December 21, 2018

Mr. Brad Shelton, P.G.
Senior Engineering Geologist
Chief, Title 27 Permitting and Mining Unit
Central Valley Regional Water Quality Control Board
11020 Sun Center Drive, Suite 200
Rancho Cordova, California 95670

Subject: Comments On Tentative Revised Waste Discharge Requirements
Lathrop Facility, San Joaquin County, California

Dear Mr. Shelton:

The RWQCB published Tentative Revised Waste Discharge Requirements (Tentative Revised WDRs) for the process water ponds on November 27, 2018, and distributed them for public comment. The Tentative Revised WDRs include a public comment period extending to December 27, 2018. Please find attached a copy of the Tentative Revised WDRs with Simplot's comments shown as highlights interspersed with the original text of the document.

Please contact me at 209-858-6470 or ryan.mock@simplot.com if you have any questions or require further information.

Sincerely,

[Signature]

Ryan Mock
Environmental Manager-Lathrop Facility
J. R. Simplot Company

Attachment: Tentative WDRs Comments
Central Valley Regional Water Quality Control Board

27 November 2018

CERTIFIED MAIL
7017 1070 0000 8876 8507

Ryan Mock,
Environmental Manager
J.R. Simplot Company,
16777 Howland Road,
Lathrop, CA 95333

NOTICE

TENTATIVE REVISED WASTE DISCHARGE REQUIREMENTS
FOR
J.R. SIMPLOT COMPANY
LATHROP FACILITY
CLASS II SURFACE IMPOUNDMENTS
CONSTRUCTION, OPERATION, MAINTENANCE, CLOSURE, POST-CLOSURE MAINTENANCE,
AND CORRECTIVE ACTION
SAN JOAQUIN COUNTY

Enclosed for your review is a copy of the tentative revision to waste discharge requirements (WDRs) for the Class II Surface Impoundments in San Joaquin County. Also enclosed is a notice of public hearing (NOPH) to interested parties, pursuant to §21730 of Title 27, California Code of Regulations, Section 20005 et seq. (Title 27). The enclosed NOPH describes the date, time, and place that the Central Valley Regional Water Quality Control Board (Central Valley Water Board) is scheduled to have a hearing to consider the adoption of the tentative WDRs.

Electronic copies of the proposed tentative WDRs and the Notice of Public Hearing are available for viewing and downloading on our website at:
www.waterboards.ca.gov/centralvalley/board_decisions/tentative_orders

Persons wishing to comment on this matter must submit their testimony, evidence, and/or comments in writing to the attention of Vinoo Jain at the Central Valley Water Board no later than 5:00 p.m. on 27 December 2018. Written materials received after 5 p.m. on 27 December 2018 will not be accepted and will not be incorporated into the administrative record if doing so would prejudice any party.
Ryan Mock, Environmental Manager
1. Simplot Company, Lathrop Facility
San Joaquin County - 2 -
27 November 2018

If you do not have access to the Internet or otherwise require paper copies of these documents, please contact Vinoo Jain at (916) 464-4607 or by email at Malar.Perinpanayagam@waterboards.ca.gov.

TENTATIVE REVISED WASTE DISCHARGE REQUIREMENTS
FOR
J.R. SIMPLOT COMPANY
LATHROP FACILITY
CLASS II SURFACE IMPOUNDMENTS
CONSTRUCTION, OPERATION, MAINTENANCE, CLOSURE, POST-CLOSURE
MAINTENANCE, AND CORRECTIVE ACTION
SAN JOAQUIN COUNTY

Waste discharge requirements (WDRs) Order No. 97-229 issued on 24 October 1997 is under consideration to be revised to include waste discharge requirements for Class II surface impoundment construction, operation, closure, post-closure maintenance and corrective action. The revised WDRs address the construction of additional surface impoundments at the facility, operation and maintenance of the existing Class II surface impoundments and corrective action for groundwater remediation. The tentative WDRs are issued to J.R. Simplot Company (Discharger) for existing and future Class II surface impoundments.

Further information about the facility and the proposed requirements can be found in the Information Sheet and the tentative WDRs that are available on the Central Valley Water Board’s website at www.waterboards.ca.gov/centralvalley/board_decisions/tentative_orders.

A public hearing concerning this matter will be held during the Regional Board meeting which is scheduled for:

DATE: 7/8 February 2019
TIME: 9:00 A.M.
PLACE: Central Valley Regional Water Quality Control Board
11020 Sun Center Drive #200
Rancho Cordova, CA 95670

The designated parties for this hearing are as follows:

- Staff of the Central Valley Regional Water Quality Control Board
- J.R. Simplot Company

Interested persons may not cross examine witnesses, and will not be subject to cross examination. Interested persons may submit evidence (e.g., photographs, eye-witness testimony, monitoring data) if the evidence is submitted in accordance with the deadlines for submitting evidence described below. Interested persons who present evidence may be subject to cross-examination. Interested persons may request status as a designated party for purposes of this hearing by submitting such request in writing to the Board no later than 5 p.m. on 27 December 2018. The request must explain the basis for status as a designated party and in particular how the person is affected by the discharge.

Tentative waste discharge requirements for the facility were issued for public comment on 27 November 2018. Persons wishing to comment on this item must submit testimony, evidence, if any, and/or comments in writing to the Central Valley Water Board no later than by
NOTICE OF PUBLIC HEARING  
J.R. SIMPLOT  
LATHROP FACILITY CLASS II SURFACE IMPOUNDMENTS  
SAN JOAQUIN COUNTY

5:00 p.m. on 27 December 2018. Written materials submitted after 5:00 p.m. on the above date will not be accepted and will not be incorporated into the administrative record absent a ruling by the Chair. A party requesting to submit late materials must demonstrate good cause for the late submission, and the Chair must find that the late submission would not prejudice the Central Valley Water Board or any designated party.

All designated parties and interested persons may speak at the Regional Board meeting, and are expected to orally summarize their written submittals. Oral testimony and cross examination will be limited in time by the Board Chair. Both designated parties and interested persons may be asked to respond to clarifying questions from Board members, counsel staff or others, at the discretion of the Board.

Anyone having questions on these tentative revised WDRs for the J.R. Simplot Company Lathrop Facility should contact Brad Shelton at (916) 464-1588. Interested parties may download the proposed Order and related documents from the Regional Water Board’s Internet website at

www.waterboards.ca.gov/centralvalley/board_decisions/tentative_orders.

Copies of these documents can also be obtained by contacting or visiting the Regional Water Board’s office at 11020 Sun Center Drive, #200, Rancho Cordova, California 95670-6114 weekdays between 8:00 a.m. and 5:00 p.m.

The procedures governing Central Valley Water Board meetings may be found at Title 23, California Code of Regulations, Section 647 et seq. and are available upon request. Hearings before the Board are not conducted pursuant to Government Code section 11500 et seq. The procedures may be obtained by accessing

http://www.waterboards.ca.gov/water_laws/

Information on meeting and hearing procedures is also available on the Board’s website at

http://www.waterboards.ca.gov/centralvalley/board_info/meetings/mtgprocd.shtml

or by contacting any one of the Board’s offices. Questions regarding such procedures should be directed to Ms. Kiran Lanfranchi-Rizzardi at (916) 464-4839.

The hearing facilities will be accessible to persons with disabilities. Individuals requiring special accommodations are requested to contact Ms. Kiran Lanfranchi-Rizzardi at (916) 464-4839 at least 5 working days prior to the meeting. TTY users may contact the California Relay Service at 1-800-735-2929 or voice line at 1-800-735-2922.

Please bring the above information to the attention of anyone you know who would be interested in this matter.

Original Signed by  
Robert Busby for

Andrew Altevogt, Assistant Executive Officer

27 November 2018
The California Regional Water Quality Control Board, Central Valley Region, (hereafter Central Valley Water Board) finds that:

1. J.R. Simplot Company (hereinafter Discharger) owns and operates three lined Class II surface impoundments (SIs or ponds) and an unlined stormwater SI located at 16777 Howland Road in the City of Lathrop (facility), in central San Joaquin County, in Section 35, T1S, R6E, MDB&M, as shown in Attachment A, which is incorporated herein and made part of this Order by reference. The facility’s Class II SIs are regulated under authority given in Water Code section 13000 et seq.; California Code of Regulations, title 27 (“Title 27”), section 20005 et seq. The facility was previously regulated by Waste Discharger Requirements (WDRs) Order No. 97-229.

2. These WDRs regulate the existing and future Class II SIs, and WDRs have been prepared to prescribe the construction, operation, maintenance, closure and post-closure maintenance requirements of the Class II SIs. In addition, these WDRs require the Discharger to continue implementing corrective action program for groundwater remediation in the vicinity of the Class II SIs.

Comments on Section 2 above
In latter sections the WDR references Occidental’s corrective action as the current remedy and requires Simplot to evaluate whether Occidental’s remedy is still capturing the inorganics plume. Simplot can use publically available data for this task but cannot “implement” the corrective action as it is being implemented by others. As such, the language in the last sentence in the above paragraph should be revised to:

In addition, these WDRs require the Discharger to continue to evaluate whether the corrective action program for groundwater remediation, being implemented by others, is effective for the area in the vicinity of the Class II SIs.

3. The operation of the unlined stormwater SI and reclamation of stormwater for land irrigation are exempted from Title 27 requirements pursuant to Title 27 section 20090. These WDRs do not regulate the unlined stormwater SI which was regulated by Order No. 97-229. The Discharger shall obtain a Non-Subchapter 15 permit for discharges of waste to land that do not require full containment, for the operation of unlined stormwater SI and reclamation of stormwater for land application, see Discharge Specification B.3.
Comments on Section 3 above

This requirement should have a date by which a Non-Subchapter 15 permit should be submitted and a provision that indicates the previous permit conditions apply until the new permit is approved since the stormwater pond will continue in use during the interim period.

4. The following documents are attached to this Order and hereby incorporated into and made a part of this Order by reference:
   - Attachment A – Site Location Map
   - Attachment B – Site Plan and Monitoring Network
   - Information Sheet
   - April 2016 – Standard Provisions and Reporting Requirements for Industrial Facilities Regulated by Title 27 (Industrial SPRRs)

5. The facility is on a 341-acre property (site) at 16777 Howland Road, Lathrop, California 95333. The existing lined Class II SIs area is approximately 9.5 acres which will be increased to approximately 12.8 acres with proposed additional Class II SIs. The existing and future permitted Class II SIs area is shown in Attachment B. The facility is comprised of Assessor’s Parcel Numbers (APN) 198-180-08 and 198-180-09.

6. The Discharger’s fertilizer manufacturing facility in city of Lathrop was previously owned by Occidental Chemical Company (Occidental) who manufactured and formulated both fertilizers and pesticides at this facility. In the late 1970’s, prior to transfer of the facility to the Discharger, groundwater at this site was found to be contaminated with organic pesticides (primarily dibromochloropropane and ethylene dibromide). Under terms and conditions of the Stipulation and Judgement Approving Settlement (No. CIV S-79-898 MLS) for investigation and cleanup of the site, approved by the U.S. District Court on 9 February 1981, Occidental is responsible for investigation and remediation of the site. Under terms and conditions of the Stipulation and Order (hereafter Stipulation) approved by the Court on 21 December 1982, the State of California consented to the transfer from Occidental to the Discharger of the Lathrop facility property and assets provided that Occidental expressly retains full responsibility for compliance with all obligations imposed by the Stipulation, and that the Discharger assumes responsibility for the proper handling, storage, and disposal of liquid and solid wastes and storm water runoff in accordance with the Stipulation. Occidental is currently operating a groundwater extraction system in the western portion of the Discharger’s fertilizer manufacturing facility at the site.

7. The Discharger submitted *Technical Report for Report of Waste Discharge* (ROWD) on 22 February 2018 and *Addendum to ROWD* on 18 June 2018. The information in the ROWD and *Addendum to ROWD* which contain the applicable information required in Title 27, has been used in revising these WDRs. The ROWD and supporting documents contain information related to this revision of the WDRs including:
   - Construction of two proposed additional Class II SIs
   - Engineered alternative liners
   - Changes to the Class II SIs operation and discharge location
   - Update to current site conditions
• Update to soil and groundwater contamination, and remediation
• Update to detection and evaluation monitoring programs

8. On 24 October 1997, the Central Valley Water Board issued Order 97-229 in which the waste management units (WMUs) at the facility were classified as Class II units for the discharge of designated waste. This Order continues to classify the WMUs as Class II units in accordance with Title 27.

9. The existing and future WMUs authorized by this Order are described as follows:

<table>
<thead>
<tr>
<th>Unit</th>
<th>Area</th>
<th>Liner/LCRS¹ Components²</th>
<th>WMU Classification &amp; Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>North SI</td>
<td>2.8 acres</td>
<td>Engineered alternative liner: 80 mil HDPE ³ primary liner, LCRS and Hypalon secondary liner</td>
<td>Class II, constructed in 1981, retrofitted to meet Title 27 performance goal in 1996, active</td>
</tr>
<tr>
<td>South SI</td>
<td>3.2 acres</td>
<td>Engineered alternative liner: 45 mil Hypalon primary liner, LCRS and Hypalon secondary liner</td>
<td>Class II, constructed in 1981, retrofitted to meet Title 27 performance goal in 1996, active</td>
</tr>
<tr>
<td>West SI</td>
<td>3.5 acres</td>
<td>Engineered alternative liner: 45 mil Hypalon primary liner, LCRS and 40 mil PVC⁴ secondary liner over existing asphalt liner</td>
<td>Class II, constructed in 1975, retrofitted to meet Title 27 performance goal in 1994, active, ready for closure</td>
</tr>
<tr>
<td>Northwest SI</td>
<td>1.6 acres (2.5 million gallons)</td>
<td>Primary 80-mil HDPE liner; LCRS drain liner (extrusion molded with integral studs on the upper side of the geomembrane) and 60-mil HDPE secondary liner</td>
<td>Class II, future</td>
</tr>
<tr>
<td>Southwest SI</td>
<td>5.2 acres (8.7 million gallons)</td>
<td>Primary 80-mil HDPE liner; LCRS drain liner (extrusion molded with integral studs on the upper side of the geomembrane) and 60-mil HDPE secondary liner.</td>
<td>Class II, future</td>
</tr>
</tbody>
</table>

¹ LCRS – Leachate collection and removal system
² All liner systems are composite liner systems unless otherwise noted, and the liner components are listed from top to bottom (Note any that are not if applicable)
³ HDPE - High density polyethylene
⁴ PVC – Polyvinylchloride

10. On-site facilities at the site, east of Howland Road, include: three active Class II SIs, one inactive SI, process water pump station, Class II SI pump stations and LCRS sumps, one
stormwater SI, crop land for land application of stormwater, a small packaged water treatment plant, a groundwater backup supply well and groundwater monitoring wells.

11. This Order implements the applicable regulations for discharges of waste to land through Prohibitions, Specifications, Provisions, and monitoring and reporting requirements. Prohibitions, Specifications, and Provisions are listed in Sections A through H of these WDRs below, and in the Industrial SPRRs dated April 2016 which are part of this Order. Monitoring and reporting requirements are included in the Monitoring and Reporting Program (MRP) R5-2019-XXXX and in the SPRRs. In general, requirements that are either in regulation or otherwise apply to all facilities regulated under Title 27 are considered to be “standard” and are therefore in the Industrial SPRRs. Any site-specific changes to a requirement in the SPRRs are included in the applicable section (A through I) of these WDRs, and the requirement in the WDRs supersedes the requirement in the Industrial SPRRs.

WASTE CLASSIFICATION AND UNIT CLASSIFICATION

12. The Discharger proposes to continue to discharge designated waste to lined Class II SIs at the facility. These classified wastes may be discharged only in accordance with Title 27.

13. Water Code section 13173 defines “Designated Waste” as either of the following:

a. Hazardous waste that has been granted a variance from hazardous waste management requirements pursuant to Health and Safety Code section 25143.

b. Nonhazardous waste that consists of, or contains, pollutants that, under ambient environmental conditions at a WMU, could be released in concentrations exceeding applicable water quality objectives or that could reasonably be expected to affect beneficial uses of the waters of the state as contained in the appropriate state water quality control plan.

14. Designated waste can be discharged only at Class I WMUs, or at Class II WMUs which comply with Title 27 and have been approved by the regional board for containment of the particular kind of waste to be discharged.

15. The following liquids are currently approved for discharge to the Class II SIs:

a. Process water,

b. Storm water from the fertilizer manufacturing area,

c. Zeolite softener backwash, and

d. Leachate collected and removed from the LCRS

16. Average discharge flowrate to the Class II SIs is 0.05 million gallon per day (mgd) and this flowrate has been consistent for last 20 years based on the information provided in the ROWD.
17. In the ROWD, the Discharger provided analytical data for samples collected from the Class II SIs during the second semiannual 2017 sampling event, as shown in the table below. The analytical data shows that the SI water quality varies since the Discharger discharges process water into the Class II SIs for storage and reuse in plant processes. Further, the process water flow and quality depend on the product that the fertilizer manufacturing facility manufactures based on seasonal demands. The table also includes the California primary maximum contaminant level (primary MCL), the lowest applicable water quality objective (WQO) for groundwater for protection of drinking water beneficial use for domestic and municipal supply wells, and the background groundwater quality at the site.

</tbody>
</table>
18. The Class II SIs analytical data indicate that the concentrations of constituents, except for barium, boron and cobalt, exceed the primary MCL or lowest applicable WQO. The data indicate that the discharge consists of or contains pollutants that, under ambient environmental conditions at a WMU, could be released in concentrations exceeding applicable WQOs or that could reasonably be expected to affect beneficial uses of the waters of the state. Therefore, the discharge is a ‘designated waste’ and as such must be discharged to a Class II WMU as required by Title 27.

19. The leachate collected in the Class II SI LCRS is pumped and returned to the SI from where it was originated.

SITE DESCRIPTION

20. The site is topographically flat, and the site elevation varies between 10 to 15 feet (ft) above mean sea level (MSL). The site slopes at approximately 5 ft per mile from east to west. The site generally drains in the direction of the San Joaquin River to the west.

21. Land uses within one mile of the facility include industrial to the north, east and west, and agricultural to the south.

22. There are 15 municipal, domestic, industrial, or agricultural groundwater supply wells within one mile of the facility.

23. The facility is south of the city of Lathrop in the San Joaquin Valley. The site is underlain by a complex sequence of interbedded sand, Silt, and clay characteristics of the Laguna Formation and overlying Victor Formation. The Corcoran Clay has been identified beneath the site and depth to the top of the unit varies from 205 to 255 ft below ground surface (bgs).
24. The measured hydraulic conductivity of the native soils underlying the Class II SIs ranges between 2.7 x 10^{-5} and 0.002 centimeters per second (cm/s) as provided in Extraction Well Pumping and Groundwater Model Report, dated 22 April 2013.

25. Based on a site-specific seismic analysis, the controlling maximum credible earthquake (MCE) for the site is a mean moment of magnitude 6.22 event located about 16 kilometers from the site. It is estimated in the Stability Analysis Proposed Process Water Ponds report, dated 27 February 2018, that a MCE event would produce a peak ground acceleration of 0.427 g at the site with a return period of 2,475 years, using the US Geological Survey-Earthquake Hazards Program Unified Hazard Tool (ASCE 7-10). The closest active fault is Greenville-March Creek-Clayton fault at a closest rupture distance of 37 kilometers from the site.

26. The facility receives an average of 14.08 inches of precipitation per year as measured at the Stockton Station (Department of Water Resources Station Number B00 8558 00). The annual mean pan evaporation is approximately 65 inches per year as measured at the Stockton Mowry Bridge Station.

27. The 100-year, 24-hour precipitation event for the facility is estimated to be 3.35 inches, based on National Oceanic and Atmospheric Administration (NOAA), Point Precipitation Frequency Estimates for California, Atlas 14, Volume 6, Version 2. The 100-year wet season is estimated to be 25.24 inches of rain.

28. The 1,000-year, 24-hour precipitation event for the facility is estimated to be 4.65 inches, based on NOAA, Point Precipitation Frequency Estimates for California, Atlas 14, Volume 6, Version 2.

29. The facility is not within a 100-year flood plain based on the Federal Emergency Management Agency’s (FEMA) Flood Insurance Rate Map, Community-Panel Number 060738-0620-F.

30. The stormwater SI is located north of the proposed northwest SI as shown on Attachment B. The Discharger discharges stormwater runoff from the majority of the fertilizer manufacturing facility area west of Howland Road to the stormwater SI which will be regulated by a separate permit (Discharger Specification B.4). Stormwater from the processing area located within the fertilizer manufacturing facility is discharged to the Class II SIs. Surface runoff from the area surrounding the Class II SIs is not contained or monitored.

Comments on Section 30 above
The area contributing runoff to the stormwater pond is reportedly less than 16 acres. As such it is not the majority of the acreage of the facility. Suggest the following language for the second sentence:

The Discharger discharges stormwater runoff from a portion of the fertilizer manufacturing facility area west of Howland Road to the stormwater SI which will be regulated by a separate permit (Discharger Specification B.4).
SURFACE WATER AND GROUNDWATER CONDITIONS

32. General direction of surface water drainage from the site is to San Joaquin River.

33. The designated beneficial uses of San Joaquin River, as specified in the Basin Plan, are municipal and domestic supply (MUN); agriculture (AGR); industrial service (IND); industrial process (PROC); navigation (NAV); water contact recreation (REC-1); non-contact water recreation (REC-2); warm fresh water habitat (WARM); cold freshwater habitat (COLD); wildlife habitat (WILD); cold and warm migration (MIGR) of aquatic organisms; warm spawning (SPWN); and commercial and sport fishing (COMM).

34. The first encountered groundwater ranges from about 8 ft to 17 feet below the native ground surface. Groundwater elevations range from about 5.35 ft MSL to 7.33 ft MSL during first semiannual 2018 sampling event.

35. Four groundwater zones have been identified beneath the facility to a depth of 338 ft bgs. Approximate depth of each zone is provided below:

- Water table zone – 10 to 27 ft bgs
- Shallow groundwater zone – 31 to 83 ft bgs
- Intermediate groundwater zone – 83 to 150 ft bgs
- Deep groundwater zone – 151 to 338 ft bgs.

36. Monitoring data indicate background groundwater quality for first encountered groundwater has electrical conductivity (EC) ranging between 1,281 and 2,118 micromhos/cm, with total dissolved solids (TDS) ranging between 740 and 1,210 milligrams per liter (mg/L). Although monitoring well LP-7 is considered background, it frequently exhibits concentrations of COCs at levels exceeding concentration limits and is therefore likely impacted by release(s) from the Class II SIs.

Comments on Section 37 above
As described above in 17 an evaluation of background conditions and updates to concentration limits should be performed before conclusions about impacts are made. Suggest the following edits to the last sentence: Although monitoring well LP-7 is considered background, it sometimes exhibits concentrations of COCs at levels exceeding concentration limits and therefore may be impacted by release(s) from the Class II SIs.

37. The direction of groundwater flow is generally from east to west. The direction of groundwater flow varies seasonally and periodically between north-northwest and south-southwest. The estimated average groundwater gradient is approximately 0.0007 ft per ft.

38. The designated beneficial uses of the groundwater, as specified in the Basin Plan, are domestic and municipal water supply (MUN), agricultural supply (AGR), industrial service supply (IND), and industrial process supply (PROC).

GROUNDWATER, UNSATURATED ZONE, LCRS AND SURFACE WATER MONITORING
39. The Discharger monitors water table and shallow water zone in the vicinity of the Class II SIs. Occidental monitors four water zones at the site, as part of the Occidental groundwater constituents of concern (COCs) remediation system located in the far western portion of the Simplot fertilizer manufacturing facility.

40. The existing groundwater monitoring network for the Class II SIs consists of background monitoring well LP-7, detection monitoring wells LP-4 through LP-11 except LP-7 for water table zone monitoring, and LP-1, LP-2, LP-3 and PW-1-48 for shallow zone monitoring. The table below provides groundwater monitoring well depth, screen interval and WMU being monitored.

41. At the time this Order was adopted, the Discharger’s detection monitoring program (DMP) for groundwater at the facility satisfied the requirements contained in Title 27. Additional downgradient monitoring wells may be required if analytical data indicate a release in the existing downgradient monitoring wells during the subsequent monitoring events or a correction action program (CAP) is implemented.

42. Title 27 section 20415(b) requires the Discharger to groundwater monitoring system for each WMU. The Discharger proposes to install additional monitoring well LP-12 to monitor future southwest SI as shown on Attachment B and did not propose additional monitoring well to monitor future northwest SI. The Discharger shall establish a groundwater detection monitoring program for the proposed Class II SIs and submit Groundwater Detection Monitoring Program Report, as part of the Water Quality Protection Standard Report, as described in Provision I.7.E

43. The unsaturated zone monitoring system for the existing Class II SIs consisted of two suction lysimeters for each SI at the time of retrofitting. The north pond’s north lysimeter
and south pond’s west lysimeter were decommissioned in 2010. The north pond’s south lysimeter was out of service during the second semiannual 2017 sampling event. Amec Foster Wheeler, on behalf of the Discharger, contacted the Central Valley Water Board in July 2017 with an inquiry as to whether the non-functioning lysimeter could be replaced by a water table groundwater monitoring well LP-11. In a 19 July 2017 email, the Central Valley Water Board indicated that the replacement request was under review. Since the groundwater is approximately 8 ft bgs (Finding 34) and the groundwater was already impacted (Finding 49), establishing a reliable unsaturated zone monitoring for the existing ponds is not feasible with suction lysimeters. The Discharger’s DMP for the unsaturated zone does not satisfy the requirements contained in Title 27 for the existing ponds.

However, release from the existing ponds to groundwater shall be minimized to the extent possible by ensuring ponds’ primary liner performance and LCRSs functionality.

44. The proposed northwest pond and southwest pond which will replace the existing west pond will be provided with pan lysimeters for unsaturated zone monitoring. The Discharger’s DMP for the proposed Class II SIs unsaturated zone monitoring will satisfy the requirements contained in Title 27.

45. Title 27 section 20340(c) and (d) state that the LCRS shall be designed and operated to ensure that there is no buildup of hydraulic head on the liner and to function without clogging through the scheduled closure of the WMU and during the post-closure maintenance period. The existing ponds were built with a geonet drainage layer serving as the LCRS. The existing north and south ponds have one LCRS sump each, and the west pond has two LCRS sumps, one at the northwest corner and the other one at southeast corner. The Discharger currently performs video inspection of the existing ponds’ LCRS sumps on alternate years to determine the condition of the liner and inlet pipes to the LCRS sumps and submits the results and findings in annual monitoring reports. The video inspection of the LCRS sumps is not adequate to evaluate the LCRS clogging which could generate hydraulic head buildup on the secondary liner. Therefore, the Discharger shall submit a work plan to test the LCRS of each existing Class II SI to demonstrate its proper operation pursuant to Title 27 section 20340(C) and (d), as described in Provision I.7.H.

46. Title 27 section 20310(a) requires the Class II WMUs, including its containment and ancillary features to be designed and constructed to prevent migration of wastes from the units to adjacent geologic materials, groundwater or surface water, during disposal operations, closure and post-closure maintenance period. A portion of the surface runoff from the fertilizer manufacturing facility, west of Howland Road, is discharged to the existing unlined stormwater SI. The surface runoff from the Class II SIs surrounding area, east of Howland Road, is not being currently regulated or monitored under current WDRs Order No. 97-229 or a general industrial stormwater permit. During the site inspection by Water Board staff on 24 August 2018, white deposits (sulfate as described by the Discharger) was observed on side slope liners of the existing Class II SIs and exposed process water conveyance pipe joints and connections especially on the process water recirculation pipe for evaporation. The Discharger washes the deposits on pipe joints/connections and slope liners into the respective ponds as part of ponds’ routine maintenance activities. This maintenance activity may cause discharge of waste outside the containment structure.
Comment on Section 46 above
This maintenance on the pipe deposits does not cause a discharge of regulated material outside the containment area of the process water pond. Discharges of materials outside of the containment are required to be reported in accordance with the standard provisions attached to the current WDRs and proposed WDRs. As such, the final sentence is both speculation and unnecessary. It should be deleted. Suggest the following additional sentence be added instead: Procedures for washing these deposits should be included with the operation and maintenance program required by these WDRs.

The Discharger shall establish a surface water monitoring system pursuant to Title 27 section 20415(c) and section 20420, as part of the WQPS and as described in Provision I.7.E. Additionally, the Discharger shall obtain a general industrial stormwater permit for stormwater discharges associated with industrial activities in the vicinity of the Class II SIs (Discharge Specification B.4).

47. For a naturally occurring COCs, Title 27 requires concentration limits for each COC be determined as follows:

- By calculation in accordance with a statistical method pursuant to Title 27, section 20415(e)(8); or
- By an alternate statistical method meeting the requirements of Title 27, section 20415(e)(8)(E).

48. The Discharger submitted an April 2003 Water Quality Protection Standard Report proposing combination of parametric statistical data analysis for constituents with sufficient analytical data and non-statistical methods for constituents with insufficient analytical data at that time, to calculate concentration limits for each monitored constituent in accordance with Title 27. The WQPS report proposed to use Interwell data analysis to calculate prediction limits for the monitored constituents. Prior to discharge waste to the proposed Class II SIs, the Discharger shall submit an updated WQPS incorporating detection monitoring system for proposed northwest and southwest ponds and additional analytical results from existing DMP, as described in Provision I.7.E. The Discharger shall update the WQPS when corrective action monitoring program is implemented in conjunction with a detection monitoring program.

Comments on Section 48 above
This finding is no longer necessary. An update to the WQPS is required by the new MRP. Suggest this section be deleted.

GROUNDWATER DEGRADATION AND CORRECTIVE ACTION

49. Historical groundwater monitoring results indicate a release to groundwater. The Central Valley Water Board requested the Discharger to submit a Corrective Action Program (CAP) to clean up groundwater in a letter dated 11 February 2005. The Discharger submitted June 2005 Corrective Action Work Plan which included phases to conduct the corrective action for the remediation of the site: an evaluation monitoring work plan, engineering feasibility study (EFS) evaluation, DMP and CAP; and presented a preliminary time schedule for implementation of above-mentioned phases. A summary of historical activities conducted by the Discharger is described in Findings 50 through 54.
50. June 2006 Evaluation Monitoring Program (EMP) Interim Report submitted by Geomatrix, on behalf of the Discharger, provided additional characterization of groundwater downgradient of the DMP wells and assessed the nature and extent of the release to design a CAP to clean up groundwater to levels that restore beneficial uses. The report found that based on analytical data from the Discharger’s groundwater monitoring wells and from the depth-discrete samples collected during the EMP, groundwater affected by a release from the Class II SIs has characteristically high ammonia and sulfate concentrations, with TDS concentrations as high as 25,000 mg/L in the water table zone; and concentration of these characteristic salts in groundwater decrease with depth and distance from the Class II SIs. The report identified the nature and extent of the release as described below.

- The nature of the release was characterized with primary COCs: TDS, sulfate and ammonium. The report stated that the high TDS concentrations in monitoring well LP-1 since the initial sample indicate that a release to groundwater occurred prior to 1982, and the continued high TDS concentrations in monitoring wells LP-1 and LP-4 compared to the low concentration in LP-3 and LP-7 suggest that the release of TDS to the water table may be ongoing. The report also stated that the source of the release appears to be process water moving into the water table in the vicinity of the lined Class II SIs based on the differences in COC concentrations and the patterns of the Stiff diagrams. Further, volatile organic carbons (VOCs) non-detects in samples from groundwater monitoring network indicates no ongoing release of VOCs from the Class II SIs.

Comments on first bullet of Section 50 above
The sentence highlighted in yellow in the above paragraph needs clarification. There was a significant historical release of process water from the ponds before the ponds were lined and from a continuing release by geologic materials affected by the historical release. The report does not conclude that there is a current release from the current lined ponds to groundwater as could be concluded by an improper reading of the highlighted section.

Suggest the following modification to the highlighted section of the paragraph: The report also stated that the source of the release appears to be process water moving into the water table in the vicinity of the lined Class II SIs, based on the differences in COC concentrations and the patterns of the Stiff diagrams. The report indicates the release would include a historical release of process water from the historical asphalt lined ponds.

- In the water table, the release was delineated as laterally extending north of the stormwater SI, east of the north pond, south of existing southwest pond (to monitoring well LP-6) and west to monitoring well LP-9. The report suggested that the release did not move north, east and south of the Class II SIs but laterally extended to the approximate location of monitoring well LP-9 based on the stiff diagrams presented in the report. Additionally, it was mentioned in the report that the Occidental groundwater extraction wells hydraulic control of the intermediate zone should limit the lateral extent of the release in the intermediate zone. The vertical extent of the release was delineated as the release-affected groundwater may be migrating into the deep zone groundwater in response to the vertical hydraulic gradient created by pumping of the
Occidental extraction wells but would be limited to the intake level of each of the extraction wells. The June 2006 Evaluation Monitoring Program report recommended additional investigation to understand the nature of the source(s) of the release.

51. June 2007 Evaluation Monitoring Program Addendum Source Area Investigation Report, prepared by Geomatrix on behalf of the Discharger, presented the results from the additional site investigation which was conducted through collecting soil and groundwater samples from exploratory borings in Phase III of the EMP implementation. The findings of the report summarized that soils near the northwest corner of the west pond may be a source area for the release based on significantly elevated concentrations of inorganic chemicals found in soil and groundwater particularly in the vicinity of the northwest corner of the west pond. However, other less concentrated source areas are also present in the vicinity of the ponds based on lower, but still elevated concentration of inorganic chemicals present in soil and groundwater at several boring locations.

52. In 2008, the Discharger assessed soil and groundwater impacts from the historical releases near the ponds and from three unrelated releases at the facility and presented the results and findings in Combined Assessment Report submitted on 3 February 2009. The report concluded that the process water ponds have been a source of ammonium and sulfate releases to the water table zone based on recent and historical groundwater monitoring data. Additionally, the report concluded that in general, COCs at the facility appear to be captured by the Occidental extraction system and the concentrations of COCs in groundwater further west of the Occidental’s extraction wells are at or near background concentrations.

53. The existence of a measurably significant evidence of a release from the ponds was determined in the Feasibility Study for Corrective Action Report, dated 24 July 2009 and prepared by Amec on behalf of the Discharger. The report evaluated potential cost-effective corrective action methods for cleanup of inorganic COCs in groundwater and soils. The Discharger found that the extraction and reuse of groundwater was the most cost-effective solution to control the source of inorganic COCs to groundwater among the four alternatives evaluated for groundwater remediation. Active soil remediation was not proposed in the Feasibility Study for Corrective Action Report, as none of the active soil remediation alternatives were found to be effective in achieve the corrective action goals or to be cost-effective. The Discharger also proposed a conceptual corrective action plan to implement the Extraction and Reuse alternative for groundwater remediation and as a pilot test spanning for two years. Addendum to Feasibility Study for Corrective Action was submitted, in response to the Central Valley Water Board’s review letter dated 17 September 2009, on 23 October 2009. In the addendum to FS report, additional evaluation of remedial methods concluded that the in-situ soil and groundwater remedial methods are infeasible because the methods are unlikely to achieve remedial goals, too costly, and/or unlikely to meet with regulatory approval; and the selected alternatives in the Feasibility Study for Corrective Action Report remained unchanged.

54. The Discharger submitted Extraction Well Pumping and Groundwater Model Report, dated 22 April 2013 and prepared by Amec on behalf of the Discharger, in accordance with the 10 September 2010 Extraction Well Pumping Test Work Plan which was approved by the Central Valley Water Board. The report summarized the procedures followed to install an extraction well (EP-1), two piezometers (P-1 and P-2) and a monitoring well (LP-11), decommission two lysimeters and implementation of a pumping test to calculate aquifer parameters in the vicinity of the process water ponds. The aquifer
parameters obtained from the pumping test were used to develop a groundwater model which simulation results indicated that three shallow extraction wells west of the existing west pond could effectively contain and remediate COCs in shallow groundwater beneath the facility.

55. Historical analytical results of samples from groundwater monitoring wells show concentration limit exceedance for monitoring parameters sulfate, nitrate, ammonia, chloride and TDS. The analytical results from first semiannual 2018 sampling event are summarized in table below.

</table>

Notes:
Concentration limit exceedances are shown in bold.
The water table and shallow zone groundwater is impacted in the vicinity of the existing Class II SIs. Review of past monitoring data is summarized below:

- Based on COCs concentration limits exceedance at the groundwater monitoring wells immediately around and down gradient to the existing west pond, a release to groundwater may be present in the west pond area. Time series plot of TDS, sulfate and ammonia concentration at groundwater monitoring wells LP-1 and LP-4, shows a decreasing concentration trend from 2004 to 2012, increasing trend from 2013 to 2016, and stable or decreasing trend since 2016. The time series plot of COC concentrations and groundwater level show that the COC concentration trends inversely varied with groundwater level at groundwater monitoring wells LP-1 and LP-4. The stable trend of sulfate and TDS concentrations in soil pore liquid at lysimeter W Pond W Lys may indicate an ongoing release.

**Comments on bullet 1 of Section 55 above**
A stable trend of sulfate and TDS is more likely indicative of a continuing release by geologic materials affected by the historical release from the asphalt ponds. An ongoing release from the current lined ponds would most likely be characterized by significant increases in these materials. As such, suggest the highlighted sentence be modified: The stable trend of sulfate and TDS concentrations in soil pore liquid at lysimeter W Pond W Lys may indicate an ongoing release including a release from historically affected geologic materials associated with the former asphalt lined ponds.

- Increasing trends of sulfate and TDS concentrations at monitoring wells LP-3, LP-5B, LP-6, LP-7, LP-9 and PW-1-48, side and downgradient to the existing north and south ponds, indicate that there are new and/or ongoing release(s) in the vicinity of the existing north and south ponds.

**Comments on bullet 2 of Section 55**
Suggest the following clarification to make it clear that "on-going" includes the historical release information:

Increasing trends of sulfate and TDS concentrations at monitoring wells LP-3, LP-5B, LP-6, LP-7, LP-9 and PW-1-48, side and downgradient to the existing north and south ponds, indicate that there are new and/or ongoing release(s), including a historical release from the previous asphalt lined ponds, in the vicinity of the existing north and south ponds.

- Background well LP-7 is impacted based on time series plot for TDS, sulfate and chloride concentrations.

**Comments on bullet 3 of Section 55**
If these data indicate background concentrations are increasing over time these increases may be due to off-site activities such as farming. The area
land use includes agricultural and the City of Lathrop has indicated the area has a regional issue with salt water intrusion. As such, suggest the following language as a replacement:

Concentrations of COCs in background well LP-7 appear to be increasing based on time series plot for TDS, sulfate and chloride concentrations.

- The analytical results of the south pond east lysimeter samples from first semiannual 2013 through second semiannual 2016 sampling events, presented in First

- Semiannual 2018 Monitoring Report, show concentration limit exceedance for COC monitoring parameters compared to groundwater concentration limits. Additionally, average pH value of the liquid collected from the lysimeter is 4.15 based on past five years monitoring data.

Comments on bullet 5 of Section 55 above

The last sentence indicates material confined in the primary liner is leaking into the secondary liner LCRS but the term “leak” is not used in a clear manner. Suggest the following replacement sentence: The primary liners of the existing Class II SIs appear to be leaking at certain freeboard levels: north pond between 3.0 ft and 1.8 ft, south pond between 2.5 ft and 2.1 ft, and west pond around 3.0 ft.

The analytical results of groundwater and unsaturated zone monitoring indicates that release(s) to groundwater from the existing Class II SIs is ongoing. The Discharger shall perform primary liner leak location detection tests and LCRS testing (Finding 45) to all existing Class II SIs as a source control measure pursuant to Title 27 section 20430(c), as described in Provision I.7.G and H, respectively. Additionally, the Discharger shall evaluate the cause for background well LP-7 impacts as described in Provision I.7.F.

56. Based on the discussions in Findings 50 through 55, release(s) from the existing Class II SIs to groundwater is ongoing. The Discharger has performed some corrective action to delineate the lateral and vertical extent of releases and to determine aquifer parameters through groundwater extraction well testing. During a conference call discussion with the Discharger on 5 November 2018, the Discharger indicated that implementing a separate groundwater extraction system as a corrective action to capture COCs in the Class II SIs’ area would influence the hydraulic control of Occidental’s groundwater remediation system which already captures the COCs present in the groundwater in the vicinity of the Class II SIs. The Occidental’s groundwater remediation system is shut down for periodic maintenance and system improvements. The Discharger shall monitor and report on the effectiveness of the Occidental’s groundwater remediation system in removing COCs present in the groundwater in the vicinity of the Class II SIs, as a corrective action and as described in Provision I.7.I and MRP R5-2019-XXXX section Corrective Action Monitoring A.8.

CONSTRUCTION AND ENGINEERED ALTERNATIVE

57. Title 27, section 20080(b) allows the Central Valley Water Board to consider the approval of an engineered alternative to the prescriptive standard. In order to approve an engineered alternative in accordance with Title 27, sections 20080(c)(1) or (2), the Discharger must demonstrate that the prescriptive design is unreasonably and...
unnecessarily burdensome and will cost substantially more than an alternative which will meet the criteria contained in Title 27, section 20080(b), or would be impractical and would not promote attainment of applicable performance standards. The Discharger must also demonstrate that the proposed engineered alternative liner system is consistent with the performance goal addressed by the particular prescriptive standard, and provides protection against water quality impairment equivalent to the prescriptive standard in accordance with Title 27, section 20080(b)(2).

58. The Discharger proposes a liner system which will be designed, constructed, and operated to prevent migration of wastes from the Unit to adjacent natural geologic materials, groundwater, or surface water during disposal operations, closure, and the post-closure maintenance period in accordance with the criteria set forth in Title 27 for Class II WMUs.

59. On 22 February 2018, the Discharger submitted ROWD requesting approval of an engineered alternative for the proposed northwest and southwest ponds to the prescriptive standard for liner requirements which would be either a single replaceable clay liner with hydraulic conductivity maximum of $1 \times 10^{-6}$ cm/sec or double clay liner with hydraulic conductivity maximum of $1 \times 10^{-6}$ cm/sec and LCRS. The engineered alternative liner proposed by the Discharger consists of, from top to bottom: primary 80-mil HDPE liner; drain liner and 60-mil HDPE secondary liner. The drain liner will be extrusion molded with integral studs on the upper side of the geomembrane to enable drainage between the primary and secondary liners.

60. In the past, the Discharger adequately demonstrated during retrofitting the existing ponds that construction of the liner prescriptive standard for the Class II SIs as described in Title 27 is incompatible with the high TDS wastes that to be stored in the Class II SIs at the facility. The Discharger has demonstrated that the proposed engineered alternative is consistent with the performance goals of the containment structures for a Class II WMU affords equivalent protection against water quality impairment.

61. This Order approves the Discharger’s proposed liner system for the proposed WMUs as described in Finding 59 and requires that the Discharger submit final design plans and construction quality assurance (CQA) plans for each new Class II SIs for review and approval at least 180 days prior to construction.

62. The LCRS of each existing Class II SI drains to its respective LCRS sump and the leachate is pumped back into the Class II SI of origin. Similarly, the LCRS of the proposed northwest and southwest ponds will drain to respective sump of each pond and the leachate will be pumped back into the Class II SI from which leachate is originated. Title 27 section 20340 (b) requires the LCRS to be designed, constructed, maintained and operated to collect and remove twice the maximum anticipated daily volume of leachate from the unit. The Discharger did not provide the capacity of each LCRS and the maximum anticipated daily volume of leachate generated from the Class II SIs in the ROWD or in the Addendum to ROWD. The Discharger shall estimate the capacity of LCRS and show that it is designed to collect and remove twice the maximum anticipated daily volume of leachate pursuant to Title 27 section 20340, as described in Provision I.7.H.
63. A pan lysimeter will be installed beneath the LCRS sump of each proposed Class II SI for unsaturated zone monitoring.

64. In the ROWD and Addendum to ROWD, the Discharger proposes that the proposed Class II SIs will be constructed to maintain a minimum of five ft (5 ft) separation from bottom of the waste to the highest anticipated elevation of underlying groundwater pursuant to the Title 27 section 20240(c) requirements. The historical highest groundwater elevation observed at the site was 8 ft MSL in 2007, and bottom of the waste at the proposed Class II SIs lowest point will be at 13 ft MSL.

65. Title 27 section 20370(a) requires Class II WMUs to be designed to withstand the maximum credible earthquake (MCE) without damage to foundation or containment structures. Stability Analysis Proposed Process Water Ponds report, dated 27 February 2018 and submitted along with the ROWD, contains a stability analysis for the proposed Class II SIs northwest and southwest pursuant to Title 27 section 21750(f)(5). The report analyzes the proposed Class II SIs under both static and dynamic conditions. The static-stability analysis indicates a factor of safety of 3.3, which is greater than the factor of safety of 1.5 required by Title 27. The dynamic (seismic) stability analysis using the peak-ground acceleration of 0.427 g for the MCE indicates a factor of safety of 1.25, which is less than the required 1.5. Title 27 section 21750(f)(5)(D) allows the Discharger to utilize a more rigorous analytical method to estimate the magnitude of movement and to demonstrate that this amount of movement can be accommodated without jeopardizing the integrity of the containment structures, in lieu of achieving a factor of safety of 1.5 under dynamic conditions. The Discharger presented that the amount of movement caused by the PGA under dynamic condition would likely be less than an inch since the estimated factor of safety is greater than 1.0.

The Discharger shall submit Class II SIs Operation and Maintenance (O&M) Manual which shall include procedures to follow to ensure the integrity of the Class II SIs containment structure after a seismic event that affected the site, as described in Provision I.7.J.

66. Title 27 section 20375(a) requires Class II SIs to have capacity for seasonal precipitation, a 1,000-year 24-hour design storm event, and to maintain at least two feet of freeboard at all times. The 1,000-year, 24-hour storm event for the site is 4.65 inches and is referred to hereafter as the "design storm". For Title 27-requitalied seasonal precipitation, the Discharger has been required to use the 100-year wet season distributed monthly to prevent overflow of the impoundment or less than two feet of freeboard during a reasonable worst-case scenario wet season. The 100-year wet season for the site is 25.24 inches. To ensure compliance with these requirements, the Discharger is required to maintain at least 30 inches (2-ft plus the amount need to hold the design storm and seasonal precipitation) of freeboard at all times except in the event of a storm equal to or exceeding the design storm event in which case at least 2-ft freeboard must be maintained.
needed to ensure efficient operation and maintenance of the ponds. Furthermore, the RWQCB acknowledges in the paragraph following this comment that Simplot has maintained adequate freeboard since 1997 using the current O&M procedures. Suggest the following replacement paragraph:

Simplot is required to maintain at least 2 feet of freeboard in all process water ponds. The required O&M plan will include procedures to prevent freeboard exceedances in the event of the occurrence of the thousand year 24-hour design storm (4.65 inches).

67. The Discharger has adequately managed the freeboard requirements for the Class II SIs in the past. Currently, the process water from the manufacturing facility is conveyed and distributed to the existing north, south and west ponds. The west pond is filled first until it reaches its capacity and then the north or the south pond is filled. The current pumping arrangement at the facility is that the process water can be returned to the manufacturing facility only from the west pond. Process water from the north and the south ponds is pumped to the west pond to return to the manufacturing facility. The perimeter perforated pipes at the south and west ponds are connected to the discharge pipe of respective pond return pumps. The piping arrangements are in place to pump excess process water from the west pond for off-site disposal to maintain freeboard requirements. The pond operators manually measure pond water level and control flow to/from the ponds since a permanent marker on the liner would not be visible with the deposits from process water. Upon construction of the proposed Class II SIs, The Discharger proposes that the process water will be discharged to the northwest pond which will serve as a settling pond, instead of the west pond and the northwest will overflow to the southwest pond. The process water will be returned from the proposed southwest pond to the fertilizer manufacturing facility.

68. A detailed water balance for the Class II SI was not included in the ROWD. As described in Finding 67, the Discharger has adequately managed the liquid level in the existing Class II SIs. The Discharger has used methods to enhance evaporation to maintain capacity in the existing north, south and west ponds. Two surface mounted evaporators and perimeter perforated pipe on the side slope were installed in the west pond, one surface mounted evaporator in the north pond and perimeter perforated pipe on the side slope in the south pond.

The Discharger shall submit a detailed water balance incorporating capacity of the proposed Class II SIs, as described in Provision 1.7.D. The water balance shall take the following factors into account:

a) The average daily base process water flow to the Class II SIs from the fertilizer manufacturing facility.

b) The average recycling process water flow from the Class II SIs to the fertilizer manufacturing facility.

c) Evaporation losses from the Class II SIs: total gallons per year, and distributed monthly.

d) The 100-year wet season (25.24 inches) is distributed monthly in accordance with average monthly rainfall patterns. Provide a table showing how this rainfall would be
distributed monthly by distributing the total amount among the months using the percentage of monthly precipitation that occurs on average.

e) The total surface area of the SIs.

f) The total surface area of the site runoff area captured by the SIs.

g) Additional capacity required to store the design storm event and additional freeboard (additional capacity translated to feet or inches of freeboard) that needs to be maintained to accommodate the design storm event.

h) The capacity of the lined SIs at the two-foot freeboard level.

i) Capacity loss because of solid accumulation in the Class II SIs.

69. In the past, the process water from the Class II SIs was hauled offsite for disposal during heavy precipitation events to maintain freeboard requirements. A piping arrangement to pump process water from the west pond for offsite disposal was observed by the Water Board staff during the site inspection on 24 August 2018. The Discharger shall submit contingency procedures for disposal of the Class II SI liquid when the Class II SI is near capacity if the water balance find that the Class II SI would be near capacity during its operational period, as part of the O&M Plan and as described in Provision 1.7.J.

Comments on Section 69 above
The above paragraph is not factually correct. Process water was stored on-site until it could be reused. Suggest the following language:

In the past, the process water from the Class II SIs was stored on-site in tanks for reuse following heavy precipitation events to maintain freeboard requirements. The Discharger shall submit contingency procedures for on-site storage of the Class II SI liquid when the Class II SI is near capacity if the water balance find that the Class II SI would be near capacity during its operational period, as part of the O&M Plan and as described in Provision 1.7.J.

70. The Action Leakage Rate (ALR) is the maximum flow rate through the primary liner to the LCRS beyond which the Discharger is required to take actions to inspect and repair the primary liner system. The ALR is based on the recommendations in the 1992 USEPA guidance document *Action Leakage Rate for Leak Detection Systems*. The guidance recommends that ALR for lined SIs be set at no more than 1,000 gallons per acre per day. In the *Addendum to ROWD*, the Discharger determined that the capacity of the proposed ponds’ LCRS sumps is adequate to monitor leaks in excess of the ALR which is 100 gallons per acre per day as presented in the report. However, the Discharger did not provide supporting documents for how ALR was derived.

Currently, the leachate collected and removed from the existing Class II SIs is returned to
the SI of origin. Based on the data presented in the First Semiannual 2018 Monitoring Report, more volume of leachate was pumped from the south and west ponds’ LCRS sumps than from the north pond. A noticeable trend was not observed for leachate generation from each pond. However, the Discharger noted in the semiannual monitoring reports that the primary liners of the ponds are leaking at certain freeboard levels: north pond between 3.0 ft and 1.8 ft, south pond between 2.5 ft and 2.1 ft, and west pond around 3.0 ft.

The Discharger shall estimate ALR for the existing and proposed Class II SIs using the 1992 EPA guidance. Additionally, the Discharger shall evaluate the leakage through the existing Class II SIs primary geomembrane, conduct a leak location survey, and compare the liquid volume in the LCRS sump to the estimated ALR. The estimated ALR and the results of the evaluation shall be submitted in a Existing Class II SIs Primary Liner Evaluation Report as detailed in Provisions I.7.G. Further, the liquid level in the existing Class II SIs should be maintained below the liner leaking levels until the primary liner is evaluated and repaired per Provision I.7.G (see Facility Specification C.3).

Comments on Section 70 above
Leakage of materials from the primary liner to the secondary liner is endemic to all double lined ponds, even in new construction. Consequently, the fact that some leakage is occurring does not justify putting severe restrictions on the operational levels allowed in the ponds. Requirements in the MRP include calculation of ALRs. Restrictions included in the WDRs require ponds that exceed ALRs to be taken out of service for repairs. Testing of the liners and the LCRSs is also required. As such, protective measures already included in the WDRs adequately address evaluation of the rate of liquid accumulation in the LCRSs and measures for testing and maintenance.

Furthermore, the issue of restricting pond levels to 1.8, 2.5 and 3 feet for the north, south and west ponds respectively as described would have the effect of so limiting pond capacity as to make them unusable and may require suspension of associated plant production operations. Also, the testing required by the WDRs would require each pond to be emptied out in turn so it could be cleaned. The restricted storage capacity would not allow for emptying of each pond in turn so the testing and cleaning required by the WDRs could be performed.

In summary, the concerns with the rate of leachate accumulation have been adequately addressed by other provisions in the WDRS and restrictions on the pond levels would cause practical concerns with both plant operation and fulfillment of the provisions of the WDRS. Therefore, Simplot requests the last sentence in the paragraph be deleted and along with the same provision in the associated Facility Specification C.3.

71. Construction will proceed only after all applicable construction quality assurance plans have been approved by Executive Officer.

SURFACE IMPOUNDMENT CLOSURE

72. Title 27, section 21400 provides closure requirements for SIs, which include the following options:
Mandatory clean-closure attempt.

Fallback closure options:

i. Closure as a landfill, requiring that the SIs with compacted and dewatered waste shall be closed as a landfill pursuant to Title 27, section 21090.

ii. Closure as a land treatment unit, requiring SIs which contain only decomposable wastes at closure be closed as a land treatment unit pursuant to Title 27, section 21420.

73. Closure and Post-Closure Maintenance Plan Class II Surface Impoundments (CPCMP), dated 25 April 1996, for the existing Class II SIs is included in the Addendum to ROWD. The Discharger proposed a closure approach of clean closure of the north and south Class II SIs, consolidating fertilizer-affected soils into the west pond, grading the site to provide positive drainage, and constructing a cover over the west pond that consists of a geomembrane and an asphaltic concrete surface suitable for use as a parking lot. The proposed southwest pond will be constructed in place of the existing west pond.

The Discharger shall submit a closure work plan for the existing west pond pursuant to Title 27, section 21400, prior to the construction of the proposed southwest pond, as described in Provision I.7.K. Additionally, the Discharger shall submit a preliminary closure and post-closure maintenance plan for the existing and proposed Class II SIs pursuant to Title 27, section 21769(b) as described in Provision I.7.L. The preliminary closure plan for the Class II SIs shall include a post-closure maintenance plan if closure of any Class II SI is envisioned as fallback closure option pursuant to Title 27, section 21400(b)(2).

CLOSURE, POST-CLOSURE MAINTENANCE AND CORRECTIVE ACTION FINANCIAL ASSURANCES

74. The Class II SIs are currently in service. The Discharger did not propose a closure plan and cost estimate for the SI closure in the ROWD or Addendum to ROWD. Title 27 section 21400 sets the closure requirements for the SIs and allows the Discharger either to clean close the SI, or close as a landfill or land treatment unit in cases where clean-closure is infeasible. Further, Title 27 section 21769(a) and (b) sets the preliminary closure and post-closure maintenance plan (PCPCMP) requirements including reasonable estimate of the maximum expected cost that would be incurred at any time during the Unit’s projected life for a third party both to close the unit and to carry out the first thirty years of post-closure maintenance, and for the Regional Water Board’s review and approval of such plans.

The Discharger shall submit the closure and/or post-closure maintenance cost estimates for the existing and proposed Class II SIs at the facility, as described in Provision I.7.L. Upon approval of PCPCMP and closure and/or post-closure maintenance cost estimate for the existing and proposed ponds, the Discharger shall submit an updated closure and/or post-closure cost estimate and financial assurances to account for inflation by 1 June every year, as described in Provision I.7.N.

75. Title 27, section 20380, subdivision (b) requires that the Discharger obtain and maintain assurance of financial responsibility for initiating and completing corrective action for all known or reasonably foreseeable releases from the WMUs. The Discharger submitted
2005 Corrective Action Work Plan to address the known groundwater and soil contamination in the vicinity of the Class II SIs.

The Discharger shall submit a corrective action cost estimate for initiating and completing corrective action for all known or reasonably foreseeable releases from the Class II SIs pursuant to Title 27 section 20380(b), 22220 and 22101, as described in Provision I.7.M. Upon approval of the corrective action cost estimate, the Discharger shall submit updated corrective action cost estimate to account for inflation by 1 June of each year.

76. Title 27, section 22207 (a) requires the Discharger to establish financial assurances for closure in accordance with the approved cost estimate naming the Central Valley Water Board as the beneficiary. The cost estimate must be equal to the cost of closing the Class II SIs at the point in their active life when the extent and manner of operation would make closure the most expensive. When closing units in phases, the estimate may account for closing only the maximum area or unit of the SIs open at any time. Additionally, Title 27 section 22212(a) requires the Discharger to establish an irrevocable fund for the approved post-closure cost estimate naming the Central Valley Water Board as the beneficiary, if closure of any Class II SIs is envisioned as fallback closure option. Title 27, section 20380 (b) and 22222, require that the Discharger obtain and maintain assurance of financial responsibility for initiating and completing corrective action for all known or reasonably foreseeable releases from the WMUs in accordance with the approved cost estimate naming the Central Valley Water Board as the beneficiary. The Discharger shall submit assurance of financial responsibility as described in Provision I.7.N.

CEQA AND OTHER CONSIDERATIONS

77. The action to revise waste discharge requirements for this existing facility is exempt from the provisions of the California Environmental Quality Act (CEQA), Public Resource Code section 21000, et seq., and the CEQA guidelines, in accordance with Title 14, section 15301.

78. This order implements:

- The Water Quality Control Plan for the Sacramento River and San Joaquin River Basins, Fifth;
- The prescriptive standards and performance goals of California Code of Regulations, title 27, section 20005 et seq., effective 18 July 1997, and subsequent revisions;
- The applicable provisions of Title 40 C.F.R. section 258 “Subtitle D” federal regulations as required by State Water Board Resolution 93-62.

79. Based on the threat and complexity of the discharge, the facility is determined to be classified 2C as defined below:

- Category 2 threat to water quality, defined as, “Those discharges of waste that could impair the designated beneficial uses of the receiving water, cause short-term
violations of water quality objectives, cause secondary drinking water standards to be violated, or cause a nuisance."

- Category C complexity, defined as, “Any discharger for which waste discharge requirements have been prescribed pursuant to Section 13263 or the Water Code not included in Category A or Category B as described above. Included are dischargers having no waste treatment systems or that must comply with best management practices, dischargers having passive treatment and disposal systems, or dischargers having waste storage systems with land disposal.”

80. The Statement of Policy With Respect to Maintaining High Quality of Waters in California, SWRCB Order WQ 68-16 (hereinafter "Anti-Degradation Policy") was adopted by the State Water Board in October 1968. Anti-Degradation Policy limits the Board’s discretion to authorize the degradation of "high-quality waters." This policy has been incorporated into the Board’s Basin Plans. "High-quality waters" are defined as those waters where water quality is more than sufficient to support beneficial uses designated in the Board’s Basin Plan. Whether or not a water is a high-quality water is established on a constituent-by-constituent basis, which means that an aquifer can be considered a high-quality water with respect to one constituent, but not for others. (SWRCB Order No. WQ 91-10.)

81. Anti-Degradation Policy applies when an activity discharges to high quality waters and will result in some degradation of such high-quality waters. When it applies, the Policy requires that WDRs reflect best practicable treatment or control (BPTC) of wastes and that any degradation of high-quality waters (a) will be consistent with the maximum benefit to the people of the State, and (b) will not result in an exceedance of water quality objectives. If the activity will not result in the degradation of high-quality waters, Anti-Degradation Policy does not apply, and the Discharger need only demonstrate that it will use "best efforts" to control the discharge of waste.

82. Anti-Degradation Policy does not apply to the discharge of waste to J.R Simplot Lathrop Facility Class II SIs. The requirements of this Order are designed to ensure that any such wastes remain contained at the facility and will not reach waters of the State. The requirements of this Order reflect the Discharger’s best efforts to control such wastes.

83. Water Code section 13267(b) provides that: "In conducting an investigation specified in subdivision (a), the Regional Board may require that any person who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge waste within its region, or any citizen or domiciliary, or political agency or entity of this state who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge waste outside of its region that could affect the quality of the waters of the state within its region shall furnish, under penalty of perjury, technical or monitoring program reports which the board requires. The burden, including costs of these reports, shall bear a reasonable relationship to the need for the reports and the benefits to be obtained from the reports.

84. The technical reports required by this Order and the attached "Monitoring and Reporting Program R5-2018-XXXX" are necessary to assure compliance with these waste discharge requirements. The Discharger owns and operates the facility that discharges the waste subject to this Order.
PROCEDURAL REQUIREMENTS

85. All local agencies with jurisdiction to regulate land use, liquid waste disposal, air pollution, and to protect public health have approved the use of this site for the discharges of waste to land stated herein.

86. The Central Valley Water Board notified the Discharger and interested agencies and persons of its intent to prescribe waste discharge requirements for this discharge, and has provided them with an opportunity for a public hearing and an opportunity to submit their written views and recommendations.

87. The Central Valley Water Board, in a public meeting, heard and considered all comments pertaining to the discharge.

88. Any person aggrieved by this action of the Central Valley Water Board may petition the State Water Board to review the action in accordance with Water Code section 13320 and California Code of Regulations, title 23, sections 2050 and following. The State Water Board must receive the petition by 5:00 p.m., 30 days after the date that this Order becomes final, except that if the thirtieth day following the date that this Order becomes final falls on a Saturday, Sunday, or state holiday, the petition must be received by the State Water Board by 5:00 p.m. on the next business day. Copies of the law and regulations applicable to filing petitions may be found on the Internet at:

http://www.waterboards.ca.gov/public_notices/petitions/water_quality

or will be provided upon request.

IT IS HEREBY ORDERED, pursuant to California Water Code sections 13263 and 13267, that Order 97-229 is rescinded except for purposes of enforcement, and that J.R. Simplot Company, its agents, successors, and assigns, in order to meet the provisions of Division 7 of the California Water Code and the regulations adopted thereunder, shall comply with the following:

A. PROHIBITIONS

1. The discharge of ‘hazardous waste’ is prohibited. For the purposes of this Order, the term ‘hazardous waste’ is as defined in California Code of Regulations, Title 23, section 2510 et seq.

2. The cessation of any corrective action measure is prohibited without written Executive Officer approval. If routine maintenance or a breakdown results in cessation of corrective action for greater than 24 hours, the Discharger shall notify Board staff.
3. The Discharger shall comply with all Standard Prohibitions listed in Section C of the Industrial SPRRs which are attached hereto and made part of this Order by reference.

B. DISCHARGE SPECIFICATIONS

1. Only non-hazardous liquid wastes shall be discharged to the Class II SIs. The discharge shall not cause a condition of pollution or nuisance as defined by the Water Code section 13050. As stated in Finding 15, the nonhazardous liquid wastes allowed to be discharged to the Class II SIs are:

   a. Process water,
   b. Storm water from fertilizer manufacturing area,
   c. Zeolite softener backwash, and
   d. Leachate collected and removed from the LCRS

2. The Discharger shall, in a timely manner, remove and relocate any wastes discharged at this facility in violation of this Order. If the Discharger is unable to remove and relocate the waste, the Discharger shall submit a report to the Central Valley Water Board explaining how the discharge occurred, why the waste cannot be removed, and any updates to the waste acceptance program necessary to prevent re-occurrence. If the waste is a hazardous waste, the Discharger shall immediately notify the Department of Toxic Substances Control.

3. The Discharger shall obtain a Non-Subchapter 15 permit for discharges of waste to land that do not require full containment, for the operation of unlined stormwater SI and reclamation of stormwater for land application.

   **Comments on Section 3 above**
   This requirement should have a date by which a Non-Subchapter 15 permit should be submitted and a provision that indicates the previous permit conditions apply until the new permit is approved. Otherwise it is not clear which permit provisions apply for operation of the stormwater pond during the interim period.

4. The Discharger shall obtain a general industrial stormwater permit for stormwater discharges associated with industrial activities in the vicinity of the Class II SIs

5. The Discharger shall comply with all Standard Discharge Specifications listed in Section D of the Industrial SPRRs which are attached hereto and made part of this Order by reference.

C. FACILITY SPECIFICATIONS

1. Annually, prior to the anticipated rainy season but no later than 1 November, any necessary construction, maintenance, or repairs of precipitation and drainage control facilities shall be completed and reported in compliance with MRP No. R5-2019-XXXX.

2. The Class II SI shall have capacity for process water flows to the impoundment, precipitation and contaminated site runoff from a 100-year wet season of 25.24
inches distributed at least monthly, a 1,000-year 24-hour storm event (design storm) of 4.65 inches, and shall maintain at least two (2.0) feet of freeboard at all times. To ensure compliance with this requirement, the Discharger shall maintain at least 30 inches of freeboard at all times except in the event of a storm equal to or exceeding the 1,000-year 24-hour design storm event in which case at least two (2.0) feet of freeboard must be maintained.

Comments on Section 2 above
As discussed elsewhere, a limit of 2 feet should be established and the O&M manual should contain procedures to prevent freeboard exceedances in the case of precipitation.

3. The liquid level in the existing Class II SIs should be maintained below the liner leaking levels until the primary liner is evaluated and repaired per Provision I.7.G.

Comments on Section 3 above
As described previously, leakage of materials from the primary liner to the secondary liner is endemic to all double lined ponds, even in new construction. Consequently, the fact that some leakage is occurring does not justify putting severe restrictions on the operational levels allowed in the ponds. Requirements in the MRP include calculation of ALRs. Restrictions included in the WDRs require ponds that exceed ALRs to be taken out of service for repairs. Testing of the liners and the LCRSs is also required. As such, protective measures already included in the WDRs adequately address evaluation of the rate of liquid accumulation in the LCRSs and measures for testing and maintenance.

Furthermore, the issue of restricting pond levels to 1.8, 2.5 and 3 feet for the north, south and west ponds respectively as described would have the effect of so limiting pond capacity as to make them unusable and require suspension of associated plant production operations. Also, the testing required by the WDRs would require each pond to be emptied out in turn so it could be cleaned. The restricted storage capacity would not allow for emptying of each pond in turn so the testing and cleaning required by the WDRs could be performed.

In summary, the concerns with the rate of leachate accumulation have been adequately addressed by other provisions in the WDRS and restrictions on the pond levels would cause practical concerns with both plant operation and fulfillment of the provisions of the WDRS. Therefore, Simplot requests this provision be deleted.

4. The Discharger shall install an automated rainfall gauge to track the magnitude of storm events, install a means to directly measure the available freeboard in the Class II SI at any time and record SI freeboard levels in accordance with the attached monitoring and reporting program.

Comments on Section 4 above
There are rain gauges with publically available data in the general vicinity of the facility. As such, maintaining a rain gauge specifically for the facility is unnecessary. Suggest adding language permitting use of publically available data from rain gauges in the area. Furthermore, the WDRs indicate Simplot has had no issues with freeboard and procedures to maintain freeboard should be included in
the required O&M manual. As such, installation and maintenance of an automated means to measure and record available freeboard at all times is unnecessary. Suggest the following language:

The Discharger shall install an automated rainfall gauge to track the magnitude of storm events or obtain information from publically available sources in the vicinity of the facility. Procedures for monitoring freeboard shall be included in the O&M manual required in this WDR.

5. Waste shall not be placed in the Class II SIs that would affect the physical and chemical properties of the liner to ensure containment of discharged wastes over the operating life, closure, and post-closure maintenance period of the Class II SIs.

6. Waste shall not be placed in the Class II SI that would affect the physical and chemical properties of the LCRS to ensure the required transmission of leachate over the life of the WMUs and the post-closure maintenance period.

7. LCRSs shall be maintained to collect twice the anticipated daily volume of leachate generated by each SI and to prevent the buildup of hydraulic head on the underlying liner at any time. The depth of the fluid in any LCRS sump shall be kept at the minimum needed for safe pump operation

8. Any direct-line discharge to a SI shall have fail-safe equipment or operating procedures to prevent overfilling.

9. The SI(s) shall be designed, constructed and maintained to prevent scouring and/or erosion of the liners and other containment features at points of discharge to the impoundments and by wave action at the water line.

10. Leachate removed from a SI’s primary LCRS shall be discharged to the SI from which it originated.

11. Leachate generation by the Class II SI to the primary LCRS shall not exceed the ALR to be estimated by the Discharger and approved by the Central Valley Water Board as detailed in Provisions I.7.G. If leachate generation in the LCRS of the Class II SI exceeds the ALR, the Discharger shall:

   a. **Immediately** cease the discharge of waste, excluding the Class II SI LCRS leachate;

   Comments on Section 11a above
   This must be clarified so it is clear it is for the affected pond only. Suggest the following language:
   **Immediately** cease the discharge of waste of the affected Class II SI, excluding the Class II SI LCRS leachate;

   b. **Immediately** notify Central Valley Water Board staff by telephone and email. Submit written notification within **seven days** that includes a time schedule to locate and repair leak(s) in the liner system.
c. If repairs do not result in a leakage rate less than the required ALR, the Discharger shall submit written notification within **seven days** that includes a time schedule for replacement of the upper liner of the SI or other action necessary to reduce leachate production.

d. Complete repairs or liner replacement in accordance with the approved time schedule under “b” and/or “c”, above.

12. If leachate is detected in the pan lysimeter of a Class II SI indicating a leak in the containment structures, the Discharger shall:

e. **Immediately** notify Central Valley Water Board staff by telephone and email that the containment structures have failed.

f. **Immediately** sample and test the liquid in accordance with the unsaturated zone monitoring requirements in MRP R5-2019-XXXX.

g. Submit written notification of the release to Central Valley Water Board staff within **seven days** including a time schedule to repair the containment structures.

h. Complete repairs of the containment structures in accordance with the approved time schedule.

13. The Discharger shall submit a SI Operations and Maintenance Plan to the Central Valley Water Board as detailed in Provision I.7.J.

14. The Discharger shall submit a detailed water balance as detailed in Provision H.7.D.

15. If the level in the Class II SI reaches the 30-inch freeboard level, the Discharger shall **immediately** notify Central Valley Water Board staff by telephone and email with the Class II SI water level and the proposed actions to prevent the Class II SI from reaching the 24-inch freeboard level. Sediments or solids that accumulate in the Class II SI shall be periodically removed to maintain minimum freeboard requirements and to maintain sufficient capacity for SI leachate and for the discharge of wastes. The solids removed from the Class II SI may be reused at the fertilizer manufacturing facility. Prior to removal of these solids for off-site disposal, sufficient samples shall be taken for their characterization and classification pursuant to Article 2, Subchapter 2, Chapter 3, Division 2 of Title 27. The rationale for the sampling protocol used, the results of this sampling, and a rationale for classification of the solids shall be submitted to Central Valley Water Board staff for review.

**Comments on Section 15 above**
This provision is unnecessary and redundant as the standard provisions already require notification in the event it appears a violation of provisions is imminent.

16. Following sediment/solids removal from the Class II SI, the liner system shall be inspected for damage within 30 days and any damage shall be repaired within 60 days prior to the discharge of additional process water. A report shall be submitted to the Central Valley Water Board within 30 days of completion of the liner inspection or repair.
Comments on Section 16 above
This requirement does not take into account partial removal of sediments. Routine maintenance of the ponds should include periodic sediment removal which would typically consist of partial removal. Some language for partial removal is needed otherwise any removal will require complete draining and cleaning of the pond. The provision should be designed to promote periodic partial pond cleaning, not impede it. Suggest adding the following. Inspection may consist of a visual/manual inspection of the liner system in the event a partial removal of sediments from a pond is conducted rather than complete removal.

17. The Discharger shall comply with all Standard Facility Specifications listed in Section E of the Industrial SPRRs which are part of this Order.

D. CONSTRUCTION SPECIFICATIONS

1. The Class II SI and related containment structures shall be constructed and maintained to prevent, to the greatest extent possible, inundation, erosion, slope failure, washout, and overtopping under 1,000-year, 24-hour precipitation conditions.

2. Waste management units shall be designed, constructed and operated to prevent inundation or washout due to flooding events with a 100-year return period.

3. Materials used to construct liners shall have appropriate physical and chemical properties to ensure containment of discharged wastes over their operating life.

4. LCRSs shall be designed, constructed, and maintained to collect twice the anticipated daily volume of leachate generated by each SI and to prevent the buildup of hydraulic head on the underlying liner at any time. The LCRS pump shall be capable of removing this volume of leachate and/or 150% of the Action Leakage Rate flow, whichever is greater.

5. The depth of the fluid in any LCRS sump shall be kept at the minimum needed for safe pump operation without excessive pump cycling that could damage the pump.

6. The Discharger shall submit a design report including water balance for the existing and proposed Class II SIs, plans, specifications, and a construction quality assurance plan for review and approval prior to constructing any new lined waste management unit.

7. The Discharger shall submit a final report documenting construction of any new Class II SI for review and approval prior to discharging wastes to the waste management unit.

8. The Class II SI liner system shall consist of, from the top down:

1. Primary 80-mil HDPE liner,
2. Drain liner which will be extrusion molded with integral studs on the upper side of the geomembrane to enable drainage between the primary and secondary liner,

9. The Class II SI shall have a sump to collect and return leachate to the impoundment of origin that leaks through the primary liner. The sump shall include a dedicated automated pump to remove leachate and return it to the impoundment.

10. The Class II SI shall have a flow totalizer to measure leachate volumes pumped from the sump in order to track leakage rates.

11. The Class II SI shall have an unsaturated zone monitoring system consisting of a pan lysimeter beneath the entire sump area of the impoundment.

12. The Class II SI and any overflow basin shall have permanent markings on the liner, or a permanent freeboard gauge so that the freeboard can be observed and recorded at any time. The markings or gauge shall have increments no greater than 6 inches.

13. The Discharger shall not proceed with liner construction (other than earth moving and grading in preparation for liner construction) until the construction plans, specifications, and all applicable construction quality assurance plans have been approved.

14. The Discharger may propose changes to the liner system design prior to construction, provided that approved components are not eliminated, the engineering properties of the components are not substantially reduced, and the proposed liner system results in the protection of water quality equal to or greater than the design prescribed by Title 27 and this Order. The proposed changes may be made following written approval by the Executive Officer. Substantive changes to the design require reevaluation as an engineered alternative and approval by the Central Valley Water Board in revised WDRs.

15. The Discharger shall comply with all Standard Construction Specifications listed in Section F of the Industrial SPRRs which are attached hereto and made part of this Order by reference.

16. The Discharger shall comply with all Storm Water Provisions listed in Section L of the Industrial SPRRs which are attached hereto and made part of this Order by reference.

E CORRECTIVE ACTION SPECIFICATIONS

1. For all units/modules in a corrective action program to address a release from the unit/module, the Discharger shall implement all corrective measures necessary to remediate the release and prevent a continued or subsequent release from the Unit, including, but not necessarily limited to, repairs, cleanup, and source control. Additional measures shall be implemented, as appropriate, if monitoring data indicates that cleanup is not being achieved in a reasonable timeframe and/or if waste constituent concentrations are increasing. To demonstrate cleanup of all water-bearing media affected by the release, the Discharger shall complete the applicable proof period under Title 27, section 20430(g).
F CLOSURE AND POST-CLOSURE MAINTENANCE SPECIFICATIONS

1. Prior to constructing the proposed southwest pond in place of the existing west pond, the Discharger shall submit a closure work plan for the existing west pond as described in Provision I.7.K.

2. At closure of the Class II SI, the Discharger shall clean-close the unit(s) pursuant to Title 27 section 21400(b)(1). All precipitates, settled solids, liner materials, and adjacent natural geologic materials contaminated by wastes shall be completely removed and discharged to an appropriately permitted landfill facility. If after reasonable attempts to remove contaminated natural geologic materials, the Discharger demonstrates that removal of all remaining contamination is infeasible, the impoundment and/or overflow basins shall be closed as a landfill pursuant to Title 27 section 21400(b)(2)(A). In this event, the Discharger shall backfill and grade the area and submit a revised Final Closure and Post-Closure Maintenance Plan proposing a final cover meeting the requirements of Title 27 section 21090 and shall perform all post-closure maintenance in the approved Post-Closure Maintenance Plan. The Discharger shall submit a preliminary closure and post-closure maintenance plan for the Class II SIs at the facility as described in Provision I.7.L.

The current closure plan does not indicate clean closure. Suggest removal of "If after reasonable attempts to remove contaminated natural geologic materials, the Discharger demonstrates that removal of all remaining contamination is infeasible" owing to high groundwater levels.

3. Prior to closure, the Discharger shall submit a final or partial final closure and post-closure maintenance plan prepared by a California-registered civil engineer or certified engineering geologist, and that contains all application information required in Title 27 section 21769, for review and approval of Central Valley Water Board.

4. The Discharger shall comply with all Standard Closure and Post-Closure Specifications listed in Section F of the Industrial SPRRs which are attached hereto and made part of this Order by reference.

G FINANCIAL ASSURANCE SPECIFICATIONS

1. Title 27 section 21769(a) and (b) sets the preliminary closure and post-closure maintenance plan (PCPCMP) requirements including reasonable estimate of the maximum expected cost that would be incurred at any time during the Unit’s projected life for a third party both to close the unit and to carry out the first thirty years of post-closure maintenance, and for the Regional Water Board’s review and approval of such plans. The Discharger shall submit the closure and/or post-closure maintenance cost estimates for the existing and proposed Class II SIs at the facility, to Central Valley Water Board for review and approval by 31 August 2019, as described in Provision I.7.M.

2. The Discharger shall submit a corrective action cost estimate for initiating and completing corrective action for all known or reasonably foreseeable releases from the Class II SIs pursuant to Title 27 section 20380(b), 22220 and 22101, as described in Provision I.7.M.
3. Upon approval of the closure and post-closure cost estimate by Central Valley Water Board, pursuant to Title 27 Section 22207 and/or section 22212, the Discharger shall submit a report showing that it has established an irrevocable closure and/or post-closure maintenance fund at least for the approved amount with the Central Valley Water Board named as beneficiary to ensure closure of the Class II SIs. The financial assurances mechanism shall be one listed in Title 27 section 22228 for which the Discharger is eligible. For financial assurance mechanisms requiring funding, the Discharger shall either fully fund the mechanism by 1 June 2020 or may propose a payment schedule. If the Discharger proposes a payment schedule to fund the mechanism, it shall submit a report by 1 June 2021 showing that the mechanism is fully funded. For financial assurance mechanisms not requiring funding, such as a Guarantee, the Discharger shall submit a report showing the mechanism is in place by 1 June 2020.

4. By 1 June 2020, pursuant to Title 27 section 22222, the Discharger shall submit a report showing that it has established an irrevocable corrective action fund at least for the approved amount with the Central Valley Water Board named as beneficiary to ensure funds are available to address a known or reasonably foreseeable release from the Class II SI. The financial assurances mechanism shall be one listed in Title 27 section 22228 for which the Discharger is eligible. For financial assurance mechanisms requiring funding, the Discharger shall either fully fund the mechanism by 1 June 2020 or may propose a payment schedule. If the Discharger proposes a payment schedule to fund the mechanism, it shall submit a report by 1 June 2021 showing that the mechanism is fully funded. For financial assurance mechanisms not requiring funding, the Discharger shall submit a report showing the mechanism is in place by 1 June 2020.

5. By 1 June of each year, the Discharger shall submit a report to the Central Valley Water Board that reports the balance of both the closure and corrective action funds or the amounts of the Guarantees and the adjustments to account for inflation in accordance with Title 27 section 22236.

6. The Discharger shall comply with all Standard Financial Assurance Specifications listed in Section H of the Industrial SPRRs which are attached hereto and made part of this Order by reference.

H MONITORING SPECIFICATIONS

1. The Discharger shall comply with the detection monitoring program provisions of Title 27 for groundwater, surface water, and the unsaturated zone, and in accordance with Monitoring and Reporting Program (MRP) R5-2019-XXXX, and the Standard Monitoring Specifications listed in Section I of the Industrial SPRRs which are attached.
hereto and made part of this Order by reference.

2. The Discharger shall, for any waste management unit in a corrective action monitoring program, comply with the corrective action monitoring program provisions of Title 27, MRP R5-2019-XXXX, and the Standard Monitoring Specifications listed in Section I of Industrial SPRRs which are attached hereto and made part of this Order by reference.

3. The Discharger shall comply with the WQPS as specified in this Order, MRP R5-2019-XXXX, and the Industrial SPRRs which are attached hereto and made part of this Order by reference.

4. The concentrations of the constituents of concern in waters passing the Point of Compliance (defined pursuant to Title 27, section 20164 as a vertical surface located at the hydraulically downgradient limit of the landfill unit that extends through the uppermost aquifer underlying the unit) shall not exceed the concentration limits established pursuant to MRP R5-2019-XXXX.

5. For each monitoring event, the Discharger shall determine whether the Class II SIs are in compliance with the WQPS using procedures specified in MRP R5-2019-XXXX and the Standard Monitoring Specifications in Section I of the Industrial SPRRs which are attached hereto and made part of this Order by reference.

6. As specified in MRP R5-2019-XXXX, the Discharger shall enter all reports and monitoring data into the online Geotracker database as required by Division 3 of Title 27 and Chapter 30, Division 3 of Title 23.

7. The Discharger shall comply with all Standard Monitoring Specifications and Response to a Release specifications listed in Sections I and J of the Industrial SPRRs which are attached hereto and made part of this Order by reference.

I PROVISIONS

1. The Discharger shall maintain a copy of this Order at the facility, including the MRP R5-2019-XXXX and the Industrial SPRRs which are part of this Order, and make it available at all times to facility operating personnel, who shall be familiar with its contents, and to regulatory agency personnel.

2. The Discharger shall comply with all applicable provisions of Title 27 that are not specifically referred to in this Order.

3. The Discharger shall comply with MRP R5-2019-XXXX, which is incorporated into and made part of this Order by reference.

4. The Discharger shall comply with the applicable portions of the Standard Provisions and Reporting Requirements for Industrial Facilities Regulated by Title 27 which are attached hereto and made part of this Order by reference.

5. If there is any conflicting or contradictory language between the WDRs, the MRP, or the SPRRs, then language in the WDRs shall supersede either the MRP or the
SPRRs, and language in the MRP shall supersede the SPRRs.

6. All reports required by this Order shall be submitted pursuant to Water Code section 13267, and to the extent applicable, shall be prepared by the appropriately licensed professional as described in the Standard Provisions and Reporting Requirements.

7. The Discharger shall complete the tasks contained in these waste discharge requirements in accordance with the following time schedule:

<table>
<thead>
<tr>
<th>Task</th>
<th>Compliance Date</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>A. Construction Plans</strong></td>
<td>90 days prior to proposed construction</td>
</tr>
<tr>
<td>Submit construction and design plans for review and approval. (see all Construction Specifications in Section D, above and Section F of the SPRRs.)</td>
<td></td>
</tr>
<tr>
<td><strong>B. Construction Report</strong></td>
<td>60 days prior to proposed discharge</td>
</tr>
<tr>
<td>Submit a construction report for review and approval upon completion demonstrating construction was in accordance with approved construction plans (see Standard Construction Specification F.27 in the Industrial SPRRs).</td>

</tr>
</tbody>
</table>
Water Board, a leak location test shall be performed on the primary liner to find any defects. The test report shall include:

1. Results from the primary liner leak location test; and
2. Class II SI ALR:
   a. Evaluation of the leakage through the Class II SI primary geomembrane by estimating the ALR using the 1992 EPA guidance document Action Leakage Rate for Leak Detection Systems, for review and approval.
   b. Comparison of the liquid volume collected in the Class II SI LCRS sump to estimated ALR.
3. Proposed primary liner repair plan, if required, including primary liner repair specifications and Construction Quality Assurance Plan.

This item will require removal of the liquid and solid waste in the ponds. In order for the plant to operate, at least two ponds should remain in service at all times. Solids removal will need to be a phased process conducted during the season where rain is unlikely to occur and include: dewatering of the pond, dewatering of the sediments, storage and transportation of the sediments, cleaning of the pond bottom, testing of the liner, submittal and approval of a primary liner repair plan, repair of the liner, testing of the repairs, additional iterations of testing and repair as needed and reporting of the testing results. As such, the process for each pond will require several months and completing the process for all ponds will need to take place over a period of years. Performing these activities during seasons with rainfall would interfere with pond cleaning, testing and repair. Suggest that the due date for the evaluation report be determined as part of the leak detection test work plan submittal.

<table>
<thead>
<tr>
<th>West Pond, December 31, 2020</th>
<th>South Pond, December 31, 2022</th>
</tr>
</thead>
<tbody>
<tr>
<td>North Pond, December 31, 2024</td>
<td></td>
</tr>
</tbody>
</table>

Based on a review of the tasks associated with this provision a preliminary working schedule for sediment removal and liner testing and reporting is presented below:

As noted above, final dates should be determined as part of Work Plan acceptance.
### H. Existing Class II Surface Impoundment

**LCRS Testing**

The LCRS of the existing Class II SIs shall be tested to evaluate its performance and functionality pursuant to Title 27 section 20340(c) and (d). The Discharger shall submit followings for Central Valley Water Board review and approval.

#### 1) LCRS Testing Work Plan

LCRS testing work plan shall be submitted to test the LCRS of each existing pond, including west pond until it is replaced with the proposed southwest pond, to demonstrate proper operation pursuant to Title 27 section 20340(d). The work plan shall include a time schedule to test each existing pond, a proposed method of LCRS testing and criteria for performance evaluation.

#### 2) LCRS Testing Report

Upon approval of the LCRS Testing Work Plan, the Discharger shall perform the LCRS testing and submit the testing results in a report that shall include, but not limited to:

- The existing LCRS testing results
- Capacity of each Class II SI LCRS and LCRS sump. The Discharger shall estimate the capacity of each existing and proposed LCRS and show that it is designed to collect and remove twice the maximum
anticipated daily volume of leachate pursuant to Title 27 section 20340.

c. Proposed corrective action, if the LCRS of any existing pond fails to meet evaluation criteria.

   It is proposed that additional time be provided for work plan acceptance and performing the required testing.

I. Groundwater Corrective Action

The groundwater in the vicinity of the Class II SIs is impacted by release(s) from the Class II SIs. The Discharger has evaluated the nature and extent of the release and performed extraction well testing for groundwater remediation. Implementing a localized corrective action (groundwater pumping) in the vicinity of the Class II SIs would potentially negatively influence the hydraulic control of Occidental’s groundwater remediation system. The COCs present in the groundwater in the vicinity of the Class II SIs is captured by the Occidental's groundwater remediation system.

The Discharger shall monitor and report the effectiveness of Occidental’s groundwater remediation system, which captures the COCs present in the groundwater in the vicinity of the Class II SIs, in removing the COCs present in the groundwater in the vicinity of the Class II SIs, per the Correction Action Monitoring A.8 of MRP R5-2019-XXXX requirements.

Comments on Section I above. Suggest the following addition to the end of the last paragraph to clarify how the data for the evaluation will be obtained: Simplot may use publically available data from Occidental for the required evaluations.
J. Surface Impoundment Operations and Maintenance Plan

Submit a plan that addresses operation and maintenance of the SIs, including, but not limited to: procedure to maintain adequate freeboard, the procedure and schedule for leak testing of SI liners; the procedure and schedule for replacing SI liners, including rationale for replacement; routine inspections to assess existing liner integrity, including in conjunction with sediment removal; annual testing of the LCRS to demonstrate proper operation; and the proposed Action Leakage Rate (ALR) for each SI, calculated using the 1992 United States Environmental Protection Agency method outlined in their guidance document *Action Leakage Rate for Leak Detection Systems*, or equivalent procedures. The O&M plan shall include a contingency plan describing the procedures for off-site disposal of process water when liquid level in the SI

<tr>
<td>N. Class II Surface Impoundment Financial Assurance</td>
<td>Pursuant to Title 27 Section 22207 and/or section 22212, the Discharger shall submit a report showing that it has established an irrevocable closure and/or post-closure maintenance fund at least for the approved amount to conduct closure activities with the Central Valley Water Board named as beneficiary to ensure closure of the Class II SIs. The financial assurances mechanism shall be one</td>
</tr>
</tbody>
</table>
listed in Title 27 section 22228 for which the Discharger is eligible.

Title 27, section 20380 (b) and 22222, require that the Discharger obtain and maintain assurance of financial responsibility for initiating and completing corrective action for all known or reasonably foreseeable releases from the WMUs in accordance with the approved cost estimate naming the Central Valley Water Board as the beneficiary.

Upon approval, the Discharger shall obtain and maintain assurance of financial responsibility with Central Valley Water Board named as beneficiary, for the Class II SI closure and/or post-closure maintenance and corrective action in at least the approved amount of the current cost estimate, adjusted for inflation annually.

8. The Discharger shall comply with all General Provisions listed in Section K of the Industrial SPRRs which are part of this Order.

9. The Central Valley Water Board has converted to a paperless office system. All project correspondence and reports required under this Order shall therefore be submitted electronically rather than in paper form, as follows:

All technical reports and monitoring reports required under this Order shall be converted to PDF and uploaded via internet to the State Water Board’s GeoTracker database at http://geotracker.waterboards.ca.gov, as specified in California Code of Regulations, title 23, section 3892, subdivision (d) and section 3893. Project-associated analytical data shall be similarly uploaded to the GeoTracker database in an appropriate format specified under this Order under a site-specific global identification number. Information on the GeoTracker database is provided at:

http://www.swrcb.ca.gov/ust/electronic_submittal/index.shtm
Notification of the Geotracker upload shall be emailed to the Central Valley Water Board at: centralvalleysacramento@waterboards.ca.gov. To ensure that the submittal is routed to the appropriate staff as quickly as possible, the following information shall be included in the body of the email:

I, PATRICK PULUPA, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, Central Valley Region, on______________________.

______________________
PATRICK PULUPA, Executive Officer
In Order No. R5-2019-XXXX and its associated Monitoring and Reporting Program (MRP), the Central Valley Regional Water Quality Control Board prescribes updated waste discharge requirements (WDRs) for the J.R. Simplot (Discharger) Lathrop Facility Class II surface impoundments (facility) in San Joaquin County, situated approximately one mile south of the town of Lathrop, south of the City of Stockton.

The facility currently consists of approximately 341 acres of property (site) on the east and west sides of Howland Road north of Highway 120 and south of Louise Avenue. The area west of Howland Road includes the Discharger’s fertilizer plant (manufacturing and warehousing) and Occidental’s groundwater remediation system. The area east of Howland Road includes Simplot’s water management systems, which currently consist of the unlined stormwater pond, three Class II surface impoundments (north, south and west ponds) and about 101 acres of agricultural property irrigated with storm water supplemented by water from the facility’s supply wells.

Pursuant to Title 27 of the California Code of Regulations (Title 27), the lined ponds have been classified as a “Class II” unit. The Facility was previously been assessed with an overall Threat to Water Quality (TTWQ) and Complexity (CPLX) rating of 2C. This order continues the waste management unit classification for the ponds and incorporates this threat and complexity rating.

The WDR Order No. 97-229 regulated the three lined ponds, one unlined stormwater pond and wastewater reclamation from the stormwater pond. The operation of unlined stormwater pond and reclamation of stormwater for land irrigation are exempted from Title 27 requirements pursuant to Title 27 section 20090. The WDR Order No. R5-2019-XXXX regulates the three lined ponds and does not regulate the unlined stormwater pond which was regulated by Order No. 97-229. The Discharger shall obtain a Non-Subchapter 15 permit for discharges of waste to land that do not require full containment, for the operation of unlined stormwater pond and reclamation of stormwater for land application.

Facility Description

As of 1 January 1983, Occidental Chemical Company (Occidental) who manufactured and formulated both fertilizer and pesticides at the facility, conveyed to the Discharger certain property and assets of the manufacturing facility. Prior to transfer of the manufacturing facility to the Discharger, groundwater at this site was found to be contaminated with some organic pesticides [primarily dibromochloropropane (DBCP) and ethylene dibromide]. Under terms and conditions of the Stipulation and Judgment Approving Settlement (No. CIV S-79-898 MLS) for investigation and cleanup of the Occidental site, approved by the U.S. District Court on 9 February 1981, Occidental is responsible for investigation and remediation of the site. Under terms of the Stipulation and Order (hereafter Stipulation) approved by the Court on 21 December 1982, the State of California consented to the transfer from Occidental to the Discharger of the Lathrop manufacturing facility’s property and assets provided that Occidental expressly retains full responsibility for compliance with all obligations
imposed by the Stipulation, and that Simplot assumes responsibility for the proper handling, storage and disposal of liquid and solid wastes and stormwater runoff in accordance with the Stipulation.

Occidental implemented a groundwater remedial program that included the extraction and treatment of affected groundwater and the injection of treated groundwater in the far western portion of the Simplot facility. Occidental conducts ongoing groundwater remediation, related to releases of DBCP, ethylene dibromide (EDB) and sulfolane, which are collectively referred to as Occidental’s constituents of concern (COCs), around the site using 17 groundwater extraction wells, a treatment system for extracted groundwater and two groundwater injection wells. Occidental has been monitoring groundwater for Occidental COCs and inorganic constituents east and west of Howland Road. Additionally, Occidental also installed a temporary groundwater remediation system on the east side of facility (Occidental, 2012). This system treats groundwater from the facility’s backup supply well (BSW, see Attachment B). The temporary treatment system removes sulfolane from BSW water for use within Simplot operations. Occidental reports separately to the RWQCB on operations and monitoring of these systems.

Four groundwater zones have been identified beneath the facility to a depth of 338 feet below ground surface (bgs): water table zone, shallow groundwater zone, intermediate groundwater zone and deep groundwater zone. The Discharger monitors well in the water table and shallow groundwater zones at the facility. Occidental monitors all four groundwater zones under a separate MRP.

**Class II Surface Impoundments**

The three Class II ponds were constructed with asphalt liners between 1975 and 1982 and retrofitted with double liner system (double Hypalon or Hypalon and PVC liners) to meet performance goals of Title 27 between 1994 and 1996. The north pond primary liner was replaced with 80-mil high density polyethylene (HDPE) in 2010. The Discharger discharges an average flow rate of approximately 0.05 million gallon per day (total flow rate) of process water, stormwater from fertilizer processing area and zeolite softener backwash to the ponds. The process water stored in the ponds generally has high concentrations of total dissolved solids (TDS), sulfate and ammonia with low concentrations of bicarbonate and low pH.

Currently, the process water from the fertilizer manufacturing facility is conveyed and distributed to the existing north, south and west ponds. The west pond is filled first until it reaches its capacity and then the north or the south pond is filled. The current pumping arrangement at the facility is that the process water can be returned to the manufacturing facility only from the west pond. Process water from the north and the south ponds is pumped to the west pond to return to the manufacturing facility. The piping arrangements are in place to pump excess process water from the west pond for off-site disposal to maintain freeboard requirements. The leachate collected and removed from the leachate collection and removal system (LCRS) is returned to the pond of origin. Surface mounted evaporators in the west and north ponds, and the perimeter perforated pipes at the south and west enhances evaporation from the ponds. The facility operators manually measure pond water level and control flow to/from the ponds. The solids accumulated at the bottom of the ponds over the time, contain high value for fertilizer nutrients, therefore the Discharger reuses it at their facility when it is removed from the ponds to maintain sufficient liquid capacity.

Simplot proposes removal of the following paragraphs shown as redline strikeout since the new pond is no longer proposed:

In 2017, the site experienced annual precipitation of approximately 15.55 inches which was larger than the annual average precipitation of 11.84 inches from 1965 to 1977 as recorded at weather station in Manteca, CA. Several of the storms in 2017 also occurred in close succession. The Discharger installed two temporary storage tanks to increase the process water storage capacity. The Discharger proposes to replace the existing west and non-functioning southwest ponds with two new...
Class II surface impoundments: northwest and southwest ponds, to increase the process water storage capacity.

The Discharger has proposed an engineered alternative to the composite liner prescribed in the construction standard of Title 27 (i.e., a synthetic liner underlain by a compacted clay liner). The Discharger has demonstrated in the past that the clay liners used in a composite liner system are incompatible with the high TDS wastes (primarily calcium sulfate). The Discharger has shown that compacted clay liners are primarily sodium montmorillonite clays composed of aluminum and magnesium silicates. The high concentration of calcium in Simplot’s discharge will replace the sodium thereby making the clay liner more pervious. The Discharger also pointed out that calcium sulfate in its gypsum form is sold as a commercial product to improve water penetration in soils with high clay content. Therefore, the Discharger has proposed a synthetic double-liner system to meet the performance goals addressed by the Title 27 standards. No other alternatives to Title 27 liner requirements have been proposed.

The proposed ponds will have a liner system consisting of primary 60-mil HDPE liner, drain liner for LCRS and 60-mil HDPE secondary liner, and pan lysimeters for unsaturated zone monitoring. The ponds will be constructed with minimum 5-foot separation from bottom of waste to highest anticipated elevation of groundwater. The Discharger proposes that the northwest pond will serve as a settling pond and the overflow from the northwest pond will be discharged to the south pond from where the process water will be returned to the fertilizer manufacturing facility.

Groundwater Degradation and Corrective Action

Historical and recent groundwater monitoring results indicate release(s) to groundwater in the vicinity of the existing Class II surface impoundments. The Central Valley Water Board requested the Discharger to submit a corrective action program to clean up groundwater in a letter dated 11 February 2005. The Discharger submitted a corrective action work plan in June 2005 and has performed some corrective action to delineate the lateral and vertical extent of the releases and to determine aquifer parameters through groundwater extraction well testing. During a conference call discussion with the Discharger on 5 November 2018, the Discharger indicated that implementing a separate groundwater extraction system as a corrective action to capture COCs in the Class II SIs’ area would influence the hydraulic control of Occidental’s groundwater remediation system which already captures the COCs present in the groundwater in the vicinity of the Class II SIs.

The Discharger shall monitor and report on the effectiveness of the Occidental’s groundwater remediation system in removing COCs present in the groundwater in the vicinity of the Class II SIs, as a corrective action and as described in the WDRs.

Comments on preceding paragraph

Simplot is unable to control access to information concerning the performance of Occidental’s groundwater remediation system. As such the monitoring and reporting of the effectiveness of the system should be based on publically available information that Occidental is already required to provide to the RWQCB. Suggest the following sentence be added: Monitoring and reporting of the effectiveness of Occidentals groundwater remediation system shall be based on publically available data provided by Occidental.

WDR Revision

This Order implements construction, operation, maintenance, post-closure maintenance and corrective action requirements for the existing and proposed Class II surface impoundments. Notable revisions to the Facility’s WDRs include:

a. Construction of two proposed new Class II SIs
b. Engineered alternative liner
c. Changes to the Class II SIs operation and discharge location

d. Update to current site conditions

e. Update to soil and groundwater contamination, and remediation

f. Update to detection and evaluation monitoring programs

Approximate Scale: 1 inch = 80 feet (360 meters)
This monitoring and reporting program (MRP) is issued to J.R. Simplot Company (Discharger) pursuant to California Water Code section 13267 and incorporates requirements for groundwater, surface water, and unsaturated zone monitoring and reporting; facility monitoring, maintenance, and reporting; and financial assurances reporting contained in California Code of Regulations, title 27, section 20005, et seq. (hereafter Title 27), Waste Discharge Requirements (WDRs) Order No. R5-2019-XXXX, and the Standard Provisions and Reporting Requirements for Industrial Facilities dated April 2016 (Industrial SPRRs). Compliance with this MRP is ordered by the WDRs and the Discharger shall not implement any changes to this MRP unless a revised MRP is issued by the Central Valley Water Board or the Executive Officer. Failure to comply with this MRP, or with the SPRRs, constitutes noncompliance with the WDRs and with Water Code Section 13267, which can result in the imposition of civil monetary liability.

A. MONITORING

The Discharger shall comply with the detection monitoring program provisions of Title 27 for groundwater, surface water, and the unsaturated zone in accordance with Standard Monitoring Specifications in Section I of the Industrial SPRRs. All monitoring shall be conducted in accordance with the most current approved Sample Collection and Analysis Plan, which includes quality assurance/quality control standards.

All compliance monitoring wells established for the detection monitoring program shall constitute the monitoring points for the groundwater Water Quality Protection Standard (WQPS). All detection monitoring program groundwater monitoring wells, unsaturated zone monitoring devices, leachate, and surface water monitoring points shall be sampled and analyzed for monitoring parameters and constituents of concern (COCs) as indicated and listed in Tables 1 through 5.

The Discharger shall use USEPA test methods with the lowest achievable detection limit for that constituent taking any matrix interferences into account. The reporting limit shall be no higher than the practical quantitation limit. The Discharger shall report all trace concentrations that are between the detection limit and the practical quantitation limit. All metals analyses shall be for dissolved metals.
The monitoring program of this MRP includes:

</tbody>
</table>

1. **Groundwater Monitoring**

The Discharger shall operate and maintain a groundwater detection monitoring system that complies with the applicable provisions of Title 27, sections 20415 and 20420. The detection monitoring system shall be certified by a California-licensed professional civil engineer or geologist as meeting the requirements of Title 27. The current groundwater detection monitoring system meets the applicable requirements of Title 27 for the existing Class II surface impoundment. The Discharger shall submit an updated detection monitoring program for groundwater monitoring of the proposed Class II surface impoundments as part of the updated WQPS, as described in Provision I.7.E of the WDRs.

The current groundwater monitoring network shall consist of the following:

<table>
<thead>
<tr>
<th>Groundwater Monitoring Well</th>
<th>Top of Casing (MSL)</th>
<th>Total Depth (ft)</th>
<th>Screen Interval from Top of Casing (ft)</th>

Groundwater samples shall be collected semiannually from the background wells, detection monitoring wells, corrective action monitoring wells (if any), and any additional wells added as part of the approved groundwater monitoring system. The Discharger shall collect, preserve, and transport groundwater samples in accordance with the approved Sample Collection and Analysis Plan. Depth to groundwater shall be measured to the nearest 0.01 feet. Samples shall be collected and analyzed for the monitoring parameters in accordance with the methods and frequency specified in the following table:

<table>

</tr>
</tbody>
</table>

² Monitoring of dissolved metals is required for any wells that are or have been identified as contaminant sources.
The Discharger shall measure the groundwater elevation in each well **quarterly**, determine groundwater flow direction, and estimate groundwater flow rates in the uppermost aquifer and in any zones of perched water and in any additional portions of the zone of saturation monitored. The results shall be reported semiannually, including the times of expected highest and lowest elevations of the water levels in the wells, pursuant to Title 27, section 20415(e)(15).

The groundwater samples shall be collected and analyzed for general minerals and dissolved metals provided in Table 7.

2. **Unsaturated Zone Monitoring**

The Discharger shall operate and maintain an unsaturated zone detection monitoring system that complies with the applicable provisions of Title 27, sections 20415 and 20420. The current unsaturated zone detection monitoring system does not meet the applicable requirements of Title 27 for the existing Class II surface impoundments. Currently, the north pond does not have any suction lysimeters in service for soil pore liquid monitoring and the south pond has one suction lysimeter in service. Since the groundwater is approximately 8 feet below ground surface and the groundwater is already impacted in the vicinity of the existing ponds, establishing a reliable unsaturated zone monitoring for the existing ponds is not feasible with suction lysimeters. The Discharger shall install unsaturated zone monitoring devices (after review and approval by Central Valley Water Board staff) each time a new Class II waste management unit is constructed.

The current unsaturated zone monitoring network shall consist of:

<table>
<thead>
<tr>
<th>Mon Pt.</th>
<th>Status</th>
<th>WMU Being Monitored</th>
</tr>
</thead>
<tbody>
<tr>
<td>N Pond S Lys</td>
<td>Detection, not in service</td>
<td>North Pond</td>

<td>South Pond</td>
</tr>
<tr>
<td>W Pond N Lys</td>
<td>Detection</td>
<td>West Pond</td>
</tr>
<tr>
<td>W Pond W Lys</td>
<td>Detection</td>
<td>West Pond</td>
</tr>
</tbody>
</table>

Unsaturated zone samples shall be collected from the monitoring network listed above and shall be analyzed for the parameters and constituents listed in the following table in accordance with the specified methods and frequencies (pan-lysimeters need only be sampled when liquid is present). Pan-lysimeters shall be inspected for the presence of liquid **monthly**. If liquid is detected in a previously dry pan-lysimeter, the Discharger shall follow the procedures in the WDRs under “B. Discharge Specifications” and shall **immediately** sample and test the liquid for Field and Monitoring Parameters listed in the following table.

<table>
<thead>
<tr>

Volatile Organic Compounds ug/L  Semiannually  Semiannually
General Minerals 1 Annualy
Dissolved Metals (except Barium, Copper and Lead) 1

Note:
ml – milliliter

1 The groundwater samples shall be collected and analyzed for general minerals and dissolved metals provided in Table 7.

Comments on Note 1 above
Unsaturated zone samples are not groundwater. Should this be interpreted to mean general minerals and metals samples collected from the unsaturated zone should be analyzed for the same constituents as groundwater samples?

The Discharger shall collect, preserve, and transport samples in accordance with the quality assurance/quality control standards contained in the approved Sample Collection and Analysis Plan.

Monitoring results for the unsaturated zone shall be included in monitoring reports and shall include an evaluation of potential impacts of the facility on the unsaturated zone and compliance with the Water Quality Protection Standard.

3. Surface Water Monitoring

The Discharger shall operate a surface water detection monitoring system for any facility where runoff from waste management unit areas flows or could flow to waters of the United States. The monitoring system shall comply with the applicable provisions of Title 27, sections 20415 and 20420. At the facility runoff from Class II surface impoundments areas generally sheet flows to east side of the property boundary and general direction of the runoff flow is to San Joaquin River. The facility does not have a surface water detection monitoring system that meets the applicable requirements of Title 27. The Discharger shall establish a surface water monitoring system pursuant to Title 27 section
20415(c) and section 20420, as part of the WQPS and as described in Provision I.7.E of the WDRs.

For surface water detection monitoring (after review and approval of the WQPS by Central Valley Water Board staff), a sample shall be collected at each monitoring point location and analyzed for the monitoring parameters and constituents in accordance with the methods and frequency specified in the following table.

### Table 3: Surface Water Monitoring

1. Freeboard shall be measured weekly and within 24 hours after onsite rainfall of greater than two inches in a 24 hour period. Freeboard shall be measured from the top of the surface impoundment down to the water level in the impoundment and can be measured using markings on the primary geomembrane liner or a free-standing gauge.

**Comments on Note 1 above**

Suggest adding "or measurements can be collected using another method of equivalent accuracy."  

2. Flow of process water into Class II surface impoundment as measured and recorded at totalizing meter.

3. Process water flow returned to the fertilizer manufacturing facility or transferred from one pond to another as measured and recorded at the totalizing meter.

4. The *groundwater* samples shall be collected and analyzed for general minerals and dissolved metals provided in Table 7.

**Comments on Note 4 above**

Surface impoundment samples are not groundwater. Should this be interpreted to mean general minerals and metals samples collected from the impoundments should be analyzed for the same constituents as groundwater samples?

### 5. LCRS Monitoring, Action Leakage Rate, and Annual LCRS Testing

**LCRS Monitoring:** The Discharger shall operate and maintain leachate collection and removal system (LCRS) sumps, record and calculate monthly leakage rates, and conduct annual testing of each LCRS in accordance with Title 27 and this monitoring program.

The current LCRS leachate sump monitoring points are:

- **Mon Pt.**
- MWU Where Sump is Located
- N Pond Sump North pond
- S Pond Sump South pond
- W Pond NW Sump West Pond
- W Pond SE Sump West Pond

All LCRS sumps shall be inspected monthly for the presence of leachate, and flow shall be recorded in accordance with the following table. If leachate is detected in a previously dry sump, the Discharger shall verbally notify Central Valley Water Board staff within seven days and shall immediately sample and test the leachate for Field and Monitoring Parameters listed in the following table. Leachate in the LCRS sump shall then be sampled for all parameters and constituents in accordance with the frequencies listed in the following table, whenever liquid is present.
Comments on preceding paragraph of Section 5:
LCRS sumps at the process water ponds have all previously had leachate present. Suggest deletion of provisions only applicable to new sumps as none of these are to be installed.
Table 5: LCRS Monitoring

¹ Flow in gallons per day from LCRS sump back to surface impoundment.

**Action Leakage Rate:** If monthly monitoring of the flow rate into the LCRS shows an exceedance of the Action Leakage Rate required by the WDRs, the Discharger shall follow the procedures in the WDRs under “C. Facility Specifications”. Tabulated monthly leakage rates shall be included in the semiannual monitoring reports.

**Annual LCRS Testing:** All LCRSs shall be tested annually pursuant to Title 27, section 20340(d) to demonstrate proper operation. The results of these tests shall be reported to the Central Valley Water Board in the Annual Monitoring Report and shall include comparisons with earlier tests made under comparable conditions.

### 6. Waste Discharge Monitoring

The Discharger shall monitor all wastes discharged to the Class II surface impoundment(s) on a monthly basis and report the results in the semiannual monitoring reports:

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Units</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

**Comments on Section 6 above**

The pond material is somewhat corrosive and therefore frequent maintenance will be needed on flow meters used to provide the above data. As such, there should be a provision that the pond system can still operate if the meters are not in service due to maintenance. At other installations calculated volumes...
7. Facility Monitoring

a. Annual Facility Inspection

Annually, prior to the anticipated rainy season, but no later than 30 September, the Discharger shall conduct an inspection of the facility. The inspection shall assess repair and maintenance needed for liner systems; LCRS pumps, piping and control systems; drainage control systems; groundwater monitoring wells; unsaturated zone monitoring systems; and shall assess preparedness for winter conditions including but not limited to the required surface impoundment capacity and erosion and sedimentation control. The Discharger shall take photos of any problems areas before and after repairs. Any necessary construction, maintenance, or repairs shall be completed by 1 November. Annual facility inspection reporting shall be submitted as required in Section B.3 of this MRP.

b. Major Storm Events

The Discharger shall inspect all precipitation, diversion, and drainage facilities and all WMU berms for damage within 7 days following major storm events capable of causing damage or significant erosion. Freeboard in Class II surface impoundments shall be measured and recorded within 24 hours after onsite rainfall of greater than two inches in a 24 hour period. The Discharger shall take photos of any problems areas before and after repairs. Necessary repairs shall be completed within 30 days of the inspection. Notification and reporting requirements for major storm events shall be conducted as required in Section B.4 of this MRP.

c. Rainfall Monitoring

The Discharger shall monitor and record onsite rainfall data using an automated rainfall gauge. Data shall be used in establishing the severity of storm events and wet seasons for comparison with design parameters used for WMU design and conveyance and drainage design. Daily data and onsite observation shall be used for establishing the need for inspection and repairs after major storm events. Rainfall data shall be reported in the semiannual monitoring reports as required by this MRP under “Reporting”.

Suggest editing the first sentence to include using publically available data: The Discharger shall monitor and record onsite rainfall data using an automated rainfall gauge or publically available rainfall data from gauges in the vicinity of the facility.
8. Corrective Action Monitoring

The soil and groundwater in the vicinity of the Class II surface impoundments have been impacted and the Discharger is in the process of implementing a corrective action program to cleanup the groundwater to levels that restore beneficial uses. The Discharger shall perform the corrective action as described in Provision I.7.I of the WDRs Order No. R5-2019-XXXX.

**Comments on Section 8 above**

Suggested edit to clarify the existence of the known historical release: The soil and groundwater in the vicinity of the Class II surface impoundments have been impacted by historical operation of the previous unlined ponds and the Discharger is in the process of implementing a corrective action program to cleanup the groundwater to levels that restore beneficial uses.

Upon implementation of a corrective action for groundwater remediation, the Discharger shall establish a corrective action monitoring program which to be reviewed and approved by Central Valley Water Board staff. the Discharger shall conduct corrective action monitoring to demonstrate the effectiveness of corrective action in accordance with Title 27, section 20430 and this MRP. Groundwater monitoring wells and unsaturated zone monitoring points that are in a corrective action monitoring program shall be monitored in accordance with the groundwater and unsaturated zone monitoring requirements in parts A.1 and A.2 of this MRP, except as modified in this part of the MRP for any additional constituents or modified monitored frequencies.

The Discharger's COCs in groundwater are captured by the Occidental’s groundwater remediation system which is located western portion of the Discharger’s fertilizer manufacturing facility. The Discharger shall record the hours of operation and quantity of groundwater treated for any corrective action system, including Occidental groundwater remediation system if the Discharger depends on this system for removal of COCs present in the groundwater until it is in service, and report them in the Semiannual Monitoring Report required in Section B.1 of this MRP. The Discharger shall estimate the total mass of each monitoring parameters in part A.1 of this MRP to assess the progress of groundwater corrective action and reported in the Semiannual Monitoring Report (including method of calculations) in the format below:

<table>
<thead>
<tr>
<th>Zone</th>
<th>Quantity of Groundwater Treated, gallons per month</th>
<th>Amount Removed During Month</th>
<th>Cumulative Amount Removed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Water Table</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Shallow</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Comments on Section 8 Table above**

Simplot is not in control of the availability of these data. As such, they must rely.
B. REPORTING

The Discharger shall submit the following reports in accordance with the required schedule:

**Reporting Schedule**

<table>
<thead>
<tr>

**Comments on Section B above**

To reduce the total number of required separate reports, Simplot requests reporting under provision B3 be submitted concurrent with B2 on February 1.

**Reporting Requirements**

The Discharger shall submit monitoring reports **semiannually** with the data and information as required in this Monitoring and Reporting Program and as required in WDRs Order No. R5-2019-XXX and the Standard Provisions and Reporting Requirements (particularly Section I: “Standard Monitoring Specifications” and Section J: “Response to a Release”). In reporting the monitoring data required by this program, the Discharger shall arrange the data in tabular form so that the date, the constituents, the concentrations, and the units are readily discernible. The data shall be summarized in such a manner so as to illustrate clearly the compliance with waste discharge requirements or the lack thereof. Data shall also be submitted in a digital format, such as a computer disk.

Field and laboratory tests shall be reported in each monitoring report. Semiannual and annual monitoring reports shall be submitted to the Central Valley Water Board in accordance with the above schedule for the calendar period in which samples were taken or observations made. In addition, the Discharger shall enter all monitoring data and monitoring reports into the online Geotracker database as required by Division 3 of Title 27.

The results of **all monitoring** conducted at the site shall be reported to the Central
Valley Water Board in accordance with the reporting schedule above for the calendar period in which samples were taken or observations made.

The Discharger shall retain records of all monitoring information, including all calibration and maintenance records, all original strip chart recordings of continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order. Records shall be maintained throughout the life of the facility. Such records shall be legible and shall show the following for each sample:

a) Sample identification and the monitoring point or background monitoring point from which it was taken, along with the identity of the individual who obtained the sample;

b) Date, time, and manner of sampling;

c) Date and time that analyses were started and completed, and the name of the personnel and laboratory performing each analysis;

d) Complete procedure used, including method of preserving the sample, and the identity and volumes of reagents used;

e) Calculation of results; and

f) Results of analyses, and the MDL and PQL for each analysis. All peaks shall be reported.

Required Reports

1. **Semiannual Monitoring Report**: Monitoring reports shall be submitted semiannually and are due on **1 August** and **1 February**. Each semiannual monitoring report shall contain at least the following:

a) For each groundwater monitoring point addressed by the report, a description of:

   1) The time of water level measurement;

   2) The type of pump - or other device - used for purging and the elevation of the pump intake relative to the elevation of the screened interval;

   3) The method of purging used to stabilize water in the well bore before the sample is taken including the pumping rate; the equipment and methods used to monitor field pH, temperature, and conductivity during purging; results of pH, temperature, conductivity, and turbidity testing; and the method of disposing of the purge water;

   4) The type of pump - or other device - used for sampling, if different than the pump or device used for purging; and

   5) A statement that the sampling procedure was conducted in accordance with the approved Sample Collection and Analysis Plan.

b) A map or aerial photograph showing the locations of observation stations,
monitoring points, and background monitoring points.

c) The estimated quarterly groundwater flow rate and direction in the uppermost aquifer, in any zones of perched water, and in any additional zone of saturation monitored based upon water level elevations taken prior to the collection of the water quality data submitted in the report [Title 27, section 20415(e)(15)].

d) Cumulative tabulated monitoring data for all monitoring points and constituents for groundwater, LCRS/leachate, unsaturated zone, surface water, and the surface impoundments. Concentrations below the laboratory reporting limit shall not be reported as “ND” unless the reporting limit is also given in the table. Otherwise they shall be reported “<” the reporting limit (e.g., <0.10). Units shall be as required in Tables 1 through 5 unless specific justification is given to report in other units. Refer to the Industrial SPRRs Section I “Standard Monitoring Specifications” for requirements regarding MDLs and PQLs.

e) Laboratory statements of results of all analyses evaluating compliance with requirements.

f) An evaluation of the concentration of each monitoring parameter as compared to the current concentration limits, and the results of any required verification testing for constituents exceeding a concentration limit. Report any actions taken under Section J: Response to a Release in the SPRRs for verified exceedances of a concentration limit for wells/constituents not already in corrective action monitoring.

g) Tabulated monthly freeboard levels in the Class II surface impoundment with comparison to the freeboard requirement in the Facility Specifications of the WDRs.

h) Tabulated monthly leakage rates into the LCRS sump with comparison to the Action Leakage Rate in the Facility Specifications of the WDRs, and a discussion of required response if ALR was exceeded.

i) A summary of all waste discharge monitoring required in Section A.6 of this MRP.

j) A summary of all Facility Monitoring including onsite rainfall data for the reporting period required in Section A.7 of this MRP.

k) A summary of all Corrective Action Program monitoring required in Section A.8 of this MRP.

l) A discussion about any solids that were removed from the Class II surface impoundment during the reporting period to regain capacity.

2. **Annual Monitoring Report**: The Discharger shall submit an Annual Monitoring Report to the Central Valley Water Board by 1 February covering the reporting period of the previous monitoring year. If desired, the Annual Monitoring Report may be combined with the second semiannual report, but if so, shall clearly state that it is both a semi-annual and annual monitoring report in its title. Each Annual Monitoring Report shall contain the following additional information beyond what is required for semiannual monitoring reports:
a) All monitoring parameters shall be graphed to show historical trends at each monitoring point and background monitoring point, for all samples taken within at least the previous five calendar years. Each such graph shall plot the concentration of one or more constituents for the period of record for a given monitoring point or background monitoring point, at a scale appropriate to show trends or variations in water quality. The graphs shall plot each datum, rather than plotting mean values. Graphical analysis of monitoring data may be used to provide significant evidence of a release.

b) An evaluation of the monitoring parameters with regards to the cation/anion balance, and a graphical presentation using a Stiff diagram, a Piper graph, or a Schoeller plot.

c) All historical monitoring data for which there are detectable results, including data for the previous year, shall be submitted in tabular form in a digital file format such as a computer disk. The Central Valley Water Board regards the submittal of data in hard copy and in digital format as “...the form necessary for...” statistical analysis [Title 27, section 20420(h)], that facilitates periodic review by the Central Valley Water Board.

Comments on Section c above
The historical record for the site goes back to at least the 1990s. The earliest data, if available, is only compiled in hard copy. Simplot can readily provide complete monitoring data from 2007 onwards for all media. Suggest the first sentence be revised to: All historical monitoring data, from at least 2007 onwards, for which there are detectable results, including data for the previous year, shall be submitted in tabular form in a digital file format such as a computer disk.

d) Hydrographs of each well showing the elevation of groundwater with respect to the elevations of the top and bottom of the screened interval and the elevation of the pump intake. Hydrographs of each well shall be prepared quarterly and submitted annually.

e) A comprehensive discussion of the compliance record, and the result of any corrective actions taken or planned which may be needed to bring the Discharger into full compliance with the waste discharge requirements.

f) A written summary of the monitoring results, indicating any changes made or observed since the previous Annual Monitoring Report.

g) The results of the annual testing of the LCRS.

h) Updated concentration limits for each monitoring parameter at each monitoring well based on the new background data set.

i) A comprehensive discussion of any Corrective Action Program required by this MRP under Section A.8 including a discussion of long-term trends in the concentrations of the pollutants in the groundwater monitoring wells and an analysis of whether the pollutants are being effectively treated.
3. **Annual Facility Inspection Reporting**: By 15 November of each year, the Discharger shall submit a report describing the results of the inspection and the repair measures implemented, preparations for winter, and include photographs of any problem areas and the repairs. Refer to Section A.7.a of this MRP, above. As described above date should be moved so the report is combined with the annual.

   **Comments on Section 3 above**
   
   Report due date should be aligned with annual reporting date (1 February).

4. **Major Storm Event Reporting**: The Discharger shall notify Central Valley Water Board staff within 24 hours after a storm event of greater than two inches in 24 hours as to the status of freeboard in any Class II surface impoundment. The Discharger shall also notify Central Valley Water Board staff within 7 days after major storm events of any damage or significant erosion and report any needed repairs within 14 days of completion of the repairs, including photographs of the problem and the repairs. Refer to Section A.7.b of this MRP above for requirements for performing the inspection and conducting the repairs.

   **Comments on Section 4 above**
   
   The 24 hour notification required for larger storm events could be difficult to achieve, especially if the precipitation event occurs on the weekend or during a holiday. It is also unnecessary as any filling of the ponds beyond specified maximum levels is a violation of the WDRs and must be reported as specified in the standard provisions (quoted below). "In the event the Discharger does not comply or will be unable to comply with any prohibition or limitation of this Order for any reason, the Discharger shall notify the appropriate Central Valley Water Board office by telephone as soon as it or its agents have knowledge of such noncompliance or potential for noncompliance, and shall confirm this notification in writing within two weeks." As such, the first sentences of the provision should be deleted and the second sentence should read:

   **Major Storm Event Reporting**: The Discharger shall report any damage or significant erosion after major storm events in the annual monitoring report and report any needed repairs. Reporting shall include date of completion of the repairs and photographs of the problem and the repairs.

1. **Financial Assurances Report**: By 1 June of each year, the Discharger shall submit a report to the Central Valley Water Board that reports the balance of all the closure, post-closure maintenance and corrective action funds or the amounts of the Guarantees and the adjustments to account for inflation in accordance with
Title 27 Section 22236. Refer to Financial Assurances Specifications G.1 through G.5 of the WDRs.

C. WATER QUALITY PROTECTION STANDARD AND COMPLIANCE PERIOD

1. Water Quality Protection Standard Report

For each waste management unit, the Water Quality Protection Standard (WQPS) shall consist of all COCs, the concentration limit for each constituent of concern, the verification retesting procedure to confirm measurably significant evidence of a release, the point of compliance, and all water quality monitoring points for each monitored medium. Program specific WQPS shall be developed for facilities conducting a detection monitoring program in conjunction with a corrective action program.

The Water Quality Protection Standard for naturally occurring waste constituents consists of the COCs, the concentration limits, and the point of compliance and all monitoring points. Any proposed changes to the Water Quality Protection Standard other than annual update of the concentration limits shall be submitted in a report for review and approval.

The report shall:

a. Identify all distinct bodies of surface and ground water that could be affected in the event of a release from a waste management unit or portion of a unit. This list shall include at least the uppermost aquifer and any permanent or ephemeral zones of perched groundwater underlying the facility.

b. Include a map showing the monitoring points and background monitoring points for the surface water monitoring program, groundwater monitoring program, and the unsaturated zone monitoring program. The map shall include the point of compliance in accordance with Title 27, section 20405.

c. Evaluate the perennial direction(s) of groundwater movement within the uppermost groundwater zone(s).

d. Include a proposed statistical method for calculating concentration limits for monitoring parameters and constituents of concern that are detected in 10% or greater of the background data (naturally-occurring constituents) using a statistical procedure from Title 27, section 20415(e)(8)(A-D)] or section 20415(e)(8)(E).
e. Include a retesting procedure to confirm or deny measurably significant evidence of a release pursuant to Title 27, section 20415(e)(8)(E) and section 20420(j)(1-3).

The Water Quality Protection Standard shall be certified by a California-registered civil engineer or geologist as meeting the requirements of Title 27. If subsequent sampling of the background monitoring point(s) indicates significant water quality changes due to either seasonal fluctuations or other reasons unrelated to waste management activities at the site, the Discharger may request modification of the Water Quality Protection Standard.

The Discharger proposed the methods for calculating concentration limits in the April 2003 Water Quality Protection Standard Report. The limits are calculated using Interwell prediction limits at 95% confidence and 95% coverage based on background data from background monitoring well LP-7.

The Water Quality Protection Standard shall be updated annually for each monitoring well using new and historical monitoring data.

2. Monitoring Parameters

Monitoring parameters are a select group of constituents that are monitored during each monitoring event that are the waste constituents, reaction products, hazardous constituents, and physical parameters that provide a reliable indication of a release from a waste management unit. The monitoring parameters for all waste management units are those listed in the tables in Section A of this MRP specified monitored medium.

3. Concentration Limits

For a naturally occurring constituent of concern, the concentration limit for each constituent of concern shall be determined as follows:

a. By calculation in accordance with a statistical method pursuant to Title 27, section 20415(e)(8); or

b. By an alternate statistical method meeting the requirements of Title 27, section 20415(e)(8)(E).

The methods for calculating concentration limits were included in the April 2003 Water Quality Protection Standard Report. The Discharger proposed combination of parametric statistical data analysis for constituents with sufficient analytical data and non-statistical methods for constituents with insufficient analytical data at that time, to calculate concentration limits for each monitored constituent in accordance with Title 27. The statistical method used Interwell prediction limits at 95% confidence and 95% coverage based on background
data from background monitoring well LP-7. The Discharger shall submit an updated WQPS incorporating detection monitoring system in conjunction with a corrective action monitoring program, and additional analytical results from existing detection monitoring program, as described in Provision I.7.E. of the WDRs.

The Discharger has been using concentration limits set in MRP R5-2008-0838 for the COCs and reported in the semiannual monitoring reports. This MRP uses the same concentration limits set in MRP R5-2008-0838 until the Central Valley Water Board review and approve the updated WQPS to be submitted per WDR Provision I.7.E. The concentration limits for the COCs are tabulated in the Table 7 below.

**TABLE 7. CONSTITUENTS OF CONCERN, ANALYTICAL METHODS, AND CONCENTRATION LIMITS**

4. Retesting Procedures for Confirming Evidence of a Release

If monitoring results indicate measurably significant evidence of a release, as described in Standard Monitoring Specification I.43 of the SPRRs, then:

a. For analytes that are detected in less than 10% of the background samples (such as non-naturally occurring constituents), the Discharger shall use the non-statistical retesting procedure required in Standard Monitoring Specification I.44 of the SPRRs.

b. For analytes that are detected in 10% or greater of the background samples (naturally occurring constituents), the Discharger shall use one of the statistical retesting procedure as required in Standard Monitoring Specification I.45 of the SPRRs.

5. Point of Compliance

The point of compliance for the water standard at each waste management unit is a vertical surface located at the hydraulically downgradient limit of the Unit that extends through the uppermost aquifer underlying the unit. The following are monitoring locations at the point of compliance:

<table>
<thead>
<tr>
<th>Cell or Module</th>

<td>Shallow</td>
</tr>
<tr>
<td>West Pond</td>
<td>LP-1</td>
<td>Shallow</td>
</tr>
</tbody>
</table>

6. Compliance Period

The compliance period for each waste management unit shall be the number of years equal to the active life of the unit plus the closure period. The compliance period is the minimum period during which the Discharger shall conduct a water quality monitoring program subsequent to a release from the waste management unit. The compliance period shall begin anew each time the Discharger initiates an evaluation monitoring program [Title 27, section 20410].

7. Monitoring Points

A monitoring point is a well, device, or location specified in the waste discharge requirements, which monitoring is conducted and at which the water quality
The monitoring points for each monitored medium are listed in Section A of this MRP.

D. **TRANSMITTAL LETTER FOR ALL REPORTS**

A transmittal letter explaining the essential points shall accompany each report. At a minimum, the transmittal letter shall identify any violations found since the last report was submitted, and if the violations were corrected. If no violations have occurred since the last submittal, this shall be stated in the transmittal letter. The transmittal letter shall also state that a discussion of any violations found since the last report was submitted, and a description of the actions taken or planned for correcting those violations, including any references to previously submitted time schedules, is contained in the accompanying report. The transmittal letter shall contain a statement by the discharger, or the discharger's authorized agent, under penalty of perjury, that to the best of the signer's knowledge the report is true, accurate, and complete.

The Discharger shall implement the above monitoring program on the effective date of this Program.

A. APPLICABILITY

1. These Standard Provisions and Reporting Requirements (SPRRs) are applicable to Class II surface impoundments, waste piles, and land treatment units that are regulated by the Central Valley Regional Water Quality Control Board (hereafter, Central Valley Water Board) pursuant to the provisions of California Code of Regulations, title 27 (“Title 27”), section 20005 et seq.

2. “Order,” as used throughout this document, means the Waste Discharge Requirements (WDRs) to which these SPRRs are incorporated.

3. The requirements prescribed herein do not authorize the commission of any act causing injury to the property of another, and do not protect the Discharger from liabilities under federal, state, or local laws. This Order does not convey any property rights or exclusive privileges.

4. The provisions of this Order are severable. If any provision of this Order is held invalid, the remainder of this Order shall not be affected.

5. If there is any conflicting or contradictory language between the WDRs, the Monitoring and Reporting Program (MRP), or the SPRRs, then language in the WDRs shall govern over either the MRP or the SPRRs, and language in the MRP shall govern over the SPRRs.

6. If there is a site-specific need to change a requirement in these SPRRs for a particular facility, the altered requirement shall be placed in the appropriate section of the WDRs and will supersede the corresponding SPRRs requirement. These SPRRs are standard and cannot be changed as part of the permit writing process or in response to comments, but they will be periodically updated on an as-needed basis.

7. Unless otherwise stated, all terms are as defined in Water Code section 13050 and in Title 27, section 20164.

B. TERMS AND CONDITIONS

1. Failure to comply with any waste discharge requirement, monitoring and reporting requirement, or Standard Provisions and Reporting Requirement, or other order or prohibition issued, reissued, or amended by the Central Valley Water Board or the State Water Board, or intentionally or negligently discharging waste, or causing or permitting waste to be deposited where it is discharged into the waters of the state and creates a condition of pollution or nuisance, is a violation of this Order and the Water Code, which can result in the imposition of civil monetary liability [Wat. Code, § 13350(a)]

2. After notice and opportunity for a hearing, this Order may be terminated or modified for cause, including, but not limited to [Wat. Code, § 13381]:
a. Violation of any term or condition contained in this Order;

b. Obtaining this Order by misrepresentation, or failure to disclose fully all relevant facts;

c. A change in any condition that results in either a temporary or permanent need to reduce or eliminate the authorized discharge; or

d. A material change in the character, location, or volume of discharge.

3. Before initiating a new discharge or making a material change in the character, location, or volume of an existing discharge, the Discharger shall file a new report of waste discharge (ROWD), or other appropriate joint technical document (JTD), with the Central Valley Water Board [Wat. Code, § 13260(c) and § 13264(a)]. A material change includes, but is not limited to, the following:

a. An increase in area or depth to be used for solid waste disposal beyond that specified in waste discharge requirements;

b. A significant change in disposal method, location, or volume (e.g., change from land disposal to land treatment);

c. A change in the type of waste being accepted for disposal; or

d. A change to previously-approved liner systems or final cover systems that would eliminate components or reduce the engineering properties of components.

4. Representatives of the Central Valley Water Board may inspect the facilities to ascertain compliance with the waste discharge requirements. The inspection shall be made with the consent of the owner or possessor of the facilities or, if the consent is refused, with a duly issued warrant. However, in the event of an emergency affecting the public health or safety, an inspection may be made without consent or the issuance of a warrant [Wat. Code, §13267(c)].

5. The Central Valley Water Board will review this Order periodically and will revise these waste discharge requirements when necessary [Wat. Code, § 13263(e) and Title 27, § 21720(b)].

6. Except for material determined to be confidential in accordance with California law and regulations, all reports prepared in accordance with terms of this Order shall be available for public inspection at the offices of the Central Valley Water Board [Wat. Code, § 13267(b)]. Data on waste discharges, water quality, geology, and hydrogeology shall not be considered confidential.

7. A discharge of waste into the waters of the state is a privilege, not a right. No discharge of waste into waters of the state, whether or not the discharge is
made pursuant to waste discharge requirements, shall create a vested right to continue the discharge [Wat. Code, § 13263(g)].

8. Technical and monitoring reports specified in this Order are requested pursuant to the Water Code [§13267(b)]. Failure to furnish the reports by the specified deadlines or falsifying information in the reports, are misdemeanors that may be liable civilly in accordance with §13268(b) of the Water Code [Wat. Code, §13268(a)].

C. STANDARD PROHIBITIONS

1. The discharge of wastes which have the potential to reduce or impair the integrity of containment structures or which, if commingled with other wastes in the waste management unit, could produce violent reaction, heat or pressure, fire or explosion, toxic by-products, or reaction products, which, in turn:
   a. require a higher level of containment than provided by the unit; or
   b. are ‘restricted wastes’; or
   c. impair the integrity of containment structures;

   is prohibited [Title 27, § 20200(b)].

2. The discharge of wastes outside of a waste management unit or portions of a unit specifically designed for their containment is prohibited.

3. The discharge of waste to a closed waste management unit is prohibited.

4. The discharge of waste constituents to the unsaturated zone or to groundwater is prohibited, except within the treatment zone at a land treatment unit.

5. The discharge of solid or liquid waste or leachate to surface waters, surface water drainage courses, or groundwater is prohibited.

D. STANDARD DISCHARGE SPECIFICATIONS

1. The Discharger is responsible for accurate characterization of wastes, including a determination of whether or not wastes will be compatible with containment features and other wastes at the waste management unit and whether or not the wastes are required to be managed as a hazardous waste [Title 27, § 20200(c)] or designated waste [Title 27, § 20210].

2. Leachate collected from a waste management unit shall be discharged to the unit from which it came, or discharged to an appropriate waste management unit in accordance with Title 27 and in a manner consistent with the waste classification of the liquid [Title 27, § 20200(d) and § 20340(g)].
3. Wastes shall be discharged only into waste management units specifically designed for their containment and/or treatment, as described in this Order.

4. The discharge shall remain within the designated disposal area at all times.

5. The discharge of waste shall not cause a nuisance condition [Wat. Code, § 13050(m)].

E. STANDARD FACILITY SPECIFICATIONS

1. All waste management units shall be designed, constructed, and operated to ensure that wastes, including leachate, will be a minimum of 5 feet above the highest anticipated elevation of underlying groundwater [Title 27, § 20240(c)], including the capillary fringe.

2. Surface and subsurface drainage from outside of a waste management unit shall be diverted from the unit [Title 27, § 20365(e)].

3. The Discharger shall immediately notify the Central Valley Water Board staff of any slope failure occurring at a waste management unit. Any failure which threatens the integrity of containment features or the waste management unit shall be promptly corrected in accordance with an approved method [Title 27, § 21710(c)(2)].

4. The Discharger shall immediately notify Central Valley Water Board staff of any flooding, unpermitted discharge of waste off-site or outside of waste management units, equipment failure, or other change in site conditions which could impair the integrity of waste or leachate containment facilities or precipitation and drainage control structures.

5. The Discharger shall maintain in good working order any facility, control system, or monitoring device installed to achieve compliance with the waste discharge requirements.

6. The Discharger shall lock all groundwater monitoring wells with a lock on the well cap or monitoring well box. All monitoring devices shall be clearly labeled with their designation including all monitoring wells, LCRS risers, and lysimeter risers and shall be easily accessible for required monitoring by authorized personnel. Each monitoring device shall be clearly visible and be protected from damage by equipment or vehicles.

7. The Discharger shall maintain the depth of the fluid in the sump of each waste management unit at the minimum needed for efficient pump operation (the depth at which the pump turns on given the pump intake height and maximum pump cycle frequency).
8. Each LCRS shall be tested at least annually to demonstrate proper operation. The results of the tests shall be compared with earlier tests made under comparable conditions [Title 27, § 20340(d)].

9. The Discharger shall maintain a Storm Water Pollution Prevention Plan and Monitoring Program and Reporting Requirements in accordance with State Water Board Order No. 2014-0057-DWQ (or most recent general industrial storm water permit), or retain all storm water on-site.

F. STANDARD CONSTRUCTION SPECIFICATIONS

1. The Discharger shall submit for review and approval at least 90 days prior to proposed construction, design plans and specifications for new Class II waste management units that include the following:

   a. Detailed construction drawings showing all required liner system components, the LCRS, leachate sump, unsaturated zone monitoring system, and access to the LCRS for required annual testing.

   b. A Construction Quality Assurance (CQA) Plan prepared by a California-registered civil engineer or certified engineering geologist, and that meets the requirements of Title 27, section 20324.

   c. A geotechnical evaluation of the area soils, evaluating their use as the base layer or reference to the location of this information in the ROWD/JTD [Title 27, § 21750(f)(4)].

   d. Information about the seismic design of the proposed new waste management unit (or reference to the location of this information in the ROWD/JTD) in accordance with Title 27, section 20370.

   e. A revised water quality monitoring plan for groundwater detection monitoring (or information showing the existing plan is adequate) in accordance with Title 27, section 20415.

   f. An Operation Plan (or reference to the location of this information in the ROWD/JTD) meeting the requirements of Title 27, sections 21760(b) and 20375(b).

2. All containment structures shall be designed by, and construction shall be supervised by, a California registered civil engineer or a certified engineering geologist, and shall be certified by that individual as meeting the prescriptive standards, or approved engineered alternative design, in accordance with this Order prior to waste discharge.

3. The Discharger shall not proceed with construction until the construction plans, specifications, and all applicable construction quality assurance plans have
been approved. Waste management units shall receive a final inspection and approval of the construction by Central Valley Water Board staff before use of the unit commences [Title 27, § 20310(e)].

4. Any report, or any amendment or revision of a report, that proposes a design or design change that might affect a waste management unit’s containment features or monitoring systems shall be approved by a California registered civil engineer or a certified engineering geologist [Title 27, § 21710(d)].

5. Materials used in containment structures shall have appropriate chemical and physical properties to ensure that such structures do not fail to contain waste because of pressure gradients, physical contact with waste or leachate, chemical reactions with soil or rock, climatic conditions, the stress of installation, or because of the stress of daily operations [Title 27, § 20320(a)].

6. Waste management units and their respective containment structures shall be designed and constructed to limit, to the greatest extent possible, ponding, infiltration, inundation, erosion, slope failure, washout, and overtopping [Title 27, § 20365(a)].

7. The Discharger shall design storm water conveyance systems for Class II units for a 1,000-year, 24-hour storm event [Title 27, § 21750(e)(3)].

8. All Class II waste management units shall be designed to withstand maximum credible earthquake without damage to the foundation or to the structures that control leachate, or surface drainage, or erosion [Title 27, § 20370(a)].

9. The Discharger shall perform stability analyses that include components to demonstrate the integrity of the waste management unit foundation, final slopes, and containment systems under both static and dynamic conditions throughout the life of the unit [Title 27, § 21750(f)(5)].

10. New Class II Units, other than LTUs and expansions of existing Class II units, shall have a 200 foot setback from any known Holocene fault. [Title 27, § 20250(d)].

11. Liners shall be designed and constructed to contain the fluid, including waste, and leachate [Title 27, § 20330(a)].

12. Hydraulic conductivities shall be determined primarily by appropriate field test methods in accordance with accepted civil engineering practice. The results of laboratory tests with both water and leachate, and field tests with water, shall be compared to evaluate how the field permeabilities will be affected by leachate. It is acceptable for the Discharger to use appropriate compaction tests in conjunction with laboratory hydraulic conductivity tests to determine field permeabilities as long as a reasonable number of field hydraulic conductivity tests are also conducted [Title 27, § 20320(c)].
13. Hydraulic conductivities specified for containment structures other than the final cover shall be relative to the fluids (leachate) to be contained. Hydraulic conductivities for the final cover shall be relative to water [Title 27, § 20320(b)].

14. A test pad for each barrier layer and any final cover shall be constructed in a manner duplicating the field construction. Test pad construction methods, with the designated equipment, shall be used to determine if the specified density/moisture-content/hydraulic conductivity relationships determined in the laboratory can be achieved in the field with the compaction equipment to be used and at the specified lift thickness [Title 27, § 20324(g)(1)(A)].

15. The Discharger shall ensure proper preparation of the subgrade for any liner system that includes a GCL so as to provide a smooth surface that is free from rocks, sticks, or other debris that could damage or otherwise limit the performance of the GCL.

16. The Discharger shall propose an electronic leak location survey of the top liner for any new waste management unit in the construction quality assurance plan unless the Discharger demonstrates that a leak location survey is not needed.

17. Leachate collection and removal systems are required for Class II surface impoundments [Title 27, § 20340(a)].

18. The LCRS shall be designed, constructed, maintained, and operated to collect and remove twice the maximum anticipated daily volume of leachate from the waste management unit [Title 27, § 20340(b)].

19. Leachate collection and removal systems shall be designed and operated to function without clogging through the life of the waste management unit.

20. The leachate sump, leachate removal pump, and pump controls shall be designed and set to maintain a fluid depth no greater than the minimum needed for efficient pump operation [Title 27, § 20340(c)].

21. All construction of liner systems and final cover systems shall be performed in accordance with a Construction Quality Assurance Plan certified by a registered civil engineer or a certified engineering geologist [Title 27, § 20323].

22. The Construction Quality Assurance program shall be supervised by a registered civil engineer or a certified engineering geologist who shall be designated the CQA officer [Title 27, § 20324(b)(2)].

23. The Discharger shall ensure that a third party independent of both the Discharger and the construction contractor performs all of the construction quality assurance monitoring and testing during the construction of a liner system.
24. The Discharger shall notify Central Valley Water Board staff at least 14 days prior to commencing field construction activities including construction of a new Class II waste management unit, construction of a final cover (for units closed as a landfill), or any other construction that requires Central Valley Water Board staff approval under this Order.

25. The Discharger shall submit for review and approval at least 60 days prior to proposed discharge, final documentation required in Title 27 Section 20324(d)(1)(C) following the completion of construction of a new Class II waste management unit. The report shall be certified by a registered civil engineer or a certified engineering geologist and include a statement that the liner system was constructed in accordance with the approved design plans and specifications, the CQA Plan, the requirements of the WDRs, and that it meets the performance goals of Title 27. The report shall contain sufficient information and test results to verify that construction was in accordance with the design plans and specifications, the construction quality assurance plan, and the performance goals of Title 27.

26. The Discharger shall not discharge waste onto a newly constructed liner system until the final documentation report has been reviewed and an acceptance letter has been received.

G. STANDARD CLOSURE AND POST-CLOSURE SPECIFICATIONS

1. The final closure and post-closure maintenance plan for the waste management unit shall include at least the following: an itemized cost analysis, closure schedule, any proposed final treatment procedures, map, changes to the unit description presented in the most recent ROWD, future land use, and a construction quality assurance plan [Title 27, § 21769(c) & (d)].

2. Closure of each waste management unit shall be under the direct supervision of a registered civil engineer or certified engineering geologist [Title 27, § 20950(b)].

3. The final cover of waste management units closed as a landfill shall be designed, graded, and maintained to prevent ponding and soil erosion due to high run-off velocities [Title 27, § 21090(b)(1)(A)].

4. The final grading design shall be designed and approved by a registered civil engineer or certified engineering geologist [Title 27, § 21090(b)(1)(C)].

5. All final cover designs shall include a minimum 1-foot thick erosion resistant vegetative layer or a mechanically erosion-resistant layer [Title 27, § 21090(a)(3)(A)(1 & 2)].
6. Areas with slopes greater than ten percent, surface drainage courses, and areas subject to erosion by wind or water shall be designed and constructed to prevent such erosion [Title 27, § 21090(b)(2)].

7. The Discharger shall design storm water conveyance systems for Class II units that are closed as a landfill for a 1,000-year, 24-hour storm event [Title 27, § 21750(e)(3)].

8. Construction or repair of a final cover system’s low-hydraulic conductivity layer is to be carried out in accordance with an approved construction quality assurance plan [Title 27, § 21090(b)(1)(E)].

9. Within 30 days of completion of all closure activities, the Discharger shall certify that all closure activities were performed in accordance with the most recently approved final closure plan and CQA Plan, and in accordance with all applicable regulations. The Discharger shall also certify that units that are closed as a landfill shall be maintained in accordance with an approved post-closure maintenance plan [Title 27, § 21710(c)(6)].

10. The post-closure maintenance period for units closed as a landfill shall continue until the Central Valley Water Board determines that wastes remaining in the landfill unit(s) no longer pose a threat to water quality [Title 27, § 20950(a)(1)].

11. The Discharger shall periodically inspect and identify problems with the final cover including areas that require replanting, erosion, areas lacking free drainage, and any areas damaged by equipment operations [Title 27, § 21090(a)(4)(B)].

12. The Discharger shall repair any cover promptly in accordance with a cover repair plan to be included in the final post-closure maintenance plan [Title 27, § 21090(a)(4)(C)].

H. STANDARD FINANCIAL ASSURANCE PROVISIONS

1. The Discharger shall establish an irrevocable fund (or provide other means) for closure to ensure closure of each Class II unit in accordance with an approved closure plan [Title 27, § 20950(f) and § 22207(a)].

2. The Discharger shall obtain and maintain assurances of financial responsibility for initiating and completing corrective action for all known and reasonably foreseeable releases from the waste management unit [Title 27, §20380(b) and § 22222].

I. STANDARD MONITORING SPECIFICATIONS

1. The water quality monitoring program shall include appropriate and consistent sampling and analytical procedures and methods designed to ensure that
monitoring results provide a reliable indication of water quality at all monitoring points and background monitoring points [Title 27, § 20415(e)(4)].

2. All monitoring systems shall be designed and certified by a registered geologist or a registered civil engineer [Title 27, § 20415(e)(1)].

3. All monitoring wells shall be cased and constructed in a manner that maintains the integrity of the monitoring well bore hole and prevents the bore hole from acting as a conduit for contaminant transport [Title 27, § 20415(b)(4)(A)].

4. All sample chemical analyses of any material shall be performed by a laboratory certified by the California Department of Health Services [Wat. Code, § 13176(a)].

5. A Detection Monitoring Program for a new Class II waste management unit shall be installed, operational, and one year of monitoring data collected from background monitoring points prior to the discharge of wastes [Title 27, § 20415(e)(6)].

6. Background for water samples shall be represented by the data from all samples taken from applicable background monitoring points during that reporting period (at least one sample from each background monitoring point).

7. The Discharger shall submit for approval, establish, and maintain an approved Sample Collection and Analysis Plan. The Sample Collection and Analysis Plan shall at a minimum include:

   a. Sample collection procedures describing purging techniques, sampling equipment, and decontamination of sampling equipment;

   b. Sample preservation information and shipment procedures;

   c. Sample analytical methods and procedures;

   d. Sample quality assurance/quality control (QA/QC) procedures;

   e. Chain of Custody control; and

   f. Sample analysis information including sample preparation techniques to avoid matrix interferences, method detection limits (MDLs), practical quantitation limits (PQLs) and reporting limits (RLs), and procedures for reporting trace results between the MDL and PQL.

If required by the Executive Officer, the Discharger shall modify the Sample Collection and Analysis Plan to conform with this Order.
8. For any given monitored medium, the samples taken from all monitoring points and background monitoring points to satisfy the data analysis requirements for a given reporting period shall all be taken within a span not to exceed 30 days, unless a longer time period is approved, and shall be taken in a manner that ensures sample independence to the greatest extent feasible. Specific methods of collection and analysis must be identified. Sample collection, storage, and analysis shall be performed according to the most recent version of USEPA Methods, such as the latest editions, as applicable, of: (1) Methods for the Analysis of Organics in Water and Wastewater (USEPA 600 Series), (2) Test Methods for Evaluating Solid Waste (SW-846, latest edition), and (3) Methods for Chemical Analysis of Water and Wastes (USEPA 600/4-79-020), and in accordance with the approved Sample Collection and Analysis Plan. Appropriate sample preparation techniques shall be used to minimize matrix interferences.

9. If methods other than USEPA-approved methods or Standard Methods are used, or there is a proposed alternant USEPA method than the one listed in the MRP, the proposed methodology shall be submitted for review and approval prior to use, including information showing its equivalence to the required method.

10. The methods of analysis and the detection limits used must be appropriate for the expected concentrations. For the monitoring of any constituent or parameter that is found in concentrations which produce more than 90% non-numerical determinations (i.e., “trace” or “ND”) in data from background monitoring points for that medium, the analytical method having the lowest MDL shall be selected from among those methods which would provide valid results in light of any matrix effects or interferences.

11. The laboratory reporting limit (RL) for all reported monitoring data shall be set no greater than the practical quantitation limit (PQL).

12. "Trace" results - results falling between the MDL and the PQL - shall be reported as such, and shall be accompanied both by the estimated MDL and PQL values for that analytical run.

13. Laboratory data shall not be altered or revised by the Discharger. If the Discharger observes potential lab errors, it shall identify the issue in the monitoring report and shall describe steps that will be taken to prevent similar errors in the future.

14. MDLs and PQLs shall be derived by the laboratory for each analytical procedure, according to State of California laboratory accreditation procedures. These MDLs and PQLs shall reflect the detection and quantitation capabilities of the specific analytical procedure and equipment used by the lab, rather than simply being quoted from USEPA analytical method manuals. In relatively
interference-free water, laboratory-derived MDLs and PQLs are expected to closely agree with published USEPA MDLs and PQLs. MDLs and PQLs shall be reported.

15. If the laboratory suspects that, due to a change in matrix or other effects, the true detection limit or quantitation limit for a particular analytical run differs significantly from the laboratory-derived MDL/PQL values, the results shall be flagged in the laboratory report accordingly, along with estimates of the detection limit and quantitation limit actually achieved. The **MDL shall always be calculated such that it represents the lowest achievable concentration associated with a 99% reliability of a nonzero result.** The PQL shall always be calculated such that it represents the lowest constituent concentration at which a numerical value can be assigned with reasonable certainty that it represents the constituent’s actual concentration in the sample. Normally, PQLs should be set equal to the concentration of the lowest standard used to calibrate the analytical procedure.

16. All **QA/QC data** shall be reported, along with the sample results to which they apply, including the method, equipment, analytical detection and quantitation limits, the percent recovery, an explanation for any recovery that falls outside the QC limits, the results of equipment and method blanks, the results of spiked and surrogate samples, the frequency of quality control analysis, and the name and signature of a responsible person from the laboratory. **Sample results shall be reported unadjusted for blank results or spike recoveries.** In cases where contaminants are detected in QA/QC samples (i.e., field, trip, or lab blanks), the accompanying sample results shall be appropriately flagged, but the analytical results shall not be adjusted.

17. Unknown chromatographic peaks shall be reported, flagged, and tracked for potential comparison to subsequent unknown peaks that may be observed in future sampling events. Identification of unknown chromatographic peaks that recur in subsequent sampling events may be required.

18. The sampling interval of each monitoring well shall be appropriately screened and fitted with an appropriate filter pack to enable collection of representative groundwater samples [Title 27, § 20415(b)(4)(B)].

19. All borings are to be logged during drilling under the direct supervision of a registered geologist or registered civil engineer with expertise in stratigraphic well logging [Title 27, § 20415(e)(2)].

20. Soils are to be described according to the Unified Soil Classification System [Title 27, § 20415(e)(2)(A)]. Rock is to be described in a manner appropriate for the purpose of the investigation [Title 27, § 20415(e)(2)(B)].
21. The Discharger shall submit a work plan for review and approval at least **60 days** prior to installation or abandonment of groundwater monitoring wells.

22. The Discharger shall provide Central Valley Water Board staff a minimum of **one week** notification prior to commencing any field activities related to the installation or abandonment of monitoring devices.

23. The water quality protection standard shall consist of the constituents of concern (COC), concentration limits, and the point of compliance. The water quality protection standard shall apply during the active life of the waste management unit, closure period, post-closure maintenance period, and any compliance period under Title 27, section 20410 [Title 27, § 20390].

24. The point of compliance at which the water quality protection standard applies is a vertical surface located at the hydraulically downgradient limit of the waste management unit that extends through the uppermost aquifer underlying the unit [Title 27, § 20405].

25. The compliance period is the minimum period of time during which the Discharger shall conduct a water quality monitoring program and is the number of years equal to the active life of the waste management unit plus the closure period [Title 27, § 20410(a)].

26. The groundwater monitoring system shall include a sufficient number of monitoring points, installed at appropriate locations, to yield groundwater samples from the uppermost aquifer that represent the quality of groundwater that has not been affected by a release from the waste management unit [Title 27, § 20415(b)(1)(A)].

27. The Detection Monitoring Program shall include a sufficient number of monitoring points, installed at appropriate locations and depths to yield groundwater samples from the uppermost aquifer that represent the quality of groundwater passing the point of compliance to allow the detection of a release from the waste management unit [Title 27, § 20415(b)(1)(B)1].

28. Additional monitoring points shall be added as necessary to provide the best assurance of the **earliest possible detection** of a release from the waste management unit [Title 27, § 20415(b)(1)(B)2].

29. The Detection Monitoring Program shall also include a sufficient number of monitoring points installed at appropriate depths and locations to yield groundwater samples from other aquifers or perched zones not already monitored to provide the **earliest possible detection** of a release from the waste management unit [Title 27, § 20415(b)(1)(B)3. and 4., and §20420(b)].
30. A surface water monitoring system shall be established to monitor each surface water body that could be affected by a release from the waste management unit [Title 27, § 20415(c)].

31. An unsaturated zone monitoring system shall be established for each waste management unit [Title 27, § 20415(d)].

32. The Discharger shall notify Central Valley Water Board staff within **seven days** if fluid is detected in a previously dry LCRS, unsaturated zone monitoring system, or if a progressive increase is detected in the volume of fluid in a LCRS [Title 27, § 21710(c)(3)].

33. Driller's logs for all monitoring wells shall to be submitted to the Central Valley Water Board and the Department of Water Resources [Wat. Code, § 13751 and Title 27, § 20415(b)(3)].

34. Groundwater elevation, temperature, electrical conductivity, turbidity, and pH are to be accurately measured at each well each time groundwater is sampled [Title 27, § 20415(e)(13)].

35. The groundwater flow rate and direction in the uppermost aquifer and in any zones of perched water and in any additional portions of the zone of saturation being monitored shall be determined at least quarterly [Title 27, § 20415(e)(15)].

36. The Discharger shall graph all analytical data from each monitoring point and background monitoring point and shall submit the graphs to the Central Valley Water Board annually [Title 27, § 20415(e)(14)].

37. For each waste management unit, the Discharger shall collect all data necessary for selecting appropriate data analysis methods for establishing background values for each constituent of concern and for each monitoring parameter [Title 27, § 20420(c)]. The Discharger shall propose a data analysis method that includes a detailed description of the criteria to be used for determining “measurably significant” (as defined in Title 27, section 20164) evidence of a release from the waste management unit and determining compliance with the water quality protection standard [Title 27, § 20415(e)(6) and (7)].

38. For statistical analysis of data, the Discharger shall use one of the methods described in Title 27, section 20415(e)(8)(A)-(E). A non-statistical data analysis method can be used if the method can achieve the goal of the particular monitoring program at least as well as the most appropriate statistical method [Title 27, § 20415(e)(8)]. The Discharger shall use a statistical or nonstatistical data analysis method that complies with Title 27, section 20415(e)(7, 8, 9, and 10), to compare the concentration of each constituent of concern or monitoring parameter with its respective background concentration to determine whether
there has been a measurably significant evidence of a release from the waste management unit. For any given monitoring point at which a given constituent has already exhibited a measurably significant indication of a release at that monitoring point, the Discharger may propose to monitor the constituent, at that well, using a concentration-versus-time plot.

39. The Discharger may propose an alternate statistical method [to the methods listed under Title 27, section 20415(e)(8)(A-D)] in accordance with Title 27, section 20415(e)(8)(E), for review and approval.

40. The statistical method shall account for data below the practical quantitation limit (PQL) with one or more statistical procedures that are protective of human health and the environment. Any PQL validated pursuant to Title 27, section 20415(e)(7) that is used in the statistical method shall be the lowest concentration (or value) that can be reliably achieved within limits of precision and accuracy specified in the WDRs or an approved Sample Collection and Analysis Plan for routine laboratory operating conditions that are available to the facility. The Discharger’s technical report (Sample Collection and Analysis Plan and/or Water Quality Protection Standard Report), pursuant to Title 27, section 20415(e)(7), shall consider the PQLs listed in Appendix IX, Article 19 to Chapter 14 of Division 4.5 of Title 22, CCR, for guidance when specifying limits of precision and accuracy. For any given constituent monitored at a background or downgradient monitoring point, an indication that falls between the MDL and the PQL for that constituent (hereinafter called a “trace” detection) shall be identified and used in appropriate statistical or non-statistical tests. Nevertheless, for a statistical method that is compatible with the proportion of censored data (trace and ND indications) in the data set, the Discharger can use the laboratory’s concentration estimates in the trace range (if available) for statistical analysis, in order to increase the statistical power by decreasing the number of “ties”.

41. The water quality protection standard for organic compounds which are not naturally occurring and not detected in background groundwater samples shall be taken as the detection limit of the analytical method used (e.g., USEPA methods 8260 and 8270).

42. Alternate statistical procedures may be used for determining the significance of analytical results for common laboratory contaminants (i.e., methylene chloride, acetone, di(2-ethylhexyl)phthalate, and di-n-octyl phthalate) if part of an approved water quality protection standard. Nevertheless, analytical results involving detection of these analytes in any background or downgradient sample shall be reported and flagged for easy reference by Central Valley Water Board staff.

43. **Confirmation of Measurably Significant Evidence of a Release.** Whenever a constituent is detected at a detection monitoring point at a concentration that exceeds the concentration limit from the water quality protection standard, the
Discharger shall conduct verification sampling to confirm if the exceedance is due to a release or if it is a false-positive (unless previous monitoring has already confirmed a release for that constituent at that monitoring point). An exceedance of the concentration limit from the water quality protection standard is considered measurably significant evidence of a release that must be either confirmed or denied. There are two separate verification testing procedures:

a. Standard Monitoring Specification I.44 provides the procedure for analytes that are detected in less than 10% of the background samples such as non-naturally occurring constituents like volatile organic compounds; and

b. Standard Monitoring Specification I.45 provides the procedure for analytes that are detected in 10% or greater of the background samples such as naturally occurring constituents like chloride.

44. Verification Procedure for Analytes Detected in Less than 10% of Background Samples. The Discharger shall use the following non-statistical method for all analytes that are detected in less than 10% of the background samples. The non-statistical method shall be implemented as follows:

a. Initial Determination of Measurably Significant Evidence of a Release. Identify each analyte in the current detection monitoring point sample that exceeds either its respective MDL or PQL, and for which a release has not been previously confirmed. The Discharger shall conclude that the exceedance provides a preliminary indication of a release or a change in the nature or extent of the release, at that monitoring point, if either:

1) The data contains two or more analytes that equal or exceed their respective MDLs; or

2) The data contains one or more analyte that equals or exceeds its PQL.

b. Discrete Retest [Title 27, § 20415(e)(8)(E) and § 20420(j)(1-3)]:

1) In the event that the Discharger or Central Valley Water Board staff concludes (pursuant to paragraph I.44.a., above) that there is a preliminary indication of a release, then the Discharger shall immediately notify Central Valley Water Board staff by phone or e-mail and, within 30 days of such indication, shall collect two new (retest) samples from the monitoring point where the release is preliminarily indicated and analyze them for the constituents that caused the need for the retest.

2) Confirmation of a Release. As soon as the retest data are available, the Discharger shall conclude that measurably significant evidence of a release is confirmed if (not including the original sample) two or more
analytes equal or exceed their respective MDLs or if one or more analyte equals or exceeds its PQL. The Discharger shall then:

a) **Immedieately** verbally notify the Central Valley Water Board whether or not the retest confirmed measurably significant evidence of a release for the analyte at the monitoring point, and follow up with written notification submitted by certified mail **within seven days** of the verbal notification; and

b) Carry out the requirements of Section J, **RESPONSE TO A RELEASE** if a release has been confirmed.

c) Add any five-year analyte that is confirmed per this method to the monitoring parameter list such that it is monitored during each regular monitoring event.

45. **Verification Procedure for Analytes Detected in 10% or Greater of the Background Samples.** The Discharger shall use either a statistical or non-statistical method pursuant to Title 27, section 20415(e)(8)(E) for all analytes that are detected in 10% or greater of the background samples. The Discharger shall use one of the statistical methods required in Title 27, section 20415(e)(8)(E) unless another method has been proposed by the Discharger in a Water Quality Protection Standard Report (or equivalent report) and approved by the Central Valley Water Board in a Monitoring and Reporting Program pursuant to Title 27, section 20415(e)(8)(A-D) or section 20415(e)(8)(E). The method shall be implemented as follows:

a. **Initial Determination of Measurably Significant Evidence of a Release.** The Discharger shall compare the value reported by the laboratory for each analyte to the statistically-derived concentration limit from the most recent report (Annual Monitoring Report or Water Quality Protection Standard Report) that uses the approved statistical procedure. If the value exceeds the concentration limit for that constituent, the Discharger shall conclude that there in measurably significant evidence of a release [Title 27, § 20420(i)].

b. **Retest Method** [Title 27, § 20415(e)(8)(E) and § 20420(j)(1-3)].

1) In the event that the Discharger or Central Valley Water Board staff concludes (pursuant to paragraph I.45.a., above) that there is a preliminary indication of a release, then the Discharger shall **immediately** notify Central Valley Water Board staff by phone or e-mail and, within **30 days** [Title 27, § 20415(e)(8)(E)(3)] of such indication, the Discharger shall implement a verification procedure/retest option, in accordance with Title 27, sections 20415(e)(8)(E) and 20420(j)(2). The verification procedure shall include either a single “composite” retest (i.e., a statistical analysis that augments and reanalyzes the data from the monitoring point that indicated a release) or shall consist of at least two “discrete” retests
(i.e., statistical analyses each of which analyzes only newly-acquired data from the monitoring point that indicated a release) [Title 27, § 20415(e)(8)(E)]. The Discharger may use an alternate method previously approved by the Central Valley Water Board and included in the Monitoring and Reporting Program. The verification procedure shall comply with the requirements of Title 27, section 20415(e)(8)(E) in addition to the performance standards of Title 27, section 20415(e)(9). The retest samples shall be collected from the monitoring point where the release is preliminarily indicated and shall be analyzed for the constituents that caused the need for the retest. For any indicated monitoring parameter or constituent of concern, if the retest results of one or more of the retest data suites confirm the original indication, the Discharger shall conclude that measurably significant evidence of a release has been confirmed.

2) **Confirmation of a Release.** As soon as the retest data are available, the Discharger shall evaluate the results pursuant to paragraph I.45.b.1, above and shall:

a) **Immediately** verbally notify the Central Valley Water Board whether or not the retest confirmed measurably significant evidence of a release for the analyte at the monitoring point, and follow up with written notification submitted by certified mail **within seven days** of the verbal notification; and

b) Carry out the requirements of Section J, **RESPONSE TO A RELEASE** if a release has been confirmed.

c) Add any five-year analyte that is confirmed per this method to the monitoring parameter list such that it is monitored during each regular monitoring event.

46. **Physical Evidence of a Release.** If the Discharger determines that there is a significant **physical** evidence of a release, the Discharger shall immediately verbally notify Central Valley Water Board staff and provide written notification **by certified mail within 7 days** of such determination, and within **90 days** shall submit an amended report of waste discharge to establish an Evaluation Monitoring Program [Title 27, § 20385(a)(3) and § 20420(l)(1) & (2)].
J. RESPONSE TO A RELEASE

1. Measurably Significant Evidence of a Release Has Been Confirmed. If the Discharger has confirmed that there is measurably significant evidence of a release from a waste management unit pursuant to Standard Monitoring Specification I.44 or I.45, then the Discharger shall:

a. Immediately sample all monitoring points in the affected medium at that waste management unit and determine the concentration of all monitoring parameters and constituents of concern for comparison with established concentration limits. Because this constituent of concern scan does not involve statistical testing, the Discharger will need to collect and analyze only a single water sample from each monitoring point in the affected medium [Title 27, § 20420(k)(1)].

b. Within 90 days of confirming measurably significant evidence of a release, the Discharger shall submit an amended report of waste discharge to establish an Evaluation Monitoring Program meeting the requirements of Title 27, sections 20420(k)(5)(A-D), including but not limited to the results of sampling pursuant to paragraph J.1.a, above. The Evaluation Monitoring Program shall be designed for the collection and analysis of all data necessary to assess the nature and extent of the release and to determine the spatial distribution and concentration of each constituent throughout the zone affected by the release [Title 27, § 20420(k)(5) and § 20425(b)].

c. Within 180 days of confirming measurably significant evidence of a release, the Discharger shall submit to the Central Valley Water Board an initial engineering feasibility study for a Corrective Action Program necessary to meet the requirements of Title 27, section 20430. At a minimum, the initial engineering feasibility study shall contain a detailed description of the corrective action measures that could be taken to achieve background concentrations for all constituents of concern [Title 27, § 20420(k)(6)].

d. If the Discharger confirms that there is measurably significant evidence of a release from the waste management unit at any monitoring point, the Discharger may attempt to demonstrate that a source other than the waste management unit caused the evidence of a release or that the evidence is an artifact caused by an error in sampling, analysis, or statistical evaluation or by natural variation in groundwater, surface water, or the unsaturated zone. The Discharger may make a demonstration pursuant to Title 27, section 20420(k)(7) in addition to or in lieu of submitting both an amended report of waste discharge or an engineering feasibility study; however, the Discharger is not relieved of the requirements and due dates of Title 27, sections 20420(k)(6) & (7) unless Central Valley Water Board staff agree that the demonstration successfully shows that a source other than the
waste management unit caused the evidence of a release or that the
evidence resulted from error in sampling, analysis, or statistical evaluation
or from natural variation in groundwater, surface water, or the unsaturated
zone. In order to make this demonstration, the Discharger shall notify the
Central Valley Water Board by certified mail of the intent to make the
demonstration within seven days of determining measurably significant
evidence of a release, and shall submit a report within 90 days of
determining measurably significant evidence of a release [Title 27,
§ 20420(k)(7)].

e. **Within 90 days** of the date that the Evaluation Monitoring Program from
paragraph J.1.b is approved (the date is it established), the Discharger shall
complete and submit the following:

i) **Results and Assessment for the Evaluation Monitoring Program.**
A report with the results and assessment based on the approved
Evaluation Monitoring Program [Title 27, § 20425(b)].

ii) **Updated Engineering Feasibility Study.** An updated engineering
feasibility study for corrective action based on the data collected to
delineate the release and data from the ongoing monitoring program
required under Title 27, section 20425(e) [Title 27, § 20425(c)].

iii) **Amended ROWD for a Corrective Action Program.** An amended
report of waste discharge to establish a Corrective Action Program
meeting the requirements of Title 27, section 20430 based on the data
collected to delineate the release and based on the updated
engineering feasibility study [Title 27, § 20425(d)].

### K. GENERAL PROVISIONS

1. In the event the Discharger does not comply or will be unable to comply with any
prohibition or limitation of this Order for any reason, the Discharger shall notify
the appropriate Central Valley Water Board office by telephone **as soon as** it or
its agents have knowledge of such noncompliance or potential for
noncompliance, and shall confirm this notification in writing **within two weeks.**
The written notification shall state the nature, time, and cause of noncompliance,
and shall describe the measures being taken to prevent recurrences and shall
include a timetable for corrective actions.

2. All reports and transmittal letters shall be signed by persons identified below:

a. For a corporation: by a principal executive officer of at least the level of
senior vice-president.

b. For a partnership or sole proprietorship: by a general partner or the
proprietor.
c. For a municipality, state, federal or other public agency: by either a
principal executive officer or ranking elected or appointed official.

d. A duly authorized representative of a person designated in a, b or c above
if:

1) The authorization is made in writing by a person described in a, b, or c
of this provision;

2) The authorization specifies either an individual or a position having
responsibility for the overall operation of the regulated facility or activity,
such as the position of plant manager, operator of a Unit,
superintendent, or position of equivalent responsibility (a duly
authorized representative may thus be either a named individual or any
individual occupying a named position); and

3) The written authorization is submitted to the Central Valley Water
Board.

e. Any person signing a document under this Section shall make the following
certification:

“I certify under penalty of law that I have personally examined and am
familiar with the information submitted in this document and all attachments
and that, based on my inquiry of those individuals immediately responsible
for obtaining the information, I believe that the information is true, accurate,
and complete. I am aware that there are significant penalties for submitting
false information, including the possibility of fine and imprisonment.”

3. The Discharger shall take all reasonable steps to minimize any adverse impact
to the waters of the State resulting from noncompliance with this Order. Such
steps shall include accelerated or additional monitoring as necessary to
determine the nature, extent, and impact of the noncompliance.

4. The owner of the waste management facility shall have the continuing
responsibility to assure protection of waters of the State from discharged wastes
and leachate generated by discharged waste during the active life, closure, and
any post-closure maintenance period of the waste management units and during
subsequent use of the property for other purposes.

5. The fact that it would have been necessary to halt or reduce the permitted
activity in order to maintain compliance with this Order shall not be regarded as
a defense for the Discharger’s violations of this Order.

6. The Discharger shall notify the Central Valley Water Board of a material change
in; the types, quantity, or concentrations of wastes discharged; site operations
and features; or proposed closure procedures, including changes in cost
estimates. This notification shall be given a reasonable time before the changes are made or become effective. No changes shall be made without Central Valley Water Board approval following authorization for closure pursuant to the site Notification of Closure [Title 27, § 21710(a)(4)].

7. The Discharger shall maintain legible records of the volume and type of each waste discharged at each waste management unit or portion of a unit, and the manner and location of discharge. Such records shall be maintained by the Discharger until the beginning of the post-closure maintenance period. These records shall be on forms approved by the State Water Board or Central Valley Water Board and shall be maintained at the waste management facility until the beginning of the post-closure maintenance period. These records shall be available for review by representatives of the State Water Board or Central Valley Water Board at any time during normal business hours. At the beginning of the post-closure maintenance period, copies of these records shall be sent to the Central Valley Water Board [Title 27, § 21720(f)].

8. In the event of any change in landowner or the operator of the waste management facility, the Discharger shall notify the succeeding owner or operator in writing of the existence of this Order. A copy of that notification shall be sent to the Central Valley Water Board.

9. In the event of any change of ownership or responsibility for construction, operation, closure, or post-closure maintenance of the waste discharge facilities described in this Order, the Discharger shall notify the Central Valley Water Board prior to the effective date of the change and shall include a statement by the new Discharger that construction, operation, closure, or post-closure maintenance will be in compliance with this Order and any revisions thereof [Title 27, § 21710(c)(1)].

10. To assume ownership or operation under this Order, the succeeding owner or operator must apply in writing to the Central Valley Water Board requesting transfer of the Order within 14 days of assuming ownership or operation of this facility. The request must contain the requesting entity’s full legal name, the State of incorporation if a corporation, the name and address and telephone number of the persons responsible for contact with the Central Valley Water Board, and a statement. The statement shall comply with the signatory requirements contained in General Provision K.2 and state that the new owner or operator assumes full responsibility for compliance with this Order. Failure to submit the request shall be considered a discharge without requirements, a violation of the Water Code. Transfer of this Order shall be approved or disapproved by the Central Valley Water Board.

L. STORM WATER PROVISIONS

1. The Discharger shall design storm water conveyance systems for Class II units for a 1,000-year, 24-hour storm event [Title 27, § 21750(e)(3)].
2. Waste management units and their respective containment structures shall be designed and constructed to limit, to the greatest extent possible, ponding, infiltration, inundation, erosion, slope failure, washout, and overtopping under the precipitation conditions for the unit [Title 27, § 20365(a)].

3. Precipitation on Class II waste piles which is not diverted by covers or drainage control systems shall be collected and managed through the LCRS, which shall be designed and constructed to accommodate the precipitation conditions for each class unit [Title 27, § 20365(b)].

4. Diversion and drainage facilities shall be designed, constructed, and maintained to [Title 27, § 20365(c)]:
   a. Accommodate the anticipated volume of precipitation and peak flows from surface runoff and under the precipitation conditions for the waste management unit.
   b. Effectively divert sheet flow runoff laterally, via the shortest distance, into the drainage and collection facilities.
   c. Prevent surface erosion through the use of energy dissipators where required to decrease the velocity of runoff, slope protection, and other erosion control measures where needed to prevent erosion.
   d. Control and intercept run-on, in order to isolate uncontaminated surface waters from water that might have come into contact with waste.
   e. Take into account:
      i) For closed waste management units and for closed portions of units, the expected final contours of the closed unit, including its planned drainage pattern.
      ii) For operating portions of waste management units other than surface impoundments, the unit’s drainage pattern at any given time.
      iii) The possible effects of the waste management unit’s drainage pattern on and by the regional watershed.
      iv) The design capacity of drainage systems of downstream and adjacent properties by providing for the gradual release of retained water downstream in a manner which does not exceed the expected peak flow rate at the point of discharge if there were no waste management facility.
   f. Preserve the system’s function. The Discharger shall periodically remove accumulated sediment from the sedimentation or detention basins as needed to preserve the design capacity of the system.
5. Collection and holding facilities associated with precipitation and drainage control systems shall be emptied immediately following each storm or otherwise managed to maintain the design capacity of the system [Title 27, § 20365(d)].

6. Surface and subsurface drainage from outside of a waste management unit shall be diverted from the unit [Title 27, § 20365(e)].

7. Cover materials shall be graded to divert precipitation from the waste management unit, to prevent ponding of surface water over wastes, and to resist erosion as a result of precipitation [Title 27, § 20365(f)].

8. Any drainage layer in a final cover shall be designed and constructed to intersect with the final drainage system for the waste management unit in a manner promoting free drainage from all portions of the drainage layer [Title 27, §20365(f)].
