Governor

December 7, 2005

Ms. June Christman
Managing Director of Environmental Services
Paramount Petroleum Corporation
14700 Downey Avenue
Paramount, CA 90723

VIA CERTIFIED MAIL RETURNED RECEIPT REQUESTED No. 7002 0860 0004 5295 6994

Dear Ms. Christman:

WASTE DISCHARGE REQUIREMENTS - PARAMOUNT PETROLEUM CORPORATION - PARAMOUNT PETROLEUM CORPORATION FACILITY, PARAMOUNT, CA. (NPDES NO. CA0056065, CI NO. 6038)

Our letters dated October 12, 2005, 2005, transmitted a tentative order for renewal of your permit to discharge wastes under the National Pollutant Discharge Elimination System (NPDES).

Pursuant to Division 7 of the California Water Code, this Regional Board at a public hearing held on December 1, 2005, reviewed the revised tentative requirements, considered all factors in the case, and adopted Order No. R4-2005-0082 (copy attached) relative to this waste discharge. Order No. R4-2005-0082 serves as your permit under the NPDES and expires on August November 10, 2010. Section 13376 of the California Water Code requires that an application for a new permit must be filed at least 180 days before the expiration date.

You are required to implement the *Monitoring and Reporting Program* (MRP) on the effective date of Order No. R4-2005-0082. Your first monitoring report for the January – March reporting period is due by April 15, 2006. All monitoring reports should be sent to the Regional Board, Attn: Information Technology Unit.

When submitting monitoring, technical reports, or any correspondence regarding the discharge under Order No. R4-2005-0082 to the Regional Board, please include a reference to Compliance File No. CI 6038 and NPDES No. CA0056065, which will assure that the reports are directed to the appropriate file and staff. Please do not combine your discharge monitoring reports with other reports. Please submit each type of report as a separate document.

We are sending the final copy of the permit only to the Discharger. For those on the mailing list who would like access to a copy of the final permit, please go to the Regional Board's website http://www.waterboards.ca.gov/losangeles/.

California Environmental Protection Agency

If you have any questions, please contact Mazhar Ali at (213) 576-6652.

Sincerely,

David Hung, Chief

ORDER NO. R4-2005-0082 NPDES NO. CA0056065

The following Discharger is authorized to discharge in accordance with the conditions set forth in this Order:

Discharger	Paramount Petroleum Corporation	
Name of Facility	Paramount Petroleum Corporation	
	14700 Downey Avenue	
Facility Address	Paramount, CA 90723	
	Los Angeles County	

The Discharger is authorized to discharge from the following discharge points as set forth below:

Discharge	Effluent	Discharge	Discharge Point	Receiving Water	
Point	Description	Point Latitude	Longitude		
001	Storm water	33 ° 45' 18" N	118 ° 12' 48" W	Storm Drain to Los Cerritos Channel	

This Order was adopted by the Regional Water Board on:	December 1, 2005			
This Order shall become effective on:	January 1, 2006			
This Order shall expire on:	November 10, 2010			
The U.S. Environmental Protection Agency (USEPA) and the classified this discharge as a minor discharge.	Regional Water Board have			
The Discharger shall file a Report of Waste Discharge in accordance with Title 23, California Code of Regulations, not later than 180 days in advance of the Order expiration date as application for issuance of new waste discharge requirements.				

IT IS HEREBY ORDERED, that Order No. 99-131 is rescinded upon the effective date of this Order except for enforcement purposes, and, in order to meet the provisions contained in Division 7 of the California Water Code (CWC) and regulations adopted thereunder, and the provisions of the federal Clean Water Act (CWA), and regulations and guidelines adopted thereunder, the Discharger shall comply with the requirements herein.

I, Jonathan S. Bishop, Executive Officer, do hereby certify the following is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, Los Angeles Region, on December 1, 2005.

Jonathan S. Bishop, Executive Officer

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD REGION 4, LOS ANGELES REGION

ORDER NO. R4-2005-0082X NPDES NO. CA0056065

I. FACILITY INFORMATION

The following Discharger is authorized to discharge in accordance with the conditions set forth in this Order:

Discharger	Paramount Petroleum Corporation
Name of Facility	Paramount Petroleum Corporation
	14700 Downey Avenue
Facility Address	Paramount, CA 90723
	Los Angeles County
Facility Contact, Title, and Phone	Kathryn Gleeson, Manager Environmental, (562)748-4613
Mailing Address	Same as Facility Address
Type of Facility	Industrial (IND)
Facility Design Flow	N/A

II. FINDINGS

The California Regional Water Quality Control Board, Los Angeles Region (hereinafter Regional Water Board), finds:

- A. **Background.** Paramount Petroleum Corporation (hereinafter Discharger or Paramount) is currently discharging under Order No. 99-131 and a National Pollutant Discharge Elimination System (NPDES) Permit No. CA0056065. The Discharger submitted a Report of Waste Discharge (ROWD), dated June 2, 2004, and applied for a NPDES permit renewal to discharge up to 800,000 gallons per day (gpd) of storm water from the Paramount Petroleum Corporation facility, hereinafter Facility.
- B. **Facility Description.** The Discharger owns and operates the petroleum oil refinery. The refinery processes approximately 50,000 barrels per day of crude oil into various products, including motor fuels, diesel, jet fuel, and asphalt products.
- C. Discharge Description. The current storm water system consists of storm water from the processing areas and from the non-processing areas. Storm water in the processing areas generally flows towards the south of the facility while storm water from the non-processing areas flows along the refinery's north road. The processing area is sub-divided into two sections; old processing area and the new processing area. The old processing area includes the crude units. The newer processing area includes hydo-processing plant, asphalt plant and tank farm area. Storm water from the old processing area after treatment is discharged to the local sanitation district sewer line. The storm water from the new processing area is sent to a holding pond. Prior to discharge, solids and oils are controlled by a weir and a skirted boom that surround the discharge pump area. The storm water from the pond is normally discharged to the same local sanitation district sewer line, in accordance with its permit requirements. During heavy rains and in emergency conditions, when the holding capacity of the tanks and pond is exceeded, Paramount will discharge it to storm drain after treatment through a planned treatment system. The selection and design of the planned treatment system is currently being evaluated. The maximum emergency storm water that will be discharged from the pond after treatment to the storm drain on Downey Avenue through Discharge Point 001 (Latitude: 33° 45' 18" N and Longitude: 118° 12' 48" W) is 0.4 million gallons per day.(MGD).

Storm water from the northern area of the refinery (non-processing areas) flows west along the refinery's north road. Storm water runoff from the northern portion of the refinery then commingles with the runoff from the parking area prior to flowing out the front entrance of the refinery to the storm drain located on Downey Avenue. To prevent sediment or oil from discharging to the storm drain, oil adsorbent booms, silt fencing, and hay bales are placed at strategic locations before the storm water flow exit the refinery property. The Discharger is currently in the process of filing a Notice of Intent (NOI) for enrollment in the NPDES General Permit for Storm Water Discharges Associated with Industrial Activity [State Water Resources Control Board (State Board) Order No. 97-03-DWQ, NPDES Permit No. CAS000001].

Attachment B provides a topographic map of the area around the facility. Attachment C provides a flow schematic of the facility.

- D. Legal Authorities. This Order is issued pursuant to section 402 of the Federal CWA and implementing regulations adopted by the USEPA and Chapter 5.5, Division 7 of the CWC. It shall serve as a NPDES permit for point source discharges from this facility to surface waters. This Order also serves as Waste Discharge Requirements (WDRs) pursuant to Article 4, Chapter 4 of the CWC for discharges that are not subject to regulation under CWA section 402.
- E. Background and Rationale for Requirements. The Regional Water Board developed the requirements in this Order based on information submitted as part of the application, through monitoring and reporting programs, and through special studies. Attachments A through J, which contain background information and rationale for Order requirements, are hereby incorporated into this Order and, thus, constitute part of the Findings for this Order.
- F. California Environmental Quality Act (CEQA). This action to adopt an NPDES permit is exempt from the provisions of the California Environmental Quality Act (Public Resources Code Section 21100, et seq.) in accordance with Section 13389 of the CWC.
- G. **Technology-based Effluent Limitations.** The Code of Federal Regulations (CFR) at 40 CFR §122.44(a) requires that permits include applicable technology-based limitations and standards. This Order includes technology-based effluent limitations based on Effluent Limitations Guidelines and Standards for the Petroleum Refining Point Source Category in 40 CFR Part 419 and/or Best Professional Judgment (BPJ) in accordance with 40 CFR §125.3. A detailed discussion of the technology-based effluent limitations development is included in the Fact Sheet (Attachment F).
- H. Water Quality-based Effluent Limitations. Section 122.44(d) of 40 CFR requires that permits include Water Quality Based Effluent Limitations (WQBELs) to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water. Where numeric water quality objectives have not been established, 40 CFR §122.44(d) specifies that WQBELs may be established using USEPA criteria guidance under CWA section 304(a), proposed State criteria or a State policy interpreting narrative criteria supplemented with other relevant information, or an indicator parameter.
- No More Stringent than Federal Law. This Order contains restrictions on individual pollutants that are no more stringent than required by the federal Clean Water Act. Individual pollutant restrictions consist of technology-based restrictions and water quality-based effluent limitations. The technology-based effluent limitations are discussed in detail in the Fact Sheet (Attachment F) and the permit's technology-based pollutant restrictions are no more stringent than required by the Clean Water Act. WQBELs have been scientifically derived to implement water quality objectives that protect beneficial uses. beneficial uses and the water quality objectives have been approved pursuant to federal law and are the applicable federal water quality standards. To the extent that toxic pollutant WQBELs were derived from the California Toxics Rule (CTR), the CTR is the applicable standard pursuant to 40 CFR § 131.38. All beneficial uses and water quality objectives contained in the Basin Plan were approved under state law and submitted to and approved by USEPA prior to May 30, 2000. Any water quality objectives and beneficial uses submitted to USEPA prior to May 30, 2000, but not approved by USEPA before that date, are nonetheless "applicable water quality standards for purposes of the [Clean Water] Act" pursuant to 40 CFR § 131.21(c)(1). Collectively, this Order's restrictions on individual pollutants are no more stringent than required to implement the technology-based

requirements of the Clean Water Act and the applicable water quality standards for purposes of the Clean Water Act.

J. Water Quality Control Plans. The Regional Water Board adopted Water Quality Control Plan for the Coastal Watersheds of Los Angeles and Ventura Counties (hereinafter Basin Plan) that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. In addition, State Water Resources Control Board (State Water Board) Resolution No. 88-63 requires that, with certain exceptions, the Regional Water Board assign the municipal and domestic supply use to water bodies that do not have beneficial uses listed in the Basin Plan. Beneficial uses applicable to the Los Cerritos Channel are as follows:

Discharge Point	Receiving Water Name	Beneficial Use(s)
001	Los Cerritos Channel	Existing: Wildlife habitat (WILD) Intermittent: Non-contact water recreation (REC-2), and warm freshwater habitat (WARM) Potential: Municipal and domestic water supply (MUN), and contact water recreation (REC-1)

The 1994 Basin Plan provided water quality objectives for ammonia to protect aquatic life, in Table 3-1 through Tables 3-4. However, those ammonia objectives were revised on March 4, 2004, by the Regional Water Board with the adoption of Resolution No. 2004-022, Amendment to the Water Quality Plan for the Los Angeles Region to Update the Ammonia Objectives for Inland Surface Waters Not Characteristic of Freshwater (including enclosed bays, estuaries and wetlands) with the Beneficial Use designations for protection of "Aquatic Life". The ammonia Basin Plan amendment has not yet been approved by the Office of Administrative Law or the USEPA. The revised criteria are not available for use until the aforementioned approvals have been obtained."

The State Board adopted a Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Water and Enclosed Bays and Estuaries of California (Thermal Plan) on May 18, 1972, and amended this plan on September 18, 1975. This plan contains temperature objectives for inland surface waters.

Requirements of this Order specifically implement the applicable Water Quality Control Plans.

- K. National Toxics Rule (NTR) and California Toxics Rule (CTR). USEPA adopted the NTR on December 22, 1992, which was amended on May 4, 1995 and November 9, 1999, and the CTR on May 18, 2000, which was amended on February 13, 2001. These rules include water quality criteria for priority pollutants and are applicable to this discharge.
- L. Data Availability and Reasonable Potential Monitoring. 40 CFR section 122.44(d)(1)(ii) requires that each toxic pollutant be analyzed with respect to its reasonable potential when

determining whether a discharge (1) causes; (2) has the reasonable potential to cause; or (3) contributes to the exceedance of a receiving water quality objective. This is done by performing a reasonable potential analysis (RPA) for each pollutant. In performing the RPA, the permitting authority uses procedures that account for existing controls on point and nonpoint sources of pollution, the variability of the pollutant or pollutant parameter in the effluent, and the sensitivity of the species to toxicity testing (when evaluating whole effluent toxicity). Because of effluent variability, there is always some degree of uncertainty in determining an effluent's impact on the receiving water. The U.S. EPA's Technical Support Document for Water Quality-Based Toxics Control (TSD) of 1991 (USEPA/505/2-90-001), addresses this issue by suggesting the use of a statistical approach.

Regional Board staff has determined that pollutants that have effluent limitations in the current Order will be included in this Order. The effluent limitations have been modified based on the revised water quality criteria contained in the CTR and the requirements contained in the TSD. Further, effluent limitations have been established for priority pollutants, that show reasonable potential to exceed state water quality standards. This Order also includes requirements for additional monitoring to provide the data needed to complete an RPA for all of the priority pollutants.

RPA was completed using the data collected at the site to determine if any of the pollutants sampled previously at the site showed reasonable potential. Based on the RPA for Discharge Serial No. 001, lead demonstrated reasonable potential to exceed water quality standards:

- M. Antidegradation Policy. Section 131.12 of 40 CFR requires that State water quality standards include an antidegradation policy consistent with the federal policy. The State Board established California's antidegradation policy in State Board Resolution No. 68-16, which incorporates the requirements of the federal antidegradation policy. Resolution No. 68-16 requires that existing quality of waters be maintained unless degradation is justified based on specific findings. As discussed in detail in the Fact Sheet (Attachment F) the permitted discharge is consistent with the antidegradation provision of 40 CFR §131.12 and State Water Board Resolution No. 68-16.
- N. Anti-Backsliding Requirements. Sections 402(o)(2) and 303(d)(4) of the CWA and federal regulations at 40 CFR § 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permit, with some exceptions where limitations may be relaxed. All effluent limitations in this Order are at least as stringent as the effluent limitations in the previous Order.
- O. **Monitoring and Reporting.** Section 122.48 of 40 CFR requires that all NPDES permits specify requirements for recording and reporting monitoring results. Sections 13267 and 13383 of the CWC authorize the Regional Water Boards to require technical and monitoring reports. The Monitoring and Reporting Program (MRP) No. 6038 establishes monitoring and reporting requirements to implement federal and State requirements. This MRP is provided in Attachment E.
- P. Standard and Special Provisions. Standard Provisions, which in accordance with 40 CFR §§ 122.41 and 122.42, apply to all NPDES discharges and must be included in every NPDES permit, are provided in Attachment D. The Regional Water Board has also included

in this Order special provisions applicable to the Discharger. A rationale for the special provisions contained in this Order is provided in the attached Fact Sheet (Attachment F).

- Q. Alaska Rule. On March 30, 2000, USEPA revised its regulation that specifies when new and revised State and Tribal water quality standards (WQS) become effective for CWA purposes (40 CFR §131.21, 65 FR 24641, April 27, 2000). Under USEPA's new regulation (also known as the Alaska rule), new and revised standards submitted to USEPA after May 30, 2000, must be approved before being used for CWA purposes. The final rule also provides that standards already in effect and submitted to USEPA by May 30, 2000, may be used for CWA purposes, whether or not approved by USEPA.
- R. **Notification of Interested Parties.** The Regional Water Board has notified the Discharger and interested agencies and persons of its intent to prescribe Waste Discharge Requirements for the discharge and has provided them with an opportunity to submit their written comments and recommendations. Details of notification are provided in the Fact Sheet (Attachment F) of this Order.
- S. Consideration of Public Comment. The Regional Water Board, in a public meeting, heard and considered all comments pertaining to the discharge. Details of the Public Hearing are provided in the Fact Sheet (Attachment F) of this Order.

III. DISCHARGE PROHIBITIONS

- A. Wastes discharged shall be limited to a maximum of 400,000 gpd of storm water through Discharge Point 001 as described in the findings.
- B. Wastes discharged through Discharge Point 001 shall be limited to storm water from production area from Paramount Petroleum Corporation facility. The discharge shall occur only due to storm events. Discharge of wastes from accidental spills or other sources is prohibited.
- C. Discharges of water, materials, thermal wastes, elevated temperature wastes, toxic wastes, deleterious substances, or wastes other than those authorized by this Order, to the storm drain system or other waters of the State, are prohibited.
- D. Neither the treatment nor the discharge of pollutants shall create a pollution, contamination, or nuisance as defined by Section 13050 of the CWC.
- E. Wastes discharged shall not contain any substances in concentrations toxic to human, animal, plant, or aquatic life.
- F. The discharge shall not cause a violation of any applicable water quality standards for receiving waters adopted by the Regional Water Board or the State Water Board as required by the Federal CWA and regulations adopted thereunder. If more stringent applicable water quality standards are promulgated or approved pursuant to Section 303 of the Federal CWA, and amendments thereto, the Board will revise and modify this Order in accordance with such more stringent standards.
- G. The discharge of any radiological, chemical, or biological warfare agent or high level radiological waste is prohibited.
- H. Any discharge of wastes at any point(s) other than specifically described in this Order is prohibited, and constitutes a violation of the Order.

IV. EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

- A. Effluent Limitations Discharge Points 001
 - 1. Final Effluent Limitations Discharge Point 001
 - a. The discharge of storm water shall maintain compliance with the following effluent limitations at Discharge Point 001, with compliance measured at Monitoring Location M-001, as described in the attached MRP (Attachment E of the tentative Order):

		Final Effluent Limitations			
Parameter	Units	Average Monthly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Biochemical Oxygen Demand 5-day @ 20°C (BOD)	mg/L		30		
Oil and Grease	mg/L		15		
рН	standard units			6.5	8.5
Total Suspended Solids (TSS)	mg/L		75		
Arsenic, Total Recoverable	μg/L		50		
Cadmium, Total Recoverable	μg/L		3.7		
Chromium (VI)	μg/L		15		·
Copper, Total Recoverable	μg/L		17		
Lead, Total Recoverable	μg/L		8.3		
Mercury, Total Recoverable	μg/L		2.0		
Selenium, Total Recoverable	μg/L		10		••••
Silver, Total Recoverable	μg/L		3.4		
Zinc, Total Recoverable	μg/L		110		
Benzene	μg/L		1.0		
Ethylbenzene	μg/L		700		
Toluene	μg/L		150		
Phenolic Compounds	μg/L	· 	1.0		
Temperature	°F		86		

Parameter		Final Effluent Limitations			
	Units	Average Monthly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Total Organic Carbon (TOC)	Mg/L		110		
Xylene	μg/L		1,750		
Total Petroleum Hydrocarbons	μg/L		100		

- b. There shall be no acute toxicity in the discharge. The acute toxicity of the effluent shall be such that:
 - i. The average survival in the undiluted effluent for any three (3) consecutive 96-hour static or continuous flow bioassay tests shall be at least ninety percent (90%) survival, and
 - ii. No single test producing less than 70% survival. Compliance with the toxicity objectives will be determined by the method described in MRP, Attachment E of the tentative Order.
- B. Land Discharge Specifications [Not Applicable]
- C. Reclamation Specifications [Not Applicable]

V. RECEIVING WATER LIMITATIONS

A. Surface Water Limitations

Receiving water limitations are based on water quality objectives contained in the Basin Plan and are a required part of this Order. The discharge shall not cause the following in the Los Cerritos Channel:

- 1. The normal ambient pH to fall below 6.5 nor exceed 8.5 units nor vary from normal ambient pH levels by more than 0.5 units.
- Depress the concentration of dissolved oxygen to fall below 5.0 mg/L anytime, and the median dissolved oxygen concentration for any three consecutive months shall not be less than 80% of the dissolved oxygen content at saturation.
- 3. Surface water temperature to rise greater than 5 °F above the natural temperature of the receiving waters at any time or place. At no time the temperature shall be raised above 80 °F as a result of waste discharged.
- 4. Exceed total ammonia (as N) concentrations specified in the Regional Water Board Resolution No. 2002-011. Resolution No. 2002-011 revised the ammonia criteria in the 1994 Basin Plan, to be consistent with the 1999 USEPA update on ammonia criteria. Adopted on April 28, 2002, Resolution No. 2002-011 was approved by State Water Board, Office of Administrative Law and USEPA on April 30, 2003, June 5, 2003, and June 19, 2003, respectively and is now in effect.
- The presence of visible, floating, suspended or deposited macroscopic particulate matter or foam.
- 6. Oils, greases, waxes, or other materials in concentrations that result in a visible film or coating on the surface of the receiving water or on objects in the water.
- 7. Suspended or settleable materials, chemical substances or pesticides in amounts that cause nuisance or adversely affect any designated beneficial use.
- 8. Toxic or other deleterious substances in concentrations or quantities which cause deleterious effects on aquatic biota, wildlife, or waterfowl or render any of these unfit for human consumption either at levels created in the receiving waters or as a result of biological concentration.
- 9. Accumulation of bottom deposits or aquatic growths.
- Biostimulatory substances at concentrations that promote aquatic growth to the extent that such growth causes nuisance or adversely affects beneficial uses.
- 11. The presence of substances that result in increases of biochemical oxygen demand that adversely affect beneficial uses.
- 12. Taste or odor-producing substances in concentrations that alter the natural taste, odor, and/or color of fish, shellfish, or other edible aquatic resources; cause nuisance; or adversely affect beneficial uses.

- 13. Alteration of turbidity, or apparent color beyond present natural background levels.
- 14. Damage, discolor, nor cause formation of sludge deposits on flood control structures or facilities nor overload the design capacity.
- 15. Degrade surface water communities and populations including vertebrate, invertebrate, and plant species.
- Problems associated with breeding of mosquitoes, gnats, black flies, midges, or other pests.
- 17. Create nuisance, or adversely effect beneficial uses of the receiving water.
- 18. Violation of any applicable water quality standards for receiving waters adopted by the Regional Water Board or State Water Board. If more stringent applicable water quality standards are promulgated or approved pursuant to section 303 of the CWA, or amendments thereto, the Regional Water Board will revise or modify this Order in accordance with such standards.

B. Groundwater Limitations

1. The discharge shall not cause the underlying groundwater to be degraded, to exceed water quality objectives, unreasonably affect beneficial uses, or cause a condition of pollution or nuisance.

VI. PROVISIONS

A Standard Provisions

- 1. Federal Standard Provisions. The Discharger shall comply with all Standard Provisions included in Attachment D of this Order.
- Regional Water Board Standard Provisions. The Discharger shall comply with the following provisions:
 - a. This Order may be modified, revoked, reissued, or terminated in accordance with the provisions of 40 CFR §§ 122.44, 122.62, 122.63, 122.64, 125.62 and 125.64. Causes for taking such actions include, but are not limited to: failure to comply with any condition of this Order; endangerment to human health or the environment resulting from the permitted activity; or acquisition of newly-obtained information which would have justified the application of different conditions if known at the time of Order adoption. The filing of a request by the Discharger for an Order modification, revocation, and issuance or termination, or a notification of planned changes or anticipated noncompliance does not stay any condition of this Order.
 - b. The Discharger must comply with the lawful requirements of municipalities, counties, drainage districts, and other local agencies regarding discharges of storm water to storm drain systems or other water courses under their jurisdiction; including applicable requirements in municipal storm water management program developed to comply with NPDES permits issued by the Regional Water Board to local agencies.

- c. Discharge of wastes to any point other than specifically described in this Order and permit is prohibited and constitutes a violation thereof.
- d. The Discharger shall comply with all applicable effluent limitations, national standards of performance, toxic effluent standards, and all federal regulations established pursuant to Sections 301, 302, 303(d), 304, 306, 307, 316, 318, 405, and 423 of the Federal CWA and amendments thereto.
- e. These requirements do not exempt the operator of the waste disposal facility from compliance with any other laws, regulations, or ordinances which may be applicable; they do not legalize this waste disposal facility, and they leave unaffected any further restraints on the disposal of wastes at this site which may be contained in other statutes or required by other agencies.
- f. Oil or oily material, chemicals, refuse, or other objectionable materials shall not be stored or deposited in areas where they may be picked up by rainfall and carried off of the property and/or discharged to surface waters. Any such spill of such materials shall be contained and removed immediately.
- g. A copy of these waste discharge specifications shall be maintained at the discharge facility so as to be available at all times to operating personnel.
- h. After notice and opportunity for a hearing, this Order may be terminated or modified for cause, including, but not limited to:
 - Violation of any term or condition contained in this Order;
 - ii. Obtaining this Order by misrepresentation, or failure to disclose all relevant facts; and
 - j. A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge.
- i. If there is any storage of hazardous or toxic materials or hydrocarbons at this facility and if the facility is not manned at all times, a 24-hour emergency response telephone number shall be prominently posted where it can easily be read from the outside.
- j. The Discharger shall notify the Board not later than 120 days in advance of implementation of any plans to alter production capacity of the product line of the manufacturing, producing or processing facility by more than 10%. Such notification shall include estimates of proposed production rate, the type of process, and projected effects on effluent quality. Notification shall include submittal of a new report of waste discharge and appropriate filing fee.
- k. The Discharger shall file with the Regional Water Board a report of waste discharge at least 120 days before making any material change or proposed change in the character, location or volume of the discharge.
- I. All existing manufacturing, commercial, mining, and silvicultural dischargers must notify the Regional Water Board as soon as they know or have reason to believe

that they have begun or expect to begin to use or manufacture intermediate or final product or byproduct of any toxic pollutant that was not reported on their application.

- m. In the event of any change in name, ownership, or control of these waste disposal facilities, the discharger shall notify the Regional Water Board of such change and shall notify the succeeding owner or operator of the existence of this Order by letter, copy of which shall be forwarded to the Regional Water Board.
- n. The CWC provides that any person who violates a waste discharge requirement or a provision of the CWC is subject to civil penalties of up to \$5,000 per day, \$10,000 per day, or \$25,000 per day of violation, or when the violation involves the discharge of pollutants, is subject to civil penalties of up to \$10 per gallon per day or \$25 per gallon per day of violation; or some combination thereof, depending on the violation, or upon the combination of violations. Violation of any of the provisions of the NPDES program or of any of the provisions of this Order may subject the violator to any of the penalties described herein, or any combination thereof, at the discretion of the prosecuting authority; except that only one kind of penalty may be applied for each kind of violation.
- o. The discharge of any product registered under the Federal Insecticide, Fungicide, and Rodenticide Act to any waste stream which may ultimately be released to waters of the United States, is prohibited unless specifically authorized elsewhere in this permit or another NPDES permit. This requirement is not applicable to products used for lawn and agricultural purposes.
- p. The discharge of any waste resulting from the combustion of toxic or hazardous wastes to any waste stream that ultimately discharges to waters of the United States is prohibited, unless specifically authorized elsewhere in this permit.
- q. The Discharger shall notify the Executive Officer in writing no later than 6 months prior to planned discharge of any chemical, other than the products previously reported to the Executive Officer, which may be toxic to aquatic life. Such notification shall include:
 - Name and general composition of the chemical,
 - ii. Frequency of use,
 - iii. Quantities to be used.
 - iv. Proposed discharge concentrations, and
 - v. USEPA registration number, if applicable.
- B. Monitoring and Reporting Program Requirements

The Discharger shall comply with the MRP, and future revisions thereto, in Attachment E of this Order. If there is any conflict between provisions stated in MRP and the Standard Provisions, those provisions stated in the MRP shall prevail.

C. Special Provisions

1. Reopener Provisions

- a. If more stringent applicable water quality standards are promulgated or approved pursuant to Section 303 of the Federal CWA, and amendments thereto, the Regional Water Board will revise and modify this Order in accordance with such more stringent standards.
- b. This Order may be reopened to include effluent limitations for toxic constituents determined to be present in significant amounts in the discharge through a more comprehensive monitoring program included as part of this Order and based on the results of the reasonable potential analysis (RPA).
- c. This Order may be reopened and modified, to incorporate in accordance with the provisions set forth in 40 CFR Parts 122 and 124, to include requirements for the implementation of the watershed management approach.
- d. This Order may be reopened and modified, in accordance with the provisions set forth in 40 CFR Parts 122 and 124, to include requirements for the implementation of the watershed management approach or to include new Minimum Levels (MLs).
- e. This Order may be reopened and modified, to revise effluent limitations as a result of future Basin Plan Amendments, such as an update of an objective or the adoption of a total maximum daily load (TMDL) for the Los Cerritos Channel.
- f. This Order may be reopened upon the submission by the Discharger of adequate information, as determined by the Regional Water Board, to provide for dilution credits or a mixing zone, as may be appropriate.

2. Special Studies, Technical Reports and Additional Monitoring Requirements

- a. Toxicity Reduction Evaluation (TRE) Workplan. The Discharger shall submit to the Regional Water Board an Initial Investigation TRE workplan (1-2 pages) within 180 days of the effective date of this permit. This plan shall describe the steps the permittee intends to follow in the event that toxicity is detected, and should include at a minimum:
 - A description of the investigation and evaluation techniques that will be used to identify potential causes/sources of toxicity, effluent variability, and treatment system efficiency;
 - A description of the facility's method of maximizing in-house treatment efficiency and good housekeeping practices, and a list of all chemicals used in operation of the facility; and
 - iii. If a toxicity identification evaluation (TIE) is necessary, an indication of the person who would conduct the TIEs (i.e., an in-house expert or an outside contractor) (Section V of MRP, Attachment E, provides references for the guidance manuals that should be used for performing TIEs.)

- 3. Best Management Practices and Pollution Prevention
 - a. Storm Water Pollution Prevention Plan (SWPPP). The Discharger shall submit, within 90 days of the effective date of this Order:
 - i. An updated SWPPP that describes site-specific management practices for minimizing contamination of storm water runoff and for preventing contaminated storm water runoff from being discharged directly to waters of the State. The SWPPP shall be developed in accordance with the requirements in *Storm Water Pollution Prevention Plan Requirements* (Attachment G).
 - ii. The Discharger shall submit an updated Spill Contingency Plan. The Contingency Plan shall be site-specific and shall cover all areas of the facility. The Contingency Plan shall be reviewed at the same time as the SWPPP.

Plans shall cover all areas of the facility and shall include an updated drainage map for the facility. The Discharger shall identify on a map of appropriate scale the areas that contribute runoff to the permitted discharge points; describe the activities in each area and the potential for contamination of storm water runoff and the discharge of hazardous waste/material; and address the feasibility of containment and/or treatment of the storm water. The plans shall be reviewed annually and at the same time. Updated information shall be submitted within 30 days of revision.

- 4. Construction, Operation and Maintenance Specifications
 - a. The Discharger shall at all times properly operate and maintain all facilities and systems installed or used to achieve compliance with this Order.
- 5. Special Provisions for Municipal Facilities (POTWs Only) [Not Applicable]
- 6. Other Special Provisions Not Applicable [Not Applicable]

VII. COMPLIANCE DETERMINATION

Compliance with the effluent limitations contained in Section IV of this Order will be determined as specified below:

A. Single Constituent Effluent Limitation.

If the concentration of the pollutant in the monitoring sample is greater than the effluent limitation and greater than or equal to the reported ML (see Reporting Requirement in Section I.G of the MRP, Attachment E), then the Discharger is out of compliance.

B. Effluent Limitations Expressed as a Sum of Several Constituents.

If the sum of the individual pollutant concentrations is greater than the effluent limitation, then the Discharger is out of compliance. In calculating the sum of the concentrations of a group of pollutants, consider constituents reported as "Not Detected" (ND) or "Detected, but Not Quantified" (DNQ) to have concentrations equal to zero, provided that the applicable ML is used.

C. Effluent Limitations Expressed as a Median.

In determining compliance with a median limitation, the analytical results in a set of data will be arranged in order of magnitude (either increasing or decreasing order); and

- 1. If the number of measurements (n) is odd, then the median will be calculated as = $X_{(n+1)/2}$, or
- 2. If the number of measurements (n) is even, then the median will be calculated as = $[X_{n/2} + X_{(n/2)+1}]$, i.e., the midpoint between the n/2 and n/2+1 data points.
- D. Mass-based Effluent Limitations.

In calculating mass emission rates from the monthly average concentrations, use one half of the method detection limit for ND and the estimated concentration for DNQ for the calculation of the monthly average concentration. To be consistent with Section VII.B of this Order, if all pollutants belonging to the same group are reported as ND or DNQ, the sum of the individual pollutant concentrations should be considered as zero for the calculation of the monthly average concentration.

E. Maximum Daily Effluent Limitation (MDEL).

If a daily discharge exceeds the MDEL for a given parameter, an alleged violation will be flagged and the discharger will be considered out of compliance for that parameter for that 1 day only within the reporting period. For any 1 day during which no sample is taken, no compliance determination can be made for that day.

G. Instantaneous Minimum Effluent Limitation.

If the analytical result of a single grab sample is lower than the instantaneous minimum effluent limitation for a parameter, a violation will be flagged and the discharger will be considered out of compliance for that parameter for that single sample. Non-compliance for each sample will be considered separately (e.g., the results of two grab samples taken within a calendar day that both are lower than the instantaneous minimum effluent limitation would result in two instances of non-compliance with the instantaneous minimum effluent limitation).

H. Instantaneous Maximum Effluent Limitation.

If the analytical result of a single grab sample is higher than the instantaneous maximum effluent limitation for a parameter, a violation will be flagged and the discharger will be considered out of compliance for that parameter for that single sample. Non-compliance for each sample will be considered separately (e.g., the results of two grab samples taken

within a calendar day that both exceed the instantaneous maximum effluent limitation would result in two instances of non-compliance with the instantaneous maximum effluent limitation).

ATTACHMENT A - DEFINITIONS, ACRONYMS, AND ABBREVIATIONS

DEFINITIONS

Average Monthly Effluent Limitation (AMEL): the highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

Daily Discharge: Daily Discharge is defined as either: (1) the total mass of the constituent discharged over the calendar day (12:00 am through 11:59 pm) or any 24-hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit), for a constituent with limitations expressed in units of mass or; (2) the unweighted arithmetic mean measurement of the constituent over the day for a constituent with limitations expressed in other units of measurement (e.g., concentration).

The daily discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day or other 24-hour period defined as a day) or by the arithmetic mean of analytical results from one or more grab samples taken over the course of the day.

For composite sampling, if 1 day is defined as a 24-hour period other than a calendar day, the analytical result for the 24-hour period will be considered as the result for the calendar day in which the 24-hour period ends.

Instantaneous Maximum Effluent Limitation: the highest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous maximum limitation).

Instantaneous Minimum Effluent Limitation: the lowest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous minimum limitation).

Maximum Daily Effluent Limitation (MDEL): the highest allowable daily discharge of a pollutant.

ATTACHMENT B - TOPOGRAPHIC MAP

ATTACHMENT C - FLOW SCHEMATIC

ATTACHMENT D - FEDERAL STANDARD PROVISIONS

I. STANDARD PROVISIONS - PERMIT COMPLIANCE

A. Duty to Comply

- 1. The Discharger must comply with all of the conditions of this Order. Any noncompliance constitutes a violation of the CWA and the CWC and is grounds for enforcement action, for permit termination, revocation and reissuance, or denial of a permit renewal application [40 CFR §122.41(a)].
- 2. The Discharger shall comply with effluent standards or prohibitions established under Section 307(a) of the CWA for toxic pollutants and with standards for sewage sludge use or disposal established under Section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not been modified to incorporate the requirement [40 CFR §122.41(a)(1)].

B. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order [40 CFR §122.41(c)].

C. Duty to Mitigate

The Discharger shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment [40 CFR §122.41(d)].

D. Proper Operation and Maintenance

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this Order [40 CFR §122.41(e)].

E. Property Rights

- 1. This Order does not convey any property rights of any sort or any exclusive privileges [40 CFR §122.41(g)].
- 2. The issuance of this Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of State or local law or regulations [40 CFR §122.5(c)].

F. Inspection and Entry

The Discharger shall allow the Regional Water Board, State Water Board, USEPA, and/or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to [40 CFR §122.41(i)] [CWC 13383(c)]:

- 1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order [40 CFR §122.41(i)(1)];
- 2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order [40 CFR §122.41(i)(2)];
- 3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order [40 CFR §122.41(i)/3)];
- 4. Sample or monitor, at reasonable times, for the purposes of assuring Order compliance or as otherwise authorized by the CWA or the CWC, any substances or parameters at any location [40 CFR §122.41(i)(4)].

G. Bypass

1. Definitions

- a. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility [40 CFR §122.41(m)(1)(i)].
- b. "Severe property damage" means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production [40 CFR §122.41(m)(1)(ii)].
- 2. Bypass not exceeding limitations The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions Permit Compliance I.G.3 and I.G.5 below [40 CFR §122.41(m)(2)].
- 3. Prohibition of bypass Bypass is prohibited, and the Regional Water Board may take enforcement action against a Discharger for bypass, unless [40 CFR §122.41(m)(4)(i)]:
 - a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage [40 CFR §122.41(m)(4)(A)];
 - b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable

engineering judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance [40 CFR §122.41(m)(4)(B)]; and

- c. The Discharger submitted notice to the Regional Water Board as required under Standard Provision Permit Compliance I.G.5 below [40 CFR §122.41(m)(4)(C)].
- 4. The Regional Water Board may approve an anticipated bypass, after considering its adverse effects, if the Regional Water Board determines that it will meet the three conditions listed in Standard Provisions Permit Compliance I.G.3 above [40 CFR §122.41(m)(4)(ii)].

5. Notice

- a. Anticipated bypass. If the Discharger knows in advance of the need for a bypass, it shall submit a notice, if possible at least 10 days before the date of the bypass [40 CFR §122.41(m)(3)(i)].
- b. Unanticipated bypass. The Discharger shall submit notice of an unanticipated bypass as required in Standard Provisions Reporting V.E below [40 CFR §122.41(m)(3)(ii)].

H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology-based permit effluent limitations because of factors beyond the reasonable control of the permittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation [40 $CFR \S 122.41(n)(1)$].

- 1. Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology-based permit effluent limitations if the requirements of paragraph H.2 of this section are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review [40 CFR §122.41(n)(2)].
- 2. Conditions necessary for a demonstration of upset. A Discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that [40 CFR §122.41(n)(3)]:
 - An upset occurred and that the Discharger can identify the cause(s) of the upset [40 CFR §122.41(n)(3)(i)];
 - b. The permitted facility was, at the time, being properly operated [40 CFR $\S122.41(n)(3)(i)$];
 - The Discharger submitted notice of the upset as required in Standard Provisions

 Reporting V.E.2.b [40 CFR §122.41(n)(3)(iii)]; and

- d. The Discharger complied with any remedial measures required under Standard Provisions – Permit Compliance I.C above [40 CFR §122.41(n)(3)(iv)].
- 3. Burden of proof. In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof [40 CFR §122.41(n)(4)].

II. STANDARD PROVISIONS - PERMIT ACTION

A. General

This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any Order condition [40 CFR §122.41(f)].

B. Duty to Reapply

If the Discharger wishes to continue an activity regulated by this Order after the expiration date of this Order, the Discharger must apply for and obtain a new permit [40 CFR §122.41(b)].

C. Transfers

This Order is not transferable to any person except after notice to the Regional Water Board. The Regional Water Board may require modification or revocation and reissuance of the Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the CWC [40 CFR §122.41(I)(3)] [40 CFR §122.61].

III. STANDARD PROVISIONS - MONITORING

- A. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity [40 CFR §122.41(j)(1)].
- B. Monitoring results must be conducted according to test procedures under 40 CFR Part 136 or, in the case of sludge use or disposal, approved under 40 CFR Part 136 unless otherwise specified in 40 CFR Part 503 unless other test procedures have been specified in this Order [40 CFR §122.41(j)(4)] [40 CFR §122.44(j)(1)(iv)].

IV. STANDARD PROVISIONS - RECORDS

A. Except for records of monitoring information required by this Order related to the Discharger's sewage sludge use and disposal activities, which shall be retained for a period of at least five years (or longer as required by 40 CFR Part 503), the Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the Regional Water Board Executive Officer at any time [40 CFR §122.41(j)(2)].

B. Records of monitoring information shall include:

- 1. The date, exact place, and time of sampling or measurements [40 CFR §122.41(j)(3)(i)];
- The individual(s) who performed the sampling or measurements [40 CFR §122.41(j)(3)(ii)];
- 3. The date(s) analyses were performed [40 CFR §122.41(j)(3)(iii)];
- 4. The individual(s) who performed the analyses [40 CFR §122.41(j)(3)(iv)];
- 5. The analytical techniques or methods used [40 CFR §122.41(j)(3)(v)]; and
- 6. The results of such analyses [40 CFR §122.41(j)(3)(vi)].
- C. Claims of confidentiality for the following information will be denied [40 CFR §122.7(b)]:
 - 1. The name and address of any permit applicant or Discharger [40 CFR §122.7(b)(1)]; and
 - 2. Permit applications and attachments, permits and effluent data [40 CFR §122.7(b)(2)].

V. STANDARD PROVISIONS - REPORTING

A. Duty to Provide Information

The Discharger shall furnish to the Regional Water Board, State Water Board, or USEPA within a reasonable time, any information which the Regional Water Board, State Water Board, or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order or to determine compliance with this Order. Upon request, the Discharger shall also furnish to the Regional Water Board, State Water Board, or USEPA copies of records required to be kept by this Order [40 CFR §122.41(h)] [CWC 13267].

B. Signatory and Certification Requirements

- 1. All applications, reports, or information submitted to the Regional Water Board, State Water Board, and/or USEPA shall be signed and certified in accordance with paragraph (2.) and (3.) of this provision [40 CFR §122.41(k)].
- 2. All permit applications shall be signed as follows:
 - For a corporation: By a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (i) A president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities, provided, the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment

recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures [40 CFR §122.22(a)(1)];

- b. For a partnership or sole proprietorship: by a general partner or the proprietor, respectively [40 CFR §122.22(a)(2)]; or
- c. For a municipality, State, federal, or other public agency: by either a principal executive officer or ranking elected official. For purposes of this provision, a principal executive officer of a federal agency includes: (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of USEPA) [40 CFR §122.22(a)(3)].
- 3. All reports required by this Order and other information requested by the Regional Water Board, State Water Board, or USEPA shall be signed by a person described in paragraph (b) of this provision, or by a duly authorized representative of that person. A person is a duly authorized representative only if:
 - a. The authorization is made in writing by a person described in paragraph (2.) of this provision [40 CFR §122.22(b)(1)];
 - b. The authorization specified either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company (a duly authorized representative may thus be either a named individual or any individual occupying a named position) [40 CFR §122.22(b)(2)]; and
 - c. The written authorization is submitted to the Regional Water Board, State Water Board, or USEPA [40 CFR §122.22(b)(3)].
- 4. If an authorization under paragraph (3.) of this provision is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of paragraph (3.) of this provision must be submitted to the Regional Water Board, State Water Board, or USEPA prior to or together with any reports, information, or applications, to be signed by an authorized representative [40 CFR §122.22(c)].
- 5. Any person signing a document under paragraph (2.) or (3.) of this provision shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of

my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations" [40 CFR §122.22(d)].

C. Monitoring Reports

- 1. Monitoring results shall be reported at the intervals specified in the MRP, Attachment E, in this Order [40 CFR §122.41(I)(4)].
- 2. Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the Regional Water Board or State Water Board for reporting results of monitoring of sludge use or disposal practices [40 CFR §122.41(I)(4)(i)].
- 3. If the Discharger monitors any pollutant more frequently than required by this Order using test procedures approved under 40 CFR Part 136 or, in the case of sludge use or disposal, approved under 40 CFR Part 136 unless otherwise specified in 40 CFR Part 503, or as specified in this Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the Regional Water Board [40 CFR §122.41(I)(4)(ii)].
- 4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order [40 CFR §122.41(I)(4)(iii)].

D. Compliance Schedules

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order, shall be submitted no later than 14 days following each schedule date [40 CFR §122.41(I)(5)].

E. Twenty-Four Hour Reporting

- 1. The Discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A written submission shall also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance [40 CFR §122.41(I)(6)(i)].
- 2. The following shall be included as information that must be reported within 24 hours under this paragraph [40 CFR §122.41(I)(6)(ii)]:
 - Any unanticipated bypass that exceeds any effluent limitation in this Order [40 CFR §122.41(I)(6)(ii)(A)].
 - b. Any upset that exceeds any effluent limitation in this Order [40 CFR §122.41(I)(6)(ii)(B)].

- c. Violation of a maximum daily discharge limitation for any of the pollutants listed in this Order to be reported within 24 hours [40 CFR §122.41(I)(6)(ii)(C)].
- 3. The Regional Water Board may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours [40 CFR §122.41(I)(6)(iii)].

F. Planned Changes

The Discharger shall give notice to the Regional Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when [40 CFR §122.41(I)(1)]:

- 1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 CFR §122.29(b) [40 CFR §122.41(l)(1)(i)]; or
- 2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants which are subject neither to effluent limitations in this Order nor to notification requirements under 40 CFR Part 122.42(a)(1) (see Additional Provisions—Notification Levels VII.A.1) [40 CFR §122.41(I)(1)(ii)].
- 3. The alteration or addition results in a significant change in the Discharger's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan [40 CFR §122.41(I)(1)(iii)].

G. Anticipated Noncompliance

The Discharger shall give advance notice to the Regional Water Board or State Water Board of any planned changes in the permitted facility or activity that may result in noncompliance with General Order requirements [40 CFR §122.41(I)(2)].

H. Other Noncompliance

The Discharger shall report all instances of noncompliance not reported under Standard Provisions – Reporting E.3, E.4, and E.5 at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision – Reporting V.E [40 CFR $\S122.41(I)(7)$].

I. Other Information

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Regional Water Board, State Water Board, or USEPA, the Discharger shall promptly submit such facts or information [40 CFR §122.41(I)(8)].

VI. STANDARD PROVISIONS - ENFORCEMENT

- The CWA provides that any person who violates section 301, 302, 306, 307, 308, 318 or 405 of the Act, or any permit condition or limitation implementing any such sections in a permit issued under section 402, or any requirement imposed in a pretreatment program approved under sections 402(a)(3) or 402(b)(8) of the Act, is subject to a civil penalty not to exceed \$25,000 per day for each violation. The CWA provides that any person who negligently violates sections 301, 302, 306, 307, 308, 318, or 405 of the Act, or any condition or limitation implementing any of such sections in a permit issued under section 402 of the Act, or any requirement imposed in a pretreatment program approved under section 402(a)(3) or 402(b)(8) of the Act, is subject to criminal penalties of \$2,500 to \$25,000 per day of violation, or imprisonment of not more than one (1) year, or both. In the case of a second or subsequent conviction for a negligent violation, a person shall be subject to criminal penalties of not more than \$50,000 per day of violation, or by imprisonment of not more than two (2) years, or both. Any person who knowingly violates such sections, or such conditions or limitations is subject to criminal penalties of \$5,000 to \$50,000 per day of violation, or imprisonment for not more than three (3) years, or both. In the case of a second or subsequent conviction for a knowing violation, a person shall be subject to criminal penalties of not more than \$100,000 per day of violation, or imprisonment of not more than six (6) years, or both. Any person who knowingly violates section 301, 302, 303, 306, 307, 308, 318 or 405 of the Act, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of the Act, and who knows at that time that he thereby places another person in imminent danger of death or serious bodily injury, shall, upon conviction, be subject to a fine of not more than \$250,000 or imprisonment of not more than 15 years, or both. In the case of a second or subsequent conviction for a knowing endangerment violation, a person shall be subject to a fine of not more than \$500,000 or by imprisonment of not more than 30 years, or both. organization, as defined in section 309(c)(3)(B)(iii) of the CWA, shall, upon conviction of violating the imminent danger provision, be subject to a fine of not more than \$1,000,000 and can be fined up to \$2,000,000 for second or subsequent convictions [40 CFR §122.41(a)(2)] [CWC 13385 and 13387].
- B. Any person may be assessed an administrative penalty by the Regional Water Board for violating section 301, 302, 306, 307, 308, 318 or 405 of this Act, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of this Act. Administrative penalties for Class I violations are not to exceed \$10,000 per violation, with the maximum amount of any Class I penalty assessed not to exceed \$25,000. Penalties for Class II violations are not to exceed \$10,000 per day for each day during which the violation continues, with the maximum amount of any Class II penalty not to exceed \$125,000 [40 CFR §122.41(a)(3)].
- C. The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by a fine of not more than \$10,000, or by imprisonment for not more than 2 years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than \$20,000 per day of violation, or by imprisonment of not more than 4 years, or both [40 CFR §122.41(j)(5)].
- D. The CWA provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this Order, including monitoring reports or reports of compliance or

noncompliance shall, upon conviction, be punished by a fine of not more than \$10,000 per violation, or by imprisonment for not more than six months per violation, or by both [40 CFR $\S122.41(k)(2)$].

VII. ADDITIONAL PROVISIONS - NOTIFICATION LEVELS

A. Non-Municipal Facilities

Existing manufacturing, commercial, mining, and silvicultural dischargers shall notify the Regional Water Board as soon as they know or have reason to believe [40 CFR §122.42(a)]:

- 1. That any activity has occurred or will occur that would result in the discharge, on a routine or frequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" [40 CFR §122.42(a)(1)]:
 - a. 100 μg/L [40 CFR §122.42(a)(1)(i)];
 - b. 200 μ g/L for acrolein and acrylonitrile; 500 μ g/L for 2,4-dinitrophenol and 2-methyl-4,6-dinitrophenol; and 1 milligram per liter (mg/L) for antimony [40 CFR §122.42(a)(1)(ii)];
 - c. Five (5) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge [40 CFR §122.42(a)(1)(iii)]; or
 - d. The level established by the Regional Water Board in accordance with 40 CFR §122.44(f) [40 CFR §122.42(a)(1)(iv)].
- 2. That any activity has occurred or will occur that would result in the discharge, on a non-routine or infrequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" [40 CFR §122.42(a)(2)]:
 - a. 500 μg/L [40 CFR §122.42(a)(2)(i)];
 - b. 1 mg/L for antimony [40 CFR §122.42(a)(2)(ii)];
 - c. Ten (10) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge [40 CFR §122.42(a)(2)(iii)]; or
 - d. The level established by the Regional Water Board in accordance with 40 CFR §122.44(f) [40 CFR §122.42(a)(2)(iv)].

B. Publicly-Owned Treatment Works (POTWs)

All POTWs shall provide adequate notice to the Regional Water Board of the following [40 CFR §122.42(b)]:

1. Any new introduction of pollutants into the POTW from an indirect discharger that would be subject to Sections 301 or 306 of the CWA if it were directly discharging those pollutants [40 CFR §122.42(b)(1)]; and

PARAMOUNT PETROLEUM CORPORATION PARAMOUNT PETROLEUM CORPORATION FACILITY ORDER NO. R4-2005-0082 NPDES NO. CA0056065

2. Any substantial change in the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of adoption of the Order [40 CFR §122.42(b)(2)].

Adequate notice shall include information on the quality and quantity of effluent introduced into the POTW as well as any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW [40 CFR §122.42(b)(3)].

ATTACHMENT E - MONITORING AND REPORTING PROGRAM (MRP) NO. 6038

The Code of Federal Regulations (CFR) at 40 CFR §122.48 requires that all NPDES permits specify monitoring and reporting requirements. CWC sections 13267 and 13383 also authorize the Regional Water Quality Control Boards to require technical and monitoring reports. This MRP establishes monitoring and reporting requirements which implement the federal and California regulations.

I. GENERAL MONITORING PROVISIONS

- A. An effluent sampling station shall be established for each point of discharge (Discharge Point 001 [Latitude 33°45'18", Longitude 118°12'48"]) and shall be located where representative samples of that effluent can be obtained.
- B. Effluent samples shall be taken downstream of any addition to treatment works and prior to mixing with the receiving waters.
- C. This Regional Water Board shall be notified in writing of any change in the sampling stations once established or in the methods for determining the quantities of pollutants in the individual waste streams.
- D. Pollutants shall be analyzed using the analytical methods described in 40 CFR §§ 136.3, 136.4, and 136.5 (revised May 14, 1999); or, where no methods are specified for a given pollutant, by methods approved by this Regional Water Board or the State Water Board. Laboratories analyzing effluent samples and receiving water samples shall be certified by the California Department of Health Services Environmental Laboratory Accreditation Program (ELAP) or approved by the Executive Officer and must include quality assurance/quality control (QA/QC) data in their reports. A copy of the laboratory certification shall be provided each time a new certification and/or renewal of the certification is obtained from ELAP.
- E. For any analyses performed for which no procedure is specified in the USEPA guidelines or in the MRP, the constituent or parameter analyzed and the method or procedure used must be specified in the monitoring report.
- F. Each monitoring report must affirm in writing that "all analyses were conducted at a laboratory certified for such analyses by the Department of Health Services or approved by the Executive Officer and in accordance with current USEPA guideline procedures or as specified in this Monitoring and Reporting Program".
- G. The monitoring reports shall specify the analytical method used, the MDL, and the ML for each pollutant. For the purpose of reporting compliance with numerical limitations, performance goals, and receiving water limitations, analytical data shall be reported by one of the following methods, as appropriate:
 - 1. An actual numerical value for sample results greater than or equal to the ML; or
 - 2. "Detected, but Not Quantified (DNQ)" if results are greater than or equal to the laboratory's MDL but less than the ML; or,
 - 3. "Not-Detected (ND)" for sample results less than the laboratory's MDL with the MDL indicated for the analytical method used.

Analytical data reported as "less than" for the purpose of reporting compliance with permit limitations shall be the same or lower than the permit limitation(s) established for the given parameter.

Current MLs (Attachment H) are those published by the State Water Board in the Policy for the Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California, March 2, 2000.

H. Where possible, the MLs employed for effluent analyses shall be lower than the permit limitations established for a given parameter. If the ML value is not below the effluent limitation, then the lowest ML value and its associated analytical method shall be selected for compliance purposes. At least once a year, the Discharger shall submit a list of the analytical methods employed for each test and associated laboratory QA/QC procedures.

The Regional Water Board, in consultation with the State Water Board Quality Assurance Program, shall establish a ML that is not contained in Attachment H to be included in the Discharger's permit in any of the following situations:

- 1. When the pollutant under consideration is not included in Attachment H;
- 2. When the Discharger and Regional Water Board agree to include in the permit a test method that is more sensitive than that specified in 40 CFR Part 136 (revised May 14, 1999);
- When the Discharger agrees to use an ML that is lower than that listed in Attachment H;
- 4. When the Discharger demonstrates that the calibration standard matrix is sufficiently different from that used to establish the ML in Attachment A, and proposes an appropriate ML for their matrix; or,
- 5. When the Discharger uses a method whose quantification practices are not consistent with the definition of an ML. Examples of such methods are the USEPA-approved method 1613 for dioxins and furans, method 1624 for volatile organic substances, and method 1625 for semi-volatile organic substances. In such cases, the Discharger, the Regional Water Board, and the State Water Board shall agree on a lowest quantifiable limitation and that limitation will substitute for the ML for reporting and compliance determination purposes.
- I. Water/wastewater samples must be analyzed within allowable holding time limits as specified in 40 CFR §136.3. All QA/QC items must be run on the same dates the samples were actually analyzed, and the results shall be reported in the Regional Water Board format, when it becomes available, and submitted with the laboratory reports. Proper chain of custody procedures must be followed, and a copy of the chain of custody shall be submitted with the report.
- J. All analyses shall be accompanied by the chain of custody, including but not limited to data and time of sampling, sample identification, and name of person who performed sampling, date of analysis, name of person who performed analysis, QA/QC data, method detection limits, analytical methods, copy of laboratory certification, and a perjury statement executed by the person responsible for the laboratory.

- K. The Discharger shall calibrate and perform maintenance procedures on all monitoring instruments and to insure accuracy of measurements, or shall insure that both equipment activities will be conducted.
- L. The Discharger shall have, and implement, an acceptable written quality assurance (QA) plan for laboratory analyses. The annual monitoring report required in Section X.D shall also summarize the QA activities for the previous year. Duplicate chemical analyses must be conducted on a minimum of 10% of the samples, or at least one sample per sampling period, whichever is greater. A similar frequency shall be maintained for analyzing spiked samples.
- M. When requested by the Regional Water Board or USEPA, the Discharger will participate in the NPDES discharge monitoring report QA performance study. The Discharger must have a success rate equal to or greater than 80%.
- N. For parameters that both average monthly and daily maximum limitations are specified and the monitoring frequency is less than four times a month, the following shall apply. If an analytical result is greater than the average monthly limitation, the Discharger shall collect four additional samples at approximately equal intervals during the month, until compliance with the average monthly limitation has been demonstrated. All five analytical results shall be reported in the monitoring report for that month, or 45 days after results for the additional samples were received, whichever is later. In the event of noncompliance with an average monthly effluent limitation, the sampling frequency for that constituent shall be increased to weekly and shall continue at this level until compliance with the average monthly effluent limitation has been demonstrated. The Discharger shall provide for the approval of the Executive Officer a program to ensure future compliance with the average monthly limitation.
- O. In the event wastes are transported to a different disposal site during the report period, the following shall be reported in the monitoring report:
 - 1. Types of wastes and quantity of each type:
 - 2. Name and address for each hauler of wastes (or method of transport if other than by hauling); and
 - 3. Location of the final point(s) of disposal for each type of waste.

If no wastes are transported off-site during the reporting period, a statement to that effect shall be submitted.

P. Each monitoring report shall state whether or not there was any change in the discharge as described in the Order during the reporting period.

II. MONITORING LOCATIONS

The Discharger shall establish the following monitoring locations to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements in this Order:

Discharge Point Name	Monitoring Location Name	Monitoring Location Description
001	M-001	Shall be located at Discharge Point 001 at latitude 33° 45′ 18″ N and longitude 118° 12′ 48″ W. Storm water, which is collected in the holding pond, is discharged to a storm drain at Downey Avenue through Discharge Point 001.
	R-001	Shall be located midstream in the Los Cerritos Channel at a point within 50 feet upstream of the discharge point of the storm drain to Los Cerritos Channel.

III. INFLUENT MONITORING REQUIREMENTS [Not Applicable]

IV. EFFLUENT MONITORING REQUIREMENTS

- A. Monitoring Location M-001
 - 1. The Discharger shall monitor the discharge of storm water at M-001 as follows:

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
Biochemical Oxygen Demand 5-day @ 20°C (BOD)	mg/L	Grab	1/discharge ¹	2
Oil and Grease	mg/L	Grab	1/discharge ¹	2
рН	standard units	Grab	1/discharge ^{1,3}	2
Total Suspended Solids (TSS)	mg/L	Grab	1/discharge ¹	2
Arsenic, Total Recoverable	μg/L	Grab /	1/discharge ^{1,3,7}	2
Cadmium, Total Recoverable	μg/L	Grab	1/discharge ^{1,3,7}	2
Chromium (VI)	μg/L	Grab	1/discharge ^{1,3,7}	2
Copper, Total Recoverable	μg/L	Grab	1/discharge ^{1,3,7}	2
Lead, Total Recoverable	μg/L	Grab	1/discharge ^{1,3,7}	2
Mercury, Total Recoverable	μg/L	Grab	1/discharge ^{1,3,7}	2
Selenium, Total Recoverable	μg/L	Grab	1/discharge ^{1,3,7}	2
Silver, Total Recoverable	μg/L	Grab	1/discharge ^{1,3,7}	2
Zinc, Total Recoverable	μg/L	Grab	1/discharge ^{1,3,7}	2
Benzene	μg/L	Grab	1/discharge ^{1,3,7}	2
Ethylbenzene	μg/L	Grab	1/discharge ^{1,3,7}	2
Toluene	μg/L	Grab	1/discharge ^{1,3,7}	2
Acute Toxicity ⁴	% survival	Grab	1/year	2
Flow, Total	gallons/	Grab	1/discharge ¹	2

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
	day			
Phenolic Compounds	μg/L	Grab	1/discharge ¹	2
Temperature	°F	Grab	1/discharge ¹	2
Total Organic Carbon	mg/L	Grab	1/discharge ¹	2
Xylene	μg/L	Grab	1/discharge ^{1,7}	2
Tertiary butyl alcohol (TBA)	μg/L	Grab	1/discharge ¹	2
Di-isopropyl ether (DIPE)	μg/L	Grab	1/discharge ¹	2
Tertiary amyl methyl ether (TAME)	μg/L	Grab	1/discharge ¹	2
Ethyl tertiary butyl ether (ETBE)	μg/L	Grab	1/discharge ¹	2
Total Petroleum Hydrocarbons (TPH) 6,8	μg/L	Grab	1/discharge ¹	2
Methyl tertiary butyl ether (MTBE)	μg/L	Grab	1/discharge ¹	2 .
Remaining Priority Pollutants ⁵	μg/L	Grab	1/year ^{3,6,7}	2

- 1. During periods of discharge, samples shall be collected during the first hour of the discharge. Each separate period of discharge shall be sampled, but no more than one sample per 2 weeks is required. Flow shall be recorded daily during each period of discharge.
- 2. Pollutants shall be analyzed using the analytical methods described in 40 CFR Part 136; for priority pollutants the methods must meet the lowest MLs specified in Attachment 4 of the SIP and included as Attachment H. If no methods are specified for a given pollutant, use methods approved by this Regional Water Board or the State Water Board.
- 3. The Discharger shall obtain representative effluent samples from the holding pond if no discharge from the holding pond is anticipated for the entire calendar year. The samples shall be collected during the first hour of a storm event for the calendar year.
- See Section V.
- 5. Priority Pollutants as defined by the CTR defined in Finding II.I of this Order and included as Attachment I.
- 6. Samples shall be collected during the first hour of the discharge during the first discharge event of the calendar year.
- 7. If there is no discharge to storm drain/receiving water from Discharge Serial No. 001, then the discharges to POTW shall be sampled annually for Outfall 001. Representative samples shall be collected from treated containment pond effluent prior to discharge to sanitary sewer trunk line. No action shall be taken by the Regional Board for any exceedances. Discharger will highlight in bold that the monitoring results are of POTW discharge (from Discharge Serial Nos. 001) and the results are being submitted for conduction of Reasonable Potential Analysis (RPA).
- 8. TPH measured by U.S. EPA Methods 418.1 or 8015 for both the gas and diesel ranges.

V. WHOLE EFFLUENT TOXICITY TESTING REQUIREMENTS

A. Definition of Toxicity

1. Acute Toxicity.

Acute toxicity is a measure of primarily lethal effects that occur over a 96-hour period. Acute toxicity shall be measured in percent survival measured in undiluted (100%) effluent.

- a. The average survival in the undiluted effluent for any three (3) consecutive 96-hour static or continuous flow bioassay tests shall be at least 90% survival, and
- b. No single test shall produce less than 70% survival.

B. Acute Toxicity Effluent Monitoring Program

- 1. The Discharger shall conduct acute toxicity tests on effluent grab samples by methods specified in 40 CFR Part 136 which cites USEPA's *Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms*, Fifth Edition, October 2002, USEPA, Office of Water, Washington D.C. (EPA/821-R-02-012) or a more recent edition to ensure compliance in 100 % effluent.
- 2. The fathead minnow, *Pimephales promelas*, shall be used as the test species for fresh water discharges and the topsmelt, *Atherinops affinis*, shall be used as the test species for brackish effluent. The method for topsmelt is found in USEPA's *Short-term Method for Estimating the Chronic Toxicity of Effluents and Receiving Waters to West Coast Marine and Estuarine Organisms*, First Edition, August 1995 (EPA/600/R-95/136).
- 3. In lieu of conducting the standard acute toxicity testing with the fathead minnow, the Discharger may elect to report the results or endpoint from the first 48 hours of the chronic toxicity test as the results of the acute toxicity test.
- 4. Effluent samples shall be collected before discharge to the receiving water.
- C. Chronic Toxicity Effluent Monitoring Program [Not Applicable]

D. Quality Assurance

- 1. Concurrent testing with a reference toxicant shall be conducted. Reference toxicant tests shall be conducted using the same test conditions as the effluent toxicity tests (e.g., same test duration, etc).
- 2. If either the reference toxicant test or effluent test does not meet all test acceptability criteria (TAC) as specified in the test methods manuals (EPA/600/4-91/002 and EPA/821-R-02-014), then the Discharger must re-sample and re-test at the earliest time possible.

- 3. Control and dilution water should be receiving water or laboratory water, as appropriate, as described in the manual. If the dilution water used is different from the culture water, a second control using culture water shall be used.
- E. Accelerated Monitoring and Initial Investigation TRE Trigger
 - 1. Special Provision VI.C.2.a of the Order requires the Discharger to develop and submit for approval an Initial Investigation TRE Workplan.
 - 2. If the results of a toxicity test exceed the acute toxicity effluent limitations (as defined below):

Acute Toxicity:

- i. The average survival in the undiluted effluent for any three (3) consecutive 96-hour static or continuous flow bioassay tests shall be at least 90%, and
- ii. No single test shall produce less than 70% survival.

then, the Discharger shall begin the investigation and evaluation as specified in the Dischargers's Initial Investigation TRE Workplan and begin accelerated monitoring by conducting six additional tests, one approximately every 2 weeks, over a 12-week period. The samples shall be collected and the tests initiated no less than 7 days apart. The Discharger shall ensure that they receive results of a failing acute toxicity test within 24 hours of the close of the test and the additional tests shall begin within 3 business days of the receipt of the result.

- 3. If implementation of the Initial Investigation TRE Workplan indicates the source of toxicity (e.g., a temporary plant upset, etc.), then the Discharger may discontinue the Initial Investigation TRE and resume routine testing frequency.
- F. Toxicity Reduction Evaluation (TRE)/ Toxicity Identification Evaluation (TIE) Trigger
 - 1. If the accelerated testing shows consistent toxicity as defined below:
 - a. Acute Toxicity:
 - i. If the results of any two of the six accelerated tests are less than 90% survival, or
 - ii. If the initial test and any of the additional six acute toxicity bioassay tests result in less than 70% survival.

then, the Discharger shall immediately implement the TRE as described below.

- G. Steps in TRE and TIE Procedures
 - 1. Following a TRE trigger, the Discharger shall initiate a TRE in accordance with the facility's Initial Investigation TRE workplan. At a minimum, the Discharger shall use USEPA manuals EPA/600/2-88/070 (industrial) or EPA/833B-99/002 (municipal) as guidance. The Discharger shall expeditiously develop a more detailed TRE workplan

for submittal to the Executive Officer within 30 days of the trigger, which will include, but not be limited to:

- a. Further actions to investigate and identify the cause of toxicity;
- b. Actions the Discharger will take to mitigate the impact of the discharge and prevent the recurrence of toxicity;
- c. Standards the Discharger will apply to consider the TRE complete and to return to normal sampling frequency; and,
- d. A schedule for these actions.
- 2. The following is a stepwise approach in conducting the TRE:
 - a. Step 1 Basic data collection. Data collected for the accelerated monitoring requirements may be used to conduct the TRE;
 - Step 2 Evaluates optimization of the treatment system operation, facility housekeeping, and the selection and use of in-plant process chemicals;
 - c. Step 3 If Steps 1 and 2 are unsuccessful, Step 3 implements a TIE by employing all reasonable efforts and using currently available TIE methodologies. The Discharger shall use the USEPA acute and chronic manuals, EPA/600/6-91/005F (Phase I), EPA/600/R-96-054 (for marine), EPA/600/R-92/080 (Phase II), and EPA-600/R-92/081 (Phase III) as guidance. The objective of the TIE is to identify the substance or combination of substances causing the observed toxicity;
 - d. Step 4 Assuming successful identification or characterization of the toxicant(s), Step 4 evaluates final effluent treatment options;
 - e. Step 5 Evaluates in-plant treatment options; and.
 - f. Step 6 Consists of confirmation once a toxicity control method has been implemented.

Many recommended TRE elements parallel source control, pollution prevention, and storm water control program best management practices. To prevent duplication of efforts, evidence of implementation of these control measures may be sufficient to comply with TRE requirements. By requiring the first steps of a TRE to be accelerated testing and review of the facility's TRE workplan, a TRE may be ended in its early stages. All reasonable steps shall be taken to reduce toxicity to the required level. The TRE may be ended at any stage if monitoring indicates there is no longer toxicity (or six consecutive acute toxicity test results are greater than 90% survival).

- 3. If a TRE/TIE is initiated prior to completion of the accelerated testing schedule required by this permit, then the accelerated testing schedule may be terminated, or used as necessary in performing the TRE/TIE, as determined by the Executive Officer.
- 4. Toxicity tests conducted as part of a TRE/TIE may also be used for compliance determination, if appropriate.

5. The Regional Water Board recognizes that toxicity may be episodic and identification of causes of and reduction of sources of toxicity may not be successful in all cases. Consideration of enforcement action by the Regional Water Board will be based in part on the Discharger's actions and efforts to identify and control or reduce sources of consistent toxicity.

H. Reporting

- 1. The Discharger shall submit a full report of the toxicity test results, including any accelerated testing conducted during the month as required by this permit. Test results shall be reported as % survival for acute toxicity test results with the self monitoring reports (SMR) for the month in which the test is conducted.
- 2. If an initial investigation indicates the source of toxicity and accelerated testing is unnecessary, then those results also shall be submitted with the DMR for the period in which the investigation occurred.
 - a. The full report shall be submitted on or before the end of the month in which the DMR is submitted.
 - b. The full report shall consist of (1) the results; (2) the dates of sample collection and initiation of each toxicity test; (3) the acute toxicity average limitation or chronic toxicity limitation or trigger.
- 3. Test results for toxicity tests also shall be reported according to the appropriate manual chapter on Report Preparation and shall be attached to the DMR. Routine reporting shall include, at a minimum, as applicable, for each test:
 - a. Sample date(s);
 - b. Test initiation date;
 - c. Test species;
 - d. End point values for each dilution (e.g., number of young, growth rate, percent survival);
 - e. NOEC value(s) in percent effluent;
 - f. IC₁₅, IC₂₅, IC₄₀ and IC₅₀ values in percent effluent;
 - g. $TU_c \text{ values } \left(TU_c = \frac{100}{NOEC} \right);$
 - h. Mean percent mortality (+standard deviation) after 96 hours in 100% effluent (if applicable);
 - i. NOEC and lowest observed effect concentration (LOEC) values for reference toxicant test(s);
 - i. IC₂₅ value for reference toxicant test(s);
 - k. Any applicable charts; and
 - I. Available water quality measurements for each test (e.g., pH, dissolved oxygen, temperature, conductivity, hardness, salinity, ammonia).
- 4. The Discharger shall provide a compliance summary, which includes a summary table of toxicity data from all samples collected during that year.

PARAMOUNT PETROLEUM CORPORATION PARAMOUNT PETROLEUM CORPORATION FACILITY ORDER NO. R4-2005--0082 NPDES NO. CA0056065

The Discharger shall notify by telephone or electronically, this Regional Water Board of any toxicity exceedance of the limitation or trigger within 24 hours of receipt of the results followed by a written report within 14 calendar days of receipt of the results. The verbal or electronic notification shall include the exceedance and the plan the Discharger has taken or will take to investigate and correct the cause(s) of toxicity. It may also include a status report on any actions required by the permit, with a schedule for actions not yet completed. If no actions have been taken, the reasons shall be given.

VI. LAND DISCHARGE MONITORING REQUIREMENTS [Not Applicable]

VII. RECLAMATION MONITORING REQUIREMENTS [Not Applicable]

VIII. RECEIVING WATER MONITORING REQUIREMENTS

- A. Monitoring Location R-001
 - The Discharger shall monitor upstream Los Cerritos Channel at Monitoring Location R-001 as follows:

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
pH ¹	standard units	Grab	2	3
Priority Pollutants 1,4	μg/L	Grab	2	3
Hardness (CaCO ₃) ¹	mg/L	Grab	2	3
Temperature	°F	Grab	2	3

- Must analyze pH and hardness of the receiving water at the same time the samples are collected for priority pollutants analysis.
- Monitoring shall be performed in the first year and fourth year (total of two monitoring events per life of the permit) after adoption of the permit. Shall be monitored concurrently with effluent Priority Pollutant monitoring specified in Section IV.A.1 of Monitoring and Reporting Program, Attachment E.
- Pollutants shall be analyzed using the analytical methods described in 40 CFR Part 136; for priority pollutants the methods must meet the lowest MLs specified in Attachment H. If no methods are specified for a given pollutant, use methods approved by this Regional Water Board or the State Water Board.
- 4 Priority Pollutants as defined by the CTR defined in Finding II.I of this Order and included as Attachment I.
- C. Visual Monitoring of Upstream and Downstream Receiving Water Sampling Points [Not Applicable]

IX. OTHER MONITORING REQUIREMENTS

A. Storm Water Monitoring

- 1. Rainfall Monitoring. The Discharger shall measure and record the rainfall on each day of the month. This information shall be included in the monitoring report for that month.
- Visual Observation. The Discharger shall make visual observations of all storm water discharge locations during at least one storm event per month that produces a significant storm water discharge. Observations shall note the presence of floating and suspended materials, oil and grease, discoloration, turbidity, and odor at the storm water discharge locations. A "significant storm water discharge" is a continuous discharge of storm water for a minimum of one hour, or the intermittent discharge of storm water for a minimum of 3 hours in a 12-hour period.

X. REPORTING REQUIREMENTS

A. General Monitoring and Reporting Requirements

- 1. The Discharger shall comply with all Standard Provisions (Attachment D) related to monitoring, reporting, and recordkeeping.
- 2. If there is no discharge during any reporting period, the report shall so state.
- 3. Each monitoring report shall contain a separate section titled "Summary of Non-Compliance" which discusses the compliance record and corrective actions taken or planned that may be needed to bring the discharge into full compliance with waste discharge requirements. This section shall clearly list all non-compliance with waste discharge requirements, as well as all excursions of effluent limitations.
- 4. The Discharger shall inform the Regional Water Board well in advance of any proposed construction activity that could potentially affect compliance with applicable requirements

B. Self Monitoring Reports (SMRs)

- 1. At any time during the term of this permit, the State or Regional Water Board may notify the Discharger to electronically submit self-monitoring reports. Until such notification is given, the Discharger shall submit self-monitoring reports in accordance with the requirements described below.
- 2. The Discharger shall submit quarterly, and annual SMRs including the results of all required monitoring using USEPA-approved test methods or other test methods specified in this Order. Quarterly reports shall be due on April 15, July 15, October 15, and January 15 following each calendar quarter. Annual reports shall be due on March 1 following each calendar year.
- 3. Monitoring periods and reporting for all required monitoring shall be completed according to the following schedule:

Sampling Monitoring Period Frequency Begins On		Monitoring Period	SMR Due Date
X / year	January 1, 2006	January 1 through December 31	March 1
X / Discharge Event	First day of discharge after the effective date of the permit		April 15 July 15 October 15 January 15

- 4. The Discharger shall report with each sample result the applicable ML and the current MDL, as determined by the procedure in 40 CFR Part 136.
- 5. The Discharger shall arrange all reported data in a tabular format. The data shall be summarized to clearly illustrate whether the facility is operating in compliance with interim and/or final effluent limitations. Where applicable, the Discharger shall include results of receiving water observations.
- 6. Each monitoring report shall state whether or not there was any change in the discharge as described in the Order during the reporting period.
- 7. The Discharger shall attach a cover letter to the SMR. The information contained in the cover letter shall clearly identify violations of the WDRs; discuss corrective actions taken or planned; and the proposed time schedule for corrective actions. Identified violations must include a description of the requirement that was violated and a description of the violation.
- 8. SMRs must be submitted to the Regional Water Board, signed and certified as required by the standard provisions (Attachment D), to the address listed below:

California Regional Water Quality Control Board Los Angeles Region 320 W. 4th Street, Suite 200 Los Angeles, CA 90013 Attn.: Information and Technology Unit

- C. Discharge Monitoring Reports (DMRs) [Not Applicable]
- D. Other Reports
 - 1. By March 1 of each year, the Discharger shall submit an annual report to the Board. The report shall contain both tabular and graphical summaries of the monitoring data obtained during the previous year. In addition, the discharger shall discuss the compliance record and the corrective actions taken or planned which may be needed to bring the discharge into full compliance with the waste discharge requirements.
 - 2. The Discharger shall include in the annual report, an annual summary of the quantities of all chemicals, listed by both trade and chemical names, which are used for cooling and/or boiler water treatment and which are discharged.
 - 3. The Discharger shall file with the Regional Water Board technical reports on self-monitoring work performed according to the detailed specifications contained in any Monitoring and Reporting Programs as directed by the Executive Officer.

- 4. The Discharger shall submit to the Board, together with the first monitoring report required by this permit, a list of all chemicals and proprietary additives which could affect this waste discharge, including quantities of each. Any subsequent changes in types and/or quantities shall be reported promptly.
- 5. This Regional Water Board requires the Discharger to file with the Board, within 90 days after the effective date of this Order, a technical report on his preventive (failsafe) and contingency (cleanup) plans for controlling accidental discharges, and for minimizing the effect of such events. The technical report should:
 - a. Identify the possible sources of accidental loss, untreated waste bypass, and contaminated drainage. Loading and storage areas, power outage, waste treatment unit outage, and failure of process equipment, tanks and pipes should be considered.
 - b. Evaluate the effectiveness of present facilities and procedures and state when they become operational.
 - c. Describe facilities and procedures needed for effective preventive and contingency plans.
 - d. Predict the effectiveness of the proposed facilities and procedures and provide an implementation schedule contingent interim and final dates when they will be constructed, implemented, or operational.

This Regional Water Board, after review of the technical report, may establish conditions which it deems necessary to control accidental discharges and to minimize the effects of such events. Such conditions may be incorporated as part of this Order, upon notice to the Discharger.

As described in Section II of this Order, this Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this Order.

I. PERMIT INFORMATION

The following Table summarizes administrative information related to the facility.

Table F-1 Facility Information

WDID	4B192348001
Discharger	Paramount Petroleum Corporation
Name of Facility	Paramount Petroleum Corporation
	14700 Downey Avenue
Facility Address	Paramount, CA 90723
	Los Angeles County
Facility Contact, Title and Phone	Ms. Kathryn Gleeson, Manager
r acinty Contact, Title and Phone	Environmental, (562) 748-4613
Authorized Person to Sign and Submit	Ms. June Christman, Director of
Reports	Environmental Services, (562) 748-4704
Mailing Address	Same as Facility Address
Billing Address	Attn: Accounts Payable, 14700 Downey
Dining Address	Avenue, Paramount, CA 90723
Type of Facility	Industrial (IND)
Major or Minor Facility	Minor
Threat to Water Quality	2
Complexity	В
Pretreatment Program	N/A
Reclamation Requirements	N
Facility Permitted Flow	0.4 million gallons per day (MGD)
Facility Design Flow	N/A
Watershed	Los Angeles County Coastal Streams
Receiving Water	Los Cerritos Channel
Receiving Water Type	Channel

- A. Paramount Petroleum Corporation (hereinafter Discharger) is the owner and operator of Paramount Petroleum Corporation Facility (hereinafter Facility), a petroleum refining facility.
- B. The Facility discharges storm water to a storm drain which discharges to the Los Cerritos Channel, a water of the United States and is currently regulated by Order No. 99-131 which was adopted on December 9, 1999 and expired on October 10, 2004.

C. The Discharger filed a Report of Waste Discharge (ROWD) and submitted an application for renewal of its WDRs and NPDES permit on June 2, 2004. A site visit was conducted on August 25, 2004, to observe operations and collect additional data to develop permit limitations and conditions.

II. FACILITY DESCRIPTION

A. Description of Facility and Storm Water System

The refinery occupies an area in the city of Paramount, California, which is bounded by Lakewood Boulevard to the east, Somerset Avenue and a railroad right-of-way to the south, Downey Avenue to the west, and Contreras Street, residential and commercial properties to the north. This property contains the offices, petroleum refining process units, above ground storage tanks and refined product distribution racks associated with the Paramount operation.

The refinery processes approximately 50,000 barrels per day of crude oil into various products, including motor fuels, diesel, jet fuel, and asphalt products. The total area of the Facility is approximately 65 acres. There are four processing areas, including the crude units, hydroprocessing, and two asphalt plants. Approximately 120 above ground storage tanks are on-site, mostly bounding the north and east areas of the refinery. There are 26 loading and/or unloading truck racks on the site, and two rail car loading facilities. Most of the crude oil received at the refinery is via underground pipeline, and approximately 50% of Paramount's finished product is shipped out via underground pipeline.

The site operates 24 hours a day, 7 days a week except during maintenance shutdowns. Activities to support the refining process, such as maintenance activities, including vehicle and equipment repair, also take place at the site. Maintenance activities generally occur 8 hours a day, 5 days a week.

The current storm water drainage system at the Facility is shown in Attachment B. Since the issuance of the existing permit, the Facility has altered the storm water collection system; therefore, the storm water collection system described in the existing permit is no longer applicable. The current storm water system consists of storm water from the processing areas and from the non-processing areas. Storm water in the processing areas generally flows towards the south of the facility while storm water from the nonprocessing areas flows along the refinery's north road. The processing area is subdivided into two sections; old processing area and the new processing area. The old processing area includes the crude units. The newer processing area includes hydoprocessing plant, asphalt plant and tank farm area. Storm water from the old processing area after treatment is discharged to the local sanitation district sewer line. The storm water from the new processing area is sent to a holding pond. Prior to discharge, solids and oils are controlled by a weir and a skirted boom that surround the discharge pump area. The storm water from the pond is normally discharged to the same local sanitation district sewer line, in accordance with its permit requirements. During heavy rains and in emergency conditions, when the holding capacity of the tanks and pond is exceeded. Paramount will discharge it to storm drain after treatment through a planned treatment system. The selection and design of the planned treatment system is currently being evaluated. The maximum emergency storm water that will be discharged from the pond after treatment to the storm drain on Downey Avenue through Discharge Point 001

(Latitude: 33° 45' 18" N and Longitude: 118° 12' 48" W) is 0.4 million gallons per day.(MGD).

Storm water from the northern area of the refinery (non-processing areas) flows west along the refinery's north road. Storm water runoff from the northern portion of the refinery then commingles with the runoff from the parking area prior to flowing out the front entrance of the refinery to the storm drain located on Downey Avenue. Best management practices (BMPs) have been incorporated to reduce storm water pollution in the non-process areas. The BMPs include:

1. North Road

- a. Berming the south side of the North Road so water from the refinery does not run on the North Road.
- b. Cleaning the road prior to rainy season.
- c. Street sweeping the North Road prior to and during the rainy season.
- d. Installment of straw bale and oil absorbent socks along the fenceline and the driveway.

2. Parking Lots

- a. Usage of better housekeeping to keep parking lots from litter and debris.
- b. Providing adequate litter recepticles, keeping them covered and emptying it frequently.
- c. Sweeping the parking lots [prior to rainy seasons.
- d. Protecting the storm water drains during any repair or cleaning of the parking lots.
- e. Recoating or resealing the asphalt during dry weather.

Discharger is currently in the process of applying for enrollment in the General Industrial Storm Water Permit program for discharge of storm water from non-process areas.

B. Discharge Points and Receiving Waters

The Facility discharges up to a total of 0.4 MGD of storm water from the processing areas to the storm drain on Downey Avenue through Discharge Point 001 located at 33° 45' 18" N and 118° 12' 48" W. The storm drain discharges to the Los Cerritos Channel, a water of the United States.

C. Summary of Existing Requirements and Self-Monitoring Report (SMR) Data

The Discharger submitted four sets of discharge data for Discharge Point 001 during the permit term. Effluent data for storm water discharge through Discharge Point 001 are available for February 12, 2003, December 29, 2004, February 14, 2005, and March 22, 2005. Quarterly monitoring reports submitted by the Discharger between the 1st quarter of 2000 and the 2nd quarter of 2004 indicate that the discharge from the Facility through Discharge Point 001 only occurred in the 2nd quarter of 2003. The three additional data sets were submitted by the Facility on March 30, 2005. Effluent Limitations/Discharge Specifications contained in the existing Order for discharges from Discharge Points 001 (Monitoring Location 001), and the representative monitoring data for Discharge Point 001 from the term of the existing permit are as follows:

Table F-2
Summary of Effluent Limitations in Order No. 99-131 and SMR For Discharge Point 001

Parameter ¹	Units	Maximum Daily Effluent Limitation	Monitoring Data for Discharge Point 001 (January 2000 to March 2005) Highest Daily Discharge
Biochemical Oxygen Demand	mg/L	30	140
5-day @ 20 °C (BOD)	lbs/day	200	183
Oil and Grease	mg/L	15	3
On and Oroaco	lbs/day	100	5.8
рН	standard units	6 to 9 ²	7.7
Total Suspended Solids (TSS)	mg/L	150	464
	lbs/day	1001	1573
Arsenic	μg/L	50	10
Cadmium	μg/L	3.7	<10
Chromium (VI)	μg/L	15	0.8
Copper	μg/L	17	127
Lead	μg/L	15	82
Mercury	μg/L	2	<0.5
Selenium	μg/L	10	<20
Silver	μg/L	3.4	<20
Zinc	μg/L	110	679
Asbestos	million fibers/L		0.19
Benzene	μg/L	1.0	84
Ethylbenzene	μg/L	700	35
Toluene	μg/L	150	199
Naphthalene	μg/L		7.7
Bromodichloromethane	μg/L		1.64
Chromium, Total	μg/L		95
Flow	MGD	0.80	0.79
Phenolic Compounds	μg/L	1.0	<0.1
Temperature	F	100	64
Total Organia Carban (TOC)	mg/L	110	16
Total Organic Carbon (TOC)	lbs/day	734	51
1,2,4-Trimethylbenzene	μg/L		5.3
1,3,5-Trimethylbenzene	μg/L		1.2
Xylene	μg/L	1750	213
Hardness	mg/L		153
Salinity	mg/L		8

¹ Other pollutants analyzed were reported as not detected

² pH should be between 6 and 9

D. Compliance Summary

Effluent data submitted by the Discharger to the Regional Water Board for Discharge Point 001 indicate that the Discharger has exceeded existing permit limitations as outlined in the Table below:

Table F-3
Compliance Summary For Discharge Point 001

Date	Monitoring Period	Violation Type	Pollutant ¹	Reported Value	Permit Limitation	Units
2/12/2003	2 nd Quarter, 2003	Maximum	BOD	140	30	mg/L
2/12/2003	2 nd Quarter, 2003	Maximum	TSS	393	150	mg/L
2/12/2003	2 nd Quarter, 2003	Maximum	Copper	127	17	μg/L
2/12/2003	2 nd Quarter, 2003	Maximum	Lead	82	15	μg/L
2/12/2003	2 nd Quarter, 2003	Maximum	Zinc	679	110	μg/L
2/12/2003	2 nd Quarter, 2003	Maximum	Zinc	5.6	1.0	μg/L
2/12/2003	2 nd Quarter, 2003	Reporting	Tempera- ture	Not Reported	100	°F
12/29/2004	4 th Quarter, 2004	Maximum	TSS	238	150	mg/L
12/29/2004	4 th Quarter, 2004	Maximum	Copper	62	17	μg/L
12/29/2004	4 th Quarter, 2004	Maximum	Lead	39	15	μg/L
12/29/2004	4 th Quarter, 2004	Maximum	Zinc	607	110	μg/L
12/29/2004	4 th Quarter, 2004	Maximum	Benzene	2.5	1.0	μg/L
2/14/2005	2 nd Quarter, 2005	Maximum	BOD	37	30	mg/L
2/14/2005	2 nd Quarter, 2005	Maximum	TSS	206	150	mg/L
2/14/2005	2 nd Quarter, 2005	Maximum	Benzene	26	1.0	μg/L
3/22/2005	2 nd Quarter, 2005	Maximum	BOD	95	30	mg/L
3/22/2005	2 nd Quarter, 2005	Maximum	TSS	464	150	mg/L
3/22/2005	2 nd Quarter, 2005	Maximum	Benzene	84	1.0	μg/L
3/22/2005	2 nd Quarter, 2005	Maximum	Toluene	199	150	μg/L

^{1.} BOD = 5-day biochemical oxygen demand @ 20°C; TSS = total suspended solids

All identified violations are being evaluated for appropriate enforcement actions.

E. Planned Changes – Paramount made changes separating storm water from the processing areas from the non-processing areas. Storm water from older process areas is discharged to sanitary sewer. Only emergency storm water from new processing areas is discharged to storm drain after treatment. Currently the size and type of treatment system is being evaluated for selection and installation.

III. APPLICABLE PLANS, POLICIES, AND REGULATIONS

The requirements contained in the tentative Order are based on the requirements and authorities described in this section.

A. Legal Authorities

The tentative Order is issued pursuant to section 402 of the Federal CWA and implementing regulations adopted by the USEPA and Chapter 5.5, Division 7 of the CWC. It shall serve as a NPDES permit for point source discharges from this Facility to surface waters. The tentative Order also serves as WDRs pursuant to Article 4, Chapter 4 of the CWC for discharges that are not subject to regulation under CWA section 402.

B. California Environmental Quality Act (CEQA)

This action to adopt an NPDES permit is exempt from the provisions of the California Environmental Quality Act (Public Resources Code Section 21100, et seq.) in accordance with Section 13389 of the CWC.

C. State and Federal Regulations, Policies, and Plans

1. Water Quality Control Plans. The Regional Water Board adopted a Water Quality Control Plan for the Coastal Watersheds of Los Angeles and Ventura Counties (hereinafter Basin Plan) that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. In addition, State Water Board Resolution No. 88-63 requires that, with certain exceptions, the Regional Water Board assign the municipal and domestic supply use to water bodies that do not have beneficial uses listed in the Basin Plan. Beneficial uses applicable to the Los Cerritos Channel to Estuary are as follows:

Table F-4
Discharge Points, Receiving Waters, and Beneficial Uses

Discharge Point	Receiving Water Name	Beneficial Use(s)
001	Los Cerritos Channel to Estuary	Existing: Wildlife habitat (WILD) Intermittent: Non-contact water recreation (REC-2) and warm freshwater habitat (WARM) Potential: Municipal and domestic water supply (MUN) and contact water recreation (REC-1)

2. **Ammonia Basin Plan Amendment.** The 1994 Basin Plan provided water quality objectives for ammonia to protect aquatic life in Table 3-1 through Table 3-4. However, those ammonia objectives were revised on March 4, 2004, by the Regional

Water Board with the adoption of Resolution No. 2004-022, Amendment to the Water Quality Plan for the Los Angeles Region to Update the Ammonia Objectives for Inland Surface Waters Not Characteristic of Freshwater (including enclosed bays, estuaries and wetlands) with the Beneficial Use designations for protection of "Aquatic Life". The ammonia Basin Plan amendment has not yet been approved by the Office of Administrative Law or the USEPA. The revised criteria are not available for use until the aforementioned approvals have been obtained.

- 3. **Thermal Plan.** The State Water Board adopted a *Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Water and Enclosed Bays and Estuaries of California* (Thermal Plan) on May 18, 1972, and amended this plan on September 18, 1975. This plan contains temperature objectives for inland surface waters.
- 4. **National Toxics Rule (NTR) and California Toxics Rule (CTR).** USEPA adopted the NTR on December 22, 1992, which was amended on May 4, 1995 and November 9, 1999, and the CTR on May 18, 2000, which was amended on February 13, 2001. These rules include water quality criteria for priority pollutants and are applicable to this discharge. The provisions for compliance schedules sunset on May 18, 2005.
- 5. Antidegradation Policy. Section 131.12 of 40 CFR requires that State water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16, which incorporates the requirements of the federal antidegradation policy. Resolution No. 68-16 requires that existing water quality is maintained unless degradation is justified based on specific findings. As discussed in detail in this Fact Sheet, the permitted discharge is consistent with the antidegradation provision of 40 CFR §131.12 and State Water Board Resolution No. 68-16.
- 6. **Anti-Backsliding Requirements.** Sections 402(o)(2) and 303(d)(4) of the CWA and 40 CFR §122.44(I) prohibit backsliding in NPDES permits. These anti-backsliding provisions require that effluent limitations in a reissued permit must be as stringent as those in the existing permit, with some exceptions in which limitations may be relaxed. All effluent limitations in the tentative Order are at least as stringent as the effluent limitations in the existing Order.
- 7. **Monitoring and Reporting Requirements.** Section 122.48 of 40 CFR requires that all NPDES permits specify requirements for recording and reporting monitoring results. Sections 13267 and 13383 of the CWC authorize the Regional Water Boards to require technical and monitoring reports. The tentative MRP establishes monitoring and reporting requirements to implement federal and State requirements. The tentative MRP is provided in Attachment E.
- 8. Alaska Rule. On March 30, 2000, USEPA revised its regulation that specifies when new and revised State and Tribal water quality standards (WQS) become effective for CWA purposes (40 CFR 131.21, 65 FR 24641, April 27, 2000). Under USEPA's new regulation (also known as the Alaska rule), new and revised standards submitted to USEPA after May 30, 2000, must be approved before being used for CWA purposes. The final rule also provides that standards already in effect and

submitted to USEPA by May 30, 2000, may be used for CWA purposes, whether or not approved by USEPA.

D. Impaired Water Bodies on CWA 303(d) List

Section 303(d) of the CWA requires states to identify specific water bodies where water quality standards are not expected to be met after implementation of technology-based effluent limitations on point sources. For all 303(d)-listed water bodies and pollutants, the Regional Water Board plans to develop and adopt TMDLs that will specify waste load allocations (WLAs) for point sources and load allocations (LAs) for non-point sources, as appropriate.

USEPA approved the State's 2002 303(d) list of impaired water bodies on July 25, 2003. Certain receiving waters in the Los Angeles and Ventura County watersheds do not fully support beneficial uses and therefore have been classified as impaired on the 2002 303(d) list and have been scheduled for TMDL development.

The 2002 State Water Board's California 303(d) List classifies the Los Cerritos Channel as impaired. The pollutants of concern include ammonia, chlordane (sediment), copper, high coliform count, lead, and zinc. To date, no TMDL has been completed for this segment of water. Therefore, no conditions in the tentative Order are based on TMDLs.

The Facility discharges storm water from the refinery. It is unlikely that the discharge would contain ammonia, chlordane (sediment), and high coliform count. The discharge is not expected to impair Los Cerritos Channel for these pollutants. Available effluent data indicate that copper, lead, and zinc are present in the discharge and may have contributed to impairment. Effluent limitations for copper, lead, and zinc have been established to protect the Los Cerritos Channel from impairment caused by this discharge.

E. Other Plans, Polices and Regulations [Not Applicable]

IV. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

The CWA requires point source discharges to control the amount of conventional, non-conventional, and toxic pollutants that are discharged into the waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. There are two principal bases for effluent limitations: 40 CFR §122.44(a) requires that permits include applicable technology-based limitations and standards; and 40 CFR §122.44(d) requires that permits include WQBELs to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water. Where numeric water quality objectives have not been established, three options exist to protect water quality: 1) 40 CFR §122.44(d) specifies that WQBELs may be established using USEPA criteria guidance under CWA section 304(a); 2) proposed State criteria or a State policy interpreting narrative criteria supplemented with other relevant information may be used; or 3) an indicator parameter may be established.

The Facility is a petroleum refinery that processes crude oil into various products, including motor fuels, diesel, jet fuel, and asphalt products. The discharge consists of storm water from the refinery to the storm drain through Discharge Point 001. Typical pollutants present in these waste streams may include solids, oil and grease, organic compounds, and metals. Solids are

commonly present in storm water of industrial facilities and therefore, 5-day biochemical oxygen demand @ 20°C (BOD) and total suspended solids (TSS) are pollutants of concern. In addition, the Facility deals with crude oil and refinery products that are a potential source of oil and grease, organic compounds, and metals. Organic pollutants from petroleum facilities typically include benzene, ethylbenzene, toluene, phenolic compounds, xylene, and other organic compounds. Also, pH and temperature are pollutants of concern because the discharge of industrial storm water also has the potential to affect the pH and temperature of the receiving water body. When the existing permit was issued in 1999, BOD, oil and grease, pH, TSS, arsenic, cadmium, chromium (VI), copper, lead, mercury, selenium, silver, zinc, benzene, ethylbenzene, toluene, phenolic compounds, total organic carbon (TOC), and xylene were considered pollutants of concern and were regulated in the existing permit. The Facility operation has not changed significantly since the existing permit was issued. Therefore, these pollutants are also considered pollutants of concern for the tentative permit. The Regional Water Board has determined that regulating benzene, ethylbenzene, toluene, phenolic compounds, TOC, and xylene will control other organic compounds from the discharge. Similarly, regulating arsenic, cadmium, chromium (VI), copper, lead, mercury, selenium, silver, zinc will control other metals from the discharge.

The Report of Waste Discharge indicates that the expected total average discharge rate of storm water to the storm drain through Discharge Point 001 is 0.4 MGD.

A. Discharge Prohibitions

The discharge prohibitions are based on the requirements of the Basin Plan, State Water Board's plans and policies, CWC, and existing permit provisions, and are consistent with the requirements set for other discharges regulated by NPDES permits to the Los Cerritos Channel.

B. Technology-Based Effluent Limitations

1. Scope and Authority

The CWA requires that technology-based effluent limitations be established based on several levels of control:

- a. Best practicable treatment control technology (BPT) is based on the average of the best performance by plants within an industrial category or subcategory.
 BPT standards apply to toxic, conventional, and nonconventional pollutants.
- b. Best available technology economically achievable (BAT) represents the best existing performance of treatment technologies that are economically achievable within an industrial point source category. BAT standards apply to toxic and nonconventional pollutants.
- c. Best conventional pollutant control technology (BCT) is a standard for the control from existing industrial point sources of conventional pollutants including BOD, TSS, oil and grease, fecal coliform, and pH. The BCT standard is established after considering the "cost reasonableness" of the relationship between the cost of attaining a reduction in effluent discharge and the benefits that would result, and also the cost effectiveness of additional industrial treatment beyond BPT.

d. New source performance standards (NSPS) that represent the best available demonstrated control technology standards. The intent of NSPS guidelines is to set limitations that represent state-of-the-art treatment technology for new sources.

The CWA requires USEPA to develop effluent limitations, guidelines and standards (ELGs) representing application of BPT, BAT, BCT, and NSPS. Section 402(a)(1) of the CWA and 40 CFR §125.3 of the NPDES regulations authorize the use of BPJ to derive technology-based effluent limitations on a case-by-case basis where ELGs are not available for certain industrial categories and/or pollutants of concern. Where BPJ is used, the permit writer must consider specific factors outlined in 40 CFR §125.3.

2. Applicable Technology-Based Effluent Limitations

Based on the type of operation, Paramount Refinery is categorized as a topping refinery as defined in 40 CFR § 419.10 (Effluent Limitation Guidelines and Standards for the Petroleum Refining Point Source Category). Because the discharge through Discharge Point 001 consists of contaminated runoff, effluent limitations for contaminant runoff established in 40 CFR §§ 419.12, 419.13, and 419.14 are applicable to the discharge. 40 CFR §§ 419.12, 419.13, and 419.14 establishes effluent limitations of 15 mg/L for oil and grease and 110 mg/L for TOC for contaminant runoff. When the discharge exceeds the effluent limitation of oil and grease or TOC specified above, then effluent limitations for BOD, oil and grease, pH. TSS, chromium, chromium (VI), phenols, and chemical oxygen demand (COD), also available in 40 CFR §§ 419.12, 419.13, and 419.14, are applicable. The existing permit contains effluent limitation of 15 mg/L for oil and grease and 110 mg/L for TOC and the data submitted by the Discharger shows that the discharge can meet the effluent limitation of 15 mg/L for oil and grease and 110 mg/L for TOC easily. Therefore, for the tentative permit effluent limitation of 15 mg/L for oil and grease and 110 mg/L for TOC are established.

The tentative Order also includes technology-based effluent limitations based on BPJ in accordance with 40 CFR §125.3. As discussed earlier, BOD, oil and grease, arsenic, cadmium, chromium (VI), copper, lead, mercury, selenium, silver, zinc, benzene, ethylbenzene, toluene, phenolic compounds, TOC, xylene, and total petroleum hydrocarbons (TPH) are pollutants of concern for this type of discharge and existing permit includes effluent limitations for these pollutants, except TPH. Section 402(o) of the CWA and 40 CFR §122.44(I) require that effluent limitations or conditions in reissued Orders be at least as stringent as those in the existing Orders. Based on BPJ, effluent limitations for all the above pollutants except oil and grease and TOC for Discharge Point 001 in the tentative Order are carried over from the existing Order (Order No. 99-131). Removal of these numeric limitations would constitute backsliding under CWA Section 402(o). The Regional Water Board has determined that these numeric effluent limitations continue to be applicable to the Facility and that backsliding is not appropriate. To be consistent with similar permits recently issued by the Regional Board, a new limit of 100 µg/L for TPH and the daily maximum effluent limitation for TSS in the tentative Order has been revised to 75 mg/L. Summaries of the technology-based effluent limitations are described in Tables F-5.

Table F-5
Summary of Technology-Based Effluent Limitations
Discharge Point 001

•	•	•	
Parameter	Units	Effluent Limitations Maximum Daily	
Biochemical Oxygen Demand 5-day @ 20°C (BOD)	mg/L	30	
Oil and Grease	mg/L	15	
Total Suspended Solids (TSS)	mg/L	75	
Arsenic, Total Recoverable	μg/L	50	
Cadmium, Total Recoverable	μg/L	3.7	
Chromium (VI)	μg/L	15	
Copper, Total Recoverable	μg/L	17	
Lead, Total Recoverable	μg/L	15	
Mercury, Total Recoverable	μg/L	2.0	
Selenium, Total Recoverable	μg/L	10	
Silver, Total Recoverable	μg/L	3.4	
Zinc, Total Recoverable	μg/L	110	
Benzene	μg/L	1.0	
Ethylbenzene	μg/L	700	
Toluene	μg/L	150	
Phenolic Compounds	μg/L	1	
Total Organic Carbon (TOC)	mg/L	110	
Total Petroleum Hydrocarbons	μg/L	100	
Xylene	μg/L	1,750	

C. Water Quality-Based Effluent Limitations (WQBELs)

1. Scope and Authority

As specified in 40 CFR §122.44(d)(1)(i), permits are required to include WQBELs for toxic pollutants (including toxicity) that are or may be discharged at levels which cause, have reasonable potential to cause, or contribute to an excursion above any state water quality standard. The process for determining reasonable potential and calculating WQBELs when necessary is intended to protect the designated uses of the receiving water as specified in the Basin Plan, and achieve applicable water quality objectives and criteria that are contained in other state plans and policies, or water quality criteria contained in the CTR and NTR. The specific procedures for determining reasonable potential and, if necessary, for calculating WQBELs are contained in the USEPA Technical Support Document (TSD) for storm water discharges. The TSD states that "an analogous approach developed by a regulatory authority can be used to determine the reasonable potential" (for storm water discharges). In the tentative Order, the Regional Water Board has used the TSD methodology to evaluate reasonable potential for storm water discharges through Discharge Point 001.

2. Applicable Beneficial Uses and Water Quality Criteria and Objectives

The receiving water is the Los Cerritos Channel. The beneficial uses applicable to the Los Cerritos Channel are summarized in Section III.C.1 of this Fact Sheet. Priority pollutant water quality criteria in the CTR are applicable to the Los Cerritos Channel. Some water quality criteria are hardness dependent. The Discharger did not provide hardness data for the receiving water. The minimum effluent hardness of 144 mg/L, reported by the Discharger, was used for evaluation of reasonable potential.

3. Determining the Need for WQBELs

Sufficient effluent and receiving water data are needed to conduct a complete RPA. If data are not sufficient, the Discharger will be required to gather the appropriate data for the Regional Water Board to conduct the RPA. Upon review of the data, and if the Regional Water Board determines that WQBELs are needed to protect the beneficial uses, the permit will be reopened for appropriate modification.

The Discharger submitted four sets of discharge data for Discharge Point 001. Effluent data for storm water discharge through Discharge Point 001 are available for February 12, 2003, December 29, 2004, February 14 2005, and March 22, 2005. Quarterly monitoring reports submitted by the Discharger between the 1st quarter of 2000 and the 2nd quarter of 2004 indicate that the discharge from the Facility only occurred in the 2nd quarter of 2003. An additional three effluent data sets were recently submitted by the Facility. The discharge data for February 14, 2005, and 22nd March 2005 contained effluent data for a few of the CTR pollutants. No receiving water data were submitted during the entire term of the permit. Because the Facility rarely discharges through Discharge Point 001, a large number of data points for all the CTR pollutants may never be available for analysis. Therefore, the RPA was performed for the priority pollutants regulated in the CTR for which data are available. Based on the RPA, there is reasonable potential to exceed water quality standards for copper, lead, zinc, and benzene for discharges through Discharge Point 001. Refer to Attachment J for a summary of the RPA and associated effluent limitation calculations.

4. WQBEL Based on Basin Plan and Thermal Plan

The Basin Plan states that the pH of inland surface waters shall not be depressed below 6.5 or raised above 8.5 as a result of waste discharge. Based on the requirements of the Basin Plan an instantaneous minimum limitation of 6.5 and an instantaneous maximum limitation of 8.5 for pH are included in the proposed permit.

The Basin Plan lists temperature requirements for the receiving waters and references the Thermal Plan. Based on the requirements of the Thermal Plan and a white paper developed by Regional Water Board staff entitled *Temperature and Dissolved Oxygen Impacts on Biota in Tidal Estuaries and Enclosed Bays in the Los Angeles Region*, a maximum effluent temperature limitation of 86 °F is included in the proposed permit. The white paper evaluated the optimum temperatures for steelhead, topsmelt, ghost shrimp, brown rock crab, jackknife clam, and blue mussel. The new temperature effluent limitation is reflective of new information available that

indicates that the 100 °F temperature is not protective of aquatic organisms. A survey was completed for several kinds of fish and the 86 °F temperature was found to be protective.

5. Final WQBELs

Summaries of the water quality-based effluent limitations for Discharge Point 001 are shown in Tables F-6.

Tables F-6
Summary of Water Quality-based Effluent Limitations
Discharge Point 001

	Units	Effluent Limitations					
Parameter		Average Monthly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum		
Copper, Total Recoverable	μg/L		20				
Lead, Total Recoverable	μg/L		8.3				
Zinc, Total Recoverable	μg/L		163				
Benzene	μg/L		142				
рН	standard units.			6.5	8.5		
Temperature	°F		86				

6. Whole Effluent Toxicity (WET)

Whole effluent toxicity (WET) protects the receiving water quality from the aggregate toxic effect of a mixture of pollutants in the effluent. WET tests measure the degree of response of exposed aquatic test organisms to an effluent. The WET approach allows for protection of the narrative "no toxics in toxic amounts" criterion or implementing numeric criteria for toxicity. There are two types of WET tests: acute and chronic. An acute toxicity test is conducted over a short time period and measures mortality. A chronic toxicity test is conducted over a longer period of time and measures mortality, reproduction, and growth.

The Basin Plan specifies a narrative objective for toxicity, requiring that all waters be maintained free of toxic substances in concentrations that are lethal to, or produce other detrimental response on aquatic organisms. Detrimental response includes but is not limited to decreased growth rate, decreased reproductive success of resident or indicator species, and/or significant alterations in population, community ecology, or receiving water biota. The existing Order contains acute toxicity limitations and monitoring requirements in accordance with the Basin Plan, in which the acute toxicity objective for discharges dictates that the average survival in undiluted effluent for any three consecutive 96-hour static or continuous flow bioassay tests shall be at least 90%, with no single test having less than 70% survival. Consistent with Basin Plan requirements, the tentative Order includes acute toxicity limitations and monitoring requirements from the existing Order.

During the normal course of business, the storm water discharges at Paramount Refinery to receiving waters occur only after a significant storm event. The discharge is not continuous and the discharge of storm water is not expected to contribute to long term toxic effects. Intermittent discharges are likely to have short term toxic effects. The Discharger will be required to conduct acute toxicity testing in accordance with the Basin Plan.

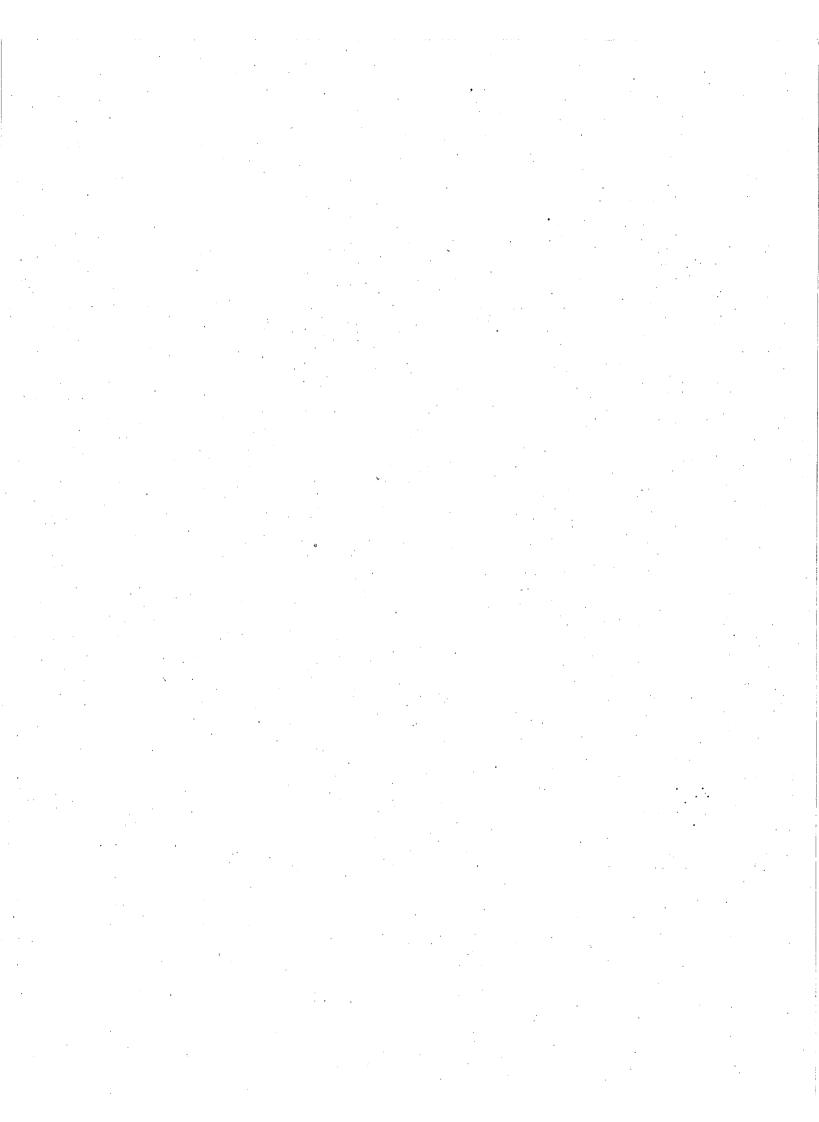

D. Final Effluent Limitations

Section 402(o) of the CWA and 40 section CFR 122.44(I) require that effluent limitations or conditions in reissued Orders be at least as stringent as those in the existing Orders. Removal of numeric limitations in the tentative permit for pollutants regulated in the existing permit would constitute backsliding under CWA Section 402(o). The effluent limitations in the tentative permit are the same as or more stringent than those of the existing Order, and therefore, backsliding is not applicable to the Facility. The tentative effluent limitations for BOD, oil and grease, arsenic, cadmium, chromium (VI), copper, mercury, selenium, silver, zinc, benzene, ethylbenzene, toluene, acute toxicity, phenolic compounds, TOC, and xylene are the same as those of the existing permit for Discharge Point 001. However, the tentative effluent limitations for lead for Discharge Point 001 are more stringent than those in the existing permit. The tentative effluent imitations for pH and temperature are also more stringent than those in the existing permit for both Discharge Point 001.

Final effluent limitations for Discharge Point 001 are summarized in Table F-7. For each pollutant, the selected final effluent concentration limitation is the more stringent of the technology-based effluent limitation, available in Table F-5 and the WQBELs available in Table F-6. Toxicity requirements are based on the discussion in Section IV.C.5.

Table F-7
Summary of Final Effluent Limitations
Discharge Point 001

		Final Effluent Limitations				
Parameter	Units	Average Monthly	Maximum Daily	Instanta- neous Minimum	Instantan- eous Maximum	Rationale ¹
Biochemical Oxygen Demand 5-day @ 20°C (BOD)	mg/L		30			E
Oil and Grease	mg/L		15			Е
pН	standard units			6.5	8.5	ВР
Total Suspended Solids (TSS)	mg/L		75			BPJ
Arsenic, Total Recoverable	μg/L		50			Е
Cadmium, Total Recoverable	μg/L		3.7			E

		Final Effluent Limitations				[
Parameter	Units	Average Monthly	Maximum Daily	Instanta- neous Minimum	Instantan- eous Maximum	Rationale ¹
Chromium (VI)	μg/L		15			Е
Copper, Total Recoverable	μg/L		17			E
Lead, Total Recoverable	μg/L		8.3			CTR
Mercury, Total Recoverable	μg/L		2.0			Е
Selenium, Total Recoverable	μg/L		10			E
Silver, Total Recoverable	μg/L	<u> </u>	3.4			E
Zinc, Total Recoverable	μg/L		110		 ·	E
Benzene	μg/L		1.0			E
Ethylbenzene	μg/L		700			Е
Toluene	μg/L		150			Е
Acute Toxicity	% survival			2		E
Phenolic Compounds	μg/L		1.0	FRA 400 No.		Е
Temperature	°F		86			TP
Total Organic Carbon (TOC)	mg/L		110			E
Xylene	μg/L		1,750			E .
Total Petroleum Hydrocarbons	μg/L		100			BPJ

- 1. BP = Basin Plan, TP = Thermal Plan, E = Existing permit limitation; BPJ = Best Professional Judgement, CTR = California Toxic Rule
- 2. There shall be no acute toxicity in the discharge. The acute toxicity of the effluent shall be such that (i) the average survival in the undiluted effluent for any three (3) consecutive 96-hour static or continuous flow bioassay tests shall be at least 90%, and (ii) no single test producing less than 70% survival. Compliance with the toxicity objectives will be determined by the method described in MRP, Attachment E.
- E. Land Discharge Specifications [Not Applicable]
- F. Reclamation Specifications [Not Applicable]

V. RATIONALE FOR RECEIVING WATER LIMITATIONS

A. Surface Water

The Basin Plan contains numeric and narrative water quality objectives applicable to all surface waters within the Los Angeles Region. Water quality objectives include an objective to maintain the high quality waters pursuant to federal regulations (40 CFR §131.12) and State Water Board Resolution No. 68-16. Receiving water limitations in the tentative Order are included to ensure protection of beneficial uses of the receiving water and are based on the water quality objectives contained in the Basin Plan.

B. Groundwater

The receiving water limitations for groundwater in the tentative Order are based upon the water quality objectives contained in the Basin Plan.

VI. RATIONALE FOR MONITORING AND REPORTING REQUIREMENTS

Section 122.48 of 40 CFR requires all NPDES permits to specify recording and reporting of monitoring results. Sections 13267 and 13383 of the CWC authorize the Water Boards to require technical and monitoring reports. The MRP in Attachment E of the tentative Order, establishes monitoring and reporting requirements to implement federal and state requirements. The following provides the rationale for the monitoring and reporting requirements contained in the tentative MRP for this Facility.

A. Influent Monitoring [Not Applicable]

B. Effluent Monitoring

Monitoring for those pollutants expected to be present in the Monitoring Location M-001 at Discharge Point 001, will be required as shown in the tentative MRP (Attachment E). To determine compliance with effluent limitations, the proposed monitoring plan carries forward monitoring requirements from existing Order 99-131. In the tentative permit, monitoring requirements for BOD, oil and grease, pH, TSS, arsenic, cadmium, chromium (VI), copper, lead, mercury, selenium, silver, zinc, benzene, ethylbenzene, toluene, acute toxicity, flow, phenolic compounds, temperature, TOC, and xylene are carried over from the existing permit. In addition, monitoring requirements are established for, ammonia, tertiary butyl alcohol (TBA), di-isopropyl ether (DIPE), tertiary amyl methyl ether (TAME), ethyl tertiary butyl ether (ETBE), methyl tertiary butyl ether (MTBE), and total petroleum hydrocarbons (TPH). Because the discharge through Discharge Point 001 will occur only during storm events, the tentative Order requires that the monitoring for the pollutants are performed once per discharge event. However, for priority pollutants and acute toxicity, at a minimum, annual monitoring is required to characterize the discharge for future analysis.

The Regional Water Board is requiring that the Discharger conduct effluent monitoring of the CTR priority pollutants. The monitoring requirements and frequencies for the priority pollutants in the proposed permit are carried over from the existing permit.

C. Whole Effluent Toxicity Testing Requirements

Whole effluent toxicity (WET) protects the receiving water quality from the aggregate toxic effect of a mixture of pollutants in the effluent. An acute toxicity test is conducted over a short time period and measures mortality. The tentaive Order includes limitations for acute toxicity, and therefore, monitoring requirements are included in the MRP (Attachment E) to determine compliance with the effluent limitations established in Limitations and Discharge Requirements, Effluent Limitations, Sections IV.A.1.a and b of this tentative Order.

D. Receiving Water Monitoring

1. Surface Water

The Regional Water Board is requiring that the Discharger conduct upstream receiving water monitoring of the CTR priority pollutants at Monitoring Location R-001, to determine reasonable potential. The Discharger must also analyze temperature, pH, and hardness of the upstream receiving water at the same time the samples are collected for priority pollutants analysis.

2. Groundwater [Not Applicable]

E. Other Monitoring Requirements

Other monitoring requirements include rainfall monitoring and visual observation. Rainfall monitoring is required to estimate the storm water run off discharged from the facility. Visual observation of the storm drain is required to ensure that no objectionable material is discharged to the storm drain during a storm event.

VII. RATIONALE FOR PROVISIONS

A. Standard Provisions

1. Federal Standard Provisions

Standard Provisions, which in accordance with 40 CFR §§122.41and 122.42, apply to all NPDES discharges and must be included in every NPDES permit, are provided in Attachment D to the Order.

Regional Water Board Standard Provisions

Regional Water Board Standard Provisions are based on the CWA, USEPA regulations, and the CWC.

B. Special Provisions

1. Reopener Provisions

These provisions are based on 40 CFR Part 123 and the existing Order. The Regional Water Board may reopen the permit to modify permit conditions and

requirements. Causes for modifications include the promulgation of new federal regulations, modification in toxicity requirements, or adoption of new regulations by the State Water Board or Regional Water Board, including revisions to the Basin Plan.

2. Special Studies and Additional Monitoring Requirements

a. Toxicity Identification Evaluations or Toxicity Reduction Evaluations. This provision is based on the SIP, Section 4, Toxicity Control Provisions, which establishes minimum toxicity control requirements for implementing the narrative toxicity objective for aquatic life protection established in the basin plans of the State of California.

3. Best Management Practices and Pollution Prevention

The objective of the tentative Order is to protect the beneficial uses of receiving waters. To meet this objective, the tentative Order requires the Discharger to develop and implement a SWPPP and address storm water runoff to the storm drain which discharges to the Los Cerritos Channel. This is consistent with the SWPPP requirements in the NPDES General Permit for Storm Water Discharges Associated with Industrial Activity (State Water Board Order No. 97-03-DWQ, NPDES Permit No. CAS000001). A SWPPP outlines site-specific management processes for minimizing storm water runoff contamination and for preventing contaminated storm water runoff from being discharged directly into surface waters. Storm water discharges occur at the Facility and best management practices are identified as one method to reduce contamination of storm water.

The tentative permit also require the Discharger to develop and implement a Spill Contingency Plan to control discharge of pollutants. This provision is included in the tentative Order to minimize and control the amount of pollutants discharged in case of a spill. This will ensure compliance with the tentative Order and protect the beneficial uses of the receiving water.

4. Construction, Operation, and Maintenance Specifications

This provision is based on the requirements of 40 CFR §122.41(e). Proper operation and maintenance of facilities and systems is required to limit the discharge of pollutants through mismanagement and operation.

- 5. Special Provisions for Municipal Facilities (POTWs Only) [Not Applicable]
- Other Special Provisions [Not Applicable]

VIII. PUBLIC PARTICIPATION

The Regional Water Board is considering the issuance of WDRs that will serve as a NPDES permit for the Paramount Petroleum Corporation facility. As a step in the WDR adoption process, the Regional Water Board staff has developed tentative WDRs. The Regional Water Board encourages public participation in the WDR adoption process.

A. Notification of Interested Parties

The Regional Water Board has notified the Discharger and interested agencies and persons of its intent to prescribe waste discharge requirements for the discharge and has provided them with an opportunity to submit their written comments and recommendations.

B. Written Comments

The staff determinations are tentative. Interested persons are invited to submit written comments concerning these tentative WDRs. Comments should be submitted either in person or by mail to:

Executive Officer
California Regional Water Quality Control Board
Los Angeles Region
320 West 4th Street, Suite 200
Los Angeles, CA 90013

To be fully responded to by staff and considered by the Regional Board, written comments pertaining to this proposed Board action must be submitted to the Regional Board staff no later than 5 p.m. on November 7, 2005. The Regional Board chair may exclude from the record written materials received after this date. (See Cal. Code Regs., tit. 23, § 648.4).

C. Public Hearing

The Regional Board will hold a public hearing on the tentative WDRs during its regular Board meeting on the following date and time and at the following location:

Date:

December 1, 2005

Time:

9:00 a.m.

Location:

Metropolitan Water District of Southern California, Board Room

700 North Alameda Street, Los Angeles, California.

Interested persons are invited to attend. At the public hearing, the Regional Board will hear testimony, if any, pertinent to the discharge, WDRs, and permit. Oral testimony will be heard; however, for accuracy of the record, important testimony should be in writing.

Please be aware that dates and venues may change. Our web address is www.waterboards.ca.gov/rwqcb4 where you can access the current agenda for changes in dates and locations.

D. Waste Discharge Requirements Petitions

Any aggrieved person may petition the State Water Resources Control Board to review the decision of the Regional Board regarding the final WDRs. The petition must be submitted within 30 days of the Regional Board's action to the following address:

State Water Resources Control Board, Office of General Counsel ATTN: Elizabeth Miller Jennings, Senior Staff Counsel 1001 I Street, 22nd Floor Sacramento, CA 95814

E. Information and Copying

The Report of Waste Discharge, related documents, tentative effluent limitations and special provisions, comments received, and other information are on file and may be inspected at the address below at any time between 8:30 a.m. and 4:45 p.m., Monday through Friday. Copying of documents may be arranged through the Regional Water Board by calling (213) 576-6600.

California Regional Water Quality Control Board Los Angeles Region 320 West 4th Street, Suite 200 Los Angeles, CA 90013

F. Register of Interested Persons

Any person interested in being placed on the mailing list for information regarding the WDRs and NPDES permit should contact the Regional Water Board, reference this Facility, and provide a name, address, and phone number.

G. Additional Information

Requests for additional information or questions regarding the tentative order should be directed to Mazhar Ali at (213)576-6652.

ATTACHMENT G - STORM WATER POLLUTION PREVENTION PLAN REQUIREMENTS

1. Implementation Schedule

A storm water pollution prevention plan (SWPPP) shall be developed and implemented for each facility covered by this General Permit in accordance with the following schedule.

- a. Facility operators beginning industrial activities before October 1, 1992 shall develop and implement the SWPPP no later than October 1, 1992. Facility operators beginning industrial activities after October 1, 1992 shall develop and implement the SWPPP when industrial activities begin.
- b. Existing facility operators that submitted a Notice of Intent (NOI), pursuant to State Water Resources Control Board (State Water Board) Order No. 91-013-DWQ (as amended by Order No. 92-12) or San Francisco Bay Regional Water Quality Control Board (Regional Water Board) Order No. 92-11 (as amended by Order No. 92-116), shall continue to implement their existing SWPPP and shall implement any necessary revisions to their SWPPP in a timely manner, but in no case later than August 1, 1997.

2. Objectives

The SWPPP has two major objectives: (a) to identify and evaluate sources of pollutants associated with industrial activities that may affect the quality of storm water discharges and authorized non-storm water discharges from the facility; and (b) to identify and implement site- specific best management practices (BMPs) to reduce or prevent pollutants associated with industrial activities in storm water discharges and authorized non-storm water discharges. BMPs may include a variety of pollution prevention measures or other low-cost and pollution control measures. They are generally categorized as non-structural BMPs (activity schedules, prohibitions of practices, maintenance procedures, and other low-cost measures) and as structural BMPs (treatment measures, run-off controls, overhead coverage.) To achieve these objectives, facility operators should consider the five phase process for SWPPP development and implementation as shown in Table A.

TABLE A FIVE PHASES FOR DEVELOPING AND IMPLEMENTING INDUSTRIAL STORM WATER POLLUTION PREVENTION PLANS

PLANNING AND ORGANIZATION

Form Pollution Prevention Team Review other plans

ASSESSMENT PHASE

Develop a site map Identify potential pollutant sources Inventory of materials and chemicals List significant spills and leaks Identify non-storm water discharges Assess pollutant Risks

BEST MANAGEMENT PRACTICES IDENTIFICATION PHASE

Non-structural BMPs Structural BMPs Select activity and site-specific BMPs

IMPLEMENTATION PHASE

Train employees Implement BMPs Conduct recordkeeping and reporting

EVALUATION / MONITORING

Conduct annual site evaluation Review monitoring information Evaluate BMPs Review and revise SWPPP

The SWPPP requirements are designed to be sufficiently flexible to meet the needs of various facilities. SWPPP requirements that are not applicable to a facility should not be included in the SWPPP.

A facility's SWPPP is a written document that shall contain a compliance activity schedule, a description of industrial activities and pollutant sources, descriptions of BMPs, drawings, maps, and relevant copies or references of parts of other plans. The SWPPP shall be revised whenever appropriate and shall be readily available for review by facility employees or Regional Water Board inspectors.

3. Planning and Organization

a. Pollution Prevention Team

The SWPPP shall identify a specific individual or individuals and their positions within the facility organization as members of a storm water pollution prevention team responsible for developing the SWPPP, assisting the facility manager in SWPPP implementation and revision, and conducting all monitoring program activities required in Section B of this General Permit. The SWPPP shall clearly identify the General Permit related responsibilities, duties, and activities of each team member. For small facilities, storm water pollution prevention teams may consist of one individual where appropriate.

b. Review Other Requirements and Existing Facility Plans

The SWPPP may incorporate or reference the appropriate elements of other regulatory requirements. Facility operators should review all local, State, and Federal requirements that impact, complement, or are consistent with the requirements of this General Permit. Facility operators should identify any existing facility plans that contain storm water pollutant control measures or relate to the requirements of this General Permit. As examples, facility operators whose facilities are subject to Federal Spill Prevention Control and Countermeasures' requirements should already have instituted a plan to control spills of certain hazardous materials. Similarly, facility operators whose facilities are subject to air quality related permits and regulations may already have evaluated industrial activities that generate dust or particulates.

4. Site Map

The SWPPP shall include a site map. The site map shall be provided on an $8-\frac{1}{2}$ x 11 inch or larger sheet and include notes, legends, and other data as appropriate to ensure that the site map is clear and understandable. If necessary, facility operators may provide the required information on multiple site maps.

The following information shall be included on the site map:

- a. The facility boundaries; the outline of all storm water drainage areas within the facility boundaries; portions of the drainage area impacted by run-on from surrounding areas; and direction of flow of each drainage area, on-site surface water bodies, and areas of soil erosion. The map shall also identify nearby water bodies (such as rivers, lakes, and ponds) and municipal storm drain inlets where the facility's storm water discharges and authorized non-storm water discharges may be received.
- b. The location of the storm water collection and conveyance system, associated points of discharge, and direction of flow. Include any structural control measures that affect storm water discharges, authorized non-storm water discharges, and run-on. Examples of structural control measures are catch basins, berms, detention ponds, secondary containment, oil/water separators, diversion barriers, etc.
- c. An outline of all impervious areas of the facility, including paved areas, buildings, covered storage areas, or other roofed structures.
- d. Locations where materials are directly exposed to precipitation and the locations where significant spills or leaks identified in Section A.6.a.iv. below have occurred.
- e. Areas of industrial activity. This shall include the locations of all storage areas and storage tanks, shipping and receiving areas, fueling areas, vehicle and equipment storage/maintenance areas, material handling and processing areas, waste treatment and disposal areas, dust or particulate generating areas, cleaning and rinsing areas, and other areas of industrial activity which are potential pollutant sources.

5. List of Significant Materials

The SWPPP shall include a list of significant materials handled and stored at the site. For each material on the list, describe the locations where the material is being stored, received, shipped, and handled, as well as the typical quantities and frequency. Materials shall include raw materials, intermediate products, final or finished products, recycled materials, and waste or disposed materials.

6. Description of Potential Pollutant Sources

a. The SWPPP shall include a narrative description of the facility's industrial activities, as identified in Section A.4.e above, associated potential pollutant sources, and potential pollutants that could be discharged in storm water discharges or authorized non-storm water discharges. At a minimum, the following items related to a facility's industrial activities shall be considered:

i. Industrial Processes

Describe each industrial process, the type, characteristics, and quantity of significant materials used in or resulting from the process, and a description of the manufacturing, cleaning, rinsing, recycling, disposal, or other activities related to the process. Where applicable, areas protected by containment structures and the corresponding containment capacity shall be described.

ii. Material Handling and Storage Areas

Describe each handling and storage area, type, characteristics, and quantity of significant materials handled or stored, description of the shipping, receiving, and loading procedures, and the spill or leak prevention and response procedures. Where applicable, areas protected by containment structures and the corresponding containment capacity shall be described.

iii. Dust and Particulate Generating Activities

Describe all industrial activities that generate dust or particulates that may be deposited within the facility's boundaries and identify their discharge locations; the characteristics of dust and particulate pollutants; the approximate quantity of dust and particulate pollutants that may be deposited within the facility boundaries; and a description of the primary areas of the facility where dust and particulate pollutants would settle.

iv. Significant Spills and Leaks

Describe materials that have spilled or leaked in significant quantities in storm water discharges or non-storm water discharges since April 17, 1994. Include toxic chemicals (listed in 40 CFR, Part 302) that have been discharged to storm water as reported on U.S. Environmental Protection Agency (U.S. EPA) Form R, and oil and hazardous substances in excess of reportable quantities (see 40 Code of Federal Regulations [CFR], Parts 110, 117, and 302).

The description shall include the type, characteristics, and approximate quantity of the material spilled or leaked, the cleanup or remedial actions that have occurred or are planned, the approximate remaining quantity of materials that may be exposed to storm water or non-storm water discharges, and the preventative measures taken to ensure spill or leaks do not reoccur. Such list shall be updated as appropriate during the term of this General Permit.

v. Non-Storm Water Discharges

Facility operators shall investigate the facility to identify all non-storm water discharges and their sources. As part of this investigation, all drains (inlets and outlets) shall be evaluated to identify whether they connect to the storm drain system.

All non-storm water discharges shall be described. This shall include the source, quantity, frequency, and characteristics of the non-storm water discharges and associated drainage area.

Non-storm water discharges that contain significant quantities of pollutants or that do not meet the conditions provided in Special Conditions D. are prohibited by this General Permit (Examples of prohibited non-storm water discharges are contact and non-contact cooling water, boiler blowdown, rinse water, wash water, etc.). Non-storm water discharges that meet the conditions provided in Special Condition D. are authorized by this General Permit. The SWPPP must include BMPs to prevent or reduce contact of non-storm water discharges with significant materials or equipment.

vi. Soil Erosion

Describe the facility locations where soil erosion may occur as a result of industrial activity, storm water discharges associated with industrial activity, or authorized non-storm water discharges.

b. The SWPPP shall include a summary of all areas of industrial activities, potential pollutant sources, and potential pollutants. This information should be summarized similar to Table B. The last column of Table B, "Control Practices", should be completed in accordance with Section A.8. below.

TABLE B EXAMPLE

ASSESSMENT OF POTENTIAL POLLUTION SOURCES AND CORRESPONDING BEST MANAGEMENT PRACTICES SUMMARY

Area	Activity	Pollutant Source	Pollutant	Best Management Practices
Vehicle &	Fueling	Spills and leaks	fuel oil	Use spill and overflow protection.
Equipment		during delivery.		
Fueling		•		Minimize run-on of storm water into
	٠	Spills caused by		the fueling area.
		topping off fuel		
		tanks.		Cover fueling area.
		Hosing or		Use dry cleanup methods rather than
		washing down		hosing down area.

		Rainfall running		maintenance program to preventive
	,	off fuel oil, and		tank and line leaks.
		rainfall running onto and off		Inspect fueling cross regularly to
		fueling area.		Inspect fueling areas regularly to detect problems before they occur.
		iucing area.		detect problems before they occur.
		·		Train employees on proper fueling,
·	· .			cleanup, and spill response
				techniques.

7. Assessment of Potential Pollutant Sources

- a. The SWPPP shall include a narrative assessment of all industrial activities and potential pollutant sources as described in A.6. above to determine:
 - i. Which areas of the facility are likely sources of pollutants in storm water discharges and authorized non-storm water discharges, and
 - ii. Which pollutants are likely to be present in storm water discharges and authorized non-storm water discharges. Facility operators shall consider and evaluate various factors when performing this assessment such as current storm water BMPs; quantities of significant materials handled, produced, stored, or disposed of; likelihood of exposure to storm water or authorized non-storm water discharges; history of spill or leaks; and run-on from outside sources.

b. Facility operators shall summarize the areas of the facility that are likely sources of pollutants and the corresponding pollutants that are likely to be present in storm water discharges and authorized non-storm water discharges.

Facility operators are required to develop and implement additional BMPs as appropriate and necessary to prevent or reduce pollutants associated with each pollutant source. The BMPs will be narratively described in Section 8 below.

8. Storm Water Best Management Practices

The SWPPP shall include a narrative description of the storm water BMPs to be implemented at the facility for each potential pollutant and its source identified in the site assessment phase (Sections A.6. and 7. above). The BMPs shall be developed and implemented to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. Each pollutant and its source may require one or more BMPs. Some BMPs may be implemented for multiple pollutants and their sources, while other BMPs will be implemented for a very specific pollutant and its source.

The description of the BMPs shall identify the BMPs as (1) existing BMPs, (2) existing BMPs to be revised and implemented, or (3) new BMPs to be implemented. The description shall also include a discussion on the effectiveness of each BMP to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. The SWPPP shall provide a summary of all BMPs implemented for each pollutant source. This information should be summarized similar to Table B.

Facility operators shall consider the following BMPs for implementation at the facility:

a. Non-Structural BMPs

Non-structural BMPs generally consist of processes, prohibitions, procedures, schedule of activities, etc., that prevent pollutants associated with industrial activity from contacting with storm water discharges and authorized non-storm water discharges. They are considered low technology, cost-effective measures. Facility operators should consider all possible non-structural BMPs options before considering additional structural BMPs (see Section A.8.b. below). Below is a list of non-structural BMPs that should be considered:

i. Good Housekeeping

Good housekeeping generally consist of practical procedures to maintain a clean and orderly facility.

ii. Preventive Maintenance

Preventive maintenance includes the regular inspection and maintenance of structural storm water controls (catch basins, oil/water separators, etc.) as well as other facility equipment and systems.

iii. Spill Response

This includes spill clean-up procedures and necessary clean-up equipment based upon the quantities and locations of significant materials that may spill or leak.

iv. Material Handling and Storage

This includes all procedures to minimize the potential for spills and leaks and to minimize exposure of significant materials to storm water and authorized non-storm water discharges.

v. Employee Training

This includes training of personnel who are responsible for (1) implementing activities identified in the SWPPP, (2) conducting inspections, sampling, and visual observations, and (3) managing storm water. Training should address topics such as spill response, good housekeeping, and material handling procedures, and actions necessary to implement all BMPs identified in the SWPPP. The SWPPP shall identify periodic dates for such training. Records shall be maintained of all training sessions held.

vi. Waste Handling/Recycling

This includes the procedures or processes to handle, store, or dispose of waste materials or recyclable materials.

vii. Recordkeeping and Internal Reporting

This includes the procedures to ensure that all records of inspections, spills, maintenance activities, corrective actions, visual observations, etc., are developed, retained, and provided, as necessary, to the appropriate facility personnel.

viii. Erosion Control and Site Stabilization

This includes a description of all sediment and erosion control activities. This may include the planting and maintenance of vegetation, diversion of run-on and runoff, placement of sandbags, silt screens, or other sediment control devices, etc.

ix. Inspections

This includes, in addition to the preventative maintenance inspections identified above, an inspection schedule of all potential pollutant sources. Tracking and follow-up procedures shall be described to ensure adequate corrective actions are taken and SWPPPs are made.

x. Quality Assurance

This includes the procedures to ensure that all elements of the SWPPP and Monitoring Program are adequately conducted.

b. Structural BMPs

Where non-structural BMPs as identified in Section A.8.a. above are not effective, structural BMPs shall be considered. Structural BMPs generally consist of structural devices that reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. Below is a list of structural BMPs that should be considered:

i. Overhead Coverage

This includes structures that provide horizontal coverage of materials, chemicals, and pollutant sources from contact with storm water and authorized non-storm water discharges.

ii. Retention Ponds

This includes basins, ponds, surface impoundments, bermed areas, etc. that do not allow storm water to discharge from the facility.

iii. Control Devices

This includes berms or other devices that channel or route run-on and runoff away from pollutant sources.

iv. Secondary Containment Structures

This generally includes containment structures around storage tanks and other areas for the purpose of collecting any leaks or spills.

v. Treatment

This includes inlet controls, infiltration devices, oil/water separators, detention ponds, vegetative swales, etc. that reduce the pollutants in storm water discharges and authorized non-storm water discharges.

9. Annual Comprehensive Site Compliance Evaluation

The facility operator shall conduct one comprehensive site compliance evaluation (evaluation) in each reporting period (July 1-June 30). Evaluations shall be conducted within 8-16 months of each other. The SWPPP shall be revised, as appropriate, and the revisions implemented within 90 days of the evaluation. Evaluations shall include the following:

- A review of all visual observation records, inspection records, and sampling and analysis results.
- b. A visual inspection of all potential pollutant sources for evidence of, or the potential for, pollutants entering the drainage system.
- c. A review and evaluation of all BMPs (both structural and non-structural) to determine whether the BMPs are adequate, properly implemented and maintained, or whether additional BMPs are needed. A visual inspection of equipment needed to implement the SWPPP, such as spill response equipment, shall be included.
- d. An evaluation report that includes, (i) identification of personnel performing the evaluation, (ii) the date(s) of the evaluation, (iii) necessary SWPPP revisions, (iv) schedule, as required in Section A.10.e, for implementing SWPPP revisions, (v) any incidents of non-compliance and the corrective actions taken, and (vi) a certification that the facility operator is in compliance with this General Permit. If the above certification cannot be provided, explain in the evaluation report why the facility operator is not in compliance with this General Permit. The evaluation report shall be submitted as part of the annual report, retained for at least five years, and signed and certified in accordance with Standard Provisions 9. and 10. of Section C. of this General Permit.

10. SWPPP General Requirements

- a. The SWPPP shall be retained on site and made available upon request of a representative of the Regional Water Board and/or local storm water management agency (local agency) which receives the storm water discharges.
- b. The Regional Water Board and/or local agency may notify the facility operator when the SWPPP does not meet one or more of the minimum requirements of this Section. As requested by the Regional Water Board and/or local agency, the facility operator shall submit an SWPPP revision and implementation schedule that meets the minimum requirements of this section to the Regional Water Board and/or local agency that requested the SWPPP revisions. Within 14 days after implementing the required SWPPP revisions, the facility operator shall provide written certification to the

Regional Water Board and/or local agency that the revisions have been implemented.

- c. The SWPPP shall be revised, as appropriate, and implemented prior to changes in industrial activities which (i) may significantly increase the quantities of pollutants in storm water discharge, (ii) cause a new area of industrial activity at the facility to be exposed to storm water, or (iii) begin an industrial activity which would introduce a new pollutant source at the facility.
- d. Other than as provided in Provisions B.11, B.12, and E.2 of the General Permit, the SWPPP shall be revised and implemented in a timely manner, but in no case more than 90 days after a facility operator determines that the SWPPP is in violation of any requirement(s) of this General Permit.
- e. When any part of the SWPPP is infeasible to implement by the deadlines specified in Provision E.2 or Sections A.1, A.9, A.10.c, and A.10.d of this General Permit due to proposed significant structural changes, the facility operator shall submit a report to the Regional Water Board prior to the applicable deadline that (i) describes the portion of the SWPPP that is infeasible to implement by the deadline, (ii) provides justification for a time extension, (iii) provides a schedule for completing and implementing that portion of the SWPPP, and (iv) describes the BMPs that will be implemented in the interim period to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. Such reports are subject to Regional Water Board approval and/or modifications. Facility operators shall provide written notification to the Regional Water Board within 14 days after the SWPPP revisions are implemented.
- f. The SWPPP shall be provided, upon request, to the Regional Water Board. The SWPPP is considered a report that shall be available to the public by the Regional Water Board under Section 308(b) of the Clean Water Act.

ATTACHMENT H -MINIMUM LEVELS in ppb (µg/L)

The Minimum Levels (MLs) in this appendix are for use in reporting and compliance determination purposes in accordance with section 2.4 of the State Implementation Policy. These MLs were derived from data for priority pollutants provided by State certified analytical laboratories in 1997 and 1998. These MLs shall be used until new values are adopted by the SWRCB and become effective. The following tables (Tables 2a - 2d) present MLs for four major chemical groupings: volatile substances, semi-volatile substances, inorganics, and pesticides and PCBs.

Table 2a - VOLATILE SUBSTANCES*	GC	GCMS
1,1 Dichloroethane	0.5	1
1,1 Dichloroethylene	0.5	2
1,1,1 Trichloroethane	0.5	2
1,1,2 Trichloroethane	0.5	2
1,1,2,2 Tetrachloroethane	0.5	1.
1,2 Dichlorobenzene (volatile)	0.5	2
1,2 Dichloroethane	0.5	2
1,2 Dichloropropane	0.5	1
1,3 Dichlorobenzene (volatile)	0.5	2
1,3 Dichloropropene (volatile)	0.5	2
