CHAIRMAN NAHAI: Yes. You don't have to have a comment. No. I was expecting we'd go to the maintenance issue but maybe not. That happens on page 10.

MR. COE: Mr. Chairman, on page 9 --

CHAIRMAN NAHAI: Yes.

MR. COE: -- Item 6, "properly designed outdoor material storage areas," again for the third barrel off "where feasible." I would delete "where feasible."

R0072212

MR. LEON: That's page 7 of 17, under

No. 6.

CHAIRMAN NAHAI: Why am I having difficulty finding it? I see it.

MR. LEON: It's the third bullet point.

CHAIRMAN NAHAI: Thank you. Anything more on page 9?

Okay. Moving on to page 10, now here there are a bunch of treatment or structural BMPs that have to be dealt with, I mean, throughout this paragraph.

But with respect to the issue of maintenance and ongoing responsibility, are we in the situation that we're not going to tell the cities how to accomplish this, or is it appropriate for us to suggest a recorded covenant against properties as to the obligation to comply with maintenance requirements? It's a legal question.

MR. LEON: I think we can suggest it. Ultimately, it'll be up to the cities to come up with what they would like to use, including some of the methods and devices that we talked about earlier, but certainly it wouldn't hurt to suggest it.

CHAIRMAN NAHAI: Okay. So the language would be enabling language. It would say that one device that could be used could be this.

MR. LEON: Exactly.

R0072213

CHAIRMAN NAHAI: Okay.

MS. DIAMOND: I have a couple of things

on that first paragraph on page 10, the word "may," the condition of transfer. It's about four sentences down.

MR. COE: It should be deleted.

MS. DIAMOND: Right. "Will include," not may include.

And the last sentence I think Dr. Coe earlier said not to get rid of the word "encourage." That's too vague.

MR. COE: Yes. "The information shall be transferred."

MS. DIAMOND: "Transfer this information with subsequent sale of the property."

CHAIRMAN NAHAI: Okay. All right. Going on to page 11 and, you know, this brings us to the roofing issue, and we heard a lot of testimony about this. But, you know, I mean, Dennis, this is precisely one of the issues -- I mean we heard about fecal coliform from birds. We heard about aerial deposition. We heard about water quantity as well as water quality.

You know, it kind of leads me to think that perhaps this shouldn't be included at this point but that either you should be encouraged to go and take a look at this issue a little bit more before it is included, you know, by a reopener if necessary or something of that nature. How would that work?

MS. DIAMOND: Are you saying it should not be an exemption?

R0072214

MS. CLOKE: You're saying to delete?

CHAIRMAN NAHAI: Everybody can give their suggestions. My feeling about it is that we don't -- that roofing surfaces -- the roofing surfaces exemption at this point should not be included but that it may be that additional studies or facts may come to light that may additionally justify its inclusion at some time in the future.

But I really -- I think, you know, to the extent that -- one of the problems is that we have 50 percent of our rainfall just running off into the ocean, and I don't think having a roofing exemption helps that issue at all, you know, even if it doesn't add to the polluting loading, which it well might.

So I don't know. You tell me what you think. I'm open to all kinds of persuasion, especially at this time of the day.

MR. DICKERSON: As written, the provision provides that roofing material -- in order for the exemption to be in place, that roofing materials -- or rather that the -- I was simply trying to build some flexibility that would allow us to consider the notion that if you add this material -- if you add this volume of water, which in some cases will be actually half of the volume of water from a 100,000 square foot commercial development, I'd say you really have to build bigger BMPs. It's going to cost more.

R0072215

And if intrinsically the water is cleaner, much cleaner then the water that's coming off

over the ground, you're basically adding a lot of clean water to a system that could be far more efficient without having to deal with that, and that's simply a common sense practical approach that I've taken.

If you'd like me to add some language that would help this along as if we made an affirmative showing that under certain conditions that indeed the rooftop runoff does substantially contribute to the pollution, that would go a long way.

MS. DIAMOND: The problem that I have with it is that I think we should err on the side of caution. Since there have been no studies and since we know that runoff is considerable and that this rooftop runoff is not going to be percolating into the ground if we don't have some BMPs, if it's not included, it's just more impermeable surface.

I mean, whether it's up at the roof or down at the bottom, some of it's going to end up in the streets, and it's going to be continuing along into the ocean. I don't -- I really don't believe we should have an exemption for rooftops until such time we get some definitive studies that show that it doesn't contribute to pollution. I mean, I feel very strongly that this is one exemption that should not be included, and we should not have an exemption for rooftops. It's way too big.

MR. LEON: The provision under discussion is on page 9 of 17 at the top of first full paragraph.

MS. CLOKE: I'd like to add to that. I mean we have had a lot of testimony today, and we also have letters from the EPA and the EPA strongly --

MR. COE: January 13 letter.

MS. CLOKE: Yes. I'm referring to a January 13th letter where the EPA says that "We are also concerned, however, that the Regional Board's proposal would exclude roofed surface areas in certain circumstances in the calculation of rainfall runoff. We believe that this provision could prove overly broad and may hinder implementation, and we would recommend that it be removed."

I am also looking at a letter from Elizabeth -- excuse me, now I'm going to have a name problem -- Chetel and talks about -- where she says that "the exclusion of the area roofing requires the explanation that roofs are impervious surfaces that divert water into storm water drains and reduce percolation to groundwater reservoirs. Due to the air quality in Los Angeles County, the Ph of roof storm water could be quite low especially first flushes.

"In addition, considering the additional volume of water shed from roofs accounts for a high percentage of the impervious surface area and that the calculation minus the roof area will guarantee undersized treatment of control BMPs and inadequate control of first flushes through treatment structures and that these failures and complaints could be avoided

if we included these."

And I'm not going to read everything into the record that's in here, but over and over again the rooftop area was referred to in studies by scientists and books that we had, reports that have been done, and if you look at Los Angeles, as you said, if you come in, you know, in an airplane and you look down, you can see how much of the city is covered in -- how much of the area of the city is covered in rooftops.

We hope that these rooftops are impervious. We all hope that our roofs don't leak and -- although, sometimes I have to convince -- admit that mine does and --

CHAIRMAN NAHAI: Maybe there's the answer to the whole problem. Make the roofs leak.

MS. CLOKE: And so I think it's terribly important that this entire exclusion be eliminated at this time. I think that this board always, as it should, is open to new information, and if new information comes to us in the future that this should be had amended, we're always open to that, but at this moment, I can see no common sense reason or practical reason for allowing this exclusion.

CHAIRMAN NAHAI: Ultimately, this is your call, Dennis.

But do we have any other opinions from board members on this issue or guidance?

MR. SHAHEEN: I guess intuitively, I

guess, my initial reaction -- the only thing I've heard too would be that it doesn't belong in there as an exclusion, but, I mean, the thing that concerns me is the fact of the cost estimates made this a big part of it, and I'm all for taking board dollars but applying them, I guess, to the problem, I guess I'm a just little concerned. I don't have enough information if that doubles now the preventive measures that would take place to support it if you took that exemption out.

I mean I don't know. I just struggle a little bit with making sure that we've solved the problem with the dollars that are being spent.

MS. DIAMOND: I'd like to respond to that. It seems to me that all of the other cities around the country that have done this, none of them have rooftop exemptions, and we've seen studies that show that the costs are quite low. I mean, in terms of the cost of doing business, they were like .5 percent. Some of them were .3 percent.

MR. SHAHEEN: Were the costs that we saw today based on this exemption being in or out?

MS. DIAMOND: Not from other cities. There are no other rooftop exemptions in other cities.

MR. SHAHEEN: But the cost -- I guess I was referring to the costs that we saw today that were presented.

R0072219

MS. DIAMOND: I -- some of the BMPs that

I think are required to take off the -- to move the runoff, I don't think they're that expensive. I happen to have a roof, and we have ways of keeping the water -- getting the water from my roof into the garden, and it was a very inexpensive thing to do, so I'm not -- I don't think it's a major cost.

MR. COE: That's a thought that keeps coming to my mind. It doesn't have anything to do with Storm Water Pollution Prevention. It's water conservation. There's a big opportunity for that, but that's another subject for another day.

I think this would be a little hard to administer too. You have to monitor, see if there's pollutants coming off the roof and off the air conditioning ducts and so on. And I'm persuaded by the fact that the EPA is against it.

CHAIRMAN NAHAI: So --

MS. DIAMOND: The only thing commonsensical about it is I think that it would encourage as many rooftops as possible, and we'll have rooftop to rooftop development if we have this kind of an exclusion.

CHAIRMAN NAHAI: I don't know if that's going to happen.

MR. MILLER: I don't agree with that because you have zoning laws that prevent that. You can't change a zoning law just because you have an EPA requirement or a requirement from us.

CHAIRMAN NAHAI: I don't think we're going to find builders, you know, wanting to build these massive roofs just in order to avoid putting a little grassy patch down.

MS. CLOKE: Well, roofs cost money too. Building roofs cost money. I wanted to respond to something that was said down the table which is -- was the question of whether the percentage point applied, whether there was a roof inclusion in that calculation. As I remember it, the roof was in -- there was no exclusion, if I'm just saying that correctly, and also to point out that this -- there is no other city in that whole long list of cities across the United States that have implemented -- and states across the United States that have implemented these programs that has a rooftop exclusion. I mean, -- there's no precedent for it.

And in addition to that in terms of the cost I think that because of your own building experience, you know that this is really the least expensive and lowest tech opportunity for decreasing volume into the storm water system, and volume is -- it's not just water concentration. It also, you know, carries the pollution farther out, carries pollution, as we saw, in the Tapia report.

CHAIRMAN NAHAI: All right. Let's move on then. Do I have any other comments with respect to page 11?

MS. CLOKE: Could I just have somebody explain the restaurant issue to me? I'm not sure --

CHAIRMAN NAHAI: But that's the next issue.

MS. CLOKE: No. I mean, I'm not quite sure where we are on --

MR. COE: Exclusion. In the middle of the page.

CHAIRMAN NAHAI: Yes. That's still on page 9.

MS. DIAMOND: That's the next issue.

MS. CLOKE: I'm sorry. I was on the wrong page.

CHAIRMAN NAHAI: So the issue with respect to the restaurants is this: What restaurants -- it says, "Where the land area for development or redevelopment is less than 5,000 square feet or excluded from the numerical BMP design standard requirement," and the issue that arises here is whether smaller fast-food takeout operations which are smaller than 5,000 square feet should be excluded.

Now, it may be that under the 1996 permit we're constrained, and we can't do anything. You're shaking your head at me.

MR. SWAMIKANNU: Yes. Mr. Chairman, the issue here is for restaurants to already have the requirements. The requirements are two categories. One is soil control pollution prevention. And the next

requirement is to mitigate storm water the first three-quarters of an inch.

This exclusion is from the requirement to mitigate storm water from three-quarters of an inch only. So it's the numerical limit standard that doesn't apply.

CHAIRMAN NAHAI: I understand that. But the issue I think is why shouldn't the number be 2,000 square feet or 2,500 square feet?

MR. SWAMIKANNU: I provided an explanation using what's done ordinarily around the country.

CHAIRMAN NAHAI: Okay. So you're -- yeah. You said that you adopted this based on the standard that has been adopted around the country.

MR. SWAMIKANNU: Country, yes

CHAIRMAN NAHAI: You know, that's good enough for me. I mean, if that is the standard and that is what has been done around and that is what has been determined to be effective --

R0072223

MR. SWAMIKANNU: Sort of the threshold I guess for more quantity because below 5,000 we have all these soils controls you have to start your restaurants. So whether they increase traffic or not, when they open or not, things like that. Here the requirement is basically to treat these quantities --

CHAIRMAN NAHAI: So what you're saying is that with respect to takeout establishments below 5,000

square feet, there are already sufficient requirements in place to ensure that they do not significantly contribute to urban runoff --

MR. SWAMIKANNU: Yes.

CHAIRMAN NAHAI: Is that what you're saying to me?

MR. SWAMIKANNU: Yes.

MS. CLOKE: As I read this, and we might be able to make this -- they are only excluded from the numerical design standard, but that they have to implement the BMPs.

CHAIRMAN NAHAI: But I think it says that.

MS. CLOKE: Okay.

CHAIRMAN NAHAI: It says "are excluded from the numerical BMP design standard requirement." We said right in the definition, in the definition clause, there will be a definition of "commercial development."

Moving on now to page 12. Dr. Coe, you had a change in paragraph 3?

MR. COE: Yeah.

CHAIRMAN NAHAI: The word "consider" you wanted changed.

MR. DICKERSON: Yes. This is at page 10 of 17, Section 3 "Properly designed vehicle equipment wash areas."

R0072224

CHAIRMAN NAHAI: I imagine you would want

to delete the word "consider" and change "including" to "include."

MR. COE: Well, I -- well, starting with "to alleviate this problem," I've eliminated that as a possible approach here and start at the end of "considering inclusion of the project plans and area." Delete everything up to that point and start off with "Therefore, any such area for washing, steam cleaning of vehicles and equipment is included in the site design, must meet the following." It doesn't sound too smooth but --

CHAIRMAN NAHAI: Let me just repeat my suggestion to you, Jack, and you may think that it works, and we could just say "To alleviate this problem," comma, "include" instead of saying "consider including," just say "include." In other words, it would be a directive. "Include in the project plans an area for washing/steam cleaning of vehicles and equipment."

MR. COE: That would be fine.

CHAIRMAN NAHAI: Anything more on page 12?

R0072225

Anything on page 13?

Anything on page 14?

MS. DIAMOND: Yes. Well, there was just -- I think it was also a housekeeping in the first paragraph, the word "consider" is used again. Just change that to "include" that the vehicle equipment

wash areas --

MR. DICKERSON: Yes. We're at page 23 of 17 at the top.

MS. DIAMOND: Sorry. And then further down "parking lots," the way it's worded now parking lots are -- unless we've changed that, it's getting so late I'm beginning to forget what we've done. We don't want them -- or I would suggest that they not be commercial stand alone parking lots.

CHAIRMAN NAHAI: No. Because we now have -- your "parking lots" is a term of art in the document, and it's now defined simply as parking lots, 5,000 square feet or more or with 25 or more parking spaces.

MS. DIAMOND: So we've taken care of that.

CHAIRMAN NAHAI: Yes. So yes, that's taken care of. Anything else on page 14?

Okay. Moving on to page 15, we need to consider some language clarifications with respect to the waivers, and we need to decide the question of where the waivers come before the board or before the executive officer.

R0072226

MR. DICKERSON: Okay. We're at page 13 of 17 at the top, No. 11, "Waiver."

MS. CLOKE: Well, one of the things that we discussed was adding a clarification regarding the exhaustion of all BMP options before it was possible to

even consider a waiver. We talked about adding that clarification. That was one of the issues.

CHAIRMAN NAHAI: What if we did this: What if in subparagraph 2 little i's where it says "unfavorable or unstable soil conditions at a site to attempt infiltration," after the word "infiltration," we add a parenthetical that says "Provided, however, that the foregoing shall not" -- "shall not waive other BMP options" or something of that nature.

I don't know, Jorge. You're the lawyer.

MR. LEON: Yeah. But you've got the big chair over there.

CHAIRMAN NAHAI: I'm not a lawyer here.

MS. DIAMOND: There was some testimony that -- there was some testimony today that there would be some BMPs that could be applicable and practical in almost any situation. Almost. So could we add language so that there would be some BMPs considered if these were not possible?

MR. LEON: Yeah. The idea is to rewrite this so that it's not an entirely usable as an escape clause.

MS. DIAMOND: Right.

R0072227

MR. LEON: Because it defines a reasonable argument, perhaps, that says that you can't use infiltration, then somebody could say we're not going to use anything then.

CHAIRMAN NAHAI: I'll tell you what we'll

do. Right after the word "surface," with the sentence that finishes with the word "surface," what if we add there a sentence that goes "impracticability as to any particular BMP shall not excuse or waive application of any other available BMP or practical BMP." How about we do that?

MR. LEON: It seems to me that that continues to apply to the other BMPs.

CHAIRMAN NAHAI: All right. So you have that language basically.

Okay. The next change with respect to this paragraph was again a change Dr. Coe offered, if I may, Jack, which was that instead of just talking about where the groundwater is less than 10 feet from the soil surface that we also refer to unconfined aquifers.

MR. COE: Yes.

MR. DICKERSON: Yes.

CHAIRMAN NAHAI: And, Dennis, regarding the issue of other waivers coming back to us, I am wondering whether it would be practicable to say that waivers would come back to the Regional Board but that the Regional Board reserves the right to delegate, you know, the possibility of giving waivers to the executive officer. That way if we get a class of projects that are deserving of waivers, then we could define them and we could just delegate the waiver giving authority down to the staff level, if you think that-that's workable.

MR. DICKERSON: We will make that work. It sounds good.

CHAIRMAN NAHAI: All right. Anything more on page 15?

MR. LEON: Just a real quick question of clarification on that point. The discussion as I understood it when the parties commented seemed to be concerned about, in the first instance, the permittees being able to provide the waiver. Are you now suggesting that it's the executive officer and/or the board under the conditions that you just stated?

CHAIRMAN NAHAI: Yes.

MR. LEON: Ought to be the ones, not the permittees.

CHAIRMAN NAHAI: Yes.

MR. LEON: Thank you.

CHAIRMAN NAHAI: And I would note for the record that the language that's before us does not contemplate the permittees being the arbiters of whether a waiver is appropriate or not. It says the executive officer. All that I'm suggesting is that instead of the executive officer would be -- would be vested in the Regional Board but with the Regional Board having the express right to delegate that authority to the executive officer.

R0072229

MR. LEON: Okay.

CHAIRMAN NAHAI: Okay. Anything more on page 15?

Anything on page 16?

MR. SWAMIKANNU: Mr. Chair, before you go on, on the waiver provision, I think we have three specific situations where you already recognize the authority to issue waiver.

CHAIRMAN NAHAI: Yes.

MR. SWAMIKANNU: These are for any other conditions.

CHAIRMAN NAHAI: Yes. Correct.

On page 16, any comments, perhaps, on suggested resources or how to get a copy of them? Nothing on page 17.

MR. COE: Sixteen, the editorial, this is the beginning of Table 1. Do you need the table number and the title?

MR. SWAMIKANNU: Table 1 begins on 16, and it has a title.

MR. COE: Right. Mine doesn't.

MR. SWAMIKANNU: Mine doesn't either, but I'm fixing it now.

MR. COE: Very important.

CHAIRMAN NAHAI: Do we need to take a vote, or we're just providing suggestions?

MR. LEON: That's exactly what I wanted to discuss next. There is an outstanding issue that may require board action, that is, the applicability of the provisions to the Long Beach Municipality as a separate permit. As I understand it, we've been

provided to the executive officer in terms of suggested points to consider are -- well, exactly that. Suggestions.

CHAIRMAN NAHAI: I think it's a little stronger than that. I think the executive officer asked for the board's directions, and we've provided them.

MR. LEON: If you're going to give directions, then we should have a motion that provides the foregoing comments directed to the executive officer to be considered for the rewrite but we still do have --

MR. DICKERSON: The resolution.

MR. LEON: We do have a resolution, but the resolution is now changed somewhat. We'll have to change the terms of the resolution to capture --

CHAIRMAN NAHAI: To incorporate these amendments.

MR. LEON: -- the board's motion.

CHAIRMAN NAHAI: Okay. Then I'll -- the motion is for what now? How does one --

MR. LEON: I would suggest a motion that -- from the board to direct the executive officer to modify -- issue a proposal --

CHAIRMAN NAHAI: To adopt and modify?

MR. LEON: Right. That's Issue No. 1.

Issue No. 2 is with respect to the City of Long Beach we have to figure out what we want to do

here.

CHAIRMAN NAHAI: Let's deal with Issue No. 1 first. Okay. So I'll move the direction to the executive officer to adopt and amend the SUSMPs before us in accordance with the directions or suggestions that we've just provided.

MS. CLOKE: I'll second that.

CHAIRMAN NAHAI: We have a second.

All in favor?

ALL: Aye.

CHAIRMAN NAHAI: Any opposed?

And we have an abstention from Marilyn Lyon.

Now, what is the second issue?

MR. LEON: The second issue is the applicability of the SUSMPs to the City of Long Beach. As you know they're treated under a separate permit, and I might inquire of the city's representative as to what they want to do. The options are these: No. 1, let's just let it carry over so that we can come back and take a board action at a later date that imposes the SUSMPs in accordance with the modifications that Dennis Dickerson will be making.

CHAIRMAN NAHAI: Is it part of our agenda to impose it today?

R0072232

MR. LEON: It is. It's noticed as an agenda item for the board to take action.

CHAIRMAN NAHAI: Why would we delay it

then?

MR. LEON: Well, that's another option. It's in the resolution.

MS. CLOKE: I thought we agreed that everything that Long Beach was --

CHAIRMAN NAHAI: The question is whether it's part of our agenda today.

MR. DICKERSON: It might be best to, since we're specifically taking a formal action to modify another permit, make sure we have all the noticing issues properly done for that for us to rewrite and adopt and then to bring it back for formal action to apply for Long Beach. Does that make sense?

MR. LEON: That would work.

CHAIRMAN NAHAI: That's your recommendation?

MR. DICKERSON: I'm thinking just to make it perfectly clean.

CHAIRMAN NAHAI: Okay. We've made our position clean. I don't mind.

MR. COE: And the action by the -- the future action by the board on this would be Long Beach only.

R0072233

CHAIRMAN NAHAI: Yes.

MS. DIAMOND: And the SUSMP as it's been amended or suggested for amendment to you that apply to Long Beach, would that be a motion before us that would apply to Long Beach, this permit?

MR. DICKERSON: Yes.

CHAIRMAN NAHAI: Well, let's do that. When would you defer it to?

MR. DICKERSON: It's going to take a little time. Probably the April meeting.

CHAIRMAN NAHAI: So moved.

MS. CLOKE: Is that their start date?

MR. LEON: I'm missing something here that is noticed here.

Xavier, could you explain?

MR. SWAMIKANNU: On -- in the tentative resolution also we asked that the board adopt this numerical standard to apply under the State's Storm Water General Permit for post-construction BMPs in the Los Angeles region and --

CHAIRMAN NAHAI: With respect to the resolution we're going to have, we're going to take a vote on the resolution, but I think -- when you're saying that, are you referring specifically to Long Beach?

MR. SWAMIKANNU: No. No. That's the third item.

CHAIRMAN NAHAI: Yes. I think we can go ahead and take a vote on the resolution which would have been modified by the suggestions that we've just given.

R0072234

MR. SWAMIKANNU: Yes.

CHAIRMAN NAHAI: So as to the -- and then

it refers specifically to action to Long Beach until the April meeting. Will that satisfy you?

MR. LEON: That does.

MS. MALMSTEN: Mr. Chairman, I'm sorry. I realize this is not part of your procedure, but I am -- and I spoke with Jorge. I am Lisa Malmsten. I'm with the city attorneys' office in the city of Long Beach.

And I share your interest in creating a clean procedure, and what I had expressed to Jorge is I think you have a potential of unlawful delegation issue on something that you need to take official action on, you leave a part of the box not filled out yet, and I think that's what Dennis is talking about doing and bringing back.

So my suggestion that would make it cleaner might be to delete reference to Long Beach from the resolution tonight. If you -- people have concerns -- members of the board have concerns about Long Beach's implementation program, we have staff here that can speak to how vigorously the BMPs are being produced in the city of Long Beach and how our Storm Water Monitoring Program is kicking in, if that's the concern.

MS. DIAMOND: How would it hurt Long Beach if it was included in the resolution?

R0072235

MS. MALMSTEN: The concern is whether the .75 be implemented any sooner for Long Beach than for

anybody else. We're starting to create a really muddy record here, and we want to be protected just as much as you do.

If there's a clear statement from the staff that the items in the BMP will not be adopted -- I mean, excuse me -- not be required to be implemented in the city of Long Beach until they are adopted for everybody else, we would be comfortable with that.

MS. CLOKE: But we are adopting it for everybody else and we've put a six-month date for cities and a 30 day beyond that date for implementation for individual permittees, for individual permits.

MR. DICKERSON: We're recommending that Long Beach be formally considered with proper notice with revised language in April.

CHAIRMAN NAHAI: I think that's okay as long as we don't then have an argument about the numeric limit. That's what I don't want to have.

MS. CLOKE: But that's what -- the lady just said she doesn't care.

R0072236

CHAIRMAN NAHAI: I know.

MS. MALMSTEN: I didn't say I didn't care. What is it --

MS. CLOKE: You said that as long as it was the same for you and everybody had the same dates that --

MS. MALMSTEN: As long as the -- if there were numerical standards adopted, that they be the

same.

MS. CLOKE: Right.

MS. MALMSTEN: And that the implementation be a consistent implementation date.

MS. CLOKE: And that's our contention.

MS. MALMSTEN: I would -- okay. There is one more thing. If you delay to April and you're talking about things that require amendments to our general plan, we'll need the six months just like everybody else needs the six months. So I don't know where we are.

MS. CLOKE: So let's not delay.

MS. MALMSTEN: I'm very confused.

MS. CLOKE: Let's vote at the same time that we vote for everybody. No. I'm backwards?

MS. MALMSTEN: The problem is things aren't flushed out yet. If we had a document that said this is what it is now, after the directors had an opportunity to make his changes pursuant to your recommendations -- and I have to tell you that we haven't had the copies. We've been trying madly to keep up with the changes, and we're not at all clear, I think I probably speak for most of the audience, on what changes you've made. So they'll have to come back.

R0072237

I have a bit of a conundrum. One of the things that I suggested was continuing the public hearing as to Long Beach. Obviously, we need to, you

know, see what there is and have an opportunity to comment, but you don't need to set up a whole new big hearing on this. There ought to be an interim procedure, and perhaps Jorge has a suggestion. Dump it back to you.

CHAIRMAN NAHAI: Well, I think if it's merely a matter of providing a clear document to Long Beach, that's one thing. But I believe it's the board's intent that we direct that the numeric limits be applied. We've decided on the six months' time limit plus thirty days. With respect to the exclusion of rooftops, we've given that direction.

The one position -- the one thing that I would think would not be tolerable is for Long Beach to come back and attempt to have a second viewing and a second airing of those issues. So that's where -- because that would be -- that would not be fair to the other permittees. And if that's what's going to happen, then I would rather we just go ahead and adopt it for Long Beach the same way as we have for the other cities under the county-wide permit.

But if it's just simply a matter of having the clean document with the changes, giving that to Long Beach, having them come back for the adoption of the same standards as to the city of Long Beach as we've adopted with respect to the other permittees, then that's fine.

R0072238

MS. CLOKE: Mr. Chairman, I think that if

we do that, we are going to have a lot of other cities that are going to be asking for exactly the same treatment. I think we should treat everybody equally tonight.

MS. MALMSTEN: You have two different permits before you.

MS. CLOKE: I understand that, but our action applies to all, to both, to all the cities, and I think that -- I think that it's a -- more appropriate and not showing any kind of special treatment if we say that this that we've passed applies to everybody.

CHAIRMAN NAHAI: Well, I need to have a staff recommendation.

MS. MALMSTEN: I could --

MR. DICKERSON: I -- everything that I'm aware of in discussions with the city of Long Beach, and please clarify this, is that you know now what the board has adopted. They've certainly adopted the .75. There's no question about that. There are some language changes as well. But the .75 has been the big critical issue, and it's clear that that is what the board's intent is. It's clear that that is what the board will consider, and should we do it back in April, that is formally what will be before the board for adoption.

R0072239

And I think as long as you're willing to say that you don't have any problem at this point in renewing the challenge to 75, then we could probably

proceed.

MS. MALMSTEN: I could phrase that by pointing out that by having a public hearing doesn't mean you continue public comment. I can agree with everything you say so long as whatever legal rights we have this evening continue to apply so that we are not waiving anything by failing to raise any legal points we may have between now and the next hearing.

MS. DIAMOND: This is feeling very muddy to me.

MS. MALMSTEN: It is very muddy. I agree with you.

MS. DIAMOND: I would rather -- and I'm not going to offer it, but I would rather find a solution in the form of a motion so that whatever Dennis comes up with from our direction tonight for long -- for L.A. County and the other permittees will apply to Long Beach at the same time.

MS. CLOKE: And so that they have the same start date as everybody else.

MS. DIAMOND: And the six months begins at the same time.

MS. CLOKE: So that there's an equal responsibility throughout the region.

R0072240

MR. DICKERSON: Then in the resolution there's Item 3, "The Regional Board adopts the approved requirements as provisions applicable to the SUSMP requirements for the City of Long Beach." That covers

it, Jorge, does it not?

MR. LEON: Yes.

MR. DICKERSON: So we adopt the resolution with that language included.

CHAIRMAN NAHAI: Let's do that then.

MS. MALMSTEN: I would just like to register that we think there's an unlawful delegation issue, so we've preserved that issue. Thank you.

CHAIRMAN NAHAI: All right. Then in that case, what would our motion need to be with respect to the resolution and the amendment?

MR. LEON: I think we're at a point where the motion could be just adoption -- a motion for adoption of the resolution as is.

CHAIRMAN NAHAI: As is subject to the amendments that we've given to the executive officer?

MR. LEON: Correct.

CHAIRMAN NAHAI: Could I have a motion to that effect, please?

MS. DIAMOND: I so move.

CHAIRMAN NAHAI: Second?

MS. CLOKE: Second.

CHAIRMAN NAHAI: All in favor?

ALL: Aye.

CHAIRMAN NAHAI: Any opposed? **R0072241**

And Marilyn Lyon abstains.

Does that conclude it? Yes, it does. No other motions are necessary.

I'd suggest that we adjourn. Thank you very much everybody. Thank you for the excellent presentations.

(Proceedings concluded at 6:45 p.m.)

STATE OF CALIFORNIA

I, Jennifer Alaniz, CSR No. 10992, a Certified Shorthand Reporter in and for the State of California, do hereby certify:

That the foregoing proceedings were taken down by me in shorthand at the time and place named therein and were thereafter transcribed under my supervision; that this transcript contains a full, true and correct record of the proceedings which took place at the time and place set forth in the caption hereto.

I further certify that I have no interest in the event of this action.

EXECUTED this 8th day of FEBRUARY, 2000.

JENNIFER ALANIZ

Gray Davis
Governor

Notice of Public Meeting/Hearing

Serving Coastal Los Angeles & Ventura Counties

Thursday, April 22, 1999 ***419th Regular Board Meeting***
9:00 a.m.

City of Camarillo, Council Chambers
601 Carmen Drive
Camarillo, California

Agenda

Submittal of Written Material for Regional Board Consideration

To ensure that the Regional Board has the opportunity to fully study and consider written material, it is necessary to submit 15 copies at least five (5) days before the meeting. This will allow distribution of the material to the Board Members and appropriate staff in advance of the meeting. Pursuant to Title 23 California Code of Regulations Section 648.2, the Regional Board may refuse to admit written testimony into evidence unless the proponent can demonstrate why he or she was unable to submit the material on time or that compliance with the deadline would otherwise create a hardship. If any other party demonstrates prejudice resulting from admission of the written testimony, the Regional Board may refuse to admit it. If you are reading a statement at the meeting, please provide the Executive Assistant with a copy at the meeting.

The Board will recess for a 15 minute break at approximately 10:30 a.m. and recess for lunch at approximately 12:30 pm. The meeting will reconvene at approximately 1:30 pm.

Pledge of Allegiance.

1. Roll Call and Introduction of New Board Member(s).
   [Robyn Goodman, 213/576-6613].....Board Members Present

2. Board Member Designations.

   2.1 Report of Nominating Committee and Election of Officers.
   (The Board will elect a Chair and Vice-Chair for 1999.).....Board Action

   2.2 Designation of Board Member Representatives for Santa Monica Bay Restoration Project (SMBRP) and other Entities.
   (The Board will designate member representatives.).....Board Action

3. Order of Agenda.....Board Direction
(The agenda items are numbered for identification purposes only and will not necessarily be considered in this order).

4. Approval of Regular Meeting Minutes of December 14, 1998.
[Robyn Goodman, 576-6613].....Board Action

5. 1998 Board Outstanding Achievement Award. *(The Board will present a staff person(s) with the Board Outstanding Achievement Award for 1998.)*
[Dennis Dickerson, 576-6605].....Board Action

6. Resolution of Appreciation for Past Board Members John Slezak, Past Chairperson and Charlotte Craven, Past Vice-Chairperson. *(The Board will present both past members with a Resolution of Appreciation for their service on the Board.)*.....Board Action

7. Board Member Ex Parte Communication Disclosure.
[Jorge Leon, 916/657-2428].....Information/Discussion
(Board Members will identify any discussions they may have had requiring disclosure pursuant to Government Code Section 11430.40.)

8. Uncontested Items Calendar.....Board Action
(Items marked with an asterisk are expected to be routine and noncontroversial. The Board will be asked to approve these items at one time without discussion. If any interested party, Board Member, or staff person requests that an item be removed from the calendar, it will be taken up in the regular agenda order.

9. Public Forum *(Any person may address the Board regarding any matter within the Board's jurisdiction. This need not be related to any item on the agenda. Remarks will be limited to three (3) minutes.)*

WASTE DISCHARGE REQUIREMENTS

10. **Consideration of NPDES Requirements – New, Renewal, Rescission**.....Board Action
(After a hearing, the Board will be asked to adopt or rescind the proposed permits for the following facilities.)

New

*10.1 West Basin Municipal Water District (Carson Regional Water Recycling Project), Carson [Mazhar Ali, 576-6652].....CA0064246

Renewal

*10.2 California Department of Water Resources (William E. Warne Power Plant), Pyramid Lake [Ha Nguyen, 576-6658].....CA0059188

Rescission

*10.3 Riverbank Bulk Water, Wilmington [Kwang Lee, 576-6666].....CA0055964
*10.4 Aratex Services Inc., Long Beach [Kwang Lee, 576-6666].....CA0063045
*10.5 Sta-Lube, Inc. (3039 Ana Street), Rancho Dominguez
[Gary Schultz, 576-6665].....CA0064025
*10.6 Bethlehem Steel Corp. (Vernon Industry Plaza), Vernon
[Gary Schultz, 576-6665].....CA0060755
*10.7 Ventura Regional Sanitation District (Nyeland Acres Wastewater
Treatment Plant), Oxnard [Veronica Cuevas-Alpuche, 576-6662].....CA0059005
*10.8 Santa Clarita Community College District (College of the Canyons),
Santa Clarita [Ha Nguyen, 576-6658].....CA0055565
*10.9 Ventura Harbor Boatyard, Ventura [Ha Nguyen, 576-6658].....CA0058998
*10.10 Southern Pacific Milling Co. (Santa Paula Facility), Santa Paula
[Ha Nguyen, 576-6658].....CA0000981
*10.11 Los Angeles Times, Los Angeles [Gary Schultz, 576-6665].....CA0061913
*10.12 Los Angeles Times, Los Angeles [Gary Schultz, 576-6665].....CA0060666
*10.13 L and R Auto Parks, Inc., Los Angeles [Gary Schultz, 576-6665].....CA0062171
*10.14 Robert Chan (B.C. Plaza), Los Angeles [Gary Schultz, 576-6665].....CA0060607
*10.15 Maguire Thomas Partners, Los Angeles [Gary Schultz, 576-6665].....CA0062065
*10.16 College Spring Partnership, Los Angeles [Gary Schultz, 576-6665].....CA0061182
*10.17 Alpha Therapeutic Corp., Los Angeles [Dan Radelescu, 576-6668].....CA0058777
*10.18 Lubricating Specialties Co., Vernon [Dan Radelescu, 576-6668].....CA0059978

11. **Consideration of Non-NPDES Requirements – New, Revision, Rescission**.....Board Action
(After a hearing, the Board will be asked to adopt or rescind the proposed requirements for the following facilities.)

New

*11.1 San Gabriel Basin Water Quality Authority (So. El Monte Operable Unit),
So. El Monte [Ejigu Solomon, 576-6727].....99-022
*11.2 RAMCO Newhall Company, Ventura [David Hung, 576-6723].....85-16

Revision

*11.3 Hathaway Children's Services, Lakeview Terrace [Magdy Baiady, 576-6699].....68-30
*11.4 The Marblehead Land Company (Point Dume Club Wastewater Treatment Plant),
Malibu [Ahmad Lamaa, 576-6716].....68-071

*11.5 Ventura Port District (Maintenance Dredging), Ventura
[Michael Lyons, 576-6718].....79-059
*11.6 Dominguez Energy Limited Partnership and Dominguez Properties,
Limited Partnership, Carson [Rebecca Chou, 576-6733].....86-075

Rescission

*11.7 Texaco Exploration and Production, Inglewood [Rebecca Chou, 576-6733].....84-14
*11.8 Church of Scientology (Western United States Canyon Oaks Ranch School) [Ahmad Lamaa, 576-6716].....92-086
*11.9 SPV Sanitation District Inc. and Williams Homes Inc., Agua Dulce [Bryan Schweickert, 266-7520].....89-022

ENFORCEMENT ISSUES

12. Administrative Civil Liability (ACL) Complaints for Failure to Submit Annual Reports Against the Following Permittees of the General Permit on Storm Water Discharges Associated with Industrial Activity. *(The Board will conduct a public hearing to receive evidence and testimony concerning an ACL Complaint issued to the following permittees. Following the public hearing, the Board may take action to affirm, modify or rescind the ACLs).*
[Bryan Schweickert, 576-6786].....Board Action

12.1 Complaint No. 98-099 against Beneto Inc. Truck Terminal, Long Beach (WDID 4B19SO 01401)
12.2 Complaint No. 98-100 against Harout's Auto, Sun Valley (WDID 4B19SO 04503)
12.3 Complaint No. 98-102 against Hugo Giusto Auto, Maywood (WDID 4B19SO 04928)
12.4 Complaint No. 98-103 against Foothill Foundry, Azusa (WDID 4B19SO 04947)
12.5 Complaint No. 98-106 against Truck Parts Company, Sun Valley (WDID 4B19SO 05937)
12.6 Complaint No. 98-107 against Taylor Desk, Lynwood (WDID 4B19SO 06999)

*13. Rescission of a Cease and Desist Order for Ventura Regional Sanitation District (Nyeland Acres Wastewater Treatment Plant), *Oxnard (After a hearing, the Board will be asked to rescind the Cease and Desist Order.)*
[Veronica Cuevas-Alpuche, 576-6662].....Consent Calendar

OTHER BUSINESS

14. Consideration of a Resolution Authorizing the Executive Officer to Execute the Prospective Purchaser Agreement and Covenant Not to Sue for the SKG Playa, LLC, Studio Land Co., LLC and Playa Capital Company, LLC (The Dream-works Site). *(The Board will be asked to adopt the tentative Resolution).* [John Geroch, 576-6735].....Board Action

15. Consideration of a Resolution Authorizing the Executive Officer to Execute the Prospective Purchaser Agreement and Covenant Not to Sue for the Comstock, Crosser & Associates Development Company, Inc., a California Corporation. *(The Board will be asked to adopt the tentative Resolution).* [David Hung, 576-6723].....Board Action

16. Consideration of Recommended Best Management Practices (BMPs) for Development Planning and Construction for Municipal Storm Water Programs in Los Angeles County. *(The Board will be asked to adopt the tentative Resolution approving the recommended BMPs).*
[Xavier Swamikannu, 576-6654].....Board Action

17. HR Textron Inc., Santa Clarita *(The Board will be asked to (1) adopt a Resolution approving a Negative Declaration and (2) adopt Waste Discharge Requirements for the facility).*
[Rebecca Chou, 576-6733].....Board Action

    17.1 Resolution Approving the Environmental Checklist and Negative Declaration Inc. (Potable Water and Nutrient Injection)

    17.2 Waste Discharge Requirements for HR Textron, Inc. Santa Clarita (Potable Water and Nutrient Injection)

18. Consideration of Resolution Authorizing the Executive Officer to Approve the Recommended Proposition A Projects for Reducing Urban Runoff Pollutant Load in Urban Runoff to Santa Monica Bay. *(The Board will be asked to adopt the tentative Resolution).*
[Marianne Yamaguchi, 576-6614].....Board Action

INFORMATION ITEMS *(Please note that these items are for information only. There will be no voting or formal action taken by the Board on these items.)*

19. Status Report and Briefing of Total Maximum Daily Loads (TMDL). *(Staff will present a summary and time schedule of TMDL activities, and an update on the progress of the Regional Board's TMDL efforts.)* [Jonathan Bishop, 576-6681].....Information/Discussion

20. Status Report on Closure of Azusa Landfill Reclamation (ALR). *(Staff will update the Board on the status of closure operations at the Azusa Landfill).*
[Rodney Nelson, 576-6719].....Information/Discussion

21. Status Report of City of Los Angeles' Hyperion Treatment Plant Consent Decree *(Staff will update the Board on the status of the Consent Decree.)*
[Dennis Dasker, 576-6616].....Information/Discussion

22. Board Member Communications.....Information/Discussion
(The Board Members may discuss communications, correspondence, or other items of general interest relating to matters within the Board's jurisdiction.)

23. Report of Cost Benefit Task Committee.....Information/Discussion
(The Committee will give a progress report.) [Mr. Keston]

24. Executive Officer's Report.....Information/Discussion

25. Closed Session. .....By Board

At any time during the regular session, the Board may adjourn to a closed session to consider litigation, personnel matters, or to deliberate on a decision to be reached based upon evidence introduced in a hearing. Discussion of litigation is within the attorney-client privilege and may be held in closed session. Authority: Government Code Sections 11126(a)(d)(q).

26. Adjournment of current meeting. Next Regular Meeting is Thursday, May 27, at 9:00 a.m., U.S. Court of Appeals Building, 125 S. Grand Avenue, Pasadena.

***

A copy of the complete agenda package is available for examination at the Regional Board Office during regular working hours. Questions about specific items on the agenda should be directed to the staff person whose name is listed with the item.

***

Material presented to the Board as part of testimony that is to be made part of the record must be left with the Board. This includes photographs, slides, charts, diagrams, etc. All Board files pertaining to the items on this Agenda are hereby made a part of the record submitted to the Regional Board by staff for its consideration prior to action on the related items.

*****

Our new web site address is www.swrcb.ca.gov/~rwqcb4. The site can also be accessed through the State Water Resources Control Board's web site at www.swrcb.ca.gov., then clicking on "Interesting Links". Information currently available includes the Regional Board's meeting schedule, a list of the Regional Board members, a list of staff and phone numbers arranged by their work unit,, a copy of the Underground Storage Tank database and information relevant to the UST program, linkage to the Santa Monica Bay Restoration Project's home page, and links to other governmental agencies. If you need further information, please contact Jack Price at 213/576-6669.

****

A listing of pending water quality certification applications currently on public notice pursuant to Section 401 of the Federal Clean Water Act may be obtained by calling Alex Fu at 213/576-6692.

Recommended BMPs for Site Planning, Post-Construction, and Redevelopment/Infill

R0072251

Site Planning BMPs
Minimize Storm Water Runoff
Pervious Drainage System
Reduce Area of Impervious Surface
Site Layout

Post-Construction BMPs	
BMP Name	**BMP Identification No. and Name [a]**
Car Wash Facility	SC3, Vehicle and Equipment Washing and Steam Cleaning
Constructed Wetlands	TC3, Constructed Wetlands
Control of Impervious Runoff	Not applicable.
Efficient Irrigation	Not applicable.
Energy Dissipaters	ESC40, Outlet Protection
Extended Detention Basins	TC5, Extended Detention Basin
Infiltration Basins	TC1, Infiltration
Infiltration Trenches	TC1, Infiltration
Inlet Trash Racks	Not applicable.
Landscape Design	ESC2, Preservation of Existing Vegetation; ECS10, Seeding and Planting; ESC11, Mulching
Linings for Urban Runoff Conveyance Channels	Not applicable.
Materials Management	SC5, Outdoor Loading/Unloading of Materials; SC6, Outdoor Container Storage of Liquids; SC8, Outdoor Storage of Raw Materials, Products, and By-Products
Media Filtration	TC6, Media Filtration
Motor Fuel Concrete Dispensing Areas	SC2, Vehicle and Equipment Fueling
Motor Fuel Dispensing Area Canopy	SC2, Vehicle and Equipment Fueling
Oil/Water Separators and Water Quality Inlets	TC7, Oil/Water Separators and Water Quality Inlets
Outdoor Storage	SC6, Outdoor Container Storage of Liquids; SC8, Outdoor Storage of Raw Materials, Products, and By-Products
Porous Pavement and Alternative Surfaces	TC1, Infiltration
Protect Slopes and Channels	ECS40, Outlet Protection; ESC42, Slope Roughening and Terracing
Self-Contained Areas for Vehicle or Equipment Washing, Steam Cleaning, Maintenance, Repair, or Material Processing	SC3, Vehicle and Equipment Washing and Steam Cleaning; SC4, Vehicle and Equipment Maintenance and Repair; SC7, Outdoor Process Equipment Operations and Maintenance
Storm Drain System Stenciling and Signage	SC30, Storm Drain System Signs
Trash Container Areas	SC9, Waste Handling and Disposal
Vegetated Swales and Strips	TC4, Bio-filters
Wet Pond	TC2,Wet Pond

[a] Corresponds to the BMP number and name as in the *California Storm Water Best Management Practice Handbooks* (1993).

BMP Fact Sheets

R0072255

ACTIVITY: DEWATERING OPERATIONS

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from dewatering operations by using sediment controls and by testing the groundwater for pollution.

APPROACH

There are two general classes of pollutants that may result from dewatering operations; sediment, and toxics and petroleum products. A high sediment content in dewatering discharges is common because of the nature of the operation. On the other hand, toxics and petroleum products are not commonly found in dewatering discharges unless, the site or surrounding area has been used for light or heavy industrial activities, or the area has a history of groundwater contamination. The following steps will help reduce storm water pollution from dewatering discharges:

Sediment

- Use sediment controls to remove sediment from water generated by dewatering (See Sediment Trap (ESC 55) and Sediment Basin (ESC 56) in Chapter 5).
- Use filtration to remove sediment from a sediment trap or basin. Filtration can be achieved with:
  - Sump pit and a perforated or slit standpipe with holes and wrapped in filter fabric. The standpipe is surrounded by stones which filters the water as it collects in the pit before being pumped out. Wrapping the standpipe in filter fabric may require an increased suction inlet area to avoid clogging and unacceptable pump operation.
  - Floating suction hose to allow cleaner surface water to be pumped out.

Toxics and Petroleum Products

- In areas suspected of having groundwater pollution, sample the groundwater near the excavation site and have the water tested for known or suspected pollutants at a certified laboratory. Check with the Regional Water Quality Control Board and the local wastewater treatment plant for their requirements for dewatering, additional water quality tests, and disposal options.
- With a permit from the Regional Water Quality Control Board, you may be able to recycle/reuse pumped groundwater for landscape irrigation, or discharge to the storm sewer. With a permit from the local agency, you may be able to treat pumped groundwater and discharge it to the municipal wastewater treatment plant via the sanitary sewer.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ◒ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements

- ◒ Capital Costs
- ◒ O&M Costs
- ◒ Maintenance
- ◒ Training
- ○ Suitability for Slopes >5%

● High ○ Low

R0072256

ACTIVITY: PAVING OPERATIONS

Graphic: North Central Texas COG, 1993

DESCRIPTION

Prevent or reduce the discharge of pollutants from paving operations, using measures to prevent runon and runoff pollution, properly disposing of wastes, and training employees and subcontractors.

APPROACH

- Avoid paving during wet weather.
- Store materials away from drainage courses to prevent storm water runon (see CA10 Material Delivery and Storage).
- Protect drainage courses, particularly in areas with a grade, by employing BMPs to divert runoff or trap/filter sediment (see Chapter 5).
- Leaks and spills from paving equipment can contain toxic levels of heavy metals and oil and grease. Place drip pans or absorbent materials under paving equipment when not in use. Clean up spills with absorbent materials rather than burying. See CA32 (Vehicle and Equipment Maintenance) and CA12 (Spill Prevention and Control) in this chapter.
- Cover catch basins and manholes when applying seal coat, tack coat, slurry seal, fog seal, etc.
- Shovel or vacuum saw-cut slurry and remove from site. Cover or barricade storm drains during saw cutting to contain slurry.
- If paving involves portland cement concrete, see CA23 (Concrete Waste Management) in this chapter.
- If paving involves asphaltic concrete, follow these steps:
  - Do not allow sand or gravel placed over new asphalt to wash into storm drains, streets, or creeks by sweeping. Properly dispose of this waste by referring to CA20 (Solid Waste Management) in this chapter.
  - Old asphalt must be disposed of properly. Collect and remove all broken asphalt from the site and recycle whenever possible.
  - If paving involves on-site mixing plant, follow the storm water permitting requirements for industrial activities.
- Train employees and subcontractors.

REQUIREMENTS

- Costs (Capital, O&M)
  - All of the above are low cost measures.
- Maintenance
  - Inspect employees and subcontractors to ensure that measures are being followed.
  - Keep ample supplies of drip pans or absorbent materials on-site.

LIMITATIONS

- There are no major limitations to this best management practice.

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

Targeted Pollutants

- ◒ Sediment
- ○ Nutrients
- ◒ Toxic Materials
- ◒ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

- ◒ Maintenance
- ◒ Training
- ○ Suitability for Slopes >5%

● High ○ Low

CA2

Best Management Practices

ACTIVITY: STRUCTURE CONSTRUCTION AND PAINTING

Graphic: North Central Texas COG, 1993

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from structure construction and painting by enclosing or covering or berming building material storage areas, using good housekeeping practices, using safer alternative products, and training employees and subcontractors.

APPROACH

- Keep the work site clean and orderly. Remove debris in a timely fashion. Sweep the area.
- Use soil erosion control techniques if bare ground is exposed (See Chapter 5).
- Buy recycled or less hazardous products to the maximum extent practicable.
- Conduct painting operations consistent with local air quality and OSHA regulations.
- Properly store paints and solvents. See CA10 (Material Delivery and Storage) in this chapter.
- Properly store and dispose waste materials generated from the activity. See the waste management BMPs (CA20 to CA24) in this chapter.
- Recycle residual paints, solvents, lumber, and other materials to the maximum extent practicable.
- Make sure that nearby storm drains are well marked to minimize the chance of inadvertent disposal of residual paints and other liquids.
- Clean the storm drain system in the immediate construction area after construction is completed.
- Educate employees who are doing the work.
- Inform subcontractors of company policy on these matters and include appropriate provisions in their contract to make certain proper housekeeping and disposal practices are implemented.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - These BMPs are generally of low to moderate cost.
- Maintenance
  - Maintenance should be minimal.

LIMITATIONS

- Safer alternative products may not be available, suitable, or effective in every case.
- Hazardous waste that cannot be re-used or recycled must be disposed of by a licensed hazardous waste hauler.

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

Targeted Pollutants

- ○ Sediment
- ○ Nutrients
- ◒ Toxic Materials
- ○ Oil & Grease
- ● Floatable Materials
- ● Other Construction Waste

- ● Likely to Have Significant Impact

- Control Internal Erosion

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from material delivery and storage by minimizing the storage of hazardous materials on-site, storing materials in a designated area, installing secondary containment, conducting regular inspections, and training employees and subcontractors.

This best management practice covers only material delivery and storage. For other information on materials, see CA11 (Material Use), or CA12 (Spill Prevention and Control). For information on wastes, see the waste management BMPs in this chapter.

APPROACH

The following materials are commonly stored on construction sites:

- Soil,
- Pesticides and herbicides,
- Fertilizers,
- Detergents,
- Plaster or other products,
- Petroleum products such as fuel, oil, and grease, and
- Other hazardous chemicals such as acids, lime, glues, paints, solvents, and curing compounds.

Storage of these materials on-site can pose the following risks:

- Storm water pollution,
- Injury to workers or visitors,
- Groundwater pollution, and
- Soil contamination.

Therefore, the following steps should be taken to minimize your risk:

- Designate areas of the construction site for material delivery and storage.
  - Place near the construction entrances, away from waterways
  - Avoid transport near drainage paths or waterways
  - Surround with earth berms (see ESC30, Earth Dike.)
  - Place in an area which will be paved
- Storage of reactive, ignitable, or flammable liquids must comply with the fire codes of your area. Contact the local Fire Marshal to review site materials, quantities, and proposed storage area to determine specific requirements. See the Flammable and Combustible Liquid Code, NFPA30.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.
- Keep an accurate, up-to-date inventory of materials delivered and stored on-site.
- Keep your inventory down.

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from material use by using alternative products, minimizing hazardous material use on-site, and training employees and subcontractors.

APPROACH

The following materials are commonly used on construction sites:

- Pesticides and herbicides,
- Fertilizers,
- Detergents,
- Plaster and other products,
- Petroleum products such as fuel, oil, and grease, and
- Other hazardous chemicals such as acids, lime, glues, paints, solvents, and curing compounds.

Use of these materials on-site can pose the following risks:

- Storm water pollution,
- Injury to workers or visitors,
- Groundwater pollution, and
- Soil contamination.

Therefore, the following steps should be taken to minimize your risk:

- Use less hazardous, alternative materials as much as possible.
- Minimize use of hazardous materials on-site.
- Use materials only where and when needed to complete the construction activity.
- Follow manufacturer's instructions regarding uses, protective equipment, ventilation, flammability, and mixing of chemicals.
- Personnel who use pesticides should be trained in their use. The California Department of Pesticide Regulation and county agricultural commissioners license pesticide dealers, certify pesticide applicators, and conduct on-site inspections.
- Do not over-apply fertilizers, herbicides, and pesticides. Prepare only the amount needed. Follow the recommended usage instructions. Over-application is expensive and environmentally harmful. Unless on steep slopes, till fertilizers into the soil rather than hydroseeding. Apply surface dressings in several smaller applications, as opposed to one large application, to allow time for infiltration and to avoid excess material being carried off-site by runoff. Do not apply these chemicals just before it rains.
- Train employees and subcontractors in proper material use.

CA11

Best Management Practices

ACTIVITY: SPILL PREVENTION AND CONTROL

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from leaks and spills by reducing the chance for spills, stopping the source of spills, containing and cleaning up spills, properly disposing of spill materials, and training employees.

This best management practice covers only spill prevention and control. However, CA10 (Material Delivery and Storage) and CA11 (Material Use), also contain useful information, particularly on spill prevention. For information on wastes, see the waste management BMPs in this chapter.

APPROACH

The following steps will help reduce the storm water impacts of leaks and spills:

Define "Significant Spill"

- Different materials pollute in different amounts. Make sure that each employee knows what a "significant spill" is for each material they use, and what is the appropriate response for "significant" and "insignificant" spills.

General Measures

- Hazardous materials and wastes should be stored in covered containers and protected from vandalism.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Train employees in spill prevention and cleanup.
- Designate responsible individuals.

Cleanup

- Clean up leaks and spills immediately.
- On paved surfaces, clean up spills with as little water as possible. Use a rag for small spills, a damp mop for general cleanup, and absorbent material for larger spills. If the spilled material is hazardous, then the used cleanup materials are also hazardous and must be sent to either a certified laundry (rags) or disposed of as hazardous waste.
- Never hose down or bury dry material spills. Clean up as much of the material as possible and dispose of properly. See the waste management BMPs in this chapter for specific information.

Reporting

- Report significant spills to local agencies, such as the Fire Department; they can assist in cleanup.
- Federal regulations require that any significant oil spill into a water body or onto an adjoining shoreline be reported to the National Response Center (NRC) at 800-424-8802 (24 hour).

Targeted Pollutants

- ○ Sediment
- ○ Nutrients
- ◒ Toxic Materials
- ◒ Oil & Grease

CA12

Best Management Practices

ACTIVITY: SOLID WASTE MANAGEMENT

Graphic: North Central Texas COG, 1993

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from solid or construction waste by providing designated waste collection areas and containers, arranging for regular disposal, and training employees and subcontractors.

APPROACH

Solid waste is one of the major pollutants resulting from construction. Construction debris includes:

- Solid waste generated from trees and shrubs removed during land clearing, demolition of existing structures (rubble), and building construction;
- Packaging materials including wood, paper and plastic;
- Scrap or surplus building materials including scrap metals, rubber, plastic, glass pieces, and masonry products; and
- Domestic wastes including food containers such as beverage cans, coffee cups, paper bags, and plastic wrappers, and cigarettes.

The following steps will help keep a clean site and reduce storm water pollution:

- Select designated waste collection areas on-site.
- Inform trash hauling contractors that you will accept only water-tight dumpsters for on-site use. Inspect dumpsters for leaks and repair any dumpster that is not water tight.
- Locate containers in a covered area and/or in a secondary containment.
- Provide an adequate number of containers with lids or covers that can be placed over the container to keep rain out or to prevent loss of wastes when it's windy.
- Plan for additional containers and more frequent pickup during the demolition phase of construction.
- Collect site trash daily, especially during rainy and windy conditions.
- Erosion and sediment control devices tend to collect litter. Remove this solid waste promptly.
- Make sure that toxic liquid wastes (used oils, solvents, and paints) and chemicals (acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.
- Salvage or recycle any useful material. For example, trees and shrubs from land clearing can be used as a brush barrier (see ESC53), or converted into wood chips, then used as mulch on graded areas (see ESC11).
- Do not hose out dumpsters on the construction site. Leave dumpster cleaning to trash hauling contractor.
- Arrange for regular waste collection before containers overflow.

CA20

Best Management Practices

ACTIVITY: HAZARDOUS WASTE MANAGEMENT

Graphic: North Central Texas COG, 1993

Objectives

- Housekeeping Practices
- **Contain Waste**
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from hazardous waste through proper material use, waste disposal, and training of employees and subcontractors.

APPROACH

Many of the chemicals used on-site can be hazardous materials which become hazardous waste upon disposal. These wastes may include:

- Paints and solvents;
- Petroleum products such as oils, fuels, and grease;
- Herbicides and pesticides;
- Acids for cleaning masonry; and
- Concrete curing compounds.

In addition, sites with existing structures may contain wastes which must be disposed of in accordance with Federal, State, and local regulations. These wastes include:

- Sandblasting grit mixed with lead-, cadmium-, or chromium-based paints;
- Asbestos; and
- PCBs (particularly in older transformers).

The following steps will help reduce storm water pollution from hazardous wastes:

Material Use

- Use all of the product before disposing of the container.
- Do not remove the original product label, it contains important safety and disposal information.
- Do not over-apply herbicides and pesticides. Prepare only the amount needed. Follow the recommended usage instructions. Over-application is expensive and environmentally harmful. Apply surface dressings in several smaller applications, as opposed to one large application, to allow time for infiltration and to avoid excess material being carried off-site by runoff. Do not apply these chemicals just before it rains. People applying pesticides must be certified in accordance with Federal and State regulations.
- Do not clean out brushes or rinse paint containers into the dirt, street, gutter, storm drain, or stream. "Paint out" brushes as much as possible. Rinse water-based paints to the sanitary sewer. Filter and re-use thinners and solvents. Dispose of excess oil-based paints and sludge as hazardous waste.

Targeted Pollutants

- ○ Sediment
- ○ Nutrients
- ◒ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

CA21

Best Management Practices

ACTIVITY: CONTAMINATED SOIL MANAGEMENT

Objectives

- Housekeeping Practices
- **Contain Waste**
- **Minimize Disturbed Areas**
- **Stabilize Disturbed Areas**
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from contaminated soil and highly acidic or alkaline soils by conducting pre-construction surveys, inspecting excavations regularly, and remediating contaminated soil promptly.

APPROACH

Contaminated soils may occur on your site for several reasons including:

- Past site uses and activities;
- Detected or undetected spills and leaks; and
- Acid or alkaline solutions from exposed soil or rock formations high in acid or alkaline-forming elements.

Most developers conduct pre-construction environmental assessments as a matter of routine. Recent court rulings holding contractors liable for cleanup costs when they unknowingly move contaminated soil, highlight the need for contractors to confirm that a site assessment is completed before earth moving begins.

The following steps will help reduce storm water pollution from contaminated soil:

- Conduct thorough site planning including pre-construction geologic surveys.
- Look for contaminated soil as evidenced by discoloration, odors, differences in soil properties, abandoned underground tanks or pipes, or buried debris.
- Prevent leaks and spills to the maximum extent practicable. Contaminated soil can be expensive to treat and/or dispose of properly. However, addressing the problem before construction is much less expensive than after the structures are in place.
- Test suspected soils at a certified laboratory.
- If the soil is contaminated, work with the local regulatory agencies to develop options for treatment and/or disposal.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - Prevention of leaks and spills is inexpensive. Treatment and/or disposal of contaminated soil can be quite expensive.
- Maintenance
  - Inspect excavated areas daily for signs of contaminated soil.
  - Implement CA12, Spill Prevention and Control, to prevent leaks and spills as much as possible.

Targeted Pollutants

- ◒ Sediment
- ○ Nutrients
- ● Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

CA22

Best Management Practices

ACTIVITY: CONCRETE WASTE MANAGEMENT

Objectives

Housekeeping Practices

Contain Waste

Minimize Disturbed Areas

Stabilize Disturbed Areas

Protect Slopes/Channels

Control Site Perimeter

Control Internal Erosion

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from concrete waste by conducting washout off-site, performing on-site washout in a designated area, and training employees and subcontractors.

APPROACH

The following steps will help reduce storm water pollution from concrete wastes:

- Store dry and wet materials under cover, away from drainage areas.
- Avoid mixing excess amounts of fresh concrete or cement on-site.
- Perform washout of concrete trucks off site or in designated areas only.
- Do not wash out concrete trucks into storm drains, open ditches, streets, or streams.
- Do not allow excess concrete to be dumped on-site, except in designated areas.
- For on-site washout:
  - locate washout area at least 50 feet from storm drains, open ditches, or water bodies. Do not allow runoff from this area by constructing a temporary pit or bermed area large enough for liquid and solid waste;
  - wash out wastes into the temporary pit where the concrete can set, be broken up, and then disposed of properly.
- When washing concrete to remove fine particles and expose the aggregate, avoid creating runoff by draining the water to a bermed or level area.
- Do not wash sweepings from exposed aggregate concrete into the street or storm drain. Collect and return sweepings to aggregate base stock pile, or dispose in the trash.
- Train employees and subcontractors in proper concrete waste management.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - All of the above are low cost measures.
- Maintenance
  - Inspect subcontractors to ensure that concrete wastes are being properly managed.
  - If using a temporary pit, dispose hardened concrete on a regular basis.

LIMITATIONS

- Off-site washout of concrete wastes may not always be possible.

CA23

Best Management Practices

ACTIVITY: SANITARY/SEPTIC WASTE MANAGEMENT

Objectives

- Housekeeping Practices
- **Contain Waste**
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from sanitary/septic waste by providing convenient, well-maintained facilities, and arranging for regular service and disposal.

APPROACH

Sanitary or septic wastes should be treated or disposed of in accordance with State and local requirements. These requirements may include:

- Locate sanitary facilities in a convenient location.
- Untreated raw wastewater should never be discharged or buried.
- Temporary septic systems should treat wastes to appropriate levels before discharging.
- If using an on-site disposal system (OSDS), such as a septic system, comply with local health agency requirements.
- Temporary sanitary facilities that discharge to the sanitary sewer system should be properly connected to avoid illicit discharges.
- If discharging to the sanitary sewer, contact the local wastewater treatment plant for their requirements.
- Sanitary/septic facilities should be maintained in good working order by a licensed service.
- Arrange for regular waste collection by a licensed hauler before facilities overflow.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - All of the above are low cost measures.
- Maintenance
  - Inspect facilities regularly.
  - Arrange for regular waste collection.

LIMITATIONS

- There are no major limitations to this best management practice.

CA24

Best Management Practices

ACTIVITY: VEHICLE AND EQUIPMENT CLEANING

Graphic: North Central Texas COG, 1993

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from vehicle and equipment cleaning by using off-site facilities, washing in designated, contained areas only, eliminating discharges to the storm drain by infiltrating or recycling the wash water, and/or training employees and subcontractors.

APPROACH

- Use off-site commercial washing businesses as much as possible. Washing vehicles and equipment outdoors or in areas where wash water flows onto paved surfaces or into drainage pathways can pollute storm water. If you wash a large number of vehicles or pieces of equipment, consider conducting this work at an off-site commercial business. These businesses are better equipped to handle and dispose of the wash waters properly. Performing this work off-site can also be economical by eliminating the need for a separate washing operation at your site.
- If washing must occur on-site, use designated, bermed wash areas to prevent wash water contact with storm water, creeks, rivers, and other water bodies. The wash area can be sloped for wash water collection and subsequent infiltration into the ground.
- Use as little water as possible to avoid having to install erosion and sediment controls for the wash area.
- Use phosphate-free, biodegradable soaps.
- Educate employees and subcontractors on pollution prevention measures.
- Do not permit steam cleaning on-site. Steam cleaning can generate significant pollutant concentrations.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - All of the above are low cost measures.
- Maintenance
  - Minimal, some berm repair may be necessary.

LIMITATIONS

- Even phosphate-free, biodegradable soaps have been shown to be toxic to fish before the soap degrades.
- Sending vehicles/equipment off-site should be done in conjunction with ESC24 (Stabilized Construction Entrance).

CA30

Best Management Practices

ACTIVITY: VEHICLE AND EQUIPMENT FUELING

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

DESCRIPTION

Prevent fuel spills and leaks, and reduce their impacts to storm water by using off-site facilities, fueling in designated areas only, enclosing or covering stored fuel, implementing spill controls, and training employees and subcontractors.

APPROACH

- Use off-site fueling stations as much as possible. Fueling vehicles and equipment outdoors or in areas where fuel may spill/leak onto paved surfaces or into drainage pathways can pollute storm water. If you fuel a large number of vehicles or pieces of equipment, consider using an off-site fueling station. These businesses are better equipped to handle fuel and spills properly. Performing this work off-site can also be economical by eliminating the need for a separate fueling area at your site.
- If fueling must occur on-site, use designated areas, located away from drainage courses, to prevent the runon of storm water and the runoff of spills.
- Discourage "topping-off" of fuel tanks.
- Always use secondary containment, such as a drain pan or drop cloth, when fueling to catch spills/leaks.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Use adsorbent materials on small spills rather than hosing down or burying the spill. Remove the adsorbent materials promptly and dispose of properly.
- Carry out all Federal and State requirements regarding stationary above ground storage tanks.
- Avoid mobile fueling of mobile construction equipment around the site; rather, transport the equipment to designated fueling areas. With the exception of tracked equipment such as bulldozers and perhaps forklifts, most vehicles should be able to travel to a designated area with little lost time.
- Train employees and subcontractors in proper fueling and cleanup procedures.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - All of the above measures are low cost, except for the capital costs of above ground tanks that meet all local environmental, zoning, and fire codes.
- Maintenance
  - Keep ample supplies of spill cleanup materials on-site.
  - Inspect fueling areas and storage tanks on a regular schedule.

LIMITATIONS

- Sending vehicles/equipment off-site should be done in conjunction with ESC24 (Stabilized Construction Entrance).

Targeted Pollutants

- ○ Sediment
- ○ Nutrients
- ◒ Toxic Materials
- ◒ Oil & Grease
- ○ Floatable Materials

CA31

Best Management Practices

ACTIVITY: VEHICLE AND EQUIPMENT MAINTENANCE

Graphic: North Central Texas COG, 1993

DESCRIPTION

Prevent or reduce the discharge of pollutants to storm water from vehicle and equipment maintenance by running a "dry site". This involves using off-site facilities, performing work in designated areas only, providing cover for materials stored outside, checking for leaks and spills, containing and cleaning up spills immediately, and training employees and subcontractors.

APPROACH

- Keep vehicles and equipment clean, don't allow excessive build-up of oil and grease.
- Use off-site repair shops as much as possible. Maintaining vehicles and equipment outdoors or in areas where vehicle or equipment fluids may spill or leak onto the ground can pollute storm water. If you maintain a large number of vehicles or pieces of equipment, consider using an off-site repair shop. These businesses are better equipped to handle vehicle fluids and spills properly. Performing this work off-site can also be economical by eliminating the need for a separate maintenance area.
- If maintenance must occur on-site, use designated areas, located away from drainage courses, to prevent the runon of storm water and the runoff of spills.
- Always use secondary containment, such as a drain pan or drop cloth, to catch spills or leaks when removing or changing fluids.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Use adsorbent materials on small spills rather than hosing down or burying the spill. Remove the adsorbent materials promptly and dispose of properly.
- Regularly inspect on-site vehicles and equipment for leaks, and repair immediately.
- Check incoming vehicles and equipment (including delivery trucks, and employee and subcontractor vehicles) for leaking oil and fluids. Do not allow leaking vehicles or equipment on-site.
- Segregate and recycle wastes, such as greases, used oil or oil filters, antifreeze, cleaning solutions, automotive batteries, hydraulic, and transmission fluids.
- Train employees and subcontractors in proper maintenance and spill cleanup procedures.
- For a quick reference on disposal alternatives for specific wastes, see Table 4.2, CA40, Employee/Subcontractor Training.

REQUIREMENTS

- Costs (Capital, O&M)
  - All of the above are low cost measures.
- Maintenance
  - Keep ample supplies of spill cleanup materials on-site.
  - Inspect maintenance areas on a regular schedule.

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

Targeted Pollutants

CA32

Best Management Practices

ACTIVITY: EMPLOYEE/SUBCONTRACTOR TRAINING (Continue)

- Consider posting the quick reference table around the job site or in the on-site office trailer to reinforce training.
- Train employee/subcontractors in standard operating procedures and spill cleanup techniques described in the fact sheets. Employee/subcontractors trained in spill containment and cleanup should be present during the loading/unloading and handling of materials.
- Personnel who use pesticides should be trained in their use. The California Department of Pesticide Regulation and county agricultural commissioners license pesticide dealers, certify pesticide applicators, and conduct on-site inspections.
- Proper education of off-site contractors is often overlooked. The conscientious efforts of well trained employee/subcontractors can be lost by unknowing off-site contractors, so make sure they are well informed about what they are expected to do on-site.

CA40

DISCHARGE/ACTIVITY	BUSINESS/COMMERCIAL Disposal Priorities	Approval	RESIDENTIAL Disposal Priorities
General Construction and Painting; Street and Utility Maintenance (cont'd)			
Non-hazardous paint scraping/ sand blasting	1. Dry sweep, dispose as trash		1. Dry sweep, dispose as trash
HAZARDOUS paint scraping/sand blasting (e.g. marine paints or paints containing lead or tributyl tin)	1. Dry sweep, dispose as hazardous waste		1. Dry sweep, take to HHW drop-off
Soil from excavations during periods when storms are forecast	1. Should not be placed in street or on paved areas 2. Remove from site or backfill by end of day 3. Cover with tarpaulin or surround with hay bales, or use other runoff controls 4. Place filter mat over storm drain Note: Thoroughly sweep following removal of dirt in all four alternatives.		
Soil from excavations placed on paved surfaces during periods when storms are not forecast	1. Keep material out of storm conveyance systems and thoroughly remove via sweeping following removal of dirt		
Cleaning streets in construction areas	1. Dry sweep and minimize tracking of mud 2. Use silt ponds and/or similar pollutant reduction techniques when flushing pavement		
Soil erosion, sediments	1. Cover disturbed soils, use erosion controls, block entry to storm drain. 2. Seed or plant immediately.		
Fresh cement, grout, mortar	1. Use/reuse excess 2. Dispose to trash		1. Use/reuse excess 2. Dispose as trash
Washwater from concrete/mortar (etc.) cleanup	1. Wash onto dirt area, spade in 2. Pump and remove to appropriate disposal facility 3. Settle, pump water to sanitary sewer	POTW	1. Wash onto dirt area, spade in 2. Pump and remove to appropriate disposal facility 3. Settle, pump water to sanitary sewer
Aggregate wash from driveway/patio construction	1. Wash onto dirt area, spade in 2. Pump and remove to appropriate disposal facility 3. Settle, pump water to sanitary sewer	POTW	1. Wash onto dirt area, spade in 2. Pump and remove to appropriate disposal facility 3. Settle, pump water to sanitary sewer

Pesticides	1. Use up. Rinse containers use rinsewater as product. Dispose rinsed containers as trash 2. Dispose unused pesticide as hazardous waste		1. Use up. Rinse containers, use rinsewater as pesticide. Dispose rinsed container as trash. 2. Take unused pesticide to HHW drop-off
Garden clippings	1. Compost 2. Take to Landfill		1. Compost 2. Dispose as trash.
Tree trimming	1. Chip if necessary, before composting or recycling		1. Chip if necessary, before composting or recycling
Swimming pool, spa, fountain water (emptying)	1. Do not use metal-based algicides (i.e. Copper Sulfate) 2. Recycle/reuse (e.g. irrigation) 3. Determine chlorine residual = 0, wait 24 hours and then discharge to storm drain.	POTW	1. Do not use metal-based algicides (i.e. Copper Sulfate) 2. Recycle/reuse (e.g. irrigation) 3. Determine chlorine residual = 0, wait 24 hours and then discharge to storm drain.
Acid or other pool/spa/fountain cleaning	1. Neutralize and discharge to sanitary sewer	POTW	
Swimming pool, spa filter backwash	1. Reuse for irrigation 2. Dispose on dirt area 3. Settle, dispose to sanitary sewer		1. Use for landscape irrigation 2. Dispose on dirt area 3. Settle, dispose to sanitary sewer
Vehicle Wastes			
Used motor oil	1. Use secondary containment while storing, send to recycler.		1. Put out for curbside recycling pickup where available 2. Take to Recycling Facility or auto service facility with recycling program 3. Take to HHW events accepting motor oil
Antifreeze	1. Use secondary containment while storing, send to recycler.		1. Take to Recycling Facility
Other vehicle fluids and solvents	1. Dispose as hazardous waste		1. Take to HHW event
Automobile batteries	1. Send to auto battery recycler 2. Take to Recycling Center		1. Exchange at retail outlet 2. Take to Recycling Facility or HHW event where batteries are accepted
Motor home/construction trailer waste	1. Use holding tank. Dispose to sanitary sewer		1. Use holding tank, dispose to sanitary sewer.

R0072273

DISCHARGE/ACTIVITY	BUSINESS/COMMERCIAL Disposal Priorities	Approval	RESIDENTIAL Disposal Priorities
Other Wastes (cont'd)			
Kitchen Grease	1. Provide secondary containment, collect, send to recyler. 2. Provide secondary containment, collect, send to POTW via hauler.	POTW	1. Collect, solidify, dispose as trash
Restaurant cleaning of floor mats, exhaust filters, etc.	1. Clean inside building with discharge through grease trap to sanitary sewer. 2. Clean outside in container or bermed area with discharge to sanitary sewer.		
Clean-up wastewater from sewer back-up	1. Follow this procedure: a. Block storm drain, contain, collect, and return spilled material to the sanitary sewer. b. Block storm drain, rinse remaining material to collection point and pump to sanitary sewer. (no rinse-water may flow to storm drain)		

16-45
R0072274

BMP: SCHEDULING

DESCRIPTION

Sequencing the construction project to reduce the amount and duration of soil exposed to erosion by wind, rain, runoff, and vehicle tracking.

SUITABLE APPLICATIONS

Proper sequencing of construction activities to reduce erosion potential should be incorporated into the schedule of every construction project. Use of other, more costly yet less effective, erosion and sedimentation controls, may often be reduced through proper construction sequencing.

APPROACH

- Project design considerations: Design project to integrate into existing land contours. Significant regrading of a site will require more costly erosion and sedimentation control measures and may require that on-site drainage facilities be installed.
- Incorporate existing, natural areas: Inventory and evaluate the existing site terrain and vegetation. Disturbance of highly erosive natural areas (e.g., steep, unstable slope areas, watercourses) should be minimized, while protecting other areas may enhance site aesthetics. Construction should not disturb these areas (see ESC2).
- Avoid rainy periods: Schedule major grading operations during dry months. Allow enough time before rainfall begins to stabilize the soil with vegetation or physical means (see ESC 10 to 24) or to install temporary sediment trapping devices (see ESC 50 to 56).
- Practice erosion and sediment control year round: Erosion may be caused during dry seasons by "freak" rainfall, wind and vehicle tracking. Therefore, keep the site stabilized year-round, and retain wet season sediment trapping devices.
- Minimize soil exposed at one time: Schedule projects to disturb only small portions of the site at any one time. Complete grading as soon as possible. Immediately stabilize the disturbed portion before grading the next portion. Practice staged seeding—revegetate cut and fill slopes as the work progresses.
- Trenching: Close and stabilize open trenches as soon as possible. Sequence trenching projects so that most open portions of the trench are closed before new trenching is begun.

REQUIREMENTS

- Cost
  - Construction scheduling to reduce erosion may increase other construction costs due to reduced economies of scale in performing site grading. The cost-effectiveness of scheduling techniques should be compared with the other, less effective erosion and sedimentation controls to achieve a cost-effective balance.

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

Targeted Pollutants

- ○ Sediment

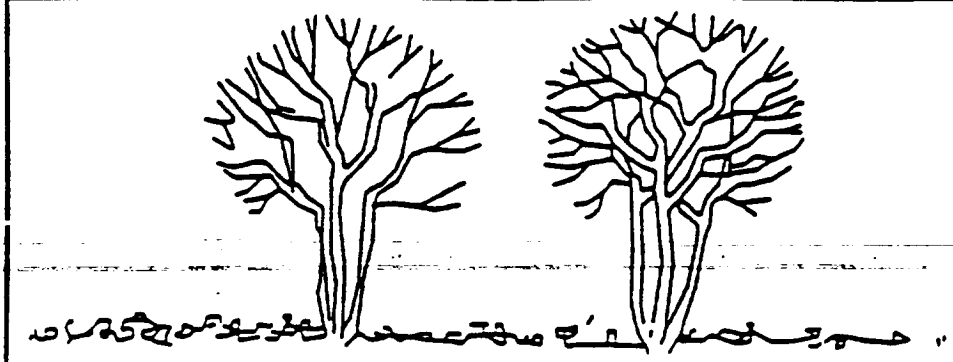
- ○ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements



- ○ Capital Costs
- ○ O&M Costs
- ○ Maintenance
- ○ Training
- ○ Suitibility for Slopes >5%

● High ○ Low

ESC1

Best Management Practices

BMP: PRESERVATION OF EXISTING VEGETATION

GENERAL DESCRIPTION

Carefully planned preservation of existing vegetation minimizes the potential of removing or injuring existing trees, vines, shrubs and/or grasses that serve as erosion controls.

SUITABLE APPLICATIONS

- Areas within site where no construction activity occurs, or occurs at a later date.
- Sensitive areas where natural vegetation exist and should be preserved, such as: steep slopes, watercourses, and building sites in wooded areas.
- Areas where local, state and federal government requires preservation, such as: vernal pools, wetlands, marshes, certain oak trees, etc.

INSTALLATION/APPLICATION CRITERIA

- Clearly mark, flag or fence vegetation or areas where vegetation should be preserved.
- Prepare landscaping plans which include as much existing vegetation as possible and state proper care of this vegetation both during and after construction.
- Define and protect with berms, fencing, signs, etc., a setback area from vegetation to be preserved. Setback area size should be based on the location, species, size, age and potential impact of adjacent construction activities or permanent improvements.
- Proposed landscaping plans which do not include plant species that compete with the existing vegetation.
- Do not locate construction traffic routes, spoil piles, etc., where significant adverse impact on existing vegetation may occur.

REQUIREMENTS

- Maintenance
  - Inspection and maintenance requirements for protection of vegetation are low.
  - During construction the limits of grading or disturbance should be clearly marked at all times.
  - Irrigation or maintenance of native trees or vegetation should conform to specifications on the Landscape Plan.
- Cost
  - There is little cost associated with preserving existing vegetation if properly planned during the project design, and may yield aesthetic benefits which enhance property values.

LIMITATIONS

- Requires forward planning by the owner/developer, contractor and design staff.
- For sites with diverse topography, it is often difficult and expensive to save existing trees while grading the site satisfactorily for the planned development.

Objectives

- Housekeeping Practices
- Contain Waste
- **Minimize Disturbed Areas**
- **Stabilize Disturbed Areas**
- **Protect Slopes/Channels**
- **Control Site Perimeter**
- Control Internal Erosion

Targeted Pollutants

- ● Sediment

R0072276

Additional Information — Preservation of Existing Vegetation

Methods for protecting existing vegetation and trees:

- Stake off root system limits (drip line of tree). Some counties limit construction within 5 feet of the tree drip line.
- Fence off the area to be preserved or along the tree drip line.
- Flag or mark trees to remain in place.
- Tree wells and retaining walls (permanent) help preserve existing vegetation, but must be large enough to protect the root system (see below).
- For the California Oak tree, no trenching or irrigation should be allowed within the driplines of the tree, since both these activities are detrimental to the preservation of the tree.
- Where grading under trees is necessary, excavation and fill should be limited to 1 foot within the driplines.

SUPPLEMENTAL INFORMATION, JUNE 1998

Limit and phase clearing. By clearing only those areas immediately essential for completing site construction, buffer zones are preserved and soil remains undisturbed until construction begins in a particular area. Additionally, the proposed limits of land disturbance should be physically marked off to ensure that no more than the required land area is cleared.

ESC2

BMP: SEEDING AND PLANTING

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- **Stabilize Disturbed Areas** ●
- **Protect Slopes/Channels** ●
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

Seeding of grasses and plantings of trees, shrubs, vines and ground covers provide long-term stabilization of soil. In some areas, with suitable climates, grasses can be planted for temporary stabilization.

SUITABLE APPLICATIONS

- Appropriate for site stabilization both during construction and post-construction.
- Any graded/cleared areas where construction activities have ceased.
- Open space cut and fill areas.
- Steep slopes.
- Spoil piles.
- Vegetated swales.
- Landscape corridors.
- Stream banks.

INSTALLATION/APPLICATION CRITERIA

Type of vegetation, site and seedbed preparation, planting time, fertilization and water requirements should be considered for each application.

Grasses:

- Ground preparation: fertilize and mechanically stabilize the soil.
- Tolerant of short-term temperature extremes and waterlogged soil conditions.
- Appropriate soil conditions: shallow soil base, good drainage, slope 2:1 or flatter.
- Develop well and quickly from seeds.
- Mowing, irrigating, and fertilizing are vital for promoting vigorous grass growth.

Trees and Shrubs:

- Selection Criteria: vigor, species, size, shape & wildlife food source.
- Soil conditions: select species appropriate for soil,drainage & acidity.
- Other Factors: wind/exposure, temperature extremes, and irrigation needs.

Vines and Ground Covers:

- Ground preparation: lime and fertilizer preparation.
- Use proper seeding rates.
- Appropriate soil conditions: drainage, acidity, slopes.
- Generally avoid species requiring irrigation.

Best Management Practices

16-51

R0072278

Additional Information — Seeding and Planting

Permanent seeding of grasses, sodding, and planting of trees, shrubs, vines and ground covers can provide long-term stabilization of soil. Permanent seeding and planting contributes to long-term site aesthetics and helps reduce erosion by reducing the velocity of runoff, allowing infiltration to occur, filtering sediments, and by holding soil particles in place.

Seeding and planting should be applied as soon as final grading is done to all graded and cleared areas of the construction site where plant cover is ultimately desired. For example, vegetation may be established along landscaped corridors and buffer zones where they may act as filter strips (see TC6 in Chapter 5 of the Municipal Handbook). Additionally, vegetated swales, steep and/or rocky slopes and stream banks can also serve as appropriate areas for seeding and plantings.

Installation/Application Criteria

Application of appropriate vegetation must consider: the seedbed or plantbed, proper seasonal planting times, water requirements fertilizer requirements and availability of the selected vegetation within the project's region. Permanent plantings during the construction stage of projects require careful coordination between the local agency inspectors, project managers, construction managers, and landscape contractor. Protocols for coordination and implementation procedures regarding site access, construction staging, and short- and long-term planting areas should be developed prior to the construction bid process. Where possible, these protocols should be established by and remain the responsibility of the site owner.

Because of the many available types of plants and ground covers and because site conditions and land use vary so widely within California, a set of general guidelines is included for installation/application of grasses, trees and shrubs, vines and ground covers. However, your local municipality, Soil Conservation Service, agricultural extention, or other resources should be consulted on appropriate species, planting requirements, and maintenance needs for your climate and soils.

Grasses

Grasses, depending on the type, provide short-term soil stabilization during construction or can serve as long- term/ permanent soil stabilization for disturbed areas. In general, grasses provide low maintenance to areas that have been cleared, graded and mechanically stabilized.

Selection:

The selection of the grass type is determined by the climate, irrigation, mowing frequency, maintenance effort and soil-bed conditions. Although grasses provide quick germination and rapid growth, they also have a shallow root system and are not as effective in stabilizing deep soils, where trees, shrubs and deep rooted ground covers may be more appropriate. Several grasses are adaptable to the various California climates. The figure at the end of these fact sheets shows appropriate grasses for regions within California. Blue grass is well adapted throughout California except for in the valley regions. The blue grass is found on dry, sandy soils that have good drainage. Bermuda grass, on the other hand is well adapted in the valley region where soils are dry, coarse and heavier. Specific seed mix and/or varieties for each site should be provided by an approved/qualified plant materials specialist.

R0072279

ESC10

Additional Information — Seeding and Planting

Caution should be exercised in the non-native vegetation because of impacts to native vegetation on adjacent lands. For example, species that may be planted at the construction site can quickly spread and compete with originally undisturbed vegetation such as the California Poppy and California buckwheat, both of which complete poorly with introduced grasses (e.g., planting wild oats is illegal in California). In addition to stabilizing disturbed soil, vines and ground covers can perform the following functions:

1. Provide attractive cover that does not need mowing.
2. Help to define traffic areas and control pedestrian movement.

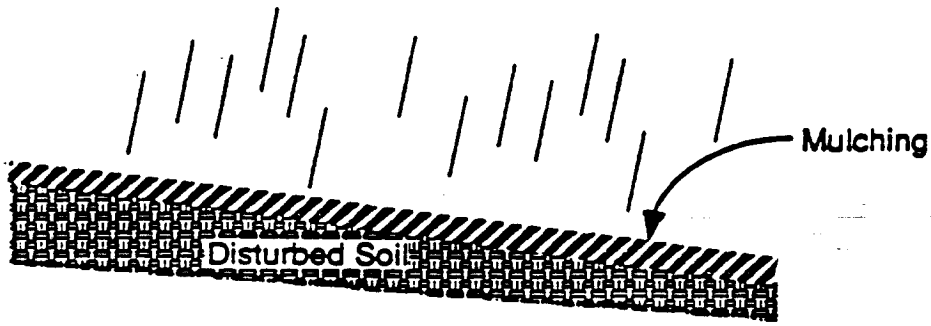
Site Preparation:
Ground covers are plants that naturally grow very close together, causing severe competition for space nutrients and water. Soil for ground covers should be well prepared. The entire area should be spaded, disced, or rototilled to a depth of six to eight inches. Two to three inches of organic material, such as good topsoil or peat, should be spread over the entire area.

Planting:
The following steps will help ensure good plant growth.

1. Make the plantings following the contours of the land.
2. Dig the holes 1/3 larger than the plant root ball.
3. Know what depth to place the plants.
4. Use good topsoil or soil mixture with a lot of organic matter.
5. Fill hole 1/3 to 1/2 full, shake plants to settle soil among roots, then water.
6. Leave saucer-shaped depression around the plant to hold water.
7. Water thoroughly and regularly.
8. Space plants according to the type of plant and the extent of covering desired.

Materials:
There are many different species of vines and ground covers from which to choose, but care must be taken in their selection. It is essential to select planting materials suited to both the intended use and specific site characteristics. The plants discussed in this handbook are those which are known to be adapted to California, and commonly available from commercial nurseries. Additional information can be obtained from local nurserymen, landscape architects, and extension agents. An approved low water use plant list may be obtained from the State Department of Water Resources or the Soils Conservation Service.

Requirements
Maintenance



General requirements include:

- Grass maintenance should be minimal to none. Irrigation and regular fertilizing may be required for some types of grasses. Mowing is only required in areas where aesthetics or fire hazards are a concern.
- Young trees should receive an inch of water each week for the first two years after planting. The tree should be watered deeply, but not more often than once per week.
- Transplanted trees should be fertilized on an annual basis.
- Proper pruning, watering, and application of fertilizer is necessary to maintain healthy and vigorous shrubs. A heavy layer of mulch applied around the shrubs reduces weeds and retains moisture.
- Trim old growth as needed to improve the appearance of ground covers. Most covers need once-a-year trimming to promote growth.

ESC10

BMP: MULCHING

GENERAL DESCRIPTION

Mulching is used to temporarily and permanently stabilize cleared or freshly seeded areas. Types of mulches include organic materials, straw, wood chips, bark or other wood fibers, decomposed granite, and gravel.

SUITABLE APPLICATIONS

- Temporary stabilization of freshly seeded and planted areas.
- Temporary stabilization during periods unsuitable for growing vegetation.
- Temporary stabilization of areas that cannot be seeded or planted (e.g., insufficient rain, steep slope).
- Mulches such as gravel and decomposed soils may be used as post-construction BMPs, particularly in arid regions.

INSTALLATION/APPLICATION CRITERIA

Mulch prevents erosion by protecting the soil surface and fostering growth of new seedings that do not stabilize by themselves.

- May be used with netting to supplement soil stabilization.
- Apply to planting areas where slopes are 2:1 or greater.
- Binders may be required for steep areas, or if wind and runoff is a problem.
- Type of mulch, binders, and application rates should be recommended by manufacturer/contractor.

REQUIREMENTS

- Maintenance
  - Must be inspected weekly and after rain for damage or deterioration.
- Cost: Average annual cost for installation and maintenance (3–4 month useful life, source: EPA, 1992)
  - Straw Mulch: $7,500 per acre.
  - Wood Fiber Mulch: $3,500 per acre.
  - Jute Netting: $12,500 per acre.

LIMITATIONS

- Wood fiber mulches should be used only in areas with over 20 inches annual precipitation.
- Organic mulches are not permanent erosion control measures.
- Mulches tend to lower the soil surface temperature, and may delay germination of some seeds.
- Permanent mulches for arid regions should include gravel and decomposed soils.

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- **Stabilize Disturbed Areas**
- **Protect Slopes/Channels**
- Control Site Perimeter
- Control Internal Erosion

ESC11

Best Management Practices

Additional Information — Mulching

Preparations/Methods and Equipment

Straw Mulch: Should be applied in an even, uniform manner, either by hand or by mulch blowing equipment. Straw mulches must be anchored to prevent the mulch from being blown or washed off the site. Anchoring is achieved in two ways:

- Crimping: The mulch is anchored by running a heavy disc with flat, dull, serrated, closely-spaced blades over the mulched soil. Effective crimping embeds the mulch about 2 inches into the soil without completely covering it. The disc should be run once or twice across the soil. About 2 1/2 tons of straw mulch per acre should be applied if the mulch is anchored by crimping.
- Tacking: Achieved using a emulsified asphalt or binder either independently or followed by crimping. If tacked, straw mulch may be applied at a rate of 1 3/4 ton per acre, and tacked with emulsified asphalt at a rate of 500 gallons per acre.

Wood Fiber Mulch: Typically applied with a hydroseeder at a rate of about 1000 to 1500 pounds per acre, or as a slurry consisting of at least 150 pounds of binder, 400 pounds of wood fiber mulch, and 200 gallons of water per acre.

Requirements

Maintenance: Mulched areas require frequent inspection for damage and deterioration. Requirements will vary greatly based on the type of mulch used and the type of vegetation to be established. Vegetative mulches are usually not intended to be permanent; but are extended only as a base for re-seeding or re-vegetation. Where a permanent anchor for vegetation is required, along steep slopes or areas of higher velocity flows, then a geotextile mat or net is recommended (see ESC20).

BMP: GEOTEXTILES AND MATS

Objectives

- *Housekeeping Practices*
- *Contain Waste*
- *Minimize Disturbed Areas*
- *Stabilize Disturbed Areas* (●)
- *Protect Slopes/Channels* (●)
- *Control Site Perimeter*
- *Control Internal Erosion*

GENERAL DESCRIPTION

Mattings made of natural or synthetic material which are used to temporarily or permanently stabilize soil.

SUITABLE APPLICATIONS

Typically suited for post-construction site stabilization, but may be used for temporary stabilization of highly erosive soils.

- Channels and streams.
- Steep slopes.

INSTALLATION/APPLICATION CRITERIA

Mattings may be applied to disturbed soils and where existing vegetation has been removed. The following organic matting materials provide temporary protection until permanent vegetation is established, or when seasonal circumstances dictate the need for temporary stabilization until weather or construction delays are resolved.

- Jute mattings.
- Straw mattings.

The following synthetic mattings may be used for either temporary or post-construction stabilization, both with and without vegetation

- Excelsior matting.
- Glass fiber matting.
- Staples.
- Mulch nettings.

REQUIREMENTS

- Maintenance
  - Inspect monthly and after significant rainfall.
  - Re-anchor loosened matting and replace missing matting and staples as required.
- Cost
  - Relatively high compared to other BMPs.

LIMITATIONS

- Mattings are more costly than other BMP practices, limiting their use to areas where other BMPs are ineffective (e.g., channels, steep slopes).
- May delay seed germination, due to reduction in soil temperature.
- Installation requires experienced contractor to ensure soil stabilization and erosion protection.

Additional Information — Geotextiles and Mats

Site Preparation: After the site has been shaped and graded to the approved design, prepare a friable seed bed relatively free from clods and rocks more than 1 inches in diameter and any foreign material that will prevent contact of the protective mat with the soil surface.

Planting: Fertilize and seed in accordance with seeding specifications or other types of landscaping plans. When using jute matting on a seeded area, apply approximately half the seed before laying the mat and the remainder after laying the mat. The protective matting can be laid over areas where grass has been planted and the seedlings have emerged. Where vines or other ground covers are to be planted, lay the protective matting first and then plant through matting according to design of planting.

Erosion Stops: Erosion stops are made of glass fiber strips, excelsior matting strips or tight-folded jute matting blanket or strips for use on steep, highly erodible watercourses. The stops are placed in narrow trenches six to twelve inches deep across the channel and left flush with the soil surface. They are to cover the full cross section of designed flow.

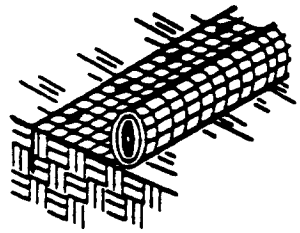
Laying and Securing Matting: Before laying the matting, all erosion stops should be installed and the friable seed bed made free from clods, rocks, and roots. The surface upon which the separation fabric will be placed should be compacted and finished according to the requirements of the manufacturer's recommendations.

Most matting comes with the manufacturer's recommendations for installation. Most channels will require multiple widths of matting, and the matting should be unrolled starting at the upper end of the channel, allowing a four inch overlap of mattings along the center of the channel. To secure, bury the top ends of the matting in a narrow trench, a minimum of six inches deep. Backfill trench and tamp firmly to conform to channel cross section. Secure with a row of staples about four inches down slope from the trench with staples twelve inches apart.

Where matting crosses erosion stops, reinforce with a double row of staples at six inch spacing, using a staggered pattern on either side of the erosion stop. When the matting is overlapped, the discharge end of the matting liner should be similarly secured with a double row of staples.

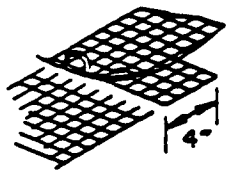
Mechanical or manual laydown equipment should be capable of handling full rolls of fabric, and laying the fabric smoothly, without wrinkles or folds. The equipment should meet the fabric manufacturer's recommendations or equivalent standards.

Final Check: Check the following after the mating is installed:



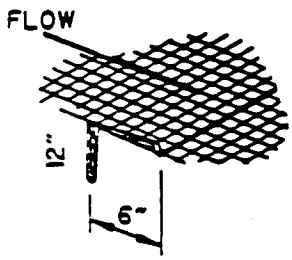
- Make sure matting is uniformly in contact with the soil.
- All lap joints are secure.
- All staples are flush with the ground.
- All disturbed areas seeded.

Limitations

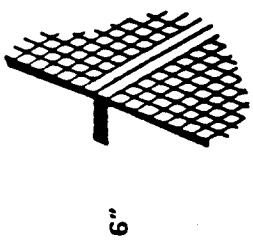


Properly installed mattings provide excellent erosion control but do so at relatively high cost. This high cost typically limits the use of mattings to areas of concentrated channel flow and steep slopes.

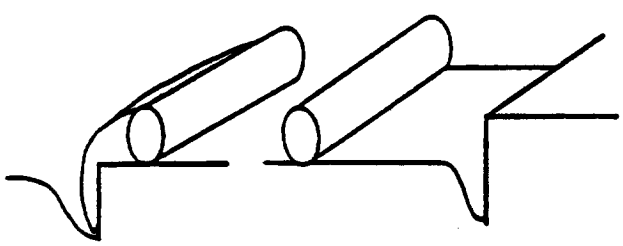
Installation is critical and requires experienced contractors. The contractor should install the matting material in such a manner that continuous contact between the material and the soil occurs, otherwise the material will not stabilize the soil and erosion will occur beneath the material. Ultraviolet protection may be required on some geotextiles. Matting strengths and uses vary; the manufacturer's specifications should be followed.



ESC20



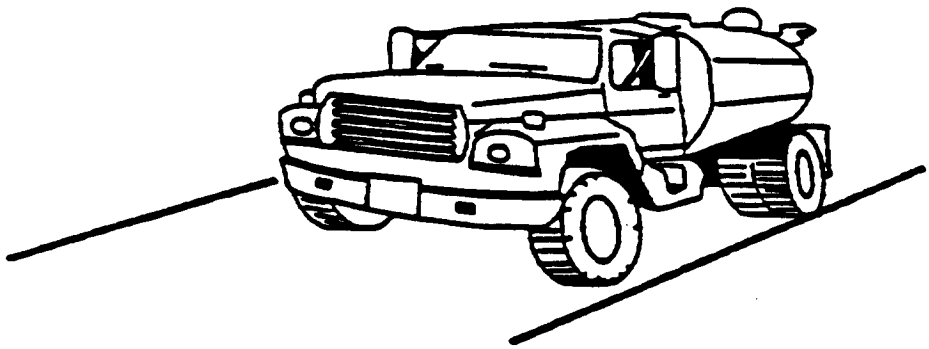
ANCHOR SLOT: BURY THE UP-CHANNEL END OF THE NET IN A 12" DEEP TRENCH. TAMP THE SOIL FIRMLY. STAPLE AT 12" INTERVALS ACROSS THE NET.



OVERLAP: OVERLAP EDGES OF THE STRIPS AT LEAST 4". STAPLE EVERY 12" DOWN THE CENTER OF THE STRIP.

JOINING STRIPS: INSERT THE NEW ROLL OR NET IN A TRENCH, AS WITH THE ANCHOR SLOT. OVERLAP THE UP-CHANNEL END OF THE PREVIOUS ROLL 18" AND TURN THE END OF THE PREVIOUS ROLL JUST BELOW THE ANCHOR SLOT, LEAVING 6" OVERLAP.

CHECK SLOTS: ON ERODIBLE SOILS OR STEEP SLOPES, CHECK SLOTS SHOULD BE MADE EVERY 15 FEET. INSERT A FOLD OF THE NET INTO A 6" TRENCH AND TRAMP FIRMLY. STAPLE AT 12" INTERVALS ACROSS THE NET. LAY THE NET SMOOTHLY ON THE SURFACE OF THE SOIL - DO NOT STRETCH THE NET, AND DO NOT ALLOW WRINKLES.



ANCHORING ENDS AT STRUCTURES:
PLACE THE END OF THE NET IN A 12" SLOT ON THE UP-CHANNEL SIDE OF THE STRUCTURE.
FILL THE TRENCH AND TAMP FIRMLY.
ROLL THE NET UP THE CHANNEL.
PLACE STAPLES AT 12" INTERVALS ALONG THE ANCHOR END OF THE NET.

INSTALLATION OF NETTING AND MATTING

ESC20

BMP: DUST CONTROLS

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

Dust control measures are used to stabilize soil from wind erosion, and reduce dust generated by construction activities.

SUITABLE APPLICATIONS

- Clearing and grading activities.
- Construction vehicle traffic on unpaved roads.
- Drilling and blasting activities.
- Sediment tracking onto paved roads.
- Soil and debris storage piles.
- Batch drop from front end loaders.
- Areas with unstabilized soil.
- Final grading/site stabilization usually is sufficient to control post-construction dust sources.

INSTALLATION/APPLICATION CRITERIA

- Schedule construction activities to minimize exposed area (See ESC 1).
- Quickly stabilize exposed soils using vegetation, mulching, spray-on adhesives, calcium chloride, sprinkling, and stone/gravel layering (See ESC 10 and 11).
- Identify and stabilize key access points prior to commencement of construction (See ESC 24).
- Minimizing the impact of dust by anticipating the direction of prevailing winds.
- Direct most construction traffic to stabilized roadways within the project site (See ESC 23).

REQUIREMENTS

- Maintenance
  - Most dust control measures require frequent, often daily, attention.
- Cost
  - Installation costs for water/chemical dust suppression are low, but annual costs may be quite high since these measures are effective for only a few hours to a few days.

LIMITATIONS

- Watering prevents dust only for a short period and should be applied daily (or more often) to be effective.
- Overwatering may cause erosion.
- Oil should not be used for dust control because the oil may migrate into drainageway and/or seep into the soil.
- Certain chemically-treated subgrades may make soil water repellant, increasing runoff.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ◒ Toxic Materials
- ◒ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements

- ○ Capital Costs
- ◒ O&M Costs
- ◒ Maintenance
- ○ Training
- ○ Suitability for Slopes >5%

R0072286

● High ○ Low

ESC21

Best Management Practices

Additional Information — Dust Controls

In addition, there are many other BMPs identified in this handbook that provide dust control including:

- Seeding and Plantings (ESC 10)
- Mulching (ESC 11)
- Construction Road Stabilization (ESC 23)
- Stabilized Construction Entrances (ESC 24)

Limitations

- Oil treated subgrades should not be used because the oil may migrate into drainageways and/or seep into the soil.
- Chemically treated subgrades may make the soil water repellant, interfering with long-term infiltration, and the vegetation/re-vegetation of the site. Some chemical dust suppressants may be subject to freezing and may contain solvents and should be handled properly.
- Asphalt, as a mulch tack or chemical mulch, requires a 24 hour curing time to avoid adherence to equipment, worker shoes, etc. Application should be limited because asphalt surfacing may eventually migrate into the drainage system.
- In compacted areas, watering and other liquid dust control measures may wash sediment or other constituents into the drainage system.

Dear Xavier:

Thank you for sending the list of recommended Best Management Practices (BMPs) for the Storm Water Program. Attached is the Restaurant Standard Urban Storm Water Mitigation Plan and our comments referencing those BMPs only. I will attend the April 22 hearing for considering these BMPs, and I will provide oral testimony as well.

If you or the Board wish to call me regarding these written comments, you can reach me at 714-778-7150. Thank you for the opportunity to provide the quick service restaurant point of view on this important issue.

Sincerely,

Michael Kissel

CKE Restaurants, Inc. Comments
for
RESTAURANT
STANDARD URBAN STORM WATER MITIGATION PLAN

1. PROPERLY DESIGN EQUIPMENT/ACCESSORY WASH AREAS

The installation of a self-contained structure with pretreatment equipment for a sanitary sewer discharge in most free-standing quick service restaurants (QSRs) would have to be incorporated into the outdoor trash enclosure. According to the proposed plan, this would require a roof structure. Since such a structure would significantly increase the cost of new restaurants, it is recommended that each site be given the opportunity for conditional waiver for a cover if that site can demonstrate effective Best Management Practices in keeping the area clean.

2. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Stenciling of storm drain inlets, channels, creeks and catch basins are a responsibility of the municipality or county in unincorporated areas. These areas are outside the jurisdiction of most businesses.

3. PROPERLY DESIGN OUTDOOR MATERIAL STORAGE AREAS

These structures would, again, apply to QSRs with trash enclosures. Berms and dikes would interfere with the access to the trash containers. A sloped pavement in the enclosure would prevent materials from escaping the area. It is also recommended that a conditional waiver be given to these structures for coverings as well.

4. PROPERLY DESIGN TRASH STORAGE AREAS

See comments for BMPs 1 and 3.

5. CONSIDER ROOFTOP RUNOFF TREATMENT

Since exhaust system cleaning services are the primary contributors of rooftop runoff, they should be required to provide BMPs for mitigation of this problem. With the installation of catalytic converters required by the South Coast AQMD for chain-driven charbroilers, the accumulation of rooftop pollutants form cooking exhaust is no longer an issue.

6. CONTROL PARKING LOT RUNOFF

It is recommended that products claiming to mitigate this runoff be researched and presented to industry. We have not seen a product that can properly filter the volume of water involved in this operation. Infiltration trenches, parking grooves, vegetated swales and landscape islands do not remove the materials from waster steam or they deposit them into the soil impacting the groundwater.

7. PROVIDE PROOF OF ONGOING BMP MAINTENANCE

Any documentation of any kind of BMP maintenance should be kept to a minimum. Extensive documentation would be burdensome to QSRs.

RESTAURANT

STANDARD URBAN STORM WATER MITIGATION PLAN

DEFINITION

A restaurant is a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption. (SIC code 5812)

GOALS

- Prevent potential pollutants from entering the storm drain system and ultimately impacting receiving waters.
- Reduce amount of runoff.
- Eliminate non-stormwater discharges to the storm drains.

REQUIREMENTS

Developers and/or owners will be required to incorporate Best Management Practices (BMPs) 1 through 7 into project plans and designs. Where the developer and/or owner believes that a BMP is not appropriate or applicable to a specific project, the developer will be required to provide an explanation.

1. PROPERLY DESIGN EQUIPMENT/ACCESSORY WASH AREAS

Equipment/accessory washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the stormwater conveyance system. To alleviate this problem, include in the project plans an area for the washing/steam cleaning of equipment and accessories. This area must meet the following:

- This area must be self-contained, equipped with a clarifier, or other pretreatment facility, and properly connected to a sanitary sewer.
- If this wash area is to be located outdoors, it must be covered, paved and have secondary containment.

2. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Storm drain stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets. The stencil contains a brief statement that prohibits the dumping of improper materials into the stormwater conveyance system. Graphical icons, either illustrating

5. CONSIDER ROOFTOP RUNOFF TREATMENT

Rooftop runoff has the potential to transport toxic compounds, oil and grease, bacteria, and suspended solids. Consideration should be given to implementing the following techniques for treating runoff from individual building rooftops and allowing it to infiltrate into the soil (See Table 1: Suggested Resources for additional sources of information):

- Dry-wells
- Cisterns
- Foundation planting
- Permeable areas near buildings

6. CONTROL PARKING LOT RUNOFF

Parking lots have the potential to contribute oil and grease, trash, heavy metals, and suspended solids to the stormwater conveyance system. Consideration should be given to implementing the following structural BMPs to both reduce the impervious land coverage of parking areas and to filter runoff before it reaches the storm drain system (See Table 1: Suggested Resources for additional sources of information):

- Vegetated swales and landscape islands
- Infiltration trenches
- Oil/Water separators and water quality inlets
- Media filtration
- Bioretention facility
- Hybrid lots
- Parking groves
- Permeable overflow parking

TABLE ESC 21.2 COMMONLY USED CHEMICALS FOR DUST CONTROL

	SALTS	ORGANIC, NON PETROLEUM-BASED	PETROLEUM BASED PRODUCTS[1]
CHEMICAL TYPES	• Calcium Chloride[2] • Magnesium Chloride • Natural Brines	• Calcium Lignosulfonate • Sodium Lignosulfonate • Ammonium Lignosulfonate	• Bunker Oil • Asphalt Primer • Emulsified Asphalt
LIMITATIONS	Can lose effectiveness in dry periods with low humidity. Leaches from road in heavy rain Not recommended for gravel road surfaces with low fines. Recommended 10-20% fines.	Not affected by dry weather and low humidity. Leached from road in heavy rain if not sufficiently cured. Best performance on gravel roads with high surface fines (10-30%) and dense compact surface with loose gravel.	Generally effective regardless of climatic conditions may pothole in wet weather. Best performance on gravel roads with 5-10% fines.
COMMENTS	Calcium Chloride is popular. May become slippery when wet on gravel surfaces with high fines.	Ineffective on gravel surfaces low in fines. May become slippery when wet on gravel surfaces with high fines content.	Creates a hardened crust.

[1] Motor oils and oil treatments are not recommended due to adverse effects on plant life and groundwater.

[2] Not recommended due to adverse effects on plant life.

R0072293

BMP: TEMPORARY STREAM CROSSING

GENERAL DESCRIPTION

A temporary access stream crossing is a temporary culvert, ford or bridge placed across a waterway to provide access for construction purposes for a period of less than one year. Temporary access crossings are not intended to be used to maintain traffic for the general public.

SUITABLE APPLICATIONS

Temporary stream crossings should be installed at all designated crossings of perennial and intermittent streams on the construction site, as well as for dry channels which may be significantly eroded by construction traffic.

INSTALLATION/APPLICATION CRITERIA

Requires knowledge of stream flows and soil strength and should be designed under the direction of a California registered engineer with knowledge of both hydraulics and construction loading requirements for structures.

REQUIREMENTS

- Maintenance
  - Inspect weekly and after each significant rainfall, including assessment of foundations.
  - Periodically remove silt from crossings.
  - Replace lost aggregate from inlets and outlets of culverts.
- Cost
  - CalTrans Construction Cost Index for temporary bridge crossing is $45-$95 per square feet.

LIMITATIONS

- May be an expensive for a temporary improvement.
- Requires other BMPs to minimize soil disturbance during installation and removal.
- Fords should only be used in dry weather.

R0072294

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ○ Toxic Materials
- ◒ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

Implementation Requirements

- ○ Suitability for Slopes >5%

● High ○ Low

ESC22

Best Management Practices

Additional Information — Temporary Stream Crossing

- May be expensive temporary cost
- Increased soil disturbance upon installation and removal
- Temporary culverts need regular maintenance and can cause erosion if the culvert becomes clogged.
- A temporary ford offers little if any erosion control in flowing streams and can often make erosion worse. Fords should only be used in the dry season on dry streams.

Construction in waterways is subject to additional permit requirements. Contact the local municipal storm water agency for additional information.

BMP: CONSTRUCTION ROAD STABILIZATION

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

Access roads, subdivision roads, parking areas, and other on-site vehicle transportation routes should be stabilized immediately after grading and frequently maintained to prevent erosion and control dust.

SUITABLE APPLICATIONS

- Temporary construction traffic.
- Phased construction projects and off-site road access.
- Detour roads.
- Construction during wet weather.

INSTALLATION/APPLICATION CRITERIA

- Road should follow topographic contours to reduce erosion of the roadway.
- The roadway slope should not exceed 15 percent.
- Gravel roads should be a minimum 4-inch thick, 2-3 inch coarse aggregate base applied immediately after grading, or as recommended by soils engineer.
- Chemical stabilizers or water are usually required on gravel or dirt roads to prevent dust (see Dust Control ESC 21).

REQUIREMENTS

- Maintenance
  - Periodically apply additional aggregate on gravel roads.
  - Active dirt construction roads are commonly watered three or more times per day during the dry season.
  - Inspect weekly, and after each rain.
  - Repair any eroded areas immediately.
- Cost
  - Gravel construction roads are moderately expensive, but cost is often balanced by reductions in construction delay.
  - No additional costs for dust control on construction roads should be required above that needed to meet local air quality requirements.

LIMITATIONS

- The roadway must be removed or paved when construction is complete.
- Certain chemical stabilization methods may cause storm water or soil pollution and should not be used (see Dust Control ESC 21).
- Management of construction traffic is subject to air quality control measures. Contact the local air quality management agency.

Targeted Pollutants

BMP: STABILIZED CONSTRUCTION ENTRANCE

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

The construction entrance practice is a stabilized pad of aggregate underlain with filter cloth located at any point where traffic will be entering or leaving a construction site to or from a public right-of-way, street, alley, sidewalk or parking area. Stabalizing the construction entrance significantly reduces the amount of sediment (dust, mud) tracked off-site, especially if a washrack incorporated for removing caked on sediment.

SUITABLE APPLICATIONS

- All points of construction ingress and egress.
- Unpaved areas where sediment tracking occurs from site onto paved roads.

INSTALLATION/APPLICATION CRITERIA

- Construct on level ground where possible.
- Stones should be 1-3 inches.
- Minimum depth of stones should be 6 inches or as recommended by soils engineer.
- Length should be 50-foot minimum, and 30-foot minimum width.
- Provide ample turning radii as part of entrance.

REQUIREMENTS

- Maintenance
  - Inspect monthly and after each rainfall.
  - Replace gravel material when surface voids are visible.
  - Remove all sediment deposited on paved roadways within 24 hours.
  - Remove gravel and filter fabric at completion of construction
- Cost: Average annual cost for installation and maintenance (Source: EPA, 1992)
  - Without Wash Rack: $1500 each.
  - With Wash Rack: $2200 each.

LIMITATIONS

- Requires periodic top dressing with additional stones.
- Should be used in conjunction with street sweeping on adjacent public right-of-way.

Targeted Pollutants

- ◒ Sediment
- ◒ Nutrients
- ◒ Toxic Materials
- ◒ Oil & Grease

BMP: EARTH DIKE

Objectives

- Housekeeping Practices
- **Contain Waste**
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- **Protect Slopes/Channels**
- **Control Site Perimeter**
- **Control Internal Erosion**

GENERAL DESCRIPTION

The temporary earth dike is a temporary berm or ridge of compacted soil, used to divert runoff or channel water to a desired location.

SUITABLE APPLICATIONS

Earth dikes are typically used to divert concentrated runoff through disturbed areas into another BMP (e.g., sediment basins), to divert runoff away from disturbed or unstable slopes, to divert runoff from off-site and undisturbed areas around disturbed areas, and as a containment for construction materials and wastes. The dikes should remain in place until the disturbed areas are permanently stabilized. The dikes must be on-site and must safely convey anticipated flood flows.

INSTALLATION/APPLICATION CRITERIA

- All dikes should be compacted by earth-moving equipment.
- All dikes should have positive drainage to a stabilized outlet.
- Top width may be wider and side slopes may be flatter at crossings for construction traffic.
- Dikes should direct sediment-laden runoff into a sediment trapping device.
- Dikes should be stabilized with vegetation, chemicals, or physical devices.

REQUIREMENTS

- Maintenance
  - Inspect periodically and after every significant rainfall; repair as necessary.
- Cost
  - Cost ranges from $15 to $55 per foot for both earthwork and stabilization and depends on availability of material, site location, and access.

LIMITATIONS

Dikes should not be used for drainage areas greater than 10 acres, or along slopes greater than 10 percent. For larger areas more permanent drainage structures should be built. All drainage structures should be built in compliance with local municipal requirements.

- Earth dikes may create more disturbed area on site and become barriers to construction equipment.
- Earth dikes must be stabilized immediately, which adds cost and maintenance concerns.
- Diverted storm water may cause downstream flood damage.
- Dikes should not be constructed of soils which may be easily eroded.
- Regrading the site to remove the dike may add additional cost.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ◒ Toxic Materials
- ◒ Oil & Grease
- ○ Floatable Materials
- ◒ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

BMP: TEMPORARY DRAINS AND SWALES

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- **Protect Slopes/Channels**
- **Control Site Perimeter**
- **Control Internal Erosion**

GENERAL DESCRIPTION

Temporary drains and swales are used to divert off-site runoff around the construction site, divert runoff from stabilized areas around disturbed areas, and direct runoff into sediment basins or traps.

SUITABLE APPLICATIONS

Temporary drains and swales are appropriate for diverting any upslope runoff around unstabilized or disturbed areas of the construction site:

- Prevent slope failures.
- Prevent damage to adjacent property.
- Prevents erosion and transport of sediments into water ways.
- Increases the potential for infiltration.
- Diverts sediment-laden runoff into sediment basins or traps.

INSTALLATION/APPLICATION CRITERIA

Temporary drainage swales will effectively convey runoff and avoid erosion if built properly:

- Size temporary drainage swales using local drainage design criteria.
- A permanent drainage channel must be designed by a professional engineer (see the local drainage design criteria for proper design).
- At a minimum, the drain/swale should conform to predevelopment drainage patterns and capacities.
- Construct the drain/swale with an uninterrupted, positive grade to a stabilized outlet.
- Provide erosion protection or energy dissipation measures if the flow out of the drain or swale can reach an erosive velocity.

REQUIREMENTS

- Maintenance
  - Inspect weekly and after each rain.
  - Repair any erosion immediately.
  - Remove sediment which builds up in the swale and restricts its flow capacity.
- Cost
  - The cost of a drainage swale increases with drainage area and slope. Typical. swales for controlling internal erosion are inexpensive.

LIMITATIONS

- Temporary drains and swales or any other diversion of runoff should not adversely impact upstream or downstream properties.
- Temporary drains and swales must conform to local floodplain management requirements.

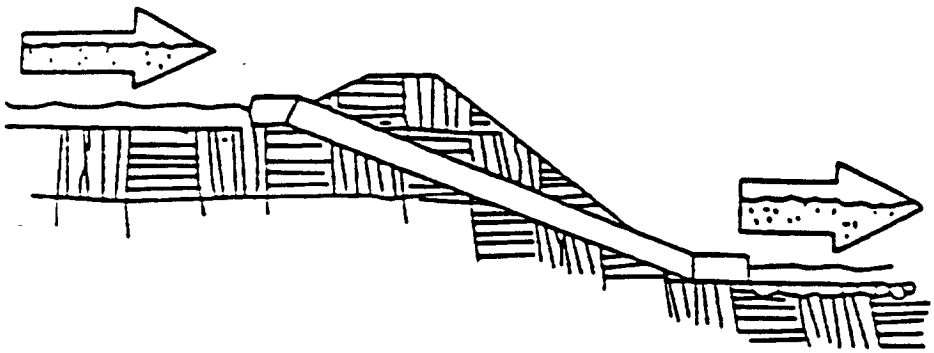
CROSS SECTION



PLAN

TEMPORARY DRAINAGE SWALE

ESC31

R0072303

BMP: SLOPE DRAIN

GENERAL DESCRIPTION

A temporary pipe or lined channel to drain the top of a slope to a stable discharge point at the bottom of a slope without causing erosion.

SUITABLE APPLICATIONS

- Where concentrated flow of surface runoff must be conveyed down a slope in order to prevent erosion.
- Drainage for top of slope diversion dikes or swales.
- Emergency spillway for a sediment basin.
- Drainage for top of cut/fill slopes where water can accumulate.

The types of slope drain can include:

- Pipe drops.
- Flexible downdrains.
- Sectional downdrains.
- Lined terrace drains.

INSTALLATION/APPLICATION CRITERIA

- Secure inlet and surround with dikes to prevent gully erosion, and anchor pipe to slope.
- Size to convey at least the peak of a 10-year, 24-hour storm (See local flood control agency for requirements).
- Stabilize outlet.

REQUIREMENTS

- Maintenance
  - Structure must be inspected regularly and after storms.
  - Inlet must be free of undercutting and no water should circumvent the entry.
  - Outlet should not produce erosion; velocity dissipators must be maintained.
  - Pipe anchors must be checked to ensure that the pipe remains anchored to the slope.
- Cost
  - CalTrans Cost Schedule gives regional cost ranges.

LIMITATIONS

- Maximum drainage area per slope drain is 5 acres. (For large areas use a paved chute, rock lined channel or additional pipes.)
- Clogged slope drains will force water around the pipe and cause slope erosion.
- Dissipation of high flow velocities at the pipe outlet is required to avoid downstream erosion.
- Failure can result in flooding and severe erosion.

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- **Protect Slopes/Channels**
- Control Site Perimeter
- Control Internal Erosion

Targeted Pollutants

- ○ Training
- ◒ Suitability for Slopes >5%

● High ○ Low

ESC32

Best Management Practices

16 - 88

Additional Information — Slope Drain

Design:
Unless specified by the local municipality, the capacity for temporary drains should be sufficient to handle the peak runoff from a 10-year, 24-hour rainfall event. The pipe size may be computed using the Rational Method or a method established by the local municipality. Higher flows must be safely stored or routed to prevent any offsite concentration of flow, and any erosion of the slope.

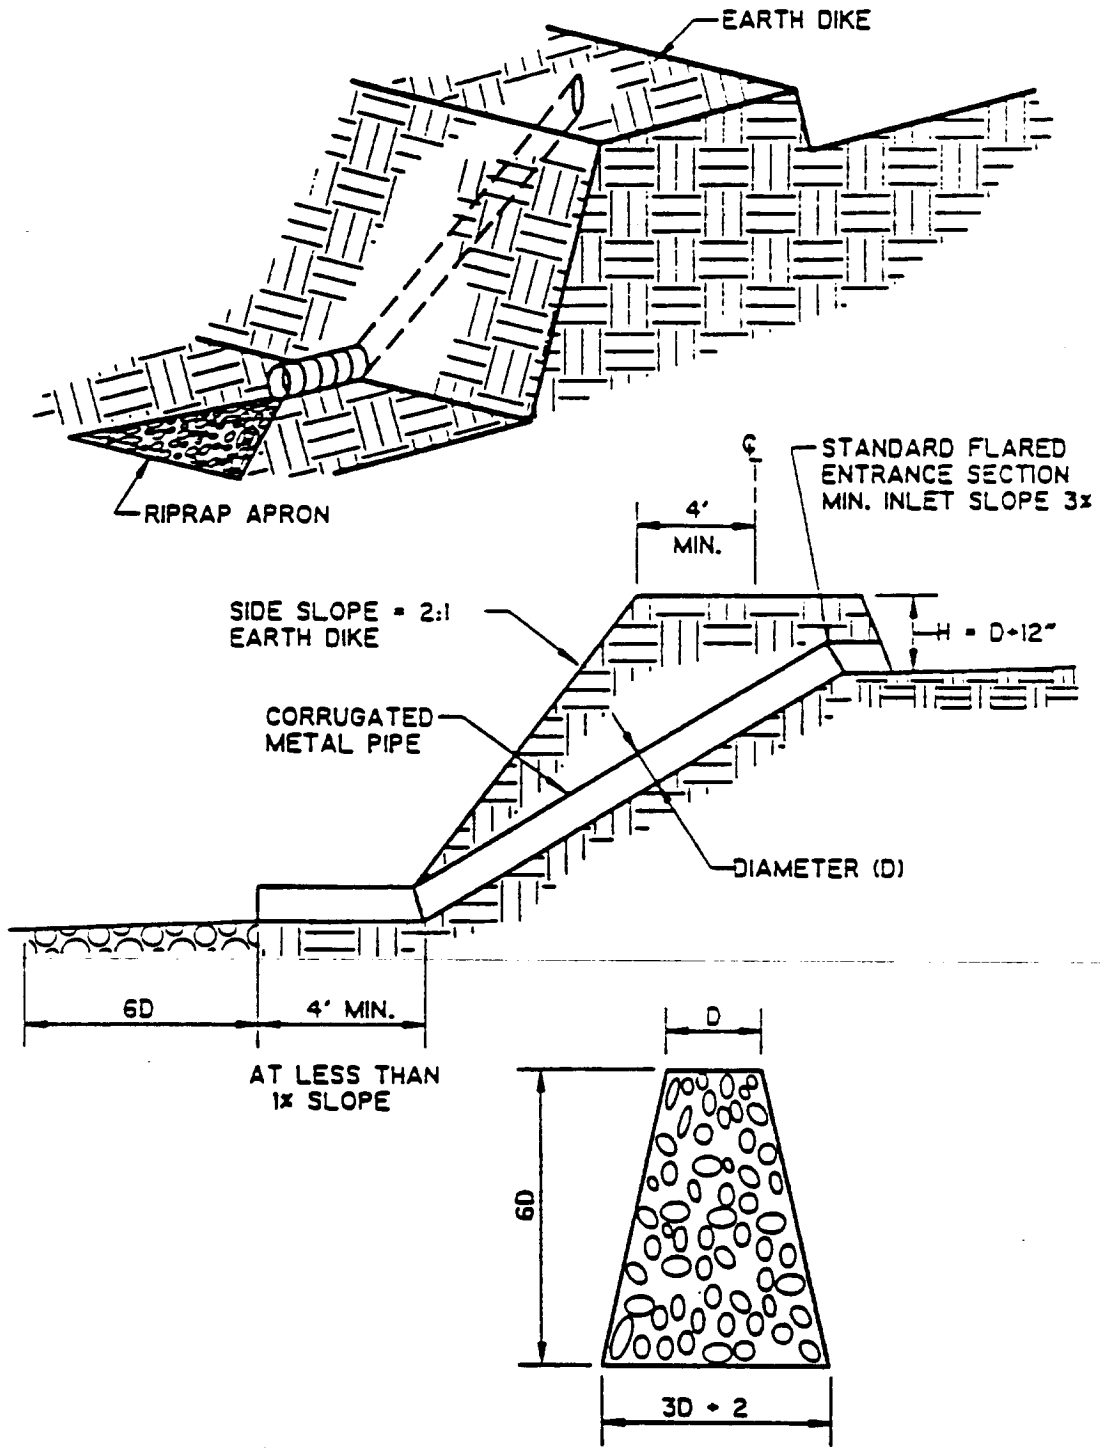
As a guide, temporary pipe slope drains should not be sized smaller than shown in the following table:

MINIMUM PIPE DIAMETER	MAXIMUM DRAINAGE AREA (ACRES)
12"	0.5
18"	1.5
21"	2.5
24"	3.5
30"	5.0

Permanent improvements must be designed and installed if the drainage area is greater than 5 acres.

The following additional design criteria should be considered:

- Construct the pipe slope drain entrance of a standard flared end section with a minimum 6-inch metal toe plate to prevent runoff from undercutting the pipe inlet. The slope of the entrance is usually at least 3 percent.
- Thoroughly compact the soil around and under the pipe and entrance section.
- Securely fasten the slope drain sections together, have gasketed watertight fittings, and securely anchored into the soil.
- Secure the flared inlet section to the slope drain and have watertight connecting bands.
- Use interceptor dikes to direct runoff into a slope drain. The height of the dike should be at least 1 foot higher at all points than the top of the inlet pipe.
- If the pipe slope drain is conveying sediment-laden water, direct all flows into a sediment trap (ESC55) or sediment basin (ESC56).
- Unless the pipe directly enters a sediment trap/basin, stabilize the area below the outlet with a riprap apron.



Limitations
Installation is critical for effective use of the pipe slope drain to minimize potential gully erosion. Maximum drainage area per pipe slope drain is 5 acres. For larger areas use a paved chute, rock lined channel or additional pipes. (See the local municipality for drainage requirements)

- During large storms, pipe slope drains may become clogged or overcharged, forcing water around the pipe and causing extreme slope erosion.
- Structures for dissipation of high flow velocities at the pipe outlet must be constructed to avoid downstream erosion.
- Failure of this type of temporary structure may result in flooding and severe erosion.
- If the sectional downdrain is not sized correctly, the runoff can spill over the drain sides causing gully erosion, and potential failure of the structure.

BMP: OUTLET PROTECTION

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- **Protect Slopes/Channels** (circled)
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

Rock outlet protection is a physical device composed of rock, grouted riprap, or concrete rubble which is placed at the outlet of a pipe to prevent scour of the soil caused by high pipe flow velocities, and to absorb flow energy to produce non-erosive velocities.

SUITABLE APPLICATIONS

- Wherever discharge velocities and energies at the outlets of culverts, conduits or channels are sufficient to erode the next downstream reach.
- Rock outlet protection is best suited for temporary use during construction because it is usually less expensive and easier to install than concrete aprons or energy dissipators.
- A sediment trap below the pipe outlet is recommended if runoff is sediment laden.
- Permanent rock riprap protection should be designed and sized by the engineer as part of the culvert, conduit or channel design.
- Grouted riprap should be avoided in areas of freeze and thaw because the grout will break up.

INSTALLATION/APPLICATION CRITERIA

Rock outlet protection is effective when the rock is sized and placed properly. When this is accomplished, rock outlets do much to limit erosion at pipe outlets. Rock size should be increased for high velocity flows. General recommendations for rock size and length of outlet protection mat are presented in the additional information sheet. Best results are obtained when sound, durable, angular rock is used. CalTrans Standard Specifications or the local municipality can provide additional specifications for constructing outlet protection devices.

REQUIREMENTS

- Maintenance
  - Inspect after each significant rain for erosion and/or disruption of the rock, and repair immediately.
  - Grouted or wire-tied rock riprap can minimize maintenance requirements.
- Cost
  - CalTrans Cost Schedule gives regional cost ranges.

LIMITATIONS

- Large storms often wash away the rock outlet protection and leave the area susceptible to erosion.
- Sediment captured by the rock outlet protection may be difficult to remove without removing the rock.
- Outlet protection may negatively impact the channel habitat.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ○ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials

BMP: CHECK DAMS

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- **Protect Slopes/Channels**
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

Small temporary dams constructed across a swale or drainage ditch. Check dams reduce the velocity of concentrated stormwater flows, thereby reducing erosion of the swale or ditch, and promoting sedimentation behind the dam. If properly anchored, brush or rock filter berms (ESC53) may be used for check dams.

SUITABLE APPLICATIONS

- Used to prevent erosion by reducing the velocity of channel flow in small intermittent channels and temporary swales.
- May also promote sedimentation behind the dam, but should not be considered to be a primary sediment trapping device because subsequent storms will scour and resuspend much of the trapped sediment.

INSTALLATION/APPLICATION CRITERIA

- Check dams should be placed at a distance and height to allow small pools to form between each one.
- Backwater from a downstream check dam should reach the toe of the upstream check dam.
- Major floods (2 year storm or larger) should safely flow over the check dam without an increase in upstream flooding or destruction of the checkdam.
- Primarily used in small, steep channels where velocities exceed 2 fps.
- Used in steep terrain where velocity reduction is required.
- A deep sump may be provided immediately upstream of the check dam to capture excessive sediment.
- Check dams may be built of rocks or logs, which are secured against damage during significant floods.

REQUIREMENTS

- Maintenance
  - Inspect for sediment buildup behind the check dam and signs of erosion around the check dam after each rain.
  - Remove accumulated sediment whenever it reaches one-half the sump depth.
- Cost
  - See CalTrans Cost Schedule for regional cost data.

LIMITATIONS

- Use only in small open channels which drain 10 acres of less.
- Not to be used in live streams.
- Do not install in lined or vegetated channels.

BMP: SLOPE ROUGHENING/TERRACING

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- **Stabilize Disturbed Areas**
- **Protect Slopes/Channels**
- Control Site Perimeter
- Control Internal Erosion

GENERAL DEFINITION

Slope roughening/terracing creates microclimates for establishing vegetation, reduces runoff velocity, increases infiltration, and provides small depressions for trapping sediment.

SUITABLE APPLICATIONS

- Any cleared area prior to seeding and planting.
- Required for cleared, erodible slopes steeper than 3:1 and higher than 5 feet prior to seeding and planting.

INSTALLATION/APPLICATION CRITERIA

Slope roughening/terracing is performed in several ways:

- Stair-step grading.
- Grooving.
- Furrowing.
- Tracking.
- Rough grading.
- No grading.

REQUIREMENTS

- Maintenance
  - Inspect roughened slopes weekly and after rainfall for excessive erosion.
  - Revegetate as quickly as possible.
- Cost (source: EPA, 1992)
  - Surface Roughening: Performed at no (e.g., rough grading) to low (e.g., tracking) cost.
  - Terracing: Average annual cost is $4 per linear foot (2 year useful life).

LIMITATIONS

- Roughening is of limited effectiveness on its own, but is used to speed revegetation.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ○ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

BMP: SILT FENCE

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

GENERAL DESCRIPTION

A silt fence is made of a filter fabric which has been entrenched, attached to supporting poles, and sometimes backed by a wire fence for support. The silt fence detains sediment-laden water, promoting sedimentation behind the fence.

SUITABLE APPLICATIONS

- Along the perimeter of the site.
- Below the toe of a cleared slope.
- Along streams and channels.
- Around temporary spoil areas.
- Across swales with catchments less than 1 acre.
- Below other small cleared areas.

INSTALLATION/APPLICATION

- Use principally in areas where sheet flow occurs.
- Install along a level contour, so water does not pond more than 1.5 feet at any point.
- No more than 1 acre, 100 ft., or 0.5 cfs of concentrated flow should drain to any point along the silt fence.
- Turn ends of fence uphill.
- Provide area behind the fence for runoff to pond and sediment to settle (approx. 1200 sq. ft. per acre draining to the silt fence).
- Select filter fabric which retains 85% of the soil, by weight, based on sieve analysis, but is not finer than an equivalent opening size of 70.

REQUIREMENTS

- Maintenance
  - Inspect weekly and after each rainfall.
  - Repair wherever fence is damaged.
  - Remove sediment when it reaches 1/3 the height of the fence.
- Cost (source: EPA, 1992)
  - Average annual cost for installation and maintenance (assumes 6 month useful life): $7 per lineal foot ($850 per drainage acre)

LIMITATIONS

- Do not use where 85% of the soil, by weight, passes through a No. 200 sieve because the filter fabric will clog.
- Do not place fence on a slope, or across any contour line.
- Do not use in streams, channels, or anywhere flow has concentrated.
- Do not use in locations where ponded water may cause flooding.

Targeted Pollutants

- ● Sediment
- ○ Nutrients
- ○ Toxic Materials
- ○ Oil & Grease
- ○ Floatable Materials
- ○ Other Construction Waste

- ● Likely to Have Significant Impact
- ○ Probable Low or Unknown Impact

- ○ Suitability for Slopes >5%

● High ○ Low

ESC50

Best Management Practices

R0072313

Additional Information — Silt Fence

To reduce the chance of clogging, it is preferable to specify a fabric with openings as large as allowed by the criteria. No fabric should be specified with an EOS smaller than U.S. Standard Sieve No. 100 [0.0059 in. (0.15 mm.)]. If 85 percent or more of a soil, by weight, passes through the openings in a No. 200 sieve [0.0029 in. (0.074 mm.)], filter fabric should not be used. Most of the particles in such a soil would not be retained if the EOS was too large, and they would clog the fabric quickly if the EOS was small enough to capture the soil.

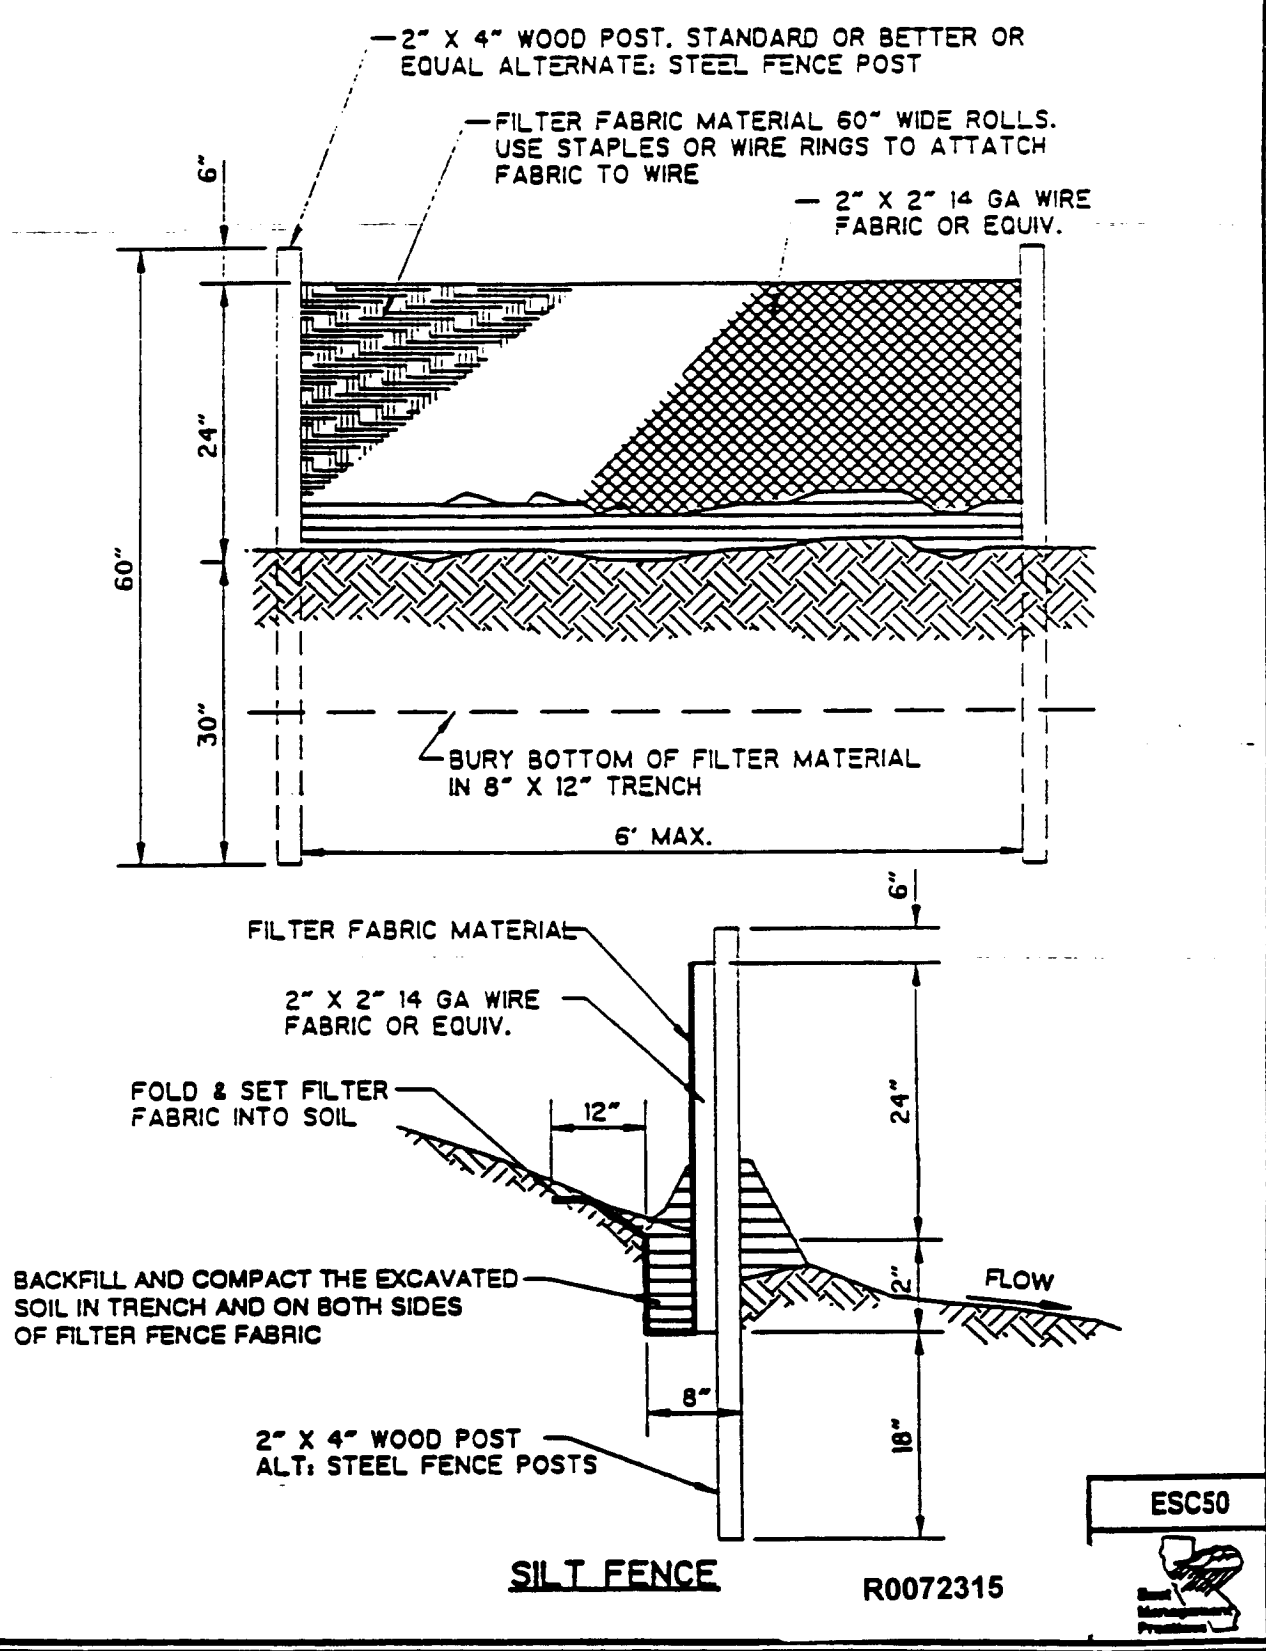
The fence should be supported by a wire mesh if the fabric selected does not have sufficient strength and bursting strength characteristics for the planned application (as recommended by the fabric manufacturer). Filter fabric material should contain ultraviolet ray inhibitors and stabilizers to provide a minimum of six months of expected usable construction life at a temperature range of 0° F. to 120° F.

Installation Guidelines:
Filter fences are to be constructed on a level contour. Sufficient area should exist behind the fence for ponding to occur without flooding or overtopping the fence.

- Posts should be spaced a maximum of 6 feet apart and driven securely into the ground a minimum of 30 inches.
- A trench should be excavated approximately 8 inches wide and 12 inches deep along the line of posts and upslope from the barrier.
- When standard strength filter fabric is used, a wire mesh support fence should be fastened securely to the upslope side of the posts using heavy-duty wire staples at least 1 inch long, tie wires or hog rings. The wire should extend into the trench a minimum of 4 inches.
- The standard strength filter fabric should be stapled or wired to the fence, and 40 inches of the fabric should extend into the trench. When extra-strength filter fabric and closer post spacing are used, the wire mesh support fence may be eliminated and the filter fabric stapled or wired directly to the posts.
- Avoid the use of joints. The filter fabric should be purchased in a continuous roll, then cut to the length of the barrier. When joints are necessary, filter cloth should be spliced together only at a support post, with a minimum 6 inch overlap, and both ends securely fastened to the post.
- The trench should be backfilled with compacted native material.

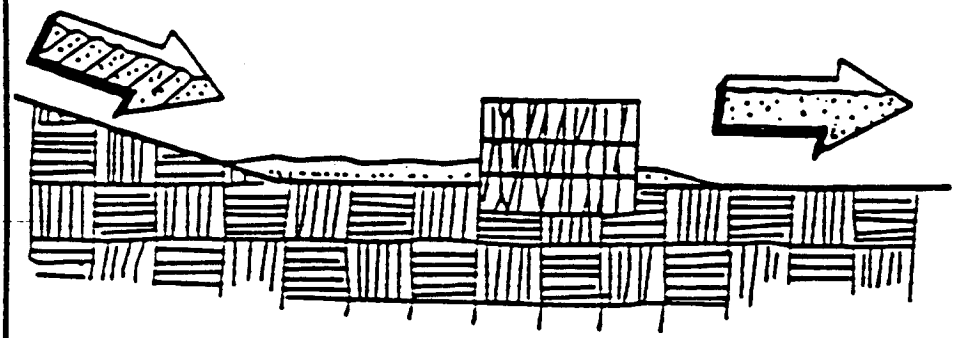
Requirements
Maintenance:

Inspect monthly during dry periods and immediately after each rainfall. Repair as necessary. Sediment must be removed when it reaches approximately one third the height of the fence, especially if heavy rains are expected.



Filter fences should not be removed until the upslope area has been permanently stabilized.

Limitations
- Filter fences will create a temporary sedimentation pond on the upstream side of the fence and may cause temporary flooding. Fences not constructed on a level contour will be overtopped by concentrated flow resulting in failure of the filter fence.
- Filter fences are not practical where large flows of water are involved, hence the need to restrict their use to drainage areas of one acre or less, and flow rates of less than 0.5 cfs.
- Problems may arise from incorrect selection of pore size and/or improper installation.
- Do not allow water depth to exceed 1.5 ft. at any point.
- Improperly installed fences are subject to failure from undercutting, overlapping, or collapsing.



ESC50

R0072314

Additional Information — Silt Fence

BMP: STRAW BALE BARRIERS

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- (●) Control Site Perimeter
- (●) Control Internal Erosion

GENERAL DEFINITION

A straw bale barrier consists of straw bales placed end to end along a level contour in a shallow trench and staked to hold them in place. The barrier detains runoff, creating a pond behind the barrier where sedimentation occurs.

SUITABLE APPLICATIONS

- Along the perimeter of the site.
- Along streams and channels.
- Across swales with small catchments.
- Around temporary spoil areas.
- Below other small, cleared areas.

INSTALLATION/APPLICATION CRITERIA

- Use primarily in areas where sheet or rill flow occurs.
- No more than 1/4 acre per 100 feet of barrier should drain to the barrier.
- Install along a level contour.
- Place in a 4-inch deep trench.
- Backfill and compact the excavated soil on the upstream face of the barrier.
- Secure each bale with two stakes.
- Leave enough area (about 1200 sq. ft. per acre) behind the barrier for runoff to pond (no more than 1.5 ft. depth) and sediment to settle.

REQUIREMENTS

- Maintenance
  - Inspect weekly and after each rain.
  - Replace bales which have decomposed or whose bindings have broken.
  - Remove sediment behind the barrier when it reaches a depth of 6 inches.
- Costs (source: EPA, 1992)
  - Average annual cost for installation and maintenance (assumes 3 month useful life): $17 per lineal foot ($6,800 per drainage acre).

LIMITATIONS

- Straw bale barriers are not to be used for extended periods of time because they tend to rot and fall apart.
- Suitable only for sheet flow on slopes of 2% or flatter.
- Not appropriate for large drainage areas, limit to one acre or less.
- Straw bales lose their effectiveness rapidly due to rotting, thus constant maintenance is required.
- Not recommended for concentrated flow, inlet protection, channel flow, and live streams.
- Bale bindings of jute or cotton not recommended.

Targeted Pollutants

- (●) Sediment
- (○) Nutrients
- (○) Toxic Materials
- (○) Oil & Grease
- (○) Floatable Materials
- (○) Other Construction Waste

- (●) Likely to Have Significant Impact

- (●) O&M Costs
- (●) Maintenance
- (○) Training
- (○) Suitibility for Slopes >5%

(●) High (○) Low

ESC51

Best Management Practices

R0072316

Additional Information — Straw Bale Barrier

A straw bale barrier consists of a series of secured anchored bales placed to intercept sediment-laden runoff from small drainage areas of disturbed soil. The barrier ponds runoff and allow sediment to settle. Straw bale dikes should not be used for extended periods of time because they tend to rot and fall apart.

The straw bale barrier is used where there are no concentrations of water in a channel or drainageway, and where erosion would occur from sheet flow. These barriers are typically constructed below disturbed areas subject to sheet flow of runoff.

Installation/Application

Straw bale barriers should be used for drainage areas no more than 1/4 acre per 100 feet of barrier length, with no more than 100 ft upstream of any point along the barrier. The barrier should be placed along a level contour no greater than 2:1. When installed and maintained according to the guidelines on this fact sheet, straw bale dikes remove approximately 67% of the sediment transported in construction site runoff. This optimum efficiency can only be achieved through careful maintenance, with special attention to replacing rotted or broken bales. The barrier should be constructed on a level contour to prevent concentration of flow against a small portion of the barrier.

An effective straw bale barrier should be installed in the following manner:

1. Bales should be placed on the contour and in a row with ends tightly abutting the adjacent bales.
2. Leave area for runoff to pond upstream of the barrier by locating barrier away from the toe of slopes. This also provides access for maintenance.
3. Each bale should be embedded in the soil a minimum of (4) inches and placed so the bindings are horizontal. Bindings placed on soil will soon disintegrate and cause the barrier to fail.
4. Bales should be securely anchored in place by either two stakes or re-bars driven through the bale. The first stake in each bale should be driven toward the previously laid bale at an angle to force the bales together. Stakes should be driven flush with the bale.
5. Backfill and compact the excavated soil along the upstream face of the barrier.
6. Remove the barrier when it has served its usefulness so as not to block or impede storm flow or drainage.

BMP: SAND BAG BARRIER

GENERAL DEFINITION

Stacking sand bags along a level contour creates a barrier which detains sediment-laden water, ponding water upstream of the barrier and promoting sedimentation.

SUITABLE APPLICATIONS

- Along the perimeter of the site.
- Check dams across streams and channels.
- Along streams and channels.
- Barrier for utility trenches in a channel.
- Across swales with small catchments.
- Division dike or berm.
- Below the toe of a cleared slope.
- Create a temporary sediment trap.
- Around temporary spoil areas.
- Below other small cleared areas.

INSTALLATION/APPLICATION CRITERIA

- May be used in drainage areas up to 5 acres.
- Install along a level contour.
- Base of sand bag barrier should be at least 48 inches wide.
- Height of sand bag barrier should be at least 18 inches high.
- 4 inch PVC pipe may be installed between the top layer of sand bags to drain large flood flows.
- Provide area behind barrier for runoff to pond and sediment to settle, size according to sediment trap BMP criteria (ESC55).
- Place below the toe of a slope.
- Use sand bags large enough and sturdy enough to withstand major flooding.

REQUIREMENTS

- Maintenance
  - Inspect after each rain.
  - Reshape or replace damaged sand bags immediately.
  - Remove sediment when it reaches six inches in depth.
- Cost
  - Sand bag barriers are more costly, but typically have a longer useful life than other barriers.

LIMITATIONS

- Sand bags are more expensive than other barriers, but also more durable.
- Burlap should not be used for sand bags.

BMP: BRUSH OR ROCK FILTER

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- **Protect Slopes/Channels**
- **Control Site Perimeter**
- **Control Internal Erosion**

GENERAL DEFINITION

A rock filter berm is made of rock 3/4 to 3 inches in diameter and placed along a level contour where sheet flow may be detained and ponded, promoting sedimentation. A brush barrier is composed of brush (usually obtained during the site clearing) wrapped in filter cloth and anchored to the toe of the slope. If properly anchored brush or rock filters may be used for sediment trapping and velocity reduction. See Check Dam BMP (ESC41) for more information.

SUITABLE APPLICATIONS

- As check dams across mildly sloped construction roads.
- Below the toe of slopes.
- Along the site perimeter.
- Along streams and channels.
- Around temporary spoil areas.
- Below other small cleared areas.
- At sediment traps at culvert/pipe outlets.

INSTALLATION/APPLICATION CRITERIA

- Use principally in areas where sheet or rill flow occurs.
- For rock filter, use larger rock and place in a staked, woven wire sheathing if placed where concentrated flows occur.
- Install along a level contour.
- Leave area behind berm where runoff can pond and sediment can settle.
- Drainage area should not exceed 5 acres.

REQUIREMENTS

- Maintenance
  - Inspect monthly and after each rainfall.
  - If berm damaged, reshape and replace lost/dislodged rock.
  - Remove sediments when depth reaches 1/3 of berm height, or 1 ft.
- Cost
  - Brush filter: Low to moderate cost if debris from on-site clearing and grubbing is used.
  - Rock filter: Expensive, since off-site materials, hand construction and demolition/ removal are usually required.

ESC53

Best Management Practices

Additional Information — Brush or Rock Filter

Rock Filter

A rock filter consists of open graded rock installed at the toe of a slope, along the perimeter of a developing or disturbed area, and as a checkdam across construction roads. Their purpose is to intercept sediment laden runoff from disturbed areas of the site, allow the runoff to pond, promote sedimentation behind the filter, and slowly release the water as sheet flow.

Rock filters are appropriate where a temporary measure is needed to prevent sediments from entering right-of-ways of traffic areas such as near the toe of slopes, incorporated into temporary stabilized construction entrances (ESC 26), or at other locations along the construction site perimeter. Rock filters may also be used as check dams across one or more lanes of construction traffic temporary roads, or unsurfaced rights of way subject to construction traffic.

Advantages of the rock filters are that they may be less costly than other temporary barriers, and are relatively efficient at sediment removal.

Installation/Application:

Planning:

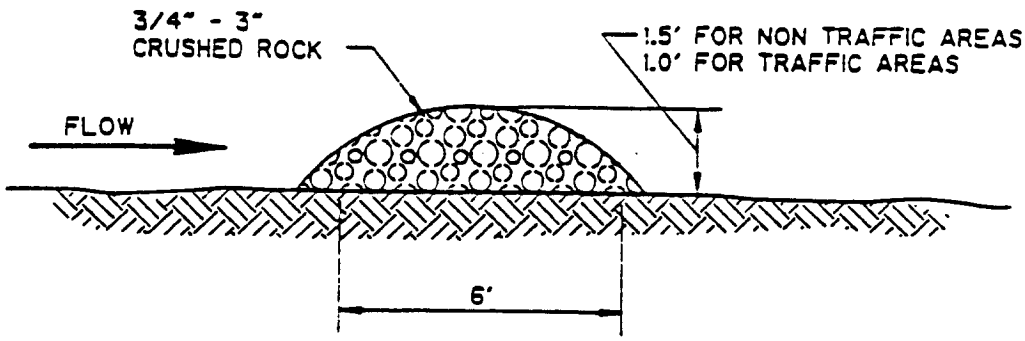
- Rock filters should be placed along a level contour to intercept sheet flow.
- Allow ample room for ponding, sedimentation, and access by sediment removal equipment between the berm and the toes of slopes.
- Flow through the filter should occur as sheet flow into an undisturbed or stabilized area.
- Installation in stream beds requires large rock, staking of woven wire sheathing, and daily inspection.

Design & Sizing Criteria:

The following design criteria are commonly used to construct filters:

- In Non-Traffic Areas:
  - Maximum flow-through rate per square foot of filter = 60 gpm
  - Height = 18 inches minimum
  - Top width = 24 inches minimum
  - Side slopes = 2:1 or flatter
  - Woven wire sheathing (poultry netting) is recommended in areas of concentrated flow. The wire should be 1 inch diameter hexagonal mesh, galvanized 20 gauge.
  - Build the filter along on a level contour.
  - Rock: 3/4 to 3 inches open graded for sheet flow, 3 to 5 inches open graded for concentrated flow.

- In Construction Traffic Areas:
  - Height = 12" maximum
  - Provide multiple filters in series, spaced as shown.
    Every 300 ft on slopes less than 5 percent
    Every 200 ft on slopes 5 to 10 percent
    Every 100 ft on slopes greater than 10 percent.



Brush Filter

Brush filters trap and filter sediments in a manner similar to other barriers in this handbook (e.g., silt fence, straw bale barrier, rock filter), but have the advantage of being constructed from brush cleared from the site and usually disposed off-site at a cost.

BMP: STORM DRAIN INLET PROTECTION

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabilize Disturbed Areas
- Protect Slopes/Channels
- **Control Site Perimeter**
- **Control Internal Erosion**

GENERAL DEFINITION

Devices of various designs which detain sediment-laden runoff and allow the sediment it to settle prior to discharge into a storm drain inlet or catch basin.

SUITABLE APPLICATIONS

- Every storm drain inlet receiving sediment-laden runoff should be protected, either by covering the inlet or promoting sedimentation upstream of the inlet.

INSTALLATION/APPLICATION

- Five types of inlet protection are presented below, however, it is recognized that other effective methods and proprietary device, exist and may be selected:
  - Filter Fabric Fence: Appropriate for drainage basins less than one acre with less than a 5 percent slope.
  - Block and Gravel Filter: Appropriate for flows greater than 0.5 cfs.
  - Gravel and Wire Mesh Filter: Used on curb or drop inlets where construction equipment may drive over the inlet.
  - Sand bag barrier: Used to create a small sediment trap upstream of inlets on sloped, paved streets.
  - Excavated Drop Inlet Sediment Trap: An excavated area around the inlet to trap sediment (see Sediment Trap ESC 55).
- Select the appropriate type of inlet protection and design as referred to or as described in this fact sheet.
- Use only for drainage areas smaller than one acre unless a sediment trap first intercepts the runoff.
- Provide area around the inlet for water to pond without flooding structures and property.

REQUIREMENTS

- Maintenance
  - Inspect weekly and after each rain.
  - Replace clogged filter fabric or stone filters immediately.
  - Remove sediment when depth exceeds half the height of the filter, or half the depth of the sediment trap.
  - Remove as soon as upstream soils are stabilized and streets are swept.
- Cost (source: EPA, 1992)
  - Average annual cost for installation and maintenance (1 year useful life) is $150 per inlet.

ESC54

Best Management Practices

16 - 120

Additional Information — Storm Drain Inlet Protection

Storm drain inlet protection consists of a sediment filter or an impounding area around or upstream of a storm drain, drop inlet, or curb inlet. This erosion and sedimentation control BMP prevents excessive sediment from entering storm drainage systems prior to permanent stabilization of the disturbed area.

All on-site storm drain inlets should be protected. Off-site, inlets should be protected in areas where construction activity tracks sediment onto paved areas or where inlets receive runoff from disturbed areas.

Installation/Aplication Criteria

Planning

Large amounts of sediment may enter the storm drain system when storm drains are installed before the upslope drainage area is stabilized, or where construction is adjacent to an existing storm drain. In cases of extreme sediment loading, the storm drain itself may clog and lose a major portion of its capacity. To avoid these problems, it is necessary to prevent sediment from entering the system at the inlets.

Inlet control measures presented in this handbook should not be used for inlets draining more than one acre. Runoff from larger disturbed areas should be first routed through a Temporary Sediment Trap (see ESC 56). Different types of inlet protection are appropriate for different applications depending on site conditions and the type of inlet. Inlet protection methods not presented in this handbook should be approved by the local storm water management agency.

General Design and sizing criteria:

- Grates and spaces around all inlets should be sealed to prevent seepage of sediment-laden water.
- Excavate sediment sumps (where needed)1 to 2 feet with 2:1 side slopes around the inlet.

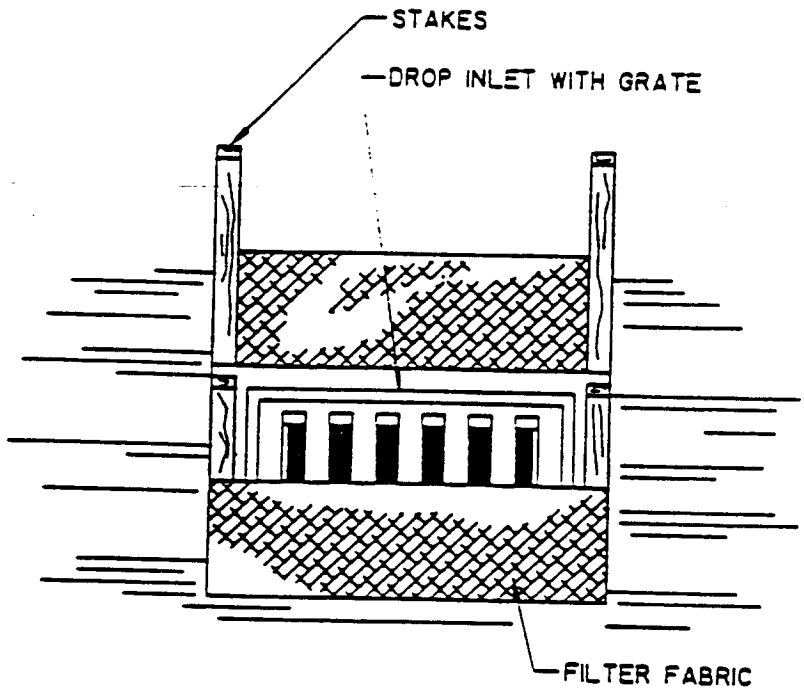
Installation procedures for filter fabric fence:

a. Place 2 inch by 2 inch wooden stakes around the perimeter of the inlet a maximum of 3 feet apart and drive them at least 8 inches into the ground. The stakes must be at least 3 feet long.
b. Excavate a trench approximately 8 inches wide and 12 inches deep around the outside perimeter of the stakes.
c. Staple the filter fabric (for materials and specifications, see Silt Fence ESC 50) to wooden stakes so that 32 inches of the fabric extends out and can be formed into the trench. Use heavy-duty wire staples at least one inch in length.
d. Backfill the trench with 3/4 inch or less washed gravel all the way around.

Installation procedure for block and gravel filter:

a. Place hardware cloth or comparable wire mesh with one-half inch openings over the drop inlet so that the wire extends a minimum of 1 foot beyond each side of the inlet structure. If more than one strip is necessary, overlap the strips. Place filter fabric over the wire mesh.
b. Place concrete blocks lengthwise on their sides in a single row around the perimeter of the inlet, so that the open ends face outward, not upward. The ends of adjacent blocks should abut. The height of the barrier can be varied, depending on design needs, by stacking combinations of blocks that are 4 inches, 8 inches, and 12 inches wide. The row of blocks should be at least 12 inches but no greater than 24 inches high.
c. Place wire mesh over the outside vertical face (open end) of the concrete blocks to prevent stone from being washed through the blocks. Use hardware cloth or comparable wire mesh with one half inch openings.
d. Pile washed stone against the wire mesh to the top of the blocks. Use 3/4 to 3 inch gravel.

Installation procedure for gravel and wire mesh filters:



a. Place wire mesh over the drop inlet so that the wire extends a minimum of 1 foot beyond each side of the inlet structure. Use hardware cloth or comparable wire mesh with one-half inch openings. If more than one strip of mesh is necessary, overlap the strips. Place filter fabric over wire mesh.

BMP: SEDIMENT TRAP

Objectives

- Housekeeping Practices
- Contain Waste
- Minimize Disturbed Areas
- Stabalize Disturbed Areas
- Protect Slopes/Channels
- Control Site Perimeter
- Control Internal Erosion

GENERAL DEFINITION

A sediment trap is a small, excavated or bermed area where runoff from small drainage areas is detained and sediment can settle.

SUITABLE APPLICATIONS

- Any disturbed area less than 5 acres. (Sediment Basins, ESC56, must be used for drainage areas greater than 5 acres).
- Along the perimeter of the site at locations where sediment-laden runoff is discharged off-site.
- Around and/or upslope from storm drain inlet protection measures.
- At any point within the site where sediment-laden runoff can enter stabilized or natural areas or waterways.

INSTALLATION/APPLICATION CRITERIA

- Build outside the area to be graded before clearing, grubbing, and grading begin.
- Locate where the trap can be easily cleared of sediment.
- Trap size depends on the type of soil, size of the drainage area, and desired sediment removal efficiency.
- The larger the trap, the less frequently sediment must be removed.
- The outlet of the trap must be stabilized with rock, vegetation, or another suitable material.
- A stable emergency spillway must be installed to safely convey major floods (see your local flood control agency).

REQUIREMENTS

- Maintenance
  - Remove sediment when the sediment storage zone is no more than 1 ft. from being full.
  - Inspect weekly and after each rain.
- Cost (source: EPA, 1992)
  - Average annual cost per installation and maintenance (18 month useful life) is $0.70 per $ft.^3$ ($1,300 per drainage acre).

LIMITATIONS

- Only use for drainage areas up to 5 acres (see Sedimentation Basin BMP ST8 for larger areas).
- Only removes coarse sediment (medium silt size and larger) unless sized like a sedimentation basin.

Best Management Practices

16-128

Additional Information — Sediment Trap

3. The trap is removed and the area stabilized when the upslope drainage area has been properly stabilized.
4. All cut-and-fill slopes should be 3:1 or flatter.
5. When a riser is used, all pipe joints must be watertight.
6. When a riser is used, at least the top two-thirds of the riser shall be perforated with 1/2-inch diameter holes spaced 8 inches vertically and 10 to 12 inches horizontally. (See Sediment Basin, ESC56)
7. When an earth or stone outlet is used, the outlet crest elevation should be at least 1 foot below the top of the embankment.
8. When a crushed stone outlet is used, the crushed stone used in the outlet should meet AASHTO M43, size No. 2 or 24, or its equivalent such as MSHA No. 2. Gravel meeting the above gradation may be used if crushed stone is not available.

BMP: SEDIMENT BASIN

Objectives

- *Housekeeping Practices*
- *Contain Waste*
- *Minimize Disturbed Areas*
- *Stabalize Disturbed Areas*
- *Protect Slopes/Channels*
- *Control Site Perimeter*
- *Control Internal Erosion* (●)

GENERAL DEFINITION

A pond created by excavation or constructing an embankment, and designed to retain or detain runoff sufficiently to allow excessive sediment to settle.

SUITABLE APPLICATIONS

- At the outlet of all disturbed watershed 10 acres or larger.
- At the outlet of smaller disturbed watersheds, as necessary.
- Where post construction detention basins will be located.
- Should be used in association with dikes, temporary channels, and pipes used to divert disturbed areas into the basin and undisturbed areas around the basin.

INSTALLATION/APPLICATION

- Construct before clearing and grading work begins.
- Do not locate in a stream.
- All basin sites should be located where failure of the embankment would not cause loss of life/property damage.
- Large basins are subject to state/local dam safety requirements.
- Securely anchor and install an anti-seep collar on the outlet pipe/riser, and provide an emergency spillway for passing major floods (see local flood control agency).
- The basin volume should be sized to capture runoff from a 2-year, 24-hour storm, or other appropriate design storms specified by the local agency. A detention time of 24 to 40 hours should allow 70 to 80 percent of sediment to settle.
- The basin volume consists of two zones:
  - A sediment storage zone at least 1 foot deep.
  - A settling zone at least 2 feet deep.
- The length to settling depth ratio (L/SD) should be less than 200.
- The length to width ratio should be greater than 6:1, or baffles are required to prevent short circuiting.

REQUIREMENTS

- Maintenance
  - Inspect weekly and after each rain.
  - Remove sediment where the sediment storage zone is half full.
- Cost: Average annual cost for installation and maintenance (2 year useful life, source: EPA, 1992)
  - Basin less than 50,000 $ft.^3$: $0.40 per $ft.^3$ ($700 per drainage acre)
  - Basin size greater than 50,000 $ft.^3$: $0.20 per $ft.^3$ ($350 per drainage acre)

Xavier Swamikannu
Los Angeles Regional Water Quality Control Board
320 W. 4th Street, Suite 200
Los Angeles, CA 90013

Dear Xavier:

Thank you for sending the list of recommended Best Management Practices (BMPs) for the Storm Water Program. Attached is the Restaurant Standard Urban Storm Water Mitigation Plan and our comments referencing those BMPs only. I will attend the April 22 hearing for considering these BMPs, and I will provide oral testimony as well.

If you or the Board wish to call me regarding these written comments, you can reach me at 714-778-7150. Thank you for the opportunity to provide the quick service restaurant point of view on this important issue.

Sincerely,

Michael Kissel
Environmental Health Compliance Specialist

CKE Restaurants, Inc. Comments
for
RESTAURANT
STANDARD URBAN STORM WATER MITIGATION PLAN

1. PROPERLY DESIGN EQUIPMENT/ACCESSORY WASH AREAS

The installation of a self-contained structure with pretreatment equipment for a sanitary sewer discharge in most free-standing quick service restaurants (QSRs) would have to be incorporated into the outdoor trash enclosure. According to the proposed plan, this would require a roof structure. Since such a structure would significantly increase the cost of new restaurants, it is recommended that each site be given the opportunity for conditional waiver for a cover if that site can demonstrate effective Best Management Practices in keeping the area clean.

2. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Stenciling of storm drain inlets, channels, creeks and catch basins are a responsibility of the municipality or county in unincorporated areas. These areas are outside the jurisdiction of most businesses.

3. PROPERLY DESIGN OUTDOOR MATERIAL STORAGE AREAS

These structures would, again, apply to QSRs with trash enclosures. Berms and dikes would interfere with the access to the trash containers. A sloped pavement in the enclosure would prevent materials from escaping the area. It is also recommended that a conditional waiver be given to these structures for coverings as well.

4. PROPERLY DESIGN TRASH STORAGE AREAS

See comments for BMPs 1 and 3.

5. CONSIDER ROOFTOP RUNOFF TREATMENT

Since exhaust system cleaning services are the primary contributors of rooftop runoff, they should be required to provide BMPs for mitigation of this problem. With the installation of catalytic converters required by the South Coast AQMD for chain-driven charbroilers, the accumulation of rooftop pollutants form cooking exhaust is no longer an issue.

6. CONTROL PARKING LOT RUNOFF

It is recommended that products claiming to mitigate this runoff be researched and presented to industry. We have not seen a product that can properly filter the volume of water involved in this operation. Infiltration trenches, parking grooves, vegetated swales and landscape islands do not remove the materials from waster steam or they deposit them into the soil impacting the groundwater.

7. PROVIDE PROOF OF ONGOING BMP MAINTENANCE

Any documentation of any kind of BMP maintenance should be kept to a minimum. Extensive documentation would be burdensome to QSRs.

RESTAURANT

STANDARD URBAN STORM WATER MITIGATION PLAN

DEFINITION

A restaurant is a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption. (SIC code 5812)

GOALS

- Prevent potential pollutants from entering the storm drain system and ultimately impacting receiving waters.
- Reduce amount of runoff.
- Eliminate non-stormwater discharges to the storm drains.

REQUIREMENTS

Developers and/or owners will be required to incorporate Best Management Practices (BMPs) 1 through 7 into project plans and designs. Where the developer and/or owner believes that a BMP is not appropriate or applicable to a specific project, the developer will be required to provide an explanation.

1. PROPERLY DESIGN EQUIPMENT/ACCESSORY WASH AREAS

Equipment/accessory washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the stormwater conveyance system. To alleviate this problem, include in the project plans an area for the washing/steam cleaning of equipment and accessories. This area must meet the following:

- This area must be self-contained, equipped with a clarifier, or other pretreatment facility, and properly connected to a sanitary sewer.
- If this wash area is to be located outdoors, it must be covered, paved and have secondary containment.

2. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Storm drain stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets. The stencil contains a brief statement that prohibits the dumping of improper materials into the stormwater conveyance system. Graphical icons, either illustrating

5. CONSIDER ROOFTOP RUNOFF TREATMENT

Rooftop runoff has the potential to transport toxic compounds, oil and grease, bacteria, and suspended solids. Consideration should be given to implementing the following techniques for treating runoff from individual building rooftops and allowing it to infiltrate into the soil (See Table 1: Suggested Resources for additional sources of information):

- Dry-wells
- Cisterns
- Foundation planting
- Permeable areas near buildings

6. CONTROL PARKING LOT RUNOFF

Parking lots have the potential to contribute oil and grease, trash, heavy metals, and suspended solids to the stormwater conveyance system. Consideration should be given to implementing the following structural BMPs to both reduce the impervious land coverage of parking areas and to filter runoff before it reaches the storm drain system (See Table 1: Suggested Resources for additional sources of information):

- Vegetated swales and landscape islands
- Infiltration trenches
- Oil/Water separators and water quality inlets
- Media filtration
- Bioretention facility
- Hybrid lots
- Parking groves
- Permeable overflow parking

LOS ANGELES COUNTY MUNICIPAL STORM WATER PROGRAM - APPROVING BEST MANAGEMENT PRACTICES (BMPs) FOR DEVELOPMENT PLANNING AND CONSTRUCTION (Board Resolution No. 99-03)

Dear Ms. Grant:

On April 22, 1999, the Regional Board at its hearing adopted Board Resolution No. 99-03 approving the List of BMPs for use in Development Planning/ Development Construction model programs. A copy of the Resolution and Approved BMPs (Attachments 1, 2, and 3) are attached.

The List of BMPs is now part of the Development Planning/ Development Construction model programs approved by the Executive Officer. Please update these model programs appropriately.

If you have any questions, please call me at (213) 576-6654.

Sincerely,

Xavier Swamikannu, D.Env.

State of California
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

Resolution No. 99-03

APPROVING BEST MANAGEMENT PRACTICES
FOR
MUNICIPAL STORM WATER AND URBAN RUNOFF MANAGEMENT PROGRAMS
IN
LOS ANGELES COUNTY

(NPDES NO. CAS614001)

WHEREAS, THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION FINDS:

1. Pursuant to the requirements of Order No. 96-054, Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles (Permit), the Principal Permittee, in consultation with the Co-Permittees, has developed model programs for Development Construction and Development Planning. These programs must include Best Management Practices (BMPs) to control/ minimize the discharge of pollutants to receiving waters.

2. The Permit requires that the Regional Board approve these BMPs, to be part of the Development Planning and Development Construction Model Program, before implementation by Permittees.

3. The Lists of BMPs have been evaluated and are considered appropriate practices for the respective programs/ activity.

4. This Resolution adopts a master list of BMPs for Development Planning and Development Construction Projects in Los Angeles County. These BMPs when implemented at development projects, in combination, will reduce pollutants in storm water discharges to the "maximum extent practicable".

THEREFORE BE IT RESOLVED THAT:

1. The Best Management Practices contained in the following Attachments are approved:

   a. Attachment 1 - Development Planning
   b. Attachment 2 - Development Construction
   c. Attachment 3 – Supplementary List of BMPs

2. The Permittees shall select and require implementation of the most effective BMPs, approved and attached hereto (and as may hereafter be updated) for storm water/ urban runoff pollution control benefits.

R0072336

3. The Regional Board Executive Officer is hereby authorized to update the master list and to incorporate additional detail to the BMPs as necessary.

I, Dennis Dickerson, Executive Officer, do hereby certify that the foregoing is a full, true and correct copy of a Resolution adopted by the California Regional Water Quality Control Board, Los Angeles Region, on April 22, 1999.

DENNIS A. DICKERSON
Executive Officer

STANDARD URBAN STORM WATER MITIGATION PLANS AND BOARD RESOLUTION APPROVING POST-CONSTRUCTION BMP REQUIREMENTS FOR DEVELOPMENT PLANNING AND CONSTRUCTION (Board Resolution No. R-00-02)

Dear Mr. Stone and Mr. Holland:

On January 26, 2000, the Regional Board at its hearing adopted Board Resolution No. R-00-02 directing me to approve the Standard Urban Storm Water Mitigation Plan (SUSMP) with changes noted. The Regional Board at the same time also adopted the SUSMP requirements for the City of Long Beach under the City of Long Beach municipal separate storm sewer system (MS4) permit (Board Order No. 99-060).

Copies of the Regional Board Executive Officer approved SUSMP, Board Directed Changes - Supplement, and the Resolution adopted by the Regional Board are attached.

The City of Long Beach and all Los Angeles County Municipal Storm Water Permittees will have until September 8, 2000, to promulgate ordinances or amend municipal codes to implement the SUSMP requirements. The SUSMP requirements shall take effect no later than October 8, 2000. All parties, including the City of Long Beach, will have 30 days from the date of this letter to file a review of the action by the State Water Resources Control Board.

If you have any questions, please call me at (213) 576-6605 or Dr. Swamikannu at (213) 576-6654.

Sincerely,

Dennis A. Dickerson
Executive Officer

State of California
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

Resolution No. R-00-02

APPROVING THE
STANDARD URBAN STORM WATER MITIGATION PLAN
FOR
MUNICIPAL STORM WATER AND URBAN RUNOFF MANAGEMENT PROGRAMS
IN LOS ANGELES COUNTY

WHEREAS, THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION FINDS:

1. On July 15, 1996, a municipal separate storm sewer system permit (Los Angeles County MS4 Permit) was issued to the County of Los Angeles and 85 incorporated cities to control and minimize the discharge of pollutants associated with storm water and urban runoff. This permit became Regional Board Order No. 96-054, Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles.

2. On June 30, 1999, a municipal storm water permit was issued to the City of Long Beach (City of Long Beach MS4 Permit) which removed the City of Long Beach from Board Order No. 96-054, giving the City of Long Beach its own distinct Municipal Storm Water and Urban Runoff NPDES permit, Regional Board Order No. 99-060, "Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the City of Long Beach".

3. On August 19, 1999, a statewide general storm water permit for construction activity (Statewide Construction Storm Water Permit) was adopted by the State Water Resources Control Board (State Board). This permit became State Board Order No. 99-08-DWQ, and applies to construction projects that disturbs five acres or more or is part of a larger common plan of sale in the Los Angeles region.

4. Many of the rivers and streams in Los Angeles County are formally designated as impaired, pursuant to Section 303 (d) of the federal Water Pollution Control Act, for specific pollutants that are commonly found in storm water and urban runoff.

5. Storm water runoff carries with it many pollutants in varying concentrations that are suspended in, and or dissolved, in the runoff. The sources of these pollutants include nearly all properties that have been developed since the pollutants originate through the many diverse activities of habitation and land use. Pollutants generated from individual property developments vary greatly in the concentration or loading of each pollutant. Generally, the relative contribution of the pollutant from runoff from any individual property development will represent only a small portion of the entire loading of a water body given the many square miles of land upon which storm water runoff is generated. When the individual contributions from tens of thousands of discrete property units are aggregated, the pollutant loading becomes significant. The resultant pollutant loads results in the impairment of that water body and the conveyance of pollutants, including sediments, metals, complex organic compounds, oil and grease, nutrients, and pesticides to the ocean and harbors within Los Angeles County. The loading of pollutants generated in the Los Angeles area are being measured through the monitoring program being conducted by the Los Angeles County Department of Public Works in conformance with its obligations as the Principal Permittee under the Los Angeles CountyMS4 Permit.

6. The nature of property use is related to the types and quantities of pollutants that are transported from that property during a rainfall event.

7. As property is developed or redeveloped, the utilization of Best Management Practices provide an opportunity to reduce the loading of pollutants to water bodies. This is accomplished by various techniques and can be passive (source reduction) or active (treatment). As property is developed from undisturbed lands, the project can be designed to incorporate Structural or Treatment Control (Best Management Practices (BMPs) that would normally not be available or practical to use on property that has been in urban use.

8. BMPs are effective means of reducing pollutants and Structural or Treatment Control BMPs can be "designed-into" a project in a cost effective way and in a manner that is either transparent to or which enhances the use to which the property has been placed. Some BMPs encourage the setting aside of areas as a greenbelt to allow storm water runoff to flow over areas which are permeable, thereby allowing all or a portion of the runoff to infiltrate. Other BMPs can be designed and built into structures such as catch basins that incorporate replaceable filters to absorb oily wastes or by installing screens to prevent litter from passing through the system and into the water body.

9. Arrays of Structural or Treatment control BMPs are available to developers of both new and redevelopment properties. The use of BMPs is already required by the terms of the Los Angeles County and Long Beach Municipal Storm Water and Urban Runoff NPDES permits.

10. The ability of any BMP to be effective is limited by the volume of water that the BMP is exposed to in any discrete period of time. A BMP that can only be effective for a small volume of storm water runoff is inherently less effective than one sized to accommodate a larger volume of water.

11. Storm water runoff will normally convey a disproportionate loading of pollutants in the initial period runoff is generated during a storm event. Storm events generating up to 0.75 inches of precipitation, measured over a 24-hour period, constitute 85 percent of the total amount of runoff that can be expected during an average wet season. Designing a BMP to be able to accommodate this amount of runoff will result in the application of a BMP intervention to all but 15% of the total runoff during a year, and usually all of the critical runoff that occurs in the early phase of the precipitation event, commonly referred to as the "first Flush."

12. Both the Los Angeles County MS4 Permit (Part III.A.1.c) and the City of Long Beach MS4 Permits contain provisions related to the adoption of Standard Urban Storm Water Mitigation Plans (SUSMPs) requiring their development and implementation.

13. Standard Urban Storm Water Mitigation Plans are required for a specified set of enumerated projects and the permit specifically identifies seven distinct categories for which SUSMPs are required to be prepared. The permit specifically states that the seven categories of projects are the minimum categories requiring SUSMPs.

14. Standard Urban Storm Water Mitigation Plans are also required for development or redevelopment of Parking Lots 5,000 square feet or greater and Locations in Environmentally Sensitive Areas. These categories have been added to advance efforts to control storm water pollution beyond the minimum in Los Angeles County.

15. Standard Urban Storm Water Mitigation Plans are required to be approved by the Regional Board Executive Officer following which they are to be implemented by the Permittees and used by the Permittees as the minimum criteria for the approval of project specific Urban Storm Water Mitigation Plans and the issuance of grading or building permits to project applicants.

16. The Statewide Construction Storm Water Permit requires that Storm Water Pollution Prevention Plans (State SWPPPs) contain post-construction BMPs that will be implemented after construction is complete.

17. Section 402 (p) of the Clean Water Act requires the Administrator of the United States Environmental Protection Agency or her designated agent, in this instance, the Regional Board, to require as part of the storm water program "controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants." [USC Section 1342 (p)(3)(B)].

18. A recent decision of the United States 9th Circuit Court of Appeals, *Defenders of Wildlife v. Browner* (1999) Case No. 98-71080, provides additional support and clarification of the authority of the Administrator and the Regional Board to impose additional controls on storm water pollution. The Court in *Defenders of Wildlife v. Browner* said that the USEPA and the States have discretion under the law to determine what pollution controls are appropriate to achieve compliance.

19. Pursuant to the requirements of Regional Board Order No. 96-054, Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles, the Regional Board Executive Officer received a proposal for Standard Urban Storm Water Mitigation Plans submitted by the Principal Permittee.

20. Upon the review of the Regional Board Executive Officer, the Standard Urban Storm Water Mitigation Plan submitted for the seven applicable categories was deemed inadequate. A revised SUSMP proposal was developed subsequent to a discussion of the proposal's conceptual foundation at a public workshop held on August 10, 1999. This workshop was well attended with over 80 municipal representatives and interested parties participating.

21. On August 16, 1999, a public notice was issued indicating that the Standard Urban Storm Water Mitigation Plans proposed by the Principal Permittee would be augmented by the addition of criteria related to specifying numerical design criteria for BMP construction. The matter was noticed for the Regional Board's September meeting to allow the issue to be discussed before the Board although no formal action of the Regional Board itself is required for SUSMP approval.

22. On September 16, 1999, the Regional Board conducted a public hearing on the Standard Urban Storm Water Mitigation Plan proposal as amended by the Executive Officer. At that hearing, the Regional Board Executive Officer suggested additional time would be necessary to develop a more comprehensive proposal incorporating the comments received at the public hearing.

23. Between September 16, 1999 and January 25, 2000, the Regional Board Executive Officer met with interested parties to discuss comments and concerns from interested parties.

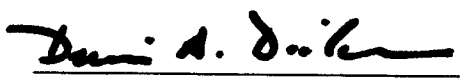
24. The Southern California Council of Governments (SCAG) has indicated its interest in obtaining funding to prepare a regional plan(s) to address storm water pollution and identify regional treatment solutions for implementation.

25. On December 7, 1999, the Regional Board Executive Officer released a revised Standard Urban Storm Water Mitigation Plan document to interested parties.

THEREFORE BE IT RESOLVED THAT:

1. The Regional Board endorses the Standard Urban Storm Water Mitigation Plan prepared by the Regional Board Executive Officer and noticed to the public on December 7, 1999 and the concepts therein relating to numerical storm water mitigation standards for Best Management Practices; and

2. The Regional Board directs the Regional Board Executive Officer to approve the Standard Urban Storm Water Mitigation Plan at the earliest opportunity incorporating changes made and formally approved by the Regional Board at the January 26, 1999 Board Hearing;



3. The Regional Board adopts the approved requirements as provisions applicable to the SUSMP requirements for the City of Long Beach.

4. The Regional Board adopts the numerical mitigation standards for storm water, endorsed herein, as the minimum design criteria for review of post-construction BMPs in the Los Angeles Region for construction projects subject to coverage under the Statewide Construction Storm Water Permit.

5. The Regional Board encourages the Permittees and all interested parties to work together in a spirit of cooperation to effect the implementation of the Standard Urban Storm Water Mitigation Plan at the earliest possible date, and

6. The Regional Board encourages the efforts by the Southern California Council of Governments and area Council of Governments (COGs) to develop regional plans and identify regional solutions to address storm water pollution from new development and redevelopment.

I, Dennis Dickerson, Executive Officer, do hereby certify that the foregoing is a full, true and correct copy of a Resolution adopted by the California Regional Water Quality Control Board, Los Angeles Region, on January 26, 2000.

DENNIS A. DICKERSON
Executive Officer

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD

LOS ANGELES REGION

STAFF REPORT AND RECORD OF DECISION

STANDARD URBAN STORM WATER MITIGATION PLANS

AND

NUMERICAL DESIGN STANDARDS FOR BEST MANAGEMENT PRACTICES

SUPPLEMENT

BOARD DIRECTED CHANGES

The Regional Board at its January 26, 2000, meeting directed the Regional Board Executive Officer to amend the Standard Urban Storm Water Mitigation Plans (SUSMPs) as indicated by the change sheet presented at the meeting (dated January 25, 2000), and changes directed by the Regional Board during the meeting. The Regional Board also adopted the same SUSMP requirements for the City of Long Beach under its separate municipal storm water permit (Board Order No. 99-060) for project categories that require SUSMPs.

Regional Board Counsel designated the record for the proceeding to include: (i) all staff files and the transcript of proceedings for the January 26, 2000, Hearing; (ii) all staff files and transcript of proceedings for the September 16, 1999, Board Information Item Discussion; (iii) all staff files for the August 10, 1999, Workshop, (iv) all SUSMP Proposals circulated by the Permittees, (v) all SUSMP Proposals circulated by the Regional Board Staff, (vi) all comments received and responses; (vii) and all exhibits presented to the Board.

This "Supplement" document enumerates the significant changes made to the SUSMP that were directed by the Board at the hearing and the bases for the changes in the "Transcript of Proceedings", testimony presented or materials submitted to the Regional Board, and other relevant documents.

Applicability of the SUSMP

The SUSMP requirements apply to all projects in the nine enumerated categories for the Los Angeles County MS4 Program. While some development planning/ construction requirements in the permit are made applicable only to "Discretionary Projects", this limitation does not cover the seven "enumerated project categories" in Board Order No.

R0072350

96-054, and the two additionally designated "enumerated project categories" by the Regional Board Executive Officer and affirmed by the Regional Board.[1]

Applicability to Categories for the City of Long Beach

A statement has been added to clarify that SUSMP requirements adopted by the Regional Board apply to the City of Long Beach MS4 Program for only: (i) 10-99 home subdivisions; (ii) 100 or more subdivisions; (iii) 100,000 or more square foot commercial developments; and (iv) projects located adjacent to or discharging to environmentally sensitive areas. For the remaining five categories, equivalent requirements have been included directly in or are expected to be developed shortly under the City of Long Beach Storm Water Management Plan.[2]

Effective Date for SUSMP Requirements

A statement has been included to provide Permittees 6 months from the date of Regional Board Executive Officer's approval of the SUSMP to amend ordinances and codes to be consistent with the adopted SUSMP requirements, and thence 30 days thereafter for the requirements to take effect.[3]

Definition of Commercial Development

The definition of "Commercial Development" has been reworded to be inclusive of all developments that are not considered "Residential" or "Heavy Industrial" based on the categorization of the federal storm water regulations.[4]

Definition of Environmentally Sensitive Areas

A new "Table 3" has been added to the SUSMP to list areas presently covered under the definition of "environmentally sensitive areas" based on readily ascertainable designations by the State Water Resources Control Board, the California Resources Agency, and the County of Los Angeles.[5]

---

[1] Transcript of Proceedings, January 26, 2000 (CSR No. 10992 and 11568) at 228. Discussion by Regional Board Counsel Leon and direction by Board Member Cloke.

[2] Ibid. at 289. Clarification by Dr. Swamikannu and request by Board Member Cloke to include clear text to explain its applicability to the City of Long Beach.

[3] Ibid at 76 and 300. Recommendation by Mr. Dickerson responding to a question by Regional Board Chairman Nahai and affirmation by Board.

[4] Ibid at 66 and 285. Discussion by Board Members on the scope of the definition and response by Dr. Xavier Swamikannu.

[5] Ibid. at 206, 280, and 305. Discussion with Chairman Nahai and Dr. Coe of the ready ascertainibility of the designated sites, and agreement to provide a listing in the SUSMP.

Definition of Parking Lots

The definition of "Parking Lots " has been reworded to eliminate the "stand alone" limitation, so that it now applies to all parking lots with 5,000 square feet or more or with 25 parking spaces or more and exposed to storm water.[6]

Definition of Redevelopment

The definition of "Redevelopment" has been reworded to include a minimum threshold of at least 5,000 square feet of impervious area addition to an existing property in order for the SUSMP requirements to apply. The threshold value is consistent with other threshold values in the SUSMP, such as Parking Lots and Restaurants.[7]

Definition of Restaurant

The definition of "Restaurant" has been reworded to limit applicability to "stand-alone" facilities and exclude co-located stalls or food counters in general purpose establishments such as markets and grocery stores.[8]

Definition of Retail Gasoline Outlet

The definition of "Retail Gasoline Outlet" has been reworded to include all retail gasoline outlets that sell gasoline and lubricating oils without consideration of the proportion of receipts derived from such sales.[9]

Conflict with Local Practices

The paragraph has been reworded to allow local ordinances to differ from the SUSMP so long as they are more stringent.[10]

Responsibility and Conditions for BMP Transfer

The language has been modified to ensure that the responsibility for the maintenance of Structural or Treatment Control BMPs is properly transferred with the sale of a property and is mandatory.[11]

---

[6] Ibid. at 301 and 306. Board Members Cloke and Diamond discuss and direct staff to eliminate the "stand-alone" limitation.

[7] Ibid. at 67 and 302. Board Chairman Nahai discusses the absence of a minimum threshold and directs staff to set a minimum value to address his concerns of proportionality aberrations.

[8] Ibid. at 68. Board Chairman interprets applicability and Dr. Swamikannu confirms the interpretation.

[9] Ibid. at 46, 49, 308. Board Members discuss the staff proposed definition based on primary activity and direct staff to extend the definition to include all gas stations that pump gas.

[10] Ibid. at 308. Board Members discuss the language and provide specific language for the purpose of local program consistency and to ensure adherence to the SUSMP requirements.

Roofing Surface Area Exclusion from Mitigation Standard

The roofing surface credit for calculation of storm water runoff volume for mitigation has been eliminated.[12]

Limited Exclusion for Small Restaurants from Mitigation Standard

The sentence has been clarified to state to exempt restaurants less than 5,000 square feet from the requirement to mitigate storm water only. All other requirements for restaurants apply.[13]

Waiver Provision

The paragraph has been modified to recognize proximity to an unconfined water table as one basis for the granting of a waiver.[14]

A sentence has been added to require that all other BMPs be considered and rejected before a waiver from the numerical mitigation standard is granted.[15]

A statement has been added to require that non-enumerated bases for waiver be brought to the Regional Board for consideration. The Regional Board can delegate the approval authority for a class of waivers to the Regional Board Executive Officer.[16]

---

[11] Ibid. at 63 and 313 Board Members discuss the significance of ensuring proper transfer of BMP maintenance responsibility and provide firm enabling language.

[12] Ibid. at 48 and 314. Board Members discuss the elimination of the rooftop exemption with the possibility of reconsideration in the future if Permittees affirmatively demonstrate that rooftop runoff is not a source of pollutants.

[13] Ibid. at 322. Board Members discuss the limited exclusion and agree with Dr. Swamikannu's rationale for the exclusion threshold from numerical design standards.

[14] Ibid. at. 60 Board Member Coe suggests the change to address the issue and Dr. Swamikannu accepts the suggestion.

[15] Ibid. 74 and 326 Board Members discuss the Waiver provision and provide language to ensure that all options for mitigation are considered.

[16] Ibid. at 75 and 328. Board Chairman Nahai provides direction to staff to require any new waiver bases to be brought to the Regional Board to ensure public discussion and consideration.

STANDARD URBAN STORM WATER MITIGATION PLAN

DEVELOPMENT PLANNING

CHANGE SHEET (Revised)

Summary

The Change Sheet lists proposed changes to the Final Tentative - Standard Urban Storm Water Mitigation Plan, (December 7, 1999). In general, the proposed changes respond to commenters' suggestions on improving clarity, format, and implementability of the Standard Urban Storm Water Mitigation Plan.

Noteworthy changes include, the addition of a definition for 'storm event' and the requirement of professional registration for certifying persons under the "Alternative Certification' option. Two new references have been added to augment implementation guidance. These are, (i) National Stormwater Best Management Practices (BMP) Database, Version 1.0, and (ii) Denver *Urban Storm Drainage Criteria Manual, Volume 3 – Best Management Practices.*

In the Change Sheet, cross-reference to pages and paragraphs are for the 'Clean Version' dated December 7, 2000. New text added to a sentence is indicated by underline.

Background

1. Page 2 paragraph three, Clarify that a City has to adopt same requirements for the Citywide SUSMP

   Sentence changed to read, "The Permittees are required to adopt the requirements set herein in their own SUSMP."

2. Page 2 paragraph 3, Delete reference to Urban Storm Water Mitigation to avoid confusion

   Sentence changed to read, "Each Permittee will approve the project plan as part of the development plan approval process....

3. Page 3 paragraph 2, Clarify the environmentally sensitive area category.

   Sentence changed to read, "Location within or directly adjacent to or discharging directly to an environmentally sensitive area.

4. Page 3 paragraph 2, Make requirement applicable to stand-alone parking lots only

   Sentence changed to read, "Commercial stand-alone parking lots 5,000 square feet or more.....

Definitions

5. Order definitions alphabetically

   Definitions reordered alpha-numerically

6. Page 3, Modify definition of hillsides to add specificity.

   Definition changed to read, "property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is twenty-five percent or greater."

7. Page 3, Delete exceptions in the definition of Automotive Repair Shop

   Exceptions deleted, now reads, "Automotive Repair Shop" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539."

8. Page 3, Modify definition of 100,000 square foot commercial development for simplicity.

   Definition changed to read, "any commercial development that creates at least 100,000 square feet of impermeable area, including parking areas".

9. Page 4 , Add references for definition of environmentally sensitive areas

   References added for Areas of Special Biological Significance and Area of Ecological Significance.

10. Page 4, , Change definition to include a threshold trigger for requirements to apply to Redevelopment

    Definition changed to read, "Redevelopment" means, on an already developed site, the creation or addition of fifty percent or more of impervious surfaces or the making of improvements to fifty percent or more of the existing structure. Redevelopment includes.....

11. Page 5, , Change definition for Retail gasoline outlets to clarify 'primarily engaged'.

    Definition changed to read, ""Retail Gasoline Outlet" means a facility engaged in selling gasoline and lubricating oils, which derives more than fifty percent of its annual gross receipts from the sale of gasoline, lubricating oils tires, batteries, automobile parts and other automotive services.

12. New Definition, Define a storm event

    Defined storm event to mean, "a rainfall event that produces more than 0.1 inch of precipitation and that, which is separated from the previous storm event by at least 72 hours of dry weather."

SUSMP Provisions Applicable to All Categories

13. Page 5, paragraph 3, Change sentence for clarity

    Sentence changed to read, "....shall not exceed the estimated pre-development rate for developments where it is reasonably foreseeable that the increased peak storm water discharge rate will result in increased potential for downstream erosion."

14. Page 5, paragraph 4, Delete text that makes act dependent on effort

Sentence changed to read, "Concentrate or cluster Development on portions of a site while leaving the remaining land in a natural undisturbed condition."

15. Page 6, paragraph 1, Change sentence for clarity

    Sentence changed to read, "...or the detectable inputs of the pollutant are at a concentrations or loads considered potentially toxic to humans and/or flora and fauna."

16. Page 6, paragraph 2, Add reference

    Added reference, "Denver *Urban Storm Drainage Criteria Manual, Volume 3 – Best Management Practices*"

17. Page 6, paragraph 3, Add text to enable BMP combination alternative

    Added text to read, "However, it is possible that a combination of BMPs not so designated, may in a particular circumstance, be better suited to maximize the reduction of the pollutants".

18. Page 6, paragraph 4, Delete text that is tentative

    Text deleted to read, "Project plans must include BMPs consistent....."

19. Page 6, paragraph 4, Add text to promote use of natural drainage systems

    Add text to read, "Utilize natural drainage systems to the maximum extent practicable"

19. Page 6, paragraph 4, Add text to minimize flow to natural drainage systems

    Text added to read, "Control or reduce or eliminate flow to natural drainage systems to the maximum extent practicable"

20. Page 7, paragraph 2, Change sentence for clarity

    Sentence changed to read, "Materials with the potential to contaminate storm water must be: (1) placed in an enclosure..."

21. Page 7, paragraph 3, Add text to exclude single family residences

    Sentence added to read, " Individual single family residences are exempt from these requirements"

22. Page 8, paragraph 1, Change text for clarity

    Text changed to read, "The transfer of property to a private or public owner must have conditions..."

23. Page 8, paragraph 1, Add text to require maintenance inspection and record.

    Sentence added to read, "The condition of transfer may include a provision that the property owner conduct maintenance inspection of all treatment control BMPs at least once a year and retain proof of inspection."

24. Page 8, paragraph 3, Delete text for clarity

    Text deleted, "~~each runoff event up to and including~~", Now reads, "the 85th percentile 24-hour runoff event...."

25. Page 8, paragraph 3, Correct based on revised chart treatment volume from 85 percent to 80 percent.

    Text changed to read, "to achieve 80 percent or more volume treatment....."

26. Page 8, paragraph 3, Change text for clarity

    Sentence changed to read, "....runoff produced from a 0.75 inch storm event, prior..."

27. Page 8, paragraph 3, Change text for clarity

    Sentence changed to read, "....volume of runoff produced from a historical-record based reference 24-hour rainfall criterion...."

28. Page 9, paragraph 2, Change text to offer partial credit for roofing surfaces diversion

    Sentence changed to read, "A proportional area of roofing surface may be excluded..."

29. Page 9, paragraph 2, Change text for clarity.

    Sentence changed to read, "storm water conveyance system does not directly discharge to a natural stream or channel segment scheduled for restoration".

30. Page 9, paragraph 3, Change text to clarify exemption from numerical standard only.

    Sentence changed to read, "Restaurants, where the land area for development or redevelopment is less than 5,000 square feet, are excluded from the numerical BMP design standard requirement.

Provisions Applicable to Individual Priority Projects

31. Page 10, paragraph 2, and Page 12, paragraph 1, Change text to eliminate mandatory cover.

    Sentence change to read, "...area must be self-contained and/or covered, equipped with a clarifier,..."

32. Page 12, paragraph 3, Change text for clarity.

    Text modified to read, "....hydrocarbons that are deposited on parking lot surfaces by motor vehicles"

33. Page 12, paragraph 3, Add introductory text.

    Sentence added to read, "To minimize the offsite transport of pollutants, the following design criteria are required".

Waiver

34. Page 13, paragraph 1, Add text for clarity

    Text added to read, "....because an existing or potential underground source of drinking water..."

35. Page 13, paragraph 1, Change text to clarify that Permittee is petitioner.

    Sentence modified to read, "Any other justification for impracticability must be separately petitioned by the Permittee and approved...."

Alternative Certification

36. Page 13, paragraph 1, Change sentences to require professional registration and recommend training verification.

    Sentences added to read "...accept a signed certification from a Civil Engineer or a Licensed Architect registered in the State of California, that the plan meets the criteria." And, "The Permittee is encouraged to verify that certifying person(s) have been trained on BMP design for water quality, not more than two years prior to the signature date."

Suggested Resources

37. Page 15, Add reference BMP database and on-line Texas Non-point Source Book

    Reference added, "National Stormwater Best Management Practices (BMP) Database, Version 1.0" ; and "Texas Non-Point Source Book".

STANDARD URBAN STORM WATER MITIGATION PLAN

FOR LOS ANGELES COUNTY AND CITIES IN LOS ANGELES COUNTY

Final
Approved – Regional Board Executive Officer
March 8, 2000.

R0072358

STANDARD URBAN STORM WATER MITIGATION PLAN

BACKGROUND

The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Los Angeles County Permit) issued to Los Angeles County and 85 cities (Permittees) by the Los Angeles Regional Water Quality Control Board (Regional Board) on July 15, 1996, requires the development and implementation of a program addressing storm water pollution issues in development planning for private projects. The same requirements are applicable to the City of Long Beach under its separate municipal storm water permit (City of Long Beach MS4 Permit), which was issued on June 30, 1999.

The requirement to implement a program for development planning is based on, federal and state statutes including: Section 402 (p) of the Clean Water Act, Section 6217 of the Coastal Zone Act Reauthorization Amendments of 1990 ("CZARA"), and the California Water Code. The Clean Water Act amendments of 1987 established a framework for regulating storm water discharges from municipal, industrial, and construction activities under the NPDES program. The primary objectives of the municipal storm water program requirements are to:

1. Effectively prohibit non-storm water discharges, and
2. Reduce the discharge of pollutants from storm water conveyance systems to the Maximum Extent Practicable (MEP statutory standard).

The Standard Urban Storm Water Mitigation Plan (SUSMP) was developed as part of the municipal storm water program to address storm water pollution from new Development and Redevelopment by the private sector. This SUSMP contains a list of the minimum required Best Management Practices (BMPs) that must be used for a designated project. Additional BMPs may be required by ordinance or code adopted by the Permittee and applied generally or on a case by case basis. The Permittees are required to adopt the requirements set herein in their own SUSMP. Developers must incorporate appropriate SUSMP requirements into their project plans. Each Permittee will approve the project plan as part of the development plan approval process and prior to issuing building and grading permits for the projects covered by the SUSMP requirements.

All projects that fall into one of seven categories are identified in the Los Angeles County MS4 Permit as requiring SUSMPs. These categories are:

- Single-Family Hillside Residences
- 100,000 Square Foot Commercial Developments
- Automotive Repair Shops
- Retail Gasoline Outlets
- Restaurants
- Home Subdivisions with 10 to 99 housing units
- Home Subdivisions with 100 or more housing units

The Regional Board Executive Officer has designated two additional categories subject to SUSMP requirements for the Los Angeles County MS4 Permit. These categories are:

- Location within or directly adjacent to or discharging directly to an environmentally sensitive area, and
- Parking lots 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff

The City of Long Beach permit requires SUSMP for the following categories only: (i) 10-99 home subdivisions; (ii) 100 or more subdivisions; (iii) 100,000 or more square foot commercial developments; and (iv) Projects located adjacent to or discharging to environmentally sensitive areas. For the remaining five categories, equivalent requirements have been included directly in or are expected to be developed shortly under the City of Long Beach Storm Water Management Plan.

Permittees shall amend codes and promulgate ordinances not later than September 8, 2000, to give legal effect to the SUSMP requirements. The SUSMP requirements for projects identified herein shall take effect not later than October 8, 2000.

DEFINITIONS

"100,000 Square Foot Commercial Development" means any commercial development that creates at least 100,000 square feet of impermeable area, including parking areas."Automotive Repair Shop" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539.

"Best Management Practice (BMP)" means any program, technology, process, siting criteria, operational methods or measures, or engineered systems, which when implemented prevent, control, remove, or reduce pollution.

"Commercial Development" means any development on private land that is not heavy industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, multi-apartment buildings, car wash facilities, mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses and other light industrial complexes.

"Directly Connected Impervious Area (DCIA)" means the area covered by a building, impermeable pavement, and/ or other impervious surfaces, which drains directly into the storm drain without first flowing across permeable land area (e.g. lawns).

"Discretionary Project" means a project which requires the exercise of judgement or deliberation when the public agency or public body decides to approve or disapprove a particular activity, as distinguished from situations where the public agency or body merely has to determine whether there has been conformity with applicable statutes, ordinances, or regulations.

"Environmentally Sensitive Area" means an area designated as an Area of Special Biological Significance by the State Water Resources Control Board (*Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties* (1994) and amendments) or an area designated as an Area of Ecological Significance by the County of Los *Angeles (Los Angeles County Significant Areas Study, Los Angeles County Department of Regional Planning (1976)* and amendments) or an area designated as a significant natural area by the California Resources Agency. Refer to Table 3 for a listing.

"Greater than (>) 9 unit home subdivision" means any subdivision being developed for 10 or more 10 single-family or multi-family dwelling units.

"Hillside" means property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is twenty-five percent or greater.

"Infiltration" means the downward entry of water into the surface of the soil.

"New Development" means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.

"Parking Lot" means land area or facility for the temporary parking or storage of motor vehicles used personally, for business or for commerce with a lot size of 5,000 square feet or more, or with 25 or more parking spaces.

"Redevelopment" means, on an already developed site, the creation or addition of at least 5,000 square feet of impervious surfaces or the creation or addition of fifty percent or more of impervious surfaces or the making of improvements to fifty percent or more of the existing structure. Redevelopment includes, but is not limited to: the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/ or exterior construction or remodeling; replacement of impervious surface that is not part of a routine maintenance activity; and land disturbing activities related with structural or impervious surfaces.

"Restaurant" means a stand-alone facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption. (SIC code 5812).

"Retail Gasoline Outlet" means any facility engaged in selling gasoline and lubricating oils.

"Source Control BMP" means any schedules of activities, prohibitions of practices, maintenance procedures, managerial practices or operational practices that aim to prevent storm water pollution by reducing the potential for contamination at the source of pollution.

"Storm Event" means a rainfall event that produces more than 0.1 inch of precipitation and that, which is separated from the previous storm event by at least 72 hours of dry weather.

"Structural BMP" means any structural facility designed and constructed to mitigate the adverse impacts of storm water and urban runoff pollution (e.g. canopy, structural enclosure). The category may include both Treatment Control BMPs and Source Control BMPs.

"Treatment" means the application of engineered systems that use physical, chemical, or biological processes to remove pollutants. Such processes include, but are not limited to, filtration, gravity settling, media adsorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

"Treatment Control BMP" means any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media adsorption or any other physical, biological, or chemical process.

CONFLICTS WITH LOCAL PRACTICES

Where provisions of the SUSMP requirements conflict with established local codes, (e.g., specific language of signage used on storm drain stenciling), the Permittee may continue the local practice and modify the SUSMP to be consistent with the code, except that to the extent that the standards in the SUSMP are more stringent than those under local codes, such more stringent standards shall apply.

SUSMP PROVISIONS APPLICABLE TO ALL CATEGORIES

REQUIREMENTS

1. PEAK STORM WATER RUNOFF DISCHARGE RATES

Post-development peak storm water runoff discharge rates shall not exceed the estimated pre-development rate for developments where the increased peak storm water discharge rate will result in increased potential for downstream erosion.

2. CONSERVE NATURAL AREAS

If applicable, the following items are required and must be implemented in the site layout during the subdivision design and approval process, consistent with applicable General Plan and Local Area Plan policies:

- Concentrate or cluster Development on portions of a site while leaving the remaining land in a natural undisturbed condition.
- Limit clearing and grading of native vegetation at a site to the minimum amount needed to build lots, allow access, and provide fire protection.
- Maximize trees and other vegetation at each site by planting additional vegetation, clustering tree areas, and promoting the use of native and/or drought tolerant plants.
- Promote natural vegetation by using parking lot islands and other landscaped areas.
- Preserve riparian areas and wetlands.

3. MINIMIZE STORM WATER POLLUTANTS OF CONCERN

Storm water runoff from a site has the potential to contribute oil and grease, suspended solids, metals, gasoline, pesticides, and pathogens to the storm water conveyance system. The development must be designed so as to minimize, to the maximum extent practicable, the introduction of pollutants of concern that may result in significant impacts, generated from site runoff of directly connected impervious areas (DCIA), to the storm water conveyance system as approved by the building official. Pollutants of concern, consist of any pollutants that exhibit one or more of the following characteristics: current loadings or historic deposits of the pollutant are impacting the beneficial uses of a receiving water, elevated levels of the pollutant are found in sediments of a receiving water and/or have the potential to bioaccumulate in organisms therein, or the detectable inputs of the pollutant are at a concentrations or loads considered potentially toxic to humans and/or flora and fauna.

In meeting this specific requirement, "minimization of the pollutants of concern" will require the incorporation of a BMP or combination of BMPs best suited to maximize the reduction of pollutant loadings in that runoff to the Maximum Extent Practicable. Those

BMPs best suited for that purpose are those listed in the *California Storm Water Best Management Practices Handbooks*; *Caltrans Storm Water Quality Handbook: Planning and Design Staff Guide*; *Manual for Storm Water Management in Washington State*; *The Maryland Stormwater Design Manual*; *Florida Development Manual: A Guide to Sound Land and Water Management*; Denver *Urban Storm Drainage Criteria Manual, Volume 3 – Best Management Practices* and *Guidance Specifying Management Measures for Sources of Nonpoint Pollution in Coastal Waters* , USEPA Report No. EPA-840-B-92-002, as "likely to have significant impact" beneficial to water quality for targeted pollutants that are of concern at the site in question. However, it is possible that a combination of BMPs not so designated, may in a particular circumstance, be better suited to maximize the reduction of the pollutants.

Examples of BMPs that can be used for minimizing the introduction of pollutants of concern generated from site runoff are identified in Table 2. Any BMP not specifically approved by the Regional Board in Resolution No. 99-03, "Approving Best Management Practices for Municipal Storm Water and Urban Runoff Programs in Los Angeles County", for development planning may be used if they have been recommended in one of the above references.

4. PROTECT SLOPES AND CHANNELS

Project plans must include BMPs consistent with local codes and ordinances and the SUSMP to decrease the potential of slopes and/or channels from eroding and impacting storm water runoff:

- Convey runoff safely from the tops of slopes and stabilize disturbed slopes.
- Utilize natural drainage systems to the maximum extent practicable
- Control or reduce or eliminate flow to natural drainage systems to the maximum extent practicable
- Stabilize permanent channel crossings.
- Vegetate slopes with native or drought tolerant vegetation.
- Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion, with the approval of all agencies with jurisdiction, e.g., the U.S. Army Corps of Engineers and the California Department of Fish and Game

5. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Storm drain stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets. The stencil contains a brief statement that prohibits the dumping of improper materials into the storm water conveyance system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are

effective supplements to the anti-dumping message.

- All storm drain inlets and catch basins within the project area must be stenciled with prohibitive language (such as: "NO DUMPING – DRAINS TO OCEAN") and/or graphical icons to discourage illegal dumping.
- Signs and prohibitive language and/or graphical icons, which prohibit illegal dumping, must be posted at public access points along channels and creeks within the project area.
- Legibility of stencils and signs must be maintained.

6. PROPERLY DESIGN OUTDOOR MATERIAL STORAGE AREAS

Outdoor material storage areas refer to storage areas or storage facilities solely for the storage of materials. Improper storage of materials outdoors may provide an opportunity for toxic compounds, oil and grease, heavy metals, nutrients, suspended solids, and other pollutants to enter the storm water conveyance system. Where proposed project plans include outdoor areas for storage of materials that may contribute pollutants to the storm water conveyance system, the following Structural or Treatment BMPs are required:

- Materials with the potential to contaminate storm water must be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the storm water conveyance system; or (2) protected by secondary containment structures such as berms, dikes, or curbs.
- The storage area must be paved and sufficiently impervious to contain leaks and spills.
- The storage area must have a roof or awning to minimize collection of storm water within the secondary containment area.

7. PROPERLY DESIGN TRASH STORAGE AREAS

A trash storage area refers to an area where a trash receptacle or receptacles are located for use as a repository for solid wastes.

Loose trash and debris can be easily transported by the forces of water or wind into nearby storm drain inlets, channels, and/or creeks. All trash container areas must meet the following Structural or Treatment Control BMP requirements (individual single family residences are exempt from these requirements):

- Trash container areas must have drainage from adjoining roofs and pavement diverted around the area(s).

- Trash container areas must be screened or walled to prevent off-site transport of trash.

8. PROVIDE PROOF OF ONGOING BMP MAINTENANCE

Improper maintenance is one of the most common reasons why water quality controls will not function as designed or which may cause the system to fail entirely. It is important to consider who will be responsible for maintenance of a permanent BMP, and what equipment is required to perform the maintenance properly. As part of project review, if a project applicant has included or is required to include, Structural or Treatment Control BMPs in project plans, the Permittee shall require that the applicant provide verification of maintenance provisions through such means as may be appropriate, including, but not limited to legal agreements, covenants, CEQA mitigation requirements and/or Conditional Use Permits.

For all properties, the verification will include the developer's signed statement, as part of the project application, accepting responsibility for all structural and treatment control BMP maintenance until the time the property is transferred and, where applicable, a signed agreement from the public entity assuming responsibility for Structural or Treatment Control BMP maintenance. The transfer of property to a private or public owner must have conditions requiring the recipient to assume responsibility for maintenance of any Structural or Treatment Control BMP to be included in the sales or lease agreement for that property, and will be the owner's responsibility. The condition of transfer shall include a provision that the property owners conduct maintenance inspection of all Structural or Treatment Control BMPs at least once a year and retain proof of inspection. For residential properties where the Structural or Treatment Control BMPs are located within a common area which will be maintained by a homeowner's association, language regarding the responsibility for maintenance must be included in the projects conditions, covenants and restrictions (CC&Rs). Printed educational materials will be required to accompany the first deed transfer to highlight the existence of the requirement and to provide information on what storm water management facilities are present, signs that maintenance is needed, how the necessary maintenance can be performed, and assistance that the Permittee can provide. The transfer of this information shall also be required with any subsequent sale of the property.

If Structural or Treatment Control BMPs are located within a public area proposed for transfer, they will be the responsibility of the developer until they are accepted for transfer by the County or other appropriate public agency. Structural or Treatment Control BMPs proposed for transfer must meet design standards adopted by the public entity for the BMP installed and should be approved by the County or other appropriate public agency prior to its installation.

9. DESIGN STANDARDS FOR STRUCTURAL OR TREATMENT CONTROL BMPs

Structural or Treatment control BMPs selected for use at any project covered by this SUSMP shall meet the design standards of this Section unless specifically exempted.

Post-construction Structural or Treatment Control BMPs shall be designed to:

A. mitigate (infiltrate or treat) storm water runoff from either:

1. the 85th percentile 24-hour runoff event determined as the maximized capture storm water volume for the area, from the formula recommended in *Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998)*, or

2. the volume of annual runoff based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment by the method recommended in *California Stormwater Best Management Practices Handbook – Industrial/ Commercial,* (1993), or

3. the volume of runoff produced from a 0.75 inch storm event, prior to its discharge to a storm water conveyance system, or

4. the volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event,

AND

B. control peak flow discharge to provide stream channel and over bank flood protection, based on flow design criteria selected by the local agency.

Limited Exclusion

Restaurants, where the land area for development or redevelopment is less than 5,000 square feet, are excluded from the numerical Structural or Treatment Control BMP design standard requirement only.

10. PROVISIONS APPLICABLE TO INDIVIDUAL PRIORITY PROJECT CATEGORIES

REQUIREMENTS

A. 100,000 SQUARE FOOT COMMERCIAL DEVELOPMENTS

1. PROPERLY DESIGN LOADING/UNLOADING DOCK AREAS

Loading/unloading dock areas have the potential for material spills to be quickly transported to the storm water conveyance system. To minimize this potential, the following design criteria are required:

- Cover loading dock areas or design drainage to minimize run-on and runoff of storm water.
- Direct connections to storm drains from depressed loading docks (truck wells) are prohibited.

2. PROPERLY DESIGN REPAIR/MAINTENANCE BAYS

Oil and grease, solvents, car battery acid, coolant and gasoline from the repair/maintenance bays can negatively impact storm water if allowed to come into contact with storm water runoff. Therefore, design plans for repair bays must include the following:

- Repair/maintenance bays must be indoors or designed in such a way that doesn't allow storm water runon or contact with storm water runoff.
- Design a repair/maintenance bay drainage system to capture all washwater, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

3. PROPERLY DESIGN VEHICLE/EQUIPMENT WASH AREAS

The activity of vehicle/equipment washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. Include in the project plans an area for washing/steam cleaning of vehicles and equipment. The area in the site design must be:

- Self-contained and/ or covered, equipped with a clarifier, or other pretreatment facility, and properly connected to a sanitary sewer.

B. RESTAURANTS

1. PROPERLY DESIGN EQUIPMENT/ACCESSORY WASH AREAS

The activity of outdoor equipment/accessory washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. Include in the project plans an area for the washing/steam cleaning of equipment and accessories. This area must be:

- Self-contained, equipped with a grease trap, and properly connected to a sanitary sewer.
- If the wash area is to be located outdoors, it must be covered, paved, have secondary containment, and be connected to the sanitary sewer.

C. RETAIL GASOLINE OUTLETS

1. PROPERLY DESIGN FUELING AREA

Fueling areas have the potential to contribute oil and grease, solvents, car battery acid, coolant and gasoline to the storm water conveyance system. The project plans must include the following BMPs:

- The fuel dispensing area must be covered with an overhanging roof structure or canopy. The canopy's minimum dimensions must be equal to or greater than the area within the grade break. The canopy must not drain onto the fuel dispensing area, and the canopy downspouts must be routed to prevent drainage across the fueling area.
- The fuel dispensing area must be paved with Portland cement concrete (or equivalent smooth impervious surface), and the use of asphalt concrete shall be prohibited.
- The fuel dispensing area must have a 2% to 4% slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of storm water to the extent practicable.
- At a minimum, the concrete fuel dispensing area must extend 6.5 feet (2.0 meters) from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot (0.3 meter), whichever is less.

D. AUTOMOTIVE REPAIR SHOPS

1. PROPERLY DESIGN FUELING AREA

Fueling areas have the potential to contribute oil and grease, solvents, car battery acid, coolant and gasoline to the storm water conveyance system. Therefore, design plans, which include fueling areas, must contain the following:

- The fuel dispensing area should be covered with an overhanging roof structure or canopy. The cover's minimum dimensions must be equal to or greater than the area within the grade break. The

cover must not drain onto the fuel dispensing area and the downspouts must be routed to prevent drainage across the fueling area.

- The fuel dispensing areas must be paved with Portland cement concrete (or equivalent smooth impervious surface), and the use of asphalt concrete shall be prohibited.
- The fuel dispensing area must have a 2% to 4% slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of storm water.
- At a minimum, the concrete fuel dispensing area must extend 6.5 feet (2.0 meters) from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot (0.3 meter), whichever is less.

2. PROPERLY DESIGN REPAIR/MAINTENANCE BAYS

Oil and grease, solvents, car battery acid, coolant and gasoline from the repair/maintenance bays can negatively impact storm water if allowed to come into contact with storm water runoff. Therefore, design plans for repair bays must include the following:

- Repair/maintenance bays must be indoors or designed in such a way that doesn't allow storm water run-on or contact with storm water runoff.
- Design a repair/maintenance bay drainage system to capture all wash-water, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

3. PROPERLY DESIGN VEHICLE/EQUIPMENT WASH AREAS

The activity of vehicle/equipment washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. Include in the project plans an area for washing/steam cleaning of vehicles and equipment. This area must be:

- Self-contained and/or covered, equipped with a clarifier, or other pretreatment facility, and properly connected to a sanitary sewer or to a permitted disposal facility.

4. PROPERLY DESIGN LOADING/UNLOADING DOCK AREAS

Loading/unloading dock areas have the potential for material spills to be quickly transported to the storm water conveyance system. To minimize this potential, the following design criteria are required:

- Cover loading dock areas or design drainage to minimize run-on and runoff of storm water.
- Direct connections to storm drains from depressed loading docks (truck wells) are prohibited.

E. PARKING LOTS

1. PROPERLY DESIGN PARKING AREA

Parking lots contain pollutants such as heavy metals, oil and grease, and polycyclic aromatic hydrocarbons that are deposited on parking lot surfaces by motor-vehicles. These pollutants are directly transported to surface waters. To minimize the offsite transport of pollutants, the following design criteria are required:

- Reduce impervious land coverage of parking areas
- Infiltrate runoff before it reaches storm drain system.
- Treat runoff before it reaches storm drain system

2. PROPERLY DESIGN TO LIMIT OIL CONTAMINATION AND PERFORM MAINTENANCE

Parking lots may accumulate oil, grease, and water insoluble hydrocarbons from vehicle drippings and engine system leaks.

- Treat to remove oil and petroleum hydrocarbons at parking lots that are heavily used (e.g. fast food outlets, lots with 25 or more parking spaces , sports event parking lots, shopping malls, grocery stores, discount warehouse stores)
- Ensure adequate operation and maintenance of treatment systems particularly sludge and oil removal, and system fouling and plugging prevention control

11. WAIVER

A Permittee may, through adoption of an ordinance or code incorporating the treatment requirements of the SUSMP, provide for a waiver from the requirement if impracticability for a specific property can be established. A waiver of impracticability shall be granted only when all other Structural or Treatment Control BMPs have been considered and rejected as infeasible. Recognized situations of impracticability include, (i) extreme limitations of space for treatment on a redevelopment project, (ii) unfavorable or unstable soil conditions at a site to attempt infiltration, and (iii) risk of ground water contamination because a known unconfined aquifer lies beneath the land surface or an existing or potential underground source of drinking water is less than 10 feet from the soil surface. Any other justification for impracticability must be separately petitioned by the Permittee and submitted to the Regional Board for consideration. The Regional Board may consider approval of the waiver justification or may delegate the authority to approve a class of waiver justifications to the Regional Board Executive Officer. The supplementary waiver justification becomes recognized and effective only after approval by the Regional Board or the Regional Board Executive Officer. A waiver granted by a Permittee to any development or redevelopment project may be revoked by the Regional Board Executive Officer for cause and with proper notice upon petition.

If a waiver is granted for impracticability, the Permittee must require the project proponent to transfer the savings in cost, as determined by the Permittee, to a storm water mitigation fund to be used to promote regional or alternative solutions for storm water pollution in the storm watershed and operated by a public agency or a non-profit entity.

12. LIMITATION ON USE OF INFILTRATION BMPs

Three factors significantly influence the potential for storm water to contaminate ground water. They are (i) pollutant mobility, (ii) pollutant abundance in storm water, (iii) and soluble fraction of pollutant. The risk of contamination of groundwater may be reduced by pretreatment of storm water. A discussion of limitations and guidance for infiltration practices is contained in, *Potential Groundwater Contamination from Intentional and Non-Intentional Stormwater Infiltration, Report No. EPA/600/R-94/051, USEPA (1994).*

In addition, the distance of the groundwater table from the infiltration BMP may also be a factor determining the risk of contamination. A water table distance separation of ten feet depth in California presumptively poses negligible risk for storm water not associated with industrial activity or high vehicular traffic.

Infiltration BMPs are not recommended for areas of industrial activity or areas subject to high vehicular traffic (25,000 or greater average daily traffic (ADT) on main roadway or 15,000 or more ADT on any intersecting roadway) unless appropriate pretreatment is provided to ensure groundwater is protected and the infiltration BMP is not rendered ineffective by overload.

13. ALTERNATIVE CERTIFICATION FOR STORM WATER TREATMENT MITIGATION

In lieu of conducting detailed BMP review to verify Structural or Treatment Control BMPs adequacy, a Permittee may elect to accept a signed certification from a Civil Engineer or a Licensed Architect registered in the State of California, that the plan meets the criteria established herein. The Permittee is encouraged to verify that certifying person(s) have been trained on BMP design for water quality, not more than two years prior to the signature date. Training conducted by an organization with storm water BMP design expertise (e.g., a University, American Society of Civil Engineers, American Society of Landscape Architects, American Public Works Association, or the California Water Environment Association) may be considered qualifying.

TABLE 2

EXAMPLE BEST MANAGEMENT PRACTICES (BMPs)

The following are examples of BMPs that can be used for minimizing the introduction of pollutants of concern that may result in significant impacts, generated from site runoff to the storm water conveyance system. (See Table 1: Suggested Resources for additional sources of information):

- Provide reduced width sidewalks and incorporate landscaped buffer areas between sidewalks and streets. However, sidewalk widths must still comply with regulations for the Americans with Disabilities Act and other life safety requirements.
- Design residential streets for the minimum required pavement widths needed to comply with all zoning and applicable ordinances to support travel lanes; on-street parking; emergency, maintenance, and service vehicle access; sidewalks; and vegetated open channels.
- Comply with all zoning and applicable ordinances to minimize the number of residential street cul-de-sacs and incorporate landscaped areas to reduce their impervious cover. The radius of cul-de-sacs should be the minimum required to accommodate emergency and maintenance vehicles. Alternative turnarounds should be considered.
- Use permeable materials for private sidewalks, driveways, parking lots, or interior roadway surfaces (examples: hybrid lots, parking groves, permeable overflow parking, etc.).
- Use open space development that incorporates smaller lot sizes.
- Reduce building density.
- Comply with all zoning and applicable ordinances to reduce overall lot imperviousness by promoting alternative driveway surfaces and shared driveways that connect two or more homes together.
- Comply with all zoning and applicable ordinances to reduce the overall imperviousness associated with parking lots by providing compact car spaces, minimizing stall dimensions, incorporating efficient parking lanes, and using pervious materials in spillover parking areas.
- Direct rooftop runoff to pervious areas such as yards, open channels, or vegetated areas, and avoid routing rooftop runoff to the roadway or the storm water conveyance system.
- Vegetated swales and strips
- Extended/dry detention basins
- Infiltration basin
- Infiltration trenches
- Wet ponds
- Constructed wetlands
- Oil/Water separators
- Catch basin inserts
- Continuous flow deflection/ separation systems
- Storm drain inserts
- Media filtration
- Bioretention facility
- Dry-wells
- Cisterns
- Foundation planting
- Catch basin screens
- Normal flow storage/ separation systems
- Clarifiers
- Filtration systems
- Primary waste water treatment systems

TABLE 3

HABITAT PROTECTION IN THE LOS ANGELES COUNTY AREA

Agency:
State Water Resources Control Board

Designation:
Areas of Significant Biological Significance (ASBS)

Definition:
Areas designated by the State Water Resources Control Board as requiring protection of species or biological communities to the extent that alteration of natural water quality is undesirable.

Affected Area:
(See Table 1 & Figure 2)

Agency:
Los Angeles County Department of Regional Planning

Designation:
Significant Ecological Areas (SEA)

Definitions:
Significant Ecological Areas (SEAs) are areas that have been identified by the Los Angeles County General Plan as containing unique or unusual species assemblages, or areas of habitat that are rapidly declining in the Los Angeles County. The SEAs were established to protect a special or sometimes unique collection of habitats and species from loss due to encroachment and human disturbances. However, SEAs are not intended to function as isolated preservation areas.

Affected Areas:
(See Table A & Figure 1)

Agency:
California Department of Fish & Game

Designation:
Natural Communities Conservation Plan Region (NCCP)

Definition:
Identifies and provides for the regional or area wide protection and perpetuation of natural wildlife diversity, while allowing compatible and appropriate development and growth. The goal of the program is to protect sufficient resources in regional preserves to assure the survival of the ecosystem and, at the same time, permit compatible uses of less sensitive land.

Affected Area:
(See Table 1 & Figure 3)

Dear Mr. Montevideo, Mr. Deitsch, and Mr. Welch:

PETITIONS OF THE CITIES OF ARTESIA, ET AL., THE CITY OF ARCADIA, AND WESTERN STATES PETROLEUM ASSOCIATION (REVIEW OF JANUARY 26, 2000 ACTION OF THE REGIONAL BOARD, AND ACTIONS AND FAILURES TO ACT BY BOTH THE REGIONAL BOARD AND ITS EXECUTIVE OFFICER PURSUANT TO ORDER NO. 96-054, PERMIT FOR MUNICIPAL STORM WATER AND URBAN RUN-OFF DISCHARGES WITHIN LOS ANGELES COUNTY [NPDES NO. CAS614001]), LOS ANGELES REGION: CONSOLIDATION OF COMPLETED PETITIONS, 20-DAY RESPONSE
SWRCB/OCC FILES A-1280, A-1280(a) AND A-1280(b)

The above-referenced petitions are complete. As authorized by the California Code of Regulations, title 23, section 2054, the petitions will be consolidated for review since they are legally and factually related. The Los Angeles Regional Water Quality Control Board (RWQCB) and other interested parties may now file a response to the petitions. Responses are due within 20 days of the date of this letter, addressed to my attention. In addition, all responses must be sent to the Cities of Artesia, et al., the City of Arcadia and Western States Petroleum Association, at the addresses listed above and, if appropriate, to the RWQCB. The RWQCB is requested to file the administrative record (copied on one side to the extent possible) within this 20-day period.

Copies of the petitions may be obtained from the Cities of Artesia, et al., the City of Arcadia and Western States Petroleum Association. If you have any questions regarding this letter, please contact me at (916) 657-2421 or CALNET 8-437-2421.

Sincerely,

Elizabeth Miller Jennings
Senior Staff Counsel

Dear Mr. Montevideo and Mr. Welch:

PETITIONS OF THE CITIES OF BELLFLOWER, ET AL. AND WESTERN STATES PETROLEUM ASSOCIATION (REVIEW OF JANUARY 26, 2000 ACTION OF THE REGIONAL BOARD, AND ACTIONS AND FAILURES TO ACT BY BOTH THE REGIONAL BOARD AND ITS EXECUTIVE OFFICER PURSUANT TO ORDER NO. 96-054, PERMIT FOR MUNICIPAL STORM WATER AND URBAN RUN-OFF DISCHARGES WITHIN LOS ANGELES COUNTY [NPDES NO. CAS614001]), LOS ANGELES REGION: AMENDMENT OF PARTIES TO PETITION
SWRCB/OCC FILES A-1280 and A-1280(b)

I have received your amendments to the above petitions. The City of Artesia will be deleted as a petitioner, and the Cities of Bell Gardens, Compton, Hawaiian Gardens, Huntington Park, Industry, Montebello, Paramount, Rosemead and San Gabriel will be added as petitioners. The title of petition A-1280 will now refer to the Cities of Bellflower et al.

The amended petitions you filed will be reviewed along with the original petition. The Los Angeles Regional Water Quality Control Board (RWQCB) and interested persons may submit responses to the amended petitions within 20 days of the date of this letter. In addition, all responses must be sent to the Cities of Bellflower et al. and Western States Petroleum Association, at the addresses listed above and, if appropriate, to the RWQCB.

Copies of the amended petitions may be obtained from the Cities of Bellflower et al. and Western States Petroleum Association. If you have any questions regarding this letter, please contact me at (916) 657-2421 or CALNET 8-437-2421.

Sincerely,

Elizabeth M. Jennings
Senior Staff Counsel

Dear Messrs. Swamikannu and Beckman:

PETITIONS OF THE CITIES OF BELLFLOWER, ET AL., CITY OF ARCADIA, AND WESTERN STATES PETROLEUM ASSOCIATION (REVIEW OF JANUARY 26, 2000 ACTION OF THE REGIONAL BOARD, AND ACTIONS AND FAILURES TO ACT BY BOTH THE REGIONAL BOARD AND ITS EXECUTIVE OFFICER PURSUANT TO ORDER NO. 96-054, PERMIT FOR MUNICIPAL STORM WATER AND URBAN RUN-OFF DISCHARGES WITHIN LOS ANGELES COUNTY [NPDES NO. CAS614001]), LOS ANGELES REGION: EXTENSION OF TIME TO RESPOND
SWRCB/OCC FILES A-1280, A-1280(a), and A-1280(b)

Pursuant to your requests, the administrative record of the Los Angeles Regional Water Quality Control Board (RWQCB) and all responses to these petitions and amendments thereto are now due on May 2, 2000. The RWQCB and interested persons may submit responses to the petition and amendments by that date.

If you have any questions regarding this letter, please contact me at (916) 657-2421 or CALNET 8-437-2421.

Sincerely,

Elizabeth M. Jennings

Dear Messrs. Montevideo, Welch, and Deitsch:

PETITIONS OF THE CITIES OF BELLFLOWER, ET AL., THE CITY OF ARCADIA, AND WESTERN STATES PETROLEUM ASSOCIATION (REVIEW OF JANUARY 26, 2000 ACTION OF THE REGIONAL BOARD, AND ACTIONS AND FAILURES TO ACT BY BOTH THE REGIONAL BOARD AND ITS EXECUTIVE OFFICER PURSUANT TO ORDER NO. 96-054, PERMIT FOR MUNICIPAL STORM WATER AND URBAN RUN-OFF DISCHARGES WITHIN LOS ANGELES COUNTY [NPDES NO. CAS614001]), LOS ANGELES REGION: DISMISSAL OF STAY REQUEST **SWRCB/OCC FILES A-1280, A-1280(a), and A-1280(b)**

Review of the above-referenced requests for stay is complete. This review indicates that the request for stay in this matter fails to produce proof of all three of the prerequisites for a stay as specified in California Code of Regulations, title 23, section 2053. Accordingly, your request is denied. The petition you filed with the State Water Resources Control Board (State Water Board) concerning the above-mentioned matter is still under review. As described in a separate Notice, the State Water Board will hold a hearing on the merits of the petitions. You will also be notified of any further action on your petitions.

If you have any questions about this matter, please contact Elizabeth Miller Jennings, Senior Staff Counsel, in the Office of Chief Counsel, at (916) 657-2421.

Sincerely,

Edward C. Anton
Acting Executive Director

00 MAY 12 AM 9:35
QUALITY CONTROL BOARD
LOS ANGELES REGION

PURPOSE OF HEARING

The State Water Resources Control Board (State Water Board) has scheduled a hearing on the above petitions at the time and place noted above. The hearing will take place on June 7, 2000 at 10:00 a.m. If necessary, the State Water Board will continue the hearing on June 8, 2000, at 9:00 a.m. The purpose of the hearing is to receive oral and written testimony and policy statements that will assist the State Water Board in reviewing the actions of the Los Angeles Regional Water Quality Control Board (Regional Water Board) and its Executive Officer in approving and issuing the Standard Urban Storm Water Mitigation Plan (SUSMP).

The State Water Board may meet in closed session to deliberate on a decision to be made based on evidence taken at the hearing, either immediately following the hearing or at a subsequent time. The closed session is authorized under Government Code section 11126, subdivision (c)(3). The State Water Board may consider taking further action on these petitions. If so, a draft decision will be circulated to the public, prior to adoption at a subsequent public meeting. As described in a separate letter, the State Water Board will not hold a hearing on the stay request in this matter.

HEARING PROCEDURES

A copy of the procedures governing State Water Board hearings may be found at

Title 23, California Code of Regulations, section 648 and following, and is available at http://www.swrcb.ca.gov/cawtrcde/adcov.doc or upon request. The hearing will not be conducted as a formal hearing under Chapter 5 of the Administrative Procedure Act (commencing at Government Code section 11500).

HEARING PARTICIPATION

Participants at the hearing are either "parties" or "interested persons." Parties to the hearing may present evidence and are subject to cross-examination. Parties may also cross-examine witnesses for other parties. Interested persons may present non-evidentiary policy statements, and are not subject to cross-examination. Interested persons may not cross-examine parties.

The following participants are hereby designated as parties at the hearing:

1. All cities named as petitioners in Files A-1280 and A-1280(a), Building Industry Association of Southern California, Building Industry Legal Defense Foundation
2. Western States Petroleum Association
3. Natural Resources Defense Council, Santa Monica BayKeeper, Heal the Bay
4. Los Angeles Regional Water Quality Control Board

All other persons who wish to participate in the hearing as a party must request party status by submitting a request no later than **May 19, 2000**. The request must explain the basis for status as a party, the evidence that will be presented, and a statement explaining why the above parties do not adequately represent the person's interests.

To ensure that all participants have an opportunity to participate in the hearing, the following time limits will apply. Each of the four parties listed above, and any other parties that are designated, will have 60 minutes to testify. Each interested person will have 3 minutes to present a policy statement. Participants with similar comments are requested to make joint presentations, and participants are requested to avoid redundant comments. Additional time may be provided upon a showing that additional time is necessary.

WRITTEN TESTIMONY, EXHIBITS AND POLICY STATEMENTS

The administrative record before the Regional Water Board in this matter will be made a part of the record before the State Water Board. Therefore, documents and evidence already in the record should not be submitted. A brief summary of earlier submissions is acceptable, if it is received by the deadlines below.

All written evidence and exhibits must be received no later than **May 31, 2000**. Non-evidentiary policy statements must be received by the close of the hearing.

Each party proposing to present testimony and exhibits on factual or other evidentiary matters at the hearing must submit the testimony and exhibits in writing. Oral testimony that goes beyond the scope of written testimony may be excluded. Persons who propose to offer expert testimony must include a statement of qualifications of the expert witness. Parties must submit 8 copies of written testimony and

must submit 8 copies of written testimony and exhibits to the State Water Board, and must send one copy to each of the other parties at the addresses listed below. Interested persons may submit one copy of policy statements in advance to the State Water Board only.

RECEIVED
00 MAY 30 PM 1:44
STATE WATER RESOURCES CONTROL BOARD
QUALITY CONTROL BOARD
LOS ANGELES REGION

MAY 25 2000

Richard Montevideo, Esq.
Rutan & Tucker
611 Anton Boulevard, 14th Floor
Costa Mesa, CA 92626-1950

Dear Mr. Montevideo:

PETITIONS OF THE CITIES OF BELLFLOWER, ET AL., CITY OF ARCADIA, AND WESTERN STATES PETROLEUM ASSOCIATION (REVIEW OF JANUARY 26, 2000 ACTION OF THE REGIONAL BOARD, AND ACTIONS AND FAILURES TO ACT BY BOTH THE REGIONAL BOARD AND ITS EXECUTIVE OFFICER PURSUANT TO ORDER NO. 96-054, PERMIT FOR MUNICIPAL STORM WATER AND URBAN RUN-OFF DISCHARGES WITHIN LOS ANGELES COUNTY [NPDES NO. CAS614001]), LOS ANGELES REGION: RESPONSE TO LETTER DATED MAY 23, 2000
SWRCB/OCC FILES A-1280, A-1280(a), and A-1280(b)

In response to your letter dated May 23, 2000, the State Water Resources Control Board (State Water Board) considers the issues in your petition to be very important, and therefore, in response to your request, is hearing the matter at its earliest opportunity. In light of the petitioners' interest in resolving these issues quickly, and the requirement that a petitioner who requests a hearing must describe in detail the evidence that it will provide in making that request (California Code of Regulations (CCR), title 23, section 2050(b)), the timing of the notice for the hearing and the hearing itself appears appropriate. I am aware that two comment letters in the 14-volume administrative record were not included, but I have requested staff at the Los Angeles Regional Water Quality Control Board (Regional Water Board) to provide these.

Regarding your questions about the hearing process, I believe the hearing notice is clear, and it is in compliance with the Administrative Procedure Act (APA) (Government Code section 11400 et seq.; APA).

The State Water Board has complied with the procedures set forth in Title 23, CCR section 648.1 for designating parties. If you wish to contest those designations, you may make those arguments during your presentation to the Board at the hearing. The time for cross-examination will not be included in your 60-minutes presentation. The chairman will determine amount of time for cross-examination in the proceedings. The allowance for a closing statement is discretionary. (Id., at section 648.5(d).) If the Board members allow closing statements, they will not be

deducted from the 60 minutes. Regarding your question about subpoenas, the rule regarding their use is in California Code of Regulations, title 23, section 649.6.

You question the authority of the State Water Board to meet in closed session following the conclusion of the hearing. The Open Meeting Act allows for closed session "to deliberate on a decision to be reached in a proceeding required to be conducted pursuant to Chapter 5 (commencing with section 11500) or Part 1 of Division 3 of title 2 [formal hearings under the APA] *or similar provisions of law*." (Government Code section 11126(c)(3); emphasis added.) In this matter, the State Water Board is holding a formal hearing pursuant to Chapter 4.5 (commencing with section 11400) of the APA. This hearing, which includes notice and cross-examination, is similar to the Chapter 5 formal hearing, and a closed session is authorized by section 11126(c)(3). Finally, you state that you reserve the right to object of holding an "informal hearing." This is not an informal hearing, and California Code of Regulations, title 23, section 648.7 is not applicable.

If you have any questions, you may contact me at 916-657-2421.

Sincerely,

Elizabeth M. Jennings
Senior Staff Counsel

Dear Messrs. Montevideo, Deitsch, Welch, Helperin, and León:

PETITIONS OF THE CITIES OF BELLFLOWER, ET AL., CITY OF ARCADIA, AND WESTERN STATES PETROLEUM ASSOCIATION (REVIEW OF JANUARY 26, 2000 ACTION OF THE REGIONAL BOARD, AND ACTIONS AND FAILURES TO ACT BY BOTH THE REGIONAL BOARD AND ITS EXECUTIVE OFFICER PURSUANT TO ORDER NO. 96-054, PERMIT FOR MUNICIPAL STORM WATER AND URBAN RUN-OFF DISCHARGES WITHIN LOS ANGELES COUNTY [NPDES NO. CAS614001]), LOS ANGELES REGION: POST HEARING BRIEFS SWRCB/OCC FILES A-1280, A-1280(a), and A-1280(b)

As Acting Chairman Baggett stated at the conclusion of the June 7-8 hearing in Torrance, you are each asked to submit a post-hearing brief in this matter. The briefs must be received at this office no later than 5:00 p.m. on July 7, 2000. Late submittals will not be entered into the record or considered. The briefs are subject to a 10-page, double-spaced limit. No new evidence, exhibits or testimony may be attached. You may make references to documents that are already in the record.

The State Water Resources Control Board (State Water Board) would like you to address the following questions in your brief. This information may be of great use to the State Water Board in formulating its response to the petitions. It will be most useful if you provide specific language that you believe should be included in the Standard Urban Storm Water Mitigation Plans (SUSMP).

1. If there is to be a numeric design standard for infiltration or treatment, is the .75-inch standard appropriate? Should it be substituted with a different numeric standard, including potentially different numbers for different areas? If there were a range of numbers, how would that be implemented?

2. What types of redevelopment or remodeling projects should be included within the mitigation requirements?

3. Should location, such as environmentally-sensitive areas, be a factor in determining the application of the SUSMP? If so, what specific types of projects should be included?

4. Should the SUSMP apply to both discretionary projects and ministerial projects? How should the term "discretionary" be defined?

If you have any questions about the post-trial briefs, please call Bruce Fujimoto, Chief of the Storm Water Unit, at 916-657-0908.

Sincerely,

Craig M. Wilson

Dear Messrs. Montevideo, Welch, and Deitsch:

PETITIONS OF THE CITIES OF BELLFLOWER, ET AL, THE CITY OF ARCADIA, AND WESTERN STATES PETROLEUM ASSOCIATION (REVIEW OF JANUARY 26, 2000 ACTION OF THE REGIONAL BOARD, AND ACTIONS AND FAILURES TO ACT BY BOTH THE REGIONAL BOARD AND ITS EXECUTIVE OFFICER PURSUANT TO ORDER NO. 96-054, PERMIT FOR MUNICIPAL STORM WATER AND URBAN RUN-OFF DISCHARGES WITHIN LOS ANGELES COUNTY [NPDES NO. CAS614001]), LOS ANGELES REGION: BOARD MEETING NOTIFICATION
SWRCB/OCC FILES A-1280, A-1280(a), and A-1280(b)

Enclosed is a copy of the proposed order in the above-entitled matter. The State Water Resources Control Board (SWRCB) will consider this order at a special meeting which will be held during its workshop session on *Thursday, October 5, 2000,* commencing at *10:00 a.m.* in the First Floor Hearing Room of the Bonderson Building, 901 P Street, Sacramento.

The SWRCB has already held a hearing in this matter. Evidence relating to this matter will not be heard at the meeting or accepted before the meeting. You may submit written comments on the order so long as they are received at the SWRCB no later than *Thursday, September 28, 2000, at 5:00 pm.*

At the meeting, interested persons will be allowed to comment orally on the draft order, subject to the following time limits. Each designated party will be allowed up to five minutes for oral comment, with an additional reasonable time for questions by the SWRCB members. Other interested persons will be allotted a lesser amount of time to address the SWRCB as time permits. The order may be adopted at the special meeting as proposed or may be modified as determined by the SWRCB.

If there are any questions or comments, please call Elizabeth Miller Jennings, Senior Staff Counsel, of the Office of Chief Counsel, at (916) 657-2421.

Sincerely,

Craig M. Wilson
Chief Counsel

STATE OF CALIFORNIA
STATE WATER RESOURCES CONTROL BOARD

ORDER: WQ 2000-

In the Matter of the Petitions of
THE CITIES OF BELLFLOWER, ET AL., THE CITY OF ARCADIA, AND WESTERN STATES PETROLEUM ASSOCIATION
Review of January 26, 2000 Action of the Regional Board
and
Actions and Failures to Act
by both the
California Regional Water Quality Control Board,
Los Angeles Region and Its Executive Officer
Pursuant to Order No. 96-054,
Permit for Municipal Storm Water and Urban Run-Off Discharges Within
Los Angeles County
[NPDES NO. CAS614001]

SWRCB/OCC FILES A-1280, A-1280(a) and A-1280(b)

BY THE BOARD:

On July 15, 1996, the Los Angeles Regional Water Quality Control Board (Regional Water Board) issued a revised national pollutant discharge elimination system (NPDES) permit in Order No. 96-054 (permit) to the 85 incorporated cities and the county within Los Angeles County (the County).[1] The permit covers storm water discharges from municipal separate storm sewer systems throughout the County.[2]

[1] This was the second storm water permit adopted for Los Angeles County and its cities. The first permit was the subject of an earlier Order. (In the Matter of Natural Resources Defense Council, Inc., Order WQ 91-04). In this permit, the County is designated as the Principal Permittee, and each city is designated as a permittee. The County is required to submit various documents on behalf of all of the permittees.
[2] The Regional Water Board has since issued a separate permit for one city, Long Beach. The relevant provisions of the Long Beach permit are similar to those in Order No. 96-054.

The permit contains provisions for the regulation of storm water discharges from development planning and construction.[3] Pursuant to these provisions, the County was required to submit Standard Urban Storm Water Mitigation Plans (SUSMPs).[4] The SUSMPs are plans that designate best management practices (BMPs) that must be used in specified categories of development projects. The County submitted SUSMPs, but the Regional Water Board approved the SUSMPs only after making revisions. The Executive Officer issued the revised SUSMPs on March 8, 2000.[5]

On February 25, 2000, the State Water Resources Control Board (State Water Board or Board) received a petition for review of the actions and failures to act regarding the SUSMPs from a number of cities, the Building Industry Association of Southern California and the Building Industry Legal Defense Foundation (jointly referred to as Cities). A second petition was received from the City of Arcadia. And a third petition was received from the Western States Petroleum Association (WSPA). On April 7, 2000, the petitioners filed amendments to their petitions, concerning the March 8, 2000 issuance of the SUSMPs. The Cities' amendment also revised the list of cities included in the petition. The Cities' petition now includes 32 cities. The petitions are legally and factually related, and have therefore been consolidated for purposes of review.[6] The petitioners also requested a stay of the SUSMPs. This request was denied by letter, dated May 11, 2000.

---

[3] Permit, Part 2.III. These provisions focus more on post-construction impacts of development than on discharges from construction activities.
[4] Permit, Part 2.III.A.1.c.
[5] These are referred to herein as the Final SUSMPs. The Final SUSMPs also apply to Long Beach, even though it is subject to a separate permit.
[6] Cal. Code of Regs., tit. 23, section 2054.

On June 7 and 8, 2000, the Board held a hearing in Torrance. Several entities, including the petitioners, the Regional Water Board, and several environmental groups[7], were designated parties. The evidence from that hearing has been included in the record before the Board. The record for comments on the petition was kept open until the end of the hearing. The parties were allowed to submit post-hearing briefs.[8]

I. BACKGROUND

In prior Orders[9] this Board has explained the need for the municipal storm water programs and the emphasis on BMPs in lieu of numeric effluent limitations. The emphasis for preventing pollution from storm water discharges is still on the development and implementation of effective BMPs, but with the expectation that the level of effort will increase over time. In its Interim Permitting Approach[10], the United States Environmental Protection Agency (U.S. EPA) stated that first-round permits should include BMPs, and expanded or better-tailored BMPs in subsequent permits where necessary to attain water quality standards. Dischargers, consultants, and academic institutions in California and nationwide have conducted numerous studies on the effectiveness of BMPs and appropriate design standards. While many questions are still

[7] The environmental groups are Natural Resources Defense Council, Inc., Santa Monica BayKeeper, and Heal the Bay.

[8] There are several documents that were not timely received and, therefore, are not made a part of the record before the Board. The hearing notice specified that all evidence from parties must be received by May 31, 2000. The Regional Water Board submitted documents on June 6, 2000. The hearing notice specified that policy statements were due by the close of the hearing. Several comment letters were received June 12, 13, and 19, 2000. None of these submittals are a part of the record. The post-hearing briefs were subject to a 10-page limit. The environmental groups submitted objections to the post-hearing brief submitted by the Cities. First, the environmental groups challenge the length of the brief. All briefs were subject to a 10-page limit. The Cities submitted a 10-page brief, with a 22-page attachment showing extensive proposed revisions to the SUSMPs. This submittal violates the page limit, and only the brief is considered part of the record. Second, the environmental groups claim that an e-mail message referred to by the petitioners is subject to attorney-client privilege and should not have been used in this hearing. This e-mail message, from the Regional Water Board's counsel to one of its engineers, was placed in the Regional Water Board's administrative record and submitted to the State Water Board. Any privilege that may have attached to the message has been waived and no longer exists. Finally, the post-hearing brief from the City of Arcadia was received late and will not be considered. Documents submitted late for interim deadlines (such as the deadline for submitting responses to the petitions), have been included in the record.

[9] See, especially Orders WQ 91-03 (In the Matter of Citizens for a Better Environment et al.) and WQ 91-04.

[10] Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits. (61 Federal Register 57425.)

outstanding, more is expected of municipal dischargers, and many are implementing more effective programs.

While storm water management plans are improving, our knowledge of the impacts is also growing. Urban runoff has been determined to be a significant contributor of impairment to waters throughout the state. In Los Angeles specifically, beach closures are sometimes associated with urban runoff. In adopting the SUSMPs, the Regional Water Board took note of the urgent need for preventing further pollution from urban runoff and storm water discharges.

It is important to emphasize the role of the SUSMPs within the totality of regulating storm water discharges, and the purpose of these particular control measures. The requirement to prepare SUSMPS was part of the development controls in the permit. In addition to development controls, the permit requires education, public outreach, programs to restrict illicit connections and discharges, and controls on public facilities. In the context of the entire effort required by the permit, the development controls can be seen as preventing the existing situation from becoming worse.

The Final SUSMPs include a list of mandatory BMPs for nine categories of development. There are provisions that are applicable to all categories and lists of BMPs for individual categories. Requirements applicable to all categories include provisions to limit erosion from new development and redevelopment, requirements to conserve natural areas, protection of slopes and channels, and storm drain stenciling. Examples of BMPs specific to categories of discharge include design of loading docks for commercial projects and design of fueling areas for retail gasoline outlets. In most respects, the Final SUSMPs were similar to those proposed by the County. The significant departures were the inclusion of a numeric design standard for structural or treatment control BMPs, and the inclusion of certain types of projects that were not

covered in the County's proposal. The design standard creates objective and measurable criteria for the amount of runoff that must be treated or infiltrated by BMPs.

The record indicates that the purpose of the development controls, including the SUSMPs, is not simply to prevent pollution associated with construction runoff. As the petitioners point out, construction discharges are already subject to this Board's Statewide Construction Permit. The development controls in the SUSMPs, on the other hand, focus on post-construction runoff. They are aimed at limiting not just the pollutants in runoff from the new development, but also the volume of runoff that enters the municipal storm sewer system. By limiting runoff from new development, the SUSMPs prevent increased impacts from urban runoff generally. There is adequate technical information in the record to show that by controlling the volume of runoff from new development, BMPs can be effective in reducing the discharge of pollutants in storm water runoff.

The Procedure for Adopting the SUSMPs

The permit requires a program for controls on Development Planning and Construction. It involved a number of submissions by the County in consultation with the Cities. The first step was submission of a checklist for determining priority projects and exempt projects. The checklist was due on January 30, 1998. A list of recommended BMPs for development projects was also due on that date. The SUSMPs were due within six months of approval of the BMP list, and were to incorporate BMPs for certain categories of development. Following approval of the SUSMPs, the cities and County were to implement development programs for priority projects, consistent with the BMP list and the SUSMPs.

The BMP list was not approved until April 22, 1999. Thereafter, the County submitted proposed SUSMPs on July 22, 1999. The Regional Water Board held a public workshop on

August 10, 1999. Following the workshop, the County submitted revisions to the SUSMPs on August 12, 1999. On August 16, 1999, the Regional water Board gave notice that it would discuss the SUSMPs in a public meeting on September 16, 1999. There was significant discussion at that meeting regarding the intent of the Executive Officer to approve the SUSMPs, but with revisions including a numeric design standard. At the conclusion of the meeting, the Regional Water Board members asked the Executive Officer to revise the SUSMPs and bring them back to another meeting. On December 7, 1999, the Executive Officer circulated revised SUSMPs for public review. This document incorporated a numeric design standard and made other revisions to the permittees' proposal. The Regional Water Board held a hearing on the SUSMPs on January 26, 2000. At that meeting, the Regional Water Board endorsed the SUSMPs revised by the Executive Officer, but directed him to make further changes. The Executive Officer issued the Final SUSMPs on March 8, 2000.

The Contents of the Final SUSMPs

The permit provides that the SUSMPs must incorporate the appropriate elements of the BMP list and, at a minimum, apply to seven development categories: 100-plus home subdivisions; 10-plus home subdivisions; 100,000-plus square foot commercial developments; automotive repair shops; retail gasoline outlets; restaurants; and hillside single-family dwellings.

The SUSMPs proposed by the County applied to these seven categories. Various BMPs applied to the different categories, and the SUSMPs contained narrative mitigation requirements for source control and treatment. The July proposals stated:

> "The development must be designed so as to mitigate (infiltrate and/or treat) the site runoff generated from impervious directly connected areas that may contribute pollutants of concern to the storm water conveyance system."

There were no numeric design criteria for mitigation. According to various participants, earlier County drafts had included design standards to mitigate flows from 0.6-inch storm events. But any numeric criteria had been removed from the version that was submitted.

In its revised SUSMPs, submitted on August 12, the County explained in its cover letter that the mitigation language did not mean that all runoff must be mitigated. Rather, the County's intent was to omit a numerical standard from the SUSMPs. The revised SUSMPs no longer referred to mitigation at all. Instead, the following language replaced the mitigation requirement:

> "The development must be designed so as to minimize, to the maximum extent practicable (MEP), the introduction of pollutants of concern that may result in significant impacts, generated from site runoff of directly connected impervious areas (DCIA), to the storm water conveyance system as approved by the building official."

The Final SUSMPs, as approved by the Executive Officer and the Regional Water Board, included several revisions from the County's submittal. The revision that is of greatest concern to the petitioners is the addition of Design Standards for Structural or Treatment Control BMPs.[11] The design standards require that developments subject to the SUSMPs shall be designed to mitigate storm water runoff (by treatment or infiltration) from one of the following:

> "1. The 85th percentile 24-hour runoff event determined as the maximized capture storm water volume for the area..., or
> 2. The volume of annual runoff based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment..., or
> 3. The volume of runoff produced from a 0.75 inch storm event, prior to its discharge to a storm water conveyance system, or
> 4. The volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event."

[11] The Final SUSMPs also include the narrative language quoted from the County's August 22, 1999 proposal.

The Final SUSMPs also applied to two additional categories of development: parking lots over 5,000 square feet or with 25 or more spaces and exposed to storm water, and to developments in environmentally-sensitive areas. Other revisions included application to all projects in the categories instead of discretionary projects only and the definition of redevelopment.

II. CONTENTIONS AND FINDINGS[12]

Contention: The petitioners contend that the Regional Water Board erred in not complying with the Administrative Review Process within the permit, and acted arbitrarily and capriciously and in violation of the Clean Water Act and state law.

Finding: The permit required the County, in consultation with the cities subject to the permit, to submit SUSMPs. The permit includes some general minimum requirements for the SUSMPs.[13] The Executive Officer is granted authority to approve the SUSMPs.[14]

The permit also contains an administrative review process.[15] The permit states that the administrative review process "formalizes the procedure for review and acceptance of reports and documents" and "provides a method to resolve any differences in compliance expectations between the Regional Board and Permittees, prior to initiating enforcement action."[16] Following this introductory statement, the permit includes two procedures. The first is for review and approval or disapproval of reports and documents. The second is the dispute resolution section that must be followed prior to enforcement action.

---

[12] This Order does not address all of the issues raised by the petitioners. The Board finds that the issues that are not addressed are insubstantial and not appropriate for State Water Board review. (See *People v. Barry* (1987) 194 Cal.App.3d 158, [239 Cal.Rptr. 349], Cal. Code Regs., tit. 3, § 052.)
[13] Permit, Part 2, III.A.1.c.
[14] Permit, Part 2, III.A.2.
[15] Permit, Part 2, I.G.
[16] *Id.*

The process for review of documents that are subject to the Executive Officer's approval is that the Executive Officer will notify the permittees of the results of the review and approval or disapproval within 120 days. If the Executive Officer does not do so, the permittees must notify the Regional Water Board of their intent to implement the documents without approval. The Executive Officer then has 10 days to respond, or the permittees may implement the program and the Executive Officer may not make modifications.

The dispute resolution procedure is to be used when the Executive Officer determines that a permittee's storm water program is insufficient to meet the permit's provisions. The Executive Officer must send a "Notice of Intent to Meet and Confer" with the permittee. A meet and confer period then ensues, resulting in a written "Storm Water Program Compliance Amendment (SWPCA)." The permittee is provided time to comply with the SWPCA. The Executive Officer is not allowed to take enforcement action against a permittee until the Executive Officer notifies the permittee in writing that the administrative review process has been exhausted and that a violation exists warranting enforcement.

The petitioners contend that the Executive Officer failed to notify the permittees that their SUSMPs were inadequate within 120 days of its submittal. The petitioners also argue that, by revising the SUSMPs without pursuing the dispute resolution process, the Regional Water Board "violated" the terms of the permit.

The provision for review of documents, which clearly includes the SUSMPs, requires that the Executive Officer notify the permittees of the results of the review and approval or disapproval within 120 days. The County submitted the revised SUSMPs on August 12, 1999. Within 120 days, the Regional Water Board held a workshop where staff expressed their concerns with the SUSMPs. Also within 120 days the Regional Water Board itself held a public

meeting where there was extensive discussion and concern by board members that the SUSMPs did not include a numeric standard. And, prior to any notification by the permittees that they would proceed with implementing their SUSMPs, the Regional Water Board held a hearing January 26, 2000, where it directed the Executive Officer to issue the SUSMPs with revisions. The Executive Officer did so on March 8, 2000.

It is clear from the record that the Executive Officer, and the Regional Water Board itself, did inform the permittees that the SUSMPs were inadequate. There was no requirement for a specific form for expressing disapproval of documents. The extensive discussion and meetings on the need for revisions to the SUSMPs, and the Executive Officer's approval of revised SUSMPs, plainly refutes the allegation that the Regional Water Board never notified the permittees of its disapproval of the County's proposed SUSMPs.

The permittees also claim that the Regional Water Board "violated" the permit by failing to institute the meet and confer process.[17] The dispute resolution process, which includes meet and confer, did not apply to the decision to disapprove the proposed SUSMPs. That process is only required when the Regional Water Board ultimately takes an enforcement action against a permittee. It is separate from the process for review and approval or disapproval of documents, and does not even appear to relate to possible enforcement actions for submission of inadequate documents. This is illustrated by the fact that the provision regarding documents refers to submittals from both the Principal Permittee and the individual permittees, while the dispute resolution provision refers only to the permittees. This distinction is relevant because the County is charged with submitting the documents, while the individual permittees are responsible for compliance. A fair reading of the entire section on the administrative review process is that the

[17] We note that permits are issued to permittees to allow discharges to waters of the state. It is only permittees, and not Regional Water Boards, who can be charged with violating permits.

review and approval or disapproval of documents applies to submission of documents by the County on behalf of the cities, while the dispute resolution process applies to enforcement actions against any permittees for failing to implement adequate programs.

Contention: The petitioners contend that the Regional Water Board was not authorized to revise the SUSMPs to add more stringent requirements.

Finding: The petitioners contend that the mitigation standards in the SUSMPs are more stringent than the requirement in the permit to reduce pollutants in storm water runoff to the maximum extent practicable (MEP)[18]. The issue of what level of protection constitutes MEP will be discussed *Infra*, in the discussion of the reasonableness of the numeric standards. But the petitioners also make certain procedural claims on this point. They argue that in approving the BMP list, the Regional Water Board determined that those BMPs constituted MEP and that the Board could not add additional BMPs in the SUSMPs. They also contend the Regional Water Board itself had no authority to "usurp" the Executive Officer's role in reviewing the SUSMPs.[19] Finally, the petitioners contend that the Regional Water Board was not authorized to mandate a program for the permittees without amending the permit.

The permit requires the County to submit a list of BMPs for approval. The Regional Water Board approved this list. Following approval of the list, the County was required to submit the SUSMPs, which must "incorporate the appropriate elements of the recommended BMPs list."[20] The petitioners contend that by approving the list, the Regional Water Board determined that those BMPs constituted MEP, and that under the terms of the permit the Regional Water Board could not require additional BMPs.

---

[18] The technology-based standard for controls under municipal storm water permits is MEP. For a fuller discussion of this standard, see Order WQ 91-03.
[19] It is undisputed that, at its January 26, 2000 meeting, the Board directed the Executive Officer to make additional revisions to the SUSMPs.
[20] Permit, Part 2, III.A.1.c.

In addressing this contention, we face what appears to be a fundamental misunderstanding of the numeric design standards on the part of the petitioners. The design standards are objective criteria that developers must achieve in designing their BMPs. The design standards are not separate BMPs. The standards tell what magnitude of storm event the BMPs must be designed to treat or infiltrate. They do not specify the BMPs that must be employed.

The SUSMPs as submitted by the County specify BMPs for various categories of development. Many of these BMPs are designed to minimize the pollutants in storm water runoff, by reducing flow through infiltration or by treatment. Examples of BMPs proposed by the County include infiltration basins and trenches, oil/water separators, and media filtration. The County's proposed SUSMPs also included language requiring minimizing the introduction of pollutants to the storm water conveyance system. That language remains unchanged in the Final SUSMPs. The only significant difference between the two versions of the SUSMPs was that the Regional Water Board established numeric criteria for designing the BMPs.

In adopting the Final SUSMPs, the Regional Water Board based its decision on the MEP standard.[21] The Regional Water Board did not significantly revise the BMP list or specify further the actions that developers must take to comply with the SUSMPs. Thus, we find that the Regional Water Board did not inappropriately revise its determination of what constituted MEP.

The Regional Water Board is the political body responsible for water quality control in the Los Angeles region.[22] While the Regional Water Board may delegate specified powers and duties to its Executive Officer,[23] it can at any time act on its own behalf. The fact that the Board authorized its Executive Officer to approve the SUSMPs in the permit did not mean that the Board thereby denied itself the opportunity to provide direction to the Executive Officer in his

[21] Resolution R-00-02.
[22] Water Code sections 13200 and 13225.
[23] Water Code section 13223.

approval. Such an interpretation of its delegation authority would result in an improper failure of the Board to assume responsibility for water quality in the region.

We also find that the Regional Water Board was authorized to revise the SUSMPs to achieve compliance with the permit's requirements. The SUSMPs are a part of implementation of the permit. Because the permit regulates storm water discharges throughout the entire Los Angeles region and it is implemented by 85 cities and the County, it is obvious that the permit could not spell out every detail of the program for the five-year term of the permit. Instead, the implementation is through the submission, review and approval, and implementation of various programs, including the SUSMPs.[24] Where it receives a submission that it finds is not consistent with the requirements of the permit, it is reasonable for the Regional Water Board to be able to require revisions. The Regional Water Board is not required to amend the permit each time it approves a submittal or approves a submittal with revisions. On the other hand, if the Regional Water Board's action in requiring revisions is inconsistent with the terms of the permit, then the Board should not act without first amending the permit. While the Regional Water Board could have required the County to make the revisions rather than making them itself, we see no harm in the Regional Water Board's approach.

As will be discussed below, in most respects the Final SUSMPs are consistent with the permit. But there are some portions of the SUSMPs that are not consistent, and in those cases the SUSMPs provisions are further revised in this Order.

Contention: The petitioners make various procedural claims, including that they were denied due process, and that the Regional Water Board violated the Administrative Procedure

[24] A fuller discussion of the use of storm water management plans to incorporate a developing program is found in Order No. WQ 91-03.

Act, the California Environmental Quality Act (CEQA), and the California Constitution, Article XIII B, section 6 (regarding state mandates).

Finding: The petitioners point out that at the January 26, 2000 Regional Water Board hearing, there was some confusion over late changes to the SUSMPs and they contend they were not provided adequate opportunity to comment. There was significant discussion of the SUSMPs over several months. We do not agree with the petitioners that a program of this magnitude must necessarily take years to develop. But we are concerned that at the January 26, 2000 hearing, interested persons and permittees were not given adequate time to review late revisions or to comment on them. Given the intense interest in this issue, the Regional Water Board should have diverged from its strict rule limiting individual speakers to three minutes and should have allowed groups to make joint presentations.[25] But to the extent the Regional Water Board's process caused any harm, this Board cured those harms. We held a two-day hearing in Los Angeles County, where all parties were allowed significant time to present their positions and testimony. In addition, we allowed the introduction of new evidence that had not been presented to the Regional Water Board. At this point, all parties have been afforded a full opportunity to review the Final SUSMPs, to present their positions and evidence, and to engage in cross-examination. The petitioners' due process rights have been protected.

The Board has already addressed the contentions regarding compliance with other laws in prior decisions. The Administrative Procedure Act exempts the adoption of permits from its requirements.[26] While the SUSMPs are not a permit, they are implementing documents for a permit, and are therefore subject to the exemption. Moreover, they are relevant only to this

[25] For future adjudicative proceedings that are highly controversial or involve complex factual or legal issues, we encourage regional water boards to follow the procedures for formal hearings set forth in Cal. Code of Regs., tit. 23, section 648 et seq.

[26] Government Code section 11352; See, Order No. 95-4 (In the Matter of the City and County of San Francisco).

permit, and are not a general rule of application. The constitutional provisions regarding state mandates also do not apply to NPDES permits.[27] As will be explained below, the SUSMPs as revised herein, are consistent with MEP and therefore are federally mandated. The provisions of CEQA requiring adoption of environmental documents also do not apply to NPDES permits.[28] Again, as an implementing document for the permit, there is no requirement for a separate CEQA analysis.[29]

Contention: The petitioners contend that the SUSMPs do not properly apply the maximum extent practicable standard.

Finding: The permit, consistent with Clean Water Act section 402(p)(3)(B)(iii), requires controls to reduce the discharge of pollutants to the maximum extent practicable, or MEP.[30] In approving the Final SUSMPs, the Regional Water Board acknowledged that one of the primary objectives of the municipal storm water program is the requirement to reduce the discharge of pollutants from storm water conveyance systems to the MEP.[31] While all parties appear to agree that the standard for the SUSMPs is MEP, they disagree about what level of effort is necessary to comply with that standard.

The petitioners approach this issue from two angles. First, they contend that the SUSMPs will not provide water quality benefits that reflect MEP. Second, they contend that there could be adverse impacts on groundwater quality that have not been adequately evaluated.

---

[27] See, Order No. WQ 90-3 (In the Matter of San Diego Unified Port District).
[28] Water Code section 13389.
[29] We do note with interest the environmental groups' comment that if the permittees believed it was necessary to comply with the APA and CEQA prior to adoption of the SUSMPs, then they themselves would have violated those acts in tl.eir submissions of the proposed SUSMPs.
[30] Permit, Finding 13.
[31] Final SUSMPs, at page 2; Resolution No. R-00-02, at page 3.

Storm Water Design Standards as MEP

In adopting the Final SUSMPs, the Regional Water Board found that many rivers and streams in Los Angeles County are impaired for pollutants found in storm water and urban runoff, and that storm water runoff carries pollutants from nearly all types of developed properties.[32] Pollutant loading from the aggregate of development in the basin results in impairments from sediments, metals, complex organic compounds, oil and grease, nutrients, and pesticides.[33] The Final SUSMPs reflect two goals: to reduce the amounts of these pollutants in runoff and to reduce the ability of runoff to act as a conveyance system to deliver more pollutants to receiving waters. The Final SUSMPs, which include lists of BMPs and design standards requiring treatment or infiltration, address these two goals.

Clean Water Act section 402(p)(3)(B)(iii), which sets forth the requirements for establishing MEP in municipal storm water permits, provides that such permits "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants." The United States Environmental Protection Agency (U.S. EPA), in a guidance document, explains that BMPs should be used in first-round storm water permits, and "expanded or better-tailored BMPs in subsequent permits, where necessary, to provide for the attainment of water quality standards."[34] The Clean Water Act, as interpreted by U.S. EPA, does require that, in a second-round permit,[35] expanded BMPs may be appropriate. In light of the number of water

[32] Resolution No. R-00-02.
[33] *Id.*
[34] Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits, 61 Federal Register 57425 (1996).
[35] The original permit was issued in 1990. The 1996 permit is a second-round permit.

bodies impaired by runoff in Los Angeles County, it was appropriate to expand the scope of BMPs during the permit term.

The regulations implementing section 402(p) specifically require municipalities to have controls to reduce the discharge of pollutants from their storm sewer systems that "receive discharges from areas of new development and significant redevelopment," including post-construction discharges.[36] Clearly, it was appropriate for the Regional Water Board to require BMPs for new development and significant redevelopment. The permittees, who submitted their own version of SUSMPs with listed BMPs for categories of development, appear to have no real quarrel with this general mandate.

This Board has already endorsed requirements to limit the flow of the "first flush" of storm water, which may contain more significant pollutants.[37] The permittees' own version of the SUSMPs required mitigation of storm water runoff by treatment or infiltration, thus conceding the propriety of these two approaches to lessening the impact of storm water discharges. The crux of the disagreement is that the Regional Water Board added numeric design standards to establish the amount of runoff that must be treated or infiltrated, and required the mandatory application of these standards to categories of development.

The addition of measurable standards for designing the BMPs provides additional guidance to developers and establishes a clear target for the development of the BMPs. The U.S. EPA guidance manual suggests the use of design criteria and performance standards for post-construction BMPs.[38] The numeric criteria the Regional Water Board adopted essentially

---

[36] 40 CFR section 122.26(d)(2)(iv)(A)(2).
[37] In the Matter of National Steel and Shipbuilding Company, et al., Order WQ 98-07, at slip opinion 7.
[38] Guidance Manual for the Preparation of Part 2 of the NPDES Permit Applications for Discharges from Municipal Separate Strom Sewer Systems, at page 6-4 (November 1992).

requires that 85 percent of the runoff from the development be infiltrated or treated.[39] In adopting these standards, the Regional Water Board based its decision on a research review of standards in other states and a statistical analysis of the rainfall in the area. The standard was set to gain the maximum benefit in mitigation while imposing the least burden on developers.[40] In light of the evidence of the use of this or more stringent standards in other states, the expert testimony supporting this standard, the endorsement by U.S. EPA in its comments, and the cost-effectiveness of its implementation (discussed below), the Regional Water Board acted appropriately in determining that the standards reflect MEP.[41]

We also find that the Regional Water Board appropriately applied these standards to seven of the categories listed in the SUSMPs: single-family hillside residences, 100,000 square foot commercial developments, automotive repair shops, restaurants, home subdivisions with 10 to 99 housing units, home subdivisions with 100 or more housing units, and parking lots with 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff.[42] These categories, except for parking lots, were already targeted for special treatment in the permit. The evidence shows that each listed category can be a significant source of pollutants and/or runoff following development. It is appropriate that the design standards apply so that BMPs for these categories of development result in the infiltration or treatment of a significant about of the runoff.

---

[39] Four different methods of calculation are permitted, so the percentage of capture may vary slightly.

[40] At the hearing in this matter, Regional Water Board staff explained that the standard was set at the bottom of the "knee" of the curve where the benefits of the mitigation requirements decrease and the cost increases. Other states have set the standard higher along this curve, requiring 90 to 95 percent mitigation.

[41] This conclusion in no way departs from our acceptance of BMPs in lieu of numeric effluent limitations in storm water permits. (See, e.g., Order WQ 91-03 and Order WQ 91-04.) The numeric standard is a design standard for BMPs. It does not quantify or limit the pollutants in the effluent. It also does not specify which of the listed BMPs must be employed.

[42] As discussed below, this Board is revising the SUSMPs to delete the application of the design standards to retail gasoline outlets and to locations within or directly adjacent to or discharging directly to environmentally-sensitive areas.

Potential Impacts on Ground Water

The petitioners contend that infiltration of runoff may lead to ground water pollution, and that the Regional Water Board did not properly consider such potential impacts. The mitigation standards provide for a waiver where there is a risk of ground water contamination because a known unconfined aquifer lies beneath the land surface or an existing or potential underground source of drinking water is less than ten feet from the soil surface.[43] The Final SUSMPs also include a discussion on how to use infiltration so that the risk of contamination of groundwater is reduced, and where infiltration is not appropriate.[44]

The Regional Water Board did consider the potential impacts to groundwater from infiltration, and included appropriate limitations and guidance on its use as a BMP. These provisions will ensure adequate protection of groundwater from any adverse impacts due to infiltration.

Contention: The petitioners contend the Regional Water Board failed to show that the SUSMPs as adopted are cost-effective and that the benefits to be obtained outweigh the costs.

Finding: The petitioners refer to the Preamble to the Phase II storm water regulations[45] as the basis for their economic argument. The quoted language, however, does not wholly support the petitioners' contention. The Preamble states that President Clinton's Clean Water Initiative clarifies "that the maximum extent practicable standard should be applied in a site-specific, flexible manner, taking into account cost considerations as well as water quality effects."[46] It is clear that cost should be considered in determining MEP; this does not mean that

[43] Final SUSMP, page 14.
[44] *Id.*, at page 15.
[45] 64 Federal Register 68722 and following. These regulations do not apply to the permit, but the general language on MEP is relevant to EPA's interpretation of the standard.
[46] 64 Federal Register 68722, 68732 (December 8, 1999).

the Regional Water Board must demonstrate that the water quality benefits outweigh the economic costs.

While the standard of MEP is not defined in the storm water regulations or the Clean Water Act, the term has been defined in other federal rules. Probably the most comparable law that uses the term is the Superfund legislation, or CERCLA, at section 121(b). The legislative history of CERCLA indicates that the relevant factors, to determine whether MEP is met in choosing solutions and treatment technologies, include technical feasibility, cost, and state and public acceptance.[47] Another example of a definition of MEP is found in a regulation adopted by the Department of Transportation for onshore oil pipelines. MEP is defined as to "the limits of available technology and the practical and technical limits on a pipeline operator . . . ."[48]

These definitions focus mostly on technical feasibility, but cost is also a relevant factor. There must be a serious attempt to comply, and practical solutions may not be lightly rejected. If, from the list of BMPs, a permittee chooses only a few of the least expensive methods, it is likely that MEP has not been met. On the other hand, if a permittee employs all applicable BMPs except those where it can show that they are not technically feasible in the locality, or whose cost would exceed any benefit to be derived, it would have met the standard. MEP requires permittees to choose effective BMPs, and to reject applicable BMPs only where other effective BMPs will serve the same purpose, the BMPs would not be technically feasible, or the cost would be prohibitive. Thus while cost is a factor, the Regional Water Board is not required to perform a cost-benefit analysis.

In reviewing the record, it is apparent that the Regional Water Board did evaluate the cost of the SUSMPs. While the petitioners claim there is no evidence in the record to show the

[47] 132 Cong. Rec. H 9561 (Oct. 8, 1986).
[48] 49 CFR section 194.5.

SUSMPs are necessary and cost effective, the opposite is true. The record is replete with documentation of costs of pilot mitigation projects, studies from similar programs in other states, and research studies. The Regional Water Board complied with the requirement to consider cost.

The Regional Water Board found that the cost to include BMPs that will meet the mitigation criteria will be one to two percent of the total development cost. This amount appears reasonable, especially in light of the amount of impervious surface already in Los Angeles County and the impacts on impaired water bodies. In considering the cost of compliance, it is also important to consider the costs of impairment. The beach closures in the Los Angeles region, well documented in the evidence, have reached critical proportions. These beach closures clearly have a financial impact on the area, and should be positively affected by the SUSMPs.

We do note that there could be further cost savings for developers if the permittees develop a regional solution for the problem. We recommend that the cities and the County, along with other interested agencies, work to develop regional solutions so that individual dischargers are not forced to create numerous small-scale projects. While the SUSMPs are an appropriate means of requiring mitigation of storm water discharges, we also encourage innovative regional approaches.

Contention: The petitioners have raised contentions regarding details of the SUSMPs, including the amount of time allowed for inclusion of SUSMPs in local ordinances, and their application to both "discretionary" and "non-discretionary" projects. In addition, during the hearing certain ambiguities in the wording of the Final SUSMPs became apparent, including the provisions regarding redevelopment and environmentally-sensitive areas. In this portion of the

Order we address these issues and also the application of the design standards to retail gasoline outlets (RGOs) and the waiver funding requirements.

Finding: The testimony at the hearing in this matter revealed that there are specific provisions of the SUSMPs that create confusion as to the types of development projects subject to the mitigation design standards. The petitioners also contend that application of the standards to specific types of development either is unreasonable or is inconsistent with the terms of the permit. The specific requirements are discussed below.

Retail Gasoline Outlets

Petitioner WSPA contends that RGOs should be excluded from the SUSMPs. Its petition raised the same general contentions as the other petitioners, but at the hearing WSPA presented evidence specific to RGOs. In particular, WSPA raised questions about the propriety of applying the design standards for BMPs to RGOs. In considering this issue, we conclude that construction of RGOs is already heavily regulated and that owners may be limited in their ability to construct infiltration facilities. Moreover, in light of the small size of most RGOs, treatment also may not be feasible, or safe. The mandatory BMPs that are included in the SUSMPs should be adequate to achieve MEP at RGOs.[49] We conclude that RGOs should not be subject to the BMP design standards because they are already heavily regulated and may be limited in their ability to construct infiltration facilities or to perform treatment.

Redevelopment Projects

The SUSMPs were written to apply to new development and to some types of redevelopment in nine categories of projects. The definition of "redevelopment" reflected the intent of the Regional Water Board to define the scope of redevelopment projects subject to the

[49] WSPA also refers to the list of BMI s in a publication of the California Storm Water Quality Task Force. (Best Management Practice Guide – Retail Gasoline Outlets. March 1997.) This publication includes BMPs in addition to those listed in the SUSMPs, which should be considered for inclusion therein.

requirements. That definition[50], however, was somewhat confusing, and it was apparent from testimony at the hearing that the parties had different understandings of the scope of redevelopment subject to the SUSMPs. In their post-hearing briefs, the various parties appeared to agree on the actual intent of the Regional Water Board in including redevelopment in the SUSMPs. This intent was to include redevelopment that adds or creates at least 5,000 square feet of impervious surface to the original development and, where the addition constitutes less than 50 percent of the original development, to limit the application of the BMP design standards to the addition.

While some parties requested further requirements for development, it appears that the Regional Water Board's original intent was relatively simple to apply and results in a fair and appropriate application of the SUSMPs' requirements to redevelopment. Therefore, we will revise the definition in the SUSMPs accordingly.

Environmentally-Sensitive Areas

The permit required that the SUSMPs address at least seven development categories.[51] The final SUSMPs added two more categories: parking lots of 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff; and location within or directly adjacent to an environmentally-sensitive area (ESA). The petitioners contend that the

[50] The SUSMPs state: "Redevelopment" means, on an already developed site, the creation or addition of at least 5,000 square feet of impervious surfaces or the creation or addition of fifty percent or more of impervious surfaces or the making of improvements to fifty percent or more of the existing structure. Redevelopment includes, but is not limited to: the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/or exterior construction or remodeling; replacement of impervious surface that is not part of a routine maintenance activity; and land disturbing activities related with structural or impervious surfaces.

[51] The categories listed in the permit are: single-family hill residences, 100,000 . quare-foot commercial developments, automotive repair shops, retail gasoline outlets, restaurants, home subdivisions with 10 to 99 housing units, and home subdivisions with 100 or more housing units. Permit, Part 2, III.A.1.c.

addition of ESAs was inappropriate because the permit refers only to "development categories"[52] and ESA is a location category.

Whether or not the Regional Water Board went beyond the permit's terms in including this category, we find a fundamental problem with the language of the SUSMPs regarding ESAs. All of the other categories are relatively simple to apply because they describe the types of development that fall within the category. For instance, the threshold for a commercial development is 100,000 square feet. If the development is smaller, it is not subject to the SUSMPs. But for developments within ESAs, the SUSMPs contain no threshold. This absence led to speculation by the petitioners that something as small as a new patio on a home in an ESA would make the SUSMPs applicable. The Regional Water Board, at the hearing and in its post-hearing brief, conceded that there should be some threshold. While the Regional Water Board did recommend a specific threshold, we believe that it is inappropriate for this Board to add a threshold that has not been fully discussed by all interested persons.

While it may be appropriate to include more stringent controls for developments in ESAs, we also note that such developments are already subject to extensive regulation under other regulatory programs. Moreover, in light of the permit language limiting the SUSMPs to development categories, ESAs are not an appropriate category within the SUSMPs. The Regional Water Board may choose to consider the issue further when it reissues the permit.

Discretionary and Non-Discretionary, or Ministerial, Projects

The petitioners contend that the SUSMPs should apply only to projects that are considered "discretionary" within the meaning of California Environmental Quality Act

[52] *Id.*

(CEQA).[53] They argue that the inclusion of non-discretionary, or ministerial, projects is inconsistent with the terms of the permit.

The permit provisions on development projects do refer to "discretionary" projects in several places. The permittees are directed to develop a checklist for determining priority and exempt projects.[54] Priority projects are defined as development and redevelopment projects requiring discretionary approval, which may have a potential significant effect on storm water quality.[55] The permittees are also required to develop a BMP list.[56] In developing the SUSMPs, the permittees are required to incorporate appropriate elements of the BMP list.[57] Next, the permittees must develop a program on planning control measures for priority projects (which are limited to projects requiring discretionary approval), consistent with the list of BMPs and the SUSMPs.[58] The permit further states that, in order to assure compliance with these requirements, the permittees must develop guidelines on preparing CEQA documents that link mitigation conditions to "local discretionary project approvals."[59]

Taken as a whole, the provisions of the permit appear to link the development requirements for SUSMPs to developments that receive discretionary approval by local governments, as defined in CEQA. The SUSMPs are an implementation tool for the permit and must be consistent with the permit. While the limitation of the SUSMPs to discretionary projects may not be sufficiently broad for an effective storm water control program, the Regional Water Board acted inappropriately in expanding the SUSMPs to include non-discretionary projects. The Regional Water Board may consider expanding the development controls beyond CEQA

[53] Public Resources Code section 21000 *et seq.*
[54] Permit, Part 2, III.A.1.a.
[55] *Id.*
[56] Permit, Part 2, III.A.1.b.
[57] Permit, Part 2, III.A.1.c.
[58] Permit, Part 2, III.a.2.
[59] Permit, Part 2, III.a.3.b.

discretionary projects when it reissues the permit. But at this time, the SUSMPs must be revised so that they are limited to development projects requiring discretionary approval within the meaning of CEQA.[60]

Waiver Funding Requirement

Where a waiver is granted from the design standard requirements, the Final SUSMPs provide that the permittee must require the project proponent to transfer the cost savings to a storm water mitigation fund. The fund is to be operated by a public agency or a non-profit entity, to promote regional or alternative solutions for storm water pollution in the same storm watershed. The petitioners contend that the funding requirement will create an additional administrative burden.

The concept of a mitigation fund or "bank" is a positive idea for obtaining regional solutions to storm water runoff. As a long-term strategy, municipal storm water dischargers should work to establish regional mitigation facilities, which may be more cost-effective and more technically effective than mitigation structures at individual developments. But at this point there are not sufficient resources in place to require all permittees to establish such funds or to find appropriate non-profit organizations. Before mandating funding, preliminary questions should be answered, including who will manage the fund, what types of projects it will be used for, what entities can legally operate such funds, and how permittees will determine the amount of the assessments. It would be appropriate for the County to consider developing a program with the appropriate flood control agency, or as a model for the separate cities to develop. There may be suitable agencies to administer such funds, but the development of programs may take

[60] We note that the Final SUSMPs already include a definition of "discretionary project" consistent with the definition in the CEQA guidelines. Final SUSMPs at page 4 of 25; Title 14, California Code of Regulations, section 15357. Apparently this definition was inadvertently retained after the Regional Water Board decided to expand the SUSMPs beyond discretionary projects.

some time. The Regional Water Board should consider adopting such a program when it reissues the permit, after consultation with the appropriate local agencies.

///

///

///

R0072444

III. CONCLUSIONS

Based on the discussion above, the Board concludes that:

1. The Regional Water Board complied with the procedural requirements of the permit, including the Administrative Review Process, in approving the Final SUSMPs.
2. The Regional Water Board was authorized to revise the SUSMPs by including more stringent requirements than the permittees had proposed.
3. The Regional Water Board complied with did not violate the Administrative Procedure Act, CEQA, or the Constitutional provisions on state mandates. The petitioners' due process rights have been protected
4. The Regional Water Board considered the costs of the SUSMPs, and acted reasonably in requiring these controls in light of the expected benefits to water quality.
5. The Final SUSMPs reflect a reasonable interpretation of development controls that achieve reduction of pollutants in storm water discharges to the maximum extent practicable.
6. The SUSMPs include adequate protections of groundwater quality from any impacts from infiltration.
7. The SUSMPs will be revised to clarify the intent of the Regional Water Board and to make them consistent with the permit. Specifically, retail gasoline outlets should not be subject to the BMP design standards because they are already heavily regulated and may be limited in their ability to construct infiltration facilities or to perform treatment. Redevelopment projects should be subject to the SUSMPs only if they result in creation or addition of 5,000 square feet of impervious surfaces. Environmentally-sensitive areas should not be listed as a category in the SUSMPs. The SUSMPs should only apply to discretionary projects. The requirement for funding by project proponents who receive waivers should be deleted. The SUSMPs will be amended as shown in the attachment to this Order.

R0072445

8. In light of the revisions of the SUSMPs made by this Order, and to allow the permittees adequate time to adopt implementing ordinances, the deadline for adopting ordinances will be revised to January 15, 2001, and the effective date of the Final SUSMPs will be revised to February 15, 2001.

IV. ORDER

IT IS HEREBY ORDERED that the Standard Urban Storm Water Mitigation Plans for Los Angeles County and Cities in Los Angeles County is revised consistent with the amendments attached hereto. In all other respects the petitions are dismissed.

CERTIFICATION

The undersigned, Administrative Assistant to the Board, does hereby certify that the foregoing is a full, true, and correct copy of an order duly and regularly adopted at a meeting of the State Water Resources Control Board held on August 17, 2000.

AMENDMENTS TO SUSMPS

[These amendments are to the Final SUSMP, as published March 8, 2000]

Page 3 of 25

First full paragraph:

All **discretionary development and redevelopment** projects that fall into one of ~~seven~~ **the following** categories are ~~identified in the Los Angeles County MS4 Permit as requiring~~ **subject to these** SUSMPs. These categories are:

- Single-family Hillside Residences
- 100,000 Square Foot Commercial Developments
- Automotive Repair Shops
- Retail Gasoline Outlets
- Restaurants
- Home Subdivisions with 10 to 99 housing units
- Home Subdivisions with 100 or more housing units
- **Parking lots 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff**

Second full paragraph:

~~The Regional Board Executive Officer has designated two additional categories subject to SUSMP requirements for the Los Angeles County MS4 Permit. These categories are:~~

- ~~Location within or directly adjacent to or discharging directly to an environmentally sensitive area, and~~
- ~~Parking lots 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff~~

Fourth full paragraph:

Permittees shall amend codes not later than ~~September 8, 2000~~ **January 15, 2001**, to give legal effect to the SUSMP requirements. The SUSMP requirements for projects identified herein shall take effect not later than ~~October 8, 2000~~ **February 15, 2001**.

Page 4 of 25

Delete definition of "Environmentally Sensitive Area"

Revise Definition of "Redevelopment":

"Redevelopment" means, on an already developed site, the creation or addition of at least 5,000 square feet of impervious surfaces ~~or the creation or addition of fifty percent or more of impervious surfaces or the making of improvements to fifty percent or more of the existing structure~~. Redevelopment includes, but is not limited to: the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/or exterior construction or remodeling; replacement of impervious surface that is not part of a routing maintenance activity; and land disturbing activities related with structural or impervious surfaces. **Where redevelopment results in an increase of less than fifty percent of the impervious surfaces of a previously existing development, and the existing development was not subject to these SUSMPs, the Design Standards apply only to the addition, and not to the entire development.**

Page 10 of 25

Add to "Limited Exclusion": Retail Gasoline Outlets

STATE WATER RESOURCES CONTROL BOARD
BOARD MEETING SESSION -- OFFICE OF CHIEF COUNSEL
October 5, 2000

ITEM 16

SUBJECT

IN THE MATTER OF THE PETITIONS OF THE CITIES OF BELLFLOWER, ET AL., THE CITY OF ARCADIA, AND WESTERN STATES PETROLEUM ASSOCIATION FOR REVIEW OF THE JANUARY 26, 2000 ACTION OF THE REGIONAL BOARD AND ACTIONS AND FAILURES TO ACT BY BOTH THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION AND ITS EXECUTIVE OFFICER PURSUANT TO ORDER NO. 96-054. PERMIT FOR MUNICIPAL STORM WATER AND URBAN RUN-OFF DISCHARGES WITHIN LOS ANGELES COUNTY [NPDES NO. CAS614001]. SWRCB/OCC FILES A-1280, A-1280(a), and A-1280(b).

LOCATION

Los Angeles

DISCUSSION

The Los Angeles Regional Water Quality Control Board adopted Standard Urban Storm Water Mitigation Plans (SUSMPs) for certain development projects in Los Angeles County. Several petitioners, including 32 cities, the Building Industry Association, and Western States Petroleum Association, filed petitions challenging the SUSMPs. In particular, the petitioners seek review of the requirements in the SUSMPs to mitigate storm water runoff from developments by treatment or infiltration.

POLICY ISSUE

Should the Board approve the SUSMPs, while revising the types of development that are subject to the mitigation requirements?

FISCAL IMPACT

This activity is budgeted within existing resources and no additional fiscal demands will occur as a result of approving this item.

RWQCB IMPACT

The Regional Water Board is not required to take any further action.

STAFF RECOMMENDATION

Adopt the draft order approving the SUSMPs, but revising the types of development subject to the mitigation requirements.

Policy Review: _____

Legal Review: _____

Fiscal Review: _____

California Regional Water Quality Control Board,
Los Angeles Region and Its Executive Officer
Pursuant to Order No. 96-054,
Permit for Municipal Storm Water and Urban Run-Off Discharges Within
Los Angeles County
[NPDES NO. CAS614001]

SWRCB/OCC FILES A-1280, A-1280(a) and A-1280(b)

BY THE BOARD:

On July 15, 1996, the Los Angeles Regional Water Quality Control Board (Regional Water Board) issued a revised national pollutant discharge elimination system (NPDES) permit in Order No. 96-054 (permit) to the 85 incorporated cities and the county within Los Angeles County (the County).[1] The permit covers storm water discharges from municipal separate storm sewer systems throughout the County.[2]

[1] This was the second storm water permit adopted for Los Angeles County and its cities. The first permit was the subject of an earlier Order. (In the Matter of Natural Resources Defense Council, Inc., Order WQ 91-04). In this permit, the County is designated as the Principal Permittee, and each city is designated as a permittee. The County is required to submit various documents on behalf of all of the permittees.
[2] The Regional Water Board has since issued a separate permit for one city, Long Beach. The relevant provisions of the Long Beach permit are similar to those in Order No. 96-054.

The permit contains provisions for the regulation of storm water discharges from development planning and construction.[3] Pursuant to these provisions, the County was required to submit Standard Urban Storm Water Mitigation Plans (SUSMPs).[4] The SUSMPs are plans that designate best management practices (BMPs) that must be used in specified categories of development projects. The County submitted SUSMPs, but the Regional Water Board approved the SUSMPs only after making revisions. The Executive Officer issued the revised SUSMPs on March 8, 2000.[5]

On February 25, 2000, the State Water Resources Control Board (State Water Board or Board) received a petition for review of the actions and failures to act regarding the SUSMPs from a number of cities, the Building Industry Association of Southern California and the Building Industry Legal Defense Foundation (jointly referred to as Cities). A second petition was received from the City of Arcadia. And a third petition was received from the Western States Petroleum Association (WSPA). On April 7, 2000, the petitioners filed amendments to their petitions, concerning the March 8, 2000 issuance of the SUSMPs. The Cities' amendment also revised the list of cities included in the petition. The Cities' petition now includes 32 cities. The petitions are legally and factually related, and have therefore been consolidated for purposes of review.[6] The petitioners also requested a stay of the SUSMPs. This request was denied by letter, dated May 11, 2000.

[3] Permit, Part 2.III. These provisions focus more on post-construction impacts of development than on discharges from construction activities.
[4] Permit, Part 2.III.A.1.c.
[5] These are referred to herein as the Final SUSMPs. The Final SUSMPs also apply to Long Beach, even though it is subject to a separate permit.
[6] Cal. Code of Regs., tit. 23, section 2054.

On June 7 and 8, 2000, the Board held a hearing in Torrance. Several entities, including the petitioners, the Regional Water Board, and several environmental groups[7], were designated parties. The evidence from that hearing has been included in the record before the Board. The record for comments on the petition was kept open until the end of the hearing. The parties were allowed to submit post-hearing briefs.[8]

I. BACKGROUND

In prior Orders[9] this Board has explained the need for the municipal storm water programs and the emphasis on BMPs in lieu of numeric effluent limitations. The emphasis for preventing pollution from storm water discharges is still on the development and implementation of effective BMPs, but with the expectation that the level of effort will increase over time. In its Interim Permitting Approach[10], the United States Environmental Protection Agency (U.S. EPA) stated that first-round permits should include BMPs, and expanded or better-tailored BMPs in subsequent permits where necessary to attain water quality standards. Dischargers, consultants, and academic institutions in California and nationwide have conducted numerous studies on the effectiveness of BMPs and appropriate design standards. While many questions are still

[7] The environmental groups are Natural Resources Defense Council, Inc., Santa Monica BayKeeper, and Heal the Bay.

[8] There are several documents that were not timely received and, therefore, are not made a part of the record before the Board. The hearing notice specified that all evidence from parties must be received by May 31, 2000. The Regional Water Board submitted documents on June 6, 2000. The hearing notice specified that policy statements were due by the close of the hearing. Several comment letters were received June 12, 13, and 19, 2000. None of these submittals are a part of the record. The post-hearing briefs were subject to a 10-page limit. The environmental groups submitted objections to the post-hearing brief submitted by the Cities. First, the environmental groups challenge the length of the brief. All briefs were subject to a 10-page limit. The Cities submitted a 10-page brief, with a 22-page attachment showing extensive proposed revisions to the SUSMPs. This submittal violates the page limit, and only the brief is considered part of the record. Second, the environmental groups claim that an e-mail message referred to by the petitioners is subject to attorney-client privilege and should not have been used in this hearing. This e-mail message, from the Regional Water Board's counsel to one of its engineers, was placed in the Regional Water Board's administrative record and submitted to the State Water Board. Any privilege that may have attached to the message has been waived and no longer exists. Finally, the post-hearing brief from the City of Arcadia was received late and will not be considered. Documents submitted late for interim deadlines (such as the deadline for submitting responses to the petitions), have been included in the record.

[9] See, especially Orders WQ 91-03 (In the Matter of Citizens for a Better Environment et al.) and WQ 91-04.

[10] Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits. (61 Federal Register 57425.)

outstanding, more is expected of municipal dischargers, and many are implementing more effective programs.

While storm water management plans are improving, our knowledge of the impacts is also growing. Urban runoff has been determined to be a significant contributor of impairment to waters throughout the state. In Los Angeles specifically, beach closures are sometimes associated with urban runoff. In adopting the SUSMPs, the Regional Water Board took note of the urgent need for preventing further pollution from urban runoff and storm water discharges.

It is important to emphasize the role of the SUSMPs within the totality of regulating storm water discharges, and the purpose of these particular control measures. The requirement to prepare SUSMPS was part of the development controls in the permit. In addition to development controls, the permit requires education, public outreach, programs to restrict illicit connections and discharges, and controls on public facilities. In the context of the entire effort required by the permit, the development controls can be seen as preventing the existing situation from becoming worse.

The Final SUSMPs include a list of mandatory BMPs for nine categories of development. There are provisions that are applicable to all categories and lists of BMPs for individual categories. Requirements applicable to all categories include provisions to limit erosion from new development and redevelopment, requirements to conserve natural areas, protection of slopes and channels, and storm drain stenciling. Examples of BMPs specific to categories of discharge include design of loading docks for commercial projects and design of fueling areas for retail gasoline outlets. In most respects, the Final SUSMPs were similar to those proposed by the County. The significant departures were the inclusion of a numeric design standard for structural or treatment control BMPs, and the inclusion of certain types of projects that were not

R0072461

covered in the County's proposal. The design standard creates objective and measurable criteria for the amount of runoff that must be treated or infiltrated by BMPs.

The record indicates that the purpose of the development controls, including the SUSMPs, is not simply to prevent pollution associated with construction runoff. As the petitioners point out, construction discharges are already subject to this Board's Statewide Construction Permit. The development controls in the SUSMPs, on the other hand, focus on post-construction runoff. They are aimed at limiting not just the pollutants in runoff from the new development, but also the volume of runoff that enters the municipal storm sewer system. By limiting runoff from new development, the SUSMPs prevent increased impacts from urban runoff generally. There is adequate technical information in the record to show that by controlling the volume of runoff from new development, BMPs can be effective in reducing the discharge of pollutants in storm water runoff.

The Procedure for Adopting the SUSMPs

The permit requires a program for controls on Development Planning and Construction. It involved a number of submissions by the County in consultation with the Cities. The first step was submission of a checklist for determining priority projects and exempt projects. The checklist was due on January 30, 1998. A list of recommended BMPs for development projects was also due on that date. The SUSMPs were due within six months of approval of the BMP list, and were to incorporate BMPs for certain categories of development. Following approval of the SUSMPs, the cities and County were to implement development programs for priority projects, consistent with the BMP list and the SUSMPs.

The BMP list was not approved until April 22, 1999. Thereafter, the County submitted proposed SUSMPs on July 22, 1999. The Regional Water Board held a public workshop on

August 10, 1999. Following the workshop, the County submitted revisions to the SUSMPs on August 12, 1999. On August 16, 1999, the Regional water Board gave notice that it would discuss the SUSMPs in a public meeting on September 16, 1999. There was significant discussion at that meeting regarding the intent of the Executive Officer to approve the SUSMPs, but with revisions including a numeric design standard. At the conclusion of the meeting, the Regional Water Board members asked the Executive Officer to revise the SUSMPs and bring them back to another meeting. On December 7, 1999, the Executive Officer circulated revised SUSMPs for public review. This document incorporated a numeric design standard and made other revisions to the permittees' proposal. The Regional Water Board held a hearing on the SUSMPs on January 26, 2000. At that meeting, the Regional Water Board endorsed the SUSMPs revised by the Executive Officer, but directed him to make further changes. The Executive Officer issued the Final SUSMPs on March 8, 2000.

The Contents of the Final SUSMPs

The permit provides that the SUSMPs must incorporate the appropriate elements of the BMP list and, at a minimum, apply to seven development categories: 100-plus home subdivisions; 10-plus home subdivisions; 100,000-plus square foot commercial developments; automotive repair shops; retail gasoline outlets; restaurants; and hillside single-family dwellings.

The SUSMPs proposed by the County applied to these seven categories. Various BMPs applied to the different categories, and the SUSMPs contained narrative mitigation requirements for source control and treatment. The July proposals stated:

> "The development must be designed so as to mitigate (infiltrate and/or treat) the site runoff generated from impervious directly connected areas that may contribute pollutants of concern to the storm water conveyance system."

There were no numeric design criteria for mitigation. According to various participants, earlier County drafts had included design standards to mitigate flows from 0.6-inch storm events. But any numeric criteria had been removed from the version that was submitted.

In its revised SUSMPs, submitted on August 12, the County explained in its cover letter that the mitigation language did not mean that all runoff must be mitigated. Rather, the County's intent was to omit a numerical standard from the SUSMPs. The revised SUSMPs no longer referred to mitigation at all. Instead, the following language replaced the mitigation requirement:

> "The development must be designed so as to minimize, to the maximum extent practicable (MEP), the introduction of pollutants of concern that may result in significant impacts, generated from site runoff of directly connected impervious areas (DCIA), to the storm water conveyance system as approved by the building official."

The Final SUSMPs, as approved by the Executive Officer and the Regional Water Board, included several revisions from the County's submittal. The revision that is of greatest concern to the petitioners is the addition of Design Standards for Structural or Treatment Control BMPs.[11] The design standards require that developments subject to the SUSMPs shall be designed to mitigate storm water runoff (by treatment or infiltration) from one of the following:

> "1. The 85th percentile 24-hour runoff event determined as the maximized capture storm water volume for the area..., or
> 2. The volume of annual runoff based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment..., or
> 3. The volume of runoff produced from a 0.75 inch storm event, prior to its discharge to a storm water conveyance system, or
> 4. The volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event."

[11] The Final SUSMPs also include the narrative language quoted from the County's August 22, 1999 proposal.

The Final SUSMPs also applied to two additional categories of development: parking lots over 5,000 square feet or with 25 or more spaces and exposed to storm water, and to developments in environmentally-sensitive areas. Other revisions included application to all projects in the categories instead of discretionary projects only and the definition of redevelopment.

II. CONTENTIONS AND FINDINGS[12]

Contention: The petitioners contend that the Regional Water Board erred in not complying with the Administrative Review Process within the permit, and acted arbitrarily and capriciously and in violation of the Clean Water Act and state law.

Finding: The permit required the County, in consultation with the cities subject to the permit, to submit SUSMPs. The permit includes some general minimum requirements for the SUSMPs.[13] The Executive Officer is granted authority to approve the SUSMPs.[14]

The permit also contains an administrative review process.[15] The permit states that the administrative review process "formalizes the procedure for review and acceptance of reports and documents" and "provides a method to resolve any differences in compliance expectations between the Regional Board and Permittees, prior to initiating enforcement action."[16] Following this introductory statement, the permit includes two procedures. The first is for review and approval or disapproval of reports and documents. The second is the dispute resolution section that must be followed prior to enforcement action.

---

[12] This Order does not address all of the issues raised by the petitioners. The Board finds that the issues that are not addressed are insubstantial and not appropriate for State Water Board review. (See *People v. Barry* (1987) 194 Cal.App.3d 158, [239 Cal.Rptr. 349], Cal. Code Regs., tit. 3, § 052.)
[13] Permit, Part 2, III.A.1.c.
[14] Permit, Part 2, III.A.2.
[15] Permit, Part 2, I.G.
[16] *Id.*

The process for review of documents that are subject to the Executive Officer's approval is that the Executive Officer will notify the permittees of the results of the review and approval or disapproval within 120 days. If the Executive Officer does not do so, the permittees must notify the Regional Water Board of their intent to implement the documents without approval. The Executive Officer then has 10 days to respond, or the permittees may implement the program and the Executive Officer may not make modifications.

The dispute resolution procedure is to be used when the Executive Officer determines that a permittee's storm water program is insufficient to meet the permit's provisions. The Executive Officer must send a "Notice of Intent to Meet and Confer" with the permittee. A meet and confer period then ensues, resulting in a written "Storm Water Program Compliance Amendment (SWPCA)." The permittee is provided time to comply with the SWPCA. The Executive Officer is not allowed to take enforcement action against a permittee until the Executive Officer notifies the permittee in writing that the administrative review process has been exhausted and that a violation exists warranting enforcement.

The petitioners contend that the Executive Officer failed to notify the permittees that their SUSMPs were inadequate within 120 days of its submittal. The petitioners also argue that, by revising the SUSMPs without pursuing the dispute resolution process, the Regional Water Board "violated" the terms of the permit.

The provision for review of documents, which clearly includes the SUSMPs, requires that the Executive Officer notify the permittees of the results of the review and approval or disapproval within 120 days. The County submitted the revised SUSMPs on August 12, 1999. Within 120 days, the Regional Water Board held a workshop where staff expressed their concerns with the SUSMPs. Also within 120 days the Regional Water Board itself held a public

R0072466

meeting where there was extensive discussion and concern by board members that the SUSMPs did not include a numeric standard. And, prior to any notification by the permittees that they would proceed with implementing their SUSMPs, the Regional Water Board held a hearing January 26, 2000, where it directed the Executive Officer to issue the SUSMPs with revisions. The Executive Officer did so on March 8, 2000.

It is clear from the record that the Executive Officer, and the Regional Water Board itself, did inform the permittees that the SUSMPs were inadequate. There was no requirement for a specific form for expressing disapproval of documents. The extensive discussion and meetings on the need for revisions to the SUSMPs, and the Executive Officer's approval of revised SUSMPs, plainly refutes the allegation that the Regional Water Board never notified the permittees of its disapproval of the County's proposed SUSMPs.

The permittees also claim that the Regional Water Board "violated" the permit by failing to institute the meet and confer process.[17] The dispute resolution process, which includes meet and confer, did not apply to the decision to disapprove the proposed SUSMPs. That process is only required when the Regional Water Board ultimately takes an enforcement action against a permittee. It is separate from the process for review and approval or disapproval of documents, and does not even appear to relate to possible enforcement actions for submission of inadequate documents. This is illustrated by the fact that the provision regarding documents refers to submittals from both the Principal Permittee and the individual permittees, while the dispute resolution provision refers only to the permittees. This distinction is relevant because the County is charged with submitting the documents, while the individual permittees are responsible for compliance. A fair reading of the entire section on the administrative review process is that the

[17] We note that permits are issued to permittees to allow discharges to waters of the state. It is only permittees, and not Regional Water Boards, who can be charged with violating permits.

R0072467

review and approval or disapproval of documents applies to submission of documents by the County on behalf of the cities, while the dispute resolution process applies to enforcement actions against any permittees for failing to implement adequate programs.

Contention: The petitioners contend that the Regional Water Board was not authorized to revise the SUSMPs to add more stringent requirements.

Finding: The petitioners contend that the mitigation standards in the SUSMPs are more stringent than the requirement in the permit to reduce pollutants in storm water runoff to the maximum extent practicable (MEP)[18]. The issue of what level of protection constitutes MEP will be discussed *Infra*, in the discussion of the reasonableness of the numeric standards. But the petitioners also make certain procedural claims on this point. They argue that in approving the BMP list, the Regional Water Board determined that those BMPs constituted MEP and that the Board could not add additional BMPs in the SUSMPs. They also contend the Regional Water Board itself had no authority to "usurp" the Executive Officer's role in reviewing the SUSMPs.[19] Finally, the petitioners contend that the Regional Water Board was not authorized to mandate a program for the permittees without amending the permit.

The permit requires the County to submit a list of BMPs for approval. The Regional Water Board approved this list. Following approval of the list, the County was required to submit the SUSMPs, which must "incorporate the appropriate elements of the recommended BMPs list."[20] The petitioners contend that by approving the list, the Regional Water Board determined that those BMPs constituted MEP, and that under the terms of the permit the Regional Water Board could not require additional BMPs.

---

[18] The technology-based standard for controls under municipal storm water permits is MEP. For a fuller discussion of this standard, see Order WQ 91-03.

[19] It is undisputed that, at its January 26, 2000 meeting, the Board directed the Executive Officer to make additional revisions to the SUSMPs.

[20] Permit, Part 2, III.A.1.c.

In addressing this contention, we face what appears to be a fundamental misunderstanding of the numeric design standards on the part of the petitioners. The design standards are objective criteria that developers must achieve in designing their BMPs. The design standards are not separate BMPs. The standards tell what magnitude of storm event the BMPs must be designed to treat or infiltrate. They do not specify the BMPs that must be employed.

The SUSMPs as submitted by the County specify BMPs for various categories of development. Many of these BMPs are designed to minimize the pollutants in storm water runoff, by reducing flow through infiltration or by treatment. Examples of BMPs proposed by the County include infiltration basins and trenches, oil/water separators, and media filtration. The County's proposed SUSMPs also included language requiring minimizing the introduction of pollutants to the storm water conveyance system. That language remains unchanged in the Final SUSMPs. The only significant difference between the two versions of the SUSMPs was that the Regional Water Board established numeric criteria for designing the BMPs.

In adopting the Final SUSMPs, the Regional Water Board based its decision on the MEP standard.[21] The Regional Water Board did not significantly revise the BMP list or specify further the actions that developers must take to comply with the SUSMPs. Thus, we find that the Regional Water Board did not inappropriately revise its determination of what constituted MEP.

The Regional Water Board is the political body responsible for water quality control in the Los Angeles region.[22] While the Regional Water Board may delegate specified powers and duties to its Executive Officer,[23] it can at any time act on its own behalf. The fact that the Board authorized its Executive Officer to approve the SUSMPs in the permit did not mean that the Board thereby denied itself the opportunity to provide direction to the Executive Officer in his

[21] Resolution R-00-02.
[22] Water Code sections 13200 and 13225.
[23] Water Code section 13223.

approval. Such an interpretation of its delegation authority would result in an improper failure of the Board to assume responsibility for water quality in the region.

We also find that the Regional Water Board was authorized to revise the SUSMPs to achieve compliance with the permit's requirements. The SUSMPs are a part of implementation of the permit. Because the permit regulates storm water discharges throughout the entire Los Angeles region and it is implemented by 85 cities and the County, it is obvious that the permit could not spell out every detail of the program for the five-year term of the permit. Instead, the implementation is through the submission, review and approval, and implementation of various programs, including the SUSMPs.[24] Where it receives a submission that it finds is not consistent with the requirements of the permit, it is reasonable for the Regional Water Board to be able to require revisions. The Regional Water Board is not required to amend the permit each time it approves a submittal or approves a submittal with revisions. On the other hand, if the Regional Water Board's action in requiring revisions is inconsistent with the terms of the permit, then the Board should not act without first amending the permit. While the Regional Water Board could have required the County to make the revisions rather than making them itself, we see no harm in the Regional Water Board's approach.

As will be discussed below, in most respects the Final SUSMPs are consistent with the permit. But there are some portions of the SUSMPs that are not consistent, and in those cases the SUSMPs provisions are further revised in this Order.

Contention: The petitioners make various procedural claims, including that they were denied due process, and that the Regional Water Board violated the Administrative Procedure

[24] A fuller discussion of the use of storm water management plans to incorporate a developing program is found in Order No. WQ 91-03.

Act, the California Environmental Quality Act (CEQA), and the California Constitution, Article XIII B, section 6 (regarding state mandates).

Finding: The petitioners point out that at the January 26, 2000 Regional Water Board hearing, there was some confusion over late changes to the SUSMPs and they contend they were not provided adequate opportunity to comment. There was significant discussion of the SUSMPs over several months. We do not agree with the petitioners that a program of this magnitude must necessarily take years to develop. But we are concerned that at the January 26, 2000 hearing, interested persons and permittees were not given adequate time to review late revisions or to comment on them. Given the intense interest in this issue, the Regional Water Board should have diverged from its strict rule limiting individual speakers to three minutes and should have allowed groups to make joint presentations.[25] But to the extent the Regional Water Board's process caused any harm, this Board cured those harms. We held a two-day hearing in Los Angeles County, where all parties were allowed significant time to present their positions and testimony. In addition, we allowed the introduction of new evidence that had not been presented to the Regional Water Board. At this point, all parties have been afforded a full opportunity to review the Final SUSMPs, to present their positions and evidence, and to engage in cross-examination. The petitioners' due process rights have been protected.

The Board has already addressed the contentions regarding compliance with other laws in prior decisions. The Administrative Procedure Act exempts the adoption of permits from its requirements.[26] While the SUSMPs are not a permit, they are implementing documents for a permit, and are therefore subject to the exemption. Moreover, they are relevant only to this

[25] For future adjudicative proceedings that are highly controversial or involve complex factual or legal issues, we encourage regional water boards to follow the procedures for formal hearings set forth in Cal. Code of Regs., tit. 23, section 648 et seq.

[26] Government Code section 11352; See, Order No. 95-4 (In the Matter of the City and County of San Francisco).

permit, and are not a general rule of application. The constitutional provisions regarding state mandates also do not apply to NPDES permits.[27] As will be explained below, the SUSMPs as revised herein, are consistent with MEP and therefore are federally mandated. The provisions of CEQA requiring adoption of environmental documents also do not apply to NPDES permits.[28] Again, as an implementing document for the permit, there is no requirement for a separate CEQA analysis.[29]

Contention: The petitioners contend that the SUSMPs do not properly apply the maximum extent practicable standard.

Finding: The permit, consistent with Clean Water Act section 402(p)(3)(B)(iii), requires controls to reduce the discharge of pollutants to the maximum extent practicable, or MEP.[30] In approving the Final SUSMPs, the Regional Water Board acknowledged that one of the primary objectives of the municipal storm water program is the requirement to reduce the discharge of pollutants from storm water conveyance systems to the MEP.[31] While all parties appear to agree that the standard for the SUSMPs is MEP, they disagree about what level of effort is necessary to comply with that standard.

The petitioners approach this issue from two angles. First, they contend that the SUSMPs will not provide water quality benefits that reflect MEP. Second, they contend that there could be adverse impacts on groundwater quality that have not been adequately evaluated.

---

[27] See, Order No. WQ 90-3 (In the Matter of San Diego Unified Port District).
[28] Water Code section 13389.
[29] We do note with interest the environmental groups' comment that if the permittees believed it was necessary to comply with the APA and CEQA prior to adoption of the SUSMPs, then they themselves would have violated those acts in their submissions of the proposed SUSMPs.

R0072472

Storm Water Design Standards as MEP

In adopting the Final SUSMPs, the Regional Water Board found that many rivers and streams in Los Angeles County are impaired for pollutants found in storm water and urban runoff, and that storm water runoff carries pollutants from nearly all types of developed properties.[32] Pollutant loading from the aggregate of development in the basin results in impairments from sediments, metals, complex organic compounds, oil and grease, nutrients, and pesticides.[33] The Final SUSMPs reflect two goals: to reduce the amounts of these pollutants in runoff and to reduce the ability of runoff to act as a conveyance system to deliver more pollutants to receiving waters. The Final SUSMPs, which include lists of BMPs and design standards requiring treatment or infiltration, address these two goals.

Clean Water Act section 402(p)(3)(B)(iii), which sets forth the requirements for establishing MEP in municipal storm water permits, provides that such permits "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants." The United States Environmental Protection Agency (U.S. EPA), in a guidance document, explains that BMPs should be used in first-round storm water permits, and "expanded or better-tailored BMPs in subsequent permits, where necessary, to provide for the attainment of water quality standards."[34] The Clean Water Act, as interpreted by U.S. EPA, does require that, in a second-round permit,[35] expanded BMPs may be appropriate. In light of the number of water

[32] Resolution No. R-00-02.
[33] *Id.*
[34] Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits, 61 Federal Register 57425 (1996).
[35] The original permit was issued in 1990. The 1996 permit is a second-round permit.

bodies impaired by runoff in Los Angeles County, it was appropriate to expand the scope of BMPs during the permit term.

The regulations implementing section 402(p) specifically require municipalities to have controls to reduce the discharge of pollutants from their storm sewer systems that "receive discharges from areas of new development and significant redevelopment," including post-construction discharges.[36] Clearly, it was appropriate for the Regional Water Board to require BMPs for new development and significant redevelopment. The permittees, who submitted their own version of SUSMPs with listed BMPs for categories of development, appear to have no real quarrel with this general mandate.

This Board has already endorsed requirements to limit the flow of the "first flush" of storm water, which may contain more significant pollutants.[37] The permittees' own version of the SUSMPs required mitigation of storm water runoff by treatment or infiltration, thus conceding the propriety of these two approaches to lessening the impact of storm water discharges. The crux of the disagreement is that the Regional Water Board added numeric design standards to establish the amount of runoff that must be treated or infiltrated, and required the mandatory application of these standards to categories of development.

The addition of measurable standards for designing the BMPs provides additional guidance to developers and establishes a clear target for the development of the BMPs. The U.S. EPA guidance manual suggests the use of design criteria and performance standards for post-construction BMPs.[38] The numeric criteria the Regional Water Board adopted essentially

[36] 40 CFR section 122.26(d)(2)(iv)(A)(2).
[37] In the Matter of National Steel and Shipbuilding Company, et al., Order WQ 98-07, at slip opinion 7.
[38] Guidance Manual for the Preparation of Part 2 of the NPDES Permit Applications for Discharges from Municipal Separate Strom Sewer Systems, at page 6-4 (November 1992).

requires that 85 percent of the runoff from the development be infiltrated or treated.[39] In adopting these standards, the Regional Water Board based its decision on a research review of standards in other states and a statistical analysis of the rainfall in the area. The standard was set to gain the maximum benefit in mitigation while imposing the least burden on developers.[40] In light of the evidence of the use of this or more stringent standards in other states, the expert testimony supporting this standard, the endorsement by U.S. EPA in its comments, and the cost-effectiveness of its implementation (discussed below), the Regional Water Board acted appropriately in determining that the standards reflect MEP.[41]

We also find that the Regional Water Board appropriately applied these standards to seven of the categories listed in the SUSMPs: single-family hillside residences, 100,000 square foot commercial developments, automotive repair shops, restaurants, home subdivisions with 10 to 99 housing units, home subdivisions with 100 or more housing units, and parking lots with 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff.[42] These categories, except for parking lots, were already targeted for special treatment in the permit. The evidence shows that each listed category can be a significant source of pollutants and/or runoff following development. It is appropriate that the design standards apply so that BMPs for these categories of development result in the infiltration or treatment of a significant about of the runoff.

---

[39] Four different methods of calculation are permitted, so the percentage of capture may vary slightly.

[40] At the hearing in this matter, Regional Water Board staff explained that the standard was set at the bottom of the "knee" of the curve where the benefits of the mitigation requirements decrease and the cost increases. Other states have set the standard higher along this curve, requiring 90 to 95 percent mitigation.

[41] This conclusion in no way departs from our acceptance of BMPs in lieu of numeric effluent limitations in storm water permits. (See, e.g., Order WQ 91-03 and Order WQ 91-04.) The numeric standard is a design standard for BMPs. It does not quantify or limit the pollutants in the effluent. It also does not specify which of the listed BMPs must be employed.

[42] As discussed below, this Board is revising the SUSMPs to delete the application of the design standards to retail gasoline outlets and to locations within or directly adjacent to or discharging directly to environmentally-sensitive areas.

R0072475

Potential Impacts on Ground Water

The petitioners contend that infiltration of runoff may lead to ground water pollution, and that the Regional Water Board did not properly consider such potential impacts. The mitigation standards provide for a waiver where there is a risk of ground water contamination because a known unconfined aquifer lies beneath the land surface or an existing or potential underground source of drinking water is less than ten feet from the soil surface.[43] The Final SUSMPs also include a discussion on how to use infiltration so that the risk of contamination of groundwater is reduced, and where infiltration is not appropriate.[44]

The Regional Water Board did consider the potential impacts to groundwater from infiltration, and included appropriate limitations and guidance on its use as a BMP. These provisions will ensure adequate protection of groundwater from any adverse impacts due to infiltration.

Contention: The petitioners contend the Regional Water Board failed to show that the SUSMPs as adopted are cost-effective and that the benefits to be obtained outweigh the costs.

Finding: The petitioners refer to the Preamble to the Phase II storm water regulations[45] as the basis for their economic argument. The quoted language, however, does not wholly support the petitioners' contention. The Preamble states that President Clinton's Clean Water Initiative clarifies "that the maximum extent practicable standard should be applied in a site-specific, flexible manner, taking into account cost considerations as well as water quality effects."[46] It is clear that cost should be considered in determining MEP; this does not mean that

[43] Final SUSMP, page 14.
[44] *Id.*, at page 15.
[45] 64 Federal Register 68722 and following. These regulations do not apply to the permit, but the general language on MEP is relevant to EPA's interpretation of the standard.
[46] 64 Federal Register 68722, 68732 (December 8, 1999).

the Regional Water Board must demonstrate that the water quality benefits outweigh the economic costs.

While the standard of MEP is not defined in the storm water regulations or the Clean Water Act, the term has been defined in other federal rules. Probably the most comparable law that uses the term is the Superfund legislation, or CERCLA, at section 121(b). The legislative history of CERCLA indicates that the relevant factors, to determine whether MEP is met in choosing solutions and treatment technologies, include technical feasibility, cost, and state and public acceptance.[47] Another example of a definition of MEP is found in a regulation adopted by the Department of Transportation for onshore oil pipelines. MEP is defined as to "the limits of available technology and the practical and technical limits on a pipeline operator . . . ."[48]

These definitions focus mostly on technical feasibility, but cost is also a relevant factor. There must be a serious attempt to comply, and practical solutions may not be lightly rejected. If, from the list of BMPs, a permittee chooses only a few of the least expensive methods, it is likely that MEP has not been met. On the other hand, if a permittee employs all applicable BMPs except those where it can show that they are not technically feasible in the locality, or whose cost would exceed any benefit to be derived, it would have met the standard. MEP requires permittees to choose effective BMPs, and to reject applicable BMPs only where other effective BMPs will serve the same purpose, the BMPs would not be technically feasible, or the cost would be prohibitive. Thus while cost is a factor, the Regional Water Board is not required to perform a cost-benefit analysis.

In reviewing the record, it is apparent that the Regional Water Board did evaluate the cost of the SUSMPs. While the petitioners claim there is no evidence in the record to show the

[47] 132 Cong. Rec. H 9561 (Oct. 8, 1986).
[48] 49 CFR section 194.5.

R0072477

SUSMPs are necessary and cost effective, the opposite is true. The record is replete with documentation of costs of pilot mitigation projects, studies from similar programs in other states, and research studies. The Regional Water Board complied with the requirement to consider cost.

The Regional Water Board found that the cost to include BMPs that will meet the mitigation criteria will be one to two percent of the total development cost. This amount appears reasonable, especially in light of the amount of impervious surface already in Los Angeles County and the impacts on impaired water bodies. In considering the cost of compliance, it is also important to consider the costs of impairment. The beach closures in the Los Angeles region, well documented in the evidence, have reached critical proportions. These beach closures clearly have a financial impact on the area, and should be positively affected by the SUSMPs.

We do note that there could be further cost savings for developers if the permittees develop a regional solution for the problem. We recommend that the cities and the County, along with other interested agencies, work to develop regional solutions so that individual dischargers are not forced to create numerous small-scale projects. While the SUSMPs are an appropriate means of requiring mitigation of storm water discharges, we also encourage innovative regional approaches.

Contention: The petitioners have raised contentions regarding details of the SUSMPs, including the amount of time allowed for inclusion of SUSMPs in local ordinances, and their application to both "discretionary" and "non-discretionary" projects. In addition, during the hearing certain ambiguities in the wording of the Final SUSMPs became apparent, including the provisions regarding redevelopment and environmentally-sensitive areas. In this portion of the

Order we address these issues and also the application of the design standards to retail gasoline outlets (RGOs) and the waiver funding requirements.

Finding: The testimony at the hearing in this matter revealed that there are specific provisions of the SUSMPs that create confusion as to the types of development projects subject to the mitigation design standards. The petitioners also contend that application of the standards to specific types of development either is unreasonable or is inconsistent with the terms of the permit. The specific requirements are discussed below.

Retail Gasoline Outlets

Petitioner WSPA contends that RGOs should be excluded from the SUSMPs. Its petition raised the same general contentions as the other petitioners, but at the hearing WSPA presented evidence specific to RGOs. In particular, WSPA raised questions about the propriety of applying the design standards for BMPs to RGOs. In considering this issue, we conclude that construction of RGOs is already heavily regulated and that owners may be limited in their ability to construct infiltration facilities. Moreover, in light of the small size of most RGOs, treatment also may not be feasible, or safe. The mandatory BMPs that are included in the SUSMPs should be adequate to achieve MEP at RGOs.[49] We conclude that RGOs should not be subject to the BMP design standards because they are already heavily regulated and may be limited in their ability to construct infiltration facilities or to perform treatment.

Redevelopment Projects

The SUSMPs were written to apply to new development and to some types of redevelopment in nine categories of projects. The definition of "redevelopment" reflected the intent of the Regional Water Board to define the scope of redevelopment projects subject to the

[49] WSPA also refers to the list of BMPs in a publication of the California Storm Water Quality Task Force. (Best Management Practice Guide – Retail Gasoline Outlets. March 1997.) This publication includes BMPs in addition to those listed in the SUSMPs, which should be considered for inclusion therein.

requirements. That definition[50], however, was somewhat confusing, and it was apparent from testimony at the hearing that the parties had different understandings of the scope of redevelopment subject to the SUSMPs. In their post-hearing briefs, the various parties appeared to agree on the actual intent of the Regional Water Board in including redevelopment in the SUSMPs. This intent was to include redevelopment that adds or creates at least 5,000 square feet of impervious surface to the original development and, where the addition constitutes less than 50 percent of the original development, to limit the application of the BMP design standards to the addition.

While some parties requested further requirements for development, it appears that the Regional Water Board's original intent was relatively simple to apply and results in a fair and appropriate application of the SUSMPs' requirements to redevelopment. Therefore, we will revise the definition in the SUSMPs accordingly.

Environmentally-Sensitive Areas

The permit required that the SUSMPs address at least seven development categories.[51] The final SUSMPs added two more categories: parking lots of 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff; and location within or directly adjacent to an environmentally-sensitive area (ESA). The petitioners contend that the

[50] The SUSMPs state: "Redevelopment" means, on an already developed site, the creation or addition of at least 5,000 square feet of impervious surfaces or the creation or addition of fifty percent or more of impervious surfaces or the making of improvements to fifty percent or more of the existing structure. Redevelopment includes, but is not limited to: the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/or exterior construction or remodeling; replacement of impervious surface that is not part of a routine maintenance activity; and land disturbing activities related with structural or impervious surfaces.

[51] The categories listed in the permit are: single-family hill residences, 100,000 square-foot commercial developments, automotive repair shops, retail gasoline outlets, restaurants, home subdivisions with 10 to 99 housing units, and home subdivisions with 100 or more housing units. Permit, Part 2, III.A.1.c.

addition of ESAs was inappropriate because the permit refers only to "development categories"[52] and ESA is a location category.

Whether or not the Regional Water Board went beyond the permit's terms in including this category, we find a fundamental problem with the language of the SUSMPs regarding ESAs. All of the other categories are relatively simple to apply because they describe the types of development that fall within the category. For instance, the threshold for a commercial development is 100,000 square feet. If the development is smaller, it is not subject to the SUSMPs. But for developments within ESAs, the SUSMPs contain no threshold. This absence led to speculation by the petitioners that something as small as a new patio on a home in an ESA would make the SUSMPs applicable. The Regional Water Board, at the hearing and in its post-hearing brief, conceded that there should be some threshold. While the Regional Water Board did recommend a specific threshold, we believe that it is inappropriate for this Board to add a threshold that has not been fully discussed by all interested persons.

While it may be appropriate to include more stringent controls for developments in ESAs, we also note that such developments are already subject to extensive regulation under other regulatory programs. Moreover, in light of the permit language limiting the SUSMPs to development categories, ESAs are not an appropriate category within the SUSMPs. The Regional Water Board may choose to consider the issue further when it reissues the permit.

Discretionary and Non-Discretionary, or Ministerial, Projects

The petitioners contend that the SUSMPs should apply only to projects that are considered "discretionary" within the meaning of California Environmental Quality Act

[52] *Id.*

R0072481

(CEQA).[53] They argue that the inclusion of non-discretionary, or ministerial, projects is inconsistent with the terms of the permit.

The permit provisions on development projects do refer to "discretionary" projects in several places. The permittees are directed to develop a checklist for determining priority and exempt projects.[54] Priority projects are defined as development and redevelopment projects requiring discretionary approval, which may have a potential significant effect on storm water quality.[55] The permittees are also required to develop a BMP list.[56] In developing the SUSMPs, the permittees are required to incorporate appropriate elements of the BMP list.[57] Next, the permittees must develop a program on planning control measures for priority projects (which are limited to projects requiring discretionary approval), consistent with the list of BMPs and the SUSMPs.[58] The permit further states that, in order to assure compliance with these requirements, the permittees must develop guidelines on preparing CEQA documents that link mitigation conditions to "local discretionary project approvals."[59]

Taken as a whole, the provisions of the permit appear to link the development requirements for SUSMPs to developments that receive discretionary approval by local governments, as defined in CEQA. The SUSMPs are an implementation tool for the permit and must be consistent with the permit. While the limitation of the SUSMPs to discretionary projects may not be sufficiently broad for an effective storm water control program, the Regional Water Board acted inappropriately in expanding the SUSMPs to include non-discretionary projects. The Regional Water Board may consider expanding the development controls beyond CEQA

R0072482

discretionary projects when it reissues the permit. But at this time, the SUSMPs must be revised so that they are limited to development projects requiring discretionary approval within the meaning of CEQA.[60]

Waiver Funding Requirement

Where a waiver is granted from the design standard requirements, the Final SUSMPs provide that the permittee must require the project proponent to transfer the cost savings to a storm water mitigation fund. The fund is to be operated by a public agency or a non-profit entity, to promote regional or alternative solutions for storm water pollution in the same storm watershed. The petitioners contend that the funding requirement will create an additional administrative burden.

The concept of a mitigation fund or "bank" is a positive idea for obtaining regional solutions to storm water runoff. As a long-term strategy, municipal storm water dischargers should work to establish regional mitigation facilities, which may be more cost-effective and more technically effective than mitigation structures at individual developments. But at this point there are not sufficient resources in place to require all permittees to establish such funds or to find appropriate non-profit organizations. Before mandating funding, preliminary questions should be answered, including who will manage the fund, what types of projects it will be used for, what entities can legally operate such funds, and how permittees will determine the amount of the assessments. It would be appropriate for the County to consider developing a program with the appropriate flood control agency, or as a model for the separate cities to develop. There may be suitable agencies to administer such funds, but the development of programs may take

[60] We note that the Final SUSMPs already include a definition of "discretionary project" consistent with the definition in the CEQA guidelines. Final SUSMPs at page 4 of 25; Title 14, California Code of Regulations, section 15357. Apparently this definition was inadvertently retained after the Regional Water Board decided to expand the SUSMPs beyond discretionary projects.

some time. The Regional Water Board should consider adopting such a program when it reissues the permit, after consultation with the appropriate local agencies.

III. CONCLUSIONS

Based on the discussion above, the Board concludes that:

1. The Regional Water Board complied with the procedural requirements of the permit, including the Administrative Review Process, in approving the Final SUSMPs.
2. The Regional Water Board was authorized to revise the SUSMPs by including more stringent requirements than the permittees had proposed.
3. The Regional Water Board complied with did not violate the Administrative Procedure Act, CEQA, or the Constitutional provisions on state mandates. The petitioners' due process rights have been protected.
4. The Regional Water Board considered the costs of the SUSMPs, and acted reasonably in requiring these controls in light of the expected benefits to water quality.
5. The Final SUSMPs reflect a reasonable interpretation of development controls that achieve reduction of pollutants in storm water discharges to the maximum extent practicable.
6. The SUSMPs include adequate protections of groundwater quality from any impacts from infiltration.
7. The SUSMPs will be revised to clarify the intent of the Regional Water Board and to make them consistent with the permit. Specifically, retail gasoline outlets should not be subject to the BMP design standards because they are already heavily regulated and may be limited in their ability to construct infiltration facilities or to perform treatment. Redevelopment projects should be subject to the SUSMPs only if they result in creation or addition of 5,000 square feet of impervious surfaces. Environmentally-sensitive areas should not be listed as a category in the SUSMPs. The SUSMPs should only apply to discretionary projects. The requirement for

R0072484

funding by project proponents who receive waivers should be deleted. The SUSMPs will be amended as shown in the attachment to this Order.

8. In light of the revisions of the SUSMPs made by this Order, and to allow the permittees adequate time to adopt implementing ordinances, the deadline for adopting ordinances will be revised to January 15, 2001, and the effective date of the Final SUSMPs will be revised to February 15, 2001.

IV. ORDER

IT IS HEREBY ORDERED that the Standard Urban Storm Water Mitigation Plans for Los Angeles County and Cities in Los Angeles County is revised consistent with the amendments attached hereto. In all other respects the petitions are dismissed.

CERTIFICATION

The undersigned, Administrative Assistant to the Board, does hereby certify that the foregoing is a full, true, and correct copy of an order duly and regularly adopted at a meeting of the State Water Resources Control Board held on October 19, 2000.

[These amendments are to the Final SUSMP, as published March 8, 2000]

Page 3 of 25

First full paragraph:

All **discretionary development and redevelopment** projects that fall into one of ~~seven~~ **the following** categories are ~~identified in the Los Angeles County MS4 Permit as requiring~~ **subject to these** SUSMPs. These categories are:

- Single-family Hillside Residences
- 100,000 Square Foot Commercial Developments
- Automotive Repair Shops
- Retail Gasoline Outlets
- Restaurants
- Home Subdivisions with 10 to 99 housing units
- Home Subdivisions with 100 or more housing units
- **Parking lots 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff**

Second full paragraph:

~~The Regional Board Executive Officer has designated two additional categories subject to SUSMP requirements for the Los Angeles County MS4 Permit. These categories are:~~

- ~~Location within or directly adjacent to or discharging directly to an environmentally sensitive area, and~~
- ~~Parking lots 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff~~

Fourth full paragraph:

Permittees shall amend codes not later than ~~September 8, 2000~~ **January 15, 2001**, to give legal effect to the SUSMP requirements. The SUSMP requirements for projects identified herein shall take effect not later than ~~October 8, 2000~~ **February 15, 2001**.

Page 4 of 25

Delete definition of "Environmentally Sensitive Area"

Revise Definition of "Redevelopment":

"Redevelopment" means, on an already developed site, the creation or addition of at least 5,000 square feet of impervious surfaces ~~or the creation or addition of fifty percent or more of impervious surfaces or the making of improvements to fifty percent or more of the existing structure~~. Redevelopment includes, but is not limited to: the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/or exterior construction or remodeling; replacement of impervious surface that is not part of a routing maintenance activity; and land disturbing activities related with structural or impervious surfaces. **Where redevelopment results in an increase of less than fifty percent of the impervious surfaces of a previously existing development, and the existing development was not subject to these SUSMPs, the Design Standards apply only to the addition, and not to the entire development.**

STATE WATER RESOURCES CONTROL BOARD WORKSHOP & BOARD MEETING AGENDA

Wednesday, October 4, 2000 – 11:30 a.m.
Thursday, October 5, 2000 -- 9:00 a.m.

First-Floor Hearing Room
Paul R. Bonderson Building
901 P Street, Sacramento

Questions regarding this agenda call Maureen Marché (916) 657-0990 or fax 657-0932. This notice and associated staff reports can be accessed electronically through our Internet address: http://www.swrcb.ca.gov. (Note: agenda items should be available electronically on September 27, 2000.)

Workshop includes informal discussion of items to be presented for action at a future business meeting. People who are interested in items on the agenda are urged to attend workshops as they may miss valuable discussion that will not be repeated at the Board meeting. NOTE: There is no voting at workshops. Items requiring Board action must come to a Board meeting.

Please note time limitations on presentations may be imposed.
The State Board requests that oral testimony be summarized.
Submittal of written comments is encouraged to ensure
that all comments will be included in the
record before the Board.*

ITEM 1 WILL BE DISCUSSED STARTING AT 11:30 A.M., WEDNESDAY, OCTOBER 4, 2000.
ITEMS 2-14 WILL BE DISCUSSED STARTING AT 1:00 P.M., WEDNESDAY, OCTOBER 4, 2000

Workshop

PUBLIC FORUM
Any member of the public may address and ask questions of the Board relating to any matter within the Board's jurisdiction, provided the matter is not on the Board's agenda or pending before the Board or a Regional Board. *Note: Presentations at the Public Forum will be limited to 5 minutes or otherwise at the discretion of the Chairman.*

WATER QUALITY
1. Presentation of the Assembly Bill 982 Public Advisory Group's Ambient Surface Water Monitoring Report. (Information Item – Assembly Bill 982 Public Advisory Group will present its Ambient Surface Water Monitoring Report to the Board.)

2. Status Report of Current Priorities by Tri-TAC. (Information item.)

CLEAN WATER PROGRAMS PETITION Removed

3. In the Matter of the Petition of G.W. Singletary for Review of a Determination of the Division of Clean Water Programs, State Water Resources Control Board, Finding Petitioner Ineligible to Participate in the Underground Storage Tank Cleanup Fund. SWRCB/OCC File UST-145. (The Board will consider, at a Board Meeting, whether to adopt the proposed order upholding the Division's decision.)

OCEAN PLAN
4. Consideration of a Resolution Approving Proposed Amendments to the California Ocean Plan (Ocean Plan). (The Board will consider, at a Board meeting whether to adopt the proposed amendments to the Ocean Plan.) As previously noticed, comments on the Draft Functional Equivalent Document dated September 1, 2000 are requested to be received by 5:00 p.m., September 28, 2000. Comments should be sent to Frank Palmer, SWRCB, Division of Water Quality, P. O. Box 944213, Sacramento, CA 94244-2130. Electronic comments can be sent to Chris Beegan at **beegc@dwq.swrcb.ca.gov**.

Item No. 16

ERRATA SHEET
REGARDING DRAFT ORDER FOR CITIES OF BELLFLOWER ET AL.
(FILES A-1280, A-1280(a) AND A-1280(b)

At page 21, at end of second full paragraph, add new footnote:

We note that the SUSMPs as written do not in any way preclude the use of regional solutions as a means to comply with the BMP and design standard requirements.

At pages 22-23, revise paragraph on Retail Gasoline Outlets as follows:

Retail Gasoline Outlets

Petitioner WSPA contends that RGOs should be excluded from the SUSMPs. Its petition raised the same general contentions as the other petitioners, but at the hearing WSPA presented evidence specific to RGOs. In particular, WSPA raised questions about the propriety of applying the design standards for BMPs to RGOs. In considering this issue, we conclude that construction of RGOs is already heavily regulated and that owners may be limited in their ability to construct infiltration facilities. Moreover, in light of the small size of ~~most~~ many RGOs and the proximity to underground tanks, treatment also may not be feasible, or safe. The mandatory BMPs that are included in the SUSMPs ~~should~~ may be adequate to achieve MEP at RGOs, but the Regional Water Board should consider adding additional mandatory BMPs, such as use of dry cleanup methods (e.g. sweeping) for removal of litter and debris, use of rags and absorbents for leaks and spills, restricting the practice of washing down hard surfaces unless the wash water is collected and disposed of properly, annual training of employees on proper spill cleanup and waste disposal methods, and the inclusion of BMPs to address trash receptacle areas and air/water supply areas.[1] We conclude that because RGOs ~~should not be subject to the BMP design standards because they~~ are already heavily regulated and may be limited in their ability to construct infiltration facilities or to perform treatment, they should not be subject to the BMP design standards at this time, and recommend that the Regional Water Board undertake further consideration of a threshold relative to size of the RGO, number of fueling nozzles, or some other relevant factor.

[1] ~~WSPA also refers to the~~These BMPs are from a list of BMPs in a publication of the California Storm Water Quality Task Force. (Best Management Practice Guide – Retail Gasoline Outlets. March 1997.) This publication includes BMPs in addition to those listed in the SUSMPs~~, which should be considered for inclusion therein~~.

STANDARD URBAN STORM WATER MITIGATION PLANS AND BOARD RESOLUTION APPROVING POST-CONSTRUCTION BMP REQUIREMENTS FOR DEVELOPMENT PLANNING AND CONSTRUCTION (Board Resolution No. R-00-02)

Dear Mr. Stone and Mr. Holland:

On January 26, 2000, the Regional Board at its hearing adopted Board Resolution No. R-00-02 directing me to approve the Standard Urban Storm Water Mitigation Plan (SUSMP) with changes noted. The Regional Board at the same time also adopted the SUSMP requirements for the City of Long Beach under the City of Long Beach municipal separate storm sewer system (MS4) permit (Board Order No. 99-060).

Copies of the Regional Board Executive Officer approved SUSMP, Board Directed Changes - Supplement, and the Resolution adopted by the Regional Board are attached.

The City of Long Beach and all Los Angeles County Municipal Storm Water Permittees will have until September 8, 2000, to promulgate ordinances or amend municipal codes to implement the SUSMP requirements. The SUSMP requirements shall take effect no later than October 8, 2000. All parties, including the City of Long Beach, will have 30 days from the date of this letter to file a review of the action by the State Water Resources Control Board.

If you have any questions, please call me at (213) 576-6605 or Dr. Swamikannu at (213) 576-6654.

Sincerely,

Dennis A. Dickerson
Executive Officer

Cc: Permittees
Interested Parties

R0072492

State of California
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

Resolution No. R-00-02

APPROVING THE
STANDARD URBAN STORM WATER MITIGATION PLAN
FOR
MUNICIPAL STORM WATER AND URBAN RUNOFF MANAGEMENT PROGRAMS
IN LOS ANGELES COUNTY

WHEREAS, THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION FINDS:

1. On July 15, 1996, a municipal separate storm sewer system permit (Los Angeles County MS4 Permit) was issued to the County of Los Angeles and 85 incorporated cities to control and minimize the discharge of pollutants associated with storm water and urban runoff. This permit became Regional Board Order No. 96-054, Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles.

2. On June 30, 1999, a municipal storm water permit was issued to the City of Long Beach (City of Long Beach MS4 Permit) which removed the City of Long Beach from Board Order No. 96-054, giving the City of Long Beach its own distinct Municipal Storm Water and Urban Runoff NPDES permit, Regional Board Order No. 99-060, "Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the City of Long Beach".

3. On August 19, 1999, a statewide general storm water permit for construction activity (Statewide Construction Storm Water Permit) was adopted by the State Water Resources Control Board (State Board). This permit became State Board Order No. 99-08-DWQ, and applies to construction projects that disturbs five acres or more or is part of a larger common plan of sale in the Los Angeles region.

4. Many of the rivers and streams in Los Angeles County are formally designated as impaired, pursuant to Section 303 (d) of the federal Water Pollution Control Act, for specific pollutants that are commonly found in storm water and urban runoff.

5. Storm water runoff carries with it many pollutants in varying concentrations that are suspended in, and or dissolved, in the runoff. The sources of these pollutants include nearly all properties that have been developed since the pollutants originate through the many diverse activities of habitation and land use. Pollutants generated from individual property developments vary greatly in the concentration or loading of each pollutant. Generally, the relative contribution of the pollutant from runoff from any individual property development will represent only a small portion of the entire loading of a water body given the many square miles of land upon which storm water runoff is generated. When the individual contributions from tens of thousands of discrete property units are aggregated, the pollutant loading becomes significant. The resultant pollutant loads results in the impairment of that water body and the conveyance of pollutants, including sediments, metals, complex organic compounds, oil and grease, nutrients, and pesticides to the ocean and harbors within Los Angeles County. The loading of pollutants generated in the Los Angeles area are being measured through the monitoring program being conducted by the Los Angeles County Department of Public Works in conformance with its obligations as the Principal Permittee under the Los Angeles CountyMS4 Permit.

R0072493

6. The nature of property use is related to the types and quantities of pollutants that are transported from that property during a rainfall event.

7. As property is developed or redeveloped, the utilization of Best Management Practices provide an opportunity to reduce the loading of pollutants to water bodies. This is accomplished by various techniques and can be passive (source reduction) or active (treatment). As property is developed from undisturbed lands, the project can be designed to incorporate Structural or Treatment Control (Best Management Practices (BMPs) that would normally not be available or practical to use on property that has been in urban use.

8. BMPs are effective means of reducing pollutants and Structural or Treatment Control BMPs can be "designed-into" a project in a cost effective way and in a manner that is either transparent to or which enhances the use to which the property has been placed. Some BMPs encourage the setting aside of areas as a greenbelt to allow storm water runoff to flow over areas which are permeable, thereby allowing all or a portion of the runoff to infiltrate. Other BMPs can be designed and built into structures such as catch basins that incorporate replaceable filters to absorb oily wastes or by installing screens to prevent litter from passing through the system and into the water body.

9. Arrays of Structural or Treatment control BMPs are available to developers of both new and redevelopment properties. The use of BMPs is already required by the terms of the Los Angeles County and Long Beach Municipal Storm Water and Urban Runoff NPDES permits.

10. The ability of any BMP to be effective is limited by the volume of water that the BMP is exposed to in any discrete period of time. A BMP that can only be effective for a small volume of storm water runoff is inherently less effective than one sized to accommodate a larger volume of water.

11. Storm water runoff will normally convey a disproportionate loading of pollutants in the initial period runoff is generated during a storm event. Storm events generating up to 0.75 inches of precipitation, measured over a 24-hour period, constitute 85 percent of the total amount of runoff that can be expected during an average wet season. Designing a BMP to be able to accommodate this amount of runoff will result in the application of a BMP intervention to all but 15% of the total runoff during a year, and usually all of the critical runoff that occurs in the early phase of the precipitation event, commonly referred to as the "first Flush."

12. Both the Los Angeles County MS4 Permit (Part III.A.1.c) and the City of Long Beach MS4 Permits contain provisions related to the adoption of Standard Urban Storm Water Mitigation Plans (SUSMPs) requiring their development and implementation.

13. Standard Urban Storm Water Mitigation Plans are required for a specified set of enumerated projects and the permit specifically identifies seven distinct categories for which SUSMPs are required to be prepared. The permit specifically states that the seven categories of projects are the minimum categories requiring SUSMPs.

14. Standard Urban Storm Water Mitigation Plans are also required for development or redevelopment of Parking Lots 5,000 square feet or greater and Locations in Environmentally Sensitive Areas. These categories have been added to advance efforts to control storm water pollution beyond the minimum in Los Angeles County.

15. Standard Urban Storm Water Mitigation Plans are required to be approved by the Regional Board Executive Officer following which they are to be implemented by the Permittees and used by the Permittees as the minimum criteria for the approval of project specific Urban Storm Water Mitigation Plans and the issuance of grading or building permits to project applicants.

16. The Statewide Construction Storm Water Permit requires that Storm Water Pollution Prevention Plans (State SWPPPs) contain post-construction BMPs that will be implemented after construction is complete.

17. Section 402 (p) of the Clean Water Act requires the Administrator of the United States Environmental Protection Agency or her designated agent, in this instance, the Regional Board, to require as part of the storm water program "controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants." [USC Section 1342 (p)(3)(B)].

18. A recent decision of the United States 9th Circuit Court of Appeals, *Defenders of Wildlife v. Browner* (1999) Case No. 98-71080, provides additional support and clarification of the authority of the Administrator and the Regional Board to impose additional controls on storm water pollution. The Court in *Defenders of Wildlife v. Browner* said that the USEPA and the States have discretion under the law to determine what pollution controls are appropriate to achieve compliance.

19. Pursuant to the requirements of Regional Board Order No. 96-054, Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles, the Regional Board Executive Officer received a proposal for Standard Urban Storm Water Mitigation Plans submitted by the Principal Permittee.

20. Upon the review of the Regional Board Executive Officer, the Standard Urban Storm Water Mitigation Plan submitted for the seven applicable categories was deemed inadequate. A revised SUSMP proposal was developed subsequent to a discussion of the proposal's conceptual foundation at a public workshop held on August 10, 1999. This workshop was well attended with over 80 municipal representatives and interested parties participating.

21. On August 16, 1999, a public notice was issued indicating that the Standard Urban Storm Water Mitigation Plans proposed by the Principal Permittee would be augmented by the addition of criteria related to specifying numerical design criteria for BMP construction. The matter was noticed for the Regional Board's September meeting to allow the issue to be discussed before the Board although no formal action of the Regional Board itself is required for SUSMP approval.

22. On September 16, 1999, the Regional Board conducted a public hearing on the Standard Urban Storm Water Mitigation Plan proposal as amended by the Executive Officer. At that hearing, the Regional Board Executive Officer suggested additional time would be necessary to develop a more comprehensive proposal incorporating the comments received at the public hearing.

23. Between September 16, 1999 and January 25, 2000, the Regional Board Executive Officer met with interested parties to discuss comments and concerns from interested parties.

24. The Southern California Council of Governments (SCAG) has indicated its interest in obtaining funding to prepare a regional plan(s) to address storm water pollution and identify regional treatment solutions for implementation.

25. On December 7, 1999, the Regional Board Executive Officer released a revised Standard Urban Storm Water Mitigation Plan document to interested parties.

THEREFORE BE IT RESOLVED THAT:

1. The Regional Board endorses the Standard Urban Storm Water Mitigation Plan prepared by the Regional Board Executive Officer and noticed to the public on December 7, 1999 and the concepts therein relating to numerical storm water mitigation standards for Best Management Practices; and

2. The Regional Board directs the Regional Board Executive Officer to approve the Standard Urban Storm Water Mitigation Plan at the earliest opportunity incorporating changes made and formally approved by the Regional Board at the January 26, 1999 Board Hearing;

3. The Regional Board adopts the approved requirements as provisions applicable to the SUSMP requirements for the City of Long Beach.

4. The Regional Board adopts the numerical mitigation standards for storm water, endorsed herein, as the minimum design criteria for review of post-construction BMPs in the Los Angeles Region for construction projects subject to coverage under the Statewide Construction Storm Water Permit.

5. The Regional Board encourages the Permittees and all interested parties to work together in a spirit of cooperation to effect the implementation of the Standard Urban Storm Water Mitigation Plan at the earliest possible date, and

6. The Regional Board encourages the efforts by the Southern California Council of Governments and area Council of Governments (COGs) to develop regional plans and identify regional solutions to address storm water pollution from new development and redevelopment.

I, Dennis Dickerson, Executive Officer, do hereby certify that the foregoing is a full, true and correct copy of a Resolution adopted by the California Regional Water Quality Control Board, Los Angeles Region, on January 26, 2000.

DENNIS A. DICKERSON
Executive Officer

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD

LOS ANGELES REGION

STAFF REPORT AND RECORD OF DECISION

STANDARD URBAN STORM WATER MITIGATION PLANS

AND

NUMERICAL DESIGN STANDARDS FOR BEST MANAGEMENT PRACTICES

SUPPLEMENT

BOARD DIRECTED CHANGES

The Regional Board at its January 26, 2000, meeting directed the Regional Board Executive Officer to amend the Standard Urban Storm Water Mitigation Plans (SUSMPs) as indicated by the change sheet presented at the meeting (dated January 25, 2000), and changes directed by the Regional Board during the meeting. The Regional Board also adopted the same SUSMP requirements for the City of Long Beach under its separate municipal storm water permit (Board Order No. 99-060) for project categories that require SUSMPs.

Regional Board Counsel designated the record for the proceeding to include: (i) all staff files and the transcript of proceedings for the January 26, 2000, Hearing; (ii) all staff files and transcript of proceedings for the September 16, 1999, Board Information Item Discussion; (iii) all staff files for the August 10, 1999, Workshop, (iv) all SUSMP Proposals circulated by the Permittees, (v) all SUSMP Proposals circulated by the Regional Board Staff, (vi) all comments received and responses; (vii) and all exhibits presented to the Board.

This "Supplement" document enumerates the significant changes made to the SUSMP that were directed by the Board at the hearing and the bases for the changes in the "Transcript of Proceedings", testimony presented or materials submitted to the Regional Board, and other relevant documents.

Applicability of the SUSMP

The SUSMP requirements apply to all projects in the nine enumerated categories for the Los Angeles County MS4 Program. While some development planning/ construction requirements in the permit are made applicable only to "Discretionary Projects", this limitation does not cover the seven "enumerated project categories" in Board Order No.

96-054, and the two additionally designated "enumerated project categories" by the Regional Board Executive Officer and affirmed by the Regional Board.[1]

Applicability to Categories for the City of Long Beach

A statement has been added to clarify that SUSMP requirements adopted by the Regional Board apply to the City of Long Beach MS4 Program for only: (i) 10-99 home subdivisions; (ii) 100 or more subdivisions; (iii) 100,000 or more square foot commercial developments; and (iv) projects located adjacent to or discharging to environmentally sensitive areas. For the remaining five categories, equivalent requirements have been included directly in or are expected to be developed shortly under the City of Long Beach Storm Water Management Plan.[2]

Effective Date for SUSMP Requirements

A statement has been included to provide Permittees 6 months from the date of Regional Board Executive Officer's approval of the SUSMP to amend ordinances and codes to be consistent with the adopted SUSMP requirements, and thence 30 days thereafter for the requirements to take effect.[3]

Definition of Commercial Development

The definition of "Commercial Development" has been reworded to be inclusive of all developments that are not considered "Residential" or "Heavy Industrial" based on the categorization of the federal storm water regulations.[4]

Definition of Environmentally Sensitive Areas

A new "Table 3" has been added to the SUSMP to list areas presently covered under the definition of "environmentally sensitive areas" based on readily ascertainable designations by the State Water Resources Control Board, the California Resources Agency, and the County of Los Angeles.[5]

R0072498

Definition of Parking Lots

The definition of "Parking Lots " has been reworded to eliminate the "stand alone" limitation, so that it now applies to all parking lots with 5,000 square feet or more or with 25 parking spaces or more and exposed to storm water.[6]

Definition of Redevelopment

The definition of "Redevelopment" has been reworded to include a minimum threshold of at least 5,000 square feet of impervious area addition to an existing property in order for the SUSMP requirements to apply. The threshold value is consistent with other threshold values in the SUSMP, such as Parking Lots and Restaurants.[7]

Definition of Restaurant

The definition of "Restaurant" has been reworded to limit applicability to "stand-alone" facilities and exclude co-located stalls or food counters in general purpose establishments such as markets and grocery stores.[8]

Definition of Retail Gasoline Outlet

The definition of "Retail Gasoline Outlet" has been reworded to include all retail gasoline outlets that sell gasoline and lubricating oils without consideration of the proportion of receipts derived from such sales.[9]

Conflict with Local Practices

The paragraph has been reworded to allow local ordinances to differ from the SUSMP so long as they are more stringent.[10]

Responsibility and Conditions for BMP Transfer

The language has been modified to ensure that the responsibility for the maintenance of Structural or Treatment Control BMPs is properly transferred with the sale of a property and is mandatory.[11]

---

[6] Ibid. at 301 and 306. Board Members Cloke and Diamond discuss and direct staff to eliminate the "stand-alone" limitation.

[7] Ibid. at 67 and 302. Board Chairman Nahai discusses the absence of a minimum threshold and directs staff to set a minimum value to address his concerns of proportionality aberrations.

[8] Ibid. at 68. Board Chairman interprets applicability and Dr. Swamikannu confirms the interpretation.

[9] Ibid. at 46, 49, 308. Board Members discuss the staff proposed definition based on primary activity and direct staff to extend the definition to include all gas stations that pump gas.

[10] Ibid. at 308. Board Members discuss the language and provide specific language for the purpose of local program consistency and to ensure adherence to the SUSMP requirements.

Roofing Surface Area Exclusion from Mitigation Standard

The roofing surface credit for calculation of storm water runoff volume for mitigation has been eliminated.[12]

Limited Exclusion for Small Restaurants from Mitigation Standard

The sentence has been clarified to state to exempt restaurants less than 5,000 square feet from the requirement to mitigate storm water only. All other requirements for restaurants apply.[13]

Waiver Provision

The paragraph has been modified to recognize proximity to an unconfined water table as one basis for the granting of a waiver.[14]

A sentence has been added to require that all other BMPs be considered and rejected before a waiver from the numerical mitigation standard is granted.[15]

A statement has been added to require that non-enumerated bases for waiver be brought to the Regional Board for consideration. The Regional Board can delegate the approval authority for a class of waivers to the Regional Board Executive Officer.[16]

---

[11] Ibid. at 63 and 313 Board Members discuss the significance of ensuring proper transfer of BMP maintenance responsibility and provide firm enabling language.

[12] Ibid. at 48 and 314. Board Members discuss the elimination of the rooftop exemption with the possibility of reconsideration in the future if Permittees affirmatively demonstrate that rooftop runoff is not a source of pollutants.

[13] Ibid. at 322. Board Members discuss the limited exclusion and agree with Dr. Swamikannu's rationale for the exclusion threshold from numerical design standards.

[14] Ibid. at. 60 Board Member Coe suggests the change to address the issue and Dr. Swamikannu accepts the suggestion.

[15] Ibid. 74 and 326 Board Members discuss the Waiver provision and provide language to ensure that all options for mitigation are considered.

[16] Ibid. at 75 and 328. Board Chairman Nahai provides direction to staff to require any new waiver bases to be brought to the Regional Board to ensure public discussion and consideration.

STANDARD URBAN STORM WATER MITIGATION PLAN

DEVELOPMENT PLANNING

CHANGE SHEET (Revised)

Summary

The Change Sheet lists proposed changes to the Final Tentative - Standard Urban Storm Water Mitigation Plan, (December 7, 1999). In general, the proposed changes respond to commenters' suggestions on improving clarity, format, and implementability of the Standard Urban Storm Water Mitigation Plan.

Noteworthy changes include, the addition of a definition for 'storm event' and the requirement of professional registration for certifying persons under the "Alternative Certification' option. Two new references have been added to augment implementation guidance. These are, (i) National Stormwater Best Management Practices (BMP) Database, Version 1.0, and (ii) Denver *Urban Storm Drainage Criteria Manual, Volume 3 – Best Management Practices.*

In the Change Sheet, cross-reference to pages and paragraphs are for the 'Clean Version' dated December 7, 2000. New text added to a sentence is indicated by underline.

Background

1. Page 2 paragraph three, Clarify that a City has to adopt same requirements for the Citywide SUSMP

   Sentence changed to read, "The Permittees are required to adopt the requirements set herein in their own SUSMP."

2. Page 2 paragraph 3, Delete reference to Urban Storm Water Mitigation to avoid confusion

   Sentence changed to read, "Each Permittee will approve the project plan as part of the development plan approval process....

3. Page 3 paragraph 2, Clarify the environmentally sensitive area category.

   Sentence changed to read, "Location within or directly adjacent to or discharging directly to an environmentally sensitive area.

4. Page 3 paragraph 2, Make requirement applicable to stand-alone parking lots only

   Sentence changed to read, "Commercial stand-alone parking lots 5,000 square feet or more.....

Definitions

5. Order definitions alphabetically

   Definitions reordered alpha-numerically

6. Page 3, Modify definition of hillsides to add specificity.

   Definition changed to read, "property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is twenty-five percent or greater."

R0072501

7. Page 3, Delete exceptions in the definition of Automotive Repair Shop

   Exceptions deleted, now reads, "Automotive Repair Shop" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539."

8. Page 3, Modify definition of 100,000 square foot commercial development for simplicity.

   Definition changed to read, "any commercial development that creates at least 100,000 square feet of impermeable area, including parking areas".

9. Page 4 , Add references for definition of environmentally sensitive areas

   References added for Areas of Special Biological Significance and Area of Ecological Significance.

10. Page 4, , Change definition to include a threshold trigger for requirements to apply to Redevelopment

    Definition changed to read, "Redevelopment" means, on an already developed site, the creation or addition of fifty percent or more of impervious surfaces or the making of improvements to fifty percent or more of the existing structure. Redevelopment includes.....

11. Page 5, , Change definition for Retail gasoline outlets to clarify 'primarily engaged'.

    Definition changed to read, ""Retail Gasoline Outlet" means a facility engaged in selling gasoline and lubricating oils, which derives more than fifty percent of its annual gross receipts from the sale of gasoline, lubricating oils tires, batteries, automobile parts and other automotive services.

12. New Definition, Define a storm event

    Defined storm event to mean, "a rainfall event that produces more than 0.1 inch of precipitation and that, which is separated from the previous storm event by at least 72 hours of dry weather."

SUSMP Provisions Applicable to All Categories

13. Page 5, paragraph 3, Change sentence for clarity

    Sentence changed to read, "....shall not exceed the estimated pre-development rate for developments where it is reasonably foreseeable that the increased peak storm water discharge rate will result in increased potential for downstream erosion."

14. Page 5, paragraph 4, Delete text that makes act dependent on effort

Sentence changed to read, "Concentrate or cluster Development on portions of a site while leaving the remaining land in a natural undisturbed condition."

15. Page 6, paragraph 1, Change sentence for clarity

    Sentence changed to read, "...or the detectable inputs of the pollutant are at a concentrations or loads considered potentially toxic to humans and/or flora and fauna."

16. Page 6, paragraph 2, Add reference

    Added reference, "Denver *Urban Storm Drainage Criteria Manual, Volume 3 – Best Management Practices*"

17. Page 6, paragraph 3, Add text to enable BMP combination alternative

    Added text to read, "However, it is possible that a combination of BMPs not so designated, may in a particular circumstance, be better suited to maximize the reduction of the pollutants".

18. Page 6, paragraph 4, Delete text that is tentative

    Text deleted to read, "Project plans must include BMPs consistent....."

19. Page 6, paragraph 4, Add text to promote use of natural drainage systems

    Add text to read, "Utilize natural drainage systems to the maximum extent practicable"

19. Page 6, paragraph 4, Add text to minimize flow to natural drainage systems

    Text added to read, "Control or reduce or eliminate flow to natural drainage systems to the maximum extent practicable"

20. Page 7, paragraph 2, Change sentence for clarity

    Sentence changed to read, "Materials with the potential to contaminate storm water must be: (1) placed in an enclosure..."

21. Page 7, paragraph 3, Add text to exclude single family residences

    Sentence added to read, " Individual single family residences are exempt from these requirements"

22. Page 8, paragraph 1, Change text for clarity

    Text changed to read, "The transfer of property to a private or public owner must have conditions..."

23. Page 8, paragraph 1, Add text to require maintenance inspection and record.

    Sentence added to read, "The condition of transfer may include a provision that the property owner conduct maintenance inspection of all treatment control BMPs at least once a year and retain proof of inspection."

24. Page 8, paragraph 3, Delete text for clarity

    Text deleted, "~~each runoff event up to and including~~", Now reads, "the 85th percentile 24-hour runoff event...."

25. Page 8, paragraph 3, Correct based on revised chart treatment volume from 85 percent to 80 percent.

    Text changed to read, "to achieve 80 percent or more volume treatment....."

26. Page 8, paragraph 3, Change text for clarity

    Sentence changed to read, "....runoff produced from a 0.75 inch storm event, prior..."

27. Page 8, paragraph 3, Change text for clarity

    Sentence changed to read, "....volume of runoff produced from a historical-record based reference 24-hour rainfall criterion...."

28. Page 9, paragraph 2, Change text to offer partial credit for roofing surfaces diversion

    Sentence changed to read, "A proportional area of roofing surface may be excluded..."

29. Page 9, paragraph 2, Change text for clarity.

    Sentence changed to read, "storm water conveyance system does not directly discharge to a natural stream or channel segment scheduled for restoration".

30. Page 9, paragraph 3, Change text to clarify exemption from numerical standard only.

    Sentence changed to read, "Restaurants, where the land area for development or redevelopment is less than 5,000 square feet, are excluded from the numerical BMP design standard requirement.

Provisions Applicable to Individual Priority Projects

31. Page 10, paragraph 2, and Page 12, paragraph 1, Change text to eliminate mandatory cover.

    Sentence change to read, "...area must be self-contained and/or covered, equipped with a clarifier,..."

32. Page 12, paragraph 3, Change text for clarity.

    Text modified to read, "....hydrocarbons that are deposited on parking lot surfaces by motor vehicles"

33. Page 12, paragraph 3, Add introductory text.

    Sentence added to read, "To minimize the offsite transport of pollutants, the following design criteria are required".

Waiver

34. Page 13, paragraph 1, Add text for clarity

    Text added to read, "....because an existing or potential underground source of drinking water..."

35. Page 13, paragraph 1, Change text to clarify that Permittee is petitioner.

    Sentence modified to read, "Any other justification for impracticability must be separately petitioned by the Permittee and approved...."

Alternative Certification

36. Page 13, paragraph 1, Change sentences to require professional registration and recommend training verification.

    Sentences added to read "...accept a signed certification from a Civil Engineer or a Licensed Architect registered in the State of California, that the plan meets the criteria." And, "The Permittee is encouraged to verify that certifying person(s) have been trained on BMP design for water quality, not more than two years prior to the signature date."

Suggested Resources

37. Page 15, Add reference BMP database and on-line Texas Non-point Source Book

    Reference added, "National Stormwater Best Management Practices (BMP) Database, Version 1.0" ; and "Texas Non-Point Source Book".

STANDARD URBAN STORM WATER MITIGATION PLAN

FOR LOS ANGELES COUNTY AND CITIES IN LOS ANGELES COUNTY

Final
Approved – Regional Board Executive Officer
March 8, 2000.

R0072505

LOS ANGELES COUNTY URBAN RUNOFF AND STORM WATER NPDES PERMIT

STANDARD URBAN STORM WATER MITIGATION PLAN

BACKGROUND

The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Los Angeles County Permit) issued to Los Angeles County and 85 cities (Permittees) by the Los Angeles Regional Water Quality Control Board (Regional Board) on July 15, 1996, requires the development and implementation of a program addressing storm water pollution issues in development planning for private projects. The same requirements are applicable to the City of Long Beach under its separate municipal storm water permit (City of Long Beach MS4 Permit), which was issued on June 30, 1999.

The requirement to implement a program for development planning is based on, federal and state statutes including: Section 402 (p) of the Clean Water Act, Section 6217 of the Coastal Zone Act Reauthorization Amendments of 1990 ("CZARA"), and the California Water Code. The Clean Water Act amendments of 1987 established a framework for regulating storm water discharges from municipal, industrial, and construction activities under the NPDES program. The primary objectives of the municipal storm water program requirements are to:

1. Effectively prohibit non-storm water discharges, and
2. Reduce the discharge of pollutants from storm water conveyance systems to the Maximum Extent Practicable (MEP statutory standard).

The Standard Urban Storm Water Mitigation Plan (SUSMP) was developed as part of the municipal storm water program to address storm water pollution from new Development and Redevelopment by the private sector. This SUSMP contains a list of the minimum required Best Management Practices (BMPs) that must be used for a designated project. Additional BMPs may be required by ordinance or code adopted by the Permittee and applied generally or on a case by case basis. The Permittees are required to adopt the requirements set herein in their own SUSMP. Developers must incorporate appropriate SUSMP requirements into their project plans. Each Permittee will approve the project plan as part of the development plan approval process and prior to issuing building and grading permits for the projects covered by the SUSMP requirements.

All projects that fall into one of seven categories are identified in the Los Angeles County MS4 Permit as requiring SUSMPs. These categories are:

- Single-Family Hillside Residences
- 100,000 Square Foot Commercial Developments
- Automotive Repair Shops
- Retail Gasoline Outlets
- Restaurants
- Home Subdivisions with 10 to 99 housing units
- Home Subdivisions with 100 or more housing units

The Regional Board Executive Officer has designated two additional categories subject to SUSMP requirements for the Los Angeles County MS4 Permit. These categories are:

- Location within or directly adjacent to or discharging directly to an environmentally sensitive area, and
- Parking lots 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff

The City of Long Beach permit requires SUSMP for the following categories only: (i) 10-99 home subdivisions; (ii) 100 or more subdivisions; (iii) 100,000 or more square foot commercial developments; and (iv) Projects located adjacent to or discharging to environmentally sensitive areas. For the remaining five categories, equivalent requirements have been included directly in or are expected to be developed shortly under the City of Long Beach Storm Water Management Plan.

Permittees shall amend codes and promulgate ordinances not later than September 8, 2000, to give legal effect to the SUSMP requirements. The SUSMP requirements for projects identified herein shall take effect not later than October 8, 2000.

DEFINITIONS

"100,000 Square Foot Commercial Development" means any commercial development that creates at least 100,000 square feet of impermeable area, including parking areas."Automotive Repair Shop" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539.

"Best Management Practice (BMP)" means any program, technology, process, siting criteria, operational methods or measures, or engineered systems, which when implemented prevent, control, remove, or reduce pollution.

"Commercial Development" means any development on private land that is not heavy industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, multi-apartment buildings, car wash facilities, mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses and other light industrial complexes.

"Directly Connected Impervious Area (DCIA)" means the area covered by a building, impermeable pavement, and/ or other impervious surfaces, which drains directly into the storm drain without first flowing across permeable land area (e.g. lawns).

"Discretionary Project" means a project which requires the exercise of judgement or deliberation when the public agency or public body decides to approve or disapprove a particular activity, as distinguished from situations where the public agency or body merely has to determine whether there has been conformity with applicable statutes, ordinances, or regulations.

"Environmentally Sensitive Area" means an area designated as an Area of Special Biological Significance by the State Water Resources Control Board (*Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties* (1994) and amendments) or an area designated as an Area of Ecological Significance by the County of Los *Angeles (Los Angeles County Significant Areas Study, Los Angeles County Department of Regional Planning (1976)* and amendments) or an area designated as a significant natural area by the California Resources Agency. Refer to Table 3 for a listing.

"Greater than (>) 9 unit home subdivision" means any subdivision being developed for 10 or more 10 single-family or multi-family dwelling units.

"Hillside" means property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is twenty-five percent or greater.

"Infiltration" means the downward entry of water into the surface of the soil.

"New Development" means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.

"Parking Lot" means land area or facility for the temporary parking or storage of motor vehicles used personally, for business or for commerce with a lot size of 5,000 square feet or more, or with 25 or more parking spaces.

"Redevelopment" means, on an already developed site, the creation or addition of at least 5,000 square feet of impervious surfaces or the creation or addition of fifty percent or more of impervious surfaces or the making of improvements to fifty percent or more of the existing structure. Redevelopment includes, but is not limited to: the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/ or exterior construction or remodeling; replacement of impervious surface that is not part of a routine maintenance activity; and land disturbing activities related with structural or impervious surfaces.

"Restaurant" means a stand-alone facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption. (SIC code 5812).

"Retail Gasoline Outlet" means any facility engaged in selling gasoline and lubricating oils.

"Source Control BMP" means any schedules of activities, prohibitions of practices, maintenance procedures, managerial practices or operational practices that aim to prevent storm water pollution by reducing the potential for contamination at the source of pollution.

"Storm Event" means a rainfall event that produces more than 0.1 inch of precipitation and that, which is separated from the previous storm event by at least 72 hours of dry weather.

"Structural BMP" means any structural facility designed and constructed to mitigate the adverse impacts of storm water and urban runoff pollution (e.g. canopy, structural enclosure). The category may include both Treatment Control BMPs and Source Control BMPs.

"Treatment" means the application of engineered systems that use physical, chemical, or biological processes to remove pollutants. Such processes include, but are not limited to, filtration, gravity settling, media adsorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

"Treatment Control BMP" means any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media adsorption or any other physical, biological, or chemical process.

CONFLICTS WITH LOCAL PRACTICES

Where provisions of the SUSMP requirements conflict with established local codes, (e.g., specific language of signage used on storm drain stenciling), the Permittee may continue the local practice and modify the SUSMP to be consistent with the code, except that to the extent that the standards in the SUSMP are more stringent than those under local codes, such more stringent standards shall apply.

SUSMP PROVISIONS APPLICABLE TO ALL CATEGORIES

REQUIREMENTS

1. PEAK STORM WATER RUNOFF DISCHARGE RATES

Post-development peak storm water runoff discharge rates shall not exceed the estimated pre-development rate for developments where the increased peak storm water discharge rate will result in increased potential for downstream erosion.

2. CONSERVE NATURAL AREAS

If applicable, the following items are required and must be implemented in the site layout during the subdivision design and approval process, consistent with applicable General Plan and Local Area Plan policies:

- Concentrate or cluster Development on portions of a site while leaving the remaining land in a natural undisturbed condition.
- Limit clearing and grading of native vegetation at a site to the minimum amount needed to build lots, allow access, and provide fire protection.
- Maximize trees and other vegetation at each site by planting additional vegetation, clustering tree areas, and promoting the use of native and/or drought tolerant plants.
- Promote natural vegetation by using parking lot islands and other landscaped areas.
- Preserve riparian areas and wetlands.

3. MINIMIZE STORM WATER POLLUTANTS OF CONCERN

Storm water runoff from a site has the potential to contribute oil and grease, suspended solids, metals, gasoline, pesticides, and pathogens to the storm water conveyance system. The development must be designed so as to minimize, to the maximum extent practicable, the introduction of pollutants of concern that may result in significant impacts, generated from site runoff of directly connected impervious areas (DCIA), to the storm water conveyance system as approved by the building official. Pollutants of concern, consist of any pollutants that exhibit one or more of the following characteristics: current loadings or historic deposits of the pollutant are impacting the beneficial uses of a receiving water, elevated levels of the pollutant are found in sediments of a receiving water and/or have the potential to bioaccumulate in organisms therein, or the detectable inputs of the pollutant are at a concentrations or loads considered potentially toxic to humans and/or flora and fauna.

In meeting this specific requirement, "minimization of the pollutants of concern" will require the incorporation of a BMP or combination of BMPs best suited to maximize the reduction of pollutant loadings in that runoff to the Maximum Extent Practicable. Those

BMPs best suited for that purpose are those listed in the *California Storm Water Best Management Practices Handbooks*; *Caltrans Storm Water Quality Handbook: Planning and Design Staff Guide*; *Manual for Storm Water Management in Washington State*; *The Maryland Stormwater Design Manual*; *Florida Development Manual: A Guide to Sound Land and Water Management*; Denver *Urban Storm Drainage Criteria Manual, Volume 3 – Best Management Practices* and *Guidance Specifying Management Measures for Sources of Nonpoint Pollution in Coastal Waters* , USEPA Report No. EPA-840-B-92-002, as "likely to have significant impact" beneficial to water quality for targeted pollutants that are of concern at the site in question. However, it is possible that a combination of BMPs not so designated, may in a particular circumstance, be better suited to maximize the reduction of the pollutants.

Examples of BMPs that can be used for minimizing the introduction of pollutants of concern generated from site runoff are identified in Table 2. Any BMP not specifically approved by the Regional Board in Resolution No. 99-03, "Approving Best Management Practices for Municipal Storm Water and Urban Runoff Programs in Los Angeles County", for development planning may be used if they have been recommended in one of the above references.

4. PROTECT SLOPES AND CHANNELS

Project plans must include BMPs consistent with local codes and ordinances and the SUSMP to decrease the potential of slopes and/or channels from eroding and impacting storm water runoff:

- Convey runoff safely from the tops of slopes and stabilize disturbed slopes.
- Utilize natural drainage systems to the maximum extent practicable
- Control or reduce or eliminate flow to natural drainage systems to the maximum extent practicable
- Stabilize permanent channel crossings.
- Vegetate slopes with native or drought tolerant vegetation.
- Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion, with the approval of all agencies with jurisdiction, e.g., the U.S. Army Corps of Engineers and the California Department of Fish and Game

5. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Storm drain stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets. The stencil contains a brief statement that prohibits the dumping of improper materials into the storm water conveyance system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are

effective supplements to the anti-dumping message.

- All storm drain inlets and catch basins within the project area must be stenciled with prohibitive language (such as: "NO DUMPING – DRAINS TO OCEAN") and/or graphical icons to discourage illegal dumping.
- Signs and prohibitive language and/or graphical icons, which prohibit illegal dumping, must be posted at public access points along channels and creeks within the project area.
- Legibility of stencils and signs must be maintained.

6. PROPERLY DESIGN OUTDOOR MATERIAL STORAGE AREAS

Outdoor material storage areas refer to storage areas or storage facilities solely for the storage of materials. Improper storage of materials outdoors may provide an opportunity for toxic compounds, oil and grease, heavy metals, nutrients, suspended solids, and other pollutants to enter the storm water conveyance system. Where proposed project plans include outdoor areas for storage of materials that may contribute pollutants to the storm water conveyance system, the following Structural or Treatment BMPs are required:

- Materials with the potential to contaminate storm water must be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the storm water conveyance system; or (2) protected by secondary containment structures such as berms, dikes, or curbs.
- The storage area must be paved and sufficiently impervious to contain leaks and spills.
- The storage area must have a roof or awning to minimize collection of storm water within the secondary containment area.

7. PROPERLY DESIGN TRASH STORAGE AREAS.

A trash storage area refers to an area where a trash receptacle or receptacles are located for use as a repository for solid wastes.

Loose trash and debris can be easily transported by the forces of water or wind into nearby storm drain inlets, channels, and/or creeks. All trash container areas must meet the following Structural or Treatment Control BMP requirements (individual single family residences are exempt from these requirements):

- Trash container areas must have drainage from adjoining roofs and pavement diverted around the area(s).

- Trash container areas must be screened or walled to prevent off-site transport of trash.

8. PROVIDE PROOF OF ONGOING BMP MAINTENANCE

Improper maintenance is one of the most common reasons why water quality controls will not function as designed or which may cause the system to fail entirely. It is important to consider who will be responsible for maintenance of a permanent BMP, and what equipment is required to perform the maintenance properly. As part of project review, if a project applicant has included or is required to include, Structural or Treatment Control BMPs in project plans, the Permittee shall require that the applicant provide verification of maintenance provisions through such means as may be appropriate, including, but not limited to legal agreements, covenants, CEQA mitigation requirements and/or Conditional Use Permits.

For all properties, the verification will include the developer's signed statement, as part of the project application, accepting responsibility for all structural and treatment control BMP maintenance until the time the property is transferred and, where applicable, a signed agreement from the public entity assuming responsibility for Structural or Treatment Control BMP maintenance. The transfer of property to a private or public owner must have conditions requiring the recipient to assume responsibility for maintenance of any Structural or Treatment Control BMP to be included in the sales or lease agreement for that property, and will be the owner's responsibility. The condition of transfer shall include a provision that the property owners conduct maintenance inspection of all Structural or Treatment Control BMPs at least once a year and retain proof of inspection. For residential properties where the Structural or Treatment Control BMPs are located within a common area which will be maintained by a homeowner's association, language regarding the responsibility for maintenance must be included in the projects conditions, covenants and restrictions (CC&Rs). Printed educational materials will be required to accompany the first deed transfer to highlight the existence of the requirement and to provide information on what storm water management facilities are present, signs that maintenance is needed, how the necessary maintenance can be performed, and assistance that the Permittee can provide. The transfer of this information shall also be required with any subsequent sale of the property.

If Structural or Treatment Control BMPs are located within a public area proposed for transfer, they will be the responsibility of the developer until they are accepted for transfer by the County or other appropriate public agency. Structural or Treatment Control BMPs proposed for transfer must meet design standards adopted by the public entity for the BMP installed and should be approved by the County or other appropriate public agency prior to its installation.

9. DESIGN STANDARDS FOR STRUCTURAL OR TREATMENT CONTROL BMPs

Structural or Treatment control BMPs selected for use at any project covered by this SUSMP shall meet the design standards of this Section unless specifically exempted.

Post-construction Structural or Treatment Control BMPs shall be designed to:

A. mitigate (infiltrate or treat) storm water runoff from either:

1. the 85th percentile 24-hour runoff event determined as the maximized capture storm water volume for the area, from the formula recommended in *Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998)*, or

2. the volume of annual runoff based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment by the method recommended in *California Stormwater Best Management Practices Handbook – Industrial/ Commercial,* (1993), or

3. the volume of runoff produced from a 0.75 inch storm event, prior to its discharge to a storm water conveyance system, or

4. the volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event.

AND

B. control peak flow discharge to provide stream channel and over bank flood protection, based on flow design criteria selected by the local agency.

Limited Exclusion

Restaurants, where the land area for development or redevelopment is less than 5,000 square feet, are excluded from the numerical Structural or Treatment Control BMP design standard requirement only.

10. PROVISIONS APPLICABLE TO INDIVIDUAL PRIORITY PROJECT CATEGORIES

REQUIREMENTS

A. 100,000 SQUARE FOOT COMMERCIAL DEVELOPMENTS

1. PROPERLY DESIGN LOADING/UNLOADING DOCK AREAS

Loading/unloading dock areas have the potential for material spills to be quickly transported to the storm water conveyance system. To minimize this potential, the following design criteria are required:

- Cover loading dock areas or design drainage to minimize run-on and runoff of storm water.
- Direct connections to storm drains from depressed loading docks (truck wells) are prohibited.

2. PROPERLY DESIGN REPAIR/MAINTENANCE BAYS

Oil and grease, solvents, car battery acid, coolant and gasoline from the repair/maintenance bays can negatively impact storm water if allowed to come into contact with storm water runoff. Therefore, design plans for repair bays must include the following:

- Repair/maintenance bays must be indoors or designed in such a way that doesn't allow storm water runon or contact with storm water runoff.
- Design a repair/maintenance bay drainage system to capture all washwater, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

3. PROPERLY DESIGN VEHICLE/EQUIPMENT WASH AREAS

The activity of vehicle/equipment washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. Include in the project plans an area for washing/steam cleaning of vehicles and equipment. The area in the site design must be:

- Self-contained and/ or covered, equipped with a clarifier, or other pretreatment facility, and properly connected to a sanitary sewer.

B. RESTAURANTS

1. PROPERLY DESIGN EQUIPMENT/ACCESSORY WASH AREAS

The activity of outdoor equipment/accessory washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. Include in the project plans an area for the washing/steam cleaning of equipment and accessories. This area must be:

- Self-contained, equipped with a grease trap, and properly connected to a sanitary sewer.
- If the wash area is to be located outdoors, it must be covered, paved, have secondary containment, and be connected to the sanitary sewer.

C. RETAIL GASOLINE OUTLETS

1. PROPERLY DESIGN FUELING AREA

Fueling areas have the potential to contribute oil and grease, solvents, car battery acid, coolant and gasoline to the storm water conveyance system. The project plans must include the following BMPs:

- The fuel dispensing area must be covered with an overhanging roof structure or canopy. The canopy's minimum dimensions must be equal to or greater than the area within the grade break. The canopy must not drain onto the fuel dispensing area, and the canopy downspouts must be routed to prevent drainage across the fueling area.
- The fuel dispensing area must be paved with Portland cement concrete (or equivalent smooth impervious surface), and the use of asphalt concrete shall be prohibited.
- The fuel dispensing area must have a 2% to 4% slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of storm water to the extent practicable.
- At a minimum, the concrete fuel dispensing area must extend 6.5 feet (2.0 meters) from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot (0.3 meter), whichever is less.

D. AUTOMOTIVE REPAIR SHOPS

1. PROPERLY DESIGN FUELING AREA

Fueling areas have the potential to contribute oil and grease, solvents, car battery acid, coolant and gasoline to the storm water conveyance system. Therefore, design plans, which include fueling areas, must contain the following:

- The fuel dispensing area should be covered with an overhanging roof structure or canopy. The cover's minimum dimensions must be equal to or greater than the area within the grade break. The

cover must not drain onto the fuel dispensing area and the downspouts must be routed to prevent drainage across the fueling area.

- The fuel dispensing areas must be paved with Portland cement concrete (or equivalent smooth impervious surface), and the use of asphalt concrete shall be prohibited.
- The fuel dispensing area must have a 2% to 4% slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of storm water.
- At a minimum, the concrete fuel dispensing area must extend 6.5 feet (2.0 meters) from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot (0.3 meter), whichever is less.

2. PROPERLY DESIGN REPAIR/MAINTENANCE BAYS

Oil and grease, solvents, car battery acid, coolant and gasoline from the repair/maintenance bays can negatively impact storm water if allowed to come into contact with storm water runoff. Therefore, design plans for repair bays must include the following:

- Repair/maintenance bays must be indoors or designed in such a way that doesn't allow storm water run-on or contact with storm water runoff.
- Design a repair/maintenance bay drainage system to capture all wash-water, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

3. PROPERLY DESIGN VEHICLE/EQUIPMENT WASH AREAS

The activity of vehicle/equipment washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. Include in the project plans an area for washing/steam cleaning of vehicles and equipment. This area must be:

- Self-contained and/or covered, equipped with a clarifier, or other pretreatment facility, and properly connected to a sanitary sewer or to a permitted disposal facility.

4. PROPERLY DESIGN LOADING/UNLOADING DOCK AREAS

Loading/unloading dock areas have the potential for material spills to be quickly transported to the storm water conveyance system. To minimize this potential, the following design criteria are required:

- Cover loading dock areas or design drainage to minimize run-on and runoff of storm water.
- Direct connections to storm drains from depressed loading docks (truck wells) are prohibited.

E. PARKING LOTS

1. PROPERLY DESIGN PARKING AREA

Parking lots contain pollutants such as heavy metals, oil and grease, and polycyclic aromatic hydrocarbons that are deposited on parking lot surfaces by motor-vehicles. These pollutants are directly transported to surface waters. To minimize the offsite transport of pollutants, the following design criteria are required:

- Reduce impervious land coverage of parking areas
- Infiltrate runoff before it reaches storm drain system.
- Treat runoff before it reaches storm drain system

2. PROPERLY DESIGN TO LIMIT OIL CONTAMINATION AND PERFORM MAINTENANCE

Parking lots may accumulate oil, grease, and water insoluble hydrocarbons from vehicle drippings and engine system leaks.

- Treat to remove oil and petroleum hydrocarbons at parking lots that are heavily used (e.g. fast food outlets, lots with 25 or more parking spaces , sports event parking lots, shopping malls, grocery stores, discount warehouse stores)
- Ensure adequate operation and maintenance of treatment systems particularly sludge and oil removal, and system fouling and plugging prevention control

11. WAIVER

A Permittee may, through adoption of an ordinance or code incorporating the treatment requirements of the SUSMP, provide for a waiver from the requirement if impracticability for a specific property can be established. A waiver of impracticability shall be granted only when all other Structural or Treatment Control BMPs have been considered and rejected as infeasible. Recognized situations of impracticability include, (i) extreme limitations of space for treatment on a redevelopment project, (ii) unfavorable or unstable soil conditions at a site to attempt infiltration, and (iii) risk of ground water contamination because a known unconfined aquifer lies beneath the land surface or an existing or potential underground source of drinking water is less than 10 feet from the soil surface. Any other justification for impracticability must be separately petitioned by the Permittee and submitted to the Regional Board for consideration. The Regional Board may consider approval of the waiver justification or may delegate the authority to approve a class of waiver justifications to the Regional Board Executive Officer. The supplementary waiver justification becomes recognized and effective only after approval by the Regional Board or the Regional Board Executive Officer. A waiver granted by a Permittee to any development or redevelopment project may be revoked by the Regional Board Executive Officer for cause and with proper notice upon petition.

If a waiver is granted for impracticability, the Permittee must require the project proponent to transfer the savings in cost, as determined by the Permittee, to a storm water mitigation fund to be used to promote regional or alternative solutions for storm water pollution in the storm watershed and operated by a public agency or a non-profit entity.

12. LIMITATION ON USE OF INFILTRATION BMPs

Three factors significantly influence the potential for storm water to contaminate ground water. They are (i) pollutant mobility, (ii) pollutant abundance in storm water, (iii) and soluble fraction of pollutant. The risk of contamination of groundwater may be reduced by pretreatment of storm water. A discussion of limitations and guidance for infiltration practices is contained in, *Potential Groundwater Contamination from Intentional and Non-Intentional Stormwater Infiltration, Report No. EPA/600/R-94/051, USEPA (1994).*

In addition, the distance of the groundwater table from the infiltration BMP may also be a factor determining the risk of contamination. A water table distance separation of ten feet depth in California presumptively poses negligible risk for storm water not associated with industrial activity or high vehicular traffic.

Infiltration BMPs are not recommended for areas of industrial activity or areas subject to high vehicular traffic (25,000 or greater average daily traffic (ADT) on main roadway or 15,000 or more ADT on any intersecting roadway) unless appropriate pretreatment is provided to ensure groundwater is protected and the infiltration BMP is not rendered ineffective by overload.

13. ALTERNATIVE CERTIFICATION FOR STORM WATER TREATMENT MITIGATION

In lieu of conducting detailed BMP review to verify Structural or Treatment Control BMPs adequacy, a Permittee may elect to accept a signed certification from a Civil Engineer or a Licensed Architect registered in the State of California, that the plan meets the criteria established herein. The Permittee is encouraged to verify that certifying person(s) have been trained on BMP design for water quality, not more than two years prior to the signature date. Training conducted by an organization with storm water BMP design expertise (e.g., a University, American Society of Civil Engineers, American Society of Landscape Architects, American Public Works Association, or the California Water Environment Association) may be considered qualifying.

TABLE 2

EXAMPLE BEST MANAGEMENT PRACTICES (BMPs)

The following are examples of BMPs that can be used for minimizing the introduction of pollutants of concern that may result in significant impacts, generated from site runoff to the storm water conveyance system. (See Table 1: Suggested Resources for additional sources of information):

- Provide reduced width sidewalks and incorporate landscaped buffer areas between sidewalks and streets. However, sidewalk widths must still comply with regulations for the Americans with Disabilities Act and other life safety requirements.
- Design residential streets for the minimum required pavement widths needed to comply with all zoning and applicable ordinances to support travel lanes; on-street parking; emergency, maintenance, and service vehicle access; sidewalks; and vegetated open channels.
- Comply with all zoning and applicable ordinances to minimize the number of residential street cul-de-sacs and incorporate landscaped areas to reduce their impervious cover. The radius of cul-de-sacs should be the minimum required to accommodate emergency and maintenance vehicles. Alternative turnarounds should be considered.
- Use permeable materials for private sidewalks, driveways, parking lots, or interior roadway surfaces (examples: hybrid lots, parking groves, permeable overflow parking, etc.).
- Use open space development that incorporates smaller lot sizes.
- Reduce building density.
- Comply with all zoning and applicable ordinances to reduce overall lot imperviousness by promoting alternative driveway surfaces and shared driveways that connect two or more homes together.
- Comply with all zoning and applicable ordinances to reduce the overall imperviousness associated with parking lots by providing compact car spaces, minimizing stall dimensions, incorporating efficient parking lanes, and using pervious materials in spillover parking areas.
- Direct rooftop runoff to pervious areas such as yards, open channels, or vegetated areas, and avoid routing rooftop runoff to the roadway or the storm water conveyance system.
- Vegetated swales and strips
- Extended/dry detention basins
- Infiltration basin
- Infiltration trenches
- Wet ponds
- Constructed wetlands
- Oil/Water separators
- Catch basin inserts
- Continuous flow deflection/ separation systems
- Storm drain inserts
- Media filtration
- Bioretention facility
- Dry-wells
- Cisterns
- Foundation planting
- Catch basin screens
- Normal flow storage/ separation systems
- Clarifiers
- Filtration systems
- Primary waste water treatment systems

TABLE 3

HABITAT PROTECTION IN THE LOS ANGELES COUNTY AREA

Agency:
State Water Resources Control Board

Designation:
Areas of Significant Biological Significance (ASBS)

Definition:
Areas designated by the State Water Resources Control Board as requiring protection of species or biological communities to the extent that alteration of natural water quality is undesirable.

Affected Area:
(See Table 1 & Figure 2)

Agency:
Los Angeles County Department of Regional Planning

Designation:
Significant Ecological Areas (SEA)

Definitions:
Significant Ecological Areas (SEAs) are areas that have been identified by the Los Angeles County General Plan as containing unique or unusual species assemblages, or areas of habitat that are rapidly declining in the Los Angeles County. The SEAs were established to protect a special or sometimes unique collection of habitats and species from loss due to encroachment and human disturbances. However, SEAs are not intended to function as isolated preservation areas.

Affected Areas:
(See Table A & Figure 1)

Agency:
California Department of Fish & Game

Designation:
Natural Communities Conservation Plan Region (NCCP)

Definition:
Identifies and provides for the regional or area wide protection and perpetuation of natural wildlife diversity, while allowing compatible and appropriate development and growth. The goal of the program is to protect sufficient resources in regional preserves to assure the survival of the ecosystem and, at the same time, permit compatible uses of less sensitive land.

Affected Area:
(See Table 1 & Figure 3)

Dear Ms. Jennings:

ADMINISTRATIVE RECORD OF THE LOS ANGELES REGIONAL WATER QUALITY CONTROL BOARD – IN RE: THE CITIES OF BELLFLOWER, ET AL., CITY OF ARCADIA, AND WESTERN STATES PETROLEUM ASSOCIATION (REVIEW OF JANUARY 26, 2000, ACTION OF THE REGIONAL BOARD AND IT EXECUTIVE OFFICER PURSUANT TO ORDER NO. 96-054, PERMIT FOR MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN LOS ANGELES COUNTY [NPDES NO. CAS614001]). [SWRCB/OCC FILES A-1280, A-1280(a) AND A-1280 (b)]

We are transmitting, herein, the pertinent Administrative Record and Administrative Record Index in response to the above named Petitions that are for review before the State Board. Regional Board Counsel Leon submitted an advance copy of the Administrative Record Index to you via e-mail on May 2, 2000.

Please note we reserve the right to introduce additional documents into the Administrative Record, that may have been inadvertently omitted at this time.

Should you have any questions or need more information, please call me at (213) 576 –6654 or Parvaneh Khayat at (213) 576 – 6740, or Regional Board Counsel, Jorge Leon at (916) 657-2428.

Sincerely,

Xavier Swamikannu

I. INTRODUCTION

Petitioners who include municipalities and trade associations for the building industry and petroleum distributors, challenge the actions of the Regional Board and the Regional Board Executive Officer in adopting requirements for new development and significant redevelopment to control post-construction storm water pollution. Petitioners object to the requirements for various substantive and procedural reasons. In essence, Petitioners contend that the Regional Board has no basis in law or fact to adopt requirements for new development and significant redevelopment, unless these requirements are the same as those presented by Petitioner Permittees under the provisions of the Los Angeles County municipal separate storm sewer system Permit (hereafter, the "LA County MS4 Permit"). Petitioners also contend that they were denied due process because they were not provided additional notice and allowed more time to review the action of the Regional Board.

Petitioners misunderstand the very nature of the regulatory process and thereby invert the burden of proof in this case. Because they misunderstand the burden of proof, petitioners misconstrue what evidence is needed to support the requirements. This is not an enforcement action in which the Regional Board must show harm or violation. Rather, the starting place for analysis is that storm water discharges from large municipal separate storm sewer systems, to waters of the United States without permits are illegal. Once such discharges are regulated under an MS4 NPDES permit, the Permittees must implement a comprehensive storm water management program to reduce pollutants in storm water to the maximum extent practicable. The Regional Board need not demonstrate with empirical evidence that Petitioners are actually harming surface waters or conduct a cost-benefit analysis in order to ensure compliance with regulations, as Petitioners assert. Rather, the Regional Board must follow the requirements of the federal and state law and exercise best professional judgment in adopting and enforcing protective measures. The Regional Board, as the permit issuance and enforcement authority, is fully granted the charge to enumerate objective measures of compliance, including numerical mitigation criteria, to ensure enforceability of permit requirements.

The question therefore before the State Water Resources Control Board (hereafter "State Board") in this Petition is not whether the Regional Board carried its burden of evidence but rather did it properly execute its legal duties. A careful review of the entire record shows the Regional Board did so.

II. BACKGROUND

A. LOS ANGELES COUNTY MUNICIPAL STORM WATER PERMIT HISTORY

On June 18, 1990, the California Regional Water Quality Control Board, Los Angeles Region (Los Angeles Regional Board) adopted the first NPDES permit for Stormwater/Urban Runoff Discharged in Los Angeles County (Order No. 90-079). This Permit was issued on a system-wide basis for all the cities in Los Angeles County and the County of Los Angeles. The 1990 permit was challenged regarding its alleged failure to include specific water quality objectives and was upheld on May 16, 1991 in a decision issued by the State Water Resources Control Board (Order No. WQ 91-04; See also, WQ 91-03)

The LA County MS4 Permit was reissued on July 15, 1996, and made consistent with Federal Regulations for MS4s issued November 16, 1990. [55 Fed. Reg. 48073, Appendix F; 55 Fed. Reg. 48072)]. On June 10, 1997, the State Board dismissed a Petition filed by the City of Long Beach." On July 9, 1997, the City of Long Beach filed a Petition for Writ of Mandate/Complaint for Declaratory and Injunctive Relief before Superior Court. The court case was settled in May 1999, and under the terms of the settlement agreement the City of Long Beach was issued a separate MS4 Permit ("LB MS4 Permit") on June 30, 1999. The LB MS4 Permit contains similar requirements to the LA County MS4 Permit including requirements for Development Planning and Standard Urban Storm Water Mitigation Plans (SUSMPs).

B. NEW DEVELOPMENT REQUIREMENTS

The Los Angeles County MS4 Permit and the Long Beach MS4 Permit contain requirements that Standard Urban Storm Water Mitigation Plans (SUSMPs) be prepared for priority planning projects and that they include appropriate Best Management Practices (BMPs) and guidelines to reduce pollutants in storm water to the maximum extent practicable (Permit Pt. 2. III.A.)

On April 22, 1999, the Regional Board approved a List of BMPs for MS4 Permittees to select from and require implementation of the most effective BMPs in their Development Planning and Development Construction programs (Board Resolution No. 99-03)(A.R. xx) The Regional Board at that time also requested that the SUSMPs for Priority Planning Project categories, which incorporate the BMPs, be brought before it for discussion.1

Los Angeles County Department of Public Works (LACDPW), on behalf of the Permittees, submitted SUSMPs for Regional Board Executive Officer approval on July 22, 1999. These SUSMPs were revised and resubmitted on August 12, 1999, after a joint SUSMP workshop held on August 10, 1999, to clarify the meaning of some text. SUSMPs were submitted for: (i) 100+ home subdivisions; (ii) 10-99 home subdivisions; (iii) 100+ square-foot commercial developments; (iv) automotive repair facilities; (v) retail gasoline outlets; (vi) restaurants; and (vii) hillside located single-family dwellings. Prior to submittal to the Regional Board, draft versions of the SUSMPs were distributed to environmental groups, contractors, developers, consultants and trade industry groups for review and comment.

The Regional Board provided a Public Notice on August 16, 1999, that SUSMP requirements will be discussed before it on September 16, 1999, and invited comments from interested parties. Comments were received from municipalities, environmental groups,

1 Transcript of Proceedings, April 22, 1999. at

businesses, environmental consultants, and the building industry. Before the conclusion of the Hearing, the Regional Board Executive Officer requested that he be given more time to fully consider the issue and hold discussions with all interested parties to hear their concerns. The Regional Board authorized the Regional Board Executive Officer to proceed but directed him to bring the issue back to the Regional Board because of the broad interest in the community that the SUSMP requirements had generated.

On December 7, 1999, staff released a revised SUSMP (hereafter "Board SUSMP") for public review and comment. A "Summary of Comments and Responses" and a "Tentative Board Resolution" were included in the package mailed out with the Public Notice of Proposed Action at a special hearing scheduled for January 6, 2000. The Hearing was rescheduled to January 26, 2000, in deference to numerous requests from local government officials, building industry representatives, and others that it be postponed because of the intervening holiday season.

The Board SUSMP retained much of the language of the original SUSMPs submitted by Permittees, eliminated redundant language, consolidated similar requirements, and added some terms to ensure enforceability. As before the Board SUSMP included numerical design criteria for BMPs. In addition two new categories of designated priority planning projects were listed: (i) projects located adjacent to or discharging to environmentally sensitive areas, and (ii) parking lots with 25 or more parking spaces.

A week prior to January 26, 2000, Regional Board staff made available:(i) a Tentative Change Sheet to the December 7, 2000, Tentative SUSMP Draft, and (ii) the "Staff Report and Record of Decision" (A.R. Vol. 02). On January 26, 2000, the Regional Board held a nine-hour hearing and provided the opportunity for all parties to provide comments. All the same interested parties again submitted comments as before. At the conclusion of the public comment period, the Regional Board members discussed the issues, asked questions of staff, and provided direction to the Regional Board Executive Officer to approve the SUSMP with the Regional Board directed changes and staff proposed changes in the Change Sheet. At the same time, the Regional Board

adopted a Resolution to state that the SUSMP requirements are applicable to the City of Long Beach (except as noted) and that the numerical mitigation criteria establishes the standard for review in the Los Angeles Region for post-construction BMPs under the State General Construction Storm Water Permit (Order 99-08-DWQ

The Regional Board Executive Officer issued the Final Board SUSMP on March 8, 2000, together with a "Staff Report and Record of Decision – Supplement" and "Board Resolution" (No. R-00-02) (A.R. Vol. 14). On or after February 24, 2000, Petitioners filed a petition with the State Board requesting administrative review, challenging the actions of the Regional Board, and the actions of the Regional Board Executive Officer in issuing the Board SUSMP.

C. WATER QUALITY AND STORM WATER IN THE LOS ANGELES REGION

The water quality impacts of urbanization and urban storm water discharges have been summarized by several recent USEPA reports.2 Urbanization causes changes in hydrology and increases pollutant loads which adversely impact water quality and impair the beneficial uses of receiving waters. Increases in population density and imperviousness result in changes to stream hydrology including:

(i) increased peak discharges compared to predevelopment levels;

(ii) increased volume of storm water runoff with each storm compared to pre-development levels;

(iii) decreased travel time to reach receiving water; (iv) increased frequency and severity of floods;

(iv) reduced stream flow during prolonged periods of dry weather due to reduced level of infiltration;

2 *Storm Water Phase II Report to Congress* (USEPA 1995); *Report to Congress on the Phase II Storm Water Regulations* (USEPA1999); *Coastal Zone Management Measures Guidance* (USEPA 1992)

(v) increased runoff velocity during storms due to a combination of effects of higher discharge peaks, rapid time of concentration, and smoother hydraulic surfaces from chanellization, and

(vi) decreased infiltration and diminish groundwater recharge.

The LA County MS4 program conducts monitoring to:

(i) quantify mass emissions for pollutants,

(ii) identify critical sources for pollutants of concern in storm water;

(iii) evaluate BMP effectiveness, and

(iv) evaluate receiving water impacts.

The monitoring indicates that instream concentrations of pathogen indicators (fecal coliform and streptococcus), heavy metals (such as Pb, Cu, Zn,) and pesticides (such as diazinon) exceed state and federal water quality criteria.3 The mass emissions of pollutants to the ocean are significant from the urban Watershed Management Areas (WMAs) such as the Los Angeles River WMA, Ballona Creek WMA, and Coyote Creek WMA with the Los Angeles River WMA providing more than seventy percent of the loadings. Critical sources data for facilities (such as auto-salvage yards, primary metal facilities, and automotive repair shops) showed that total and dissolved heavy metals (Pb, Cu, Zn, and Cd), and total suspended solids (TSS) exceeded state and federal water quality criteria by as much as a hundred times. The results are consistent with a limited term study conducted by the Regional Board to characterize storm water runoff in the Los Angeles region before the issuance of MS4 permits.4 Storm water runoff data from predominant landuses showed similar patterns. Light-industrial, commercial and transportation landuses showed the highest range of exceedances. A pesticide (diazinon) showed higher ranges from residential landuse. The data for polycyclic aromatic hydrocarbons (PAHs), a known

3 Los Angeles County 1998-1999 Stormwater Monitoring Report, Los Angeles County Department of Public Works (1999). Data summarizes results of storm water monitoring for the most recent year and the past five years.

4 *Storm Water Runoff in Los Angeles and Ventura Counties, Final Report* (1988), California Regional Water Quality Control Board, Los Angeles, SCCWRP Contribution C292. This study found the highest mean concentrations of pollutants of concern such as heavy metals in the urban watershed rivers and that they contributed significant loads to the ocean.

pollutant of concern in urban storm water runoff, is inconclusive but improved analytical methods may yield more definitive results next year. Receiving water impacts studies found that storm water discharges from urban watersheds exhibit toxicity that are attributable to heavy metals. Biosurveys of the sea-bottom showed bioaccumulation of toxicants. Sediment analysis showed higher concentrations of pollutants such as Pb and PAHs than rural watersheds (2 to 4 times higher). In addition, toxicity of dry weather flows was observed with the cause of toxicity undetermined.5 Previous studies have found chemical concentration of pollutants that exceed state and federal water quality criteria in storm drains flowing to the ocean,6 and that there are adverse health impacts from swimming near them.7

Treatment BMP requirements on new development and redevelopment offer the most cost effective strategy to reduce pollutant loads to surface waters. Retrofit of existing development will be expensive and may be considered on a targeted basis. Studies on the economic impacts of watershed protection indicate that storm water quality management has a positive or at least neutral economic effect while greatly improving the quality of surface waters.8

D. APPLICABLE FEDERAL AND STATE AUTHORITY

1. Federal Authority

The Federal Water Pollution Control Act was adopted in 1948, amended in 1972, and amended in 1977 as the Clean Water Act of 1977 ("Clean Water Act"). Congress enacted the Clean Water Act "to restore and maintain the chemical, physical, and biological integrity of the Nations's waters." 33 U.S.C. § 1251(a). The Clean Water Act established the National Pollutant

5 *Toxicity of Dry Weather Flow from the Santa Monica Bay Watershed*, Bay, S. et al (1996), Bull. Southern California Acad. Sci. 5(1), pp. 33-45. The paper describes preliminary results on dry weather toxicity which have been confirmed by the MS4 monitoring program.

6 *Chemical Contaminant Release into Santa Monica Bay, Final Report*, American Oceans Campaign , Santa Monica (1993)

7 *The Health Effects of Swimming in Ocean Water Contaminated by Storm Drain Runoff*, Haile, R.W. et al. (1999), Epidemiology 10: 355-363). The study found higher risks of respiratory and gastrointestinal symptoms from swimmers.

8 *The Economics of Watershed Protection*, T. Schuler (1999), Center for Watershed Protection, Endicott, MD. The article summarizes nationwide studies to support the statement that watershed planning and storm water management provide positive economic benefits.

R0072543

Discharge Elimination System (NPDES) that required permits for any discharge of pollutants from a point source pursuant to section 402 of the Clean Water Act. 33 U.S.C. § 1342. The Clean Water Act authorizes EPA or an authorized State to implement an NPDES permit program. 33 U.S.C. § 1342(a)(1) and (b). In 1987, recognizing the threat from stormwater runoff, Section 402 of the Clean Water Act was amended to add subsection 402(p) which established a statutory scheme for storm water runoff through NPDES permit requirements for municipal storm water discharges from Municipal Separate Storm Sewer Systems ("MS4s"). 33 U.S.C. §§ 1342(p). That section "established deadlines by which certain storm water dischargers must apply for permits, the EPA or states must act on permits and dischargers must implement their permits. "Natural Resources Defense Council v. U.S. EPA, 966 F.2d 1292, 1296 (9th Cir. 1992). States may administer NPDES programs after they have submitted a description of the program, a statement from the Attorney General to the Environmental Protection Agency ("EPA") a Memorandum of Agreement with EPA, and the program is approved. (33 U.S.C.§ 1342(b); 40 C.F.R. § 123.21 et seq.) The Administrator shall approve State programs which conform to the applicable requirements. (40 C.F.R. § 123.1(c)).

2. The California NPDES Permitting Authority

a. *NPDES Memorandum between EPA and the State*

The State of California is one of forty states with an approved State NPDES Program. This program has been in effect since 1973. The latest NPDES Memorandum of Agreement between the U.S. Environmental Protection Agency and The California State Water Resources Control Board approved by EPA on September 22, 1989 states as follows:

> "*The Chairman of the State Board and the Regional Administrator of the EPA, Region 9 hereby affirm that the State Board and the Regional Boards have primary authority for the issuance, compliance monitoring, and enforcement of all NPDES permits in California including NPDES general permits and permits for federal facilities; and ...permits to dischargers for which EPA has assumed direct responsibility pursuant to 40 C.F.R. 123.44...*"

b. *Attorney General's Statement for the State National Pollutant Discharge Elimination System Program*

In May 1987, the Attorney General of the State of California submitted its Statement of legal authority to implement a State National Pollutant Discharge elimination system program. Chapter 5.5 of the Water Code, Sections 13370 et seq., sets forth the specific sections relating to the NPDES program in California. Those sections were added to assure consistency with the Clean Water Act. U.S. EPA has certified California's NPDES programs and the Regional Board's authority to issue permits as part of the approved program. Water Code § 13377 specifically authorizes the Regional Board to issue NPDES permits:9 The EPA has approved the entire regulatory scheme set forth in the Porter Cologne Act that establishes a comprehensive statewide program for water quality administered regionally, through the State Water Resources Control Board and the nine regional boards, within a framework of statewide coordination and policy. (Water Code § 13000 *et. seq*)

c. *Summary of Applicable California Regulatory Program*

To obtain approval, a state must have adequate authority to implement requirements enumerated in the Clean Water Act. 33 U.S.C. § 1342(b). The Porter Cologne Water Quality Act is the controlling water quality law for California. The State Board and the nine Regional Boards implement the Act. (Water Code §§ 174, 13200). The Porter Cologne Act and its regulations include both general and specific sections for implementing the Clean Water Act Programs. (See Water Code § 13370 *et seq*). The Regional Boards adopt Regional Water Quality Control Plans ("Basin Plans") for each region. (Water Code § 13240). The Basin Plan covering the area of this Permit, was adopted by the Regional Board on June 13, 1994, was approved by the State Water Resources Control Board on November 17, 1994 and is a public document

9 "Notwithstanding any other provision of this division, the state board or the regional boards shall, as required or authorized by the Federal Water Pollution Control Act, as amended, issue waste discharge requirements ...which apply and insure compliance with all applicable provisions of the act and acts amendatory thereof or supplemental thereto, together with any more stringent effluent standards or limitations necessary to implement water quality control plans, or for the protection of beneficial uses, or to prevent nuisance." Water Code § 13374 states: "The term "waste discharge requirements" as referred to in this division is the equivalent of the term "permits" as used in the Federal Water Pollution Control Act, as amended."

generally available. The Basin Plan specifically discusses the NPDES permit program that regulates storm water runoff from land surfaces that flow into storm drains or directly into natural waterbodies during rainfall. The principal means of regulating activities, which may affect water quality and the principal means of implementing water quality control plans, is through issuance of waste discharge requirements.

Water Code § 13376 sets forth the Permittees duties to obtain waste discharge requirements.10 Section 13376 is modeled on the provisions of the Clean Water Act. (Compare § 13376, with Clean Water Act sections 301, 402, 33 U.S.C. §§ 1311, 1342) By prohibiting the "discharge of pollutants" except as in accordance with a state permit, in the form of waste discharge requirements, section 13376 requires waste discharge requirements for all discharges for which the Clean Water Act requires an NPDES permit.11

State Board regulations provide that a report of waste discharge is the equivalent of an NPDES Permit Application, and that reports of waste discharge for point source discharges

---

10 . Section 13376 provides, in pertinent part: "Any person discharging pollutants or proposing to discharge pollutants to the navigable waters of the United States within this state...shall file a report of such discharge in accordance with he procedures set forth in section 13260....The discharge of pollutants...by any person except as authorized pursuant to waste discharge requirements....is prohibited...." § 13376. The terms"discharge," pollutants," and "navigable waters," as used in section 13376 and other provisions of Chapter 5.5 of the Porter-Cologne Act, have the same meaning as in the Clean Water Act. § 13373. The term "waste Discharge requirements," as used in Chapter 5.5. of the Porter-Cologne Act, is the equivalent of the term "permits," as used in the Clean Water Act § 13374.

11 Any person discharging waste or proposing to discharge waste that could affect the quality of waters of the state, must submit a *report of waste discharge* to the board. Water Code § 13260. A "discharge of waste", as used in the Porter-Cologne Act provisions on waste discharge requirements, includes, but is not limited to , any "discharge or runoff of a pollutant", within the meaning of the Clean Water Act. (33 U.S.C. § 1323, 1362). Specific authority for Clean Water Act Programs in the Porter Cologne Act include the issuance and enforcement of waste discharge requirements for both point and non-point sources. Waste discharge requirements may establish more stringent requirements than those required or authorized by the Clean Water Act. Water Code § 13377.

Where other provisions of the Porter-Cologne Act are inconsistent with Chapter 5.5, the provisions of Chapter 5.5 prevail to the extent of any inconsistency. Water Code § 13372. See State Water Resources Control Board No. WQ-80-19, State Board rejected an argument that Water Code § 13360 limits the authority of the state and regional boards to specify the manner of compliance with an NPDES permit. (See 33 U.S.C. § 1342(a)(1); see *NRDC, Inc. v. Costle*, 568 F. 2d 1369 (D.C. Cir. 1977)) In addition, EPA regulations adopted under the Clean Water Act authorize conditions in NPDES permits setting "best management practices" where numeric effluent limitations are infeasible or where reasonably necessary to achieve effluent limitations and standards or to carry out the purposes and intent of the Act. 40 C.F.R. § 122.62K. "Best Management Practices" are defined to include, for NPDES permits, 'treatment requirement, operating procedures, and practices to control...sludge or waste disposal...' 40 C.F.R. § 122.2. Consequently, since the Clean Water Act authorizes the imposition of conditions including best management practices, in NPDES permits where limitations and standards have not been promulgated, the Porter-Cologne Act gives the State and Regional Boards the same authority. To the *extent that this authorization is inconsistent with the provisions of water code section 13360, the authority of the State and Regional Boards to implement the provisions of the Clean Water Act under Water Code Section 13377 must prevail. See Water Code Section 13372."* (State Board Order No. WQ 80-19 at pgs. 19-21.)

R0072546

to surface waters shall be filed and processed in compliance with U.S.EPA's NPDES program regulations. (22 Cal. Admin. Code §§ 2235(b), 2235.1, 2235.2) Thus, the Porter Cologne Act and state board regulations have incorporated by reference all EPA NPDES regulations applicable to the States. (40 C.F.R. § 122, 123, and 124)

d. *No requirement of specific water quality impact for permit issuance*

There is no requirement in state or federal law that either EPA or the State is required to obtain information on the impacts to water quality of the discharges of pollutants or waste prior to the issuance of a permit to that discharger. Any city with a population exceeding 100,000 that owns or operates a municipal separate storm sewer system pursuant to EPA regulations implementing Clean Water Act Section 402(p) is required to have a permit. The Clean Water Act requires U.S.EPA and the States to regulate, through the issuance of NPDES permits, all discharges of pollutants to the nation's waters. CWA § 402; *NRDC v. Costle,* 568 F. 2d 1369 (D.C. Cir. 1977). "A permit is required where the population figures are net or exceeded; issuance is not conditioned on proving actual impacts to water quality." (Order No WQ 95-2, May 17, 1995; 55 Fed. Reg. 222 at 48038.

The initial storm water regulations were based upon extensive studies, which documented impacts on water quality from large and medium urban areas. (*See Natural Resources Defense Council v. U.S. EPA*, 966 F.2d 1292 (9th Cir. 1992) *In Natural Resources Defense Council v. U.S. EPA,* the court rejected an exemption in the CWA for oil and gas facilities where storm water was uncontaminated. *Id.*, at p. 1305. The Court noted: "...by designating these light industries as a group that need only apply for permits if actual exposure occurs, EPA impermissibly alters the statutory scheme...no other classes of industrial activities are subject to the more lenient "actual exposure" test. *To require actual exposure entirely shifts the burden in the permitting scheme. Most industrial facilities will have to apply for permits and show the EPA or state that they are in compliance. Light industries will be relieved from applying for permits unless actual exposure occurs...The permitting scheme then will work only if these facilities self-report, or the EPA searches out the sources and shows that exposure is*

occurring...[T]he regulations appear to contemplate neither..." Id., at p. 1305. To condition a permit on proving actual impacts to water quality alters the statutory scheme and wrongly places the burden on the permitting agency instead of forcing a facility to prove that they are in compliance.12

IV. STANDARD OF REVIEW

The standard of review for this type of permit is statutory and is not based upon the denial of a fundamental vested right. Water Code section 13263(g) states that the discharge of waste into the waters of the State is a privilege, not a right.

The State Board's charge here in reviewing Regional Board actions is to determine whether the Regional Board has acted properly (Water Code § 13320). In exercising its independent judgment, however, the State Board must afford a strong presumption of correctness to the administrative findings, and the party challenging the administrative decision bears the burden to prove that the administrative findings are contrary to the weight of the evidence. (*Fukuda v. City of Angels* (1999) 20 Cal.4th 805, 815.) "Considerable weight should be given to the findings of experienced administrative bodies made after a full and formal

---

12 In *NRDC v. U.S. EPA*, the court explained: "This case involves runoff from diffuse sources that eventually passes through storm sewer systems and is thus subject to the NPDES permit program.... One recent study concluded that pollution from such sources, including runoff from urban areas, construction sites, and agricultural land, is now a leading cause of water quality impairment. 55 Fed.Reg. at 47.991 " Id. at 1295. "The Nationwide Urban Runoff Program (NURP) conducted from 1978 through 1984 found that urban runoff from residential, commercial and industrial areas produces a quantity of suspended solids and chemical oxygen demand that is equal to or greater than that from secondary treatment sewage plants. 55 Fed. Reg. at 47.991. A significant number of samples tested exceeded water quality criteria for one or more pollutants. *Id.*, at p. 47, 992. Urban

hearing, especially in cases involving technical and scientific evidence. [Citation.]" (*Id.*, p. 812.) The State Board should give proper consideration to the Regional Board's expertise in the field of storm water pollution and related areas for the Los Angeles region. (*United States v. State Water Resources Control Board* (1986) 182 Cal.App.3d 82, 113.). Factual findings made by the Regional Board in the process of approving SUSMP requirements for new development should be reviewed under the clear error standard [*Tonry v. Security Experts Inc.*, 20 F.3d 967 (9th Cir. 1994)]. In the absence of a clear error of judgement of the facts, the State Board should uphold the Regional Board action.

In addition the State Board should deny Petitioners request for a stay of the requirements. Petitioners make up a small subset of the eighty-six MS4 municipalities in Los Angeles County, A stay would penalize the good-faith efforts of the larger number of the Permittees who, rather than petitioning the Regional Board's determination, are moving toward conformance with state and federal law. The State Board should take notice that the challenge to the SUSMP requirements is not unanimous.

V. ARGUMENTS

A. THE REGIONAL BOARD AND ITS EXECUTIVE OFFICER'S APPROVAL OF REQUIREMENTS FOR NEW DEVELOPMENT AND REDEVELOPMENT ARE NOT ENFORCEMENT ACTIONS SUBJECT TO THE ADMINISTRATIVE REVIEW PROCESS SET FORTH IN ORDER NO 96-054

The Los Angeles MS4 Permit sets forth an Administrative Procedure to be followed by the Regional Board Executive Officer "for the review and acceptance of documents" and "to resolve any differences in compliance expectations between the Regional Board and Permittees, prior to *initiating enforcement action*." Petitioners contend that the present process, by which the

R0072549

Regional Board considered approval of the SUSMP requirements, violates this process as set out in the Permit. Petitioners are grossly mistaken. The LA County MS4 Permit requires that SUSMPs be submitted to the Regional Board Executive Officer for approval. The action by the Regional Board and the Regional Board Executive Officer to approve the SUSMP was not an enforcement action but rather one of document review. The Regional Board's express statement at the September 16, 1999, hearing that the SUSMPs be brought before it for discussion voided the 120 day response condition stated in the permit for Regional Board Executive Officer approval documents (A.R. Vol. 12).13

Even if the Administrative Review provisions are found to apply, Petitioners' arguments that the Administrative Review process was not followed relies heavily on a premise that the Permit process provides significant notice, review and meet-and-confer protections that will benefit the Permittees. Those provisions must be considered in their full context, including, harm to the interest protected, and significantly, the deadline set forth in the permit for implementation. That deadline (July 30, 1999) has come and gone. Permittees submitted a final SUSMP to the Regional Board on August 10, 1999, well past the deadline. Because of the lapse of the deadline, the lack of countywide implementation of an effective SUSMP, and the impending expiration of Order No. 96-054 itself, the Regional Board was well within its right to consider the process prescribed in the permit for approval of a program implementation component to be obsolete.

Further, the Regional Board's action did not harm Petitioners interest protected by the Administrative Review process (i.e., ensuring conference with Regional Board staff to help resolve differences prior to formal action). The Regional Board Executive Officer met numerous times with Petitioners between August 1999 and January 2000 to listen to their concerns and communicate Regional Board expectations. During these discussions, several proposals were

13 Transcript of Proceedings, September 16, 1999.

R0072550

exchanged between the staff and the interested parties and the record in this matter now contains a substantial number of comments and responses. It is illustrative that Petitioners do not make the argument that actual prejudice derived from the Regional Board's failure to follow the process, but rather, seek to merely elevate form over substance.

The State Board should take note that the U.S. EPA, the federal agency with regulatory responsibility for implementation of the CWA in the U.S., endorsed the Regional Board Executive Officer's action in approving the SUSMP.14 The U.S. EPA also provided oral testimony at the January 26, 2000, hearing in support of changes directed by the Regional Board.15

Moreover, as a further consideration, the U.S. EPA's October, 1999 "NPDES Program Implementation Review" for the Los Angeles Region was critical of the process set forth in the Los Angeles County MS4 permit for model program approval because it had resulted in interminable delays.16

Given the circumstances of this matter, (i) the fact that the failure to follow the process has not deprive the Petitioners of any opportunity to discuss the SUSMP provisions and propose alternatives or any other protections, and (ii) the fact that the Regional Board's primary responsibility is to protect the water quality in the Region (Water Code Section 13000), the Board was well within its legal authority to approve the SUSMP presented by Regional Board staff with Board directed changes, rather than delay program implementation.

---

14 See Letter of January 13, 2000 to Dennis Dickerson, Executive Officer from Alexis Strauss, Director, Water Division, U.S. EPA.

15 See Transcript of Proceedings January 26, 2000. at p 161. Ms. Alexis Strauss', Director, Water Division, U.S. EPA Region IX, statement that the Regional Board consider removing certain exemptions.

16 See NPDES Program Implementation Review: California Regional Water Quality Control Board 4, Los Angeles Region. USEPA, Region 9, Final Report – October 1999., at page 10 of 45. The report notes at page 28 that the process was "...hindering overall progress towards achieving permit objectives".

For these reasons, the State Board should reject Petitioners' claim that the Regional Board acted unlawfully in not following the Administrative Review Process described in the permit.

B. THE REGIONAL BOARD HAS FULL AUTHORITY UNDER THE CLEAN WATER ACT (33 U.S.C S 1251 *et seq.*) AND THE PORTER COLOGNE ACT (CAL. WATER CODE S 13000 *et seq.*) TO ESTABLISH MINIMUM CRITERIA TO ENSURE COMPLIANCE

Petitioner's argue that the Regional Board lacks authority under State and Federal law to establish objective criteria to determine compliance (SUSMP requirements) where Permittees are implementing the requirements of the Los Angeles County MS4 permit. Nothing could be further from the truth. Permittees by their failure to have an approved program to control storm water runoff from new developments and significant redevelopment have presumptively failed the statutory standard for compliance, i.e "reduce pollutants to the maximum extent practicable"

Petitioner's also contend that the Regional Board must demonstrate that the Board SUSMP requirements, because they differ from those submitted by the Permittees, will "reduce pollutants to the maximum extent practicable".

Petitioners' arguments turn the CWA and the Porter-Cologne Act on their heads. In essence, Petitioners assume they have a right to discharge pollutants under a MS4 permit with little or no controls absent a showing by the Regional Board that their activities are harmful or are not "reducing pollutants to the maximum extent practicable". This assumption impermissibly alters the statutory scheme set forth in the CWA and Porter-Cologne Act. To require evidence of actual discharge or that Permittees are not reducing pollutants or showing of harm entirely shifts the burden in the permitting scheme. To condition implementation of

requirements in a permit on proving actual impacts to water quality or showing sub-par implementation alters the statutory scheme and wrongly places the burden on the permitting agency instead of forcing a discharger to prove it is in compliance with the law. (See e.g., *Natural Resources Defense Council* v. *U.S. EPA* (9th Cir. 1992) 966 F.2d 1292 [court rejects an exemption in the CWA for oil and gas facility where storm water was uncontaminated; court says by designating these industries as a group that need apply for permits only if actual exposure occurs, EPA impermissibly alters statutory scheme.].)

Hence, there is no need to show with empirical evidence that Petitioners are required to implement specific storm water controls only where they are discharging pollutants or causing harm. Once the regulations require controls for storm water runoff from new development and significant development based on a general determination that pollutants could be discharged in storm water, a fact Petitioners never challenge, the Regional Board must interpret and enforce requirements in the permit as mandated by the Clean Water Act and Porter-Cologne sufficient to protect water quality. The only question, then, is whether the Regional Board followed the law in adopting the SUSMP requirements, and whether, in the exercise of its best professional judgment, the Regional Board properly exercised its authority to require definite criteria and other conditions for new development and significant redevelopment "to reduce pollutants in storm water to the maximum extent practicable"

The record establishes that urban stormwater runoff, from new development and redevelopment, poses a serious threat to surface waters because urbanization adds pollutants that are picked up from the ground and transported in storm water. (A.R. Vols. 09, 10). The record shows that scientific evidence justifies controls to mitigate runoff from 0.75 inch or equivalent of precipitation. Substantial deference should be accorded to a regulatory agency's reasonable and consistent held interpretation of its own regulations [*Arkansas v. Oklahoma*, 503 U.S. 91, 110 (1992)]. Federal courts have held that where an NPDES permit does not specify the manner in

which compliance is determined, the Regional Board's interpretation of the proper method to determine compliance should be given considerable deference, so long as it is reasonable [*Russian River Watershed Protection Committee v. City of Santa Rosa*, Case No. 97-15179, 9th Cir. (1998)]

It is revealing that Permittees initially included a numerical BMP design standard (0.6 inch) in an early SUSMP draft circulated among Permittees, but then had the numerical criteria removed (A.R. Vol. 10). It is not unreasonable to assume that Permittees did so in order to render the SUSMP unenforceable. Without an objective standard, there would be no definite design criteria to size BMPs for storm water quality. Developers and builders would then merely have to pay lip service to a vague and subjective standard that neither the Permittees could require compliance with nor the Regional Board could enforce.

Petitioners further claim that the List of BMPs approved by the Regional Board, pursuant to Board Resolution No. 99-03, by itself will ensure that Permittees have met the standard of compliance for new development and significant redevelopment. These statements are incorrect. The List of BMPs approved by the Regional Board constitutes a menu of BMPs considered by the Regional Board as appropriate for the control of pollutants from new development and significant redevelopment. However, "to reduce storm water pollutants to the maximum extent practicable" through structural and treatment controls for new development and significant redevelopment, three elements would be necessary, (i) best combinations of BMPs (ii) sized based on water quality equivalent design standards, and (iii) selected to reduce the pollutants of concern. Only the first element has been satisfied by Permittees when they incorporate the Board approved BMPs List into their program. The Permittees SUSMP failed because it lacked the second element. The third element does not come into play until the time when Permittees review development plans submitted by builders and developers. Permittees therefore can be presumed to have failed to comply with the requirements of the Clean Water Act.

Also, the Regional Board's action in setting definite criteria for the control of pollutants in storm water from new development and significant redevelopment is consistent with a recent State Board ruling, that storm water permits include clear requirements to achieve compliance. (Order WQ 98-01) 17

Thus, Petitioners' claim that the Regional Board lacks the authority to impose definitive requirements for new development and redevelopment must be rejected.

C. THE REGIONAL BOARD PROPERLY NOTICED THE ACTION, PROVIDED ADEQUATE TIME FOR PUBLIC REVIEW, AND CONDUCTED A FAIR HEARING

Petitioners contend that the Regional Board violated their due process rights by failing to provide Petitioners sufficient notice prior to the public hearing of their proposed actions and sufficient opportunity to be heard prior to taking action. At issue appears to be the Change Sheet dated January 25, 2000. The Change Sheet was provided for Regional Board consideration, in large part to make changes to the SUSMP considered reasonable, and requested by Permittees, through their comment letters (See A.R. Vol. 02). Petitioners also contend that the Regional Board made substantive changes to the SUSMP after the close of the public comment period on January 26, 2000.

The procedural history of the Regional Board action shows that Petitioners were given "first opportunity" to draft the SUSMP requirements and submit them through the LACDPW to the Regional Board Executive Officer for approval. Several versions of the SUSMP were circulated for almost six months before a final document was submitted to the Regional Board on July 21, 1999. This document was again revised and resubmitted on August 12, 1999. Regional Board staff conducted a technical workshop on August 10, 1999, with testimony from national experts to discuss the fundamental principles for the control of pollution from new

17 In Re: Environmental Health Coalition, Order WQ 98-01, at 11. The State Board upheld the MS4 permit issued by the San Diego Regional Board but found it necessary to state, "storm water permits [should] contain the strongest and clearest possible language to protect water quality"

development and redevelopment. (A.R. Vol. 10) Further, the Regional Board conducted an information workshop on September 9, 1999, to hear comments on staff recommended SUSMP requirements. Before the adoption of the SUSMP requirements on January 26, 2000, the Regional Board held two workshops, and Regional Board staff conducted several consultative meetings with various interests including Petitioners. Extensive testimony was allowed on the SUSMP requirements at all these times. Regional Board staff also made several appearances at local council of governments and regional planning agency meetings to discuss the requirements.

On December 8, 1999, the Regional Board circulated the tentative Board SUSMP along with a document entitled "Response to Comments" summarizing comments and responding to whether or not certain suggested revisions were accepted or declined and why. In addition, on January 18, 2000, the Regional Board released a "Supplemental Response to Comments" and "the Staff Report and Record of Decision".(A.R. Vol. 02) The Regional Board approved the Final SUSMP on January 26, 2000, after nine hours of testimony and Board discussion. At that meeting, the Regional Board considered all testimony and directed that the Regional Board Executive Officer make certain revisions. (A.R. Vol. 12) Petitioners claim they were denied due process under the state and federal Constitutions because they were not allowed additional period for notice, review, and comment for the Board directed changes.

The Regional Board complied with the federal procedural requirements for adopting NPDES permits under section 124 of Title 40, Code of Federal Regulations and with Water Code Section 13377. The Regional Board circulated the tentative SUSMP for thirty days, held a hearing on the contested item, made revisions in response to comments, and prepared a document containing responses to those comments. The final revisions to the SUSMP made after the close of the public comment period were made in response to oral testimony.

Petitioners claim the revisions constituted significant changes, which required further comment. A close examination of the record, however, demonstrates that the Regional Board fully considered all material presented and made decisions consistent with their

responsibilities under the Water Code Section 13225(a). While the issues might have been significant, as illustrated by the considerable time and effort that the Regional Board invested in its consideration, the issues were not new issues. The record will indicate that the same concerns were communicated orally and in writing some months before, not just on January 26, 2000.

Petitioners specifically contend that application of the SUSMP requirements to all projects (not just "discretionary projects") and elimination of the "roof-top" exemption constitutes significant changes that require new notice. Both terms, as originally set forth prior to Board modification, convey limitations that had been proposed by Permittees in the development of the proposal presented to the Board in order to restrict the scope of the application of the SUSMP requirements. The Regional Board was well within its regulatory authority to find that the proposed limitations have no basis in permit, statute, or regulation and to eliminate them thus giving the SUSMP requirements the broadest application. Following Petitioners' argument about due process to its logical conclusion would mean that the Regional Board could never complete public deliberations and conclude permitting actions.18 There is simply no due process violation under the facts of this case.

Petitioner asserts that it was denied a fair hearing because: (1) Regional Board failed to provide Petitioner with adequate time to address its concerns with the SUSMP, and the opportunity to prepare evidence against requirements at the hearing on January 26, 2000; (2) Regional Board made significant changes to the SUSMP requirements after the close of public comment on the date of the hearing; (3) Regional Board did not provide Petitioner with adequate notice of the new SUSMP requirements before it was reviewed and approved;

Government Code Section 11125 requires that the public be provided 10 days notice of business to be transacted by a state body. The transmittal letter attached to the December 7, 1999 tentative SUSMP provided interested parties some 50 days of notice. Additionally,

18 Notably, these permits apply for only five years. (40 C.F.R. § 122.46.) If petitioners had their way, the Regional Board would never be able to require its implementation.

Respondent has not violated any regulations pertaining to a pre-hearing public comment period because no such regulations exist.

Section 648.3 of the Board regulations contains the procedural requirements that governed the January 26 hearing. (CCR § 648.3.) This section directs that all "adjudicatory proceedings be conducted in such a manner as the Board deems most suitable to the particular case with a view toward securing relevant information expeditiously without unnecessary delay and expense to the parties and to the Board." (CCR § 648.3(a).) The regulations do not require precise technical specificity with regard to procedure. Rather, they suggest a more common-sense approach to hearing procedure than is required in trial settings. (*See* CCR § 648.4(a) "The proceedings will not be conducted according to technical rules relating to evidence and witnesses.") *The regulations give no indication of the length of time that should be allotted to each speaker.* The regulations give no guidance as to what documents must constitute the administrative record. The regulations simply conclude that "[a]ny final decision made pursuant to evidence introduced at an adjudicatory hearing shall be based on the record and shall include a statement of the reasons for the decision, and where appropriate, findings and conclusions." (CCR § 648.7.)

The procedural requirements of the federal Clean Water Act (CWA) provide a source of reference for state permit programs. The federal regulations promulgated under the CWA provide specific procedures for issuing, modifying, revoking, and reissuing NPDES permits. (40 C.F.R. § 124 et seq.) The regulations list the provisions of the CWA that may be implemented by state programs. (40 C.F.R. § 123.25.) According to the regulations, "[s]tates need not implement provisions identical to the listed provisions. Implemented provisions must, however, establish requirements at least as stringent as the corresponding listed provisions." (*Id.*)

The section pertaining to public notice and comment provides that a single notice may be used by the Regional Board to provide public notice of both the proposed permit action and the scheduled hearing. (40 C.F.R. § 124.10(b)(2).) The notice must be given at least 30 days before

the public hearing and it must allow at least 30 days for public comment. (40 C.F.R. § 124.10(b)(1), (2).). 19

In each of the cases that Petitioners cite to support the argument that it was denied a fair trial, the hearings involved therein affected vested, fundamental rights such as a public employee's right to continued permanent employment, (*English v. Long Beach*, (1950) 35 Cal.2d 155), and the right to pursue an occupation (*Bank of America v. Long Beach*, (1975) 50 Cal.App.3d 882). Both of these cases involve rights that were already possessed by the individual and which therefore are fundamental and vested. (*Bixby v. Pierno* (1971) 4 Cal.3d 130, 146.) Accordingly, the procedural protections required in these cases are not germane to the instant proceeding, which did not affect a vested right. The California Water Code specifically indicates that a discharge of waste into state waters via an NPDES permit is a privilege, *not a vested right*. (Water Code § 13263(g) (emphasis added).) An administrative proceeding that does not affect a vested interest does not implicate the procedural protections of the due process clause. (*Clark v. City of Hermosa Beach*, 48 Cal.App.4th 1152, 1178. (1996))

Petitioners cite no cases that involve the type of administrative permit proceeding that is at issue here. Moreover, each of the cases cited by Petitioner involved egregious abuses of discretion by the City of Long Beach that resulted in the court finding a prejudicial denial of a fair hearing. No such egregious actions are present in this matter. Even assuming that Petitioner does have a protected interest, the procedures used by Respondent at the January 26, 2000, hearing are consistent with the flexible requirements of procedural due process and should be accorded great weight.

19 The federal regulations governing adjudicatory hearing procedures and format do not apply to state-operated NPDES programs, and are only applicable to EPA-issued permits. (40 C.F.R. § 124.71.)

"[T]here is no precise manner of hearing which must be afforded; rather the particular interests at issue must be considered in determining what kind of hearing is appropriate ... [w]hat must be afforded is a reasonable opportunity to be heard." (*Saleeby v. State Bar*, (1985) 39 Cal.3d 547, 565.)20

In *Mohilef v. Janovici*, (1996) 51 Cal.App.4th 267, the Court held that due process is satisfied as long as the petitioner is given a meaningful opportunity to respond to the charges against him and recognized that substantial weight must be given to the agency's judgment and procedures:

"[D]ifferences in the origin and function of administrative agencies preclude the wholesale transplantation of the rules of procedure, trial, and review which have evolved from the history and experience of courts....In assessing what process is due..., substantial weight must be given to the good-faith judgments of the [agency] that [its] procedures ... assure fair consideration of the ... claims of the individuals." (*Mohilef*, 51 Cal.App.4th at 288-289 (quoting *Mathews v. Eldridge*, (1976) 424 U.S. 319, 348-349).)

The Supreme Court later reiterated this principle in *Vermont Yankee Nuclear Power Corp. v. NRDC* (1978) 435 U.S. 519 by noting that:

"[A]dministrative agencies should be free to fashion their own rules of procedure and to pursue methods of inquiry capable of permitting them to discharge their multitudinous duties." (*Id.* at 543.)

R0072560

20 In *Saleeby*, the Court concluded that the State Bar was not required to provide petitioner with a formal hearing so long as petitioner was afforded a "reasonable opportunity to raise objections to the particular application the bar desires to take." (*Id.* at 566.) Like the respondent in *Saleeby*, the Respondent in the instant case did not offend due process because Petitioner was given ample opportunity to raise objections and comment on the draft permit, and it availed itself of these opportunities both prior to and during the hearing. In *CEEED v. California Coastal Zone Conserv. Comm'n*, (1974) 43 Cal.App.3d 306, the Court held that the system for coastal zone permits under Coastal Conservation Act of 1972 fully guaranteed procedural due process to permit

In light of the comprehensive public comment history of the proposed permit and the significant degree of deference that is accorded administrative agencies, Respondent clearly provided Petitioner with a meaningful opportunity to present its concerns and comments, and thus Petitioner was provided with a fair hearing.

For the reasons enumerated, Petitioners arguments that they were not provided adequate notice and were denied a fair hearing must be set aside.

D. THE ACTIONS OF THE REGIONAL BOARD TO APPLY OBJECTIVE AND ENFORCEABLE REQUIREMENTS ARE CONSISTENT WITH THE AUTHORITY GIVEN IT BY THE CLEAN WATER ACT AND THE PORTER COLOGNE ACT.

Petitioners argue that the SUSMP requirements, including numerical mitigation standards, approved by the Regional Board impose new requirements in excess of those set forth in the permit, and the action procedurally and substantively modifies the permit.

The LA County MS4 permit set up a process for Petitioners' to develop conditions for new development and significant redevelopment to control storm water pollution. The requirement in the permit that the Regional Board Executive Officer approve the conditions was to ensure that the final SUSMP, is sufficient and enforceable under state and federal law. The record is clear and convincing that the SUSMPs proposed by Permittees fell short of the legal standard for adequacy. Further, the interminable delay that ensued with the back and forth submittal and review of other model programs clearly indicated that the administrative approval process followed by the Respondent was hampering its regulatory obligation to ensure that Permittees comply with the Clean Water Act, a deficiency also identified by the U.S. EPA in its Report (A.R. Vo. 8).

Because there is no express national standard for the control of storm water pollutants from new developments, one must defer to statements of policy and intent made by the U.S.EPA. The U.S.EPA under Phase I regulations did not fully describe the expectations for MS4 Permittees in controlling post construction storm water discharges from new development and significant redevelopment except that "a comprehensive master plan" was required [55 Fed Reg. 48054]. For a better understanding, we look to the Final Rule for Phase II storm water regulations. Therein, the U.S.EPA notes that "prior planning and designing for the minimization of pollutants in storm water is the most cost-effective approach to storm water quality management" [64 Fed Reg. 68759], and identifies four essential elements to control storm water from new development and redevelopment. These are, (i) to develop and implement strategies that include a combination of structural and non-structural BMPs; (ii) adopt an ordinance to address post construction runoff; (iii) ensure long term operation and maintenance of the BMPs; and (iv) ensure that controls are in place that will *minimize* water quality impacts. [Emphasis added] EPA goes on to say:

> "The requirements .....[are] consistent with the permit application requirements for large MS4s for post-construction controls for new development and redevelopment."

The SUSMP requirements approved by the Regional Board achieve all four enumerated objectives for new development and redevelopment. Petitioners SUSMP failed to implement three of these four objectives.

Further, the Federal Court of Appeals has unequivocally stated that Congress intended for "the Administrator or a State to design [substantive] controls" for storm water discharges from MS4s but did not mandate a particular approach [*NRDC v. USEPA*, 966 F.2d 1292 (9th Cir. 1992)]. The court held that it is appropriate to defer to U.S.EPA [and the State] where the agency supplied a "reasoned explanation".

The record will show that the Regional Board has provided more than a "reasoned explanation" for its action. The establishment of definite criteria to evaluate compliance with requirements to control storm water pollution from new development and redevelopment does not constitute an amendment. Petitioners were provided the opportunity to develop one, and failed to do so. Thus, the Regional Board under due diligence had no option but to independently research and develop a standard that would ensure that BMPs are adequately designed to reduce pollutants in storm water runoff from new development. Nothing in State of Federal law prohibits such an act. In fact, failure by the Regional Board to affirmatively establish such a standard under the circumstances would have been a dereliction of responsibility under the Clean Water Act and the Porter Cologne Act.

E. THE REGIONAL BOARD'S REQUIREMENT OF NUMERICAL DESIGN STANDARDS FOR TREATMENT CONTROL AND STRUCTURAL BEST MANAGEMENT PRACTICES IS TECHNICALLY DEFENSIBLE, AND NOT ARBITRARY AND CAPRICIOUS

Petitioner's argue that the Regional Board's numerical design standard is arbitrary and capricious, yet provide no evidence in support of the claim. To the contrary, the technical basis for design standards for post-construction BMPs is discussed in detail in the "Staff Report and Record of Decision" and the calculations have been made part of the Administrative Record.

Similar standards for the design of post-construction BMPs have already been adopted by a number of municipalities subject to Phase I storm water regulations. These design standards are considered by these municipalities to meet the statutory standard for control of storm water discharges from new development and significant redevelopment.21 The State Board should note that some of the foremost national storm water experts have submitted letters in support of

21 .WEF Manual of Practice No. 23. The manual discusses the basis for the sizing of storm water quality BMPs and adds,.."the 80th percentile runoff event is now considered by municipalities ...to be cost-effective...and the design that achieves MEP definition of the Clean Water Act."

the numerical design standard set by the Regional Board.22 (A.R. Vol. 7) In addition, several States, including Washington, Florida, and Maryland have imposed similar requirements on a statewide basis pursuant to their implementation of the Federal Phase I storm water regulations.

It is also relevant, from a burden consideration, that the numerical mitigation standard required by the Regional Board is less than categorical effluent limitations for storm water set by the U.S. EPA for combined animal feedlot operations or for sediment removal from construction sites or new development BMP design criteria applied in the Pacific Northwest. (A.R. Vol. 09).

Petitioners' claim that the requirements are arbitrary and capricious must therefore be set aside as a ploy to escape regulation.

F. THE REGIONAL BOARD IS NOT REQUIRED TO SEPARATELY PROVIDE EVIDENCE OF COST-EFFECTIVENESS OR PERFORM A COST-BENEFIT ANALYSIS WHEN IMPLEMENTING AND ENFORCING A FEDERAL REGULATORY REQUIREMENT

Petitioners contend that the Regional Board failed to conduct a cost-benefit analysis and consider the economic impacts of the SUSMP requirements. A separate economic analysis is not required when implementing a federal regulation. Nevertheless, Regional Board staff conducted an economic impact evaluation of the SUSMP requirements on an actual project, in the pipeline for approval at the City of Los Angeles. The analysis determined that the cost of compliance with the requirement amounted to less than one percent of the project cost. This analysis is discussed in the "Record of Decision and Staff Report" and the calculations have been made part of the Administrative Record. A relative comparison of the economic cost of the Board SUSMP standard with other similar standards indicate that the cost was a fraction of the cost of the other standards to manage storm water to reduce water quality impacts. [A.R. Vol. 09] 23

22 See A.R. Vol. 07. Letters submitted by Prof. M. Stenstrom- UCLA, Prof. R. Pitt- U. of Alabama, Prof. R Horner- U. of Washington, and Tom Schuler - Center for Watershed Protection.

23 Transcript of Proceedings, January 26, 2000. at 39

R0072564

In contrast, Petitioners have provided no evidence to substantiate the claim that the numerical design standard is not cost-effective. Thus Petitioners argument that the Regional Board's requirements for new development are not cost-effective must be rejected.

G. THE REGIONAL BOARD IS AUTHORIZED BY THE CLEAN WATER ACT AND THE PORTER-COLOGNE ACT TO REQUIRE ALL MEASURES NECESSARY TO ENSURE THE PROTECTION OF RECEIVING WATER QUALITY

The Regional Board has the authority to adopt the Board SUSMP requirements and numerical mitigation standards for new development and significant redevelopment. The LA County MS4 permit requires that each of the Permittees develop an Urban Storm Water Mitigation Plan following the model approved by the Regional Board Executive Officer.24 The Regional Board action adopted the model, or Standard Storm Water Mitigation Plan for the Permittees to follow.

Although the LA County MS4 permit provides that the Regional Board Executive Officer has authority to approve the model program, as proposed, the Board SUSMP was submitted to the Board itself for review and endorsement at the January 26, 2000, meeting. Following consideration by the Board, the Regional Board Executive Officer approved the SUSMP for Los Angeles County Permittees. The Board approved SUSMP was released on March 8, 2000. In addition, the Board adopted a resolution that made the SUSMP applicable to the City of Long Beach. This was required because the City of Long Beach has a storm water permit (Order No. 99-060) separate from the one applicable to other cities in the County.

The Board approved SUSMP requires, *inter alia,* that (a) post-construction treatment control BMPs be required for nine categories of development and (b) the BMPs be designed to

24 Los Angeles Municipal Permit, (Part III.A., at Page 31.)

R0072565

mitigate (treat or infiltrate) the runoff from all storms up to 0.75 inch of rainfall for 24-hour period or equivalent runoff volume. As discussed in detail in "Background", these requirements are based upon application of provisions of the Clean Water Act (CWA), section 402(p). The federal provisions require that a storm water program:

> "* * *
>
> (ii) Shall include a requirement to effectively prohibit non-storm water discharges into storm sewers; and
>
> (iii) Shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants." [Section 402(p)(3)(B), USC Section 1342(p)(3)(B), emphasis added.]

The proposal is an effort to meet the Clean Water Act requirements. In a 1992 decision, the U.S. Court of Appeals for the Ninth Circuit (*NRDC v. U.S.EPA*, 966 F.2d 1292) interpreted the above language as providing the Administrator or the State with substantial authority:

> "[t]he language in (iii), above, requires the Administrator or the State to design controls. Congress did not mandate a minimum standards approach or specify that U.S. EPA develop minimal performance requirements...we must defer to U.S. EPA on matters such as this, where U.S. EPA has supplied a reasoned explanation of its choices."

The decision in essence holds that the U.S. EPA and the States are authorized to require implementation of storm water control programs that, upon "reasoned explanation," accomplish the goals of Section 402(p).

R0072566

Moreover, in a very recent decision, the Ninth Circuit Court of Appeals reinforced the U.S. EPA's and the State's authority in this area. In *Defenders of Wildlife v. Browner* (1999) Case No. 98-71080, the Ninth Circuit Court of Appeals reviewed an action of the U.S. EPA to adopt a Storm Water Management Program in the State of Arizona. That program included best management practices such as storm water detention basins, retention basins, and infiltration ponds. The question was whether the U.S. EPA can require numeric limitations to ensure strict compliance with the state water-quality standards. The Court concluded that the CWA does not require strict compliance; however, citing the language of (iii), above, it stated: "[t]hat provision gives the U.S. EPA discretion to determine what pollution controls are appropriate. As this court stated in *NRDC v. U.S. EPA*, 'Congress gave the administrator discretion to determine what controls are necessary...[cites omitted] (at page 11687).

The Board SUSMP meets the Clean Water Act Section 402(p) requirements and Regional Board staff has provided a "reasoned explanation of its choices" in the SUSMP "Record of Decision and Staff Report", the "Record of Decision and Staff Report - Supplement" and the accompanying materials. (A.R. Vol. 14) Accordingly, the Board SUSMP requirements are well within the Regional Board's authority to regulate MS4 discharges.

Petitioners' arguments must thus be rejected.

H. THE REGIONAL BOARD ACTION DOES NOT VIOLATE CALIFORNIA WATER CODE SECTION 13360

Petitioners contend that the Regional Board's action violates Water Code § 13360 because it prohibits the Regional Board from specifying the manner of compliance. In Part the Water Code Section reads,

"No waste discharge requirement or other order...shall specify the design, location, type of construction.... or particular manner in which compliance may be had"

The Board SUSMP requirements set a numerical design standard for the control of storm water pollutants from new development and significant redevelopment. Petitioners' challenge here focuses on this one issue, although it is not articulated in that manner.

The Board included a design standard in the SUSMPs in order to establish an objective measure to evaluate compliance with the statutory standard of MEP contained in federal and state law. Thus, the numerical design criteria in the SUSMP are more similar to technology standards, such as Best Available Technology (BAT), applied to traditional point source discharges. These standards have broad technical reach...and are not unique to any singular approach. Further, the Regional Board provided four equivalent methods to derive the volume of storm water to be treated to remove pollutants. The record establishes clear technical and regulatory bases to include the criteria. Note also that these are minimum standards and Petitioners can use stricter criteria. 25

Petitioners claim that the Regional Board action to include a numerical BMP design standard in the SUSMP for new development, in essence *specifies design and the manner of compliance* [emphasis added] is patently false, and must be rejected

I. THE REGIONAL BOARD ACTION DOES NOT VIOLATE THE UNFUNDED MANDATE PROVISION OF THE CALIFORNIA CONSTITUTION

Petitioners assert that the Regional Board by its action has imposed requirements in excess of the federal mandate, and therefore is in violation of the State Constitution prohibiting unfunded mandates. Petitioners' analysis of this issue is incorrect and misleading. Petitioner omitted the most important sections of the implementing state statutory language and omitted the

25 Transcript of Hearings, January 26, 2000. At 292, See Regional Counsel Leon's response to the non applicability of Water Code Section 13360 here

key language in the cases they cited. The California Constitution, Article XIII B, Section 6 states:

> "Whenever the Legislature or any state agency mandates a new program or higher level of service on any local government, the state shall provide a subvention of funds to reimburse such local government for the costs of such program or increased level of service....(Cal. Const. Art. XIIIB, § 6). Government Code §§ 17500 through 17630 were enacted to implement Article XIII B, section 6.

This section was not intended to cover a *PERMIT OR ORDER OR REQUIREMENTS THEREIN* issued by a regulatory agency of state government imposing federal requirements upon parties prohibited from discharging waste into the waters of the State and the United States under both state and federal law. If Petitioners' analysis was correct, every Permittee could file a "Claim" for reimbursement to comply with regulatory actions, claiming that they require a "new program" or an "increased level of service." The Constitution addresses reimbursement for additional "services" mandated by the State upon local agencies, not regulatory requirements imposed upon all Permitees, including cities and counties. The intent of the constitutional section was not to require reimbursement for expenses incurred by local agencies complying with laws that apply to all state residents and entities. (See *City of Sacramento v. State of California*, 50 Cal.3d. 51 (1990) citing *County of Los Angeles v. State of California*, 43 Cal.3d. 46.

In addition, two exemptions exist. One exemption applies if "the local agency or school district has the authority to levy service charges, fees, or assessments sufficient to pay for the mandated program or increased level of service." (Government Code § 17556(d). Government Code § 17556(c) exempts claims where "the statute ...implemented a federal law or regulation and resulted in costs mandated by the federal government, unless the statute...mandates costs which exceed the mandate in that federal law or regulation."[emphasis added].26

26 Gov. Code § 17514 provides: "costs mandated by the state" means any increased costs which a local agency or school district is required to incur after July 1, 1980, as a result of any statute enacted on or after January 1,

1975, which mandates a new program or higher level of service of an exsiting program within the meaning of Section 6 of Article XIII B of the California Constitution."

The Permit provisions to which Petitioners object are consistent with the Clean Water Act and federal regulations and are not more stringent than the federal requirements. Moreover, the permit does not create a state "program" to be administered by the local agency, transferring fiscal responsibility for "services" to be extended to the public. The requirements to control runoff from new development and redevelopment are federally imposed regulations on municipalities owning and/ or operating large or medium MS4s. All the cases cited by Petitioners are inapplicable to this situation27.

Petitioners claim is without merit and must be rejected.

J. THE REGIONAL BOARD ACTION DOES NOT VIOLATE THE CALIFORNIA ADMINISTRATIVE PROCEDURES ACT

Petitioners argue that the SUSMP requirements constitute rulemaking, in violation of the California Administrative Procedure Act, Government Code Section 11340 *et.seq*. Petitioners' argument is grossly incorrect. The APA requirements apply only to rulemaking activities. Contrary to the Petitioners' assertion, the action is not "rulemaking" in nature. Rather, it is the identification of further requirements set forth in the Los Angeles County MS4 permit. Under the APA itself, the issuance of such permits is not subject to the rulemaking requirements of the APA (Government Code Section 11352(b).

---

27 *County of Fresno v. State,* (1991) 53 Cal. App. 3d 482 involved a facial constitutional challenge by the County of Fresno to a statute establishing minimum statewide standards for business and area plans relating to the handling and release or threatened release of hazardous materials and requiring local governments to implement its provisions. The Court found that a program was not a reimbursable state-mandated program under Govt. Code § 17556 (d) "if the agency has the authority to levy a charge or fee sufficient to pay for the program." Id. at 484. The court found that Article XIII B applies to taxation and "was not intended to reach beyond taxations." Id. 487. *Hayes v. Commission on State Mandates*, (1992) 11 Cal.App.4th 1564 addressed the exception set forth in Gov. Code § 17556(c). This case involved a decade long battle over claims by two county superintendents of schools for reimbursement for mandated special education programs. The court stated that the "costs mandated by the federal government are exempt from an agency's taxing and spending limits," and therefore exempt from reimbursement. Id. at 1580.

K. THE REGIONAL BOARD ACTION IS STATUTORILY EXEMPT FROM THE PROVISIONS OF THE CALIFORNIA ENVIRONMENTAL QUALITY ACT

Petitioners' claim that the Regional Board is required to review potential significant environmental impacts before approving SUSMP requirements. The issuance of the LA County MS4 permit itself, and the requirements contained in the permit, is exempt from CEQA (Water Code Section 13389). Accordingly, no specific CEQA documentation has been prepared for this action. Nonetheless, Regional Board staff prepared preliminary cost-benefit analyses contained in the supporting material and these have been made part of the Administrative Record (A.R. Vol. 09)

VI. CONCLUSION

The SUSMP requirements approved by the California Regional Water Quality Board are necessary and authorized by state and federal statute. The Regional Board has the authority to require conditions to control storm water pollution from new development and redevelopment. The Regional Board action does not constitute a "regulation" requiring its filing before the Office of Administrative law. The Regional Board is accorded considerable deference to its determination that the SUSMP requirements will "reduce pollutants in storm water to the maximum extent practicable". The evidence supports the findings. All the terms of the SUSMP requirements are authorized under the Clean Water Act and State statutes. The Regional Board action does not impose unfunded mandates.

A review of the substance of the allegations in this Petition, rather than the hyperbole, as to the actual requirements of state and federal law reveals that the Regional Board acted based on the evidence presented before it and the rule of law.

Therefore, the Regional Board and the Regional Board Executive Officer respectfully ask the State Board to find Petitioners claim invalid, reject the request for a stay of the requirements, and deny the Petition

R0072573

June 6/7 2000

Legal Issues

Jorge Leon, Senior Staff Counsel

The Administrative Review Process of Order 96-054

- The Regional Board created the Administrative Review Process.
- The Administrative Review Process sets forth a procedure "for review and acceptance of reports and documents submitted to the Regional Board" and a method "to resolve any differences in compliance expectations between the Regional Board and Permittees, prior to initiating enforcement action."

The Administrative Review Process of Order 96-054

- The Administrative Review Process does not deprive the Regional Board of authority to adopt the SUSMP for these reasons:

  1. The Administrative Review Process was rendered obsolete and suspended by:

     - The July, 1999 deadline for implementation passed;
     - In April, 1999 and again in September, 1999, the Regional Board directed the Executive Officer to bring a SUSMP proposal for its consideration;

The Administrative Review Process of Order 96-054

2. Development v. Compliance: The Administrative Review Process applies to Compliance and Enforcement, not development of the SUSMP

3. If the Administrative Review Process were deemed to apply, there has been substantial compliance with the process

   - Submittal of proposal and public review
   - Executive Officer Response
   - Meet and Confer
   - Executive Officer Acceptance or Rejection

4. Finally, acceptance of Petitioner's position would lead to an unintended, unending process.

The Regional Board exercised proper authority under both federal and state law

- Regional Board may "require controls to reduce the discharge of pollutants ..and such other provisions ..determines appropriate." [33 U.S.C. 342(p)(B)(iii)]
- EPA's Interim Permitting Policy authorizes "more specific conditions or limitations to be incorporated into storm water permits as necessary and appropriate" [61 Fed. Register 43761]
- Administering agency accorded high degree of deference in areas of law they regulate.

  [Chevron v. NRDC (1984) 467 U.S. 837]

Changes to the SUSMP at the January 26, 2000 Public Hearing

- The changes made by the Board to the proposal presented by staff were based on parties' comments, staff recommendations and Board Member concerns.

- The changes were a "logical outgrowth" of previous SUSMP versions and staff discussions with the parties. The Petitioners' rights to due process and adequate notice were protected.

Changes to the SUSMP at the January 26, 2000 Public Hearing

- The Changes:
  - Applicability of the SUSMP:
    - The SUSMP requirements apply to all projects in the nine enumerated categories for the LA County MS4 Program. While some development planning/construction requirements in the permit are made applicable only to "discretionary projects", this limitation does not cover the seven "enumerated project categories" in Order No. 96-054, and the two additionally designated "enumerated project categories" by the Executive Officer and affirmed by the Regional Board.

Changes to the SUSMP at the January 26, 2000 Public Hearing

- The Changes:
  - Applicability to Categories for the City of Long Beach:
    - A statement was added to clarify that the SUSMP requirements adopted by the Regional Board apply to the City of Long Beach for (I) 10-99 home subdivisions; (ii) 100 or more home subdivisions; (iii) 100,000 or more square foot commercial developments; and (iv) projects located adjacent to or discharging to environmentally sensitive areas. For the remaining five categories, equivalent requirements have been included directly in or are expected to be developed shortly under the City of Long Beach Storm Water Management Program

Changes to the SUSMP at the January 26, 2000 Public Hearing

- The Changes:
  - Effective Date of SUSMP Requirements: A statement was included to provide Permittees 6 months from the date of Executive Officer approval of the SUSMP to amend ordinances and codes to be consistent with the adopted SUSMP requirements, and thence 30 days thereafter for the requirements to take effect.
  - Definition of Commercial Development: The Definition of "Commercial Development" was revised to include all developments that are not considered "residential" or "heavy industrial" based on the categorization of the federal storm water regulations.

Changes to the SUSMP at the January 26, 2000 Public Hearing

- The Changes:
  - Definition of Environmentally Sensitive Areas:

    A new "Table 3" was added to the SUSMP to list areas presently covered under the definition of "environmentally sensitive areas" based on readily ascertainable designations by the State Board, the California Resources Agency, and the County of Los Angeles.
  - Roofing Surface Area Exclusion from Mitigation Standard:

    The roofing surface credit for calculation of storm water runoff volume for mitigation was eliminated.

Changes to the SUSMP at the January 26, 2000 Public Hearing

- The Changes:
  - Limited Exclusion for Small Restaurants from Mitigation Standard:

    The language was revised to exempt restaurants of less than 5,000 square feet from the requirement to mitigate storm water.
  - Waiver Provision:

    The language was revised to recognize proximity to an unconfined water table as one basis for granting of a waiver.

    A sentence was added to require that all other BMPs be considered and rejected before a waiver from the numerical mitigation standard is granted.

    A statement was added to require that non-enumerated bases for waiver be brought to the Regional Board for consideration.

Changes to the SUSMP at the January 26, 2000 Public Hearing

- The Changes:
  - Effective Date of SUSMP Requirements:

    A statement was included to provide Permittees 6 months from the date of Executive Officer approval of the SUSMP to amend ordinances and codes to be consistent with the adopted SUSMP requirements, and thence 30 days thereafter for the requirements to take effect.
  - Definition of Commercial Development:

    The Definition of "Commercial Development" was revised to include all developments that are not considered "residential" or "heavy industrial" based on the categorization of the federal storm water regulations.

The SUSMP is not a Regulation

- The Administrative Procedure Act (Government Code Section 11340, et seq.) requires compliance with certain procedural steps which culminate in consideration for approval of an agency action by the Office of Administrative Law.
- The issuance of permits by the Regional Boards is specifically exempted from that process by Government Code Section 11352(b).
- The SUSMP is a part of Permit Order No. 96-054, and therefore exempt from APA.

The SUSMP is not an Unfunded Mandate

- "Unfunded Mandate" provisions of the State Constitution provision does not cover permits issued imposing federal requirements
- The SUSMP, like the Permit, imposes federal requirements
- Government Code Section 17556 (c) Exemption

The Regional Board has ample authority to adopt the SUSMP

- The Regional Board was authorized to adopt the numerical design standard.

The Regional Board adopted the SUSMP in conformance with applicable administrative procedures

- The adoption process included legally adequate notice and opportunity for comment.
- Board heard testimony from some 25 speakers on September 16, 1999
- The Board heard testimony for an entire hearing day on January 26, 2000
- Changes made on January 26 were "logical outgrowth" of the noticed SUSMP Proposal.

Adoption of the SUSMP is the not the subject of CEQA compliance

- The SUSMP is a requirement of Permit No. 96-054. It is part of the permit.
- Since permit issuance is exempt from CEQA (Water Code Section 13389) so is the SUSMP.
- Timing: Regional Board could have adopted the Permit and SUSMP in the same proceeding at the same time, obviating the CEQA argument.

The SUSMP adoption process was not unscientific or arbitrary

- Technically defensible
- Based on local data and nationally accepted methods
- Criteria in use by other states and communities range from 0.5 to 2 inches
  (FL, WA, MD, VA, CO)
- Similar criteria in use by Santa Monica, Calabasas, Ventura County, and unincorporated LA County
- A lengthy administrative record that supports the action
- The Board and staff had the benefit of many studies and reports and several workshops and Board hearings

R0072582

The SUSMP does not run afoul of CWC Section 13360

- CWC Section 13360 provides that "No waste discharge requirement or other order…shall specify the design location, type of construction, or particular manner in which compliance may be had with that requirement, order"
- The SUSMP does not so specify
- Order No. 99-03 provides many BMPs from which Petitioners can choose to comply
- Up to Petitioners to select compliance method

CONCLUSION: The Regional Board's action to approve the SUSMP was appropriate

- Petitioners' procedural arguments do no more than elevate form over substance and should be rejected.
- Petitioners' substantive arguments lack legal support and should be rejected
- The Regional Board acted with full authority under the California Water Code and the Clean Water Act to craft a SUSMP that protects water quality.
- The Regional Board's adoption was made necessary by the Petitioner's failure to act.

June 6/7 2000

SCRIPT FOR HEARING

THANK YOU DENNIS

DISTINGUISHED MEMBERS OF THE STATE BOARD. I WILL BE PRESENTING (I) THE TECHNICAL AND SCIENTIFIC RATIONALE FOR THE NUMERICAL DESIGN CRITERIA; (III) COMPARE THE CRITERIA FOR LOS ANGELES WITH THOSE OF SISTER JURISDICTIONS; (II) EXPLAIN HOW IT MIGHT BE APPLIED TO A PARTICULAR PROJECT; (IV) DISCUSS COST ANALYSIS CONDUCTED BY STAFF; (V) DESCRIBE POTENTIAL COST SAVINGS FROM INNOVATIVE PROJECT DESIGNS; AND (VI) SUM UP WITH THE EXPERIENCE OF OTHER STATES IN IMPELMENTING DESIGN CRITERIA FOR NEW DEVELOPMENT AND REDEVELOPMENT PROJECTS.

THE SELECTION OF THE WATER QUALITY DESIGN STORM FOR THE LA REGION IS BASED ON THE APPROACH RECOMMENDED BY THE ASCE AND WEF IN THEIR MANUAL OF PRACTICE. THE METHOD IS A MODIFICATION OF THE RATIONALE METHOD IN HYDROLOGY AND UTILIZES THE IDEA THAT THERE IS A CERTAIN VOLUME OF WATER THAT CAN BE CAPTURED OR TREATED BASED ON THE NATURE OF PRECIPITATION. SMALL RAINFALL EVENTS ARE COMMON WHILE EXTREME FLOOD EVENTS ARE RARE. YOU HAVE ON SCREEN THE EMPERICAL EQUATION THAT RELATES THE EFFICIENT TREATMENT VOLUME TO A DESIRED PERCENT TREATMENT COEEFICIENT MULTIPLIED BY THE RUNOFF COOEFICIENT MULTIPLIED BY THE MEAN PRECIPITATION VOLUME. THIS TRANSLATES TO IN COASTAL CALIFORNIA TO A RUNOFF INCH OF 0.12 – 0.86. IN HIGHLY PAVED AREAS LIKE LA, THE VALUE IS AT THE HIGHER END. FOR LESS URBANIZED AREAS THE VALUE WILL BE LOWER.

THE REGIONAL BOARD ADOPTED 4 EQUIVALENT NUMEREICAL DESIGN STANDARDS (OR MITIGATION CRITERIA) FOR NEW DEVELOPMENT AND REDEVELOPMETN PROJECTS, THE WEF/ASCE METHOD IS THE PRIMARY METHOD AND DIRECTLY DETERMINES THE EFFICIENT INCH OF RUNOFF THAT CAN BE TREATED FOR WATER QUALITY PURPOSES. THE SECOND METHOD IS SIMILAR AND IS DESCRIBED IN THE CA BMP HANDBOOK. IT USES THE ANNUAL RUNOFF VOLUME CAPTURE METHOD TO CALCULATE THE VOLUME OF RUNOFF THAT IS TO BE TREATED. THE THIRD AND FOURTH METHODS ARE ESSENTIALLY THE SAME. THE 0.75-INCH RAINFALL CRITERION IS A MORE SPECIFIC STATEMENT OF THE 85^{TH} PERCENTILE RAINFALL VALUE AND USES THE PRINCIPLE OF DIMINSHING RETURNS.

AS I INDICATED BEFORE, SMALLER RAINFALL EVENTS ARE MORE COMMON THAN FLOOD CAUSING EXTREME RAINFALL EVENTS. THE GRAPH BEFORE YOU - ON THE VERTICAL AXIS IS CUMULATIVE RAINFALL

VOLUME IN INCHES. ON THE HORIZONTAL AXIS IS RAINFALL IN INCHES PER 24 HOUR. THE LARGEST VOLUMES OF WATER ARE PRODUCED BY RAINFALL EVENTS THAT ARE LESS THAN I INCH. . THIS DATA COMES FROM THE 50-YEAR RAINFALL RECORDS FOR THE LAX AREA.

THIS GRAPH SHOWS THE 0.75-INCH DERIVATION OF THE NUMERICAL DESIGN STANDARD FOR LOS ANGELES. ON THE VERTICAL AXIS YOU HAVE CUMULATIVE PROBABILITY OF RAINFALL EVENT. ON THE HORIZONTAL AXIS ARE THE 24-HOUR RAINFALL IN INCHES. ANY PARTICULAR POINT ON THE CURVE WOULD INDICATE THE PROBABILITY OF RAINFALL EQUAL TO A LESS THAN THE AMOUNT AT THE POINT OF INTERSECTION. THUS, THE PROBABILITY OF OCCURANCE OF A RAINFALL EVENT EQUAL TO OR LESS THAN 0.75 INCH IS ABOUT 85 PERCENT. THE 85 PERCENTILE IS THE MID POINT OF THE KNEE OF THE CURVE. THE TOP OF THE KNEE IS INDICATIVE OF THE POINT OF DIMINISHING RETURNS. THE DATA WAS OBTAINED FROM HUNDRED YEAR RECORDS FOR THE DOWNTOWN CIVIC CENTER STATION, WHICH IS THE REPRESENTATIVE STATION SELECTED BY LA COUNTY DEPARTMENT OF PUBLIC WORKS.

THE NEXT GRAPH IS SIMILAR TO THE PREVIOUS. IT IS PRESENTED TO ILLUSTRATE THE POINT THAT THE 85^{TH} PERCENTILE VALUE WOULD BE HIGHER FOR COASTAL AREAS IN LA. IN THIS CASE 1.2 INCHES FOR WEST LA. THE VALUE CHOSEN FOR THE REGION IS THUS THE AVERAGE. CITIES IN A WATERSHED CAN ELECT A DIFFERENT VALUE SO LONG AS THEY USE ANY ONE OF THE METHODS. "IT IS NOT ONE SIZE FITS ALL."

MY NEXT SLIDE COMPARES THE WQ DESIGN STANDARDS AND OTHER CRITERIA FOR NEW DEVELOPMENT AND REDEVELOPMENT THRESHOLDS FOR LA WITH THOSE OF THE STATES OF WASHINGTON, FLORIDA, AND MARYLAND. THESE STATES HAVE SOME YEARS OF EXPERIENCE BEHIND THEM. IN GENERAL THE WQ DESIGN CRITERIA AND OTHER THRESHOLDS FOR THE LA REGION ARE LOWER – OUR RAINFALL CRITERIA IS 0.75 WHEN COMPARED WITH 1.3 INCHES FOR WA. OUR PERCENTILE RAINFALL CRITERIA IS 85^{TH} PERCENTILE RATHER THAN THE 90^{TH} FOR THESE STATES. THE REDEVELOPMENT THRESHOLD FOR LA IS 5000 SQ. FT. AS WHEN COMAPRED TO FLORIDA'S 4000 SQ. FT. WE HAVE NOT ADOPTED PERFORMANCE STANDARDS, AND OUR REQUIREMENTS APPLY TO NINE ENUMERATED CATEGORIES RATHER THAN ALL DEVELOPMENT CATEGORIES THAT MEET THE MINIMUM THRESHOLD.

HOW WOULD APPLICATION OF THE CRITERIA PROCEED IN THE REAL WORLD. WE EXPECT THAT DEVELOPER WILL PREPARE A PLAN. THE PLAN WOULD CONTAIN SOURCE CONTROL BMPs AND STRUCTURAL BMPs SUCH AS A SHED. THE PLAN WOULD ALSO IDENTIFY A SET OF TREATMENT CONTROL BMPs SIZED TO MITIGATE RUNOFF FROM 0.75 INCH OF RAINFALL FROM THE DEVELOPMENT. MITIGATION MEANS INFILTRATION,

TREATMENT OR CAPTURE. THE SELECTION OF BMPs IS LEFT TO THE DEVELOPER OR THE MUNICIPALITY MAY PRESCRIBE.

THE NEXT SLIDE LISTS BMPs THAT ONE MIGHT CHOOSE TO SATISFY THE SUSMP REQUIREMENTS FOR TREATMENT CONTROL BMPs – A SWALE ALONG THE PARKWAY, DETENTION BASIN INTEGRATED INTO THE DEVELOPMENT AS A LAKE; CATCH-BASIN BASKETS FOR TRASH...AND SO ON.

THE IMPLEMENTATION OF A FEDERAL REGULATION BY THE REGIONAL BOARD DOES NOT REQUIRE THAT A SEPARATE COST ANALYSIS BE CONDUCTED. NEVERTHELESS STAFF WORKED WITH THE CITY OF LA TO DETERMINE COSTS ASSOCIATED WITH THE RULE FOR A PROJECT IN THE PIPELINE – A FIVE ACRE $ 6.5 MILLION COMMERCIAL DEVELOPMENT IN DOWNTOWN LA. REFERENCES FOR TASK COSTS ARE CALCULATIONS ARE INCLUDED WITH THE ADMINISTRATIVE RECORD AND WITH OUR EVIDENCE AND EXHIBIT SUPPLEMENT. THE MITIGATION COST TO SIZE A DETENTION BASIN BASED ON THE NUMERICAL STANDARD WORKS OUT TO LESS THAN 1 PERCENT OF THE PROJECT COST.

IN THE SECOND EXAMPLE WE EVALUATED COSTS FOR NON CAPTURE BMPs SUCH AS AN INFILTRATION TRENCH AND VEGETATED SWALES. AGAIN COSTS INCLUDING DESIGN, CONSTRUCTION, MAINTENANCE AMOUNTED TO LESS THAN 1 PERCENT OF THE PROJECT COST. IT IS GENERALLY ACCEPTED THAT ABOUT 5 PERCENT OF THE PROJECT COST IS REASONABLE FOR WQ MITIGATION.

DESIGN CRITERIA FOR STORM WATER IS NOT NEW. THE NEXT GRAPH COMPARES THE RELATIVE COST ON THE BASIS OF THE RAINFALL INCH TO BE CAPTURED OR TREATED. FROM RIGHT TO LEFT – FLOOD CONTROL CRITERIA [100 YEAR]; CAFO'S [25 YEAR]; SEDIMENT CAPTURE DURING CONSTRUCTION [10 YEAR]; WQ DESIGN CRITERIA FOR COASTAL WASHINGTON STATE [6 MONTH]; AND THE 0.75 INCH FOR LA. LOOKING AT THE GRAPH, THE RELATIVE COST FOR A DETENTION BASIN FOR WQ IN COASTAL WA IS ALMOST 70 PERCENT MORE THAN LA. A FLOOD CONTROL BASIN IN LA WOULD HAVE REQUIRED EXPENDITURES 8 X AS MUCH. IN SHORT THE COST OF COMPLYING WITH WQ DESIGN STANDARD IS REASONABLE.

WEF DESIGN STANDARD

The Design Storm

$$P_o = a.C.P_A$$

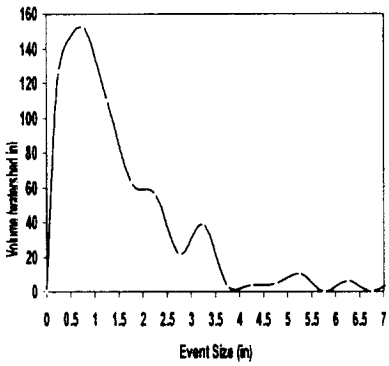
P_o - Maximized water quality "treatment" volume

a - "Treatment" volume coefficient

C - Area runoff coefficient

P_A - Mean storm precipitation volume

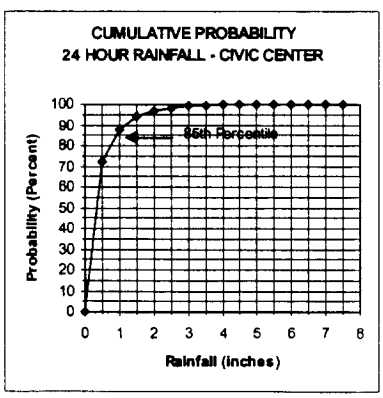
Ref: Urban Runoff Quality Management, WEF Manual of Practice No. 23 and ASCE Manual and Report on Engineering Practice No. 87 (1998)



Range in coastal CA for 85% annual runoff "treatment" 0.12 - 0.86 inch

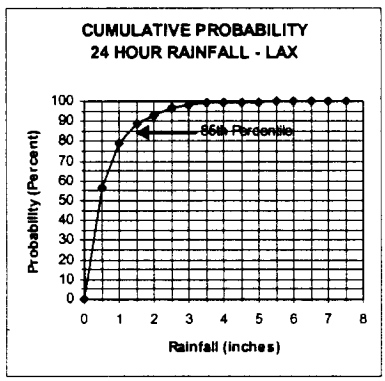
NUMERICAL STORM WATER MITIGATION STANDARD

Four different and equivalent volumetric methods to determine BMP sizing criteria



- Maximized volume capture (ASCE Method)
- Percent volume treatment (CA Handbook)
- All events up to 0.75 inch 24-hr precipitation
- Historical record 85th percentile rainfall event

SCIENTIFIC CONCEPT



- Largest volumes of runoff are produced by smaller storms
- Criteria promotes BMP application to smaller more frequent storms

TECHNICAL ANALYSIS

- 85th Percentile 24 hour rainfall event (0.75 inch)
- Representative rainfall station for Los Angeles County
- 100 + Years Records

TECHNICAL ANALYSIS

- 85th Percentile 24 hour rainfall event (1.2 inch)
- Rainfall station representative for Coastal Los Angeles County
- 50 + Years Records

COMPARISON WITH CRITERIA IN OTHER STATES

	MARYLAND	FLORIDA	WASHINGTON	Los Angeles
Design Criteria (Rainfall)	1 inch	1 inch	1.3 inch	0.75 inch
Design Criteria (Percentile)	90th	>90th	>90th	85th
Development Threshold Criteria	5000 sq. ft.	4000 sq ft	5000 sq. ft.	5000 sq. ft
Performance Standard	80% TSS and 40 % P Removal (Proposed)	80% TSS Removal	% TSS Removal (Proposed)	None
Development Categories	All	All	All	Nine
Year Implemented	1982	1979	1992	2000

R0072589

CRITERIA APPLICATION

Example - 100+ Home Sub-division

- Select source control and structural BMPs from guidance in SUSMP
- Select a set of treatment control BMPs from guidance to affect pollutants in total runoff from the first 0.75 inch of rainfall.

(Note: No Specific BMP or BMP Efficiency is prescribed)

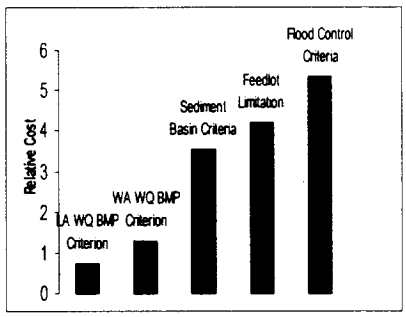
- Size BMPs for respective drainage area
- Submit Plan to municipality for approval.

CRITERIA APPLICATION

- Hypothetical Treatment Control BMPs to select from:
  - Swale (along parkway)
  - Infiltration basin (at end of swale)
  - Biofilters (around parking lot)
  - Greenbelt (between rear yards)
  - Detention basin (as a lake)
  - Catch-basin baskets (for trash)

(Note: BMPs are from menu already approved by Board April 1999)

BMP COST



- Five Acre Commercial Development
  - Project Cost is $6.5 million
  - Detention Basin BMP (Example 1)
    - Excavation and Haul away = $12,870
    - Land Cost = $28,800
    - Maintenance (1 / year cleanout) = $33
    - Total Cost = About $42,000
  - Mitigation Percent Cost = 0.6 %

BMP COST

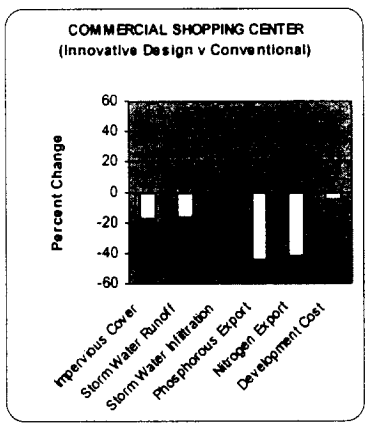
- Infiltration Trench and Vegetated Swale BMPs (Example 2)
  - Trench with Gravel = $13,500
  - Land Cost = Minimal
  - Maintenance (5 yr replacement) = $1350 per yr
  - Swale = $4050
  - Land Cost / Maintenance = Within Landscaping
  - Combined Cost = About $19,000

  Mitigation Percent Cost = 0.3 %

RELATIVE COST COMPARISON

- Relative cost much less than similar storm water criteria.
- Comparable criteria for wet regions, e.g., Pacific Northwest is higher.

COST BENEFIT EFFECTIVENESS OF DESIGN CRITERIA



Open Space Design

- increased natural area conservation
- reduced surface runoff by 25 percent
- reduced pollutant export by 40 to 50 percent
- development cost reduced by 12 percent

Source: Watershed Protection Techniques Vol.. 3, "Better Site Design" (2000)

COST BENEFIT EFFECTIVENESS OF DESIGN CRITERIA

Innovative Design

- reduced impervious cover
- reduced surface runoff by 17 percent
- reduced pollutant export by 40 to 45 percent
- development cost slightly lower than conventional design

Source: Watershed Protection Techniques Vol.. 3, "Better Site Design" (2000)

THE EXPERIENCE OF OTHER STATES

Do the design standards impose undue burden and unsupportable costs?

"Complying with the Florida rule...does not impose undue burdens"
- E. Livingston, FL Department of Environmental Protection.

"In the beginning...(circa 1982) the design standards were very burdensome ... [startup costs]. Currently....routine"
- B. Clevenger, MD Department of the Environment

"Substantial costs to implementing storm water controls...but .. [costs] are incremental to existing development and permit review costs"
- E. O'Brien, WA Department of Ecology

THE EXPERIENCE OF OTHER STATES

Have there been noticeable improvements to water quality?

"[Undoubtedly] implementation...has greatly reduced the effects of growth....[M]ajor reason why the state has so few ...impaired water[s].
- E. Livingston, FL Department of Environmental Protection.

"Modest water quality improvement [limited compliance because of poor interpretation]. Expected to change dramatically with our new Manual"
- B. Clevenger, MD Department of the Environment

"[H]ave not been monitoring specifically. ...[some] anecdotal evidence"
- E. O'Brien, WA Department of Ecology

CONCLUSION	10

INTRODUCTION

The State Board conducted a two-day hearing in the matter on June 7 and June 8. The State Board, in a letter dated June 12, requested the parties to the Petition to submit a Post-hearing Brief addressing four questions by July 7. The Los Angeles Regional Board's response follows.

RESPONSE TO QUESTIONS

I. If There Is To Be A Numeric Design Standard For Infiltration Or Treatment, Is The 0.75-Inch Standard Appropriate? Should It Be Substituted With A Different Numeric Standard, Including Potentially Different Numbers for Different Areas? If There Were A Range Of Numbers How Would They Be Implemented?

A. Numerical Design Criteria and Storm Water Quality

A numeric design standard is the most elementary criterion necessary to ensure that post construction BMPs for new development and significant redevelopment are sized to reduce pollutants in storm water runoff to the statutory standard of MEP. The next step would be to relate treatment or infiltration volume to pollutant removal capabilities based on a technology or performance standard. As presented in the Regional Board's oral testimony on June 8, other jurisdictions have already taken this step by establishing performance standards for total suspended solids, zinc, nitrogen and phosphorous[1]. The third step would be to relate the BMP performance standard to receiving water objectives and beneficial uses. For example, the Province of Ontario, Canada, specifies total suspended solids removal standards based on fish habitat protection guidelines.[2] The Los Angeles Regional Board's action is at best a first step.

B. The 0.75 Inch And the Other Three Numeric Design Criteria are Appropriate

From a regulator's view point, the ideal numerical criteria to ensure that the MEP standard is met for storm water discharges should have the following characteristics. The criteria

[1] See Slide No. 6 of Dr. Swamikannu's presentation and the Transcript of the June 7 Hearing. Refer also to Statements of Policy provided by Maryland, Washington and Florida contained in the record for the Hearing.

[2] See, *Best Practice Environmental Guidelines for Urban Stormwater*, Cooperative Research Center for Catchment Hydrology. Melbourne, Australia (1997). The document includes a comprehensive review of criteria for storm water treatment including methods in North America.

R0072598

must be, (i) simple to use, (ii) practical and cost effective, (iii) prescriptive, (iv) flexible, and (v) scientific and technically defensible. [3] The criteria must also encourage innovation.

The Regional Board's four methods to determine the appropriate water quality design criteria for post-construction BMPs, including the 0.75-inch rainfall treatment criterion, are simple to use. They are cost-effective because the volume of rainfall or runoff to be treated is based on the water quality efficient (maximized) volume or precipitation event. The methods are also prescriptive and thus easy to follow in contrast to the Petitioners empty alternative.[4] Three of the four design criteria provide the opportunity for site flexibility. All four design criteria produce values for storm water treatment that are similar (not surprising because the Los Angeles area is highly paved).[5] Finally, the Regional Board has soundly documented and justified the technical and scientific basis for the numerical water quality design criteria in the record and in oral testimony before the State Board.[6] In addition, the choice of design standards presented will promote BMP design innovation.

C. The Numeric Design Criteria – Different Numbers For Different Areas

The numerical criteria provided by the Regional Board already provides Petitioners the opportunity to account for differences in site conditions such as rainfall patterns and percent surface area imperviousness. In fact, the ASCE Method (maximized volume treatment) and the California Handbook Method (annual percent volume treatment) both calculate the runoff volume (a direct measure) to be treated to remove pollutants rather than rainfall volume (an indirect measure). Thus, if an MS4 Permittee wants to use an area sensitive method, all the permittee needs to do is select either one of these methods and obtain a site-specific or area specific value (greater than or less than the 0.75-inch design standard). The claim made by Petitioners that the design criterion is "one size fits all" is ingenuous, because only the 0.75-inch standard is numerically prescriptive. The rationale to listing the 0.75-inch standard is to provide the simplest choice of criterion that is also readily understandable. A single determinate value promotes countywide certainty and consistency for the development community. However, the 0.75-inch standard is not the sole BMP design criterion provided by the Regional Board. Three other

[3] Some of these factors must be balanced against each other. For e.g., the simpler an approach the less rigorously scientific it is.
[4] Permittees did propose a 0.6-inch design criteria in an early draft. However, admittedly that the number was selected arbitrarily.
[5] See Regional Board's calculations for the required retention basin volume using the four methods. The values are within ten percent of one another. AR 9(18)
[6] See the Record of Decision and Staff Report at 2 [AR 2(2)] and Dr. Swamikannu's June 8 testimony Slides 1 – 5 for the scientific basis; AR 14(3) for the mathematical calculations; and our May 5 Response in Opposition to Petition at 31 for a legal analysis.

R0072599

derivative design criteria based on long-term precipitation records or rainfall runoff patterns are also provided.

D. Numerical Design Criteria Implemented As a Range of Numbers

As discussed earlier, three of the four methods for determining the water quality design criteria already allow for the option of area specific numerical values that are different from the 0.75 inch standard. In theory, the Los Angeles County MS4 program could have at least 86 different design standard values based on the number of municipal jurisdictions. The Los Angeles County MS4 permit allows for such differences, regardless of the merits of having so many numbers, which might be a compliance nightmare for the development community.[7] A SUSMP that differs from the Regional Board approved SUSMP only by a numerical value that is different than the 0.75 inch, but derived using one of the other three accepted design criteria methods, would be ruled not only as being substantially similar but also of being functionally identical. If an MS4 Permittee uses this option, the Regional Board will review the calculations and accept the functionally identical design numerical value for inclusion in guidelines and in technical manuals.

II. What Types Of Redevelopment Or Remodeling Projects Should Be Included Within The Mitigation Requirements?

A. Significance of Redevelopment and Remodeling

Petitioners have argued that the current definition of "redevelopment" is confusing and may be too broad and burdensome if literally applied.[8] They claim that a single-family homeowner making interior remodeling changes or replacing a roof would be required to install treatment control BMPs. The Regional Board did not intend for the rule to apply to internal remodeling projects or limited external work such as roof replacements. The current definition of "redevelopment" in the SUSMP, is largely a result of the Regional Board's efforts to incorporate clarifying text proposed by Permittees.[9]

In order to determine which categories of redevelopment or remodeling projects should be subject to the SUSMP requirements, the Regional Board reviewed the rule implementation in other leading jurisdictions. Washington, Maryland and Florida apply the requirement to control

[7] Board Order No. 96-054 at 34. "develop a program on planning control measures consistent with [SUSMP]....[S]hall initiate implementation....following approval of the model [SUSMP]"

[8] The source of the definition is the "State of Washington, Vol. 1 – Minimum Technical Requirements", May 31 Evidence and Exhibit Supplement at 20.

[9] See comment letters from the Executive Advisory Committee [AR 6(10)] Los Angeles County [AR 2(16)]. Permittees recommended that the definition include the phrase "the addition, to an already developed site, of 50 percent or more impervious area or improvements to 50 percent or more of the existing improvements on site".

R0072600

storm water pollution from redevelopment projects to all categories of urban development based on a minimum threshold of impervious area addition, not just specific types of development.[10] After all, when the pollutants created by urbanization have the potential to adversely impact receiving waters, restricting the application of the rule to too few project categories might defeat the important objective of reversing the adverse impacts of past urban development practices. The application of SUSMP requirements to redevelopment projects offers the singular opportunity to regulators, not only to hold the line on water pollution from storm water discharges, but also to cost effectively reverse the adverse impacts on water quality of past urbanization.

B. Definition of Redevelopment

The Regional Board proposes the following definition of "redevelopment"' to clear up any ambiguity of the kind suggested by Petitioners. "Redevelopment" means:

"On an already developed site, the creation or addition of 5,000 square feet or more of impervious surfaces. If the creation or addition of impervious surfaces is fifty percent or more than the existing impervious surface area, then storm water runoff from the entire area (existing and additions) must be considered for purposes of storm water mitigation. If the creation or addition is less than fifty percent of the existing impervious area, then storm water runoff from only the addition area needs mitigation. Redevelopment includes, but is not limited to: the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/ or exterior construction or remodeling; replacement of impervious surface that is not part of a routine maintenance activity; and land disturbing activities related with structural or impervious surfaces".

C. Types of Redevelopment Projects to Be Included

The Los Angeles Regional Board's application of SUSMP requirements to redevelopment projects is limited in scope, unlike the other leading jurisdictions. It applies to only nine specific categories of redevelopment projects[11] and only as follows: for, (a) exterior surfaces or foundation, removal and replacement which results in the creation or addition of 5,000 square feet or more of impervious surfaces (except projects in environmentally sensitive areas where the creation or addition must exceed 1,250 square feet),[12] and (b) other impervious

[10] See statements of policy submitted by, E. Livingston, Florida Department of Environmental Protection (May 31, 2000) at p 2; E. O'Brien, Washington Department of Ecology (May 25, 2000) at p 4; and B. Clevanger, Maryland Department of the Environment (May 31, 2000) at 5, May 31 Evidence and Exhibit Supplement

[11] See Standard Urban Storm Water Mitigation Plan at 3. AR 14(1).

[12] See *Infra* at 25 for CEQA rule on redevelopment threshold

surfaces, the removal down to bare soil or base course and replacement, which results in the creation or addition of 5,000 square feet or more of impervious surfaces (except projects in environmentally sensitive areas where the creation or addition must exceed 1,250 square feet).

III. Should Location Such As Environmentally Sensitive Areas Be A Factor in Determining the Application of the SUSMP? If So, What Specific Types Of Projects Should Be Included?

A. The Significance of Location

The location of new development and redevelopment projects in "environmentally sensitive areas" may demand that special requirements be imposed. The purpose of such requirements is to ensure that unique characteristics of project siting be considered in mitigating potential adverse impacts. The USEPA, in discussing storm water controls, notes: "Sensitive area protection is an important element of conservation design...These areas are particularly susceptible to degradation by storm water runoff."[13] There are two main reasons why the application of requirements for new development and redevelopment should apply to projects situated in "environmentally sensitive areas."

First, the geographic location of a development project can impact an ecologically fragile area. A sensitive habitat has a much lower capacity to withstand pollutant shocks than might be acceptable in the general circumstance, and so deserves special attention. The California Public Resources Code (CPRC) § 30240 (b) conditions the siting of developments in areas adjacent to "environmentally sensitive areas" to prevent adverse impacts.[14] Similarly, the California Environmental Quality Act (CEQA)[15] excludes from its categorical rule exemption, those projects situated in "environmentally sensitive areas".[16] In essence, a project that is ordinarily insignificant in its impact on the environment may in a particularly sensitive environment be significant.[17]

Further, the State Board sees fit to designate by the location of discharge 'Areas of Special Biological Significance' (ASBS) to protect natural water conditions and prohibit waste discharges unless the State Board finds that there would be "no adverse impacts to beneficial

---

[13] See the USEPA Report "Preliminary Data Summary of Urban Storm Water Best Management Practices" EPA No. 821-R-99-012 (1999) at 5-40.

[14] Public Resources Code § 30240(b) states, "Development in areas adjacent to environmentally sensitive habitat areas shall be sited and designed to prevent impacts which would significantly degrade those areas...."

[15] CEQA is an environmental statute that requires public agencies to fully consider the potential environmental impact of projects prior to approval.

[16] See CPRC § 21000.

[17] 19 CCR 15300.2. This sub-section lists location in an environmentally sensitive area as an exception to categorical exemptions determined by the Secretary for Resources. Categorical exemptions are deemed to not have a significant effect on the environment.

R0072602

uses."[18] The State Board here accepts a shifting of the burden to itself to make the affirmative determination rather than allow permissive action by default because of discharge location.

Examples from other jurisdictions abound. The State of Washington implements a procedural variation of the ASBS, where it requires "a use authorization" for storm water discharges potentially impacting public aquatic lands.[19] Florida imposes more stringent conditions for storm water treatment on new development and redevelopment projects based on the discharge location.[20]

The Los Angeles Regional Board's application of SUSMP requirements to projects in "environmentally sensitive areas" is another basic first step. The rule merely applies requirements based on location rather than imposes more stringent criteria. The consideration by the Regional Board of location of projects for the SUSMP requirements to apply is not new, nor without precedent.

Second, an environmental agency such as the Regional Board has a co-stewardship responsibility, when implementing water quality regulations, to ensure that its actions are in harmony with overlapping environmental mandates for other state and federal resource conservation agencies.[21] The Regional Board, in part, elected to apply SUSMP requirements to projects in environmentally sensitive areas to complement implementation rather than jeopardize or harm the environmental mandates of other State or federal agencies.[22]

B. The Definition of Environmentally Sensitive Areas

The SUSMP cross-references the applicability of SUSMP requirements to "environmentally sensitive area" to designations by other public agencies with designation powers, such as the State Board and the California Resources Agency, not itself. CPRC § 30107.5 defines an "environmentally sensitive area" as: "an area in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which would be easily disturbed or degraded by human activities and developments." The SUSMP requirements apply to development and redevelopment projects, which are "located in, discharging directly to, or adjacent to an environmentally sensitive area."

---

[18] See California Ocean Plan and Regional Board Basin Plan at 5-1. AR 10(17)

[19] The State of Washington under the use authorization may require, "...application of more stringent requirements that [it] determines are necessary to meet statutory obligations to protect the quality of the state's aquatic lands" See *supra* at 8.

[20] The State of Florida raises the storm water treatment performance standard for new developments to 95% for direct discharges to Outstanding Florida Waters from 85% percent for other waters. Florida, Urban Stormwater Program, Policy Statement and AR. 11(1)

[21] Such agencies include, the California Coastal Commission, the California Department of Fish and Game, the U.S. Fish and Wildlife Service, and the U.S. National Oceanographic and Administrative Service to name a few.

[22] See Staff Report and Record of Decision at 11 (January 18, 2000) AR 2(2), for a fuller discussion.

R0072603

For the record, the Regional Board proposes to clarify two areas of this definition that may be subject to some ambiguity. These are, (i) the meaning of the phrase "directly adjacent", and (ii) the phrase "directly discharging to." "Directly adjacent" means situated within 200 feet of the contiguous zone required for the continued maintenance, function, and structural stability of the environmentally sensitive area.[23] "Directly discharging to" means outflow from a drainage conveyance system that is composed entirely or predominantly of flows from the subject property, development, subdivision or industrial facility, and not commingled with the flows from adjacent lands.

C. Specific Types of Project to be Included

The SUSMP does not explicitly identify which categories of projects in environmentally sensitive areas are subject to its requirements. The Regional Board's original intent was to provide municipalities with some discretion as to which categories to include or exclude. One may reasonably exempt a few select categories of development based on the rationale that the SUSMP requirements may impose undue burden or that the category of projects have insignificant impact.

Rather than list the types of categories that might be included under the SUSMP requirements, as implied in the question, the Regional Board would support either: (i) the exclusion of a few specific project categories, or (ii) the establishment of a lower threshold than the general rule. The project categories or the threshold may be selected based on the legal principle that statutes [regulations and permit conditions] which are *pari materia* should be read [and interpreted] together and harmonized where possible (*NRDC v. Arcata,* 59 Cal.App. 3d 959(1976)).[24]

We note that CEQA exempts from its requirements projects located in environmentally sensitive areas, if additions to existing structures are less than 2,500 square feet.[25] We propose the following as the determinative threshold for SUSMP requirements to apply in "environmentally sensitive areas" for new development and redevelopment projects irrespective of project category: "for projects in, directly adjacent to, or discharging directly to an environmentally sensitive area, the addition or creation of 2,500 square feet or more of

---

[23] For a discussion on minimum dimensions to protect aquatic resources, see, "The Architecture of Stream Buffers", T. Schuler, (1995), Watershed Protection Techniques Vol. 1(4).

[24] The *Arcata* Court ruled that timber harvesting activities regulated by the Forest Practice Act of 1972 were also subject to CEQA, where the Forest Practice Act was silent on the matter, because it involved "Discretionary" action by a public official.

[25] 19 CCR 15301. In part this section categorically exempts from CEQA requirements projects in environmentally sensitive areas if "the addition will not result in an increase in more than, (1) 50 percent of the floor area of the structures before the addition or 2,500 square feet whichever is less;" If the project is not in an environmentally sensitive area, the exemption threshold is 10,000 square feet. CEQA also categorically exempts single family residences, small apartments and duplexes, and small commercial structures developments in areas not designated environmentally sensitive.

R0072604

impervious area. For redevelopment projects, the addition of impervious area must be more than 1,250 square feet."

IV. Should the SUSMP Apply to Both Discretionary Projects and Ministerial Projects? How Should the Term Discretionary Be Defined?

A. Discretionary Projects vs. Ministerial Projects

In CEQA, a "Discretionary Project" is one which requires the exercise of judgement or deliberation when the public agency or body decides to approve or disapprove a particular activity, as distinguished from situations where the public agency or body merely has to determine whether there has been conformity with applicable statutes, ordinances, or regulations. A "Ministerial Project" is a one where a governmental decision involves little or no personal judgement by the public official as to the wisdom or manner of carrying out the project. The public official merely applies the law to the facts as presented but uses no special discretion or judgement in reaching a decision.[26]

B. Interpretation of the Term Discretionary

Petitioners have argued that the application of SUSMP requirements is limited to "Discretionary" projects because the 'enumerated categories"appear in Board Order No. 96-054 in a subsection qualified by the term "discretionary projects." However, the term "Discretionary" is not defined in the permit. A definition is included in the SUSMP but the term "Discretionary Projects" was deleted from the main body of text. The Regional Board elected to interpret application of the SUSMP requirements in the broadest possible manner.[27] New development storm water controls for projects in "enumerated categories" should not be limited by the condition of "Discretionary".

A review of an interpretation by the California Supreme Court of the term "Discretionary"clearly establishes that it must be read principally on policy considerations relevant to the governmental entity having jurisdiction rather than through a plain semantic inquiry. [*Lipman v. Brisbane Elementary Sch. Dist.*, 55 Cal.2d. 224 (1961); *Johnson v. California*, 69 Cal.2d. 782 (1968)][28] Further, where the nature of a development project involves both 'Ministerial" and "Discretionary" aspects, courts have held that the rule application should

[26] The environmental application of the term "Discretionary" derives from a California Supreme Court ruling in *Johnson v. State of California*, 69 Cal.2d. 782 (1968) where the court ruled that a basic policy decision is considered "Discretionary" and thus subject to immunity from civil action, but not ministerial actions which must face case-by-case adjudication. CEQA guidelines adopt the court interpretations of the two terms.

[27] Regional Board Response to Petition at 25 discusses the Board rationale in more detail.

[28] In these cases, the California Supreme Court rejected a pure mechanical analysis of the term "discretionary" and relied greatly on the policy considerations relevant to the purposes of the governmental action in ruling on the merits of the claim.

R0072605

be interpreted to "afford the fullest possible protection to the environment"[*People v. Dept. of Housing and Community Development*, 45 Cal.App.3d 185 (1975); *Day v. City of Glendale*, 51 Cal. App. 3d 817 (1975)][29]. The Regional Board is thus on firm ground when it adopted SUSMP requirements to apply to all development and redevelopment projects in 'enumerated categories" irrespective of whether they are considered 'Discretionary' or 'Ministerial' in a municipal jurisdiction.

C. The Relevance of the Term Discretionary

The definition of "Discretionary" as it is applied in development planning is derived from CEQA. However, whether a project is "Discretionary" or "Ministerial" under CEQA should have little bearing on the Regional Board's ability to subject it to storm water control requirements for new development and significant redevelopment. This is especially true where the origin of the definition in environmental regulation affords municipalities a procedure to limit public review of the potential environmental significance of the action.[30]

In essence, a strict application of the term under CEQA would allow one municipality to consider a SUSMP project category "Discretionary" while in another municipality it may be deemed "Ministerial" because of a municipality preferences and idiosyncrasies. A "Ministerial" project will escape SUSMP requirements if applicability is limited to projects considered "Discretionary." Also under CEQA, similar projects within a municipality may be subject to different treatment depending on designation as "Ministerial" or "Discretionary" on the basis of subtle differences in project characteristics or zoning considerations. [31] Clearly, the Regional Board did not intend for different standards to govern different municipalities or even different standards for similar projects within the same municipality. The determinative consideration for the application of SUSMP requirements should be whether a particular category of development has been determined to cause or contribute to significant pollution of storm water. These categories should be required to implement post-construction BMPs to mitigate storm water pollution.[32] The classification under CEQA should not be the determining factor.

---

[29] In these cases, the Appellate Courts ruled that environmental statutes and regulations should be interpreted to afford the maximum protection to the environment within the reasonable scope of statutory language.

[30] In *Day v. Glendale*, 51 Cal.App.3d. 877 (1975), the court ruled that projects not explicitly identified as "Ministerial" in CEQA cannot be considered exempt if they contained some elements that are "Discretionary". Quoting the court, "[to do so] would eviscerate CEQA, a result clearly not intended by the Legislature".

[31] For example in the City of Santa Monica, a restaurant development would be considered "Discretionary" under CEQA only if it served alcohol. A gas station development would be considered "Ministerial" if it is not adjacent to a residential zone [personal communication by Mr. P. Foley, Planning Department, City of Santa Monica, 06/26/2000]. The sale of alcohol at a restaurant or the proximity of a gas station to homes has little or no relevance to its impact on storm water quality.

[32] The Staff Report and Record of Decision at 11-12 discusses the rationale for these categories to be included. AR 3(7).

R0072606

D. Application to New Development and Redevelopment Projects

The Regional Board proposes that the definition of "Discretionary Projects" be deleted from the SUSMP section on 'Definitions' since the term no longer has any significance and does not appear in the main body of text.[33] However, if it is found necessary to define the term "Discretionary Project" because it appears in the Los Angeles County MS4 permit, then the Regional Board proposes the following definition:

"Discretionary Project" means a project, other than a project which is in a category enumerated by the Regional Board or State Board, and which requires the exercise of judgement or deliberation when the public agency or public body decides to approve or disapprove a particular activity, as distinguished from situations where the public agency or body merely has to determine whether there has been conformity with applicable statutes, ordinances, or regulations."

CONCLUSION

Numerical design criteria for treatment BMPs are indispensable, if the Regional Board is to ensure that storm water controls at new development and redevelopment are being implemented "to reduce pollutants to the maximum extent practicable." The choice of design criteria provided by the Regional Board offers municipalities the opportunity to set a design standard that may be different from the 0.75-inch standard, when area conditions substantially differ. The Regional Board supports, "the addition or creation of 5,000 square feet of impervious area or more" in eight of the nine SUSMP categories, as the threshold for SUSMP requirements to apply for redevelopment and remodeling projects, the exception being projects in environmentally sensitive areas. Location of projects should be an important factor in determining the applicability of SUSMP requirements. Consistent with thresholds under CEQA, the Regional Board recommends that the addition or creation of 2,500 square feet or more of impervious surfaces to be considered the minimum threshold for projects in environmentally sensitive areas to be subject to the SUSMP requirements. Finally, the SUSMP requirements should apply to all projects in "enumerated categories" not just projects considered "Discretionary" under CEQA. For these reasons, the State Board must uphold the actions of the Regional Board in adopting the SUSMP and the requirements therein.

REGIONAL BOARD COMMENT ON PROPOSED ORDER

I. INTRODUCTION

The State Water Resources Control Board (State Board) conducted a hearing on the above matter in Torrance, California, on June 7 and June 8, 2000. On July 12, the State Board invited the designated parties to respond to four questions in a Post-hearing Brief which was to be submitted no later than July 7. The Regional Board submitted its Post-hearing Brief on July 7. On August 28, the State Board issued a Proposed Order on the matter, and invited the designated parties to comment on or before September 28. The Regional Board's response follows.

II. COMMENT ON THE PROPOSED ORDER

The Regional Board supports the State Board's decision to uphold the authority of Regional Boards to establish numerical water quality design criteria for Best Management Practices (BMPs) "to reduce pollutants in municipal storm water discharges to the maximum extent practicable" (MEP) as required by federal law. This decision resolves what constitutes the fundamental challenge by Petitioners of the Board approved Standard Urban Storm Water Mitigation Plan (Final SUSMP).

The Regional Board respectfully disagrees with the State Board on the following issues that limit the applicability of the Final SUSMP, and requests that the State Board modify its final decision appropriately. Specifically, the Regional Board contends that, (i) Retail Gasoline Outlets (RGOs) should not be categorically exempt from BMP design standards; (ii) Projects in Environmentally Sensitive Areas (ESAs) should be subject to SUSMP requirements; (iii) SUSMP requirements should apply to enumerated projects irrespective of whether they are considered "Discretionary" or "Ministerial" as interpreted under the California Environmental Quality Act (CEQA); and (iv) Impracticability waiver beneficiaries should be required to transfer funds to regional mitigation projects, since regional funds and projects have already been established.

In addition the Regional Board recommends that the State Board, (i) amend its definition of "redevelopment", for purposes of clarity, as suggested by the Regional Board herein; and (ii) correct, to reflect the record, the statement that the Regional Board did not give interested persons and Permittees adequate time to review late revisions to the Final SUSMP or provide comment.

Regional Board Recommended Changes

A. Retail Gasoline Outlets Do Not Merit An Exemption

The State Board's conclusion to exempt RGOs from the numerical mitigation standard is not supported by the evidence in the Administrative Record (AR) and is contrary to State and federal law. Presumably, RGOs are being exempted because they are, (i) heavily regulated; (ii) limited in their ability to construct infiltration BMPs; (iii) generally small in size; and (iv) storm water treatment may not be feasible or safe.[1]

RGOs are a well identified source of urban storm water pollutants that impair receiving waters.[2] The State Board appears to accept the evidence in the record that RGOs are appropriately identified by the Regional Board as being subject to SUSMP requirements because they discharge significant quantities of pollutants of concern.[3] Also, Petitioner Western States Petroleum Association (WSPA) acknowledges that storm water discharges from even "normally operated and maintained" RGOs are at least as bad

[1] Respondents note that the issue of numerical design criteria application to RGOs was not among the four questions that designated parties were asked to address in the Post-hearing Brief.

[2] AR Vol. 10, Item 16 Ref #113 at p 30. This study funded by the USEPA and conducted by Sacramento County identified heavy metals such as lead, copper, and zinc in significant concentrations in storm water runoff from gas stations. Volatile Organic Compounds (VOCs) from fueling areas were rarely detected because of their volatility. Data on Polycyclic Aromatic Hydrocarbons (PAHs) was inconclusive because analytical detection limits used were higher than regulatory action levels. See also AR Vol. 10, Item 16 Ref # 29 generally for a national view.

[3] State Board Proposed Order at 18, admits that the evidence [in the record] "shows that each listed category can be a significant source of pollutants..."

as discharges from commercial parking lots and diffuse urban runoff.[4] The obvious reason that "normally operated and maintained" RGOs do not demonstrate any improvement in storm water discharge quality is because existing BMPs do not address pollutants generated by motor-vehicle traffic.[5] Heavy metals, significant concentrations of which occur in storm water discharges from RGOs, have been demonstrated to be the main cause of toxicity in Santa Monica Bay during wet weather.[6]

The State Board surmises that RGOs merit a categorical exemption because they are over-regulated, yet does not enumerate what these regulations are, and if any are protective of surface water quality.[7] Under State law, the State Board is the primary authority for implementation of the federal Clean Water Act (CWA), and for matters related to water quality within the State.[8] The Regional Board is unaware of any basis in federal or State statute that permits the State Board or Regional Boards to abdicate their water quality authority because discharges from facilities that impact water quality are already regulated for other purposes. Attainment and maintenance of receiving water objectives and the protection of beneficial uses should be the paramount considerations.

---

[4] AR Vol. 10, Item 16, Ref #173 at p 13. The WSPA sponsored study concludes that pollutant concentrations in storm water discharges from RGOs are similar to concentrations from commercial parking lots and diffuse urban runoff. The Proposed Order correctly does not exempt commercial parking lots, restaurants, and residential/ commercial development from the numerical mitigation criteria, yet RGOs are exempted. See also June 7 State Board Hearing Transcript at p 231; comment by WSPA witness, that "concentrations of metals, hydrocarbons, and solids were no higher than.... roads and parking lots".

[5] See June 8 State Board Hearing Transcript at p 136, Regional Board staff testimony that current BMPs at RGOs do not address pollution associated with vehicular traffic.

[6] See Evidence and Exhibit Supplement submitted by Respondent Regional Board on May 3, – "Study of the Impact of Storm Water Discharge on Santa Monica Bay – Executive Summary", Los Angeles County Department of Public Works (1999), which identifies Zn and Cu as principal pollutants that cause storm water toxicity.

[7] The Regional Board's review of regulations that affect RGOs identified, (i) business license for business operation, (ii) Fire Department for tank/ piping integrity and gasoline storage; (iii) County Public Works for underground storage of hazardous chemicals; (iv) Air Quality Management District for VOC emissions; (v) Sanitation District for any sanitary sewer discharges; (vi) County Weights and Measures for sale of gasoline; (vi) Department of Toxics Substance Control for waste motor oil disposal; (vii) County Health for food and beverage sale; and (viii) Regional Board for regulation of leaking tanks to protect groundwater.

[8] Cal. Wat. Code § 13160 states that, "the State Board is designated as the state water pollution control authority for all purposes.... in federal act." Cal. Pub. Res. Code § 30412 states that, "other State agencies shall not modify, adopt conditions, or take any action in conflict with any determination by the State Board in matters relating to water quality".

Second the State Board finds that RGOs are limited in their ability to construct infiltration BMPs, but does not discuss what the compelling limitations are. Infiltration is but one form of mitigation. The SUSMP clearly does not mandate infiltration BMPs. Other options exist such as the installation of fabricated treatment BMPs to remove storm water runoff pollutants using physical, biological, or chemical processes.[9] Petitioner WSPA in its challenge and oral arguments did not present any coherent or convincing basis to validate the claim of limited ability.

Third, the State Board concludes that the relative "small size" of RGOs provides a compelling basis to exempt RGOs from the requirement to treat storm water. It should be noted that presently restaurants are subject to the SUSMP numerical mitigation requirement, where the area of development or redevelopment is 5,000 square feet or more. Similarly, commercial parking lots 5,000 square feet or more are subject to the numerical mitigation criteria. In contrast, the typical modern gas station is between 15,000 and 30,000 square feet.[10] The rationale of size thus appears flawed. The State Board's Proposed Order upholds the application of the numerical mitigation criteria to a 5,000 square feet restaurant development and a 5,000 square feet parking lot but not to a 30,000 square feet RGO development, which may contribute higher concentrations and loadings of storm water pollutants

Further, while the size of RGOs may be a consideration to assess their significance as a source of pollutants, their prolific numbers should also be a factor to be taken into consideration. There are nearly 3,500 operating RGOs in Los Angeles County. [11]

---

[9] June 7/8 State Board Hearing Transcript at p 41 and p 134. Regional Board staff comment in response to questions and cross-examination on the feasibility of storm water treatment at RGOs. Other jurisdictions do not exempt RGOs from requiring storm water treatment. In fact "oil-water separators" fitted with a rain diversion valve were at one time commonly installed at RGOs because of local agency industrial waste regulations.

[10] See Footnote 2 *supra*. Gas stations in the study ranged in area from 18,358 to 30,423 square feet.

[11] The Regional Board database has a record of approximately 4,600 RGO sites with leaking underground tanks. There are an estimated 3,500 gas stations currently operational in Los Angeles County that are covered by the municipal site-visit/ inspection program under the permit.

Undoubtedly, RGOs in Los Angeles County are a significant source of storm water pollutants because of their sheer number even if each facility is relatively small in area. Moreover, the on-going redevelopment of gas station sites to retrofit underground storage tanks for groundwater protection provides Petitioner WSPA a unique opportunity to reconfigure facilities for surface water quality improvements as well.

Fourth, the State Board surmises that storm water treatment may not be feasible or safe at RGOs. The Regional Board is not aware of any basis in the record to substantiate such a determination. Fabricated treatment systems have been commonly used at RGOs to separate waste-oil before discharge to the sanitary sewer system. Safety or feasibility has not been an issue when sanitation districts required RGOs to install treatment systems in order to obtain connection permits to the sanitary sewer system. There is no evidence in the record to support Petitioner WSPA's argument that the requirement to treat storm water somehow introduces new and different safety and feasibility considerations, as when compared to wastewater treatment systems which RGOs have readily installed.

B. Environmentally Sensitive Areas Is An Appropriate SUSMP Category

The Regional Board disagrees with the State Board's Proposed Order to exclude ESAs from SUSMP requirements. Admittedly, the ESA category is "locational" rather than "developmental" and presents some difficulty in application. The State Board's Proposed Order states that ESAs were not discussed by interested persons during permit adoption and that ESAs are subject to extensive regulations under other regulatory programs, without enumerating what these are. Significantly, the Proposed Order also does not explain whether these unidentified regulations adequately protect impacts to surface water quality.

Contrary to the statement in the Proposed Order, ESAs were indeed discussed during the Los Angeles County MS4 permit adoption process. For example, the permit includes

requirements for new development and redevelopment that apply to ESAs.[12] Also, the Regional Board lists ESAs as a specific SUSMP category in the City of Long Beach MS4 permit adopted on June 15, 1999.[13] Similarly, ESAs are included as a category for the application of numerical mitigation standards in the Ventura County MS4 permit adopted by the Regional Board on July 27, 2000.

The application of environmental regulations to new development and redevelopment based on category typing as "developmental" or "locational" is not treated under State law as being incompatible. For example, CEQA exempts certain "developmental" projects from its requirements but does not do so when the projects are "locational", i.e., when situated in ESAs.[14] In this respect, the State Board might wish to look at actions and interpretation of "development" in ESAs, as they pertain to water quality, by the California Coastal Commission, which administers the California Coastal Act.[15] This is pertinent because the State Board has entered into a Memorandum of Understanding (MOU) with the Coastal Commission to jointly promote the protection of water quality and natural resources from adverse impacts of non-point pollution including urban runoff.[16] At the California Commission's January 2000 Public Meeting, the Commission adopted the numerical mitigation criteria for post-construction BMPs for all development projects in the coastal zone without qualification. The Coastal Commission reaffirmed its

---

[12] See Board Order No. 96-054, Pt 2. III.A.3, p 36 requiring development planning guidelines to address riparian corridors, wetlands, and biological integrity of drainage systems.

[13] See Board Order No. 99-060, Pt 4. I.D.5, at p 17, admitted into the record, without objection, by Respondent Regional Board at the June 8 State Board Hearing.

[14] See Post-hearing Brief at footnote 25 citing 19 CCR 15301 which exempts certain categories except where they are located in ESAs.

[15] Cal. Pub. Res. Code § 30000 *et seq.* Specifically § 30231 requires that the Commission regulate land development to protect the coastal environment from adverse impacts of storm water runoff. The Commission has a special responsibility to protect ESAs in the coastal zone. Cal. Pub. Res. Code § 30107.5 defines ESAs and Cal. Pub. Res. Code § 30240 specifies the degree of protection that must be afforded.

[16] See "Memorandum of Understanding Between the State Water Resources Control Board and the California Coastal Commission, February 2, 2000, Plan for California's Nonpoint Source Pollution Control Program (2000)".

stance in regards to numerical mitigation criteria at its August 2000 Public Meeting.[17] In fact, an argument can be made that the State Board's interpretation of "development" projects subject to regulation for water quality within the coastal zone so long as it is inconsistent with the Coastal Commission's rule, violates Cal Pub. Res. Code § 30400.[18]

If the State Board's central concern is that ESAs were not adequately discussed during adoption of the Los Angeles County MS4, the Regional Board reaffirms its intent to add ESAs to the list of SUSMP categories when the permit is reissued in 2001. The State Board is requested to clarify that its ruling, if left unchanged from the Proposed Order, does not apply to the Regional Board adopted City of Long Beach MS4 permit (Board Order No. 99-060) and the Ventura County MS4 permit (Board Order No. 00-108). The ESA category was fully discussed during the adoption of these two MS4 permits. We note that the State Board rejected the Regional Board's recommendation to provide a development project area threshold for ESAs based on current State law, which would have cured any draconian interpretation of the rule as speculated by Petitioners.[19]

C. Include All Projects in SUSMP Categories

The Regional Board respectfully disagrees with the State Board's determination that the Regional Board acted "inappropriately in expanding the SUSMPs to include non-discretionary projects". We find that limiting the application of SUSMP requirements to "discretionary projects" is not supported by the federal CWA, EPA storm water regulations, the California Water Code, or the California Public Resources Code.[20]

---

[17] Regional Board Member Ms. Susan Cloke and Board staff member Dr. Swamikannu briefed the Commission, by invitation, on technical and policy issues related to SUSMPs at the meeting.

[18] Cal Pub. Res. Code § 30400 states that in the absence of specific authorization by law or agreement with the Coastal Commission, no agency shall exercise powers established by the California Coastal Act or the federal Coastal Zone Management Act.

[19] See Respondent Regional Board's Post-hearing Brief at footnote 25 citing, 19 CCR 15301. CEQA exempts projects in ESAs that disturb less than 2,500 square feet of area.

[20] Please see the Regional Board's comment herein at p 6 on exclusion of ESAs.

The main basis behind the determination appears to be the observation that the term "discretionary" appears in several parts of the permit (Board Order No. 96-054). However, the term "discretionary" was not defined in the permit even though the permit contains a section on Definitions.[21] Indeed, as the controversy indicates, there was no "meeting of the minds" as to its meaning when the permit was adopted. Thus, the Regional Board did not expand the scope of the SUSMPs at its January 26 Board Hearing. The "discretionary" limitation, as contemplated in CEQA, never existed in the permit and was never adopted by this Board. Rather, the Regional Board followed traditional rules of regulatory interpretation and deleted the "discretionary" limitation and definition in the SUSMP, articulated retrospectively by Permittees, when there is neither the basis in law nor any clue as to the Regional Board's intent when the permit was adopted in 1996. The CEQA definition of "discretionary" was a concept introduced much later by Petitioners in an attempt to limit applicability of the SUSMPs.[22]

If the permit is read as a whole, the Regional Board clearly intended that storm water controls on new development and redevelopment apply to all types of projects, not just 'discretionary' projects'. Specific language in the permit, in addition to the development of SUSMPs, requires the update of CEQA guidelines and General Plans to consider storm water impacts.[23] The State Board's Proposed Order opens up an unintended loophole.[24] If the State Board's determination remains unchanged, the Regional Board expresses its firm intent to close the loophole when the Los Angeles County MS4 permit is reissued in 2001. Recently, the Regional Board adopted the Ventura County MS4 permit (Board Order No. 00-108) without any reference to the term 'discretionary' therein.

---

[21] See Board Order No. 96-054, Attachment D, Glossary of Terms.

[22] The CEQA definition of "discretionary" that appears in the Final SUSMP is an inadvertent carry over from the Aug 12, 2000, SUSMP submitted by Permittees. There is no reference to the term in the main document.

[23] See Board Order No. 96-054, Pt 2. III.A.3, p 36 requiring the update of CEQA guidelines and General Plans.

[24] Case in point, in the City of Los Angeles in the past year there were 37,514 development project approvals, of which only 1,276 (3.4 percent) were in the "discretionary" category as defined under CEQA.

D. Retain the Requirement to Regionally Mitigate Where A Waiver is Granted

The Regional Board respectfully requests that the State Board reconsider its decision to eliminate the requirement to "mitigation fund" regional projects where an infeasibility waiver is granted from the requirement to treat storm water.[25] The Proposed Order calls it a "positive idea for obtaining regional solutions", yet deletes the requirement because Permittees are yet to establish a management and fund administration framework. Quite to the contrary the framework is already in place.

For example, the County of Los Angeles, as the Principal Permittee for the Los Angeles MS4 program, currently supports regional permit tasks such as public education/ outreach and MS4 monitoring using funds from a regional benefit assessment. Also, the Southern California Association of Governments (SCAG), the federal CWA § 205 (j) regional planning agency, expressed a definite interest, during the SUSMP hearings, in coordinating the development of regional solutions to storm water problems.[26] Sharing regional costs already occurs in SCAG's other program areas. Similarly, the TREEPeople, a non-profit environmental group, has been working with local agencies and school districts to implement solutions to mitigate runoff and promote water reuse.

Without doubt, there exists presently in the Los Angeles Region public and non-profit entities fully capable or already involved in developing and implementing regional solutions to storm water pollution. The purpose of the requirement in the Final SUSMP, besides consideration of equity, was to accelerate implementation and to support the efforts of such groups. The Regional Board's action was not contrary to state law or policy. Thus, the State Board may choose to defer to the Regional Board to make the judgement of reasonableness of the requirement to "mitigation bank".

[25] Respondents note that the issue of storm water mitigation funding was not among the four questions that designated parties were asked to address in the Post-hearing brief. See also Footnote 1 *supra*.

[26] See AR Vol. 6, Item 23, where SCAG proposes to lead and coordinate regional solutions.

E. Edit the Definition of "Redevelopment"

The Regional Board suggests that the State Board amend its definition of "redevelopment", which is derived from the Regional Board's Post-hearing Brief, to provide better clarity. We postulate that the first part of the definition should describe the kind of practices that constitute redevelopment. The second part should explain its application to SUSMP categories.

Our recommendation is as follows, - Redevelopment ~~includes~~ **means**, but is not limited to: the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/or exterior construction or remodeling; replacement of impervious surface that is not part of routine maintenance activity; and land disturbing activities related ~~with~~ **to** structural or impervious surfaces. **For the purposes of this rule**, redevelopment includes, on an already developed site, the ~~creation~~ **replacement** or addition of ~~at least~~ 5,000 square feet **or more** of impervious surfaces. Where redevelopment results in an increase of less than fifty percent of the impervious surface of a previously existing development, and the existing development was not subject to these SUSMP requirements, the design standards apply only to the addition and not to the entire development.[27]

F. Regional Board Provided Interested Persons and Permittees Adequate Time.

The State Board expresses a concern that the Regional Board did not provide interested persons and Permittees adequate time to review late revisions or to comment on them at the January 26 hearing. Suggestions include that the Regional Board should have deviated from its hearing procedure, and should have allowed groups to make joint presentations.

[27] Changes to the State Board's definition in the Proposed Order are indicated by bold and strikeouts. The phrase 'at least 5,000 square feet" does not make clear that the rule applies to projects above the threshold, only that it might. The phrase "5,000 square feet or more" leaves no room for doubt.

The Regional Board adopted revisions at the January 26 to resolve contested issues that were discussed over a period of several months. These were not new issues that would warrant the granting of additional time to conduct adequate review. Petitioners' argument for additional time was a strategic move to delay the process.[28] We submit that the State Board's comment on the argument inadvertently validates such a delaying strategy. Followed to its logical conclusion, neither the State Board nor the Regional Board would be able to conclude any matter, because changes made at Board hearings, in response to testimony on contested issues, would require postponing the decision.

Further, the Regional Board did not deviate from its established hearing procedure for the January 26 meeting for good reason. At the September 17, 1999, meeting on the same matter, Petitioners complained that the Regional Board was being prejudicial because it deviated from the hearing procedure by allowing the environmental community to make a joint presentation.[29] Consequently, both Permittees and the environmental community were allowed to make joint presentations at the January 26 meeting, each designated party being given a 30-minute block. Co-petitioner Building Industry of Southern California (BIA) was invited to become part of the Permittee group presentation, because BIA was not recognized as a separate designated party.[30] Thus, while the State Board may have cured any alleged harm by conducting a two day hearing on the matter, the Regional Board's process did not cause any harm that is evident from the record.

---

[28] See June 8 State Board Hearing Transcript at p 157 where Petitioners request setting up a statewide committee to discuss the matter further - continuing the pattern of procrastination. See also Petitioner Bellflower *et al.* Post-hearing Brief at p 3.

[29] See AR Vol. 12, September Regional Board Hearing Transcript at p. 203. BIA representative objects to the group presentation format allowed for the environmental community, and states, "if we are going to do this in the future,.... set the rules prior to the hearing".

[30] Respondent Regional Board notes that while BIA did not present comments jointly with the Permittee group at the January 26 Board Hearing, BIA is a Co-petitioner with municipalities in Complaint Bellflower *et al.* and not a separate Petitioner.

III. CONCLUSION

In conclusion, the Regional Board strongly supports the State Board's decision to uphold the authority of Regional Boards to establish numerical BMP water quality design criteria to regulate the discharge of pollutants in storm water from MS4s to meet the statutory standard of MEP.

The Regional Board requests that the State Board revise the Proposed Order to make the following changes:

(i) Correct the record to state that the Regional Board's hearing process did not cause Petitioners any harm that is evident from the record, notwithstanding the fact that the State Board's hearing process cured any alleged harm.

(ii) Edit the definition of "redevelopment" as suggested by the Regional Board herein for clarity.

(iii) Eliminate the categorical exemption from the numerical mitigation standard provided to RGOs, because it contradicts the application of the criteria to other similar SUSMP categories and is neither supported by the evidence in the record nor State and federal law.

(iv) Reinstate ESAs as a SUSMP category because the designation is consistent with the interpretation of "development" regulation by the Coastal Commission, with whom the State Board has an MOU to protect water quality and to reduce the adverse impact of urban runoff on natural resources.

(v) Delete the limitation imposed by the State Board on application of the SUSMP requirements to only "discretionary projects", as understood in CEQA, because the limitation in the same sense was not adopted by the Regional Board in 1996 and is not supported by State and federal law.

(vi) Reinstate the requirement to mitigation bank where an impracticability waiver is granted, because the infrastructure and the institutions are already in place to implement regional solutions.

Finally, the Regional Board thanks the State Board for fully considering and deliberating on the matter, conducting a two day hearing in Torrance, Los Angeles County, and holding a special meeting in Sacramento before issuing a decision.

Mr. Craig M. Wilson
Chief Counsel
State Water Resources Control Board
901 P Street
P.O. Box 100
Sacramento, California 95812-0100

RE: PROPOSED ORDER REGARDING THE REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION, STANDARD URBAN STORM WATER MITIGATION PLANS

Dear Mr. Wilson:

The staff of the California Coastal Commission (CCC) supports the State Water Resources Control Board (State Board)'s proposed order to uphold the numeric water quality design criteria for Best Management Practices (BMPs) developed by the Regional Water Quality Control Board, Los Angeles Region (LARWQCB) in the Standard Urban Storm Water Mitigation Plan (SUSMP) issued March 8, 2000. We believe that these design standards represent a significant step towards implementing effective measures for controlling polluted runoff. The CCC has similarly established a design goal, to be evaluated on a case-by-case basis, for BMPs (or suites of BMPs) to treat, infiltrate or filter stormwater from each runoff event, up to and including the 85th percentile, 24-hour runoff event, throughout the Coastal Zone.

However, we have concerns regarding several of the State Board's modifications of the SUSMP requirements. These are as follows: 1) the categorical exemption of Retail Gasoline Outlets (RGOs) from the SUSMP requirements, 2) the elimination of projects within Environmentally Sensitive Areas (ESAs) from the SUSMP requirements, and 3) limiting SUSMP requirements only to "discretionary" projects as interpreted under the California Environmental Quality Act (CEQA).

The current regulatory framework under which RGOs operate does not adequately address nonpoint source pollution generated from these facilities. As you know, RGOs have been identified nationwide as a source of urban storm water pollutants, which can, especially in heavily urbanized areas, contribute significantly to the impairment water quality. Polluted runoff associated with the traffic volumes at RGOs and their relatively large area of impervious surfaces

R0072623

can be significant. This polluted runoff may be as much or greater than that generated at other similarly sized retail establishments or parking lots, which are required to comply with the SUSMP requirements. To control nonpoint source pollution generated from RGOs, we believe that a categorical exemption should not be created for RGOs and that they should be subject to the same SUSMP requirements as other retail facilities (i.e., where the area of development or redevelopment is 5,000 square feet or more). The CCC therefore urges the State Board to uphold the Regional Water Board's decision to apply the SUSMPs to all RGOs.

The CCC believes that the SUSMPs should be applied to all projects within or adjacent to ESAs. Development activities in an around ESAs can have a significant impact on water quality. Many of the ESAs within the jurisdiction of the CCC are directly affected by runoff from adjacent urban areas. ESAs by their very nature require thoughtful consideration throughout the planning and development process. Minimizing impacts of nonpoint source pollution on ESAs should be an integral part of this process.

The State Board's reasoning for exclusion of the ESA category as "locational" rather than "developmental" is unclear. Another category retained within the SUSMP requirements "Single Family Hillside Residences" appears to be locational as well. Regardless of the distinction, controlling nonpoint source pollution impacts on ESAs is important. The CCC understands that the LARWQCB intends to add ESAs to the list of SUSMP categories when the permit is reissued in 2001. The CCC therefore urges the State Board to uphold the Regional Water Board's decision to include ESAs as a SUSMP category in the interim.

The CCC believes that the SUSMPs should be applied to all projects within the categories of development to which the SUSMPs apply, not simply to those projects that are discretionary projects within the meaning of CEQA. The CCC is concerned that exempting all nondiscretionary projects from the SUSMPs will significantly reduce the effectiveness of the Regional Water Board's storm water pollution control efforts -- thereby impeding the CCC's efforts to protect and restore the quality of water along the Los Angeles County coast. The State Board's draft order itself suggests that exempting nondiscretionary developments from the SUSMPs may undermine the Regional Water Board's storm water control program. (See Draft Order, at p.25.)

In particular, the CCC believes the distinction between discretionary and nondiscretionary projects that is so crucial in the context of CEQA has no bearing on storm water control efforts. The crucial inquiry for the purposes of storm water control is whether the characteristics of a particular development are such that it is likely to contribute to storm water pollution problems. Whether the developer may proceed with a project as a matter of right or must instead obtain a variety of discretionary approvals is irrelevant to the impact of the project on storm water runoff. For example, a 50-space parking lot gives rise to the same storm water runoff concerns regardless of whether approval of the parking lot is discretionary or ministerial.

The CCC therefore urges the State Board to uphold the Regional Water Board's decision to apply the SUSMPs to all projects that fall within one of the covered categories of development regardless of whether the projects require discretionary approval.

We appreciate your consideration of these comments. If you have any questions regarding these comments, please contact Alfred Wanger of my staff at (415) 597-5886.

Sincerely,

Re: Petitions of the Cities of Artesia, *et al.*, the City of Arcadia, and Western States Petroleum Association, for Review of January 26, 2000 Action of the Los Angeles Regional Board, "and Actions and Failures to Act by Both the Regional Board and Its Executive Officer"
Timing and Format of Responses

Dear Ms. Jennings:

We are preparing responses to the above-referenced petitions and are writing to clarify two procedural issues regarding the timing and format of those responses. It is our understanding that the State Board intends to consolidate these petitions for purposes of its review. We further understand that at least one of the petitioners listed above has filed an amendment to its original petition, subsequent to your March 30, 2000, 20-Day Notice Letter informing interested parties of the existence of the completed petitions. Finally, we understand that you intend to issue another 20-Day Notice Letter specifically concerning that amendment. In addition to the delay caused by the amendment, we have had some difficulty obtaining some of the petitions from the petitioners.

Due to the consolidation of the petitions, and in order to promote efficiency, we intend to submit one comprehensive response to all of the petitions. Furthermore, because of the delay caused by the amendment to one petition, and our difficulty in obtaining certain petitions from the petitioners, we intend to submit our consolidated response no later than twenty days after your issuance of a follow-up 20-Day Notice Letter regarding the amendment (assuming we have received the complete set of petitions and amendments by then).

When we spoke on April 10, 2000, you indicated informally that this approach would be acceptable. We are writing to confirm our understanding of this process going forward.

Re: Petitions of the Cities of Bellflower, *et al.*, the City of Arcadia, and Western States Petroleum Association, for Review of January 26, 2000 Action of the Los Angeles Regional Board, "and Actions and Failures to Act by Both the Regional Board and Its Executive Officer."

Dear Mr. Montevideo:

We are in receipt of your April 18, 2000, letter to Elizabeth Jennings of the State Water Resources Control Board, objecting to our request for an extension of time in which to comment on the above-referenced petitions. As we indicated in our letter of April 11, 2000, Ms. Jennings has already approved the timing and approach articulated in our letter. Furthermore, the extension we requested has since been re-confirmed, both by letter and also during a subsequent April 14, 2000 conversation with Ms. Jennings. We understand that the new response date will be sometime next month, and that Ms. Jennings will be notifying all parties of the exact deadline shortly.

In this regard, your letter indicates that it is "inconsistent with the regulations to provide additional time to respond" and that "there is no basis and no authority to extend the time to respond to the Petition under the regulations or otherwise." This is patently untrue. Indeed, state board attorneys routinely approve reasonable extensions in many scenarios. An extension of time is particularly appropriate in an instance such as this one, in which interested parties intent on opposing an appeal are faced both with a shifting target (amended appeals) as well as difficulty in obtaining the original petitions from appellants.

Sincerely,

David Beckman /a.h.

V. CONCLUSION 31

R0072634

I. INTRODUCTION

The Petitions for Review filed by the Cities of Bellflower, *et al.*, the City of Arcadia, and Western States Petroleum Association ("WSPA") (collectively, "Petitioners"), constitute a desperate attempt to avoid having to take any real action to control the ever-increasing stormwater problem that is the number one source of water pollution in Southern California – and the worst such problem in the Nation.[1] The petitions are completely without merit and should be denied. In fact, if the State Board were to conclude that this extremely careful and well-considered regional board action should be overturned, no action by any regional board in the state could withstand scrutiny.

A. Factual Background

"Communities across the nation are finding that their water resources are degrading in response to growth and development."[2] The Center for Watershed Protection's "four-year effort to examine new ways to reduce pollutant loads and protect aquatic resources" revealed that "a fundamentally different approach toward development [is] needed to reliably protect streams and other aquatic resources."[3] In fact, development planning is generally recognized as one of the most critical aspects of any stormwater management program, and assuring that appropriate best management practices ("BMPs") are implemented in the development process, and that they are sized sufficiently to be effective, is essential to these programs.

Recognizing these facts, on January 26, 2000, the Regional Water Quality Control Board, Los Angeles Region ("Regional Board" or "LA-RWQCB") took its first significant step to stem the ever-increasing flow of stormwater pollution into Los Angeles-area rivers and bays. The Regional Board concluded that, like hundreds of other municipalities across the country, Los Angeles area municipalities needed to adopt a meaningful approach to new and redevelopment, one that controls urban runoff and prevents future development from further polluting the area's waterways.

---

[1] See September 6, 1999 *Los Angeles Times* article, attached hereto as Exhibit A.

[2] Rapid Watershed Planning Handbook (Center for Watershed Protection, Oct. 1998) at xiii, attached hereto as Exhibit B.

[3] Site Planning for Urban Stream Protection (Center for Watershed Protection, Dec. 1995) at 1, attached hereto as Exhibit C.

R0072635

This action was long-overdue. The municipal stormwater permit issued to the Los Angeles-area municipalities ("the Permit")[4] was adopted by the Regional Board in the Summer of 1996, and it explicitly requires – by July, 1998 – the adoption of a Standard Urban Stormwater Mitigation Plan ("SUSMP") to guide development planning and ensure that completed projects can control their polluted runoff. Permit, Part 2.III.A.1.b. and c. The process of developing the SUSMP, like so many of the "model programs" that were to be developed under the Permit, was delayed, in large part, by municipal resistance. Finally, on January 26, 2000, almost four years after the Permit was adopted, the Regional Board approved the SUSMP, via Resolution Number R-00-02 ("R-00-02" or the "Resolution"), which is part of the administrative record.

The Regional Board's long-awaited action is of critical importance to the efforts to control stormwater in the Los Angeles area, and it received wide-spread support throughout the region. Because it requires development projects to take responsibility for their runoff, it may allow the ever-growing metropolis that is Los Angeles County and environs to continue to grow without destroying its own resources and livability. The Regional Board's adoption of the SUSMP was praised by the *Los Angeles Times* in back-to-back editorials. See Exhibit D. It was also supported by many municipalities and other government entities, including, among others, the City of Los Angeles, the United States Environmental Protection Agency, and the California Coastal Commission. See Exhibits E, F, and G.

Nevertheless, several of the municipal permittees under the Permit ("Permittees"), along with the Building Industry and WSPA, filed petitions that – given their "shotgun approach" – show that they are desperate to find some technicality they can use to overturn the Regional Board's action. These Petitioners, and particularly the Permittee-Petitioners who have dragged their feet on Permit implementation over the last four years, now have the audacity to raise procedural issues to further delay its implementation. Many of their claims were never even raised below, and thus, cannot legally be raised on review. Those claims that were raised below, and that are raised again here, are uniformly without merit, as is explained below.

---

[4] NPDES No. CAS61400, Order No. 96-054.

In addition, the doctrine of estoppel precludes bad actors, such as the Petitioners, from raising these arguments now, when the implementation of the SUSMP is already nearly two years late. See 11 B.E. Witkin, Summary of California Law, "Equity" (9th Ed. 1990) §§ 7-10 and 176.

B. Petitioners' Claims

The Petitioners claims fit into four general categories, as summarized below and discussed in detail in the "Argument" section of this brief.

1. Misguided Procedural Claims

Petitioners argue that (1) the Regional Board's Executive Officer never formally disapproved their proposed SUSMP, as allegedly required by the Permit; (2) the final SUSMP was prepared by Regional Board staff, instead of the Permittees; (3) the Regional Board failed to follow the Administrative Review Process laid out in the permit; and (4) late modifications to the SUSMP deprived them of due process. These procedural claims range from the misguided to the absurd. The Board's actions clearly indicated that the Permittees' proposed SUSMP was inadequate, and that the Board would thus move to complete an SUSMP, as it was required to do. In so doing, the Board provided ample opportunity for public participation. Furthermore, the changes that were instituted by the Board leading up to the January 26, 2000 hearing ("Hearing"), as well as those made at the Hearing, were all logical outgrowths of the extensive process that preceded them, and were therefore all legitimate changes that did not necessitate recirculation. In fact, not only were they logical outgrowths of the process, but virtually all of those changes had been formally discussed in previous proposals and hearings, and many of the changes simply constituted a return to the form and content of previous proposals. Thus, these changes did not necessitate circulation of yet another revised version of the long-overdue SUSMP.

2. Misrepresentations of Previous Regional Board Orders and Resolutions

Petitioners point to previous Regional Board resolutions and orders, in hopes of finding something within those documents to preclude the instant action. They claim that the Regional Board's approval, last April, of a list of BMPs somehow estopped the Board from rejecting the Permittees' proposed SUSMP. They also point to sections of the Permit itself, which they claim limit the Board's authority. In reality, the BMP-list approval was a precursor to the SUSMP, the

R0072637

sections of the Permit at issue provided only minimum requirements, and neither of these things imposed any restraint on the Regional Board's authority to act as it did on the SUSMP.

3. Attacks on the Regional Board's Findings

Petitioners attack the Regional Board's findings and claim that the Board failed to conduct certain allegedly mandatory evaluations. However, a brief review of the Resolution leaves one wondering whether the Petitioners even read it, as it begins with an explicit list of the Board's extensive findings. Indeed, each of the issues that the Petitioners claim as "unsupported" is not only addressed in the Resolution, but is also well-supported in the administrative record (the "Record"). Consequently, these frivolous claims must fail as well.

4. Distorted and Imaginary Legal Requirements

Finally, Petitioners invent a number of legal requirements and prohibitions that they claim prevent the SUSMP from taking effect. These include claims that: (1) the Regional Board lacked the authority to adopt an SUSMP containing obligations beyond those included in the Permittees' proposed SUSMP; (2) the Regional Board does not have authority to require the Permittees to amend their municipal codes or to regulate real property; (3) the Regional Board cannot establish any specific standards because doing so would impinge on some minimum degree of flexibility guaranteed to the municipalities; (4) the Regional Board violated the California Environmental Quality Act ("CEQA") by not considering various potential negative impacts of the SUSMP; (5) the SUSMP constitutes an "unfunded mandate" in violation of the California Constitution; and finally (6) the SUSMP constitutes an underground regulation, in violation of provisions of the California Administrative Procedures Act. As discussed below, none of these "everything but the kitchen sink" claims withstands analysis.

5. Additional Demands

Petitioners have also requested a stay of the Regional Board's order adopting the SUSMP and related actions, and a hearing on their petitions. Both requests should be denied. The requests for stays were addressed in NRDC, Santa Monica BayKeeper, and Heal the Bay's April 28, 2000, Opposition to Request for Stay ("Stay Opposition"). Petitioners request for a hearing should be denied because the Petitioners have failed to provide either of the legally required elements: the

requisite statement of the evidence to be presented, or a satisfactory explanation for why such information was not provided previously, during the more-than-six-month period in which this extended process was played out.

II. STANDARD OF REVIEW

"[I]n order to uphold a Regional Board action, [the State Board] must be able to find that the action was based on substantial evidence." In the Matter of the Petition of Stinnes-Western Chem. Corp., WQ 86-16 (Sept. 18, 1986) at 16. The Stinnes-Western opinion upholds the regional board action in question as being "based on numerous facts and the record as a whole." Id. The State Board notes that the applicable standard requires "a search of the record for a 'reasonable factual basis.'" Id. at 17. Finally, it states that, just as the superior courts must defer to the water boards' expertise, the State Board must also "recognize the Regional Board's judgment in matters involving water resources and water quality." Id. at 18.

Thus, the State Board's role is not to decide how it would have acted if presented with the same facts, but to determine whether the Regional Board's action was supported by a reasonable factual basis.

III. SUBSTANTIAL PORTIONS OF THE PETITIONS ARE BARRED BY PETITIONERS' FAILURE TO EXHAUST ADMINISTRATIVE REMEDIES.

"The exhaustion of an administrative remedy has been held *jurisdictional* in California." 3 B.E. Witkin California Procedure (4th Ed. 1996) § 307 (emphasis in original). Notwithstanding this well-settled requirement – and the prolonged, nearly six-month-long period during which the SUSMP proposal was under active consideration by the Regional Board – Petitioners have submitted a set of legal arguments that contains many issues now raised for the first time. Compare "Objections to Proposed Regional Board Action regarding Standard Urban Storm Water Mitigation Plans (SUSMPs) – Order No. 96-054" (Ruttan & Tucker, December 22, 1999) ("Objections"), attached hereto as Exhibit H, to Consolidated Petitions of the Cities of Bellflower, *et al.*, the City of Arcadia, and Western States Petroleum Association. In fact, Petitioners essentially made only five legal arguments before the Regional Board (See Objections at 1) but now have employed a "kitchen sink" approach on appeal.

R0072639

This is grossly unfair. Petitioners should be barred from raising these arguments now. The State Board should summarily dismiss, on this basis alone, all arguments now advanced by the Petitioners that were not placed squarely before the Regional Board, through the aforementioned Objections, or in another competent manner. Without waiving this argument, we now address each of Petitioners' substantive arguments, in turn.

IV. ARGUMENT

A. The Regional Board Complied with All Requisite Procedures

Petitioners raise several interrelated procedural issues. In essence, their claims boil down to two basic questions: (1) Did the Regional Board have the authority to allow its staff to draft the SUSMP and to direct the Executive Officer to approve it? (2) Was the Regional Board allowed to make the changes that it made in the final days leading up to its adoption of the SUSMP? The answer to each of these questions is clearly "Yes."

1. The Regional Board was Fully Within its Rights in Ordering its Executive Officer to Adopt an SUSMP Based on the One Prepared by Regional Board Staff.

Petitioners make much of the "Administrative Review" procedure laid out in Part 2.I.G of the Permit. The Permit states that, "[f]or documents that require Executive Officer's approval, the Executive Officer will notify the . . . Permittee of the results of the review and approval or disapproval within 120 days." Permit, Part 2.I.G.1.a. The Permit designates the SUSMP as such a document – one to be submitted to the Executive Officer for approval. Part 2.III.A., Table 3.[5]

There is no doubt that the Regional Board complied with these provisions, in that it more than ensured the availability of the public participation opportunities that the administrative review procedure was designed to provide. Moreover, even if the SUSMP adoption process differed from

[5] The Permittees also refer to subsequent sections of the Permit, wherein it states that if the "Executive Officer determines that a Permittee's storm water program is insufficient . . ., the Executive Officer shall send a 'Notice of Intent to Meet and Confer (NIMC)' to the Permittee." Part 2.I.G.2. However, as the Permittees repeatedly point out, the provisions of Part 2.I.G.2 relate to enforcement actions by the Regional Board. See, e.g., Ps & As at 5 ("Executive Officer is prohibited from taking 'enforcement action again [sic] a Permittee until . . ."); Bellflower Petition at 11 ("The Executive Officer shall not take enforcement action against a Permittee until. . ."). As enforcement action is not at issue here, these provisions are irrelevant.

R0072640

the process outlined in the Permit in a substantive manner, the Board was not obliged as a matter of law to follow the precise procedure in the Permit.

a) The Board Complied with the Permit Procedure

The "Administrative Review process" on which the Petitioners' focus so much attention was established by the Board itself, as part of the Permit, to provide for stakeholder participation. There can be no doubt that the Board more than complied with the process, and provided ample opportunities for input. Furthermore, even for statutory directives, "substantial compliance is the governing test for determining whether statutory requirements have been met. [Citation omitted.] Strict compliance is required only when the intent of the statute can only be served by such a test." National Parks and Conservation Ass'n v. County of Riverside, 42 Cal. App. 4th, 1505, 1522 (1996).

The phrase substantial compliance "means 'actual compliance in respect to the substance essential to every reasonable objective' of the provisions." Tyler v. Children's Home Soc'y, 29 Cal. App. 4th 511, 540 (1995), citing Stasher v. Harger-Haldeman, 58 Cal. 2d 23, 28 (1962). Thus, even if the Administrative Review process purported to limit the Regional Board's discretion in implementing the Permit, and even assuming that the Permit provisions that the Board adopted could somehow have risen to the level of a statutory mandate (which they clearly do not), at most, the Regional Board was still required only to comply with the reasonable objectives behind those provisions.

The clear objective of the Administrative Review process was to guarantee stakeholder involvement in the process by which the remaining elements of the Permit were to be developed. Thus, it is worth taking a moment to review the process that the Regional Board employed, to allay any doubts regarding the extensive opportunities for stakeholder involvement.

The issue of the SUSMP first arose during the Regional Board's April 22, 1999 hearing. At that time, the Regional Board explicitly requested that the SUSMP be brought before it for review. See Exhibit I. There can be no question that the Board was authorized to make this request. To suggest otherwise would be to argue that the Regional Board irretrievably abdicated its power and duty to oversee the implementation of the Permit, and by extension, the Clean Water Act's NPDES

R0072641

permitting requirements, when it first assigned the Executive Officer responsibility for reviewing the SUSMP. That cannot be the case. See, e.g., Cal. Water Code § 13225; see also infra at 9.

The County released its initial proposal on May 20, 1999, and the Permittees submitted their official proposed SUSMP on July 21, 1999. However, prior to presenting that SUSMP to the Board, Regional Board staff ("Staff") held a workshop, in August of 1999, to give the Permittees an additional opportunity for input into the process. As a result of that workshop, an unusual step for the Regional Board, the Permittees retracted their proposal and submitted yet another revised version. Staff then presented that final proposal to the Board at the September 16, 1999 hearing, as directed. As is the case with any issue the Board asks Staff to bring before it, Staff made certain recommendations to the Board at the hearing. Nevertheless, the proposal that Staff presented was still the Permittees' proposal.

The Board took comments from dozens of interested parties at the September hearing. Based in large part on the extensive input it received from the Petitioners, the Board delayed its already-overdue decision so that Staff could go back and look at the issue in even greater detail. The Board also directed the Executive Officer to bring back a final proposal for a Board decision.[6] Staff then hosted a series of meetings with Permittees, and, after meeting with representatives of Petitioners over a four month period, the Board again took written and oral comments at the final Hearing, before adopting the SUSMP. Thus, the Board extended the review process and provided exceptional procedural process, over and above the normal requirements, in order to consider the concerns raised by the Petitioners.

Nothing in the Permit precluded the Regional Board from taking these steps. To the extent that the Permit did not specifically call for the extensive process that was followed, the decision to proceed in this manner was an appropriate exercise of the Regional Board's discretion to ensure adequate opportunities for public participation. In fact, it was an extraordinarily gracious gift to the

[6] Petitioners' claim that the Regional Board's action is invalid because the Executive Officer never formally disapproved their proposed SUSMP is hardly worth mentioning. Staff's official recommendation, and the subsequent course of events that transpired after the Permittees' submittal of their second proposed SUSMP, including the Board's direction to Staff to take charge of the matter, certainly constitutes a constructive, if a not formal, disapproval of the Permittees' proposal.

Permittees, in that, in order to accomplish it, the Board delayed an already-overdue program beyond the deadline in the Permit.

Moreover, the Permit explicitly provides for minor changes to its provisions. Permit, Part 3.I. Only "major revision[s] in the overall scope of the program . . . must be approved by the Regional Board as amendments to this Order." Id. Thus, even if the Regional Board's actions are viewed as a procedural change in the implementation of the Permit, they only added additional procedure, without violating any aspect of the Permit; and they certainly were not "a major revision in the overall scope of the program" requiring a formal amendment process. Id.

In sum, far from failing to provide for public participation, the Regional Board bent over backwards to ensure that stakeholders had an adequate opportunity to be heard, to the point of delaying Permit implementation considerably. The numerous meetings, hearings, workshops, and revisions that the Board provided clearly constituted compliance with the meet and confer provisions of the Permit, as well as with any other alleged procedural requirements, as all those steps enhanced public participation and clarity.

Furthermore, in adopting the Permit, the Regional Board could not have intended to require strict adherence to the process that Petitioners demand. This would be the ultimate elevation of form over substance, and could drag the process out forever, as it would require Staff to repeatedly reject proposed SUSMPs in the hopes that one would someday appear that met their specifications, rather than simply inserting the necessary minimum elements themselves. Such a process clearly would not have been acceptable. Given that this program was already substantially behind schedule, it was entirely appropriate for the Board to take charge of the development of the SUSMP in order to ensure that a system was in place to protect public health and the environment.

b) The Regional Board's Own Permit Could Not Limit the Board's Ability to Proceed in the Manner Necessary to Protect Public Health and the Environment.

To the extent that the Permit's Administrative Review process might purport to limit the Regional Board's powers by limiting the manner in which it implements aspects of the Permit left outstanding at the time the Permit was adopted, any such "apparent limitations" would be ineffectual. Agencies cannot, via issuance of permits, limit their own statutorily-defined authority,

and they cannot be estopped from performing their duties that are designed to protect the public. See, e.g., Smith v. Santa Barbara, 7 Cal. App. 4th 770, 775 (1992) (county *must* revoke land use permit, as "public entity may be estopped from enforcing the law only in extraordinary cases"); Morrison v. California Horse Racing Bd., 205 Cal. App. 3d 211, 218 (1988) (noting "public policy restraints on estopping the government"). Hence, even if one assumed that the Regional Board did depart in some substantial manner from the process outlined in the Permit (which it did not), it would have had the power to do so.

2. The Regional Board Did Not Violate Petitioners' Due Process or Notice and Comment Rights by Making Changes to the Proposal Before It.

Petitioners allege that the Regional Board deprived them of due process by making changes to the proposed SUSMP and not re-circulating the revised version for additional public comment. "Statement of Points and Authorities in Support of Legal Issues in Petition . . ." filed by the Cities of Bellflower, *et al.* ("Ps & As") at 3 and 12-13; "Petition for Review . . ." filed by the Cities of Bellflower, *et al.* ("Bellflower Petition") at 12 and 23-24; "Petition for Review of the [Regional Board's] January 26, 2000 Approval of the [SUSMP]," filed by WSPA ("WSPA Petition") at 4.[7]

In particular, Petitioners Cities of Bellflower, *et al.*, point to the Regional Board's setting of a deadline for the adoption of local ordinances, the fact that the final SUSMP was applied to non-discretionary projects as well as discretionary ones, and the removal of the proposed " 'roof top' exemption." Ps & As at 13; Bellflower Petition at 24. WSPA also complains of the "expansion of the definition of 'retail gasoline outlet' and the elimination of the credit for roofing surface area." WSPA Amendment to Petition at 2.

The simple answer to all of these claims is that the Regional Board may make any changes to the proposals before it that are logical outgrowths of the proposals, without having to recirculate the revisions for additional comments. See, e.g., United Steel Workers v. Marshall, 647 F.2d 1189,

[7] This pleading includes no references to the separate Petition for Review submitted by the City of Arcadia, as that petition references, "joins in," and "rel[ies] upon" the Bellflower Petition and its associated documents. Letter from Stephen P. Deitsch, Best Best & Krieger LLP, to State Water Resources Control Board re "Petition for Review of January 26, 2000 Action . . . and Actions and Failure to Act . . ." (Feb. 25, 2000) at 1-2.

R0072644

1222 (D.C. Cir. 1980), cert. denied, 101 S. Ct. 3149 (1981) (upholding as a "logical outgrowth" the agencies' decision to lower health standard from 150 $\mu g/m^3$ to 50 $\mu g/m^3$, when 100 $\mu g/m^3$ was the noticed proposal). "A contrary rule would lead to the absurdity that ... the agency can learn from the comments on its proposals only at the peril of starting a new procedural round of commentary." International Harvester Co. v. Ruckelshaus, 478 F. 2d 615, 632, n.51 (D.C. Cir 1973).

It should have been clear to the Petitioners that the Regional Board was in fact considering the precise sorts of changes the Petitioners are now challenging, as all of these changes were logical outgrowths of the various comments and proposals that were circulated over the six months leading up to the Regional Board's final action at the January 26, 2000 Hearing. In fact, most of these issues were not only "logical outgrowths" of previous proposals, but were explicitly discussed at various points throughout the process. Indeed, in many cases, the Board's changes simply reinstated conditions that had been previously considered by the Regional Board at the September, 1999 hearing.

With respect to the requirement for local ordinances, for example, the original Permit has an entire section requiring Permittees to secure legal authority to implement the requirements imposed by the Permit and its various programs, and to show that they have done so. Permit, Part 2.I.E. Thus, the Permittees should have known they would be responsible for demonstrating the legal authority to implement the SUSMPs. By requiring the municipalities to adopt an ordinance within six months of SUSMP adoption, all the Board did was clarify a time-line for that to occur. The establishment of the timeframe for a requirement that was already forecast is necessarily a logical outgrowth of the requirement itself. Indeed, how else would the board implement the provision?

The removal of the roof-top exemption was also clearly appropriate without another round of notice and comment. As a point of reference, this exemption was added by the Executive Officer after the original Board hearing in September, 1999. Until the Board released its December 7, 1999, proposal, no such exemption had ever been discussed. Taking this novel exemption back out, thus making the SUSMP more like the Permittees' original proposal, and more like the proposal that was before the Board in September of 1999, was certainly a logical outgrowth of the process. Moreover, the fact that its removal was recognized as a strong possibility is evident in the

fact that several of the Petitioners sent in comment letters specifically supporting its inclusion and advocating for its retention.[8] Yet another round of comments on this would have been pointless.

Petitioners also complain about the application of the SUSMP to non-discretionary projects, yet the question of whether the development planning program should apply to non-discretionary projects as well as discretionary ones was at issue as far back as January of 1999. See, e.g., Letter from Alex Helperin, NRDC to Dennis Dickerson, Regional Board (Jan. 8, 1999), attached hereto as Exhibit K. Furthermore, the scope of projects to which the SUSMP would apply has been an issue from the beginning, and many of the Petitioners have shown their awareness of it by raising the issue in their comment letters. See, e.g., Letter from Samuel Wilson, Director of Community Services & Water, Vernon, to Dennis Dickerson (Jan. 14, 2000) at 3, attached hereto as Exhibit L.[9]

Finally, as to WSPA's claim about the definition of "retail gasoline outlet," what WSPA fails to mention is that one of the central reasons for its presence at both hearings was its concern over the applicability of the SUSMPs to retail gas stations. Thus, they were clearly aware that it was well within the scope of possibilities for the Regional Board to take the action that it took. The issue of how to define "Retail Gasoline Outlet" was also raised by various Petitioners prior to the Hearing. See, e.g., Exhibit J at 4.

In sum, the modifications to the SUSMP in the final days leading up to the Hearing, and the changes made by the Board at the Hearing itself, were all fully within the scope of the sorts of items already being discussed, and, as such, were all logical outgrowths of existing proposals. The

---

[8] See, e.g., Letter from Rufus C. Young, Jr., Burke, Williams & Sorensen, LLP (on behalf of, among others, Petitioners the Cities of Compton and Industry) to Dennis Dickerson, Executive Officer, Regional Board (Jan. 5, 2000) at 2, attached hereto as Exhibit J.

[9] The cases cited by Petitioner Cities of Bellflower, *et al.*, are inapposite. They involve situations where a party was affirmatively "denied the opportunity to present evidence," Bank of America v. Long Beach, 50 Cal. App. 3d 882, 886 (1975), and where evidence was withheld until "five minutes before the last hearing." Id. at 888. Such was not the case here, as there is no claim that any party was denied an opportunity to present evidence, and the changes implemented at, and just prior to, the final Hearing were logical outgrowths of the existing proposals, not new evidence. Similarly in English v. Long Beach, 35 Cal. 2d 155 (1950), the issue was whether "petitioner was deprived of a fair hearing because the board in reaching its decision relied upon evidence taken outside the hearing." Id. at 156-157. No such issues are presented here.

Board was therefore under no obligation to recirculate yet another revised proposed SUSMP, and the Petitioners' due process and notice and comment rights were in no way compromised.

B. Previous Regional Board Resolutions and Orders Did Not Limit the Regional Board's Discretion in Reviewing and Adopting the SUSMP.

1. The Regional Board in No Way Limited its Discretion Over SUSMP-Approval In Approving the List of Applicable BMPs

Petitioners assert the frivolous argument that the Regional Board, in approving the "master list of BMPs," thereby decreed that any manner of implementation of those BMPs would suffice, and that no further requirements were necessary or even could be imposed. Ps & As at 6; Bellflower Petition at 9. This contention dramatically twists the Board's process and clear intent.

The Regional Board was required to approve a list of BMPs prior to approving the SUSMP. Permit Part 2.III.A.1.b. and c. Furthermore, in order to approve that list of BMPs, the Regional Board had to find, and in fact did find, that the BMPs it was approving, "when implemented at development projects . . . [would] reduce pollutants in storm water dischargers to the 'maximum extent practicable'." LA-RWQCB Res. No. 99-03, Finding 4; see 33 U.S.C. § 1342(p)(3)(B)(iii). That statement by the Regional Board in no way relinquished its ability to specify how or where those BMPs must be installed, as all parties understood. Indeed, the Permit makes clear that the SUSMP was still to come, Permit, Part 2.III.A.1.c., and its fundamental purpose was to provide greater clarity as to which BMPs were most appropriate for which types of projects. See also the discussion on page 10, above, regarding an agency's ability to limit its own powers.

The bottom line is that, in order to function as intended, BMPs must be installed correctly; appropriate BMPs must be installed at each site, based on the unique conditions of the site; they must be maintained; and as the Regional Board noted, they must be of large enough to be effective. R-00-02, Finding 10. It is simply nonsensical to suggest that, in adopting the BMPs, the Regional Board forsook its ability to impose any further conditions on those BMPs. Petitioners' logic would imply that one could choose the wrong BMP for a site, make it too small, install it incorrectly, and fail to maintain it, and the Regional Board would be powerless to object because its had found that BMP to meet the "maximum extent practicable" (or "MEP") standard. That cannot be right.

2. Far From Precluding the SUSMP, the Permit Mandates Just the Sort of Program the SUSMP Implements.

Petitioners claim that the Permit itself limits the Regional Board's authority. Ps & As at 3; Bellflower Petition at 16. They claim, for example, that the Permit precluded the Regional Board from imposing requirements on "non-discretionary" projects, and that the Regional Board's inclusion of additional categories of development – beyond those explicitly listed in the Permit – is illegal. Id.

Not only does the language in the Permit not limit the Regional Board's ability to expand the scope of the SUSMP, but it explicitly envisions that the Board may go further. Petitioners once again fail to cite to the Permit, quite possibly because the reader would see that the Permit says:

> "**At the minimum**, SUSMPs and guidelines shall be prepared for the following development categories:"

Permit, Part 2.III.A.1.c. (emphasis added). Thus, the Permit was explicitly designed to create minimum standards, and the Regional Board was well within its rights to go beyond the categories listed in the Permit. The Regional Board recognized, and explicitly relied upon, this fact in applying the SUSMP to additional categories of development, and in concluding, for example, that it would make no sense to limit the SUSMP to discretionary projects. R-00-02, Finding 13.

C. The Regional Board's Findings Were More Than Adequate as a Basis for its Action and Well-Supported by the Administrative Record.

Petitioners reference three issues that they claim should have been addressed in official Regional Board "findings" prior to the adoption of the SUSMP. They say that "the Regional Board SUSMP was adopted without evidence or findings showing that it would improve water quality, that it is cost effective, or even that it will 'reduce the discharge of pollutants to the maximum extent practicable.'" Ps & As at 4. However, each of these issues is addressed in the Regional Board's findings and is supported by substantial evidence in the Record. Furthermore, Petitioners fail to justify why these issues must be addressed in the first place.

1. Improvements to Water Quality

Petitioners claim that the Regional Board adopted the SUSMP "without evidence or findings showing that it would improve water quality." Ps & As at 4; see also Bellflower Petition

R0072648

at 19. To the contrary, the Regional Board made explicit findings that urban runoff carries pollutants to local waterways, and that the use of BMPs can limit that transport process. See R-00-02, Findings 5-7. It also recognized that "the ability of any BMP to be effective is limited by the volume of water that the BMP is exposed to in any discrete period of time," and that the minimum volumetric performance level adopted by the Regional Board for the sizing of BMPs is beneficial because it will ensure the capture of the majority of pollutants. Id., Findings 10 and 11. Thus, Petitioners' claims that these issues were not addressed by the Regional Board are simply wrong.

Moreover, there was an enormous – perhaps unprecedented – amount of evidence in the Record to support these findings. See, e.g., Letter from NRDC, Santa Monica BayKeeper, and Heal the Bay to the Regional Board (Jan. 14, 2000), attached hereto as Exhibit M, at 15-17. As noted above, the State Board is to uphold the actions of a regional board if those actions were "based on substantial evidence" or the Record shows any "reasonable factual basis" for them. WQ 86-16 at 16. Here, the Regional Board's action was based on overwhelming evidence, and thus, its actions were not only valid, but necessary.

2. Cost-Effectiveness

Petitioners claim that the SUSMP was adopted without evidence or findings to show that it is cost-effective. Ps & As at 7-8; Bellflower Petition at 17-19. However, once again, the Regional Board included a specific finding that "BMPs can be 'designed-into' a project in a cost effective way," R-00-02, Finding 8, see also Findings 9-11, and the SUSMP was designed specifically to accomplish that purpose.

Furthermore, these findings were well-supported by the Record, including (1) the Regional Board's own empirical analyses of the costs of implementing the SUSMP in various real-world situations (itself a rare step for any regional board to take), (2) extensive testimony at the hearings regarding cost issues, and (3) other documents submitted as part of the Record. See, e.g., Exhibit M at 17-19. In fact, as is discussed in detail in the Stay Opposition, the documentation in the Record uniformly demonstrates that, contrary to the Petitioners' claims of great expense, the costs to implement the SUSMP will be quite minor.

Finally, this is an example of an area where Petitioners complain of the absence of an analysis that is not even required. The MEP standard is the applicable standard for the municipal stormwater management program, and the fact that dozens of areas around the country already implement more stringent programs than the one outlined in the SUSMP, see Exhibit M at 12-14, in and of itself, should suffice to show that the SUSMP is practicable. It is not necessary to show that the specific costs outweigh the benefits in order to adopt the SUSMP.[10]

3. Reduction in Pollutants to the Maximum Extent Practicable

Petitioners claim that the SUSMP has not been proven to reduce pollutants to the maximum extent practicable, as required by the Clean Water Act. Ps & As at 4 and 8; Bellflower Petition at 19-20.[11] This flies directly in the face of their statement, in another context, that the Board already determined that any implementation of the BMPs would satisfy the MEP standard. See Bellflower Petition at 9, citing LA-RWQCB Res. No. 99-03, Finding 4. Further, the Regional Board's findings

---

[10] Petitioners also argue for a substantive legal requirement, based on the Clean Water Act ("CWA"), its regulations, and the Porter-Cologne Act, requiring the Regional Board to perform a cost-benefit analysis prior to adopting the SUSMP. Ps & As at 7-8; Bellflower Petition at 17-19; see also WSPA Petition at 3. However, they are unable to cite to anything to support this novel claim. Their only CWA-related reference is to a statement from the Federal Register regarding President Clinton's non-regulatory Clean Water Initiative, which is explicitly described as a "proposal." Bellflower Petition at 17. Furthermore, the Clean Water Initiative did not propose a cost-benefit analysis, *per se*, but rather, "taking into account cost considerations as well as water quality effects." 64 Fed. Reg. 68722, 68732 (Dec. 8, 1999). The Regional Board did this. See above and Exhibit M at 15-19. Finally, Petitioners neglect to mention that the first part of the proposal suggests "establishing a phased compliance. . . approach for discharges from municipal separate storm sewer systems with priority on controlling discharges from municipal growth and development areas." Id. (emphasis added), which is exactly what the SUSMP does.

With respect to the Porter-Cologne Act, Petitioners cite to four statutory sections, two of which *allow* the State Board and regional boards to request analyses of water quality where a cost-benefit analysis supports doing so, Cal. Water Code §§ 13165 and 13225, and one of which relates only to the creation of water quality objectives. Id. at § 13241. Since the Regional Board was neither requesting such an analysis nor creating water quality objectives in adopting the SUSMP, these citations are totally irrelevant. (WSPA also cites to Water Code section 13263(a), but its only reference to economics is an implicit one, by virtue of its reference to section 13241, discussed above.) Finally, Petitioners cite to one line in the Permit, which – far from requiring a cost-benefit analysis prior to adopting the SUSMP – requires a developer information program to inform developers about "cost effective storm water pollution control measures." Permit Part 2.III.A.4.c.

[11] Petitioners also complain that the Regional Board did not assess the *Permittees'* proposed SUSMP to determine whether *it* would meet the MEP standard. Bellflower Petition at 15. Of course, this is irrelevant, as the Regional Board's duty is to identify and adopt the most appropriate plan; it is not limited by any requirement to adopt the first plan that crosses its desk and satisfies the MEP standard.

collectively support the reasonableness and practicability of the SUSMP. R-00-02, Findings 7-14. In short, this issue was considered and the Regional Board did make the appropriate findings.

Moreover, it is unclear what Petitioners seek to accomplish with this argument. If they are arguing that the SUSMP has not been "proven" to entirely satisfy the MEP standard, that argues in favor of adopting additional and/or more stringent restrictions, not for reverting to a *less* stringent program. By going further than the Permittees' proposed SUSMP, the Regional Board necessarily came closer to the standard than it would have if it approved the Permittees' proposed SUSMP. Thus, it was required to adopt its version of the version proffered by the Permittees.

If, on the other hand, Petitioners are arguing that the SUSMP exceeds the MEP standard in that it is impracticable, query why the Petitioners present no information regarding its practicability. It is, after all, the Petitioners burden to show that the SUSMP is impracticable. This is especially true given that the Board found that the SUSMP is practicable. See R-00-02, Findings 8-11.

D. Legal Arguments

Petitioners raise a series of legal arguments that are either distortions of existing law or inventions that do not reflect anything in existing law. We address each of these meritless claims in turn, below.

1. The Regional Board Was Not Limited by the Terms of the SUSMP Proposed by the Petitioner/Permittees

Petitioners make the bizarre argument that the Regional Board exceeded its authority precisely because it adopted an SUSMP that included obligations not listed in the Permittees' proposed SUSMP. Ps & As at 3; Bellflower Petition at 13. Of course, the entire purpose of Regional Board review of Permittees' submittals is to give the Regional Board the opportunity to demand more and/or different things from the Permittees than that which the Permittees might voluntarily suggest. Thus, this argument makes no sense, except as an expression of hubris, and perhaps that explains why the Petitioners cite no law in support of this claim.

2. The Regional Board Has the Authority to Impose Requirements that Necessitate Modifications to Municipal Codes.

In their amended petition, the Cities of Bellflower, *et al.*, raise, for the first time, an objection to the requirement that the Permittees amend their municipal codes as necessary to implement the SUSMP. Amended Petition for Review submitted by the Cities of Bellflower, *et al.*, (Apr. 6, 2000) ("Bellflower 2") at 3. As is explained above, see section III, Petitioners cannot raise issues for the first time on review. However, even beyond their failure to raise this issue below, it is simply inaccurate to contend that the Regional Board lacks authority to require the Permittees to take steps to add any necessary legal authority to be able to implement the Permit, including the SUSMP, and to do so by a certain date. The Permit has an entire section requiring Permittees to secure legal authority to implement the requirements of the Permit, and to show that they have done so, Permit, Part 2.I.E., and the regulations promulgated under the federal Clean Water Act ("CWA") explicitly mention this mandate. 40 C.F.R. § 122.26(d)(2(i). Moreover, the Regional Board has inherent authority to require the Permittees to take whatever steps are necessary to ensure the implementation of the BMPs the Board deems necessary to protect the region's waters. See Cal. Water Code §§ 13377, 74 ("regional boards shall, as required or authorized by the [CWA], issue [permits] which apply and ensure compliance with all applicable provisions of the act.")

3. The Regional Board Has the Authority to Impose Requirements on the Permittees Related to the Control of Real Property.

Petitioners also argue for the first time in Bellflower 2 that the Regional Board lacks the authority to impose requirements regarding responsibility for maintenance of the BMPs, and for the transfer of such responsibility with the transfer of property. Id. at 4-5. They claim that the Regional Board has no authority to impose such requirements and that the requirements "may result in a violation of State and Federal law," subject the Permittees to civil damage claims, and infringe on their police powers. Id.

Petitioners do not cite a single statute, case, or other authority for this "parade of horrors" they predict. While Petitioners have failed to disclose what laws they feel will be violated, how they would be subject to liability, or how their police powers would be affected, it is clear that they are substantively wrong about these claims. As a state agency assigned the responsibility to

implement federal law, there is no reason why the Regional Board could not require its municipal Permittees to require developers to include certain conditions in the title to their property, or otherwise regulate the management of property in the public interest. Again, the Permit explicitly requires "each Permittee [to] demonstrate that it possesses the legal authority necessary," Permit, Part 2.E.1, as do the regulations, 40 C.F.R. § 122.26(d)(2(i), and it is therefore explicitly contemplated that there may have to be an enhancement of existing authority.

4. The Regional Board Was Not Required to Undertake Any Formal Assessments of the Sorts Petitioners Allege Were Required Prior to Adopting the SUSMP.

Petitioners argue that the SUSMP will have ancillary negative impacts on things such as groundwater protection and pest control, will create nuisances and liabilities, and that the Regional Board failed to analyze those issues. Ps & As at 7 n.3; Bellflower Petition at 19-20. However, they completely fail to meet their burden, as they cannot even establish the existence of the alleged requirements to assess these specific issues. The only citation they provide for any of these issues is Water Code section 13241, which relates only to the establishment of water quality objectives. Since the creation of water quality objectives was not at issue in the adoption of the SUSMP, this citation is irrelevant, and Petitioners charges have absolutely no basis or merit.

Furthermore, even though not required, some, if not all, of these issues were considered by the Regional Board. With respect to Petitioners' concern for groundwater protection, for example, the Regional Board included a specific exemption in the SUSMP to avoid infiltration in situations where groundwater resources would be placed at risk. See SUSMP Requirement 11 (Waiver). Similarly, because the Regional Board has not mandated that any specific structural BMP(s) must be used in an individual development in meeting the volumetric performance level, the developers and the Permittees can choose those BMPs that minimize any of the issues that may be of concern to them. Finally, the information submitted to the Record showed that similar programs are already underway all across the country. See Exhibit M at 12-14.

5. The Regional Board Was Not Required to Walk the Permittees Through the Implementation Process Prior to Adopting the SUSMP

Petitioners complain that the Regional Board "provided no direction on how the Permittees were to proceed with the implementation of the mandated . . . SUSMP, how such programs could lawfully and reasonably and practicably be incorporated into existing Permittees' Codes . . . and how such . . . codes could realistically be properly reviewed, revised, and implemented throughout the entire County, within six (6) months." Bellflower Petition at 20. The Regional Board was under no obligation to explain to the Permittees how to implement the mandates of the SUSMP within their respective municipal systems. Had the Regional Board done so, the Petitioners would no doubt be complaining about the intrusion on their autonomy. The Regional Board exercised its judgment appropriately and provided a full half-year – despite the fact that the SUSMP is already over a year overdue, see page 2, above – for the Permittees to comply. This is not even a colorable claim regarding the legitimacy of the SUSMP.

6. Neither Water Code 13360, Nor Any Other Provision of Law Cited by the Petitioners, Prohibits the Regional Board from Adopting Specific Criteria for the Control of Municipal Stormwater from Development.

Petitioners argue that the cities should be given flexibility in deciding which BMPs to use. Bellflower Petition at 15-16; WSPA Petition at 3. In fact, they have been given such flexibility. The Regional Board approved a list of literally dozens of different BMPs from which developers and municipal Permittees may choose for any given project. See LA-RWQCB Res. No. 99-03, attached hereto as Exhibit N.

Petitioners further argue, without any support or explanation whatsoever, that the SUSMP requirements mandate a specific manner of compliance, and therefore violate Water Code section 13360. Ps & As at 8; Bellflower Petition at 21. This is untrue for two separate reasons. First, the SUSMP does not mandate any specific manner of compliance with a discharge limit, as prohibited by Section 13360,[12] but is itself an independent compilation of mandatory BMPs and a required performance level for them, unrelated to any discharge limit. Second, even if the SUSMP were to violate Section 13360 – which it does not – the federal Clean Water Act pre-empts such a state law.

[12] All further section references are to the California Water Code, unless otherwise noted.

a) The SUSMP Does Not Dictate How to Comply With a Discharge Limit, But Is an Independent Compilation of Required BMPs and a Sizing Component to Ensure Their Adequate Performance

Section 13360 states that no waste discharge requirement or other order of a regional board "shall specify the design, location, type of construction, or particular manner in which compliance may be had with that requirement, order or decree, and the person so ordered shall be permitted to comply with the order in any lawful manner." Cal. Water Code § 13360. As interpreted by the California Court of Appeal in Tahoe-Sierra Preservation Council v. State Water Resources Control Bd., this means that the Regional Board "may not prescribe the manner in which compliance may be achieved with a discharge standard." 210 Cal. App. 3d 1421, 1438 (1989). The SUSMP at issue in this case does not specify how one is to comply with any "discharge standard." In fact, it is totally independent of any discharge standard; it is a separately-mandated array of BMPs to control runoff from new and redevelopment projects, coupled with a sizing specification to ensure that the BMPs function at an adequate level of performance. The Regional Board has not provided any "discharge standard" – i.e., mandatory level of effluent quality – associated with the SUSMP.

Indeed, the numerical performance level in the SUSMP is similar to the runoff limits for new development upheld by Tahoe-Sierra. In that case, plaintiffs challenged certain provisions of the Lake Tahoe Basin Water Quality Plan that established limits on new development to control runoff. Specifically, the provisions (a) established limits on land coverage for new development in certain designated areas, and (b) prohibited water runoff from new development above that level which would occur if the established land coverage standards were met. The Court of Appeal upheld both the standard and the prohibition on the basis that the Basin Plan did not preclude any means of compliance with the runoff limitation and therefore it did not improperly specify the particular manner of compliance.

Like the volumetric runoff limit in Tahoe-Sierra, the SUSMP establishes a volumetric benchmark for stormwater control, leaving the actual manner of compliance to the individual cities and/or development projects. In fact, the SUSMP's volumetric specification is far more flexible than the runoff standard at issue in Tahoe-Sierra, because (1) in that case, there was arguably only

one practicable way to comply with the standard,[13] and (2) it truly was a discharge "standard," in that it limited the volume of allowable stormwater runoff, rather than a specification of a minimum performance level for required structural devices.

Further, the performance level at issue here requires that whatever post-construction structural BMPs are used,[14] they be sized so as to mitigate storm water runoff from either (1) the 85th percentile 24-hour runoff event; (2) the volume of annual runoff to achieve 80 percent or more volume treatment; (3) the volume of runoff from a .75 inch storm event; or (4) the volume of runoff produced by a 24-hour rainfall criterion for treatment that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event. In addition, the BMPs must control peak flow discharge to provide stream channel and over bank flood protection. See SUSMP (March 8, 2000).

From the plain reading of this provision, it is clear that it does not prescribe the design, location, type of construction, or particular manner in which compliance may be had with any

---

[13] The Court in Sierra-Tahoe also noted that "if under present conditions of knowledge and technology, there is only one manner in which compliance may be achieved, that is of no moment" and there is no violation of section 13360. Sierra-Tahoe, at 1438; see also Pacific Water Conditioning Assoc., Inc. v. City Council, 73 Cal. App. 3d 546 (1977) (holding no violation of section 13360 because the sole manner of compliance was prescribed by the circumstances, not by the order). Thus, a lack of a variety of technological means to comply with a performance level does not transform it into a prescription for the means of compliance – even if such circumstances existed here.

[14] The requirements imposed by the SUSMP are of two types: (1) the BMPs, and (2) the required numerical/volumetric performance level for those BMPs. The essence of the petitions before the State Board is a challenge to the latter. Petitioners rest their contention that the SUSMP constitutes a "discharge standard" on their claim that the SUSMP "mandates the implementation of a specific Numerical Mitigation Standard and specific design standards to be complied with." Bellflower Petition at 21, ¶ 63. Of course, as indicated above, these are not numerical discharge standards, as even some of the Petitioners recognize. See, e.g., Letter from Elroy Kiepke, City Engineer, City of La Cañada Flintridge, to Dennis Dickerson, Regional Board (Dec. 21, 1999), included in the Record, at 1.

However, even if Petitioners did intend to challenge the BMPs themselves, they are no longer permitted to do so, as the BMPs were approved by the Regional Board over a year ago. See Exhibit N. Moreover, the wealth of BMPs available would defeat any claim that the Board dictated the manner of compliance. See note 16. Finally, Petitioners never objected to the BMPs when they were approved, and in fact, many were supportive. In fact, the BMPs in the SUSMP impose the exact same requirements (with the exception of seven substantially similar requirements added by the Regional Board) proposed by the County of Los Angeles, with the support and approval of the rest of the Permittees, in their August 11, 1999, draft SUSMP. Compare Final SUSMP to Ps & As Exhibit A. It was not until the SUSMP was issued, with its volumetric specification for the performance of those BMPs, that the Permittees voiced any opposition.

standard. Instead, the Permittees are free to choose any one of the four numeric levels provided in the SUSMP. Moreover, the Permittees are free to choose the method or manner of compliance and the BMPs to which it will be applied, from a lengthy list of approved BMPs.[15] Finally, the State Board has found that there is no violation of Section 13360 if an order allows a discharger to select from a number of permissible alternatives for achieving compliance with a standard.[16] Thus, it is clear that the SUSMP's numerical specifications do not violate Section 13360.

b) The Federal Clean Water Act Requires the Use of BMPs and Pre-Empts Any State Law in Conflict With That Requirement.

Even assuming, *arguendo*, that the SUSMP violated Section 13360, it would be permissible under other sections of the Water Code. Water Code Section 13377 provides that, notwithstanding any other provision of the Porter-Cologne Act, the State and Regional Boards shall issue NPDES permits as required or authorized by the CWA to ensure compliance with all applicable provisions of the Act. See Cal. Water Code § 13377.

Under the CWA, the Administrator of the United States Environmental Protection Agency ("EPA"), and authorized states, are authorized to issue permits that include any conditions deemed necessary to carry out the provisions of the Act. 33 U.S.C. § 1342(a)(1); NRDC v. Costle, 568 F.2d 1369 (D.C. Cir. 1977). Moreover, CWA section 402(p)(3) actually requires municipal storm water NPDES permits to "require controls . . . including **management practices [BMPs], control techniques and system, design and engineering methods** . . . as . . . appropriate for the control of such pollutants." 33 U.S.C. § 1342(p)(3)(B) (emphasis added).

Further, EPA regulations authorize NPDES permits to require BMPs where reasonably necessary to achieve effluent limitations and standards or to carry out the purposes and extent of the Act. 40 C.F.R. § 122.44(k). BMPs are defined to include "schedules of activities, prohibitions

---

[15] See LA-RWQCB Res. No. 99-03, attached hereto as Exhibit N; Final SUSMP, Table 2 (highlighting the litany of options available).

[16] In the Matter of the Petition of Citizens for a Better Environment, *et al.* for Review of Action and Inaction of San Francisco Regional Water Quality Control Board, State Water Resources Control Board Order No. WQ 90-5 (finding that Cease and Desist Order did not violate Section 13360 because it allowed the dischargers to select the manner of compliance from permissible alternatives specified in the Order)

R0072657

of practices, maintenance procedures, and other management practices to prevent or reduce pollution of 'waters of the United States.' BMPs also include treatment requirements, **operating procedures**, and practices to control plant site runoff . . ." 40 C.F.R. § 122.2 (emphasis added).[17]

Because the CWA authorizes, and indeed requires, the imposition of BMPs in NPDES permits, the Porter-Cologne Act gives the Regional Boards the same authority, via Section 13377.[18] To the extent that these requirements are inconsistent with Section 13360, the authority of the regional boards to implement Section 13377 prevails.[19]

Thus, it is clear that the Regional Board is authorized under the federal Clean Water Act to set forth specific BMPs where necessary to achieve standards.[20] In this case, specific BMPs are reasonably necessary to achieve effluent limitations and standards or to carry out the purposes and extent of the Act. 40 C.F.R. § 122.44(k).

In sum, neither the volumetric performance level nor the narrative BMPs violate Water Code Section 13360.

7. The Regional Board did Not Violate CEQA Because the Adoption of the SUSMP Was Exempt from CEQA Requirements.

Petitioners claim that the Regional Board violated the California Environmental Quality Act ("CEQA"), Cal. Pub. Res. Code §§ 21000 *et seq.*, by failing to consider the potential environmental impacts from the adoption of the SUSMP. Ps & As at 11-12; Bellflower Petition at 23; WSPA Petition at 4-5. Petitioners acknowledge that the Board found its actions to be exempt from CEQA pursuant to Water Code section 13389. However, Petitioners City of Bellflower, *et al* , note that Section 13389 only exempts the adoption of waste discharge requirements ("WDRs"), Ps & As at

---

[17] 40 C.F.R. section 122.1 explicitly includes discharges of storm water as a category of point sources requiring NPDES permits; thus the requirements of Part 122 of the Code of Federal Regulations apply to municipal storm water permit requirements.

[18] See In the Matter of the Petitions of Las Virgenes Municipal Water District et al., State Water Resources Control Board Order No. WQ 80-19 at 20-21 (Nov. 20, 1980); see also In the Matter of the Petition of the Dept. of Parks and Recreation, State Water Resources Control Board Order No. WQ 82-15 at 14 (Oct. 21, 1982)

[19] Id.

[20] See also Defenders of Wildlife v. Browner, 191 F.3d 1159, 1161 and 1166-67 (9th Cir. 1999) (upholding the inclusion of specific structural BMPs in a municipal storm water permit).

R0072658

12, and WSPA argues that it applies only to the adoption of "federally-mandated waste discharge requirements and permits." WSPA Petition at 5. Because the SUSMP is part of a WDR (as is explained below) and is federally mandated (as explained in the prior section and below), its adoption was not subject to CEQA.

a) The SUSMP Is an Element of a Waste Discharge Requirement

The SUSMP is an explicit part of the Permit. Part 2.III.A.1.c. Since the Permit is, on its very face, denominated a WDR, the SUSMP is also part of a WDR. See also 14 C.C.R. § 15263 (the CEQA exemption for WDRs applies to NPDES permits); Cal. Water Code § 13374 (same). Thus, even if the exemption in Section 13389 is limited to the adoption of WDRs, it applies to the whole of the Permit, including the SUSMP, which is thus exempt from CEQA.

Furthermore, viewing NPDES permits (and the SUSMP) as WDRs for purposes of CEQA review was affirmed in Pacific Water Conditioning Ass'n v. City Council, 73 Cal. App. 3d 546 (1977). The court explained that the exemption in Section 13389 is not merely an administrative concession to regional boards who only have 120 days to issue WDRs after receiving a report of intended discharge, but rather, is part of the Porter-Cologne Act ordained specifically to allow the State to administer the NPDES program. Id. at 556. The court states that "[i]t is fairly apparent that the exemption for the promulgation of waste discharge requirements from CEQA contained in Water Code Section 13389 was meant to parallel the exemption for the issuance of NPDES permits from the requirements of NEPA found in Section 1371 of the federal act." Id. at 556. Thus, the fact that the SUSMPs were not separately "agendized" or "noticed" as WDRs is irrelevant, as the whole of the Permit is exempt from CEQA pursuant to Section 13389.

b) The Requirement for BMPs Is Federally Mandated, and Defenders of Wildlife Does Not Negate that Requirement or Make it Discretionary.

As is explained in section IV.D.6.b), above, the implementation of BMPs is mandated by the CWA. WSPA argues that CEQA applies because the "proposed numerical design standards are not federally required." Id. at 4-5.[21] In support of its claim that the SUSMP is "not federally

[21] A general explanation of why the SUSMP was federally mandated is provided above, at pages 23-23. Here, we specifically address WSPA's invocation of Defenders of Wildlife.

R0072659

required," WSPA states that the CWA does not require compliance with "numeric limitations," and it cites to Defenders of Wildlife v. Browner. Id. at 5, lines 5-6. This statement reveals WSPA's fundamental misunderstanding both of the SUSMP and the CWA.

Defenders of Wildlife addressed the question of whether CWA section 402(p) requires the establishment of water quality-based, numeric effluent limits for municipal stormwater discharges. The SUSMP is not a numeric limit, but a minimum performance level established to satisfy the MEP requirement. Nowhere in the SUSMP does it set forth any numerical discharge limitation, either in terms of a maximum volume or pollutant concentration. The numerical specification in the SUSMP is for the sizing BMPs; it establishes no limits on the nature of the eventual discharge. Moreover, even if the SUSMP did include numeric pollution limits, it was not designed in reference to applicable water quality standards, which was the issue in the Defenders of Wildlife case. Thus, that case is irrelevant.[22] What the SUSMP is designed in reference to is the MEP standard, which is mandated by the CWA. See section IV.D.6.b), above; Defenders of Wildlife, 191 F.3d 1159, 1164 (1999). Thus, the SUSMP is the direct result of a CWA mandate, and it is exempt from the requirements of CEQA. By WSPA's logic, requiring that storm drains be cleaned "annually" would be a "numeric limit."

Finally, WSPA mistakenly applies Committee for a Progressive Gilroy v. State Water Resources Control Bd., 192 Cal. App. 3d 847 (1987), to claim that the CEQA exemption of Section 13389 is not applicable to SUSMPs. WSPA Petition at 5. Gilroy is not applicable to the case at hand because the challenged orders in Gilroy were issued under the exclusive authority of the Porter-Cologne Act, and not under the CWA, as the SUSMP was. Id. at 862. As the Gilroy court

[22] The CWA creates a two-pronged system for water quality control. That system imposes both technology-based standards and water quality-based standards. The SUSMP is a technology-based standard. It is based on existing technology and the requirement to control the discharge of pollutants to the MEP standard; it is not designed to ensure achievement of water quality standards. Defenders of Wildlife, on the other hand, involved a dispute over whether municipal stormwater permits had to include numeric effluent limits to meet water quality standards. As indicated above, see footnote 20, Defenders explicitly upheld the imposition of BMPs, as in the SUSMP. Thus, its holding regarding numeric effluent limits is irrelevant to the current dispute.

points out, Section 13372 limits the exemption of Section 13389 to those actions "required under the [CWA]." As is explained above, the SUSMP was a CWA requirement.[23]

In sum, the SUSMP, as a part of a federally-mandated municipal stormwater permit, is both a WDR and federally-mandated, and thus, is exempt from CEQA pursuant to Section 13389.

8. The SUSMP Is Not an "Unfunded Mandate" in Violation of the California Constitution Because it is Part of an NPDES Permit.

Petitioners argue that the SUSMP constitutes an "unfunded mandate" prohibited by the California Constitution, Article XIII.B Section 6. WSPA Petition at 6, Ps & As at 9-10; Bellflower Petition at 21-22. The referenced provision of the Constitution requires state subvention of funds to reimburse local governments when the legislature or a state agency mandates a new program or higher level of service on local agencies.[24] Accordingly, state subvention is not required when the federal government imposes the costs of a new program or higher level of service. Cal. Const. Art. XIII.B, § 6; Hayes v. Commission on State Mandates, 11 Cal. App. 4th 1564, 1581 (1992).

The state Legislature enacted Part 7, within Division 4 of Title 2 of the Government Code, Cal. Gov't Code §§ 17500 *et seq.*, to implement the provisions of the California Constitution at issue.[25] Part 7 defines the types of costs for which the state is required to reimburse local agencies. The fundamental principle is that reimbursement is only required for "costs mandated by the state." Cal. Gov't Code §§ 17561. Such costs are specifically defined to exclude orders issued by regional boards pursuant to the Porter-Cologne Act. Id. at §§ 17514 and 16. Thus, the Legislature clarified that the "unfunded mandate" provision of the California Constitution does not apply to regional board WDRs.

---

[23] As SUSMPs are exempt from CEQA, Petitioners' arguments about the Regional Board's failure to consider potentially significant adverse effects of the SUSMP are irrelevant, as are any references to the potential-impacts and categorical-exemption discussions in Azusa Land Reclamation Co., Inc. v. Main San Gabriel Basin Watermaster, cited in Ps & As at 11-12.

[24] Section 6 of Article XIII.B of the California Constitution provides in pertinent part:

> Whenever the Legislature or any State agency mandates a new program or higher level of service on any local government, the State shall provide a subvention of funds to reimburse such local government for the costs of such program or increased level of service. Cal. Const. Art. XIII.B, § 6.

[25] In the Matter of the Petition of the City of San Bernardino, State Board Order No. WQ 91-08 (July, 18, 1991) ("WQ 91-08") at *5.

R0072661

On this basis, the State Board has routinely found that regional board orders establishing WDRs are not reimbursable. See, e.g., WQ 91-08, supra note 25 at *8 (noting its recommendation to the Commission on State Mandates to deny a claim that WDRs constituted an unfunded mandate for five different reasons, including the facts that the orders were not executive orders and that they were designed to implement federal law). In fact, the State Board has been abundantly clear that the entire NPDES program is exempt from this constitutional requirement. In responding to a claim by the San Diego Unified Port District that including it as a responsible party on an existing NPDES permit violated the "unfunded mandates" provision, the State Board stated:

> We disagree with . . . the contention that this constitutional provision applies to NPDES permits. The requirement to reimburse local agencies for state-mandated costs does not apply to NPDES permits issued by the Regional Boards. The NPDES program is a federally-mandated program. . . . Further, claims for reimbursement of state mandates rest solely with the Commission on State Mandates and not with the agency issuing the underlying order."[26]

It is a therefore a well-established fact that *regional* board orders implementing the CWA are exempt from the requirements of reimbursements.

Petitioners nevertheless attempt to argue that the Regional Board's adoption of the SUSMP was a purely "discretionary" act, see, e.g., Bellflower Petition at 21; WSPA Petition at 6, and that it therefore does fall under the "unfunded mandates" provision. Not only is this irrelevant, based on the standard articulated above, but both the BMPs and the SUSMP clearly are mandated, by both the CWA and the Permit. The SUSMP does not become an unfunded mandate simply because the Regional Board appropriately exercised its discretion in defining the particulars. Moreover, under WSPA's logic (which is again premised on a misunderstanding of Defenders of Wildlife), virtually everything that any regional board did would require state subvention.

9. The SUSMP is Not an Underground Regulation Because it is an Element of a Permit

Petitioners claim that the SUSMP constitutes a "regulation" promulgated in violation of the California Administrative Procedures Act ("APA"). Ps & As at 10-11; Bellflower Petition at 22-

[26] In the Matter of the Petition of San Diego Unified Port District, Order No. WQ 90-3 (May 17, 1990) at *18 (emphasis added).

23; WSPA Petition at 5. Chapter 3.5 of the APA, Cal. Gov't Code §§ 11340-59, prohibits state administrative agencies from issuing any "regulation" without complying with APA procedures for the adoption of regulations. Id. at § 11340.5(a). Regulations that are adopted in violation of these procedures are often referred to as "underground regulations." Frankel v. Kizer, 21 Cal. App. 4th 743, 747 (1993).

However, as indicated above, the APA rules regarding underground regulations apply only to "regulations" as defined in the Government Code. Cal. Gov't Code § 11340.5(a). As Petitioners themselves admit in their brief, "California law does not require administrative agencies to comply with the APA when simply issuing or amending permits, including waste discharge requirements." Ps & As at 10. Petitioners are correct. The APA explicitly excludes the "issuance of [WDRs] and permits pursuant to section 13263" from its ambit. Cal. Gov't Code § 11352(b). Since the SUSMP is an element of the Permit, which is also a WDR, this concession is dispositive of the issue, and the SUSMP is "not subject to [the relevant] chapter" of the APA. Id. at § 11352.

Petitioners, citing Cal. Gov't Code § 11342(g), go on to argue that the APA provides an exception to the exemption for cases in which a permit constitutes a "standard of general application." However, the section cited by Petitioners merely defines "regulation" to include standards of general application; it does not contradict the overarching and admitted restriction on the entire chapter of the APA that is at issue – namely, that it does not apply to permits (even though permits, of course, by definition, do apply generally to all permittees).[27]

WSPA also argues that Government Code section 11352(b) is inapplicable because it exempts only "required" waste discharge requirements and permits. However, the exemption provided by this statutory section is not so limited. Moreover, WSPA provides no basis for its interpretation of the statute as being so limited. Instead, WSPA once again relies on its mistaken assumption that the SUSMP is both water quality-based and a numerical effluent limit for

[27] Nor does Petitioners citation to State Water Resources Control Bd. v. Office of Admin. Law aid them. See Ps & As at 10-11. As Petitioners admit, that case dealt with an amendment to a water quality control plan. Whether or not such plans constitute "regulations" for APA purposes is irrelevant, as the SUSMP is an element of a permit, not a water quality control plan. Furthermore, such plans do not enjoy the benefits of Government Code section 11352(b), which specifically exempts permits and WDRs.

municipal discharges (and therefore not "required") in order to make its interpretation useful to it. The SUSMP is neither. See above. Thus, even under WSPA's unsubstantiated interpretation of Government Code 11352(b) as applying only to "required" WDRs, this section still would apply to the SUSMP, thus exempting it from APA requirements.

E. Request for Stay

Petitioners requests for stays of the SUSMP and various other Regional Board actions are addressed in the accompanying Stay Opposition, which is incorporated by reference herein. In essence, these requests should be denied because Petitioners have completely failed to satisfy the well-established prerequisites for obtaining a stay.

F. Request for a Hearing

All of the Petitioners save WSPA requested a hearing before the State Board. Bellflower Petition at 24. However, State Board regulations establish clear conditions that must be satisfied in order for a hearing to be granted, and those conditions have not been satisfied here. The regulations state:

> If petitioner requests a hearing for the purpose of presenting additional evidence, the petition shall include a statement that additional evidence is available that was not presented to the regional board or that evidence was improperly excluded by the regional board. A detailed statement of the nature of the evidence and of the facts to be proved shall also be included. If evidence was not presented to the regional board the reason it was not presented shall be explained.

23 C.C.R. § 2050 (emphasis added).

Petitioners claim to have had "available evidence [that was] not presented to the Regional Board," Bellflower Petition at 24, yet they provide neither a sufficient explanation of the reason it was not presented, nor a "detailed statement of the nature of the evidence and the facts to be proved." Consequently, by the plain language of the applicable regulations, this request must be denied.

Their only explanation for why the information was not presented is their claim that the Regional Board provided late notice of certain changes and made substantive changes after the close of public testimony. Id. However, it is absolutely appropriate, and even routine, for the Regional Board to make changes to proposals at their hearings. Indeed, that is much of the purpose

of the hearing. Furthermore, as explained above, see § IV.A.2, because the changes were within the scope of the suggestions and challenges that had been circulated for over six months prior to the hearing, or at least were logical outgrowths thereof, the changes were perfectly legitimate. Petitioners had ample opportunity to present any information that they felt was relevant at any time between May of 1999 (see page 8) and January 26, 2000.

Furthermore, Petitioners provide no explanation of what information or evidence they wish to present, making it impossible to determine whether the information is substantively worthy of introduction. Moreover, this failure is in direct conflict with the requirements of the State Board regulations. Consequently, the State Board should deny Petitioners' request for a hearing and should rule directly on the merits of their petitions.

V. CONCLUSION

For all the foregoing reasons, the instant Petitions for Review should be DENIED.

Re: Scheduling of Expert Testimony
Petitions of the Cities of Bellflower, *et al.*, the City of Arcadia, and Western States Petroleum Association, for Review of January 26, 2000 Action of the Los Angeles Regional Board, "and Actions and Failures to Act by Both the Regional Board and Its Executive Officer"

Dear Ms. Jennings:

The Natural Resources Defense Council ("NRDC"), Santa Monica BayKeeper, and Heal the Bay, having been designated as a "party" for purposes of the hearing on the above-referenced petitions (the "Hearing"), are currently arranging witnesses and testimony for presentation at the Hearing. We are writing to formally request that the agenda for the Hearing be structured so as to permit the attendance of Dr. Richard Horner – a national expert on stormwater management who is extremely familiar with the program at issue – as an expert witness. Dr. Horner's testimony is critical to the presentation of our case, for the reasons articulated below. Indeed, his absence due to a scheduling conflict would be prejudicial to our case, given the fact that we received less than thirty days' notice of the Hearing.

Dr. Horner is a professor in the Departments of Civil and Environmental Engineering and Landscape Architecture at the University of Washington, where he has been teaching and conducting research on issues of urban runoff for the past 18 years. He has published over 100 book chapters, articles, and technical reports on the subject of urban runoff.

Dr. Horner is extremely familiar with the standard urban stormwater mitigation plan ("SUSMP") that is being challenged. He has followed the development of the SUSMP, and he has submitted testimony to the Regional Board, in the form of signed declarations accompanying NRDC's comment letters. Indeed, he has served as NRDC's primary consultant in reviewing the SUSMP. Dr. Horner's insights into the SUSMP are therefore unique – if not indispensable.

Fax 212 727-1773

www.nrdc.org

Dr. Horner lives in Seattle and, due to personal obligations, must be back in Seattle by 5 p.m. on the evening of June 7, 2000. The available commercial flights require that, in order for him to meet this prior obligation, he must fly out of Los Angeles International Airport at 12:30 p.m. on June 7. Thus, the only time on June 7 when Dr. Horner is able to testify is between 10 and 11:30 a.m. (Dr. Horner is also available to testify on June 8, but scheduling his testimony then is precluded by the fact that the Hearing may conclude on June 7.)

Dr. Horner has offered to sign a written affidavit that could be introduced at the Hearing. However, State Board regulations require that "[a]ny witness providing written testimony shall appear at the hearing and affirm that the written testimony is true and correct." 23 C.C.R. § 648.4(d). Consequently, his presence will nevertheless be required.

Accordingly, we hereby request that provision be made in the scheduling of the Hearing agenda to assure that Dr. Horner can testify – and, to the extent necessary, be cross-examined – between 10 and 11:30 a.m. on June 7. Alternatively, we request that the State Board guarantee that the Hearing will continue to June 8, in order to permit Dr. Horner to attend.

Thank you very much for your assistance in this matter. Feel free to contact me, at (323) 934-6900, if you have any questions regarding this request.

Sincerely,

David S. Beckman

NRDC Presentation
June 6/7 2000

Types of Filtration Mechanisms

- Sand Filters
- Vegetative Filters
- Catch Basin Inserts
- Other Media Filters (including Compost)

Types of Gravity Separation

- Detention Basins
- Wet Ponds
- Oil/ Water Separators

Development Process of SUSMP

August 10, 1999 - Workshop

September 16, 1999 - Informational Item for the Board

September 16, 1999 - Public Comment before the Board

August - December - Approximately 50 Informal Meetings

December, 1999 - Renewed Release

January 26, 2000 - Second Formal Hearing

Los Angeles Regional Water Quality Control Board
Standard Urban Stormwater Mitigation Plan Hearing
SWRCB/OCC Files A-1280, (a) and (b)

California State Water Resources Control Board
June 7-8, 2000

Presented by:

Natural Resources Defense Council
Santa Monica BayKeeper
Heal the Bay

Mark Gold, D.Env.
Executive Director of Heal the Bay

- D.Env., Environmental Science & Engineering
- M.S., Biology
- Adjunct faculty member, UCLA
- Member of EPA's Federal Advisory Committee for Urban Wet Weather
- Conducted research on local water quality for over 15 years

The Economic Benefits of Clean Coastal Waters

- Ocean Dependent Activities generates approx. $9 billion annually for Southern California
- Coastal tourism generates approx. $2 billion annually to LA County
  (not including fishing, navigation, and other commercial purposes)
- 50-60 million visitors annually to Santa Monica Bay Beaches alone

Urban Runoff Problem in Los Angeles County

- Largest source of impairments to Santa Monica Bay
- Southern California has one of the worst runoff problems in the entire country

Urban Runoff Problem in Los Angeles County

- Beaches with poor water quality
- Aquatic toxicity
- Contaminated Sediments
- Trash and Debris
- Increased erosion and sedimentation and habitat degradation

The 1998 303(d) List of Impaired Waters

In Region 4:

- 156 impaired water bodies and water body segments
- 734 specific impairments
- 19 major pollutants of concern

The 1998 303(d) List of Impaired Waters

Common Contaminants of Concern:

- Heavy Metals - copper, lead, zinc
- Oil and Grease
- Polycyclic Aromatic Hydrocarbons
- Trash and Debris
- Total Suspended Solids (TSS)
- Pathogens
- Nutrients
- Pesticides

Contaminants of Concern in Urban Runoff in the Los Angeles Region

➢ Studies have found that concentrations of contaminants of concern in the region's storm drains exceed federal and state water quality criteria (e.g. 1993 AOC Report)

Beach Contamination due to Urban Runoff in the Los Angeles Region

- Studies have found high levels of indicator bacteria in both wet weather and dry weather in Santa Monica Bay (Gold, et al., 1990 and 1992; Stenstrom and Strecker, 1993)

- Studies have also found elevated indicator bacteria levels in storm drains which discharge to Santa Monica Bay (Gold, et al., 1990)

Adverse Health Impacts of Urban Runoff in the Los Angeles Region

1995 Epidemiological Study found a statistically significant increase in adverse health effects from swimming within 100 yards of a flowing storm drain, including:

- fever
- chills
- ear discharge
- vomiting
- coughing with phlegm
- gastrointestinal illness
- respiratory disease

Toxicity

- Studies have shown toxicity of stormwater flows in the region (e.g. Ballona and Malibu Creeks, Bay, S., et al. (1996))
- SCCWRP study on Ballona Creek:
  - Well developed toxic plume into Santa Monica Bay during rain events extended up to 2 miles offshore
  - Toxicity exhibited two days after rain
  - Zinc and copper accounted for 5-44% of toxicity

Trash and Debris

- 25% of bottom of SM Bay contains man-made materials
- Trash levels have remained consistently high since at least 1977
- Annual Costs to Clean-Up:
  - LA County - $4,000,000
  - City of Long Beach - $970,000
  - Port of Long Beach - $400,000

Contaminated Sediments

- Creates "Toxic Hot Spots" at the Mouths of Rivers
  - 14 Sites of Concern and 7 Hot Spots have been identified in the LA Region
- Marina del Rey/Ballona Creek
  - 725,000 cubic meters identified as contaminated with DDT, Dieldrin, Chlordane, and Metals
- Accumulation of Sediment
- Huge Costs Associated with Dredging

High Flow Rates Caused by Urban Runoff Can Cause Ecological Impairments

- Malibu Creek Watershed
- Natural Creeks
- Habitat Degradation
- Increased Erosion and Sedimentation

Water Quality Impacts of Increased Population Density and Imperviousness

- Increase in peak discharges
- Increase in volume of runoff from storms
- Increase in runoff velocity
- Increase in frequency and severity of floods
- Reduced stream flow during dry weather due to reduced infiltration
- Reduced infiltration and groundwater recharge

The Role of New and Redevelopment in Creating the Problem

- Storm water pollution = volume and velocity of surface runoff + concentration of pollutants in runoff
- By creating impervious surface, development has dramatic effects on increasing the quantity and quality of storm water runoff
- Adverse effects are encountered at 10% impervious surface in a watershed or subwatershed

The CWA Requires the Inclusion of BMPs in Municipal Stormwater Permits

- Municipal storm water permits must "require controls . . . including management practices [BMPs], control techniques and system, design and engineering methods . . . as appropriate for the control of such pollutants." 33 U.S.C. Sec. 1342 (p)(3)(B).

- BMPs are required in permits "where reasonably necessary to achieve effluent limitations and standards or to carry out the purposes and intent of [the] CWA." 40 C.F.R. Sec. 122.44(k)(3).

The CWA Requires the Inclusion of BMPs in Municipal Stormwater Permits

- The CWA also authorizes the EPA and authorized states to issue permits that include <u>any conditions deemed necessary</u> to carry out the provisions of the CWA. 33 U.S.C. Sec. 1342(a)(1); <u>NRDC v. Browner</u>, 568 F.2d 1369 (D.C. Cir. 1977).

The CWA Requires the Inclusion of BMPs in Municipal Stormwater Permits

- Federal regulations require BMPs in permits where reasonably necessary to achieve effluent limitations and standards or to carry out the purposes and extent of the CWA. 40 C.F.R. Sec. 122.44(k).

The CWA Requires the Inclusion of BMPs in Municipal Stormwater Permits

- The Ninth Circuit upheld the inclusion of specific structural BMPs in a municipal stormwater permit. Defenders of Wildlife v. Browner, 191 F.3d 1159, 1161 (9th Cir. 1999).

Versions of the SUSMPs

- Early 1999 - Preliminary Drafts of Model SUSMPs for Cities within L.A. County
- May, 1999 - Los Angeles County's SUSMPs
- May 20, 1999 - "Final Draft" Model SUSMPs
- July 21, 1999 - Submittal of Proposed Model SUSMPs
- August 12, 1999 - Revised Proposed Model SUSMPs
- August 16, 1999 - Proposed Model SUSMPs with Changes by Board Staff
- December 7, 1999 - Final Tentative SUSMP
- March 8, 2000 - Final SUSMP

Versions of the SUSMPs

- Early 1999 - Preliminary Drafts of Model SUSMPs for Cities within L.A. County
- May, 1999 - Los Angeles County's SUSMPs
- May 20, 1999 - "Final Draft" Model SUSMPs
- July 21, 1999 - Submittal of Proposed Model SUSMPs
- August 12, 1999 - Revised Proposed Model SUSMPs
- August 16, 1999 - Proposed Model SUSMPs with Changes by Board Staff
- December 7, 1999 - Final Tentative SUSMP
- March 8, 2000 - Final SUSMP

Water Code Section 13360 Does Not Prohibit the Adoption of Specific BMPs

- The SUSMP is a statutorily mandated compilation of required practices and structures, along with a minimum performance level.

- The SUSMP does not prescribe "the manner in which compliance may be achieved with a discharge standard." Tahoe-Sierra Preservation Council v. State Water Resources Control Bd., 210 Cal. App. 3d 1421, 1438 (1989).

- The SUSMP is similar to the runoff limits for new development upheld in Tahoe-Sierra.

Water Code Section 13360 Does Not Prohibit the Adoption of Specific BMPs

- The CWA requires the use of BMPs and pre-empts any conflicting state law.

- "Notwithstanding any other provision of [the Porter-Cologne Act], the state board or regional boards shall, as required or authorized by the [CWA] . . . issue waste discharge requirements . . . [to] ensure compliance with all applicable provisions of the [CWA] . . ." Cal. Water Code Sec. 13377.

The CWA Requires the Inclusion of Specific BMPs in Municipal Stormwater Permits

- BMPs are defined to include "schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce pollution.... BMPs also include treatment requirements, operating procedures, and practices to control plant site runoff...." 40 C.F.R. Sec 122.2.

The Adoption of the SUSMP is Exempt from CEQA Requirements

- "Neither the State Board nor the Regional Boards shall be required to comply with the provisions of [CEQA] prior to the adoption of any waste discharge requirement." Water Code Sec. 13389.

- The SUSMP is a part of the Los Angeles County Permit, which is a WDR.

Contrary to WSPA's Contention, the Requirement for BMPs is Federally Mandated and Thus Exempt From CEQA

- The SUSMP is mandated by the CWA in that it is a minimum performance level established to satisfy the MEP requirement of CWA sec. 402(p).
- The SUSMP is not a numeric effluent limit.
- WSPA's reliance on Defenders of Wildlife v. Browner is completely misplaced.

The SUSMP is NOT an Unfunded Mandate

Regional Board orders implementing the CWA are exempt from the requirements of reimbursements.

- "The requirement to reimburse local agencies for state-mandated costs does not apply to NPDES permits issued by the Regional Boards."[1]
- Gov't Code Sec. 17514 and 17516 specifically exclude orders issued by Regional Boards pursuant to the Porter-Cologne Act from the requirements of reimbursement.

[1] In the Matter of the Petition of San Diego Unified Port District, Order No. WQ 90-3 (May 17, 1990) at *18.

The SUSMP is NOT an "Underground Regulation" Promulgated in Violation of the APA

- **The SUSMP is not a regulation as defined by the APA.**
- **The APA explicitly excludes the "issuance of [WDRs] and permits pursuant to section 13263." Cal. Gov't Code Sec. 11352(b)**
- **The SUSMP is part of a WDR.**

"Conventional structural BMPs can be a useful element in the management of storm water quality but they are not a panacea to achieve water quality standards."[1]

"Changes in urban planning and design will also be required to address peak flow and volume increases that occur with urbanization."[2]

STATE WATER RESOURCES CONTROL BOARD

In Re: the Consolidated Petitions of the Cities of Bellflower, *et al.*, the City of Arcadia, and Western States Petroleum Association, for Review of Actions and Inaction by the California Regional Water Quality Control Board, Los Angeles Region, and its Executive Officer, in Connection with Order No. 96-054 [NPDES No. CAS614001] and Resolution No. R-00-02 (Jan. 26, 2000).	SWRCB/OCC FILES A-1280, (a), and (b) POST-HEARING BRIEF ON BEHALF OF NRDC, THE SANTA MONICA BAYKEEPER, AND HEAL THE BAY Date: N/A Time: N/A Location: N/A

R0072690

I. INTRODUCTION

The Natural Resources Defense Council, Heal the Bay, and the Santa Monica BayKeeper (collectively, "NRDC") submit this post-hearing brief in response to the four questions raised by the State Water Resources Control Board ("Board") in its June 12, 2000 letter. The answers to the Board's four questions are found by considering the basic, underlying legal standard that governs the development of the program at issue and municipal stormwater programs in general.

The main purpose of the Standard Urban Stormwater Mitigation Plan ("SUSMP") adopted by the Los Angeles Regional Water Quality Control Board ("LA-RWQCB" or "Regional Board") is identical to the federal statutory requirement underlying any municipal stormwater program: to minimize the discharge of pollutants to the maximum extent practicable. SUSMP at 2 and 6; Permit, Part 2; 33 U.S.C. § 1342(p)(3)(B)(iii). While additional requirements also apply, the maximum extent practicable (or "MEP") standard is a fundamental one with which any modifications to the SUSMP must be consistent.

In order to effectively minimize the discharge of pollutants, as required by MEP, a stormwater pollution control program must satisfy a number of requirements, of which two are particularly relevant here: (1) it must be of sufficient scope to address all the major sources of pollution; and (2) it must include a performance standard to ensure that it effects clear requirements, effective controls, and a level playing field. In addition, the ultimate objective of this and other programs implemented under the Permit is "to protect the beneficial uses of receiving waters in Los Angeles County." Permit at 7, Finding 27.

Given these considerations, the .75-inch design standard is the absolute minimum sizing standard that will satisfy the applicable legal requirements. Further, the SUSMP must apply to "environmentally-sensitive areas" and to *both* "ministerial" and "discretionary projects." Finally, the definition of "redevelopment" must remain essentially the same as it is now. By retaining these essential aspects of the SUSMP, as approved by the Regional Board, the Board can assure that the SUSMP program is consistent with the MEP standard. Just as important, the Board can assure that it supports the efforts of a unanimous Regional Board in taking a critical step toward controlling one of the worst storm water pollution problems in the nation.

III. THE BOARD'S FOUR QUESTIONS

A. The 0.75-inch Design Standard

1. Is It the Appropriate Numerical Standard?

The 0.75-inch design standard[1] currently in the SUSMP is the minimum acceptable standard for development planning in the Los Angeles area. A more appropriate standard for development in the Los Angeles area would require projects to be designed to mitigate all the runoff generated from either the first 1.0 inches of rain, or from the a one-year, 24-hour storm, whichever is greater, as recommended by Dr. Richard Horner, a nationally renowned stormwater expert.[2] Nonetheless, as is explained below, the 0.75-inch standard is minimally acceptable for the region.

a) Application of the MEP Standard

The appropriate numerical sizing standard is one that satisfies the underlying requirement to control the discharge of pollutants to the maximum extent practicable. Uncontroverted evidence in the record – as well as common sense – indicates that the greater quantity of water that a structural best management practice ("BMP") is designed to handle, the more pollution it can remove. See also LA-RWQCB Resolution No. R-00-02, Finding 10 ("[t]he ability of any BMP to be effective is limited by the volume of water that the BMP is exposed to in any discrete period of time.") Thus, if the standard were simply to control the discharge of pollutants to the "maximum extent," the answer to the question of the appropriate standard would be simply: "the bigger, the better."

The remainder of the "maximum extent practicable" standard introduces the notion of practicability. It essentially limits the "the bigger, the better" mandate at the point at which it becomes impracticable to design BMPs any larger. "Practicability" can be assessed in this context by the real-world experience of literally hundreds of other jurisdictions across the nation, which already institute programs similar to the SUSMP, with sizing standards far in excess of 0.75

---

[1] In reality, the numerical design standard provided in the current SUSMP provides a more flexible list of four different equations, from which the regulated parties can select. We refer to that standard as "the 0.75-inch design standard" for simplicity.

[2] See NRDC Comment Letter (Sept. 9, 1999) at 1, n.2 (Admin. Record, Vol. VII, Item 30), for a more comprehensive discussion (hereinafter referred to as "September Comment Letter").

R0072692

inches.[3] Locally, the City of Santa Monica has had a similar program in place for several years, employing, for example, a 1.0 inch standard for new parking lots. The fact that so many municipalities have been able to implement programs with sizing standards of 1.0-1.3 inches, without any demonstrated negative social or economic consequences, conclusively demonstrates that it is not impracticable to implement a 0.75-inch standard in Los Angeles. Thus, in order to comply with the legally-mandated MEP standard, the SUSMP must include a sizing standard that is equal to or greater than 0.75 inches.

b) Using Diminishing Returns as a Standard

There are other means of determining the limits of practicability. Several experts around the country have endorsed a system that uses empirical data regarding the pollution removal efficiencies of BMPs as their size increases to find the "point of diminishing returns." This is not the applicable legal standard, but we address it here because of its apparently wide-spread use.

This method recognizes that, as the size of a BMP increases by a fixed amount, the amount of corresponding benefit obtained becomes progressively smaller; hence, "diminishing returns." The County of Los Angeles ("County") used this method to develop its numerical design standard, and the result was the adoption of the 0.75-inch standard. See discussion in September Comment Letter at 2-3 (Admin. Record, Vol. VII, Item 30). The County also incorporated the MEP standard in its analysis. See Id. at 1.

The LA-RWQCB used a version of this approach in developing its standard, as well. The 0.75-inch design standard appears in Section 9 (page 10) of the SUSMP.[4] When this model is used in Los Angeles, and local hydrologic conditions are inserted into the equation, the resulting number is approximately 0.75 inches. Never, in the more-than-a-year that this issue has been being discussed, has any of the Petitioners presented a single iota of actual data to counter this fact.

---

[3] See, e.g., Exhibit L to the brief "Points and Authorities To Be Presented by NRDC, the Santa Monica BayKeeper, and Heal the Bay," submitted to the Board on May 31, 2000.

[4] The first option listed in Section 9 for calculating the minimum size for structural BMPs is to use the industry-standard WEF model and the "maximized capture storm water volume," which is based on this principle of diminishing returns.

c) Support for the 0.75 Inch Standard

Finally, we note that the 0.75-inch design standard is not only minimally acceptable under the MEP standard and repeatedly validated by analyses of diminishing returns, but it is also widely supported by experts and agencies all over the country. In fact, as the Record shows, this standard was supported by *the four leading stormwater experts in the United States*: Dr. Michael Stenstrom (UCLA), Dr. Robert Pitt (Univ. of Alabama), Thomas Schuler (Center for Watershed Protection), and Dr. Richard Horner (Univ. of Washington). It is also supported by the United States Environmental Protection Agency, the California Coastal Commission, and the Santa Monica Mountains Conservancy. The strong support of top-notch experts from every region of the United States serves to underscore that the opposition of some cities and a few industry groups is largely knee-jerk. Rarely, if ever, has *any* technical proposal by *any* Regional Board received such extraordinary national support.

d) Summary

In sum, whatever criterion one selects – the legal standard of MEP, the industry models of diminishing returns, or reliance on expert recommendations – the existing standard is the right one.

2. Should There Be Different Numerical Standards For Different Areas?

Answer: Not beyond what the SUSMP already provides. No change should be made.

As is explained above, see supra at 3 and footnote 1, the SUSMP actually provides four different options for calculating the numerical design standard for structural BMPs. These various formulas take into account both the degree of imperviousness and the local hydrologic conditions. Thus, the numerical design standard is already tailored to both site-specific and regional conditions.

Furthermore, to the extent that the standards are based on principles of diminishing returns, those principles apply equally regardless of the locale. The shape of the curve representing the percentage of pollutants removed relative to the size of the BMPs is essentially the same regardless of how much rainfall occurs or what the characteristics of the site are. Thus, in order to maximize the cost-effectiveness of this program, one can choose an optimal sizing standard (or formula) that works independent of the location within the basin. This is what the LA-RWQCB has done.

Finally, there are the related issues of level playing fields and simplicity. Were a variable standard implemented, some cities are sure to claim that they will be disadvantaged compared to other municipalities. More important perhaps, variable standards would be more difficult to implement and monitor, making the task of reducing runoff pollution more challenging to the RWQCB staff and also to those with the responsibility of complying with the SUSMP.

B. Redevelopment

The "redevelopment" issue became clouded at the Hearing, partly due to ambiguity within the SUSMP, and partly due to the extreme and misleading examples suggested by the Petitioners. NRDC supports the Board's efforts to clarify this issue, while leaving existing definitions largely intact. In addition to answering the Board's specific questions, we attempt to provide a more cogent structure below as well as set forth language that can be used in the SUSMP (see page 8).

As a preliminary matter, it is important to understand the general scope of application of the SUSMP program, and to draw two clarifying distinctions regarding SUSMP requirements.

1. The Scope of the SUSMP Program

There are two separate criteria that must be satisfied by any development project for the SUSMP requirements to apply to it: (1) it must be of a type that is among the nine enumerated categories in the SUSMP; and (2) it must qualify as "new development" or "redevelopment," as defined in the SUSMP. In order to clarify the SUSMP's application, the definition of "redevelopment" should be clarified and there should be a distinction drawn to clarify the application of two different types of SUSMP requirements.

2. Distinction: Baseline BMP Requirements v. Sizing Requirements

The first distinction is between the two types of requirements imposed by the SUSMP, which we refer to as (1) the "baseline BMP requirements" and (2) the "sizing requirement." The baseline BMP requirements appear in Sections 6, 7, and 10 of the SUSMP, and require specific, individual, common-sense BMPs, tailored to the specific type of development at issue. (For example, loading dock areas and fueling stations must be covered, SUSMP at 11 and 12.)

The intent of the SUSMP is that common-sense, "baseline BMP requirements" apply to any development to which they are relevant, regardless of whether it otherwise qualifies as "redevelopment," provided the development meets the first criterion above – i.e., it is among the nine enumerated categories. (In other words, any time a fueling station is built at a gas station, it should be covered; any time a trash containment area is built at one of the nine types of facilities, it should be screened.) Developers should not be able to avoid these basic, common-sense requirements by "piecemealing" their development to keep it under a "redevelopment" threshold.

The "sizing requirement," on the other hand, which appears in Section 9 of the SUSMP, requires the mitigation of a minimum volume of runoff, by designing additional structural BMPs to be at least a minimum size. Here, a threshold is necessary, as the Board recognized in asking what types of projects should be included "within the mitigation requirements?" Thus, the following discussion is limited to the application of the sizing requirement.

3. The Second Distinction – Entire Facility v. Newly Developed Area

The second distinction to bear in mind is a distinction between two different thresholds that trigger compliance with the sizing requirement: first, the type and amount of development that should trigger compliance with the sizing requirement *just with respect to the area developed*; and second, the type and amount of development that should trigger a requirement to bring an *entire facility* into compliance with the sizing requirement, as if the whole facility were being built at that time. The answer to the Board's question (what types of redevelopment should trigger a sizing requirement?) differs depending on how much of a facility the sizing requirement is to apply.

a) Mitigation of the Runoff From the Entire Facility

The intent of the redevelopment provisions was to ensure that, if there is a major change to a facility, the entire facility must come into compliance with the numeric sizing requirement, the 0.75 standard. See, e.g., Hearing Tr. at 304. No one ever intended it to apply to the resurfacing of a roof, as the Petitioners suggested at the Hearing. The first sentence in the current definition of

R0072696

"redevelopment" lists three (3) types of changes that constitute redevelopment:[5] (1) additions of at least 5,000 square feet, (2) additions of at least 50% of impervious surface, or (3) *improvements to fifty percent or more of the existing structure*. It is the third part of this definition that is confusing and should be modified.

In order to accomplish the intended purpose – to apply the numeric sizing requirement to an entire facility only when that facility undergoes a major change – the definition of "redevelopment" should include the second factor from the current definition and an analogous cost threshold (as in the County program). Thus, an entire facility (which falls within one of the nine categories covered by the SUSMP) should have to comply with the sizing requirement whenever any of the following changes are made (whether it be in the context of redevelopment or remodeling – the terminology does not matter, if one of these criteria is met): (1) there is a 50% increase in impervious area, (2) the cost of new improvements exceeds 50% of the market value of the existing improvements (this is consistent with the County's program).

b) Mitigation of Runoff From the Modified/Newly Developed Area

The first factor in the current definition – the addition of 5,000 square feet – was intended to serve as a floor, to ensure that large facilities could not add 49% to their areas without having to comply with the numeric sizing requirement. However, there is some indication that the intent was for very large facilities (e.g., 100,000 ft.^{2}) that add more than 5,000 ft.^{2} of impervious surface <u>but less than 50 percent</u> of their total area to have to comply with the numeric sizing requirement *only on the new area*, rather than having to bring the entire facility into compliance.

NRDC can accept this limitation with one caveat: given that such redevelopment need only mitigate the runoff <u>from the new area</u>, this requirement is actually quite modest. Accordingly, NRDC believes that the threshold should be 1,000 ft.^{2}. The requirement would still exclude minor redevelopment, but there is no reason why redevelopment of more than 1,000 ft.^{2} should be exempt from the mitigation requirement <u>on that redeveloped area</u>. Moreover, since this only applies to the

[5] The second sentence in the definition is meant to be illustrative only, and its specifics of that language is not important, provided the first sentence is clarified, as nothing that does not satisfy the criteria in the first sentence would be regulated based on the second sentence.

R0072697

second of the two SUSMP application criteria, the additional 1,000 ft.^{2} would still have to occur at one of the nine types of enumerated facilities for the requirement to apply.

4. Suggested Language

In order to effectuate the system described above, changes are necessary to the definition of redevelopment, as well as to the scoping language that explains which of the requirements in the SUSMP apply to redevelopment projects. We suggest the following change to the definition of redevelopment and the addition of a section on scope of application, as follows:

a) Redevelopment

" 'Redevelopment' means, on an already developed site, the creation or addition of at fifty percent or more of impervious surfaces or the making of improvements valued at at least 50 percent of the value of the existing improvements. Redevelopment may include, but is not limited to . . ."

b) Scope of Application to Development and Redevelopment

"All of the requirements of this SUSMP apply to any new development that fits within one of the nine enumerated categories.

"All of the requirements of this SUSMP apply to the whole of any facility that fits within one of the nine enumerated categories and that undergoes any 'redevelopment,' as defined herein.

"Notwithstanding a failure to qualify as 'redevelopment,' as defined herein, any addition of 1,000 ft.^{2} of impervious surface to a facility that is among the nine enumerated categories must comply with the mitigation requirement in section 9 of the SUSMP in the newly developed area.

"All of the requirements of this SUSMP other than those in section 9 apply to any changes at existing facilities and any new development that is among the nine enumerated categories."

C. Environmentally-Sensitive Areas

There is no question that location should be a factor in determining the application of the SUSMP. The Permit itself is explicit about that. See Permit, Part 2.III.A.1.a. It is also consistent with the underlying objective of the permit, discussed in the Introduction, of "protect[ing] the beneficial uses of receiving waters." Permit at 7, Finding 27. Creating an additional category for environmentally-sensitive areas is a reasonable way to achieve this goal. Finally, the contention that the Permit only allows for new "development categories" to be added is completely unsupported and nonsensical. There is nothing in the Permit that limits the additional types of categories that the LA-RWQCB may add beyond the seven categories enumerated in the Permit.

R0072698

In addition, because projects within (or discharging to) an environmentally-sensitive area are a category unto themselves, based on the legitimate concern over the beneficial uses of those areas, there is no reason to further restrict the application of the SUSMP based on one or more of the other project types. Any new development or qualifying redevelopment within such an area should be covered. Of course, this would still exclude minor additions (under 1,000 ft^2) to existing developments. No change is necessary in the SUSMP to achieve this.

D. Discretionary Projects

The Board asked two questions: (1) whether the SUSMP should apply to discretionary, as well as ministerial, projects; and (2) how "discretionary" should be defined. The answer to the first question eliminates the need for an answer to the second, as the term "discretionary" is irrelevant. The SUSMP should apply to all project types that meet the two criteria defining the scope of the program (see supra at 5), regardless of whether such projects are deemed "discretionary" or not. Indeed, if the Board were to limit the SUSMP only to the relatively small number of projects which must receive discretionary approvals, the Board would effectively eviscerate the SUSMP.

Indeed, it would be arbitrary and capricious to limit the requirements of the SUSMP only to projects where permits are not "automatically" granted (i.e., discretionary projects). There is no meaningful distinction between discretionary and non-discretionary projects with respect to their potential impact on water quality, their ability to control runoff, or the reviewing agency's ability to ensure that these requirements are satisfied. Indeed, serious runoff pollution problems are defined by the fact that they are created by numerous incremental discharges of pollution, not only or primarily by a relatively few large, "discretionary" projects.

It is, therefore, not surprising that the Clean Water Act makes no distinction between "discretionary" and "non-discretionary" projects; the Act applies equally and generally without consideration of this distinction. In fact, the "discretionary/non-discretionary" dichotomy is an artifact of the California Environmental Quality Act ("CEQA") with no logical or legal applicability here. It would be a logical mistake, and a legal error, to so condition the SUSMP.

With respect to the Permit, although it does highlight discretionary projects, nothing in the Permit limits the LA-RWQCB's authority to apply the SUSMP more broadly. In fact, the Permit explicitly permits the SUSMP to apply to more categories of projects than are enumerated therein. Finally, if the Permit did profess to limit the LA-RWQCB's authority in a manner than prevented it from controlling the discharge of pollutants to the MEP, such a limitation would be invalid. See NRDC Opp. Brief at 9-10. Indeed, the Clean Water Act does not limit the application of the MEP standard to purely discretionary projects.

In sum, the requirements in the SUSMP are just like other commonplace codes (such as the electrical code or the building code) that apply generally. Building inspectors would have to ensure compliance with the SUSMP, just as they routinely do with respect to a myriad of other requirements, prior to issuing an approval. It is critically important that the Board allow the SUSMP provisions to work in the only way in which they will meaningfully reduce polluted runoff: by applying to all projects that fall within the SUSMP's substantive provisions, whether or not deemed "ministerial" or "discretionary" in the CEQA lexicon.

IV. Conclusion

For all the foregoing reasons, the demands within the Petitions for Review should be DENIED and the SUSMP should be upheld and modified as specified above.

Respectfully submitted,

STATE WATER RESOURCES CONTROL BOARD

In Re: the Consolidated Petitions of the Cities of Bellflower, *et al.*, the City of Arcadia, and Western States Petroleum Association, for Review of Actions and Inaction by the California Regional Water Quality Control Board, Los Angeles Region, and its Executive Officer, in Connection with Order No. 96-054 [NPDES No. CAS614001] and Resolution No. R-00-02 (Jan. 26, 2000).	SWRCB/OCC FILES A-1280, (a), and (b) OBJECTIONS TO PETITIONERS' POST-HEARING BRIEF Date: June 7-8, 2000 Time: 10:00 a.m. Location: Torrance Cultural Arts Center

The Natural Resources Defense Council, Heal the Bay, and the Santa Monica BayKeeper (collectively, "NRDC") hereby object to the City of Bellflower, et al.'s post-hearing brief ("brief") on the ground that the brief exceeds the page length requirements imposed by the State Water Resources Control Board ("Board"). The brief also improperly cites documents which are protected by the attorney-client privilege. Each issue is briefly discussed below.

R0072703

First, the Board's June 12, 2000 Order regarding post-hearing briefs ("Order") stated, in pertinent part, that briefs were "subject to a 10-page, double-spaced limit" and that "[n]o new evidence, exhibits, or testimony may be attached." Board's Order at 1. Nevertheless, Petitioners attached a lengthy exhibit to their brief, in violation of the Order. The exhibit is directly responsive to the questions raised in the Board's Order, containing suggested SUSMP revisions. It contains information of exactly the type which was included by other parties in the text of their briefs proper. Petitioners should not be allowed to vastly expand their brief by breaking the rules.

Second, Petitioners purport to cite a communication between a Board attorney and a Regional Water Quality Control Board staff-member. This communication is subject to the attorney-client privilege and, therefore, should not have been used in this quasi-adjudicative administrative proceeding. (In this connection, it is worth noting that the communication does not stand for the premise for which it is cited. Rather, the attorney-client communication reflects a view on what Regional Board *staff* could do, on the one hand, and what the *Regional Board* could do, on the other.)

Therefore, NRDC respectfully requests that the Board strike Petitioners' post-hearing brief because it is significantly violates the Board's Order—as it was clearly calculated to do. The Board also should purge the administrative record of communications which are subject to the attorney-client privilege (or related doctrines protecting attorney work product).

Re: Draft Order: Petitions of the Cities of Bellflower, *et al.*, the City of Arcadia, and Western States Petroleum Association, for Review of January 26, 2000 Action of the Los Angeles Regional Board

Dear Chairman Baggett and Members of the Board:

I. Introduction

The Natural Resources Defense Council ("NRDC"), Santa Monica BayKeeper, and Heal the Bay hereby submit the following written comments on the August 24, 2000 draft order ("Draft Order") issued in the above-entitled matter by the State Water Resources Control Board (the "Board").

Generally, we support the Board's Draft Order and, in particular, those aspects which uphold the general thrust of the SUSMP program and its numeric sizing criteria. In general, we believe that the Draft Order, if finalized, constitutes a critical step forward in the battle to control this State's leading source of water quality impairment—polluted runoff.

Nevertheless, we are very troubled by three aspects of the Draft Order, each of which constitutes a substantial weakening of the SUSMP program approved by the Los Angeles Regional Water Quality Control Board ("Regional Board"). By overturning the Regional Board's inclusion in the SUSMP of retail gasoline outlets ("RGOs"), Environmentally Sensitive Areas ("ESAs"), and ministerial projects, the Board proposes to open serious loopholes in the plan. Not only is each of these three exclusions in the Draft Order legally unsupported, but each also constitutes extremely poor public policy. The role of this Board should be to support efforts by Regional Water Boards to tailor pollution reduction programs to the needs of the watershed. These three elements of the Draft Order constitute a profound deviation from this role.

II. Standard that Governs this Board's Review of the SUSMP.

As we described in our briefs, and at the hearing in this matter last June, the Board's role here is circumscribed by well-settled law. In short, the Board's actions must be based on substantial evidence in the record; furthermore, the basis and reasons provided by the Regional Board in support of the challenged action may not be disturbed where they are sound and well-justified in the record. *See In the Matter of the Petition of Stinnes-Western Chem. Corp.*, WQ 86-16 (Sept. 18, 1986) at 16-18.

III. The Board Must Revise the Draft Order and Uphold the Regional Board's Inclusion of Gas Stations, Environmentally-Sensitive Areas, and Ministerial Actions in the SUSMP.

The vast majority of the Draft Order clearly complies with the applicable legal requirements, but three elements just as patently do not: the RGO, ESA, and ministerial actions issues. With respect to each area, the Board appears to have ignored copious evidence in the administrative record that supports the Regional Board's actions while failing to articulate a reasonable basis, and substantial evidence, in support of its own proposed course.

A. The Board's Draft Order Fails to Identify A Single Valid Basis for Excluding Retail Gasoline Outlets from the Provisions of the SUSMP.

The Draft Order concludes that RGOs should not be subject to the SUSMP's numeric design criteria for three reasons: RGOs are "heavily regulated," relatively small (and therefore allegedly unable to treat storm water), and existing BMP approaches "should be adequate to achieve MEP." Draft Order at 22. None of these conclusions is supported by evidence in the record. Indeed, the Board's approach here is directly contrary to evidence submitted and testimony adduced at the June hearing in this matter.

First, there is not a scintilla of evidence in the record to support the notion that RGOs need not be subject to the SUSMP's design requirements because they are already "heavily regulated," the first premise advanced in the Draft Order. In fact, both the Geomatrix report prepared for WSPA, "Storm Water Best Management Practices for Retail Gasoline Outlets," and the California Storm Water Quality Task Force's "Best Management Practice Guide for Retail Gasoline Outlets" discuss the applicable regulatory context. Neither document identifies any regulatory program that even approximates the SUSMP's design requirements, nor any existing requirement that interposes any impediment to structural treatment approaches. *See* "Storm Water Best Management Practices for Retail Gasoline Outlets" ("Geomatrix") at 1-2; "Best Management Practice Guide for Retail Gasoline Outlets" ("SWQTF") at 2-3.

Second, there is not a scintilla of evidence in the record to support the concept that the "relatively small size" of RGOs precludes structural treatment approaches in general or those designed in compliance with the SUSMP numeric design approach specifically. In fact, the Geomatrix study discusses a wide variety of structural treatment approaches.

Far from stating or implying that these are impractical due to RGO size, WSPA's own consultants recognized that these approaches can, and would, be installed at RGOs:

> In the event that the practical pollution prevention measures described above [sweeping, canopies, etc.] are determined to be insufficient, *or in areas where additional controls are mandated*, it may be necessary to install storm water treatment devices.

Geomatrix at 15 (emphasis added). The Geomatrix report goes on to discuss appropriate structural BMPs and their relative effectiveness at controlling various pollutants, and WSPA's consultants even include references "that provide sufficient design level information . . . ." *Id.* Nowhere is any analysis provided that suggests that RGOs could not meet the SUSMP design standard. It is, therefore, nonsensical for the Board to rely on the "relatively small size" of RGOs as a basis for excluding them from a treatment requirement. The fact that installation of these devices is not desirable from WSPA's perspective is beside the point. *See Geomatrix* at 15-31.

Third, the record also does not provide even remote support for the Draft Order's vague suggestion that existing approaches "should be adequate" to meet MEP. Draft Order at 22. In fact, no state or federal agency has ever stated or implied that "existing approaches" are adequate to meet MEP. Just the opposite is true. The SWQTF document, for example, is prefaced by a half-page disclaimer which states, among other things, that no water board in California has "endorsed the contents" therein. SWQTF at 1. Indeed, the authors of the SWQTF report (who notably include representatives of ARCO, Unocal, Chevron, WSPA, and Geomatrix) do *not* state that the guide is intended to represent MEP.[1]

Critically in this connection, WSPA and its own experts have admitted that runoff from even "*properly operated and maintained RGOs*" is "not appreciably different" from sources which this Board and the Regional Board have determined, consistent with the MEP standard, must be subject to the SUSMP. *Geomatrix* at 32 (emphasis added). The Draft Order's exclusion of RGOs is, therefore, entirely arbitrary. By treating equally polluted sources, such as RGOs and parking lots, in a fundamentally different manner, the Draft Order fails to apply the MEP standard in an even-handed way. The Draft Order must be revised so that RGOs must meet all SUSMP requirements.

[1] To the contrary, they suggest that the collected BMPs discussed in the SWQTF report are intended to serve as a "default" approaches for the State, a purpose which logically presumes the necessity to go beyond "default" where circumstances require it.

B. **The Board's Draft Order Errs by Not Upholding the Applicability of the SUSMP to ESAs and Then Directing the Regional Board To Supply an ESA Threshold.**

Environmentally Sensitive Areas, known as ESAs, require the highest degree of protection from polluted urban runoff, and yet this Board proposes to offer these areas no protection at all. Because of apparent confusion over the manner in which the SUSMP is intended to work, an unsupported impression of the efficacy of current law in protecting ESAs, and an unwillingness to remand this issue back to the Regional Board for additional clarification, the Board suggests that it is indifferent to protecting California's most vulnerable ecosystems. We doubt that these are the Board's intentions and suggest a better course, one which is consistent with law: uphold the Regional Board's inclusion of ESAs in the SUSMP and direct the Regional Board to supply a new development project threshold after appropriate public notice.

First, the Draft Order betrays a misunderstanding of how the SUSMP applies to ESAs. The Draft Order suggests critically that the SUSMP, in this instance, is not "relatively simple to apply." Draft Order at 24. In point of fact, it is simple to apply when it comes to redevelopment projects. As to redevelopment, the generally applicable 5000 square foot SUSMP threshold applies to ESAs just as it does to any other development category. Hence the notion that the SUSMP might be triggered by something as small as a patio addition in an ESA is as absurd as it is calculated to frighten the Board. As for new development, the Regional Board appeared to concede that a minimum sizing threshold should be used—a revision which the Board acknowledges would clarify the SUSMP in regard to new development in or near ESAs.

Second, as with the RGO issue, here again the Board asserts, without foundation, that development in ESAs is already subject to "extensive regulation under other regulatory programs." Draft Order at 24. While it may be true that other programs, such as this Board's own Areas of Special Biological Significance ("ASBS") rules, can condition new development's impacts on water quality, there is no evidence in the record that demonstrates that these unnamed programs offer equivalent protection. For example, many ESAs would not come under this Board's ASBS program. Moreover, just this month, some dischargers have challenged the applicability of the ASBS protections to inland discharges and to storm water discharges, whether direct or indirect. Finally, even where ecologically sensitive areas have been designated with some sort of special status (such as Malibu Creek and Lagoon in Southern California), this has not prevented them from becoming polluted.

In short, the Board's premise does not withstand analysis and is faulty. Furthermore, it is entirely unsupported in the record as a basis to exclude ESAs from the SUSMP. Orders of the Board, like those of any administrative agency, cannot rest on cursory conclusions without support in the record. *See, e.g.*, 23 C.C.R. Section 648.7 ("[a]ny final decision of the Board . . . shall be based on the record and shall include a statement of reasons for the decision . . . .").

Third and finally, while the Draft Order's conclusion regarding ESAs is not explicitly predicated on the issue of whether ESAs are appropriately considered "development categories," there can be no question that the Regional Board's use of that term encompasses ESAs. Draft Order at 24. In arguing the contrary position, Petitioners attempt to make a linguistic mountain out of a molehill. The best evidence of whether the Regional Board considered ESAs to be a "development category" is to consider those permits issued by the Regional Board contemporaneously with the SUSMP. Those permits, Order No. 99-060 (City of Long Beach) and Order No. 00-108 (Ventura County), *make clear that SUSMP provisions apply to "development categories" and explicitly include ESAs as one such category. See* City of Long Beach Municipal Storm Water Permit, Order No. 99-060, at 16-17 and Ventura County Storm Water Permit, Order No. 00-108, at 16-17. This is direct and cogent evidence that the Regional Board considers "development categories" to include ESAs. Whether or not the Regional Board's phraseology here is artful is immaterial.

For these reasons, the Regional Board did not err by including ESAs in the Los Angeles County SUSMP, and this Board should not overturn this essential aspect of the SUSMP. The Board, instead, should remand the narrow new development "threshold" issue to the Regional Board. Remanding issues to a Regional Board is consistent with the Board's typical practice and, in this instance, is particularly appropriate given the Los Angeles RWQCB's great familiarity with the underlying issues.

IV. While the Permit Does Refer to Discretionary Projects, These References Do Not Amount to a Limitation on Applying the SUSMP to Non-Discretionary, or Ministerial, Projects.

The Draft Order identifies a number of references in the Permit to "discretionary" projects. Draft Order at 25. Petitioners claim that these references constitute a prohibition on the application of the SUSMP to non-discretionary projects. The Draft Order sustains Petitioners argument, although the Draft Order properly notes that "the limitation of the SUSMP to discretionary projects may not be sufficiently broad for an effective storm water control program." Draft Order at 25.

Nevertheless, neither the Petitioners nor the Board in the Draft Order have identified a single place in the Permit which "prohibits" or "limits" the SUSMP provisions to discretionary projects. Under the circumstances, the Board errs in transmuting the Permit's implied focus on discretionary projects into something it is not: a limitation on application to non-discretionary, or ministerial, projects.[2]

Rules of statutory construction, while not directly applicable to the interpretation of a permit, set forth approaches which are relevant nonetheless. It is a "cardinal rule of

[2] In this connection, it is logical that the Permit would focus on the largest projects, those that are typically "discretionary." These projects may, on their own, pose significant water quality threats and be subject to extensive public debate. The Permit's focus does not necessarily exclude application of the SUSMPs to run-of-the-mill ministerial projects, which naturally would not necessarily be the focus of extensive discussion.

statutory construction that courts must not add provisions to statutes." Security Pac. Nat'l Bank v. Wozab, 51 Cal. 3d 991, 998 (1990). Literal interpretations should be made unless repugnant to the obvious purpose of a statute. Duty v. Abex Corp., 214 Cal. App. 3d 742, 749 (1989).

Applying these rules to the Permit, it is clear that the Board is adding a prohibition to the Permit where the plain words of its text provides none. Likewise, the Board is failing to literally interpret the Permit. The Board is, instead, surmising the meaning of the Permit based on the interrelationship between a number of permit provisions, none of which states or approximates the extreme conclusion the Board is, *itself*, supplying (an absolute prohibition on application of the SUSMP to ministerial projects).

Even if the Board's interpretation of the Permit were correct, the fact that the Board itself recognizes that its interpretation is at odds with the probable needs of an adequate storm water control program (Draft Order at 25) has consequences which the Board may not avoid. The Board, essentially, is saying that the underlying Permit is (most probably) flawed in that, by not extending the SUSMP to ministerial projects, it does not control storm water pollution to the maximum extent practicable, as the Clean Water Act requires. At minimum, therefore, the Board must, consistent with the logic of its Draft Order, order the Regional Board to reopen and address this impermissible limitation in its current Los Angeles County storm water permit. It is inconsistent with the Board's duties here to recognize such an important shortcoming, in such an important element of the State's water quality control program, without assuring that the issue is remedied promptly.

V. Conclusion

For all of these reasons, we respectfully request that the Board finalize the Draft Order as proposed, but with the following important changes:

1. Affirm the applicability of the SUSMP's numerical sizing criteria to Retail Gasoline Outlets;

2. Affirm the applicability of the SUSMP, and its numeric sizing criteria, to Environmentally Sensitive Areas and remand the narrow issue of what new development threshold should apply to the Regional Board; and

(continued . . .)

3. Affirm the applicability of the SUSMP, and its numeric sizing criteria, to non-discretionary, or ministerial, projects and approvals.

Sincerely,

David S. Beckman

Re: Petition for Review of January 26, 2000 Action of the California Regional Water Quality Control Board, Los Angeles Region, and Actions and Failures to Act By It and Its Executive Officer, Dennis Dickerson, Pursuant to Order No. 96-054 (NPDES No. CAS 61400)

Dear Ladies and Gentlemen:

The undersigned serves as City Attorney for the City of Arcadia, California ("Arcadia"). Pursuant to Title 23 California Code of Regulations ("CCR") Section 2050, et seq., Arcadia hereby petitions the State Water Resources Control Board (the "Board"), pursuant to California Water Code Section 13320 and applicable California law, for review of the above actions and failures to act. Arcadia further requests an Immediate Stay pursuant to California Water Code Section 13321 and Title 23 CCR Section 2053, and further requests a Hearing pursuant to Title 23 CCR Section 2050(b).

Arcadia makes reference to the filing with the Board of a certain "PETITION FOR REVIEW OF JANUARY 26, 2000 ACTION OF THE CALIFORNIA REGIONAL WATER QUALITY CONTROL, LOS ANGELES REGION, AND ACTIONS AND FAILURES TO ACT BY IT AND ITS EXECUTIVE OFFICER, DENNIS DICKERSON, PURSUANT TO NO. 96-054 (NPDES NO. CAS 614001), filed with the Board together with supporting and related documents

on or about February 25, 2000 in the matter captioned, "The Cities of Artesia, et seq., et al. v. the California Regional Water Quality Control Board, Los Angeles Region, et al." (the "Related Petition"). Arcadia deems the facts, allegations and matters set forth in the Related Petition to be applicable to Arcadia and hereby joins in and intends to rely upon the Related Petition for purposes of Arcadia's Petition. Pursuant to Title 23 CCR Section 2050, Arcadia further sets forth the following:

(1) The City of Arcadia is a municipal corporation organized and existing under the laws of the State of California and located in the County of Los Angeles, California, and is governed by its Charter. Arcadia's address is City of Arcadia, 240 West Huntington Drive, P.O. Box 60021, Arcadia, California 92066-6021.

(2) Arcadia is a permitee under that certain Permit issued by the California Regional Water Quality Control Board, Los Angeles Region, on July 15, 1996, Waste Discharge Requirement for Municipal Storm Water and Urban Run-Off Discharges within the County of Los Angeles, Order No. 96-054 (NPDES No. CAS 614001). Arcadia is an interested aggrieved party as Arcadia is adversely impacted by actions taken by the California Regional Water Quality Control Board, Los Angeles Region and Dennis Dickerson ("Respondents") in connection with a Regional Board mandated Standard Urban Storm Water Mitigation Plan imposed on Arcadia and other interested parties on January 26, 2000, and as Arcadia is adversely impacted by failures to act on the part of the Respondents in connection with a Standard Urban Strom Water Mitigation Plan submitted by Arcadia and other parties in July of 1999. Arcadia is challenging the actions taken by the Respondents on January 26, 2000 and the failures of the Respondents to act lawfully in reviewing and approving the Standard Urban Storm Water Mitigation Plan submitted by Arcadia and other parties, in accordance with state and federal law, as described in the Related Petition.

(3) The date on which Respondents acted or failed to take appropriate action was January 26, 2000. On and after that date, the Respondents have continued to fail to take appropriate action as set forth in the Related Petition.

(4) Arcadia alleges that the actions and failures to act by the Respondents are inappropriate and improper, and in support of this allegation incorporates by reference herein the Related Petition and, without limitation, Paragraphs 11 through and including 75 thereof.

(5) Arcadia is aggrieved as result of the actions and failure to act by the Respondents and, in support in of this allegation, incorporates by reference herein the Related Petition and, without limitation, Paragraphs 11 through 86 thereof.

(6) Arcadia requests that the Board grant to Arcadia the relief set forth in Paragraphs (1) through and including (6) on pages 27 and 28 of the Related Petition, as if Arcadia were one of the "Petitioners" as described therein.

(7) Arcadia hereby incorporates by reference, joins in and relies upon the Related Petition including, without limitation, the statement of points and authorities filed in support of the Related Petition.

(8) Arcadia understands and believes that, as set forth in Paragraph 79 of the Related Petition, a copy of a request to the Regional Board requesting the preparation of the Regional Board's record in connection with this matter, including a request for a copy of the audiotapes and the reporter transcripts of the January 26, 2000 hearing, as well as a request for a list of persons the Regional Board has identified as having an interest in the subject matter of this Petition, has been served on the Regional Board.

(9) This Petition has been set to Respondents Regional Board and its Executive Officer.

(10) Arcadia relies upon the matters as set forth in Paragraph 79 of the Related Petition with respect to the preparation of the Regional Board's record.

Arcadia hereby requests a Hearing pursuant to Title 23 CCR Section 2050(b). In support thereof, Arcadia relies upon the facts, allegations and matters set forth in the Related Petition including, without limitation, Paragraphs 76 through and including 78 thereof.

Pursuant to Title 23 CCR Section 2053, Arcadia seeks a stay of the action taken by the Regional Board and any subsequent action to be taken by the Executive Officer in imposing the Regional Board SUSMP, as that term is defined in the Related Petition, in clear violation of the terms of the Permit and state and federal law in order to avoid substantial harm to Arcadia. In support of its request for a stay, Arcadia relies upon the Related Petition including, without limitation, Paragraphs 80 through and including 86 thereof, and all documents filed by the Petitioners in the Related Petition in support thereof.

Please contact the undersigned with respect to any correspondence and other communication submitted to Arcadia concerning this Petition.

Very truly yours,

Stephen P. Deitsch

PROOF OF SERVICE

I, Monica F. Almore declare:

I am a resident of the State of California and over the age of eighteen years, and not a party to the within action; my business address is Best Best & Krieger LLP, 3750 University Avenue, Suite 400, P.O. Box 1028, Riverside, California 92502-1028. On July 7, 2000, I served the within documents:

PETITIONERS' POST-HEARING REPLY BRIEF TO JUNE 12, 2000 STATE BOARD INQUIRY

☐ by transmitting via facsimile the document(s) listed above to the fax number(s) set forth below on this date before 5:00 p.m.

☒ by placing the document(s) listed above in a sealed envelope with postage thereon fully prepaid, in the United States mail at Riverside, California addressed as set forth below.

☐ by causing personal delivery by of the document(s) listed above to the person(s) at the address(es) set forth below.

☐ by personally delivering the document(s) listed above to the person(s) at the address(es) set forth below.

☐ I caused such envelope to be delivered via overnight delivery addressed as indicated on the attached service list. Such envelope was deposited for delivery by **{Overnight Delivery Name Inserted Here}** following the firm's ordinary business practices.

See Attached Service List

I am readily familiar with the firm's practice of collection and processing correspondence for mailing. Under that practice it would be deposited with the U.S. Postal Service on that same day with postage thereon fully prepaid in the ordinary course of business. I am aware that on motion of the party served, service is presumed invalid if postal cancellation date or postage meter date is more than one day after date of deposit for mailing in affidavit.

I declare under penalty of perjury under the laws of the State of California that the above is true and correct.

Executed on July 7, 2000, at Riverside, California.

Monica F. Almore

STATE WATER RESOURCES CONTROL BOARD

In the Matter of the Petition of WESTERN STATES PETROLEUM ASSOCIATION, Petitioner, For Review of the Los Angeles Regional Water Quality Control Board's January 26, 2000 Approval of the Standard Urban Stormwater Mitigation Plan Regulation	FILE NO. _____ PETITION FOR REVIEW OF THE REGIONAL WATER QUALITY CONTROL BOARD -- LOS ANGELES REGION'S JANUARY 26, 2000 APPROVAL OF THE STANDARD URBAN STORMWATER MITIGATION PLAN REGULATION

I. INTRODUCTION

The Western States Petroleum Association ("WSPA") requests that the State Water Resources Control Board ("State Board") review the Regional Water Quality Control Board -- Los Angeles Region's ("Regional Board") January 26, 2000 approval of the Standard Urban Stormwater Mitigation Plan ("SUSMP"). The Regional Board's failure to follow mandatory procedural requirements and failure to adequately consider the economic consequences of its action require that the State Board reverse the Regional Board's action. This petition is filed pursuant to California Water Code Section 13320 and Title 23, California Code of Regulations, Section 2050.

R0072722

II. INFORMATION REQUIRED BY SECTION 2050

In support of WSPA's Petition For Review, WSPA provides the following information as required by Title 23, California Code of Regulations, Section 2050:

A. The Petitioner is the Western States Petroleum Association, 505 N. Brand Blvd., Suite 1400, Glendale, California 91203.

B. Petitioner requests review of the Regional Board's January 26, 2000 approval of the SUSMP regulation which, among other requirements, mandates treatment control best management practices including numeric design standards. These standards would impact a number of project categories, including retail gasoline outlets. As of the date this petition was prepared, the final approved Regional Board resolution was not yet available from the Regional Board.

C. The Regional Board's approval of the SUSMP regulation occurred on January 26, 2000.

D. The Regional Board's action was improper for the following reasons: 1) The Regional Board's Mandate Of Specified Numerical Design Standards Without Properly Evaluating Their Economic Consequences Is Arbitrary, Capricious and Contrary to Law; 2) The Regional Board Did Not Allow Adequate Time For Public Review of Significant Changes To The Proposal; 3) The Regional Board Did Not Satisfy CEQA Requirements; 4) The Regional Board Has Not Complied with the Administrative Procedure Act; and 5) The Numeric Design Standards Are An Unfunded Mandate.

WSPA incorporates herein by reference the statement of points and authorities at Part II. G below. As the Regional Board has not yet made its final approved order available, additional grounds for review of the Regional Board action may be discovered at a later date. If needed, further details regarding the Regional Board's action and the grounds for review will be provided in supplemental pleadings.

E. WSPA is a trade association representing approximately thirty companies engaged in all aspects of the exploration for, production, refining, transportation and marketing of petroleum and petroleum products in the Western United States. WSPA is aggrieved by the Regional Board's action because many of its members own or operate retail gasoline stations in the portion of

California that will be impacted by the SUSMP regulation's mandatory requirements on retail gasoline outlets. In particular, the SUSMP regulation's numeric design standards will impose significant unnecessary costs and expenses on these WSPA members during the construction of new retail gasoline outlets. In addition, WSPA, as an advocate for its members, has an interest in ensuring that the Regional Board's orders and regulations are reasonable and in compliance with applicable legal requirements.

F. WSPA requests the State Board either delete the numeric design standards applicable to retail gasoline outlets from the Regional Board's order or that the State Board remand the matter to the Regional Board with directions to do the same, and requests such other relief as any subsequently discovered facts may indicate is appropriate.

G. WSPA provides the following statement of points and authorities in support of this Petition. As the Regional Board has not yet issued its final approved order with respect to this matter, additional grounds for review of the Regional Board's action may be discovered at a later date. If needed, supplemental Points and Authorities will be submitted.

Several procedural and substantive defects in the Regional Board's action require the reversal of the Regional Board's approval of the SUSMP regulation and the mandated numeric design standards applicable to retail gasoline outlets. Each of these defects is described below.

1. The Regional Board's Mandate Of Specific Numerical Design Standards Without Properly Evaluating Their Economic Consequences Is Arbitrary, Capricious and Contrary to Law.

The Regional Board must evaluate "economic considerations" when establishing waste discharge requirements and water quality standards. Water Code Sections 13241(d) and 13263(a). In addition, the Regional Board is prohibited from specifying the "design, location, type of construction, or particular manner" for compliance with a Regional Board requirement or order. Water Code § 13360(a). Contrary to this authority, the SUSMP regulation requires implementation of specified numeric design requirements to mitigate storm water runoff. The Regional Board performed no analysis to determine whether any of the specified numerical design standards would be economically achievable or reasonable if applied to retail gasoline outlets. The evidence before the Regional Board showed that such numeric standards were unnecessary, expensive and would

provide little or no environmental benefit. In fact, that evidence indicated that such standards could result in an environmental detriment. Because the Regional Board had no basis to show that the numerical design standards were economically reasonable or practicable, the Regional Board's application of such requirements to retail gasoline outlets is arbitrary, capricious and contrary to its authority.

2. The Regional Board Did Not Allow Adequate Time For Public Review of Significant Changes to The Proposal.

The 19-page Staff Report and Record of Decision supporting the proposal was only released on January 18, 2000 -- just eight days before the Regional Board's action. In addition, a Change Sheet containing significant substantive modifications to the proposal was released on Friday, January 21, 2000 and the revised version of the proposal was not made available to the public before the Regional Board hearing. By delaying the release of these key documents, the Regional Board violated due process by depriving affected members of the public of an adequate opportunity to review and comment.

Moreover, the short time period allowed for public review of these critical documents is contrary to the public review requirements contained in the Regional Board's prior Order No. 96-054. That order required a 45-day period for interested parties to submit comments and provided the Executive Officer with a 120-day period to consider the proposal and comments before reaching its decision. Due to the late release of key documents, the Regional Board's staff prevented the requirements of Order No. 96-054 from being fulfilled and the public was deprived of the opportunity to meaningfully participate in the agency's process.

3. The Regional Board Did Not Satisfy CEQA Requirements.

The Regional Board's action will have a significant impact on the environment because it would require many new construction projects to submit an Urban Storm Water Mitigation Plan for approval and implement specific post-construction controls, which, in the case of retail gasoline outlets at least, could have potentially significant adverse effects on groundwater. Since the proposed numerical design standards are not federally required and they will significantly affect the

environment, the Regional Board must follow CEQA requirements if it wishes to adopt such standards.

The Regional Board's Staff Report incorrectly suggested that the proposed numerical design standard is federally required by Section 402(p) of the Clean Water Act. Contrary to the Regional Board's interpretation, the Clean Water Act does not require municipal stormwater discharges to comply with numeric limitations -- any such requirements are discretionary. Defenders of Wildlife v. Browner, 191 F.3d 1159, 1166-67 (9th Cir. 1999). Therefore, the Regional Board's adoption of numerical design standards, if authorized at all, must be through its State authority.

The Regional Board's Staff Report asserted that the proposed regulation is exempt from CEQA by reason of Water Code Section 13389, however, that section only exempts the adoption of federally-mandated waste discharge requirements and permits. See Water Code § 13372; Committee for a Progressive Gilroy v. State Water Resources Control Bd., 192 Cal. App. 3d 847 (1987). As noted, since numeric design standards are not federally-mandated, CEQA review of the SUSMP regulation is required.

4. The Regional Board Has Not Complied with the Administrative Procedure Act.

The Regional Board did not follow the requirements of the California Administrative Procedure Act (APA). The APA applies because the numeric design standards are a standard of general application which meets the APA definition of a regulation. See Government Code Section 11342. Contrary to the assertion in the Regional Board's Staff Report, Government Code Section 11352(b) does not exempt the proposal from the APA because this provision only exempts required "waste discharge requirements and permits" and, as described above, neither federal nor state law requires numeric design standards to be included in permits. Therefore, the Regional Board's adoption of the numeric design standards is a quasi-legislative action and the APA applies. Moreover, the Regional Board Staff Report's assertion that any challenge to the Regional Board's action would be untimely is ludicrous. The numerical design standards were added to the proposed SUSMP regulation shortly before it was adopted and the Regional Board's final approved order evidencing such action has not yet even been finalized.

5. The Numeric Design Standards Are An Unfunded Mandate.

The proposed numeric design standards also constitute an unfunded mandate prohibited by the California Constitution. See Cal. Constitution Art. 13B § 6. Since the numeric design standards are not required by any federal law and have been adopted through a discretionary exercise of authority by the Regional Board, the limits are not "costs mandated by the federal government." Government Code Section 17513. Consequently, since the numeric design standards do not qualify as a federal mandate, the Regional Board's order is invalid because it does not provide for appropriate funding.

H. A list of persons known by the Regional Board to have an interest in this matter was requested from the Regional Board, but not available at the time this petition was prepared. A copy of a February 24, 2000 letter to the Regional Board requesting this list is attached hereto as Exhibit A.

I. A copy of this petition has been sent to the Regional Board.

J. A copy of a request by WSPA to prepare the Regional Board record on this matter is attached hereto as Exhibit A.

III. CONCLUSION

For the foregoing reasons, WSPA respectfully requests that the State Board grant this petition.

DATED: February 24, 2000

Respectfully submitted,

Gregory R. McClintock

Re: Request for Preparation of the Regional Board Record of the January 26, 2000 SUSMP Approval

Dear Sir or Madam:

On behalf of the Western States Petroleum Association, this letter constitutes a request pursuant to Title 23, California Code of Regulations, section 2050 for the preparation of the record from the Regional Board's January 26, 2000 approval of the Standard Urban Stormwater Mitigation Plan, including the transcript of the Board hearing of that date, if available.

In addition, we request a copy of the Regional Board's list of parties known to have an interest in the SUSMP proceeding. We understand that one or more other petitions for review are being filed as well and it is not our intention to require duplicative work. If convenient, you can simply provide us with a copy of whatever you provide to the other petitioners.

Sincerely,

Lyman C. Welch

WESTERN STATES PETROLEUM ASSOCIATION

STATE OF CALIFORNIA

STATE WATER RESOURCES CONTROL BOARD

In the Matter of the Petition of WESTERN STATES PETROLEUM ASSOCIATION, Petitioner, For Review of the Los Angeles Regional Water Quality Control Board's January 26, 2000 Approval of the Standard Urban Stormwater Mitigation Plan Regulation	FILE NO. A-1280(b) **AMENDMENT TO WESTERN STATES PETROLEUM ASSOCIATION'S PETITION FOR REVIEW OF THE REGIONAL WATER QUALITY CONTROL BOARD – LOS ANGELES REGION'S JANUARY 26, 2000 APPROVAL OF THE STANDARD URBAN STORMWATER MITIGATION PLAN REGULATION**

The Western States Petroleum Association ("WSPA") hereby amends its petition, pending before the State Board pursuant to California Water Code Section 13320 and Title 23, California Code of Regulations, Section 2050, for review of the January 26, 2000 action of the Los Angeles Regional Water Quality Control Board ("Regional Board") approving the Standard Urban Stormwater Mitigation Plan ("SUSMP") regulation. WSPA files this amendment to ensure that the subsequent actions by the Executive Officer of the Regional Board and the final approved SUSMP regulation are deemed to be covered by WSPA's petition. In support of this amendment, WSPA states as follows:

1. On March 8, 2000, the Executive Officer of the Regional Board approved the final SUSMP regulation as directed by the January 26, 2000 resolution of the Regional Board. On or about

this date, the Executive Officer also released copies of the final approved SUSMP regulation and the January 26, 2000 Regional Board Resolution No. R-00-02 to the public. A copy of Regional Board Resolution No. R-00-02 is attached hereto as Exhibit A. A copy of the final Approved Standard Urban Stormwater Mitigation Plan for the Los Angeles Region is attached hereto as Exhibit B.

2. The Executive Officer made significant changes to the final SUSMP regulation which were not the subject of public review and which are not supported by the administrative record. Such significant changes include, without limitation, expansion of the definition of a "retail gasoline outlet" and elimination of the credit for roofing surface area that had previously been authorized in calculating stormwater runoff volume. The Regional Board's March 8, 2000 summary of several of these significant changes to the SUSMP regulation is attached hereto as Exhibit C.

3. The Executive Officer's approval of the final SUSMP regulation, the adoption of significant changes to the SUSMP regulation and Regional Board Resolution No. R-00-02 each suffer from the same procedural and substantive defects set forth in WSPA's original Petition for Review. WSPA incorporates by reference all of the information in its original Petition for Review, including the information required by Section 2050, as if set forth fully herein.

4. A copy of this filing has been sent to the Regional Board.

FOR THE FOREGOING REASONS, WSPA respectfully requests that the State Board grant this amended petition.

DATED: April 6, 2000

Respectfully submitted,

MAYER, BROWN & PLATT
GREGORY R. McCLINTOCK
LYMAN C. WELCH

State of California
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

Resolution No. R-00-02

APPROVING THE
STANDARD URBAN STORM WATER MITIGATION PLAN
FOR
MUNICIPAL STORM WATER AND URBAN RUNOFF MANAGEMENT PROGRAMS
IN LOS ANGELES COUNTY

WHEREAS, THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION FINDS:

1. On July 15, 1996, a municipal separate storm sewer system permit (Los Angeles County MS4 Permit) was issued to the County of Los Angeles and 85 incorporated cities to control and minimize the discharge of pollutants associated with storm water and urban runoff. This permit became Regional Board Order No. 96-054, Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles.

2. On June 30, 1999, a municipal storm water permit was issued to the City of Long Beach (City of Long Beach MS4 Permit) which removed the City of Long Beach from Board Order No. 96-054, giving the City of Long Beach its own distinct Municipal Storm Water and Urban Runoff NPDES permit, Regional Board Order No. 99-060, "Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the City of Long Beach".

3. On August 19, 1999, a statewide general storm water permit for construction activity (Statewide Construction Storm Water Permit) was adopted by the State Water Resources Control Board (State Board). This permit became State Board Order No. 99-08-DWQ, and applies to construction projects that disturbs five acres or more or is part of a larger common plan of sale in the Los Angeles region.

4. Many of the rivers and streams in Los Angeles County are formally designated as impaired, pursuant to Section 303 (d) of the federal Water Pollution Control Act, for specific pollutants that are commonly found in storm water and urban runoff.

5. Storm water runoff carries with it many pollutants in varying concentrations that are suspended in, and or dissolved, in the runoff. The sources of these pollutants include nearly all properties that have been developed since the pollutants originate through the many diverse activities of habitation and land use. Pollutants generated from individual property developments vary greatly in the concentration or loading of each pollutant. Generally, the relative contribution of the pollutant from runoff from any individual property development will represent only a small portion of the entire loading of a water body given the many square miles of land upon which storm water runoff is generated. When the individual contributions from tens of thousands of discrete property units are aggregated, the pollutant loading becomes significant. The resultant pollutant loads results in the impairment of that water body and the conveyance of pollutants, including sediments, metals, complex organic compounds, oil and grease, nutrients, and pesticides to the ocean and harbors within Los Angeles County. The loading of pollutants generated in the Los Angeles area are being measured through the monitoring program being conducted by the Los Angeles County Department of Public Works in conformance with its obligations as the Principal Permittee under the Los Angeles CountyMS4 Permit.

EXHIBIT
A
R0072732

6. The nature of property use is related to the types and quantities of pollutants that are transported from that property during a rainfall event.

7. As property is developed or redeveloped, the utilization of Best Management Practices provide an opportunity to reduce the loading of pollutants to water bodies. This is accomplished by various techniques and can be passive (source reduction) or active (treatment). As property is developed from undisturbed lands, the project can be designed to incorporate Structural or Treatment Control (Best Management Practices (BMPs) that would normally not be available or practical to use on property that has been in urban use.

8. BMPs are effective means of reducing pollutants and Structural or Treatment Control BMPs can be "designed-into" a project in a cost effective way and in a manner that is either transparent to or which enhances the use to which the property has been placed. Some BMPs encourage the setting aside of areas as a greenbelt to allow storm water runoff to flow over areas which are permeable, thereby allowing all or a portion of the runoff to infiltrate. Other BMPs can be designed and built into structures such as catch basins that incorporate replaceable filters to absorb oily wastes or by installing screens to prevent litter from passing through the system and into the water body.

9. Arrays of Structural or Treatment control BMPs are available to developers of both new and redevelopment properties. The use of BMPs is already required by the terms of the Los Angeles County and Long Beach Municipal Storm Water and Urban Runoff NPDES permits.

10. The ability of any BMP to be effective is limited by the volume of water that the BMP is exposed to in any discrete period of time. A BMP that can only be effective for a small volume of storm water runoff is inherently less effective than one sized to accommodate a larger volume of water.

11. Storm water runoff will normally convey a disproportionate loading of pollutants in the initial period runoff is generated during a storm event. Storm events generating up to 0.75 inches of precipitation, measured over a 24-hour period, constitute 85 percent of the total amount of runoff that can be expected during an average wet season. Designing a BMP to be able to accommodate this amount of runoff will result in the application of a BMP intervention to all but 15% of the total runoff during a year, and usually all of the critical runoff that occurs in the early phase of the precipitation event, commonly referred to as the "first Flush."

12. Both the Los Angeles County MS4 Permit (Part III.A.1.c) and the City of Long Beach MS4 Permits contain provisions related to the adoption of Standard Urban Storm Water Mitigation Plans (SUSMPs) requiring their development and implementation.

13. Standard Urban Storm Water Mitigation Plans are required for a specified set of enumerated projects and the permit specifically identifies seven distinct categories for which SUSMPs are required to be prepared. The permit specifically states that the seven categories of projects are the minimum categories requiring SUSMPs.

14. Standard Urban Storm Water Mitigation Plans are also required for development or redevelopment of Parking Lots 5,000 square feet or greater and Locations in Environmentally Sensitive Areas. These categories have been added to advance efforts to control storm water pollution beyond the minimum in Los Angeles County.

15. Standard Urban Storm Water Mitigation Plans are required to be approved by the Regional Board Executive Officer following which they are to be implemented by the Permittees and used by the Permittees as the minimum criteria for the approval of project specific Urban Storm Water Mitigation Plans and the issuance of grading or building permits to project applicants.

16. The Statewide Construction Storm Water Permit requires that Storm Water Pollution Prevention Plans (State SWPPPs) contain post-construction BMPs that will be implemented after construction is complete.

R0072733

17. Section 402 (p) of the Clean Water Act requires the Administrator of the United States Environmental Protection Agency or her designated agent, in this instance, the Regional Board, to require as part of the storm water program "controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants." [USC Section 1342 (p)(3)(B)].

18. A recent decision of the United States 9th Circuit Court of Appeals, *Defenders of Wildlife v. Browner* (1999) Case No. 98-71080, provides additional support and clarification of the authority of the Administrator and the Regional Board to impose additional controls on storm water pollution. The Court in *Defenders of Wildlife v. Browner* said that the USEPA and the States have discretion under the law to determine what pollution controls are appropriate to achieve compliance.

19. Pursuant to the requirements of Regional Board Order No. 96-054, Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles, the Regional Board Executive Officer received a proposal for Standard Urban Storm Water Mitigation Plans submitted by the Principal Permittee.

20. Upon the review of the Regional Board Executive Officer, the Standard Urban Storm Water Mitigation Plan submitted for the seven applicable categories was deemed inadequate. A revised SUSMP proposal was developed subsequent to a discussion of the proposal's conceptual foundation at a public workshop held on August 10, 1999. This workshop was well attended with over 80 municipal representatives and interested parties participating.

21. On August 16, 1999, a public notice was issued indicating that the Standard Urban Storm Water Mitigation Plans proposed by the Principal Permittee would be augmented by the addition of criteria related to specifying numerical design criteria for BMP construction. The matter was noticed for the Regional Board's September meeting to allow the issue to be discussed before the Board although no formal action of the Regional Board itself is required for SUSMP approval.

22. On September 16, 1999, the Regional Board conducted a public hearing on the Standard Urban Storm Water Mitigation Plan proposal as amended by the Executive Officer. At that hearing, the Regional Board Executive Officer suggested additional time would be necessary to develop a more comprehensive proposal incorporating the comments received at the public hearing.

23. Between September 16, 1999 and January 25, 2000, the Regional Board Executive Officer met with interested parties to discuss comments and concerns from interested parties.

24. The Southern California Council of Governments (SCAG) has indicated its interest in obtaining funding to prepare a regional plan(s) to address storm water pollution and identify regional treatment solutions for implementation.

25. On December 7, 1999, the Regional Board Executive Officer released a revised Standard Urban Storm Water Mitigation Plan document to interested parties.

THEREFORE BE IT RESOLVED THAT:

1. The Regional Board endorses the Standard Urban Storm Water Mitigation Plan prepared by the Regional Board Executive Officer and noticed to the public on December 7, 1999 and the concepts therein relating to numerical storm water mitigation standards for Best Management Practices; and

2. The Regional Board directs the Regional Board Executive Officer to approve the Standard Urban Storm Water Mitigation Plan at the earliest opportunity incorporating changes made and formally approved by the Regional Board at the January 26, 1999 Board Hearing;

3. The Regional Board adopts the approved requirements as provisions applicable to the SUSMP requirements for the City of Long Beach.

4. The Regional Board adopts the numerical mitigation standards for storm water, endorsed herein, as the minimum design criteria for review of post-construction BMPs in the Los Angeles Region for construction projects subject to coverage under the Statewide Construction Storm Water Permit.

5. The Regional Board encourages the Permittees and all interested parties to work together in a spirit of cooperation to effect the implementation of the Standard Urban Storm Water Mitigation Plan at the earliest possible date, and

6. The Regional Board encourages the efforts by the Southern California Council of Governments and area Council of Governments (COGs) to develop regional plans and identify regional solutions to address storm water pollution from new development and redevelopment.

I, Dennis Dickerson, Executive Officer, do hereby certify that the foregoing is a full, true and correct copy of a Resolution adopted by the California Regional Water Quality Control Board, Los Angeles Region, on January 26, 2000.

ORIGINAL SIGNED BY

DENNIS A. DICKERSON
Executive Officer

STANDARD URBAN STORM WATER MITIGATION PLAN

FOR LOS ANGELES COUNTY AND CITIES IN LOS ANGELES COUNTY

Final
Approved – Regional Board Executive Officer
March 8, 2000.

B

LOS ANGELES COUNTY URBAN RUNOFF AND STORM WATER NPDES PERMIT

STANDARD URBAN STORM WATER MITIGATION PLAN

BACKGROUND

The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Los Angeles County Permit) issued to Los Angeles County and 85 cities (Permittees) by the Los Angeles Regional Water Quality Control Board (Regional Board) on July 15, 1996, requires the development and implementation of a program addressing storm water pollution issues in development planning for private projects. The same requirements are applicable to the City of Long Beach under its separate municipal storm water permit (City of Long Beach MS4 Permit), which was issued on June 30, 1999.

The requirement to implement a program for development planning is based on, federal and state statutes including: Section 402 (p) of the Clean Water Act, Section 6217 of the Coastal Zone Act Reauthorization Amendments of 1990 ("CZARA"), and the California Water Code. The Clean Water Act amendments of 1987 established a framework for regulating storm water discharges from municipal, industrial, and construction activities under the NPDES program. The primary objectives of the municipal storm water program requirements are to:

1. Effectively prohibit non-storm water discharges, and
2. Reduce the discharge of pollutants from storm water conveyance systems to the Maximum Extent Practicable (MEP statutory standard).

The Standard Urban Storm Water Mitigation Plan (SUSMP) was developed as part of the municipal storm water program to address storm water pollution from new Development and Redevelopment by the private sector. This SUSMP contains a list of the minimum required Best Management Practices (BMPs) that must be used for a designated project. Additional BMPs may be required by ordinance or code adopted by the Permittee and applied generally or on a case by case basis. The Permittees are required to adopt the requirements set herein in their own SUSMP. Developers must incorporate appropriate SUSMP requirements into their project plans. Each Permittee will approve the project plan as part of the development plan approval process and prior to issuing building and grading permits for the projects covered by the SUSMP requirements.

All projects that fall into one of seven categories are identified in the Los Angeles County MS4 Permit as requiring SUSMPs. These categories are:

- Single-Family Hillside Residences
- 100,000 Square Foot Commercial Developments
- Automotive Repair Shops
- Retail Gasoline Outlets
- Restaurants
- Home Subdivisions with 10 to 99 housing units
- Home Subdivisions with 100 or more housing units

The Regional Board Executive Officer has designated two additional categories subject to SUSMP requirements for the Los Angeles County MS4 Permit. These categories are:

- Location within or directly adjacent to or discharging directly to an environmentally sensitive area, and
- Parking lots 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff

The City of Long Beach permit requires SUSMP for the following categories only: (i) 10-99 home subdivisions; (ii) 100 or more subdivisions; (iii) 100,000 or more square foot commercial developments; and (iv) Projects located adjacent to or discharging to environmentally sensitive areas. For the remaining five categories, equivalent requirements have been included directly in or are expected to be developed shortly under the City of Long Beach Storm Water Management Plan.

Permittees shall amend codes and promulgate ordinances not later than September 8, 2000, to give legal effect to the SUSMP requirements. The SUSMP requirements for projects identified herein shall take effect not later than October 8, 2000.

DEFINITIONS

"100,000 Square Foot Commercial Development" means any commercial development that creates at least 100,000 square feet of impermeable area, including parking areas."Automotive Repair Shop" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539.

"Best Management Practice (BMP)" means any program, technology, process, siting criteria, operational methods or measures, or engineered systems, which when implemented prevent, control, remove, or reduce pollution.

"Commercial Development" means any development on private land that is not heavy industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, multi-apartment buildings, car wash facilities, mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses and other light industrial complexes.

"Directly Connected Impervious Area (DCIA)" means the area covered by a building, impermeable pavement, and/ or other impervious surfaces, which drains directly into the storm drain without first flowing across permeable land area (e.g. lawns).

"Discretionary Project" means a project which requires the exercise of judgement or deliberation when the public agency or public body decides to approve or disapprove a particular activity, as distinguished from situations where the public agency or body merely has to determine whether there has been conformity with applicable statutes, ordinances, or regulations.

"Environmentally Sensitive Area" means an area designated as an Area of Special Biological Significance by the State Water Resources Control Board (*Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties* (1994) and amendments) or an area designated as an Area of Ecological Significance by the County of Los *Angeles (Los Angeles County Significant Areas Study, Los Angeles County Department of Regional Planning (1976)* and amendments) or an area designated as a significant natural area by the California Resources Agency. Refer to Table 3 for a listing.

"Greater than (>) 9 unit home subdivision" means any subdivision being developed for 10 or more 10 single-family or multi-family dwelling units.

"Hillside" means property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is twenty-five percent or greater.

"Infiltration" means the downward entry of water into the surface of the soil.

"New Development" means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.

"Parking Lot" means land area or facility for the temporary parking or storage of motor vehicles used personally, for business or for commerce with a lot size of 5,000 square feet or more, or with 25 or more parking spaces.

"Redevelopment" means, on an already developed site, the creation or addition of at least 5,000 square feet of impervious surfaces or the creation or addition of fifty percent or more of impervious surfaces or the making of improvements to fifty percent or more of the existing structure. Redevelopment includes, but is not limited to: the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/ or exterior construction or remodeling; replacement of impervious surface that is not part of a routine maintenance activity; and land disturbing activities related with structural or impervious surfaces.

"Restaurant" means a stand-alone facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption. (SIC code 5812).

"Retail Gasoline Outlet" means any facility engaged in selling gasoline and lubricating oils.

"Source Control BMP" means any schedules of activities, prohibitions of practices, maintenance procedures, managerial practices or operational practices that aim to prevent storm water pollution by reducing the potential for contamination at the source of pollution.

"Storm Event" means a rainfall event that produces more than 0.1 inch of precipitation and that, which is separated from the previous storm event by at least 72 hours of dry weather.

"Structural BMP" means any structural facility designed and constructed to mitigate the adverse impacts of storm water and urban runoff pollution (e.g. canopy, structural enclosure). The category may include both Treatment Control BMPs and Source Control BMPs.

"Treatment" means the application of engineered systems that use physical, chemical, or biological processes to remove pollutants. Such processes include, but are not limited to, filtration, gravity settling, media adsorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

"Treatment Control BMP" means any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media adsorption or any other physical, biological, or chemical process.

CONFLICTS WITH LOCAL PRACTICES

Where provisions of the SUSMP requirements conflict with established local codes, (e.g., specific language of signage used on storm drain stenciling), the Permittee may continue the local practice and modify the SUSMP to be consistent with the code, except that to the extent that the standards in the SUSMP are more stringent than those under local codes, such more stringent standards shall apply.

SUSMP PROVISIONS APPLICABLE TO ALL CATEGORIES

REQUIREMENTS

1. PEAK STORM WATER RUNOFF DISCHARGE RATES

Post-development peak storm water runoff discharge rates shall not exceed the estimated pre-development rate for developments where the increased peak storm water discharge rate will result in increased potential for downstream erosion.

2. CONSERVE NATURAL AREAS

If applicable, the following items are required and must be implemented in the site layout during the subdivision design and approval process, consistent with applicable General Plan and Local Area Plan policies:

- Concentrate or cluster Development on portions of a site while leaving the remaining land in a natural undisturbed condition.
- Limit clearing and grading of native vegetation at a site to the minimum amount needed to build lots, allow access, and provide fire protection.
- Maximize trees and other vegetation at each site by planting additional vegetation, clustering tree areas, and promoting the use of native and/or drought tolerant plants.
- Promote natural vegetation by using parking lot islands and other landscaped areas.
- Preserve riparian areas and wetlands.

3. MINIMIZE STORM WATER POLLUTANTS OF CONCERN

Storm water runoff from a site has the potential to contribute oil and grease, suspended solids, metals, gasoline, pesticides, and pathogens to the storm water conveyance system. The development must be designed so as to minimize, to the maximum extent practicable, the introduction of pollutants of concern that may result in significant impacts, generated from site runoff of directly connected impervious areas (DCIA), to the storm water conveyance system as approved by the building official. Pollutants of concern, consist of any pollutants that exhibit one or more of the following characteristics: current loadings or historic deposits of the pollutant are impacting the beneficial uses of a receiving water, elevated levels of the pollutant are found in sediments of a receiving water and/or have the potential to bioaccumulate in organisms therein, or the detectable inputs of the pollutant are at a concentrations or loads considered potentially toxic to humans and/or flora and fauna.

In meeting this specific requirement, "minimization of the pollutants of concern" will require the incorporation of a BMP or combination of BMPs best suited to maximize the reduction of pollutant loadings in that runoff to the Maximum Extent Practicable. Those BMPs best suited for that purpose are those listed in the *California Storm Water Best Management Practices Handbooks*; *Caltrans Storm Water Quality Handbook: Planning and Design Staff Guide*; *Manual for Storm Water Management in Washington State*;

The Maryland Stormwater Design Manual; *Florida Development Manual: A Guide to Sound Land and Water Management*; Denver *Urban Storm Drainage Criteria Manual, Volume 3 – Best Management Practices* and *Guidance Specifying Management Measures for Sources of Nonpoint Pollution in Coastal Waters* , USEPA Report No. EPA-840-B-92-002, as "likely to have significant impact" beneficial to water quality for targeted pollutants that are of concern at the site in question. However, it is possible that a combination of BMPs not so designated, may in a particular circumstance, be better suited to maximize the reduction of the pollutants.

Examples of BMPs that can be used for minimizing the introduction of pollutants of concern generated from site runoff are identified in Table 2. Any BMP not specifically approved by the Regional Board in Resolution No. 99-03, "Approving Best Management Practices for Municipal Storm Water and Urban Runoff Programs in Los Angeles County", for development planning may be used if they have been recommended in one of the above references.

4. PROTECT SLOPES AND CHANNELS

Project plans must include BMPs consistent with local codes and ordinances and the SUSMP to decrease the potential of slopes and/or channels from eroding and impacting storm water runoff:

- Convey runoff safely from the tops of slopes and stabilize disturbed slopes.
- Utilize natural drainage systems to the maximum extent practicable
- Control or reduce or eliminate flow to natural drainage systems to the maximum extent practicable
- Stabilize permanent channel crossings.
- Vegetate slopes with native or drought tolerant vegetation.
- Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion, with the approval of all agencies with jurisdiction, e.g., the U.S. Army Corps of Engineers and the California Department of Fish and Game

5. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Storm drain stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets. The stencil contains a brief statement that prohibits the dumping of improper materials into the storm water conveyance system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are effective supplements to the anti-dumping message.

- All storm drain inlets and catch basins within the project area must be

stenciled with prohibitive language (such as: "NO DUMPING – DRAINS TO OCEAN") and/or graphical icons to discourage illegal dumping.

- Signs and prohibitive language and/or graphical icons, which prohibit illegal dumping, must be posted at public access points along channels and creeks within the project area.
- Legibility of stencils and signs must be maintained.

6. PROPERLY DESIGN OUTDOOR MATERIAL STORAGE AREAS

Outdoor material storage areas refer to storage areas or storage facilities solely for the storage of materials. Improper storage of materials outdoors may provide an opportunity for toxic compounds, oil and grease, heavy metals, nutrients, suspended solids, and other pollutants to enter the storm water conveyance system. Where proposed project plans include outdoor areas for storage of materials that may contribute pollutants to the storm water conveyance system, the following Structural or Treatment BMPs are required:

- Materials with the potential to contaminate storm water must be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the storm water conveyance system; or (2) protected by secondary containment structures such as berms, dikes, or curbs.
- The storage area must be paved and sufficiently impervious to contain leaks and spills.
- The storage area must have a roof or awning to minimize collection of storm water within the secondary containment area.

7. PROPERLY DESIGN TRASH STORAGE AREAS

A trash storage area refers to an area where a trash receptacle or receptacles are located for use as a repository for solid wastes.

Loose trash and debris can be easily transported by the forces of water or wind into nearby storm drain inlets, channels, and/or creeks. All trash container areas must meet the following Structural or Treatment Control BMP requirements (individual single family residences are exempt from these requirements):

- Trash container areas must have drainage from adjoining roofs and pavement diverted around the area(s).

- Trash container areas must be screened or walled to prevent off-site transport of trash.

8. PROVIDE PROOF OF ONGOING BMP MAINTENANCE

Improper maintenance is one of the most common reasons why water quality controls will not function as designed or which may cause the system to fail entirely. It is important to consider who will be responsible for maintenance of a permanent BMP, and what equipment is required to perform the maintenance properly. As part of project review, if a project applicant has included or is required to include, Structural or Treatment Control BMPs in project plans, the Permittee shall require that the applicant provide verification of maintenance provisions through such means as may be appropriate, including, but not limited to legal agreements, covenants, CEQA mitigation requirements and/or Conditional Use Permits.

For all properties, the verification will include the developer's signed statement, as part of the project application, accepting responsibility for all structural and treatment control BMP maintenance until the time the property is transferred and, where applicable, a signed agreement from the public entity assuming responsibility for Structural or Treatment Control BMP maintenance. The transfer of property to a private or public owner must have conditions requiring the recipient to assume responsibility for maintenance of any Structural or Treatment Control BMP to be included in the sales or lease agreement for that property, and will be the owner's responsibility. The condition of transfer shall include a provision that the property owners conduct maintenance inspection of all Structural or Treatment Control BMPs at least once a year and retain proof of inspection. For residential properties where the Structural or Treatment Control BMPs are located within a common area which will be maintained by a homeowner's association, language regarding the responsibility for maintenance must be included in the projects conditions, covenants and restrictions (CC&Rs). Printed educational materials will be required to accompany the first deed transfer to highlight the existence of the requirement and to provide information on what storm water management facilities are present, signs that maintenance is needed, how the necessary maintenance can be performed, and assistance that the Permittee can provide. The transfer of this information shall also be required with any subsequent sale of the property.

If Structural or Treatment Control BMPs are located within a public area proposed for transfer, they will be the responsibility of the developer until they are accepted for transfer by the County or other appropriate public agency. Structural or Treatment Control BMPs proposed for transfer must meet design standards adopted by the public entity for the BMP installed and should be approved by the County or other appropriate public agency prior to its installation.

9. DESIGN STANDARDS FOR STRUCTURAL OR TREATMENT CONTROL BMPs

Structural or Treatment control BMPs selected for use at any project covered by this

SUSMP shall meet the design standards of this Section unless specifically exempted.

Post-construction Structural or Treatment Control BMPs shall be designed to:

A. mitigate (infiltrate or treat) storm water runoff from either:

1. the 85th percentile 24-hour runoff event determined as the maximized capture storm water volume for the area, from the formula recommended in *Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998)*, or

2. the volume of annual runoff based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment by the method recommended in *California Stormwater Best Management Practices Handbook – Industrial/ Commercial*, (1993), or

3. the volume of runoff produced from a 0.75 inch storm event, prior to its discharge to a storm water conveyance system, or

4. the volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event,

AND

B. control peak flow discharge to provide stream channel and over bank flood protection, based on flow design criteria selected by the local agency.

Limited Exclusion

Restaurants, where the land area for development or redevelopment is less than 5,000 square feet, are excluded from the numerical Structural or Treatment Control BMP design standard requirement only.

10. PROVISIONS APPLICABLE TO INDIVIDUAL PRIORITY PROJECT CATEGORIES

REQUIREMENTS

A. 100,000 SQUARE FOOT COMMERCIAL DEVELOPMENTS

1. PROPERLY DESIGN LOADING/UNLOADING DOCK AREAS

Loading/unloading dock areas have the potential for material spills to be quickly transported to the storm water conveyance system. To minimize this potential, the following design criteria are required:

- Cover loading dock areas or design drainage to minimize run-on and runoff of storm water.
- Direct connections to storm drains from depressed loading docks (truck wells) are prohibited.

2. PROPERLY DESIGN REPAIR/MAINTENANCE BAYS

Oil and grease, solvents, car battery acid, coolant and gasoline from the repair/maintenance bays can negatively impact storm water if allowed to come into contact with storm water runoff. Therefore, design plans for repair bays must include the following:

- Repair/maintenance bays must be indoors or designed in such a way that doesn't allow storm water runon or contact with storm water runoff.
- Design a repair/maintenance bay drainage system to capture all washwater, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

3. PROPERLY DESIGN VEHICLE/EQUIPMENT WASH AREAS

The activity of vehicle/equipment washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. Include in the project plans an area for washing/steam cleaning of vehicles and equipment. The area in the site design must be:

- Self-contained and/ or covered, equipped with a clarifier, or other pretreatment facility, and properly connected to a sanitary sewer.

B. RESTAURANTS

1. PROPERLY DESIGN EQUIPMENT/ACCESSORY WASH AREAS

The activity of outdoor equipment/accessory washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. Include in the project plans an area for the

washing/steam cleaning of equipment and accessories. This area must be:

- Self-contained, equipped with a grease trap, and properly connected to a sanitary sewer.
- If the wash area is to be located outdoors, it must be covered, paved, have secondary containment, and be connected to the sanitary sewer.

C. RETAIL GASOLINE OUTLETS

1. PROPERLY DESIGN FUELING AREA

Fueling areas have the potential to contribute oil and grease, solvents, car battery acid, coolant and gasoline to the storm water conveyance system. The project plans must include the following BMPs:

- The fuel dispensing area must be covered with an overhanging roof structure or canopy. The canopy's minimum dimensions must be equal to or greater than the area within the grade break. The canopy must not drain onto the fuel dispensing area, and the canopy downspouts must be routed to prevent drainage across the fueling area.
- The fuel dispensing area must be paved with Portland cement concrete (or equivalent smooth impervious surface), and the use of asphalt concrete shall be prohibited.
- The fuel dispensing area must have a 2% to 4% slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of storm water to the extent practicable.
- At a minimum, the concrete fuel dispensing area must extend 6.5 feet (2.0 meters) from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot (0.3 meter), whichever is less.

D. AUTOMOTIVE REPAIR SHOPS

1. PROPERLY DESIGN FUELING AREA

Fueling areas have the potential to contribute oil and grease, solvents, car battery acid, coolant and gasoline to the storm water conveyance system. Therefore, design plans, which include fueling areas, must contain the following:

- The fuel dispensing area should be covered with an overhanging roof structure or canopy. The cover's minimum dimensions must be equal to or greater than the area within the grade break. The cover must not drain onto the fuel dispensing area and the downspouts must be routed to prevent drainage across the fueling area.
- The fuel dispensing areas must be paved with Portland cement concrete (or equivalent smooth impervious surface), and the use of asphalt concrete shall be prohibited.
- The fuel dispensing area must have a 2% to 4% slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of storm water.
- At a minimum, the concrete fuel dispensing area must extend 6.5 feet (2.0 meters) from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot (0.3 meter), whichever is less.

2. PROPERLY DESIGN REPAIR/MAINTENANCE BAYS

Oil and grease, solvents, car battery acid, coolant and gasoline from the repair/maintenance bays can negatively impact storm water if allowed to come into contact with storm water runoff. Therefore, design plans for repair bays must include the following:

- Repair/maintenance bays must be indoors or designed in such a way that doesn't allow storm water run-on or contact with storm water runoff.
- Design a repair/maintenance bay drainage system to capture all wash-water, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

3. PROPERLY DESIGN VEHICLE/EQUIPMENT WASH AREAS

The activity of vehicle/equipment washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. Include in the project plans an area for washing/steam cleaning of vehicles and equipment. This area must be:

- Self-contained and/or covered, equipped with a clarifier, or other pretreatment facility, and properly connected to a sanitary sewer or to a permitted disposal facility.

4. PROPERLY DESIGN LOADING/UNLOADING DOCK AREAS

Loading/unloading dock areas have the potential for material spills to be quickly transported to the storm water conveyance system. To minimize this potential, the following design criteria are required:

- Cover loading dock areas or design drainage to minimize run-on and runoff of storm water.
- Direct connections to storm drains from depressed loading docks (truck wells) are prohibited.

E. PARKING LOTS

1. PROPERLY DESIGN PARKING AREA

Parking lots contain pollutants such as heavy metals, oil and grease, and polycyclic aromatic hydrocarbons that are deposited on parking lot surfaces by motor-vehicles. These pollutants are directly transported to surface waters. To minimize the offsite transport of pollutants, the following design criteria are required:

- Reduce impervious land coverage of parking areas
- Infiltrate runoff before it reaches storm drain system.
- Treat runoff before it reaches storm drain system

2. PROPERLY DESIGN TO LIMIT OIL CONTAMINATION AND PERFORM MAINTENANCE

Parking lots may accumulate oil, grease, and water insoluble hydrocarbons from vehicle drippings and engine system leaks.

- Treat to remove oil and petroleum hydrocarbons at parking lots that are heavily used (e.g. fast food outlets, lots with 25 or more parking spaces , sports event parking lots, shopping malls, grocery stores, discount warehouse stores)
- Ensure adequate operation and maintenance of treatment systems particularly sludge and oil removal, and system fouling and plugging prevention control

11. WAIVER

A Permittee may, through adoption of an ordinance or code incorporating the treatment requirements of the SUSMP, provide for a waiver from the requirement if impracticability for a specific property can be established. A waiver of impracticability shall be granted only when all other Structural or Treatment Control BMPs have been considered and rejected as infeasible. Recognized situations of impracticability include, (i) extreme limitations of space for treatment on a redevelopment project, (ii) unfavorable or unstable soil conditions at a site to attempt infiltration, and (iii) risk of ground water contamination because a known unconfined aquifer lies beneath the land surface or an existing or potential underground source of drinking water is less than 10 feet from the soil surface. Any other justification for impracticability must be separately petitioned by the Permittee and submitted to the Regional Board for consideration. The Regional Board may consider approval of the waiver justification or may delegate the authority to approve a class of waiver justifications to the Regional Board Executive Officer. The supplementary waiver justification becomes recognized and effective only after approval by the Regional Board or the Regional Board Executive Officer. A waiver granted by a Permittee to any development or redevelopment project may be revoked by the Regional Board Executive Officer for cause and with proper notice upon petition.

If a waiver is granted for impracticability, the Permittee must require the project proponent to transfer the savings in cost, as determined by the Permittee, to a storm water mitigation fund to be used to promote regional or alternative solutions for storm water pollution in the storm watershed and operated by a public agency or a non-profit entity.

12. LIMITATION ON USE OF INFILTRATION BMPs

Three factors significantly influence the potential for storm water to contaminate ground water. They are (i) pollutant mobility, (ii) pollutant abundance in storm water, (iii) and soluble fraction of pollutant. The risk of contamination of groundwater may be reduced by pretreatment of storm water. A discussion of limitations and guidance for infiltration practices is contained in, *Potential Groundwater Contamination from Intentional and Non-Intentional Stormwater Infiltration, Report No. EPA/600/R-94/051, USEPA (1994).*

In addition, the distance of the groundwater table from the infiltration BMP may also be a factor determining the risk of contamination. A water table distance separation of ten feet depth in California presumptively poses negligible risk for storm water not associated with industrial activity or high vehicular traffic.

Infiltration BMPs are not recommended for areas of industrial activity or areas subject to high vehicular traffic (25,000 or greater average daily traffic (ADT) on main roadway or 15,000 or more ADT on any intersecting roadway) unless appropriate pretreatment is provided to ensure groundwater is protected and the infiltration BMP is not rendered ineffective by overload.

13. ALTERNATIVE CERTIFICATION FOR STORM WATER TREATMENT MITIGATION

In lieu of conducting detailed BMP review to verify Structural or Treatment Control BMPs adequacy, a Permittee may elect to accept a signed certification from a Civil Engineer or a Licensed Architect registered in the State of California, that the plan meets the criteria established herein. The Permittee is encouraged to verify that certifying person(s) have been trained on BMP design for water quality, not more than two years prior to the signature date. Training conducted by an organization with storm water BMP design expertise (e.g., a University, American Society of Civil Engineers, American Society of Landscape Architects, American Public Works Association, or the California Water Environment Association) may be considered qualifying.

TABLE 2

EXAMPLE BEST MANAGEMENT PRACTICES (BMPs)

The following are examples of BMPs that can be used for minimizing the introduction of pollutants of concern that may result in significant impacts, generated from site runoff to the storm water conveyance system. (See Table 1: Suggested Resources for additional sources of information):

- Provide reduced width sidewalks and incorporate landscaped buffer areas between sidewalks and streets. However, sidewalk widths must still comply with regulations for the Americans with Disabilities Act and other life safety requirements.
- Design residential streets for the minimum required pavement widths needed to comply with all zoning and applicable ordinances to support travel lanes; on-street parking; emergency, maintenance, and service vehicle access; sidewalks; and vegetated open channels.
- Comply with all zoning and applicable ordinances to minimize the number of residential street cul-de-sacs and incorporate landscaped areas to reduce their impervious cover. The radius of cul-de-sacs should be the minimum required to accommodate emergency and maintenance vehicles. Alternative turnarounds should be considered.
- Use permeable materials for private sidewalks, driveways, parking lots, or interior roadway surfaces (examples: hybrid lots, parking groves, permeable overflow parking, etc.).
- Use open space development that incorporates smaller lot sizes.
- Reduce building density.
- Comply with all zoning and applicable ordinances to reduce overall lot imperviousness by promoting alternative driveway surfaces and shared driveways that connect two or more homes together.
- Comply with all zoning and applicable ordinances to reduce the overall imperviousness associated with parking lots by providing compact car spaces, minimizing stall dimensions, incorporating efficient parking lanes, and using pervious materials in spillover parking areas.
- Direct rooftop runoff to pervious areas such as yards, open channels, or vegetated areas, and avoid routing rooftop runoff to the roadway or the storm water conveyance system.
- Vegetated swales and strips
- Extended/dry detention basins
- Infiltration basin
- Infiltration trenches
- Wet ponds
- Constructed wetlands
- Oil/Water separators
- Catch basin inserts
- Continuous flow deflection/ separation systems
- Storm drain inserts
- Media filtration
- Bioretention facility
- Dry-wells
- Cisterns
- Foundation planting
- Catch basin screens
- Normal flow storage/ separation systems
- Clarifiers
- Filtration systems
- Primary waste water treatment systems

TABLE 3

HABITAT PROTECTION IN THE LOS ANGELES COUNTY AREA

Agency:
State Water Resources Control Board

Designation:
Areas of Significant Biological Significance (ASBS)

Definition:
Areas designated by the State Water Resources Control Board as requiring protection of species or biological communities to the extent that alteration of natural water quality is undesirable.

Affected Area:
(See Table 1 & Figure 2)

Agency:
Los Angeles County Department of Regional Planning

Designation:
Significant Ecological Areas (SEA)

Definitions:
Significant Ecological Areas (SEAs) are areas that have been identified by the Los Angeles County General Plan as containing unique or unusual species assemblages, or areas of habitat that are rapidly declining in the Los Angeles County. The SEAs were established to protect a special or sometimes unique collection of habitats and species from loss due to encroachment and human disturbances. However, SEAs are not intended to function as isolated preservation areas.

Affected Areas:
(See Table A & Figure 1)

Agency:
California Department of Fish & Game

Designation:
Natural Communities Conservation Plan Region (NCCP)

Definition:
Identifies and provides for the regional or area wide protection and perpetuation of natural wildlife diversity, while allowing compatible and appropriate development and growth. The goal of the program is to protect sufficient resources in regional preserves to assure the survival of the ecosystem and, at the same time, permit compatible uses of less sensitive land.

Affected Area:
(See Table 1 & Figure 3)

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD

LOS ANGELES REGION

STAFF REPORT AND RECORD OF DECISION

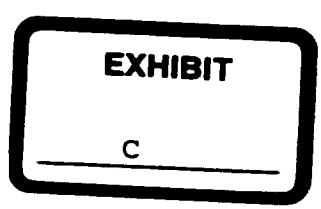
STANDARD URBAN STORM WATER MITIGATION PLANS

AND

NUMERICAL DESIGN STANDARDS FOR BEST MANAGEMENT PRACTICES

SUPPLEMENT

BOARD DIRECTED CHANGES



The Regional Board at its January 26, 2000, meeting directed the Regional Board Executive Officer to amend the Standard Urban Storm Water Mitigation Plans (SUSMPs) as indicated by the change sheet presented at the meeting (dated January 25, 2000), and changes directed by the Regional Board during the meeting. The Regional Board also adopted the same SUSMP requirements for the City of Long Beach under its separate municipal storm water permit (Board Order No. 99-060) for project categories that require SUSMPs.

Regional Board Counsel designated the record for the proceeding to include: i) all staff files and the transcript of proceedings for the January 26, 2000, Hearing; (ii) all staff files and transcript of proceedings for the September 16, 1999, Board Information Item Discussion; (iii) all staff files for the August 10, 1999, Workshop, (iv) all SUSMP Proposals circulated by the Permittees, (v) all SUSMP Proposals circulated by the Regional Board Staff, (vi) all comments received and responses; (vii) and all exhibits presented to the Board.

This "Supplement" document enumerates the significant changes made to the SUSMP that were directed by the Board at the hearing and the bases for the changes in the "Transcript of Proceedings", testimony presented or materials submitted to the Regional Board, and other relevant documents.

Applicability of the SUSMP

The SUSMP requirements apply to all projects in the nine enumerated categories for the Los Angeles County MS4 Program. While some development planning/ construction requirements in the permit are made applicable only to "Discretionary Projects", this limitation does not cover the seven "enumerated project categories" in Board Order No.

96-054, and the two additionally designated "enumerated project categories" by the Regional Board Executive Officer and affirmed by the Regional Board[1].

Applicability to Categories for the City of Long Beach

A statement has been added to clarify that SUSMP requirements adopted by the Regional Board apply to the City of Long Beach MS4 Program foronly: (i) 10-99 home subdivisions; (ii) 100 or more subdivisions; (iii) 100,000 or more square foot commercial developments; and (iv) projects located adjacent to or discharging to environmentally sensitive areas. For the remaining five categories, equivalent requirements have been included directly in or are expected to be developed shortly under the City of Long Beach Storm Water Management Plan.[2]

Effective Date for SUSMP Requirements

A statement has been included to provide Permittees 6 months from the date of Regional Board Executive Officer's approval of the SUSMP to amend ordinances and codes to be consistent with the adopted SUSMP requirements, and thence 30 days thereafter for the requirements to take effect.[3]

Definition of Commercial Development

The definition of "Commercial Development" has been reworded to be inclusive of all developments that are not considered "Residential" or "Heavy Industrial" based on the categorization of the federal storm water regulations.[4]

Definition of Environmentally Sensitive Areas

A new "Table 3" has been added to the SUSMP to list areas presently covered under the definition of "environmentally sensitive areas" based on readily ascertainable designations by the State Water Resources Control Board, the California Resources Agency, and the County of Los Angeles.[5]

---

[1] Transcript of Proceedings, January 26, 2000 (CSR No. 10992 and 11568) at 228. Discussion by Regional Board Counsel Leon and direction by Board Member Cloke.

[2] Ibid. at 289. Clarification by Dr. Swamikannu and request by Board Member Cloke to include clear text to explain its applicability to the City of Long Beach.

[3] Ibid at 76 and 300. Recommendation by Mr. Dickerson responding to a question by Regional Board Chairman Nahai and affirmation by Board.

[4] Ibid at 66 and 285. Discussion by Board Members on the scope of the definition and response by Dr. Xavier Swamikannu.

[5] Ibid. at 206, 280, and 305. Discussion with Chairman Nahai and Dr. Coe of the ready ascertainibility of the designated sites, and agreement to provide a listing in the SUSMP.

Definition of Parking Lots

The definition of "Parking Lots " has been reworded to eliminate the "stand alone" limitation, so that it now applies to all parking lots with 5,000 square feet or more or with 25 parking spaces or more and exposed to storm water.[6]

Definition of Redevelopment

The definition of "Redevelopment" has been reworded to include a minimum threshold of at least 5,000 square feet of impervious area addition to an existing property in order for the SUSMP requirements to apply. The threshold value is consistent with other threshold values in the SUSMP, such as Parking Lots and Restaurants.[7]

Definition of Restaurant

The definition of "Restaurant" has been reworded to limit applicability to "stand-alone" facilities and exclude co-located stalls or food counters in general purpose establishments such as markets and grocery stores.[8]

Definition of Retail Gasoline Outlet

The definition of "Retail Gasoline Outlet" has been reworded to include all retail gasoline outlets that sell gasoline and lubricating oils without consideration of the proportion of receipts derived from such sales.[9]

Conflict with Local Practices

The paragraph has been reworded to allow local ordinances to differ from the SUSMP so long as they are more stringent.[10]

Responsibility and Conditions for BMP Transfer

The language has been modified to ensure that the responsibility for the maintenance of Structural or Treatment Control BMPs is properly transferred with the sale of a property and is mandatory.[11]

---

[6] Ibid. at 301 and 306. Board Members Cloke and Diamond discuss and direct staff to eliminate the "stand-alone" limitation.

[7] Ibid. at 67 and 302. Board Chairman Nahai discusses the absence of a minimum threshold and directs staff to set a minimum value to address his concerns of proportionality aberrations.

[8] Ibid. at 68. Board Chairman interprets applicability and Dr. Swamikannu confirms the interpretation.

[9] Ibid. at 46, 49, 308. Board Members discuss the staff proposed definition based on primary activity and direct staff to extend the definition to include all gas stations that pump gas.

[10] Ibid. at 308. Board Members discuss the language and provide specific language for the purpose of local program consistency and to ensure adherence to the SUSMP requirements.

Roofing Surface Area Exclusion from Mitigation Standard

The roofing surface credit for calculation of storm water runoff volume for mitigation has been eliminated.[12]

Limited Exclusion for Small Restaurants from Mitigation Standard

The sentence has been clarified to state to exempt restaurants less than 5,000 square feet from the requirement to mitigate storm water only. All other requirements for restaurants apply.[13]

Waiver Provision

The paragraph has been modified to recognize proximity to an unconfined water table as one basis for the granting of a waiver.[14]

A sentence has been added to require that all other BMPs be considered and rejected before a waiver from the numerical mitigation standard is granted.[15]

A statement has been added to require that non-enumerated bases for waiver be brought to the Regional Board for consideration. The Regional Board can delegate the approval authority for a class of waivers to the Regional Board Executive Officer.[16]

---

[11] Ibid. at 63 and 313 Board Members discuss the significance of ensuring proper transfer of BMP maintenance responsibility and provide firm enabling language.

[12] Ibid. at 48 and 314. Board Members discuss the elimination of the rooftop exemption with the possibility of reconsideration in the future if Permittees affirmatively demonstrate that rooftop runoff is not a source of pollutants.

[13] Ibid. at 322. Board Members discuss the limited exclusion and agree with Dr. Swamikannu's rationale for the exclusion threshold from numerical design standards.

[14] Ibid. at. 60 Board Member Coe suggests the change to address the issue and Dr. Swamikannu accepts the suggestion.

[15] Ibid. 74 and 326 Board Members discuss the Waiver provision and provide language to ensure that all options for mitigation are considered.

[16] Ibid. at 75 and 328. Board Chairman Nahai provides direction to staff to require any new waiver bases to be brought to the Regional Board to ensure public discussion and consideration.

Elizabeth Miller Jennings, Esq.
Office of Chief Counsel
State Water Resources Control Board
P.O. Box 100
Sacramento, CA 95812-0100

Re: File Nos. A-1280, A-1280(a), and A-1280(b)

Dear Ms. Jennings:

In order to clarify the Pre-Hearing Submission on behalf of the Western States Petroleum Association (WSPA) and avoid any surprise at the hearing, please be advised that I, Lyman C. Welch, will appear before the Board on behalf of WSPA during the June 7th hearing in the above matter. On WSPA's behalf, I expect to present an introductory statement to the Board which will include the matters raised in WSPA's Petition and Pre-Hearing Submission and will also conduct cross-examination and present a closing argument (if allowed) on WSPA's behalf.

Sincerely,

Lyman C. Welch

Lyman C. Welch

XII.	CONCLUSION	14

I. INTRODUCTION

Petitioners herein file this Petition challenging the action taken by the Regional Water Quality Control Board, Los Angeles Region ("Regional Board") on January 26, 2000, and all related action taken or to be taken by its Executive Officer in connection therewith, concerning Order No. 96-054 (NPDES No. CAS614001) Waste Discharge Requirements for Municipal Storm Water and Urban Run Off Discharges within the County of Los Angeles (hereinafter "Permit," "Order," or "Order No. 96-054"). The Petition further challenges various "failures to act" on the part of the Respondents, namely their failures to comply with the Administrative Review Process under the Permit with respect to the Standard Urban Storm Water Mitigation Plan ("SUSMP") submitted by the Permittees under the subject Permit.[1]

Petitioners challenge the action taken by the Regional Board on January 26, 2000, the prior and subsequent actions of the Executive Officer in connection thereto, and the failures to act by the Respondents in reviewing and processing the Permittees' SUSMP program, for the following reasons: (1) Respondents failed to comply with the Administrative Review Process set forth in Order No. 96-054; (2) Respondents have no authority under the Permit, the Clean Water Act (33 U.S.C. § 1251 *et seq.*) or the Porter-Cologne Act (Cal. Water Code § 13000 et seq.) to mandate their own SUSMP program on the Permittees; (3) the actions taken by the Respondents violated the terms of the Permit, the Clean Water Act, and the Porter-Cologne Act; (4) Respondents failed to present evidence to support the costs effectiveness of the Regional Board SUSMP program and/or to show that the benefits to be obtained therefrom outweigh its costs; (5) Respondents failed to present credible evidence to show that the Regional Board SUSMP program will reduce pollutants to the maximum extent practicable; (6) Respondents' actions are in violation of California Water Code Section 13360; (7) Respondents' actions will result in the imposition of unfunded mandates in violation of the California Constitution; (8) the Regional Board's actions constitute regulations adopted in violation of the California Administrative Procedures Act; (9)

[1] The Points and Authorities supporting the legal issues in the Petition are set forth in the Petition itself. The following represents a summary of the Points and Authorities, and Petitioners submit this Statement of Points and Authorities, along with those Points and Authorities in the Petition, as their collective Statement of Points and Authorities in support of the legal issues raised in the Petition.

Respondents have failed to comply with the requirements of the California Environmental Quality Act ("CEQA"); and (10) Respondents have failed to provide proper notice of their proposed actions and have failed to provide Petitioners sufficient opportunity to be heard thereby depriving Petitioners of a fair hearing and due process of law.

For the foregoing reasons, as further set forth below and in the Petition itself, Petitioners respectfully request that the actions taken by the Regional Board and its Executive Officer be overturned and that the Executive Officer be required to take action on the Permittees' SUSMP in accordance with the requirements of Order No. 96-054.

II. BACKGROUND

On July 15, 1996, Respondent Regional Board issued Order No. 96-054, Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles, to all municipalities within the County. Under the Permit, the City Petitioners and all other Permittees thereunder were required to submit a SUSMP to the Executive Officer for his/her review and approval or disapproval within six (6) months of the Regional Board's approval of the recommended Best Management Practices for development projects ("BMPs"). These BMPs were approved by the Regional Board on April 22, 1999, with the adoption of Resolution No. 99-03. In July of 1999 and thereafter through a modification in August of 1999, the Permittees timely submitted their SUSMP Program. 7/30/99 deadline

By its own terms, the Permittees' SUSMP applies to certain development categories identified in the Permit, and requires applicants of designated development projects to submit an Urban Stormwater Mitigation Plan that implements appropriate requirements and measures to minimize impacts from storm water runoff, and to reduce storm water pollutants to the maximum extent practicable. A copy of the Permittees' SUSMP, as submitted in July of 1999 and as thereafter revised in August of 1999, is attached to the Petition and marked as Exhibit "A."

The Permittees' SUSMP incorporates the appropriate elements of the recommended list of BMPs approved by the Regional Board through Resolution No. 99-03 on April 22, 1999. To date, since the submittal of the Permittees SUSMP, the Executive Officer has failed to either approve or

IEPA

disapprove the Permittees' SUSMP, and has thus failed to act in accordance with the Administrative Review process set forth under the Permit.

Rather than permitting the Executive Officer to exercise his discretion and act upon the Permittees' SUSMP, as required under the Permit, on January 26, 2000, the Regional Board directed the Executive Officer to approve a SUSMP prepared by its staff (hereinafter "Regional Board SUSMP"). Under the requirements of the Permit, however, the Regional Board SUSMP could not legally have been forced on the Permittees. To the contrary, the Permit requires that the SUSMP Program submitted by the Permittees be reviewed and acted upon and that an administrative process be followed to resolve "any differences in compliance expectations" with the Permittees' SUSMP Program.

The Regional Board SUSMP consists of a December 7, 1999 Program prepared by Regional Board Staff and thereafter modified by staff through a change sheet dated January 25, 2000. It was then further substantially modified by the Regional Board itself on January 26, 2000, ***after the close of the public testimony***. Copies of the December 2, 1999, Regional Board Program and the January 25, 2000, Change Sheet are attached to the Petition and collectively marked as Exhibit "B." The Regional Board and the Executive Officer's actions in approving the Regional Board mandated SUSMP directly contradict the express terms of the Permit itself and were taken without providing Petitioners with sufficient notice of the proposed provisions and a fair hearing.

The Regional Board SUSMP far exceeds the obligations and requirements of the Permittees under the Permittees' SUSMP, and was thus adopted by the Regional Board in excess of its authority under the Permit, the Clean Water Act, and the Porter-Cologne Act. In particular, the Regional Board's SUSMP imposes, among other requirements, the following terms not agreed to or concurred with by the Permittees: (1) a requirement that the Permittees impose a design standard/numerical mitigation measure to require the treatment of .75 inches of rainfall over a 24 hour period in nine (9) priority project categories of development (hereafter the "Numerical Mitigation Standard"); (2) a requirement that the Permittees expand their SUSMP to apply to all "non-discretionary" as well as "discretionary" projects within the nine subject project categories, in violation of the terms of the Permit; (3) a requirement that the SUSMP extend to two additional

project categories, in addition to the seven categories set forth in the terms of the Permit; and (4) a requirement that the SUSMP apply to all "redevelopment" within the nine priority project categories, again in conflict with the Permittees' SUSMP.

In addition, the Regional Board SUSMP was adopted without evidence or findings showing that it would improve water quality, that it is cost effective, or even that it will "reduce the discharge of pollutants to the maximum extent practicable," as required under the Clean Water Act. The Regional Board SUSMP was adopted and imposed on the Permittees without sufficient testing, analysis, or other evidence as to its effectiveness and without any balancing of the benefits of the Program versus its excessive cost. Respondents in this Petition have acted arbitrarily and capriciously and have not acted in accordance with law.

In short, the SUSMP mandated by the Regional Board on January 26, 2000, has not been submitted by or agreed to by the Permittees, has not been adopted in accordance with the terms of the Permit, the Clean Water Act or the Porter-Cologne Act, has not been shown to be cost-effective or beneficial to the waters of the State of California or the United States, and has not been shown to control pollutants to the "maximum extent practicable" as required by state and federal law.

III. RESPONDENTS' ACTIONS WERE IMPROPER AND INAPPROPRIATE BECAUSE RESPONDENTS FAILED TO COMPLY WITH THE ADMINISTRATIVE REVIEW PROCESS REQUIRED UNDER ORDER NO. 96-054

The Administrative Review Process set forth under the Permit (Order No. 96-054, § 2.I.G) requires that the Regional Board and its Executive Officer follow an Administrative Process "for review and acceptance of reports and documents submitted to the Regional Board," and provides for a method "to resolve ***any differences*** in compliance expectations between the Regional Board and Permittees, prior to initiating enforcement action." (Id.) The Regional Board, at its January 26, 2000 hearing, admitted that the Administrative Review Process applied, and further admitted it had failed to comply with the letter of the law required by this process. Respondents' failure to

comply with these terms of the subject Permit and to properly process the Permittees' SUSMP pursuant to the Permittees' Administrative Review Process constitutes a violation of the Permit and federal and state law.

Under the Administrative Review Process, the Executive Officer is required to notify the Permittees of his approval or disapproval of the Permittees' SUSMP within 120 days of its submittal. To date, Respondents have failed to comply with such requirement and have failed to comply with various other requirements set forth in the Permit in reviewing and processing the Permittees' SUSMP. (See Order No. 96-054, Part 2.I.G.) Respondents have further failed to resolve any differences in compliance expectation with the Permittees' SUSMP, which is required by the Permit before the Permittees can be found to be in violation of the Permit. Accordingly, under the terms of the Permit, the Executive Officer is prohibited from taking ***"enforcement action again a Permittee until the Executive Officer has notified the Permittee in writing that the Administrative Review Process has been exhausted and that the Executive Officer has determined that a violation exists warranting enforcement."*** (Order No. 96-054, Part 2.I.G.2.d.)

In failing to act on the Permittees' SUSMP in accordance with the Permit, and through the Regional Board and the Executive Officer's actions to force the Regional Board SUSMP on the Permittees, Respondents acted inappropriately and improperly. (23 CCR, § 2052 (A)(B).) The State Board must therefore find that Respondents acted arbitrarily and capriciously in violation of law, and should order said Respondents to comply with the terms of the Permit and review and process the Permittees' SUSMP accordingly. (Id.)

IV. RESPONDENTS HAVE NO AUTHORITY UNDER THE PERMIT, THE CLEAN WATER ACT, OR THE PORTER-COLOGNE ACT TO MANDATE THEIR OWN SUSMP ON THE PERMITTEES.

In July of 1996, when the Regional Board issued Order No. 96-054, the Board exercised its discretion and set forth the requirements by which the Permittees were to comply with the requirements of the Clean Water Act to reduce the discharge of pollutants "to the maximum extent practicable." (See, 33 U.S.C. § 1342(p)(3)(b).) To date, Respondents have produced no evidence

make any findings or show any relationship between the reasonableness of these costs and the need for the program instead of the Permittees' SUSMP Program. Respondents' failure to analyze the costs of its mandated SUSUMP violates the California Water Code and Order No. 96-054, and precludes implementation of cost effective storm water pollution control measures under the Order.

VI. THE REGIONAL BOARD'S SUSMP HAS NOT BEEN SHOWN TO REDUCE POLLUTANTS TO THE MAXIMUM EXTENT PRACTICABLE

The Clean Water Act requires the subject Permittees to impose controls to reduce pollutants "to the maximum extent practicable." At the time of the hearing on January 26, 2000, and prior thereto, the Regional Board failed to present sufficient evidence to show its SUSMP will result in the reduction of pollutants "to the maximum extent practicable" as required under state and federal law. Accordingly, because Respondents have failed to show that their mandated SUSMP program controls pollutants "to the maximum extent practicable," under the express terms of the Clean Water Act, U.S.C. Title 33, Section 1342(p)(3)(B), there is no requirement that Petitioners implement such program.

VII. RESPONDENTS' ACTIONS VIOLATE CALIFORNIA WATER CODE SECTION 13360.

California Water Code Section 13360 prohibits the Regional Board, as well as the State Board, from specifying specific design, location or types of construction or other particular types of compliance requirements in any order or set of waste discharge requirements. The Regional Board's attempt to mandate its SUSMP, in furtherance of an "order" issued under the Clean Water Act and Waste Discharge Requirements, is a direct violation of Section 13360, because it is an attempt to impose on the Permittees "specific design, location or types of construction or other types of compliance requirements." (See Cal. Water Code § 13360.) Accordingly, the action taken by the Respondents in attempting to mandate the Regional Board's SUSMP violates California Water Code Section 13360.

///

VIII. RESPONDENTS' ACTIONS WILL RESULT IN THE IMPOSITION OF UNFUNDED MANDATES IN VIOLATION OF THE CALIFORNIA CONSTITUTION.

Under Article XIII B, Section 6 of the California Constitution, a state agency is prohibited from shifting the financial burden of carrying out governmental functions to local entities, unless it includes a provision specifically reimbursing local governments for the costs of such functions. In the instant case, the Regional Board has imposed its SUSMP program without providing any funding mechanism to the Permittees to implement the mandated program.

Regional Board staff has contended that the imposition of the Regional Board SUSMP is not an unfunded mandate because it involves a Federal Permit. Not true. As explained in Hayes v. Commission on State Mandates (1992) 11 Cal.App.4th 1564, the prohibition on unfunded mandates applies even where federal law is involved, unless the state has "***no true choice***" in the manner of implementing the federal program. (Id. at 1593 emphasis added.)

Moreover, Respondents have contended that they have the "discretion" to impose their SUSMP program on the Permittees rather than the Permittees' SUSMP. In fact, Respondents have specifically relied upon the Ninth Circuit decision in Defenders of Wildlife v. Browner (1999) 191 F.3d 1159 to argue that they have the "discretion" to mandate the Numerical Mitigation Standard and other requirements on the Permittees.[4]

Respondents' reliance on Defenders of Wildlife v. Browner is self-defeating. As set forth above, the existing Permit and federal and state law do not provide Respondents with any authority to exercise "discretion" to impose a SUSMP not contemplated by the Permit. Even if such discretion existed in this circumstance, however, the exercise of such discretion would require the provision of funds to carry out the purportedly "discretionary" mandated SUSMP. Respondents cannot have it both ways. Either Respondents have the "discretion" under the Permit to mandate their SUSMP program on the Permittees, or they do not. If they have the "discretion" to do so, they then are exercising such "discretion" to mandate a non-federally mandated program.

---

[4] Respondents' reliance on Defenders of Wildlife v. Browner is misplaced. As earlier noted, the Los Angeles Region has operated under the current NPDES Permit since 1996. The instant case does not address the issuance of a permit as was the case in Defenders of Wildlife.

If such discretion exists and was the basis for the mandated SUSMP, the mandate ***must*** be funded in compliance with Article XIII B, Section 6 of the California Constitution. (Hayes, supra, 11 Cal.App.4th at 1564.) Conversely, if they do not have the "discretion" to mandate such a program on the Permittees (as such is prohibited by the terms of the Permit itself), then the Respondents' actions are void *ab initio*.

IX. RESPONDENTS' ACTIONS CONSTITUTED THE ADOPTION OF REGULATIONS IN VIOLATION OF THE CALIFORNIA ADMINISTRATIVE PROCEDURES ACT.

The California Administrative Procedures Act, Government Code sections 11340, *et seq.* ("APA") was enacted to establish basic minimum procedural requirements for the adoption, amendment, or repeal of administrative regulations promulgated by the State's many administrative agencies. (See Grier v. Kizer (1990) 219 Cal.App.3d 422, 431; see also, Gov. Code § 11346.) Although California law does not require administrative agencies to comply with the APA when simply issuing or amending permits, including the issuance of waste discharge requirements, where the permit or amendment in question rises to the level of an order, regulation, or ***standard of general application***, the APA applies. (Gov. Code § 11342(g).)

The action taken on January 26, 2000 by the Regional Board – directing its Executive Officer to adopt the Regional Board SUSMP and requiring the Permittees' compliance therewith – constitutes an order and standard of general application because it was imposed on ***all*** Permittees, i.e., some 85 plus cities in the County, and the County itself. The Regional Board's SUSMP will require the implementation of a Numerical Mitigation Standard and other requirements on ***all*** "discretionary" and "non-discretionary" projects within the nine (9) development categories throughout the entire County of Los Angeles. As a result, the actions taken by the Respondents have risen to the level of an order and a regulation and a standard of general application, requiring compliance with the APA.

In State Water Resources Control Board v. Office of Admin. Law (1993) 12 Cal.App.4th 697, the Court analyzed various amendments to a water quality control plan and found that such

amendments constituted a "regulation" which was required to be adopted in compliance with the APA. The court held that where an administrative agency's directive "looks like a regulation, reads like a regulation, and acts like a regulation, it will be treated as a regulation whether or not the agency in question so labeled it." (Id. at 702.) The court further found that in light of this strong legislative mandate, the regulatory agency directives at issue, such as amendments to the Water Quality Control Plan, were regulations.

Here, the Regional Board's mandated SUSMP program was imposed under Order No. 96-054, which does not allow for the compulsion of such a program or the compulsion of any program. Far removed from the Order's provisions and having general application to some 86 public entities and innumerable development projects, the mandated SUSMP program constitutes a "regulation" for purposes of the APA. Because the requirements of the APA have not been complied with, the action taken by the Respondents has no legal force or effect. (Id. at 702.)

X. RESPONDENTS HAVE FAILED TO COMPLY WITH THE REQUIREMENTS OF THE CALIFORNIA ENVIRONMENTAL QUALITY ACT.

CEQA required the Respondents to review potential significant environmental impacts before taking their action of January 26, 2000. Specifically, CEQA requires the consideration of all potential significant environmental impacts resulting from the project imposed on the Permittees by the Respondents. (See Cal. Pub. Res. Code § 21000 et seq; Azuza Land Reclamation Co. v. Main San Gabriel Basin Watermaster 52 Cal.App.4th 1165, 1188-1191 [holding that Regional Water Board's adoption of order that approved the continued dumping of municipal solid waste constituted a "project" under CEQA].) In this case, there are a number of potentially significant environmental impacts Respondents should have considered under CEQA, but failed to do so. For example, Respondents failed to consider the impacts of their actions on ground water quality, vector control, the generation of solid and/or hazardous waste, the creation of nuisances throughout the County, the impact on the development of infiltration basins/ponds on low and moderate income housing and other development throughout the County, as well as other potentially significant environmental impacts.

Regional Board staff has incorrectly contended that California Water Code Section 13389 exempts Respondents actions from the requirements of CEQA. However, Section 13389 clearly only exempts the State and Regional Boards from the requirements of CEQA "prior to the adoption of any waste discharge requirement." (See Cal. Water Code § 13389.) In the instant case, Respondents' actions were neither agendized nor publicly noticed as proposed actions to amend or adopt new "waste discharge requirements." In addition, and as discussed above and in the Petition itself, federal law and state law governing waste discharge requirements provide no authorization for Respondents' actions. Moreover, the action taken by the Board and the follow-up action taken by its Executive Officer will have significant adverse environmental impacts on the general public. Respondents' actions were not exempt from CEQA. (See, e.g., Azuza Land Reclamation Co., supra, 52 Cal.App.4th 1165, 1216-1218.)

Accordingly, Petitioners respectfully request that the action taken by the Regional Board and its Executive Officer in imposing the Regional Board's SUSMP be overturned, as Respondents have failed to comply with the requirements of CEQA.

XI. RESPONDENTS HAVE FAILED TO PROVIDE PROPER NOTICE OF THEIR PROPOSED ACTIONS AND HAVE FAILED TO PROVIDE PETITIONERS SUFFICIENT OPPORTUNITY TO BE HEARD, THEREBY DEPRIVING THEM OF DUE PROCESS OF THE LAW.

As referenced above and in the Petition, the action taken by the Respondents is not and was not authorized anywhere under the Permit, the Clean Water Act or the Porter-Cologne Act. Nonetheless, Respondents conducted a "public hearing" prior to taking action, presumably to evidence the following of some administrative procedure. Respondents, however, failed to provide Petitioners sufficient notice prior to the public hearing of their proposed actions and failed to provide Petitioners sufficient opportunity to be heard prior to taking such actions.

Specifically, on the ***day of the hearing***, Regional Board staff presented a "change sheet" dated January 25, 2000, which contained a number of substantive and non-substantive changes to the proposed Regional Board SUSMP. Petitioners, and each of them, therefore were not given

full opportunity to fully review, investigate and consider the ramifications of the proposed changes because the change sheet was not provided to the Petitioners until the January 26, 2000 hearing.

In addition, after the close of public testimony at the January 26, 2000 hearing, the Regional Board made a series of substantive changes to the proposed Regional Board SUSMP, including but not limited to requiring its application to "non-discretionary" as well as "discretionary" projects, and requiring the Permittees to adopt local ordinances within six (6) months of the date of the Executive Officer's signature of the Order, with implementation 30 days thereafter. The Regional Board also decided to delete the "roof top" exemption from the previously proposed SUSMP. All of these actions of the Regional Board were taken after the close of public testimony, without proper notice to the Petitioners, and without providing Petitioners a sufficient opportunity to be heard, thereby depriving Petitioners of a fair hearing.

Respondents' substantial revisions from the previously proposed SUSMP without providing Petitioners with the any notice or opportunity to be heard denied Petitioners a fair hearing. (See, e.g., Bank of America v. Long Beach (1975) 50 Cal.App.3d 882, 886-888 ["Clearly, evidence to be used against a party must be disclosed in such fashion that there is an opportunity to rebut it." [Citations]]. "A hearing requires that the party be apprised of the evidence against him so that he may have an opportunity to refute, test, and explain it, and the requirement of a hearing necessarily contemplates a decision in light of the evidence there introduced. [Citations]." (English v. Long Beach (1950) 35 Cal.2d 155, 158-159.) The Regional Board's actions denied Petitioners any reasonable opportunity to fully present their position on the significant revisions of the mandated SUSMP, thereby depriving Petitioners of due process of law.

///

XII. CONCLUSION

For the foregoing reasons, as well as those set forth in the Petition, Petitioners herein and each of them, respectfully request that the action taken by the Los Angeles Regional Water Quality Control Board on January 26, 2000, and all subsequent actions based thereon by its Executive Officer, be overturned, and that the Executive Officer be directed to review and approve the Permittees' SUSMP in accordance with the terms of Order No. 96.054, as well as the Clean Water Act and state law.

Dated: February 27, 2000

Case No. DECLARATION OF EDUARD SCHRODER IN SUPPORT OF REQUEST FOR STAY AND PETITION FOR REVIEW OF ACTION OF THE LOS ANGELES REGIONAL WATER QUALITY CONTROL BOARD ON JANUARY 26, 2000, AND OF ITS EXECUTIVE OFFICER, AND OF RESPONDENTS FAILURES TO ACT PURSUANT TO ORDER NO. 96-054 (NPDES NO. CAS614001)

DECLARATION OF EDUARD SCHRODER

I, Eduard Schroder, declare as follows:

1. I am a member of the Executive Advisory Committee for the Storm Water Program for Los Angeles County, an ad hoc committee consisting of certain Permittees under the California Regional Water Quality Control Board, Los Angeles Region Order No. 96-054 (NPDES No. CAS 614001), Waste Discharge Requirements For Municipal Storm Water and Urban Runoff Discharges from the County of Los Angeles (hereafter "Permit" or "Order No. 96-054"). I am also the Public Works Director for the City of Signal Hill ("City") and have acted in this capacity since June of 1999. Prior to my employment with the City of Signal Hill, I was employed with the City of El Segundo from January of 1994 to June of 1999 as its Public Works Director.

2. As a part of my responsibilities as a member of the Executive Advisory Committee and as the Public Works Director for the City, I was involved either personally or through the efforts of a consultant retained by the City, in the preparation and submittal of the Standard Urban Storm Water Mitigation Plan ("SUSMP") submitted on behalf of the Permittees for Los Angeles County in July of 1999. I was, moreover, involved in discussions which proceeded and followed the submission of the Permittees' SUSMP with other representatives of Permittees within the County, and with representatives of the Regional Water Quality Control Board. I was also involved in the preparation and submission of changes to the Permittees' July 1999 SUSMP Program, changes which were submitted in August of 1999 to the Los Angeles Regional Water Quality Control Board ("Regional Board"). The Permittees' SUSMP Program, as submitted in July of 1999 and modified in August, is hereafter referred to as the "Permittees' SUSMP."

3. I attended a public workshop conducted on September 16, 1999 by the Regional Board, where at that time Regional Board staff recommended to its Board that it consider unilateral staff imposed mandated changes on the Permittees' SUSMP Program. At this September 16th workshop, the Regional Board took no action on either the Permittees' SUSMP or the Regional Board staff's proposed SUSMP, but instead determined to continue the matter for approximately 90 days with a new hearing to be renoticed.

4. On January 26, 2000, I attended a public hearing conducted by the Regional Board

on a proposed SUSMP program that included a number of provisions that were not agreed to by the Permittees nor included in the Permittees' SUSMP Program as modified and submitted in August of 1999. In fact, at the time of the January 26, 2000 public hearing, and even to this date, neither the Regional Board nor its Executive Officer have reviewed and approved or disapproved the Permittees' SUSMP Program, in accordance with the Administrative Review Process set forth under Order No. 96-054. Rather, the focus of the Regional Board on January 26, 2000, was on a Regional Board SUSMP Program dated December 7, 1999 as modified by a change sheet dated January 25, 2000 by the Regional Board staff. Because the January 25, 2000 change sheet was not distributed until the day of the hearing, I and representatives of other Petitioners did not have sufficient time to properly review and analyze the changes proposed in the change sheet, and were moreover not in a position to provide adequate testimony on these changes.

5. At the close of the January 26, 2000 public comment period, I am informed that the Regional Board proceeded to make yet additional modifications to the staff's proposed SUSMP Program, and to direct its Executive Officer to adopt the Regional Board SUSMP Program as modified by staff through its change sheet dated January 25, 2000, and as further modified by the Board on January 26. The SUSMP Program mandated by the Board on January 26, 2000 is hereafter referred to as the "Regional Board SUSMP." Because of the additional changes made by the Regional Board itself after the close of the public comment period at the hearing on January 26, again I and other Petitioners were not in a position to analyze all of the proposed changes made to the Regional Board SUSMP Program at the hearing, nor were we able to proceed and present evidence to the Regional Board to address concerns we have with the changes.

6. Although an Order has not yet been adopted by the Executive Officer, I am informed that the Regional Board SUSMP imposed the following mandated programs and terms, among others, that have not been agreed to or provided for in the Permittees' SUSMP: (1) a design standard/numerical mitigation measure on the retention and/or treatment of storm water run off of .75 inches within a 24 hour storm event for nine (9) project categories set forth in the Regional Board SUSMP; (2) the application of the SUSMP to all "non-discretionary" as well as "discretionary" projects falling within the nine subject project categories in the County of Los

Angeles, in violation of the terms of Order No. 96-054; (3) the addition of two additional priority project categories beyond those set forth in Order No. 96-054, i.e., development in "environmentally sensitive areas" and the development of parking lots with 25 or more spaces; and (4) the application of the Regional Board SUSMP to "redevelopment" as opposed to "development" as provided for under Order No. 96-054.

7. The action taken by the Regional Board on January 26, 2000, and the failure of the Executive Officer to act on the Permittees' SUSMP, has resulted in the Regional Board taking action inconsistent with the Administrative Review Process under the Permit by failing to allow their Executive Officer to act on the Permittees' SUSMP, and by mandating the Regional Board SUSMP on the Permittees.

8. I have read Order No. 96-054 and am very familiar with its terms and the programs submitted by the Permittees under the Permit. The terms of the Permit do not give the Regional Board the discretion to impose new Permit requirements on the Permittees in mid-stream without a proper hearing on an amendment to the Permit. In addition, the programs set forth in the Regional Board SUSMP will result in the imposition of mandated requirements and programs on Permittees throughout the County of Los Angeles, at significant cost and expense to such Permittees, without any funding from the Regional Board or the State Board to carry out the requirements of these mandates.

9. Additional concerns with the actions taken by the Regional Board and its Executive Officer involve the lack of information and scientific evidence and studies on the Regional Board SUSMP Program, the benefits to be obtained from such SUSMP Program, the costs effectiveness of the Regional Board SUSMP, and the lack of information and direction on the implementability of the Regional Board SUSMP. The Regional Board did not provide sufficient evidence at the hearing on January 26, or otherwise, to adequately address these issues, or the requirement that the SUSMP Program reduce the discharge of pollutants to the maximum extent practicable.

10. As referenced above, a number of changes were submitted to the Regional Board through a change sheet dated January 25, 2000, a change sheet that was not presented to the Permittees until January 26, 2000 at the time of the hearing. Some of the changes in the change

sheet concern substantial changes to the Program submitted by the Regional Board in December of 1999. Further, after the close of public testimony, I am informed that the Regional Board itself proceeded to make a number of substantial and significant changes to the Regional Board's SUSMP, without prior notice of the proposed changes and without giving the public, including the Petitioners, an opportunity to provide evidence and input on such proposed changes. These changes include, among other changes, expanding the application of this SUSMP Program to "non-discretionary" as well as "discretionary" projects within the City, providing the City with only six months in which to adopt an ordinance to implement the Regional Board's SUSMP on both discretionary and non-discretionary projects, with only an additional 30 days to implement the Program; and deleting the so-called "roof top" exemption from the terms of the Program. With these changes and others, but without sufficient notice of the same, the Regional Board and its Executive Officer failed to give the Petitioners sufficient opportunity to be heard and to present evidence on these various issues and others raised by these last minute changes.

11. The impact that will result from the actions and inactions taken by the Regional Board and its Executive Officer concern not only the Permittees, but also the building industry, the restaurant industry, and the public at large. The impacts are, moreover, substantial and far reaching. First, the water quality benefits to be obtained from the imposition of the Regional Board's mandated SUSMP Program are undefined, untested, and unknown. Second, although the actual cost to implement the Regional Board SUSMP are unknown at this time (as they have not been fully investigated by the Regional Board), the costs are known to be significant both in terms of additional development costs, design costs, land costs, implementation costs, maintenance costs and environmental costs. Third, substantial harm will result not only to the development community, the building industry and the restaurant industry in the form of lost land and high development costs, these costs will be passed on to the general public, making it more difficult to provide low and moderate income housing, and other affordable development. Fourth, the potential liability, bodily injury and property damage created by the design standards imposed by the Regional Board's action are unknown, but are believed to be substantial. Fifth, the Regional Board has failed to address the implementation problems created by its actions, and has failed to

consider the problems created by expanding the application of SUSMPs to "non-discretionary" projects, in violation of the terms of the Permit. Sixth, the Regional Board has failed to analyze the potential impacts on groundwater quality created by allowing the introduction and infiltration of pollutants of concern through the soil and into the region's groundwater. Finally, the Regional Board has failed to consider the vector and pest control problems created by its actions, and the nuisances that will result from the Regional Board SUSMP.

12. Accordingly, unless the action taken by the Regional Board and its Executive Officer is stayed, substantial harm will result to both the Petitioners under the Petition, as well as citizens throughout the County of Los Angeles and the general public. Moreover, if a stay is granted to allow the State Board to adequately review the action taken by the Regional Board and its Executive Officer, and to determine whether such action was appropriate or at least whether such action raises substantial questions of law or fact, I am aware of no evidence indicating any substantial harm to any person or member of the public. Clearly, the harm to be incurred by the Petitioners and the members of the public, as well as the building and restaurant industry, far outweigh any alleged harm to any person or the public should a stay not be granted.

13. With this Petition, Petitioners believe there are substantial questions of fact which must be addressed that have not been addressed by this Regional Board, many of which we did not have a full opportunity to raise with the Board because of the last minute nature of the changes. In addition, I am advised by counsel for the Petitioners that there are substantial questions of law raised by the Regional Board's and the Executive Officer's actions of January 26, 2000 and thereafter.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct of my own personal knowledge, if called upon as a witness I could and would competently testify thereto under oath.

This Declaration was executed this 24th day of February, 2000 in the City of Signal Hill, County of Los Angeles, State of California.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

Attn: Craig M. Wilson, Esq.

Re: The Cities of Arcadia, et al. v. The California Regional Water Quality Control Board, Los Angeles Region, et al.

Dear Mr. Wilson:

Enclosed with this letter is a Petition to the State Water Resources Control Board on behalf of a number of Petitioners in the County of Los Angeles challenging actions and inactions of the California Regional and Water Quality Control Board, Los Angeles Region, and its Executive Officer, in connection with the NPDES Permit for Municipal Storm Water and Urban Run-Off Discharges within the County of Los Angeles, Order No. 96-054 (NPDES No. CAS 614001). The Petition itself includes the points and authorities supporting the legal issues raised in the Petition. In addition, enclosed is a separate set of points and authorities supporting the legal issues raised in the Petition which, when combined with the points and authorities in the Petition itself, collectively constitute the Petitioners' statement of points and authorities for purposes of this proceeding.

Please note that the Petitioners are also seeking a hearing for purposes of presenting additional evidence that could not have been presented at the time of the hearing on January 26, 2000, because of the late notice and improper notice provided to the Petitioners on substantial modifications made to the Regional Board's proposed Standard Urban Storm Water Mitigation Plan ("SUSMP") and changes made after the close of the public testimony.

Also attached to and enclosed with the Petition is a request to the Regional Board to prepare the transcripts and tape recordings of the proceeding on January 26, 2000, as well as a request that the Regional Board prepare a list of persons known by the Regional Board to have

an interest in the subject matter of this Petition, and to forward such list to the State Board and the Petitioners.

Finally, enclosed please find an affidavit supporting Petitioners' request for a stay given the significant harm that will result to Petitioners if a stay is not granted, and the lack of harm to other interested persons if a stay is granted. We look forward to an expeditious resolution of the issues raised in the Petition.

Thank you for your consideration of the above and the enclosed. If you have any questions or need any additional information in this regard, please do not hesitate to contact the undersigned.

Sincerely,

RUTAN & TUCKER, LLP

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

PETITION BEFORE THE

STATE WATER RESOURCES CONTROL BOARD

THE CITIES OF ARTESIA, BELLFLOWER, BURBANK, CERRITOS, COMMERCE, DIAMOND BAR, DOWNEY, IRWINDALE, LA CANADA-FLINTRIDGE, LA MIRADA, LA VERNE, LAKEWOOD, LAWNDALE, MONROVIA, PALOS VERDES ESTATES, PICO RIVERA, POMONA, RANCHO PALOS VERDES, SANTA FE SPRINGS, SIGNAL HILL, SOUTH GATE, VERNON, WALNUT, AND WHITTIER, municipal corporations; and THE BUILDING INDUSTRY ASSOCIATION OF SOUTHERN CALIFORNIA, a Non-Profit Mutual Benefit Corporation, and THE BUILDING INDUSTRY LEGAL DEFENSE FOUNDATION, a Non-Profit Mutual Benefit Corporation, Petitioners, vs. THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION; and DENNIS DICKERSON, Executive Director of the Los Angeles Regional Water Quality Control Board, Respondents.	Case No. PETITION FOR REVIEW OF JANUARY 26, 2000 ACTION OF THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION, AND ACTIONS AND FAILURES TO ACT BY IT AND ITS EXECUTIVE OFFICER, DENNIS DICKERSON, PURSUANT TO ORDER NO. 96-054 (NPDES NO. CAS614001) [Request for Immediate Stay - Water Code Section 13321 and 14 CCR Section 2053] [Request for Hearing - 14 CCR Section 2050(b)]

Petitioners, the Cities of Artesia, Bellflower, Burbank, Cerritos, Commerce, Diamond Bar, Downey, Irwindale, La Canada-Flintridge, La Mirada, La Verne, Lakewood, Lawndale, Monrovia,

Palos Verdes Estates, Pico Rivera, Pomona, Rancho Palos Verdes, Santa Fe Springs, Signal Hill, South Gate, Vernon, Walnut, and Whittier (hereafter collectively the "City Petitioners"), and the Building Industry Association of Southern California and the Building Industry Legal Defense Foundation, hereafter collectively "Petitioners," hereby petition the State Water Resources Control Board ("State Board"), pursuant to California Water Code Section 13320 and applicable California law, as follows:

I. GENERAL ALLEGATIONS

1. City Petitioners herein, are and at all relevant times herein, were cities organized under and existing under the laws of the State of California and located in the County of Los Angeles, California. The respective address for each City Petitioner is as follows:

(a) Artesia – 18747 Clarkdale Avenue, Artesia, CA 90701

(b) Bellflower – 166600 Civic Center Drive, Bellflower, CA 90706

(c) Burbank – 275 E. Olive Avenue, Burbank, CA 91502

(d) Cerritos - 18125 Bloomfield Avenue, Cerritos, CA 90703-3130

(e) Commerce – 2535 Commerce Way, Commerce, CA 90040

(f) Diamond Bar – 21660 E. Copley Drive, Diamond Bar, CA 91765

(g) Downey – 11111 Brookshire Avenue, Downey, CA 90241

(h) Irwindale - 5050 N. Irwindale Avenue, Irwindale, CA 91706

(i) La Canada Flintridge – 1327 Foothill Boulevard, La Canada Flintridge, CA 91011

(j) La Mirada – 13700 La Mirada Boulevard, La Mirada, CA 90638

(k) La Verne – 3660 "D" Street, La Verna, CA 91750-3599

(l) Lakewood – 5050 N. Clark Avenue, Lakewood, CA 90712

(m) Lawndale – 14717 Burin Avenue, Lawndale, CA 90260

(n) Monrovia – 415 S. Ivy Avenue, Monrovia, CA 91016

(o) Palos Verdes Estates –340 Palos Verdes Drive W., Palos Verdes Estates, CA 90274

(p) Pico Rivera – 6615 Passons Boulevard, Pico Rivera, CA 90660

(q) Pico Rivera – 6615 Passons Boulevard, Pico Rivera, CA 90660

(r) Pomona – 505 S. Gary Avenue, Pomona, CA 91769

(s) Rancho Palos Verdes – 30940 Hawthorne Boulevard, Rancho Palos Verdes, CA 90275

(t) Santa Fe Springs – 11710 Telegraph Road, Santa Fe Springs, CA 90670

(u) Signal Hill - 2175 Cherry Avenue, Signal Hill, CA 90806

(v) South Gate – 8650 California Avenue, South Gate, CA 90280

(w) Vernon - 4305 Santa Fe Avenue, Vernon, CA 90058

(x) Walnut – 2120 La Puente Road, Walnut, CA 91789

(y) Whittier –13230 Penn Street, Whittier, CA 90602

2. City Petitioners, and each of them, are Permittees under that Permit issued by the California Regional Water Quality Control Board, Los Angeles Region, on July 15, 1996, Waste Discharge Requirements for Municipal Storm Water and Urban Run-Off Discharges within the County of Los Angeles, Order No. 96-054 (NPDES NO. CAS 614001).

3. Petitioners the Building Industry Legal Defense Foundation ("BILD") and the Building Industry Association of Southern California ("BIA/SC") are Non-Profit Mutual Benefit Corporations whose addresses are:

(a) Building Industry Association of Southern California – 1330 S. Valley Vista Drive, Diamond Bar, CA 91765

(b) Building Industry Legal Defense Foundation – 1330 S. Valley Vista Drive, Diamond Bar, CA 91765

4. BILD and BIA/SC are California non-profit corporations dedicated to representing the interests of members of the Southern California construction and building industry. BILD is a wholly owned subsidiary of BIA/SC whose purposes are to monitor legal developments and participate in litigation impacting the residential construction industry in Southern California. BIA/SC's 1,800 members include a significant number of residential developers and associate businesses that construct approximately 70% of all the residential housing units built annually in the Southern California Region. BILD and BIA/SC members reside and conduct commercial land

development activities within the jurisdiction of the California Regional Water Quality Control Board, Los Angeles Region, and within the City Petitioners' jurisdictions. BIA/SC and BILD members are currently engaged in, and in the future will engage in, development projects that must comply with and implement Order No. 96-054, Waste Discharge Requirements for Municipal Storm Water and Urban Run-Off Discharges within the County of Los Angeles. BILD and BIA/SC are authorized to bring legal action, including this Petition, on behalf of BILD and BIA/SC members.

5. City Petitioners, BILD, and BIA/SC are interested aggrieved parties as said Petitioners and their members are adversely impacted by actions taken by Respondents in connection with a Regional Board mandated Standard Urban Storm Water Mitigation Plan imposed on Petitioners and other interested parties on January 26, 2000, and as said Petitioners are adversely impacted by failures to act on the part of Respondents in connection with a Standard Urban Storm Water Mitigation Plan submitted by the City Petitioners in July of 1999. Petitioners herein, as aggrieved parties, with this Petition, are challenging the actions taken by the Respondents on January 26, 2000, and the failures of the Respondents to act lawfully in reviewing and approving the Standard Urban Storm Water Mitigation Plan submitted by the City Petitioners, in accordance with state and federal law, as described below. The actions taken by the Respondents, and each of them, and their failures to act, were improper, inappropriate, arbitrary and capricious, and in violation of state and federal law.

6. Respondent, the California Regional Water Quality Control Board, Los Angeles Region ("Regional Board"), is and at all relevant times herein, was a regional agency created pursuant to the provisions of the California Water Code, Section 13200 *et seq.*

7. Respondent Dennis Dickerson is, and at all relevant times herein was, the Executive Officer of the Regional Board.

8. The State Water Resources Control Board ("State Board") is a state agency created pursuant to the California Water Code Sections 174 *et seq.* and 13200 *et seq.* and is charged with formulating and adopting state policy for water quality control within the State of California.

9. Under State law, in formulating and revising state policy for water quality control,

the State Board is required to consult with and carefully evaluate the recommendations of concerned federal, state and local agencies on water quality policy issues. (Cal. Water Code § 13144.) The State Board is designated as the state water pollution control agency for all purposes stated in the Federal Water Pollution Control Act (the "Clean Water Act" - 33 U.S.C.§ 1251 et seq.), and is the authorized agency to exercise powers delegated to it under the Clean Water Act and any amendments thereto. (Cal. Water Code § 13160.) The State Board is further empowered pursuant to state and federal law, to adopt water quality control plans as required by the Clean Water Act, and such plans, when adopted, supersede any Regional Water Quality Control plans. (Cal. Water Code § 13170.)

10. Pursuant to California Water Code Section 13320 and the regulations thereto, the State Water Resources Control Board has jurisdiction over this Petition.

II. THE REQUIREMENTS OF THE CLEAN WATER ACT AND STATE LAW

11. The Federal Water Pollution Control Act was adopted in 1948, amended in 1972, and again amended in 1977 as the Clean Water Act of 1977. In 1987, the Act was amended to establish new controls on industrial and municipal storm water discharges. The 1987 amendments, in part, required National Pollutant Discharge Elimination System ("NPDES") Permits for storm water discharges from Municipal Separate Storm Sewer Systems ("MS4s").

12. The Clean Water Act requires permits for discharges from municipal storm sewer systems to require controls "to reduce the discharge of pollutants to the maximum extent practicable." (33 U.S.C. § 1342(p)(3)(B).) Dischargers who are issued permits and who operate within the terms of such permits are thus in compliance with the requirements of the Clean Water Act.

13. The State of California is one of 38 or more states with authorization to administer certain aspects of the NPDES Program within its jurisdiction. The State Board administers the NPDES Program in California pursuant to the Clean Water Act and pursuant to that Memorandum Of Understanding between the U.S. Environmental Protection Agency ("U.S. EPA") and the California State Water Resources Control Board, effective September 22, 1989.

14. Pursuant to California Water Code Section 13160, the State Board is the designated

agency to exercise the powers delegated to the state under the Clean Water Act, including the right and obligation to administer the NPDES Program. Federal regulations allow NPDES authority within the state to be shared between two or more state agencies, if each agency has statewide jurisdiction over a class of activities or discharges. When more than one agency is responsible for issuing Permits within the state, each agency must make a submission meeting the requirements of the Federal regulations. (40 C.F.R. § 123.1(g)(1).) The Regional Board is not a state agency with statewide jurisdiction over a class of activities or discharges, and has not been authorized under the Clean Water Act or the Federal regulations to administer the NPDES Program in California, and accordingly, has no authority to do so.

15. Under existing State law, the State Board may require any state or local agency to investigate and report on any technical factors involved in water quality, provided, however, that the burden, including the costs of such reports, bears a reasonable relationship to the need for the report and the benefits to be obtained therefrom. (Cal. Water Code § 13165.)

16. Also under State law, the Regional Board, in requiring state or local agencies to investigate and report on technical factors involved in water quality control, may require such investigations from local agencies only where they can show that the burden, including the cost of such reports, bears a reasonable relationship to the need for the report and the benefits to be obtained therefrom. (Cal. Water Code § 13225(c).)

17. Respondent Regional Board is required to formulate and adopt water quality control plans for all areas within its region, and is further required to consult with and consider the recommendations of affected local agencies. (Cal. Water Code § 13240.) In establishing water quality objectives and water quality control plans within its region, the Regional Board is required to consider specific factors, including:

(a) Past, present and probable future beneficial uses of water;

(b) Environmental characteristics of the hydrographic unit under consideration, including the quality of water available thereto;

(c) Water quality conditions that could reasonably be achieved through the coordinated control of all factors which affect water quality in the area;

(d) Economic considerations.

(Cal. Water Code 13241.)

18. California Water Code Section 13360, moreover, prohibits the Regional Board, as well as the State Board, from specifying in any order or set of waste discharge requirements, specific designs, locations, or types of construction standards, or a particular manner in which compliance with an order, requirement or set of waste discharge requirements, is to be met. All persons are permitted to comply with the requirements of any order or waste discharge requirements in any lawful manner. (Cal. Water Code § 13360(a).)

III. ORDER NO. 96-054 (NPDES NO. CAS614001) AND THE PERMITTEES' SUSMP

19. On or about July 15, 1996, and effective as of July 31, 1996, Petitioner Cities were issued a Permit from the Regional Board, Order No. 96-054 (NPDES No. CAS614001), Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles, a Permit purportedly issued pursuant to the Clean Water Act and the Porter-Cologne Act (hereafter "Permit," "Order" or "Order No. 96-054").

20. In accordance with the terms and provisions of the Permit, the Permittees thereunder, including the City Petitioners herein, were required to submit a Standard Urban Storm Water Mitigation Plan ("SUSMP") to Respondent Dennis Dickerson, the Executive Officer of the Regional Board, for the Executive Officer's review and approval or disapproval. Under the terms of the Permit, the SUSMP was to be submitted within six months of the Regional Board's approval of the Permittees' Best Management Practices for development projects within their jurisdiction. Best Management Practices were not approved by the Regional Board until April 22, 1999, pursuant to Resolution No. 99-03. The required SUSMP program was therefore timely submitted by the Permittees to Respondent Dickerson in July of 1999. This SUSMP Program was thereafter modified in August of 1999 to address certain Regional Board comments (hereafter the July and August 1999 submittals are collectively referred to as the "Permittees' SUSMP").

21. By its terms, the Permittees' SUSMP applies to certain specified development categories identified in the Permit itself, and requires the applicants of designated development projects to submit an Urban Storm Water Mitigation Plan that implements, to the maximum extent

practicable, appropriate requirements and measures to minimize impacts from storm water runoff, and to reduce storm water pollutants to the maximum extent practicable. The Permittees' SUSMP incorporated additional conditions and requirements as required by the Permit and as necessary to reduce pollutants to the maximum extent practicable. A copy of the Permittees' SUSMP as submitted in July of 1999, and the modifications submitted in August of 1999, are attached hereto and collectively marked as Exhibit "A."

22. The Permittees' SUSMP incorporates the appropriate elements of the recommended list of Best Management Practices ("BMPs") approved by the Respondent Regional Board on April 22, 1999, by Resolution No. 99-03, and is a guideline to be used by the individual Permittees to develop their own specific programs for use in their individual jurisdictions. By its terms, the Permittees' SUSMP applies to "discretionary" projects as defined under the California Environmental Quality Act that fall within one of seven (7) project categories as outlined in the Permit, specifically: 10-99 home subdivisions; 100+ home subdivisions; single family hillside developments; 100,000 square foot commercial development; automotive repair shops; retail gas station outlets; and restaurants.

23. The Permittees' SUSMP identifies as potential Best Management Practices, the following BMPS: the reduction of impervious surfaces and increased landscaped areas; the direction of roof top runoff to pervious surfaces such yards; open channels of vegetated areas; the use of vegetated swales and strips in accordance with design criteria to be determined by the local jurisdiction; the use of extended/dry detention basins in accordance with the design criteria to be determined by the local jurisdiction; the use of infiltration basins, trenches, wet ponds, constructed wetlands, oil/water separators, catch basins inserts, continuous deflective separation units, storm drain inserts, media filtration, bioretention basins, dry wells, foundation planting, and other Best Management Practices, all in accordance with design criteria to be determined by the local jurisdiction. Additional requirements in the Permittees' SUSMP include the protection of slopes and channels, storm drain stenciling and signage, the proper design of common outdoor material storage areas, the proper design of common trash storages areas, the providing of proof of ongoing BMP maintenance, and various other requirements, all with the stated goal of reducing pollutants

"to the maximum extent practicable" in accordance with the Clean Water Act.

24. Pursuant to Resolution No. 99-03 adopted by the Regional Board on April 22, 1999, the Regional Board found that the approved BMPs "when implemented at development projects, in combination, will reduce pollutants and storm water discharges to the maximum extent practicable." Accordingly, pursuant to Resolution No. 99-03, the Regional Board has determined that the proposed and approved BMPs, when implemented, meet the Permittees requirements under the Clean Water Act, i.e., to reduce the discharge of pollutants to the maximum extent practicable (see 33 U.S.C. § 1342(p)(3)(B)) and, thus, the utilization of the approved BMPs in the Permittees' SUSMP is direct evidence of the Permittees' compliance with the Clean Water Act.

IV. RESPONDENTS HAVE FAILED TO COMPLY WITH THE ADMINISTRATIVE REVIEW PROCESS UNDER ORDER NO. 96-054

25. The Permit contains a very specific Administrative Review Process required to be followed by the Regional Board and the Executive Officer in reviewing Stormwater Programs to be developed under Order No. 96-054. Respondents, on January 26, 2000, acknowledged the application of this Administrative Review Process to the Permittees' SUSMP program.

26. The Administrative Review Process provides the procedure to be followed "for review and acceptance of reports and documents submitted to the Regional Board," and further provides for a method ***"to resolve any differences in compliance expectations between the Regional Board and Permittees, prior to initiating enforcement action."*** (Order No. 96-054, § 2.I.G.)

27. The Administrative Review Process also identified the process to be followed by the Executive Officer in determining whether the Permittees' SUSMP is sufficient and in compliance with the requirements of Order No. 96-054. Under the Administrative Review Process, the Executive Officer was required to notify the Permittees of his approval or disapproval of the Permittees' SUSMP program within 120 days of its submittal. If the Executive Officer does not respond within 120 days following submittal, the Permittees may notify the Regional Board of their intent to implement the program as submitted, and if after ten days the Executive Officer has not responded, the Permittee may implement "the submitted program" without modification by the

Executive Officer. Although the Permittees' SUSMP was submitted in July of 1999 and resubmitted in August of 1999, to date, the Respondents have failed to respond to the Permittees' SUSMP.

28. Further, under the Administrative Review Process, the Executive Officer was to send a "Notice of Intent to Meet and Confer" ("NIMC") to the Permittees, and was to outline ***"specific information"*** required to support his determination that the Permittees' SUSMP did not include sufficient controls to reduce pollutants to the maximum extent practicable. The NIMC is to include a timeframe by which the Permittees must meet with the Regional Board staff to demonstrate their program is sufficient to meet the requirements of the Permit, and if not, to seek clarification of the steps to be undertaken to comply with the requirements of Order No. 96-054. Further, under the Administrative Review Process and the plain language of Order No. 96-054, it is the Permittees' program, not a program submitted by some third party (including the Regional Board), that must be sufficient to comply with the terms of the Permit. To date, the Executive Officer has failed to provide the Permittees with an NIMC, and has failed to take action on the Permittees' SUSMP.

29. Moreover, under the Administrative Review Process, after an NIMC had been forwarded to the Permittees, Regional Board staff is required to meet and confer with the Permittees to allow the Permittees the opportunity to demonstrate ***"that the Permittees' program is sufficient to meet the requirements of this Order,"*** and if not, to seek clarification on the steps to be taken to meet the provisions of the Order. To date, the Executive Officer and staff have failed to comply with this requirement.

30. In addition, under the Administrative Review Process, the meet and confer period is to conclude with either a notice of program sufficiency to the Permittees, or with a submittal and acceptance by the Executive Officer of a written "Stormwater Program Compliance Agreement" ("SPCA"), which is to include implementation deadlines. The Executive Officer may terminate the meet and confer period after a reasonable period due to a lack of progress on issues and may order submittal of the SPCA by a specified date. To date, the Respondent Executive Officer has failed to comply with this requirement, and has never terminated the meet and confer

process let alone commenced it; nor has the Executive Officer ever submitted an order requiring the submittal of an SPCA by a particular date.

31. Furthermore, under the Administrative Review Process, the Respondent Executive Officer is required to approve or reject a submitted SPCA, or an amended SPCA, within 120 days of its submittal. If the Executive Officer rejects the SPCA, he is required to state the reasons for his rejection. To date, the Respondent Executive Officer has failed to approve or reject a submitted SPCA, as the Executive Officer has never commenced or terminated the meet and confer process and has never ordered the submittal of an SPCA.

32. Also under the Administrative Review Process, once a Permittee receives a rejection of an SPCA, the Permittee is to be given sixty (60) days to remedy the specified deficiency and resubmit the SPCA. If the Executive Office has not responded within 120 days following the submittal of an SPCA, a Permittee is to notify the Executive Officer of its intent to implement the SPCA as submitted, and if the Executive Officer has not responded within ten (10) days, the Permittee is entitled to implement the submitted SPCA. To date, the Respondent Executive Officer has failed to reject an SPCA, and has failed to give the Permittees an opportunity, upon such rejection, to submit within 60 days thereafter a remedy of the specified deficiency of the SPCA.

33. Finally, under the Administrative Review Process: ***"The Executive Officer shall not take enforcement action against a Permittee until the Executive Officer has notified the Permittee in writing that the Administrative Review Process has been exhausted and that the Executive Officer has determined that a violation exists warranting enforcement."*** (Order, Part 2.I.G.2.d.)

34. As of the date of this Petition, the Regional Board and the Executive Officer have failed to act on the Permittees' SUSMP in accordance with the Administrative Review Process under Order No. 96-054, and thus have failed to act in accordance with the requirements of the Clean Water Act and the Porter-Cologne Act.

V. THE REGIONAL BOARD SUSMP PROGRAM

35. On September 16, 1999, Regional Board staff unilaterally proposed changes to the

Permittees' SUSMP program and discussed those changes at a public workshop. At that time, however, neither the Regional Board nor the Executive Officer took any action on their SUSMP program, and instead continued their consideration of a unilateral Regional Board staff mandated SUSMP program for approximately ninety (90) days.

36. On January 26, 2000, the date of the action that is presently being challenged by the Petitioners herein, the Regional Board conducted a public hearing on a proposed SUSMP program submitted by its staff (but not the Permittees), and proceeded to ***direct*** its Executive Officer to approve an SUSMP program that was proposed by the Regional Board staff on December 7, 1999, as modified by staff through a change sheet dated January 25, 2000, and as further modified by the Regional Board itself at the hearing on January 26, 2000. (The SUSMP program proposed by staff as modified by the Board on January 26, 2000, is hereafter referred to as the "Regional Board SUSMP.") Copies of the December 2, 1999 program and the January 25, 2000 change sheet are attached hereto and collectively marked as Exhibit "B."

37. The Respondents' "public hearing" of January 26, 2000 complied with no procedural requirement under the Clean Water Act or the Porter-Cologne Act for the adoption or an amendment to a permit, or otherwise. Moreover, because of the last minute changes made by the Regional Board staff at the January 26, 2000 hearing, through the Change Sheet, which contained both substantive and non-substantive changes, Petitioners, and each of them, were not provided sufficient notice of the potential action to be taken by the Regional Board, and were furthermore not provided sufficient opportunity to be heard prior to the Regional Board's taking their action of January 26, 2000. In addition, at the public hearing, but after the close of public testimony, the Regional Board, in its deliberations, made a number of substantive changes to the proposed Regional Board SUSMP, including but not limited to requiring its application to all "non-discretionary" as well as "discretionary" projects, and including requiring the Permittees to adopt local ordinances within six (6) months of the date of the Executive Officer's signature of the order and to implement the proposed SUSMP program thirty (30) days thereafter. These changes and other changes made by the Regional Board after the close of public testimony resulted in the Petitioners being denied sufficient opportunity to be heard on such substantive changes and has

resulted in a denial of due process rights to the Petitioners.

38. By letter dated February 23, 2000, the record of the January 26, 2000 hearing, including transcripts of the hearing and audiotapes identifying the changes made by the Regional Board itself to the Regional Board SUSMP, was requested in accordance with this Petition. A true and correct copy of this letter requesting the preparation of the transcripts and the audiotapes is attached hereto and marked as Exhibit "C."

39. The Regional Board SUSMP greatly expands the obligations and requirements of the Permittees beyond the Permittees' SUSMP and therefore beyond the requirements of the Permit, the Clean Water Act, and the Porter-Cologne Act. Specifically, the Regional Board SUSMP imposes, among other requirements, the following requirements that are not included within the Permittees' SUSMP and that have not been agreed to by the Permittees pursuant to the Administrative Review Process or otherwise: (a) a requirement that the Permittees impose design standards/numerical mitigation measures to require the treatment of .75 inches of rainfall over a 24-hour period in nine (9) priority categories of development described below (hereafter referred to as the "Numerical Mitigation Standard"); (b) a requirement that the Permittees expand their SUSMP program to apply to all "non-discretionary" as well as "discretionary" projects within the nine project categories; (c) a requirement that the SUSMP extend to two (2) additional project categories, in addition to the seven (7) categories set forth in Order No. 96-054, i.e., parking lots of 25 spaces or more and "environmentally sensitive areas;" and (d) a requirement that the SUSMPs apply to all "redevelopment" within the nine (9) priority project categories (the term "redevelopment" is defined in the Regional Board's SUSMP to include the creation or addition of 50% or more impervious surfaces or the making of improvements of 50% or more of the existing structure).

40. Of critical importance is the Numerical Mitigation Standard mandated by the Regional Board's SUSMP, a provision that had not proposed or agreed to by the Petitioners. The .75 Numerical Mitigation Standard is a design standard for post construction projects whereby post-construction treatment control BMPs must be designed to mitigate (infiltrate or treat) storm water runoff to achieve 85% or more volume treatment. It is a design standard which the Regional

Board staff has determined will result in the treatment of up to .75 inches of rainfall over a 24 hour period for each and every storm event. As a result of this .75 Numerical Mitigation Standard, Permittees will be required to impose structural controls on new development and redevelopment in the nine (9) categories of development referenced below, to include among other things, extended detention basins on all such discretionary and non-discretionary projects, wet ponds, infiltration basins/ponds (which reduce the developable space), storm drain-connected oil/grease separators, catch basin inserts, grassy swales and other similar devices. The nine (9) categories of discretionary and non-discretionary development and redevelopment projects to which this requirement would apply are: (1) 100+ home subdivisions; (2) 10-99 home subdivisions; (3) 100,000 square feet commercial development; (4) automotive repair shops; (5) retail gasoline outlets; (6) restaurants over 5,000 square feet; (7) hillside located single family dwellings; (8) parking lots with 25 or more space (equivalent to approximately 5,000 square feet of surface area); and (9) development in unmapped areas known as "environmentally sensitive areas."

VI. RESPONDENTS' ACTIONS AND INACTIONS WERE INAPPROPRIATE, IMPROPER, AND IN VIOLATION OF THE PERMIT AND STATE AND FEDERAL LAW

41. The actions taken by the Regional Board on January 26, 2000, and any subsequent follow up action to be taken by the Executive Officer pursuant to such action, as well as the failure of the Respondents to comply with the terms of the Permit, were in conflict with the Permit, the Clean Water Act, and State law, were not supported by substantial evidence in the record or otherwise, and were arbitrary and capricious.

A. Respondents Have Failed To Comply With the Administrative Review Process And To Take Action On The Permittees' SUSMP Program In Accordance With The Requirements Of Order No. 96-054 And The Clean Water Act.

42. To date, as set forth above, neither the Executive Officer nor the Regional Board, have acted on the Permittees' SUSMP in accordance with the Permit. The Permit and the Administrative Process thereunder required that the Executive Officer notify the Permittees of the results of his review and approval or disapproval of their SUSMP program within 120 days of its

submittal. Although the Permittees' SUSMP was submitted to the Executive Officer in July of 1999, and thereafter resubmitted to address comments of the Executive Officer in August of 1999, to date neither the Executive Officer nor the Regional Board have reviewed the Permittees' SUSMP program to determine whether that SUSMP program will reduce pollutants "to the maximum extent practicable" in accordance with the requirements of the Clean Water Act.

43. Respondents, and each of them, as discussed above, have failed to comply with the requirements of the Administrative Review Process under Order No. 96-054, and have acted improperly and arbitrarily and capriciously in violation of its terms and in violation of the Clean Water Act and State law.

B. <u>Respondents Actions Were Not Authorized By The Permit, The Clean Water Act, Or The Porter-Cologne Act</u>.

44. Upon the issuance of a NPDES Permit pursuant to the Clean Water Act, Permittees who comply with the terms of the Permit and take action to "reduce pollutants to the maximum extent practicable" are in compliance with the Clean Water Act and State law. There is no provision in the Clean Water Act, the Porter-Cologne Act, or the Permit, that enables the Regional Board or its Executive Officer to impose *new requirements* that are inconsistent with the provisions of the Permit, and that are not required under the Clean Water Act or State law on the Permittees.

45. Under the final rule issued by U.S. EPA in December of 1999 entitled "National Pollutant Discharge Elimination System – Regulations For Revision Of The Water Pollution Control Program Addressing Stormwater Discharges," U.S. EPA recommends that the BMPs to be chosen, be appropriate for the local community, and recognized that MS4 operators are to have significant flexibility to develop post-construction controls as appropriate to address local concerns and to apply new control technologies as they become available. U.S. EPA further commented that "redevelopment" projects may have more site constraints that narrow the range of appropriate BMPs. In this same rule, U.S. EPA further determined that MS4 operators are to have flexibility to determine the appropriate BMPs to address local water quality concerns, and that such operators are to develop an appropriate combination of BMPs to be applied on a site-by-site

regional or watershed basis. (See 64 Federal Register 68722, *et seq.*) Even the definition provided within EPA's Final Rule for "redevelopment" differs significantly from the definition of "redevelopment" provided in the Regional Board SUSMP Program. The above shows that the mandated programs set forth in the Regional Board SUSMP are not programs mandated anywhere in the Clean Water Act or the regulations thereunder, and, more importantly, that such Regional Board SUSMP programs contradict the letter, spirit and intent of the Clean Water Act.

46. The action taken by the Regional Board on January 26, 2000, and any subsequent action taken by the Executive Officer, are similarly actions that were not authorized by the Permit. Specifically, the Regional Board had no authority to usurp the authority of the Executive Officer under the Permit and to mandate its own SUSMP program on the Permittees. For example, the Respondents' actions in requiring a SUSMP program on all "non-discretionary," as well as on "discretionary" projects is not authorized by the Permit, or state or federal law, and contradicts the express terms of the Permit. Similarly, the addition of two more priority project categories, i.e., the application of the Regional Board SUSMP program to environmentally sensitive areas and projects of 25 or more parking spaces, is inconsistent with the terms of the Permit and is similarly not authorized by state or federal law.

47. The Regional Board's action of January 26, 2000 is also a violation of the Permit and state and federal law as the Regional Board has substituted its discretion for the discretion of the Executive Officer (as provided for under the Permit issued by the Regional Board in July of 1996). The action taken by the Regional Board and the required direction provided to its Executive Officer is a direct violation of the Permit and state and federal law as the Permit specifically provides for the Executive Officer to review the Permittees' SUSMP in accordance with the Administrative Review Process under the Permit, and does ***not*** permit the Regional Board to eliminate the Executive Officer's discretion and to ignore the Administrative Review Process required by the Permit.

48. Further, neither the Clean Water Act, the Porter-Cologne Act nor the Permit, authorize the Respondents Regional Board and its Executive Officer, to mandate a program on the Permittees without first properly seeking an amendment to Order No. 96-054, or without the

existence of other legal authority to do so. The Clean Water Act requires the Permittees to require controls "to reduce the discharge of pollutants to the maximum extent practicable." Respondents have made no findings and submitted no evidence to show that the Regional Board's SUSMP will "reduce the discharge of pollutants to the maximum extent practicable," nor has the Regional Board submitted any evidence or made any findings to show that the Permittees' SUSMP program does not sufficiently "require controls to reduce the discharge of pollutants to the maximum extent practicable," or that the Regional Board SUSMP was necessary and superior to the Permittees' Program to "reduce the discharge of pollutants to the maximum extent practicable."

49. The actions of the Regional Board on imposing new requirements under the Order No. 96-054 are inconsistent with the Clean Water Act, the regulations thereunder, the Permit and state law, and were actions taken arbitrarily and capriciously.

C. **Respondents Have Failed To Present Evidence To Show That Regional Board SUSMP Is Cost Effective And That The Benefits To Be Obtained From The Implementation Of The Program Outweigh Its Costs.**

50. The Clean Water Act and the regulations thereunder, as well as the Porter-Cologne Act, all require that the controls to be imposed "to reduce pollutants to the maximum extent practicable" be cost effective. In its final rule on "National Pollutant Discharge Elimination System – Regulations For Revision Of The Water Pollution Control Program Addressing Stormwater Discharges," adopted in December of 1999, U.S. EPA specifically commented that President Clinton's Clean Water Initiative clarified "that the maximum extent practicable standard should be applied in a site-specific, flexible manner, ***taking into account cost considerations as well as well as water quality effects....***" (See 64 Federal Register 68722, 68732.)

51. To date, Respondents have failed to analyze and consider all potential costs involved in complying with their mandated SUSMP program, and failed to weigh the benefits of the program in light of all the potential costs, and failed to issue findings that the benefits of the program outweigh its costs and that the Regional Board SUSMP program was cost effective. As a result, said Respondents have violated the terms of the Clean Water Act and the regulations thereunder, as well as the Porter-Cologne Act, and the terms of the Permit itself.

52. Although the Regional Board failed to analyze the cost necessary to implement the Regional Board's SUSMP, evidence was submitted to the Board at the January 26, 2000 hearing which showed that the costs to implement the Regional Board SUSMP will be significant in terms of development costs, design costs, land costs and other costs, including environmental impacts. In fact, significant costs must be incurred to implement and comply with the Regional Board SUSMP by the Permittees, the building industry, the restaurant industry, all Petitioners herein, and all other persons and stakeholders impacted by the Regional Board SUSMP, in the form of land costs, significant development costs, design costs, implementation costs, maintenance costs, insurance costs, and various other costs, all of which will be passed on to the general public, making it more difficult to develop and redevelop property, and to provide low and moderate income housing and other affordable development.

53. The Regional Board and its Executive Officer and staff performed virtually no analysis on the cost effectiveness of the proposed Numerical Mitigation Standard and the other requirements imposed pursuant to the Regional Board SUSMP. As discussed above, the Clean Water Act requires an accounting of cost considerations. Further, California Water Code Sections 13165, 13225, and 13241 require a cost/benefit analysis before imposing such controls. Section 13225 specifically allows the Regional Board to require as necessary "any state or local agency to investigate and report on technical factors involved in water quality control or to obtain its own analysis of water; provided that the burden, including costs of such reports shall bear reasonable relationship to the need of the report and the benefits to be obtained therefrom." (Cal. Water Code § 13225(c).) Further, in establishing water quality objectives, the Regional Board is required to consider "economic considerations." (Cal. Water Code § 13241.) The failure of the Regional Board to establish any findings and to perform any cost benefit analysis to show that the mandated programs under the Regional Board SUSMP are necessary and cost effective is a violation of state and federal law.

54. Further, under Section 2.III.A.4 of the Permit, the Principal Permittee (the County of Los Angeles), in consultation with the other Permittees, is to develop a model program to inform developers seeking "discretionary approvals" (such as the approval needed where Urban

Storm Water Mitigation Plans are to be incorporated in the development process) of, among other things: (i) the development and construction of storm water management; (ii) the maximization of pervious areas and storm water infiltration (where geology and topography permit); and (iii) "***cost effective*** storm water pollution control measures." The Permit's requirement for developers to be informed of "cost effective storm water pollution control measures" is further evidence of the Permit's requirement that any "storm water pollution control measures" to be implemented must be "cost effective" before being imposed.

55. Respondents have submitted no evidence to show that the Regional Board SUSMP program is necessary and cost effective; nor have they submitted any evidence to show that the benefits to be obtained from such a program, particularly including the marginal benefits, if any, over the Permittees' SUSMP program, exceed the enormous costs of the Respondents' program.

D. <u>The Regional Board SUSMP Program Is Not Supported By The Evidence Or Findings And Has Not Been Shown To Reduce "Pollutants To The Maximum Extent Practicable In Accordance With State And Federal Law</u>.

56. The action taken by the Respondents herein is further a violation of state and federal law and the requirements of the Permit, as the Respondents failed to make the appropriate findings and to perform the necessary analysis and study to evidence any water quality benefits to be obtained from the imposition of the Regional Board's SUSMP instead of, and in place of, the Permittees' SUSMP. In short, the water quality benefits to be obtained from the Regional Board's SUSMP are undefined, untested, and unknown, and have not been shown to be controls which "reduce the discharge of pollutants to maximum extent practicable."

57. With the adoption of the Regional Board SUSMP, Respondents have failed to analyze the potential impacts on groundwater quality created by the introduction and infiltration of pollutants of concern through the soil and into the groundwater throughout the County of Los Angeles, and have failed to analyze the environmental characteristics of the potentially impacted groundwater quality, the groundwater quality conditions in issue and economic considerations, all as required under the Porter-Cologne Act (see, e.g., Cal. Water Code § 13241). In effect, Respondents have failed to conduct appropriate study, analysis and investigation into impacts on

the environment, the community, and the health and safety of the public that will result from the Regional Board SUSMP.

58. The potential significant environmental impacts not analyzed by the Regional Board include the impact of the Regional Board SUSMP on groundwater quality, vector and pest control, the creation of nuisances throughout the County, resulting property damage, as well as potential personal injury and liability created by compliance with the Numerical Mitigation Standard. For example, for a one acre development project, approximately 2,700 square feet of land would need to be dedicated to a detention basin large enough to hold some 20,000 gallons of water, at a cost of approximately $65,000 (inclusive of estimated land cost). The Regional Board's SUSMP has failed to account for the maintenance of such a detention basin and the liabilities associated with such, and the nuisance created by its development, including problems of vector control, the creation of additional potential hazardous and solid wastes, and the potential bodily harm and personal injury that may result from such an attractive nuisance.

59. In addition, Respondents provided no direction on how the Permittees were to proceed with the implementation of the mandated Regional Board SUSMP, how such programs could lawfully and reasonably and practicably be incorporated into existing Permittees' Codes for the building, construction, grading, and design of "discretionary" and "non-discretionary" projects, and how such building codes could realistically be properly reviewed, revised, and implemented throughout the entire County, within six (6) months from the Respondents' actions, as required by the Respondents on January 26, 2000.

60. Respondents failed to provide sufficient time in accordance with the timeframe set forth under Order No. 96-054 for Petitioners to properly implement the mandated SUSMP program and for the regulated industry and the general public to comply with its terms.

61. Respondents have failed to establish any findings to support a determination that the Regional Board SUSMP is protective of water quality, would result in the reduction of pollutants to the maximum extent practicable, is necessary and cost effective, and is implementable by the Petitioners.

E. **The Regional Board SUSMP Is A Mandated Program That Violates California Water Code Section 13360.**

62. California Water Code Section 13360 prohibits the Regional Board, as well as the State Board, from specifying in any order or set of waste discharge requirements, specific design, location, or types of construction or other particular types of compliance requirements. Section 13360 provides, in pertinent part, that: "No waste discharge requirement or other order of a regional board or the state board or decree of a court issued under this division shall specify the design, location, type of construction, or particular manner in which compliance may be had with that requirement, order, or decree, and the person so ordered shall be permitted to comply with the order in any lawful manner."

63. The Regional Board's SUSMP, by its terms, mandates the implementation of a specific Numerical Mitigation Standard and specific design standards to be complied with, in violation of California Water Code Section 13360.

F. **Action Taken By The Regional Board On January 26, 2000, Will Result In The Imposition Of Unfunded Mandates And A Violation Of The California Constitution.**

64. Respondents, by requiring compliance with the Regional Board's SUSMP's on the Permittees and other local governmental Petitioners, have imposed new programs and/or have required a higher level of service of existing programs that are not required or mandated under the Clean Water Act or under any federal regulations thereunder.

65. The actions of the Respondents in imposing various unfunded programs and mandates on Petitioners are violations of the provisions of the California Constitution, specifically Article XIII B, Section 6, of the California Constitution.

66. The final rule issued by U.S. EPA in December of 1999 entitled "National Pollutant Discharge Elimination System – Regulations For Revision Of The Water Pollution Control Program Addressing Stormwater Discharges" provides that, to the extent possible, NPDES Permitting authorities are to provide financial assistance to MS4s, which often have limited resources, for the development and implementation of local programs. In fact, in this same final rule, U.S. EPA strongly encourages states to provide whatever assistance possible to local

agencies. Although mandating its SUSMP program on petitioners and other persons throughout the County, Respondents have failed to provide any financial assistance to the Permittees to carry out the Regional Board's mandate.

67. In fact, in the final rule for Phase II cities, U.S. EPA determined that such rule contains a federal mandate that may result in expenditures of "$100 million or more in any one year for both state, local, and tribal governments, in the aggregate, and the private sector." (64 Federal Register 68722, 68797.)

68. As a result of the imposition of such onerous unfunded programs and mandates said Respondents have violated the California Constitution and the actions taken by the Respondents herein are therefore invalid and unconstitutional.

G. The Imposition Of The Regional Board's SUSMP Program Is A Violation Of The Administrative Procedures Act.

69. The Regional Board's action on January 26, 2000, and the numerous requirements and mandates set forth in its mandated SUSMP program, is equivalent to the adoption of regulations, requiring compliance with the California Administrative Procedures Act.

70. The California Administrative Procedures Act, in relevant part requires, prior to the adoption, amendment, or repeal of regulations, proper notice of such regulations, including a 45-day public notice requirement, and a 15-day notice requirement for non-substantial changes to the proposed regulations or changes thereto, prior to the hearing.

71. With the action taken on January 26, 2000, the Respondents failed to comply with the requirements of the Administrative Procedures Act. Specifically, Respondents failed to comply with the 45-day notice requirement as well as the 15-day notice requirement for non-substantial changes as the Board made substantial changes, even on the day of the hearing. For example, on the day of the hearing, the Regional Board deleted an exemption for roof top runoff and determined to apply the SUSMP program to all "non-discretionary," as well as "discretionary," projects, falling within the categories set forth thereunder.

72. The action taken by the Regional Board on January 26, 2000, is in violation of the California Administrative Procedures Act, and accordingly constitutes invalid and inappropriately

adopted regulations. (See, Cal. Gov. Code § 11340 *et seq.*)

H. Respondents Have Failed To Comply With The Requirements Of The California Environmental Quality Act.

73. The California Environmental Quality Act ("CEQA"), Public Resources Code Section 21000 *et seq.*, required that the Respondents review potential significant environmental impacts created by their actions, before taking the action described on January 26, 2000, and the subsequent action of the Executive Officer in carrying out the direction of the Regional Board.

74. The actions taken by the Regional Board on January 26, 2000 and the subsequent actions of its Executive Officer requiring the Permittees to implement the Regional Board SUSMP for all priority "projects" as described in the Regional Board's SUSMP, including both "discretionary" and "non-discretionary" projects, required compliance with the terms and provisions of CEQA, including a review of all potentially significant environmental impacts created by such a program.

75. Specifically, in proceeding with the "project" and the mandated requirements to be included in subsequent "projects," the Regional Board failed to consider a number of potentially significant adverse environmental impacts, including the impact of such projects on groundwater quality, vector and pest control, the generation of solid and/or hazardous wastes, the creation of various nuisances throughout the County, the reduction of available land for low and moderate income housing and other development, and the general impact of the development of infiltration basins/ponds, wet ponds, grassy swales and extended detention basins throughout the County. The failure of the Respondents to proceed in accordance with the requirements of CEQA is a violation of its terms and the regulations thereunder.

VII. A HEARING BEFORE THE STATE BOARD IS REQUIRED SINCE RESPONDENTS FAILED TO PROVIDE PROPER NOTICE OF THEIR PROPOSED ACTIONS AND FAILED TO PROVIDE PETITIONERS A SUFFICIENT OPPORTUNITY TO BE HEARD, THEREBY DEPRIVING THEM OF DUE PROCESS OF LAW AND PREVENTING THEM FROM PRESENTING AVAILABLE EVIDENCE.

76. The Regional Board SUSMP includes a number of substantive and non-substantive

changes set forth in the change sheet dated January 25, 2000, a change sheet not provided to the Petitioners until January 26, 2000 at the time of the hearing. The Regional Board SUSMP program further includes substantial changes made after the close of the public comment period on January 26, 2000, including changes made by the Regional Board to apply the Regional Board SUSMP to all "non-discretionary" as well as "discretionary" projects that fall within the nine (9) subject categories, and including the deletion of the "roof top" exemption set forth in the prior draft of the Regional Board SUSMP, as well as numerous other changes. Further, the Regional Board imposed a time frame of adopting ordinances and amending City Codes of six (6) months from the date the Executive Officer executes an order, with the Petitioners and some 85 cities throughout the County being required to implement the SUSMP within 30 days thereafter.

77. The numerous changes set forth in the change sheet of January 25, and the various substantive and non-substantive changes made by the Regional Board after the close of public testimony, without providing Petitioners sufficient notice of the Regional Board's consideration of these issues, and without providing Petitioners sufficient opportunity to be heard on such matters, constitutes a deprivation of due process of law and violates California's Open Meeting Laws. Petitioners are entitled to a full hearing before the State Board so that available evidence not presented to the Regional Board because of the Respondents improper and late notice to Petitioners, and because of Respondents making of substantive changes after the close of public testimony, may be fully presented and considered.

78. In addition, Respondents actions of January 26, 2000 are actions that were not authorized under Order No. 96-054, the Clean Water Act or the Porter-Cologne Act. To the extent that such action can be interpreted as amendments to Order No. 96-054 and/or new waste discharge requirements, Respondents, and each of them, have failed to comply with the public comment and notice requirements of the Clean Water Act, and the regulations thereunder and state law, and have failed to provide the Petitioners with sufficient notice of such amendments and sufficient opportunity to be heard, thereby again depriving Petitioners of their rights to due process of law by denying them a fair hearing.

VIII. REQUEST TO REGIONAL BOARD FOR PREPARATION OF RECORD AND FOR LIST OF PERSONS KNOWN TO REGIONAL BOARD TO HAVE AN INTEREST IN THE SUBJECT MATTER OF THIS PETITION

79. A copy of this Petition will be simultaneously served on Respondents Regional Board and its Executive Officer. A copy of a request to the Regional Board requesting the preparation of the Regional Board's Record in connection with this matter, including a request for a copy of the audiotapes and the reporter transcripts of the January 26, 2000 hearing, as well as a request for a list of persons the Regional Board has identified as having an interest in the subject matter of this Petition, has been served on the Regional Board. A true and correct copy of the letter setting forth such a request is attached hereto and marked as Exhibit "C."

VIII. A STAY IS NECESSARY PENDING STATE BOARD REVIEW OF THIS PETITION AND THE RELIEF SOUGHT HEREIN

80. A stay of the action taken by the Regional Board and any subsequent action to be taken by the Executive Officer in imposing the Regional Board SUSMP, in clear violation of the terms of the Permit and State and federal law, is necessary to avoid substantial harm to each of the Petitioners herein, the public at large, and all Permittees.

81. Without the issuance of a stay, the Petitioners and all Permittees, along with the public at large, may be forced to commence the implementation of very costly design standards and the Numerical Mitigation Standard, and to commence compliance with an invalid SUSMP program where there has been no showing that such action will result in the reduction of pollutants to the "maximum extent practicable," and where the result of such action will be the wasteful expenditure of millions of dollars of construction costs, design costs, land costs, maintenance costs, implementation and administrative costs, as well as the modification of countless municipal codes. A stay is further necessary because compliance with the Regional Board SUSMP may adversely impact groundwater quality throughout the County, creates nuisances and vector control problems, discourages development and redevelopment throughout the County, and increase the costs of low and moderate income housing and other developments.

82. Unless a stay is issued, compliance with the action taken by the Regional Board

and the Executive Officer will result in a diversion of significant resources toward an invalid SUSMP program and away from the Permittees' SUSMP program.

83. Accordingly, a stay of the action taken by the Respondents is necessary to minimize the substantial harm that will result to the Petitioner, the Permittees, the general public, and the members of the building, development and restaurant industries, as well as the additional harm that may result to the environment, including the waters of the State of California.

84. Further, a stay of the action taken by the Regional Board, pending review of this Petition, will result in little, if any, harm to other interested persons and the public. There is no identified benefit from the implementation of the Regional Board SUSMP over the Permittees' SUSMP, and the City Petitioners herein are prepared and will proceed with the implementation of their SUSMP, in accordance with the terms of Order No. 96-054.

85. No evidence has been presented by the Regional Board or its staff in the course of the hearing or otherwise, that would show that any delay in the implementation of the Regional Board's SUSMP program, as opposed to the Permittees' SUSMP, will result in substantial harm to the public. The harm that will result to Petitioners, the public, the regulated industry, and the State's groundwater if the Permittees are forced to comply with the action taken by Respondents, will far outweigh any alleged harm to interested persons and the public from the issuance of a stay.

86. As set forth above in the allegations in this Petition, substantial questions of both law and fact exist which must be resolved before a determination can be made on whether the action taken by the Regional Board and its Executive Officer, and the failure to act by the Executive Officer, are consistent with State and federal law and the terms of the Permit, and whether the determinations made by such Respondents are supported by law and the evidence in the record.

///

///

///

///

///

WHEREFORE, Petitioners herein, and each of them pray as follows:

(1) that an Order be issued forthwith staying the action taken by the Regional Board on January 26, 2000 in connection with the Regional Board's SUSMP, and any related action of its Executive Officer, in violation of California Regional Water Quality Control Board, Los Angeles Region, Order No. 96-054 (NPDES No. CAS614001) Waste Discharge Requirements for Municipal Storm Water and Urban Run-Off Discharges within the County of Los Angeles, pending a hearing and/or a determination by the State Board on the validity of such action and/or the validity of the failure of the Executive Officer to act in accordance with the Administrative Review Process under Order No. 96-054;

(2) that Petitioners be provided a hearing before the State Board to present additional evidence that is available but that was not presented to the Regional Board at the January 26, 2000 hearing. Petitioners were denied due process of law and a sufficient opportunity to be heard when Respondents submitted changes through a January 25, 2000 change sheet which Petitioners did not have sufficient time to review and consider, and when the Regional Board itself, after the close of the public comment period proceeded to make additional substantive changes to the Regional Board SUSMP. Accordingly, Petitioners were denied the ability to provided sufficient evidence to the Respondents at the time of the hearing as they were provided insufficient notice of the proposed Regional Board SUSMP and as substantive changes were made to the Regional Board SUSMP after the close of public testimony. A hearing is therefore required before the State Board to address the issues Petitioner was prevented from addressing at the time of the January 26, 2000 hearing.

(3) that an Order be issued by the State Board setting aside the action taken by the Regional Board in connection with Order No. 96-054 on January 26, 2000, and any related action of Respondent Executive Officer, or, in the alternative, that the State Board modify such actions so that they are in compliance with the requirements of State and federal law and the requirements of Order No. 96-054;

(4) that an Order be issued by the State Board that Respondents comply with the requirements of the Administrative Review Process and that said Respondents process the

Permittees' SUSMP program in accordance with the requirements of Order 96-054;

(5) that an Order by issued by the State Board providing for such other and further relief as is just and proper;

(6) that costs, attorney fees and other expert fees incurred in pursuing this Petition be awarded to Petitioners.

Dated: February 24, 2000

IN REPLY PLEASE
REFER TO FILE EP-3

Mr. Dennis Dickerson, Executive Officer
California Regional Water Quality
Control Board - Los Angeles Region
320 West 4th Street, Suite 200
Los Angeles, CA 90013-1105

Attention Technical Support Unit

Dear Mr. Dickerson:

COMPLIANCE FILE NO. 6948
MUNICIPAL STORMWATER PERMIT NO. CAS614001 - ORDER NO. 96-054
STANDARD URBAN STORMWATER MITIGATION PLANS (SUSMPs)

Enclosed are the Standard Urban Stormwater Mitigation Plans (SUSMPs) for your review and approval. As described in the National Pollutant Discharge Elimination System Permit, Part 2.III.A.1.c, the Principal Permittee, in consultation with the Permittees shall develop SUSMPs for use during planning and permitting of Priority Projects within the following development categories.

- a 100+ home subdivision
- a 10-99 home subdivision
- a 100,000+ square-foot commercial development
- an automotive repair shop
- a retail gasoline outlet
- a restaurant
- a hillside-located single-family dwelling

In addition to including input from the Permittees in the development of these SUSMPs, we twice distributed them to environmental groups, contractors, developers, consultants and applicable trade industries for their review and considered their comments in the development of the SUSMPs.

Also enclosed is a copy of the comments submitted by the City of Los Angeles. They are being sent with the SUSMPs at the City's request.

If you have any questions, please contact Tim Piasky at (626) 458-5969, Monday through Thursday, 7:00 a.m. to 5:30 p.m.

Very truly yours,

HARRY W. STONE
Director of Public Works

100+ HOME SUBDIVISION

STANDARD URBAN STORM WATER MITIGATION PLAN

DEFINITION

A 100+ home subdivision is defined as any subdivision lot being developed for more than 100 single-family or multi-family homes.

BACKGROUND

The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Permit) issued to Los Angeles County and 85 cities (Permittees) by the Los Angeles Regional Water Quality Control Board (Regional Board) on July 15, 1996, required the development and implementation of a program addressing stormwater pollution issues in development planning for private projects.

The requirement to implement a program addressing development planning is based on the primary objectives of the 1987 amendments to the Clean Water Act that established a framework for regulating stormwater discharges from municipal, industrial, and construction activities under the NPDES. The primary objectives are to:

- Effectively prohibit non-storm water discharges, and
- Reduce the discharge of pollutants from stormwater conveyance systems to the Maximum Extent Practicable.

This Standard Urban Stormwater Mitigation Plan (SUSMP) was developed as part of the program addressing Development Planning for the private sector. The Permittees will use this SUSMP to develop their own citywide SUSMP. Discretionary projects (as defined by CEQA), that fall into one of the seven categories (10-99 Home Subdivision, 100+ Home Subdivision, Single-Family Hillside Residence, 100,000 Square Foot Commercial Development, Automotive Repair Shop, Retail Gasoline Outlet, and Restaurant) will need to implement the appropriate SUSMP requirements into their project plans. This SUSMP outlines the necessary Best Management Practices (BMPs) which must be incorporated into design plans for 100+ Home Subdivision projects. Should any conflict be discovered with the new guidelines and any pre-existing regulation, the pre-existing regulation will prevail.

For development projects where the cost of new improvements exceeds a pre-determined threshold, the new and the existing improvements shall comply with this SUSMP. When the cost of new improvements is less than the pre-determined threshold, only the new improvements need to comply with this SUSMP. The pre-determined threshold shall be consistent with the local jurisdiction's policy for application of other building codes to new improvements.

REQUIREMENTS

1. PEAK STORM WATER RUNOFF DISCHARGE RATES

Peak storm water runoff discharge rates shall not exceed pre-development levels for developments where an increased peak storm water discharge rate may result in an increased potential for downstream erosion.

2. CONSERVE NATURAL AREAS

If applicable, the following items are required and must be implemented in the site layout during the subdivision design and approval process, consistent with applicable General Plan and Local Area Plan policies:

- Every effort shall be made to concentrate or cluster development on portions of a site while leaving the remaining land in a natural undisturbed condition.
- Limit clearing and grading of native vegetation at a site to the minimum amount needed to build lots, allow access, and provide fire protection.
- Maximize trees and other vegetation at each site by planting additional vegetation, clustering tree areas, and promoting the use of native and/or drought tolerant plants. Wherever practical, promote natural vegetation by using parking lot islands and other landscaped areas.
- Preserve riparian areas and wetlands.

3. MITIGATE STORMWATER RUNOFF

Stormwater runoff from a site has the potential to contribute oil and grease, suspended solids, metals, gasoline, pesticides, and pathogens to the stormwater conveyance system. The development must be designed so as to mitigate (infiltrate and/or treat) the site runoff generated from impervious directly connected areas that may contribute pollutants of concern to the stormwater conveyance system. Pollutants of concern, as defined by the Permit, consist of any pollutants that exhibit one or more of the following characteristics: current loadings or historic deposits of the pollutant are impacting the beneficial uses of a receiving water, elevated levels of the pollutant are found in sediments of a receiving water and/or have the potential to bioaccumulate in organisms therein, or the detectable inputs of the pollutant are at a level high enough to be considered potentially toxic to humans and/or flora and fauna. In designing your

R0072826

project to meet this requirement, you are not limited to the BMPs below.

In meeting this specific requirement, "treatment" of runoff will require the incorporation of a BMP or combination of BMPs best suited to maximize the reduction of pollutant loadings in that runoff. Those BMPs best suited for that purpose are, at a minimum, those listed in the California Storm Water Best Management Practices Handbooks as "likely to have significant impact" beneficial to water quality for targeted pollutants that are of concern at the site in question. However, it is possible that a combination of BMPs not so designated may, in a particular circumstance, be best suited to maximize the reduction of the pollutants.

Reducing Post-Development Runoff

Limiting impervious areas will help reduce the amount of site runoff generated. The following are examples which can be used for this purpose (See Table 1: Suggested Resources for additional sources of information):

- Provide reduced width sidewalks and incorporate landscaped buffer areas between sidewalks and streets. However, sidewalk widths must still comply with regulations for the Americans with Disabilities Act and other life safety requirements.

- Design residential streets for the minimum required pavement widths needed to comply with all zoning and applicable ordinances to support travel lanes; on-street parking; emergency, maintenance, and service vehicle access; sidewalks; and vegetated open channels.

- Comply with all zoning and applicable ordinances to minimize the number of residential street cul-de-sacs and incorporate landscaped areas to reduce their impervious cover. The radius of cul-de-sacs should be the minimum required to accommodate emergency and maintenance vehicles. Alternative turnarounds should be considered.

- Use permeable materials for private sidewalks, driveways, parking lots, or interior roadway surfaces (examples: hybrid lots, parking groves, permeable overflow parking, etc.).

- Use open space development that incorporates smaller lot sizes.

- Reduce building density.

- Comply with all zoning and applicable ordinances to reduce overall lot imperviousness by promoting alternative driveway surfaces and shared driveways that connect two or more homes together.

- Comply with all zoning and applicable ordinances to reduce the overall imperviousness

associated with parking lots by providing compact car spaces, minimizing stall dimensions, incorporating efficient parking lanes, and using pervious materials in spillover parking areas.

- Direct rooftop runoff to pervious areas such as yards, open channels, or vegetated areas, and avoid routing rooftop runoff to the roadway or the stormwater conveyance system.

Mitigating Stormwater Runoff

The following are examples of Treatment Control BMPs that can be used for mitigating the site runoff generated impervious directly connected areas that may contribute pollutants of concern to the stormwater conveyance system (See Table 1: Suggested Resources for additional sources of information):

- Vegetated swales and strips (Applicability and design criteria to be determined by the local jurisdiction)
- Extended/dry detention basins (Applicability and design criteria to be determined by the local jurisdiction)
- Infiltration basins (Applicability and design criteria to be determined by the local jurisdiction)
- Infiltration trenches (Applicability and design criteria to be determined by the local jurisdiction)
- Wet ponds (Applicability and design criteria to be determined by the local jurisdiction)
- Constructed wetlands (Applicability and design criteria to be determined by the local jurisdiction)
- Oil/Water separators (Applicability and design criteria to be determined by the local jurisdiction)
- Catch basin inserts (Applicability and design criteria to be determined by the local jurisdiction)
- Continuous deflective separation units (Applicability and design criteria to be determined by the local jurisdiction)
- Storm drain inserts (Applicability and design criteria to be determined by the local jurisdiction)

- Media filtration (Applicability and design criteria to be determined by the local jurisdiction)
- Bioretention facility (Applicability and design criteria to be determined by the local jurisdiction)
- Dry-wells (Applicability and design criteria to be determined by the local jurisdiction)
- Cisterns (Applicability and design criteria to be determined by the local jurisdiction)
- Foundation planting (Applicability and design criteria to be determined by the local jurisdiction)

4. PROTECT SLOPES AND CHANNELS

If applicable, the project plans must include BMPs consistent with local code and ordinance to decrease the potential of slopes and/or channels from eroding and impacting stormwater runoff:

- Convey runoff safely from the tops of slopes and stabilize disturbed slopes.
- Stabilize permanent channel crossings.
- Vegetate slopes with native or drought tolerant vegetation.
- Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion.

5. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Storm drain stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets. The stencil contains a brief statement that prohibits the dumping of improper materials into the stormwater conveyance system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are effective supplements to the anti-dumping message.

- All storm drain inlets and catch basins must be stenciled with prohibitive language (such as: "NO DUMPING – DRAINS TO OCEAN") and/or graphical icons to discourage illegal dumping.

- Signs and prohibitive language and/or graphical icons discouraging illegal dumping must be posted along channels and creeks.

- Legibility of stencils and signs must be maintained.

6. PROPERLY DESIGN COMMON OUTDOOR MATERIAL STORAGE AREAS

Common outdoor material storage areas refer to storage areas or storage facilities solely for the storage of materials used in the routine maintenance of common areas or common facilities such as swimming pools, tennis courts, green belt areas, etc.

Improper storage of materials outdoors can allow toxic compounds, oil and grease, heavy metals, nutrients, and suspended solids to enter the stormwater conveyance system. Where proposed project plans include common outdoor areas for storage of materials that may contribute pollutants to the stormwater conveyance system, the following structural BMPs are required:

- Areas where materials are to be stored must be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the storm water conveyance system; or (2) protected by secondary containment structures such as berms, dikes, or curbs.

- The storage area must be paved and sufficiently impervious to contain leaks and spills.

- Where feasible, the storage area should have a roof or awning to minimize collection of stormwater within the secondary containment area.

7. PROPERLY DESIGN COMMON TRASH STORAGE AREAS

A common trash storage area refers to an area where a trash receptacle or receptacles are located for use by more than one household or dwelling unit as a repository for household wastes.

Loose trash and debris can be easily transported by the forces of water or wind into nearby storm drain inlets, channels, and/or creeks. All common trash container areas must meet the following requirements:

- Trash container areas must have drainage from adjoining roofs and pavement diverted around the area(s).

- Trash container areas must be screened or walled to prevent off-site transport of trash.

8. PROVIDE PROOF OF ONGOING BMP MAINTENANCE

Improper maintenance is one of the most common reasons for water quality controls to not function as designed or to fail entirely. It is important to consider who will be responsible for maintenance of a permanent BMP, and what equipment is required to perform the maintenance properly. As part of project review, if a project applicant has included (or will be required to include) structural BMPs in project plans, Permittee staff will require that the applicant provide verification of maintenance provisions.

For all properties, this verification will consist of having the developer sign a statement declaring responsibility for all structural BMP maintenance until the time the property is transferred. This transfer of property must have conditions requiring the recipient to assume responsibility for maintenance of any structural BMPs to be included in the sales or lease agreement for that property, and will be the owner's responsibility. For residential properties where the structural BMPs are located within a common area which will be maintained by a homeowner's association, language regarding the responsibility for maintenance must be included in the projects conditions, covenants and restrictions (CC&R's). Printed educational materials will be required to accompany the first deed transfer to highlight the existence of the requirement and to provide information on what stormwater management facilities are present, signs that maintenance is needed, how the necessary maintenance can be performed, and assistance that the Permittee can provide. It will also encourage the transfer of this information with subsequent sale of the property.

If structural BMPs are located within a public area proposed for transfer, they will be the responsibility of the developer until they are accepted for transfer by the County or other appropriate public agency. The structural BMP proposed for transfer will need prior approval from the County or other appropriate public agency and will be considered on a case by case basis.

10 - 99 HOME SUBDIVISION

STANDARD URBAN STORM WATER MITIGATION PLAN

DEFINITION

Any subdivision lot being developed for 10 to 99 single-family or multi-family homes.

BACKGROUND

The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Permit) issued to Los Angeles County and 85 cities (Permittees) by the Los Angeles Regional Water Quality Control Board (Regional Board) on July 15, 1996, required the development and implementation of a program addressing stormwater pollution issues in development planning for private projects.

The requirement to implement a program addressing development planning is based on the primary objectives of the 1987 amendments to the Clean Water Act that established a framework for regulating stormwater discharges from municipal, industrial, and construction activities under the NPDES. The primary objectives are to:

- Effectively prohibit non-storm water discharges, and
- Reduce the discharge of pollutants from stormwater conveyance systems to the Maximum Extent Practicable.

This Standard Urban Stormwater Mitigation Plan (SUSMP) was developed as part of the program addressing Development Planning for the private sector. The Permittees will use this SUSMP to develop their own citywide SUSMP. Discretionary projects (as defined by CEQA), that fall into one of the seven categories (10-99 Home Subdivision, 100+ Home Subdivision, Single-Family Hillside Residence, 100,000 Square Foot Commercial Development, Automotive Repair Shop, Retail Gasoline Outlet, and Restaurant) will need to implement the appropriate SUSMP requirements into their project plans. This SUSMP outlines the necessary Best Management Practices (BMPs) which must be incorporated into design plans for 10-99 Home Subdivision projects. Should any conflict be discovered with the new guidelines and any pre-existing regulation, the pre-existing regulation will prevail.

For development projects where the cost of new improvements exceeds a pre-determined threshold, the new and the existing improvements shall comply with this SUSMP. When the cost of new improvements is less than the pre-determined threshold, only the new improvements need to comply with this SUSMP. The pre-determined threshold shall be consistent with the local jurisdiction's policy for application of other building codes to new improvements.

REQUIREMENTS

1. PEAK STORM WATER RUNOFF DISCHARGE RATES

Peak storm water runoff discharge rates shall not exceed pre-development levels for developments where an increased peak storm water discharge rate may result in an increased potential for downstream erosion.

2. CONSERVE NATURAL AREAS

If applicable, the following items are required and must be implemented in the site layout during the subdivision design and approval process, consistent with applicable General Plan and Local Area Plan policies:

- Every effort shall be made to concentrate or cluster development on portions of a site while leaving the remaining land in a natural undisturbed condition.
- Limit clearing and grading of native vegetation at a site to the minimum amount needed to build lots, allow access, and provide fire protection.
- Maximize trees and other vegetation at each site by planting additional vegetation, clustering tree areas, and promoting the use of native and/or drought tolerant plants. Wherever practical, promote natural vegetation by using parking lot islands and other landscaped areas.
- Preserve riparian areas and wetlands.

3. PROTECT SLOPES AND CHANNELS

If applicable, the project plans must include BMPs consistent with local code and ordinance to decrease the potential of slopes and/or channels from eroding and impacting stormwater runoff:

- Convey runoff safely from the tops of slopes and stabilize disturbed slopes.
- Stabilize permanent channel crossings.
- Vegetate slopes with native or drought tolerant vegetation.

- Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion.

4. MITIGATE STORMWATER RUNOFF

Stormwater runoff from a site has the potential to contribute oil and grease, suspended solids, metals, gasoline, pesticides, and pathogens to the stormwater conveyance system. The development must be designed so as to mitigate (infiltrate and/or treat) the site runoff generated from impervious directly connected areas that may contribute pollutants of concern to the stormwater conveyance system. Pollutants of concern, as defined by the Permit, consist of any pollutants that exhibit one or more of the following characteristics: current loadings or historic deposits of the pollutant are impacting the beneficial uses of a receiving water, elevated levels of the pollutant are found in sediments of a receiving water and/or have the potential to bioaccumulate in organisms therein, or the detectable inputs of the pollutant are at a level high enough to be considered potentially toxic to humans and/or flora and fauna. In designing your project to meet this requirement, you are not limited to the BMPs below.

In meeting this specific requirement, "treatment" of runoff will require the incorporation of a BMP or combination of BMPs best suited to maximize the reduction of pollutant loadings in that runoff. Those BMPs best suited for that purpose are, at a minimum, those listed in the California Storm Water Best Management Practices Handbooks as "likely to have significant impact" beneficial to water quality for targeted pollutants that are of concern at the site in question. However, it is possible that a combination of BMPs not so designated may, in a particular circumstance, be best suited to maximize the reduction of the pollutants.

Reducing Post-Development Runoff

Limiting impervious areas will help reduce the amount of site runoff generated. The following are examples which can be used for this purpose (See Table 1: Suggested Resources for additional sources of information):

- Provide reduced width sidewalks and incorporate landscaped buffer areas between sidewalks and streets. However, sidewalk widths must still comply with regulations for the Americans with Disabilities Act and other life safety requirements.

- Design residential streets for the minimum required pavement widths needed to comply with all zoning and applicable ordinances to support travel lanes; on-street parking; emergency, maintenance, and service vehicle access; sidewalks; and vegetated open channels.

- Comply with all zoning and applicable ordinances to minimize the number of residential street cul-de-sacs and incorporate landscaped areas to reduce their impervious cover. The radius of cul-de-sacs should be the minimum required to accommodate emergency and maintenance vehicles. Alternative turnarounds should be considered.

- Use permeable materials for private sidewalks, driveways, parking lots, or interior roadway surfaces (examples: hybrid lots, parking groves, permeable overflow parking, etc.).

- Use open space development that incorporates smaller lot sizes.

- Reduce building density.

- Comply with all zoning and applicable ordinances to reduce overall lot imperviousness by promoting alternative driveway surfaces and shared driveways that connect two or more homes together.

- Comply with all zoning and applicable ordinances to reduce the overall imperviousness associated with parking lots by providing compact car spaces, minimizing stall dimensions, incorporating efficient parking lanes, and using pervious materials in spillover parking areas.

- Direct rooftop runoff to pervious areas such as yards, open channels, or vegetated areas, and avoid routing rooftop runoff to the roadway or the stormwater conveyance system.

Mitigating Stormwater Runoff

The following are examples of Treatment Control BMPs that can be used for mitigating the site runoff generated from impervious directly connected areas that may contribute pollutants of concern to the stormwater conveyance system (See Table 1: Suggested Resources for additional sources of information):

- Vegetated swales and strips (Applicability and design criteria to be determined by the local jurisdiction)

- Extended/dry detention basins (Applicability and design criteria to be determined by the local jurisdiction)

- Infiltration basins (Applicability and design criteria to be determined by the local jurisdiction)

- Infiltration trenches (Applicability and design criteria to be determined by the local jurisdiction)

- Wet ponds (Applicability and design criteria to be determined by the local jurisdiction)
- Constructed wetlands (Applicability and design criteria to be determined by the local jurisdiction)
- Oil/Water separators (Applicability and design criteria to be determined by the local jurisdiction)
- Catch basin inserts (Applicability and design criteria to be determined by the local jurisdiction)
- Continuous deflective separation units (Applicability and design criteria to be determined by the local jurisdiction)
- Storm drain inserts (Applicability and design criteria to be determined by the local jurisdiction)
- Media filtration (Applicability and design criteria to be determined by the local jurisdiction)
- Bioretention facility (Applicability and design criteria to be determined by the local jurisdiction)
- Dry-wells (Applicability and design criteria to be determined by the local jurisdiction)
- Cisterns (Applicability and design criteria to be determined by the local jurisdiction)
- Foundation planting (Applicability and design criteria to be determined by the local jurisdiction)

5. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Storm drain stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets. The stencil contains a brief statement that prohibits the dumping of improper materials into the stormwater conveyance system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are effective supplements to the anti-dumping message.

- All storm drain inlets and catch basins must be stenciled with prohibitive language (such as: "NO DUMPING – DRAINS TO OCEAN") and/or graphical icons to discourage illegal dumping.

- Signs and prohibitive language and/or graphical icons discouraging illegal dumping must be posted along channels and creeks.

- Legibility of stencils and signs must be maintained.

6. PROPERLY DESIGN COMMON OUTDOOR MATERIAL STORAGE AREAS

Common outdoor material storage areas refer to storage areas or storage facilities solely for the storage of materials used in the routine maintenance of common areas or common facilities such as swimming pools, tennis courts, green belt areas, etc.

Improper storage of materials outdoors can allow toxic compounds, oil and grease, heavy metals, nutrients, and suspended solids to enter the stormwater conveyance system. Where proposed project plans include common outdoor areas for storage of materials that may contribute pollutants to the stormwater conveyance system, the following structural BMPs are required:

- Areas where materials are to be stored must be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the storm water conveyance system; or (2) protected by secondary containment structures such as berms, dikes, or curbs.

- The storage area must be paved and sufficiently impervious to contain leaks and spills.

- Where feasible, the storage area should have a roof or awning to minimize collection of stormwater within the secondary containment area.

7. PROPERLY DESIGN COMMON TRASH STORAGE AREAS

A common trash storage area refers to an area where a trash receptacle or receptacles are located for use by more than one household or dwelling unit as a repository for household wastes.

Loose trash and debris can be easily transported by the forces of water or wind into nearby storm drain inlets, channels, and/or creeks. All common trash container areas must meet the following requirements:

- Trash container areas must have drainage from adjoining roofs and pavement diverted around the area(s).

- Trash container areas must be screened or walled to prevent off-site transport of trash.

8. PROVIDE PROOF OF ONGOING BMP MAINTENANCE

Improper maintenance is one of the most common reasons for water quality controls to not function as designed or to fail entirely. It is important to consider who will be responsible for maintenance of a permanent BMP, and what equipment is required to perform the maintenance properly. As part of project review, if a project applicant has included (or will be required to include) structural BMPs in project plans, Permittee staff will require that the applicant provide verification of maintenance provisions.

For all properties, this verification will consist of having the developer sign a statement declaring responsibility for all structural BMP maintenance until the time the property is transferred. This transfer of property must have conditions requiring the recipient to assume responsibility for maintenance of any structural BMPs to be included in the sales or lease agreement for that property, and will be the owner's responsibility. For residential properties where the structural BMPs are located within a common area which will be maintained by a homeowner's association, language regarding the responsibility for maintenance must be included in the projects conditions, covenants and restrictions (CC&R's). Printed educational materials will be required to accompany the first deed transfer to highlight the existence of the requirement and to provide information on what stormwater management facilities are present, signs that maintenance is needed, how the necessary maintenance can be performed, and assistance that the Permittee can provide. It will also encourage the transfer of this information with subsequent sale of the property.

If structural BMPs are located within a public area proposed for transfer, they will be the responsibility of the developer until they are accepted for transfer by the County or other appropriate public agency. The structural BMP proposed for transfer will need prior approval from the County or other appropriate public agency and will be considered on a case by case basis.

R0072840

100,000 SQUARE FOOT COMMERCIAL DEVELOPMENT

STANDARD URBAN STORM WATER MITIGATION PLAN

DEFINITION

Categorization as a commercial development of 100,000 or more square feet will be based on total impermeable area, including parking area, as opposed to lot size or building footprint.

BACKGROUND

The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Permit) issued to Los Angeles County and 85 cities (Permittees) by the Los Angeles Regional Water Quality Control Board (Regional Board) on July 15, 1996, required the development and implementation of a program addressing stormwater pollution issues in development planning for private projects.

The requirement to implement a program addressing development planning is based on the primary objectives of the 1987 amendments to the Clean Water Act that established a framework for regulating stormwater discharges from municipal, industrial, and construction activities under the NPDES. The primary objectives are to:

- Effectively prohibit non-storm water discharges, and
- Reduce the discharge of pollutants from stormwater conveyance systems to the Maximum Extent Practicable.

This Standard Urban Stormwater Mitigation Plan (SUSMP) was developed as part of the program addressing Development Planning for the private sector. The Permittees will use this SUSMP to develop their own citywide SUSMP. Discretionary projects (as defined by CEQA), that fall into one of the seven categories (10-99 Home Subdivision, 100+ Home Subdivision, Single-Family Hillside Residence, 100,000 Square Foot Commercial Development, Automotive Repair Shop, Retail Gasoline Outlet, and Restaurant) will need to implement the appropriate SUSMP requirements into their project plans. This SUSMP outlines the necessary Best Management Practices (BMPs) which must be incorporated into design plans for 100,000 Square Foot Commercial Development projects. Should any conflict be discovered with the new guidelines and any pre-existing regulation, the pre-existing regulation will prevail.

For development projects where the cost of new improvements exceeds a pre-determined threshold, the new and the existing improvements shall comply with this SUSMP. When the cost of new improvements is less than the pre-determined threshold, only the new improvements need to comply with this SUSMP. The pre-determined threshold shall be consistent with the local jurisdiction's policy for application of other building codes to new improvements.

REQUIREMENTS

1. PEAK STORM WATER RUNOFF DISCHARGE RATES

Peak storm water runoff discharge rates shall not exceed pre-development levels for developments where an increased peak storm water discharge rate may result in an increased potential for downstream erosion.

2. PROTECT SLOPES AND CHANNELS

If applicable, the project plans must include BMPs consistent with local code and ordinance to decrease the potential of slopes and/or channels from eroding and impacting stormwater runoff:

- Convey runoff safely from the tops of slopes and stabilize disturbed slopes.
- Stabilize permanent channel crossings.
- Vegetate slopes with native or drought tolerant vegetation.
- Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion.

3. MITIGATE STORMWATER RUNOFF

Stormwater runoff from a site has the potential to contribute oil and grease, suspended solids, metals, gasoline, pesticides, and pathogens to the stormwater conveyance system. The development must be designed so as to mitigate (infiltrate and/or treat) the site runoff generated from impervious directly connected areas that may contribute pollutants of concern to the stormwater conveyance system. Pollutants of concern, as defined by the Permit, consist of any pollutants that exhibit one or more of the following characteristics: current loadings or historic deposits of the pollutant are impacting the beneficial uses of a receiving water, elevated levels of the pollutant are found in sediments of a receiving water and/or have the potential to bioaccumulate in organisms therein, or the detectable inputs of the pollutant are at a level high enough to be considered potentially toxic to humans and/or flora and fauna. In designing your project to meet this requirement, you are not limited to the BMPs below.

In meeting this specific requirement, "treatment" of runoff will require the incorporation of a

BMP or combination of BMPs best suited to maximize the reduction of pollutant loadings in that runoff. Those BMPs best suited for that purpose are, at a minimum, those listed in the California Storm Water Best Management Practices Handbooks as "likely to have significant impact" beneficial to water quality for targeted pollutants that are of concern at the site in question. However, it is possible that a combination of BMPs not so designated may, in a particular circumstance, be best suited to maximize the reduction of the pollutants.

Reducing Post-Development Runoff

Limiting impervious areas will help reduce the amount of site runoff generated. The following are examples, which can be used for this purpose (See Table 1: Suggested Resources for additional sources of information):

- Provide reduced width sidewalks and incorporate landscaped buffer areas between sidewalks and streets. However, sidewalk widths must still comply with regulations for the Americans with Disabilities Act and other life safety requirements.

- Use permeable materials for private sidewalks, driveways, parking lots, or interior roadway surfaces (examples: hybrid lots, parking groves, permeable overflow parking, etc.).

- Comply with all zoning and applicable ordinances to reduce the overall imperviousness associated with parking lots by providing compact car spaces, minimizing stall dimensions, incorporating efficient parking lanes, and using pervious materials in spillover parking areas.

- Direct rooftop runoff to pervious areas such as yards, open channels, or vegetated areas, and avoid routing rooftop runoff to the roadway or the stormwater conveyance system.

Mitigating Stormwater Runoff

The following are examples of Treatment Control BMPs that can be used for mitigating the site runoff generated from impervious directly connected areas that may contribute pollutants of concern to the stormwater conveyance system (See Table 1: Suggested Resources for additional sources of information):

- Vegetated swales and strips (Applicability and design criteria to be determined by the local jurisdiction)

- Extended/dry detention basins (Applicability and design criteria to be determined by the local jurisdiction)

- Infiltration basins (Applicability and design criteria to be determined by the local jurisdiction)
- Infiltration trenches (Applicability and design criteria to be determined by the local jurisdiction)
- Wet ponds (Applicability and design criteria to be determined by the local jurisdiction)
- Constructed wetlands (Applicability and design criteria to be determined by the local jurisdiction)
- Oil/Water separators (Applicability and design criteria to be determined by the local jurisdiction)
- Catch basin inserts (Applicability and design criteria to be determined by the local jurisdiction)
- Continuous deflective separation units (Applicability and design criteria to be determined by the local jurisdiction)
- Storm drain inserts (Applicability and design criteria to be determined by the local jurisdiction)
- Media filtration (Applicability and design criteria to be determined by the local jurisdiction)
- Bioretention facility (Applicability and design criteria to be determined by the local jurisdiction)
- Dry-wells (Applicability and design criteria to be determined by the local jurisdiction)
- Cisterns (Applicability and design criteria to be determined by the local jurisdiction)
- Foundation planting (Applicability and design criteria to be determined by the local jurisdiction)

4. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Storm drain stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets. The stencil contains a brief statement that prohibits the dumping of improper materials into the stormwater conveyance system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are effective supplements to the anti-dumping message.

- All storm drain inlets and catch basins must be stenciled with prohibitive language (such as: "NO DUMPING – DRAINS TO OCEAN") and/or graphical icons to discourage illegal dumping.

- Signs and prohibitive language and/or graphical icons discouraging illegal dumping must be posted along channels and creeks.

- Legibility of stencils and signs must be maintained.

5. PROPERLY DESIGN OUTDOOR MATERIAL STORAGE AREAS

Improper storage of materials outdoors can allow toxic compounds, oil and grease, heavy metals, nutrients, and suspended solids to enter the stormwater conveyance system. Where proposed project plans or activities may result in outdoor areas for storage or use of materials that may contribute pollutants to the stormwater conveyance system, the following structural BMPs are required:

- Areas where materials are to be stored must be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the storm water conveyance system; or (2) protected by secondary containment structures such as berms, dikes, or curbs.

- The storage area must be paved and sufficiently impervious to contain leaks and spills.

- Where feasible, the storage area should have a roof or awning to minimize collection of storm water within the secondary containment area.

6. PROPERLY DESIGN TRASH STORAGE AREAS

Loose trash and debris can be easily transported by the forces of water or wind into nearby storm drain inlets, channels, and/or creeks. All trash container areas must meet the following requirements:

- Trash container areas must have drainage from adjoining roofs and pavement diverted around the area(s).
- Trash container areas must be screened or walled to prevent off-site transport of trash.

7. PROPERLY DESIGN LOADING/UNLOADING DOCK AREAS

Loading/unloading dock areas have the potential for material spills to be quickly transported to the stormwater conveyance system. To minimize this potential, the following design criteria are required:

- Cover loading dock areas or design drainage to minimize run-on and runoff of stormwater.
- Direct connections to storm drains from depressed loading docks (truck wells) are prohibited.

8. PROPERLY DESIGN REPAIR/MAINTENANCE BAYS

Oil and grease, solvents, car battery acid, coolant and gasoline from the repair/maintenance bays can negatively impact stormwater if allowed to come into contact with stormwater runoff. Therefore, design plans for repair bays must include the following:

- Repair/maintenance bays must be indoors or designed in such a way that doesn't allow stormwater runon or contact with stormwater runoff.
- Design a repair/maintenance bay drainage system to capture all washwater, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

9. PROPERLY DESIGN VEHICLE/EQUIPMENT WASH AREAS

Vehicle/equipment washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the stormwater conveyance system. To alleviate this problem, consider including in the project plans an area for washing/steam cleaning of vehicles and equipment. If such an area is included in the site design, it must meet the following:

- This area must be self-contained, covered, equipped with a clarifier, or other pretreatment facility, and properly connected to a sanitary sewer.

10. PROVIDE PROOF OF ONGOING BMP MAINTENANCE

Improper maintenance is one of the most common reasons for water quality controls to not function as designed or to fail entirely. It is important to consider who will be responsible for maintenance of a permanent BMP, and what equipment is required to perform the maintenance properly. As part of project review, if a project applicant has included (or will be required to include) structural BMPs in project plans, Permittee staff will require that the applicant provide verification of maintenance provisions.

For all properties, this verification will consist of having the developer sign a statement declaring responsibility for all structural BMP maintenance until the time the property is transferred. This transfer of property must have conditions requiring the recipient to assume responsibility for maintenance of any structural BMPs to be included in the sales or lease agreement for that property, and will be the owner's responsibility.

If structural BMPs are located within a public area proposed for transfer, they will be the responsibility of the developer until they are accepted for transfer by the County or other appropriate public agency. The structural BMP proposed for transfer will need prior approval from the County or other appropriate public agency and will be considered on a case by case basis.

AUTOMOTIVE REPAIR SHOP

STANDARD URBAN STORM WATER MITIGATION PLAN

DEFINITION

An automotive repair shop is a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539. Exceptions do apply for SIC codes 5013, 5014, and 5541. For SIC code 5013, if the business has no outside storage of any recycled oil or other hazardous substances, it is not included. For SIC code 5014, if the business does not engage in any repair work, it is not included. For SIC code 5541, if the business does not engage in any onsite repair work, it is not included.

BACKGROUND

The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Permit) issued to Los Angeles County and 85 cities (Permittees) by the Los Angeles Regional Water Quality Control Board (Regional Board) on July 15, 1996, required the development and implementation of a program addressing stormwater pollution issues in development planning for private projects.

The requirement to implement a program addressing development planning is based on the primary objectives of the 1987 amendments to the Clean Water Act that established a framework for regulating stormwater discharges from municipal, industrial, and construction activities under the NPDES. The primary objectives are to:

- Effectively prohibit non-storm water discharges, and
- Reduce the discharge of pollutants from stormwater conveyance systems to the Maximum Extent Practicable.

This Standard Urban Stormwater Mitigation Plan (SUSMP) was developed as part of the program addressing Development Planning for the private sector. The Permittees will use this SUSMP to develop their own citywide SUSMP. Discretionary projects (as defined by CEQA), that fall into one of the seven categories (10-99 Home Subdivision, 100+ Home Subdivision, Single-Family Hillside Residence, 100,000 Square Foot Commercial Development, Automotive Repair Shop, Retail Gasoline Outlet, and Restaurant) will need to implement the appropriate SUSMP requirements into their project plans. This SUSMP outlines the necessary Best Management Practices (BMPs) which must be incorporated into design plans for Automotive Repair Shop projects. Should any conflict be discovered with the new guidelines and any pre-existing regulation, the pre-existing regulation will prevail.

For development projects where the cost of new improvements exceeds a pre-determined threshold, the new and the existing improvements shall comply with this SUSMP. When the cost of new improvements is less than the pre-determined threshold, only the new improvements

need to comply with this SUSMP. The pre-determined threshold shall be consistent with the local jurisdiction's policy for application of other building codes to new improvements.

REQUIREMENTS

1. PEAK STORM WATER RUNOFF DISCHARGE RATES

Peak storm water runoff discharge rates shall not exceed pre-development levels for developments where an increased peak storm water discharge rate may result in an increased potential for downstream erosion.

2. PROPERLY DESIGN FUELING AREA

Fueling areas have the potential to contribute oil and grease, solvents, car battery acid, coolant and gasoline to the stormwater conveyance system. Therefore, design plans which include fueling areas must include the following:

- Where feasible, fuel dispensing areas should be covered with an overhanging roof structure or canopy. The cover's minimum dimensions must be equal to or greater than the area within the grade break. The cover must not drain onto the fuel dispensing area and the downspouts must be routed to prevent drainage across the fueling area.

- Fuel dispensing areas must be paved with portland cement concrete (or equivalent smooth impervious surface), and the use of asphalt concrete shall be prohibited.

- The fuel dispensing area must have a 2% to 4% slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of stormwater to the extent practicable.

- At a minimum, the concrete fuel dispensing area must extend 6.5 feet (2.0 meters) from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot (0.3 meter), whichever is less.

3. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Storm drain stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets. The stencil contains a brief statement that prohibits the dumping of improper materials into the stormwater conveyance system. Graphical icons, either illustrating

anti-dumping symbols or images of receiving water fauna, are effective supplements to the anti-dumping message.

- All storm drain inlets and catch basins must be stenciled with prohibitive language (such as: "NO DUMPING – DRAINS TO OCEAN") and/or graphical icons to discourage illegal dumping.

- Signs and prohibitive language and/or graphical icons discouraging illegal dumping must be posted along channels and creeks.

- Legibility of stencils and signs must be maintained.

4. PROPERLY DESIGN OUTDOOR MATERIAL STORAGE AREAS

Improper storage of materials outdoors can allow toxic compounds, oil and grease, heavy metals, nutrients, and suspended solids to enter the stormwater conveyance system. Where proposed project plans or activities may result in outdoor areas for storage or use of materials that may contribute pollutants to the stormwater conveyance system, the following structural BMPs are required:

- Areas where materials are to be stored must be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the storm water conveyance system; or (2) protected by secondary containment structures such as berms, dikes, or curbs.

- The storage area must be paved and impervious to contain leaks and spills.

- Where feasible, the storage area should have a roof or awning to minimize collection of storm water within the secondary containment area.

5. PROPERLY DESIGN TRASH STORAGE AREA

Loose trash and debris can be easily transported by the forces of water or wind into nearby storm drain inlets, channels, and/or creeks. All trash container areas must meet the following requirements:

- Trash container areas must have drainage from adjoining roofs and pavement diverted around the area(s).

- Trash container areas must be screened or walled to prevent off-site transport of trash.

6. PROPERLY DESIGN REPAIR/MAINTENANCE BAYS

Oil and grease, solvents, car battery acid, coolant and gasoline from the repair/maintenance bays can negatively impact stormwater if allowed to come into contact with stormwater runoff. Therefore, design plans for repair bays must include the following:

- Repair/maintenance bays must be indoors or designed in such a way that doesn't allow stormwater runon or contact with stormwater runoff.

- Design a repair/maintenance bay drainage system to capture all washwater, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

7. PROPERLY DESIGN LOADING/UNLOADING DOCK AREAS

Loading/unloading dock areas have the potential for material spills to be quickly transported to the stormwater conveyance system. To minimize this potential, the following design criteria are required:

- Cover loading dock areas or design drainage to minimize run-on and runoff of stormwater.
- Direct connections to storm drains from depressed loading docks (truck wells) are prohibited.

8. PROPERLY DESIGN VEHICLE/EQUIPMENT WASH AREAS

Vehicle/equipment washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the stormwater conveyance system. To alleviate this problem, consider including in the project plans an area for washing/steam cleaning of vehicles and equipment. If such an area is included in the site design, it must meet the following:

- This area must be self-contained, covered, equipped with a clarifier, or other pretreatment facility, and properly connected to a sanitary sewer.

9. PROVIDE PROOF OF ONGOING BMP MAINTENANCE

Improper maintenance is one of the most common reasons for water quality controls to not function as designed or to fail entirely. It is important to consider who will be responsible for maintenance of a permanent BMP, and what equipment is required to perform the maintenance properly. As part of project review, if a project applicant has included (or will be required to include) structural BMPs in project plans, Permittee staff will require that the applicant provide verification of maintenance provisions.

For all properties, this verification will consist of having the developer sign a statement declaring responsibility for all structural BMP maintenance until the time the property is transferred. This transfer of property must have conditions requiring the recipient to assume responsibility for maintenance of any structural BMPs to be included in the sales or lease agreement for that property, and will be the owner's responsibility.

If structural BMPs are located within a public area proposed for transfer, they will be the responsibility of the developer until they are accepted for transfer by the County or other appropriate public agency. The structural BMP proposed for transfer will need prior approval from the County or other appropriate public agency and will be considered on a case by case basis.

RETAIL GASOLINE OUTLET

STANDARD URBAN STORM WATER MITIGATION PLAN

DEFINITION

A retail gasoline outlet is primarily engaged in selling gasoline and lubricating oils. These establishments frequently sell other merchandise, such as tires, batteries, and automobile parts. Frequently, these establishments also perform minor automotive repair work. Gasoline stations combined with other activities, such as grocery stores, convenience stores, or car wash facilities, are classified according to the primary activity.

BACKGROUND

The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Permit) issued to Los Angeles County and 85 cities (Permittees) by the Los Angeles Regional Water Quality Control Board (Regional Board) on July 15, 1996, required the development and implementation of a program addressing stormwater pollution issues in development planning for private projects.

The requirement to implement a program addressing development planning is based on the primary objectives of the 1987 amendments to the Clean Water Act that established a framework for regulating stormwater discharges from municipal, industrial, and construction activities under the NPDES. The primary objectives are to:

- Effectively prohibit non-storm water discharges, and
- Reduce the discharge of pollutants from stormwater conveyance systems to the Maximum Extent Practicable.

This Standard Urban Stormwater Mitigation Plan (SUSMP) was developed as part of the program addressing Development Planning for the private sector. The Permittees will use this SUSMP to develop their own citywide SUSMP. Discretionary projects (as defined by CEQA), that fall into one of the seven categories (10-99 Home Subdivision, 100+ Home Subdivision, Single-Family Hillside Residence, 100,000 Square Foot Commercial Development, Automotive Repair Shop, Retail Gasoline Outlet, and Restaurant) will need to implement the appropriate SUSMP requirements into their project plans. This SUSMP outlines the necessary Best Management Practices (BMPs) which must be incorporated into design plans for Retail Gasoline Outlet projects. Should any conflict be discovered with the new guidelines and any pre-existing regulation, the pre-existing regulation will prevail.

For development projects where the cost of new improvements exceeds a pre-determined threshold, the new and the existing improvements shall comply with this SUSMP. When the cost of new improvements is less than the pre-determined threshold, only the new improvements

need to comply with this SUSMP. The pre-determined threshold shall be consistent with the local jurisdiction's policy for application of other building codes to new improvements.

REQUIREMENTS

1. PEAK STORM WATER RUNOFF DISCHARGE RATES

Peak storm water runoff discharge rates shall not exceed pre-development levels for developments where an increased peak storm water discharge rate may result in an increased potential for downstream erosion.

2. PROPERLY DESIGN FUELING AREA

Fueling areas have the potential to contribute oil and grease, solvents, car battery acid, coolant and gasoline to the stormwater conveyance system. The project plans must include the following BMPs:

- Where feasible, fuel dispensing areas should be covered with an overhanging roof structure or canopy. The canopy's minimum dimensions must be equal to or greater than the area within the grade break. The canopy must not drain onto the fuel dispensing area, and the canopy downspouts must be routed to prevent drainage across the fueling area.

- Fuel dispensing areas must be paved with portland cement concrete (or equivalent smooth impervious surface), and the use of asphalt concrete shall be prohibited.

- The fuel dispensing area must have a 2% to 4% slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of stormwater to the extent practicable.

- At a minimum, the concrete fuel dispensing area must extend 6.5 feet (2.0 meters) from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot (0.3 meter), whichever is less.

3. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Storm drain stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets. The stencil contains a brief statement that prohibits the dumping of improper materials into the stormwater conveyance system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are effective supplements to the anti-dumping message.

- All storm drain inlets and catch basins must be stenciled with prohibitive language (such as: "NO DUMPING – DRAINS TO OCEAN") and/or graphical icons to discourage illegal dumping.

- Signs and prohibitive language and/or graphical icons discouraging illegal dumping must be posted along channels and creeks.

- Legibility of stencils and signs must be maintained.

4. PROPERLY DESIGN OUTDOOR MATERIAL STORAGE AREAS

Improper storage of materials outdoors can allow toxic compounds, oil and grease, heavy metals, nutrients, and suspended solids to enter the stormwater conveyance system. Where proposed project plans or activities may result in outdoor areas for storage or use of materials that may contribute pollutants to the stormwater conveyance system, the following structural BMPs are required:

- Areas where materials are to be stored must be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the storm water conveyance system; or (2) protected by secondary containment structures such as berms, dikes, or curbs.

- The storage area must be paved and sufficiently impervious to contain leaks and spills.

- Where feasible, the storage area should have a roof or awning to minimize collection of storm water within the secondary containment area.

5. PROPERLY DESIGN TRASH STORAGE AREA

Loose trash and debris can be easily transported by the forces of water or wind into nearby storm drain inlets, channels, and/or creeks. All trash container areas must meet the following requirements:

- Trash container areas must have drainage from adjoining roofs and pavement diverted around the area(s).
- Trash container areas must be screened or walled to prevent off-site transport of trash.

6. PROPERLY DESIGN REPAIR/MAINTENANCE BAYS

Oil and grease, solvents, car battery acid, coolant and gasoline from the repair/maintenance bays can negatively impact stormwater if allowed to come into contact with stormwater runoff. Therefore, design plans for repair bays must include the following:

- Repair/maintenance bays must be indoors or designed in such a way that doesn't allow stormwater run-on or contact with stormwater runoff.
- Design a repair/maintenance bay drainage system to capture all washwater, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

7. PROPERLY DESIGN VEHICLE/EQUIPMENT WASH AREAS

Vehicle/equipment washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the stormwater conveyance system. To alleviate this problem, consider including in the project plans an area for washing/steam cleaning of vehicles and equipment. If such an area is included in the site design, it must meet the following:

- This area must be self-contained, covered, equipped with a clarifier, or other pretreatment facility, and properly connected to a sanitary sewer.

8. PROVIDE PROOF OF ONGOING BMP MAINTENANCE

Improper maintenance is one of the most common reasons for water quality controls to not function as designed or to fail entirely. It is important to consider who will be responsible for maintenance of a permanent BMP, and what equipment is required to perform the maintenance properly. As part of project review, if a project applicant has included (or will be required to include) structural BMPs in project plans, Permittee staff will require that the applicant provide verification of maintenance provisions.

For all properties, this verification will consist of having the developer sign a statement declaring responsibility for all structural BMP maintenance until the time the property is transferred. This transfer of property must have conditions requiring the recipient to assume responsibility for maintenance of any structural BMPs to be included in the sales or lease agreement for that property, and will be the owner's responsibility.

If structural BMPs are located within a public area proposed for transfer, they will be the responsibility of the developer until they are accepted for transfer by the County or other appropriate public agency. The structural BMP proposed for transfer will need prior approval from the County or other appropriate public agency and will be considered on a case by case basis.

RESTAURANT

STANDARD URBAN STORM WATER MITIGATION PLAN

DEFINITION

A restaurant is a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption. (SIC code 5812)

BACKGROUND

The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Permit) issued to Los Angeles County and 85 cities (Permittees) by the Los Angeles Regional Water Quality Control Board (Regional Board) on July 15, 1996, required the development and implementation of a program addressing stormwater pollution issues in development planning for private projects.

The requirement to implement a program addressing development planning is based on the primary objectives of the 1987 amendments to the Clean Water Act that established a framework for regulating stormwater discharges from municipal, industrial, and construction activities under the NPDES. The primary objectives are to:

- Effectively prohibit non-storm water discharges, and
- Reduce the discharge of pollutants from stormwater conveyance systems to the Maximum Extent Practicable.

This Standard Urban Stormwater Mitigation Plan (SUSMP) was developed as part of the program addressing Development Planning for the private sector. The Permittees will use this SUSMP to develop their own citywide SUSMP. Discretionary projects (as defined by CEQA), that fall into one of the seven categories (10-99 Home Subdivision, 100+ Home Subdivision, Single-Family Hillside Residence, 100,000 Square Foot Commercial Development, Automotive Repair Shop, Retail Gasoline Outlet, and Restaurant) will need to implement the appropriate SUSMP requirements into their project plans. This SUSMP outlines the necessary Best Management Practices (BMPs) which must be incorporated into design plans for Restaurant projects. Should any conflict be discovered with the new guidelines and any pre-existing regulation, the pre-existing regulation will prevail.

For development projects where the cost of new improvements exceeds a pre-determined threshold, the new and the existing improvements shall comply with this SUSMP. When the cost of new improvements is less than the pre-determined threshold, only the new improvements need to comply with this SUSMP. The pre-determined threshold shall be consistent with the local jurisdiction's policy for application of other building codes to new improvements.

REQUIREMENTS

1. PEAK STORM WATER RUNOFF DISCHARGE RATES

Peak storm water runoff discharge rates shall not exceed pre-development levels for developments where an increased peak storm water discharge rate may result in an increased potential for downstream erosion.

2. PROTECT SLOPES AND CHANNELS

If applicable, the project plans must include BMPs consistent with local code and ordinance to decrease the potential of slopes and/or channels from eroding and impacting stormwater runoff:

- Convey runoff safely from the tops of slopes and stabilize disturbed slopes.
- Stabilize permanent channel crossings.
- Vegetate slopes with native or drought tolerant vegetation.
- Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion.

3. PROPERLY DESIGN EQUIPMENT/ACCESSORY WASH AREAS

Equipment/accessory washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the stormwater conveyance system. To alleviate this problem, include in the project plans an area for the washing/steam cleaning of equipment and accessories. This area must meet the following:

- This area must be self-contained, equipped with a grease trap, and properly connected to a sanitary sewer.
- If this wash area is to be located outdoors, it must be covered, paved, have secondary containment, and be connected to the sanitary sewer.

4. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Storm drain stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets. The stencil contains a brief statement that prohibits the dumping of improper materials into the stormwater conveyance system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are effective supplements to the anti-dumping message.

- All storm drain inlets and catch basins must be stenciled with prohibitive language (such as: "NO DUMPING – DRAINS TO OCEAN") and/or graphical icons to discourage illegal dumping.

- Signs and prohibitive language and/or graphical icons discouraging illegal dumping must be posted along channels and creeks.

- Legibility of stencils and signs must be maintained.

5. PROPERLY DESIGN OUTDOOR MATERIAL STORAGE AREAS

Improper storage of materials outdoors can allow toxic compounds, oil and grease, heavy metals, nutrients, and suspended solids to enter the stormwater conveyance system. Where proposed project plans or activities may result in outdoor areas for storage or use of materials that may contribute pollutants to the stormwater conveyance system, the following structural BMPs are required:

- Areas where materials are to be stored must be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the storm water conveyance system; or (2) protected by secondary containment structures such as berms, dikes, or curbs.

- The storage area must be paved and sufficiently impervious to contain leaks and spills.

- Where feasible, the storage area should have a roof or awning to minimize collection of storm water within the secondary containment area.

6. PROPERLY DESIGN TRASH STORAGE AREAS

Loose trash and debris can be easily transported by the forces of water or wind into nearby storm drain inlets, channels, and/or creeks. All trash container areas must meet the following requirements:

- Trash container areas must have drainage from adjoining roofs and pavement diverted around the area(s).

- Trash container areas must be screened or walled to prevent off-site transport of trash.

7. PROVIDE PROOF OF ONGOING BMP MAINTENANCE

Improper maintenance is one of the most common reasons for water quality controls to not function as designed or to fail entirely. It is important to consider who will be responsible for maintenance of a permanent BMP, and what equipment is required to perform the maintenance properly. As part of project review, if a project applicant has included (or will be required to include) structural BMPs in project plans, Permittee staff will require that the applicant provide verification of maintenance provisions.

For all properties, this verification will consist of having the developer sign a statement declaring responsibility for all structural BMP maintenance until the time the property is transferred. This transfer of property must have conditions requiring the recipient to assume responsibility for maintenance of any structural BMPs to be included in the sales or lease agreement for that property, and will be the owner's responsibility.

If structural BMPs are located within a public area proposed for transfer, they will be the responsibility of the developer until they are accepted for transfer by the County or other appropriate public agency. The structural BMP proposed for transfer will need prior approval from the County or other appropriate public agency and will be considered on a case by case basis.

SINGLE FAMILY HILLSIDE RESIDENCE

STANDARD URBAN STORM WATER MITIGATION PLAN

DEFINITION

"Hillside" is as defined by the local jurisdiction. For example, one jurisdiction defines "hillside" as a property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is 25% or greater, and where grading contemplates cut or fill slopes 30 feet high or greater.

BACKGROUND

The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Permit) issued to Los Angeles County and 85 cities (Permittees) by the Los Angeles Regional Water Quality Control Board (Regional Board) on July 15, 1996, required the development and implementation of a program addressing stormwater pollution issues in development planning for private projects.

The requirement to implement a program addressing development planning is based on the primary objectives of the 1987 amendments to the Clean Water Act that established a framework for regulating stormwater discharges from municipal, industrial, and construction activities under the NPDES. The primary objectives are to:

- Effectively prohibit non-storm water discharges, and
- Reduce the discharge of pollutants from stormwater conveyance systems to the Maximum Extent Practicable.

This Standard Urban Stormwater Mitigation Plan (SUSMP) was developed as part of the program addressing Development Planning for the private sector. The Permittees will use this SUSMP to develop their own citywide SUSMP. Discretionary projects (as defined by CEQA), that fall into one of the seven categories (10-99 Home Subdivision, 100+ Home Subdivision, Single-Family Hillside Residence, 100,000 Square Foot Commercial Development, Automotive Repair Shop, Retail Gasoline Outlet, and Restaurant) will need to implement the appropriate SUSMP requirements into their project plans. This SUSMP outlines the necessary Best Management Practices (BMPs) which must be incorporated into design plans for Single-Family Hillside Residence projects. Should any conflict be discovered with the new guidelines and any pre-existing regulation, the pre-existing regulation will prevail.

For development projects where the cost of new improvements exceeds a pre-determined threshold, the new and the existing improvements shall comply with this SUSMP. When the cost of new improvements is less than the pre-determined threshold, only the new improvements need to comply with this SUSMP. The pre-determined threshold shall be consistent with the local jurisdiction's policy for application of other building codes to new improvements.

REQUIREMENTS

1. PEAK STORM WATER RUNOFF DISCHARGE RATES

Peak storm water runoff discharge rates shall not exceed pre-development levels for developments where an increased peak storm water discharge rate may result in an increased potential for downstream erosion.

2. CONSERVE NATURAL AREAS

If applicable, the following items are required and must be implemented in the site layout during the subdivision design and approval process, consistent with applicable General Plan and Local Area Plan policies:

- Every effort shall be made to concentrate or cluster development on portions of a site while leaving the remaining land in a natural undisturbed condition.
- Limit clearing and grading of native vegetation at a site to the minimum amount needed to build lots, allow access, and provide fire protection.
- Maximize trees and other vegetation at each site by planting additional vegetation, clustering tree areas, and promoting the use of native and/or drought tolerant plants. Wherever practical, promote natural vegetation by using parking lot islands and other landscaped areas.
- Preserve riparian areas and wetlands.

3. PROTECT SLOPES AND CHANNELS

If applicable, the project plans must include BMPs consistent with local code and ordinance to decrease the potential of slopes and/or channels from eroding and impacting stormwater runoff:

- Convey runoff safely from the tops of slopes and stabilize disturbed slopes.
- Stabilize permanent channel crossings.
- Vegetate slopes with native or drought tolerant vegetation.

- Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion.

4. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Storm drain stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets. The stencil contains a brief statement that prohibits the dumping of improper materials into the stormwater conveyance system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are effective supplements to the anti-dumping message.

- All storm drain inlets and catch basins must be stenciled with prohibitive language (such as: "NO DUMPING – DRAINS TO OCEAN") and/or graphical icons to discourage illegal dumping.

- Signs and prohibitive language and/or graphical icons discouraging illegal dumping must be posted along channels and creeks.

- Legibility of stencils and signs must be maintained.

5. PROVIDE PROOF OF ONGOING BMP MAINTENANCE

Improper maintenance is one of the most common reasons for water quality controls to not function as designed or to fail entirely. It is important to consider who will be responsible for maintenance of a permanent BMP, and what equipment is required to perform the maintenance properly. As part of project review, if a project applicant has included (or will be required to include) structural BMPs in project plans, Permittee staff will require that the applicant provide verification of maintenance provisions.

For all properties, this verification will consist of having the developer sign a statement declaring responsibility for all structural BMP maintenance until the time the property is transferred. This transfer of property must have conditions requiring the recipient to assume responsibility for maintenance of any structural BMPs to be included in the sales or lease agreement for that property, and will be the owner's responsibility. For residential properties where the structural BMPs are located within a common area which will be maintained by a homeowner's association, language regarding the responsibility for maintenance must be included in the projects conditions, covenants and restrictions (CC&R's). Printed educational materials will be required to accompany the first deed transfer to highlight the existence of the requirement and to

provide information on what stormwater management facilities are present, signs that maintenance is needed, how the necessary maintenance can be performed, and assistance that the Permittee can provide. It will also encourage the transfer of this information with subsequent sale of the property.

If structural BMPs are located within a public area proposed for transfer, they will be the responsibility of the developer until they are accepted for transfer by the County or other appropriate public agency. The structural BMP proposed for transfer will need prior approval from the County or other appropriate public agency and will be considered on a case by case basis.

HARRY W. STONE, Director

ADDRESS ALL CORRESPONDENCE TO:
P.O. BOX 1460
ALHAMBRA, CALIFORNIA 91802-1460

August 12, 1999

IN REPLY PLEASE
REFER TO FILE: EP-3

Mr. Dennis Dickerson, Executive Officer
California Regional Water Quality
Control Board - Los Angeles Region
320 West 4th Street, Suite 200
Los Angeles, CA 90013-1105

Dear Mr. Dickerson:

STANDARD URBAN STORMWATER MITIGATION PLANS

I am writing to clarify the intended meaning of some wording in the Standard Urban Stormwater Mitigation Plans (SUSMPs) submitted to you on July 21, 1999.

At the workshop held on August 10, 1999, regarding SUSMPs, you indicated that the following statement in the SUSMPs would be interpreted to mean that all runoff would need to be mitigated:

> "The development must be designed so as to mitigate (infiltrate and/or treat) the site runoff generated from impervious directly connected areas that may contribute pollutants of concern to the stormwater conveyance system".

The actual intent of that statement was to omit a numerical standard from the SUSMPs. Enclosed is a revised version of the SUSMPs to clarify the intended meaning.

If you have any questions, please call me at (626) 458-5948, Monday through Thursday, 7:00 a.m. to 5:30 p.m.

Very truly yours,

HARRY W. STONE
Director of Public Works

Terri M Grant

100+ HOME SUBDIVISION

STANDARD URBAN STORM WATER MITIGATION PLAN

DEFINITION

A 100+ home subdivision is defined as any subdivision lot being developed for more than 100 single-family or multi-family homes.

BACKGROUND

The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Permit) issued to Los Angeles County and 85 cities (Permittees) by the Los Angeles Regional Water Quality Control Board (Regional Board) on July 15, 1996, required the development and implementation of a program addressing stormwater pollution issues in development planning for private projects.

The requirement to implement a program addressing development planning is based on the primary objectives of the 1987 amendments to the Clean Water Act that established a framework for regulating stormwater discharges from municipal, industrial, and construction activities under the NPDES. The primary objectives are to:

- Effectively prohibit non-storm water discharges, and
- Reduce the discharge of pollutants from stormwater conveyance systems to the Maximum Extent Practicable.

This Standard Urban Stormwater Mitigation Plan (SUSMP) was developed as part of the program addressing Development Planning for the private sector. The Permittees will use this SUSMP to develop their own citywide SUSMP. Discretionary projects (as defined by CEQA), that fall into one of the seven categories (10-99 Home Subdivision, 100+ Home Subdivision, Single-Family Hillside Residence, 100,000 Square Foot Commercial Development, Automotive Repair Shop, Retail Gasoline Outlet, and Restaurant) will need to implement the appropriate SUSMP requirements into their project plans. This SUSMP outlines the necessary Best Management Practices (BMPs) which must be incorporated into design plans for 100+ Home Subdivision projects. Should any conflict be discovered with the new guidelines and any pre-existing regulation, the pre-existing regulation will prevail.

For development projects where the cost of new improvements exceeds a pre-determined threshold, the new and the existing improvements shall comply with this SUSMP. When the cost of new improvements is less than the pre-determined threshold, only the new improvements need to comply with this SUSMP. The pre-determined threshold shall be consistent with the local jurisdiction's policy for application of other building codes to new improvements.

REQUIREMENTS

1. PEAK STORM WATER RUNOFF DISCHARGE RATES

Peak storm water runoff discharge rates shall not exceed pre-development levels for developments where an increased peak storm water discharge rate may result in an increased potential for downstream erosion.

2. CONSERVE NATURAL AREAS

If applicable, the following items are required and must be implemented in the site layout during the subdivision design and approval process, consistent with applicable General Plan and Local Area Plan policies:

- Every effort shall be made to concentrate or cluster development on portions of a site while leaving the remaining land in a natural undisturbed condition.
- Limit clearing and grading of native vegetation at a site to the minimum amount needed to build lots, allow access, and provide fire protection.
- Maximize trees and other vegetation at each site by planting additional vegetation, clustering tree areas, and promoting the use of native and/or drought tolerant plants. Wherever practical, promote natural vegetation by using parking lot islands and other landscaped areas.
- Preserve riparian areas and wetlands.

3. MINIMIZE STORMWATER POLLUTANTS OF CONCERN

Stormwater runoff from a site has the potential to contribute oil and grease, suspended solids, metals, gasoline, pesticides, and pathogens to the stormwater conveyance system. The development must be designed so as to minimize, to the maximum extent practicable (MEP), the introduction of pollutants of concern that may result in significant impacts, generated from site runoff of directly connected impervious areas (DCIA), to the stormwater conveyance system as approved by the building official. Pollutants of concern, as defined by the Permit, consist of any pollutants that exhibit one or more of the following characteristics: current loadings or historic deposits of the pollutant are impacting the beneficial uses of a receiving water, elevated levels of the pollutant are found in sediments of a receiving water and/or have the potential to bioaccumulate in organisms therein, or the detectable inputs of the pollutant are at a level high

enough to be considered potentially toxic to humans and/or flora and fauna. DCIA is defined as the area covered by pavement, building and other impervious surfaces which drain directly into the storm drain without first flowing across pervious areas (e.g. lawns).

In meeting this specific requirement, "minimization of the pollutants of concern" will require the incorporation of a BMP or combination of BMPs best suited to maximize the reduction of pollutant loadings in that runoff to the MEP. Those BMPs best suited for that purpose are, at a minimum, those listed in the California Storm Water Best Management Practices Handbooks as "likely to have significant impact" beneficial to water quality for targeted pollutants that are of concern at the site in question. However, it is possible that a combination of BMPs not so designated may, in a particular circumstance, be best suited to maximize the reduction of the pollutants.

Example Best Management Practices (BMPs)

The following are examples of BMPs that can be used for minimizing the introduction of pollutants of concern that may result in significant impacts, generated from site runoff of DCIA, to the stormwater conveyance system. (See Table 1: Suggested Resources for additional sources of information):

- Provide reduced width sidewalks and incorporate landscaped buffer areas between sidewalks and streets. However, sidewalk widths must still comply with regulations for the Americans with Disabilities Act and other life safety requirements.

- Design residential streets for the minimum required pavement widths needed to comply with all zoning and applicable ordinances to support travel lanes; on-street parking; emergency, maintenance, and service vehicle access; sidewalks; and vegetated open channels.

- Comply with all zoning and applicable ordinances to minimize the number of residential street cul-de-sacs and incorporate landscaped areas to reduce their impervious cover. The radius of cul-de-sacs should be the minimum required to accommodate emergency and maintenance vehicles. Alternative turnarounds should be considered.

- Use permeable materials for private sidewalks, driveways, parking lots, or interior roadway surfaces (examples: hybrid lots, parking groves, permeable overflow parking, etc.).

- Use open space development that incorporates smaller lot sizes.

- Reduce building density.

- Comply with all zoning and applicable ordinances to reduce overall lot imperviousness by

promoting alternative driveway surfaces and shared driveways that connect two or more homes together.

- Comply with all zoning and applicable ordinances to reduce the overall imperviousness associated with parking lots by providing compact car spaces, minimizing stall dimensions, incorporating efficient parking lanes, and using pervious materials in spillover parking areas.

- Direct rooftop runoff to pervious areas such as yards, open channels, or vegetated areas, and avoid routing rooftop runoff to the roadway or the stormwater conveyance system.

- Vegetated swales and strips (Applicability and design criteria to be determined by the local jurisdiction)

- Extended/dry detention basins (Applicability and design criteria to be determined by the local jurisdiction)

- Infiltration basins (Applicability and design criteria to be determined by the local jurisdiction)

- Infiltration trenches (Applicability and design criteria to be determined by the local jurisdiction)

- Wet ponds (Applicability and design criteria to be determined by the local jurisdiction)

- Constructed wetlands (Applicability and design criteria to be determined by the local jurisdiction)

- Oil/Water separators (Applicability and design criteria to be determined by the local jurisdiction)

- Catch basin inserts (Applicability and design criteria to be determined by the local jurisdiction)

- Continuous deflective separation units (Applicability and design criteria to be determined by the local jurisdiction)

- Storm drain inserts (Applicability and design criteria to be determined by the local jurisdiction)

- Media filtration (Applicability and design criteria to be determined by the local jurisdiction)

- Bioretention facility (Applicability and design criteria to be determined by the local jurisdiction)
- Dry-wells (Applicability and design criteria to be determined by the local jurisdiction)
- Cisterns (Applicability and design criteria to be determined by the local jurisdiction)
- Foundation planting (Applicability and design criteria to be determined by the local jurisdiction)

4. PROTECT SLOPES AND CHANNELS

If applicable, the project plans must include BMPs consistent with local code and ordinance to decrease the potential of slopes and/or channels from eroding and impacting stormwater runoff:

- Convey runoff safely from the tops of slopes and stabilize disturbed slopes.
- Stabilize permanent channel crossings.
- Vegetate slopes with native or drought tolerant vegetation.
- Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion.

5. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Storm drain stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets. The stencil contains a brief statement that prohibits the dumping of improper materials into the stormwater conveyance system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are effective supplements to the anti-dumping message.

- All storm drain inlets and catch basins must be stenciled with prohibitive language (such as: "NO DUMPING – DRAINS TO OCEAN") and/or graphical icons to discourage illegal dumping.
- Signs and prohibitive language and/or graphical icons discouraging illegal dumping must be

posted along channels and creeks.

- Legibility of stencils and signs must be maintained.

6. PROPERLY DESIGN COMMON OUTDOOR MATERIAL STORAGE AREAS

Common outdoor material storage areas refer to storage areas or storage facilities solely for the storage of materials used in the routine maintenance of common areas or common facilities such as swimming pools, tennis courts, green belt areas, etc.

Improper storage of materials outdoors can allow toxic compounds, oil and grease, heavy metals, nutrients, and suspended solids to enter the stormwater conveyance system. Where proposed project plans include common outdoor areas for storage of materials that may contribute pollutants to the stormwater conveyance system, the following structural BMPs are required:

- Areas where materials are to be stored must be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the storm water conveyance system; or (2) protected by secondary containment structures such as berms, dikes, or curbs.

- The storage area must be paved and sufficiently impervious to contain leaks and spills.

- Where feasible, the storage area should have a roof or awning to minimize collection of stormwater within the secondary containment area.

7. PROPERLY DESIGN COMMON TRASH STORAGE AREAS

A common trash storage area refers to an area where a trash receptacle or receptacles are located for use by more than one household or dwelling unit as a repository for household wastes.

Loose trash and debris can be easily transported by the forces of water or wind into nearby storm drain inlets, channels, and/or creeks. All common trash container areas must meet the following requirements:

- Trash container areas must have drainage from adjoining roofs and pavement diverted around the area(s).

- Trash container areas must be screened or walled to prevent off-site transport of trash.

8. PROVIDE PROOF OF ONGOING BMP MAINTENANCE

Improper maintenance is one of the most common reasons for water quality controls to not function as designed or to fail entirely. It is important to consider who will be responsible for maintenance of a permanent BMP, and what equipment is required to perform the maintenance properly. As part of project review, if a project applicant has included (or will be required to include) structural BMPs in project plans, Permittee staff will require that the applicant provide verification of maintenance provisions.

For all properties, this verification will consist of having the developer sign a statement declaring responsibility for all structural BMP maintenance until the time the property is transferred. This transfer of property must have conditions requiring the recipient to assume responsibility for maintenance of any structural BMPs to be included in the sales or lease agreement for that property, and will be the owner's responsibility. For residential properties where the structural BMPs are located within a common area which will be maintained by a homeowner's association, language regarding the responsibility for maintenance must be included in the projects conditions, covenants and restrictions (CC&R's). Printed educational materials will be required to accompany the first deed transfer to highlight the existence of the requirement and to provide information on what stormwater management facilities are present, signs that maintenance is needed, how the necessary maintenance can be performed, and assistance that the Permittee can provide. It will also encourage the transfer of this information with subsequent sale of the property.

If structural BMPs are located within a public area proposed for transfer, they will be the responsibility of the developer until they are accepted for transfer by the County or other appropriate public agency. The structural BMP proposed for transfer will need prior approval from the County or other appropriate public agency and will be considered on a case by case basis.

10 - 99 HOME SUBDIVISION

STANDARD URBAN STORM WATER MITIGATION PLAN

DEFINITION

Any subdivision lot being developed for 10 to 99 single-family or multi-family homes.

BACKGROUND

The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Permit) issued to Los Angeles County and 85 cities (Permittees) by the Los Angeles Regional Water Quality Control Board (Regional Board) on July 15, 1996, required the development and implementation of a program addressing stormwater pollution issues in development planning for private projects.

The requirement to implement a program addressing development planning is based on the primary objectives of the 1987 amendments to the Clean Water Act that established a framework for regulating stormwater discharges from municipal, industrial, and construction activities under the NPDES. The primary objectives are to:

- Effectively prohibit non-storm water discharges, and
- Reduce the discharge of pollutants from stormwater conveyance systems to the Maximum Extent Practicable.

This Standard Urban Stormwater Mitigation Plan (SUSMP) was developed as part of the program addressing Development Planning for the private sector. The Permittees will use this SUSMP to develop their own citywide SUSMP. Discretionary projects (as defined by CEQA), that fall into one of the seven categories (10-99 Home Subdivision, 100+ Home Subdivision, Single-Family Hillside Residence, 100,000 Square Foot Commercial Development, Automotive Repair Shop, Retail Gasoline Outlet, and Restaurant) will need to implement the appropriate SUSMP requirements into their project plans. This SUSMP outlines the necessary Best Management Practices (BMPs) which must be incorporated into design plans for 10-99 Home Subdivision projects. Should any conflict be discovered with the new guidelines and any pre-existing regulation, the pre-existing regulation will prevail.

For development projects where the cost of new improvements exceeds a pre-determined threshold, the new and the existing improvements shall comply with this SUSMP. When the cost of new improvements is less than the pre-determined threshold, only the new improvements need to comply with this SUSMP. The pre-determined threshold shall be consistent with the local jurisdiction's policy for application of other building codes to new improvements.

REQUIREMENTS

1. PEAK STORM WATER RUNOFF DISCHARGE RATES

Peak storm water runoff discharge rates shall not exceed pre-development levels for developments where an increased peak storm water discharge rate may result in an increased potential for downstream erosion.

2. CONSERVE NATURAL AREAS

If applicable, the following items are required and must be implemented in the site layout during the subdivision design and approval process, consistent with applicable General Plan and Local Area Plan policies:

- Every effort shall be made to concentrate or cluster development on portions of a site while leaving the remaining land in a natural undisturbed condition.
- Limit clearing and grading of native vegetation at a site to the minimum amount needed to build lots, allow access, and provide fire protection.
- Maximize trees and other vegetation at each site by planting additional vegetation, clustering tree areas, and promoting the use of native and/or drought tolerant plants. Wherever practical, promote natural vegetation by using parking lot islands and other landscaped areas.
- Preserve riparian areas and wetlands.

3. PROTECT SLOPES AND CHANNELS

If applicable, the project plans must include BMPs consistent with local code and ordinance to decrease the potential of slopes and/or channels from eroding and impacting stormwater runoff:

- Convey runoff safely from the tops of slopes and stabilize disturbed slopes.
- Stabilize permanent channel crossings.
- Vegetate slopes with native or drought tolerant vegetation.

- Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion.

4. MINIMIZE STORMWATER POLLUTANTS OF CONCERN

Stormwater runoff from a site has the potential to contribute oil and grease, suspended solids, metals, gasoline, pesticides, and pathogens to the stormwater conveyance system. The development must be designed so as to minimize, to the maximum extent practicable (MEP), the introduction of pollutants of concern that may result in significant impacts, generated from site runoff of directly connected impervious areas (DCIA), to the stormwater conveyance system as approved by the building official. Pollutants of concern, as defined by the Permit, consist of any pollutants that exhibit one or more of the following characteristics: current loadings or historic deposits of the pollutant are impacting the beneficial uses of a receiving water, elevated levels of the pollutant are found in sediments of a receiving water and/or have the potential to bioaccumulate in organisms therein, or the detectable inputs of the pollutant are at a level high enough to be considered potentially toxic to humans and/or flora and fauna. DCIA is defined as the area covered by pavement, building and other impervious surfaces which drain directly into the storm drain without first flowing across pervious areas (e.g. lawns).

In meeting this specific requirement, "minimization of the pollutants of concern" will require the incorporation of a BMP or combination of BMPs best suited to maximize the reduction of pollutant loadings in that runoff to the MEP. Those BMPs best suited for that purpose are, at a minimum, those listed in the California Storm Water Best Management Practices Handbooks as "likely to have significant impact" beneficial to water quality for targeted pollutants that are of concern at the site in question. However, it is possible that a combination of BMPs not so designated may, in a particular circumstance, be best suited to maximize the reduction of the pollutants.

Example Best Management Practices (BMPs)

The following are examples of BMPs that can be used for minimizing the introduction of pollutants of concern that may result in significant impacts, generated from site runoff of DCIA, to the stormwater conveyance system. (See Table 1: Suggested Resources for additional sources of information):

- Provide reduced width sidewalks and incorporate landscaped buffer areas between sidewalks and streets. However, sidewalk widths must still comply with regulations for the Americans with Disabilities Act and other life safety requirements.

- Design residential streets for the minimum required pavement widths needed to comply with all zoning and applicable ordinances to support travel lanes; on-street parking; emergency, maintenance, and service vehicle access; sidewalks; and vegetated open channels.

- Comply with all zoning and applicable ordinances to minimize the number of residential street cul-de-sacs and incorporate landscaped areas to reduce their impervious cover. The radius of cul-de-sacs should be the minimum required to accommodate emergency and maintenance vehicles. Alternative turnarounds should be considered.

- Use permeable materials for private sidewalks, driveways, parking lots, or interior roadway surfaces (examples: hybrid lots, parking groves, permeable overflow parking, etc.).

- Use open space development that incorporates smaller lot sizes.

- Reduce building density.

- Comply with all zoning and applicable ordinances to reduce overall lot imperviousness by promoting alternative driveway surfaces and shared driveways that connect two or more homes together.

- Comply with all zoning and applicable ordinances to reduce the overall imperviousness associated with parking lots by providing compact car spaces, minimizing stall dimensions, incorporating efficient parking lanes, and using pervious materials in spillover parking areas.

- Direct rooftop runoff to pervious areas such as yards, open channels, or vegetated areas, and avoid routing rooftop runoff to the roadway or the stormwater conveyance system.

- Vegetated swales and strips (Applicability and design criteria to be determined by the local jurisdiction)

- Extended/dry detention basins (Applicability and design criteria to be determined by the local jurisdiction)

- Infiltration basins (Applicability and design criteria to be determined by the local jurisdiction)

- Infiltration trenches (Applicability and design criteria to be determined by the local jurisdiction)

- Wet ponds (Applicability and design criteria to be determined by the local jurisdiction)

- Constructed wetlands (Applicability and design criteria to be determined by the local jurisdiction)
- Oil/Water separators (Applicability and design criteria to be determined by the local jurisdiction)
- Catch basin inserts (Applicability and design criteria to be determined by the local jurisdiction)
- Continuous deflective separation units (Applicability and design criteria to be determined by the local jurisdiction)
- Storm drain inserts (Applicability and design criteria to be determined by the local jurisdiction)
- Media filtration (Applicability and design criteria to be determined by the local jurisdiction)
- Bioretention facility (Applicability and design criteria to be determined by the local jurisdiction)
- Dry-wells (Applicability and design criteria to be determined by the local jurisdiction)
- Cisterns (Applicability and design criteria to be determined by the local jurisdiction)
- Foundation planting (Applicability and design criteria to be determined by the local jurisdiction)

5. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Storm drain stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets. The stencil contains a brief statement that prohibits the dumping of improper materials into the stormwater conveyance system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are effective supplements to the anti-dumping message.

- All storm drain inlets and catch basins must be stenciled with prohibitive language (such as: "NO DUMPING – DRAINS TO OCEAN") and/or graphical icons to discourage illegal dumping.

- Signs and prohibitive language and/or graphical icons discouraging illegal dumping must be posted along channels and creeks.

- Legibility of stencils and signs must be maintained.

6. PROPERLY DESIGN COMMON OUTDOOR MATERIAL STORAGE AREAS

Common outdoor material storage areas refer to storage areas or storage facilities solely for the storage of materials used in the routine maintenance of common areas or common facilities such as swimming pools, tennis courts, green belt areas, etc.

Improper storage of materials outdoors can allow toxic compounds, oil and grease, heavy metals, nutrients, and suspended solids to enter the stormwater conveyance system. Where proposed project plans include common outdoor areas for storage of materials that may contribute pollutants to the stormwater conveyance system, the following structural BMPs are required:

- Areas where materials are to be stored must be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the storm water conveyance system; or (2) protected by secondary containment structures such as berms, dikes, or curbs.

- The storage area must be paved and sufficiently impervious to contain leaks and spills.

- Where feasible, the storage area should have a roof or awning to minimize collection of stormwater within the secondary containment area.

7. PROPERLY DESIGN COMMON TRASH STORAGE AREAS

A common trash storage area refers to an area where a trash receptacle or receptacles are located for use by more than one household or dwelling unit as a repository for household wastes.

Loose trash and debris can be easily transported by the forces of water or wind into nearby storm drain inlets, channels, and/or creeks. All common trash container areas must meet the following requirements:

- Trash container areas must have drainage from adjoining roofs and pavement diverted around the area(s).

- Trash container areas must be screened or walled to prevent off-site transport of trash.

8. PROVIDE PROOF OF ONGOING BMP MAINTENANCE

Improper maintenance is one of the most common reasons for water quality controls to not function as designed or to fail entirely. It is important to consider who will be responsible for maintenance of a permanent BMP, and what equipment is required to perform the maintenance properly. As part of project review, if a project applicant has included (or will be required to include) structural BMPs in project plans, Permittee staff will require that the applicant provide verification of maintenance provisions.

For all properties, this verification will consist of having the developer sign a statement declaring responsibility for all structural BMP maintenance until the time the property is transferred. This transfer of property must have conditions requiring the recipient to assume responsibility for maintenance of any structural BMPs to be included in the sales or lease agreement for that property, and will be the owner's responsibility. For residential properties where the structural BMPs are located within a common area which will be maintained by a homeowner's association, language regarding the responsibility for maintenance must be included in the projects conditions, covenants and restrictions (CC&R's). Printed educational materials will be required to accompany the first deed transfer to highlight the existence of the requirement and to provide information on what stormwater management facilities are present, signs that maintenance is needed, how the necessary maintenance can be performed, and assistance that the Permittee can provide. It will also encourage the transfer of this information with subsequent sale of the property.

If structural BMPs are located within a public area proposed for transfer, they will be the responsibility of the developer until they are accepted for transfer by the County or other appropriate public agency. The structural BMP proposed for transfer will need prior approval from the County or other appropriate public agency and will be considered on a case by case basis.

100,000 SQUARE FOOT COMMERCIAL DEVELOPMENT

STANDARD URBAN STORM WATER MITIGATION PLAN

DEFINITION

Categorization as a commercial development of 100,000 or more square feet will be based on total impermeable area, including parking area, as opposed to lot size or building footprint.

BACKGROUND

The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Permit) issued to Los Angeles County and 85 cities (Permittees) by the Los Angeles Regional Water Quality Control Board (Regional Board) on July 15, 1996, required the development and implementation of a program addressing stormwater pollution issues in development planning for private projects.

The requirement to implement a program addressing development planning is based on the primary objectives of the 1987 amendments to the Clean Water Act that established a framework for regulating stormwater discharges from municipal, industrial, and construction activities under the NPDES. The primary objectives are to:

- Effectively prohibit non-storm water discharges, and
- Reduce the discharge of pollutants from stormwater conveyance systems to the Maximum Extent Practicable.

This Standard Urban Stormwater Mitigation Plan (SUSMP) was developed as part of the program addressing Development Planning for the private sector. The Permittees will use this SUSMP to develop their own citywide SUSMP. Discretionary projects (as defined by CEQA), that fall into one of the seven categories (10-99 Home Subdivision, 100+ Home Subdivision, Single-Family Hillside Residence, 100,000 Square Foot Commercial Development, Automotive Repair Shop, Retail Gasoline Outlet, and Restaurant) will need to implement the appropriate SUSMP requirements into their project plans. This SUSMP outlines the necessary Best Management Practices (BMPs) which must be incorporated into design plans for 100,000 Square Foot Commercial Development projects. Should any conflict be discovered with the new guidelines and any pre-existing regulation, the pre-existing regulation will prevail.

For development projects where the cost of new improvements exceeds a pre-determined threshold, the new and the existing improvements shall comply with this SUSMP. When the cost of new improvements is less than the pre-determined threshold, only the new improvements need to comply with this SUSMP. The pre-determined threshold shall be consistent with the local jurisdiction's policy for application of other building codes to new improvements.

REQUIREMENTS

1. PEAK STORM WATER RUNOFF DISCHARGE RATES

Peak storm water runoff discharge rates shall not exceed pre-development levels for developments where an increased peak storm water discharge rate may result in an increased potential for downstream erosion.

2. PROTECT SLOPES AND CHANNELS

If applicable, the project plans must include BMPs consistent with local code and ordinance to decrease the potential of slopes and/or channels from eroding and impacting stormwater runoff:

- Convey runoff safely from the tops of slopes and stabilize disturbed slopes.
- Stabilize permanent channel crossings.
- Vegetate slopes with native or drought tolerant vegetation.

Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion.

3. MINIMIZE STORMWATER POLLUTANTS OF CONCERN

Stormwater runoff from a site has the potential to contribute oil and grease, suspended solids, metals, gasoline, pesticides, and pathogens to the stormwater conveyance system. The development must be designed so as to minimize, to the maximum extent practicable (MEP), the introduction of pollutants of concern that may result in significant impacts, generated from site runoff of directly connected impervious areas (DCIA), to the stormwater conveyance system as approved by the building official. Pollutants of concern, as defined by the Permit, consist of any pollutants that exhibit one or more of the following characteristics: current loadings or historic deposits of the pollutant are impacting the beneficial uses of a receiving water, elevated levels of the pollutant are found in sediments of a receiving water and/or have the potential to bioaccumulate in organisms therein, or the detectable inputs of the pollutant are at a level high enough to be considered potentially toxic to humans and/or flora and fauna. DCIA is defined as the area covered by pavement, building and other impervious surfaces which drain directly into the storm drain without first flowing across pervious areas (e.g. lawns).

In meeting this specific requirement, "minimization of the pollutants of concern" will require the incorporation of a BMP or combination of BMPs best suited to maximize the reduction of pollutant loadings in that runoff to the MEP. Those BMPs best suited for that purpose are, at a minimum, those listed in the California Storm Water Best Management Practices Handbooks as "likely to have significant impact" beneficial to water quality for targeted pollutants that are of concern at the site in question. However, it is possible that a combination of BMPs not so designated may, in a particular circumstance, be best suited to maximize the reduction of the pollutants.

Example Best Management Practices (BMPs)

The following are examples of BMPs that can be used for minimizing the introduction of pollutants of concern that may result in significant impacts, generated from site runoff of DCIA, to the stormwater conveyance system. (See Table 1: Suggested Resources for additional sources of information):

- Provide reduced width sidewalks and incorporate landscaped buffer areas between sidewalks and streets. However, sidewalk widths must still comply with regulations for the Americans with Disabilities Act and other life safety requirements.

- Use permeable materials for private sidewalks, driveways, parking lots, or interior roadway surfaces (examples: hybrid lots, parking groves, permeable overflow parking, etc.).

- Comply with all zoning and applicable ordinances to reduce the overall imperviousness associated with parking lots by providing compact car spaces, minimizing stall dimensions, incorporating efficient parking lanes, and using pervious materials in spillover parking areas.

- Direct rooftop runoff to pervious areas such as yards, open channels, or vegetated areas, and avoid routing rooftop runoff to the roadway or the stormwater conveyance system.

- Vegetated swales and strips (Applicability and design criteria to be determined by the local jurisdiction)

- Extended/dry detention basins (Applicability and design criteria to be determined by the local jurisdiction)

- Infiltration basins (Applicability and design criteria to be determined by the local jurisdiction)

- Infiltration trenches (Applicability and design criteria to be determined by the local

jurisdiction)

- Wet ponds (Applicability and design criteria to be determined by the local jurisdiction)
- Constructed wetlands (Applicability and design criteria to be determined by the local jurisdiction)
- Oil/Water separators (Applicability and design criteria to be determined by the local jurisdiction)
- Catch basin inserts (Applicability and design criteria to be determined by the local jurisdiction)
- Continuous deflective separation units (Applicability and design criteria to be determined by the local jurisdiction)
- Storm drain inserts (Applicability and design criteria to be determined by the local jurisdiction)
- Media filtration (Applicability and design criteria to be determined by the local jurisdiction)
- Bioretention facility (Applicability and design criteria to be determined by the local jurisdiction)
- Dry-wells (Applicability and design criteria to be determined by the local jurisdiction)
- Cisterns (Applicability and design criteria to be determined by the local jurisdiction)
- Foundation planting (Applicability and design criteria to be determined by the local jurisdiction)

4. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Storm drain stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets. The stencil contains a brief statement that prohibits the dumping of improper materials into the stormwater conveyance system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are effective supplements to the anti-dumping message.

- All storm drain inlets and catch basins must be stenciled with prohibitive language (such as: "NO DUMPING – DRAINS TO OCEAN") and/or graphical icons to discourage illegal dumping.

- Signs and prohibitive language and/or graphical icons discouraging illegal dumping must be posted along channels and creeks.

- Legibility of stencils and signs must be maintained.

5. PROPERLY DESIGN OUTDOOR MATERIAL STORAGE AREAS

Improper storage of materials outdoors can allow toxic compounds, oil and grease, heavy metals, nutrients, and suspended solids to enter the stormwater conveyance system. Where proposed project plans or activities may result in outdoor areas for storage or use of materials that may contribute pollutants to the stormwater conveyance system, the following structural BMPs are required:

- Areas where materials are to be stored must be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the storm water conveyance system; or (2) protected by secondary containment structures such as berms, dikes, or curbs.

- The storage area must be paved and sufficiently impervious to contain leaks and spills.

- Where feasible, the storage area should have a roof or awning to minimize collection of storm water within the secondary containment area.

6. PROPERLY DESIGN TRASH STORAGE AREAS

Loose trash and debris can be easily transported by the forces of water or wind into nearby storm drain inlets, channels, and/or creeks. All trash container areas must meet the following requirements:

- Trash container areas must have drainage from adjoining roofs and pavement diverted around the area(s).
- Trash container areas must be screened or walled to prevent off-site transport of trash.

7. PROPERLY DESIGN LOADING/UNLOADING DOCK AREAS

Loading/unloading dock areas have the potential for material spills to be quickly transported to the stormwater conveyance system. To minimize this potential, the following design criteria are required:

- Cover loading dock areas or design drainage to minimize run-on and runoff of stormwater.
- Direct connections to storm drains from depressed loading docks (truck wells) are prohibited.

8. PROPERLY DESIGN REPAIR/MAINTENANCE BAYS

Oil and grease, solvents, car battery acid, coolant and gasoline from the repair/maintenance bays can negatively impact stormwater if allowed to come into contact with stormwater runoff. Therefore, design plans for repair bays must include the following:

- Repair/maintenance bays must be indoors or designed in such a way that doesn't allow stormwater runon or contact with stormwater runoff.
- Design a repair/maintenance bay drainage system to capture all washwater, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

9. PROPERLY DESIGN VEHICLE/EQUIPMENT WASH AREAS

Vehicle/equipment washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the stormwater conveyance system. To alleviate this problem, consider including in the project plans an area for washing/steam cleaning of vehicles and equipment. If such an area is included in the site design, it must meet the following:

- This area must be self-contained, covered, equipped with a clarifier, or other pretreatment facility, and properly connected to a sanitary sewer.

10. PROVIDE PROOF OF ONGOING BMP MAINTENANCE

Improper maintenance is one of the most common reasons for water quality controls to not function as designed or to fail entirely. It is important to consider who will be responsible for maintenance of a permanent BMP, and what equipment is required to perform the maintenance properly. As part of project review, if a project applicant has included (or will be required to include) structural BMPs in project plans, Permittee staff will require that the applicant provide verification of maintenance provisions.

For all properties, this verification will consist of having the developer sign a statement declaring responsibility for all structural BMP maintenance until the time the property is transferred. This transfer of property must have conditions requiring the recipient to assume responsibility for maintenance of any structural BMPs to be included in the sales or lease agreement for that property, and will be the owner's responsibility.

If structural BMPs are located within a public area proposed for transfer, they will be the responsibility of the developer until they are accepted for transfer by the County or other appropriate public agency. The structural BMP proposed for transfer will need prior approval from the County or other appropriate public agency and will be considered on a case by case basis.

TO: **Los Angeles County Municipal Storm Water and Urban Runoff NPDES Permittees**
Long Beach Municipal Storm Water and Urban Runoff NPDES Permittees
Interested Parties

FROM: **Dennis A. Dickerson**
Executive Officer

DATE: **December 7, 1999**

SUBJECT: **Proposed Standard Urban Storm Water Mitigation Plan and Supporting Regional Board Resolution**

On September 16th, at the Regional Board meeting, I advised the Regional Board that additional time to develop a revised Standard Urban Storm Water Mitigation Plan proposal would be in the best interest to ensure that the proposal were more fully documented and supported by the record. At that time, I indicated that Regional Board staff would develop a revised proposal at the earliest opportunity but probably not less than 90 days later. This proposal has been developed and is being noticed through this memorandum to Permittees and Interested Parties. The proposal is also being mailed and placed on the Regional Board's Internet website.

The proposed Standard Urban Storm Water Mitigation Plan is designed to ensure that storm water pollution is addressed in one of the most effective ways possible, i.e., by incorporating Best Management Practices (BMPs) in the design phase of new development and redevelopment. The proposal also provides for numerical design standards to ensure that storm water runoff is managed for water quality concerns in addition to flood protection and that pollutants carried by storm water are retained and not delivered to waterways.

The proposed Standard Urban Storm Water Mitigation Plan adds two additional categories for controls, parking lots and environmentally sensitive areas. The proposal also attempts to respond to various concerns by incorporating provisions that allow for flexibility thereby recognizing that a single numerical standard may not be appropriate in every case. Also, the proposed Standard Urban Storm Water Mitigation Plan has taken the original language offered by the Principal Permittee and eliminates much of the duplication allowing for a more concise and understandable document.

A Tentative Resolution is also being offered to the Regional Board for their consideration at the January 6, 2000 Board Meeting. This Tentative resolution acknowledges the structure of both the Los Angeles and Long Beach Municipal Storm Water Permits by allowing the Standard Urban Storm Water Mitigation Plan approval to be accomplished by the Executive Officer for the Los Angeles permit while the Regional Board itself would approve the Standard Urban Storm Water Mitigation Plan pursuant to the City of Long Beach permit. If adopted by the Regional Board, the Tentative resolution would approve the Long Beach Standard Urban Storm Water Mitigation Plan while encouraging the Executive Officer to approve the Los Angeles Standard Urban Storm Water Mitigation Plan. In addition, the Regional Board is being asked to adopt the numerical design standards as the minimum standards for

post-construction BMPs required by the statewide general permit for construction activity for construction projects in the Los Angeles Region.

The September 16, 1999 public hearing was lengthy with many commentors. It is understood that many interested parties will again wish to speak before the Regional Board. In an effort to ensure that the Regional Board is provided with a comprehensive understanding of the concerns associated with this proposal, special arrangements for the presentation of comments are being considered. Specific details on the presentation arrangements for the January 6th Board meeting will be provided in the regular agenda notice. Interested parties are encouraged to contact the Executive Officer to suggest consolidation of comments from many parties into a more comprehensive presentation with an extended time limit.

If you represent a Permittee or other interested party, it would be helpful that by December 20, 1999 you would coordinate with other co-interested individuals and notify this office of (1) lead designated speaker; (2) amount of time needed by the lead speaker; and (3) your request for time for additional speakers and the identity of such additional speakers. The Board will announce the amount of time available for the submission of oral comments in this matter and for discussion among the Board members in the formal notice of the Board's agenda. Upon receipt of the above information, the staff will recommend an allotment of time for all interested parties, based upon the information received. Parties who have not submitted the requested information will be provided any remaining time following allotment.

CC Regional Board Members

STANDARD URBAN STORM WATER MITIGATION PLAN

FOR LOS ANGELES COUNTY AND CITIES IN LOS ANGELES COUNTY

STANDARD URBAN STORM WATER MITIGATION PLAN

BACKGROUND

The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Permit) issued to Los Angeles County and 85 cities (Permittees) by the Los Angeles Regional Water Quality Control Board (Regional Board) on July 15, 1996, requires the development and implementation of a program addressing storm water pollution issues in development planning for private projects. The same requirements are applicable to the City of Long Beach under its separate municipal storm water permit, which was issued on June 30, 1999.

The requirement to implement a program for development planning is based on, federal and state statutes including: Section 402 (p) of the Clean Water Act, Section 6217 of the Coastal Zone Act Reauthorization Amendments of 1990 ("CZARA"), and the California Water Code. The Clean Water Act amendments of 1987 established a framework for regulating storm water discharges from municipal, industrial, and construction activities under the NPDES program. The primary objectives of the municipal storm water program requirements are to:

- Effectively prohibit non-storm water discharges, and
- Reduce the discharge of pollutants from storm water conveyance systems to the Maximum Extent Practicable

The Standard Urban Storm Water Mitigation Plan (SUSMP) was developed as part of the municipal storm water program to address storm water pollution from new Development and Redevelopment by the private sector. This SUSMP contains a list of the minimum required Best Management Practices (BMPs) that must be used for a designated project. Additional BMPs may be required by ordinance or code adopted by the Permittee and applied generally or on a case by case basis. This SUSMP applies to projects that are Priority Projects (Discretionary Projects) as defined by the NPDES Permit. The Permittees are required to use this SUSMP to develop their own citywide SUSMP. Developers must incorporate appropriate SUSMP requirements into their project plans. Each Permittee will approve an Urban Storm Water Mitigation Plan as part of the development process and prior to issuing building and grading permits for the projects covered by the SUSMP requirements.

Discretionary projects, that fall into one of seven categories are identified in the NPDES Permit

as requiring SUSMPs. These categories are:

Single-Family Hillside Residences
100,000 Square Foot Commercial Developments
Automotive Repair Shops
Retail Gasoline Outlets
Restaurants
Home Subdivisions with >10 housing units*

* (Note: this category is two separate categories in the NPDES Permit)

The Regional Board Executive Officer has designated two additional categories subject to SUSMP requirements. These categories are:

Location adjacent to or discharging to an environmentally sensitive area, and
Parking lot 5,000 square feet or more or with 25 or more parking spaces and potentially exposed to storm water runoff

DEFINITIONS

"Greater than (>) 9 unit home subdivision" means any subdivision being developed for 10 or more 10 single-family or multi-family dwelling units.

"100,000 Square Foot Commercial Development" means Developments based on total impermeable area, including parking areas, as opposed to lot size or building footprint.

"Retail Gasoline Outlet" means a facility primarily engaged in selling gasoline and lubricating oils. These establishments frequently sell other merchandise, such as tires, batteries, and automobile parts. Frequently, these establishments also perform minor automotive repair work. Gasoline stations combined with other activities, such as grocery stores, convenience stores, or car wash facilities, are classified according to the primary activity.

"Hillside" means property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope and where grading contemplates cut or fill slopes .

"Automotive Repair Shop" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539. Exceptions do apply for SIC codes 5013, 5014, and 5541. For SIC code 5013, if the business has no outside storage of any recycled oil or other hazardous substances, it is not included. For SIC code 5014, if the business does not engage in any repair work, it is not included. For SIC code 5541, if the business does not engage in any onsite repair work, it is not included.

"Restaurant" means a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption. (SIC code 5812)

"Parking Lot" means land area or facility for the parking of commercial or business or private motor vehicles.

"Environmentally Sensitive Area" means an area designated as an Area of Special Biological Significance by the State Water Resources Control Board or an area designated as a Significant Natural Area by the California Resources Agency or an area designated as an area of Ecological Significance by the County of Los Angeles.

"Best Management Practice (BMP)" means any program, technology, process, siting criteria, operational methods or measures, or engineered systems, which when implemented prevent, control, remove, or reduce pollution.

"Source Control BMP" means any schedules of activities, prohibitions of practices, maintenance procedures, managerial practices or operational practices that aim to prevent storm water pollution by reducing the potential for contamination at the source of pollution.

"Treatment Control BMP" means any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media adsorption or any other physical, biological, or chemical process.

"Structural BMP" means any structural facility designed and constructed to mitigate the adverse impacts of storm water and urban runoff pollution (e.g. canopy, structural enclosure). The category may include both treatment control BMPs and source control BMPs.

"Treatment" means the application of engineered systems that use physical, chemical, or biological processes to remove pollutants. Such processes include, but are not limited to, filtration, gravity settling, media adsorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

"Infiltration" means the downward entry of water into the surface of the soil.

"Directly Connected Impervious Area (DCIA)" means the area covered by pavement, building and other impervious surfaces which drain directly into the storm drain without first flowing across pervious areas (e.g. lawns).

"New Development" means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.

Redevelopment" means, on an already developed site, the creation or addition of impervious surfaces; the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/ or exterior construction or remodeling; replacement of impervious surface that is not part of a routine maintenance activity; land disturbing activities related with structural or impervious surfaces .

"Discretionary Project" means a project which requires the exercise of judgement or deliberation when the public agency or public body decides to approve or disapprove a particular activity, as distinguished from situations where the public agency or body merely has to determine whether there has been conformity with applicable statutes, ordinances, or regulations.

CONFLICTS WITH LOCAL PRACTICES

Where provisions of the SUSMP requirements conflict with established local codes , (e.g., specific language of signage used on storm drain stenciling), the Permittee may continue the local practice and modify the SUSMPs contained herein to be consistent with the code, except where those practices would defeat or circumvent the intent of the SUSMP requirements.

SUSMP PROVISIONS APPLICABLE TO ALL CATEGORIES

REQUIREMENTS

1. PEAK STORM WATER RUNOFF DISCHARGE RATES

Post-development peak storm water runoff discharge rates shall not exceed estimated pre-development levels for developments where an increased peak storm water discharge rate may result in a foreseeable increased potential for downstream erosion.

2. CONSERVE NATURAL AREAS

If applicable, the following items are required and must be implemented in the site layout during the subdivision design and approval process, consistent with applicable General Plan and Local Area Plan policies:

- Every effort shall be made to concentrate or cluster development on portions of a site while leaving the remaining land in a natural undisturbed condition.
- Limit clearing and grading of native vegetation at a site to the minimum amount needed to build lots, allow access, and provide fire protection.
- Maximize trees and other vegetation at each site by planting additional vegetation, clustering tree areas, and promoting the use of native and or drought tolerant plants. Wherever practical, promote natural vegetation by using parking lot islands and other landscaped areas.
- Preserve riparian areas and wetlands.

3. MINIMIZE STORM WATER POLLUTANTS OF CONCERN

Storm water runoff from a site has the potential to contribute oil and grease, suspended solids, metals, gasoline, pesticides, and pathogens to the stormwater conveyance system. The development must be designed so as to minimize, to the maximum extent practicable , the introduction of pollutants of concern that may result in significant impacts, generated from site runoff of directly connected impervious areas (DCIA), to the storm water conveyance system as

approved by the building official. Pollutants of concern, as defined by the Permit, consist of any pollutants that exhibit one or more of the following characteristics: current loadings or historic deposits of the pollutant are impacting the beneficial uses of a receiving water, elevated levels of the pollutant are found in sediments of a receiving water and/or have the potential to bioaccumulate in organisms therein, or the detectable inputs of the pollutant are at a level high enough to be considered potentially toxic to humans and/or flora and fauna.

In meeting this specific requirement, "minimization of the pollutants of concern" will require the incorporation of a BMP or combination of BMPs best suited to maximize the reduction of pollutant loadings in that runoff to the Maximum Extent Practicable. Those BMPs best suited for that purpose are those listed in the *California Storm Water Best Management Practices Handbooks*; *Caltrans Storm Water Quality Handbook: Planning and Design Staff Guide*; *Manual for Storm Water Management in Washington State*; *The Maryland Stormwater Design Manual*; *Florida Development Manual: A Guide to Sound Land and Water Management*; and *Guidance Specifying Management Measures for Sources of Nonpoint Pollution in Coastal Waters* . USEPA Report No. EPA-840-B-92-002, as "likely to have significant impact" beneficial to water quality for targeted pollutants that are of concern at the site in question..

Examples of BMPs that can be used for minimizing the introduction of pollutants of concern generated from site runoff are identified in Table 2. Any BMP not specifically approved by the Regional Board in Resolution No. 99-03, "Approving Best Management Practices for Municipal Storm Water and Urban Runoff Programs in Los Angeles County", for development planning may be used if they have been recommended in one of the above references.

4. PROTECT SLOPES AND CHANNELS

If applicable, project plans must include BMPs consistent with local codes and ordinances to decrease the potential of slopes and/or channels from eroding and impacting storm water runoff:

- Convey runoff safely from the tops of slopes and stabilize disturbed slopes.
- Stabilize permanent channel crossings.
- Vegetate slopes with native or drought tolerant vegetation.
- Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion, with the approval of all agencies with jurisdiction, e.g., the U.S. Army Corps of Engineers and the California Department of Fish and Game

5. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Storm drain stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets. The stencil contains a brief statement that prohibits the dumping of improper materials into the stormwater conveyance system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are effective supplements to the anti-dumping message.

- All storm drain inlets and catch basins within the project area must be stenciled with prohibitive language (such as: "NO DUMPING – DRAINS TO OCEAN") and or graphical icons to discourage illegal dumping.
- Signs and prohibitive language and or graphical icons discouraging illegal dumping must be posted at public access points along channels and creeks within the project area.
- Legibility of stencils and signs must be maintained.

6. PROPERLY DESIGN OUTDOOR MATERIAL STORAGE AREAS

Outdoor material storage areas refer to storage areas or storage facilities solely for the storage of materials.
Improper storage of materials outdoors may provide an opportunity for toxic compounds, oil and grease, heavy metals, nutrients, suspended solids, and other pollutants to enter the stormwater conveyance system. Where proposed project plans include outdoor areas for storage of materials that may contribute pollutants to the stormwater conveyance system, the following *structural* BMPs are required:

- Areas where materials are to be stored must be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the storm water conveyance system; or (2) protected by secondary containment structures such as berms, dikes, or curbs.
- The storage area must be paved and sufficiently impervious to contain leaks and spills.
- Where feasible, the storage area should have a roof or awning to minimize collection of stormwater within the secondary containment area.

7. PROPERLY DESIGN TRASH STORAGE AREAS

A trash storage area refers to an area where a trash receptacle or receptacles are located for use as a repository for solid wastes.
Loose trash and debris can be easily transported by the forces of water or wind into nearby storm drain inlets, channels, and or creeks. All trash container areas must meet the following *structural BMP* requirements:

- Trash container areas must have drainage from adjoining roofs and pavement diverted around the area(s).
- Trash container areas must be screened or walled to prevent off-site transport of trash.

8. PROVIDE PROOF OF ONGOING BMP MAINTENANCE

Improper maintenance is one of the most common reasons why water quality controls will not function as designed or which may cause the system to fail entirely. It is important to consider who will be responsible for maintenance of a permanent BMP, and what equipment is required to perform the maintenance properly. As part of project review, if a project applicant has included, or is required to include, treatment control BMPs in project plans, the Permittee shall require that the applicant provide verification of maintenance provisions through such means as may be appropriate, including, but not limited to legal agreements, covenants, CEQA mitigation requirements and or Conditional Use Permits.

For all properties, this verification will include the developer's signed statement, as part of its project application, accepting responsibility for all structural BMP maintenance until the time the property is transferred and, where applicable, a signed agreement from the public entity assuming responsibility for structural BMP maintenance. This transfer of property must have conditions requiring the recipient to assume responsibility for maintenance of any treatment control BMPs to be included in the sales or lease agreement for that property, and will be the owner's responsibility. For residential properties where the treatment control BMPs are located within a common area which will be maintained by a homeowner's association, language regarding the responsibility for maintenance must be included in the projects conditions, covenants and restrictions (CC&R's). Printed educational materials will be required to accompany the first deed transfer to highlight the existence of the requirement and to provide information on what stormwater management facilities are present, signs that maintenance is needed, how the necessary maintenance can be performed, and assistance that the Permittee can provide. It will also encourage the transfer of this information with subsequent sale of the property.

If treatment control BMPs are located within a public area proposed for transfer, they will be the responsibility of the developer until they are accepted for transfer by the County or other appropriate public agency. Treatment control BMPs proposed for transfer must meet design standards adopted by the public entity for the BMP installed and should be approved by the County or other appropriate public agency prior to its installation.

9. DESIGN STANDARDS FOR TREATMENT CONTROL BMPS

Treatment control BMPs selected for use at any project covered by this SUSMP shall meet the design standards of this Section unless specifically exempted.

Post-construction Treatment Control BMPs shall be designed to:

A. mitigate (infiltrate or treat) storm water runoff from either:

1. each runoff event up to and including the 85th percentile 24-hour runoff event determined as the maximized capture storm water volume for the area, from the formula recommended in *Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998)*, or

2. the volume of annual runoff based on unit basin storage water quality volume, to achieve 85 percent or more volume treatment by the method recommended in *California Stormwater Best Management Practices Handbook – Industrial/ Commercial*, (1993), or

3. the volume of runoff produced from each and every storm event up to and including 0.75 inch of rainfall, prior to its discharge to a storm water conveyance system, or

4. the volume of runoff produced from each and every storm event up to and including a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event.

AND

B. control peak flow discharge to provide stream channel and over bank flood protection, based on flow design criteria selected by the local agency.

The area of roofing surfaces may be excluded from the total area for calculation of rainfall or runoff volume to be treated provided:

a. the roofing materials will not be a source of pollutants of concern in storm water, and

b. storm water from the roofing surfaces is diverted directly to a storm water conveyance system, and

c. roof based exhaust systems, vents, filters, and air pollution control devices will not present a significant source of pollutants of concern in storm water, and

d. the storm water conveyance system does not directly or indirectly discharge to a natural stream or unlined channel or channel segment scheduled for restoration.

Exclusions

Restaurants, where the land area for development or redevelopment is less than 5,000 square feet, are excluded from the requirements of this Section.

10. PROVISIONS APPLICABLE TO INDIVIDUAL PRIORITY PROJECT CATEGORIES

A. 100,000 SQUARE FOOT COMMERCIAL DEVELOPMENTS

1. PROPERLY DESIGN LOADING/UNLOADING DOCK AREAS

Loading unloading dock areas have the potential for material spills to be quickly transported to the storm water conveyance system. To minimize this potential, the following design criteria are required:

- Cover loading dock areas or design drainage to minimize run-on and runoff of storm water.
- Direct connections to storm drains from depressed loading docks (truck wells) are prohibited

R0072906

2. PROPERLY DESIGN REPAIR/MAINTENANCE BAYS

Oil and grease, solvents, car battery acid, coolant and gasoline from the repair maintenance bays can negatively impact storm water if allowed to come into contact with storm water runoff. Therefore, design plans for repair bays must include the following:

- Repair maintenance bays must be indoors or designed in such a way that doesn't allow storm water runon or contact with storm water runoff.
- Design a repair maintenance bay drainage system to capture all washwater, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

3. PROPERLY DESIGN VEHICLE/EQUIPMENT WASH AREAS

Vehicle equipment washing steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. To alleviate this problem, consider including in the project plans an area for washing steam cleaning of vehicles and equipment. If such an area is included in the site design, it must meet the following:

- This area must be self-contained, covered, equipped with a clarifier, or other pretreatment facility, and properly connected to a sanitary sewer.

B. RESTAURANTS

1. PROPERLY DESIGN EQUIPMENT/ACCESSORY WASH AREAS

Outdoor equipment accessory washing steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. To alleviate this problem, include in the project plans an area for the washing steam cleaning of equipment and accessories. This area must meet the following:

- This area must be self-contained, equipped with a grease trap, and properly connected to a sanitary sewer.
- If this wash area is to be located outdoors, it must be covered, paved, have secondary containment, and be connected to the sanitary sewer.

C. RETAIL GASOLINE OUTLETS

1. PROPERLY DESIGN FUELING AREA

Fueling areas have the potential to contribute oil and grease, solvents, car battery acid, coolant and gasoline to the storm water conveyance system. The project plans must include the

following BMPs:

- Fuel dispensing areas should be covered with an overhanging roof structure or canopy. The canopy's minimum dimensions must be equal to or greater than the area within the grade break. The canopy must not drain onto the fuel dispensing area, and the canopy downspouts must be routed to prevent drainage across the fueling area.
- Fuel dispensing areas must be paved with portland cement concrete (or equivalent smooth impervious surface), and the use of asphalt concrete shall be prohibited.
- The fuel dispensing area must have a 2% to 4% slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of storm water to the extent practicable.
- At a minimum, the concrete fuel dispensing area must extend 6.5 feet (2.0 meters) from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot (0.3 meter), whichever is less.

D. AUTOMOTIVE REPAIR SHOPS

1. PROPERLY DESIGN FUELING AREA

Fueling areas have the potential to contribute oil and grease, solvents, car battery acid, coolant and gasoline to the storm water conveyance system. Therefore, design plans, which include fueling areas, must contain the following:

- Fuel dispensing areas should be covered with an overhanging roof structure or canopy. The cover's minimum dimensions must be equal to or greater than the area within the grade break. The cover must not drain onto the fuel dispensing area and the downspouts must be routed to prevent drainage across the fueling area.
- Fuel dispensing areas must be paved with portland cement concrete (or equivalent smooth impervious surface), and the use of asphalt concrete shall be prohibited.
- The fuel dispensing area must have a 2% to 4% slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of storm water.
- At a minimum, the concrete fuel dispensing area must extend 6.5 feet (2.0 meters) from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot (0.3 meter), whichever is less.

2. PROPERLY DESIGN REPAIR/MAINTENANCE BAYS

Oil and grease, solvents, car battery acid, coolant and gasoline from the repair maintenance bays can negatively impact storm water if allowed to come into contact with storm water runoff. Therefore, design plans for repair bays must include the following:

- Repair maintenance bays must be indoors or designed in such a way that doesn't allow storm water run-on or contact with storm water runoff.
- Design a repair maintenance bay drainage system to capture all washwater, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

3. PROPERLY DESIGN VEHICLE/EQUIPMENT WASH AREAS

Vehicle equipment washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. To alleviate this problem, consider including in the project plans an area for washing/steam cleaning of vehicles and equipment. If such an area is included in the site design, it must meet the following:

- This area must be self-contained, covered, equipped with a clarifier, or other pretreatment facility, and properly connected to a sanitary sewer or to a permitted disposal facility.

4. PROPERLY DESIGN LOADING/UNLOADING DOCK AREAS

Loading unloading dock areas have the potential for material spills to be quickly transported to the storm water conveyance system. To minimize this potential, the following design criteria are required:

- Cover loading dock areas or design drainage to minimize run-on and runoff of storm water.
- Direct connections to storm drains from depressed loading docks (truck wells) are prohibited.

E. PARKING LOTS

1. PROPERLY DESIGN PARKING AREA

Parking lots contain pollutants such as heavy metals, oil and grease, and polycyclic aromatic hydrocarbons that deposit on these surfaces from motor vehicle traffic. These pollutants are directly transported to surface waters.

- Reduce impervious land coverage of parking areas
- Infiltrate runoff before it reaches storm drain system.
- Treat runoff before it reaches storm drain system

2. PROPERLY DESIGN TO LIMIT OIL AND PERFORM MAINTENANCE

Parking lots may accumulate oil, grease, and water insoluble hydrocarbons from vehicle drippings and engine system leaks.

- Treat to remove oil and petroleum hydrocarbons at parking lots that are heavily used (e.g. fast food outlets, lots with 25 or more parking spaces , sports event parking lots, shopping malls, grocery stores, discount warehouse stores)
- Ensure adequate operation and maintenance of treatment systems particularly sludge and oil removal, and system fouling and plugging prevention control

11. WAIVER

A Permittee may, through adoption of an ordinance or code inc incorporating the treatment requirements of the SUSMP, provide for a waiver from the requirement if impracticability for a specific property can be established. Recognized situations of impracticability include (i) extreme limitations of space for treatment on a redevelopment project, (ii) unfavorable or unstable soil conditions at a site to attempt infiltration, and (iii) risk of ground water contamination because an underground source of drinking water is less than 10 feet from the soil surface. Any other justification for impracticability must be separately approved by the Regional Board Executive Officer before it becomes recognized and effective. A waiver granted to any development or redevelopment project may be revoked by the Regional Board Executive Officer for cause and with proper notice upon petition.

If a waiver is granted for impracticability, the Permittee must require the project proponent to transfer the savings in cost, as determined by the Permittee, to a storm water mitigation fund to be used to promote regional or alternative solutions for storm water pollution in the storm watershed and operated by a public agency or a non-profit entity.

12. LIMITATION ON USE OF INFILTRATION BMPS

Three factors significantly influence the potential for storm water to contaminate ground water. They are (i) pollutant mobility, (ii) pollutant abundance in storm water, (iii) and soluble fraction of pollutant. The risk of contamination of groundwater may be reduced by pretreatment of storm water. A discussion of limitations and guidance for infiltration practices is contained in, *Potential Groundwater Contamination from Intentional and Non-Intentional Stormwater Infiltration, Report No. EPA 600 R-94/051, USEPA (1994).*

In addition, the distance of the groundwater table from the infiltration BMP may also be a factor determining the risk of contamination. A water table distance separation of ten feet depth in California presumptively poses negligible risk for storm water not associated with industrial activity or high vehicular traffic.

Infiltration BMPs are not recommended for areas of industrial activity or areas subject to high vehicular traffic (25,000 or greater average daily traffic (ADT) on main roadway or 15,000 or more ADT on any intersecting roadway) unless appropriate pretreatment is provided to ensure groundwater is protected and the infiltration BMP is not rendered ineffective by overload.

13. ALTERNATIVE CERTIFICATION FOR STORM WATER TREATMENT MITIGATION

A Permittee may elect to accept a signed certification that the plan meets the criteria established herein and that the plan preparer has undergone training on designing BMPs to meet the numerical mitigation criteria, in lieu of conducting detailed BMP review to verify treatment control BMP adequacy. The training must have been conducted by an organization with storm

water BMP design expertise (e.g., a University, American Society of Civil Engineers, American Society of Landscape Architects, or the California Water Environment Association) with the training and curriculum accepted by the Regional Board Executive Officer. For the certification to be valid, training must have been received not more than two years prior to the signature date on the plan.

TABLE 2: Example Best Management Practices (BMPs)

The following are examples of BMPs that can be used for minimizing the introduction of pollutants of concern that may result in significant impacts. generated from site runoff to the storm water conveyance system. (See Table 1: Suggested Resources for additional sources of information):

- Provide reduced width sidewalks and incorporate landscaped buffer areas between sidewalks and streets. However. sidewalk widths must still comply with regulations for the Americans with Disabilities Act and other life safety requirements.
- Design residential streets for the minimum required pavement widths needed to comply with all zoning and applicable ordinances to support travel lanes: on-street parking: emergency. maintenance. and service vehicle access: sidewalks: and vegetated open channels.
- Comply with all zoning and applicable ordinances to minimize the number of residential street cul-de-sacs and incorporate landscaped areas to reduce their impervious cover. The radius of cul-de-sacs should be the minimum required to accommodate emergency and maintenance vehicles. Alternative turnarounds should be considered
- Use permeable materials for private sidewalks. driveways. parking lots. or interior roadway surfaces (examples: hybrid lots. parking groves. permeable overflow parking. etc.).
- Use open space development that incorporates smaller lot sizes.
- Reduce building density.
- Comply with all zoning and applicable ordinances to reduce overall lot imperviousness by promoting alternative driveway surfaces and shared driveways that connect two or more homes together.
- Comply with all zoning and applicable ordinances to reduce the overall imperviousness associated with parking lots by providing compact car spaces. minimizing stall dimensions. incorporating efficient parking lanes. and using pervious materials in spillover parking areas.
- Direct rooftop runoff to pervious areas such as yards. open channels. or vegetated areas. and avoid routing rooftop runoff to the roadway or the storm water conveyance system.
- Vegetated swales and strips
- Extended dry detention basins
- Infiltration basin
- Infiltration trenches
- Wet ponds
- Constructed wetlands
- Oil Water separators
- Catch basin inserts
- Continuous flow deflection separation systems
- Storm drain inserts
- Media filtration
- Bioretention facility
- Dry-wells
- Cisterns
- Foundation planting
- Catch basin screens
- Normal flow storage separation systems
- Clarifiers
- Filtration systems
- Primary waste water treatment systems

STANDARD URBAN STORM WATER MITIGATION PLANS

SUMMARY OF COMMENTS RECEIVED AND RESPONSE

The comments received on the Standard Urban Storm Water Mitigation Plans (SUSMPs) and Regional Board staff response is divided into two sections. The first sections. lists main issues and staff response in detail. The second section summarizes all significant comments received by the Board on SUSMP before December 6, 1999, and the staff response including any actions taken to address the comment.

A. MAIN ISSUES AND RESPONSE

1 Comment:The Regional Board lacks regulatory discretion to establish a numerical mitigation measure for storm water treatment.

Response: The municipal storm water permit for Los Angeles County and Cities requires that SUSMPs achieve specific objectives which include to (i) minimize adverse impacts to natural communities; (ii) maximize infiltration to the extent practicable; (iii) minimize parking lot pollution; (iv) provide for appropriate controls to reduce storm water pollutant loads.[1] Staff interprets this provision of the permit, underlying federal law, and the statutory standard of Maximum Extent Practicable (MEP) as requiring SUSMPs to incorporate numerical mitigation measures for development planning projects in order to achieve compliance with water quality standards. Without a numerical mitigation measure, developers will select no treatment BMPs because there will be no BMP sizing guideline. Board Resolution No. 99-03 which states that "The Permittees shall select and require implementation of the most effective BMPs,...." will then be without effect.[2]

The 1987 Clean Water Act amendments give USEPA and States considerable discretion on establishing provisions for implementation in storm water programs.[3] Further, interim USEPA policy guidelines on BMPs for storm water programs explains that the permitting authority can require more specific conditions or limitations to meet water quality

---

[1] Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles (Board Order No. 96-054; NPDES No. CAS614001) Part 2. III.A.2)

[2] The Regional Board adopted Resolution No. 99-03 approving BMPs for Development Planning and Development Construction on April 22, 1999.

[3] 33 U S C Section 1342(p)(B)(iii). "require controls to reduce the discharge of pollutants to the maximim extent practicable, including management practices, control techniques and systems, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of pollutants."

standards where adequate information exists.[4] In addition, courts accord administrative agencies a high degree of deference in the areas of law they regulate.[5]

2. Comment: Anti-degradation policy prohibits new construction when water quality is already impaired.

Response: The municipal storm water permit in agreement with federal storm water regulations requires controls on new development to reduce storm water pollution. There is no prohibition on new construction.

3. Comment: The numerical mitigation criteria mandates the capture of storm water which will require expensive land acquisition cost.

Response: The numerical mitigation measure defines the definite volume of storm water that must be treated for water quality benefits. Treatment is the application of any physical, biological, or chemical method that can be used to remove pollutants in storm water. Providing storage volume for the runoff or capture is one form of treatment. It is not mandatory and other options may be considered such as reducing impervious cover and promoting infiltration.

4. Comment: The proposed numerical mitigation measure is not based on science and is an arbitrarily agreed to number in settlement of a lawsuit.

Response: The proposed numerical measures are technically defensible. The measures are based on the principle that most rainfall events are in the smaller range and higher rainfall runoff producing events are less frequent. Designing storm water treatment controls for the smaller events will reduce storm water pollutant loads significantly while optimizing BMP costs. The primary numerical method to determine BMP design criteria is the maximized water quality treatment volume method recommended by the American Society of Civil Engineers (ASCE). The 0.75-inch rainfall event method happens to be also the one that was agreed to in a lawsuit settlement agreement between the NRDC and the County of Los Angeles. The four methods proposed as choices are equivalent variants and in a technical comparison were in agreement to within 10% of one another. It is highly probable that parties that settle a litigation select a numerical criterion that is reasonable and factual.

5. Comment: The numerical mitigation measure will require implementation of BMPs that have not been proven to be effective in the region.

Response: The proposed numerical mitigation measure defines the quantity of storm water (volume) that has to be treated to remove pollutants. This criterion does not in anyway describe the effectiveness of BMPs to be used. The effectiveness of any particular BMP is dependent on design parameters and the range for its applications. Physical geography has little influence on the effectiveness of BMPs while proper

[4] 61 Fed Register 43761. "The interim permitting approach uses best management practices in first-round strom water permits, and expanded or better-tailored BMPs in subsequent permits, where necessary, to provide for the attainment of water quality standards. In cases where adequate information exists to develop more specific conditions or limitations to meet water quality standards, these conditions or limitations are to be incorporated into storm water permits, as necessary and appropriate."

[5] See e.g. Chevron U.S.A. v. Natural Res. Def. Council, (1984) 467 U.S. 837

maintenance is a big factor. Information on BMP effectiveness can be found in research reports and national BMP databases. The numerical mitigation measure in combination with the effectiveness of a BMP determines the overall annual load of pollutant that can be removed.

6 Comment: The post-construction treatment BMPs will require costly maintenance

Response: Treatment BMPs do require proper maintenance and maintenance costs are BMP specific. Poor or non-existent maintenance will result in an ineffective BMP. Information on BMP maintenance costs can be obtained from national databases and reports. See references in the Record of Decision. A cursory review indicates that maintenance costs are reasonable.

7. Comment: The Regional Board did not perform an economic analysis required by State and Federal law.

Response: The implementation of a federal regulation does not require separate economic analysis. A relative quantitative comparison performed with similar criteria for storm water management or flood control, sediment removal from construction, combined animal feedlot operations, and State of Washington water quality criteria indicated that the numerical mitigation criteria would cost about three to ten times less. In addition, staff performed BMP cost calculations for an actual site in Los Angeles in the process of development and determined that the mitigation criteria cost is less than 0.5 percent of the project cost.

8. Comment: The Regional Board did not provide adequate public notices to interested parties

Response: Regional Board action was not contemplated at the September Regional Board meeting and thus no public notice was necessary. Nevertheless, Board staff provided a 30-day public notice and mailed a copy to all parties on file. Staff was unable to verify the claim by some that they did not receive copies of the public notice or provide an explanation. Staff will again provide 30 day-notice of the proposed action on the SUSMPs scheduled by the Regional Board for January 6, 2000.

B. SUMMARY OF ALL SIGNIFICANT COMMENTS AND RESPONSE

COMMENTER	COMMENT	RESPONSE	ACTION
General City of Los Angeles Western States Petroleum Association	1. Conduct first a quantitative review of the basis of designation of selected categories as priority-planning projects.	The categories are designated in the permit and were selected based on risk sources data compiled in the first term of permit implementation	No action necessary
Los Cerritos Channel Task Force	2. Provide level playing field for unincorporated and incorporated cities within LA County	Four methods of determining the mitigation measure are provided to ensure some flexibility. The methods are equivalent. See ROD	Four equivalent methods included as mitigation criteria in SUSMP

COMMENTER	COMMENT	RESPONSE	ACTION
Bellflower, Claremont, Commerce, Covina, Diamond Bar, Downey, Huntington Park, Industry, Irwindale, Lakewood, La Mirada, Lomita, Lynwood, Maywood, Montebello, Paramount, Norwalk, Rancho Palos Verdes, Santa Fe Springs, Whittier	3. No other MS 4 permits in California require numerical criteria for runoff mitigation	All MS4 permits are required to have controls on new development and redevelopment that will reduce pollutants to the MEP. The USEPA has identified the lack of specific criteria as a deficiency in its Report to Congress ON Phase II (1999)	No action necessary
SCAG	4. Provide the opportunity for the development of regional BMPs instead of site by site requirements	May be considered by Board in a Resolution	Will suggest interest to Regional Board
SCAG	5. Make the numerical mitigation measure voluntary pilot program for the first two years	Federal laws and regulations require that controls on new development and redevelopment be enforceable	No action necessary
Santa Monica	6. More studies not necessary to establish mitigation criteria and evaluate BMPs	We agree that there exists sufficient information to establish numerical mitigation criteria and to design BMP for optimum performance and effectiveness	No action necessary
Bellflower, Claremont, Commerce, Covina, Diamond Bar, Downey, Huntington Park, Industry, Irwindale, Lakewood, La Mirada, Lomita, Lynwood, Maywood, Montebello, Paramount, Norwalk, Rancho Palos Verdes, Santa Fe Springs, Whittier	7. Numerical mitigation measure is an unfunded mandate	Implementation of a federal permit program is not an unfunded mandate as described in the State constitution. See memo from legal counsel	No action necessary
Bellflower, Claremont, Commerce, Covina, Diamond Bar, Downey, Huntington Park, Industry, Irwindale, Lakewood, La Mirada, Lomita, Long Beach, Los Angeles, Lynwood, Maywood, Montebello, Paramount, Norwalk, Rancho Palos Verdes, Santa Clarita, Santa Fe Springs, Vernon, Whittier, BIA, EAC, New Hall Land and Farming, Long Beach Chamber of Commerce	8. Numerical mitigation measure is not based on sound science	Disagree. Our review of local data and implementation programs in states such as WA, FL, and MD indicates that the approach to establishing numerical mitigation measure is scientific and reasonable. The methods have also been endorsed by national science and engineering associations	References to important documents provided in the SUSMP. A bibliography of references reviewed for the action is included in the ROD
Bellflower, Cerritos, Claremont, Commerce, Covina, Diamond Bar, Downey, Huntington Park, Industry, Irwindale, Lakewood, La Mirada, Lomita, Long Beach, Lynwood, Maywood, Montebello, Paramount, Norwalk, Rancho Palos Verdes, Santa Fe Springs, Whittier	9. Treatment controls will be required irrespective of siting factors limiting application	Site conditions will determine what BMPs are appropriate. A provision for waiver is provided where mitigation may be infeasible. Mitigation banking may be an alternative	Waiver provision has been included in the SUSMP where impract cability is established
Covina, Irwindale, La Mirada, Lomita, Norwalk, Whittier	10. Provide sufficient time for Council of Governments to review and comment	Staff will mail and e-mail copies to SCAG for distribution to COGs.	Staff will mail public notice of proposed action to SCAG and COGs
Cerritos, Diamond Bar	11. Developers will move to build in counties without numerical mitigation measures	The mitigation measure requirement for new development is based on federal law. Other Regional Boards are likely to develop and evaluate compliance using similar criteria. The USEPA considers the absence of numerical storm water BMP design criteria for new development a deficiency. See USEPA Phase II Final Rule	No action necessary

COMMENTER	COMMENT	RESPONSE	ACTION
Bellflower Cerritos Claremont Commerce Covina Diamond Bar Downey Huntington Park Industry Irwindale Lakewood La Mirada Lomita Long Beach Lynwood Maywood Montebello Paramount Glendora Norwalk Rancho Palos Verdes Santa Fe Springs Whittier Truxaw and Associates Long Beach Chamber of Commerce	12 BMPs will require costly maintenance	Maintenance of BMPs is essential and strategies to support maintenance activities are discussed in USEPA s Phase II Final Rule	No action necessary
Azusa Claremont EAC	13 Perform cost benefit analysis	The implementation of federal law does not require a separate cost benefit analysis Relative cost comparisons and BMP cost calculations performed indicate that the cost of the mitigation measure is reasonable for the water quality benefits it will bring	No action necessary

Vernon Los Angeles	26 Require similar criteria for USEPA Phase I industrial facilities	The requirements are for new development in selected categories Expansion to other categories may be considered for the next permit term Will recommend application to construction permits in the LA Region covered by the State General Storm Water permit for construction activity	Will propose to the Board to consider in its Resolution that the same
Brash	27 Filter media is not an effective BMP	Disagree Filter media are effective BMPs if properly configured See letter to Brash from RB Executive Officer date Oct 19 1999	No action necessary

COMMENTER	COMMENT	RESPONSE	ACTION
Santa Clarita	26. Provide criteria for flow based controls in addition to volumetric based controls	Flow based controls which are essential to maintain BMP effectiveness reduce flow velocities minimize downstream erosion potential, and prevent over bank flooding are left to the judgement of the local agency.	A statement has been included in the SUSMP that flow design criteria be determined by the local agency
Santa Clarita	29. Limit application of criteria to impervious surfaces	The criterion is applied to the whole area Credit for the pervious areas is automatically considered through the runoff coefficient Roofing areas have been excluded for commercial facilities	No action necessary
Santa Clarita EAC	30. Provide greater flexibility in application of the mitigation criteria	The four methods of selecting the numerical mitigatio through criteria and waiver procedures offer sufficient flexibility in application	Provide in the SUSMP four equivalent methods of determining the numerical mitigation measure
Los Angeles	31. The numerical mitigation measure should be a guidelines and not a requirement for land development	Federal laws and regulations require that controls on new development and redevelopment be enforceable	No action necessary
Los Angeles	32. Setting a numerical mitigation measure is a discretionary action Provide cost estimates of impacts and benefits and release documentation for public comment and review under CEQA	The requirements under an NPDES permit are exempt from review under CEQA Preliminary costing estimates indicate that they are reasonable	No action necessary
Los Angeles	33. Identify the regulatory authority which authorizes the Regional Board to establish the numerical mitigation measure	Regulatory requirement is found at 40 CFR 122.26 (d)(2)(iv)(A); (2) Statutory authority is at 33 USC 342(p)(B)(iii) See also court's opinion in Defenders of Wildlife v Browner (No 98-71080) (9th Cir. 1999) and in NRDC v USEPA 966 F2d 1292 (9th Cir 1992)	No action necessary
Los Angeles	34. Setting a numerical mitigation measure is a discretionary action. Provide cost estimates of impacts and benefits and release documentation for public comment and review under CEQA	The requirements under an NPDES permit are exempt from review under CEQA Preliminary costing estimates indicate that they are reasonable	No action necessary
Western States Petroleum Association (WSPA)	35. Postpone consideration because of inadequate notice	A thirty-day notice on this action has been provided A thirty-day notice on the September 1999 Board meeting was provided even though it was not required for a Regional Board information item	No action necessary
Apartment Association, BIA	36. There is no regulatory requirement that there be a numerical measure	Disagree. See detailed explanation under main issues and response.	No action necessary
NRDC	37. Receiving water limits and anti-degradation policies apply independently from mitigation criteria	Agree that mitigation standards are separate from the numerical mitigation measure The Office of Chief Counsel confirms that MS4 programs must meet water quality standards in a memo dated October 14, 1999	No action necessary
Burke Williams & Sorenson	38. Provide broad legal authority for the SUSMP requirement	We will include legal citations that are relevant to the jurisdiction of the Regional Board	Relevant laws are cited in the SUSMP to provide legal justification
Burke Williams & Sorenson	39. Delay SUSMP requirements in light of PL 106-74 requiring USEPA to submit reports to Congress	The USEPA has already submitted the reports to Congress and thus no delay is warranted	No action necessary

COMMENTER	COMMENT	RESPONSE	ACTION
Santa Monica Baykeeper	40. New development can be prohibited under the Federal Anti-degradation policy if it degrades or adds pollutants to local waters	Disagree. See detailed explanation under main issues and response	No action necessary
EAC Downey Lakewood	41. Provide authority in the Clean Water Act to regulate flow to address water quality.	The U.S. Supreme Court has held that regulation of flow to protect beneficial uses is within the authority of the Clean Water Act PUD No. 1 v. WA Dept. of Ecology 511 U.S. 700 (1994)	No action necessary

TENTATIVE

State of California
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

Resolution No. xx-xx

APPROVING THE RECORD FOR
STANDARD URBAN STORM WATER MITIGATION PLAN
FOR
MUNICIPAL STORM WATER AND URBAN RUNOFF MANAGEMENT PROGRAMS
IN LOS ANGELES COUNTY

WHEREAS, THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION FINDS:

1. On July 15, 1996, a municipal storm water permit was issued to the County of Los Angeles and 85 incorporated cities to control and minimize the discharge of pollutants associated with storm water and urban runoff. This permit became Regional Board Order No. 96-054, Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles.

2. On June 30, 1999, a municipal storm water permit was issued to the City of Long Beach which removed the City of Long Beach from Board Order No. 96-054, giving the City of Long Beach its own distinct Municipal Storm Water and Urban Runoff NPDES permit, Regional Board Order No. 99-060, Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the City of Long Beach.

3. On August 19, 1999, a statewide general storm water permit for construction activity was adopted by the State Water Resources Control Board (State Board). This permit became State Board Order No. 99-08-DWQ, and applies to construction projects that disturbs five acres or more or is part of a larger common plan of sale in the Los Angeles region.

4. Many of the rivers and streams in Los Angeles County are formally designated as impaired, pursuant to Section 303 (d) of the federal Water Pollution Control Act, for specific pollutants that are commonly found in storm water and urban runoff.

5. Storm water runoff carries with it many pollutants in varying concentrations that are suspended in, and or dissolved, in the runoff. The sources of these pollutants include nearly all properties that have been developed since the pollutants originate through the many diverse activities of habitation and land use. Pollutants generated from individual property developments vary greatly in the concentration or loading of each pollutant. Generally, the relative contribution of the pollutant from runoff from any individual property development will represent only a small portion of the entire loading of a water body given the many square miles of land upon which storm water runoff is generated. When the individual contributions from tens of thousands of discrete property units are aggregated, the pollutant loading becomes significant. The resultant pollutant loads results in the impairment of that water body and the conveyance of pollutants, including sediments, metals, complex organic compounds, oil and grease, nutrients, and pesticides to the ocean and harbors within Los Angeles County. The loading of pollutants generated in the Los Angeles area are being measured through the monitoring program being conducted by the Los Angeles County Department of Public Works in conformance with its obligations as the Principal Permittee under the Los Angeles County Municipal Storm Water and Urban Runoff NPDES permit.

6. The nature of property use is related to the types and quantities of pollutants that are transported from that property during a rainfall event.

7. As property is developed or redeveloped, the utilization of Best Management Practices provide an opportunity to reduce the loading of pollutants to water bodies. This is accomplished by various techniques and can be passive (source reduction) or active (treatment). As property is developed from undisturbed lands, the project can be designed to incorporate structural BMPs that would normally not be available or practical to use on property that has been in urban use.

8. BMPs are effective means of reducing pollutants and treatment control BMPs can be "designed-into" a project in a cost effective way and in a manner that is either transparent to or which enhances the use to which the property has been placed. Some BMPs encourage the setting aside of areas as a greenbelt to allow storm water runoff to flow over areas which are permeable, thereby allowing all or a portion of the runoff to infiltrate. Other BMPs can be designed and built into structures such as catch basins that incorporate replaceable filters to absorb oily wastes or by installing screens to prevent litter from passing through the system and into the water body.

9. Arrays of treatment control BMPs are available to developers of both new and redevelopment properties. The use of BMPs is already required by the terms of the Los Angeles County and Long Beach Municipal Storm Water and Urban Runoff NPDES permits.

10. The ability of any BMP to be effective is limited by the volume of water that the BMP is exposed to in any discrete period of time. A BMP that can only be effective for a small volume of storm water runoff is inherently less effective than one sized to accommodate a larger volume of water.

11. Storm water runoff will normally convey a disproportionate loading of pollutants in the initial period runoff is generated during a storm event. Storm events generating up to 0.75 inches of precipitation, measured over a 24-hour period, constitute 85 percent of the total amount of runoff that can be expected during an average wet season. Designing a BMP to be able to accommodate this amount of runoff will result in the application of a BMP intervention to all but 15% of the total runoff during a year, and usually all of the critical runoff that occurs in the early phase of the precipitation event, commonly referred to as the "first Flush."

12. Both the Los Angeles County (Part III.A.1.c) and the Long Beach Municipal Storm Water and Urban Runoff permits contain provisions related to the adoption of Standard Urban Storm Water Mitigation Plans (SUSMPs) requiring their development and implementation.

13. Standard Urban Storm Water Mitigation Plans are required for a specified set of discretionary "Priority Projects" and the permit specifically identifies seven distinct categories for which SUSMPs are required to be prepared. The permit specifically states that the seven categories of "Priority Projects" are the minimum categories requiring SUSMPs.

14. Standard Urban Storm Water Mitigation Plans are also required for development or redevelopment of Parking Lots 5,000 square feet or greater and Locations in Environmentally Sensitive Areas. These categories have been added to advance efforts to control storm water pollution beyond the minimum in Los Angeles County.

15. Standard Urban Storm Water Mitigation Plans are required to be approved by the Regional Board Executive Officer following which they are to be implemented by the Permittees and used by the Permittees as the minimum criteria for the approval of project specific Urban Storm Water Mitigation Plans and the issuance of grading or building permits to project applicants.

16. The statewide general storm water permit for construction activity requires that Storm Water Pollution Prevention Plans (State SWPPPs) contain post-construction BMPs that will be implemented after construction is complete.

17. Section 402 (p) of the Clean Water Act requires the Administrator of the United States Environmental Protection Agency or her designated agent, in this instance, the Regional Board, to require as part of the storm water program "controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants." [USC Section 1342 (p)(3)(B)].

18. A recent decision of the United States 9th Circuit Court of Appeals, Defenders of Wildlife v. Browner (1999) Case No. 98-71080, provides additional support and clarification of the authority of the Administrator and the Regional Board to impose additional controls on storm water pollution. The Court in Defenders of Wildlife v. Browner said that the USEPA and the States have discretion under the law to determine what pollution controls are appropriate to achieve compliance.

19. Pursuant to the requirements of Regional Board Order No. 96-054, Waste Discharge Requirements for Municipal Storm Water and Urban Runoff Discharges within the County of Los Angeles, the Regional Board Executive Officer received a proposal for Standard Urban Storm Water Mitigation Plans submitted by the Principal Permittee.

20. Upon the review of the Regional Board Executive Officer, the Standard Urban Storm Water Mitigation Plan submitted for the seven applicable categories was deemed inadequate. A revised SUSMP proposal was developed subsequent to a discussion of the proposal's conceptual foundation at a public workshop held on August 10, 1999. This workshop was well attended with over 80 municipal representatives and interested parties participating.

21. On August 16, 1999, a public notice was issued indicating that the Standard Urban Storm Water Mitigation Plans proposed by the Principal Permittee would be augmented by the addition of criteria related to specifying numerical design criteria for BMP construction. The matter was noticed for the Regional Board's September meeting to allow the issue to be discussed before the Board although no formal action of the Regional Board itself is required for SUSMP approval.

22. On September 16, 1999, the Regional Board conducted a public hearing on the Standard Urban Storm Water Mitigation Plan proposal as amended by the Executive Officer. At that hearing, the Regional Board Executive Officer suggested additional time would be necessary to develop a more comprehensive proposal incorporating the comments received at the public hearing.

23. Between September 16 and December 3, 1999, the Regional Board Executive Officer met with interested parties to discuss comments and concerns from interested parties.

24. The Southern California Council of Governments (SCAG) has indicated its interest in obtaining funding to prepare a regional plan(s) to address storm water pollution and identify regional treatment solutions for implementation.

25. On December 7, 1999, the Regional Board Executive Officer released a revised Standard Urban Storm Water Mitigation Plan document to interested parties.

THEREFORE BE IT RESOLVED THAT:

1. The Regional Board endorses the Standard Urban Storm Water Mitigation Plan prepared by the Regional Board Executive Officer and noticed to the public on December 7, 1999 and the concepts therein relating to numerical storm water mitigation standards for Best Management Practices; and

2. The Regional Board encourages the Regional Board Executive Officer to approve the Standard Urban Storm Water Mitigation Plan at the earliest opportunity incorporating any specific changes recommended and formally approved by the Regional Board at the January 6, 1999 Board Hearing.

3. The Regional Board adopts the approved requirements as provisions applicable to the SUSMP requirements for the City of Long Beach.

4. The Regional Board adopts the numerical mitigation standards for storm water, endorsed herein, as the minimum design criteria for review of post-construction BMPs in the Los Angeles Region for construction projects subject to coverage under the state storm water general permit for construction activity.

5. The Regional Board encourages the Permittees and all interested parties to work together in a spirit of cooperation to effect the implementation of the Standard Urban Storm Water Mitigation Plan at the earliest possible date, and

6. The Regional Board encourages the efforts by the Southern California Council of Governments and area Council of Governments (COGs) to develop regional plans and identify regional solutions to address storm water pollution from new development and redevelopment.

I, Dennis Dickerson, Executive officer, do hereby certify that the foregoing is a full, true and correct copy of a Resolution adopted by the California Regional Water Quality Control Board, Los Angeles Region, on January 6, 2000.

DENNIS A. DICKERSON
Executive Officer

STANDARD URBAN STORM WATER MITIGATION PLAN

DEVELOPMENT PLANNING

CHANGE SHEET (Revised)

Summary

The Change Sheet lists proposed changes to the Final Tentative - Standard Urban Storm Water Mitigation Plan, (December 7, 1999). In general, the proposed changes respond to commenters' suggestions on improving clarity, format, and implementability of the Standard Urban Storm Water Mitigation Plan.

Noteworthy changes include, the addition of a definition for 'storm event' and the requirement of professional registration for certifying persons under the "Alternative Certification' option. Two new references have been added to augment implementation guidance. These are, (i) National Stormwater Best Management Practices (BMP) Database, Version 1.0, and (ii) Denver *Urban Storm Drainage Criteria Manual, Volume 3 – Best Management Practices.*

In the Change Sheet, cross-reference to pages and paragraphs are for the 'Clean Version' dated December 7, 2000. New text added to a sentence is indicated by underline.

Background

1. Page 2 paragraph three, Clarify that a City has to adopt same requirements for the Citywide SUSMP

   Sentence changed to read, "The Permittees are required to adopt the requirements set herein in their own SUSMP."

2. Page 2 paragraph 3. Delete reference to Urban Storm Water Mitigation to avoid confusion

   Sentence changed to read, "Each Permittee will approve the project plan as part of the development plan approval process....

3. Page 3 paragraph 2, Clarify the environmentally sensitive area category.

   Sentence changed to read, "Location within or directly adjacent to or discharging directly to an environmentally sensitive area.

4. Page 3 paragraph 2, Make requirement applicable to stand-alone parking lots only

   Sentence changed to read, "Commercial stand-alone parking lots 5,000 square feet or more.....

Definitions

5. Order definitions alphabetically

   Definitions reordered alpha-numerically

6. Page 3, Modify definition of hillsides to add specificity.

   Definition changed to read, "property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is twenty-five percent or greater."

R0072928

7. Page 3, Delete exceptions in the definition of Automotive Repair Shop

   Exceptions deleted, now reads, "Automotive Repair Shop" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539."

8. Page 3, Modify definition of 100,000 square foot commercial development for simplicity.

   Definition changed to read, "any commercial development that creates at least 100,000 square feet of impermeable area, including parking areas".

9. Page 4 , Add references for definition of environmentally sensitive areas

   References added for Areas of Special Biological Significance and Area of Ecological Significance.

10. Page 4. . Change definition to include a threshold trigger for requirements to apply to Redevelopment

    Definition changed to read. "Redevelopment" means, on an already developed site, the creation or addition of fifty percent or more of impervious surfaces or the making of improvements to fifty percent or more of the existing structure. Redevelopment includes.....

11. Page 5. . Change definition for Retail gasoline outlets to clarify 'primarily engaged'.

    Definition changed to read. ""Retail Gasoline Outlet" means a facility engaged in selling gasoline and lubricating oils, which derives more than fifty percent of its annual gross receipts from the sale of gasoline, lubricating oils tires, batteries, automobile parts and other automotive services.

12. New Definition. Define a storm event

    Defined storm event to mean, "a rainfall event that produces more than 0.1 inch of precipitation and that, which is separated from the previous storm event by at least 72 hours of dry weather."

SUSMP Provisions Applicable to All Categories

13. Page 5, paragraph 3. Change sentence for clarity

    Sentence changed to read. "....shall not exceed the estimated pre-development rate for developments where it is reasonably foreseeable that the increased peak storm water discharge rate will result in increased potential for downstream erosion."

14. Page 5, paragraph 4, Delete text that makes act dependent on effort

Sentence changed to read. "Concentrate or cluster Development on portions of a site while leaving the remaining land in a natural undisturbed condition."

15. Page 6, paragraph 1, Change sentence for clarity

    Sentence changed to read. "...or the detectable inputs of the pollutant are at a concentrations or loads considered potentially toxic to humans and/or flora and fauna."

16. Page 6, paragraph 2, Add reference

    Added reference. "Denver *Urban Storm Drainage Criteria Manual, Volume 3 – Best Management Practices*"

17. Page 6, paragraph 3, Add text to enable BMP combination alternative

Added text to read, "However, it is possible that a combination of BMPs not so designated, may in a particular circumstance, be better suited to maximize the reduction of the pollutants".

18. Page 6, paragraph 4, Delete text that is tentative

Text deleted to read, "Project plans must include BMPs consistent....."

19. Page 6, paragraph 4, Add text to promote use of natural drainage systems

Add text to read, "Utilize natural drainage systems to the maximum extent practicable"

19. Page 6, paragraph 4, Add text to minimize flow to natural drainage systems

Text added to read, "Control or reduce or eliminate flow to natural drainage systems to the maximum extent practicable"

20. Page 7, paragraph 2, Change sentence for clarity

Sentence changed to read, "Materials with the potential to contaminate storm water must be: (1) placed in an enclosure..."

21. Page 7, paragraph 3, Add text to exclude single family residences

Sentence added to read, " Individual single family residences are exempt from these requirements"

22. Page 8, paragraph 1, Change text for clarity

Text changed to read, "The transfer of property to a private or public owner must have conditions..."

23. Page 8, paragraph 1, Add text to require maintenance inspection and record.

Sentence added to read, "The condition of transfer may include a provision that the property owner conduct maintenance inspection of all treatment control BMPs at least once a year and retain proof of inspection."

24. Page 8, paragraph 3, Delete text for clarity

Text deleted, "~~each runoff event up to and including~~", Now reads, "the 85th percentile 24-hour runoff event...."

25. Page 8, paragraph 3, Correct based on revised chart treatment volume from 85 percent to 80 percent.

Text changed to read, "to achieve 80 percent or more volume treatment....."

26. Page 8, paragraph 3, Change text for clarity

Sentence changed to read, "....runoff produced from a 0.75 inch storm event, prior..."

27. Page 8, paragraph 3, Change text for clarity

Sentence changed to read, "....volume of runoff produced from a historical-record based reference 24-hour rainfall criterion...."

28. Page 9, paragraph 2, Change text to offer partial credit for roofing surfaces diversion

    Sentence changed to read, "A proportional area of roofing surface may be excluded..."

29. Page 9, paragraph 2, Change text for clarity.

    Sentence changed to read, "storm water conveyance system does not directly discharge to a natural stream or channel segment scheduled for restoration".

30. Page 9, paragraph 3, Change text to clarify exemption from numerical standard only.

    Sentence changed to read, "Restaurants, where the land area for development or redevelopment is less than 5,000 square feet, are excluded from the numerical BMP design standard requirement.

Provisions Applicable to Individual Priority Projects

31. Page 10, paragraph 2, and Page 12, paragraph 1, Change text to eliminate mandatory cover.

    Sentence change to read, "...area must be self-contained and/or covered, equipped with a clarifier...."

32. Page 12, paragraph 3, Change text for clarity.

    Text modified to read, "....hydrocarbons that are deposited on parking lot surfaces by motor vehicles"

33. Page 12, paragraph 3, Add introductory text.

    Sentence added to read, "To minimize the offsite transport of pollutants, the following design criteria are required".

Waiver

34. Page 13, paragraph 1, Add text for clarity

    Text added to read, "....because an existing or potential underground source of drinking water..."

35. Page 13, paragraph 1, Change text to clarify that Permittee is petitioner.

    Sentence modified to read, "Any other justification for impracticability must be separately petitioned by the Permittee and approved...."

Alternative Certification

36. Page 13, paragraph 1, Change sentences to require professional registration and recommend training verification.

    Sentences added to read "...accept a signed certification from a Civil Engineer or a Licensed Architect registered in the State of California, that the plan meets the criteria." And, "The Permittee is encouraged to verify that certifying person(s) have been trained on BMP design for water quality, not more than two years prior to the signature date."

Suggested Resources

37. Page 15, Add reference BMP database and on-line Texas Non-point Source Book

    Reference added, "National Stormwater Best Management Practices (BMP) Database, Version 1.0" ; and "Texas Non-Point Source Book".

Los Angeles, CA 90013

Re: **Waste Discharge Requirements And NPDES Permit For Municipal Storm Water And Urban Run Off Discharges In The County Of Los Angeles (Order No. 96-054, NPDES No. CAS 614001) - Petition To State Board For Action Taken By Regional Board On January 26, 2000**

Dear Mr. Dickerson:

In connection with the upcoming filing of a Petition to the State Water Resources Control Board concerning the actions of the Regional Board and its Executive Officer on January 26, 2000, and their failure to act on the Permittees' SUSMP, as well as their failure to act in accordance with the Administrative Review Process under Order No. 96-054, the Clean Water Act, and the Porter-Cologne Act, this office is in the process of preparing a Petition to the State Water Resources Control Board.

Pursuant to Title 23 of the California Code of Regulations, Section 2050, please have the Regional Board's Record on this matter prepared, including a copy of the tape recording of the Regional Board's hearing on January 26, 2000, as well as a copy of the Reporter's transcript.

In addition, pursuant to the regulations and in furtherance of the Petition to the State Board, please have a list of persons that are known to the Regional Board to have an interest in the subject matter of this Petition prepared, and have copies of such list forwarded to this office and the State Board, as well as all Petitioners.

Thank you for your assistance in this matter, and please do not hesitate to contact me should you have any questions.

Sincerely,

RUTAN & TUCKER

Richard Montevideo

State Water Resources Control Board
Los Angeles Region
320 W. 4th St., Suite 200
Los Angeles, California 90013

Re: Administrative Record for Standard Urban Storm Water Mitigation Plan

Dear Ms. Khayat:

You may recall that I recently inspected the Administrative Record pertaining to the Standard Urban Storm Water Mitigation Plan at the Regional Board's office. Our further review of the Administrative Record has revealed it is missing some items. The missing items are in Volume 8, identified as numbers 20 and 59. (A copy of the index is enclosed with the highlighted items.) We would appreciate you sending us copies of the two missing documents as soon as possible given the May 31, 2000 filing deadline set by the State Board.

Thank you for your assistance.

Very truly yours,

RUTAN & TUCKER, LLP

Petitioners herein file this Summary of Argument and Reply to the Opposition filed by Respondents, the Los Angeles Regional Water Quality Board and Dennis Dickerson, its Executive Officer (hereafter "Respondents"), and in reply to the Opposition papers filed collectively by the Natural Resource Defense Council, Inc., the Santa Monica Bay Keeper, and Heal The Bay (hereafter collectively "NRDC").

I. INTRODUCTION.

Respondents and the NRDC have skirted the fundamental deficiency with the Respondents' mandated SUSMP program. Namely, Petitioners have been granted a Permit to discharge to the Municipal Storm Sewer Systems ("MS4s"), and as the Permittees are in compliance with this Permit, they are in compliance with the Clean Water Act and State law. Nothing in the Permit authorizes Respondents to ***mandate*** a SUSMP program on the Permittees. In fact, the opposite is true, that is, the SUSMP program is to be a program submitted by the Permittees and reviewed by the Executive Officer. At worst, is to be a negotiated program through a formal meet and confer process which may include the preparation of a Storm Water Program Compliance Amendment ("SPCA"). Neither the Respondents nor the NRDC have cited any authority to the contrary,[1] and they have been unable to cite to any language which refutes the Petitioners' position in this regard or to support their claims that the Permit need ***not*** be complied with. In short, the Permittees have submitted a SUSMP program which the Respondents have failed to review and approve in accordance with the Permit itself, and the Respondents have breached the Permit by failing to comply with its terms, and with other terms of the Permit concerning the development and application of the SUSMP program.

Interestingly enough, Respondents argue that it is the Permittees that have missed the point as Respondents contend that this is "not an enforcement action in which the Regional Board must show harm or violation," (see, Respondents' Opposition, p. 4, ll. 17-18), and the question "is not

---

[1] Interestingly enough the NRDC attempts to mislead the State Board into believing that the SUSMP approved by the Board was proposed and proffered by the Permittees. "Nevertheless the proposal that staff presented was still the Permittees' proposal." (Emphasis in original.) (See, NRDC Opposition Points and Authorities at p. 8, ll. 10-11.) In addition, at page 17 the NRDC continues with its misrepresentation: "Thus it [the Regional Board] was required to adopt its version of the version proffered by the Permittees." (NRDC Opposition, p. 17, l. 8.) These statements by the NRDC are simply false.

whether the Regional Board carried its burden of evidence but rather did it properly execute its legal duties." (Respondents' Opposition, p. 5, ll. 3-4.) Maybe Respondents are correct that the issue is not necessarily whether Respondents met their burden of proof, but rather whether the Respondents' actions have any legal effect on these Petitioners or any other parties, as the Respondents' actions violate the requirements of the Permit. In short, the central questions raised by this Petition are (1) whether the Respondents complied with the terms of their own Permit, and if so, (2) whether their actions are otherwise authorized by State and federal law. The evidence in the record and the evidence to be presented at the time of the hearing will show that the answer to both these questions is a resounding "no."[2]

II. RESPONDENTS' HAVE VIOLATED THE TERMS OF THEIR OWN PERMIT.

The evidence in the Administrative Record ("A.R.") and the express language of the Permit itself show that the Regional Board failed to comply with the requirements of the Permit in the development, review and approval of the SUSMP program. Specifically, Respondents failed to comply with the requirements of Part 2.III.A of the Permit concerning the preparation and application of the SUSMP, and Respondents failed to comply with the Administrative Review Process for the review and approval of the Permittees' SUSMP program in accordance with Part 2.I.G of the Permit. As a result of Respondents' failure to comply with both the development process for the SUSMP program and the Administrative Review Process, the subject Petition must be granted and the actions of the Respondents, in their entirety, must be overturned with the program submitted by the Permittees in August of 1999 being deemed approved in accordance with the terms of the Permit.

---

[2] Contrary to Respondents' and NRDC's contentions regarding this Board's standard of review of the Respondents' actions in issuing the SUSMP Program, this Board must exercise its "independent judgment" (Water Code § 13330) to determine that such actions were "appropriate and proper." (Water Code § 13320), not the more deferential standard proposed by such parties. (*See, e.g., Marina County Water Dist. v. State Water Resources Control Bd.* (1984) 163 Cal.App.3d 132, 136-137; *In the Matter of the Petition of Exxon Company, USA* (1985) Order No. WQ 86-16 at p. 14; *In the Matter of Application of 22627 Henwood Associates, Inc.* (1988) Order No. WR 88-19 at pp. 8, 14, *Water Right Application 30298, Diane Stuller* (1997) Order No. WR 9704 at pp. 19-20.

A. Respondents' Action Violated The Administrative Review Process Under The Permit.

At the hearing at the time of the Permit, counsel for the Respondents candidly admitted that the Administrative Review Process applied, and that it was a clean process that should have been followed. According to the Respondents' counsel: "I think it does qualify under the provisions of the Permit Mr. Montevideo has cited." (A.R., Vol. 12, January 26, 2000, Transcript, p. 151 (hereinafter "Transcripts"), lines 3-5.) Regional Board's counsel continues and reaffirms his belief in this regard stating: "It's true, if I had my druthers, I'd rather stick to the process because it's so clean. It fits neatly into the permit requirements." (Transcripts, p. 152, lines 25-27.) Accordingly, Respondents have admitted the Administrative Review Process applies to the review and approval of the subject SUSMP program and that such procedures should have been followed.

In their opposition, Respondents make the unique argument that the Administrative Review Process only applies prior "to initiating enforcement action" against the Petitioners. (See Respondents' Opposition, p. 16.) In effect, Respondents appear to be arguing that they can impose programs that are not approved in accordance with the Administrative Review Process, but simply cannot enforce those program until they have complied with the terms of the process. The argument is nonsensical. Respondents admit that the Administrative Review Process applies to the review of the SUSMP program and further admit that the Administrative Review Process must be complied with prior to "initiating enforcement actions." Thus, in accordance with Respondents' own arguments, the Administrative Review Process applies, should have been complied with, and no enforcement action can be taken until it has complied with. In short, Respondents appear to be making the Petitioners' argument that the action taken by the Regional Board on January 26, 2000, and the subsequent action of its Executive Officer, have no legal force or effect.

Further, Respondents and the NRDC continue to ignore the fact that upon the Regional Board's issuance of the Permit in July of 1996, all of the Respondents' authority under both the Clean Water Act and State law to regulate MS4s in Los Angeles County was limited by Order

No. 96-054. Accordingly, the development, review, and approval of Respondents' mandated SUSMP program, a program developed directly contrary to the process to be followed under the Permit, are actions that were taken in excess of Respondents' authority under both the Clean Water Act and State law.

Next, Respondents make the awkward argument that the Administrative Review Process is a process that is to benefit the "Permittees," (*id.* at p. 17, ll. 10-13) and that such provisions must be considered in their full context including harm to the interests protected and the deadlines set forth in the Permit for implementation, namely, July 30, 1999. The argument is then that because this deadline of July 30, 1999 was not complied with [because of the Regional Board's inaction], that magically the Regional Board was within its right to consider the process to be "obsolete." (*Id.* at p. 17, ll. 15-20.) No citation to the Permit or State or federal law is made, and no explanation is provided as to why the Administrative Review Process suddenly became "obsolete."[3]

Finally, the Regional Board contends that, even if the process was not obsolete, the Respondents' actions did not harm the Petitioners' interest. In making this argument, Respondents overlook the fact that the entire Administrative Review Process has been ignored, that the Regional Board's SUSMP program is not scientifically supported, and that the program was not developed and otherwise applied in accordance with the express terms of the Permit (see discussion below).

The problem with each of the Respondents' arguments in connection with the

---

[3] Respondents interestingly and incorrectly argue that the deadline for implementation of the SUSMP program was July 30, 1999, and that Permittees submitted a final SUSMP to the Regional Board on August 10, 1999. Respondents obviously are going out of their way to mislead the State Board on the true facts of the case. As Respondents well know, the SUSMP could not be prepared and submitted until Respondents had approved the Petitioners' BMPs which, unfortunately, did not occur until April of 1999. Moreover, the SUSMP program was in fact submitted on July 21, 1999, prior to July 30, 1999, and was submitted timely in accordance with the Respondents' approval of the Petitioners' BMPs, but was resubmitted in August of 1999 after the Respondents submitted comments to the Petitioners' initial submittal. Further, Respondents and the NRDC's arguments on the deadline of July 30, 1999 are disingenuous as both parties recognized that it is the Respondents who have completely failed to comply with any of the timelines set forth in the subject Permit, as evidenced by the NRDC's petition to the United States Environmental Protection Agency to decertify the Regional Board and withdraw its authority, and the Regional Board's failure to oppose such a Petition at this time. (See Exhibit "5" to Petitioners' summary of evidence.)

Administrative Review Process is that they are not supported by the language of the Permit or the evidence in the record. Specifically, nothing in the Permit provides that the Administrative Review Process will become "obsolete," if the Regional Board or any other party fails to meet a deadline. Nothing in the Permit gives the Respondents the authority to dispense with the meet and confer process under the Administrative Review Process simply because the Regional Board unilaterally dispensed with it. Nothing in the Permit gives the Respondents the authority to completely fail to provide review of the SUSMP program submitted by the Permittees, and to unilaterally devise their own SUSMP program and thereafter force the terms of the program they developed on the Permittees. In fact, Respondents' counsel at the time of the hearing on January 26, 2000, recognized that the whole purpose of the Administrative Review Process was to protect the Permittees from unilateral action of the Board: "I think the reason for the provisions having to do with the administrative review process was to protect the parties, the Permittees, from having to be unilaterally told [what] to do at this stage of the process." (Transcripts, p. 151, l. 26 – p. 152, l. 1.) Respondents have thwarted the entire purpose of the Administrative Review Process.

The Administrative Review Process was put into place for the very purpose of resolving differences in compliance expectations and in programs submitted for review and approval by the Executive Officer. The Administrative Review Process was put into place to require a continuing dialogue between the Permittees and the Executive Officer over the program submitted by the Permittees. The Administrative Review Process was put into place to provide the parties sufficient time to evaluate the programs submitted, and to enable the Permittees time to show the Executive Officer that their program was sufficient, which would then lead to a Notice of Program Sufficiency. The Administrative Review Process was put into place to enable the Executive Officer (if after the meet and confer process he or she believed the proposed program remained deficient), to request the submission of a Storm Water Program Compliance Amendment ("SPCA") and if that amendment was still not acceptable, to provide the Permittees an additional 60 days to remedy any deficiency in the SPCA. The Administrative Review Process was specifically put into place to provide a procedure to resolve differences over a SUSMP program and other programs, i.e., ***a due process*** requirement to be followed to resolve the exact dispute that

has arisen in this case and to avoid a Regional Board mandated program.

The Administrative Review Process was put into place to assure every step in the process was followed by the Regional Board, and to avoid a mandated SUSMP program that was not developed in accordance with the Permit.

Petitioners have been substantially prejudiced by the Regional Board's complete and absolute rejection of the Administrative Review Process required by Order No. 96-054.[4]

B. Respondents Have Failed to Comply With the Permit's Requirements for the Development of the Permittees' SUSMP Program.

In addition to the Respondents' failure to comply with the review process as required by the terms of the Permit, Respondents similarly violated the terms of the Permit by failing to comply with the procedures required for the actual development of the SUSMP program. Specifically, pursuant to Part 2.III.A.1. of the Permit, it is the "Principal Permittee, in consultation with the Permittees" that was to develop the Standard Urban Storm Water Mitigation Plans under subsection (1)(c) of the Development Planning and Construction Section of the Permit. (See Part 2.III.A.1.c.) Nowhere in the development process of the SUSMP program is there a provision that allows the ***Regional Board,*** in consultation with the Permittees, or otherwise, to develop the SUSMP program. Accordingly, Respondents have violated this principal concept of the Permit, by themselves developing the SUSMP program in violation of the terms of the Permit.

Second, the Permit states in no less than ***three (3)*** different locations that the Development Planning Programs, specifically including the SUSMP programs, are to apply only to ***"development projects requiring discretionary approval."*** (See Part 2.III.A.1.; Part 2.III.A.3.;

---

[4] The NRDC's position on the application of the Administrative Review Process is no more credible than the Respondents. NRDC contends that the Regional Board substantially complied with the process. Clearly, no compliance is not substantial compliance. The NRDC next argues that the proposal that staff presented to the Regional Board was "still the Permittees' proposal." This contention is a false statement and there is no evidence anywhere in the record that the SUSMP program mandated on the Permittees is "the Permittees' proposal." (See NRDC Opposition, p. 8, ll. 10-11.) Finally, the NRDC argues that no one could expect the Regional Board to have intended strict adherence to the process set forth in the Permit as this would elevate form over substance. Not only has there not been strict compliance, there has been **no adherence to the procedures set forth in the Permit,** and the only elevation that has occurred in this case, is the elevation of the Regional Board's SUSMP program (that has never been agreed to by the Permittees) over the Permittees' rights to due process of law.

and Part 2.III.A.4.) Yet, in spite of the clear terms of the Permit and the application of SUSMP programs only to ***"discretionary"*** development projects, Respondents chose to ignore the Permit and to require the application of the SUSMP programs to "non-discretionary" as well as "discretionary" development projects.

Third, the SUSMP program, again pursuant to the terms of the Permit, was only to apply to ***"development categories"*** and specifically the development categories set forth under Part 2.III.A.1.c. The Respondents' requirement that the SUSMP program also apply to all "environmentally sensitive areas" is a direct violation of the terms of the Permit because "environmentally sensitive areas" are plainly not ***"development categories."*** In fact, the terms of the Permit itself recognize that the "model documented system," such as a checklist to be developed by the Permittees, is to consider the location of projects with respect to designated "environmentally sensitive areas," as well as the slope and erosion potential of the site and surrounding areas. Thus, "environmentally sensitive areas," according to the Permit, are to be considered in the course of the "model documented system," as is the erosion potential of the site, but not as a "development category" for purposes of the SUSMP.

The SUSMP program is only to be applied to "development categories" and nothing in the Permit allows for or requires the Permittees to apply SUSMP programs to generic locations within the County that are not "development categories." Respondents' application of the SUSMP program to environmentally sensitive areas, as well as the unsupported expansion of the seven development categories to include parking lots in excess of 5,000 square feet, represent clear violations of the Permit.

In addition, Respondents have violated the terms of the Permit with the development of their mandated SUSMP program by prohibiting post-development peak storm water runoff discharges that exceed estimated pre-development rates, where the increased peak storm water discharge rate will result in increased potential for downstream erosion. (See Regional Board SUSMP, p. 6, § 1.) This contradicts the terms of the Permit itself, specifically Part 2.III.A.1.b., which provides that:

> For developments where increased storm water discharge rates will result in an increase in downstream erosion potential, the list of recommended

BMPs shall include those BMPs which can be used to maintain peak runoff rates at pre-development levels ***to the maximum extent feasible.***

Accordingly, Respondents have violated the terms of the Permit by deleting the standard in the Permit by which development may result in downstream erosion potential, i.e. by deleting the standard to reduce these levels "to the maximum extent feasible."

In short, Respondents have ignored a number of significant elements of the Development Planning Procedures to be followed in developing a SUSMP program, and they have further changed the requirements and the scope and application of SUSMP programs so as to apply it to developments and projects not permitted or called for anywhere in the Permit.

Respondents have thus not only violated the approval process required for the review and approval of the Permittees' SUSMP program, they have, moreover, fundamentally violated the substantive requirements to be followed in developing the SUSMP program.

III. RESPONDENTS HAVE NO AUTHORITY UNDER STATE AND FEDERAL LAW TO MANDATE THEIR OWN SUSMP PROGRAM ON THE PERMITTEES.

When the Los Angeles Regional Board issued Order No. 96-054 in July of 1996, that Board exercised its discretion and set forth the requirements by which the Permittees were permitted to discharge pollutants into their MS4s, and the requirements to "reduce the discharge of pollutants to the maximum extent practicable." (See 33 U.S.C. § 1342(p)(3)(b).) With the issuance of said Permit, Permittees are authorized by state and federal law to allow discharges of storm water and non-storm water, in accordance with the Permit, into their MS4s. Neither Respondents nor the NRDC cite any authority in their voluminous opposition papers that provides authority to the Regional Board to, in midstream, impose ***new*** mandates and requirements on the Permittees ***in excess*** of the conditions and requirements set forth in the existing Permit.

Neither the Clean Water Act nor the Porter-Cologne Act authorize the Respondents to violate the terms of an NPDES Permit and to proceed outside of its requirements. In short, the Respondents have cited no authority under any state or federal law that justifies their bad faith breach of the terms of the Permit issued in July of 1996. Not only are the Respondents actions in direct violation of the terms of the Permit and thus the Clean Water Act, in addition, because there

is no authority for their actions, they are void *ab initio* and constitute meaningless actions having no legal force or effect.

IV. RESPONDENTS' PROPOSED SUSMP PROGRAM HAS NOT BEEN SHOWN TO BE COST EFFECTIVE AS REQUIRED BY THE TERMS OF THE PERMIT ITSELF AND STATE AND FEDERAL LAW.

Respondents argue that "economic analysis is not required when implementing a federal regulation" without any citation for the same, and without recognizing that the SUSMP program was to be adopted in accordance with the terms of the Permit and State and federal law, all of which require a review of the ***cost effectiveness*** of the proposed program.

The terms of the Permit itself clearly provide the Permittees with the discretion to consider the ***cost effectiveness*** of their programs in developing BMPs, which are then used in the development of the SUSMP program. Specifically, subsection (b) of Part III.A.1. on page 34 of the Permit provides that: ***"Cost effectiveness, ease of maintenance, and consistency with other environmental mandates may also be considered."*** Accordingly, the terms of the Permit itself make it very clear that "cost effectiveness" may, at the discretion of the ***Permittees***, be considered. The Permittees, throughout this process, have informed the Respondents that the cost effectiveness of the proposed BMPs is essential for a successful program. Similarly, subsection (c) of Part 2.III.4. of the Permit ***requires*** the Permittees to develop model programs to inform developers seeking "discretionary approvals" of "cost effective storm water pollution control measures." Accordingly, under the Permit, the cost effectiveness of the proposed programs must be considered in developing SUSMP programs.

State and federal law support the requirement of "cost effectiveness," as the regulations to the Clean Water Act require the "maximum extent practicable" standard to be applied "in a site-specific, flexible manner, taking into account cost considerations as well as water quality effects." (See 64 F.R. 68722, 68732.) In addition, California Water Code §§ 13165, 13225(c), and 13241 all require that before the Respondents can mandate a program similar to the SUSMP program mandated on the Permittees, such requirements are to be shown to be cost effective, with the cost bearing a reasonable relationship to the need for the program, and with the benefits of the program

outweighing the costs.

In response to these requirements for consideration of costs and a cost/benefit analysis, Respondents claim that they have in fact submitted evidence of a cost effective program, and that as such the record supports their mandating of the proposed SUSMP program on the Permittees. The evidence in the record, however, shows the contrary. First, there is no evidence in the record to show that the Respondents have performed the necessary analysis to identify the "pollutants of concern" and to identify the "sources of pollutants" in developing their SUSMP program. To the contrary, Respondents have attempted to impose a "one size fits all" program that would require the same structural/treatment BMPs to be utilized in the development of a low or moderate income housing development, in comparison to the development of a large refinery. Specifically, the same numerical mitigation standard of .75 inches of rain over a 24 hour period, must be complied with, without any recognition of the pollutants of concern from the low income housing project and the cost per unit to comply with this standard, or the benefits to be obtained therefrom. The result of the Regional Board's SUSMP program is a SUSMP program that has failed to consider the pollutants of concern, the sources of these pollutants, the cost to address the pollutants for any particular development projects, and the benefits to be obtained therefrom.

Respondents and the NRDC claim that in fact the Regional Board did present some evidence of the cost to develop and maintain a retention basin for a five acre commercial development project. Unfortunately, the costs presented show on their face that the Regional Board's numbers were deficient and bear no relationship to reality. Specifically, the Regional Board estimated that the cost to maintain a detention basin for a five acre commercial development project would equal a whopping "$33.00" per year, and that the total cost of the detention basin, as they relate to the project costs, would equate to .6%. Clearly, the maintenance costs of $33.00 per year for a detention basin for a five acre commercial development is not credible regardless of the size of the detention basin. Further, in their example, the Regional Board failed to provide any specifics as to the size of the detention basin, the quantity of water to be retained in the detention basin, and the amount of land needed for the basin.

In addition, the Regional Board's costs did not include any fencing or security costs for the

detention basin, additional liability insurance required for the maintenance of the detention basin, and the additional cost to dispose of the water from the detention basin and/or to dispose of any potentially "hazardous waste" that may arise from the accumulation of all of the unidentified pollutants in the detention basin. Nor did the Regional Board's example identify what pollutants of concern were to be addressed by its detention basin, and whether its detention basin would be effective in addressing such pollutants of concern, i.e. whether the proposed purposes and benefits of the detention basin outweighed its cost. In short, the Respondents' costs analysis contains no cost/benefit analysis and the costs actually identified were understated.

V. RESPONDENTS HAVE FAILED TO COMPLY WITH THE REQUIREMENTS OF THE CALIFORNIA ENVIRONMENTAL QUALITY ACT.

The California Environmental Quality Act requires the consideration of all potentially significant environmental impacts resulting from the proposed project to be imposed on the Permittees by the Respondents. Respondents argue that California Water Code Section 13389 exempts their mandated SUSMP program from the requirements of CEQA. The plain language of Section 13389, however, shows that it only applies to the "adoption" of waste discharge requirements. (See Cal. Water Code § 13389.) Here, the waste discharge requirements in question were "adopted" in July of 1996, and the SUSMP program in issue is not an adopted waste discharge requirement, but instead a storm water mitigation program to be developed by the Permittees, and reviewed by the Regional Board, with the purpose of reducing the discharge of pollutants to the maximum extent practicable. As the approval of the SUSMP program was not noticed as, and was not the "adoption" of, waste discharge requirements, California Water Code Section 13389 has no application.

Furthermore, the terms of the Permit itself expressly give the discretion to the ***Permittees*** to consider ***"other environmental mandates"*** in their consideration of the best management practices to be then incorporated into their SUSMP program. (See Permit, Part 2.III.1.b.)

In addition, for the Respondents and the NRDC to simply ignore the need to comply, if not with the letter of CEQA, then the spirit of CEQA, is a hypocritical position for these so-called environmental protection organizations to assume. Sound public policy dictates the consideration

of all potentially significant environmental impacts from the approval of the SUSMP program in issue, before rendering the decision (which in this case particularly includes consideration of the impact of this decision on available low and moderate income housing, the disparate environmental and economic impacts on economically disadvantaged communities throughout the County, the creation of attractive nuisances, the mosquito and rat control problems created by the mandated SUSMP program, problems created from the generation and disposal of the storm water runoff, the generation and disposal of solid and/or hazardous waste from the detention basins, and the general impact created by the development of infiltration basin/ponds, wet ponds, grassy swales and extended detention basins throughout the County, specifically including the potential significant adverse impacts on groundwater quality).

VI. RESPONDENTS' ACTIONS WILL RESULT IN THE IMPOSITION OF UNFUNDED MANDATES IN VIOLATION OF THE CALIFORNIA CONSTITUTION.

Respondents argue that Article 13 B Section 6 of the California Constitution does not apply to the mandated SUSMP program as it only applies to additional levels of "service" on local governments and not "regulatory requirements" imposed on the Permittees. The argument, however, falls on its face as the Regional Board's mandated SUSMP program is clearly not a "regulatory requirement" imposed by any state or federal law on the Permittees. Rather, it is a program that is being mandated by the Regional Board in its "discretion."

Specifically, Respondents have consistently claimed that they have the "discretion" to mandate the numerical mitigation standard, relying upon the Ninth Circuit decision of *Defenders of Wildlife v. Browner* (1999) 191 F.3d 1159. Respondents, in fact, have to make the argument that they have the "discretion" to impose their requirements since nothing in state or federal law ***requires*** the numerical mitigation standard or any of the other specific provisions of the SUSMP program to be mandated by the Respondents. In short, Respondents must make the argument that they have the "discretion" to impose the SUSMP requirements ***specifically because*** the SUSMP requirements are not "regulatory requirements" under either state or federal law. If these requirements had been "regulatory requirements" under state or federal law, Respondents would

not need to argue they have the "discretion" to impose the requirements, but could simply argue they were required to impose the requirements.

For this same reason, the exemption to the prohibition on imposing unfunded mandates under Government Code § 17556(c) does not apply, as Respondents are not requiring the implementation of a federal mandate as such a mandate only applies where the State has ***"no true choice"*** in the manner of implementing a federal program. (*Hayes v. Commission on State Mandates* (1992) 11 Cal.App.4th 1564, 1593.) As discussed in *Defenders of Wildlife v. Browner, supra*, 191 F.3d 1159, according to the Respondents, not only do they have a "true choice," they in fact have the "discretion" to mandate the SUSMP program.

Finally, Respondents rely upon Government Code § 17556(d) to argue there is an exemption from the prohibition on imposing "unfunded mandates" where the local agency "has the authority to levy service charges, fees or assessments sufficient to pay for the mandated program or increase level of service." (Respondents' Opposition, p. 36, ll. 22-25.) Under the prohibitions and requirements of Proposition 218 adopted by the voters of California in 1996, as well as Propositions 13 and 62, the Permittees in fact do not "have the authority" to impose fees to pay for the cost of carrying out the Regional Board's mandated SUSMP program.

VII. RESPONDENTS' ACTIONS EQUATE TO THE ADOPTION OF INVALID REGULATIONS IN VIOLATION OF THE CALIFORNIA ADMINISTRATIVE PROCEDURES ACT.

Respondents argue, without citation or any authority of any kind, that their actions are not "rule making" in nature. In effect, Respondents argue that their actions are not "rule making" because they say they are not "rule making." The requirements of the California Administrative Procedures Act, however, and a review of the evidence in the record shows quite the opposite, and the Respondents have failed to comply with the requirements of the Administrative Procedures Act ("APA").

Specifically, although the APA does not apply to the issuance or amendment of permits, including waste discharge requirements, if the action in question rises to the level of an "order," a "regulation" or a "standard of general application," the APA clearly applies. (Gov. Code

§ 11342(g).) In the instant case, the SUSMP program is a one size fits all program that is being imposed on all cities throughout the County of Los Angeles, including the County itself, and is being applied to all discretionary and non-discretionary projects that fall within a very broad description of "development categories," including a large undefined area known as "environmentally sensitive areas."

In addition, on May 25, 2000, Respondent Regional Board specifically determined to refrain from issuing a new NPDES MS4 permit for Ventura County until a showing could be made as to why the general standard that was being imposed on the Los Angeles County Permittees should not also be applied in Ventura County. Clearly, the Regional Board's action has risen to the level of a "standard of general application" that is being mandated on cities throughout all of Los Angeles County, and now apparently Ventura County.

Moreover, Respondents attempt to force the Permittees to regulate the contractual terms of private purchase/sale agreements for real property, and to regulate the specific language of conditions, covenants and restrictions ("CC&R's") of homeowner's associations, is nothing short of legislation by the Regional Board.

VIII. RESPONDENTS' ACTIONS VIOLATE CALIFORNIA WATER CODE § 13360.

Respondents argue that their mandated SUSMP program is not governed by Water Code Section 13360(a), claiming that their standards have "broad technical reach . . . and are not unique to any singular approach." Respondents further argue that their standards are "minimum standards and Petitioners can use stricter criteria." (Respondents' Opposition, p. 35, ll. 12-17.) A review of the mandated SUSMP program itself, however, shows the opposite. Specifically, the numerical design standard in question identified in Section 9, entitled "Design Standards for Structural or Treatment Controlled BMPs," may provide four different options for purposes of mitigating/infiltrating or treating storm water runoff, but only with respect to options on ***calculating*** the quantity of runoff to mitigate or treat. That is, the design standard gives the Permittees four different ways in which to ***calculate*** the amount of runoff that is to be treated, but still requires structural or controlled BMPs to be designed on a project-by-project basis, for both discretionary and non-discretionary projects, for runoff equating to a storm event of .75 inches of

rain over a 24 hour period.

In short, there is absolutely no flexibility for the Permittees to modify the need for the structural/treatment BMP given the use in issue, the designated pollutants of concern, or the ability of the Permittees to capture the runoff and address the pollutants of concern through a regional collection system. Rather, each project is required to include structural/treatment BMPs to address .75 inches of rain over a 24 hour period. Respondents have imposed a design standard that is prohibited by California Water Code Section 13360(a).

Interestingly enough, the NRDC argues that, on the one hand, for purposes of Section 13360 the SUSMP is "totally independent of any design standard" (NRDC Opposition, p. 21, ll. 9-11), but on the other hand, for purposes of CEQA, argues that the SUSMP is a part of a waste discharge requirement and therefore is covered by the exemption under 13389. (NRDC Opposition, p. 24, l. 16 – p. 25, l. 4.) Obviously, the NRDC is willing to make whatever argument it believes sounds reasonable, without regard to consistency in its position. Water Code Section 13360(a) applies to not only waste discharge requirements but also to other orders by the Regional Board which specify the "design, location, type of construction, or ***particular manner*** in which compliance may be had with that requirement, order or decree. . . ." (See Cal. Water Code § 13360(a).) The Regional Board's actions violate Water Code Section 13360(a).

IX. RESPONDENTS' ACTIONS HAVE DEPRIVED PETITIONERS OF THEIR PROCEDURAL AND SUBSTANTIVE RIGHTS TO DUE PROCESS OF LAW.

Respondents argue that they provided adequate due process of law to Petitioners because Respondents held workshops in August and September, and because they circulated a tentative draft of the SUSMP on December 8, 1999. Respondents thereafter argue that they provided adequate due process of law because they complied "with the federal procedural requirements for *adopting* NPDES permits under Section 124 of Title 40, Code of Federal Regulations and with Water Code § 13377." (Respondents' Opposition, p. 23, ll. 20-23.)

Respondents have missed the sum and substance of Petitioners' argument. Specifically, at no time prior to the hearing of January 26, 2000, did the Regional Board ever notify the Petitioners either in a workshop or in any written notice or draft SUSMP program, that the Regional Board

intended to apply the SUSMP program to "non-discretionary" development projects. In fact, such an application is directly contrary to the express terms of the Permit. Yet, after the close of the public testimony, the Regional Board itself, in the course of its deliberations, decided to apply their SUSMP program to all "non-discretionary" projects that fall within the nine categories specified by the Regional Board. This lack of notice did not comply with any notice provision under state or federal law. Petitioners were not given sufficient notice and an opportunity to be heard on this issue, to present their argument that the Permit only allows the application of SUSMP programs to "discretionary" projects.

Similarly, with respect to the roof top exemption, at the time of the hearing, the Respondent Executive Officer, even after all the testimony was presented, stated he simply did not believe there was any factual basis or that he had enough data to include roof top water within the application of the SUSMP program. Clearly, with the Executive Officer, the party charged with the responsibility for approving the SUSMP program, admitting that even he did not have sufficient information to include roof top water within the program, the Regional Board's adoption of the SUSMP program violated the Petitioners' rights to due process of law.

In addition, Petitioners were denied their rights to basic due process of law as the Permit specifically provides for the discretion to the ***Executive Officer*** to issue the SUSMP program, ***not the Regional Board***. The Regional Board's "direction" to the Executive Officer, who was then compelled to follow that direction, given his position on the lack of data to include roof top water, is a direct violation of the procedural requirements of the Permit, and a violation of Petitioners' rights to due process of law. Further, the last minute submittal of the change sheet of January 25, 2000, which was not given to the Petitioners until the date of the hearing, was clearly insufficient notice and an opportunity to be heard on the items set forth in the change sheet.

Finally, and most importantly, Petitioners were denied their right to due process of law as their express rights as set forth in the Administrative Review Process were completely ignored by the Respondents.

In sum, Petitioners were not provided sufficient notice and a full opportunity to be heard, and they were not provided their substantive rights as provided for in the terms of the Permit itself.

CONCLUSION.

For the foregoing reasons, Petitioners respectfully request that Respondents be required to comply with the terms of Order No. 96-054 and State and federal law, and that the actions of the Regional Board on January 26, 2000 and the Executive Officer, pursuant to his order of March 8, 2000, be overturned with direction to Respondents to comply with the terms of the Permit and applicable law.

Dated: May 30, 2000

Respectfully submitted

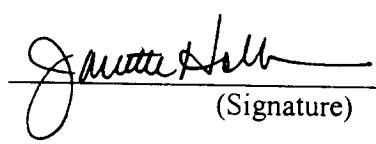
PROOF OF SERVICE BY MAIL

STATE OF CALIFORNIA)
) ss.:
COUNTY OF ORANGE)

I am employed in the County of Orange, State of California. I am over the age of 18 and not a party to the within action. My business address is 611 Anton Boulevard, Fourteenth Floor, Costa Mesa, California 92626-1998.

On May 30, 2000, I served on interested parties in said action the within:

PETITIONERS' SUMMARY OF ARGUMENTS AND REPLY TO OPPOSITIONS FILED BY RESPONDENTS AND NRDC, SANTA MONICA BAY KEEPER AND HEAL THE BAY



by placing a true copy thereof in sealed envelope(s) addressed as stated on the attached mailing list.

I am readily familiar with this firm's practice of collection and processing correspondence for mailing. Under that practice it would be deposited with the U.S. postal service on that same day in the ordinary course of business. I am aware that on motion of party served, service is presumed invalid if postal cancellation date or postage meter date is more than 1 day after date of deposit for mailing in affidavit.

Executed on May 30, 2000, at Costa Mesa, California.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct.

Janette Hollmer

I. IF THERE IS TO BE A NUMERIC DESIGN STANDARD FOR INFILTRATION OR TREATMENT, IS THE .75-INCH STANDARD APPROPRIATE? SHOULD IT BE SUBSTITUTED WITH A DIFFERENT NUMERIC DESIGN STANDARD INCLUDING POTENTIALLY DIFFERENT NUMBERS FOR DIFFERENT AREAS? IF THERE WERE A RANGE OF NUMBERS HOW WOULD THAT BE IMPLEMENTED?

Although a numeric design standard(s) for infiltration or treatment ***may*** be appropriate for certain developments, the .75-inch standard is not the appropriate standard. The .75" standard was not developed in accordance with the requirements of the Permit or the Clean Water Act ("Act"), nor was it based on an analysis of the pollutants of concern and the sources of those pollutants. Further, the .75" was designed without considering its impact on affordable housing, ground water quality, or single family homeowners. Rather, the evidence shows the .75" standard was extracted from the County's settlement with the NRDC, and was thereafter applied in haste, as broadly as possible, without compliance with the requirements of the Permit and State and Federal law.

Evidence of this cavalier "we must do something" approach is Respondents' last minute expansion of the SUSMP program to "non-discretionary" projects, without considering the import of this action, and without providing sufficient opportunity for Petitioners to be heard on the issue. Further evidence the SUSMP was developed cavalierly and in haste is the inclusion of admittedly overly broad and unwieldy definitions which go to the heart of the SUSMP, i.e., the definitions of "new development" and "redevelopment," and Respondents' improper application of the SUSMP to "environmentally sensitive areas," as well as their failure to give due consideration to the impact of their SUSMP on homeowners. The evidence shows the .75" standard was developed with no more scrutiny, study or deliberateness than were the other facially flawed terms of the SUSMP.

By law, the SUSMP program should have been developed pursuant to the process set forth under the express terms of the Los Angeles County NPDES Permit, Order No. 96-054. The Permit itself was developed under the auspices of the Act and the regulations thereunder. The regulations specifically envision developing a "management program" under an application process that requires the development of "quantitative data," and the development of particular information on "source identification" and "source characterization." (40 CFR 122.26(d)(1) and (2).) Accordingly, "management programs" developed under the Act are to be designed to address

pollutants of concern and their sources through "quantitative data." (Id.)

As emphasized at the hearing, Respondents failed to follow a process which would lead to a program based on the identity of pollutants and the sources of those pollutants. This process, which is effectively required under the Act and incorporated into the Permit through the provisions concerning the development of programs, was not followed either in form or in substance. Nor was Respondents' SUSMP, specifically including its .75 standard, developed in accordance with the ***Administrative Review Process*** under the Permit, i.e. the express procedural requirements of the Permit ***designed to ensure that a fair, deliberate and collaborative process*** was followed. The Administrative Process required to be followed by the Permit, i.e. the express due process to be provided to the Permittees (Permit, p. 21, § I.G.1),[1] was ignored by Respondents, and the result was a one size fits all standard that was not based on sound science.

Finally, none of the state programs Respondents relied upon to support their own program, i.e. Florida, Maryland, and Washington, when scrutinized in any detail, is applied as broadly or haphazardly as Respondents'. For example, **Maryland's** program includes three major "waiver categories," including developments that result in "***less than a ten percent increase in the pre-development 2-year storm event***" as well as those "***projects completely surrounded by an existing storm water drain system of sufficient capacity to convey the increase in discharge caused by the new development.***" In fact, according to the responses provided by Maryland, "***most redevelopment is waived under Maryland's original and current and storm water regulations.***"

Similarly, **Washington's** 1999 draft Storm Water Manual distinguishes non-pollution generating surfaces from pollution generating surfaces and exempts certain surfaces such as "residential roofs, commercial roofs that do not accumulate pollutants from vents and fugitive emissions . . . ." The Manual further allows ***local governments*** to exempt redevelopment projects if they have adopted a plan that fulfills those requirements through ***"regional facilities."***

---

[1] At the hearing, Respondents' counsel argued that since the Permit was created by the Regional Board, the Board has the ability to change it including changing the Administrative Review Process. (See Transcripts of June 8th hearing , p. 52, ll. 3-11.) Clearly, the Respondents had not proposed any language changes to the terms of the Permit and never noticed a public hearing or otherwise noticed a meeting on proposed changes. Respondents cannot now be permitted to change the Permit *de facto* by an after-the-fact argument to justify their failure to follow its terms.

Last, the **Florida** program recognizes that under the Act, water pollution control programs can be either water-quality effluent based or technology based. According to Florida, ***every*** storm water treatment program is technology based and requires the conducting of an analysis, including rainfall characteristics, runoff characteristics (i.e. storm water volume, pollutant loadings, drainage area), and BMP effectiveness. (See 5/31/00 FDEP letter, p.2, Item 2.) In addition, Florida recognizes that "***[r]egional stormwater systems, which manage the stormwater from several developments or an entire drainage basin, offer many advantages over the piecemeal approach that relies upon small, individual onsite systems.***" (See FLA. BMPs § 2.2. F.)

In light of: (1) the lack of analysis conducted by Respondents in comparison to the extensive analysis conducted in other states; (2) the numerous facial deficiencies and ambiguities in Respondents' program; (3) the import of this program on the millions of citizens and visitors to the County; and (4) the significant financial and environmental costs involved in implementing such a program, as well as the impracticability of reversing direction in midstream once a program is in place, Petitioners respectfully request that any numeric criteria to be developed be scrutinized by a Statewide Stormwater Quality Technical Advisory Committee ("TAC"), to be charged with following a deliberate and collaborative process on the appropriateness of numeric criteria, and, if appropriate, the development of such criteria for Los Angeles County.

The TAC should consist of representatives of the State Board, the Regional Boards of Los Angeles and San Diego, representatives of the Counties of Los Angeles, Ventura and San Diego, as well as the Southern California Association of Governments ("SCAG"), and City Planners, Public Works Directors, the Building Industry, and environmental organizations, WSPA and other interested stakeholders. Petitioners suggest that a Chair with significant experience in storm water quality issues, be appointed to preside over the TAC, such as Mr. Douglas Harrison, Director of the Fresno County Flood Control and Water Conservation District.

To address the State Board's June 12th request for "specific language" to be included in a SUSMP program, as well as the State Board's apparent desire for the Petitioners to put forth specific numeric criteria, Petitioners are proposing that the attached SUSMP program be implemented within 90 days of State Board approval, ***except*** the numerical standards therein,

which are to be studied and utilized as a starting point for peer review by the TAC.[2]

Given the obvious errors in the hastily adopted Regional Board SUSMP, no numerical standards should be imposed until the requisite deliberative process has been adhered to, and a program is developed that is scientifically based and designed to address the storm water quality problems in Los Angeles County. ***Such a program should consider such issues as BMP effectiveness, affordable housing, groundwater quality, vector control issues, and financial constraints on cities and their constituents.*** Petitioners respectfully object to ***any*** numerical criteria, unless and until a collaborative and deliberative process is followed. As Florida has found, the development of a storm water program requires, at a minimum, conducting an analysis of rainfall characteristics, runoff characteristics (i.e. storm water volume, pollutant loadings, drainage area) and BMP effectiveness. Any numeric standard imposed without sufficient analysis could have disastrous consequences for this County and others throughout the State. Accordingly, the imposition of ***any*** numeric design standard(s), including the numeric criteria proposed in the attached, absent a sound scientific basis by the TAC or equivalent entity, is opposed by the Petitioners. The proposed revisions to Respondents' SUSMP are summarized as follows:[3]

(1) The SUSMP has been revised so that any numeric criteria do not apply to Single

---

[2] As referenced in the Petition, because the Regional Board is not a state agency with state-wide jurisdiction, it and other ***Regional Boards*** do not have the authority to impose a SUSMP program or to administer the NPDES program within their jurisdictions, ***without*** appropriate and sufficient direction from the State Board. (See 40 CFR 123.1(g)(1), and 123.22(b).) Only State agencies with "statewide jurisdiction over a class of activities or discharges" are authorized to administer NPDES programs. (Id.) The lack of State direction to individual Regions has resulted in the present problem of different Regional Boards developing varying standards without statewide direction. In developing a "standard of general application," the State Board is required to comply with the rule-making requirements of the APA, Govt. Code § 11340 et seq. As support for the fact that the Respondents have adopted "regulations," Petitioners offer that at the time of the hearing on June 8, Chairman Nahai admitted that ***"After all of that consideration and all of the deliberations, we adopted a set of regulations."*** (June 8th Transcripts, p. 64, ll. 25-26.)

Govt. Code § 11340.5(a) requires the State Board to formally establish it objectives, guidelines and requirements through formal rule making. The APA expressly prohibits public agencies from issuing, utilizing and enforcing any ***order, rule***, or ***standard of general application***, unless such has been adopted as a formal regulation. (See Union of American Physicians & Dentists v. Kizer (1990) 223 Cal.App.3d 490, 496.) Clearly, Regional Boards throughout the State will be basing their direction to cities on the State Board's action on this Petition. Any action imposing specific numeric criteria by this State Board will, therefore, be equivalent to establishing state policy, and the requirements of the APA must be complied with.

[3] The attached SUSMP is the Regional Board's final March 8, 2000 SUSMP program with redlined changes to address the numerous deficiencies Petitioners contend exist with the program.

Family Residences or Units, Subdivisions of 10-99 Homes, Low or Moderate Income Housing Projects, or Redevelopment of historical buildings, sites or landmarks. Also, the addition of 5,000 sq. ft. parking lots has been limited to commercial standalone lots of 25 or more spaces;

(2) Consistent with the Permit, the SUSMP has been revised to apply only to "Discretionary Projects" and the term "project" in the SUSMP is defined as a "discretionary project." Respondents' definition of Discretionary Project is identical to the definition in the regulations to CEQA, and has therefore not been modified. (See 14 CCR § 15357.)

(3) Respondents' inappropriate adoption of "environmentally sensitive areas" to the Permit's seven designated "development" categories, has been deleted, and the term has been redefined to be consistent with its definition in the Development Planning Program, developed under the Permit, and approved by the Executive Officer on 2/11/99.

(4) The term "New Development" has been revised to mean land disturbing activities "resulting in the creation of at least 5,000 square of additional impervious surfaces" "exposed to rainfall," thereby narrowing its scope from the creation of any "impervious surface." The revision avoids the application of the SUSMP to the porch example discussed at the hearing. The term "Redevelopment" has similarly been redefined.

(5) The Section 1 prohibition on Post-Construction Peak Storm Water Runoff Discharges causing erosion has been revised to be consistent with the Permit to only apply to "the maximum extent feasible."

(6) Section 8 has been revised to eliminate language that requires Permittees to ***legislate*** required language in CC&Rs and in purchase/sale agreements between private parties.

(7) For purposes of review by the TAC, Section 9 dealing with the numeric design standard for BMPs has been revised so that these standards only apply where "new development" or "redevelopment" activity will result in additional storm water runoff, in comparison to pre-project runoff, and only where the additional runoff will not otherwise be captured or treated by proximate or regional BMPs constructed or to be constructed within 3 years. (This is consistent with Maryland's program that applies only if there is a 10 % increase in post development runoff from a two year storm event, and its exemption of projects completely surrounded by a sufficient

system, as well as Washington's program that allows local governments to exempt redevelopment projects, where the requirements are met through regional facilities.)

(8) Section 9 dealing with the design standard for BMPs, has been revised for review by the TAC so that different numeric standards, depending on the type of development, may apply.[4] Petitioners propose that the TAC consider a standard that is based on the volume of runoff produced in the 70th percentile 24-hour storm event for 100,000 Square Feet Commercial Developments, the 60th percentile 24-hour storm event for Automotive Repair Shops, Retail Gasoline Outlets ("RGOs"), and Restaurants, and the 50th percentile 24-hour storm event for Home subdivisions with 100 or more housing units. Section 9 has also been revised to include other formulas to calculate a volume of runoff for control or treatment, including a formula that considers the imperviousness of the project. RGOs are exempted where the RGO otherwise complies with the California Best Management Practice Guides for RGOs;

(9) Section 9 has been revised to only require project applicants to design structural or treatment control BMPs to address post-project runoff, consistent with the standard set forth above, unless and until a Statewide Storm Water Quality Mitigation Fund, similar to the State's Underground Storage Tank Fund for underground storage tank releases, has been created. The State Fund is to reimburse project applicants for their costs in developing BMPs necessary to address pre-project runoff only. Applying the Numerical Design Standard under the SUSMP program only to post-development runoff, unless a State Fund is in place, is again consistent with the Maryland program which exempts development categories that result in a less than 10% increase in the pre-development 2-year storm event, as well as its waiver for projects completely surrounded by a sufficient drainage system.

(10) Section 11 of the SUSMP has been revised to provide a waiver for impracticability where there is a "reasonable" risk of groundwater contamination, and to add a basis for a waiver if there is a reasonable risk to the health and safety of the public as a result of vectors, as well as to

---

[4] Respondents' first numeric criteria (§ 9.A.1) is ambiguous and appears to be a misapplication of concepts in the WEF Manual. Respondents further fail to consider the WEF Manual determination that if only 70% of the otherwise maximized storm water capture volume is captured, the decrease in total suspended sediment is insignificant. (WEF Manual, p. 174.)

add a waiver for impracticability on other grounds as established by the applicant.

(11) Section 11 has been revised so that waivers need not be approved by the Regional Board, in part in light of the time constraints created by waiting for Board approval. However, the Executive Officer will have the ability, upon petition, to overturn the granting of a waiver.

(12) The Section 11 Waiver dealing with fees has been revised so that rather than simply have the project applicant pay ***precisely*** the same amount into an account otherwise expended to install an ***impracticable*** BMP, the applicant would instead pay a ***mitigation*** fee, to be applied to the cost (including the administrative costs) of developing an alternative solution, specifically including a regional solution, and to require that the Permittees establish a nexus between the fee imposed on the applicant, the pollutants of concern from such project, and the impact on the proposed alternative system. Further, the Regional Board must, within 12 months, develop a matching fund program to match the funds collected by Permittees, whereby such funds are to be utilized to administer the SUSMP program, including developing regional solutions.

In sum, the SUSMP would require the treatment or capture of runoff only from discretionary New Development or Redevelopment projects (defined as adding 5,000 square feet of impervious surface), where the proposed development will result in an increase in runoff from the project site, as compared to pre-project runoff. Any numeric criteria to be developed by the TAC would not apply to pre-project runoff (consistent with the Maryland Program) until a State Storm Water Quality Fund for urban runoff has been created. The SUSMP would also exempt from any numeric criteria individual Single Family Units, 10-99 Home Subdivisions, Historical buildings, sites and landmarks, and low/moderate income housing. It would, moreover, not apply to environmentally sensitive areas, but allows the impacts of such projects to be addressed in the normal CEQA process and the Development Planning provisions of the Permit.

Petitioners respectfully request that all aspects of the attached SUSMP program be adopted and implemented within 90 days, ***except*** the specific numeric design standards, as no such standards should be adopted and implemented unless and until they can be analyzed, reviewed and are implementable, as determined by the TAC.

II. WHAT TYPES OF DEVELOPMENT OR REMODELING PROJECTS SHOULD BE INCLUDED WITHIN THE MITIGATION REQUIREMENTS?

The development and remodeling projects to be included within the SUSMP as identified above and in the attached, should be limited to those "discretionary" projects that result in a net increase in impervious surface of at least 5,000 square feet. This 5,000 square foot restriction should be incorporated into the definitions of "New Development" and "Redevelopment." In addition, any numerical criteria should not apply to individual Single Family units, 10-99 Home Subdivisions, Low and Moderate Income Housing Projects, or to the development of historical buildings, sites or landmarks, as well as RGOs that implement applicable Task Force BMPs.

III. SHOULD LOCATION, SUCH AS ENVIRONMENTALLY SENSITIVE AREAS, BE A FACTOR IN DETERMINING THE APPLICATION OF THE SUSMP? IF SO, WHAT SPECIFIC TYPES OF PROJECTS SHOULD BE INCLUDED?

The location of a project in an "environmentally sensitive area" should be a factor in determining whether a project is a "Priority Project" for purposes of the Permit and in the development of conditions of approval for the project. Under the Permit, however, the "location" of a project is not and should not be the basis for triggering the application of a SUSMP. Rather, the location of the Project in an "environmentally sensitive area" should instead be a consideration in developing and approving the project, and should be considered a potential significant environmental impact for purposes of determining compliance with CEQA. Under Section III.A.1.c of the Permit, (p. 34), the Permit specifically provides for the application of SUSMPs to "***development categories***." Nothing in the Permit provides for the application of SUSMPs to areas or locations, and Respondents' action applying the SUSMP in such fashion is contrary to the clear terms of the Permit."[5] In short, where a project is a Priority Project because it falls within an environmental sensitive area and may have a "potentially significant effect on storm water quality," the project itself should be reviewed to consider its potential impact on storm water quality and, if appropriate, modified to mitigate any such impacts. (Permit, p. 33.)

[5] Permittees and Respondents recognized in the approved Development Planning Program devised pursuant to § III.A.1.a of the Permit, that the Permit does not define "environmentally sensitive areas," and therefore proceeded to define the term in Footnote 3 therein. This Program was approved by the Executive Officer on 2/11/99, and this same definition should accordingly be carried through in the SUSMP's definition of "environmental sensitive areas."

IV. SHOULD THE SUSMP BE APPLIED TO BOTH DISCRETIONARY PROJECTS AND MINISTERIAL PROJECTS? HOW SHOULD THE TERM "DISCRETIONARY" BE DEFINED?

The terms of the Permit make it very clear the SUSMP is only to apply to "discretionary" projects. As discussed at the hearing, the Permit specifically limits the application of SUSMPs to ***"development projects requiring discretionary approval."*** Three other provisions in the "Development Planning" Part of the Permit make it crystal clear that SUSMPs are to apply only to "discretionary" projects. (Permit, p.33, 34 & 36, §§ 1, 3, & 4 to § III.A. "Development Planning.")

The fact that the Permit only applies to "discretionary" projects was conceded by Respondents through an e-mail from their counsel, Mr. Leon, to Mr. Swamikannu dated 1/25/00. In this e-mail Mr. Swamikannu asks: "The 1996 permit talks about discretionary projects. Can SUSMPs be applied to non-discretionary projects as well as discretionary or is the Board limited in this instance." Mr. Leon replies: ***"It's my belief that, since the permit says 'discretionary,' we're stuck. It simply does not include non-discretionary activities. To include them in this proposal by the EO is beyond the scope of the Permit authority. It would take an act of the Board to amend the permit to include non-discretionary activities."*** This e-mail (Item 19 of Vol. 2 of the A.R.) confirms Respondents knew the Permit only allowed the application of SUSMPs to "discretionary projects" and that "it ***would take an act of the Board to amend the Permit to include non-discretionary activities."*** Thus, Respondents knew they were "stuck" when applying SUSMPs to "non-discretionary" projects, but chose to ignore the Permit and to adopt a program in direct violation of its terms.[6] Interestingly enough, the definition of "Discretionary Project" in Respondents' SUSMP is verbatim from the CEQA guidelines. (14 CCR § 15357.)

Respondents last minute decision to apply the SUSMP program to all "non-discretionary" projects, without notice to the Permittees, and without consideration of the impact of this decision,

---

[6] Mr. Leon's interpretation is confirmed on p. 2 of Respondents' 12/7/99 Tentative Resolution, which was the draft resolution prepared for adoption at the January 26 hearing. Pursuant to Finding 13 therein, the Regional Board was to find: "13. Standard Urban Stormwater Mitigation Plans are required for a ***specified set of discretionary*** priority projects." (See A.R. p. 11-29 of Item 2 of Vol. 2.) Petitioners intended on addressing the 1/25/00 e-mail and Finding 13 through cross-examination at the hearing. Unfortunately sufficient time was not provided to address these and numerous other issues Petitioners intended to address through cross-examination.

is consistent with their over-zealous approach to hastily adopt a SUSMP, irrespective of the substantive or procedural requirements of the Permit. The belated inclusion of "nondiscretionary" projects exemplifies Respondents desire to "just do something" and its refusal to follow the deliberate and collaborative process required by the Permit and the Act, to do something right.

V. CONCLUSION

In conclusion, the Respondents' numeric standard was extracted from the County's settlement with the NRDC, and is the result of insufficient staffing, funding and inadequate study of the pollutants of concern, their sources, and the best means to mitigate such pollutants.[7] Petitioners respectfully pray that the pollutants of concern and the sources be identified, that the effectiveness of the BMPs be assessed, that a cost/benefit analysis be performed to weigh the benefits of any numeric standard(s) versus its costs, and that the environmental costs such as the impact on groundwater quality, vectors, and the impact on low/moderate income housing, be considered, as well as other more effective alternatives such as regional solutions.

Petitioners further respectfully request that any program be established in accordance with the requirements of the APA (Govt. Code § 11340 et seq.), the Constitutional Prohibition on Unfunded Mandates (Cal. Const. Art. XIII B, § 6), CEQA (Pub. Res. Code § 21000 et seq.), the Cost/Benefit requirements of State and federal law, Water Code Section 13360 on specific design standards, as well as the regulations to the Act requiring "source identification" and consideration of "quantitative data." (40 CFR § 122.26(d)(1) & (2).)

Petitioners respectfully request that all aspects of the attached SUSMP, ***except*** the numeric criteria to be referred to the TAC for comprehensive review, be approved.[8]

Dated: July 6, 2000

RUTAN & TUCKER LLP

RICHARD MONTEVIDEO

[7] In its Petition to EPA, ***the NRDC*** contends ***its*** petition "demonstrates that the Regional Board inexplicably devotes the least amount of resources to its worst water quality problem: polluted runoff. Because of its legal inadequacy and objective ineffectiveness, EPA must withdraw the State's authority vested in the Regional Board to oversee the Storm Water Program in Los Angeles unless these deficiencies are corrected within ninety days." (Petitioners' Exh. 5, p. 2, ll. 21-26.)

[8] Petitioners hereby incorporate all of the prior arguments set forth in their Petition, their prior briefings and at the hearing, in this post-hearing brief and continue to contest that the Respondents' SUSMP program is invalid for all of the reasons set forth therein.

PETITIONERS' PROPOSED REVISIONS TO RESPONDENTS'

STANDARD URBAN STORM WATER MITIGATION PLAN

FOR LOS ANGELES COUNTY AND CITIES IN LOS ANGELES COUNTY

STANDARD URBAN STORM WATER MITIGATION PLAN

BACKGROUND

The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Los Angeles County Permit) issued to Los Angeles County and 85 cities (Permittees) by the Los Angeles Regional Water Quality Control Board (Regional Board) on July 15, 1996, requires the development and implementation of a program addressing storm water pollution issues in development planning for private projects. The same requirements are applicable to the City of Long Beach under its separate municipal storm water permit (City of Long Beach MS4 Permit), which was issued on June 30, 1999.

The requirement to implement a program for development planning is based on, federal and state statutes including: Section 402 (p) of the Clean Water Act, Section 6217 of the Coastal Zone Act Reauthorization Amendments of 1990 ("CZARA"), and the California Water Code. The Clean Water Act amendments of 1987 established a framework for regulating storm water discharges from municipal, industrial, and construction activities under the NPDES program. The primary objectives of the municipal storm water program requirements are to:

1. Effectively prohibit non-storm water discharges, and
2. Reduce the discharge of pollutants from storm water conveyance systems to the Maximum Extent Practicable (MEP statutory standard).

The Standard Urban Storm Water Mitigation Plan (SUSMP) was developed as part of the municipal storm water program to address storm water pollution from new Development and Redevelopment by the private sector. This SUSMP contains a list of the minimum required Best Management Practices (BMPs) that must be used for a designated project. Additional BMPs may be required by ordinance or code adopted by the Permittee and applied generally or on a case by case basis. The Permittees are required to adopt the requirements set herein in their own SUSMP. Developers must incorporate appropriate SUSMP requirements into their project plans. Each Permittee will approve the project plan as part of the development plan approval process and prior to issuing building and grading permits for the **discretionary** projects covered by the SUSMP requirements.

All ~~projects~~ **Discretionary Projects** that fall into one of seven categories are identified in the Los Angeles County MS4 Permit as requiring SUSMPs. These categories are:

- Single-Family Hillside Residences
- 100,000 Square Foot Commercial Developments
- Automotive Repair Shops
- Retail Gasoline Outlets
- Restaurants
- Home Subdivisions with 10 to 99 housing units
- Home Subdivisions with 100 or more housing units

The ~~Regional Board Executive Officer has designated two additional categories~~ **Design Standards for Structural or Treatment Control BMPs as set forth in Section 9 below shall not apply to Single-Family Hillside Residences (or any individual single-family housing unit, including any individual condominium or apartment unit), Home Subdivisions with 10 to 99 Housing Units, Low or**

Moderate Income Housing projects, or projects involving Historical Sites, Buildings or Landmarks. In addition, the following added category is subject to SUSMP requirements for the Los Angeles County MS4 Permit. ~~These categories are:~~;

- ~~Location within or directly adjacent to or discharging directly to an environmentally sensitive area, and~~Parking lots ~~5,000 square feet or more or~~ **Stand alone commercial parking lots** with 25 or more parking spaces ~~and potentially~~ **which are** exposed to ~~storm water runoff~~ **rainfall.**

The City of Long Beach permit requires SUSMP for the following categories only: (i) 10-99 home subdivisions; (ii) 100 or more subdivisions; (iii) 100,000 or more square foot commercial developments; and (iv) Projects located adjacent to or discharging to environmentally sensitive areas. For the remaining five categories, equivalent requirements have been included directly in or are expected to be developed shortly under the City of Long Beach Storm Water Management Plan.

Permittees shall amend codes and promulgate ordinances not later than ~~September 8, 2000~~ **six (6) months after this SUSMP is finally adopted and not otherwise subject to legal challenge**, to give legal effect to the SUSMP requirements. The SUSMP requirements for projects identified herein shall take effect ~~not later than October 8, 2000.~~ **nine (9) months after this SUSMP is finally adopted and not otherwise subject to legal challenge.**

DEFINITIONS

"100,000 Square Foot Commercial Development" means any commercial development that creates at least 100,000 square feet of impermeable area, including parking ~~areas."Automotive~~ **areas.**

"Automotive Repair Shop" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539.

"Best Management Practice (BMP)" means any program, technology, process, siting criteria, operational methods or measures, or engineered systems, which when implemented prevent, control, remove, or reduce pollution.

"Commercial Development" means any development on private land that is not heavy industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, multi-apartment buildings, car wash facilities, mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses and other light industrial complexes.

"Directly Connected Impervious Area (DCIA)" means the area covered by a building, impermeable pavement, and/ or other impervious surfaces, which drains directly into the storm drain without first flowing across permeable land area (e.g. lawns).

"Discretionary Project" means a project which requires the exercise of judgement or deliberation when the public agency or public body decides to approve or disapprove a particular activity, as distinguished from situations where the public agency or body merely has to determine whether there has been conformity with applicable statutes, ordinances, or regulations.

"Environmentally Sensitive Area" means an area designated ~~as an Area of Special Biological Significance by the State Water Resources Control Board (Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties (1994) and amendments) or an area designated as an Area of Ecological Significance by the County of Los Angeles (Los Angeles County Significant Areas Study, Los Angeles County Department of Regional Planning (1976) and amendments) or an area designated as a significant natural area by the California Resources Agency. Refer to Table 3 for a listing.~~ **by the Permittees within their jurisdiction as "environmentally sensitive" utilizing criteria such as, but not limited to, the presence of the following: endangered, threatened, or rare species or their habitats; locally designated species (e.g., heritage trees); locally designated natural communities (e.g., oak forest, coastal habitat, etc.); and wildlife**

dispersal or migration corridors.

"Greater than (>) 9 unit home subdivision" means any subdivision being developed for 10 or more 10 single-family or multi-family dwelling units.

"Hillside" means property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is twenty-five percent or greater.

"Infiltration" means the downward entry of water into the surface of the soil.

"New Development" means land disturbing activities ~~;~~ **and** structural development~~, including~~ **(including the** construction or installation of a building or structure~~, creation of~~**), conducted through a Discretionary Project, resulting in the creation of at least 5,000 square feet of additional** impervious surfaces ~~; and land subdivision~~ **exposed to rainfall**.

"Parking Lot" means land area or facility for the temporary parking or storage of motor vehicles used personally, for business or for commerce with a lot size of 5,000 square feet or more, or with 25 or more parking spaces.

"Project" for purposes of this document shall mean a "Discretionary Project" as defined above.

"Redevelopment" means development~~"Redevelopment" means~~, on an already developed site, ~~the creation or addition of~~ **through a Discretionary Project, resulting in** at least 5,000 square feet of **additional** impervious surfaces ~~or the creation or addition of fifty percent or more of impervious surfaces or the making of improvements to fifty percent or more of the existing structure. Redevelopment includes, but is not limited to: the expansion of a building footprint or addition or replacement of a structure; structural development including an increase in gross floor area and/ or exterior construction or remodeling; replacement of impervious surface that is not part of a routine maintenance activity; and land disturbing activities related with structural or impervious surfaces~~ **exposed to rainfall**.

"Restaurant" means a stand-alone facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption. (SIC code 5812).

"Retail Gasoline Outlet" means any facility engaged in selling gasoline and lubricating oils.

"Source Control BMP" means any schedules of activities, prohibitions of practices, maintenance procedures, managerial practices or operational practices that aim to prevent storm water pollution by reducing the potential for contamination at the source of pollution.

"Storm Event" means a rainfall event that produces more than 0.1 inch of precipitation and that, which is separated from the previous storm event by at least 72 hours of dry weather.

"Structural BMP" means any structural facility designed and constructed to mitigate the adverse impacts of storm water and urban runoff pollution (e.g. canopy, structural enclosure). The category may include both Treatment Control BMPs and Source Control BMPs.

"Treatment" means the application of engineered systems that use physical, chemical, or biological processes to remove pollutants. Such processes include, but are not limited to, filtration, gravity settling, media adsorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

"Treatment Control BMP" means any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media adsorption or any other physical, biological, or chemical process.

CONFLICTS WITH LOCAL PRACTICES
Where provisions of the SUSMP requirements conflict with established local codes, (e.g., specific language of signage used on storm drain stenciling), the Permittee may continue the local practice and modify the SUSMP to be consistent with the code, except that to the extent that the standards in the SUSMP are more stringent than those under local codes, such more stringent standards shall apply.

SUSMP PROVISIONS APPLICABLE TO ALL CATEGORIES

REQUIREMENTS

1. PEAK STORM WATER RUNOFF DISCHARGE RATES

~~Post~~ **To the maximum extent feasible, post**-development peak storm water runoff discharge rates shall not exceed the estimated pre-development rate for developments where the increased peak storm water discharge rate will result in increased potential for downstream erosion.

2. CONSERVE NATURAL AREAS

If applicable, the following items are required and must be implemented in the site layout during the subdivision design and approval process, consistent with applicable General Plan and Local Area Plan policies:

- Concentrate or cluster Development on portions of a site while leaving the remaining land in a natural undisturbed condition.
- Limit clearing and grading of native vegetation at a site to the minimum amount needed to build lots, allow access, and provide fire protection.
- Maximize trees and other vegetation at each site by planting additional vegetation, clustering tree areas, and promoting the use of native and/or drought tolerant plants.
- Promote natural vegetation by using parking lot islands and other landscaped areas.
- Preserve riparian areas and wetlands.

3. MINIMIZE STORM WATER POLLUTANTS OF CONCERN

Storm water runoff from a site has the potential to contribute oil and grease, suspended solids, metals, gasoline, pesticides, and pathogens to the storm water conveyance system. The development must be designed so as to minimize, to the maximum extent practicable, the introduction of pollutants of concern that may result in significant impacts, generated from site runoff of directly connected impervious areas (DCIA), to the storm water conveyance system as approved by the building official. Pollutants of concern, consist of any pollutants that exhibit one or more of the following characteristics: current loadings or historic deposits of the pollutant are impacting the beneficial uses of a receiving water, elevated levels of the pollutant are found in sediments of a receiving water and/or have the potential to bioaccumulate in organisms therein, or the detectable inputs of the pollutant are at a concentrations or loads considered potentially toxic to humans and/or flora and fauna.

In meeting this specific requirement, "minimization of the pollutants of concern" will require the incorporation of a BMP or combination of BMPs best suited to maximize the reduction of pollutant loadings in that runoff to the Maximum Extent Practicable. Those BMPs best suited for that purpose are those listed in the *California Storm Water Best Management Practices Handbooks*; *Caltrans Storm Water Quality Handbook: Planning and Design Staff Guide*; *Manual for Storm Water Management in Washington State*; *The Maryland Stormwater Design Manual*; *Florida Development Manual: A Guide to Sound Land and Water Management*; Denver *Urban Storm Drainage Criteria Manual, Volume 3 – Best*

Management Practices and *Guidance Specifying Management Measures for Sources of Nonpoint Pollution in Coastal Waters* , USEPA Report No. EPA-840-B-92-002, as "likely to have significant impact" beneficial to water quality for targeted pollutants that are of concern at the site in question. However, it is possible that a combination of BMPs not so designated, may in a particular circumstance, be better suited to maximize the reduction of the pollutants.

Examples of BMPs that can be used for minimizing the introduction of pollutants of concern generated from site runoff are identified in Table 2. Any BMP not specifically approved by the Regional Board in Resolution No. 99-03, "Approving Best Management Practices for Municipal Storm Water and Urban Runoff Programs in Los Angeles County", for development planning may be used if they have been recommended in one of the above references.

4. PROTECT SLOPES AND CHANNELS

Project plans must include BMPs consistent with local codes and ordinances and the SUSMP to decrease the potential of slopes and/or channels from eroding and impacting storm water runoff:

- Convey runoff safely from the tops of slopes and stabilize disturbed slopes.
- Utilize natural drainage systems to the maximum extent practicable
- Control or reduce or eliminate flow to natural drainage systems to the maximum extent practicable
- Stabilize permanent channel crossings.
- Vegetate slopes with native or drought tolerant vegetation.
- Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion, with the approval of all agencies with jurisdiction, e.g., the U.S. Army Corps of Engineers and the California Department of Fish and Game

5. PROVIDE STORM DRAIN SYSTEM STENCILING AND SIGNAGE

Storm drain stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets. The stencil contains a brief statement that prohibits the dumping of improper materials into the storm water conveyance system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are effective supplements to the anti-dumping message.

- All storm drain inlets and catch basins within the project area must be stenciled with prohibitive language (such as: "NO DUMPING – DRAINS TO OCEAN") and/or graphical icons to discourage illegal dumping.
- Signs and prohibitive language and/or graphical icons, which prohibit illegal dumping, must be posted at public access points along channels and creeks within the project area.
- Legibility of stencils and signs must be maintained.

6. PROPERLY DESIGN OUTDOOR MATERIAL STORAGE AREAS

Outdoor material storage areas refer to storage areas or storage facilities solely for the storage of materials. Improper storage of materials outdoors may provide an opportunity for toxic compounds, oil and grease, heavy metals, nutrients, suspended solids, and other pollutants to enter the storm water conveyance system. Where proposed project plans include outdoor areas for storage of materials that may contribute pollutants to the storm water conveyance system, the following Structural or Treatment BMPs are required:

- Materials with the potential to contaminate storm water must be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the storm water conveyance system; or (2) protected by secondary containment structures such as berms, dikes, or curbs.
- The storage area must be paved and sufficiently impervious to contain leaks and spills.
- The storage area must have a roof or awning to minimize collection of storm water within the secondary containment area.

7. PROPERLY DESIGN TRASH STORAGE AREAS

A trash storage area refers to an area where a trash receptacle or receptacles are located for use as a repository for solid wastes.

Loose trash and debris can be easily transported by the forces of water or wind into nearby storm drain inlets, channels, and/or creeks. All trash container areas must meet the following Structural or Treatment Control BMP requirements (individual single family residences are exempt from these requirements):

- Trash container areas must have drainage from adjoining roofs and pavement diverted around the area(s).

- Trash container areas must be screened or walled to prevent off-site transport of trash.

8. PROVIDE PROOF OF ONGOING BMP MAINTENANCE

Improper maintenance is one of the most common reasons why water quality controls will not function as designed or which may cause the system to fail entirely. It is important to consider who will be responsible for maintenance of a permanent BMP, and what equipment is required to perform the maintenance properly. As part of project review, if a project applicant has included or is required to include, Structural or Treatment Control BMPs in project plans, the Permittee shall require that the applicant provide verification of maintenance provisions through such means as may be appropriate, including, but not limited to legal agreements, covenants, CEQA mitigation requirements and/or Conditional Use Permits.

For all properties, the verification will include the developer's signed statement, as part of the project application, accepting responsibility for all structural and treatment control BMP maintenance until the time the property is transferred and, where applicable, a signed agreement from the public entity assuming responsibility for Structural or Treatment Control BMP maintenance. ~~The transfer of property to a private or public owner must have conditions requiring the recipient to assume responsibility for maintenance of any Structural or Treatment Control BMP to be included in the sales or lease agreement for that property, and will be the owner's responsibility. The condition of transfer shall include a provision that the property owners conduct maintenance inspection of all Structural or Treatment Control BMPs at least once a year and retain proof of inspection. For residential properties where the Structural or Treatment Control BMPs are located within a common area which will be maintained by a homeowner's association, language regarding the responsibility for maintenance must be included in the projects conditions, covenants and restrictions (CC&Rs). Printed educational materials will be required to accompany the first deed transfer to highlight the existence of the requirement and to provide information on what storm water management facilities are present, signs that maintenance is needed, how the necessary maintenance can be performed, and assistance that the Permittee can provide. The transfer of this information shall also be required with any subsequent sale of the property.~~

If Structural or Treatment Control BMPs are located within a public area proposed for transfer, they will be the responsibility of the developer until they are accepted for transfer by the County or other appropriate public agency. Structural or Treatment Control BMPs proposed for transfer must meet design standards

adopted by the public entity for the BMP installed and should be approved by the County or other appropriate public agency prior to its installation.

9. DESIGN STANDARDS FOR STRUCTURAL OR TREATMENT CONTROL BMPs[1]

~~Structural or Treatment~~ **Unless otherwise exempted, post-construction structural or treatment** control BMPs selected for use at any **New Development or Redevelopment** project covered by this SUSMP**, where the New Development or Redevelopment project will result in additional storm water runoff, in comparison to pre-project runoff from the project site, and where such additional runoff will not otherwise be captured or treated by proximate or regional structural or treatment control BMPs existing, or to be constructed within three (3) years from the date of completion of the project,** shall meet the design standards of this Section ~~unless specifically exempted.~~,

~~Post-construction Structural or Treatment Control~~ **The post-construction structural or treatment control** BMPs shall be designed to:

A. mitigate (infiltrate or treat) storm water runoff ~~from either:~~ **that results from:**

1. ~~the 85th percentile 24-hour runoff event determined as~~ **the volume of runoff produced from the 70th percentile 24-hour storm event for 100,000 Square Foot Commercial Developments, the 60th percentile 24-hour storm event for Automotive Repair Shops, Retail Gasoline Outlets and Restaurants, and the 50th percentile 24-hour storm event for Home Subdivisions with 100 or More Housing Units, as determined from the historical record-based cumulative occurrence probability for the referenced rain gauge in Los Angeles County as developed by the County of Los Angeles, Department of Public Works; or**

2. the maximized capture storm water volume ~~for the area, from the formula recommended~~ **determined through the application of formulas 5.1 and 5.2** in Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998)~~,~~ **where i = the imperviousness ratio for the project as determined by the project engineer or derived from the list of imperviousness ratio developed by the County of Los Angeles Department of Public Works for the land use(s) proposed for the New Development or Redevelopment project, a = the event capture ratio for a 24-hour drain time from Table 5.4, and P_6 = .60 from Figure 5.3;** or

3. the volume of annual runoff based on unit basin storage water quality volume, to achieve ~~80~~ **70** percent or more volume treatment ~~by the method recommended in~~ **for 100,000 Square Foot Commercial Developments by the method set forth in Appendix D to the** *California Stormwater Best Management Practices Handbook – ~~Industrial/ Commercial, (1993), or~~* ***Municipal,*** **(1993), 60 percent or more for Automotive Repair Shops, Retail Gasoline Outlets and Restaurants, and 50 percent or more for Home Subdivisions with 100 or more housing units; or**

4. ~~the volume of runoff produced from a 0.75 inch storm event, prior to its discharge to a storm water conveyance system, or~~ **the water quality capture volume for the Los Angeles region as determined by the formulas for water quality capture outside the Denver region contained in Section 4.4.2 of the *Urban Storm Drainage Criteria Manual, Volume 3,* update, published by the Urban Drainage and Flood Control District, Denver, Colorado, September 1, 1999;**

---

1 The numeric criteria set forth herein are included ***only*** for purposes of analysis as a starting point for review by the proposed State-wide Storm Water Quality Technical Advisory Committee.

~~the volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event,~~ AND

~~AND~~

~~B. control~~ B. Control peak flow discharge to provide stream channel and over bank flood protection, based on flow design criteria selected by the local agency.

~~Limited Exclusion~~ C. Exclusions

1. ~~Restaurants, where the land area for development or redevelopment is less than 5,000 square feet, are excluded from the numerical Structural or Treatment Control BMP design standard requirement only.~~ All pre-project storm water runoff shall be excluded from the calculations referenced in Subsection 9(A) above, until such time as a State-Wide Urban Storm Water Mitigation Fund has been created that enables project applicants to seek reimbursement for all costs and fees incurred in addressing pre-project storm water runoff, as well as costs and fees paid to Permittees in the form of permit fees and oversight and administrative review costs.

2. Retail Gasoline Outlets which implement all applicable requirements of the California Storm Water Quality Task Force Best Management Practice Guide for Retail Gasoline Outlets (March 1997) shall be excluded from the Numerical Design Standards set forth in Subsection 9(A) above.

10. PROVISIONS APPLICABLE TO INDIVIDUAL PRIORITY PROJECT CATEGORIES

REQUIREMENTS

A. 100,000 SQUARE FOOT COMMERCIAL DEVELOPMENTS

1. PROPERLY DESIGN LOADING/UNLOADING DOCK AREAS

Loading/unloading dock areas have the potential for material spills to be quickly transported to the storm water conveyance system. To minimize this potential, the following design criteria are required:

- Cover loading dock areas or design drainage to minimize run-on and runoff of storm water.
- Direct connections to storm drains from depressed loading docks (truck wells) are prohibited.

2. PROPERLY DESIGN REPAIR/MAINTENANCE BAYS

Oil and grease, solvents, car battery acid, coolant and gasoline from the repair/maintenance bays can negatively impact storm water if allowed to come into contact with storm water runoff. Therefore, design plans for repair bays must include the following:

- Repair/maintenance bays must be indoors or designed in such a way that doesn't allow storm water runon or contact with storm water runoff.
- Design a repair/maintenance bay drainage system to capture all washwater, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the

storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

3. PROPERLY DESIGN VEHICLE/EQUIPMENT WASH AREAS

The activity of vehicle/equipment washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. Include in the project plans an area for washing/steam cleaning of vehicles and equipment. The area in the site design must be:

- Self-contained and/ or covered, equipped with a clarifier, or other pretreatment facility, and properly connected to a sanitary sewer.

B. RESTAURANTS

1. PROPERLY DESIGN EQUIPMENT/ACCESSORY WASH AREAS

The activity of outdoor equipment/accessory washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. Include in the project plans an area for the washing/steam cleaning of equipment and accessories. This area must be:

- Self-contained, equipped with a grease trap, and properly connected to a sanitary sewer.
- If the wash area is to be located outdoors, it must be covered, paved, have secondary containment, and be connected to the sanitary sewer.

C. RETAIL GASOLINE OUTLETS

1. PROPERLY DESIGN FUELING AREA

Fueling areas have the potential to contribute oil and grease, solvents, car battery acid, coolant and gasoline to the storm water conveyance system. The project plans must include the following BMPs:

- The fuel dispensing area must be covered with an overhanging roof structure or canopy. The canopy's minimum dimensions must be equal to or greater than the area within the grade break. The canopy must not drain onto the fuel dispensing area, and the canopy downspouts must be routed to prevent drainage across the fueling area.
- The fuel dispensing area must be paved with Portland cement concrete (or equivalent smooth impervious surface), and the use of asphalt concrete shall be prohibited.
- The fuel dispensing area must have a 2% to 4% slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of storm water to the extent practicable.
- At a minimum, the concrete fuel dispensing area must extend 6.5 feet (2.0 meters) from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot (0.3 meter), whichever is less.

D. AUTOMOTIVE REPAIR SHOPS

1. PROPERLY DESIGN FUELING AREA

Fueling areas have the potential to contribute oil and grease, solvents, car battery acid, coolant and gasoline to the storm water conveyance system. Therefore, design plans, which include fueling areas, must contain the following:

- The fuel dispensing area should be covered with an overhanging roof structure or canopy. The cover's minimum dimensions must be equal to or greater than the area within the grade break. The cover must not drain onto the fuel dispensing area and the downspouts must be routed to prevent drainage across the fueling area.
- The fuel dispensing areas must be paved with Portland cement concrete (or equivalent smooth impervious surface), and the use of asphalt concrete shall be prohibited.
- The fuel dispensing area must have a 2% to 4% slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of storm water.
- At a minimum, the concrete fuel dispensing area must extend 6.5 feet (2.0 meters) from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot (0.3 meter), whichever is less.
-

2. PROPERLY DESIGN REPAIR/MAINTENANCE BAYS

Oil and grease, solvents, car battery acid, coolant and gasoline from the repair/maintenance bays can negatively impact storm water if allowed to come into contact with storm water runoff. Therefore, design plans for repair bays must include the following:

- Repair/maintenance bays must be indoors or designed in such a way that doesn't allow storm water run-on or contact with storm water runoff.
- Design a repair/maintenance bay drainage system to capture all wash-water, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit.

3. PROPERLY DESIGN VEHICLE/EQUIPMENT WASH AREAS

The activity of vehicle/equipment washing/steam cleaning has the potential to contribute metals, oil and grease, solvents, phosphates, and suspended solids to the storm water conveyance system. Include in the project plans an area for washing/steam cleaning of vehicles and equipment. This area must be:

- Self-contained and/or covered, equipped with a clarifier, or other pretreatment facility, and properly connected to a sanitary sewer or to a permitted disposal facility.

4. PROPERLY DESIGN LOADING/UNLOADING DOCK AREAS

Loading/unloading dock areas have the potential for material spills to be quickly transported to the storm water conveyance system. To minimize this potential, the following design criteria are required:

- Cover loading dock areas or design drainage to minimize run-on and runoff of storm water.
- Direct connections to storm drains from depressed loading docks (truck wells) are prohibited.

E. PARKING LOTS

1. PROPERLY DESIGN PARKING AREA

Parking lots contain pollutants such as heavy metals, oil and grease, and polycyclic aromatic hydrocarbons that are deposited on parking lot surfaces by motor-vehicles. These pollutants are directly transported to surface waters. To minimize the offsite transport of pollutants, the following design criteria are required:

- Reduce impervious land coverage of parking areas
- Infiltrate runoff before it reaches storm drain system.
- Treat runoff before it reaches storm drain system

2. PROPERLY DESIGN TO LIMIT OIL CONTAMINATION AND PERFORM MAINTENANCE

Parking lots may accumulate oil, grease, and water insoluble hydrocarbons from vehicle drippings and engine system leaks.

- Treat to remove oil and petroleum hydrocarbons at parking lots that are heavily used (e.g. fast food outlets, lots with 25 or more parking spaces , sports event parking lots, shopping malls, grocery stores, discount warehouse stores)
- Ensure adequate operation and maintenance of treatment systems particularly sludge and oil removal, and system fouling and plugging prevention control

11. WAIVER

A Permittee may, through adoption of an ordinance or code incorporating the treatment requirements of the SUSMP, provide for a waiver from the ~~requirement~~ **Numerical Design Standards under Section 9 above,** if impracticability for a specific ~~property~~ **project** can be established. A waiver of impracticability shall be granted only when all ~~other~~ **reasonable** Structural or Treatment Control BMPs have been considered and rejected as infeasible **or impracticable**. Recognized ~~situations~~ **circumstances** of impracticability include~~,~~**;** (i) ~~extreme~~ limitations of space ~~for treatment on a redevelopment project,~~ **at a Redevelopment project;** (ii) unfavorable or unstable soil conditions at a site to attempt infiltration~~, and~~**;** (iii) **a reasonable** risk of ground water contamination ~~because a known unconfined aquifer lies beneath the land surface or an existing or potential underground source of drinking water is less than 10 feet from the soil surface. Any other justification for impracticability must be separately petitioned by the Permittee and submitted to the Regional Board for consideration. The Regional Board may consider approval of the waiver justification or may delegate the authority to approve a class of waiver justifications to~~ **that cannot otherwise be reasonably mitigated; (iv) a reasonable risk of harm to the health and safety of the public as a result of potential vectors that cannot reasonably be mitigated; and (v) such other grounds for impracticably as may be established by the Project Applicant as reviewed and approved by the Permittee. A waiver granted by a Permittee for any New Development or Redevelopment project may be revoked by** the Regional Board Executive Officer~~. The supplementary waiver justification becomes recognized and effective only after approval by the Regional Board or the Regional Board Executive Officer. A waiver granted by a Permittee to any development or redevelopment project may be revoked by the Regional Board Executive Officer~~ for cause and with proper notice upon petition **within thirty (30) days**.

If a waiver is granted for impracticability, the Permittee ~~must~~ **shall** require the project ~~proponent to transfer the savings in cost~~ **applicant to pay a mitigation fee**, as determined by the Permittee, to a

~~storm water mitigation fund to be used to promote regional or alternative solutions for storm water pollution in the storm watershed and operated by a public agency or a non-profit entity.~~ **be applied by the Permittee towards the cost, including administrative costs, of developing an alternative solution, specifically including but not limited to, a regional solution to storm water runoff pollutants created from the proposed project. The Permittee shall establish a nexus between the amount of the fees imposed on the project applicant, the volume of storm water runoff, and the pollutants of concern from the proposed project, and the proposed alternative solution.**

Within twelve (12) months from the effective date of this SUSMP, the Regional Board shall, develop a matching fund program to match each dollar collected by the Permittees under this Waiver provision, whereby such funds received from the Regional Board shall be used by the Permittees to implement, administer and develop alternative and other regional solutions to urban storm water runoff, and to otherwise administer the Standard Urban Storm Water Mitigation Plan.

12. LIMITATION ON USE OF INFILTRATION BMPs

Three factors significantly influence the potential for storm water to contaminate ground water. They are (i) pollutant mobility, (ii) pollutant abundance in storm water, (iii) and soluble fraction of pollutant. The risk of contamination of groundwater may be reduced by pretreatment of storm water. A discussion of limitations and guidance for infiltration practices is contained in, *Potential Groundwater Contamination from Intentional and Non-Intentional Stormwater Infiltration, Report No. EPA/600/R-94/051, USEPA (1994).*

In addition, the distance of the groundwater table from the infiltration BMP may also be a factor determining the risk of contamination. A water table distance separation of ten feet depth in California presumptively poses negligible risk for storm water not associated with industrial activity or high vehicular traffic.

Infiltration BMPs are not recommended for areas of industrial activity or areas subject to high vehicular traffic (25,000 or greater average daily traffic (ADT) on main roadway or 15,000 or more ADT on any intersecting roadway) unless appropriate pretreatment is provided to ensure groundwater is protected and the infiltration BMP is not rendered ineffective by overload.
12.

13. ALTERNATIVE CERTIFICATION FOR STORM WATER TREATMENT MITIGATION

In lieu of conducting detailed BMP review to verify Structural or Treatment Control BMPs adequacy, a Permittee may elect to accept a signed certification from a Civil Engineer or a Licensed Architect registered in the State of California, that the plan meets the criteria established herein. The Permittee is encouraged to verify that certifying person(s) have been trained on BMP design for water quality, not more than two years prior to the signature date. Training conducted by an organization with storm water BMP design expertise (e.g., a University, American Society of Civil Engineers, American Society of Landscape Architects, American Public Works Association, or the California Water Environment Association) may be considered qualifying.

14. RESOURCES AND REFERENCE

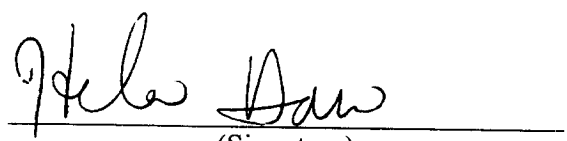
PROOF OF SERVICE BY MAIL

STATE OF CALIFORNIA)
) ss.:
COUNTY OF ORANGE)

I am employed in the County of Orange, State of California. I am over the age of 18 and not a party to the within action. My business address is 611 Anton Boulevard, Fourteenth Floor, Costa Mesa, California 92626-1998.

On July 6, 2000, I served on interested parties in said action the within:

PETITIONERS' POST-HEARING REPLY BRIEF TO JUNE 12, 2000 STATE BOARD INQUIRY



by placing a true copy thereof in sealed envelope(s) addressed as stated on the attached mailing list.

I am readily familiar with this firm's practice of collection and processing correspondence for mailing. Under that practice it would be deposited with the U.S. postal service on that same day in the ordinary course of business. I am aware that on motion of party served, service is presumed invalid if postal cancellation date or postage meter date is more than 1 day after date of deposit for mailing in affidavit.

Executed on July 6, 2000, at Costa Mesa, California.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct.

Helen Davis

Petitioners,

vs.

THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION; and DENNIS DICKERSON, Executive Director of the Los Angeles Regional Water Quality Control Board,

Respondents.

Case Nos. A-1280, A-1280(a), and A-1280(b)

PETITIONERS' RESPONSE TO NRDC'S OBJECTIONS TO PETITIONERS' POST-HEARING BRIEF

Hearing
Date: June 7-8, 2000
Time: 10:00 a.m.
Location: 3350 Civic Center Drive
Torrance, CA 90503

Petitioners Bellflower, et al. respectfully reply to the objections of the NRDC to said Petitioners' Post-Hearing Brief as follows:

I. PETITIONERS' POST HEARING BRIEF WAS SPECIFICALLY RESPONSIVE TO THE STATE BOARD'S JUNE 12, 2000 REQUEST AND COMPLIED WITH THE REQUIREMENTS OF SUCH REQUEST.

The NRDC objects to Petitioners' Post-Hearing Brief because of the attached proposed revisions to the Regional Board's SUSMP Program.[1] The short answer to the NRDC's objection is that the Petitioners' Post-Hearing Brief complies with the State Board's June 12 directive. First, the attached proposed SUSMP language is ***summarized in the text of the Brief*** itself and each of the proposed revisions to the Regional Board's SUSMP are explained within the 10-page Post-Hearing Brief. Second, the attached redlined SUSMP was not an additional exhibit, but is an existing document in the Record that has been modified to show changes in light of the June 12, 2000 State Board letter specifically requesting that ***"specific language that you believe should be included in the Standard Urban Storm Water Mitigation Plan (SUSMP)"*** be provided. Accordingly, the Post-Hearing Brief in addition to providing an explanation of the proposed changes, complies with this specific request of the State Board for ***"specific language" to be included*** in the SUSMP.

In addition, showing the actual revisions to the Regional Board's proposed SUSMP in a redlined fashion was necessary for the benefit of all the parties so that the context of the numerous changes to the SUSMP were readable and easily understood. Reviewing the ***"specific language"*** and deletions and changes to the SUSMP, without the benefit of their context, would have been virtually impossible given the numerous changes that were necessary. The original Regional Board's SUSMP itself contained some 15 pages of text and is already a part of the Record in these proceedings. The proposed changes to the SUSMP, as shown by the redlining, merely puts the specific language requested by the State Board in context. The NRDC may not agree with the changes, but given the State Board's request for ***"specific language"*** to be "included in the SUSMP," the NRDC's disagreement does not change either the specific request for the language,

[1] It is worth noting that the NRDC has filed objections to the Petitioners' Post-Hearing Brief, but has said nothing about the Regional Board's Brief, which is 10 pages of what appears to be six point print with even smaller print in the footnotes.

nor the relevance and importance of showing the changes in context on a document that is already in the Record. Given the length of the SUSMP and the numerous revisions and ***"specific language"*** added or modified, providing a redlined version of the SUSMP was not only consistent with the State Board's request, it was necessary so that the ***"specific language" to be included in the SUSMP*** could be understood and properly considered.

For the foregoing reasons, the Post-Hearing Brief is consistent with and in compliance with the State Board's June 12, 2000 Order, and Petitioners respectfully request that the NRDC's objections in this regard be overruled.

II. THE NRDC DOES NOT HAVE STANDING TO ASSERT THE ATTORNEY-CLIENT PRIVILEGE, AND THE DISCLOSURE AND INCLUSION OF THE COMMUNICATION IN THE ADMINISTRATIVE RECORD CONSTITUTES A WAIVER OF SUCH PRIVILEGE.

Interestingly, the NRDC attempts to assert the attorney-client privilege on behalf of the Regional Board, where the NRDC is not the client and thus is not the holder of the attorney-client privilege. California law is very clear that only the holder of the privilege, or a representative of the holder, is authorized to assert the privilege. (Evid. Code § 954.) There has been no showing by the NRDC that they are either the holder of the privilege, i.e., that they are Mr. Leon's client, or that they are "a person" authorized on behalf of the Regional Board to assert the privilege. Accordingly, ***the NRDC has no standing to assert the privilege***. (See Evid. Code § 954.)

Second, it is evident from the Regional Board's inclusion of this e-mail (Item 19 of Volume 2 of the Administrative Record) and other communications from counsel in the Record, that Respondents ***purposely*** included the information as a part of the Administrative Record, a Record that was made available to all of the parties in this Petition. Under California law, pursuant to Evidence Code Section 912, any privilege that would have attached to the communication in question, was clearly waived as a result of its inclusion in the Administrative Record and the making of the communication and all aspects of the Administrative Record available for public review. (See Evid. Code § 912(a).) Respondents apparently made the decision to include this and other documents in the Administrative Record to support their decision to impose the SUSMP on the Petitioners; Respondents cannot now hide behind the

NRDC and seek to exclude a document that confirms they acted improperly and in violation of the terms of the NPDES Permit in doing so. A***ccordingly, the initial inclusion of the document as a part of the Administrative Record constitutes a waiver under Evidence Code 912(a).***

In addition, the failure of the Regional Board, ***since the preparation of the Record***, to subsequently claim the privilege or to assert that the inclusion of the document was in any way inadvertent (specifically including its failure to assert the privilege months after the Administrative Record had been prepared and three (3) weeks after Petitioners have submitted their Post-Hearing Brief) is a ***"failure to claim the privilege in any proceeding in which the holder has a legal standing and opportunity to claim the privilege,"*** and is thus a second basis for waiver under Evidence Code Section 912(a). Respondent's failure to claim the privilege throughout these proceedings, and even now, constitutes a waiver of the privilege. (See, e.g., Calvert v. State Bar (1991) 54 Cal. 3d 765, 780; Scottsdale Insurance Co. v. Superior Court (1997) 59 Cal.App.4th 263, 274.)

Finally, the NRDC's mischaracterization of the communication does not change the printed words of the e-mail and the conclusions of the Regional Board's counsel that ***"it would take an act of the Board to amend the Permit to include non-discretionary activities"*** since to include non-discretionary activities ***"is beyond the scope of the Permit authority."*** Clearly, the Regional Board, and its counsel, knew that the plain language of the Permit did not provide for the application of SUSMPs to "non-discretionary activities," and further knew that their decision to apply the SUSMP to non-discretionary activities was directly contrary to the express terms of the Permit. The relevance of the e-mail, a copy of which is attached as Exhibit "A" hereto for the State Board's convenience, is apparent from its face.

///

III. CONCLUSION.

Petitioners respectfully request that the objections of the NRDC to the Petitioners' Post-Hearing Brief be overruled in their entirety.

From: Jorge Leon
To: Xavier Swamikannu
Date: 1/25/00 2:58PM
Subject: Re: SUSMP

1. It's my belief that, since the Permit says "discretionary," we're stuck. It simply does not include nondiscretionary activities. To include them in this proposal by the EO is beyond the scope of the Permit authority. It would take an act of the Board to amend the Permit to include non-discretionary activities.

2. I would recommend reading this liberally. I.e., the enumerated categories are inclusive of all types of development, including nondiscretionary activities. The enumerated categories are included are the list because there is sound evidence showing the need to control those discharges. These are within the EO's authority to control regardless of whether they are discretionary or not.

3, 4 and 5. I don't know enough about the remaining three issues yet, but will try to be conversant by tomorrow a.m.
>>> Dennis Dickerson 01/24/00 06:19PM >>>
Need a quick check on three issues:

1) The 1996 permit talks about discretionary projects. Can SUSMPs be applied to non-discretionary projects as well as discretionary or is the board limited in this instance. See Page 4 of the NRDC letter.

2) Are the enumerated categories comprehensive of all types of development?
Or are non-discretionary projects in a specified category included?

3) We are concerned about a single family home on a hillside but not, apparently, if the runoff is to an ESA. Is this distinction appropriate.

4) Xavier: is the change sheet definition for an ESA clear or what we discussed?

5) Xavier, there are some glitches with the change sheet that must be fixed tomorrow, i.e., references to pages in the change sheet don't match the Dec 7th version.

Attorneys for Petitioner
WESTERN STATES PETROLEUM ASSOCIATION

STATE OF CALIFORNIA

STATE WATER RESOURCES CONTROL BOARD

In the Matter of the Petitions of the Cities of Bellflower, et al., the City of Arcadia, and Western States Petroleum Association, Petitioners, For Review of January 26, 2000 Action of the Regional Board, and Actions and Failures to Act by Both the Regional Board and its Executive Officer Pursuant to Order No. 96-054, Permit for Municipal Storm Water and Urban Run-Off Discharges within Los Angeles County [NPDES No. CAS614001]	FILE NOS. A-1280, A-1280(a) and A-1280(b) **WESTERN STATES PETROLEUM ASSOCIATION'S COMMENTS ON THE BOARD'S TENTATIVE ORDER**

Pursuant to the Board's August 28, 2000 Order, the Western States Petroleum Association ("WSPA") submits these comments on the Board's tentative order in this matter.

SUMMARY

WSPA fully supports the Board's tentative order that retail gasoline outlets be excluded from the numeric design standards of the Standard Urban Stormwater Mitigation Plan ("SUSMP"). Retail gasoline outlets are already heavily regulated under federal, state and local requirements and the SUSMP numeric design standards are neither feasible nor proven effective for retail gasoline outlets. In lieu of the SUSMP numeric design standards, WSPA urges the Board to encourage the statewide

adoption of the best management practices developed and published by the California Stormwater Task Force in their March 1997 Best Management Practice Guide for Retail Gasoline Outlets (the "Task Force BMPs").

COMMENTS

I. WSPA Fully Supports the Exclusion of Retail Gasoline Outlets From the SUSMP Numeric Design Standards.

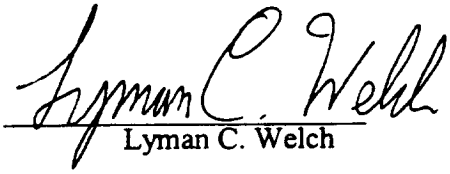
WSPA applauds the Board's recognition that retail gasoline outlets should not be subject to the numeric design standards of the SUSMP. Due to the plethora of regulations which already apply to retail gasoline outlets and the practical problems of implementing stormwater infiltration or treatment systems at retail gasoline outlets, the SUSMP numeric design requirements are neither necessary nor are they a practical option.

Retail gasoline outlets are heavily regulated at the federal, state and local level. For example, retail gasoline outlets are subject to USEPA regulation of underground storage tanks; federal spill prevention, containment and control requirements; OSHA requirements; state and local fire codes; state and local requirements for hazardous materials and emergency response plans; state and local underground storage tank requirements; state and local building codes; national, state, and local air regulations; and numerous other requirements. Indeed, additional regulations on underground storage tanks are expected to take effect in California in the near future.

As shown during the hearing and detailed in WSPA's prior filings, retail gasoline outlets are limited in their ability to construct treatment/infiltration facilities. Requiring infiltration at retail gasoline outlets would likely cause subsurface contamination as accidental spillage of gasoline is directed into the soil. Further, there is no evidence that the other potential treatment devices allowed by the SUSMP would be effective at controlling any pollutants from retail gasoline outlets. Moreover, several types of treatment devices (such as oil/water separators, sand filters, and compost filters) would require that an additional subterranean structure be built beneath the retail gasoline outlet and could result in a potentially hazardous situation.

For these reasons, WSPA strongly supports the Board's decision to exclude retail gasoline outlets from the numeric design standards of the SUSMP.

II. WSPA Supports the Implementation of the Task Force BMPs Throughout California.



The tentative order's statement that the Task Force BMPs "should be considered for inclusion" in the SUSMPs (Board Tentative Order, p. 22, footnote 49) is laudable and should provide direction to other regional boards. WSPA asks that the tentative order be expanded to encourage other regional boards to specify use of the Task Force BMPs in stormwater permits in their regions. The question of what BMPs should apply to retail gasoline outlets is likely to arise in connection with permit applications or renewals other than the SUSMP. Indeed, the Los Angeles Regional Board has implemented provisions almost identical to the SUSMP in the NPDES permit for the County of Ventura. (The Ventura permit is the subject of WSPA's petition for review in SWRCB/OCC File A-1320(a)). Moreover, San Diego's Regional Board has recently postponed consideration of numeric sizing criteria for permits pending ongoing efforts to develop statewide standards.

As shown at the hearing, the Task Force BMPs are appropriate for use throughout California as a means to prevent and/or reduce stormwater pollution from retail gasoline outlets. Since the Task Force BMPs were developed and published by the California Stormwater Quality Task Force, WSPA has encouraged the implementation of the Task Force BMPs throughout California by both existing retail gasoline outlets and new facilities. Support for implementation of the Task Force BMPs throughout California in the tentative order would improve control of stormwater runoff and avoid future piecemeal appeals of individual permits which do not follow the Task Force BMPs or the Board's tentative order in this matter.

VIII.	CONCLUSION.	15

Petitioners herein respectfully submit the following comments on the State Board's August 24, 2000 Draft Order ("Order"), inclusive of Attachment A which sets forth additional proposed changes to Respondents' SUSMP and which are incorporated herein and made a part of these written comments.

I. INTRODUCTION.

With these comments, Petitioners seek clarification of the findings of the Order and/or revisions to the Order to resolve internal inconsistencies within the Order, as well as to resolve inconsistencies between the Order and the evidence presented through the Petition process. Petitioners do not seek to reargue the issues raised by the Petition with these comments, but continue to maintain that each and every argument in the Petition, and in the supporting briefs and submissions, are correct and appropriate, and contend that the Respondents' actions, both procedurally and substantively, were inconsistent with the Permit and State and federal law. Petitioners further contend that the Respondents' SUSMP should have been invalidated in its entirety by the State Board. Accordingly, the comments herein are submitted without prejudice to Petitioners' prior arguments in these proceedings or in any subsequent proceeding.[1]

II. THE DRAFT ORDER SHOULD BE MODIFIED TO ALLOW FOR THE DEVELOPMENT OF REGIONAL SOLUTIONS AS TRUE ALTERNATIVES TO THE SITE-BY-SITE OR PROJECT-BY-PROJECT MANDATE.

Throughout the course of these proceedings, Petitioners have consistently contended that

---

[1] For example, Petitioners continue to contend the .75 numerical design standard is a one-size-fits-all standard that was not developed based on sound science considering the pollutants of concern and the sources of those pollutants. The .75 standard also does not account for the differences in the development categories and the need for different SUSMPs and/or different design standards. If the SUSMP was to apply the same inflexible numerical design standard to all development categories, then what purpose did the Respondents have in creating in the NPDES Permit two different residential development categories, one category for subdivisions with 10 or more homes, and a second category for subdivisions with 100 or more units. (Permit, p. 34, Part III.A.1.c.) If identical standards and SUSMPS were to apply to both categories, then only one category, the 10+ home subdivision category, was necessary. Clearly the former category would include the latter, and this distinction would have no meaning unless different SUSMP standards were to apply to different development categories. Petitioners continue to maintain that the Administrative Review Process was the appropriate and only process to address such concerns with the SUSMP, and that this process was blatantly violated, both procedurally and substantively by the Respondents' refusal to administratively process the Permittees' SUSMP, and thereafter by their actions in mandating a SUSMP that was not agreed to by the Permittees.

Respondents should have allowed for ***regional alternatives*** in the SUSMP to the site-by-site or project-by-project mandated programs. The development of regional facilities must be recognized as providing the best solution to this State's urban runoff problems. Yet, as written, the Respondents' SUSMP provides no flexibility or allowance for regional solutions, and even the State Board's Draft Order, although ***encouraging*** the development of regional solutions, does not provide for such solutions as ***alternatives*** to the site-by-site, project-by-project programs in Respondents' SUSMP. (Draft Order, p. 21.)

In at least two separate sections of the Draft Order, the State Board recommends that the Permittees and other interested agencies "***work to develop regional solutions so that individual dischargers are not forced to create numerous small-scale projects. While the SUSMPs are an appropriate means of requiring mitigation of storm water discharges, we also encourage innovative regional approaches.***" (Draft Order, p. 21.) The State Board further finds that "cost savings" could be achieved "if the Permittees developed a ***regional solution*** for the problem," (Draft Order, p. 21) and that ***"[a]s a long-term strategy, municipal storm water dischargers should work to establish regional mitigation facilities, which may be more cost-effective and more technically effective than mitigation structures at individual developments."*** (Draft Order, p. 26.)

In spite of the above findings, no specific language was incorporated by the State Board into the SUSMP to effectuate this objective, and ***no incentive*** was provided to "the cities and the County, along with other interested agencies, [to] work to develop regional solutions." In short, without the incorporation of additional modifications to the Regional Board's SUSMP, the development of a "regional solution" will not avoid the creation of "numerous small-scale projects," since under the Draft Order, irrespective of whether a regional solution is appropriate and more technically and economically effective, individual SUSMPs for the "numerous small-scale projects" still appear to be required.

In reality, the only way "innovative regional approaches" can truly be encouraged is to incorporate "regional solutions" as true alternatives to the numerous small-scale projects within the SUSMP itself. Unless the development of regional approaches are true alternatives to the site-

by-site or project-by-project mandate, no "regional solutions" will be developed as they would serve no purpose.

As discussed in Petitioners' Post Hearing Brief, the State of Washington's 1999 Draft Storm Water Manual expressly allows local governments to exempt redevelopment projects if they have adopted a plan that fulfills the requirements in issue through "regional facilities." Furthermore, the State of Florida expressly recognizes in their BMPs that "***[r]egional stormwater systems, which manage the stormwater from several developments or the entire drainage basin, offer many advantages over the piecemeal approach that relies upon small, individual onsite systems.***" (See FLA. BMPs § 2.2F.)

In addition, the concept of a regional approach as an "alternative" to individual site-by-site systems, is by no means a new or novel concept. From individual water wells as compared to the intricate water delivery system presently utilized by the Metropolitan Water District and other water purveyors, to the use of regional sewage treatment facilities in comparison to individual septic tanks, to the delivery of any public utility including, for example, electricity, in comparison to an individual generator on particular projects sites, it is apparent that regional solutions to urban storm water runoff problems must be developed before any SUSMP program can be successful.

The Clean Water Act ("Act"), in sections 208 and 319, recognizes the utility of region-based solutions to non-point source water pollution. (33 U.S.C. §§ 1288-1289; 33 U.S.C. § 1329 & § 1329(b)(4) [requiring states "to the maximum extent practicable implement a management program . . . on a **watershed-by-watershed basis** . . . . "].) In implementing the Act, U.S. EPA has **strongly** encouraged and relied upon regional options for water quality regulations. (See, e.g., U.S. EPA & Dept. of Agriculture, EPA-840-R-98-001 Clean Water Action Plan: Restoring and Protecting America's Waters 81 (1998); Notice of Availability of Clean Water Action Plan 63 Fed.Reg. 14109 (summarizing Action Plan); Office of Water, U.S. EPA, EPA-841-R-97-011, Statewide watershed management facilitation (1997); Office of Water, U.S. EPA, EPA-840-S-96-001, Watershed Approach Framework (1996); Assessment and Watershed Protection Division, U.S. EPA, EPA-841-R-95-003, Watershed Protection: A Project Focus (1995).)

Failing to expressly allow "regional solutions" within the final SUSMP would be a step

backwards in time to the use of septic tanks on individual sites to process sewage, and is a limitation that will only delay implementation of a successful SUSMP Program. The attached proposed additional amendments to the final SUSMP (Attachment "A") are ***in addition*** to those changes proposed by the State Board in its Draft Order. Specifically, as to the incorporation of the principle of "regional alternatives," Petitioners would suggest that a second paragraph be added to the Limited Exclusion section of Section 9 "Design Standards for Structural or Treatment Control BMPs," to read as follows:

Limited Exclusions

The project applicant may comply with the numerical Structural or Treatment Control BMP design standard by utilizing proximate or regional Structural or Treatment Control BMPs as alternatives to site-by-site or project-by-project BMPs.

Petitioners respectfully request that the Draft Order be revised to incorporate the above-proposed revisions to Respondents' SUSMP in order to truly utilize "regional alternatives" to the creation of "numerous small-scale projects."[2]

III. LOW/MODERATE INCOME HOUSING PROJECTS AND SINGLE FAMILY HILLSIDE HOMES SHOULD BE EXEMPT FROM THE SUSMP'S .75 STANDARD.

A. Low/Moderate Income Housing Should be Exempt from the .75 Standard.

Petitioners submitted substantial evidence at the time of the hearing on the Petition showing that compliance with the .75 standard for low/moderate income homes would both increase the unit cost of such homes, and decrease the number of available units. (See, e.g., Testimony of Ms. Dee Zinke, June 7, 2000 Transcripts, p. 189, lines 9-18, and p. 190, lines 3-11.)

Evidence was further presented that the application of the .75 standard as a one-size fits all standard to all covered projects, would result in disparate treatment of residents of low/moderate income units, as the cost per unit to comply would be greater on a per unit basis (given the limited

---

[2] To the extent the existing language in Respondents' SUSMP can be interpreted to provide for the flexibility of using a regional alternative in accordance with the above proposed language, Petitioners respectfully request that the State Board's Draft Order be amended to clarify the State Board's interpretation in this regard.

open space as compared to other single family developments). (See Testimony of Ms. Dee Zinke June 7, 2000 Transcripts, p. 190, line 12 through p. 191, line 22.) Accordingly, the actual and percentage cost per unit to comply with the .75 numerical design mandate on low/moderate income housing would be higher than the same cost for other single family housing units. Additional concerns were expressed over the environmental injustice created by such disproportionate impacts and the general discriminatory impact on low-income communities. (*Id.* at 190, lines 12-22; also see testimony of Mayor Margaret Clark, June 7, 2000 Transcript, p. 25 lines 11-19.)

Further, no evidence was submitted by the Respondents (or any other party) to refute the Petitioners' evidence and its arguments on the disparate impact, and the record remains uncontroverted that low/moderate income housing projects will be adversely and disparately impacted by the application of the .75 standard. (Id.)

Finally, neither Respondents nor any other party submitted any evidence to show that the "new development" or redevelopment" of low/moderate income units as a whole will have any material adverse impact on the region's urban runoff. Yet, clearly the reverse is true and is unrefuted, i.e., the .75 standard, if imposed on low/moderate income housing projects, will have a material adverse impact on the development of such necessary housing. Petitioners therefore propose that an exception to the application of the .75 numerical standard to 10+ and 100+ home subdivisions be added for low/moderate income housing projects. (See Attachment "A" hereto.)

During the course of these proceedings, Petitioners have argued strenuously that a "one-size-fits-all standard" was inappropriate and that different standards, depending on the type of development and pollutants of concern and the sources of those pollutants, should have been developed. In particular, in its post hearing brief, Petitioners proposed exempting ***all*** single family 10-99 units subdivisions, single family hillside homes and low/moderate income housing projects from the .75 standard. Understanding the State Board has not been persuaded to apply such a broad exemption, Petitioners respectfully request that, at a minimum, low/moderate income housing units and single family hillside homes be excluded from the application of the .75 standard.

B. **Single Family Hillside Homes Should be Exempt from the .75 Standard.**

The Draft Order, at page 18, provides that: "[t]he evidence shows that each listed category can be a significant source of pollutants and/or runoff following development. It is appropriate that the design standards apply so that BMPs for these categories of development result in the infiltration or treatment of a significant about [amount] of the runoff." (Draft Order, p. 18.)

Yet, with respect to "single family hillside homes," no evidence was submitted at the hearing or otherwise to support the application of a .75 numerical standard (or any other numerical standard) to such developments. Nor did Respondents provide any justification for distinguishing a single family hillside home from a single family non-hillside home, and no argument was made by the Respondents (in spite of various arguments by Petitioners concerning the impact of the SUSMP on individual homeowners and the concern over a one-size fits all standard), that the .75 standard should be discriminately applied to single family ***hillside*** units.

Although Petitioners do not oppose applying the ***other*** aspects of the SUSMP to hillside homes, applying the .75 numerical design standard will result in an unreasonable, and in many instances, an unworkable standard without any benefit to the quality of our urban runoff. Most single family homes slope towards the street, with small front yards and two or three car driveways. Requiring compliance with the .75 standard for individual homes will in most all cases be economically and/or physically impossible. Unlike larger developments, where a designated amount of open space (at significant cost) can be planned and carved out of otherwise developable space, complying with the .75 design standard for most individual single family homes, will be impracticable, if not impossible, as there will be insufficient space on individual lots to capture .75 inches of rainfall over a 24 hour period.

Further, the distinction between a hillside home in comparison to a non-hillside home, ***after*** grading, is insignificant and/or non-existent, as most homes are built on level graded pads.[3] To impose the .75 standing on individual ***hillside*** homes will truly result in a one-size fits all standard without giving any meaningful consideration to the impact of the requirement on

[3] The March 8, 2000, Regional Board SUSMP defines "hillside" to mean "property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is twenty-five percent or greater."

individual homeowners, or the limited, if any, benefits to be obtained from such a requirement.

In light of the lack of any evidence on the need to apply the .75 design standard to single family hillside homes, and the impracticability of applying the standard, both economically and practicably, Petitioners respectfully request that the .75 standard not apply to the development of individual single family hillside homes.

IV. A STATE WIDE STORMWATER QUALITY TASK FORCE SHOULD BE CREATED.

As is apparent from the evidence submitted at the time of the hearing on the storm water programs of other states throughout the Country, the development of an efficient and effective storm water program, specifically including appropriate numerical limitations, is an evolving process, requiring significant deliberation and collaboration among all interested stakeholders.

The lessons learned from programs in other states such as Florida, Maryland and Washington show that not only is the constitution of an effective storm water program an evolving process, it is a process that should be handled state-wide through a collective and collaborative task force, whose primary purpose is to assist in developing a storm water runoff program that meets the needs of the citizens of the state, while at the same time remaining flexible enough to address the varying urban runoff problems. Programs may differ from region to region, depending on the level of rainfall, the type of development, the existing and proposed landscape, the pollutants of concern and sources of those pollutants, the proximity to ground water and the impacts on the quality of the ground water, vector concerns, and various other variables.

Admittedly, California has a long road to travel before it can be satisfied with the quality of its urban runoff, and a successful storm water program will only be achieved after due consideration is provided to interested stakeholders, specifically including representatives of the parties who will be implementing the programs, i.e., the various Permittees, as well as the Southern California Association of Governments, city planners, public works directors, the building industry, and the representative environmental organizations and other interested stakeholders. Necessary issues to be addressed by a Statewide Task Force include the application of the .75 standard to the various types of developments, whether a single standard should be

applied to all developments or whether various design standards should be derived, whether the .75 standard is the appropriate standard and whether it should be modified on a watershed basis, whether the costs of implementing the .75 standard are justified in light of the expected benefits, and whether the benefits to surface water quality outweigh the potential adverse impacts from this standard or any other standard on the quality of our groundwater. The Task Force should be given specific target dates to complete specific studies, and should be asked to provide input on regional solutions, funding mechanisms, and alternative BMPs. The Task Force should also evaluate the likely costs and benefits of implementing a numerical design standard, including the economic impacts on lower income communities throughout the State.

Accordingly, Petitioners respectfully request that the Draft Order be revised to form a State-Wide Task Force as outlined above, and to include a recommendation to the State Legislature to make funds available to further the work of the Task Force, so that our existing storm water quality problems are not addressed in a microcosm, but are addressed statewide and resolved through a deliberative and collaborative process.

V. THE TERM "NEW DEVELOPMENT" SHOULD BE REVISED TO BE CONSISTENT WITH THE STATE BOARD'S REVISION OF THE DEFINITION OF "REDEVELOPMENT".

In the Draft Order, the State Board recognizes the need for changes to the definition of "Redevelopment" given the over breadth and ambiguity with Respondents' definition. That the term "Redevelopment" was in need of revision was apparent from the evidence submitted at the time of the hearing, as well as the various post-hearing submissions, ***all*** requesting that the term be revised. The State Board's revisions to the definition of "Redevelopment" are thus necessary and appropriate modifications and should remain without revision.

However, many of the same ambiguities and concerns created by the overbroad and ambiguous definition of "Redevelopment" also exist with Respondents' definition of "New Development." Specifically, the term "New Development" is broadly defined to include ***"land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision."*** (Final SUSMP, p. 4.) As

discussed in Petitioners' post-hearing brief, it was, in part, this broad and ambiguous definition of "New Development" that led to some of the concerns expressed by the Petitioners at the time of the hearing that the Regional Board's SUSMP would lead to absurd results. One example provided at the hearing was development in an existing SUSMP category (such as a single family "hillside" home or a home located in an environmental sensitive area), where a new porch or some other "impervious surface" was to be added. Under the Respondents' SUSMP, where a new porch is added to a single family hillside home, this "New Development" non-discretionary project could have been read as triggering a SUSMP for the entire site.

Clearly, "New Development" must mean something other than "land disturbing activities or the creation of impervious surfaces," and the term should be revised to be consistent with the eight development categories set forth in the State Board's Draft Order. Petitioners purpose that the term "New Development" be revised to read as follows:

> **"New Development" means land disturbing activities, structural development and/or land subdivision resulting in the development of one of the eight project categories listed above, i.e., a single-family hillside residence, a 100,000 square foot commercial development, an automotive repair shop, a retail gasoline outlet, a restaurant, a home subdivision with 10-99 units, a home subdivision with 100 or more housing units or a Parking Lot."**[4]

Petitioners respectfully request that the term "New Development" be revised as set forth above and in Attachment A hereto, to give meaning to the revised definition of "Redevelopment" and to be consistent with the other provisions of the Final SUSMP, as well as to avoid the over breadth and ambiguity discussed above and at the time of the hearing.

VI. THE FINDINGS IN THE STATE BOARD'S DRAFT ORDER HIGHLIGHT THE NEED FOR FURTHER MODIFICATIONS TO THE SUSMP TO COMPLY WITH THE REQUIREMENTS OF WATER CODE SECTION 13360.

In finding that the .75 numerical standard was appropriate, the State Board, in the Draft Order, found that the numerical standards were "design standards" to be utilized as "objective

---

[4] It should be recognized that although Petitioners have identified a "single family hillside residence" as being included within a definition of new development, Petitioners do not believe that the .75 numerical standard should be applied to such a development category. Rather, only the remaining portions of the SUSMP and the BMPs set forth therein should be applicable.

criteria that developers must achieve in ***designing*** their BMPs." (Draft Order, p. 12.) The State Board further determined that "the only significant difference between the two versions of the SUSMPs is that the Regional Board established numerical criteria for ***designing*** the BMPs." (Id.)[5]

Pursuant to California Water Code Section 13360(a), "[n]o waste discharge requirement or other order of a regional board or the state board or decree of a court issued under this division shall specify the ***design,*** location, type of construction, or ***particular manner*** in which compliance may be had with that requirement, order, or decree, and the person so ordered shall be permitted to comply with the order in any lawful manner." (Cal. Water Code § 13360(a).)

The State Board's recognition that the .75 design standard is a ***design*** standard that "developers must achieve in developing their BMPs" is a finding which proves the Regional Board was specifying the "***design***" or "***particular manner***" in which "compliance" was to be had in order to comply with the SUSMP. The Regional Board's imposition of the .75 standard, combined with the State Board's finding that this numerical design standard was in fact a standard that project proponents "***must achieve in designing their BMPs***" flies directly in the face of the prohibition set forth under Water Code Section 13360(a).

Instead of a specific .75 standard for the ***design*** of BMPs, to comply with the requirements of Section 13360 of the California Water Code, the Regional Board and State Board should set forth a general standard in accordance with the "maximum extent practicable" guideline provided by the Clean Water Act. (33 U.S.C. § 1342(p)(3).) Specifying a design standard by which BMPs are to be constructed, rather than requiring compliance with a general standard clearly violates the basic principle of Section 13360 that Permittees are permitted to comply with the Order in any lawful manner and cannot be required to "***design***" their systems in a "***particular manner.***" In short, it is appropriate for the State Board or a Regional Board to identify "the disease and command that it be cured," but under Water Code Section 13360(a), it is inappropriate for the State Board or a Regional Board to "dictate the cure." (*Tahoe Sierra Preservation Council v. State Water Resources Control Board* (1989) 210 Cal.App.3d 1421, 1438.)

---

[5] Obviously, there are a number of other differences that exists between the Permitees' SUSMP and Respondents, including the addition of "environmentally sensitive areas," "redevelopment," "non-discretionary projects," and the waiver fee.

Beyond the general "maximum extent practicable" standard set forth in the Clean Water Act, presumably the Respondents could have identified the pollutants of concern and the source of those pollutants along with a list of suggested BMPs. However, imposing a specific numerical "***design***" standard for the BMPs is "dictating the cure" to the Permittees, and is something that the California Legislature has expressly prohibited. (Cal. Water Code § 13360(a).)

In light of the finding of the State Board that the .75 numerical standard is in fact a "design" standard for the BMPs in question, the .75 standard should be deleted from the Final SUSMP, and a general standard, in accordance with the requirements of the Clean Water Act and State law should be devised.

VII. THE STATE BOARD PROPERLY CORRECTED VARIOUS DEFECTS AND DEFICIENCIES WITHIN THE RESPONDENTS' FINAL SUSMP.

A. The State Board's Deletion Of "Environmentally Sensitive Areas" From The SUSMP's "Development Categories" Was Required.

The plain language of the NPDES Permit shows that SUSMPs were only to apply to "development ***categories***" as opposed to "development ***locations***." Further, the Permit expressly envisions the need for Permittees to consider whether a project falls within "environmental sensitive areas and the slope and erosion potential of the site and Part 2, III, surrounding areas," and, if so, the project itself should be reviewed and its potential impact on storm water quality evaluated. (Permit, p. 33) Where a project falls within an "environmentally sensitive area," if urban runoff will adversely impact the environmentally sensitive area (or the environment in general), obviously the project itself will then have to be modified and/or mitigation measures implemented, before the project can be approved. (See California Environmental Quality Act ("CEQA"), Pub. Res. Code § 21000 *et seq.*)

As recognized by the State Board in the Draft Order (see Draft Order, p. 24), developments within "environmentally sensitive areas" are already subject to extensive regulation through other environmental laws, statutes and regulations, and thus imposing additional regulatory requirements pursuant to the SUSMP generally on all developments in such areas, particularly where there is no nexus between what caused the area to be environmentally sensitive and the

stormwater run off, would be arbitrary and capricious.

Whether a development covered by the SUSMP or otherwise falls within an environmentally sensitive area, the impact of the project, under existing California law, pursuant to the California Environmental Quality Act and other environmental statutes, must be evaluated. Accordingly, it would be arbitrary and capricious to include a "location" such as an "environmentally sensitive area" into the "development categories" in which to apply the subject SUSMP.

B. The State Board's Deletion Of "Non-Discretionary" Projects From The SUSMP Was Required In Light Of The Express Language Of The Permit And The Unworkable Application Of The SUSMPs Without Such A Correction.

As set forth in the Draft Order itself, the language of the Permit is very clear that SUSMPs are only to apply to "discretionary" projects. (See Permit, Part 2. III, p. 33, 34 and 36.) Further, as supported by the Administrative Record, it is apparent that even the Respondents did not believe they had the authority to apply the SUSMP to "non-discretionary" approvals. (See 1/25/00 e-mail of Mr. Leon, A.R. Vol 2, Item 19; and Respondents' 12/7/99 Tentative Resolution, Finding 13, stating the SUSMPs were required for "discretionary Priority Project." A.R., Vol 2, Item 2, p. 11-29.)

It is also apparent that Respondents failed to provide adequate notice and an opportunity for the Petitioners to be heard on the issue of applying the SUSMP to "non-discretionary" projects, given that such "non-discretionary" projects were not added until the day of the hearing, and given the confusion expressed even by Respondents on what was meant by "non-discretionary." (See June 8, 2000 Transcripts, p. 47, line 13 - p. 51, line 9.) Moreover, the inclusion of "non-discretionary" projects would have expanded the application of the SUSMP to projects far beyond those envisioned by the Respondents in drafting the SUSMP, and would have led to a number of absurd and unattended applications of the program.[6]

---

[6] Examples discussed at the time of the hearing included application of the .75 standard to an entire site as a result of merely installing a new roof at a covered development category, or the construction of a new porch at a single family hillside home or at a home within an environmentally sensitive area.

Respondents' eleventh hour inclusion of "non-discretionary" projects into the SUSMP further highlights the need for a collaborative and deliberative process ***with the Permittees***. It was apparent from the hearing before the State Board that Respondents did not fully appreciate or comprehend the import of applying the SUSMP to "non-discretionary" projects, or what would constitute a "non-discretionary" versus a "discretionary" approval (an issue that is specifically within the expertise of the Permittees and thus an issue in which the Permittees could have and would have willingly provided input and information to the Respondents had the Permittees been given the opportunity). Leaving the Permittees out of this part of the decision-making process, when it is the Permittees that must administer the programs and apply and enforce the SUSMPs throughout their respective jurisdictions, illustrates the importance of following a collaborative process and conferring with the Permittees on all aspects of the SUSMP ***before*** attempting to mandate its terms. Petitioners were denied due process through the inclusion of "non-discretionary" projects into the SUSMP at the eleventh hour, and the State Board's deletion of such "non-discretionary" projects was required as a result of such denial of due process, and as a result of the specific language of the NPDES Permit in issue.

C. The Waiver Fee Proposed By Respondents Was Unworkable And Premature.

As proposed in Respondents' Final SUSMP, a waiver could only be granted upon a finding of "impracticability." Where "impracticability" was found, a Permittee was then ***mandated*** to ***"require the project proponent to transfer the savings in costs, as determined by the Permittee, to a storm water mitigation fund to be used to promote regional or alternative solutions for storm water pollution in the storm watershed and operated by a public agency or a non-profit entity."*** (Final SUSMP, p. 15.) No other guidance was provided on the application, administration or assessment of such a fee.

The requirement that a Permittee collect from the project proponent the same amount of ***"savings in costs"*** would render the waiver provision meaningless in all cases where impracticability was created by economics. Obviously, requiring the same amount in "***savings in costs***" to be paid into a fund, where there has been a finding of impracticability, again illustrates the results of the Respondents' failure to follow a collaborative and deliberative process.

In addition, the waiver fee as written by Respondents, was incomprehensible, as the Regional Board failed to recognize "regional solutions" as alternatives to site-by-site or project-by-project programs, apparently except in cases of impracticability. Thus, under the Respondents' waiver fee provision, "regional solutions" could never be realized unless a ***series of projects*** in the region were found to be impracticable. Otherwise, the so-called "regional solution" would be meaningless, as it would be nothing other than a single off-site detention basin for the particular project determined to be "impracticable." Thus, Respondents' waiver fee, at best, would have lead to an inefficient and underutilized regional alternative, and, at worst, would have resulted in an insurmountable roadblock to the proposed development in issue.

The State Board's deletion of the "waiver funding requirement" was necessary given the poor drafting of the requirement and the lack of thoughtful evaluation by the Regional Board. Petitioners herein, however, would support the creation of a waiver fund, created at the Permittee's individual discretion within the respective jurisdictions, and working with the County and other cities within the respective watersheds, to develop sensible regional alternatives to the existing proposed site-by-site .75 numerical standard.

D. <u>The Exclusion Of "Retail Gasoline Outlets" From The .75 Numerical Standard Was Appropriate.</u>

Significant health and safety concerns were created by the inclusion of Retail Gasoline Outlets within the SUSMP, and particularly the required application of the .75 numerical standard to such developments. At the time of the hearing on June 7 and June 8, Petitioner the Western States Petroleum Association, submitted detailed evidence that Retail Gasoline Outlets are already heavily regulated and that the California Best Practices Management Guide for Retail Gasoline Outlets (March 1997) does not recommend or impose numerical standards on such facilities.

Respondents failed to submit substantial evidence to refute the evidence submitted by WSPA, and nor did Respondents submit sufficient evidence to show that the health and safety concerns created by the imposition of the .75 standard were outweighed by any marginal benefit to be obtained by application of the .75 standard to Retail Gasoline Outlets.

VIII. CONCLUSION.

The Respondents' SUSMP was adopted and imposed on the Permittees through a flawed Administrative Process. Particularly, Respondents failed to follow the deliberative and collaborative process envisioned under the NPDES Permit through the Permit's meet and confer process and through the Permit's requirement that the Permittees, rather than the Respondents, prepare the final SUSMP. Accordingly, Respondents acted contrary to the terms of the Permit and State and federal law by imposing the SUSMP on the Permittees, and by failing to consider sound science and the pollutants of concern and the sources of those pollutants from particular development categories.

In addition, both the Regional Board and the State Board failed to properly consider and apply the requirements of the Administrative Procedures Act (Gov. Code § 11340 *et seq.*), the California Constitutional Prohibition on Unfounded Mandates (Cal. Const. Art. XIII B § 6), the requirements of the California Environmental Quality Act (Pub. Res. Code § 21000 *et seq.*), the entirety of the cost/benefit requirements provided for under both State and federal law, as well as the requirements of Cal. Water Code Section 13360 on specific design standards. In short, the proposed SUSMP, even with the revisions proposed by the State Board, is both scientifically and legally deficient and should have been overturned in its entirety.

///

Petitioners respectfully request that, at a minimum, the State Board's Draft Order be modified in accordance with the above discussion and Attachment A hereto, including the incorporation of regional solutions as an express alternative to the site-by-site project-by-project programs, the exemption of low/moderate income housing projects and single family hillside homes, the creation of a State Wide Task Force to further study and address the issues in question, and the revision of the definition of "New Development" to be consistent with the covered projects in the SUSMP. Petitioners respectfully reserve their rights to further challenge any aspect of the State Board's Order and/or the Respondents' proposed SUSMP that remain in violation of the Clean Water Act, the Porter Cologne Act, and other applicable provisions of State and federal law.

ATTACHMENT A

ADDITIONAL PROPOSED AMENDMENTS TO SUSMPS

[These amendments are to the final SUSMP, as published March 8, 2000, and are being proposed **in addition** to the State Board's Proposed Amendments dated August 10, 2000]

Page 4 of 25

Revise definition of "New Development":

"New Development" means land disturbing activities, structural development and/or land subdivision resulting in the development of one of the eight project categories listed above, i.e., a single-family hillside residence, a 100,000 square foot commercial development, an automotive repair shop, a retail gasoline outlet, a restaurant, a home subdivision with 10-99 units, a home subdivision with 100 or more units, or a Parking Lot.

Page 10 of 25

Add to "Limited Exclusion": Single family hillside homes and Low/Moderate Income Housing Projects.

Page 10 of 25

Add a second paragraph to the "Limited Exclusion Section" to read as follows:

The project applicant may comply with the numerical Structural or Treatment Control BMP design standard by utilizing proximate or regional Structural or Treatment Control BMPs as alternatives to site-by-site or project-by-project BMPs.

PETITION BEFORE THE

STATE WATER RESOURCES CONTROL BOARD

THE CITIES OF BELLFLOWER, BELL GARDENS, BURBANK, CERRITOS, COMMERCE, COMPTON, DIAMOND BAR, DOWNEY, HAWAIIAN GARDENS, HUNTINGTON PARK, INDUSTRY, IRWINDALE, LA CANADA-FLINTRIDGE, LA MIRADA, LA VERNE, LAKEWOOD, LAWNDALE, MONROVIA, MONTEBELLO, PALOS VERDES ESTATES, PARAMOUNT, PICO RIVERA, POMONA, RANCHO PALOS VERDES, ROSEMEAD, SAN GABRIEL, SANTA FE SPRINGS, SIGNAL HILL, SOUTH GATE, VERNON, WALNUT, AND WHITTIER, municipal corporations; and THE BUILDING INDUSTRY ASSOCIATION OF SOUTHERN CALIFORNIA, a Non-Profit Mutual Benefit Corporation, and THE BUILDING INDUSTRY LEGAL DEFENSE FOUNDATION, a Non-Profit Mutual Benefit Corporation, Petitioners, vs. THE CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION; and DENNIS DICKERSON, Executive Director of the Los Angeles Regional Water Quality Control Board, Respondents.	Case No. A-1280, A-1280(a) a[illegible]1280(b) PETITIONERS' OBJECTION[illegible] REGIONAL BOARD'S REFERENCE TO [illegible]A RECORD EVIDENCE IN REGIONAL [illegible]D'S SEPTEMBER 27, 2000 WRIT[illegible] COMMENTS

I. INTRODUCTION.

Petitioners respectfully object to extra record evidence referred to by the [illegible]nal Board in its written comments of September 27, 2000 on the State Board's Draft Order. B[illegible]r dated August 28, 2000, the State Board provided all parties, including the Regional Bo[illegible]n opportunity to comment on the Draft Order. However, in this same letter, the Sta[illegible]ard indicated it had already conducted a hearing on the matter and that ***"evidence rel[illegible]to this matter will not be heard at the meeting or accepted before the meeting."*** In va[illegible]ocations throughout its written comments on the Draft Order, the Regional Board improp[illegible]ted evidence ***not in the record*** in an attempt to convince the State Board to change it[illegible]rminations in the Draft Order.

As the State Board indicated that additional evidence would not be heard [illegible] meeting or ***"accepted before the meeting,"*** Petitioners respectfully request that such extra r[illegible]evidence cited by the Regional Board, not be considered and that all such comments by th[illegible]ional Board be stricken.

II. THE REGIONAL BOARD'S EXTRA RECORD EVIDENCE REGA[illegible]NG RETAIL GASOLINE OUTLETS SHOULD BE STRICKEN.

For reasons that are unclear, the Regional Board, on line 21 of page 5 of t[illegible]EGIONAL BOARD COMMENT ON PROPOSED ORDER" (hereafter "Regional Board's C[illegible]ents") contended that there are "3,500 operating RGOs in Los Angeles County." Simil[illegible]n page 5, footnote 11, the Regional Board referred to a database it maintains on leaking un[illegible]ound storage tanks. While ignoring the potential problems and risks to our groundwater quali[illegible]ated by its SUSMP and its goal of having less impervious space (apparently even for RGOs[illegible] Regional Board refers to its records on leaking underground tanks and the number of gaso[illegible]cations currently operational in Los Angeles County, all of which is evidence not in the [illegible]nistrative Record. ***Petitioners respectfully request that such reference to evidence not in[illegible]ecord be stricken.***

///

///

III. THE REGIONAL BOARD CITES SEVERAL REFERENCES TO E NCE CONCERNING ENVIRONMENTALLY SENSITIVE AREAS THA ST BE STRICKEN, AS SUCH EVIDENCE IS NOT IDENTIFIED ANYWH IN THE RECORD.

The Regional Board starts its argument by admitting that Environmentall sitive Areas ("ESAs") are "locational" rather than "developmental" and that the inclusion of E n the SUSMP present "some difficulty in application." (Regional Board Comments p. es 16-18.) Unfortunately, the Regional Board's argument continues with references to the C Long Beach MS4 Permit without any reference to the record as to where this documen introduced into evidence during these proceedings.[1] It also references the inclusion of the V a County MS4 Permit, which it claims was adopted on ***July 27, 2000***, a document plainly evidence in these proceedings. (Regional Board Comments, p. 7, lines 1-4, and p. 8, lines 7-

Similarly, while attempting to make the argument that other agencies dea ESAs differently, referring specifically to the California Coastal Commission admini he California Coastal Act, and referring to an MOU apparently entered into betwee State Board and the Coastal Commission, as well as Coastal Commission determinations in J y 2000 and August 2000, the Regional Board in effect makes the State Board's argument tha s are already highly regulated in California. Unfortunately, all of these statements sh e stricken since in making its arguments, the Regional Board relies upon extra record evid ot permitted to be introduced in such written comments and thus inappropriately included as of the record that is before the State Board. (See Regional Board Comments, page 7, l through page 8, line 1, where the Regional Board improperly refers to the MOU with the tal Commission, as well as the January 2000 and August 2000 meetings of the Coa ommission.)

Similarly, the references to the Long Beach Permit and the Ventura Cou mit should be stricken from the record in issue unless the Regional Board can identify whe e Record

---

[1] The Regional Board contends the Long Beach Permit was introduced into e e at the June 8 hearing, but the parties were not provided copies of the Permit at the time, and egional Board has failed to identify where in the Record the Long Beach Permit itself w itted into evidence, and if so, through whose testimony.

these documents were introduced into evidence. (See Regional Board Comments [redacted] lines 1-4 and p. 8, lines 7-11.)

IV. THE REGIONAL BOARD REFERS TO EVIDENCE IN THE COU[redacted]OF ITS ARGUMENT ON 'NONDISRETIONARY PROJECTS' THAT MUS[redacted] STRICKEN.

Finally, in making its argument that "nondiscretionary" projects should b[redacted]uded within the subject SUSMP (irrespective of the express language in the NPDES Permit t[redacted]ontrary and its prior admissions to the contrary), the Regional Board argues it recently "adop[redacted]e Ventura County MS4 Permit (Board Order No. 00-108) without any reference to the term[redacted]etionary' therein." (Regional Board Comments, p. 9, lines 19-20). The Regional Board ap[redacted]tly included "nondiscretionary projects" in the SUSMP in Ventura County and seeks to convi[redacted]e State Board that because it did so in connection with the Ventura County Permit, that [redacted]ate Board should rest assured it will do so again with respect to the Los Angeles County Pe[redacted] The Regional Board is apparently intent on applying the SUSMP in Los Angeles Cou[redacted]o "nondiscretionary projects," irrespective of what the evidence may show in the c[redacted] of the hearing process on the new permit, and the propriety or impropriety of doing the[redacted]. The argument does not change the lack of opportunity provided to the Petitioners to [redacted]ss this issue at the hearing on January 26, 2000, and nor does it change the express language [redacted] Permit itself, which does not allow for the inclusion of "nondiscretionary" projects with[redacted] SUSMP. More importantly, the argument is inappropriate, as the Regional Board is referr[redacted] extra record evidence; i.e., the adoption of the Ventura County Permit, which must be stricke[redacted]n the Regional Board's written comments. (See Regional Board Comments, p. 9, line[redacted]0.)

///

///

///

///

///

///

V. CONCLUSION.

For the foregoing reasons, Petitioners herein respectfully request that the record evidence referenced and relied upon by the Regional Board in its written comme[illegible]n the State Board's Draft Order be stricken in its entirety, as it violates the admonishment p[illegible]d by the State Board in its August 28, 2000 directive.

John Robertus, Executive Officer
California Regional Water Quality Control Board
San Diego Region
9771 Clairemont Mesa Blvd.
San Diego, CA 92124

Dear Mr. Robertus:

PROPOSED NUMERIC SIZING CRITERIA FOR POST-CONSTRUCTION BMPS

The following comments are submitted for public testimony at the Regional Board's March 8, 2000 *Public Workshop on Numeric Sizing Criteria for Post-Construction BMPs for New and Re-Development.*

The County of San Diego has reviewed the Regional Board's February 25, 2000 Staff Report and March 6, 2000 Supplemental Staff Report regarding the proposed requirement of numeric sizing criteria for post-construction Best Management Practices (BMPs). Like other municipal stormwater co-permittees, we strongly support the reasonable application of appropriate stormwater quality controls, which are consistent with federal NPDES stormwater permitting regulations and the State Water Code. As such, we are conceptually open to the use of numeric sizing criteria for specified categories of development and redevelopment activities, but believe that the establishment of these or other specific criteria by the Regional Board would constitute an intrusion into local government authority and responsibility. Furthermore, we have a number of concerns about these criteria as they are currently proposed by Regional Board staff.

A. Legal and Regulatory Basis for SUSMP and Numeric Sizing Criteria

The County questions, and after further analysis may contest in an appropriate forum, the assertion in the Staff Report that "[t]he Regional Board has the authority to require the proposed Standard Urban Storm Water Mitigation Plan (SUSMP) and numerical sizing criteria for new construction and significant redevelopment post-construction BMPs." The County's concerns and objections in this area are related to the specificity of the requirements staff proposes to impose. Therefore, a decision to mandate specific numeric criteria would increase the seriousness of the County's concern.

1. Mandating Municipal Imposition of SUSMPs and Numeric Criteria

Staff's analysis claims authority for the Regional Board that is so broad and unguided that the specific provisions of 40 CFR 122.26(d)(2)(iv)(2) would lose any importance as limitations on the Regional Board's power over municipal governments. This is not what Congress or the state legislature intended, and it is not what the Courts have ratified in the cases cited by staff.

The Regional Board may well have the regulatory authority to directly require selected dischargers to capture stormwater to the degree staff suggests.[1] But that authority does not imply that the Regional Board also has the authority to force municipalities, as political and regulatory entities, to impose those requirements on others by ordinance or in permits.

The clearest and most directly applicable statement of the Regional Board's (delegated) power in this area is that contained in 40 CFR 122.26(d)(2)(iv)(2). That language (subject to requirements concerning unfunded mandates, discussed below) empowers the Regional Board to require municipal dischargers to utilize planning procedures including a master plan to develop controls. It requires that such plans address post-construction controls to reduce pollutants in discharges from storm sewers.

Staff's proposal contrasts sharply. Staff has not proposed a requirement concerning planning procedures or master plans, but a requirement to include specific numerical requirements in a municipal ordinance or municipal permits. Staff has not proposed a requirement concerning pollutants coming from municipal storm drains, but a requirement that would (purportedly) make municipalities accountable for specific industrial, commercial and residential discharges to those drains. The Regional Board lacks authority to force municipalities to impose such requirements. It also lacks authority to make municipalities liable under the Clean Water Act or the State Water Code for discharges by other entities to its storm drains.

The Board should also be mindful that staff's proposal would effectively impose important new requirements on dischargers without an environmental review process, without an appropriate rulemaking process and without consideration of the actual costs and benefits of the proposed requirements for any specific project. Foregoing these disciplines has emboldened staff to propose requirements that are far more stringent than those contained in the state's own general stormwater permits, which are applicable to industrial facilities and construction projects.

Staff's proposal is also so specific that it violates the prohibition in State Water Code section 13360 against specifying the manner of compliance with a waste discharge requirement.

The Regional Board has authority over the County as a discharger of stormwater, but that is a limited regulatory authority. The Regional Board should be guided in the exercise of that authority by 40 CFR 122.26(d)(2)(iv)(2), and should issue a revised municipal permit that requires and allows the County to address post construction controls in its planning process and

[1] If the Board has this authority, it comes with responsibilities. (Cf., Supplemental Information report at page 8, second bullet.) If acting directly, the Regional Board would confront its legal responsibilities to support findings with evidence, to follow mandated procedures when issuing rules, to determine and consider a full range of environmental impacts and alternatives and to provide due process when issuing permits. The Board would also, to an attenuated degree, confront some basic political and regulatory responsibilities (e.g., to accept responsibility for the requirements it mandated and to find the resources and fortitude to enforce those requirements).

general plan. It should not attempt to dictate the shape of County regulatory programs with the degree of specificity staff has proposed.

The case law discussed by staff does not establish that the Regional Board has authority to require municipalities to conduct themselves as staff has proposed.

NRDC v. *U.S. EPA* (1992) 966 F.2d 1292, 1308 ("NRDC II") was a challenge to an EPA rulemaking. There was no issue in that case of state authority to impose requirements on municipalities as political and governmental entities. Moreover, the principal holding in that case was that EPA was required to conform its regulations to the statute Congress had enacted. Thus, EPA could not limit the scope of the statutory program, or defer statutory deadlines. EPA's decision not to set specific minimum standards or numerical criteria in its regulations was upheld, however.

Staff would use this case, which upheld and preserved flexibility, as a justification for staff recommendations that would destroy municipalities' land use planning and stormwater management flexibility.

Nor does *Defenders of Wildlife* v. *Browner* (1999) 191 F.3d 1159 provide the mandate for SUSMPs and numeric sizing criteria that staff suggests. The question the court addressed in depth in its opinion was whether the court could compel EPA to require municipal stormwater dischargers to comply with state water quality standards, after EPA had chosen not to impose that requirement. The court refused to compel such requirements, finding that Congress drew a clear distinction between mandatory requirements for industrial dischargers and for municipal stormwater dischargers. "[T]he statute unambiguously demonstrates that Congress did not require municipal storm-sewer dischargers to comply strictly with 33 U.S.C. sec. 1311(b)(1)(C) [i.e., state water quality standards]." (*Id.* at 1165.) While the court also stated that EPA could impose such requirements if it determined they were necessary (*Id.* at 1166), the holding in the case and the thrust of the opinion was that permits which imposed only BMP requirements were legally adequate.

Significantly, there was no discussion in this case of the scope of EPA or state authority to dictate to municipalities the specific scope and terms of municipal stormwater regulatory programs. Absent a discussion of this issue, the case is not authority on the issue of what the Regional Board can compel the County to do. Staff, nevertheless, cite the case as a mandate for their proposed intrusions on municipal prerogatives.

2. Unfunded Mandates

Article 13B, Sec. 6 of the California Constitution provides that no state agency may mandate a new program or a higher level of service by a local government unless the state provides a subvention of funds to reimburse that local government for the costs of such program or higher level of service. The purpose of this provision is to prevent the state from forcing programs on local government. (*City of Richmond* v. *Commission on State Mandates* (1998) 64 Cal.App.4th 1190.) A Regional Board decision to require municipalities to implement a new and specific regulatory program, for the categories of sources identified in staff's proposal, would clearly be a state mandate, despite the arguable nexus to the Clean Water Act. (*Hayes* v. *Commission on State Mandates* (1992) 11 Cal.App.4th 1564.)

Staff's proposed impositions upon the County are an unfunded mandate prohibited by the state constitution, which the County will not accept.

3. Other Requirements of Doubtful Legality

The County is also concerned that the Regional Board lacks authority to require the County to impose other specific requirements proposed by staff.

First, the Regional Board lacks authority to require the County to regulate peak flow discharges of stormwater to protect stream banks and prevent flooding. These are important goals but they are not issues of stormwater pollution over which the Regional Board has jurisdiction, much less authority that supersedes County authority. *PUD No. 1* v. *Washington Department of Ecology* (1994) 511 U.S. 700, cited by staff, does not give the Regional Board this authority. Instead, that case held that under section 401 of the Clean Water Act (not 402) the state could establish minimum flows (not maximum flows) when approving a dam (not a municipal stormwater discharge) in order to protect formally established beneficial uses of the dammed stream. Moreover, the case held that even in these circumstances state authority was circumscribed: it could only impose requirements to ensure compliance with "applicable effluent limitations and other appropriate state law requirements." No such nexus exists to support the flow limitation requirement staff proposes to impose.

Second, the County believes the Regional Board lacks authority, at least on this record, to require the County to require dischargers to identify an entity with perpetual responsibility for BMP maintenance and an assured source of funding. No authority is offered for this proposed imposition, and the staff materials make no serious attempt to demonstrate the proposed imposition is necessary to keep pollutants out of stormwater. This suggested requirement is also presumptively unreasonable, given the low costs staff attributes to BMP maintenance, the high cost of entity formation and formal financial assurance mechanisms and the availability of other means to ensure that BMPs are maintained. It is unlikely staff would be proposing this requirement if they were the ones who would be required to explain it, impose it and enforce it in the real world.

Third, the County believes the Regional Board lacks authority to limit the County's discretion concerning stormwater capture only to cases in which the Regional Board determines that such capture is impracticable. If authority and responsibility are linked, the County should have the authority to manage and implement programs for which it is responsible. Staff's suggestion that the Regional Board retain a veto over flexibility and discretion in a program that staff proposes be forced onto municipalities, is unacceptable to the County.

Finally, the County is not aware of any Regional Board authority to require in lieu fees as proposed by staff. Staff identifies no authority for this proposal.

4. Failure To Perform Proper CEQA Analysis

The County asserts that the Regional Board cannot take the actions proposed by staff because no environmental review has been conducted to support such action as required by the California Environmental Quality Act ("CEQA"). (Pub. Resources Code, § 21000 et seq.) The County anticipates that the proposed actions would cause significant environmental impacts, some of which are noted below. Moving forward without even identifying those impacts would be irresponsible.

a. The Regional Board Will Be Asked To Approve a Project

CEQA requires that a public agency perform environmental review prior to determining whether or not to approve a project that may have significant impacts on the environment. (Pub. Resources Code, § 21080.) CEQA Guidelines (Cal. Code Regs., tit. 14, § 15000 et seq.) define an approval as a decision that commits the public to a definite course of action on its project. (Cal. Code Regs., tit. 14, § 15352.) Staff states on page 3 of the Supplemental Information for Public Workshop:

> "At the conclusion of the Workshop, the SDRWQCB will vote to include, or not to include, numeric sizing criteria in the upcoming municipal storm water permit."

If the Regional Board votes to include numeric sizing criteria in the upcoming municipal permit, it will constitute an "approval" under CEQA and will trigger the requirement to have the necessary environmental review to support the approval. No environmental review has been performed to support this action.

b. The Regional Board Must Comply With CEQA

The reports prepared by staff make no mention of CEQA or the need to satisfy its requirements prior to taking the staff's proposed action. The County can only speculate that staff has either failed to recognize that CEQA compliance is required or is relying upon Water Code section 13389 (Regional Board not required to comply with CEQA when adopting waste discharge requirements, except requirements for new sources, as defined by federal law). Such reliance would be misplaced for two reasons. First, the actions being proposed by staff are not required by federal law and, therefore, Water Code section 13389 is not applicable to the proposed actions. (Water Code, § 13372; *Committee for a Progressive Gilroy* v. *State Water Resources Control Bd.* (1987) 192 Cal.App.3d 847.) Second, even if federal law required the proposed actions, the waste discharge requirements that would be proposed for adoption would be requirements for new sources. Therefore, the Regional Board would be required by the specific terms of Water Code section 13389, to comply with CEQA.

c. Public Policy Demands That The Regional Board Satisfy CEQA

Legal arguments aside, the Regional Board must not move forward with staff's proposed actions until staff has studied all of the environmental impacts that may be forthcoming.

Also, the Regional Board must complete the CEQA process prior to deciding to implement numeric sizing criteria in order to assure that the co-permittees will be able to comply with the requirements. The co-permittees will be required to comply with CEQA prior to imposing the type of restrictions contemplated by staff. If the Regional Board has not completed the CEQA process and considered all of the potential impacts of the proposed actions prior to their adoption, the co-permittees are likely to find that CEQA demands some modifications of the proposed actions that will be inconsistent with the Regional Board's requirements. However, once the Regional Board has completed the CEQA process and addressed the environmental concerns, the co-permittees will be able to rely upon this documentation when they are forced to implement the program.

B. Implementation Issues

In addition to the legal and regulatory issues already cited, Regional Board staff have failed to adequately consider the full range of potential issues and problems associated with implementation of the proposed criteria.

1. Costs

It is the County's belief, without having had an opportunity to fully study this item, that the costs presented by Board staff are inadequately explored and may be significantly underestimated. Staff have cited a figure of 0.7% of total project cost as a typical high-end implementation cost. However, it is unclear whether this analysis incorporates stormwater treatment costs, entity formation and financial assurance mechanism costs, or all relevant maintenance costs. Moreover, even if this figure is accurate for this scenario, it is misleading since it relies on the assumption that the total project and land costs for a 5.51 acre, $6.5 million warehouse project will be typical of the projects that would be subject to the proposed criteria. Many urban projects will present different ratios of project value, land value and stormwater capture costs. In particular, the last minute inclusion by staff of two additional project categories ("locations adjacent to or discharging to an environmentally sensitive area" and "exposed parking lots > 5,000 square feet or with > 25 spaces") virtually assures that numerous smaller projects would be subject to these requirements. These projects would likely bear proportionally greater costs.

To accurately assess the financial impacts of BMP installation and maintenance, it is necessary to carefully consider a wide range of factors. Staff's analysis appears to have only partially addressed such costs. These should be fully explored in a public forum prior to the consideration of numeric sizing criteria, even conceptually, by the Regional Board.

2. Flexibility

Flexibility in the application of permit requirements is key to program success since the blanket requirement of rigid performance criteria over broad and inflexible categories of development could effectively prohibit development in many areas (e.g., sites where percolation is poor and large areas are not available to infiltrate, filter, or treat runoff). Additionally, the retention of water in open areas or catchment basins is likely to result in other problems, such as mosquito-breeding or the creation of artificial wetlands, an issue of serious concern since it could result in requirements to comply with additional environmental regulations. It is incumbent on Regional Board staff to provide adequate flexibility in its permitting process to allow local municipalities to avoid these and other potential problems.

The Supplemental Staff Report states that "[a] provision is included to allow affected parties to develop their own sizing or performance criteria using alternative approaches" and that, "upon approval by the SDRWQCB," these would replace the interim proposed criteria. Yet no such provision is contained in any of the materials provided. However, the report does go on to state that if alternative criteria are not proposed and approved, the interim criteria will become permanent. This raises serious concerns about Board intrusion into local decision making, an intrusion which would eliminate the flexibility needed by municipalities to implement effective development planning programs. While staff are very careful to state that the issue before the Board is not the consideration of specific numeric criteria, it is abundantly clear that upon conceptual approval, they intend to establish such criteria and to retain complete control over their application. It is of little comfort that they intend to do so in a public forum.

3. Effectiveness and Cost-Effectiveness

Ultimately, the practices implemented under this permit should enhance the co-permittees' ability to meet existing discharge requirements and to improve the quality of local receiving waters. It is currently unclear whether the proposed criteria would accomplish this. Staff's proposal relies on the critical assumption that increased retention of stormwater flows will reduce pollutant loadings, and therefore improve water quality. Yet, no data substantiating these assumptions are provided in either of the reports.

Staff assertion that this proposal would be "cost effective" is not supported by analysis. Staff characterize their initial[2] selection of the 85th percentile, 24-hour runoff event as "the point of diminishing returns, i.e., the BMP capacity beyond which, insignificant increase in pollutant removal (and hence water quality protection) will occur, relative to the additional costs." However, while this proposed criterion would likely ensure the capture of the majority of runoff, it in no way establishes a relationship to pollutant reduction or, more importantly, to the achievement of specific water quality objectives. It only states an assumption that such a relationship exists. It is incumbent on Regional Board staff both to provide an effectiveness analysis which demonstrates such a nexus and to determine how changes in stormwater capture requirements would affect both the costs of capture and the discharge of pollutants.

In conclusion, the County is extremely concerned about the lack of opportunity provided to review these reports prior to the RWQCB's March 8 Workshop. The March 2, 2000 release of the RWQCB's original Staff Report and subsequent March 6, 2000 release of the Supplemental Report have allowed County staff four and two working days, respectively, to review and respond to these documents. Additionally, this has occurred in a period during which Board Staff were fully aware that nearly identical criteria proposed by the Los Angeles Regional Board were under appeal.

We urge the Regional Board to reject staff's current proposal to include numeric sizing criteria in its revised municipal stormwater permit. The establishment of such criteria is most appropriately left to local jurisdictions. Further, it is recommended that Board staff work cooperatively with affected parties to determine an approach which allows municipalities to retain an appropriate level of local control and does not unfairly burden the development industry. Given the potential significance of the proposed requirements, any other approach would be irresponsible and would likely be subject to appeal.

Sincerely,

ROBERT R. COPPER
Deputy Chief Administrative Officer

RRC/jp

[2] This 85th percentile figure is misleading because staff subsequently apply a safety factor of 2. The effective percentile for this proposal is therefore substantially higher than 85.
