Subject: TUO Condition 1(D)iii--Update

In a continuing effort towards meeting the TUO modified outflow for June 2021 of 3,000 cfs on a 14-day running average and protecting upstream storage levels, Reclamation and DWR are coordinating a "one facility export" operation to begin on June 11.

A one facility export operation utilizes the Delta Mendota Canal (DMC)-CA Intertie (DCI) to help distribute the limited export between the California Aqueduct and the Delta Mendota Canal (DMC) and the limited exports will either be solely from Jones Pumping Plant or Banks Pumping Plant. Beginning June 11, Jones Pumping Plant will be zero cfs and an export rate of 850 cfs through Clifton Court Forebay is planned to meet Byron Bethany Irrigation District and DWR's South Bay Aqueduct needs and will provide water through the DCI to the upper reach of the DMC canal, which is normally fed directly by Jones PP.

Field operations staff will be monitoring both canal systems during this unique operation to evaluate its sustainability of operations and if conditions warrant, exports may be shifted solely to Jones PP or back to a dual facility export operation.

Therefore in accordance with Condition 1(D)iii of the June 1, 2021 Order Conditionally Approving a Petition for Temporary Urgency Changes, the following is a projection of State and federal one-facility exports beginning 6/11/2021, the purposes and considerations for those exports, and an explanation of why it is in the public interest to export that water when D-1641 requirements are not being met.

<table>
<thead>
<tr>
<th>Beginning June 11, 2021 (SWP one facility export operation)</th>
<th>Should a shift be warranted to a CVP one facility export operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>SWP Exports</td>
<td>CVP Exports</td>
</tr>
<tr>
<td>Planned exports</td>
<td>850 cfs</td>
</tr>
</tbody>
</table>
This rate allows the SWP to supply water to Byron Bethany Irrigation District, who diverts from Clifton Court Forebay, and also to the SWP South Bay Public Water Agencies who are not directly connected to San Luis Reservoir and who rely on direct diversions from the Delta to meet their municipal and industrial demands due to limited or exhausted local storage and a lack of sufficient alternative supplies.

This rate allows the CVP the ability to maintain deliveries without the need to start and stop one unit in a 24-hour period (i.e. cycling) which could result in catastrophic damage to the pumping units. Water exported at Jones Pumping Plant is primarily diverted for planning for and meeting municipal and industrial (M&I) public health and safety demands, wildlife refuge demands as required under CVPIA and senior water right holders.

Should a one facility operation not be sustainable at either facility, the following is a projection of State and federal exports, the purposes and considerations for those exports, and an explanation of why it is in the public interest to export that water when D-1641 requirements are not being met.
