the General Permit.

Storm Event means any rain event greater than 0.25 inch in 24 hours except where specifically stated otherwise.

Storm Water means storm water runoff, snow melt runoff, and surface runoff and drainage.

Storm Water Discharge Associated with Industrial Activity means industrial discharge as defined in 40 CFR 122.26(b)(14)

Storm Water Quality Improvement Plan (SQIP) is the Permittees equivalent title for a Storm Water Management Plan. The SQIP means the Permittees program, which includes all elements and descriptions, collectively developed by the Permittees in accordance with provisions of the NPDES Permit, to comply with applicable federal and state law.

Structural BMP means any structural facility designed and constructed to mitigate the adverse impacts of storm water and urban runoff pollution (e.g. canopy, structural enclosure). The category may include both Treatment Control BMPs and Source Control BMPs.

SUSMP or Development Standards means Standard Urban Stormwater Mitigation Plans. They are standards which the Permittees must develop and implement for new development and significant redevelopment projects to control the discharge of storm water pollutants in post-construction storm water.

Total Maximum Daily Load (TMDL) means the sum of the individual waste load allocations for point sources and load allocations for nonpoint sources and natural background.

Toxicity Identification Evaluation (TIE) means a set of procedures to identify the specific chemical(s) responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.

Toxicity Reduction Evaluation (TRE) means a study conducted in a step-wise process to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity.

Treatment means the application of engineered systems that use physical, chemical, or biological processes to remove pollutants. Such processes include, but are not limited to, filtration, gravity settling, media absorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

Treatment Control BMP means any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media absorption or any other physical, biological, or chemical process.

U.S. EPA Phase I Facilities means facilities in specified industrial categories that are required to obtain an NPDES permit for storm water discharges, as required by 40 CFR 122.26(c). These categories include facilities subject to storm water effluent limitation guidelines, new source performance standards, or toxic pollutant effluent standards (40 CFR N); manufacturing facilities; oil and gas/mining facilities; hazardous waste treatment, storage, or disposal facilities; landfills, land application sites, and open dumps; recycling facilities; steam electric power generating facilities; transportation facilities sewage of wastewater treatment works; and light manufacturing facilities.

Vehicle Maintenance/Material Storage Facilities/Corporation Yards means any Permittee owned or operated facility or portion thereof that conducts industrial activity, operates equipment, handles materials, and provides services similar to Federal Phase I facilities; performs fleet vehicle service/maintenance on ten or more vehicles per day including repair, maintenance, washing, and fueling; performs maintenance and/or repair of heavy industrial machinery/equipment; and stores chemicals, raw materials, or waste materials in quantities that require a hazardous materials business plan or a Spill Prevention, Control, and Counter-measures (SPCC) plan.

Water Quality Standards and Water Quality Objectives means water quality criteria contained in the Basin Plan, the National Toxics Rule, the California Toxics Rule, and other state or federally approved surface water quality plans. Such plans are used by the Regional Board to regulate all discharges, including storm water discharges.

Waters of the State means any surface water or groundwater, including saline waters, within boundaries of the state.

Waters of the United States means:

a. All waters that are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;

b. All interstate waters, including interstate wetlands;

c. All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters:

    1. Which are or could be used by interstate or foreign travelers for recreational or other purposes;
    2. From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or
    3. Which are used or could be used for industrial purposes by industries in interstate commerce;

d. All impoundments of waters otherwise defined as waters of the United States under this definition;

e. Tributaries of waters identified in paragraphs (a) through (d) of this definition;

f. The territorial sea; and

g. Wetlands adjacent to waters (other than waters that are themselves wetlands) identified in paragraph (a) through (f) of this definition.

Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR 423.22(m), which also meet the criteria of this definition) are not waters of the United States. This exclusion applies only to man-made bodies of water, which neither were originally created in waters of the United States (such as disposal area in wetlands) nor resulted from the impoundment of waters of the United States. Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the CWA, the final authority regarding CWA jurisdiction remains with U.S. EPA.

Wet Season means the calendar period beginning October 1 through April 15.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL VALLEY REGION

STANDARD PROVISIONS AND REPORTING REQUIREMENTS
FOR
WASTE DISCHARGE REQUIREMENTS
(National Pollutant Discharge Elimination System)

February 2004

A. GENERAL PROVISIONS

1. Any violation of this Order constitutes a violation of the Federal Clean Water Act (CWA) and the California Water Code (CWC) and, therefore, may result in enforcement action under either or both laws.

2. The Clean Water Act provides that any person who violates a portion of this Order implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Clean Water Act is subject to a civil penalty not to exceed $25,000 per day for each violation. Any person who willfully or negligently violates this Order with regard to these sections of the CWA is subject to a fine of not less than $2,500 nor more than $25,000 per day of violation, or by imprisonment for not more than one year, or both.

3. The requirements prescribed herein do not authorize the commission of any act causing injury to the property of another; protect the Discharger from liability under federal, state, or local laws; or guarantee the Discharger a capacity right in the receiving waters.

4. The Discharger shall allow representatives of the Regional Water Quality Control Board (hereafter Board), the State Water Resources Control Board (hereafter State Board) and the United States Environmental Protection Agency (hereafter U.S. U.S. EPA), upon presentation of credentials, at reasonable hours, to:

   a. enter premises where wastes are treated, stored, or discharged and facilities in which any required records are kept;

   b. copy any records required to be kept under terms and conditions of this Order;

   c. inspect facilities, monitoring equipment, practices, or operations regulated or required by this Order; and

   d. sample, photograph or video tape any discharge, waste, waste unit or monitoring device.

5. If the Discharger's wastewater treatment plant is publicly owned or subject to regulation by the California Public Utilities Commission, it shall be supervised and operated by persons possessing certificates of appropriate grade according to Title 23, California Code of Regulations (CCR), Division 3, Chapter 14.

6. The Discharger shall at all times properly operate and maintain all facilities, and systems of treatment and control including sludge use and disposal facilities (and related appurtenances) that are installed or used to achieve compliance with this Order.

   Proper operation and maintenance includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by the Discharger only when necessary to achieve compliance with this Order.

7. After notice and opportunity for a hearing, this Order may be terminated or modified for cause, including, but not limited to:

a. violation of any term or condition contained in this Order;

b. obtaining this Order by misrepresentation or by failing to disclose fully all relevant facts;

c. a change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge; and

d. a material change in the character, location, or volume of discharge.

The causes for modification include:

a. New regulations. New regulations have been promulgated under Section 405(d) of the Clean Water Act, or the standards or regulations on which the permit was based have been changed by promulgation of amended standards or regulations or by judicial decision after the permit was issued.

b. Land application plans. When required by a permit condition to incorporate a land application plan for beneficial reuse of sewage sludge, to revise an existing land application plan, or to add a land application plan.

c. Change in sludge use or disposal practice. Under 40 Code of Federal Regulations (CFR) 122.62(a)(1), a change in the Discharger's sludge use or disposal practice is a cause for modification of the permit. It is cause for revocation and reissuance if the Discharger requests or agrees.

The Regional Board may review and revise this Order at any time upon application of any affected person or the Board's own motion.

8. The filing of a request by the Discharger for modification, revocation and reissuance, or termination of this Order, or notification of planned changes or anticipated noncompliance, does not stay any condition of this Order.

   The Discharger shall furnish, within a reasonable time, any information the Board or U.S. EPA may request to determine compliance with this Order or whether cause exists for modifying or terminating this Order. The Discharger shall also furnish to the Board, upon request, copies of records required to be kept by this Order.

9. If a toxic effluent standard or prohibition (including any scheduled compliance specified in such effluent standard or prohibition) is established under Section 307(a) of the CWA, or amendments thereto, for a toxic pollutant that is present in the discharge authorized herein, and such standard or prohibition is more stringent than any limitation upon such pollutant in this Order, the Board will revise or modify this Order in accordance with such toxic effluent standard or prohibition.

   The Discharger shall comply with effluent standards and prohibitions within the time provided in the regulations that establish those standards or prohibitions, **even if this Order has not yet been modified.**

10. If more stringent applicable water quality standards are approved, pursuant to Section 303 of the CWA, or amendments thereto, the Board will revise and modify this Order in accordance with such more stringent standards.

11. This Order shall be modified, or alternately revoked and reissued, to comply with any applicable effluent standard or limitation issued or approved under Sections 301(b)(2)(C) and (D), 304(b)(2), and 307(a)(2) of the CWA, if the effluent standard or limitation so issued or approved:

    a. contains different conditions or is otherwise more stringent than any effluent limitation in the Order; or

    b. controls any pollutant limited in the Order.

    The Order, as modified or reissued under this paragraph, shall also contain any other requirements of the CWA then applicable.

12. The provisions of this Order are severable. If any provision of this Order is found invalid, the remainder of this Order shall not be affected.

13. By-pass (the intentional diversion of waste streams from any portion of a treatment facility or collection system, except those portions designed to meet variable effluent limits) is prohibited except under the following conditions:

    a. (1) by-pass was unavoidable to prevent loss of life, personal injury, or severe property damage; (severe property damage means substantial physical damage to property, damage to the treatment facilities that causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a by-pass; severe property damage does not mean economic loss caused by delays in production);

    and

    (2) there were no feasible alternatives to by-pass, such as the use of auxiliary treatment facilities or retention of untreated waste; this condition is not satisfied if adequate backup equipment should have been installed in the exercise of reasonable engineering judgment to prevent a by-pass that would otherwise occur during normal periods of equipment downtime or preventive maintenance;

    or

    b. (1) by-pass is required for essential maintenance to assure efficient operation;

    and

    (2) neither effluent nor receiving water limitations are exceeded;

    and

    (3) the Discharger notifies the Board ten days in advance.

    The permittee shall submit notice of an unanticipated by-pass as required in paragraph B.1. below.

14. Upset means an exceptional incident in which there is unintentional and temporary noncompliance with effluent limitations because of factors beyond the reasonable control of the Discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, failure to

implement an appropriate pretreatment program, or careless or improper action. A Discharger that wishes to establish the affirmative defense of an upset in an action brought for noncompliance shall demonstrate, through properly signed, contemporaneous operating logs, or other evidence, that:

a. an upset occurred due to identifiable cause(s);

b. the permitted facility was being properly operated at the time of the upset;

c. notice of the upset was submitted as required in paragraph B. 1.; and

d. remedial measures were implemented as required under paragraph A. 17.

In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof.

15. This Order is not transferable to any person except after notice to the Board. The Board may modify or revoke and reissue the Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA.

16. Except for data determined to be confidential under Section 13267 of the CWC, all reports prepared in accordance with terms of this Order shall be available for public inspection at the offices of the Board and U.S. EPA. Effluent data are not confidential.

17. The Discharger shall take all reasonable steps to minimize any adverse effects to waters of the State or users of those waters resulting from any discharge or sludge use or disposal in violation of this Order. Reasonable steps shall include such accelerated or additional monitoring as necessary to determine the nature and impact of the non-complying discharge or sludge use or disposal.

18. The fact that it would have been necessary for the Discharger to halt or reduce the permitted activity in order to comply with this Order shall not be a defense for violating this Order.

19. The Discharger shall ensure compliance with any existing or future pretreatment standard promulgated by U.S. EPA under Section 307 of the CWA, or amendment thereto, for any discharge to the municipal system.

20. The discharge of any radiological, chemical or biological warfare agent or high-level, radiological waste is prohibited.

21. A copy of this Order shall be maintained at the discharge facility and be available at all times to operating personnel. Key operating personnel shall be familiar with its content.

22. Neither the treatment nor the discharge shall create a condition of nuisance or pollution as defined by the CWC, Section 13050.

B. GENERAL REPORTING REQUIREMENTS

1. In the event the Discharger does not comply or will be unable to comply for any reason, with any prohibition, daily maximum effluent limitation, or receiving water limitation of this Order, the Discharger shall notify the Board by telephone (916) 464-3291*[Note: Current phone numbers for all three Regional Board offices may be found on the internet at http://www.swrcb.ca.gov/rwqcb5/contact_us.]* within 24 hours of having knowledge of such noncompliance, and shall confirm this notification in writing within five days, unless the Board waives

confirmation. The written notification shall state the nature, time, duration, and cause of noncompliance, and shall describe the measures being taken to remedy the current noncompliance and, prevent recurrence including, where applicable, a schedule of implementation. Other noncompliance requires written notification as above at the time of the normal monitoring report.

2. Safeguard to electric power failure:

   a. The Discharger shall provide safeguards to assure that, should there be reduction, loss, or failure of electric power, the discharge shall comply with the terms and conditions of this Order.

   b. Upon written request by the Board the Discharger shall submit a written description of safeguards. Such safeguards may include alternate power sources, standby generators, retention capacity, operating procedures, or other means. A description of the safeguards provided shall include an analysis of the frequency, duration, and impact of power failures experienced over the past five years on effluent quality and on the capability of the Discharger to comply with the terms and conditions of the Order. The adequacy of the safeguards is subject to the approval of the Board.

   c. Should the treatment works not include safeguards against reduction, loss, or failure of electric power, or should the Board not approve the existing safeguards, the Discharger shall, within ninety days of having been advised in writing by the Board that the existing safeguards are inadequate, provide to the Board and U.S. EPA a schedule of compliance for providing safeguards such that in the event of reduction, loss, or failure of electric power, the Discharger shall comply with the terms and conditions of this Order. The schedule of compliance shall, upon approval of the Board, become a condition of this Order.

3. The Discharger, upon written request of the Board, shall file with the Board a technical report on its preventive (failsafe) and contingency (cleanup) plans for controlling accidental discharges, and for minimizing the effect of such events. This report may be combined with that required under B.2.

   The technical report shall:

   a. Identify the possible sources of spills, leaks, untreated waste by-pass, and contaminated drainage. Loading and storage areas, power outage, waste treatment unit outage, and failure of process equipment, tanks and pipes should be considered.

   b. Evaluate the effectiveness of present facilities and procedures and state when they became operational.

   c. Predict the effectiveness of the proposed facilities and procedures and provide an implementation schedule containing interim and final dates when they will be constructed, implemented, or operational.

      The Board, after review of the technical report, may establish conditions, which it deems necessary to control accidental discharges and to minimize the effects of such events. Such conditions shall be incorporated as part of this Order, upon notice to the Discharger.

4. The Discharger shall file with the Board a Report of Waste Discharge at least 180 days before making any material change in the character, location, or volume of the discharge. A **material change** includes, but is not limited to, the following:

   a. Adding a major industrial waste discharge to a discharge of essentially domestic sewage, or adding a new process or product by an industrial facility resulting in a change in the character of

the waste.

b. Significantly changing the disposal method or location, such as changing the disposal to another drainage area or water body.

c. Significantly changing the method of treatment.

d. Increasing the discharge flow beyond that specified in the Order.

5. A publicly owned treatment works (POTW) whose waste flow has been increasing, or is projected to increase, shall estimate when flows will reach hydraulic and treatment capacities of its treatment and disposal facilities. The projections shall be made in January, based on the last three years' average dry weather flows, peak wet weather flows and total annual flows, as appropriate. When any projection shows that capacity of any part of the facilities may be exceeded in four years, the Discharger shall notify the Board by **31 January.** A copy of the notification shall be sent to appropriate local elected officials, local permitting agencies and the press. Within 120 days of the notification, the Discharger shall submit a technical report showing how it will prevent flow volumes from exceeding capacity or how it will increase capacity to handle the larger flows. The Board may extend the time for submitting the report.

6. A manufacturing, commercial, mining, or silvicultural discharger shall notify the Board as soon as it knows or has reason to believe:

   a. That any activity has occurred or will occur that would result in the discharge of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels":

      (1) 100 micrograms per liter (µg/l);

      (2) 200 µg/l for acrolein and acrylonitrile; 500 µg/l for 2,4-dinitrophenol and 2-methyl-4,6-dinitrophenol; and 1 milligram per liter (mg/l) for antimony;

      (3) five times the maximum concentration value reported for that pollutant in the Report of Waste Discharge; or

      (4) the level established by the Board in accordance with 40 CFR 122.44(f).

   b. That it expects to begin to use or manufacture, as an intermediate or final product or by-product, any toxic pollutant that was not reported in the Report of Waste Discharge.

7. A POTW shall provide adequate notice to the Board of:

   a. any new introduction of pollutants into the POTW from an indirect discharger that would be subject to Sections 301 or 306 of the CWA if it were directly discharging those pollutants, and

   b. any substantial change in the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of adoption of the Order, and

   c. any planned physical alterations or additions to the permitted facility, or changes planned in the Discharger's sludge use or disposal practice, where such alterations, additions, or changes may justify the application of permit conditions that are different from or absent in the existing permit including notification of additional disposal sites not reported during the permit application

process, or not reported pursuant to an approved land application plan.

Adequate notice shall include information on the quality and quantity of effluent introduced into the POTW as well as any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW.

8. The Discharger shall give advance notice to the Board of any planned changes in the permitted facility or activity that may result in noncompliance with this Order.

9. The Discharger shall submit technical reports as directed by the Executive Officer.

10. Any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this Order, including monitoring reports or reports of compliance or noncompliance shall, upon conviction, be punished by a fine of not more than $10,000 per violation, or by imprisonment for not more than two years per violation, or by both.

C. PROVISIONS FOR MONITORING

1. All analyses shall be performed in accordance with the latest edition of *Guidelines Establishing Test Procedures for Analysis of Pollutants,* promulgated by U.S. EPA (40 CFR 136) or other procedures approved by the Board.

2. Chemical, bacteriological, and bioassay analyses shall be conducted at a laboratory certified for such analyses by the State Department of Health Services. In the event a certified laboratory is not available to the Discharger, analyses performed by a noncertified laboratory will be accepted provided a Quality Assurance-Quality Control Program is instituted by the laboratory. A manual containing the steps followed in this program must be kept in the laboratory and shall be available for inspection by Board staff. The Quality Assurance-Quality Control Program must conform to U.S. EPA guidelines or to procedures approved by the Board.
   Unless otherwise specified, all metals shall be reported as Total Metals.
   Unless otherwise specified, bioassays shall be performed in the following manner:

   a. Acute bioassays shall be performed in accordance with guidelines approved by the Board and the Department of Fish and Game or in accordance with methods described in U.S. EPA's manual for measuring acute toxicity of effluents (EPA-821-R-02-012 and subsequent amendments).

   b. Short-term chronic bioassays shall be performed in accordance with U.S. EPA guidelines (EPA-821-R-02-013 and subsequent amendments).

3. Laboratories that perform sample analyses must be identified in all monitoring reports submitted to the Board and U.S. EPA.

4. The Discharger shall conduct analysis on any sample provided by U.S. EPA as part of the Discharge Monitoring Quality Assurance (DMQA) program. The results of any such analysis shall be submitted to U.S. EPA's DMQA manager.

5. Effluent samples shall be taken downstream of the last addition of wastes to the treatment or discharge works where a representative sample may be obtained prior to mixing with the receiving waters. Samples shall be collected at such a point and in such a manner to ensure a representative sample of the discharge.

6. All monitoring and analysis instruments and devices used by the Discharger to fulfill the prescribed

monitoring program shall be properly maintained and calibrated as necessary, at least yearly, to ensure their continued accuracy.

7. The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this Order shall, upon conviction, be punished by a fine of not more than $10,000 per violation, or be imprisoned for not more than two years per violation, or by both.

8. The Discharger shall retain records of all monitoring information, including all calibration and maintenance records, all original strip chart recordings of continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order. Records shall be maintained for a minimum of five years from the date of the sample, measurement, report, or application. This period may be extended during the course of any unresolved litigation regarding this discharge or when requested by the Board Executive Officer.

9. The records of monitoring information shall include:

    a. the date, exact place, and time of sampling or measurements,
    b. the individual who performed the sampling of measurements,
    c. the date(s) analyses were performed,
    d. the individual(s) who performed the analyses,
    e. the laboratory which performed the analyses,
    f. the analytical techniques or methods used, and
    g. the results of such analyses.

D. REPORTING REQUIREMENTS FOR MONITORING

1. The Discharger shall file with the Board technical reports on self-monitoring performed according to the detailed specifications contained in the Monitoring and Reporting Program attached to this Order.

2. Monitoring reports shall be submitted on forms to be supplied by the Board to the extent that the information reported may be entered on the forms. Alternate forms may be approved for use by the Board.

3. The results of all monitoring required by this Order shall be reported to the Board, and shall be submitted in such a format as to allow direct comparison with the limitations and requirements of this Order. Unless otherwise specified, discharge flows shall be reported in terms of the monthly average and the daily maximum discharge flows.

4. The results of analyses performed in accordance with specified test procedures, taken more frequently than required at the locations specified in the Monitoring and Reporting Program, shall be reported to the Board and used in determining compliance.

5. Upon written request of the Board, the Discharger shall submit a summary monitoring report to the Board. The report shall contain both tabular and graphical summaries of the monitoring data obtained during the previous year(s).

6. All reports shall be signed by a person identified below:

    a. **For a corporation:** by a principal executive officer of at least the level of senior vice-president.

b. **For a partnership or sole proprietorship:** by a general partner or the proprietor, respectively.

c. **For a municipality, state, federal or other public agency:** by either a principal executive officer or ranking elected or appointed official.

d. A duly authorized representative of a person designated in 6a, 6b or 6c of this requirement if:

(1) the authorization is made in writing by a person described in 6a, 6b, or 6c of this provision,

(2) the authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity, such as the position of plant manager, superintendent, or position of equivalent responsibility. (A duly authorized representative may thus be either a named individual or any individual occupying a named position), and

(3) the written authorization is submitted to the Board.

Each person signing a report required by this Order or other information requested by the Board shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

The Discharger shall mail a copy of each monitoring report and any other reports required by this Order to:

Central Valley Regional Water Quality Control Board
11020 Sun Center Drive, #200
Rancho Cordova, CA 95670-6114
Note: Current addresses for all three Regional Board offices may be found on the internet at http://www.swrcb.ca.gov/rwqcb5/contact_us.

In addition, dischargers designated as a "major" discharger shall transmit a copy of all monitoring reports to U.S. EPA (see address in Provision G. 10).

E. DEFINITIONS:

1. The **daily discharge rate** is obtained from the following calculation for any calendar day:

$$\text{Daily discharge rate (lbs/day)} = \frac{8.34}{N} \sum_{I}^{N} Q_i C_i$$

In which N is the number of samples analyzed in a day. Q_i and C_i are the flow rate (mgd) and the

constituent concentration (mg/l), respectively, which are associated with each of the N grab samples that may be taken in a day. If a composite sample is taken, C_i is the concentration measured in the composite sample and Q_i is the average flow rate occurring during the period over which samples are composited.

2. The **monthly or weekly average discharge rate** is the total of daily discharge rates during a calendar month or week, divided by the number of days in the month or week that the facility was discharging.

   Where less than daily sampling is required by this permit, the monthly or weekly average discharge rate shall be determined by the summation of all the daily discharge rates divided by the number of days during the month or week for which the rates are available.

   For other than weekly or monthly periods, compliance shall be based upon the average of all rates available during the specified period.

3. The **monthly or weekly average concentration** is the arithmetic mean of measurements made during a calendar month or week, respectively.

4. The **daily maximum discharge rate** means the total discharge by weight during one day.

5. The **daily maximum concentration** is the greatest concentration found in grab or composite samples analyzed for one day.

6. **A grab sample** is an individual sample collected in less than 15 minutes.

7. Unless otherwise specified, a **composite sample** is a combination of individual samples collected over the specified sampling period:

   a. at equal time intervals, with a maximum interval of one hour, and

   b. at varying time intervals (average interval one hour or less) so that each sample represents an equal portion of the cumulative flow.

   The duration of the sampling period shall be specified in the Monitoring and Reporting Program. The method of compositing shall be reported with the results.

8. **Sludge** means the solids, residues, and precipitates separated from, or created in, wastewater by the unit processes of a treatment system.

9. **Median** is the value below which half the samples (ranked progressively by increasing value) fall. It may be considered the middle value, or the average of the two middle values.

10. **Overflow** means the intentional or unintentional diversion of flow from the collection and transport systems, including pumping facilities.

F. PRETREATMENT PROGRAM REQUIREMENTS (Applies to dischargers required to establish pretreatment programs by this Order.)

The Discharger shall be responsible for the performance of all pretreatment requirements contained in 40 CFR Part 403 and shall be subject to enforcement actions, penalties, fines, and other remedies by the U.S. EPA, or other appropriate parties, as provided in the CWA, as amended (33 USC 1351, et. seq.)

The Discharger shall implement and enforce its Approved publicly owned treatment works (POTW) Pretreatment Program. The Discharger's Approved POTW Pretreatment Program is hereby made an enforceable condition of this permit. U.S. EPA may initiate enforcement action against an industrial user for noncompliance with applicable standards and requirements as provided in the Act.
The Discharger shall enforce the requirements promulgated under Sections 307(b), (c), and (d) and Section 402(b) of the CWA. The Discharger shall cause industrial users subject to Federal Categorical Standards to achieve compliance no later than the date specified in those requirements or, in the case of a new industrial user, upon commencement of the discharge.

1. The Discharger shall perform the pretreatment functions as required in 40 CFR Part 403 including, but not limited to:

   a. Implement the necessary legal authorities as provided in 40 CFR 403.8(f)(l).

   b. Enforce the pretreatment requirements under 40 CFR 403.5 and 403.6.

   c. Implement the programmatic functions as provided in 40 CFR 403.8(f)(2), in particular, the publishing of a list of significant violators.

   d. Provide the requisite funding and personnel to implement the pretreatment program as provided in 40 CFR 403.8(f)(3).

G. ANNUAL PRETREATMENT REPORT REQUIREMENTS (Applies to dischargers required to establish pretreatment programs by this Order.)

The Discharger shall submit annually a report to the Board, with copies to US U.S. EPA Region 9 and the State Board, describing the Discharger's pretreatment activities over the previous 12 months. In the event that the Discharger is not in compliance with any conditions or requirements of this Order, including noncompliance with pretreatment audit/compliance inspection requirements, then the Discharger shall also include the reasons for noncompliance and state how and when the Discharger shall comply with such conditions and requirements.

An annual report shall be submitted by **28 February** or as otherwise specified in the Order and include at least the following items:

1. A summary of analytical results from representative, flow proportioned, 24-hour composite sampling of the POTW's influent and effluent for those pollutants U.S. EPA has identified under Section 307(a) of the CWA which are known or suspected to be discharged by industrial users.

   The Discharger is not required to sample and analyze for asbestos until U.S. EPA promulgates an applicable analytical technique under 40 CFR 136. Sludge shall be sampled during the same 24-hour period and analyzed for the same pollutants as the influent and effluent sampling and analysis. The sludge analyzed shall be a composite sample of a minimum of 12 discrete samples taken at equal time intervals over the 24-hour period. Wastewater and sludge sampling and analysis shall be performed at least annually. The discharger shall also provide any influent, effluent or sludge monitoring data for nonpriority pollutants which may be causing or contributing to Interference, Pass-Through or adversely impacting sludge quality. Sampling and analysis shall be performed in accordance with the techniques prescribed in 40 CFR 136 and amendments thereto.

2. A discussion of Upset, Interference, or Pass-Through incidents, if any, at the treatment plant which the Discharger knows or suspects were caused by industrial users of the POTW. The discussion shall include the reasons why the incidents occurred, the corrective actions taken and, if known, the name

and address of the industrial user(s) responsible. The discussion shall also include a review of the applicable pollutant limitations to determine whether any additional limitations, or changes to existing requirements, may be necessary to prevent Pass-Through, Interference, or noncompliance with sludge disposal requirements.

3. The cumulative number of industrial users that the Discharger has notified regarding Baseline Monitoring Reports and the cumulative number of industrial user responses.

4. An updated list of the Discharger's industrial users including their names and addresses, or a list of deletions and additions keyed to a previously submitted list. The Discharger shall provide a brief explanation for each deletion. The list shall identify the industrial users subject to federal categorical standards by specifying which set(s) of standards are applicable. The list shall indicate which categorical industries, or specific pollutants from each industry, are subject to local limitations that are more stringent than the federal categorical standards. The Discharger shall also list the noncategorical industrial users that are subject only to local discharge limitations. The Discharger shall characterize the compliance status through the year of record of each industrial user by employing the following descriptions:

   a. complied with baseline monitoring report requirements (where applicable);

   b. consistently achieved compliance;

   c. inconsistently achieved compliance;

   d. significantly violated applicable pretreatment requirements as defined by 40 CFR 403.8(f)(2)(vii);

   e. complied with schedule to achieve compliance (include the date final compliance is required);

   f. did not achieve compliance and not on a compliance schedule; and

   g. compliance status unknown.

   A report describing the compliance status of each industrial user characterized by the descriptions in items c. through g. above shall be submitted for each calendar quarter **within 21 days of the end of the quarter.** The report shall identify the specific compliance status of each such industrial user and shall also identify the compliance status of the POTW with regards to audit/pretreatment compliance inspection requirements. If none of the aforementioned conditions exist, at a minimum, a letter indicating that all industries are in compliance and no violations or changes to the pretreatment program have occurred during the quarter must be submitted. The information required in the fourth quarter report shall be included as part of the annual report. This quarterly reporting requirement shall commence upon issuance of this Order.

5. A summary of the inspection and sampling activities conducted by the Discharger during the past year to gather information and data regarding the industrial users. The summary shall include:

   a. the names and addresses of the industrial users subjected to surveillance and an explanation of whether they were inspected, sampled, or both and the frequency of these activities at each user; and

   b. the conclusions or results from the inspection or sampling of each industrial user.

6. A summary of the compliance and enforcement activities during the past year. The summary shall

include the names and addresses of the industrial users affected by the following actions:

a. Warning letters or notices of violation regarding the industrial users' apparent noncompliance with federal categorical standards or local discharge limitations. For each industrial user, identify whether the apparent violation concerned the federal categorical standards or local discharge limitations.

b. Administrative orders regarding the industrial users noncompliance with federal categorical standards or local discharge limitations. For each industrial user, identify whether the violation concerned the federal categorical standards or local discharge limitations.

c. Civil actions regarding the industrial users' noncompliance with federal categorical standards or local discharge limitations. For each industrial user, identify whether the violation concerned the federal categorical standards or local discharge limitations.

d. Criminal actions regarding the industrial users noncompliance with federal categorical standards or local discharge limitations. For each industrial user, identify whether the violation concerned the federal categorical standards or local discharge limitations.

e. Assessment of monetary penalties. For each industrial user identify the amount of the penalties.

f. Restriction of flow to the POTW.

g. Disconnection from discharge to the POTW.

7. A description of any significant changes in operating the pretreatment program which differ from the information in the Discharger's approved Pretreatment Program including, but not limited to, changes concerning: the program's administrative structure, local industrial discharge limitations, monitoring program or monitoring frequencies, legal authority or enforcement policy, funding mechanisms, resource requirements, or staffing levels.

8. A summary of the annual pretreatment budget, including the cost of pretreatment program functions and equipment purchases.

Duplicate signed copies of these reports shall be submitted to the Board and the

State Water Resources Control Board
Division of Water Quality
P.O. Box 100
Sacramento, CA 95812-0100

and the

Regional Administrator
U.S. Environmental Protection Agency W-5
75 Hawthorne Street
San Francisco, CA 94105

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL VALLEY REGION

ORDER NO. R5-2008-0142

NPDES NO. CAS082597

FACT SHEET

CITIES OF CITRUS HEIGHTS, ELK GROVE, FOLSOM, GALT, RANCHO CORDOVA
SACRAMENTO AND COUNTY OF SACRAMENTO
STORM WATER DISCHARGES FROM
MUNICIPAL SEPARATE STORM SEWER SYSTEM
SACRAMENTO COUNTY

I. PURPOSE

The Regional Water Quality Control Board, Central Valley Region (Regional Water Board) will be considering adoption of a renewal of the County of Sacramento and the cities of Citrus Heights, Elk Grove, Folsom, Galt, Rancho Cordova and Sacramento Municipal Separate Storm Sewer System NPDES Permit (hereinafter referred to as Permit). The purpose of this Fact Sheet is to give the Permittees and interested parties an overview of the Permit as well as to provide the regulatory, technical and background basis for the Permit requirements. Sections II through IV describe water quality problems from storm water and urban runoff, and Permit conditions designed to address these problems. Sections V and VI discuss each major element of the permittees' storm water management plans (referred to as Storm Water Quality Improvement Plans (SQIPs) by the Permittees). The SQIPs will be adopted by the Regional Water Board and are considered an integral and enforceable component of the proposed Permit.

The proposed Permit specifies requirements necessary for the Permittees to reduce the discharge of pollutants in urban runoff to the maximum extent practicable (MEP). However, since compliance with the MEP standard is an iterative process, the Permittees' storm water programs must continually be assessed and modified as urban runoff management knowledge increases, to incorporate improved programs, control measures, best management practices (BMPs), etc. in order to achieve the MEP standard. This iterative process of continual assessment, revision, and improvement of storm water management program implementation is expected to achieve compliance with water quality standards.

II. THE NEED TO REGULATE STORM WATER DISCHARGES

A. Impacts

The quality of storm water and urban runoff are fundamentally important to the health of the environment and the quality of life in the Central Valley Region. Polluted storm water runoff is a leading cause of water quality impairment in the Sacramento area, as well as other potential sources as aerial deposition and runoff from sources outside the urban area. Storm water and urban runoff (during dry and wet weather) are often polluted with pesticides, fertilizers, animal droppings, trash, food wastes, automotive byproducts, and many other toxic substances generated by urban environments. Water that flows over streets, parking lots, construction sites, and industrial, commercial, residential, and municipal areas carries these pollutants through the storm drain systems directly into receiving waters.

The Natural Resources Defense Council (NRDC) 1999 report, *Stormwater Strategies, Community Responses to Runoff Pollution*[1] identifies two main causes of the storm water pollution problem in urban areas. Both causes are directly related to development in urban and urbanizing areas:

1. Increased volume and velocity of surface runoff. There are three types of human-made impervious covers that increase the volume and velocity of runoff: (i) rooftop, (ii) transportation imperviousness, and (iii) non-porous (impervious) surfaces. As these impervious surfaces increase, infiltration will decrease, forcing more water to run off the surface, picking up speed and pollutants.

2. High concentration of pollutants in the runoff. Certain activities, such as those from industrial sites, are large contributors of pollutant concentrations to the storm water system.

The report also identified several activities causing storm water pollution from urban areas, practices of homeowners, businesses, and government agencies.

Studies conducted by the United States Geological Survey (USGS)[2] confirm the link between urbanization and water quality impairments in urban watersheds due to contaminated storm water runoff. Furthermore, the water quality impacts of urbanization and urban storm water discharges have been

[1] *Clean Water & Oceans: Water Pollution: In Depth Report Stormwater Strategies, Community Responses to Runoff Pollution*. Natural Resources Defense Council (NRDC), 1999.
[2] *Water Quality in the Puget Sound Basin, Washington and British Columbia, 1996-98,*Circular 1216 - USGS 2000; *Water Quality in the Long Island-New Jersey Coastal Drainages, New Jersey and New York, 1996-98,* Circular 1201 - USGS 2000

summarized by several other U.S. EPA reports.[3] Urbanization causes changes in hydrology and increases pollutant loads, which adversely impact water quality and impairs the beneficial uses of receiving waters.

Increases in population density and imperviousness result in changes to stream hydrology including:

1. Increased peak discharges compared to predevelopment levels;

2. Increased volume of storm water runoff with each storm compared to pre-development levels;

3. Decreased travel time to reach receiving water; increased frequency and severity of floods;

4. Reduced stream flow during prolonged periods of dry weather due to reduced levels of infiltration;

5. Increased runoff velocity during storms due to a combination of effects of higher discharge peaks, rapid time of concentration, and smoother hydraulic surfaces from channelization; and

6. Decreased infiltration and groundwater recharge.

In order to reduce pollutants and runoff flows from new development and redevelopment to the MEP, each Permittee is required to ensure that all feasible BMPs are considered. The MEP standard involves applying BMPs that are effective in reducing the discharge of pollutants in storm water runoff. In discussing the MEP standard, the State Water Board has said the following: "There must be a serious attempt to comply, and practical solutions may not be lightly rejected. If, from the list of BMPs, a permittee chooses only a few of the least expensive methods, it is likely that MEP has not been met. On the other hand, if a permittee employs all applicable BMPs except those where it can show that they are not technically feasible in the locality, or whose cost would exceed any benefit to be derived, it would have met the standard. MEP requires permittees to choose effective BMPs, and to reject applicable BMPs only where other effective BMPs will serve the same purpose, the BMPs would not be technically feasible, or the cost would be prohibitive." (Order No. WQ 2000-11, at p.20.) MEP is the result of the cumulative effect of implementing, continuously evaluating, and making corresponding changes to a variety of technically and economically feasible BMPs that ensures the most appropriate controls are implemented in the

[3] *Storm Water Phase II Report to Congress* (U.S. EPA 1995); Report to Congress on the Phase II Storm Water Regulations (U.S. EPA1999); Coastal Zone Management Measures Guidance (U.S. EPA 1992)

most effective manner. This process of implementing, evaluating, revising, or adding new BMPs is commonly referred to as the iterative approach. For Small MS4s, EPA has stated that pollutant reductions to the MEP will be realized by implementing BMPs through the six minimum measures described in the permit. (64 Federal Register 68753.)

B. **Benefits of Permit Program Implementation**

Implementation of Best Management Practices (BMPs) will reduce pollutant discharges and improve surface water quality to the maximum extent practicable (MEP). The expected benefits of implementing the provisions of the Sacramento MS4 National Pollutant Discharge Elimination System (NPDES) permit include:

1. **Enhanced Aesthetic Value**: Storm water affects the appearance and quality of a water body, and the desirability of working, living, traveling, or owning property near that water body. Reducing storm water pollution will increase benefits as these water bodies recover and become more desirable.

2. **Enhanced Opportunities for Boating**: reducing sediment and other pollutants, and increasing water clarity, which enhances the boating experience for users, offer additional benefits.

3. **Enhanced Commercial Fishing**: Important because commercial fisheries are a significant part of the nation's economy, and 28% of the estuaries in the 305(b) Report were impacted by storm water/urban runoff.

4. **Enhanced Recreational and Subsistence Fishing**: Pollutants in storm water can eliminate or decrease the numbers, or size, of sport fish and shell fish in receiving waters.

5. **Reduced Flood Damage**: Storm water runoff controls may mitigate flood damage by addressing problems due to the diversion of runoff, insufficient storage capacity, and reduced channel capacity from sedimentation.

6. **Reduced Illness from Consuming Contaminated Fish**: Storm water controls may reduce the presence of pathogens in fish caught by recreational anglers.

7. **Reduced Illness from Swimming in Contaminated Water**: Epidemiological studies indicate that swimmers in water contaminated

by storm water runoff are more likely to experience illness than those who swim farther away from a storm water outfall.

8. **Enhanced Opportunities for Non-contact Recreation**: Storm water controls reduce turbidity, odors, floating trash, and other pollutants, which then allow waters to be used as focal point for recreation, and enhance the experience of the users.

9. **Drinking Water Benefits**: Pollutants from storm water runoff, such as solids, toxic pollutants, and bacteria may pose additional costs for treatment, or render the water unusable for drinking.

10. **Water Storage Benefits**: Storm water is a major source of impairment for reservoirs. The heavy load of solids deposited by storm water runoff can lead to rapid sedimentation of reservoirs and the loss of needed water storage capacity.[4]

11. **Improved Habitat Benefits**: Storm water can have significant impacts to habitat and aquatic life. Stormwater controls can minimize impacts to creek corridors and the wildlife dependent on them.

III. STATUTORY AND REGULATORY HISTORY AND OTHER CONSIDERATIONS OF THE STORM WATER PROGRAM

A. Basis for Permit Conditions

In the 15 years following the introduction of the Clean Water Act in 1972, water pollution control efforts focused primarily on wastewater discharges from facilities such as factories and sewage treatment plants, with less emphasis on diffuse sources. The federal Clean Water Act (CWA) prohibits the discharge of any pollutant to waters from a point source, unless a NPDES permit authorizes the discharge. Because the focus on reducing pollutants was centered on industrial and sewage treatment discharges, the U.S. Congress amended the CWA in 1987, requiring the U.S. EPA to create phased NPDES requirements for storm water discharges.

In response to the 1987 Amendments to the CWA, the U.S. EPA developed Phase I of the NPDES Storm Water Program in 1990. Phase I required NPDES permits for storm water discharges from: (i) "medium" and "large" MS4s generally serving, or located in incorporated places or counties with, populations of 100,000 or more people; and (ii) eleven categories of industrial

[4] *Report to Congress on Phase II Storm Water Regulations*. U.S. EPA, Office of Water. EPA-833-R-99-001, Oct. 1999.

activity (including construction activity that disturbs five acres or greater of land).

Phase II, adopted in December 2000 and implemented in March 2003, required operators of small MS4s and small construction sites (construction activity disturbing greater than or equal to 1 acre of land or less than 1 acre if part of a larger common plan of development or sale) in urban areas to control storm water runoff discharges.

B. Statutory Basis for Permit Conditions

The intent of the permit conditions is to meet the statutory mandate of the CWA. The conditions established by this permit are based on Section 402(p)(3)(B) of the CWA which mandates that a permit for discharges from MS4s must: (1) effectively prohibit the discharges of non-storm water to the MS4; and (2) require controls to reduce pollutants in discharges from MS4 to the maximum extent practicable (MEP) including best management practices, control techniques, system design and engineering methods, and such other provisions determined to be appropriate. Compliance with water quality standards is to be achieved over time, through an iterative approach requiring improved BMPs.

The permit requires the implementation of a comprehensive SQIP through a selection of BMPs [see 40 Code of Federal Regulations (CFR) 122.44(k)] as the mechanism to achieving the reduction of pollutants in storm water to the maximum extent practicable (MEP) [see CWA. § 402(p)(3)(B)(iii)].

C. Regulatory Basis for Permit Conditions

As a result of the statutory requirements of the CWA, the U.S. EPA promulgated the MS4 Permit application regulations set forth in 40 CFR 122.26(d). These federal regulations described in detail the permit application requirements for MS4s operators. The information in the Report of Waste Discharge[5] was utilized to develop the permit conditions and determine the Permittees' status in relationship to these conditions.

D. Discharge Limitations

Federal regulations require effluent limitations for all pollutants that are or may be discharged at a level that will cause or have the reasonable potential to cause, or contribute to an in-stream excursion above a narrative or numerical water quality standard. Based on information submitted as part of

[5] County of Sacramento and the Cities of Sacramento, Citrus Heights, Elk Grove, Folsom, Galt, and Rancho Cordova, *Report of Waste Discharge,* June 2007.

the application, in studies, and as directed by monitoring and reporting programs, the Regional Water Board finds that the discharge has a reasonable potential to cause or contribute to an in-stream excursion above a water quality standard for several constituents including pesticide and metals, toxicity, pH, temperature, dissolved oxygen, pathogen and chlorine from illicit discharges.

No numeric effluent limitations are proposed at this time. In accordance with 40 CFR 122.44(k), the U.S. EPA has required a series of increasingly more effective BMPs[6], in the form of a comprehensive SQIP and performance standards, in lieu of numeric limitations.[7]

The State Water Resources Control Board (SWRCB) convened a Storm Water Panel (Blue Ribbon Panel) of experts to address the issue of numeric effluent limits.[8] The study, finalized in June 2006, also concluded that it is not feasible at this time to set enforceable numeric effluent limits for storm water and non-storm water discharges from MS4s.

E. Permitting Approach

The 1987 amendments to the Clean Water Act required municipalities to apply for MS4 permits that would reduce the pollutants in discharges to the maximum extent practicable. EPA Phase I Final Rule and Regulations then established the regulations for NPDES permit application requirements. EPA discussed how the language of CWA section 402(p)(3) contemplated fundamentally different characteristics of many municipalities and that municipalities would have permits tailored to meet particular geographical, hydrological, and climatic conditions. EPA continued to discuss that if MS4 permit conditions required storm water management programs (SWMP) to be developed and implemented, the program elements were enforceable in accordance with the terms of permit. EPA further pointed out that the permit goal for MS4 discharges is to avoid inflexibility in the types and levels of control. EPA stated that if mandatory requirements were appropriate, these requirements should be established under the authority of 40 CFR Section 402(p)(6), which addresses permit application requirements.

The SQIP is required as part of the Report of Waste Discharge pursuant to 40 CFR 122.26(2)(d)(iv); therefore is an integral and enforceable component

[6] *Interpretative Policy Memorandum on Reapplication Requirements* of MS4s issued by U.S. EPA (61 Fed. Reg. 41697), August 9, 1996
[7] *Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits* (61 Fed. Reg. 43761), September 1, 1996
[8] Recommendations of the Blue Ribbon Panel were finalized as *The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities,* dated 19 June 2006.

of the MS4 permit. In addition, the California Superior Court ruled, *"Because the Storm water Management Plan is incorporated and is deemed an integral part of the Permits…any changes to the Plan are actually changes to the Permits. Because these are changes to the Permits, the notice and comment requirements must be complied with."* (*San Francisco Baykeeper vs. Regional Water Quality Control Board, San Francisco Bay Region,* Consolidated Case No. 500527, California Superior Court, 14 November 2003).

F. **Policy**

The State Water Resources Control Board adopted Resolution 68-16 ("Statement of Policy with Respect to Maintaining High Quality of Waters in California") (Antidegradation Policy), which requires the Regional Water Board to assure maintenance of the high quality of waters of the State unless the Regional Water Board makes certain findings. Under this policy, water quality degradation may be allowed if the following conditions are met: 1) any change in water quality must be consistent with maximum benefit to the people of the State; 2) will not unreasonably affect present and anticipated beneficial uses; 3) will not result in water quality less than prescribed in the Basin Plan; and 4) the discharge is required to meet waste discharge requirements that result in the best practicable treatment or control necessary to assure that pollution or nuisance will not occur and the highest water quality consistent with maximum benefit to the people of the state will be maintained. The communities covered by this Permit have continued to develop since adoption of the previous permit. The increase in volume and mass of pollutants from the new urban runoff will not have significant impacts on aquatic life, municipal and domestic supply, and recreation uses, which are the beneficial uses most likely affected by the pollutants discharged.

An antidegradation analysis was submitted in September 2007.[9] The water quality impacts presented in the analysis shows that storm water runoff emanating from new urban development projected to occur in the Sacramento Urbanized Area during the next five years will generally produce minor changes in loadings and concentrations of the ten pollutants evaluated. The pollutants evaluated include: diazinon, dissolved copper, *E. coli,* biological oxygen demand (BOD), total dissolved solids (TDS), total mercury, total nitrogen, total organic carbon (TOC), chrysene and total suspended solids (TSS). Constituents selected for evaluation include those identified by the Permittees as Target Pollutants in the Report of Waste Discharge,[10] constituents for which the Regional Water Board is developing TMDLs, and/or

[9] Sacramento Stormwater Quality Partnership, *Antidegradation Analysis – Storm Water Management Program,* September 2007, Larry Walker and Associates.
[10] County of Sacramento and the Cities of Sacramento, Citrus Heights, Elk Grove, Folsom, Galt, and Rancho Cordova, *Report of Waste Discharge,* June 2007.

constituents considered particularly relevant to the water quality of the Sacramento-San Joaquin Delta.

Section 5.0 of the Antidegradation Analysis[11] provides an assessment of the Storm Water Management Program. The program elements include new development standards that were developed and implemented during the last permit term. This Permit requires the revision of the development standards and associated technical design guidance (a.k.a. *Stormwater Quality Design Manual*,[12] requiring new development and significant redevelopment priority projects to incorporate appropriate source control measures, runoff reduction control measures, and/or treatment control measures. Site design and site-specific source controls are generally the most effective means to control urban runoff pollution because they keep pollutants from contacting runoff and minimize the need for treatment. Runoff reduction measures disconnect impervious surfaces from the storm drain system and promote infiltration when site conditions allow; such measures can reduce the treatment volume or flow required. Treatment controls are intended to remove pollutants from site runoff before reaching the storm drain system or receiving water.

The Water Quality Impacts Assessment Methodology, found in Section 6.3 of the antidegradation analysis, includes a rainfall-runoff mass balance model. Land use projections and the best available agricultural runoff data were used to estimate the change in loadings from 2007 and 2012 urbanized areas. These load changes were then used along with available receiving water data to assess changes in receiving water concentrations and compliance with known water quality objectives. The model shows that the estimated pollutant loading attributable to new urban development show both increases and decreases depending on the constituent. The constituent-by-constituent evaluation of modeled impacts due to new urban development is presented in Section 6.3.5. The analysis reports that the estimated pollutant reductions for existing and new urban development range from 5% to 10%, with the exception of reductions assumed for diazinon. Diazinon has been phased out of urban use and its use in agriculture has greatly decreased, but a conservative estimate of 75% rather than 100% pollutant reduction was chosen to account for stockpiling and continued allowable use of products containing the pesticide. The percent reductions shown in Table 6-7[13] reflect a very conservative estimate for pollutant reduction due to implementation of Stormwater Quality Improvement Plan best management practices. Additionally, implementation of best management practices (primarily, extended detention basins) for new urban development, along with elements

[11] *Antidegradation Analysis*, pages 5-1 to 5-11.
[12] Sacramento Stormwater Quality Partnership and City of Roseville, *Stormwater Quality Design Manual for the Sacramento and South Placer Regions,* May 2007.
[13] *Antidegradation Analysis,* pages 6-8.

of low impact development, such as onsite infiltration, and hydromodification concepts, are expected to further reduce pollutant concentrations and flows attributable to new urban development runoff. Specific elements of the Permittee's Stormwater Quality Improvement Plan are discussed in Section 5, and outlined in Appendix A of the analysis.

Based on the antidegradation analysis: 1) some degradation for a limited number of constituents is consistent with the maximum benefit to the people of the state; 2) the activity is necessary to accommodate important economic or social development in the area; 3) resulting water quality is adequate to fully protect and maintain existing beneficial uses; and 4) the discharge will not cause measurable changes in the receiving waters that cause the receiving waters to fall below applicable water quality objectives.

The analysis included an examination of: 1) existing applicable water quality standards; 2) ambient conditions in receiving waters compared to standards; 3) incremental changes in constituent loading, both concentration and mass; 4) treatability and levels of treatment or controls to be used and whether increased treatment is proposed to offset any increased volume or mass of discharge; 5) reduction of the discharge of pollutants from the urban areas to the maximum extent practicable (MEP); 6) comparison of the proposed increased volume or mass of pollutants relative to the volume or mass of pollutants that existed when the current permit was adopted; 7) an assessment of the significance of changes in ambient water quality compared to historic conditions, and 8) an analysis of alternatives to the discharge and treatment or control methods that would reduce water quality impacts.

The discharge from continued urban development will result in some minimal degradation of waters of the state and navigable waters of the United States, but in this case, such degradation is consistent with the maximum benefit to the people of the state. Limited degradation that does not cause exceedance of water quality objectives is warranted to allow for the economic benefit stemming from local growth. There is also a need in the Sacramento area to accommodate growth. The Regional Water Board does not have the jurisdiction to control growth in the County of Sacramento and associated Cities, but is required to assure that the receiving waters are adequately protected as a result of urban discharges. The proposed Permit allows storm water utility service necessary to accommodate housing and economic expansion in the area, and is considered to be a benefit to the people of the State. Compliance with these requirements will result in the reduction of discharge pollutants from the urban areas to the MEP.

The Regional Water Board is required to protect beneficial uses of receiving waters that involve freshwater aquatic life (e.g., WARM, COLD, SPWN, MIGR). The Basin Plan's toxicity narrative objective, reflected in Receiving

Water Limitation C.1 of the Order states in L: "Toxic pollutants to be present in the water column, sediments, or biota in concentrations that produce detrimental physiological responses in human, plant, animal, or aquatic life; or that bioaccumulate in aquatic resources at levels which are harmful to human health." This receiving water limitation is designed to provide protection of the beneficial uses of the receiving water. Therefore, the numeric receiving water limit for chlorine has been removed from the order since the objective is covered by the narrative toxicity objective.

IV. BACKGROUND – SACRAMENTO AREAWIDE NPDES MS4 PERMIT PROGRAM

A. Sacramento Areawide NPDES MS4 Permit History

In June 1990, the Regional Board issued the first NPDES permit for the Sacramento area-wide MS4 program (Program). The permit was issued to Permittees from the County of Sacramento and the cities of Sacramento, Folsom and Galt. The County of Sacramento and the City of Sacramento have populations greater than 250,000 and are considered large municipalities in accordance with Appendices H and F, respectively, of Part 122 of Title 40 of the Federal Code of Regulations (40 CFR 122). The Cities of Folsom and Galt are urbanized areas with populations of less than 100,000 and would ordinarily not be covered under the Phase I program. However, because of their proximity to the urbanized areas of the County and the location of their storm sewer system discharges relative to discharges from the County's system, these cities were designated in 1990 as part of the large MS4 (40 CFR 122.26(b)(7)(iii)).

In 1996, the Regional Board renewed the Sacramento area-wide MS4 permit for a second five-year term. On 3 November 2000, the Permittees (now including the newly incorporated Cities of Citrus Heights and Elk Grove within the Sacramento Urbanized Area) submitted Reports of Waste Discharge to the Regional Water Board to request renewal of their MS4 permit.

In December 2002, the Regional Water Board adopted the third Sacramento area-wide MS4 permit. The City of Rancho Cordova incorporated in 2003 and was therefore added to the Permit by the Regional Water Board in 2004.

The Permittees' SQIPs[14,15] submitted with the Report of Waste Discharge in June 2007 describe the 18-year history and evolution of the Sacramento program, including a summary of accomplishments and findings.

[14] County of Sacramento and the Cities of Citrus Heights, Elk Grove, Folsom, Galt, and Rancho Cordova, *Storm Water Quality Improvement Plan (SQIP), Draft* June 2007.
[15] City of Sacramento, *Stormwater Quality Improvement Plan (SQIP)*, Draft June 2007.

B. Storm Drain System

The Permittees have jurisdiction over and/or maintenance responsibility for their respective MS4s that they own and operate in Sacramento County. The storm water discharges consist of storm water generated from various land uses in all the hydrologic sub-basins, which discharge into urban creeks and in turn flow into the primary rivers of Sacramento County. All discharges from the Sacramento Urbanized Area ultimately make their way to the Sacramento River. The tributary rivers which receive storm water from one or more Permittees include the American, Cosumnes and Mokelumne Rivers. The quality and quantity of these storm water discharges varies considerably, owing to the effects of land use, season, geology, and sequence and duration of hydrologic events.

C. Total Maximum Daily Loads (TMDLs)

Total Maximum Daily Loads (TMDLs) are one of the Regional Board's highest priorities. The Regional Water Board considers storm water discharges from the Sacramento Urbanized Area to be significant sources of pollutants. The proposed Permit includes a list of 303(d) listed waterbodies, some of which have TMDLs that are in various stages of completion. NPDES permits must be consistent with approved TMDL waste load allocations. To implement adopted TMDLs, this proposed Permit implements control programs developed to attain waste load allocations.

The Permittees submitted to the Regional Water Board a Pesticide Plan (in 2004) to fulfill the need for a pesticide toxicity control plan as required by the urban creeks pesticide TMDL. The Pesticide Plan was subsequently approved by the Regional Water Board. The plan addresses their own use of pesticides including diazinon, chlorpyrifos, and other lower priority pesticides and use of such pesticides by other sources within their jurisdiction. This proposed Order fulfills a component of the TMDL Implementation Plan adopted by this Regional Water Board on 23 June 2006 for diazinon and chlorpyrifos for the Sacramento-San Joaquin Delta Waterways and by requiring a management plan which includes BMPs, BMP implementation plan, effectiveness assessment, and compliance schedule that describes actions that will be taken to reduce diazinon and chlorpyrifos discharges and meet the applicable allocations. This proposed Order includes Provisions consistent with the TMDL waste load allocations and the Basin Plan implementation program. This proposed Order specifies monitoring and assessment requirements to implement these Provisions. The establishment of Water Quality Based Effluent Limits expressed as iterative BMPs to achieve the Waste Load Allocation (WLA) compliance schedule is appropriate and is expected to be sufficient to achieve the WLA specified in the TMDL.

The Regional Water Board Toxic Hot Spots Clean-up Plan (California Water Code section 13394) identified the following hot spots that are applicable to this discharge:

a. Mercury in the Delta; and
b. Diazinon and Chlorpyrifos in Morrison Creek in the City of Sacramento

The California Water Code section 13395 requires the reevaluation of waste discharge requirements for dischargers who have discharged pollutants causing all or part of the toxic hot spot. The waste discharge requirements must be revised to include requirements that "prevent the maintenance or further pollution of existing toxic hot spots." Further "(t)he Regional Water Board may determine it is not necessary to revise a waste discharge requirement only if it finds that the toxic hot spot resulted from practices no longer being conducted by the discharger... or that the discharger's contribution to the creation or maintenance of the toxic hot spot is not significant." Requirements to prevent the creation of new or maintenance of existing toxic hot spots are included with the provisions to address the 303(d) listings for these waterbodies.

The Delta, Sacramento River, American River, and Lake Natoma are on the Clean Water Act Section 303(d) List as mercury impaired because of elevated levels of methylmercury in fish. In addition, the State Board has designated the Delta as a toxic hot spot under the Bay Protection and Toxic Hot Spot Cleanup Program.

To address mercury impairment of the Delta, Sacramento and American Rivers, and Lake Natoma, this Permit requires the Permittees to:

- Continue to implement the Mercury Plan.

- Coordinate the Permittees' mercury control programs with the above-mentioned countywide U-waste management strategy.

- Evaluate the total mercury and methylmercury data collected under the previous Permit and continue urban discharge monitoring to determine the extent to which urban lands within the Sacramento area contribute methylmercury and total mercury to the individual impaired water bodies (Delta, Sacramento River, American River, and Lake Natoma).

- Estimate the amount of total mercury and sediment prevented from discharging to receiving waters by existing BMPs in the Sacramento Urbanized Area such as, but not limited to, street cleaning, detention basins, and erosion and sediment controls.

- Consider including total mercury and methylmercury monitoring in the design of future BMP studies to estimate the extent to which existing and new BMPs reduce total mercury and reduce and/or increase methylmercury discharges.

The Monitoring and Reporting Program portion of this proposed Order specifies monitoring and assessment requirements that must be implemented to gather information for future mercury control programs. Once the Delta mercury control program is approved, there may be additional monitoring requirements to identify the sources of the methylmercury and total mercury in urban runoff to the Delta, lower American River, and the other mercury-impaired water bodies.

Finding No. 87 of the proposed Order states: "CWA Section 303(d) and 40 CFR 130.7 require states to identify water quality-impaired water bodies and pollutants of concern, and develop Total Maximum Daily Loads (TMDLs). A TMDL is a quantitative assessment of the total pollutant load that can be discharged from all sources each day while still meeting water quality objectives. The Regional Water Board is currently in the process of developing TMDLs for listed water bodies within the Region. Prior to TMDL's being adopted and approved, Permittees must implement actions to address their contribution to the water quality impairments. Once the Regional Water Board and U.S. EPA approve TMDLs, this Order may be amended to incorporate provisions consistent with waste load allocations established under the TMDLs."

Provision D.3.d. of the proposed Order requires the Permittees revise their SQIP to comply with regional or watershed-specific requirements, and/or waste load allocations developed and approved pursuant to the process for the designation and implementation of TMDLs for impaired water bodies.

V. STORM WATER MANAGEMENT PROGRAM ELEMENTS

Federal regulations (40 CFR 122.26(d)(2)(iv)) provide that, *"A proposed management program covers the duration of the permit. It shall include a comprehensive planning process which involves public participation and where necessary intergovernmental coordination, to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate. The program shall also include a description of staff and equipment available to implement the program."*

As part of the June 2007 Report of Waste Discharge, the County of Sacramento in association with the cities of Citrus Heights, Elk Grove, Folsom, Galt and Rancho Cordova submitted a SQIP, and the City of Sacramento submitted a separate

SQIP. These SQIPs describe the framework for management of storm water discharges during the term of this permit. The draft SQIPs provide the goals and objectives, legal authorities, source identification process, funding sources, best management practices (BMPs) evaluation and improvement process, approach for effectiveness assessments of the programs, and a monitoring plan. The draft SQIPs also include specificity for each program element and control measures that identifies what actions are to be taken, the timeframe for the actions, the responsible parties and the data that needs to be collected in order to identify if the program is effective. The overall goals of the Permittees' SQIPs are to a) reduce the degradation of waters of the State and Waters of the United States (U.S.) by urban runoff and protect their beneficial uses, and b) develop and implement an effective SQIP that is well understood and broadly supported by regional stakeholders. The SQIPs are an integral and enforceable component of the proposed Permit.

The SQIPs include the following major program components:

i. Program Management
ii. Construction Element
iii. Commercial/Industrial Element
iv. Municipal Operations Element
v. Illicit Discharge Element
vi. Public Outreach Element (including watershed stewardship)
vii. Planning and New Development Element
viii. Monitoring Program
ix. Water Quality Based Program (Target Pollutant Program)
x. Watershed Stewardship
xi. Training
xii. Program Effectiveness Assessment

Some of the components and the corresponding Order requirements are discussed below.

A. **Program Management**

Program management includes planning, fiscal analysis, legal authority, staffing, inter and intra-agency coordination, and internal and external (i.e., compliance) reporting.

The Permit requires that each Permittee agency demonstrates that they have adequate funding to comply with the requirements of this Permit. Most agencies have established stormwater utilities, which are fees assessed on a property to the property owner based on an estimate of storm water runoff generated for the site, to fund these activities. The City of Folsom is the only Permittee agency that receives their program funding from the General Fund.

Financing the increasing requirements of the MS4 program offers a considerable challenge for municipalities. Proposition 218 significantly limits a municipality's ability to increase funding by requiring storm water utility fees and fee increases to go before the voters for approval[16]. There has been limited success in California in recent years in achieving approval of new stormwater utility fees.

The Permit requires each agency to have the legal authority necessary to implement their program. Each Permittee agency has an adopted stormwater ordinance in place, which defines allowable discharges within the municipality and provides the necessary authority to conduct enforcement against those who discharge illegally. In addition, each municipality has the legal authority to require the use and maintenance of construction BMP's through their grading ordinances.

The Permit also requires that the Permittees demonstrate that they have the necessary agreements in place to coordinate joint program activities. The Permittees have executed a memorandum of understanding (MOU) which defined a partnership and each agency's role in the joint program. This Permit requires that the Permittees update the MOU.

For compliance reporting, the Permit requires submission of an Annual Work Plan by 1 May of each year. The Annual Work Plan describes the Permittees' proposed activities for the upcoming year beginning 1 July of the current year and ending 30 June the following year. The Permit also requires submission of an Annual Report by 1 October of each year. The Annual Report documents the status of the Permittees' activities conducted during the previous fiscal year in conformance with the approved SQIPs, including the results of the Program Effectiveness Assessment. The Annual Report includes a compilation of deliverables and milestones completed during the previous 12-month period, as described in the SQIP and Annual Work Plan.

B. Construction Program Element

Legal Authority and Discussion

Federal regulations [40 CFR 122.26(d)(2)(iv)(D)] provide that a proposed management program must include *"a description of a program to implement and maintain structural and non-structural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system."*

[16] Cal. Const. Art. XIID, 6.c; *Howard Jarvis Taxpayers Association v. City of Salinas* (2002) 98. Cal.App. 4th 1351.

Status of the Sacramento Program

Since the initiation of the program in 1990, the Permittees have completed the following work:

- Established the legal authority to prohibit non-stormwater discharges and enforce those prohibitions through the adoption of local land grading and erosion control and stormwater ordinances
- Established and continued implementation of inspections, reporting procedures and enforcement to achieve compliance on construction sites.
- Conducted employee training with regard to review, inspection and enforcement
- Provided outreach and guidance to the development community through workshops and brochures on local and State requirements
- Established and maintained tracking databases and maps to assist with investigations and identification of problem areas

Discussion of the Requirements in This Permit

This Permit requires the continuation of the Permittees' review, inspection, and enforcement activities, and further requires the performance of an assessment to determine the effectiveness of these activities and identify any necessary modifications for continuous improvement.

C. **Commercial/Industrial Program Element**

Legal Authority and Discussion

Federal regulations [40 CFR 122.26(d)(2)(iv)(C)] require the following, *"A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system.*

The program shall:

1. *Identify priorities and procedures for inspections and establishing and implementing control measures for such discharges;*

2. Describe a monitoring program for storm water discharges associated with industrial facilities… "

The municipality is ultimately responsible for discharges from the MS4. Because industrial awareness of the program may not be complete, there may be facilities within the MS4 area that should be permitted but are not (non-filers). The Phase I regulations requiring industries to obtain permit coverage for storm water discharges is largely based on the Standard Industrial Classification Code. This has been shown to be incomplete in identifying industries (which include commercial businesses) that may be significant sources of storm water pollution. In addition, the permitting authority may not have adequate resources to provide the necessary oversight of permitted facilities. Therefore, it is in the municipality's best interest to assess the specific situation and implement an industrial/commercial inspection and enforcement program to control the contribution of pollutants to the MS4 from all these potential sources.

In the preamble to the 1990 regulations, the U.S. EPA clearly states the intended strategy for discharges of storm water associated with industrial activity:

"Municipal operators of large and medium municipal separate storm sewer systems are responsible for obtaining system-wide or area permits for their system's discharges. These permits are expected to require that controls be placed on storm water discharges associated with industrial activity which discharge through the municipal system."

The U.S. EPA also notes in the preamble that *"municipalities will be required to meet the terms of their permits related to industrial dischargers*."

Similarly, in the U.S. EPA's Guidance Manual[10] (Chapter 3.0), it is specified that MS4 applicants must demonstrate that they possess adequate legal authority to:

- Control construction site and other industrial discharges to MS4s;
- Prohibit illicit discharges and control spills and dumping;
- Carry out inspection, surveillance, and monitoring procedures.[17]

The document goes on to explain that *"control"*, in this context means not only to require disclosure of information, but also to *limit, discourage, or terminate* a storm water discharge to the MS4. Further, to satisfy its permit conditions, a municipality may need to impose additional requirements on discharges from

[17] *Guidance Manual For the Preparation of Part 2 of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems* - U.S. EPA -November 1992

permitted industrial facilities, as well as discharges from industrial facilities and construction sites *not* required to obtain permits.

In the same Guidance Manual[18] (Chapter 6.3.3), it is stated that the municipality is ultimately responsible for discharges from their MS4. Consequently, the MS4 applicant must describe how the municipality will help the U.S. EPA and authorized NPDES States to:

- Identify priority industries discharging to their systems;
- Review and evaluate storm water pollution prevention plans (SWPPPs) and other procedures that industrial facilities must develop under general or individual permits;
- Establish and implement BMPs to reduce pollutants from these industrial facilities (or require industry to implement them); and
- Inspect and monitor industrial facilities discharging storm water to the municipal systems to ensure these facilities are in compliance with their NPDES storm water permit, if required.
- Recognizing that the Permittees are ultimately responsible for the quality of storm water discharges from the MS4, the Permittees must effectively regulate industrial/commercial facilities and activities to maintain compliance with their stormwater ordinances by continuing implementation of their current programs and enhancing them, as needed, based on effectiveness assessments.

It may be necessary to update existing ordinances if they do not provide sufficient legal authority to implement the above components as required by the regulations.

Status of the Sacramento Program

Since 1990, the Permittees have completed the following work as part of the Industrial/Commercial Program:

- Developed and revised Stormwater Ordinances to prohibit non-stormwater discharges to the MS4, prevent prohibited conditions, require appropriate BMPs for pollutant generating activities, and authorize a structured inspection program for industrial and commercial facilities
- Significant industries were identified based upon their potential to discharge pollutants to the MS4. Mobile categories are subject to focused outreach efforts while stationary facilities are included in a program of regular compliance inspections

[18] *Id.*

- Established agreement with Sacramento County Environmental Management Department (EMD) to conduct routine inspections of targeted industries on behalf of MS4 Permittees. EMD was provided authority to enforce local stormwater ordinances within 7 jurisdictions in Sacramento County and to recover costs from the regulated community to fund the program.
- Launched the Clean Water Business Partner program, an incentive program to encourage businesses to protect stormwater quality

Discussion of Requirements in This Permit

This Permit requires the continuation of the Permittees' inspection, response and enforcement activities at priority commercial/industrial facilities and coordination with the Regional Water Board at facilities covered under the Industrial General Permit. The Permit also requires the performance of an assessment to determine the effectiveness of these activities and identify any necessary modifications for continuous improvement.

Recognizing the dual coverage envisioned by the federal regulations[19], and suggested partnership between local and State authorities, this Permit requires Permittees to coordinate with State activities for the implementation of the General Industrial Activities Storm Water Permit (General Industrial Permit). The goal is to control industrial sources and other sources not specifically covered under Phase I storm water regulations but identified as significant contributors of pollutants by the municipalities through their identification and prioritization studies. The net result should be a better and improved coordinated program with greater impact on limiting and eliminating (as a final goal) the contribution of pollutants to the receiving water while maintaining and/or restoring the capacity of the receiving water to sustain the beneficial uses without impairments.

Based on the dual coverage and partnership approach between the permitting authority and municipalities that the U.S. EPA envisioned in the storm water regulations[20,21], and in order to best use limited resources at the State and local levels, the Permit includes improvements requiring the Permittees to: (i) Control the storm water discharges associated with industrial activities and other commercial facilities identified as significant contributors of pollutants; and (ii) Assist the Regional Board in implementing the general permit for industrial activities.

[19] Federal Register Vol. 55, No 222, pp. 48000; U.S. EPA Storm Water Phase II Compliance Assistance Guide, 2000, pp. 4-32 and 5-11, where it clarifies the dual responsibility
[20] Letter dated December 19, 2000, from Alexis Strauss, Director, Water Division, U.S. EPA Region IX, to Dennis Dickerson, Executive Officer, Regional Water Quality Control Board-Los Angeles Region.
[21] Letter dated April 30, 2001, from Alexis Strauss, Director, Water Division, U.S. EPA Region IX, to Honorable Stephen Horn, U.S. House of Representatives

This approach is consistent with the nationwide approach used by the U.S. EPA in issuing *second term* MS4 permits[22]. Also, this approach is consistent with other MS4 permits issued in California: San Diego, Santa Clara, and Los Angeles permits. The education and outreach should be continued under the auspices of the Public Education program.

D. **Municipal Operations Program Element**

Legal Authority and Discussion

Federal regulations [40 CFR 122.26(d)(2)(iv)(A)(1,3,4,5, and 6)] require that each Permittee must develop a program to reduce the discharge of pollutants from the MS4 to the maximum extent practicable for all urban land uses and activities, including municipal areas and activities.

Permittees regularly provide services to communities that result in the enhancement of the lives of the residents. Some of these services include: sewage system operations; drinking water distribution; flood control and prevention activities; public construction activities; road maintenance; landscaping; recreational facility management; and parking facility management. Other activities are required to support these community services, such as fleet maintenance and operation of corporation yards and material storage facilities.

Each Permittee is required to update and continue to implement a Municipal Operations Program Element in its SQIP to effectively prohibit non-storm water discharges and prevent or reduce pollutants in runoff from all municipal land use areas, facilities, and activities to the MEP.

Status of the Sacramento Stormwater Program

Since 1990, the Permittees have completed the following work as part of the Municipal Operations Element:

- Complied with the State General Construction Permit for applicable municipal construction projects;
- Conducted audits of existing municipal facilities having the potential to discharge pollutants into urban runoff, and developed applicable mitigation procedures and/or best management practices (BMPs) to reduce pollutant discharges to the MEP at these sites;
- Conducted prioritized storm drain/facility maintenance activities based

[22] MS4 NPDES Permits issued to Palm Beach County, Broward County, Sarasota County, Florida, Tulsa, Oklahoma, Denver, Colorado.

upon accumulation of debris, customer complaints, and seasonal concerns;
- Implemented cleaning and maintenance programs for prioritized streets and parking lots;
- Ensured that most (for some Permittees, all) storm drain inlets were marked with the "No Dumping-Drains to Creek/River" message with either durable curb markers, stenciling, or permanent concrete stamps; and
- Trained affected staff at least annually on the impacts of stormwater pollution, associated prevention activities, and illicit connection and discharge identification and reporting procedures.

Discussion of the Requirements in This Permit

This Permit requires the continuation of the Permittees' efforts from the previous permit term to control stormwater pollution resulting from the operation and maintenance of permittee-owned land use areas, facilities, and activities. The Permit further requires the performance of an assessment to determine the effectiveness of these activities and identify any necessary modifications for continuous improvement.

E. **Illicit Discharge Program Element**

Legal Authority and Discussion

Federal regulations [40 CFR 122.26(d)(2)(iv)(B)] state that a proposed management program shall include a schedule, to detect and remove (or require the discharger to the municipal storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer. It states further that a Permittee must include in its proposed management program a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal storm sewer system.

During dry weather, much of the discharge to storm drain systems consists of wastes and wastewater from non-storm water sources that could include illicit discharges or connections, or both. Illicit discharges may occur either through direct connections, such as deliberate or mistaken piping, or through indirect connections, such as dumping, spillage, subsurface infiltration, and washdown.

Each Permittee is required to update and continue to implement an Illicit Discharge Detection and Elimination Program component of the SQIP to actively seek and eliminate illicit discharges and connections to the MEP.

Status of the Sacramento Program

Since the initiation of the program in 1990, the Permittees have completed the following work:

- Established the legal authority to prohibit illegal discharges and enforce those prohibitions through the adoption of local Stormwater Ordinances
- Established and have been implementing illicit discharge response and reporting procedures to investigate, identify and abate illicit discharges
- Conducted employee training with regard to illicit discharges and enforcement
- Continued implementation of solid, recycling and household hazardous waste collection programs
- Conducted illicit discharge field screening activities which resulted in few if any discharges to eliminate.
- Established and maintained tracking databases and maps to assist with investigations and identification of problem areas

Discussion of Requirements in this Permit

This Permit requires the continuation of the Permittees' inspection, response, and enforcement activities, and further requires the performance of an assessment to determine the effectiveness of these activities and identify any necessary modifications for continuous improvement.

F. **Public Outreach Public Education Program (Collectively Public Outreach Program)**

Legal Authority and Discussion

Federal regulations [40 CFR 122.26(d)(2)(iv)(A)(6)] provide that the proposed management program include, "*A description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewer system associated with the application of pesticides, herbicides, and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications, and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities." These regulations [40 CFR 122.26(d)(2)(iv)(B)(6)] also provide that the proposed management program include, "A description of education activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials."*

To satisfy the Public Outreach Program, the Permittees need to: (i) Implement a public education program to distribute educational materials to the community, or conduct equivalent outreach activities about the impacts of storm water discharges on local water bodies and the steps that can be taken to reduce storm water pollution; and (ii) Determine the appropriate BMPs and measurable goals for this minimum control measure.

Status of the Sacramento Program

The Permittees have made significant progress in developing and implementing programs to educate the public about the impacts of stormwater pollution. In addition, the Permittees encourage the public to participate in stewardship activities to enhance and protect the quality of Sacramento's waterways.

The following highlights the major accomplishments of the regional public outreach program since 1990:

- Developed a 24-hour public reporting hotline for stormwater-related issues
- Developed and implemented a regional media campaign, including Cable TV commercials, billboards and other media. Due in large part to this campaign, the permittees far exceeded the 2002-07 stormwater permit term requirements for the number of impressions
- Promoted the Sacramento Stormwater Quality Partnership's website to the general public
- Promoted citizen participation in watershed stewardship (e.g., volunteer storm drain stenciling, creek cleanups)
- Developed and distributed several educational materials for school children, residents, and businesses
- Developed the Clean Water Business Partner program, an incentive program to encourage businesses to protect stormwater quality
- Developed educational materials for the multicultural community
- Supported several educational programs targeting school children
- Participated in various community outreach events
- Coordinated with other agencies/organizations to develop and implement effective outreach
- Conducted public opinion surveys to gauge the level of awareness and behavior changes within the community or target audience

Discussion of Requirements in This Permit

Appendix 1B

Regulatory Background and Requirements Relevant to the Sacramento Stormwater Quality Partnership

REGULATIONS DIRECTLY RELEVANT TO THE SACRAMENTO STORMWATER MANAGEMENT PROGRAM

The principal regulatory vehicles for protection of water quality in California are the federal Clean Water Act and the State of California Porter-Cologne Water Quality Control Act. Figure C-1 in Appendix C shows regulatory milestones in the 19-year history of the Sacramento Stormwater Management Program.

FEDERAL NPDES PROGRAM

In 1972, the US Congress enacted the Clean Water Act (CWA), a landmark piece of legislation intended to restore the nation's waterways to "fishable and swimmable" conditions. The United States Environmental Protection Agency (USEPA) is the federal agency charged with implementation of the CWA. The CWA includes a "zero discharge" goal, in which discharges of pollutants to waters of the United States from any point source are effectively prohibited, unless the discharge complies with a National Pollutant Discharge Elimination System (NPDES) permit. The 1987 amendments to the CWA added Section 402(p), which established a framework for regulating municipal, industrial, and construction site stormwater discharges under the NPDES program. Section 402(p) also established the NPDES permit program goals for the municipal stormwater programs, which are to reduce the discharge of pollutants to the "maximum extent practicable" and to eliminate non-stormwater discharges. To meet these requirements the municipality uses "management practices, control techniques and systems, design and engineering methods and such other provisions … appropriate for the control of such pollutants" (CWA Section 402(p)). These measures are commonly referred to as best management practices (BMPs).

On November 16, 1990, USEPA published the Phase I stormwater regulations[1], which established application requirements for stormwater NPDES permits for municipal separate storm sewer systems (MS4s). The Phase I regulations required municipalities with a population greater than 100,000 and selected industries (including construction sites greater than five acres) to obtain a NPDES permit for their stormwater discharges. In 1999, USEPA promulgated the Phase II regulations[2], which established permit application requirements for communities with a population between 50,000 and 100,000, and construction sites that disturb an area from one to five acres in size.

In California, the State Water Resources Control Board (SWRCB) administers the NPDES stormwater permitting program through the nine Regional Water Quality Control Boards (Regional Boards).

2 National Pollutant Discharge Elimination System – Regulations for Revision of the Water Pollution Control Program – Additional Stormwater Discharges; Final Rule. 40 CFR Parts 9, 122, 123 and 124, U.S. Environmental Protection Agency (USEPA), December 9, 1999.

STATE OF CALIFORNIA BASIN PLANS, NPDES PROGRAM

The Porter-Cologne Water Quality Control Act requires the development of water quality management plans for drainage basins within California ("basin plans"). The basin plans serve as the regional policy for protecting water quality within each watershed, defined as the area of land draining to a particular water body. The basin plans include identification of the beneficial uses of each receiving water, establishment of water quality objectives necessary to protect these beneficial uses, and development of an implementation plan to ensure long-term protection of the water body and its beneficial uses. In establishing water quality objectives, the regulatory agencies must consider: (1) past, present, and probable future beneficial uses, (2) environmental characteristics of the watershed, (3) water quality conditions that could reasonably be achieved, (4) economic considerations, (5) the need for developing housing in the area, and (6) the need to develop and use recycled water. The Regional Boards principally implement basin plans through Waste Discharge Requirements (WDRs).

The SWRCB issues statewide permits, including categorical "general permits" for construction sites and industrial facilities, and Phase II municipalities. The nine Regional Boards issue individual permits to specific dischargers within their geographic areas of jurisdiction. Regional Boards may also issue general permits for construction or industrial activities in their regions. Municipalities, including the Sacramento Stormwater Quality Partnership permittees (Partnership), obtain individual NPDES permits from the Regional Boards. It should be noted that even though construction sites and industries are covered under the general permits, the Phase I municipalities, including the Partnership, are also required to address construction and industrial activities in their own programs. USEPA intended this intentional overlap to induce more local regulation and enforcement and enable the municipalities to control construction and industrial discharges into their own storm drainage systems.

The SWRCB and Regional Boards issue NPDES permits by including Waste Discharge Requirements in conformance with the state's Porter-Cologne requirements. The state waste discharge program is broader than the NPDES Program, covering nonpoint sources and groundwater in addition to point sources and surface waters. The Regional Water Quality Control Board, Central Valley Region (referred to hereafter as "the Regional Board") issues and administers the Sacramento NPDES municipal stormwater permit for the County of Sacramento and the Cities of Citrus Heights, Elk Grove, Folsom, Galt, Rancho Cordova and Sacramento.

As part of Phase II, the State Water Resources Control Board adopted a General Permit for the Discharge of Storm Water from Small MS4s (WQ Order No. 2003-0005-DWQ) to provide permit coverage for smaller municipalities, including non-traditional small MS4s, which include governmental facilities such as military bases, public campuses, and prison and hospital complexes.

In California, stormwater NPDES Permits include standard requirements to the effect that discharges "shall not cause or contribute to violations of water quality objectives nor shall they cause certain conditions to occur which create a condition of nuisance or water quality impairment in receiving waters." The SWRCB requires permittees to address these standard requirements through the implementation of control measures to reduce pollutants in storm water discharges.

SACRAMENTO NPDES MUNICIPAL STORMWATER PERMIT

The original Phase I municipal permits were issued between 1991 and 1994, following development and submittal of an extensive two-part application by each permittee or group of permittees. The Sacramento NPDES stormwater permit was one of the first permits to be issued in the nation, in 1990 (Order No. 90-158). This early permit preceded promulgation of the Phase I regulations (in December 1990) and did not require the development of the formal two-part application, although similar information was generally required of the Partnership during the first permit term. The Regional Boards try to reissue NPDES permits every five years. The Regional Board issued the second Sacramento NDPES permit in 1996 (Order No. 96-105), the third NPDES permit in December 2002 (Order No. R5-2002-0206), and the fourth and current permit in September 2008 (Order No. R5-2008-0142). The Regional Board made the current permit effective in late October 2008. The smaller municipalities, such as the cities of Folsom and Galt, were individually brought into the Phase I program as permittees along with larger municipalities. The Regional Board considers all Partnership municipalities as part of the Phase I regulated community, regardless of size.

The Partnership has subsequently developed Stormwater Quality Improvement Plans (SQIP) in conformance with the Phase I regulations. However, for planning purposes, the Partnership also reviewed and considered the Phase II regulations in developing the Stormwater Quality Improvement Plans, to account for advances in stormwater programs made in the ten years between the Phase I and Phase II regulations. Table 1, at the end of this appendix, is a summary of the pertinent points of the Phase I and II regulations.

Receiving Water Quality Objectives

The Sacramento Stormwater NPDES Permit requires comparison of receiving water monitoring data to receiving water quality objectives (WQOs), and submittal of a Notice of Water Quality Exceedance (NWQE) to the Regional Board within 90 days of an exceedance of a water quality objective in a receiving water monitoring event. A Report of Water Quality Exceedance (RWQE) is then required on determination by either the Partnership or Regional Board that municipal stormwater discharges are causing or contributing to an exceedance of an applicable receiving water specific water quality objective. The RWQE "describes BMPs that are currently being implemented and additional BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedance of Water Quality Standards." These evaluations consider water quality objectives for the Sacramento River, American River and their tributaries. The Partnership derives the applicable water quality objectives from the California Toxics Rule (CTR), the Water Quality Control Plan for the Sacramento River and San Joaquin River Basins (Basin Plan), and objectives specified in the NPDES Permit (e.g., mercury).

The NPDES Permit also requires Regional Board notification within 48 hours of receiving water column toxicity results for receiving water samples with greater than 50% mortality.

"Maximum Extent Practicable" Standard

Section 402(p)(3)(B) of the CWA requires the Regional Boards to issue NPDES municipal stormwater permits that require dischargers to develop and implement programs with the goal of reducing the discharge of pollutants in stormwater runoff to the maximum extent practicable (MEP). Although the CWA established the permit requirement of MEP for municipal permittees,

neither the CWA nor subsequent regulations provide a specific definition. It is clear, however, that MEP is a requirement to reduce the discharge of pollutants, not to prohibit such discharge. The stormwater regulations state that MEP is to be achieved through implementation of control measures that involve public outreach, illegal discharge elimination, construction site controls, new development controls, pollution prevention and good housekeeping for municipal operations, and industrial site controls. The Phase II regulations provide additional insight into MEP by linking the implementation of BMPs with the achievement of measurable goals. The SWRCB's Senior Counsel, in a 1993 memorandum[3], further made the point that achieving the MEP standard requires a meaningful, rather than a perfunctory, program. The 1993 memorandum interprets the meaning of MEP to include *technical feasibility, cost and benefit derived with the burden being on the municipality to demonstrate compliance with MEP by showing that a BMP is not technically feasible in the locality or that BMP costs would exceed any benefit to be derived*. The SWRCB further discusses the term in two Water Quality Orders: WQ 1000-11 and 91-03.

The Sacramento Stormwater Management Program defines MEP in a functional way, as an iterative process of (1) developing a sound and thorough program of BMPs commensurate with available resources, (2) implementing the program, and (3) evaluating and refining the program over time. These steps are briefly described below:

- ***Development*** of the program relies on stormwater program guidance from USEPA, applicable regulations, best professional judgment, information gained from implementation and evaluation of the program, information learned from other municipal stormwater programs, evolving local conditions, communication with regulators, and public input. This is consistent with the SWRCB's expressed opinion that compliance with MEP requires a meaningful program.
- ***Implementation*** activities, including BMPs, are the foundation of the program. Considerations in selecting appropriate BMPs include technical feasibility, pollutant removal effectiveness, legal authority, compatibility with other agency programs and goals, economic factors (including the ability to capitalize on existing opportunities and cost effectiveness), public acceptance and whether the BMP focuses on Sacramento's target pollutants.
- The ***evaluation*** process for the program addresses both the overall program and its individual program elements through assessment of effectiveness measures and performance measures. Effectiveness measures are those intended to directly measure the effect that certain activities have on making a difference in water quality, the public's behavior, etc. Performance measures are intended to measure the level of effort that the Partnership is expending to satisfy the NPDES permit requirements in reducing stormwater pollution. See Chapter 2.3 of the Stormwater Quality Improvement Plan for more information.

The effectiveness of the iterative program outlined above is enhanced by the Partnership "target pollutant" process, in which target pollutants are identified in urban runoff discharges and priority-ranked according to a comprehensive set of criteria. The Partnership then investigates

[3] Elizabeth Miller Jennings, "Definition of Maximum Extent Practicable", State Water Resources Control Board Memorandum, February 11, 1993.

sources of high-ranking target pollutants, and identifies control measures for the reduction of significant sources of the high-priority pollutants.

Consequences of Noncompliance

The NPDES Permit is federally enforceable, which means that if a permittee does not comply with the terms of the permit, it may be subject to CWA authorized enforcement actions and penalties by the Regional Board, US EPA and private third parties. Penalties for noncompliance with the CWA can be up to $37,500[4] per incident per day. Moreover, federal enforceability includes the right of interested parties to sue under the CWA Section 405 citizen suit provision. Environmental advocacy groups have brought numerous lawsuits against NPDES permittees, various state regulatory agencies and the EPA since the early 1990's.

STATEWIDE/GENERAL PERMITS

Within the NPDES program, the State of California has adopted several statewide general permits, covering stormwater discharges from specific types of activities. Those wishing to engage in the specified activities must conform to the requirements of the relevant general permit. The state administers and enforces the general permits even when the activities take place in a municipality covered by an individual MS4 NPDES permit. The general permits are therefore generally of benefit to the permitted MS4s, as they provide an additional level of regulatory oversight and responsibility for the covered categories of discharges. The most pertinent statewide/general permits are discussed below.

Construction General Permit

Construction projects that disturb one or more acres of soil are required to obtain coverage under the General Permit for Discharges of Storm Water Associated with Construction Activity (*Construction General Permit*, SWRCB Order #99-08-DWQ). Construction activity subject to this permit includes clearing, grading and disturbances to the ground such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade or capacity of the facility. The SWRCB reissued the Construction General Permit on August 19, 1999. The SWRCB circulated a preliminary review draft of the revised Construction General Permit on March 2, 2007 and subsequently circulated a second draft on March 18, 2008. The SWRCB recently released a third draft of the revised Construction General Permit.

To obtain coverage under the Construction General Permit, applicants must submit a Notice of Intent (NOI), Site Map, and the appropriate permit fee to the SWRCB. The discharger files a Notice of Termination with the Regional Board upon project completion.

The SWPPP must contain a site map(s), which shows the construction site perimeter, existing and proposed buildings, lots, roadways, storm water collection and discharge points, general topography both before and after construction, and drainage patterns across the project. The SWPPP must list Best Management Practices (BMPs) the applicant will use to protect storm water runoff and the placement of those BMPs. Additionally, the SWPPP must contain a visual monitoring program, a chemical monitoring program for "non-visible" pollutants to be implemented if there is a failure of BMPs, and a sediment monitoring plan if the site discharges directly to a water body listed on the 303(d) list for sediment.

[4]Current penalty as of January 12, 2009, regularly adjusted for inflation.

Based upon the previous drafts of the Construction General Permit, the final revised Construction General Permit will likely differ from Order 99-08-DWQ in several significant ways. Some of the more significant projected changes include:

- Electronic submittal of NOIs and SWPPP to allow greater public access
- Specific qualification requirements for construction SWPPP developers and those responsible for implementing the SWPPPs
- Categorization of the risk of sediment discharge from sites into at least three risk levels
- Permit requirements tiered to the risk level of the site
- Numeric Action Levels and Numeric Effluent Limitations for construction site runoff
- Runoff monitoring to assess performance and compliance with the action levels and effluent limits
- Receiving water monitoring for some sites
- Annual reporting of visual and water quality monitoring results through an electronic system.

From the standpoint of the municipal stormwater program, the net effect of this General Permit is to assist MS4s in the implementation of the construction element of the stormwater management program, by providing an independent means of ensuring compliance with stormwater regulations at construction sites.

Industrial General Permit

The Industrial Storm Water General Permit (*Industrial General Permit*, SWRCB Order #97-03-DWQ) regulates discharges associated with 10 broad categories of industrial activities. Facilities that discharge storm water associated with industrial activity requiring a General Permit are listed by category in 40 CFR Section 122.26(b)(14). For the most part, these facilities are identified in the federal regulations by a Standard Industrial Classification (SIC). The SWRCB adopted this permit in 1999. The SWRCB circulated, but did not adopt, a draft revised permit in 2005.

To obtain coverage for stormwater discharges and authorized non-stormwater discharges pursuant to the Industrial General Permit, facility operators must submit a Notice of Intent (NOI), a site maps, and annual fee to the SWRCB. This General Permit requires facility operators to:

- Eliminate unauthorized non-storm water discharges;
- Develop and implement a Storm Water Pollution Prevention Plan (SWPPP); and
- Perform monitoring of storm water discharges and authorized non-storm water discharges.

The Industrial General Permit requires the implementation of management measures that will achieve the performance standard of best available technology economically achievable (BAT) and best conventional pollutant control technology (BCT). Through the SWPPP, sources of pollutants are identified and the means to manage the sources to reduce storm water pollution (i.e., BMPs) are described.

This General Permit does not preempt or supersede the authority of local agencies (e.g., municipal NPDES Permit-holders) to prohibit, restrict, or control storm water discharges and authorized non-storm water discharges to storm drain systems or other water-courses within their jurisdictions as allowed by state and federal law. The net effect of this General Permit for local

agencies is to assist MS4s in the implementation of the municipal stormwater program, by providing an independent means of ensuring compliance with stormwater regulations at industrial facilities.

Caltrans Statewide Stormwater Permit

The SWRCB regulates runoff discharges from Caltrans facilities under a statewide NPDES permit issued to Caltrans in 1999 (Order # 99-06-DWQ). Currently the SWRCB is drafting this permit renewal.

Caltrans discharges consist of stormwater and non-storm runoff generated from (a) maintenance and operation of state-owned highways, freeways, and roads; (b) maintenance facilities; (c) other properties, facilities, activities, and construction projects; (d) permanent discharges from subsurface dewatering, and (e) temporary construction related dewatering activities which discharge directly to surface waters or through municipal storm water conveyance systems to surface water bodies in the state. Some stormwater discharges from Caltrans-owned rights-of-way, properties, facilities and activities discharge to stormwater conveyances managed by NPDES-permitted municipalities. On the other hand, some stormwater discharges from these municipalities discharge to storm water conveyances managed by Caltrans.

The Regional Boards have issued stormwater NPDES Permits for the discharge of stormwater from MS4s to municipalities in California that require such permits. Caltrans operates highways and highway-related properties, activities, and facilities that cross through all of these permitted areas. This statewide Caltrans permit covers all municipal stormwater activities by Caltrans in California, both in areas that require an MS4 permit and areas that do not currently require a permit, and all Caltrans construction activities that require a permit under the federal stormwater regulations.

This NPDES Permit does not preempt or supersede the authority of local municipal agencies to prohibit, restrict, or control storm water discharges and authorized non-storm water discharges to storm drain systems or other watercourses within their jurisdictions as allowed by state and federal law. However, the principal responsibility for management of stormwater discharges from state transportation facilities in the Sacramento urban area rests with Caltrans.

Aquatic Pesticides General Permits

In response to court cases and guidance, in 2004 the SWRCB adopted two general permits for discharges of aquatic pesticides into waters of the United States. One permit regulates the use of aquatic weed killers (WQO 2004-0009-DWQ for aquatic weed control) and the other regulates aquatic pesticides used to control mosquitoes and other vectors (WQO 2004-0008-DWQ for vector control). In adopting these permits, the SWRCB found that Ninth Circuit Court decisions (beginning in 2001 with the “Headwaters” decision) appeared to require these permits and that relevant USEPA guidance documents might not be a legal basis for a lack of coverage under an NPDES permit. According to the Ninth Circuit Court, the application of pesticides into waters of the United States, or onto aquatic plants growing in waters of the United States, results in discharges of pollutants and requires coverage under a National Pollutant Discharge Elimination System (NPDES) permit.

On November 20, 2006, USEPA issued its final rule on aquatic pesticides (40 C.F.R. § 122.3(h)(1)). This rule was intended to eliminate the need for a NPDES permit for the

application of pesticides to waters, if the application is made in accordance with Federal Insecticide, Fungicide and Rodenticide Act (FIFRA) labels. USEPA's regulation took effect on January 26, 2007. However a Sixth Circuit Court decision filed on January 7, 2009, determined that USEPA's final rule is not a reasonable interpretation of the CWA and vacated the final rule. The current status of the Aquatic Pesticide is still uncertain, as federal court actions are under appeal, and US EPA has requested a two year extension to develop the permit.

Low Threat and Limited Threat Discharges

Low threat discharges are those with low potential for causing or contributing to water quality impairment. Regional Boards issue general permits on a regional basis for such discharges, rather than on a statewide basis by the SWRCB. For the Central Valley Region, the relevant orders are Regional Board Orders:

- R5-2008-0081 Waste Discharge Requirements for Dewatering and Other Low Threat Discharges to Surface Waters
- R5-2008-0082 Waste Discharge Requirements For Limited Threat Discharges of Treated/Untreated Groundwater from Cleanup Sites, Wastewater from Superchlorination Projects and Other Limited Threat Wastewaters.

R5-2008-0081 covers discharges by individuals, public agencies, private businesses and other legal entities of clean or relatively pollutant-free wastewaters that pose little or no threat to the quality of waters of the United States. Discharges covered by this General Order are either four months or less in duration or have an average dry weather flow less than 0.25 million gallons per day (MGD).

To obtain coverage under this Order, the Discharger must submit a complete Notice of Intent including (1) information concerning its discharge location; (2) a map showing the location of the site, treatment system (if applicable), discharge point(s), and receiving water; (3) an evaluation of reclamation options; (4) narrative and schematic descriptions of the existing or proposed treatment system, including blueprints signed by a Registered Engineer or Geologist (if applicable); (5) analysis of the proposed effluent for specified pollutants; and (6) the appropriate fee.

R5-2008-0082 covers dischargers of treated or untreated groundwater from cleanup sites, including groundwater extracted during short-term and long-term pumping/aquifer tests, and equipment decontamination water, dischargers of wastewater from superchlorination projects, and dischargers of other limited threat wastewaters. Dischargers of wastewaters containing sewage of human origin or containing significant oxygen demanding substances prior to treatment are not covered by this Order.

To obtain coverage under this Order, the Discharger must submit a complete application, which includes USEPA Application Forms 1 and 2D; State Water Board Form 200, a map of the location of the project, discharge point(s), and receiving water; a full description of the proposed project on official letterhead; blueprints of the proposed treatment system signed by a Registered Engineer or Geologist (if applicable); analysis of the proposed effluent for specified pollutants; an evaluation of reclamation options; public notice requirements; and the appropriate fee.

This Order does not preempt or supersede the authority of state or local agencies to prohibit, restrict or control the discharge of wastewater subject to their jurisdiction.

OTHER REGULATIONS THAT MAY AFFECT THE SACRAMENTO STORMWATER MANAGEMENT PROGRAM

CWA Section 303(d) - Total Maximum Daily Loads

Section 303(d) of the CWA requires the states to identify waters that are not attaining water quality standards. The identified water bodies comprise the state's "303(d) list," also referred to as the "impaired waters" list. The CWA requires the states to establish priority rankings for listed water bodies and to establish the total maximum daily load (TMDL) for pollutants impairing those waters. According to USEPA, a TMDL is a numerical calculation of the amount of a pollutant – or load – that a water body can assimilate and still meet standards. A TMDL includes one or more numerical targets calculated to represent attainment of the applicable standards, considering seasonal variations and a margin of safety, and allocation of the target or load among the various sources of the pollutant. The states must incorporate TMDLs and load reduction requirements into the basin plans.

USEPA Region IX (which includes Sacramento) developed guidance for California on minimum requirements to meet TMDL regulations, the application of water quality standards, and how NPDES permits are to be written for discharges to listed water bodies.

The State of California subsequently adopted two policies related to the TMDL process:

- ***The Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List*** (SWRCB Resolution 2004-0063, September 2004). The "Listing Policy" describes the process by which the State Water Resources Control Board and Regional Water Quality Control Boards will comply with the listing requirements of section 303(d) of the federal Clean Water Act (CWA). The Policy establishes a standardized approach for developing California's section 303(d) list.
- ***The Water Quality Control Policy for Addressing Impaired Waters*** (SWRCB Resolution 2005-0050, June 2005). The "TMDL Policy" is intended to ensure that the impaired waters of the state are addressed in a timely and meaningful fashion. The majority of TMDLs are established through an implementation plan adopted as a Basin Plan amendment (BPA), but the TMDL Policy allows a TMDL to be established through alternative regulatory actions. For the Amendment to become final, it must be approved by the State Water Resources Control Board, the California Office of Administrative Law, and USEPA.

TMDLs affect NPDES permit holders that discharge into 303(d) listed water bodies by, as Regional Boards develop source load allocations to support each TMDL. Listed water bodies on the 2006 303(d) list[5] into which Sacramento urban runoff ultimately flows include: Arcade Creek, Chicken Ranch Slough, Strong Ranch Slough, Elder Creek, Elk Grove Creek, Morrison Creek, the Natomas East Main Drain, Lake Natoma, the lower American River, the Sacramento River from Red Bluff to the Delta, and Delta waterways. The Sacramento Stormwater Management Program addresses pollutants for pertinent listed water bodies through its target

[5] The SWRCB adopted the 2006 Clean Water Act section 303(d) list of water quality limited segments at a October 25, 2006 Board Meeting.

pollutant reduction activities and monitoring program. The Regional Board issued a draft 303(d) list for public comment in January 2009 that includes new listings for pyrethroids and other constituents for water bodies that receive Sacramento urban runoff.

The following TMDLs are currently in effect or proceeding through the TMDL/BPA adoption and approval process.

Sacramento/Feather River Diazinon and Chlorpyrifos TMDL/BPA

The Regional Board originally adopted this TMDL and Basin Plan Amendment in 2003 and then readopted in them in 2007. The 2007 amendment revised the water quality objectives and control program for diazinon originally adopted in 2003 and adds water quality objectives and a control program for chlorpyrifos for the Sacramento and Feather River. The 2007 Basin Plan Amendment was fully approved and effective as of August 11, 2008. The pesticide objectives specified in the 2008 amendments are:

Diazinon Water Quality Objective:

0.16 µg/L 1-hour average (acute); 0.10 µg/L 4-day average (chronic), not to be exceeded more than once in a three-year period

Chlorpyrifos Water Quality Objective:

0.025 µg/L 1-hour average (acute); 0.015 µg/L 4-day average (chronic), not to be exceeded more than once in a three-year period

The Waste Load Allocations (WLA) for all NPDES-permitted dischargers, Load Allocations (LA) for nonpoint source discharges, and the Loading Capacity of the Sacramento and Feather Rivers shall not exceed the sum (S) of one (1) as defined below.

$$S = C_D/WQO_D + C_C/WQO_C \leq 1.0$$

where C_D = concentration of diazinon, WQO_D = diazinon water quality objective, C_C = concentration of chlorpyrifos, WQO_C = chlorpyrifos water quality objective,

Sacramento Urban Creeks TMDL – Diazinon/Chlorpyrifos

This TMDL was implemented in 2004 without a Basin Plan amendment, via provisions in the Sacramento Stormwater NPDES Permit. The TMDL contains the former California Department of Fish and Game criteria as objectives for diazinon and chlorpyrifos. The TMDL targets and load allocations are concentration based, and account for the additive effects of diazinon and chlorpyrifos. The requirements of the TMDL are addressed by the NPDES Permit requirement for development of a pesticide control plan. The TMDL is due to be reviewed for possible revision, and the Partnership has commented directly to the Regional Board that the TMDL is completed since the withdrawal by 2004 of Federal registration ofthese pesticides for most urban uses has led to greatly reduced concentrations in discharges, and attainment of the TMDL goals.

Sacramento/San Joaquin Delta TMDL/BPA for Diazinon and Chlorpyrifos

The "Basin Plan Amendment for the Control of Diazinon and Chlorpyrifos Runoff into the Sacramento-San Joaquin Delta" established water quality objectives for diazinon and chlorpyrifos in Delta waterways. The Basin Plan Amendment is fully approved and effective as

of October 10, 2007. The adopted diazinon objectives/TMDL targets are equal to the revised CA DF&G objectives (160 ng/L acute and 100 ng/L chronic).

Central Valley Pesticides TMDL/BPA

This ongoing TMDL project covers most of the Central Valley Regional Water Quality Control Board jurisdiction, i.e. the Sacramento and San Joaquin River watersheds, and is much broader in technical scope than any of the other previous or ongoing TMDLs. The project includes:

- all natural streams below major reservoirs that could receive agricultural or urban runoff (not constructed drains unless listed in Basin Plan)
- comprehensive coverage of current-use pesticides (not just diazinon and chlorpyrifos); excludes legacy pesticides (such as DDT)
- preparation of a risk assessment for pesticides in Sacramento Valley
- evaluation and development of water quality criteria for selected pesticides
- evaluation and development of sediment quality criteria for selected pesticides (likely including pyrethroids)
- a perfunctory aquatic life beneficial use assessment for selected streams
- monitoring for pesticides identified in the risk assessment

Pyrethroid Re-evaluation and Registration Review

Based on reported pyrethroid aquatic toxicity, including a signficant number of urban areas, the California Department of Pesticide Regulation (DPR) in 2006 initiated a re-evaluation of pyrethroid pesticide registrations. This process is intended to identify and effectively mitigate toxicity sources, which may include pesticide use restrictions or even removal of certain products from the market. USEPA is also preparing to address the observed toxicity as part of its registration review process which is scheduled to begin in 2010. As a result of comments by California water quality agencies, including the Permittees and CASQA, US EPA has begun incorporating improved urban surface water quality protection in pyrethroid product label language.

Structural Pest Control Board IPM regulations

The California Structural Pest Control Board (SPCB), which is the lead agency for regulation of professional structural pest control operators, in 2008 adopted regulations to establish Integrated Pest Management (IPM) training requirements for new licensees and as continuing education requirements for license renewal. These requirements, established largely in response to concerns expressed by California Water Boards and CASQA, became effective in April 2009. In addition, the SPCB has adopted regulations (pending final approval by the Office of Administrative Law) to allow its regulated community to more effectively market the environmental benefits of IPM, and has begun the process to establish statewide standards for certification of IPM services

Delta Mercury/Methylmercury TMDL/BPA

The TMDL and Basin Plan Amendment "For the Control of Methylmercury in the Sacramento-San Joaquin Delta Estuary" are currently in development using a facilitated stakeholder process in which the Permittees are participants. This TMDL will be precedent setting, as the Regional Board intends to work upstream from the Delta in developing mercury TMDLs for the American, Sacramento and Feather Rivers, building on the precedents/loadings set in the Delta TMDL. Proposed Delta water quality objectives include three fish tissue objectives for mercury,

covering different size classes/trophic levels of fish, to protect both human health and wildlife. Allocations for known mercury sources are proposed to limit fish mercury exposure and assimilation. The February 2008 draft TMDL/BPA includes wasteload allocations for urban runoff equivalent to a 44% reduction in current methylmercury concentrations, effective four years from the Basin Plan Amendment. This can be achieved through source reduction, treatment, or an offset program.

Related mercury policies under development:

- *Proposed CTR Objective for Methylmercury*
  The SWRCB has begun the process to develop "Proposed Methylmercury Objectives for Inland Surface Waters, Enclosed Bays, and Estuaries in California" (December 2006). The elements of the proposed policy may include methylmercury fish tissue objectives, total mercury water quality objectives, methylmercury water quality objectives, or some combination.
- *Proposed Mercury Offset Policy for SF Bay and Delta*
  The SWRCB's "Proposed State Policy for Water Quality Control, San Francisco Bay, Sacramento-San Joaquin River Delta and Tributaries Mercury Discharge Offset Policy" (January 2007) would allow mercury dischargers (especially those subject to NPDES permits) to offset some mercury TMDL loading allocations by taking other actions, such as removing mercury from Delta sediments. This policy, if properly constructed, has the potential to provide regulatory mechanisms that would allow NPDES dischargers, including urban runoff discharge agencies in the TMDL area, to apply resources within the watershed to most effectively address mercury and methyl mercury sources.

Central Valley Drinking Water Policy

To address drinking water treatment challenges and potential public health concerns in the crucial Sacramento/San Joaquin River Delta region, a multi-year effort is currently underway to develop a drinking water policy for surface waters in the Central Valley. The goal is to develop a policy that provides clear guidance to ensure consistent source water protection. This policy may include provisions that affect municipal stormwater dischargers upstream of the Delta. The policy considers pathogen indicators, organic carbon, nutrients, and salinity with a project horizon of 2030. Currently the City of Sacramento participates in the effort that is primary CalFed and stakeholder funded. Efforts include developing source control program alternatives and cost projections, comprehensive load modeling, and drinking water treatment requirement cost projections.

Wetlands and Riparian Area Protection Policy

A statewide Wetland and Riparian Area Protection Policy (WRAPP) is under development by the SWRCB to provide additional protection for wetlands and riparian areas, which are considered critical to the protection and enhancement of water quality throughout California's diverse watersheds. Additional regulatory attention to these areas is affirmed by statewide policies such as the Wetlands Conservation Policy (Executive Order W-59-93), also known as the state's "No Net Loss" Policy for Wetlands; and the Policy for Implementation and Enforcement of the Nonpoint Source Pollution Control Program (State Water Board Resolution No. 2004-0030).

Special protections are considered warranted for wetlands, riparian areas, and headwaters because these areas have high resource value, are vulnerable to filling, and are not systematically protected by other programs. Insufficient protections for wetlands and riparian areas in the past led to significant historic losses of these resources in California. As a result, the remaining wetlands and riparian areas in the state are considered to be extremely valuable resources. The WRAPP policy will encourage basin-level analysis and protection, because some functions of wetlands, riparian areas and headwater streams - including pollutant removal, flood water retention and habitat connectivity - are manifest at the watershed level.

This new policy is primarily intended to address the following three areas:

- Provide clarity in the existing regulatory framework for protecting those wetlands and riparian areas that are no longer regulated under the CWA, due to recent federal court cases that have limited federal jurisdiction and increased the relative role and importance of the state's water quality programs and authorities.
- Provide statewide consistency in the definition of wetlands and riparian areas, to ensure protection of beneficial uses under the California Water Code.
- Provide statewide consistency in definitions of beneficial uses for wetland and riparian area functions (e.g., pollutant removal, floodwater retention, and habitat connectivity) and lack of consistent statewide requirements for evaluating the condition of wetland and riparian area resources. Condition assessments are necessary for determining potential impacts from discharges and other activities on wetland and riparian area water quality and associated beneficial uses; and for determining the actions that are necessary to avoid, minimize, and mitigate any potential impacts to protect wetland and riparian resources.

Upon adoption, this Policy may expand the areas covered as regulated receiving waters of the state beyond those covered by the federal definition.

LOW IMPACT DEVELOPMENT/SUSTAINABILITY

On January 20, 2005, the SWRCB adopted sustainability as a core value for all California Water Boards' activities and programs, and directed Regional Board staff to consider sustainability in all future policies, guidelines and regulatory actions.

An emerging tool of sustainability that is directly applicable to urban stormwater management is Low Impact Development (LID), which uses site design and storm water management practices to maintain, as nearly as possible, a site's pre-development runoff rates and volumes. Design techniques are employed to infiltrate, filter, store, evaporate and detain runoff close to the source of rainfall. The Water Boards are encouraging the use of LID in California in various ways:

- Regulation through site-specific and general permits;
- Providing advocacy and outreach to local governments through the Water Board's Training Academy and regional workshops;
- Researching how to incorporate LID language in to Standard Urban Storm Water Mitigation Plan (SUSMP) requirements;
- Funding LID-related projects through the consolidated grants program; and

- Funding through CWA 319 funds to provide for researching the applicability of the Impervious Surface Analysis Tool (ISAT) for land use planners.
- Participation in the California Water and Land Use Partnership (CaWaLUP) Center at U.C. Davis, a collaborative effort made up of representative staff from government agencies, non-profit organizations, and academia, which aims to improve consideration of the water resource implications of land use in California's local government decisions.

LID design tools present promise for assisting local stormwater agencies in meeting SUSMP requirements and reducing potential discharges of pollutants from areas of new and re-development.

Table 1. Summary of the Phase I and Phase II Stormwater Regulations

Phase I	Phase II
Promulgated in 1990	*Promulgated in 1999*
• Regulated community: municipal separate storm sewer systems serving populations of 100,000 or more, construction sites over 5 acres, and specified industrial activities	• Regulated community: municipal urban systems under 100,000 and construction sites of 1 acre or more • Also provides for a "no exposure" exemption for any Phase I industrial facility.
Goals: eliminate illegal discharges and reduce discharges of stormwater pollutants to the MEP	Goals: reduce the discharge of stormwater pollutants to the MEP and protect water quality
Application Process: • Two-part permit application • Individual municipal permits, which incorporate, by reference, the Partnership's management program. • General Permits are issued by the SWRCB to cover construction and industrial activities.	Application Process: • General Permit (SWRCB, 2003) • Application includes NOI, SWMP, and fee.
The proposed management program must address the following elements: • Commercial and residential area source control (includes municipal operations, new development, and pesticides control) • Illicit discharges and improper disposal (includes illicit connections, illegal dumping, and public education) • Industrial facilities • Construction sites The application must also specify proposed: • Monitoring • Assessment and reporting activities The two-part permit application also requires: • Statement of legal authority • Discharge characterization • Map of the system • Identification of industries • Field screening for illegal discharges • Identification of outfalls	Minimum control measures to be included in SWMP: • Public education • Public participation • Illicit discharge detection and elimination • Construction site stormwater runoff control • Post-construction stormwater management • Pollution prevention and good housekeeping for municipal operations BMPs and measurable goals must be specified in SWMP for each control measure. Must include assessment of effectiveness of SWMP and revision as necessary.

Appendix 1C

History of the Sacramento Stormwater Management Program

This appendix provides a brief history of the Sacramento Stormwater Management Program (Program). Since its beginning in 1990, the Program has evolved significantly by building on accomplishments made, utilizing experience and data gained, and responding to changing regulations and permit provisions. Early efforts focused on program development, but as priorities and activities became better defined through the years, the Program has shifted more towards implementation, while continuing to adapt and improve activities based on effectiveness evaluations.

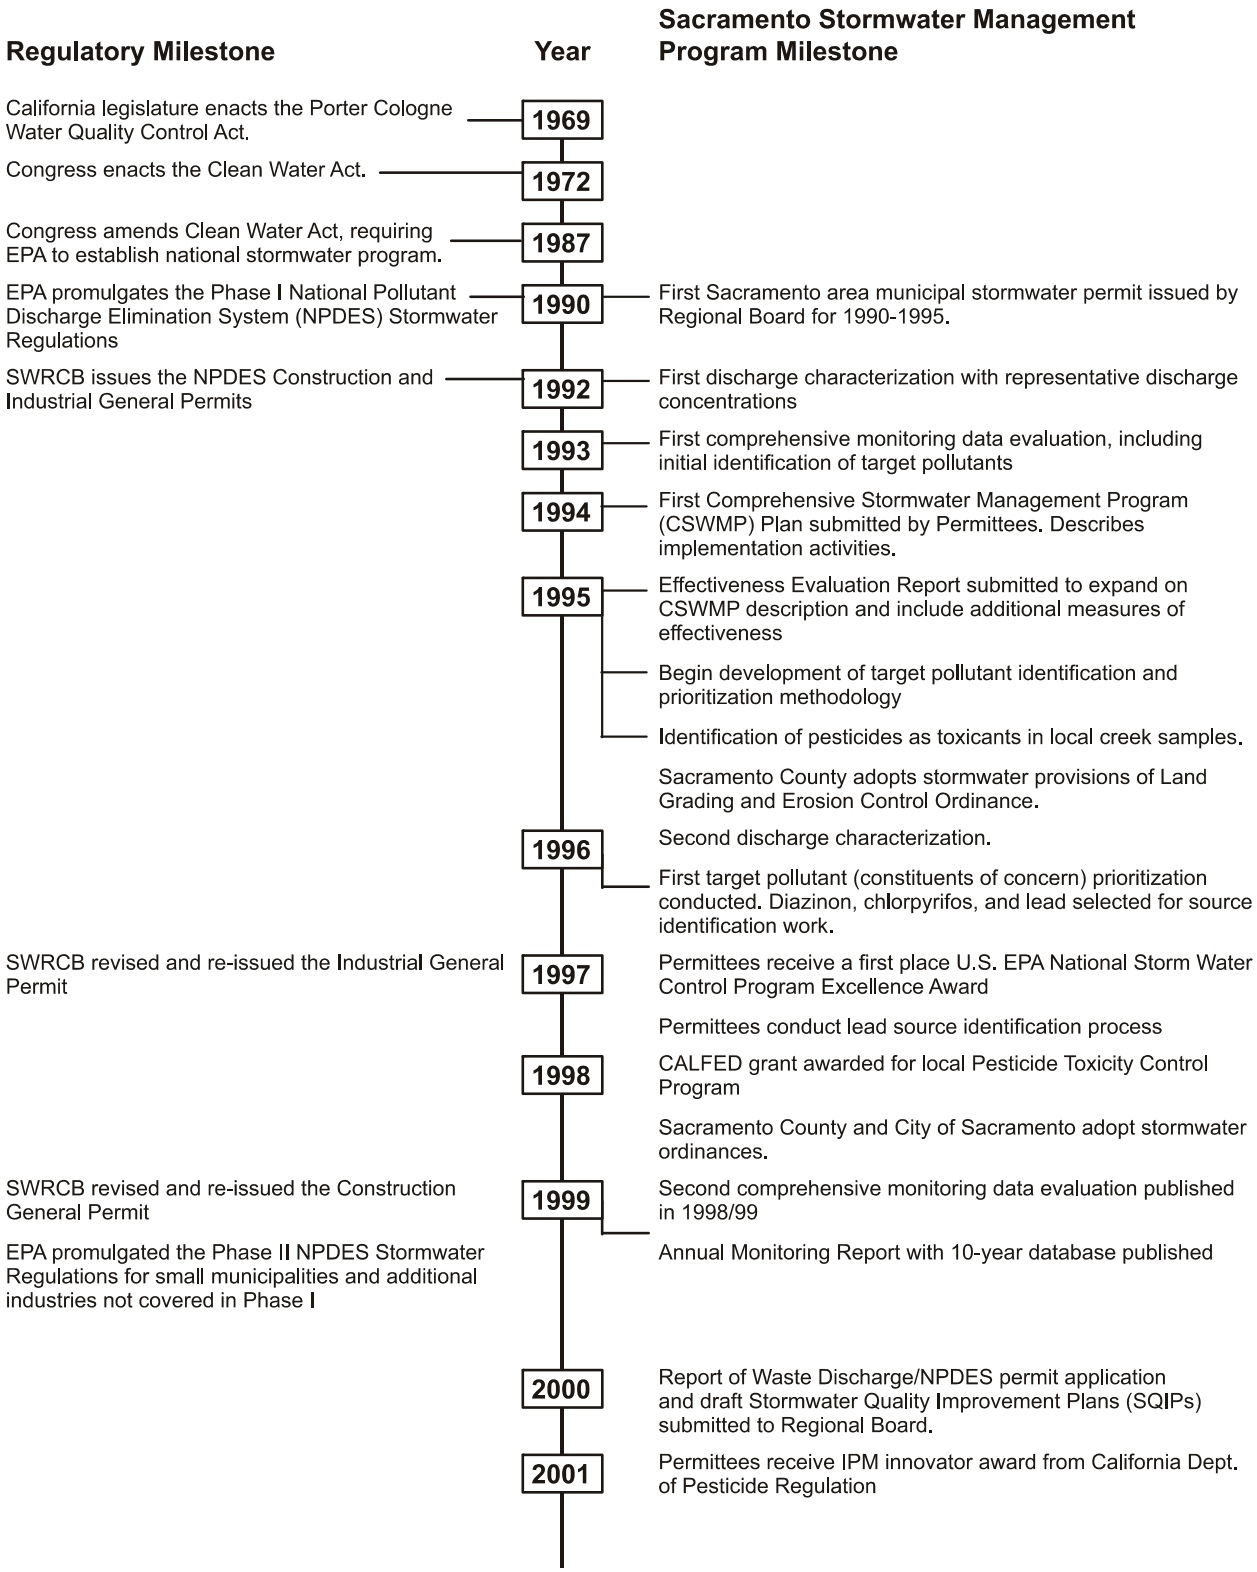
Sacramento Areawide NPDES Municipal Stormwater Permit

As explained briefly in Chapter 1 and in more detail in Appendix B (Regulatory Background), under the federal Clean Water Act, stormwater discharges are regulated through National Pollutant Discharge Elimination System (NPDES) stormwater permits. In California, the State Water Board and its nine Regional Water Boards oversee implementation of the Clean Water Act, and the Central Valley Regional Water Quality Control Board (referred to as "Regional Water Board" in this SQIP) issues and enforces NPDES stormwater permits within the Central Valley.

In 1990, under the Phase I NPDES stormwater regulations adopted by U.S. EPA, municipal stormwater permits are required for municipalities located in metropolitan areas with a population greater than 100,000. In 1990, the Regional Board issued the Sacramento area municipal stormwater permit to the County of Sacramento and Cities of Sacramento, Folsom and Galt (collectively Permittees). The municipal stormwater permit requires the Permittees to implement best management practices to reduce pollutants in urban stormwater discharges to the maximum extent practicable (MEP)[1].

The Sacramento area municipal stormwater permit was renewed in 1996, 2002 and most recently in 2008. Three cities within the county (Citrus Heights, Elk Grove and Rancho Cordova) have become incorporated since the program began and were added as Permittees.

Sacramento Stormwater Management Program



The Program's initial emphasis in the early 1990s was on securing support and stable funding from upper management and their respective jurisdictions' governing bodies, as well as establishing a basic program structure consistent with federal stormwater regulations. Evolution of the Program has included significant refinements of program activities primarily aimed at promoting the most effective use of resources. Several key strategies listed below have guided the Permittees in the selection and design of best management practices:

- Identification and focus on pollutants that pose the highest risk for water quality impacts.
- Evaluation of the Program's effectiveness
- Leveraging of resources through coordination with other agencies and programs

Figure C-1 shows major regulatory and Program milestones. Additional detail about the significant monitoring accomplishments since 1989 is provided on Figure C-2.

[1] The term MEP is discussed in more detail in Appendix 1B.

Figure C-1
Milestones of the Sacramento Stormwater Quality Partnership

Regulatory Milestone	Year	Sacramento Stormwater Management Program Milestone
SWRCB revised and re-issued the Construction General Permit	2002	Third Sacramento NPDES Municipal Stormwater Permit (No. CAS082597) issued by Regional Board for 2003-2007
		Newly incorporated Citrus Heights and Elk Grove added as Permittees.
		Second target pollutant ID and ranking conducted.
SWRCB issued the Phase II NPDES municipal stormwater general permit. Municipalities in Placer, Yolo and El Dorado Counties began submitting Notices of Intent to Comply and associated stormwater management plans	2003	SQIPs modified to address new municipal stormwater permit requirements.
		Industrial inspection program begins.
		Cost share MOU adopted by Permittees.
Regional Water Board adopts TMDL for Diazinon and Chlorpyrifos in Urban Creeks	2004	Modifi ed Sacramento County/Small Cities SQIP to add information for new City of Rancho Cordova
	2005	City of Elk Grove modified its SQIP in response to directive from Regional Water Board
		Mercury and Pesticide Plans submitted to Regional Board.
Regional Water Board releases draft Delta mercury TMDL.	2006	Pesticide Plan approved
		Permittees adopt drainage design regulations
SWRCB issued the Preliminary Draft Construction General Permit (March 2007)	2007	Report of Waste Discharge/NPDES permit application and SQIPs submitted to Regional Water Board 180 days prior to expiration of 2002 permit (Submitted to Regional Water Board June 2007)
		Drainage Design Manual finalized by Permittees
SWRCB issued the second Preliminary Draft Construction General Permit (March 2008)	2008	Fourth Sacramento NPDES Municipal Stormwater Permit (No. CAS082597) issued by Regional Board for 2008-2013 (December 2008)
Regional Water Board drafts update to CWA 303(d) list of impaired waters (January 2009)	2009	SQIP submitted to Regional Water Board as required by permit (April 2009)
SWRCB expected the third Draft Construction General Permit (April 2009)		

See SQIP Glossary for definitions of acronyms.

Sacramento Stormwater Monitoring Program

The Permittees implemented the Monitoring Program (described in Chapter 2, Section 2.4) since the 1989/90 fiscal year. Notable accomplishments over the seventeen-year history are summarized below and illustrated on the timeline in Figure C-2.

- Considerable environmental data have been collected to characterize water quality of urban runoff discharges, urban tributaries and local rivers.
- Water quality data collected by the Permittees, along with other available data, have been used to identify top priority pollutants (target pollutants) in local urban runoff discharges and receiving waters.
- Studies of selected structural best management practices (BMPs) have been conducted to provide information on performance and effectiveness of these devices for potential use in the Sacramento area.
- A study was initiated of wet detention basin performance in the North Natomas area of recent development. Inlet and outlet (discharge) can be used to characterize the effectiveness of new development standards and wet detention basins

- Water quality database tools have been developed to facilitate data access and evaluation using statistical analysis tools and water quality objective (WQO) comparison tools.
- A study was conducted to quantify the statistical power of the water quality data being collected to reliably measure changes in urban runoff water quality over time.
- A methodology was developed during the 2002-07 permit term to evaluate receiving water data, notify the Regional Water Board of receiving water quality exceedances and modify program activities to address receiving water quality concerns.
- During 2008-13 permit stormwater permit term, the Permittees will better evaluate urban runoff from new development with the addition of the North Natomas monitoring site
- The Permittees initiated a new program-wide effectiveness evaluation that will be reported annually with more detailed reports in the 2013 Report of Waste Discharge (ROWD)

Figure C–2
Sacramento Stormwater Monitoring Program Highlights (1990-2009)

Pre-Permit	1989/90	• Conducted American River and urban runoff monitoring under a 205(j) grant
Year 1	1990/91	• Initiated the Sacramento Stormwater Monitoring Program under NPDES Stormwater Permit issued in June 1990
Year 2	1991/92	• Conducted the First Discharge Characterization Project study • Completed the Auto Dismantler Special Study
Year 3	1992/93	• Developed first target pollutant lists (formerly called “constituents of concern”)
Year 4	1993/94	• Prepared the first comprehensive Annual Monitoring Report (1992/93) • Augmented Regional Board 104(b) grant study to identify toxicants in urban creeks and urban runoff • Completed Gasoline Station BMP Special Study
Year 5	1994/95	• Supported the Coordinated Monitoring Program for continued river monitoring • Continued to augment the Regional Board 104(b) grant study which identified diazinon as urban creek and urban runoff toxicant • Investigated oil/water separators

Figure C-2 (Continued)
Sacramento Stormwater Monitoring Program Highlights (1990-2009)

Year 6 1995/96	• Completed toxicity identification evaluation special study on urban runoff, Arcade Creek, and Elder Creek • Conducted second Discharge Characterization Project study • Developed long-term effectiveness evaluation methodology • Developed procedures for target pollutant prioritization, source identification, and control measure identification. • Conducted inlet protection device special study for the Construction Element
Year 7 1996/97	• Augmented the Sacramento River Watershed Program Pesticide Toxicity Survey on Arcade Creek
Year 8 1997/98	• Developed stormwater quality database • Conducted statistical power analysis of water quality data • Developed long-term discharge monitoring strategy of monitoring two years on and one year off • Completed copper source identification work • Awarded grant from CALFED for Pesticide Toxicity Control Program • Began monitoring for New Development Element special studies • Continued river, BMP, and urban runoff monitoring
Year 9 1998/99	• Began Pesticide Toxicity Control Program Phase 1 monitoring • Conducted copper/lead workshop to identify opportunities to incorporate target pollution reduction activities into program elements • Completed investigation of structural control measure for new development • Continued river, BMP, and urban runoff monitoring
Year 10 1999/00	• Conducted a comprehensive analysis of 10-year stormwater quality database • Completed the Pesticide Toxicity Control Program Phase 1 monitoring • Prepared the Clean Water Business Partner Program Non-Structural Control Measures Report • Continued river, BMP, and urban runoff monitoring
Year 11 2000/01	• Amended the target pollutant prioritization process and conducted a full target pollutant prioritization • Submitted the final Pesticide Toxicity Control Program report to CALFED • Continued river, BMP, and urban runoff monitoring

Figure C-2 (Continued)
Sacramento Stormwater Monitoring Program Highlights (1990-2009)

Year 12	2001/02	• Completed the Brown Road Detention Basin Study • Completed the Landscape Control Measure Study • Completed river and BMP monitoring.
Year 13	2002/03	• Completed urban runoff and river monitoring • Prepared for bioassessment, urban tributary, additional pesticide, rainwater and water column toxicity monitoring
Year 14	2003/04	• Initiated bioassessment, urban tributary, additional pesticide, Rainwater, and Water Column Toxicity monitoring • Continued coordinated urban runoff and river monitoring • Submitted work plan for Wet Detention Basin Water Quality Study • Began Erosion Potential Study
Year 15	2004/05	• Completed Erosion Potential Study • Began Structural BMP Effectiveness Study • Continued preparation for Wet Detention Basin Water Quality Study • Continued coordinated river, urban tributary, additional pesticide, rainwater and bioassessment monitoring • Cooperated with UC Davis on pathogen source tracking
Year 16	2005/06	• Began Dry Weather Diversion Feasibility Study • Completed Discharge Characterization Study • Continued coordinated river, urban runoff, urban tributary, additional pesticide and bioassessment monitoring • Began work on Dissolved Oxygen, pH and Temperature Urban Tributary Study • Began Detention Basin Sediment Study • Continued cooperation with UC Davis on pathogen source tracking
Year 17	2006/07	• Completed Dry Weather Diversion Feasibility Study • Completed Detention Basin Sediment Study • Continued with Structural BMP Effectiveness Studies • Completed Phase I of Dissolved Oxygen, pH and Temperature Urban Tributary Study • Continued coordinated river, urban runoff, urban tributary, additional pesticide and bioassessment monitoring

Figure C-2 (Continued)
Sacramento Stormwater Monitoring Program Highlights (1990-2009)

Year 18 2007/08	• Continued Wet Detention Basin Water Quality monitoring • Completed Phase II of Dissolved Oxygen, pH and Temperature Urban Tributary Study • Completed receiving water monitoring required in permit • Continued coordinated river, urban tributary, additional pesticide and bioassessment monitoring
Year 19 2008/09	• Transition to new permit monitoring requirements including urban runoff, urban tributary, river, and sediment monitoring • Continued Wet Detention Basin Water Quality monitoring • Continued Phase III of Dissolved Oxygen, pH and Temperature Urban Tributary Study • Began discharge characterization monitoring of new development urban runoff • Amended the target pollutant prioritization process and conducted a full target pollutant prioritization

See SQIP Glossary for definitions of acronyms

The foregoing is a correct copy of a resolution adopted by the Board of Supervisors, Sacramento County, California

on 4-22-2003

Dated 4-23-2003

Clerk of said Board of Supervisors

By Kay F. Johnson Deputy

RESOLUTION NO. 2003-0396

BE IT RESOLVED AND ORDERED that the Chair of the Board of Supervisors be and is hereby authorized and directed to execute the "Memorandum of Understanding Regarding Administrative Responsibilities and Apportionment of Costs Under NPDES Permit No. CAS0082597", in the form hereto attached, on behalf of the COUNTY OF SACRAMENTO, a political subdivision of the State of California, with the Cities of Citrus Heights, Elk Grove, Folsom, Galt, and Sacramento, and to do and perform everything necessary to carry out the purpose of this Resolution.

On a motion by Supervisor Johnson, seconded by Supervisor Dickinson, the foregoing Resolution was passed and adopted by the Board of Supervisors of the County of Sacramento this 22nd day of April, 2003, by the following vote, to wit:

AYES: Supervisors, Dickinson, Johnson, Niello, Nottoli, Collin

NOES: Supervisors, None

ABSENT: Supervisors, None

ABSTAIN: Supervisors, None

In accordance with Section 25103 of the Government Code of the State of California a copy of the document has been delivered to the Chairman of the Board of Supervisors, County of Sacramento on APR 2 2 2003

By Kay F. Johnson Deputy Clerk, Board of Supervisors

(SEAL)

Chair of the Board of Supervisors
of Sacramento County, California

ATTEST: Cindy A. Turner
Clerk of the Board of Supervisors

FILED

APR 2 2 2003

BOARD OF SUPERVISORS

Cindy A. Turner

CLERK OF THE BOARD

RESOLUTION NO. 2003-30

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF CITRUS HEIGHTS, CALIFORNIA, APPROVING A MEMORANDUM OF UNDERSTANDING REGARDING ADMINISTRATIVE RESPONSIBILITIES AND APPORTIONMENT OF COSTS UNDER NPDES PERMIT NO. CAS0082597

WHEREAS, Congress in 1987 amended Section 402 of the Federal Clean Water Act (33 U.S.C.A. Section 1342 (p)) to require the U.S. Environmental Protection Agency ("EPA") to promulgate regulations ("regulations") for permits for stormwater discharges; and

WHEREAS, the regulations are designed to control pollutants associated with stormwater discharges though the use of the National Pollutant Discharge Elimination System ("NPDES") permit system which allows the lawful discharge of stormwater into the waters of the United States; and

WHEREAS, the regulations are designed to require NPDES permits for discharges from municipal storm sewers on a system-wide or jurisdiction-wide basis; and

WHEREAS, the California Regional Water Quality Control Board, Central Valley Region ("Regional Board") has been charged by the State of California, as delegated by the EPA, with the responsibility to issue NPDES permits within the Central Valley Region; and

WHEREAS, the Regional Board has adopted a NPDES stormwater permit (NPDES No. CAS0082597, Order No. R5-2002-0206 and hereinafter referred to as "Permit") for the County and the Cities of Citrus Heights, Elk Grove, Folsom, Galt, Rancho Cordova and Sacramento (hereinafter referred to collectively as the "Permittees") on December 2002, effective January 25, 2003; and

WHEREAS, the Permit requires the Permittees to monitor stormwater discharges and implement multiple programs to reduce the level of pollutants discharged into receiving waters; and

WHEREAS, the Permittees desire to develop an integrated stormwater discharge management program with the objective of improving water quality in urban creeks, the Sacramento River, American River, and the Delta; and

WHEREAS, the parties desire to receive and/or share the work product of consultants retained by the other parties, the direct work product of the parties themselves, and costs associated with monitoring and implementation of the program; and

WHEREAS, in an effort to meet the deadline set forth by the NPDES permit, City Council grants authority to the city attorney and City Manager to approve minor changes to the MOU without returning to City Council.

NOW, THEREFORE, BE IT RESOLVED AND ORDERED by the City Council of the City of Citrus Heights that the City Manager is hereby authorized to execute a Memorandum of Understanding Regarding Administrative Responsibilities and Apportionment of Costs Under NPDES Permit No. CAS0082597.

The City Clerk shall certify the passage and adoption of this Resolution and enter it into the book of original resolutions.

PASSED AND ADOPTED by the City Council of the City of Citrus Heights, California, this 26th day of March, 2003, by the following vote, to wit:

AYES: Council Members Bruins, Daniels, MacGlashan, Shelby and Hughes

RESOLUTION NO. 2003-76

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF ELK GROVE TO AUTHORIZE THE CITY ELK GROVE TO ENTER INTO A MEMORANDUM OF UNDERSTANDING WITH THE NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMITTEES IN SACRAMENTO COUNTY

WHEREAS, the City of Elk Grove desires to take over responsibility for the Stormwater Drainage Program on July 1, 2003, from Sacramento County, which will include the responsibility for meeting the requirements of the NPDES permit; and

WHEREAS, the City of Elk Grove must sign a formal Memorandum of Understanding (MOU) with the other permittees in Sacramento County to meet the NPDES permit requirements.

NOW, THEREFORE, BE IT RESOLVED that the City Council of the City of Elk Grove hereby authorizes the Mayor to sign the new Memorandum of Understanding with permittees in Sacramento County.

PASSED AND ADOPTED by the City Council of the City of Elk Grove this 16th day of April 2003.

RESOLUTION NO. 7052

A RESOLUTION AUTHORIZING THE MAYOR TO EXECUTE A MEMORANDUM OF UNDERSTANDING REGARDING ADMINISTRATIVE RESPONSIBILITIES AND APPORTIONMENT OF COSTS UNDER NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM PERMIT NO. CAS082597

WHEREAS, in July 1992, a Memorandum of Understanding (MOU) was executed by the County of Sacramento and the Cities of Folsom, Sacramento, and Galt (the Co-Permittees) to define the apportionment of costs for joint activities conducted to comply with the provisions of National Pollutant Discharge Elimination System (NPDES) Permit CAS082597 (Permit); and,

WHEREAS, Resolution 3779 authorized execution of the apportionment MOU; and,

WHEREAS, in November 1996, an additional MOU was executed by the Co-Permittees to define the roles and responsibilities of conducting administrative services for joint activities to comply with the Permit; and,

WHEREAS, Resolution 5240 authorized execution of the administrative services responsibilities MOU; and,

WHEREAS, on December 19, 2002, the California Regional Water Quality Control Board adopted a renewal of the Permit which included the addition of the Cities of Citrus Heights and Elk Grove; and,

WHEREAS, Provision 7e of the new Permit requires an updated MOU be executed no later than April 1, 2003, to identify the roles and responsibilities and apportionment of costs for joint activities to be conducted by the Co-Permittees:

NOW, THEREFORE, BE IT RESOLVED that the City of Folsom authorizes the Mayor to execute the Memorandum of Understanding regarding administrative responsibilities and apportionment of costs under NPDES permit no. CAS082597

PASSED AND ADOPTED on this 25th day of March 2003, by the following roll-call vote:

CITY CLERK, CITY OF GALT

RESOLUTION NO. 2003-40

RESOLUTION OF THE CITY COUNCIL OF THE CITY OF GALT, CALIFORNIA, APPROVING THE MEMORANDUM OF UNDERSTANDING BETWEEN THE COUNTY OF SACRAMENTO, AND THE CITIES OF SACRAMENTO, CITRUS HEIGHTS, ELK GROVE, FOLSOM AND GALT REGARDING ADMINISTRATIVE RESPONSIBILITIES UNDER NATIONAL POLLUTANTS DISCHARGE ELIMINATION SYSTEM (NPDES)

WHEREAS, the City of Galt is a co-permittee with Sacramento County and Cities of Sacramento, Citrus Heights, Elk Grove, and Folsom under a Stormwater National Pollutant Discharge Elimination System (NPDES) permit issued by Regional Water Quality Control Board (RWQCB); and

WHEREAS, this permit was adopted on December 6, 2002 by RWQCB and became effective January 25, 2003; and

WHEREAS, the NPDES permit required development and implementation of programs to reduce pollution caused by stormwater runoff in accordance with the Federal Clean Water Act and administered by the State of California Department of Water Resources; and

WHEREAS, the NPDES permit also requires that permittees enter into a Memorandum of Understanding outlining various activities required and each permittee's financial and permit requirement responsibilities.

NOW, THEREFORE, BE IT RESOLVED AND ORDERED by the City Council of the City of Galt, California, that the Mayor, or in his absence, the Vice Mayor, is hereby authorized and directed to execute said Memorandum of Understanding between the County of Sacramento and the Cities of Sacramento, Citrus Heights, Elk Grove, Folsom and Galt.

BE IT FURTHER RESOLVED AND ORDERED that said Memorandum of Understanding is available and on file in the City Clerk's Office, and is incorporated herein by reference and made a part of this Resolution.

The City Clerk shall certify the passage and adoption of this resolution and enter it into the book of original resolutions.

PASSED AND ADOPTED by the City Council of the City of Galt, California, this 15th day of April, 2003, upon a motion by Council Member Malson, seconded by Council Member Raboy, by the following vote, to wit:

FOR CITY CLERK USE ONLY

RESOLUTION NO.: 2003-202

DATE ADOPTED: APR 22 2003

MEMORANDUM OF UNDERSTANDING REGARDING ADMINISTRATIVE RESPONSIBILITIES AND APPORTIONMENT OF COSTS UNDER NPDES PERMIT NO. CAS0082597

This Memorandum of Understanding ("MOU") is made and entered into this ___ day of _____, 2003 by the County of Sacramento ("County"), the City of Sacramento ("City of Sacramento"), the City of Citrus Heights ("Citrus Heights"), the City of Elk Grove ("Elk Grove"), the City of Folsom ("Folsom"), and the City of Galt ("Galt").

RECITALS

WHEREAS, Congress in 1987 amended Section 402 of the Federal Clean Water Act (33 U.S.C.A. Section 1342 (p)) to require the United States Environmental Protection Agency ("EPA") to promulgate regulations ("Regulations") for permits for stormwater discharges; and

WHEREAS, the Regulations are designed to control pollutants associated with stormwater discharges through the use of the National Pollutant Discharge Elimination System ("NPDES") permit system which allows the lawful discharge of stormwater into the waters of the United States; and

WHEREAS, the Regulations are designed to require NPDES permits for discharges from municipal storm sewers on a system-wide or jurisdiction-wide basis; and

WHEREAS, the EPA has delegated to the State of California the authority to issue NPDES permits; and

WHEREAS, the California Regional Water Quality Control Board, Central Valley Region ("Regional Board") has been charged by the State of California State Water Resources Control Board (SWRCB) with the responsibility to issue NPDES permits within the Central Valley Region; and

WHEREAS, on December 6, 2002 the Regional Board has adopted a NPDES stormwater permit, NPDES No. CAS0082597, Order No. R5-2002-0206, (hereinafter referred to as "Permit") for the County of Sacramento and the Cities of Citrus Heights, Elk Grove, Folsom, Galt, Rancho Cordova and Sacramento (hereinafter referred to collectively as the "Permittees" and individually as a "Permittee"); and

WHEREAS, the Permit is effective January 25, 2003; and

WHEREAS, the incorporation of the City of Rancho Cordova was approved by the voters in November 5, 2002; and

WHEREAS, the provisions of the Permit will apply to Rancho Cordova upon its incorporation which is effective July 1, 2003; and

WHEREAS, upon the incorporation of Rancho Cordova, the County will provide services to Rancho Cordova at least until June 30, 2004 related to compliance with the Permit; and

WHEREAS, the Permit requires the Permittees to monitor stormwater discharges and implement multiple programs to reduce the level of pollutants discharged into receiving waters; and

WHEREAS, the Permittees desire to develop an integrated stormwater discharge management program with the objective of improving water quality in receiving waters identified in the Permit including but not limited to, urban creeks, the Sacramento River, and the American River; and

WHEREAS, the Permittees will incur various other costs relating to monitoring and/or implementing programs; and

WHEREAS, the parties desire to receive and/or share the work product of consultants retained by the other parties, or the direct work product of the parties themselves; and

WHEREAS, the Permit requires execution of a MOU regarding administrative responsibilities and apportionment of costs.

NOW, THEREFORE, in consideration of the mutual promises hereinafter set forth, the Permittees agree as follows:

1. Purpose

This MOU formalizes the manner in which each Permittee shall collaborate with all other Permittees to address common issues, promote consistency among each Permittees' stormwater quality programs, coordinate resources in regional monitoring and public outreach programs, and plan and coordinate activities required to comply with the Permit.

This MOU provides a management structure and cost sharing method for the following:

a. Term of MOU and participant responsibilities;

b. Primary contacts and decision making;

c. Designation of Joint Activities and cost sharing;

d. Information management and reporting; and

e. Other collaborative arrangements for NPDES Permit compliance activities.

2. Previous MOU superseded

This MOU supersedes and terminates the following agreements previously existing between the parties to this MOU:

- The MOU entitled "Memorandum Of Understanding Regarding Administrative Responsibilities Under NPDES Permit No. CA0082597", dated November 12, 1996.
- The MOU entitled "Memorandum of Understanding Regarding Apportionment of Costs for NPDES Program Activities" dated July 28, 1992.

This MOU does not affect, supersede, or modify any other agreements presently existing between any of the parties to this MOU.

3. Participants in MOU

The parties to this MOU include the County, Citrus Heights, Elk Grove, Folsom, Galt, and City of Sacramento.

4. Addition of new Permittees to MOU

Any newly incorporated city, including the City of Rancho Cordova, or any other local jurisdiction that becomes a Permittee due to action by the Regional Board, may become a party to this MOU. To become a party to this MOU, the governing body of the new Permittee must approve a separate addendum to the MOU making the new Permittee bound by its terms and conditions. Addition of a new Permittee in this manner shall not require further modification of this MOU nor approval by the other Permittees, except that Exhibit A shall be modified to reflect the new permittee and appropriate shared costs. A copy of any such addendum shall be made available to all the Permittees.

5. Rancho Cordova

Upon the incorporation of the City of Rancho Cordova ("Rancho Cordova") it will become a Permittee and the County will provide services pursuant to Government Code section 57348 to Ranch Cordova related to its compliance with the Permit and will implement the provisions of this MOU on behalf of Rancho Cordova. After June 30, 2004, Rancho Cordova may choose to comply with the Permit using its own staff or may contract with another entity to provide services related to its compliance with the Permit. After June 30, 2004, the Rancho Cordova City Council must approve an addendum to this MOU to bind Rancho Cordova to the terms of this MOU. If it fails to take this affirmative action, Rancho Cordova will not become a party to this MOU.

6. Term of MOU

The provisions of this MOU shall commence upon approval of this MOU by each of the Permittees and shall terminate upon adoption of a successor MOU or in a manner consistent with section 8 of this MOU.

7. Withdrawal of Individual Permittees

If any Permittee withdraws or ceases to be covered by the Permit, then said Permittee shall no longer be bound by all terms and conditions of this MOU except for the indemnity and hold harmless provisions of this MOU, which shall remain in full force as to acts or omissions occurring prior to withdrawal. The withdrawal of any Permittee shall not affect the terms and conditions of this MOU among the remaining Permittees, except that the cost sharing proportions shall be recalculated to reflect the changes caused by the withdrawal.

8. Termination

Each party shall have the right to withdraw from and terminate its responsibilities under this MOU at any time by serving upon all other parties thirty (30) business days advance written notice of withdrawal. The notice shall be deemed served and effective for all purposes on the date it is deposited in the United States mail, postage prepaid and addressed in accordance with the terms and provisions of this MOU.

Any party withdrawing from this MOU shall pay its proportionate share of any work performed under the MOU up to the effective date of withdrawal. This shall include unexpected expenses that were not known at the time of withdrawal, but are related to work or actions that occurred before the effective date of the withdrawal.

9. Indemnification and Claims

Notwithstanding any other provisions of this MOU, each Permittee shall indemnify, defend and hold harmless all other Permittees, their officers, agents, and employees from and against any and all claims, losses, liabilities or damages, including payment of reasonable attorney's fees and costs, arising, out of the Permittee's non-compliance with the Permit, through negligence, internal act or omission, or through any other act or omission by the Permittee, its officers, agents, employees, and/or subcontractors.

It is the intention of each Permittee that the provisions of this paragraph be interpreted to impose on each party responsibility to the other for the acts and omissions of their respective officers, directors, agents, employees, and/or contractors. It is also the intention of each Permittee that, where comparative fault is determined to have been contributory, principles of comparative fault will be followed and each party shall bear the proportionate cost of any damage

attributable to the fault of that party, its officers, directors, agents, employees, and/or contractors.

The County will be responsible for the administration of any public liability claims made against the parties to the MOU.

10. Insurance or Self-Insurance

Each party, at its sole cost and expense, shall carry insurance -or self-insure - its activities in connection with this Agreement, and obtain, keep in force and maintain, insurance or equivalent programs of self-insurance, for general liability, workers compensation, property, professional liability, and business automobile liability with coverage limits that are adequate to cover its potential liabilities hereunder, subject to the reasonable approval of the other parties. Each party agrees to provide the other thirty (30) days' advance written notice of any cancellation, termination or lapse of any of the insurance or self-insurance coverages.

11. Amendments

This MOU may be modified or amended in writing if executed by the governing body of all parties.

12. Responsibilities of Each Permittee

a. Each Permittee understands and agrees that there is no agency relationship between the Permittees. It is further understood and agreed by the Permittees that any person employed by each Permittee shall be entirely and exclusively under the direction, supervision, and control of the employing Permittee.

b. The Permittees are legal entities and have the authority to develop, administer, implement, and enforce stormwater management programs within their own jurisdictions. The individual Permittees are solely responsible for compliance with the Permit within their respective jurisdictions. The County is solely responsible for compliance with the Permit within the urbanized unincorporated areas of the County of Sacramento.

c. Each Permittee acknowledges, understands, and accepts that it is legally bound by the terms and conditions of the Permit as issued by the Regional Board.

d. Each Permittee is solely responsible for the retention and/or storage of its own data, documents, and reports or writings, for the length of time required by the Permit or until three years after the expiration of the Permit, whichever is greater.

e. Each Permittee is responsible for complying with the provisions of the California Environmental Quality Act (CEQA, Public Resource Code section 21000, et seq.) in connection with the implementation of the terms, conditions, and requirements of the Permit and this MOU.

13. Separate Agreements between Permittees

Nothing in this MOU shall prevent individual Permittees from entering into agreements with each other or with other parties to obtain or to provide services related to implementation of Permit or MOU obligations. Such service agreements do not relieve individual Permittees from their obligations under the Permit or this MOU, and obligations under this MOU will supercede any conflicting obligations of separate agreements.

14. Primary Contacts

The County and City of Sacramento shall serve as the primary co-contacts with regulating agencies such as EPA, SWRCB, and the Regional Board regarding Permit matters that are of interest to all Permittees. Permit matters that are specific to a particular jurisdiction should be addressed directly to that jurisdiction. The County and City of Sacramento shall relay and transmit any correspondence relating to the Permit received from the Regional Board, SWRCB, or EPA to the other Permittees within five (5) business days of receipt. The designation of primary contacts is intended only as a convenience for the regulating agencies, and each Permittee understands and agrees that this provision does not relieve each Permittee of any of its Permit obligations, nor imposes any new Permit obligations on the County and City of Sacramento.

15. Information sharing

Except as provided in the section of this MOU entitled "Non-participation in Joint Activities", if any Permittee submits any required documents, reports, or writings relating to stormwater discharges to the Regional Board, SWRCB, or EPA, said Permittee shall send a copy of the document, report, or other writing to the each other Permittee. At its discretion, the Permittee sending copies of documents may require reimbursement from the receiving parties for its copying costs.

Each Permittee agrees to make available to the other parties to this MOU all non-confidential and non-privileged data, documents, reports, or writings that are public records relating to the Permit upon written request. At the discretion of the Permittee that is providing the copies, the Permittee requesting the information shall be responsible for all costs incurred in connection with said request, including copying costs.

16. Steering Committee

The Permittees shall establish a Steering Committee, consisting of representatives designated by their jurisdiction's management. The purpose of the Steering Committee is to provide forum for making decisions and providing guidance to the Permittees relative to the implementation of common activities that are subject to the terms of this MOU. The responsibilities and activities of the Steering Committee including, but not limited to, the following:

- Oversight of MOU implementation
- Resolution of issues and disputes regarding this MOU
- Management of Joint Activities defined in this MOU
- Management and designation of additional Joint Activities not specified in this MOU.
- Approval of the scope of Joint Activities.
- Designation and approval of reimbursable staff support for Joint Activities.
- Determination of reimbursement mechanisms.

Any action by the Steering Committee requires the support of at least two-thirds of all the Steering Committee members. The Steering Committee may conduct its business, including any official actions or approvals, in various reasonable manners as it sees fit, provided that a good faith effort is made to accommodate the preferences of all members. Methods for conducting Steering Committee business may include but are not limited to the following: meetings conducted in person, telephone, email, on-line discussions, routing of hard copy by courier or U.S. Mail, or any reasonable combination of methods.

Each Steering Committee representative has an equal vote on the Steering Committee.

The management of any Permittee jurisdiction may delegate authority to another authorized representative to represent it on the Steering Committee, including the casting of its vote. This does not relieve each Permittee of the responsibility to obtain funding authority or any other authority necessary for participation in a Joint Activity.

17. Joint Activities

The terms and conditions of this MOU apply to activities, as defined in this section, that are related to compliance with the requirements of the Permit, and that provide work products, services, or other benefits that are of common benefit to all Permittees. Such activities shall be referred to herein as "Joint Activities".

18. Joint Activities designated in MOU

a. Mandatory Joint Activities. The following activities are hereby designated as Joint Activities and include projects specified in the Permit. All the signatories of this MOU agree to participate in cost sharing for these activities:

(1) Annual Monitoring Report
(2) Development Standards Plan
(3) Urban Discharge Monitoring
(4) River Monitoring
(5) Water Column Toxicity Monitoring
(6) Urban Tributary Monitoring
(7) Additional Pesticide Monitoring
(8) Bioassessment
(9) Water Quality Detention Effectiveness Study
(10) Erosion Potential Study
(11) Dry weather flow diversion study
(12) Structural BMP Effectiveness Studies

b. Optional Joint Activities. With respect to the Joint Activities described in this section, the Permitee advocating the activity will query the Permittees to determine whether or not they agree to cost-share in the particular support activity. If a Permittee does not desire to cost share in the support activity, they will not be included in the cost share formula for that activity, and will be considered a non-participant subject to the restrictions in the Non-Participation in Joint Activities section of this agreement. Optional Joint Activities include, but are not limited to:

(1) Monitoring Program Support contract
(2) The following elements of the Pesticide Control Program:
    (a) Water Wise Pesticide Outreach
    (b) PRISM grant for pesticide activities
    (c) Participation in Urban Pesticide Committee
    (d) Pesticide Program Support contract

(3) Certain portions of the Public Education and Outreach Programs requirements as designated and approved by the Steering Committee

19. Joint Submittals

All Permittees agree to cooperate on a consolidated submittal for the Joint Activities designated in this MOU. To facilitate and coordinate these submittals, each year the Steering Committee shall designate a lead agency or agencies for each submittal. The lead agency will be responsible for overall coordination, completion, and delivery of the submittal. The lead agency shall deliver or mail to the Regional Board joint compliance documents, reports, or other writings.

The other Permittees agree to prepare and forward to the lead agency in a timely manner, any jurisdiction specific sections that are necessary for these submittals. When the Permit requires submission of any joint compliance documents, reports, or other writings by a specific date, each Permittee shall ensure that the lead agency receives the document, report, or other writing to be filed thirty (30) business days prior to the specified date unless a different time is otherwise agreed to in writing by the Permittees. In the event that a Permittee is unable to comply with this provision for any reason, said Permittee shall notify the other Permittees in writing of the anticipated submission date and the reason for the delay, and shall provide a copy of the letter to the Regional Board.

20. Designation of Additional Joint Activities

The Steering Committee shall be responsible for the consideration and designation of additional activities as Joint Activities. Joint Activities should be activities that provide work products, services, or other benefits that are of benefit to all Permittees.

21. Documentation of Joint Activities

For each Joint Activity designated by this MOU or by the Steering Committee, the Steering Committee or the lead agency responsible for the implementation of the activity shall provide all Permittees with adequate documentation. This documentation shall include the following elements and any other documentation as determined by the Steering Committee:

a. Description of the scope and purpose of the activity;
b. Copies of applicable contracts;
c. Significant decisions regarding the management of the activity;
d. Any changes to the scope and purpose of a joint activity shall be in writing.

Each Permittee shall submit documentation to the other Permittees indicating whether or not it will participate in each Joint Activity, except for mandatory Joint Activities designated in this MOU.

22. Non-participation in Joint Activities

Permittees must participate in the mandatory Joint Activities as designated in this MOU. For any other Joint Activity, a Permittee may choose not to participate. A Permittee that chooses not to participate, fails to obtain proper authority to fund the Joint Activity, or fails to pay its portion of costs, will be considered a Non-Participant and shall not be entitled to the consultant services or the use of work products resulting from the Joint Activity. In addition, Non-Participants for a given Joint Activity may not claim or imply participation in any public documents, including any reports to the Regional Board, such as Annual Progress Reports or Annual Monitoring Reports. Any Non-Participant that fails to comply with these

restrictions, thereby gaining the benefit of a particular Joint Activity, shall be liable to reimburse the other Permittees, according to the cost sharing provisions of this MOU, as though it had been a full participant in the Joint Activity.

23. Contract Administrator

For each designated Joint Activity that requires contracted services, the Steering Committee shall designate one Permittee that is willing to serve as the Contract Administrator. The Contract Administrator shall be responsible for the following activities for each contract:

a. Establish a contract through its jurisdiction.
b. Act as the fiscal agent for the contract and provide accounting of costs as needed.
c. Provide on-going contract administration.
d. Maintain records regarding Permittee decisions, agreements, and obligations related to the contract and the Joint Activity.
e. Update other Permittees in a timely manner regarding implementation of the Joint Activity and the status of pertinent contracts.
f. Distribute to other Permittees copies of studies, reports, and other work products prepared per the contract.

Upon approval by the Steering Committee, the Contract Administrator for a particular Joint Activity may be entitled to reimbursement of costs from the other Permittees, according to the cost sharing proportions in Exhibit A. Such reimbursement may include staff time and other resources used to provide contract administration on behalf of the other Permittees.

The Contract Administrator shall be authorized to conduct day-to-day administration of the contract. However, no changes to the scope of services or the approved contract amount shall be made without the approval of the Steering Committee.

24. Ownership of Work Product

All technical data, evaluations, plans, specifications, reports or other work products associated with a Joint Activity produced by a consultant or any party to the Joint Activity shall become the mutual property of all participating parties, subject to Federal copyright laws.

25. Communication with Consultant

Each party may communicate directly with a consultant, except as set forth below:

a. Any communications relating to a change or modification in the scope of work to be performed by a consultant, or any communication which will

increase or should reasonably be expected to increase the compensation due to a consultant shall not be submitted to the consultant unless:

1. The Steering Committee approves the change or modification; or

2. The Steering Committee does not object and the party requesting the change or modification advises all other parties in writing that it will be solely responsible for any and all compensation due to the consultant resulting from said change or modification.

b. Any communications relating to a change or modification in the schedule of performance shall not be submitted to a consultant unless all parties agree to the change or modification.

c. If any party submits any document, reports or writing to a consultant, as provided herein, a copy of such document, report or writing shall be submitted to all other parties.

26. Permittee responsibilities for Joint Activities

Each Permittee is responsible for the following:

a. Designation of an authorized representative and any necessary alternates to the Steering Committee.
b. Accurate documentation of staff time and other resources for which Joint Activity cost share reimbursement is claimed.
c. Obtaining any necessary legal and administrative authority to participate in each Joint Activity.
d. Timely payment of all monetary obligations as a Participant.

27. Cost Apportionment for Joint Activities

a. Each Permittee understands and acknowledges that the implementation of the terms, conditions, or requirements of the Permit by each Permittee may result in significant benefit to the other Permittees. It is the intent of the Permittees to fairly and equitably apportion the costs of such benefits. When a Permittee agrees to participate in a Joint Activity it agrees to share the costs of the Joint Activity as defined by this MOU and the Steering Committee.

b. Cost apportionment for Joint Activities shall apply to any costs associated with contracting under this MOU, including but not limited to, services, materials, and equipment.

c. Cost apportionment for Joint Activities may include the following as specified and approved by the Steering Committee:

1. Contract administration by Permittee staff.
2. Significant Joint Activity support provided by specified Permittee staff.
3. Any other expenses that provide a shared benefit to the Permittees.

d. Each Permittee is responsible for confirming or obtaining the necessary authority from its governing body and to meet any other legal and administrative requirements of its jurisdiction to provide the funding for its participation in Joint Activities.

28. Cost Apportionment Method

All parties hereby agree that any compensation due to consultants or any other party under the terms and conditions of this MOU shall be apportioned among all parties participating in a given Joint Activity, in proportion to their respective populations, utilizing the following method:

- The populations used for this apportionment shall be based on the official population estimates of the Sacramento Area Council of Governments (SACOG) for the years 2000 and 2010,
- The arithmetic mean of the population of each Permittee for these years will be calculated.
- The calculated mean populations will be used to determine the cost share proportions of each Permittee.

The SACOG population estimates and calculated population proportions agreed to by the Permittees are shown in Exhibit A of this MOU.

Upon approval by the Steering Committee, revised official SACOG estimates may be used to recalculate the population proportion used for allocating costs.

29. Invoicing, Payment, and Notices

The Contract Administrator shall, upon receipt of an invoice from the consultant, or upon the computation of the charges for the work product, send a copy of said invoice or computation to all participating parties.

The participating parties shall advise the Contract Administrator of any disputed amount in writing within ten (10) business days of the receipt of said invoice. The Contract Administrator shall thereafter submit separate invoices to the participating parties for their proportioned share of the undisputed amount. The participating parties shall pay to the Contract Administrator their invoiced share within thirty (30) business days of receipt of the separate invoice. The parties agree to exercise good faith and diligence in the resolution of any disputed invoiced amounts.

Unless the persons or addresses are otherwise identified in the manner specified in this paragraph, all invoices, payments or notices or other writings authorized or

required by this MOU shall be deposited in the United States mail, postage prepaid and addressed to the respective parties as follows:

County: Department of Water Resources County of Sacramento 827 7th Street, Room 301 Sacramento, CA 95814 Attn: Stormwater Program Manager	City of Sacramento: Director Department of Utilities City of Sacramento 1391 35th Ave Sacramento, CA 95822
Elk Grove: Manager of Engineering and Building City of Elk Grove 8400 Laguna Palms Way Elk Grove, CA 95758	Folsom: Director Department of Public Works/City Engine City of Folsom 50 Natoma Street Folsom, CA 95630
Galt: Director Public Works Department City of Galt 495 Industrial Drive Galt, CA 95632	Citrus Heights: Director, General Services Department 6237 Fountain Square Drive Citrus Heights, CA 95621-5577

30. Dispute resolution

Whenever any party disagrees as to any matter covered under this MOU, this dispute resolution process shall govern. Until the dispute is resolved, all parties shall continue to perform pursuant to the terms of this MOU.

The parties shall make a good faith effort to resolve the dispute at the Steering Committee level. If this effort is unsuccessful, within ten (10) business days after the identification of the dispute, any party may give the other party a written request for a meeting between the respective Department Directors or Directors' designees. The purpose of this meeting shall be to ascertain whether a resolution of the disagreement is possible without third party intervention.

31. Entire MOU

Except as provided otherwise herein, this instrument and any attachments hereto constitute the entire MOU between the parties concerning the subject matter hereof.

32. Execution in Counterparts

This agreement may be executed in counterparts.

IN WITNESS WHEREOF, the parties hereto have caused this MOU to be duly executed as of the day and year first above written.

Sacramento Stormwater Quality Partnership

HYDROMODIFICATION MANAGEMENT WORK PLAN

Introduction

This work plan describes the proposed tasks and schedule to prepare the Sacramento Area Hydromodification Management Plan (HMP). This work plan and the eventual HMP are required compliance deliverables of the Sacramento Areawide Municipal Stormwater Permit (Sacramento Municipal Permit), Order R5-2008-0142, adopted by the Central Valley Regional Water Quality Control Board (Regional Water Board) on September 11, 2008. The work plan is due April 30, 2009 and the HMP is due one year following the approval of the work plan by the Regional Water Board.

This work plan was prepared by the Sacramento Stormwater Quality Partnership (Partnership or permittees); which includes the County of Sacramento and the Cities of Sacramento, Rancho Cordova, Galt, Folsom, Elk Grove, and Citrus Heights. The County of Sacramento, on behalf of the SSQP, will be the lead agency for the HMP development effort and will solicit and administer consultant services to produce the HMP. The cost of developing the HMP will be shared between the permittees per the latest *Memorandum of Understanding for the Sacramento Stormwater Quality Partnership.*

The permittees plan to adopt an HMP approach that promotes consistency across the county and equity for the development and landowner community, while building on others' experiences.

Background and Regulatory Requirements

Provision 15.c of the Sacramento Municipal Permit states: "The HMP shall require controls to manage the increases in the magnitude (e.g., flow control), frequency, volume and duration of runoff from development projects in order to protect receiving waters from increased potential for erosion and other adverse impacts with consideration towards maintaining (or reproducing) the pre-development hydrology".

The Sacramento Municipal Permit identifies exemptions from the HMP requirements for projects that discharge to waterways with low erosion potential. These exemptions include:

(a) Discharges into creeks that are concrete-lined or significantly armored;

(b)Underground storm drain systems discharging directly to the rivers;

(c) Construction of infill projects in highly developed watersheds, where the potential for single-project and/or cumulative impacts is minimal; and

(d) Projects that do not create an increase in impervious surfaces over pre-project conditions.

(e) A project within a transit oriented corridor or within ½ mile of a transit station and/or intermodal facility.

(f) Redevelopment projects that redevelop existing brownfield sites or creates affordable housing.

The HMP development effort will build upon the foundation created in past years by the permittees, including these work products:

- Development Standard Plan (DSP), December 2003
- Each Permittee's amended development standards, May 2006
- Stormwater Quality Design Manual for the Sacramento and South Placer Regions, May 2007.

The Partnership recently completed several tasks in order to develop this work plan:

1. **Review of Current and Past HMPs Statewide**

   The Partnership worked with Eric Berntsen of the State Water Board to advise his research of other HMP programs in California. The State Water Board produced a table (attached to the Partnership's pilot project report appendix A described below) describing and comparing the existing HMP efforts statewide. This information allows the Partnership to take advantage of lessons learned from other areas in the State; such as modeling criteria, development of design tools, schedule and cost.

2. **Coordination with Other Statewide Hydromodification Related Efforts and Technical Experts**

   The Partnership will be developing the HMP based on the findings of other HMPs around the state and is therefore actively engaged with several groups that are sharing information for the benefit of others. These include:

   - Hydromodification Planning Group – State Water Board initiative
   - Southern California Coastal Water Resources Project (SCCWRP) Regional Hydromodification Management Study
   - Riparian Buffers Research Initiative – State Water Board

The permittees have involved various technical experts in the process to provide technical and peer review of the Sacramento pilot project and help ensure that it is consistent with other statewide findings and recommendations. These professionals include:

- Brian Bledsoe, Colorado State University

- Eric Stein, Sothern California Coastal Water research Project
- Matt Yeager, San Bernardino County

3. Completion of the Sacramento Pilot Project

The permittees retained a consultant to conduct a pilot project in Sacramento County and prepare a report of findings and recommendations. This pilot project helps form the basis of this work plan and the eventual HMP. The pilot project is described in more detail below.

Technical Approach: The Sacramento Pilot Project

In 2008, the Partnership conducted a pilot project for a portion of a relatively small watershed that represents various development conditions (from undeveloped to fully developed) in Sacramento County (Elder Creek) to recommend/demonstrate the technical methodologies that could be used to evaluate the susceptibility of this creek and other local creeks to erosion and degradation. The findings of this pilot project are included in the attached memo (*Pilot Project to Access Decision Support Tools for Hydromodification Management in the Sacramento Area*) and form the basis for developing the areawide HMP.

The pilot project consisted of a three tiered approach:

Tier 1 - Development of an Applicability and Susceptibility Mapping Screening Tool

- Developed HMP criteria based on review of other related studies and factors pertinent to local area. Reviewed existing documents to synthesize example criteria and design standards (e.g. Alameda, Santa Clara, etc.).

- Developed GIS layers and information. This task included: Defining accurate creek alignments through a combination of terrain and aerial techniques; creating an overlay of community specific plans; defining creek types (i.e. lined, natural, etc.) through desktop analysis and input from Sacramento County about operation and maintenance and plans in progress; and defining creek ecology using readily available sources (e.g., existing bioassessments, habitat conservation plans, etc.) to include as a GIS layer, if available.

- Developed susceptibility mapping using an appropriate GIS-based alternative analysis. Determined appropriate stream power thresholds based on literature review and inspection of field conditions.

Tier 2 - Field verification of Screening Tool

- Conducted field geomorphic assessment and other assessment methodologies to verify GIS analysis, for representative accessible sites in the pilot watershed.

Tier 3 - Development of Preliminary Procedures for Hydromodification Mitigation

- Conducted research of other HMP efforts to gather data for relating a suitable stream power threshold with potential mitigation actions.
- Recommended various mitigation measure concepts for hydromodification management to meet the requirments of the Sacramento Municipal Permit, based on findings of the Sacramento pilot project:
    - Integrated On-site Low Impact Development (LID) design strategies
    - Flow-duration basins
    - In-stream restoration
    - Planning measures (e.g. natural buffers)

Anticipated HMP Components/Tasks

The permittees plan to retain consultant services in FY 2009-10 to assist with conducting all or some of the following work in order to prepare the Sacramento Area HMP:

- Characterize stream conditions and future development patterns using existing data and necessary field verification
- Select assessment method and produce an “Applicability and Susceptibility Map” based on the criteria identified (proposed) in the pilot project.
- Develop guidance for HMP mitigation measures.
- Use Continuous Simulation Modeling and hydrograph matching analysis to develop sizing criteria for HMP mitigation measures.
- Develop design tools for implementing HMP requirements.
- Adopt amendments as needed to local permitting agency codes, procedures and programs.
- Incorporate hydromodification management technical guidance into the *Stormwater Quality Design Manual for Sacramento and South Placer Regions*

(Stormwater Quality Design Manual). Develop an integrated approach for hydromodification and LID criteria that builds on the existing measures in the *Stormwater Quality Design Manual*.

- Conduct Outreach with the development community (likely via the Building Industry Association (BIA), Civil Engineers and Land Surveyors of California (CELSOC), and others), the environmental community and other interested parties.
- Implement or co-sponsor training for agency staff, the development community, and local engineers.
- Continue to collaborate and coordinate with the State Water Board and appropriate technical experts.

Please refer to Figure 1 for a draft HMP outline. Outline to be finalized as the HMP document is developed.

Anticipated HMP Adoption and Implementation Schedule

Activity	**Date**
Submit HMP work plan to Regional Water Board	April 30, 2009
Conduct informational workshop for development community and other interested parties	May/June 2009
Retain consultant services to assist with HMP development.	Summer 2009
Conduct work needed to prepare HMP.	Summer 2009-Summer 2010
Submit HMP to Regional Water Board for approval	Summer 2010 (1 year after regulatory approval of HMP work plan)
Amend individual permittee development standards as needed to implement the HMP	6 months after Regional Board approval of the HMP
Update technical guidance (*Stormwater Quality Design Manua*l) to include HMP design criteria	6 months after the amendment of the development standards
Conduct outreach to the development community	Summer 2009 & during update of technical guidance
Conduct training of agency staff	During and after update of technical guidance

USGS	United States Geological Survey

1 BACKGROUND

1.1 CONTEXT

Historically, the County of Sacramento and other agencies have sought to control stormwater runoff from urban development[1] in order to protect property from flooding. The main flood control strategies included realigning, widening and armoring stream channels to reduce the floodplain and more efficiently convey water, and installing detention basins to control the peak flows of runoff released to the streams. Changes to the water regime caused by development, flood control, or other reasons (e.g., changes to the creeks for agricultural irrigation and construction of dams for water supply and power generation) are types of hydromodification[2]. In recent years, there has been a growing awareness that while flood control is still critical to protect life and property, historical flood-control methods do not protect creek habitat, and in some cases, may aggravate erosion problems and contribute to habitat degradation. Therefore, it is important to manage the water regime changes caused by new development in ways that protect environmental resources, not just prevent flooding.

The Sacramento Areawide Municipal Stormwater Permit (Permit)[3] requires the County of Sacramento and co-permittees[4] to develop a Hydromodification Management Plan (HMP). The HMP will describe the approach for locally mitigating the impacts of increased stormwater runoff from future new development and redevelopment where the runoff flowing to creeks can cause erosion or other harm. The following is an excerpt of the Permit describing those requirements (Provision 15c):

1. *The HMP shall require controls to manage the increases in the magnitude (e.g., flow control), frequency, volume and duration of runoff from development projects in order to protect receiving waters from increased potential for erosion and other adverse impacts with consideration towards maintaining (or reproducing) the pre-development hydrology. The HMP shall address, but not be limited to, the following:*
    a. *Requires incorporation of controls, including structural and nonstructural BMPs, to mitigate the projected increases in flows;*
    b. *Controls post-development runoff rates and velocities from a site to avoid adverse impact on downstream erosion, flooding and stream habitat;*

[1] Development increases the volume, duration, and frequency of stormwater runoff because it replaces pervious land with hard surfaces that prevent rain water from soaking into the ground, and because it reduces or eliminates vegetation (including trees), which intercepts rain and increases evapotranspiration.

[2] The US EPA defines hydromodification as: "Alteration of the hydrologic characteristics of coastal and noncoastal waters, which in turn could cause degradation of water resources. In the case of a stream channel this is the process whereby a stream bank is eroded by flowing water. This typically results in the suspension of sediments in the water course."

[3] Order R5-2008-0142 adopted by the Central Valley Regional Water Quality Control Board (Regional Water Board) on September 11, 2008.

[4] The 7 Permittees include Sacramento County and the Cities of Sacramento, Rancho Cordova, Galt, Folsom, Elk Grove and Citrus Heights (collectively known as the Sacramento Stormwater Quality Partnership, or SSQP.)

c. *Minimizes the quantity of storm water directed to impermeable surfaces and the MS4s (municipal storm drain);*
d. *Maximizes the percentage of permeable surfaces to allow more percolation of storm water into the ground;*
e. *Considers the full range of BMPs in the Stormwater Quality Design Manual; and*
f. *Considers various assessment methodologies designed to evaluate the existing geomorphic condition of receiving waters, along with the expected susceptibility of these receiving waters to erosion/change as a result of hydromodification from land development and other land uses.*

2. *This requirement does not apply to new development and redevelopment projects where the project discharges storm water runoff into creeks or storm drains where the potential for erosion, or other impacts to beneficial uses, is minimal. The HMP shall describe the criteria used in determining the site-specific conditions applied to this requirement. Such situations may include, but not limited to the following:*
    a. *Discharges into creeks that are concrete-lined or significantly armored;*
    b. *Underground storm drain systems discharging directly to the rivers;*
    c. *Construction of infill projects in highly developed watersheds, where the potential for single-project and/or cumulative impacts is minimal; and*
    d. *Projects that do not create an increase in impervious surfaces over pre-project conditions.*

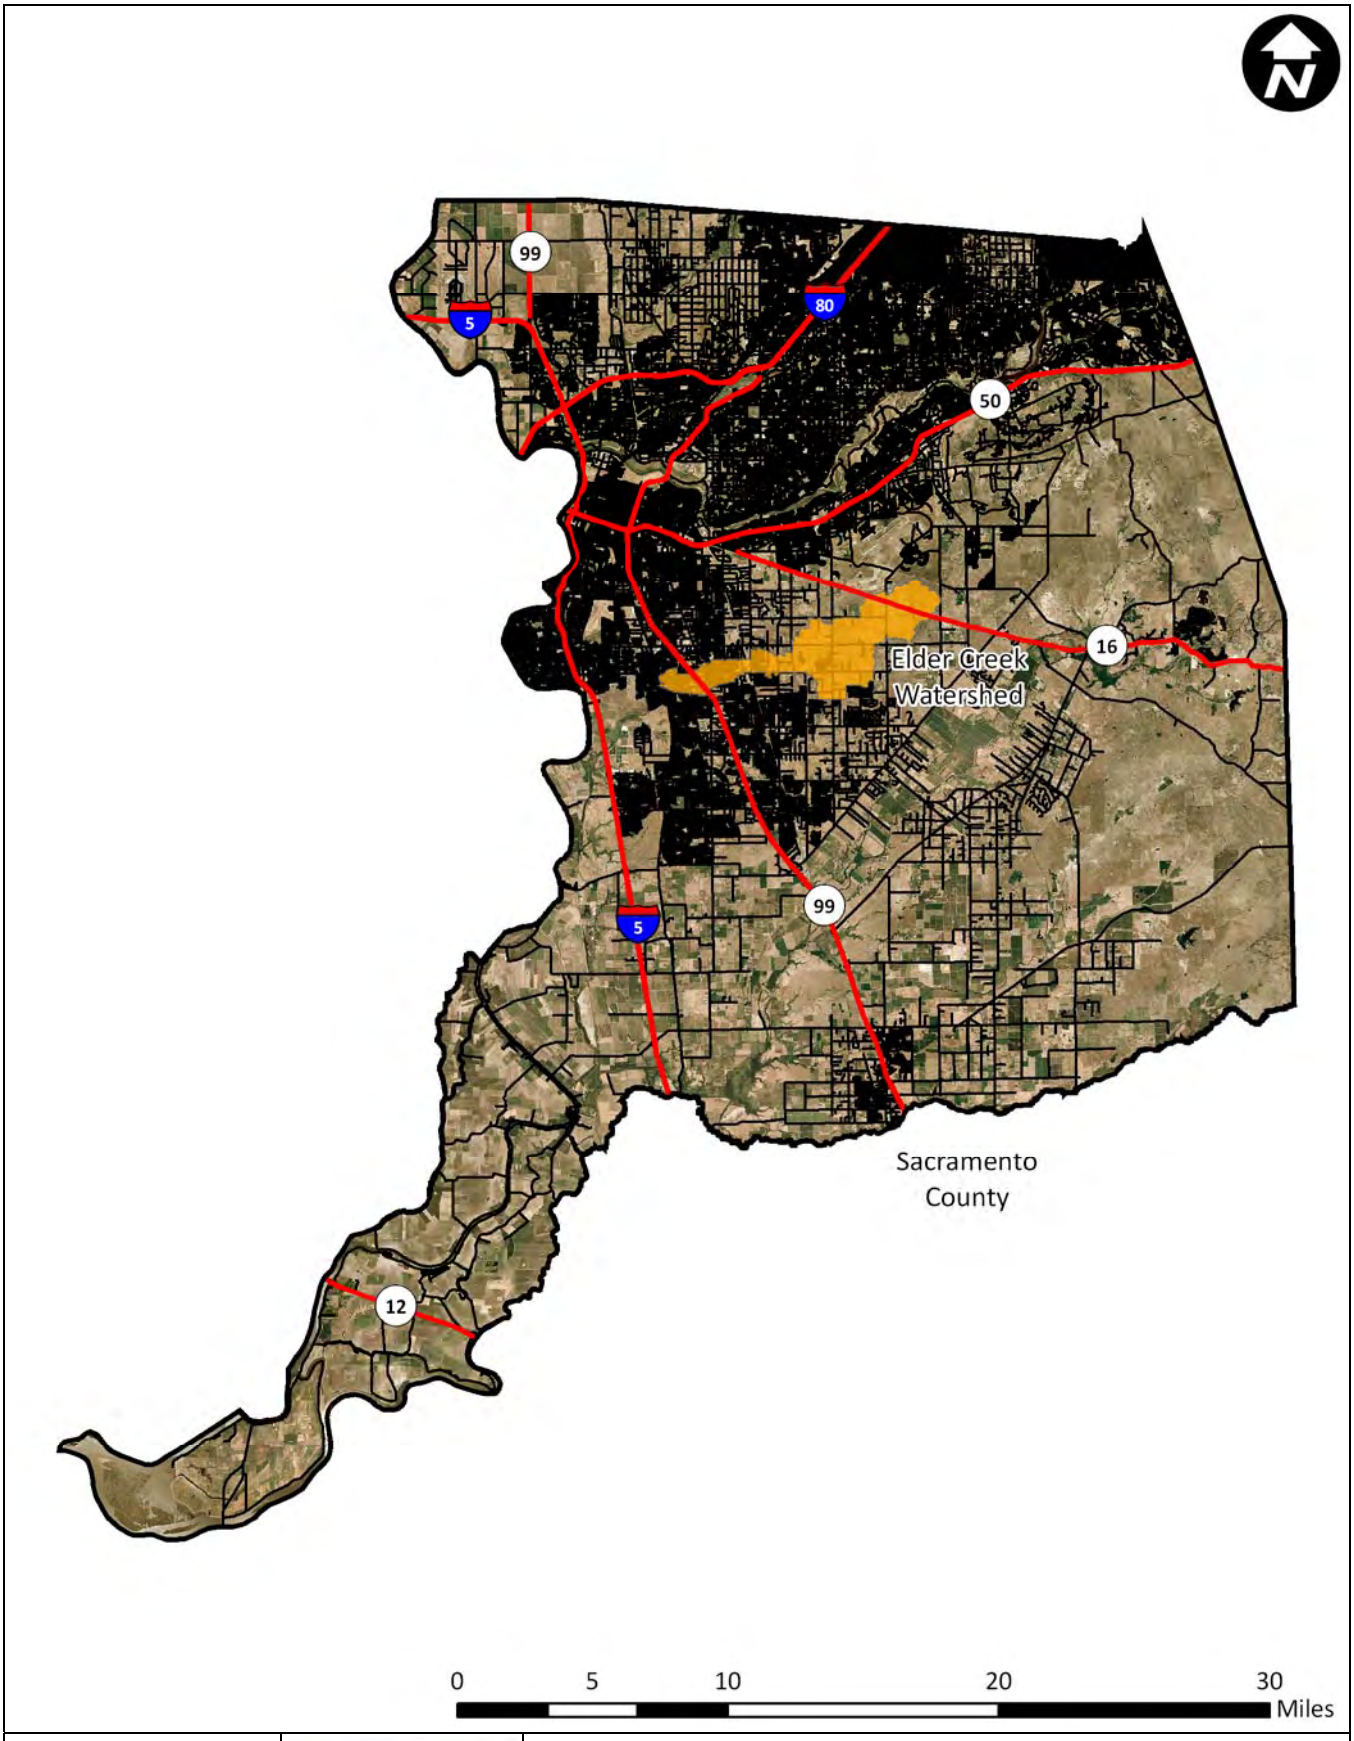
The permit further specifies that a work plan to complete the HMP is due April 30, 2009, and the HMP is due one year after the Regional Water Board approves the work plan.

The goals for the Sacramento HMP process include:

- Develop a consistent approach across the County regarding when and how to impose runoff flow controls from new development and redevelopment, and what those controls should be.
- Develop an approach that works for all the permittees and is equitable for the development and landowner community.
- Build on others' experiences rather than duplicate prior efforts.
- Produce a relatively straightforward set of tools that can be used by permittees' planners and engineers and the development community.

1.2 OVERVIEW

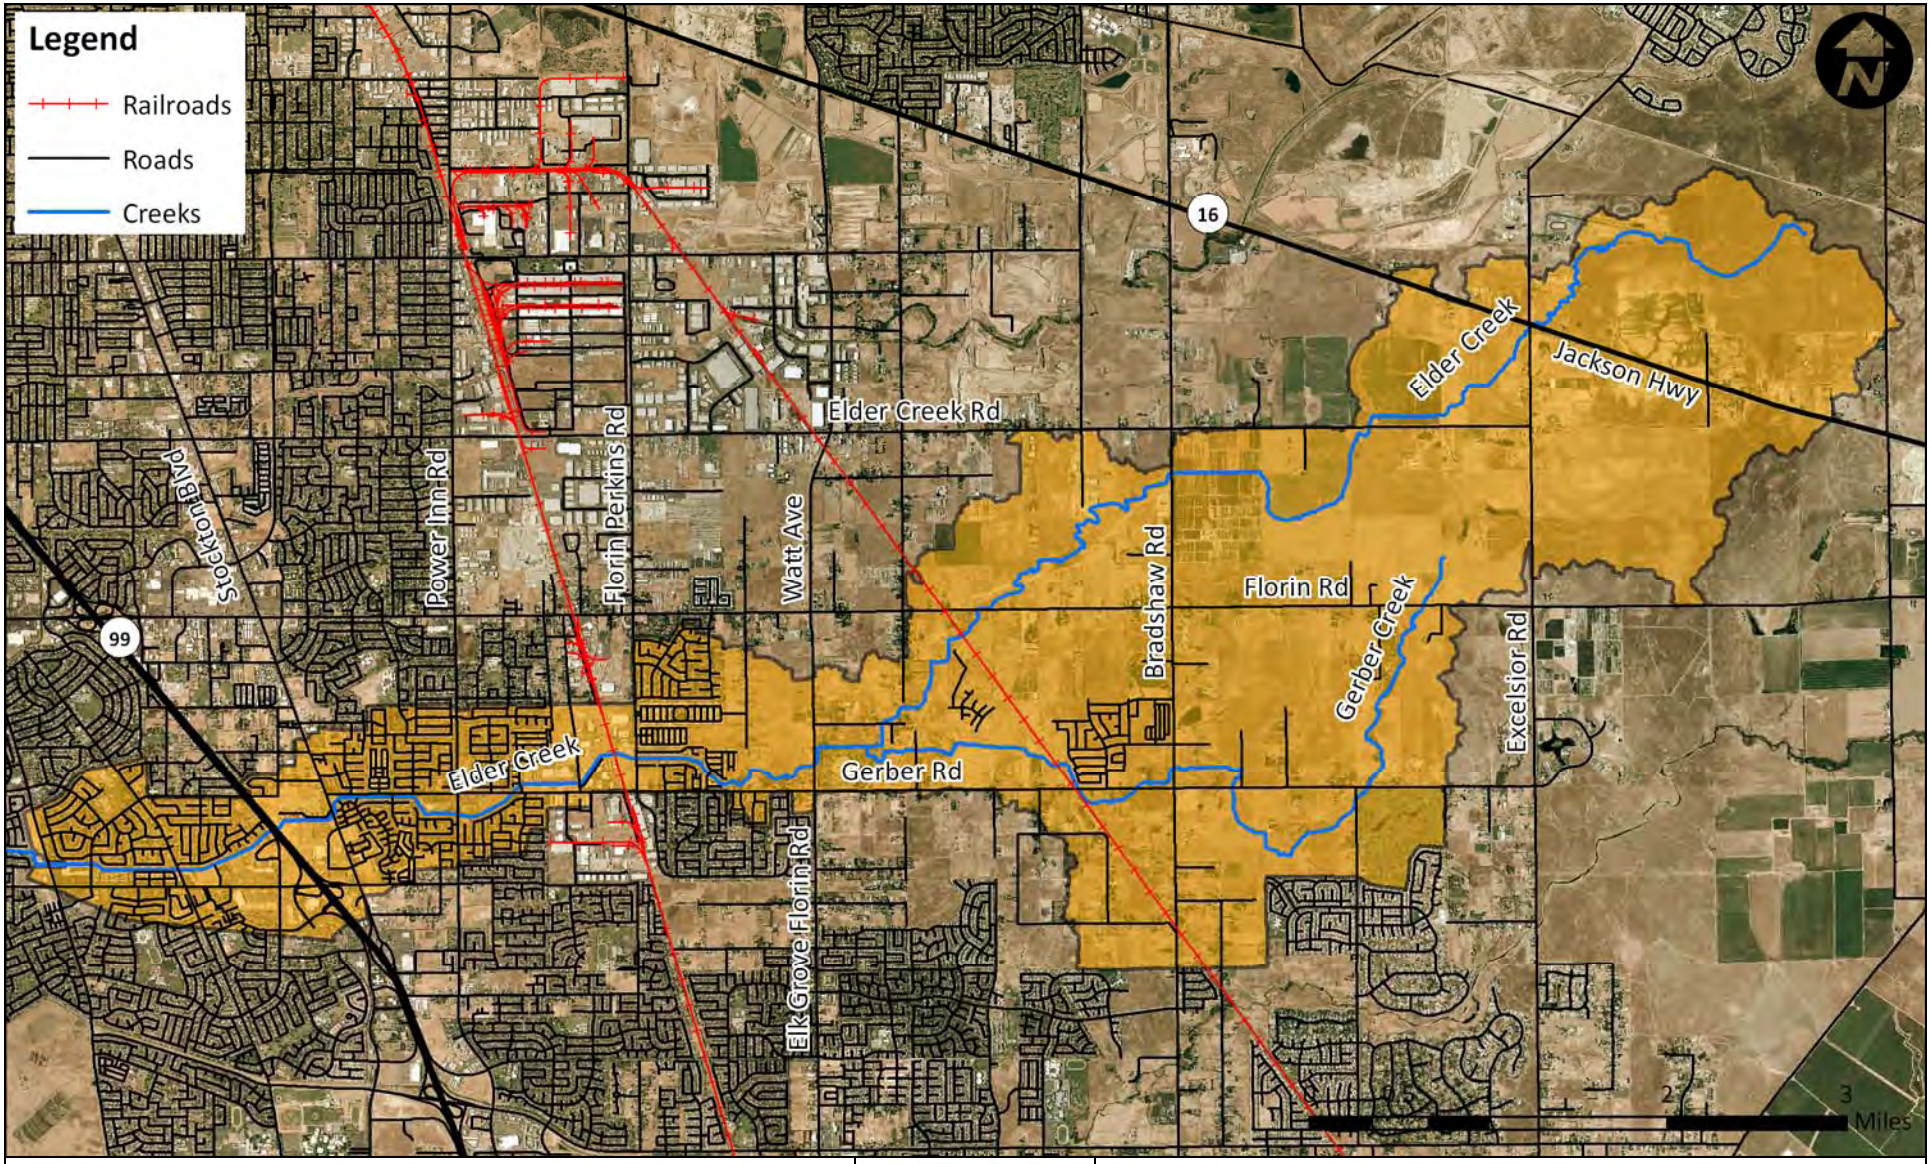
As a first step toward developing the HMP, the County and co-permittees contracted with cbec, inc., to complete a pilot project to develop and test ideas that could be incorporated into the HMP. This report presents the results of that work. The County selected the Elder Creek watershed in south Sacramento County for the pilot project (see Figure 1-1). That watershed, to include Gerber Creek, was selected because it represents a range of development conditions, from arable and grazing land uses in the upper watershed, transitioning through partial development to fully developed areas in the lower watershed (see Figure 1-2). In the upper watershed Elder Creek is relatively undisturbed, while in the middle and



lower parts of the watershed the creek transitions to more relatively disturbed, including concrete-lined channel segments.

This report describes how tools that could be used in the HMP were developed and tested. This report focuses on three key tools:

1. Applicability criteria and mapping (Section 2), which is a way to identify where there is more than minimal potential for erosion or other harm from increased runoff from new development and therefore control measures are required (i.e. are not exempt per Permit provision 15c.2 quoted above). A sample applicability map was developed for the Elder Creek watershed, based on potential applicability criteria.
2. Susceptibility assessment (Section 3), which is a way to identify the susceptibility of receiving waters to erosion, as required by Permit provision 15c.1.f. previously quoted. A sample susceptibility map/approach was developed for the Elder Creek watershed.
3. A concept for a decision-support tool (Section 4) for applying the hydromodification management requirements to specific projects.



As a starting point to develop the tools, the project team worked with the State Water Resources Control Board (State Water Board) to review and summarize hydromodification plans and approaches from throughout California. A table summarizing other agencies' programs is attached as Appendix A. That table highlights hydromodification triggers and criteria, applicability mapping, and exemptions as well as tools to address and counter potential hydromodification impacts. Key findings from Appendix A were used to inform the pilot study and are described in the appropriate sections of this report.

The tools described in this report were developed and tested for preliminary demonstration purposes only and have not been adopted. In fact, as described later, the findings of this work indicate that some of the tools tested may not be appropriate for the Sacramento area. A workshop was held in December 2008 to discuss the tools and receive initial feedback by technical experts (who are listed in the acknowledgments). This report reflects that feedback. Section 5 of this report outlines key findings and conclusions and provides a discussion of potential next steps.

2 APPLICABILITY MAPPING AND CRITERIA

As explained in Section 1.1, the Permittees' HMP must describe criteria to determine site-specific conditions where it is/is not necessary for new development/redevelopment projects to control the increases in magnitude, frequency , volume, and duration of runoff because there is minimal potential for erosion and degradation in the receiving waters. As specified in the permit, this could include sites that discharge into concrete-lined channels or sites in already highly developed watersheds where the potential for impacts is low. Applicability mapping is one way to identify those areas of a jurisdiction where new development/redevelopment is subject to or exempt from hydromodification requirements.

2.1 APPROACH USED BY OTHER CALIFORNIA REGIONS

The table in Appendix A summarizing other agency HMPs includes triggers for when hydromodification controls may apply and it shows whether or not each HMP includes applicability mapping. As shown on the table, some but not all of the adopted HMPs in California include applicability mapping. Appendix A includes selected examples of applicability maps from other jurisdictions.

For the counties that have applicability maps, some are based on land use and habitat considerations (e.g. Alameda), existing percent impervious cover (e.g. Santa Clara), and/or the presence/absence of hardened channels (e.g. San Bernardino). Many of the adopted HMPs include exemptions for projects that discharge to fully hardened channels. Criteria that distinguish between developed and relatively undeveloped watersheds are less common. Regions that have adopted this methodology typically used metrics such as existing impervious thresholds less than 65 percent to delineate areas that are subject to hydromodification controls.

2.2 APPLICABILITY CRITERIA USED IN THIS PILOT PROJECT

For this pilot project, two applicability criteria were chosen for demonstration purposes only and to illustrate how they could be translated into an applicability map:

1. Subwatersheds with percent impervious cover less than 50 percent;
2. Subwatersheds not draining to hardened (namely "Type 1 improved" as defined by the County)[5] channels.

Using those applicability criteria, developments located in subwatersheds with percent impervious cover (PIC) greater than 50 or discharging to engineered (Type 1) channels would be exempt from hydromodification control requirements.

The two applicability criteria tested in the pilot project relate to the permit provisions 15c.ii(a) and (c), which provide examples for situations that could be exempt, including discharges into concrete-lined

[5] See Section 2.3.1.2 for description of Sacramento County's channel designation method.

channels or sites in already highly developed watersheds where the potential for impacts is minimal. Pertaining to the above criteria, note that:

- PIC is one measure that can be used to define how "highly developed" a watershed is. The 50 percent threshold for impervious cover was selected based on the practical consideration that existing impervious cover within the developed/urbanized lower end of Elder Creek watershed exceeded an aggregate value of 50 percent. This number may not work for other watersheds in the County. In fact, many watersheds in the Sacramento area already considered "highly developed" or "built out" have an average percent imperviousness of about 42 percent.
- The Type 1 hardened channels in the lower end of the Elder Creek watershed have been significantly altered over the years through straightening, confinement in a narrow corridor bounded closely by development, and use of concrete and riprap. These channels are therefore not good candidates for future restoration, and are much less susceptible to erosion.

2.3 PILOT APPLICABILITY MAPPING

2.3.1 Data Used to Develop the Pilot Applicability Map

The following data sets, readily available or created as part of this project, were used to create the draft applicability map.

2.3.1.1 Creek Alignments

A variety of existing maps show creek alignments. However, due to inconsistencies and inaccuracies in those maps, the project team digitized accurate creek alignments for the main stems of Elder and Gerber Creeks using a combination of contour mapping and aerial photography (see Figure 2-1).

2.3.1.2 Creek or Channel Types

Channel types were defined through a combination of City and County data and limited field verification for the main stems of Elder and Gerber Creeks. Figure 2-2 shows an example for Elder Creek in the vicinity of Elk Grove Florin Rd. Specifically, the County's Drainage Operations & Maintenance Section identifies five (5) channel types within their jurisdiction to distinguish the various levels of improved and unimproved channels and permissible maintenance activities (County DWR, 2006); channel types are briefly summarized below, along with examples of how they apply to Elder Creek. To clarify, "improved" as used here by the County refers to channels that have been modified through conventional means for the purposes of flood control and does not refer to channels that have been restored for ecological reasons.

- **Type 1 – Improved Channel without Significant Riparian Habitat**
  Significant alterations have occurred to improve the passage of irrigation and/or flood waters via straightening within constructed banks and hardened channels (e.g. concrete, riprap, earthen). Channels may be manually or mechanically cleaned as needed at any time throughout

the year; all other channel types are maintained according to regulatory scheduling restrictions for habitat protection. Figure 2-3 depicts a Type 1 channel along Elder Creek excavated into geologic control[6] with a concreted low flow channel.

- **Type 2 – Improved Channel with Significant Riparian Habitat**
  Significant alterations have occurred to improve the passage of irrigation and/or flood waters via straightening within constructed banks and hardened channels (e.g. concrete, riprap, earthen). Riparian habitat has established via volunteer vegetative growth. Type 2 channels on Elder Creek are typically straightened and not hardened with concrete or riprap, but that is not to say excavation or incision to bed control has not occurred.
- **Type 3 – Improved Mitigated Channel**
  Significant alterations have occurred to improve the passage of irrigation and/or flood waters via straightening within constructed banks and hardened channels (e.g. concrete, riprap, earthen). Riparian habitat has established following planting of vegetation/trees to mitigate for prior loss of riparian habitat.
- **Type 4 – Unimproved Channel without Significant Riparian Habitat**
  No significant alterations have occurred to improve the passage of irrigation and/or flood waters, but the channel lacks riparian habitat.
- **Type 5 – Unimproved Channel with Significant Riparian Habitat**
  No significant alterations have occurred to improve the passage of irrigation and/or flood waters and the channel includes significant habitat. Figure 2-4 depicts a Type 5 channel along Elder Creek that has incised down to bed control.

Within its maintenance jurisdiction, the County also designates natural stream channels, which typically contain significant riparian habitat; as appropriate, those stream channels are cross listed as one of the five channel types described above. Designated natural streams are typically segments of larger creeks (e.g. Arcade Creek from Auburn Blvd to Greenback Lane) and not the headwater creeks and tributaries upstream of maintained channels. For the purposes of this document, natural channels are either designated as such and maintained by the County or are headwater creeks and tributaries upstream of maintained channels (see Figure 2-5).

Due to inconsistencies and inaccuracies among creek mapping sources and channel types, channel types were manually assigned to the digitized creeks. A similar process combining desktop analysis and field verification may be needed to create County-wide maps for the HMP.

In addition to field checking existing channel conditions in the Elder Creek watershed, the project team incorporated information on planned (near future) development drainage modifications provided by the County.

[6] Geologic control as used here refers to the presence of an erosion resistant surface such as hardpan and/or indurated/hardened layer or parent material that inhibits degradation of the creek bed.

2.3.1.3 Percent Impervious Cover

The project team estimated percent impervious cover (PIC) for the Elder Creek Watershed using land use maps provided by the Sacramento Area Council of Governments (SACOG) combined with draft PIC values per land use category developed by the Office of Environmental Health Hazard Assessment (OEHHA). SACOG's land use maps consisted of a draft 2005 existing conditions map and the draft 2050 Blueprint map; only the draft 2005 map (see Figure 2-6) was used to develop the draft applicability map. There were several instances where the land use was defined as "vacant" or "blank", which was reclassified based on interpretation of aerial photography. At the County scale, it may be necessary to solicit SACOG to update the land use maps. In future iterations, the County propose to use the 2030 General Plan in lieu of the 2050 Blueprint. For this pilot study, the land use differences were minor.

For this pilot, the OEHHA percent imperviousness values shown in Table 2-1 were used to convert the draft 2005 existing land use map to a percent impervious cover (PIC) map. The OEHHA values differ slightly from the percent imperviousness values used by the County in their drainage manual. In future iterations, the County proposes to use the percent impervious values in the *Sacramento County/City Drainage Manual (Hydrology Standards)* due to familiarity by the local development community and to be consistent with the *Stormwater Quality Manual for Sacramento and South Placer Region*s.

Table 2-1. OEHHA (2008) draft percent impervious cover (PIC) values

SACOG Land Use	PIC	SACOG Land Use	PIC
High Density Residential	67	Heavy Industrial	91
Medium-High Density Residential	53	Light Industrial	81
Medium Density Residential	53	Agriculture	4
Low Density Residential	44	Open Space	2
Very Low Density Residential	30	Mixed Use	80
Rural Residential	6	Public/Quasi-Public	44
High-Intensity Office	86	Parking Lot	92
Moderate-Intensity Office	69	Urban Streets	92
Community/Neighborhood Commercial/Office	80	Suburban Streets	96
Regional Retail	82	Rural Residential Streets	47
Community/Neighborhood Retail	82	Highways	44

2.3.1.4 Subwatersheds

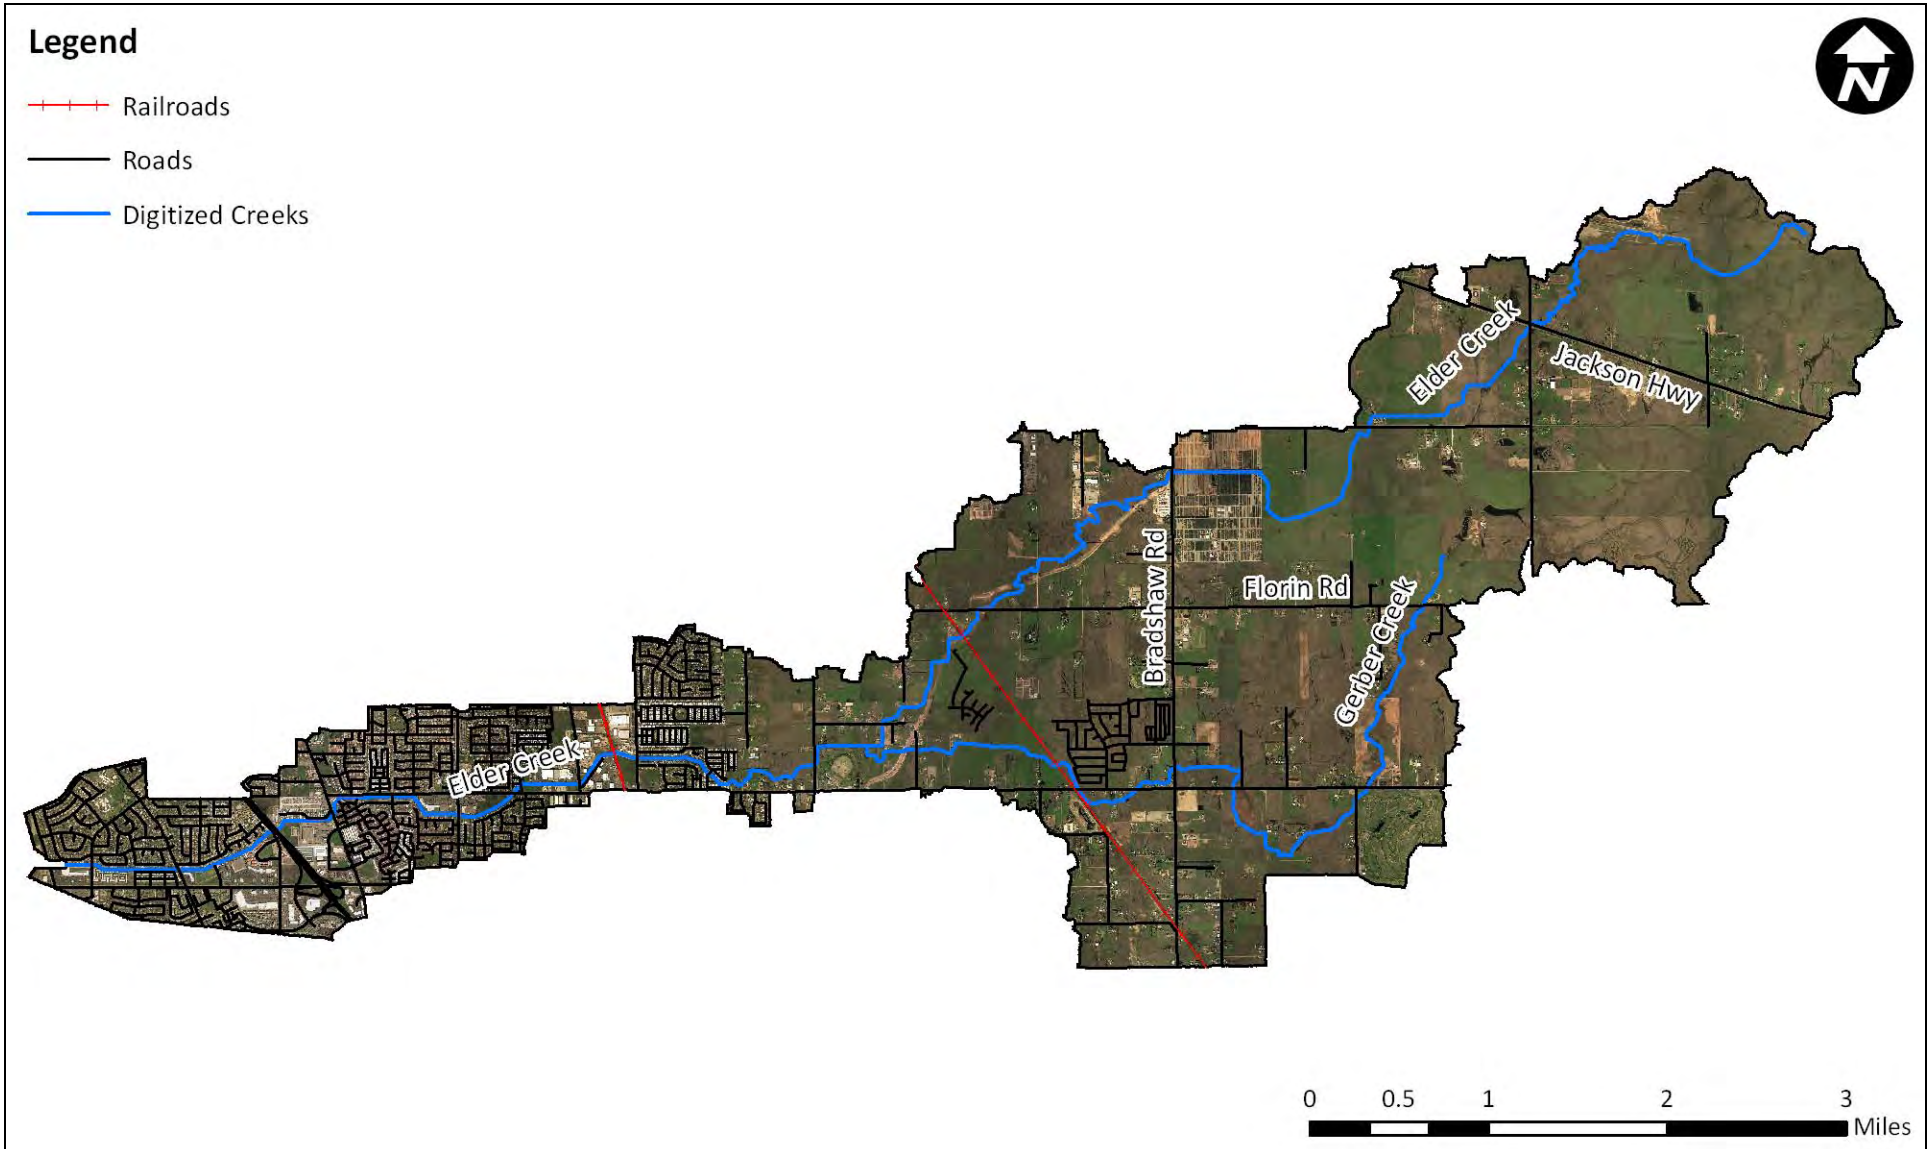
Subwatershed boundaries developed for the susceptibility mapping (see Section 3.1.5) were used for the applicability mapping.

2.3.2 Draft Applicability Map and Considerations

Based on the previously described draft applicability criteria and data, two versions of the applicability map were created for the Elder Creek Watershed (Figures 2-7a and 2-7b). Both use draft 2005 land use conditions as the basis, but one map uses existing channel conditions and the other incorporates permitted channel modifications related to planned (near future) development.

Figure 2-7a is a draft applicability map based on the draft 2005 land use condition, which depicts existing channel conditions. The red hatched subwatersheds represent existing urbanization with a PIC greater than 50 percent, and those areas coincidently are also directly tributary to hardened (Type 1) channels. All other subwatersheds above French Road and denoted in green have an aggregate PIC less than 50 percent and are tributary to improved Type 2 channels as well as unimproved and natural channel types. For the purposes of this pilot study, those areas would thus be designated as subwatersheds to which HMP regulations apply.

Figure 2-7b is a draft applicability map based on the draft 2005 land use condition but assuming implementation of the permitted drainage modifications associated with a planned (near future) development in this watershed (as depicted in Figure 3-3). The red and green hatched subwatersheds drain to hardened or engineered channels and would therefore be exempt, per the applicability criteria for this pilot study. As previously noted, the applicability criteria were chosen for demonstration purposes only. A higher or lower threshold, or alternative criteria, could be selected for the final Sacramento HMP.



The criteria used to determine where hydromodification controls are/are not needed are important. If the criteria are not stringent enough, then creeks will not be adequately protected (in violation of the Permit). If the criteria are too stringent, then developers will be subject to the cost of controls that do not have a clear environmental benefit.

In addition, more stringent criteria may be needed for relatively undeveloped watersheds (e.g. areas less than 50 percent impervious cover) discharging to unstable Type 4 or Type 5 channels. Conversely, criteria may be less stringent in urban areas with no channel restoration options or in less-developed areas with stable Type 4 or Type 5 channels, where development could be required to match pre-project volumes only, for example. Definition of stable or unstable channels could be defined by the methods outlined in Section 3.2 (e.g. Table 3-1).

If applicability criteria and mapping are included as tools in the HMP, they could be refined based on the following outstanding questions:

1. Should the degree of existing channel degradation correspond to a degree of stringency in the criteria?
2. Should HMP standards still apply when downstream channels have already been modified in anticipation of future upstream developments?

3. When mapping channel types or defining exemptions based on channel type, should the potential for restoring concrete or degraded channels be considered on a case-by-case basis?
4. Should exemption criteria be considered based on factors other than PIC or channel type? For example, should exemption criteria be considered for transit oriented and smart growth development or using flow criteria for various discharge pipe diameters or using percent impervious per capita, etc?
5. Is the PIC criterion appropriate for Sacramento? PIC may not be an appropriate criterion due to the fact that many watersheds in the Sacramento area already considered "highly developed" or "built out" have an average percent imperviousness of about 42 percent. Also, even in undeveloped areas of Sacramento, soils tend to naturally have lower permeability and higher runoff rates due to hardpan conditions and historical grazing practices. Using a factor that relates the acreage developed to the acreage of potential development within each watershed may be a better indicator of how heavily developed that watershed is. This issue will be explored further as the HMP is developed.
6. Should the plan consider more restrictive criteria than generally used in other jurisdictions, if the restrictive criteria are based on the latest research findings and science?

3 SUSCEPTIBILITY MAPPING AND ASSESSMENT

As shown in the excerpted Permit requirements included in Section 1.1, the Permittees' HMP must consider various assessment methodologies to evaluate the existing geomorphic condition of local receiving waters[7], along with the expected susceptibility of those receiving waters to erosion/change as a result of hydromodification from land development and other land uses. This section evaluates how susceptibility mapping/assessment could be done and tests the approach in the Elder Creek watershed.

Susceptibility mapping is a technique to identify areas of creeks and rivers that could be susceptible to erosion and degradation due to anthropogenic disturbance. The technique has been academically developed (Simon & Downs, 1995; Hack, 1957; Bledsoe & Watson, 2004). Susceptibility mapping is frequently undertaken using Geographical Information Systems (GIS) and hydrologic techniques with field-based techniques used to calibrate or validate the GIS techniques. The pilot susceptibility mapping approach for the Elder Creek Watershed used a three-tiered approach:

Tier 1 – Map areas of high and low stream erosion potential using GIS- and hydrology-based techniques.

Tier 2 – Conduct field-based assessments for selected areas identified in Tier 1, to provide calibration and validation for the susceptibility mapping.

Tier 3 – Identify key geomorphic thresholds (e.g., relationship between channel slope, median particle size, drainage area, critical bank heights in various channel materials, channel response to changes in flow and sediment supply, etc) from a comparison of stable and unstable channels and identify potential hydromodification mitigation solutions based on the results. Tier 3 could also be used to specify potential additional analysis techniques recommended by the HMP for future permit applications.

3.1 TIER 1 – SCREENING LEVEL SUSCEPTIBILITY MAPPING

The project team evaluated two approaches to Tier 1 (screening level) erosion susceptibility mapping in order to select the most appropriate approach for this pilot study. The team compared Hack's methodology (Hack, 1957), which is a function of channel slope, grain size, and drainage area, to the specific stream power methodology (Simon & Downs, 1995). Specific stream power (SSP) is the power expended by moving water per unit area of the streambed. It is a parameter closely related to many basic factors used to describe the varying hydraulic and sedimentation processes in a stream, such as velocity, depth, energy slope, grain size, etc. (SCCWRP, 2008) The critical SSP is the threshold at which erosion of bed and/or bank begins to occur. [8]

[7] The geomorphic condition of a stream refers to its form and function as a result of environmental and anthropogenic factors such as the shape of its cross section.

[8] See Sections 3.1.1 and 3.1.4 for additional information on SSP.

The specific stream power methodology was chosen for this pilot project, because it did not rely upon field measurements of grain size (which may be difficult to quantify in a system, such as the Elder Creek watershed, that has been excavated and incised to geologic control). Subsequent iterations of the susceptibility mapping methodology could incorporate other methodologies that include characterization of bed and bank materials.[9]

Specific stream power, which has extensively been used to describe overall channel conditions and channel processes, can be used as an indicator of channel response to urbanization (Bledsoe, 1999). In this study, specific stream power has been applied to highlight the potential erosive impacts of urbanization on the receiving waters; however, the absolute severity of those impacts has not been addressed. To understand the severity of those potential impacts, specific stream power needs to be correlated to a range of measurable field conditions (e.g. erodibility of bed and bank materials, channel width, entrenchment, grade control, proximity to geomorphic thresholds and geologic control, etc.) within the County to adequately be used as an indicator of existing channel conditions and future channel responses; thus, the need for Tier 2 and Tier 3.

For this pilot project, specific stream power was assessed and compared for existing conditions and future urbanization for only the 2-year recurrence interval flood assuming no traditional flood control detention (as later detailed in the approach below). Other recurrence interval floods, such as the 5- and 10-year, also have geomorphic significance; however those were not integrated into the calculations due to the difficulty of readily quantifying the in-channel component responsible for in-channel processes. In order to do this, a routing model or at-a-station hydraulic calculations would be needed. This assumption should be addressed in future iterations of the methodology if applied at the County scale. This could be achieved through sensitivity analyses using a range of flows and identification of a range of flows with geomorphic significance.

The following sections further describe the components of screening level susceptibility mapping.

3.1.1 Specific Stream Power

Specific stream power (SSP), or the power expended per unit area of the streambed, can be described in various forms (i.e. function of drainage area or median grain size), but was applied to the pilot project according to the following equation:

$$SSP = \gamma \cdot (Q/w) \cdot S$$

where *SSP* is specific stream power in W/m^2, γ is the specific weight of water (9,807 N/m^3), *Q* is the bankfull discharge (m^3/s), *w* is the channel width (m) as approximated from a combination of field measurements and aerial photography, and *S* is the local channel slope derived from the County's terrain model.

[9] This and other recommendations are summarized in Section 5.

Derivation of bankfull discharge is further described below.

3.1.2 Bankfull Discharge

The study approximated bankfull conditions[10] for existing conditions and future urbanization by using the USGS regional regression equations, as described and implemented in the National Flood Frequency (NFF) program (Reis & Crouse, 2002). For California, the USGS developed a suite of equations for estimating the magnitude and recurrence interval for floods in rural settings in different regions (Waananen & Crippen, 1977). However, similar equations for urban settings have not been developed for California. As such, the national urban equations (Sauer et al., 1983; Sauer, 1985) were used to estimating the magnitude and recurrence interval for floods in urban settings. The national urban equations, which utilize the rural equations, were based on 269 gauged basins in 56 cities and 31 states; the data locations included a representative cross section of west coast metropolitan areas, including Sacramento.

The national urban equations do not account for detention storage. Since detention storage is common in the Sacramento area, the relative comparisons drawn in this report between existing conditions and future urbanization may be conservative by overestimating the impacts from urbanization.

For this demonstration, bankfull discharge was approximated as the magnitude of the 2-year recurrence interval flood. Using regional regression equations applicable to Elder and Gerber Creeks and the County, the 2-year flood peaks were computed by the following:

$$RQ2 = 0.24 \cdot A^{0.88} \cdot P^{1.58} \cdot H^{-0.8} \quad \text{(rural)}$$

$$UQ2 = 2.35 \cdot A^{0.41} \cdot SL^{0.17} \cdot (RI2 + 3)^{2.04} \cdot (ST + 8)^{-0.65} \cdot (13 - BDF)^{-0.32} \cdot IA^{0.15} \cdot RQ2^{0.47} \quad \text{(urban)}$$

where *RQ2* is the 2-year rural peak discharge (ft^3/s), *UQ2* is the 2-year urban peak discharge, *A* is the drainage area (mi^2), *P* is the mean annual precipitation (in), *H* is an elevation index (in 1000's of ft), *SL* is the channel slope derive from topographic data as measured between points that are 10% and 85% of the main channel length upstream of the point of interest, *RI2* is the 2-year 2-hour rainfall (in) from NOAA Atlas 2, *ST* is the percent basin storage of a permanent nature (i.e. lakes, reservoirs, wetlands) and not of a temporary nature (i.e. detention ponds), *BDF* is a basin development factor on a scale of 0 to 12, and *IA* is percent imperviousness.

If this methodology is applied at the County scale, it may be appropriate to 1) refine the regional regression equations to better reflect conditions in Sacramento County, 2) use the County's event-based rainfall-runoff model SacCalc to estimate a range of discharge conditions for various scenarios (which is

[10] The bankfull stage corresponds to the discharge at which channel maintenance is the most effective, that is, the discharge at which moving sediment, forming or removing bars, forming or changing bends and meanders, and generally doing work that results in the average morphologic characteristics of channels (Dunne & Leopold, 1978).

preferred by the County over regional regression in future iterations), and/or 3) integrate a range of discharge conditions (i.e. the 2-year through 100-year) to provide for a comparison of approximate flow duration curves (i.e. in lieu of continuous hydrologic simulation).

3.1.3 Basin Development Factor

The basin development factor (BDF) is typically computed as the summation of codes (0 or 1) assigned to four parameters describing the degree of urbanized drainage over three (3) approximately equal subareas upstream of the point of interest (see Figure 3-1). Codes are assigned to the four parameters as follows:

- *Channel improvements* (e.g. straightening, enlargening, deepening, clearing) occupying more than 50% of the length of the main channels and principal tributaries are assigned a value of 1.
- *Channel linings* (e.g. concrete) occupying more than 50% of the length of the main channels and principal tributaries are assigned a value of 1.
- *Storm drains* occupying more than 50% of the secondary tributaries are assigned a value of 1.
- *Curb-and-gutter* occupying more than 50% of the streets and highways are assigned a value of 1.

For this pilot project, the BDF parameters were manually implemented in GIS by assigning codes for existing conditions and future urbanization based on land use mapping.

3.1.4 Channel Risk (or Susceptibility)

For this pilot project demonstration, it was assumed that in the short-term, increased discharge due to urbanization would be conveyed within the existing channel (i.e. future channel width and slope remains unchanged from existing conditions). Alternatively, channel width and slope could be changed to assess how instream approaches (e.g. bank stabilization, habitat enhancement) would reduce SSP.

The risk of channel degradation due to hydromodification as a result of future urbanization was calculated as:

$$RISK = \frac{SSP_{future}}{SSP_{exist}} = \frac{Q_{future} \cdot \left(\gamma \cdot S_{future} / w_{future}\right)}{Q_{exist} \cdot \left(\gamma \cdot S_{exist} / w_{exist}\right)}$$

or alternatively:

$$RISK = \frac{\left(SSP - SSP_c\right)_{future}}{\left(SSP - SSP_c\right)_{exist}} = \frac{\left(Q - Q_c\right)_{future} \cdot \left(\gamma \cdot S_{future} / w_{future}\right)}{\left(Q - Q_c\right)_{exist} \cdot \left(\gamma \cdot S_{exist} / w_{exist}\right)}$$

where *RISK* is a ratio identifying the relative change from existing conditions, SSP_c is the critical specific stream power at which channel processes (e.g. bed or bank erosion) begin, *exist* is existing conditions, and *future* is anticipated urbanization.

Only the former equation was applied (assuming $S_{future} = S_{exist}$ and $w_{future} = w_{exist}$) since critical specific stream power has not been correlated with local field observations (i.e. Tier 3).

3.1.5 GIS-Based Approach

Arc Hydro was used within ESRI's ArcGIS to perform the specific stream power calculations due to its off-the-shelf functionality. Alternatively, raster algebra and some creative scripting could be used to perform the calculations.

3.1.5.1 GIS Inputs

The following existing data sets were used to implement the above approach within ArcGIS:

- County of Sacramento 2006 terrain model and contours from LiDAR
- County of Sacramento 2006 high resolution aerial photography
- County of Sacramento creek/channel alignments and types
- County and City of Sacramento storm drain networks
- SACOG 2005 draft existing land use map (see Figure 2-6)
- SACOG 2050 draft Blueprint land use map (see Figure 3-2)
- OEHHA percent impervious table (see Table 2-1)
- Land use map showing planned drainage modifications associated with development expected to occur in the near future in the Elder Creek Watershed (see Figure 3-3)
- Mean annual precipitation (Rantz, 1969)
- NOAA Atlas 2 (Miller et al., 1973) 2-year 6-hour precipitation map (see Figure 3-4)

3.1.5.2 GIS Data Processing and Calculations

The project team took the following steps to manipulate the existing data sets to calculate specific stream power for the existing condition (i.e. 2005), the interim condition (e.g. some intermediate level of urban growth such as the buildout of a single development or specific plan within the watershed being studied), and the future urbanized condition (i.e. 2050):

1. Converted the terrain model to a digital elevation model (DEM) to support spatial calculations
2. Digitized accurate creek alignments for the main stems of Elder and Gerber Creeks using a combination of contour mapping and aerial photography
3. Reconditioned the DEM in Arc Hydro by "burning" digitized creeks, defining "walls" based on storm drain networks, and "filling sinks" to create a hydrologically correct DEM
4. Preprocessed the DEM in Arc Hydro by calculating flow characteristics and defining creek/channel segments and aggregated subwatersheds
5. Calculated aggregate subwatershed characteristics and applied to creek/channel segments
    a. Arc Hydro/Spatial Analyst – *A*, *P*, *H*, *S*, *SL*, *RI2*, *ST*, *IA*
    b. Manually – *BDF*, *w*

c. Field Calculator – *RQ2*, *UQ2*, *SSP*, *RISK*

3.1.6 Draft Susceptibility Maps and Recommendations

Draft susceptibility maps for the existing condition (i.e. 2005), interim condition, and future urbanized condition (i.e. 2050) are presented in Figure 3-5, Figure 3-6 (a and b), and Figure 3-7 (a and b), respectively. Figure 3-5 shows the calculated specific stream power while Figure 3-6 (a and b) and Figure 3-7 (a and b) show the increase in specific stream power relative to existing conditions by means of a ratio. However, since specific stream power was not correlated to measurable field conditions for this pilot project, Figures 3-5, 3-6 (a and b), and 3-7 (a and b) should be used with a level of caution.

Figure 3-5 demonstrates that under existing conditions there is a reach of relatively higher specific stream power in the vicinity of Elk Grove Florin Rd (refer to Figure 2-4), which is a Type 5 channel that has incised down to bed control and is bounded by a Type 2 channel upstream and a Type 1 channel downstream (refer to Figure 2-2). The downstream Type 1 channel has been widened and excavated into geologic control to accommodate urbanized runoff, resulting in relatively lower specific stream power. Upstream of this reach, which is in an agricultural setting scattered with rural residential and industrial parcels (refer to Figure 2-6), the channel Types 2, 4, and 5 have consistent, but variable, specific stream power.

Although they do not reflect variations in field conditions and critical specific stream power, Figure 3-6 (a and b) and Figure 3-7 (a and b) demonstrate the increased susceptibility of the channels to erosive forces due to future levels of urbanization. Under the interim condition scenario for this pilot project, there is up to a 50 percent increase in specific stream power (see Figure 3-6a); however, when the planned drainage modifications are implemented (i.e. newer improved Type 1 channels) in this watershed, specific stream power through the planned development would decrease relative to existing conditions.

Under the future urbanization scenario for this pilot project, there would be up to a 200 percent increase in specific stream power, especially in the headwaters of Elder and Gerber Creeks (see Figure 3-7a); however, after planned drainage modifications are in place (Figure 3-7b), specific stream power through the planned drainage modifications would be reduced relative to existing conditions in some, but not all, sections.

Even though these findings are based only on the 2-year recurrence interval flood peak and assume no traditional flood detention, it is put forth as an approximate method for qualifying the susceptibility of channels to future urbanization due to a range of flows. Additional assumptions and limitations built into the susceptibility mapping include:

- Specific stream power was used to compare relative susceptibility of the channels from existing to urbanized conditions and calculated as a ratio;
- The discharge parameter in the specific stream power equation relied on the USGS regional regression equations for urban conditions;

- The basin development factor in the USGS regional regression equations was used to characterize the level of development of for existing and urbanized conditions;
- Readily available data from various organizations was used to perform the GIS calculations; and
- Rapid geomorphic assessments, restricted to access from road crossings, were conducted in a limited fashion using an adaptation of the method by Simon & Downs (1995).

Potential improvements to this method have been identified and are further summarized in Section 5. Specifically, recommendations to refine the susceptibility mapping approach include:

- Modify the channel subreaches to be more uniform and/or show delineations at distinct changes in channel type, geology, existing land use, etc;
- Use SacCalc rather than regional regression to generate the flows; and
- Customize and/or automate ArcHydro to better handle the needs of either a regional regression or SacCalc approach at the County scale.

3.2 TIER 2 – FIELD-BASED ASSESSMENTS

Tier 2 of the susceptibility mapping approach includes field assessments to validate and calibrate the Tier 1 tool. Typically, Rapid Geomorphic Assessment (RGA) techniques are used to characterize the existing geomorphic conditions of channels.

3.2.1 Methods

Various methods exist to perform RGA, which are aimed at assessing channel stability and sensitivity to alteration. Such methods can be used to identify active processes and rank the relative stability (or instability) of the channel or system through the use of diagnostic characteristics describing the site (index variables) and the channel (hydraulic, geomorphic, and riparian corridor variables). One such method culminates in the calculation of an objective stability index to classify the reach as stable, transitional, or unstable (Simon et al., 2007; Simon & Downs, 1995; see Figure 3-8). The form depicted in Figure 3-8 is an adaptation of Simon & Downs (1995), which originally included parameters to address instabilities at bridge crossings. This method also includes an assessment of the stage of channel evolution (see Figure 3-9) after Simon (1989), which is generally accepted by geomorphologists as the process by which a river will adjust to changes in hydrology and sediment supply.

Another RGA technique is that developed by the Ontario Ministry of the Environment (OME, 2003) as a simplified approach to assessing stream geomorphology (see Figure 3-10). Its derivation is based on geomorphic assessments carried out on over 40 streams in Ontario, British Columbia, Texas, and Vermont and culminates in the calculation of a channel stability index (CSI), as depicted in Table 3-1, based on evidence of degradation, aggradation, widening, and/or planform changes. The RGA method was recently used by the Southern California Coastal Water Research Project to document the impacts of urbanization on stream geomorphology in southern California (Coleman et al., 2005). The RGA method has also been adopted by various city and state agencies and their consultants (WLA, 2006).

Table 3-1. Interpretation of RGA form channel stability index value (OME, 2003)

Channel Stability Index (CSI)	Classification	Interpretation
CSI < 0.2	In regime (stable)	The channel morphology is within a range of variance for streams of similar hydrographic characteristics – evidence of instability is isolated or associated with normal river meander propagation processes
0.2 < CSI < 0.4	Transitional or stressed (potentially unstable)	Channel morphology is within the range of variance for streams of similar hydrographic characteristics but the evidence of instability is frequent
CSI > 0.4	In adjustment (unstable)	Channel morphology is not within the range of variance and evidence of instability is wide spread

Given the presence of geologic control in Elder Creek (and many other creeks within the County), which inhibits further degradation of the creek bed, but may exacerbate bank erosion, a specific assessment of bank erosion potential may be warranted. One such method (see Figure 3-11) is the empirically derived Bank Erosion Hazard Index (BEHI) developed by Rosgen (1996). The underlying principle of BEHI is that bank erosion occurs by fluvial scour at the bank toe as well as by mechanical failure of the bank material. An assessment of bank geometry, bank material, and bank vegetation are then used to classify the susceptibility of the banks to erosion.

The two previous methods (i.e. OME RGA and BEHI) were recently combined in a geomorphic study of Upper Laguna Creek (ULC) in Sacramento County between Bond Rd and Eagles Nest Rd (WLA, 2006; Geosyntec, 2007). WLA combined the two methods into a classification matrix (see Figure 3-12) to assess the overall geomorphic stability of Upper Laguna Creek. Such an approach could be applied at the County scale.

3.2.2 Preliminary Findings

Very limited RGA was performed (due to private property access limitations) of Elder Creek based on visual observations in the vicinity of road crossings using the method depicted in Figure 3-8. At all locations (see Figure 3-13), due to their proximity to Type 2 channels, the reaches exhibited bed control (i.e. geologic or hardpan) with varying degrees of bank erosion (see Figure 3-14) and could be generally be classified as transitional.

3.2.3 Recommendations

At the County scale, it will be important to select a RGA method with diagnostic characteristics well suited to the variability and underlying geology of the many creeks within the County. The method could be an adaptation of the methods listed above, or other methods not described, but the method selected

will need to produce reliable findings that result in a consistent and defensible stability and/or risk classification scheme or index, e.g. stable, transitional, and unstable or low, medium, and high. It is anticipated that the chosen classification index will need to be calibrated to a representative sample of creeks within the County to find the results meaningful when RGAs are performed County-wide to verify the existing condition findings in Tier 1.

3.3 TIER 3 – IDENTIFICATION OF KEY GEOMORPHIC THRESHOLDS

The purpose of Tier 3 is to identify key geomorphic thresholds (e.g., relationship between channel slope, median particle size, drainage area, critical bank heights in various channel materials, channel response to changes in flow and sediment supply, etc) from a comparison of stable and unstable channels and identify potential hydromodification mitigation solutions based on the results. Tier 3 could also be used to specify potential additional analysis techniques recommended by the HMP for future development applications.

3.3.1 Discussion

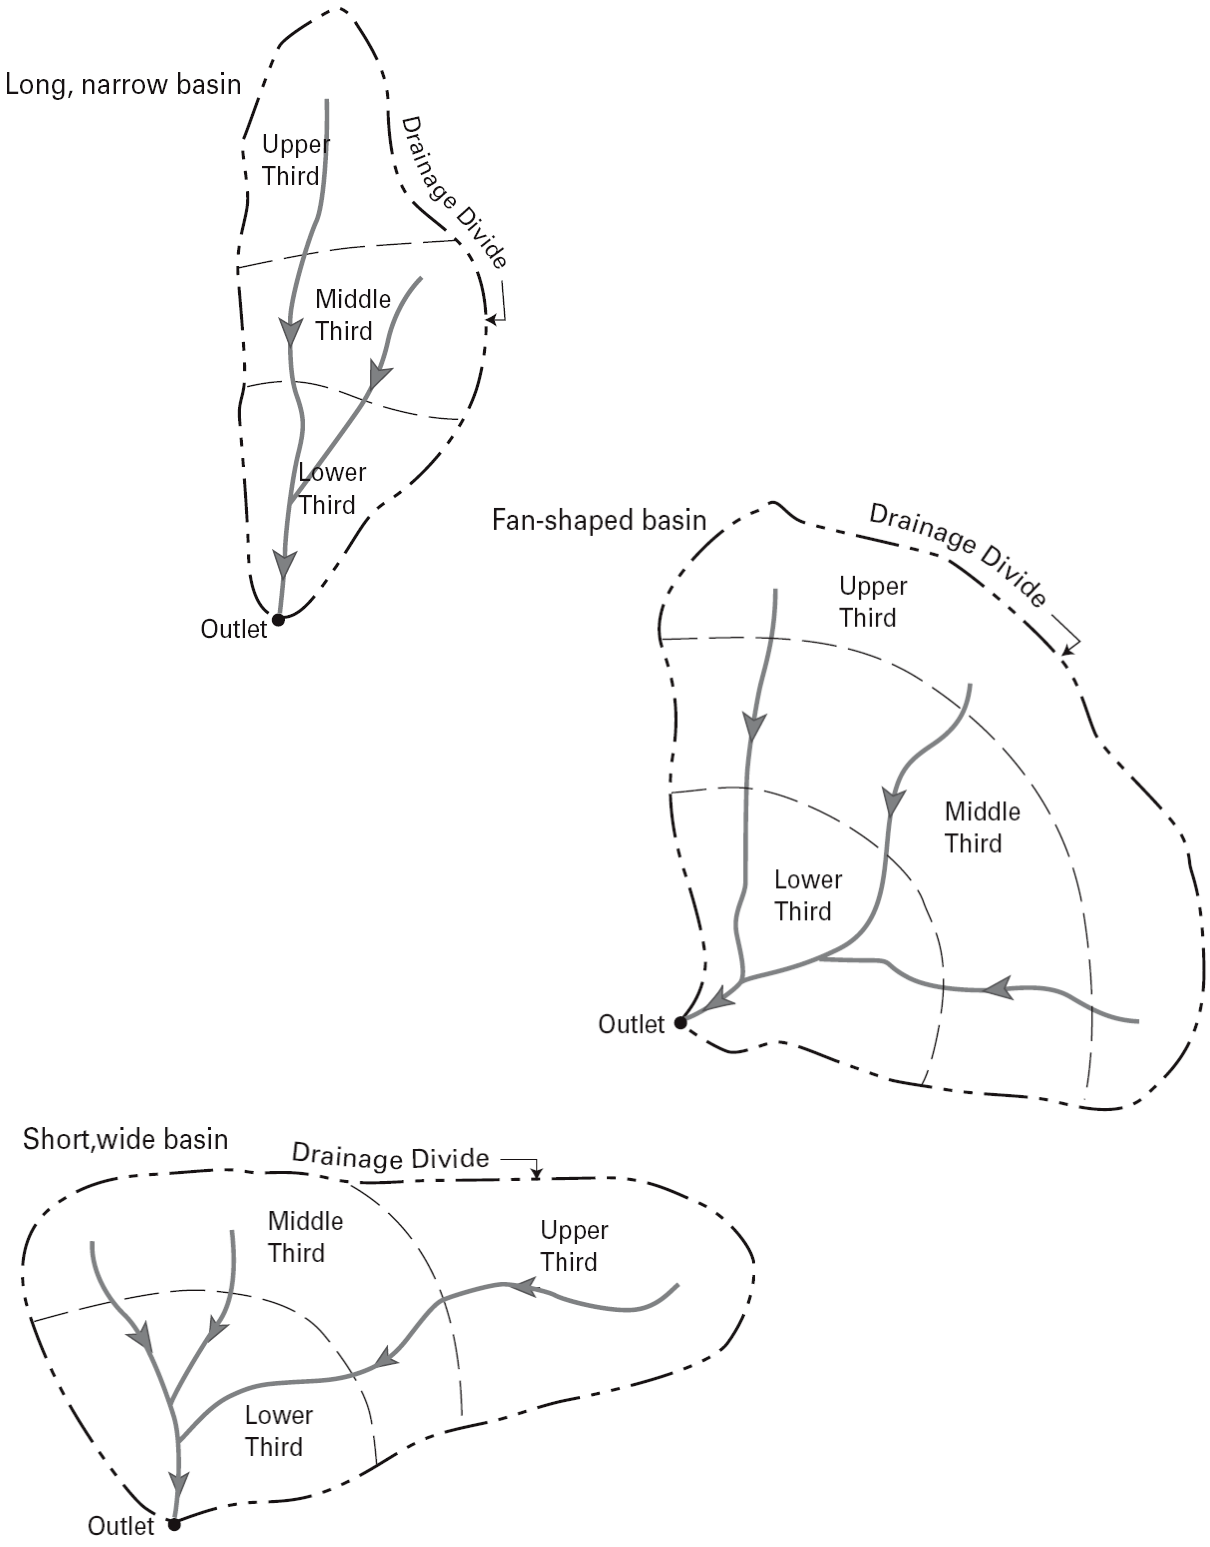
Based on the results of Tier 1 and Tier 2, potential management strategies could be formulated that could provide guidance to either mitigate for hydromodification, or provide interim stabilization solutions until a revised equilibrium is achieved. Table 3-2 outlines potential management strategies. This matrix uses results obtained from the SSP analysis (SSP Ratio obtained from Tier 1) and RGA results (Channel Evolution Model [CEM] type, Channel Stability Index [CSI] and Bank Erosion Hazard Index [BEHI] from Tier 2). Table 3-3 provides an alternative form to Table 3-2.

3.3.2 Recommendations

Table 3-2 provides an initial concept of how different mitigation measures could be required depending on the findings of the susceptibility analysis. Recommendations for how to develop the table include:

1. Conduct RGA sampling throughout the County on a range of creeks representing different types and degrees of degradation in order to characterize the range of CEM types.
2. Conduct County-wide sampling of a range of different bank conditions to characterize the range of BEHI values.
3. Create a County-wide susceptibility map in order to characterize the range of SSP ratios for a specified range of hydrology.
4. Provide a range of solutions to mitigate for the proposed hydromodifcation impacts given the results of 1, 2, and 3.
5. Potentially also recommend analysis tools for use in the HMP, from traditional empirical hydrologic approaches to continuous simulation modeling.

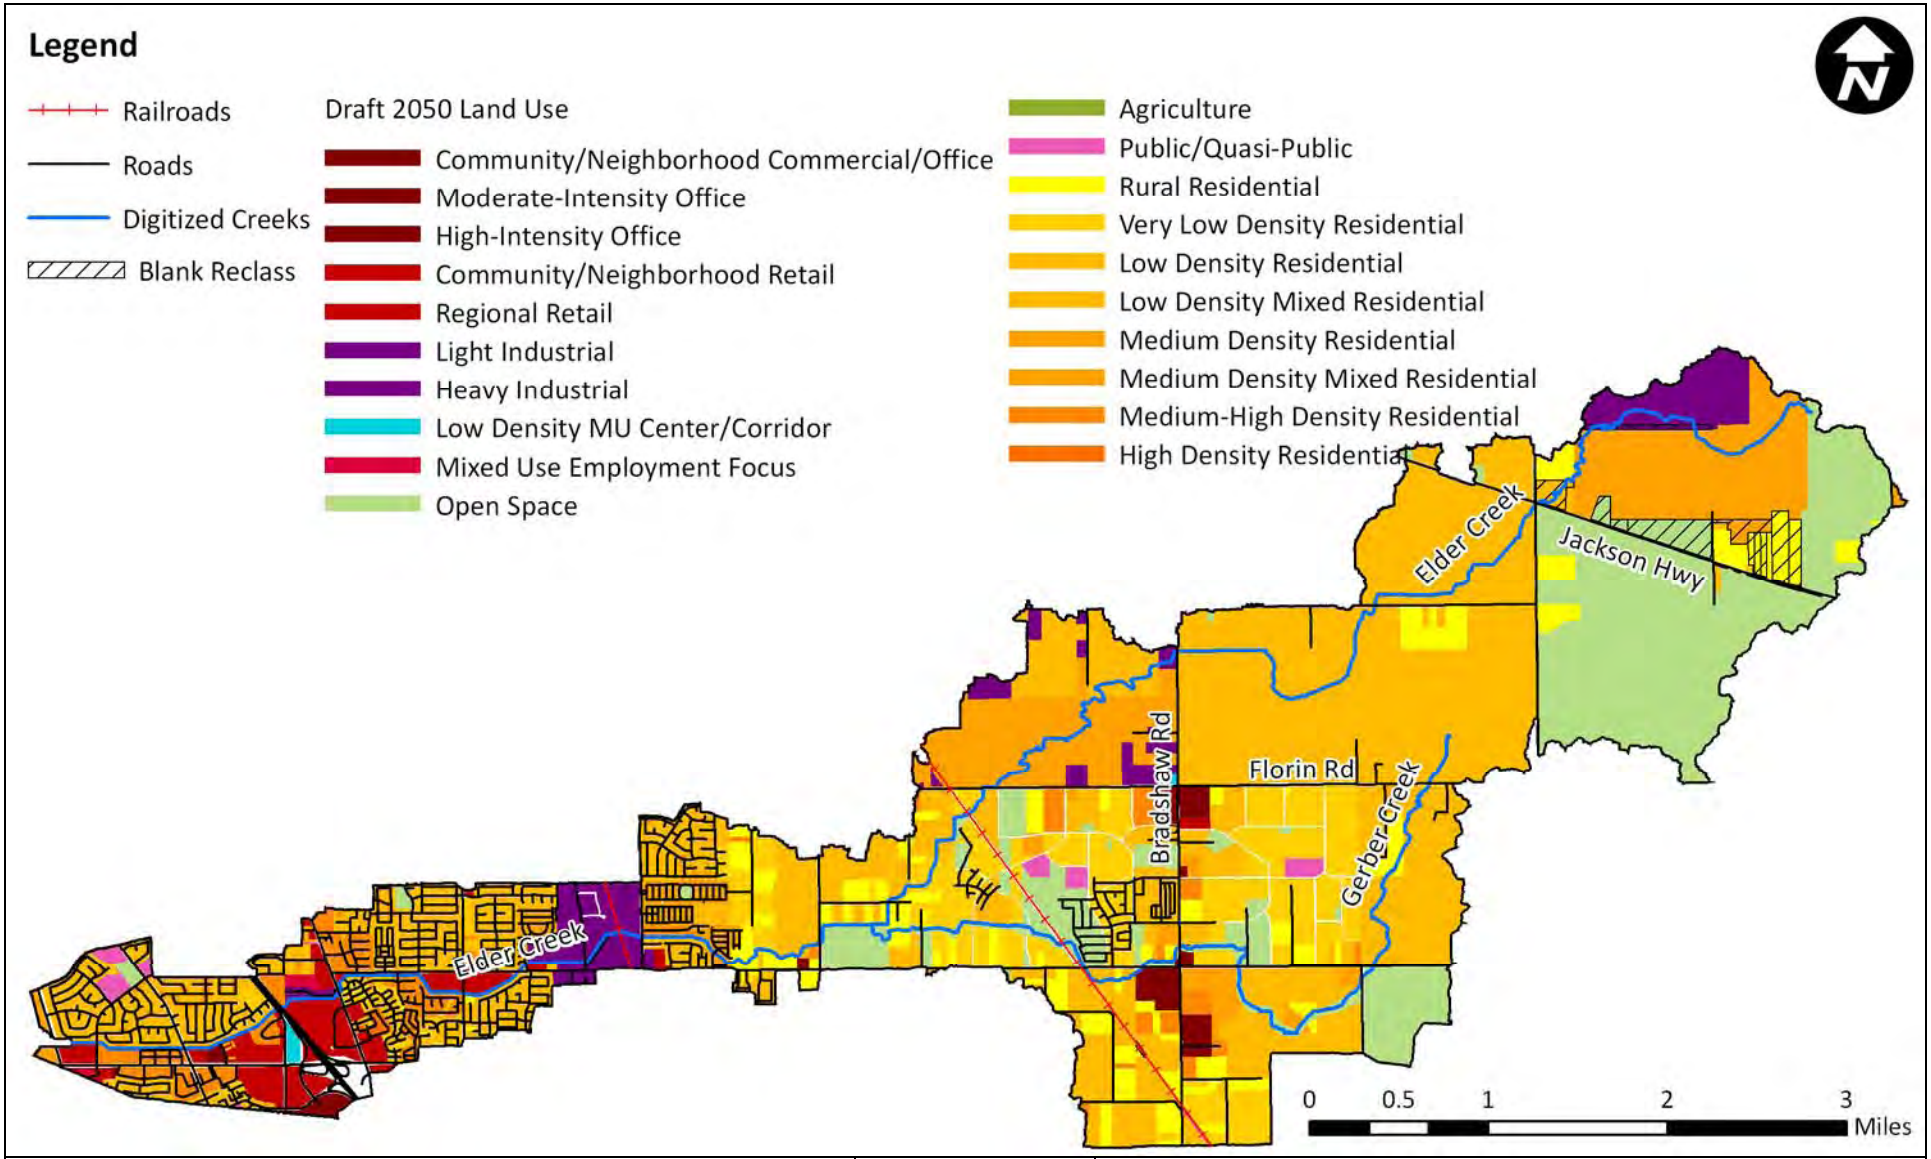
Table 3-2. Potential management strategies (version 1)



CEM Type[1]	CSI-BEHI Class[2]	SSP Ratio[3]	Management Strategy
I	Values to be determined through detailed assessments through HMP	Values to be determined through detailed assessments through HMP	1. Minimum runoff reduction and setback measures.
I & II			1. Grade control and/or local bank stabilization may be necessary to protect structures, riparian habitat as equilibrium slope is re-established.
III			1. Grade control and/or local bank stabilization may be necessary to protect structures, riparian habitat as equilibrium slope is re-established. 2. Flow duration control. 3. LID measures 4. Combination of 1 through 3.
III & IV			1. Grade control and/or local bank stabilization may be necessary to protect structures, riparian habitat as equilibrium slope is re-established. 2. Flow duration control. 3. LID measures 4. Combination of 1 through 3.
IV & V			1. Local bank stabilization. 2. Habitat enhancement features.

Notes: [1] channel evolution stage per Simon (1989); [2] combined CSI-BEHI classification; [3] for example, ratio of future to existing specific stream power as determined per Section 3.1.

Table 3-3. Potential management strategies (version 2)



CSI Class	BEHI Class	SSP Ratio Continuum		
		Low	Moderate	High
Stable	Low	1	2,3	2,3,
	Moderate	1,5	2,3,5	2,3,5,6
	High	1,5	2,3,5	2,3,5,6
Transitional	Low	1,4	2,3,4	2,3,4
	Moderate	1,4,5	2,3,4,5	2,3,4,5,6
	High	1,4,5	2,3,4,5	2,3,4,5,6
Unstable	Low	1,4,6	2,3,4,6	2,3,4,6
	Moderate	1,4,5,6	2,3,4,5,6	2,3,4,5,6
	High	1,4,5,6	2,3,4,5,6	2,3,4,5,6

Notes: [1] minimum runoff reduction and setback measures; [2] flow duration control; [3] LID measures; [4] grade control; [5] bank stabilization; [6] habitat enhancement

4 CONCEPT FOR RISK-BASED DECISION SUPPORT TOOL (DST)

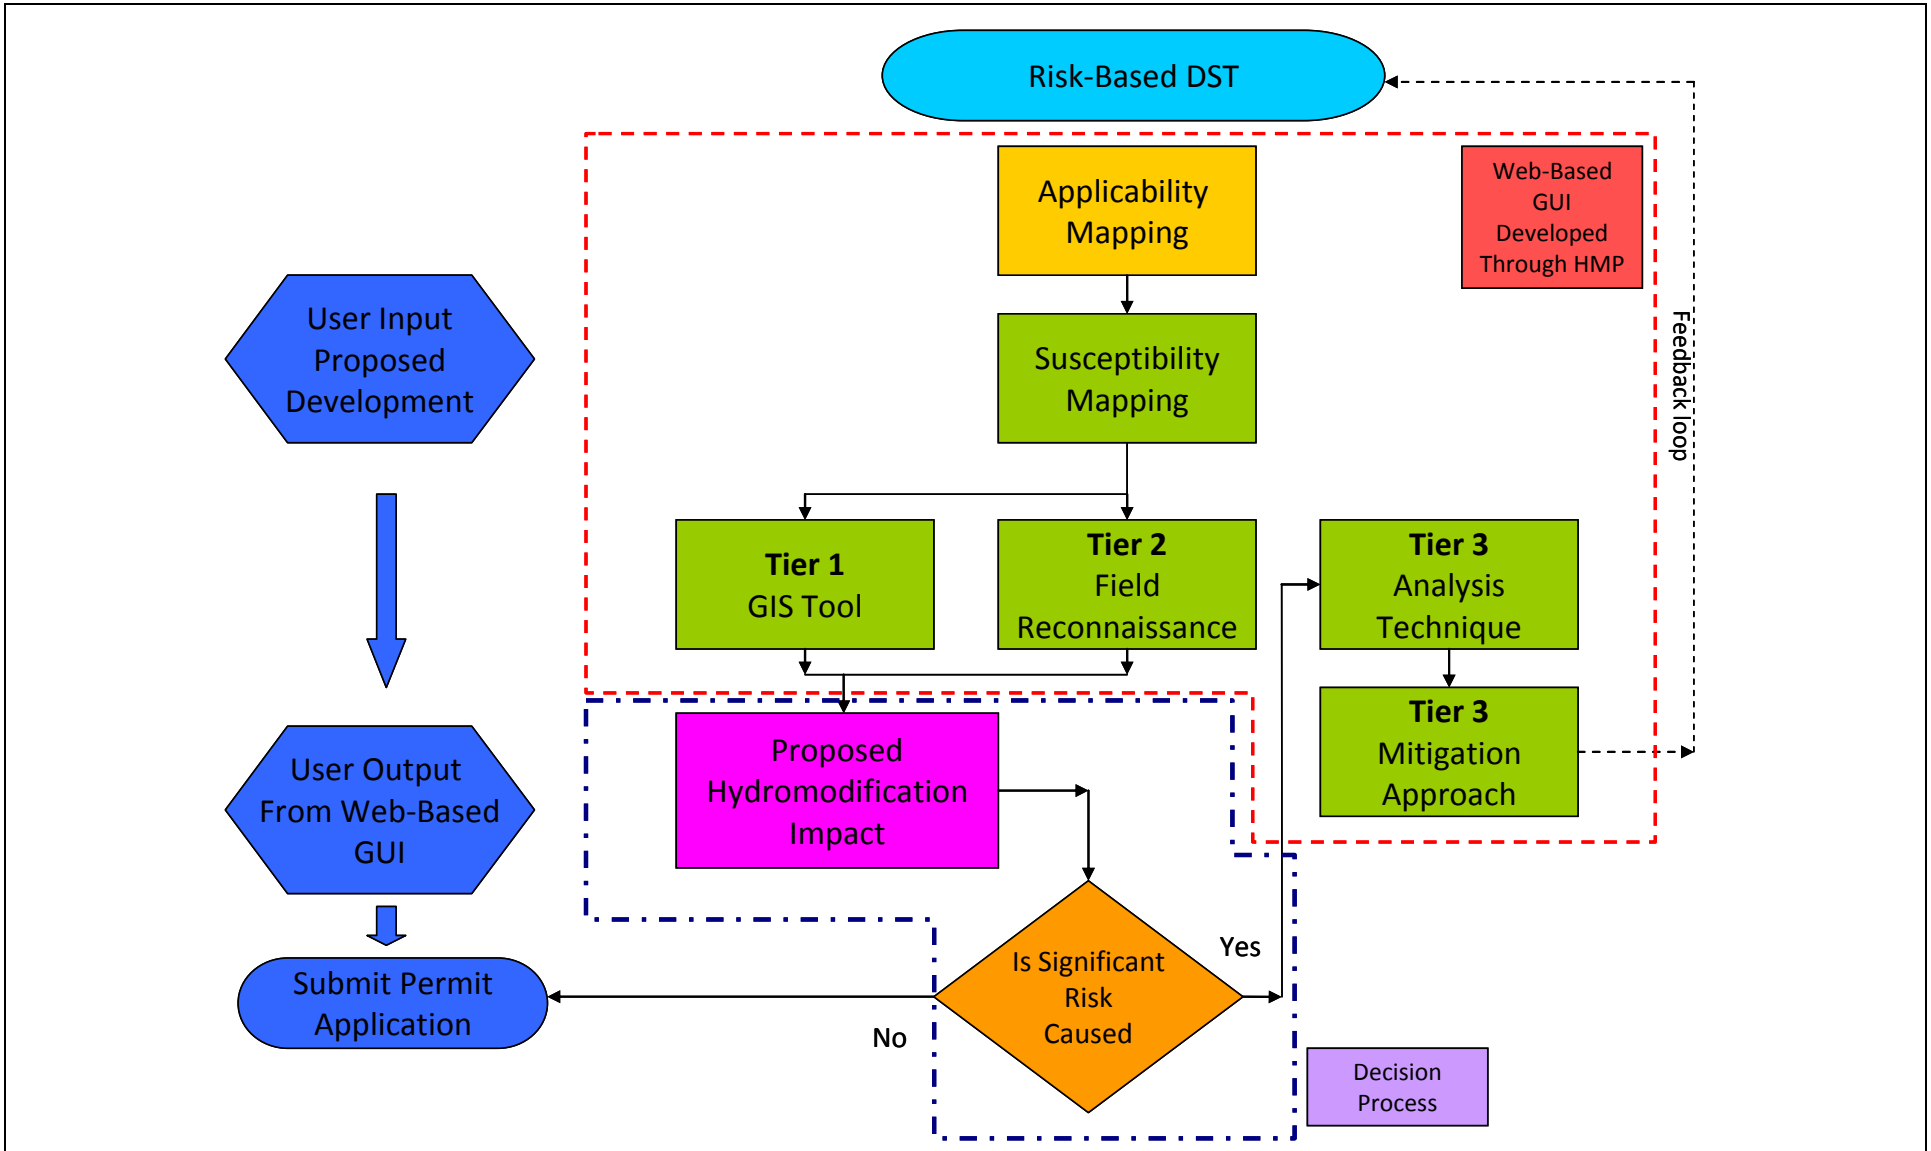
This section describes a concept for a risk-based decision support tool (DST) based on the findings of the applicability and susceptibility work described in Sections 2 and 3. This concept is presented for discussion purposes only; like the rest of this report, it has not been formally adopted for use in the Sacramento HMP.

4.1 CONCEPTUAL DST PROCESS

Figure 4-1 shows a process flowchart which combines elements of the applicability mapping and susceptibility mapping/assessment into a GIS-based DST.

The user of the DST would enter the details of the proposed development (using a graphical user interface (GUI) or web-based interface) such as geographic location, area, density and percent impervious. The DST would then calculate various parameters for watershed conditions based on the proposed development, to compare to the existing conditions, which would already be incorporated into the DST (developed through the HMP). For example, a parameter that could be calculated is the SSP ratio (SSP of proposed development / existing SSP) as described in Section 3. Primarily the applicability mapping, and Tier 1 and Tier 2 of the susceptibility mapping, would be utilized by the DST for this purpose.

The GUI would then show the user whether, based on the results of the analysis, the project would be exempted from HMP requirements or not. If exempted, the user could then proceed directly to finalizing a development application based on other conditions. If not exempted, Tier 3 of the analysis would be implemented which would provide the user guidance about techniques that should be utilized for further analysis, and/or potential guidance on hydromodification mitigation measures. Further in-depth analysis tools could include the use of continuous simulation hydrologic modeling, or empirical hydrologic relationships.



The corresponding reduction in impacts as a result of implementation of the mitigation measures could also be shown through the DST.

Ideally, the DST should be developed as a web-based tool connected to a detailed database housed at a Permittee's offices. This would facilitate readily available evaluation of areas subject to HMPs by planners, engineers and developers. It is anticipated that the DST would be a screening tool and would not be used for thorough analysis for ultimate permit application. The DST would be used in conjunction with additional planning and guidance provided by the permitting agency.

4.2 APPLICATION OF THE DST

Figure 4-2 is a conceptual diagram illustrating how the DST could be used. Insert A of Figure 4-2 shows a hypothetical watershed with a corresponding network of creeks. The color shading of the various creeks

could represent SSP or perhaps some combination of applicability and susceptibility mapping results. Insert B shows a hypothetical view of a new development within the watershed, an input by the user. The corresponding increase in a parameter such as the SSP ratio is also shown in Insert B. The user could then have the opportunity to insert potential conceptual hydromodification mitigation actions, and the DST could provide guidance on these, as shown by Inserts C, D, and E. Typical hydromodification mitigation methods include source control (e.g. LID), flow duration control (FDC), and in-stream controls (e.g., restoration/rehabilitation of the creek channel to improve/enhance environmental conditions). Insert F shows the corresponding reduction in the SSP ratio or the absolute SSP, for example. The objective would be to reduce the SSP to as close to the existing SSP as possible, or an SSP ratio of 1.

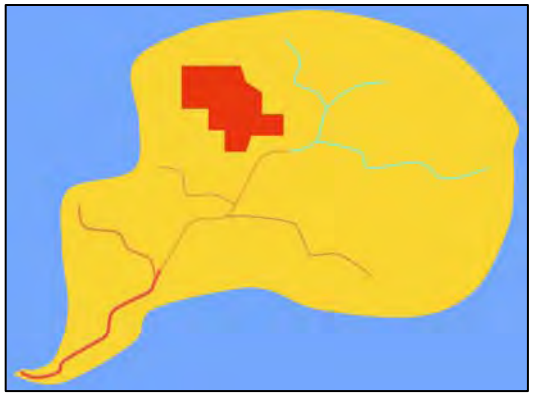
Sacramento County HMP – Pilot Applicability and Susceptibility Mapping



Flow chart for Decision Support Tool

Project No. 07-1006 | Created By: CBB | **Figure 4-1**

C:\Work\Projects\07-1006_SacCntyHMP\Reporting\Fig4-1_v2.doc
3/10/2009

Existing watershed in various states of degradation with varying SSPs. Lighter blues = lower SSP, darker blues and purple = higher SSP

Proposed development located in watershed with a corresponding increase in SSP. Orange and red = increasing SSP

Potential options for hydromodification mitigation inserted into DST. Here the green lines represent some form of source control, such as LID / BMPs.

Other options for hydromodification mitigation inserted into DST. Here the blue square represents a flow duration control basin (detention basin modified for HMP).

Third typical option for hydromodification mitigation, in-stream control, inserted into DST. The blue sinuous dashed line represents in-stream control / rehabilitation.

Corresponding reduction in SSP, as a result of the implementation of combinations of hydromodification mitigation actions, calculated by DST.

5 FINDINGS AND RECOMMENDATIONS

The approaches outlined in this report are somewhat new and innovative. However, certain similarities and consistencies exist between the approaches described here and those being developed by the Southern California Coastal Water Research Project (SCCWRP) and Colorado State University. In summary, the following sections highlight key findings from the pilot project and recommendations for development of the Sacramento HMP.

5.1 APPLICABILITY FINDINGS AND RECOMMENDATIONS

Verify that an applicability map is needed as part of the HMP process and select criteria to be used to develop the applicability map (in addition to the criteria specified in the permit). The list of questions provided in Section 2.3.2, and the information summarized in Appendix A for other California programs should be used to guide the selection process. The following should also be considered:

- A reasonable amount of existing data are available for Sacramento County from which suitable GIS layers could be developed for use in applicability mapping (and susceptibility mapping). For some datasets (e.g. creek alignments, land use), additional data manipulation will be required to produce suitable GIS data for this analysis.
- Percent impervious cover (PIC) is not recommended as an applicability criterion for the Sacramento area because it is not a good predictor of urbanized versus undeveloped conditions for this area.

5.2 SUSCEPTIBILITY CONSIDERATIONS

Following the applicability mapping step, susceptibility mapping and assessments should be conducted for creeks in non-exempt areas of the County in order to determine the magnitude and type of mitigation that might be required to address potential hydromodification impacts from future development.

5.2.1 Tier 1 Considerations

As demonstrated here, the specific stream power approach within a GIS framework, based on regional regression techniques and limited to the 2-year recurrence interval flood, is one way to map creek susceptibility to future urbanization. Even though the findings are based only on the 2-year recurrence interval flood and assume no traditional flood detention (surrogate flow), it is put forth as an approximate method for qualifying the susceptibility of creeks to future urbanization due to a range of flows. It should be noted that additional field reconnaissance in the form of geomorphic assessments (Tier 2) will be required to calibrate and validate the GIS tools developed.

Other methodologies, or adaptations to this methodology, should be considered before applying County-wide. Such adaptations may include:

- Refining the regional regression equations to better reflect conditions in the County
- Using the County's event-based rainfall-runoff model SacCalc to provided the flow inputs (as preferred by the County)
- Considering a range of flows to provide for a comparison of approximate flow duration curves
- Quantifying the relationship between the surrogate flow and event-based runoff for adopted developments with traditional detention
- Refining the mapping to show delineations at distinct changes in channel type, geology, existing land use, etc.
- Reasonably limiting the analysis to 1st order streams (as preferred by the County)
- Limiting the study to the Urban Services Boundary (as preferred by the County)
- Using the 2030 General Plan (as preferred by the County)
- Automating or customizing tools to facilitate efficient application of the selected method at the County scale.

5.2.2 Tier 2 Considerations

At the County scale, it will be important to select a RGA method whose diagnostic characteristics are well suited to the variability and underlying geology of the many creeks within the County. The method could be an adaptation of the methods described, or other methods not described, but the method selected will need to produce reliable findings that result in a consistent and defensible stability and/or risk classification scheme, e.g. stable, transitional, and unstable or low, medium, and high. It is anticipated that the classification scheme chosen will need to be calibrated to a representative sample of creeks within the County to find the results meaningful when RGAs are performed County-wide to verify the existing condition findings in Tier 1. As such, careful consideration should be given to select the range of typical Sacramento urban creek conditions in order to bracket potential conditions for susceptibility mapping. However, the field reconnaissance associated with the susceptibility mapping could be relatively labor intensive and hence expensive.

5.2.3 Tier 3 Considerations

In Section 3.3.1, demonstration of Tier 3 was presented as a concept, which could be developed more rigorously through the HMP. Possible recommendations for how to develop the concept are reiterated here:

1. Conduct RGA sampling throughout the County on a range of creeks representing different types and degrees of degradation in order to characterize the range of CEM types.
2. Conduct County-wide sampling of a range of different bank conditions to characterize the range of BEHI values.
3. Create a County-wide susceptibility map in order to characterize the range of SSP ratios for a specified range of hydrology.

5.3 DECISION SUPPORT TOOL CONSIDERATIONS

A screening level decision support tool (DST), within a web-based GIS framework, could be developed for County-wide use by agency staff and the development community to assess the potential degradational risk of receiving waters by a particular proposed development and prescribe the most appropriate potential mitigation solutions for that project. One possible question that will need to be addressed is how the DST will consider the cumulative impact of multiple developments within any one watershed.

5.4 OTHER RECOMMENDATIONS

Development standards for hydromodification management should be effectively integrated with other requirements for flood protection, stormwater quality treatment and runoff reduction.

Selected Hydromodification Plans/Permits (prepared by State Water Resources Control Board Stormwater Section)

County	Hydromodification Triggers	Hydromodification Criteria	Applicability Mapping	Hydrology Model	LID	Flow Duration Control	Instream Options	Exemptions
Alameda	10,000 square feet or more impervious surface (new development and re-development) When a re-development project results in an increase of more than 50% impervious surface, the entire project is subject to hydromodification criteria.	Range of flows to control: Post-project flow rates and durations = pre-project flow rates and durations from 10 % of the pre-project Q2 to the pre-project Q10 Goodness of fit: Post-project flow duration curve shall not deviate above the pre-project flow duration curve by more than 10% over more than 10% of the length of the curve corresponding to the range of flows to control. Allowable flow rate (Qcp): Qcp ≥10 % Q2 if modified value is substantiated by analysis of actual channel resistance (cannot exceed 50% Q2)	Applicability map provided by county Applicable Projects:: - hilly areas, high slopes (>25%) - projects that discharge to channel reaches where there is concern of bank instability, sensitive habitat, or restoration - land area between the hills and the tidal zone where there are not direct discharges to tidally-influenced waterbodies	Bay Area Hydrology Model (BAHM)	Required to the "maximum extent practicable". LID is also referred to as hydrologic source controls	Required. Must use continuous simulation model to demonstrate compliance.	Cannot reconfigure stable stream channel to accommodate post-project flow regime. Must use flow duration control even if channel is degraded prior to development	Projects that result in no net increase in impervious surface Projects where runoff will flow through enclosed storm drains, existing concrete culverts, or fully hardened (with bed and banks continuously concrete-lined) channels to SF Bay Projects that discharge directly to channels that are tidally influenced or primarily depositional. Projects can be exempt from hydromod criteria if there is no alternative stormwater treatment retrofit, hydromod

								retrofit, regional hydromod control, or instream option. Projects must employ LID and storm water treatment controls, however.
Contra Costa	10,000 square feet or more impervious surface (new development and re-development) When a re-development project results in an increase of more than 50% impervious surface, the entire project is subject to hydromodification criteria.	Range of flows to control: Post-project flow rates and durations = pre-project flow rates and durations from 10 % of the pre-project Q2 to the pre-project Q10 Goodness of fit: Post-project flow duration curve shall not deviate above the pre-project flow duration curve by more than 10% over more than 10% of the Length of the curve corresponding to the range of flows to control. For flow rates from	No applicability map. Risk based approach to determine whether projected increases in runoff peaks and durations will accelerate erosion of receiving stream reaches.	USEPA's Hydrograph Simulation Program—Fortran (HSPF)	Preferred approach. LID is also referred to as hydrologic source controls. LID is accounted for in the HSPF-based sizing calculators that are used to demonstrate compliance with the hydromod criteria. In addition, no net increase in impervious area demonstrates compliance with hydromod	Used in HSPF-based sizing calculators and necessary if developer does not use LID measures. May be used if developer will mitigate erosion through instream options	Can reconfigure stable stream channel to accommodate post-project flow regime. Medium and High risk projects may restore stream to fully mitigate potential risk.	Projects where runoff will flow through enclosed storm drains, existing concrete culverts, or fully hardened (with bed and banks continuously concrete-lined) channels to SF Bay Projects that discharge directly to channels that are tidally influenced or primarily depositional.

County	Hydromodification Triggers	Hydromodification Criteria	Applicability Mapping	Hydrology Model	LID	Flow Duration Control	Instream Options	Exemptions
		0.5Q2 to Q2, the post-project peak flows shall not exceed pre-project peak flows. For flow rates from Q2 to Q10, post-project peak flows may exceed pre-project flows by up to 10% for a 1-year frequency interval. For example, post-project flows could exceed pre-project flows by up to 10% for the interval from Q9 to Q10 or from Q5.5 to Q6.5, but not from Q8 to Q10.			criteria			
San Diego	One acre or more impervious surface, 5000 square feet or more impervious surface for commercial, retail gas outlet, single family homes on steep slopes, etc.	Maintain magnitude and duration of post project flows to pre project flows: Interim Criteria: Match 5-year storm hydrograph-taking sediment supply into account	May be in HMP.	HSPF	Strongly encouraged. County has produced LID manual	Part of HMP	Part of HMP	Part of HMP
San Mateo	10,000 square feet or more impervious surface (new development and re-development) When a re-development project	An erosion potential (Ep) of up to 1.0 shall be maintained for creek segments downstream of the discharge point. Off-site control	Applicability map provided by county Shows exempt areas (areas with hardened channels to SF Bay, etc.)	BAHM	Required to the "maximum extent practicable". LID is also referred to as hydrologic source controls	Required. Must use continuous simulation model to demonstrate compliance.	Cannot reconfigure stable stream channel to accommodate post-project flow regime.	Projects that result in no net increase in impervious surface Projects where runoff will flow

		Q2)						controls, however.
Santa Clara	10,000 square feet or more impervious surface (new development and re-development) in applicable areas. When a re-development project results in an increase of more than 50% impervious surface, the entire project is subject to hydromodification criteria. Applicable areas: - area less than or equal to 65% impervious - catchments and subwatersheds that are less than 65% impervious	Range of flows to control Flow rates for pre-development and post-development = velocity, must maintain a minimum velocity for full and half full flow. Depending on the pipe diameter and the slope, percent. Post-project flow rates and durations = pre-project flow rates and durations from 10 % of the pre-project Q2 to the pre-project Q10. Goodness of fit Post-project flow duration curve shall not deviate above the pre-project flow duration curve by more than 10% over more than 10% of the length of the curve corresponding to the range of flows to control.	Projects found in areas of HM applicability; applicability map provided by county. Based on impervious area. Applicable areas: - area less than or equal to 65% impervious - catchments and subwatersheds that are less than 65% impervious	BAHM	Required to the "maximum extent practicable". LID is also referred to as hydrologic source controls	Required. Must use continuous simulation model to demonstrate compliance.	Cannot reconfigure stable stream channel to accommodate post-project flow regime. Must use flow duration control even if channel is degraded prior to development	Projects that result in no net increase in impervious surface Projects where runoff will flow through enclosed storm drains, existing concrete culverts, or fully hardened (with bed and banks continuously concrete-lined) channels to SF Bay Projects that discharge directly to channels that are tidally influenced or primarily depositional. Projects can be exempt from hydromod criteria if there is no alternative stormwater

San Bernardino	One acre or more impervious surface, 5000 square feet or more impervious surface for commercial, retail gas outlet, single family homes on steep slopes, etc.	Consider flows and volumes from 5, 2, and 1 year return period storms. Estimate pre-and post-project soil loss. Tiered, risk-based approach. More detailed analysis required if flow and sediment supply changes will lead to undesirable channel response.	Applicability Mapping based on presence/absence of hardened channels, etc.	Part of HMP. May be event-based for low risk projects, continuous simulation for high risk projects.	Strongly encouraged. County is developing LID manual	Part of HMP.	Part of HMP	Part of HMP
