I. Introduction

This Monitoring and Reporting Program (MRP) is issued pursuant to California Water Code (Water Code) section 13267 which authorizes the California Regional Water Quality Control Board, Central Valley Region (hereafter Central Valley Water Board or “board”), to require preparation and submittal of technical and monitoring reports. This MRP includes requirements for a third-party representative entity assisting individual irrigated lands operators or owners that are members of the third-party (Members), as well as requirements for individual Members subject to and enrolled under Waste Discharge Requirements General Order for Growers within the Eastern San Joaquin River Watershed that are Members of the Third-Party Group, Order R5-2012-XXXX (hereafter referred to as the “Order”). The requirements of this MRP are necessary to monitor Member compliance with the conditions/provisions of the Order and determine whether state waters receiving discharges from Members are meeting water quality objectives. Additional discussion and rationale for this MRP’s requirements are provided in Attachment A of the Order.

This MRP establishes specific surface and ground water monitoring, reporting, and electronic data deliverable requirements for the third-party. Due to the nature of irrigated agricultural operations, monitoring requirements for surface waters and groundwater will be periodically reassessed to determine if changes should be made to better represent irrigated agriculture discharges to state waters. The monitoring schedule will also be reassessed so that constituents are monitored during application and/or release timeframes when constituents of concern are most likely to affect water quality. The third-party shall not implement any changes to this MRP unless the Central Valley Water Board or the Executive Officer issues a revised MRP.

II. General Provisions

This Monitoring and Reporting Program (MRP) conforms to the goals of the Non-point Source (NPS) Program as outlined in *The Plan for California’s Nonpoint Source Pollution (NSP) Program* by:

- tracking, monitoring, assessing and reporting program activities,
- ensuring consistent and accurate reporting of monitoring activities,
- targeting NPS Program activities at the watershed level,
- coordinating with public and private partners, and
- tracking implementation of management practices to improve water quality and protect existing beneficial uses.

Monitoring data collected to meet the requirements of the Order must be collected and analyzed in a manner that assures the quality of the data. The third-party must follow sampling and analytical procedures as specified in Attachment C, Order No. R5-2008-0005, Coalition Group Monitoring Program Quality Assurance Project Plan Guidelines (QAPP Guidelines) and any revisions thereto approved by the Executive Officer.¹

To the extent feasible, all technical reports required by this MRP must be submitted electronically in a format specified by the Central Valley Water Board that is reasonably available to the third-party.

This MRP requires the third-party to collect information from its Members and allows the third-party to report the information to the board in a summary format. The third-party must submit specific Member information collected as part of the Order and this MRP when requested by the Executive Officer or as specified in the Order.

¹ Central Valley Water Board staff will circulate proposed revisions of the QAPP Guidelines for public review and comment prior to Executive Officer consideration for approval.

T
E
N
T
A
T
I
V
E

This MRP Order becomes effective on **DATE**. The Central Valley Water Board Executive Officer may revise this MRP as necessary. Upon the effective date of this MRP, the third-party, on behalf of the individual Members, shall implement the following monitoring and reporting.

III. Surface Water Quality Monitoring Requirements

A. Surface Water Monitoring Sites

There are three different types of monitoring sites described below: 1) Core sites; 2) Represented sites; and 3) Special Project sites. Core sites are monitored comprehensively on an ongoing basis to track trends in surface water quality and to identify water quality problems. Represented sites generally have characteristics similar to, and are, therefore, represented by the Core sites within their common zone.² -When a water quality problem is identified at a Core site, the represented sites are evaluated and potentially monitored to determine whether the water quality problem is also occurring at the Represented site. (some represented water bodies may not have a monitoring site, e.g. in cases when there is no access). Special Project sites are identified and monitored to investigate identified water quality problems. A Core site or Represented site may also be a Special Project site.

1. Core Site Monitoring

At a minimum, surface water monitoring (as described in section III.C.1) within each zone shall be conducted at one of the designated Core sites (see Table 1) for two consecutive years, followed by two years of monitoring at the second Core monitoring site. Core site monitoring shall alternate continuously between the two Core sites. When a water quality objective or trigger limit at a monitored Core site is exceeded, the parameter associated with the exceedance must be monitored for a third consecutive year.³

2. Represented Site Monitoring

When a water quality objective or trigger limit is exceeded at a Core site, the third-party must evaluate the potential for similar risks or threats to water quality associated with that parameter at the sites represented by the Core site (Represented sites). The evaluation must be included in the Monitoring Report (see section V below). If pesticide use information or other factors indicate a risk, monitoring for that parameter must be performed in the appropriate Represented water bodies. The proposed monitoring plan must be included in the Monitoring Plan Update (see section III.C below). Any such monitoring must occur for a minimum of two years during the time period of highest risk of exceedance of water quality objectives for that parameter. -When a water quality objective at a monitored Represented site is exceeded, the parameter associated with the exceedance must be monitored for a third consecutive year.⁴

² As part of their 25 August 2008 Monitoring and Reporting Program Plan (2008 MRPP), the East San Joaquin Water Quality Coalition (the Coalition) designated six zones within its area based on hydrology, crop types, land use, soil types, and rainfall. The zones identified in the 2008 MRPP are the same zones as those identified in Table 1.

³ If two exceedances have occurred within the two years the Core site is being monitored, a third year of monitoring is not required. However, the parameter would need to be monitored in accordance with the Management Plan for that parameter and site.

⁴ If two exceedances have occurred within the two years the Represented site is being monitored, a third year of monitoring is not required. However, the parameter would need to be monitored in accordance with the Management Plan for that parameter and site.

T
E
N
T
A
T
I
V
E

Any watershed area that does not contain a monitoring site due to issues of access or location downstream of urban influence must be represented by the Core sites in that zone. Any applicable surface water quality management plan (SQMP) actions associated with the Core site must take place in the these watershed areas (represented drainage-drainages without monitoring sites).

3. Special Project Sites

In addition to Core and Represented sites, the third-party may designate Special Project sites as needed in a surface water quality management plan (SQMP) to evaluate commodity or management practice-specific effects on identified water quality problems,⁵ or to evaluate sources of identified water quality problems.

The Executive Officer may require the third-party to conduct local or site-specific monitoring to address a parameter associated with a management plan or TMDL (see section III.C.5. below). Core sites and Represented sites located in areas where management plans are required will also be considered Special Project sites for the parameter(s) subject to the management plan(s).

B. Monitoring Locations

The location of Core and monitored Represented sites are identified in Table 1 below. The third-party may submit written requests (including technical justification) for removal/addition of monitoring sites for approval by the Executive Officer.

*Monitored Represented sites in the table are not an exhaustive list; the Executive Officer may require the third-party to add monitoring sites for represented water bodies as necessary to meet the requirements of the Order.

C. Monitoring Requirements and Schedule

1. Surface Water Monitoring

Surface water monitoring must provide sufficient data to describe irrigated agriculture's impacts on surface water quality and to determine whether existing or newly implemented management practices comply with the surfacereceiving water limitations of the Order. Surface water monitoring shall include a comprehensive suite of constituents (also referred to as "parameters") monitored periodically in a manner that allows for an evaluation of the condition of a water body and determination of whether irrigated agriculture operations in the Eastern San Joaquin Watershed are causing or contributing to any surface water quality problems.

T
E
N
T
A
T
I
V
E

Surface water assessment monitoring shall be conducted at Core sites and shall consist of the general water quality parameters, nutrients, pathogen indicators, water column and sediment toxicity, pesticides, and metals identified in section III.C.3. By 1 August of the calendar year in which monitoring begins the third-party shall identify a specific set of monitoring parameters (Monitoring Plan Update) for each site that is scheduled to be monitored (see section III.C.3 below).⁷ The third-party shall continue monitoring as described in the Coalition's 25 August 2008 Monitoring and Reporting Program Plan (2008 MRPP) until the Executive Officer has approved the Monitoring Plan Update. If there are no proposed or required changes to the previous Monitoring Program Plan or Monitoring Plan Update, the third-party is not required to submit the Monitoring Plan Update.

Follow-up sampling. The Central Valley Water Board Executive Officer may request that a parameter(s) of concern continue to be monitored at a specific Core or Represented site during non-scheduled years. Parameters of concern may include, but are not limited to, parameters that exceed an ~~adopted~~applicable water quality objective or water quality trigger (see section ~~V~~VIII).

Sampling events shall be scheduled to capture at least two storm runoff events per year, except where a different frequency has been required or approved by the Executive Officer. The third-party shall identify storm runoff monitoring criteria that are based on precipitation levels and knowledge of soils or other factors affecting when storm runoff is expected to occur at monitoring sites. The collection of storm runoff samples shall not be contingent upon the timing of other sampling events and could result in monitoring more than once during a month.

2. Monitoring Schedule and Frequency

The third-party shall identify the appropriate monitoring periods (e.g., months, seasons) for all parameters that require testing (Table 2), including a discussion of the rationale to support the proposed schedule.

For metals, pesticides, and aquatic toxicity, the monitoring periods shall be determined utilizing previous monitoring results, knowledge of agricultural use patterns (if applicable), pesticide use trends, chemical characteristics, and other applicable criteria. All other required parameters shall be monitored according to an approved schedule and frequency during the years in which monitoring is conducted at the Core and Represented sites.

Monitoring must be conducted when the pollutant is most likely to be present. If there is a temporal or seasonal component to the beneficial use, monitoring must also be conducted when beneficial use impacts could occur. The frequency of data collection must be sufficient to allow determination of compliance with the relevant numeric water quality objective(s) or water quality triggers. The third-party may submit written requests for the removal or addition of monitoring sites or parameters, or to modify the monitoring schedule and frequency, for approval by the Executive Officer.

3. Monitoring Parameters

Water quality and flow monitoring shall be used to assess the wastes in discharges from irrigated lands to surface waters and to evaluate the effectiveness of management practice implementation. Water quality is evaluated with both field-measured parameters and laboratory analytical data as listed on Table 2 of this MRP. The pesticides identified as "to be determined" (TBD) on Table 2 shall be identified ~~according to~~as part of a process ~~developed by the Central Valley Water Board staff~~ that includes ~~stakeholder~~input from qualified scientists and coordination with the Department of Pesticide Regulation. Based on this process, the Executive Officer will provide the third-party

⁷ A monitoring year is defined according to water year, which is 1 October through 30 September.

T
E
N
T
A
T
I
V
E

with a list of pesticides that require monitoring in areas where they are applied and have the potential to impair water quality. ~~The third party shall monitor pesticides as appropriate to the region and commodities grown.~~

Parameters that are part of an adopted TMDL that is in effect and for which irrigated agriculture is a source within the Eastern San Joaquin River Watershed shall be monitored in accordance with the adopted Basin Plan provisions or as directed by the Executive Officer. Current adopted TMDLs within the Eastern San Joaquin River Watershed for which irrigated agriculture is a source include the San Joaquin River Deep Water Ship Channel dissolved oxygen; San Joaquin River salt, boron, selenium, diazinon, and chlorpyrifos.

The metals to be monitored at sites within each site subwatershed shall be determined through an evaluation of several factors. The evaluation will provide the basis for including or excluding each metal. Evaluation factors shall include, but not be limited to: documented use of the metal applied to lands for irrigated agricultural purposes in the last three years; prior monitoring results; geological or hydrological conditions; and mobilization or concentration by irrigated agricultural operations. The third-party may also consider other factors such as acute and chronic toxicity thresholds and chemical characteristics of the metals. The third-party shall evaluate the monitoring parameters listed in Table 2 to determine which metals warrant monitoring for each site subwatershed. Documentation of the evaluations must be provided to the Central Valley Water Board as part of the Monitoring Plan Update.

The third-party shall identify in the Monitoring Plan Update all parameters to be monitored and the proposed monitoring periods and frequency at selected sites by 1 August of the year in which monitoring begins (monitoring period begins 1 October). If there are no changes from the previous Executive Officer approved monitoring (i.e., approved MRPP, or previously approved Monitoring Plan Update), the third-party is not required to submit the Monitoring Plan Update. The Monitoring Plan Update shall be subject to Executive Officer review and approval prior to the initiation of changes in monitoring activities.

E
N
T
A
T
I
V
E

4. Toxicity Testing

The purpose of toxicity testing is to: 1) evaluate compliance with the Basin Plan narrative toxicity water quality objective; 2) identify the causes of toxicity when and where it is observed (e.g. metals, pesticides, ammonia, etc.); and 3) evaluate any additive toxicity or synergistic effects due to the presence of multiple constituents.

a. Aquatic Toxicity

Aquatic toxicity testing shall include *Ceriodaphnia dubia*, *Pimephales promelas*, and *Selenastrum capricornutum* in the water column. Testing for *C. dubia* and *P. promelas* shall follow the USEPA acute toxicity testing methods.^{8,9} Testing for *S. capricornutum* shall follow the USEPA short-term chronic toxicity testing methods.¹¹ Toxicity test endpoints are survival for *C. dubia* and *P. promelas*, and growth for *S. capricornutum*.

Water column toxicity analyses shall be conducted on 100% (undiluted) sample for the initial screening. A sufficient sample volume shall be collected in order to allow the laboratory to conduct a Phase I Toxicity Identification Evaluation (TIE) on the same sample, should toxicity be detected, in an effort to identify the cause of the toxicity.

If a 50% or greater difference in *Ceriodaphnia dubia* or *Pimephales promelas* mortality in an ambient sample, as compared to the laboratory control, is detected at any time in an acceptable test, a TIE shall be initiated within 48 hours of such detection. If a 50% or greater reduction in *Selenastrum capricornutum* growth in an ambient sample, as compared to the laboratory control, is detected at the end of an acceptable test, a TIE shall be initiated within 48 hours of such detection.

At a minimum, Phase I TIE¹² manipulations shall be conducted to determine the general class(es) (e.g., metals, non-polar organics, and polar organics) of the chemical(s) causing toxicity. The laboratory report of TIE results submitted to the Central Valley Water Board must include a detailed description of the specific TIE manipulations that were utilized.

If within the first 96 hours of the initial toxicity screening, the mortality reaches 100%, a multiple dilution test shall be initiated. The dilution series must be initiated within 24 hours of the sample reaching 100% mortality, and must include a minimum of five (5) sample dilutions in order to quantify the magnitude of the toxic response. For the fathead minnow test, the laboratory must take the steps to procure test species within one working day, and the multiple dilution tests must be initiated the day fish are available.

Ceriodaphnia dubia and *Pimephales promelas* Media Renewal

Daily sample water renewals shall occur during all acute toxicity tests to minimize the effects of rapid pesticide losses from test waters. A feeding regime of 2 hours prior to test initiation and 2 hours prior to test renewal shall be applied. Test solution renewal must be 100% renewal for

T
I
V
E

Ceriodaphnia dubia by transferring organisms by pipet into fresh solutions, as defined in the freshwater toxicity testing manual.

Selanastrum capricornutum Pre-Test Treatment

Algae toxicity testing shall not be preceded with treatment of the chelating agent EDTA. The purpose of omitting this agent is to ensure that metals used to control algae in the field are not removed from sample aliquots prior to analysis or during the initial screening.

b. Sediment Toxicity

Sediment toxicity analyses shall be conducted according to EPA Method 600/R-99/064. Sampling and analysis for sediment toxicity testing utilizing *Hyalella azteca* shall be conducted at each monitoring location established by the third-party for water quality monitoring, if appropriate sediment (i.e. silt, clay) is present at the site. If appropriate sediment is not present at the designated water quality monitoring site, an alternative site with appropriate sediment shall be designated for all sediment collection and toxicity testing events. Sediment samples shall be collected and analyzed for toxicity twice per year, with one sample collected between 15 August and 15 October, and one sample collected between 1 March and 30 April, during each year of monitoring. The *H. azteca* sediment toxicity test endpoint is survival. The Executive Officer may request different sediment sample collection timing and frequency under a SQMP.

All sediment samples must be analyzed for total organic carbon (TOC) and grain size. Analysis for TOC is necessary to evaluate the expected magnitude of toxicity to the test species. Note that sediment collected for grain size analysis shall not be frozen. If the sample is not toxic to the test species, the additional sample volume can be discarded.

Sediment samples that show significant toxicity to *Hyalella azteca* at the end of an acceptable test and that exhibit ~~≥ 20% reduction in~~ < 80% organism survival compared to the control will require pesticide analysis of the same sample in an effort to determine the potential cause of toxicity. The third-party may use the previous three years of available PUR data to determine which of the parameters listed in Table 2 require testing in the sediment sample. Analysis at practical reporting limits of 1 ng/g on a dry weight basis for each pesticide is required to allow comparison to established lethal concentrations of these chemicals to the test species. This follow-up analysis must begin within five business days of when the toxicity criterion described above is exceeded. The third-party may also follow up with a sediment TIE when there is ≥ 50% reduction in test organism survival as compared to the laboratory control. -Sediment TIEs are an optional tool.

5. Special Project Monitoring

The Central Valley Water Board or Executive Officer may require the third-party to conduct local or site-specific monitoring where monitoring identifies a water quality problem (Special Project Monitoring). The studies shall be representative of the effects of changes in management practices for the parameters of concern. Once Special Project Monitoring is required, the third-party must submit a Special Project Monitoring proposal. The proposal must provide the justification for the proposed study design, specifically identifying how the study design will quantify irrigated agriculture's contribution to the water quality problem, identify sources, and evaluate management practice effectiveness. When such a study is required, the proposed study must include an evaluation of the feasibility of conducting commodity and management practice specific field studies for those commodities and irrigated agricultural practices that could be associated with the pollutants of concern. Special Project Monitoring studies will be designed to evaluate the effectiveness of practices used by multiple Members and will not be required of the third-party to evaluate compliance of an individual Member.

T
E
N
T
A
T
I
V
E

D. Surface Water Data Management Requirements

All surface water field and laboratory data must be uploaded into the Central Valley Regional Data Center (CV RDC) database and will be exported to the California Environmental Data Exchange Network (CEDEN) once data have been approved as CEDEN comparable. The third-party will input its data into a replica of the CV RDC database following CV RDC and CEDEN business and formatting rules.

The third-party shall utilize the most current version of the database and update associated lookup lists on a routine basis. The third-party shall ensure that the data loaded meet the formatting and business rules as detailed in the most current version of the document "Format and Business Rules for the CV RDC CEDEN Comparable Database."

The Central Valley Water Board has developed several tools to assist the third-party with processing and loading of its data. These tools, whether required or optional, will help the third-party to efficiently conduct data processing and loading and meet data management requirements.

CEDEN Comparable Field Sheets (Required)

The third party shall use CEDEN comparable field sheets when entering data. An example CEDEN comparable field sheet can be found on the CV RDC webpage. This field sheet was designed to match the entry user interface within the CEDEN comparable database to allow for easier data entry of all sample collection information. Modified versions of the field sheet may be submitted to the Central Valley Water Board Executive Officer for approval.

Format Quick Guide (Optional Tool)

The Format Quick Guide is a guidance document for the formatting of data tailored specifically for the third-party. It contains a column by column guide for filling out the CV RDC data templates with the applicable required codes. The Central Valley Water Board CV RDC will provide this document, and updates to it, upon request based on an approved monitoring plan and associated QAPP.

EDD Checklist (Optional Tool)

The electronic data deliverable (EDD) checklist provides for a structured method for reviewing data deliverables from data entry staff or laboratories prior to loading. An updated checklist will be made available on the CV RDC website.

Online Data Checker (Optional Tool)

An online data checker was developed to automate the checking of the datasets against the current format requirements and business rules associated with CEDEN comparable data. The data checker can be accessed on the CV RDC webpage. Please note that data submission will not be accepted through this tool; however, the checker can still be used to check data for errors.

Electronic Quality Assurance Program Plan (eQAPP) (Required)

The third-party shall use an eQAPP when collecting and analyzing monitoring data. The eQAPP is a spreadsheet document containing the quality control requirements for each analyte and method as detailed in the most current version of the third-party's approved QAPP. Each analyte, method, extraction, units, recovery limits, QA sample requirement, etc. is included in this document using the appropriate codes required for the CEDEN comparable database. The third party shall use the document to format the reported data and conduct a quality control review prior to loading. Data that do not meet the project quality assurance acceptance requirements must be flagged accordingly and must include brief notes detailing the problem within the provided comments field. Included in this file are also the most recent CEDEN comparable station name and code list as well as the applicable project CEDEN codes for retrieving data from the CEDEN website once data arrive there.

IV. **Groundwater Quality Monitoring and Management Practice Assessment, and Evaluation Requirements**

The groundwater quality monitoring, assessment, and evaluation requirements in this MRP have been developed in consideration of the critical questions developed by the Groundwater Monitoring Advisory Workgroup (questions are presented in the Information Sheet, Attachment A). The third-party must collect sufficient data to describe irrigated agricultural impacts on groundwater quality and to determine whether existing or newly implemented management practices comply with the groundwater receiving water limitations of the Order.

The strategy for A. — Groundwater Vulnerability Designations

~~The third-party and staff of the Central Valley Water Board will evaluate available information pertaining to discharges of waste from irrigated lands to groundwater pursuant to the procedures set forth in section IV.B below. As a default this Order defines high vulnerable areas within the Eastern San Joaquin River Watershed as those areas that have been identified by the State Water Board Hydrogeologically Vulnerable Areas, areas covered by the California Department of Pesticide Regulation groundwater protection program, and areas identified by the board with exceedances of water quality objectives for which irrigated agriculture waste discharges may cause, or contribute to the exceedance. The third-party may elect to recommend refinements or changes to this definition during the development of the Groundwater Assessment Report (GAR). These vulnerability designations will be made by the third-party and staff of the Central Valley Water Board using a combination of physical properties (soil, type, depth to groundwater, known agricultural impacts to beneficial uses, etc.) and management practices (irrigation method, crop type, nutrient application and removal rates, etc.). The refinement process is not static but dynamic; groundwater vulnerability designations will continue to be updated and refined periodically as conditions warrant.~~

~~The resulting evaluating groundwater quality and protection consists of 1) Groundwater Assessment Report, 2) Management Practices Evaluation Program, and 3) Groundwater Quality Trend Monitoring Program.~~

~~The Groundwater Quality Assessment Report (GAR) groundwater vulnerability designations will provide the basis provides the foundational information necessary for the development/design of the Trend/Management Practices Evaluation Program and Representative the Groundwater Monitoring programs to be implemented under the Groundwater Quality Trend Monitoring Strategy.~~

~~Vulnerability designations for groundwater are required by this MRP as part of the Groundwater Assessment Report identified in section IV.B below. Program. The GAR also identifies the high vulnerability groundwater areas where ~~vulnerability designations may be refined/updated periodically during the Monitoring Report process. The Executive Officer will make the final determination regarding vulnerability designations.~~~~

- ~~1. **High vulnerability areas** – 1) do meet the requirements for the preparation of a Groundwater Quality Management Plan (see WDRs VIII.I.2; GQMP:1,3, or 4) or 2) information provided in the Groundwater Assessment Report indicates irrigated lands could cause or contribute to an exceedance of water quality objectives or degradation of groundwater quality that may threaten applicable beneficial uses must be developed and implemented.~~

~~**Low vulnerability areas** – are not high vulnerability areas as described above.~~

T
E
N
T
A
T
I
V
E

~~**Prioritization of high vulnerability areas:** The third party may also prioritize the areas designated as high vulnerability areas for purposes of preparing trend and representative groundwater monitoring programs. When establishing relative priorities for high vulnerability areas, the third party shall consider the following:~~

- ~~• Identified exceedances of water quality objectives for which irrigated agriculture waste discharges are the cause, or a contributing source;~~
- ~~• The proximity of the high vulnerability area to areas contributing recharge to urban and rural communities where groundwater serves as a significant source of supply;~~
- ~~• Existing field or operational practices identified to be associated with irrigated agriculture waste discharges that are the cause, or a contributing source; and~~
- ~~• The largest acreage commodity types comprising up to at least 80% of the irrigated agricultural acreage in the high vulnerability areas and the irrigation and fertilization practices employed by those commodities.~~

~~2. B. Groundwater~~ The overall goal of the Management Practice Evaluation Program (MPEP) is to determine the effects, if any, irrigated agricultural practices have on first encountered groundwater under different conditions that could affect the discharge of waste from irrigated lands to groundwater (e.g., soil type, depth to groundwater, irrigation practice, crop type, nutrient management practice).

~~3. The overall objectives of the Groundwater Quality Trend Monitoring Program are to determine baseline quality of groundwater relevant to irrigated agriculture and develop long-term groundwater quality information that can be used to evaluate the regional effects of irrigated agricultural practices.~~

Each of these elements has its own specific objectives (provided below), and the design of each will differ in accordance with the specific objectives to be reached. While it is anticipated that these programs will provide sufficient groundwater quality and management practice effectiveness data to evaluate whether management practices of irrigated agriculture are protective of groundwater quality, the Executive Officer may also, pursuant to Water Code section 13267, order Members to perform additional monitoring or evaluations, where violations of this Order are documented or the irrigated agricultural operation is found to be a significant threat to groundwater quality.

A. Groundwater Quality Assessment Report

The purpose of the Groundwater Quality Assessment Report (GAR) is to provide the technical basis informing the scope and level of effort for implementation of the ~~Groundwater Monitoring Strategy~~ described in section IV.C below. ~~The three main objectives of the GAR are to:~~

- ~~• Identify where irrigated agricultural operations may cause or contribute to known groundwater quality impacts or where conditions make Order's groundwater more vulnerable to impacts from irrigated agricultural activities (high vulnerability areas),⁴³~~
- ~~• Produce a prioritization of high vulnerability areas, and~~
- ~~• Evaluate the merit and feasibility of incorporating existing groundwater data collection efforts and their corresponding monitoring well systems to achieve the objectives of this Order and support its groundwater monitoring requirements.~~

⁴³ ~~The third party must consider the Department of Pesticide Regulation groundwater protection areas and the State Water Board hydrogeological vulnerability areas when designating high vulnerability areas. If a DPR or State Water Board vulnerability area is not identified as a "high vulnerability" area in the GAR, the third party must provide sufficient evidence, including relevant water quality data, to justify that area's reclassification as "low vulnerability."~~

T
E
N
T
A
T
I
V
E

~~The GAR information will provide the basis for the development of the Trend and Representative Groundwater Monitoring programs to be implemented under the Groundwater Monitoring Strategy and implementation provisions. Three (3) months after receiving an NOA from the Central Valley Water Board, the third-party will provide a proposed outline of the GAR to the Executive Officer that describes data sources and references that will be considered in developing the GAR. The GAR is due one (1) year after third-party receipt of an NOA from the board.~~

1. Objectives. The main objectives of the GAR are to:

- Provide an assessment of all available, applicable and relevant data and information to determine the high and low vulnerability areas where discharges from irrigated lands may result in groundwater quality degradation.
- Establish priorities for implementation of monitoring and studies within high vulnerability areas.
- Provide a basis for establishing workplans to assess groundwater quality trends.
- Provide a basis for establishing workplans and priorities to evaluate the effectiveness of agricultural management practices to protect groundwater quality.
- Provide a basis for establishing groundwater quality management plans in high vulnerability areas and priorities for implementation of those plans.

2. GAR components. ~~The GAR shall include, at a minimum, the following data components: Detailed land use information with emphasis on land uses associated with irrigated agricultural operations. The GAR shall include, at a minimum, the following data components:~~

- ~~Detailed land use information with emphasis on land uses associated with irrigated agricultural operations.~~ The information shall identify the largest acreage commodity types in the third-party area, including the most prevalent commodities comprising up to at least 80% of the irrigated agricultural acreage in the third-party area.
- Information regarding depth to groundwater, provided as a contour map(s).
- Groundwater recharge information, including identification of areas contributing recharge to urban and rural communities where groundwater serves as a significant source of supply.
- Soil survey information, including significant areas of high salinity, alkalinity and acidity.
- Shallow groundwater constituent concentrations (potential constituents of concern include any material applied as part of the agricultural operation, including constituents in irrigation supply water [e.g., pesticides, fertilizers, soil amendments, etc.] that could impact beneficial uses or cause degradation).
- Information on existing groundwater data collection and analysis efforts relevant to this Order (e.g., Department of Pesticide Regulation [DPR] United States Geological Survey [USGS] State Water Board Groundwater Ambient Monitoring and Assessment [GAMA], California Department of Public Health, local groundwater management plans, etc.). This groundwater data compilation and review shall include readily accessible information relative to the Order on existing monitoring well networks, individual well details, and monitored parameters. For existing monitoring networks (or portions thereof) and/or relevant data sets, the third-party should assess the possibility of data sharing between the data-collecting entity, the third-party, and the Central Valley Water Board.

3. GAR data review and analysis. To develop the above data components, the GAR shall ~~review~~ include review and use, where applicable, of relevant existing federal, state, county, and local databases and documents, ~~as appropriate.~~

T
E
N
T
A
T
I
V
E

- ~~The GAR shall discuss pertinent geologic and hydrogeologic information for the third-party area(s) and utilize GIS mapping applications, graphics, and tables, as appropriate, in order to clearly convey pertinent data, support data analysis, and show results.~~

The GAR shall ~~evaluate~~ include an evaluation of the above data components to:

- Determine where known groundwater quality impacts exist for which irrigated agricultural operations are a potential contributor or where conditions make groundwater more vulnerable to impacts from irrigated agricultural activities ~~(high vulnerability areas). It shall also provide the rationale for proposed vulnerability determinations.~~
- Determine the merit and feasibility of incorporating existing groundwater data collection efforts, and their corresponding monitoring well systems for obtaining appropriate groundwater quality information to achieve the objectives of and support groundwater monitoring activities under this Order. -This shall include specific findings and conclusions and provide the rationale for conclusions.
- Prepare a ranking of high vulnerability areas for staged implementation of the Groundwater Monitoring Strategy described below to provide a basis for prioritization of workplan activities.
- The GAR shall discuss pertinent geologic and hydrogeologic information for the third-party area(s) and utilize GIS mapping applications, graphics, and tables, as appropriate, in order to clearly convey pertinent data, support data analysis, and show results.

4. Groundwater vulnerability designations. The GAR shall designate high/low vulnerability areas for groundwater in consideration of high and low vulnerability definitions provided in Attachment E of the Order. Vulnerability designations may be refined/ updated periodically during the Monitoring Report process. The third-party must review and confirm or modify vulnerability designations every five (5) years after Executive Officer approval of the GAR. The vulnerability designations will be made by the third-party using a combination of physical properties (soil type, depth to groundwater, known agricultural impacts to beneficial uses, etc.) and management practices (irrigation method, crop type, nitrogen application and removal rates, etc.). The third-party shall provide the rationale for proposed vulnerability determinations. The Executive Officer will make the final determination regarding vulnerability designations.

If the GAR is not submitted to the board by the required deadline, the Executive Officer will designate default high/low vulnerability groundwater areas using such information as 1) those areas that have been identified by the State Water Board as Hydrogeologically Vulnerable Areas, 2) California Department of Pesticide Regulation groundwater protection areas, and 3) areas with exceedances of water quality objectives for which irrigated agriculture waste discharges may cause or contribute to the exceedance.

5. Prioritization of high vulnerability groundwater areas. The third-party may prioritize the areas designated as high vulnerability areas to comply with the requirements of this Order, including conducting monitoring programs and carrying out required studies. When establishing relative priorities for high vulnerability areas, the third party may consider, but not be limited to, the following:

- Identified exceedances of water quality objectives for which irrigated agriculture waste discharges are the cause, or a contributing source.
- The proximity of the high vulnerability area to areas contributing recharge to urban and rural communities where groundwater serves as a significant source of supply.
- Existing field or operational practices identified to be associated with irrigated agriculture waste discharges that are the cause, or a contributing source.

T
E
N
T
A
T
I
V
E

- The largest acreage commodity types comprising up to at least 80% of the irrigated agricultural acreage in the high vulnerability areas and the irrigation and fertilization practices employed by these commodities.
- Legacy or ambient conditions of the groundwater.
- Groundwater basins currently or proposed to be under review by CV-SALTS.
- Identified constituents of concern, e.g., relative toxicity, mobility.

Additional information such as models, studies, and information collected as part of this Order may also be considered in designating and prioritizing vulnerability areas for groundwater. Such data includes, but is not limited to, 1) those areas that have been identified by the State Water Board as Hydrogeologically Vulnerable Areas, 2) California Department of Pesticide Regulation groundwater protection areas, and 3) areas with exceedances of water quality objectives for which irrigated agriculture waste discharges may cause or contribute to the exceedance.

The Executive Officer will review and may approve or require changes to any third-party proposed high/low vulnerability areas and the proposed priority ranking. The vulnerability areas, or any changes thereto, shall not be effective until third-party receipt of written approval by the Executive Officer.

C. Groundwater Monitoring StrategyB. Management Practice Evaluation Program

The goal of the Management Practice Evaluation Program (MPEP) is to determine the effects, if any, irrigated agricultural practices have on first encountered groundwater. A MPEP is required in high vulnerability groundwater areas and must address the constituents of concern described in the GAR. This section provides the goals, objectives, and minimum reporting requirements for the MPEP. As specified in section IV.D of this MRP, the third-party is required to develop a workplan that will describe the methods that will be utilized to achieve the MPEP requirements.

1. Objectives. The objectives of the MPEP are to:

Identify

~~The strategy for groundwater monitoring consists of two parallel tracks; 1) a Trend Monitoring Program and 2) a Representative Monitoring Program. Each of these two groundwater monitoring programs has its own specific objectives, and the design of the associated monitoring networks will differ in accordance with the specific objectives to be reached. While it is anticipated that these two groundwater monitoring programs will provide sufficient groundwater data to evaluate whether management practices of irrigated agriculture are protective of groundwater quality, the Executive Officer may also, pursuant to Water Code section 13267, order Members to perform groundwater monitoring. Such an order may occur, for instance, if violations of the Order are documented or the irrigated agricultural operation is found to be a significant threat to groundwater quality.~~

1. Trend Groundwater Monitoring Program

~~a. Objectives – The objectives of the Trend Groundwater Monitoring Program are (1) to determine baseline quality of groundwater relevant to irrigated agriculture, and (2) to develop long term groundwater quality information that can be used to evaluate the regional effects (i.e., not site-specific effects) of irrigated agriculture and its practices.~~

~~b. Implementation – To reach the stated objectives for the Trend Groundwater Monitoring Program, the third party shall develop a groundwater monitoring network that will (1) be implemented over both high and low vulnerability areas in the third-party area; and will (2) employ shallow wells, but not necessarily wells completed in the uppermost zone of first encountered groundwater. The use of existing wells is less costly than installing wells~~

T
E
N
T
A
T
I
V
E

~~specifically designed for groundwater monitoring, while still yielding data which can be compared with historical and future data to evaluate long term groundwater trends. The third party may also consider using existing monitoring networks such as those used by AB 3030 and SB 1938 plans.~~

~~The third party shall submit a proposed Trend Groundwater Monitoring Workplan described in section IV.D.1 below to the Central Valley Water Board. The proposed network shall consist of a sufficient number of wells to provide coverage in the third party geographic area so that baseline conditions and composite regional effects of irrigated agriculture can be assessed according to the Trend monitoring objectives. The rationale for the distribution of Trend monitoring wells shall be included in the workplan. A required workplan for conducting trend monitoring within the third party's boundaries is detailed in section IV.D.1 below.~~

~~c. Reporting - The results of the trend monitoring are to be included in the third party's Monitoring Report and shall include a map of the sampled wells, tabulation of the analytical data, and time concentration charts. Groundwater monitoring data are to be submitted electronically to the State Water Board's GeoTracker Database and to the Central Valley Water Board.~~

~~Following collection of sufficient data (sufficiency to be determined by the method of analysis proposed by the third party) from each well, the third party is to evaluate the data for trends. The methods to be used to evaluate trends shall be proposed by the third party in the Trend Groundwater Monitoring Workplan described in section IV.D.1 below.~~

~~2. Representative Groundwater Monitoring Program~~

- ~~• A Representative Groundwater Monitoring Program (RGMP) is required where known groundwater quality impacts exist for which irrigated agricultural operations are a potential contributor or where conditions make groundwater more vulnerable to impacts from irrigated agricultural activities (high vulnerability areas). The objective of the RGMP is to identify whether existing site-specific and/or commodity-specific management practices are protective of groundwater quality and whether that determination is affected by site conditions in the within high vulnerability groundwater areas. A second objective of the RGMP is to assess whether, and to what extent, any~~
- ~~• Determine if newly implemented management practices are improving or may result in improving groundwater quality.~~
- ~~• Develop an annual estimate of the potential mass loading of nitrogen to groundwater and other transport and storage mechanisms (e.g., crop uptake, soil, air, etc.) in high vulnerability groundwater areas.~~
- ~~• Utilize the results of evaluated management practices to determine whether practices implemented at represented Member farms (i.e., those not specifically evaluated, but having similar site conditions), need to be improved.~~

Given the wide range of management practices/commodities that are used within the third party's boundaries, it is anticipated that the third party will rank or prioritize its high vulnerability areas and commodities, and present a phased approach to implement the RGMP MPEP.

~~2. a. Implementation - The RGMP requires monitoring of wells completed into first encountered groundwater. Monitoring of first encountered groundwater is important because it more readily. Since management practices evaluation may transcend watershed or third party boundaries, this Order allows identification of developing a MPEP on a watershed or regional basis that involves participants in other areas or third party groups, provided the area from which water entering a well originates than deeper wells and allows identification of changes in~~

T
E
N
T
A
T
I
V
E

~~groundwater quality from activities on the surface at the earliest possible time. Representative monitoring may be evaluation studies are conducted in a manner representative of areas to which it will be applied. The MPEP may be conducted in one of the following ways:~~

- ~~• By the third-party,~~
- ~~• by watershed or commodity groups within an area with known groundwater impacts or vulnerability, or~~
- ~~• by watershed or commodity groups that wish to determine the effects of regional or commodity driven management practices. As such, representative monitoring may transcend watershed or third-party boundaries, involving participants in other areas or third-party groups, provided the monitoring is conducted in a manner representative of areas to which it will be applied.~~

A master schedule describing the rank or priority for the investigation(s) of the high vulnerability areas (or commodities within these areas) to be examined under the RGMPMPEP shall be prepared and submitted to the Executive Officer as detailed in the Representative Groundwater Monitoring Management Practices Evaluation Program Workplan section IV.D below.

- 4.3. ~~b. — Report—~~ Reports of the RGMP may MPEP must be submitted to the Executive Officer as part of the third-party's Monitoring Report or in a separate report due on the same date as the Monitoring Report. The report shall include all data¹⁴ (including analytical reports) collected by each phase of the RGMPMPEP since the previous report was submitted. The report shall also contain a tabulated summary of data collected to date by the Representative Groundwater Monitoring Program. MPEP. The report shall summarize the monitoring activities conducted under the RGMPMPEP, and identify the number and location of installed monitoring wells relative to each other and other types of monitoring devices. Within each report, the third-party shall evaluate the groundwater monitoring data and make a determination whether groundwater is being impacted by activities at farms being monitored by the RGMP. ~~If the management practices being implemented at a monitored farm are found not to be protective of groundwater quality, the Executive Officer may issue an order to the owner/operator of the monitored farm to identify and implement management practices that are protective of groundwater quality prior to submittal of the Summary Representative Monitoring Report (SRMR) described below. MPEP.~~

Each report shall also include an evaluation of whether the specific phase(s) of the Representative Groundwater Monitoring Management Practices Evaluation Program is/are on schedule to provide the data needed to complete the SRMR Management Practices Evaluation Report (detailed below) by the required deadline. If the evaluation concludes that information needed to complete the SRMR Management Practices Evaluation Report may not be available by the required deadline, the report shall include measures that will be taken to bring the program back on schedule.

- ~~c. Summary Representative Monitoring~~4. Management Practices Evaluation Report— No later than six (6) years after implementation of each phase of the RGMPMPEP, the third-party shall submit a Summary Representative Monitoring Management Practices Evaluation Report (SRMR MPEP) identifying management practices that are protective of groundwater quality for the range of conditions found at farms covered by that phase of the study. The identification of management practices for the range of conditions must be of sufficient specificity to allow

¹⁴ The data need not be associated with a specific parcel or Member.

T
E
N
T
A
T
I
V
E

Members of the third-party and staff of the Central Valley Water Board to identify which practices at monitored farms are appropriate for farms with the same or similar range of site conditions, and generally where such farms may be located within the third-party area (e.g., the summary report may need to include maps of the third-party that identify the types of management practices that should be implemented in certain areas based on specified site conditions). -The summary report MRPER must include an adequate technical justification for the conclusions that incorporates available data and reasonable interpretations of geologic and engineering principles to identify management practices protective of groundwater quality.

_____The report shall include an assessment of whether monitored farms are implementing each management practice to determine which management practices that are protective of groundwater quality. If monitoring concludes that management practices currently in use are not protective of groundwater quality based upon information contained in the SRMR MRPER, and therefore are not confirmed to be sufficient to ensure compliance with the groundwater receiving water limitations of the Order, the third-party in conjunction with commodity groups and/or other experts (e.g., University of California Cooperative Extension, Natural Resources Conservation Service) shall propose and implement new/alternative management practices to be subsequently evaluated at monitored farms. Where applicable, existing GQMPs shall be updated by the third-party group to be consistent with completed SRMRs the findings of the Management Practices Evaluation Report.

DC. Groundwater Quality Trend Monitoring Workplans

The third-party shall develop and submit workplans for conducting Trend and Representative Groundwater Monitoring to the Executive Officer for approval. These workplans shall be submitted within two (2) years of third-party receipt of a NOA from the board. Required workplan elements are presented in the sections below.

1. Trend Monitoring Workplan

The third-party shall develop a workplan for conducting trend monitoring within its boundaries that meets This section provides the objectives and minimum sampling and reporting requirements described for Groundwater Quality Trend Monitoring. As specified in section IV.C.1. The Trend Monitoring Workplan shall also provide information/details regarding the following topics:

- ~~a. A discussion of the rationale for the number of proposed wells to be monitored and their locations. The rationale needs to consider: 1) the variety of agricultural commodities produced within the third party's boundaries (particularly those commodities comprising the most irrigated agricultural acreage), 2) the conditions discussed/identified in the GAR related to the vulnerability prioritization within the third-party area, and 3) the areas identified in the GAR as contributing significant recharge to urban and rural communities where groundwater serves as a significant source of supply.~~
- ~~b. Well details for wells proposed for trend monitoring, including:
 - i. GPS coordinates;
 - ii. Physical address of the property on which the well is situated (if available);
 - iii. California State well number (if known);
 - iv. Well depth;
 - v. Top and bottom perforation depths;
 - vi. A copy of the water well drillers log, if available;
 - vii. Depth of standing water (static water level), if available (this may be obtained after implementing the program); and
 - viii. Well seal information (type of material, length of seal).~~

T
E
N
T
A
T
I
V
E

~~c. Proposed sampling schedule: Trend monitoring wells E of this MRP, the third-party is required to develop a workplan that will be sampled annually at the same time of the year for the indicator parameters identified in Table 3 below describe the methods that will be utilized to achieve the trend monitoring requirements.~~

1. Objectives. The objectives of Groundwater Quality Trend Monitoring are (1) to determine baseline quality of groundwater relevant to irrigated agriculture, and (2) to develop long-term groundwater quality information that can be used to evaluate the regional effects (i.e., not site-specific effects) of irrigated agriculture and its practices.

2. Implementation. To reach the stated objectives for the Groundwater Quality Trend Monitoring program, the third-party shall develop a groundwater monitoring network that will (1) be implemented over both high and low vulnerability areas in the third-party area; and will (2) employ shallow wells, but not necessarily wells completed in the uppermost zone of first encountered groundwater. The use of existing wells is less costly than installing wells specifically designed for groundwater monitoring, while still yielding data which can be compared with historical and future data to evaluate long-term groundwater trends. The third party may also consider using existing monitoring networks such as those used by AB 3030 and SB 1938 plans.

The third-party shall submit a proposed Trend Groundwater Monitoring Workplan described in section IV.E below to the Central Valley Water Board. The proposed network shall consist of a sufficient number of wells to provide coverage in the third-party geographic area so that baseline conditions and composite regional effects of irrigated agriculture can be assessed according to the trend monitoring objectives. The rationale for the distribution of trend monitoring wells shall be included in the workplan.

3. Reporting. The results of trend monitoring are to be included in the third-party's Monitoring Report and shall include a map of the sampled wells, tabulation of the analytical data, and time concentration charts. Groundwater monitoring data are to be submitted electronically to the State Water Board's GeoTracker Database and to the Central Valley Water Board.

Following collection of sufficient data (sufficiency to be determined by the method of analysis proposed by the third-party) from each well, the third-party is to evaluate the data for trends. The methods to be used to evaluate trends shall be proposed by the third-party in the Trend Groundwater Monitoring Workplan described in section IV.d. Proposed method(s) to be used to evaluate trends in the groundwater monitoring data over time.

Trend monitoring wells are also to be sampled initially and once every five years thereafter for the following COCs:

- Total dissolved solids (TDS)
- General minerals: — Anions (carbonate, bicarbonate, chloride, and sulfate)
- Cations (boron, calcium, sodium, magnesium, and potassium)

2. Representative Groundwater Monitoring Workplan

The third-party E below.

D. Management Practices Evaluation Workplan

The third-party, either solely or in conjunction with a Representative Monitoring Management Practices Evaluation Group¹⁵ (watershed or commodity based), shall prepare either a Representative Groundwater Monitoring a Management Practices Evaluation Workplan(s) that proposes. The workplan shall be submitted to the Executive Officer for review and approval. The workplan must identify a reasonable number of monitoring-locations situated throughout the high vulnerability groundwater area(s), and encompassing the range of management practices used, the major agricultural commodities, and site conditions under which these commodities are grown, or a scientifically sound alternative to groundwater monitoring that will provide equivalent information. Any alternative to groundwater monitoring, such as modeling or vadose zone sampling, must be proposed by the third-party and approved by the Executive Officer in order to be included within the Representative Groundwater Monitoring Workplan. Any proposed alternative must ensure that the objectives of the Representative Groundwater Monitoring program are accomplished and sufficient groundwater monitoring is collected or available to confirm or validate the effectiveness of the alternative method(s). For any method proposed as an alternative to groundwater monitoring, sufficient data must be collected to confirm that the method can accurately predict the concentrations of COCs in first-encountered groundwater.

The workplan shall be designed to meet the objectives and minimum requirements described in section IV.C.2. If the third-party chooses to rank or prioritize its high vulnerability areas in its GAR, a single Representative Groundwater Monitoring Workplan may be prepared which includes a timeline describing the priority and schedule for each of the areas/commodities to be investigated and the submittal dates for addendums proposing the details of each area's investigation. B of this MRP.

1. Workplan approach. The workplan must include a scientifically sound approach to evaluating the effect of management practices on groundwater quality. The proposed Representative approach may include:

- groundwater monitoring,
- modeling,
- vadose zone sampling, or
- other scientifically sound and technically justifiable methods for meeting the objectives of the Management Practices Evaluation Program.

¹⁵ A Representative Monitoring Group refers to an entity that may be formed or collaborated with to develop and carry out representative groundwater monitoring (e.g., commodity groups).

T
E
N
T
A
T
I
V
E

Sufficient groundwater monitoring data should be collected or available to confirm or validate the conclusions regarding the effect of the evaluated practices on groundwater quality. Any groundwater quality monitoring that is part of the workplan must be of first encountered groundwater. Monitoring of first encountered groundwater more readily allows identification of the area from which water entering a well originates than deeper wells and allows identification of changes in groundwater quality from activities on the surface at the earliest possible time.

2. Groundwater Monitoring-quality monitoring –constituent selection. Where groundwater quality monitoring is proposed, the Management Practices Evaluation Workplan must identify-;

- the constituents to be monitoredassessed, and
- the frequency of monitoringthe data collection (e.g., groundwater quality or vadose zone monitoring; soil sampling) for each constituent.

The proposed constituents shall be selected based upon the information collected from the GAR and must be sufficient to identifydetermine if the management practices being monitoredevaluated are protective of groundwater quality. At a minimum, the baseline constituents to be monitored under Representative Groundwater Monitoringfor any groundwater quality monitoring must include those parameters required under Trend Monitoringtrend monitoring.

3. Workplan implementation and analysis. The proposed Representative Groundwater MonitoringManagement Practices Evaluation Workplan shall contain sufficient information/justification for the Executive Officer to evaluate the ability of the monitoringevaluation program to identify whether existing management practices in combination with site conditions, are protective of groundwater quality. The workplan must explain how data collected at monitoredevaluated farms will be used to assess potential impacts to groundwater at represented farms that are not part of the Representative Groundwater MonitoringManagement Practices Evaluation Program’s monitoring network. This information is needed to demonstrate whether data collected from the monitoring network will allow identification of management practices that are protective of water quality at Member farms represented by the third-party, including represented farms from(i.e., farms for which on-site data areevaluation of practices is not collected.conducted).

4. Master workplan –prioritization. If the third-party chooses to rank or prioritize its high vulnerability areas in its GAR, a single Management Practices Evaluation Workplan may be prepared which includes a timeline describing the priority and schedule for each of the areas/commodities to be investigated and the submittal dates for addendums proposing the details of each area’s investigation.

5. Installation of monitoring wells. Upon approval of the Representative Groundwater MonitoringManagement Practices Evaluation Workplan, the third-party shall prepare and submit a Representative Groundwater Monitoring Workplan-Monitoring Well Installation and Sampling Plan (MWISP-), if applicable. A description of the MWISP and its required elements/submittals are presented as Appendix MRP-2. The MWISP must be approved by the Executive Officer prior to the installation of the MWISP’s associated monitoring wells.

E. Trend Monitoring Workplan

The third-party shall develop a workplan for conducting trend monitoring within its boundaries that meets the objectives and minimum requirements described in section IV.C of this MRP. The

T
E
N
T
A
T
I
V
E

workplan shall be submitted to the Executive Officer for review and approval. The Trend Monitoring Workplan shall provide information/details regarding the following topics:

1. *Workplan approach.* A discussion of the rationale for the number of proposed wells to be monitored and their locations. The rationale needs to consider: 1) the variety of agricultural commodities produced within the third-party's boundaries (particularly those commodities comprising the most irrigated agricultural acreage), 2) the conditions discussed/identified in the GAR related to the vulnerability prioritization within the third-party area, and 3) the areas identified in the GAR as contributing significant recharge to urban and rural communities where groundwater serves as a significant source of supply.

2. *Well details.* Details for wells proposed for trend monitoring, including:
 - ix. GPS coordinates;
 - x. Physical address of the property on which the well is situated (if available);
 - xi. California State well number (if known);
 - xii. Well depth;
 - xiii. Top and bottom perforation depths;
 - xiv. A copy of the water well drillers log, if available;
 - xv. Depth of standing water (static water level), if available (this may be obtained after implementing the program); and
 - xvi. Well seal information (type of material, length of seal).

3. *Proposed sampling schedule.* Trend monitoring wells will be sampled, at a minimum, annually at the same time of the year for the indicator parameters identified in Table 3 below.

4. *Workplan implementation and analysis.* Proposed method(s) to be used to evaluate trends in the groundwater monitoring data over time.

Table 3: Trend Monitoring Constituents

<u>Annual Monitoring</u>
<u>Conductivity (at 25 °C)* (µmhos/cm)</u>
<u>pH* in pH units</u>
<u>Dissolved oxygen (DO)* (mg/L)</u>
<u>Temperature* (°C)</u>
<u>Nitrate as nitrogen (mg/L)</u>
<u>* field parameters</u>
<u>Trend monitoring wells are also to be sampled initially and once every five years thereafter for the following COCs:</u>
<u>Total dissolved solids (TDS) (mg/L)</u>
<u>General minerals (mg/L):</u>
<u> Anions (carbonate, bicarbonate, chloride, and sulfate)</u>
<u> Cations (boron, calcium, sodium, magnesium, and potassium)</u>

V. Third-Party Reporting Requirements

Reports and notices shall be submitted in accordance with section IX of the Order, Reporting Provisions.

T
E
N
T
A
T
I
V
E

A. Quarterly Submittals of Surface Water Monitoring Results

Each quarter, the third-party shall submit the previous quarter's surface water monitoring results in an electronic format. The deadlines for these submittals are listed in Table 4 below.

Table 4. Quarterly Surface Water Monitoring Data Reporting Schedule

Due Date	Type	Reporting Period
1 March	Quarterly Monitoring Data Report	1 July through 30 September of previous calendar year
1 June	Quarterly Monitoring Data Report	1 October through 31 December of previous calendar year
1 September	Quarterly Monitoring Data Report	1 January through 31 March of same calendar year
1 December	Quarterly Monitoring Data Report	1 April through 30 June of same calendar year

Exceptions to due dates for submittal of electronic data may be granted by the Executive Officer if good cause is shown. The Quarterly Surface Water Monitoring Data Report shall include the following for the required reporting period:

1. An Excel workbook containing an export of all data records uploaded and/or entered into the CEDEN comparable database (surface water data). The workbook shall contain, at a minimum, those items detailed in the QAPP Guidelines-most recent version of the third-party's approved QAPP.
2. The most current version of the third-party's eQAPP.
3. Electronic copies of all field sheets.
4. Electronic copies of photos obtained from all surface water monitoring sites, clearly labeled with the CEDEN comparable station code and date.
5. Electronic copies of all applicable laboratory analytical reports on a CD.
6. For toxicity reports, all laboratory raw data must be included in the analytical report (including data for failed tests), as well as copies of all original bench sheets showing the results of individual replicates, such that all calculations and statistics can be reconstructed. The toxicity analyses data submittals must include individual sample results, negative control summary results, and replicate results. The minimum in-test water quality measurements reported must include the minimum and maximum measured values for specific conductivity, pH, ammonia, temperature, and dissolved oxygen.
7. For chemistry data, analytical reports must include, at a minimum, the following:
 - a. A lab narrative describing QC failures,
 - b. Analytical problems and anomalous occurrences,
 - c. Chain of custody (COCs) and sample receipt documentation,
 - d. All sample results for contract and subcontract laboratories with units, RLs and MDLs,
 - e. Sample preparation, extraction and analysis dates, and
 - f. Results for all QC samples including all field and laboratory blanks, lab control spikes, matrix spikes, field and laboratory duplicates, and surrogate recoveries.

Laboratory raw data such as chromatograms, spectra, summaries of initial and continuing calibrations, sample injection or sequence logs, prep sheets, etc., are not required for submittal, but must be retained by the laboratory in accordance with the requirements of section X of the Order, Record-keeping Requirements.

T
E
N
T
A
T
I
V
E

If any data are missing from the quarterly report, the submittal must include a description of what data are missing and when they will be submitted to the Central Valley Water Board. If data are not loaded into the CEDEN comparable database, this shall also be noted with the submittal.

B. Annual Groundwater Monitoring Results

Annually, by 1 May, the third-party shall submit the prior year's groundwater monitoring results as an Excel workbook containing an export of all data records uploaded and/or entered into the State Water Board GeoTracker database. If any data are missing from the report, the submittal must include a description of what data are missing and when they will be submitted to the Central Valley Water Board. If data are not loaded into the GeoTracker database, this shall also be noted with the submittal.

C. Monitoring Report

The Monitoring Report shall be submitted by 1 May every ~~two (2) years~~year, with the first report due 1 May 2014. The report shall cover the monitoring periods from the previous ~~two~~hydrologic water ~~years~~year. A hydrologic water year is defined as 1 October through 30 September. The report shall include the following components:

1. Signed transmittal letter;
2. Title page;
3. Table of contents;
4. Executive summary;
5. Description of the third-party geographical area;
6. Monitoring objectives and design;
7. Sampling site/monitoring well descriptions and rainfall records for the time period covered under the Monitoring Report;
8. Location map(s) of sampling sites/monitoring wells, crops and land uses;
9. Tabulated results of all analyses arranged in tabular form so that the required information is readily discernible;
10. Discussion of data relative to water quality objectives, and water quality management plan milestones, where applicable;
11. Sampling and analytical methods used;
12. Summary of Quality Assurance Evaluation results (as identified in the most recent version of the third-party's approved QAPP Guidelines for Precision, Accuracy and Completeness);
13. Specification of the method(s) used to obtain estimated flow at each surface water monitoring site during each monitoring event;
14. Summary of exceedances of water quality objectives/trigger limits occurring during the reporting period and for surface water related pesticide use information;
15. Actions taken to address water quality exceedances that have occurred, including but not limited to, revised or additional management practices implemented;
16. Evaluation of monitoring data to identify spatial trends and patterns;
17. Summary of Annual-Nitrogen Budgets/Management Plan information submitted to the third-party, ~~including confirmation of budget development for those Members that are subject to such requirements~~;
18. Summary of management practice information collected as part of Farm Evaluations;
19. Summary of mitigation monitoring;
20. Summary of education and outreach activities;
21. Conclusions and recommendations.

Additional requirements and clarifications necessary for the above report components are described below.

T
E
N
T
A
T
I
V
E

Report Component (1) — Signed Transmittal Letter

A transmittal letter shall accompany each report. The transmittal letter shall be submitted and signed in accordance with the requirements of section IX of the Order, Reporting Provisions.

Report Component (8) — Location Maps

Location map(s) showing the sampling sites/monitoring wells, crops, and land uses within the third party's geographic area must be updated (based on available sources of information) and included in the Monitoring Report. An accompanying GIS shapefile or geodatabase of monitoring site and monitoring well information must include the CEDEN comparable site code and name (surface water only) and Global Positioning System (GPS) coordinates (surface water sites and wells used for monitoring). The map(s) must contain a level of detail that ensures they are informative and useful. GPS coordinates must be provided as latitude and longitude in the decimal degree coordinate system (at a minimum of five decimal places). The datum must be either WGS 1984 or NAD83, and clearly identified on the map. The source and date of all data layers must be identified on the map(s). All data layers/shapefiles/geodatabases included in the map shall be submitted with the Monitoring Report.

Report Component (9) – Tabulated Results

In reporting monitoring data, the third-party shall arrange the data in tabular form so that the required information is readily discernible. The data shall be summarized in such a manner to clearly illustrate compliance with the data collection requirements of the MRP.

Report Component (10) — Data Discussion to Illustrate Compliance

The report shall include a discussion of the third-party's compliance with the data collection requirements of the MRP. If a required component was not met, an explanation for the missing data must be included. Results must also be compared to water quality objectives and trigger limits.

Report Component (12) — Quality Assurance Evaluation (Precision, Accuracy and Completeness)

A summary of precision and accuracy results (both laboratory and field) is required in the report. The required data quality objectives are identified in the QAPP Guidelines most recent version of the third-party's approved QAPP; acceptance criteria for all measurements of precision and accuracy must be identified. The third-party must review all QA/QC results to verify that protocols were followed and identify any results that did not meet acceptance criteria. A summary table or narrative description of all QA/QC results that did not meet objectives must be included. Additionally, the report must include a discussion of how the failed QA/QC results affect the validity of the reported data. The corrective actions to be implemented are described in the QAPP Guidelines.

In addition to precision and accuracy, the third-party must also calculate and report completeness. Completeness includes the percentage of all quality control results that meet acceptance criteria, as well as a determination of project completeness. For further explanation of this requirement, refer to the most recent version of the QAPP Guidelines. The third-party may ask the laboratory to provide assistance with evaluation of their QA/QC data, provided that the third-party prepares the summary table or narrative description of the results for the Monitoring Report.

Report Component (14) — Summary of Exceedances

A summary of the exceedances of water quality objectives or triggers that have occurred during the monitoring period is required in the Monitoring Report. In the event of exceedances for pesticides or toxicity in surface water, pesticide use data must be included in the Monitoring Report. Pesticide use

T
E
N
T
A
T
I
V
E

information may be acquired from the agricultural commissioner. This requirement is described further in the following section on Exceedance Reports.

Report Component (16) — Evaluation of Monitoring Data

The third-party must evaluate its monitoring data in the Monitoring Report in order to identify potential trends and patterns in surface and groundwater quality that may be associated with waste discharge from irrigated lands. As part of this evaluation, the third-party must analyze all readily available monitoring data that meet program quality assurance requirements to determine deficiencies in monitoring for discharges from irrigated agricultural lands and whether additional sampling locations are needed. If deficiencies are identified, the third-party must propose a schedule for additional monitoring or source studies. Upon notification from the Executive Officer, the third-party must monitor any parameter in a watershed that lacks sufficient monitoring data (i.e., a data gap should be filled to assess irrigated agriculture's effects on water quality).

The third-party should incorporate pesticide use information, as needed, to assist in its data evaluation. Wherever possible, the third-party should utilize tables or graphs that illustrate and summarize the data evaluation.

Report Component (17) – Summary of ~~Annual~~Reported Nitrogen BudgetsData

The third-party shall aggregate information from Members' ~~Annual~~Nitrogen Budget WorksheetsManagement Plan Summary Reports to characterize the input, uptake, and loss of nitrogen fertilizer applications by specific crops in the Eastern San Joaquin River Watershed. -The third-party's assessment of ~~the nitrogen budget~~Nitrogen Management Plan information ~~should~~must include, at a minimum, comparisons of farms with the same crops, similar soil conditions, and similar practices (e.g., irrigation management).- This information will include a summary of nitrogen consumption ratios by crop or other equivalent reporting units.- ~~The third-party will also provide the data and the estimated crop nitrogen needs for the different crop types. The nitrogen consumption ratio is the ratio of total nitrogen available for crop uptake (from sources including, but not limited to, fertilizers, manures, composts, nitrates in irrigation supply water and soil) to the estimated crop consumption of nitrogen. The third-party will also provide the data submitted by their Members that were used to develop this summary in an electronic format, compatible with ArcGIS, identified to at least the section (TRS) level. The ratio is an estimate of anticipated crop consumption in comparison to total applied nitrogen through sources including fertilizers, manures, composts, nitrates in irrigation supply water and other sources. township level.~~¹⁶

Report Component (18) – Summary of Management Practice Information

The third-party will aggregate and summarize information collected from Farm Evaluations. The third party will provide the data ~~used~~submitted by their Members to develop this summary in an electronic format, compatible with ArcGIS, identified to at least the ~~section (TRS)~~township level.¹²

Report Component (19) – Mitigation Monitoring

As part of the Monitoring Report, the third-party shall report on the CEQA mitigation measures reported by Members to meet the provisions of the Order and any mitigation measures the third-party has implemented on behalf of Members. The third-party is not responsible for submitting information that ~~Dischargers~~Members do not send them directly by the 1 March deadline (see section VII.E of the Order for individual Discharger mitigation monitoring requirements). The Mitigation Monitoring Report shall include information on the implementation of CEQA mitigation measures (mitigation measures are described in Attachment C of the Order), including the measure implemented, identified potential impact the measure addressed, location of the mitigation measure (township, range, section), and any steps taken to monitor the ongoing success of the measure.

¹⁶ The Member and their associated parcel need not be identified.

T
E
N
T
A
T
I
V
E

D. Surface Water Exceedance Reports

The third-party shall provide surface water exceedance reports if monitoring results show exceedances of adopted numeric water quality objectives or trigger limits, which are based on interpretations of narrative water quality objectives. For each surface water quality objective exceeded at a monitoring location, the third-party shall submit an Exceedance Report to the Central Valley Water Board. The estimated flow at the monitoring location and photographs of the site must be submitted in addition to the exceedance report but do not need to be submitted more than once. The third-party shall evaluate all of its monitoring data and determine exceedances no later than five (5) business days after receiving the laboratory analytical reports for an event. Upon determining an exceedance, the third-party shall send the Exceedance Report by email to the third-party's designated Central Valley Water Board staff contact by the next business day. The Exceedance Report shall describe the exceedance, the follow-up monitoring, and analysis or other actions the third-party may take to address the exceedance. Upon request, the third-party shall also notify the agricultural commissioner of the county in which the exceedance occurred and/or the director of the Department of Pesticide Regulation.

Surface water exceedances of pesticides or toxicity: When any pesticide or toxicity exceedance is identified at a location that is not under an approved management plan for toxicity or pesticides, follow-up actions must include an investigation of pesticide use within the location's watershed area. For toxicity exceedances, the investigation must include all pesticides applied within the area that drains to the monitoring site during the four weeks immediately prior to the exceedance date. The pesticide use information may be acquired from the agricultural commissioner, or from information received from Members within the same drainage area. Results of the pesticide use investigation must be summarized and discussed in the Monitoring Report.

VI. Group Option - Templates

The Order provides the option for the third-party to develop templates as an alternative to templates provided by the Central Valley Water Board's Executive Officer. This section describes the minimum requirements that must be met prior to approval of those templates.

Prior to Executive Officer approval of any template, the Central Valley Water Board will post the draft template on its website for a review and comment period. Stakeholder comments will be considered by Central Valley Water Board staff. Based on information provided by the third-party and after consideration of comments provided by other interested stakeholders, the Central Valley Water Board's Executive Officer will either: (1) approve the template; (2) conditionally approve the template or (3) disapprove the template. Review of the template and the associated action by the Executive Officer will be based on findings as to whether the template meets applicable requirements and contains all of the information required.

A. Farm Evaluation Template

Should the third-party choose to develop the Farm Evaluation Template per the Group Option outlined in section VIII.C of the Order, the following provisions apply.

The third-party must develop a template or web-based information system to gather Farm Evaluation information from Members for each parcel enrolled. The goal of the template is to gather information on general site conditions and Member management practices in place to protect water quality. At a minimum, the template must be designed to collect the following information.

- Identification of the crops grown and acreage of each crop.
- Location of the farm.

T
E
N
T
A
T
I
V
E

- Identification of on-farm management practices implemented to achieve the Order's farm management performance standards. Specifically track which management practices recommended in management plans have been implemented at the farm.
- Identification of whether or not there is movement of soil during storm events and/or during irrigation drainage events (sediment and erosion risk areas) and a description of where this occurs.
- Identification of whether or not water leaves the property and is conveyed downstream and a description of where this occurs.
- Location of in-service wells and abandoned wells. Identification of whether wellhead protection and backflow prevention practices have been implemented.

As part of its submittal for approval, the third-party must identify the entities that participated in the development of the Farm Evaluation Template.

B. Nitrogen Management Plan Template

Should the third-party choose to develop the Nitrogen Management Plan Template per the Group Option outlined in section VIII.C of the Order, the following provisions apply.

The Nitrogen Management Plan template must be developed by the third-party in consultation with the Central Valley Water Board, and as appropriate, the California Department of Food and Agriculture (CDFA), the University of California Extension, and the Natural Resource Conservation Services (NRCS). In developing the template, the third-party should consider, to the extent appropriate, the major criteria established in Code 590 of the NRCS Nutrient Management document, including soil and plant tissue testing, nitrogen application rates, nitrogen application timing, consideration of organic nitrogen fertilizer, consideration of irrigation water nitrogen levels.

In addition to the Nitrogen Management Plan Template, the third-party must provide a template for the Nitrogen Management Plan Summary Report. The Nitrogen Management Plan Summary Report Template must provide for reporting of the nitrogen consumption ratio for each crop grown for each parcel enrolled by the Member (this MRP requires reporting of this information to the board by township, Member/parcel need not be specified). The Nitrogen Management Plan Summary Report must also gather information required in the Monitoring Report and information needed for the Management Practices Evaluation Program.¹⁷

As part of its submittal for approval, the third-party must identify the entities that participated in the development of the Nitrogen Management Plan Template.

C. Sediment and Erosion Control Plan Template

Should the third-party choose to develop the Sediment and Erosion Control Plan Template per the Group Option outlined in section VIII.C of the Order, the following provisions apply.

The third-party will create a template to assist Members that must prepare a Sediment and Erosion Control Plan. The goal of the template shall be to assist Members in achieving the farm management performance standards of the Order, which include the requirement to minimize or

¹⁷ The Monitoring Report and MPEP will be developed by the third-party. This template is the mechanism by which the third-party will gather the information necessary to develop the Monitoring Report and conduct the MPEP. As such, this template will be a tool to facilitate Member reporting for third-party studies, analysis, and summary reporting to the board. Unless requested by the Executive Officer, Member completed templates will not be submitted directly to the board.

T
E
N
T
A
T
I
V
E

eliminate the discharge of sediment above natural background levels. At a minimum, the template must be designed to facilitate Member consideration of the following.

- Identification of locations subject to erosion or locations subject to frequent water flow events that may mobilize sediment (sediment and erosion risk areas). Locations to be evaluated include the fields, roads or stream crossings within the enrolled parcel, and discharge points from the field.
- Identification of practices implemented at sediment and erosion risk areas to minimize or eliminate the discharge of sediment above natural background levels.

As part of its submittal for approval, the third-party must identify the entities that participated in the development of the Sediment and Erosion Control Plan Template.

VII. Sediment Discharge and Erosion Assessment Report

The third-party shall prepare a Sediment Discharge and Erosion Assessment Report. The report shall be submitted to the Executive Officer for review. The goal of the report is to determine which irrigated agricultural areas within the Eastern San Joaquin River Watershed are subject to erosion and may discharge sediment that may degrade surface waters. The objective of the report is to determine which Member operations are within such areas, and need to develop a Sediment and Erosion Control Plan. The report must be developed to achieve the above goal and objective and must at a minimum, provide a description of the sediment and erosion areas as a series of ArcGIS shapefiles with a discussion of the methodologies utilized to develop the report.

VI.VIII. Water Quality Triggers for Development of Management Plans

This Order requires that Members comply with all adopted water quality objectives and established federal water quality criteria applicable to their discharges. The *Water Quality Control Plan for the Sacramento River and San Joaquin River Basins* (Basin Plan) contains numeric and narrative water quality objectives applicable to surface water and groundwater within the Order's watershed area. USEPA's 1993 National Toxics Rule (NTR) and 2000 California Toxics Rule (CTR) contain water quality criteria which, when combined with Basin Plan beneficial use designations constitute numeric water quality standards. Table 5 of this MRP lists Basin Plan numeric water quality objectives and NTR/CTR criteria for constituents of concern that may be discharged by Members.

Table 5 does not include water quality criteria that may be used to interpret narrative water quality objectives, which shall be considered trigger limits. Trigger limits will be developed by the Central Valley Water Board staff through a process involving coordination with the Department of Pesticide Regulation (for pesticides) and stakeholder input. The trigger limits will be designed to implement narrative Basin Plan objectives and to protect applicable beneficial uses. The Executive Officer will make a final determination as to the appropriate trigger limits. ~~Any trigger limits proposed by the third party or determination of appropriate trigger limits by the Executive Officer must be consistent with applicable Basin Plan policies governing the interpretation of narrative water quality objectives.~~

VII.IX. Quality Assurance Project Plan (QAPP)

The third-party must develop and/or maintain a QAPP that includes watershed and site-specific information, project organization and responsibilities, and the quality assurance components in the QAPP Guidelines. Chemical, bacteriological, and bioassay analyses shall be conducted at a laboratory certified for such analyses by the California Department of Public Health (DPH), except where the DPH has not developed a certification program for the material to be analyzed.

The East San Joaquin Water Quality Coalition's existing QAPP was approved by the Executive Officer on 25 November 2008. The existing QAPP is acceptable for use by the third-party. Any

T
E
N
T
A
T
I
V
E

necessary modifications to the QAPP for groundwater monitoring shall be submitted with the MPEP and groundwater trend and representative monitoring workplans- (section IV, MRP). Any proposed modifications to the approved QAPP must receive Executive Officer approval prior to implementation.

The Central Valley Water Board may conduct an audit of the third-party's contracted laboratories at any time in order to evaluate compliance with the most current version of the QAPP Guidelines. Quality control requirements are applicable to all of the constituents listed in the QAPP Guidelines, as well as any additional constituents that are analyzed or measured, as described in the appropriate method. Acceptable methods for laboratory and field procedures as well as quantification limits are described in the QAPP Guidelines.

Temperature	Temperature	Basin Plan (h)	variable		IS								
Total Dissolved Solids (TDS)	Chemical Constituents	California Secondary MCL, recommended level	500 – 1,000	mg/L	G & IS	X	X		X	X			--
Turbidity	Turbidity	Basin Plan. Where natural turbidity is <1 NTU	2	NTU	IS								
		Where natural turbidity is between 1 and 5 NTUs, increases shall not exceed 1 NTU.	variable; 2-6	NTU	IS								
		Where natural turbidity is between 5 and 50 NTUs, increases shall not exceed 20%.	variable; 6 - 70	NTU	IS								
		Where natural turbidity is between 50 and 100 NTUs, increases shall not exceed 10 NTUs.	variable; 60-110	NTU	IS								
		Where natural turbidity is greater than 100 NTUs, increases shall not exceed 10%.	variable	NTU	IS								
Zinc	Chemical Constituents	California Secondary MCL (total zinc)	5,000	ug/L	G & IS	X			X				7440-66-6

TENTATIVE

Constituent / Parameter (Synonym)	Basin Plan Water Quality Objective	Source of Numeric Threshold <i>(footnotes in parentheses are at bottom of table)</i>	Numeric Threshold (a)	Units	G= Groundwater IS= Inland Surface Water	Numeric Threshold Protects Designated Beneficial Use(s) in the Water Body:							
						Groundwater			Inland Surface Waters				
						MUN- MCL	MUN- Toxicity	AGR	MUN- MCL	MUN- Toxicity	Aquatic Life & Consump	AGR	CAS Number
Zinc	Toxicity	California Toxics Rule (USEPA) (g) (dissolved zinc)	variable	ug/L	IS						X		

Footnotes to Table 8:

a	Numeric thresholds are maximum levels unless noted otherwise.
b	Monthly mean.
c	See Basin Plan for definition of Critical Year.
d	Applies in waters designated for contact recreation (REC-1).
e	Geometric mean of the fecal coliform concentration based on a minimum of not less than five samples for any 30-day period shall not exceed this number.
f	No more than ten percent of the total number of samples taken during any 30-day period shall exceed this number.
g	These numeric thresholds are hardness dependent. As hardness increases, water quality objectives generally increase.
h	The natural receiving water temperature shall not be altered unless it can be demonstrated to the satisfaction of the Water Board that such alteration does not adversely affect beneficial uses. However, at no time shall the temperature of WARM and COLD waters be increased more than 5 degrees F above natural receiving water temperature.

Abbreviations:

CAS	Chemical Abstracts Service Registry Number
fw	freshwater
MCL	maximum contaminant limit
MUN	municipal and domestic supply

Beneficial Uses:

AGR	Agricultural water uses, including irrigation supply and stock watering
Aquatic Life & Consump	Aquatic life and consumption of aquatic resources
MUN-MCL	Municipal or domestic supply with default selection of drinking water MCL when available
MUN-Toxicity	Municipal or domestic supply with consideration of human toxicity thresholds that are more stringent than drinking water MCLs
