Subject: Grassland Bypass Project
 Submission of the Pesticide Evaluation Protocol Results and proposed pesticide
 monitoring constituents and schedule.

Dear Patrick,

As indicated in the June 9, 2016 letter regarding the Pesticide Monitoring Plan submittal for the surface water discharges from the Grassland Bypass Project, pesticide monitoring is to be identified using a list of pesticides and a set of evaluation factors provided by the Executive Officer (EO). For 2018 and hereafter, determining pesticides and metals (boron, copper, and zinc) for monitoring will occur through the Pesticide Evaluation Protocol (PEP; disseminated November 29, 2016).

The PEP process starts by comparing the pesticides applied within the Grassland Drainage Area over the past three years to the 376 pesticides on the EO list. The Coalition then adds degradates for a select number of pesticides and removes pesticides from the list through a series of steps provided in the PEP. The series of steps the Coalition used to determine the pesticides to monitor for the upcoming WY includes:

- Compiling the last three years of PUR data for each subwatershed
- Excluding pesticides not on the EO's list of pesticides,
- Adding degradates of any parent compounds that have reported usage,
- Grouping pesticides with the same toxicant in water,
- Calculating the cumulative monthly average for each pesticide,
- Calculating the annual use averaged by month for each pesticide,
- Calculating the Aquatic Life Relative Risk Ratio (cumulative monthly average divided by aquatic life reference value), and
- Calculating the Human Health Relative Risk Ratio (annual monthly use divided by human health reference value).

Pesticides were excluded from monitoring if any of the evaluation steps below were true.

1. Pesticides with an organic carbon partitioning coefficient (K_{oc}) greater than 100,000 and an aquatic life reference value above 1 $\mu\text{g/L}$.
2. Pesticides with a hydrolysis half-life of less than one day.
3. Pesticides with both vapor pressure greater than 1×10^{-4} mPa and Henry's Law Constant greater than 100 Pa m^3/mol .

209 826-9698 FAX

4. Pesticides with a Human Health Ratio less than 10 and an Aquatic Life Ratio less than 50.
5. Pesticides where the monthly use is less than 10% of the total applied over the past three years.
6. Pesticides with no commercially available analytical methods.

The Coalition evaluated pesticides based on the human health criteria where available; pesticides with Maximum Containment Levels (MCLs) or Numeric Criteria for Priority Toxic Pollutants for the State of California (CTR) are required to be considered for monitoring. These include 1,3-dichloropropene, copper, glyphosate, and oxamyl. Justification for not monitoring pesticides with MCLs/CTRs is included in the attached Excel workbook (tab "GDA_Final", Column "ExclusionNote"). Monitoring is not required for pesticides without adopted numeric criteria. Waterbodies within the Grasslands Drainage Area do not have a MUN beneficial use designation, and therefore no human health criteria are applicable. The initial ranking list for pesticides with human health concerns is included in the PEP analysis in the attached Excel workbook.

The 2012 303(d) list includes the following applied pesticides for the specific waterbody to be monitored by the Grassland Bypass Project: chlorpyrifos (San Joaquin River), diazinon (San Joaquin River), and boron (San Joaquin River and Mud Slough). Chlorpyrifos and diazinon are addressed through the San Joaquin River Diazinon and Chlorpyrifos TMDL, and boron is monitored weekly at all three monitoring locations (as outlined in Attachment B of Monitoring Order R5-2015-0094). In addition, all three pesticides are also addressed through the PEP process. Mud Slough, North (downstream of San Luis Drain) is also listed for pesticides (general category), which is also addressed through the PEP process.

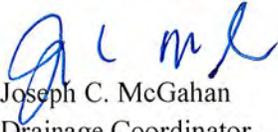

The Excel file with exclusion notes of the PEP process and additional rationale for the exclusion of pesticides was emailed to your staff on October 12, 2018. The file also includes separate tabs for the proposed monitoring schedule that summarizes the results and lists the pesticide constituents to be monitored in each month.

Table 1 shows the proposed Pesticide Monitoring Schedule resulting from the PEP analysis. This table lists the constituents that are likely to be detected, and in which month they are most likely to be detected. Table 2 lists the pesticides and analytical methods.

As indicated in Attachment B of Monitoring Order R5-2015-0094, pesticide monitoring is to occur at Sites B3, D, and R in accordance with the monitoring schedule shown in the attached tables. Consistent with the February 28, 2018 letter from Regional Board staff, pesticide monitoring shall only be conducted when there is discharge from the Grassland Drainage Area to the San Luis Drain.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel or represented members properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for knowingly submitting false information, including the possibility of fine and imprisonment for violations. Please let me know if you have any questions.

Very truly yours,
