Impacts to population and housing would be similar to the proposed alternative since impacts would be site specific and within similar locations. [Similar impact]

Recreation

Impacts to recreation would be similar to the proposed alternative since impacts would be site specific and within similar locations. [Similar impact]

Transportation and Circulation

Impacts to transportation and circulation would be similar to the proposed alternative since impacts would be site specific and within similar locations. [Similar impacts]

Utilities and Service Systems

Impacts to utilities and service systems would be similar to the proposed alternative since impacts would be site specific and within similar locations. [Similar impacts]

6.4.2 Non-Structural BMPs Only Project Alternative

The Non-Structural BMPs Only Project Alternative would involve implementation of the proposed program and its associated non-structural BMPs only. No structural BMPs would be implemented as the significant and unavoidable impacts are generally related to construction activities associated with the structural BMPs. For example, the significant and unavoidable air quality, noise, and cultural resources impacts would be avoided through implementation of non-structural BMPs only because non-structural BMPs would not result in construction activities.

The proposed program would focus on implementation of policies, actions, and activities that are intended to prevent pollutants from entering stormwater runoff, thus eliminating the source of the pollutants.

Ability to Meet Program Objectives

The Non-Structural BMPs Only Project Alternative would avoid the potential environmental impacts that would occur as a result of implementing the proposed program. While these measures would help to improve water quality in the EWMP areas, sole reliance on these non-structural BMPs may not provide the level of water quality treatment needed to meet the water quality objectives of the Regional Water Quality Control Board Basin Plan and as required by the MS4 Permit. The Non-Structural BMPs Only Project Alternative may not meet the objectives of the proposed program to collaborate among agencies to promote more cost-effective and multi-beneficial water quality improvement projects because Non-Structural BMPs are generally implemented individually in each jurisdiction, so collaboration efforts for cost-effective solutions diminishes with implementation of non-structural BMPs only. Nonetheless, potential impacts of this alternative are discussed in the following pages.

RB-AR 8667

Impact Analysis

Aesthetics

The Non-Structural BMPs Only Project Alternative would avoid construction impacts identified in the proposed alternative. However, many BMPs, such as green-streets and grassy swales, would improve local aesthetics. The Non-Structural BMPs Only Project Alternative would minimize this multi-purpose benefit of the project. [Greater impacts]

Air Quality

The Non-Structural BMPs Only Project Alternative would avoid construction impacts identified in the proposed alternative. The elimination of construction emissions throughout the region would result in the use of fewer off-road vehicles and fewer emissions. [Fewer impacts]

Biological Resources

The Non-Structural BMPs Only Project Alternative would avoid direct impacts to biological resources from construction. Although dry-weather flows would be reduced under this alternative, relying solely on non-structural BMPs would be less effective than the combination of BMPs planned in the proposed alternative. Impacts to biological resources would be less under the Non-Structural BMPs Only Project Alternative. [Fewer impacts]

Cultural Resources

The Non-Structural BMPs Only Project Alternative would avoid construction impacts, resulting in fewer impacts to cultural resources. [Fewer impacts]

Geology and Soils/Mineral Resources

The Non-Structural BMPs Only Project Alternative would avoid construction impacts and infiltration impact, resulting in fewer impacts to geological resources. The potential for increased unstable soils from infiltration would be reduced under this alternative. [Fewer impacts]

Greenhouse Gases

The Non-Structural BMPs Only Project Alternative would avoid construction impacts identified in the proposed alternative. The elimination of construction emissions throughout the region would result in fewer GHG emissions. [Fewer impacts]

Hazards and Hazardous Waste

The Non-Structural BMPs Only Project Alternative would avoid construction impacts and infiltration impact, resulting in fewer impacts to hazards. The potential for increased mobilization of contamination in soils would be reduced under this alternative. [Fewer impacts]

Hydrology and Water Quality

The water quality benefit provided by the structural BMPs would be eliminated under this alternative. Achieving water quality objectives required in the MS4 Permit with no structural

BMPs would be unlikely. The potential for non-compliance with the MS4 Permit under this alternative would result in a significant impact of the alternative. [Greater impacts]

Land Use Planning/Agriculture

The Non-Structural BMPs Only Project Alternative would avoid construction impacts and infiltration impact, resulting in fewer impacts to land uses and agriculture. [Fewer impacts]

Noise

The Non-Structural BMPs Only Project Alternative would avoid construction impacts and infiltration impact, resulting in fewer impacts to noise. [Fewer impacts]

Population and Housing

The avoidance of construction would not affect population and housing. Impacts would be similar to the proposed alternative. [Similar impacts]

Recreation

The avoidance of construction would not affect recreation. Impacts would be similar to the proposed alternative. [Similar impacts]

Transportation and Circulation

The avoidance of construction would reduce impacts to transportation and circulation. Impacts would be less than the proposed alternative. [Fewer impacts]

Utilities and Service Systems

The avoidance of construction and increased infiltration would reduce impacts to utilities and service systems. Impacts would be less than the proposed alternative. [Fewer impacts]

6.4.3 Distributed Structural and Non-Structural BMPs Only Program Alternative (No Centralized or Regional)

The Distributed Structural BMPs Only Project Alternative would involve implementation of the proposed program and only its associated distributed structural BMPs and non-structural BMPs. Since much of the impacts of program implementation would occur during construction of the large-scale regional and centralized BMPs, this alternative would result in fewer construction impacts than the proposed project.

Ability to Meet Program Objectives

The Distributed Structural BMPs Only Program Alternative would meet the objectives of the proposed program to collaborate among agencies to promote more cost-effective and multi-beneficial water quality improvement projects. However, because distributed structural BMPs tend to be smaller in nature and typically are distributed widely throughout the watershed, more BMPs may be necessary to meet water quality objectives in the MS4 Permit. The ability to meet the water quality objectives would be less certain under this alternative. Potential impacts of this alternative are discussed in the following pages.

Impact Analysis

Aesthetics

Constructing more distributed BMPs and no large-scale regional or centralized BMPs would result in similar aesthetics impacts on the regional level within each watershed. Although more widely dispersed projects would result in more locations being subjected to short-term construction activities, post-construction impacts would largely be beneficial, since green-streets and small-scale grassy swales would be installed that generally would improve local character in urban settings. In addition, any adverse post-construction impacts to local aesthetics from the larger BMPs would be avoided. [Fewer impacts]

Air Quality

Constructing fewer large-scale BMPs would result in fewer daily emissions. Although construction of more widely dispersed small-scale BMPs may increase the number of construction projects, the smaller size would result in the use of fewer off-road vehicles and fewer emissions. [Fewer impacts]

Biological Resources

Constructing fewer large-scale BMPs would result in impacts similar to biological resources as the proposed alternative. Impacts to biological resources from construction of BMPs would be site specific regardless of the type of program being implemented. The potential to reduce surface flows supporting riparian and wetland resources would be similar to the proposed alternative. [Similar impacts]

Cultural Resources

Constructing fewer large-scale BMPs, but more small-scale BMPs would have similar impacts to cultural resources as the proposed alternative. Impacts to cultural resources would be site specific regardless of the type of project being implemented. [Similar impacts]

Geology and Soils/Mineral Resources

Impacts to geological and mineral resources would be similar to the proposed alternative since impacts would be site specific regardless of the type of BMPs being built. [Similar impacts]

Greenhouse Gases

Construction of the BMPs would result in only minor GHG emissions. Constructing fewer large-scale BMPs would result in fewer GHG emissions overall, but in terms of the cumulative impact to global climate change, the impact would be similar to the proposed alternative. [Similar impacts]

Hazards and Hazardous Waste

Impacts to hazards and hazardous waste would be similar to the proposed alternative since impacts would be site specific regardless of the type of BMPs being built. Localized subsurface contamination could be affected by any of the BMP types and individual projects would be subject to similar preconstruction evaluations to assess suitability of the location. [Similar impacts]

Hydrology and Water Quality

The water quality benefit provided by the large-scale regional BMPs would be eliminated under this alternative. Achieving water quality objectives required in the MS4 Permit with a greater number of small-scale BMPs may be unlikely if larger regional BMPs are not constructed. The potential for noncompliance with the MS4 Permit under this alternative would result in a significant impact compared to that of the proposed alternative. [Greater impact]

Land Use Planning/Agriculture

Construction of a greater number of BMPs would have greater impacts to land uses within each watershed since more projects would be required. The large-scale BMPs would be located in areas with sufficient developable space. Eliminating use of these large open-space areas would disperse land use acquisition and compatibility impacts throughout the watershed. Impacts would be greater under this alternative. [Greater impacts]

Noise

Construction of more BMPs would subject a greater number of people to temporary construction noise. However, impacts from the longer-term construction of large BMPs would be avoided. Since impacts would be site specific, impacts from construction noise would be similar to the proposed alternative. [Similar impacts]

Population and Housing

Construction of more small-scale BMPs and fewer large-scale BMPs would have similar effects to population and housing as the proposed alternative. [Similar impacts]

Recreation

Construction of more small-scale BMPs and fewer large-scale BMPs would have similar effects to recreation within the watersheds. Impacts would be site specific under either alternative. [Similar impacts]

Transportation and Circulation

Construction of more small-scale BMPs and fewer large-scale BMPs would have similar effects to transportation and circulation within the watersheds. Smaller projects would have shorter duration impacts to roadways, but would occur in more locations. Impacts would be site specific under either alternative. [Similar impacts]

Utilities and Service Systems

Construction of more small-scale BMPs and fewer large-scale BMPs would have similar effects to utilities and service systems as the proposed alternative. Construction impacts would be site specific. [Similar impacts]

6.5 Comparison of Alternatives

This section provides a summary comparison of the alternatives relative to the proposed program, with respect to their ability to meet program objectives and their relative environmental impacts compared to the proposed program. **Table 6-2** summarizes the ability of the proposed program, the No Program Alternative, the Non-Structural BMPs Only Project Alternative, and the Distributed Structural and Non-Structural BMPs Only Project Alternative to meet the program objectives; it also summarizes the environmental impacts of these alternatives relative to the proposed program.

6.6 Alternatives Suggested in Scoping

Several alternatives were suggested in comment letters received during the Notice of Preparation (NOP) Scoping process. These comments are included in Appendix A. One comment letter from Dr. Tom Williams representing the Sierra Club suggested that the PEIR include an assessment of several funding mechanism alternatives, including: Single Parcel Fee Assessment, Parcel Area Fee Assessment, Hybrid Parcel Area Fee Assessment, Zero Discharge Assessment, and Large Parcel Assessment. These suggested alternatives would not lessen any significant environmental impacts of the Program and were therefore not considered in this PEIR. Although CEQA allows for discussion of economic impacts and project costs as measures of feasibility, the funding mechanisms required to implement projects are generally not susceptible to environmental analysis. For these reasons, these suggested alternatives were not evaluated as program alternatives for CEQA compliance.

In addition to the fee assessment alternatives, the comment suggested a Full Capture and Recharge of Flows Greater than 100 cfs Alternative. This suggested alternative was rejected from further consideration because of the infeasibility of capturing all storm flows in Los Angeles County. The retention basins required to retain all storm flows in the County would be unrealistic, requiring most of the developed land in the County to be accomplished. The comment may have been suggesting full capture of all flows less than 100 cfs, but, again, this alternative was rejected from further consideration for the same reason: that the retention basins needed to retain and recharge all flows in Los Angeles County waterways less than 100 cfs would require enormous areas of undeveloped lands that are currently developed. Furthermore, groundwater recharge is only feasible in certain areas of the County because of the poor percolation capacity of surficial soils in some areas. The accumulation of subsurface clay lenses creates recharge barriers in many places of the County, making retention and recharge of large quantities of stormwater infeasible in these locations.

TABLE 6-2
ABILITY OF PROJECT ALTERNATIVES TO MEET PROJECT OBJECTIVES

	Proposed Program	No Project	Non-Structural BMPs Only	Distributed Structural/Non-Structural BMPs Only
Project Objectives				
To collaborate among agencies (Permittee jurisdictions) across the watershed to promote more cost-effective and multi-beneficial water quality improvement projects to comply with the MS4 Permit.	Yes	No	No	No
To develop watershed-wide EWMPs that will, once implemented, remove or reduce pollutants from dry- and wet-weather urban runoff in a cost-effective manner.	Yes	No	No	No
To reduce the impact of stormwater and non-stormwater on receiving water quality.	Yes	Yes	No	Yes
Environmental Impacts				
Aesthetics	LSM	Similar	Greater	Fewer
Air Quality (construction/operation)	SU/LTS	Similar	Fewer	Similar
Biology	LSM	Similar	Fewer	Similar
Cultural Resources	SU	Similar	Fewer	Similar
Geology/Mineral Resources	LSM	Similar	Fewer	Similar
Greenhouse Gases	LTS	Similar	Fewer	Similar
Hazards and Hazardous Materials	LSM	Similar	Fewer	Similar
Hydrology and Water Quality	LSM	Greater	Greater	Greater
Land Use/Agriculture	LTS	Similar	Similar	Greater
Noise (construction/operation)	SU/LTS	Similar	Fewer	Similar
Public Services/Recreation	LTS	Similar	Similar	Similar
Population and Housing and Environmental Justice	LTS	Similar	Similar	Similar
Transportation and Traffic	LSM	Similar	Fewer	Similar
Utilities and Service Systems	LSM	Similar	Fewer	Similar

LTS = Less than Significant
LSM = Less than Significant with Mitigation
SU = Significant and Unavoidable

6.7 Environmentally Superior Alternative

CEQA requires that an EIR identify the environmentally superior alternative(s) of a project other than the proposed program or the "no project" alternative (CEQA Guidelines Section 15126.6 (e)(2)). As stated at the beginning of this chapter, the purpose of this alternatives analysis is to consider a reasonable range of alternatives that could feasibly attain most of the basic project objectives and avoid or substantially lessen significant program impacts.

The No Program Alternative would require that individual Permittees design and construct BMPs locally to achieve MS4 Permit compliance. As a result, impacts from construction of large and small BMPs would be similar to the proposed alternative. None of the significant and unavoidable impacts of the proposed alternative would be avoided by this alternative. Furthermore, since the ability to achieve compliance with MS4 Permit water quality objectives would be reduced if each Permittee were on their own, impacts to water quality would be greater under this alternative.

The Distributed Structural BMPs Only Alternative would result in construction of an increased number of distributed BMPs, but would avoid construction and operational impacts associated with the large-scale centralized and regional BMPs. Many of the significant and unavoidable impacts of the proposed alternative would be avoided or substantially minimized under this alternative, including construction impacts involving noise and air emissions. However, since the ability to achieve compliance with MS4 Permit water quality objectives would be reduced without the larger-scale centralized and regional BMPs, impacts to water quality would be greater under this alternative.

The Non-Structural BMPs Only Alternative would avoid all of the significant and unavoidable impacts associated with construction of the structural BMPs. In addition, nearly all of the impacts associated with the proposed alternative would be avoided, including impacts from infiltration to neighboring subsurface structures, mobilization of contaminants, and site-specific impacts to cultural and biological resources. However, since the ability to achieve compliance with MS4 Permit water quality objectives would be substantially reduced, impacts to water quality would be greater under this alternative, and compliance with the MS4 Permit would be unlikely. Even though this alternative would avoid significant and unavoidable impacts of construction and operation of structural BMPs, the failure to meet water quality objectives and achieve MS4 Permit compliance would outweigh the avoidance of the other impacts. In order to reduce overall potential impacts, the EWMPs will emphasize the use of non-structural BMPs that include true source control measures , e.g. reduction of copper in brake pads through enacted state-wide legislation. Furthermore, as discussed, due to the difficultly of locating larger regional BMPs, the use of distributed BMPs with a lower potential for impact will be emphasized in the EWMPs as well. 6-16,

As a result, since the proposed alternative would provide the best chance of achieving regional water quality objectives, it is considered the environmentally superior alternative.

Appendix A
Notice of Preparation

Notice of Preparation

Date	August 29, 2014
To:	California Office of Planning and Research, Responsible and Trustee Agencies and Interested Parties
Subject:	Notice of Preparation of a Draft Program Environmental Impact Report
Project:	Enhanced Watershed Management Programs
Lead Agency:	Los Angeles County Flood Control District
Review Period:	August 29, 2014 through September 29, 2014

The Los Angeles County Flood Control District (LACFCD) will be the Lead Agency and will prepare a Program Environmental Impact Report (PEIR) for the project identified in this notice. We need to know the views of you or your agency as to the scope and content of the environmental information which is germane to your agency's statutory responsibilities in connection with the proposed project. This Notice of Preparation (NOP) has been prepared to notify agencies and interested parties that the LACFCD is beginning preparation of a PEIR pursuant to the California Environmental Quality Act (CEQA) for its proposed Enhanced Watershed Management Programs (EWMPs, or “program”).

The Los Angeles County Flood Control Act was adopted by the State Legislature in 1915 and established the LACFCD and empowered it to provide flood risk management, water conservation, and recreation and aesthetic enhancement within its boundaries. The LACFCD is governed as a separate entity by the Board of Supervisors of the County of Los Angeles and is operated by the County's Department of Public Works. The LACFCD encompasses more than 3,000 square miles, 85 cities, and approximately 2.1 million land parcels. The LACFCD, the County of Los Angeles, and 84 incorporated cities within Los Angeles County (collectively referred to as Permittees) are covered under a Municipal Separate Storm Sewer System (MS4) Permit (Order No. R4-2012-0175; National Pollutant Discharge Elimination System [NPDES] Permit No. CAS004001) for the discharge of urban runoff to waters of the United States. The purpose of the MS4 Permit is to ensure Permittees are not causing or contributing to exceedances of water quality objectives or impairments of beneficial uses in the receiving waters of the Los Angeles region.

The 2012 MS4 Permit for Los Angeles County gives Permittees the option of implementing an innovative approach to Permit compliance through development of EWMPs. The LACFCD and participating Permittees have opted to exercise this option and have submitted 12 separate Notices of Intent (NOIs) for the development of 12 EWMPs in their respective watershed groups to the Los Angeles Regional Water Quality Control Board (LARWQCB). The LARWQCB is responsible for approval of the EWMPs in compliance with the MS4 Permit. Implementation of the EMWPs would occur following approval by the LARWQCB. The preparation of the 12 separate EWMPs will be a collective effort among the LACFCD and the applicable agencies in each respective EWMP. The 12 EWMPs will vary for each watershed group, but will generally provide the opportunity for Permittees to customize their stormwater programs to achieve compliance with applicable receiving water limitations (RWLs) and water-quality-based effluent limits (WQBELs) in accordance with the MS4 Permit through implementation of stormwater best management practices (BMPs) or watershed control measures. BMPs vary in function and type, with each BMP providing unique design characteristics and benefits from implementation. The overarching goal of BMPs in the EWMP is to reduce the impact of stormwater and non-stormwater on receiving water

quality and address the water quality priorities as defined by the MS4 Permit. The development of each EWMP will involve the evaluation and selection of multiple BMP types, including nonstructural (institutional) and distributed, centralized, and regional structural watershed control measures, that will be implemented to meet compliance goals and strategies under the 2012 MS4 Permit.

The LACFCD, as a regional agency charged with conserving stormwater for use in our local water supply, has a vested interest in increasing opportunities for stormwater capture and groundwater recharge. The LACFCD has flood control infrastructure in each of the EWMP areas and is participating in all 12 EWMPs. The LACFCD will be working with the applicable Permittees and other stakeholders in all 12 EWMP watersheds to develop the EWMPs, which will be implemented by the Permittees that have jurisdiction within each EWMP area. The Permittees implementing the projects defined in the EWMPs, or "implementing agencies," will vary between EWMPs and individual projects. The LACFCD will be an implementing agency only on those projects for which it has been identified in an EWMP as a responsible implementing party.

Project Location: The proposed program would be located in several watersheds of Los Angeles County and would include the following enhanced watershed management groups: Ballona Creek, Beach Cities, Dominguez Channel, Malibu Creek, Marina del Rey, North Santa Monica Bay Coastal Watersheds (NSMBCW), Palos Verdes Peninsula, Rio Hondo/San Gabriel River Water Quality Group (RH/SGRWQG), Santa Monica Bay, Upper Los Angeles River, Upper San Gabriel River, and Upper Santa Clara River. The project area is indicated in Figure 1.

Broad Range of Potential Benefits from EWMPs: If implemented, the proposed EWMP-generated benefits would include:

- Improved Water Quality
- Reduction in Impairment of Water Bodies for Designated Beneficial Uses
- Promotion of Water Conservation and Supply
- Enhanced Recreation Opportunities
- Support for Public Education Opportunities
- Improved Local Aesthetics
- Management of Flood Risks

Public Comments: The LACFCD is soliciting the views of interested persons and agencies as to the scope and content of the environmental information to be evaluated in the PEIR. In accordance with CEQA, agencies are requested to review the project description in this NOP and provide their comments on environmental issues related to the statutory responsibilities of the agency. The PEIR will be used by LACFCD's governing Board, the Los Angeles County Board of Supervisors, when considering approval of the proposed EWMPs as well as for any related discretionary approvals.

Due to the time limits mandated by state law, all comments to the NOP are due no later than September 29, 2014. Please send your comments to the address shown below. Include a return address or email address and a contact name in your agency with your comments.

Gregg BeGell, P.E.
County of Los Angeles Department of Public Works
Project Management Division II
900 South Fremont Avenue, 5th Floor
Alhambra, CA 91803
(626) 300-3298
gbegell@dpw.lacounty.gov

This NOP and other PEIR information, as it becomes available, can be accessed at:
www.LACoH2Osheds.com

Scoping Meetings: Three scoping meetings will be held to receive public comments regarding the scope and content of the PEIR. The scoping meetings will include a brief presentation providing an overview of the proposed program and the CEQA process. After the presentation, oral comments will be accepted. Written comment forms will be supplied for those who wish to submit comments in writing at the scoping meeting. Written comments also may be submitted anytime during the NOP review period. The scoping meetings will be held as follows:

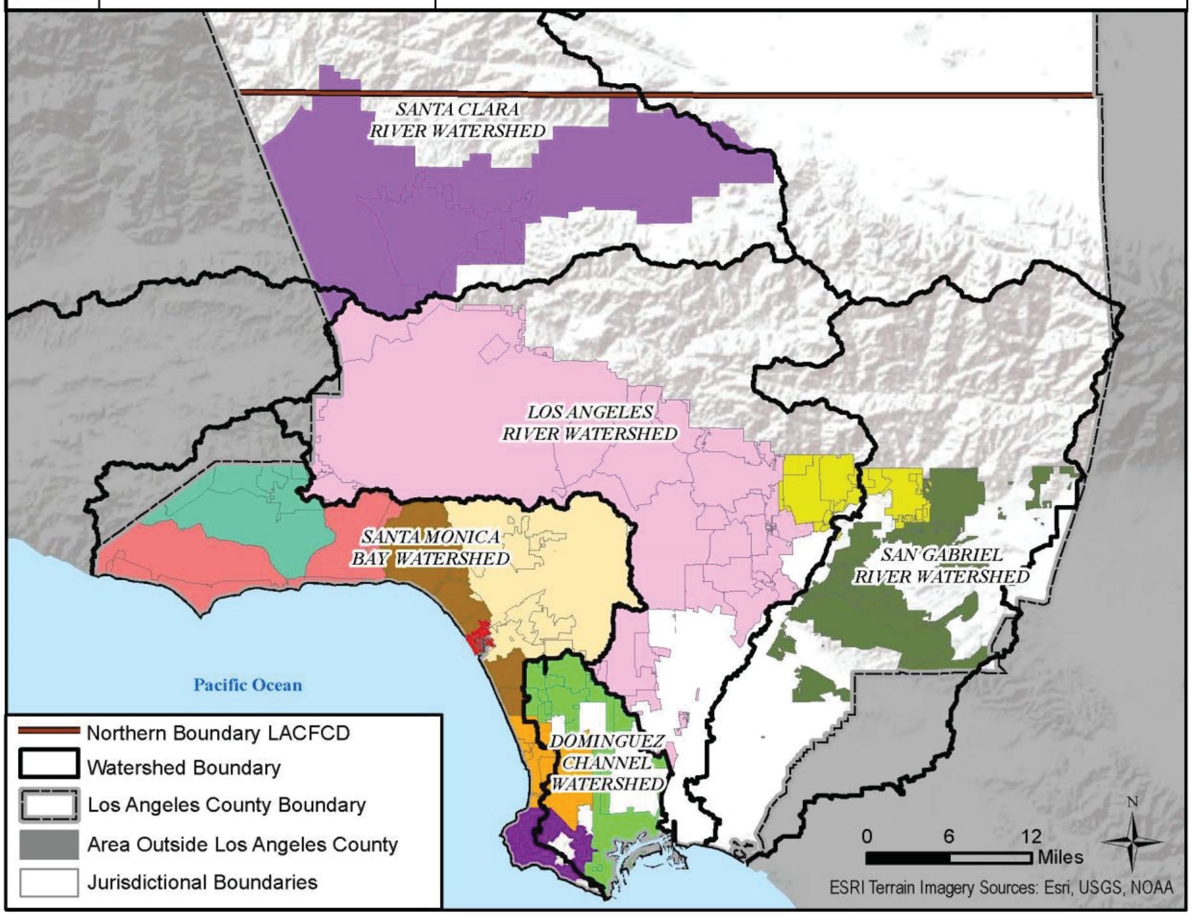
Figure 1: Overview EWMP Groups

	Group Name	Cities/Permittees Involved
	Ballona Creek	Beverly Hills, Culver City, Inglewood, Los Angeles, Santa Monica, West Hollywood, LA County, LACFCD
	Beach Cities Watershed Management Group	Hermosa Beach, Manhattan Beach, Redondo Beach, Torrance, LACFCD
	Dominguez Channel Watershed Management Group	El Segundo, Hawthorne, Inglewood, Los Angeles, Lomita, LA County, LACFCD
	Malibu Creek Watershed	Agoura Hills, Calabasas, Hidden Hills, Westlake Village, LA County, LACFCD
	Marina del Rey	Culver City, Los Angeles, LA County, LACFCD
	North Santa Monica Bay Coastal Watersheds	LA County, Malibu, LACFCD
	Palos Verdes Peninsula EWMP Agencies	Palos Verdes Estates, Rancho Palos Verdes, Rolling Hills Estates, LA County, LACFCD
	Rio Hondo/San Gabriel River Water Quality Group	Arcadia, Azusa, Bradbury, Duarte, Monrovia, LA County, Sierra Madre, LACFCD
	Santa Monica Bay Watershed Jurisdictions 2 & 3	Los Angeles, El Segundo, Santa Monica, LA County, LACFCD
	Upper Los Angeles River Watershed	Alhambra, Burbank, Calabasas, Glendale, Hidden Hills, La Canada Flintridge, Los Angeles, Montebello, Monterey Park, Pasadena, Rosemead, San Gabriel, San Marino, South Pasadena, Temple City, LA County, LACFCD
	Upper San Gabriel River	Baldwin Park, Covina, Glendora, Industry, La Puente, LA County, LACFCD
	Upper Santa Clara River Watershed	LA County, Santa Clarita, LACFCD



1. Introduction

The LACFCD along with other applicable Permittees have submitted NOIs to the LARWQCB to develop EWMPs for 12 watershed groups, in accordance with the 2012 MS4 Permit, Order No. R4-2012-0175. The LARWQCB is responsible for approval of the final EWMPs in compliance with the MS4 Permit. Implementation of the EMWPs would occur following approval of the final plan. To begin preparing the EWMPs, the Permittees collaborated on, developed, and submitted Draft Work Plans to the LARWQCB, outlining the proposed approach to preparation of each of their respective EWMPs. The primary approach to each of the EWMPs, as identified in the Draft Work Plans, includes identifying community-friendly, cost-effective methods of reducing urban runoff pollution and incorporating distributed and centralized structural and nonstructural watershed control measures for a multi-pollutant, multi-benefit approach. The EWMPs will also evaluate multi-benefit regional projects that will retain (through infiltration or capture and reuse) the stormwater quality design volume (85th percentile storm for 24 hours) for the runoff from the contributing drainage area.

The proposed project includes the potential nonstructural (institutional) and distributed, centralized, and regional structural watershed control measures described in the Draft Work Plans and detailed in the EWMPs currently under preparation. These measures will be evaluated in the PEIR. The PEIR will provide a program-level assessment of the overall permit compliance effort, focusing particularly on the structural watershed control measures proposed in each of the 12 EWMP areas.

1.1 Project Location

The proposed program includes several watershed management groups of Los Angeles County, which include the following EWMP groups: Ballona Creek, Beach Cities, Dominguez Channel, Malibu Creek, Marina del Rey, North Santa Monica Bay Coastal Watersheds (NSMBCW), Palos Verdes Peninsula, Rio Hondo/San Gabriel River Water Quality Group (RH/SGRWQG), Santa Monica Bay, Upper Los Angeles River, Upper San Gabriel River, and Upper Santa Clara River. The geographic scope covered by each of these 12 EWMPs is described in further detail below and shown in Figure 1.

- Ballona Creek – The Ballona Creek EWMP area covers the Ballona Creek watershed. The Permittees within this EWMP are the Cities of Beverly Hills, West Hollywood, Los Angeles, Inglewood, Culver City, Santa Monica, and West Hollywood; County of Los Angeles; and LACFCD.

- Beach Cities – The Beach Cities EWMP area covers portions of three watersheds: Santa Monica Bay Watershed Jurisdictional Group (SMB JG) 5 & 6, Dominguez Channel Watershed, and Machado Lake Watershed. The Permittees within this EWMP are the Cities of Redondo Beach, Manhattan Beach, Hermosa Beach, and Torrance; and the LACFCD.

- Dominguez Channel – The Dominguez Channel EWMP area covers portions of three watersheds: Dominguez Channel Watershed, the Machado Lake Watershed, and the Los Angeles/Long Beach Harbors Watershed. The Permittees within this EWMP are the Cities of El Segundo, Hawthorne, Inglewood, Lomita, and Los Angeles; County of Los Angeles; and the LACFCD.

- Malibu Creek – The Malibu Creek Watershed (MCW) EWMP area covers the majority of the MCW. The Permittees within this EWMP are the Cities of Agoura Hills, Calabasas, Hidden Hills, , and Westlake Village; County of Los Angeles; and the LACFCD.

RB-AR 8704

- Marina del Rey – The Marina del Rey EWMP area covers the Marina del Rey Watershed. The Permittees within this EWMP are the Cities of Los Angeles and Culver City; County of Los Angeles; and LACFCD.

- North Santa Monica Bay – The NSMBCW EWMP area covers the SMB JG 1, SMB JG 4, and a portion of Malibu Creek within the City of Malibu's borders. The Permittees within this EWMP are the City of Malibu; County of Los Angeles; and LACFCD.

- Palos Verdes Peninsula – The Palos Verdes Peninsula watershed management area covers most of the SMB JG7, the Los Angeles Harbor subwatershed, and the Machado Lake subwatershed. The Permittees within this EWMP are the Cities of Rancho Palos Verdes, Palos Verdes Estates, and Rolling Hills Estates; County of Los Angeles; and LACFCD.

- Rio Hondo/San Gabriel River – The RH/SGRWQG EWMP area covers portions of the Los Angeles and San Gabriel River watersheds. The Permittees within this EWMP are the Cities of Arcadia, Azusa, Bradbury, Duarte, Monrovia, and Sierra Madre; County of Los Angeles; and LACFCD.

- Santa Monica Bay – The Santa Monica Bay EWMP area covers the central region of the Santa Monica Bay Watershed (SMB JG2 and SMB JG3) and includes the urbanized Dockweiler and Santa Monica subwatersheds, as well as natural open space located in the Castle Rock, Pulga Canyon, Temescal Canyon, and Santa Monica Canyon subwatersheds. The Permittees within this EWMP include the Cities of Los Angeles, Santa Monica, and El Segundo; County of Los Angeles; and LACFCD.

- Upper Los Angeles River – The Upper Los Angeles River EWMP area covers the upper reaches of the Los Angeles River Watershed. The Permittees within this EWMP are the Cities of Alhambra, Burbank, Calabasas, Glendale, Hidden Hills, La Cañada Flintridge, Los Angeles, Montebello, Monterey Park, Pasadena, Rosemead, San Gabriel, San Marino, South Pasadena, and Temple City; County of Los Angeles; and LACFCD.

- Upper San Gabriel River – The Upper San Gabriel River EWMP area covers portions of the San Gabriel River Watershed. The Permittees within this EWMP are the Cities of Baldwin Park, Covina, Glendora, Industry, and La Puente; County of Los Angeles; and LACFCD.

- Upper Santa Clara River – The Upper Santa Clara River EWMP area covers the Upper Santa Clara River Watershed. The Permittees within this EWMP are the City of Santa Clarita; County of Los Angeles; and LACFCD.

2. Background

2.1 Stormwater/Water Quality

MS4 discharges consist of stormwater and non-stormwater generated from municipal land uses that are ultimately discharged into surface waters throughout the region. The MS4 system includes curbs and gutters, man-made channels, catch basins, and storm drains throughout the Los Angeles region. Discharges may adversely affect receiving surface water quality with pollutants such as bacteria, nutrients (nitrogen and phosphorus), aluminum, copper, lead, zinc, diazinon, and cyanide. Aquatic toxicity, particularly during wet weather, is also a concern. Stormwater and non-stormwater discharges of debris and trash are also a pervasive water quality problem in the Los Angeles region. Pollutants in stormwater and non-stormwater may have damaging effects on both human health and aquatic ecosystems.

Water quality assessments conducted by the LARWQCB have identified impairment of beneficial uses of water bodies in the Los Angeles region possibly caused or contributed to by pollutant loading from municipal stormwater and non-stormwater discharges. The MS4 Permit described below is designed to reduce pollutant loads into local surface waters.

2.2 Total Maximum Daily Loads

The federal Clean Water Act (CWA), Section 303(d), requires states to identify waters that do not meet water quality standards despite the treatment by pollution-control technology. States are required not only to identify these “water quality limited segments” but also to prioritize such waters for the purpose of developing Total Maximum Daily Loads (TMDLs). A TMDL is defined as the “sum of the individual waste load allocations (WLAs) for point sources and load allocations for nonpoint sources and natural background” (40 CFR 130.2), such that the capacity of the water body to assimilate constituent loads (the loading capacity) is not exceeded. A TMDL represents an amount of pollution that can be released into a specific water body without causing a decline in water quality and impairment of beneficial uses. The TMDL also allocates the loads among current and future pollutant sources to the water body and forms the basis for WQBELs and RWLs assigned in NPDES permits. LARWQCB and United States Environmental Protection Agency (USEPA) have established 33 TMDLs that identify Los Angeles County MS4 discharges as one of the pollutant sources causing or contributing to these water quality impairments.

2.3 MS4 Permit

On November 8, 2012, the LARWQCB adopted the fourth NPDES MS4 Permit (Order No. R4-2012-0175) for discharges from the MS4 within the coastal watersheds of Los Angeles County. The MS4 Permit became effective on December 28, 2012. The 2012 MS4 Permit establishes the waste discharge requirement for stormwater and non-stormwater discharges within the watersheds of Los Angeles County. The MS4 Permit identifies conditions, requirements, and programs that municipalities must comply with to protect regional water resources from adverse impacts associated with pollutants in stormwater and urban runoff. The MS4 Permit contains effluent limitations, RWLs, Minimum Control Measures (MCMs), TMDL provisions, and outlines the process for developing watershed management programs, including the EWMP.

The 2012 MS4 Permit includes provisions that allow Permittees to voluntarily choose to implement an EWMP to achieve permit compliance with RWLs. The intent of the EWMP is to comprehensively evaluate opportunities, within the participating Permittees' collective jurisdictional boundaries, for collaboration among Permittees and other partners on multi-benefit regional projects that, wherever feasible, retain non-stormwater runoff and also address flood control and/or water supply. Twelve EWMP groups have formed to implement a collaborative approach to meeting the requirements of the 2012 MS4 Permit.

3. Enhanced Watershed Management Plans

The MS4 Permittees listed in Figure 1 submitted 12 NOIs for the development of 12 EWMPs to the LARWQCB. The 12 NOIs were approved by the LARWQCB. The 12 EWMPs being developed in Los Angeles County for the applicable watersheds have been a collaborative effort by the various EWMP agencies.

The EWMPs provide for their respective areas a comprehensive stormwater management plan that optimizes the stormwater and financial resources under the stewardship of the EWMP groups. The EWMPs include multi-benefit stormwater management projects that may also provide environmental, aesthetic, recreational, water supply, and/or other community enhancements in a cost-effective manner.

To begin preparing the EWMPs, the Permittees collaborated on, developed, and submitted Draft Work Plans to the LARWQCB, outlining the proposed approach to preparation of each of their respective EWMPs. The EWMP Work Plans establish the basis for the EWMPs. The EWMP Draft Work Plans describe the path that MS4 Permittees propose to complete the Watershed Management Program requirements of the 2012 MS4 Permit.

In accordance with the provisions of the MS4 permit, the work plans describe the following steps to EWMP development:

1. Identification of water quality priorities, including evaluation of existing water quality conditions, classification of pollutants, assessment of known and suspected pollutant sources in the watershed, and prioritization of water quality issues in the watershed

2. Characterization of existing and potential control measures within the watershed

3. Addressing the approach to incorporate reasonable assurance analysis (RAA) in the optimization of watershed control measures

The LARWQCB is responsible for approval or denial of the EWMPs in compliance with the MS4 Permit. Implementation of the EMWPs would occur following approval by the LARWQCB.

4. EWMP Watershed Control Measures

The MS4 Permit requires Permittees to identify strategies, control measures, and BMPs that will be implemented. Improvements to water quality will be achieved through implementation of watershed control measures that consist of both structural and nonstructural BMPs. BMPs vary in function and type, with each BMP providing unique design characteristics and benefits from implementation. Opportunities for BMP implementation are driven by locations where BMPs are feasible/desirable. The overarching goal of BMPs in the EWMPs is to reduce the impact of stormwater and non-stormwater on receiving water quality and to address water conservation and the water quality priorities. The development of the

EWMPs will involve the evaluation and selection of multiple BMP types, as described in the following pages.

4.1 Structural BMPs

Structural BMPs involve the construction of a physical control measure to alter the hydrology and/or water quality of incoming stormwater or non-stormwater. The three major functions for structural BMPs are infiltration, water quality treatment, and storage, as follows:

- Infiltration – Runoff is directed to percolate into the underlying soils. Infiltration generally reduces the volume of runoff and increases groundwater recharge.
- Water quality treatment – Pollutants are removed through various unit processes, including filtration, settling, sedimentation, sorption, straining, and biological or chemical transformations.
- Storage – Runoff is captured, stored (detained), and slowly released into downstream waters. Storage can reduce the peak flow rate from a site, but does not directly reduce runoff volume.

There are three categories of structural BMPs—regional, centralized, and distributed; they are defined by the runoff area treated by the BMP and the required retention volume in accordance with the Permit. Structural BMPs fall under a variety of subcategories that correspond to their function and water quality benefit. Each of these three categories is described below.

4.1.1 Regional Structural BMPs

"Regional EWMP projects" are defined by the MS4 Permit as multi-benefit regional projects that, wherever feasible, retain all non-stormwater runoff and all stormwater runoff from the 85th percentile, 24-hour storm event for the contributing drainage area, while also achieving other benefits such as flood control and/or water supply. Examples of regional structural BMPs include:

- Infiltration BMPs
  - Surface Infiltration BMPs (Infiltration Basins, Infiltration Trenches, Infiltration Galleries, and Bioretention-implemented as single or multiple types)
  - Multi-Directional Infiltration BMPs (Dry Wells, Hybrid Bioretention, and Dry Wells)
- Detention Basins (promote settling out of larger particles)
- Capture and Use BMPs (underground cisterns, storage, and use as irrigation)

Regional BMPs include infiltration facilities that promote groundwater recharge and detention facilities that encourage settling of larger particles in stormwater flows. Infiltration and detention regional BMPs can be either constructed as open-surface basins or subsurface galleries. Capture and Use BMPs collect and use stormwater where applicable for purposes such as irrigation. All of these BMP types must retain the required design storm volume without release into the MS4 or receiving waters.

Opportunities for Regional BMPs will be identified and evaluated within and across subwatersheds, with focus on the multi-benefit potential for capture and reuse of wet-weather flows within variable drainage areas. Availability of public land will be the first criteria for identifying the location and type of BMP. Potential project locations may include areas with open spaces, whether they are within parks, large parking lots, or vacant spaces.

Regional BMPs that may be included in the EWMPs will be identified and described further in the PEIR.

4.1.2 Centralized Structural BMPs

Centralized structural BMPs are constructed structural practices intended to treat runoff from a contributing area of multiple parcels. Generally, centralized structural BMPs are installed on large public parcels or adjacent to storm drain outfalls and receiving waters. Some examples of centralized structural BMPs include the following:

- Bioinfiltration BMPs (Bioretention with underdrain, bioinfiltration, highflow biotreatment, and raised underdrain, vegetated swales, filter strips—implemented as single or multiple types)
- Constructed wetlands (aboveground and belowground)
- Treatment BMPs/Low-flow diversion
- Creek/river/floodplain/estuary restoration

4.1.3 Distributed Structural BMPs

Distributed structural BMPs are constructed structural practices intended to treat runoff close to the source and are typically implemented at a single- or few-parcel level. The following list includes common distributed BMPs that can be implemented at the parcel level:

- Site scale detention (dry/wet detention ponds, detention chambers)
- Green infrastructure/Low Impact Development (LID)
  - Biofiltration
  - Bioretention
  - Porous/permeable pavers
  - Green streets
  - Infiltration BMPs
  - Bioswales/buffer strips
  - Planter boxes
  - Rainfall harvesting (green roofs, rain barrels, and cisterns)
- Flow-Through Treatment BMPs
  - Media/cartridge filters
  - High-flow biotreatment
- Source Control Treatment BMPs
  - Catch basin inserts/screens
  - Hydrodynamic separators
  - Gross solids removal devices (GSRDs)
  - Low flow diversions

4.2 Institutional BMPs/ Non-Structural Control Measures

These are policies, actions, and activities which are intended to prevent pollutants from entering stormwater runoff, thus eliminating the source of the pollutants. Most institutional BMPs are implemented to meet Minimum Control Measure (MCM) requirements in the MS4 permit; MCMs are considered a subset of institutional BMPs. MCMs do not involve construction of facilities that physically remove pollutants, but may involve costs associated with the procurement and installation of items such as signage or spill response kits. The six categories of MCMs outlined in the MS4 permit are as follows:

- Development Construction Program
- Planning and Land Development Program
- Industrial Commercial Facilities Control Program
- Illicit Connections and Illicit Discharges Detection and Elimination Program
- Public Agency Activities Program
- Public Information and Participation Program

Nonstructural BMPs or Institutional Controls are often implemented as programs or strategies which seek to prevent and/or reduce runoff and/or pollution close to the source. Nonstructural BMPs include but are not limited to:

- Irrigation control (runoff reduction) and water-efficient landscaping
- Brake pad replacement
- Covered trash receptacles
- Replacement of lead in wheel weights, or reduction in the copper content of brake pads
- Pet waste cleanup stations
- Street sweeping
- Catch basin cleaning
- Downspout disconnect program

The MS4 permit allows Permittees to customize MCMs to address high-priority water quality goals within their watersheds. Customization can range from eliminating an MCM (with the exception of the Planning and Land Development Program requirement), proposing actions within an MCM to target specific water quality issues, and increasing or decreasing activities within an MCM (with appropriate justification).

Because the LACFCD does not have jurisdictional authority for ordinance and code enactment or enforcement, they are limited in application of MCMs for Public Information and Participation Programs.

5. Potential Environmental Impacts

The LACFCD is considering having the PEIR evaluate the following preliminary listing of potential environmental issues. The environmental issues to be addressed will be finalized after the close of the public comment period and comments on the NOP are received.

The PEIR will focus on potential effects that could result from implementation of the projects and management actions identified in each EWMP. The PEIR will assess the physical changes to the environment that would likely result from the construction and operation of EWMP projects, including direct, indirect, and cumulative impacts. Potential impacts are summarized below. The PEIR will identify mitigation measures if necessary to minimize potentially significant impacts of each EWMP. The PEIR is anticipated to evaluate, at a minimum, the following preliminary listing of environmental issues.

Aesthetics

Potential direct and indirect impacts could occur both during construction and after the proposed EWMP facilities are built and operating. Potential issues associated with aesthetics in relation to the proposed EWMP BMPs could include obstruction of high-quality or important views during either construction or operation of EWMP BMPs, impacts to local character, or construction of facilities incompatible with local recreation facilities or open-space areas. The PEIR will identify the potential visible physical changes to the natural and man-made environment, including the addition of new BMPs into the viewshed (temporary and permanent) and the removal of other components from the view (i.e., blocking of views). The PEIR will also identify the potential effects of the proposed EWMP BMPs on the existing light, glare, shadow, and shade environments.

Air Quality

Construction and operation of EWMP projects could cause air emissions. Air emissions could result from construction equipment exhaust, ground disturbance during construction, material hauling, construction employee-commute travel, vehicle operational maintenance trips, and vehicle trips associated with any increases in employment. Operation of some of the proposed EWMP facilities may potentially generate emissions associated with energy use. The PEIR will evaluate the effects of construction and operational activities on air quality and also will develop mitigation measures if necessary to reduce potential impacts.

Biological Resources

Implementation of the EWMP projects could occur within existing sensitive habitats. The projects could result in changes to wildlife habitat, disruption of natural movement corridors, fragmentation or isolation of wildlife habitats, and disturbance of sensitive species during construction or operation. In particular, reduced flows in downstream segments resulting from runoff retention could alter riparian and aquatic habitats. The PEIR will evaluate the potential for such facilities to impact biological resources and will also discuss local ordinances and state and federal regulations governing biological resources.

Cultural Resources

The proposed EWMP BMPs would require construction of structural BMPs which could be above and/or below ground. Issues regarding cultural resources during construction activities could include disturbance of known or unknown archeological sites, paleontological resources, and/or human remains where groundbreaking activities occur as well as disturbance or alteration of structures with historical importance. The PEIR will assess the potential effects of the proposed EWMP BMPs on cultural resources, including archaeological, paleontological, and Native American resources. Mitigation measures will be identified if necessary to reduce the level of impact where possible.

Geology, Soils, and Seismicity

Southern Los Angeles County is a seismically active region. The proposed EWMP BMPs would require construction of structural BMPs that could be subject to potential seismic and geologic hazards, including ground shaking, liquefaction, soil stability conditions, soil erosion rates, expansive soils, and landslides. Policies provided in the County's General Plan and applicable standard County requirements will be evaluated as to their effect of mitigating or avoiding any potentially significant effects. The PEIR will identify mitigation measures if necessary to reduce potential adverse effects to proposed facilities.

Greenhouse Gas Emissions

Implementation of proposed EWMP BMPs could result in the generation of greenhouse gas (GHG) emissions associated with construction and operations. The PEIR will estimate construction-related emissions and long-term operational emissions, including total CO_2-equivalent emissions for evaluating the effects of GHGs. The PEIR will examine the project's effects on global climate change and evaluate consistency of the project with the State's GHG emissions reduction goals.

Hazards and Hazardous Materials

Excavation during construction of proposed EWMP BMPs could uncover contaminated soils or hazardous substances that pose a substantial hazard to human health or the environment. Construction activities could result in the release of hazardous materials. Potential hazards will be evaluated and assessed by reviewing the data collected by the California State Water Resources Control Board (SWRCB) GeoTracker and the California Department of Toxic Substances Control (DTSC) Envirostor databases. The policies provided in the County's General Plan and any standard County requirements will be evaluated as to their effect of mitigating or avoiding any potentially significant effects. The PEIR will evaluate the potential for EWMP projects to result in the release of hazardous materials. Mitigation measures will be proposed if necessary to reduce any significant effects of the project that may involve hazardous material issues to ensure that any hazards encountered during construction would be handled in accordance with applicable regulations.

Hydrology and Water Quality

Implementation of the proposed EWMP BMPs may change local drainage patterns at construction sites, which could affect the volume, quality, and rates of surface runoff that in turn could affect local surface water resources. Considered cumulatively, the proposed EWMP facilities may also change regional drainage patterns, which could affect the hydrology, hydraulics, and/or water quality of streams, rivers, and other receiving waters. The PEIR will identify relevant federal, state, and local regulations and agencies, including provisions of the federal Clean Water Act, the state Porter-Cologne Water Quality Control Act, and the permitting and regulatory authority of the RWQCB. The PEIR will identify stormwater quality protection measures required during construction and operation of proposed facilities. The PEIR also will evaluate potential impacts to flood control capacity and develop mitigation strategies if necessary to avoid significant impacts.

Implementation of the proposed EWMP BMPs would likely result in increased infiltration and recharge in various locations throughout the EWMP watersheds. Such activities could affect local groundwater levels and water quality. The PEIR will evaluate potential effects of increased storm water recharge and will identify mitigation measures if necessary to ensure that potentially necessary significant impacts are reduced or avoided.

Land Use and Recreation

Implementation of the proposed EWMP BMPs would include implementation of structural BMPs throughout the EWMP watershed areas. Issues associated with land use and planning could result from construction of new BMPs from the proposed EWMP. Issues associated with these components could include compatibility with adjacent land uses or zoning designations, consistency with relevant land use policies, and access to adjacent land during new construction or repairs of existing flood control or recharge facilities. The PEIR will evaluate the compatibility of the proposed EWMP BMPs with existing and planned land uses within the EWMP watershed areas.

Noise

Implementation of the proposed EWMP BMPs would require implementation of structural BMPs that would potentially generate noise and vibration. Construction activities that could be a significant source of noise and vibrations include trucking operations, use of heavy construction equipment (e.g., graders, cranes, and frontend loaders), pile driving activities, and blasting. Fixed sources of noise may include pumps and motors at pump stations. Construction noise and vibration impacts related to the proposed EWMP facilities will be evaluated at a program level. The PEIR will recommend mitigation strategies to ensure that proposed EWMP projects implemented by local agencies comply with local noise policies and ordinances.

Population and Housing/Growth Inducement

Implementation of the proposed EWMP BMPs will include implementation of structural and nonstructural BMPs that would improve water quality and increase stormwater infiltration. The proposed EWMP BMPs are unlikely to affect population and housing or induce growth. In addition, construction of the proposed EWMP BMPs or alteration of current facilities is not anticipated to lead to displacement or interruption of operation of businesses during construction. The PEIR will, however, identify current population and employment projections and identify local planning jurisdictions with the authority to approve growth and mitigate secondary effects of growth.

Public Services

Implementation of the proposed EWMP BMPs is unlikely to affect demand for public services, or, by itself, to require new or expanded facilities for public service providers. Potential issues related to the construction and operation of the proposed EWMP facilities include disruption or impediment of fire, police, or other emergency services to areas/facilities where proposed EWMP facilities would be constructed or operated. However, the PEIR will assess the potential for the proposed EWMP BMPs to affect police and fire protection services, schools, parks, and recreational facilities, such that new or expanded buildings or structures may be required that would, in turn, affect the environment.

Traffic and Transportation

Construction of the proposed EWMP BMPs could affect traffic on local roadways as a result of vehicle trips associated with hauling of material and equipment, road closures and detours, increased demand for parking to serve construction workers, and increase in traffic hazards caused by construction activities. The PEIR will evaluate the potential for additional construction vehicles, lane closures, or road closures to impact traffic and circulation. The PEIR will identify mitigation strategies to reduce any potential effects.

Utilities and Energy

Potential issues related to the construction and operation of the proposed BMPs include the disruption or impediment of service to areas where the proposed BMPs would be constructed or operated. Existing and projected regional supplies, demands, and facilities will be described along with any existing constraints, deficiencies, or service issues for the proposed EWMP BMPs. The PEIR will evaluate the project's potential to affect utilities and will identify mitigation measures to minimize the effects.

Implementation of the proposed EWMP BMPs would also result in implementation of watershed control measures that may potentially increase the amount of energy required locally to operate some of these BMPs. The PEIR will evaluate potential energy consumption associated with implementation of structural and nonstructural BMPs.

Scoping Report

Introduction and EWMP Overview

The Los Angeles County Flood Control District (LACFCD) is the Lead Agency for the proposed Enhanced Watershed Management Programs (EWMPs) Environmental Impact Report. The Los Angeles County Flood Control Act was adopted by the State Legislature in 1915 and established the LACFCD and empowered it to provide flood risk management, water conservation, and recreation and aesthetic enhancement within its boundaries. The LACFCD, the County of Los Angeles, and 84 incorporated cities within Los Angeles County (collectively referred to as Permittees) are covered under a Municipal Separate Storm Sewer System (MS4) Permit (Order No. R4-2012-0175; National Pollutant Discharge Elimination System [NPDES] Permit No. CAS004001) for the discharge of urban runoff to waters of the United States. The purpose of the MS4 Permit is to ensure Permittees are not causing or contributing to exceedances of water quality objectives or impairments of beneficial uses in the receiving waters of the Los Angeles region.

The 2012 MS4 Permit for Los Angeles County gives Permittees the option of implementing an innovative approach to MS4 Permit compliance through development of EWMPs. The LACFCD, along with participating Permittees, has opted to exercise this option and has submitted 12 separate Notices of Intent (NOIs) for the development of 12 EWMPs in their respective watershed groups to the Los Angeles Regional Water Quality Control Board (LARWQCB). The intent of the EWMP is to comprehensively evaluate opportunities for collaboration on multi-benefit regional projects that retain non-stormwater runoff and also address flood control and/or water supply within the participating Permittees' collective jurisdictional boundaries. The LARWQCB is responsible for approval of the EWMPs in compliance with the MS4 Permit. Implementation of the EMWPs would occur following approval by the LARWQCB.

The primary goals and objectives of the EWMPs are:

- To collaborate among agencies (Permittee jurisdictions) across the watershed to promote more cost-effective and multi-beneficial water quality improvement projects to comply with the MS4 Permit;
- To develop watershed-wide EWMPs that will, once implemented, remove or reduce pollutants from dry- and wet-weather urban runoff in a cost-effective manner; and
- To reduce the impact of stormwater and non-stormwater on receiving water quality.

Following the adoption of the MS4 permit by the RWQCB, Permittees in each EWMP area formed Watershed Management Groups (WMGs) to collaborate on the development of EWMPs. The proposed program includes several watershed management groups of Los Angeles County, covering the following EWMP areas: Ballona Creek, Beach Cities, Dominguez Channel, Malibu Creek, Marina del Rey, North Santa Monica Bay, Palos Verdes Peninsula, Rio Honda/San Gabriel River, Santa Monica Bay, Upper Los Angeles River, Upper San Gabriel River, and Upper Santa Clara River.

Notice of Preparation

Pursuant to Section 15082 of *CEQA Guidelines*, the lead agency is required to send a Notice of Preparation (NOP) stating that an EIR will be prepared to the State Office of Planning and Research (OPR), responsible and trustee agencies, and federal agencies involved in funding or approving the project. The NOP must provide sufficient information in order for responsible agencies to make a meaningful response. At a minimum, the NOP must include a description of the project, location of the project, and probable environmental effects of the project (*CEQA Guidelines*, Section 15082(a)(1)). Within 30 days after receiving the NOP, responsible and trustee agencies and OPR shall provide the lead agency with specific detail about the scope and content of the environmental information related to that agency's area of statutory responsibility that must be included in the draft EIR (*CEQA Guidelines*, Section 15082(b)).

A Notice of Preparation (NOP) was published by the LACFCD on August 29, 2014. The NOP was circulated to federal, state, and local agencies, as well as other interested parties, for a period of 30 days. The NOP was made available in print and electronic form, and the LACFCD accepted comments on the NOP for a 30-day period, closing on September 29, 2014. In addition, an email notification regarding the availability of the NOP was sent to over 700 interested EWMP stakeholders. Reports of email notification deliveries and bounce-backs are located in Attachment 3. A lack of comments from interested parties prompted LACFCD to extend the public comment period an additional 30 days; it ultimately closed on October 29, 2014. Additionally, the LACFCD posted a Twitter message regarding the comment period extension, and uploaded a recording of the Scoping Meeting Presentation to the project website, to augment the public outreach activities. The NOP was also made available on the project website: www.LACoH2Osheds.com. The NOP discussed the purpose of the EWMPs and their management strategies, identified the EWMP Study Areas, and provided a brief and preliminary list of environmental issue areas that could be impacted.

Table 1-1 provides a list of the commenters that sent comments on the NOP. The comment letters are located in Attachment 9.

Scoping Meetings

Pursuant to *CEQA Guidelines* Section 15083, the LACFCD held three public scoping meetings on September 9, 10, and 15 of 2014 to receive comments on the NOP. The purpose of the meetings was to present the proposed EWMPs to the interested stakeholders and receive public input regarding the proposed scope of the PEIR analysis. Attendees were provided an opportunity to voice comments or concerns regarding potential effects of the program. The Scoping Meeting Presentation (Attachment 4), Sign-In Sheets (Attachment 5), and summary of verbal comments made at the meetings (Attachment 6) are found in this report.

The next formal opportunity for the public to comment on the proposed project will occur when the Draft PEIR is distributed for a 45-day review period, anticipated to occur between January and March of 2015.

Attachments to this Report

This Scoping Report contains documents pertinent to the scoping process. The following items are included:

Attachment 1: Notice of Preparation
Attachment 2: Notice of Completion
Attachment 3: Summary of NOP Availability Emails
Attachment 4: Scoping Meeting Presentation
Attachment 5: Scoping Meeting Sign-In Sheets
Attachment 6: Scoping Meeting Public Comments
Attachment 7: State Clearinghouse Distribution of NOP
Attachment 8: Comment Period Extension Letter
Attachment 9: Public Comment Letters Received

Notice of Preparation

ORIGINAL FILED

AUG 29 2014

LOS ANGELES. COUNTY CLERK

Notice of Preparation

Date	August 29, 2014
To:	California Office of Planning and Research, Responsible and Trustee Agencies and Interested Parties
Subject:	Notice of Preparation of a Draft Program Environmental Impact Report
Project:	Enhanced Watershed Management Programs
Lead Agency:	Los Angeles County Flood Control District
Review Period:	August 29, 2014 through September 29, 2014

The Los Angeles County Flood Control District (LACFCD) will be the Lead Agency and will prepare a Program Environmental Impact Report (PEIR) for the project identified in this notice. We need to know the views of you or your agency as to the scope and content of the environmental information which is germane to your agency's statutory responsibilities in connection with the proposed project. This Notice of Preparation (NOP) has been prepared to notify agencies and interested parties that the LACFCD is beginning preparation of a PEIR pursuant to the California Environmental Quality Act (CEQA) for its proposed Enhanced Watershed Management Programs (EWMPs, or "program").

The Los Angeles County Flood Control Act was adopted by the State Legislature in 1915 and established the LACFCD and empowered it to provide flood risk management, water conservation, and recreation and aesthetic enhancement within its boundaries. The LACFCD is governed as a separate entity by the Board of Supervisors of the County of Los Angeles and is operated by the County's Department of Public Works. The LACFCD encompasses more than 3,000 square miles, 85 cities, and approximately 2.1 million land parcels. The LACFCD, the County of Los Angeles, and 84 incorporated cities within Los Angeles County (collectively referred to as Permittees) are covered under a Municipal Separate Storm Sewer System (MS4) Permit (Order No. R4-2012-0175; National Pollutant Discharge Elimination System [NPDES] Permit No. CAS004001) for the discharge of urban runoff to waters of the United States. The purpose of the MS4 Permit is to ensure Permittees are not causing or contributing to exceedances of water quality objectives or impairments of beneficial uses in the receiving waters of the Los Angeles region.

The 2012 MS4 Permit for Los Angeles County gives Permittees the option of implementing an innovative approach to Permit compliance through development of EWMPs. The LACFCD and participating Permittees have opted to exercise this option and have submitted 12 separate Notices of Intent (NOIs) for the development of 12 EWMPs in their respective watershed groups to the Los Angeles Regional Water Quality Control Board (LARWQCB). The LARWQCB is responsible for approval of the EWMPs in compliance with the MS4 Permit. Implementation of the EMWPs would occur following approval by the LARWQCB. The preparation of the 12 separate EWMPs will be a collective effort among the LACFCD and the applicable agencies in each respective EWMP. The 12 EWMPs will vary for each watershed group, but will generally provide the opportunity for Permittees to customize their stormwater programs to achieve compliance with applicable receiving water limitations (RWLs) and water-quality-based effluent limits (WQBELs) in accordance with the MS4 Permit through implementation of stormwater best management practices (BMPs) or watershed control measures. BMPs vary in function and type, with each BMP providing unique design characteristics and benefits from implementation. The overarching goal of BMPs in the EWMP is to reduce the impact of stormwater and non-stormwater on receiving water

Notice of Preparation

Date	August 29, 2014
To:	California Office of Planning and Research, Responsible and Trustee Agencies and Interested Parties
Subject:	Notice of Preparation of a Draft Program Environmental Impact Report
Project:	Enhanced Watershed Management Programs
Lead Agency:	Los Angeles County Flood Control District
Review Period:	August 29, 2014 through September 29, 2014

The Los Angeles County Flood Control District (LACFCD) will be the Lead Agency and will prepare a Program Environmental Impact Report (PEIR) for the project identified in this notice. We need to know the views of you or your agency as to the scope and content of the environmental information which is germane to your agency's statutory responsibilities in connection with the proposed project. This Notice of Preparation (NOP) has been prepared to notify agencies and interested parties that the LACFCD is beginning preparation of a PEIR pursuant to the California Environmental Quality Act (CEQA) for its proposed Enhanced Watershed Management Programs (EWMPs, or "program").

The Los Angeles County Flood Control Act was adopted by the State Legislature in 1915 and established the LACFCD and empowered it to provide flood risk management, water conservation, and recreation and aesthetic enhancement within its boundaries. The LACFCD is governed as a separate entity by the Board of Supervisors of the County of Los Angeles and is operated by the County's Department of Public Works. The LACFCD encompasses more than 3,000 square miles, 85 cities, and approximately 2.1 million land parcels. The LACFCD, the County of Los Angeles, and 84 incorporated cities within Los Angeles County (collectively referred to as Permittees) are covered under a Municipal Separate Storm Sewer System (MS4) Permit (Order No. R4-2012-0175; National Pollutant Discharge Elimination System [NPDES] Permit No. CAS004001) for the discharge of urban runoff to waters of the United States. The purpose of the MS4 Permit is to ensure Permittees are not causing or contributing to exceedances of water quality objectives or impairments of beneficial uses in the receiving waters of the Los Angeles region.

The 2012 MS4 Permit for Los Angeles County gives Permittees the option of implementing an innovative approach to Permit compliance through development of EWMPs. The LACFCD and participating Permittees have opted to exercise this option and have submitted 12 separate Notices of Intent (NOIs) for the development of 12 EWMPs in their respective watershed groups to the Los Angeles Regional Water Quality Control Board (LARWQCB). The LARWQCB is responsible for approval of the EWMPs in compliance with the MS4 Permit. Implementation of the EMWPs would occur following approval by the LARWQCB. The preparation of the 12 separate EWMPs will be a collective effort among the LACFCD and the applicable agencies in each respective EWMP. The 12 EWMPs will vary for each watershed group, but will generally provide the opportunity for Permittees to customize their stormwater programs to achieve compliance with applicable receiving water limitations (RWLs) and water-quality-based effluent limits (WQBELs) in accordance with the MS4 Permit through implementation of stormwater best management practices (BMPs) or watershed control measures. BMPs vary in function and type, with each BMP providing unique design characteristics and benefits from implementation. The overarching goal of BMPs in the EWMP is to reduce the impact of stormwater and non-stormwater on receiving water

quality and address the water quality priorities as defined by the MS4 Permit. The development of each EWMP will involve the evaluation and selection of multiple BMP types, including nonstructural (institutional) and distributed, centralized, and regional structural watershed control measures, that will be implemented to meet compliance goals and strategies under the 2012 MS4 Permit.

The LACFCD, as a regional agency charged with conserving stormwater for use in our local water supply, has a vested interest in increasing opportunities for stormwater capture and groundwater recharge. The LACFCD has flood control infrastructure in each of the EWMP areas and is participating in all 12 EWMPs. The LACFCD will be working with the applicable Permittees and other stakeholders in all 12 EWMP watersheds to develop the EWMPs, which will be implemented by the Permittees that have jurisdiction within each EWMP area. The Permittees implementing the projects defined in the EWMPs, or "implementing agencies," will vary between EWMPs and individual projects. The LACFCD will be an implementing agency only on those projects for which it has been identified in an EWMP as a responsible implementing party.

Project Location: The proposed program would be located in several watersheds of Los Angeles County and would include the following enhanced watershed management groups: Ballona Creek, Beach Cities, Dominguez Channel, Malibu Creek, Marina del Rey, North Santa Monica Bay Coastal Watersheds (NSMBCW), Palos Verdes Peninsula, Rio Hondo/San Gabriel River Water Quality Group (RH/SGRWQG), Santa Monica Bay, Upper Los Angeles River, Upper San Gabriel River, and Upper Santa Clara River. The project area is indicated in Figure 1.

Broad Range of Potential Benefits from EWMPs: If implemented, the proposed EWMP-generated benefits would include:

- Improved Water Quality
- Reduction in Impairment of Water Bodies for Designated Beneficial Uses
- Promotion of Water Conservation and Supply
- Enhanced Recreation Opportunities
- Support for Public Education Opportunities
- Improved Local Aesthetics
- Management of Flood Risks

Public Comments: The LACFCD is soliciting the views of interested persons and agencies as to the scope and content of the environmental information to be evaluated in the PEIR. In accordance with CEQA, agencies are requested to review the project description in this NOP and provide their comments on environmental issues related to the statutory responsibilities of the agency. The PEIR will be used by LACFCD's governing Board, the Los Angeles County Board of Supervisors, when considering approval of the proposed EWMPs as well as for any related discretionary approvals.

Due to the time limits mandated by state law, all comments to the NOP are due no later than September 29, 2014. Please send your comments to the address shown below. Include a return address or email address and a contact name in your agency with your comments.

Gregg BeGell, P.E.
County of Los Angeles Department of Public Works
Project Management Division II
900 South Fremont Avenue, 5th Floor
Alhambra, CA 91803
(626) 300-3298
gbegell@dpw.lacounty.gov

This NOP and other PEIR information, as it becomes available, can be accessed at:
www.LACoH2Osheds.com

Scoping Meetings: Three scoping meetings will be held to receive public comments regarding the scope and content of the PEIR. The scoping meetings will include a brief presentation providing an overview of the proposed program and the CEQA process. After the presentation, oral comments will be accepted. Written comment forms will be supplied for those who wish to submit comments in writing at the scoping meeting. Written comments also may be submitted anytime during the NOP review period. The scoping meetings will be held as follows:

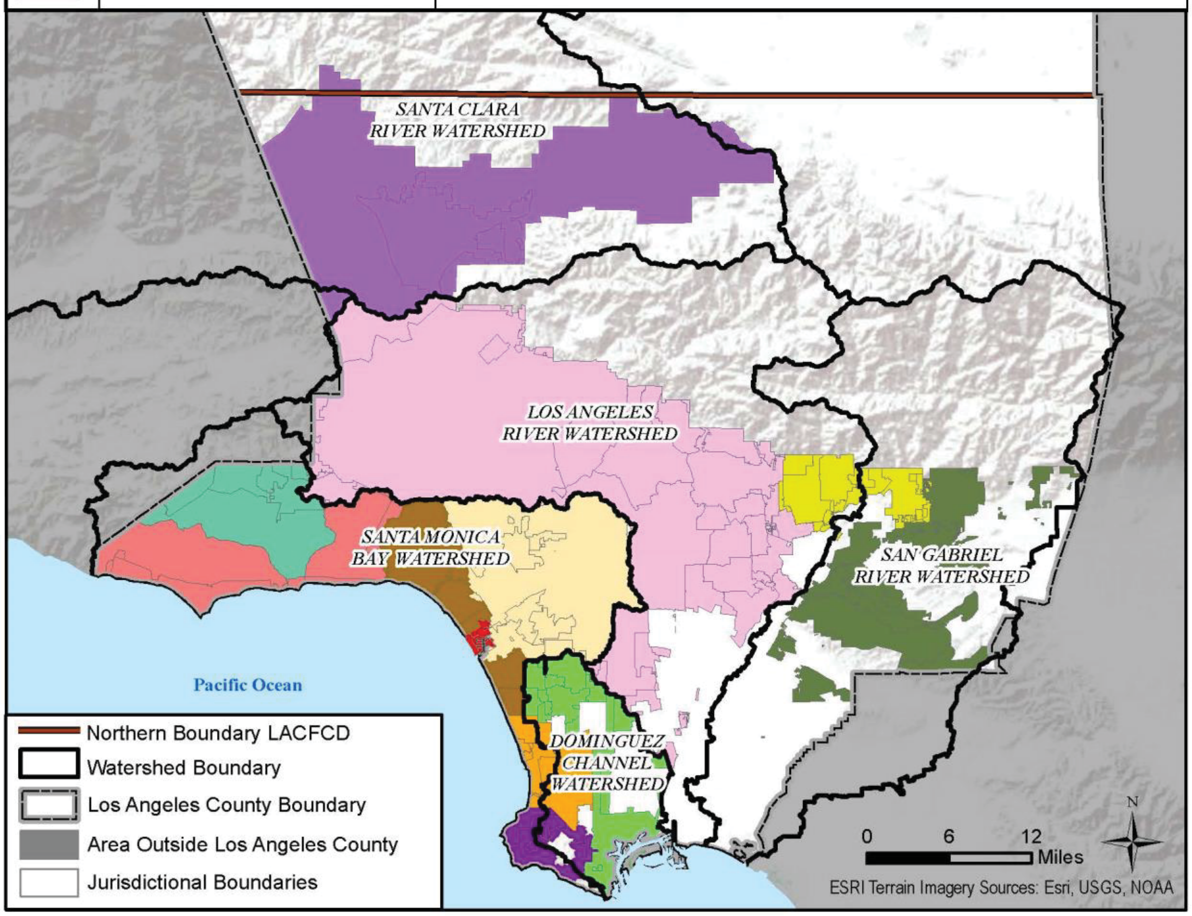
Figure 1: Overview EWMP Groups

Group Name		Cities/Permittees Involved
	Ballona Creek	Beverly Hills, Culver City, Inglewood, Los Angeles, Santa Monica, West Hollywood, LA County, LACFCD
	Beach Cities Watershed Management Group	Hermosa Beach, Manhattan Beach, Redondo Beach, Torrance, LACFCD
	Dominguez Channel Watershed Management Group	El Segundo, Hawthorne, Inglewood, Los Angeles, Lomita, LA County, LACFCD
	Malibu Creek Watershed	Agoura Hills, Calabasas, Hidden Hills, Westlake Village, LA County, LACFCD
	Marina del Rey	Culver City, Los Angeles, LA County, LACFCD
	North Santa Monica Bay Coastal Watersheds	LA County, Malibu, LACFCD
	Palos Verdes Peninsula EWMP Agencies	Palos Verdes Estates, Rancho Palos Verdes, Rolling Hills Estates, LA County, LACFCD
	Rio Hondo/San Gabriel River Water Quality Group	Arcadia, Azusa, Bradbury, Duarte, Monrovia, LA County, Sierra Madre, LACFCD
	Santa Monica Bay Watershed Jurisdictions 2 & 3	Los Angeles, El Segundo, Santa Monica, LA County, LACFCD
	Upper Los Angeles River Watershed	Alhambra, Burbank, Calabasas, Glendale, Hidden Hills, La Canada Flintridge, Los Angeles, Montebello, Monterey Park, Pasadena, Rosemead, San Gabriel, San Marino, South Pasadena, Temple City, LA County, LACFCD
	Upper San Gabriel River	Baldwin Park, Covina, Glendora, Industry, La Puente, LA County, LACFCD
	Upper Santa Clara River Watershed	LA County, Santa Clarita, LACFCD



1. Introduction

The LACFCD along with other applicable Permittees have submitted NOIs to the LARWQCB to develop EWMPs for 12 watershed groups, in accordance with the 2012 MS4 Permit, Order No. R4-2012-0175. The LARWQCB is responsible for approval of the final EWMPs in compliance with the MS4 Permit. Implementation of the EMWPs would occur following approval of the final plan. To begin preparing the EWMPs, the Permittees collaborated on, developed, and submitted Draft Work Plans to the LARWQCB, outlining the proposed approach to preparation of each of their respective EWMPs. The primary approach to each of the EWMPs, as identified in the Draft Work Plans, includes identifying community-friendly, cost-effective methods of reducing urban runoff pollution and incorporating distributed and centralized structural and nonstructural watershed control measures for a multi-pollutant, multi-benefit approach. The EWMPs will also evaluate multi-benefit regional projects that will retain (through infiltration or capture and reuse) the stormwater quality design volume (85^{th} percentile storm for 24 hours) for the runoff from the contributing drainage area.

The proposed project includes the potential nonstructural (institutional) and distributed, centralized, and regional structural watershed control measures described in the Draft Work Plans and detailed in the EWMPs currently under preparation. These measures will be evaluated in the PEIR. The PEIR will provide a program-level assessment of the overall permit compliance effort, focusing particularly on the structural watershed control measures proposed in each of the 12 EWMP areas.

1.1 Project Location

The proposed program includes several watershed management groups of Los Angeles County, which include the following EWMP groups: Ballona Creek, Beach Cities, Dominguez Channel, Malibu Creek, Marina del Rey, North Santa Monica Bay Coastal Watersheds (NSMBCW), Palos Verdes Peninsula, Rio Hondo/San Gabriel River Water Quality Group (RH/SGRWQG), Santa Monica Bay, Upper Los Angeles River, Upper San Gabriel River, and Upper Santa Clara River. The geographic scope covered by each of these 12 EWMPs is described in further detail below and shown in Figure 1.

- Ballona Creek – The Ballona Creek EWMP area covers the Ballona Creek watershed. The Permittees within this EWMP are the Cities of Beverly Hills, West Hollywood, Los Angeles, Inglewood, Culver City, Santa Monica, and West Hollywood; County of Los Angeles; and LACFCD.

- Beach Cities – The Beach Cities EWMP area covers portions of three watersheds: Santa Monica Bay Watershed Jurisdictional Group (SMB JG) 5 & 6, Dominguez Channel Watershed, and Machado Lake Watershed. The Permittees within this EWMP are the Cities of Redondo Beach, Manhattan Beach, Hermosa Beach, and Torrance; and the LACFCD.

- Dominguez Channel – The Dominguez Channel EWMP area covers portions of three watersheds: Dominguez Channel Watershed, the Machado Lake Watershed, and the Los Angeles/Long Beach Harbors Watershed. The Permittees within this EWMP are the Cities of El Segundo, Hawthorne, Inglewood, Lomita, and Los Angeles; County of Los Angeles; and the LACFCD.

- Malibu Creek – The Malibu Creek Watershed (MCW) EWMP area covers the majority of the MCW. The Permittees within this EWMP are the Cities of Agoura Hills, Calabasas, Hidden Hills, , and Westlake Village; County of Los Angeles; and the LACFCD.

RB-AR 8729

- Marina del Rey – The Marina del Rey EWMP area covers the Marina del Rey Watershed. The Permittees within this EWMP are the Cities of Los Angeles and Culver City; County of Los Angeles; and LACFCD.

- North Santa Monica Bay – The NSMBCW EWMP area covers the SMB JG 1, SMB JG 4, and a portion of Malibu Creek within the City of Malibu's borders. The Permittees within this EWMP are the City of Malibu; County of Los Angeles; and LACFCD.

- Palos Verdes Peninsula – The Palos Verdes Peninsula watershed management area covers most of the SMB JG7, the Los Angeles Harbor subwatershed, and the Machado Lake subwatershed. The Permittees within this EWMP are the Cities of Rancho Palos Verdes, Palos Verdes Estates, and Rolling Hills Estates; County of Los Angeles; and LACFCD.

- Rio Hondo/San Gabriel River – The RH/SGRWQG EWMP area covers portions of the Los Angeles and San Gabriel River watersheds. The Permittees within this EWMP are the Cities of Arcadia, Azusa, Bradbury, Duarte, Monrovia, and Sierra Madre; County of Los Angeles; and LACFCD.

- Santa Monica Bay – The Santa Monica Bay EWMP area covers the central region of the Santa Monica Bay Watershed (SMB JG2 and SMB JG3) and includes the urbanized Dockweiler and Santa Monica subwatersheds, as well as natural open space located in the Castle Rock, Pulga Canyon, Temescal Canyon, and Santa Monica Canyon subwatersheds. The Permittees within this EWMP include the Cities of Los Angeles, Santa Monica, and El Segundo; County of Los Angeles; and LACFCD.

- Upper Los Angeles River – The Upper Los Angeles River EWMP area covers the upper reaches of the Los Angeles River Watershed. The Permittees within this EWMP are the Cities of Alhambra, Burbank, Calabasas, Glendale, Hidden Hills, La Cañada Flintridge, Los Angeles, Montebello, Monterey Park, Pasadena, Rosemead, San Gabriel, San Marino, South Pasadena, and Temple City; County of Los Angeles; and LACFCD.

- Upper San Gabriel River – The Upper San Gabriel River EWMP area covers portions of the San Gabriel River Watershed. The Permittees within this EWMP are the Cities of Baldwin Park, Covina, Glendora, Industry, and La Puente; County of Los Angeles; and LACFCD.

- Upper Santa Clara River – The Upper Santa Clara River EWMP area covers the Upper Santa Clara River Watershed. The Permittees within this EWMP are the City of Santa Clarita; County of Los Angeles; and LACFCD.

2. Background

2.1 Stormwater/Water Quality

MS4 discharges consist of stormwater and non-stormwater generated from municipal land uses that are ultimately discharged into surface waters throughout the region. The MS4 system includes curbs and gutters, man-made channels, catch basins, and storm drains throughout the Los Angeles region. Discharges may adversely affect receiving surface water quality with pollutants such as bacteria, nutrients (nitrogen and phosphorus), aluminum, copper, lead, zinc, diazinon, and cyanide. Aquatic toxicity, particularly during wet weather, is also a concern. Stormwater and non-stormwater discharges of debris and trash are also a pervasive water quality problem in the Los Angeles region. Pollutants in stormwater and non-stormwater may have damaging effects on both human health and aquatic ecosystems.

Water quality assessments conducted by the LARWQCB have identified impairment of beneficial uses of water bodies in the Los Angeles region possibly caused or contributed to by pollutant loading from municipal stormwater and non-stormwater discharges. The MS4 Permit described below is designed to reduce pollutant loads into local surface waters.

2.2 Total Maximum Daily Loads

The federal Clean Water Act (CWA), Section 303(d), requires states to identify waters that do not meet water quality standards despite the treatment by pollution-control technology. States are required not only to identify these "water quality limited segments" but also to prioritize such waters for the purpose of developing Total Maximum Daily Loads (TMDLs). A TMDL is defined as the "sum of the individual waste load allocations (WLAs) for point sources and load allocations for nonpoint sources and natural background" (40 CFR 130.2), such that the capacity of the water body to assimilate constituent loads (the loading capacity) is not exceeded. A TMDL represents an amount of pollution that can be released into a specific water body without causing a decline in water quality and impairment of beneficial uses. The TMDL also allocates the loads among current and future pollutant sources to the water body and forms the basis for WQBELs and RWLs assigned in NPDES permits. LARWQCB and United States Environmental Protection Agency (USEPA) have established 33 TMDLs that identify Los Angeles County MS4 discharges as one of the pollutant sources causing or contributing to these water quality impairments.

2.3 MS4 Permit

On November 8, 2012, the LARWQCB adopted the fourth NPDES MS4 Permit (Order No. R4-2012-0175) for discharges from the MS4 within the coastal watersheds of Los Angeles County. The MS4 Permit became effective on December 28, 2012. The 2012 MS4 Permit establishes the waste discharge requirement for stormwater and non-stormwater discharges within the watersheds of Los Angeles County. The MS4 Permit identifies conditions, requirements, and programs that municipalities must comply with to protect regional water resources from adverse impacts associated with pollutants in stormwater and urban runoff. The MS4 Permit contains effluent limitations, RWLs, Minimum Control Measures (MCMs), TMDL provisions, and outlines the process for developing watershed management programs, including the EWMP.

The 2012 MS4 Permit includes provisions that allow Permittees to voluntarily choose to implement an EWMP to achieve permit compliance with RWLs. The intent of the EWMP is to comprehensively evaluate opportunities, within the participating Permittees' collective jurisdictional boundaries, for collaboration among Permittees and other partners on multi-benefit regional projects that, wherever feasible, retain non-stormwater runoff and also address flood control and/or water supply. Twelve EWMP groups have formed to implement a collaborative approach to meeting the requirements of the 2012 MS4 Permit.

3. Enhanced Watershed Management Plans

The MS4 Permittees listed in Figure 1 submitted 12 NOIs for the development of 12 EWMPs to the LARWQCB. The 12 NOIs were approved by the LARWQCB. The 12 EWMPs being developed in Los Angeles County for the applicable watersheds have been a collaborative effort by the various EWMP agencies.

The EWMPs provide for their respective areas a comprehensive stormwater management plan that optimizes the stormwater and financial resources under the stewardship of the EWMP groups. The EWMPs include multi-benefit stormwater management projects that may also provide environmental, aesthetic, recreational, water supply, and/or other community enhancements in a cost-effective manner.

To begin preparing the EWMPs, the Permittees collaborated on, developed, and submitted Draft Work Plans to the LARWQCB, outlining the proposed approach to preparation of each of their respective EWMPs. The EWMP Work Plans establish the basis for the EWMPs. The EWMP Draft Work Plans describe the path that MS4 Permittees propose to complete the Watershed Management Program requirements of the 2012 MS4 Permit.

In accordance with the provisions of the MS4 permit, the work plans describe the following steps to EWMP development:

1. Identification of water quality priorities, including evaluation of existing water quality conditions, classification of pollutants, assessment of known and suspected pollutant sources in the watershed, and prioritization of water quality issues in the watershed
2. Characterization of existing and potential control measures within the watershed
3. Addressing the approach to incorporate reasonable assurance analysis (RAA) in the optimization of watershed control measures

The LARWQCB is responsible for approval or denial of the EWMPs in compliance with the MS4 Permit. Implementation of the EMWPs would occur following approval by the LARWQCB.

4. EWMP Watershed Control Measures

The MS4 Permit requires Permittees to identify strategies, control measures, and BMPs that will be implemented. Improvements to water quality will be achieved through implementation of watershed control measures that consist of both structural and nonstructural BMPs. BMPs vary in function and type, with each BMP providing unique design characteristics and benefits from implementation. Opportunities for BMP implementation are driven by locations where BMPs are feasible/desirable. The overarching goal of BMPs in the EWMPs is to reduce the impact of stormwater and non-stormwater on receiving water quality and to address water conservation and the water quality priorities. The development of the

EWMPs will involve the evaluation and selection of multiple BMP types, as described in the following pages.

4.1 Structural BMPs

Structural BMPs involve the construction of a physical control measure to alter the hydrology and/or water quality of incoming stormwater or non-stormwater. The three major functions for structural BMPs are infiltration, water quality treatment, and storage, as follows:

- Infiltration – Runoff is directed to percolate into the underlying soils. Infiltration generally reduces the volume of runoff and increases groundwater recharge.
- Water quality treatment – Pollutants are removed through various unit processes, including filtration, settling, sedimentation, sorption, straining, and biological or chemical transformations.
- Storage – Runoff is captured, stored (detained), and slowly released into downstream waters. Storage can reduce the peak flow rate from a site, but does not directly reduce runoff volume.

There are three categories of structural BMPs—regional, centralized, and distributed; they are defined by the runoff area treated by the BMP and the required retention volume in accordance with the Permit. Structural BMPs fall under a variety of subcategories that correspond to their function and water quality benefit. Each of these three categories is described below.

4.1.1 Regional Structural BMPs

"Regional EWMP projects" are defined by the MS4 Permit as multi-benefit regional projects that, wherever feasible, retain all non-stormwater runoff and all stormwater runoff from the 85th percentile, 24-hour storm event for the contributing drainage area, while also achieving other benefits such as flood control and/or water supply. Examples of regional structural BMPs include:

- Infiltration BMPs
  - Surface Infiltration BMPs (Infiltration Basins, Infiltration Trenches, Infiltration Galleries, and Bioretention-implemented as single or multiple types)
  - Multi-Directional Infiltration BMPs (Dry Wells, Hybrid Bioretention, and Dry Wells)
- Detention Basins (promote settling out of larger particles)
- Capture and Use BMPs (underground cisterns, storage, and use as irrigation)

Regional BMPs include infiltration facilities that promote groundwater recharge and detention facilities that encourage settling of larger particles in stormwater flows. Infiltration and detention regional BMPs can be either constructed as open-surface basins or subsurface galleries. Capture and Use BMPs collect and use stormwater where applicable for purposes such as irrigation. All of these BMP types must retain the required design storm volume without release into the MS4 or receiving waters.

Opportunities for Regional BMPs will be identified and evaluated within and across subwatersheds, with focus on the multi-benefit potential for capture and reuse of wet-weather flows within variable drainage areas. Availability of public land will be the first criteria for identifying the location and type of BMP. Potential project locations may include areas with open spaces, whether they are within parks, large parking lots, or vacant spaces.

Regional BMPs that may be included in the EWMPs will be identified and described further in the PEIR.

4.1.2 Centralized Structural BMPs

Centralized structural BMPs are constructed structural practices intended to treat runoff from a contributing area of multiple parcels. Generally, centralized structural BMPs are installed on large public parcels or adjacent to storm drain outfalls and receiving waters. Some examples of centralized structural BMPs include the following:

- Bioinfiltration BMPs (Bioretention with underdrain, bioinfiltration, highflow biotreatment, and raised underdrain, vegetated swales, filter strips—implemented as single or multiple types)
- Constructed wetlands (aboveground and belowground)
- Treatment BMPs/Low-flow diversion
- Creek/river/floodplain/estuary restoration

4.1.3 Distributed Structural BMPs

Distributed structural BMPs are constructed structural practices intended to treat runoff close to the source and are typically implemented at a single- or few-parcel level. The following list includes common distributed BMPs that can be implemented at the parcel level:

- Site scale detention (dry/wet detention ponds, detention chambers)
- Green infrastructure/Low Impact Development (LID)
    - Biofiltration
    - Bioretention
    - Porous/permeable pavers
    - Green streets
    - Infiltration BMPs
    - Bioswales/buffer strips
    - Planter boxes
    - Rainfall harvesting (green roofs, rain barrels, and cisterns)
- Flow-Through Treatment BMPs
    - Media/cartridge filters
    - High-flow biotreatment
- Source Control Treatment BMPs
    - Catch basin inserts/screens
    - Hydrodynamic separators
    - Gross solids removal devices (GSRDs)
    - Low flow diversions

4.2 Institutional BMPs/ Non-Structural Control Measures

These are policies, actions, and activities which are intended to prevent pollutants from entering stormwater runoff, thus eliminating the source of the pollutants. Most institutional BMPs are implemented to meet Minimum Control Measure (MCM) requirements in the MS4 permit; MCMs are considered a subset of institutional BMPs. MCMs do not involve construction of facilities that physically remove pollutants, but may involve costs associated with the procurement and installation of items such as signage or spill response kits. The six categories of MCMs outlined in the MS4 permit are as follows:

- Development Construction Program
- Planning and Land Development Program
- Industrial Commercial Facilities Control Program
- Illicit Connections and Illicit Discharges Detection and Elimination Program
- Public Agency Activities Program
- Public Information and Participation Program

Nonstructural BMPs or Institutional Controls are often implemented as programs or strategies which seek to prevent and/or reduce runoff and/or pollution close to the source. Nonstructural BMPs include but are not limited to:

- Irrigation control (runoff reduction) and water-efficient landscaping
- Brake pad replacement
- Covered trash receptacles
- Replacement of lead in wheel weights, or reduction in the copper content of brake pads
- Pet waste cleanup stations
- Street sweeping
- Catch basin cleaning
- Downspout disconnect program

The MS4 permit allows Permittees to customize MCMs to address high-priority water quality goals within their watersheds. Customization can range from eliminating an MCM (with the exception of the Planning and Land Development Program requirement), proposing actions within an MCM to target specific water quality issues, and increasing or decreasing activities within an MCM (with appropriate justification).

Because the LACFCD does not have jurisdictional authority for ordinance and code enactment or enforcement, they are limited in application of MCMs for Public Information and Participation Programs.

5. Potential Environmental Impacts

The LACFCD is considering having the PEIR evaluate the following preliminary listing of potential environmental issues. The environmental issues to be addressed will be finalized after the close of the public comment period and comments on the NOP are received.

The PEIR will focus on potential effects that could result from implementation of the projects and management actions identified in each EWMP. The PEIR will assess the physical changes to the environment that would likely result from the construction and operation of EWMP projects, including direct, indirect, and cumulative impacts. Potential impacts are summarized below. The PEIR will identify mitigation measures if necessary to minimize potentially significant impacts of each EWMP. The PEIR is anticipated to evaluate, at a minimum, the following preliminary listing of environmental issues.

Aesthetics

Potential direct and indirect impacts could occur both during construction and after the proposed EWMP facilities are built and operating. Potential issues associated with aesthetics in relation to the proposed EWMP BMPs could include obstruction of high-quality or important views during either construction or operation of EWMP BMPs, impacts to local character, or construction of facilities incompatible with local recreation facilities or open-space areas. The PEIR will identify the potential visible physical changes to the natural and man-made environment, including the addition of new BMPs into the viewshed (temporary and permanent) and the removal of other components from the view (i.e., blocking of views). The PEIR will also identify the potential effects of the proposed EWMP BMPs on the existing light, glare, shadow, and shade environments.

Air Quality

Construction and operation of EWMP projects could cause air emissions. Air emissions could result from construction equipment exhaust, ground disturbance during construction, material hauling, construction employee-commute travel, vehicle operational maintenance trips, and vehicle trips associated with any increases in employment. Operation of some of the proposed EWMP facilities may potentially generate emissions associated with energy use. The PEIR will evaluate the effects of construction and operational activities on air quality and also will develop mitigation measures if necessary to reduce potential impacts.

Biological Resources

Implementation of the EWMP projects could occur within existing sensitive habitats. The projects could result in changes to wildlife habitat, disruption of natural movement corridors, fragmentation or isolation of wildlife habitats, and disturbance of sensitive species during construction or operation. In particular, reduced flows in downstream segments resulting from runoff retention could alter riparian and aquatic habitats. The PEIR will evaluate the potential for such facilities to impact biological resources and will also discuss local ordinances and state and federal regulations governing biological resources.

Cultural Resources

The proposed EWMP BMPs would require construction of structural BMPs which could be above and/or below ground. Issues regarding cultural resources during construction activities could include disturbance of known or unknown archeological sites, paleontological resources, and/or human remains where groundbreaking activities occur as well as disturbance or alteration of structures with historical importance. The PEIR will assess the potential effects of the proposed EWMP BMPs on cultural resources, including archaeological, paleontological, and Native American resources. Mitigation measures will be identified if necessary to reduce the level of impact where possible.

Geology, Soils, and Seismicity

Southern Los Angeles County is a seismically active region. The proposed EWMP BMPs would require construction of structural BMPs that could be subject to potential seismic and geologic hazards, including ground shaking, liquefaction, soil stability conditions, soil erosion rates, expansive soils, and landslides. Policies provided in the County's General Plan and applicable standard County requirements will be evaluated as to their effect of mitigating or avoiding any potentially significant effects. The PEIR will identify mitigation measures if necessary to reduce potential adverse effects to proposed facilities.

Greenhouse Gas Emissions

Implementation of proposed EWMP BMPs could result in the generation of greenhouse gas (GHG) emissions associated with construction and operations. The PEIR will estimate construction-related emissions and long-term operational emissions, including total CO_2-equivalent emissions for evaluating the effects of GHGs. The PEIR will examine the project's effects on global climate change and evaluate consistency of the project with the State's GHG emissions reduction goals.

Hazards and Hazardous Materials

Excavation during construction of proposed EWMP BMPs could uncover contaminated soils or hazardous substances that pose a substantial hazard to human health or the environment. Construction activities could result in the release of hazardous materials. Potential hazards will be evaluated and assessed by reviewing the data collected by the California State Water Resources Control Board (SWRCB) GeoTracker and the California Department of Toxic Substances Control (DTSC) Envirostor databases. The policies provided in the County's General Plan and any standard County requirements will be evaluated as to their effect of mitigating or avoiding any potentially significant effects. The PEIR will evaluate the potential for EWMP projects to result in the release of hazardous materials. Mitigation measures will be proposed if necessary to reduce any significant effects of the project that may involve hazardous material issues to ensure that any hazards encountered during construction would be handled in accordance with applicable regulations.

Hydrology and Water Quality

Implementation of the proposed EWMP BMPs may change local drainage patterns at construction sites, which could affect the volume, quality, and rates of surface runoff that in turn could affect local surface water resources. Considered cumulatively, the proposed EWMP facilities may also change regional drainage patterns, which could affect the hydrology, hydraulics, and/or water quality of streams, rivers, and other receiving waters. The PEIR will identify relevant federal, state, and local regulations and agencies, including provisions of the federal Clean Water Act, the state Porter-Cologne Water Quality Control Act, and the permitting and regulatory authority of the RWQCB. The PEIR will identify stormwater quality protection measures required during construction and operation of proposed facilities. The PEIR also will evaluate potential impacts to flood control capacity and develop mitigation strategies if necessary to avoid significant impacts.

Implementation of the proposed EWMP BMPs would likely result in increased infiltration and recharge in various locations throughout the EWMP watersheds. Such activities could affect local groundwater levels and water quality. The PEIR will evaluate potential effects of increased storm water recharge and will identify mitigation measures if necessary to ensure that potentially necessary significant impacts are reduced or avoided.

Land Use and Recreation

Implementation of the proposed EWMP BMPs would include implementation of structural BMPs throughout the EWMP watershed areas. Issues associated with land use and planning could result from construction of new BMPs from the proposed EWMP. Issues associated with these components could include compatibility with adjacent land uses or zoning designations, consistency with relevant land use policies, and access to adjacent land during new construction or repairs of existing flood control or recharge facilities. The PEIR will evaluate the compatibility of the proposed EWMP BMPs with existing and planned land uses within the EWMP watershed areas.

Noise

Implementation of the proposed EWMP BMPs would require implementation of structural BMPs that would potentially generate noise and vibration. Construction activities that could be a significant source of noise and vibrations include trucking operations, use of heavy construction equipment (e.g., graders, cranes, and frontend loaders), pile driving activities, and blasting. Fixed sources of noise may include pumps and motors at pump stations. Construction noise and vibration impacts related to the proposed EWMP facilities will be evaluated at a program level. The PEIR will recommend mitigation strategies to ensure that proposed EWMP projects implemented by local agencies comply with local noise policies and ordinances.

Population and Housing/Growth Inducement

Implementation of the proposed EWMP BMPs will include implementation of structural and nonstructural BMPs that would improve water quality and increase stormwater infiltration. The proposed EWMP BMPs are unlikely to affect population and housing or induce growth. In addition, construction of the proposed EWMP BMPs or alteration of current facilities is not anticipated to lead to displacement or interruption of operation of businesses during construction. The PEIR will, however, identify current population and employment projections and identify local planning jurisdictions with the authority to approve growth and mitigate secondary effects of growth.

Public Services

Implementation of the proposed EWMP BMPs is unlikely to affect demand for public services, or, by itself, to require new or expanded facilities for public service providers. Potential issues related to the construction and operation of the proposed EWMP facilities include disruption or impediment of fire, police, or other emergency services to areas/facilities where proposed EWMP facilities would be constructed or operated. However, the PEIR will assess the potential for the proposed EWMP BMPs to affect police and fire protection services, schools, parks, and recreational facilities, such that new or expanded buildings or structures may be required that would, in turn, affect the environment.

Traffic and Transportation

Construction of the proposed EWMP BMPs could affect traffic on local roadways as a result of vehicle trips associated with hauling of material and equipment, road closures and detours, increased demand for parking to serve construction workers, and increase in traffic hazards caused by construction activities. The PEIR will evaluate the potential for additional construction vehicles, lane closures, or road closures to impact traffic and circulation. The PEIR will identify mitigation strategies to reduce any potential effects.

Utilities and Energy

Potential issues related to the construction and operation of the proposed BMPs include the disruption or impediment of service to areas where the proposed BMPs would be constructed or operated. Existing and projected regional supplies, demands, and facilities will be described along with any existing constraints, deficiencies, or service issues for the proposed EWMP BMPs. The PEIR will evaluate the project's potential to affect utilities and will identify mitigation measures to minimize the effects.

Implementation of the proposed EWMP BMPs would also result in implementation of watershed control measures that may potentially increase the amount of energy required locally to operate some of these BMPs. The PEIR will evaluate potential energy consumption associated with implementation of structural and nonstructural BMPs.

Project Description: *(please use a separate page if necessary)*

The development of the EWMP will involve the evaluation and selection of multiple watershed control measures or best management practices (BMP) types including non-structural and distributed, centralized and regional structural BMPs. These BMPs will be implemented to meet compliance goals and strategies under the 2012 MS4 Permit. Structural BMPs involve the construction of a physical control measure to alter the hydrology and/or water quality of incoming stormwater or non-stormwater. The three major functions for structural BMPs are infiltration, water quality treatment, and storage. There are three categories of structural BMPs, defined by the runoff area treated by the BMP and the required retention volume in accordance with the Permit. "Regional EWMP projects" are defined by the MS4 Permit as multi-benefit regional projects that, wherever feasible, retain all non-storm water runoff and all storm water runoff from the 85th percentile, 24-hour storm event for the contributing drainage areas, while also achieving other benefits including flood control and/or water supply. These structural BMPs are defined as "regional" BMPs based on this Permit retention requirement. Example of regional structural BMPs include infiltration BMPs, detention basins and capture and use BMPs. Centralized structural BMPs capture and treat stormwater from a contributing area of multiple parcels, and include bio-infiltration BMPs, constructed wetlands, and creek/stream restoration projects. Generally, centralized BMPs are installed on large public parcels or adjacent to storm drain outfalls and receiving waters. Distributed structural BMPs are constructed structural practices intended to treat runoff close to the source and are typically implemented at a single- or few-parcel level.

Reviewing Agencies Checklist

Lead Agencies may recommend State Clearinghouse distribution by marking agencies below with and "X".
If you have already sent your document to the agency please denote that with an "S".

	Air Resources Board		Office of Emergency Services

Scoping Meeting Presentation

Enhanced Watershed Management Programs

Program Environmental Impact Report
Scoping Meeting

Los Angeles County Flood Control District

September 9, 2014

Chace Park Community Room

13650 Mindanao Way

Marina del Rey, CA 90292

Welcome and Introductions

- Los Angeles County Flood Control District (LACFCD)
  - Gregg BeGell, P.E., Project Manager
  - TJ Moon
- Weston Solutions, Inc.
  - Andrea Crumpacker
- Environmental Science Associates
  - Environmental Consultant: ESA
    - Tom Barnes, Project Director
    - David Pohl, Project Manager

Scoping Meeting Agenda

- Municipal Separate Storm Sewer System (MS4) Discharge Permit
  - Enhanced Watershed Management Program (EWMP)
  - LACFCD Role
- California Environmental Quality Act (CEQA) Overview and Process
- Issues to be analyzed in the Program Environmental Impact Report (PEIR)
- CEQA Schedule
- Receive Public Comments

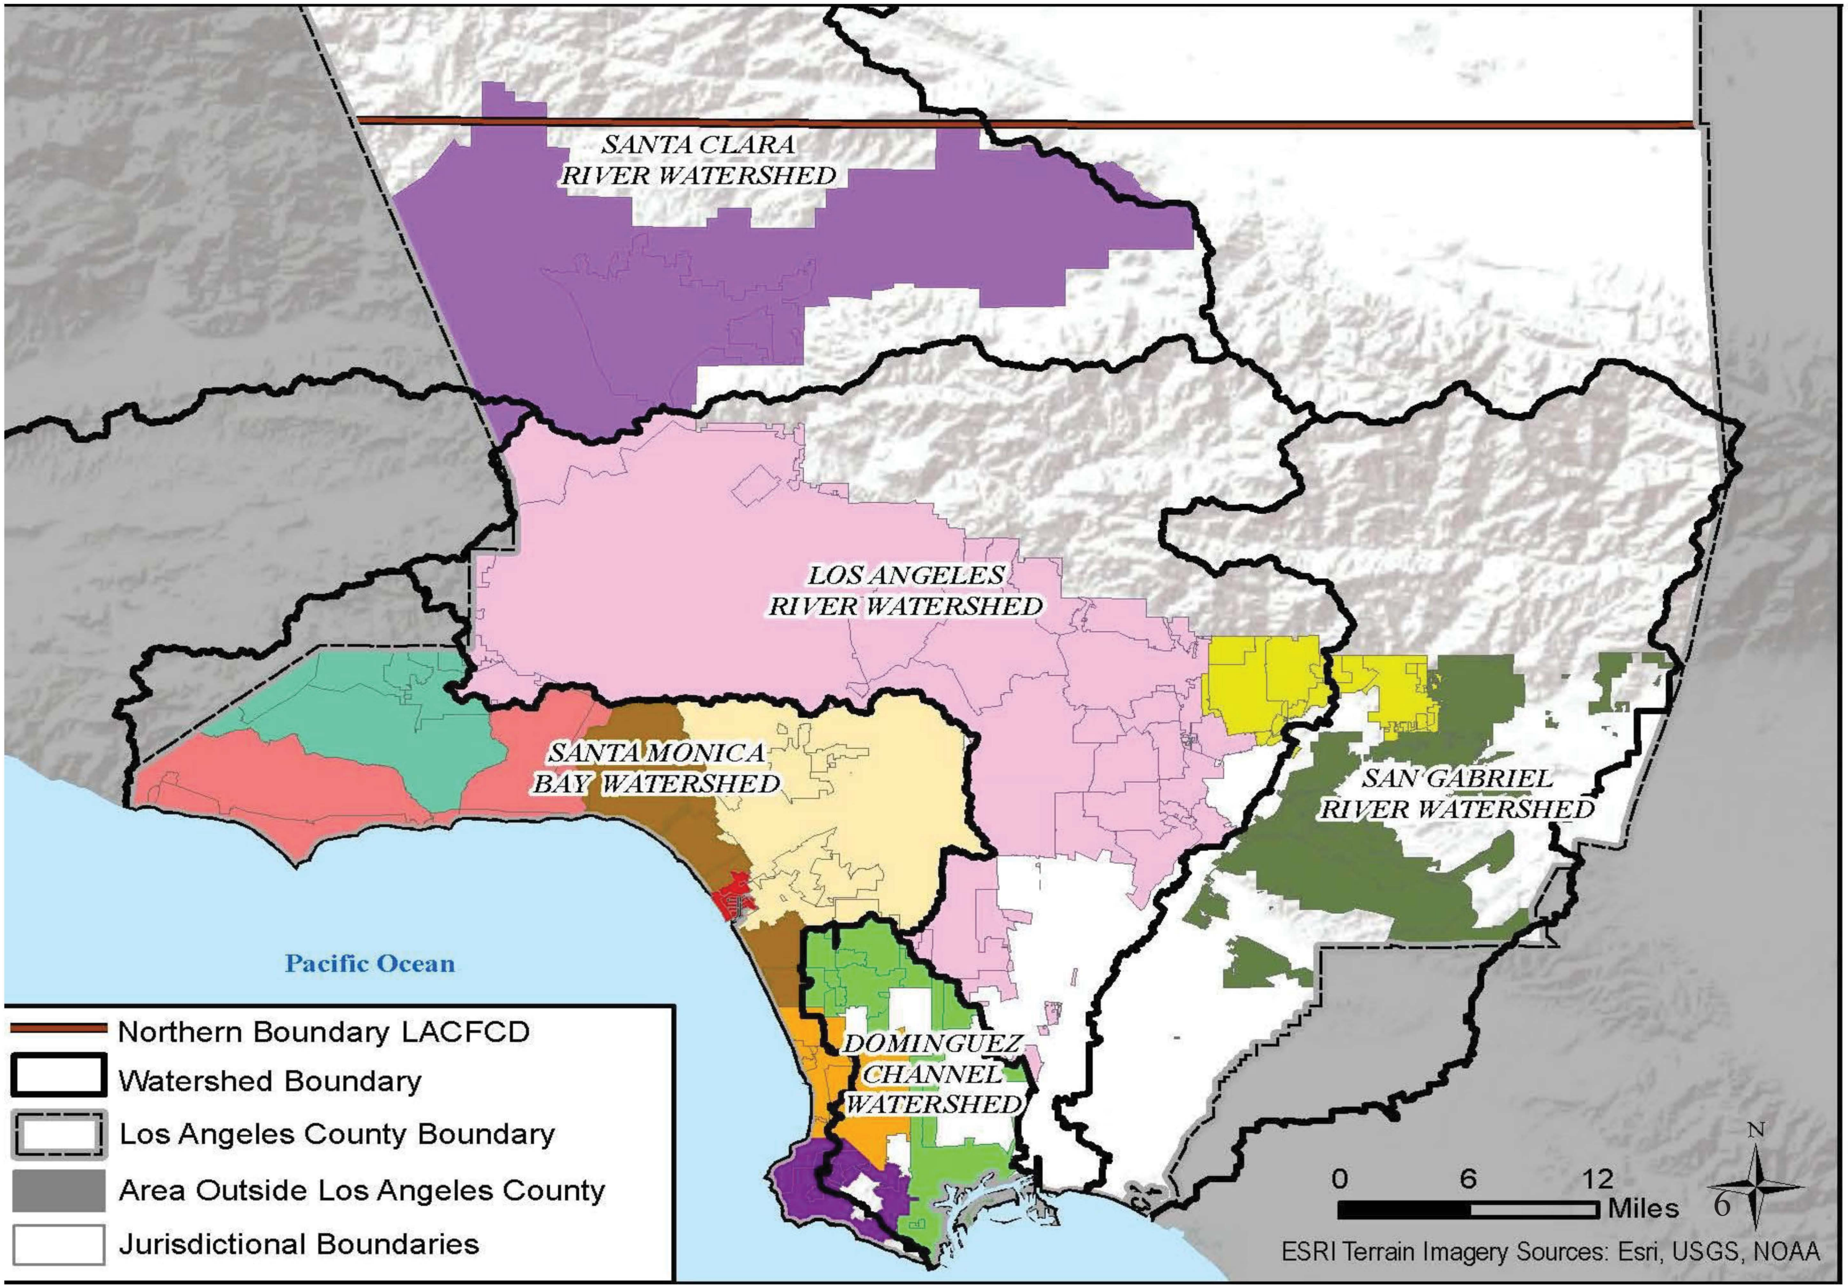
MS4 Permit Compliance

- **Project Purpose:** MS4 Permit Compliance (R4-2012-0175)
  - Each Permittee is responsible for its local MS4 compliance
  - Permit compliance through EWMPs
    - 12 NOIs submitted to LARWQCB
    - Collectively prepared by participating Permittees
  - Los Angeles Regional Water Quality Control Board (LARWQCB) approves EWMPs

Enhanced Watershed Management Program (EWMP)

- Identify Watershed Control Measures
  - Structural Best Management Practices (BMPs)
  - Non-Structural BMPs
- Reasonable Assurance Analysis
- Priority Ranking
- Implementation by each participating Permittee

MS4 EWMP Participating Permittees



MS4 EWMP Participating Permittees

Group Name	Permittees Involved
Ballona Creek	Beverly Hills, Culver City, Inglewood, Los Angeles, Santa Monica, West Hollywood, LA County, LACFCD
Beach Cities Watershed Management Group	Hermosa Beach, Manhattan Beach, Redondo Beach, Torrance, LACFCD
Dominguez Channel Watershed Management Group	El Segundo, Hawthorne, Inglewood, Los Angeles, Lomita, LA County, LACFCD
Malibu Creek Watershed	Agoura Hills, Calabasas, Hidden Hills, Westlake Village, LA County, LACFCD
Marina Del Rey	Culver City, Los Angeles, LA County, LACFCD
North Santa Monica Bay Coastal Watersheds	LA County, Malibu, LACFCD
Palos Verdes Peninsula EWMP Agencies	Palos Verdes Estates, Rancho Palos Verdes, Rolling Hills Estates, LA County, LACFCD
Rio Hondo/San Gabriel River Water Quality Group	Arcadia, Azusa, Bradbury, Duarte, Monrovia, LA County, Sierra Madre, LACFCD
Santa Monica Bay Watershed Jurisdictions 2 & 3	Los Angeles, El Segundo, Santa Monica, LA County, LACFCD
Upper Los Angeles River Watershed	Alhambra, Burbank, Calabasas, Glendale, Hidden Hills, La Canada Flintridge, Los Angeles, Montebello, Monterey Park, Pasadena, Rosemead, San Gabriel, San Marino, South Pasadena, Temple City, LA County, LACFCD
Upper San Gabriel River	Baldwin Park, Covina, Glendora, Industry, La Puente, LA County, LACFCD
Upper Santa Clara River Watershed	LA County, Santa Clarita, LACFCD

California Environmental Quality Act (CEQA)

Disclosure	Decision-Making Tool	Mitigation
Identifies potential impacts to the environment	Informs the public and decision makers about potential environmental impacts	Identifies ways to avoid or reduce potential impacts

Overview – Why is LACFCD leading this PEIR?

- LACFCD operates and maintains flood control facilities in all 12 EWMP Groups
- LACFCD has vested interest in increasing opportunities for stormwater capture and groundwater recharge
- LACFCD will be working with Permittees and other stakeholders in all 12 EWMP watersheds to identify potential projects
- The proposed projects may have an environmental impact

Overview - Role of Permittees

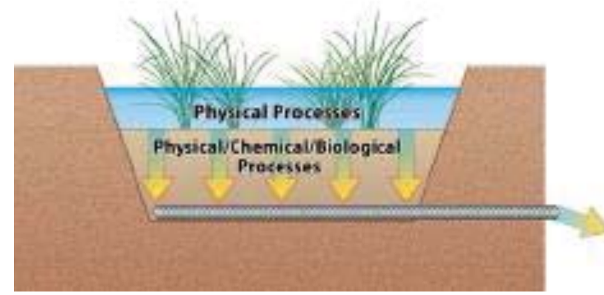
- EWMPs will be implemented by the Permittees with jurisdiction in EWMP area
- The Permittees implementing the proposed projects, or "Implementing Agencies," will vary between EWMPs and individual projects

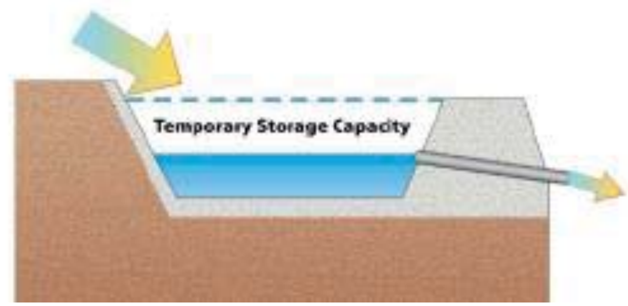
Proposed Project Objectives

- Achieve Water Quality Performance goals through EWMP implementation
- Regional Compliance with the MS4 Permit
  - Coordinated implementation of compliance strategies
  - Watershed-specific compliance strategies
- Environmentally Responsible Opportunities
  - Beneficial flood control, water supply, and habitat

Watershed Control Measures

- Structural BMPs or Physical Control Measures
  - Infiltration
  - Water quality treatment
  - Storage



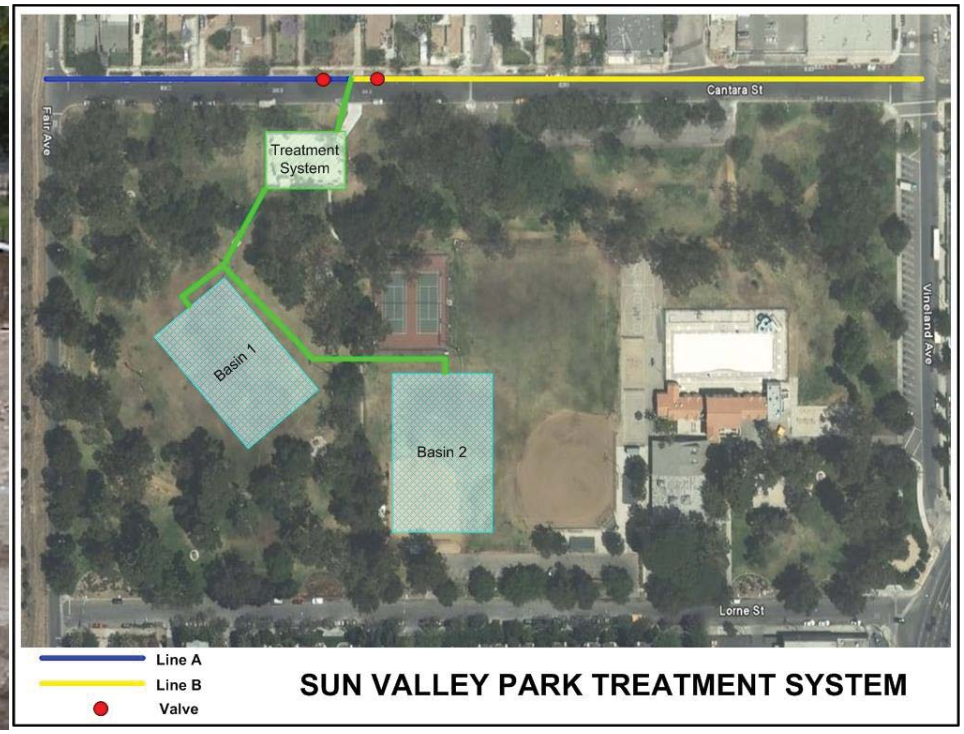


- Categories of Structural BMPs
  - Regional
  - Centralized
  - Distributed
- Non-Structural BMPs

Regional EWMP Projects

- Retain all runoff from the 85^{th} percentile, 24-hour storm event for tributary drainage area
  - Infiltration BMPs
  - Retention basins
  - Capture and Use BMPs
- May include use of public lands with open space areas, e.g., parks, large parking lots, or vacant space

Example Regional EWMP Project – Retention and Infiltration Basin



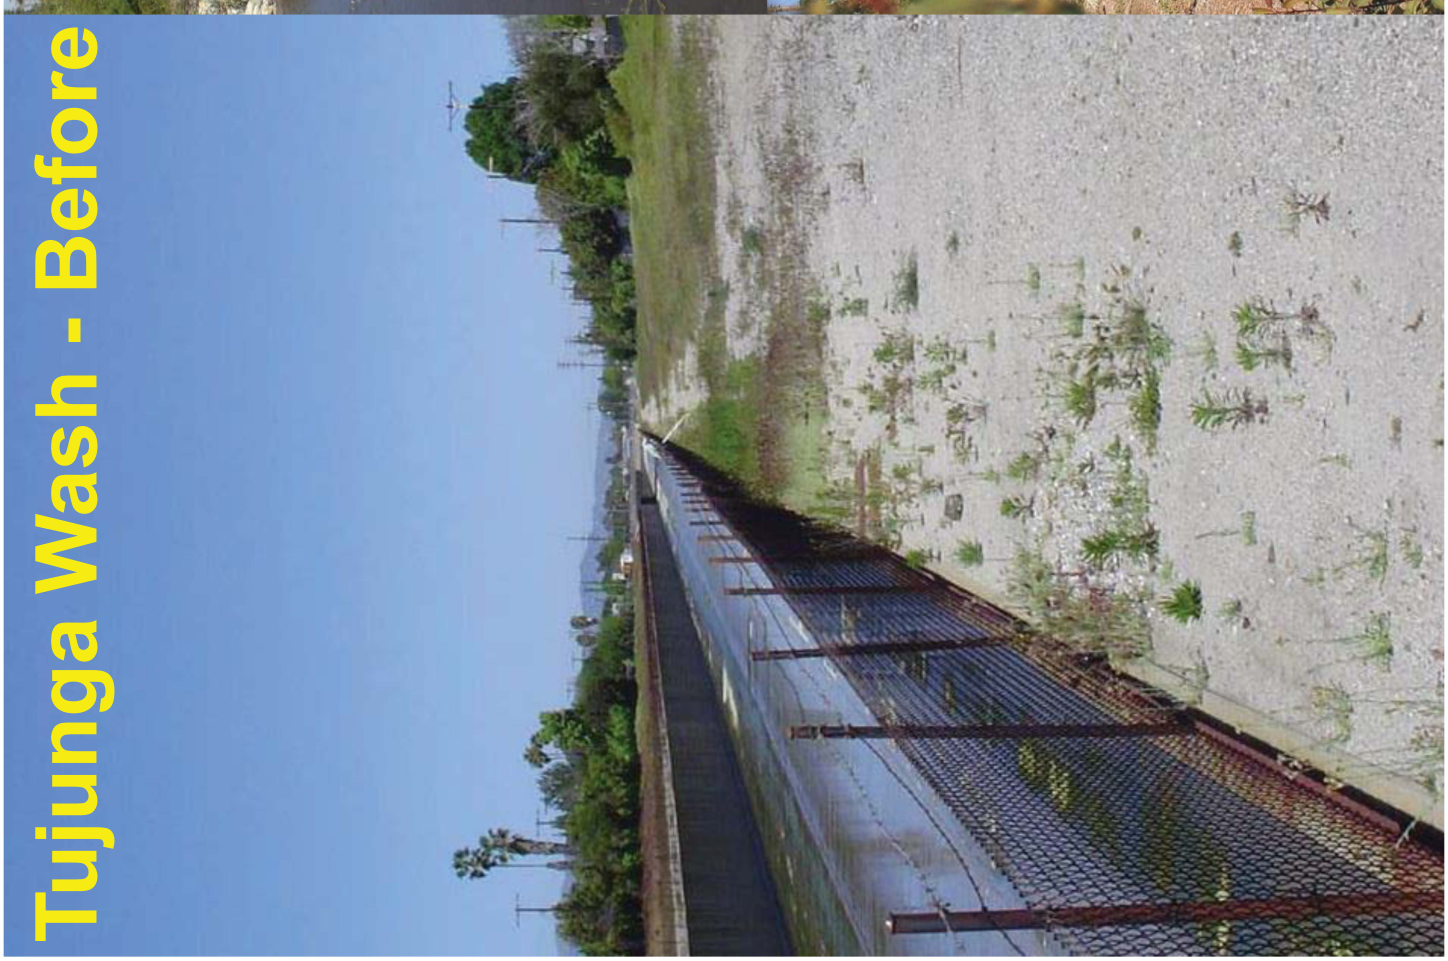
RB-AR 8782

Sun Valley Park Drain and Infiltration System

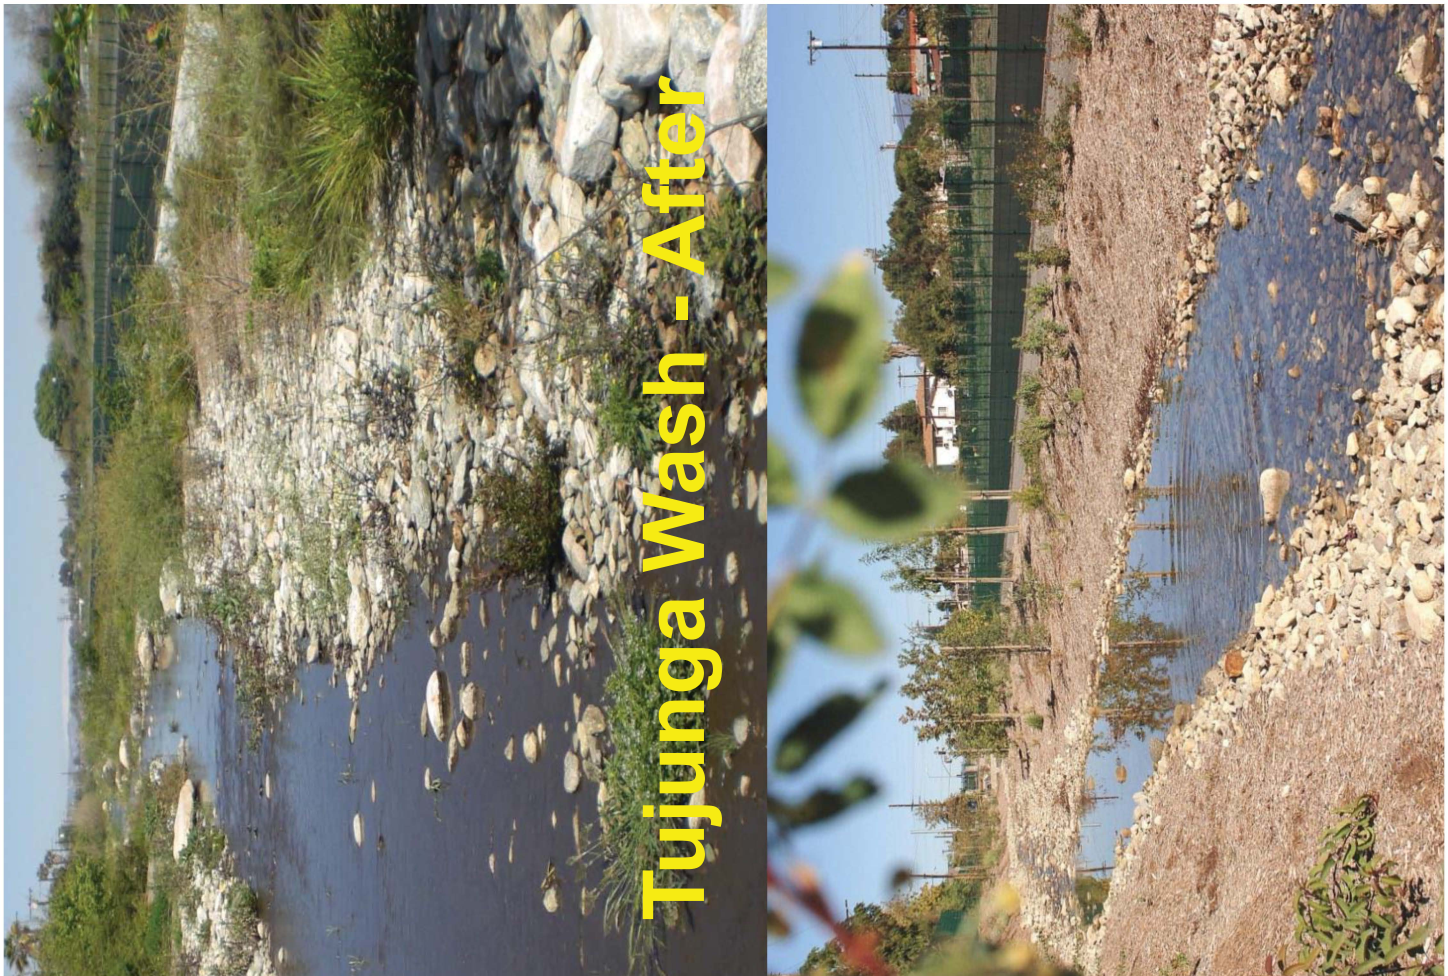
RB-AR 8784

Centralized Structural BMPs

- Constructed structural practices intended to treat runoff from a contributing area of multiple parcels
- Generally installed on large public parcels or adjacent to storm drain outfalls and receiving waters
- Examples:
  - Bio-filtration BMPs
  - Constructed wetlands
  - Treatment BMPs low-flow diversion
  - Creek/River restoration



Tujunga Wash - Before



Tujunga Wash - After

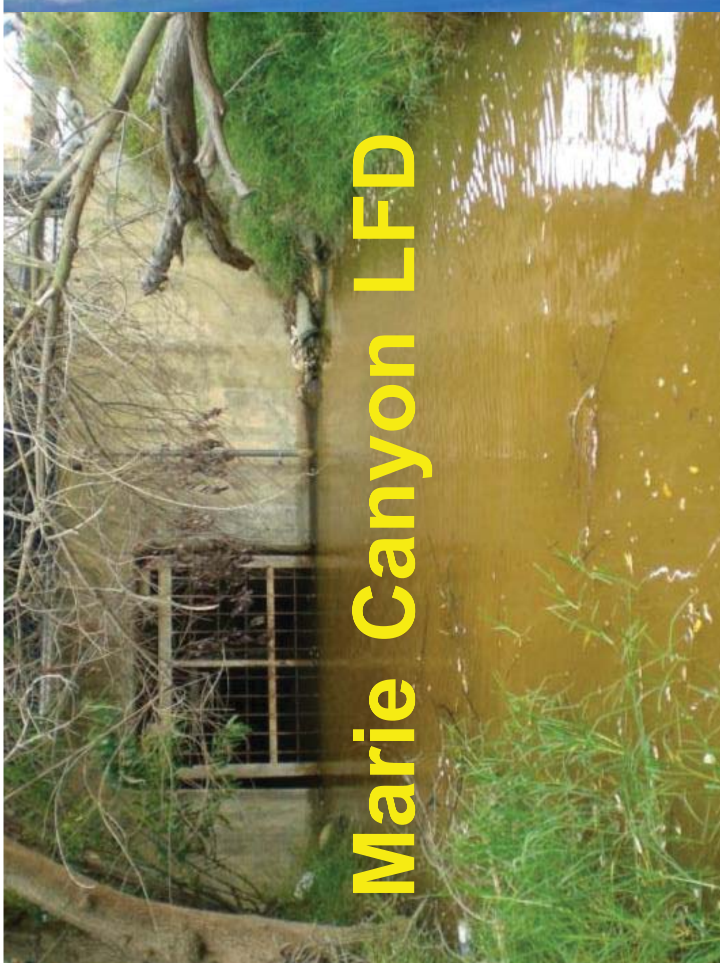
Example Centralized Structural BMP – Dominguez Gap Wetlands Project

Before

After

Example Centralized Structural BMP – Marie Canyon Low Flow Diversion (LFD)

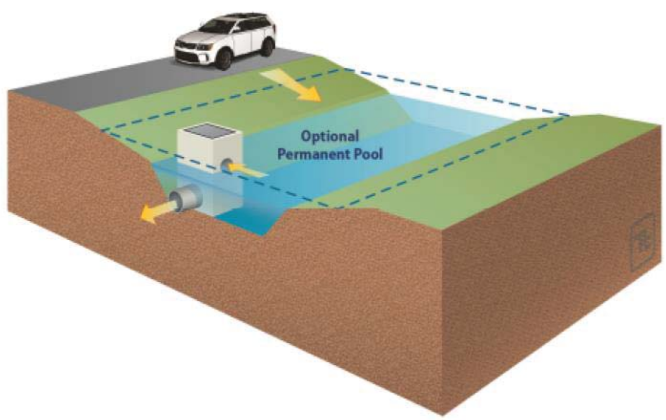
Marie Canyon LFD



Distributed Structural BMPs

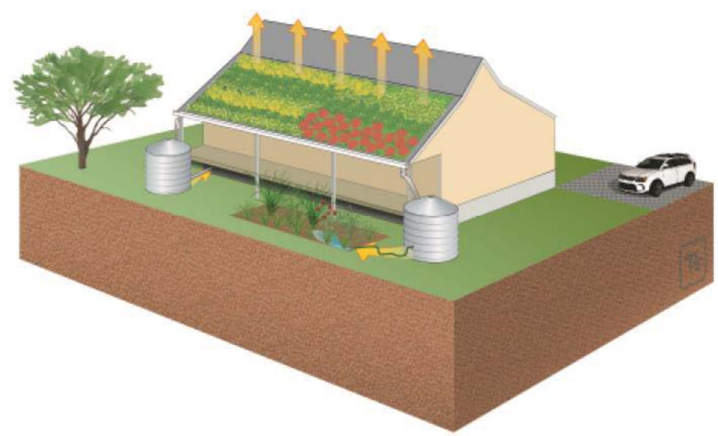
- Constructed BMPs that treat runoff close to the source and typically implemented at a single- or few-parcel level
- Green Infrastructure / Low Impact Development
  - Biofiltration
  - Bioretention
  - Bioswales / buffer strips
  - Green streets
  - Infiltration BMPs
  - Rainfall harvesting
  - Porous / permeable pavers
  - Planter boxes
- Flow-Through Treatment BMPs
  - Media / Cartridge filters
  - High-flow biotreatment
- Source Control Treatment BMPs
  - Catch basin inserts / screens
  - Gross solids removal devices
  - Hydrodynamic separators

Distributed Structural BMP Proposed Projects



Typical distributed site-scale detention schematic (arrows indicate water pathways).

Typical distributed bioretention and biofiltration schematic showing underdrain option (arrows indicate water pathways).



Typical distributed rainfall harvest schematic (arrows indicate water pathways).

Valinda Greenway Project (2009)

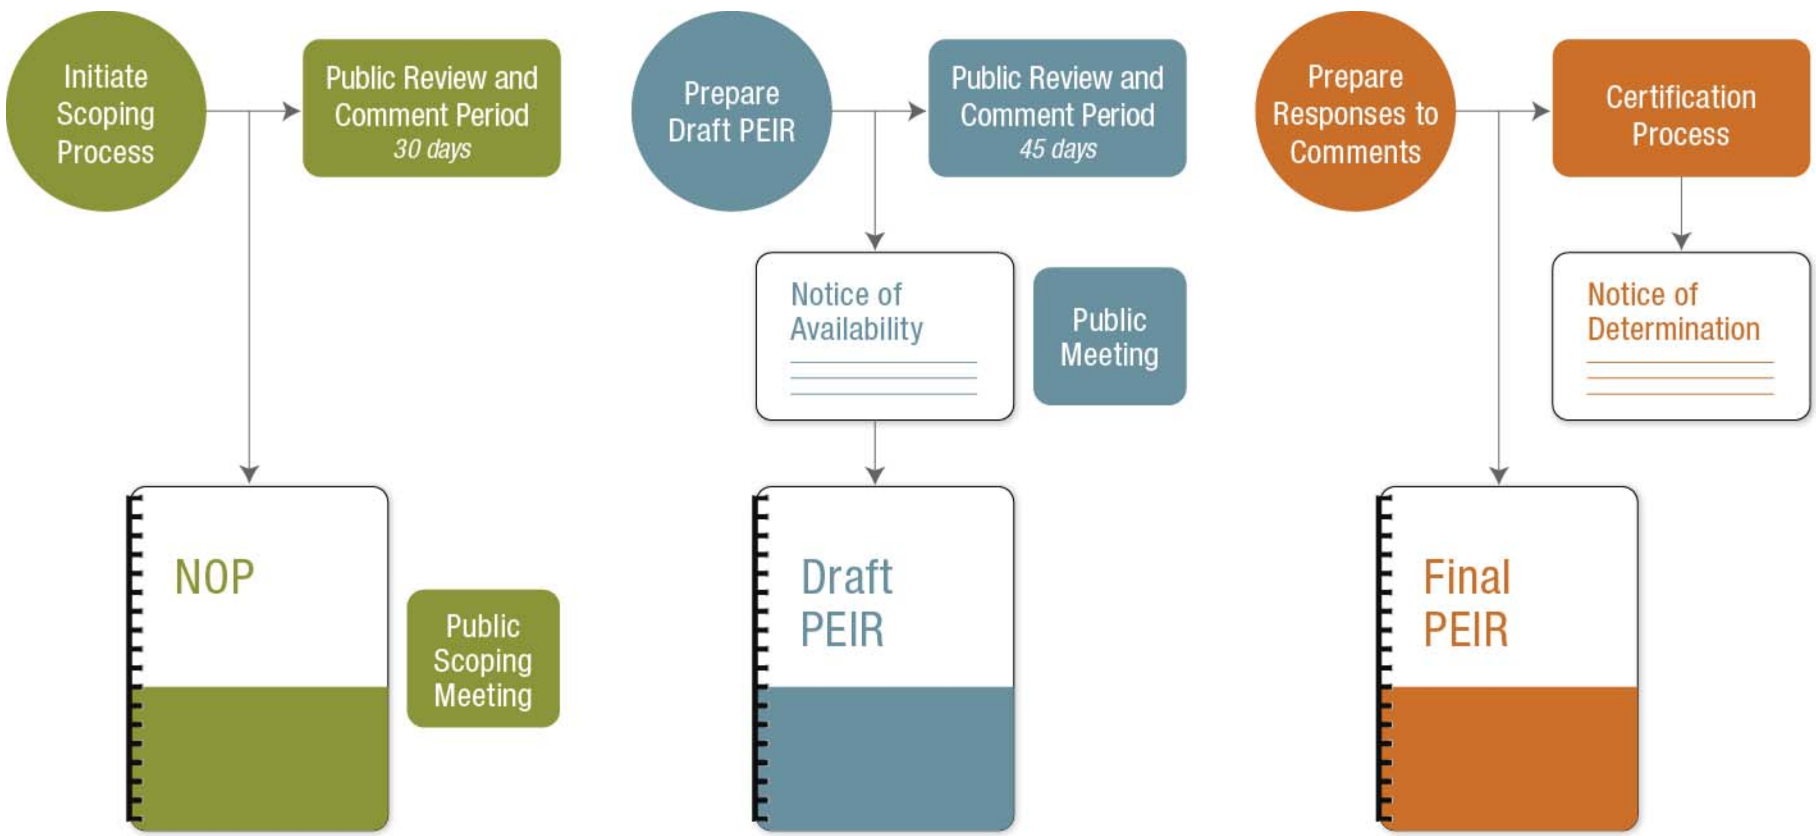
Non-Structural BMPs

- Prevent and/or reduce runoff and/or pollution close to the source
- Nonstructural BMPs part of overall EWMP implementation program – Examples:
  - Irrigation control
  - Covered trash receptacles
  - Replacement of brake pads & lead in wheel weights
  - Pet waste cleanup stations
  - Street sweeping
  - Catch basin cleaning
  - Downspout disconnect program

Program-Level Assessment

- Program assessment for LACFCD to submit EWMPs to LARWQCB
  - LARWQCB Responsible Agency for Approving EWMPs
- Used to evaluate a plan or program that has multiple components or actions
  - Focuses on the Effects of Implementing EWMPs
- Individual projects will be reviewed as they are further developed to determine what if any further review under CEQA is necessary

CEQA Process for an EIR



Issues to be Analyzed in the PEIR

- Aesthetics
- Air Quality
- Agriculture and Forestry
- Biological Resources
- Cultural Resources
- Geology, Soils & Seismicity
- Greenhouse Gas Emissions
- Hazards & Hazardous Materials
- Mandatory Findings of Significance

- Hydrology & Water Quality
- Land Use and Planning
- Mineral Resources
- Noise
- Population & Housing
- Public Services
- Recreation
- Traffic & Transportation
- Utilities & Energy
- Alternatives
- Cumulative Projects

PEIR Schedule Estimate

2014 - 2015	Deliverable/Milestone
August - September	• 30-Day public review of Notice of Preparation • Three scoping meetings
October - December	• Draft PEIR preparation
January - March	• 45-Day public review period for PEIR • Public review meetings
March	• Response to Comments • Final PEIR preparation
April	• Submission to Board of Supervisors for consideration of project approval and certification of PEIR

NOP Comments

- Comment period closes September 29, 2014 by 5:00 PM

- NOP and other project information can be downloaded from www.LACoH2Osheds.com

- Submit Comments
  - At scoping meeting: verbal or written comments
  - Or mail or email comments no later than September 29th to:

Scoping Meeting Public Comments

EWMP PEIR Scoping Meeting
Burton Chace Park, Marina del Rey
September 9, 2014

Comments and questions following the presentation by Tom Barnes, Project Director from Environmental Services, Inc.

- Will this program require 12 environmental impact reports (EIRs), one for each of the 12 watershed within the LACFCD that will be participating in the development of an Enhanced Watershed Management Plan (EWMP) or just one EIR for all 12 watersheds?
    - Only one EIR will be required.

- How does the EWMP relate to the TDML plans? Will this effort end up replacing the TDML implementation plans that have been developed for each of these 12 watersheds?
    - That question cannot be answered at this time.

- Each watershed has a specific pollutant type and a TMDL implementation plan designed to address that pollutant. Given the variety of different problem pollutants in each of these watersheds, the EWMP should not replace the TMDL implementation plans. Are these TMDL implementation plans now on hold while this EWMP is being developed?

- The reason there is no one else here tonight is that there are no specific projects being presented for us to analyze. Over the years, the same set of water quality improvement objectives are presented in every meeting but never with any specific projects. We need to know specifically what is being planned. The EIRs are just words but give us nothing specific.

- Regarding the Santa Monica Bay Plan, the City of LA did not meet water quality objectives. From 2006, the City has had 8 years to comply with the consent decree but it has never reached the mandated goals. We heard that it would take the equivalent of 25 Hyperion Treatment Plants to achieve these water quality goals, and at a tremendous cost. So, how can you ask for public input without presenting us specific projects to review including the costs associated with those projects? Today, we have agencies with plans that are never implemented and taxing us without telling us what we are paying for.

- You can have no plans without public involvement but there can be no meaningful public involvement without specifics.

- Questions that should be addressed during these meetings: Will the Plan (or proposed project?) comply with the TMDL implementation plans and what will it really cost to implement? We have heard costs as high as $150 billion for LA County to fully meet is water quality goals and that $3 billion is being spent on the Ballona Creek treatment wetlands. People want to know what bang what they are really going to get for their buck since they have been repeatedly disappointed by past programs.

- You are heading into years of litigation from people who actually would support this project, if you do not provide more specific project information.   The piece meal approach to solving these water quality projects does not cut it. Over the years we have seen politically motivated plans developed for each city council district rather than comprehensive plans that can realistically achieve the objectives of the Clean Water Act. What is needed now is for you to make a list of projects a part of the Notice of Preparation (NOP) and not wait for the EIR.

- What we want to know and it needs to be included in the EIR are the environmental impacts from specific projects. What we want to see is a plan that is designed to actually comply with the Clean Water Act and to see that funding is available for that plan, to see those dollars actually spent on the projects, and result in actual, tangible cleaning up of our water.

- If you already have a projects lined up, where can I go to see that list of projects?
    - A link is available which we will send to you.

- The process is faulty if the NOP does not contain a list of projects from the very start of this process.
    - The reason we are doing it this way is that the EWMP programs is being designed to launch the whole compliance effort.

LA County Flood Control District
Enhanced Watershed Management Programs PEIR
Scoping Meeting
September 9, 2014, 6pm

Oral Public Comments

Mr. Rex Frankel:

- How many EIRs will be involved?
- Is this a replacement for TMDL implementation plans?
- Are implementation plans on hold?
- There are no projects to comment on – this is why there is nobody here at the meeting
- Ballona Wetlands is a concern…is that an EWMP project?
- Has the City of LA made progress in implementing plans?
- Has had 8 years under consent decree, but there are no specific projects
- Public needs to know associated costs
- How can we comment without specifics?
- Ballona project is a primary concern
- You are proposing taxes without specifics…therefore there will be no public involvement
- What is it going to cost??
- Is Ballona going to be a water quality urban runoff dump?
- Specifics should be available in the NOP

EWMP PEIR Scoping Meeting Notes
Monrovia Community Center
September 15, 2014

Comments and questions from meeting attendees following the presentation.

- Do each of the 12 individual EWMP watershed areas have their own public process?
    - This environmental process is being conducted by the Flood Control District for their use to clear EWMP related projects. Each watershed can use the one being developed by the Flood Control District or create their own for a specific project.

- Are individual projects being identified in the EIR?
    - A list of projects with descriptions will be developed that that will be included in the final document. It will be a live document during the time of submittal. The analysis focuses on project types because the projects will vary.

- Is the MS4 permit in response to regulation?
    - It is in response to the Clean Water Act for municipalities.

- Will funding be identified through this process for some of the projects that may be implemented?
    - CEQA does not address cost unless it is related to change in the environment.

- If one wishes to advocate for particular projects within an EWMP what is the process to do this.
    - Write/include in your comment through EWMP process or through the permittee

- Will criteria vary from watershed to watershed, or will the same criteria be used for all?
- Is there interaction between this project and reclamation? How does this relate to recycled water? Do you talk to each other?
- Education should be part of the evaluation criteria. The value of education should be priority.

LA County Flood Control District
Enhanced Watershed Management Programs PEIR
Scoping Meeting
September 15, 2014, 6pm

Oral Public Comments

- Does each EWMP have its own public process?
- Will individual projects be identified in EIR?
- Is MS4 permit response (?) to legal action?
- Is funding attached to this process?
- How do I advocate for a project?
    - Through EWMP team?
    - Or EIR team?
- Are criteria the same for each watershed?
- How does this relate to recycled water programs?
- Is educational value of a project a high priority? It should be.

Notice of Preparation

RECEIVED
SEP 09 2014
DEPT. PUBLIC WORKS
PROJECT MANAGEMENT DIVISION II

August 29, 2014

To: Reviewing Agencies

Re: Enhanced Watershed Management Programs (EWMP) Program EIR
SCH# 2014081106

Attached for your review and comment is the Notice of Preparation (NOP) for the Enhanced Watershed Management Programs (EWMP) Program EIR draft Environmental Impact Report (EIR).

Responsible agencies must transmit their comments on the scope and content of the NOP, focusing on specific information related to their own statutory responsibility, within 30 days of receipt of the NOP from the Lead Agency. This is a courtesy notice provided by the State Clearinghouse with a reminder for you to comment in a timely manner. We encourage other agencies to also respond to this notice and express their concerns early in the environmental review process.

Please direct your comments to:

Gregg BeGell
Los Angeles County Flood Control District
900 South Fremont Avenue, 11th Floor
Alhambra, CA 91803

with a copy to the State Clearinghouse in the Office of Planning and Research. Please refer to the SCH number noted above in all correspondence concerning this project.

If you have any questions about the environmental document review process, please call the State Clearinghouse at (916) 445-0613.

Sincerely,

Scott Morgan
Director, State Clearinghouse

Document Details Report
State Clearinghouse Data Base

SCH# 2014081106
Project Title Enhanced Watershed Management Programs (EWMP) Program EIR
Lead Agency Los Angeles County Flood Control District

Type NOP Notice of Preparation

Description The development of the EWMP will involve the evaluation and selection of multiple watershed control measures or best management practices (BMP) types including non-structural and distributed, centralized and regional structural BMPs. These BMPs will be implemented to meet compliance goals and strategies under the 2014 MS4 Permit. Structural BMPs involve the construction of a physical control measure to alter the hydrology and/or water quality of incoming stormwater or non-stormwater. The three major functions for structural BMPs are infiltration, water quality treatment, and storage. These are three categories of structural BMPs, defined by the runoff area treated by the BMP and the required retention volume in accordance with the Permit.

Comment Period Extension Letter

Dear Stakeholder and Interested Party,

The Los Angeles County Flood Control District (LACFCD) has extended the public comment period for the Notice of Preparation (NOP) of a Program Environmental Impact Report (PEIR) for proposed Enhanced Watershed Management Programs (EWMP). The extended NOP comment period will end October 29, 2014. The LACFCD is soliciting feedback from interested persons and agencies as to the scope and content of the environmental information to be evaluated in the PEIR. Comments may be submitted by regular mail or email to the address provided below.

Gregg BeGell, P.E.
County of Los Angeles Department of Public Works
Project Management Division II
900 South Fremont Avenue, 5th Floor
Alhambra, CA 91803
(626) 300-3298
gbegell@dpw.lacounty.gov

As Lead Agency, LACFCD has developed the NOP to notify Responsible and Trustee Agencies and interested parties that the LACFCD is preparing the PEIR for the proposed project. The Notice of Preparation (NOP) for the PEIR as well as an audio presentation describing the process can be accessed at: www.LACoH2Osheds.com. The audio presentation has been added to the web-site for those that were not able to attend the three Scoping Meetings held in September.

The LACFCD, the County of Los Angeles, and 84 incorporated cities within Los Angeles County (collectively referred to as Permittees) are covered under federal clean water regulations ("permits") for the discharge of urban runoff to waters of the United States. Under the 2012 Municipal Separate Storm Sewer System (MS4) Permit for Los Angeles County, Permitees have the option of implementing an innovative approach to Permit compliance through development of EWMPs. The LACFCD, along with participating cities, has opted to exercise this option through the development of 12 EWMPs in their respective watershed groups. These EWMPs will identify structural and non-structural strategies to achieve permit compliance. The EWMPs will be submitted to the Los Angeles Regional Water Quality Control Board (LARWQCB) for approval. Implementation of the EMWPs would occur following approval by the LARWQCB.

We will continue to keep you informed of the process.

RE: Public Comments: Notice of Preparation of a Draft Program Environmental Impact Report for Enhanced Watershed Management Programs

Dear Mr. BeGell:

Thank you for your efforts on the Notice of Preparation (NOP) for the Draft Program Environmental Impact Report for the Enhanced Watershed Management Programs (EWMP). I am confident your work will result in an informative and precise first tier final Program Environmental Report (PEIR) that is adequate, complete, and a good faith effort at full disclosure. The purpose of my comments, per Section 15168(c)(5) of the 2014 California Environmental Quality Act (CEQA) Statute and Guidelines, is to assist in the creation of a PEIR "that deals with the effects of the program as specifically and comprehensively as possible." Additionally, I realize that by doing "a good and detailed analysis of the program, many subsequent activities could be found to be within the scope of the project described in the program EIR, and no further environmental documents would be required."

I recognize and appreciate the herculean task involved for the Flood Control District and it is my sincere attempt to keep my comments relevant to the NOP. As such, I have attempted to draft my comments in a reader-friendly manner that identify the issue and propose a feasible solution(s). My comments only address the content of the NOP.

COMMENTS ON THE CONTENT OF THE NOP

1. Introduction

(Page No. 2) Please elaborate on the approval process. It would be informative if the role between the Los Angeles County Flood Control District (LACFCD) and the Los Angeles Regional Water Quality Control Board (LARWQCB) is further explained. The introduction does a good job explaining the steps involved in the EWMP process, but lacks clarity on the connection between the PEIR and LARWQCB. In particular, the sentence in mind states, “The LARWQCB is responsible for approval of the EWMPs in compliance with the MS4 Permit. Implementation of the EMWPs would occur following approval by the LARWQCB.”

If the LARWQCB approves the EWMPs then who adopts the final PEIR? How does this PEIR fit into the responsibilities and mandates of the LARWQCB? All 12 of the EWMPs specify a date when the final EWMPs will be submitted (June 2015) to the LARWQCB, but no mention is made about the PEIR. Will the Lead Agency submit a EWMP packet on behalf of all 12 EWMPS and will the PEIR be a part of that packet? In addition, the NOI submitted to the LARWQCB by each Watershed Management Group (WMG) span two programs: the EWMPs ‘and’ Coordinated Integrated Monitoring Programs (CIMP). Does this PEIR also analyze the CIMP?

(Page 5) The opening paragraph states that “The primary approach to each of the EWMPs, as identified in the Draft Work Plans, includes identifying community-friendly, cost-effective methods of reducing urban runoff pollution and incorporating distributed and centralized structural and nonstructural watershed control measures for a multi-pollutant, multi-benefit approach.” However, a review of all 12 EWMPs indicates that there was no cost/benefit analysis completed to substantiate the “cost-effectiveness” of these methods. Please identify any additional documentation supporting this claim.

(Page No. 5) Please clarify the use of the term “project.” The final sentence in the first paragraph states, “The EWMPs will also evaluate multi-benefit regional projects that will retain (through infiltration or capture and reuse) the stormwater quality design volume (85th percentile storm for 24 hours) for the runoff from the contributing drainage area.” Evaluating, I’m assuming site-level projects with regional benefits, at the PEIR level increases the dissonance between the goal of an EIR, as Section 21002.1(d) of the CEQA Statute states, “to consider the effects, both individual and collective, of all activities involved in a project,” and the inherent collective geographic scope of the PEIR. I reviewed all 12 of the EWMPs and CIMPs. All 12 of the EWMPs do not identify projects currently in the works and no analysis is provided. The EWMPs seem to be evaluating plans and policies. Clarification of the term project would be beneficial in order to clearly understand the scope of this PEIR.

In addition, Section 21003 states that, “All persons and public agencies involved in the environmental review process be responsible for carrying out the process in the most efficient, expeditious manner in order to conserve the available financial, governmental, physical, and social resources with the objective that those resources may be better applied toward the mitigation of actual significant effects on the environment.” In an effort to avoid the possibility of imposing an unfunded mandate on local cities and/or non-profit groups to undertake the second tier of this PEIR, the prudent use of public funds, and to promote a second tier CEQA process that is streamlined, I feel it would be beneficial to incorporate an analysis of current projects in the “pipeline.”

This is critical because a review of the Greater Los Angeles County Integrated Regional Water Management (IRWM) database reveals over 190 water resources projects with regionally-significant benefits in the pipeline (Appendix A). The IRWM is a funding mechanism that encourages regional and local collaboration in the design of sustainable water resources infrastructure. To date, regional agencies, cities, non-profits and community representative groups, have collaborated and submitted project proposals of regional significance. Not all of these projects incorporate BMPs, per say (many do), and many have already been deemed categorically exempt. Additional vetting would need to take place in order to identify projects in-line with a low impact development ideal to collaborate and integrate compliance strategies that are based on a multi-pollutant approach with a focus on green infrastructure that maximize the retention and use of urban runoff as a resource for recharging aquifers and for irrigation and other uses.

If this nexus to analyze the impacts of regional projects is deemed reasonably feasible, further vetting of the projects would be required to understand their CEQA status. The question is who conducts this analysis, the LACFCD or the WMGs? This is important to figure out since Section 15152(b) of the CEQA Statute and Guidelines states that, "Tiering does not excuse the lead agency from adequately analyzing reasonably foreseeable significant environmental effects of the project and does not justify deferring such analysis to a later tier EIR or negative declaration."

(Page 5) The second paragraph states, "The PEIR will provide a program-level assessment of the overall permit compliance effort, focusing particularly on the structural watershed control measures proposed in each of the 12 EWMP areas." The project list on Appendix A identifies projects aiming to implement watershed control measures throughout Los Angeles County. Many of these projects are categorically exempt, have concluded their own environmental assessment or already constructed, however, the database (L.A. County Water Plan) where I retrieved these does not clearly indicate this information. Furthermore, none of the 12 EWMPs under consideration undertook this task to see how the proposed physical changes within their EWMP may or may not comply with the goals and objectives of their respective plans and policies. In an effort to, as Section 15152© describes, "avoid deferring the potential significant impacts to the second tier and possibly preventing the adequate identification of significant effects of the planning approval at hand," it may be worthwhile to include this list in the PEIR analysis or have the WMGs revise their draft plans to incorporate this analysis.

1.1 Project Location

The description of the location could be augmented by elaborating on the environmental context. That is, adding maps identifying the tributaries, rivers, channels, etc. within the 12 watersheds could increase understanding of the local watershed functional characteristics. This detailed information is contained in most of the individual EWMPs. A reference to the website location of each respective EWMP could suffice.

Additionally, there is no reference to the types of soils that underlie the 12 EWMPS. The EWMPs provide a summary of these soil characteristics. A reference to the website location of each respective EWMP would be helpful. It is important to know the soil types and their respective infiltration rates in order to understand the feasibility of implementing certain structural BMPs. I realize that this may be covered in more depth under the Geology, Soils and Seismicity category, but there is no clear reference in the accompanying summary.

2. BACKGROUND

2.1 Stormwater/Water Quality

(Page 7) The first paragraph states, "Discharges may adversely affect receiving surface water quality with pollutants such as bacteria, nutrients (nitrogen and phosphorus), aluminum, copper, lead, zinc, diazinon, and cyanide. Aquatic toxicity, particularly during wet weather, is also a concern. Stormwater and non-stormwater discharges of debris and trash are also a pervasive water quality problem in the Los Angeles region." It would be beneficial to add the types of pollution stemming from the natural environment (non-anthropogenic), too. What kind of pollutants exists in the soils being eroded from natural settings and vacant parcels of land?

2.2 Total Maximum Daily Loads

The final sentence in this paragraph states, "LARWQCB and United States Environmental Protection Agency (USEPA) have established 33 TMDLs that identify Los Angeles County MS4 discharges as one of the pollutant sources causing or contributing to these water quality impairments." Please elaborate on the NPDES permit process. Is there a need for discretionary approval of the EWMPs or PEIR by the USEPA? Is there a need for the USEPA to issue a TMDL or other permit? If so, is there a need to do a concurrent Environmental Impact Statement?

2.3 MS4 Permit

(Page 8) This section states. "The intent of the EWMP is to comprehensively evaluate opportunities, within the participating Permittees' collective jurisdictional boundaries, for collaboration among Permittees and other partners on multi-benefit regional projects that, wherever feasible, retain non-stormwater runoff and also address flood control and/or water supply." Has the United States Army Corp of Engineers (USACE) been a part of these collaborative efforts? Are any of their existing infrastructure being directly or indirectly impacted by the EWMPs? Is there a need for discretionary approval of the EWMPs or PEIR by the USACE? Is there a need for the USACE to issue a permit related to the EWMPs? If so, is there a need to do a concurrent Environmental Impact Statement?

3. Enhanced Watershed Management Plans

As mentioned in the first comment under the Introduction heading, please elaborate on the approval process. Specifically, how the PEIR fits into the LARWQCBs approval of the EWMPs.

4.1.1 Regional Structural BMPs

The second paragraph states, "Opportunities for Regional BMPs will be identified and evaluated within and across subwatersheds, with focus on the multi-benefit potential for capture and reuse of wet-weather flows within variable drainage areas." What method and level of detail will be used to identify and evaluate BMPs? This paragraph goes on to state that, "Potential project locations may include areas with open spaces, whether they are within parks, large parking lots, or vacant spaces," indicating that a geographically site-specific analysis is appropriate under this PEIR. Collectively, there is over 190 regional projects identified in Appendix A being proposed by the various members of the WMGs. Based on the site-specific potential project locations stated above, is it feasible to include an analysis of the project list (Appendix A)?

5 Potential Environmental Impacts

This section (nor the LACoH2Osheds website) does not reference the completion of an Initial Study per Section 15063©(1). How did the Lead Agency identify the effects determined not to be significant? Is there an explanation of the reasons for determining that potentially significant effects would not be significant?

Sincerely,

<u>Enrique Huerta, M.S.</u>

Appendix A

Comment Letter to the LACFCD: Draft PEIR

	Project Name	Project Proponent	Project Description
1	25 mgd Sea Water Desalinization Plant in West Basin	West Basin Municipal Water District	The project proposes to construct a 25mgd Seawater Desalination Plant in West Basin's service area for potable water use. First, a Demonstration Plant will be necessary to evaluate the water quality performance and treatment stability, assess efficient energy recovery devices, optimize operational performance utilizing full scale process equipment, and to acquire the necessary data to achieve regulatory compliance and approval. West Basin and its partners will perform the full battery of water quality analyses to ensure that the demonstration project meets all Federal and State Drinking Water Standards. With the knowledge gained by operating the Demonstration Plant, West Basin expects to move forward with the planning, design, and construction of a full scale 25,000 AFY seawater desalination and education facility. West Basin anticipates operating the Demonstration Plant for at least two years while plans are being completed and finalized for the full-scale plant. The Demonstration Facility is in design.
2	AMR Conversion Project	Los Angeles County Waterworks District No. 29	The project consists of replacing the older water meters in Waterworks District No. 29. The District maintains approximately 7,700 water meters in Malibu and Topanga. About 40 percent of the meters are older than 15 years and 30 percent are 20 years or older. Meters lose accuracy over time, representing unaccounted water consumption in the District. Older meters typically under-measure water use. Replacing old water meters with automated meter reading (AMR) meters will yield timely, reliable water consumption patterns for detecting leaks and producing accurate customer bills. Higher bills with higher water use volumes will alert District customers about their water consumption habits, which is expected to encourage conservation. The current practice is to replace meters as the meters stop functioning or become unreadable. About 20% of the water meters in Malibu and Topanga have been replaced with AMR meters.
3	Agoura Road Gap Recycled Water System Expansion	Las Virgenes Municipal Water District	The project would extend the existing recycled water line along Agoura Road to serve existing customers who use potable water for landscape irrigation. Pipeline for this project is estimated at 9250 feet of 8 inch pipe and would connect to existing recycled water pipelines on both east and west sides of the extension. This would connect the gap that exists between Reyes Adobe Road and Lewis Road and improve the system hydraulics and reliability of service to customers. The estimated maximum daily demand for the Agoura Road Extension is 73 gpm.

4	Agua Amarga Lunada Canyon Habitat Restoration	Palos Verdes Peninsula Land Conservancy & City of Rancho Palos Verdes	Restore 20 acres at Agua Amarga Reserve, to provide habitat for the Federally threatened Coastal California gnatcatcher, the Federally endangered Palos Verdes blue butterfly, and the rare cactus wren. A one-mile trail in the Reserve continues to the coast. A year-round flow of water is discharged to the head of Lunada Canyon via a County of Los Angeles storm drain; the water then flows below ground through the canyon, the course of an historic blue line stream, and re-emerges at its confluence with Agua Amarga Canyon, also a blue-line stream that flows into the Santa Monica Bay. Invasive plant species provide little water infiltration and threaten to spread to the pristine lower canyon. The project will remove invasive plants, restore 18 acres of riparian and coastal sage scrub; install 2 acres of cactus scrub in highly degraded fuel modification areas; improve trails and add trail signage. Interpretive signage will educate hikers about creating wildlife-friendly fuel modification zone.
5	Aliso Creek - Limekiln Creek Restoration Project	City of Los Angeles Bureau of Sanitation Watershed Protection Division	Stormwater runoff would be diverted from Aliso Creek and from Limekiln Creek and stormwater runoff generated on site will be treated. In addition to providing water quality benefits, the project will result in the creation of self-sustaining riparian woodland vegetation and other re-vegetated areas, as well as providing recreational opportunities to area residents.The site has an area of approx. 11.8 acres and is currently used as a flood control facility, provides open space, and serves as part of Vanalden Park.Wet weather runoff and dry weather runoff from an approx. 12,091 acres that drains to the confluence of Aliso Creek and Limekiln Creek is going to be captured and conveyed to the project site for treatment.On-site generated flows will also be captured and treated.Proposed BMPs to treat captured water:Low flow channel diversions and pumping:Pre-screening devices, Bioswales, Vegetated detention basins, Landscaping with native upland and riparian species and Installing decomposed granite pathways.
6	Alondra Regional Park	Successor Agency, City of Compton	Alondra Regional Park is a multi-benefit project that serves disadvantaged communities while meeting IRWMP water management objectives. The entire site is currently an empty 18-acre lot owned by the City of Compton. This proposal is for Phase I of the project and covers 12 acres on the southern half of the parcel. The park provides recreational opportunities while improving surface water discharges into the Dominguez Channel Watershed. The project site sits low on the drainage area and will capture 1.5AF of stormwater. The park features a swale and daylighted stream to remove nutrients and pollutants that otherwise flow to local waterways. The large biofiltration field will reduce peak flows, improve water quality and occasionally serve as a recreational field. Surface water quality improvements would help the region meet requirements under the Municipal Separate Storm Sewer System Permit. The project also includes native shrubs and trees that will increase habitat for birds, butterfly species and mammals.

7	Alternative Decker Canyon Recycled Water Extension	Las Virgenes Municipal Water District	As with the original Decker Canyon Recycled Water Extension pipeline route, this alternate would primarily serve the Malibu Golf Club, the largest potable water user in the LVMWD service area. The 2007 Master Plan advocated that serving the golf course with recycled water could be an important strategy for relieving eventual stress on the potable system. The longer alternative route used in this project would also serve other demands along the way. In addition to the golf club, significant recycled water demands are expected to come from a new development (Triangle Ranch) and conversion of the existing Medea Valley ranchettes to recycled water use. The project is projected to deliver 459 AF/Y of recycled water, offsetting the same amount of potable demand that would occur if the extension were not built.
8	Andrews Park Subsurface Storage, Use and Infiltration Project	City of Redondo Beach	The project will consist of a diversion, conveyance pipes, a gross solids removal device (GSRD), an irrigation storage tank, and an infiltration gallery. Dry- and wet-weather flows will be diverted from the existing storm drain up to the maximum diversion flow rate and will then enter the storage tank through the conveyance pipe and GSRD. Once the storage tank reaches a depth of 1.5 feet, flows will be pumped to be used for onsite subsurface irrigation. When the storage volume of the irrigation tank reaches capacity, runoff will flow via an overflow pipe into the infiltration gallery, where the water will infiltrate subsurface soils. When continual flows fill the infiltration gallery and irrigation storage vault to storage capacity, diverted flows will back-up through the diversion piping and prevent additional flow diversion until capacity is freed up due to irrigation use and/or infiltration losses.
9	Arroyo Seco Confluence Gateway	Arroyo Seco Foundation	The Confluence Gateway Greenway Program will restore a 1/3 mile stretch of urban land alongside the Arroyo Seco, in the Arroyo Seco Scenic Byway Corridor, into a riparian greenway and open space park with native landscaping and a bicycle/pedestrian path. Not only would the project embody a first step in enhancing river access and recreation opportunities, it would provide a key link between the planned Los Angeles River greenways at the confluence and the Metro Rail station in the historic Lincoln Heights neighborhood, thus enabling light rail and bicycle access to the Arroyo Seco and the Los Angeles River. Ultimately, the Arroyo Seco greenway is envisioned to extend to South Pasadena, and this initial segment at the confluence would be an important hub in the regional river parkway and bicycle trail network.

10	Arroyo Seco North Branch Creek Daylighting	Arroyo Seco Foundation	Naturalize north branch storm drain and restore stream through Sycamore Grove Park. Primary Objectives Addressed by the Project: By re-establishing an urban stream, this project addresses water quality, riparian habitat restoration, groundwater recharge, flood management, and public education. The Sycamore Grove Park site is approximately 800 feet long and 400 feet wide. This 8-acre site is located in northeast Los Angeles and situated west of the SR-110 (). This site encompasses Sycamore Grove Park and is bounded by South Avenue 49 to the northeast, the SR-110 to the east, medium density residential uses to the south, and North Figueroa Street to the west. Sycamore Grove Park is a landscaped area consisting of a large lawn, playground, and parking area. The North Branch tributary is contained within a storm drain beneath Sycamore Grove Park.
11	Baldwin Lake	Los Angeles Arboretum Foundation	For centuries the waters of Baldwin Lake have sustained human endeavor. A rich historic site, its role began in the Native America period when springs and marsh, precursors to today's lake, supported nearby habitation. In the late 19th Century, Elias Jackson Baldwin chose the Lake as the center for agriculture and land development that shaped the establishment of the east San Gabriel Valley. Today, as the centerpiece of the Los Angeles County Arboretum, the Lake is an educational and scenic resource serving hundreds of thousands of visitors. Looking to the future, Baldwin Lake is envisioned as a model for community-based environmental stewardship and regional approaches to water management and conservation. Ideally located at the edge of the Raymond Basin aquifer, the Lake offers great potential as the nexus for water management and ground water recharge for the Arboretum's 127 acres, as well as the surrounding urban watershed. Educational programming that interprets the history of the Lake, particul
12	Ballona Creek Water Quality and Beach Improvement & Beneficial Use Project	City of Los Angeles Bureau of Sanitation Watershed Protection Division	Project is to implement the valuable uses of stormwater and to improve the water quality in Ballona Creek Watershed. Ballona Creek Low Flow Treatment Facility (LFTF), also known as North Outfall Treatment Facility (NOTF), is one of several projects proposed in Ballona Creek TMDL Implementation Plans for Bacteria, Metals, and Toxic Pollutants. The LFTF includes a 1 million gallon storage facility and has the capacity to treat up to 150 cfs, including screening of coarse, fine sediments, and disinfection with sodium hypochlorite. NOTF was constructed in 1987 by City of Los Angeles. The project proposes to use the existing treatment facility and construct a low-flow diversion structure in Ballona Creek Channel to divert and treat full dry-weather flow and partial wet-weather flow. 65 percent of Ballona Creek Watershed (85 square miles) is located upstream of the Project, with average dry-weather flows ranging from 14 to 25 cfs. Treatment will include coarse screens, sedimentation, filtration, and disinfection.

13	Be A Water Saver Water Conservation Program	City of Burbank Water and Power	The City of Burbank proposes to expand and increase water conservation through the expansion of a comprehensive indoor/outdoor financial incentive program that will result in immediate and sustainable water savings. The proposed Rebate Program to install 1,300 HE toilets, replace 300,000 square feet of turf with native landscapes, capture and reuse rain water 3 million gallons of rain water with rain barrels, and increase water conservation education efforts will save an estimated 500 AF of water annually. Grant funding for the proposed project will facilitate greater water savings by providing funding for greater levels of participation sooner than would be realized under typical funding efforts. Furthermore, these benefits will be realized faster by utilizing a proven system for conservation, a truly ready to proceed project. This project has the potential to double participation levels.
14	Bette Davis Park Water Recycling Project	LADWP	This project will consist of planning, design, and construction of approximately 4,625 feet of new 8-inch PVC and Ductile Iron recycled water pipeline to extend Glendale's recycled water distribution system from the intersection of Flower St. and Grandview Ave. to Bette Davis Park. Approximately 4,300 feet of pipeline will be installed within Glendale's city right of way. Through an Agreement with the City of Glendale, this project will be designed and constructed by Glendale's contractors and LADWP will reinburse Glendale for the costs. This will reduce the City's potable demand for non-potable uses. This project will offset up to 75 AFY of potable water with recycled water.
15	Big Dalton Sluiceway Rehabilitation	Los Angeles County Flood Control District	This project will upgrade the sluiceway to function as a low level outlet for regulating flows under high reservoir pressure and repair various facility components for the dam. The existing sluice gate at the upstream end is to be replaced with a new heavy duty hydraulic actuated gate, the sluiceway is to be lined with new pipe for the entire length, and a throttling valve is to be installed at the outlet. Storm releases through the sluiceway will reduce the rate of sediment accumulation and prevent sediment deposits at the face of the dam. Incoming sediments during storm flows could be routed through the reservoir to restore a more natural sediment transport system and maintain reservoir capacity
16	Big Dalton Spreading Grounds Improvements	Los Angeles County Flood Control District	The proposed project will modify and motorize the diversion box at Big Dalton Spreading Grounds to better control flows taken into the facility. The spreading basins will be reconfigured to increase percolation rates and storage capacity. An intake will be constructed from Little Dalton Diversion Channel so that additional storm flows can be diverted to the facility. A proposed outlet from Metropolitan Water District's PM-26 imported water line to the Little Dalton Diversion channel will enable imported water to be recharged at the spreading grounds.

17	Big Rock Bypass	Los Angeles County Waterworks District No. 29	The project consists of constructing three 18-inch diameter bypass water pipelines approximately 1,500 feet in length within the areas of active landslides along Pacific Coast Highway. This bypass will serve as a permanent replacement of an existing 30-inch diameter water pipeline that has experienced significant breaks resulting in large water loss. The proposed pipeline will be raised to a shallow trench and protected by a reinforced concrete box covered with steel plates to provide quick access if any leakage occurs. In addition, 18-inch Flexible Expansion Joints will also be installed at several locations with the areas of the active landslides to prevent damage or rupture of pipelines from ground movement.
18	Big Tujunga Dam Spillway Dam	Los Angeles County Flood Control District	Construction of a dam within the spillway at Big Tujunga Dam to increase the maximum storage capacity of the reservoir by approximately 705 acre-feet.
19	Big Tujunga Reservoir Sediment Removal	Los Angeles County Flood Control District	The 2009 Station Fire was the largest fire in Angeles National Forest recorded history and burned over 160,000 acres before containment on October 16, 2009. Approximately 87% of the watershed tributary to Big Tujunga Reservoir was affected. On average, a watershed will take five years or more to recover from a forest fire burn. During this time, increased amounts of debris production are anticipated from the denuded ground surface. Based on the 2010-11 storm season surveys, the total amount of sediment in the Big Tujunga Reservoir is approximately 2 million cubic yards. The County of Los Angeles Department of Public Works on behalf of the Los Angeles County Flood Control District proposes a sediment removal project to permanently remove up to 4.4 mcy of sediment from Big Tujunga Reservoir. Sediment will be excavated and transported using low emission trucks or conveyor belt to Maple Canyon Sediment Placement Site adjacent to Big Tujunga Dam. The project will be completed over four years starting in the sum
20	Boulevard Pit Stormwater Capture Project	LADWP	Acquire and develop Boulevard Pit into a multi-use retention and recharge facility to enhance stormwater conservation.
21	Branford Spreading Basin Cleanout and Pump	Los Angeles County Flood Control District	Branford Spreading Ground has very low percolation rates compared to the Tujunga Spreading Ground directly across the Tujunga Wash Channel. This project will install a pump from Branford Spreading Ground to direct water into the Tujunga Spreading Ground leading to more groundwater recharge. In addition, the project will clean out the clogging layer at the bottom of basin, which will also improve percolation rates.

22	Broadway Neighborhood Stormwater Greenway Project	City of Los Angeles Bureau of Sanitation	In partnership with Water Replenishment District of Southern California and it's "Regional and Distributed Stormwater Capture Feasibiltiy Study," the proposed project will design and implement stormwater Best Management Practices (BMPs) in the City of Los Angeles with the primary goals of TMDL compliance and stormwater infiltration. Three levels of BMPs will be developed; local parcel based Low Impact Development (LID) for 8 acres (60 residential parcels), neighborhood scale LID for 12 acres (3 residential streets and 2 blocks of commercial streets), and a sub-regional scale facility for 30 acres of mixed land uses. The local and neighborhood BMPs will capture and infiltrate all dry-weather flow and up to the ¾ inch storm. The sub regional BMP will capture up to the 2 inch storm for 30 acres. The sub regional BMP will also receive dry-weather flows from 228 acres of mixed land uses. Designs will be standardized to remote widespread implementation.
23	Bull Creek Stormwater Capture	Los Angeles County Flood Control District	Historical records show that an annual average of 625 acre-feet of water passes though Bull Creek. All flows from Bull Creek are lost to the ocean via the Los Angeles River. This project proposes conserving the lost water by diverting flows from the new LADWP facility using a rubber dam and conveying flows through a pipeline to Pacoima Spreading Grounds where it would be captured and recharge the local aquifier.
24	Bull CreekLos Angeles Reservoir Water Quality Improvement Project	LADWP	Plan, design, and construct stormwater conveyance facilities for compliance with the Enhanced Surface Water Treatment Rule. Facilities will be designed according to standards adopted by Department of Water Resources, Division of Safety of Dams. Improvements include widening a portion of the Bull Creek Extension Channel, realigning a section downstream of the widening, construction of a new diversion structure and overflow structure, and improvements to inlet structures. The Los Angeles Reservoir spillway will be removed from service. Proposed design facilitates a future stormwater capture program.
25	Burbank Partnership Water Recycling Project	LADWP	The Burbank Partnership Water Recycling Project involves the planning, design, and construction of approximately 27,000 feet of recycled water pipelines in the North Hollywood area. The three individual segments that comprise the project are the Chandler Boulevard Bike Path segment, the Whitnall Dog Park segment, and the North Hollywood Park segment. These segments will connect to Burbank's recycled water distribution system at three separate connection points and will be served by recycled water treated at the Burbank Water Reclamation Plant. This project is expected to offset up to 285 AFY of potable water with recycled water.

26	Burbank Water and Power Recycled Water System Expansion, Phase 3	City of Burbank Water and Power	The third phase of the City of Burbank's recent recycled water system expansion. As a result of previous phases, over 20 miles of recycled water pipelines have been installed resulting in the distribution of over 2,300 AF of recycled water annually; amounting to 13% of the City's water demand by the end of 2014. The City will continue expanding its recycled water distribution to offset potable water use in this phase by constructing two new recycled water pipelines known as, the LA Equestrian Center (LAEC) and the Naomi pipelines. The LAEC is located on the borders of the cities of Burbank and Los Angeles consisting of landscape areas, stables, offices and corrals; the latter requiring dust control with water trucks. The Naomi pipeline would primarily provide recycled water to a very large commercial data center and smaller customers. Completion of these pipelines will increase recycled water distribution by an estimated 61 AFY, resulting in a direct and immediate potable water savings of 61 AF annually.
27	C Marvin Brewer Desalter Brackish Groundwater Facility Expansion	West Basin Municipal Water District	The Desalter currently has the capacity to extract up to 2,000 acre-feet annually of brackish water. In 2003 the old wells at the site were decommissioned and construction began in 2005 for the first replacement well. The facility became operational in 2006 at a reduced capacity using the new well and the original RO unit. The facility has not been operating to its full capacity since it came online again in 2007 because of water quality issues. Funding is also needed to correct the water quality problems in order to get the facility to its full operating capacity. The proposed 500 AFY capacity expansion will allow the facility to become operational at its full capacity of 2,000 acre-feet per year. The site is already owned by California Water Service Co. and leased by West Basin and is developed as a desalting facility. The expansion will include the installation of a new production well, and the addition of an acid pretreatment unit and a reverse osmosis treatment unit on the existing site.
28	CITYWIDE STORM DRAIN CATCH BASIN CURB SCREENS	CITY of CALABASAS	Installation of storm drain catch basin curb screens at all applicable locations citywide. These screens are the stainless variety approved curb by Los Angeles County. The purpose of the curb screens is to stop trash from entering the catch basins which eventually discharge into both the Los Angeles River and Malibu Creek watersheds. By implementing this project, City of Calabasas will be in compliance with the Trash TMDL both for LA River and Malibu Creek watersheds. Based on studies done, reduction in trash and debris loadings will also reduce Bacterial and sediment loading in the watershed. By implementing the project, disadvantaged communities downstream of Calabasas in Los Angeles River will benefit from cleaner water. The scope work consists of measuring all catch basin openings, drafting RFP with detailed specifications, soliciting proposals from the list of Los Angeles County's approved venders, negotiating contract, implementation/construction, monitoring and reporting.

29	Caballero Creek & Los Angeles River Confluence Park	Mountains Recreation and Conservation Authority	The project will convert a 1.55 acre vacant parcel at the confluence of the Los Angeles River and Caballero Creek into a publicly-accessible natural park with habitat restoration, paths, site furnishings, water quality improvements, waterfront-access, and educational amentities. The design utilizes an innovative mixes low-tech mechanical and biological methods to filter and infiltrate storm waters increases regional water quality. The project creates a multi-benefit park that provides ecosystem services as well as cultural services, like recreation and eco-tourism. The project concept was developed in partnership with the City and County of Los Angeles who have committed to retain ownership, maintenance and operation responsibilities while allowing the Mountains Recreation and Conservation Authority (MRCA) to oversee design and construction. Nearby Reseda High School will monitor the project and use it for hands-on learning and community service opportunities.
30	Camino San Rafael Recycled Water Project	Glendale Water & Power	This project will consist of design and construction of approximately 8300 feet & 6000 feet of new 4"and 8" PVC recycled water pipeline, respectively. The project also consists of installing a two booster stations. This project will extend Glendale's recycled water distribution system to provide recycled water for common area irrigation to the Camino San Rafael Homes. This project will offset up to 90 AFY of potable water with recycled water. This will reduce the City's demand on potable water.
31	Carson Regional Water Recycling Project	West Basin Municipal Water District	The Carson Regional Water Recycling Expansion Project includes the expansion of the existing recycled water treatment facility and the construction of several laterals. This is a new demand on the system and will require expansion of treatment process capacity and conveyance to include; lateral pipelines, pump stations, treatment units, storage tanks, and waste management facilities. The BP Refinery requires single-pass reverse osmosis treatment units. BP Refinery is estimating a need of 2,100 acre-feet per year (AFY). The project will be further expanded to serve customers within the City of Los Angeles' jurisdiction for the refineries in the port area. The City will need recycled water to satisfy a use of 9,300 AFY. The City is in the preliminary design stage.

32	Chase Street Stormwater Greenway	City of Los Angeles Bureau of Sanitation, Watershed Protection Division	The Project will provide a street-end interpretive area on Bull Creek at Chase Street, and install a Stormwater Greenway along Chase Street from the eastern street end on the north side right-of-way to Hayvenhurst, and on the north and south right-of-way to Gothic. Vegetated planters in the parkways will capture and infiltrate street runoff, and will provide storm water filtration, and tree shading. The Bull Creek street-end will feature a native landscape as habitat and a recreational rest stop along the channel, and will provide an interpretive site for wildlife selected and supported by the specific native planting used in the project. A channel diversion from Bull Creek, with a pre-filter and lift station, will transfer runoff through a pipeline to a local Sod Farm where it will be used to irrigate up to 30-commercial acres. The project will integrate water conservation goals (LADWP), Storm water objectives (BOS), Economic enhancements to city property (LAWA), & public health and recreation benefits.
33	Chemical Study - Rio Hondo	Los Angeles County Flood Control District	This project will install a chemical treatment system at the Rio Hondo Coastal Spreading Grounds to remove sediment fines from the water and improve the percolation rates. A Percolation Optimization Investigation (POI) report was done by Montgomery Watson Harza (MWH) in 2003 to evaluate the County's spreading grounds and the impact of suspended solids on percolation rates. The report made a number of recommendations and the recommendations will be implemented at the Rio Hondo flood control facility. The project will install a coagulant chemical feeder and mixer at the grounds intake. This will allow the silt in the stormwater to coagulate and settle prior the cleaner water to flowing into spreading grounds. When this occurs, the spreading grounds will be able to percolate more water, thus conserving and recharging more groundwater.
34	Chevy Oaks Recycled Water Project	Glendale Water & Power	This project will consist of design and construction of approximately 920 feet, 1900 feet & 2100 feet of new 4", 8" and 12" PVC recycled water pipeline, respectively. The project also consists of installing a small booster station. This project will extend Glendale's recycled water distribution system to provide recycled water for irrigation to the Chevy Oaks Homes. This project will offset up to 30 AFY of potable water with recycled water. This will reduce the City's demand on potable water.
35	City of Carson Rain Barrel Give Away Phase II	City of Carson, Development Services Department, Engineering Services Division	At completion of a prior grant, a modest amount of money remained unused. With the acquiesence of the granting agency, the City of Carson purchased 16 rain barrels and set up a website lottery system in order to award them to residents. The response was overwhelming and with no advertising over 100 contestents were disappointed to not receive a rain barrel. This proposal would lead to the purchase of an additional 1,000 rainbarrels (depending on cost and grant amount) to restock the lottery reserves. Advertising and management of the program would be provided as part of the City of Carson grant match. More information on Fiskar Rain Barrels is available at http://www2.fiskars.com/Products/Yard-and-Garden/Rain-Barrel-Systems

36	City of Monrovia Fire Department - Training Center Water Recycling Project	Upper San Gabriel Valley Municipal Water District	Upper District in cooperation with the City and Fire Department of Monrovia are submitting this project incorporating both dry and wet weather runoff capture, treatment and storage for the new Regional Training Center. Once collected, the fire training water and the 85th percentile of a 24 hour storm event (as required by the City's MS4 permit) will be treated before being discharged into storage holding tanks which will store the treated water for future reuse by the training facility. The objective is to offset the use of potable water at the facility, eliminate storm water discharge and capture wet-weather storm water runoff. Finally, if the wet-weather event is larger than the 85th percentile, then provisions are being considered to treat as much of the additional wet-weather storm water runoff via a natural infiltration gallery (bioswale) before being discharged into the City's storm water system.
37	Cogswell Dam Inlet/Outlet Works Rehabilitation Project	Los Angeles County Flood Control District	This project will consist of refurbishment and upgrades to the outlet works, tunnels, and repair of various facility components at Cogswell Dam. The project will increase operational effectiveness for flood control and water conservation. The project will involve: a complete overhaul of the dam's entire inlet/outlet works; upgrade on the electrical control equipment; repair of downstream facilities; structural repairs on the upstream facing slab; security upgrades; and other various repairs essential for maintaining and operating a flood control facility. The overall project intent is to improve Cogswell Dam for maintaining dam safety, increased efficiency and reliability of flood control operations, and enhancement of water conservation efforts.
38	Cold Creek Diamond Acquisition	Mountains Restoration Trust	The project will acquire 4.87 acres (APN 4455-021-040) of natural undisturbed open space within the existing 1348-acre Cold Creek Preserve in the Santa Monica Mountains National Recreation Area. The acquisition is part of the state-funded Cold Creek Restoration Plan designed to acquire 539.06 acres to protect the wild and scenic, perennial Cold Creek, the habitat linkage between Topanga State Park and Malibu Creek State Park, the values of Los Angeles County's Significant Ecological Area #9, and a future venue for environmental education, research, and recreation. The area includes significant oak, sycamore, and willow communities, supports a range of wildlife including mountain lion, gray fox and raptors. The pure waters once supported the federally-listed endangered southern steelhead trout.
39	Conservation Budget Based Tiered Rate Structure	West Basin Municipal Water District	This project helps our customer agencies to develop a water conservation, budget-based rate structure for their customers. The project is beneficial to West Basin's cities and retail water agencies because it provides a pricing structure that will incentivizes its customers to conserve water. This pricing method has been used in other parts of the State and has been successssful at reducing water usage and reqarding those who do so with lower rates on their water bill.

40	Conversion of 237th Street Sump Tributary to Machado Lakes for Nutrient and Toxics TMDL BMPs	City of Torrance	This project would convert the 237th St. Sump (4.5 acre-feet) into a retention/infiltration basin BMP for Toxics and Nutrient TMDL compliance and provide open spaces for wildlife habitat. This project would install diversion structures that would divert the first 4.5 acre-feet of stormwater from a 71 acre tributary area away from the system tributary to Machado Lake (Wilmington Drain) to be retained and infiltrated in this basin. Trash screens would be installed at the catch basin in the watershed by a seperate project. During the dry season the basin would remain an open space for wild life and retain urban run-off and nutrients form 71 acres. By diverting stormwater back into this basin, the City and County storm drain systems would have more capacity during rain events. This project would also increase groundwater recharge.
41	Creek Crossings Repairs	Los Angeles County Waterworks District No. 29	This project consists of repairing corroded and deteriorated sections of aboveground pipeline and developing a Corrosion Monitoring, Control, and Maintenance Program. The Waterworks District 29 transmission water pipeline runs along the Pacific Coast Highway in Malibu. The proposed pipeline repairs are located at eight creek crossings attached to bridge structures. The project will significantly prevent future leaks and breaks in the main transmission pipeline which is the primary source of water supply for Malibu and Topanga. The development of a maintenance program is essential to maintaining water supply reliability for the region.
42	Deauville Distributed Water Reuse Project	City of Santa Monica	The project would harvest stormwater and brackish groundwater for high level treatment and non-potable use around the City, replacing the use of imported potable water. The City would install a 1.3 million gallon storage tank next to the Santa Monica Pier, Deauville lot, to harvest stormwater from the Pier sub-watershed during rain events and brackish groundwater during dry periods. The project would have an optional overflow to an infiltration gallery. A saline extraction well would be installed in sand next to the storage tank. The project would install pre-treatment catch basin inserts in the drainage area or a centralized hydrodynamic separator-screening device to remove trash and debris from stormwater. Modular nanofiltration (NF) and a saltwater reverse osmosis (RO) treatment systems at the site would treat these stored local water resources to high quality for various uses around the City in the existing recycled water system. All concentrated brine by-product would be sent to the sanitary sewer.
43	Decker Canyon Recycled Water System Extension	Las Virgenes Municipal Water District	The Decker Canyon recycled water pump station, pipeline, and tank would furnish recycled water primarily to Malibu Country Club Golf Course and Tract 47962-Sycamore Canyon Estates near the pump station location and other nearby ranchettes. The project would comprise a high-lift pump station, ~23,000 linear feet of pipeline along Westlake Blvd and Decker Canyon Rd, and a 60-foot diameter concrete tank near the corner of Decker Canyon Rd and Mulholland Hwy. Approximately 229 AF of recycled water per year would be used by this project.

44	Del Rey Lagoon Water Quality Improvement Project	City of Los Angeles Bureau of Sanitation Watershed Protection Division	The Del Rey Lagoon Water Quality Improvement Project proposes to improve water quality by reducing the source and amount of fecal indicator bacteria in the Del Rey Lagoon and surrounding waterbodies such as the Santa Monica Bay and Dockweiler Beach. Project components include stormdrain systems, vegetated swales, irrigation system retrofit, and drainage modifications. Education and outreach to the public will also be included in the project scope. The vegetated swales are designed to capture, retain, and treat runoff from the adjacent residential, transportation, and landscaped area during dry weather and partially during wet weather. Existing irrigation system will be retrofitted with a smart irrigation system to reduce excessive irrigation runoff, thereby conserving water and reducing flow. Catch basins and storm drains will be installed to capture and divert excess wet-weather flow into the sewer system. Project also includes a nature viewing deck and educational displays that explain local flora-fauna.
45	Demonstration Gardens at Los Angeles County Fire Department Stations	West Basin Municipal Water District	This project involves the installation of drought-tolerant demonstration gardens at a minimum of five fire stations throughout the West Basin service area. These gardens will replace turf and/or concrete areas that are directly in front of the fire stations in order to provide a maximum visibility to the public. The gardens will be utilizing drought-tolerant and/or native plants that will be designed by professional landscape designers that specialize in climate-appropriate plans and trees. The main goal is to provide water conservation and runoff reduction measures and secondarily to educate the public about the measures so that they can create these spaces at their own homes. West Basin strives to reduce demands by implementing conservation and education programs throughout the communities it serves. This project aims to continue implementing outdoor water conservation/education programs to influence the public to create these spaces in their own homes.
46	Devil's Gate Dam and Reservoir Water Conservation	Los Angeles County Flood Control District	This project proposes to conserve stormwater by holding a reservoir pool behind Devil's Gate Dam and diverting the water to Eaton Wash Dam and Eaton Wash Spreading Grounds for poststorm groundwater recharge. A pump will be installed in the Devil's Gate Dam reservoir and water will be pumped out and conveyed through over 26,000 feet of pipeline to Eaton Wash Dam where it can be held for recharge at downstream spreading ground facilities.

47	Devil's Gate Reservoir Sediment Removal and Management Project	Los Angeles County Flood Control District	The 2009 Station Fire was the largest fire in Angeles National Forest recorded history and burned over 160,000 acres in the San Gabriel Mountains. Approximately 68% of the watershed tributary to Devil's Gate Reservoir was burned and as a result of the storms that occurred in the two wet seasons after the fire, sediment levels in the reservoir increased by more than one million cubic yards. The County of Los Angeles Department of Public Works on behalf of the Los Angeles County Flood Control District is planning a sediment removal project of up to 4 million cubic yards. A sediment removal project from behind Devil's Gate Dam is vital to the health of the Arroyo Seco flood control system. The goal of this project is to restore flood control capacity and establish a reservoir configuration more suitable for routine maintenance activities. The project will last approximately 5 years with construction starting in 2014.
48	Dominguez Channel Greenway Phase III	Los Angeles County Flood Control District	The project will consist of development of a native landscaped greenway and bikeway/pedestrian trail along the north side of the Dominguez Channel, between Vermont Av and Normandie Av. The project will include the following: access/maintenance road improvements for the new/improved bikeway; AC repair and replacement, slurry seal, American Disability Act (ADA) access ramps and bikeway/pedestrian signage and striping. Landscaping improvements include landscaping using native and drought-tolerant plants, irrigation, as-needed fencing repair/replacement. Educational/interpretive signage will also be included along the bikeway/pedestrian trail. A study is also recommended to consider additional pedestrian crosswalks with street lamp lighting for added safety. The project is currently on hold until the LACFCD completes a study to address deficiencies in its levees.
49	Dominguez Channel Trash Reduction Via ARS Installation in the City of Carson, CA	City of Carson, Development Services Department, Engineering Services Division	This project would install Automatic Retracting Screens (ARS) in the 1800 Storm Drain Catch Basins in the City of Carson. The proponents favor ARS to collect trash at street level where the trash can be quickly and cost effectively collected weekly by the existing City Street Sweeping Contractor and eliminates the need for other more costly and difficult to maintain downstream trash control systems. This project anticipates the continuing development of local and state waterway trash control efforts and alleviates the need to develop these expensive federal, state and local requlatory mandates. In comparison to other "downstream" trash control systems, the maintenance status of ARS is easily assessed and visible to the public, which is then able to report those locations where maintenance is warranted. Since ARS systems are located in the street sweeper path, maintenance (trash collection) occurs weekly, the trash stays dry and is less subject to the degradation that generates other pollutants (bacteria).

50	Dominguez Gap Spreading Grounds West Basin Percolation Enhancement	Los Angeles County Flood Control District	The proposed project will increase the percolation within the spreading grounds facility in order to increase groundwater recharge. The preliminary scope includes removing between 5 to 10-feet of clay sediment or installing vertical trenches/drains through the poorly draining strata in the facility's west basin. Preliminary studies have been conducted including boring samples which will be used to further develop conceptual plans and estimate project benefits.
51	Duck Farm River Parkway Phase 1 - Water Enhancement Project	Watershed Conservation Authority	The Duck Farm River Park, once a natural floodplain, has been disconnected from the natural processes of the river for decades as a result of urbanization & flood management. The Project reintroduces natural systems through a riparian/pocket wetland/seasonal streambed that improves both habitat and collect, filter & infiltrate stormwater flows onsite, as well as stormwater from the adjacent freeway in collaboration w/Caltrans. The project will transition irrigation source (annually forecasted to require 19M gallons) from imported, highly processed potable water to either local groundwater or recycled water as its source of supply. The public will benefit by being reconnected to nature, the river, & from educational & interpretive programming possible at the site. This change in supply will reduce greenhouse gases & the parks carbon footprint. Outdoor classroom & interactive educational experiences with children will inspire local youth to learn more about our watershed, water conservation & sustainability
52	Eaton Spreading Grounds Intake Improvements	Los Angeles County Flood Control District	The project will increase the intake and storage capacity of the Eaton Wash Spreading Grounds facility. This will improve the facility's ability to recharge storm water into the groundwater basin, thus greatly increasing the sustainable local groundwater supply that is vital for the region. Los Angeles County Flood Control District will replace the vehicle access slab with a metal grate over the spreading grounds drop intake channel and replace the current diversion flashboards with an inflatable gate within the intake channel. These improvements in Eaton Wash Channel will better direct flows into Eaton Wash Spreading Grounds, thereby increasing its intake capacity. Basin 1 will be enlarged to increase the facility's storage capacity. The project will include improvements to the property along Sierra Madre Boulevard that will significantly improve the sustainability, aesthetics, and safety of the public walkway and street view. Two driveway entrances will be improved by increasing the gate set-back fu
53	Eaton Wash Dam Inlet/Outlet Works Rehabilitation Project	Los Angeles County Flood Control District	The dam outlet works rehabilitation project involves the removal of the existing outlet tower and gate house. Once these major components are removed, construction of a gate valve, debris racks, hydraulic power system with a block house, control systems, modification of the outlet works structure, and rehabilitation of the gate valves will commence. It will provide necessary erosion protection measures and improve water quality during low-flow releases from the dam.

54	Elysian Reservoir Water Quality Improvement Project	LADWP	LADWP is planning to cover the existing Elysian Reservoir in order to meet US EPA water quality regulations. In April 2012, the Board of Water & Power Commissioners certified the Environmental Impact Report and approved the floating cover alternative. The project will install a flexible membrane floating cover over the existing water surface. Also included are supporting infrastructure (piping, valves, liner) and site improvements (roadway paving, fencing). The reservoir will operate in the same manner, providing potable storage for the distribution system. Construction is anticipated to being by 2015. In conjuntion with the project, a Community Parks Fund was established by the Board of Commissioners. The fund is to be used for unspecified public purposes related to community parks. Best efforts will be made to locate enhancements primarily in the Elysian Park area, working together with the community and other City of Los Angeles agencies.
55	Encinal Emergency Connection	Los Angeles County Waterworks District No. 29	The project consists of adding a new emergency water source to supply Waterworks District No. 29 through a new interconnection along Encinal Canyon Road at the District boundary with Las Virgenes Municipal Water District (LVMWD). This interconnection would bring water from Metropolitan Water District of Southern California through LVMWD to provide additional supply to the District during emergencies.
56	Foothill Municipal Water District Recycled Water Project	Foothill Municipal Water District	Three hydrologic areas were studied for the development of satellite recycled water facilities. Foothill Municipal Water District (FMWD) is pursuing the construction of one facility near Berkshire Place in La Canada at this time. This project will treat wastewater using a membrane bioreactor and recharge the product into the groundwater basin using infiltration galleries underneath athletic fields for multi-beneficial uses. Cal Poly Pomona has partnered with FMWD and is developing a model that will also capture stormwater for recharge using the same infiltration galleries. A conservation and education component has also been added. Landscaping will be done to showcase drought tolerant plants at both the MBR site and school site. Tours will be available so that students may learn about stormwater capture, groundwater, recycled water, conservation and the watershed since the Arroyo Seco and Hahamongna Park are across the street. This 0.250 MGD plant will save enough energy annually for 80 homes in So. Cal.
57	Freeway Runoff Infiltration Demonstration Project	City of Santa Monica	Divert runoff from a section of the Santa Monica Freeway within the City of Santa Monica, treat and infiltrate within an area near the freeway, either a landscaped area or parking lot. The infiltration zones will be augered, if necessary to by-pass poor permeable soils. There will be pre-treatment before infiltration to remove trash, oil/grease, sediments. It will be a passive system, i.e. gravity-fed and low into the system. The treatment-infiltration areas will be areas either already with a storm drain in the area, or the creation of new ones to harvest the runoff. The goal will be to keep runoff out of the existing storm drains and out of the storm drain system.

58	Glen Oaks Storm Water Capture Project	Los Angeles Beautification Team	The Prop O funded phase I, the installation of six bio-swales and 4 dry wells. This watershed in an average rainfall year brings 300 acre feet of water to Glen Oaks Blvd. Phase I was completed in January 2014 and is currently capturing an estimated 30 acre feet per year leaving approximately 270 acre feet available for storm water capture. Phase II will consist of an additional eight dry wells for an estimated $625,000, plus the cost of City Services (Design fees, permits and over site), that will capture an additional 40 to 45 acre feet annually.
59	Glendale Narrows Habitat Enhancement Project	Council for Watershed Health	The Glendale Narrows Riverwalk will provide approximately one mile of multi-use recreation along the Los Angeles River. There are several invasive plant species that are prevalent adjacent to the Riverwalk in the Glendale Narrows area of the Los Angeles River. These invasive plant infestations jeopardize the improvements to water quality and degrade habitat for native aquatic, avian, reptile, amphibian, and invertebrate species. In collaboration with the City of Glendale Community Services & Parks Department, the Council for Watershed Health (Council) proposes to develop and manage a 3-4 year restoration project to map, control, and monitor invasive arundo and invasive palm trees in the Riverwalk project area in the Glendale Narrows sections of the Los Angeles River. A native plant propagation and replanting effort is also proposed to reestablish riparian plants.
60	Goldsworthy Groundwater Desalter Expansion	City of Torrance	The Goldsworthy Desalter (Desalter) treats water from the saline plume in the West Coast Groundwater Basin for drinking water. The brackish water is treated to meet or exceed municipal drinking water standards through the use of a reverse osmosis system. The existing Desalter produces approximately 2,000 acre-feet of potable drinking water per year. When the Desalter was originally constructed in 2002, it was designed for expansion to over 5000 acre-feet per year of drinking water. In 2012 the Water Replenishment District of Southern California had a Feasibility Study for the Expansion of Desalter prepared for and approved by the U. S. Bureau of Reclamation. The expansion would involve the installation of additional reverse osmosis treatment units, construction of two additional source water wells, transmission mains and related appurtenance. The project also diverts waste water away from Santa Monica Bay where discharges cause TMDL violations for bacteria.

61	Groundwater Reliability Improvement Project (GRIP)	Water Replenishment District of Southern California	The overarching goal of the GRIP Recycled Water Project is to offset the current use of imported water by providing up to 21,000 acre-feet per year (AFY) of recycled water as a reliable supply source for groundwater basin replenishment via the Montebello Forebay within a reasonable timeframe. The source for the recycled water will be the Los Angeles County Sanitation Districts' San Jose Creek Water Reclamation Plant (SJCWRP). Tertiary treated recycled water, advanced treated recycled water (microfiltration, reverse osmosis and advanced oxidation), or a combination of the two will be conveyed from the SJCWRP via an existing pipeline or possibly a new pipeline for recharge in the Central Groundwater Basin through the Montebello Forebay Spreading Grounds or potentially a new injection well field.
62	Groundwater System Improvement Study	LADWP	The purpose of the Groundwater System Imrovement Study (GSIS) is to perform an independent study to identify, characterize, and evaluate emerging water quality constituents for the San Fernando Basin (SFB). This will include a comprehensive analysis that will provide recommendations in developing short and long-term projects, including the design and construction of groundwater treatment facilities, to maximize the use of the groundwater supply in the SFB. As a part of the GSIS, the LADWP will be drilling approxinmately 26 new groundwater monitoring wells, and perform short-term monitoring of existing and new wells, in order to obtain supplemental water quality data necessary for planning the groundwater treatment afcilities in the SFB.
63	Groundwater Treatment Facilities	LADWP	Design and construction of groundwater treatment facilities in North Hollywwod, Rinaldi-Toluca and Tujunga Wellfields in the San Fernando Basin (SFB), with a treatment capacity of 122,900 acre-feet per year.
64	Hansen Dam Golf Course Water Recycling Project	LADWP	Construct 4,500 feet of 20" pipeline, pumping station and pipe support bridge to deliver recycled water from the Tillman Plant to the Hansen Dam Golf Course and other potential future users. Water will be pumped from the Hansen Tank.
65	Hansen Dam Water Conservation Project	Los Angeles County Flood Control District	Hansen Dam, situated adjacent to the Tujunga Wash Channel in the San Fernando Valley, is a vital part of flood control efforts in the Los Angeles River drainage basin. The primary purpose of Hansen Dam is flood control; however the opportunity exists to increase water conservation and water supply through increased water recharge upstream of the dam. The current operation of the dam allows for an average annual water conservation of 17,100 acre feet per year. The Water Conservation Project, which involves utilizing the existing Debris and Flood Control Pools for water conservation purposes by raising their respective maximum elevations to allow for additional water supply storage, would increase the dam's water conservation ability. This extra supply storage would allow for dam releases to downstream spreading grounds and other facilities fo
66	Hansen Dam Water Conservation and Supply	The River Project	Change management regime of Hansen Dam to focus on water conservation by maintaining a water conservation pool within the reservoir during and subsequent to flood season.

67	Headworks East Reservoir	LADWP	onstruction of a 110 MG buried reservoir along with a 4 MW hydroplant at the former Headworks Spreading Grounds to replace the storage capacity lost when Ivanhoe Reservoir is removed from service. Needed to bring the Water System into comliance with state and federal drinking water regulations by the regulatory deadline of November 2014
68	Headworks Ecosystem Restoration	LADWP	Please refer to the Greater Los Angeles County Integrated Regional Water Management OPTI database for a project description

Mr. Gregg BeGell, P.E.
County of Los Angeles Department of Public Works
Project Management Division II
900 South Fremont, 5th Floor
Alhambra, CA 91803

Dear Mr. BeGell,

The purpose of this letter is to register my support for the restoration of Baldwin Lake as part of the Enhanced Watershed Management Plan (EWMP) for the Rio Hondo Watershed. The lake has experienced significant deterioration in recent decades as a consequence of surface run-off and its very future is very much at risk. Establishing the restoration of Baldwin Lake as a priority project as part of the EWMP will ensure its status as an important ecological and historic asset for generations to come.

Many thanks for attention to this matter.

Very truly yours,

George L. Ball

Subject: Enhanced Watershed Management Plan

As a volunteer at the L.A. County Arboretum, I would like to voice my support for the Enhanced Watershed Management Plan (EWMP) for the Rio Hondo Watershed, in which the Arboretum resides.

Every time I set foot in the Arboretum and look around me I see what can only be described as a treasure that belongs to the people of Los Angeles County. The condition of Baldwin Lake, the centerpiece around which the Arboretum exists is deplorable. It is in desperate need of restoration. Please do all that you can to see that this plan is instituted and that, through it, funding may be found to preserve Baldwin Lake.

DEPT. PUBLIC WORKS
PROJECT MANAGEMENT DIVISION II

Subject: Baldwin Lake Restoration
Los Angeles County Arboretum and Botanic Garden

Dear Mr. BeGell:

As president of the L.A. County Arboretum Foundation and as a concerned citizen, I encourage you to restore Baldwin Lake at the Arboretum. I am sure you are aware that the lake has environmental significance to Los Angeles County including impact on water conservation and reclamation, regional ecology, educational opportunity, and historical importance.

The restoration of Baldwin Lake, including improvements to its function as an urban runoff collection basin, should be considered as a high-priority project within the Rio Hondo Enhanced Watershed Management Plan.

Please note the following:

1. Baldwin Lake, with a current capacity of just under four million gallons, if returned to its original depth, would provide over twelve million gallons of storage capacity. With modification, it could also serve as a significant infiltration basin for aquifer recharge.

2. Tule Pond to the north, a canal roughly 600ft. in length, is the point of entry for the urban watershed, feeding directly into Baldwin Lake. Its size, shape and location offer great potential for water quality enhancement through modification as a bioswale.

3. The Lake is a key educational, scenic, wildlife, and historic resource serving over 330,000 visitors per year, including over 16,000 elementary school students on field trips. The project would provide an unrivaled opportunity to educate a broad public about regional water management, home and community water conservation, and the role of the Raymond Basin and other key water resources that sustain us.

4. The Los Angeles Arboretum Foundation, the County's non-profit partner in operating the Arboretum, stands ready to help leverage public dollars to realize the site's unique educational potential. **At our recent strategic planning meeting (October 25th) the restoration of Baldwin Lake was the top priority for the foundation over the next year.**

In sum, Baldwin Lake offers the ideal project to both enhance watershed function and serve the public with remarkable educational, ecological, and scenic benefits. It is an exceptionally strong candidate for inclusion in the Rio Hondo Enhanced Watershed Management Plan.

Sincerely,

Kenneth D. Hill, Ph.D., P.E.
President, L.A. County Arboretum Foundation

Dear Mr. BeGell,

I am a frequent visitor to our LA County Arboretum. Here I can find beauty, contentment and sollice for my busy lifestyle.

Baldwin Lake is one of our families favorite visiting areas. Here we find the solitude and the different forms of wildfowl very enjoyable.

Lately we find that our lake is becoming a disaster! The water is murkey, the banks are crumbling and it has a swamp like look in certain areas.

On behalf of my family and many friends and visitors I implore you to take advantage of the opportunity now available to restore the health and beauty of our beloved lake.

Thank you for your consideration.
Sincerely.
Marsha Perez

COMMENTS ON NOTICE OF PREPARATION FOR DRAFT PROGRAM EIR FOR ENHANCED WATERSHED MANAGEMENT PROGRAMS FOR L.A. COUNTY

September 29, 2014, 1:30 pm

From Rex Frankel, director, Ballona Ecosystem Education Project,
6038 west 75th street, L.A. CA 90045
310-738-0861, email: rexfrankel@yahoo.com

I understand why no one but myself attended the NOP hearing on September 9th in Marina Del Rey. You have no specific projects to analyze for environmental impacts. You are attempting to analyze the environmental impact of words, not specific actions. It is impossible to analyze the impacts of no stated physical projects, just as it is impossible to analyze those unstated projects' impacts on the environmental setting, ie., the proper baseline, because you have no specific locations for these unspecified projects. Thus all you can say is to analyze the entire county. The two most essential parts of an environmental analysis are missing here: specific projects and specific sites. You have the process all backwards here, and thus, commenting on this NOP in any specific manner is impossible.

Some background: In 2002, local governments settled lawsuits and agreed to consent decrees and promised to stop violations of bacterial health codes at our beaches by 2021. This agreement gave the public agencies an extension beyond the original deadline of 2013 but only if the projects created new parkland and river corridors that could catch and clean water before it fouled the beaches.

In 2006, L.A. City proposed its first big plan under this agreement, an Implementation Plan for the Santa Monica Bay Beaches watersheds. This plan was sent back for redrafting by the RWQCB as it only reached 2% of its target and thus, would not accomplish the goal in the consent decree.

Also in 2006, L.A. city proposed the Integrated Resource Plan which mainly focused on building 25 Hyperion-style urban runoff treatment plants which would have cost the average homeowner ratepayer $400 a month. This plan went nowhere.

In 2012, the County Supervisors tried to quietly approve a $300 million per year property tax hike to build a non-existent list of runoff cleansing and capturing projects. Howls of opposition arose and that plan went nowhere. The public wanted to know what they were paying for.

Now, you are finally starting to design the cleanup plan. But how can you ask the public to weigh in on the scope of the environmental analysis of that plan, when your description of that plan contains no specifics? Your stated plan to defer the environmental analysis of specific project impacts to when each one is up for approval thus ignores the cumulative impacts and therefore is "piecemealing", by starting major momentum of a project that is composed of many necessary parts, yet deferring analysis and the controversy to a multitude of separate EIRs and CEQA documents and public hearings, all the while public input is diffused. We never get to weigh in on whether we like the complete plan because the Program EIR has no specifics to arouse concern and the real project discussion is delayed until much later in a way that requires massive efforts by the public to keep track of the success of the big plan.

The people who will pay for this plan want to see the specifics before you raise our taxes to pay for it. We want expanded and unpaved river corridor parks. We do not want the plan to include converting existing wetlands and wildlife habitat into pollution dumps and sumps. We want what we were promised, not a lame compromise that puts the cleanup burden on existing public lands, parks and house front yards. We want a complete plan for us to judge whether it will accomplish its promises and goals before you produce an EIR, not the other way around.

Please put me on the notification list for all actions relating to this project. Thank you.

Subject: ADDITIONAL COMMENTS ON L.A. County Enhanced Watershed Management Program, Notice of Preparation

ADDITIONAL COMMENTS ON EWMP NOP: October 29, 2014

The problem I have with a Program EIR for a "program" that is devoid of a list of all necessary specific projects is that it short-circuits the cumulative impacts review plus it facilitates illegal piecemealing of the many TMDL compliance projects. A program EIR can be allowed when the individual and currently unknown specific sub projects have "independent utility", thus building and analyzing them separately has no impact on the effectiveness of the other sub projects, nor does it make it mandatory that these other projects also be approved. That is not the case here. The goal of the EWMP and the sub projects is "to achieve permit compliance with RWLs" (NOP page 7 paragraph 3 and page 8, paragraph 1). Thus, all projects must be approved and successfully achieve their goals or the region will not be in compliance with the 2012 MS4 permit, the Federal Clean Water Act and the NPDES permits. If only some of the projects prove feasible and buildable, the construction of the others will not result in CWA compliance. That begs the question of is this project worthwhile if piecemealed at all? Will the beach only be clean in certain locations along the shore, while others will not be as a treatment strategy proved too expensive or technologically infeasible? If the taxpayers ultimately decide this project is too expensive, but certain parts are already built, does that mean that pulling-the-plug will result in non compliance and thus a waste of the taxpayers' dollars already spent? This s

How can the public know if the permits and Clean Water Act will be complied with if the approval of the individual pieces of the compliance strategy are broken up into numerous pieces each receiving their own separate CEQA review? All of this leads me to conclude that the specific projects must be reviewed and approved as part of a master plan project, with the public knowing the full cost of compliance, the full impacts of all projects and alternative policy choices. One specific alternative, distasteful as I find it, would be analysis of only building some projects and also enforcing no-swimming rules for three days after rainfall at beaches.

I will repeat the conclusion of my first NOP comments: The people who will pay for this plan want to all of the see the specifics before you raise our taxes to pay for it. We want expanded and unpaved river corridor parks. We do not want the plan to include converting existing wetlands and wildlife habitat into pollution dumps and sumps. We want what we were promised, not a lame compromise that puts the cleanup burden on existing public lands, parks and house front yards. We want a complete plan for us to judge whether it will accomplish its promises and goals before you analyze and mandate it with an EIR, not the other way around.

Rex

Thank you for your comments. It will be reviewed for use in the PEIR.

Yes, when people think of an EIR they are thinking of a project. This is a Program EIR, the main PEIR document contains some projects as examples but it’s a program.

We are presently working on the PEIR, check our website for information and details. www.LACoH2Osheds.com. We will be posting the PEIR plus public review meetings on the website.

Scoping for Programmatic EIR

RE: **COMMENTS for Enhanced Watershed Management Plan PEIR CS-CH#2014081106**
Based on NOP and other project information downloaded from www.LACoH2Osheds.com.

Thank you for the opportunities to comment on the Notice of Preparation/Initial Study (NOP/IS) and other Scoping documents related to the proposed LA County Enhanced Watershed Management Plan (EWMP). Also thank you for the extension of the deadline for such comments, I believe it was very helpful for our commenters.

I could have continued for many more pages but I have been exhausted by the lack of real effort on the part of the preparers to make the Enhanced Watershed Program project meaningful, adequate, and complete and initially assess its secondary and tertiary impacts for knowledgeable public reviewers. Unfortunately the current NOP/IS and supporting documents appears to be an initial version of the vague program that has been developed by others, rather than a project or even program level DEIR preparation and is in need of major tecchnical additions, editing, technical, and other revisions. The Scoping documents are inadequate and incomplete for the purposes of Scoping, and Scoping documents must updated, revised, and reissued. If you need further clarifications and many more comments, I am available for discussions or correspondence with your staff.

Dr. TW: Background: 40+ years with Worldwide/California water resources, management plans, water supplies, water distribution and transmission systems, and remote water resources development, with preparation, review, and commenting for 300+ EIRs/EISs/EAs (1972 to Date) and with 30+ years in Parsons and URS Corporations, 12+ years with Dubai Govt./Dubai World, and 6+years with Sierra Club Angeles Chapter (Water, Transportation, and Oil and Gas Comtes) and Citizens Coalition for a Safe Community.

Thank you for the opportunity to review and comment. Our comments form two parts: general and specific comments, as shown below for the Section and the two segments.

I have tried to provide citations in comment format with Doc./page/paragraph. Where appropriate, text has been inserted from documents and emphasis added usually as **<u>bolded/underlines</u>**. ***Comments/Requests are added in bolded/italics.***

1. GENERAL COMMENTS

1-1 Scoping and Project/Program Purposes and Needs

The Program description for any DEIR or PDEIR must include the basis of the project: Purposes, Needs Goals, Objectives,

Absence of clearly defined purposes and need, goals and objectives, and priorities renders both the Program and Projects virtually non-reviewable and thereby inadequate and incomplete for public review and comment.

Without purposes and needs/goals and objectives, the public and reviewers cannot be expected to provide reasonable alternatives.

NOP/IS

p.1/par.2 The **purpose** of the MS4 Permit is to ensure Permittees are not causing or contributing to exceedances of water quality **objectives** or impairments of beneficial uses in the receiving waters of the Los Angeles region.

7/3 2.2 States are required not only to identify these “water quality limited segments” but also to prioritize such waters for the **purpose of developing Total Maximum Daily Loads** (TMDLs).

9/5 4.1.1 Capture and Use BMPs collect and use stormwater where applicable for **purposes** such as irrigation.

1/3 The overarching **goal** of BMPs in the EWMP is to reduce the impact of stormwater and non-stormwater on receiving water 2/1 quality and address the water quality priorities as defined by the MS4 Permit.

2/1 The development of each EWMP will involve the evaluation and selection of multiple BMP types, including nonstructural (institutional) and distributed, centralized, and regional structural watershed control measures, that will be implemented to meet **compliance goals and strategies under the 2012 MS4 Permit**.

8/7 The overarching **goal** of BMPs in the EWMPs is to reduce the impact of stormwater and non-stormwater on receiving water quality and to address water conservation and the water quality **priorities**.

11/3 The MS4 permit allows Permittees to customize MCMs to address high-priority water quality **goals** within their watersheds.

13/2 The PEIR will examine the project’s effects on global climate change and evaluate consistency of the project with the State’s GHG emissions reduction **goals**.

Scoping Meeting - Pic 4

- **Project Purpose:** MS4 Permit Compliance (R4-2012-0175)
  - Each Permittee is responsible for its local MS4 compliance
  - Permit compliance through EWMPs
- 12 NOIs submitted to LARWQCB
- Collectively prepared by participating Permittees
  - Los Angeles Regional Water Quality Control Board (LARWQCB) approves EWMPs

1-2 PEIR Contents

1-2 Total lack of reference to assignment of significance and related mitigation.

NOP/IS lacks clear definition and presentation as to potential effects, scopes, and schedules of the program and related projects and their implementation, construction, and operations.

As a water resources project, the physical changes represent a small portion of the overall potential effect of the program and projects, and the NOP does not reflect the systemic nature of water resources effects on the environment.

The NOP and the PDEIR andd PjDEIRs must clearly provide a Scope for each basin, schedules, and related environmental sectors, a Schedule for "implementation", construction, and "operations" (?=forever).

The PEIR will -

"result from implementation of the projects and management actions identified in each EWMP
"result from the construction and operation of EWMP projects,
"focus on potential effects.
"assess the physical changes...including direct, indirect, and cumulative impacts.
"identify mitigation measures to minimize potentially significant impacts of each EWMP.
"anticipated to evaluate...following preliminary listing of environmental issues.

RB-AR 8859

1-3. Environmental Resources, Setting, and Effects - Employment, Costs, Revenues, and Socieconomics

Employment, Costs, Revenues, and Socioeconomics Although mentions are made regarding economic and employment effects related to the Program and its projects, no costs-benefits, financials/funding sources, or other revenues assessments are included in the NOP.

Similarly, socioeconomics for major infrastructure programs and projects are closely related to "Environmental Justice" of those receiving benefits and those experiencing adverse effects directly through water-related operations and indirectly through direct/indirect payments for such effects and prospective benefits for those with much largely parcels and incomes.

5/1 The primary approach to each of the EWMPs, as identified in the Draft Work Plans, includes identifying community-friendly, **cost-effective methods** of reducing urban runoff pollution and incorporating distributed and centralized structural and nonstructural watershed control measures for a multi-pollutant, multi-benefit approach.

8/3 The EWMPs include multi-benefit stormwater management projects that may also provide environmental, aesthetic, recreational, water supply, and/or other community enhancements **cost-effective manner**.

11/1 Most institutional BMPs are implemented to meet Minimum Control Measure (MCM) requirements in the MS4 permit; MCMs are considered a subset of institutional BMPs. MCMs do not involve construction of facilities that physically remove pollutants, but **may involve costs associated with the procurement and installation** of items such as signage or spill response kits.

12.3 Air Quality Construction and operation of EWMP projects could cause air emissions...vehicle trips associated with **any increases in employment**....

14/3 Population...The PEIR will, however, identify current population and **employment projections**...

1-4 Controversies Regarding Program/Projects --- Stormwater Fees

Since the LACo Board of Supervisors have experienced significant controversy regarding the imposition of parcel fees for stormwater revenue and funding and has further created controversies regarding reassignment of parcel-area fees to parcel only fees, a thorough review of the economic, employment, and environmental justice issues must be addressed and defined for the NOP/IS,

As currently understood but avoided in Water agency and County presentations, an increase (e.g., x2+) in LACo stormwater fees would be applied on a parcel basis (no matter the size of parcel) as being proposed under the 2014 Measure P initiative which has no relationship to stormwater runoff and effects, compared to the current Recreation and Parks 1990s initiative which are based on parcel area (sqft) fees. For stormwater generation, area is directly related stormwater generation (e.g., 5000sqft may generate less runoff than 50,000sqft lots).

Therefore the NOP has not discussed the socioeconomic effects and related Environmental Justice issues related to the proposed program and the related controversy. A thorough assessment of all related revenue/costs issues must be presented in the PDEIR, including sources of revenues, revenue streams for life-of-project costs (especially for operations, maintenance, and replacements), basis for revenues (by parcel or by parcel-area), and Environmental Justice (which is not mentioned any where in the NOP/IS or presentation).

1-5 Mitigation Measures

Inconsistency uses and lack of definitions for most if not all related terms.

activities of "develop", identify", "proposed", or "evaluate".

to reduce potential, reduce the level, reduce potential adverse effect, any significant effects, to avoid,

are reduced or avoided, recommend

Vague generalities are presented and are so inconsistently applied within the same or related paragraphs as to render the entire presentation as useless.

The PDEIR must clearly present in matrices with links to discussions and appendices the project and program effects (quantifiedd/ranked), levels of significance for each sector/parameter, criteria levels for significances, proposed mitigations/compensations for significant effects, and a quantitative ranking of the effects levels following mitigation/compensation.

Lack of Mitigation

1-6 No measures are mentioned for many sectors but no basis could be established for such omissions, and comparable effects could be expected within these sectors similar to those that had need for measures mentioned.

12/2 Aesthetics ***No mitigation mentioned.***
12/4 Biology... ***No mitigation mentioned.***
13/2 Greenhouse Gases ***No mitigation mentioned***.
13/6 Land Use... ***No mitigation mentioned.***
14/4 Public Services... ***No mitigation mentioned.***
15/1 The PEIR will **evaluate potential energy consumption** associated with implementation of structural and nonstructural BMPs. ***No mitigation mentioned for Energy***

1-7 Mitigation, protection, and other measures and strategies are mentioned along with textual review of environmental sector but without any clear and concise statement of what they are, when they would be used, and how they could affect impacts, effects, and conditions. Mitigation measures in the Scoping NOP/IS are inconsistently mentioned as shown below.
Mitigation or compensation is required by CEQA for significant impacts.
Although mitigation is mentioned in the NOP/IS, mitigation and compensation are not mentioned in the Scoping Presentation slides; in reverse of "Alternatives", not mentioned in NOP/IS but present once in the Presentation.
Various terms - without definitions and consistent uses.
Protection measures mitigation strategies
significant effects
significant impacts
potentially necessary significant impacts
mitigate secondary effects of growth
As lead agency for the program LACo must clearly state the sole responsibility for thorough and consistent implementation in all projects of CEQA compliance and consistency of impact mitigation and compensation (including Environmental Justice and Socioeconomics).
The recirculated NOP/IS and PDEIR must provide a thorough presentation of:
Definitions of all related terms,
Process and quantified analyses for establishing the level of effects, mitigation, and remaining adverse effects and potential subjects of compensation,
Consistency of mitigations amongst all watersheds,
All current mitigation and compensation measures planned or anticipated by the Program and Project proponents, and
Explanation of absence of mitigation or compensation.
Examples

12/3 Air Quality...The PEIR...will **develop** mitigation measures if necessary to **reduce potential impacts**.
12/5 Cultural Resources Mitigation measures will be **identified** if necessary to **reduce the level of impact where possible**.
13/1 Geology... The PEIR will identify mitigation measures if necessary to **reduce potential adverse effects** to proposed facilities.
13/3 Hazards... Mitigation measures will be **proposed** if necessary to **reduce any significant effects** of the project...enountered during construction would be handled in accordance with applicable regulations.
13/4 Hydrology... The PEIR will identify stormwater quality **protection measures** required during construction and operation of proposed facilities. The PEIR also will **evaluate** potential impacts to flood control capacity and **develop mitigation strategies** if necessary **to avoid significant impacts**.
13/5 The PEIR will **evaluate** potential effects of increased storm water recharge and will identify mitigation measures if necessary to ensure that **potentially necessary significant impacts are reduced or avoided**.
14/2 Noise... The PEIR will **recommend mitigation strategies** to ensure that proposed EWMP projects implemented by local agencies comply with local noise policies and ordinances.
14/3 Population... The PEIR will...identify local planning jurisdictions with the authority to approve growth and **mitigate secondary effects of growth**.

14/5 Traffic... The PEIR will **identify mitigation strategies to reduce any potential effects**.
14/6 Utilities... The PEIR will **evaluate the project's potential to affect utilities** and will **identify mitigation measures to minimize the effects**.

1-8 Alternatives Although the project proponent has chosen to prepare an Environmental Impact Report, no mention is made regarding alternatives in the Initial Study/NOP. Only one reference to alternatives in all available related documents occurs in Slide 28, "Issues to be Analyzed" in the PEIR Scoping Presentation.

As the preparer included one reference to Alternatives, complete exclusion of such from the IS/NOP represents an arbitrary and incomplete presentation of CEQA documents. Without a clear concise statement of purposes and needs (goals and objectives, etc.), reasonable alternatives cannot be developed through the public participation and have not been developed by the watershed stakeholders.

LACo must revise and recirculate the NOP.

LACo must include a thorough description of Purposes and Needs for the project, quantification of such P&Ns, detailed quantified analyses as to how the Program achieves such P&Ns, basis for development of other alternative programs and projects within each alternative, and an assessment as to the best available alternative.

Some prospective alternatives include:

- ***Single parcel fee assessment for 20-plus year full Administration, O&M and replacements;***
- ***Parcel-Area fee assessment for 20-plus year full Administration, O&M and replacements;***
- ***Hybrid Parcel-Area/Runoff fee assessment for 20-plus year full Administration, O&M and replacements;***
- ***Zero-Parcel Discharge Assessment and fee adjustment for 20-plus year full Administration, O&M and replacements;***
- ***Large-Parcel and Large Discharge Assessment and fee increments for 20-plus year full Administration, O&M and replacements;***
- ***Full capture and recharge of flows of >100cfs from all waterways;***

1-9 Mitigation Monitoring and Report Plan The Draft Programmatic Environmental Impact Reports must include draft plans for the implementation, monitoring, and enforcements of the Mitigation Monitoring, and Reporting Plan for the Program. Also the PDEIR and draft Programmatic MMR Plan must provide the descriptions and process for funding, staffing, means, monitoring, enforcement, and reporting for the public for the monitoring of all Project-Level activities and compliance which must be subject to noticing/subscriptions, public reviews, and comment as part of the project-DEIR processes and not wait until the "Final EIR" is circulated for projects.

1-10 Scoping Report Because of the poor development of the NOP/IS and lack of coordination between the LACo efforts and those projected for the individual Project DEIRs and dispersed responsibilities for compliance and responsibilities, following the October 29th deadline for these comments, we request that LACo recirculate the entire NOP/IS, and if not done issue a Scoping Report ass to the LACo responses to comments and the table of contents for the PDEIR in order to establish the level of incorporation provided for the Scoping comments herein.

1-11 As indicated elsewhere many terms have been used and will be used inconsistently in the NOP/IS and Scoping Presentation and has created confusion and such must be avoided in the PDEIR.

The PDEIR must contain a single glossary and set of definitions for all terms for the PDEIR, and preparers and editors must assure full and specific compliance and consistency for all usage. Such a glossary may be included as an appendix with proper references throughout the PDEIR.

1-12 Program Compliance and Monitoring The LACo, Department of Public Works, Flood Control District is assumed to be in charge of the EWMP Program and has 12 groups responsible for specific areas and is related to the Los Angeles Regional Water Quality Control Board through the MS4 permit and sub-permits for water quality and flows within the Program regional and

area watersheds. No formal agreement has been presented as part of the NOP/IS and discussion seems to differ between the NOP/IS and the Scoping Presentation. As the LACFCD is scoping the PDEIR, reviewers must assume that only the LACo shall answer to the LARWQCB for compliance and monitoring for the next 20 years and that LACo shall have the powers, staffing, expertise, and funding to assure compliance of 12 different agencies/sub-permittees.

The Program description of the PDEIR must clearly and concisely present the administrative and operational arrangement and oversight assurance mechanisms to achieve implementation of all aspects of the MS4 permit and sub-permits and any and all CEQA and MS4 permit terms, conditions, mitigations, and compensations which may be related the Program and its projects. All contractual, regulatory, and judicial records must be provided as appendices and referenced within the text.

1-13 During a 20+ year Program, Implementation and Enforcement of all elements for 12+ different plans represent a major quality control/assurance and management and must be provided with adequate enforcement capabilities and support. The LACo, Department of Public Works, Flood Control District is assumed to be in charge of the EWMP Program and has 12 groups responsible for implementation, completion, and enforcement activities related to but in addition to those of the Los Angeles Regional Water Quality Control Board through the MS4 permit and sub-permits for water quality and flows within the Program regional and area watersheds.

No formal management and enforcement agreement has been presented as part of the NOP/IS and the Scoping Presentation. As the LACFCD is scoping the PDEIR, reviewers must assume that only the LACo shall answer to the LARWQCB for implementation and enforcements for the next 20 years and that LACo shall have the powers, staffing, expertise, and funding to assure implementation and enforcement with 12 different agencies/sub-permittees.

Fundamentally, will LACFCD or LARWQCB assess penalties against the sub-permittees for lack of timely implementation, achievement, and penalties.

The Program description of the PDEIR must clearly and concisely present the administrative and operational arrangement and quality-controls/assurance processes to achieve initiation and completion of all aspects of the MS4 permit and sub-permits and assignment of penalties , both financial and organizational for any and all CEQA and MS4 permits which may be related the Program and its projects. The LACFCD must also have the specific powers to assume direct authority over any projects under its responsibilities to the LARWQCB, and such must be documented within the PDEIR and PFEIR as appendices and referenced within the text

Environmental Sectors

2-1 No mention is made of "wetlands" which are often not included under either riparian (trees and bushes with dry land beneath) or aquatic habitats (open and standing water). Although this is one of the few specific habitats with federal and special protections, it is not mentioned which indicates the lack of background on the preparers part or a specific avoidance of controversial issues. The current NOP/IS lack competence, adequacy, and completeness for the public and stakeholder to review and comment upon the scope and specificity requireed for the PDEIR and subsequent PjDEIRs.

Revise and recirculate the entire NOP/IS and related documents.

The recirculation NOP/IS and the PDEIR must contain a general map of the Program and area maps for each of the projects with the following:

- ***all existing delineated riparian, wetlands, and aquatic habitats;***
- ***related existing upstream and adjacent infiltration, recharge, and liquefaction areas;***
- ***potential groundwater movement patterns for 1500ft upstream and downstream of wetlands and riparian habitats; and***
- ***current surface water flows for 1500ft upstream and downstream of wetlands and riparian habitats.***

12/4 **Biological Resources** Implementation of the EWMP projects could occur within existing sensitive habitats...result in changes to wildlife habitat, disruption of natural movement corridors, fragmentation or isolation of wildlife habitats, and disturbance of sensitive species during construction or operation...could alter **riparian and aquatic habitats**. The PEIR will evaluate the potential for such facilities to impact biological resources and will also discuss local ordinances and state and federal regulations governing biological resources.

2-2 Geology and Groundwater Slight mention is made of groundwater, infiltration, recharge, and related liquefaction although much of the stormwater reduction must depend upon groundwater storage of captured runoff. The General Plan has not specific policies regarding changing the entire groundwater regime by massive expansion of septic tank/leach field system in another LACo project (i.e., Hauled Water Initiative) and this Programs LID and related recharge systems.

No information has been provided as to where recharge/infiltration areas are in relation to liquefaction zones and their drier extensions of alluvium and other permeable soils and bedrock.

The recirculation NOP/IS and the PDEIR must contain a general map of the Program and area maps for each of the projects with the following:

All geologically potential recharge/infiltration areas, existing recharging project, and proposed recharging areas and of all areas with more than 10 septic tanks per any 100 acres;

Currently delineated liquefaction areas and geologically similar surface materials which are not now considered as liquefiable due to lack of high groundwater tables;

Known groundwater levels and elevations of stream beds downslope of the groundwater tables; and

Anticipated local and project recharging rates.

12/6 5. Geology, Soils, and Seismicity Southern Los Angeles County is a seismically active region. The proposed EWMP BMPs would require **construction** of structural BMPs that could be subject to potential seismic and geologic hazards, including 13/1 ground shaking, **liquefaction**, soil stability conditions, soil erosion rates, expansive soils, and landslides. Policies provided in the County's General Plan and applicable standard County requirements will be evaluated as to their effect of **mitigating or avoiding any potentially significant effects.**...

13/4 Hydrology and Water Quality Implementation of the proposed EWMP BMPs may change **local drainage patterns at construction sites**,...which could affect the hydrology, hydraulics, and/or water quality of streams, rivers, and other receiving waters...The PEIR also will evaluate potential impacts to flood control capacity and develop mitigation strategies if necessary to avoid significant impacts.

13/5 Implementation of the proposed EWMP BMPs would likely result in **increased infiltration and recharge** in various locations throughout the EWMP watersheds. **Such activities could affect local groundwater levels and water quality**. The PEIR will evaluate potential effects of **increased storm water recharge** and will identify mitigation measures if necessary to ensure that potentially necessary significant impacts are reduced or avoided.

2-3 Hazards and Groundwater Recharge No mention is made regarding the influence of groundwater movements upon hazards and hazardous materials in the soil/alluvium/bedrock context. Groundwater plumes have cause major expansions of underground contamination from storage tanks and contaminated soil. Contaminated groundwater in the northeastern and western San Fernando Valley and elsewhere are known to be migrating based on the groundwater flows and basin pumping for water supplies.

Current LACo policies do not reflect the responsibilities and liabilities of LACo approved watershed plans causing the changes of hazardous materials migration induced by groundwater flows fed by LACo and agency approved recharge/infiltration projects.

No information has been provided as to where recharge/infiltration areas, groundwater flows, and known or expected contaminated groundwater and soils, and potential routes for plume migration through extensions of alluvium and other permeable soils and bedrock.

The recirculation NOP/IS and the PDEIR must contain a general map of the Program and projects' area maps with the following:

Known subsurface contaminated soils and groundwater and active remediation sites;

Known pump/treat/use or pump/treat/recharge projects;

Current and expected recharge/infiltration areas; and

Known/Expected groundwater migration pathways.

13/3 **Hazards and Hazardous Materials** Excavation during construction of proposed EWMP BMPs could uncover **contaminated soils or hazardous substances** that pose a substantial hazard to human health or the environment...The policies provided in the County's General Plan and any standard County requirements will be evaluated as to their effect of mitigating or avoiding any potentially significant effects.

2-4 Socioeconomics (including Total and Disposal Incomes, Employment, Existing Infrastructure Costs, and Property and Other Revenues)

No information has been provided as to any socioeconomic setting, effects, and mitigation for the program or the projects.

The recirculation NOP/IS and the PDEIR must contain an overall socioeconomic review of the Program area and separate project area for each of the projects with the following:

- ***Educational, employment, age/gender, and other socioeconomic parameters to characterize the areas for the Program and its projects;***
- ***Incomes, Current Taxes and Fees, and other Ability-To-Pay parameters to characterize the areas for the Program and its projects;***
- ***Existing Special Assessment Districts and Other Urban Costs for Local Residents and Property Owners for the Program's and its projects' areas; and***
- ***State and conditions of existing infrastructure and potential for major future projects in the same Program's and its projects' areas.***

2-5 "Environmental Justice" No information has been provided as to any information regarding the setting, effects, and mitigation for the program or the projects related to issues of Environmental Justice.

The recirculation NOP/IS and the PDEIR must contain an overall and specific projects' Environmental Justice review of the similar major infrastructure programs and projects as related to those receiving benefits and those experiencing adverse effects directly through water-related operations and indirectly through direct/indirect payments for such effects and prospective benefits for those with much largely parcels and incomes.

2-6 Mitigation Monitoring and Reporting Plan The Draft Programmatic and Draft Project Environmental Impact Reports must include tiered draft plans for the implementation, monitoring, and enforcements of the Mitigation Monitoring, and Reporting Plan which will be subject to public review and comment as part of the DEIR processes and not wait until the "Final EIR" is circulated.

Re: Restoration of Baldwin Lake

Dear Mr. BeGell:

I write to urge you to make the restoration of Baldwin Lake a high priority as you lead the effort to create the EWMP for the Rio Hondo Watershed.

The restoration of Baldwin Lake, including modifications to the depth of the lake and adaptation of Tule Pond as a bioswale, would enhance Baldwin Lake's water quality and give it a more significant water collection function while simultaneously enhancing its scenic, educational, and historic value at the center of the Los Angeles County Arboretum and Botanic Garden.

The restored lake would also provide an exceptional opportunity to educate the public about regional water management, home and community water conservation, and the role of the Raymond Basin and the other water resources in sustaining us. It is a key resource that serves over 330,000 visitors per year, including more than 16,000 elementary school students on field trips.

As a member of the board of the Los Angeles Arboretum Foundation, the County's non-profit partner in operating the Arboretum, I stand ready to help leverage public dollars to realize Baldwin Lake's unique potential to provide direct public benefit in a multitude of ways. It is the ideal project both to enhance the watershed function and serve the public with remarkable educational, ecological, and scenic benefits.

I respectfully submit that the County include the Baldwin Lake in the Rio Hondo Enhanced Watershed Management Plan.

Very truly yours,

Elizabeth Byrne Debreu
Board Member, Los Angeles Arboretum Foundation

Re: **Enhanced Watershed Management Programs**
Notice of Preparation
IGR#140912FL
Vic.: LA/Various watersheds locations

Dear Mr. BeGell:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the above referenced project. The proposed project will prepare a Program Environmental Impact Report (PEIR) for the project identified, such as the 12 separate Enhanced Watershed Management Programs (EWMPs); it will be prepared as a collective effort among the Los Angeles County Flood Control District (LACFCD) and the applicable agencies in each respective EWMP.

We would like to remind you that storm water run-off is a sensitive issue for Los Angeles and Ventura counties. Please be mindful that projects need to be designed to discharge clean run-off water.

Any work to be performed within the State Right-of-way will need an Encroachment Permit and any transportation of heavy construction equipment and/or materials which requires the use of oversized-transport vehicles on State highways will require a Caltrans transportation permit. We recommend that large size truck trips be limited to off-peak commute periods. In addition, a truck/traffic construction management plan is needed for this project.

If you have any questions, please feel free to contact me at (213) 897-9140 or project coordinator Frances Lee at (213) 897-0673 or electronically at frances.lee@dot.ca.gov.

Sincerely,

Dianna Watson

MWD
METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA

Executive Office

September 24, 2014 **Via Mail**

Mr. Gregg BeGell
Project Management Division II
Los Angeles County Flood Control District
900 South Fremont Avenue, 5th Floor
Alhambra, CA 91803

Dear Mr. BeGell:

Notice of Preparation for the Draft Program
Environmental Impact Report for the Enhanced Watershed Management Programs

The Metropolitan Water District of Southern California (Metropolitan) has reviewed the Notice of Preparation of a Draft Program Environmental Impact Report for Enhanced Watershed Management Programs (EWMPs) in Los Angeles County, California. The Los Angeles County Flood Control District (LACFCD) is the Lead Agency. An EWMP is one regulatory compliance mechanism for stormwater management under the Los Angeles County Municipal Separate Storm Sewer System (MS4) Permit adopted in 2012 (hereafter referred to as 2012 LA County MS4 Permit). The LACFCD proposes the development of 12 separate EWMPs in their respective watershed groups. The potential benefits from the EWMPs include the following: (1) improved water quality; (2) reduction in the impairment of water bodies for Designated Beneficial Uses; (3) promotion of water conservation and supply; (4) enhanced recreational opportunities; (4) support for public education opportunities; (5) improved local aesthetics; and (6) management of flood risks. This letter contains Metropolitan's comments to the proposed project as a potentially affected agency.

Metropolitan is a public agency and regional water wholesaler. It is comprised of 26 member public agencies serving approximately 18.4 million people in portions of six counties in Southern California, including Los Angeles County. Metropolitan's mission is to provide its 5,200-square-mile service area with adequate and reliable supplies of high-quality water to meet present and future needs in an environmentally and economically responsible way. Metropolitan owns and operates numerous facilities within Los Angeles County including pipelines, a water treatment plant, power plants, dams, reservoirs, and other infrastructure associated with our water conveyance and distribution system.

The proposed project may impact Metropolitan's ability to dewater its pipelines. As part of a proactive maintenance and refurbishment program, Metropolitan periodically dewaters its treated and raw water pipelines prior to inspection, maintenance, or repair activities. Such periodic inspections and repairs are essential to prevent pipe failures and subsequent damage from high-pressure water releases. These water discharges are short-term in nature and are acknowledged by the LA County Regional Water Quality Control Board as having a *de minimus,* or low-threat, impact to the environment and aquatic life. As such, these discharges are categorized as "Conditionally Exempt Essential Non-Storm Water Discharges" under the 2012 LA County MS4 Permit.

Metropolitan requests that LACFCD and its co-permitees continue to allow for periodic discharges by potable water systems into the MS4 under the proposed EWMPs. These "Conditionally Exempt Essential Non-Storm Water Discharges" are specifically called out as permissible under the 2012 LA County MS4 Permit. Per the conditions set forth in the 2012 LA County MS4 Permit, Metropolitan will continue to follow industry-accepted best management practices (BMPs) for its potable water system discharges. BMPs include, but are not limited to, the following: (a) advanced notification of LACFCD 72 hours prior to all planned discharges greater than 100,000 gallons and as soon as possible after an unplanned discharge greater than 100,000 gallons; (b) dechlorination; (c) monitoring for pollutants of concern; and (d) recordkeeping (e.g., date, time, and location of discharge, discharge pathway, receiving water, total number of gallons discharged, BMPs used, etc.).

Based on a review of the proposed project boundaries, the proposed project has potential to impact Metropolitan facilities. Metropolitan must be allowed to maintain its rights-of-way and requires unobstructed access to its facilities in order to maintain and repair its system. Any future design plans associated with this project should be submitted to the attention of Metropolitan's Substructures Team. Approval of the project should be contingent on Metropolitan's approval of design plans for portions of the proposed project that could impact its facilities.

Detailed prints of drawings of Metropolitan's pipelines and rights-of-way may be obtained by calling Metropolitan's Substructures Information Line at (213) 217-6564. To assist the applicant in preparing plans that are compatible with Metropolitan's facilities and easements, we have enclosed a copy of the "Guidelines for Developments in the Area of Facilities, Fee Properties, and/or Easement of The Metropolitan Water District of Southern California." Please note that all submitted designs or plans must clearly identify Metropolitan's facilities and rights-of-way.
We appreciate the opportunity to provide input to your planning process and we look forward to receiving future documentation and plans for this project. For further assistance, please contact Ms. Michelle Morrison at (213) 217-7906.

Very truly yours,

Deborah Day

J:\Environmental Planning&Compliance\COMPLETED JOBS\September2014\EPT Job No. 20140944MIS

Enclosures: Planning Guidelines and Map of Metropolitan Facilities in Project Vicinity

Guidelines for Developments in the Area of Facilities, Fee Properties, and/or Easements of The Metropolitan Water District of Southern California

1. Introduction

a. The following general guidelines should be followed for the design of proposed facilities and developments in the area of Metropolitan's facilities, fee properties, and/or easements.

b. We require that 3 copies of your tentative and final record maps, grading, paving, street improvement, landscape, storm drain, and utility plans be submitted for our review and written approval as they pertain to Metropolitan's facilities, fee properties and/or easements, prior to the commencement of any construction work.

2. Plans, Parcel and Tract Maps

The following are Metropolitan's requirements for the identification of its facilities, fee properties, and/or easements on your plans, parcel maps and tract maps:

a. Metropolitan's fee properties and/or easements and its pipelines and other facilities must be fully shown and identified as Metropolitan's on all applicable plans.

b. Metropolitan's fee properties and/or easements must be shown and identified as Metropolitan's with the official recording data on all applicable parcel and tract maps.

c. Metropolitan's fee properties and/or easements and existing survey monuments must be dimensionally tied to the parcel or tract boundaries.

d. Metropolitan's records of surveys must be referenced on the parcel and tract maps.

3. Maintenance of Access Along Metropolitan's Rights-of-Way

a. Proposed cut or fill slopes exceeding 10 percent are normally not allowed within Metropolitan's fee properties or easements. This is required to facilitate the use of construction and maintenance equipment, and provide access to its aboveground and belowground facilities.

b. We require that 16-foot-wide commercial-type driveway approaches be constructed on both sides of all streets crossing Metropolitan's rights-of-way. Openings are required in any median island. Access ramps, if necessary, must be at least 16-feet-wide. Grades of ramps are normally not allowed to exceed 10 percent. If the slope of an access ramp must exceed 10 percent due to the topography, the ramp must be paved. We require a 40-foot-long level area on the driveway approach to access ramps where the ramp meets the street. At Metropolitan's fee properties, we may require fences and gates.

c. The terms of Metropolitan's permanent easement deeds normally preclude the building or maintenance of structures of any nature or kind within its easements, to ensure safety and avoid interference with operation and maintenance of Metropolitan's pipelines or other facilities. Metropolitan must have vehicular access along the easements at all times for inspection, patrolling, and for maintenance of the pipelines and other facilities on a routine basis. We require a 20-foot-wide clear zone around all above-ground facilities for this routine access. This clear zone should slope away from our facility on a grade not to exceed 2 percent. We must also have access along the easements with construction equipment. An example of this is shown on Figure 1.

d. The footings of any proposed buildings adjacent to Metropolitan's fee properties and/or easements must not encroach into the fee property or easement or impose additional loading on Metropolitan's pipelines or other facilities therein. A typical situation is shown on Figure 2. Prints of the detail plans of the footings for any building or structure adjacent to the fee property or easement must be submitted for our review and written approval as they pertain to the pipeline or other facilities therein. Also, roof eaves of buildings adjacent to the easement or fee property must not overhang into the fee property or easement area.

e. Metropolitan's pipelines and other facilities, e.g. structures, manholes, equipment, survey monuments, etc. within its fee properties and/or easements must be protected from damage by the easement holder on Metropolitan's property or the property owner where Metropolitan has an easement, at no expense to Metropolitan. If the facility is a cathodic protection station it shall be located prior to any grading or excavation. The exact location, description and way of protection shall be shown on the related plans for the easement area.

4. Easements on Metropolitan's Property

a. We encourage the use of Metropolitan's fee rights-of-way by governmental agencies for public street and utility purposes, provided that such use does not interfere with Metropolitan's use of the property, the entire width of the property is accepted into the agency's public street system and fair market value is paid for such use of the right-of-way.

b. Please contact the Director of Metropolitan's Right of Way and Land Division, telephone (213) 250-6302, concerning easements for landscaping, street, storm drain, sewer, water or other public facilities proposed within Metropolitan's fee properties. A map and legal description of the requested easements must be submitted. Also, written evidence must be submitted that shows the city or county will accept the easement for the specific purposes into its public system. The grant of the easement will be subject to Metropolitan's rights to use its land for water pipelines and related purposes to the same extent as if such grant had not been made. There will be a charge for the easement. Please note that, if entry is required on the property prior to issuance of the easement, an entry permit must be obtained. There will also be a charge for the entry permit.

5. Landscaping

Metropolitan's landscape guidelines for its fee properties and/or easements are as follows:

a. A green belt may be allowed within Metropolitan's fee property or easement.

b. All landscape plans shall show the location and size of Metropolitan's fee property and/or easement and the location and size of Metropolitan's pipeline or other facilities therein.

c. Absolutely no trees will be allowed within 15 feet of the centerline of Metropolitan's existing or future pipelines and facilities.

d. Deep-rooted trees are prohibited within Metropolitan's fee properties and/or easements. Shallow-rooted trees are the only trees allowed. The shallow-rooted trees will not be permitted any closer than 15 feet from the centerline of the pipeline, and such trees shall not be taller than 25 feet with a root spread no greater than 20 feet in diameter at maturity. Shrubs, bushes, vines, and ground cover are permitted, but larger shrubs and bushes should not be planted directly over our pipeline. Turf is acceptable. We require submittal of landscape plans for Metropolitan's prior review and written approval. (See Figure 3).

e. The landscape plans must contain provisions for Metropolitan's vehicular access at all times along its rights-of-way to its pipelines or facilities therein. Gates capable of accepting Metropolitan's locks are required in any fences across its rights-of-way. Also, any walks or drainage facilities across its access route must be constructed to AASHTO H-20 loading standards.

f. Rights to landscape any of Metropolitan's fee properties must be acquired from its Right of Way and Land Division. Appropriate entry permits must be obtained prior to any entry on its property. There will be a charge for any entry permit or easements required.

6. Fencing

Metropolitan requires that perimeter fencing of its fee properties and facilities be constructed of universal chain link, 6 feet in height and topped with 3 strands of barbed wire angled upward and outward at a 45 degree angle or an approved equal for a total fence height of 7 feet. Suitable substitute fencing may be considered by Metropolitan. (Please see Figure 5 for details).

7. Utilities in Metropolitan's Fee Properties and/or Easements or Adjacent to Its Pipeline in Public Streets

Metropolitan's policy for the alinement of utilities permitted within its fee properties and/or easements and street rights-of-way is as follows:

a. Permanent structures, including catch basins, manholes, power poles, telephone riser boxes, etc., shall not be located within its fee properties and/or easements.

b. We request that permanent utility structures within public streets, in which Metropolitan's facilities are constructed under the Metropolitan Water District Act, be placed as far from our pipeline as possible, but not closer than 5 feet from the outside of our pipeline.

c. The installation of utilities over or under Metropolitan's pipeline(s) must be in accordance with the requirements shown on the enclosed prints of Drawings Nos. C-11632 and C-9547. Whenever possible we request a minimum of one foot clearance between Metropolitan's pipe and your facility. Temporary support of Metropolitan's pipe may also be required at undercrossings of its pipe in an open trench. The temporary support plans must be reviewed and approved by Metropolitan.

d. Lateral utility crossings of Metropolitan's pipelines must be as perpendicular to its pipeline alinement as practical. Prior to any excavation our pipeline shall be located manually and any excavation within two feet of our pipeline must be done by hand. This shall be noted on the appropriate drawings.

e. Utilities constructed longitudinally within Metropolitan's rights-of-way must be located outside the theoretical trench prism for uncovering its pipeline and must be located parallel to and as close to its rights-of-way lines as practical.

f. When piping is jacked or installed in jacked casing or tunnel under Metropolitan's pipe, there must be at least two feet of vertical clearance between the bottom of Metropolitan's pipe and the top of the jacked pipe, jacked casing or tunnel. We also require that detail drawings of the shoring for the jacking or tunneling pits be submitted for our review and approval. Provisions must be made to grout any voids around the exterior of the jacked pipe, jacked casing or tunnel. If the piping is installed in a jacked casing or tunnel the annular space between the piping and the jacked casing or tunnel must be filled with grout.

g. Overhead electrical and telephone line requirements:

1) Conductor clearances are to conform to the California State Public Utilities Commission, General Order 95, for Overhead Electrical Line Construction or at a greater clearance if required by Metropolitan. Under no circumstances shall clearance be less than 35 feet.

2) A marker must be attached to the power pole showing the ground clearance and line voltage, to help prevent damage to your facilities during maintenance or other work being done in the area.

3) Line clearance over Metropolitan's fee properties and/or easements shall be shown on the drawing to indicate the lowest point of the line under the most adverse conditions including consideration of sag, wind load, temperature change, and support type. We require that overhead lines be located at least 30 feet laterally away from all above-ground structures on the pipelines.

4) When underground electrical conduits, 120 volts or greater, are installed within Metropolitan's fee property and/or easement, the conduits must be incased in a minimum of three inches of red concrete. Where possible, above ground warning signs must also be placed at the right-of-way lines where the conduits enter and exit the right-of-way.

h. The construction of sewerlines in Metropolitan's fee properties and/or easements must conform to the California Department of Health Services Criteria for the Separation of Water Mains and Sanitary Services and the local City or County Health Code Ordinance as it relates to installation of sewers in the vicinity of pressure waterlines. The construction of sewerlines should also conform to these standards in street rights-of- way.

i. Cross sections shall be provided for all pipeline crossings showing Metropolitan's fee property and/or easement limits and the location of our pipeline(s). The exact locations of the crossing pipelines and their elevations shall be marked on as-built drawings for our information.

j. Potholing of Metropolitan's pipeline is required if the vertical clearance between a utility and Metropolitan's pipeline is indicated on the plan to be one foot or less. If the indicated clearance is between one and two feet, potholing is suggested. Metropolitan will provide a representative to assists others in locating and identifying its pipeline. Two-working days notice is requested.

k. Adequate shoring and bracing is required for the full depth of the trench when the excavation encroaches within the zone shown on Figure 4.

l. The location of utilities within Metropolitan's fee property and/or easement shall be plainly marked to help prevent damage during maintenance or other work done in the area. Detectable tape over buried utilities should be placed a minimum of 12 inches above the utility and shall conform to the following requirements:

1) Water pipeline: A two-inch blue warning tape shall be imprinted with:

"CAUTION BURIED WATER PIPELINE"

2) Gas, oil, or chemical pipeline: A two-inch yellow warning tape shall be imprinted with:

"CAUTION BURIED _______ PIPELINE"

3) Sewer or storm drain pipeline: A two-inch green warning tape shall be imprinted with:

"CAUTION BURIED ______ PIPELINE"

4) Electric, street lighting, or traffic signals conduit: A two-inch red warning tape shall be imprinted with:

"CAUTION BURIED _______ CONDUIT"

5) Telephone, or television conduit: A two-inch orange warning tape shall be imprinted with:

"CAUTION BURIED _______ CONDUIT"

m. Cathodic Protection requirements:

1) If there is a cathodic protection station for Metropolitan's pipeline in the area of the proposed work, it shall be located prior to any grading or excavation. The exact location, description and manner of protection shall be shown on all applicable plans. Please contact Metropolitan's Corrosion Engineering Section, located at Metropolitan's F. E. Weymouth Softening and Filtration Plant, 700 North Moreno Avenue, La Verne, California 91750, telephone (714) 593-7474, for the locations of Metropolitan's cathodic protection stations.

2) If an induced-current cathodic protection system is to be installed on any pipeline crossing Metropolitan's pipeline, please contact Mr. Wayne E. Risner at (714) 593-7474 or (213) 250-5085. He will review the proposed system and determine if any conflicts will arise with the existing cathodic protection systems installed by Metropolitan.

3) Within Metropolitan's rights-of-way, pipelines and carrier pipes (casings) shall be coated with an approved protective coating to conform to Metropolitan's requirements, and shall be maintained in a neat and orderly condition as directed by Metropolitan. The application and monitoring of cathodic protection on the pipeline and casing shall conform to Title 49 of the Code of Federal Regulations, Part 195.

4) If a steel carrier pipe (casing) is used:

(a) Cathodic protection shall be provided by use of a sacrificial magnesium anode (a sketch showing the cathodic protection details can be provided for the designers information).

(b) The steel carrier pipe shall be protected with a coal tar enamel coating inside and out in accordance with AWWA C203 specification.

n. All trenches shall be excavated to comply with the CAL/OSHA Construction Safety Orders, Article 6, beginning with Sections 1539 through 1547. Trench backfill shall be placed in 8-inch lifts and shall be compacted to 95 percent relative compaction (ASTM D698) across roadways and through protective dikes. Trench backfill elsewhere will be compacted to 90 percent relative compaction (ASTM D698).

o. Control cables connected with the operation of Metropolitan's system are buried within streets, its fee properties and/or easements. The locations and elevations of these cables shall be shown on the drawings. The drawings shall note that prior to any excavation in the area, the control cables shall be located and measures shall be taken by the contractor to protect the cables in place.

p. Metropolitan is a member of Underground Service Alert (USA). The contractor (excavator) shall contact USA at 1-800-422-4133 (Southern California) at least 48 hours prior to starting any excavation work. The contractor will be liable for any damage to Metropolitan's facilities as a result of the construction.

8. Paramount Right

Facilities constructed within Metropolitan's fee properties and/or easements shall be subject to the paramount right of Metropolitan to use its fee properties and/or easements for the purpose for which they were acquired. If at any time Metropolitan or its assigns should, in the exercise of their rights, find it necessary to remove any of the facilities from the fee properties and/or easements, such removal and replacement shall be at the expense of the owner of the facility.

9. Modification of Metropolitan's Facilities

When a manhole or other of Metropolitan's facilities must be modified to accommodate your construction or reconstruction, Metropolitan will modify the facilities with its forces. This should be noted on the construction plans. The estimated cost to perform this modification will be given to you and we will require a deposit for this amount before the work is performed. Once the deposit is received, we will schedule the work. Our forces will coordinate the work with your contractor. Our final billing will be based on actual cost incurred, and will include materials, construction, engineering plan review, inspection, and administrative overhead charges calculated in accordance with Metropolitan's standard accounting practices. If the cost is less than the deposit, a refund will be made; however, if the cost exceeds the deposit, an invoice will be forwarded for payment of the additional amount.

10. Drainage

a. Residential or commercial development typically increases and concentrates the peak storm water runoff as well as the total yearly storm runoff from an area, thereby increasing the requirements for storm drain facilities downstream of the development. Also, throughout the year water from landscape irrigation, car washing, and other outdoor domestic water uses flows into the storm drainage system resulting in weed abatement, insect infestation, obstructed access and other problems. Therefore, it is Metropolitan's usual practice not to approve plans that show discharge of drainage from developments onto its fee properties and/or easements.

b. If water must be carried across or discharged onto Metropolitan's fee properties and/or easements, Metropolitan will insist that plans for development provide that it be carried by closed conduit or lined open channel approved in writing by Metropolitan. Also the drainage facilities must be maintained by others, e.g., city, county, homeowners association, etc. If the development proposes changes to existing drainage features, then the developer shall make provisions to provide for replacement and these changes must be approved by Metropolitan in writing.

11. Construction Coordination

During construction, Metropolitan's field representative will make periodic inspections. We request that a stipulation be added to the plans or specifications for notification of Mr. __________ of Metropolitan's Operations Services Branch, telephone (213) 250-____, at least two working days prior to any work in the vicinity of our facilities.

12. Pipeline Loading Restrictions

a. Metropolitan's pipelines and conduits vary in structural strength, and some are not adequate for AASHTO H-20 loading. Therefore, specific loads over the specific sections of pipe or conduit must be reviewed and approved by Metropolitan. However, Metropolitan's pipelines are typically adequate for AASHTO H-20 loading provided that the cover over the pipeline is not less than four feet or the cover is not substantially increased. If the temporary cover over the pipeline during construction is between three and four feet, equipment must restricted to that which

imposes loads no greater than AASHTO H-10. If the cover is between two and three feet, equipment must be restricted to that of a Caterpillar D-4 tract-type tractor. If the cover is less than two feet, only hand equipment may be used. Also, if the contractor plans to use any equipment over Metropolitan's pipeline which will impose loads greater than AASHTO H-20, it will be necessary to submit the specifications of such equipment for our review and approval at least one week prior to its use. More restrictive requirements may apply to the loading guideline over the San Diego Pipelines 1 and 2, portions of the Orange County Feeder, and the Colorado River Aqueduct. Please contact us for loading restrictions on all of Metropolitan's pipelines and conduits.

b. The existing cover over the pipeline shall be maintained unless Metropolitan determines that proposed changes do not pose a hazard to the integrity of the pipeline or an impediment to its maintenance.

13. Blasting

a. At least 20 days prior to the start of any drilling for rock excavation blasting, or any blasting, in the vicinity of Metropolitan's facilities, a two-part preliminary conceptual plan shall be submitted to Metropolitan as follows:

b. Part 1 of the conceptual plan shall include a complete summary of proposed transportation, handling, storage, and use of explosions.

c. Part 2 shall include the proposed general concept for blasting, including controlled blasting techniques and controls of noise, fly rock, airblast, and ground vibration.

14. CEQA Requirements

a. When Environmental Documents Have Not Been Prepared

1) Regulations implementing the California Environmental Quality Act (CEQA) require that Metropolitan have an opportunity to consult with the agency or consultants preparing any environmental documentation. We are required to review and consider the environmental effects of the project as shown in the Negative Declaration or Environmental Impact Report (EIR) prepared for your project before committing Metropolitan to approve your request.

2) In order to ensure compliance with the regulations implementing CEQA where Metropolitan is not the Lead Agency, the following minimum procedures to ensure compliance with the Act have been established:

a) Metropolitan shall be timely advised of any determination that a Categorical Exemption applies to the project. The Lead Agency is to advise Metropolitan that it and other agencies participating in the project have complied with the requirements of CEQA prior to Metropolitan's participation.

b) Metropolitan is to be consulted during the preparation of the Negative Declaration or EIR.

c) Metropolitan is to review and submit any necessary comments on the Negative Declaration or draft EIR.

d) Metropolitan is to be indemnified for any costs or liability arising out of any violation of any laws or regulations including but not limited to the California Environmental Quality Act and its implementing regulations.

b. When Environmental Documents Have Been Prepared

If environmental documents have been prepared for your project, please furnish us a copy for our review and files in a timely manner so that we may have sufficient time to review and comment. The following steps must also be accomplished:

1) The Lead Agency is to advise Metropolitan that it and other agencies participating in the project have complied with the requirements of CEQA prior to Metropolitan's participation.

2) You must agree to indemnify Metropolitan, its officers, engineers, and agents for any costs or liability arising out of any violation of any laws or regulations including but not limited to the California Environmental Quality Act and its implementing regulations.

15. Metropolitan's Plan-Review Cost

a. An engineering review of your proposed facilities and developments and the preparation of a letter response

giving Metropolitan's comments, requirements and/or approval that will require 8 man-hours or less of effort is typically performed at no cost to the developer, unless a facility must be modified where Metropolitan has superior rights. If an engineering review and letter response requires more than 8 man-hours of effort by Metropolitan to determine if the proposed facility or development is compatible with its facilities, or if modifications to Metropolitan's manhole(s) or other facilities will be required, then all of Metropolitan's costs associated with the project must be paid by the developer, unless the developer has superior rights.

b. A deposit of funds will be required from the developer before Metropolitan can begin its detailed engineering plan review that will exceed 8 hours. The amount of the required deposit will be determined after a cursory review of the plans for the proposed development.

c. Metropolitan's final billing will be based on actual cost incurred, and will include engineering plan review, inspection, materials, construction, and administrative overhead charges calculated in accordance with Metropolitan's standard accounting practices. If the cost is less than the deposit, a refund will be made; however, if the cost exceeds the deposit, an invoice will be forwarded for payment of the additional amount. Additional deposits may be required if the cost of Metropolitan's review exceeds the amount of the initial deposit.

16. Caution

We advise you that Metropolitan's plan reviews and responses are based upon information available to Metropolitan which was prepared by or on behalf of Metropolitan for general record purposes only. Such information may not be sufficiently detailed or accurate for your purposes. No warranty of any kind, either express or implied, is attached to the information therein conveyed as to its accuracy, and no inference should be drawn from Metropolitan's failure to comment on any aspect of your project. You are therefore cautioned to make such surveys and other field investigations as you may deem prudent to assure yourself that any plans for your project are correct.

17. Additional Information

GENERAL NOTES

1. All ferrous parts and materials shall be galvanized after fabrication
2. Adjustable tighteners shall be turnbuckle or equivalent, having minimum 6" take-up
3. Extension arms for barbed wire shall be steel, malleable iron or wrought iron and shall be attached to the top of the post with a ¼ inch round head rivet. The extension arms shall carry three wires each at approximately 5 inch centers in a plane approximately 45° from the vertical.
4. All gate hinges shall be heavy duty malleable iron or steel, industrial service type, 270 degree swing, of approved quality and design
5. Secure cap to post with ¼ inch round head rivet

Use	Type	Nominal Size (Inches)	Actual O.D. (Inches)	Weight per foot (Pounds)
End, corner, slope, pull and gate posts (for single gates 6 feet or less in width and double gates 12 feet or less in width) for chain link fabric 72 inches or higher	Pipe	2½	2.875	5.79
End, corner, slope, pull and gate posts (for single gates 6 feet or less in width and double gates 12 feet or less in width) for chain link fabric less than 72 inches height	Pipe	2	2.375	3.65
Gate posts for single swing gates over 6 feet but not over 13 feet in width and double swing gates over 12 feet but not over 26 feet in width.	Pipe	3½	4.000	9.11
Gate posts for single swing gates over 13 feet but not over 18 feet in width and double swing gates over 26 feet but not over 36 feet in width.	Pipe	6	6.625	18.97
Gate posts for single swing gates over 18 feet in width and double swing gates over 36 feet in width	Pipe	8	8.625	24.70
Line posts for chain link fabric 72 inches or higher	Pipe	2	2.375	3.65

Alhambra, CA 91803

RE: SCH# 2014081106 Enhanced Watershed Management Programs (EWMP) Program EIR, Los Angeles County.

Dear Mr. BeGell,

The Native American Heritage Commission (NAHC) has reviewed the Notice of Preparation (NOP) referenced above. The California Environmental Quality Act (CEQA) states that any project that causes a substantial adverse change in the significance of an historical resource, which includes archeological resources, is a significant effect requiring the preparation of an EIR (CEQA Guidelines 15064(b)). To comply with this provision the lead agency is required to assess whether the project will have an adverse impact on historical resources within the area of project effect (APE), and if so to mitigate that effect. To adequately assess and mitigate project-related impacts to archaeological resources, the NAHC recommends the following actions:

- ✓ Contact the appropriate regional archaeological Information Center for a record search. The record search will determine:
  - If a part or all of the area of project effect (APE) has been previously surveyed for cultural resources.
  - If any known cultural resources have already been recorded on or adjacent to the APE.
  - If the probability is low, moderate, or high that cultural resources are located in the APE.
  - If a survey is required to determine whether previously unrecorded cultural resources are present.
- ✓ If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
  - The final report containing site forms, site significance, and mitigation measurers should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum, and not be made available for pubic disclosure.
  - The final written report should be submitted within 3 months after work has been completed to the appropriate regional archaeological Information Center.
- ✓ Contact the Native American Heritage Commission for:
  - A Sacred Lands File Check. **USGS 7.5-minute quadrangle name, township, range, and section required**
  - A list of appropriate Native American contacts for consultation concerning the project site and to assist in the mitigation measures. **Native American Contacts List attached**
- ✓ Lack of surface evidence of archeological resources does not preclude their subsurface existence.
  - Lead agencies should include in their mitigation plan provisions for the identification and evaluation of accidentally discovered archeological resources, per California Environmental Quality Act (CEQA) Guidelines §15064.5(f). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American, with knowledge in cultural resources, should monitor all ground-disturbing activities.
  - Lead agencies should include in their mitigation plan provisions for the disposition of recovered cultural items that are not burial associated, which are addressed in Public Resources Code (PRC) §5097.98, in consultation with culturally affiliated Native Americans.
  - Lead agencies should include provisions for discovery of Native American human remains in their mitigation plan. Health and Safety Code §7050.5, PRC §5097.98, and CEQA Guidelines §15064.5(e), address the process to be followed in the event of an accidental discovery of any human remains and associated grave goods in a location other than a dedicated cemetery.

Sincerely,

Katy Sanchez

Subject: COMMENTS ON NOTICE OF PREPARATION FOR DRAFT PROGRAM EIR FOR EWMP'S FOR L.A. COUNTY

Dear DWP Representatives and Interested Parties,

I understand why no one but Rex Frankel attended the NOP hearing on September 9th in Marina Del Rey. You have no specific projects to analyze for environmental impacts. You are attempting to analyze the environmental impact of words, not specific actions. It is impossible to analyze the impacts of no stated physical projects, just as it is impossible to analyze those unstated projects' impacts on the environmental setting, ie., the proper baseline, because you have no specific locations for these unspecified projects. Thus all you can say is to analyze the entire county. The two most essential parts of an environmental analysis are missing here: specific projects and specific sites. You have the process all backwards here, and thus, commenting on this NOP in any specific manner is impossible.

Some background: In 2002, local governments settled lawsuits and agreed to consent decrees and promised to stop violations of bacterial health codes at our beaches by 2021. This agreement gave the public agencies an extension beyond the original deadline of 2013 but only if the projects created new parkland and river corridors that could catch and clean water before it fouled the beaches.

In 2006, L.A. City proposed its first big plan under this agreement, an Implementation Plan for the Santa Monica Bay Beaches watersheds. This plan was sent back for redrafting by the RWQCB as it only reached 2% of its target and thus, would not accomplish the goal in the consent decree.

Also in 2006, L.A. city proposed the Integrated Resource Plan which mainly focused on building 25 Hyperion-style urban runoff treatment plants which would have cost the average homeowner ratepayer $400 a month. This plan went nowhere.

You also were to include identifying a location(s) adjacent to the Oxford Lagoon Bird Conservation Area where a water treatment and recycling facility could be located. This was intended to be a mandatory component of the future, now current, Oxford Basin Multiuse Enhancement Project. The City of Los Angeles Thatcher Maintenance Yard is an ideal location for a facility that could serve Marina del Rey and the Oxford Triangle neighborhood. The Oxford Basin Project should not proceed, including Prop 84 funding, until a recycled water component is included as promised.

In 2012, the County Supervisors tried to quietly approve a $300 million per year property tax hike to build a non-existent list of runoff cleansing and capturing projects. Howls of opposition arose and that plan went nowhere. The public wanted to know what they were paying for.

Now, you are finally starting to design the cleanup plan. But how can you ask the public to weigh in on the scope of the environmental analysis of that plan, when your description of that plan contains no specifics? Your stated plan to defer the environmental analysis of specific project impacts to when each one is up for approval thus ignores the cumulative impacts and therefore is "piecemealing", by starting major momentum of a project that is composed of many necessary parts, yet deferring analysis and the controversy to a multitude of separate EIRs and CEQA documents and public hearings, all the while public input is diffused. We never get to weigh in on whether we like the complete plan because the Program EIR has no specifics to arouse concern and the real project discussion is delayed until much later in a way that requires massive efforts by the public to keep track of the success of the big plan.

The people who will pay for this plan want to see the specifics before you raise our taxes to pay for it. We want expanded and unpaved river corridor parks. We do not want the plan to include converting existing wetlands and wildlife habitat into pollution dumps and sumps. We want what we were promised, not a lame compromise that puts the cleanup burden on existing public lands, parks and house front yards. We want a complete plan for us to judge whether it will accomplish its promises and goals before you produce an EIR, not the other way around.

Please put me on the notification list for all actions relating to this project.

Respectfully submitted,

Douglas Fay

To: Begell, Gregg - Consultant
Subject: Comments LACFCD SCH 2014081106 NOP Enhanced Watershed Management Programs due 9.29.2014

The Project Description is listed on the State Clearinghouse site as:

The development of the EWMP will involve the evaluation and selection of multiple watershed control measures or best management practices (BMP) types including non-structural and distributed, centralized and regional structural BMPs. These BMPs will be implemented to meet compliance goals and strategies under the 2014 MS4 Permit. Structural BMPs involve the construction of a physical control measure to alter the hydrology and/or water quality of incoming stormwater or non-stormwater. The three major functions for structural BMPs are infiltration, water quality treatment, and storage. These are three categories of structural BMPs, defined by the runoff area treated by the BMP and the required retention volume in accordance with the Permit.

Comments:

Watershed control measures seems to be the emphasis, but that term is not defined. It seems to exclude Watershed Protection Management Measure in areas applicable to the Coastal Zone Act Reauthorization Amendments which recognizes the impact of land-use activities on estuaries, beaches, marine resources and the ocean. *Economically feasible measures* and *greatest degree of pollutant reduction achievable* are terms from that Act.

All receiving waters should be identified as to type and federal jurisdiction.

The project only allows a build environment in a watershed that should have natural lands, ecosystems and normal watershed characteristics including ambient water quality standards and the Southern California Bight.

Antidegradation procedures should be addressed.

Alternatives should be presented for non-structural or structural projects.

Surrounding land uses and settings should be addressed as should settings such as air space in relationship to bird migratory patterns. Ambient air quality should be included.

Other public agencies should be included. US Army Corps of Engineers plays a role in navigable waters as does Caltrans in its responsibility for NPDES compliance.

Private parties, such as Lauren Bon (Water Rights Draft Permit A032212) should be included.

Baselines should be presented.

There should be consistency including applications of the various General Plan and its Elements across jurisdictions. Infrastructure should be addressed including but not limited to age, condition and operations and maintenance.

Since federal regulations are enforced involving Clean Water Act Navigable Waters, we question why there is no NEPA document preparation.

Subject: COMMENTS ON NOTICE OF PREPARATION FOR DRAFT PROGRAM EIR FOR ENHANCED WATERSHED MANAGEMENT PROGRAMS FOR LA COUNTY

Grassroots Coalition submits its support of the comments made below by Mr. Rex Frankel.
Due on the 29th, GC was in transit from out of state and belatedly requests that its support of the comments below be part of
the record.
Please also note attachment of imagery of California.
Currently, the State Coastal Conservancy and the Dept of Fish and Wildlife have created a preordained outcome for the Ballona Wetlands Restoration. This outcome that has been determined to destroy the freshwater aquifers of Ballona (classified as potential drinking water) without the legal requirements of public participation and transparency of process that the millions of dollars of public bond money set forth in 2004. Such destructive plans to the watershed of the Ballona Valley should not be allowed to proceed.
The failure of the state to fully engage the public and provide accountability and transparency of process has led to the
dire situation of groundwater removal that CAlifornia and Ballona Wetlands have.

Hello Mr. BeGell,

I am a volunteer and member of the Arboretum located in Arcadia and would like to express my concern for the poor condition of the lake. As a volunteer docent I provide guided walks through the gardens as well as the lake perimeter. Visitors are dismayed and saddened to see the decline of such a great and wonderful treasure in the midst of our urban lifestyle. To have open space in our crowded communities is truly a rarity and must be preserved for future generations to appreciate. Please take my request for restoring the lake to heart.

Thank you for reading my message.

Mr. Carter,

Thank you for your email regarding Baldwin Lake at the LA Arboretum. I have added your contact information to the stakeholder list for the Rio Hondo/San Gabriel River Water Quality Group to receive notifications of future stakeholder meetings regarding the group's Enhanced Watershed Management Program (EWMP). We anticipate the next stakeholder meeting to occur in early to mid-Spring of next year to discuss the progress of the EWMP process with interested stakeholders. I have also forwarded your email to the group members for their consideration as they continue to discuss and develop their EWMP plan.

Thanks again for your comments.

Subject: Baldwin Lake/Enhanced Watershed Management Plan

Dear Mr. Begell and Ms. Osmena

This message is to encourage you to include the restoration of the Los Angeles County Arboretum's Baldwin Lake as a part of the Enhanced Watershed Management Plan for the Rio Hondo Watershed. To me, the following points emphasize the importance of this lake:

- It is one of the very few lakes easily accessible to the public in the San Gabriel Valley area, or even the Los Angeles basin
- It is an important environmental asset to the wildlife that is in or passes through the San Gabriel Valley
- It has historical significance regarding E.J. Baldwin's life as the founder of the city of Arcadia
- It has historical significance pertaining to the entertainment industry as a movie and TV location, and consequently is a tourist attraction
- It is geologically important and interesting as the last (I think) remaining sag pond along the Raymond earthquake fault

I encourage you to support restoring and including the lake in whatever watershed management plans evolve.

Regards,

Dale Carter
Arboretum volunteer and docent

Attached for your review and comment is the Notice of Preparation (NOP) for the Enhanced Watershed Management Programs (EWMP) Program EIR draft Environmental Impact Report (EIR).

Responsible agencies must transmit their comments on the scope and content of the NOP, focusing on specific information related to their own statutory responsibility, within 30 days of receipt of the NOP from the Lead Agency. This is a courtesy notice provided by the State Clearinghouse with a reminder for you to comment in a timely manner. We encourage other agencies to also respond to this notice and express their concerns early in the environmental review process.

Please direct your comments to:

Gregg BeGell
Los Angeles County Flood Control District
900 South Fremont Avenue, 11th Floor
Alhambra, CA 91803

with a copy to the State Clearinghouse in the Office of Planning and Research. Please refer to the SCH number noted above in all correspondence concerning this project.

If you have any questions about the environmental document review process, please call the State Clearinghouse at (916) 445-0613.

Sincerely,

Scott Morgan
Director, State Clearinghouse

Re: Restoration of Baldwin Lake

Dear Mr. BeGell:

I write to urge you to make the restoration of Baldwin Lake a high priority as you lead the effort to create the EWMP for the Rio Hondo Watershed.

The restoration of Baldwin Lake, including modifications to the depth of the lake and adaptation of Tule Pond as a bioswale, would enhance Baldwin Lake's water quality and give it a more significant water collection function while simultaneously enhancing its scenic, educational, and historic value at the center of the Los Angeles County Arboretum and Botanic Garden.

The restored lake would also provide an exceptional opportunity to educate the public about regional water management, home and community water conservation, and the role of the Raymond Basin and the other water resources in sustaining us. It is a key resource that serves over 330,000 visitors per year, including more than 16,000 elementary school students on field trips.

As a member of the board of the Los Angeles Arboretum Foundation, the County's non-profit partner in operating the Arboretum, I stand ready to help leverage public dollars to realize Baldwin Lake's unique potential to provide direct public benefit in a multitude of ways. It is the ideal project both to enhance the watershed function and serve the public with remarkable educational, ecological, and scenic benefits.

I respectfully submit that the County include the Baldwin Lake in the Rio Hondo Enhanced Watershed Management Plan.

Very truly yours,

Elizabeth Byrne Debreu
Board Member, Los Angeles Arboretum Foundation

Mr. Carter,

Thank you for your email regarding Baldwin Lake at the LA Arboretum. I have added your contact information to the stakeholder list for the Rio Hondo/San Gabriel River Water Quality Group to receive notifications of future stakeholder meetings regarding the group's Enhanced Watershed Management Program (EWMP). We anticipate the next stakeholder meeting to occur in early to mid-Spring of next year to discuss the progress of the EWMP process with interested stakeholders. I have also forwarded your email to the group members for their consideration as they continue to discuss and develop their EWMP plan.

Thanks again for your comments.

Subject: Baldwin Lake/Enhanced Watershed Management Plan

Dear Mr. Begell and Ms. Osmena

This message is to encourage you to include the restoration of the Los Angeles County Arboretum's Baldwin Lake as a part of the Enhanced Watershed Management Plan for the Rio Hondo Watershed. To me, the following points emphasize the importance of this lake:

- It is one of the very few lakes easily accessible to the public in the San Gabriel Valley area, or even the Los Angeles basin
- It is an important environmental asset to the wildlife that is in or passes through the San Gabriel Valley
- It has historical significance regarding E.J. Baldwin's life as the founder of the city of Arcadia
- It has historical significance pertaining to the entertainment industry as a movie and TV location, and consequently is a tourist attraction
- It is geologically important and interesting as the last (I think) remaining sag pond along the Raymond earthquake fault

I encourage you to support restoring and including the lake in whatever watershed management plans evolve.

Regards,

Dale Carter
Arboretum volunteer and docent

Subject: COMMENTS ON NOTICE OF PREPARATION FOR DRAFT PROGRAM EIR FOR ENHANCED WATERSHED MANAGEMENT PROGRAMS FOR L.A. COUNTY

You have no specific projects to analyze for environmental impacts. You are attempting to analyze the environmental impact of words, not specific actions. It is impossible to analyze the impacts of no stated physical projects, just as it is impossible to analyze those unstated projects' impacts on the environmental setting, ie., the proper baseline, because you have no specific locations for these unspecified projects. Thus all you can say is to analyze the entire county. The two most essential parts of an environmental analysis are missing here: specific projects and specific sites. You have the process all backwards here, and thus, commenting on this NOP in any specific manner is impossible.

Some background: In 2002, local governments settled lawsuits and agreed to consent decrees and promised to stop violations of bacterial health codes at our beaches by 2021. This agreement gave the public agencies an extension beyond the original deadline of 2013 but only if the projects created new parkland and river corridors that could catch and clean water before it fouled the beaches.

In 2006, L.A. City proposed its first big plan under this agreement, an Implementation Plan for the Santa Monica Bay Beaches watersheds. This plan was sent back for redrafting by the RWQCB as it only reached 2% of its target and thus, would not accomplish the goal in the consent decree.

Also in 2006, L.A. city proposed the Integrated Resource Plan which mainly focused on building 25 Hyperion-style urban runoff treatment plants which would have cost the average homeowner ratepayer $400 a month. This plan went nowhere.

In 2012, the County Supervisors tried to quietly approve a $300 million per year property tax hike to build a non-existent list of runoff cleansing and capturing projects. Howls of opposition arose and that plan went nowhere. The public wanted to know what they were paying for.

Now, you are finally starting to design the cleanup plan. But how can you ask the public to weigh in on the scope of the environmental analysis of that plan, when your description of that plan contains no specifics? Your stated plan to defer the environmental analysis of specific project impacts to when each one is up for approval thus ignores the cumulative impacts and therefore is "piecemealing", by starting major momentum of a project that is composed of many necessary parts, yet deferring analysis and the controversy to a multitude of separate EIRs and CEQA documents and public hearings, all the while public input is diffused. We never get to weigh in on whether we like the complete plan because the Program EIR has no specifics to arouse concern and the real project discussion is delayed until much later in a way that requires massive efforts by the public to keep track of the success of the big plan.

The people who will pay for this plan want to see the specifics before you raise our taxes to pay for it. We want expanded and unpaved river corridor parks. We do not want the plan to include converting existing wetlands and wildlife habitat into pollution dumps and sumps. We want what we were promised, not a lame compromise that puts the cleanup burden on existing public lands, parks and house front yards. We want a complete plan for us to judge whether it will accomplish its promises and goals before you produce an EIR, not the other way around.

Please put me on the notification list for all actions relating to this project. Thank you.

Re: **Enhanced Watershed Management Programs**
Notice of Preparation
IGR#140912FL
Vic.: LA/Various watersheds locations

Dear Mr. BeGell:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the above referenced project. The proposed project will prepare a Program Environmental Impact Report (PEIR) for the project identified, such as the 12 separate Enhanced Watershed Management Programs (EWMPs); it will be prepared as a collective effort among the Los Angeles County Flood Control District (LACFCD) and the applicable agencies in each respective EWMP.

We would like to remind you that storm water run-off is a sensitive issue for Los Angeles and Ventura counties. Please be mindful that projects need to be designed to discharge clean run-off water.

Any work to be performed within the State Right-of-way will need an Encroachment Permit and any transportation of heavy construction equipment and/or materials which requires the use of oversized-transport vehicles on State highways will require a Caltrans transportation permit. We recommend that large size truck trips be limited to off-peak commute periods. In addition, a truck/traffic construction management plan is needed for this project.

If you have any questions, please feel free to contact me at (213) 897-9140 or project coordinator Frances Lee at (213) 897-0673 or electronically at frances.lee@dot.ca.gov.

Sincerely,

Dianna Watson

Subject: COMMENTS ON NOTICE OF PREPARATION FOR DRAFT PROGRAM EIR FOR EWMP'S FOR L.A. COUNTY

Dear DWP Representatives and Interested Parties,

I understand why no one but Rex Frankel attended the NOP hearing on September 9th in Marina Del Rey. You have no specific projects to analyze for environmental impacts. You are attempting to analyze the environmental impact of words, not specific actions. It is impossible to analyze the impacts of no stated physical projects, just as it is impossible to analyze those unstated projects' impacts on the environmental setting, ie., the proper baseline, because you have no specific locations for these unspecified projects. Thus all you can say is to analyze the entire county. The two most essential parts of an environmental analysis are missing here: specific projects and specific sites. You have the process all backwards here, and thus, commenting on this NOP in any specific manner is impossible.

Some background: In 2002, local governments settled lawsuits and agreed to consent decrees and promised to stop violations of bacterial health codes at our beaches by 2021. This agreement gave the public agencies an extension beyond the original deadline of 2013 but only if the projects created new parkland and river corridors that could catch and clean water before it fouled the beaches.

In 2006, L.A. City proposed its first big plan under this agreement, an Implementation Plan for the Santa Monica Bay Beaches watersheds. This plan was sent back for redrafting by the RWQCB as it only reached 2% of its target and thus, would not accomplish the goal in the consent decree.

Also in 2006, L.A. city proposed the Integrated Resource Plan which mainly focused on building 25 Hyperion-style urban runoff treatment plants which would have cost the average homeowner ratepayer $400 a month. This plan went nowhere.

You also were to include identifying a location(s) adjacent to the Oxford Lagoon Bird Conservation Area where a water treatment and recycling facility could be located. This was intended to be a mandatory component of the future, now current, Oxford Basin Multiuse Enhancement Project. The City of Los Angeles Thatcher Maintenance Yard is an ideal location for a facility that could serve Marina del Rey and the Oxford Triangle neighborhood. The Oxford Basin Project should not proceed, including Prop 84 funding, until a recycled water component is included as promised.

In 2012, the County Supervisors tried to quietly approve a $300 million per year property tax hike to build a non-existent list of runoff cleansing and capturing projects. Howls of opposition arose and that plan went nowhere. The public wanted to know what they were paying for.

Now, you are finally starting to design the cleanup plan. But how can you ask the public to weigh in on the scope of the environmental analysis of that plan, when your description of that plan contains no specifics? Your stated plan to defer the environmental analysis of specific project impacts to when each one is up for approval thus ignores the cumulative impacts and therefore is "piecemealing", by starting major momentum of a project that is composed of many necessary parts, yet deferring analysis and the controversy to a multitude of separate EIRs and CEQA documents and public hearings, all the while public input is diffused. We never get to weigh in on whether we like the complete plan because the Program EIR has no specifics to arouse concern and the real project discussion is delayed until much later in a way that requires massive efforts by the public to keep track of the success of the big plan.

The people who will pay for this plan want to see the specifics before you raise our taxes to pay for it. We want expanded and unpaved river corridor parks. We do not want the plan to include converting existing wetlands and wildlife habitat into pollution dumps and sumps. We want what we were promised, not a lame compromise that puts the cleanup burden on existing public lands, parks and house front yards. We want a complete plan for us to judge whether it will accomplish its promises and goals before you produce an EIR, not the other way around.

Please put me on the notification list for all actions relating to this project.

RE: Public Comments: Notice of Preparation of a Draft Program Environmental Impact Report for Enhanced Watershed Management Programs

Dear Mr. BeGell:

Thank you for your efforts on the Notice of Preparation (NOP) for the Draft Program Environmental Impact Report for the Enhanced Watershed Management Programs (EWMP). I am confident your work will result in an informative and precise first tier final Program Environmental Report (PEIR) that is adequate, complete, and a good faith effort at full disclosure. The purpose of my comments, per Section 15168(c)(5) of the 2014 California Environmental Quality Act (CEQA) Statute and Guidelines, is to assist in the creation of a PEIR "that deals with the effects of the program as specifically and comprehensively as possible." Additionally, I realize that by doing "a good and detailed analysis of the program, many subsequent activities could be found to be within the scope of the project described in the program EIR, and no further environmental documents would be required."

I recognize and appreciate the herculean task involved for the Flood Control District and it is my sincere attempt to keep my comments relevant to the NOP. As such, I have attempted to draft my comments in a reader-friendly manner that identify the issue and propose a feasible solution(s). My comments only address the content of the NOP.

COMMENTS ON THE CONTENT OF THE NOP

1. Introduction

(Page No. 2) Please elaborate on the approval process. It would be informative if the role between the Los Angeles County Flood Control District (LACFCD) and the Los Angeles Regional Water Quality Control Board (LARWQCB) is further explained. The introduction does a good job explaining the steps involved in the EWMP process, but lacks clarity on the connection between the PEIR and LARWQCB. In particular, the sentence in mind states, "The LARWQCB is responsible for approval of the EWMPs in compliance with the MS4 Permit. Implementation of the EMWPs would occur following approval by the LARWQCB."

If the LARWQCB approves the EWMPs then who adopts the final PEIR? How does this PEIR fit into the responsibilities and mandates of the LARWQCB? All 12 of the EWMPs specify a date when the final EWMPs will be submitted (June 2015) to the LARWQCB, but no mention is made about the PEIR. Will the Lead Agency submit a EWMP packet on behalf of all 12 EWMPS and will the PEIR be a part of that packet? In addition, the NOI submitted to the LARWQCB by each Watershed Management Group (WMG) span two programs: the EWMPs 'and' Coordinated Integrated Monitoring Programs (CIMP). Does this PEIR also analyze the CIMP?

(Page 5) The opening paragraph states that "The primary approach to each of the EWMPs, as identified in the Draft Work Plans, includes identifying community-friendly, cost-effective methods of reducing urban runoff pollution and incorporating distributed and centralized structural and nonstructural watershed control measures for a multi-pollutant, multi-benefit approach." However, a review of all 12 EWMPs indicates that there was no cost/benefit analysis completed to substantiate the "cost-effectiveness" of these methods. Please identify any additional documentation supporting this claim.

(Page No. 5) Please clarify the use of the term "project." The final sentence in the first paragraph states, "The EWMPs will also evaluate multi-benefit regional projects that will retain (through infiltration or capture and reuse) the stormwater quality design volume (85th percentile storm for 24 hours) for the runoff from the contributing drainage area." Evaluating, I'm assuming site-level projects with regional benefits, at the PEIR level increases the dissonance between the goal of an EIR, as Section 21002.1(d) of the CEQA Statute states, "to consider the effects, both individual and collective, of all activities involved in a project," and the inherent collective geographic scope of the PEIR. I reviewed all 12 of the EWMPs and CIMPs. All 12 of the EWMPs do not identify projects currently in the works and no analysis is provided. The EWMPs seem to be evaluating plans and policies. Clarification of the term project would be beneficial in order to clearly understand the scope of this PEIR.

In addition, Section 21003 states that, "All persons and public agencies involved in the environmental review process be responsible for carrying out the process in the most efficient, expeditious manner in order to conserve the available financial, governmental, physical, and social resources with the objective that those resources may be better applied toward the mitigation of actual significant effects on the environment." In an effort to avoid the possibility of imposing an unfunded mandate on local cities and/or non-profit groups to undertake the second tier of this PEIR, the prudent use of public funds, and to promote a second tier CEQA process that is streamlined, I feel it would be beneficial to incorporate an analysis of current projects in the "pipeline."

This is critical because a review of the Greater Los Angeles County Integrated Regional Water Management (IRWM) database reveals over 190 water resources projects with regionally-significant benefits in the pipeline (Appendix A). The IRWM is a funding mechanism that encourages regional and local collaboration in the design of sustainable water resources infrastructure. To date, regional agencies, cities, non-profits and community representative groups, have collaborated and submitted project proposals of regional significance. Not all of these projects incorporate BMPs, per say (many do), and many have already been deemed categorically exempt. Additional vetting would need to take place in order to identify projects in-line with a low impact development ideal to collaborate and integrate compliance strategies that are based on a multi-pollutant approach with a focus on green infrastructure that maximize the retention and use of urban runoff as a resource for recharging aquifers and for irrigation and other uses.

If this nexus to analyze the impacts of regional projects is deemed reasonably feasible, further vetting of the projects would be required to understand their CEQA status. The question is who conducts this analysis, the LACFCD or the WMGs? This is important to figure out since Section 15152(b) of the CEQA Statute and Guidelines states that, "Tiering does not excuse the lead agency from adequately analyzing reasonably foreseeable significant environmental effects of the project and does not justify deferring such analysis to a later tier EIR or negative declaration."

(Page 5) The second paragraph states, "The PEIR will provide a program-level assessment of the overall permit compliance effort, focusing particularly on the structural watershed control measures proposed in each of the 12 EWMP areas." The project list on Appendix A identifies projects aiming to implement watershed control measures throughout Los Angeles County. Many of these projects are categorically exempt, have concluded their own environmental assessment or already constructed, however, the database (L.A. County Water Plan) where I retrieved these does not clearly indicate this information. Furthermore, none of the 12 EWMPs under consideration undertook this task to see how the proposed physical changes within their EWMP may or may not comply with the goals and objectives of their respective plans and policies. In an effort to, as Section 15152© describes, “avoid deferring the potential significant impacts to the second tier and possibly preventing the adequate identification of significant effects of the planning approval at hand,” it may be worthwhile to include this list in the PEIR analysis or have the WMGs revise their draft plans to incorporate this analysis.

1.1 Project Location

The description of the location could be augmented by elaborating on the environmental context. That is, adding maps identifying the tributaries, rivers, channels, etc. within the 12 watersheds could increase understanding of the local watershed functional characteristics. This detailed information is contained in most of the individual EWMPs. A reference to the website location of each respective EWMP could suffice.

Additionally, there is no reference to the types of soils that underlie the 12 EWMPS. The EWMPs provide a summary of these soil characteristics. A reference to the website location of each respective EWMP would be helpful. It is important to know the soil types and their respective infiltration rates in order to understand the feasibility of implementing certain structural BMPs. I realize that this may be covered in more depth under the Geology, Soils and Seismicity category, but there is no clear reference in the accompanying summary.

2. BACKGROUND

2.1 Stormwater/Water Quality

(Page 7) The first paragraph states, “Discharges may adversely affect receiving surface water quality with pollutants such as bacteria, nutrients (nitrogen and phosphorus), aluminum, copper, lead, zinc, diazinon, and cyanide. Aquatic toxicity, particularly during wet weather, is also a concern. Stormwater and non-stormwater discharges of debris and trash are also a pervasive water quality problem in the Los Angeles region." It would be beneficial to add the types of pollution stemming from the natural environment (non-anthropogenic), too. What kind of pollutants exists in the soils being eroded from natural settings and vacant parcels of land?

2.2 Total Maximum Daily Loads

The final sentence in this paragraph states, "LARWQCB and United States Environmental Protection Agency (USEPA) have established 33 TMDLs that identify Los Angeles County MS4 discharges as one of the pollutant sources causing or contributing to these water quality impairments." Please elaborate on the NPDES permit process. Is there a need for discretionary approval of the EWMPs or PEIR by the USEPA? Is there a need for the USEPA to issue a TMDL or other permit? If so, is there a need to do a concurrent Environmental Impact Statement?

2.3 MS4 Permit

(Page 8) This section states. "The intent of the EWMP is to comprehensively evaluate opportunities, within the participating Permittees' collective jurisdictional boundaries, for collaboration among Permittees and other partners on multi-benefit regional projects that, wherever feasible, retain non-stormwater runoff and also address flood control and/or water supply." Has the United States Army Corp of Engineers (USACE) been a part of these collaborative efforts? Are any of their existing infrastructure being directly or indirectly impacted by the EWMPs? Is there a need for discretionary approval of the EWMPs or PEIR by the USACE? Is there a need for the USACE to issue a permit related to the EWMPs? If so, is there a need to do a concurrent Environmental Impact Statement?

3. Enhanced Watershed Management Plans

As mentioned in the first comment under the Introduction heading, please elaborate on the approval process. Specifically, how the PEIR fits into the LARWQCBs approval of the EWMPs.

4.1.1 Regional Structural BMPs

The second paragraph states, "Opportunities for Regional BMPs will be identified and evaluated within and across subwatersheds, with focus on the multi-benefit potential for capture and reuse of wet-weather flows within variable drainage areas." What method and level of detail will be used to identify and evaluate BMPs? This paragraph goes on to state that, "Potential project locations may include areas with open spaces, whether they are within parks, large parking lots, or vacant spaces," indicating that a geographically site-specific analysis is appropriate under this PEIR. Collectively, there is over 190 regional projects identified in Appendix A being proposed by the various members of the WMGs. Based on the site-specific potential project locations stated above, is it feasible to include an analysis of the project list (Appendix A)?

5 Potential Environmental Impacts

This section (nor the LACoH2Osheds website) does not reference the completion of an Initial Study per Section 15063©(1). How did the Lead Agency identify the effects determined not to be significant? Is there an explanation of the reasons for determining that potentially significant effects would not be significant?

Sincerely,

Enrique Huerta, M.S.

Appendix A

Comment Letter to the LACFCD: Draft PEIR

	Project Name	Project Proponent	Project Description
1	25 mgd Sea Water Desalinization Plant in West Basin	West Basin Municipal Water District	The project proposes to construct a 25mgd Seawater Desalination Plant in West Basin's service area for potable water use. First, a Demonstration Plant will be necessary to evaluate the water quality performance and treatment stability, assess efficient energy recovery devices, optimize operational performance utilizing full scale process equipment, and to acquire the necessary data to achieve regulatory compliance and approval. West Basin and its partners will perform the full battery of water quality analyses to ensure that the demonstration project meets all Federal and State Drinking Water Standards. With the knowledge gained by operating the Demonstration Plant, West Basin expects to move forward with the planning, design, and construction of a full scale 25,000 AFY seawater desalination and education facility. West Basin anticipates operating the Demonstration Plant for at least two years while plans are being completed and finalized for the full-scale plant. The Demonstration Facility is in design.
2	AMR Conversion Project	Los Angeles County Waterworks District No. 29	The project consists of replacing the older water meters in Waterworks District No. 29. The District maintains approximately 7,700 water meters in Malibu and Topanga. About 40 percent of the meters are older than 15 years and 30 percent are 20 years or older. Meters lose accuracy over time, representing unaccounted water consumption in the District. Older meters typically under-measure water use. Replacing old water meters with automated meter reading (AMR) meters will yield timely, reliable water consumption patterns for detecting leaks and producing accurate customer bills. Higher bills with higher water use volumes will alert District customers about their water consumption habits, which is expected to encourage conservation. The current practice is to replace meters as the meters stop functioning or become unreadable. About 20% of the water meters in Malibu and Topanga have been replaced with AMR meters.
3	Agoura Road Gap Recycled Water System Expansion	Las Virgenes Municipal Water District	The project would extend the existing recycled water line along Agoura Road to serve existing customers who use potable water for landscape irrigation. Pipeline for this project is estimated at 9250 feet of 8 inch pipe and would connect to existing recycled water pipelines on both east and west sides of the extension. This would connect the gap that exists between Reyes Adobe Road and Lewis Road and improve the system hydraulics and reliability of service to customers. The estimated maximum daily demand for the Agoura Road Extension is 73 gpm.

4	Agua Amarga Lunada Canyon Habitat Restoration	Palos Verdes Peninsula Land Conservancy & City of Rancho Palos Verdes	Restore 20 acres at Agua Amarga Reserve, to provide habitat for the Federally threatened Coastal California gnatcatcher, the Federally endangered Palos Verdes blue butterfly, and the rare cactus wren. A one-mile trail in the Reserve continues to the coast. A year-round flow of water is discharged to the head of Lunada Canyon via a County of Los Angeles storm drain; the water then flows below ground through the canyon, the course of an historic blue line stream, and re-emerges at its confluence with Agua Amarga Canyon, also a blue-line stream that flows into the Santa Monica Bay. Invasive plant species provide little water infiltration and threaten to spread to the pristine lower canyon. The project will remove invasive plants, restore 18 acres of riparian and coastal sage scrub; install 2 acres of cactus scrub in highly degraded fuel modification areas; improve trails and add trail signage. Interpretive signage will educate hikers about creating wildlife-friendly fuel modification zone.
5	Aliso Creek - Limekiln Creek Restoration Project	City of Los Angeles Bureau of Sanitation Watershed Protection Division	Stormwater runoff would be diverted from Aliso Creek and from Limekiln Creek and stormwater runoff generated on site will be treated. In addition to providing water quality benefits, the project will result in the creation of self-sustaining riparian woodland vegetation and other re-vegetated areas, as well as providing recreational opportunities to area residents.The site has an area of approx. 11.8 acres and is currently used as a flood control facility, provides open space, and serves as part of Vanalden Park.Wet weather runoff and dry weather runoff from an approx. 12,091 acres that drains to the confluence of Aliso Creek and Limekiln Creek is going to be captured and conveyed to the project site for treatment.On-site generated flows will also be captured and treated.Proposed BMPs to treat captured water:Low flow channel diversions and pumping:Pre-screening devices, Bioswales, Vegetated detention basins, Landscaping with native upland and riparian species and Installing decomposed granite pathways.
6	Alondra Regional Park	Successor Agency, City of Compton	Alondra Regional Park is a multi-benefit project that serves disadvantaged communities while meeting IRWMP water management objectives. The entire site is currently an empty 18-acre lot owned by the City of Compton. This proposal is for Phase I of the project and covers 12 acres on the southern half of the parcel. The park provides recreational opportunities while improving surface water discharges into the Dominguez Channel Watershed. The project site sits low on the drainage area and will capture 1.5AF of stormwater. The park features a swale and daylighted stream to remove nutrients and pollutants that otherwise flow to local waterways. The large biofiltration field will reduce peak flows, improve water quality and occasionally serve as a recreational field. Surface water quality improvements would help the region meet requirements under the Municipal Separate Storm Sewer System Permit. The project also includes native shrubs and trees that will increase habitat for birds, butterfly species and mammals.

7	Alternative Decker Canyon Recycled Water Extension	Las Virgenes Municipal Water District	As with the original Decker Canyon Recycled Water Extension pipeline route, this alternate would primarily serve the Malibu Golf Club, the largest potable water user in the LVMWD service area. The 2007 Master Plan advocated that serving the golf course with recycled water could be an important strategy for relieving eventual stress on the potable system. The longer alternative route used in this project would also serve other demands along the way. In addition to the golf club, significant recycled water demands are expected to come from a new development (Triangle Ranch) and conversion of the existing Medea Valley ranchettes to recycled water use. The project is projected to deliver 459 AF/Y of recycled water, offsetting the same amount of potable demand that would occur if the extension were not built.
8	Andrews Park Subsurface Storage, Use and Infiltration Project	City of Redondo Beach	The project will consist of a diversion, conveyance pipes, a gross solids removal device (GSRD), an irrigation storage tank, and an infiltration gallery. Dry- and wet-weather flows will be diverted from the existing storm drain up to the maximum diversion flow rate and will then enter the storage tank through the conveyance pipe and GSRD. Once the storage tank reaches a depth of 1.5 feet, flows will be pumped to be used for onsite subsurface irrigation. When the storage volume of the irrigation tank reaches capacity, runoff will flow via an overflow pipe into the infiltration gallery, where the water will infiltrate subsurface soils. When continual flows fill the infiltration gallery and irrigation storage vault to storage capacity, diverted flows will back-up through the diversion piping and prevent additional flow diversion until capacity is freed up due to irrigation use and/or infiltration losses.
9	Arroyo Seco Confluence Gateway	Arroyo Seco Foundation	The Confluence Gateway Greenway Program will restore a 1/3 mile stretch of urban land alongside the Arroyo Seco, in the Arroyo Seco Scenic Byway Corridor, into a riparian greenway and open space park with native landscaping and a bicycle/pedestrian path. Not only would the project embody a first step in enhancing river access and recreation opportunities, it would provide a key link between the planned Los Angeles River greenways at the confluence and the Metro Rail station in the historic Lincoln Heights neighborhood, thus enabling light rail and bicycle access to the Arroyo Seco and the Los Angeles River. Ultimately, the Arroyo Seco greenway is envisioned to extend to South Pasadena, and this initial segment at the confluence would be an important hub in the regional river parkway and bicycle trail network.

10	Arroyo Seco North Branch Creek Daylighting	Arroyo Seco Foundation	Naturalize north branch storm drain and restore stream through Sycamore Grove Park. Primary Objectives Addressed by the Project: By re-establishing an urban stream, this project addresses water quality, riparian habitat restoration, groundwater recharge, flood management, and public education. The Sycamore Grove Park site is approximately 800 feet long and 400 feet wide. This 8-acre site is located in northeast Los Angeles and situated west of the SR-110 (). This site encompasses Sycamore Grove Park and is bounded by South Avenue 49 to the northeast, the SR-110 to the east, medium density residential uses to the south, and North Figueroa Street to the west. Sycamore Grove Park is a landscaped area consisting of a large lawn, playground, and parking area. The North Branch tributary is contained within a storm drain beneath Sycamore Grove Park.
11	Baldwin Lake	Los Angeles Arboretum Foundation	For centuries the waters of Baldwin Lake have sustained human endeavor. A rich historic site, its role began in the Native America period when springs and marsh, precursors to today's lake, supported nearby habitation. In the late 19th Century, Elias Jackson Baldwin chose the Lake as the center for agriculture and land development that shaped the establishment of the east San Gabriel Valley. Today, as the centerpiece of the Los Angeles County Arboretum, the Lake is an educational and scenic resource serving hundreds of thousands of visitors. Looking to the future, Baldwin Lake is envisioned as a model for community-based environmental stewardship and regional approaches to water management and conservation. Ideally located at the edge of the Raymond Basin aquifer, the Lake offers great potential as the nexus for water management and ground water recharge for the Arboretum's 127 acres, as well as the surrounding urban watershed. Educational programming that interprets the history of the Lake, particul
12	Ballona Creek Water Quality and Beach Improvement & Beneficial Use Project	City of Los Angeles Bureau of Sanitation Watershed Protection Division	Project is to implement the valuable uses of stormwater and to improve the water quality in Ballona Creek Watershed. Ballona Creek Low Flow Treatment Facility (LFTF), also known as North Outfall Treatment Facility (NOTF), is one of several projects proposed in Ballona Creek TMDL Implementation Plans for Bacteria, Metals, and Toxic Pollutants. The LFTF includes a 1 million gallon storage facility and has the capacity to treat up to 150 cfs, including screening of coarse, fine sediments, and disinfection with sodium hypochlorite. NOTF was constructed in 1987 by City of Los Angeles. The project proposes to use the existing treatment facility and construct a low-flow diversion structure in Ballona Creek Channel to divert and treat full dry-weather flow and partial wet-weather flow. 65 percent of Ballona Creek Watershed (85 square miles) is located upstream of the Project, with average dry-weather flows ranging from 14 to 25 cfs. Treatment will include coarse screens, sedimentation, filtration, and disinfection.

13	Be A Water Saver Water Conservation Program	City of Burbank Water and Power	The City of Burbank proposes to expand and increase water conservation through the expansion of a comprehensive indoor/outdoor financial incentive program that will result in immediate and sustainable water savings. The proposed Rebate Program to install 1,300 HE toilets, replace 300,000 square feet of turf with native landscapes, capture and reuse rain water 3 million gallons of rain water with rain barrels, and increase water conservation education efforts will save an estimated 500 AF of water annually. Grant funding for the proposed project will facilitate greater water savings by providing funding for greater levels of participation sooner than would be realized under typical funding efforts. Furthermore, these benefits will be realized faster by utilizing a proven system for conservation, a truly ready to proceed project. This project has the potential to double participation levels.
14	Bette Davis Park Water Recycling Project	LADWP	This project will consist of planning, design, and construction of approximately 4,625 feet of new 8-inch PVC and Ductile Iron recycled water pipeline to extend Glendale's recycled water distribution system from the intersection of Flower St. and Grandview Ave. to Bette Davis Park. Approximately 4,300 feet of pipeline will be installed within Glendale's city right of way. Through an Agreement with the City of Glendale, this project will be designed and constructed by Glendale's contractors and LADWP will reinburse Glendale for the costs. This will reduce the City's potable demand for non-potable uses. This project will offset up to 75 AFY of potable water with recycled water.
15	Big Dalton Sluiceway Rehabilitation	Los Angeles County Flood Control District	This project will upgrade the sluiceway to function as a low level outlet for regulating flows under high reservoir pressure and repair various facility components for the dam. The existing sluice gate at the upstream end is to be replaced with a new heavy duty hydraulic actuated gate, the sluiceway is to be lined with new pipe for the entire length, and a throttling valve is to be installed at the outlet. Storm releases through the sluiceway will reduce the rate of sediment accumulation and prevent sediment deposits at the face of the dam. Incoming sediments during storm flows could be routed through the reservoir to restore a more natural sediment transport system and maintain reservoir capacity
16	Big Dalton Spreading Grounds Improvements	Los Angeles County Flood Control District	The proposed project will modify and motorize the diversion box at Big Dalton Spreading Grounds to better control flows taken into the facility. The spreading basins will be reconfigured to increase percolation rates and storage capacity. An intake will be constructed from Little Dalton Diversion Channel so that additional storm flows can be diverted to the facility. A proposed outlet from Metropolitan Water District's PM-26 imported water line to the Little Dalton Diversion channel will enable imported water to be recharged at the spreading grounds.

17	Big Rock Bypass	Los Angeles County Waterworks District No. 29	The project consists of constructing three 18-inch diameter bypass water pipelines approximately 1,500 feet in length within the areas of active landslides along Pacific Coast Highway. This bypass will serve as a permanent replacement of an existing 30-inch diameter water pipeline that has experienced significant breaks resulting in large water loss. The proposed pipeline will be raised to a shallow trench and protected by a reinforced concrete box covered with steel plates to provide quick access if any leakage occurs. In addition, 18-inch Flexible Expansion Joints will also be installed at several locations with the areas of the active landslides to prevent damage or rupture of pipelines from ground movement.
18	Big Tujunga Dam Spillway Dam	Los Angeles County Flood Control District	Construction of a dam within the spillway at Big Tujunga Dam to increase the maximum storage capacity of the reservoir by approximately 705 acre-feet.
19	Big Tujunga Reservoir Sediment Removal	Los Angeles County Flood Control District	The 2009 Station Fire was the largest fire in Angeles National Forest recorded history and burned over 160,000 acres before containment on October 16, 2009. Approximately 87% of the watershed tributary to Big Tujunga Reservoir was affected. On average, a watershed will take five years or more to recover from a forest fire burn. During this time, increased amounts of debris production are anticipated from the denuded ground surface. Based on the 2010-11 storm season surveys, the total amount of sediment in the Big Tujunga Reservoir is approximately 2 million cubic yards. The County of Los Angeles Department of Public Works on behalf of the Los Angeles County Flood Control District proposes a sediment removal project to permanently remove up to 4.4 mcy of sediment from Big Tujunga Reservoir. Sediment will be excavated and transported using low emission trucks or conveyor belt to Maple Canyon Sediment Placement Site adjacent to Big Tujunga Dam. The project will be completed over four years starting in the sum
20	Boulevard Pit Stormwater Capture Project	LADWP	Acquire and develop Boulevard Pit into a multi-use retention and recharge facility to enhance stormwater conservation.
21	Branford Spreading Basin Cleanout and Pump	Los Angeles County Flood Control District	Branford Spreading Ground has very low percolation rates compared to the Tujunga Spreading Ground directly across the Tujunga Wash Channel. This project will install a pump from Branford Spreading Ground to direct water into the Tujunga Spreading Ground leading to more groundwater recharge. In addition, the project will clean out the clogging layer at the bottom of basin, which will also improve percolation rates.

22	Broadway Neighborhood Stormwater Greenway Project	City of Los Angeles Bureau of Sanitation	In partnership with Water Replenishment District of Southern California and it's "Regional and Distributed Stormwater Capture Feasibiltiy Study," the proposed project will design and implement stormwater Best Management Practices (BMPs) in the City of Los Angeles with the primary goals of TMDL compliance and stormwater infiltration. Three levels of BMPs will be developed; local parcel based Low Impact Development (LID) for 8 acres (60 residential parcels), neighborhood scale LID for 12 acres (3 residential streets and 2 blocks of commercial streets), and a sub-regional scale facility for 30 acres of mixed land uses. The local and neighborhood BMPs will capture and infiltrate all dry-weather flow and up to the ¾ inch storm. The sub regional BMP will capture up to the 2 inch storm for 30 acres. The sub regional BMP will also receive dry-weather flows from 228 acres of mixed land uses. Designs will be standardized to remote widespread implementation.
23	Bull Creek Stormwater Capture	Los Angeles County Flood Control District	Historical records show that an annual average of 625 acre-feet of water passes though Bull Creek. All flows from Bull Creek are lost to the ocean via the Los Angeles River. This project proposes conserving the lost water by diverting flows from the new LADWP facility using a rubber dam and conveying flows through a pipeline to Pacoima Spreading Grounds where it would be captured and recharge the local aquifier.
24	Bull CreekLos Angeles Reservoir Water Quality Improvement Project	LADWP	Plan, design, and construct stormwater conveyance facilities for compliance with the Enhanced Surface Water Treatment Rule. Facilities will be designed according to standards adopted by Department of Water Resources, Division of Safety of Dams. Improvements include widening a portion of the Bull Creek Extension Channel, realigning a section downstream of the widening, construction of a new diversion structure and overflow structure, and improvements to inlet structures. The Los Angeles Reservoir spillway will be removed from service. Proposed design facilitates a future stormwater capture program.
25	Burbank Partnership Water Recycling Project	LADWP	The Burbank Partnership Water Recycling Project involves the planning, design, and construction of approximately 27,000 feet of recycled water pipelines in the North Hollywood area. The three individual segments that comprise the project are the Chandler Boulevard Bike Path segment, the Whitnall Dog Park segment, and the North Hollywood Park segment. These segments will connect to Burbank's recycled water distribution system at three separate connection points and will be served by recycled water treated at the Burbank Water Reclamation Plant. This project is expected to offset up to 285 AFY of potable water with recycled water.

26	Burbank Water and Power Recycled Water System Expansion, Phase 3	City of Burbank Water and Power	The third phase of the City of Burbank's recent recycled water system expansion. As a result of previous phases, over 20 miles of recycled water pipelines have been installed resulting in the distribution of over 2,300 AF of recycled water annually; amounting to 13% of the City's water demand by the end of 2014. The City will continue expanding its recycled water distribution to offset potable water use in this phase by constructing two new recycled water pipelines known as, the LA Equestrian Center (LAEC) and the Naomi pipelines. The LAEC is located on the borders of the cities of Burbank and Los Angeles consisting of landscape areas, stables, offices and corrals; the latter requiring dust control with water trucks. The Naomi pipeline would primarily provide recycled water to a very large commercial data center and smaller customers. Completion of these pipelines will increase recycled water distribution by an estimated 61 AFY, resulting in a direct and immediate potable water savings of 61 AF annually.
27	C Marvin Brewer Desalter Brackish Groundwater Facility Expansion	West Basin Municipal Water District	The Desalter currently has the capacity to extract up to 2,000 acre-feet annually of brackish water. In 2003 the old wells at the site were decommissioned and construction began in 2005 for the first replacement well. The facility became operational in 2006 at a reduced capacity using the new well and the original RO unit. The facility has not been operating to its full capacity since it came online again in 2007 because of water quality issues. Funding is also needed to correct the water quality problems in order to get the facility to its full operating capacity. The proposed 500 AFY capacity expansion will allow the facility to become operational at its full capacity of 2,000 acre-feet per year. The site is already owned by California Water Service Co. and leased by West Basin and is developed as a desalting facility. The expansion will include the installation of a new production well, and the addition of an acid pretreatment unit and a reverse osmosis treatment unit on the existing site.
28	CITYWIDE STORM DRAIN CATCH BASIN CURB SCREENS	CITY of CALABASAS	Installation of storm drain catch basin curb screens at all applicable locations citywide. These screens are the stainless variety approved curb by Los Angeles County. The purpose of the curb screens is to stop trash from entering the catch basins which eventually discharge into both the Los Angeles River and Malibu Creek watersheds. By implementing this project, City of Calabasas will be in compliance with the Trash TMDL both for LA River and Malibu Creek watersheds. Based on studies done, reduction in trash and debris loadings will also reduce Bacterial and sediment loading in the watershed. By implementing the project, disadvantaged communities downstream of Calabasas in Los Angeles River will benefit from cleaner water. The scope work consists of measuring all catch basin openings, drafting RFP with detailed specifications, soliciting proposals from the list of Los Angeles County's approved venders, negotiating contract, implementation/construction, monitoring and reporting.

29	Caballero Creek & Los Angeles River Confluence Park	Mountains Recreation and Conservation Authority	The project will convert a 1.55 acre vacant parcel at the confluence of the Los Angeles River and Caballero Creek into a publicly-accessible natural park with habitat restoration, paths, site furnishings, water quality improvements, waterfront-access, and educational amentities. The design utilizes an innovative mixes low-tech mechanical and biological methods to filter and infiltrate storm waters increases regional water quality. The project creates a multi-benefit park that provides ecosystem services as well as cultural services, like recreation and eco-tourism. The project concept was developed in partnership with the City and County of Los Angeles who have committed to retain ownership, maintenance and operation responsibilities while allowing the Mountains Recreation and Conservation Authority (MRCA) to oversee design and construction. Nearby Reseda High School will monitor the project and use it for hands-on learning and community service opportunities.
30	Camino San Rafael Recycled Water Project	Glendale Water & Power	This project will consist of design and construction of approximately 8300 feet & 6000 feet of new 4"and 8" PVC recycled water pipeline, respectively. The project also consists of installing a two booster stations. This project will extend Glendale's recycled water distribution system to provide recycled water for common area irrigation to the Camino San Rafael Homes. This project will offset up to 90 AFY of potable water with recycled water. This will reduce the City's demand on potable water.
31	Carson Regional Water Recycling Project	West Basin Municipal Water District	The Carson Regional Water Recycling Expansion Project includes the expansion of the existing recycled water treatment facility and the construction of several laterals. This is a new demand on the system and will require expansion of treatment process capacity and conveyance to include; lateral pipelines, pump stations, treatment units, storage tanks, and waste management facilities. The BP Refinery requires single-pass reverse osmosis treatment units. BP Refinery is estimating a need of 2,100 acre-feet per year (AFY). The project will be further expanded to serve customers within the City of Los Angeles' jurisdiction for the refineries in the port area. The City will need recycled water to satisfy a use of 9,300 AFY. The City is in the preliminary design stage.

32	Chase Street Stormwater Greenway	City of Los Angeles Bureau of Sanitation, Watershed Protection Division	The Project will provide a street-end interpretive area on Bull Creek at Chase Street, and install a Stormwater Greenway along Chase Street from the eastern street end on the north side right-of-way to Hayvenhurst, and on the north and south right-of-way to Gothic. Vegetated planters in the parkways will capture and infiltrate street runoff, and will provide storm water filtration, and tree shading. The Bull Creek street-end will feature a native landscape as habitat and a recreational rest stop along the channel, and will provide an interpretive site for wildlife selected and supported by the specific native planting used in the project. A channel diversion from Bull Creek, with a pre-filter and lift station, will transfer runoff through a pipeline to a local Sod Farm where it will be used to irrigate up to 30-commercial acres. The project will integrate water conservation goals (LADWP), Storm water objectives (BOS), Economic enhancements to city property (LAWA), & public health and recreation benefits.
33	Chemical Study - Rio Hondo	Los Angeles County Flood Control District	This project will install a chemical treatment system at the Rio Hondo Coastal Spreading Grounds to remove sediment fines from the water and improve the percolation rates. A Percolation Optimization Investigation (POI) report was done by Montgomery Watson Harza (MWH) in 2003 to evaluate the County's spreading grounds and the impact of suspended solids on percolation rates. The report made a number of recommendations and the recommendations will be implemented at the Rio Hondo flood control facility. The project will install a coagulant chemical feeder and mixer at the grounds intake. This will allow the silt in the stormwater to coagulate and settle prior the cleaner water to flowing into spreading grounds. When this occurs, the spreading grounds will be able to percolate more water, thus conserving and recharging more groundwater.
34	Chevy Oaks Recycled Water Project	Glendale Water & Power	This project will consist of design and construction of approximately 920 feet, 1900 feet & 2100 feet of new 4", 8" and 12" PVC recycled water pipeline, respectively. The project also consists of installing a small booster station. This project will extend Glendale's recycled water distribution system to provide recycled water for irrigation to the Chevy Oaks Homes. This project will offset up to 30 AFY of potable water with recycled water. This will reduce the City's demand on potable water.
35	City of Carson Rain Barrel Give Away Phase II	City of Carson, Development Services Department, Engineering Services Division	At completion of a prior grant, a modest amount of money remained unused. With the acquiesence of the granting agency, the City of Carson purchased 16 rain barrels and set up a website lottery system in order to award them to residents. The response was overwhelming and with no advertising over 100 contestents were disappointed to not receive a rain barrel. This proposal would lead to the purchase of an additional 1,000 rainbarrels (depending on cost and grant amount) to restock the lottery reserves. Advertising and management of the program would be provided as part of the City of Carson grant match. More information on Fiskar Rain Barrels is available at http://www2.fiskars.com/Products/Yard-and-Garden/Rain-Barrel-Systems

36	City of Monrovia Fire Department - Training Center Water Recycling Project	Upper San Gabriel Valley Municipal Water District	Upper District in cooperation with the City and Fire Department of Monrovia are submitting this project incorporating both dry and wet weather runoff capture, treatment and storage for the new Regional Training Center. Once collected, the fire training water and the 85th percentile of a 24 hour storm event (as required by the City's MS4 permit) will be treated before being discharged into storage holding tanks which will store the treated water for future reuse by the training facility. The objective is to offset the use of potable water at the facility, eliminate storm water discharge and capture wet-weather storm water runoff. Finally, if the wet-weather event is larger than the 85th percentile, then provisions are being considered to treat as much of the additional wet-weather storm water runoff via a natural infiltration gallery (bioswale) before being discharged into the City's storm water system.
37	Cogswell Dam Inlet/Outlet Works Rehabilitation Project	Los Angeles County Flood Control District	This project will consist of refurbishment and upgrades to the outlet works, tunnels, and repair of various facility components at Cogswell Dam. The project will increase operational effectiveness for flood control and water conservation. The project will involve: a complete overhaul of the dam's entire inlet/outlet works; upgrade on the electrical control equipment; repair of downstream facilities; structural repairs on the upstream facing slab; security upgrades; and other various repairs essential for maintaining and operating a flood control facility. The overall project intent is to improve Cogswell Dam for maintaining dam safety, increased efficiency and reliability of flood control operations, and enhancement of water conservation efforts.
38	Cold Creek Diamond Acquisition	Mountains Restoration Trust	The project will acquire 4.87 acres (APN 4455-021-040) of natural undisturbed open space within the existing 1348-acre Cold Creek Preserve in the Santa Monica Mountains National Recreation Area. The acquisition is part of the state-funded Cold Creek Restoration Plan designed to acquire 539.06 acres to protect the wild and scenic, perennial Cold Creek, the habitat linkage between Topanga State Park and Malibu Creek State Park, the values of Los Angeles County's Significant Ecological Area #9, and a future venue for environmental education, research, and recreation. The area includes significant oak, sycamore, and willow communities, supports a range of wildlife including mountain lion, gray fox and raptors. The pure waters once supported the federally-listed endangered southern steelhead trout.
39	Conservation Budget Based Tiered Rate Structure	West Basin Municipal Water District	This project helps our customer agencies to develop a water conservation, budget-based rate structure for their customers. The project is beneficial to West Basin's cities and retail water agencies because it provides a pricing structure that will incentivizes its customers to conserve water. This pricing method has been used in other parts of the State and has been successsful at reducing water usage and reqarding those who do so with lower rates on their water bill.

40	Conversion of 237th Street Sump Tributary to Machado Lakes for Nutrient and Toxics TMDL BMPs	City of Torrance	This project would convert the 237th St. Sump (4.5 acre-feet) into a retention/infiltration basin BMP for Toxics and Nutrient TMDL compliance and provide open spaces for wildlife habitat. This project would install diversion structures that would divert the first 4.5 acre-feet of stormwater from a 71 acre tributary area away from the system tributary to Machado Lake (Wilmington Drain) to be retained and infiltrated in this basin. Trash screens would be installed at the catch basin in the watershed by a seperate project. During the dry season the basin would remain an open space for wild life and retain urban run-off and nutrients form 71 acres. By diverting stormwater back into this basin, the City and County storm drain systems would have more capacity during rain events. This project would also increase groundwater recharge.
41	Creek Crossings Repairs	Los Angeles County Waterworks District No. 29	This project consists of repairing corroded and deteriorated sections of aboveground pipeline and developing a Corrosion Monitoring, Control, and Maintenance Program. The Waterworks District 29 transmission water pipeline runs along the Pacific Coast Highway in Malibu. The proposed pipeline repairs are located at eight creek crossings attached to bridge structures. The project will significantly prevent future leaks and breaks in the main transmission pipeline which is the primary source of water supply for Malibu and Topanga. The development of a maintenance program is essential to maintaining water supply reliability for the region.
42	Deauville Distributed Water Reuse Project	City of Santa Monica	The project would harvest stormwater and brackish groundwater for high level treatment and non-potable use around the City, replacing the use of imported potable water. The City would install a 1.3 million gallon storage tank next to the Santa Monica Pier, Deauville lot, to harvest stormwater from the Pier sub-watershed during rain events and brackish groundwater during dry periods. The project would have an optional overflow to an infiltration gallery. A saline extraction well would be installed in sand next to the storage tank. The project would install pre-treatment catch basin inserts in the drainage area or a centralized hydrodynamic separator-screening device to remove trash and debris from stormwater. Modular nanofiltration (NF) and a saltwater reverse osmosis (RO) treatment systems at the site would treat these stored local water resources to high quality for various uses around the City in the existing recycled water system. All concentrated brine by-product would be sent to the sanitary sewer.
43	Decker Canyon Recycled Water System Extension	Las Virgenes Municipal Water District	The Decker Canyon recycled water pump station, pipeline, and tank would furnish recycled water primarily to Malibu Country Club Golf Course and Tract 47962-Sycamore Canyon Estates near the pump station location and other nearby ranchettes. The project would comprise a high-lift pump station, ~23,000 linear feet of pipeline along Westlake Blvd and Decker Canyon Rd, and a 60-foot diameter concrete tank near the corner of Decker Canyon Rd and Mulholland Hwy. Approximately 229 AF of recycled water per year would be used by this project.

44	Del Rey Lagoon Water Quality Improvement Project	City of Los Angeles Bureau of Sanitation Watershed Protection Division	The Del Rey Lagoon Water Quality Improvement Project proposes to improve water quality by reducing the source and amount of fecal indicator bacteria in the Del Rey Lagoon and surrounding waterbodies such as the Santa Monica Bay and Dockweiler Beach. Project components include stormdrain systems, vegetated swales, irrigation system retrofit, and drainage modifications. Education and outreach to the public will also be included in the project scope. The vegetated swales are designed to capture, retain, and treat runoff from the adjacent residential, transportation, and landscaped area during dry weather and partially during wet weather. Existing irrigation system will be retrofitted with a smart irrigation system to reduce excessive irrigation runoff, thereby conserving water and reducing flow. Catch basins and storm drains will be installed to capture and divert excess wet-weather flow into the sewer system. Project also includes a nature viewing deck and educational displays that explain local flora-fauna.
45	Demonstration Gardens at Los Angeles County Fire Department Stations	West Basin Municipal Water District	This project involves the installation of drought-tolerant demonstration gardens at a minimum of five fire stations throughout the West Basin service area. These gardens will replace turf and/or concrete areas that are directly in front of the fire stations in order to provide a maximum visibility to the public. The gardens will be utilizing drought-tolerant and/or native plants that will be designed by professional landscape designers that specialize in climate-appropriate plans and trees. The main goal is to provide water conservation and runoff reduction measures and secondarily to educate the public about the measures so that they can create these spaces at their own homes. West Basin strives to reduce demands by implementing conservation and education programs throughout the communities it serves. This project aims to continue implementing outdoor water conservation/education programs to influence the public to create these spaces in their own homes.
46	Devil's Gate Dam and Reservoir Water Conservation	Los Angeles County Flood Control District	This project proposes to conserve stormwater by holding a reservoir pool behind Devil's Gate Dam and diverting the water to Eaton Wash Dam and Eaton Wash Spreading Grounds for poststorm groundwater recharge. A pump will be installed in the Devil's Gate Dam reservoir and water will be pumped out and conveyed through over 26,000 feet of pipeline to Eaton Wash Dam where it can be held for recharge at downstream spreading ground facilities.

47	Devil's Gate Reservoir Sediment Removal and Management Project	Los Angeles County Flood Control District	The 2009 Station Fire was the largest fire in Angeles National Forest recorded history and burned over 160,000 acres in the San Gabriel Mountains. Approximately 68% of the watershed tributary to Devil's Gate Reservoir was burned and as a result of the storms that occurred in the two wet seasons after the fire, sediment levels in the reservoir increased by more than one million cubic yards. The County of Los Angeles Department of Public Works on behalf of the Los Angeles County Flood Control District is planning a sediment removal project of up to 4 million cubic yards. A sediment removal project from behind Devil's Gate Dam is vital to the health of the Arroyo Seco flood control system. The goal of this project is to restore flood control capacity and establish a reservoir configuration more suitable for routine maintenance activities. The project will last approximately 5 years with construction starting in 2014.
48	Dominguez Channel Greenway Phase III	Los Angeles County Flood Control District	The project will consist of development of a native landscaped greenway and bikeway/pedestrian trail along the north side of the Dominguez Channel, between Vermont Av and Normandie Av. The project will include the following: access/maintenance road improvements for the new/improved bikeway; AC repair and replacement, slurry seal, American Disability Act (ADA) access ramps and bikeway/pedestrian signage and striping. Landscaping improvements include landscaping using native and drought-tolerant plants, irrigation, as-needed fencing repair/replacement. Educational/interpretive signage will also be included along the bikeway/pedestrian trail. A study is also recommended to consider additional pedestrian crosswalks with street lamp lighting for added safety. The project is currently on hold until the LACFCD completes a study to address deficiencies in its levees.
49	Dominguez Channel Trash Reduction Via ARS Installation in the City of Carson, CA	City of Carson, Development Services Department, Engineering Services Division	This project would install Automatic Retracting Screens (ARS) in the 1800 Storm Drain Catch Basins in the City of Carson. The proponents favor ARS to collect trash at street level where the trash can be quickly and cost effectively collected weekly by the existing City Street Sweeping Contractor and eliminates the need for other more costly and difficult to maintain downstream trash control systems. This project anticipates the continuing development of local and state waterway trash control efforts and alleviates the need to develop these expensive federal, state and local requlatory mandates. In comparison to other "downstream" trash control systems, the maintenance status of ARS is easily assessed and visible to the public, which is then able to report those locations where maintenance is warranted. Since ARS systems are located in the street sweeper path, maintenance (trash collection) occurs weekly, the trash stays dry and is less subject to the degradation that generates other pollutants (bacteria).

50	Dominguez Gap Spreading Grounds West Basin Percolation Enhancement	Los Angeles County Flood Control District	The proposed project will increase the percolation within the spreading grounds facility in order to increase groundwater recharge. The preliminary scope includes removing between 5 to 10-feet of clay sediment or installing vertical trenches/drains through the poorly draining strata in the facility's west basin. Preliminary studies have been conducted including boring samples which will be used to further develop conceptual plans and estimate project benefits.
51	Duck Farm River Parkway Phase 1 - Water Enhancement Project	Watershed Conservation Authority	The Duck Farm River Park, once a natural floodplain, has been disconnected from the natural processes of the river for decades as a result of urbanization & flood management. The Project reintroduces natural systems through a riparian/pocket wetland/seasonal streambed that improves both habitat and collect, filter & infiltrate stormwater flows onsite, as well as stormwater from the adjacent freeway in collaboration w/Caltrans. The project will transition irrigation source (annually forecasted to require 19M gallons) from imported, highly processed potable water to either local groundwater or recycled water as its source of supply. The public will benefit by being reconnected to nature, the river, & from educational & interpretive programming possible at the site. This change in supply will reduce greenhouse gases & the parks carbon footprint. Outdoor classroom & interactive educational experiences with children will inspire local youth to learn more about our watershed, water conservation & sustainability
52	Eaton Spreading Grounds Intake Improvements	Los Angeles County Flood Control District	The project will increase the intake and storage capacity of the Eaton Wash Spreading Grounds facility. This will improve the facility's ability to recharge storm water into the groundwater basin, thus greatly increasing the sustainable local groundwater supply that is vital for the region. Los Angeles County Flood Control District will replace the vehicle access slab with a metal grate over the spreading grounds drop intake channel and replace the current diversion flashboards with an inflatable gate within the intake channel. These improvements in Eaton Wash Channel will better direct flows into Eaton Wash Spreading Grounds, thereby increasing its intake capacity. Basin 1 will be enlarged to increase the facility's storage capacity. The project will include improvements to the property along Sierra Madre Boulevard that will significantly improve the sustainability, aesthetics, and safety of the public walkway and street view. Two driveway entrances will be improved by increasing the gate set-back fu
53	Eaton Wash Dam Inlet/Outlet Works Rehabilitation Project	Los Angeles County Flood Control District	The dam outlet works rehabilitation project involves the removal of the existing outlet tower and gate house. Once these major components are removed, construction of a gate valve, debris racks, hydraulic power system with a block house, control systems, modification of the outlet works structure, and rehabilitation of the gate valves will commence. It will provide necessary erosion protection measures and improve water quality during low-flow releases from the dam.

54	Elysian Reservoir Water Quality Improvement Project	LADWP	LADWP is planning to cover the existing Elysian Reservoir in order to meet US EPA water quality regulations. In April 2012, the Board of Water & Power Commissioners certified the Environmental Impact Report and approved the floating cover alternative. The project will install a flexible membrane floating cover over the existing water surface. Also included are supporting infrastructure (piping, valves, liner) and site improvements (roadway paving, fencing). The reservoir will operate in the same manner, providing potable storage for the distribution system. Construction is anticipated to being by 2015. In conjuntion with the project, a Community Parks Fund was established by the Board of Commissioners. The fund is to be used for unspecified public purposes related to community parks. Best efforts will be made to locate enhancements primarily in the Elysian Park area, working together with the community and other City of Los Angeles agencies.
55	Encinal Emergency Connection	Los Angeles County Waterworks District No. 29	The project consists of adding a new emergency water source to supply Waterworks District No. 29 through a new interconnection along Encinal Canyon Road at the District boundary with Las Virgenes Municipal Water District (LVMWD). This interconnection would bring water from Metropolitan Water District of Southern California through LVMWD to provide additional supply to the District during emergencies.
56	Foothill Municipal Water District Recycled Water Project	Foothill Municipal Water District	Three hydrologic areas were studied for the development of satellite recycled water facilities. Foothill Municipal Water District (FMWD) is pursuing the construction of one facility near Berkshire Place in La Canada at this time. This project will treat wastewater using a membrane bioreactor and recharge the product into the groundwater basin using infiltration galleries underneath athletic fields for multi-beneficial uses. Cal Poly Pomona has partnered with FMWD and is developing a model that will also capture stormwater for recharge using the same infiltration galleries. A conservation and education component has also been added. Landscaping will be done to showcase drought tolerant plants at both the MBR site and school site. Tours will be available so that students may learn about stormwater capture, groundwater, recycled water, conservation and the watershed since the Arroyo Seco and Hahamongna Park are across the street. This 0.250 MGD plant will save enough energy annually for 80 homes in So. Cal.
57	Freeway Runoff Infiltration Demonstration Project	City of Santa Monica	Divert runoff from a section of the Santa Monica Freeway within the City of Santa Monica, treat and infiltrate within an area near the freeway, either a landscaped area or parking lot. The infiltration zones will be augered, if necessary to by-pass poor permeable soils. There will be pre-treatment before infiltration to remove trash, oil/grease, sediments. It will be a passive system, i.e. gravity-fed and low into the system. The treatment-infiltration areas will be areas either already with a storm drain in the area, or the creation of new ones to harvest the runoff. The goal will be to keep runoff out of the existing storm drains and out of the storm drain system.

58	Glen Oaks Storm Water Capture Project	Los Angeles Beautification Team	The Prop O funded phase I, the installation of six bio-swales and 4 dry wells. This watershed in an average rainfall year brings 300 acre feet of water to Glen Oaks Blvd. Phase I was completed in January 2014 and is currently capturing an estimated 30 acre feet per year leaving approximately 270 acre feet available for storm water capture. Phase II will consist of an additional eight dry wells for an estimated $625,000, plus the cost of City Services (Design fees, permits and over site), that will capture an additional 40 to 45 acre feet annually.
59	Glendale Narrows Habitat Enhancement Project	Council for Watershed Health	The Glendale Narrows Riverwalk will provide approximately one mile of multi-use recreation along the Los Angeles River. There are several invasive plant species that are prevalent adjacent to the Riverwalk in the Glendale Narrows area of the Los Angeles River. These invasive plant infestations jeopardize the improvements to water quality and degrade habitat for native aquatic, avian, reptile, amphibian, and invertebrate species. In collaboration with the City of Glendale Community Services & Parks Department, the Council for Watershed Health (Council) proposes to develop and manage a 3-4 year restoration project to map, control, and monitor invasive arundo and invasive palm trees in the Riverwalk project area in the Glendale Narrows sections of the Los Angeles River. A native plant propagation and replanting effort is also proposed to reestablish riparian plants.
60	Goldsworthy Groundwater Desalter Expansion	City of Torrance	The Goldsworthy Desalter (Desalter) treats water from the saline plume in the West Coast Groundwater Basin for drinking water. The brackish water is treated to meet or exceed municipal drinking water standards through the use of a reverse osmosis system. The existing Desalter produces approximately 2,000 acre-feet of potable drinking water per year. When the Desalter was originally constructed in 2002, it was designed for expansion to over 5000 acre-feet per year of drinking water. In 2012 the Water Replenishment District of Southern California had a Feasibility Study for the Expansion of Desalter prepared for and approved by the U. S. Bureau of Reclamation. The expansion would involve the installation of additional reverse osmosis treatment units, construction of two additional source water wells, transmission mains and related appurtenance. The project also diverts waste water away from Santa Monica Bay where discharges cause TMDL violations for bacteria.

61	Groundwater Reliability Improvement Project (GRIP)	Water Replenishment District of Southern California	The overarching goal of the GRIP Recycled Water Project is to offset the current use of imported water by providing up to 21,000 acre-feet per year (AFY) of recycled water as a reliable supply source for groundwater basin replenishment via the Montebello Forebay within a reasonable timeframe. The source for the recycled water will be the Los Angeles County Sanitation Districts' San Jose Creek Water Reclamation Plant (SJCWRP). Tertiary treated recycled water, advanced treated recycled water (microfiltration, reverse osmosis and advanced oxidation), or a combination of the two will be conveyed from the SJCWRP via an existing pipeline or possibly a new pipeline for recharge in the Central Groundwater Basin through the Montebello Forebay Spreading Grounds or potentially a new injection well field.
62	Groundwater System Improvement Study	LADWP	The purpose of the Groundwater System Imrovement Study (GSIS) is to perform an independent study to identify, characterize, and evaluate emerging water quality constituents for the San Fernando Basin (SFB). This will include a comprehensive analysis that will provide recommendations in developing short and long-term projects, including the design and construction of groundwater treatment facilities, to maximize the use of the groundwater supply in the SFB. As a part of the GSIS, the LADWP will be drilling approxinmately 26 new groundwater monitoring wells, and perform short-term monitoring of existing and new wells, in order to obtain supplemental water quality data necessary for planning the groundwater treatment afcilities in the SFB.
63	Groundwater Treatment Facilities	LADWP	Design and construction of groundwater treatment facilities in North Hollywwod, Rinaldi-Toluca and Tujunga Wellfields in the San Fernando Basin (SFB), with a treatment capacity of 122,900 acre-feet per year.
64	Hansen Dam Golf Course Water Recycling Project	LADWP	Construct 4,500 feet of 20" pipeline, pumping station and pipe support bridge to deliver recycled water from the Tillman Plant to the Hansen Dam Golf Course and other potential future users. Water will be pumped from the Hansen Tank.
65	Hansen Dam Water Conservation Project	Los Angeles County Flood Control District	Hansen Dam, situated adjacent to the Tujunga Wash Channel in the San Fernando Valley, is a vital part of flood control efforts in the Los Angeles River drainage basin. The primary purpose of Hansen Dam is flood control; however the opportunity exists to increase water conservation and water supply through increased water recharge upstream of the dam. The current operation of the dam allows for an average annual water conservation of 17,100 acre feet per year. The Water Conservation Project, which involves utilizing the existing Debris and Flood Control Pools for water conservation purposes by raising their respective maximum elevations to allow for additional water supply storage, would increase the dam's water conservation ability. This extra supply storage would allow for dam releases to downstream spreading grounds and other facilities fo
66	Hansen Dam Water Conservation and Supply	The River Project	Change management regime of Hansen Dam to focus on water conservation by maintaining a water conservation pool within the reservoir during and subsequent to flood season.

67	Headworks East Reservoir	LADWP	onstruction of a 110 MG buried reservoir along with a 4 MW hydroplant at the former Headworks Spreading Grounds to replace the storage capacity lost when Ivanhoe Reservoir is removed from service. Needed to bring the Water System into comliance with state and federal drinking water regulations by the regulatory deadline of November 2014

RE: Public Comment: Notice of Preparation of a Draft Program Environmental Impact Report for Enhanced Watershed Management Programs

Dear Mr. BeGell:

Thank you for your efforts on the Notice of Preparation (NOP) of the Draft Program Environmental Impact Report for the Enhanced Watershed Management Programs (EWMP). I am confident your work will result in an informative and precise first tier final Program Environmental Report (PEIR) that is adequate, complete, and a good faith effort at full disclosure. The purpose of my comments, per Section 15168(c)(5) of the 2014 California Environmental Quality Act (CEQA) Statute and Guidelines, is to assist in the creation of a PEIR "that deals with the effects of the program as specifically and comprehensively as possible." Additionally, I realize that by doing "a good and detailed analysis of the program, many subsequent activities could be found to be within the scope of the project described in the program EIR, and no further environmental documents would be required."

I recognize and appreciate the herculean task involved for the Flood Control District and it is my sincere attempt to keep my comments relevant to the NOP. As such, I have attempted to draft my comments in a reader-friendly manner that identify the issue and, wherever possible, propose a feasible solution. My comments only address the content of the NOP.

COMMENTS ON THE CONTENT OF THE NOP

1. Introduction

COMMENT No. 1: (Page No. 2) Please elaborate on the approval process. It would be informative if the role between the Los Angeles County Flood Control District (LACFCD) and the Los Angeles Regional Water Quality Control Board (LARWQCB) is further explained. The introduction does a good job explaining the steps involved in the EWMP process, but lacks clarity on the connection between the PEIR and LARWQCB. In particular, the sentence in mind states, “The LARWQCB is responsible for approval of the EWMPs in compliance with the MS4 Permit. Implementation of the EMWPs would occur following approval by the LARWQCB.”

If the LARWQCB approves the EWMPs then who adopts the final PEIR? How does this PEIR fit into the responsibilities and mandates of the LARWQCB? All 12 of the EWMPs specify a date when the final EWMPs will be submitted (June 2015) to the LARWQCB, but no mention is made about the PEIR. In addition, the NOI submitted to the LARWQCB by each Watershed Management Group (WMG) span two programs: the EWMPs ‘and’ Coordinated Integrated Monitoring Programs (CIMP). What is a CIMP? Does this PEIR also analyze the CIMP?

COMMENT No. 2: (Page 2) Project Location – Please elaborate as to whether the policies and plans of the EWMPs are targeting public property, public right-of-ways, land owned by the LACFCD and/or private property.

COMMENT No. 3: (Page 4, Figure 1 – Overview of EWMP Groups) The EWMP groups only identify a total of 47 participating cities (Permittees) throughout los Angeles County. However, there are 37 remaining Permittees throughout Los Angeles County that are not part of the

EWMP groups. Is this PEIR broad enough in scope for Los Angeles County? How will the remaining 37 cities meet compliance goals and strategies under the 2012 MS4 Permit?

COMMENT No. 4: (Page 5) The opening paragraph states that "The primary approach to each of the EWMPs, as identified in the Draft Work Plans, includes identifying community-friendly, cost-effective methods of reducing urban runoff pollution and incorporating distributed and centralized structural and nonstructural watershed control measures for a multi-pollutant, multi-benefit approach." However, a review of all 12 EWMPs indicates that there was no cost/benefit analysis or any modeling completed to substantiate the "cost-effectiveness" of these methods. Please identify any additional documentation supporting this claim.

COMMENT No. 5: (Page No. 5) This comment attempts to clarify the scope of the PEIR by asking, "how much information is enough?" Please clarify the use of the term "project." The final sentence in the first paragraph states, "The EWMPs will also evaluate multi-benefit regional projects that will retain (through infiltration or capture and reuse) the stormwater quality design volume (85th percentile storm for 24 hours) for the runoff from the contributing drainage area." Evaluating, site-level projects at the PEIR level creates a lack of agreement between the inherent programmatic and geographic scope of the PEIR and the site-specific goal of a single-project EIR, as Section 21002.1(d) of the CEQA Statute states, "to consider the effects, both individual and collective, of all activities involved in 'a' project." I reviewed all 12 of the EWMPs and CIMPs and they do not identify projects currently in the works and no analysis is provided. The EWMPs seem to be evaluating plans and policies. Clarification of the term project would be beneficial in order to clearly understand the scope of this PEIR.

Providing additional contrast is, Section 21003 which states, “All persons and public agencies involved in the environmental review process be responsible for carrying out the process in the most efficient, expeditious manner in order to conserve the available financial, governmental, physical, and social resources with the objective that those resources may be better applied toward the mitigation of actual significant effects on the environment.” In an effort to avoid the possibility of imposing an unfunded mandate on local cities and/or non-profit groups to undertake the second tier of this PEIR, the prudent use of public funds, and to promote a second tier CEQA process that is streamlined, I feel it would be beneficial to incorporate an analysis of current projects in the “pipeline.”

This is critical because a review of the Greater Los Angeles County Integrated Regional Water Management (IRWM) database reveals over 190 water resources projects with regionally-significant benefits in the pipeline (Attachment A). The IRWM is a funding mechanism that encourages regional and local collaboration in the design of sustainable water resources infrastructure. To date, regional agencies, cities, non-profits and community representative groups, have collaborated and submitted project proposals of regional significance. Not all of these projects incorporate BMPs, per say (many do), and many have already been deemed categorically exempt. Additional vetting would need to take place in order to identify projects in-line with a low impact development ideal to collaborate and integrate compliance strategies that are based on a multi-pollutant approach with a focus on green infrastructure that maximize the retention and use of urban runoff as a resource for recharging aquifers and for irrigation and other uses.

If this nexus to analyze the impacts of regional projects is deemed reasonably feasible, further vetting of the projects would be required to understand their CEQA status. The question is who conducts this analysis, the LACFCD or the WMGs? This is important to figure out since Section 15152(b) of the CEQA Statute and Guidelines states that, “Tiering does not excuse the lead agency from adequately analyzing reasonably foreseeable significant environmental effects of the project and does not justify deferring such analysis to a later tier EIR or negative declaration.”

COMMENT No. 6: (Page 5) The second paragraph states, “The PEIR will provide a program-level assessment of the overall permit compliance effort, focusing particularly on the structural watershed control measures proposed in each of the 12 EWMP areas.” The project list on Attachment A identifies projects aiming to implement watershed control measures throughout Los Angeles County. Many of these projects are categorically exempt, have concluded their own environmental assessment or already constructed, however, the database (L.A. Water Plan) where I retrieved these does not clearly indicate this information. Furthermore, none of the 12 EWMPs under consideration undertook this task to see how the proposed physical changes within their EWMP may or may not comply with the goals and objectives of their respective plans and policies. In an effort to, as Section 15152© describes, “avoid deferring the potential significant impacts to the second tier and possibly preventing the adequate identification of significant effects of the planning approval at hand,” it may be worthwhile to include this list of “reasonably foreseeable” regional projects in the PEIR analysis or have the WMGs revise their draft plans to incorporate this analysis.

1.1 Project Location

COMMENT No. 7: Refer to Comment No. 2. In addition, the description of the location could be augmented by elaborating on the baseline environmental context. Also, adding maps identifying the tributaries, rivers, channels, etc. within the 12 watersheds could increase understanding of the local watershed functional characteristics. The maps are contained in most of the individual EWMPs. A reference to the website location of each respective EWMP could suffice.

Additionally, there is no reference to the types of soils that underlie the 12 EWMPS. The EWMPs provide a summary of these soil characteristics. A reference to the website location of each respective EWMP would be helpful. It is important to know the soil types and their respective infiltration rates in order to understand the feasibility of implementing certain structural BMPs. I realize that this may be covered in more depth under the Geology, Soils and Seismicity category, but there is no clear reference in the accompanying summary.

2. BACKGROUND

2.1 Stormwater/Water Quality

COMMENT No. 8: (Page 7) The first paragraph states, “Discharges may adversely affect receiving surface water quality with pollutants such as bacteria, nutrients (nitrogen and phosphorus), aluminum, copper, lead, zinc, diazinon, and cyanide. Aquatic toxicity, particularly during wet weather, is also a concern. Stormwater and non-stormwater discharges of debris and trash are also a pervasive water quality problem in the Los Angeles region.” It would be beneficial to add the types of pollution stemming from the natural environment (non-anthropogenic), too. What kind of pollutants exists in the stormwater resulting from the erosion of soil from natural settings and undeveloped vacant parcels of land?

2.2 Total Maximum Daily Loads

COMMENT No. 9: A sentence in section reads, "A TMDL is defined as the "sum of the individual waste load allocations (WLAs) for point sources and load allocations for nonpoint sources and natural background" (40 CFR 130.2), such that the capacity of the water body to assimilate constituent loads (the loading capacity) is not exceeded." What currently happens when TMDLs are exceeded? Is there a monetary fine?

2.3 MS4 Permit

COMMENT No. 10: (Page 7) This section states, "The MS4 Permit identifies conditions, requirements, and programs that municipalities must comply with to protect regional water resources from adverse impacts associated with pollutants in stormwater and urban runoff." What currently happens if these conditions or requirements are not met by municipalities? Is there a monetary fine?

3. Enhanced Watershed Management Plans

COMMENT No. 11: As mentioned in the first comment under the Introduction heading, please elaborate on the approval process. Specifically, how the PEIR fits into the LARWQCBs approval of the EWMPs. Additionally, there's a sentence that states, "The 2012 MS4 Permit includes provisions that allow Permittees to voluntarily choose to implement a EWMP to achieve permit compliance with RWLs." How will permit compliance be verified and who will monitor compliance?

4.1.1 Regional Structural BMPs

COMMENT No. 12: The second paragraph states, "Opportunities for Regional BMPs will be identified and evaluated within and across subwatersheds, with focus on the multi-benefit potential for capture and reuse of wet-weather flows within variable drainage areas." What method and level of detail will be used to identify and evaluate BMPs? This paragraph goes on to state that, "Potential project locations may include areas with open spaces, whether they are within parks, large parking lots, or vacant spaces," indicating that a geographically site-specific analysis is appropriate under this PEIR. Collectively, there is over 190 regional projects identified in Attachment A being proposed by the various members of the WMGs. Based on the site-specific potential project locations stated above, is it feasible to include an analysis of the project list (Attachment A)?

5 Potential Environmental Impacts

COMMENT No. 13: This section (nor the LACoH2Osheds website) does not reference the completion of an Initial Study per Section 15063©(1), nor provide clarity as to what is not being decided. How did the Lead Agency identify the effects determined not to be significant? Is there an explanation of the reasons for determining that potentially significant effects would not be significant?

COMMENT No. 14: The sentence that states, "The PEIR will assess the physical changes to the environment that would likely result from the construction and operation of EWMP projects," does not reference assessing the physical changes that would result from 'maintenance' of said project(s).

COMMENT No. 15: Air Quality Category – In an effort to help identify California communities that are disproportionately burdened by multiple sources of pollution, this category should also consider evaluating the air quality data collected by the Office of Environmental Health Hazard Assessment's (OEHHA) California Communities Environmental Health Screening Tool Version 2.0 (CalEnviroScreen 2.0).

COMMENT No. 16: Hazards and Hazardous Materials – In an effort to help identify California communities that are disproportionately burdened by multiple sources of pollution, the following sentence, "Potential hazards will be evaluated and assessed by reviewing the data collected by the California State Water Resources Control Board (SWRCB) GeoTracker and the California Department of Toxic Substances Control (DTSC) Envirostor databases," should also consider evaluating the data collected by the OEHHA California Communities Environmental Health Screening Tool Version 2.0 (CalEnviroScreen 2.0).

COMMENT No. 17: POPULATION AND HOUSING/GROWTH INDUCEMENT – Assuming that not all cities have the staff or capacity to implement the objectives of the plans and policies of EWMPs, what are some of the unforeseen consequences of minimal to no implementation of BMPs or LID in communities/cities with low median household income? Will these cities bear an unfair burden of paying non-compliance fines?

Sincerely,

Enrique Huerta, M.S.

Attachment A

Reasonably Foreseeable Water Resources Projects in LA County - NOP: Draft PEIR, EWMP

	Project Name	Project Proponent	Project Description
1	25 mgd Sea Water Desalinization Plant in West Basin	West Basin Municipal Water District	The project proposes to construct a 25mgd Seawater Desalination Plant in West Basin's service area for potable water use. First, a Demonstration Plant will be necessary to evaluate the water quality performance and treatment stability, assess efficient energy recovery devices, optimize operational performance utilizing full scale process equipment, and to acquire the necessary data to achieve regulatory compliance and approval. West Basin and its partners will perform the full battery of water quality analyses to ensure that the demonstration project meets all Federal and State Drinking Water Standards. With the knowledge gained by operating the Demonstration Plant, West Basin expects to move forward with the planning, design, and construction of a full scale 25,000 AFY seawater desalination and education facility. West Basin anticipates operating the Demonstration Plant for at least two years while plans are being completed and finalized for the full-scale plant. The Demonstration Facility is in design.
2	AMR Conversion Project	Los Angeles County Waterworks District No. 29	The project consists of replacing the older water meters in Waterworks District No. 29. The District maintains approximately 7,700 water meters in Malibu and Topanga. About 40 percent of the meters are older than 15 years and 30 percent are 20 years or older. Meters lose accuracy over time, representing unaccounted water consumption in the District. Older meters typically under-measure water use. Replacing old water meters with automated meter reading (AMR) meters will yield timely, reliable water consumption patterns for detecting leaks and producing accurate customer bills. Higher bills with higher water use volumes will alert District customers about their water consumption habits, which is expected to encourage conservation. The current practice is to replace meters as the meters stop functioning or become unreadable. About 20% of the water meters in Malibu and Topanga have been replaced with AMR meters.
3	Agoura Road Gap Recycled Water System Expansion	Las Virgenes Municipal Water District	The project would extend the existing recycled water line along Agoura Road to serve existing customers who use potable water for landscape irrigation. Pipeline for this project is estimated at 9250 feet of 8 inch pipe and would connect to existing recycled water pipelines on both east and west sides of the extension. This would connect the gap that exists between Reyes Adobe Road and Lewis Road and improve the system hydraulics and reliability of service to customers. The estimated maximum daily demand for the Agoura Road Extension is 73 gpm.

4	Agua Amarga Lunada Canyon Habitat Restoration	Palos Verdes Peninsula Land Conservancy & City of Rancho Palos Verdes	Restore 20 acres at Agua Amarga Reserve, to provide habitat for the Federally threatened Coastal California gnatcatcher, the Federally endangered Palos Verdes blue butterfly, and the rare cactus wren. A one-mile trail in the Reserve continues to the coast. A year-round flow of water is discharged to the head of Lunada Canyon via a County of Los Angeles storm drain; the water then flows below ground through the canyon, the course of an historic blue line stream, and re-emerges at its confluence with Agua Amarga Canyon, also a blue-line stream that flows into the Santa Monica Bay. Invasive plant species provide little water infiltration and threaten to spread to the pristine lower canyon. The project will remove invasive plants, restore 18 acres of riparian and coastal sage scrub; install 2 acres of cactus scrub in highly degraded fuel modification areas; improve trails and add trail signage. Interpretive signage will educate hikers about creating wildlife-friendly fuel modification zone.
5	Aliso Creek - Limekiln Creek Restoration Project	City of Los Angeles Bureau of Sanitation Watershed Protection Division	Stormwater runoff would be diverted from Aliso Creek and from Limekiln Creek and stormwater runoff generated on site will be treated. In addition to providing water quality benefits, the project will result in the creation of self-sustaining riparian woodland vegetation and other re-vegetated areas, as well as providing recreational opportunities to area residents.The site has an area of approx. 11.8 acres and is currently used as a flood control facility, provides open space, and serves as part of Vanalden Park.Wet weather runoff and dry weather runoff from an approx. 12,091 acres that drains to the confluence of Aliso Creek and Limekiln Creek is going to be captured and conveyed to the project site for treatment.On-site generated flows will also be captured and treated.Proposed BMPs to treat captured water:Low flow channel diversions and pumping:Pre-screening devices, Bioswales, Vegetated detention basins, Landscaping with native upland and riparian species and Installing decomposed granite pathways.
6	Alondra Regional Park	Successor Agency, City of Compton	Alondra Regional Park is a multi-benefit project that serves disadvantaged communities while meeting IRWMP water management objectives. The entire site is currently an empty 18-acre lot owned by the City of Compton. This proposal is for Phase I of the project and covers 12 acres on the southern half of the parcel. The park provides recreational opportunities while improving surface water discharges into the Dominguez Channel Watershed. The project site sits low on the drainage area and will capture 1.5AF of stormwater. The park features a swale and daylighted stream to remove nutrients and pollutants that otherwise flow to local waterways. The large biofiltration field will reduce peak flows, improve water quality and occasionally serve as a recreational field. Surface water quality improvements would help the region meet requirements under the Municipal Separate Storm Sewer System Permit. The project also includes native shrubs and trees that will increase habitat for birds, butterfly species and mammals.

7	Alternative Decker Canyon Recycled Water Extension	Las Virgenes Municipal Water District	As with the original Decker Canyon Recycled Water Extension pipeline route, this alternate would primarily serve the Malibu Golf Club, the largest potable water user in the LVMWD service area. The 2007 Master Plan advocated that serving the golf course with recycled water could be an important strategy for relieving eventual stress on the potable system. The longer alternative route used in this project would also serve other demands along the way. In addition to the golf club, significant recycled water demands are expected to come from a new development (Triangle Ranch) and conversion of the existing Medea Valley ranchettes to recycled water use. The project is projected to deliver 459 AF/Y of recycled water, offsetting the same amount of potable demand that would occur if the extension were not built.
8	Andrews Park Subsurface Storage, Use and Infiltration Project	City of Redondo Beach	The project will consist of a diversion, conveyance pipes, a gross solids removal device (GSRD), an irrigation storage tank, and an infiltration gallery. Dry- and wet-weather flows will be diverted from the existing storm drain up to the maximum diversion flow rate and will then enter the storage tank through the conveyance pipe and GSRD. Once the storage tank reaches a depth of 1.5 feet, flows will be pumped to be used for onsite subsurface irrigation. When the storage volume of the irrigation tank reaches capacity, runoff will flow via an overflow pipe into the infiltration gallery, where the water will infiltrate subsurface soils. When continual flows fill the infiltration gallery and irrigation storage vault to storage capacity, diverted flows will back-up through the diversion piping and prevent additional flow diversion until capacity is freed up due to irrigation use and/or infiltration losses.
9	Arroyo Seco Confluence Gateway	Arroyo Seco Foundation	The Confluence Gateway Greenway Program will restore a 1/3 mile stretch of urban land alongside the Arroyo Seco, in the Arroyo Seco Scenic Byway Corridor, into a riparian greenway and open space park with native landscaping and a bicycle/pedestrian path. Not only would the project embody a first step in enhancing river access and recreation opportunities, it would provide a key link between the planned Los Angeles River greenways at the confluence and the Metro Rail station in the historic Lincoln Heights neighborhood, thus enabling light rail and bicycle access to the Arroyo Seco and the Los Angeles River. Ultimately, the Arroyo Seco greenway is envisioned to extend to South Pasadena, and this initial segment at the confluence would be an important hub in the regional river parkway and bicycle trail network.

10	Arroyo Seco North Branch Creek Daylighting	Arroyo Seco Foundation	Naturalize north branch storm drain and restore stream through Sycamore Grove Park. Primary Objectives Addressed by the Project: By re-establishing an urban stream, this project addresses water quality, riparian habitat restoration, groundwater recharge, flood management, and public education. The Sycamore Grove Park site is approximately 800 feet long and 400 feet wide. This 8-acre site is located in northeast Los Angeles and situated west of the SR-110 (). This site encompasses Sycamore Grove Park and is bounded by South Avenue 49 to the northeast, the SR-110 to the east, medium density residential uses to the south, and North Figueroa Street to the west. Sycamore Grove Park is a landscaped area consisting of a large lawn, playground, and parking area. The North Branch tributary is contained within a storm drain beneath Sycamore Grove Park.
11	Baldwin Lake	Los Angeles Arboretum Foundation	For centuries the waters of Baldwin Lake have sustained human endeavor. A rich historic site, its role began in the Native America period when springs and marsh, precursors to today's lake, supported nearby habitation. In the late 19th Century, Elias Jackson Baldwin chose the Lake as the center for agriculture and land development that shaped the establishment of the east San Gabriel Valley. Today, as the centerpiece of the Los Angeles County Arboretum, the Lake is an educational and scenic resource serving hundreds of thousands of visitors. Looking to the future, Baldwin Lake is envisioned as a model for community-based environmental stewardship and regional approaches to water management and conservation. Ideally located at the edge of the Raymond Basin aquifer, the Lake offers great potential as the nexus for water management and ground water recharge for the Arboretum's 127 acres, as well as the surrounding urban watershed. Educational programming that interprets the history of the Lake, particul
12	Ballona Creek Water Quality and Beach Improvement & Beneficial Use Project	City of Los Angeles Bureau of Sanitation Watershed Protection Division	Project is to implement the valuable uses of stormwater and to improve the water quality in Ballona Creek Watershed. Ballona Creek Low Flow Treatment Facility (LFTF), also known as North Outfall Treatment Facility (NOTF), is one of several projects proposed in Ballona Creek TMDL Implementation Plans for Bacteria, Metals, and Toxic Pollutants. The LFTF includes a 1 million gallon storage facility and has the capacity to treat up to 150 cfs, including screening of coarse, fine sediments, and disinfection with sodium hypochlorite. NOTF was constructed in 1987 by City of Los Angeles. The project proposes to use the existing treatment facility and construct a low-flow diversion structure in Ballona Creek Channel to divert and treat full dry-weather flow and partial wet-weather flow. 65 percent of Ballona Creek Watershed (85 square miles) is located upstream of the Project, with average dry-weather flows ranging from 14 to 25 cfs. Treatment will include coarse screens, sedimentation, filtration, and disinfection.

13	Be A Water Saver Water Conservation Program	City of Burbank Water and Power	The City of Burbank proposes to expand and increase water conservation through the expansion of a comprehensive indoor/outdoor financial incentive program that will result in immediate and sustainable water savings. The proposed Rebate Program to install 1,300 HE toilets, replace 300,000 square feet of turf with native landscapes, capture and reuse rain water 3 million gallons of rain water with rain barrels, and increase water conservation education efforts will save an estimated 500 AF of water annually. Grant funding for the proposed project will facilitate greater water savings by providing funding for greater levels of participation sooner than would be realized under typical funding efforts. Furthermore, these benefits will be realized faster by utilizing a proven system for conservation, a truly ready to proceed project. This project has the potential to double participation levels.
14	Bette Davis Park Water Recycling Project	LADWP	This project will consist of planning, design, and construction of approximately 4,625 feet of new 8-inch PVC and Ductile Iron recycled water pipeline to extend Glendale's recycled water distribution system from the intersection of Flower St. and Grandview Ave. to Bette Davis Park. Approximately 4,300 feet of pipeline will be installed within Glendale's city right of way. Through an Agreement with the City of Glendale, this project will be designed and constructed by Glendale's contractors and LADWP will reinburse Glendale for the costs. This will reduce the City's potable demand for non-potable uses. This project will offset up to 75 AFY of potable water with recycled water.
15	Big Dalton Sluiceway Rehabilitation	Los Angeles County Flood Control District	This project will upgrade the sluiceway to function as a low level outlet for regulating flows under high reservoir pressure and repair various facility components for the dam. The existing sluice gate at the upstream end is to be replaced with a new heavy duty hydraulic actuated gate, the sluiceway is to be lined with new pipe for the entire length, and a throttling valve is to be installed at the outlet. Storm releases through the sluiceway will reduce the rate of sediment accumulation and prevent sediment deposits at the face of the dam. Incoming sediments during storm flows could be routed through the reservoir to restore a more natural sediment transport system and maintain reservoir capacity
16	Big Dalton Spreading Grounds Improvements	Los Angeles County Flood Control District	The proposed project will modify and motorize the diversion box at Big Dalton Spreading Grounds to better control flows taken into the facility. The spreading basins will be reconfigured to increase percolation rates and storage capacity. An intake will be constructed from Little Dalton Diversion Channel so that additional storm flows can be diverted to the facility. A proposed outlet from Metropolitan Water District's PM-26 imported water line to the Little Dalton Diversion channel will enable imported water to be recharged at the spreading grounds.

17	Big Rock Bypass	Los Angeles County Waterworks District No. 29	The project consists of constructing three 18-inch diameter bypass water pipelines approximately 1,500 feet in length within the areas of active landslides along Pacific Coast Highway. This bypass will serve as a permanent replacement of an existing 30-inch diameter water pipeline that has experienced significant breaks resulting in large water loss. The proposed pipeline will be raised to a shallow trench and protected by a reinforced concrete box covered with steel plates to provide quick access if any leakage occurs. In addition, 18-inch Flexible Expansion Joints will also be installed at several locations with the areas of the active landslides to prevent damage or rupture of pipelines from ground movement.
18	Big Tujunga Dam Spillway Dam	Los Angeles County Flood Control District	Construction of a dam within the spillway at Big Tujunga Dam to increase the maximum storage capacity of the reservoir by approximately 705 acre-feet.
19	Big Tujunga Reservoir Sediment Removal	Los Angeles County Flood Control District	The 2009 Station Fire was the largest fire in Angeles National Forest recorded history and burned over 160,000 acres before containment on October 16, 2009. Approximately 87% of the watershed tributary to Big Tujunga Reservoir was affected. On average, a watershed will take five years or more to recover from a forest fire burn. During this time, increased amounts of debris production are anticipated from the denuded ground surface. Based on the 2010-11 storm season surveys, the total amount of sediment in the Big Tujunga Reservoir is approximately 2 million cubic yards. The County of Los Angeles Department of Public Works on behalf of the Los Angeles County Flood Control District proposes a sediment removal project to permanently remove up to 4.4 mcy of sediment from Big Tujunga Reservoir. Sediment will be excavated and transported using low emission trucks or conveyor belt to Maple Canyon Sediment Placement Site adjacent to Big Tujunga Dam. The project will be completed over four years starting in the sum
20	Boulevard Pit Stormwater Capture Project	LADWP	Acquire and develop Boulevard Pit into a multi-use retention and recharge facility to enhance stormwater conservation.
21	Branford Spreading Basin Cleanout and Pump	Los Angeles County Flood Control District	Branford Spreading Ground has very low percolation rates compared to the Tujunga Spreading Ground directly across the Tujunga Wash Channel. This project will install a pump from Branford Spreading Ground to direct water into the Tujunga Spreading Ground leading to more groundwater recharge. In addition, the project will clean out the clogging layer at the bottom of basin, which will also improve percolation rates.

22	Broadway Neighborhood Stormwater Greenway Project	City of Los Angeles Bureau of Sanitation	In partnership with Water Replenishment District of Southern California and it's "Regional and Distributed Stormwater Capture Feasibiltiy Study," the proposed project will design and implement stormwater Best Management Practices (BMPs) in the City of Los Angeles with the primary goals of TMDL compliance and stormwater infiltration. Three levels of BMPs will be developed; local parcel based Low Impact Development (LID) for 8 acres (60 residential parcels), neighborhood scale LID for 12 acres (3 residential streets and 2 blocks of commercial streets), and a sub-regional scale facility for 30 acres of mixed land uses. The local and neighborhood BMPs will capture and infiltrate all dry-weather flow and up to the ¾ inch storm. The sub regional BMP will capture up to the 2 inch storm for 30 acres. The sub regional BMP will also receive dry-weather flows from 228 acres of mixed land uses. Designs will be standardized to remote widespread implementation.
23	Bull Creek Stormwater Capture	Los Angeles County Flood Control District	Historical records show that an annual average of 625 acre-feet of water passes though Bull Creek. All flows from Bull Creek are lost to the ocean via the Los Angeles River. This project proposes conserving the lost water by diverting flows from the new LADWP facility using a rubber dam and conveying flows through a pipeline to Pacoima Spreading Grounds where it would be captured and recharge the local aquifier.
24	Bull CreekLos Angeles Reservoir Water Quality Improvement Project	LADWP	Plan, design, and construct stormwater conveyance facilities for compliance with the Enhanced Surface Water Treatment Rule. Facilities will be designed according to standards adopted by Department of Water Resources, Division of Safety of Dams. Improvements include widening a portion of the Bull Creek Extension Channel, realigning a section downstream of the widening, construction of a new diversion structure and overflow structure, and improvements to inlet structures. The Los Angeles Reservoir spillway will be removed from service. Proposed design facilitates a future stormwater capture program.
25	Burbank Partnership Water Recycling Project	LADWP	The Burbank Partnership Water Recycling Project involves the planning, design, and construction of approximately 27,000 feet of recycled water pipelines in the North Hollywood area. The three individual segments that comprise the project are the Chandler Boulevard Bike Path segment, the Whitnall Dog Park segment, and the North Hollywood Park segment. These segments will connect to Burbank's recycled water distribution system at three separate connection points and will be served by recycled water treated at the Burbank Water Reclamation Plant. This project is expected to offset up to 285 AFY of potable water with recycled water.

26	Burbank Water and Power Recycled Water System Expansion, Phase 3	City of Burbank Water and Power	The third phase of the City of Burbank's recent recycled water system expansion. As a result of previous phases, over 20 miles of recycled water pipelines have been installed resulting in the distribution of over 2,300 AF of recycled water annually; amounting to 13% of the City's water demand by the end of 2014. The City will continue expanding its recycled water distribution to offset potable water use in this phase by constructing two new recycled water pipelines known as, the LA Equestrian Center (LAEC) and the Naomi pipelines. The LAEC is located on the borders of the cities of Burbank and Los Angeles consisting of landscape areas, stables, offices and corrals; the latter requiring dust control with water trucks. The Naomi pipeline would primarily provide recycled water to a very large commercial data center and smaller customers. Completion of these pipelines will increase recycled water distribution by an estimated 61 AFY, resulting in a direct and immediate potable water savings of 61 AF annually.
27	C Marvin Brewer Desalter Brackish Groundwater Facility Expansion	West Basin Municipal Water District	The Desalter currently has the capacity to extract up to 2,000 acre-feet annually of brackish water. In 2003 the old wells at the site were decommissioned and construction began in 2005 for the first replacement well. The facility became operational in 2006 at a reduced capacity using the new well and the original RO unit. The facility has not been operating to its full capacity since it came online again in 2007 because of water quality issues. Funding is also needed to correct the water quality problems in order to get the facility to its full operating capacity. The proposed 500 AFY capacity expansion will allow the facility to become operational at its full capacity of 2,000 acre-feet per year. The site is already owned by California Water Service Co. and leased by West Basin and is developed as a desalting facility. The expansion will include the installation of a new production well, and the addition of an acid pretreatment unit and a reverse osmosis treatment unit on the existing site.
28	CITYWIDE STORM DRAIN CATCH BASIN CURB SCREENS	CITY of CALABASAS	Installation of storm drain catch basin curb screens at all applicable locations citywide. These screens are the stainless variety approved curb by Los Angeles County. The purpose of the curb screens is to stop trash from entering the catch basins which eventually discharge into both the Los Angeles River and Malibu Creek watersheds. By implementing this project, City of Calabasas will be in compliance with the Trash TMDL both for LA River and Malibu Creek watersheds. Based on studies done, reduction in trash and debris loadings will also reduce Bacterial and sediment loading in the watershed. By implementing the project, disadvantaged communities downstream of Calabasas in Los Angeles River will benefit from cleaner water. The scope work consists of measuring all catch basin openings, drafting RFP with detailed specifications, soliciting proposals from the list of Los Angeles County's approved venders, negotiating contract, implementation/construction, monitoring and reporting.

29	Caballero Creek & Los Angeles River Confluence Park	Mountains Recreation and Conservation Authority	The project will convert a 1.55 acre vacant parcel at the confluence of the Los Angeles River and Caballero Creek into a publicly-accessible natural park with habitat restoration, paths, site furnishings, water quality improvements, waterfront-access, and educational amentities. The design utilizes an innovative mixes low-tech mechanical and biological methods to filter and infiltrate storm waters increases regional water quality. The project creates a multi-benefit park that provides ecosystem services as well as cultural services, like recreation and eco-tourism. The project concept was developed in partnership with the City and County of Los Angeles who have committed to retain ownership, maintenance and operation responsibilities while allowing the Mountains Recreation and Conservation Authority (MRCA) to oversee design and construction. Nearby Reseda High School will monitor the project and use it for hands-on learning and community service opportunities.
30	Camino San Rafael Recycled Water Project	Glendale Water & Power	This project will consist of design and construction of approximately 8300 feet & 6000 feet of new 4"and 8" PVC recycled water pipeline, respectively. The project also consists of installing a two booster stations. This project will extend Glendale's recycled water distribution system to provide recycled water for common area irrigation to the Camino San Rafael Homes. This project will offset up to 90 AFY of potable water with recycled water. This will reduce the City's demand on potable water.
31	Carson Regional Water Recycling Project	West Basin Municipal Water District	The Carson Regional Water Recycling Expansion Project includes the expansion of the existing recycled water treatment facility and the construction of several laterals. This is a new demand on the system and will require expansion of treatment process capacity and conveyance to include; lateral pipelines, pump stations, treatment units, storage tanks, and waste management facilities. The BP Refinery requires single-pass reverse osmosis treatment units. BP Refinery is estimating a need of 2,100 acre-feet per year (AFY). The project will be further expanded to serve customers within the City of Los Angeles' jurisdiction for the refineries in the port area. The City will need recycled water to satisfy a use of 9,300 AFY. The City is in the preliminary design stage.

32	Chase Street Stormwater Greenway	City of Los Angeles Bureau of Sanitation, Watershed Protection Division	The Project will provide a street-end interpretive area on Bull Creek at Chase Street, and install a Stormwater Greenway along Chase Street from the eastern street end on the north side right-of-way to Hayvenhurst, and on the north and south right-of-way to Gothic. Vegetated planters in the parkways will capture and infiltrate street runoff, and will provide storm water filtration, and tree shading. The Bull Creek street-end will feature a native landscape as habitat and a recreational rest stop along the channel, and will provide an interpretive site for wildlife selected and supported by the specific native planting used in the project. A channel diversion from Bull Creek, with a pre-filter and lift station, will transfer runoff through a pipeline to a local Sod Farm where it will be used to irrigate up to 30-commercial acres. The project will integrate water conservation goals (LADWP), Storm water objectives (BOS), Economic enhancements to city property (LAWA), & public health and recreation benefits.
33	Chemical Study - Rio Hondo	Los Angeles County Flood Control District	This project will install a chemical treatment system at the Rio Hondo Coastal Spreading Grounds to remove sediment fines from the water and improve the percolation rates. A Percolation Optimization Investigation (POI) report was done by Montgomery Watson Harza (MWH) in 2003 to evaluate the County's spreading grounds and the impact of suspended solids on percolation rates. The report made a number of recommendations and the recommendations will be implemented at the Rio Hondo flood control facility. The project will install a coagulant chemical feeder and mixer at the grounds intake. This will allow the silt in the stormwater to coagulate and settle prior the cleaner water to flowing into spreading grounds. When this occurs, the spreading grounds will be able to percolate more water, thus conserving and recharging more groundwater.
34	Chevy Oaks Recycled Water Project	Glendale Water & Power	This project will consist of design and construction of approximately 920 feet, 1900 feet & 2100 feet of new 4", 8" and 12" PVC recycled water pipeline, respectively. The project also consists of installing a small booster station. This project will extend Glendale's recycled water distribution system to provide recycled water for irrigation to the Chevy Oaks Homes. This project will offset up to 30 AFY of potable water with recycled water. This will reduce the City's demand on potable water.
35	City of Carson Rain Barrel Give Away Phase II	City of Carson, Development Services Department, Engineering Services Division	At completion of a prior grant, a modest amount of money remained unused. With the acquiesence of the granting agency, the City of Carson purchased 16 rain barrels and set up a website lottery system in order to award them to residents. The response was overwhelming and with no advertising over 100 contestents were disappointed to not receive a rain barrel. This proposal would lead to the purchase of an additional 1,000 rainbarrels (depending on cost and grant amount) to restock the lottery reserves. Advertising and management of the program would be provided as part of the City of Carson grant match. More information on Fiskar Rain Barrels is available at http://www2.fiskars.com/Products/Yard-and-Garden/Rain-Barrel-Systems

36	City of Monrovia Fire Department - Training Center Water Recycling Project	Upper San Gabriel Valley Municipal Water District	Upper District in cooperation with the City and Fire Department of Monrovia are submitting this project incorporating both dry and wet weather runoff capture, treatment and storage for the new Regional Training Center. Once collected, the fire training water and the 85th percentile of a 24 hour storm event (as required by the City's MS4 permit) will be treated before being discharged into storage holding tanks which will store the treated water for future reuse by the training facility. The objective is to offset the use of potable water at the facility, eliminate storm water discharge and capture wet-weather storm water runoff. Finally, if the wet-weather event is larger than the 85th percentile, then provisions are being considered to treat as much of the additional wet-weather storm water runoff via a natural infiltration gallery (bioswale) before being discharged into the City's storm water system.
37	Cogswell Dam Inlet/Outlet Works Rehabilitation Project	Los Angeles County Flood Control District	This project will consist of refurbishment and upgrades to the outlet works, tunnels, and repair of various facility components at Cogswell Dam. The project will increase operational effectiveness for flood control and water conservation. The project will involve: a complete overhaul of the dam's entire inlet/outlet works; upgrade on the electrical control equipment; repair of downstream facilities; structural repairs on the upstream facing slab; security upgrades; and other various repairs essential for maintaining and operating a flood control facility. The overall project intent is to improve Cogswell Dam for maintaining dam safety, increased efficiency and reliability of flood control operations, and enhancement of water conservation efforts.
38	Cold Creek Diamond Acquisition	Mountains Restoration Trust	The project will acquire 4.87 acres (APN 4455-021-040) of natural undisturbed open space within the existing 1348-acre Cold Creek Preserve in the Santa Monica Mountains National Recreation Area. The acquisition is part of the state-funded Cold Creek Restoration Plan designed to acquire 539.06 acres to protect the wild and scenic, perennial Cold Creek, the habitat linkage between Topanga State Park and Malibu Creek State Park, the values of Los Angeles County's Significant Ecological Area #9, and a future venue for environmental education, research, and recreation. The area includes significant oak, sycamore, and willow communities, supports a range of wildlife including mountain lion, gray fox and raptors. The pure waters once supported the federally-listed endangered southern steelhead trout.
39	Conservation Budget Based Tiered Rate Structure	West Basin Municipal Water District	This project helps our customer agencies to develop a water conservation, budget-based rate structure for their customers. The project is beneficial to West Basin's cities and retail water agencies because it provides a pricing structure that will incentivizes its customers to conserve water. This pricing method has been used in other parts of the State and has been successssful at reducing water usage and reqarding those who do so with lower rates on their water bill.

40	Conversion of 237th Street Sump Tributary to Machado Lakes for Nutrient and Toxics TMDL BMPs	City of Torrance	This project would convert the 237th St. Sump (4.5 acre-feet) into a retention/infiltration basin BMP for Toxics and Nutrient TMDL compliance and provide open spaces for wildlife habitat. This project would install diversion structures that would divert the first 4.5 acre-feet of stormwater from a 71 acre tributary area away from the system tributary to Machado Lake (Wilmington Drain) to be retained and infiltrated in this basin. Trash screens would be installed at the catch basin in the watershed by a seperate project. During the dry season the basin would remain an open space for wild life and retain urban run-off and nutrients form 71 acres. By diverting stormwater back into this basin, the City and County storm drain systems would have more capacity during rain events. This project would also increase groundwater recharge.
41	Creek Crossings Repairs	Los Angeles County Waterworks District No. 29	This project consists of repairing corroded and deteriorated sections of aboveground pipeline and developing a Corrosion Monitoring, Control, and Maintenance Program. The Waterworks District 29 transmission water pipeline runs along the Pacific Coast Highway in Malibu. The proposed pipeline repairs are located at eight creek crossings attached to bridge structures. The project will significantly prevent future leaks and breaks in the main transmission pipeline which is the primary source of water supply for Malibu and Topanga. The development of a maintenance program is essential to maintaining water supply reliability for the region.
42	Deauville Distributed Water Reuse Project	City of Santa Monica	The project would harvest stormwater and brackish groundwater for high level treatment and non-potable use around the City, replacing the use of imported potable water. The City would install a 1.3 million gallon storage tank next to the Santa Monica Pier, Deauville lot, to harvest stormwater from the Pier sub-watershed during rain events and brackish groundwater during dry periods. The project would have an optional overflow to an infiltration gallery. A saline extraction well would be installed in sand next to the storage tank. The project would install pre-treatment catch basin inserts in the drainage area or a centralized hydrodynamic separator-screening device to remove trash and debris from stormwater. Modular nanofiltration (NF) and a saltwater reverse osmosis (RO) treatment systems at the site would treat these stored local water resources to high quality for various uses around the City in the existing recycled water system. All concentrated brine by-product would be sent to the sanitary sewer.
43	Decker Canyon Recycled Water System Extension	Las Virgenes Municipal Water District	The Decker Canyon recycled water pump station, pipeline, and tank would furnish recycled water primarily to Malibu Country Club Golf Course and Tract 47962-Sycamore Canyon Estates near the pump station location and other nearby ranchettes. The project would comprise a high-lift pump station, ~23,000 linear feet of pipeline along Westlake Blvd and Decker Canyon Rd, and a 60-foot diameter concrete tank near the corner of Decker Canyon Rd and Mulholland Hwy. Approximately 229 AF of recycled water per year would be used by this project.

44	Del Rey Lagoon Water Quality Improvement Project	City of Los Angeles Bureau of Sanitation Watershed Protection Division	The Del Rey Lagoon Water Quality Improvement Project proposes to improve water quality by reducing the source and amount of fecal indicator bacteria in the Del Rey Lagoon and surrounding waterbodies such as the Santa Monica Bay and Dockweiler Beach. Project components include stormdrain systems, vegetated swales, irrigation system retrofit, and drainage modifications. Education and outreach to the public will also be included in the project scope. The vegetated swales are designed to capture, retain, and treat runoff from the adjacent residential, transportation, and landscaped area during dry weather and partially during wet weather. Existing irrigation system will be retrofitted with a smart irrigation system to reduce excessive irrigation runoff, thereby conserving water and reducing flow. Catch basins and storm drains will be installed to capture and divert excess wet-weather flow into the sewer system. Project also includes a nature viewing deck and educational displays that explain local flora-fauna.
45	Demonstration Gardens at Los Angeles County Fire Department Stations	West Basin Municipal Water District	This project involves the installation of drought-tolerant demonstration gardens at a minimum of five fire stations throughout the West Basin service area. These gardens will replace turf and/or concrete areas that are directly in front of the fire stations in order to provide a maximum visibility to the public. The gardens will be utilizing drought-tolerant and/or native plants that will be designed by professional landscape designers that specialize in climate-appropriate plans and trees. The main goal is to provide water conservation and runoff reduction measures and secondarily to educate the public about the measures so that they can create these spaces at their own homes. West Basin strives to reduce demands by implementing conservation and education programs throughout the communities it serves. This project aims to continue implementing outdoor water conservation/education programs to influence the public to create these spaces in their own homes.
46	Devil's Gate Dam and Reservoir Water Conservation	Los Angeles County Flood Control District	This project proposes to conserve stormwater by holding a reservoir pool behind Devil's Gate Dam and diverting the water to Eaton Wash Dam and Eaton Wash Spreading Grounds for poststorm groundwater recharge. A pump will be installed in the Devil's Gate Dam reservoir and water will be pumped out and conveyed through over 26,000 feet of pipeline to Eaton Wash Dam where it can be held for recharge at downstream spreading ground facilities.

47	Devil's Gate Reservoir Sediment Removal and Management Project	Los Angeles County Flood Control District	The 2009 Station Fire was the largest fire in Angeles National Forest recorded history and burned over 160,000 acres in the San Gabriel Mountains. Approximately 68% of the watershed tributary to Devil's Gate Reservoir was burned and as a result of the storms that occurred in the two wet seasons after the fire, sediment levels in the reservoir increased by more than one million cubic yards. The County of Los Angeles Department of Public Works on behalf of the Los Angeles County Flood Control District is planning a sediment removal project of up to 4 million cubic yards. A sediment removal project from behind Devil's Gate Dam is vital to the health of the Arroyo Seco flood control system. The goal of this project is to restore flood control capacity and establish a reservoir configuration more suitable for routine maintenance activities. The project will last approximately 5 years with construction starting in 2014.
48	Dominguez Channel Greenway Phase III	Los Angeles County Flood Control District	The project will consist of development of a native landscaped greenway and bikeway/pedestrian trail along the north side of the Dominguez Channel, between Vermont Av and Normandie Av. The project will include the following: access/maintenance road improvements for the new/improved bikeway; AC repair and replacement, slurry seal, American Disability Act (ADA) access ramps and bikeway/pedestrian signage and striping. Landscaping improvements include landscaping using native and drought-tolerant plants, irrigation, as-needed fencing repair/replacement. Educational/interpretive signage will also be included along the bikeway/pedestrian trail. A study is also recommended to consider additional pedestrian crosswalks with street lamp lighting for added safety. The project is currently on hold until the LACFCD completes a study to address deficiencies in its levees.
49	Dominguez Channel Trash Reduction Via ARS Installation in the City of Carson, CA	City of Carson, Development Services Department, Engineering Services Division	This project would install Automatic Retracting Screens (ARS) in the 1800 Storm Drain Catch Basins in the City of Carson. The proponents favor ARS to collect trash at street level where the trash can be quickly and cost effectively collected weekly by the existing City Street Sweeping Contractor and eliminates the need for other more costly and difficult to maintain downstream trash control systems. This project anticipates the continuing development of local and state waterway trash control efforts and alleviates the need to develop these expensive federal, state and local regulatory mandates. In comparison to other "downstream" trash control systems, the maintenance status of ARS is easily assessed and visible to the public, which is then able to report those locations where maintenance is warranted. Since ARS systems are located in the street sweeper path, maintenance (trash collection) occurs weekly, the trash stays dry and is less subject to the degradation that generates other pollutants (bacteria).

50	Dominguez Gap Spreading Grounds West Basin Percolation Enhancement	Los Angeles County Flood Control District	The proposed project will increase the percolation within the spreading grounds facility in order to increase groundwater recharge. The preliminary scope includes removing between 5 to 10-feet of clay sediment or installing vertical trenches/drains through the poorly draining strata in the facility's west basin. Preliminary studies have been conducted including boring samples which will be used to further develop conceptual plans and estimate project benefits.
51	Duck Farm River Parkway Phase 1 - Water Enhancement Project	Watershed Conservation Authority	The Duck Farm River Park, once a natural floodplain, has been disconnected from the natural processes of the river for decades as a result of urbanization & flood management. The Project reintroduces natural systems through a riparian/pocket wetland/seasonal streambed that improves both habitat and collect, filter & infiltrate stormwater flows onsite, as well as stormwater from the adjacent freeway in collaboration w/Caltrans. The project will transition irrigation source (annually forecasted to require 19M gallons) from imported, highly processed potable water to either local groundwater or recycled water as its source of supply. The public will benefit by being reconnected to nature, the river, & from educational & interpretive programming possible at the site. This change in supply will reduce greenhouse gases & the parks carbon footprint. Outdoor classroom & interactive educational experiences with children will inspire local youth to learn more about our watershed, water conservation & sustainability
52	Eaton Spreading Grounds Intake Improvements	Los Angeles County Flood Control District	The project will increase the intake and storage capacity of the Eaton Wash Spreading Grounds facility. This will improve the facility's ability to recharge storm water into the groundwater basin, thus greatly increasing the sustainable local groundwater supply that is vital for the region. Los Angeles County Flood Control District will replace the vehicle access slab with a metal grate over the spreading grounds drop intake channel and replace the current diversion flashboards with an inflatable gate within the intake channel. These improvements in Eaton Wash Channel will better direct flows into Eaton Wash Spreading Grounds, thereby increasing its intake capacity. Basin 1 will be enlarged to increase the facility's storage capacity. The project will include improvements to the property along Sierra Madre Boulevard that will significantly improve the sustainability, aesthetics, and safety of the public walkway and street view. Two driveway entrances will be improved by increasing the gate set-back fu
53	Eaton Wash Dam Inlet/Outlet Works Rehabilitation Project	Los Angeles County Flood Control District	The dam outlet works rehabilitation project involves the removal of the existing outlet tower and gate house. Once these major components are removed, construction of a gate valve, debris racks, hydraulic power system with a block house, control systems, modification of the outlet works structure, and rehabilitation of the gate valves will commence. It will provide necessary erosion protection measures and improve water quality during low-flow releases from the dam.

54	Elysian Reservoir Water Quality Improvement Project	LADWP	LADWP is planning to cover the existing Elysian Reservoir in order to meet US EPA water quality regulations. In April 2012, the Board of Water & Power Commissioners certified the Environmental Impact Report and approved the floating cover alternative. The project will install a flexible membrane floating cover over the existing water surface. Also included are supporting infrastructure (piping, valves, liner) and site improvements (roadway paving, fencing). The reservoir will operate in the same manner, providing potable storage for the distribution system. Construction is anticipated to being by 2015. In conjuntion with the project, a Community Parks Fund was established by the Board of Commissioners. The fund is to be used for unspecified public purposes related to community parks. Best efforts will be made to locate enhancements primarily in the Elysian Park area, working together with the community and other City of Los Angeles agencies.
55	Encinal Emergency Connection	Los Angeles County Waterworks District No. 29	The project consists of adding a new emergency water source to supply Waterworks District No. 29 through a new interconnection along Encinal Canyon Road at the District boundary with Las Virgenes Municipal Water District (LVMWD). This interconnection would bring water from Metropolitan Water District of Southern California through LVMWD to provide additional supply to the District during emergencies.
56	Foothill Municipal Water District Recycled Water Project	Foothill Municipal Water District	Three hydrologic areas were studied for the development of satellite recycled water facilities. Foothill Municipal Water District (FMWD) is pursuing the construction of one facility near Berkshire Place in La Canada at this time. This project will treat wastewater using a membrane bioreactor and recharge the product into the groundwater basin using infiltration galleries underneath athletic fields for multi-beneficial uses. Cal Poly Pomona has partnered with FMWD and is developing a model that will also capture stormwater for recharge using the same infiltration galleries. A conservation and education component has also been added. Landscaping will be done to showcase drought tolerant plants at both the MBR site and school site. Tours will be available so that students may learn about stormwater capture, groundwater, recycled water, conservation and the watershed since the Arroyo Seco and Hahamongna Park are across the street. This 0.250 MGD plant will save enough energy annually for 80 homes in So. Cal.
57	Freeway Runoff Infiltration Demonstration Project	City of Santa Monica	Divert runoff from a section of the Santa Monica Freeway within the City of Santa Monica, treat and infiltrate within an area near the freeway, either a landscaped area or parking lot. The infiltration zones will be augered, if necessary to by-pass poor permeable soils. There will be pre-treatment before infiltration to remove trash, oil/grease, sediments. It will be a passive system, i.e. gravity-fed and low into the system. The treatment-infiltration areas will be areas either already with a storm drain in the area, or the creation of new ones to harvest the runoff. The goal will be to keep runoff out of the existing storm drains and out of the storm drain system.

58	Glen Oaks Storm Water Capture Project	Los Angeles Beautification Team	The Prop O funded phase I, the installation of six bio-swales and 4 dry wells. This watershed in an average rainfall year brings 300 acre feet of water to Glen Oaks Blvd. Phase I was completed in January 2014 and is currently capturing an estimated 30 acre feet per year leaving approximately 270 acre feet available for storm water capture. Phase II will consist of an additional eight dry wells for an estimated $625,000, plus the cost of City Services (Design fees, permits and over site), that will capture an additional 40 to 45 acre feet annually.
59	Glendale Narrows Habitat Enhancement Project	Council for Watershed Health	The Glendale Narrows Riverwalk will provide approximately one mile of multi-use recreation along the Los Angeles River. There are several invasive plant species that are prevalent adjacent to the Riverwalk in the Glendale Narrows area of the Los Angeles River. These invasive plant infestations jeopardize the improvements to water quality and degrade habitat for native aquatic, avian, reptile, amphibian, and invertebrate species. In collaboration with the City of Glendale Community Services & Parks Department, the Council for Watershed Health (Council) proposes to develop and manage a 3-4 year restoration project to map, control, and monitor invasive arundo and invasive palm trees in the Riverwalk project area in the Glendale Narrows sections of the Los Angeles River. A native plant propagation and replanting effort is also proposed to reestablish riparian plants.
60	Goldsworthy Groundwater Desalter Expansion	City of Torrance	The Goldsworthy Desalter (Desalter) treats water from the saline plume in the West Coast Groundwater Basin for drinking water. The brackish water is treated to meet or exceed municipal drinking water standards through the use of a reverse osmosis system. The existing Desalter produces approximately 2,000 acre-feet of potable drinking water per year. When the Desalter was originally constructed in 2002, it was designed for expansion to over 5000 acre-feet per year of drinking water. In 2012 the Water Replenishment District of Southern California had a Feasibility Study for the Expansion of Desalter prepared for and approved by the U. S. Bureau of Reclamation. The expansion would involve the installation of additional reverse osmosis treatment units, construction of two additional source water wells, transmission mains and related appurtenance. The project also diverts waste water away from Santa Monica Bay where discharges cause TMDL violations for bacteria.

61	Groundwater Reliability Improvement Project (GRIP)	Water Replenishment District of Southern California	The overarching goal of the GRIP Recycled Water Project is to offset the current use of imported water by providing up to 21,000 acre-feet per year (AFY) of recycled water as a reliable supply source for groundwater basin replenishment via the Montebello Forebay within a reasonable timeframe. The source for the recycled water will be the Los Angeles County Sanitation Districts' San Jose Creek Water Reclamation Plant (SJCWRP). Tertiary treated recycled water, advanced treated recycled water (microfiltration, reverse osmosis and advanced oxidation), or a combination of the two will be conveyed from the SJCWRP via an existing pipeline or possibly a new pipeline for recharge in the Central Groundwater Basin through the Montebello Forebay Spreading Grounds or potentially a new injection well field.
62	Groundwater System Improvement Study	LADWP	The purpose of the Groundwater System Imrovement Study (GSIS) is to perform an independent study to identify, characterize, and evaluate emerging water quality constituents for the San Fernando Basin (SFB). This will include a comprehensive analysis that will provide recommendations in developing short and long-term projects, including the design and construction of groundwater treatment facilities, to maximize the use of the groundwater supply in the SFB. As a part of the GSIS, the LADWP will be drilling approxinmately 26 new groundwater monitoring wells, and perform short-term monitoring of existing and new wells, in order to obtain supplemental water quality data necessary for planning the groundwater treatment afcilities in the SFB.
63	Groundwater Treatment Facilities	LADWP	Design and construction of groundwater treatment facilities in North Hollywwod, Rinaldi-Toluca and Tujunga Wellfields in the San Fernando Basin (SFB), with a treatment capacity of 122,900 acre-feet per year.
64	Hansen Dam Golf Course Water Recycling Project	LADWP	Construct 4,500 feet of 20" pipeline, pumping station and pipe support bridge to deliver recycled water from the Tillman Plant to the Hansen Dam Golf Course and other potential future users. Water will be pumped from the Hansen Tank.
65	Hansen Dam Water Conservation Project	Los Angeles County Flood Control District	Hansen Dam, situated adjacent to the Tujunga Wash Channel in the San Fernando Valley, is a vital part of flood control efforts in the Los Angeles River drainage basin. The primary purpose of Hansen Dam is flood control; however the opportunity exists to increase water conservation and water supply through increased water recharge upstream of the dam. The current operation of the dam allows for an average annual water conservation of 17,100 acre feet per year. The Water Conservation Project, which involves utilizing the existing Debris and Flood Control Pools for water conservation purposes by raising their respective maximum elevations to allow for additional water supply storage, would increase the dam's water conservation ability. This extra supply storage would allow for dam releases to downstream spreading grounds and other facilities fo
66	Hansen Dam Water Conservation and Supply	The River Project	Change management regime of Hansen Dam to focus on water conservation by maintaining a water conservation pool within the reservoir during and subsequent to flood season.

67	Headworks East Reservoir	LADWP	onstruction of a 110 MG buried reservoir along with a 4 MW hydroplant at the former Headworks Spreading Grounds to replace the storage capacity lost when Ivanhoe Reservoir is removed from service. Needed to bring the Water System into comliance with state and federal drinking water regulations by the regulatory deadline of November 2014
68	Headworks Ecosystem Restoration	LADWP	Please refer to the Greater Los Angeles County Integrated Regional Water Management OPTI database for a project description

DEPT. PUBLIC WORKS
PROJECT MANAGEMENT DIVISION II

Mr. Gregg BeGell, P.E.
County of Los Angeles Department of Public Works
Project Management Division II
900 South Fremont, 5th Floor
Alhambra, CA 91803

Dear Mr. BeGell,

The purpose of this letter is to register my support for the restoration of Baldwin Lake as part of the Enhanced Watershed Management Plan (EWMP) for the Rio Hondo Watershed. The lake has experienced significant deterioration in recent decades as a consequence of surface run-off and its very future is very much at risk. Establishing the restoration of Baldwin Lake as a priority project as part of the EWMP will ensure its status as an important ecological and historic asset for generations to come.

Many thanks for attention to this matter.

Very truly yours,

George L. Ball

Subject: Restoration of Baldwin Lake

Hello Mr. BeGell,

I am a volunteer and member of the Arboretum located in Arcadia and would like to express my concern for the poor condition of the lake. As a volunteer docent I provide guided walks through the gardens as well as the lake perimeter. Visitors are dismayed and saddened to see the decline of such a great and wonderful treasure in the midst of our urban lifestyle. To have open space in our crowded communities is truly a rarity and must be preserved for future generations to appreciate. Please take my request for restoring the lake to heart.

Thank you for reading my message.

Subject: Enhanced Watershed Management Plan

As a volunteer at the L.A. County Arboretum, I would like to voice my support for the Enhanced Watershed Management Plan (EWMP) for the Rio Hondo Watershed, in which the Arboretum resides.

Every time I set foot in the Arboretum and look around me I see what can only be described as a treasure that belongs to the people of Los Angeles County. The condition of Baldwin Lake, the centerpiece around which the Arboretum exists is deplorable. It is in desperate need of restoration. Please do all that you can to see that this plan is instituted and that, through it, funding may be found to preserve Baldwin Lake.

Laura Rocha

Subject: Comments LACFCD SCH 2014081106 NOP Enhanced Watershed Management Programs due 9.29.2014

The Project Description is listed on the State Clearinghouse site as:

The development of the EWMP will involve the evaluation and selection of multiple watershed control measures or best management practices (BMP) types including non-structural and distributed, centralized and regional structural BMPs. These BMPs will be implemented to meet compliance goals and strategies under the 2014 MS4 Permit. Structural BMPs involve the construction of a physical control measure to alter the hydrology and/or water quality of incoming stormwater or non-stormwater. The three major functions for structural BMPs are infiltration, water quality treatment, and storage. These are three categories of structural BMPs, defined by the runoff area treated by the BMP and the required retention volume in accordance with the Permit.

Comments:

Watershed control measures seems to be the emphasis, but that term is not defined. It seems to exclude Watershed Protection Management Measure in areas applicable to the Coastal Zone Act Reauthorization Amendments which recognizes the impact of land-use activities on estuaries, beaches, marine resources and the ocean. *Economically feasible measures* and *greatest degree of pollutant reduction achievable* are terms from that Act.

All receiving waters should be identified as to type and federal jurisdiction.

The project only allows a build environment in a watershed that should have natural lands, ecosystems and normal watershed characteristics including ambient water quality standards and the Southern California Bight.

Antidegradation procedures should be addressed.

Alternatives should be presented for non-structural or structural projects.

Surrounding land uses and settings should be addressed as should settings such as air space in relationship to bird migratory patterns. Ambient air quality should be included.

Other public agencies should be included. US Army Corps of Engineers plays a role in navigable waters as does Caltrans in its responsibility for NPDES compliance.

Private parties, such as Lauren Bon (Water Rights Draft Permit A032212) should be included.

Baselines should be presented.

There should be consistency including applications of the various General Plan and its Elements across jurisdictions. Infrastructure should be addressed including but not limited to age, condition and operations and maintenance.

Since federal regulations are enforced involving Clean Water Act Navigable Waters, we question why there is no NEPA document preparation.

Subject: Baldwin Lake Restoration
Los Angeles County Arboretum and Botanic Garden

Dear Mr. BeGell:

As president of the L.A. County Arboretum Foundation and as a concerned citizen, I encourage you to restore Baldwin Lake at the Arboretum. I am sure you are aware that the lake has environmental significance to Los Angeles County including impact on water conservation and reclamation, regional ecology, educational opportunity, and historical importance.

The restoration of Baldwin Lake, including improvements to its function as an urban runoff collection basin, should be considered as a high-priority project within the Rio Hondo Enhanced Watershed Management Plan.

Please note the following:

1. Baldwin Lake, with a current capacity of just under four million gallons, if returned to its original depth, would provide over twelve million gallons of storage capacity. With modification, it could also serve as a significant infiltration basin for aquifer recharge.

2. Tule Pond to the north, a canal roughly 600ft. in length, is the point of entry for the urban watershed, feeding directly into Baldwin Lake. Its size, shape and location offer great potential for water quality enhancement through modification as a bioswale.

3. The Lake is a key educational, scenic, wildlife, and historic resource serving over 330,000 visitors per year, including over 16,000 elementary school students on field trips. The project would provide an unrivaled opportunity to educate a broad public about regional water management, home and community water conservation, and the role of the Raymond Basin and other key water resources that sustain us.

4. The Los Angeles Arboretum Foundation, the County's non-profit partner in operating the Arboretum, stands ready to help leverage public dollars to realize the site's unique educational potential. **At our recent strategic planning meeting (October 25th) the restoration of Baldwin Lake was the top priority for the foundation over the next year.**

In sum, Baldwin Lake offers the ideal project to both enhance watershed function and serve the public with remarkable educational, ecological, and scenic benefits. It is an exceptionally strong candidate for inclusion in the Rio Hondo Enhanced Watershed Management Plan.

Sincerely,

Kenneth D. Hill, Ph.D., P.E.
President, L.A. County Arboretum Foundation

Dear Mr. BeGell,

I am a frequent visitor to our LA County Arboretum. Here I can find beauty, contentment and sollice for my bus lifestyle.

Baldwin Lake is one of our families favorite visiting areas. Here we find the solitude and the different forms of wildfowl very enjoyable.

Lately we find that our lake is becoming a disaster! The water is murkey, the banks are crumbling and it has a swamp like look in certain areas.

On behalf of my family and many friends and visitors I implore you to take advantage of the opportunity now available to restore the health and beauty of our beloved lake.

Thank you for your consideration.
Sincerely.
Marsha Perez

MWD
METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA

Executive Office

September 24, 2014 **Via Mail**

Mr. Gregg BeGell
Project Management Division II
Los Angeles County Flood Control District
900 South Fremont Avenue, 5th Floor
Alhambra, CA 91803

Dear Mr. BeGell:

Notice of Preparation for the Draft Program
Environmental Impact Report for the Enhanced Watershed Management Programs

The Metropolitan Water District of Southern California (Metropolitan) has reviewed the Notice of Preparation of a Draft Program Environmental Impact Report for Enhanced Watershed Management Programs (EWMPs) in Los Angeles County, California. The Los Angeles County Flood Control District (LACFCD) is the Lead Agency. An EWMP is one regulatory compliance mechanism for stormwater management under the Los Angeles County Municipal Separate Storm Sewer System (MS4) Permit adopted in 2012 (hereafter referred to as 2012 LA County MS4 Permit). The LACFCD proposes the development of 12 separate EWMPs in their respective watershed groups. The potential benefits from the EWMPs include the following: (1) improved water quality; (2) reduction in the impairment of water bodies for Designated Beneficial Uses; (3) promotion of water conservation and supply; (4) enhanced recreational opportunities; (4) support for public education opportunities; (5) improved local aesthetics; and (6) management of flood risks. This letter contains Metropolitan's comments to the proposed project as a potentially affected agency.

Metropolitan is a public agency and regional water wholesaler. It is comprised of 26 member public agencies serving approximately 18.4 million people in portions of six counties in Southern California, including Los Angeles County. Metropolitan's mission is to provide its 5,200-square-mile service area with adequate and reliable supplies of high-quality water to meet present and future needs in an environmentally and economically responsible way. Metropolitan owns and operates numerous facilities within Los Angeles County including pipelines, a water treatment plant, power plants, dams, reservoirs, and other infrastructure associated with our water conveyance and distribution system.

The proposed project may impact Metropolitan's ability to dewater its pipelines. As part of a proactive maintenance and refurbishment program, Metropolitan periodically dewaters its treated and raw water pipelines prior to inspection, maintenance, or repair activities. Such periodic inspections and repairs are essential to prevent pipe failures and subsequent damage from high-pressure water releases. These water discharges are short-term in nature and are acknowledged by the LA County Regional Water Quality Control Board as having a *de minimus,* or low-threat, impact to the environment and aquatic life. As such, these discharges are categorized as "Conditionally Exempt Essential Non-Storm Water Discharges" under the 2012 LA County MS4 Permit.

Metropolitan requests that LACFCD and its co-permitees continue to allow for periodic discharges by potable water systems into the MS4 under the proposed EWMPs. These "Conditionally Exempt Essential Non-Storm Water Discharges" are specifically called out as permissible under the 2012 LA County MS4 Permit. Per the conditions set forth in the 2012 LA County MS4 Permit, Metropolitan will continue to follow industry-accepted best management practices (BMPs) for its potable water system discharges. BMPs include, but are not limited to, the following: (a) advanced notification of LACFCD 72 hours prior to all planned discharges greater than 100,000 gallons and as soon as possible after an unplanned discharge greater than 100,000 gallons; (b) dechlorination; (c) monitoring for pollutants of concern; and (d) recordkeeping (e.g., date, time, and location of discharge, discharge pathway, receiving water, total number of gallons discharged, BMPs used, etc.).

Based on a review of the proposed project boundaries, the proposed project has potential to impact Metropolitan facilities. Metropolitan must be allowed to maintain its rights-of-way and requires unobstructed access to its facilities in order to maintain and repair its system. Any future design plans associated with this project should be submitted to the attention of Metropolitan's Substructures Team. Approval of the project should be contingent on Metropolitan's approval of design plans for portions of the proposed project that could impact its facilities.

Detailed prints of drawings of Metropolitan's pipelines and rights-of-way may be obtained by calling Metropolitan's Substructures Information Line at (213) 217-6564. To assist the applicant in preparing plans that are compatible with Metropolitan's facilities and easements, we have enclosed a copy of the "Guidelines for Developments in the Area of Facilities, Fee Properties, and/or Easement of The Metropolitan Water District of Southern California." Please note that all submitted designs or plans must clearly identify Metropolitan's facilities and rights-of-way.
We appreciate the opportunity to provide input to your planning process and we look forward to receiving future documentation and plans for this project. For further assistance, please contact Ms. Michelle Morrison at (213) 217-7906.

Very truly yours,

Deborah Day

J:\Environmental Planning&Compliance\COMPLETED JOBS\September2014\EPT Job No. 20140944MIS

Enclosures: Planning Guidelines and Map of Metropolitan Facilities in Project Vicinity

Guidelines for Developments in the Area of Facilities, Fee Properties, and/or Easements of The Metropolitan Water District of Southern California

1. Introduction

a. The following general guidelines should be followed for the design of proposed facilities and developments in the area of Metropolitan's facilities, fee properties, and/or easements.

b. We require that 3 copies of your tentative and final record maps, grading, paving, street improvement, landscape, storm drain, and utility plans be submitted for our review and written approval as they pertain to Metropolitan's facilities, fee properties and/or easements, prior to the commencement of any construction work.

2. Plans, Parcel and Tract Maps

The following are Metropolitan's requirements for the identification of its facilities, fee properties, and/or easements on your plans, parcel maps and tract maps:

a. Metropolitan's fee properties and/or easements and its pipelines and other facilities must be fully shown and identified as Metropolitan's on all applicable plans.

b. Metropolitan's fee properties and/or easements must be shown and identified as Metropolitan's with the official recording data on all applicable parcel and tract maps.

c. Metropolitan's fee properties and/or easements and existing survey monuments must be dimensionally tied to the parcel or tract boundaries.

d. Metropolitan's records of surveys must be referenced on the parcel and tract maps.

3. Maintenance of Access Along Metropolitan's Rights-of-Way

a. Proposed cut or fill slopes exceeding 10 percent are normally not allowed within Metropolitan's fee properties or easements. This is required to facilitate the use of construction and maintenance equipment, and provide access to its aboveground and belowground facilities.

b. We require that 16-foot-wide commercial-type driveway approaches be constructed on both sides of all streets crossing Metropolitan's rights-of-way. Openings are required in any median island. Access ramps, if necessary, must be at least 16-feet-wide. Grades of ramps are normally not allowed to exceed 10 percent. If the slope of an access ramp must exceed 10 percent due to the topography, the ramp must be paved. We require a 40-foot-long level area on the driveway approach to access ramps where the ramp meets the street. At Metropolitan's fee properties, we may require fences and gates.

c. The terms of Metropolitan's permanent easement deeds normally preclude the building or maintenance of structures of any nature or kind within its easements, to ensure safety and avoid interference with operation and maintenance of Metropolitan's pipelines or other facilities. Metropolitan must have vehicular access along the easements at all times for inspection, patrolling, and for maintenance of the pipelines and other facilities on a routine basis. We require a 20-foot-wide clear zone around all above-ground facilities for this routine access. This clear zone should slope away from our facility on a grade not to exceed 2 percent. We must also have access along the easements with construction equipment. An example of this is shown on Figure 1.

d. The footings of any proposed buildings adjacent to Metropolitan's fee properties and/or easements must not encroach into the fee property or easement or impose additional loading on Metropolitan's pipelines or other facilities therein. A typical situation is shown on Figure 2. Prints of the detail plans of the footings for any building or structure adjacent to the fee property or easement must be submitted for our review and written approval as they pertain to the pipeline or other facilities therein. Also, roof eaves of buildings adjacent to the easement or fee property must not overhang into the fee property or easement area.

e. Metropolitan's pipelines and other facilities, e.g. structures, manholes, equipment, survey monuments, etc. within its fee properties and/or easements must be protected from damage by the easement holder on Metropolitan's property or the property owner where Metropolitan has an easement, at no expense to Metropolitan. If the facility is a cathodic protection station it shall be located prior to any grading or excavation. The exact location, description and way of protection shall be shown on the related plans for the easement area.

4. Easements on Metropolitan's Property

a. We encourage the use of Metropolitan's fee rights-of-way by governmental agencies for public street and utility purposes, provided that such use does not interfere with Metropolitan's use of the property, the entire width of the property is accepted into the agency's public street system and fair market value is paid for such use of the right-of-way.

b. Please contact the Director of Metropolitan's Right of Way and Land Division, telephone (213) 250-6302, concerning easements for landscaping, street, storm drain, sewer, water or other public facilities proposed within Metropolitan's fee properties. A map and legal description of the requested easements must be submitted. Also, written evidence must be submitted that shows the city or county will accept the easement for the specific purposes into its public system. The grant of the easement will be subject to Metropolitan's rights to use its land for water pipelines and related purposes to the same extent as if such grant had not been made. There will be a charge for the easement. Please note that, if entry is required on the property prior to issuance of the easement, an entry permit must be obtained. There will also be a charge for the entry permit.

5. Landscaping

Metropolitan's landscape guidelines for its fee properties and/or easements are as follows:

a. A green belt may be allowed within Metropolitan's fee property or easement.

b. All landscape plans shall show the location and size of Metropolitan's fee property and/or easement and the location and size of Metropolitan's pipeline or other facilities therein.

c. Absolutely no trees will be allowed within 15 feet of the centerline of Metropolitan's existing or future pipelines and facilities.

d. Deep-rooted trees are prohibited within Metropolitan's fee properties and/or easements. Shallow-rooted trees are the only trees allowed. The shallow-rooted trees will not be permitted any closer than 15 feet from the centerline of the pipeline, and such trees shall not be taller than 25 feet with a root spread no greater than 20 feet in diameter at maturity. Shrubs, bushes, vines, and ground cover are permitted, but larger shrubs and bushes should not be planted directly over our pipeline. Turf is acceptable. We require submittal of landscape plans for Metropolitan's prior review and written approval. (See Figure 3).

e. The landscape plans must contain provisions for Metropolitan's vehicular access at all times along its rights-of-way to its pipelines or facilities therein. Gates capable of accepting Metropolitan's locks are required in any fences across its rights-of-way. Also, any walks or drainage facilities across its access route must be constructed to AASHTO H-20 loading standards.

f. Rights to landscape any of Metropolitan's fee properties must be acquired from its Right of Way and Land Division. Appropriate entry permits must be obtained prior to any entry on its property. There will be a charge for any entry permit or easements required.

6. Fencing

Metropolitan requires that perimeter fencing of its fee properties and facilities be constructed of universal chain link, 6 feet in height and topped with 3 strands of barbed wire angled upward and outward at a 45 degree angle or an approved equal for a total fence height of 7 feet. Suitable substitute fencing may be considered by Metropolitan. (Please see Figure 5 for details).

7. Utilities in Metropolitan's Fee Properties and/or Easements or Adjacent to Its Pipeline in Public Streets

Metropolitan's policy for the alinement of utilities permitted within its fee properties and/or easements and street rights-of-way is as follows:

a. Permanent structures, including catch basins, manholes, power poles, telephone riser boxes, etc., shall not be located within its fee properties and/or easements.

b. We request that permanent utility structures within public streets, in which Metropolitan's facilities are constructed under the Metropolitan Water District Act, be placed as far from our pipeline as possible, but not closer than 5 feet from the outside of our pipeline.

c. The installation of utilities over or under Metropolitan's pipeline(s) must be in accordance with the requirements shown on the enclosed prints of Drawings Nos. C-11632 and C-9547. Whenever possible we request a minimum of one foot clearance between Metropolitan's pipe and your facility. Temporary support of Metropolitan's pipe may also be required at undercrossings of its pipe in an open trench. The temporary support plans must be reviewed and approved by Metropolitan.

d. Lateral utility crossings of Metropolitan's pipelines must be as perpendicular to its pipeline alinement as practical. Prior to any excavation our pipeline shall be located manually and any excavation within two feet of our pipeline must be done by hand. This shall be noted on the appropriate drawings.

e. Utilities constructed longitudinally within Metropolitan's rights-of-way must be located outside the theoretical trench prism for uncovering its pipeline and must be located parallel to and as close to its rights-of-way lines as practical.

f. When piping is jacked or installed in jacked casing or tunnel under Metropolitan's pipe, there must be at least two feet of vertical clearance between the bottom of Metropolitan's pipe and the top of the jacked pipe, jacked casing or tunnel. We also require that detail drawings of the shoring for the jacking or tunneling pits be submitted for our review and approval. Provisions must be made to grout any voids around the exterior of the jacked pipe, jacked casing or tunnel. If the piping is installed in a jacked casing or tunnel the annular space between the piping and the jacked casing or tunnel must be filled with grout.

g. Overhead electrical and telephone line requirements:

1) Conductor clearances are to conform to the California State Public Utilities Commission, General Order 95, for Overhead Electrical Line Construction or at a greater clearance if required by Metropolitan. Under no circumstances shall clearance be less than 35 feet.

2) A marker must be attached to the power pole showing the ground clearance and line voltage, to help prevent damage to your facilities during maintenance or other work being done in the area.

3) Line clearance over Metropolitan's fee properties and/or easements shall be shown on the drawing to indicate the lowest point of the line under the most adverse conditions including consideration of sag, wind load, temperature change, and support type. We require that overhead lines be located at least 30 feet laterally away from all above-ground structures on the pipelines.

4) When underground electrical conduits, 120 volts or greater, are installed within Metropolitan's fee property and/or easement, the conduits must be incased in a minimum of three inches of red concrete. Where possible, above ground warning signs must also be placed at the right-of-way lines where the conduits enter and exit the right-of-way.

h. The construction of sewerlines in Metropolitan's fee properties and/or easements must conform to the California Department of Health Services Criteria for the Separation of Water Mains and Sanitary Services and the local City or County Health Code Ordinance as it relates to installation of sewers in the vicinity of pressure waterlines. The construction of sewerlines should also conform to these standards in street rights-of- way.

i. Cross sections shall be provided for all pipeline crossings showing Metropolitan's fee property and/or easement limits and the location of our pipeline(s). The exact locations of the crossing pipelines and their elevations shall be marked on as-built drawings for our information.

j. Potholing of Metropolitan's pipeline is required if the vertical clearance between a utility and Metropolitan's pipeline is indicated on the plan to be one foot or less. If the indicated clearance is between one and two feet, potholing is suggested. Metropolitan will provide a representative to assists others in locating and identifying its pipeline. Two-working days notice is requested.

k. Adequate shoring and bracing is required for the full depth of the trench when the excavation encroaches within the zone shown on Figure 4.

l. The location of utilities within Metropolitan's fee property and/or easement shall be plainly marked to help prevent damage during maintenance or other work done in the area. Detectable tape over buried utilities should be placed a minimum of 12 inches above the utility and shall conform to the following requirements:

1) Water pipeline: A two-inch blue warning tape shall be imprinted with:

"CAUTION BURIED WATER PIPELINE"

2) Gas, oil, or chemical pipeline: A two-inch yellow warning tape shall be imprinted with:

"CAUTION BURIED _______ PIPELINE"

3) Sewer or storm drain pipeline: A two-inch green warning tape shall be imprinted with:

"CAUTION BURIED ______ PIPELINE"

4) Electric, street lighting, or traffic signals conduit: A two-inch red warning tape shall be imprinted with:

"CAUTION BURIED _______ CONDUIT"

5) Telephone, or television conduit: A two-inch orange warning tape shall be imprinted with:

"CAUTION BURIED _______ CONDUIT"

m. Cathodic Protection requirements:

1) If there is a cathodic protection station for Metropolitan's pipeline in the area of the proposed work, it shall be located prior to any grading or excavation. The exact location, description and manner of protection shall be shown on all applicable plans. Please contact Metropolitan's Corrosion Engineering Section, located at Metropolitan's F. E. Weymouth Softening and Filtration Plant, 700 North Moreno Avenue, La Verne, California 91750, telephone (714) 593-7474, for the locations of Metropolitan's cathodic protection stations.

2) If an induced-current cathodic protection system is to be installed on any pipeline crossing Metropolitan's pipeline, please contact Mr. Wayne E. Risner at (714) 593-7474 or (213) 250-5085. He will review the proposed system and determine if any conflicts will arise with the existing cathodic protection systems installed by Metropolitan.

3) Within Metropolitan's rights-of-way, pipelines and carrier pipes (casings) shall be coated with an approved protective coating to conform to Metropolitan's requirements, and shall be maintained in a neat and orderly condition as directed by Metropolitan. The application and monitoring of cathodic protection on the pipeline and casing shall conform to Title 49 of the Code of Federal Regulations, Part 195.

4) If a steel carrier pipe (casing) is used:

(a) Cathodic protection shall be provided by use of a sacrificial magnesium anode (a sketch showing the cathodic protection details can be provided for the designers information).

(b) The steel carrier pipe shall be protected with a coal tar enamel coating inside and out in accordance with AWWA C203 specification.

n. All trenches shall be excavated to comply with the CAL/OSHA Construction Safety Orders, Article 6, beginning with Sections 1539 through 1547. Trench backfill shall be placed in 8-inch lifts and shall be compacted to 95 percent relative compaction (ASTM D698) across roadways and through protective dikes. Trench backfill elsewhere will be compacted to 90 percent relative compaction (ASTM D698).

o. Control cables connected with the operation of Metropolitan's system are buried within streets, its fee properties and/or easements. The locations and elevations of these cables shall be shown on the drawings. The drawings shall note that prior to any excavation in the area, the control cables shall be located and measures shall be taken by the contractor to protect the cables in place.

p. Metropolitan is a member of Underground Service Alert (USA). The contractor (excavator) shall contact USA at 1-800-422-4133 (Southern California) at least 48 hours prior to starting any excavation work. The contractor will be liable for any damage to Metropolitan's facilities as a result of the construction.

8. Paramount Right

Facilities constructed within Metropolitan's fee properties and/or easements shall be subject to the paramount right of Metropolitan to use its fee properties and/or easements for the purpose for which they were acquired. If at any time Metropolitan or its assigns should, in the exercise of their rights, find it necessary to remove any of the facilities from the fee properties and/or easements, such removal and replacement shall be at the expense of the owner of the facility.

9. Modification of Metropolitan's Facilities

When a manhole or other of Metropolitan's facilities must be modified to accommodate your construction or reconstruction, Metropolitan will modify the facilities with its forces. This should be noted on the construction plans. The estimated cost to perform this modification will be given to you and we will require a deposit for this amount before the work is performed. Once the deposit is received, we will schedule the work. Our forces will coordinate the work with your contractor. Our final billing will be based on actual cost incurred, and will include materials, construction, engineering plan review, inspection, and administrative overhead charges calculated in accordance with Metropolitan's standard accounting practices. If the cost is less than the deposit, a refund will be made; however, if the cost exceeds the deposit, an invoice will be forwarded for payment of the additional amount.

10. Drainage

a. Residential or commercial development typically increases and concentrates the peak storm water runoff as well as the total yearly storm runoff from an area, thereby increasing the requirements for storm drain facilities downstream of the development. Also, throughout the year water from landscape irrigation, car washing, and other outdoor domestic water uses flows into the storm drainage system resulting in weed abatement, insect infestation, obstructed access and other problems. Therefore, it is Metropolitan's usual practice not to approve plans that show discharge of drainage from developments onto its fee properties and/or easements.

b. If water must be carried across or discharged onto Metropolitan's fee properties and/or easements, Metropolitan will insist that plans for development provide that it be carried by closed conduit or lined open channel approved in writing by Metropolitan. Also the drainage facilities must be maintained by others, e.g., city, county, homeowners association, etc. If the development proposes changes to existing drainage features, then the developer shall make provisions to provide for replacement and these changes must be approved by Metropolitan in writing.

11. Construction Coordination

During construction, Metropolitan's field representative will make periodic inspections. We request that a stipulation be added to the plans or specifications for notification of Mr. __________ of Metropolitan's Operations Services Branch, telephone (213) 250-____, at least two working days prior to any work in the vicinity of our facilities.

12. Pipeline Loading Restrictions

a. Metropolitan's pipelines and conduits vary in structural strength, and some are not adequate for AASHTO H-20 loading. Therefore, specific loads over the specific sections of pipe or conduit must be reviewed and approved by Metropolitan. However, Metropolitan's pipelines are typically adequate for AASHTO H-20 loading provided that the cover over the pipeline is not less than four feet or the cover is not substantially increased. If the temporary cover over the pipeline during construction is between three and four feet, equipment must restricted to that which

imposes loads no greater than AASHTO H-10. If the cover is between two and three feet, equipment must be restricted to that of a Caterpillar D-4 tract-type tractor. If the cover is less than two feet, only hand equipment may be used. Also, if the contractor plans to use any equipment over Metropolitan's pipeline which will impose loads greater than AASHTO H-20, it will be necessary to submit the specifications of such equipment for our review and approval at least one week prior to its use. More restrictive requirements may apply to the loading guideline over the San Diego Pipelines 1 and 2, portions of the Orange County Feeder, and the Colorado River Aqueduct. Please contact us for loading restrictions on all of Metropolitan's pipelines and conduits.

b. The existing cover over the pipeline shall be maintained unless Metropolitan determines that proposed changes do not pose a hazard to the integrity of the pipeline or an impediment to its maintenance.

13. <u>Blasting</u>

a. At least 20 days prior to the start of any drilling for rock excavation blasting, or any blasting, in the vicinity of Metropolitan's facilities, a two-part preliminary conceptual plan shall be submitted to Metropolitan as follows:

b. Part 1 of the conceptual plan shall include a complete summary of proposed transportation, handling, storage, and use of explosions.

c. Part 2 shall include the proposed general concept for blasting, including controlled blasting techniques and controls of noise, fly rock, airblast, and ground vibration.

14. <u>CEQA Requirements</u>

a. <u>When Environmental Documents Have Not Been Prepared</u>

1) Regulations implementing the California Environmental Quality Act (CEQA) require that Metropolitan have an opportunity to consult with the agency or consultants preparing any environmental documentation. We are required to review and consider the environmental effects of the project as shown in the Negative Declaration or Environmental Impact Report (EIR) prepared for your project before committing Metropolitan to approve your request.

2) In order to ensure compliance with the regulations implementing CEQA where Metropolitan is not the Lead Agency, the following minimum procedures to ensure compliance with the Act have been established:

a) Metropolitan shall be timely advised of any determination that a Categorical Exemption applies to the project. The Lead Agency is to advise Metropolitan that it and other agencies participating in the project have complied with the requirements of CEQA prior to Metropolitan's participation.

b) Metropolitan is to be consulted during the preparation of the Negative Declaration or EIR.

c) Metropolitan is to review and submit any necessary comments on the Negative Declaration or draft EIR.

d) Metropolitan is to be indemnified for any costs or liability arising out of any violation of any laws or regulations including but not limited to the California Environmental Quality Act and its implementing regulations.

b. <u>When Environmental Documents Have Been Prepared</u>

If environmental documents have been prepared for your project, please furnish us a copy for our review and files in a timely manner so that we may have sufficient time to review and comment. The following steps must also be accomplished:

1) The Lead Agency is to advise Metropolitan that it and other agencies participating in the project have complied with the requirements of CEQA prior to Metropolitan's participation.

2) You must agree to indemnify Metropolitan, its officers, engineers, and agents for any costs or liability arising out of any violation of any laws or regulations including but not limited to the California Environmental Quality Act and its implementing regulations.

15. <u>Metropolitan's Plan-Review Cost</u>

a. An engineering review of your proposed facilities and developments and the preparation of a letter response

giving Metropolitan's comments, requirements and/or approval that will require 8 man-hours or less of effort is typically performed at no cost to the developer, unless a facility must be modified where Metropolitan has superior rights. If an engineering review and letter response requires more than 8 man-hours of effort by Metropolitan to determine if the proposed facility or development is compatible with its facilities, or if modifications to Metropolitan's manhole(s) or other facilities will be required, then all of Metropolitan's costs associated with the project must be paid by the developer, unless the developer has superior rights.

b. A deposit of funds will be required from the developer before Metropolitan can begin its detailed engineering plan review that will exceed 8 hours. The amount of the required deposit will be determined after a cursory review of the plans for the proposed development.

c. Metropolitan's final billing will be based on actual cost incurred, and will include engineering plan review, inspection, materials, construction, and administrative overhead charges calculated in accordance with Metropolitan's standard accounting practices. If the cost is less than the deposit, a refund will be made; however, if the cost exceeds the deposit, an invoice will be forwarded for payment of the additional amount. Additional deposits may be required if the cost of Metropolitan's review exceeds the amount of the initial deposit.

16. Caution

We advise you that Metropolitan's plan reviews and responses are based upon information available to Metropolitan which was prepared by or on behalf of Metropolitan for general record purposes only. Such information may not be sufficiently detailed or accurate for your purposes. No warranty of any kind, either express or implied, is attached to the information therein conveyed as to its accuracy, and no inference should be drawn from Metropolitan's failure to comment on any aspect of your project. You are therefore cautioned to make such surveys and other field investigations as you may deem prudent to assure yourself that any plans for your project are correct.

RE: SCH# 2014081106 Enhanced Watershed Management Programs (EWMP) Program EIR, Los Angeles County.

Dear Mr. BeGell,

The Native American Heritage Commission (NAHC) has reviewed the Notice of Preparation (NOP) referenced above. The California Environmental Quality Act (CEQA) states that any project that causes a substantial adverse change in the significance of an historical resource, which includes archeological resources, is a significant effect requiring the preparation of an EIR (CEQA Guidelines 15064(b)). To comply with this provision the lead agency is required to assess whether the project will have an adverse impact on historical resources within the area of project effect (APE), and if so to mitigate that effect. To adequately assess and mitigate project-related impacts to archaeological resources, the NAHC recommends the following actions:

- ✓ Contact the appropriate regional archaeological Information Center for a record search. The record search will determine:
  - If a part or all of the area of project effect (APE) has been previously surveyed for cultural resources.
  - If any known cultural resources have already been recorded on or adjacent to the APE.
  - If the probability is low, moderate, or high that cultural resources are located in the APE.
  - If a survey is required to determine whether previously unrecorded cultural resources are present.
- ✓ If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
  - The final report containing site forms, site significance, and mitigation measurers should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum, and not be made available for pubic disclosure.
  - The final written report should be submitted within 3 months after work has been completed to the appropriate regional archaeological Information Center.
- ✓ Contact the Native American Heritage Commission for:
  - A Sacred Lands File Check. **USGS 7.5-minute quadrangle name, township, range, and section required**
  - A list of appropriate Native American contacts for consultation concerning the project site and to assist in the mitigation measures. **Native American Contacts List attached**
- ✓ Lack of surface evidence of archeological resources does not preclude their subsurface existence.
  - Lead agencies should include in their mitigation plan provisions for the identification and evaluation of accidentally discovered archeological resources, per California Environmental Quality Act (CEQA) Guidelines §15064.5(f). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American, with knowledge in cultural resources, should monitor all ground-disturbing activities.
  - Lead agencies should include in their mitigation plan provisions for the disposition of recovered cultural items that are not burial associated, which are addressed in Public Resources Code (PRC) §5097.98, in consultation with culturally affiliated Native Americans.
  - Lead agencies should include provisions for discovery of Native American human remains in their mitigation plan. Health and Safety Code §7050.5, PRC §5097.98, and CEQA Guidelines §15064.5(e), address the process to be followed in the event of an accidental discovery of any human remains and associated grave goods in a location other than a dedicated cemetery.

Sincerely,

Katy Sanchez

Subject: COMMENTS ON NOTICE OF PREPARATION FOR DRAFT PROGRAM EIR FOR ENHANCED WATERSHED MANAGEMENT PROGRAMS FOR LA COUNTY

Grassroots Coalition submits its support of the comments made below by Mr. Rex Frankel.
Due on the 29th, GC was in transit from out of state and belatedly requests that its support of the comments below be part of
the record.
Please also note attachment of imagery of California.
Currently, the State Coastal Conservancy and the Dept of Fish and Wildlife have created a preordained outcome for the Ballona Wetlands Restoration. This outcome that has been determined to destroy the freshwater aquifers of Ballona (classified as potential drinking water) without the legal requirements of public participation and transparency of process that the millions of dollars of public bond money set forth in 2004. Such destructive plans to the watershed of the Ballona Valley should not be allowed to proceed.
The failure of the state to fully engage the public and provide accountability and transparency of process has led to the
dire situation of groundwater removal that CAlifornia and Ballona Wetlands have.

I understand why no one but myself attended the NOP hearing on September 9th in Marina Del Rey. You have no specific projects to analyze for environmental impacts. You are attempting to analyze the environmental impact of words, not specific actions. It is impossible to analyze the impacts of no stated physical projects, just as it is impossible to analyze those unstated projects' impacts on the environmental setting, ie., the proper baseline, because you have no specific locations for these unspecified projects. Thus all you can say is to analyze the entire county. The two most essential parts of an environmental analysis are missing here: specific projects and specific sites. You have the process all backwards here, and thus, commenting on this NOP in any specific manner is impossible.

Some background: In 2002, local governments settled lawsuits and agreed to consent decrees and promised to stop violations of bacterial health codes at our beaches by 2021. This agreement gave the public agencies an extension beyond the original deadline of 2013 but only if the projects created new parkland and river corridors that could catch and clean water before it fouled the beaches.

In 2006, L.A. City proposed its first big plan under this agreement, an Implementation Plan for the Santa Monica Bay Beaches watersheds. This plan was sent back for redrafting by the RWQCB as it only reached 2% of its target and thus, would not accomplish the goal in the consent decree.

Also in 2006, L.A. city proposed the Integrated Resource Plan which mainly focused on building 25 Hyperion-style urban runoff treatment plants which would have cost the average homeowner ratepayer $400 a month. This plan went nowhere.

In 2012, the County Supervisors tried to quietly approve a $300 million per year property tax hike to build a non-existent list of runoff cleansing and capturing projects. Howls of opposition arose and that plan went nowhere. The public wanted to know what they were paying for.

Now, you are finally starting to design the cleanup plan. But how can you ask the public to weigh in on the scope of the environmental analysis of that plan, when your description of that plan contains no specifics? Your stated plan to defer the environmental analysis of specific project impacts to when each one is up for approval thus ignores the cumulative impacts and therefore is "piecemealing", by starting major momentum of a project that is composed of many necessary parts, yet deferring analysis and the controversy to a multitude of separate EIRs and CEQA documents and public hearings, all the while public input is diffused. We never get to weigh in on whether we like the complete plan because the Program EIR has no specifics to arouse concern and the real project discussion is delayed until much later in a way that requires massive efforts by the public to keep track of the success of the big plan.

The people who will pay for this plan want to see the specifics before you raise our taxes to pay for it. We want expanded and unpaved river corridor parks. We do not want the plan to include converting existing wetlands and wildlife habitat into pollution dumps and sumps. We want what we were promised, not a lame compromise that puts the cleanup burden on existing public lands, parks and house front yards. We want a complete plan for us to judge whether it will accomplish its promises and goals before you produce an EIR, not the other way around.

Please put me on the notification list for all actions relating to this project. Thank you.

ADDITIONAL COMMENTS ON EWMP NOP: October 29, 2014

The problem I have with a Program EIR for a "program" that is devoid of a list of all necessary specific projects is that it short-circuits the cumulative impacts review plus it facilitates illegal piecemealing of the many TMDL compliance projects. A program EIR can be allowed when the individual and currently unknown specific sub projects have "independent utility", thus building and analyzing them separately has no impact on the effectiveness of the other sub projects, nor does it make it mandatory that these other projects also be approved. That is not the case here. The goal of the EWMP and the sub projects is "to achieve permit compliance with RWLs" (NOP page 7 paragraph 3 and page 8, paragraph 1). Thus, all projects must be approved and successfully achieve their goals or the region will not be in compliance with the 2012 MS4 permit, the Federal Clean Water Act and the NPDES permits. If only some of the projects prove feasible and buildable, the construction of the others will not result in CWA compliance. That begs the question of is this project worthwhile if piecemealed at all? Will the beach only be clean in certain locations along the shore, while others will not be as a treatment strategy proved too expensive or technologically infeasible? If the taxpayers ultimately decide this project is too expensive, but certain parts are already built, does that mean that pulling-the-plug will result in non compliance and thus a waste of the taxpayers' dollars already spent? This s

How can the public know if the permits and Clean Water Act will be complied with if the approval of the individual pieces of the compliance strategy are broken up into numerous pieces each receiving their own separate CEQA review? All of this leads me to conclude that the specific projects must be reviewed and approved as part of a master plan project, with the public knowing the full cost of compliance, the full impacts of all projects and alternative policy choices. One specific alternative, distasteful as I find it, would be analysis of only building some projects and also enforcing no-swimming rules for three days after rainfall at beaches.

I will repeat the conclusion of my first NOP comments: The people who will pay for this plan want to all of the see the specifics before you raise our taxes to pay for it. We want expanded and unpaved river corridor parks. We do not want the plan to include converting existing wetlands and wildlife habitat into pollution dumps and sumps. We want what we were promised, not a lame compromise that puts the cleanup burden on existing public lands, parks and house front yards. We want a complete plan for us to judge whether it will accomplish its promises and goals before you analyze and mandate it with an EIR, not the other way around.

Rex

Thank you for your comments. It will be reviewed for use in the PEIR.

Yes, when people think of an EIR they are thinking of a project. This is a Program EIR, the main PEIR document contains some projects as examples but it’s a program.

We are presently working on the PEIR, check our website for information and details.
www.LACoH2Osheds.com. We will be posting the PEIR plus public review meetings on the website.

SUBJECT: **County of Los Angles, Enhanced Watershed Management Plan**
Scoping for Programmatic EIR

RE: **COMMENTS for Enhanced Watershed Management Plan PEIR CS-CH#2014081106**
Based on NOP and other project information downloaded from www.LACoH2Osheds.com.

Thank you for the opportunities to comment on the Notice of Preparation/Initial Study (NOP/IS) and other Scoping documents related to the proposed LA County Enhanced Watershed Management Plan (EWMP). Also thank you for the extension of the deadline for such comments, I believe it was very helpful for our commenters.

I could have continued for many more pages but I have been exhausted by the lack of real effort on the part of the preparers to make the Enhanced Watershed Program project meaningful, adequate, and complete and initially assess its secondary and tertiary impacts for knowledgeable public reviewers. Unfortunately the current NOP/IS and supporting documents appears to be an initial version of the vague program that has been developed by others, rather than a project or even program level DEIR preparation and is in need of major tecchnical additions, editing, technical, and other revisions. The Scoping documents are inadequate and incomplete for the purposes of Scoping, and Scoping documents must updated, revised, and reissued. If you need further clarifications and many more comments, I am available for discussions or correspondence with your staff.

Dr. TW: Background: 40+ years with Worldwide/California water resources, management plans, water supplies, water distribution and transmission systems, and remote water resources development, with preparation, review, and commenting for 300+ EIRs/EISs/EAs (1972 to Date) and with 30+ years in Parsons and URS Corporations, 12+ years with Dubai Govt./Dubai World, and 6+years with Sierra Club Angeles Chapter (Water, Transportation, and Oil and Gas Comtes) and Citizens Coalition for a Safe Community.

Thank you for the opportunity to review and comment. Our comments form two parts: general and specific comments, as shown below for the Section and the two segments.

I have tried to provide citations in comment format with Doc./page/paragraph. Where appropriate, text has been inserted from documents and emphasis added usually as **<u>bolded/underlines</u>**. ***Comments/Requests are added in bolded/italics.***

Dr. Tom Williams
323-528-9682

1. GENERAL COMMENTS

1-1 Scoping and Project/Program Purposes and Needs

The Program description for any DEIR or PDEIR must include the basis of the project: Purposes, Needs Goals, Objectives,

Absence of clearly defined purposes and need, goals and objectives, and priorities renders both the Program and Projects virtually non-reviewable and thereby inadequate and incomplete for public review and comment.

Without purposes and needs/goals and objectives, the public and reviewers cannot be expected to provide reasonable alternatives.

NOP/IS

p.1/par.2 The **purpose** of the MS4 Permit is to ensure Permittees are not causing or contributing to exceedances of water quality **objectives** or impairments of beneficial uses in the receiving waters of the Los Angeles region.

7/3 2.2 States are required not only to identify these "water quality limited segments" but also to prioritize such waters for the **purpose of developing Total Maximum Daily Loads** (TMDLs).

9/5 4.1.1 Capture and Use BMPs collect and use stormwater where applicable for **purposes** such as irrigation.

1/3 The overarching **goal** of BMPs in the EWMP is to reduce the impact of stormwater and non-stormwater on receiving water 2/1 quality and address the water quality priorities as defined by the MS4 Permit.

2/1 The development of each EWMP will involve the evaluation and selection of multiple BMP types, including nonstructural (institutional) and distributed, centralized, and regional structural watershed control measures, that will be implemented to meet **compliance goals and strategies under the 2012 MS4 Permit**.

8/7 The overarching **goal** of BMPs in the EWMPs is to reduce the impact of stormwater and non-stormwater on receiving water quality and to address water conservation and the water quality **priorities**.

11/3 The MS4 permit allows Permittees to customize MCMs to address high-priority water quality **goals** within their watersheds.

13/2 The PEIR will examine the project's effects on global climate change and evaluate consistency of the project with the State's GHG emissions reduction **goals**.

Scoping Meeting - Pic 4

• **Project Purpose:** MS4 Permit Compliance (R4-2012-0175)
– Each Permittee is responsible for its local MS4 compliance
– Permit compliance through EWMPs
• 12 NOIs submitted to LARWQCB
• Collectively prepared by participating Permittees
– Los Angeles Regional Water Quality Control Board (LARWQCB) approves EWMPs

1-2 PEIR Contents

1-2 Total lack of reference to assignment of significance and related mitigation.

NOP/IS lacks clear definition and presentation as to potential effects, scopes, and schedules of the program and related projects and their implementation, construction, and operations.

As a water resources project, the physical changes represent a small portion of the overall potential effect of the program and projects, and the NOP does not reflect the systemic nature of water resources effects on the environment.

The NOP and the PDEIR andd PjDEIRs must clearly provide a Scope for each basin, schedules, and related environmental sectors, a Schedule for "implementation", construction, and "operations" (?=forever).

The PEIR will -

"result from implementation of the projects and management actions identified in each EWMP
"result from the construction and operation of EWMP projects,
"focus on potential effects.
"assess the physical changes...including direct, indirect, and cumulative impacts.
"identify mitigation measures to minimize potentially significant impacts of each EWMP.
"anticipated to evaluate...following preliminary listing of environmental issues.

RB-AR 9026

1-3. Environmental Resources, Setting, and Effects - Employment, Costs, Revenues, and Socieconomics

Employment, Costs, Revenues, and Socioeconomics Although mentions are made regarding economic and employment effects related to the Program and its projects, no costs-benefits, financials/funding sources, or other revenues assessments are included in the NOP.

Similarly, socioeconomics for major infrastructure programs and projects are closely related to "Environmental Justice" of those receiving benefits and those experiencing adverse effects directly through water-related operations and indirectly through direct/indirect payments for such effects and prospective benefits for those with much largely parcels and incomes.

5/1 The primary approach to each of the EWMPs, as identified in the Draft Work Plans, includes identifying community-friendly, **cost-effective methods** of reducing urban runoff pollution and incorporating distributed and centralized structural and nonstructural watershed control measures for a multi-pollutant, multi-benefit approach.

8/3 The EWMPs include multi-benefit stormwater management projects that may also provide environmental, aesthetic, recreational, water supply, and/or other community enhancements **cost-effective manner**.

11/1 Most institutional BMPs are implemented to meet Minimum Control Measure (MCM) requirements in the MS4 permit; MCMs are considered a subset of institutional BMPs. MCMs do not involve construction of facilities that physically remove pollutants, but **may involve costs associated with the procurement and installation** of items such as signage or spill response kits.

12.3 Air Quality Construction and operation of EWMP projects could cause air emissions...vehicle trips associated with **any increases in employment**....

14/3 Population...The PEIR will, however, identify current population and **employment projections**...

1-4 Controversies Regarding Program/Projects --- Stormwater Fees

Since the LACo Board of Supervisors have experienced significant controversy regarding the imposition of parcel fees for stormwater revenue and funding and has further created controversies regarding reassignment of parcel-area fees to parcel only fees, a thorough review of the economic, employment, and environmental justice issues must be addressed and defined for the NOP/IS,

As currently understood but avoided in Water agency and County presentations, an increase (e.g., x2+) in LACo stormwater fees would be applied on a parcel basis (no matter the size of parcel) as being proposed under the 2014 Measure P initiative which has no relationship to stormwater runoff and effects, compared to the current Recreation and Parks 1990s initiative which are based on parcel area (sqft) fees. For stormwater generation, area is directly related stormwater generation (e.g., 5000sqft may generate less runoff than 50,000sqft lots).

Therefore the NOP has not discussed the socioeconomic effects and related Environmental Justice issues related to the proposed program and the related controversy. A thorough assessment of all related revenue/costs issues must be presented in the PDEIR, including sources of revenues, revenue streams for life-of-project costs (especially for operations, maintenance, and replacements), basis for revenues (by parcel or by parcel-area), and Environmental Justice (which is not mentioned any where in the NOP/IS or presentation).

1-5 Mitigation Measures

Inconsistency uses and lack of definitions for most if not all related terms.

activities of "develop", identify", "proposed", or "evaluate".

to reduce potential, reduce the level, reduce potential adverse effect, any significant effects, to avoid,

are reduced or avoided, recommend

Vague generalities are presented and are so inconsistently applied within the same or related paragraphs as to render the entire presentation as useless.

The PDEIR must clearly present in matrices with links to discussions and appendices the project and program effects (quantifiedd/ranked), levels of significance for each sector/parameter, criteria levels for significances, proposed mitigations/compensations for significant effects, and a quantitative ranking of the effects levels following mitigation/compensation.

Lack of Mitigation

1-6 No measures are mentioned for many sectors but no basis could be established for such omissions, and comparable effects could be expected within these sectors similar to those that had need for measures mentioned.

12/2 Aesthetics ***No mitigation mentioned.***
12/4 Biology... ***No mitigation mentioned.***
13/2 Greenhouse Gases ***No mitigation mentioned***.
13/6 Land Use... ***No mitigation mentioned.***
14/4 Public Services... ***No mitigation mentioned.***
15/1 The PEIR will **evaluate potential energy consumption** associated with implementation of structural and nonstructural BMPs. ***No mitigation mentioned for Energy***

1-7 Mitigation, protection, and other measures and strategies are mentioned along with textual review of environmental sector but without any clear and concise statement of what they are, when they would be used, and how they could affect impacts, effects, and conditions. Mitigation measures in the Scoping NOP/IS are inconsistently mentioned as shown below.

Mitigation or compensation is required by CEQA for significant impacts.

Although mitigation is mentioned in the NOP/IS, mitigation and compensation are not mentioned in the Scoping Presentation slides; in reverse of "Alternatives", not mentioned in NOP/IS but present once in the Presentation.

Various terms - without definitions and consistent uses.

Protection measures mitigation strategies
significant effects
significant impacts
potentially necessary significant impacts
mitigate secondary effects of growth

As lead agency for the program LACo must clearly state the sole responsibility for thorough and consistent implementation in all projects of CEQA compliance and consistency of impact mitigation and compensation (including Environmental Justice and Socioeconomics).

The recirculated NOP/IS and PDEIR must provide a thorough presentation of:

Definitions of all related terms,
Process and quantified analyses for establishing the level of effects, mitigation, and remaining adverse effects and potential subjects of compensation,
Consistency of mitigations amongst all watersheds,
All current mitigation and compensation measures planned or anticipated by the Program and Project proponents, and
Explanation of absence of mitigation or compensation.

Examples

12/3 Air Quality...The PEIR...will **develop** mitigation measures if necessary to **reduce potential impacts**.

12/5 Cultural Resources Mitigation measures will be **identified** if necessary to **reduce the level of impact where possible**.

13/1 Geology... The PEIR will identify mitigation measures if necessary to **reduce potential adverse effects** to proposed facilities.

13/3 Hazards... Mitigation measures will be **proposed** if necessary to **reduce any significant effects** of the project...enountered during construction would be handled in accordance with applicable regulations.

13/4 Hydrology... The PEIR will identify stormwater quality **protection measures** required during construction and operation of proposed facilities. The PEIR also will **evaluate** potential impacts to flood control capacity and **develop mitigation strategies** if necessary **to avoid significant impacts**.

13/5 The PEIR will **evaluate** potential effects of increased storm water recharge and will identify mitigation measures if necessary to ensure that **potentially necessary significant impacts are reduced or avoided**.

14/2 Noise... The PEIR will **recommend mitigation strategies** to ensure that proposed EWMP projects implemented by local agencies comply with local noise policies and ordinances.

14/3 Population... The PEIR will...identify local planning jurisdictions with the authority to approve growth and **mitigate secondary effects of growth**.

14/5 Traffic... The PEIR will **identify mitigation strategies to reduce any potential effects**.
14/6 Utilities... The PEIR will **evaluate the project's potential to affect utilities** and will **identify mitigation measures to minimize the effects**.

***1-8 Alternatives** Although the project proponent has chosen to prepare an Environmental Impact Report, no mention is made regarding alternatives in the Initial Study/NOP. Only one reference to alternatives in all available related documents occurs in Slide 28, "Issues to be Analyzed" in the PEIR Scoping Presentation.*

As the preparer included one reference to Alternatives, complete exclusion of such from the IS/NOP represents an arbitrary and incomplete presentation of CEQA documents. Without a clear concise statement of purposes and needs (goals and objectives, etc.), reasonable alternatives cannot be developed through the public participation and have not been developed by the watershed stakeholders.

LACo must revise and recirculate the NOP.

LACo must include a thorough description of Purposes and Needs for the project, quantification of such P&Ns, detailed quantified analyses as to how the Program achieves such P&Ns, basis for development of other alternative programs and projects within each alternative, and an assessment as to the best available alternative.

Some prospective alternatives include:

- ***Single parcel fee assessment for 20-plus year full Administration, O&M and replacements;***
- ***Parcel-Area fee assessment for 20-plus year full Administration, O&M and replacements;***
- ***Hybrid Parcel-Area/Runoff fee assessment for 20-plus year full Administration, O&M and replacements;***
- ***Zero-Parcel Discharge Assessment and fee adjustment for 20-plus year full Administration, O&M and replacements;***
- ***Large-Parcel and Large Discharge Assessment and fee increments for 20-plus year full Administration, O&M and replacements;***
- ***Full capture and recharge of flows of >100cfs from all waterways;***

***1-9 Mitigation Monitoring and Report Plan** The Draft Programmatic Environmental Impact Reports must include draft plans for the implementation, monitoring, and enforcements of the Mitigation Monitoring, and Reporting Plan for the Program. Also the PDEIR and draft Programmatic MMR Plan must provide the descriptions and process for funding, staffing, means, monitoring, enforcement, and reporting for the public for the monitoring of all Project-Level activities and compliance which must be subject to noticing/subscriptions, public reviews, and comment as part of the project-DEIR processes and not wait until the "Final EIR" is circulated for projects.*

***1-10 Scoping Report** Because of the poor development of the NOP/IS and lack of coordination between the LACo efforts and those projected for the individual Project DEIRs and dispersed responsibilities for compliance and responsibilities, following the October 29th deadline for these comments, we request that LACo recirculate the entire NOP/IS, and if not done issue a Scoping Report ass to the LACo responses to comments and the table of contents for the PDEIR in order to establish the level of incorporation provided for the Scoping comments herein.*

1-11 As indicated elsewhere many terms have been used and will be used inconsistently in the NOP/IS and Scoping Presentation and has created confusion and such must be avoided in the PDEIR.

The PDEIR must contain a single glossary and set of definitions for all terms for the PDEIR, and preparers and editors must assure full and specific compliance and consistency for all usage. Such a glossary may be included as an appendix with proper references throughout the PDEIR.

***1-12 Program Compliance and Monitoring** The LACo, Department of Public Works, Flood Control District is assumed to be in charge of the EWMP Program and has 12 groups responsible for specific areas and is related to the Los Angeles Regional Water Quality Control Board through the MS4 permit and sub-permits for water quality and flows within the Program regional and*

area watersheds. No formal agreement has been presented as part of the NOP/IS and discussion seems to differ between the NOP/IS and the Scoping Presentation. As the LACFCD is scoping the PDEIR, reviewers must assume that only the LACo shall answer to the LARWQCB for compliance and monitoring for the next 20 years and that LACo shall have the powers, staffing, expertise, and funding to assure compliance of 12 different agencies/sub-permittees.

The Program description of the PDEIR must clearly and concisely present the administrative and operational arrangement and oversight assurance mechanisms to achieve implementation of all aspects of the MS4 permit and sub-permits and any and all CEQA and MS4 permit terms, conditions, mitigations, and compensations which may be related the Program and its projects. All contractual, regulatory, and judicial records must be provided as appendices and referenced within the text.

1-13 During a 20+ year Program, Implementation and Enforcement of all elements for 12+ different plans represent a major quality control/assurance and management and must be provided with adequate enforcement capabilities and support. The LACo, Department of Public Works, Flood Control District is assumed to be in charge of the EWMP Program and has 12 groups responsible for implementation, completion, and enforcement activities related to but in addition to those of the Los Angeles Regional Water Quality Control Board through the MS4 permit and sub-permits for water quality and flows within the Program regional and area watersheds.

No formal management and enforcement agreement has been presented as part of the NOP/IS and the Scoping Presentation. As the LACFCD is scoping the PDEIR, reviewers must assume that only the LACo shall answer to the LARWQCB for implementation and enforcements for the next 20 years and that LACo shall have the powers, staffing, expertise, and funding to assure implementation and enforcement with 12 different agencies/sub-permittees.

Fundamentally, will LACFCD or LARWQCB assess penalties against the sub-permittees for lack of timely implementation, achievement, and penalties.

The Program description of the PDEIR must clearly and concisely present the administrative and operational arrangement and quality-controls/assurance processes to achieve initiation and completion of all aspects of the MS4 permit and sub-permits and assignment of penalties , both financial and organizational for any and all CEQA and MS4 permits which may be related the Program and its projects. The LACFCD must also have the specific powers to assume direct authority over any projects under its responsibilities to the LARWQCB, and such must be documented within the PDEIR and PFEIR as appendices and referenced within the text

Environmental Sectors

2-1 No mention is made of "wetlands" which are often not included under either riparian (trees and bushes with dry land beneath) or aquatic habitats (open and standing water). Although this is one of the few specific habitats with federal and special protections, it is not mentioned which indicates the lack of background on the preparers part or a specific avoidance of controversial issues. The current NOP/IS lack competence, adequacy, and completeness for the public and stakeholder to review and comment upon the scope and specificity requireed for the PDEIR and subsequent PjDEIRs.

Revise and recirculate the entire NOP/IS and related documents.

The recirculation NOP/IS and the PDEIR must contain a general map of the Program and area maps for each of the projects with the following:

all existing delineated riparian, wetlands, and aquatic habitats;

related existing upstream and adjacent infiltration, recharge, and liquefaction areas;

potential groundwater movement patterns for 1500ft upstream and downstream of wetlands and riparian habitats; and

current surface water flows for 1500ft upstream and downstream of wetlands and riparian habitats.

12/4 **Biological Resources** Implementation of the EWMP projects could occur within existing sensitive habitats...result in changes to wildlife habitat, disruption of natural movement corridors, fragmentation or isolation of wildlife habitats, and disturbance of sensitive species during construction or operation...could alter **riparian and aquatic habitats**. The PEIR will evaluate the

RB-AR 9030

potential for such facilities to impact biological resources and will also discuss local ordinances and state and federal regulations governing biological resources.

2-2 Geology and Groundwater   Slight mention is made of groundwater, infiltration, recharge, and related liquefaction although much of the stormwater reduction must depend upon groundwater storage of captured runoff. The General Plan has not specific policies regarding changing the entire groundwater regime by massive expansion of septic tank/leach field system in another LACo project (i.e., Hauled Water Initiative) and this Programs LID and related recharge systems.

No information has been provided as to where recharge/infiltration areas are in relation to liquefaction zones and their drier extensions of alluvium and other permeable soils and bedrock.

The recirculation NOP/IS and the PDEIR must contain a general map of the Program and area maps for each of the projects with the following:

All geologically potential recharge/infiltration areas, existing recharging project, and proposed recharging areas and of all areas with more than 10 septic tanks per any 100 acres;

Currently delineated liquefaction areas and geologically similar surface materials which are not now considered as liquefiable due to lack of high groundwater tables;

Known groundwater levels and elevations of stream beds downslope of the groundwater tables; and

Anticipated local and project recharging rates.

12/6 5.   Geology, Soils, and Seismicity   Southern Los Angeles County is a seismically active region. The proposed EWMP BMPs would require **construction** of structural BMPs that could be subject to potential seismic and geologic hazards, including   13/1   ground shaking, **liquefaction**, soil stability conditions, soil erosion rates, expansive soils, and landslides.   Policies provided in the County's General Plan and applicable standard County requirements will be evaluated as to their effect of **mitigating or avoiding any potentially significant effects.**...

13/4   Hydrology and Water Quality   Implementation of the proposed EWMP BMPs may change **local drainage patterns at construction sites**,...which could affect the hydrology, hydraulics, and/or water quality of streams, rivers, and other receiving waters...The PEIR also will evaluate potential impacts to flood control capacity and develop mitigation strategies if necessary to avoid significant impacts.

13/5   Implementation of the proposed EWMP BMPs would likely result in **increased infiltration and recharge** in various locations throughout the EWMP watersheds. **Such activities could affect local groundwater levels and water quality**. The PEIR will evaluate potential effects of **increased storm water recharge** and will identify mitigation measures if necessary to ensure that potentially necessary significant impacts are reduced or avoided.

2-3   Hazards and Groundwater Recharge   No mention is made regarding the influence of groundwater movements upon hazards and hazardous materials in the soil/alluvium/bedrock context. Groundwater plumes have cause major expansions of underground contamination from storage tanks and contaminated soil. Contaminated groundwater in the northeastern and western San Fernando Valley and elsewhere are known to be migrating based on the groundwater flows and basin pumping for water supplies.

Current LACo policies do not reflect the responsibilities and liabilities of LACo approved watershed plans causing the changes of hazardous materials migration induced by groundwater flows fed by LACo and agency approved recharge/infiltration projects.

No information has been provided as to where recharge/infiltration areas, groundwater flows, and known or expected contaminated groundwater and soils, and potential routes for plume migration through extensions of alluvium and other permeable soils and bedrock.

The recirculation NOP/IS and the PDEIR must contain a general map of the Program and projects' area maps with the following:

Known subsurface contaminated soils and groundwater and active remediation sites;

Known pump/treat/use or pump/treat/recharge projects;

Current and expected recharge/infiltration areas; and

Known/Expected groundwater migration pathways.

13/3   **Hazards and Hazardous Materials**   Excavation during construction of proposed EWMP BMPs could uncover **contaminated soils or hazardous substances** that pose a substantial hazard to human health or the environment...The policies provided in the County's General Plan and any standard County requirements will be evaluated as to their effect of mitigating or avoiding any potentially significant effects.

2-4 Socioeconomics (including Total and Disposal Incomes, Employment, Existing Infrastructure Costs, and Property and Other Revenues)

No information has been provided as to any socioeconomic setting, effects, and mitigation for the program or the projects.

The recirculation NOP/IS and the PDEIR must contain an overall socioeconomic review of the Program area and separate project area for each of the projects with the following:

Educational, employment, age/gender, and other socioeconomic parameters to characterize the areas for the Program and its projects;

Incomes, Current Taxes and Fees, and other Ability-To-Pay parameters to characterize the areas for the Program and its projects;

Existing Special Assessment Districts and Other Urban Costs for Local Residents and Property Owners for the Program's and its projects' areas; and

State and conditions of existing infrastructure and potential for major future projects in the same Program's and its projects' areas.

2-5 "Environmental Justice" No information has been provided as to any information regarding the setting, effects, and mitigation for the program or the projects related to issues of Environmental Justice.

The recirculation NOP/IS and the PDEIR must contain an overall and specific projects' Environmental Justice review of the similar major infrastructure programs and projects as related to those receiving benefits and those experiencing adverse effects directly through water-related operations and indirectly through direct/indirect payments for such effects and prospective benefits for those with much largely parcels and incomes.

2-6 Mitigation Monitoring and Reporting Plan The Draft Programmatic and Draft Project Environmental Impact Reports must include tiered draft plans for the implementation, monitoring, and enforcements of the Mitigation Monitoring, and Reporting Plan which will be subject to public review and comment as part of the DEIR processes and not wait until the "Final EIR" is circulated.

DEPT. PUBLIC WORKS
PROJECT MANAGEMENT DIVISION II

August 29, 2014

To: Reviewing Agencies

Re: Enhanced Watershed Management Programs (EWMP) Program EIR
SCH# 2014081106

Attached for your review and comment is the Notice of Preparation (NOP) for the Enhanced Watershed Management Programs (EWMP) Program EIR draft Environmental Impact Report (EIR).

Responsible agencies must transmit their comments on the scope and content of the NOP, focusing on specific information related to their own statutory responsibility, within 30 days of receipt of the NOP from the Lead Agency. This is a courtesy notice provided by the State Clearinghouse with a reminder for you to comment in a timely manner. We encourage other agencies to also respond to this notice and express their concerns early in the environmental review process.

Please direct your comments to:

Gregg BeGell
Los Angeles County Flood Control District
900 South Fremont Avenue, 11th Floor
Alhambra, CA 91803

with a copy to the State Clearinghouse in the Office of Planning and Research. Please refer to the SCH number noted above in all correspondence concerning this project.

If you have any questions about the environmental document review process, please call the State Clearinghouse at (916) 445-0613.

Sincerely,

Scott Morgan
Director, State Clearinghouse

Document Details Report
State Clearinghouse Data Base

SCH# **2014081106**
Project Title Enhanced Watershed Management Programs (EWMP) Program EIR
Lead Agency Los Angeles County Flood Control District

Type **NOP** Notice of Preparation

Description The development of the EWMP will involve the evaluation and selection of multiple watershed control measures or best management practices (BMP) types including non-structural and distributed, centralized and regional structural BMPs. These BMPs will be implemented to meet compliance goals and strategies under the 2014 MS4 Permit. Structural BMPs involve the construction of a physical control measure to alter the hydrology and/or water quality of incoming stormwater or non-stormwater. The three major functions for structural BMPs are infiltration, water quality treatment, and storage. These are three categories of structural BMPs, defined by the runoff area treated by the BMP and the required retention volume in accordance with the Permit.

Appendix D
Sensitive Natural Communities Descriptions

APPENDIX D

Sensitive Natural Communities Descriptions

California Walnut Woodland[1]

Description: Similar to and intergrading with Interior Live Oak Woodland or Coast Live Oak Woodland, but with a more open tree canopy dominated by *Juglans californica*. The open tree canopy allows development of a grassy understory. In most sites, this understory is composed of introduced winter-active annuals that complete most of their growth cycle before the deciduous *Juglans* leafs out in spring. *Site Factors*: On relatively moist, fine-textured soils of valley slopes and bottoms, as well as encircling rocky outcrops. These drier, rocky sites often support Venturan or Riversidian Sage Scrub. Intergrades with Coast Live Oak Woodland or Coast Live Oak Forest on more mesic sites, especially in canyons.

Characteristic Species: *Juglans californica*, *Quercus agrifolia*, *Q. engelmannii*, *Rhus ovata*, *R. trilobata*, [*Bromus rubens*],[*Marrubium vulgare*]

Distribution: South side of San Gabriel Mountains to the Santa Ana Mountains, mostly between 500 feet and 3,000 feet.

Canyon Live Oak Ravine Forest*

Description: Similar to Coast Live Oak Forest, but usually denser and not so tall. Dominated by *Quercus chrysolepis*, a broadleaved sclerophyll. Typically forms forests with little understory up to 20 m tall in canyons. Trees often with multiple trunks, probably from crown-sprouting after fires. Growing season from late spring into summer, similar to that of Lower Montane Coniferous Forests.

Site Factors: Transitional between low elevation broadleaved forests and higher elevation coniferous forests. On rocky, often steep slopes with little soil development. Typically in canyons and on north-facing slopes at relatively low elevations and on south-facing slopes at higher elevations. At higher elevations with colder winters than Mixed Evergreen Forest, Blue Oak Woodland, Coast Live Oak Forest or Californian Mixed Chaparral. Often adjacent to Montane Chaparral on dry slopes or lower Montane Coniferous Forest on less rocky soils. May intergrade with any of the above vegetation types and is not always distinct from them.

Characteristic Species: *Calocedrus decurrens*, *Lithocarpus densiflorus*, *Pinus coulteri* (Southern Coast Ranges), *Pseudotsuga menziesii*, *Quercus chrysolepis*, *Umbellularia californica*

---

[1] Descriptions taken from: Holland, R. F. 1986. Preliminary descriptions of the terrestrial natural communities of California. Unpublished report. State of California, The Resources Agency, Department of Fish and Game, Natural Heritage Division, Sacramento, California. Please note: Many species names have changed since the preparation of this document. Also, brackets denote species that are non-native.

Distribution: Inner Northern Coast Ranges from Siskiyou County to Lake County, Southern Coast Ranges from Mount Diablo to Monterey County. West slope of the Sierra Nevada from Tehama County to Kern County at elevations of 1,000 to 4,000 feet in the north and 3,000 to 6,000 feet in the south. Replaced by the closely related Bigcone Spruce-Canyon Oak Forest in the Transverse and Peninsular Ranges of Southern California.

Mainland Cherry Forest

Stands of hollyleaf cherry (*Prunus ilicifolia*) on steep, dry, north-facing slopes with rocky, sandstone-derived soils. Plants most often seen as shrubs, but may reach tree size. Stands with large trees are exceptional (California Native Plant Society).

Open Engelmann Oak Woodland*

Description: An evergreen woodland quite reminiscent of Blue Oak Woodland but dominated by *Quercus engelmannii* with an understory of typical "grassland" species.

Site Factors: Relatively moist sites on fine-textured soils of gentle slopes and valley bottoms. Intergrades with Venturan or Riversidean Sage Scrubs on drier, rockier sites, and with Dense Engelmann Oak Woodland on more mesic sites. Often surrounds grassland portreros, occupying the ecotone between the grassland (on fine-textured, deep soils) and surrounding shrub fields (on rockier, drier sites).

Characteristic Species: *Juglans californica*, *Quercus agrifolia*, *Q. engelmannii*, *Rhus ovata*, *R. trilobata*
Distribution: Mainly in the Santa Ana Mountains of San Diego and adjacent Riverside counties, usually below about 4,000 feet.

Riversidean Alluvial Fan Sage Scrub*

Description: This is the most xeric expression of Coastal Sage Scrub south of Point Conception. Typical stands are fairly open and dominated by *Artemisia californica*, *Eriogonum fasciculatum*, and [*Bromus rubens]*, each attaining at least 20 percent cover.

Site Factors: Typically on xeric sites such as steep slopes, severely drained soils, or clays that released stored soil moisture only slowly. Intergrades at slightly higher elevations with several Southern Californian chaparrals.

Characteristic Species: *Artemisia californica*, *Atriplex canescens*, [*Bromus rubens*], *Encelia farinosa*, *Ericameria pinefolia*, *Eriodictyon crassifolium*, *Eriogonum fasciculatum*, *Gutierrezia californica*, *Ericameria linearifolia*, *Isomeris arboreus*, *Lotus scoparius*, *Malacothamnus fasciculatus*, *Salvia apiana*, *S. mellifera*, *Yucca whipplei parishii*

Distribution: Along the coastal base of the Transverse and Peninsular ranges from central Los Angeles County to the Mexican frontier.

Southern California Arroyo Chub/Santa Ana Sucker Stream

Streams used by arroyo chub (*Gila orcuttii*) and/or Santa Ana sucker (*Catostomus santaanae*).

Southern California Coastal Lagoon

Coastal lagoons in Southern California.

Southern California Threespine Stickleback Stream

Streams used by threespine stickleback (*Gasterosteus aculeatus*), typically slow-flowing waterways along the coast with emergent vegetation.

Southern Coast Live Oak Riparian Forest*

Description: Open to locally dense evergreen sclerophyllous riparian woodlands dominated by *Quercus agrifolia*. This type appears to be richer in herbs and poorer in understory shrubs than other riparian communities. Similar to and questionably distinct from Central Coast Live Oak Riparian Forest.

Site Factors: Bottomlands and outer floodplains along larger streams, on fine-grained, rich alluvium.

Characteristic species: *Acer macrophyllum*, *Artemisia douglasiana*, *Cardamine californica*, *Eucrypta chrysanthemifolia*, *Heteromeles arbutifolia*, *Keckiella cordifolia*, *Lonicera hispidula*, *Mara macrocarpus*, *Pholistoma auritum*, *Quercus agrifolia*, *Rhus trilobata*, *Rosa californica*, *Rubus ursinus*, *Sambucus Mexicana*, *Symphoricarpos mollis*, *Toxicodendron diversilobum*, *Umbellularia californica*
Distribution: Canyons and valleys of coastal Southern California, mostly south of Point Conception.

Southern Coastal Bluff Scrub*

Description: Similar to Northern Coastal Bluff Scrub (a low, often prostrate, scrub 5-50 cm high, forming continuous mats or more scattered. Dwarf shrubs, herbaceous perennials, and annuals are represented…), but plants less prostrate (up to 2 meters tall). Most plants woody and/or succulent. Most growth and flowering occur from late winter through spring.

Site Factors: Similar to Northern Coastal Bluff Scrub (exposed to nearly constant winds with high salt content; soil usually rocky and poorly developed), but conditions less extreme as a result of less intense but still moisture-laden winds. Intergrades in less exposed settings with Venturan Coastal Sage Scrub, or on finer-grained soils with Valley and Foothill Grassland.

Characteristic Species: *Atriplex* spp., *Calystegia cyclostegia*, *C. macrostegia*, *Castilleja affinis*, *Chorizanthe orcuttiana*, *Coreopsis gigantea, C. maritima*, *Dudleya* spp., *Encelia californica*, *Erigeron glaucus*, *Eriophyllum staechadifolium*, *Mesembryanthemum* sp., *Haploppappus* spp., *Malacothrix saxatilis*, *Marah macrocarpus*, [*Carpobrotus aequilateralus*], [*Mesembryanthemum crystallinum*], *Opuntia littoralis*, *Rhus integrifolia*

Distribution: At localized sites along the coast, south of Point Conception; Point Mugu, Point Dume, Point Vicente, Dana Point, Torrey Pines State Reserve, Point Loma, etc. Several sites on the off-shore islands.

Southern Coastal Salt Marsh*

Description: Similar to Northern Coastal Salt Marsh (highly productive, herbaceous and suffrutescent, salt-tolerant hydorphytes forming moderate to dense cover and up to 1 meter tall) but with a longer growing season and greater abundance of suffrutescent species in the higher, drier sites. Southern "specialties" include *Atriplex watsonii*, *Batis maritima*, *Lycium californicum*, *Monanthochloe littoralis*, *Sueda californica*, and *Salicornia subterminalis*.

Site Factors: Very similar to Northern Coastal Salt Marsh (usually found along sheltered inland margins of bays, lagoons, and estuaries; these hydric soils are subject to regular tidal inundation by saltwater for at least part of each year) but with warmer water and air temperatures. *Frankenia*, *Sueda*, and/or *Salicornia subterminalis* often occur along the upper, landward edges of the marshes; *Salicornia bigelovii*, *S. virginica*, and *Batis maritima* at middle elevations; and *Spartina* closest to open water.

Characteristic Species: *Amblyopappus pussilus*, *Atriplex watsonii*, *Batis maritima*, *Cressa truxillensis*, *Cuscuta salina*, *Distichlis spicata* var. *spicata*, *Frankenia grandifolia*, *Heliotropium curassavicum*, *Jaumea carnosa*, *Juncus acutus sphaerocarpus*, *Limonium californicum*, [*Carpobrotus aequilateralis*], [*Mesembryanthemum crystalinum*], [*M. nodiflorum*], *Monanthochloe littoralis*, *Salicornia bigelovii*, *Salicornia* spp., *Spartina foliosa*, *Suaeda californica*

Distribution: Bays, lagoons, and estuaries along the coast from about Point Conception to the Mexican border. Intergrades broadly with Northern Coastal Salt Marsh along the south central coast. Nowhere as extensive as the larger northern marshes, and now considerably reduced by land development activities. Good to fair examples occur at Goleta Slough and near Carpinteria, Santa Barbara County; Point Mugu, Ventura County; Upper Newport Bay, Orange County; and several small areas in San Diego County.

Southern Cottonwood-Willow Riparian Forest*

Description: Tall, open, broadleafed winter-deciduous riparian forests dominated by *Populus fremontii*, *P. trichocarpa*, and several tree willows. Similar to Central Coast Cottonwood-Sycamore Riparian Forest, although apparently with less *Quercus agrifolia* or *Alnus rhombifolia* (this merits further study). Understories usually are shrubby willows.

Site Factors: Sub-irrigated and frequently overflowed lands along rivers and streams. The dominant species require moist, bare mineral soil for germination and establishment. This is provided after flood waters recede, leading to uniform-aged stands in this seral type.

Characteristic species: *Artemisia douglasiana*, *Baccaris viminea*, *Marah macrocarpus*, *Platanus racemosa*, *Populus fremontii*, *P. trichocarpa*, *Salix gooddingii*, *S. hindsiana*, *S. lasiandra*, *S. lasiolepis*, *Urtica holosericea*

Distribution: Along perennially wet stream reaches of the Transverse and Peninsular ranges, from Santa Barbara County south to Baja California Norte and east to the edge of the deserts.

Southern Dune Scrub*

Description: Similar to Central Dune Scrub (a dense coastal scrub community of scattered shrubs, subshrubs, and herbs, generally less than 1 meter tall and often developing considerable cover) but plants somewhat shorter and often succulent.

Site Factors: Similar to Central and Northern Dune Scrub (Central: restricted to the coast on ± stabilized backdune slopes, ridges, and flats), but drier and somewhat warmer and probably with less onshore wind. Intergrades toward the coast with Southern Foredunes and away from the coast on rockier soils with Venturan Sage Scrub, or Coastal Succulent Scrub.

Characteristic Species: *Atriplex leucophylla*, *Croton californicus*, *Ephedra californica*, *Ericameria ericoides*, *Haplopappus venetus vernonioides*, *Lupinus chamissonia*, *Lycium brevipes*, [*Mesembryanthemum crystallinum*], *Opuntia littoralis*, *Rhus integrifolia*, *Simmondsia chinensis*
Distribution: Same general areas as Southern Foredunes (areas of sand accumulation along the coast between Point Conception and the Mexican border), but usually a little farther back from the coast. With the notable exception of the El Segundo Dunes, this community has been virtually eliminated from mainland Southern California. Other small examples persist in Baja California and the Channel Islands.

Southern Mixed Riparian Forest

Streamside forest with mixed species composition.

Southern Riparian Forest

Streamside forest with mixed species composition.

Southern Sycamore-Alder Riparian Woodland*

Description: A tall, open, broadleafed, winter-deciduous streamside woodland dominated by *Platanus racemosa* (and often also *Alnus rhombifolia*). These stands seldom form closed canopy forests, and even may appear as trees scattered in a shrubby thicket of sclerophyllous and deciduous species. Lianas include *Rubus ursinus* and *Toxicodendron diversilobum*. Distinctions between this type and Sycamore Alluvial Woodland merit additional study.

Site Factors: Very rocky streambeds subject to seasonally high-intensity flooding. *Alnus* increases in abundance on more perennial streams, while *Platanus* favors more intermittent hydrographs.

Characteristic Species: *Acer macrophyllum*, *Alnus rhombifolia*, *Artemisia douglasiana*, *Aralia californica*, *Equisetum hyemale*, *Oryzopsis miliacea*, *Quercus agrifolia*, *Rubus ursinus*, *Sambucus Mexicana*, *Toxicodendron diversilobum*, *Umbellularia californica*, *Urtica holsoericea*

Distribution: Transverse and Peninsular Ranges from Point Conception south into Baja California Norte.

Southern Willow Scrub*

Description: Dense, broadleafed, winter-deciduous riparian thickets dominated by several *Salix* species, with scattered emergent *Populus fremontii* and *Platanus racemosa*. Most stands are too dense to allow much understory development.

Site Factors: Loose, sandy, or fine gravelly alluvium deposited near stream channels during flood flows. This early seral type requires repeated flooding to prevent succession to Southern Cottonwood-Sycamore Riparian Forest.

Characteristic Species: *Pluchea sericea*, *Populus fremontii*, *Salix gooddingii*, *S. hindsiana*, *S. laevigata arauipa*, *S. lasiandra*, *S. lasiolepis*, *S. leucodendroides*, others?

Distribution: Formerly extensive along the major rivers of coastal Southern California, but now much reduced by urban expansion, flood control, and channel "improvements."

Valley Oak Woodland*

Description: Similar to Northern Oak Woodland and Blue Oak Woodland, but typically more open, forming a grassy-understoried savanna rather than a closed woodland. *Quercus lobata* is usually the only tree present. This winter-deciduous species is California's largest broad-leaved tree, with mature individuals reaching 15–35 meters. Most stands consist of open-canopy growth form trees and seldom exceed 30–40 percent absolute cover.

Site Factors: On deep, well-drained alluvial soils, usually in valley bottoms, apparently with more moisture in summer than in Blue Oak Woodland. Intergrades with Valley Oak Riparian Forest near rivers and with Blue Oak Woodland on drier slopes. Also found on non-alluvial settings in the South Coast and Transverse Ranges. Fire may have prevented some valley oak stands from succeeding to Ponderosa Pine or Coulter Pine forests before fire suppression.

Characteristic Species: *Quercus lobata*, *Elymus triticoides*, *Toxicodendron diversilobum*, *Q. douglasii*
Distribution: Sacramento and San Joaquin valleys adjacent to the Sierra Nevada foothills, valleys of the Coast Ranges from Lake County to western Los Angeles County. Usually below 2000 feet (610 meters).

Walnut Forest

Riparian corridors dominated by California walnut (*Juglans californica*). Other species present may include foothill ash (*Fraxinus dipetala*), coast live oak (*Quercus agrifolia*), Mexican elderberry (*Sambucus Mexicana*), and California bay (*Umbellularia californica*).

Appendix F

Supplemental Hydrology and Water Quality Data

ESA

APPENDIX F

Supplemental Hydrology and Water Quality Data

This appendix provides supplemental information describing the Enhanced Watershed Management Program (EWMP) Management Areas, the designated Beneficial Uses of the major water bodies within each EWMP Area, and applicable Total Maximum Daily Loads (TMDLs) for each EWMP Area and Permittee.

Land Use

Table F-1 describes land use in each of the EWMP Management Areas, based on the 2005 Southern California Area Governments Land Use Database. As previously described in Section 3.8, "Hydrology and Water Quality," each EWMP group falls into one of six categories:

- **Southern Coastal EWMP Areas** (Beach Cities, Santa Monica Bay Jurisdictions 2 + 3, Marina Del Rey, Ballona Creek), dominated by urbanized beach communities with high-density residential and commercial land uses.
- **Northern Coastal EWMP Areas** (Malibu Creek and Northern Santa Monica Bay), characterized by lower-density development along the coast and greater open space areas inland.
- **Upper San Gabriel and Rio Hondo/San Gabriel EWMP Areas**, characterized by higher-density development in the lower watershed areas and lower-density development and open space in the upper watersheds where the foothills to the San Gabriel Mountains begin.
- **Upper Los Angeles River EWMP Area,** which is primarily urbanized with high-density residential and commercial uses but with characteristics of the Upper San Gabriel in the farthest upper reaches near the foothills.
- **Dominguez Channel and Palos Verdes Peninsula EWMP Areas,** with high-density beach and inland communities and a relatively larger area of industrial land use.
- **Upper Santa Clara River EWMP Area**, which is predominantly open space.

TABLE F-1
LAND USE DISTRIBUTIONS WITHIN EWMP AREAS

	Land Use Distribution (%)[1]

1. Percentages do not total 100% due to small areas (<4%) of no data.

Surface Water Hydrology of EWMP Management Areas

The following sections describe major surface water hydrologic features in each EWMP Management Area.

Ballona Creek

The Ballona Creek watershed covers more than 81,000 acres, over 78,000 of which fall in the EWMP Area within the jurisdiction of Municipal Separate Storm Sewer System (MS4) Permittees. The Los Angeles County Flood Control District (LACFCD) owns and operates drainage infrastructure within incorporated and unincorporated areas in the watershed. Land use within the EWMP Area is primarily urbanized (82.5%), with most urbanized areas (59.2%) in multi- or single-family housing.

Ballona Creek and Estuary are collectively approximately 9.5 miles long and divided into three hydrologic units: Reach 1, which extends for 2 miles from Cochran Avenue to National

Boulevard (channelized); Reach 2, which extends for about 4 miles from National Boulevard to Centinela Avenue, where Ballona Estuary starts (channelized); and Ballona Estuary, which starts at Centinela Creek and extends for 3.5 miles to the Pacific Ocean (soft-bottom channel, tidally influenced). Major tributaries to Ballona Creek include Sepulveda Canyon Channel (Reach 2) and Centinela Creek (Ballona Estuary). Other water bodies in the watershed include the Del Rey Lagoon and the Ballona Wetlands, which are both connected to the Ballona Estuary through tide gates. The Ballona Wetlands, which are the site of a major multiagency restoration project, encompass approximately 626 acres (541 acres of wetlands and 85 acres of roads, parking lots, levees, and other structures). Approximately 460 acres of the Ballona Wetlands are located within the Ballona Creek watershed; the remaining portion is located in the Marina Del Rey watershed. The Ballona Wetlands are owned and/or managed by the California Department of Fish and Wildlife (CDFW) and the State Land Commission and, as such, are not subject to MS4 Permit or EWMP requirements.

Beach Cities

The Beach Cities EWMP Area covers over 20,000 acres divided into three watersheds: Santa Monica Bay (38.4% of the EWMP Area), Dominguez Channel (36.1%), and Machado Lake watershed (35.5%). This watershed is the most relatively urbanized of the EWMP areas as 93.9% of the watershed is urbanized. Significantly, almost a quarter of the EWMP Area is commercial and industrial lands.

The Dominguez Channel watershed within the Beach Cities EWMP includes drainage from the Torrance Carson Channel (Torrance Lateral). The Machado Lake watershed includes drainage from the Wilmington Drain, an LAFCD facility. Additional information about the Dominguez Channel and Machado Lake watersheds is provided below in the Dominguez Channel EWMP description. Beaches within the Beach Cities EWMP Area do not have any storm drain infrastructure that collects and discharges beach runoff directly to Santa Monica Bay and are therefore considered non-point sources, which are not subject to the MS4 Permit or EWMP requirements. Similarly, the Hermosa Beach and Manhattan Beach piers are not part of the MS4; they are non-point sources excluded from the MS4 Permit scope and therefore the EWMP.

Dominguez Channel

Dominguez Channel is a 15.7-mile-long waterway that drains 133 square miles of the Los Angeles Basin. The lower half of this watershed— approximately 37,600 acres—is subject to the Dominguez Channel EWMP. This EWMP Area is highly urbanized (91.9%), with over a third of the area in commercial and industrial uses.

The EWMP Area includes three receiving water bodies: Machado Lake, Dominguez Channel, and the Los Angeles Harbor. Machado Lake is a 40-acre freshwater lake/reservoir that impounds stormwater runoff from the Wilmington Drain, an LACFCD facility. Approximately 3,000 feet of the drain immediately upstream of Machado Lake is earthen-lined and vegetated; the remainder upstream is channelized. Immediately downstream of the lake is a 63-acre seasonal freshwater marsh. The portion of Dominguez Channel within the EWMP Area is composed of 3 miles of the lined channel between Imperial Highway near Interstate 105 to Vermont Avenue near Interstate 110, and 2.2 miles of the unlined tidal estuary channel downstream of Vermont Avenue. The

EWMP Area also includes 1.8 miles of the Torrance Carson Channel, or Torrance Lateral, which drains into the Dominguez Channel estuary. The estuary drains into the northeast side of the Consolidated Slip, the uppermost section of the tidal Los Angeles Harbor. The Los Angeles Inner Harbor within the EWMP Area covers about 3,000 acres and includes portions of both the Los Angeles and Long Beach Harbors. Other portions of the Los Angeles Harbor covered in the EWMP are the Fish Harbor (91 acres), and the inner and outer portions of Cabrillo Beach. Inner Cabrillo Beach (82 acres) on the north side of the peninsula (west of Fish Harbor) is considered to be a bay/harbor, while Outer Cabrillo Beach (~ 0.58 miles long) to the south is considered to be a coastal shoreline.

Malibu Creek

The Malibu Creek Watershed drains over 75,000 acres of the Santa Monica Mountains north of Los Angeles and is the largest contributing watershed to Santa Monica Bay. Over 42,000 acres of this watershed within Los Angeles County comprise the Malibu Creek EWMP Area. Unincorporated Los Angeles County lands account for 70% of the EWMP Area; this does not include federal lands within the Santa Monica Mountains National Recreation Area, state lands within Malibu Creek State Park, or lands managed by the Santa Monica Mountains Conservancy. Almost 80% of the EWMP Area is open space, with most development centered around the communities of Agoura Hills and Calabasas.

Major tributaries to Malibu Creek include Cold Creek, Las Virgenes Creek, Medea Creek, and Potrero Valley Creek. The creek terminates at the Pacific Ocean at Malibu Lagoon, which is currently the location of a multi-agency habitat and water quality enhancement project. The watershed is characterized by steep topography and densely vegetated ravines typical of undeveloped coastal mountains, which create many dangerous and inaccessible areas that cannot be safely monitored and are not suitable for water quality Best Management Practices (BMPs). In addition, the Monterey/Modelo formation outcrops in the watershed are natural sources of sulfate, phosphate, metals, and selenium, and are believed to contribute to the Malibu Creek Watershed water quality impairments. The development of the Malibu Creek EWMP is closely coordinated with that of the North Santa Monica Bay EWMP, which is responsible for lands to the west and east of the Malibu Creek Watershed Management Area.

Marina del Rey

Marina del Rey is the largest man-made small craft harbor in the world, and is a small contributing watershed to Santa Monica Bay. The Marina del Rey Harbor is open to the Santa Monica Bay through the main channel and shares a common breakwater with Ballona Creek. Of the 1400-acre EWMP Area, 92.7% is urbanized, with relatively high proportions of multifamily residential (27.4%) and commercial (19.1%) lands.

Four subwatersheds drain to the harbor: Subwatershed 1, composed primarily of unincorporated County lands immediately surrounding the main harbor; Subwatershed 2, which includes the Venice Canals and Ballona Lagoon that discharge into the main channel; Subwatershed 3, a small area north of the main harbor that drains into the harbor via the Boone Olive Pump Plant; and Subwatershed 4, which drains City of Los Angeles and Culver City lands into the 10-acre Oxford Basin, which is connected to the harbor via storm drains and tide gates. The 2004 Marina del Rey

Small Drain Survey completed for the Los Angeles County Department of Beaches and Harbors (LACDBH) identified approximately 724 small outfalls that discharge directly into harbor, the majority of which serve the individual parcels and small roads among the basins. LACDBH is responsible for approximately 700 of these outfalls associated with leased parcel sites, and the LACFCD is responsible for 20 outfalls and two storm drain inlets that flow into the Oxford Basin. No MS4 Permittee was identified for the remaining storm drains. A small section of the Ballona Wetlands drains into Subwatershed 1, but, as state lands, it is not subject to the MS4 Permit or EWMP process.

North Santa Monica Bay

The North Santa Monica Bay EWMP Area includes over 55,000 acres within Santa Monica Bay Jurisdictional Groups (JGs) 1 and 4, and the portion of 9 within the City of Malibu's borders. It does not include federal lands within the Santa Monica Mountains National Recreation Area, state lands within Malibu Creek State Park, or lands managed by the Santa Monica Mountains Conservancy. Similar to the Malibu Creek EWMP Area, most of the watershed is undeveloped open space—93.1%, more than any other EWMP Area. Most development is single-family housing within the incorporated boundaries of the City of Malibu. Like the Malibu Creek EWMP Area, the North Santa Monica Bay EWMP Area is characterized by steep topography and densely vegetated ravines typical of undeveloped coastal mountains.

The North Santa Monica Bay EWMP Area includes portions of 6 watersheds, 18 subwatersheds, and 28 coastal streams that all drain directly to Santa Monica Bay and are thus subject to the provisions of the California Ocean Plan (SWRCB, 2012). The Ocean Plan regulates waste discharges to protect the quality of ocean waters for use and enjoyment by the general public. In particular, the Ocean Plan designates Areas of Special Biological Significance (ASBS), which are areas requiring special protection of species or biological communities to the extent that maintenance of natural water quality is ensured. The area from Laguna Point to Latigo Point offshore of a portion of the North Santa Monica Bay EWMP Area is designated as ASBS 24. North Santa Monica Bay EWMP agencies requested and received an exemption from the Ocean Plan (SWRCB Resolution No. 2012-0012) that establishes criteria for allowable discharge of stormwater and nonpoint source pollution to Santa Monica Bay.

Palos Verdes Peninsula

The Palos Verdes Peninsula is situated in the southwestern portion of Los Angeles County atop the Palos Verdes Hills, which are bounded to the north by the City of Torrance, to the east by the City of Los Angeles, and to the south and west by the Pacific Ocean. The EWMP Area covers over 14,000 acres of incorporated, unincorporated (Los Angeles County), and LACFCD lands throughout the peninsula (see Figure 3.8-1); it does not include the City of Rolling Hills, which is participating in the peninsula's Coordinated Integrated Monitoring Program (CIMP). Most of the watershed's land use is distributed between single family housing (55.8%) and open space (30.2%), and the area is particularly known for its equestrian and golf facilities.

The EWMP Area is divided into two watersheds: (1) the Santa Monica Bay Watershed and (2) the Greater Dominguez Channel Watershed Management Area, which is further subdivided into two subwatersheds, the Los Angeles Harbor Subwatershed and the Machado Lake Subwatershed (previously described in detail under the Dominguez Channel EWMP). A drainage divide dissects the Peninsula from the northeast to the southwest with the westerly portion (63% of the EWMP Area) draining into Santa Monica Bay and the easterly portion draining into Machado Lake (22%) and the Los Angeles Harbor (15%) subwatersheds. Water drains from the peninsula to receiving waters through a combination of vegetated open channels and storm drains.

Rio Hondo/San Gabriel River

The Rio Hondo/San Gabriel River EWMP Area includes over 26,000 acres of land within the eastern portion of the Los Angeles River watershed (tributary to Rio Hondo) (38% of the EWMP Area) and the upper portion of the urban San Gabriel River watershed (62%). The EWMP Area does not include federal lands that are part of Angeles National Forest. Approximately 73% of the EWMP Area is urbanized, with single-family housing comprising 47%. The remaining quarter of the area is undeveloped open space, mostly along lower slopes of the San Gabriel Mountains. Both Rio Hondo and the San Gabriel River are heavily urbanized, channelized, and managed systems.

Rio Hondo is a tributary of the Los Angeles River, which receives drainage from the Rio Hondo/San Gabriel River MS4 Permittees via several smaller tributaries: Arcadia Wash, Little Santa Anita Wash, Monrovia Canyon Wash, and Sawpit Wash. Prior to draining to the Rio Hondo, the Santa Anita and Sawpit Washes drain to Peck Road Water Conservation Park (a.k.a. Peck Road Lake), which then drains to the Rio Hondo. Peck Road Lake is owned by the LACFCD and maintained by the Los Angeles County Department of Parks and Recreation.

Reach 5 of the San Gabriel River receives drainage from Little Dalton Wash, Big Dalton Wash, and San Dimas Wash. About 4 miles below the mouth of the San Gabriel Canyon is the Santa Fe Dam and Reservoir, which is operated and maintained by the LACFCD through an easement with the U.S. Army Corps of Engineers (USACE). Both the Rio Hondo and San Gabriel River flow into the Whittier Narrows Reservoir upstream and may merge behind the reservoir during large storm events. Flows from the upper watershed are directed to spreading grounds located in and adjacent to the Rio Hondo and San Gabriel Rivers.

Santa Monica Bay Jurisdictions 2 + 3

The EWMP Area for Santa Monica Bay Jurisdictions 2 + 3 includes over 25,000 acres of land north and northwest of the Marina del Rey EWMP Area and East of the North Santa Monica Bay EWMP Area. Approximately half of the area is composed of mostly undeveloped lands within the Santa Monica Mountains; the other half includes much more urban areas in the cities of Los Angeles, Santa Monica, and El Segundo. The EWMP Area does not include state lands within Topanga State Park or those managed by the Santa Monica Mountains Conservancy, federal lands within the Santa Monica Mountains National Recreation Area, or Chevron lands at their facility in El Segundo.

Subwatersheds within the Santa Monica Bay EWMP Group Area include the mostly open space Castle Rock, Pulga Canyon, Temescal Canyon, and Santa Monica Canyon Subwatersheds characterized by steep topography and densely vegetated ravines typical of undeveloped coastal mountains. Other subwatersheds include the more urbanized Dockweiler and Santa Monica subwatersheds, which are dominated by residential, commercial, and industrial uses.

Upper Los Angeles River

The area considered in the Upper Los Angeles River EWMP covers approximately 479 square miles (over 308,000 acres), which is more than half of the total area of the entire Los Angeles River watershed. A little over 75% of the watershed is urbanized, with slightly more than half of the watershed comprising multi- and single-family residential housing. The watershed includes multiple facilities owned and operated by LACFCD as well as multiple major transportation corridors.

The Los Angeles River is approximately 55 miles long, and five of six reaches lie within the Upper Los Angeles River EWMP Area. The natural hydrology of the Los Angeles River watershed has been significantly altered by urbanization, channelization, and the construction of dams and flood control reservoirs. The river and many of its tributaries are lined with concrete for most or all of their length. Soft-bottom segments of the river occur where groundwater upwelling prevents armoring of the river bottom. The river is segmented into six reaches by the Basin Plan as follows:

- Reach 6 begins at the headwaters of the Los Angeles River (the confluence of Arroyo Calabasas and Bell Creek) and extends to Balboa Boulevard.
- Reach 5 runs from Balboa Boulevard through the Sepulveda Basin.
- Reach 4 runs from Sepulveda Dam to Riverside Drive.
- Reach 3 runs from Riverside Drive to Figueroa Street.
- Reach 2 runs from Figueroa Street to Carson Street.
- Reach 1 runs from Carson Street to the estuary.

Reach 1 is outside the boundaries of the Upper Los Angeles River EWMP but is a receiving water body for the entire EWMP Area. Major tributaries to the Upper Los Angeles River include Aliso Canyon Creek, Bell Creek, Bull Creek, Tujunga Wash, Burbank Western Channel, Arroyo Seco, Rio Hondo, and Compton Creek. Other water bodies covered in the EWMP include Echo Park Lake, Legg Lake, and Lake Calabasas. The Los Angeles River is the focus of a proposed multi-agency restoration effort that aims to improve habitat, water quality, flood management, and recreational/transportation amenities along much of the length of the river. USACE recently approved $1 billion in funding to restore 11 miles of the river from downtown through Elysian Park; this first phase would restore 719 acres of habitat and restore the river’s confluence with Verdugo Wash.

Upper San Gabriel River

The Upper San Gabriel River EWMP Area includes almost 68,000 ac of land that are not covered within the Rio Hondo/San Gabriel River EWMP Area described above. The EWMP Area does not include state lands or federal lands that are part of Angeles National Forest. Similar to the Upper Los Angeles River watershed, approximately three quarters of the Upper San Gabriel River EWMP Area is urbanized, with approximately half in multi- and single-family housing. More than half of the area is unincorporated lands within the jurisdiction of Los Angeles County.

As previously mentioned, the San Gabriel River is a heavily managed system, with abundant channelization, dams, and other flood management infrastructure.

Water bodies within the EWMP area include Thompson Wash, Little Dalton Wash, Big Dalton Wash, San Dimas Creek, Walnut Creek Wash, Puente Creek, San Jose Creek Reaches 1 and 2, San Gabriel River Reaches 2 through 5, and the North Fork of Coyote Creek. Receiving waters downstream of the EWMP area include Reach 1 of the San Gabriel River, Coyote Creek, and the San Gabriel Estuary. Additionally, there are unnamed tributaries draining unincorporated County areas that discharge into Coyote Creek and Puddingstone Reservoir.

Upper Santa Clara River

The Upper Santa Clara EWMP Area includes over 121,400 ac of lands within unincorporated Los Angeles County and the City of Santa Clarita. Roughly three quarters of the watershed is undeveloped open space bounded by the San Gabriel and Santa Susana Mountains; the remaining quarter includes the urbanized portions of the City of Santa Clarita and its environs. The EWMP Area does not include the majority of the upper river's watershed located within state and federal lands, nor the downstream watershed within Ventura County.

The Santa Clara River is one of the last primarily "natural" rivers in Southern California, with relatively few dams/reservoirs in its watershed (Pyramid Lake and Castaic Lake are notable exceptions, though neither are regulated through this EWMP). Though much of the river is bounded by flood control levees, no portions of it are channelized into concrete structures like more urban rivers. In years of significant rainfall, ephemeral springs and year-round flows exist in some tributaries and natural upstream areas. The portion of the river downstream within Ventura County is a target for enhancement by the California Coastal Conservancy and other agencies; therefore, actions in the upper watershed that affect flows downstream must be carefully considered.

Beneficial Uses

Table F-2 on the following page summarizes the beneficial uses for major hydrologic features within each of the 12 EWMP Management Areas. The TMDLs described in Table F-3 are meant to maintain or improve these beneficial uses.

Total Maximum Daily Loads

Table F-3 on page 13 summarizes the relevant TMDLs for each Permittee within each EWMP Area. Some TMDLs, such as those for Santa Monica Bay, are applicable to multiple EWMP Areas.

xisting beneficial use

otential beneficial use action would require a detailed analysis of the area.

ermittent beneficial use

and I: shall be protected as required.

sterisked MUN designations are designated under SB 88-63 and RB 89-03. Some designations may be considered for exemption at a later date.

Vaterbodies are listed multiple times if they cross hydrologic area or subarea boundaries. Beneficial use designations apply to all tributaries to the indicated waterbody, if not listed separately.

Vaterbodies designated as WET may have wetlands habitat associated with only a portion of the waterbody. Any regulatory action would require a detailed analysis of the area.

oastal waterbodies which are also listed in inland Surface Waters Tables (2-1) or in Wetlands Table (2-4).

ne or more rare species utilizes all ocean, bays, estuaries, and coastal wetlands for foraging and/or nesting.

quatic organisms utilize all bays, esturaries, lagoons, and coastal wetlands, to a certain extent, for spawning and early development. This may include migration into areas which are heavily influenced
nwater inputs.

ccess prevented by Los Angeles County Department of Public Works in concrete-channelized areas.

reas of Special Biological Significance: along coast from Latigo Point to Laguna Point, Big Sycamore Canyon and Abalone Cove Ecological Reserves, and Point Fermin Marine Life Refuge.

reas exhibiting large shellfish populations include Malibu, Point Dume, Point Fermin, White Point and Zuma Beach.

Most frequently used grunion spawning beaches. Other beaches may be used as well.

The REC-1 use designation does not apply to recreational activities associated with the swimmable goal as expressed in the Federal Clean Water Act section 101(a)(2) and regulated under the REC-
e Basin Plan, or the associated bacteriological objectives set to protect those activities. However, water quality objectives set to protect other REC-1uses associated with the fishable goal as expresse
Federal Clean Water Act section 1010(a)(2) shall remain in effect for waters where the (au) footnote appears.

The High Flow Suspension only applies to water contact recreational activities associated with the swimmable goal as expressed in the federal Clean Water Act section 101(a)(2) and regulated under
C-1 use, noncontact water recreation involving incidental water contact regulated under the REC-2 use, and the associated bacteriological objectives set to protect those activities. Water quality object
o protect (1) other recreational uses associated with the fishable goal as expressed in the federal Clean Water Act section 101(a)(2) and regulated under the REC-1 use and (2) other REC-2 uses (e.
s involving the aesthetic aspects of water) shall remain in effect at all times for waters where the (av) footnote appears.

nly applies to upper portion of the corresponding water body.

nly applies to lower portion of the corresponding water body.

ccess prohibited by Los Angeles County Department of Public Works

eneficial uses were not identified in the Basin Plan for Peck Road Park Lake. Therefore the downstream segment's uses (Rio Hondo Reach 1) apply based on Regional Board input (USEPA, 2012b).

nly major water bodies listed here; for complete list see Basin Plan.

CHAPTER 10 FINAL EIR PURPOSE AND ENVIRONMENTAL REVIEW PROCESS

10.1 Purpose

As defined by Section 15050 of the *California Environmental Quality Act (CEQA) Guidelines*, the Los Angeles County Flood Control District (LACFD) is serving as "Lead Agency" for the preparation of the Program Environmental Impact Report (PEIR) for implementation of the Enhanced Watershed Management Programs (EWMPs). The Final PEIR presents the environmental information and analyses that have been prepared for the proposed program, including comments received addressing the adequacy of the Draft PEIR, and responses to those comments. The Final PEIR—which includes the Draft PEIR, responses to comments and clarifications and modifications—will be used by the Board of Supervisors in the decision-making process for the proposed program.

10.2 Environmental Review Process

Public Circulation

A Notice of Preparation (NOP)/Initial Study (SCH No. 2014081106) was circulated for a 30-day public review period beginning on August 29, 2014. Twenty (20) individual written comment letters were received and used in the preparation of the Draft PEIR. Following the preparation of the Draft PEIR, eight other comment letters were later identified as comments submitted during the NOP public review period. These comment letters did not include any new comment topics that the existing identified NOP comments, and have since been added to Table 1.1 in Chapter 12, *Clarifications and Modifications* of this PEIR. The Draft PEIR for the proposed project was initially circulated for a 45-day public review period beginning on January 21, 2015 and ending on March 9, 2015. Per an announcement via e-mail blast on March 6, the comment period was extended through March 16, 2015 at 5PM. A total of 46 individual written comment letters were received on the Draft PEIR.

Section 15088 of the *CEQA Guidelines* requires that the lead agency evaluate comments on environmental issues received from persons and agencies that reviewed the Draft PEIR and prepare a written response addressing each of the comments received. The response to comments is contained in this document—Volume 2, Chapter 11 of the Final PEIR. Volumes 1 and 2 together constitute the Final PEIR. A list of agencies and interested parties who have commented on the Draft PEIR is provided below. A copy of each numbered comment letter and a lettered response to each comment are provided in Chapter 11, *Response to Comments*, of this Final PEIR.

The following agencies, organizations and individuals submitted written comments on the Draft PEIR.

Agencies

City of Baldwin Park Department of Public Works – January 21, 2015 (Comment Letter 1)

Culver City Department of Public Works – February 13, 2015 (Comment Letter 2)

City of Baldwin Park Department of Public Health – February 23, 2015 (Comment Letter 3)

Metropolitan Water District – February 25, 2015 (Comment Letter 4)

City of Inglewood Public Works Department – March 2, 2015 (Comment Letter 5)

City of Los Angeles Sanitation District – March 2, 2015 (Comment Letter 6)

Los Angeles Regional Water Quality Control Board– March 6, 2015 (Comment Letter 7)

City of West Hollywood – March 9, 2015 (Comment Letter 8)

County of Los Angeles Department of Parks and Recreation – March 10, 2015 (Comment Letter 9)

Central Basin Municipal Water District – March 12, 2015 (Comment Letter 10)

City of Malibu – March 16, 2015 (Comment Letter 11)

State Clearinghouse – March 17, 2015 (Comment Letter 12)

City of Santa Monica – March 12, 2015 (Comment Letter 45)

Organizations

Westwood Gardens Civic Association – March 1, 2015 (Comment Letter 13)

Arcadia Historical Society – March 3, 2015 (Comment Letter 14)

Kellogg Garden Products – March 4, 2015 (Comment Letter 15)

Los Angeles Water Keeper – March 9, 2015 (Comment Letter 16)

Topanga Creek Watershed Committee – March 9, 2015 (Comment Letter 17)

Monrovia –March 11, 2015 (Comment Letter 18)

California Native Plant Society – March 16, 2015 (Comment Letter 19)

Sierra Club, Angeles Chapter – March 17, 2015 (Comment Letter 20)

Interested Individuals

Connie Heflin – February 10, 2015 (Comment Letter 21)

Harry Heflin – February 13, 2015 (Comment Letter 22)

Leelee Doughty – February 24, 2015 (Comment Letter 23)

Jonathan Weiss – February 24, 2015 (Comment Letter 24)

George Brumder – February 24, 2015 (Comment Letter 25)

Pamela Warner – February 26, 2015 (Comment Letter 26)

Kathleen BonEske – March 2, 2015 (Comment Letter 27)

Dan Foliart – March 2, 2015 (Comment Letter 28)

Catherine Heinlein – March 2, 2015 (Comment Letter 29)

Andy Edmonds – March 3, 2015 (Comment Letter 30)

Shake Manigonian – March 3, 2015 (Comment Letter 31)

Gina Shaw – March 3, 2015 (Comment Letter 32)

Chris and Gloria Cox – March 4, 2015 (Comment Letter 33)

Margaret Page – March 4, 2015 (Comment Letter 34)

Virginia Stein – March 4, 2015 (Comment Letter 35)

Martini Arden – March 5, 2015 (Comment Letter 36)

Kristine Hannibal – March 5, 2015 (Comment Letter 37)

Emily Rosedale-Kousoulis – March 8, 2015 (Comment Letter 38)

Margaraux Viera – March 8, 2015 (Comment Letter 39)

Robin Kirk – March 9, 2015 (Comment Letter 40)

Joyce Dillard – March 16, 2015 (Comment Letter 41)

Rex Frankel – March 16, 2015 (Comment Letter 42)

Theresa Brady – March 18, 2015 (Comment Letter 43)

Enrique Huerta (Comment Letter 44)

Sarah Hays – February 27, 2015 (Comment Letter 46)

Public Meetings, Newspaper Ads and E-mails

LACFCD held 6 community meetings on January 29 and February 3, 5, 10, 11 and 17, 2015 to discuss the Draft PEIR analysis and alternatives. The six public meetings that took place at 6PM each night listed are as follows:

- Public Meeting 1 (Florence-Firestone Service Center – January 29, 2015)
- Public Meeting 2 (LA County Fire Camp – February 3, 2015)
- Public Meeting 3 (San Pedro Service Center – February 5, 2015)

- Public Meeting 4 (Topanga Library – February 10, 2015)
- Public Meeting 5 (Hacienda Heights Community Center – February 11, 2015)
- Public Meeting 6 (East Los Angeles Library – February 17, 2015)

The general topics of oral public comments made at these meetings were transcribed and presented in Section 11.3 of Chapter 11, *Response to Comments*, of this Final PEIR. As the lead agency under CEQA, LACFCD provided responses to the comments received on the Draft PEIR.

A summary of the PEIR was included in the following publications:

- LA Times (legal notice – 1/29)
- The Signal (legal notice – 1/23)
- Arcadia Weekly (legal notice – 1/26)
- Eastern Group Publications (legal notice – 1/29)
- Santa Monica Daily Press (legal notice – 1/28, website ad – 2/5, print ad – 2/6 through 2/12)
- San Gabriel Valley Tribune (legal notice – 2/9, website ad – 2/8, print ad – 2/9 through 2/12)
- Topanga Messenger (website ad – 2/4 through 3/4, print ad – 2/12)
- Malibu Times (legal notice – 2/11, website ad – 2/5 through 3/5)

CHAPTER 11 RESPONSE TO COMMENTS

11.1 REQUIREMENTS FOR RESPONDING TO COMMENTS ON A DRAFT EIR

Lead agencies are required to evaluate all comments on environmental issues received on the Draft PEIR and prepare a written response pursuant to CEQA Guidelines Section 15088. Written responses should address the environmental issue(s) raised and provide a detailed response. Rationale must be provided when specific comments or suggestions (e.g., additional mitigation measures) are not accepted. In addition, the written response must be a good faith and reasoned analysis. As long as a good faith effort at full disclosure is made in the EIR (CEQA Guidelines Section 15204), lead agencies need only to respond to significant environmental issues associated with the project and do not need to provide all the information requested by commenters.

CEQA Guidelines Section 15204 recommends that commenters provide detailed comments that focus on the sufficiency of the Draft PEIR in identifying and analyzing the possible impacts on the environment and ways in which the significant effects of the project might be avoided or mitigated. CEQA Guidelines Section 15204 also notes that commenters should provide an explanation and evidence supporting their comments. Pursuant to CEQA Guidelines Section 15064, an effect shall not be considered significant in the absence of substantial evidence.

CEQA Guidelines Section 15088 also recommends that where the response to comments results in revisions to the Draft PEIR, those revisions should be noted as a revision to the Draft PEIR or in a separate section of the Final EIR. Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

11.2 COMMENTS AND RESPONSE TO COMMENTS

This section responds to those comments received that specifically pertain to the scope and content of the Draft PEIR. The written comment letters received by the County are included at the beginning of each response.

Where comments have prompted changes to text in the Draft EIR, the new text is provided in indented paragraphs showing additions in <u>underline</u> and deletions in ~~strikethrough~~ text. These changes have been compiled in Chapter 12. Where stated in the responses that implementation of mitigation measures would reduce potentially significant impacts to less than significant levels, it is assumed that the agencies implementing the projects will employ the mitigation as well. As noted in the Draft EIR on page 1-4, "Each implementing agency would determine the significance after mitigation for potential impacts of their proposed projects."

Subject: Support for LACFCD Program EIR to Evaluate Enhanced Watershed Management Programs (EWMPs)

Dear Mr. BeGell:

The City of Baldwin Park supports the development of programs that improve water quality.

The Los Angeles County Flood Control District is preparing a Program Environmental Impact Report (PEIR) to evaluate the proposed Enhanced Watershed Management Programs (EWMPs) that are being developed to improve water quality in Los Angeles County. The PEIR is an Advanced Planning Document describing details of the Countywide water quality program (EWMPs) being launched in partnership with Baldwin Park and other municipalities in the County to comply with new MS4 Permit. Advanced Planning improves public awareness and government transparency and provides for a higher level assessment of policy decisions prior to the consideration of individual projects.

The City of Baldwin Park has reviewed the Draft PEIR and agrees with its conclusions regarding the impacts of the proposed EWMPs on the environment and its proposed mitigation measures. The City is writing to offer its support for the implementation of EWMPs to achieve compliance with the MS4 Permit and to encourage the certification of the Program Environmental Impact Report (PEIR) developed by the Los Angeles County Flood Control District (LACFCD).

Sincerely,

D-Wall

Daniel Wall, P.E.
Director of Public Works

Response to Comment Letter 1 (City of Baldwin Park Department of Public Works – January 21, 2015)

Response to Comment 1-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The commenter's support for the PEIR is noted.

To Mr. BeGell:

The Los Angeles County Flood Control District is preparing a Program Environmental Impact Report (PEIR) to evaluate proposed Enhanced Watershed Management Programs (EWMPs) being developed to comply with the new National Pollutant Discharge Elimination System Permit No. CAS004001 (MS4 Permit). The PEIR is an Advanced Planning Document describing details of twelve EWMPs being developed countywide in partnership with local agencies. Advanced Planning improves public awareness and government transparency and provides for a higher level assessment of policy decisions prior to the consideration of individual projects.

The City of Culver City supports preparation of the PIER by the Los Angeles County Flood Control District.

Yours truly,

Charles Herbertson, P.E.
Public Works Director, City Engineer

Response to Comment Letter 2 (Culver City Department of Public Works – February 13, 2015)

Response to Comment Letter 2-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The commenter's support for the PEIR is noted.

Subject: Notice of Availability of the Draft Program EIR for the Enhanced Watershed Management Programs-Comments

Dear Mr. BeGell,

Thank you for the opportunity to comment on the Enhanced Watershed Management Programs Draft EIR. The Los Angeles County Department of Public Health-Environmental Health Division has reviewed the document, and offers the following comment:

In the Hydrological Resources Chapter, in section 3.8-2 on the impact on Groundwater it is stated: **"The proposed project would result in higher groundwater levels and could potentially affect groundwater quality."**
We agree with the above statement, but we noticed the question of the impact on existing and future Onsite Wastewater Treatment Systems (OWTS) was not addressed. OWTS are still the only method of wastewater disposal in some areas of the County of Los Angeles.

Please feel free to contact me for any questions regarding this comment.

Thank you.

Michelle Tsiebos, REHS, DPA
Environmental Health Specialist IV

Fax. (626) 813-3016

Response to Comment Letter 3 (City of Baldwin Park Department of Public Health – February 23, 2015)

Response to Comment 3-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The PEIR evaluates potential impacts of higher groundwater levels on groundwater quality on Page 3.8-5. As noted in the PEIR, Regional BMPs would recharge stormwater into the groundwater basin and could raise local groundwater levels following major storm events. In areas with shallow groundwater tables or impermeable soils, recharge could result in mounding that affects subsurface infrastructure such as building or bridge foundations. As noted in the comment, OWTS are classified as subsurface infrastructure and could be affected if water was infiltrated adjacent to their location. However, areas within the County where OWTS are used for wastewater treatment (rather than a sewer system) are usually more rural with some exceptions for instance in Malibu. The proposed BMPs would be installed largely but not exclusively in highly urbanized areas. Therefore, OWTS are not expected to be significantly affected by BMP implementation except in certain areas, such as Malibu. However, in response to the comment, Mitigation Measure HYDRO-3 has been modified on page 3.8-36 of the PEIR, as shown below to specifically include an assessment of local OWTS when installing BMPs. Implementation of the mitigation measure would reduce potentially significant impacts to less than significant levels. This modification has been included in Chapter 12, *Clarifications and Modifications* of the Final PEIR. Since the Draft PEIR already identified potentially significant impacts to groundwater quality, the comment does not identify a new significant impact, and the modification to the mitigation measure clarifying that on-site treatment plant systems can be one of many sources of pollution does not trigger recirculation of the Draft PEIR under Section 15088.5 of the *CEQA Guidelines*.

> **HYDRO-3:** Prior to the installation of an infiltration BMP, the Permittee shall conduct a <u>regulatory</u> database review for contaminated groundwater sites within a quarter mile of the proposed infiltration facility. <u>The review shall include locations of on-site wastewater treatment systems that could be affected by the BMP.</u> The Permittee shall identify whether any contaminated groundwater plumes <u>or leach fields</u> are present <u>within close proximity to the BMP location that could be affected by infiltrated water</u> and whether coordination with the local and state environmental protection overseeing agency and responsible party is warranted prior to final design of infiltration facility.

Los Angeles County Flood Control District
900 South Fremont Avenue, 5th Floor
Alhambra, CA 91803

RECEIVED
MAR 03 2015
DEPT. PUBLIC WORKS
PROJECT MANAGEMENT DIVISION II

Dear Mr. BeGell:

Notice of Availability of the Draft Program
Environmental Impact Report for the Enhanced Watershed Management Programs

The Metropolitan Water District of Southern California (Metropolitan) has reviewed the Draft Program Environmental Impact Report for Enhanced Watershed Management Programs (EWMPs) in Los Angeles County, California. The Los Angeles County Flood Control District (LACFCD) is the Lead Agency. An EWMP is one regulatory compliance mechanism for stormwater management under the Los Angeles County Municipal Separate Storm Sewer System (MS4) Permit adopted in 2012 (hereafter referred to as 2012 LA County MS4 Permit). The LACFCD proposes the development of 12 separate EWMPs in their respective watershed groups. The potential benefits from the EWMPs include the following: (1) improved water quality; (2) reduction in the impairment of water bodies for Designated Beneficial Uses; (3) promotion of water conservation and supply; (4) enhanced recreational opportunities; (4) support for public education opportunities; (5) improved local aesthetics; and (6) management of flood risks. Metropolitan commented on the Notice of Preparation for this project in September 2014. This letter contains Metropolitan's comments to the proposed project as a potentially affected agency.

Metropolitan is a public agency and regional water wholesaler. It is comprised of 26 member public agencies serving approximately 18.4 million people in portions of six counties in Southern California, including Los Angeles County. Metropolitan's mission is to provide its 5,200-square-mile service area with adequate and reliable supplies of high-quality water to meet present and future needs in an environmentally and economically responsible way. Metropolitan owns and operates numerous facilities within Los Angeles County including pipelines, a water treatment plant, power plants, dams, reservoirs, and other infrastructure associated with our water conveyance and distribution system.

Metropolitan supports the development and implementation of EWMPs, particularly as watershed management plans can impact supply and promote water conservation. A governor-declared drought has been in effect since January 17, 2014, and agency and public awareness is extremely important in carrying out conservation measures.

The proposed project may impact Metropolitan's ability to dewater its pipelines. As part of a proactive maintenance and refurbishment program, Metropolitan periodically dewaters its treated and raw water pipelines prior to inspection, maintenance, or repair activities. Such periodic inspections and repairs are essential to prevent pipe failures and subsequent damage from high-pressure water releases. These water discharges are short-term in nature and are acknowledged by both the LA County Regional Water Quality Control Board and the State Water Resources Control Board as having a *de minimus,* or low-threat, impact to the environment and aquatic life. As such, these discharges are categorized as "Conditionally Exempt Essential Non-Storm Water Discharges" under the 2012 LA County MS4 Permit and are authorized under the recently adopted Statewide NPDES Permit for Drinking Water System Discharges to Waters of the United States (Order WQ 2014-0194-DWQ).

Metropolitan requests that LACFCD and its co-permitees continue to allow for periodic discharges by potable water systems into the MS4 under the proposed EWMPs. These *de minimus,* low-threat discharges are specifically called out as permissible under the 2012 LA County MS4 and Statewide Drinking Water System Discharges permits. Metropolitan will continue to follow industry-accepted best management practices (BMPs) for its potable water system discharges. BMPs include, but are not limited to, the following: (a) advanced notification of LACFCD 72 hours prior to all planned discharges greater than 100,000 gallons and as soon as possible after an unplanned discharge greater than 100,000 gallons; (b) dechlorination; (c) monitoring for pollutants of concern; and (d) recordkeeping (e.g., date, time, and location of discharge, discharge pathway, receiving water, total number of gallons discharged, BMPs used, etc.).

Based on a review of the proposed project boundaries, the proposed project has potential to impact Metropolitan facilities. Metropolitan must be allowed to maintain its rights-of-way and requires unobstructed access to its facilities in order to maintain and repair its system. Any future design plans associated with this project should be submitted to the attention of Metropolitan's Substructures Team. Approval of the project should be contingent on Metropolitan's approval of design plans for portions of the proposed project that could impact its facilities.

Detailed prints of drawings of Metropolitan's pipelines and rights-of-way may be obtained by calling Metropolitan's Substructures Information Line at (213) 217-6564. To assist the applicant in preparing plans that are compatible with Metropolitan's facilities and easements, we have enclosed a copy of the "Guidelines for Developments in the Area of Facilities, Fee Properties, and/or Easement of The Metropolitan Water District of Southern California." Please note that all submitted designs or plans must clearly identify Metropolitan's facilities and rights-of-way.

We appreciate the opportunity to provide input to your planning process and we look forward to receiving future documentation and plans for this project. For further assistance, please contact Ms. Michelle Morrison at (213) 217-7906.

Very truly yours,

for

Deirdre West
Manager, Environmental Planning Team

MIND FACILITIES OVERLAY

Guidelines for Developments in the
Area of Facilities, Fee Properties, and/or Easements
of The Metropolitan Water District of Southern California

1. Introduction

a. The following general guidelines should be followed for the design of proposed facilities and developments in the area of Metropolitan's facilities, fee properties, and/or easements.

b. We require that 3 copies of your tentative and final record maps, grading, paving, street improvement, landscape, storm drain, and utility plans be submitted for our review and written approval as they pertain to Metropolitan's facilities, fee properties and/or easements, prior to the commencement of any construction work.

2. Plans, Parcel and Tract Maps

The following are Metropolitan's requirements for the identification of its facilities, fee properties, and/or easements on your plans, parcel maps and tract maps:

a. Metropolitan's fee properties and/or easements and its pipelines and other facilities must be fully shown and identified as Metropolitan's on all applicable plans.

b. Metropolitan's fee properties and/or easements must be shown and identified as Metropolitan's with the official recording data on all applicable parcel and tract maps.

c. Metropolitan's fee properties and/or easements and existing survey monuments must be dimensionally tied to the parcel or tract boundaries.

d. Metropolitan's records of surveys must be referenced on the parcel and tract maps.

3. Maintenance of Access Along Metropolitan's Rights-of-Way

a. Proposed cut or fill slopes exceeding 10 percent are normally not allowed within Metropolitan's fee properties or easements. This is required to facilitate the use of construction and maintenance equipment, and provide access to its aboveground and belowground facilities.

b. We require that 16-foot-wide commercial-type driveway approaches be constructed on both sides of all streets crossing Metropolitan's rights-of-way. Openings are required in any median island. Access ramps, if necessary, must be at least 16-feet-wide. Grades of ramps are normally not allowed to exceed 10 percent. If the slope of an access ramp must exceed 10 percent due to the topography, the ramp must be paved. We require a 40-foot-long level area on the driveway approach to access ramps where the ramp meets the street. At Metropolitan's fee properties, we may require fences and gates.

c. The terms of Metropolitan's permanent easement deeds normally preclude the building or maintenance of structures of any nature or kind within its easements, to ensure safety and avoid interference with operation and maintenance of Metropolitan's pipelines or other facilities. Metropolitan must have vehicular access along the easements at all times for inspection, patrolling, and for maintenance of the pipelines and other facilities on a routine basis. We require a 20-foot-wide clear zone around all above-ground facilities for this routine access. This clear zone should slope away from our facility on a grade not to exceed 2 percent. We must also have access along the easements with construction equipment. An example of this is shown on Figure 1.

d. The footings of any proposed buildings adjacent to Metropolitan's fee properties and/or easements must not encroach into the fee property or easement or impose additional loading on Metropolitan's pipelines or other facilities therein. A typical situation is shown on Figure 2. Prints of the detail plans of the footings for any building or structure adjacent to the fee property or easement must be submitted for our review and written approval as they pertain to the pipeline or other facilities therein. Also, roof eaves of buildings adjacent to the easement or fee property must not overhang into the fee property or easement area.

e. Metropolitan's pipelines and other facilities, e.g. structures, manholes, equipment, survey monuments, etc. within its fee properties and/or easements must be protected from damage by the easement holder on Metropolitan's property or the property owner where Metropolitan has an easement, at no expense to Metropolitan. If the facility is a cathodic protection station it shall be located prior to any grading or excavation. The exact location, description and way of protection shall be shown on the related plans for the easement area.

4. Easements on Metropolitan's Property

a. We encourage the use of Metropolitan's fee rights-of-way by governmental agencies for public street and utility purposes, provided that such use does not interfere with Metropolitan's use of the property, the entire width of the property is accepted into the agency's public street system and fair market value is paid for such use of the right-of-way.

b. Please contact the Director of Metropolitan's Right of Way and Land Division, telephone (213) 250-6302, concerning easements for landscaping, street, storm drain, sewer, water or other public facilities proposed within Metropolitan's fee properties. A map and legal description of the requested easements must be submitted. Also, written evidence must be submitted that shows the city or county will accept the easement for the specific purposes into its public system. The grant of the easement will be subject to Metropolitan's rights to use its land for water pipelines and related purposes to the same extent as if such grant had not been made. There will be a charge for the easement. Please note that, if entry is required on the property prior to issuance of the easement, an entry permit must be obtained. There will also be a charge for the entry permit.

5. Landscaping

Metropolitan's landscape guidelines for its fee properties and/or easements are as follows:

a. A green belt may be allowed within Metropolitan's fee property or easement.

b. All landscape plans shall show the location and size of Metropolitan's fee property and/or easement and the location and size of Metropolitan's pipeline or other facilities therein.

c. Absolutely no trees will be allowed within 15 feet of the centerline of Metropolitan's existing or future pipelines and facilities.

d. Deep-rooted trees are prohibited within Metropolitan's fee properties and/or easements. Shallow-rooted trees are the only trees allowed. The shallow-rooted trees will not be permitted any closer than 15 feet from the centerline of the pipeline, and such trees shall not be taller than 25 feet with a root spread no greater than 20 feet in diameter at maturity. Shrubs, bushes, vines, and ground cover are permitted, but larger shrubs and bushes should not be planted directly over our pipeline. Turf is acceptable. We require submittal of landscape plans for Metropolitan's prior review and written approval. (See Figure 3).

e. The landscape plans must contain provisions for Metropolitan's vehicular access at all times along its rights-of-way to its pipelines or facilities therein. Gates capable of accepting Metropolitan's locks are required in any fences across its rights-of-way. Also, any walks or drainage facilities across its access route must be constructed to AASHTO H-20 loading standards.

f. Rights to landscape any of Metropolitan's fee properties must be acquired from its Right of Way and Land Division. Appropriate entry permits must be obtained prior to any entry on its property. There will be a charge for any entry permit or easements required.

6. <u>Fencing</u>

Metropolitan requires that perimeter fencing of its fee properties and facilities be constructed of universal chain link, 6 feet in height and topped with 3 strands of barbed wire angled upward and outward at a 45 degree angle or an approved equal for a total fence height of 7 feet. Suitable substitute fencing may be considered by Metropolitan. (Please see Figure 5 for details).

7. <u>Utilities in Metropolitan's Fee Properties and/or Easements or Adjacent to Its Pipeline in Public Streets</u>

Metropolitan's policy for the alinement of utilities permitted within its fee properties and/or easements and street rights-of-way is as follows:

a. Permanent structures, including catch basins, manholes, power poles, telephone riser boxes, etc., shall not be located within its fee properties and/or easements.

b. We request that permanent utility structures within public streets, in which Metropolitan's facilities are constructed under the Metropolitan Water District Act, be placed as far from our pipeline as possible, but not closer than 5 feet from the outside of our pipeline.

c. The installation of utilities over or under Metropolitan's pipeline(s) must be in accordance with the requirements shown on the enclosed prints of Drawings Nos. C-11632 and C-9547. Whenever possible we request a minimum of one foot clearance between Metropolitan's pipe and your facility. Temporary support of Metropolitan's pipe may also be required at undercrossings of its pipe in an open trench. The temporary support plans must be reviewed and approved by Metropolitan.

d. Lateral utility crossings of Metropolitan's pipelines must be as perpendicular to its pipeline alinement as practical. Prior to any excavation our pipeline shall be located manually and any excavation within two feet of our pipeline must be done by hand. This shall be noted on the appropriate drawings.

e. Utilities constructed longitudinally within Metropolitan's rights-of-way must be located outside the theoretical trench prism for uncovering its pipeline and must be located parallel to and as close to its rights-of-way lines as practical.

f. When piping is jacked or installed in jacked casing or tunnel under Metropolitan's pipe, there must be at least two feet of vertical clearance between the bottom of Metropolitan's pipe and the top of the jacked pipe, jacked casing or tunnel. We also require that detail drawings of the shoring for the jacking or tunneling pits be submitted for our review and approval. Provisions must be made to grout any voids around the exterior of the jacked pipe, jacked casing or tunnel. If the piping is installed in a jacked casing or tunnel the annular space between the piping and the jacked casing or tunnel must be filled with grout.

g. Overhead electrical and telephone line requirements:

1) Conductor clearances are to conform to the California State Public Utilities Commission, General Order 95, for Overhead Electrical Line Construction or at a greater clearance if required by Metropolitan. Under no circumstances shall clearance be less than 35 feet.

2) A marker must be attached to the power pole showing the ground clearance and line voltage, to help prevent damage to your facilities during maintenance or other work being done in the area.

3) Line clearance over Metropolitan's fee properties and/or easements shall be shown on the drawing to indicate the lowest point of the line under the most adverse conditions including consideration of sag, wind load, temperature change, and support type. We require that overhead lines be located at least 30 feet laterally away from all above-ground structures on the pipelines.

4) When underground electrical conduits, 120 volts or greater, are installed within Metropolitan's fee property and/or easement, the conduits must be incased in a minimum of three inches of red concrete. Where possible, above ground warning signs must also be placed at the right-of-way lines where the conduits enter and exit the right-of-way.

h. The construction of sewerlines in Metropolitan's fee properties and/or easements must conform to the California Department of Health Services Criteria for the Separation of Water Mains and Sanitary Services and the local City or County Health Code Ordinance as it relates to installation of sewers in the vicinity of pressure waterlines. The construction of sewerlines should also conform to these standards in street rights-of- way.

i. Cross sections shall be provided for all pipeline crossings showing Metropolitan's fee property and/or easement limits and the location of our pipeline(s). The exact locations of the crossing pipelines and their elevations shall be marked on as-built drawings for our information.

j. Potholing of Metropolitan's pipeline is required if the vertical clearance between a utility and Metropolitan's pipeline is indicated on the plan to be one foot or less. If the indicated clearance is between one and two feet, potholing is suggested. Metropolitan will provide a representative to assists others in locating and identifying its pipeline. Two-working days notice is requested.

k. Adequate shoring and bracing is required for the full depth of the trench when the excavation encroaches within the zone shown on Figure 4.

l. The location of utilities within Metropolitan's fee property and/or easement shall be plainly marked to help prevent damage during maintenance or other work done in the area. Detectable tape over buried utilities should be placed a minimum of 12 inches above the utility and shall conform to the following requirements:

1) Water pipeline: A two-inch blue warning tape shall be imprinted with:

"CAUTION BURIED WATER PIPELINE"

2) Gas, oil, or chemical pipeline: A two-inch yellow warning tape shall be imprinted with:

"CAUTION BURIED _______ PIPELINE"

3) Sewer or storm drain pipeline: A two-inch green warning tape shall be imprinted with:

"CAUTION BURIED ______ PIPELINE"

4) Electric, street lighting, or traffic signals conduit: A two-inch red warning tape shall be imprinted with:

"CAUTION BURIED _______ CONDUIT"

5) Telephone, or television conduit: A two-inch orange warning tape shall be imprinted with:

"CAUTION BURIED _______ CONDUIT"

m. Cathodic Protection requirements:

1) If there is a cathodic protection station for Metropolitan's pipeline in the area of the proposed work, it shall be located prior to any grading or excavation. The exact location, description and manner of protection shall be shown on all applicable plans. Please contact Metropolitan's Corrosion Engineering Section, located at Metropolitan's F. E. Weymouth Softening and Filtration Plant, 700 North Moreno Avenue, La Verne, California 91750, telephone (714) 593-7474, for the locations of Metropolitan's cathodic protection stations.

2) If an induced-current cathodic protection system is to be installed on any pipeline crossing Metropolitan's pipeline, please contact Mr. Wayne E. Risner at (714) 593-7474 or (213) 250-5085. He will review the proposed system and determine if any conflicts will arise with the existing cathodic protection systems installed by Metropolitan.

3) Within Metropolitan's rights-of-way, pipelines and carrier pipes (casings) shall be coated with an approved protective coating to conform to Metropolitan's requirements, and shall be maintained in a neat and orderly condition as directed by Metropolitan. The application and monitoring of cathodic protection on the pipeline and casing shall conform to Title 49 of the Code of Federal Regulations, Part 195.

4) If a steel carrier pipe (casing) is used:

(a) Cathodic protection shall be provided by use of a sacrificial magnesium anode (a sketch showing the cathodic protection details can be provided for the designers information).

(b) The steel carrier pipe shall be protected with a coal tar enamel coating inside and out in accordance with AWWA C203 specification.

n. All trenches shall be excavated to comply with the CAL/OSHA Construction Safety Orders, Article 6, beginning with Sections 1539 through 1547. Trench backfill shall be placed in 8-inch lifts and shall be compacted to 95 percent relative compaction (ASTM D698) across roadways and through protective dikes. Trench backfill elsewhere will be compacted to 90 percent relative compaction (ASTM D698).

o. Control cables connected with the operation of Metropolitan's system are buried within streets, its fee properties and/or easements. The locations and elevations of these cables shall be shown on the drawings. The drawings shall note that prior to any excavation in the area, the control cables shall be located and measures shall be taken by the contractor to protect the cables in place.

p. Metropolitan is a member of Underground Service Alert (USA). The contractor (excavator) shall contact USA at 1-800-422-4133 (Southern California) at least 48 hours prior to starting any excavation work. The contractor will be liable for any damage to Metropolitan's facilities as a result of the construction.

8. Paramount Right

Facilities constructed within Metropolitan's fee properties and/or easements shall be subject to the paramount right of Metropolitan to use its fee properties and/or easements for the purpose for which they were acquired. If at any time Metropolitan or its assigns should, in the exercise of their rights, find it necessary to remove any of the facilities from the fee properties and/or easements, such removal and replacement shall be at the expense of the owner of the facility.

9. Modification of Metropolitan's Facilities

When a manhole or other of Metropolitan's facilities must be modified to accommodate your construction or reconstruction, Metropolitan will modify the facilities with its forces. This should be noted on the construction plans. The estimated cost to perform this modification will be given to you and we will require a deposit for this amount before the work is performed. Once the deposit is received, we will schedule the work. Our forces will coordinate the work with your contractor. Our final billing will be based on actual cost incurred, and will include materials, construction, engineering plan review, inspection, and administrative overhead charges calculated in accordance with Metropolitan's standard accounting practices. If the cost is less than the deposit, a refund will be made; however, if the cost exceeds the deposit, an invoice will be forwarded for payment of the additional amount.

10. Drainage

a. Residential or commercial development typically increases and concentrates the peak storm water runoff as well as the total yearly storm runoff from an area, thereby increasing the requirements for storm drain facilities downstream of the development. Also, throughout the year water from landscape irrigation, car washing, and other outdoor domestic water uses flows into the storm drainage system resulting in weed abatement, insect infestation, obstructed access and other problems. Therefore, it is Metropolitan's usual practice not to approve plans that show discharge of drainage from developments onto its fee properties and/or easements.

b. If water must be carried across or discharged onto Metropolitan's fee properties and/or easements, Metropolitan will insist that plans for development provide that it be carried by closed conduit or lined open channel approved in writing by Metropolitan. Also the drainage facilities must be maintained by others, e.g., city, county, homeowners association, etc. If the development proposes changes to existing drainage features, then the developer shall make provisions to provide for replacement and these changes must be approved by Metropolitan in writing.

11. Construction Coordination

During construction, Metropolitan's field representative will make periodic inspections. We request that a stipulation be added to the plans or specifications for notification of Mr. __________ of Metropolitan's Operations Services Branch, telephone (213) 250-____, at least two working days prior to any work in the vicinity of our facilities.

12. Pipeline Loading Restrictions

a. Metropolitan's pipelines and conduits vary in structural strength, and some are not adequate for AASHTO H-20 loading. Therefore, specific loads over the specific sections of pipe or conduit must be reviewed and approved by Metropolitan. However, Metropolitan's pipelines are typically adequate for AASHTO H-20 loading provided that the cover over the pipeline is not less than four feet or the cover is not substantially increased. If the temporary cover over the pipeline during construction is between three and four feet, equipment must restricted to that which

imposes loads no greater than AASHTO H-10. If the cover is between two and three feet, equipment must be restricted to that of a Caterpillar D-4 tract-type tractor. If the cover is less than two feet, only hand equipment may be used. Also, if the contractor plans to use any equipment over Metropolitan's pipeline which will impose loads greater than AASHTO H-20, it will be necessary to submit the specifications of such equipment for our review and approval at least one week prior to its use. More restrictive requirements may apply to the loading guideline over the San Diego Pipelines 1 and 2, portions of the Orange County Feeder, and the Colorado River Aqueduct. Please contact us for loading restrictions on all of Metropolitan's pipelines and conduits.

b. The existing cover over the pipeline shall be maintained unless Metropolitan determines that proposed changes do not pose a hazard to the integrity of the pipeline or an impediment to its maintenance.

13. Blasting

a. At least 20 days prior to the start of any drilling for rock excavation blasting, or any blasting, in the vicinity of Metropolitan's facilities, a two-part preliminary conceptual plan shall be submitted to Metropolitan as follows:

b. Part 1 of the conceptual plan shall include a complete summary of proposed transportation, handling, storage, and use of explosions.

c. Part 2 shall include the proposed general concept for blasting, including controlled blasting techniques and controls of noise, fly rock, airblast, and ground vibration.

14. CEQA Requirements

a. When Environmental Documents Have Not Been Prepared

1) Regulations implementing the California Environmental Quality Act (CEQA) require that Metropolitan have an opportunity to consult with the agency or consultants preparing any environmental documentation. We are required to review and consider the environmental effects of the project as shown in the Negative Declaration or Environmental Impact Report (EIR) prepared for your project before committing Metropolitan to approve your request.

2) In order to ensure compliance with the regulations implementing CEQA where Metropolitan is not the Lead Agency, the following minimum procedures to ensure compliance with the Act have been established:

a) Metropolitan shall be timely advised of any determination that a Categorical Exemption applies to the project. The Lead Agency is to advise Metropolitan that it and other agencies participating in the project have complied with the requirements of CEQA prior to Metropolitan's participation.

b) Metropolitan is to be consulted during the preparation of the Negative Declaration or EIR.

c) Metropolitan is to review and submit any necessary comments on the Negative Declaration or draft EIR.

d) Metropolitan is to be indemnified for any costs or liability arising out of any violation of any laws or regulations including but not limited to the California Environmental Quality Act and its implementing regulations.

b. <u>When Environmental Documents Have Been Prepared</u>

If environmental documents have been prepared for your project, please furnish us a copy for our review and files in a timely manner so that we may have sufficient time to review and comment. The following steps must also be accomplished:

1) The Lead Agency is to advise Metropolitan that it and other agencies participating in the project have complied with the requirements of CEQA prior to Metropolitan's participation.

2) You must agree to indemnify Metropolitan, its officers, engineers, and agents for any costs or liability arising out of any violation of any laws or regulations including but not limited to the California Environmental Quality Act and its implementing regulations.

15. <u>Metropolitan's Plan-Review Cost</u>

a. An engineering review of your proposed facilities and developments and the preparation of a letter response

giving Metropolitan's comments, requirements and/or approval that will require 8 man-hours or less of effort is typically performed at no cost to the developer, unless a facility must be modified where Metropolitan has superior rights. If an engineering review and letter response requires more than 8 man-hours of effort by Metropolitan to determine if the proposed facility or development is compatible with its facilities, or if modifications to Metropolitan's manhole(s) or other facilities will be required, then all of Metropolitan's costs associated with the project must be paid by the developer, unless the developer has superior rights.

b. A deposit of funds will be required from the developer before Metropolitan can begin its detailed engineering plan review that will exceed 8 hours. The amount of the required deposit will be determined after a cursory review of the plans for the proposed development.

c. Metropolitan's final billing will be based on actual cost incurred, and will include engineering plan review, inspection, materials, construction, and administrative overhead charges calculated in accordance with Metropolitan's standard accounting practices. If the cost is less than the deposit, a refund will be made; however, if the cost exceeds the deposit, an invoice will be forwarded for payment of the additional amount. Additional deposits may be required if the cost of Metropolitan's review exceeds the amount of the initial deposit.

16. Caution

We advise you that Metropolitan's plan reviews and responses are based upon information available to Metropolitan which was prepared by or on behalf of Metropolitan for general record purposes only. Such information may not be sufficiently detailed or accurate for your purposes. No warranty of any kind, either express or implied, is attached to the information therein conveyed as to its accuracy, and no inference should be drawn from Metropolitan's failure to comment on any aspect of your project. You are therefore cautioned to make such surveys and other field investigations as you may deem prudent to assure yourself that any plans for your project are correct.

17. Additional Information

Should you require additional information, please contact:

GENERAL NOTES

1. All ferrous parts and materials shall be galvanized after fabrication
2. Adjustable tighteners shall be turnbuckle or equivalent, having minimum 6" take-up
3. Extension arms for barbed wire shall be steel, malleable iron or wrought iron and shall be attached to the top of the post with a ¼ inch round head rivet. The extension arms shall carry three wires each at approximately 5 inch centers in a plane approximately 45° from the vertical.
4. All gate hinges shall be heavy duty malleable iron or steel, industrial service type, 270 degree swing, of approved quality and design.
5. Secure cap to post with ¼ inch round head rivet

Use	Type	Nominal Size (Inches)	Actual O.D. (Inches)	Weight per foot (Pounds)
End, corner, slope, pull and gate posts (for single gates 6 feet or less in width and double gates 12 feet or less in width) for chain link fabric 72" inches or higher	Pipe	2½	2.875	3.79
End, corner, slope, pull and gate posts (for single gates 6 feet or less in width and double gates 12 feet or less in width) for chain link fabric less than 72 inches height	Pipe	2	2.375	3.65
Gate posts for single swing gates over 6 feet but not over 13 feet in width and double swing gates over 12 feet but not over 26 feet in width.	Pipe	3½	4.000	9.11
Gate posts for single swing gates over 13 feet but not over 18 feet in width and double swing gates over 26 feet but not over 36 feet in width.	Pipe	6	6.625	18.97
Gate posts for single swing gates over 18 feet in width and double swing gates over 36 feet in width	Pipe	8	8.625	24.70
Line posts for chain link fabric 72 inches or higher	Pipe	2	2.375	3.65
	H-Section	2¼ x 1⅞		4.10
Line posts for chain link fabric less than 72 inches in height	Pipe	1½	1.900	2.72

Response to Comment Letter 4 (Metropolitan Water District – February 25, 2015)

Response to Comment 4-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or “Program”). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The commenter’s support for the PEIR is noted.

Response to Comment 4-B

The comment notes that dewatering discharges from water utilities are permitted under separate NPDES permits and WDRs issued by the RWQCB. The EWMPs would be designed to accommodate projected flows within their watersheds. If a pipeline dewatering activity resulted in a volume of water greater than the capacity of the BMP, it could potentially overwhelm the BMP, and discharge from the MS4 as is currently the case. Advanced notification of the discharges as currently required would ensure that no adverse impacts would occur.

Response to Comment 4-C

Periodic dewatering discharges from water utilities are permitted under separate NPDES permits and WDRs issued by the RWQCB; therefore, the proposed EWPMS would not inhibit these discharges. Advanced notification of the discharges as currently required would ensure that no adverse impacts would occur. The commenter’s plan to continue to follow BMPs for these discharges is noted for the record.

Response to Comment 4-D

The proposed EWMP BMPs are under development. As BMPs are developed, the location of underground utilities would be identified to ensure that services are maintained and access to utilities is maintained. If a project is expected to interfere with Metropolitan’s facility access, the project operator would consult with Metropolitan prior to implementation. In response to this comment, an additional mitigation measure has been added (UTIL-1) under the Impact 3.14-1 discussion on page 3.14-14 as follows (thereby shifting the numbering of the original Mitigation Measures UTIL-1 and UTIL-2 to Mitigation Measures UTIL-2 and UTIL-3):

> Construction requiring ground disturbance could encounter buried utilities including water supply infrastructure. As part of Mitigation Measure UTIL-1, ~~the project design,~~ Implementing Agencies ~~would be required to identify the potential for underground utilities and determine whether they would need to be relocated to accommodate the BMP. As standard construction practices require, Implementing Agencies~~ would conduct an underground utility search prior to excavation and would coordinate with utility providers in advance to ensure no disruption in services to the utility customers. With

implementation of UTIL-1, i~~I~~mpacts to water supply and other utility infrastructure would be less than significant.

On page 3.14-14 as follows (further lessening less than significant impacts):

Mitigation Measures: ~~None required~~

UTIL-1: Prior to implementation of BMPs, the implementing agency shall conduct a search for local utilities above and below ground that could be affected by the project. The implementing agencies shall contact each utility potentially affected to address relocation of the utility if necessary to ensure access and services are maintained.

Under the Impact 3.14-3 discussion on page 3.14-16 as follows:

Construction requiring ground disturbance could encounter buried utilities including water supply infrastructure. As part of Mitigation Measure UTIL-1, ~~the project design,~~ Implementing Agencies ~~would be required to identify the potential for underground utilities and determine whether they would need to be relocated to accommodate the BMP. As standard construction practices require, Implementing Agencies~~ would conduct an underground utility search prior to excavation and would coordinate with utility providers in advance to ensure no disruption in services to the utility customers. With implementation of UTIL-1, i~~I~~mpacts to water supply and other utility infrastructure would be less than significant.

On page 3.14-16 as follows (further lessening less than significant impacts):

These flows would not be affected by infiltration BMPs. However, implementation of **Mitigation Measure UTIL-~~1~~2** would ensure that downstream water rights would not be affected by upstream diversions.

On page 3.14-17 as follows:

Mitigation Measure: Implement Mitigation Measure UTIL-1.

UTIL-~~1~~2: Prior to approval of BMPs, implementing agencies shall evaluate the potential for impacts to downstream beneficial uses, including surface water rights. Implementing agencies shall not approve BMPs that result in preventing access to previously appropriated surface water downstream.

On page 3.14-18 as follows:

Development of a waste management or recycling plan (**Mitigation Measure UTIL-~~2~~3**) would reduce this impact.

On page 3.14-18 as follows:

Mitigation Measure:

UTIL-~~2~~3: Implementing agencies shall encourage construction contractors to recycle construction materials and divert inert solids (asphalt, brick, concrete, dirt, fines, rock, sand, soil, and stone) from disposal in a landfill, where feasible. Implementing agencies shall incentivize construction contractors with waste minimization goals in bid specifications where feasible.

Under the Impact 3.14-5 discussion on page 3.14-19 as follows:

Construction requiring ground disturbance could encounter buried or overhead utilities including electric or gas conveyance infrastructure. As part of Mitigation Measure UTIL-1, ~~the project design,~~ Implementing Agencies ~~would be required to identify the potential for underground utilities and determine whether they would need to be relocated to accommodate the BMP. As standard construction practices require, Implementing Agencies~~ would conduct an underground utility search prior to excavation and would coordinate with utility providers in advance to ensure no disruption in services to the utility customers. Impacts to electric or gas infrastructure would be less than significant.

On page 3.14-20 as follows (further lessening less than significant impacts):

Mitigation Measures: ~~None required~~ Implement Mitigation Measure UTIL-1.

This change also applies to the cumulative impact discussion, requiring added text on page 3.14-21 as follows:

The proposed program consists of improvements to existing storm drainage facilities as well as new storm drain facilities within the EWMP program areas. This PEIR contains an analysis on the potential environmental effects that might result from the installation of storm drainage facilities identified in the proposed EWMPs. **Mitigation Measure UTIL-1** would require the implementing agency to search for local utilities that could be affected by the project, thereby avoiding impacts to existing utilities. Cumulative impacts to storm drain facilities would be less than significant.

Impacts to the existing water supplies are anticipated to be beneficial as a result of the stormwater and non-stormwater runoff infiltration and conservation BMPs implemented across the EWMP areas. **Mitigation Measure UTIL-~~1~~2** would require that implementing agencies evaluate impacts to downstream beneficial uses, including surface water rights prior to BMP approval. No adverse cumulative impacts related to new or expanded water supply resources or entitlements would occur.

Construction and operation of the structural BMPs would generate solid waste; however, landfills serving the program area are expected to have sufficient capacity to accommodate the amount of waste generated. Development of a waste management or recycling plan (**Mitigation Measure UTIL-~~2~~3**) would reduce this impact. Disposal of the solid waste generated during construction and operation would comply with all pertinent regulations and statutes. All other projects implemented in the area would also be required to comply with federal, state, and local solid waste regulations and statutes. Cumulative impacts would be less than significant.

And on page 3.14-21 as follows (further lessening less than significant impacts):

> **Mitigation Measures:** Implement **Mitigation Measure UTIL-1**, ~~and~~ **Mitigation Measure UTIL-2**, and **Mitigation Measure UTIL-3.**

These modifications have been included in Chapter 12, *Clarifications and Modifications*, of the Final PEIR. The Draft PEIR identified the need for underground utility searches as standard practice. However, in response to the comment and to ensure that the practice is carried out, the new mitigation measure is added. The need to investigate project areas for underground utilities was noted in the analysis on page 3.14-16 as a standard practice. The new Mitigation Measure UTIL-1 ensures that the practice is carried out. Therefore, no new significant impact would occur, and the modification does not trigger recirculation of the Draft PEIR under Section 15088.5 of the *CEQA Guidelines*.

Response to Comment 4-E

The commenter's statement that Metropolitan pipeline details can be obtained from Metropolitan and that all designs or plans must identify Metropolitan's facilities and rights-of-way has been noted for the record. Metropolitan pipelines qualify as potential utilities that could be affected by future projects, and thus would be included in the required search for utilities as specified in Mitigation Measure UTIL-1 added in Response to Comment 4-D above.

Alhambra, CA 91803

Re: Enhanced Watershed Management Programs (EWMP)

Dear Mr. BeGell:

The City of Inglewood (City) supports the development of programs that improve water quality.

The Los Angeles County Flood Control District (LACFCD) is preparing the Program Environmental Impact Report (PEIR) to evaluate the proposed Enhanced Watershed Management Programs (EWMP); this program is being developed to improve water quality in Los Angeles County.

PEIR is an advanced planning document that describes details of the countywide water quality program EWMP. Partnership with municipalities in the county will promote compliance with the new MS4 Permit.

The City reviewed the draft PEIR and agrees with its conclusions regarding the impacts of the proposed EWMP on the environment and its proposed mitigation measures.

Therefore, the purpose of this letter is to offer the City's support for the implementation of EWMP.

Sincerely,

Louis A. Atwell, P.E.
Public Works Director

Response to Comment Letter 5 (City of Inglewood Public Works Department – March 2, 2015)

Response to Comment 5-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The commenter's support for the PEIR is noted.

Mr. Gregg BeGell, P.E.
County of Los Angeles
Department of Public Works
900 South Fremont Avenue, 5th Floor
Alhambra, CA 91803

Dear Mr. BeGell:

LOS ANGELES COUNTY FLOOD CONTROL DISTRICT PROGRAM EIR FOR THE ENHANCED WATERSHED MANAGEMENT PROGRAMS

The City of Los Angeles (City) supports the development of programs that improve water quality. Through LA Sanitation, the City acts as watershed lead in the development of Enhanced Watershed Management Programs (EWMPs) that are being developed to improve water quality in Los Angeles County for four (4) watersheds, including the Upper Los Angeles River, Ballona Creek, Dominguez Channel, and Santa Monica Bay watersheds. These plans aim to provide a multi-benefit approach to complying with water quality regulations, leading to the construction of projects that will improve stormwater quality, enhance water supply, improve flood control, and bring green space and other amenities to the community.

The Los Angeles County Flood Control District (LACFCD) is preparing a Program Environmental Impact Report (EIR) to evaluate the proposed EWMPs. The Program EIR is an Advanced Planning Document describing details of the County-wide water quality program (EWMPs) being launched in partnership with municipalities in the County to comply with the new MS4 Permit. Advanced planning improves public awareness and government transparency and provides for a higher level assessment of policy decisions prior to the consideration of individual projects.

LA Sanitation has reviewed the Draft PEIR and supports the advanced planning approach detailed in the PEIR. LA Sanitation is writing to offer its support for the implementation of EWMPs to achieve compliance with the MS4 Permit and to encourage the certification of the Program Environmental Impact Report (EIR) developed by the LACFCD.

Sincerely,

SHAHRAM KHARAGHANI, Ph.D., P.E., BCEE
Program Manager

Subject: EWMP Draft PEIR Comments

Mr. BeGell, P.E,

Please see the following comments from the Los Angeles Regional Water Board on the County of Los Angeles's Draft PEIR:

1. The draft EIR notes that participation in an EWMP is optional but some sections of the document make it appear that the Los Angeles MS4 Permit requires permittees to develop EWMPs to ensure meeting water quality objectives.
2. The draft EIR makes it appear that all EWMP projects will be implemented in an urbanized area. The draft EIR's assumptions regarding project implementation appear valid but there should be a short discussion of potential impacts of projects implemented in non-urbanized areas (e.g. Upper Santa Clara River EWMP).
3. The Basin Plan for the California Regional Water Quality Control Board, Santa Ana Region is included as a reference but the Basin Plan for the California Regional Water Quality Control Board, Los Angeles Region, where the EWMP projects will be implemented, is not referenced.

If you have any questions feel free to contact me.

Response to Comment Letter 7 (Los Angeles Regional Water Quality Control Board – March 6, 2015)

Response to Comment 7-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The commenter does not specifically identify which sections of the PEIR the comment refers to, however, the LACFCD acknowledges that participation in an EWMP is one of several options identified in the MS4 Permit for achieving compliance with water quality standards.

The MS4 Permit allows Permittees the option of preparing an EWMP to achieve compliance as noted on page 1-1. The commenter is correct that preparation of an EWMP is not a requirement for each Permittee. However, the MS4 provides specific requirements for Permittees that elect to prepare EWMPs. The PEIR refers to these "requirements" when explaining the Permit's outline for preparing an EWMP as noted on page 1-3 and elsewhere in the document. In response to this comment the text on page 1-1 has been revised as follows:

> The MS4 Permit gives Permittees the option of implementing an innovative approach to permit compliance through development of an Enhanced Watershed Management Program (EWMP). Development of an EWMP is optional, but allows Permittees a longer timeline to develop and implement Best Management Practices (BMPs) needed to achieve compliance. The EWMPS will result in additional benefits including provision of open space and parkland, habitat creation, and stormwater retention. Permittees not preparing Watershed Management Programs or EWMPs must achieve compliance within a year of permit adoption. The EWMPs will identify potential and priority structural and non-structural ~~Best Management Practices (~~BMPs~~)~~ within the region's stormwater collection system to improve runoff water quality. The LACFCD, along with participating Permittees, has opted to exercise this option and has submitted to the LARWQCB 12 separate Notices of Intent (NOIs) for the development of EWMPs within 12 distinct watershed groups (refer to **Figure 1-1**). Implementation of the EMWPs would be the responsibility of each Permittee and would occur following approval of the EWMPs by the LARWQCB.

And on page 1-3 as follows:

> The timeline identified in the MS4 Permit requires that Permittees who elect to prepare Watershed Management Programs submit them ~~the EWMP~~ to the LARWQCB by June 28, 2015, in order to be in compliance with the permit conditions. The LACFCD recognizes that implementation of the EWMPs may potentially result in changes to environmental conditions. As a result, the LACFCD has prepared this Program

> Environmental Impact Report (PEIR) in compliance with the California Environmental Quality Act (CEQA) to provide the public and the responsible and trustee agencies with information about the potential effects on the local and regional environment associated with implementation of the EWMPs. The LACFCD will submit the PEIR to its governing body, the Los Angeles County Board of Supervisors, for approval prior to submittal of the EWMPs. The EWMPs will be submitted by each EWMP group to the LARWQCB.

Participation in a Watershed Management Program is voluntary and allows a Permittee to address the highest watershed priorities, including complying with the requirements of Receiving Water Limitations, Total Maximum Daily Load Provisions by customizing the control measures. The Watershed Management Programs shall ensure that discharges from the Permittee's MS4: (i) achieve applicable water quality-based effluent limitations, (ii) do not cause or contribute to exceedances of receiving water limitations, and (iii) do not include non-storm water discharges that are effectively prohibited. Watershed Management Programs shall be developed either collaboratively or individually using the Regional Water Board's Watershed Management Areas (WMAs). Permittees may elect to develop an enhanced Watershed Management Program (EWMP). An EWMP is one that comprehensively evaluates opportunities, within the participating Permittees' collective jurisdictional area in a WMA, for collaboration among Permittees and other partners on multi-benefit regional projects.

As a result of the extended timeline given to achieve permit compliance through development of EWMP, as well as collaboration of resources, several Permittees have selected to prepare EWMPs as their form of MS4 Permit compliance; specific requirements detailed in the MS4 Permit must be met to successfully implement this compliance method. The PEIR discusses the effects of the implementation of these EWMPs.

Response to Comment 7-B:

The PEIR assumes that BMPs may be installed in any location, whether urbanized or previously undisturbed. The impact analysis assumes some projects may be proposed in open space areas and evaluates impact avoidance and minimization measures. The PEIR provides maps in Appendix G to the PEIR showing prospective locations for BMPs. The locations are broadly distributed throughout the watersheds. The LACFCD acknowledges that BMPs are not limited to urban areas but may be installed throughout a watershed if necessary to achieve water quality objectives. In response to the comment, the following changes have been made to the PEIR on page 1-3.

> The PEIR analysis is not intended to focus on the site-specific construction and operation details of each management strategy and project included in the EWMP. Rather, this PEIR serves as a first-tier environmental document that focuses on the effects of implementing the EWMPs to reduce urban runoff pollution <u>anywhere in the watershed</u>. The analysis assesses worst case situations where construction or operation of projects may significantly impact environmental resources<u> whether in urban environments or previously undisturbed open space</u>. The analysis outlines mitigation strategies to be followed by the LACFCD and other implementing agencies that rely on this PEIR to

> avoid or minimize impacts wherever feasible. The determinations of significance after mitigation in this PEIR will apply to the LACFCD and other implementing agencies that rely on this PEIR and the mitigation measures proposed herein.

And on page 1-11 as follows:

> The PEIR focuses its assessment on construction and operation of these potential and priority BMPs to be installed throughout the watersheds—but primarily within urbanized areas where the pollutant loading is greatest and where these BMPs can be most cost-effective in meeting water quality goals. The analysis assesses worst case situations where construction or operation of projects may significantly impact environmental resources. The analysis also considers potential impacts and mitigation for BMPs implemented in less developed and urbanized areas of the EWMP where water quality issues may exist that are not directly linked to urbanization but are still regulated under the MS4 Permit. The analysis outlines mitigation strategies to be followed by Implementing Agencies to avoid or minimize impacts wherever feasible. Exact locations and BMP designs are not defined. Rather, the overall compliance strategy of BMP type, quantity, and geographic distribution is assessed on a cumulative, regional scale.

Response to Comment 7-C:

The Basin Plan for the Santa Ana Regional Water Quality Control Board is mistakenly included as a reference on page 9-16. Refer to page 3.8-29 of Section 3.8, *Hydrology and Water Quality*, which correctly references the Los Angeles Basin Plan. The correct reference has been updated in Chapter 9, *References*, as shown below.

> California Regional Water Quality Control Board, ~~Santa Ana~~ Los Angeles Region - 1994~~5~~ Water Quality Control Plan ~~for the Santa Ana River~~ Los Angeles Region ~~Basin~~ (Basin Plan) ~~updated in February 2008~~ June 1994.

NOTICE OF AVAILABILITY OF A DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT FOR THE ENHANCED WATERSHED MANAGEMENT PROGRAMS

The Department of Parks and Recreation (DPR) has reviewed the above project for potential impact on the facilities under the jurisdiction of the Department and offers the following comments:

The County Park facilities listed in the document as candidates for structural BMP implementation would likely experience some level of temporary construction impacts:

- **Ladera Park** (Ballona Creek EWMP Group)
- **Hellen Keller Park** (Dominguez Channel Watershed Management Area Group)
- **Roosevelt Park** (Upper Los Angeles River Watershed EWMP)
- **San Angelo Park** (Upper San Gabriel River EWMP Group)
- **Adventure Park** (Upper San Gabriel River EWMP Group)
- **Allen Martin Park** (Upper San Gabriel River EWMP Group)
- **Bassett Park** (Upper San Gabriel River EWMP Group)
- **Santa Anita Golf Course** (Rio Hondo/San Gabriel River Water Quality Group)
- **Chester Washington Golf Course** (Dominguez Channel WMA Group)
- **The Los Angeles County Arboretum** (Rio Hondo/San Gabriel River WQ Group)
- **Peck Road Water Conservation Park** (Rio Hondo/San Gabriel River WQ Group)

Please continue to coordinate with our Department as BMP project-types (bio-infiltration cells, bio-swales, porous pavement and filter strips, low-flow diversions, detention ponds, treatment wetlands, and steam/creek restoration projects) and funding opportunities are identified as well as implementation priorities established.

Thank you for including this Department in the environmental review process. If you have any questions, please contact Bryan Moscardini of my staff at (213) 351-5133 or by email at bmoscardini@parks.lacounty.gov.

Sincerely,

Kathline King

Kathline J. King
Chief of Planning

KK:JR:bm / Response to LACFCD-EWMP

c: Parks and Recreation (N. E. Garcia, J. Rupert, B. Moscardini)

Response to Comment Letter 9 (County of Los Angeles Department of Parks and Recreation – March 10, 2015)

Response to Comment 9-A

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The projects implemented as part of the EWMPs are not known at this time; therefore, specific impacts to parks are not known. As discussed in Impact 3.12-4 on pages 3.12-12 and 3.12-13 of the PEIR, certain parts of selected parks and recreational facilities would temporarily be removed from service during the construction of the final proposed structural BMPs, and could potentially increase the use of adjacent parks and other recreational facilities. However, construction periods for each BMP are expected to be relatively short, typically several months to a year. Because the construction will be temporary, the physical deterioration of park and recreational facilities to which recreational activities were diverted would not be substantial. Coordination with the County Parks and Recreation Department will be carried out as projects are identified and moved forward. This comment has been noted and will be provided to the County of Los Angeles Board of Supervisors for their consideration.

Response to Comment 9-B

The proposed EWMP BMPs are under development. Coordination with the County Parks and Recreation Department will be carried out as projects, funding and implementation priorities are identified.

Re: Responses and Comments to the Draft Program Environmental Impact Report for the Enhanced Watershed Management Programs (PEIR)

Dear Mr. BeGell,

This following letter presents comments to the Draft Program Environmental Impact Report for the Enhanced Watershed Management Programs (PEIR). I would like to thank you for the opportunities to comment on the PEIR and for the extension of the deadline for such comments.

Project Purpose

- Municipal Separate Storm System (MS4) Permit Compliance (Order No. R4-2012-0175)
- Each Permittee is responsible for its local MS4 compliance through development of Enhanced Watershed Management Programs (EWMPs)
- Twelve (12) Notices of Intent (NOIs) have been submitted for the development of twelve (12) EWMPs in their respective watershed groups to the Los Angeles Regional Water Quality Control Board (LARWQCB).
- The LARWQCB is responsible for approval of the WWMPs in compliance with the MS4 Permit.

Enhanced Watershed Management Program (EWMP)

- Permittees are to identify watershed control measures through implementation of storm water best management practices (BMPs).
- Goal of BMPs in the EWMP is to reduce the impact of stormwater and non-stormwater on receiving water quality.

- The PEIR focuses on the effects of implementing the EWMP overall as plans to reduce urban runoff pollution.
- The LACDPW has a vested interest in increasing opportunities for stormwater capture and groundwater recharge as a means of assisting local water supply augmentation.
- Central Basin MWD is interested in and supports LACDPW in its efforts to augment local water supply.

Goals and Objectives

- Achieve Water Quality Performance goals through EWMP implementation.
- Promote more cost-effective and multi-beneficial water quality improvement projects to comply with the MS4.
- Reduce the impact of stormwater and non-storrnwater on receiving water quality.
- Remove or reduce pollutants from dry and wet-weather urban runoff in a cost-effective manner.
- We recommend a goal to increase stormwater capture to augment water supply.

Centralized Structural BMPs vs. Distributed Structural BMPs

- Centralized Structural BMPs are intended to treat runoff from a contributing area of multiple parcels. They are generally installed on large public parcels or adjacent to storm drain outfalls and receiving waters. Examples of Centralized Structural BMPs include Dominguez Gap Wetlands project of creek restoration.
- Another great example of a Centralized Structural BMP is Marie Canyon Low Flow Diversion (LFD) in which the urban runoff from Pepperdine University and the neighboring residential tract are diverted through a drainage course to a low flow diversion station.
- Distributed Structural BMPS treat runoff close to the source and are typically implemented at a single or few parcel level.
- Examples include green infrastructure and low impact development such as: biofiltration, bioretention, bioswales, buffer strips, green streets, rainfall harvesting, planter boxes, and permeable pavers.

The Planning Associates Questions and Comments to the PEIR

- **Introduction**
  - **Comment:** Please elaborate and identify projects currently in the works and provide analysis on the plans and policies guiding these projects.
  - **Comment:** Does tiering from the PEIR excuse the lead agency from analyzing foreseeable significant environmental effects of the project?
  - **Comment:** There are no references to the types of soils or vegetation that underlie the 12 EWMPs. A short summary of the soil types and their respective infiltration rates would be helpful in the introduction summary.

  - **Comment:** What types of pollution stem from the natural environment and exist in the soils being eroded from natural parcels of land?

- **Agriculture and Forestry**
  - **Comment:** What impact does the EWMP projects have on wetlands? Please provide detail background on specific avoidances or controversial issues.

- **Biological Resources:**
  - **Comment:** Implementation of the EWMP projects could occur within existing sensitive habitats, which may result in changes to wildlife habitat, disruption of natural movement corridors, or disturbance of sensitive species during construction or operation. How will the PEIR evaluate for such impacts and how can local ordinances or state and federal regulations protect or mitigate from these disruptions to the natural environment? What Habitat Mitigation plans have been contemplated or prepared?

- **Cultural Resources**
  - **Comment:** Area of Project Effect (APE) must be surveyed for cultural resources and to determine if an archaeological inventory survey is required.
  - **Comment:** The Native American Heritage Commission must be contacted for consultation concerning projects in sensitive cultural sites. Who are the most probable Native American Tribes of interest in the project area? Are there probable cultural sites in the project area or APE areas?

- **Geology, Soils & Seismicity**
  - **Comment:** Please provide more detail as to where recharge and groundwater infiltration areas are in relation to liquefaction zones and other permeable soils.
  - **Comment:** More information is needed on known groundwater levels and the elevations of stream beds downslopes of the groundwater tables.

- **Hazards & Hazardous**
  - **Comment:** It is important to provide more detail on the influence of groundwater movements upon hazards and hazardous materials in the soil because contaminated groundwater can migrate to groundwater flows and basin pumping for water supplies.
  - **Comment:** The PEIR must illustrate the uncovering of contaminated soils or hazardous substances during excavation of proposed EWMP BMPs that pose a hazard to public safety or the natural environment.

- **Mandatory Findings of Significance**
  - **Comment:** Information regarding the setting, effects, and mitigation for the projects related to issues of environmental justice will be necessary to

understand those receiving benefits and those experiencing adverse effects directly or indirectly through water related operations.

- **Hydrology & Water Quality:**
    - **Comment:** It will be helpful if the PEIR expanded as to where recharge and infiltration areas are in relation to liquefaction zones and other permeable soils. A general map of the program area will help illustrate this more effectively.
    - **Comment:** Illustrations of known groundwater levels and elevation of stream beds downslope of the groundwater tables will be beneficial.
    - **Comment:** Implementation of the proposed EWMP BMPs may result in increased infiltration and recharge in various locations throughout the EWMP watersheds. Therefore, it is important that the PEIR evaluate potential effects of increased storm water recharge and identify mitigation measure.

- **Population & Housing**
    - **Comment:** What are the consequences of minimal or no implementation of BMPs in cities with low income housing? How will these communities bear the burden of paying non-compliance fees?

- **Alternatives**
    - **Comment:** What method and level of detail will be used to identify and evaluate BMPs?

- **Cumulative Projects**
    - **Comment:** The PDEIR must provide a general map of the projects with existing delineated riparian, wetlands, and aquatic habitats.

Thank you for allowing interested persons such as myself to ask questions and provide comments to this Draft PEIR.

Cordially,

Kevin P. Hunt, P.E.
Interim General Manager

Response to Comment Letter 10 (Central Basin Municipal Water District – March 12, 2015)

Response to Comment 10-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The PEIR acknowledges that most of the projects to be included in the EWMPs are either currently undefined or currently under development. Priority projects are listed in Appendix G of the PEIR. Some background on the MS4 Permit is provided in Section 1, explaining the policies guiding the implementation of the BMPs.

Response to Comment 10-B:

Because project details are largely incomplete since the EWMPs are being drafted concurrently, each individual project will be subject to a CEQA compliance evaluation prior to approval by the implementing agencies as noted in Section 1 of the Draft PEIR. As individual projects identified in the EWMPs are fully developed, the implementing agency (i.e., the Permittee responsible for implementing the project) will conduct CEQA analysis for individual projects, as appropriate, or may determine that no additional CEQA analysis is required or that a project is exempt from CEQA. Each implementing agency would determine the significance after mitigation for potential impacts of its proposed projects.

The PEIR serves as a first-tier environmental document that focuses on the effects of implementing the EWMPs to reduce urban runoff pollution. The analysis assesses worst case situations where construction or operation of projects may significantly impact environmental resources. The analysis outlines mitigation strategies to be followed by the LACFCD and other implementing agencies that rely on the PEIR to avoid or minimize impacts wherever feasible.

The PEIR provides the LACFCD a foundation for any necessary future environmental review that focus on individual projects of the EWMPs for which the LACFCD is the designated Lead Agency.

Response to Comment 10-C:

The 12 EWMPs cover a large geography that exhibits numerous soil types. A comprehensive soils assessment and vegetation mapping within the entire County would not be helpful at the high-level scale of the impact analysis because the level of detail needed for individual BMP projects would not be feasible for all potential BMP locations throughout the County. Soil types may differ acre-by-acre in potential BMP locations, requiring a site specific analysis that is impractical to employ for the entire County in the PEIR. Some areas are underlain by alluvial soils of varying characteristics and other areas by clay or bedrock. Some areas are underlain by aquitards—subsurface impermeable clay layers—that prevent infiltrated water from entering deeper drinking water aquifers. Locating infiltration BMPs in areas with permeable soils (generally sandy soils that allow percolation of water) is a primary criterion for successful infiltration. Mitigation Measure GEO-1 requires that implementing agencies conduct geotechnical assessment of proposed BMP locations to ascertain soil types prior to installing infiltration BMPs, which reduces potentially significant impacts to less than significant levels.

Response to Comment 10-D:

As noted on page 3.8-35 of the PEIR, soils may contain legacy contamination from past overlying uses or may contain naturally occurring minerals that may be entrained by infiltrating water and conveyed to the drinking water aquifer. Naturally occurring pollutants may include minerals such as arsenic, iron, and manganese. Concentrations of these pollutants are regulated in drinking water. Other pollutants may include petroleum hydrocarbons, nitrates, and pathogens. As described in the PEIR, Mitigation Measures HYDRO-1 through HYDRO-3 would lessen potential impacts from naturally occurring pollutants to a less than significant level.

> **HYDRO-3:** Prior to the installation of an infiltration BMP, the Permittee shall conduct a <u>regulatory</u> database review for contaminated groundwater sites within a quarter mile of the proposed infiltration facility. <u>The review shall include locations of on-site wastewater treatment systems that could be affected by the BMP.</u> The Permittee shall identify whether any contaminated groundwater plumes <u>or leach fields</u> are present and whether coordination with the local and state environmental protection overseeing agency and responsible party is warranted prior to final design of infiltration facility.

Response to Comment 10-E:

Impacts to wetlands were discussed in Impact 3.3-3 on page 3.3-26 of the Draft PEIR. Mitigation measures BIO-1 through BIO-9 were identified to mitigate impacts to wetlands and reduce potentially significant impacts to less than significant levels. Mitigation BIO-9 specifically requires conducting formal wetland delineation in areas where potential jurisdictional resources (i.e., wetlands or drainages) subject to the jurisdiction of the United States Army Corps of Engineers, the Los Angeles Regional Water Quality Control Board, and the California Department of Fish and Wildlife may be affected by the project.

Response to Comment 10-F:

Impacts to sensitive habitats, wildlife habitat, and natural movement corridors were discussed in Impact 3.3-1, Impact 3.3-2, and Impact 3.3-4, respectively. Mitigation Measures BIO-1 through BIO-8 involve the protection of sensitive habitats and wildlife habitat and would reduce potentially significant impacts under Impact 3.3-1 and Impact 3.3-2 to less than significant levels. As noted under Impact 3.3-4 on pages 3.3-27 and 3.3-28 of the PEIR, , implementation of the EWMPs would not be expected to interfere with wildlife movement or any migratory corridor/linkage, and the BMPs would not be constructed within a native wildlife nursery site; no mitigation is necessary to reduce Impact 3.3-4 to less than significant levels.

Response to Comment 10-G:

The proposed EWMP BMPs as described in the PEIR are under development. Impacts to cultural resources are detailed in in Impact 3.4-1 through Impact 3.4-4 of the Draft PEIR (pages 3.4-19 through 3.4-26). Per Mitigation Measure CUL-2, an archeological survey of the APE shall be performed where deemed appropriate by a qualified archaeologist, which would reduce potentially significant impacts to less than significant levels.

Response to Comment 10-H

The proposed EWMP BMPs as described in the PEIR are under development. Mitigation Measures CUL-2, CUL-3 of the Draft PEIR (pages 3.4-22 through 3.4-23) require consultation with local Native American representatives concerning Phase I cultural resources, treatment measures, qualification of historical resources or unique archaeological resources requiring archaeological monitoring, and avoidance measures and mitigation. These mitigation measures would reduce potentially significant impacts to less than significant levels. For projects under development, additional mitigation measures may be identified as necessary to address future-identified impacts.

Response to Comment 10-I:

Figure 3.5-3 locates the liquefaction zones established in the County. Figures 2-5 through 2-16 identify potential BMP locations. As BMPs are developed, a site assessment would be conducted in accordance with County Low Impact Development Standards. This includes identifying the potential for seismically-induced liquefaction and other ground failures. In addition, Mitigation Measure GEO-1 requires that implementing agencies conduct geotechnical assessment of proposed BMP locations to ascertain soil types prior to installing infiltration BMPs, which would identify liquefaction zones. The PEIR acknowledges that BMPs will be located within liquefaction zones.

Response to Comment 10-J:

The proposed EWMP BMPs as described in the PEIR are under development. Site specific details regarding groundwater levels and flow gradient would be collected as the BMPs are developed and additional environmental impacts will be analyzed pursuant to the requirements of the California Environmental Quality Act. The PEIR includes Mitigation Measure HYDRO-2 that requires implementing agencies to identify depth to groundwater prior to implementing infiltration BMPS. Mitigation Measure GEO-2 requires implementing agencies to contact groundwater managers prior to installing infiltration BMPs. Both of these mitigation measures would reduce potentially significant impacts to less than significant levels.

Response to Comment 10-K:

The PEIR acknowledges on page 3.8-35 that underground contamination may be influenced by infiltration BMPs. Mitigation Measure HYDRO-3 requires a database search for groundwater contamination plumes prior to installing infiltration BMPs and would reduce potentially significant impacts to less than significant levels.

It should be noted that as part of Response to Comment 3-A above, Mitigation Measure HYDRO-3 has been modified on page 3.8-36 of the PEIR as shown below:

> **HYDRO-3:** Prior to the installation of an infiltration BMP, the Permittee shall conduct a regulatory database review for contaminated groundwater sites within a quarter mile of the proposed infiltration facility. The review shall include locations of on-site wastewater treatment systems that could be affected by the BMP. The Permittee shall identify whether any contaminated groundwater plumes or leach fields are present and whether coordination with the local and state environmental protection overseeing agency and responsible party is warranted prior to final design of infiltration facility.

Response to Comment 10-L:

As discussed in Section 3.8, *Hazards and Hazardous Materials*, page 3.7-19, contaminated soil and/or groundwater could be encountered during excavation posing a health hazard to construction crews, the public, and the environment. Implementation of Mitigation Measure HAZ-2 would reduce the potential impact to less than significant. Mitigation Measure HAZ-2 would require a Phase I Environmental Site Assessment in areas where hazardous material use or management may have occurred and would reduce potentially significant impacts to less than significant levels.

Response to Comment 10-M:

Environmental justice is discussed in Section 3.11, *Population and Housing and Environmental Justice*, Impact 3.11-4 on page 3.11-7. The PEIR concludes that impacts would be less than significant due to the broad distribution of water quality BMPs to be implemented throughout the communities. No mitigation was determined to be necessary to reduce environmental justice impacts to less than significant levels.

Response to Comment 10-N:

Figure 3.5-3 locates the liquefaction zones established in the County. Figures 2-5 through 2-16 identify potential BMP locations. The 12 EWMPs cover a large geography that exhibits numerous soil types. A comprehensive soils assessment and recharge mapping within the entire County would not be helpful at the high-level scale of the impact analysis because the level of detail needed for individual BMP projects would not be feasible for all potential BMP locations throughout the County. Soil types may differ acre-by-acre in potential BMP locations, requiring a site-specific analysis that is impractical to employ for the entire County in the PEIR. Some areas are underlain by alluvial soils of varying characteristics and other areas by clay or bedrock. Some areas are underlain by aquitards—subsurface impermeable clay layers—that prevent infiltrated water from entering deeper drinking water aquifers. Locating infiltration BMPs in areas with permeable soils (generally sandy soils that allow percolation of water) is a primary criterion for successful infiltration.

As described in Section 3.14, *Utilities*, page 3.14-1 of the Draft PEIR, the largest stormwater detention and recharge facilities in Los Angeles County are located along the San Gabriel River in the City of Pico Rivera. These facilities are shown in Figure 3.14-1, Water Recharge Facilities. As BMPs are developed, a site assessment would be conducted in accordance with County Low Impact Development Standards. This includes identifying the potential for seismically-induced liquefaction and other ground failures. In addition, Mitigation Measure GEO-1 requires that implementing agencies conduct geotechnical assessment of proposed BMP locations to ascertain soil types prior to installing infiltration BMPs, which would identify liquefaction zones. The PEIR acknowledges that BMPs will be located within liquefaction zones.

Response to Comment 10-O:

The proposed EWMP BMPs as described in the PEIR are under development. Site-specific details regarding groundwater levels and as necessary, streambeds downslope of the groundwater tables, would be collected as the BMPs are developed and additional environmental impacts will be analyzed pursuant to the requirements of the California Environmental Quality Act. The PEIR includes Mitigation Measure HYDRO-2 that requires implementing agencies to identify depth to groundwater prior to implementing infiltration BMPS. Mitigation Measure GEO-2 requires implementing agencies to contact groundwater managers prior to installing infiltration BMPs. Both of these mitigation measures would reduce potentially significant impacts to less than significant levels.

Response to Comment 10-P:

The PEIR includes an assessment of potential impacts of groundwater recharge to water quality on page 3.8-35 and to soil stability on page 3.5-23. Implementation of Mitigation Measures GEO-1, HYDRO-1, HYDRO-2, and HYDRO-3 would reduce impacts to less than significant levels. It should be noted that as part of Response to Comment 3-A above, Mitigation Measure HYDRO-3 has been modified as shown below.

HYDRO-3: Prior to the installation of an infiltration BMP, the Permittee shall conduct a <u>regulatory</u> database review for contaminated groundwater sites within a quarter mile of the proposed infiltration facility. <u>The review shall include locations of on-site wastewater treatment systems that could be affected by the BMP.</u> The Permittee shall identify whether any contaminated groundwater plumes <u>or leach fields</u> are present <u>within close proximity to the BMP location that could be affected by infiltrated water</u> and whether coordination with the local and state environmental protection overseeing agency and responsible party is warranted prior to final design of infiltration facility.

It should be noted that as part of Response to Comment 16-J below, Mitigation Measure HYDRO-4 has been added under Impact 3.8-3 as shown below, which would also reduce impacts to water quality and soil stability.

> <u>**HYDRO-4:** Prior to approving a structural BMP, the implementing agencies shall conduct an evaluation of the potential hydromodification impacts of the project. The evaluation shall recommend design measures necessary to prevent or minimize</u>

any identified impacts, including flooding, erosion and/or scour. Design measures could include velocity dissipaters and bank re-enforcement components. Implementing agencies shall include these measures in project designs.

The 12 EWMPs cover a large geography that exhibits numerous soil types. A comprehensive stormwater recharge assessment within the entire County would not be helpful at the high-level scale of the impact analysis because the level of detail needed for individual BMP projects would not be feasible for all potential BMP locations throughout the County. Soil types may differ acre-by-acre in potential BMP locations, requiring a site specific analysis that is impractical to employ for the entire County in the PEIR. Some areas are underlain by alluvial soils of varying characteristics and other areas by clay or bedrock. Some areas are underlain by aquitards—subsurface impermeable clay layers—that prevent infiltrated water from entering deeper drinking water aquifers. Locating infiltration BMPs in areas with permeable soils (generally sandy soils that allow percolation of water) is a primary criterion for successful infiltration. As described in Section 3.14, *Utilities*, page 3.14-1 of the Draft PEIR, the largest stormwater detention and recharge facilities in Los Angeles County are located along the San Gabriel River in the City of Pico Rivera. These facilities are shown in Figure 3.14-1, Water Recharge Facilities. Mitigation Measure GEO-1 requires that implementing agencies conduct geotechnical assessment of proposed BMP locations to ascertain soil types prior to installing infiltration BMPs, which reduces potentially significant impacts to less than significant levels.

Response to Comment 10-Q:

The EWMPs are being developed cooperatively by municipalities covered in the Permit. Each Permittee is required to implement stormwater quality improvement BMPs regardless of the economic condition of the city or local community. As cooperating Permittees, the EWMP groups have combined resources to develop BMPs benefiting the entire region. Access to funding for BMPs is not an environmental impact addressed in this PEIR. However, the EWMPs will contain a discussion on proposed funding sources available. Financing considerations are outside the realm of CEQA and are thus outside of this PEIR analysis.

Response to Comment 10-R:

The EWMP groups have developed BMPs based on modeling of local water quality and water quality objectives. The PEIR describes the Permit requirements in Section 1. As individual projects are proposed for implementation, the lead agencies will identify the specific benefits provided by each BMP. If proposed BMPs potentially result in significant impacts, the lead agency for the BMP will assess project alternatives if required to address CEQA compliance on the project level.

Response to Comment 10-S:

The PEIR identifies natural communities within the County in Figure 3.3-7, Natural Communities in Section 3.3, *Biological Resources*. The PEIR acknowledges on pages 3.3-18 through 3.3-32 that BMPs could affect natural communities. Implementation of Mitigation Measures BIO-1 through BIO-9 are proposed to mitigate potential effects to less than significant levels.

RE: Draft Program Environmental Impact Report (EIR) Support and Comments

To Mr. BeGell:

The City of Malibu supports the development of programs that improve water quality and has historically taken steps to ensure protection of local waters. Therefore, the City of Malibu is committed to such efforts and is actively working with the County of Los Angeles and the Los Angeles County Flood Control District (LACFCD) on the Enhanced Watershed Management Program (EWMP) for the North Santa Monica Bay Coastal Watersheds. The City would like to acknowledge the LACFCD for its efforts to prepare a Program EIR evaluating the proposed EWMPs in Los Angeles County that are being developed to protect water quality.

The Program EIR describes details of the County-wide EWMPs being launched in partnership with municipalities in the County to comply with the 2012 Los Angeles region municipal stormwater permit Order No. R4-2012-0175 (Permit). Such advanced planning improves public awareness and government transparency and provides for a higher level assessment of policy decisions prior to the consideration of individual projects. The City of Malibu reviewed the Draft Program EIR and generally agrees with its conclusions regarding the impacts of the proposed EWMPs on the environment and its proposed mitigation measures. The City also offers the enclosed comments and clarifications for consideration.

The City of Malibu expresses its support for the implementation of EWMPs to achieve compliance with the Permit and to encourage the certification of the Program EIR developed by LACFCD. The City of Malibu appreciates the attention to these issues and the opportunity to partner in the solution to protecting the region's water quality. If you have any questions regarding this letter, please contact me at (310) 456-2489 x 275 or jbrown@malibucity.org.

Sincerely,

[illegible]vn
Senior [illegible] Programs Coordinator

Doc. Reference			Comments
Page (pdf/section-page)	Parag.	Section	City of Malibu
3.9-28, and 442/3.14-10			The document says that LA City and LA County have LID ordinances in place and that some cities may also have LID ordinances. The document should reflect that all EWMP cities are required to have LID ordinances in place that comply with specific MS4 permit requirements by June 28, 2015 (the same date the EWMP's must be submitted for review). For example and not meant as a limitation, see page 3.9-28. Since this is a regulatory requirement under the 2012 permit, the LID requirements that must be included in city ordinances can be accounted for in the analysis and conclusions throughout the document.
3.2-13			Air quality section needs a regulatory setting section for cities.
3.1-1			The City has questions about the conclusion that there is a significant and unavoidable construction noise impact. See Impact 3.10-1 and cumulative discussion. Essentially, the City does not have enough information based on what is written to determine if we agree with the conclusion. The document should explain why it assumes, after mitigation, that there may be circumstances where the construction activities for these types of projects may exceed thresholds, or the basis or for that assumption. We typically assume that projects will follow the law unless there is a specific reason to believe these types of projects will exceed noise standards. If a project does violate any local standards, every city has code enforcement teams and strategies in place to promptly remedy the problem or stop construction until it can be remedied. Thus, it is unlikely that a noise violation would go on long enough to cause a significant, unavoidable impact in the community. Please reconsider this conclusion or provide more information explaining the basis for this conclusion.
general			Some of the projects listed (especially, Wildlife Rd, Broad Beach rd, and Legacy Pumps Upgrade) in the PEIR are projects which were to be completed within 30 months of permit adoption as a condition of EWMP Notice of Intent submittals . . . such projects are either already completed or under construction and have gone through their own CEQA process if needed. The PEIR should make clear that these are included as examples of the types of projects that may be included in the EWMPs but not projects that are covered by the PEIR.
ES-2	1	ES	In the Executive Summary, page ES-2 first full paragraph, second sentence, suggest modifying the second sentence to insert the following: "The EWMPs will identify potential and priority structural and non-structural Best Management Practices (BMPs) within the [drainage areas served by the] region's stormwater collection system to improve runoff water quality." Otherwise it sounds like the PEIR only covers projects actually constructed in the LACFCD easements and it would be of limited use to other agencies who want to tier off of the document.
372/3.9-38	1	3.9	structural BMPs would be implemented largely in ~~urbanized~~ developed areas
393/3.10-19	4	3.1	Given the urbanized environment of [insert: much of] the County, the potential exists…
404/3.11-5	1		the structural BMPs would generally be located within existing ~~urbanized~~ developed areas
412/3.12-1		map	the westernmost HS and elementary school in Malibu/N. Santa Monic Bay EWMP area overlap on the map and make it hard to see there are both. Perhaps offset them a little more.

Response to Comment Letter 11 (City of Malibu – March 16, 2015)

Response to Comment 11-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or “Program”). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The commenter’s support for the PEIR is noted.

Response to Comment 11-B:

Page 2-18 of the PEIR has been updated with the correct early 2015 completion date for the Wildlife Road Project. Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-C:

Page 2-25 of the PEIR has been updated to change “flat” gate to “flap” gate. Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-D:

The commenter states that "treating stormwater and urban runoff prior to the entering into…" should read, “treating stormwater and **dry-weather** runoff prior to **flowing** into…"

Page 2-31 of the PEIR has been updated to change “treating stormwater and urban runoff prior to the entering into…" to “treating stormwater and **dry-weather** runoff prior to **flowing** into.” Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-E:

Page 2-31 of the PEIR has been updated to delete “with potential to incorporate harvest and use systems for Malibu Drains.” Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-F:

Page 2-31 of the PEIR has been updated to read, “Two types of biofilters are included; pre-manufactured and custom designed biofilters." Chapter 12, Clarifications and Modifications, outlines the revisions to the Draft PEIR.

Response to Comment 11-G:

Page 2-37 of the PEIR has been updated to add "compliance with Santa Monica Bay and Malibu Creek Bacteria TMDL requirements." Chapter 12, Clarifications and Modifications, outlines the revisions to the Draft PEIR.

Response to Comment 11-H:

The comment includes copied text from the Draft PEIR, page 2-41, Section 2.5. However, no suggested text revisions were provided. As a result, no change was identified.

Response to Comment 11-I:

The use of the phrase “predominately urbanized” is appropriate for the figures. The location of BMPs will not be limited to urbanized or developed areas, but will be located wherever water quality improvements are needed to comply with water quality objectives. No revision is necessary.

Response to Comment 11-J:

The green dots on the figures indicate potential locations being considered for regional or centralized projects. If the green dots were indicated in the legend but not shown on the map, the BMP information was not available at the time of publication of the Draft PEIR. Appendix G includes the locations of priority projects shown as red dots on the figures. No revision is necessary.

Response to Comment 11-K:

Page 3.1-2 of the PEIR has been updated to change “large-acre residential properties” to “large-acre and rural residential properties.” Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-L:

Page 3.1-2 of the PEIR generalizes the acreage of impervious acres in Ballona Creek and Malibu Creek watersheds, but no precise calculation has been prepared. No revision is necessary.

Response to Comment 11-M:

Page 3.2-1 of the PEIR has been updated to change “the majority of the County is highly urbanized and consists of several cities, communities, and unincorporated areas” to “the majority of the County is highly urbanized with some adjacent rural areas and consists of several cities, communities, and unincorporated areas.” Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-N:

Page 3.3-2 of the PEIR has been updated to reflect this change "these watersheds are characterized by dense residential development along the coast and less development and greater open space areas inland" to "these watersheds are characterized by dense residential development immediately along the coast and less development and greater open space areas as you move off the shoreline and head inland." Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-O:

Page 3.3-19 of the PEIR has been updated to identify "Creek" in all instances in which "Malibu Creek Watershed" is intended. Additionally, "Creek" has been added to all other appropriate instances in the Draft PEIR. Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-P:

Page 3.3-20 of the PEIR has been updated to change "Malibu Watershed" to "Malibu Creek Watershed." Additionally, "Creek" has been added to all other appropriate instances in the Draft PEIR. Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-Q:

The use of the phrase "pre-urbanization" is appropriate for the text. And is consistent with the text on Page 3.2-1 of the PEIR, which has been updated to change "the majority of the County is highly urbanized and consists of several cities, communities, and unincorporated areas" to "the majority of the County is highly urbanized with some adjacent rural areas and consists of several cities, communities, and unincorporated areas." No changes are needed.

Response to Comment 11-R:

Page 3.3-24 of the PEIR has been updated to change "Malibu Watershed" to "Malibu Creek Watershed." Additionally, "Creek" has been added to all other appropriate instances. Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-S:

Page 3.3-26 of the PEIR has been updated to change "Malibu Watershed" to "Malibu Creek Watershed." Additionally, "Creek" has been added to all other appropriate instances. Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-T:

Page 3.8-4 of the PEIR has been updated to change "in urbanized areas along Santa Monica Bay" to "in urbanized areas along central and south Santa Monica Bay." Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-U:

The exact original text as described above could not be located in the document. No revision is necessary to page 3.8-4 of the PEIR.

Response to Comment 11-V:

Page 3.8-6 of the PEIR has been updated to change “address bacteria loading” to “prevent possible bacteria loading.” Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-W:

The use of the phrase “predominately located in urbanized” is appropriate for the figures. No revision is necessary.

Response to Comment 11-X:

The “Potential (Regional and Centralized) BMPs” symbolized by green circles are located in the key at the bottom left corner of Figure 3.8-3. No revision is necessary to Figure 3.8-3 of the PEIR.

Response to Comment 11-Y:

Page 3.8-27 of the PEIR has been updated to add “including Los Angeles County from certain Ocean Plan ASBS discharge prohibitions” after “which exempts certain listed dischargers.” Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR. The revisions are also

Response to Comment 11-Z:

Page 3.8-27 of the PEIR has been updated to add “California Department of Parks and Recreation” and to add “Laguna Point to Latigo Point,” and to delete “and the California.” Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-AA:

Page 3.8-27 of the PEIR has been updated to change “provided that it:” to “the discharge:”. Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-BB:

Page 3.8-38 of the PEIR has been updated to change “Drainage patterns would change through implementation of these non-structural institutional BMPs, implementation of LID strategies, which include on-site infiltration, that would minimize off-site flows as well as the potential for erosion and off-site siltation" to “Drainage patterns would change through implementation of these non-structural institutional BMPs**.** However, implementation of LID strategies, which include on-site infiltration,-would minimize off-site flows as well as the potential for erosion and off-site siltation." Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment CC:

Page 3.8-39 of the PEIR has been updated to reflect this change “The structural BMPs would also provide improvements to water quality of receiving waters” to “The structural BMPs would also provide protections to water quality of receiving waters.” Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-DD:

Page 3.8-39 of the PEIR has been updated to change “BMPs but would be designed to improve water quality and reduce stormwater flow volumes” to “BMPs but would be designed to improve runoff water quality and reduce stormwater flow volumes.” Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-EE:

Page 3.9-1of the PEIR has been updated to change “The majority of the County is highly urbanized and consists of several cities, communities and unincorporated areas” to “The majority of the County is highly urbanized with some adjacent rural areas and consists of several cities, communities and unincorporated areas.” Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-FF:

Page 3.9-1of the PEIR has been updated to change “The EWMP agencies have no jurisdiction over the land that is owned by the State of California (i.e., California Department of Fish and Wildlife, the State Lands Commission, and the California Department of Transportation) or the U.S. Government” to , “The EWMP agencies have no jurisdiction over the land that is owned by the State of California (i.e., California Department of Parks and Recreation, California Department of Fish and Wildlife, the State Lands Commission, and the California Department of Transportation) or the U.S. Government (i.e., National Parks Service).” Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-GG:

The use of the phrase “predominately located in urbanized” is appropriate. No changes are needed.

Response to Comment 11-HH:

The “Potential (Regional and Centralized) BMPs” symbolized by green circles are located in the key at the bottom right corner of Figure 3.9-6 of the PEIR. No revision is necessary.

Response to Comment 11-II:

The numerous cities encompassed by the EWMP area all have their own respective agricultural designations. As implementation of the individual BMP projects proceeds, any agricultural designations within the project area will be identified and evaluated on a project-by-project basis during subsequent CEQA environmental processes. No revision is required on page 3.9-26 of the PEIR.

Response to Comment 11-JJ:

LID standards are required to be in place within the jurisdictions of Permittees that have chosen EWMPs as their form of compliance with the MS4 Permit. Page 3.9-28 of the PEIR has been updated to reflect this change. Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-KK:

Page 3.9-36 of the PEIR, has been updated to change "Malibu Watershed" to "Malibu Creek Watershed." Additionally, "Creek" has been added to all other appropriate instances. Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-LL:

The use of the phrase "urban areas" is appropriate. No revision is necessary.

Response to Comment 11-MM:

The PEIR identifies LID ordinances as non-structural BMPs that will assist in achieving permit compliance. The statements on page 3.9-38 and 3.14-10 of the PEIR are sufficient and no changes are needed.

Response to Comment 11-NN:

The regulatory summary in Section 3.2, *Air Quality* of the PEIR is sufficient and no changes are needed.

Response to Comment 11-OO:

The PEIR concludes that under worse-case scenarios, noise impacts could be significant and unavoidable. This does not mean that all projects will result in significant noise impacts. No revision is necessary on page 3.10-1 of the PEIR.

Response to Comment 11-PP:

As noted in Chapter 1 of the PEIR, each individual project will undergo subsequent CEQA determination by the lead implementing agency prior to approval. No revision is necessary.

Response to Comment 11-QQ:

The sentence is sufficient and no revision is necessary.

Response to Comment 11-RR:

The use of the word “urbanized” is appropriate. No changes are needed on Page 3.9-38 of the PEIR.

Response to Comment 11-SS:

The sentence is sufficient and no revision is necessary.

Response to Comment 11-TT:

The sentence is sufficient and no revision is necessary.

Response to Comment 11-UU:

Figure 3.12-1 of the PEIR is meant to provide an estimated location for schools. No changes are needed.

Response to Comment 11-VV:

The commenter’s statement that there is an additional water retailer for a private neighborhood in Malibu has been noted for the record. However, no information was provided for this retailer, such as the ‘additional small district’s’ name, therefore, no information was added to page 3.14-1.

Response to Comment 11-WW:

The commenter states that “creek” should be added when referring to Malibu Creek Watershed, such as in the following sentence, “In areas with natural unimproved streams, such as in the Santa Clara River watershed and Malibu **Creek** watershed where surface water diversions may be more common, stormwater flows are conveyed downstream quickly.”

Page 3.14-16 of the PEIR has been updated to add “Creek” in between “Malibu” and “watershed.” Additionally, “Creek” has been added to all other appropriate instances. Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-XX:

Although the Santa Monica Bay Coastal Watershed has some natural unimproved streams, the Santa Clara River and Malibu Creek watersheds were used as examples in the sentence mentioned by the commenter since they contain greater numbers of natural unimproved streams. Therefore, the sentence is considered sufficient and no revision was made.

Response to Comment 11-YY:

Page 3.14-18 of the PEIR has been updated to change "it is feasible to recycle or reuse at least 50 percent or construction" to "it is feasible to recycle or reuse at least 50 percent **of** construction." Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-ZZ:

Table 4.1 on page 4-4 of the PEIR has been updated to change "early to mid-2014" to "early to mid-**2015**." Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-AAA:

Table 4.1 on page 4-4 of the PEIR has been updated to change "early to mid-2014" to "early to mid-**2015**." Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment 11-BBB:

Page 6-5 of the PEIR has been updated to change "reduce pollutants from dry- and wet-weather urban runoff" to "reduce pollutants from dry- and wet-weather runoff." Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

Response to Comment CCC:

The commenter copied text from the PEIR but suggested no revision. The copied text from the PEIR has been noted for the record.

Response to Comment DDD:

Table 6-2 on page 6-13 of the PEIR has been updated to change "pollutants from dry- and wet-weather urban runoff in a cost-effective manner" to "pollutants from dry- and wet-weather runoff in a cost-effective manner." Chapter 12, *Clarifications and Modifications,* outlines the revisions to the Draft PEIR.

SCH#: 2014081106

Dear Gregg BeGell:

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. The review period closed on March 6, 2015, and no state agencies submitted comments by that date. This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act.

Please call the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process. If you have a question about the above-named project, please refer to the ten-digit State Clearinghouse number when contacting this office.

Sincerely,

Scott Morgan
Director, State Clearinghouse

Project Title Enhanced Watershed Management Programs (EWMP) Program EIR
Lead Agency Los Angeles County Flood Control District

Type EIR Draft EIR

Description The development of the EWMP will involve the evaluation and selection of multiple watershed control measures or best management practices (BMP) types including non-structural and distributed, centralized and regional structural BMPs. These BMPs will be implemented to meet compliance goals and strategies under the 2014 MS4 Permit. Structural BMPs involve the construction of a physical control measure to alter the hydrology and/or water quality of incoming stormwater or non-stormwater. The three major functions for structural BMPs are infiltration, water quality treatment, and storage. These are three categories of structural BMPs, defined by the runoff area treated by the BMP and the required retention volume in accordance with the Permit.

RE: Support for Westwood Neighborhood Greenway

Dear Mr. BeGell:

I am writing to you today as the President of Westwood Gardens Civic Association, which is comprised of 620 single family homes situated within the boundaries of Ayres Avenue on the north, National Blvd. on the south, Midvale Avenue on the west and Overland and Dunleer Place on the east. Our HOA has been in existence since 1948, over 66 years, and is one of the longest standing homeowner's association on the west side of Los Angeles. We take great pride in our community and work very hard to preserve and protect it for the peaceful enjoyment of all our homeowners.

On behalf of our Board of Directors, and as a member of the WNG Steering Committee, I am writing in support of the WNG as part of the Enhanced Watershed Management Plan (EWMP) for the Ballona Creek Watershed. This WNG Project will be a multi-benefit project providing not only urban runoff treatment, but also native habitat and public access via transit, bicycle and pedestrian paths.

This will be a unique opportunity for our greater community as it will be adjacent to the busiest station on the Expo Light Rail line, part of the growing Metro transit network.

Our Homeowner's association is the most immediately affected and impacted by this project between Overland and Westwood, as it backs up directly adjacent to our residents' backyards. With your support, along with many others which the Greenway project has already received, this Westwood Neighborhood Greenway may actually come to fruition along with the opening of the Expo II Light Rail Line, for the benefit of everyone.

Sincerely,

Marilyn Tusher

Marilyn Tusher, President
Westwood Gardens Civic Association, Inc.

Response to Comment Letter 13 (Westwood Gardens Civic Association – March 1, 2015)

Response to Comment 13-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The commenter's support for the PEIR is noted.

Response to Comment 13-B:

The commenter's statement that their homeowner's association is the most immediately affected and impacted by the Westwood Neighborhood Greenway project between Overland and Westwood is noted for the record. The PEIR assesses the environmental impacts associated with implementation of EWMPs as a form of compliance with the MS4 Permit. More site investigations are needed to fully vet the proposed Westwood Neighborhood Greenway project and define the project scope needed to satisfy the EWMP's requirements. The City of Los Angeles is the primary agency who will benefit from a water quality project at the Westwood Neighborhood Greenway project. The City of Los Angeles will likely play a major role in the decision to implement an EWMP project at Westwood Neighborhood Greenway project.

PROJECT MANAGEMENT DIVISION II

Dear Mr. BeGell,

On behalf of Arcadia Historical Society, I would like to add our concerns about the Arboretum's Baldwin Lake to the public comments you have been collecting on behalf of the Rio Hondo Watershed Management Plan. The Arboretum is the historic core of the City of Arcadia, and the Society takes seriously all issues that impact both the important structures located there and the natural setting that makes the Arboretum such a significant piece of County property. Baldwin Lake is part of the 'landscape significance' of the National Register of Historic Places listing for both the Queen Anne Cottage and Coach Barn, but more than that notable distinction, Baldwin Lake has played an important role in educating our youth about water and how it attracted settlers over the years.

Arcadia schools regularly visit the Arboretum on field trips (as do countless other schools, many in districts far less affluent than Arcadia Unified), and the impression left on those young minds potentially remains forever. I grew up in Arcadia and personally remember my visits to the Arboretum where lessons taught about both water and wildlife that depend on it remain with me today.

We have all been concerned as we watch the water level in the lake decline, and we understand the need to conserve water wherever possible. Surely this historic body of water can be saved, however. We have seen movie locations dredge parts of the lake, but we have also seen those same large filming units pay little heed as their equipment destabilized the historic perimeter wall of Baldwin Lake. If the lake basin can be deepened sufficiently, and if the historic retaining walls can be restored to their original purpose, perhaps Baldwin Lake can become a "highlight reel" of responsible water management.

Arcadia Historical Society is committed to the mission of preserving and protecting our historic treasures. Baldwin Lake is surely a treasure that has significance far beyond storm water management. One hopes that deepening the basin will help keep storm waters "in Arcadia" rather than flowing freely out to the sea, but perhaps as importantly, preserving the historic integrity of Baldwin Lake means continuing the ongoing role it has played in educating our youth that man originally occupied this land now called Arcadia because of the presence of water.

The Arboretum is an incredible public resource, and Baldwin Lake is the heartbeat. Please add our voice to others who are asking that this historic body of water be part of the important projects that the Enhanced Watershed Management Plan endorses.

Sincerely,

Gene Glasco
President, Arcadia Historical Society

Response to Comment Letter 14 (Arcadia Historical Society – March 3, 2015)

Response to Comment 14-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The PEIR assesses the environmental impacts associated with implementation of EWMPs as a form of compliance with the MS4 Permit. The restoration of Baldwin Lake is shown as a potential priority project to be implemented as part of the Rio Hondo/San Gabriel River EWMP in Figure 2-13 of the PEIR. More site investigations by implementing agencies are needed to fully vet the proposed project and define the project scope needed to satisfy the EWMP's requirements. The City of Arcadia is the primary agency who will benefit from a water quality project at the Baldwin Lake. The City of Arcadia will likely play a major role in the decision to implement an EWMP project at Baldwin Lake.

Dear Gregg,

The restoration of Baldwin Lake will both enhance watershed function and serve the public with exceptional educational, ecological, and scenic benefits. Baldwin Lake is a beloved public resource visited by over 330,000 annual visitors; its inclusion as a high priority project within the Rio Hondo/San Gabriel River Enhanced Watershed Management Plan offers unparalleled public benefit.

Please provide every consideration to including Baldwin Lake restoration in the plan.

Sincerely,

Hap Kellogg

Re: Comments on Los Angeles County Draft Program Environmental Impact Report for Enhanced Watershed Management Programs under the Los Angeles County Municipal Separate Storm Sewer System Permit, NPDES Permit No. CAS004001, Order No. R4-2012-0175

Dear Mr. BeGell:

On behalf of the Natural Resources Defense Council ("NRDC"), Los Angeles Waterkeeper ("Waterkeeper"), and Heal the Bay (collectively, "Environmental Groups"), we are writing with regard to the Draft Program Environmental Impact Report ("PEIR") for the 12 Enhanced Watershed Management Programs ("EWMP") under the 2012 Los Angeles County Municipal Separate Storm Sewer System Permit ("2012 MS4 Permit" or "2012 Permit").[1] We appreciate the opportunity to submit these comments to the Los Angeles County Department of Public Work's Flood Control District. ("LACFCD").

I. Introduction

As an initial matter, Environmental Groups' comments on the EWMP Draft PEIR should not be construed as approval or acceptance of the 2012 Permit terms. We continue to maintain that several provisions of the Permit fail to meet the requirements of the federal Clean Water Act and California Porter Cologne Act, and are otherwise inconsistent with

[1] The Enhanced Watershed Management Programs addressed in the Program Environmental Impact Report ("PEIR") encompass several watersheds of Los Angeles County including the following: Ballona Creek, Beach Cities, Dominguez Channel, Malibu Creek, Marina del Rey, North Santa Monica Bay Coastal Watersheds, Palos Verdes Peninsula, Rio Hondo/San Gabriel River Water Quality Group, Santa Monica Bay, Upper Los Angeles River, Upper San Gabriel River, and Upper Santa Clara River.

both federal and state law. Environmental Groups filed a petition[2] with the State Water Resources Control Board ("State Board"), which demonstrates the ways in which the 2012 Permit violates these legal requirements. The State Board has yet to make a determination on our petition.

Under the 2012 Permit, permittees electing to participate in an EWMP are required to submit a draft EWMP plan by June 2015. (2012 Permit, at VI.C.4.c.iv.) The EWMP Work Plans submitted by permittees in June 2014 presented an opportunity for permittees to demonstrate their commitment to developing EWMPs to meet required Receiving Water Limitations ("RWLs") and Total Maximum Daily Load ("TMDL") provisions. Environmental Groups reviewed the EWMP Work Plans and submitted comments to the Regional Board.[3] As we expressed in our comments, many permittees have made significant progress towards developing their draft EWMPs. However, the Work Plans are in many instances unclear as to what analysis or programs will ultimately be incorporated into final EWMPs to be submitted to the Regional Board in June 2015. In fact, some of the Work Plans clearly indicate that the permittees' management programs, as currently envisioned, will not ensure that discharges from the permittees' MS4 systems do not cause or contribute to exceedances of RWLs, including applicable water quality standards, or TMDL limitations in the 2012 Permit, and otherwise fail to meet Permit requirements.

EWMP Work Plan deficiencies do not bode well for the June 2015 Draft EWMPs, and this CEQA process is an opportunity for LACFCD and EWMP permittees to address our concerns with program development thus far. The Regional Board-approved delay in progress toward compliance with water quality based effluent limits ("WQBELs") and RWLs for EWMP permittees cannot pass lightly—the draft plans submitted by EWMP groups in June 2015 must fully and clearly demonstrate a path to compliance and cleaner waters for the region. To this extent, any identified deficiencies with the EWMP Work Plans must be addressed prior to submission of the draft EWMPs in 2015, and should also be addressed in this PEIR to fully assess the potential environmental impacts of the program.

---

[2] For a full explanation of how the permit violates the law, see Memorandum of Points and Authorities in Support of Petition of NRDC, Los Angeles Waterkeeper and Heal the Bay for Review of Action by the California Regional Water Quality Control Board, Los Angeles Region, in Adopting the Los Angeles County Municipal Separate Stormwater National Pollutant Discharge Elimination System (NPDES) Permit; Order No. R4-2012-0175; NPDES Permit No. CAS004001 (Dec, 10, 2012) ("Environmental Groups' Petition"), SWRCB/OCC File No. A-2236(m), attached as Exhibit A.
[3] *See* Environmental Groups' Comments on Enhanced Watershed Management Work Plans and Monitoring Plans Pursuant to Requirements under the Los Angeles County Municipal Separate Storm Sewer System Permit, NPDES Permit No. CAS004001, Order No. R4-2012-0175, submitted to the Regional Board September 16, 2014, attached as Exhibit B.

II. General Comments

Environmental Groups have categorized comments into general comments about the approach in the PEIR and some specific comments about the PEIR analysis. Because the approach in the Draft PEIR will likely follow to the management programs due in June 2015, LACFCD should take this important opportunity to revise the Draft PEIR to address the concerns articulated below.

A. Inadequate Information Related to Ensuring Compliance with Required Water Quality Limits Undermines the Success of the PEIR

In areas of the permittees' jurisdictions where retention of the 85th percentile, 24-hour storm event is not technically feasible, EWMPs must include other watershed control measures to "ensure that MS4 discharges achieve compliance with all interim and final WQBELs set forth in Part VI.E. . . . and [] ensure that MS4 discharges do not cause or contribute to exceedances of receiving water limitations in Part V.A." (*Id*. at VI.C.1.g.v.) In several instances, the Draft PEIR acknowledges this legal obligation and claims that planning efforts are aimed towards that goal. However, whether the environmental impact of the program will indeed include compliance remains uncertain. In fact, based on Environmental Groups' review of several of the EWMP Work Plans related to the Draft PEIR and the very general information included in the Draft PEIR, the actual environmental impact of the EWMPs is difficult to determine. Deficiencies identified in the EWMP Work Plans potentially undermine statements of intended compliance in the PEIR. Thus, Environmental Groups urge LACFCD to clarify several issues related to assuring ultimate compliance with water quality limits.

First, several EWMP Work Plans related to the Draft PEIR insufficiently prioritize pollutants as required in the 2012 MS4 Permit. Permittees are required to prioritize pollutants into three categories: (1) TMDL pollutants (highest priority), (2) 303(d) listed but no applicable TMDL (high priority), and (3) insufficient data to determine impairment, but exceeds RWLs (medium priority). Category (1) must also include non-TMDL pollutants that have similar fate and transport mechanisms as TMDL pollutants. (2012 Permit, at VI.C.2.a.i.) Prioritization is essential to ensuring compliance with required limits. Some of the deficiencies in prioritization include failing to include priority pollutants,[4] and failing to justify exclusion of some pollutants.[5] Additionally, permittees have set incorrect timelines for TMDL implementation and compliance in

(lacks explanation of why Total Aluminum is not included as a priority despite data demonstrating exceedances).
[5] *See* North Santa Monica Bay Coastal Watersheds EWMP Work Plan, at 18.

some cases.[6] Without adequately characterizing each watershed and prioritizing the right pollutants, it is impossible to fully assess the environmental impacts of the proposed programs under CEQA. Environmental Groups understand that the EWMPs are still in development, but this PEIR must include a process and approach that complies with permit terms to fully evaluate the impacts of proposed actions.

B. Green Infrastructure Should Be Prioritized Wherever Feasible

Environmental Groups commend the LACFCD for proposing multi-benefit stormwater projects that emphasize flood risk mitigation, water conservation and water supply. In light of the fact that the LACFCD has a vested interest in increasing opportunities for stormwater capture and groundwater recharge as a means of assisting local water supply and augmentation, we urge the LACFCD to work with Permittees in all 12 EWMP watersheds to prioritize green infrastructure or low-impact development (LID) practices wherever feasible, and provided that such projects do not produce significant adverse impacts.

Environmental Groups have long supported the use of green infrastructure techniques to control urban runoff. Green infrastructure provides multiple benefits to surrounding communities at a higher benefit-cost ratio when compared to grey infrastructure.[7] A 2007 U.S. Environmental Protection Agency (EPA) study found that "in the vast majority of cases . . . implementing well-chosen LID practices saves money for developers, property owners, and communities while protecting and restoring water quality."[8] With only "a few exceptions," the EPA study found that "[t]otal capital cost savings ranged from 15 to 80 percent when LID methods were used" instead of conventional stormwater management techniques.[9] The EPA study is not alone in reaching this conclusion. A report by ECONorthwest concluded that LID methods not only "cost less to install, have lower operations and maintenance (O&M) costs, and provide more cost-effective stormwater management and water-quality than conventional stormwater controls" but they also provide "ecosystem services and associated economic benefits that conventional

[9] *Id.* at iv.

stormwater controls do not.[10] Moreover, a survey released by the American Society of Landscape Architects in 2011 found that green infrastructure reduced or did not influence project costs 75 percent of the time."[11]

Given the current severe drought conditions, protecting and augmenting local water supplies is essential for long-term sustainability. A report by the NRDC found that implementing LID practices at new and redeveloped residential and commercial properties in urbanized areas of Southern California and limited portions of San Francisco Bay has the potential to increase local water supplies by up to 405,000 acre-feet of water per year by 2030.[12] This volume of water accounts for roughly two-thirds of all water used by the City of Los Angeles each year.[13] Historically, Southern California has imported approximately 50 percent of its water supply from distant, energy-intensive sources such as the Sacramento-San Joaquin Delta and the Colorado River.[14] Green infrastructure thus has the potential to greatly reduce Los Angeles' dependence on imported water.

Last but not least, Environmental Groups strongly advocate for the implementation of structural BMPs (distributed, centralized, and regional) that capture stormwater and store it for reuse – so long as they do not produce significant adverse impacts – as such practices provide both water quality *and* water supply benefits.

III. Specific Concerns in the PEIR

Section 3.5 – Geologic and Mineral Resources
Impact 3.5-2: "The proposed program could result in substantial soil erosion or the loss of top soil."

The Draft PEIR states environmental impacts associated with substantial soil erosion or loss of top soil are less than significant. Environmental Groups disagree. EWMP projects are encouraged to retain the 85th percentile 24-hour storm event; however, it is unclear that all EWMP BMPs will retain this volume and even if they did, in some instances some volume of runoff will remain untreated. Thus, at least some percentage of stormwater generated, which will vary depending on individual EWMPs, will be treated and discharged into the MS4. Although discharge points from centralized and

[11] Stormwater Case Studies, American Society of Landscape Architects, available at http://www.asla.org/stormwatercasestudies.aspx.
[12] Natural Resources Defense Council, *A Clear Blue Future: How Greening California Cities Can Address Water Resources and Climate Challenges in the 21st Century*, August 2009, at 4, available at http://www.nrdc.org/water/lid/files/lid_hi.pdf ("A Clear Blue Future").
[13] *Id*.
[14] *Id.*, at 18-19.

distributed BMPs would be designed to minimize scour potential, soil erosion and loss of top soil are still likely to occur during precipitation events. Los Angeles County contains over 110 soft bottom reaches – increased scour and loss of top soil could severely affect beneficial uses of these reaches. In addition, the 2012 Permit outlines specific hydromodification requirements – it is unclear if the Draft PEIR is consistent with hydromodification provisions in the 2012 Permit. The Final PEIR needs to address all potential soil erosion and loss of top soil scenarios and needs to reference the hydromodification provisions outlined on pg. 105 of the 2012 Permit.

Impact 3.5-5: "The proposed program could have soils incapable of adequately supporting the use of a septic tank or alternative wastewater treatment systems where sewers are not available for the disposal of wastewater."

Environmental Groups are concerned with wastewater created in areas incapable of adequate disposal options (sewer system or septic tanks). In the event that implemented BMPs generate wastewater and cannot properly dispose of wastes via sewer system or septic tanks, the Final PEIR needs to outline how waste will be managed (i.e. tank, truck, etc.). In addition, the Final PEIR should reference the State Board's Water Quality Control Policy for Siting, Design, Operation, and Maintenance of Onsite Wastewater Treatment Systems and General Waste Discharge Requirements for Small Domestic Wastewater Treatment Systems (Order WQ 2014-0153-DWQ) when soils are capable of supporting the use of septic tanks.

Cumulative Impact/GEO-2: "Prior to installing BMPs designed to recharge local groundwater supplies, the Implementation Agency shall notify local groundwater manager including the Upper Los Angeles River Area Water Master, the Water Replenishment District of Southern California, or the San Gabriel Water Master as well as local water producers such as local municipalities and water companies. The Implementing Agency shall coordinate BMP siting efforts with groundwater managers and producers to mitigate high groundwater levels while increasing local water supplies."

Environmental Groups agree Implementation Agencies should always notify local groundwater managers and producers before stormwater BMPs are implemented; however, the Draft PEIR fails to acknowledge or reference Salt and Nutrient Management Plans being developed and implemented for Los Angeles County groundwater basins. These Plans outline groundwater inputs and exports as well as identify basins' assimilative capacities. We believe the Final PEIR needs to discuss EWMP coordination with Salt and Nutrient Management Plans. In the light of climate change, protecting while simultaneously contributing to Los Angeles' local water supply is essential for long-term water sustainability.

Section 3.7 – Hazards and Hazardous Materials
Impact 3.7-2: "The proposed program could create a significant hazard to the public or the environment through the accumulation of potentially hazardous materials into BMPs."
HAZ-1: "Implementing agencies shall prepare and implement maintenance practices that include periodic removal and replacement of surface soils and media that may accumulate constituents that could result in further migration of constituents to sub-soils and groundwater. A BMP Maintenance Plan shall be prepared by Implementing Agencies upon approval of the individual BMP projects that identifies the frequency and procedures for removal and/or replacement of accumulated debris, surface soils and/or media (to depth where constituent concentrations do not represent a hazardous conditions and/or have the potential to migrate further and impact groundwater) to avoid accumulation of hazardous concentrations and the potential to migrate further to sub-soils and groundwater. The BMP Maintenance Plan may consist of a general maintenance guideline that applies to several types of smaller distributed BMPs. For smaller distributed BMPs on private property, these plans may consist of a maintenance covenant that includes requirements to avoid the accumulation of hazardous concentrations in these BMPs that may impact underlying sub-soils and groundwater. Structural BMPs shall be designed to prevent migration of constituents that may impact groundwater."

Environmental Groups support Implementing Agencies' development of BMP Maintenance Plans outlining BMP maintenance practices as this is necessary to sustain stormwater BMP efficacies. Yet we want to highlight the all-too-common shortcoming Implementing Agencies encounter in operations and maintenance of stormwater BMPs – failure to devote adequate resources. Bolstering of agencies' resources, such as additional staffing, training, and funding mechanisms, is necessary and commonly overlooked in the implementation of BMP maintenance plans. Without acknowledging Implementation Agency resources while implementing BMP Maintenance Plants, it is unlikely EWMPs' discharges will comply with water quality standards in the long-term. The Final PEIR needs to expand HAZ-1 to discuss additional agencies' resources needed to implement BMP Maintenance Plans.

Section 3.8: Hydrology and Water Quality
Impact 3.8-1: "The proposed project would result in higher groundwater levels and could potentially affect groundwater quality"
See Cumulative Impact/GEO-2 response above.

Impact 3.8-2: "The proposed project could substantially alter the existing drainage pattern of a site or area through the alteration of the course of a stream or river, or by other means, in a manner that would result in substantial erosion or siltation on- or off-site."
See Impact 3.5-2 response above.

IV. Conclusion

Environmental Groups appreciate this opportunity to comment on the Draft PEIR submitted by the LACFCD for the 12 EWMP groups. Please feel free to contact us with any questions or concerns you may have.

Sincerely,

STATE WATER RESOURCES CONTROL BOARD

In the Matter of the Petition of NRDC, Los Angeles Waterkeeper, and Heal the Bay, for Review of Action by the California Regional Water Quality Control Board, Los Angeles Region, in Adopting the Los Angeles County Municipal Separate Stormwater National Pollutant Discharge Elimination System (NPDES) Permit; Order No. R4-2012-0175; NPDES Permit No. CAS004001	MEMORANDUM OF POINTS AND AUTHORITIES IN SUPPORT OF PETITION FOR REVIEW OF LOS ANGELES REGIONAL WATER QUALITY CONTROL BOARD ACTION OF ADOPTING ORDER NO. R4-2012-0175

I. INTRODUCTION

This petition seeks review of a pollution discharge permit that is both unlawful and inadequate to protect the region's waters or the public health. The Los Angeles Regional Water Quality Control Board's ("Regional Board" or "Board") permit for Los Angeles County municipal separate storm sewer systems ("MS4s")[1] is the unfortunate result of six years of delay in renewing the previous permit, and of largely ignoring the crucial need to address the region's ongoing legacy of water pollution. The 2012 Permit, and the process the Regional Board followed in adopting it, were both deeply flawed, and impermissibly weaken or "backslide" from the requirements of the previous, 2001 MS4 permit.[2] The critical—but by no means only—flaw of the 2012 Permit is that it often abandons requirements to comply with both narrative and numeric water quality standards in receiving waters as a means of protecting water quality. For the reasons discussed below, Petitioners respectfully request that the State Water Resources Control Board ("State Board") overturn these unlawful provisions of the 2012 Permit, or remand the matter to the Regional Board with specific direction to remedy the provisions of the 2012 Permit that violate state and federal law.

The 2012 Permit is unlawful due to its inclusion of safe harbors from provisions, required by the 2001 Permit, that require that discharges comply with Water Quality Standards. The safe harbors—provisions that excuse compliance with Water Quality Standards in the Permit's Receiving Water Limitations section, are illegal for four principal reasons: 1) the safe harbors violate federal anti-backsliding requirements; 2) the safe harbors violate state and federal antidegradation requirements; 3) the safe harbors violate requirements for incorporation of TMDLs

[1] Regional Board, Waste Discharge Requirements for Municipal Separate Storm Sewer System (MS4) Discharges Within the Coastal Watersheds of Los Angeles County, Except Those Discharges Originating From the City of Long Beach, Order No. R4-2012-0175, NPDES Permit No CAS004001 (Nov. 8, 2012) ("2012 Permit" or "Permit").

[2] Regional Board, Waste Discharge Requirements for Municipal Separate Storm Sewer and Urban Runoff Discharges Within the County of Los Angeles, and the Incorporated Cities Therein, Except the City of Long Beach, Order No. 01-182, NPDES Permit No. CAS004001 (Dec. 13, 2001) ("2001 Permit").

into National Pollutant Discharge Elimination System permits; and, 4) the Regional Board failed to make sufficient findings or provide evidence in the record to support the inclusion of the safe harbors in the 2012 Permit.

These violations of law present compelling reasons for the State Board to exercise its statutory duty to correct the unlawful actions of the Regional Board. These corrections are seriously needed to protect the waters of Los Angeles County and the public health.

A. Factual Background

1. Monitoring Demonstrates That the Los Angeles County MS4s Discharge Pollution to Receiving Waters

The stormwater systems regulated by the 2012 Permit discharge bacteria, metals, and other pollutants at unsafe levels to rivers, lakes, and beaches in Los Angeles County. This pollution causes increased rates of human illness, harm to the environment, and an economic loss of tens to hundreds of millions of dollars every year from public health impacts alone. As the Regional Board itself acknowledges:

> Discharges of storm water and non-storm water from the . . . Los Angeles County [MS4s] convey pollutants to surface waters throughout the Los Angeles Region. . . . the primary pollutants of concern in these discharges . . . are indicator bacteria, total aluminum, copper, lead, zinc, diazanon, and cyanide. Aquatic toxicity, particularly during wet weather, is also a concern. . .
>
> Pollutants in storm water and non-storm water have damaging effects on both human health and aquatic ecosystems. Water quality assessments conducted by the Regional Water Board have identified impairment of beneficial uses of water bodies in the Los Angeles Region caused or contributed to by pollutant loading from municipal storm water and non-storm water discharges.

(2012 Permit, at p. 13, Finding A.)[3,4]

---

[3] This comports with the findings of the U.S. Environmental Protection Agency ("EPA"), which considers urban runoff to be "one of the most significant reasons that water quality standards are not being met nationwide." (U.S. General Accounting Office (June 2001) Water Quality: Better Data and Evaluation of Urban Runoff Programs Needed to Assess Effectiveness, Report No. GAO-01-679, at 37.)

The pollutants that impair the region's waters come in large part from the MS4s subject to the permit at issue. Monitoring data from mass emission stations in area streams and rivers demonstrate that the MS4s persistently contribute to violations of Water Quality Standards and cleanup targets (total maximum daily loads or "TMDLs") in Los Angeles area water bodies. Monitoring revealed 1,105 violations since 2003 of water quality limits for fecal bacteria, various heavy metals, ammonia, pH, and cyanide, among other constituents, in Ballona Creek, Malibu Creek, the Los Angeles River, Santa Clara River, Dominguez Channel, and Coyote Creek.[5]

Monitoring conducted by non-profit organizations confirms that MS4s in Los Angeles County pollute in the region. Data collected by these organizations show:

- Malibu Creek routinely exceeded limits for nitrogen, ammonia, phosphate, E.coli, and enterococcus bacteria during wet and dry weather.[6]
- Compton Creek commonly exceeded applicable pollution limits; the highest magnitude of exceedances occurred during storm events at storm drain outfalls.[7]
- 13 of 22 sites sampled in the Los Angeles River watershed during 2005 received an F grade for failing water quality standards for PH, temperature, dissolved solids, nutrients, dissolved oxygen, and turbidity.[8]
- Dry weather discharges from 18 storm drains flowing into Ballona Creek, which is impaired by fecal bacteria, had consistently high levels of bacteria.[9]

---

[4] Unless otherwise noted, all references to documents in this brief are to documents that were timely submitted to the Regional Board and are part of the record in this matter. We include documents originally submitted by Petitioners here for the convenience of the State Water Resources Control Board ("State Board").

[8] Friends of the Los Angeles River (2005) The First State of the Los Angeles River Report, at 3.

[9] See Exhibit C: Los Angeles Waterkeeper, Ballona Creek Data (2011-2012).

Receiving water sampling conducted in Ballona Creek, together with dry weather storm drain sampling, as well as monitoring from the City of Malibu, demonstrate a link between polluted storm drain discharges and exceedances of water quality standards, and that the MS4 system is a significant source of this pollution to receiving waters.[10]

Finally, California Ocean Plan standards and fecal bacteria TMDL limits established to protect the health of beachgoers have been exceeded on thousands of occasions. Monitoring identified 3,369 exceedances of beach bacteria TMDL limits at 65 Los Angeles County beach monitoring locations during the April – October dry weather season from 2006 through 2011, exposing the public to various well-documented health risks associated with recreating in polluted water.[11]

2. Stormwater Pollution Threatens Public Health

Polluted urban runoff increases bacteria levels and illness rates among swimmers.[12] Contact with waters contaminated by stormwater runoff can lead to fever, chills, ear infections and discharge, coughing and respiratory ailments, vomiting, diarrhea and other gastrointestinal illness, and skin rashes.[13] Scientists reviewing 22 epidemiological studies found that 19 of them showed that adverse health effects were significantly related to fecal indicator bacteria or bacterial pathogens.[14] One local analysis investigated health risks of people exposed to storm drain runoff

while swimming in Santa Monica Bay and found that swimmers exposed directly in front of a storm drain experienced increased health risks of approximately 50-100 percent compared with people swimming more than 400 yards away from the drain.[15]

The Regional Board itself has acknowledged that the harm to the public from exceeding bacteria standards "is dramatic both in terms of health impacts to exposed beachgoers, and the economic cost to the region associated with related illnesses." (2001 Permit (as amended by Order R4-2009-0130), at p. 16, Finding E.32.) These health impacts come at tremendous cost—one study demonstrated that swimming at polluted beaches in Los Angeles County caused between 427,800 and 993,000 excess cases of gastroenteritis per year, resulting in annual health costs of between $14 and $35 million, or $120 and $278 million per year (depending on whether only market costs or both market and non-market costs, such as willingness-to-pay not to get sick, were considered).[16]

3. Controlling stormwater pollution provides numerous economic benefits, while stormwater pollution creates many economic harms

Controlling pollution from MS4 systems has far-reaching economic and social benefits for the region. According to a report to California's Resources Agency, "California has the largest Ocean Economy in the United States, ranking number one overall for both employment and gross state product. . . ."[17] One study estimated that local beach goers in California spend as much as $9.5 billion annually and the non-market values associated with beach going in California may be as high as $5.8 billion annually.[18]

[18] Pendleton, L. (July 2004) *Harvesting Ocean Observing Technologies to Improve Beach Management: Estimating the Regional Economic Benefits of Improvements in the California*

Unfortunately, stormwater runoff in Los Angeles County's coastal waters causes or contributes to an enormous number of beach closures or advisories each year.[19] Beach closures and advisories result in direct and indirect negative effects on the coastal economy, such as lost revenue.[20] One study estimated that a hypothetical beach closure of Huntington Beach for one day would result in a loss of 1200 beach visits and associated economic losses of $100,000.[21] Conversely, the National Oceanic and Atmospheric Association found that improving water quality in Long Beach from a C grade to the healthier standards of Huntington City Beach (a B grade) would create $8.8 million in economic benefits over a 10-year period.[22]

Moreover, the economic and social benefits of stormwater regulation, such as those achievable through this Permit, far outweigh the costs of implementation. For example, the staff report for the Metals TMDL for the Los Angeles River and its tributaries found that removing metals from the waterways would have benefits of as much as $18 billion (if structural systems were used), in comparison to costs of between $5.7 and $7.4 billion.[23] This would be in addition to "[u]nquantifiable health benefits" associated with implementation.[24]

B. Legal Background

In 1972, Congress enacted the Clean Water Act ("CWA") to "restore and maintain the chemical, physical, and biological integrity of the Nation's waters." (33 U.S.C. § 1251(a); see also, *NRDC v. U.S.E.P.A.*, 859 F.2d 156, 198 (D.C. Cir. 1988); *NRDC v. Costle,* 568 F.2d 1369, 1373 (D.C. Cir. 1977); *American Frozen Foods Inst. v. Train*, 539 F. 2d 107, 124 (D.C. Cir. 1976).) The Act sought to eliminate the discharge of pollutants into navigable waters by 1985, and to achieve fishable and swimmable conditions, wherever possible, by 1983. (33 U.S.C. § 1251(a)(1)-(2).) Courts have consistently recognized that the CWA is a tough law—"strong medicine." (*Texas Municipal Power Agency v. U.S. EPA* (5th Cir. 1988) 836 F.2d 1482, 1488.)[25]

Overall, the Act prohibits the discharge of any pollutant from a point source into a water of the United States except as in compliance with the Act. (33 U.S.C. §§ 1311(a), 1342.) "Point source" is defined to mean any discrete "conveyance," such as a pipe or channel, (33 U.S.C. § 1362(14)), and thus includes MS4s, which are elaborate networks of such conveyances. (33 U.S.C. §§ 1342(p), 1362(14).)[26] A point source, such as an MS4, can comply with the CWA by obtaining a discharge permit under the National Pollutant Discharge Elimination System ("NPDES") program. (33 U.S.C. § 1342(b), (p).)

The CWA requires each state to adopt Water Quality Standards ("WQSs") for all waters within its boundaries and submit them to the U.S. Environmental Protection Agency ("EPA") for approval. (33 U.S.C. §§ 1311(b)(1)(C), 1313.) WQSs include maximum permissible pollutant levels that must be sufficiently stringent to protect public health and enhance water quality, consistent with the uses for which the water bodies have been designated. (33 U.S.C. §

---

[25] "The [Clean Water Act] is strong medicine. . . . Congress explicitly recognized that reduction of the amount of effluents—not merely their dilution or dispersion—is the goal of the [Act]." (*Texas Municipal Power Agency*, 836 F.2d at 1488.)

[26] The discharge of pollutants from an MS4, often called "polluted runoff" or "urban runoff," is a two-part problem. It includes what is often referred to as non-stormwater discharges—typically, landscape irrigation flows, washwater, and other flows not related to precipitation carrying herbicides, bacteria, metals, used motor oil, and other pollutants. And it includes urban stormwater—which is basically what it sounds like—storm flows that contain pollutants from the urban environment. (*See* 33 U.S.C. § 1342(p)(3)(B)(ii)-(iii).)

1313(c)(2)(A).) WQSs provide the reference point "to prevent water quality from falling below acceptable levels." (*PUD No. 1 of Jefferson County v. Washington Dep't of Ecology* (1994) 511 U.S. 700, 704 [quotation omitted].) States also must identify as impaired any water bodies that fail to meet water quality standards. (33 U.S.C. § 1313(d).)

For impaired waters, states must establish TMDLs, which set a daily limit on the discharge of each pollutant necessary to achieve water quality standards. (*Id.* § 1313(d)(1).) The TMDL "assigns a ***waste load allocation (WLA)*** to each point source, which is that portion of the TMDL's total pollutant load, which is allocated to a point source for which a NPDES permit is required." (*Communities for a Better Env't v. State Water Res. Control Bd.* (2005) 132 Cal.App.4th 1313, 1321 (emphasis in original).) Critically, federal law requires that "once a TMDL is developed, effluent limitations in NPDES permits must be consistent with the WLA's in the TMDL." (*Id.*, at 1322 (citing 40 C.F.R. § 122.44(d)(1)(vii)(B).) According to EPA, which overseas implementation of the CWA, "[w]here the TMDL includes WLAs for stormwater sources that provide numeric pollutant load . . . the WLA should, where feasible, be translated into numeric [water quality-based effluent limitations] in the applicable stormwater permits." [27]

Like other NPDES permits, MS4 permits must ensure that discharges from storm sewers do not cause or contribute to a violation of water quality standards. (33 U.S.C. § 1311(a); 1313; 1341(a); 1342(p).)[28] Renewal permits—like the 2012 Permit, at issue—may not contain weaker

---

[27] Memorandum from James A. Hanlon and Denise Keehner, U.S. EPA, to Water Management Division Directors, Regions 1 – 10, re: Revisions to the November 22, 2002 Memorandum "Establishing Total Maximum Daily Load (TMDL) Wasteload Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on Those WLAs, November 12, 2010, ("EPA Hanlon Memo") at 3. (Attached as Request for Notice ("RN") "Exhibit A".)

[28] See, e.g., State Board Order No. WQ 99-05, *Own Motion to Review the Petition of Environmental Health Coalition to Review Waste Discharge Requirements Order No. 96-03*; In addition, permits for discharges from municipal storm sewers "shall require controls to reduce the discharge of pollutants to the maximum extent practicable . . . and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants. (33 U.S.C. § 1342(p)(3)(B)(iii).) This language in section 1342(p) has been held by California courts to grant "the EPA (and/or a state approved to issue the NPDES permit) . . . the discretion to impose 'appropriate' water pollution controls in addition to those that come within the definition of 'maximum extent practicable.'" (*Building Industry Ass'n of San Diego County v. State Water*

standards than those contained in the previous permit, except under limited circumstances. (33 U.S.C. § 1342(o); 40 C.F.R. § 122.44(l).) Federal and state law additionally require implementation of an antidegradation policy, that mandates that existing water quality in navigable waters be maintained unless degradation is justified by specific findings. (See, 40 C.F.R. § 131.12(a)(1).)

1. The 2001 Los Angeles County MS4 Permit

In 2001, the Regional Board adopted an NPDES permit for MS4s in Los Angeles County,[29] which was intended to address the harm caused by pollutants conveyed via storm drains to surface waters in the Los Angeles area. The permit regulated Los Angeles County, the Los Angeles County Flood Control District, and 84 incorporated cities within the County.

Importantly, the 2001 Permit contained Receiving Water Limitations ("RWLs"), which required that "discharges from the MS4 that cause or contribute to the violation of Water Quality Standards or water quality objectives are prohibited." (2001 Permit, at Part 2.1.)[30] The Permittees were directed to begin remedial measures immediately if discharges violate water quality standards. (*Id*., at Part 2.3.) If exceedances of water quality standards persisted, notwithstanding control measures, the Permittees "shall assure compliance" by preparing a compliance report that identifies the violations and adopting more stringent pollution control measures to correct them. (*Id*.)

Complying with the 2001 Permit's iterative process assisted Permittees in meeting water quality goals, but did not excuse violations of water quality standards. An earlier MS4 permit for Orange County, approved by the State Board, had included language stating "the permittees will

---

Resources Control Bd. (2004) 124 Cal.App.4th 866, 883 (citing *Defenders of Wildlife v. Browner* (9th Cir. 1999) 191 F.3d 1159, at 1165–1167).)

[29] This was the third such permit issued by the Regional Board to Los Angeles County and local municipalities. Prior permits were adopted in 1990 and 1996. (2001 Permit, p. 1, Finding A.)

[30] "Water Quality Standards and Water Quality Objectives" are defined in the 2001 Permit to mean "water quality criteria contained in the Basin Plan, the California Ocean Plan, . . . the California Toxics Rule, and other state or federally approved surface water quality plans." (2001 Permit, at Part 5, p. 70.)

not be in violation of [receiving water limitations] so long as they are in compliance with [the iterative process set forth in the permit]."[31] EPA objected to that provision, (which MS4 permits for Vallejo and Riverside County had additionally adopted), as a "safe harbor," meaning the provision deemed the permittees in compliance with the permit regardless of whether Water Quality Standards were then met. In response, the State Board directed the Regional Boards to include receiving water limitations language devised by EPA, without a safe harbor provision, into all future MS4 permits.[32]

The Regional Board followed this clear directive in the 2001 Permit. Indeed, when the County and 43 cities challenged the permit in state court, the court ruled that the Regional Board "included Parts 2.1 and 2.2 in the Permit without a 'safe harbor.'" (*Id.*)[33] The Regional Board supports this interpretation: "the plain meaning of these provisions is clear: they prohibit discharges that cause or contribute to a 'violation of Water Quality Standards' [or water quality objectives] or to a condition of nuisance." Put simply, "[t]he Regional Board's position . . . is that the Permit cannot be read to excuse exceedances of water quality standards."[34] Finally, the Ninth Circuit confirmed the state court's interpretation of the 2001 Permit's Receiving Water Limitations, holding that "no such 'safe harbor' is present in this Permit. . . . [there is] no textual

---

[31] See, State Board Order No. WQ 98-01, *Own Motion to Review the Petition of Environmental Health Coalition to Review Waste Discharge Requirements Order No. 96-03*, at 6-7.
[32] See, State Board WQ Order 99-05.
[33] *See, In re L.A. County Mun. Storm Water Permit Litigation.*, No. BS 080548 at 4-7 (L.A. Super. Ct. Mar. 24, 2005) ("*L.A. County Mun. Stormwater*"). The court noted that, "the Regional Board acted within its authority when it included Parts 2.1 and 2.2 in the Permit without a 'safe harbor,' whether or not compliance therewith requires efforts that exceed the 'MEP' standard." (*In re L.A. County Mun. Stormwater*, at 7.) But regardless of this authority, as described above, the Court found that "the terms of the Permit taken, as a whole, constitute the Regional Board's definition of MEP, including, but not limited to, the challenged Permit Provisions." (*Id*. at 7-8.)
[34] Brief of Amicus Curiae California Regional Water Quality Control Board, Los Angeles Region, in *Santa Monica Baykeeper v. City of Malibu* No. CV 08-1465-AHM (PLAx) (C.D. Cal.) (filed Feb. 5, 2010), at 9; *see also,id*. at 4.

support for the proposition that compliance with certain provisions shall forgive non-compliance with the discharge prohibitions."[35]

2. The 2012 Permit

On November 8, 2012, the Regional Board adopted a new MS4 permit for Los Angeles County. Like the prior 2001 Permit, the 2012 Permit states that, "Discharges from the MS4 that cause or contribute to the violation of receiving water limitations are prohibited." (2012 Permit, at Part V.A.1.)[36] Rather than maintaining the 2001 Permit's strict prohibition against discharges that cause or contribute to an exceedance of Water Quality Standards, however, the Permit instead incorporates several safe harbors that create broad exemptions to the RWLs section, rendering the limitations inoperative in certain circumstances.

Under the 2012 Permit, Permittees have several different compliance options, two of which trigger application of a safe harbor. In particular, dischargers may elect to develop or participate in a Watershed Management Program ("WMP"), or Enhanced Watershed Management Program ("EWMP"). (2012 Permit, at Part VI.C.) These programs in many aspects allow a permittee to draft their own permit requirements, conditions, and schedules for compliance. Under a WMP, a permittee is required to identify water quality priorities (*id*. at VI.C.5.a), select watershed control measures to be implemented, (*id*. at VI.C.5.b), and establish compliance schedules for addressing water quality priorities. (*Id*. at VI.C.5.c.) For an EWMP, a permittee must, where feasible within a given watershed, retain all storm water runoff from the 85th percentile, 24-hour storm event for the drainage areas tributary to the projects. (*Id*. at VI.C.1.g.) Under both options, Permittees must conduct a "reasonable assurance" analysis to assess whether the programs will result in discharges

---

[35] *Natural Resources Defense Council v. County of Los Angeles* (2011) 673 F.3d 880, 897. This portion of the 9th Circuit Court's Opinion is not subject to further review.

[36] The Permit defines "Receiving Water Limitation" as: "Any applicable numeric or narrative water quality objective or criterion, or limitation to implement the applicable water quality objective or criterion, for the receiving water as contained in Chapter 3 or 7 of the Water Quality Control Plan for the Los Angeles Region (Basin Plan), water quality control plans or policies adopted by the State Water Board, or federal regulations, including but not limited to, 40 CFR § 131.38." (Permit, at Attachment A, A-17.)

that achieve water quality based effluent limitations and RWLs in the 2012 Permit. (*Id.* at VI.C.1.g; VI.C.5.b.iv(5).)

Although it is a goal of these programs to ensure that stormwater discharges do not cause or contribute to exceedances of RWLs, (see, e.g., *id.* at VI.C.5.b.ii), and that TMDL WLAs are achieved, it is not a requirement that the programs achieve these results in fact. Permittees are instead given a safe harbor from the prohibition on violations of RWLs, or, in some cases of TMDL limits, if they participate in a WMP or an EWMP. The safe harbors include relief from RWL compliance: 1) during the development of a WMP or an EWMP, before the plan is approved; 2) after a plan is submitted to and approved by the Regional Board; and, 3) when the specific RWL (or combination of water quality standard and waterbody) at issue is already addressed by a TMDL.[37]

More specifically, in the first instance, a safe harbor applies to discharges by a permittee upon notification of its intent to develop a WMP or an EWMP to the Regional Board. During the period of plan development and review (up to 28 months from the 2012 Permit adoption date for a WMP or 40 months from the 2012 Permit adoption date for an EWMP before it may be approved (*Id.* at VI.C.4.a.)), the permittee is excused for violations of the Permit's RWLs:

- "Upon notification of a Permittee's intent to develop a WMP or EWMP and prior to approval of its WMP or EWMP, a Permittee's full compliance with all of the following requirements shall constitute a Permittee's compliance with the receiving water limitations provisions in Part V.A. not otherwise addressed by a TMDL . . . ."[38]

(2012 Permit, at Part VI.C.2.d.)[39] Second, after approval of a Permittee's WMP or EWMP by the Regional Board or the Board's Executive Officer, a safe harbor removes liability for

---

[37] In this last case, in some circumstances the 2012 Permit provides a safe harbor for compliance with either interim or final TMDL limits, or both.

[38] We note that the Regional Board lacks authority to exempt state law requirements prohibiting the causation of a condition of nuisance under Part V.A.2.

[39] The Permittee is required to: "i. Provide[] timely notice of its intent to develop a WMP or EWMP, ii. Meet[] all interim and final deadlines for development of a WMP or EWMP, iii. For the area to be covered by the WMP or EWMP, target[] implementation of watershed control measures in its existing storm water management program . . . and iv. Receive[] final approval of

a violation of all RWLs if the WMP or EWMP addresses that pollutant/waterbody combination, regardless of whether or not compliance with the RWL is actually achieved:

- "A Permittee's full compliance with all requirements and dates for their achievement in an approved Watershed Management Program or EWMP shall constitute a Permittee's compliance with the receiving water limitations provisions in Part V.A. of this Order for the specific water body-pollutant combinations addressed by an approved Watershed Management Program or EWMP."

(*Id*. at VI.C.2.b.) Third, the 2012 Permit provides a safe harbor from certain TMDL requirements. Specifically, the 2012 Permit provides a safe harbor for interim TMDL WLAs for permittees indicating their intent to develop a WMP or an EWMP:

- "Upon notification of a Permittee's intent to develop a WMP or EWMP and prior to approval of its WMP or EWMP, a Permittee's full compliance with all of the following requirements[40] shall constitute a Permittee's compliance with provisions pertaining to interim WQBELs with compliance deadlines occurring prior to approval of a WMP or EWMP."

(*Id*. at VI.E.2.d.i(4)(d).) And, for permittees implementing an EWMP, the 2012 Permit provides a safe harbor for all TMDL final limits other than for Trash TMDLs:

- "A Permittee shall be deemed in compliance with an applicable final water quality-based effluent limitation and final receiving water limitation for the pollutant(s) associated with a specific TMDL if. . . . In drainage areas where Permittees are implementing an EWMP, (i) all non-storm water and (ii) all storm water runoff up to and including the volume equivalent to the 85th percentile, 24-hour event is retained for the drainage area tributary to the applicable receiving water."

(*Id*. at VI.E.2.e.i(4).) By allowing these safe harbors, the 2012 Permit excuses compliance with TMDL WLAs, and with its RWLs where the 2001 Permit mandated compliance.

---

its WMP or EWMP within 28 or 40 months, respectively." (Permit, at Part VI.C.3.b.i-iv.) The safe harbor does not apply to interim Trash TMDL limits.

[40] The Permittee is required to to: "i. Provide[] timely notice of its intent to develop a WMP or EWMP, ii. Meet[] all interim and final deadlines for development of a WMP or EWMP, iii. For the area to be covered by the WMP or EWMP, target[] implementation of watershed control measures in its existing storm water management program . . . and iv. Receive[] final approval of its WMP or EWMP within 28 or 40 months, respectively." (2012 Permit, at Parts VI.E.2.d.i(4)(d)(1)-(4).)

II. STANDARD OF REVIEW

The State Board must exercise its independent judgment as to whether a Regional Board action is reasonable. (See, *Stinnes-Western Chemical Corp.*, State Board WQ Order No. 86-16 (1986).) Specifically, the State Board's review is equivalent to the standard a reviewing court would apply under California Code of Civil Procedure Section 1094.5, (*id*.), which states "[a]buse of discretion is established if the respondent has not proceeded in the manner required by law, the order or decision is not supported by the findings, or the findings are not supported by the evidence." (Cal. Civ. Proc. Code § 1094.5(b); see also, *Zuniga v. Los Angeles County Civil Serv. Comm'n* (2006) 137 Cal.App.4th 1255, 1258 (applying same statutory standard).) "Where it is claimed that the findings are not supported by the evidence, . . . abuse of discretion is established if the court determines that the findings are not supported by the weight of the evidence." (Cal. Civ. Proc. Code § 1094.5(c).)

The administrative decision must be accompanied by findings that allow the court reviewing the order or decision to "bridge the analytic gap between the raw evidence and ultimate decision or order." (*Topanga Ass'n for a Scenic Cmty. v. County of Los Angeles* (1974) 11 Cal.3d 506, 515.) This requirement "serves to conduce the administrative body to draw legally relevant sub-conclusions supportive of its ultimate decision . . . to facilitate orderly analysis and minimize the likelihood that the agency will randomly leap from evidence to conclusions." (*Id.* at 516.) "Absent such roadsigns, a reviewing court would be forced into unguided and resource-consuming explorations; it would have to grope through the record to determine whether some combination of credible evidentiary items which supported some line of factual and legal conclusions supported the ultimate order or decision of the agency." (*Id.* at 516, n.15.)

III. ARGUMENT

A. The Permit Creates Illegal Safe Harbors in Violation of Federal Anti-Backsliding and Antidegradation Requirements

1. The 2012 Permit Creates Safe Harbors that Exempt Compliance with Receiving Water Limitations in Some Circumstances

Rather than maintaining the 2001 Permit's prohibition against discharges that cause or contribute to an exceedance of water quality standards, the 2012 Permit creates safe harbors that exempt compliance with the Receiving Water Limitations for Permittees that elect to participate in a WMP or an EWMP. These safe harbor provisions violate multiple provisions of the CWA and other federal and state regulations, and render the 2012 Permit unlawful.

The 2012 Permit creates safe harbors by deeming a Permittee to be in compliance with the Permit's RWLs (which was required by the 2001 Permit), both once a WMP or an EWMP has been approved by the Regional Board and during plan development.[41] The Ninth Circuit defined a "safe harbor" as "the proposition that compliance with certain provisions shall forgive non-compliance with the discharge prohibitions." (*Natural Resources Defense Council, Inc. v. County of Los Angeles* (9th Cir. 2011) 673 F.3d 880, 897 (cert. granted on other grounds).) Unfortunately, the new Permit establishes just such a program. If a Permittee meets the program requirements for a WMP or an EWMP, it *legally* complies with the 2012 Permit's RWLs, regardless of whether the RWLs are *actually* achieved.

During the 2012 Permit adoption hearing,[42] the Regional Board's Executive Officer admitted that these provisions provide a safe harbor from liability for RWL violations. While attempting to define each provision as only a "compliance mechanism," Mr. Sam Unger stated, "at best, it's a conditional safe harbor."[43] Similarly, Mr. Unger stated: "Permittees have to be in

---

[41] We note that the 2012 Permit's approach is nonsensical in this regard, as it creates a safe harbor from compliance with Receiving Water Limitations (and for interim TMDL limits) prior to approval of a WMP or an EWMP, while the safe harbor is ultimately expressly conditioned on the approval of the TMDL.

[42] Regional Board, In the Matter of the Regional Board Public Meeting/Hearing, Thursday, November 8, 2012. ("November 8 Hearing.")

[43] Mr. Sam Unger, Executive Officer, Regional Board, November 8 Hearing, at 346:25.

compliance with the milestones and the activities set out in developing the plan for the watershed management program. And if they're not, then the operative part of the permit that would take place is these receiving water limitation[s]."[44] Precisely—the effect of this scheme is that if a Permittee is in compliance with the requirements of a WMP or an EWMP, the Receiving Water Limitations are *not* operative. There is simply no defensible argument that these provisions constitute anything other than safe harbors, which violate federal and state law.

2. The 2012 Permit's Safe Harbors Violate Federal Anti-Backsliding Requirements

Clean Water Act and federal regulations prohibit backsliding, or weakening of permit terms, from the previous permit. Section 402(o)(1) of the Clean Water Act requires that, for effluent limitations based on a state standard, "a permit may not be renewed, reissued, or modified to contain effluent limitations which are less stringent than the comparable effluent limitations in the previous permit," except in circumstances not present here. (33 U.S.C. § 1342(o)(1).) Similarly, federal regulations require that "when a permit is renewed or reissued, interim effluent limitations, standards or conditions must be at least as stringent as the final effluent limitations, standards, or conditions in the previous permit. . . ." (40 C.F.R. § 122.44(l)(1).) By providing a safe harbor waiving requirements to meet Water Quality Standards, the 2012 Permit flatly violates these federal requirements.

a. The Safe Harbors Render the RWLs Less Stringent Than in the Previous Permit

The Permit allows a Permittee participating in a WMP or an EWMP to comply with Receiving Water Limitations, even if a Permittee's discharges actually cause or contribute to an exceedance of the Receiving Water Limitations, including violations of Water Quality Standards. By contrast, the 2001 Permit required compliance with WQSs. Thus, the 2012 Permit excuses discharges of pollution and violations of WQSs that the previous permit prohibited.

[44] Mr. Sam Unger, Executive Officer, Regional Board, November 8 Hearing, at 324:8-12.

b. The Receiving Water Limitations Cannot be Weakened Unless Consistent With 1313(d)(4) or 402(o)

Section 402(o) of the Clean Water Act (33 U.S.C. § 1342(o)), generally prohibits relaxation of, among other things, an effluent limitation "necessary to meet water quality standards . . . schedules of compliance, established pursuant to any State law or regulations . . . or any other Federal law or regulation, or required to implement any applicable water quality standard established pursuant to" the CWA. (See, 33 U.S.C. § 1342(o)(1); 33 U.S.C. § 1311(b)(1)(C).)[45] Although a permit may contain less stringent requirements if the change is consistent with the requirements of 33 U.S.C. § 1313(d)(4) or the enumerated exceptions in section 402(o)(2).[46] The safe harbors in the 2012 Permit satisfy none of these conditions.

i. The Receiving Water Limitations Are Covered by Anti-Backsliding Requirements as "Effluent Limitations" and "Standards or Conditions" of the 2001 Permit

The Clean Water Act defines the term "effluent limitation" broadly, as "any restriction established by a State or the Administrator on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from point sources. . . ." (33 U.S.C. § 1362(11).) By prohibiting the "discharge" of any pollutant in quantities sufficient to cause or contribute to an exceedance of Receiving Water Limitations, the RWLs easily fit within this sweeping definition. (*See also*, *NRDC v. U.S.E.P.A.* (D.C. Cir. 1981) 656 F.2d 768, 775-76 (as a practical matter the limitation restricted the discharge of pollution and consequently was an effluent limitation), *NRDC v. U.S.E.P.A.* (D.C. Cir. 1982) 673 F.2d 400, 403 (33 U.S.C. § 502(11) "defines 'effluent limitation' as 'any restriction', not just numeric limitations").)

---

[45] We note that EPA has recognized that providing additional time for compliance for a provision required by the previous permit violates anti-backsliding requirements. (Letter from Jon M. Capacasa, Director Water Protection Division, EPA Region III to Jay Sakai, Maryland Department of the Environment, re: Specific Objection to Prince George's County Phase I Municipal Separate Storm Sewer System (MS4) Permit MD0068284, at 3 (Attached as RN "Exhibit B").) The additional time allotted by the new Permit to achieve compliance with RWLs, required in the 2001 Permit, for Permittees developing a WMP or an EWMP constitutes a less stringent limitation.

[46] See also, U.S. EPA (September 2010) NPDES Permit Writers' Manual ("NPDES Manual), at 7-1 to 7-3. (Attached as RN "Exhibit C".)

In addition, the RWLs constitute "standards" or "conditions" protected by anti-backsliding requirements under 40 C.F.R. § 122.44(l). Board staff have attempted to avoid the plain implications of section 402(o) by saying that the CWA "talks about [anti-backsliding] in terms of effluent limits. And we're talking about receiving water limitations."[47] Yet, even if this were the case, the safe harbors would still be unlawful. EPA's anti-backsliding regulations require that "effluent limitations, *standards or conditions* must be at least as stringent as the final effluent limitations, *standards, or conditions* in the previous permit. . . ." (40 C.F.R. § 122.44(l)(1) (emphasis added).) Thus these requirements "apply to questions regarding non-water quality-based effluent limits," including "backsliding questions regarding permit conditions, (rather than permit limitations) even where the conditions in question are based on water quality considerations."[48] Regional Board staff confirmed at the November 8 Hearing that, at a minimum, the "receiving water limits would be considered a condition[] [of the] permit."[49] As a result, even if section 402(o) were inapplicable, which it is not, the prohibition on anti-backsliding contained in 40 CFR 122.44(l) applies to the RWLs as conditions. Because in either case the 2012 Permit weakens the Receiving Water Limitations as compared with the 2001 Permit, it violates anti-

---

[47] Ms. Deborah Smith, Regional Board, November 8 Hearing at 313:5-7.

[48] EPA (1989) Memorandum on Interim Guidance on Implementation of Section 402(o) Anti-Backsliding Rules For Water Quality-Based Permits, from James R. Elder, Director, Office of Water Enforcement and Permits to Water Management Division Directors, Regions I-X, NPDES State Directors, at 2. (Attached as RN "Exhibit D".) ("Section 402(o) is silent on the issue of permit conditions, and only addresses backsliding from permit limitations"); See also, EPA (Sept. 2010) NPDES Permit Writers' Manual, EPA 833-K-10-001, at 7-4. ("NPDES Manual")

[49] Ms. Deborah Smith, Regional Board, November 8 Hearing, at 314:6-7. Earlier draft versions of the Permit had previously acknowledged the application of anti-backsliding requirements in this context, but, inexplicably, staff edited the October 18, 2012 draft of the 2012 Permit to remove reference to "conditions" in its explanation of anti-backsliding requirements. Referring to 40 C.F.R. § 122.44(l), the sentence "anti-backsliding provisions require effluent limitations or other conditions in a reissued permit to be as stringent as those in the previous permit," was revised to read "anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permit. . . ." (2012 Permit, at p. 25, Finding N.) Thus, the Permit only incompletely states the requirements of federal anti-backsliding regulations it then proceeds to violate.

backsliding requirements. In addition, as discussed below, the exemptions to anti-backsliding do not apply here.

ii. The Safe Harbors do not Qualify Under Section 1313(d)(4) as Exceptions to the Anti-Backsliding Rule

Section 1313(d)(4) restricts what effluent limitations may be revised in a renewal permit. First, where water quality standards are not being attained (see 33 U.S.C. § 1313(d)(4)(A)), a less stringent effluent limitation based on a TMDL or other WLA is allowed in a renewal permit only if "the cumulative effect of all such revised effluent limitations based on such total maximum daily load or waste load allocation will assure the attainment of such water quality standard," or if the designated use is removed. (33. U.S.C. § 1313(d)(4)(A).)[50] Second, for waters that are meeting applicable water quality standards, (under 33 U.S.C. § 1313(d)(4)(B)), a limitation based on a TMDL or Water Quality Standard may only be weakened if it is consistent with the applicable state antidegradation policy. (33 U.S.C. § 1342(o)(1).)[51]

Neither of these conditions has been met. First, for waters that are failing to meet WQSs, the 2012 Permit fails to demonstrate that the revised standards will assure WQSs will be attained. Second, where waters are currently attaining WQSs, the Permit fails to provide required analysis consistent with the state's antidegradation policy. These allowances violate the anti-backsliding requirements both during WMP or EWMP development, before the plan is approved by the Regional Board, and after WMP or EWMP approval, during the plan's implementation.

iii. The Safe Harbors do not Qualify Under Section 402(o)(2) as Exceptions to the Anti-Backsliding Rule

Although section 402(o)(2) lists a series of exceptions to the otherwise applicable anti-backsliding requirements, none applies to this permit. The law's exemptions include:

---

[50] See also, EPA, NPDES Permit Writer's Manual, at 7-3.
[51] See also, EPA, NPDES Manual, at 7-2; Exhibit 7-2. For further discussion of antidegradation issues raised by the 2012 Permit, see section III.A.3, below.

> (A) material and substantial alterations or additions to the permitted facility occurred after permit issuance which justify the application of a less stringent effluent limitation; (B)(i) information is available which was not available at the time of permit issuance . . . and which would have justified the application of a less stringent effluent limitation at the time of permit issuance; or (ii) the Administrator determines that technical mistakes or mistaken interpretations of law were made in issuing the permit under section (a)(1)(B) of this section; (C) a less stringent effluent limitation is necessary because of events over which the permittee has no control and for which there is no reasonably available remedy; (D) the permittee has received a permit modification under [various other sections] of this title; or (E) the permittee has installed the treatment facilities required to meet the effluent limitations in the previous permit and has properly operated and maintained the facilities but has nevertheless been unable to achieve the previous effluent limitations. . .

(33 U.S.C. § 1342(o)(2).) None of these exceptions apply to the adoption of the 2012 Permit. Other than an unsupported and insufficient statement by Board counsel at the November 8 Hearing that "Had in 2001 there been 33 [new] TMDLs [incorporated into the Permit] it's possible the Board might have done something very different than what they did" in adopting the 2001 Permit, the Regional Board offered no evidence that these exceptions apply.[52] As a result, the anti-backsliding requirements of section 402(o) prohibit the adoption of safe harbors in the 2012 Permit.

iv. The Safe Harbors Violate Section 402(o)(3)'s Prohibition Against Changes that Would Result in a Violation of Applicable Water Quality Standards

Even if the 2012 Permit's safe harbors complied with the above anti-backsliding requirements, which they do not, they would still be unlawful under section 402(o)(3), which serves as a "*safety clause* that provides an absolute limitation on backsliding."[53] Section 402(o)(3) requires that in no event shall a permit "be renewed, reissued, or modified to contain a less stringent effluent limitation if the implementation of such limitation would result in a violation of a water quality standard" under 33 U.S.C. § 1313. (33 U.S.C. § 1342(o)(3).) Thus, as EPA explains, "even if one or more of the backsliding exceptions outlined in the statute is applicable and met, CWA section 402(o)(3) acts as a floor and restricts the extent to which effluent

---

[52] Ms. Jennifer Fordyce, Regional Board Counsel, November 8 Hearing at 317:11-13.
[53] See EPA, NPDES Manual at 7-4.

limitations may be relaxed."[54] The 2012 Permit, by explicitly excusing violations of Receiving Water Limitations which prohibit discharges that cause or contribute to a violation of WQSs, fails to meet this federally mandated minimum level of protection.

3. The 2012 Permit's Safe Harbor Provisions Violate State and Federal Antidegradation Requirements

The overall goal of the Clean Water Act is the complete elimination of the discharge of pollutants into waters of the United States. (33 U.S.C. § 1251(a)(1).) To help meet this goal, states must implement an antidegradation policy. As discussed below, the permit does not comply with applicable antidegradation requirements.

a. The Safe Harbors Violate Antidegradation Requirements that Prohibit Actions that Would Lead to Lower Water Quality

The federal antidegradation policy contains a three "Tier" test for determining when increases in pollutant loadings or adverse changes to water quality may be allowed. (40 C.F.R. § 131.12.) While Tier II and Tier III apply only to high quality waters and "outstanding National resource waters," respectively, Tier I antidegradation analysis applies to *all* waters of the United States, including waters that do not exceed the CWA section 101(a) goals.[55] "Tier One classification applies a minimum level of protection to all waters, which protects even seriously degraded water bodies, by prohibiting any additional pollution that would affect existing uses."[56]

California has established a state antidegradation policy, which incorporates the federal antidegradation policy and establishes additional requirements.[57] NPDES permit renewals or modifications such as the 2001 and 2012 Los Angeles County MS4 Permits are subject to both

---

[54] See EPA, NPDES Manual at 7-4.
[55] (64 Fed. Reg. 46058, 46063, *Revisions to the National Pollutant Discharge Elimination System Program and Federal Antidegradation Policy in Support of Revisions to the Water Quality Planning and Management Regulation*.
[56] Brawer, J.M., "Antidegradation Policy and Outstanding Natural Resource Waters in the Northern Rocky Mountain States," 20 Pub. Land & Resources L. Rev. 13, 18 (1999).
[57] See, State Board Resolution 68-16; *see also In the Matter of the Petition of Rimmon C. Fay*, State Board Order No. WQ 86-17 at 16-19 (November 20. 1986).

state and federal antidegradation requirements.[58] The State antidegradation policy specifically addresses only "high quality" waters, or waters of better quality than required by water quality standards for a particular beneficial use (or conversely, those waters not designated as "impaired"). However, the State policy applies to all waters, including surface and groundwater, to changes in water quality since 1968, and to all uses, including existing and potential uses.[59]

Together, state and federal anti-degradation requirements mandate that existing water quality in navigable waters be maintained, unless degradation is justified based on specific findings. In no case may water quality be lowered to a level that would interfere with existing or designated uses. Thus any action by a Regional Board, including permit issuance, that would result in lower water quality—either in high quality or impaired waters—must be analyzed to ensure consistency with state and federal antidegradation policy. Further, because a receiving water can be considered high quality for one beneficial use, and impaired for others, the analysis must be conducted pollutant by pollutant, and beneficial use by beneficial use. (*See, Associacion de Gente Unida for El Agua v. Central Valley Regional Board* (2012) (210 Cal.App.4th 1255) [149 Cal.Rptr.3d 132, 142; 144] (citing "St. Water Res. Control Bd., Guidance Memorandum (Feb. 16, 1995); 40 CFR 131.12(a)(1).)

Accordingly, the Regional Board was required to conduct a Tier I analysis for all waters impacted by the Los Angeles County MS4 systems, and a Tier II analysis for higher quality Los Angeles waters (taking account of water quality for specific pollutant and beneficial use considerations). In past instances when the Regional Board has failed to provide adequate findings to verify that beneficial uses or high-quality waters will be maintained, the State Board has remanded the orders to the Regional Board for further proceedings.[60] The same should be done here.

---

[58] *See*, SWRCB Order No. WQ 86-17; EPA, Region IX, *Guidance on Implementing the Antidegradation Provisions of 40 C.F.R. § 131.12,* at 2-4 (June 3, 1987) ("EPA Antidegradation Guidance"). (Attached as RN "Exhibit E".)

[59] State Board Resolution 68-16.

[60] See e.g., State Board Order WQ 86-17, at 28 (State Board remanded Regional Board order due to the Regional Board's failure to make appropriate findings as to whether an increase in

b. The Regional Board did not Conduct Any Required Antidegradation Analysis

As noted in section III.A.1. above, the safe harbor provisions in the 2012 Permit weaken the Receiving Water Limitations compared with the 2001 Permit requirements.[61] However, despite the 2012 Permit's explicit weakening of the prior permit's limits, and the resulting continued degradation of receiving waters, the Regional Board conducted *no* antidegradation analysis. The 2012 Permit's reference to antidegradation is limited to a cursory summary of the legal requirements, and a conclusion that "[t]he permitted discharge is consistent with the anti-degradation provision of [40 CFR] section 131.12 and State Water Board Resolution No. 68-16." (2012 Permit, at p. 25, Finding J.) Simply claiming that no degradation will occur does not satisfy the requirements of the Clean Water Act. (*Associacion de Gente Unida*, 149 Cal.Rptr., at 136.; see also, *American Funeral Concepts-American Cremation Soc'y v. Board of Funeral Directors and Embalmers* (1982) 136 Cal.App.3d 303, 309.)

Even assuming, as the Regional Board claims, that the new Receiving Water Limitations are as stringent as those in the previous Permit, allowing a permit regime that degrades receiving waters to continue triggers antidegradation analysis. At a minimum, the 2012 Permit maintains the existing failed program implementation for 18 or 30 months during WMP or EWMP development and a potentially additional 10 months during Regional Board review of the plans. Such an approach is inconsistent with antidegradation requirements. As the Third Appellate District

---

suspended solids and bacteria would violate antidegradation requirements in an area used for body-contact sports.); see also, *Topanga Ass'n for a Scenic Cmty.*, 11 Cal.3d at 515

[61] Board counsel indicated that anti-degradation is not a concern during the planning phase for either WMP or EWMPs, before the plans are either approved or adopted, because "they still have to implement their existing MS4 program. So they're going to keep doing what they're doing right now . . . the water quality is not going to get worse." (Ms. Jennifer Fordyce, Regional Board counsel, November 8 Hearing, at 318:3-7; see also Ms. Renee Purdy, Regional Board, November 8 Hearing, at 318:12-18.) Yet as discussed earlier, under the existing program, monitoring shows persistent violations of water quality standards, including in waters not yet listed as impaired under CWA section 303(d).

pointedly stated in rejecting the Regional Board's argument that because a new dairy permit was no worse than the last:

> Our problem with the Regional Board's reliance on the assertion that no groundwater degradation is allowed is twofold. First, as the order itself recognizes, the groundwater quality has degraded, and dairy operations are partly responsible. To the extent that the Order allows historic practices to continue without change, degradation will continue.

(*Associacion de Gente Unida*, 149 Cal.Rptr., at 145.)

There is no meaningful debate that urban runoff continues to degrade receiving waters in the Los Angeles area, and that the stormwater programs implemented under the prior permit failed to control that degradation. Therefore, because an antidegradation analysis is required, and the 2012 Permit fails to conduct that analysis, the 2012 Permit violates State and Federal Law.

B. The Permit Unlawfully Fails to Incorporate Waste-Load Allocations Consistent With Applicable TMDLs

The Clean Water Act relies on TMDLs to restore water bodies that fail to meet water quality standards. TMDLs establish a clear and scientifically-driven pathway towards protecting beneficial issues for public health and aquatic life. The CWA and its implementing regulations require that NPDES permits are consistent with the assumptions and requirements of TMDL WLAs. (40 C.F.R.§ 122.44(d)(1)(vii)(B).)[62]

Consistent with EPA regulations, the MS4-related WLAs for TMDLs adopted in the Los Angeles Region must be properly reflected in the MS4 Permit. The Permit itself states:

> The Permittees shall comply with the applicable water quality-based effluent limitations and/or receiving water limitations contained in Attachments L through R, consistent with the assumptions and requirements of the WLAs established in the TMDLs, including implementation plans and schedules, where provided for in the State adoption and approval of the TMDL (40 CFR §122.44(d)(1)(vii)(B); Cal.Wat. Code §13263(a)).

(2012 Permit, at Part VI.E.1.c.) However, the Permit fails to properly incorporate the very limitations it acknowledges are necessary. During this renewal, 33 TMDLs were newly incorporated into the 2012 Permit. In violation of the federal requirements, the 2012 Permit fails

---

[62] See, EPA Hanlon Memo.

to ensure compliance with all interim and final WLAs for these TMDLs and incorporates illegal compliance schedules as permit terms.

1. The 2012 Permit Illegally Exempts Dischargers from Complying with Interim and Final Numeric Waste Load Allocations Established in TMDLs

Although all permit terms must be consistent with the assumptions and requirements of WLAs established in TMDLs, (40 C.F.R. § 122.44(d)(1)(vii)(B)), the 2012 Permit inexplicably excuses compliance with interim WLAs[63] and eliminates final WLAs in at least two instances.

First, the 2012 Permit specifies that where a Permittee is implementing an EWMP and runoff is retained up to the 85th percentile storm, the Permittee is deemed in compliance with final TMDL WLAs. (2012 Permit, at Part VI.E.2.e.i(4).) The Permit states:

> A Permittee shall be deemed in compliance with an applicable final water quality-based effluent limitation and final receiving water limitation for the pollutant(s) associated with a specific TMDL if… (4)In drainage areas where Permittees are implementing an EWMP, (i) all non-storm water and (ii) all storm water runoff up to and including the volume equivalent to the 85th percentile, 24-hour event is retained for the drainage area tributary to the applicable receiving water.

(*Id*. at Part VI.E.2.e.i.) By providing this alternative means of demonstrating compliance, the Regional Board thus creates a safe harbor from final TMDL requirements and incorporates a provision that is inconsistent with the WLAs. Under this regime, there is no assurance that actual final TMDL limits, established to achieve WQSs and protect beneficial uses, will ever be met in waterbodies throughout Los Angeles County.[64]

Second, for EPA-approved TMDLs, the 2012 Permit removes compliance obligations, again excusing Permittees from complying with final WLAs. Section VI.E.3 provides:

---

[63] Where a Permittee engages in either type of watershed management program, the Permit unlawfully eliminates the need to comply with interim WQBELs and RWLs. Indeed, the Permit includes a safe harbor for violations of interim limits that occur during and after WMP or EWMP development rather than actually achieving the interim limits defined in the TMDL. (2012 Permit, at Parts VI.C.3.a, VI.E.2.d.i(4), (4)(d); see also, Section I.B.2., above.)

[64] See discussion on evidence in the record in section III.C., below.

> TMDLs established by the USEPA, to which Permittees are subject, do not contain an implementation plan adopted pursuant to California Water code section 13424. However, USEPA has included implementation *recommendations* as part of these TMDLs. *In lieu of* inclusion of numeric water quality based effluent limitations at this time, this Order requires Permittees subject to WLAs in USEPA established TMDLs to propose and implement best management practices (BMPs) that will be effective in achieving compliance with USEPA established numeric WLAs.

(2012 Permit, at Part VI.E.3 (emphasis added).) This provision is not consistent with existing, applicable WLAs. (40 C.F.R. § 122.44(d)(1)(vii)(B).) Because TMDLs established by EPA include numeric WLAs, the 2012 Permit must include numeric WQBELs consistent with those WLAs.[65] For example, the San Gabriel River Metals and Selenium TMDL, which has been in effect since 2007, sets numeric WLAs based on the California Toxics Rule ("CTR") (40 C.F.R. 131.36(d)(10)) criteria. The MS4 Permit must incorporate the numeric WLAs set forth in the EPA San Gabriel River Metals and Selenium TMDL and other EPA TMDLs to comply with the Clean Water Act. Yet, the safe harbor provisions do not require compliance with these numeric limits, in violation of federal requirements.

2. The Permit Incorporates Illegal Compliance Schedules In Violation of 40 C.F.R. § 122.47

NPDES permits may only include schedules for achieving compliance with permit limits as permit terms when schedules for achieving compliance are authorized, appropriate, and satisfy specific requirements. (*See In the Matter of Star-Kist Caribe, Inc.* (E.A.B. 1989) 1989 EPA App. LEXIS 38, at *7; 33 U.S.C. § 1313(e)(3)(F); 40 C.F.R. § 122.47.)

Any compliance schedules incorporated into the MS4 Permit must lead to compliance "as soon as possible," (40 C.F.R. § 122.47(a)(1)), and must comply with specific requirements including:

> 1) if the compliance schedule exceeds one year, it must include interim compliance deadlines; 2) interim deadlines must be no more than one year apart; and, 3) if the time necessary for completion of any interim requirement is more than one year and is not readily divisible into stages for completion, the permit shall specify interim dates for the submission of reports of progress toward completion of the interim requirements and indicate a projected completion date.

[65] EPA Hanlon Memo

(40 C.F.R. § 122.47(a)(3).) Further, WLAs and compliance schedules in the 2012 Permit must also be consistent with other state water quality control plans and statutory deadlines; a compliance schedule may only be included in an NPDES permit as a permit term when such compliance schedules are authorized. (See *In the Matter of Star-Kist Caribe, Inc.*, 1989 EPA App. LEXIS, at *7; 33 U.S.C. § 1313(e)(3)(F).)

Section IV.A.2.a. of the 2012 Permit does not comply with these federal regulations. It provides that "[e]ach Permittee shall comply with applicable WQBELs as set forth in Part VI.E [TMDL section] of this Order, *pursuant to applicable compliance schedules*." (Emphasis added). The 2012 Permit also references TMDL implementation schedules in several other sections.[66] However, the implementation schedules set out in several of the applicable TMDLs do not satisfy federal laws governing NPDES permit compliance schedules, and therefore cannot be incorporated into the 2012 Permit.

Specifically, any implementation schedule set forth in an applicable TMDL that allows for more than one year to achieve compliance, but lacks interim deadlines, cannot be incorporated into the 2012 Permit as an NPDES compliance schedule. Because the implementation schedules set out in the Malibu Creek Bacteria TMDL, the Santa Monica Bay Beaches Bacteria TMDLs, and the Los Angeles River Indicator Bacteria TMDL do not have such deadlines, the 2012 Permit may not incorporate them without a detailed schedule. The Permit contains no such schedule.

Moreover, WLAs in metals TMDLs in Los Angeles are based on the CTR criteria, and compliance schedules for CTR-based limits are authorized through the Inland Surface Water Plan ("ISWP"). But the ISWP only authorized compliance schedules for a maximum of 10 years from the time CTR criteria were first promulgated and states that no discharger can be given a compliance schedule to meet CTR criteria after May 18, 2010.[67] As a result, any compliance schedules set out in TMDLs implementing the CTR are not authorized.

[67] State Board Resolution No. 2000-15, *Policy for the Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California*, at 19; see also October 23, 2006 EPA Letter re: California SIP, Compliance Schedule Provisions; State Board Memo dated

C. The Decision to Adopt the 2012 Permit, Including its Safe Harbor Provisions, is not Supported by the Findings or the Evidence in the Administrative Record

The Regional Board's approval of the 2012 Permit violates long-established requirements for agency decision-making. The Regional Board's findings fail to show the Board's mode of analysis to "bridge the analytic gap between the raw evidence and [the] ultimate decision or order." (*See, Topanga Ass'n for a Scenic Cmty*, 11 Cal.3d at 515.) Moreover, in critical aspects the Regional Board's final decision lacks evidentiary support in the record. The absence of adequate findings or evidence renders the Regional Board's decision unlawful. (*See*, Cal. Civ. Proc. Code § 1094.5(b); *see also, Zuniga*, 137 Cal. App. 4th at 1258.)

The 2012 Permit's discussion of anti-backsliding requirements exemplifies the Regional Board's lack of sufficient analysis.[68] Environmental Groups raised significant legal and factual argument before the Regional Board to demonstrate that the safe harbors incorporated in the 2012 Permit violate federal anti-backsliding requirements.[69] In response, the 2012 Permit merely repeats (incompletely) the legal requirements for anti-backsliding, then leaps to the conclusory statement that, "All effluent limitations in this Order are at least as stringent as the effluent limitations in the previous permit." (2012 Permit, at p. 25, Finding N.) However, bare conclusions are impermissible. (*See*, *American Funeral Concepts-American Cremation Soc'y*, 136 Cal.App.3d at 309 ("administrative findings set forth solely in the language of the applicable legislation are insufficient").)

Similarly, there is insufficient evidence to support the Regional Board's decision to adopt the safe harbor provisions allowed for Permittees under an EWMP. Participation in an EWMP

September 15, 2006 Re: CTR Compliance Schedules; State Board Resolution No. 2008-0025 at 4; Final Staff Report, State Board Resolution No. 2008-0025 at 10; Final Response to Written Comments, State Board Resolution No. 2008-0025 at 6, 9, 10, 18-19, 26.

[68] As is discussed in section III.A.3.b., the 2012 Permit's discussion of antidegradation requirements is another stark example of the lack of sufficient findings and evidentiary support.

[69] See Letter from NRDC, Los Angeles Waterkeeper, and Heal the Bay to Regional Board re: Comments on Tentative Order R4-2012-XXXX, Los Angeles County MS4 Permit, June 6, 2012 Draft, July 23, 2012; NRDC, Los Angeles Waterkeeper and Heal the Bay also presented on this issue at the October 4-5 and November 8 Regional Board Hearings on the 2012 Permit.

requires retention of runoff from the 85th percentile, 24-hour storm in exchange for safe harbors. (Permit, at Part VI.E.2.e.i.(4).) Yet there is no evidence in the record for the 2012 Permit's adoption to demonstrate that retention of the 85th percentile storm event will, in fact, achieve compliance with either Water Quality Standards required under the Receiving Water Limitations, or with the numerous TMDL WLAs required to be met in the 2012 Permit. At the November 8, 2012 Hearing, EPA specifically questioned the adequacy of the record on this point:

> [T]he EPA guidance on incorporating TMDLs into . . . MS4 permits that has been around since 2002 talks about when you come up with a BMP-based approach for incorporating a TMDL into a permit—so basically this is a BMP-based approach. You would be retaining the 85th percentile storm—you have to have in the record for the permit the justification for how that gets to those specific wasteload allocations. . . .[70]
>
> We've been very involved with the county's modeling and . . . we don't have that rigorous analysis that's been—that's required by the EPA guidance for saying and showing that that specific retention is going to achieve the numeric wasteload allocation. . . . I haven't seen the support in the administrative record, the fact sheet or otherwise.[71]

Following EPA's observation, the Regional Board Chair asked staff directly if the evidence requested by EPA was in the record.[72] The Board's Executive Officer, Mr. Unger replied:

> Yes. Yes. It was discussed when the county first presented at the last hearing, the enhanced management approach, they discussed their—the watershed modeling system that they would be using to demonstrate a reasonable assurance.[73]

However, the record, including watershed modeling discussed by Los Angeles County, does not anywhere demonstrate that retention of the 85th percentile storm will protect water quality standards or achieve TMDL WLAs as required by the Clean Water Act or EPA guidance.

In fact, the County's presentation demonstrates only that, in its view, the 85th percentile storm represents a cost-effective or "appropriate design storm [size] for use in BMP planning and design" for treatment of stormwater runoff,[74] not, as Regional Board staff appear to indicate, that

---

[70] Mr. John Kemmerer, EPA, November 8 Hearing, at 365:24-25 to 366:1-7.
[71] Mr. John Kemmerer, EPA, November 8 Hearing, at 366:10-18; 367:6-8.
[72] See, Ms. Maria Mehranian, Regional Board Chair, November 8 Hearing, at 368:13-14 (stating "So—I'm sorry . . . it is in the record?").
[73] Mr. Sam Unger, at 368:15-19.
[74] Mr. Gary Hildebrand, November 8 Hearing, at 220: 18-19.

retention of the 85th percentile storm will achieve required WLAs for all TMDLs in all watersheds covered by the permit. At both the October 4-5 Hearing and November 8 Hearing, the County discussed the decision to select the 85th percentile storm and acknowledged it was based on cost and treatment considerations:

> This concept involves the identification of a storm of specific size, the intensity, and/or duration for use in design stormwater controls to achieve water quality standards that balances cost with pollutant removal efficiency. . . .[75]
>
> The [projected] graph plots the total cost of BMPs needed throughout LA County to comply with all the TMDLs expected in the new permit against various size storm events. As can be seen, the most optimum storm size is the 85th percentile storm event.[76]

Thus, the County's explanation does not demonstrate a discernible relationship between the 85th percentile retention approach and full achievement of TMDL WLAs—just that the 85th percentile storm is a cost-effective cut-off point for pollution control measures.[77] Nor do the County or the Regional Board provide data, analysis, or in the Regional Board's case, findings to support that this BMP-based approach will achieve applicable WLAs[78] or demonstrate the validity of the County's model.[79] Accordingly, the Regional Board's

---

[75] Mr. Gary Hildebrand, November 8 Hearing, at 220: 20-24. Regional Board Staff also indicated their understanding that selection of the 85th percentile storm was a cost consideration, not an independent assessment of the storm size required to be retained to meet applicable TMDL WLAs. See, Mr. Sam Unger, November 8 Hearing, at 360:14-17 ("when you look at that curve, sort of a dollars versus precipitation event occurred, right about that 85th percentile—right at the 85th percentile, the curve trends up very markedly.").

[76] Mr. Gary Hildebrand, October 4 Hearing, at 308:7-12.

[77] The same concern rises for compliance with the Permit's Receiving Water Limitations—retention of the 85th percentile storm represents only, in the County's view, a cost effective upper limit for a design storm. This does not stand for the proposition that retention will then achieve water quality standards for all receiving waters in all conditions.

[78] 40 C.F.R. § 122.44(d)(1)(vii)(B); see also, EPA Hanlon Memo.

[79] We note that to the extent the Regional Board may have relied on additional information submitted by the County related to selection of the 85th percentile storm submitted after July 23, this evidence is not part of the record. In the agenda for the October 4-5 and the November 8 Hearings, the Regional Board stated unequivocally that "No new written materials may be submitted on the Tentative Order . . . Written comments were due by noon on July 23, 2012." (October 4-5 Agenda, at, 2; see also, Notice of Opportunity for Comment, October 18, at 2.

decision to include the EWMP safe harbors in the 2012 Permit was arbitrary and capricious.

IV. CONCLUSION

For all the foregoing reasons, the instant Petition for Review should be GRANTED.

Re: Comments on Los Angeles County Draft Program Environmental Impact Report for Enhanced Watershed Management Programs under the Los Angeles County Municipal Separate Storm Sewer System Permit, NPDES Permit No. CAS004001, Order No. R4-2012-0175

Dear Mr. BeGell:

On behalf of the Natural Resources Defense Council ("NRDC"), Los Angeles Waterkeeper ("Waterkeeper"), and Heal the Bay (collectively, "Environmental Groups"), we are writing with regard to the Draft Program Environmental Impact Report ("PEIR") for the 12 Enhanced Watershed Management Programs ("EWMP") under the 2012 Los Angeles County Municipal Separate Storm Sewer System Permit ("2012 MS4 Permit" or "2012 Permit").[1] We appreciate the opportunity to submit these comments to the Los Angeles County Department of Public Work's Flood Control District. ("LACFCD").

I. Introduction

As an initial matter, Environmental Groups' comments on the EWMP Draft PEIR should not be construed as approval or acceptance of the 2012 Permit terms. We continue to maintain that several provisions of the Permit fail to meet the requirements of the federal Clean Water Act and California Porter Cologne Act, and are otherwise inconsistent with

[1] The Enhanced Watershed Management Programs addressed in the Program Environmental Impact Report ("PEIR") encompass several watersheds of Los Angeles County including the following: Ballona Creek, Beach Cities, Dominguez Channel, Malibu Creek, Marina del Rey, North Santa Monica Bay Coastal Watersheds, Palos Verdes Peninsula, Rio Hondo/San Gabriel River Water Quality Group, Santa Monica Bay, Upper Los Angeles River, Upper San Gabriel River, and Upper Santa Clara River.

both federal and state law. Environmental Groups filed a petition[2] with the State Water Resources Control Board ("State Board"), which demonstrates the ways in which the 2012 Permit violates these legal requirements. The State Board has yet to make a determination on our petition.

Under the 2012 Permit, permittees electing to participate in an EWMP are required to submit a draft EWMP plan by June 2015. (2012 Permit, at VI.C.4.c.iv.) The EWMP Work Plans submitted by permittees in June 2014 presented an opportunity for permittees to demonstrate their commitment to developing EWMPs to meet required Receiving Water Limitations ("RWLs") and Total Maximum Daily Load ("TMDL") provisions. Environmental Groups reviewed the EWMP Work Plans and submitted comments to the Regional Board.[3] As we expressed in our comments, many permittees have made significant progress towards developing their draft EWMPs. However, the Work Plans are in many instances unclear as to what analysis or programs will ultimately be incorporated into final EWMPs to be submitted to the Regional Board in June 2015. In fact, some of the Work Plans clearly indicate that the permittees' management programs, as currently envisioned, will not ensure that discharges from the permittees' MS4 systems do not cause or contribute to exceedances of RWLs, including applicable water quality standards, or TMDL limitations in the 2012 Permit, and otherwise fail to meet Permit requirements.

EWMP Work Plan deficiencies do not bode well for the June 2015 Draft EWMPs, and this CEQA process is an opportunity for LACFCD and EWMP permittees to address our concerns with program development thus far. The Regional Board-approved delay in progress toward compliance with water quality based effluent limits ("WQBELs") and RWLs for EWMP permittees cannot pass lightly—the draft plans submitted by EWMP groups in June 2015 must fully and clearly demonstrate a path to compliance and cleaner waters for the region. To this extent, any identified deficiencies with the EWMP Work Plans must be addressed prior to submission of the draft EWMPs in 2015, and should also be addressed in this PEIR to fully assess the potential environmental impacts of the program.

---

[2] For a full explanation of how the permit violates the law, see Memorandum of Points and Authorities in Support of Petition of NRDC, Los Angeles Waterkeeper and Heal the Bay for Review of Action by the California Regional Water Quality Control Board, Los Angeles Region, in Adopting the Los Angeles County Municipal Separate Stormwater National Pollutant Discharge Elimination System (NPDES) Permit; Order No. R4-2012-0175; NPDES Permit No. CAS004001 (Dec, 10, 2012) ("Environmental Groups' Petition"), SWRCB/OCC File No. A-2236(m), attached as Exhibit A.
[3] *See* Environmental Groups' Comments on Enhanced Watershed Management Work Plans and Monitoring Plans Pursuant to Requirements under the Los Angeles County Municipal Separate Storm Sewer System Permit, NPDES Permit No. CAS004001, Order No. R4-2012-0175, submitted to the Regional Board September 16, 2014, attached as Exhibit B.

II. General Comments

Environmental Groups have categorized comments into general comments about the approach in the PEIR and some specific comments about the PEIR analysis. Because the approach in the Draft PEIR will likely follow to the management programs due in June 2015, LACFCD should take this important opportunity to revise the Draft PEIR to address the concerns articulated below.

A. Inadequate Information Related to Ensuring Compliance with Required Water Quality Limits Undermines the Success of the PEIR

In areas of the permittees' jurisdictions where retention of the 85th percentile, 24-hour storm event is not technically feasible, EWMPs must include other watershed control measures to "ensure that MS4 discharges achieve compliance with all interim and final WQBELs set forth in Part VI.E. . . . and [] ensure that MS4 discharges do not cause or contribute to exceedances of receiving water limitations in Part V.A." (*Id*. at VI.C.1.g.v.) In several instances, the Draft PEIR acknowledges this legal obligation and claims that planning efforts are aimed towards that goal. However, whether the environmental impact of the program will indeed include compliance remains uncertain. In fact, based on Environmental Groups' review of several of the EWMP Work Plans related to the Draft PEIR and the very general information included in the Draft PEIR, the actual environmental impact of the EWMPs is difficult to determine. Deficiencies identified in the EWMP Work Plans potentially undermine statements of intended compliance in the PEIR. Thus, Environmental Groups urge LACFCD to clarify several issues related to assuring ultimate compliance with water quality limits.

First, several EWMP Work Plans related to the Draft PEIR insufficiently prioritize pollutants as required in the 2012 MS4 Permit. Permittees are required to prioritize pollutants into three categories: (1) TMDL pollutants (highest priority), (2) 303(d) listed but no applicable TMDL (high priority), and (3) insufficient data to determine impairment, but exceeds RWLs (medium priority). Category (1) must also include non-TMDL pollutants that have similar fate and transport mechanisms as TMDL pollutants. (2012 Permit, at VI.C.2.a.i.) Prioritization is essential to ensuring compliance with required limits. Some of the deficiencies in prioritization include failing to include priority pollutants,[4] and failing to justify exclusion of some pollutants.[5] Additionally, permittees have set incorrect timelines for TMDL implementation and compliance in

[4] *See* North Santa Monica Bay Coastal Watersheds EWMP Work Plan, at 18; *see also* Upper Santa Clara River EWMP Work Plan, at 3-4; *see also* Upper Los Angeles River EWMP Work Plan, at Appendix 2.A. (lacks explanation of why Total Aluminum is not included as a priority despite data demonstrating exceedances).

[5] *See* North Santa Monica Bay Coastal Watersheds EWMP Work Plan, at 18.

some cases.[6] Without adequately characterizing each watershed and prioritizing the right pollutants, it is impossible to fully assess the environmental impacts of the proposed programs under CEQA. Environmental Groups understand that the EWMPs are still in development, but this PEIR must include a process and approach that complies with permit terms to fully evaluate the impacts of proposed actions.

B. Green Infrastructure Should Be Prioritized Wherever Feasible

Environmental Groups commend the LACFCD for proposing multi-benefit stormwater projects that emphasize flood risk mitigation, water conservation and water supply. In light of the fact that the LACFCD has a vested interest in increasing opportunities for stormwater capture and groundwater recharge as a means of assisting local water supply and augmentation, we urge the LACFCD to work with Permittees in all 12 EWMP watersheds to prioritize green infrastructure or low-impact development (LID) practices wherever feasible, and provided that such projects do not produce significant adverse impacts.

Environmental Groups have long supported the use of green infrastructure techniques to control urban runoff. Green infrastructure provides multiple benefits to surrounding communities at a higher benefit-cost ratio when compared to grey infrastructure.[7] A 2007 U.S. Environmental Protection Agency (EPA) study found that "in the vast majority of cases . . . implementing well-chosen LID practices saves money for developers, property owners, and communities while protecting and restoring water quality."[8] With only "a few exceptions," the EPA study found that "[t]otal capital cost savings ranged from 15 to 80 percent when LID methods were used" instead of conventional stormwater management techniques.[9] The EPA study is not alone in reaching this conclusion. A report by ECONorthwest concluded that LID methods not only "cost less to install, have lower operations and maintenance (O&M) costs, and provide more cost-effective stormwater management and water-quality than conventional stormwater controls" but they also provide "ecosystem services and associated economic benefits that conventional

stormwater controls do not.[10] Moreover, a survey released by the American Society of Landscape Architects in 2011 found that green infrastructure reduced or did not influence project costs 75 percent of the time."[11]

Given the current severe drought conditions, protecting and augmenting local water supplies is essential for long-term sustainability. A report by the NRDC found that implementing LID practices at new and redeveloped residential and commercial properties in urbanized areas of Southern California and limited portions of San Francisco Bay has the potential to increase local water supplies by up to 405,000 acre-feet of water per year by 2030.[12] This volume of water accounts for roughly two-thirds of all water used by the City of Los Angeles each year.[13] Historically, Southern California has imported approximately 50 percent of its water supply from distant, energy-intensive sources such as the Sacramento-San Joaquin Delta and the Colorado River.[14] Green infrastructure thus has the potential to greatly reduce Los Angeles' dependence on imported water.

Last but not least, Environmental Groups strongly advocate for the implementation of structural BMPs (distributed, centralized, and regional) that capture stormwater and store it for reuse – so long as they do not produce significant adverse impacts – as such practices provide both water quality *and* water supply benefits.

III. Specific Concerns in the PEIR

Section 3.5 – Geologic and Mineral Resources
Impact 3.5-2: "The proposed program could result in substantial soil erosion or the loss of top soil."

The Draft PEIR states environmental impacts associated with substantial soil erosion or loss of top soil are less than significant. Environmental Groups disagree. EWMP projects are encouraged to retain the 85th percentile 24-hour storm event; however, it is unclear that all EWMP BMPs will retain this volume and even if they did, in some instances some volume of runoff will remain untreated. Thus, at least some percentage of stormwater generated, which will vary depending on individual EWMPs, will be treated and discharged into the MS4. Although discharge points from centralized and

[12] Natural Resources Defense Council, *A Clear Blue Future: How Greening California Cities Can Address Water Resources and Climate Challenges in the 21st Century*, August 2009, at 4, available at http://www.nrdc.org/water/lid/files/lid_hi.pdf ("A Clear Blue Future").
[13] *Id*.
[14] *Id.*, at 18-19.

distributed BMPs would be designed to minimize scour potential, soil erosion and loss of top soil are still likely to occur during precipitation events. Los Angeles County contains over 110 soft bottom reaches – increased scour and loss of top soil could severely affect beneficial uses of these reaches. In addition, the 2012 Permit outlines specific hydromodification requirements – it is unclear if the Draft PEIR is consistent with hydromodification provisions in the 2012 Permit. The Final PEIR needs to address all potential soil erosion and loss of top soil scenarios and needs to reference the hydromodification provisions outlined on pg. 105 of the 2012 Permit.

Impact 3.5-5: "The proposed program could have soils incapable of adequately supporting the use of a septic tank or alternative wastewater treatment systems where sewers are not available for the disposal of wastewater."

Environmental Groups are concerned with wastewater created in areas incapable of adequate disposal options (sewer system or septic tanks). In the event that implemented BMPs generate wastewater and cannot properly dispose of wastes via sewer system or septic tanks, the Final PEIR needs to outline how waste will be managed (i.e. tank, truck, etc.). In addition, the Final PEIR should reference the State Board's Water Quality Control Policy for Siting, Design, Operation, and Maintenance of Onsite Wastewater Treatment Systems and General Waste Discharge Requirements for Small Domestic Wastewater Treatment Systems (Order WQ 2014-0153-DWQ) when soils are capable of supporting the use of septic tanks.

Cumulative Impact/GEO-2: "Prior to installing BMPs designed to recharge local groundwater supplies, the Implementation Agency shall notify local groundwater manager including the Upper Los Angeles River Area Water Master, the Water Replenishment District of Southern California, or the San Gabriel Water Master as well as local water producers such as local municipalities and water companies. The Implementing Agency shall coordinate BMP siting efforts with groundwater managers and producers to mitigate high groundwater levels while increasing local water supplies."

Environmental Groups agree Implementation Agencies should always notify local groundwater managers and producers before stormwater BMPs are implemented; however, the Draft PEIR fails to acknowledge or reference Salt and Nutrient Management Plans being developed and implemented for Los Angeles County groundwater basins. These Plans outline groundwater inputs and exports as well as identify basins' assimilative capacities. We believe the Final PEIR needs to discuss EWMP coordination with Salt and Nutrient Management Plans. In the light of climate change, protecting while simultaneously contributing to Los Angeles' local water supply is essential for long-term water sustainability.

Section 3.7 – Hazards and Hazardous Materials

Impact 3.7-2: "The proposed program could create a significant hazard to the public or the environment through the accumulation of potentially hazardous materials into BMPs."

HAZ-1: "Implementing agencies shall prepare and implement maintenance practices that include periodic removal and replacement of surface soils and media that may accumulate constituents that could result in further migration of constituents to sub-soils and groundwater. A BMP Maintenance Plan shall be prepared by Implementing Agencies upon approval of the individual BMP projects that identifies the frequency and procedures for removal and/or replacement of accumulated debris, surface soils and/or media (to depth where constituent concentrations do not represent a hazardous conditions and/or have the potential to migrate further and impact groundwater) to avoid accumulation of hazardous concentrations and the potential to migrate further to sub-soils and groundwater. The BMP Maintenance Plan may consist of a general maintenance guideline that applies to several types of smaller distributed BMPs. For smaller distributed BMPs on private property, these plans may consist of a maintenance covenant that includes requirements to avoid the accumulation of hazardous concentrations in these BMPs that may impact underlying sub-soils and groundwater. Structural BMPs shall be designed to prevent migration of constituents that may impact groundwater."

Environmental Groups support Implementing Agencies' development of BMP Maintenance Plans outlining BMP maintenance practices as this is necessary to sustain stormwater BMP efficacies. Yet we want to highlight the all-too-common shortcoming Implementing Agencies encounter in operations and maintenance of stormwater BMPs – failure to devote adequate resources. Bolstering of agencies' resources, such as additional staffing, training, and funding mechanisms, is necessary and commonly overlooked in the implementation of BMP maintenance plans. Without acknowledging Implementation Agency resources while implementing BMP Maintenance Plants, it is unlikely EWMPs' discharges will comply with water quality standards in the long-term. The Final PEIR needs to expand HAZ-1 to discuss additional agencies' resources needed to implement BMP Maintenance Plans.

Section 3.8: Hydrology and Water Quality

Impact 3.8-1: "The proposed project would result in higher groundwater levels and could potentially affect groundwater quality"

See Cumulative Impact/GEO-2 response above.

Impact 3.8-2: "The proposed project could substantially alter the existing drainage pattern of a site or area through the alteration of the course of a stream or river, or by other means, in a manner that would result in substantial erosion or siltation on- or off-site."

See Impact 3.5-2 response above.

IV. Conclusion

Environmental Groups appreciate this opportunity to comment on the Draft PEIR submitted by the LACFCD for the 12 EWMP groups. Please feel free to contact us with any questions or concerns you may have.

Response to Comment Letter 16 (Los Angeles Water Keeper – March 9, 2015)

Response to Comment 16-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

As noted on page 1-1 of the PEIR, the Regional Water Quality Control Board issued Order No. R4-2012-0175; NPDES No. CAS004001 in December 2012 covering discharges from multiple municipalities within the Los Angeles Region. The requirements of the MS4 permit are described in Section 1.2 of the PEIR. A primary objective of the proposed program noted on page 2-2 is to comply with the permit requirements. The EWMPs include a methodology required by the MS4 permit to evaluate the effectiveness of the BMPs as they are implemented. The commenter's opinion about the ability of the permit to meet the requirements of the Clean Water Act does not address the adequacy of the PEIR. The PEIR does not critique the effectiveness of the permit to achieve compliance with the Clean Water Act, but rather it evaluates the potential environmental effects that could result from implementing the types of projects proposed in the EWMPs.

Response to Comment 16-B:

The PEIR acknowledges that most of the projects to be included in the EWMPs are either currently undefined or currently under development. The PEIR explains that EWMPs are being prepared that will contain road maps to permit compliance for each of the 12 watersheds, without yet being fully detailed. The effectiveness of each EWMP to achieve permit compliance will be evaluated by the RWQCB, which may require additional projects or management actions to ensure compliance. The PEIR evaluates typical project types to assess potential impacts of implementing the entire program throughout the region over a long period of time. The use of a PEIR pursuant to CEQA Guidelines Section 15168 is intended to evaluate broad-based impacts early in the planning process and is the appropriate CEQA compliance for the EWMPs at this time.

Response to Comment 16-C:

The permit outlines a required schedule for EWMP preparation that includes project types, priority projects, reasonable assurance analysis, funding prospects, and public review requirements of the EWMPs. The Permittees may be required by the RWQCB to modify the EWMPs as time goes by in order to effectuate compliance. However, the commenter's opinion on the effectiveness of the permit to achieve compliance with the Clean Water Act does not address the adequacy of the PEIR.

RB-AR 9357

Response to Comment 16-D:

The commenter's opinion on the effectiveness of the permit to achieve compliance with the Clean Water Act does not address the adequacy of the PEIR. A PEIR is appropriate when multiple projects are contemplated under a single program that may individually or cumulatively impact the environment. The PEIR compiles reasonably available information on potential projects and environmental conditions over a large geography. Each project is designed to incrementally improve water quality. The PEIR provides preliminary location information in Appendix G for each project currently being contemplated. Although project details are largely incomplete since the EWMPs are being drafted concurrently, each individual project will be subject to a CEQA compliance evaluation prior to approval by the implementing agencies as noted in Section 1. Changes in the EWMPs as they are developed will not undermine the analysis of the overall program. The PEIR as an advanced planning tool provides an early environmental assessment of the overall EWMP compliance approach to assist Permittees in assessing individual projects.

Response to Comment 16-E:

The commenter's opinion on the prioritization of pollutants needed to achieve compliance with the Clean Water Act does not address the adequacy of the PEIR. The PEIR compiles reasonably available information on potential projects and environmental conditions over a large geography. Each project is designed to incrementally improve water quality. The PEIR provides preliminary location information in Appendix G for each project currently being contemplated. Although project details are largely incomplete since the EWMPs are being drafted concurrently, each individual project will be subject to a CEQA compliance evaluation prior to approval by the implementing agencies as noted in Section 1. Changes in the EWMPs as they are developed will not undermine the analysis of the overall program. The PEIR as an advanced planning tool provides an early environmental assessment of the overall EWMP compliance approach to assist Permittees in assessing individual projects.

Response to Comment 16-F:

The PEIR evaluates implementation of BMP types that include green infrastructure and low-impact development practices. The EWMPs include lists of projects each designed to improve surface water quality in the region.

Response to Comment 16-G:

The PEIR evaluates implementation of BMP types that include green infrastructure and low-impact development practices. The EWMPs include lists of projects each designed to improve surface water quality in the region.

Response to Comment 16-H:

The PEIR evaluates implementation of BMP types that include green infrastructure and low-impact development practices. The EWMPs include lists of projects each designed to improve surface water quality in the region.

Response to Comment 16-I:

The PEIR evaluates implementation of distributed, centralized and regional structural BMPs that capture and store stormwater. Potentially significant impacts of BMP implementation are discussed and mitigation measures identified to avoid or reduce potential adverse effects to the environment.

Response to Comment 16-J:

Although the implementation of BMPs will not eliminate soil erosion in the region, each BMP is designed to reduce pollutant loading into receiving waters. These pollutants can often absorb to sediment particles and impair water quality. The PEIR evaluates potential impacts of BMP construction on soil erosion on page 3.8-33. The PEIR notes on page 3.8-37 that implementation of BMPs will assist in reducing erosion and pollutants in the region. Therefore, impacts resulting from program implementation are less than significant since water quality would improve compared with existing conditions. Mitigation Measure HYDRO-4 has been added to the PEIR under Impact discussion 3.8-3 to address potential hydromodification impacts related to the implementation of structural BMPs.

The following modifications have been included in Chapter 12, *Clarifications and Modifications of the Final PEIR*. The Draft EIR discusses potential impacts caused by erosion and sedimentation on page 3.8-37. Mitigation Measure HYDRO-4 has been added to ensure that these impacts remain less than significant. The modification does not identify any new significant impact or trigger the need to recirculate the Draft PEIR under Section 15088.5 of the *CEQA Guidelines*.

Page 3.8-37 has been edited as follows:

Drainage Pattern Alteration Resulting in Erosion or Siltation

Impact 3.8-3: The proposed project could substantially alter the existing drainage pattern of a site or area through the alteration of the course of a stream or river, or by other means, in a manner that would result in substantial erosion or siltation on- or off-site.

Structural (Regional, Centralized, and Distributed) BMPs

The proposed structural BMPs would be designed to minimize off-site discharge of urban runoff pollutants including siltation and sedimentation. Many of the structural BMPs would include on-site infiltration of stormwater runoff which would also be effective in minimizing erosion or transport of sedimentation into receiving waters. Through increased infiltration prior to discharge into receiving waters, flows within existing streams or rivers would receive reduced stormwater flow volumes thereby decreasing flow energies. <u>Therefore, as part of implementation of Mitigation Measure HYDRO-4, implementing agencies would evaluate the potential hydromodification impacts of structural BMPs and include measures to prevent or minimize any identified impacts in the design of the BMPs, including selecting and designing discharge locations to prevent</u>

or minimize erosion and scour. As a result, the potential for erosion or siltation within existing streams or rivers would be reduced and the potential impact less than significant.

Mitigation Measures: ~~None required~~

HYDRO-4: Prior to approving a structural BMP, the implementing agencies shall conduct an evaluation of the potential hydromodification impacts of the project. The evaluation shall recommend design measures necessary to prevent or minimize any identified impacts, including flooding, erosion and/or scour. Design measures could include velocity dissipaters and bank re-enforcement components. Implementing agencies shall include these measures in project designs.

Significance Determination: Less than significant

Page 3.8-38 has been edited as follows:

Drainage Pattern Alteration Resulting in Flooding

Impact 3.8-4: The project could substantially alter the existing drainage pattern of a site or area through the alteration of the course of a stream or river or, by other means, substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site.

Structural (Regional, Centralized, and Distributed) BMPs

The proposed structural BMPs include features that would increase stormwater retention and encourage on-site infiltration to reverse the impacts from urbanization on the natural hydrograph. ~~The widespread implementation of distributed BMPs with these functions in urban areas of all the EWMP groups will significantly reduce stormwater flow volumes especially during peak storm flow events as indicated by the figure shown in Impact 3.8-3.~~ Larger retention and infiltration regional and centralized BMPs would have a beneficial effect on regional hydrology through delayed discharge to avoid the spike in peak flows currently experienced. By retaining stormwater flows and either infiltrating or releasing these flows closer to the natural hydrograph, the change in drainage patterns would result in reduced peak flows and as a result a reduced potential for flooding on- or off-site. ~~Therefore, the potential impact would be less than significant.~~

However, the implementation of structural BMPs could alter the existing drainage patterns in the immediately surrounding area, depending on the type and location of the BMP. Therefore, as part of implementation of Mitigation Measure HYDRO-4, implementing agencies would evaluate the potential hydromodification impacts of structural BMPs and include measures to prevent or minimize any identified impacts in the design of the BMPs, including selecting and designing discharge locations to avoid increasing the flood risk in the surrounding area.

Mitigation Measures: ~~None required~~

Implement Mitigation Measure HYDRO-4.

Significance Determination: Less than significant

Response to Comment 16-K:

The EWMPs are being developed to comply with the 2012 Permit requirements including its hydromodification requirements. Each EWMP includes projects throughout its watershed that would retain, detain, or slow storm flows, reducing downstream peak storm flows. Implementation of EWMPs would be an improvement to existing conditions, and complementary to RWQCB and local hydromodification requirements within the many jurisdictions of the region.

Response to Comment 16-L:

Once constructed, the structural BMPs would not generate wastewater as described on page 3.14-13. Some BMPs may divert dry weather flows to treatment facilities that would be contingent on available capacity. Potential impacts to underground wastewater conveyance systems are discussed on page 3.14-14. Construction activities that generate dewatering water or other wastewater would be subject to SWPPP and WDR requirements. The BMPs would result in improved water quality and would not significantly impact septic tanks or sewer systems.

Response to Comment 16-M:

Once constructed, the structural BMPs would not generate wastewater as described on page 3.14-13. Structural BMPs would not be subject to the referenced discharge requirements. No modifications or references are necessary.

Response to Comment 16-N:

The PEIR discusses potential impacts to groundwater quality on page 3.8-35. The PEIR acknowledges that infiltration projects could adversely affect groundwater quality and identifies mitigation measures to minimize potential impacts. The commenter is correct to reference the on-going Salt and Nutrient Management Plans (SNMPs) currently being prepared in the region. The SNMPs amend the Basin Plan, establishing salt and nutrient loading thresholds for each groundwater basin. The SNMPs include estimates for increased stormwater infiltration in the future as the region increases local water supply opportunities. Stormwater tends to have lower salt and nutrient content than imported water or recycled water. Increased infiltration of stormwater on a large scale as envisioned in the EWMPs assists in diluting salts and nutrients from other recharge sources and is consistent with and incorporated into SNMPs under development in the region. However, the PEIR acknowledges that infiltration can mobilize pollutants including salts and nutrients already in the ground. As a result, the PEIR includes Mitigation Measure HYDRO-2 that requires implementing agencies to evaluate treatment requirements for each BMP to meet Basin Plan water quality objectives; this mitigation measure would reduce potentially significant impacts to less than significant levels.

In response to the comment the following text is added to page 3.8-29 of the Draft PEIR, describing the status of Salt and Nutrient Management Plans in the region.

Salt and Nutrient Management Plans

In February 2009, the State Water Resources Control Board adopted Resolution No. 2009-0011, which established a statewide Recycled Water Policy. The Recycled Water Policy encourages increased use of recycled water and local stormwater, together with enhanced water conservation. It also requires local water and wastewater entities, together with local salt and nutrient (S/N) contributing stakeholders to develop Salt and Nutrient Management Plans (SNMPs) for each groundwater basin in California in a way that optimizes recycled water use while ensuring protection of groundwater supply and beneficial uses, agricultural beneficial uses, and human health. The Recycled Water Policy encourages development of regional S/N management strategies rather than relying on the past local RWQCB approach of imposing requirements on individual recycled water projects with no recognition of the relative and cumulative impacts when all projects and loading sources are considered regionally. Accordingly, the SNMP is intended to provide support and justification for elimination of separate anti-degradation analyses and individual site monitoring requirements for proposed recycled water projects and so that the vast majority of proposed recycled water projects may be streamlined. The intent of this streamlined permitting process is to expedite the implementation of recycled water projects in a manner that complies with State and Federal water quality laws. The SNMPs will be approved by the Regional Water Quality Control Boards (RWQCBs).

The Central and West Coast Basins SNMP was developed by the Water Replenishment District of Southern California (WRD) as the lead agency. The SNMP was submitted to LARWQCB for approval in November 2014, and was approved as a Basin Plan Amendment on February 12, 2015. The Upper Los Angeles River Area (ULARA) SNMP is currently being prepared by the ULARA Watermaster. An SNMP for the Santa Clarita River Valley East Subbasin is being prepared by a group of local stakeholders comprised of Castaic Lake Water Agency (CLWA), City of Santa Clarita, Los Angeles County Flood Control District (LACFCD), Newhall County Water District (NCWD), San Gabriel & Lower Los Angeles Rivers and Mountains Conservancy, Sanitation Districts of Los Angeles County (SDLAC) and Valencia Water Company (VWC).

This modification has been included in Chapter 12, *Clarifications and Modifications of the Final PEIR*. The modification adds background information, but does not identify any new significant impact. The modification does not trigger recirculation of the Draft PEIR under Section 15088.5 of the *CEQA Guidelines*.

Response to Comment 16-O:

The PEIR acknowledges on pages 3.1-12 and 3.7-16 that BMPs will require periodic maintenance to be effective. Mitigation Measures AES-1 and HAZ-1 both require that maintenance plans be prepared for each structural BMP to ensure their long-term effectiveness. The mitigation includes measures to ensure the functionality of the BMPs for the life of the BMP. With implementation of the mitigation measures, the PEIR concludes that impacts to the effectiveness of the BMPs would be less than significant. It should be noted, Mitigation Measure HAZ-1 has been revised as follows:

> **HAZ-1:** Implementing agencies shall prepare and implement maintenance practices that include periodic removal and replacement of surface soils and media that may accumulate constituents that could result in further migration of constituents to sub-soils and groundwater. A BMP Maintenance Plan shall be prepared by Implementing Agencies upon approval of the BMP projects that identifies the frequency and procedures for removal and/or replacement of accumulated debris, surface soils and/or media (to depth where constituent concentrations do not represent a hazardous conditions and/or have the potential to migrate further and impact groundwater) to avoid accumulation of hazardous concentrations and the potential to migrate further to sub-soils and groundwater. <u>The Maintenance Plan shall include vector control requirements.</u> The BMP Maintenance Plan may consist of a general maintenance guideline that applies to several types of smaller distributed BMPs. For smaller distributed BMPs on private property, these plans may consist of a maintenance covenant that includes requirements to avoid the accumulation of hazardous concentrations in these BMPs that may impact underlying sub-soils and groundwater. Structural BMPs shall be designed to prevent migration of constituents that may impact groundwater.

Response to Comment 16-P:

The PEIR discusses potential impacts to groundwater quality on page 3.8-35. The PEIR acknowledges that infiltration projects could adversely affect groundwater quality and identifies mitigation measures to minimize potential impacts. The commenter is correct to reference the on-going Salt and Nutrient Management Plans (SNMPs) currently being prepared in the region. The SNMPs amend the Basin Plan, establishing salt and nutrient loading thresholds for each groundwater basin. The SNMPs include estimates for increased stormwater infiltration in the future as the region increases local water supply opportunities. Stormwater tends to have lower salt and nutrient content than imported water or recycled water. Increased infiltration of stormwater on a large scale as envisioned in the EWMPs assists in diluting salts and nutrients from other recharge sources and is consistent with and incorporated into SNMPs under development in the region. However, the PEIR acknowledges that infiltration can mobilize pollutants including salts and nutrients already in the ground. As a result, the PEIR includes Mitigation Measure HYDRO-2 that requires implementing agencies to evaluate treatment requirements for each BMP to meet Basin Plan water quality objectives; this mitigation measure would reduce potentially significant impacts to less than significant levels.

In response to the comment the following text is added to page 3.8-29 of the Draft PEIR, describing the status of Salt and Nutrient Management Plans in the region.

> **<u>Salt and Nutrient Management Plans</u>**
> <u>In February 2009, the State Water Resources Control Board adopted Resolution No. 2009-0011, which established a statewide Recycled Water Policy. The Recycled Water Policy encourages increased use of recycled water and local stormwater, together with</u>

enhanced water conservation. It also requires local water and wastewater entities, together with local salt and nutrient (S/N) contributing stakeholders to develop Salt and Nutrient Management Plans (SNMPs) for each groundwater basin in California in a way that optimizes recycled water use while ensuring protection of groundwater supply and beneficial uses, agricultural beneficial uses, and human health. The Recycled Water Policy encourages development of regional S/N management strategies rather than relying on the past local RWQCB approach of imposing requirements on individual recycled water projects with no recognition of the relative and cumulative impacts when all projects and loading sources are considered regionally. Accordingly, the SNMP is intended to provide support and justification for elimination of separate anti-degradation analyses and individual site monitoring requirements for proposed recycled water projects and so that the vast majority of proposed recycled water projects may be streamlined. The intent of this streamlined permitting process is to expedite the implementation of recycled water projects in a manner that complies with State and Federal water quality laws. The SNMPs will be approved by the Regional Water Quality Control Boards (RWQCBs).

The Central and West Coast Basins SNMP was developed by the Water Replenishment District of Southern California (WRD) as the lead agency. The SNMP was submitted to LARWQCB for approval in November 2014, and was approved as a Basin Plan Amendment on February 12, 2015. This modification has been included in Chapter 12, *Clarifications and Modifications of the Final PEIR*. The modification adds background information, but does not identify any new significant impact. The modification does not trigger recirculation of the Draft PEIR under Section 15088.5 of the *CEQA Guidelines*.

Although the implementation of BMPs will not eliminate soil erosion in the region, each BMP is designed to reduce pollutant loading into receiving waters. These pollutants can often absorb to sediment particles and impair water quality. The PEIR evaluates potential impacts of BMP construction on soil erosion on page 3.8-33. The PEIR notes on page 3.8-37 that implementation of BMPs will assist in reducing erosion and pollutants in the region. Therefore, impacts resulting from program implementation are less than significant since water quality would improve compared with existing conditions. Mitigation Measure HYDRO-4 has been added to the PEIR under Impact discussion 3.8-3 to reduce any hydromodification impacts including those related to erosion and scour.

Page 3.8-37 has been edited as follows:

Structural (Regional, Centralized, and Distributed) BMPs

The proposed structural BMPs would be designed to minimize off-site discharge of urban runoff pollutants including siltation and sedimentation. Many of the structural BMPs would include on-site infiltration of stormwater runoff which would also be effective in minimizing erosion or transport of sedimentation into receiving waters. Through increased infiltration prior to discharge into receiving waters, flows within existing streams or rivers would receive reduced stormwater flow volumes thereby decreasing flow energies. Furthermore, as part of implementation of Mitigation Measure HYDRO-4, implementing agencies would design BMP discharge locations to minimize any hydromodification impacts including erosion and scour. As a result, the potential for erosion or siltation within existing streams or rivers would be reduced and the potential impact less than significant.

Mitigation Measures: ~~None required~~

HYDRO-4: Prior to approving a structural BMP, the implementing agencies shall conduct an evaluation of the potential hydromodification impacts of the project. The evaluation shall recommend design measures necessary to prevent or minimize any identified impacts, including flooding, erosion and/or scour. Design measures could include velocity dissipaters and bank re-enforcement components. Implementing agencies shall include these measures in project designs.

Thanks very much Gregg. That was helpful. The projects I am interested in are on page 435 of the document. They are described as "Infiltration", Is there another spot in the document where this is explained in more detail? I am trying to understand what kind of infiltration project is proposed for these locations. Sorry to trouble you, I tried to figure this out on my own but could not do it.

Thanks for your help

You can find more information on the priority projects in the PEIR document in Section 10 – Appendices – subsection G.

The complete PEIR can be found on our website www.lacoh2osheds.com.

The individual sections can be viewed separately.

I hope this helps.

Response to Comment Letter 17 (Topanga Creek Watershed Committee – March 9, 2015)

Response to Comment 17-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The proposed EWMP BMPs are under development. Infiltration BMPs are described on pages 2-8 through 2-24. These BMP types capture and infiltrate runoff into underlying soils. Table 2-2 in Chapter 2, *Project Description* describes specific sub-types of infiltration BMPs, which include surface infiltration BMPs (infiltration basins, bioretention, and permeable pavement) and multi-directional infiltration BMPs (dry wells and hybrid bioretention).

Response to Comment 17-B:

The MS4 Permit requires that the EWMPs identify priority projects. The priority projects are identified in Appendix G of the PEIR. The information included in the PEIR is limited to the project name and location. Additional information for the priority projects will be provided in the EWMPs.

Alhambra, CA 91803

Dear Mr. BeGell,

I am writing to you in regards to the Enhanced Watershed Management Plan for the San Gabriel and Rio Hondo Watersheds that is presently under development.

I support your efforts to enhance the water supply and achieve water quality goals to help restore the health of our local waterways.

I would urge that you consider the restoration of Baldwin Lake at the Los Angeles County Arboretum in Arcadia, CA in the proposed improvement plan. Baldwin Lake serves as an important collection basin for Arcadia's urban watershed, receiving run-off from over 150 acres of the suburban neighborhood to the north. In its present state the lake cannot adequately serve as a collection point for water run-off from the neighborhoods north of the arboretum.

The restoration of Baldwin Lake will both enhance watershed function and serve the public with exceptional educational, ecological and scenic benefits. Its inclusion as a high priority project within the Rio Hondo/San Gabriel River Enhanced Watershed Management Plan offers unparalled public benefits to our local communities.

Best regards,

Gilbert Resendez

Gilbert Resendez

Response to Comment Letter 18 (Monrovia – March 11, 2015)

Response to Comment 18-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The PEIR assesses the environmental impacts associated with implementation of EWMPs as a form of compliance with the MS4 Permit. The restoration of Baldwin Lake is shown as a potential priority project to be implemented as part of the Rio Hondo/San Gabriel River EWMP in Figure 2-13 of the PEIR. More site investigations are needed to fully vet the project and define the project scope needed to satisfy the EWMP's requirements. The City of Arcadia is the primary agency who will benefit from a water quality project at the Baldwin Lake. The City of Arcadia will likely play a major role in the decision to implement an EWMP project at Baldwin Lake.

PUBLIC COMMENT SUBMITTAL
LOS ANGELES COUNTY DEPARTMENT OF PUBLIC WORKS
***ENHANCED WATERSHED MANAGEMENT PROGRAMS* (EWMP)**
***PROGRAM ENVIRONMENTAL IMPACT REPORT* (PEIR)**

Dear Mr BeGell:

The Los Angeles/Santa Monica Mountains Chapter of California Native Plant Society thanks Los Angeles County Department of Public Works for the opportunity to review and comment on the PEIR. Our organization supports water quality improvements in conjunction with the focus on conservation, protecting habitat and native plants.

California Native Plant Society (CNPS) is a science and policy-based interest group formed a half century ago. CNPS works hard to protect California's native plant heritage and preserve it for future generations. We actively promote use of science in land use and management decisions through our *Online Rare Plant Inventory* and essential reference book: *Manual of California Vegetation*, 2nd Edition, both of which are the most advanced resources available for identifying and managing critical habitat in California. CNPS works closely with decision-makers, scientists, and local planners to advocate for well-informed and environmental friendly policies, regulations, and land management practices.

Please see our following comments organized in numeric context of the PEIR document. Our chapter representatives and scientists can be available to work with Los Angeles County Department of Public Works to advise best siting and design elements as well as best management practices pertinent to native vegetation in conjunction with all Department projects. Kindly confirm receipt of these electronically-submitted comments.

Sincerely,

[signature] for Snowdy Dodson

Snowdy Dodson, Chapter President

PUBLIC COMMENT SUBMITTAL
LOS ANGELES COUNTY DEPARTMENT OF PUBLIC WORKS
***ENHANCED WATERSHED MANAGEMENT PROGRAMS* (EWMP)**
***PROGRAM ENVIRONMENTAL IMPACT REPORT* (PEIR)**

3.3.1 Environmental Setting

The PEIR states native habitats still remain 'within mountainous areas and some drainage areas.' CNPS asserts that native plants endemic to this region are significantly more widespread than the document states. Naturally-occurring populations are found in all geographic areas of the County, including urban, disturbed, ruderal areas, engineered channels, and not limited to open space or 'pristine' habitat. All proposed project areas in the PEIR must therefore be considered as having the potential for habitat value and surveyed at times of year appropriate to the vegetation type found on site.

3.3.1.4 Upper Los Angeles River Watershed

The PEIR states that dry-weather flows caused by irrigation run-off and waste water discharges contribute to establishment of native plant habitat. First, we suggest this discussion would be more appropriately addressed in a separate section of the PEIR about existing habitat as native habitat or plant populations are found in all areas of the County including urbanized settings.

Second, it is important to note that Los Angeles County has high numbers of historic and current naturally-occurring water features with surface flows during dry weather such as artesian wells, springs, high water tables, and blue-line streams in almost every region. Native plant habitat is commonly found in these areas.

Third, the PEIR should discuss proposed maintenance measures of existing native habitat at any and all sites.

Fourth, albeit the following permit is not subject to the PEIR, we recommend the PEIR incorporate requirements currently under consideration as part of the *"Los Angeles County Flood Control District, Maintenance Clearing of Engineered Earth-bottom Flood Control Channels; File No. 99-011 WDR"* renewal by the Los Angeles Regional Water Quality Control Board. The PEIR should advise all native habitat management, maintenance, and locations considered for disturbance or removal coordinated at the inter-agency level, and annually reviewed at the appropriate times of year as dictated by plant type by qualified botanists due to the dynamics and important watershed system values of these bio-diverse areas. Native habitat areas or native plant populations should be left *in situ* at all project areas unless for a compelling project-related reason and disturbed only for purposes of thinning and trimming. Non-native and invasive plant removal is recommended for areas with native species habitat.

PUBLIC COMMENT SUBMITTAL
LOS ANGELES COUNTY DEPARTMENT OF PUBLIC WORKS
***ENHANCED WATERSHED MANAGEMENT PROGRAMS* (EWMP)**
***PROGRAM ENVIRONMENTAL IMPACT REPORT* (PEIR)**

Project Impact Discussion

The PEIR is well-researched for various sources of special plant species and habitats lists, regulations, ordinances, and CEQA guidelines. CNPS is concerned the PEIR does not more specifically address how or propose guidelines for native habitat and special plant populations in project areas.

Reference is given throughout the section to benefit goal objective of restoring waterways or riparian areas addressed by the PEIR projects to 'pre-historic conditions.' The statement is used when describing projected vegetation changes following installation of structural, non-structural, and passive projects. Pre-historic conditions of Los Angeles County can never be replicated due to gross manipulation and change of the former hydrology. This especially holds true to water features and native vegetation. California Native Plant Society strongly cautions use of this assumption by the County and advises all existing native habitat, regardless of whether its establishment is historic or from nuisance run-off, be protected for long-term beneficial uses and contribution to watershed functionality.

Structural- This section states many project sites are located within disturbed areas, implying those have no potential for sensitive species or habitat values. Your Department understands this is not the case as establishment of relatively pristine native habitat that established in some of the Earth-bottom Flood Control Channels, which are both engineered and routinely disturbed for maintenance. It is therefore recommended for purposes of due diligence that all projects that are part of this PEIR are surveyed for native plant species and habitat.

Impact 3.3-1 BMPs – Mitigation Measures

BIO-5 Habitat values that provide a wide range of nesting opportunities can extend ten months of the year, especially in the coastal Santa Monica Mountains and the Coastal Zone. It is recommended to elongate the requirement for pre-construction surveys from August 31 to October 31 throughout the County. Furthermore, the surveys should include butterflies, bats, and other pollinator species, as required by California Coastal Commission.

BIO-6 Construction, staging, and rights-of-way should be limited to the smallest possible disturbance footprint, even at sites where no special species are identified. This will ensure less biological impact to biota, soils, air, and water quality.

Response Comment Letter 19 (California Native Plant Society – March 16, 2015)

Comment Letter 19 (California Native Plant Society – March 16, 2015)

Response to Comment 19-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The backgrounds and qualifications of the California Native Plant Society have been noted.

Response to Comment 19-B:

Mitigation Measure BIO-7 requires that implementing agencies conduct floristic surveys prior to BMP installation in areas where sensitive plants may occur. The mitigation measure applies to BMP installations in urban areas as well as rural. Implementation of the mitigation measure would ensure that sensitive plants and habitats are not significantly impacted.

Response to Comment 19-C:

The PEIR describes existing habitats within the EWMP watersheds in Section 3.3.1 of the Draft PEIR. A separate description is provided for each watershed. Each watershed contains a variety of habitats.

Response to Comment 19-D:

Mitigation Measure BIO-7 requires that implementing agencies conduct floristic surveys prior to BMP installation in areas where sensitive plants may occur. The mitigation measure applies to BMP installations in urban areas as well as rural. Implementation of the mitigation measure would ensure that sensitive plants and habitats are not significantly impacted.

Response to Comment 19-E:

Mitigation Measure BIO-8 requires that implementing agencies conduct salvage and replanting plans following construction activities where sensitive habitat is impacted, which would reduce potentially significant impacts to less than significant levels.

Response to Comment 19-F:

The EWMP projects would be implemented by Permittees and coordinated with responsible agencies as needed to comply with permit requirements. Projects that would impact earth-bottom channels owned by the LACFCD would require LACFCD approval and compliance with applicable Army Corp of Engineers, RWQCB, and California Department of Fish and Wildlife resource permits including 404, 401, and 1602 permits, respectively. For example, Mitigation

Measure BIO-4 requires that implementing agencies consult with these resource agencies for projects that impact sensitive habitats and drainages. In addition, Mitigation Measure BIO-8 requires that implementing agencies conduct salvage and replanting plans following construction activities where sensitive habitat is impacted. Both mitigation measures would reduce potentially significant impacts to less than significant levels.

Response to Comment 19-G:

The EWMPs are under development. Areas that could be impacted by individual BMP projects would be analyzed on a project-specific basis. The 12 EWMPs cover a large geography that exhibits numerous native habitat and special plant population types. A native habitat and special plant population type assessment within the entire County would not be helpful at the high-level scale of the impact analysis because the level of detail needed for individual BMP projects would not be feasible for all potential BMP locations throughout the County. Habitat and plant types may differ acre-by-acre in potential BMP locations, requiring a site specific analysis that is impractical to employ for the entire County in the PEIR. Mitigation Measures BIO-1 through BIO-9 provides a road map for minimizing impacts to natural resources that could result from BMP installations, and would reduce potentially significant impacts to less than significant levels. Specifically, Mitigation Measures BIO-4, BIO-7 and BIO-8 would apply to special-status plant populations, requiring the avoidance of special-status species, pre-construction surveys, and replanting plans. Mitigation Measure BIO-1 would require the avoidance of native habitat, and Mitigation Measure BIO-8 would require the re-establishment of native vegetation following construction.

Response to Comment 19-H:

Mitigation Measures BIO-1 through BIO-9 provide a road map for minimizing impacts to natural resources that could result from BMP installations, and would reduce potentially significant impacts to less than significant levels.

Response to Comment 19-I:

Mitigation Measure BIO-7 requires that implementing agencies conduct floristic surveys prior to BMP installation in areas where sensitive plants may occur, and would reduce potentially significant impacts to less than significant levels.

Response to Comment 19-J:

The PEIR identifies a typical nesting season for birds in the southern California environments. Actual nesting behavior may be exhibited in certain locations by certain species outside of this typical range, but the February to August range is a typical nesting duration for most birds. Mitigation Measure BIO-5 would require that a pre-construction survey for breeding and nesting birds and raptors be conducted if construction and vegetation removal is proposed between February 1 and August 31. A qualified biologist shall conduct a pre-construction survey for breeding and nesting birds and raptors within 500-feet of the construction limits to determine and map the location and extent of breeding birds that could be affected by the project. Active nest sites located during the pre-construction surveys shall be avoided until the adults and young are no longer reliant on the nest site for survival as determined by a qualified biologist.

Although impacts to migratory birds are unlikely because of the disturbed nature of many project locations, the implementing agencies will be required to either avoid impacts to migratory birds and their nests. Should the nesting of any migratory bird occur on or adjacent to the project site during grading or construction activities, a USFWS-qualified biological monitor would have the authority to halt all work activities and notify the city and corresponding resource agency.

Response to Comment 19-K:

Mitigation Measure BIO-6 requires that staging areas and rights of way are marked and minimized, and would reduce potentially significant impacts to less than significant levels.

RE: Comments on Programmatic Draft EIR
Final Compiled Supplemental Comments

EWMP - SPECIFIC COMMENTS
Comments, recommendations, and additions are presented in **Bolded *Italics*** following relevant PEIR text specific to the comments are presented in plain text as was in the PEIR. Some specifically relevant PEIR text may be **Bold <u>Underlined</u>**.

NEW SUPPLEMENTAL COMMENTS
p.2-18 **Upper LA River Brandon Street and Green Street Improvements Project**
The project will reconstruct...roadway...design includes...Much of the runoff from the streets and private properties that would have otherwise drained to the Rio Hondo will be directed to the infiltration area.
No estimate or even guess as to how "much" that would be drained has been made. The EWMP and PEIR suffer from lack of rough orders of magnitude estimates of diversion, redirection, and recharge.
2-19 **Upper San Gabriel River Avocado Heights Multiuse Trail Project**
The project will...thereby reducing the amount of impermeable surfaces as well as runoff. Approximately...Combined together, **<u>up to 115 acre-feet of groundwater</u>** will be recharged annually.
Here an estimate as to how "much" is provided but without any supporting calculations and consistent application throughout the EWMP/s. The EWMP and PEIR suffer from inconsistent application of rough orders of magnitude estimates of diversion, redirection, and recharge for all watersheds.

2-26\2 Typical constructed wetland projects require extensive grading of site soils, though excavated soils are often balanced on-site to provide material for
levees,
berms,
ecotones, and
<u>other flood control/habitat features</u>.
2-27/2 **Multi-benefit flood management projects*.*** This category...designed to result in direct or indirect benefits to flood management.
...Tujunga Wash Greenway project that incorporates...detention elements can **<u>improve flood management</u>** by **<u>reducing stormwater flow rates and/or volumes</u>**.
References to multiple benefits may be appropriate but are not supported by any supporting analyses and description of specific conditions in EWMPs or the EWMP.

2-27/3 *Construction Impacts.* **Multi-benefit flood management projects** are typically expansive projects that range from a few to tens of acres in size...Because of their scale, **multi-benefit flood** 2-28/1 **management projects**...

No definitions are provided for "flood management" vs "flood control" (2-26/2), and no supporting information or analyses are provided for quantification of levels of management/control in addition to other beneficial sectors, e.g., groundwater sourcing for suburban and urban water supplies.

2-28/2 ...**centralized** BMPs...presented in **Table 2-4**. The locations of these examples of planned and implemented **centralized** BMP...in **Figure 2-3**.
Table 2-4...the **centralized** BMPs...structural BMPs that **are part** of **the** EWMP....of **potential and priority** BMPs, where data ***are***~~is~~ **available**,...*BMP Implementation Strategies*.

References to centralized BMPs, structural BMPs, and potential and priority BMPs and then "where available" cause confusion for public reviews and clearly indicate that the supporting documents are inadequate if not incomplete..

2-30 TABLE 2-4 EXAMPLES OF PLANNED CENTRALIZED BMP PROJECTS This project will also have educational signage on a riparian zone and the **stormwater cleanup objectives of this project**.

Centralized projects have been designated as priority, potential, and, here, "planned", but no clear comparison is provided. Consistent terms and usage is very important for public review and commenting.

~~*2-30/Table 2-4 Item 2* **Malibu Creek Lindero Parkway Improvements** The project...streetscape improvement project that...this parkway was **originally a flood control maintenance road**...new project,...Stormwater runoff would then be treated in the bio-swale followed by discharge into Westlake Lake...also have educational signage on a riparian zone and the **stormwater cleanup objectives** of this project. *FP*~~
~~*2-31/Table 2-4 Item 4* **Palos Verdes Peninsula San Ramon Canyon Stormwater Flood Reduction Project** The San Ramon Canyon...near Palos Verdes Drive East....landslide induced rock and soil deposits in the canyon bottom are transported during **heavy rainfall events**...creates **flooding** of the roadway, overwhelming existing drainage facilities, endangering nearby roadway integrity and threatening downstream residents...***(SRCSFRP)*** involves significant drainage restoration work to stabilize...~~
~~*2-32/Table 2-4, Item 2* Phase II of the Penmar project...**Replacing this volume of potable water with treated storm water**...provides 34.7 million gallons per year increase to annual runoff diversion capacity...By installing the **reuse option**, the overall project capacity will increase, thereby also increasing the **volume of urban runoff** that can be retained by the project **for use as an alternative source of water to potable water** for landscape irrigation.~~

2-34/1 **2.4.5 Regional Structural BMPs** Regional structural BMPs are those that can **capture the volume of water from an 85th percentile, 24-hr storm in a contributing watershed, known as the *design volume (...*85th percentile storm...0.75 inches over 24 hours**).
The project's BMPs...**alleviate local flooding** by collecting runoff from a 21-acre drainage area...into two underground infiltration galleries...

Design volumes and their analyses are not provided for contributing watersheds, provide runoff coefficients, times of concentration, etc..

~~*2-34/2 Anticipated Construction Activities:* The construction activities...are generally similar to those of their centralized counterparts, with the **exception of regional retention BMPs**,...adequate storage capacity to **hold runoff from the design storm**....Larger, multi-benefit regional BMPs are similar to **centralized multi-benefit regional flood management projects**...~~

2-42/4 The Los Angeles River...natural hydrology of the Los Angeles River watershed has been altered by channelization and the construction of dams and **flood control reservoirs**...Because of the greater extent and number of pollutant priorities, the BMP strategy in the Upper Los Angeles River watershed includes well **over a hundred planned regional and centralized retention and infiltration BMPs** ***[Estimated total unfunded projects: 400]*** that take advantage of the **favorable groundwater recharge characteristics**...BMP strategy also includes distributed smaller BMPs located throughout the urbanized areas of the watershed as retrofits in existing developments and streets. LFDs to comply with dry-weather bacteria TMDLs may also be included.

No quantification of the watersheds, recharge areas, and groundwater storage capacities has been provided. No priority assignment process has been proposed to manage the many options and maximize the uses of favorable recharge areas and storage capacities.

3.1-12/3 BMP **maintenance is also important**...Wet ponds and constructed wetlands can also become **mosquito-breeding grounds**...can usually be **reduced or eliminated through proper design and/or organic controls**.***[=maintenance]***..all BMPs need to have trash and debris removed periodically to prevent odor and preserve aesthetic values. **With proper maintenance...impacts would be less than significant.**

Although mosquitoes are mentioned, projections of potential public health impact of such occurrences are not mentioned nor supporting information provided, while trash and debris are related to odor and aesthetic values.

***3.1-15/*TABLE 3.1-1 SUMMARY OF...IMPACTS REQUIRING MITIGATION MEASURES**

Distributed BMP

LID – Green Infrastructure – Capture and Use – Cisterns, **Rain Barrels**, Green roofs, Planter Boxes

As indicated elsewhere, the LID program limits detention for single family dwellings to two rain barrels, about 100gal, while a typical 1000-2000sqft roof would generate about 450-900 gal. Rain barrels are discussed but given the limits for only single family dwelling (i.e., multi-family dwellings and commercial structures must have more than 450 gal/1000 sqft). The table and other references to rain barrel requires supporting analyses/calculations to demonstrate any significant mitigation during the EWMP implementation.

3.5-19/2 City of Los Angeles Low Impact Development Manual

In November 2011, the City of Los Angeles adopted the Stormwater Low Impact Development (LID) Ordinance #181899) with the stated **purpose** of:

- Requiring the use of LID standards and practices in future developments and redevelopments to encourage the beneficial use of rainwater and urban runoff
- **Reducing stormwater/urban runoff** while improving water quality
- Promoting rainwater harvesting
- **Reducing offsite runoff** and providing increased groundwater recharge
- **Reducing** erosion and **hydrologic impacts downstream**
- Enhancing the recreational and aesthetic values in our communities

3.5-19/3 The City institutionalized the use of LID techniques...adoption of the Stormwater LID Ordinance, the City prepared the *Development Best Management Practices Handbook, Low Impact Development Manual,...*required BMPs (City of Los Angeles, 2011).

3.7-17/2 The LID Standards...provide protocols for designing regional and centralized BMPs that minimize the potential for contaminant loading. For example, the LID Manual requires a certain distance to groundwater to ensure that adequate soil filtration occurs prior to the percolating water reaching a drinking water aquifer.

The manual and references to it fail to demonstrate and support contentions regarding the purpose and significance of a desired level of implementation during the EWMP period or the rate of implementation, especially given the minimal detention required of single family dwellings.

3.8-8/2 5. **Dominguez Channel Watersheds (Figure 3.8-6)** (Dominguez Channel EWMP and Beach Cities EWMP–...Dominquez Channel EWMP and a portion of the Beach Cities EWMP...differentiated by a **larger area** of industrial land use. Because of the **high density**...**large** regional and centralized infiltration-type BMPs will be **limited**. The structural BMP strategy will be more LFDs, both **large** (centralized) and **small** (distributed), located at MS4 outfalls...The other BMP strategy is the use of **smaller distributed BMPs**...low-impact development (LID) type of BMPs, such as green streets and biofiltration BMPs.

Such generalities require quantification, specific parameters, and some criteria and perhaps cost limitations. For this and other sib-watersheds, the EWMP and PEIR-MMRP can provide a more formal process of sizing and capacities of BMPs.

Subsurface infiltration galleries are commonly used in such surface congested areas if suitable alluvium is available.

3.8-20/1 ...these LFDs **could potentially increase** the amount of water available for recycling, reuse, and **groundwater recharge**.

3.8-21/1 ...45 percent are supplied by local groundwater basins that **are recharged naturally**...**through constructed recharge facilities** (MWD, 2010).

3.8-21/1 ...stormwater recharge facilities **currently augment local groundwater supplies** in the region by an estimated 477,000 acre-feet per year (MWD, 2014).

3.8-21/1 **One of the primary goals of the EWMP program**...**increase the amount of stormwater that is recharged**...particularly in portions of the Central Basin that experience a high degree of hydraulic connectivity between surface water and groundwater. Infiltration BMPs proposed within the EWMPs are expected to **increase the rates and amounts of groundwater recharge**...

Although herein discussions focus on the potential benefits of runoff diversion and recharge as related to augmenting local groundwater supplies to water user service areas, the remainder of the PEIR generally disregards the cumulative impacts and growth inducements of increased local water supply sources while retaining all existing capital works supply capabilities.

3.8-31/3 ***County of Los Angeles Low Impact Development Manual***

The County...prepared the 2014 Low Impact Development Standards Manual (LID Standards Manual, County of Los Angeles, 2014b) to comply with the requirements of the 2012 MS4 Permit...provides guidance for the implementation of stormwater quality control measures in new development and redevelopment projects in unincorporated areas of the County with the intention of improving water quality and mitigating potential water quality impacts from stormwater and non-stormwater discharges.

LACo may have LID requirements for future developments and redevelopments; however, the LACo recently proposed and gained voter approval for a "hauled water" initiative for existing developable areas without piped or well-sourced water supplies. Increased local groundwater recharge and additional "surplus" water supply system capacities can promote or induce such developments which were previously restricted. The cumulative effect of increased local supplies and available infrastructure capacities can directly support and induce development of the "Hauled Water" developments and their impacts on local drainages.

3.8-31/4 The LID Standards Manual addresses...**objectives and goals**:

- **Lessen** the adverse impacts of stormwater runoff from development and urban runoff on natural drainage systems, receiving waters, and other water bodies.

- **Minimize** **pollutant loadings from impervious surfaces** by requiring development projects to incorporate properly-designed, technically-appropriate BMPs and other LID strategies.
- **Minimize** erosion and other hydrologic impacts on natural drainage systems by requiring development projects to incorporate properly-designed, technically appropriate **hydromodification control development principles and technologies**.

The manual contains only generalized statements - Goals - not quantified and scheduled objectives. LIDs do not provide requirements for agencies to deal with existing and future streets and sidewalks and do not provide for capital and long-term O&M funding sources. Without quantification and definitions, "lessen" and "minimize" become irrelevant and can be attained without reference to LID.

City of Los Angeles Low Impact Development Manual

3.8-31/5 In November 2011, the City of Los Angeles adopted the Stormwater Low Impact Development Ordinance #181899 with the stated purpose of:

- Requiring the use of LID standards and practices in future developments and redevelopments to encourage the beneficial use of rainwater and urban runoff
- Reducing stormwater/urban runoff while improving water quality
- Promoting rainwater harvesting
- Reducing off-site runoff and providing increased groundwater recharge
- Reducing erosion and hydrologic impacts downstream
- Enhancing the recreational and aesthetic values in our communities

3.8-31/6 The City of Los Angeles institutionalized the use of LID techniques...Subsequent to the adoption of the Stormwater LID Ordinance, the City prepared the *Development Best Management Practices Handbook, Low Impact Development Manual,* dated June 2011, to describes the required BMPs (City of Los Angeles, 2011).

LID provisions for rain barrels for single family dwellings are only 10-20% of the total detention required for the design storm.

The EWMP and the PEIR have not provided basic supporting documentation and analyses for:

Use of the 85%ile 24-hr rainfall event;

Sufficiency of detention containers (SFD with two 50gal barrels for 450+gal runoff;

Importance of rainfall harvesting of 1000sqft on a 5000sqft lot with driveways, sidewalks, etc..

Reference to beneficial use, harvesting, enhancements, and recharge generally relate to reduce demands by existing and future users and thereby freeing up existing water supply capacity for other future developments or expanding base populations in the service areas, infrastructure support of expanded developments - growth inducements.

3.8-35/2 **Mitigation Measure HYDRO-1** requires Permittees to evaluate the suitability of BMP locations for groundwater **recharge**. **Infiltration BMP**s would not be suitable in areas of low permeability where subsurface structures could be adversely affected by groundwater mounding.

No supporting information is provided regarding recharge capability, local groundwater storage capacities and flow regimes, and potentially affected infrastructure. No process, parameters, nor criteria for "evaluations" are provided as part of EWMP and PEIR.

3.8-41/5 **Cumulative Impact Discussion Structural (Regional, Centralized, and Distributed) BMPs** **...**Implementation of the proposed structural BMPs,...**other reasonably**

foreseeable future projects...result in improved stormwater quality and reduced non storm flows....will experience reduced dry-weather runoff, a more natural hydrology, and improved receiving water 3.8-42/1 quality. In addition, new infiltration projects will incrementally augment groundwater drinking water supplies. Although the increased infiltration projects may increase pollutant loads to groundwater aquifers, pretreatment systems **coupled with regional groundwater management lead by the local Watermasters** will ensure that the beneficial uses of **groundwater basins are not significantly impaired.** ...EWMPs will beneficially impact local surface water quality and groundwater supplies. **Mitigation Measures:** None required **Significance Determination:** Less than significant

The EWMP does not provide parameters and criteria or selection of "future projects".

No management program of "coupling" between LACo, other watershed agencies, and the "Watermasters" is proposed nor committed to in the EWMP to deal with cumulative impacts.

***3.8-43*/TABLE 3.8-3 SUMMARY OF HYDROLOGICAL RESOURCE IMPACTS REQUIRING MITIGATION MEASURES Cumulative Impacts, No mitigation required**

Without a hydrologic model and analyses especially for the "design storm", no objective assessment of impacts can be made and no supporting information is provided for the absence of mitigation requirements.

Subject: Enhanced Watershed Management Plan
RE: Comments on Programmatic Draft EIR
Final Compiled Comments 1-4/4

Following provides a brief review of the CEQA/P-DEIR (PEIR) documents of almost 70MB/1000 pages. We thank the LACo Department of Public Works and Flood Control District for this opportunity to review and comment on the PEIR and greatly appreciate the deadline extension for doing such.

Overall review is that the document(s) are inadequate, incomplete, and virtually inaccessible for the general educated public due to the volume, technical character, overly-broad statements, lack of documentation and support of statements, and lack of definitions and consistency of terms and usage,

The proposed Program does not provide a plan for tiered project CEQA considerations by the other permittees nor the County itself. No plan for the Program or the projects has been established for the Enhanced Watershed Management Plan to achieve and comply with the LA Regional Water Quality Control Board's permit requirements. A program may be more generalized but still must provide a plan of actions for both the lead and responsible agencies.

The Program does not provide even the requirements, process, and procedures for subsequent CEQA compliance by other permittees and some projection as to whether EIRs, MNDs, ND, or CE will be used to tier down from this P-DEIR/P-FEIR. Conditions for Program Compliance by tiered projects have not been listed or even referenced other than some ill-defined listing of BMPs.

No current listing of all planned and funded Projects has been provided and incorporated into a scheduled and quantified plan for submission in June 2015.

Although research has been underway for five-plus years, the EWMP and this PEIR does not use nor even reference use of computerized modeling of the appropriate basins (Ballona Creek, Upper LA River, Middle LA River and Arroyo Seco, Lower LA River and San Gabriel River, and LA River Mouth/Estuary-Dominguez Channel), although the federal agencies (BLM, USGS, ACoE, etc.) and perhaps local agencies (some permittees and the Water Board) have some local or watershed models . Without a model and its components, the impacts and their significance of detention, retention, recharge, and flood protection cannot be assessed nor mitigated adequately or completely.

Three goals are provided but no objectives (sub-tiered from goals) are provided with/without defined schedules and other quantitative parameters for program monitoring. Confusion is introduced in later text when both flood control and water supply "augmentation" are also introduced as "goals" and as "objectives".

Specific goals are only to meet the MS4 Permit requirements in June 2015 and after and related water quality conditions and to meet them in a "Cost-Effectiveness" manner. However, costs, financial support, revenue, capital bonding, or economic effectiveness or efficiency are not provided, and thereby achievement of the cost effectiveness cannot be judged nor compared and appears to be presumed by submission of any proposed project.

Growth inducement is mentioned primarily with regard to direct housing construction and employment and incomes while dismissing potential effects of recharged (diverted storm flows) water supplies.

Additional benefits primarily for flood protection are mentioned in some statements while it is not supported by any text or analyses under water resources. No assessment of beneficial and adverse effects are provided for raising base flow levels from program-augmented/diverted-stormwater groundwater resources and their effects upon subsequent pollutant concentrations and flood flows.

I am retired from 30 years in water and environmental resources with Parson Corp., Pasadena and URS San Francisco and over 10 years with Dubai (UAE) government and local water and environmental companies. I have prepared sections and entire documents for more than 300 EIRs, EISs, and EAs worldwide for local agencies, cities, counties, states, federal, and international agencies and organizations and have reviewed more than 100 additional assessments. During work for URS, I was involved in the development and environmental considerations for the 1970s EPA's Santa Ana and Santa Marguerita/San Luis Rey basins plans. My reviews have included the LACity's Recycled Water Management Plan and Stormwater Capture Management Plan, and I am currently vice chair of the Steering Committee forthe LA City's Floodplain Management Plan. I am also the Senior Technical Advisor for the CCSC and a member of the Sierra Club, Angeles Chapter, Water Committee

Dr. Tom Williams

MAJOR ISSUES:
Comments regarding deficiencies have an implied request for additional information and appropriate revisions to be added in the PEIR, and especially the formal Mitigation, Monitoring, and Reporting Program.

<u>LACo Water Computer Model</u>
No model has been used or referenced.

<u>Project Storm</u>
References are made to the Project Storm event of 85th-percentile for 24-hour (not = daily) rainfall and estimated at 0.75 inches, but no primary references or sources for the storm distributions are provided. Choice of this particular criterion is not described but may be related to the permit requirements without any further considerations or its appropriateness. Provide references and demonstration that the storm precipitation applies to the entire southern LACo or where it does apply.

<u>Increased Water Supply and Growth Inducements</u>
Many statements of the use of diverted stormwater and other waters for recharge is not carried through to the ultimate effects of such recharge on base flow (exfiltration) from shallow groundwater into channels or on the available safe yields for potable water supplies. The entire PEIR is incomplete and totally inadequate for the discussion of the volumes, recharge areas, and pumping areas and uses for increased local water supplies either as a means of substitution for imported with the same population or to assure adequate total supplies for increasing or re-distributed populations.

<u>Environmental Justice for Water Supply Sources</u>
Also as an environmental justice issue, the PEIR does not address the distribution of recharge areas for both local stormwater and treated recycled waters (also part of LACo and LACity plans and projects), compared to those areas receiving the higher water quality and lower total delivered costs of imported waters. As both areas would presumably pay the same, or similar, water supply rates, they must get the same quality water (e.g., TDS, nitrates, metals, etc.), else wise an environmental justice issue appears to exist. Provide the expected water quality and any treatment related to recharged storm and treated wastewater and to imported water (e.g., northern San Fernando Valley-Santa Clarita vs Torrance-Compton-Whittier.

<u>Public Health</u>
Retention, detention, and recharge facilities create good habitats for mosquitoes and other vectors but the PEIR mention mosquito and other water related vectors four times. No discussion is presented regarding the public health issues for water- and water-logged soil related habitats for disease vectors, especially give the concerns regarding West Nile and Dengue Fever vectors. Having suffered malaria, the reviewer may be overly concerned, but some assessment and mitigation measures must be included. As a long term operations and maintenance issue, demonstration of ongoing revenue sources, and appropriate O&M funding and activities are vital to any assessment of water related projects in a dense board urban environment.
Fungi-Mold (Valley Fever) are/is would be expected to expand especially in those areas with high soil moisture and perhaps overlying near surface mounded groundwater.
Accumulations of metals and hydrocarbons may occur due to treatment by soil-based systems and stabilization of metals in project basin soils and vegetation.
Watershed health is mentioned but only as this health relates to the presence or removal of contaminants from the dry-/wet-weather runoffs.
Provide discussion regarding any stormwater-related diseases.

<u>Operations and Maintenance and Revenues</u>
Proposed facilities would be expected to have high manual maintenance.

Provide requirements for coordination/compliance with scheduled maintenance that must be incorporated into a thorough scheduled and quantified Mitigation Monitoring and Reporting Plan/Program for all facilities and operations.

Revenues and Stormwater Fees

Sources of revenues are not provided to support capital construction and replacement, financing, and long term operations and maintenance, especially any changes in the LACo Storm Water Fees on annual property tax rolls.

No provision is made for revenues based on per-parcel or per-area assessments and fees.

No assignment and delineations are made for benefits and effects/risks to the public and land owners for water quality, flood control, or recharged water supplies.

No comparisons are offered to compare abilities for overall or percentile economic groups to pay for both owners and residents.

Provide full description and assignments of revenues, life-of-project costs, and ability to pay for revenue sources.

Revenues from Groundwater Production

Groundwater resources will be increased, but it is unreported as to the ownership and allocation of the recharged water and to the process of recovery of increased local groundwater resources beyond the immediate vicinity of the recharge areas.

Flood Control, Protection, Diversion, and Other Related Issues

Flood protection, control, and management are mentioned as a goal/objective of the program but without delineation and definition, and significance to other related concerns (e.g., Growth inducement).

Provide estimated changes of wet- and dry-weather flows.

Effects of Increased Base Flow (levels and flows)

No meaningful discussion (two-2 mentions of base flows in all 504 pages) is presented as to both the beneficial and detrimental effects of higher base flow volumes and levels resulting indirectly from rising/mounding groundwater resources downslope of stormwater and recycled water recharge basins/projects.

Increased low flow volumes for pollution dilution of existing and other permitted discharges are not considered.

Increased low flow levels for increased total flood level and expanded flood area are not considered.

Special Issue: LACity - EWMP 400+ projects (BMPs) and PEIR

Inquiries, internet searches, and requests for public documents have been submitted to the Department/Board of Public Works, City of Los Angeles for documents, reports, and other materials pertaining to the reported 400+ storm water related projects, BMPs, etc., that presumably would be part of the 12 EWMPs for the permittees to submit to the LAWQCB in June 2015 and which is referenced in the LACo EWMP and this PEIR. As of 3pm-16 March, 2015, more than ten days after submission of the request to LACi-BPW, no contact has been made by the LACi-BPW or LACiDPW.

This indicates that such EWMPs' projects may be erroneously reported herein or that they are not part of the PEIR and not available to the public. This is a clear example of importance of having all information prior to preparation of the LACo EWMP and this PEIR. as the total number of stormwater related projects probably exceeds the total numbers of other permittees we must assume that the EWMP-PEIR is incomplete and inadequate for public review and meaningful comments.

Please withdraw the current PEIR and recirculate at a later date when all relevant information is available for public review and comment.

EWMP - SPECIFIC COMMENTS
Comments, recommendations, and additions are presented in **Bolded *Italics*** following relevant PEIR text specific to the comments are presented in plain text as was in the PEIR. Some specifically relevant PEIR text may be **Bold <u>Underlined</u>**.

Apdx. A, NOP, p.9/4 **4.1.1 Regional Structural BMPs** "Regional EWMP projects" are defined by the MS4 Permit as multi-benefit regional projects that, wherever feasible, retain all non-stormwater runoff and all **<u>stormwater runoff</u>** from the **<u>85th percentile, 24-hour storm event</u>** for the contributing drainage area, while also achieving other benefits such as flood control and/or water supply.

The PEIR states consistently that the project storm is the 85th percentile/24-hour/approximately 0.75inch (some up to 1 inch). However no documentation/derivation of the 24 hr storm analyses has been provided. The 24-hour storm event is not equal to a daily storm event (any 24-hr vs a 12:01:01am-11:59:59pm) and can be quite different based on moving 24-hour totals and frequency compared to that for calendar day.

Similarly the runoff from a 0.75inch rainfall would not be expected to be the same as the amount of rain falling on the ground (467gals/1000sqft vs 0.9x467gals= say 420gals) but no provision is made regarding runoff coefficients..

The PEIR is inadequate with regard to the absence of documentation/analyses demonstrating the total distribution from say 50%-100% of 24hr storm event. Furthermore no assumed runoff coefficient(s) has been provided for estimating the likely detention capacities required.

Executive Summary
The Executive Summary (ES) has not been thoroughly reviewed as the ES supposedly represents a limited version of the P-DEIR text content and cannot be assessed for adequacy and completeness as a stand-alone item. Some issues warrant some review and comments.

ES-2/2 The EWMPs **<u>will</u>** identify **<u>potential and priority</u>** **<u>structural and non-structural</u>** Best Management Practices (BMPs) within the region's stormwater collection system to improve runoff water quality.

As indicated, this EWMP has no direct factual contributions from the individual EWMPs of other permittees within LACo. No formal organization and definitions of the EWMP, EWMPs, and all the "BMPs" has been provided and consistently applied throughout the document. As the statement refers to a future condition, not in evidence, such statements here and throughout the document must be verified and suported by commitments on the part of the other permittees.

Potential and priority BMPs are referred to but are not adequately related to the EWMPs and the EWMP/PEIR and as indicated herein they ARE BEING developed, they are not developed. The EWMP and PEIR are not definitive at even a programmatic or conceptual design level.

ES-2/5 A few of the BMPs are currently **<u>well defined</u>** but most **<u>are yet to be fully developed</u>** under the EWMPs....priority BMPs...detailed in each of the EWMPs; these **<u>are being developed in parallel with the PEIR</u>**....describes the details **<u>that are available</u>** for each of the EWMPs currently...by the EWMP working groups.

1-3/3 A set of **<u>priority BMPs</u>** will be detailed in each of the EWMPs; these are being developed in parallel with the PEIR. The PEIR describes the details that are available for each of the EWMPs currently under preparation by the EWMP working groups.

As indicated, this EWMP has no direct factual contributions from the individual EWMPs of other permittees within LACo.

No definition of "Fully" or "Well" is provided for the PEIR and as they are being developed at the same time as this PEIR their entire discussion is so general as to render assessment impossible and open to any combination of current or future "projects" and BMPs as desired by the agencies. No reliable discretionary decision can be made and funded based on the PEIR.

ES-3/3 **ES.3 Project Objectives**
The primary goals and objectives of the EWMPs are:

- To **collaborate among agencies**...to promote more **cost-effective** and multi-beneficial water quality improvement projects **to comply** with the MS4 Permit.
- To develop watershed-wide EWMPs that will...**remove or reduce pollutants** from dry- and wet-weather urban runoff in a **cost-effective manner**.
- To reduce the impact of stormwater and non-stormwater on **receiving water quality**.

Elsewhere goals and objectives are mentioned and then supposed objectives are provided. Here these are largely "goals" as they have no specification of schedule or quantification.

As these are stated as "primary" with no mention of secondary or tertiary goals or objectives, the entire EWMP is without adequate or complete goals and objectives and various statement totally confuse the basis for the "project" and related " alternatives" and their compparisons and assessments.

Report is unclear as to definition and has inconsistent usage of Goals and Objectives of the Program.

These are Goals only, while objectives must have specifics as to schedule and quantitative indicators of compliance (e.g., acre-feet/year recharged, return rate changes by 2020, etc.

ES-3/5 The LACFCD has a **vested interest in increasing opportunities** for stormwater capture and groundwater recharge as a means of assisting **local water supply augmentation**.

Direct reference to increased water supply without delineation as to where augmentation and local supplies may be augmented.

Without removal of existing facilities in order to reduce existing water supply flow capacities, increased local sources can increase and must be considered as increased total water supply and appropriate assessment of growth inducement.

Local augmentation, in general, would be at lower elevations than imported water supplies would serve due to the State Water Project and Colorado River Project source elevations of imported supplies and those of most probable recharge areas and down-flow groundwater wells. Service areas of recharged stormwater and recycled waters are generally of lower elevations and of different economic status from those at higher elevations and served by imported water supplies..

1-1/3 The MS4 Permit gives Permittees the option of implementing an innovative approach to permit compliance through development of an Enhanced Watershed Management Program (EWMP)....**will identify potential and priority structural and non-structural Best Management Practices (BMPs)** within the region's stormwater collection system to improve runoff water quality. The LACFCD, along with participating Permittees, has opted to exercise this option and has submitted to the LARWQCB 12 separate Notices of Intent (NOIs) for the development of EWMPs within 12 distinct watershed groups...Implementation of the EMWPs would be the responsibility of each Permittee and would occur following approval of the EWMPs by the LARWQCB.

BMPs, groups of BMPs, and Projects are not defined at any engineering levels so as to determine cost-effectiveness, capabilities to achieve any project/program goal involving water quality or flows and their effects and impacts.

p.1-3/2 ...timeline...in the MS4 Permit requires that Permittees submit the ***12*** EWMP***s*** to the LARWQCB by June 28, 2015, in order to be in compliance with the permit conditions.

Should have started earlier. Mid March - Late June, 105 days, is a very tight, aggressive schedule and should have been better scheduled and implemented. Public participation should not be sacrificed for untimely agency coordination. Some issues may be resolved through tiering and MMRP in the Final PEIR.

LACo EWMP vs 12 additional EWMPs in 90 days following LACo BOS approval and certification may be in jeopardy.

12 EWMPs are required and presumably requires local jurisdictions to have discretionary actions by city councils. Presumably the cities will reference the LACo EWMP-PEIR as CEQA compliance but must have the project specific and local BMP EIRs/MNDs processed to be in compliance with this PEIR and CEQA. As stated herein this PEIR, the PEIR does not complete the CEQA compliance for the 12 EWMPs and their CEQA considerations.

p.1-3/2 As a result, the LACFCD has prepared this Program Environmental Impact Report (PEIR) in compliance with the California Environmental Quality Act (CEQA) to provide the public and the responsible and trustee agencies with information about the potential effects on the local and regional environment associated with implementation of the ***12*** **EWMPs**.

Relationship and contents of the master PEIR and tiered EIRs/MNDs and other CEQA documents are not clearly provided. The statement and others promote confusion between the EWMP and the EWMPs and between the PEIR and CEQA considerations for the 12 EWMPs to be tiered off of the PEIR and documented separately.

p.1-3/2 The LACFCD will submit the PEIR to its governing body, the Los Angeles County Board of Supervisors, for approval prior to submittal of the EWMPs. The **EWMPs** will be submitted by each EWMP group to the LARWQCB.

Discretionary actions by the BOS do not substitute for the discretionary actions by the 12 jurisdictions of the "EWMP Groups" (cities) to approve the 12 local EWMPs and their incorporate BMP projects.

What is an "EWMP Group"? Presumably one or more cities who will agree on an EWMP and vote to approve the EWMP before submission the the LARWCBrd. CEQA requires environmental considerations other than referencing this PEIR for the 12 local EWMPs.

p.1-3/3 **This PEIR describes and evaluates each of the EWMPs being prepared by the Permittees collectively.**

This statement suggests that this PEIR covers all EWMPs prepared by an "EWMP Groups" and that they have been prepared and incorporated herein. No documentation is provided as to whether cities approved and authorized any local EWMP and its inclusion herein. Presumably one or more cities who will agree on an EWMP and vote to approve the EWMP before submission the the LACo for inclusion in the PEIR and submission to the LARWCBrd. CEQA requires environmental considerations of the local discretionary actions other than referencing this PEIR for the 12 local EWMPs.

p.1-3/3 The discretionary action prompting the need for CEQA compliance is the **submittal** of the completed EWMPs to the LARWQCB.

Submission is not a discretionary action but a ministerial action on the part of a department following the discretionary action of a Board of Supervisors, city council, or other public elected body to approve the local EWMP and its shcedule and funding.

p.1-3/3 A few of the BMPs ***[=Projects]*** are currently well defined but most are yet to be fully developed under the ***12 local*** EWMPs. A set of **priority BMPs *[=Projects]*** will be detailed in each of the EWMPs; these are **being developed** in parallel with the PEIR. The PEIR describes the **details that are available** for each of the ***12 local*** EWMPs **currently under preparation** by the **EWMP working groups**.

Confused and demonstrates that this PEIR may be incorporating projects, BMPs (if different), some portions of the other 12 EWMPs, and the LACo EWMP which has not been approved by the LACo BOS.

Is it EWMP group, EWMP Working Group, or Permittees? Are they the same or different? Have any been approved and funded by a council in a discretionary action? Clarification is needed.

1-3/3 The EWMPs will identify **management strategies** including **hundreds of structural Best Management Practices** (BMPs) that **may be** designed and implemented by the Permittees to meet **permit compliance objectives** ***[Only one of the Program objectives]***.

Clearly indicates that this RAA model for water quality is not completed prior to its assessment and that the assessment cannot adequately assure that even the water quality goals and objectives cannot be realized.

Water quality and flow models and proposed BMP depend on diversion or reduction of flows during both dry- and wet-weather flows, and therefore the RAA must be based on a hyrdologic/hydraulic model which has not bee referenced or mentioned.

This EWMP and PEIR must provide the programmatic management strategy guidelines for those of the tiered-down EWMPs-strategies and related CEQA documents. Use of the conditional: "may be" voids following verbs and leaves the statement as irrelevant to the Program and Project EIRs.

p.1-4/par.3 The EWMPs...discussion of the environmental documents, assessments, and permitting required for the implementation of the **priority projects**. The PEIR **can provide** a basis for this discussion...PEIR in the development and implementation of the EWMPs is further discussed in this chapter in the *Purpose of the Program Environmental Impact Report*.
Priority BMPs were discussed but have not been distinguished from "Priority Projects".
A "priority project(s)" are not defined and therefore the statement is rendered meaningless.
Throughout the referenced section 1.3 (p.1-9 - 1-10), statements are made as to "can" rather "shall" and thereby the PEIR does not establish a procedure for the tiered environmental documents shall assess their environmental impacts and provide mitigation.
The PEIR does not discuss the process of tiering to projects or to specific BMPs and whether Mitigated Negative Declarations will be tiered down from this PEIR or whether the project must require tiered/focused EIRs for full and adequate CEQA compliance.
The PEIR must provide a procedural context for most if not all elements for the Project EIR/MND by the local agencies as the LACo shall be a responsible if not a lead agency for each Project. As provided the PEIR is incomplete and inadequate for establishing an expected or required procedure and process for preparation of a project specific CEQA document.

1-5/3 **Watershed Management Programs** The MS4 Permit Section VI.C (page 47) includes provisions that allow Permittees to **voluntarily choose to implement** a Watershed Management Program (WMP). The **purpose of this program** is to “allow Permittees the flexibility to develop Watershed Management Programs to implement the requirements of [the] Order on a watershed scale through customized strategies, control measures, and BMPs.” The permit states that “participation in a Watershed Management Program is **voluntary** and allows a Permittee to address the **highest watershed priorities**.”
CEQA is not voluntary and the "Program" must provide the structure for the tiered CEQA process to operate and satisfy CEQA for each project or tiered PEIR.
The permittee is not the department but the City or County. Provide a listing of all councils which have approved development and submission of an EWMP to the Regional Board.
As a program, provide all documentation as to whether the subsidiary agencies have committed to the Watershed program or whether they have voluntarily chosen not to participate.
No priorities are provided - references are made to conservation priorities, pollutant priorities, renewable priorities water quality priorities, and watershed priorities (and highest watershed pr...), but only some water quality priorities are discussed.

1-7/1

- Other Receiving Water Considerations (**second category**):
  - The second highest priority shall be considered controlling pollutants for which data indicate impairment of exceedances of receiving water limitations and the findings from the source assessment implicates discharges from the MS4.

As no hydrologic model for flows and concentrations has been provided even for the TMDL constituents, references to secondary pollutants appears totally inappropriate and purposefully attempts to elevate the credibility of compliance with the TMDL, which has not been achieved.

1-7/2 The **EWMP prioritization process** includes
identifying the priority pollutants and...
schedule for implementing BMPs to meet the following criteria:

- For pollutants...same class as TMDLs,...consider these pollutants within...same time frame as...TMDLs.
- For...303(d) list...EWMPs develop a schedule to address these pollutants **as soon as possible** with milestones.

Priority pollutants have already been prioritized and identified, and the prioritization process has not been described although referred to, and no schedule for prioritization, definition of priority projects or priority BMPs has been provided.
Prioritization process and schedule are rendered totally inadequate when modified by whenever "possible". MMRPlan must include a full and scheduled prioritization process for ALL EWMPs.

HYDROLOGICAL MODEL References to hydrological "Model"
1-8/1 **Reasonable Assurance Analysis ...**(RAA) is...to demonstrate "that the activities and control measures will achieve applicable **water-quality-based effluent limitations** and/or RWLs with compliance deadlines..."...as a **quantitative demonstration** that **control measures (such as BMPs) will be effective**, the RAA also provides an **opportunity to use a modeling process** to identify and prioritize potential control measures. The RAA for each EWMP uses a **model to simulate a critical storm (design storm)** and...achieve compliance with the TMDLs and water-quality-based effluent limitations.
1-8/2 The RAA **is being performed** as part of the preparation of the EWMPs, and **in parallel with...this PEIR.** The RAA...primary goal of the EWMP...meet the **water quality goals**. The **modeling being performed**...will determine...number and distribution of the BMP types and specific projects identified in the EWMP Work Plans will meet the water quality goals. This PEIR will assess the types of BMPs that **may be implemented** to meet **these** ***WATER QUALITY*** **goals**.
As indicated in the PEIR text and appendices, the PEIR lacks any quantified Hydrologic Model for watershed controls and has focused the only "modeling" on meeting the water quality requirements of the MS4 at discharges, not watershed controls.
Management strategies (MSs) presumably are different from the BMPs and the EWMPs which they maybe be parts of, but MSs are not defined nor associated with BMPs and EWMPs.
The RAA and a supporting/integrated Hydrologic Model must be provided in a final form to be incorporated, not be performed in parallel, with full integration/incorporation. The MMRPlan must include a final RAA.
Apdx A NOP 8/5 In accordance with the provisions of the MS4 permit, the work plans describe the following steps to EWMP development:

2. Characterization of existing and potential control measures within the watershed
3. Addressing the approach to incorporate **reasonable assurance analysis (RAA)** in the **optimization of watershed control measures**

3.2 Air Resources and 3.6 GHGs
These sections reference many air-related models and modeled/modeling results and comparable to requirements for surface, recharging, and ground waters.
Apdx A. Comment Letter to the LACFCD: Draft PEIR p.16/Item 56: Foothill Municipal Water District Recycled Water Project ... Cal Poly Pomona has partnered with FMWD and **is developing a model** that will also capture stormwater for recharge using the same infiltration galleries.
pdf-254 Comments - Model ...**no cost/benefit analysis** or any **modeling** completed to substantiate the "cost-effectiveness" of these methods. Please identify any additional documentation supporting this claim. Enrique Huerta Downey, CA ehuerta28@gmail.com
Scoping Comment Letter indicated that minor agencies/permittees may have conducted some form of hydrological model but not the EWMP or the PEIR.

1-9/1 The LACFCD will **consider** the information presented in this PEIR, along with **other factors**, **in the development and implementation of the EWMPs**. The EWMPs are to include a discussion of the environmental documents, assessments and permitting required for the implementation of the **priority projects**. The PEIR **can provide** a basis for this discussion.
1-10/2 The EWMPs are to include a discussion of the environmental documents, assessments, and permitting required for the implementation of the **priority projects**. ***Repeated***
Consider and other factors are not defined and as such allow the entire PEIR process to be set-aside.
The PEIR does not fully define the roles and participations of the LACFCD in the development of tiered EWMPs and their CEQA documents.
Again "priority projects" are mentioned and not defined with regard to "priority and potential BMPs."

CEQA texts must recognize differences between "can/could provide" and "will/would provide" and require clarity as to what will occur in the teiring of projects and CEQA documents.

1-9/3 Purpose of the Program Environmental Impact Report The LACFCD determined that implementation of the **12 EWMPs** could have a significant effect on the environment and therefore required preparation of a PEIR...-

to provide...information about...significant environmental effects of the **proposed program** ***[=EWMP]***,
to identify possible ways to minimize potentially significant effects ***[=PEIR/EIR Mitigation measures]***, and
to describe and evaluate feasible alternatives to the proposed program ***[=EIR Alternatives]***.

Use of EWMP, EWMPs, and Program causes confusion as to what is what and what will be presented in each. PEIR and EWMP/s must be revised for consistency.

1-9/4 This document has been prepared as a PEIR...one type of environmental review document that may be used to evaluate a plan or program that has multiple components (projects and actions) or to address a series of actions that are related in any of the following ways:

Geographically. As **logical parts in the chain of contemplated actions**.

- ...issuance of rules, regulations, plans, or other general criteria to govern the conduct of a continuing program.
- As **individual activities** carried out under the same authorizing statutory or regulatory authority and having **generally similar environmental effects** that can be **mitigated in similar ways**.

No logical chain has been graphically depicted/modeled and arranged to demonstrate and monitor progress to and through the permit and compliance process for such a wide variety and mammoth scale of the projects and their components (e.g., diversion-transmission-spreading-recharging-production).

1-11/1 Maps identifying **potential and priority BMP locations** are provided in Chapter 2...with the overall EWMP **watershed characteristics** and **BMP implementation strategy**.

No definition or specificity of potential and the subgroup priority BMPs and locations nor details are provided within the tables and generalized maps. No watershed characteristics are provided regarding runoff coefficients, design rainfall amounts, times of concentrations, are estimated flow levels are provided for any watershed, not even a ranking of highest to lowest flows or highest-lowest dry- and wet weather water qualities.

1-11/1 The PEIR **focuses** its assessment on **construction and operation** of these potential and priority BMPs to be installed throughout the watersheds—but primarily within urbanized areas where the **pollutant loading is greatest** and where these **BMPs can be most cost-effective** in **meeting water quality goals**.

No focused information is given regarding the BMP operations and their effectiveness in removing pollutants and meeting water quality goals (not objectives).

No information is provided regarding the degree of urbanization for each watershed, nor the assumed "loadings" being greater, median, or least.

Herein "priority" and "potential" BMPs are equated while in other statements there are implied "priority" and "non-priority" "potential BMPs".

BMPs are presumed as cost effective without documentation and analyses as to pollutant - present/removed per 100 acft or any other quantified parameter and as to achievement of current reductions down to desired goals.

Clarify and apply consistently BMPs assignments.

1-11/2 Scoping Period ...A Notice of Preparation (NOP)...was circulated to...**other interested parties**...discussed the purpose of the EWMPs and their management strategies, identified the EWMP Study Areas, and provided a brief and preliminary list of environmental issue areas that **could be impacted**.

As indicated in Scoping Comments, the PEIR does not reflect comments provided during the Scoping period and for the Initial Study and Notice.

-Socio-economics and revenue sources to assure operations and maintenance,
- Environmental justice

- Water models or Other Quantitative Estimates/Flowcharts

ly

1-18/2 **Chapter 1.0,** ***Introduction*****.** This chapter discusses...the background and **purpose** of the PEIR for the proposed program.

The PEIR does not provide the objective, full disclosure, complete, and adequate purposes of the EWMP, and therefore the purposes of the PEIR cannot be satisfied. Similarly, the PEIR is suppose to be publicly understandable/accessible which it is not.

Issue-Water Supply

2-1/ The structural watershed control measures that will be implemented by the LACFCD will be multi-benefit **stormwater projects** that emphasize **flood risk mitigation**...

Control [=BMPs] measures refers to stormwater/flood risk mitigation = Flood Control which is not developed and is not part of the Program Goals. EWMP/s may claim multiple benefits but must provide documentation and analyses in order adequate support such claims.

p.2-1/par.3 This Project Description describes types of BMPs...to illustrate the function, type of construction, and general locations of the BMP types for the **purpose** of the environmental assessment of the BMP types identified in the EWMPs.

As indicated elsewhere, the local conditions govern where the optimal locations for BMP would be and general assessments cease to be appropirate for CEQA compliance unless the forms and procedures are provided to reflect the local assessment in the project EIRs/MNDs.

2-2/2 **2.2** ***Project*** **Goals ~~and Objectives~~**

The **primary** **goals and objectives** of the EWMPs are:

- To **collaborate among agencies** (Permittee jurisdictions)...to **promote more cost-effective** and **multi-beneficial water quality improvement projects** to **comply with the MS4 Permit**.
- To develop watershed-wide EWMPs...remove or reduce pollutants from dry- and wet-weather urban runoff in a **cost-effective manner**.
- To reduce the **impact of stormwater and non-stormwater on receiving water quality**. ***[#2 and #3 are virtually identical and only differ by the "terms" used: Wet vs Dry Weather Flow vs Stormwater and Non-Stormwater, which would be defined the same]***

[In #1 and #2, references are made to cost-effectiveness although never discussed and compared.]

Reference to costs requires a description, assessment of impacts, and provisions for the life of the project - at least 25 years. Most importantly are provisions sufficient annual funding for operations and maintenance of all facilities through and beyond 2040.

Assessment must include best-available information and projections economic, financial, bonding, costs (both capital and O&M), and ability to pay by the service populations.

This is particularly important as the LACo and associated cities are promoting changes of "Storm Water Fees on the LACo annual property taxes and fees.

This deficiency and conflict clearly indicate that the entire PEIR is incomplete and inadequate with regard to costs and other related issues for the proposed program.

Table 2-3 **Project Feature - Flood Protection**

No description of flood protection is developed for the EWMP and thereby must not be included, or mentioned, without development and assessment of benefits and impacts. No coordination/collaboration has been referenced or known in the LACity Floodplain Management Plan.

2-5/1 Additional information and figures on the location and distribution of potential and priority BMPs based on available data at the time of publication of this PEIR, are presented in Section 2.5*, EWMP Watershed Characteristics and BMP Implementation Strategies*.

No additional information is provided regarding the City of Los Angeles array of 400+ projects/BMPs.

Public Health and BMP Maintenance (ongoing annual costs)

2-9/1 Wet detention ponds may require **engineering**...to ensure that the permanent pool does not become stagnant and a magnet for **mosquito production (must be emptied within 72 hours)**.

"Wet detention ponds" and dry ponds are not characterized and compared. No engineering mitigation measures are provided to mitigate this important potential impact in the urban/suburbanized areas in the vicinity of such "ponds".

Rain Barrels

2-13/2 **Planter Boxes.** Planter boxes are bioretention systems...where space constraints limit the implementation of other LID elements...designed to both filter and store runoff...used in combination with **rain barrels and cisterns** that store the runoff and then direct it ***into*** these boxes to filter the runoff.

2-14/2 **Rainfall Harvest.** Rainfall harvesting improves water quality by intercepting rooftop runoff...**rain barrels** are storage tanks used to intercept and store rooftop runoff for **nonpotable use** such as landscape irrigation or gradual infiltration.

Rain barrels and planter boxes can suffer from the same public health issues as "detention ponds".

Rain barrels are important components of the LID programs but most if not all LID ordinances require only two barrels (e.g., 100 gal storage) for a typical 1000-2000sqft roof on single family dwellings which would generate 450-900 gal of roof runoff for the design storm. Revise the entire LID write-up.

2-15/2 ***Source Control BMPs.*** Source control structural BMPs are commercial products designed to treat runoff in highly urbanized environments. Mechanical separation, or more complex physicochemical processes, provides separation of gross solids and other pollutants...**designed to sequester hydrocarbons and other pollutants**.

Residual pollutants and their disposition is not mentioned nor provided any where in the PEIR. No discussion is included regarding the soil sequestering of hydrocarbons, metals, and other pollutants in the ground materials (especially in/on clays). No estimate is provided as to anticipated sequestering per year and probable long-term removal of soil materrials before they achieve "hazardous" levels.

2-16/2 Specific examples of **distributed** BMPs that are in various stages of planning and implementation and part of a possible EWMP are presented in **Table 2-3**. The locations of these examples of planned **distributed** BMPs are shown in **Figure 2-2**. Table 2-3 presents the locations, project description, and key elements of the **distributed** BMPs to further illustrate these types of structural BMPs that **may be part** of **an** EWMP. Additional information and figures on the location and distribution of potential and priority BMPs, where data ***are***~~is~~ available, are presented in Section 2.5, *EWMP Watershed Characteristics and BMP Implementation Strategies*.

Centralized and Regional BMP discussions repetitive from 2-16/2 except as highlighted.

TO BE SUBMITTED

p.2-18 **Upper LA River Brandon Street and Green Street Improvements Project**

The project will reconstruct...roadway...design includes...Much of the runoff from the streets and private properties that would have otherwise drained to the Rio Hondo will be directed to the infiltration area.

How much

2-19 **Upper San Gabriel River Avocado Heights Multiuse Trail Project**

The project will...thereby reducing the amount of impermeable surfaces as well as runoff.
Approximately...Combined together, **up to 115 acre-feet of groundwater** will be recharged annually.

2-22/1 ***Infiltration BMPs.*** Infiltration facilities are designed to **decrease runoff volume through groundwater recharge** and improve water quality through filtration and sorption.

No discussion of beneficial effects is provided for rising base flow
providing greater dilution volumes assuming that discharges remain constant, or
providing higher water levels when stormwater arrives at downstream locations and thereby elevating the flood water levels and inundation extent.

2-26\3 **Creek/River/Floodplain/Estuary Restoration*.*** This category includes multi-benefit projects that typically combine elements of **habitat restoration**...as **flood management** and water quality improvement.

Project components such as...setback levees, floodplain bench excavation, levee breaches, and other actions can **increase...flood storage capacity**...
...This project restored 1.2 miles of natural bottomed creek habitats, which are capable of infiltrating up to 118...million gallons of stormwater from the wash into the local groundwater aquifer.
Plants in the wash also aid the biogeochemical removal of pollutants such as nitrogen.
Actually bacteria and fungi attached to the cellousic stems and leaves that are periodically submerged. Few emergent plants can absorb or treat any aqueous pollutants.

.

2-32/Table 2-4, Item 2 Phase II of the Penmar project...Replacing this volume of potable water with treated storm water...provides 34.7 million gallons per year increase to annual runoff diversion capacity...By installing the reuse option, the overall project capacity will increase, thereby also increasing the volume of urban runoff that can be retained by the project **for use as an alternative source of water to potable water** for landscape irrigation.
.

2-34/1 **2.4.5 Regional Structural BMPs** Regional structural BMPs are those that can **capture the volume of water from an 85th percentile, 24-hr storm in a contributing watershed, known as the *design volume (...*85th percentile storm...0.75 inches over 24 hours**).
The project's BMPs...**alleviate local flooding** by collecting runoff from a 21-acre drainage area...into two underground infiltration galleries...
.

2-34/2 *Anticipated Construction Activities:* The construction activities...are generally similar to those of their centralized counterparts, with the **exception of regional retention BMPs**,...adequate storage capacity to **hold runoff from the design storm**....Larger, multi-benefit regional BMPs are similar to **centralized multi-benefit regional flood management projects**...
.

2-35/1 ...**regional** BMPs...of planning ***and implementation and*** **that are part** of the EWMP are presented in **Table 2-5.** The locations of these examples of **regional** BMPs are shown in **Figure 2-5**. Table 2-5...of the **regional** BMPs to further illustrate these types of structural BMPs **that are concepts being developed through the EWMP process**. ...of potential and priority BMPs, where data ***are***~~is~~ available...*BMP Implementation Strategies*.

The complex repetitive wording and slight but several differences in these texts cause considerable confusion for the public review and participation in this CEQA process. Without clear table-ed presentation meaning and clarity are lost, rending these important issues inadequately treated in this PEIR.

2-40/1 Summarized below are the general characteristics of the watersheds within the **EWMP Groups** and the overall strategies for BMP implementation...twelve **EWMPs** are consolidated to **six watershed areas**...summary provides additional detail on the distribution and location of **potential and priority BMPs**, **where data is available**,...for each EWMP and show the location and distribution of **planned and priority regional/centralized BMPs** for which **data are available at the time of publication of this PEIR**. The **priority BMPs**...subset of the potential BMPs that have undergone a site review and project evaluation that has identified these BMPs as a priority. These **priority projects** are shown based upon **available data at the time of publication of this PEIR**.

EWMP groups, EWMPs, and watershed areas are inadequately associated and defined; presumably 12 EWMPs may be associated into 6 EWMP Groups based on watershed associations.

Similarly designations as to:

Potential, Planned, and Priority BMPs - Priority BMPs are part of Potential BMPs

Regional and centralized BMPs - excluding distributed

Priority projects or BMPs

require clear definitions and ordering in order to have adequate clarity for public review.

2-40/1 **Appendix G** provides the location and general description of the **priority BMPs**...**Distributed BMPs** are planned to be implemented throughout the urbanized areas of each EWMP.

2-43/3 ...Figures 2-5 through 2-16, each of the **EWMPs**...wide distribution of BMPs to achieve permit compliance. **Appendix G** provides the locations and general descriptions of the **priority BMPs** (**where data is available)**,...**Priority Projects** are **projects that have been identified through the EWMP process** as **targeted for implementation** within the first years following the EWMPs approval by the LARWQCB. **Identification of Priority Projects is underway** and **has not been completed by all EWMPs at this time**. ***[For any??]...*****PEIR is being prepared in parallel to the EWMPs**. **Priority Projects** ***[proper noun]*** **will be defined** in all the EWMPs **to be submitted for public comment in June 2015**. Priority Projects that have been identified at this time through the EWMP process are shown on the following figures. **Priority Projects may be regional, centralized or distributed type BMPs**. For **potential projects**...location of potential regional and centralized **BMPs** are shown. Distributed BMP will be distributed throughout the urbanized areas and are not shown on the following figures ...***2-44/1***...

No "general description" is provided for the program, projects, and BMPs, as summarized below, only listings and figures found in the Vol.1. Apdx. G EWMP Proposed BMP and Priority Project Data and Figures A-L, pages unnumbered items renders the entire appendix confusing and un-reviewable for the general public and the only "General Description" is APN numbers.

2-41/7 This watershed is further differentiated by the **importance of groundwater recharge basins** that are supplied by a **series of reservoirs further upstream**...

No information is provided regarding the basins, total projected annual recharge flows, and relationships between "reservoirs" and "recharge basins" presumably the augmented groundwater storage basins, rather than basins used for recharge.

TO BE SUBMITTED

2-42/4 The Los Angeles River...natural hydrology of the Los Angeles River watershed has been altered by channelization and the construction of dams and **flood control reservoirs**...Because of the greater extent and number of pollutant priorities, the BMP strategy in the Upper Los Angeles River watershed includes well over a hundred planned regional and centralized retention and infiltration BMPs ***[Estimated unfunded projects: 400]*** that take advantage of the **favorable groundwater recharge**

characteristics...BMP strategy also includes distributed smaller BMPs located throughout the urbanized areas of the watershed as retrofits in existing developments and streets. LFDs to comply with dry-weather bacteria TMDLs may also be included.
.

2-42/4 ...BMP strategy in the Upper Los Angeles River watershed includes well **over a hundred planned regional and centralized retention and infiltration BMPs** that take advantage of the **favorable groundwater recharge characteristics**....
No definition of BMPs has been applied to the projects proposed.
No map or other descriptive information of the 100+ retention/infiltration BMPs have not been provided.
No comparison or prioritization or even definition of favorability or recharge characterization have been provided.

2-57/1 **2.6 EWMP BMP Implementation Schedule** The EWMPs that are **being prepared in parallel** to the PEIR will provide a **timeline for the implementation** of the BMPs ***[as define in MS4/TMDLs]***...**priority BMPs**...that have undergone a site review and project evaluation and...based on available data at the time of publication of this PEIR...**Implementation of priority BMPs will begin following approval of the EWMPs by the LARWQCB...depend on the approval of the EWMPs, *1)* further environmental assessment, *2)* permitting, and *3)* availability of funding sources**.
The EWMPs will be submitted to the LARWQCB in June 2015.
The entire process of LACo-EWMP, EWMPs, BMPs, etc. and implementation of "Priority BMPs" have not been fully provided nor adequately documented.
As indicated above, a fully scheduled/timed EWMP/EWMPs implementation schedule for all BMP and for further - annual - updating must be included in the Final PEIR perhaps as part of the MMRPlan for PEIR and within each EWMPs' CEQA documents.
Statements as to the submittal dates in less than three months clearly indicates that undue pressure is being attempted in order to force the CEQA and project development processes through without due consideration as to the completeness and adequacy of project, program, and CEQA documents and processes.

2-57/4 Each EWMP will **define** priority projects, and **installation** of these projects will move forward depending on the **availability of funding** and **outcome of further project-specific CEQA review**. Funding options for implementing agencies would include obtaining **grant funds, low-interest loans, tax-based general funds, or special assessments**. Each **jurisdiction** will be responsible for securing the necessary funds over time to achieve permit compliance.
References to but absence of information regarding funding, funds, and other related economic/financial elements and their pivotal importance to any "Project" renders continued discussion of projects inadequate and incomplete and subject to major changes of any PEIR referenced "project between now and July 1, 2015 and thereafter.
Introduction of "jurisdiction" renders the discussion meaningless, incomplete and inadequate.

LID – Green Infrastructure – Capture and Use – Cisterns, Rain Barrels, Green roofs, Planter Boxes
.

3.5-19/2 ***City of Los Angeles Low Impact Development Manual***

In November 2011, the City of Los Angeles adopted the Stormwater Low Impact Development (LID) Ordinance #181899) with the stated **purpose** of:

- Requiring the use of LID standards and practices in future developments and redevelopments to encourage the beneficial use of rainwater and urban runoff
- **Reducing stormwater/urban runoff** while improving water quality
- Promoting rainwater harvesting
- **Reducing offsite runoff** and providing increased groundwater recharge
- **Reducing** erosion and **hydrologic impacts downstream**
- Enhancing the recreational and aesthetic values in our communities

.

3.5-19/3 The City institutionalized the use of LID techniques...adoption of the Stormwater LID Ordinance, the City prepared the *Development Best Management Practices Handbook, Low Impact Development Manual,...*required BMPs (City of Los Angeles, 2011).

.

3.7-17/2 The LID Standards...provide protocols for designing regional and centralized BMPs that minimize the potential for contaminant loading. For example, the LID Manual requires a certain distance to groundwater to ensure that adequate soil filtration occurs prior to the percolating water reaching a drinking water aquifer.

.

3.8-1/3 Annual precipitation can vary significantly between drought and flood conditions; periodic and occasionally severe droughts and floods within the area are well-documented (LARWQCB, 1994), and the potential for extreme precipitation (maximum intensity of precipitation for periods of 12 hours or longer which might be expected at intervals of ten to 100 years) is greater in portions of the San Gabriel Mountains than practically anywhere else in the continental United States (WERC, 2014). Average annual rainfall within the Los Angeles Basin is approximately 14.5 inches, though local averages can vary considerably depending on location within the basin (WERC, 2012).

No adequate stormwater flow forecast 85%ile
No forecast as to effects Climate changes is provided.

TO BE SUBMITTED

3.8-8/2 5. **Dominguez Channel Watersheds (Figure 3.8-6)** (Dominguez Channel EWMP and Beach Cities EWMP– ...Dominquez Channel EWMP and a portion of the Beach Cities EWMP...differentiated by a larger area of industrial land use. Because of the high density...large regional and centralized infiltration-type BMPs will be limited. The structural BMP strategy will be more LFDs, both large (centralized) and small (distributed), located at MS4 outfalls...The other BMP strategy is the use of **smaller distributed BMPs**...low-impact development (LID) type of BMPs, such as green streets and biofiltration BMPs.

.

3.8-4/3 EWMP Groups The proposed program has been divided into 12 EWMP Areas that have been organized by watershed groups that **share comparable conditions**.

The 12 EWMPs are consolidated into six watershed areas that are grouped **by similar watershed characteristics**...and also provide hydrologic features and the locations and distribution of planned and priority regional/centralized BMPs.

No comparable, similar, or differing watershed conditions or characteristics have been identified other than physical channel connections.

3.8-4/3 The **priority BMPs** are a **subset of the planned BMPs** and have been selected as **priority projects** based on a **screening assessment** of the planned projects.

Priority projects will be implemented before additional **planned projects**.

Define and compare priority, planned, and potential BMPs and projects.
Referenced "screening assessment" has not been described.

3.8-4/3 Distributed BMPs are **planned to be implemented** throughout the urbanized areas of the EWMPs.

No plan provided for distributed BMPs within the EWMP or available EWMPs.
No designation as to whether distributed BMPs/Projects will be priority, potential, or just planned projects; as provide after the priority projects.

TO BE SUBMITTED

3.8-20/1 ...these LFDs could potentially increase the amount of water available for recycling, reuse, and **groundwater recharge**.

3.8-21/1 ...45 percent are supplied by local groundwater basins that **are recharged naturally**...**through constructed recharge facilities** (MWD, 2010).
.

3.8-21/1 ...stormwater recharge facilities **currently augment local groundwater supplies** in the region by an estimated 477,000 acre-feet per year (MWD, 2014).
.

3.8-21/1 **One of the primary goals of the EWMP program**...**increase the amount of stormwater that is recharged**...particularly in portions of the Central Basin that experience a high degree of hydraulic connectivity between surface water and groundwater. Infiltration BMPs proposed within the EWMPs are expected to **increase the rates and amounts of groundwater recharge**...
.

3.8-31/3 ***County of Los Angeles Low Impact Development Manual***
The County...prepared the 2014 Low Impact Development Standards Manual (LID Standards Manual, County of Los Angeles, 2014b) to comply with the requirements of the 2012 MS4 Permit...provides guidance for the implementation of stormwater quality control measures in new development and redevelopment projects in unincorporated areas of the County with the intention of improving water quality and mitigating potential water quality impacts from stormwater and non-stormwater discharges.
.

3.8-31/4 The LID Standards Manual addresses...objectives and goals:

- Lessen the adverse impacts of stormwater runoff from development and urban runoff on natural drainage systems, receiving waters, and other water bodies.
- Minimize **pollutant loadings from impervious surfaces** by requiring development projects to incorporate properly-designed, technically-appropriate BMPs and other LID strategies.
- Minimize erosion and other hydrologic impacts on natural drainage systems by requiring development projects to incorporate properly-designed, technically appropriate **hydromodification control development principles and technologies**.

Not objective - goals yes.

City of Los Angeles Low Impact Development Manual
3.8-31/5 In November 2011, the City of Los Angeles adopted the Stormwater Low Impact Development Ordinance #181899 with the stated purpose of:

- Requiring the use of LID standards and practices in future developments and redevelopments to encourage the beneficial use of rainwater and urban runoff
- Reducing stormwater/urban runoff while improving water quality
- Promoting rainwater harvesting
- Reducing off-site runoff and providing increased groundwater recharge
- Reducing erosion and hydrologic impacts downstream
- Enhancing the recreational and aesthetic values in our communities

3.8-31/6 The City of Los Angeles institutionalized the use of LID techniques...Subsequent to the adoption of the Stormwater LID Ordinance, the City prepared the *Development Best Management Practices Handbook, Low Impact Development Manual,* dated June 2011, to describes the required BMPs (City of Los Angeles, 2011).

LID provisions for rain barrels for single family dwellings are only 10-20% of the total detention required for the design storm.

TO BE SUBMITTED
3.8-35/2 **Mitigation Measure HYDRO-1** requires Permittees to evaluate the suitability of BMP locations for groundwater **recharge**. **Infiltration BMP**s would not be suitable in areas of low permeability where subsurface structures could be adversely affected by groundwater mounding.
.

3.8-41/5 **Cumulative Impact Discussion Structural (Regional, Centralized, and Distributed) BMPs ...**Implementation of the proposed structural BMPs,...other reasonably foreseeable future projects...result in improved stormwater quality and reduced non storm flows....will experience reduced dry-weather runoff, a more natural hydrology, and improved receiving water 3.8-42/1 quality. In addition, new infiltration projects will incrementally augment groundwater drinking water supplies. **Although the increased infiltration projects may increase pollutant loads to groundwater aquifers, pretreatment systems coupled with regional groundwater management lead by the local Watermasters will ensure that the beneficial uses of groundwater basins are not significantly impaired.** ...EWMPs will beneficially impact local surface water quality and groundwater supplies. **Mitigation Measures:** None required **Significance Determination:** Less than significant
.

***3.8-43*/TABLE 3.8-3 SUMMARY OF HYDROLOGICAL RESOURCE IMPACTS REQUIRING MITIGATION MEASURES**
Cumulative Impacts, No mitigation required
Without a hydrologic model and analyses especially for the "design storm" no objective assessment of.

3.14-15/5 *Water Supply* Impact 3.14-3: The proposed program ***[=EWMP]*** **could require new or expanded water supply resources or entitlements** or require or result in the construction...could cause significant environmental effects.
Given the general purpose of the EWMP is to recharge groundwater in a urban-suburban context where groundwater is used for water supply, such "conditional-could" appears totally inappropriate and must be technically defined/determined in order to fully and adequately discussed environmental, cost-effectiveness, and compliance with discharge water quality limits over the life of the projects.

5-3/1 The proposed program is not a **land use project** and its implementation would not introduce new...or any other growth-inducing land uses. The structural BMPs would augment the physical structure of established communities,...and enhancing the water quality of existing communities. As a result, the proposed program would not induce population growth.
Most infrastructure projects do not involve much in the way of direct structured development; however, operations of such facilities support development of user structures especially where water and other service may be constraining support factors.

5-3/2 The **nature of the proposed program** is to increase stormwater recharge and improve stormwater quality;...**would not result in increased economic activity or population growth** in the EWMP areas...water recharged...**is anticipated to support existing water supply needs and reduce dependence on imported water supplies**.
Mechanisms or rules are NOT provided as to how various project waters would be assigned to only reducing imported water dependence while others may be used for supporting growth.

5-3/3 **5.4 Secondary Effects of Growth**
Implementation...would not result in a direct or indirect increase in population or employment. The proposed program itself, therefore, is **not growth-inducing and would not induce secondary effects of growth**.
Such a broad reaching statement cannot be justified as implementation (?=construction) and presumed operations (say 10% of total capital costs annually) would generate new employment within the project area and would divert funds for imported water sources outside the project area to the more local based water sources and operators employed therein.

5-3/3 While one of the main goals of the EWMPs is to **increase infiltration and potentially increase recharge of stormwater**...**the amount of water potentially recharged would not be enough to indirectly support population growth** and is intended to **support existing water supply needs**. This potential additional **recharge would contribute to local water supply needs** but would not alter population demographics. Therefore, there would be no secondary effects of growth.
Mechanisms or rules are NOT provided as to how various project waters would be assigned to only reducing imported water dependence while others may be used for supporting growth.
Again, such a statement cannot be justified as local sources can easily augment existing or future distribution without specific assignment to service areas.

6-1/1 ...Environmental Impact Report (EIR) must describe...
reasonable range of alternatives to a proposed project...
could **feasibly** attain most of the basic project objectives...
would avoid or substantially lessen...proposed project's significant environmental effects.
6-2/2 Alternatives may be eliminated...
if they **fail to meet most** of the **project objectives**,
are infeasible, or
do not avoid any significant environmental effects.

"Feasibly" is not clearly defined nor established as to whether the BMPs, EWMPs, or this EWMP can be done in technical and practical (=ECONOMIC) terms as required by the objectives and criteria for the program, the local programs/projects and BMPs. As technical feasibility is not at issue, the actual meaning of feasibly must relate to two of three goals having phrases of "cost-effectiveness". Therefore this use of feasibly and project objectives (not objectives but goal) are the costs and presumably capital and operations/maintenance. As no information is provided for costs and their fundings, these statements become totally inadequate and incomplete as no information is provided nor compared to demonstrate the alternatives compliance or lack of compliance with the MS4 permit conditions..

As two expressed "objectives" out of three include reference to "cost-effectiveness" the absence of demonstrated "cost-effectiveness" renders any comparison incomplete and inadequate for justifying an alternative discussion. The two objectives have no quantification nor scheduling and therefore are NOT OBJECTIVES but may remain as goals but without any supporting information as to costs and sources of revenues to support such costs.

6-1/3 "Feasible" means capable of being accomplished in a successful manner within a reasonable period of time, taking into account **economic**, environmental, legal, social, and technological factors.

No economic factors have been provided in the PEIR, including sources of revenues and abilities for LACo and all permittees. Therefore, the PEIR is incomplete and inadequate.

6-2/5 **6.2 Review of Proposed Program Goals and Objectives**

The alternatives presented in this chapter were analyzed for their abilities to reduce significant program impacts and meet the objectives of the proposed program, which are:

- To **collaborate** among agencies (Permittee jurisdictions) across the watershed **to promote more cost-effective** and multi-beneficial water quality improvement projects to **comply with the Municipal Separate Storm Sewer System (MS4) Permit.**
- To develop watershed-wide Enhanced Watershed Management Programs (EWMPs) that would, once implemented, remove or reduce pollutants from dry- and wet-weather urban runoff in a **cost-effective** manner.
- To **reduce the impact** of stormwater and non-stormwater on receiving water quality.

Discussion starts with a title of Goals and Objectives then switches to objectives. These are goals not objectives as they are not quantified nor scheduled in any manner.

Since two "objectives" refer to "cost-effectiveness" and no costs, revenues, economics, or financial information or assessment are not provided, all discussions of the achievements of goals and objectives becomes mute and the PEIR totally incomplete with regard to the "project" or "program" and its alternatives.

Similarly reference to collaboration becomes mute as all related agencies and those in the county have already collaborated and therefore any "collaboration" discussion must be quantified which they have not been.

As to compliance with permit conditions and reduction of impacts are only presumed without documentation which is under parallel preparation for June 2015 and without any hydrological modeling or calculations to support such contentions and comparisons amongst alternatives.

Goals are not mentioned only objectives above. The entire PEIR appears incomplete without a clear statement as to typical goals and objectives - recharge dry and wet weather runoff and 20% recharge every five years for next 25 years.

Total confusion as to goals and objectives renders the entire alternatives chapter totally inadequate. Absence of any costs/revenue information renders achievement of goals or objectives totally incomplete for both the development of the alternatives and their comparisons.

The entire Alternatives section is incomplete and totally inadequate.

6-3/3 In accordance with the CEQA "rule of reason," an EIR is required to consider a range of alternatives that permit a **reasoned choice** and that are "limited to ones that would avoid or substantially lessen any of the significant effects of the project" (CEQA Guidelines Section 5126.6(f)). The Lead Agency conducted an alternatives screening process to identify feasible alternatives to the proposed program. The screening process for identifying viable alternatives included consideration of the **following criteria**:

- Ability to meet the **program objectives**
- Ability to reduce significant environmental effects of the proposed program
- **Economic and engineering feasibility**

Since the program objectives require 2 of 3 items of "cost-effectiveness" and here a criterion requires meeting the program objectives, the PEIR appears inadequate and incomplete without the presence of and achievement of cost-effectiveness and economic feasibility-ability to pay for both vapital and O&M costs for at least 25 years.

As no economic feasibility analyses and comparisons are provided, and no jurisdictional funding is provided throughout the PEIR, no reasoned or reasonable achievements of one of three criteria can be assessed or compared.

6-3/4 The Lead Agency **conducted an alternatives screening process** to identify **feasible** alternatives to the proposed program. The screening process for identifying viable alternatives included consideration of the following criteria:

- Ability to meet the program **objectives** ***[presumes meet objectives or not considered]***
- Ability to reduce significant environmental effects of the proposed program
- **Economic** and engineering feasibility ***[presumes to meet economic feasibility parameters and criteria not presents]***

Introduction of "Lead Agency" at this point would imply some agencies other than LACoDPW, perhaps LACoFCD (??); while reference to an "alternative screening process" indicates some formal process rather than that documented in the PEIR.

Discussion of environmental effects or water-related compliance of flow and quality for a Water Resources project or program without a quantified and presumably computerized complex model for each watershed element is totally inadequate and incomplete at any level.

Introduction of "feasible" and economics without definitions and the objectives which 2/3 include costs and therefore economics strongly distorts any screening or comparisons toward costs, economics, and financial for which no information is provided or believed to be even remotely available for the PEIR, the EWMP, and most if not all of the EWMPs.

Such inadequacies and incompleteness renders Sec.6 irrelevant to the CEQA process with regard to the project, any alternatives, and any designation as to an "Environmentally Superior Alternative" compared to an "economically superior alternative".

Presumptions and unsupported statement are not with the goals of CEQA to provide a complete, adequate, objective, and quantified review and assessment of a program's or project's effects and appropriate mitigation and alternatives to such.

6-3/5 Based on these **criteria**, the **Lead Agency** has identified the following alternatives:

Introduction of "Lead Agency" at this point would imply some agencies other than LACoDPW, perhaps LACoFCD (??); while reference to an "alternative screening process" indicates some formal process rather than that documented in the PEIR.

Identifications are not supported in comparisons primarily with regard to collaboration and presumed economies of scale and cost-effectiveness.

6-9/9 **Ability to Meet Program Objectives**

The Distributed Structural BMPs Only Program Alternative would meet the **objectives** of the proposed program to collaborate among agencies to promote more cost-effective and multibeneficial water quality improvement projects. However, because distributed structural BMPs **tend to be smaller** in nature and typically are distributed widely throughout the watershed, **more BMPs** may be necessary to meet water quality objectives in the MS4 Permit. The **ability to meet** 6-10/1 the water quality objectives would be **less certain** under this alternative.

This statement indicates that distributed BMPs are cost-effective for the program although they are smaller (may disagreed based on economies of scale and information provided by LACiDWP).

"Less certain" is not defined nor is the statement supported; 100 times more sites may be sufficient and available but no presumption can be supported either way based on the PEIR.

6-12/3 **6.6 Alternatives Suggested in Scoping**

...comment letter...suggested that the PEIR include an assessment of several funding mechanism alternatives, including: Single Parcel Fee Assessment, Parcel Area Fee Assessment, Hybrid Parcel Area Fee Assessment, Zero Discharge Assessment, and Large Parcel Assessment. These suggested alternatives **would not lessen any significant environmental impacts of the Program** and were therefore not considered in this PEIR. Although CEQA allows for discussion of economic impacts and project costs as measures of feasibility, the funding mechanisms required to implement projects are **generally not susceptible to environmental analysis**.

As the program objectives and criteria for alternatives both include economics and costs and as all BMPs require both capital and operation and maintenance costs to be effective, a full documentation using the above mentions financing package must be incorporated into the project description and alternatives, especially those presented to the LARWQCB in June 2015.

Adequately funded projects within the ability to pay of the service population would assure continue environmental compliance and support of a wide array of mitigation measures compared to capital intensity project requiring longer term bonding and expensive project management.

Comparisons of large projects with high capital costs to program of lots of small projects with low capital costs but with higher operating costs have been alluded to in discussions of other alternatives but without any documentation.

As all publicly funded projects to be submitted to LARWQCB in June 2015 must be funded n have not been demonstrated at this time to be funded, any inclusion of projects in this program can not be assumed to have long-term funding to assure mitigation of impacts.

6-12/4 ...comment...Full Capture and Recharge of Flows Greater than 100 cfs Alternative...rejected...because of the **infeasibility** of capturing all storm flows...unrealistic, requiring most of the **developed land in the County to be accomplished**...

...suggesting full capture of **all flows less than 100 cfs**...was rejected from further consideration for the same reason...would require enormous areas of...currently developed...recharge is **only feasible** in certain areas of the County because of the poor percolation capacity of surficial soils...accumulation of **subsurface clay lenses** creates recharge barriers in **many places of the County**, making retention and recharge of large quantities of stormwater **infeasible** in these locations.

PEIR total lacks definitions for "feasibility" and "infeasibility" as to technically, financially, administrative, or politically aspects.

As no surface or subsurface hydrologic model is available or referenced, and supporting documentation is not provided nor apparently available for either flow capture alternative dismissal.

The PEIR does not provide maps of locations with clay lenses and their extents/depths and thereby barrier effects.

6-13/1 **6.7 Environmentally Superior Alternative** CEQA requires that an EIR identify the environmentally superior alternative(s) of a project other than the proposed program or the “no project” alternative (CEQA Guidelines Section 15126.6 (e)(2)). As stated at the beginning of this chapter, the purpose of this alternatives analysis is to consider a reasonable range of alternatives that could feasibly attain most of the basic project objectives and avoid or substantially lessen significant program impacts.

Since no information is provided as to the actual cost-effectiveness of any projects or groups of project the requirement cannot be achieved, reviewed, or commented on with the currently available information. Based on DWP information distributed small projects could achieve the economy-of-scale that larger one could and therefore any plot-by-plot LID projects. If 10,000 single family dwellings would theoretically detain 460gal/1000sf roof, one design storm would generate 4.6M gal for direct use (about one day piped water supply); however, cities do not require 460gal of rain barrels but generally only require two rain barrels of 100gal capacity.

The PEIR does not provide the basis for development of the Environmentally Superior Stormwater Alternative and those with recognized "least worst" environmental effect could not meet two of the three goals of the Program, cost effectiveness with or without real requirements for the 85%ile rainfall event.

6-13/Table 6-2 Ability of Project Alternatives to Meet **Project Objectives** Project Objectives

1. To Collaborate Among Agencies (Permittee Jurisdictions) Across the Watershed
To **Promote more cost-effective** and multi-beneficial water quality improvement projects
To comply with the MS4 Permit. ***[=portions of Objective 2 & 3]***
2. To develop watershed-wide EWMPs that will, once implemented, **remove or reduce pollutants from dry- and wet-weather urban runoff** ***[= Objective 1.]*** in a **cost-effective manner.**
3. To reduce the impact of stormwater and nonstormwater on receiving water quality. ***[=Objective 1.]***
Comparisons of alternatives and "abilities" of Project GOALS and objectives without cost-effectiveness and any hydrological model for wet/storm and dry/storm water flows render all as totally inadequate and incomplete.
As written, the objectives must be referred to as "Goals"; objectives must be measurable/monitorable with schedules and quantified levels of achievement, e.g., 4Qtr2016 and $100/ppm reduction.

6-14/3 The Non-Structural BMPs Only Alternative would avoid all of the significant and unavoidable impacts associated with construction of the structural BMPs....However, since the ability to achieve compliance with MS4 Permit water quality objectives would be substantially reduced, impacts to water quality would be greater under this alternative, and compliance with the MS4 Permit would be unlikely.
Even if it could achieve permit compliance, the Program goals of cost-effectiveness most likely could not be achieved as the disperse detention could not attain any significant economies of scale and would require vastly greater plot-by-plot compliance which is beyond the typical new, additions, or replacement linkages with structured improvements.

6-14/4 As a result, since the proposed alternative would provide the best chance of **achieving regional water quality objectives**, it is considered the environmentally superior alternative.
The conclusion is not based on any documentation or projected/estimate successful implementation and does not include any comparisons and development of cost-effectiveness or revenue sources for a much larger implementation phase. The preparers have assumed a development condition without any concept of reality and without documentation as to implementability in order to have an "Environmentally Superior Alternative", which is incomplete and inadequate.

Apdx A Appendix A Comment Letter to the LACFCD: Draft PEIR 18/#61(pdf-p.244) The overarching goal of the GRIP Recycled Water Project is to **offset the current use of imported water by providing up to 21,000 acre-feet per year (AFY)** of recycled water as a **reliable supply source for groundwater basin replenishment via the Montebello Forebay** within a reasonable timeframe.
Although the watershed channel are well known and studies for almost 100 years, no hydrologic model has been developed and incorporated into the EWMP or its component EWMPs. The current efforts therefore cannot provide a factual and quantitative basis for assessing the environmental effects of existing water resources and their future states for water supply availability and locations, flood control, and water chemistry dilutions or reductions.

ApdxA/NOP 2/2 The LACFCD, as a regional agency charged with **conserving stormwater for use in our local water supply,** has a **vested interest in increasing opportunities for stormwater capture and groundwater recharge**. The LACFCD has flood control infrastructure...LACFCD will be an implementing agency only on those projects for which it has been identified in an EWMP as a responsible implementing party.
Water supply reference without acknowledgement of growth stimulation.

Apdx A Appendix A Comment Letter to the LACFCD: Draft PEIR 18/#61(pdf-p.244) The overarching goal of the GRIP Recycled Water Project is to **offset the current use of imported water by providing up to 21,000 acre-feet per year (AFY)** of recycled water as a **reliable supply source for groundwater basin replenishment via the Montebello Forebay** within a reasonable timeframe.
Although the watershed channel are well known and studies for almost 100 years, no hydrologic model has been developed and incorporated into the EWMP or its component EWMPs. The current efforts therefore cannot provide a factual and quantitative basis for assessing the

environmental effects of existing water resources and their future states for water supply availability and locations, flood control, and water chemistry dilutions or reductions.

As indicated elsewhere, this NOP and letter statements clearly indicate the anticipated development of water supply resources which goes beyond the water quality and flood protection benefits and relates the EWMP to growth inducements for future populations needs for greater water resources without adding new imported water supply facilities.

ApdxF 7/2 The Los Angeles River is approximately 55 miles long, and five of six reaches lie within the Upper Los Angeles River EWMP Area. The natural hydrology of the Los Angeles River watershed has been significantly altered by urbanization, channelization, and the construction of dams and flood control reservoirs. The river and many of its tributaries are lined with concrete for most or all of their length. Soft-bottom segments of the river occur where groundwater upwelling prevents armoring of the river bottom.

Although the watershed channel are well known and studies for almost 100 years, no hydrologic model has been developed and incorporated into the EWMP or its component EWMPs. The current efforts therefore cannot provide a factual and quantitative basis for assessing the environmental effects of existing water resources and their future states for water supply availability and locations, flood control, and water chemistry dilutions or reductions.

FYI
#3/4
03/13/15

As of this morning sadly, nine/9 days have passed without contact from the City of LA-BrdPubWrks/DptPubWrks regarding their EWMP - BMPs - infamous 400+...as such I have incorporated pertinent comments into the PEIR comments.... Recirculate ....
It is all draft today - but monday will be final....

I will also be circulating my comments to appropriate stakeholders.

Tom Wms.

Subject: Enhanced Watershed Management Plan
RE: Comments on Programmatic Draft EIR
Specific Comments #3/4, 03/13 (16)/15.

NEW
Special Issue: LACity - EWMP 400+ projects (BMPs) and PEIR
Inquiries, internet searches, and requests for public documents have been submitted to the Department/Board of Public Works, City of Los Angeles for documents, reports, and other materials pertaining to the reported 400+ storm water related projects, BMPs, etc., that presumably would be part of the 12 EWMPs for the permittees to submit to the LAWQCB in June 2015 and which is referenced in the LACo EWMP and this PEIR. As of close-of-business 13 March, 2015, nine days after submission of the request to LACi-BPW, no contact has been made by the LACi-BPW or LACiDPW.
This indicates that such EWMPs' projects may be erroneously reported herein or that they are not part of the PEIR and not available to the public. This is a clear example of importance of having all information prior to preparation of the LACo EWMP and this PEIR. as the total number of stormwater related projects probably exceeds the total numbers of other permittees we must assume that the EWMP-PEIR is incomplete and inadequate for public review and meaningful comments.
Please withdraw the current PEIR and recirculate at a later date when all relevant information is available for public review and comment.

As a 40 year professional water resources specialist (now retired), I appreciate the physical, technical, and administrative complexity of the LA surface and ground water basins and the supply issues for 9+ million people. However, having participated in EPA Basin Studies in southern California, I also recognize that this is the first major attempt to update such earlier studies (in 40+ years) and only brought about because of regulatory issues and the drought which may be the foreword for more long term climate and hydrologic changes. As such I consider the Enhanced Watershed Management Plan (EWMP) and Draft Program Environmental Impact Report (D-PEIR or PEIR) as an important preliminary compilation requiring major updating and implementation of a comprehensive, computerized hydrologic model for the technical, administrative, and public stakeholders of the County Of Los Angeles (LACo) and as a "Work in Progress".

Central to this issue, CCSC and some members of the Sierra Club, Angeles Chapter, Water Committee request that as part of the overall revision of the D-PEIR and the LACo EWMP that:

- the LACo-EWMP/PEIR become the base online document for all storm, surface, and groundwater resources within LACo and that all related EWMPs and other water resources efforts of all permittees and preparers of EWMPs/Project EIR fully coordinate with and support integrate of teired efforts within the context and documentation of the LACo EWMP;
- the LACo become the computerized online Watershed Model (WSM or LAWSM, or "Water-One" Model, WOM) for integrating all water resources within LACo for any administrative and regulatory purposes;
- the Los Angeles Water Quality Control Board (LAWQCB) only consider as complete and adequate submissions, permits, and monitoring that has been coordinated and integrated through the WSM;
- all tiered projects (EWMPs), best-management-practices (BMPs), and any other water-related projects (e.g., flows of greater than one acre-foot per year, >1acft/yr)

More to Come
SAME as 03/09/15

The following provides a brief review of the CEQA/D-PEIR documents of almost 70MB/1000 pages. We thank the LACo Department of Public Works and Flood Control District for this opportunity to review and comment on the PEIR and greatly appreciate the deadline extension for doing such. I will be submitting detailed comments during 03/13-03/16, and these final overall comments on 03/16/15.

The overall CEQA review is that the documents are inadequate, incomplete, mostly inaccessibility and confusing for the general educated public due to the volume, technical character, overly-broad statements, lack of documentation and support of statements, and lack of consistency of terms and usage,

The proposed Program does not provide a plan for tiered project CEQA considerations by the other permittees nor the County itself. No plan for the Program or the projects has been established for the Enhanced Watershed Management Plan to achieve and comply with the LA Regional Water Quality Control Board's permit requirements. A program may be more generalized but still must provide a plan of actions for both the lead and responsible agencies.

The Program does not provide even the requirements, process, and procedures for subsequent CEQA compliance by other permittees and some projection as to whether EIRs, MNDs, ND, or CE will be used to tier down from this P-DEIR/P-FEIR. Conditions for Program Compliance by tiered projects have not been listed or even referenced other than some ill-defined listing of BMPs.

No current listing of all planned and funded Projects has been provided and incorporated into a scheduled and quantified plan for submission in June.

Although research has been underway for five-plus years, the EWMP and this EIR does not use nor even reference use of computerized modeling of the appropriate basins (Ballona Creek, Upper LA River, Middle LA River and Arroyo Seco, Lower LA River and San Gabriel River, and LA River Mouth/Estuary-Dominguez Channel) although the federal agencies (BLM, USGS, ACoE, etc.) and perhaps local agencies (some permittees and the Water Board) have some local or watershed models . Without a model and its components, the impacts and their significance of detention, retention, recharge, and flood protection cannot be assessed nor mitigated adequately or completely.

Three goals are provided but no objectives (sub-tiered from goals) are provided with/without defined schedules and other quantitative parameters for program monitoring. Confusion is introduced in later text when both flood control and water supply "augmentation" are also introduced as "goals" and as "objectives".

Specific goals are only to meet the MS4 Permit requirements and related water quality conditions and to meet them in a "Cost-Effectiveness" manner. However, costs, financial support, revenue, capital bonding, or economic effectiveness or efficiency are not provided, and thereby achievement of the cost effectiveness cannot be judged nor compared and must presumed by submission of any proposed project.

Growth inducement is mentioned primarily with regard to direct housing construction and employment and incomes while dismissing potential effectts of recharged (diverted storm flows) water supplies.

Additional benefits primarily for flood protection are mentioned in some statements while it is not supported by any text or analyses under water resources. No assessment of beneficial and adverse effects are provided for raising base flow levels from program-augmented/diverted-stormwater groundwater resources and their effects upon subsequent pollutant concentrations and flood flows.

I am retired from 30 years in water and environmental resources with Parson Corp., Pasadena and URS San Francisco and over 10 years with Dubai (UAE) government and local water and environmental companies. I have prepared sections and entire documents for more than 300 EIRs, EISs, and EAs worldwide for local agencies, cities, counties, states, federal, and international agencies and organizations and have reviewed more than 100 additional assessments. During work for URS, I was involved in the development and environmental considerations for the 1970s EPA's Santa Ana and Santa Marguerita/San Luis Rey basins plans. My reviews have included the LACity's Recycled Water Management Plan and Stormwater Capture Management Plan, and I am currently vice chair of the LA City's Floodplain Management Plan.

Dr. Tom Williams

NEW - NOT INCLUDING THOSE OF 03/09-11/15

EWMP - SPECIFIC COMMENTS
Comments, recommendations, and additions are presented in **Bolded *Italics***
PEIR text specific to the comments are presented in plain text as was in the PEIR. Some specifically relevant PEIR text may be **Bold Underlined**.

The Executive Summary (ES) has not been thoroughly reviewed as the ES supposedly represents a limited version of the P-DEIR text content and cannot be assessed for adequacy and completeness as a stand-alone item.

ES-2/2 The EWMPs **will** identify **potential and priority** **structural and non-structural** Best Management Practices (BMPs) within the region's stormwater collection system to improve runoff water quality.

As indicated, this EWMP has no direct factual contributions from the individual EWMPs of other permittees within LACo. No formal organization and definitions of the EWMP, EWMPs, and all the "BMPs" has been provided and consistently applied throughout the document. As the statement refers to a future condition, not in evidence, such statements here and throughout the document must be verified and suported by commitments on the part of the other permittees.

Potential and priority BMPs are referred to but are not adequately related to the EWMPs and the EWMP/PEIR and as indicated herein they ARE BEING developed, they are not developed. The EWMP and PEIR are not definitive at even a programmatic or conceptual deign level.

ES-2/5 A few of the BMPs are currently **well defined** but most **are yet to be fully developed** under the EWMPs....priority BMPs...detailed in each of the EWMPs; these **are being developed in parallel with the PEIR**....describes the details **that are available** for each of the EWMPs currently...by the EWMP working groups.

1-3/3 A set of **priority BMPs** **will** be detailed in each of the EWMPs; these are being developed in parallel with the PEIR. The PEIR describes the details that are available for each of the EWMPs currently under preparation by the EWMP working groups.

As indicated, this EWMP has no direct factual contributions from the individual EWMPs of other permittees within LACo.

No definition of "Fully" or "Well" is provided for the PEIR and as they are being developed at the same time as this PEIR their entire discussion is so general as to render assessment impossible and open to any combination of current or future "projects" and BMPs as desired by the agencies. No reliable discretionary decision can be made and funded based on the PEIR.

1-1/3 The MS4 Permit gives Permittees the option of implementing an innovative approach to permit compliance through development of an Enhanced Watershed Management Program (EWMP)....**will identify potential and priority structural and non-structural Best Management Practices (BMPs)** within the region's stormwater collection system to improve runoff water quality. The LACFCD, along with participating Permittees, has opted to exercise this option and has submitted to the LARWQCB 12 separate Notices of Intent (NOIs) for the development of EWMPs within 12 distinct watershed groups...Implementation of the EMWPs would be the responsibility of each Permittee and would occur following approval of the EWMPs by the LARWQCB.

BMPs, groups of BMPs, and Projects are not defined at any engineering levels so as to determine cost-effectiveness, capabilities to achieve any project/program goal involving water quality or flows and their effects and impacts.

1-3/3 The EWMPs **will** identify **management strategies** including **hundreds of structural Best Management Practices** (BMPs) that **may be** designed and implemented by the Permittees to meet **permit compliance objectives** ***[Only one of the Program objectives]***.

As indicated, this EWMP has no direct factual contributions from the individual EWMPs of other permittees within LACo.

This clearly indicates that this document and tiered documents are NOT based on any quantitative model (RAA, discussed below) for water quality and is not completed prior to its CEQA assessment and that this assessment cannot adequately assure that even the water quality goals, objectives, and regulatory requirements can be realized.

Water quality and flow models and proposed BMP depend on diversion or reduction of flows during both dry- and wet-weather flows, and therefore the RAA must be based on a hydrologic/hydraulic model which has not bee referenced or mentioned.

This EWMP and PEIR must provide the programmatic management strategy guidelines for those of the tiered-down EWMPs-strategies and related CEQA documents. Use of the conditional: "may be" voids following verbs and leaves the statement as irrelevant to the Program and Project EIRs.

1-4/3 The EWMPs **are to** include a discussion of the environmental documents, assessments, and permitting required for the implementation of the **priority projects**. The PEIR can provide a basis for this discussion. The use of the PEIR in the development and implementation of the EWMPs is further discussed in this chapter in the *Purpose of the Program Environmental Impact Report*.

As indicated, this EWMP has no direct factual contributions from the individual EWMPs of other permittees within LACo.

Priority BMPs were discussed but have not been distinguished from "Priority Projects".

The PEIR does not discuss the process of tiering to projects or to specific BMPs and whether Mitigated Negative Declarations will be tiered down from this PEIR or whether the project must require tiered/focused EIRs for full and adequate CEQA compliance.

1-7/1

- Other Receiving Water Considerations (**second category**):
  - The second highest priority shall be considered controlling pollutants for which data indicate impairment of exceedances of receiving water limitations and the findings from the source assessment implicates discharges from the MS4.

As no hydrologic model for flows and concentrations has been provided even for the TMDL constituents, references to secondary pollutants appears totally inappropriate and purposefully attempts to elevate the credibility of compliance with the TMDL, which has not been achieved.

1-7/2 The **EWMP prioritization process** includes
identifying the priority pollutants and...
schedule for implementing BMPs to meet the following criteria:

- For pollutants...same class as TMDLs,...consider these pollutants within...same time frame as...TMDLs.
- For...303(d) list...EWMPs develop a schedule to address these pollutants **as soon as possible** with milestones.

Priority pollutants have already been prioritized and identified, and the prioritization process has not been described although referred to, and no schedule for prioritization, definition of priority projects or priority BMPs has been provided.

Prioritization process and schedule are rendered totally inadequate when modified by whenever "possible". MMRPlan must include a full and scheduled prioritization process for ALL EWMPs.

1-8/2 The RAA **is being performed** as part of the preparation of the EWMPs, and **in parallel with...this PEIR.** The RAA...primary goal of the EWMP...meet the **water quality goals**. The **modeling being performed**...will determine...number and distribution of the BMP types and specific projects identified in the EWMP Work Plans will meet the water quality goals. This PEIR will assess the types of BMPs that **may be implemented** to meet **these** *WATER QUALITY* **goals**.

As indicated, this EWMP and any related RAA performance has no direct factual contributions from the individual EWMPs of other permittees within LACo.

Management strategies (MSs) presumably are different from the BMPs and the EWMPs which they maybe be parts of, but MSs are not defined nor associated with BMPs and EWMPs.

The RAA and a supporting/integrated Hydrologic Model must be provided in a final form to be incorporated, not be performed in parallel, with full integration/incorporation. The MMRPlan must include a final RAA.

1-9/1 The LACFCD will **consider** the information presented in this PEIR, along with **other factors**, **in the development and implementation of the EWMPs**. The EWMPs are to include a discussion of the environmental documents, assessments and permitting required for the implementation of the **priority projects**. The PEIR **can provide** a basis for this discussion.
1-10/2 The EWMPs are to include a discussion of the environmental documents, assessments, and permitting required for the implementation of the **priority projects**. ***Repeated***
Consider and other factors are not defined and as such allow the entire PEIR process to be set-aside.
The PEIR does not fully define the roles and participations of the LACFCD in the development of tiered EWMPs and their CEQA documents.
Again "priority projects" are mentioned and not defined with regard to "priority and potential BMPs."
CEQA texts must recognize differences between "can/could provide" and "will/would provide" and require clarity as to what will occur in the teiring of projects and CEQA documents.

1-11/1 Maps identifying **potential and priority BMP locations** are provided in Chapter 2...with the overall EWMP **watershed characteristics** and **BMP implementation strategy**.
No definition or specificity of potential and the subgroup priority BMPs and locations nor details are provided within the tables and generalized maps. No watershed characteristics are provided regarding runoff coefficients, design rainfall amounts, times of concentrations, are estimated flow levels are provided for any watershed, not even a ranking of highest to lowest flows or highest-lowest dry- and wet weather water qualities.

1-11/1 The PEIR **focuses** its assessment on **construction and operation** of these potential and priority BMPs to be installed throughout the watersheds—but primarily within urbanized areas where the **pollutant loading is greatest** and where these **BMPs can be most cost-effective** in **meeting water quality goals**.
No focused information is given regarding the BMP operations and their effectiveness in removing pollutants and meeting water quality goals (not objectives).
No information is provided regarding the degree of urbanization for each watershed, nor the assumed "loadings" being greater, median, or least.
BMPs are presumed as cost effective without documentation and analyses as to pollutant - present/removed per 100 acft or any other quantified parameter and as to achievement of current reductions down to desired goals.

2-5/1 Additional information and figures on the location and distribution of potential and priority BMPs based on available data at the time of publication of this PEIR, are presented in Section 2.5, *EWMP Watershed Characteristics and BMP Implementation Strategies*.
.

2-15/2 Source Control BMPs. Source control structural BMPs are commercial products designed to treat runoff in highly urbanized environments. Mechanical separation, or more complex physicochemical processes, provides separation of gross solids and other pollutants...**designed to sequester hydrocarbons and other pollutants**.
Residual pollutants and their disposition is not mentioned nor provided any where in the PEIR. No discussion is included regarding the soil sequestering of hydrocarbons, metals, and other pollutants in the ground materials (especially in/on clays). No estimate is provided as to anticipated sequestering per year and probable long-term removal of soil materrials before they achieve "hazardous" levels.

2-16/2 Specific examples of **distributed** BMPs that are in various stages of planning and implementation and part of a possible EWMP are presented in **Table 2-3**. The locations of these examples of planned

distributed BMPs are shown in **Figure 2-2**. Table 2-3 presents the locations, project description, and key elements of the **distributed** BMPs to further illustrate these types of structural BMPs that **may be part** of **an** EWMP. Additional information and figures on the location and distribution of potential and priority BMPs, where data ***are***~~is~~ available, are presented in Section 2.5, *EWMP Watershed Characteristics and BMP Implementation Strategies*.

Centralied and Regional BMP discussions repetitive from 2-16/2 except as highlighted.

2-28/2 ...**centralized** BMPs...presented in **Table 2-4**. The locations of these examples of planned and implemented **centralized** BMP...in **Figure 2-3**.
Table 2-4...the **centralized** BMPs...structural BMPs that **are part** of **the** EWMP....of potential and priority BMPs, where data ***are***~~is~~ available,...*BMP Implementation Strategies*.

2-35/1 ...**regional** BMPs...of planning ***and implementation and*** **that are part** of the EWMP are presented in **Table 2-5.** The locations of these examples of **regional** BMPs are shown in **Figure 2-5**.
Table 2-5...of the **regional** BMPs to further illustrate these types of structural BMPs **that are concepts being developed through the EWMP process**. ...of potential and priority BMPs, where data ***are***~~is~~ available...*BMP Implementation Strategies*.
The complex repetitive wording and slight but several differences in these texts cause considerable confusion for the public review and participation in this CEQA process. Without clear table-ed presentation meaning and clarity are lost, rending these important issues inadequately treated in this PEIR.

2-40/1 Summarized below are the general characteristics of the watersheds within the **EWMP Groups** and the overall strategies for BMP implementation...twelve **EWMPs** are consolidated to **six watershed areas**...summary provides additional detail on the distribution and location of **potential and priority BMPs**, **where data is available**,...for each EWMP and show the location and distribution of **planned and priority regional/centralized BMPs** for which **data are available at the time of publication of this PEIR**. The **priority BMPs**...subset of the potential BMPs that have undergone a site review and project evaluation that has identified these BMPs as a priority. These **priority projects** are shown based upon **available data at the time of publication of this PEIR**.
EWMP groups, EWMPs, and watershed areas are inadequately associated and defined; presumably 12 EWMPs may be associated into 6 EWMP Groups based on watershed associations.
Similarly designations as to:
Potential, Planned, and Priority BMPs - Priority BMPs are part of Potential BMPs
Regional and centralized BMPs - excluding distributed
Priority projects or BMPs
require clear definitions and ordering in order to have adequate clarity for public review.

2-40/1 Appendix G provides the location and general description of the **priority BMPs**...**Distributed BMPs** are planned to be implemented throughout the urbanized areas of each EWMP.
2-43/3 ...Figures 2-5 through 2-16, each of the **EWMPs**...wide distribution of BMPs to achieve permit compliance. **Appendix G** provides the locations and general descriptions of the **priority BMPs** (**where data is available)**,...**Priority Projects** are **projects that have been identified through the EWMP process** as **targeted for implementation** within the first years following the EWMPs approval by the LARWQCB. **Identification of Priority Projects is underway** and **has not been completed by all EWMPs at this time**. ***[For any??]...*****PEIR is being prepared in parallel to the EWMPs**. **Priority Projects *[proper noun]* will be defined** in all the EWMPs **to be submitted for public comment in June 2015**. Priority Projects that have been identified at this time through the EWMP process are shown on the following figures. **Priority Projects may be regional, centralized or distributed type BMPs**. For **potential projects**...location of potential regional and centralized **BMPs** are shown. Distributed BMP will be distributed throughout the urbanized areas and are not shown on the following figures
...2-44/1...
No "general description" is provided for the program, projects, and BMPs, as summarized below, only listings and figures found in the Vol.1. Apdx. G EWMP Proposed BMP and Priority Project

Data and Figures A-L, pages unnumbered items renders the entire appendix confusing and un-reviewable for the general public and the only "General Description" is APN numbers.

2-57/1 **2.6 EWMP BMP Implementation Schedule** The EWMPs that are **being prepared in parallel** to the PEIR will provide a **timeline for the implementation** of the BMPs ***[as define in MS4/TMDLs]***...**priority BMPs**...that have undergone a site review and project evaluation and...based on available data at the time of publication of this PEIR...**Implementation of priority BMPs will begin following approval of the EWMPs by the LARWQCB...depend on the approval of the EWMPs, *1)* further environmental assessment, *2)* permitting, and *3)* availability of funding sources**.
The EWMPs will be submitted to the LARWQCB in June 2015.
The entire process of LACo-EWMP, EWMPs, BMPs, etc. and implementation of "Priority BMPs" have not been fully provided nor adequately documented.
As indicated above, a fully scheduled/timed EWMP/EWMPs implementation schedule for all BMP and for further - annual - updating must be included in the Final PEIR perhaps as part of the MMRPlan for PEIR and within each EWMPs' CEQA documents.
Statements as to the submittal dates in less than three months clearly indicates that undue pressure is being attempted in order to force the CEQA and project development processes through without due consideration as to the completeness and adequacy of project, program, and CEQA documents and processes.

2-57/4 Each EWMP will **define** priority projects, and **installation** of these projects will move forward depending on the **availability of funding** and **outcome of further project-specific CEQA review**. Funding options for implementing agencies would include obtaining **grant funds, low-interest loans, tax-based general funds, or special assessments**. Each **jurisdiction** will be responsible for securing the necessary funds over time to achieve permit compliance.
References to but absence of information regarding funding, funds, and other related economic/financial elements and their pivotal importance to any "Project" renders continued discussion of projects inadequate and incomplete and subject to major changes of any PEIR referenced "project between now and July 1, 2015 and thereafter.
Introduction of "jurisdiction" renders the discussion meaningless, incomplete and inadequate.

3.5-19/2 ***City of Los Angeles Low Impact Development Manual***
In November 2011, the City of Los Angeles adopted the Stormwater Low Impact Development (LID) Ordinance #181899) with the stated **purpose** of:

- Requiring the use of LID standards and practices in future developments and redevelopments to encourage the beneficial use of rainwater and urban runoff
- **Reducing stormwater/urban runoff** while improving water quality
- Promoting rainwater harvesting
- **Reducing offsite runoff** and providing increased groundwater recharge
- **Reducing** erosion and **hydrologic impacts downstream**
- Enhancing the recreational and aesthetic values in our communities

.

3.5-19/3 The City institutionalized the use of LID techniques...adoption of the Stormwater LID Ordinance, the City prepared the *Development Best Management Practices Handbook, Low Impact Development Manual,...*required BMPs (City of Los Angeles, 2011).
.

3.7-17/2 The LID Standards...provide protocols for designing regional and centralized BMPs that minimize the potential for contaminant loading. For example, the LID Manual requires a certain distance to groundwater to ensure that adequate soil filtration occurs prior to the percolating water reaching a drinking water aquifer.
.

3.8-1/3 Annual precipitation can vary significantly between drought and flood conditions; periodic and occasionally severe droughts and floods within the area are well-documented (LARWQCB, 1994), and the potential for extreme precipitation (maximum intensity of precipitation for periods of 12 hours or longer which might be expected at intervals of ten to 100 years) is greater in portions of the San Gabriel Mountains than practically anywhere else in the continental United States (WERC, 2014). Average annual rainfall within the Los Angeles Basin is approximately 14.5 inches, though local averages can vary considerably depending on location within the basin (WERC, 2012).
No adequate stormwater flow forecast 85%ile

Climate changes.

3.8-8/2 5. **Dominguez Channel Watersheds (Figure 3.8-6)** (Dominguez Channel EWMP and Beach Cities EWMP– ...Dominquez Channel EWMP and a portion of the Beach Cities EWMP...differentiated by a larger area of industrial land use. Because of the high density...large regional and centralized infiltration-type BMPs will be limited. The structural BMP strategy will be more LFDs, both large (centralized) and small (distributed), located at MS4 outfalls...The other BMP strategy is the use of **smaller distributed BMPs**...low-impact development (LID) type of BMPs, such as green streets and biofiltration BMPs.
.

3.8-4/3 EWMP Groups The proposed program has been divided into 12 EWMP Areas that have been organized by watershed groups that **share comparable conditions**.
The 12 EWMPs are consolidated into six watershed areas that are grouped **by similar watershed characteristics**...and also provide hydrologic features and the locations and distribution of planned and priority regional/centralized BMPs.
No comparable, similar, or differing watershed conditions or characteristics have been identified other than physical channel connections.

3.8-4/3 The **priority BMPs** are a **subset of the planned BMPs** and have been selected as **priority projects** based on a **screening assessment** of the planned projects.
Priority projects will be implemented before additional **planned projects**.
Define and compare priority, planned, and potential BMPs and projects.
Referenced "screening assessment" has not been described.

3.8-4/3 Distributed BMPs are **planned to be implemented** throughout the urbanized areas of the EWMPs.
No plan provided for distributed BMPs within the EWMP or available EWMPs.
No designation as to whether distributed BMPs/Projects will be priority, potential, or just planned projects; as provide after the priority projects.

3.8-20/1 ...these LFDs could potentially increase the amount of water available for recycling, reuse, and **groundwater recharge**.
3.8-21/1 ...45 percent are supplied by local groundwater basins that **are recharged naturally**...**through constructed recharge facilities** (MWD, 2010).
.

3.8-21/1 ...stormwater recharge facilities **currently augment local groundwater supplies** in the region by an estimated 477,000 acre-feet per year (MWD, 2014).
.

3.8-21/1 **One of the primary goals of the EWMP program**...**increase the amount of stormwater that is recharged**...particularly in portions of the Central Basin that experience a high degree of hydraulic connectivity between surface water and groundwater. Infiltration BMPs proposed within the EWMPs are expected to **increase the rates and amounts of groundwater recharge**...
.

3.8-31/3 ***County of Los Angeles Low Impact Development Manual***
The County...prepared the 2014 Low Impact Development Standards Manual (LID Standards Manual, County of Los Angeles, 2014b) to comply with the requirements of the 2012 MS4 Permit...provides guidance for the implementation of stormwater quality control measures in new development and redevelopment projects in unincorporated areas of the County with the intention of improving water quality and mitigating potential water quality impacts from stormwater and non-stormwater discharges.
.

3.8-31/4 The LID Standards Manual addresses...objectives and goals:

- Lessen the adverse impacts of stormwater runoff from development and urban runoff on natural drainage systems, receiving waters, and other water bodies.
- Minimize **pollutant loadings from impervious surfaces** by requiring development projects to incorporate properly-designed, technically-appropriate BMPs and other LID strategies.
- Minimize erosion and other hydrologic impacts on natural drainage systems by requiring development projects to incorporate properly-designed, technically appropriate **hydromodification control development principles and technologies**.

Not objective - goals yes.

City of Los Angeles Low Impact Development Manual

3.8-31/5 In November 2011, the City of Los Angeles adopted the Stormwater Low Impact Development Ordinance #181899 with the stated purpose of:

- Requiring the use of LID standards and practices in future developments and redevelopments to encourage the beneficial use of rainwater and urban runoff
- Reducing stormwater/urban runoff while improving water quality
- Promoting rainwater harvesting
- Reducing off-site runoff and providing increased groundwater recharge
- Reducing erosion and hydrologic impacts downstream
- Enhancing the recreational and aesthetic values in our communities

.

3.8-31/6 The City of Los Angeles institutionalized the use of LID techniques...Subsequent to the adoption of the Stormwater LID Ordinance, the City prepared the *Development Best Management Practices Handbook, Low Impact Development Manual,* dated June 2011, to describes the required BMPs (City of Los Angeles, 2011).

.

3.8-35/2 **Mitigation Measure HYDRO-1** requires Permittees to evaluate the suitability of BMP locations for groundwater **recharge**. **Infiltration BMP**s would not be suitable in areas of low permeability where subsurface structures could be adversely affected by groundwater mounding.

.

3.8-41/5 **Cumulative Impact Discussion Structural (Regional, Centralized, and Distributed) BMPs** **...**Implementation of the proposed structural BMPs,...other reasonably foreseeable future projects...result in improved stormwater quality and reduced non storm flows....will experience reduced dry-weather runoff, a more natural hydrology, and improved receiving water 3.8-42/1 quality. In addition, new infiltration projects will incrementally augment groundwater drinking water supplies. **Although the increased infiltration projects may increase pollutant loads to groundwater aquifers, pretreatment systems coupled with regional groundwater management lead by the local Watermasters will ensure that the beneficial uses of groundwater basins are not significantly impaired.** ...EWMPs will beneficially impact local surface water quality and groundwater supplies. **Mitigation Measures:** None required **Significance Determination:** Less than significant

.

3.8-43/**TABLE 3.8-3 SUMMARY OF HYDROLOGICAL RESOURCE IMPACTS REQUIRING MITIGATION MEASURES Cumulative Impacts, No mitigation required**

.

3.9-2/2 ...shows land uses in the Ballona Creek Watershed and the location of **planned and priority regional/centralized Best Management Practices (BMPs)**. The location of distributed BMPs would be throughout the urbanized areas of the watershed.

3.9-4/1 land uses in the Beach Cities EWMP area...

3.9-6/1 land use in the Dominguez Channel EWMP area...

3.9-8/2 ...land uses in the Malibu Creek Watershed EWMP area...
3.9-10/2 ...land use in the Marina del Rey Watershed EWMP area...
3.9-12/1 North Santa Monica Bay EWMP area...
3.9-15/2 ...Palos Verdes Peninsula EWMP area...
3.9-17/2 ...Rio Hondo/ San Gabriel River EWMP area...
3.9-19/2 ... Santa Monica Bay EWMP area...
3.9-21/2 ... Upper Los Angeles River EWMP area...

Define and described priority, planned, and potential BMPs and projects and provide sequential arrangements. Will distributed BMP be implemented before the end of the priority or planned BMP implementation? Absence of phased or scheduled implementation listing of the BMPs or projects renders section inadequate if not incomplete.

3.14-9/4 **...**EWMP comprehensively evaluates opportunities...multi-benefit regional projects that, **wherever feasible,** retain (i) **all** nonstormwater runoff and (ii) **all stormwater runoff from the 85th percentile, 24-hour storm event** for the drainage areas tributary to the projects, **while also achieving other benefits including flood control** and **water supply**,...
Feasible.

within the participating Permittees' collective jurisdictional area in a Watershed Management Area, for collaboration among Permittees and **other partners** on (i) **all** nonstormwater runoff and (ii) **all stormwater runoff from the 85th percentile, 24-hour storm event** for the drainage areas tributary to the projects, **while also achieving other benefits** including flood control
Other partners
feasible
85th %ile
Flood control
Water supply
.
Is this an objective

3.14-15/5 *Water Supply* Impact 3.14-3: The proposed program ***[=The EWMP]*** **could require new or expanded water supply resources or entitlements** or require or result in the construction...could cause **significant environmental effects**.

Any increase in recharge and safe yields of local groundwater will be used in water supplies and support larger populations and more intensive water uses unless physical capacities are reduced by physical removal of existing facilities.

Herein, unlike other sections, the program is acknowledges as to being capable/could affecting/impacting directly on water resources and their associated water rights/entitlements and related retail service areas and populations (users).

Given the general purpose of the EWMP is to recharge groundwater in a urban-suburban context where groundwater is used for water supply, such "conditional-could" appears totally inappropriate and must be technically defined/determined in order to fully and adequately discussed environmental, cost-effectiveness, and compliance with discharge water quality limits over the life of the projects.

3.14-20/5 Impacts to the **existing water supplies are anticipated to be beneficial** as a result of the stormwater and non-stormwater runoff infiltration and conservation BMPs implemented across the EWMP areas. **Mitigation Measure UTIL-1** would require that implementing agencies **evaluate impacts to downstream beneficial uses, including surface water rights** prior to **BMP approval**. No adverse 3.14-21/1 cumulative impacts related to **new or expanded water supply resources or entitlements would occur**.

"Evaluate" is not a mitigation measure; similarly establishment of "surface water rights" for recharged groundwater and "BMP approval" are left undefined and unassigned.

Clearly require as part of the MMRPlan that the County and all Permittees and EWMPs establish recharged groundwater entitlements for every facility capable of recharging more than 100acft per year.

Clearly require as part of the MMRPlan that the County and all Permittees and EWMPs establish water supply monitoring and reporting of dependent service area expansions or increased total use and the portion which is sourced from recharged storm and recycled waters for every facility capable of recharging more than 100acft per year.

Impacts are not defined and an assumption of beneficial is not defined but would be assumed to improved/increase supply and reliability/assurance of supply for a larger population or higher uses which would lead to expanded supply service areas.

This statement contradicts the statements regarding little or no water supply growth inducements; this becomes a greater concern when stormwater recharge is combined/integrated with recharge of recycled water for storage and eventual local water supply services.

Review and revise these statements and those regarding growth inducements from increase water supply and reliability of service deliveries arising from increased local storm and recycled water sources.

Historic practices in adjudicated basins has been that whoever adds water to the basin become entitled to extract that water for their own interests.

.

4-6/1 4.3 Plan Consistency General Plans Construction of structural BMPs and adoption of non-structural BMPs would occur throughout each of the EWMP areas, encompassing 84 cities and large areas of unincorporated Los Angeles County. Each city has adopted land use plans and zoning codes covering development within their jurisdictions. Many cities including the City of Los Angeles have **adopted LID ordinances** that promote new development of storm flow retention and water quality BMPs. Each implementing agency **would be required to evaluate the consistency of each BMP** with local zoning codes. **Compliance** with city codes for placement of BMPs **would ensure that the cumulative impact of installing multiple BMPs** throughout the County **would not conflict with local plans and policies**.
.

4-6/2 The Los Angeles County General Plan includes land use designations...provides a list of **goals and policies**...that promote **storm water** quality infrastructure. The installation of multiple BMPs...**would be consistent with...goals promoting LID infrastructure and improved storm water quality**...identifies the regional conservation planning efforts...including critical habitat, significant ecological areas, habitat conservation planning areas, and...parks....enhanced water quality and a more natural hydrology **encouraged**...consistent with the habitat conservation goals of each of these plans.
Recent changes in Hauled Water Initiative constraints.

4-6/2 ...Permit describes the Watershed Management Program optional compliance approach as providing more **opportunities** for multi-benefit projects that would **encourage** goals of recreation and habitat value creation as part of the BMP. The **proposed program would be consistent with regional General Plan goals and policies**.
Program
Consistency
General Plan
Goals and Policies .

4-7/1 ...air quality, traffic, and water supply), the cumulative setting...specific regional boundaries...contributing to cumulative impacts...cumulative setting is based on development anticipated within the vicinity of the EWMP project. The impact analysis in Chapter 3...cumulative impacts for each resource area...conclusions of the cumulative analysis in Chapter 3....implementation of the BMPs would result in cumulative significant impacts to air quality, cultural resources, and noise.
Hauled water, recycled water, and stormwater.

p.4-8/Table 4-3 **SUMMARY OF CUMULATIVE IMPACT ANALYSIS**

Issue Area	Significance Determination
Hydrology and Water Quality (Cumulative)	LSM ***[Less than Significant with Mitigation].***

Given common usage of groundwater basins for recharged water storage for both storm and recycled waters revise the table and incorporate growth inducements amongst cumulative impacts for recharged stormwater.

6-2/5 **6.2 Review of Proposed Program Goals and Objectives**
The alternatives presented in this chapter were analyzed for their abilities to reduce significant program impacts and meet the objectives of the proposed program, which are:

- To **collaborate** among agencies (Permittee jurisdictions) across the watershed **to promote more cost-effective** and multi-beneficial water quality improvement projects to **comply with the Municipal Separate Storm Sewer System (MS4) Permit.**
- To develop watershed-wide Enhanced Watershed Management Programs (EWMPs) that would, once implemented, remove or reduce pollutants from dry- and wet-weather urban runoff in a **cost-effective** manner.
- To **reduce the impact** of stormwater and non-stormwater on receiving water quality.

Discussion starts with a title of Goals and Objectives then switches to objectives. These are goals not objectives as they are not quantified nor scheduled in any manner.

Since two "objectives" refer to "cost-effectiveness" and no costs, revenues, economics, or financial information or assessment are not provided, all discussions of the achievements of goals and objectives becomes mute and the PEIR totally incomplete with regard to the "project" or "program" and its alternatives.

Similarly reference to collaboration becomes mute as all related agencies and those in the county have already collaborated and therefore any "collaboration" discussion must be quantified which they have not been.

As to compliance with permit conditions and reduction of impacts are only presumed without documentation which is under parallel preparation for June 2015 and without any hydrological modeling or calculations to support such contentions and comparisons amongst alternatives.

The entire Alternatives section is incomplete and totally inadequate.

6-3/4 The Lead Agency **conducted an alternatives screening process** to identify **feasible** alternatives to the proposed program. The screening process for identifying viable alternatives included consideration of the following criteria:

- Ability to meet the program **objectives** ***[presumes meet objectives or not considered]***
- Ability to reduce significant environmental effects of the proposed program
- **Economic** and engineering feasibility ***[presumes to meet economic feasibility parameters and criteria not presents]***

Introduction of "Lead Agency" at this point would imply some agencies other than LACoDPW, perhaps LACoFCD (??); while reference to an "alternative screening process" indicates some formal process rather than that documented in the PEIR.

Discussion of environmental effects or water-related compliance of flow and quality for a Water Resources project or program without a quantified and presumably computerized complex model for each watershed element is totally inadequate and incomplete at any level.

Introduction of "feasible" and economics without definitions and the objectives which 2/3 include costs and therefore economics strongly distorts any screening or comparisons toward costs, economics, and financial for which no information is provided or believed to be even remotely available for the PEIR, the EWMP, and most if not all of the EWMPs.

Such inadequacies and incompleteness renders Sec.6 irrelevant to the CEQA process with regard to the project, any alternatives, and any designation as to an "Environmentally Superior Alternative" compared to an "economically superior alternative".

Presumptions and unsupported statement are not with the goals of CEQA to provide a complete, adequate, objective, and quantified review and assessment of a program's or project's effects and appropriate mitigation and alternatives to such.

6-3/5 Based on these **criteria**, the **Lead Agency** has identified the following alternatives:

Introduction of "Lead Agency" at this point would imply some agencies other than LACoDPW, perhaps LACoFCD (??); while reference to an "alternative screening process" indicates some formal process rather than that documented in the PEIR.

Identifications are not supported in comparisons primarily with regard to collaboration and presumed economies of scale and cost-effectiveness.

6-5/2 **Ability to Meet Program Objectives** The No Program Alternative...not meet...objective to **collaborate among agencies**...promote more cost-effective and multi-beneficial water quality improvement projects...meet the other objectives to remove or reduce pollutants from dry- and wet-weather urban runoff and reduce the impact of stormwater and non-stormwater on receiving water quality...

.

6-7/7 The Non-Structural BMPs Only Project Alternative may not meet the objectives of the proposed program to collaborate among agencies to promote more cost-effective and multibeneficial water quality improvement projects because Non-Structural BMPs are generally implemented individually in each jurisdiction, so **collaboration efforts for cost-effective solutions** diminishes with implementation of non-structural BMPs only.

.

6-9/9 **Ability to Meet Program Objectives**
The Distributed Structural BMPs Only Program Alternative would meet the **objectives** of the proposed program to collaborate among agencies to promote more cost-effective and multibeneficial water quality improvement projects. However, because distributed structural BMPs **tend to be smaller** in nature and typically are distributed widely throughout the watershed, **more BMPs** may be necessary to meet water quality objectives in the MS4 Permit. The **ability to meet** 6-10/1 the water quality objectives would be **less certain** under this alternative.

This statement indicates that distributed BMPs are cost-effective for the program although they are smaller (may disagreed based on economies of scale and information provided by LACiDWP).

"Less certain" is not defined nor is the statement supported; 100 times more sites may be sufficient and available but no presumption can be supported either way based on the PEIR.

6-12/3 **6.6 Alternatives Suggested in Scoping**
...comment letter...suggested that the PEIR include an assessment of several funding mechanism alternatives, including: Single Parcel Fee Assessment, Parcel Area Fee Assessment, Hybrid Parcel Area Fee Assessment, Zero Discharge Assessment, and Large Parcel Assessment. These suggested alternatives **would not lessen any significant environmental impacts of the Program** and were therefore not considered in this PEIR. Although CEQA allows for discussion of economic impacts and project costs as measures of feasibility, the funding mechanisms required to implement projects are **generally not susceptible to environmental analysis**.

As the program objectives and criteria for alternatives both include economics and costs and as all BMPs require both capital and operation and maintenance costs to be effective, a full documentation using the above mentions financing package must be incorporated into the project description and alternatives, especially those presented to the LARWQCB in June 2015.

Adequately funded projects within the ability to pay of the service population would assure continue environmental compliance and support of a wide array of mitigation measures compared to capital intensity project requiring longer term bonding and expensive project management.

Comparisons of large projects with high capital costs to program of lots of small projects with low capital costs but with higher operating costs have been alluded to in discussions of other alternatives but without any documentation.

As all publicly funded projects to be submitted to LARWQCB in June 2015 must be funded n have not been demonstrated at this time to be funded, any inclusion of projects in this program can not be assumed to have long-term funding to assure mitigation of impacts.

6-12/4 ...comment...Full Capture and Recharge of Flows Greater than 100 cfs Alternative...rejected...because of the **infeasibility** of capturing all storm flows...unrealistic, requiring most of the **developed land in the County to be accomplished**...
...suggesting full capture of **all flows less than 100 cfs**...was rejected from further consideration for the same reason...would require enormous areas of...currently developed...recharge is **only feasible** in certain areas of the County because of the poor percolation capacity of surficial soils...accumulation of **subsurface clay lenses** creates recharge barriers in **many places of the County**, making retention and recharge of large quantities of stormwater **infeasible** in these locations.

PEIR total lacks definitions for "feasibility" and "infeasiblity" as to technically, financially, administrative, or politically aspects.
As no surface or subsurface hydrologic model is available or referenced, and supporting documentation is not provided nor apparently available for either flow capture alternative dismissal.
The PEIR does not provide maps of locations with clay lenses and their extents/depths and thereby barrier effects.

6-13/Table 6-2 Ability of Project Alternatives to Meet **Project Objectives** Project Objectives
1. To Collaborate Among Agencies (Permittee Jurisdictions) Across the Watershed
To **Promote more cost-effective** and multi-beneficial water quality improvement projects
To comply with the MS4 Permit. ***[=portions of Objectives 2 & 3]***
2. To develop watershed-wide EWMPs that will, once implemented, **remove or reduce pollutants from dry- and wet-weather urban runoff** ***[= Objective 1.]*** in a **cost-effective manner.**
3. To reduce the impact of stormwater and nonstormwater on receiving water quality. ***[=Objective 1.]***
Program and projects confused and confusing.
As objectives, inadequately quantified and not scheduled.
Comparisons of alternatives and "abilities" of Project GOALS and objectives without cost-effectiveness and any hydrological model for wet/storm and dry/storm water flows render all as totally inadequate and incomplete.
As written, the objectives must be referred to as "Goals"; objectives must be measurable/monitorable with schedules and quantified levels of achievement, e.g., 4Qtr2016 and $100/ppm reduction.

6-14/1 The No Program Alternative...impacts...would be similar to the proposed alternative. None of the significant and unavoidable impacts of the proposed alternative would be avoided by this alternative. Furthermore, since the ability to achieve compliance with MS4 Permit water quality objectives would be reduced if each Permittee were on their own, impacts to water quality would be greater under this alternative.
.

6-14/2 The Distributed Structural BMPs Only Alternative... would avoid construction and operational impacts...However, since the ability to achieve compliance with MS4 Permit water quality objectives would be reduced without the larger-scale centralized and regional BMPs, impacts to water quality would be greater under this alternative.

RESOLUTION
Whereas the MTA/Metro and Caltrans remains supportive of the Freeway Tunnel for the SR 710 North Extension Project;
Whereas the current route and portal location remains in and under the City of Los Angeles and is contrary to the City Council Resolution of 2012;
Whereas the proposed portal buildings would foreclose any further expansion of high tech biotechnical developments; and
Whereas the most probable favored alternative, Freeway Tunnel, would include tolled trucking with a capacity of more than 40,000 trucks a day, every day.

Therefore be it resolved, the Sunland Tujunga Neighborhood Council opposes the Freeway Tunnel, either single or dual, for the selected alternative of the SR-710 North Extension project and support a more transit and rail based alternative to serve passenger and goods movements for the central/western San Gabriel Valley and eastern City of Los Angeles.

Subject: Enhanced Watershed Management Plan
RE: Comments on Programmatic Draft EIR
Specific Comments #2/4, 03/11-13-16/15.

SAME as 03/09/15
Following provides a brief review of the CEQA/P-DEIR (PEIR) documents of almost 70MB/1000 pages. We thank the LACo Department of Public Works and Flood Control District for this opportunity to review and comment on the PEIR and greatly appreciate the deadline extension for doing such. I will be submitting detailed comments during 03/09-03/16, and these overall comments on 03/09 & 16/15.

Overall review is that the document(s) are inadequate, incomplete, inaccessibility for the general educated public due to the volume, technical character, overly-broad statements, lack of documentation and support of statements, and lack of consistency of terms and usage,

The proposed Program does not provide a plan for tiered project CEQA considerations by the other permittees nor the County itself. No plan for the Program or the projects has been established for the Enhanced Watershed Management Plan to achieve and comply with the LA Regional Water Quality Control Board's permit requirements. A program may be more generalized but still must provide a plan of actions for both the lead and responsible agencies.

The Program does not provide even the requirements, process, and procedures for subsequent CEQA compliance by other permittees and some projection as to whether EIRs, MNDs, ND, or CE will be used to tier down from this P-DEIR/P-FEIR. Conditions for Program Compliance by tiered projects have not been listed or even referenced other than some ill-defined listing of BMPs.

No current listing of all planned and funded Projects has been provided and incorporated into a scheduled and quantified plan for submission in June.

Although research has been underway for five-plus years, the EWMP and this EIR does not use nor even reference use of computerized modeling of the appropriate basins (Ballona Creek, Upper LA River, Middle LA River and Arroyo Seco, Lower LA River and San Gabriel River, and LA River Mouth/Estuary-Dominguez Channel) although the federal agencies (BLM, USGS, ACoE, etc.) and perhaps local agencies (some permittees and the Water Board) have some local or watershed models . Without a model and its components, the impacts and their significance of detention, retention, recharge, and flood protection cannot be assessed nor mitigated adequately or completely.

Three goals are provided but no objectives (sub-tiered from goals) are provided with/without defined schedules and other quantitative parameters for program monitoring. Confusion is introduced in later text when both flood control and water supply "augmentation" are also introduced as "goals" and as "objectives".

Specific goals are only to meet the MS4 Permit requirements and related water quality conditions and to meet them in a "Cost-Effectiveness" manner. However, costs, financial support, revenue, capital bonding, or economic effectiveness or efficiency are not provided, and thereby achievement of the cost effectiveness cannot be judged nor compared and must presumed by submission of any proposed project.

Growth inducement is mentioned primarily with regard to direct housing construction and employment and incomes while dismissing potential effectts of recharged (diverted storm flows) water supplies.

Additional benefits primarily for flood protection are mentioned in some statements while it is not supported by any text or analyses under water resources. No assessment of beneficial and adverse effects are provided for raising base flow levels from program-augmented/diverted-stormwater groundwater resources and their effects upon subsequent pollutant concentrations and flood flows.

I am retired from 30 years in water and environmental resources with Parson Corp., Pasadena and URS San Francisco and over 10 years with Dubai (UAE) government and local water and environmental companies. I have prepared sections and entire documents for more than 300 EIRs, EISs, and EAs worldwide for local agencies, cities, counties, states, federal, and international agencies and organizations and have reviewed more than 100 additional assessments. During work for URS, I was involved in the development and environmental considerations for the 1970s EPA's Santa Ana and Santa Marguerita/San Luis Rey basins plans. My reviews have included the LACity's Recycled Water Management Plan and Stormwater Capture Management Plan, and I am currently vice chair of the LA City's Floodplain Management Plan.

Dr. Tom Williams

NEW - NOT INCLUDING THOSE OF 03/09/15

EWMP - SPECIFIC COMMENTS
Comments, recommendations, and additions are presented in **Bolded *Italics***
PEIR text specific to the comments are presented in plain text as was in the PEIR. Some specifically relevant PEIR text may be **Bold Underlined**.

ES-2/2 The EWMPs **will** identify **potential and priority** **structural and non-structural** Best Management Practices (BMPs) within the region's stormwater collection system to improve runoff water quality.
Potential and priority BMPs are referred to but are not adequately related to the EWMPs and the EWMP/PEIR and as indicated herein they ARE BEING developed, they are not developed. The EWMP and PEIR are not definitive at even a programmatic or conceptual deign level.

ES-2/5 A few of the BMPs are currently **well defined** but most **are yet to be fully developed** under the EWMPs....priority BMPs...detailed in each of the EWMPs; these **are being developed in parallel with the PEIR**....describes the details **that are available** for each of the EWMPs currently...by the EWMP working groups.
1-3/3 A set of **priority BMPs** will be detailed in each of the EWMPs; these are being developed in parallel with the PEIR. The PEIR describes the details that are available for each of the EWMPs currently under preparation by the EWMP working groups.
No definition of "Fully" or "Well" is provided for the PEIR and as they are being developed at the same time as this PEIR their entire discussion is so general as to render assessment impossible and open to any combination of current or future "projects" and BMPs as desired by the agencies. No reliable discretionary decision can be made and funded based on the PEIR.

1-1/3 The MS4 Permit gives Permittees the option of implementing an innovative approach to permit compliance through development of an Enhanced Watershed Management Program (EWMP)....**will identify potential and priority structural and non-structural Best Management Practices (BMPs)** within the region's stormwater collection system to improve runoff water quality. The LACFCD, along with participating Permittees, has opted to exercise this option and has submitted to the LARWQCB 12 separate Notices of Intent (NOIs) for the development of EWMPs within 12 distinct watershed groups...Implementation of the EMWPs would be the responsibility of each Permittee and would occur following approval of the EWMPs by the LARWQCB.
BMPs, groups of BMPs, and Projects are not defined at any engineering levels so as to determine cost-effectiveness, capabilities to achieve any project/program goal involving water quality or flows and their effects and impacts.

1-3/3 The EWMPs will identify **management strategies** including **hundreds of structural Best Management Practices** (BMPs) that **may be** designed and implemented by the Permittees to meet **permit compliance objectives** ***[Only one of the Program objectives]***.
Clearly indicates that this RAA model for water quality is not completed prior to its assessment and that the assessment cannot adequately assure that even the water quality goals and objectives cannot be realized.
Water quality and flow models and proposed BMP depend on diversion or reduction of flows during both dry- and wet-weather flows, and therefore the RAA must be based on a hyrdologic/hydraulic model which has not bee referenced or mentioned.
This EWMP and PEIR must provide the programmatic management strategy guidelines for those of the tiered-down EWMPs-strategies and related CEQA documents. Use of the conditional: "may be" voids following verbs and leaves the statement as irrelevant to the Program and Project EIRs.

1-4/3 The EWMPs are to include a discussion of the environmental documents, assessments, and permitting required for the implementation of the **priority projects**. The PEIR can provide a basis for this discussion. The use of the PEIR in the development and implementation of the EWMPs is further discussed in this chapter in the *Purpose of the Program Environmental Impact Report*.

Priority BMPs were discussed but have not been distinguished from "Priority Projects".

The PEIR does not discuss the process of tiering to projects or to specific BMPs and whether Mitigated Negative Declarations will be tiered down from this PEIR or whether the project must require tiered/focused EIRs for full and adequate CEQA compliance.

1-7/1

- Other Receiving Water Considerations (**second category**):
  - The second highest priority shall be considered controlling pollutants for which data indicate impairment of exceedances of receiving water limitations and the findings from the source assessment implicates discharges from the MS4.

As no hydrologic model for flows and concentrations has been provided even for the TMDL constituents, references to secondary pollutants appears totally inappropriate and purposefully attempts to elevate the credibility of compliance with the TMDL, which has not been achieved.

1-7/2 The **EWMP prioritization process** includes
identifying the priority pollutants and...
schedule for implementing BMPs to meet the following criteria:

- For pollutants...same class as TMDLs,...consider these pollutants within...same time frame as...TMDLs.
- For...303(d) list...EWMPs develop a schedule to address these pollutants **as soon as possible** with milestones.

Priority pollutants have already been prioritized and identified, and the prioritization process has not been described although referred to, and no schedule for prioritization, definition of priority projects or priority BMPs has been provided.

Prioritization process and schedule are rendered totally inadequate when modified by whenever "possible". MMRPlan must include a full and scheduled prioritization process for ALL EWMPs.

1-8/2 The RAA **is being performed** as part of the preparation of the EWMPs, and **in parallel with...this PEIR.** The RAA...primary goal of the EWMP...meet the **water quality goals**. The **modeling being performed**...will determine...number and distribution of the BMP types and specific projects identified in the EWMP Work Plans will meet the water quality goals. This PEIR will assess the types of BMPs that **may be implemented** to meet **these** ***WATER QUALITY*** **goals**.

Management strategies (MSs) presumably are different from the BMPs and the EWMPs which they maybe be parts of, but MSs are not defined nor associated with BMPs and EWMPs.

The RAA and a supporting/integrated Hydrologic Model must be provided in a final form to be incorporated, not be performed in parallel, with full integration/incorporation. The MMRPlan must include a final RAA.

1-9/1 The LACFCD will **consider** the information presented in this PEIR, along with **other factors**, **in the development and implementation of the EWMPs**. The EWMPs are to include a discussion of the environmental documents, assessments and permitting required for the implementation of the **priority projects**. The PEIR **can provide** a basis for this discussion.

1-10/2 The EWMPs are to include a discussion of the environmental documents, assessments, and permitting required for the implementation of the **priority projects**. *Repeated*

Consider and other factors are not defined and as such allow the entire PEIR process to be set-aside.

The PEIR does not fully define the roles and participations of the LACFCD in the development of tiered EWMPs and their CEQA documents.

Again "priority projects" are mentioned and not defined with regard to "priority and potential BMPs."

CEQA texts must recognize differences between "can/could provide" and "will/would provide" and require clarity as to what will occur in the teiring of projects and CEQA documents.

1-11/1 Maps identifying **potential and priority BMP locations** are provided in Chapter 2...with the overall EWMP **watershed characteristics** and **BMP implementation strategy**.

No definition or specificity of potential and the subgroup priority BMPs and locations nor details are provided within the tables and generalized maps. No watershed characteristics are provided regarding runoff coefficients, design rainfall amounts, times of concentrations, are estimated flow levels are provided for any watershed, not even a ranking of highest to lowest flows or highest-lowest dry- and wet weather water qualities.

1-11/1 The PEIR **focuses** its assessment on **construction and operation** of these potential and priority BMPs to be installed throughout the watersheds—but primarily within urbanized areas where the **pollutant loading is greatest** and where these **BMPs can be most cost-effective** in **meeting water quality goals**.

No focused information is given regarding the BMP operations and their effectiveness in removing pollutants and meeting water quality goals (not objectives).

No information is provided regarding the degree of urbanization for each watershed, nor the assumed "loadings" being greater, median, or least.

BMPs are presumed as cost effective without documentation and analyses as to pollutant - present/removed per 100 acft or any other quantified parameter and as to achievement of current reductions down to desired goals.

2-5/1 Additional information and figures on the location and distribution of potential and priority BMPs based on available data at the time of publication of this PEIR, are presented in Section 2.5*, EWMP Watershed Characteristics and BMP Implementation Strategies*.

.

2-15/2 Source Control BMPs. Source control structural BMPs are commercial products designed to treat runoff in highly urbanized environments. Mechanical separation, or more complex physicochemical processes, provides separation of gross solids and other pollutants...**designed to sequester hydrocarbons and other pollutants**.

Residual pollutants and their disposition is not mentioned nor provided any where in the PEIR. No discussion is included regarding the soil sequestering of hydrocarbons, metals, and other pollutants in the ground materials (especially in/on clays). No estimate is provided as to anticipated sequestering per year and probable long-term removal of soil materrials before they achieve "hazardous" levels.

2-16/2 Specific examples of **distributed** BMPs that are in various stages of planning and implementation and part of a possible EWMP are presented in **Table 2-3**. The locations of these examples of planned **distributed** BMPs are shown in **Figure 2-2**. Table 2-3 presents the locations, project description, and key elements of the **distributed** BMPs to further illustrate these types of structural BMPs that **may be part** of **an** EWMP. Additional information and figures on the location and distribution of potential and priority BMPs, where data ***are***~~is~~ available, are presented in Section 2.5, *EWMP Watershed Characteristics and BMP Implementation Strategies*.

Centralied and Regional BMP discussions repetitive from 2-16/2 except as highlighted.

2-28/2 ...**centralized** BMPs...presented in **Table 2-4**. The locations of these examples of planned and implemented **centralized** BMP...in **Figure 2-3**.
Table 2-4...the **centralized** BMPs...structural BMPs that **are part** of **the** EWMP....of potential and priority BMPs, where data ***are***~~is~~ available,...*BMP Implementation Strategies*.

2-35/1 ...**regional** BMPs...of planning ***and implementation and*** **that are part** of the EWMP are presented in **Table 2-5.** The locations of these examples of **regional** BMPs are shown in **Figure 2-5**. Table 2-5...of the **regional** BMPs to further illustrate these types of structural BMPs **that are concepts being developed through the EWMP process**. ...of potential and priority BMPs, where data ***are***~~is~~ available...*BMP Implementation Strategies*.

The complex repetitive wording and slight but several differences in these texts cause considerable confusion for the public review and participation in this CEQA process. Without clear table-ed presentation meaning and clarity are lost, rending these important issues inadequately treated in this PEIR.

2-40/1 Summarized below are the general characteristics of the watersheds within the **EWMP Groups** and the overall strategies for BMP implementation...twelve **EWMPs** are consolidated to **six watershed areas**...summary provides additional detail on the distribution and location of **potential and priority BMPs**, **where data is available**,...for each EWMP and show the location and distribution of **planned and priority regional/centralized BMPs** for which **data are available at the time of publication of this PEIR**. The **priority BMPs**...subset of the potential BMPs that have undergone a site review and project evaluation that has identified these BMPs as a priority. These **priority projects** are shown based upon **available data at the time of publication of this PEIR**.

EWMP groups, EWMPs, and watershed areas are inadequately associated and defined; presumably 12 EWMPs may be associated into 6 EWMP Groups based on watershed associations.

Similarly designations as to:

Potential, Planned, and Priority BMPs - Priority BMPs are part of Potential BMPs

Regional and centralized BMPs - excluding distributed

Priority projects or BMPs

require clear definitions and ordering in order to have adequate clarity for public review.

2-40/1 Appendix G provides the location and general description of the **priority BMPs**...**Distributed BMPs** are planned to be implemented throughout the urbanized areas of each EWMP.
2-43/3 ...Figures 2-5 through 2-16, each of the **EWMPs**...wide distribution of BMPs to achieve permit compliance. **Appendix G** provides the locations and general descriptions of the **priority BMPs** (**where data is available)**,...**Priority Projects** are **projects that have been identified through the EWMP process** as **targeted for implementation** within the first years following the EWMPs approval by the LARWQCB. **Identification of Priority Projects is underway** and **has not been completed by all EWMPs at this time**. ***[For any??]...*****PEIR is being prepared in parallel to the EWMPs**. **Priority Projects** ***[proper noun]*** **will be defined** in all the EWMPs **to be submitted for public comment in June 2015**. Priority Projects that have been identified at this time through the EWMP process are shown on the following figures. **Priority Projects may be regional, centralized or distributed type BMPs**. For **potential projects**...location of potential regional and centralized **BMPs** are shown. Distributed BMP will be distributed throughout the urbanized areas and are not shown on the following figures
...2-44/1...

No "general description" is provided for the program, projects, and BMPs, as summarized below, only listings and figures found in the Vol.1. Apdx. G EWMP Proposed BMP and Priority Project Data and Figures A-L, pages unnumbered items renders the entire appendix confusing and un-reviewable for the general public and the only "General Description" is APN numbers.

2-57/1 **2.6 EWMP BMP Implementation Schedule** The EWMPs that are **being prepared in parallel** to the PEIR will provide a **timeline for the implementation** of the BMPs ***[as define in MS4/TMDLs]***...**priority BMPs**...that have undergone a site review and project evaluation and...based on available data at the time of publication of this PEIR...**Implementation of priority BMPs will begin following approval of the EWMPs by the LARWQCB...depend on the approval of the EWMPs, *1)* further environmental assessment, *2)* permitting, and *3)* availability of funding sources**.
The EWMPs will be submitted to the LARWQCB in June 2015.

The entire process of LACo-EWMP, EWMPs, BMPs, etc. and implementation of "Priority BMPs" have not been fully provided nor adequately documented.

As indicated above, a fully scheduled/timed EWMP/EWMPs implementation schedule for all BMP and for further - annual - updating must be included in the Final PEIR perhaps as part of the MMRPlan for PEIR and within each EWMPs' CEQA documents.

Statements as to the submittal dates in less than three months clearly indicates that undue pressure is being attempted in order to force the CEQA and project development processes through without due consideration as to the completeness and adequacy of project, program, and CEQA documents and processes.

2-57/4 Each EWMP will **define** priority projects, and **installation** of these projects will move forward depending on the **availability of funding** and **outcome of further project-specific CEQA review**. Funding options for implementing agencies would include obtaining **grant funds, low-interest loans, tax-based general funds, or special assessments**. Each **jurisdiction** will be responsible for securing the necessary funds over time to achieve permit compliance.

References to but absence of information regarding funding, funds, and other related economic/financial elements and their pivotal importance to any "Project" renders continued discussion of projects inadequate and incomplete and subject to major changes of any PEIR referenced "project between now and July 1, 2015 and thereafter.

Introduction of "jurisdiction" renders the discussion meaningless, incomplete and inadequate.

3.14-15/5 *Water Supply* Impact 3.14-3: The proposed program ***[=EWMP]*** **could require new or expanded water supply resources or entitlements** or require or result in the construction...could cause significant environmental effects.

Given the general purpose of the EWMP is to recharge groundwater in a urban-suburban context where groundwater is used for water supply, such "conditional-could" appears totally inappropriate and must be technically defined/determined in order to fully and adequately discussed environmental, cost-effectiveness, and compliance with discharge water quality limits over the life of the projects.

6-2/5 **6.2 Review of Proposed Program Goals and Objectives**

The alternatives presented in this chapter were analyzed for their abilities to reduce significant program impacts and meet the objectives of the proposed program, which are:

- To **collaborate** among agencies (Permittee jurisdictions) across the watershed **to promote more cost-effective** and multi-beneficial water quality improvement projects to **comply with the Municipal Separate Storm Sewer System (MS4) Permit.**
- To develop watershed-wide Enhanced Watershed Management Programs (EWMPs) that would, once implemented, remove or reduce pollutants from dry- and wet-weather urban runoff in a **cost-effective** manner.
- To **reduce the impact** of stormwater and non-stormwater on receiving water quality.

Discussion starts with a title of Goals and Objectives then switches to objectives. These are goals not objectives as they are not quantified nor scheduled in any manner.

Since two "objectives" refer to "cost-effectiveness" and no costs, revenues, economics, or financial information or assessment are not provided, all discussions of the achievements of goals and objectives becomes mute and the PEIR totally incomplete with regard to the "project" or "program" and its alternatives.

Similarly reference to collaboration becomes mute as all related agencies and those in the county have already collaborated and therefore any "collaboration" discussion must be quantified which they have not been.

As to compliance with permit conditions and reduction of impacts are only presumed without documentation which is under parallel preparation for June 2015 and without any hydrological modeling or calculations to support such contentions and comparisons amongst alternatives.

The entire Alternatives section is incomplete and totally inadequate.

6-3/4 The Lead Agency **conducted an alternatives screening process** to identify **feasible** alternatives to the proposed program. The screening process for identifying viable alternatives included consideration of the following criteria:

- Ability to meet the program **objectives** ***[presumes meet objectives or not considered]***
- Ability to reduce significant environmental effects of the proposed program
- **Economic** and engineering feasibility ***[presumes to meet economic feasibility parameters and criteria not presents]***

Introduction of "Lead Agency" at this point would imply some agencies other than LACoDPW, perhaps LACoFCD (??); while reference to an "alternative screening process" indicates some formal process rather than that documented in the PEIR.

Discussion of environmental effects or water-related compliance of flow and quality for a Water Resources project or program without a quantified and presumably computerized complex model for each watershed element is totally inadequate and incomplete at any level.

Introduction of "feasible" and economics without definitions and the objectives which 2/3 include costs and therefore economics strongly distorts any screening or comparisons toward costs, economics, and financial for which no information is provided or believed to be even remotely available for the PEIR, the EWMP, and most if not all of the EWMPs.

Such inadequacies and incompleteness renders Sec.6 irrelevant to the CEQA process with regard to the project, any alternatives, and any designation as to an "Environmentally Superior Alternative" compared to an "economically superior alternative".

Presumptions and unsupported statement are not with the goals of CEQA to provide a complete, adequate, objective, and quantified review and assessment of a program's or project's effects and appropriate mitigation and alternatives to such.

6-3/5 Based on these **criteria**, the **Lead Agency** has identified the following alternatives:

Introduction of "Lead Agency" at this point would imply some agencies other than LACoDPW, perhaps LACoFCD (??); while reference to an "alternative screening process" indicates some formal process rather than that documented in the PEIR.

Identifications are not supported in comparisons primarily with regard to collaboration and presumed economies of scale and cost-effectiveness.

6-9/9 **Ability to Meet Program Objectives**

The Distributed Structural BMPs Only Program Alternative would meet the **objectives** of the proposed program to collaborate among agencies to promote more cost-effective and multibeneficial water quality improvement projects. However, because distributed structural BMPs **tend to be smaller** in nature and typically are distributed widely throughout the watershed, **more BMPs** may be necessary to meet water quality objectives in the MS4 Permit. The **ability to meet** 6-10/1 the water quality objectives would be **less certain** under this alternative.

This statement indicates that distributed BMPs are cost-effective for the program although they are smaller (may disagreed based on economies of scale and information provided by LACiDWP).

"Less certain" is not defined nor is the statement supported; 100 times more sites may be sufficient and available but no presumption can be supported either way based on the PEIR.

6-12/3 **6.6 Alternatives Suggested in Scoping**

...comment letter...suggested that the PEIR include an assessment of several funding mechanism alternatives, including: Single Parcel Fee Assessment, Parcel Area Fee Assessment, Hybrid Parcel Area Fee Assessment, Zero Discharge Assessment, and Large Parcel Assessment. These suggested alternatives **would not lessen any significant environmental impacts of the Program** and were therefore not considered in this PEIR. Although CEQA allows for discussion of economic impacts and project costs as measures of feasibility, the funding mechanisms required to implement projects are **generally not susceptible to environmental analysis**.

As the program objectives and criteria for alternatives both include economics and costs and as all BMPs require both capital and operation and maintenance costs to be effective, a full documentation using the above mentions financing package must be incorporated into the project description and alternatives, especially those presented to the LARWQCB in June 2015.

Adequately funded projects within the ability to pay of the service population would assure continue environmental compliance and support of a wide array of mitigation measures compared to capital intensity project requiring longer term bonding and expensive project management.

Comparisons of large projects with high capital costs to program of lots of small projects with low capital costs but with higher operating costs have been alluded to in discussions of other alternatives but without any documentation.

As all publicly funded projects to be submitted to LARWQCB in June 2015 must be funded n have not been demonstrated at this time to be funded, any inclusion of projects in this program can not be assumed to have long-term funding to assure mitigation of impacts.

6-12/4 ...comment...Full Capture and Recharge of Flows Greater than 100 cfs Alternative...rejected...because of the **infeasibility** of capturing all storm flows...unrealistic, requiring most of the **developed land in the County to be accomplished**...

...suggesting full capture of **all flows less than 100 cfs**...was rejected from further consideration for the same reason...would require enormous areas of...currently developed...recharge is **only feasible** in certain areas of the County because of the poor percolation capacity of surficial soils...accumulation of **subsurface clay lenses** creates recharge barriers in **many places of the County**, making retention and recharge of large quantities of stormwater **infeasible** in these locations.

PEIR total lacks definitions for "feasibility" and "infeasiblity" as to technically, financially, administrative, or politically aspects.

As no surface or subsurface hydrologic model is available or referenced, and supporting documentation is not provided nor apparently available for either flow capture alternative dismissal.

The PEIR does not provide maps of locations with clay lenses and their extents/depths and thereby barrier effects.

6-13/Table 6-2 Ability of Project Alternatives to Meet **Project Objectives** Project Objectives

1. To Collaborate Among Agencies (Permittee Jurisdictions) Across the Watershed
To **Promote more cost-effective** and multi-beneficial water quality improvement projects
To comply with the MS4 Permit. ***[=portions of Objective 2 & 3]***

2. To develop watershed-wide EWMPs that will, once implemented, **remove or reduce pollutants from dry- and wet-weather urban runoff** ***[= Objective 1.]*** in a **cost-effective manner.**

3. To reduce the impact of stormwater and nonstormwater on receiving water quality. ***[=Objective 1.]***

Comparisons of alternatives and "abilities" of Project GOALS and objectives without cost-effectiveness and any hydrological model for wet/storm and dry/storm water flows render all as totally inadequate and incomplete.

As written, the objectives must be referred to as "Goals"; objectives must be measurable/monitorable with schedules and quantified levels of achievement, e.g., 4Qtr2016 and $100/ppm reduction.

Subject: Enhanced Watershed Management Plan
RE: Comments on Programmatic Draft EIR
Specific Comments #1/4, 03/09-11-13-16/15.

Following provides a brief review of the CEQA/P-DEIR (PEIR) documents of almost 70MB/1000 pages. We thank the LACo Department of Public Works and Flood Control District for this opportunity to review and comment on the PEIR and greatly appreciate the deadline extension for doing such. I will be submitting detailed comments during 03/09-03/16, and these overall comments on 03/09 & 16/15.

Overall review is that the document(s) are inadequate, incomplete, inaccessibility for the general educated public due to the volume, technical character, overly-broad statements, lack of documentation and support of statements, and lack of consistency of terms and usage,

The proposed Program does not provide a plan for tiered project CEQA considerations by the other permittees nor the County itself. No plan for the Program or the projects has been established for the Enhanced Watershed Management Plan to achieve and comply with the LA Regional Water Quality Control Board's permit requirements. A program may be more generalized but still must provide a plan of actions for both the lead and responsible agencies.

The Program does not provide even the requirements, process, and procedures for subsequent CEQA compliance by other permittees and some projection as to whether EIRs, MNDs, ND, or CE will be used to tier down from this P-DEIR/P-FEIR. Conditions for Program Compliance by tiered projects have not been listed or even referenced other than some ill-defined listing of BMPs.

No current listing of all planned and funded Projects has been provided and incorporated into a scheduled and quantified plan for submission in June.

Although research has been underway for five-plus years, the EWMP and this EIR does not use nor even reference use of computerized modeling of the appropriate basins (Ballona Creek, Upper LA River, Middle LA River and Arroyo Seco, Lower LA River and San Gabriel River, and LA River Mouth/Estuary-Dominguez Channel) although the federal agencies (BLM, USGS, ACoE, etc.) and perhaps local agencies (some permittees and the Water Board) have some local or watershed models . Without a model and its components, the impacts and their significance of detention, retention, recharge, and flood protection cannot be assessed nor mitigated adequately or completely.

Three goals are provided but no objectives (sub-tiered from goals) are provided with/without defined schedules and other quantitative parameters for program monitoring. Confusion is introduced in later text when both flood control and water supply "augmentation" are also introduced as "goals" and as "objectives".

Specific goals are only to meet the MS4 Permit requirements and related water quality conditions and to meet them in a "Cost-Effectiveness" manner. However, costs, financial support, revenue, capital bonding, or economic effectiveness or efficiency are not provided, and thereby achievement of the cost effectiveness cannot be judged nor compared and must presumed by submission of any proposed project.

Growth inducement is mentioned primarily with regard to direct housing construction and employment and incomes while dismissing potential effectts of recharged (diverted storm flows) water supplies.

Additional benefits primarily for flood protection are mentioned in some statements while it is not supported by any text or analyses under water resources. No assessment of beneficial and adverse effects are provided for raising base flow levels from program-augmented/diverted-stormwater groundwater resources and their effects upon subsequent pollutant concentrations and flood flows.

I am retired from 30 years in water and environmental resources with Parson Corp., Pasadena and URS San Francisco and over 10 years with Dubai (UAE) government and local water and environmental companies. I have prepared sections and entire documents for more than 300 EIRs, EISs, and EAs worldwide for local agencies, cities, counties, states, federal, and international agencies and organizations and have reviewed more than 100 additional assessments. During work for URS, I was involved in the development and environmental considerations for the 1970s EPA's Santa Ana and Santa Marguerita/San Luis Rey basins plans. My reviews have included the LACity's Recycled Water Management Plan and Stormwater Capture Management Plan, and I am currently vice chair of the LA City's Floodplain Management Plan.

Dr. Tom Williams

MAJOR ISSUES:

<u>LACo Water Computer Model</u>
No model has been used or referenced

<u>Project Storm</u>
References are made to the Project Storm event of 85th-percentile for daily (24 hour) rainfall and estimated at 0.75 inches but no primary references or sources for the storm distributions are provided. Choice of this particular criterion is not described but may be related to the permit requirements without any further considerations or its appropriateness. Provide references and demonstration that the storm precipitation applies to the entire southern LACo or where it does apply.

<u>Increased Water Supply and Growth Inducements</u>
Many statements of the use of diverted stormwater and other waters for recharge is not carried through to the ultimate effects of such recharge on base flow (exfiltration) from shallow groundwater into channels or on the available safe yields for potable water supplies. The entire PEIR is incomplete and totally inadequate for the discussion of the volumes, recharge areas, and pumping areas and uses for increased local water supplies either as a means of substitution for imported with the same population or to assure adequate total supplies for increasing or re-distributed populations.

<u>Environmental Justice for Water Supply Sources</u>
Also as an environmental justice issue, the PEIR does not address the distribution of recharge areas for both local stormwater and treated recycled waters (also part of LACo and LACity plans and projects), compared to those areas receiving the higher water quality and lower total delivered costs of imported waters. As both areas would presumably pay the same water supply rates, they must get the same quality water (e.g., TDS, nitrates, metals, etc.), else wise an environmental justice issue appears to exist. Provide the expected water quality and any treatment related to recharged storm and treated wastewater and to imported water (e.g., northern San Fernando Valley-Santa Clarita vs Torrance-Compton-Whittier.

<u>Public Health</u>
Retention, detention, and recharge facilities create good habitats for mosquitoes and other vectors but the PEIR mention mosquito and other water related vectors four times. No discussion is presented regarding the public health issues for water- and water-logged soil related habitats for disease vectors, especially give the concerns regarding West Nile and Dengue Fever vectors. Having suffered malaria, the reviewer may be overly concerned but some assessment and mitigation measures must be included. As a long term operations and maintenance issue, ongoing revenue sources and appropriate O&M funding and activities are vital to any assessment of water related projects in a dense board urban environment.

Fungi-Mold (Valley Fever) are/is would be expected to expand especially in those areas with high soil moisture and perhaps near surface mounded groundwater.

Accumulations of metals and hydrocarbons may occur due to treatment by soil-based systems and stabilization of metals in project basin soils and vegetation.
Watershed health is mentioned but only as this health relates to the presence or removal of contaminants from the dry-/wet-weather runoffs.
No discussion is presented regarding any stormwater-related diseases.

<u>Operations and Maintenance and Revenues</u>
Proposed facilities would be expected to have high manual maintenance.
Coordination and compliance with scheduled maintenance must be incorporated into a thorough scheduled and quantified Mitigation Monitoring and Reporting Plan/Program for all facilities and operations.

<u>Revenues and Stormwater Fees</u>
Sources of revenues are not provided to support capital construction and replacement, financing, and long term operations and maintenance.
No provision is made for revenues based on per-parcel or per-area assessments and fees.
No assignment and delineations are made for benefits and effects/risks to the public and land owners for water quality, flood control, or recharged water supplies.
No comparisons are offered to compare abilities for overall or percentile economic groups to pay for both owners and residents.

<u>Revenues from Groundwater Production</u>
Groundwater resources will be increased but it is unknown as to the ownership of the recharged water and to the process of recovery of increased local groundwater resources beyond the immediate vicinity of the recharge areas.

<u>Flood Control, Protection, Diversion, and Other Related Issues</u>
Flood protection, control, and management are mentioned as a goal/objective of the program but without delineation and definition, and significance to other related concerns (e.g., Growth inducement)

<u>Effects of Increased Base Flow (levels and flows)</u>
No discussion (Two mentions of base flows in all 504 pages) is presented as to both the beneficial and detrimental effects of higher base flow volumes and levels resulting indirectly from rising/mounding groundwater resources downslope of stormwater and recycled water recharge basins/projects.
Increased low flow volumes for pollution dilution of existing and other permitted discharges are not considered.
Increased low flow levels for increased total flood level and expanded flood area are not considered.

EWMP - SPECIFIC COMMENTS
Comments, recommendations, and additions are presented in **Bolded *Italics***
PEIR text specific to the comments are presented in plain text as was in the PEIR. Some specifically relevant PEIR text may be **Bold Underlined**.

Apdx. A, NOP, p.9/4 **4.1.1 Regional Structural BMPs** "Regional EWMP projects" are defined by the MS4 Permit as multi-benefit regional projects that, wherever feasible, retain all non-stormwater runoff and all **stormwater runoff** from the **85th percentile, 24-hour storm event** for the contributing drainage area, while also achieving other benefits such as flood control and/or water supply.

The PEIR states consistently that the project storm is the 85th percentile/24-hour/approximately 0.75inch (some up to 1 inch). However no documentation/derivation of the 24 hr storm analyses has been provided. The 24-hour storm event is not equal to a daily storm event (any 24-hr vs a 12:01:01am-11:59:59pm) and can be quite different based on moving 24-hour totals and frequency compared to that for calendar day.

Similarly the runoff from a 0.75inch rainfall would not be expected to be the same as the amount of rain falling on the ground (467gals/1000sqft vs 0.9x467gals= say 420gals) but no provision is made regarding runoff coefficients..

The PEIR is inadequate with regard to the absence of documentation/analyses demonstrating the total distribution from say 50%-100% of 24hr storm event. Furthermore no assumed runoff coefficient(s) has been provided for estimating the likely detention capacities required.

ES-3/5 The LACFCD has a **vested interest in increasing opportunities** for stormwater capture and groundwater recharge as a means of assisting **local water supply augmentation**.

Direct reference to increased water supply without delineation as to where augmentation and local supplies may be augmented.

Without removal of existing facilities in order to reduce existing water supply flow capacities, increased local sources can increase and must be considered as increased total water supply and appropriate assessment of growth inducement.

Local augmentation, in general, would be at lower elevations than imported water supplies would serve due to the State Water Project and Colorado River Project source elevations of imported supplies and those of most probable recharge areas and down-flow groundwater wells. Service areas of recharged stormwater and recycled waters are generally of lower elevations and of different economic status from those at higher elevations and served by imported water supplies..

p.1-3/23 ...timeline...in the MS4 Permit requires that Permittees submit the ***12*** EWMP***s*** to the LARWQCB by June 28, 2015, in order to be in compliance with the permit conditions.

Should have started earlier. Mid March - Late June, 105 days, is a very tight, aggressive schedule and should have been better scheduled and implemented. Public participation should not be sacrificed for untimely agency coordination. Some issues may be resolved through tiering and MMRP in the Final PEIR.

LACo EWMP vs 12 additional EWMPs in 90 days following LACo BOS approval and certification may be in jeopardy.

12 EWMPs are required and presumably requires local jurisdictions to have discretionary actions by city councils. Presumably the cities will reference the LACo EWMP-PEIR as CEQA compliance but must have the project specific and local BMP EIRs/MNDs processed to be in compliance with this PEIR and CEQA. As stated herein this PEIR, the PEIR does not complete the CEQA compliance for the 12 EWMPs and their CEQA considerations.

p.1-3/2 As a result, the LACFCD has prepared this Program Environmental Impact Report (PEIR) in compliance with the California Environmental Quality Act (CEQA) to provide the public and the responsible and trustee agencies with information about the potential effects on the local and regional environment associated with implementation of the ***12*** **EWMPs**.

Relationship and contents of the master PEIR and tiered EIRs/MNDs and other CEQA documents are not clearly provided. The statement and others promote confusion between the EWMP and

the EWMPs and between the PEIR and CEQA considerations for the 12 EWMPs to be tiered off of the PEIR and documented separately.

p.1-3/2 The LACFCD will submit the PEIR to its governing body, the Los Angeles County Board of Supervisors, for approval prior to submittal of the EWMPs. The **EWMPs** will be submitted by each EWMP group to the LARWQCB.

Discretionary actions by the BOS do not substitute for the discretionary actions by the 12 jurisdictions of the "EWMP Groups" (cities) to approve the 12 local EWMPs and their incorporate BMP projects.

What is an "EWMP Group"? Presumably one or more cities who will agree on an EWMP and vote to approve the EWMP before submission the the LARWCBrd. CEQA requires environmental considerations other than referencing this PEIR for the 12 local EWMPs.

p.1-3/3 **This PEIR describes and evaluates each of the EWMPs being prepared by the Permittees collectively.**

This statement suggests that this PEIR covers all EWMPs prepared by an "EWMP Groups" and that they have been prepared and incorporated herein. No documentation is provided as to whether cities approved and authorized any local EWMP and its inclusion herein. Presumably one or more cities who will agree on an EWMP and vote to approve the EWMP before submission the the LACo for inclusion in the PEIR and submission to the LARWCBrd. CEQA requires environmental considerations of the local discretionary actions other than referencing this PEIR for the 12 local EWMPs.

p.1-3/3 The discretionary action prompting the need for CEQA compliance is the **submittal** of the completed EWMPs to the LARWQCB.

Submission is not a discretionary action but a ministerial action on the part of a department following the discretionary action of a Board of Supervisors, city council, or other public elected body to approve the local EWMP and its shcedule and funding.

p.1-3/3 A few of the BMPs ***[=Projects]*** are currently well defined but most are yet to be fully developed under the ***12 local*** EWMPs. A set of **priority BMPs *[=Projects]*** will be detailed in each of the EWMPs; these are **being developed** in parallel with the PEIR. The PEIR describes the **details that are available** for each of the ***12 local*** EWMPs **currently under preparation** by the **EWMP working groups**.

Confused and demonstrates that this PEIR may be incorporating projects, BMPs (if different), some portions of the other 12 EWMPs, and the LACo EWMP which has not been approved by the LACo BOS.

Is it EWMP group, EWMP Working Group, or Permittees? Are they the same or different? Have any been approved and funded by a council in a discretionary action? Clarification is needed.

p.1-4/par.3 The EWMPs...discussion of the environmental documents, assessments, and permitting required for the implementation of the **priority projects**. The PEIR **can provide** a basis for this discussion...PEIR in the development and implementation of the EWMPs is further discussed in this chapter in the *Purpose of the Program Environmental Impact Report*.

A "priority project(s)" are not defined and therefore the statement is rendered meaningless.

Throughout the referenced section 1.3 (p.1-9 - 1-10), statements are made as to "can" rather "shall" and thereby the PEIR does not establish a procedure for the tiered environmental documents shall assess their environmental impacts and provide mitigation.

The PEIR must provide a procedural context for most if not all elements for the Project EIR/MND by the local agencies as the LACo shall be a responsible if not a lead agency for each Project. As provided the PEIR is incomplete and inadequate for establishing an expected or required procedure and process for preparation of a project specific CEQA document.

1-5/3 **Watershed Management Programs** The MS4 Permit Section VI.C (page 47) includes provisions that allow Permittees to **voluntarily choose to implement** a Watershed Management Program (WMP). The **purpose of this program** is to “allow Permittees the flexibility to develop Watershed Management Programs to implement the requirements of [the] Order on a watershed scale through customized strategies, control measures, and BMPs." The permit states that "participation in a Watershed Management Program is **voluntary** and allows a Permittee to address the **highest watershed priorities**."

CEQA is not voluntary and the "Program" must provide the structure for the tiered CEQA process to operate and satisfy CEQA for each project or tiered PEIR.

The permittee is not the department but the City or County. Provide a listing of all councils which have approved development and submission of an EWMP to the Regional Board.

As a program, provide all documentation as to whether the subsidiary agencies have committed to the Watershed program or whether they have voluntarily chosen not to participate.

No priorities are provided - references are made to conservation priorities, pollutant priorities, renewable priorities water quality priorities, and watershed priorities (and highest watershed pr...), but only some water quality priorities are discussed.

1-9/3 Purpose of the Program Environmental Impact Report The LACFCD determined that implementation of the **12 EWMPs** could have a significant effect on the environment and therefore required preparation of a PEIR...-

to provide...information about...significant environmental effects of the **proposed program**,
to identify possible ways to minimize potentially significant effects ***[Mitigation measures]***, and
to describe and evaluate feasible alternatives to the proposed program ***[Alternatives]***.

Use of EWMP, EWMPs, and Program cause confusion as to what is what and what will be presented in each.

1-9/4 This document has been prepared as a PEIR...one type of environmental review document that may be used to evaluate a plan or program that has multiple components (projects and actions) or to address a series of actions that are related in any of the following ways:

Geographically. As **logical parts in the chain of contemplated actions**.

- ...issuance of rules, regulations, plans, or other general criteria to govern the conduct of a continuing program.
- As **individual activities** carried out under the same authorizing statutory or regulatory authority and having **generally similar environmental effects** that can be **mitigated in similar ways**.

No logical chain has been graphically depicted/modeled and arranged to demonstrate and monitor progress to and through the permit and compliance process for such a wide variety and mammoth scale of the projects and their components (e.g., diversion-transmission-spreading-recharging-production).

1-11/2 Scoping Period ...A Notice of Preparation (NOP)...was circulated to...**other interested parties**...discussed the purpose of the EWMPs and their management strategies, identified the EWMP Study Areas, and provided a brief and preliminary list of environmental issue areas that **could be impacted**.

As indicated in Scoping Comments, the PEIR does not reflect comments provided during the Scoping period and for the Initial Study and Notice.

-Socio-economics and revenue sources to assure operations and maintenance,
- Environmental justice
- Water models or Other Quantitative Estimates/Flowcharts

1-18/2 **Chapter 1.0, *Introduction*.** This chapter discusses...the background and **purpose** of the PEIR for the proposed program.

The PEIR does not provide the objective, full disclosure, complete, and adequate purposes of the EWMP, and therefore the purposes of the PEIR cannot be satisfied.

HYDROLOGICAL MODEL References to Hydrological Model

Apdx A NOP 8/5 In accordance with the provisions of the MS4 permit, the work plans describe the following steps to EWMP development:

2. Characterization of existing and potential control measures within the watershed
3. Addressing the approach to incorporate **reasonable assurance analysis (RAA)** in the **optimization of watershed control measures**

1-8/1 **Reasonable Assurance Analysis ...**(RAA) is...to demonstrate “that the activities and control measures will achieve applicable **water-quality-based effluent limitations** and/or RWLs with compliance deadlines...”...as a **quantitative demonstration** that **control measures (such as BMPs) will be effective**, the RAA also provides an **opportunity to use a modeling process** to identify and prioritize potential control measures. The RAA for each EWMP uses a **model to simulate a critical storm (design storm)** and...achieve compliance with the TMDLs and water-quality-based effluent limitations.

As indicated in the PEIR text and appendices, the PEIR lacks any quantified Hydrologic Model for watershed controls and has focused the only "modeling" on meeting the water quality requirements of the MS4 at discharges, not watershed controls.

3.2 Air Resources and 3.6 GHGs

These sections reference many air-related models and modeled/modeling results.

Apdx A. Comment Letter to the LACFCD: Draft PEIR p.16/Item 56: Foothill Municipal Water District Recycled Water Project ... Cal Poly Pomona has partnered with FMWD and **is developing a model** that will also capture stormwater for recharge using the same infiltration galleries.

pdf-254 Comments - Model ...**no cost/benefit analysis** or any **modeling** completed to substantiate the “cost-effectiveness” of these methods. Please identify any additional documentation supporting this claim. Enrique Huerta Downey, CA ehuerta28@gmail.com

Scoping Comment Letter indicated that minor agencies/permittees may have conducted some form of hydrological model but not the EWMP or the PEIR.

Issue-Water Supply

p.2-1/par.3 This Project Description describes types of BMPs...to illustrate the function, type of construction, and general locations of the BMP types for the **purpose** of the environmental assessment of the BMP types identified in the EWMPs.

As indicated elsewhere, the local conditions govern where the optimal locations for BMP would be and general assessments cease to be appropirate for CEQA compliance unless the forms and procedures are provided to reflect the local assessment in the project EIRs/MNDs.

2-22/1 ***Infiltration BMPs.*** Infiltration facilities are designed to **decrease runoff volume through groundwater recharge** and improve water quality through filtration and sorption.

No discussion of beneficial effects is provided for rising base flow
providing greater dilution volumes assuming that discharges remain constant, or
providing higher water levels when stormwater arrives at downstream locations and thereby elevating the flood water levels and inundation extent.

2-41/7 This watershed is further differentiated by the **importance of groundwater recharge basins** that are supplied by a **series of reservoirs further upstream**...

No information is provided regarding the basins, total projected annual recharge flows, and relationships between "reservoirs" and "recharge basins" presumably the augmented groundwater storage basins, rather than basins used for recharge.

2-42/4 ...BMP strategy in the Upper Los Angeles River watershed includes well **over a hundred planned regional and centralized retention and infiltration BMPs** that take advantage of the **favorable groundwater recharge characteristics**....

No definition of BMPs has been applied to the projects proposed.
No map or other descriptive information of the 100+ retention/infiltration BMPs have not been provided.
No comparison or prioritization or even definition of favorability or recharge characterization have been provided.

ES-3/3 **ES.3 Project Objectives**

The primary goals and objectives of the EWMPs are:

- To **collaborate among agencies**...to promote more **cost-effective** and multi-beneficial water quality improvement projects **to comply** with the MS4 Permit.
- To develop watershed-wide EWMPs that will...**remove or reduce pollutants** from dry- and wet-weather urban runoff in a **cost-effective manner**.
- To reduce the impact of stormwater and non-stormwater on **receiving water quality**.

Elsewhere goals and objectives are mentioned and then supposed objectives are provided. Here these are largely "goals" as they have no specification of schedule or quantification.

As these are stated as "primary" with no mention of secondary or tertiary goals or objectives, the entire EWMP is without adequate or complete goals and objectives and various statement totally confuse the basis for the "project" and related " alternatives" and their compparisons and assessments.

Report is unclear as to definition and has inconsistent usage of Goals and Objectives of the Program.

These are Goals only, while objectives must have specifics as to schedule and quantitative indicators of compliance (e.g., acre-feet/year recharged, return rate changes by 2020, etc.

2-2/2 **2.2 *Project* Goals ~~and Objectives~~**

The **primary** **goals and objectives** of the EWMPs are:

- To **collaborate among agencies** (Permittee jurisdictions)...to **promote more cost-effective** and **multi-beneficial water quality improvement projects** to **comply with the MS4 Permit**.
- To develop watershed-wide EWMPs...remove or reduce pollutants from dry- and wet-weather urban runoff in a **cost-effective manner**.
- To reduce the **impact of stormwater and non-stormwater on receiving water quality**. ***[#2 and #3 are virtually identical and only differ by the "terms" used: Wet vs Dry Weather Flow vs Stormwater and Non-Stormwater, which would be defined the same]***

[In #1 and #2, references are made to cost-effectiveness although never discussed and compared.]

Reference to costs requires a description, assessment of impacts, and provisions for the life of the project - at least 25 years. Most importantly are provisions sufficient annual funding for operations and maintenance of all facilities through and beyond 2040.

Assessment must include best-available information and projections economic, financial, bonding, costs (both capital and O&M), and ability to pay by the service populations.

This is particularly important as the LACo and associated cities are promoting changes of "Storm Water Fees on the LACo annual property taxes and fees.

This deficiency and conflict clearly indicate that the entire PEIR is incomplete and inadequate with regard to costs and other related issues for the proposed program.

Table 2-3 **Project Feature - Flood Protection**

No description of flood protection is developed for the EWMP and thereby must not be included, or mentioned, without development and assessment of benefits and impacts. No coordination/collaboration has been referenced or known in the LACity Floodplain Management Plan.

2-26\3 **Creek/River/Floodplain/Estuary Restoration*.*** This category includes multi-benefit projects that typically combine elements of **habitat restoration**...as **flood management** and water quality improvement. Project components such as...setback levees, floodplain bench excavation, levee breaches, and other actions can **increase...flood storage capacity**...

...This project restored 1.2 miles of natural bottomed creek habitats, which are capable of infiltrating up to 118...million gallons of stormwater from the wash into the local groundwater aquifer.

Plants in the wash also aid the biogeochemical removal of pollutants such as nitrogen.

Actually bacteria and fungi attached to the cellousic stems and leaves that are periodically submerged. Few emergent plants can absorb or treat any aqueous pollutants.

More to come

5-3/1 The proposed program is not a **land use project** and its implementation would not introduce new...or any other growth-inducing land uses. The structural BMPs would augment the physical structure

of established communities,...and enhancing the water quality of existing communities. As a result, the proposed program would not induce population growth.
Most infrastructure projects do not involve much in the way of direct structured development; however, operations of such facilities support development of user structures especially where water and other service may be constraining support factors.

5-3/2 The **nature of the proposed program** is to increase stormwater recharge and improve stormwater quality;...**would not result in increased economic activity or population growth** in the EWMP areas...water recharged...**is anticipated to support existing water supply needs and reduce dependence on imported water supplies**.
Mechanisms or rules are NOT provided as to how various project waters would be assigned to only reducing imported water dependence while others may be used for supporting growth.

5-3/3 **5.4 Secondary Effects of Growth**
Implementation...would not result in a direct or indirect increase in population or employment. The proposed program itself, therefore, is **not growth-inducing and would not induce secondary effects of growth**.
Such a broad reaching statement cannot be justified as implementation (?=construction) and presumed operations (say 10% of total capital costs annually) would generate new employment within the project area and would divert funds for imported water sources outside the project area to the more local based water sources and operators employed therein.

5-3/3 While one of the main goals of the EWMPs is to **increase infiltration and potentially increase recharge of stormwater**...**the amount of water potentially recharged would not be enough to indirectly support population growth** and is intended to **support existing water supply needs**. This potential additional **recharge would contribute to local water supply needs** but would not alter population demographics. Therefore, there would be no secondary effects of growth.
Mechanisms or rules are NOT provided as to how various project waters would be assigned to only reducing imported water dependence while others may be used for supporting growth.
Again, such a statement cannot be justified as local sources can easily augment existing or future distribution without specific assignment to service areas.

6-1/1 ...Environmental Impact Report (EIR) must describe...
reasonable range of alternatives to a proposed project...
could **feasibly** attain most of the basic project objectives...
would avoid or substantially lessen...proposed project's significant environmental effects.
6-2/2 Alternatives may be eliminated...
if they **fail to meet most** of the **project objectives**,
are infeasible, or
do not avoid any significant environmental effects.
"Feasibly" is not clearly defined nor established as to whether the BMPs, EWMPs, or this EWMP can be done in technical and practical (=ECONOMIC) terms as required by the objectives and criteria for the program, the local programs/projects and BMPs. As technical feasibility is not at issue, the actual meaning of feasibly must relate to two of three goals having phrases of "cost-effectiveness". Therefore this use of feasibly and project objectives (not objectives but goal) are the costs and presumably capital and operations/maintenance. As no information is provided for costs and their fundings, these statements become totally inadequate and incomplete as no information is provided nor compared to demonstrate the alternatives compliance or lack of compliance with the MS4 permit conditions..
As two expressed "objectives" out of three include reference to "cost-effectiveness" the absence of demonstrated "cost-effectiveness" renders any comparison incomplete and inadequate for justifying an alternative discussion. The two objectives have no quantification nor scheduling and therefore are NOT OBJECTIVES but may remain as goals but without any supporting information as to costs and sources of revenues to support such costs.

6-2/5 **6.2 Review of Proposed Program Goals and Objectives**

The alternatives presented in this chapter were analyzed for their abilities to reduce significant program impacts and meet the **objectives** of the proposed program, which are:

- To collaborate among agencies (Permittee jurisdictions) across the watershed to promote...

6-2/5 The alternatives presented...analyzed for their abilities to reduce significant program impacts and meet the **objectives of the proposed program**,...:

- To collaborate among agencies (Permittee jurisdictions)...
  promote more cost-effective...
  multi-beneficial water quality improvement projects...
  comply with the Municipal Separate Storm Sewer System (MS4) Permit.
- To develop watershed-wide Enhanced Watershed Management Programs (EWMPs)...
  once implemented, remove or reduce pollutants from dry- and wet-weather urban runoff
  cost-effective manner.
- To reduce the impact of stormwater and non-stormwater on receiving water quality.

Goals are not mentioned only objectives above. The entire PEIR appears incomplete without a clear statement as to typical goals and objectives - recharge dry and wet weather runoff and 20% recharge every five years for next 25 years.

Total confusion as to goals and objectives renders the entire alternatives chapter totally inadequate. Absence of any costs/revenue information renders achievement of goals or objectives totally incomplete for both the development of the alternatives and their comparisons.

6-3/3 In accordance with the CEQA "rule of reason," an EIR is required to consider a range of alternatives that permit a **reasoned choice** and that are "limited to ones that would avoid or substantially lessen any of the significant effects of the project" (CEQA Guidelines Section 5126.6(f)). The Lead Agency conducted an alternatives screening process to identify feasible alternatives to the proposed program. The screening process for identifying viable alternatives included consideration of the **following criteria**:

- Ability to meet the **program objectives**
- Ability to reduce significant environmental effects of the proposed program
- **Economic and engineering feasibility**

Since the program objectives require 2 of 3 items of "cost-effectiveness" and here a criterion requires meeting the program objectives, the PEIR appears inadequate and incomplete without the presence of and achievement of cost-effectiveness and economic feasibility-ability to pay for both vapital and O&M costs for at least 25 years.

As no economic feasibility analyses and comparisons are provided, and no jurisdictional funding is provided throughout the PEIR, no reasoned or reasonable achievements of one of three criteria can be assessed or compared.

6-1/3 "Feasible" means capable of being accomplished in a successful manner within a reasonable period of time, taking into account **economic**, environmental, legal, social, and technological factors.

No economic factors have been provided in the PEIR, including sources of revenues and abilities for LACo and all permittees. Therefore, the PEIR is incomplete and inadequate.

6-13/1 **6.7 Environmentally Superior Alternative** CEQA requires that an EIR identify the environmentally superior alternative(s) of a project other than the proposed program or the "no project" alternative (CEQA Guidelines Section 15126.6 (e)(2)). As stated at the beginning of this chapter, the purpose of this alternatives analysis is to consider a reasonable range of alternatives that could feasibly attain most of the basic project objectives and avoid or substantially lessen significant program impacts.

Since no information is provided as to the actual cost-effectiveness of any projects or groups of project the requirement cannot be achieved, reviewed, or commented on with the currently available information. Based on DWP information distributed small projects could achieve the economy-of-scale that larger one could and therefore any plot-by-plot LID projects. If 10,000 single family dwellings would theoretically detain 460gal/1000sf roof, one design storm would generate 4.6M gal for direct use (about one day piped water supply); however, cities do not require 460gal of rain barrels but generally only require two rain barrels of 100gal capacity.

The PEIR does not provide the basis for development of the Environmentally Superior Stormwater Alternative and those with recognized "least worst" environmental effect could not meet two of the three goals of the Program, cost effectiveness with or without real requirements for the 85%ile rainfall event.

6-14/3 The Non-Structural BMPs Only Alternative would avoid all of the significant and unavoidable impacts associated with construction of the structural BMPs....However, since the ability to achieve compliance with MS4 Permit water quality objectives would be substantially reduced, impacts to water quality would be greater under this alternative, and compliance with the MS4 Permit would be unlikely.
Even if it could achieve permit compliance, the Program goals of cost-effectiveness most likely could not be achieved as the disperse detention could not attain any significant economies of scale and would require vastly greater plot-by-plot compliance which is beyond the typical new, additions, or replacement linkages with structured improvements.

6-14/4 As a result, since the proposed alternative would provide the best chance of **achieving regional water quality objectives**, it is considered the environmentally superior alternative.
The conclusion is not based on any documentation or projected/estimate successful implementation and does not include any comparisons and development of cost-effectiveness or revenue sources for a much larger implementation phase. The preparers have assumed a development condition without any concept of reality and without documentation as to implementability in order to have an "Environmentally Superior Alternative", which is incomplete and inadequate.

Apdx A Appendix A Comment Letter to the LACFCD: Draft PEIR 18/#61(pdf-p.244) The overarching goal of the GRIP Recycled Water Project is to **offset the current use of imported water by providing up to 21,000 acre-feet per year (AFY)** of recycled water as a **reliable supply source for groundwater basin replenishment via the Montebello Forebay** within a reasonable timeframe.
Although the watershed channel are well known and studies for almost 100 years, no hydrologic model has been developed and incorporated into the EWMP or its component EWMPs. The current efforts therefore cannot provide a factual and quantitative basis for assessing the environmental effects of existing water resources and their future states for water supply availability and locations, flood control, and water chemistry dilutions or reductions.

ApdxA/NOP 2/2 The LACFCD, as a regional agency charged with **conserving stormwater for use in our local water supply,** has a **vested interest in increasing opportunities for stormwater capture and groundwater recharge**. The LACFCD has flood control infrastructure...LACFCD will be an implementing agency only on those projects for which it has been identified in an EWMP as a responsible implementing party.
Apdx A Appendix A Comment Letter to the LACFCD: Draft PEIR 18/#61(pdf-p.244) The overarching goal of the GRIP Recycled Water Project is to **offset the current use of imported water by providing up to 21,000 acre-feet per year (AFY)** of recycled water as a **reliable supply source for groundwater basin replenishment via the Montebello Forebay** within a reasonable timeframe.
Although the watershed channel are well known and studies for almost 100 years, no hydrologic model has been developed and incorporated into the EWMP or its component EWMPs. The current efforts therefore cannot provide a factual and quantitative basis for assessing the environmental effects of existing water resources and their future states for water supply availability and locations, flood control, and water chemistry dilutions or reductions.
As indicated elsewhere, this NOP and letter statements clearly indicate the anticipated development of water supply resources which goes beyond the water quality and flood protection benefits and relates the EWMP to growth inducements for future populations needs for greater water resources without adding new imported water supply facilities.

ApdxF 7/2 The Los Angeles River is approximately 55 miles long, and five of six reaches lie within the Upper Los Angeles River EWMP Area. The natural hydrology of the Los Angeles River watershed has been significantly altered by urbanization, channelization, and the construction of dams and flood control reservoirs. The river and many of its tributaries are lined with concrete for most or all of their length. Soft-bottom segments of the river occur where groundwater upwelling prevents armoring of the river bottom.

Although the watershed channel are well known and studies for almost 100 years, no hydrologic model has been developed and incorporated into the EWMP or its component EWMPs. The current efforts therefore cannot provide a factual and quantitative basis for assessing the environmental effects of existing water resources and their future states for water supply availability and locations, flood control, and water chemistry dilutions or reductions.

Response to Comment Letter 20 (Sierra Club, Angeles Chapter, Water Committee – March 16, 2015)

Response to Comment 20-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or “Program”). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The Upper LA River Brandon Street and Green Street Improvements Project is under construction as noted on page 2-18. Approximately 1,800 feet of biorentention planter boxes (bioswales) will be constructed throughout the project limits. In addition, an underground infiltration basin system will be installed at the cul-de-sac of Green Street with 5,800 cubic feet of infiltration capacity. Trees and drought-tolerant plants will also be added throughout the project. As an advanced planning document, the PEIR does not provide substantial detail for any individual project. Section 2.4 of the PEIR defines categories of projects that may be incorporated into the EWMPs to achieve regional water quality objectives. Tables 2-3, 2-4, and 2-5 list some of the projects that have been planned or already installed in the region that will assist in achieving the receiving water quality objectives, including the Brandon Street project. This information on Upper LA River Brandon Street and Green Street Improvements Project was taken from the Notice of Intent to prepare a EWMP by the Upper Los Angeles River Watershed Group.

Response to Comment 20-B:

Tables 2-3, 2-4, and 2-5 list some of the projects that have been planned or already installed in the region that will assist in achieving the receiving water quality objectives, including the Upper San Gabriel River Avocado Heights Multiuse Trail Project, which has already undergone environmental analysis and been approved for implementation. As a result, details of certain projects may already be known. The projects presented in Chapter 2 include some projects that are already approved and under construction or recently constructed. Approximately 2,300 feet of the multiuse trail on 5th Avenue will be constructed with decomposed granite to provide 14,000 cubic feet of infiltration capacity. In addition, an infiltration swale will be constructed at the end of 5th Avenue immediately adjacent to San Jose Creek to provide 3,200 cubic feet of capacity. Combined together, up to 115 acre-feet of groundwater will be recharged annually. This information was obtained from the Avocado Heights Multiuse Trail Fact Sheet, located in Appendix E of the Notice of Intent for the Enhanced Watershed Management Program and Coordinated Integrated Monitoring Program. However, several of the projects listed in Chapter 2 have not been fully defined and have not undergone environmental review and additional details are not yet known.

Response to Comment 20-C:

The Tujunga Wash Greenway project was mentioned on page 2-27 of the PEIR as an example of a multi-benefit flood management project that has already been approved and implemented, providing water conservation, water quality protection, flood control, recreational, and aesthetic benefit. The Tujunga Wash Greenway project involved the creation of a naturalized streamcourse designed to accept low flows diverted from the Tujunga Wash (LADPW, 2015). This project was identified only to give an idea of what other multi-benefit EWMP projects may look like once identified fully in the EWMP. As noted in Section 1, each individual project that has not yet been approved will undergo subsequent CEQA determination by the lead implementing agency prior to installation.

Response to Comment 20-D:

Flood control is defined as "the act or technique of controlling river flow with dams, dikes, artificial channels, etc., so as to minimize the occurrence of floods" (Dictionary.com, 2015). Floodplain management is defined by FEMA as "the operation of a community program of preventive and corrective measures to reduce the risk of current and future flooding, resulting in a more resilient community" (FEMA, 2015). Floodplain management considers all efforts to mitigate the effects of flooding including efforts on private property. Flood Control is one of many components of floodplain management in order to reduce the risk of flooding. Both terms generally refer to the avoidance of damages from flood events through physical structures or specific management measures. The PEIR generally uses these terms interchangeably. Flood control benefits are realized when BMPs retain local storm flows, however small in volume, that help to buffer peak flows downstream. The supporting information or analyses for quantification of levels of management/control in addition to other beneficial sectors, e.g., groundwater sourcing for suburban and urban water supplies would be assessed at the individual project level. Management of groundwater as a drinking water source for urban and suburban consumers would continue to be the responsibility of the local groundwater management agencies subject to adjudicated water rights.

Response to Comment 20-E:

Centralized BMPs are a type of structural BMP that treats runoff from a 10 acres or more tributary area, typically. The priority projects can be a centralized BMP that will be included as a project that will be immediately pursued in each EWMP. The potential projects can be a centralized BMP that may be pursued at a future date. The EWMPs are currently being prepared; the priority and potential projects listed in the PEIR are in various stages of planning and development. Page 2-28 of the PEIR notes that information for specific projects is provided in the document in cases where it is available at the time of publication of the Draft PEIR. As an advanced planning document, the PEIR does not provide substantial detail for any individual project. Individual projects requiring subsequent CEQA analyses would be determined by the lead implementing agency prior to installation.

Response to Comment 20-F:

The water quality objectives identified in EWMP areas provide the basis for the selection and scheduling of BMPs (or projects). The priority BMPs have undergone a site review and project evaluation that has identified them as having a greater opportunity to achieve the water quality objectives for their specific EWMP area. These priority BMPs were listed based upon available data at the time of publication of this PEIR. **Appendix G** provides the location and general description of the priority BMPs. These priority projects will be further developed with conceptual plans in the draft EWMPs. The term planned centralized projects is used to reflect project opportunities where it may not be feasible to construct a BMP to retain the 85th percentile storm but would have a substantial water quality benefit for a larger watershed. The term potential means that a concept will not be developed in the draft EWMP but the site will be identified as a potential project site for the future. Planned project is used to reflect projects that are already being planned to be constructed in the near future. They would not be a priority or potential project. These planned projects were part of the "30 month project" identified in each EWMP's Notice of Intent that was approved by the Regional Board. Table 2-4 includes a column that notes the status of the project as complete or planned to be installed and provides an approximate date of completion where available.

Response to Comment 20-G:

The requirement to fully capture the 85th percentile storm in a regional BMP is a Permit requirement. Providing the hydrology calculations (design volume, runoff coefficients, time of concentrations) is beyond the scope of the PEIR, as it is an advanced planning document. The PEIR evaluates typical project types to assess potential impacts of implementing the entire program throughout the region over a long period of time. More information about these projects can be obtained from the individual implementing agencies.

Response to Comment 20-H:

As stated on page 3.8-23 of the PEIR, the EWMP areas overlie various groundwater basins; these groundwater basins are summarized in **Table 3.8-2**. Each groundwater basin contains multiple recharge areas. Providing the specific recharge area locations and recharge capacities for all groundwater basins receiving infiltration from the EWMP areas is beyond the scope of the PEIR, as it is an advanced planning document. Therefore, a priority assessment based on this recharge and capacity information will need to be considered on an individual project basis. As noted in Section 2.4.2, the EWMPs include infiltration projects that are installed where the soils and groundwater capacity are favorable. The PEIR acknowledges that depth to groundwater and infiltration capacity are important factors for locating effective infiltration BMPs. Mitigation Measures GEO-1 and HYDRO-1 require that implementing agencies evaluate site suitability prior to installation and would reduce potentially significant impacts to less than significant levels.

Response to Comment 20-I:

The PEIR discusses potential impacts to public health in Impact 3.7-2. The PEIR acknowledges that accumulation of contaminants in BMPs over time could result in hazardous conditions. Mitigation Measure HAZ-1 is included to ensure that maintenance plans are prepared and implemented to reduce the risk to public health. BMPs may detain water that stagnates or generates odors. Mitigation Measure AIR-4 requires implementing agencies to consider odor controls to reduce impacts to the public. Other vectors such as mosquitos and rodents could be attracted to standing water. Local vector control agencies would employ measures to reduce public health impacts from areas of standing water in cooperation with the LACFCD as a standard practice. In response to the comment, Mitigation Measure HAZ-1 has been modified to ensure that vector control plans are incorporated into BMP maintenance plans. Both mitigation measures AIR-4 and HAZ-1 would reduce potentially significant impacts to less than significant levels. Mitigation Measure HAZ-1 has been updated as follows:

> **HAZ-1:** Implementing agencies shall prepare and implement maintenance practices that include periodic removal and replacement of surface soils and media that may accumulate constituents that could result in further migration of constituents to sub-soils and groundwater. A BMP Maintenance Plan shall be prepared by Implementing Agencies upon approval of the BMP projects that identifies the frequency and procedures for removal and/or replacement of accumulated debris, surface soils and/or media (to depth where constituent concentrations do not represent a hazardous conditions and/or have the potential to migrate further and impact groundwater) to avoid accumulation of hazardous concentrations and the potential to migrate further to sub-soils and groundwater. <u>The Maintenance Plan shall include vector control requirements.</u> The BMP Maintenance Plan may consist of a general maintenance guideline that applies to several types of smaller distributed BMPs. For smaller distributed BMPs on private property, these plans may consist of a maintenance covenant that includes requirements to avoid the accumulation of hazardous concentrations in these BMPs that may impact underlying sub-soils and groundwater. Structural BMPs shall be designed to prevent migration of constituents that may impact groundwater.

This modification has been included in Chapter 12, *Clarifications and Modifications of the Final PEIR*. The potential impact to public health is noted on page 3.7-16 of the Draft EIR. The modification clarifies that vectors are public health hazards that need to be considered along with other hazards. The modification does not identify any new significant impact or trigger the need to recirculate the Draft PEIR under Section 15088.5 of the *CEQA Guidelines*.

Response to Comment 20-J:

The addition of rain barrels as potentially effective distributed BMPs is noted in on page 2-14. Table 3.1-1 notes which mitigation measures would apply to rain barrel installation. The quantified impact to downstream hydrology from installing individual rain barrels would depend on the location, watershed, and rate of LID implementation. This information will be addressed in the applicable environmental analysis applicable to the individual BMPs once details are available.

Response to Comment 20-K:

The Low Impact Development (LID) standards included in the City of Los Angeles LID Manual are a part of the overall storm water quality improvement framework being developed within the EWMPs. Schedules for LID implementation will depend on redevelopment rates and will vary by watershed area; however, the EWMPs will include implementation schedules as required in the Permit. Also see response to Comment 20-J.

Response to Comment 20-L:

The term "high density" was used to reflect an urbanized area. The terms "large" and "small" in reference to BMPs were used to describe the expected amount of area and/or footprint of the BMPs. In the PEIR, BMP types are defined on page 2-6. Distributed Structural BMPs, treat runoff close to the source and are typically implemented at a single- or few-parcel level (e.g., facilities typically serving a contributing area less than one acre). Centralized Structural BMPs treat runoff from a contributing area of multiple parcels (e.g., facilities typically serving a contributing area on the order of tens or hundreds of acres or larger). However, additional quantification information specific to each type of BMP (distributed and centralized) was provided under the headings, *Anticipated Construction Activities*. For example, page 2-8 identifies, ground disturbance for distributed detention is typically less than 1 to 2 acres in extent, but may extend in some limited applications up to 5 acres where space is available. And on page 2-23, centralized infiltration facilities are generally larger than distributed BMPs and can vary from 2 to 10 acres in size, depending on the number of parcels (drainage area). The sizing of BMPs typically refers to designing BMPs to capture, store, and/or infiltrate a specific volume of water, and is based on a variety of factors including the adjacent topography, storm event type, base flow, etc. These details will be known on a project-specific basis, and therefore could not be provided at this level of analysis.

Response to Comment 20-M:

In addition to the discussions on pages 3.8-20 and 3.8-21 of the PEIR mentioned by the commenter, in regard to growth inducement, the PEIR acknowledges that increased stormwater recharge will augment groundwater supplies. The overall recharge volume will vary from basin to basin and from season to season and will increase over time as more BMPs are installed. This additional benefit of the EWMPs is consistent with the goals and plans of the regional groundwater basin managers and water suppliers as described in Section 3.14-1. Water retailers in Los Angeles County generally have two water sources available to them: imported water supplied by a water wholesaler (e.g., Metropolitan, Castaic Lake Water Agency) or groundwater. The two large groundwater basins in Los Angeles County are adjudicated, with established water rights made available to pumpers. The pumpers' allocations are constricted to prevent over-drafting the aquifer. The groundwater managers (Water Replenishment District of Southern California, Upper

Los Angeles River Area Water Master) augment the groundwater basins with imported surface water when available to meet demands.

Population growth is expected in the region and the local water suppliers have prepared urban water management plans that explain how they intend to meet the growing demand. The current conditions throughout the State of California indicate that imported water supplies will be more limited in the future than they have been historically. Emphasis is being placed on local supplies to replace imported water. For example, the Water Replenishment District of Southern California is actively pursuing a policy of Water Independence Now (WIN) that will eliminate imported water for replenishment and replace it with storm water and recycled water recharge. The LACFCD has no authority over population growth, land use jurisdiction, or water supplies. As noted in Section 5.3 of the PEIR, the augmentation of water supplies as a secondary outcome of the EWMPs would not induce growth or remove an obstacle to growth, but may help to replace the use of imported water over time as a part of the regional water supply portfolio managed by others.

Furthermore, the PEIR evaluates the potential impacts of increased recharge to groundwater quality and groundwater levels in Impact 3.8-1. The potential for groundwater to exfiltrate in creeks, road cuts, and areas of lower elevation is recognized on page 3.8-35. However, as low flow BMPs are installed throughout the region, base flows fed from landscape runoff are predicted to decrease throughout the region. Any new contribution to surface water flows from new groundwater seepage would be accommodated by the drainage system and would reflect a more natural condition.

As stated on page 3.14-20 of the PEIR, cumulative impacts in regard to existing water supplies are anticipated to be beneficial as a result of stormwater and non-stormwater runoff infiltration and conservation BMPs implemented across the EWMP areas.

Response to Comment 20-N:

The Hauled Water Initiative will determine the feasibility of using hauled water as a potable water source for new single-family residential development where there is no feasible source of municipal or well water available. The Notice of Preparation and Initial Study for the Hauled Water Initiative was released in September of 2014; the Initiative has not yet been approved and no public schedule has been released for completion of the environmental review (LA County Planning, 2015). Because the proposed program involves implementation of storm water infrastructure and not development of new single-family residential, the discussion of impacts relating to the promotion of hauled water developments is not relevant.

Population growth is expected in the region and the local water suppliers have prepared urban water management plans that explain how they intend to meet the growing demand. The current conditions throughout the State of California indicate that imported water supplies will be more limited in the future than they have been historically. Emphasis is being placed on local supplies to replace imported water. For example, the Water Replenishment District of Southern California is actively pursuing a policy of Water Independence Now (WIN) that will eliminate imported water for replenishment and replace it with storm water and recycled water recharge. The LACFCD has no authority over population growth, land use jurisdiction, or water supplies. As noted in Section 5.3 of the PEIR, the augmentation of water supplies as a secondary outcome of the EWMPs would not induce growth or remove an obstacle to growth, but may help to replace the use of imported water over time as a part of the regional water supply portfolio managed by others.

Response to Comment 20-O:

The priority projects were initially selected to be further investigated as part of the EWMPs. The future projects will be selected based on engineering feasibility, water quality reduction benefit, and other factors such as soil investigations, partnership opportunities, etc.

Mitigation Measures AES-1 and HAZ-1 both require that implementing agencies prepare and implement maintenance plans as part of the project approval and would reduce potentially significant impacts to less than significant levels. These mitigation measures will be adopted with the Mitigation Monitoring and Reporting Plan.

The EWMPs will summarize project costs and funding mechanisms available to implementing agencies. Implementing agencies are responsible for identifying funding mechanisms needed to effectuate Permit compliance. The PEIR does not evaluate costs or funding sources for BMP implementation since providing funding is not an environmental impact. Revenue sources will vary for each implementing agency but will likely include grant funding, low interest loans, or local fee assessment.

As no other definition for it has been stated in the LID Manual, the term “minimize” as referenced by the commenter LID Manual has been interpreted to have the following meaning: “to make as small as possible.” As no other definition for it has been stated in the LID Manual, the term “lessen” as referenced by the commenter LID Manual has been interpreted to have the following meaning: “to become less or cause something to become less” (Merriam Webster, 2015a; Merriam Webster, 2015b). The LID ordinance does not apply to existing streets, however it would apply to future streets that are part of a tract development.

Response to Comment 20-P:

Population growth is expected in the region and the local water suppliers have prepared urban water management plans that explain how they intend to meet the growing demand. The current conditions throughout the State of California indicate that imported water supplies will be more limited in the future than they have been historically. Emphasis is being placed on local supplies to replace imported water. For example, the Water Replenishment District of Southern California is actively pursuing a policy of Water Independence Now (WIN) that will eliminate imported water for replenishment and replace it with storm water and recycled water recharge. The LACFCD has no authority over population growth, land use jurisdiction, or water supplies. As noted in Section 5.3 of the PEIR, the augmentation of water supplies as a secondary outcome of the EWMPs would not induce growth or remove an obstacle to growth, but may help to replace the use of imported water over time as a part of the regional water supply portfolio managed by others.

Please also refer to Response to Comment 20-G above regarding the rainfall analysis. Please also refer to Response to Comment 20-K and 20-J regarding the sufficiency of detention containers.

Response to Comment 20-Q:

As noted on Section 2.4.2, the EWMPs include infiltration projects to be installed where the soils and groundwater capacity are favorable. The PEIR acknowledges that depth to groundwater and infiltration capacity are important factors for locating effective infiltration BMPs. Mitigation Measures GEO-1, GEO-2, and HYDRO-1 require that implementing agencies evaluate site suitability prior to installation and would reduce potentially significant impacts to less than significant levels.

Response to Comment 20-R:

The priority projects were initially selected to be further investigated as part of the EWMPs. The future projects will be selected based on engineering feasibility, water quality reduction benefit, and other factors such as soil investigations, partnership opportunities, etc. More information will be provided in each EWMP.

The PEIR provides a cumulative assessment in Section 3.8. The PEIR notes that future projects could directly or cumulatively impact local soil stability. As a result, the PEIR identifies Mitigation Measure GEO-2 that requires implementing agencies notify local groundwater managers prior to installing infiltration BMPs. Implementation of this mitigation measure would reduce potentially significant impacts to less than significant levels. The goal of the infiltration BMPs is to increase stormwater infiltration for water quality benefits but also for water supply benefits. Future increase in stormwater infiltration is consistent with regional water supply planning efforts underway by the groundwater managers (Water Replenishment District of Southern California, the ULARA Watermaster, and Santa Clarita River Valley stakeholders) and water suppliers such as Metropolitan Water District of Southern California (MWD, 2010) and the City of Los Angeles (City of Los Angeles, 2009). Implementing agencies would evaluate cumulative projects for future projects as necessary to comply with CEQA. An analysis of cumulative impacts would be included in each EIR developed by the lead agencies associated with future EWMP projects.

In regard to growth inducement as a cumulative effect of EWMP implementation, population growth is expected in the region and the local water suppliers have prepared urban water management plans that explain how they intend to meet the growing demand. The current conditions throughout the State of California indicate that imported water supplies will be more limited in the future than they have been historically. Emphasis is being placed on local supplies to replace imported water. For example, the Water Replenishment District of Southern California is actively pursuing a policy of Water Independence Now (WIN) that will eliminate imported water for replenishment and replace it with storm water and recycled water recharge. The LACFCD has no authority over population growth, land use jurisdiction, or water supplies. As noted in Section 5.3 of the PEIR, the augmentation of water supplies as a secondary outcome of the EWMPs would not induce growth or remove an obstacle to growth, but may help to replace the use of imported water over time as a part of the regional water supply portfolio managed by others.

Response to Comment 20-S:

Each EWMP employs water quality predictive modeling as part of the process of identifying BMP locations and designs. Each watershed within the region has focused on using predictive modeling tailored to its own needs. The Permit requires that Reasonable Assurance Analysis be conducted to predict the outcome of the BMPs to be employed throughout the individual watersheds. The PEIR evaluates the potential environmental impacts of implementing structural and non-structural BMPs. The effectiveness of each EWMP to achieve permit compliance will be evaluated by the RWQCB, which may require additional projects or management actions to ensure compliance.

The requirement to fully capture the 85th percentile storm in a regional BMP is a Permit requirement. Providing the hydrology calculations (design volume, runoff coefficients, time of concentrations) is beyond the scope of the PEIR, as it is an advanced planning document. The PEIR evaluates typical project types to assess potential impacts of implementing the entire program throughout the region over a long period of time. More information about these projects can be obtained from the individual implementing agencies. The capacity of each regional BMP identified will be subject to subsequent site specific analysis, which is dependent on local geology, precipitation trends and contributing area. Each regional BMP will be subject to further design, CEQA compliance, and approval by the implementing agencies.

Response to Comment 20-T:

Because project details are largely incomplete since the EWMPs are being drafted concurrently, each individual project will be subject to a CEQA compliance evaluation prior to approval by the implementing agencies as noted in Section 1 of the Draft PEIR. As individual projects identified in the EWMPs are fully developed, the implementing agency (i.e., the Permittee responsible for implementing the project) will conduct CEQA analysis for individual projects, as appropriate, or may determine that no additional CEQA analysis is required or that a project is exempt from CEQA. Each implementing agency would determine the significance after mitigation for potential impacts of its proposed projects.

The PEIR provides the LACFCD a foundation for any necessary future environmental review that focus on individual projects of the EWMPs for which the LACFCD is the designated Lead Agency.

As noted on page 1-3, the PEIR can be used by the LACFCD or other Permittees to streamline environmental review of individual projects. The process for incorporating the PEIR or tiering from the PEIR pursuant to Section 15152 of the CEQA Guidelines may be employed by lead agencies for use regarding individual BMPs at their discretion. No uniform tiering plan of action has been established for subsequent project approvals since each project will require specific consideration by varying Permittees.

Response to Comment 20-U:

As noted on page 1-3, the PEIR can be used by the LACFCD or other Permittees to streamline environmental review of individual projects. Implementation of CEQA is at the lead agency's discretion. No uniform tiering plan of action has been established for subsequent project approvals since each project will require specific consideration by varying Permittees. The process for incorporating the PEIR or tiering from the PEIR pursuant to Section 15152 of the CEQA Guidelines may be employed by lead agencies for use regarding individual BMPs at their discretion.

Response to Comment 20-V:

The proposed EWMP BMPs as described in the PEIR are under development. Potential priority projects are shown in Figures 2-5 through 2-16 and Appendix G of the PEIR. More site investigations are needed to fully vet these projects and define the project scope needed to satisfy the respective EWMP requirements; these analyses will be done following the certification of this EIR in the individual EWMPs themselves.

Response to Comment 20-W:

Each BMP will affect flood control facilities differently. Direct benefits may include reduced hyrdomodification, reduced erosion, and reduced peak flows. Retention of storm flows, whatever the volume, assists in reducing peak flows downstream. Some BMPs will reduce dry-weather flows as well. The reduction in dry weather base flow will vary from watershed to watershed and season to season and will increase over time as more BMPs are installed. A more-detailed prediction of future dry weather and wet weather flows is currently unavailable.

Each EWMP employs water quality predictive modeling as part of the process of identifying BMP locations and designs. Each watershed within the region has focused on using predictive modeling tailored to its own needs. The Permit requires that Reasonable Assurance Analysis be conducted to predict the outcome of the BMPs to be employed throughout the individual watersheds. The PEIR evaluates the potential environmental impacts of implementing structural and non-structural BMPs. The effectiveness of each EWMP to achieve permit compliance will be evaluated by the RWQCB, which may require additional projects or management actions to ensure compliance.

Providing the hydrology calculations (design volume, runoff coefficients, time of concentrations) is beyond the scope of the PEIR, as it is an advanced planning document. The PEIR evaluates typical project types to assess potential impacts of implementing the entire program throughout the region over a long period of time. More information about these projects can be obtained from the implementing agency.

Response to Comment 20-X:

The program objectives are provided in Section 2.2 of the PEIR. Quantitative objectives and success criteria are mandated in the Permit. No additional program objectives are necessary.

Response to Comment 20-Y:

The EWMPs will summarize project costs and funding mechanisms available to implementing agencies. Implementing agencies are responsible for identifying funding mechanisms needed to effectuate Permit compliance. The PEIR does not evaluate costs or funding sources for BMP implementation since providing funding is not an environmental impact. Revenue sources will vary for each implementing agency but will likely include grant funding, low interest loans, or local fee assessment.

Response to Comment 20-Z:

The PEIR acknowledges that increased stormwater recharge will augment groundwater supplies. The overall recharge volume will vary from basin to basin and from season to season and will increase over time as more BMPs are installed. This additional benefit of the EWMPs is consistent with the goals and plans of the regional groundwater basin managers and water suppliers as described in Section 3.14-1. Water retailers in Los Angeles County generally have two water sources available to them: imported water supplied by a water wholesaler (e.g., Metropolitan, Castaic Lake Water Agency) or groundwater. The two large groundwater basins in Los Angeles County are adjudicated, with established water rights made available to pumpers. The pumpers' allocations are constricted to prevent over-drafting the aquifer. The groundwater managers (Water Replenishment District of Southern California, Upper Los Angeles River Area Water Master) augment the groundwater basins with imported surface water when available to meet demands.

Population growth is expected in the region and the local water suppliers have prepared urban water management plans that explain how they intend to meet the growing demand. The current conditions throughout the State of California indicate that imported water supplies will be more limited in the future than they have been historically. Emphasis is being placed on local supplies to replace imported water. For example, the Water Replenishment District of Southern California is actively pursuing a policy of Water Independence Now (WIN) that will eliminate imported water for replenishment and replace it with storm water and recycled water recharge. The LACFCD has no authority over population growth, land use jurisdiction, or water supplies. As noted in Section 5.3 of the PEIR, the augmentation of water supplies as a secondary outcome of the EWMPs would not induce growth or remove an obstacle to growth, but may help to replace the use of imported water over time as a part of the regional water supply portfolio managed by others.

Furthermore, the PEIR evaluates the potential impacts of increased recharge to groundwater quality and groundwater levels in Impact 3.8-1. The potential for groundwater to exfiltrate in creeks, road cuts, and areas of lower elevation is recognized on page 3.8-35. However, as low flow BMPs are installed throughout the region, base flows fed from landscape runoff are predicted to decrease throughout the region. Any new contribution to surface water flows from new groundwater seepage would be accommodated by the drainage system and would reflect a more natural condition.

As stated on page 3.14-20 of the PEIR, cumulative impacts in regard to existing water supplies are anticipated to be beneficial as a result of stormwater and non-stormwater runoff infiltration and conservation BMPs implemented across the EWMP areas.

Response to Comment 20-AA:

As low flow BMPs are installed throughout the region, base flows fed from landscape runoff are predicted to decrease throughout the region. Any new contribution to surface water flows from new groundwater seepage would be accommodated by the drainage system and would reflect a more natural condition. The PEIR acknowledges on page 3.5-27 that increased recharge could raise groundwater levels in some areas and could impact shallow infrastructure such as concrete channel bottoms, bridge footings, buildings, and utilities.

Response to Comment 20-BB:

The commenter's background and qualifications are noted.

Response to Comment 20-CC:

Each EWMP employs water quality predictive modeling as part of the process of identifying BMP locations and designs. A single surface water quality model for the entire County has not been employed since such an effort would provide minimal value for the amount of effort required. Rather, each watershed within the region has focused on using predictive modeling tailored to its own needs. The Permit requires that Reasonable Assurance Analysis or modeling be conducted to predict the outcome of the BMPs to be employed throughout the individual watersheds. The PEIR evaluates the potential environmental impacts of implementing structural and non-structural BMPs. The effectiveness of each EWMP to achieve permit compliance will be evaluated by the RWQCB, which may require additional projects or management actions to ensure compliance.

Response to Comment 20-DD:

The requirement to fully capture the 85th percentile storm in a regional BMP is a Permit requirement. Providing the hydrology calculations (design volume, runoff coefficients, time of concentrations) is beyond the scope of the PEIR, as it is an advanced planning document. The PEIR evaluates typical project types to assess potential impacts of implementing the entire program throughout the region over a long period of time. More information about these projects can be obtained from the individual implementing agencies. The capacity of each regional BMP identified will be subject to subsequent site specific analysis, which is dependent on local geology, precipitation trends and contributing area. Each regional BMP will be subject to further design, CEQA compliance, and approval by the implementing agencies. More information

regarding the precipitation rainfall across the County can be found
http://www.ladpw.org/wrd/publication/engineering/Final_Report-Probability_Analysis_of_85th_Percentile_24-hr_Rainfall1.pdf

Response to Comment 20-EE:

The PEIR acknowledges that increased stormwater recharge will augment groundwater supplies. The overall recharge volume will vary from basin to basin and from season to season and will increase over time as more BMPs are installed. This additional benefit of the EWMPs is consistent with the goals and plans of the regional groundwater basin managers and water suppliers as described in Section 3.14-1. Water retailers in Los Angeles County generally have two water sources available to them: imported water supplied by a water wholesaler (e.g., Metropolitan, Castaic Lake Water Agency) or groundwater. The two large groundwater basins in Los Angeles County are adjudicated, with established water rights made available to pumpers. The pumpers' allocations are constricted to prevent over-drafting the aquifer. The groundwater managers (Water Replenishment District of Southern California, Upper Los Angeles River Area Water Master) augment the groundwater basins with imported surface water when available to meet demands.

Population growth is expected in the region and the local water suppliers have prepared urban water management plans that explain how they intend to meet the growing demand. The current conditions throughout the State of California indicate that imported water supplies will be more limited in the future than they have been historically. Emphasis is being placed on local supplies to replace imported water. For example, the Water Replenishment District of Southern California is actively pursuing a policy of Water Independence Now (WIN) that will eliminate imported water for replenishment and replace it with storm water and recycled water recharge. The LACFCD has no authority over population growth, land use jurisdiction, or water supplies. As noted in Section 5.3 of the PEIR, the augmentation of water supplies as a secondary outcome of the EWMPs would not induce growth or remove an obstacle to growth, but may help to replace the use of imported water over time as a part of the regional water supply portfolio managed by others.

Furthermore, the PEIR evaluates the potential impacts of increased recharge to groundwater quality and groundwater levels in Impact 3.8-1. The potential for groundwater to exfiltrate in creeks, road cuts, and areas of lower elevation is recognized on page 3.8-35. However, as low flow BMPs are installed throughout the region, base flows fed from landscape runoff are predicted to decrease throughout the region. Any new contribution to surface water flows from new groundwater seepage would be accommodated by the drainage system and would reflect a more natural condition.

Response to Comment 20-FF:

Implementation of the EWMPs would not disproportionately affect areas with lower than average incomes. Local water supplies are largely shared resources, managed by regional agencies (e.g., Metropolitan, Castaic Lake Water Agency) responsible for supplying drinking water equitably to the population. Local water retailers receive their water generally from imported water wholesalers and groundwater pumping. Groundwater recharge resulting from infiltration BMPs will occur throughout the region. Some areas will experience greater volumes of recharge than others due to the local topography and geology. However, local demographics will not influence water quality control infrastructure locations. The equitable delivery of high quality drinking water is the responsibility of water retailers as regulated by the State Water Resources Control Board and the California Department of Public Health.

Response to Comment 20-GG:

The PEIR discusses potential impacts to public health in Impact 3.7-2. The PEIR acknowledges that accumulation of contaminants from water and water-logged habitats in BMPs over time could result in hazardous conditions. Mitigation Measure HAZ-1 is included to ensure that maintenance plans are prepared and implemented to reduce the risk to public health. BMPs may detain water that stagnates or generates odors. Mitigation Measure AIR-4 requires implementing agencies to consider odor controls to reduce impacts to the public. Other vectors such as mosquitos and rodents could be attracted to standing water. Local vector control agencies would employ measures to reduce public health impacts from areas of standing water in cooperation with the LACFCD. In response to the comment Mitigation Measure HAZ-1 has been modified to ensure that vector control plans are incorporated into BMP maintenance plans. Both mitigation measures AIR-4 and HAZ-1 would reduce potentially significant public health impacts to less than significant levels.

> **HAZ-1:** Implementing agencies shall prepare and implement maintenance practices that include periodic removal and replacement of surface soils and media that may accumulate constituents that could result in further migration of constituents to sub-soils and groundwater. A BMP Maintenance Plan shall be prepared by Implementing Agencies upon approval of the BMP projects that identifies the frequency and procedures for removal and/or replacement of accumulated debris, surface soils and/or media (to depth where constituent concentrations do not represent a hazardous conditions and/or have the potential to migrate further and impact groundwater) to avoid accumulation of hazardous concentrations and the potential to migrate further to sub-soils and groundwater. <u>The Maintenance Plan shall include vector control requirements.</u> The BMP Maintenance Plan may consist of a general maintenance guideline that applies to several types of smaller distributed BMPs. For smaller distributed BMPs on private property, these plans may consist of a maintenance covenant that includes requirements to avoid the accumulation of hazardous concentrations in these BMPs that may impact underlying sub-soils and groundwater. Structural BMPs shall be designed to prevent migration of constituents that may impact groundwater.

Response to Comment 20-HH:

Mitigation Measures AES-1 and HAZ-1 both require that implementing agencies prepare and implement maintenance plans as part of the project approval and would reduce potentially significant impacts to less than significant levels. These mitigation measures will be adopted with the Mitigation Monitoring and Reporting Plan.

The EWMPs will summarize project costs and funding mechanisms available to implementing agencies. Implementing agencies are responsible for identifying funding mechanisms needed to effectuate Permit compliance. The PEIR does not evaluate costs or funding sources for BMP implementation since providing funding is not an environmental impact. Revenue sources will vary for each implementing agency but will likely include grant funding, low interest loans, or local fee assessment.

Response to Comment 20-II:

The EWMPs will summarize project costs and funding mechanisms available to implementing agencies. Implementing agencies are responsible for identifying funding mechanisms needed to effectuate Permit compliance. The PEIR does not evaluate costs or funding sources for BMP implementation since providing funding is not an environmental impact. Revenue sources will vary for each implementing agency but will likely include grant funding, low interest loans, or local fee assessment.

Each BMP will affect flood control facilities differently. Direct benefits may include reduced hyrdomodification, reduced erosion, and reduced peak flows. Retention of storm flows, whatever the volume, assists in reducing peak flows downstream. Some BMPs will reduce dry-weather flows as well. The reduction in dry weather base flow will vary from watershed to watershed and season to season and will increase over time as more BMPs are installed. A more-detailed prediction of future dry weather and wet weather flows is currently unavailable.

The PEIR acknowledges that increased stormwater recharge will augment groundwater supplies. The overall recharge volume will vary from basin to basin and from season to season and will increase over time as more BMPs are installed. This additional benefit of the EWMPs is consistent with the goals and plans of the regional groundwater basin managers and water suppliers as described in Section 3.14-1. Water retailers in Los Angeles County generally have two water sources available to them: imported water supplied by a water wholesaler (e.g., Metropolitan, Castaic Lake Water Agency) or groundwater. The two large groundwater basins in Los Angeles County are adjudicated, with established water rights made available to pumpers. The pumpers' allocations are constricted to prevent over-drafting the aquifer. The groundwater managers (Water Replenishment District of Southern California, Upper Los Angeles River Area Water Master) augment the groundwater basins with imported surface water and other water sources when available to meet demands.

Response to Comment 20-JJ:

The PEIR acknowledges that increased stormwater recharge will augment groundwater supplies. The overall recharge volume will vary from basin to basin and from season to season and will increase over time as more BMPs are installed. The recharge would not be considered a water banking resource that would be eligible for extraction by the recharging permittee. Once infiltrated, the water is subject to the authority of groundwater basin managers or watermaster in managed basins or otherwise subject to adjudicated settlements and the California Water Code rules governing groundwater use in California.

Page 3.8-35 of the PEIR states that in areas with shallow groundwater tables or impermeable soils, recharge could result in mounding that affects subsurface infrastructure such as building or bridge foundations. This would be a potential impact of regional BMPs that recharge large volumes of captured stormwater, but could also occur for distributed BMPs in areas with limited permeability. For example, the EWMP Areas of Malibu Creek, Northern Santa Monica Bay, and Palos Verdes are located in areas where no significant groundwater basin occurs. In addition, the West Coast Basin consists of a series of aquitards near the surface that prevent surface water percolation into the productive aquifers. Infiltration BMPs in these areas would result in shallow infiltration followed by lateral movement and seepage to nearby areas that could include creek cuts, areas of lower elevation, or basements and underground vaults. Mitigation Measure HYDRO-1 would require Permittees to evaluate the suitability of BMP locations for groundwater recharge. Infiltration BMPs would not be suitable in areas of low permeability where subsurface structures could be adversely affected by groundwater mounding.

Response to Comment 20-KK:

Each BMP will affect flood control facilities differently. Direct benefits may include reduced hyrdomodification, reduced erosion, and reduced peak flows. Retention of storm flows, whatever the volume, assists in reducing peak flows downstream. These benefits would not be growth-inducing. Some BMPs will reduce dry-weather flows as well. The reduction in dry weather base flow will vary from watershed to watershed and season to season and will increase over time as more BMPs are installed. A more-detailed prediction of future dry weather and wet weather flows is unavailable since it will depend on multiple variables including the implementation schedules of multiple BMPs.

Response to Comment 20-LL:

The PEIR evaluates the potential impacts of increased recharge to groundwater quality and groundwater levels in Impact 3.8-1. The potential for groundwater to exfiltrate in creeks, road cuts, and areas of lower elevation is recognized on page 3.8-35. However, as low flow BMPs are installed throughout the region, base flows fed from landscape runoff are predicted to decrease throughout the region. Any new contribution to surface water flows from new groundwater seepage would be accommodated by the drainage system and would reflect a more natural condition. The PEIR acknowledges on page 3.5-27 that increased recharge could raise groundwater levels in some areas and could impact shallow infrastructure such as concrete channel bottoms, bridge footings, buildings, and utilities. Mitigation Measure GEO-2 commits the LACFCD to coordinate with local groundwater managers to "mitigate high groundwater levels." This mitigation measure would reduce potentially significant impacts to less than significant levels. The changes to dry weather base flow will vary from watershed to watershed and season to season and will increase over time as more BMPs are installed. A more-detailed prediction of future dry weather and wet weather flows is currently unavailable since it will depend on multiple variables including the implementation schedules of multiple BMPs.

Each BMP will affect flood control facilities differently. Direct benefits may include reduced hyrdomodification, reduced erosion, and reduced peak flows. Retention of storm flows, whatever the volume, assists in reducing peak flows downstream. These benefits would not be growth-inducing. Some BMPs will reduce dry-weather flows as well. The reduction in dry weather base flow will vary from watershed to watershed and season to season and will increase over time as more BMPs are installed. A more-detailed prediction of future dry weather and wet weather flows is currently unavailable since it will depend on multiple variables including the implementation schedules of multiple BMPs.

Response to Comment 20-MM:

Subsequent to receiving this comment letter, the commenter's requested information was provided to the commenter by the City of Los Angeles. The EWMPs containing a list of proposed priority projects and locations will be submitted to the RWQCB in June 2015. Appendix G of the PEIR provides some location information on the priority projects known at time of publication of the PEIR. Otherwise, the PEIR describes typical project types that would be employed within each EWMP, but does not provide specific details to any individual project. The analysis in the PEIR focuses on construction impacts of typical projects, the overall cumulative impacts associated with the program, and an assessment of program alternatives. Individual projects will be identified and subject to CEQA compliance on a case by case basis by the implementing agency.

Response to Comment 20-NN:

The documentation that identifies the 85th percentile, 24 hour storm as the most cost effective storm can be obtained at http://dpw.lacounty.gov/wmd/wmms/docs/DesignStormReport.pdf

Also, the 85th percentile, 24 hour storm is a theoretical storm based on historical rainfall data and not a specific storm at a specific time. More information can be found at http://www.ladpw.org/wrd/publication/engineering/Final_Report-Probability_Analysis_of_85th_Percentile_24-hr_Rainfall1.pdf

The runoff coefficients will vary from project to project and will not be part of the PEIR, but the calculations will be provided in the EWMPs.

The requirement to fully capture the 85th percentile storm in a regional BMP is a Permit requirement. Providing the hydrology calculations (design volume, runoff coefficients, time of concentrations) is beyond the scope of the PEIR, as it is an advanced planning document. The PEIR evaluates typical project types to assess potential impacts of implementing the entire program throughout the region over a long period of time. More information about these projects can be obtained from the individual implementing agencies. The capacity of each regional BMP identified will be subject to subsequent site specific analysis, which is dependent on local geology, precipitation trends and contributing area. Each regional BMP will be subject to further design, CEQA compliance, and approval by the implementing agencies.

Response to Comment 20-OO:

The EWMPs are under development and input was received from each participating permittee. The PEIR provides available information, acknowledging that projects will be changed and added over time to meet Permit objectives. The PEIR as an advanced planning tool provides an early environmental assessment of the overall EWMP compliance approach to assist Permittees in assessing individual projects. Project types are defined clearly in Section 2.4. The requirements of the Permit are defined in Section 1.2. Each concept identified in the PEIR is defined as needed to support the reader in understanding the analysis. However, individual projects are not yet designed to the detail requested by the commenter. As projects are designed, they will be evaluated by the implementing agencies and subject to a CEQA compliance determination.

Response to Comment 20-PP:

The EWMPs are under development. The PEIR provides available information, acknowledging that projects will be changed and added over time to meet Permit objectives. Tables 2-3, 2-4, and 2-5 provide available details on planned and proposed BMPs. Appendix G provides available location information for the priority projects that were identified at the time of publication.

Response to Comment 20-QQ:

The PEIR acknowledges that most of the projects to be included in the EWMPs are either currently undefined or currently under development. The PEIR explains that EWMPs are being prepared that will contain road maps to permit compliance for each of the 12 watersheds, without yet being fully detailed. The PEIR states on page ES-2 that "The PEIR analysis is not intended to focus on site-specific construction and operational details of each management strategy and project included in the EWMP. Rather this PEIR serves as a first-tier environmental document that focuses on the effects of implementing the EWMPs to reduce urban runoff pollution." The use of a PEIR pursuant to CEQA Guidelines Section 15168 is intended to evaluate broad-based impacts early in the planning process and is the appropriate CEQA compliance document for the EWMPs at this time.

Response to Comment 20-RR:

The projects objectives provided on page ES-3 and 2-2 are appropriate objectives for a CEQA compliance evaluation. Quantitative objectives and success criteria for water quality are mandated in the Permit. No additional or altered program objectives are necessary.

Response to Comment 20-SS:

In addition to the discussions on pages 3.8-20 and 3.8-21 of the PEIR, in regard to growth inducement, the PEIR acknowledges that increased stormwater recharge will augment groundwater supplies. The overall recharge volume will vary from basin to basin and from season to season and will increase over time as more BMPs are installed. This additional benefit of the EWMPs is consistent with the goals and plans of the regional groundwater basin managers and water suppliers as described in Section 3.14-1. Water retailers in Los Angeles County generally have two water sources available to them: imported water supplied by a water wholesaler (e.g., Metropolitan, Castaic Lake Water Agency) or groundwater. The two large groundwater basins in Los Angeles County are adjudicated, with established water rights made available to pumpers. The pumpers' allocations are constricted to prevent over-drafting the aquifer. The groundwater managers (Water Replenishment District of Southern California, Upper Los Angeles River Area Water Master) augment the groundwater basins with imported surface water when available to meet demands.

Population growth is expected in the region and the local water suppliers have prepared urban water management plans that explain how they intend to meet the growing demand. The current conditions throughout the State of California indicate that imported water supplies will be more limited in the future than they have been historically. Emphasis is being placed on local supplies to replace imported water. For example, the Water Replenishment District of Southern California is actively pursuing a policy of Water Independence Now (WIN) that will eliminate imported water for replenishment and replace it with storm water and recycled water recharge. The LACFCD has no authority over population growth, land use jurisdiction, or water supplies. As noted in Section 5.3 of the PEIR, the augmentation of water supplies as a secondary outcome of the EWMPs would not induce growth or remove an obstacle to growth, but may help to replace the use of imported water over time as a part of the regional water supply portfolio managed by others.

Furthermore, the PEIR evaluates the potential impacts of increased recharge to groundwater quality and groundwater levels in Impact 3.8-1. The potential for groundwater to exfiltrate in creeks, road cuts, and areas of lower elevation is recognized on page 3.8-35. However, as low flow BMPs are installed throughout the region, base flows fed from landscape runoff are predicted to decrease throughout the region. Any new contribution to surface water flows from new groundwater seepage would be accommodated by the drainage system and would reflect a more natural condition.

As stated on page 3.14-20 of the PEIR, cumulative impacts in regard to existing water supplies are anticipated to be beneficial as a result of stormwater and non-stormwater runoff infiltration and conservation BMPs implemented across the EWMP areas.

Environmental justice is discussed in Section 3.11, *Population and Housing and Environmental Justice*, Impact 3.11-4 on page 3.11-7. The PEIR concludes that impacts would be less than significant due to the broad distribution of water quality BMPs to be implemented throughout the communities. No mitigation was determined to be necessary to reduce environmental justice impacts to less than significant levels.

Response to Comment 20-TT:

In regard to the identification of potential and priority structural and non-structural BMPs mentioned in on page 1-1 of the PEIR, the commenter states that BMPs, groups of BMPs, and Projects are not defined at any engineering levels so as to determine cost-effectiveness, capabilities to achieve any project/program goal involving water quality or flows and their effects and impacts. To define the projects at "engineering levels" as stated by the commenter is interpreted to mean providing specific design details. Appendix G of the PEIR provides some location information on the priority projects known at time of publication of the PEIR; however, the EWMPs are currently in development and project details are not currently known. The effectiveness of each EWMP to achieve permit compliance will be evaluated by the RWQCB, which may require additional projects or management actions to ensure compliance.

The EWMPs will summarize project costs and funding mechanisms available to implementing agencies. Implementing agencies are responsible for identifying funding mechanisms needed to effectuate Permit compliance. The PEIR does not evaluate costs or funding sources for BMP implementation since providing funding is not an environmental impact. Revenue sources will vary for each implementing agency but will likely include grant funding, low interest loans, or local fee assessment.

Response to Comment 20-UU:

The Permit sets the schedule for preparation and delivery of the EWMPs. EWMPs are due to the RWQCB in June 2015. In an effort to maximize public involvement and participation, the LACFCD conducted six public meetings, placed numerous ads in regional and local newspapers, and maintained information including audio presentation on a dedicated website. Individual project approvals will require CEQA compliance by implementing agencies.

Response to Comment 20-VV:

Because project details are largely incomplete since the EWMPs are being drafted concurrently, each individual project will be subject to a CEQA compliance evaluation prior to approval by the implementing agencies as noted in Section 1 of the Draft PEIR. As individual projects identified in the EWMPs are fully developed, the implementing agency (i.e., the Permittee responsible for implementing the project) will conduct CEQA analysis for individual projects, as appropriate, or may determine that no additional CEQA analysis is required or that a project is exempt from CEQA. Each implementing agency would determine the significance after mitigation for potential impacts of its proposed projects.

The PEIR provides the LACFCD a foundation for any necessary future environmental review that focus on individual projects of the EWMPs for which the LACFCD is the designated Lead Agency.

As noted on page 1-3, the PEIR can be used by the LACFCD or other Permittees to streamline environmental review of individual projects. The process for incorporating the PEIR or tiering from the PEIR pursuant to Section 15152 of the CEQA Guidelines may be employed by lead agencies for use regarding individual BMPs at their discretion. No uniform tiering plan of action has been established for subsequent project approvals since each project will require specific consideration by varying Permittees implementing the requirements of CEQA at their discretion.

Response to Comment 20-WW:

Each jurisdiction has its own responsibility and discretion to comply with CEQA for individual EWMP projects. Because project details are largely incomplete since the EWMPs are being drafted concurrently, each individual project will be subject to a CEQA compliance evaluation prior to approval by the implementing agencies as noted in Section 1 of the Draft PEIR. As individual projects identified in the EWMPs are fully developed, the implementing agency (i.e., the Permittee responsible for implementing the project) will conduct CEQA analysis for individual projects, as appropriate, or may determine that no additional CEQA analysis is required or that a project is exempt from CEQA. Each implementing agency would determine the significance after mitigation for potential impacts of its proposed projects.

The PEIR provides the LACFCD with a foundation for any necessary future environmental review that focuses on individual projects of the EWMPs for which the LACFCD is the designated lead agency.

Response to Comment 20-XX:

EWMP groups were formed by Permittees from each jurisdiction in common watersheds electing to achieve Permit compliance through the EWMP process as outlined in the Permit. Each Permittee within the EWMP group has provided staff to assist in formulating strategies for compliance that include water quality modeling and preparation of a Reasonable Assurance Analysis, otherwise known as the EWMP Working Group. EWMP group and EWMP Working Group may be used interchangeably.

Response to Comment 20-YY:

The EWMPs are being developed concurrently and will be submitted to the RWQCB in June 2015. The PEIR includes information on the content of the EWMPS that was available at the time of publication and was based on the EWMP work plans. The comment is correct in stating that individual projects will require a subsequent CEQA compliance determination by implementing agencies prior to project approval.

Response to Comment 20-ZZ:

The discretionary action of the Board of Supervisors as noted on page 1-3 of the PEIR is to approve the submittal of the EWMPs to the RWQCB.

Response to Comment 20-AAA:

The EWMPs are in the process of being developed. As such, the PEIR identifies and analyzes the impacts of project types that the EWMPs are considering within each watershed to achieve Permit compliance. As individual projects are identified, the implanting agencies will conduct a CEQA determination prior to project approval and implementation. Implementing agencies adopting this PEIR are subject to the mitigation measures developed herein and included in the MMRP.

Response to Comment 20-BBB:

EWMP groups were formed by Permittees from each jurisdiction in common watersheds electing to achieve Permit compliance through the EWMP process as outlined in the Permit. Each Permittee within the EWMP group has provided staff to assist in formulating strategies for compliance that include water quality modeling and preparation of a Reasonable Assurance Analysis, otherwise known as the EWMP Working Group. EWMP group and EWMP Working Group may be used interchangeably.

Response to Comment 20-CCC:

Each EWMP employs water quality predictive modeling as part of the process of identifying BMP locations and designs. Each watershed within the region has focused on using predictive modeling tailored to its own needs. The Permit requires that Reasonable Assurance Analysis be conducted to predict the outcome of the BMPs to be employed throughout the individual watersheds. The PEIR evaluates the potential environmental impacts of implementing structural and non-structural BMPs. The effectiveness of each EWMP to achieve permit compliance will be evaluated by the RWQCB, which may require additional projects or management actions to ensure compliance.

Providing the hydrology calculations (design volume, runoff coefficients, time of concentrations) is beyond the scope of the PEIR, as it is an advanced planning document. The PEIR evaluates typical project types to assess potential impacts of implementing the entire program throughout the region over a long period of time. More information about these projects can be obtained from the implementing agency Subsequent CEQA analysis will be performed for the implementation of specific BMPs, which will be able to use site-specific environmental setting and BMP design details to more accurately assess whether water quality goals and objectives will be met.

Response to Comment 20-DDD:

Each jurisdiction has its own responsibility and discretion to comply with CEQA for individual EWMP projects. As individual projects identified in the EWMPs are fully developed, the implementing agency (i.e., the Permittee responsible for implementing the project) will conduct CEQA analysis for individual projects, as appropriate, or may determine that no additional CEQA analysis is required or that a project is exempt from CEQA. Each implementing agency would determine the significance after mitigation for potential impacts of its proposed projects. As noted on page 1-3, the PEIR can be used by the LACFCD or other Permittees to streamline environmental review of individual projects. The process for incorporating the PEIR or tiering from the PEIR pursuant to Section 15152 of the CEQA Guidelines may be employed by lead agencies for use regarding individual BMPs at their discretion. No uniform tiering plan of action has been established for subsequent project approvals since each project will require specific consideration by varying Permittees implementing the requirements of CEQA at their discretion.

Response to Comment 20-EEE:

The priority BMPs are defined as those BMPs that have undergone a site review and project evaluation that has identified them as having a greater opportunity to achieve the water quality objectives for their specific EWMP area. These priority BMPs were listed based upon available data at the time of publication of this PEIR. A priority BMP and priority project can be used interchangeably. **Appendix G** provides the location and general description of the priority BMPs.

Response to Comment 20-FFF:

Because project details are largely incomplete since the EWMPs are being drafted concurrently, each individual project will be subject to a CEQA compliance evaluation prior to approval by the implementing agencies as noted in Section 1 of the Draft PEIR. As individual projects identified in the EWMPs are fully developed, the implementing agency (i.e., the Permittee responsible for implementing the project) will conduct CEQA analysis for individual projects, as appropriate, or may determine that no additional CEQA analysis is required or that a project is exempt from CEQA. Each implementing agency would determine the significance after mitigation for potential impacts of its proposed projects.

The PEIR serves as a first-tier environmental document that focuses on the effects of implementing the EWMPs to reduce urban runoff pollution. The analysis assesses worst case situations where construction or operation of projects may significantly impact environmental resources. The analysis outlines mitigation strategies to be followed by the LACFCD and other implementing agencies that rely on the PEIR to avoid or minimize impacts wherever feasible.

The PEIR provides the LACFCD a foundation for any necessary future environmental review that focus on individual projects of the EWMPs for which the LACFCD is the designated Lead Agency.

The process for incorporating the PEIR or tiering from the PEIR pursuant to Section 15152 of the CEQA Guidelines may be employed by lead agencies for use regarding individual BMPs at their discretion. No uniform tiering plan of action has been established for subsequent project approvals since each project will require specific consideration by varying Permittees.

Response to Comment 20-GGG:

Because project details are largely incomplete since the EWMPs are being drafted concurrently, each individual project will be subject to a CEQA compliance evaluation prior to approval by the implementing agencies as noted in Section 1 of the Draft PEIR. As individual projects identified in the EWMPs are fully developed, the implementing agency (i.e., the Permittee responsible for implementing the project) will conduct CEQA analysis for individual projects, as appropriate, or may determine that no additional CEQA analysis is required or that a project is exempt from CEQA. Each implementing agency would determine the significance after mitigation for potential impacts of its proposed projects.

The PEIR serves as a first-tier environmental document that focuses on the effects of implementing the EWMPs to reduce urban runoff pollution. The analysis assesses worst case situations where construction or operation of projects may significantly impact environmental resources. The analysis outlines mitigation strategies to be followed by the LACFCD and other implementing agencies that rely on the PEIR to avoid or minimize impacts wherever feasible.

The PEIR provides the LACFCD a foundation for any necessary future environmental review that focus on individual projects of the EWMPs for which the LACFCD is the designated Lead Agency.

The process for incorporating the PEIR or tiering from the PEIR pursuant to Section 15152 of the CEQA Guidelines may be employed by lead agencies for use regarding individual BMPs at their discretion. No uniform tiering plan of action has been established for subsequent project approvals since each project will require specific consideration by varying Permittees.

Response to Comment 20- HHH:

The PEIR does not state that CEQA is voluntary. The PEIR states that participation in an EWMP is optional.

The process for incorporating the PEIR or tiering from the PEIR pursuant to Section 15152 of the CEQA Guidelines may be employed by lead agencies for use regarding individual BMPs at their discretion. No uniform tiering plan of action has been established for subsequent project approvals since each project will require specific consideration by varying Permittees. Each jurisdiction has its own responsibility and discretion to comply with CEQA for individual EWMP projects.

Response to Comment 20- III:

The PEIR has been prepared by the LACFCD to assess the EWMP program and to make conclusions regarding projects that will require LACFCD approval. The actions of other Permittees including those that may adopt the PEIR are not subject to LACFCD approval. The list of Permittees actively involved in the EWMP process is included Table 2-1.

Response to Comment 20- JJJ:

The text on page 1-5 of the PEIR is provided to summarize the requirements of the Permit in lay-person terms. The details of pollutant priorities and water quality objectives are different for each EWMP and will be included in the EWMP submittals. The PEIR evaluates at a program level, typical projects that will be installed throughout the County to improve surface water quality.

Response to Comment 20- KKK:

In regard to the hydrologic model, each EWMP employs water quality predictive modeling as part of the process of identifying BMP locations and designs. Each watershed within the region has focused on using predictive modeling tailored to its own needs, including consideration of existing TMDLs. The Permit requires that Reasonable Assurance Analysis be conducted to predict the outcome of the BMPs to be employed throughout the individual watersheds. The PEIR evaluates the potential environmental impacts of implementing structural and non-structural BMPs. The effectiveness of each EWMP to achieve permit compliance, including with TMDLs, will be evaluated by the RWQCB, which may require additional projects or management actions to ensure compliance.

Response to Comment 20- LLL:

The priority BMPs are defined as those BMPs that have undergone a site review and project evaluation that has identified them as having a greater opportunity to achieve the water quality objectives for their specific EWMP area. These priority BMPs were listed based upon available data at the time of publication of this PEIR. **Appendix G** provides the location and general description of the priority BMPs.

The text on page 1-5 of the PEIR is provided to summarize the requirements of the Permit in lay-person terms. The details of pollutant priorities and water quality objectives are different for each EWMP and will be included in the EWMP submittals. The PEIR evaluates at a program level, typical projects that will be installed throughout the County to improve surface water quality.

Response to Comment 20- MMM:

Regarding the hydrologic model, each EWMP employs water quality predictive modeling as part of the process of identifying BMP locations and designs. A single surface water quality model for the entire County has not been employed since such an effort would provide minimal value for the amount of effort required. Further, CEQA does not require that a predictive hydrology model be conducted. Each watershed within the region has focused on using predictive modeling tailored to its own needs. The Permit requires that Reasonable Assurance Analysis be conducted to predict the outcome of the BMPs to be employed throughout the individual watersheds. The PEIR evaluates the potential environmental impacts of implementing structural and non-structural BMPs. The effectiveness of each EWMP to achieve permit compliance will be evaluated by the RWQCB, which may require additional projects or management actions to ensure compliance.

Response to Comment 20- NNN:

Management strategies include policies, actions, and activities which are intended to minimize or eliminate pollutant sources. Management strategies also include the various structural BMPs identified in the EWMPs.

Response to Comment 20- OOO:

Regarding the hydrologic model, each EWMP employs water quality predictive modeling as part of the process of identifying BMP locations and designs. A single surface water quality model for the entire County has not been employed since such an effort would provide minimal value for the amount of effort required. Rather, each watershed within the region has focused on using predictive modeling tailored to its own needs. The Permit requires that Reasonable Assurance Analysis be conducted to predict the outcome of the BMPs to be employed throughout the individual watersheds. The PEIR evaluates the potential environmental impacts of implementing structural and non-structural BMPs. The effectiveness of each EWMP to achieve permit compliance will be evaluated by the RWQCB, which may require additional projects or management actions to ensure compliance.

Response to Comment 20- PPP:

The commenter provides a statement that Appendix A and Sections 3.2 and 3.6 reference many air-related models and modeled/modeling results and comparable to requirements for surface recharging and groundwater. However, no specific comment has been identified and as such no response is necessary.

Response to Comment 20- QQQ:

Regarding the hydrologic model, each EWMP employs water quality predictive modeling as part of the process of identifying BMP locations and designs. A single surface water quality model for the entire County has not been employed since such an effort would provide minimal value for the amount of effort required. Further, CEQA does not require that a predictive hydrology model be conducted. Each watershed within the region has focused on using predictive modeling tailored to its own needs. The Permit requires that Reasonable Assurance Analysis be conducted to predict the outcome of the BMPs to be employed throughout the individual watersheds. The PEIR evaluates the potential environmental impacts of implementing structural and non-structural BMPs. The effectiveness of each EWMP to achieve permit compliance will be evaluated by the RWQCB, which may require additional projects or management actions to ensure compliance.

Response to Comment 20- RRR:

The priority BMPs have undergone a site review and project evaluation that has identified them as having a greater opportunity to achieve the water quality objectives for their specific EWMP area. These priority BMPs were listed based upon available data at the time of publication of this PEIR. A priority BMP and priority project can be used interchangeably. Appendix G provides the location and general description of the priority BMPs.

The PEIR provides the LACFCD a foundation for any necessary future environmental review that focus on individual projects of the EWMPs for which the LACFCD is the designated Lead Agency. The LACFCD, as a regional agency, is a member of each of the 12 EWMP working groups, and as such provides a commonality within each EWMP group. However, LACFCD does not have a special status or authority designated by the MS4 Permit over any of the other Permittees and cannot enforce those mitigation measures outside their jurisdiction. The LACFCD will be working with the applicable Permittees in all 12 EWMP watersheds as an equal partner to identify the types and locations of BMPs needed to achieve permit compliance within each watershed. Each Permittee may choose to rely upon this PEIR and its identified mitigation measures, as appropriate, for BMPs within its jurisdiction. Individual projects will undergo subsequent CEQA analysis and documentation, as appropriate under the requirements of CEQA, by implementing agencies. The determinations of significance after mitigation in the PEIR apply to the LACFCD and other implementing agencies that choose to rely on this PEIR and the mitigation measures proposed herein. This PEIR can be used by the LACFCD or other Permittees to streamline environmental review of individual EWMP projects should they also adopt the findings within this PEIR. As individual projects identified in the EWMPs are fully developed, the implementing agency (i.e., the Permittee responsible for implementing the project) will conduct CEQA analysis for individual projects, as appropriate, or may determine that no additional CEQA analysis is needed with compliance with the mitigation measures identified in this PEIR.

The process for incorporating the PEIR or tiering from the PEIR pursuant to Section 15152 of the CEQA Guidelines may be employed by lead agencies for use regarding individual BMPs at their discretion. No uniform tiering plan of action has been established for subsequent project approvals since each project will require specific consideration by varying Permittees. Each jurisdiction has its own responsibility and discretion to comply with CEQA for individual EWMP projects.

Response to Comment 20- SSS:

Page 1-9 of the PEIR provides basic descriptions of the CEQA process and the purpose of a PEIR in lay-person terms. The comment does not clarify what is difficult to understand about the page in question.

Response to Comment 20- TTT:

The PEIR evaluates the potential impacts of project implementation, but does not evaluate the effectiveness of the strategies for achieving Permit compliance. The EWMP process includes a mechanism for the RWQCB to determine effectiveness of the BMPs over time.

Response to Comment 20- UUU:

The priority BMPs have undergone a site review and project evaluation that has identified them as having a greater opportunity to achieve the water quality objectives for their specific EWMP area. These priority BMPs were listed based upon available data at the time of publication of this PEIR. A priority BMP and priority project can be used interchangeably. Appendix G provides the location and general description of the priority BMPs.

The PEIR evaluates the potential impacts of project implementation, but does not evaluate the effectiveness of the strategies for achieving Permit compliance. Nor does the PEIR evaluate the suitability of the proposed EWMP development methodologies. The EWMP process includes a mechanism for the RWQCB to determine effectiveness of the BMPs over time.

Each watershed is described in general in Section 2.5, as well as section 3.8, Hydrology and Water Quality, and Appendix F Supplemental Hydrology and Water Quality Data.

Providing the hydrology calculations (design volume, runoff coefficients, time of concentrations) is beyond the scope of the PEIR, as it is an advanced planning document. The PEIR evaluates typical project types to assess potential impacts of implementing the entire program throughout the region over a long period of time. More information about these projects can be obtained from the individual implementing agencies. The capacity of each regional BMP identified will be subject to subsequent site specific analysis, which is dependent on local geology, precipitation trends and contributing area. Each regional BMP will be subject to further design, CEQA compliance, and approval by the implementing agencies.

Response to Comment 20- VVV:

The PEIR evaluates the potential impacts of project implementation, but does not evaluate the effectiveness of the strategies for achieving Permit compliance. Nor does the PEIR evaluate the suitability of the proposed EWMP development methodologies. The EWMP process includes a mechanism for the RWQCB to determine effectiveness of the BMPs over time. The degree of urbanization for each watershed is described in general in Section 2.5, as well as section 3.8, *Hydrology and Water Quality*, and Appendix F Supplemental Hydrology and Water Quality Data.

Response to Comment 20- WWW:

The PEIR acknowledges that most of the projects to be included in the EWMPs are either currently undefined or currently under development. The PEIR explains that EWMPs are being prepared that will contain road maps to permit compliance for each of the 12 watersheds, without yet being fully detailed. The priority BMPs have undergone a site review and project evaluation that has identified them as having a greater opportunity to achieve the water quality objectives for their specific EWMP area. These priority BMPs were listed based upon available data at the time of publication of this PEIR. Appendix G of the PEIR provides the location and general description of the priority BMPs.

Response to Comment 20- XXX:

The EWMPs will summarize project costs and funding mechanisms available to implementing agencies. Implementing agencies are responsible for identifying funding mechanisms needed to effectuate Permit compliance. The PEIR does not evaluate costs or funding sources for BMP implementation since providing funding is not an environmental impact. Revenue sources will vary for each implementing agency but will likely include grant funding, low interest loans, or local fee assessment..

Response to Comment 20- YYY:

Eight scoping period comment letters were not included in the PEIR as part of an accidental omission. These comment letters generally expressed support for the restoration of Baldwin Lake, which was a topic mentioned in Dale Carter's letter that was included in Table 1-1 and considered as part of the PEIR development. These omitted letters have been listed in Table 1.1, NOP Commenter List, as shown in Chapter 12, *Clarifications and Modifications*. These letters are also included as a part of this Final PEIR as part of Appendix A.

Environmental justice is discussed in Section 3.11, *Population and Housing and Environmental Justice*, Impact 3.11-4 on page 3.11-7. The PEIR concludes that impacts would be less than significant due to the broad distribution of water quality BMPs to be implemented throughout the communities. No mitigation was determined to be necessary to reduce environmental justice impacts to less than significant levels.

The EWMPs will summarize project costs and funding mechanisms available to implementing agencies. Implementing agencies are responsible for identifying funding mechanisms needed to effectuate Permit compliance. The PEIR does not evaluate costs or funding sources for BMP implementation since providing funding is not an environmental impact. Revenue sources will vary for each implementing agency but will likely include grant funding, low interest loans, or local fee assessment.

Response to Comment 20- ZZZ:

The project objectives are provided in Section 2.2 of the Draft PEIR.

Response to Comment 20- AAAA:

The EWMPs provide multiple benefits, but the project objectives are to improve water quality as defined in Section 2.2 of the Draft PEIR.

Response to Comment 20- BBBB:

The use of a PEIR pursuant to CEQA Guidelines Section 15168 is intended to evaluate broad-based impacts early in the planning process and is the appropriate CEQA compliance document for the EWMPs at this time.

Response to Comment 20- CCCC:

The EWMPs will summarize project costs and funding mechanisms available to implementing agencies. Implementing agencies are responsible for identifying funding mechanisms needed to effectuate Permit compliance. The PEIR does not evaluate costs or funding sources for BMP implementation since providing funding is not an environmental impact. Revenue sources will vary for each implementing agency but will likely include grant funding, low interest loans, or local fee assessment.

Response to Comment 20-DDDD:

Each BMP will affect flood control facilities differently. Direct benefits may include reduced hyrdomodification, reduced erosion, and reduced peak flows. Retention of storm flows, whatever the volume, assists in reducing peak flows downstream. These benefits would not be growth-inducing. Some BMPs will reduce dry-weather flows as well. The reduction in dry weather base flow will vary from watershed to watershed and season to season and will increase over time as more BMPs are installed. Table 2-3 identifies multi-benefit flood management project as BMP types to be assessed.

Response to Comment 20-EEEE:

The PEIR acknowledges that most of the projects to be included in the EWMPs are either currently undefined or currently under development. The PEIR explains that EWMPs are being prepared that will contain road maps to permit compliance for each of the 12 watersheds, without yet being fully detailed. Appendix G includes a list of the locations of priority projects identified as of the time of publication of the PEIR.

Response to Comment 20-FFFF:

The PEIR assesses various potential impacts of BMP implementation including wet and dry detention ponds in Section 3. Table ES-1 summarizes all mitigation measures identified in the Section 3 analysis to avoid or minimize potentially significant impacts. The term “engineering mitigation measures” as used by the commenter likely refers to specific design components incorporated as part of wet and dry detention ponds to reduce environmental impacts during their operation. Table 3.1-1 of the PEIR states that Mitigation Measure AES-1 would apply to detention regional BMPs. The following Mitigation Measures listed below pertain to the design of the BMPs.

- Mitigation Measure AES-1 would require aboveground structures to designed to be consistent with local zoning codes and applicable design guidelines and to minimize features that contrast with neighboring development.
- Mitigation Measure GEO-1 requires a geotechnical investigation that would recommend design measures necessary to prevent excessive lateral spreading that could destabilize neighboring structures.
- Mitigation Measure HAZ-1 requires structural BMPs to be designed to prevent migration of constituents that may impact groundwater.
- Mitigation Measure HYDRO-2 requires BMP design to consider pre-treatment technologies, type, and depth of filtration media; depth to groundwater; stormwater quality data within the BMP’s collection area to assess the need and type of treatment and filtration controls; and local design manuals and ordinances requiring minimum separation distance to groundwater.
- Mitigation Measure HYDRO-4 requires that BMP discharge locations are designed to minimize any hydromodification impacts including erosion and scour. Designs could include velocity dissipaters and bank re-enforcement components.
- Mitigation Measure NOISE-2 requires mechanized stationary equipment used for BMPs to be designed with noise-attenuating features.

As noted in Section 1, each individual project will undergo subsequent CEQA determination by the lead implementing agency prior to installation; more specific design components will be known at this level of analysis.

Response to Comment 20-GGGG:

The PEIR discusses potential impacts to public health in Impact 3.7-2. The PEIR acknowledges that accumulation of contaminants in BMPs over time could result in hazardous conditions. Mitigation Measure HAZ-1 is included to ensure that maintenance plans are prepared and implemented to reduce the risk to public health. BMPs may detain water that stagnates or generates odors. Mitigation Measure AIR-4 requires implementing agencies to consider odor controls to reduce impacts to the public. Other vectors such as mosquitos and rodents could be attracted to standing water. Local vector control agencies would employ measures to reduce public health impacts from areas of standing water in cooperation with the LACFCD. In response to the comment Mitigation Measure HAZ-1 has been modified to ensure that vector control plans are incorporated into BMP maintenance plans. Both mitigation measures AIR-4 and HAZ-1 would reduce potentially significant impacts to less than significant levels. Mitigation Measure HAZ-1 has been revised as follows:

> **HAZ-1:** Implementing agencies shall prepare and implement maintenance practices that include periodic removal and replacement of surface soils and media that may accumulate constituents that could result in further migration of constituents to sub-soils and groundwater. A BMP Maintenance Plan shall be prepared by Implementing Agencies upon approval of the BMP projects that identifies the frequency and procedures for removal and/or replacement of accumulated debris, surface soils and/or media (to depth where constituent concentrations do not represent a hazardous conditions and/or have the potential to migrate further and impact groundwater) to avoid accumulation of hazardous concentrations and the potential to migrate further to sub-soils and groundwater. <u>The Maintenance Plan shall include vector control requirements.</u> The BMP Maintenance Plan may consist of a general maintenance guideline that applies to several types of smaller distributed BMPs. For smaller distributed BMPs on private property, these plans may consist of a maintenance covenant that includes requirements to avoid the accumulation of hazardous concentrations in these BMPs that may impact underlying sub-soils and groundwater. Structural BMPs shall be designed to prevent migration of constituents that may impact groundwater.

The addition of rain barrels as potentially effective distributed BMPs is noted in on page 2-14. Table 3.1-1 notes which mitigation measures would apply to rain barrel installation. The quantified impact to downstream hydrology from installing individual rain barrels would depend on the location, watershed, and rate of LID implementation. The LID write-ups on page 3.8-31 of the PEIR do not need to include specific rain barrel requirements; the basic LID objectives and goals need only be described. The detailed LID requirements will be applied to each project developed.

Response to Comment 20-HHHH:

The PEIR acknowledges that accumulation of contaminants in BMPs over time could result in hazardous conditions. Mitigation Measure HAZ-1 is included to ensure that maintenance plans are prepared and implemented to reduce the risk to public health. BMPs may detain water that stagnates or generates odors. Mitigation Measure HAZ-1 would require the removal of contaminated soils and reduce potentially significant impacts to less than significant levels. Mitigation Measure HAZ-1 has been updated as follows:

> **HAZ-1:** Implementing agencies shall prepare and implement maintenance practices that include periodic removal and replacement of surface soils and media that may accumulate constituents that could result in further migration of constituents to sub-soils and groundwater. A BMP Maintenance Plan shall be prepared by Implementing Agencies upon approval of the BMP projects that identifies the frequency and procedures for removal and/or replacement of accumulated debris, surface soils and/or media (to depth where constituent concentrations do not represent a hazardous conditions and/or have the potential to migrate further and impact groundwater) to avoid accumulation of hazardous concentrations and the potential to migrate further to sub-soils and groundwater. <u>The Maintenance Plan shall include vector control requirements.</u> The BMP Maintenance Plan may consist of a general maintenance guideline that applies to several types of smaller distributed BMPs. For smaller distributed BMPs on private property, these plans may consist of a maintenance covenant that includes requirements to avoid the accumulation of hazardous concentrations in these BMPs that may impact underlying sub-soils and groundwater. Structural BMPs shall be designed to prevent migration of constituents that may impact groundwater.

Response to Comment 20-IIII:

The commenter's statement that the centralized and regional BMP discussions are repetitive has been noted; however, repetitive language does not affect the impact conclusions of the PEIR. Centralized Structural BMPs treat runoff from a contributing area of multiple parcels (e.g., facilities typically serving a contributing area on the order of tens or hundreds of acres or larger). Regional Structural BMPs are similar but are meant to retain the 85th percentile storm over 24 hours from a contributing area.

Response to Comment 20-JJJJ:

The potential for groundwater to exfiltrate in creeks, road cuts, and areas of lower elevation is recognized on page 3.8-35. However, as low flow BMPs are installed throughout the region, base flows fed from landscape runoff are predicted to decrease throughout the region. Therefore, rising base flow is not expected to occur as mentioned by the commenter. Any new contribution to surface water flows from new groundwater seepage would be accommodated by the drainage system and would reflect a more natural condition.

Response to Comment 20-KKKK:

The commenter disagrees with the statement on page 2-26 that states that plants in the wash also aid the biogeochemical removal of pollutants such as nitrogen. The commenter's statement that few emergent plants can absorb or treat any aqueous pollutants is not substantiated with information.

Response to Comment 20-LLLL:

The Draft PEIR reflects a good faith effort to investigate and disclose environmental impacts of the project in full compliance with the requirements of CEQA. The suggestion that the Draft PEIR is complex with repetitive wording that causes confusion in relation to public review and participation in the CEQA process is not supported by substantial evidence. The Draft PEIR includes an Introduction and a clear, accurate Project Description that include all the information required by CEQA to comprise an adequate description of the project without supplying extensive detail beyond that needed for evaluation and review of the environmental impacts (14 Cal. Code Regs. Section 15124). Chapter 12, *Clarifications and Modifications*, outlines the revisions to the Draft PEIR.

Response to Comment 20-MMMM:

EWMP groups were formed by Permittees from each jurisdiction in common watersheds electing to achieve Permit compliance through the EWMP process as outlined in the Permit. Each Permittee within the EWMP group has provided staff to assist in formulating strategies for compliance that include water quality modeling and preparation of a Reasonable Assurance Analysis, otherwise known as the EWMP Working Group. EWMP group and EWMP Working Group may be used interchangeably.

The priority BMPs are defined as those BMPs that have undergone a site review and project evaluation that has identified them as having a greater opportunity to achieve the water quality objectives for their specific EWMP area. These priority BMPs were listed based upon available data at the time of publication of this PEIR. Appendix G provides the location and general description of the priority BMPs.

Each program will implement multiple projects. Projects and BMPs can be used interchangeably.

Response to Comment 20-NNNN:

The proposed EWMP BMPs as described in the PEIR are under development; therefore, total projected annual recharge flows resulting from the BMPs cannot be predicted at this time. Reservoir is defined as “usually artificial lake that is used to store a large supply of water for use in people's homes, in businesses, etc.” (Merriam-Webster, 2015c). The terms “recharge basin” and “infiltration basin” are often used synonymously; an infiltration basin is defined as “an infiltration basin is a shallow impoundment which is designed to infiltrate stormwater into the soil” (EPA, 2014). Therefore, a reservoir is usually used to describe an above-ground structure that retains water for water supply purposes and does not necessarily infiltrate water, and a recharge basin is designed to capture and infiltrate water for recharge purposes.

Response to Comment 20-OOOO:

Figure 2-14 provides the location and distribution of potential regional/centralized BMPs (which would include any retention basins) in the Upper Los Angeles River EWMP as noted on page 2-

42. Each potential location will be evaluated for site suitability by implementing agencies for inclusion in the EWMP.

Response to Comment 20-PPPP:

The proposed EWMP BMPs as described in the PEIR are under development. More site investigations are needed to fully vet the proposed projects and define the project scope needed to satisfy the respective EWMP requirements; these analyses will be done following the certification of this EIR in the individual EWMPs themselves. The decision to implement projects as part of the individual EWMPs will be decided by respective jurisdictions. The MMRP for the PEIR will include the appropriate implementation of the mitigation measures identified in the PEIR. Implementation schedules for individual BMPs will be developed within each EWMP by the Permittees.

The Permit sets the schedule for preparation and delivery of the EWMPs. EWMPs are due to the RWQCB in June 2015. In an effort to maximize public involvement and participation, the LACFCD conducted six public meetings, placed numerous ads in regional and local newspapers, and maintained information including audio presentation on a dedicated website. Individual project approvals will require CEQA compliance by implementing agencies.

Response to Comment 20-QQQQ:

The term each jurisdiction refers to each lead agency or implementing agency. The PEIR does not evaluate costs or funding sources for BMP implementation since providing funding is not an environmental impact.

Response to Comment 20-RRRR:

The PEIR assesses green-house gas emissions and climate change in Section 3.6. The EWMPs identify BMPs designed to meet the Permit limits under existing climate conditions. The EWMPs include an adaptive management process which can incorporate future climate conditions once data is collected. More information regarding the precipitation rainfall across the County can be found http://www.ladpw.org/wrd/publication/engineering/Final_Report-Probability_Analysis_of_85th_Percentile_24-hr_Rainfall1.pdf.

Response to Comment 20-SSSS:

The commenter states that no comparable, similar, or differing watershed conditions or characteristics have been identified other than physical channel connections.

The EWMPs cover distinct watersheds described in Section 2.5, Section 3.3.1 and in Section 3.8.1.

Response to Comment 20-TTTT:

The referenced screening assessment will be provided in the EWMPs. The EWMPs are under development. Planned projects are projects that are currently being implemented and identified in each EWMP's Notice of Intent. The term planned project is used to reflect projects that are already being planned to be constructed in the near future. They would not be a priority or potential project. Table 2-4 includes a column that notes the status of the project as complete or planned to be installed and provides an approximate date of completion where available.

The priority projects mentioned in the PEIR were initially selected to be further investigated as part of the EWMPs. The future projects will be selected based on engineering feasibility, water quality reduction benefit, and other factors such as soil investigations, partnership opportunities, etc. Priority projects known at the time of the publication of the PEIR are listed in Appendix G. Potential projects being developed by each EWMP group will be submitted to the RWQCB in June 2015. The screening assessment referenced will be provided in the EWMPs.

Response to Comment 20-UUUU:

Distributed BMPs do not fall into the priority, potential, or planned projects category as they will be implemented in areas where the regional/centralized BMPs are unable to capture or treat it's tributary runoff. The term planned project is used to reflect projects that are already being planned to be constructed in the near future. They would not be a priority or potential project. Table 2-4 includes a column that notes the status of the project as complete or planned to be installed and provides an approximate date of completion where available.

The priority projects mentioned in the PEIR were initially selected to be further investigated as part of the EWMPs. The future projects will be selected based on engineering feasibility, water quality reduction benefit, and other factors such as soil investigations, partnership opportunities, etc. Priority projects known at the time of the publication of the PEIR are listed in Appendix G. Potential projects being developed by each EWMP group will be submitted to the RWQCB in June 2015.

Response to Comment 20-VVVV:

The use of the word "could" is appropriate when analyzing potential impacts according to CEQA thresholds. The analysis that follows that threshold statement indicates the project would not require new or expanded water supplies. The PEIR evaluates types of projects that may be installed to comply with the Permit. Each individual project will require subsequent CEQA determination by the implementing agency.

Response to Comment 20-WWWW:

The structural BMPs would require construction and would generate some temporary employment. Maintenance of structural BMPs could potentially generate permanent employment within the maintenance staffs of the Permittees. However, implementation of the EWMPs is not expected to substantially increase or generate employment in the area.

In addition to the discussions on pages 3.8-20 and 3.8-21 of the PEIR, in regard to growth inducement, the PEIR acknowledges that increased stormwater recharge will augment groundwater supplies. The overall recharge volume will vary from basin to basin and from season to season and will increase over time as more BMPs are installed. This additional benefit of the EWMPs is consistent with the goals and plans of the regional groundwater basin managers and water suppliers as described in Section 3.14-1. Water retailers in Los Angeles County generally have two water sources available to them: imported water supplied by a water wholesaler (e.g., Metropolitan, Castaic Lake Water Agency) or groundwater. The two large groundwater basins in Los Angeles County are adjudicated, with established water rights made available to pumpers. The pumpers' allocations are constricted to prevent over-drafting the aquifer. The groundwater managers (Water Replenishment District of Southern California, Upper Los Angeles River Area Water Master) augment the groundwater basins with imported surface water when available to meet demands.

Population growth is expected in the region and the local water suppliers have prepared urban water management plans that explain how they intend to meet the growing demand. The current conditions throughout the State of California indicate that imported water supplies will be more limited in the future than they have been historically. Emphasis is being placed on local supplies to replace imported water. For example, the Water Replenishment District of Southern California is actively pursuing a policy of Water Independence Now (WIN) that will eliminate imported water for replenishment and replace it with storm water and recycled water recharge. The LACFCD has no authority over population growth, land use jurisdiction, or water supplies. As noted in Section 5.3 of the PEIR, the augmentation of water supplies as a secondary outcome of the EWMPs would not induce growth or remove an obstacle to growth, but may help to replace the use of imported water over time as a part of the regional water supply portfolio managed by others.

Response to Comment 20-XXXX:

The term "feasibility," the noun form of "feasible," is used in the PEIR in a manner consistent with its definition, which is "possible to do" (Merriam-Webster, 2015d). The term "infeasibility," the noun form of "infeasible," is used in the PEIR in a manner consistent with its definition, which is "not feasible; impracticable" (Merriam-Webster, 2015e). The project objectives provided on page ES-3 and 2-2 are appropriate objectives for a CEQA compliance evaluation. Quantitative objectives and success criteria for water quality are mandated in the Permit. No additional or altered program objectives are necessary.

Regarding a hydrologic model, each EWMP employs water quality predictive modeling as part of the process of identifying BMP locations and designs. Each watershed within the region has focused on using predictive modeling tailored to its own needs. The Permit requires that Reasonable Assurance Analysis be conducted to predict the outcome of the BMPs to be employed throughout the individual watersheds. The PEIR evaluates the potential environmental impacts of implementing structural and non-structural BMPs. The effectiveness of each EWMP to achieve permit compliance will be evaluated by the RWQCB, which may require additional projects or management actions to ensure compliance.

In regard to cost-effectiveness, the EWMPs will summarize project costs and funding mechanisms available to implementing agencies. Implementing agencies are responsible for identifying funding mechanisms needed to effectuate Permit compliance. The PEIR does not evaluate costs or funding sources for BMP implementation since providing funding is not an environmental impact. Revenue sources will vary for each implementing agency but will likely include grant funding, low interest loans, or local fee assessment.

Each BMP will affect flood control facilities differently. Direct benefits may include reduced hyrdomodification, reduced erosion, and reduced peak flows. Retention of storm flows, whatever the volume, assists in reducing peak flows downstream. Some BMPs will reduce dry-weather flows as well. The reduction in dry weather base flow will vary from watershed to watershed and season to season and will increase over time as more BMPs are installed. A more-detailed prediction of future dry weather and wet weather flows is currently unavailable.

The project objectives are provided in Section 2.2 of the Draft PEIR.

Response to Comment 20- YYYY:

Mitigation Measure GEO-1 requires that implementing agencies conduct site specific geotechnical studies to confirm that infiltration is feasible; this mitigation measure would reduce potentially significant impacts to less than significant levels.

Response to Comment 20- ZZZZ:

The EWMPs will summarize project costs and funding mechanisms available to implementing agencies. Implementing agencies are responsible for identifying funding mechanisms needed to effectuate Permit compliance. The PEIR does not evaluate costs or funding sources for BMP implementation since providing funding is not an environmental impact. Revenue sources will vary for each implementing agency but will likely include grant funding, low interest loans, or local fee assessment.

In regard to the hydrologic model, each EWMP employs water quality predictive modeling as part of the process of identifying BMP locations and designs. Each watershed within the region has focused on using predictive modeling tailored to its own needs. A single surface water quality model for the entire County has not been employed since such an effort would provide minimal value for the amount of effort required. Further, CEQA does not require that a predictive hydrology model be conducted. The Permit requires that Reasonable Assurance Analysis be conducted to predict the outcome of the BMPs to be employed throughout the individual watersheds. The PEIR evaluates the potential environmental impacts of implementing structural and non-structural BMPs. The effectiveness of each EWMP to achieve permit compliance will be evaluated by the RWQCB, which may require additional projects or management actions to ensure compliance.

Response to Comment 20-AAAAA:

In regard to the hydrologic model, each EWMP employs water quality predictive modeling as part of the process of identifying BMP locations and designs. A single surface water quality model for the entire County has not been employed since such an effort would provide minimal value for the amount of effort required. Further, CEQA does not require that a predictive hydrology model be conducted. Each watershed within the region has focused on using predictive modeling tailored to its own needs. The Permit requires that Reasonable Assurance Analysis be conducted to predict the outcome of the BMPs to be employed throughout the individual watersheds. The PEIR evaluates the potential environmental impacts of implementing structural and non-structural BMPs. The effectiveness of each EWMP to achieve permit compliance will be evaluated by the RWQCB, which may require additional projects or management actions to ensure compliance.

In addition to the discussions on pages 3.8-20 and 3.8-21 of the PEIR, in regard to growth inducement, the PEIR acknowledges that increased stormwater recharge will augment groundwater supplies. The overall recharge volume will vary from basin to basin and from season to season and will increase over time as more BMPs are installed. This additional benefit of the EWMPs is consistent with the goals and plans of the regional groundwater basin managers and water suppliers as described in Section 3.14-1. Water retailers in Los Angeles County generally have two water sources available to them: imported water supplied by a water wholesaler (e.g., Metropolitan, Castaic Lake Water Agency) or groundwater. The two large groundwater basins in Los Angeles County are adjudicated, with established water rights made available to pumpers. The pumpers' allocations are constricted to prevent over-drafting the aquifer. The groundwater managers (Water Replenishment District of Southern California, Upper Los Angeles River Area Water Master) augment the groundwater basins with imported surface water when available to meet demands.

Population growth is expected in the region and the local water suppliers have prepared urban water management plans that explain how they intend to meet the growing demand. The current conditions throughout the State of California indicate that imported water supplies will be more limited in the future than they have been historically. Emphasis is being placed on local supplies to replace imported water. For example, the Water Replenishment District of Southern California is actively pursuing a policy of Water Independence Now (WIN) that will eliminate imported water for replenishment and replace it with storm water and recycled water recharge. The LACFCD has no authority over population growth, land use jurisdiction, or water supplies. As noted in Section 5.3 of the PEIR, the augmentation of water supplies as a secondary outcome of the EWMPs would not induce growth or remove an obstacle to growth, but may help to replace the use of imported water over time as a part of the regional water supply portfolio managed by others.

Furthermore, the PEIR evaluates the potential impacts of increased recharge to groundwater quality and groundwater levels in Impact 3.8-1. The potential for groundwater to exfiltrate in creeks, road cuts, and areas of lower elevation is recognized on page 3.8-35. However, as low flow BMPs are installed throughout the region, base flows fed from landscape runoff are predicted to decrease throughout the region. Any new contribution to surface water flows from new groundwater seepage would be accommodated by the drainage system and would reflect a more natural condition.

As stated on page 3.14-20 of the PEIR, cumulative impacts in regard to existing water supplies are anticipated to be beneficial as a result of stormwater and non-stormwater runoff infiltration and conservation BMPs implemented across the EWMP areas.

Implementation of the EWMPs would not disproportionately affect areas with lower than average incomes. Local water supplies are largely shared resources, managed by regional agencies (e.g., Metropolitan, Castaic Lake Water Agency) responsible for supplying drinking water equitably to the population. Local water retailers receive their water generally from imported water wholesalers and groundwater pumping. Groundwater recharge resulting from infiltration BMPs will occur throughout the region. Some areas will experience greater volumes of recharge than others due to the local topography and geology. However, local demographics will not influence water quality control infrastructure locations. The equitable delivery of high quality drinking water is the responsibility of water retailers as regulated by the State Water Resources Control Board and the California Department of Public Health.

Response to Comment 20-BBBBB:

It should be noted that as part of Response to Comment 4-D above, a new Mitigation Measure UTIL-1 has been added to the PEIR. Therefore, the original Mitigation Measure UTIL-1 has been renumbered to Mitigation Measure UTIL-2. Page 3.14-14 has been edited as follows:

> <u>**UTIL-1:** Prior to implementation of BMPs, the implementing agency shall conduct a search for local utilities above and below ground that could be affected by the project. The implementing agencies shall contact each utility potentially affected to address relocation of the utility if necessary to ensure access and services are maintained.</u>

Mitigation Measure UTIL-2 requires that implementing agencies consider the potential for BMPs to adversely affect downstream beneficial uses and water rights, and would reduce potentially significant impacts to less than significant levels.

Response to Comment 20-CCCCC:

It should be noted that a new Mitigation Measure UTIL-1 has been added to the PEIR. Therefore, the original Mitigation Measure UTIL-1 has been renumbered to Mitigation Measure UTIL-2.

> <u>**UTIL-1:** Prior to implementation of BMPs, the implementing agency shall conduct a search for local utilities above and below ground that could be affected by the project. The implementing agencies shall contact each utility potentially affected to address relocation of the utility if necessary to ensure access and services are maintained.</u>
>
> **UTIL-~~1~~<u>2</u>:** Prior to approval of BMPs, implementing agencies shall evaluate the potential for impacts to downstream beneficial uses, including surface water rights. Implementing agencies shall not approve BMPs that result in preventing access to previously appropriated surface water downstream.

Mitigation Measure UTIL-2 states that implement agencies shall not approve BMPs that result in preventing access to previously appropriated surface water downstream. This measure ensures the protection of downstream surface water rights and would reduce potentially significant impacts to less than significant levels. Specific projects will undergo subsequent CEQA determination prior to implementation.

In addition to the discussions on pages 3.8-20 and 3.8-21 of the PEIR, in regard to growth inducement, the PEIR acknowledges that increased stormwater recharge will augment groundwater supplies. The overall recharge volume will vary from basin to basin and from season to season and will increase over time as more BMPs are installed. This additional benefit of the EWMPs is consistent with the goals and plans of the regional groundwater basin managers and water suppliers as described in Section 3.14-1. Water retailers in Los Angeles County generally have two water sources available to them: imported water supplied by a water wholesaler (e.g., Metropolitan, Castaic Lake Water Agency) or groundwater. The two large groundwater basins in Los Angeles County are adjudicated, with established water rights made available to pumpers. The pumpers' allocations are constricted to prevent over-drafting the aquifer. The groundwater managers (Water Replenishment District of Southern California, Upper Los Angeles River Area Water Master) augment the groundwater basins with imported surface water when available to meet demands.

Population growth is expected in the region and the local water suppliers have prepared urban water management plans that explain how they intend to meet the growing demand. The current conditions throughout the State of California indicate that imported water supplies will be more limited in the future than they have been historically. Emphasis is being placed on local supplies to replace imported water. For example, the Water Replenishment District of Southern California is actively pursuing a policy of Water Independence Now (WIN) that will eliminate imported water for replenishment and replace it with storm water and recycled water recharge. The LACFCD has no authority over population growth, land use jurisdiction, or water supplies. As noted in Section 5.3 of the PEIR, the augmentation of water supplies as a secondary outcome of the EWMPs would not induce growth or remove an obstacle to growth, but may help to replace the use of imported water over time as a part of the regional water supply portfolio managed by others.

Subject: Save Baldwin Lake at LA County Arboretum

Mr. Gregg BeGell,

As a member of Los Voluntarios, the volunteer organization at the Los Angles County Arboretum and Botanical Gardens would like to tell you why the restoration of Baldwin Lake is so important to me. I have been a volunteer for many decades and give tours to the public. It is one of the most visible parts of the Arboretum and is historically significant. The lake enhances the beauty of the historic Queen Ann Cottage, the historic Adobe and the jungle area. It enables the birds and water fowl to live in on the grounds which are very important to the Arboretum. The lake is one of the few natural water features in the area and a result of the Raymond Hill Fault and at times has been a mud hole due to the drought. The lake level is only 18 inches deep now, very cloudy with the stone edging collapsing into the lake. I would like to see Baldwin Lake return to its previous beautiful self which was reportedly 18 feet deep about 100 years ago. Please do whatever is necessary to restore this critical resource and historical beauty.

Connie Heflin

Response to Comment Letter 21 (Connie Heflin – February 10, 2015)

Response to Comment Letter 21-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The PEIR assesses the environmental impacts associated with implementation of EWMPs as a form of compliance with the MS4 Permit. The restoration of Baldwin Lake is shown as a potential priority project to be implemented as part of the Rio Hondo/San Gabriel River EWMP in Figure 2-13 of the PEIR. More site investigations are needed to fully vet the proposed project and define the project scope needed to satisfy the EWMP's requirements. The City of Arcadia is the primary agency who will benefit from a water quality project at the Baldwin Lake. The City of Arcadia will likely play a major role in the decision to implement an EWMP project at Baldwin Lake.

Subject: Baldwin Lake renovation

Dear Mr. BeGell,

I volunteer at the L.A. County Arboretum and several times a month take school children on Plant or History Tours through the Arboretum.

The students and I always walk through the Prehistoric Forest to the shore of Baldwin Lake since the lake is so interesting to the kids with all its plants, birds, turtles, and fishes, and they also enjoy the marvelous view of the Queen Ann Cottage across the lake.

But as I'm sure you know, Baldwin Lake is in a state of serious disrepair with crumbling banks and rock walls surrounding a silted-in basin that used to be about 15 feet deep but apparently now is only a foot or two deep.

I understand also that the mud and silt that have filled in the lake are potentially contaminated with residues that have washed into the lake over the years and settled on the bottom, possibly endangering the health of visitors and also of the wildlife that call the lake home.

I hope that in the near future the County will give the cleanup and renovation of Baldwin Lake the priority that it deserves in order to restore the beauty and safety of one of the very few natural lakes in California.

Studios often rent the Arboretum for 'filming', and I have to believe that restoring the lake to its former glory would attract more film-makers and as a result garner more filming revenues to help balance the budget.

Thank you kindly for your consideration of my request.

Sincerely,

Harry Heflin

Subject: Restore Baldwin Lake

I am very interested in the outcome of your meetings regarding the draft Rio Hondo/San Gabriel River Enhanced Watershed Management Plan (EWMP) on March 9th. Unfortunately, I will be unable to attend, but this is to say that I sincerely hope the DPW will include the restoration of Baldwin Lake in its final recommendations, for the following reasons:

1. It is eligible and scores high in 5 of the 6 criteria.(**ownership**) the Lake is publicly owned; (**opportunity site**) offers a water body nearly four acres in size; (**catchment area**) the collection basin is over 100 acres; (**likely pollutants**) cleanses runoff that likely exceeds allowances; and perhaps most importantly (**multi-use opportunities and connectivity**) offers very substantial direct public benefit.
2. Watershed Role: Baldwin Lake serves as an important collection basin for Arcadia's urban watershed, receiving runoff from over 150 acres of suburban neighborhood to the north. This officially designated watershed area served by the Lake is bounded to the west by Michillinda Avenue, to the north by the 210 freeway, to the east by Arcadia Wash, and to the south by the Arboretum and Monte Verde Drive.

I understand there are four restoration concepts the Arboretum has recommended and I agree with all of them. They are:

1. Create a bioswale at Tule Pond, where urban runoff first enters the Arboretum during storms.
2. Dredge the lake to create greater depth, thereby reducing water temperatures and enhancing water quality and ecosystem health. If Baldwin Lake is returned to its original depth, it could provide over twelve million gallons of storage capacity. Further modification could also provide aquifer recharge.
3. Stabilize the shoreline to stop erosion, restore historic character and enhance scenic quality.
4. Enhance the community value of Baldwin Lake as a key educational, scenic, wildlife, and historic resource serving over 330,000 visitors per year, including over 16,000 elementary school students. The project would provide an unrivaled opportunity to educate a broad public about regional water management, home and community water conservation, and the role of the Raymond Basin and other key water resources that sustain us.

The Arboretum has just received significant funding for, and is in the process of, creating a certified organic and sustainable garden called the Crescent Garden, demonstrating its commitment to educating children and the community about the importance of conserving and ways to use water properly in our gardens.

Thank you in advance for listening to me, a very concerned neighbor, and again, I hope you include saving Baldwin Lake per the Arboretum proposals in the final recommendations.

Sincerely, Leelee Clement Doughty, resident of Pasadena

Dear Mr. BeGell:

I write to support the Westwood Neighborhood Greenway as part of the Enhanced Watershed Management Plan (EWMP) for the Ballona Creek Watershed. The WNG will be a multi-benefit project to provide (1) urban runoff treatment, (2) native habitat, and (3) public access via transit, bicycle and pedestrian paths.

By pumping water from a perennial stream (Brown Canyon Creek) that formerly ran across the Expo ROW and the WNG area (but is now carried in the storm drain under Overland Avenue), the WNG will reduce the amount of ocean runoff and use natural and sustainable water treatment methods to remove lead, zinc, copper, and other pollutants from up to 48 million gallons of water per year. Also, the WNG will eliminate the need for potable water to irrigate both the Expo ROW and the WNG area.

As importantly, the WNG will provide unparalleled institutional BMPs, as it will be adjacent to the busiest station on the Expo Light Rail line, which itself is part of the growing Metro transit network. Sustainability education will be carried on by and offered to students and public, including USC, UCLA, Los Angeles Audubon, Dorsey High School, and Overland Avenue Elementary School.

Very truly yours,

Jonathan Weiss

Dear Ms. Osmena and Mr. BeGell,

I am an honorary trustee of the Los Angeles Arboretum Foundation, the County's non-profit partner in operating and funding the Los Angeles County Arboretum & Botanic Garden.

Baldwin Lake, created by Lucky Baldwin in the 1880s from a naturally-occurring wetland along the Raymond Fault, is today an important collection basin for Arcadia's urban watershed and an important and much-beloved feature of the Arboretum -- itself a wonderful resource for Southern California, with over 10,000 members and well over 300,000 visitors, including over 15,000 elementary school students, each year.

The restoration of Baldwin Lake will enhance Baldwin Lake's watershed function and, in addition, bring the public extraordinary educational, ecological and scenic benefits.

My wife Marilyn and I strongly urge that the restoration of Baldwin Lake be included as a high priority project within the Rio Hondo/San Gabriel River Enhanced Watershed Management Plan.

We thank you for your efforts in this direction.

Mr. George BeGill, P.E
County of L.A. Dept. of Public Works
Project Management Division II
900 S. Fremont, 5th floor
Alhambra, Ca. 91803

Dear Mr. BeGill,

I am writing to ask for your help in saving The Los Angeles County Arboretum's Baldwin Lake, and am hoping that The Enhanced Watershed Management Plan will see fit to offer assistance.

Baldwin Lake is the heart of The Arboretum. It is historical and educational as well as part of the Rio Hondo Watershed, and is in great need of attention.

Not too long ago I saw a school child in great distress. He had fallen into the lake and was covered in slime. I will never forget his attempt at courage and the clean marks of his tears.

Baldwin Lake is an environmental, historical and education gem. It has been ignored and become a hazard, full of urban runoff and in great need of assistance. I hope you and the March 9th meeting on water quality will acknowledge this, and attempt to solve the effects of years of mismanagement.

Thank you, & Save Baldwin Lake,

Pamela B. Warner

Response to Comment Letter 28 (Dan Foliart – March 2, 2015)

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The PEIR assesses the environmental impacts associated with implementation of EWMPs as a form of compliance with the MS4 Permit. The restoration of Baldwin Lake is shown as a potential priority project to be implemented as part of the Rio Hondo/San Gabriel River EWMP in Figure 2-13 of the PEIR. More site investigations are needed to fully vet the proposed project and define the project scope needed to satisfy the EWMP's requirements. The City of Arcadia is the primary agency who will benefit from a water quality project at the Baldwin Lake. The City of Arcadia will likely play a major role in the decision to implement an EWMP project at Baldwin Lake.

Dear Mr. BeGell and Ms. Osmena,

I am writing this letter as a community member of Arcadia and volunteer at the Los Angeles County Arboretum and Botanic Garden. I could include all the statistics about Baldwin Lake that you are fully aware of, however, I am writing more to share my personal stance on the importance of protecting and preserving Baldwin Lake.

The restoration and preservation of Baldwin Lake through the collection of rain water runoff seems to make logical sense. I've been a local for many years, primarily living against the San Gabriel Mountains. It doesn't take much for a storm to flood our streets and backyards; including overflowing residents swimming pools. Why not allow runoff to come through the Arboretum?

I have been coming to the Arboretum most of my life to enjoy the plant life, birds, insects, and Baldwin Lake. It dismays me (and the students I take on medicinal plant tours) to walk by a lake that now looks more like the tar pits of La Brea. How disconcerting that our community and hard-working staff at the Arboretum have had to watch the decay and wasting of a once vibrant attraction!

You have a great number of supporters rallying for the restoration of Baldwin Lake. It is the people who devote their own time, money, and energy into this historic landmark who are here making the most noise! Please do not disappoint them (me) by allowing an opportunity to do something significant for our community slip by.

Sincerely,

Catherine R. Heinlein

Dear Ms. Osmena,

Please take a few moments to read the attached letter to add my voice to those already crying out for help in saving Baldwin Lake.

Thank you,
Andy Edmonds

Dear Mr. BeGell and Ms. Osmena,

Please add my voice to those already crying out for county funding to save Baldwin Lake at the LA Co Arboretum. The reasons for this project already have been pointed out via emails, letters and meetings with people much more articulate than I. I will not waste your time reiterating those points. You already know why this needs to be done and how to go about doing it.

I did previously send letters to both of you as well as Supervisor Antonovich's office but was informed that those either did not reach you or had not been counted in the official "tally". We were told to send this letter as an email attachment.

I greatly appreciate your time and consideration in funding this project.

Sincerely,

Andy Edmonds

Dear Mr. BeGell

As a volunteer docent at the Los Angeles County Arboretum, I am submitting a plea that Baldwin Lake becomes eligible as a Priority Project for State Funds.

For the past three years, I have given tours to visitors at the Arboretum. Baldwin Lake is always of interest and a focal point of their tour, no matter where they are from. Visitors are interested in the Lake for a variety of reasons:

The rich history surrounding the Lake provides insight to the lives of the Tongva Indians and early California history

Appeals as a site for painters and photographers

Is a santuary for over 250 species of birds as well as other creatures

Retreat and quiet spot for everyone

Appeals to movie buffs due to being the site for many films

Display of numerous trees and plants surrounding the lake

Thank you for your time and consideration
Any help you can provide will be much appreciated.

Sincerely,

Shake Mamigonian

Re: Rio Hondo/San Gabriel River Enhanced Watershed Management Plan

This letter is to urge you to include the restoration of **Baldwin Lake at the Los Angeles County Arboretum and Botanic Garden** as a high priority project within the Rio Hondo/San Gabriel River Enhanced Watershed Management Plan. The restoration of Baldwin Lake will both enhance watershed function and serve the public with educational, and ecological benefits. Baldwin Lake is a valuable public resource.

This Lake is publicly owned; it offers a body of water nearly four acres in size with a collection basin of over 100 acres; it cleanses runoff that exceeds allowances and it offers a very substantial direct public benefit.
At present, the lake is so shallow it creates low water oxygen levels that are harmful to the fish, turtles and a huge variety of ducks, other birds and species.

Baldwin Lake is a key educational, scenic, wildlife, and historic resource that serves the public including both elementary, high school and college students from various school district with a large percentage of them from the **underserved area** of Los Angeles Unified School District. This project would provide a huge opportunity to educate not only the students but also the general public about regional water management, home and community water conservation, and the role of the Raymond Basin and other key water resources that sustain the people of Los Angeles County.
Thank you for you consideration of this project.

Chris Cox and Gloria Cox

I understand that my e-mail, sent to you on November 11, was not recorded, so I am re-sending it below. I will also attach it as a word document in case that is more convenient for you.

I am writing in support of the restoration of Baldwin Lake at the Los Angeles Arboretum. I have loved The Arboretum as a child, as a parent, and now as a volunteer docent. Thousands of visitors consider the lake an important reason to visit the garden, and it is a critical part of the environment of many of the birds and other animals that call The Arboretum home. On history tours, children learn how important Baldwin Lake has been since its earliest history, when Tongva Indians called their home *Aleupkigna* or *Place of Many Waters*. Our visitors have expressed dismay and concern as the water levels have declined and the quality of the water deteriorated. Please know how important Baldwin Lake is to many in our community and beyond, and take advantage of the opportunity now available to restore the health and beauty of Baldwin Lake.

Sincerely,
Margaret Page

Thank you so much,
-Kristine Hannibal

3/5/2015

To Whom it may concern at L.A. County Department of Public Works,

I'm writing to express my concern for the condition of Baldwin Lake at the L.A. Arboretum at this time and the future preservation of it as well. There seems to have been no proactive measures to keep this deterioration from happening in the past. The original retaining wall that was built by Lucky Baldwin is to the point of crumbling and is ready to fall over into the lake. This will cause further deterioration of the banks of the lake and will ultimately need to be fenced off to avoid any danger to visitors. There is also a need to clean out the mud and silt at the bottom of the lake that has built up over many years. This has made the lake very shallow, where it used to be 12-15ft deep, it is now only approx. 30inches deep. This clean-out would give the lake the capacity to hold more water. Currently the lake is filled with irrigation water, which is costly and doesn't help with the drought conditions in Southern California. It also covers up the deteriorating retaining wall and makes things appear as if all is well. There are also a number of pollutants that trickle into the lake from local runoff that needs to be addressed as well.

Baldwin Lake is and has always been a major draw for visitors young and old that come to visit and explore the Arboretum. It is also a major focal point for the Queen Anne Cottage that sits on the bank of the Lake. With the Hugo Reid Adobe under construction and fenced off for the last 2 years, the last thing the Arboretum needs is another major attraction to be fenced off as well. I believe this would raise many questions from members and the general public as well. Lastly, there are many animals and fish that consider the lake to be a home and a source of food. Please consider adding Baldwin Lake to your final list of EWMP projects submitted for funding, it will be money, and time well spent with a lasting impact.

Save Baldwin Lake.

Thank you,
Kristine Hannibal
Los Voluntarios member

To: Gregg Begell
Subject: Baldwin Lake at The LA Arboretum

Hello Mr. Gregg Be Gill, P.E.-

I am writing you to please consider helping and include **Baldwin Lake at The LA Arboretum** in the Enhanced Watershed Management Plan. I believe that Baldwin Lake is a huge part of our community and is multi-dimensional in serving the community and also by being educational. We have an opportunity to educate children and the community about water conservation and we cannot do this without the help to fund its restoration. The restoration of Baldwin Lake will both enhance watershed function AND serve the public with exceptional educational, ecological and scenic benefits. Annually, over 330,000 people visit Baldwin Lake; I myself have been going there since I was a child and hold the fondest memories of school field trips and family visits. My hope is this will continue as an Arcadia tradition and a historical landmark.

Did you know?

1. Petrochemicals and other pollutants enter the Lake as unfiltered runoff from Arcadia's urban watershed.
2. High velocity runoff flows and the unobstructed channel exacerbates shoreline erosion issues.
3. Heavy siltation continues to reduce lake depth. The original depth of 12-15 feet has been reduced to an average 30 inches.
4. Habitat quality and species diversity is degraded by diminished lake depth and low water oxygen.
5. Shoreline erosion and structural collapse continue to degrade scenic quality and reduce lake depth.
6. High bacteria counts result from abundant wildlife occupying a shallow lake with low water circulation.

I believe that this is a great opportunity to educate our youth and community about water conservation,

Thank you for your time,

Emily

Emily Rosedale-Kousoulis

Response to Comment Letter 38: (Emily Rosedale-Kousoulis – March 8, 2015)

Response to Comment 38-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The PEIR assesses the environmental impacts associated with implementation of EWMPs as a form of compliance with the MS4 Permit. The restoration of Baldwin Lake is shown as a potential priority project to be implemented as part of the Rio Hondo/San Gabriel River EWMP in Figure 2-13 of the PEIR. More site investigations are needed to fully vet the proposed project and define the project scope needed to satisfy the EWMP's requirements. The City of Arcadia is the primary agency who will benefit from a water quality project at the Baldwin Lake. The City of Arcadia will likely play a major role in the decision to implement an EWMP project at Baldwin Lake.

Response to Comment 38-B:

Refer to page 3.8-7 of the PEIR that includes a general discussion of the water quality within the Rio Hondo/San Gabriel Watershed and how it has been affected by various pollutants. Table F-3 also includes applicable TMDLs within the Rio Hondo/San Gabriel Watershed.

Response to Comment 38-C:

Refer to page 3.8-18 of the PEIR that recognizes how urbanization can increase dry weather flows within the project area; Impact 3.8-3 on page 3.8-37 of the PEIR analyzes potential impacts related to erosion and siltation resulting from implementation of the EWMPs. Mitigation Measure HYDRO-4 has been added under Impact 3.8-3 as shown below to ensure any hydromodification impacts including those related to erosion and scour remain less than significant.

> **HYDRO-4:** Prior to approving a structural BMP, the implementing agencies shall conduct an evaluation of the potential hydromodification impacts of the project. The evaluation shall recommend design measures necessary to prevent or minimize any identified impacts, including flooding, erosion and/or scour. Design measures could include velocity dissipaters and bank re-enforcement components. Implementing agencies shall include these measures in project designs.

Response to Comment 38-D:

Impact 3.8-3 on page 3.8-37 of the PEIR analyzes potential impacts related to erosion and siltation resulting from implementation of the EWMPs. Should the EWMP group decide to implement Baldwin Park restoration as an EWMP project, details regarding lake depth remediation from heavy siltation would need to be analyzed further.

Response to Comment 38-E:

Implementation of the Enhanced Watershed Management Programs as required by the MS4 Permit will involve multi-benefit regional projects that retain stormwater and non-stormwater runoff. Such benefits of water quality improvement also include habitat quality improvements. Refer to page 3.1-11 of the PEIR, which states that implementation of the structural BMPs as part of the EWMPs is anticipated to have an overall positive impact on the aesthetic environment. For example, there is anticipated to be more green space areas and less impermeable surfaces from pavement and concrete, thereby enhancing the level of greenness in the watersheds. Should the EWMP group decide to implement Baldwin Park restoration as an EWMP project, details regarding habitat restoration would need to be analyzed further.

Response to Comment 38-F:

Impact 3.8-3 on page 3.8-37 of the PEIR analyzes potential impacts related to erosion and siltation resulting from implementation of the EWMPs. Should the EWMP group decide to implement Baldwin Park restoration as an EWMP project, details regarding lake depth remediation from heavy siltation would need to be analyzed further.

Implementation of the Enhanced Watershed Management Programs as required by the MS4 Permit will involve multi-benefit regional projects that retain stormwater and non-stormwater runoff. Such benefits of water quality improvement also include habitat quality improvements. Refer to page 3.1-11 of the PEIR, which states that implementation of the structural BMPs as part of the EWMPs is anticipated to have an overall positive impact on the aesthetic environment. For example, there is anticipated to be more green space areas and less impermeable surfaces from pavement and concrete, thereby enhancing the level of greenness in the watersheds. Should the EWMP group decide to implement Baldwin Park restoration as an EWMP project, details regarding habitat restoration would need to be analyzed further.

Response to Comment 38-G:

As discussed on page 3.8-7 of the Draft PEIR, the Rio Hondo/San Gabriel Watershed in which Baldwin Lake is located, has several priority pollutants and includes not only bacteria but also nutrients, trash, metals, and sediment impacted by metals and organic compounds (DDT, PCBs, PAHs). The BMP strategy in the Upper Los Angeles River watershed and Rio Hondo watershed includes well over a hundred planned regional and centralized retention and infiltration BMPs that take advantage of the favorable groundwater recharge characteristics in defined areas of the watershed. Also planned are centralized treatment wetlands and bioinfiltration BMPs in parks and open spaces with favorable subsurface soils that promote higher infiltration rates. The BMP strategy also includes distributed smaller BMPs located throughout the urbanized areas of the watershed as retrofits in existing developments and streets. LFDs to comply with dry-weather bacteria TMDLs will also be included. Should the EWMP group decide to implement Baldwin Park restoration as an EWMP project, details regarding high bacteria counts from abundant wildlife occupying a shallow lake with low water circulation would need to be analyzed further..

Response to Comment 38-H:

Refer to page 2-1 of the PEIR, which states that educational and outreach measures would be implemented as part of EWMP non-structural BMPs.

Hello Genevieve,

Here is a copy of the speech I prepared to say at the end of tomorrow's meeting.

Thank you,
Mrs. Margaux L. Viera

Good morning. My name is Margaux Viera.

I am the great great great granddaughter of Elias Jackson "Lucky" Baldwin, who once owned Rancho Santa Anita and what is now known as, The Los Angeles Arboretum & Botanical Gardens. I am honored to be a part of The Los Angeles Arboretum's past, present and future. I am on the board of trustees and am part of the, "Save Baldwin Lake" task force. Baldwin Lake was once a natural reservoir for artesian water. Lucky Baldwin set a gold standard for water conservation when he deepened the lake basin in the late 1880's and created a water retention system that helped him irrigate acres and acres of crops. Now historic Baldwin Lake is in serious trouble. We can return Baldwin Lake to its water retention function as part of the Enhanced Watershed Management Plan, and we can also use Baldwin Lake to educate the public that the history of responsible use of water goes back much further than most people realize.

Please help to protect Baldwin Lake and it's beautiful natural resource. The Los Angeles Arboretum is very special to my family as well as to the hundreds of thousands of individuals, families and school children who visit it each year. Thank you.

Response to Comment Letter 39: (Margaraux Viera – March 9, 2015)

Response to Comment 39-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The PEIR assesses the environmental impacts associated with implementation of EWMPs as a form of compliance with the MS4 Permit. The restoration of Baldwin Lake is shown as a potential priority project to be implemented as part of the Rio Hondo/San Gabriel River EWMP in Figure 2-13 of the PEIR. More site investigations are needed to fully vet the proposed project and define the project scope needed to satisfy the EWMP's requirements. The City of Arcadia is the primary agency who will benefit from a water quality project at the Baldwin Lake. The City of Arcadia will likely play a major role in the decision to implement an EWMP project at Baldwin Lake.

Paige Anderson

To: Gregg Begell
Subject: In support of Baldwin Lake restoration

Dear Mr. Begell:
As a volunteer/docent of nearly ten years at the Arboretum I have seen the rapid degradation of Baldwin Lake.
Until now, we have felt there was no hope for its restoration. I would like to tell the visiting public that we do have hope, that we care about this resource and as a County facility we are stepping up to the responsibility of its desperately needed restoration.

Most importantly, because the lake is a collection basin for Arcadia's runoff, we have allowed its quality to be compromised with unfiltered pollutants, destabilization of its banks and siltation that threaten the viability of its storage capacity. The inclusion of the Lake in the Rio-Hondo/San Gabriel EWMP will finally give us the means to take responsibility for our lake by managing the runoff productively enabling us to restore the needed depth and give us much needed water storage capacity and aquifer recharge. We need water storage capacity and we need to be responsible for the quality of the water we share with the community and provide for our wildlife.

The inclusion of the Lake in the EWMP is a major step toward its restoration enabling the Arboretum to meet the needs of our community for a lake with water storage capacity and thereby promoting its scenic, wildlife and historic value.

Thank you for your support.

Sincerely,
Robin A. Kirk

Response to Comment Letter 40: (Robin Kirk – March 9, 2015)

Response to Comment 40-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The PEIR assesses the environmental impacts associated with implementation of EWMPs as a form of compliance with the MS4 Permit. The restoration of Baldwin Lake is shown as a potential priority project to be implemented as part of the Rio Hondo/San Gabriel River EWMP in Figure 2-13 of the PEIR. More site investigations by implementing agencies are needed to fully vet the proposed project and define the project scope needed to satisfy the EWMP's requirements. The City of Arcadia is the primary agency who will benefit from a water quality project at the Baldwin Lake. The City of Arcadia will likely play a major role in the decision to implement an EWMP project at Baldwin Lake.

Subject:	RE: Comments to LACFCD Draft PEIR Enhanced Watershed Management Programs due 3.16.2015

From: Joyce Dillard [mailto:dillardjoyce@yahoo.com]
Sent: Monday, March 16, 2015 3:50 PM
To: Gregg Begell
Subject: Comments to LACFCD Draft PEIR Enhanced Watershed Management Programs due 3.16.2015

Attached.

Joyce Dillard
P.O. Box 31377
Los Angeles, CA 90031

Comments to LACFCD Draft PEIR Enhanced Watershed Management Programs due 3.16.2015

<u>You state:</u>

> *The 2012 MS4 Permit for Los Angeles County gives Permittees the option of implementing an innovative approach to Permit compliance through development of an Enhanced Watershed Management Program (EWMP). The EWMPs will identify potential and priority* ***structural and non-structural Best Management Practices (BMPs)*** *within the region's stormwater collection system to improve runoff water quality.*

And

> *The LACFCD has limited jurisdictional authority for ordinance and code enactment or enforcement and therefore is* ***limited in nonstructural BMPs to education and outreach measures. The structural watershed control measures that will be implemented by the LACFCD will be multi-benefit stormwater projects that emphasize flood risk mitigation and water conservation and supply.***

And

> ***The LACFCD has limited jurisdictional authority for ordinance and code enactment or enforcement and therefore is limited in nonstructural BMPs to education and outreach measures****. The structural watershed control measures that will be implemented by the LACFCD will be multi-benefit stormwater projects that emphasize flood risk mitigation and water conservation and supply*.
>
> ***The LACFCD has a vested interest in increasing opportunities for stormwater capture and groundwater recharge as a means of assisting local water supply augmentation****. The LACFCD will be working with the applicable Permittees and other stakeholders in all 12 EWMP watersheds to develop such projects. The EWMPs will be implemented by the Permittees that have jurisdiction within each EWMP area.* ***The implementing agencies will be responsible for the contents of the EWMPs affecting their jurisdictions and for implementing the projects developed by the EWMPs.***

<u>Comments:</u>

We do not agree that the LA County Flood Control District LACFCD qualifies as a LEAD AGENCY.

CEQA 15051(d) states:

Where the provisions of subdivisions (a), (b), and (c) leave two or more public agencies with a substantial claim to be the Lead Agency, the public agencies may by agreement designate an agency as the Lead Agency. An agreement may also provide for cooperative efforts by two or more agencies by contract, joint exercise of powers, or similar devices.

The WATERSHED MANAGEMENT GROUPS, through the Notices of Intent and/or Memorandums of Understanding have determined Lead Agencies as:

1. Ballona Creek- City of Los Angeles
2. Beach Cities- City of Redondo Beach
3. Dominguez Channel- City of Los Angeles
4. Malibu Creek- City of Calabasas
5. Marina del Rey Harbor-County of Los Angeles
6. North Santa Monica Bay Coastal- City of Malibu
7. Palos Verdes Peninsula- City of Rancho Palos Verdes
8. Rio Hondo/San Gabriel River- City of Arcadia (not City of Sierra Madre)
9. Santa Monica Bay- Jurisdictional Groups 2 & 3- City of Los Angeles
10. Upper Los Angeles River- City of Los Angeles
11. Upper San Gabriel River- County of Los Angeles
12. Upper Santa Clara River- City of Santa Clarita

You state:

The EWMPs will identify management strategies including hundreds of structural Best Management Practices (BMPs) that may be designed and implemented by the Permittees to meet permit compliance objectives.

Comments:

APPENDIX G-EWMP Proposed BMP and Priority Project Data identified proposed projects, making this PEIR irrelevant as a programming document. They are site-specific.

You state:

The PEIR analysis is not intended to focus on the site-specific construction and operation details of each management strategy and project included in the EWMP. Rather, this PEIR serves as a ***first-tier environmental document that focuses on the effects of implementing the EWMPs to reduce urban runoff pollution****. The analysis assesses worst case situations where construction or operation of projects may significantly impact environmental resources. The analysis outlines mitigation strategies to be followed by implementing agencies to avoid or minimize impacts wherever feasible.*

Comments:

URBAN RUNOFF POLLUTION is mentioned twice in the MS4 PERMIT:

ATTACHMENT A–DEFINITIONS

Structural BMP
*Any structural facility designed and constructed to mitigate the adverse impacts of storm water and **urban runoff pollution** (e.g. canopy, structural enclosure). The category may include both Treatment Control BMPs and Source Control BMPs*

And

a. Permit Structure: Watershed Management Approach and Total Maximum Daily Load (TMDL) Implementation

A single permit will ensure consistency and equitability in regulatory requirements within Los Angeles County, while watershed-based sections within the single permit will provide flexibility to tailor permit provisions to address distinct watershed characteristics and water quality issues.

*Additionally, an internal watershed-based structure comports with the Regional Water Board's Watershed Management Initiative, its watershed-based TMDL requirements, and the LACFCD's funding initiative passed in Assembly Bill 2554. Watershed-based sections will help promote watershed-wide solutions to address water quality problems, which in many cases are the most efficient and cost-effective means to address storm water and **urban runoff pollution.***

And

Project Description
*The 12 EWMPs will vary for each watershed group, **but will generally provide the opportunity for Permittees to customize their stormwater programs to achieve compliance with applicable receiving water limitations (RWLs) and water-quality-based effluent limits (WQBELs) in accordance with the MS4 Permit through implementation of stormwater best management practices (BMPs) or watershed control measures.***

*BMPs vary in function and type, with each BMP providing unique design characteristics and benefits from implementation. **The overarching goal of BMPs in the EWMP is to reduce the impact of stormwater and non-stormwater on receiving water quality and address the water quality priorities as defined by the MS4 Permit***

PEIR does not have a main focus on Receiving Water compliance required by the MS4 Permit and intention of Enhanced Watershed Management Plans.

This PEIR is unnecessary.

<u>You state:</u>

> *LACFCD is the CEQA Lead Agency for this PEIR.* ***This PEIR can be used by the LACFCD or other Permittees to streamline environmental review of individual EWMP projects***

<u>Comments:</u>

LACFCD is not the Lead Agency for any EWMP Watershed Management Group. This could only apply to their own projects.

This document covers URBAN RUNOFF and would not streamline any review.

<u>You state:</u>

> *The timeline identified in the MS4 Permit requires that Permittees submit the EWMP to the LARWQCB by June 28, 2015, in order to be in compliance with the permit conditions.* ***The LACFCD recognizes that implementation of the EWMPs may potentially result in changes to environmental conditions. As a result, the LACFCD has prepared this Program Environmental Impact Report (PEIR) in compliance with the California Environmental Quality Act (CEQA) to provide the public and the responsible and trustee agencies with information about the potential effects on the local and regional environment associated with implementation of the EWMPs. The LACFCD will submit the PEIR to its governing body, the Los Angeles County Board of Supervisors, for approval prior to submittal of the EWMPs.*** *The EWMPs will be submitted by each EWMP group to the LARWQCB.*
>
> *This PEIR describes and evaluates each of the EWMPs being prepared by the Permittees collectively. The discretionary action prompting the need for CEQA compliance is the submittal of the completed EWMPs to the LARWQCB. The EWMPs will identify management strategies including hundreds of structural Best Management Practices (BMPs) that may be designed and implemented by the Permittees to meet permit compliance objectives.* ***A few of the BMPs are currently well defined but most are yet to be fully developed under the EWMPs****. A set of priority BMPs will be detailed in each of the EWMPs; these are being developed in parallel with the PEIR. The PEIR describes the details that are available for each of the EWMPs currently under preparation by the EWMP working groups.*

<u>Comments:</u>

LACFCD and the Los Angeles County Board of Supervisors have no authority over the municipal GENERAL PLAN and Its Elements, required by each city. Neither body represents a METROPOLITAN PLANNING ORGANIZATION with its required Regional Housing Needs Assessment which related to infrastructure needs assessment.

CITY OF LOS ANGELES has not prepared its GENERAL PLAN UPDATE or the CIRCULATION ELEMENT, both critical to any MS4 compliance issues.

You state:

> ***The PEIR provides the LACFCD a foundation for any necessary future environmental review documents that focus on individual projects of the EWMPs for which the LACFCD is the designated Lead Agency****. In addition, the PEIR can provide several advantages during the development and implementation of the EWMPs that may include:*
> - *More exhaustive consideration of effects and alternatives than would be practical in an environmental impact report (EIR) for an individual BMP project.*
> - *Consideration of cumulative impacts that might not be evident in a case-by-case or project-by-project analysis.*
> - ***Consideration by LACFCD as Lead Agency of broad policy alternatives and program-wide mitigation measures early in the process when there is greater flexibility to deal with basic problems or cumulative impacts.***

Comments:

The PEIR should be limited to LACFCD projects ONLY and all other projects in Appendix G should be removed.

You state:

> *Instead, the PEIR frames the nature and magnitude of the expected environmental impacts associated with these proposed EWMP projects and identifies program mitigation measures to reduce the impacts of the projects as proposed.*

Comments:

The following Mitigation Measures are not under the LACFCD jurisdiction, per the limited jurisdiction over for ordinance and code enactment or enforcement**:**

> ***Aesthetics***
> ***Mitigation Measures***
> ***AES-1:*** *Aboveground structures shall be designed to be consistent with local zoning codes and applicable design guidelines and to minimize features that contrast with neighboring development.*
>
> ***AES-2:*** *Implementing agencies shall develop BMP maintenance plans that are approved concurrently with each structural BMP approval. The maintenance plans must include measures to ensure functionality of the structural BMPs for*

the life of the BMP. These plans may include general maintenance guidelines that apply to a number of smaller distributed BMPs.

Air Quality
Mitigation Measures

AIR-1: *Implementing agencies shall require for large Regional or Centralized BMPs the use of low-emission equipment meeting Tier II emissions standards at a minimum and Tier III and IV emissions standards where available as CARB-required emissions technologies become readily available to contractors in the region.*

AIR-2: *For large construction efforts that may result in significant air emissions, implementing agencies shall encourage contractors to use lower-emission equipment through the bidding process where appropriate.*

AIR-3: *For large construction efforts associated with Regional or Centralized BMPs, implementing agencies shall conduct a project-specific LST analysis where necessary to determine local health impacts to neighboring land uses. Where it is determined that construction emissions would exceed the applicable LSTs or the most stringent applicable federal or state ambient air quality standards, the structural BMP project shall reduce its daily construction intensity (e.g., reducing the amount of equipment used daily, reducing the amount of soil graded/excavated daily) to a level where the structural BMP project's construction emissions would no longer exceed SCAQMD's LSTs or result in pollutant emissions that would cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standards.*

AIR-4: *During planning of structural BMPs, implementing agencies shall assess the potential for nuisance odors to affect a substantial number of people. BMPs that minimize odors shall be considered the priority when in close proximity to sensitive receptors.*

Biological Resources
Mitigation Measures

BIO-1: *Prior to approving a Regional or Centralized BMP., the Permittee shall conduct an evaluation of the suitability of the BMP location. Appropriate BMP sites should avoid impacting large areas of native habitats including upland woodlands and riparian forests that support sensitive species to the extent feasible. The evaluation shall include an assessment of potential downstream impacts resulting from flow diversions.*

BIO-2: *Prior to ground disturbing activities in areas that could support sensitive biological resources, a habitat assessment shall be conducted by a qualified biologist to determine the potential for special-status wildlife species to occur* *within affected areas, including areas directly or indirectly impacted by construction or operation of the BMPs.*

BIO-3: *If a special-status wildlife species is determined to be present or potentially present within the limits of construction activities, a qualified biologist shall conduct pre-construction surveys of proposed work zones and within an appropriately sized buffer around each area as determined by a qualified biologist within 14 days prior to ground disturbing activities. Any potential habitat capable of supporting a special-status wildlife species shall be flagged for avoidance if feasible.*

BIO-4: *If avoidance of special-status species or sensitive habitats that could support special-status species (including, but not limited to, critical habitat, riparian habitat, and jurisdictional wetlands/waters) is not feasible, the Permittee shall consult with the appropriate regulating agency (USACE/USFWS or CDFW) to determine a strategy for compliance with the Endangered Species Act, California Fish and Game Code, and other regulations protecting special-status species and sensitive habitats. The Permittee shall identify appropriate impact minimization measures and compensation for permanent impacts to sensitive habitats and species in consultation with regulatory agencies. Construction of the project will not begin until the appropriate permits from the regulatory agencies are approved.*

BIO-5: *If construction and vegetation removal is proposed between February 1 and August 31, a qualified biologist shall conduct a pre-construction survey for breeding and nesting birds and raptors within 500-feet of the construction limits to determine and map the location and extent of breeding birds that could be affected by the project. Active nest sites located during the pre-construction surveys shall be avoided until the adults and young are no longer reliant on the nest site for survival as determined by a qualified biologist.*

BIO-6: *All construction areas, staging areas, and right-of-ways shall be staked, flagged, fenced, or otherwise clearly delineated to restrict the limits of construction to the minimum necessary near areas that may support special-status wildlife species as determined by a qualified biologist.*

BIO-7: *Prior to construction in areas that could support special status plants, a qualified botanist shall conduct a pre-construction floristic inventory and focused rare plant survey of project areas to determine and map the location and extent of special-status plant species populations within disturbance areas. This survey shall occur during the typical blooming periods of special-status plants with the potential to occur. The plant survey shall follow the CDFW Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities (November 24, 2009).*

BIO-8: *If temporary construction-related impacts to special-status plant populations are identified within a disturbance area, the implementing agencies shall prepare and implement a special-status species salvage and replanting plan. The salvage and replanting plan shall include measures to salvage, replant, and monitor the disturbance area until native vegetation is re-established under the direction of CDFW and USFWS.*

BIO-9: *Prior to construction, a qualified wetland delineator shall be retained to conduct a formal wetland delineation in areas where potential jurisdictional resources (i.e., wetlands or drainages) subject to the jurisdiction of USACE, RWQCB, and CDFW, may be affected by the project. If jurisdictional resources are identified in the EWMP area and would be directly or indirectly impacted by individual projects, the qualified wetland delineator shall prepare a jurisdictional delineation report suitable for submittal to USACE, RWQCB, and CDFW for purposes of obtaining the appropriate permits. Habitat mitigation and compensation requirements shall be implemented prior to construction in accordance with Mitigation Measure BIO-4.*

BIO-10: *Oak trees and other protected trees shall be avoided to the extent feasible. If trees may be impacted by project construction, a certified arborist shall conduct a tree inventory of the construction impact area. If any oak trees or other protected trees will be impacted by BMP construction, the implementing agency shall obtain any required County or City permits.*

Cultural Resources
Mitigation Measures

CUL-1: *For individual EWMP projects that could impact buildings or structures (including infrastructure) 45 years old or older, implementing agencies shall ensure that a historic built environment survey is conducted or supervised by a qualified historian or architectural historian meeting the Secretary of the Interior's Professional Qualification Standards for Architectural History. Historic built environment resources shall be evaluated for their eligibility for listing in the CRHR or local register prior to the implementing agency's approval of project plans. If eligible resources that would be considered historical resources under CEQA are identified, demolition or substantial alteration of such resources shall be avoided. If avoidance is determined to be infeasible, the implementing agency shall require the preparation of a treatment plan to include, but not be limited to, photo-documentation and public interpretation of the resource. The plan will be submitted to the implementing agency for review and approval prior to implementation.*

CUL-2: *Implementing agencies shall ensure that individual EWMP projects that require ground disturbance shall be subject to a Phase I cultural resources inventory on a project-specific basis prior to the implementing agency's approval* *of project plans. The study shall be conducted or supervised by a qualified archaeologist, defined as an archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards for Archaeology, and shall be conducted in consultation with the local Native American representatives expressing interest. The cultural resources inventory shall include a cultural resources records search to be conducted at the South Central Coastal Information Center; scoping with the NAHC and with interested Native Americans identified by the NAHC; a pedestrian archaeological survey where deemed appropriate by the qualified archaeologist; and formal recordation of all identified archaeological resources on California Department of Parks and Recreation 523 forms and significance evaluation of such resources presented in a technical report following the guidelines in Archaeological Resource Management Reports (ARMR): Recommended Contents and Format, Department of Parks and Recreation, Office of Historic Preservation, State of California, 1990.*

If potentially significant archaeological resources are encountered during the survey, the implementing agency shall require that the resources are evaluated by the qualified archaeologist for their eligibility for listing in the CRHR and for significance as a historical resource or unique archaeological resource per CEQA Guidelines Section 15064.5. Recommendations shall be made for treatment of these resources if found to be significant, in consultation with the implementing agency and the appropriate Native American groups for prehistoric resources. Per CEQA Guidelines Section 15126.4(b)(3), preservation in place shall be the preferred manner of mitigation to avoid impacts to archaeological resources qualifying as historical resources. Methods of avoidance may include, but shall not be limited to, project re-route or re-design, project cancellation, or identification of protection measures such as capping or fencing. Consistent with CEQA Guidelines Section 15126.4(b)(3)(C), if it is demonstrated that resources cannot be avoided, the qualified archaeologist shall develop additional treatment measures, which may include data recovery or other appropriate measures, in consultation with the implementing agency, and any local Native American representatives expressing interest in prehistoric or tribal resources. If an archaeological site does not qualify as an historical resource but meets the criteria for a unique archaeological resource as defined in Section 21083.2, then the site shall be treated in accordance with the provisions of Section 21083.2.

***CUL-3:** The implementing agency shall retain archaeological monitors during ground-disturbing activities that have the potential to impact archaeological resources qualifying as historical resources or unique archaeological resources, as determined by a qualified archaeologist in consultation with the implementing agency, and any local Native American representatives expressing interest in the project. Native American monitors shall be retained for projects that have a high potential to impact sensitive Native American resources, as determined by the implementing agency in coordination with the qualified archaeologist.*

***CUL-4:** During project-level construction, should subsurface archaeological resources be discovered, all activity in the vicinity of the find shall stop and a* *qualified archaeologist shall be contacted to assess the significance of the find according to CEQA Guidelines Section 15064.5. If any find is determined to be significant, the archaeologist shall determine, in consultation with the implementing agency and any local Native American groups expressing interest, appropriate avoidance measures or other appropriate mitigation. Per CEQA Guidelines Section 15126.4(b)(3), preservation in place shall be the preferred means to avoid impacts to archaeological resources qualifying as historical resources. Methods of avoidance may include, but shall not be limited to, project re-route or re-design, project cancellation, or identification of protection measures such as capping or fencing. Consistent with CEQA Guidelines Section 15126.4(b)(3)(C), if it is demonstrated that resources cannot be avoided, the qualified archaeologist shall develop additional treatment measures, such as data recovery or other appropriate measures, in consultation with the implementing agency and any local Native American representatives expressing interest in prehistoric or tribal resources. If an archaeological site does not qualify as an historical resource but meets the criteria for a unique archaeological resource as defined in Section 21083.2, then the site shall be treated in accordance with the provisions of Section 21083.2.*

CUL-5: *For individual structural BMP projects that require ground disturbance, the implementing agency shall evaluate the sensitivity of the project site for paleontological resources. If deemed necessary, the implementing agency shall retain a qualified paleontologist to evaluate the project and provide recommendations regarding additional work, potentially including testing or construction monitoring.*

CUL-6: *In the event that paleontological resources are discovered during construction, the implementing agency shall notify a qualified paleontologist. The paleontologist will evaluate the potential resource, assess the significance of the find, and recommend further actions to protect the resource.*

CUL-7: *The implementing agency shall require that, if human remains are uncovered during project construction, work in the vicinity of the find shall cease and the County Coroner shall be contacted to evaluate the remains, following the procedures and protocols set forth in Section 15064.5 (e)(1) of the CEQA Guidelines. If the County Coroner determines that the remains are Native American, the Coroner will contact the Native American Heritage Commission, in accordance with Health and Safety Code Section 7050.5, subdivision (c), and Public Resources Code 5097.98 (as amended by AB 2641). The NAHC will then designate a Most Likely Descendant of the deceased Native American, who will engage in consultation to determine the disposition of the remains.*

Geologic and Mineral Resources
Mitigation Measures

GEO-1: *Prior to approval of infiltration BMPs, implementing agencies shall conduct a geotechnical investigation of each infiltration BMP site to evaluate infiltration suitability. If infiltration rates are sufficient to accommodate an infiltration BMP, the geotechnical investigation shall recommend design measures necessary to prevent excessive lateral spreading that could destabilize neighboring structures. Implementing agencies shall implement these measures in project designs.*

GEO-2: *Prior to installing BMPs designed to recharge local groundwater supplies, the Implementing Agency shall notify local groundwater managers including the Upper Los Angeles River Area Water Master, the Water Replenishment District of Southern California, or the San Gabriel Water Master as well as local water producers such as local municipalities and water companies. The Implementing Agency shall coordinate BMP siting efforts with groundwater managers and producers to mitigate high groundwater levels while increasing local water supplies.*

Hazards and Hazardous Materials
Mitigation Measures

HAZ-1: *Implementing agencies shall prepare and implement maintenance practices that include periodic removal and replacement of surface soils and media that may accumulate constituents that could result in further migration of constituents to sub-soils and groundwater. A BMP Maintenance Plan shall be prepared by Implementing Agencies upon approval of the individual BMP projects that identifies the frequency and procedures for removal and/or replacement of accumulated debris, surface soils and/or media (to depth where constituent concentrations do not represent a hazardous conditions and/or have the potential to migrate further and impact groundwater) to avoid accumulation of hazardous concentrations and the potential to migrate further to sub-soils and groundwater. The BMP Maintenance Plan may consist of a general maintenance guideline that applies to several types of smaller distributed BMPs. For smaller distributed BMPs on private property, these plans may consist of a maintenance covenant that includes requirements to avoid the accumulation of hazardous concentrations in these BMPs that may impact underlying sub-soils and groundwater. Structural BMPs shall be designed to prevent migration of constituents that may impact groundwater.*

HAZ-2*: Prior to the initiation of any construction requiring ground-disturbing activities in areas where hazardous material use or management may have occurred, the implementing agencies shall complete a Phase I Environmental Site Assessment (ESA) in accordance with American Society for Testing and Materials (ASTM) Standard E1527-13 for each construction site. Any recommended follow up sampling (Phase II activities) set forth in the Phase I ESA shall be implemented prior to construction. The results of Phase II studies, if necessary, shall be submitted to the local overseeing agency and any required* *remediation or further delineation of identified contamination shall be completed prior to commencement of construction.*

HAZ-3: *Implementing Agencies shall require that those BMPs that are within an airport land use plan area are compatible with criteria specified in FAA Advisory Circular No: 150/5200-33B (FAA, 2007). If the proposed BMP is within the minimum separation criteria, the Implementing Agency shall consult with the airport and collaboratively evaluate whether the potential increase in wildlife hazards can be mitigated.*

Hydrology and Water Quality
Mitigation Measures

HYDRO-1: *Prior to approving an infiltration BMP, the Permittee shall conduct an evaluation of the suitability of the BMP location. Appropriate infiltration BMP sites should avoid areas with low permeability where recharge could adversely affect neighboring subsurface infrastructure.*

HYDRO-2: *Prior to approving an infiltration BMP, the Permitee shall identify pre-treatment technologies, type, and depth of filtration media; depth to groundwater; and other design considerations necessary to prevent contaminants from impacting groundwater quality. The design shall consider stormwater quality data within the BMP's collection area to assess the need and type of treatment and filtration controls. Local design manuals and ordinances requiring minimum separation distance to groundwater shall also be met as part of the design.*

HYDRO-3: *Prior to the installation of an infiltration BMP, the Permitee shall conduct a database review for contaminated groundwater sites within a quarter mile of the proposed infiltration facility. The Permittee shall identify whether any contaminated groundwater plumes are present and whether coordination with the local and state environmental protection overseeing agency and responsible party is warranted prior to final design of infiltration facility.*

Noise
Mitigation Measures

NOISE-1: *The implementing agencies shall implement the following measures during construction as needed:*

- *Include design measures necessary to reduce the construction noise levels where feasible. These measures may include noise barriers, curtains, or shields.*
- *Place noise-generating construction activities (e.g., operation of compressors and generators, cement mixing, general truck idling) as far as possible from the nearest noise-sensitive land uses.*
- *Locate stationary construction noise sources as far from adjacent noise-sensitive receptors as possible.*

- *If construction is to occur near a school, the construction contractor shall coordinate the with school administration in order to limit disturbance to the campus. Efforts to limit construction activities to non-school days shall be encouraged.*
- *For the centralized and regional BMP projects located adjacent to noise-sensitive land uses, identify a liaison for these off-site sensitive receptors, such as residents and property owners, to contact with concerns regarding construction noise and vibration. The liaison's telephone number(s) shall be prominently displayed at construction locations.*
- *For the centralized and regional BMP projects located adjacent to noise-sensitive land uses, notify in writing all landowners and occupants of properties adjacent to the construction area of the anticipated construction schedule at least 2 weeks prior to groundbreaking.*

NOISE-2: *All structural BMPs that employ mechanized stationary equipment that generate noise levels shall comply with the applicable noise standards established by the implementing agency with jurisdiction over the structural BMP site. The equipment shall be designed with noise-attenuating features (e.g., enclosures) and/or located at areas (e.g., belowground) where nearby noise-sensitive land uses would not be exposed to a perceptible noise increase in their noise environment.*

Public Services and Recreation
Mitigation Measures

PS-1: *The Permittee implementing the EWMP project shall provide reasonable advance notification to the service providers such as fire, police, local businesses, home owners and residents of adjacent to and within areas potentially affected by the proposed EWMP project about the nature, extent and duration of construction activities. Interim updates should be provided to inform them of the status of the construction activities.*

Transportation and Circulation
Mitigation Measures

TRAF-1: *For projects that may affect traffic, implementing agencies shall require that contractors prepare a construction traffic control plan. Elements of the plan should include, but are not necessarily limited to, the following:*

- *Develop circulation and detour plans to minimize impacts to local street circulation. Use haul routes minimizing truck traffic on local roadways to the extent possible.*
- *To the extent feasible, and as needed to avoid adverse impacts on traffic flow, schedule truck trips outside of peak morning and evening commute hours.*
- *Install traffic control devices as specified in Caltrans' Manual of Traffic Controls for Construction and Maintenance Work Zones where needed to*

maintain safe driving conditions. Use flaggers and/or signage to safely direct traffic through construction work zones.

- *Coordinate with facility owners or administrators of sensitive land uses such as police and fire stations, hospitals, and schools. Provide advance notification to the facility owner or operator of the timing, location, and duration of construction activities.*

Utilities and Service Systems
Mitigation Measures

UTIL-1: *Prior to approval of BMPs, implementing agencies shall evaluate the potential for impacts to downstream beneficial uses including surface water rights. Implementing agencies shall not approve BMPs that result in preventing access to previously appropriated surface water downstream.*

UTIL-2: *Implementing agencies shall encourage construction contractors to recycle construction materials and divert inert solids (asphalt, brick, concrete, dirt, fines, rock, sand, soil, and stone) from disposal in a landfill where feasible. Implementing agencies shall incentivize construction contractors with waste minimization goals in bid specifications where feasible.*

Land Use and Agriculture Mitigation Measures were omitted as jurisdiction belongs to the Municipalities and to the County of Los Angeles for the unincorporated areas.

Alternatives should be based on Projects under the jurisdictional authority of the LACFCD only.

Response to Comment Letter 41 (Joyce Dillard – March 16, 2015)

Response to Comment 41-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The LACFCD, as a regional agency, is a member of each of the 12 EWMP working groups, and as such provides a commonality within each EWMP group. However, LACFCD does not have a special status or authority designated by the MS4 Permit over any of the other Permittees. The LACFCD will be working with the applicable Permittees in all 12 EWMP watersheds as an equal partner to identify the types and locations of BMPs needed to achieve permit compliance within each watershed. The timeline identified in the MS4 Permit requires that Permittees submit the EWMP to the LARWQCB by June 28, 2015, in order to be in compliance with the permit conditions. The LACFCD recognizes that implementation of the EWMPs may potentially result in changes to environmental conditions. The discretionary action prompting the need for CEQA compliance is the submittal of the completed EWMPs to the LARWQCB. As a result, the LACFCD, as lead agency, has prepared this Program Environmental Impact Report (PEIR) in compliance with the California Environmental Quality Act (CEQA) to provide the public and the responsible and trustee agencies with information about the potential effects on the local and regional environment associated with implementation of the EWMPs. The LACFCD will submit the PEIR to its governing body, the Los Angeles County Board of Supervisors, for approval prior to submittal of the EWMPs. The EWMPs will be submitted by each EWMP group to the LARWQCB.

Each Permittee may rely upon this PEIR, as appropriate, for BMPs within its jurisdiction. Individual projects will undergo subsequent CEQA analysis and documentation, as appropriate under the requirements of CEQA, by implementing agencies. The determinations of significance after mitigation in the PEIR apply to the LACFCD and other implementing agencies that choose to rely on this PEIR and the mitigation measures proposed herein. This PEIR can be used by the LACFCD or other Permittees to streamline environmental review of individual EWMP projects. As individual projects identified in the EWMPs are fully developed, the implementing agency (i.e., the Permittee responsible for implementing the project) will conduct CEQA analysis for individual projects, as appropriate, or may determine that no additional CEQA analysis is required or that a project is exempt from CEQA. Each implementing agency would determine the significance after mitigation for potential impacts of their proposed projects.

Response to Comment 41-B:

The PEIR acknowledges that most of the projects to be included in the EWMPs are either currently undefined or currently under development. The PEIR explains that EWMPs are being prepared that will contain road maps to permit compliance for each of the 12 watersheds, without yet being fully detailed. Appendix G includes location information about potential priority projects available at the time of publication. The use of a PEIR pursuant to CEQA Guidelines Section 15168 is intended to evaluate broad-based impacts early in the planning process and is the appropriate CEQA compliance for the EWMPs at this time. This PEIR can be used by the LACFCD or other Permittees to streamline environmental review of individual EWMP projects, as they identified and further refined. As individual projects identified in the EWMPs are moved forward, the implementing agency (i.e., the Permittee responsible for implementing the project) will conduct CEQA analysis for individual projects as appropriate or may determine that no additional CEQA analysis is required or that a project is exempt from CEQA. Each implementing agency would determine the significance after mitigation for potential impacts of their proposed projects. The PEIR provides the LACFCD a foundation for any necessary future environmental review documents that focus on individual projects of the EWMPs for which the LACFCD is the designated Lead Agency.

Response to Comment 41-C:

As noted on page 1-1 of the PEIR, the Regional Water Quality Control Board issued Order No. R4-2012-0175; NPDES No. CAS004001 in December 2012 covering discharges from multiple municipalities within the Los Angeles Region. The requirements of the MS4 permit are described in Section 1.2 of the PEIR. A primary objective of the proposed program noted on page 2-2 is to comply with the permit requirements. The EWMPs include a methodology required by the MS4 permit to evaluate the effectiveness of the BMPs as they are implemented. The commenter's opinion about the PEIR does not have the main focus on Receiving Water compliance required by the MS4 Permit and intention of Enhanced Watershed Management Plans does not address the adequacy of the PEIR. The PEIR does not critique the effectiveness on Receiving Water compliance required by the MS4 Permit, but rather it evaluates the potential environmental effects that could result from implementing the types of projects proposed in the EWMPs.

Response to Comment 41-D:

The LACFCD, as a regional agency, is a member of each of the 12 EWMP working groups, and as such provides a commonality within each EWMP group. However, LACFCD does not have a special status or authority designated by the MS4 Permit over any of the other Permittees. The LACFCD will be working with the applicable Permittees in all 12 EWMP watersheds as an equal partner to identify the types and locations of BMPs needed to achieve permit compliance within each watershed. The timeline identified in the MS4 Permit requires that Permittees submit the EWMP to the LARWQCB by June 28, 2015, in order to be in compliance with the permit conditions. The LACFCD recognizes that implementation of the EWMPs may potentially result in changes to environmental conditions. The discretionary action prompting the need for CEQA compliance is the submittal of the completed EWMPs to the LARWQCB. As a result, the LACFCD, as lead agency, has prepared this Program Environmental Impact Report (PEIR) in compliance with the California Environmental Quality Act (CEQA) to provide the public and the responsible and trustee agencies with information about the potential effects on the local and regional environment associated with implementation of the EWMPs. The LACFCD will submit the PEIR to its governing body, the Los Angeles County Board of Supervisors, for approval prior to submittal of the EWMPs. The EWMPs will be submitted by each EWMP group to the LARWQCB.

Each Permittee may rely upon this PEIR, as appropriate, for BMPs within its jurisdiction. Individual projects will undergo subsequent CEQA analysis and documentation, as appropriate under the requirements of CEQA, by implementing agencies. The determinations of significance after mitigation in the PEIR apply to the LACFCD and other implementing agencies that choose to rely on this PEIR and the mitigation measures proposed herein. This PEIR can be used by the LACFCD or other Permittees to streamline environmental review of individual EWMP projects. As individual projects identified in the EWMPs are fully developed, the implementing agency (i.e., the Permittee responsible for implementing the project) will conduct CEQA analysis for individual projects, as appropriate, or may determine that no additional CEQA analysis is needed.

Response to Comment 41-E:

The Draft PEIR acknowledges on page 1-3 that LACFCD does not have a special status or authority designated by the MS4 Permit over any of the other Permittees. The LACFCD will be working with the applicable Permittees, including with the City of Los Angeles, in the EWMP watersheds as an equal partner to identify the types and locations of BMPs needed to achieve permit compliance within each watershed. The LACFCD, as a regional agency, is a member of each of the 12 EWMP working groups, and as such provides a commonality within each EWMP group. Although each Permittee will be responsible for its own General Plan preparation and MS4 permit compliance, the LACFCD has prepared this Program Environmental Impact Report (PEIR) to provide the public and the responsible and trustee agencies with information about the potential effects on the local and regional environment associated with implementation of the EWMPs throughout the County.

Each Permittee may rely upon this PEIR, as appropriate, for BMPs within its jurisdiction. Individual projects will undergo subsequent CEQA analysis and documentation, as appropriate under the requirements of CEQA, by implementing agencies. The determinations of significance after mitigation in the PEIR apply to the LACFCD and other implementing agencies that choose to rely on this PEIR and the mitigation measures proposed herein. This PEIR can be used by the LACFCD or other Permittees to streamline environmental review of individual EWMP projects. As individual projects identified in the EWMPs are fully developed, the implementing agency (i.e., the Permittee responsible for implementing the project) will conduct CEQA analysis for individual projects, as appropriate, or may determine that no additional CEQA analysis is needed.

Response to Comment 41-F:

The MS4 Permit Section VI.C.1.g (page 48) allows for watersheds to collaborate in preparing an EWMP to achieve Permit compliance with RWLs. The intent of the EWMP is to comprehensively evaluate opportunities for collaboration on multi-benefit regional projects that retain MS4 discharges and also address flood control and/or water supply within the participating Permittees' collective jurisdictional boundaries. The LACFCD will be working with the applicable Permittees in all 12 EWMP watersheds as an equal partner to identify the types and locations of BMPs needed to achieve permit compliance within each watershed.

The LACFCD, as a regional agency, is a member of each of the 12 EWMP working groups, and as such provides a commonality within each EWMP group. The LACFCD will be working with the applicable Permittees in all 12 EWMP watersheds as an equal partner to identify the types and locations of BMPs needed to achieve permit compliance within each watershed. The LACFCD recognizes that implementation of the EWMPs may potentially result in changes to environmental conditions. The discretionary action prompting the need for CEQA compliance is the submittal of the completed EWMPs to the LARWQCB. As a result, the LACFCD, as lead agency, has prepared this Program Environmental Impact Report (PEIR) in compliance with the California Environmental Quality Act (CEQA) to provide the public and the responsible and trustee agencies with information about the potential effects on the local and regional environment associated with implementation of the EWMPs. The LACFCD will submit the PEIR to its governing body, the Los Angeles County Board of Supervisors, for approval prior to submittal of the EWMPs. The EWMPs will be submitted by each EWMP group to the LARWQCB.

Each Permittee may rely upon this PEIR, as appropriate, for BMPs within its jurisdiction. Individual projects will undergo subsequent CEQA analysis and documentation, as appropriate under the requirements of CEQA, by implementing agencies. The determinations of significance after mitigation in the PEIR apply to the LACFCD and other implementing agencies that choose to rely on this PEIR and the mitigation measures proposed herein. This PEIR can be used by the LACFCD or other Permittees to streamline environmental review of individual EWMP projects. As individual projects identified in the EWMPs are fully developed, the implementing agency (i.e., the Permittee responsible for implementing the project) will conduct CEQA analysis for individual projects, as appropriate, or may determine that no additional CEQA analysis is needed.

Response to Comment 41-G:

The LACFCD, as a regional agency, is a member of each of the 12 EWMP working groups, and as such provides a commonality within each EWMP group. However, LACFCD does not have a special status or authority designated by the MS4 Permit over any of the other Permittees and cannot enforce those mitigation measures outside their jurisdiction. The LACFCD will be working with the applicable Permittees in all 12 EWMP watersheds as an equal partner to identify the types and locations of BMPs needed to achieve permit compliance within each watershed. Each Permittee may choose to rely upon this PEIR and its identified mitigation measures, as appropriate, for BMPs within its jurisdiction. Individual projects will undergo subsequent CEQA analysis and documentation, as appropriate under the requirements of CEQA, by implementing agencies. The determinations of significance after mitigation in the PEIR apply to the LACFCD and other implementing agencies that choose to rely on this PEIR and the mitigation measures proposed herein. This PEIR can be used by the LACFCD or other Permittees to streamline environmental review of individual EWMP projects should they also adopt the findings within this PEIR. As individual projects identified in the EWMPs are fully developed, the implementing agency (i.e., the Permittee responsible for implementing the project) will conduct CEQA analysis for individual projects, as appropriate, or may determine that no additional CEQA analysis is needed with compliance with the mitigation measures identified in this PEIR.

Response to Comment 41-H:

The alternatives analyzed in the Chapter 6 of the Draft PEIR included the No Project Alternative, Non-Structural BMPs Only Alternative, and the Distributed Structural/Non-Structural BMPs Only Alternative. The majority of BMPs proposed as part of the EWMPs would be implemented within existing LACFCD facilities. However, non-structural BMPs, including street sweeping and educational programs, would be required to be implemented outside of LACFCD flood control facilities and thus outside of their jurisdiction.

LACFCD does not have a special status or authority designated by the MS4 Permit over any of the other Permittees and cannot enforce BMPs outside their jurisdiction. The LACFCD will be working with the applicable Permittees in all 12 EWMP watersheds as an equal partner to identify the types and locations of BMPs needed to achieve permit compliance within each watershed. Therefore, implementation of alternatives outside of the LACFCD jurisdiction is appropriate at this level of analysis.

COMMENTS ON THE PEIR FOR THE LA COUNTY FLOOD CONTROL DISTRICT EWMPs

by Rex Frankel, March 16, 2015, 4:58PM

We agree with the concerns of the SMMC in that this plan does not discuss land acquisition, but attempts to focus its regional urban runoff compliance strategies on using the existing inadequate supply of public land and parks.

It is clear from the 3 project objectives that this project is about surface water quality, be it in creeks, rivers or the local beaches. This goal is tied to compliance with the Federal Clean Water Act as required by the consent decree between local governments and the NRDC, Heal the Bay, etc. The consent decree, unfortunately has a drawback in that compliance with numerical limits on pollutants in waterways so far is leading to a plan that shifts those pollutants to public schools, parks, street parkways as the engineering departments tries to comply while not upsetting big landowners whose properties could become parkland as part of a multiple benefit strategy. The PEIR's drafters make the mistake of forgetting the multiple benefits approach that has gained local agencies a compliance deadline of 18 years instead of 10 from the RWQCB, and therefore, this plan has forgotten the goal of creating new parkland in parks-poor Los Angeles.

Questions not answered in this PEIR: what percentage of streets in each of the 12 EWMP areas are capable of being converted into “green streets” with so-called “distributed” water cleanup facilities?
What is the potential human health risk of converting street parkways, existing heavily used public parks and school playgrounds into these pollution catching and cleaning facilities? What areas of parkway conversions or new developments with these parkway filtration facilities have been where street parking is allowed, such that people will be inclined to walk across them? What is the slip and fall risk from the public walking through them from parked cars to homes and businesses?

<u>PIECEMEALING AND THE LEGAL CONCEPT OF INDEPENDENT UTILITY</u>

A program EIR can be justified under CEQA when the individual parts of the project can stand on their own and do not require completion of the others to complete their goal. Goals of the EWMP, however, are very specific: attaining numerical compliance with the Clean Water Act's pollution limits county-wide. A PEIR might be sufficient if the goal was a general plan to improve water quality and there was no standard of success. That is not the case here. Unless all the projects are completed, the CWA and consent decree will be violated.

Instead this project has become a case of divide and conquer, so that the impacts of the full CWA compliance project at each watershed are never considered by those who have to pay for it. Instead, each sub-project will be up for impacts review separately, subject to separate public hearings, all conveniently designed to exhaust and spread out the members of the public interested in this project. The costly choice of spending billions on cleanup projects or not swimming by a drain pipe for three days after a storm is not considered here. What the taxpayers are facing is incremental tax increases to pay for this project that will have “inertia” from all the previous funds spent, wherein taxpayers who want to say no will be reminded that all which was already spent would be wasted unless the taxpayers pay even more to finish the project. That is the essence of illegal piecemealing.

This improper segmenting of one project into hundreds of small ones also biases the range of alternatives to be considered, and is itself internally inconsistent. Only one alternative, the proposed project, attains the MS4/Clean Water Act goals. But only when the entire project is built are those goals satisfied. So based on the alternatives discussion, the County is admitting this is all one project, not 100 or more smaller projects. That is why we need an EIR that analyzes the specific projects all at once.

That is all have to say at this time.

Response to Comment Letter 42 (Rex Frankel – March 16, 2015)

Response to Comment 42-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The objectives of the EWMPs are listed in Section 2.2. Although multi-benefit projects are encouraged, the primary goal is compliance with water quality objectives established by the MS4 Permit. The creation of new parklands can be an ancillary benefit of many projects, and LACFCD is actively promoting benefits to parks within the EWMPs. The PEIR evaluates the potential impacts of project implementation, but does not evaluate the effectiveness of the strategies for achieving Permit compliance. Nor does the PEIR evaluate the suitability of the proposed EWMP development methodologies. The EWMP process includes a mechanism for the RWQCB to determine effectiveness of the BMPs over time.

Response to Comment 42-B:

Potential regional and centralized BMP locations are included in Appendix G for each EWMP area. Distributed projects could be installed in addition to the identified locations throughout each watershed. Hundreds of distributed projects could be installed, including gutter screens and small-scale green street renovations over the next 25 years and beyond. The percentage of streets that are capable of being converted into "green streets" to benefit surface water quality is not known at this time; most of the specific projects to be included in the EWMPs are either currently undefined or currently under development.

Response to Comment 42-C:

The PEIR evaluates potential impacts to public health from implementation of BMPs on page 3.7-18. The PEIR acknowledges that storm water detention BMPs will concentrate pollutants overtime. Mitigation Measure HAZ-1 requires that BMPs receive appropriate maintenance to reduce potential impacts to public health. Each individual project will be evaluated for potential impacts to public health including slip-trip impacts and public access on an individual basis as they are developed.

It should be noted in that Mitigation Measure HAZ-1 has been revised as follows:

> **HAZ-1:** Implementing agencies shall prepare and implement maintenance practices that include periodic removal and replacement of surface soils and media that may accumulate constituents that could result in further migration of constituents to sub-soils and groundwater. A BMP Maintenance Plan shall be prepared by Implementing Agencies upon approval of the BMP projects that identifies the frequency and procedures for removal and/or replacement of accumulated debris, surface soils and/or media (to depth

where constituent concentrations do not represent a hazardous conditions and/or have the potential to migrate further and impact groundwater) to avoid accumulation of hazardous concentrations and the potential to migrate further to sub-soils and groundwater. The Maintenance Plan shall include vector control requirements. The BMP Maintenance Plan may consist of a general maintenance guideline that applies to several types of smaller distributed BMPs. For smaller distributed BMPs on private property, these plans may consist of a maintenance covenant that includes requirements to avoid the accumulation of hazardous concentrations in these BMPs that may impact underlying sub-soils and groundwater. Structural BMPs shall be designed to prevent migration of constituents that may impact groundwater.

Response to Comment 42-D:

The PEIR acknowledges that most of the projects to be included in the EWMPs are either currently undefined or currently under development. The PEIR explains that EWMPs are being prepared that will contain road maps to permit compliance for each of the 12 watersheds, without yet being fully detailed. The effectiveness of each EWMP to achieve permit compliance will be evaluated by the RWQCB, which may require additional projects or management actions to ensure compliance. The PEIR evaluates typical project types to assess potential impacts of implementing the entire program throughout the region over a long period of time. The use of a PEIR pursuant to CEQA Guidelines Section 15168 is intended to evaluate broad-based impacts early in the planning process and is the appropriate CEQA compliance for the EWMPs at this time.

Response to Comment 42-E:

The use of a PEIR pursuant to CEQA Guidelines Section 15168 is appropriate and is intended to evaluate cumulative impacts of the long-term implementation of a multi-project program in order to avoid piecemealing of impact analysis. Each Permittee may rely upon this PEIR at their discretion for approval of projects under the EWMPs. Individual projects will undergo subsequent CEQA review and documentation, as appropriate, by implementing agencies. For projects where the LACFCD will be the lead agency, the mitigation measures included in the MMRP will be incorporated.

Response to Comment 42-F:

The PEIR acknowledges that most of the specific projects to be included in the EWMPs are either currently undefined or currently under development. The PEIR explains that EWMPs are being prepared that will contain road maps to permit compliance for each of the 12 watersheds, without yet being fully detailed. The effectiveness of each EWMP to achieve permit compliance will be evaluated by the RWQCB, which may require additional projects or management actions to ensure compliance. The PEIR evaluates typical project types to assess potential impacts of implementing the entire program throughout the region over a long period of time. The use of a PEIR pursuant to CEQA Guidelines Section 15168 is appropriate and is intended to evaluate broad-based impacts early in the planning process and is the appropriate CEQA compliance for the EWMPs at this time.

Subject: comments on the PEIR for water enhancement: thank you for considering them

From Theresa Brady

21844 Corvo Way

Topanga, Ca 90290

To Greg Begell

Department of Public Works

When nonnative trees are being considered for removal in a water enhancement project I would like to ask that two considerations are made paramount: Their importance in mitigation of global warming and their importance as habitat.

There is a recently passed law at the state level that requires that every project consider its impact on global warming.

The second issue is illustrated by the removal of 650 eucalyptus trees in the Oxford Lagoon. There were monarch butterflies overwintering on these trees when they were felled. The monarchs can also use other large mature trees, such as coast live oak and sycamore. The Monarchs overwinter on all of these kinds of trees up and down the California Coast. However predominantly they overwinter on stands of eucalyptus. This information is available on the internet in a booklet titled “where to see the monarchs in California”. It includes many sites, the vast majority of which are groves of eucalyptus. Therefore, it is my contention that the stands of eucalyptus should be protected unless and until it has been observed that the newly established native grove has become the preferred site for the monarchs.

The Monarch has recently been considered for endangered status by the federal department of Fish and wildlife. The result of that review will be publicized soon.

I would like to see more caution and consideration in deliberating about the removal of mature trees even nonnative. Thank you for considering my comments.

Theresa Brady

Response to Comment Letter 43 (Theresa Brady – March 18, 2015)

Response to Comment 43-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

Mitigation Measures BIO-1 through BIO-9 would ensure that habitat values are not significantly impacted and would reduce potentially significant impacts to less than significant levels. The PEIR assesses green-house gas emissions and climate change in Section 3.6. The PEIR concludes that implementation of EWMPs would be consistent with greenhouse gas emissions reductions plans.

Response to Comment 43-B:

The PEIR assesses green-house gas emissions and climate change in Section 3.6. The PEIR concludes that implementation of EWMPs would be consistent with greenhouse gas emissions reductions plans.

Response to Comment 43-C:

Mitigation Measures BIO-1 through BIO-9 would ensure that habitat values are not significantly impacted and would reduce potentially significant impacts to less than significant levels.

RE: Public Comment: Notice of Availability (NOA) of the Draft Program Environmental Impact Report for Enhanced Watershed Management Programs

Dear Mr. BeGell:

Thank you for preparing the Draft Program Environmental Impact Report (DPEIR) of the Enhanced Watershed Management Programs (EWMPs). My comments are in reference to the following disclosure issues:

- The criteria used to prepare this DPEIR are not tailored to assess the unique circumstances of the EWMPs. The requirements outlined in the state CEQA Guidelines are the statutory floor, rather than the limit, and not guaranteed as a safe harbor for compliance. The Los Angeles County Flood Control District maintains the discretion to modify or impose additional criteria or expand the project scope/activity as they determine appropriate.
- The environmental analysis in this DPEIR acknowledges the importance of doing a thorough and comprehensive analysis, but many sections lack substantial evidence in the form of facts, reasonable assumptions predicated on facts and expert opinion supported by facts. Since the DPEIR acknowledges that the EWMPs schedules and measures are presently incomplete, in draft form and not referenced as available for public review, the statements in this document cannot be verified by the public. Speculation, unsubstantiated opinion or narrative is not substantial evidence and undermines the informational purpose of a PEIR.
- The DPEIR draws a glaring distinction between a Program EIR and a project EIR which misses the opportunity to identify the impacts of large number of existing and fully-developed projects in the pipeline. At hand is whether or not the PEIR is providing the public and decision-makers with sufficient cumulative analysis to intelligently consider the environmental consequences of existing multi-benefit stormwater activities.
- Some of the mitigation measures identified in this DPEIR lack weight since they may go unnoticed by an implementing agency. Future projects may be categorically exempt from conducting an Initial Study resulting in projects that do not account and monitor for potential significant environmental impacts, as identified, in the DPEIR biological resources and cultural resources mitigation measures.
- The location of water supply recharge areas underlying the location of overly polluted and unfairly burdened low-income communities present environmental justice concerns resulting from the over concentration of future construction activities.
- The use of non-objective terms to frame the discussion of Climate Change.

COMMENTS ON THE CONTENT OF THE DEIR

Executive Summary – ES.2 Background

COMMENT NO. 1. According to Page No. ES-2, "The PEIR analysis is not intended to focus on the site-specific construction and operation details of each management strategy and project included in the EWMP. Rather, this PEIR serves as a first-tier environmental document that focuses on the effects of implementing the EWMPs to reduce urban runoff pollution." This seems to overlook the intent of both the new MS4 Permit, adopted November 2012 and effective December 2012 by the Los Angeles Regional Water Quality Control Board (LARWQCB), which "Encourages merging water quality watershed management approaches with the strategic Integrated Regional Water Management planning process resulting in additional economies of scale," and Section 15168(c)(5) of the 2014 California Environmental Quality Act (CEQA) Statute and Guidelines, which states that the goal is to assist in the creation of a PEIR "that deals with the effects of the program as specifically and comprehensively as possible…with a good and detailed analysis of the program, many subsequent activities could be found to be within the scope of the project described in the program EIR, and no further environmental documents would be required." The courts have recently downplayed (see Cleveland National Forest Foundation v. San Diego Association of Governments) the distinction between a Program and a project EIR in favor of environmental assessments that do a thorough job analyzing the reasonable foreseeable impacts of relevant activities – regional or site specific in nature.

In the coming decades, water supply, and conservation projects and programs will compete for limited fiscal resources with concurrent efforts to improve urban and stormwater runoff quality. With the cost of compliance with surface water quality regulations estimated to range from $43 to $284 billion (Brown and Caldwell, 1989 and Gordon, et al, 2002), jurisdictions and agencies in the Region face difficult funding choices. The integration of multiple water management strategies via multipurpose programs creates opportunities for a "one-stop-shop" analysis through a PEIR to efficiently use fiscal resources and significantly reduce the ask amount of future water resources grant funds.

There is an opportunity for synergy by collectively comparing how the existing multi-benefit stormwater projects of the 2014 Greater Los Angeles County Integrated Regional Water Management Plan (GLAC-IRWMP) database fare with the integrated goals of the EWMPs. This DPEIR does not reference the GLAC-IRWMP nor identifies any collaboration or overlap between multi-benefit activities. There are over 190 fully developed integrated water resources projects in the Los Angeles County Department of Public Works GLAC-IRWMP OPTI website. These projects in the database also identify the implementing agencies and each of the permittees. Incorporating these existing regional-scale projects into the PEIR could better determine whether the incremental effects of this program are cumulatively considerable when viewed in connection with the effects of past, present, and probable future activities.

COMMENT NO. 2. On Page ES.2, there is no reference to the location of the EWMPs for public review. It seems the individual EWMP documents are incomplete and on a parallel schedule with this PEIR. According to this paragraph, “This PEIR describes and evaluates each of the EWMPs being prepared by the Permittees collectively…A few of the BMPs are currently well defined but most are yet to be fully developed under the EWMPs. A set of priority BMPs will be detailed in each of the EWMPs; these are being developed in parallel with the PEIR. The PEIR describes the details that are available for each of the EWMPs currently under preparation by the EWMP working groups.”

Are the individual EWMPs available for public review? How can the public rely on a CEQA analysis “that deals with the effects of the program as specifically and comprehensively as possible,” when there is no reference material available for comparison purposes?

ES.4 Project Description

COMMENT NO. 3. The following text on Page ES.3 (and repeated in Chapter 2, Page No. 2-1) is difficult to understand. Please elaborate. “The Los Angeles County Flood Control District (LACFCD) has limited jurisdictional authority for ordinance and code enactment or enforcement and therefore is limited in nonstructural BMPs to education and outreach measures.”

1.1 CHAPTER 1 - Introduction

COMMENT NO. 4. On Page No. 1-1, was the new 2012 MS4 permit drafted in response or anticipation of the judgment issued by the United States Supreme Court for LACFCD vs. Natural Resources Defense Council (NRDC)? If so, please consider adding background information (or preferably, a new section) outlining the 2008 Clean Water Act citizen lawsuit filed by the NRDC and Santa Monica Baykeeper (Baykeeper). The case can be located here: http://www.scotusblog.com/case-files/cases/los-angeles-county-flood-control-district-v-national-resources-defense-council/.

It is important to provide a complete record of the reason and motivation behind the new MS4 permit. Specifically, please contextualize the need (and the targeted ecological functions that will improve the problem) by adding a description of the problem in relation to the mission of the NRDC and the Baykeeper, an ecological context, statutory background (legal challenge to Order No. R4-2006-0074, etc.), and a chronological list of events related to the ultimate Supreme Court decision finding that the Los Angeles County Flood Control District was "responsible for discharges of pollutants at the end of concrete channels in two rivers, the Los Angeles River and the San Gabriel River."

COMMENT NO. 5. On Page No. 1-1, please add a discussion pertaining to the agency partnership existing between the LARWQCB and the Los Angeles Area Environmental Justice Enforcement Collaborative. There is a concern that the piecemeal approach to the MS4 permit will overlook the importance of issuing a permit that ensures non-discrimination as it pertains to the potential for over-concentrated construction and facilities maintenance activities in these communities (San Fernando Valley, San Gabriel Valley, South-Central Los Angeles and the Southeast LA County cities) due to their prime and underlying soil infiltration characteristics (refer to the maps identified on Comment No. 13), which could produce an unfair overconcentration of environmental pollution burdens. According to Executive Order 12898, the LARWQCB is required to promote "meaningful engagement of overburdened communities in EPA's permitting process." The DPEIR states that, "The LACFCD, along with participating Permittees, has opted to exercise this option and has submitted to the LARWQCB 12 separate Notices of Intent (NOIs) for the development of EWMPs within 12 distinct watershed groups. Implementation of the EMWPs would be the responsibility of each Permittee and would occur following approval of the EWMPs by the LARWQCB." However, this piecemeal approach to the MS4 permit does not guarantee that environmental justice will be a priority.

1.2 Project Background. Reasonable Assurance Analysis.

1.3 CEQA Environmental Review Process. Purpose of the PEIR.

COMMENT NO. 6. On Page No. 1-10, there is a reference to the environmentally integrated approach of EWMPs. Specifically, "The analyses focus on the environmental effects of implementing the EWMPs as a program to improve surface water quality and increase water conservation." In an effort to avoid the displacement of pollution from one area (water bodies) to another (soil)—how environmentally sensitive is the EWMP approach? Will the physical control measures require the use of potable water for landscape maintenance (for example, according to the 2014 County of Los Angeles Department of Public Works Low Impact Development Standards Manual, "One potential problem with using green roofs in the Los Angeles County area is the long, hot and dry summers, which may kill the plants if they are not watered)? Will EWMPs maintain the same quality level for soils? How will this impact groundwater quality? What is the relevancy of the EWMPs to the Groundwater Management Plan and the California Systemwide Groundwater Elevation Monitoring?

COMMENT NO. 7. On Page No. 1-9, the sentence that reads, “Significance criteria have been *developed* for each environmental resource analyzed in this Draft PEIR,” seems troublesome since the significance criteria is cut-and-pasted from the CEQA Guidelines. Did the Technical Advisory Committees from each respective EWMP create the criteria?

COMMENT NO. 8. On Page No. 1-10, this sentence is repeated several times throughout the DPEIR: “The PEIR analysis is not intended to focus on the site-specific construction and operation details of each management strategy and project included in the EWMPs. Rather, this PEIR serves as a first-tier environmental document that focuses on the effects of implementing the EWMPs overall as a plan to reduce urban runoff pollution.” It can be found at a) Executive Summary on Page No. ES-2; and, b) Chapter 1, Section 1.1-Introduction on Page No. 1-3.

CHAPTER 2

Project Description

COMMENT NO. 9. On Page No. 2-1, the following statement, “The 12 EWMPs will vary for each watershed group, but will generally provide the opportunity for Permittees to customize their stormwater programs to achieve compliance with applicable receiving water limitations and/or water-quality-based effluent limits in accordance with the Municipal Separate Storm Sewer System (MS4) Permit through implementation of stormwater Best Management Practices (BMPs) or watershed control measures,” is repeated verbatim from the Executive Summary on Page No. ES-3.

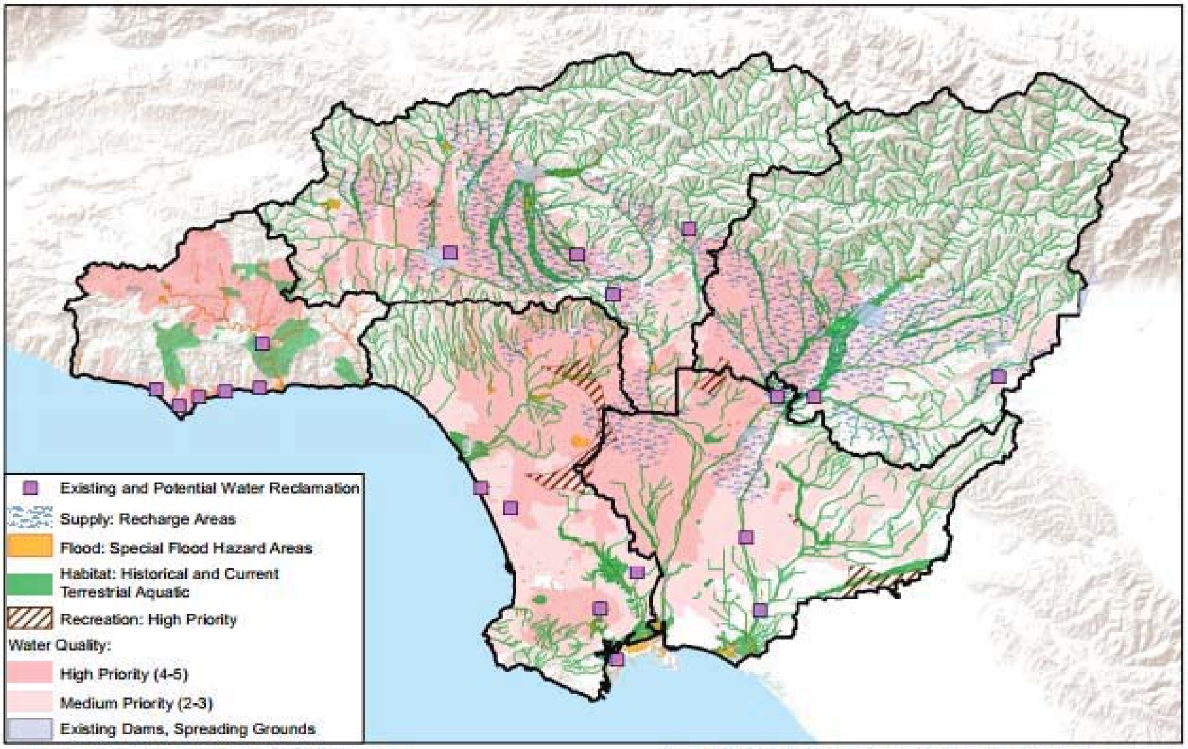
COMMENT NO. 10. On Page No. 2-1, the following statement, “Each of the Permittees identified in the MS4 permit is responsible for meeting the conditions of the permit for MS4 discharges occurring within their jurisdiction, is repeated verbatim from the Executive Summary on Page No. ES-2.

COMMENT NO. 11. On Page No. 2-7, under Section Distributed Structural BMPs – Overview and Example BMP, please add the “advantages” and “disadvantages” as identified and summarized in Appendix E, Stormwater Quality Control Measure Fact Sheets, of the 2014

County of Los Angeles Department of Public Works Low Impact Development Standards Manual, in order to compare and contrast the BMPs with a do-nothing scenario.

COMMENT NO. 12. On Page No. 2-5 under Section 2.4.1, the fifth bullet point makes reference to Planning and Land Development Programs, "which encourage the application of smart growth and low-impact development (LID) practices to development and redevelopment projects." However, "redevelopment projects" were eliminated in 2011 by order of Governor Jerry Brown when he dissolved redevelopment agencies throughout the state. I think a more appropriate and up-to-date term would be to substitute Enhanced Infrastructure Financing Districts.

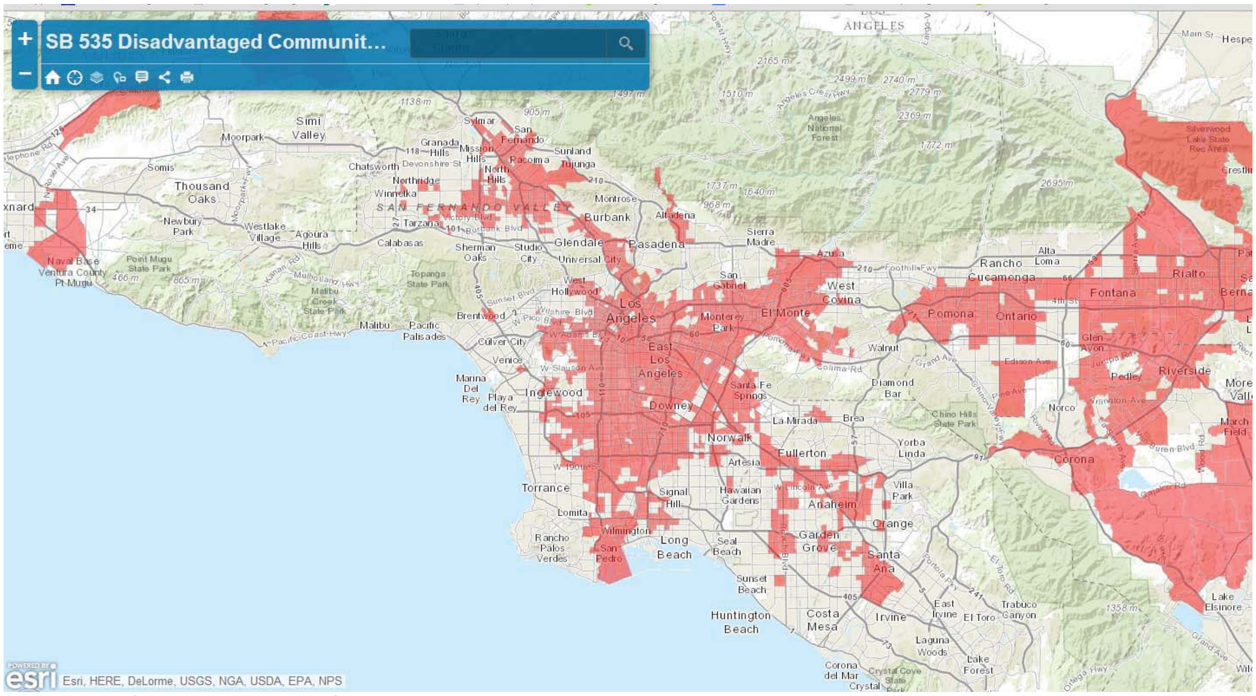
COMMENT NO. 13. On Page 2-57, consider adding a section titled Environmental Justice which discusses the unfair burden and disproportionate impacts of the proposed physical control measures on low-income and inland communities. These low-income areas, when superimposed on areas identified for their infiltration benefits, stand to overly concentrate construction and facilities maintenance activities and associated pollution. These potential recharge areas are identified as "Supply: Recharge Areas" in the 2014 GLAC-IRWMP Update and shown on the map below titled Map 5-1: GLAC Region Potential Benefits Geodatabase layers:



Note that detailed data for the NSMB Subregion is currently absent, but will be improved over time.

Map 5-1: GLAC Region Potential Benefits Geodatabase Layers

The map above identifies beneficial stormwater recharge areas that could increase the County's water supply. All of these areas are located away from the coastal areas, a hydrologic region associated with middle to upper income beach communities. Most of the areas offering stormwater recharge benefits are inland and near low-income communities like those in the San Fernando Valley, the San Gabriel Valley, South-Central Los Angeles and Southeast Los Angeles County. According to the Department of Water Resources, a Disadvantaged Community (DACs) is one whose median household income is 80% or less of the statewide average. As the following map shows (Map 2 below), DACs overlie most of these stormwater recharge areas, which can be correlated with a higher degree of future construction and operation activities associated with centralized structural, distributed structural and regional structural physical control measures that may continue to unfairly overburden these communities with added air quality, greenhouse gases, hazards and hazardous materials, land use and agricultural, noise, public service and recreation, and transportation and circulation pollution as it has historically been the case. Compounding this situation is the potential increase in the production, manufacturing, and pollution activities associated with the manufacturing of toxic construction materials like cement, plastics, and filtration/pretreatment hardware that come from factories that are also located in DACs.



Map 2 – DACs in Los Angeles County

3.2 Air Quality

3.2.1 Environmental Setting

COMMENT NO. 14. Under the Regional Setting section on Page No. 3.2-1, please include a discussion about the partnership between the LARWQCB and Los Angeles Area Environmental Justice Collaborative and the need to improve the living conditions of densely populated inland communities severely impacted by pollution stemming from traffic congestion and industrial activities. In addition, please reference current law which states that, "Under EPA's Title VI implementing regulations found at [40 C.F.R. Part 7 (PDF)](), (11 pp, 40K) EPA-funded agencies are prohibited from taking acts, including permitting actions, that are intentionally discriminatory or have a discriminatory *effect* based on race, color, or national origin." How will the LARWQCB promote, "its responsibilities under Executive Order 12898 by increasing meaningful engagement of overburdened communities in EPA's permitting process," if this DPEIR does not disclose and take into consideration the consequences of piecemealing the MS4 permit?

3.11.1 Environmental Setting

COMMENT NO. 15. The total population for Los Angeles County may not seem that significant in it of itself, but when put into a percentage of the entire population of California, the number is staggering. According to Figure 2-1 of the GLAC-IRWMP, the 2010 population of Los Angeles County represented over 25% of the entire state population. In addition, the stormwater conveyance system is among the largest in the nation and responsible for a host of diminished resources and increased pollution sinks and accumulated toxicity. Throughout the 20th Century, consumption and the one-way throughput system of stormwater conveyance became increasingly concentrated in cities that were strung together into large counties that developed adjacent to other counties and formed larger and continuous (and impervious land surfaces) megalopolis', demanding ever increasing volumes of material and water from distant sources. These megalopolis' stretch for hundreds of miles across counties and are home to millions and millions of people. Cities now cover about 2% of the global land area, but include over 60% of the total population. Los Angeles County is considered one of the largest metropolitan areas in the world.

With a region so densely populated and developed in a seemingly endless sprawl development pattern, will the increased infiltration of polluted water negatively impact an already limited amount of groundwater supply? Will the polluted water negatively affect the soil for BMPs incorporating percolation of water into underlying soils? How will the redirection of polluted water from entering water bodies and redirected to a soil medium negatively impact the ecological properties of soil as they relate to conversion, distribution, infiltration, assimilation and conversion of beneficial nutrients?

3.11.2 Regulatory Setting

COMMENT NO. 16. Under the heading, *Local*, the County General Plan, as do municipal General Plans all have procedures and mechanisms for amending land use plans, zoning plans and codes in order to accommodate changes in land use designations and densities. A General Plan and Zoning Code are not static documents. Instead, they are adaptable to changing circumstances like increases in population growth.

COMMENT NO. 17. Under the heading, *Local*, there is currently a widely used county plan that provides a vision for water resources management. The GLAC-IRWMP provides incentives for implementing sustainable stormwater capture, storage and recharge. Additionally, the GLAC IRWMP has collected an extensive list of developed projects in the pipeline for each respective

EWMP that identifies implementing agencies, permittees, and design characteristics that seem worthy of review by this PEIR.

In light of such information, do these projects comply with the MS4 permit? Have project sponsors collaborated with the agencies and permittees across the watershed to promote more cost-effective and multi-beneficial water quality improvement projects? Will the fully developed water-wide EWMPs contained in the GLAC-IRWMP OPTI database remove or reduce pollutants from dry-and-wet-weather urban runoff in a cost-effective manner? Will the fully developed water-wide EWMPs contained in the GLAC-IRWMP OPTI database reduce the impact of stormwater and non-stormwater on receiving water quality?

3.6 Greenhouse Gas Emissions – Climate Change Overview

COMMENT NO. 18. On Page No. 3.6-1, your reference language contained in the 2007 report by the International Panel on Climate Change (IPCC) seems outdated. Since 2007, climate science has made many important advances since the last IPCC assessment report, thanks to improvements in measurements and data analysis in the cryosphere, atmosphere, land, biosphere and ocean systems. Scientists also have better understanding and tools to model the role of clouds, sea ice, aerosols, small-scale ocean mixing, the carbon cycle and other processes. More observations mean that models can now be evaluated more thoroughly, and projections can be better constrained. Additionally, there is a higher level of confidence among the science community about the validity of findings as determined through evaluation of the available evidence and the degree of scientific agreement. Increasing levels of evidence and degrees of agreement are correlated with increasing confidence that climate change is directly linked to human activities and human caused.

The problematic language in question reads, "…Much of the scientific literature *suggests*…While there is some *debate* regarding this issue, it is unlikely that global climate change of the past 50 years can be explained without contribution from human activities (IPCC, 2007)." Please remove the term "suggest," since the peer-reviewed scientific literature has always maintained a direct correlation between an increase in greenhouse gases and anthropogenic activities since the 1790s with a small degree of uncertainty (refer to http://www.ipcc.ch/publications_and_data/ar4/syr/en/spms2.html). Additionally, please replace the word "debate" with the word "uncertainty." The only debate stems from the non-scientific cultural and political opinions meant to muddy the science of greenhouse gases and climate change.

Please consider replacing the outdated language I just referenced with a more up-to-date description, as contained in the 2013 Executive Summary of Climate Change 2013: The Physical Science Basis, which states, "Human activities are continuing to affect the Earth's energy budget by changing the emissions and resulting atmospheric concentrations of radiatively important gases and aerosols and by changing land surface properties. Previous assessments have already shown through multiple lines of evidence that the climate is changing across our planet, largely as a result of human activities. The most compelling evidence of climate change derives from observations of the atmosphere, land, oceans and cryosphere. Unequivocal evidence from in situ observations and ice core records shows that the atmospheric concentrations of important greenhouse gases such as carbon dioxide (CO2), methane (CH4), and nitrous oxide (N2O) have increased over the last few centuries due to anthropocentric activities. (page no. 121)"

COMMENT NO. 19. On Page No. 3.6-12, Impact Assessment, the DPEIR mentions that, "As noted, the increased concentration of GHGs in the atmosphere has been linked to global warming, which can lead to climate change," however, there is consensus in the scientific community that unless drastic measures take place soon, we will be unable to move back from our current 405 parts per million (ppm) threshold of carbon dioxide (CO_2) in the atmosphere to the necessary 350 ppm that scientists have identified as necessary to maintain a healthy environment. Furthermore, the language contained referenced above makes it seem like the scientific community does not know that this will happen. Again, the irrevocable effects of climate change will happen, unless drastic and swift measures are implemented, which does not seem likely. The United States Environmental Protection Agency states that, "CO_2 is the primary greenhouse gas emitted through human activities…Human activities are altering the carbon cycle—both by adding more CO_2 to the atmosphere and by influencing the ability of natural sinks, like forests, to remove CO_2 from the atmosphere. While CO_2 emissions come from a variety of natural sources, human-related emissions are responsible for the increase that has occurred in the atmosphere since the industrial revolution. The main human activity that emits CO_2 is the combustion of fossil fuels (coal, natural gas, and oil) for energy and transportation, although certain industrial processes and land-use changes also emit CO_2."

(http://www.epa.gov/climatechange/ghgemissions/gases/co2.html).

Chapter 5 – Growth Inducement Potential

COMMENT NO. 20. Section 5.1 CEQA Requirements. This chapter, per the CEQA "Guidelines," consider the minimum requirement for analysis. In this case, this chapter only analyzes the growth inducing effects associated with the proposed action. However, whether or not the proposed action will cause direct or indirect growth is partially addressing the underlying reason for creative sustainable programs like EWMPs. It is no secret that the population in Los Angeles County continues to grow on a daily basis and EWMPs are designed to accommodate that growth. According to the Public Policy Institute of California, population in Los Angeles County by the year 2025 will reach 11.5 million people. This represents an increase of approximately 15% from the 10,017,068 million current residents living within the EWMP project boundary (http://www.ppic.org/content/pubs/report/R_610HJR.pdf). As population increases, so does human activity resulting in the accumulation of trash, debris, chemicals, sediment or other pollutants that could adversely affect water quality if the runoff is discharged untreated. This begs the question: What effect will projected increases in population have on EWMPs? Will increased urban runoff have a negative impact on the availability of the already limited usable water supply in the region?

Response to Comment Letter 44 (Enrique Huerta – March 12, 2015)

Response to Comment 44-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These summaries of the comments in the comment letter have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

Response to Comment 44-B:

The PEIR defines typical project types in Section 2 and then in Section 3 evaluates potential impacts of implementing hundreds of these types of projects throughout the region over a long period of time. The use of a PEIR pursuant to CEQA Guidelines Section 15168 is intended to evaluate broad-based impacts early in the planning process and is the appropriate CEQA compliance for the EWMPs at this time. As projects are refined in the future, each individual project will undergo subsequent CEQA determination by the lead implementing agency prior to approval.

The 2014 Integrated Regional Water Management Plan (IRWMP) prepared by the Los Angeles County Department of Public Works is a parallel planning process that is being implemented to identify projects that may provide multiple benefits including surface water quality improvement. As stated in Chapter 1 of the Greater Los Angeles County (GLAC) 2014 IRWMP, the IRWMP reflects the region's collaborative efforts to ensure a sustainable water supply through the more efficient use of water, the protection and improvement of water quality, and environmental stewardship. The EWMPs are consistent with this IRWMP, and projects developed through the IRWMP process are being considered for inclusion within the EWMPs. However, the LACFCD would not be the lead agency for a PEIR prepared for the IRWMP, and a combined PEIR covering both the EWMP and IRWMP process is not under consideration at this time. In response to the comment the following discussion on the IRWMP is included in the Final PEIR within Section 3.8.2, Regulatory Setting.

> **Integrated Regional Water Management Plan**
>
> The 2013 Integrated Regional Water Management Plan (IRWMP) Update, approved by the Los Angeles County Board of Supervisors in 2014, was formulated to define a clear vision and direction for the sustainable management of water resources in the Greater Los Angeles County (GLAC) Region. The IRWMP, which is chaired by the Los Angeles County Flood Control District (LACFCD), covers the GLAC Region, an area of approximately 2,058 square miles, spanning from Ventura County to Orange County and from the coast to the San Gabriel Mountains. The IRWMP region includes the Los Angeles River Watershed, the Santa Monica Bay Watershed, the Dominguez Channel Watershed, and the San Gabriel River Watershed, overlapping with four of the five watersheds covered in the EWMP. Several subcommittees were involved in the IRWMP development process, covering a range of both project objectives and physical areas, to ensure successful regional collaboration. The objectives of the 2013 IRWMP Update

> include: reducing the Region's reliance on imported water; comply with water quality regulations by improving the quality of urban runoff, stormwater and wastewater; protect, restore and enhance natural processes and habitats; increase watershed friendly recreational space for all communities; reduce flood risk in flood prone areas by either increasing protection or decreasing needs using integrated flood management approaches; and adapt to and mitigate against climate change vulnerabilities.

Response to Comment 44-C:

Appendix G of the PEIR provides the location information on the priority projects that was available at the time of publication. The PEIR acknowledges that most of the projects to be included in the EWMPs are either currently undefined or currently under development. Otherwise, the PEIR defines typical project types in Section 2 and then in Section 3 evaluates potential impacts of implementing hundreds of these types of projects throughout the region over a long period of time. The use of a PEIR pursuant to CEQA Guidelines Section 15168 is intended to evaluate broad-based impacts early in the planning process and is the appropriate CEQA compliance for the EWMPs at this time.

Because project details are largely incomplete since the EWMPs are being drafted concurrently, each individual project will be subject to a CEQA compliance evaluation prior to approval by the implementing agencies as noted in Section 1 of the Draft PEIR. As individual projects identified in the EWMPs are fully developed, the implementing agency (i.e., the Permittee responsible for implementing the project) will conduct CEQA analysis for individual projects, as appropriate, or may determine that no additional CEQA analysis is required or that a project is exempt from CEQA. Each implementing agency would determine the significance after mitigation for potential impacts of its proposed projects. The public will be able to provide the Regional Water Quality Control Board with comments on the EWMPs. Upon their completion, the EWMPs shall be made available to the public for a 30-day period to allow for public comment.

The PEIR serves as a first-tier environmental document that focuses on the effects of implementing the EWMPs to reduce urban runoff pollution. The analysis assesses worst case situations where construction or operation of projects may significantly impact environmental resources. The analysis outlines mitigation strategies to be followed by the LACFCD and other implementing agencies that rely on the PEIR to avoid or minimize impacts wherever feasible.

The PEIR provides the LACFCD a foundation for any necessary future environmental review that focus on individual projects of the EWMPs for which the LACFCD is the designated Lead Agency.

Response to Comment 44-D:

The comment notes that the LACFCD does not have the authority to impose ordinances or code modifications within cities, as that authority is left to the cities. However, education and outreach efforts are effective non-structural BMPs that the LACFCD may employ throughout the County because they do not require ordinances or code modifications to achieve.

Response to Comment 44-E:

As noted on page 1-1 of the PEIR, the Regional Water Quality Control Board issued Order No. R4-2012-0175; NPDES No. CAS004001 in December 2012 covering discharges from multiple municipalities within the Los Angeles Region. The requirements of the MS4 permit are described in Section 1.2 of the PEIR. A primary objective of the proposed program noted on page 2-2 is to comply with the permit requirements. The EWMPs include a methodology required by the MS4 permit to evaluate the effectiveness of the BMPs as they are implemented. The commenter's question as to whether the abovementioned Supreme Court decision lead to the drafting of the 2012 MS4 Permit does not address the adequacy of the PEIR.

Response to Comment 44-F:

Environmental Justice was addressed in Section 3.11, *Population and Housing and Environmental Justice*. Implementation of the EWMPs would not disproportionately affect areas with lower average incomes or specific racial distributions, nor unfairly concentrate environmental pollution burdens. Structural BMPs are not expected to be concentrated in any one area or city in particular within the EWMP areas. The structural BMPs are expected to be located on public lands (e.g., schools, parks, sidewalks, and road rights-of-way) throughout the EWMP areas and would be designed to capture, convey, and/or filter stormwater and surface runoff.

Local water supplies are largely shared resources, managed by regional agencies (e.g., Metropolitan, Castaic Lake Water Agency) responsible for supplying drinking water equitably to the population. Local water retailers receive their water generally from imported water wholesalers and groundwater pumping. Groundwater recharge resulting from infiltration BMPs will occur throughout the region. Some areas will experience greater volumes of recharge than others due to the local topography and geology. However, local demographics will not influence water quality control infrastructure locations. The equitable delivery of high quality drinking water is the responsibility of water retailers as regulated by the State Water Resources Control Board and the California Department of Public Health.

Response to Comment 44-G:

A discussion of impacts to soil quality is included on pages 3.7-16 and 3.7-17 of the PEIR. Mitigation Measure HAZ-1 would reduce potential impacts to soil quality by requiring preparation and implementation of maintenance practices including periodic removal and replacement of surface soils that may accumulate constituents that could result in further migration of constituents to sub-soils and groundwater. A discussion of impacts to groundwater quality is located on pages 3.8-35 and 3.8-36 of the PEIR; implementation of Mitigation Measures HYDRO-1, HYDRO-2 and HYDRO-3 would reduce potential impacts to groundwater quality to less than significant levels. Mitigation Measure GEO-1 require that implementing agencies consult with groundwater managers prior to implementation of infiltration projects to ensure consistency with existing groundwater management plans within the South Coast Hydrologic Region; this mitigation measure would reduce potential impacts to less than significant levels. The California Statewide Groundwater Elevation Monitoring would continue to monitor groundwater levels augmented by increased stormwater recharge.

Response to Comment 44-H:

As lead agency, the County of Los Angeles Environmental Document Reporting Procedures and Guidelines adopted by the Board of Supervisors in 1987 were utilized in the environmental analysis of the PEIR. No additional significance thresholds have been adopted by the County of Los Angeles.

Response to Comment 44-I:

The commenter's statement regarding the repetition of the text from page 1-10 on pages ES-2 and 1-3 is typical since language identified in the Executive Summary (ES) is a short compilation of information found in the rest of the document. As a result, the ES is repetitious of the entire document. In this instance, the ES is summarizing language found in the Introduction. Repetition of text within the document does not affect the impact conclusions of the document.

Response to Comment 44-J:

The commenter's statement regarding the repetition of the text from page 2-1 on page ES-3 is typical since language identified in the Executive Summary (ES) is a short compilation of information found in the rest of the document. As a result, the ES is repetitious of the entire document. In this instance, the ES is summarizing language found in the Project Description. Repetition of text within the document does not affect the impact conclusions of the document.

Response to Comment 44-K:

The commenter's statement regarding the repetition of the text from page 2-1 on page ES-2 is typical since language identified in the Executive Summary (ES) is a short compilation of information found in the rest of the document. As a result, the ES is repetitious of the entire document. In this instance, the ES is summarizing language found in the Introduction. Repetition of text within the document does not affect the impact conclusions of the document.

Response to Comment 44-L:

The listing of all "advantages" and "disadvantages" of each BMP is not necessary to evaluate impacts of their implementation. Chapter 6 of the Draft PEIR includes analysis of a No Project Alternative, which is equivalent to a "do-nothing" scenario, in comparison to the proposed Program. The analysis concludes that the proposed Program itself is environmentally superior to implementation of the No Project Alternative. No addition will be made as recommended by the commenter.

Response to Comment 44-M:

The usage of the term "redevelopment project" was taken from language on page 94 the current Municipal Separate Storm Sewer System (MS4) Permit (Order No. R4-2012-0175; NPDES

Permit No. CAS004001). Redevelopment Projects are defined beginning on page 96 of the Permit. No changes are required as recommended by the commenter.

Response to Comment 44-N:

BMPs would be distributed throughout the watershed irrespective of local land uses. Though some BMPs such as infiltration BMPs are limited to areas with appropriate soils, implementation of the EWMPs would not disproportionately affect areas with lower average incomes. Environmental Justice was addressed in Section 3.11, *Population and Housing and Environmental Justice* of the PEIR. Implementation of the EWMPs would not disproportionately affect areas with lower average incomes or specific racial distributions, nor unfairly concentrate environmental pollution burdens. Structural BMPs are not expected to be concentrated in any one area or city in particular within the EWMP areas. The structural BMPs are expected to be located on public lands (e.g., schools, parks, sidewalks, and road rights-of-way) throughout the EWMP areas and would be designed to capture, convey, and/or filter stormwater and surface runoff.

The coastal EWMPs will install BMPs to address runoff water quality in similar ways as inland EWMPs. Groundwater recharge resulting from infiltration BMPs will occur throughout the region in locations with soils that accommodate infiltration. Some areas will experience greater volumes of recharge than others due to the local topography and geology. However, local demographics will not influence water quality control infrastructure locations.

Response to Comment 44-O:

Implementation of the EWMPs would not disproportionately affect areas with a specific racial distribution. The MS4 Permit does not address pollution from industrial land uses. Environmental Justice was addressed in Section 3.11, *Population and Housing and Environmental Justice*. Implementation of the EWMPs would not disproportionately affect areas with lower average incomes or specific racial distributions, nor unfairly concentrate environmental pollution burdens. Structural BMPs are not expected to be concentrated in any one area or city in particular within the EWMP areas. The structural BMPs are expected to be located on public lands (e.g., schools, parks, sidewalks, and road rights-of-way) throughout the EWMP areas and would be designed to capture, convey, and/or filter stormwater and surface runoff. To address the accumulation of contaminants in soil at BMPs, operations and maintenance plans for BMPs that might accumulate constituents in surface soils and media will be developed to include periodic removal and replacement of these potentially impacted surface materials to reduce the potential for long-term loading leading to hazardous concentrations in soils and groundwater. Implementation of Mitigation Measure HAZ-1 would reduce the potential for impacts to less-than-significant levels.

Response to Comment 44-P:

A discussion of impacts to groundwater quality is located on pages 3.8-35 and 3.8-36 of the PEIR; implementation of Mitigation Measures HYDRO-1, HYDRO-2 and HYDRO-3 would reduce potential impacts to groundwater quality to less than significant levels. The PEIR acknowledges that infiltration projects could adversely affect groundwater quality and identifies mitigation measures to minimize potential impacts. Mitigation Measure HYDRO-1 requires

Permittees to evaluate the suitability of BMP locations for groundwater recharge. Infiltration BMPs would not be suitable in areas of low permeability where subsurface structures could be adversely affected by groundwater mounding or in areas with soil contamination.

Regarding polluted water negatively affect the soil for BMPs, a discussion of impacts to soil quality is included on pages 3.7-16 and 3.7-17 of the PEIR. Mitigation Measure HAZ-1 would reduce potential impacts to soil quality by requiring preparation and implementation of maintenance practices including periodic removal and replacement of surface soils that may accumulate constituents that could result in further migration of constituents to sub-soils and groundwater. Mitigation Measure GEO-1 require that implementing agencies consult with groundwater managers prior to implementation of infiltration projects to ensure consistency with existing groundwater management plans within the South Coast Hydrologic Region; this mitigation measure would reduce potential impacts to less than significant levels. The California Statewide Groundwater Elevation Monitoring would continue to monitor groundwater levels augmented by increased stormwater recharge.

Response to Comment 44-Q:

The numerous cities encompassed by the EWMP area all have their own respective city General Plans, which may contain policies that address land use and agriculture. As implementation of the individual structural BMP projects proceed, specific policies and objectives pertaining to land use and agriculture from applicable city General Plans will be identified and evaluated on a project-by-project basis during subsequent CEQA environmental processes.

Response to Comment 44-R:

As noted on page 1-1 of the PEIR, the Regional Water Quality Control Board issued Order No. R4-2012-0175; NPDES No. CAS004001 in December 2012 covering discharges from multiple municipalities within the Los Angeles Region. The requirements of the MS4 permit are described in Section 1.2 of the PEIR. A primary objective of the proposed program noted on page 2-2 is to comply with the permit requirements. The EWMPs include a methodology required by the MS4 permit to evaluate the effectiveness of the BMPs as they are implemented. The projects are a part of MS4 compliance.

Each EWMP group comprises many permittees who are working together to develop cost-effective and multi-benefit water quality improvement projects.

Projects that infiltrate runoff will remove the associated pollutants. As described in the PEIR, Mitigation Measures HYDRO-1 through HYDRO-3 would lessen potential impacts from naturally occurring pollutants to a less than significant level. Mitigation Measure HYDRO-3 has been edited as follows:

> **HYDRO-3:** Prior to the installation of an infiltration BMP, the Permittee shall conduct a database review for contaminated groundwater sites within a quarter mile of the proposed infiltration facility. <u>The database review shall include locations of on-site wastewater treatment systems that could be affected by the BMP.</u> The Permittee shall identify

whether any contaminated groundwater plumes or leach fields are present and whether coordination with the local and state environmental protection overseeing agency and responsible party is warranted prior to final design of infiltration facility.

Furthermore, Mitigation Measure HYDRO-4 has been added, which would reduce any hydromodification impacts including related to erosion and scour, thereby reducing sedimentation of water and resulting impacts to water quality.

HYDRO-4: Prior to approving a structural BMP, the implementing agencies shall conduct an evaluation of the potential hydromodification impacts of the project. The evaluation shall recommend design measures necessary to prevent or minimize any identified impacts, including flooding, erosion and/or scour. Design measures could include velocity dissipaters and bank re-enforcement components. Implementing agencies shall include these measures in project designs.

The PEIR defines typical project types in Section 2 and then in Section 3 evaluates potential impacts of implementing hundreds of these types of projects throughout the region over a long period of time. The use of a PEIR pursuant to CEQA Guidelines Section 15168 is intended to evaluate broad-based impacts early in the planning process and is the appropriate CEQA compliance for the EWMPs at this time. As projects are refined in the future, each individual project will undergo subsequent CEQA determination by the lead implementing agency prior to approval.

The 2014 Integrated Regional Water Management Plan (IRWMP) prepared by the Los Angeles County Department of Public Works is a parallel planning process that is being implemented to identify projects that may provide multiple benefits including surface water quality improvement. As stated in Chapter 1 of the Greater Los Angeles County (GLAC) 2014 IRWMP, the IRWMP reflects the region's collaborative efforts to ensure a sustainable water supply through the more efficient use of water, the protection and improvement of water quality, and environmental stewardship. The EWMPs are consistent with this IRWMP, and projects developed through the IRWMP process are being considered for inclusion within the EWMPs. The following discussion on the IRWMP is included in the Final PEIR within Section 3.8.2, Regulatory Setting.

Integrated Regional Water Management Plan

The 2013 Integrated Regional Water Management Plan (IRWMP) Update, approved by the Los Angeles County Board of Supervisors in 2014, was formulated to define a clear vision and direction for the sustainable management of water resources in the Greater Los Angeles County (GLAC) Region. The IRWMP, which is chaired by the Los Angeles County Flood Control District (LACFCD), covers the GLAC Region, an area of approximately 2,058 square miles, spanning from Ventura County to Orange County and from the coast to the San Gabriel Mountains. The IRWMP region includes the Los Angeles River Watershed, the Santa Monica Bay Watershed, the Dominguez Channel Watershed, and the San Gabriel River Watershed, overlapping with four of the five watersheds covered in the EWMP. Several subcommittees were involved in the IRWMP development process, covering a range of both project objectives and physical areas, to ensure successful regional collaboration. The objectives of the 2013 IRWMP Update include: reducing the Region's reliance on imported water; comply with water quality regulations by improving the quality of urban runoff, stormwater and wastewater; protect, restore and enhance natural processes and habitats; increase watershed friendly recreational space for all communities; reduce flood risk in flood prone areas by either increasing protection or decreasing needs using integrated flood management approaches; and adapt to and mitigate against climate change vulnerabilities.

The EWMPs may include project developed for the IRWMP. The EWMPs are consistent with the IRWMP and share goals of multi-beneficial projects that promote increased local water supplies and water quality protection.

Response to Comment 44-S:

Section 3.6 describes the regulatory background that shapes our current greenhouse gas emissions regulations. The discussion provides an accurate summary of the history of the scientific evaluation of the issue. The PEIR evaluates the potential emissions associated with temporary construction activities. No modifications are required.

Response to Comment 44-T:

The discussion provides accurate summarizes of the history of the scientific evaluation of the issue. The PEIR evaluates the potential emissions associated with temporary construction activities. No modifications are required.

Response to Comment 44-U:

The purpose of CEQA is to analyze the effects of the project on the environment, and not the effects of the environment on the project. The implementation of water efficient practices such as stormwater harvesting and recharge would assist in increasing reliability of water supplies, but would not directly or indirectly induce growth or remove an obstacle to growth.

To: Neal Shapiro
Subject: RE: Announcing the Release of the EWMP PEIR

Gregg:

In lieu of getting the Word doc for tracking changes, here are my written comments for the Executive Summary, since I'll be out rest of week.
I'm not sure I will read the rest of the chapters. My point is that the PEIR needs to emphasize the water supply goal, offsetting potable water use, harvesting for direct and passive uses, just as much or more so than water Quality, throughout the document.

If my comments have merit to include, if you need me to go through other parts of the EIR to add similar text, I can.

Best regards,
neal

Subject: Re: Announcing the Release of the EWMP PEIR

I have what I consider a critically important addition to the argument for EWMP BMP projects. The document fails to include adequately and properly water supply, rain harvesting for direct uses locally to reduce dependence on imported. I can send a marked up peir to demonstrate my point and important edits to better make the case. The document is short changing and/or ignoring half the importance of a BMP.

Respectively

EXECUTIVE SUMMARY

ES.1 Introduction

The Los Angeles County Flood Control District (LACFCD) has prepared this Draft Program Environmental Impact Report (Draft PEIR) to provide the public and responsible and trustee agencies with information about the potential effects, both beneficial and adverse, on the local and regional environment associated with implementation of the Enhanced Watershed Management Programs (proposed program). This Draft PEIR has been prepared pursuant to the California Environmental Quality Act (CEQA) of 1970 (amended), codified at California Public Resources Code Sections 21000 et. seq., and the CEQA Guidelines in the Code of Regulations, Title 14, Division 6, Chapter 3.

This document is being circulated to local, state and federal agencies, and to interested organizations and individuals who may wish to review and comment on the Draft PEIR. Publication of this Draft PEIR marks the beginning of a 45-day public review period, during which written comments may be directed to the address below. Comments on the project should be directed to:

Gregg BeGell, P.E.
County of Los Angeles Department of Public Works
Project Management Division II
900 South Fremont Avenue, 5th Floor
Alhambra, CA 91803
gbegell@dpw.lacounty.gov

ES.2 Background

The Los Angeles County Flood Control District (LACFCD) was created in 1915 when the State Legislature adopted the Los Angeles County Flood Control Act to provide flood risk management, water conservation, and recreation and aesthetic enhancement within its boundaries. The LACFCD owns and maintains a broad network of flood control facilities that convey stormwater to the local rivers and ultimately to the ocean. The LACFCD is governed as a separate entity by the County of Los Angeles Board of Supervisors, and is operated by the County's Department of Public Works. The LACFCD, the County of Los Angeles, and 84 incorporated cities within Los Angeles County (collectively referred to as Permittees) are covered under a Municipal Separate Storm Sewer System (MS4) Permit (Order No. R4-2012-0175; National Pollutant Discharge Elimination System [NPDES] Permit No. CAS004001) for the discharge of urban runoff to waters of the United States. The purpose of the MS4 Permit is to achieve and

(A) insert ⊛ and to harvest stormwater for beneficial uses.

Comment Letter 45

maintain water quality objectives to protect beneficial uses of the receiving waters in the Los Angeles region. Each of the Permittees identified in the MS4 permit is responsible for meeting the conditions of the permit for MS4 discharges occurring within their jurisdiction.

The 2012 MS4 Permit for Los Angeles County gives Permittees the option of implementing an innovative approach to Permit compliance through development of an Enhanced Watershed Management Program (EWMP). The EWMPs will identify potential and priority structural and non-structural Best Management Practices (BMPs) within the region's stormwater collection system to improve runoff water quality. ⊛ The LACFCD, along with participating Permittees, has opted to exercise this option and has submitted to the LARWQCB 12 separate Notices of Intent (NOIs) for the development of EWMPs within 12 distinct watershed groups (refer to **Figure 1-1**). Implementation of the EMWPs would be the responsibility of each Permittee and would occur following approval of the EWMPs by the LARWQCB. (A)

The LACFCD, as a regional agency, is a member of each of the 12 EWMP working groups, and as such provides a commonality within each EWMP group. However, LACFCD does not have a special status or authority designated by the MS4 Permit over any of the other Permittees. The LACFCD will be working with the applicable Permittees in all 12 EWMP watersheds as an equal partner to identify the types and locations of BMPs needed to achieve permit compliance within each watershed.

The timeline identified in the MS4 Permit requires that Permittees submit the EWMP to the LARWQCB by June 28, 2015, in order to be in compliance with the permit conditions. The LACFCD recognizes that implementation of the EWMPs may potentially result in changes to environmental conditions. As a result, the LACFCD has prepared this Program Environmental Impact Report (PEIR) in compliance with the California Environmental Quality Act (CEQA) to provide the public and the responsible and trustee agencies with information about the potential effects on the local and regional environment associated with implementation of the EWMPs. The LACFCD will submit the PEIR to its governing body, the Los Angeles County Board of Supervisors, for approval prior to submittal of the EWMPs. The EWMPs will be submitted by each EWMP to the LARWQCB.

insert (C) For The EWMPs, a few...

This PEIR describes and evaluates each of the EWMPs being prepared by the Permittees collectively. The discretionary action prompting the need for CEQA compliance is the submittal of the completed EWMPs to the LARWQCB. The EWMPs will identify management strategies including hundreds of structural Best Management Practices (BMPs) ~~that~~ may be designed and implemented by the Permittees to meet permit compliance objectives. ⊛ ~~A~~ few of the BMPs are currently well defined but most are yet to be fully developed under the EWMPs. A set of priority BMPs will be detailed in each of the EWMPs; these are being developed in parallel with the PEIR. The PEIR describes the details that are available for each of the EWMPs currently under preparation by the EWMP working groups. (B) (C)

The PEIR analysis is not intended to focus on the site-specific construction and operation details of each management strategy and project included in the EWMP. Rather, this PEIR serves as a first-tier environmental document that focuses on the effects of implementing the EWMPs to

(B) insert ⊛ To date, 100s of BMPs exist in The region harvesting and treating rain/stormwater for passive and active beneficial uses, such as landscape infiltration and storage, and storage for direct non-potable uses.

RB-AR 9609

Comment Letter 45

reduce urban runoff pollution. The analysis assesses worst case situations where construction or operation of projects may significantly impact environmental resources. The analysis outlines mitigation strategies to be followed by implementing agencies to avoid or minimize impacts wherever feasible.

LACFCD is the CEQA Lead Agency for this PEIR. This PEIR can be used by the LACFCD or other Permittees to streamline environmental review of individual EWMP projects. As individual projects identified in the EWMPs are fully developed, the implementing agency (i.e., the Permittee responsible for implementing the project) will conduct CEQA analysis for individual projects as appropriate or may determine that no additional CEQA analysis is required or that a project is exempt from CEQA.

ES.3 Project Objectives

The primary goals and objectives of the EWMPs are:

- To collaborate among agencies (Permittee jurisdictions) within each ~~across the~~ watershed to promote more cost-effective and multi-beneficial water quality and supply improvement projects to comply with the MS4 Permit.
- To develop watershed-wide EWMPs that will, once implemented, remove or reduce pollutants from dry- and wet-weather urban runoff in a cost-effective manner.
- To reduce the impact of stormwater and non-stormwater on receiving water quality. and increase local water resources

ES.4 Project Description

The 12 EWMPs will vary for each watershed group, but will generally provide the opportunity for Permittees to customize their stormwater programs to achieve compliance with applicable receiving water limitations (RWLs) and water-quality-based effluent limits (WQBELs) in accordance with the MS4 Permit through implementation of stormwater best management practices (BMPs) or watershed control measures. BMPs vary in function and type, with each BMP providing unique design characteristics and benefits from implementation. The overarching goal(s) of BMPs in the EWMPs ~~is~~ are to reduce the impact of stormwater and non-stormwater on receiving water quality and address the water quality priorities as defined by the MS4 Permit, and to supplement local water supply and reduce dependence on imported water. The development of each EWMP will involve the evaluation and selection of multiple BMP types, including nonstructural (institutional) and distributed, centralized, and regional structural watershed control measures, that will be implemented to meet compliance goals and strategies under the 2012 MS4 Permit. The LACFCD has limited jurisdictional authority for ordinance and code enactment or enforcement and therefore is limited in nonstructural BMPs to education and outreach measures. The structural watershed control measures that will be implemented by the LACFCD will be multi-benefit stormwater projects that emphasize flood risk mitigation and water conservation and supply.

plural "s"

insert

yes! talk up supply

The LACFCD has a vested interest in increasing opportunities for stormwater capture and groundwater recharge as a means of assisting local water supply augmentation. The LACFCD will be working with the applicable Permittees and other stakeholders in all 12 EWMP or other storage and use strategies ~~where groundwater recharge~~ is NOT feasible.

watersheds to develop such projects. The EWMPs will be implemented by the Permittees that have jurisdiction within each EWMP area. The implementing agencies will be responsible for the contents of the EWMPs affecting their jurisdictions and for implementing the projects developed by the EWMPs..

and store water for beneficial uses.

Structural control measures are constructed BMPs that reduce the impact of stormwater and non-stormwater on receiving water quality. They are broken into three categories:

- ***Distributed Structural BMPs***, which treat and store runoff close to the source and are typically implemented at a single- or few-parcel level (e.g., facilities typically serving a contributing area less than one acre).
- ***Centralized Structural BMPs***, which treat and store runoff from a contributing area of multiple parcels (e.g., facilities typically serving a contributing area on the order of tens or hundreds of acres or larger).
- ***Regional Structural BMPs***, which are meant to retain the 85th percentile storm over 24 hours from a contributing area. Generally, the 85th percentile storm is approximately 0.75 inches over 24 hours and which treat and store runoff for beneficial uses

Be consistent

Whether distributed, centralized, or regional, the major structural BMP functions are infiltration, treatment, and storage, which may be used individually or in combination:

- ***Infiltration***, where runoff is directed to percolate into the underlying soils. Infiltration generally reduces the volume of runoff and can increase~~s~~ groundwater recharge.
- ***Treatment***, where pollutants are removed through various unit processes, including filtration, settling, sedimentation, sorption, straining, and biological or chemical transformations.
- ***Storage***, where runoff is captured, stored (detained), and slowly released into downstream waters or retained for local beneficial use to replace potable water. Storage can reduce the peak flow rate from a site, but does not directly reduce runoff volume.

Critical to include Retention

The types of structural BMPs to be implemented will vary between EWMPs, but most EMWPs will include a variety of distributed, centralized, and regional BMPs.

These are policies, actions, and activities which are intended to minimize or eliminate pollutant sources and promote local water resources. Most institutional BMPs are implemented to meet Minimum Control Measure (MCM) requirements in the MS4 permit; MCMs are considered a subset of institutional BMPs. These BMPs are not constructed, but may have costs associated with the procurement and installation of items such as signage or spill response kits

ES.5 Project Alternatives

An EIR must describe a range of reasonable alternatives to the proposed project or alternative project locations that could feasibly attain most of the basic project objectives and would avoid or substantially lessen any of the significant environmental impacts to the proposed project. The alternatives analysis must include the "No Project Alternative" as a point of comparison. The No Project Alternative includes existing conditions and reasonably foreseeable future conditions that would exist if the proposed project were not approved (CEQA Guidelines §15126.6).

ES.6 Summary of Impacts

Table ES-1, at the end of this chapter, presents a summary of the impacts and mitigation measures identified for the proposed project. The complete impact statements and mitigation measures are presented in Chapter 3. The level of significance for each impact was determined using significance criteria (thresholds) developed for each category of impacts; these criteria are presented in the appropriate sections of Chapter 3. Significant impacts are those adverse environmental impacts that meet or exceed the significance thresholds; less-than-significant impacts would not exceed the thresholds. Table ES-1 indicates the measures that will avoid, minimize, or otherwise reduce significant impacts to a less-than-significant level if implemented by the Permittees.

ES.7 Areas of Controversy

Several comment letters from agency and public comments were received during the scoping period. Public comments received are provided in Appendix A of this PEIR. Some of the comments from non-governmental organizations and the public expressed concerns regarding the lack of project-specific details provided in the NOP for individual BMPs. Several comments were received questioning the funding strategies to be employed by Permittees. The full list of comments highlighting areas of potential controversy received during the public scoping period is included in Appendix A.

ES.8 Issues to be Resolved

Section 15123(b)(3) of the *CEQA Guidelines* requires that an EIR contain issues to be resolved, which includes the choice among alternatives and whether or how to mitigate significant impacts. The following major issues are to be resolved:

- Determine whether the PEIR adequately describes the environmental impacts of the proposed program;
- Choose among alternatives;
- Determine whether the recommended mitigation measures should be adopted or modified; and
- Determine whether additional mitigation measures need to be applied to the project.

Response to Comment Letter 45 (City of Santa Monica – March 12, 2015)

Response to Comment 45-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

Page 47 of the revised MS4 Permit (Order No. R4-2012-0175) states that watershed management programs (including EWMPs) allow the permittees to address the highest watershed priorities, including complying with receiving water limitations and total maximum daily load provisions. According to page 48 of the revised MS4 Permit, an EWMP is a form of compliance with the MS4 Permit provisions that comprehensively evaluates opportunities within watershed management areas for collaboration on multi-benefit regional projects that, wherever feasible, retain (i) all non-storm water runoff and (ii) all storm water runoff from the 85th percentile, 24-hour storm event for the drainage areas tributary to the projects, while also achieving other benefits including flood control and water supply. Therefore, flood control and water supply are listed as secondary benefits of EWMP implementation (as opposed to the primary purpose of protecting water quality), and therefore do not require the kind of emphasis as suggested by the commenter. As a result, the handwritten text edits provided by the commenter regarding water supply, as well as other minor text edits, were not included as revisions.

27 February 2015

Gregg BeGell, P.E.
County of Los Angeles Department of Public Works
Project Management Division II
900 South Fremont, 5th Floor
Alhambra, California 91803
gbegell@dpw.lacounty.gov

Dear Mr. BeGell:

I am writing in support of the Westwood Neighborhood Greenway, Project 193 of your Enhanced Watershed Management Plan (EWMP) for the Ballona Creek Watershed. The Greenway will be a multi-benefit project which will provide (1) urban runoff treatment, (2) native habitat, and (3) public access via transit, bicycle and pedestrian paths.

By pumping water from the storm drain under Overland Avenue and daylighting this water in a stream flowing through the project area, the Greenway will use natural and sustainable water treatment methods to remove pollutants from up to 48 million gallons of water per year. Also, the Greenway project will eliminate the need for potable water to irrigate both the Expo ROW and the Greenway area.

But one exceptional feature of the Greenway project is that it will be adjacent to the busiest station on the Expo Light Rail line, which itself is part of the growing Metro transit network. Commuters riding the train or waiting for their train at the Westwood/Rancho Park Station will see it. Students walking either to school or to take the train or bus to school will see it. Signage will make it an education on watershed health for everyone who passes. And educational programs led by LA Audubon and Rancho Santa Ana Botanic Garden will introduce the Greenway to even more students; high-school-age interns can do water-quality studies as a part of their science curriculum; elementary school students can come to the Greenway to discuss watersheds and how to protect them. The adjacency to the Expo Line links the Greenway to many schools including USC, UCLA, Dorsey High School, Foshay Learning Center, Santa Monica High School, and Overland Avenue Elementary School.

Thank you for your support of this wonderful project!

Sincerely,

Sarah M Hays

Response to Comment Letter 46 (Sarah Hays – February 27, 2015)

Response to Comment 46-A:

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The PEIR assesses the environmental impacts associated with implementation of EWMPs as a form of compliance with the MS4 Permit. More site investigations are needed to fully vet the proposed Westwood Neighborhood Greenway project and define the project scope needed to satisfy the EWMP's requirements. The City of Los Angeles is the primary agency who will benefit from a water quality project at the Westwood Neighborhood Greenway project. The City of Los Angeles will likely play a major role in the decision to implement an EWMP project at Westwood Neighborhood Greenway project.

11.3 PUBLIC MEETING COMMENT SUMMARIES AND RESPONSES

This section excerpts those spoken comments transcribed during the public meetings that specifically pertain to the scope and content of the PEIR.

The six public meetings that were made available for public comments are listed below:

- Public Meeting 1 (Florence-Firestone Service Center – January 29, 2015)
- Public Meeting 2 (LA County Fire Camp – February 3, 2015)
- Public Meeting 3 (San Pedro Service Center – February 5, 2015)
- Public Meeting 4 (Topanga Library – February 10, 2015)
- Public Meeting 5 (Hacienda Heights Community Center – February 11, 2015)
- Public Meeting 6 (East Los Angeles Library – February 17, 2015)

Response to Public Meeting 1 Comments (Florence-Firestone Service Center – January 29, 2015)

7807 S. Compton Ave., Los Angeles, CA 90001
6:00 P.M. – 8:00 P.M.

The commenter is inquiring as to whether Grey Water Plumbing is legal.

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The commenter is referred to the Los Angeles County Department of Building and Safety or local municipal building department for further information regarding grey water plumbing. A plumbing permit is typically required to be obtained from the jurisdictional agency in which the grey water system would be located, prior to the erection, construction, reconstruction, installation, relocation or alteration of any graywater system.

Under State regulations, graywater is defined as untreated wastewater that has not been contaminated by toilet waste or unhealthy bodily wastes. Graywater includes wastewater from bathtubs, showers, bathroom washbasins, clothes washing machines, and laundry tubs, but does not include wastewater from kitchen sinks or dishwashers. A graywater system uses graywater for subsurface irrigation and may include tanks, valves, filters, pumps or other appurtenances along with piping and receiving landscape. Graywater should not be used in spray irrigation and should not be allowed to pond, runoff or be discharged directly into or reach any storm water system or any surface body of water. Additionally, graywater shall not be used to irrigate root crops or edible parts of food crops that touch the soil.

Response to Public Meeting 2 Comments (LA County Fire Camp – February 3, 2015)

4810 Oak Grove Drive, La Cañada Flintridge, CA 91011
6:00 P.M. – 8:00 P.M.

No comments were received at this meeting.

Response to Public Meeting 3 Comments (San Pedro Service Center – February 5, 2015)

769 W. Third St., San Pedro, CA 90731
6:00 P.M. – 8:00 P.M.

No comments were received at this meeting.

Response to Public Meeting 4 Comments (Topanga Library – February 10, 2015)

122 N. Topanga Canyon Blvd., Topanga, CA 90290
6:00 P.M. – 8:00 P.M.

Response to Comment PM4-A:

The commenter asks how the PEIR deals with open space areas.

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

The PEIR assumes that BMPs may be installed in any location, whether urbanized or previously undisturbed. The impact analysis assumes some projects may be proposed in open space areas and evaluates impact avoidance and minimization measures. The PEIR provides maps in Appendix G to the PEIR showing prospective locations for BMPs. The locations are broadly distributed throughout the watersheds. The LACFCD acknowledges that BMPs are not limited to urban areas but may be installed throughout a watershed if necessary to achieve water quality objectives. The PEIR acknowledges on page 1-11 that BMPs may be proposed in any location including open space areas. The impact analysis and mitigation measures have been prepared to reflect the wide diversity of potential project locations and evaluate worse-case conditions that may include the presence of sensitive habitats.

Response to Comment PM4-B:

The commenter is inquiring as to whether this area (Topanga Canyon) is differentiated from urban areas.

The project area is generally differentiated by the Watershed Management Areas delineated by the Regional Water Quality Control Board, shown on Figure 2-1 of the Draft PEIR. As a result of the programmatic nature of the Draft PEIR, many of the subareas located within the Watershed Management Areas were not differentiated.

The PEIR assumes that BMPs may be installed in any location, whether urbanized or previously undisturbed. The impact analysis assumes some projects may be proposed in open space areas and evaluates impact avoidance and minimization measures. The PEIR provides maps in Appendix G to the PEIR showing prospective locations for BMPs. The locations are broadly distributed throughout the watersheds. The LACFCD acknowledges that BMPs are not limited to urban areas but may be installed throughout a watershed if necessary to achieve water quality objectives. The PEIR acknowledges on page 1-11 that BMPs may be proposed in any location including open space areas. The impact analysis and mitigation measures have been prepared to reflect the wide diversity of potential project locations and evaluate worse-case conditions that may include the presence of sensitive habitats.

Because project details are largely incomplete since the EWMPs are being drafted concurrently, each individual project will be subject to a CEQA compliance evaluation prior to approval by the implementing agencies as noted in Section 1 of the Draft PEIR. As individual projects identified in the EWMPs are fully developed, the implementing agency (i.e., the Permittee responsible for implementing the project) will conduct CEQA analysis for individual projects, as appropriate, or may determine that no additional CEQA analysis is required or that a project is exempt from CEQA. Each implementing agency would determine the significance after mitigation for potential impacts of its proposed projects.

The PEIR serves as a first-tier environmental document that focuses on the effects of implementing the EWMPs to reduce urban runoff pollution. The analysis assesses worst case situations where construction or operation of projects may significantly impact environmental resources. The analysis outlines mitigation strategies to be followed by the LACFCD and other implementing agencies that rely on the PEIR to avoid or minimize impacts wherever feasible.

The PEIR provides the LACFCD a foundation for any necessary future environmental review that focus on individual projects of the EWMPs for which the LACFCD is the designated Lead Agency.

Response to Comment PM4-C:

The commenter states that there are fewer engineered channels in open space areas.

The PEIR assumes that BMPs may be installed in any location, whether urbanized or previously undisturbed. The impact analysis assumes some projects may be proposed in open space areas and evaluates impact avoidance and minimization measures. The PEIR provides maps in Appendix G to the PEIR showing prospective locations for BMPs. The locations are broadly distributed throughout the watersheds. The LACFCD acknowledges that BMPs are not limited to urban areas but may be installed throughout a watershed if necessary to achieve water quality objectives. The PEIR acknowledges on page 1-11 that BMPs may be proposed in any location including open space areas. The impact analysis and mitigation measures have been prepared to reflect the wide diversity of potential project locations and evaluate worse-case conditions that may include the presence of sensitive habitats. The project area is generally differentiated by the Watershed Management Areas delineated by the Regional Water Quality Control Board, shown on Figure 2-1 of the Draft PEIR. As a result of the programmatic nature of the Draft PEIR, many of the subareas located within the Watershed Management Areas were not differentiated.

Because project details are largely incomplete since the EWMPs are being drafted concurrently, each individual project will be subject to a CEQA compliance evaluation prior to approval by the implementing agencies as noted in Section 1 of the Draft PEIR. As individual projects identified in the EWMPs are fully developed, the implementing agency (i.e., the Permittee responsible for implementing the project) will conduct CEQA analysis for individual projects, as appropriate, or may determine that no additional CEQA analysis is required or that a project is exempt from

CEQA. Each implementing agency would determine the significance after mitigation for potential impacts of its proposed projects.

The PEIR serves as a first-tier environmental document that focuses on the effects of implementing the EWMPs to reduce urban runoff pollution. The analysis assesses worst case situations where construction or operation of projects may significantly impact environmental resources. The analysis outlines mitigation strategies to be followed by the LACFCD and other implementing agencies that rely on the PEIR to avoid or minimize impacts wherever feasible.

The PEIR provides the LACFCD a foundation for any necessary future environmental review that focus on individual projects of the EWMPs for which the LACFCD is the designated Lead Agency.

Response to Comment PM4-D:

The commenter states that the Los Angeles River is being evaluated for re-design. The commenter is asking if there is an intention to cement over the creeks in the watershed.

The EWMPs are developing projects to retain stormwater within the watershed as much as possible. Cementing creeks would act to increase the speed of water conveyed toward the ocean, which is opposite to one of the many goals of the EWMP Program. However, some projects will include armoring to protect certain areas from erosion, which may require additional concrete.

Response to Comment PM4-E:

The commenter is asking if Madera Creek was on the priority project list.

Priority projects identified at the time of publication of the PEIR are included in Appendix G. Madera Creek improvements are currently not identified on the priority projects list for the North Santa Monica Bay Coastal Watersheds EWMP.

Response to Comment PM4-F:

The commenter is inquiring as to whether the priority projects will be included as examples of proposed projects in PEIR.

Priority projects identified at the time of publication of the PEIR are included in Appendix G. Examples of regional, centralized and distributed BMP projects are identified in Chapter 2, *Project Description*, of the Draft PEIR.

Response to Comment PM4-G:

The commenter inquires as to whether the PowerPoint from the presentation is on the website.

Yes, the PowerPoint from the public meeting is available on the following website: www.LACoH2Osheds.com.

Response to Comment PM4-H:

The commenter asks if there are any priority projects in the Topanga Creek watershed.

Priority projects identified at the time of publication of the PEIR are included in Appendix G. Projects have been identified in the North Santa Monica Bay Coastal Watersheds for Topanga.

Response to Comment PM4-I:

The commenter states that Caltrans is not a Permittee, and asks if the County is working with Caltrans in cooperation.

Caltrans is not a Permittee of the MS4 Permit and is therefore not an active member of the EWMP development groups. Stormwater conveyance facilities owned by Caltrans facilities are covered under a separate stormwater discharge permit. However, Caltrans shares responsibility for certain TMDLs with MS4 Permittees and continues to work collaboratively with MS4 Permittees in addressing the TMDLs.

Response to Comment PM4-J:

The commenter asks if the permittees will engage with Caltrans for individual projects.

Caltrans is not a Permittee of the MS4 Permit and is therefore not an active member of the EWMP development groups. Stormwater conveyance facilities owned by Caltrans facilities are covered under a separate stormwater discharge permit. However, Caltrans shares responsibility for certain TMDLs with MS4 Permittees and continues to work collaboratively with MS4 Permittees in addressing the TMDLs.

Response to Comment PM4-K:

The commenter inquires about the extent Caltrans needs to engage to achieve results. Caltrans is not a Permittee of the MS4 Permit and is therefore not an active member of the EWMP development groups. Stormwater conveyance facilities owned by Caltrans facilities are covered under a separate stormwater discharge permit. However, Caltrans shares responsibility for certain TMDLs with MS4 Permittees and continues to work collaboratively with MS4 Permittees in addressing the TMDLs.

Response to Comment PM4-L:

The commenter asks if we can identify projects where we can engage with Caltrans. For example on SR 27, SR 1, US 101, or any State Route in the County.

Caltrans is not a Permittee of the MS4 Permit and is therefore not an active member of the EWMP development groups. Stormwater conveyance facilities owned by Caltrans facilities are covered under a separate stormwater discharge permit. However, Caltrans shares responsibility for certain TMDLs with MS4 Permittees and continues to work collaboratively with MS4 Permittees in addressing the TMDLs.

Response to Comment PM4-M:

The commenter asks what the County's degree of influence is in the ULARA Watershed.

LACFCD is a participant of the Upper Los Angeles River EWMP. LACFCD owns and maintains flood control facilities in unincorporated areas of the watershed, and is a partner with the watershed group to develop BMPs. Appendix G of the PEIR includes priority projects as identified at the time of publication of the PEIR for the Upper Los Angeles River watershed (Figure 2-14).

Response to Comment PM4-N:

The commenter asks what projects are being proposed in the north slope of the SM Mountains – headwaters to the LA River.

LACFCD is a participant of the Upper Los Angeles River EWMP. LACFCD owns and maintains flood control facilities in unincorporated areas of the watershed, and will partner with the watershed group to develop BMPs. Appendix G of the PEIR includes priority projects as identified at the time of publication of the PEIR for the watershed.

Response to Comment PM4-O:

The commenter asks how the inclusion of open natural space and parkland will affect water quality estimates within the EWMPs.

The water quality modeling underway for each watershed incorporates existing open space areas. Areas that are restored from developed areas to open space may provide water quality benefits and can be reflected in the EWMP adaptive management process. Some of the structural BMPs associated with the proposed program are anticipated to be located on existing parkland, as these open space areas offer ample area for potential subsurface spreading and infiltration.

Response to Comment PM4-P:

The commenter inquires as to whether we can calculate carbon footprint of undeveloped/preserved space.

Areas that are restored from developed areas to open space may provide water quality benefits and reduce carbon emissions. However, existing open space areas are part of the baseline condition.

Response to Comment PM4-Q:

The commenter inquires as to whether preservation can be a BMP, and how we can get preservation to be a BMP.

A variety of BMP types are defined in the EWMP Work Plans and NOIs. Section 2.4, EWMP BMP Types, provides an overview of non-structural and structural BMP types that will be part of the EWMPs. Additional information and figures on the location and distribution of potential and priority BMPs based on available data at the time of publication of the PEIR, are presented in Section 2.5, *EWMP Watershed Characteristics and BMP Implementation Strategies*.

Response to Comment PM4-R:

The commenter asks if restoration qualifies as a BMP.

Creek/river/floodplain/estuary restoration is identified as a potential Centralized Structural BMPs. Table 2-2 of the Draft PEIR describes the sub-types of distributed, centralized, and regional structural BMPs that form the basis of the water quality improvements proposed in the EWMPs. Creek, river, and estuary restoration projects provide a unique opportunity to restore natural cleansing processes, reestablish habitats and address impacts from hydromodification and urban runoff. These projects are the only BMPs that are implemented within the receiving water.

Response to Comment PM4-S:

The commenter asks what residents in Topanga need to be concerned with, as this EWMP is such big picture.

The PEIR assumes that BMPs may be installed in any location, whether urbanized or previously undisturbed. The impact analysis assumes some projects may be proposed in open space areas and evaluates impact avoidance and minimization measures. The PEIR provides maps in Appendix G to the PEIR showing prospective locations for BMPs. The locations are broadly distributed throughout the watersheds. The LACFCD acknowledges that BMPs are not limited to urban areas but may be installed throughout a watershed if necessary to achieve water quality objectives. The PEIR acknowledges on page 1-11 that BMPs may be proposed in any location including open space areas. The impact analysis and mitigation measures have been prepared to reflect the wide diversity of potential project locations and evaluate worse-case conditions that may include the presence of sensitive habitats. The project area is generally differentiated by the Watershed Management Areas delineated by the Regional Water Quality Control Board, shown on Figure 2-1 of the Draft PEIR.

Because project details are largely incomplete since the EWMPs are being drafted concurrently, each individual project will be subject to a CEQA compliance evaluation prior to approval by the implementing agencies as noted in Section 1 of the Draft PEIR. As individual projects identified in the EWMPs are fully developed, the implementing agency (i.e., the Permittee responsible for implementing the project) will conduct CEQA analysis for individual projects, as appropriate, or may determine that no additional CEQA analysis is required or that a project is exempt from CEQA. Each implementing agency would determine the significance after mitigation for potential impacts of its proposed projects.

The PEIR serves as a first-tier environmental document that focuses on the effects of implementing the EWMPs to reduce urban runoff pollution. The analysis assesses worst case situations where construction or operation of projects may significantly impact environmental resources. The analysis outlines mitigation strategies to be followed by the LACFCD and other implementing agencies that rely on the PEIR to avoid or minimize impacts wherever feasible.

The PEIR provides the LACFCD a foundation for any necessary future environmental review that focus on individual projects of the EWMPs for which the LACFCD is the designated Lead Agency. The Topanga watershed includes large open space areas with steep slopes and natural creeks. BMPs in these areas may be considered that slow runoff down to reduce scouring and erosion and promote infiltration. Appendix G of the PEIR includes priority projects identified at the time of publication.

Response to Comment PM4-T:

The commenter asks how he/she can find out and participate in the EWMP process.

Information on the development of the EWMPs is posted on the following website: www.LACoH2Osheds.com. The public is encouraged to attend meetings as they are posted.

Response to Comment PM4-U:

The commenter asks if there is an assessment of existing resource management plans being considered to ensure goals and objectives. These could either inform or conflict with the proposed project.

The PEIR summarizes land use management plans within the Section 3.9, *Land Use* and Section 3.3, *Biological Resources*. The Santa Monica Mountains Conservancy Plan, Los Angeles County General Plan Significant Ecological Areas, and local tree preservation ordinances are described on page 3.3-16. The PEIR evaluates consistency with local land use plans in Impact 3.9-2 on page 3.9-34.

Response to Comment PM4-V:

The commenter inquires as to whether this compliance process can assist with goals and objectives of other plans and programs.

Although the primary goals of resource plans may be different, multiple benefits are achievable. As noted on page 1-5 of the PEIR, implementation of BMPs through the EWMP process may result in ancillary benefits to water supply, flood control, and recreation.

Response to Comment PM4-W:

The commenter asks if LADWP will send responses to all meeting participants in tonight's meeting.

Responses to public agency comments will be made available to commenters within 10 days prior to the consideration of the adequacy of the PEIR by the Board of Supervisors as required by Section 15088 of the CEQA Guidelines. The responses and the Final PEIR will be available on-line at www.LACoH2Osheds.com.

Response to Comment PM4-X:

The commenter asks when permittees will go to RWQCB with their final projects.

The EWMPs will be submitted to the RWQCB by June 28, 2015.

Response to Comment PM4-Y:

The commenter asks when LA watershed meetings will take place.

Information pertaining to this project and meetings related to this project will be available on-line at www.LACoH2Osheds.com.

Response to Public Meeting 5 Comments (Hacienda Heights Community Center – February 11, 2015)

1234 Valencia Avenue, Hacienda Heights CA 91745
6:00 P.M. – 8:00 P.M.

Response to Comment PM5-A:

The commenter asks who should be called if one observes someone irrigating when it rains.

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

Each city and water utility in the County may impose differing outdoor water use restrictions during this period of drought. Please contact your local water purveyor. For enquiries and information regarding lawn watering restrictions and reporting in Los Angeles, please call the following hot-line: 1-888-CLEAN LA (1-888-253-2652). One can also visit www.CleanLA.com.

Response to Comment PM5-B:

The commenter inquires about the regulations in place to control irrigation wasting.

In regard to irrigation wasting, each city and water utility in the County may impose differing outdoor water use restrictions during this period of drought. Please contact your local water purveyor. For enquiries and information regarding lawn watering restrictions and reporting in Los Angeles, please call the following hot-line: 1-888-CLEAN LA (1-888-253-2652). One can also visit www.CleanLA.com.

Response to Comment PM5-C:

The commenter is inquiring about the benefits of a PEIR compared to an individual EIR.

The rationale for preparing a PEIR is described on page 1-3. The PEIR defines typical project types in Section 2 and then in Section 3 evaluates potential impacts of implementing hundreds of these types of projects throughout the region over a long period of time. The use of a PEIR pursuant to CEQA Guidelines Section 15168 is intended to evaluate broad-based impacts early in the planning process and is the appropriate CEQA compliance for the EWMPs at this time. As projects are refined in the future, each individual project will undergo subsequent CEQA determination by the lead implementing agency prior to approval.

Response to Comment PM5-D:

The commenter asks if these projects improve drinking water.

The PEIR discusses potential impacts to local groundwater basins on page 3.8-35. The projects under the EWMPs include regional centralized retention and infiltration projects that can recharge local aquifers. These projects can augment local water supplies. Local water supplies are largely shared resources, managed by regional agencies (e.g., Metropolitan, Castaic Lake Water Agency) responsible for supplying drinking water equitably to the population. Local water retailers receive their water generally from imported water wholesalers and groundwater pumping. Groundwater recharge resulting from infiltration BMPs will occur throughout the region. Some areas will experience greater volumes of recharge than others due to the local topography and geology. The delivery of high quality drinking water is the responsibility of water retailers as regulated by the State Water Resources Control Board and the California Department of Public Health.

Response to Comment PM5-E:

The commenter asks if the projects can be used to help save trees in local parks.

As described in Section 2 of the PEIR, several types of BMPs would promote multiple benefits to water supply, flood control and recreation. Some projects (e.g., rain barrels) may include the capture, retention, and re-use of both dry weather flows and stormwater flows to supplement irrigation of community parks to help preserve native trees and other landscape.

Response to Comment PM5-F:

The commenter is asking if the PEIR assesses the issue of public health, in particular mosquito breeding habitat. The commenter also suggests that Operation and Maintenance (O&M) issues need to address this concern.

The PEIR discusses potential impacts to public health in Impact 3.7-2. The PEIR acknowledges that accumulation of contaminants in BMPs over time could result in hazardous conditions. Mitigation Measure HAZ-1 is included to ensure that maintenance plans are prepared and implemented to reduce the risk to public health. BMPs may detain water that stagnates or generates odors. Other vectors such as mosquitos and rodents could be attracted to standing water. Local vector control agencies would employ measures to reduce public health impacts from areas of standing water in cooperation with the LACFCD. In Response to Comment 20-GG above, Mitigation Measure HAZ-1 has been revised as follows:

> **HAZ-1:** Implementing agencies shall prepare and implement maintenance practices that include periodic removal and replacement of surface soils and media that may accumulate constituents that could result in further migration of constituents to sub-soils and groundwater. A BMP Maintenance Plan shall be prepared by Implementing Agencies upon approval of the BMP projects that identifies the frequency and procedures for removal and/or replacement of accumulated debris, surface soils and/or media (to depth where constituent concentrations do not represent a hazardous conditions and/or have the potential to migrate further and impact groundwater) to avoid accumulation of hazardous concentrations and the potential to migrate further to sub-soils and groundwater. <u>The Maintenance Plan shall include vector control requirements.</u> The BMP Maintenance Plan may consist of a general maintenance guideline that applies to several types of smaller

distributed BMPs. For smaller distributed BMPs on private property, these plans may consist of a maintenance covenant that includes requirements to avoid the accumulation of hazardous concentrations in these BMPs that may impact underlying sub-soils and groundwater. Structural BMPs shall be designed to prevent migration of constituents that may impact groundwater.

Response to Comment PM5-G:

The commenter identifies that the key issue is Operation and Maintenance. He explains that sedimentation and vegetation growth results in ponding of water, which creates vector breeding habitats, a serious public health issue.

The PEIR discusses potential impacts to public health in Impact 3.7-2. The PEIR acknowledges that accumulation of contaminants in BMPs over time could result in hazardous conditions. Mitigation Measure HAZ-1 is included to ensure that maintenance plans are prepared and implemented to reduce the risk to public health. BMPs may detain water that stagnates or generates odors. Other vectors such as mosquitos and rodents could be attracted to standing water. Local vector control agencies would employ measures to reduce public health impacts from areas of standing water in cooperation with the LACFCD. Mitigation Measure HAZ-1 has been revised as follows:

HAZ-1: Implementing agencies shall prepare and implement maintenance practices that include periodic removal and replacement of surface soils and media that may accumulate constituents that could result in further migration of constituents to sub-soils and groundwater. A BMP Maintenance Plan shall be prepared by Implementing Agencies upon approval of the BMP projects that identifies the frequency and procedures for removal and/or replacement of accumulated debris, surface soils and/or media (to depth where constituent concentrations do not represent a hazardous conditions and/or have the potential to migrate further and impact groundwater) to avoid accumulation of hazardous concentrations and the potential to migrate further to sub-soils and groundwater. <u>The Maintenance Plan shall include vector control requirements.</u> The BMP Maintenance Plan may consist of a general maintenance guideline that applies to several types of smaller distributed BMPs. For smaller distributed BMPs on private property, these plans may consist of a maintenance covenant that includes requirements to avoid the accumulation of hazardous concentrations in these BMPs that may impact underlying sub-soils and groundwater. Structural BMPs shall be designed to prevent migration of constituents that may impact groundwater.

Response to Comment PM5-H:

The commenter expresses that maintenance plans need to define frequency of O&M, and it needs to address issues such as creation of habitats which restrict and/or limit O&M activities.

The PEIR discusses potential impacts to public health in Impact 3.7-2. The PEIR acknowledges that accumulation of contaminants in BMPs over time could result in hazardous conditions. Mitigation Measure HAZ-1 is included to ensure that maintenance plans are prepared and implemented to reduce the risk to public health. BMPs may detain water that stagnates or generates odors. Other vectors such as mosquitos and rodents could be attracted to standing water. Local vector control agencies would employ measures to reduce public health impacts from areas of standing water in cooperation with the LACFCD.

Response to Comment PM5-I:

The commenter is asking if citizen/community groups can be encouraged to help with maintenance such as removing trash at curb inlets.

The PEIR discusses potential impacts to public health in Impact 3.7-2. The PEIR acknowledges that accumulation of contaminants in BMPs over time could result in hazardous conditions. Mitigation Measure HAZ-1 is included to ensure that maintenance plans are prepared and implemented to reduce the risk to public health. BMPs may detain water that stagnates or generates odors. Other vectors such as mosquitos and rodents could be attracted to standing water. Local vector control agencies would employ measures to reduce public health impacts from areas of standing water in cooperation with the LACFCD. Each BMP would require its own maintenance plan. Maintenance plans would not rely on public volunteers, but many watershed clean-up activities could be supported by volunteer organizations.

Response to Comment PM5-J:

The commenter is inquiring about how detailed the evaluation of impacts to downstream resources is in the PEIR.

The PEIR evaluates the potential for impact to downstream biological resources in Impact 3.3-1 and Impact 3.3-2. Mitigation Measures BIO-1 through BIO-8 were identified to ensure that significant impacts would be avoided. Mitigation Measure BIO-1 requires that project implementers conduct a biological assessment of downstream resources prior to project approval to ensure downstream beneficial uses are not adversely affected. Because these impacts vary between site and project type, this measure is best performed on a site by site basis.

Response to Public Meeting 6 Comments (East Los Angeles Library – February 17, 2015)

4837 3rd Street, Los Angeles, CA 90022
6:00 P.M. – 8:00 P.M.

Response to Comment PM6-A:

The commenter requests a two week extension for public comment submittal.

Thank you for submitting comments to the Los Angeles County Board of Supervisors (Board of Supervisors), governing Board of the Los Angeles County Flood Control District regarding the Proposed Program (or "Program"). These comments have been noted and will be provided to the Board of Supervisors for their consideration at such time as the Project is considered by the Board of Supervisors.

A one-week extension was granted and notice of the extension was sent to interested parties. The public comment period ended March 16, 2015.

Response to Comment PM6-B:

The commenter recommends having more interactive mapping tool that allows the community to type in an address and see what projects are planned and/or prioritized near them.

This suggestion will be passed to the County Flood Control District as part of the EWMP preparation.

Response to Comment PM6-C:

The commenter suggests that the EWMP should consider projects in areas where flooding frequently occurs in the LA River and Ballona Creek EWMP areas that can capture storm water and reduce flooding.

This suggestion will be passed on to the County Flood Control District as part of the EWMP preparation.

Response to Comment PM6-D:

The commenter suggests that the EWMP should look into railroad crossing flooding because the pumps are currently undersized.

This suggestion will be passed on to the County Flood Control District as part of the EWMP preparation.

Response to Comment PM6-E:

The commenter inquires about how priority projects are identified in the EWMP.

Priority projects undergo a detailed analysis that includes a site review and project evaluation, including an evaluation of soil types, land use, potential for multi-benefit projects and other factors which identified them as a priority. The Permit requires that a Reasonable Assurance Analysis be conducted using modeling tools to predict water quality benefits of the overall group of projects within a EWMP. Appendix G of the PEIR includes priority projects identified at the time of publication.

Response to Comment PM6-F:

The commenter inquires why there aren't more priority projects in the East Los Angeles community.

Maps showing the planned and priority projects have not yet been finalized, but there are BMPs planned throughout the watershed in all neighborhoods. The distributed BMPs that are not shown on the maps include projects such as Green Streets that will have wide distribution and will be located throughout the urban areas. Appendix G of the PEIR includes priority projects identified at the time of publication.

Response to Comment PM6-G:

The commenter is inquiring about the discretionary action for the PEIR.

The discretionary action prompting the need for CEQA compliance is the submittal of the completed EWMPs to the LARWQCB. As a result, the LACFCD, as lead agency, has prepared this Program Environmental Impact Report (PEIR) in compliance with the California Environmental Quality Act (CEQA) to provide the public and the responsible and trustee agencies with information about the potential effects on the local and regional environment associated with implementation of the EWMPs. The LACFCD will submit the PEIR to its governing body, the Los Angeles County Board of Supervisors, for approval prior to submittal of the EWMPs. The EWMPs will be submitted by each EWMP group to the LARWQCB.

Response to Comment PM6-H:

The commenter is asking if the PEIR includes an economic analysis.

The EWMPs will summarize project costs and funding mechanisms available to implementing agencies. Implementing agencies are responsible for identifying funding mechanisms needed to effectuate Permit compliance. The PEIR does not evaluate costs or funding sources for BMP implementation since providing funding is not an environmental impact. Revenue sources will vary for each implementing agency but will likely include grant funding, low interest loans, or local fee assessment.

Response to Comment PM6-I:

The commenter is asking if the certification by the Board of Directors includes a means to pay for the program.

The EWMPs will summarize project costs and funding mechanisms available to implementing agencies. The Board of Directors is certifying the PEIR and approving the submittal of the EWMPS to meet the requirements of the MS4 Permit. This discretionary action does not include providing funds for any specific project.

Response to Comment PM6-J:

The commenter is asking if the system can be maintained, and what the cost is for such maintenance.

Mitigation Measure HAZ-1 is included in the PEIR to ensure that maintenance plans are prepared and implemented to reduce the risk to public health. As stated in Mitigation Measure HAZ-1, the plans shall identify the frequency and procedures for removal and/or replacement of accumulated debris, surface soils and/or media to avoid accumulation of hazardous concentrations and the potential to migrate further to sub-soils and groundwater. Mitigation Measure HAZ-1 has been revised as follows:

> **HAZ-1:** Implementing agencies shall prepare and implement maintenance practices that include periodic removal and replacement of surface soils and media that may accumulate constituents that could result in further migration of constituents to sub-soils and groundwater. A BMP Maintenance Plan shall be prepared by Implementing Agencies upon approval of the BMP projects that identifies the frequency and procedures for removal and/or replacement of accumulated debris, surface soils and/or media (to depth where constituent concentrations do not represent a hazardous conditions and/or have the potential to migrate further and impact groundwater) to avoid accumulation of hazardous concentrations and the potential to migrate further to sub-soils and groundwater. <u>The Maintenance Plan shall include vector control requirements.</u> The BMP Maintenance Plan may consist of a general maintenance guideline that applies to several types of smaller distributed BMPs. For smaller distributed BMPs on private property, these plans may consist of a maintenance covenant that includes requirements to avoid the accumulation of hazardous concentrations in these BMPs that may impact underlying sub-soils and groundwater. Structural BMPs shall be designed to prevent migration of constituents that may impact groundwater.

The EWMPs will summarize project costs and funding mechanisms regarding operations and maintenance available to implementing agencies. Implementing agencies are responsible for identifying funding mechanisms needed to effectuate Permit compliance. The PEIR does not evaluate costs or funding sources for BMP implementation since providing funding is not an environmental impact. Revenue sources will vary for each implementing agency but will likely include grant funding, low interest loans, or local fee assessment.

Response to Comment PM6-K:

The commenter is inquiring about what would happen if a project is planned that is not currently covered or listed in the PEIR.

The PEIR acknowledges that most of the projects to be included in the EWMPs are either currently undefined or currently under development. Appendix G of the PEIR includes priority projects identified at the time of publication. Some background on the MS4 Permit is provided in Section 1, explaining the policies guiding the implementation of the BMPs. As noted in Section 1, each individual project will undergo subsequent CEQA determination by the lead implementing agency prior to approval.

Response to Comment PM6-L:

The commenter is asking if the PEIR identifies the process to update the PEIR if and/or when the project/program changes.

Because project details are largely incomplete since the EWMPs are being drafted concurrently, each individual project will be subject to a CEQA compliance evaluation prior to approval by the implementing agencies as noted in Section 1 of the Draft PEIR. As individual projects identified in the EWMPs are fully developed, the implementing agency (i.e., the Permittee responsible for implementing the project) will conduct CEQA analysis for individual projects, as appropriate, or may determine that no additional CEQA analysis is required or that a project is exempt from CEQA. Each implementing agency would determine the significance after mitigation for potential impacts of its proposed projects.

The PEIR serves as a first-tier environmental document that focuses on the effects of implementing the EWMPs to reduce urban runoff pollution. The analysis assesses worst case situations where construction or operation of projects may significantly impact environmental resources. The analysis outlines mitigation strategies to be followed by the LACFCD and other implementing agencies that rely on the PEIR to avoid or minimize impacts wherever feasible.

The PEIR provides the LACFCD a foundation for any necessary future environmental review that focus on individual projects of the EWMPs for which the LACFCD is the designated Lead Agency.

Response to Comment PM6-M:

The commenter is inquiring about the methods used to reach out to community members that don’t have computers.

Notices of the public meetings were posted at the meeting sites, advertisements were placed in local papers and a list of over700 stakeholders was contacted through email. It was noted that the library has computers that provided free of charge use to the community.

Response to Comment PM6-N:

The commenter is asking about what projects are being considered to improve the trash screening curb inlet devices.

LADPW is continuing to investigate new devices and BMPs that provide more effective trash screening and pollutant removal. These distributed BMPs will continue to be implemented throughout the watershed as needed.

Response to Comment PM6-O:

The commenter is recommending that the PEIR reference the 2004 Landscaping Guidelines, Plant Palettes LA River Master Plan.

The 1996 Los Angeles River Master Plan provides design goals for the enhancement of multiple beneficial uses provided by the Los Angeles River. The landscape guidelines were updated in 2004. The landscape guidelines are specific to the Los Angeles River. Development of the EWMPs is consistent with this Master Plan.

CHAPTER 12 CLARIFICATIONS AND MODIFICATIONS

12.1 Introduction

The following clarifications and revisions are intended to update the Draft EIR in response to the comments received during the public review period. These changes, which have been incorporated into the Draft EIR, constitute the Final EIR, to be presented to the County of Los Angeles Board of Supervisors for certification and approval. These modifications clarify, amplify, or make insignificant changes to the EIR. Revisions to the EIR have not resulted in new significant impacts or mitigation measures or increased the severity of an impact. None of the criteria for recirculation set forth in the CEQA Guidelines section 15088.5(a) have been met, and recirculation of the EIR is not required.

CEQA Guidelines Section 15088.5(a):

(a) A lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review under Section 15087 but before certification…"Significant new information" requiring recirculation include, for example, a disclosure showing that:

(1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.
(2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
(3) A feasible project alternative or mitigation measure considerably different from the others previously analyzed would clearly lessen the environmental impacts of the project, but the project's proponents decline to adopt it.
(4) The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

The revisions compiled in this Chapter do not constitute "Significant new information" noted in Section 15088.5(a)(1) since no new significant environmental impacts have been identified following the publication of the Draft PEIR. Although new mitigation measures have been added based on input from commenters to ensure impacts remain less than significant, these new measures would not in and of themselves result in significant impacts nor do they represent that a new impact was identified. Rather, the measures provide for greater assurance of less than significant impacts.

The revisions compiled in this Chapter do not constitute "Significant new information" noted in Section 15088.5(a)(2) since none of the modifications would result in a substantial increase in impacts already identified. Rather, the revisions are designed to further reduce the potential for significant impacts.

The revisions compiled in this Chapter do not constitute "Significant new information" noted in Section 15088.5(a)(3) since no new alternatives have been identified that would clearly lessen impacts.

Finally, the revisions compiled in this Chapter do not constitute "Significant new information" noted in Section 15088.5(a)(4) since the PEIR is not fundamentally and basically inadequate and conclusory in nature. The PEIR compiles information available at the time of publication to assist in evaluating the values and risks of moving forward with a Permit compliance program. The PEIR as an advanced planning tool is meant to set the stage for future analysis of projects within the program as they are proposed for implementation as explained in Chapter 1 on pages 1-10 and 1-11.

12.2 Clarification and Modifications

The changes to the Draft EIR are listed by section and page number. Text which has been removed is shown in this chapter with a strikethrough line, while text that has been added is shown with an underline. All of the changes shown in this section have also been made in the corresponding Final EIR sections. Minor editorial corrections (e.g., typographical, grammatical, etc.) have been made throughout the document and are not indicated by strikethrough or underline text. The addition of the cumulative impact conclusions shown as underlined in Table ES-1 do not reflect new conclusions, but rather that the conclusions from Chapter 3 have been compiled into the table, since they were inadvertently left off the table in the Draft EIR. Please refer to Chapter 11, *Response to Comments*, for referenced comment letters and corresponding comments.

See next page showing entire Table ES-1 containing Mitigation Measure refinements.

TABLE ES-1
SUMMARY OF IMPACTS AND MITIGATION MEASURES FOR THE ENHANCED WATERSHED MANAGEMENT PROGRAMS

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
Aesthetics			
3.1-1: The proposed program could create a substantial adverse effect on a scenic vista.	**AES-1:** Aboveground structures shall be designed to be consistent with local zoning codes and applicable design guidelines and to minimize features that contrast with neighboring development.	Significant	Less than significant
3.1-2: The proposed program could substantially damage scenic resources, including but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.	Implement Mitigation Measure ~~Implementation of~~ AES-1	Significant	Less than significant
3.1-3: The proposed program could substantially degrade the existing visual character or quality of the site and its surroundings.	Implement Mitigation Measure ~~Implementation of~~ AES-1 **AES-2:** Implementing agencies shall develop BMP maintenance plans that are approved concurrently with each structural BMP approval. The maintenance plans must include measures to ensure functionality of the structural BMPs for the life of the BMP. These plans may include general maintenance guidelines that apply to a number of smaller distributed BMPs.	Significant	Less than significant
3.1-4: The proposed program could create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.	None required	Less than significant	Not applicable
Cumulative Aesthetics Impacts	Implement Mitigation Measures AES-1 and AES-2	Significant	Less than significant
Air Quality			
3.2-1: The project could conflict with or obstruct implementation of the applicable air quality plan.	None required	Less than significant	Not applicable
3.2-2: The project could violate any air quality standard or contribute substantially to an existing or projected air quality violation.	**AIR-1:** Implementing agencies shall require for large Regional or Centralized BMPs the use of low-emission equipment meeting Tier II emissions standards at a minimum and Tier III and IV emissions standards where available as CARB-required emissions technologies become readily available to contractors in the region	Significant	Significant and unavoidable for construction; Less than significant for operations.

RB-AR 9641

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
	AIR-2: For large construction efforts that may result in significant air emissions, implementing agencies shall encourage contractors to use lower-emission equipment through the bidding process where appropriate.		
3.2-3: The program could result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors).	Implement Mitigation Measures ~~Implementation of~~ AIR-1 and AIR-2	Significant	Significant and unavoidable for construction; less than significant for operations.
3.2-4: The project could expose sensitive receptors to substantial pollutant concentrations.	**AIR-3:** For large construction efforts associated with Regional or Centralized BMPs, implementing agencies shall conduct a project-specific LST analysis where necessary to determine local health impacts to neighboring land uses. Where it is determined that construction emissions would exceed the applicable LSTs or the most stringent applicable federal or state ambient air quality standards, the structural BMP project shall reduce its daily construction intensity (e.g., reducing the amount of equipment used daily, reducing the amount of soil graded/excavated daily) to a level where the structural BMP project's construction emissions would no longer exceed SCAQMD's LSTs or result in pollutant emissions that would cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standards.	Significant	Less than significant
3.2-5: The proposed program could create objectionable odors affecting a substantial number of people.	**AIR-4:** During planning of structural BMPs, implementing agencies shall assess the potential for nuisance odors to affect a substantial number of people. BMPs that minimize odors shall be considered the priority when in close proximity to sensitive receptors.	Significant	Less than significant
Cumulative Air Quality Impacts	Implement Mitigation Measures AIR-1 through AIR-2	Significant	Significant and unavoidable for construction; less-than-significant for operations
Biological Resources			
3.3-1: The proposed project could have a	**BIO-1:** Prior to approving a Regional or Centralized BMP.,	Significant	Less than significant

RB-AR 9642

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
substantial adverse effect, either directly or through habitat modifications, on any sensitive species identified as special-status in local or regional plans, policies, or regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.	the Permittee shall conduct an evaluation of the suitability of the BMP location. Appropriate BMP sites should avoid impacting large areas of native habitats including upland woodlands and riparian forests that support sensitive species to the extent feasible. The evaluation shall include an assessment of potential downstream impacts resulting from flow diversions. **BIO-2:** Prior to ground disturbing activities in areas that could support sensitive biological resources, a habitat assessment shall be conducted by a qualified biologist to determine the potential for special-status wildlife species to occur within affected areas, including areas directly or indirectly impacted by construction or operation of the BMPs. **BIO-3:** If a special-status wildlife species is determined to be present or potentially present within the limits of construction activities, a qualified biologist shall conduct pre-construction surveys of proposed work zones and within an appropriately sized buffer around each area as determined by a qualified biologist within 14 days prior to ground disturbing activities. Any potential habitat capable of supporting a special-status wildlife species shall be flagged for avoidance if feasible. **BIO-4:** If avoidance of special-status species or sensitive habitats that could support special-status species (including, but not limited to, critical habitat, riparian habitat, and jurisdictional wetlands/waters) is not feasible, the Permittee shall consult with the appropriate regulating agency (USACE/USFWS or CDFW) to determine a strategy for compliance with the Endangered Species Act, California Fish and Game Code, and other regulations protecting special-status species and sensitive habitats. The Permittee shall identify appropriate impact minimization measures and compensation for permanent impacts to sensitive habitats and species in consultation with regulatory agencies. Construction of the project will not begin until the appropriate permits from the regulatory agencies are approved. **BIO-5:** If construction and vegetation removal is proposed between February 1 and August 31, a qualified biologist shall conduct a pre-construction survey for breeding and nesting birds and raptors within 500-feet of the construction limits to determine and map the location and extent of breeding birds that could be affected by the project. Active nest sites located		

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
	during the pre-construction surveys shall be avoided until the adults and young are no longer reliant on the nest site for survival as determined by a qualified biologist. **BIO-6:** All construction areas, staging areas, and right-of-ways shall be staked, flagged, fenced, or otherwise clearly delineated to restrict the limits of construction to the minimum necessary near areas that may support special-status wildlife species as determined by a qualified biologist. **BIO-7:** Prior to construction in areas that could support special status plants, a qualified botanist shall conduct a pre-construction floristic inventory and focused rare plant survey of project areas to determine and map the location and extent of special-status plant species populations within disturbance areas. This survey shall occur during the typical blooming periods of special-status plants with the potential to occur. The plant survey shall follow the CDFW Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities (November 24, 2009). **BIO-8:** If temporary construction-related impacts to special-status plant populations are identified within a disturbance area, the implementing agencies shall prepare and implement a special-status species salvage and replanting plan. The salvage and replanting plan shall include measures to salvage, replant, and monitor the disturbance area until native vegetation is re-established under the direction of CDFW and USFWS.		
3.3-2: The proposed project could have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the CDFW or USFWS.	Implement Mitigation Measures BIO-1 through BIO-8	Significant	Less than significant
3.3-3: The proposed project could have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.	Implement BIO-1 through BIO-8 **BIO-9:** Prior to construction, a qualified wetland delineator shall be retained to conduct a formal wetland delineation in areas where potential jurisdictional resources (i.e., wetlands or drainages) subject to the jurisdiction of USACE, RWQCB, and CDFW, may be affected by the project. If jurisdictional resources are identified in the EWMP area and would be	Significant	Less than significant

RB-AR 9644

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
	directly or indirectly impacted by individual projects, the qualified wetland delineator shall prepare a jurisdictional delineation report suitable for submittal to USACE, RWQCB, and CDFW for purposes of obtaining the appropriate permits. Habitat mitigation and compensation requirements shall be implemented prior to construction in accordance with Mitigation Measure BIO-4.		
3.3-4: The proposed project could interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.	None required	Less than significant	Not applicable
3.3-5: The proposed project could conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.	**BIO-10:** Oak trees and other protected trees shall be avoided to the extent feasible. If trees may be impacted by project construction, a certified arborist shall conduct a tree inventory of the construction impact area. If any oak trees or other protected trees will be impacted by BMP construction, the implementing agency shall obtain any required County or City permits.	Significant	Less than significant
3.3-6: The proposed project could conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan.	None required	Less than significant	Not applicable
<u>Cumulative Biological Resources Impacts</u>	<u>Implement Mitigation Measures BIO-1 through BIO-10</u>	<u>Significant</u>	<u>Less than significant</u>
Cultural Resources			
3.4-1: The proposed program could cause a substantial adverse change in the significance of an historical resource as defined in §15064.5.	**CUL-1:** For individual EWMP projects that could impact buildings or structures (including infrastructure) 45 years old or older, implementing agencies shall ensure that a historic built environment survey is conducted or supervised by a qualified historian or architectural historian meeting the Secretary of the Interior's Professional Qualification Standards for Architectural History. Historic built environment resources shall be evaluated for their eligibility for listing in the CRHR or local register prior to the implementing agency's approval of project plans. If eligible resources that would be considered historical resources under CEQA are identified,	Significant	Significant and Unavoidable

RB-AR 9645

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
	demolition or substantial alteration of such resources shall be avoided. If avoidance is determined to be infeasible, the implementing agency shall require the preparation of a treatment plan to include, but not be limited to, photo-documentation and public interpretation of the resource. The plan will be submitted to the implementing agency for review and approval prior to implementation. **CUL-2:** Implementing agencies shall ensure that individual EWMP projects that require ground disturbance shall be subject to a Phase I cultural resources inventory on a project-specific basis prior to the implementing agency's approval of project plans. The study shall be conducted or supervised by a qualified archaeologist, defined as an archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards for Archaeology, and shall be conducted in consultation with the local Native American representatives expressing interest. The cultural resources inventory shall include a cultural resources records search to be conducted at the South Central Coastal Information Center; scoping with the NAHC and with interested Native Americans identified by the NAHC; a pedestrian archaeological survey where deemed appropriate by the qualified archaeologist; and formal recordation of all identified archaeological resources on California Department of Parks and Recreation 523 forms and significance evaluation of such resources presented in a technical report following the guidelines in *Archaeological Resource Management Reports (ARMR): Recommended Contents and Format*, Department of Parks and Recreation, Office of Historic Preservation, State of California, 1990. If potentially significant archaeological resources are encountered during the survey, the implementing agency shall require that the resources are evaluated by the qualified archaeologist for their eligibility for listing in the CRHR and for significance as a historical resource or unique archaeological resource per *CEQA Guidelines* Section 15064.5. Recommendations shall be made for treatment of these resources if found to be significant, in consultation with the implementing agency and the appropriate Native American groups for prehistoric resources. Per *CEQA Guidelines* Section 15126.4(b)(3), preservation in place shall be the preferred manner of mitigation to avoid impacts to		

RB-AR 9646

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
	archaeological resources qualifying as historical resources. Methods of avoidance may include, but shall not be limited to, project re-route or re-design, project cancellation, or identification of protection measures such as capping or fencing. Consistent with *CEQA Guidelines* Section 15126.4(b)(3)(C), if it is demonstrated that resources cannot be avoided, the qualified archaeologist shall develop additional treatment measures, which may include data recovery or other appropriate measures, in consultation with the implementing agency, and any local Native American representatives expressing interest in prehistoric or tribal resources. If an archaeological site does not qualify as an historical resource but meets the criteria for a unique archaeological resource as defined in Section 21083.2, then the site shall be treated in accordance with the provisions of Section 21083.2. **CUL-3:** The implementing agency shall retain archaeological monitors during ground-disturbing activities that have the potential to impact archaeological resources qualifying as historical resources or unique archaeological resources, as determined by a qualified archaeologist in consultation with the implementing agency, and any local Native American representatives expressing interest in the project. Native American monitors shall be retained for projects that have a high potential to impact sensitive Native American resources, as determined by the implementing agency in coordination with the qualified archaeologist. **CUL-4:** During project-level construction, should subsurface archaeological resources be discovered, all activity in the vicinity of the find shall stop and a qualified archaeologist shall be contacted to assess the significance of the find according to *CEQA Guidelines* Section 15064.5. If any find is determined to be significant, the archaeologist shall determine, in consultation with the implementing agency and any local Native American groups expressing interest, appropriate avoidance measures or other appropriate mitigation. Per *CEQA Guidelines* Section 15126.4(b)(3), preservation in place shall be the preferred means to avoid impacts to archaeological resources qualifying as historical resources. Methods of avoidance may include, but shall not be limited to, project re-route or re-design, project		

RB-AR 9647

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
	cancellation, or identification of protection measures such as capping or fencing. Consistent with *CEQA Guidelines* Section 15126.4(b)(3)(C), if it is demonstrated that resources cannot be avoided, the qualified archaeologist shall develop additional treatment measures, such as data recovery or other appropriate measures, in consultation with the implementing agency and any local Native American representatives expressing interest in prehistoric or tribal resources. If an archaeological site does not qualify as an historical resource but meets the criteria for a unique archaeological resource as defined in Section 21083.2, then the site shall be treated in accordance with the provisions of Section 21083.2.		
3.4-2: The program could cause a substantial adverse change in the significance of unique archaeological resources as defined in §15064.5.	Implement Mitigation Measures~~Implementation of~~ CUL-2 through CUL-4	Significant	Less than significant
3.4-3: The program could directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.	**CUL-5:** For individual structural BMP projects that require ground disturbance, the implementing agency shall evaluate the sensitivity of the project site for paleontological resources. If deemed necessary, the implementing agency shall retain a qualified paleontologist to evaluate the project and provide recommendations regarding additional work, potentially including testing or construction monitoring. **CUL-6:** In the event that paleontological resources are discovered during construction, the implementing agency shall notify a qualified paleontologist. The paleontologist will evaluate the potential resource, assess the significance of the find, and recommend further actions to protect the resource.	Significant	Less than significant
3.4-4: The program could disturb any human remains, including those interred outside of a formal cemetery.	**CUL-7:** The implementing agency shall require that, if human remains are uncovered during project construction, work in the vicinity of the find shall cease and the County Coroner shall be contacted to evaluate the remains, following the procedures and protocols set forth in Section 15064.5 (e)(1) of the CEQA Guidelines. If the County Coroner determines that the remains are Native American, the Coroner will contact the Native American Heritage Commission, in accordance with Health and Safety Code Section 7050.5, subdivision (c), and Public Resources Code 5097.98 (as amended by AB 2641). The NAHC will then designate a Most	Significant	Less than significant

RB-AR 9648

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
	Likely Descendant of the deceased Native American, who will engage in consultation to determine the disposition of the remains.		
Cumulative Cultural Resources Impacts	Implement Mitigation Measures CUL-1 through CUL-7.	Significant	Significant and unavoidable
Geologic and Mineral Resources			
3.5-1: The proposed program could locate new facilities in areas susceptible to seismic impacts such as (1) rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault, (2) strong seismic groundshaking, or (3) seismically induced liquefaction or landslides, which could expose people, structures, or habitat to potential risk of loss, damage, injury, or death.	None required	Less than significant	Not applicable
3.5-2: The proposed program could result in substantial soil erosion or the loss of topsoil.	None required	Less than significant	Not applicable
3.5-3: The proposed program could be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the program, and potentially result in on-site or off-site non-seismically induced geologic hazards such as landslides, lateral spreading, subsidence, collapse or sinkholes, settlement, or slope failure.	**GEO-1:** Prior to approval of infiltration BMPs, implementing agencies shall conduct a geotechnical investigation of each infiltration BMP site to evaluate infiltration suitability. If infiltration rates are sufficient to accommodate an infiltration BMP, the geotechnical investigation shall recommend design measures necessary to prevent excessive lateral spreading that could destabilize neighboring structures. Implementing agencies shall implement these measures in project designs.	Significant	Less than significant
3.5-4: The proposed program could be located on expansive soil as defined in 24 CCR 1803.5.3 of the California Building Code (2013), creating substantial risks to life or structures.	None required	Less than significant	Not applicable
3.5-5: The proposed program could have soils incapable of adequately supporting the use of a septic tank or alternative	None required	Less than significant	Not applicable

RB-AR 9649

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
wastewater treatment systems where sewers are not available for the disposal of wastewater.			
3.5-6: The proposed program could result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state or a locally important mineral resource recovery site delineated on a local General Plan, Specific Plan, or other land use plan.	None required	Less than significant	Not applicable
Cumulative Geologic Resources Impacts	Implement Mitigation Measure GEO-1 **GEO-2:** Prior to installing BMPs designed to recharge local groundwater supplies, the Implementing Agency shall notify local groundwater managers including the Upper Los Angeles River Area Water Master, the Water Replenishment District of Southern California, or the San Gabriel Water Master as well as local water producers such as local municipalities and water companies. The Implementing Agency shall coordinate BMP siting efforts with groundwater managers and producers to mitigate high groundwater levels while increasing local water supplies.	Significant	Less than significant
Greenhouse Gas Emissions			
3.6-1: The proposed program could generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment.	None required	Less than significant	Not applicable
3.6-2: The proposed program could conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.	None required	Less than significant	Not applicable
Cumulative Greenhouse Gas Emissions Impacts	None required	Less than significant	Not applicable
Hazards and Hazardous Materials			
3.7-1: The proposed program would create a significant hazard to the public or the	None required	Less than significant	Not applicable

RB-AR 9650

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
environment through the routine transport, use, or disposal of hazardous materials or the accidental release during construction and maintenance activities.			
3.7-2: The proposed program could create a significant hazard to the public or the environment through the accumulation of potentially hazardous materials into BMPs.	**HAZ-1:** Implementing agencies shall prepare and implement maintenance practices that include periodic removal and replacement of surface soils and media that may accumulate constituents that could result in further migration of constituents to sub-soils and groundwater. A BMP Maintenance Plan shall be prepared by Implementing Agencies upon approval of the individual BMP projects that identifies the frequency and procedures for removal and/or replacement of accumulated debris, surface soils and/or media (to depth where constituent concentrations do not represent a hazardous conditions and/or have the potential to migrate further and impact groundwater) to avoid accumulation of hazardous concentrations and the potential to migrate further to sub-soils and groundwater. <u>The Maintenance Plan shall include vector control requirements.</u> The BMP Maintenance Plan may consist of a general maintenance guideline that applies to several types of smaller distributed BMPs. For smaller distributed BMPs on private property, these plans may consist of a maintenance covenant that includes requirements to avoid the accumulation of hazardous concentrations in these BMPs that may impact underlying sub-soils and groundwater. Structural BMPs shall be designed to prevent migration of constituents that may impact groundwater.	Significant	Less than significant
3.7-3: The proposed program could emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing school.	<u>Implement Mitigation Measure</u> ~~Implementation of~~ HAZ-1	Less than significant	Not applicable
3.7-4: The proposed program could be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, could create a significant hazard to the public or the	**HAZ-2:** Prior to the initiation of any construction requiring ground-disturbing activities in areas where hazardous material use or management may have occurred, the implementing agencies shall complete a Phase I Environmental Site Assessment (ESA) in accordance with American Society for Testing and Materials (ASTM) Standard E1527-13 for each construction site. Any recommended	Significant	Less than significant

RB-AR 9651

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
environment.	follow up sampling (Phase II activities) set forth in the Phase I ESA shall be implemented prior to construction. The results of Phase II studies, if necessary, shall be submitted to the local overseeing agency and any required remediation or further delineation of identified contamination shall be completed prior to commencement of construction.		
3.7-5: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, for a project within the vicinity of a private airstrip, the project could result in a safety hazard for people residing or working in the project area.	**HAZ-3:** Implementing Agencies shall require that those BMPs that are within an airport land use plan area are compatible with criteria specified in FAA Advisory Circular No: 150/5200-33B (FAA, 2007). If the proposed BMP is within the minimum separation criteria, the Implementing Agency shall consult with the airport and collaboratively evaluate whether the potential increase in wildlife hazards can be mitigated.	Significant	Less than significant
3.7-6: The proposed program could impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.	None required	Less than significant	Not applicable
3.7-7: The proposed program could expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands.	None required	Less than significant	Not applicable
<u>**Cumulative Hazards and Hazardous Materials Impacts**</u>	<u>Implement Mitigation Measures HAZ-1, HAZ-2 and HAZ 3</u>	<u>Significant</u>	<u>Less than significant</u>
Hydrology and Water Quality			
<u>**3.8-1:** The proposed project would violate water quality standards or waste discharge requirements or further degrade water quality.</u>	<u>None required</u>	<u>Less than significant</u>	<u>Not applicable</u>
3.8-~~1~~<u>2</u>: The proposed project would result in higher groundwater levels and could potentially affect groundwater quality.	**HYDRO-1:** Prior to approving an infiltration BMP, the Permittee shall conduct an evaluation of the suitability of the BMP location. Appropriate infiltration BMP sites should avoid areas with low permeability where recharge could adversely affect neighboring subsurface infrastructure. **HYDRO-2:** Prior to approving an infiltration BMP, the	Significant	Less than significant

RB-AR 9652

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
	Permitee shall identify pre-treatment technologies, type, and depth of filtration media; depth to groundwater; and other design considerations necessary to prevent contaminants from impacting groundwater quality. The design shall consider stormwater quality data within the BMP's collection area to assess the need and type of treatment and filtration controls. Local design manuals and ordinances requiring minimum separation distance to groundwater shall also be met as part of the design. **HYDRO-3:** Prior to the installation of an infiltration BMP, the Permitee shall conduct a regulatory database review for contaminated groundwater sites within a quarter mile of the proposed infiltration facility. The review shall include locations of on-site wastewater treatment systems. The Permittee shall identify whether any contaminated groundwater plumes or leach fields are present within close proximity to the BMP location that could be affected by infiltrated water and whether coordination with the local and state environmental protection overseeing agency and responsible party is warranted prior to final design of infiltration facility.		
3.8-~~2~~3: The proposed project could substantially alter the existing drainage pattern of a site or area through the alteration of the course of a stream or river, or by other means, in a manner that would result in substantial erosion or siltation on- or off-site.	~~None required~~**HYDRO-4:** Prior to approving a structural BMP, the implementing agencies shall conduct an evaluation of the potential hydromodification impacts of the project. The evaluation shall recommend design measures necessary to prevent or minimize any identified impacts, including flooding, erosion and/or scour. Design measures could include velocity dissipaters and bank re-enforcement components. Implementing agencies shall include these measures in project designs.	Less than significant	Not applicable
3.8-~~3~~4: The project could substantially alter the existing drainage pattern of a site or area through the alteration of the course of a stream or river or, by other means, substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site.	Implement Mitigation Measures HYDRO-4	Less than significant	Not applicable
3.8-~~4~~5: The proposed project could create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide	None required	Less than significant	Not applicable

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
substantial additional sources of polluted runoff.			
3.8-~~5~~6: The project could place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other authoritative flood hazard delineation map.	None required	No impact	Not applicable
3.8-~~6~~7: The project could place within a 100-year flood hazard area structures that would impede or redirect flood flows.	None required	Less than significant	Not applicable
3.8-~~7~~8: The proposed project could expose structures to a significant risk of loss, including flooding as a result of the failure of a levee or dam.	None required	Less than significant	Not applicable
3.8-~~8~~9: The proposed project could place structures in areas subject to inundation by seiche, tsunami, or mudflow.	None required	Less than significant	Not applicable
Cumulative Hydrology and Water Quality Impacts	None required	Less than significant	Not applicable
Land Use and Agriculture			
3.9-1: The proposed program could physically divide an established community.	None required	No Impact	Not applicable
3.9-2: The proposed program could conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the program (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect.	None required	No Impact	Not applicable
3.9-3: The proposed program could conflict with any applicable habitat conservation plan or natural community conservation	None required	No Impact	Not applicable

RB-AR 9654

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
plan.			
3.9-4: The proposed program could convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use. The proposed program could involve other changes in the existing environment which, due to their location or nature, could result in conversion of agricultural land to non-agricultural use or conversion of forest land to non-forest use.	None required	No Impact	Not applicable
3.9-5: The proposed program could conflict with existing zoning for agricultural use, or a Williamson Act contract.	None required	No Impact	Not applicable
3.9-6: The proposed program could conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g)). The proposed program could result in the loss of forest land or conversion of forest land to non-forest use.	None required	No Impact	Not applicable
Cumulative Land Use and Agriculture Impacts	None required	Less than significant	Not applicable
Noise			
3.10-1: The proposed program could result in exposure of persons to, or generation of, noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of	**NOISE-1:** The implementing agencies shall implement the following measures during construction as needed:: • Include design measures necessary to reduce the construction noise levels where feasible. These measures may include noise barriers, curtains, or shields.	Significant	Significant and unavoidable for construction; less than significant for operations

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
other agencies.	• Place noise-generating construction activities (e.g., operation of compressors and generators, cement mixing, general truck idling) as far as possible from the nearest noise-sensitive land uses. • Locate stationary construction noise sources as far from adjacent noise-sensitive receptors as possible. • If construction is to occur near a school, the construction contractor shall coordinate the with school administration in order to limit disturbance to the campus. Efforts to limit construction activities to non-school days shall be encouraged. • For the centralized and regional BMP projects located adjacent to noise-sensitive land uses, identify a liaison for these off-site sensitive receptors, such as residents and property owners, to contact with concerns regarding construction noise and vibration. The liaison's telephone number(s) shall be prominently displayed at construction locations. • For the centralized and regional BMP projects located adjacent to noise-sensitive land uses, notify in writing all landowners and occupants of properties adjacent to the construction area of the anticipated construction schedule at least 2 weeks prior to groundbreaking. **NOISE-2:** All structural BMPs that employ mechanized stationary equipment that generate noise levels shall comply with the applicable noise standards established by the implementing agency with jurisdiction over the structural BMP site. The equipment shall be designed with noise-attenuating features (e.g., enclosures) and/or located at areas (e.g., belowground) where nearby noise-sensitive land uses would not be exposed to a perceptible noise increase in their noise environment.		
3.10-2: The proposed program could result in exposure of persons to, or generation of, excessive groundborne vibration.	None required	Less than significant	Not applicable
3.10-3: The proposed program could result in a substantial permanent increase in ambient noise levels in the project vicinity	~~Implementation of~~ Implement Mitigation Measures NOISE-1 and NOISE-2	Significant	Less than significant

RB-AR 9656

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
above levels existing without the project.			
3.10-4: The proposed program could result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.	~~Implementation of~~ <u>Implement Mitigation Measure</u> NOISE-1	Significant	Significant and unavoidable
3.10-5: For a project located within an airport land use plan area, or, where such a plan has not been adopted, in an area within 2 miles of a public airport or public use airport, implementation of the proposed program could expose people residing or working in the area to excessive noise levels.	None required	Less than significant	Not applicable
3.10-6: For a project located in the vicinity of a private airstrip, the proposed program could expose people residing or working in the project area to excessive noise levels.	None required	Less than significant	Not applicable
<u>**Cumulative Noise Impacts**</u>	<u>Implement Mitigation Measures NOISE-1 and NOISE-2</u>	<u>Significant</u>	<u>Significant and unavoidable for construction; less than significant for operation</u>
Population and Housing and Environmental Justice			
3.11-1: Implementation of the proposed program could induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure).	None required	No Impact	Not applicable
3.11-2: Implementation of the proposed program could displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere.	None required	No Impact	Not applicable

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
3.11-3: Implementation of the proposed program could displace substantial numbers of people, necessitating the construction of replacement housing elsewhere.	None required	No Impact	Not applicable
3.11-4: Implementation of the proposed program could affect the health or environment of minority or low income populations disproportionately.	None required	Less than significant	Not applicable
Cumulative Population and Housing and Environmental Justice Impacts	None required	No impact	Not applicable
Public Services and Recreation			
3.12-1: The proposed program could result in substantial adverse physical impacts associated with the provision of, or the need for, new or physically altered governmental fire protection facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection services.	**PS-1:** The Permittee implementing the EWMP project shall provide reasonable advance notification to the service providers such as fire, police, local businesses, home owners and residents of adjacent to and within areas potentially affected by the proposed EWMP project about the nature, extent and duration of construction activities. Interim updates should be provided to inform them of the status of the construction activities.	Significant	Less than significant
3.12-2: The proposed program could result in substantial adverse physical impacts associated with the provision of, or the need for, new or physically altered governmental police protection facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for police protection services.	None required	Less than significant	Not applicable
3.12-3: The proposed program could result in substantial adverse physical impacts associated with the provision of, or the need for, new or physically altered schools, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios,	None required	Less than significant	Not applicable

RB-AR 9658

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
response times, or other performance objectives for schools.			
3.12-4: The proposed program could increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.	None required	Less than significant	Not applicable
3.12-5: The proposed program could include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.	None required	Less than significant	Not applicable
Cumulative Public Services and Recreation Impacts	Implement Mitigation Measure PS-1	Less than significant	Not applicable
Transportation and Circulation			
3.13-1: The proposed program could intermittently and temporarily increase traffic levels and traffic delays due to vehicle trips generated by construction workers and construction vehicles on area roadways.	**TRAF-1:** For projects that may affect traffic, implementing agencies shall require that contractors prepare a construction traffic control plan. Elements of the plan should include, but are not necessarily limited to, the following: • Develop circulation and detour plans to minimize impacts to local street circulation. Use haul routes minimizing truck traffic on local roadways to the extent possible. • To the extent feasible, and as needed to avoid adverse impacts on traffic flow, schedule truck trips outside of peak morning and evening commute hours. • Install traffic control devices as specified in Caltrans' Manual of Traffic Controls for Construction and Maintenance Work Zones where needed to maintain safe driving conditions. Use flaggers and/or signage to safely direct traffic through construction work zones. • Coordinate with facility owners or administrators of sensitive land uses such as police and fire stations, hospitals, and schools. Provide advance notification to the facility owner or operator of the timing, location, and duration of construction activities.	Significant	Less than significant

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
3.13-2: Construction of the proposed program could potentially cause traffic safety hazards for vehicles, bicyclists, and pedestrians on public roadways, and could increase traffic hazards due to possible road wear.	None required	Less than significant	Not applicable
3.13-3: The proposed program could result in inadequate emergency access during construction.	None required.	Less than significant	Not applicable
3.13-4: Construction of the proposed program could contribute to cumulative impacts to traffic and transportation (traffic congestion, traffic safety, and emergency vehicle access).	Implement Mitigation Measure ~~Implementation of~~ TRAF-1	Significant	Less than significant
Utilities and Service Systems			
3.14-1: Implementation of the proposed program could exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board or result in the construction of new treatment facilities or expansion of existing facilities if the wastewater treatment provider has inadequate capacity to serve the proposed program.	~~None required~~ **UTIL-1:** Prior to implementation of BMPs, the implementing agency shall conduct a search for local utilities above and below ground that could be affected by the project. The implementing agencies shall contact each utility potentially affected to address relocation of the utility if necessary to ensure access and services are maintained.	Less than significant	Not applicable
3.14-2: The proposed program could require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.	None required	Less than significant	Not applicable
3.14-3: The proposed program could require new or expanded water supply resources or entitlements or require or result in the construction of new water facilities or expansion of existing facilities, the construction of which could cause	Implement Mitigation Measure UTIL-1. **UTIL-~~1~~2:** Prior to approval of BMPs, implementing agencies shall evaluate the potential for impacts to downstream beneficial uses including surface water rights. Implementing agencies shall not approve BMPs that result in preventing access to previously appropriated surface water downstream.	Significant	Less than significant

RB-AR 9660

Impacts	Mitigation Measures	Significance before Mitigation	Significance if Mitigation is Implemented
significant environmental effects.			
3.14-4: The proposed program could be served by a landfill with insufficient permitted capacity to accommodate the project solid waste disposal needs or the project could not comply with federal, state, and local statutes and regulations related to solid waste.	**UTIL-~~2~~3:** Implementing agencies shall encourage construction contractors to recycle construction materials and divert inert solids (asphalt, brick, concrete, dirt, fines, rock, sand, soil, and stone) from disposal in a landfill where feasible. Implementing agencies shall incentivize construction contractors with waste minimization goals in bid specifications where feasible.	Significant	Less than significant
3.14-5: Construction and operation of the proposed program would require additional energy use that could result in wasteful consumption, affect local and regional energy supplies, or conflict with applicable energy efficiency policies or standards.	None required	Less than significant	Not applicable
Cumulative Utilities and Service Systems Impacts	Implement Mitigation Measures UTIL-1, UTIL-2 and UTIL-3	Significant	Less than significant

Section	**Chapter 1, Introduction**
Page	**Clarification/Revision**

1-1 Text has been added regarding EWMP benefits in Chapter 1, *Introduction* as shown below.

The MS4 Permit gives Permittees the option of implementing an innovative approach to permit compliance through development of an Enhanced Watershed Management Program (EWMP). Development of an EWMP is optional, but allows Permittees a longer timeline to develop and implement Best Management Practices (BMPs) needed to achieve compliance. The EWMPS will result in additional benefits including provision of open space and parkland, habitat creation, and stormwater retention. Permittees not preparing Watershed Management Programs must achieve compliance within a year of permit adoption. The EWMPs will identify potential and priority structural and non-structural ~~Best Management Practices (~~BMPs~~)~~ within the region's stormwater collection system to improve runoff water quality. The LACFCD, along with participating Permittees, has opted to exercise this option and has submitted to the LARWQCB 12 separate Notices of Intent (NOIs) for the development of EWMPs within 12 distinct watershed groups (refer to **Figure 1-1**). Implementation of the EMWPs would be the responsibility of each Permittee and would occur following approval of the EWMPs by the LARWQCB.

1-3 Text has been added regarding EWMP preparation in Chapter 1, *Introduction* as shown below.

The timeline identified in the MS4 Permit requires that Permittees who elect to prepare Watershed Management Programs submit them ~~the EWMP~~ to the LARWQCB by June 28, 2015, in order to be in compliance with the permit conditions. The LACFCD recognizes that implementation of the EWMPs may potentially result in changes to environmental conditions. As a result, the LACFCD has prepared this Program Environmental Impact Report (PEIR) in compliance with the California Environmental Quality Act (CEQA) to provide the public and the responsible and trustee agencies with information about the potential effects on the local and regional environment associated with implementation of the EWMPs. The LACFCD will submit the PEIR to its governing body, the Los Angeles County Board of Supervisors, for approval prior to submittal of the EWMPs. The EWMPs will be submitted by each EWMP group to the LARWQCB.

1-3 Text has been added regarding EWMP preparation in Chapter 1, *Introduction* as shown below.

The PEIR analysis is not intended to focus on the site-specific construction and operation details of each management strategy and project included in the

EWMP. Rather, this PEIR serves as a first-tier environmental document that focuses on the effects of implementing the EWMPs to reduce urban runoff pollution anywhere in the watershed. The analysis assesses worst case situations where construction or operation of projects may significantly impact environmental resources whether in urban environments or previously undisturbed open space. The analysis outlines mitigation strategies to be followed by the LACFCD and other implementing agencies that rely on this PEIR to avoid or minimize impacts wherever feasible. The determinations of significance after mitigation in this PEIR will apply to the LACFCD and other implementing agencies that rely on this PEIR and the mitigation measures proposed herein.

1-11 The LACFCD acknowledges that BMPs are not limited to urban areas but may be installed throughout a watershed if necessary to achieve water quality objectives. Text has been added in Chapter 1, *Introduction* as shown below.

The analysis assesses worst case situations where construction or operation of projects may significantly impact environmental resources. The analysis also considers potential impacts and mitigation for BMPs implemented in less developed and urbanized areas of the EWMP where water quality issues may exist that are not directly linked to urbanization but are still regulated under the MS4 Permit. The analysis outlines mitigation strategies to be followed by Implementing Agencies to avoid or minimize impacts wherever feasible. Exact locations and BMP designs are not defined. Rather, the overall compliance strategy of BMP type, quantity, and geographic distribution is assessed on a cumulative, regional scale.

1-12 Table 1-1 has been revised to include the full list of commenters on the NOP. Text has been added in Chapter 1, *Introduction* as shown below.

TABLE 1-1
NOP COMMENTERS

Section **Chapter 2, Project Description**

Page **Clarification/Revision**

2-18 The Wildlife Road project is anticipated to be complete in early 2015 as opposed to August 2014. The correct date has been updated in Chapter 2, *Project Description*, as shown below.

Construction work on the Wildlife Road Storm Drain Improvements project was scheduled to begin March 2014 and continue through ~~August 2014~~early 2015.

2-25 The picture caption containing “Flat” gate should be changed to “flap” gate when referring to the Marie Canyon low-flow diversion system. The correction has been made in Chapter 2, *Project Description*, as shown below.

Marie Canyon Low-Flow Diversion – Fla~~t~~p Gate Diverting flow to treatment unit for bacteria

2-31 In Table 2-4, “treating stormwater and urban runoff prior to the entering into…" should read, “treating stormwater and dry-weather runoff prior to flowing into…"

The correction has been made in Chapter 2, *Project Description*, as shown below.

The Project consists of the installation of different types of biofilters at nine catch basins within the City of Malibu Right of Way, treating stormwater and dry-weather ~~urban~~ runoff prior to ~~the entering of flows~~ flowing into City-owned catch basins, which discharge to privately owned storm drain systems.

2-31	The sentence portion reading, "with potential to incorporate harvest and use systems for Malibu Drains" should be deleted. The sentence, "Three types of biofilters are contemplated; pre-manufactured and custom designed biofilters" should read, **"**Two types of biofilters are included; pre-manufactured and custom designed biofilters." The corrections have been made in Chapter 2, *Project Description*, as shown below.

The Project includes a combination of biofilters, and flow control~~, with potential to incorporate harvest and use systems for Malibu drains~~. ~~Three~~Two types of biofilters are ~~contemplated~~ included; small footprint biofilters, biofilters with volume control, and harvest and use systems.

2-37	In Table 2-4, "compliance with Malibu Creek Bacteria TMDL requirements" should be changed to "compliance with Santa Monica Bay and Malibu Creek Bacteria TMDL requirements." The corrections have been made in Chapter 2, *Project Description*, as shown below.

The project exceeds requirements to put over 300 acres of Malibu (including City Hall) into full compliance with Santa Monica Bay and Malibu Creek Bacteria TMDL requirements, providing a capture volume consistent with Los Angeles Standard Urban Stormwater Mitigation Plan requirements (assuming no upstream LID or source control measures).

Section	**Section 3.1, Aesthetics**
Page	**Clarification/Revision**
3.1-2	"Large-acreage residential properties" should be changed to large-acre and rural residential properties." The corrections have been made in Section 3.1, *Aesthetics*, as shown below.

The Malibu Creek area contains mostly undeveloped mountain areas, large-acreage and rural residential properties, and many natural streams, while Ballona Creek is predominantly channelized and highly developed with both residential and commercial properties (LARWQCB, 2011).

Section	**Section 3.2, Air Quality**
Page	**Clarification/Revision**
3.2-1	The sentence that states "The majority of the County is highly urbanized and consists of several cities, communities, and unincorporated areas" should be

changed to "The majority of the County is highly urbanized with some adjacent rural areas and consists of several cities, communities, and unincorporated areas." The corrections have been made in Section 3.2, *Air Quality*, as shown below.

The majority of the County is highly urbanized with some adjacent rural areas and consists of several cities, communities, and unincorporated areas."

Section **Section 3.3, Biological Resources**

Page **Clarification/Revision**

3.3-2 The sentence that states "These watersheds are characterized by dense residential development along the coast and less development and greater open space areas inland" should be changed to "These watersheds are characterized by dense residential development immediately along the coast and less development and greater open space areas as you move off the shoreline and head inland." The corrections have been made in Section 3.3, *Biological Resources*, as shown below.

These watersheds are characterized by dense residential development immediately along the coast and less development and greater open space areas as you move off the shoreline and head inland.

3.3-19 The text including "Malibu watershed" needs to be updated to read "Malibu Creek watershed" (this needs to be added to all instances in which "Malibu Creek Watershed" is the intent). The change has been included in Section 3.3, *Biological Resources*, as shown below.

This potential effect is most likely to occur within suburban areas, which are more prevalent in the Santa Clara River watershed, Malibu Creek watershed, and San Gabriel watershed.

3.3-20 These conditions may be most prevalent in the Santa Clara River watershed, Malibu Creek Watershed, the Upper Los Angeles River Watershed, and San Gabriel River Watershed where suburban landscape irrigation runoff has created isolated patches of riparian vegetation.

3.3-21 **Northern Coastal EWMP Watersheds *(Malibu Creek and Upper Santa Monica Bay)***

3.3-24 Groundwater seepage would continue to support the major riparian corridors in the Malibu Creek, Santa Clara, Upper Los Angeles, and San Gabriel watersheds.

3.3-26 Groundwater seepage would continue to support the major riparian corridors in the Malibu Creek, Santa Clara, Upper Los Angeles, and San Gabriel watersheds.

3.3-30 Under the cumulative impact discussion, the Mitigation Measures heading should be updated to match the mitigation measures referenced in the cumulative impact discussion.

Implementation of BMPs would ensure compliance with Section 402 of the CWA that requires MS4s to reduce dry-weather flows in this region. Although compliance with Section 402 of the CWA may result in a reduction of wetlands in the region supported by surface flow, the infiltration of surface water into the ground would offset the potential impact, resulting in a less than significant cumulative impact to biological resources in the region.

Mitigation Measures: ~~None required~~ Implement Mitigation Measures BIO-1 through BIO-10.

Significance Determination: Less than significant

Section **Section 3.5, Geologic Resources**

Page **Clarification/Revision**

3.5-28 Mitigation Measure GEO-1 is referred to as reducing cumulative impacts in the cumulative impacts discussion but its implementation is not listed under the Mitigation Measures heading for cumulative impacts. The change has been included in Section 3.5, *Geological Resources*, as shown below.

Mitigation Measures:

Implement Mitigation Measure GEO-1.

GEO-2: Prior to installing BMPs designed to recharge the local groundwater supplies, the Implementing Agency shall notify local groundwater managers, including the Upper Los Angeles River Area Water Master, the Water Replenishment District of Southern California, or the San Gabriel Water Master as well as local water producers such as local municipalities and water companies. The Implementing Agency shall coordinate BMP siting efforts with groundwater managers and producers to mitigate high groundwater levels while increasing local water supplies.

Section **Section 3.7, Hazards and Hazardous Materials**

Page **Clarification/Revision**

3.7-17 Mitigation Measure HAZ-1 has been modified to ensure that vector control plans are incorporated into BMP maintenance plans. The change has been included in Section 3.7, *Hazards and Hazardous Materials*, as shown below.

HAZ-1: Implementing agencies shall prepare and implement maintenance practices that include periodic removal and replacement of surface soils and media that may accumulate constituents that could result in further migration of constituents to sub-soils and groundwater. A BMP Maintenance Plan shall be prepared by Implementing Agencies upon approval of the BMP projects that identifies the frequency and procedures for removal and/or replacement of accumulated debris, surface soils and/or media (to depth where constituent concentrations do not represent a hazardous conditions and/or have the potential to migrate further and impact groundwater) to avoid accumulation of hazardous concentrations and the potential to migrate further to sub-soils and groundwater. The Maintenance Plan shall include vector control requirements. The BMP Maintenance Plan may consist of a general maintenance guideline that applies to several types of smaller distributed BMPs. For smaller distributed BMPs on private property, these plans may consist of a maintenance covenant that includes requirements to avoid the accumulation of hazardous concentrations in these BMPs that may impact underlying sub-soils and groundwater. Structural BMPs shall be designed to prevent migration of constituents that may impact groundwater.

3.7-23 Mitigation Measure HAZ-3 has been incorporated into the cumulative impact discussion and listed mitigation measures. The change has been included in Section 3.7, *Hazards and Hazardous Materials*, as shown below.

Cumulative Impact Discussion

Structural (Regional, Centralized, and Distributed) BMPs

BMPs would be constructed throughout the watersheds. Most of the distributed BMPs would be small in scale and would not result in cumulatively significant impacts due to increased hazards from construction or operation. However, the combination of BMPs throughout the region would change the flow paths of stormwater and urban runoff that currently occurs in the region, resulting in the retention of pollutants generally within the soil of the BMPs that use soil for filtration and retention. Mitigation Measure HAZ-1 would reduce the potential for concentrations of these pollutants to result in localized hazardous conditions at individual BMP locations. Mitigation Measure HAZ-2 would mitigate the accumulation of contaminants in soil at BMPs. For all BMPs within an airport land use area, Mitigation Measure HAZ-3 would require them to be compatible with FAA criteria. BMPs within the minimum separation criteria would trigger collaboration with the airport regarding potential wildlife hazard mitigation. Cumulatively, throughout the region, the retention and treatment of pollutants within each watershed and the reduction of pollutant loading in waterways will substantially benefit water and sediment quality of the region's habitats, rivers, and beaches. Therefore, the project's potential contribution to cumulative effects on hazards and hazardous materials is considered beneficial.

Mitigation Measures:

Implement Mitigation Measures HAZ-1, ~~and~~ HAZ-2 and HAZ-3.

Section	**Section 3.8, Hydrology and Water Quality**
Page	**Clarification/Revision**
3.8-4	The sentence that includes, "in the urbanized areas along Santa Monica Bay" should be changed to "in the urbanized areas along central and south Santa Monica Bay." The corrections have been made in Section 3.8, *Hydrology and Water Quality*, as shown below. In the urbanized areas along central and south Santa Monica Bay, the streams have been channelized.
3.8-6	The sentence containing, "address bacteria loading" should be changed to "prevent possible bacteria loading." The corrections have been made in Section 3.8, *Hydrology and Water Quality*, as shown below. Key BMP strategies are to ~~address~~ prevent possible bacteria loading to the beaches and inland waters, but because of the lower development and largely decentralized infrastructure, LFDs are not the only strategy to address this priority issue.
3.8-27	Los Angeles County is part of a General Exception of ASBS discharge prohibitions. The corrections have been made in Section 3.8, *Hydrology and Water Quality*, as shown below. In ~~March~~ 2012, the SWRCB adopted a General Exception and its amendments (Resolutions 2012-0012 and 2012-0031), ~~(SWRCB, 2012b)~~, which exempts certain listed dischargers including Los Angeles County from certain Ocean Plan ASBS discharge prohibitions. The conditions in the General Exception are designed to protect beneficial uses of the receiving water, yet allow continuation of essential public services, such as flood control, slope stability, erosion prevention, maintenance of the natural hydrologic relationship between terrestrial and marine ecosystems, public health and safety, public recreation and coastal access, commercial and recreational fishing, navigation, and essential military operations (national security) ~~(SWRCB, 2012b)~~.
3.8-27	The following sentence required clarification regarding ASBS dischargers. The corrections have been made in Section 3.8, *Hydrology and Water Quality*, as shown below. The General Exception designates the LACFCD, the City of Malibu, the California Department of Parks and Recreation and the California Department of Transportation (Caltrans) as dischargers to ASBS 24, Laguna Point to Latigo Point.~~, and the California.~~

3.8-27 Within the sentence containing "provided that it," "it" should be changed to "the discharge:" The corrections have been made in Section 3.8, *Hydrology and Water Quality*, as shown below.

The General Exception authorizes these dischargers to discharge into ASBS 24, provided that ~~it~~ the discharge:

3.8-29 Text has been added under the Local Regulations header to describe the status of Salt and Nutrient Management Plans in the region. The corrections have been made in Section 3.8, *Hydrology and Water Quality*, as shown below.

Salt and Nutrient Management Plans

In February 2009, the State Water Resources Control Board adopted Resolution No. 2009-0011, which established a statewide Recycled Water Policy. The Recycled Water Policy encourages increased use of recycled water and local stormwater, together with enhanced water conservation. It also requires local water and wastewater entities, together with local salt and nutrient (S/N) contributing stakeholders to develop Salt and Nutrient Management Plans (SNMPs) for each groundwater basin in California in a way that optimizes recycled water use while ensuring protection of groundwater supply and beneficial uses, agricultural beneficial uses, and human health. The Recycled Water Policy encourages development of regional S/N management strategies rather than relying on the past local RWQCB approach of imposing requirements on individual recycled water projects with no recognition of the relative and cumulative impacts when all projects and loading sources are considered regionally. Accordingly, the SNMP is intended to provide support and justification for elimination of separate anti-degradation analyses and individual site monitoring requirements for proposed recycled water projects and so that the vast majority of proposed recycled water projects may be streamlined. The intent of this streamlined permitting process is to expedite the implementation of recycled water projects in a manner that complies with State and Federal water quality laws. The SNMPs will be approved by the Regional Water Quality Control Boards (RWQCBs).

The Central and West Coast Basins SNMP was developed by the Water Replenishment District of Southern California (WRD) as the lead agency. The SNMP was submitted to LARWQCB for approval in November 2014, and was approved as a Basin Plan Amendment on February 12, 2015. The Upper Los Angeles River Area (ULARA) SNMP is currently being prepared by the ULARA Watermaster. An SNMP for the Santa Clarita River Valley East Subbasin is being prepared by a group of local stakeholders comprised of Castaic Lake Water Agency (CLWA), City of Santa Clarita, Los Angeles County Flood Control District (LACFCD), Newhall County Water District (NCWD), San Gabriel & Lower Los Angeles Rivers and Mountains Conservancy, Sanitation Districts of Los Angeles County (SDLAC) and Valencia Water Company (VWC).

3.8-30 Text has been added regarding the Los Angeles Integrated Regional Water Management Plan in Section 3.8.2, *Hydrology and Water Quality, Regulatory Setting.*

Integrated Regional Water Management Plan

The 2013 Integrated Regional Water Management Plan (IRWMP) Update, approved by the Los Angeles County Board of Supervisors in 2014, was formulated to define a clear vision and direction for the sustainable management of water resources in the Greater Los Angeles County (GLAC) Region. The IRWMP, which is chaired by the Los Angeles County Flood Control District (LACFCD), covers the GLAC Region, an area of approximately 2,058 square miles, spanning from Ventura County to Orange County and from the coast to the San Gabriel Mountains. The IRWMP region includes the Los Angeles River Watershed, the Santa Monica Bay Watershed, the Dominguez Channel Watershed, and the San Gabriel River Watershed, overlapping with four of the five watersheds covered in the EWMP. Several subcommittees were involved in the IRWMP development process, covering a range of both project objectives and physical areas, to ensure successful regional collaboration. The objectives of the 2013 IRWMP Update include: reducing the Region's reliance on imported water; comply with water quality regulations by improving the quality of urban runoff, stormwater and wastewater; protect, restore and enhance natural processes and habitats; increase watershed friendly recreational space for all communities; reduce flood risk in flood prone areas by either increasing protection or decreasing needs using integrated flood management approaches; and adapt to and mitigate against climate change vulnerabilities.

3.8-36 Mitigation Measure HYDRO-3 has been revised as follows in Section 3.8, *Hydrology and Water Quality*.

HYDRO-3: Prior to the installation of an infiltration BMP, the Permittee shall conduct a regulatory database review for contaminated groundwater sites within a quarter mile of the proposed infiltration facility. The review shall include locations of on-site wastewater treatment systems. The Permittee shall identify whether any contaminated groundwater plumes or leach fields are present and whether coordination with the local and state environmental protection overseeing agency and responsible party is warranted prior to final design of infiltration facility.

3.8-37 Mitigation Measure HYDRO-4 has been added as follows in Section 3.8, *Hydrology and Water Quality*.

Structural (Regional, Centralized, and Distributed) BMPs

The proposed structural BMPs would be designed to minimize off-site discharge of urban runoff pollutants including siltation and sedimentation. Many of the structural BMPs would include on-site infiltration of stormwater runoff which would also be effective in minimizing erosion or transport of sedimentation into receiving waters. Through increased infiltration prior to discharge into receiving waters, flows within existing streams or rivers would receive reduced stormwater flow volumes thereby decreasing flow energies. Furthermore, as part of implementation of Mitigation Measure HYDRO-4, implementing agencies would design BMP discharge locations to minimize any hydromodification impacts including erosion and scour. As a result, the potential for erosion or siltation within existing streams or rivers would be reduced and the potential impact less than significant.

Mitigation Measures: ~~None required~~

HYDRO-4: Prior to approving a structural BMP, the implementing agencies shall conduct an evaluation of the potential hydromodification impacts of the project. The evaluation shall recommend design measures necessary to prevent or minimize any identified impacts, including flooding, erosion and/or scour. Design measures could include velocity dissipaters and bank re-enforcement components. Implementing agencies shall include these measures in project designs.

3.8-38 The following sentence should be revised from "Drainage patterns would change through implementation of these non-structural institutional BMPs, implementation of LID strategies, which include on-site infiltration, that would minimize off-site flows as well as the potential for erosion and off-site siltation" to "Drainage patterns would change through implementation of these non-structural institutional BMPs. However, implementation of LID strategies, which include on-site infiltration, would minimize off-site flows as well as the potential for erosion and off-site siltation." The corrections have been made in Section 3.8, *Hydrology and Water Quality*, as shown below.

Drainage patterns would change through implementation of these non-structural institutional BMPs~~,~~. ~~h~~However implementation of LID strategies, which include on-site infiltration, ~~that~~ would minimize off-site flows as well as the potential for erosion and off-site siltation.

3.8-39 The sentence, "The structural BMPs would also provide improvements to water quality of receiving waters" should read, "The structural BMPs would also provide protections to water quality of receiving waters." The corrections have been made in Section 3.8, *Hydrology and Water Quality*, as shown below.

"The structural BMPs would also provide ~~improvements~~ protections to water quality of receiving waters."

3.8-39 The sentence containing, "BMPs but would be designed to improve water quality and reduce stormwater flow volumes" should read, "BMPs but would be designed to improve runoff water quality and reduce stormwater flow volumes." The change has been included in Section 3.8, *Hydrology and Water Quality*, as shown below.

"BMPs but would be designed to improve runoff water quality and reduce stormwater flow volumes"

Section	Section 3.9, Land Use and Agriculture
Page	**Clarification/Revision**

3.9-1 The sentence, "The majority of the County is highly urbanized and consists of several cities, communities and unincorporated areas" be changed to "The majority of the County is highly urbanized with some adjacent rural areas and consists of several cities, communities and unincorporated areas." The change has been included in Section 3.9, *Land Use and Agriculture*, as shown below.

The majority of the County is highly urbanized with some adjacent rural areas and consists of several cities, communities and unincorporated areas."

3.9-1 The sentence, "The EWMP agencies have no jurisdiction over the land that is owned by the State of California (i.e., California Department of Fish and Wildlife, the State Lands Commission, and the California Department of Transportation) or the U.S. Government" should be revised to add the California Department of Parks and Recreation and the National Parks Service. The change has been included in Section 3.9, *Land Use and Agriculture*, as shown below.

The EWMP agencies have no jurisdiction over the land that is owned by the State of California (i.e., California Department of Parks and Recreation, California Department of Fish and Wildlife, the State Lands Commission, and the California Department of Transportation) or the U.S. Government (i.e., National Parks Service).

3.9-28 Low Impact Development (LID) standards are required to be in place within the jurisdictions of Permittees that have chosen EWMPs as their form of compliance with the MS4 Permit. Therefore, a statement regarding LID ordinance requirements should be added. Page 3.9-28 of the Program EIR has been updated to reflect this information as shown below.

Other Cities LID

Various other cities within the County also have LID standards or guidance. The revised MS4 Permit states that permittees that choose to collaborate on the development of a Watershed Management Program (or preparers of an EWMP) shall demonstrate that there are LID ordinances in place and/or have commenced development of a LID ordinance meeting the requirements of this the MS4's Planning and Land Development Program within 60 days of the MS4 effective date (December 28, 2012) and have a draft ordinance within six months of the effective date. The goals, objectives, and content of the LID document are similar to that of the County and City of Los Angeles, and are not referenced here.

3.9-36 "Creek" needs to be added to all instances in which "Malibu Creek Watershed" is the intent. The change has been included in Section 3.9, *Land Use and Agriculture*, as shown below.

Only small areas of Designated Prime, Unique and Important Farmlands exist within the EWMP area, limited to the Santa Clara and Malibu Creek Watersheds.

3.9-38 The statement, "EWMPs would be implemented in already established urban areas" be revised to read, "EWMPs would be implemented in already established developed areas." The change has been included in Section 3.9, *Land Use and Agriculture*, as shown below.

EWMPs would be implemented in already established urban developed areas.

Section	Section 3.14, Utilities and Service Systems
Page	**Clarification/Revision**

3.14-14 Mitigation Measure UTIL-1 has been added to the project. The change has been included in Section 3.14, *Utilities and Service Systems*, as shown below.

Construction requiring ground disturbance could encounter buried utilities including water supply infrastructure. As part of Mitigation Measure UTIL-1, ~~the project design,~~ Implementing Agencies ~~would be required to identify the potential for underground utilities and determine whether they would need to be relocated to accommodate the BMP. As standard construction practices require, Implementing Agencies~~ would conduct an underground utility search prior to excavation and would coordinate with utility providers in advance to ensure no disruption in services to the utility customers. With implementation of UTIL-1, i~~I~~mpacts to water supply infrastructure would be less than significant.

3.14-14 Mitigation Measure UTIL-1 has been added to the project. The change has been included in Section 3.14, *Utilities and Service Systems*, as shown below.

Mitigation Measures: ~~None required~~

UTIL-1: Prior to implementation of BMPs, the implementing agency shall conduct a search for local utilities above and below ground that could be affected by the project. The implementing agencies shall contact each utility potentially affected to address relocation of the utility if necessary to ensure access and services are maintained.

3.14-16 Mitigation Measure UTIL-1 also applies to Impact 3.14-3. The change has been included in Section 3.14, *Utilities and Service Systems*, as shown below.

Construction requiring ground disturbance could encounter buried utilities including water supply infrastructure. As part of Mitigation Measure UTIL-1, ~~the project design,~~ Implementing Agencies ~~would be required to identify the potential for underground utilities and determine whether they would need to be relocated to accommodate the BMP. As standard construction practices require, Implementing Agencies would~~ conduct an underground utility search prior to excavation and would coordinate with utility providers in advance to ensure no disruption in services to the utility customers. With implementation of UTIL-1, i~~I~~mpacts to water supply infrastructure would be less than significant.

3.14-16 The sentence containing “Malibu watershed where surface water diversions…” should be updated to include “Malibu Creek watershed.” The change has been included in Section 3.14, *Utilities and Service Systems*, as shown below.

In areas with natural unimproved streams, such as in the Santa Clara River watershed and Malibu Creek watershed where surface water diversions may be more common, stormwater flows are conveyed downstream quickly.

3.14-16 The introduction of the new Mitigation Measure UTIL-1 impacts the numbering of the existing Mitigation Measure UTIL-1. The change has been included in Section 3.14, *Utilities and Service Systems*, as shown below.

These flows would not be affected by infiltration BMPs. However, implementation of **Mitigation Measure UTIL-~~1~~2** would ensure that downstream water rights would not be affected by upstream diversions.

3.14-17 Mitigation Measure UTIL-1 also applies to Impact 3.14-3. The change has been included in Section 3.14, *Utilities and Service Systems*, as shown below.

Mitigation Measure: Implement Mitigation Measure UTIL-1.

UTIL-~~1~~2: Prior to approval of BMPs, implementing agencies shall evaluate the potential for impacts to downstream beneficial uses, including surface water rights. Implementing agencies shall not approve BMPs that result in preventing access to previously appropriated surface water downstream.

3.14-18 The introduction of the new Mitigation Measure UTIL-1 impacts the numbering of the existing Mitigation Measure UTIL-2. The change has been included in Section 3.14, *Utilities and Service Systems*, as shown below.

Development of a waste management or recycling plan (**Mitigation Measure UTIL-~~2~~3**) would reduce this impact.

3.14-18 The statement that includes, “it is feasible to recycle or reuse at least 50 percent or construction” should be changed to “it is feasible to recycle or reuse at least 50 percent of construction.” The change has been included in Section 3.14, *Utilities and Service Systems*, as shown below.

According the County of Los Angeles, except under unusual circumstances, it is feasible to recycle or reuse at least 50 percent o~~r~~f construction and demolition debris (RWQCB, 2008).

3.14-18 The introduction of the new Mitigation Measure UTIL-1 impacts the numbering of the existing Mitigation Measure UTIL-2. The change has been included in Section 3.14, *Utilities and Service Systems*, as shown below.

Mitigation Measure:

UTIL-~~2~~3: Implementing agencies shall encourage construction contractors to recycle construction materials and divert inert solids (asphalt, brick, concrete, dirt, fines, rock, sand, soil, and stone) from disposal in a landfill, where feasible.

Implementing agencies shall incentivize construction contractors with waste minimization goals in bid specifications where feasible.

3.14-19 New Mitigation Measure UTIL-1 applies to Impact 3.14-5. The change has been included in Section 3.14, *Utilities and Service Systems*, as shown below.

Construction requiring ground disturbance could encounter buried or overhead utilities including electric or gas conveyance infrastructure. As part of Mitigation Measure UTIL-1, ~~the project design,~~ Implementing Agencies ~~would be required to identify the potential for underground utilities and determine whether they would need to be relocated to accommodate the BMP. As standard construction practices require, Implementing Agencies~~ would conduct an underground utility search prior to excavation and would coordinate with utility providers in advance to ensure no disruption in services to the utility customers. Impacts to electric or gas infrastructure would be less than significant.

3.14-20 New Mitigation Measure UTIL-1 applies to Impact 3.14-5. The change has been included in Section 3.14, *Utilities and Service Systems*, as shown below.

Mitigation Measures: ~~None required~~ Implement Mitigation Measure UTIL-1.

3.14-21 New Mitigation Measure UTIL-1 applies to cumulative impacts. The change has been included in Section 3.14, *Utilities and Service Systems*, as shown below.

The proposed program consists of improvements to existing storm drainage facilities as well as new storm drain facilities within the EWMP program areas. This PEIR contains an analysis on the potential environmental effects that might result from the installation of storm drainage facilities identified in the proposed EWMPs. **Mitigation Measure UTIL-1** would require the implementing agency to search for local utilities that could be affected by the project, thereby avoiding impacts to existing utilities. Cumulative impacts to storm drain facilities would be less than significant.

Impacts to the existing water supplies are anticipated to be beneficial as a result of the stormwater and non-stormwater runoff infiltration and conservation BMPs implemented across the EWMP areas. **Mitigation Measure UTIL-~~1~~2** would require that implementing agencies evaluate impacts to downstream beneficial uses, including surface water rights prior to BMP approval. No adverse cumulative impacts related to new or expanded water supply resources or entitlements would occur.

Construction and operation of the structural BMPs would generate solid waste; however, landfills serving the program area are expected to have sufficient capacity to accommodate the amount of waste generated. Development of a waste management or recycling plan (**Mitigation Measure UTIL-~~2~~3**) would reduce this impact. Disposal of the solid waste generated during construction and operation would comply with all pertinent regulations and statutes. All other projects implemented in the area would also be required to comply with federal, state, and local solid waste regulations and statutes. Cumulative impacts would be less than significant.

3.14-21 New Mitigation Measure UTIL-1 applies to cumulative impacts. The change has been included in Section 3.14, *Utilities and Service Systems*, as shown below.

Mitigation Measures: Implement **Mitigation Measure UTIL-1**, ~~and~~ **Mitigation Measure UTIL-2**, and **Mitigation Measure UTIL-3.**

Section **Chapter 4, Cumulative Impacts**

Page **Clarification/Revision**

4-4 In Table 4.1, the timeline for Wildlife Road should be changed from "August 2014" to "early 2015." The change has been included in Chapter 4, *Cumulative Impacts*, as shown below.

5	Wildlife Road Storm Drain Improvements	Distributed	North Santa Monica Bay Coastal Watersheds	Construction was scheduled to begin March 2014 and continue through ~~August 2014~~early 2015

4-4 In Table 4.1, the timeline for Broad Beach Biofiltration Project should be changed to "early 2015." The change has been included in Chapter 4, *Cumulative Impacts*, as shown below.

14	Broad Beach Biofiltration Project	Centralized	North Santa Monica Bay Coastal Watersheds	~~June 2014 (Completion of Construction)~~Early 2015

Section **Chapter 6, Alternatives**

Page **Clarification/Revision**

6-5 "Reduce pollutants from dry- and wet-weather urban runoff" be changed to "reduce pollutants from dry- and wet-weather runoff." The change has been included in Chapter 6, *Alternatives*, as shown below.

The No Program Alternative would not meet the EWMP objective to collaborate among agencies across the watershed to promote more cost-effective and multi-beneficial water quality improvement projects, but it would meet the other objectives to remove or reduce pollutants from dry- and wet-weather ~~urban~~ runoff and reduce the impact of stormwater and non-stormwater on receiving water quality through implementation of structural and non-structural BMPs.

6-13 "Pollutants from dry- and wet-weather urban runoff in a cost-effective manner" should be changed to "pollutants from dry- and wet-weather runoff in a cost-effective manner." The change has been included in Chapter 6, *Alternatives*, as shown below.

	Proposed Program	No Project	Non-Structural BMPs Only	Distributed Structural/ Non-Structural BMPs Only
Project Objectives				
To collaborate among agencies (Permittee jurisdictions) across the watershed to promote more cost-effective and multi-beneficial water quality improvement projects to comply with the MS4 Permit.	Yes	No	No	No
To develop watershed-wide EWMPs that will, once implemented, remove or reduce pollutants from dry- and wet-weather ~~urban~~ runoff in a cost-effective manner.	Yes	No	No	No

Section **Chapter 9, References**

Page **Clarification/Revision**

9-16 The Basin Plan for the Santa Ana Regional Water Quality Control Board is mistakenly included as a reference on page 9-16. The correct reference has been updated in Chapter 9, *References*, as shown below.

California Regional Water Quality Control Board, ~~Santa Ana~~ Los Angeles Region - 1994~~5~~ Water Quality Control Plan ~~for the Santa Ana River~~ Los Angeles Region ~~Basin~~ (Basin Plan) ~~updated in February 2008~~ June 1994.

Dear Ms. Osmena,

The purpose of this letter is to register my support for the restoration of Baldwin Lake as part of the Enhanced Watershed Management Plan (EWMP) for the Rio Hondo Watershed. The lake has experienced significant deterioration in recent decades as a consequence of surface run-off and its very future is very much at risk. Establishing the restoration of Baldwin Lake as a priority project as part of the EWMP will ensure its status as an important ecological and historic asset for generations to come.

Many thanks for attention to this matter.

Very truly yours,

George L. Ball

Mr. Lincoln,

Thank you for your email regarding Baldwin Lake at the LA Arboretum. I apologize for responding so late. I have added your contact information to the stakeholder list for the Rio Hondo/San Gabriel River Water Quality Group to receive notifications of future stakeholder meetings regarding the group's Enhanced Watershed Management Program (EWMP). We anticipate the next stakeholder meeting to occur in early to mid-Spring of next year to discuss the progress of the EWMP process with interested stakeholders. I have also forwarded your email to the group members for their consideration as they continue to discuss and develop their EWMP plan.

Thanks again for your comments.

Dear Ms. Osmena,

I am writing you as an advocate for the Enhanced Watershed Management Plan for the Rio Hondo Watershed to include Baldwin Lake. In addition to its function for water conservation/management, Baldwin Lake is integral to the history of the region and a centerpiece of the Los Angeles Arboretum which is a major County attraction.

Thank you.

William Lincoln

I am writing in support of the restoration of Baldwin Lake at the Los Angeles Arboretum. I have loved The Arboretum as a child, as a parent, and now as a volunteer docent. Thousands of visitors consider the lake an important reason to visit the garden, and it is a critical part of the environment of many of the birds and other animals that call The Arboretum home. On history tours, children learn how important Baldwin Lake has been since its earliest history, when Tongva Indians called their home *Aleupkigna* or *Place of Many Waters.* Our visitors have expressed dismay and concern as the water levels have declined and the quality of the water deteriorated. Please know how important Baldwin Lake is to many in our community and beyond, and take advantage of the opportunity now available to restore the health and beauty of Baldwin Lake.

Sincerely,
Margaret Page

Subject: Baldwin Lake at the Arboretum

I am writing this note to ask you to do what you can to help restore
Baldwin Lake in the LA County Arboretum. The historical center of the property
is in need of dredging and repair work to the sides. The lake has a water supply that is covered with
debris and water level has dropped from the original 18 feet to 18 inches.
We are losing too many historical places in the country today. Please support any projects that
will help restore the lake. The Baldwin Queen Anne Cottage and the lake are important draws for visitors from all over the world.

Thank you for your time,
L.Gayle San Miguel

The Arboretum
LOS ANGELES COUNTY ARBORETUM & BOTANIC GARDEN

September 16, 2014

Ms. Genevieve Osmena
County of Los Angeles Department of Public Works
Project Management Division II
900 South Fremont, 5th Floor
Alhambra, CA 91803

Dear Ms. Osmena:

On behalf the Arboretum community, I propose that the re-engineering of Arcadia's Baldwin Lake be included as an important priority in the Rio Hondo/San Gabriel River Enhanced Watershed Management Plan. Located within the Los Angeles County Arboretum, Baldwin Lake is a magnificent 19th century landmark that began as a naturally occurring wetland along the Raymond Fault. The lake was created by Elias Jackson Baldwin in the 1880s to serve as the centerpiece of the Baldwin Ranch, one of the largest agricultural enterprises in the region.

In the early 1950s, Baldwin Lake was repurposed to serve as the collection basin for Arcadia's urban watershed to the north, today receiving runoff from nearly 200 acres of mostly paved surfaces. During the last storm event in our area, this past March, over three million gallons of water moved into the lake with little or no bio-filtration. Within 24 hours of the start of the storm, a slick of oil across the water's surface became an almost dominant feature.

In sum, Baldwin Lake and its connecting systems were never designed to serve a very significant collection function for a large urban watershed. Consequently, annual delivery of petrochemicals and other contaminants has created a dysfunctional drainage as well as a degraded aquatic ecosystem in a highly public location of scenic, educational and historic value. A 2012 study of water and sediments found significant deposits of oil and tar, toxic pesticide residues, and bacteria counts that exceeded the limits for recreational water.

Mitigating these issues promises the ideal multi-benefit regional project. Please note the following points:

1. Baldwin Lake, with a current capacity of just under 4 million gallons, if returned to its original depth, would provide over twelve million gallons in storage capacity. With modification, it could also serve as a significant infiltration basin for aquifer recharge.

2. Tule Pond to the north, a canal roughly 600ft. in length, is the point of entry for the urban watershed, feeding directly into Baldwin Lake. Its size, shape and location offer great potential for water quality enhancement through modification as a bioswale.

3. The Lake is a key educational, scenic, wildlife, and historic resource serving over 330,000 visitors per year, including over 16,000 elementary school students on field trips. The project would provide an unrivaled opportunity to educate a broad public about regional water management, home and community water conservation, and the role of the Raymond Basin and the other key water resources that sustain us.

4. The Arboretum Foundation, the County's non-profit partner in operating the Arboretum, stands ready to help leverage public dollars to realize the site's unique educational potential.

Also, please note that in the stated ranking criteria for proposed multi-benefit regional projects, Baldwin Lake scores highly in 5 of the 6 categories. It is publicly owned, offers a water body four acres in size, is within a potential surrounding catchment area of over 100 acres, cleanses runoff that likely exceeds allowances, and perhaps most importantly, offers very substantial multi-use opportunities and connectivity. I urge your consideration of Baldwin Lake as a key project within the Rio Hondo/Upper San Gabriel Enhanced Watershed Management Plan.

I thank you for your time and consideration.

Sincerely,

Richard Schulhof, CEO
Los Angeles County Arboretum and Botanic Garden

To: Osmena, Genevieve
Subject: Arboretum's Baldwin Lake as part of Rio Hondo Watershed Management plans

Dear Ms. Osmena,

I write in support of the inclusion of the Arboretum's Baldwin Lake in Public Work's ongoing efforts to create an Enhanced Watershed Management Plan for the Rio Hondo watershed in which the Arboretum resides. I understand that many projects must be considered, but Baldwin Lake can be a jewel in this effort, perhaps even part of the Emerald Necklace one day.

I enjoyed a 35 year career as a County employee, all of those years spent at the Arboretum as the History Curator. My Master's thesis centered on land use by entrepreneur Elias Jackson "Lucky" Baldwin, founder of the City of Arcadia and premier owner of the land now known as the Arboretum. Lucky Baldwin found a sag pond on his property upon purchase in 1875, but it was already a geologic feature that worked well for Baldwin as a holding reservoir for his vast irrigation system. Baldwin acquired water rights to half of each Big and Little Santa Anita Canyon waters to supplement the natural artesian sources that came with Rancho Santa Anita, and his irrigation designs were noted and reportedly photographed by the US Geologic Service in the early 1890's. At approximately this same time, Baldwin dredged and deepened the natural basin now called Baldwin Lake, taking it to some 15-18 feet in depth. Runoff from multiple natural streams were channeled into Baldwin Lake, and outflow went south and east into orchards and vineyards. From there, waters travelled their current route through the Rio Hondo watershed, eventually reaching Whittier Narrows (where

Baldwin owned numerous parcels of adjacent land). Lucky Baldwin created an estate garden of note during his ownership years (1875-1909), and Baldwin Lake with its granite boulder-topped retaining walls was a popular feature. Period postcards document this era, as do oral histories and other primary sources of note. It is rare to find such pristine land largely undeveloped in Southern California, but Baldwin's daughters ensured that the land remain intact, and in 1947 the County of Los Angeles purchased the remaining acreage of Baldwin Ranch for public purposes.

I wrote the National Register of Historic Places nomination for Baldwin's Queen Anne Cottage and matching Coach Barn in 1980, and it was with significant urging from the State Office of Historic Preservation that the four-acre Baldwin Lake and surrounding landscape were included in this application. The entire 9-acre parcel with two structures and the entire Baldwin Lake became part of the National Register, and almost 35 years later we remain the primary caretakers of this precious resource. The addition of the strong voice and professional resources of Public Works would be greatly appreciated.

I retired in 2006, but immediately became a volunteer at the Arboretum and have continued my efforts to preserve the historic integrity of this amazing facility. I am now in my fourth year as President of the Arboretum's 300-person strong Los Voluntarios, and I am sure you will hear from others in our ranks who share the Lake every day with thousands of visiting adults and school children. We see the magic every day as children without such magnificent resources nearby enjoy both the beauty of the land and the wildlife that Baldwin Lake supports. The gradual degradation of the lake over the years has been hard to watch. I have seen the Lake go dry in past droughts, but the build-up of sediment over the past ten years has drastically exacerbated matters. What was once 12 feet or so of relatively healthy water during my working years is now perhaps 18 inches at best. I believe that Baldwin Lake is the last remaining sag pond along the Raymond Hill Fault still functioning as a body of water; to lose this incredible resource after 125 years of effort by so many would be tragic.

Not every concerned Arboretum volunteer will write despite their frequently voiced concerns, but please be assured that I confidently speak for at least our 30 member Los Voluntarios Board. We have previously written to Supervisor Antonovich with our concerns about the future well-being of Baldwin Lake, and we would be happy to share that letter with you if it is of any help in current efforts to prioritize projects within the Enhanced Watershed Management Plan.

I thank you for your consideration,

Sandy Snider

> Gregg: I would appreciate 4 or 5 discs for distribution …. thank you for the offer. Unfortunately, most of the volunteers I have spoken with say they did not save their 'sent' email items, so not sure I can retrieve them for inclusion in the PEIR. I am hearing from most of those I listed below that they are receiving notifications of the March 9 public meeting, so I am hoping that at least their email addresses can be included in the final PEIR as having sent comments.
>
> Since my last communication, I have heard from a couple of other constituents that they are sending a second letter/email ….. hopefully, those will be received and recorded (Heflin, Moore).
>
> You and Gennie have been so helpful with your prompt answers to our inquiries …. we do appreciate it.

By the way, in the course of studying past reports on the Arboretum's Baldwin Lake, I find reference to LA County Flood Control being onsite in April, 1975 with recommendations about storm water management re both Tule Pond and Baldwin Lake. The report does not list a specific citation with report number/author; is there someone with whom I could speak or some way I can access this archived report? The report (Baldwin Lake Study) is from 2007, written by Morton Price as part of a Masters project for his degree from Cal State University Los Angeles (my own alma mater).

Hello Gennie (and Gregg),

Thank you for your reply. Not that my single letter is of great importance, but I have since learned of other Arboretum volunteers and Trustees whose comment letters are also not in the Draft PEIR. All confirm that they sent letters/email and received acknowledgment of receipt from either you or Gregg.

Beside myself, names omitted include:

- Pat Wilmot, First VP Los Voluntarios
- Margaret Page, Los Voluntarios History Preservation chair
- Andy Edmonds, Los Voluntarios Herb Garden chair
- Gayle San Miguel, Los Voluntarios community liaison
- Lauragene Swenson, Los Voluntarios communications chair (though she sent to Sup. Antonovich directly and may not have cc'd either of you)
- Pam Warner, Arboretum Trustee

We haven't checked in with everyone, of course, but just a quick email to those I work with closely caused some alarm about how comment letters were accounted for. I am fairly sure that Trustees Leelee Doughty (Secretary) and Bill Lincoln (Treasurer) were intending to write; perhaps also Trustee Dan Foliart (First VP). Those bulleted above are the ones I am sure sent letters/email.

Many thanks for looking into this.

Sandy

Hi Sandy,

I apologize that your comment letter was not included in the Draft PEIR document. We are looking into why it was omitted and how to incorporate it now. Gregg Begell is the project manager for the preparation of the document and I believe he is planning to contact you with a response as well.

Subject: FW: Arboretum's Baldwin Lake as part of Rio Hondo Watershed Management plans

Hello Gennie – At our Arboretum Los Voluntarios general meeting this morning, Richard Schulhof and I were handed a DVD by one of our volunteers (Jane Florentinus) that she said came from the Dept. of Public Works. Richard was unable to open it at work, so I took it home with me. Very interesting reading, but I was left wondering why I didn't receive a direct copy as a 'stakeholder' who sent my comments in on Oct. 20, 2014 (see below). I looked at the relatively brief list of those who sent comments, but my name was not included …. I am sure this was not done on purpose, but I hope others who may have commented were not also inadvertently omitted. I do see some of our Arboretum Trustees plus others in our volunteer ranks. Should I re-submit my comments and ask others who I know sent in letters/email to do the same?

Many thanks,

Sandy Snider

Subject: Arboretum's Baldwin Lake as part of Rio Hondo Watershed Management plans

Dear Mr. BeGell,

I write in support of the inclusion of the Arboretum's Baldwin Lake in Public Work's ongoing efforts to create an Enhanced Watershed Management Plan for the Rio Hondo watershed in which the Arboretum resides. I understand that many projects must be considered, but Baldwin Lake can be a jewel in this effort, perhaps even part of the Emerald Necklace one day.

I enjoyed a 35 year career as a County employee, all of those years spent at the Arboretum as the History Curator. My Master's thesis centered on land use by entrepreneur Elias Jackson "Lucky" Baldwin, founder of the City of Arcadia and premier owner of the land now known as the Arboretum. Lucky Baldwin found a sag pond on his property upon purchase in 1875, but it was already a geologic feature that worked well for Baldwin as a holding reservoir for his vast irrigation system. Baldwin acquired water rights to half of each Big and Little Santa Anita Canyon waters to supplement the natural artesian sources that came with Rancho Santa Anita, and his irrigation designs were noted and reportedly photographed by the US Geologic Service in the early 1890's. At approximately this same time, Baldwin dredged and deepened the natural basin now called Baldwin Lake, taking it to some 15-18 feet in depth. Runoff from multiple natural streams were channeled into Baldwin Lake, and outflow went south and east into orchards and vineyards. From there, waters travelled their current route through the Rio Hondo watershed, eventually reaching Whittier Narrows (where Baldwin owned numerous parcels of adjacent land). Lucky Baldwin created an estate garden of note during his ownership years (1875-1909), and Baldwin Lake with its granite boulder-topped retaining walls was a popular feature. Period postcards document this era, as do oral histories and other primary sources of note. It is rare to find such pristine land largely undeveloped in Southern California, but Baldwin's daughters ensured that the land remain intact, and in 1947 the County of Los Angeles purchased the remaining acreage of Baldwin Ranch for public purposes.

I wrote the National Register of Historic Places nomination for Baldwin's Queen Anne Cottage and matching Coach Barn in 1980, and it was with significant urging from the State Office of Historic Preservation that the four-acre Baldwin Lake and surrounding landscape were included in this application. The entire 9-acre parcel with two structures and the entire Baldwin Lake became part of the National Register, and almost 35 years later we remain the primary caretakers of this precious resource. The addition of the strong voice and professional resources of Public Works would be greatly appreciated.

I retired in 2006, but immediately became a volunteer at the Arboretum and have continued my efforts to preserve the historic integrity of this amazing facility. I am now in my fourth year as President of the Arboretum's 300-person strong Los Voluntarios, and I am sure you will hear from others in our ranks who share the Lake every day with thousands of visiting adults and school children. We see the magic every day as children without such magnificent resources nearby enjoy both the beauty of the land and the wildlife that Baldwin Lake supports. The gradual degradation of the lake over the years has been hard to watch. I have seen the Lake go dry in past droughts, but the build-up of sediment over the past ten years has drastically exacerbated matters. What was once 12 feet or so of relatively healthy water during my working years is now perhaps 18 inches at best. I believe that Baldwin Lake is the last remaining sag pond along the Raymond Hill Fault still functioning as a body of water; to lose this incredible resource after 125 years of effort by so many would be tragic.

Not every concerned Arboretum volunteer will write despite their frequently voiced concerns, but please be assured that I confidently speak for at least our 30 member Los Voluntarios Board. We have previously written to Supervisor Antonovich with our concerns about the future well-being of Baldwin Lake, and we would be happy to share that letter with you if it is of any help in current efforts to prioritize projects within the Enhanced Watershed Management Plan.

I thank you for your consideration,

Sandy Snider

Ms. Viera,

Thank you for your email regarding Baldwin Lake at the LA Arboretum. I have added your contact information to the stakeholder list for the Rio Hondo/San Gabriel River Water Quality Group to receive notifications of future stakeholder meetings regarding the group's Enhanced Watershed Management Program (EWMP). We anticipate the next stakeholder meeting to occur in early to mid-Spring of next year to discuss the progress of the EWMP process with interested stakeholders. I have also forwarded your email to the group members for their consideration as they continue to discuss and develop their EWMP plan.

Thanks again for your comments.

Alhambra, CA 91803

Dear Gregg BeGell & Genevieve Osmena,

Since the Los Angeles Regional Water Quality Control Board has released all of the submitted EWMP Workplans and CIMPs for public comment, I have decided to write you.

My name is Margaux L. Viera. I am the great great great granddaughter of Elias Jackson “Lucky” Baldwin, who was a previous land owner of Rancho Santa Anita now know as, The Los Angeles County Arboretum & Botanical Gardens. On the land site there is a natural lake, named Baldwin Lake. I have recently joined the board of trustees at The Los Angeles Arboretum, their cultural heritage committee and lastly the group fore running the campaign to, “SAVE BALDWIN LAKE”.

Baldwin Lake has been the anchor of this site since it’s founding. The lake has been a natural source of artesian water, going back to the Baldwin era as well as being featured in thousands of film and television features. Most named is the original Tarzan feature film and the Fantasy Island television series. Hundreds of thousands of people travel each year to The Los Angeles Arboretum to experience the natural serenity, discover plant & animal species, learn about it’s founders and rich history. Many of which are grade school students coming here for the first time to experience a natural setting hidden in the middle of Los Angeles County. That is one of the things that makes, The Los Angeles Arboretum so unique and special.

The EWMP Work Plan approaches to prioritize stormwater pollutants, **identify sites that are suitable for water quality and conservation projects**, and conduct reasonable assurance analyses with a peer-reviewed model. Baldwin Lake should be placed on the top of the list and be a county priority. The CIMP details the watershed groups’ collaborative plan to conduct long-term monitoring in the watersheds in an effort to continuously assess the water quality of urban discharges and their impact on our waterways. Baldwin Lake is in dire need of your aid and attention. The current conditions of the lake fall under all your plans and could be a great model and learning tool. The preservation of this natural resource is critical for the future of our county's natural resources and the future of our children's environment.

Thank you for your time and I look forward to seeing Los Angeles county take the necessary actions needed to preserve our counties assets.

Happy holidays,

Margaux L. Viera

Dear Mr BeGell,

Attached is a resend of a letter originally sent as an email on December 2, 2014. My understanding is that since the original was an email and not a separate attachment, my letter would not have been included in the compilation of letters sent to your office.

Thank you for your time and attention.

To: "Mr. BeGell" <gbegell@dpw.lacounty.gov>

Dear Mr. BeGell,

I am writing in support of the efforts to restore Baldwin Lake at the Los Angeles Arboretum. I have lived in the Alhambra area since 1985 and over the years have been a regular visitor to the Arboretum. The decline of the lake is very obvious. It used to be a flourishing home for all kinds of birds and wildlife, but now, sadly, it just looks dirty and neglected. It is really a shame since the beautiful Queen Anne cottage forms a backdrop to the lake. Since retiring I have become a volunteer at the Arboretum and lead groups of school kids on history tours - mostly 3rd and 4th graders. The beauty of the Arboretum fascinates them, especially the inner-city kids, but all express concerns about how dirty the water in the lake looks and want to know “Why?” Please do whatever you can to support the restoration of the lake. It is part of a beautiful and historic area and deserves to be shown to it’s full potential.

If you have never visiited the Arboretum, (or if it has been a long time since your last visit), please come and see for yourself what a beautiful, fascinating and restful place it is. We have volunteer docents that would be more than happy to lead you on a tour!

Sincerely,
Patricia Wilmot

<u>Exhibit A</u>

**FINDINGS OF FACT IN SUPPORT OF FINDINGS
RELATED TO SIGNIFICANT ENVIRONMENTAL IMPACTS**

State CEQA Guidelines Section 15091

for

Enhanced Watershed Management Programs

**Final Program Environmental Impact Report
SCH# 2014081106**

Lead Agency: Los Angeles County Flood Control District

1.0 Introduction

The following findings of fact are based in part on the information contained in the Draft and Final Program Environmental Impact Report (Program EIR) for the Enhanced Watershed Management Program, as well as additional facts found in the complete record of proceedings. The Final Program EIR is hereby incorporated by reference and is available for review at the Department of Public Works, 900 south Fremont Avenue, 11th Floor, Alhambra, CA 91803, during normal business hours, and is also available on the District's website www.LACoH2Osheds.com.

In December 2012, the Los Angeles Regional Water Quality Control Board (LARWQCB) issued a Municipal Separate Storm Sewer System (MS4) Permit (Order No. R4-2012-0175; National Pollutant Discharge Elimination System [NPDES] Permit No. CAS004001) covering discharges within coastal watersheds from the collective storm sewer systems in Los Angeles County (except from the City of Long Beach). The Permit regulates the discharge of stormwater runoff to waters of the United States from facilities owned and maintained by the Los Angeles County Flood Control District (LACFCD or District), the County of Los Angeles, and 84 incorporated cities within Los Angeles County (collectively referred to as Permittees). The purpose of the MS4 Permit is to achieve and maintain water quality objectives to protect beneficial uses of the receiving waters in the Los Angeles region. Each of the Permittees identified in the MS4 permit is responsible for meeting the conditions of the permit for MS4 discharges occurring within their jurisdiction.

The MS4 Permit gives Permittees the option of implementing an innovative approach to permit compliance through development of an Enhanced Watershed Management Program (EWMP). The EWMPs will identify potential and priority structural and non-structural Best Management

Practices (BMPs) within the region's stormwater collection system to improve runoff water quality. The LACFCD, along with participating Permittees, has opted to exercise this option and has submitted to the LARWQCB 12 separate Notices of Intent (NOIs) for the development of EWMPs within 12 distinct watershed groups. Implementation of the EMWPs would be the responsibility of each Permittee and would occur following approval of the EWMPs by the LARWQCB.

The LACFCD, as a regional agency, is a member of each of the 12 EWMP working groups, and as such provides a commonality within each EWMP group. However, LACFCD does not have a special status or authority designated by the MS4 Permit over any of the other Permittees. The LACFCD will be working with the applicable Permittees in all 12 EWMP watersheds as an equal partner to identify the types and locations of BMPs needed to achieve permit compliance within each watershed.

The timeline identified in the MS4 Permit requires that Permittees submit the EWMP to the LARWQCB by June 28, 2015, in order to be in compliance with the permit conditions. The LACFCD recognizes that implementation of the EWMPs may potentially result in changes to environmental conditions. As a result, the LACFCD has prepared this Program Environmental Impact Report (PEIR) in compliance with the California Environmental Quality Act (CEQA) to provide the public and the responsible and trustee agencies with information about the potential effects on the local and regional environment associated with implementation of the EWMPs. The LACFCD will submit the PEIR to its governing body, the Los Angeles County Board of Supervisors, for approval prior to submittal of the EWMPs. The EWMPs will be submitted by each EWMP group to the LARWQCB.

The LACFCD issued a notice of preparation of a Draft Program EIR on July 27, 2012. The notice of preparation stated that the Draft Program EIR would contain a comprehensive analysis of environmental issues identified in Appendix G of the *California Environmental Quality Act (CEQA) Guidelines*. With respect to all impacts identified as "less than significant" or as having "no impact" in the Final Program EIR, the District finds that those impacts have been described accurately and are less than significant or have no impact. In addition, some impacts in the Final Program EIR were found to be potentially "significant" but are able to be mitigated to less-than-significant levels, and others were found to be "significant and unavoidable." The District finds that those impacts have been described accurately and are less than significant with the implementation of mitigation or are significant and unavoidable.

The District further finds that the application of mitigation measures identified in the Final Program EIR would be the responsibility of each agency implementing projects identified in the program (implementing agencies). The District finds that the mitigation measures identified in the Final EIR are reasonable and readily implementable under foreseeable circumstances, such that it is reasonably assumed that implementing agencies can and should adopt and implement them for their projects. The conclusions of significance for each impact in the Final Program EIR therefore assume that mitigation measures identified in the Final Program EIR would be applied as described therein.

The District has adopted the mitigation measures identified in the Final Program EIR, and will implement those measures for projects it implements under the Program. However, as explained more fully in Section 5.0, because the District will not be the implementing agency for all projects being implemented as part of the proposed program, the District cannot state with certainty that all impacts capable of being mitigated to less-than-significant levels will in fact be mitigated to a less-than-significant level. Accordingly, the District finds that as to projects where the District will not be an implementing agency, the impacts described in the Program EIR as being potentially "significant" but capable of being mitigated to less-than-significant levels must be found to be "significant and unavoidable."

2.0 Project Description

The 12 EWMPs will vary for each watershed group, but will generally provide the opportunity for Permittees to customize their stormwater programs to achieve compliance with applicable receiving water limitations (RWLs) and water-quality-based effluent limits (WQBELs) in accordance with the MS4 Permit through implementation of stormwater best management practices (BMPs) or watershed control measures. BMPs vary in function and type, with each BMP providing unique design characteristics and benefits from implementation. The overarching goal of BMPs in the EWMP is to reduce the impact of stormwater and non-stormwater on receiving water quality and address the water quality priorities as defined by the MS4 Permit. The development of each EWMP will involve the evaluation and selection of multiple BMP types, including nonstructural (institutional) and distributed, centralized, and regional structural watershed control measures, that will be implemented to meet compliance goals and strategies under the 2012 MS4 Permit. The LACFCD has limited jurisdictional authority for ordinance and code enactment or enforcement and therefore is limited in nonstructural BMPs to education and outreach measures. The structural watershed control measures that will be implemented by the LACFCD will be multi-benefit stormwater projects that emphasize flood risk mitigation and water conservation and supply.

The LACFCD has a vested interest in increasing opportunities for stormwater capture and groundwater recharge as a means of assisting local water supply augmentation. The LACFCD will be working with the applicable Permittees and other stakeholders in all 12 EWMP watersheds to develop such projects. The EWMPs will be implemented by the Permittees that have jurisdiction within each EWMP area. The implementing agencies will be responsible for the contents of the EWMPs affecting their jurisdictions and for implementing the projects developed by the EWMPs.

Structural control measures are constructed BMPs that reduce the impact of stormwater and non-stormwater on receiving water quality. They are broken into three categories:

- ***Distributed Structural BMPs***, which treat runoff close to the source and are typically implemented at a single- or few-parcel level (e.g., facilities typically serving a contributing area less than one acre).

- ***Centralized Structural BMPs***, which treat runoff from a contributing area of multiple parcels (e.g., facilities typically serving a contributing area on the order of tens or hundreds of acres or larger).
- ***Regional Structural BMPs***, which are meant to retain the 85th percentile storm over 24 hours from a contributing area. Generally, the 85^{th} percentile storm is approximately 0.75 inches over 24 hours

Whether distributed, centralized, or regional, the major structural BMP functions are infiltration, treatment, and storage, which may be used individually or combination:

- ***Infiltration*,** where runoff is directed to percolate into the underlying soils. Infiltration generally reduces the volume of runoff and increases groundwater recharge.
- ***Treatment***, where pollutants are removed through various unit processes, including filtration, settling, sedimentation, sorption, straining, and biological or chemical transformations.
- ***Storage***, where runoff is captured, stored (detained), and slowly released into downstream waters. Storage can reduce the peak flow rate from a site, but does not directly reduce runoff volume.

The types of structural BMPs to be implemented will vary between EWMPs, but most EMWPs will include a variety of distributed, centralized, and regional BMPs.

Non-structural BMPs are policies, actions, and activities which are intended to minimize or eliminate pollutant sources. Most institutional BMPs are implemented to meet Minimum Control Measure (MCM) requirements in the MS4 permit; MCMs are considered a subset of institutional BMPs. These BMPs are not constructed, but may have costs associated with the procurement and installation of items such as signage or spill response kits.

3.0 CEQA Review and Public Participation

A Notice of Preparation (NOP)/Initial Study (SCH No. 2014081106) was circulated for a 30-day public review period beginning on August 29, 2014. Twenty (20) individual written comment letters were received and used in the preparation of the Draft PEIR. The Draft PEIR for the proposed project was initially circulated for a 45-day public review period beginning on January 21, 2015 and ending on March 9, 2015. Per an announcement via e-mail blast on March 6, the comment period was extended through March 16, 2015 at 5PM. A total of 46 individual written comment letters were received on the Draft PEIR.

Section 15088 of the *CEQA Guidelines* requires that the lead agency evaluate comments on environmental issues received from persons and agencies that reviewed the Draft PEIR and prepare a written response addressing each of the comments received. The response to comments is contained in this document—Volume 3, Chapter 12 of the Final PEIR. Volumes 1 through 3 together constitute the Final PEIR. A list of agencies and interested parties who have commented on the Draft PEIR is provided below. A copy of each numbered comment letter and a lettered response to each comment are provided in Chapter 12, *Response to Comments*, of this Final PEIR.

LACFCD held 6 community meetings on January 29 and February 3, 5, 10, 11 and 17, 2015 to discuss the Draft PEIR analysis and alternatives. The six public meetings that took place at 6PM each night listed are as follows:

- Public Meeting 1 (Florence-Firestone Service Center – January 29, 2015)
- Public Meeting 2 (LA County Fire Camp – February 3, 2015)
- Public Meeting 3 (San Pedro Service Center – February 5, 2015)
- Public Meeting 4 (Topanga Library – February 10, 2015)
- Public Meeting 5 (Hacienda Heights Community Center – February 11, 2015)
- Public Meeting 6 (East Los Angeles Library – February 17, 2015)

4.0 No Environmental Impacts

4.1 Structural BMPs

4.1.1 Aesthetics

The proposed program would not create a new source of substantial light or glare that would adversely affect day or nighttime views in the area (Impact 3.1-4).

Finding

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to the creation of new sources of substantial light or glare that would adversely affect day or nighttime views in the area.

4.1.2 Air Quality

The proposed program would not conflict with or obstruct implementation of the applicable air quality plan (Impact 3.2-1).

Finding

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to conflicting with or obstructing implementation of the AQMP prepared by SCAQMD and SCAG.

4.1.3 Biological Resources

The proposed program would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. (Impact 3.3-4)

The proposed program would not conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan. (Impact 3.3-6)

Finding

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the Proposed Program would result in no impact relating to the interference with the movement of any native resident or migratory fish or wildlife or with established native resident or migratory wildlife corridors, or the impediment of the use of native wildlife nursery sites.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan.

4.1.4 Cultural Resources

The proposed program would not have any environmental effects related to cultural resources that would result in no impacts or less than significant impacts unmitigated.

4.1.5 Geologic and Mineral Resources

The proposed program would not locate new facilities in areas susceptible to seismic impacts such as (1) rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area based on other substantial evidence of a known fault, (2) strong seismic groundshaking, or (3) seismically induced liquefaction or landslides, which could expose people, structures, or habitat to potential risk of loss, damage, injury, or death (Impact 3.5-1).

The proposed program would not result in substantial soil erosion or the loss of topsoil (Impact 3.5-2).

The proposed program would not be located on expansive soil as defined in 24 CCR 1803.5.3 of the California Building Code (2013), creating substantial risks to life or structures. (Impact 3.5-4).

The proposed program would not have soils incapable of adequately supporting the use of a septic tank or alternative wastewater treatment systems where sewers are not available for the disposal of wastewater (Impact 3.5-5).

The proposed program would not result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state or a locally important mineral resource recovery site delineated on a local General Plan, Specific Plan, or other land use plan (Impact 3.5-6).

Finding

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to location of new facilities in areas susceptible to seismic impacts of various kinds.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to substantial soil erosion or loss of topsoil.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to location on expansive soil.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to having soils incapable of adequately supporting the use of septic tank or alternative wastewater treatment systems.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to the loss of availability of a known mineral resource that would be of value to the region and the residents of the state, or a locally important mineral resource recovery site delineated on a local General Plan, Specific Plan, or other land use plan.

4.1.6 Greenhouse Gas Emissions

The proposed program would not generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment (Impact 3.6-1).

The proposed program would not conflict with an applicable plan, policy, or regulation of an agency adopted for the purpose of reducing the emissions of GHGs (Impact 3.6-2).

The proposed program would not result in significant cumulative impact to GHGs.

Finding

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the Proposed Program would result in no impact relating to generation of GHG emissions.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to confliction with an applicable plan, policy, or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program does not have the potential to result in significant cumulative impacts to GHGs.

4.1.7 Hazards and Hazardous Materials

The proposed program would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials or the accidental release during construction and maintenance activities (Impact 3-7.1).

The proposed program would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing school (Impact 3.7-3).

The proposed program would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan (Impact 3.7-6).

The proposed program would not expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands (Impact 3.7-7).

Finding

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to the creation of a significant hazard to the public or environment through routine transport, use, or disposal of hazardous materials or accidental release during construction and maintenance activities.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the Proposed Program would result in no impact relating to hazardous emissions or handling of hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing school.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to the implementation of an adopted emergency response or emergency evacuation plan.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to exposure of people or structures to significant risk of loss, injury or death involving wildland fires.

4.1.8 Hydrology and Water Quality

The proposed program would not violate water quality standards or waste discharge requirements or further degrade water quality (Impact 3.8-1).

The proposed program would not substantially alter the existing drainage pattern of a site or area through the alteration of the course of a stream or river, or by other means, in a manner that would result in substantial erosion or siltation on- or off-site (Impact 3.8-3).

The proposed program would not substantially alter the existing drainage pattern of a site or area through the alteration of the course of a stream or river or, by other means, substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site (Impact 3.8-4).

The proposed program would not create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff (Impact 3.8-5).

The proposed program would not place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other authoritative flood hazard delineation map (Impact 3.8-6).

The proposed program would not place within a 100-year flood hazard area structures that would impede or redirect flood flows (Impact 3.8-7).

The proposed program would not expose structures to a significant risk of loss, including flooding as a result of the failure of a levee or dam (Impact 3.8-8).

The proposed program would not place structures in areas subject to inundation by seiche, tsunami, or mudflow (Impact 3.8-9).

The proposed program would not result in significant cumulative impact to hydrology and water quality.

Finding

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to the violation of water quality standards or waste discharge requirements.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to the alteration of the existing drainage pattern of a site in a manner that would result in substantial erosion or siltation on- or off-site. In response to comment received on the Draft EIR, Mitigation Measure HYDRO-4 has been added to ensure that Impact 3.8-3 and Impact 3.8-4 remain less than significant. The modification does not identify any new significant impact or trigger the need to recirculate the Draft PEIR under Section 15088.5 of the CEQA Guidelines.

> **HYDRO-4:** Prior to approving a structural BMP, the implementing agencies shall conduct an evaluation of the potential hydromodification impacts of the project. The evaluation shall recommend design measures necessary to prevent or minimize any identified impacts, including flooding, erosion and/or scour. Design measures could include velocity dissipaters and bank re-enforcement components. Implementing agencies shall include these measures in project designs.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to the alteration of the existing drainage pattern of a site which would increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to the creation or contribution to runoff water.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to placement of housing within a 100-year flood hazard area.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to placement of structures within a 100-year flood hazard area that would impede or redirect flood flows.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to exposure of structures to a significant risk of loss, including flooding as a result of the failure of a levee or dam.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to placement of structures in areas subject to inundation by seiche, tsunami, or mudflow.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program does not have the potential to result in significant cumulative impacts to hydrology and water quality.

4.1.9 Land Use and Agriculture

The proposed program would not physically divide an established community (Impact 3.9-1).

The proposed program would not conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the program (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect (Impact 3.9-2).

The proposed program would not conflict with any applicable habitat conservation plan or natural community conservation plan (Impact 3.9-3).

The proposed program would not convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance, as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use. The proposed program would not involve other changes in the existing environment which, due to their location or nature, could result in conversion of agricultural land to non-agricultural use or conversion of forest land to non-forest use. (Impact 3.9-4)

The proposed program would not conflict with existing zoning for agricultural use, or a Williamson Act contract (Impact 3.9-5).

The proposed program would not conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g)). The proposed program would not result in the loss of forest land or conversion of forest land to non-forest use (Impact 3.9-6).

The proposed program would not result in significant cumulative impact to land use and agriculture.

Finding

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to the physical division of an established community.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to confliction with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the program adopted for the purpose of avoiding or mitigating an environmental impact.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to confliction with any applicable habitat conservation plan or natural community conservation plan.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance, or conversion of agricultural land to non-agricultural use or conversion of forest land to non-forest use.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to confliction with existing zoning for agricultural use, or a Williamson Act contract.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to confliction with existing zoning for forest land or timberland, or the loss of forest land or conversion of forest land to non-forest use.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program does not have the potential to result in significant cumulative impacts to land use and agriculture.

4.1.10 Noise

The proposed program would not result in exposure of persons to, or generation of, excessive groundborne vibration (Impact 3.10-2).

For a project located within an airport land use plan, or, where such a plan has not been adopted, in an area within 2 miles of a public airport or public use airport, implementation of the proposed program would not expose people residing or working in the area to excessive noise levels (Impact 3.10-5)

For a project located in the vicinity of a private airstrip, the proposed program would not expose people residing or working in the project area to excessive noise levels (Impact 3.10-6).

Finding

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to exposure of persons to, or generation of, excessive groundborne vibration.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to projects located within an airport land use plan or within 2 miles of a public airport or public use airport.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to projects located in the vicinity of a private airstrip.

4.1.11 Population and Housing and Environmental Justice

Implementation of the proposed program would not induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure) (Impact 3.11-1).

Implementation of the proposed program would not displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere (Impact 3.11-2).

Implementation of the proposed program would not displace substantial numbers of people, necessitation the construction of replacement housing elsewhere (Impact 3.11-3).

Implementation of the proposed program would not affect the health or environment of minority or low income populations disproportionately (Impact 3.11-4).

The proposed program would not result in significant cumulative impact to population and housing and environmental justice.

Finding

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to introduction of substantial population growth in an area, either directly or indirectly.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to displacement of substantial numbers of existing housing.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to displacement of substantial numbers of people.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the Proposed Program would result in no impact relating to impacting the health or environment of minority or low income populations disproportionately.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program does not have the potential to result in significant cumulative impacts to population and housing and environmental justice.

4.1.12 Public Services and Recreation

The proposed program would not result in substantial adverse physical impacts associated with the provision of, or the need for, new or physically altered governmental police protection facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for police protection services (Impact 3.12-2).

The proposed program would not result in substantial adverse physical impacts associated with the provision of, or the need for, new or physically altered schools, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for schools (Impact 3.12-3).

The proposed program would not increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated (Impact 3.12-4).

The proposed program would not include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment (Impact 3.12-5).

The proposed program would not result in significant cumulative impact to public services and recreation.

Finding

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to the provision of, or need for, new or physically altered governmental police protection facilities.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to the provision of, or need for, new or physically altered schools.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to increased use of existing neighborhood and regional parks or other recreational facilities.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would not result significant cumulative impact to public services and recreation. However, Mitigation Measure PS-1 has been included to ensure that cumulative impacts remain less than significant.

PS-1: The Permittee implementing the EWMP project shall provide reasonable advance notification to service providers such as fire, police, and emergency medical services as well as to local businesses, homeowners, and other residents adjacent to and within areas potentially affected by the proposed EWMP project about the nature, extent, and duration of construction activities. Interim updates should be provided to inform them of the status of the construction activities.

4.1.13 Transportation and Circulation

Construction of the proposed program would not potentially cause traffic safety hazards for vehicles, bicyclists, and pedestrians on public roadways, and would not increase traffic hazards due to possible road wear (Impact 3.13-2).

The proposed program would not result in inadequate emergency access during construction (Impact 3.13-3).

Finding

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to traffic safety hazards for vehicles, bicyclists, and pedestrians on public roadways.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to inadequate emergency access during construction.

4.1.14 Utilities and Service Systems

Implementation of the proposed program would not exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board or result in the construction of new treatment facilities or expansion of existing facilities if the wastewater treatment provider has inadequate capacity to serve the proposed program (Impact 3.14-1).

The proposed program would not require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which would cause significant environmental effects (Impact 3.14-2).

Construction and operation of the proposed program would not require additional energy use that could result in wasteful consumption, affect local and regional energy supplies, or conflict with applicable energy efficiency policies or standards (Impact 3.14-5).

Finding

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to exceedance of wastewater treatment requirements of the applicable Regional Water Quality Control Board or result in the construction of new treatment facilities or expansion of existing facilities.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to construction of new storm water drainage facilities or expansion of existing facilities.

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in no impact relating to additional energy use.

4.2 Non-Structural (Institutional) BMPs

Non-structural control measures are policies, actions, and activities which are intended to minimize or eliminate pollutant sources. Most institutional BMPs are implemented to meet Minimum Control Measure (MCM) requirements in the MS4 permit; MCMs are considered a subset of institutional BMPs. These BMPs are not constructed, but may have costs associated with the procurement and installation of items such as signage or spill response kits. The MS4 Permit categorizes institutional BMPs into six program categories:

- Development Construction Programs, which establish standards for stormwater management from construction sites of all sizes (e.g., with or without a stormwater pollution prevention plan [SWPPP]).
- Industrial/Commercial Facilities Programs, which establish standards for pollutant reduction and control measures at industrial and commercial facilities.
- Illicit Connection and Illicit Discharges (IC/ID) Detection and Elimination Programs, which describe procedures for identifying, eliminating, and reporting illicit connections and discharges to the stormwater system.
- Public Agency Activities Programs, which describe a broad range of municipal practices such as street cleaning, landscape management, storm drain operation, and more.
- Planning and Land Development Programs, which encourage the application of smart growth and low-impact development (LID) practices to development and redevelopment projects.
- Public Information and Participation Programs, which educate and engage the public on a broad range of pollution- and stormwater-related issues.

Permittees can evaluate the MCMs, identify potential modifications that will address water quality priorities, and provide justification for modification or elimination of any MCM that is determined to be ineffective (with the exception of the Planning and Land Development Program, which may not be eliminated or modified). MCM customization may include replacement, reduced implementation, augmented implementation, focused implementation, or elimination. Because the LACFCD has limited jurisdictional authority for ordinance and code enactment or enforcement, it is limited in application of MCMs to activities such as public information and participation programs.

Non-structural/institutional BMPs do not include construction of new facilities. Consequently, the Final Program EIR finds no significant environmental impacts associated with this type of BMP, and no mitigation is required for any of the environmental resource areas.

Finding

The Board of Supervisors finds, based on the Final Program EIR, and the whole of the record, that the proposed program would result in either less than significant impacts or no impacts to all environmental topic areas analyzed in the Final Program EIR relating to implementation of non-structural/institutional BMPs within the program area.

5.0 Less than Significant Environmental Impacts

The significant impacts identified in this section are capable of being mitigated to levels of less than significant through the mitigation identified in the Final Program EIR. This mitigation has been adopted by the District. Thus, for projects implemented under the program where the District has jurisdiction over the project, the significant impacts will be mitigated to a level of less than significant. However, the EWMPs cover numerous jurisdictions and include potential projects that will be entirely within the jurisdiction of a different implementing agency. Because the District cannot ensure that these Implementing Agencies will adopt and implement the proposed mitigation measures, the District finds that the impacts identified in this section may also be significant and unavoidable with respect to projects where the District will not be an implementing agency. The conclusions of "less than significant" below will apply to the extent the Implementing Agencies adopt the proposed mitigation.

5.1 Aesthetics

Significant Effect

The proposed program could create a substantial adverse effect on a scenic vista (Impact 3.1-1).

Description of Specific Impact

During construction, equipment and materials required for temporary ground disturbances would be visible from public vantage points, but would not affect any scenic vistas past the temporary construction periods. Given the predominantly urban character of potential pump station sites and temporary nature of construction activities, impacts would be considered less than significant. A majority of structural BMPs would be located underground and would not introduce impacts to scenic vistas. Aboveground structures such as pump stations would be located in urbanized areas and would generally be single-story buildings. Such aboveground structures have the potential to impact scenic vistas, but will be required to be designed so as not to contrast existing neighborhood aesthetic features.

Finding

Permanent aboveground structures associated with certain BMPs have the potential to create substantial adverse effects on scenic vistas in the project area. The implementation of Mitigation Measure AES-1 would reduce impacts to a less-than-significant level.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce the impacts caused by the project relating to the creation of a substantial adverse effect on a scenic vista. Implementation of Mitigation Measure AES-1 would reduce the impact to a less-than-significant level by designing aboveground structures in a way that would avoid obstructing scenic vistas or views from public vantage points, and would ensure design consistency with neighboring structures.

> **AES-1:** Aboveground structures shall be designed to be consistent with local zoning codes and applicable design guidelines and to minimize features that contrast with neighboring development.

Significant Effect

The proposed program could substantially damage scenic resources, including but not limited to, trees, rocks, outcroppings, and historic buildings within a state scenic highway (Impact 3.1-2).

Description of Specific Impact

Parts of the proposed program may be visible from designated scenic highways or other locally designated scenic roadways in the project area. Rock outcroppings and historic buildings would likely not be disturbed by the project as most of the BMPs will be underground and not visible after construction is complete. Construction of the proposed program would involve removal of vegetation from individual project sites. Smaller aboveground structures would not substantially damage scenic resources, and impacts from larger structures would be reduced to a less-than-significant level with implementation of Mitigation Measure AES-1.

Finding

Permanent aboveground structures associated with certain BMPs have the potential to substantially damage scenic resources, including but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway. The implementation of Mitigation Measure AES-1 would reduce impacts to a less-than-significant level.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts. Implementation of Mitigation Measure AES-1 would serve to ensure design consistency with neighboring structures in individual project areas, thereby reducing damage to scenic resources within a state scenic highway.

> **AES-1:** Aboveground structures shall be designed to be consistent with local zoning codes and applicable design guidelines and to minimize features that contrast with neighboring development.

Significant Effect

The proposed program could substantially degrade the existing visual character or quality of the site and its surroundings (Impact 3.1-3).

Description of Specific Impact

Construction activities would visually degrade the project site and its surroundings as a result of the appearance of demolition materials, excavated areas, stockpiles, and other materials. Due to the temporary nature of construction, these adverse effects are considered less than significant. Once constructed, the BMPs would be located predominantly in urban areas and largely underground, which will not have a permanent effect on the visual character or quality of an area. Aboveground structures may degrade existing visual character of project areas as they will add to the visual landscape. Without proper maintenance of BMPs, especially wet ponds or constructed wetlands, there is a potential for substantial degradation of existing visual quality of project sites due to algal growth or public littering.

Finding

Operation of the proposed program has the potential to result in impacts related to substantial degradation of existing visual character or quality of the site and its surroundings. The implementation of Mitigation Measures AES-1 and AES-2 would reduce impacts to a less-than-significant level.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce the impacts caused by the project relating to the substantial degradation of existing visual character or quality of the site and its surroundings. Implementation of Mitigation Measures AES-1 and AES-2 would reduce the impact to a less-than-significant level.

> **AES-1:** Aboveground structures shall be designed to be consistent with local zoning codes and applicable design guidelines and to minimize features that contrast with neighboring development.
>
> **AES-2:** Implementing agencies shall develop BMP maintenance plans that are approved concurrently with each structural BMP approval. The maintenance plans must include measures to ensure functionality of the structural BMPs for the life of the BMP. These plans may include general maintenance guidelines that apply to a number of smaller distributed BMPs.

Significant Effect

The proposed program would result in a less than significant cumulative aesthetic impact with mitigation.

Description of Significant Impact

Cumulative projects in the program region have the potential to result in cumulative impacts to aesthetic resources if they would result in the removal or substantial adverse change of visual character or image of a neighborhood, community, state scenic highway, or localized area. Given that the BMPs will be located in primarily urbanized areas, introduction of structural BMPs would result in only minor changes to the visual landscape. The cumulative impacts of aboveground structures could have a significant impact to the aesthetic environment due to their potential size and location.

Finding

The proposed program's cumulative aesthetic impact is considered cumulatively significant, but would be reduced to less-than-significant with mitigation. Overall, implementation of BMPs is anticipated to have a positive impact on the aesthetic environment through the creation of open space areas and less impervious surfaces in urbanized or residential areas. After implementation of Mitigation Measures AES-1 and AES-2, cumulative impacts associated with aesthetics would be considered less-than-significant.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce the impacts caused by the project that results in a cumulative aesthetic impact. With the implementation of Mitigation Measures AES-1 and AES-2, implementation of the proposed projects would result in less-than-significant cumulative aesthetics impacts.

5.2 Air Quality

Significant Effect

The proposed program could expose sensitive receptors to substantial pollutant concentrations (Impact 3.2-4).

Description of Significant Impact

While construction-related traffic on local roadways would occur during construction, the net increase of construction vehicle trips to the existing traffic volumes on local roadways would be relatively small and would not result in carbon monoxide (CO) hotspots. These construction-related trips would only occur in the short-term, and because trip-generating land uses are not associated with the proposed program, impacts associated with CO hotspots would be less than significant. Off-road heavy-duty diesel equipment would be used only temporarily at each individual structural BMP site, therefore the construction activities associated with each structural BMP project in the EWMP areas would not expose sensitive receptors to substantial emissions of TACs. During construction of the individual structural BMPs in the project area, sensitive receptors such as residences, schools, hospitals, and daycare centers would be exposed to significant adverse localized air quality impacts. Operation of structural BMPs would not involve the emission of toxic air contaminants (TAC), and would operate passively without use of mechanical equipment. Project operation would not introduce health risks associated with TAC emissions. Construction activities could expose sensitive receptors to criteria air pollutants from vehicle exhaust and dust. Depending on the size and scope of the individual structural BMPs, a localized significance threshold (LST) analysis may be required to ensure construction emissions would not exceed SCAQMD's LSTs or result in pollutant emissions that would cause or contribute to the exceedance of the most stringent applicable federal or state ambient air quality standards.

Finding

The proposed program has the potential to expose sensitive receptors to substantial criteria air pollutant concentrations. However, implementation of Mitigation Measure AIR-3 would reduce this impact to a less-than-significant level.

Brief Explanation of the Rationale for Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts to the exposure of sensitive receptors to substantial pollutant concentrations. Implementation of Mitigation Measure AIR-3 would reduce this impact to a less-than-significant level.

> **AIR-3:** For large construction efforts associated with regional or centralized BMPs, implementing agencies shall conduct a project-specific LST analysis where necessary to determine local health impacts to neighboring land uses. Where it is determined that construction emissions would exceed the applicable LSTs or the most stringent applicable federal or state ambient air quality standards, the structural BMP project shall reduce its daily construction intensity (e.g., reducing the amount of equipment used daily, reducing the amount of soil graded/excavated daily) to a level where the structural BMP project's construction emissions would no longer exceed SCAQMD's LSTs or result in pollutant emissions that would cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standards.

Significant Effect

The proposed program could create objectionable odors affecting a substantial number of people (Impact 3.2-5).

Description of Significant Impact

The proposed program does not include any uses typically associated with odor complaints including agricultural uses, wastewater treatment plants, food processing plans, and landfills, among others. During the construction phase, exhaust odors from equipment may produce discernible odors typical of most construction sites and would be a temporary source of nuisance to adjacent uses. These odors would be temporary and intermittent in nature, so would not be considered a significant environmental impact. Certain BMPs such as restored creeks and estuaries may result in odors from saturated mud or algal blooms when left permanently wet. This may result in a severe nuisance for sensitive receptors near such BMPs, and regular maintenance may be sufficient to reduce odors in some situations.

Finding

The proposed program has the potential to create objectionable odors affecting a substantial number of people. However, implementation of Mitigation Measures AES-2 and AIR-4 would reduce impacts to a less-than-significant levels.

Brief Explanation of the Rationale for Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce the potential creation of objectionable odors affecting substantial numbers of people. Implementation of Mitigation Measures AES-2 and AIR-4 would reduce this impact to a less-than-significant level.

> **AES-2:** Implementing agencies shall develop BMP maintenance plans that are approved concurrently with each structural BMP approval. The maintenance plans must include measures to ensure functionality of the structural BMPs for the life of the BMP. These plans may include general maintenance guidelines that apply to a number of smaller distributed BMPs.
>
> **AIR-4:** During planning of structural BMPs, implementing agencies shall assess the potential for nuisance odors to affect a substantial number of people. BMPs that minimize odors shall be considered the priority when in close proximity to sensitive receptors.

5.3 Biological Resources

Significant Effect

The proposed program would have a substantial adverse impact, either directly or through habitat modifications, on species identified as special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or the U.S. Fish and Wildlife Service (Impact 3.3-1).

Description of Significant Impact

Construction of structural BMPs may affect large open space or riparian habitats that would have a higher potential to support special-status wildlife species, such as streams, wetlands, and upland scrub or oak woodlands. Mitigation Measures BIO-1 through BIO-8 require suitability studies for potential BMP sites for their potential to impact valued habitats, and require impact characterization, minimization and compensation for impacts to highly valued habitats in consultation with the USFWS and CDFW. The proposed program will implement BMPs that are designed to retain dry-weather flows, which could reduce wetted area or completely eliminate flows in certain drainages that support sensitive species. Implementation of Mitigation Measures BIO-1 through BIO-8 would help ensure that impacts to downstream biological resources are less than significant for regional and centralized BMPs. The smaller distributed BMPs would not result in significant impacts and would not be required to implement the mitigation measures.

Finding

The proposed program would have a substantial adverse impact, either directly or through habitat modifications, on species identified as special-status species in local or regional plans, policies, or regulations, or by California Department of Fish and Wildlife or the U.S. Fish and Wildlife

Service. These impacts would be reduced to a less-than-significant level with the implementation of the mitigation measures described below.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts that would have a substantial adverse impact, either directly or through habitat modifications, on any sensitive species identified as special-status in local or regional plans, policies, or regulations or by the California Department of Fish and Wildlife or the U.S. Fish and Wildlife Service. In consideration of the potential use of the project site by special-status wildlife species, impacts on special-status wildlife species would be significant. Implementation of Mitigation Measures BIO-1 through BIO-8 would reduce impacts to a less-than-significant level.

> **BIO-1:** Prior to approving a regional or centralized BMP, the Permittee shall conduct an evaluation of the suitability of the BMP location. Appropriate BMP sites should avoid impacting large areas of native habitats including upland woodlands and riparian forests that support sensitive species to the extent feasible. The evaluation shall include an assessment of potential downstream impacts resulting from flow diversions.
>
> **BIO-2**: Prior to ground-disturbing activities in areas that could support sensitive biological resources, a habitat assessment shall be conducted by a qualified biologist to determine the potential for special-status wildlife species to occur within affected areas, including areas directly or indirectly impacted by construction or operation of the BMPs.
>
> **BIO-3:** If a special-status wildlife species is determined to be present or potentially present within the limits of construction activities, a qualified biologist shall conduct preconstruction surveys of proposed work zones and within an appropriately sized buffer around each area as determined by a qualified biologist within 14 days prior to ground disturbing activities. Any potential habitat capable of supporting a special-status wildlife species shall be flagged for avoidance if feasible.
>
> **BIO-4:** If avoidance of special-status species or sensitive habitats that could support special-status species (including, but not limited to, critical habitat, riparian habitat, and jurisdictional wetlands/waters) is not feasible, the Permittee shall consult with the appropriate regulating agency (USACE/USFWS or CDFW) to determine a strategy for compliance with the Endangered Species Act, California Fish and Game Code, and other regulations protecting special-status species and sensitive habitats. The Permittee shall identify appropriate impact minimization measures and compensation for permanent impacts to sensitive habitats and species in consultation with regulatory agencies. Construction of the project will not begin until the appropriate permits from the regulatory agencies are approved.
>
> **BIO-5:** If construction and vegetation removal is proposed between February 1 and August 31, a qualified biologist shall conduct a pre-construction survey for breeding and nesting birds and raptors within 500-feet of the construction limits to determine and map

the location and extent of breeding birds that could be affected by the project. Active nest sites located during the pre-construction surveys shall be avoided until the adults and young are no longer reliant on the nest site for survival as determined by a qualified biologist.

BIO-6: All construction areas, staging areas, and right-of-ways shall be staked, flagged, fenced, or otherwise clearly delineated to restrict the limits of construction to the minimum necessary near areas that may support special-status wildlife species as determined by a qualified biologist.

BIO-7: Prior to construction in areas that could support special-status plants, a qualified botanist shall conduct a pre-construction floristic inventory and focused rare plant survey of project areas to determine and map the location and extent of special-status plant species populations within disturbance areas. This survey shall occur during the typical blooming periods of special-status plants with the potential to occur. The plant survey shall follow the CDFW Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities (November 24, 2009).

BIO-8: If temporary construction-related impacts to special-status plant populations are identified within a disturbance area, the implementing agencies shall prepare and implement a special-status species salvage and replanting plan. The salvage and replanting plan shall include measures to salvage, replant, and monitor the disturbance area until native vegetation is re-established under the direction of CDFW and USFWS.

Significant Effect

The proposed program would have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the CDFW or USFWS. (Impact 3.3-2)

Description of Significant Impact

Significant Ecological Areas (SEA), as identified by the Los Angeles County General Plan, riparian, and other sensitive communities are not expected to occur within the disturbance areas of the BMP projects since the majority of the structural BMPs would occur in developed or disturbed areas. While some regional and centralized structural BMPs could occur within or adjacent to SEAs, riparian habitat or other sensitive natural communities, these types of BMPs would provide multi-beneficial water quality and habitat restoration improvements to the applicable EWMP watershed. Additionally, each development proposed within a designated SEA must undergo a performance review process for compliance with the SEA design compatibility criteria and other standards for approval by the LA County Department of Regional Planning.

Finding

Future project-level environmental review processes would consider all proposed projects on a case-by-case basis to determine whether an individual project would impact riparian or other sensitive natural communities. Site-specific mitigation measures would be required to minimize and reduce potentially significant impacts to riparian and other sensitive natural communities. These impacts would be reduced to a less-than-significant level with the implementation of Mitigation Measures BIO-1 through BIO-8.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts that would have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the CDFW or USFWS. Implementation of Mitigation Measure **BIO-1** through **BIO-8** would reduce impacts to a less-than-significant level.

Significant Effect

The proposed program would have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means. (Impact 3.3-3)

Description of Significant Impact

Wetlands occur throughout the EWMP areas, and once project facility locations are determined, exact locations and acreages of jurisdictional areas located within or adjacent to impact areas shall be determined through a formal jurisdictional delineation. For projects impacting native vegetation within jurisdictional drainages, the implementing agency would be required to obtain California Fish and Game Code Section 1602 compliance and Section 404 compliance from the USACE and Section 401 Certification from the RWQCB. In addition, implementation of Mitigation Measures BIO-1 through BIO-9 would ensure compliance with state and federal regulations relating to potentially jurisdictional features, including wash habitat vegetation that may fall under CDFW jurisdiction.

Finding

Any projects impacting native vegetation within jurisdictional drainages would be required to comply with California Fish and Game Code Section 1602 compliance and Section 404 compliance from the USACE and Section 401 Certification from the RWQCB. These impacts would be further reduced to a less-than-significant level with the implementation of the mitigation measures described below.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts that would have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act through direct removal, filling, hydrological interruption, or other means. Implementation of Mitigation Measures **BIO-1** through **BIO-9** would reduce impacts to a less-than-significant level.

> **BIO-9:** Prior to construction, a qualified wetland delineator shall be retained to conduct formal wetland delineation in areas where potential jurisdictional resources (i.e., wetlands or drainages) subject to the jurisdiction of USACE, RWQCB, and CDFW may be

affected by the project. If jurisdictional resources are identified in the EWMP area and would be directly or indirectly impacted by individual projects, the qualified wetland delineator shall prepare a jurisdictional delineation report suitable for submittal to USACE, RWQCB, and CDFW for purposes of obtaining the appropriate permits. Habitat mitigation and compensation requirements shall be implemented prior to construction in accordance with Mitigation Measure BIO-4.

Significant Effect

The proposed program would conflict with local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance. (Impact 3.3-5)

Description of Significant Impact

The proposed program would mainly be constructed within highly urbanized and disturbed areas within existing infrastructure. Any impacts to oak trees within Los Angeles County would be required to comply with the Oak Tree Preservation Ordinance (or other tree ordinances established by the local city). A tree permit may be required if impacts to oak trees or other protected trees are determined to be necessary.

Finding

No impacts to oak trees or other protected tree species is anticipated. However, the exact locations of the BMP projects have not been established. Implementation of Mitigation Measure BIO-10 would reduce any potential impacts to protected tree species to a less-than-significant level.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts that would conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance. Implementation of Mitigation Measure BIO-10 would reduce impacts to a less-than-significant level.

> **BIO-10:** Oak trees and other protected trees shall be avoided to the extent feasible. If trees may be impacted by project construction, a certified arborist shall conduct a tree inventory of the construction impact area. If any oak trees or other protected trees will be impacted by BMP construction, the implementing agency shall obtain any required County or City permits.

Significant Effect

The proposed program would result in cumulative biological resource impacts.

Description of Significant Impact

Cumulatively, throughout the region, the retention of stormwater and treatment of pollutants within each watershed, and the reduction of pollutant loading in waterways would substantially benefit the water quality of the region's aquatic and coastal habitats, as well as the plants and wildlife dependent on them. Implementation of the BMPs would also return the local hydrology to a more natural condition. Although some drainage segments may exhibit reduced riparian habitat or wetlands over time due to the reduced dry-weather flow, the cumulative effect would be offset by increased groundwater recharge and seepage supporting expanded wetland and riparian vegetation supporting local flora and fauna populations. Therefore, the program's potential contribution to cumulative effects on biological resources is considered less than significant.

Finding

Most of the distributed BMPs would be small in scale and would not result in cumulatively significant impacts, as they would occur within existing developed or disturbed areas at existing stormwater infrastructure/facilities. For regional and centralized BMPs at the larger scale, Mitigation Measures BIO-1 through BIO-10 would reduce potentially significant impacts to biological resources, and any additional or more site-specific mitigation measures developed during the future project-level environmental review processes may further reduce potential impacts.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts to biological resources. Any potentially significant cumulative impacts to biological resources in the project region would be reduced by the implementation of Mitigation Measures BIO-1 through BIO-10.

5.4 Cultural Resources

Significant Effect

The proposed program could cause a substantial adverse change in the significance of unique archaeological resources as defined in §15064.5 (Impact 3.4-2).

Description of Significant Impact

The program area, which spans most of Los Angeles County, should be considered sensitive for archaeological resources, with degree of sensitivity varying across the program area based on specific environmental factors. Any structural BMP which involves grading, trenching, excavation, vegetation removal, or other forms of ground disturbance could impact archaeological resources.

Finding

The proposed program's potential to cause a substantial adverse change in the significance of unique archaeological resources is considered significant; however, potential adverse effects caused by the proposed program could be mitigated to a less-than-significant level.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts that would cause a substantial adverse change in the significance of unique archaeological resources. The project impacts are considered significant but would be reduced to a level that is less than significant with implementation of Mitigation Measures CUL-2 through CUL-2.

> **CUL-2**: Implementing agencies shall ensure that individual EWMP projects that require ground disturbance shall be subject to a Phase I cultural resources inventory on a project-specific basis prior to the implementing agency's approval of project plans. The study shall be conducted or supervised by a qualified archaeologist, defined as an archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards for Archaeology, and shall be conducted in consultation with the local Native American representatives expressing interest. The cultural resources inventory shall include a cultural resources records search to be conducted at the South Central Coastal Information Center; scoping with the NAHC and with interested Native Americans identified by the NAHC; a pedestrian archaeological survey where deemed appropriate by the qualified archaeologist; and formal recordation of all identified archaeological resources on California Department of Parks and Recreation 523 forms and significance evaluation of such resources presented in a technical report following the guidelines in *Archaeological Resource Management Reports (ARMR): Recommended Contents and Format*, Department of Parks and Recreation, Office of Historic Preservation, State of California, 1990.
>
> If potentially significant archaeological resources are encountered during the survey, the implementing agency shall require that the resources are evaluated by the qualified archaeologist for their eligibility for listing in the CRHR and for significance as a historical resource or unique archaeological resource per CEQA Guidelines Section 15064.5. Recommendations shall be made for treatment of these resources if found to be significant, in consultation with the implementing agency and the appropriate Native American groups for prehistoric resources. Per CEQA Guidelines Section 15126.4(b)(3), preservation in place shall be the preferred manner of mitigation to avoid impacts to archaeological resources qualifying as historical resources. Methods of avoidance may include, but shall not be limited to, project reroute or redesign, project cancellation, or identification of protection measures such as capping or fencing. Consistent with CEQA Guidelines Section 15126.4(b)(3)(C), if it is demonstrated that resources cannot be avoided, the qualified archaeologist shall develop additional treatment measures, which may include data recovery or other appropriate measures, in consultation with the implementing agency, and any local Native American representatives expressing interest in prehistoric or tribal resources. If an archaeological site does not qualify as an historical resource but meets the criteria for a unique archaeological resource as defined in Section 21083.2, then the site shall be treated in accordance with the provisions of Section 21083.2.
>
> **CUL-3**: The implementing agency shall retain archaeological monitors during ground-disturbing activities that have the potential to impact archaeological resources qualifying as historical resources or unique archaeological resources, as determined by a qualified archaeologist in consultation with the implementing agency, and any local Native

American representatives expressing interest in the project. Native American monitors shall be retained for projects that have a high potential to impact sensitive Native American resources, as determined by the implementing agency in coordination with the qualified archaeologist.

CUL-4: During project-level construction, should subsurface archaeological resources be discovered, all activity in the vicinity of the find shall stop and a qualified archaeologist shall be contacted to assess the significance of the find according to CEQA Guidelines Section 15064.5. If any find is determined to be significant, the archaeologist shall determine, in consultation with the implementing agency and any local Native American groups expressing interest, appropriate avoidance measures or other appropriate mitigation. Per CEQA Guidelines Section 15126.4(b)(3), preservation in place shall be the preferred means to avoid impacts to archaeological resources qualifying as historical resources. Methods of avoidance may include, but shall not be limited to, project reroute or redesign, project cancellation, or identification of protection measures such as capping or fencing. Consistent with CEQA Guidelines Section 15126.4(b)(3)(C), if it is demonstrated that resources cannot be avoided, the qualified archaeologist shall develop additional treatment measures, such as data recovery or other appropriate measures, in consultation with the implementing agency and any local Native American representatives expressing interest in prehistoric or tribal resources. If an archaeological site does not qualify as an historical resource but meets the criteria for a unique archaeological resource as defined in Section 21083.2, then the site shall be treated in accordance with the provisions of Section 21083.2.

Significant Effect

The proposed program could directly or indirectly destroy a unique paleontological resource or site or unique geologic feature (Impact 3.4-3).

Description of Significant Impact

The program area is underlain by a number of high or undetermined paleontological sensitivity units, which may contain significant paleontological resources. Significant paleontological resources can be uncovered even in areas of low sensitivity, though, and it is possible that ground-disturbing construction activities associated with structural BMPs could result in the inadvertent discovery of paleontological resources, which could be a significant impact.

Finding

The proposed program's potential to directly or indirectly damage or destroy unique paleontological resources or sites or unique geologic features is considered significant; however, potential adverse effects caused by the proposed program could be mitigated to a less-than-significant level.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts that would damage or destroy paleontological resources or sites or unique geologic features. The project impacts are considered significant but would be reduced to a level that is less than significant with implementation Mitigation Measures CUL-5 and CUL-6.

> **CUL-5:** For individual structural BMP projects that require ground disturbance, the implementing agency shall evaluate the sensitivity of the project site for paleontological resources. If deemed necessary, the implementing agency shall retain a qualified paleontologist to evaluate the project and provide recommendations regarding additional work, potentially including testing or construction monitoring.

> **CUL-6:** In the event that paleontological resources are discovered during construction, the implementing agency shall notify a qualified paleontologist. The paleontologist will evaluate the potential resource, assess the significance of the find, and recommend further actions to protect the resource.

Significant Effect

The proposed program could disturb human remains, including those interred outside of formal cemeteries (Impact 3.4-4).

Description of Significant Impact

There is no indication, either from the archival research results or the archaeological survey, that any particular location in the project area has been used for human burial purposes in the recent or distant past. However, in the event that human remains are inadvertently discovered during project construction activities, the human remains could be inadvertently damaged, which could be a significant impact.

Finding

The proposed program's potential to uncover buried archaeological deposits including human remains is considered significant; however, potential adverse effects caused by the project could be mitigated to a less-than-significant level.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts related to the disturbing of any human remains, including those interred outside of a formal cemetery. The project impacts are considered significant but would be reduced to a level that is less than significant with implementation of Mitigation Measure CUL-7.

> **CUL-7:** The implementing agency shall require that, if human remains are uncovered during project construction, work in the vicinity of the find shall cease and the County Coroner shall be contacted to evaluate the remains, following the procedures and protocols set forth in Section 15064.5 (e)(1) of the CEQA Guidelines. If the County Coroner determines that the remains are Native American, the Coroner will contact the Native American Heritage Commission, in accordance with Health and Safety Code Section 7050.5, subdivision (c), and Public Resources Code 5097.98 (as amended by AB 2641). The NAHC will then designate a Most Likely Descendant of the deceased

Native American, who will engage in consultation to determine the disposition of the remains.

5.5 Geologic and Mineral Resources

Significant Effect

The proposed program could be located on a geological unit or soil that is unstable, or that would become unstable as a result of the program, and potentially result in on-site or off-site non-seismically induced geologic hazards such as landslides, lateral spreading, subsidence, collapse or sinkholes, settlement, or slope failure (Impact 3.5-3).

Description of Significant Impact

Infiltration of water into subsurface soils can increase soil instability and result in saturated soils, soil piping through preferential pathways, breakouts due to infiltrated water finding utility trenches and other preferential pathways, and raising the local groundwater levels such that infrastructure foundations and underground structures could be affected by unstable soils. Structural BMPs could potentially be undermined by unstable soils or impact adjacent infrastructure and buildings; Mitigation Measure GEO-1 would reduce the impact to a less-than-significant level.

Finding

The proposed program's potential to be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the program, and potentially result in on-site or off-site non-seismically induced geologic hazards such as landslides, lateral spreading, subsidence, collapse or sinkholes, settlement, or slope failure is considered significant; however, potential adverse effects caused by the proposed program would be mitigated to a less-than-significant level.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts related to the project being located on a geologic unit or soil that is unstable, or that would become unstable as a result of the program, and potentially result in on-site or off-site non-seismically induced geologic hazards such as landslides, lateral spreading, subsidence, collapse or sinkholes, settlement, or slope failure. The project impacts are considered significant but would be reduced to a level that is less than significant with implementation of Mitigation Measure GEO-1.

> **GEO-1:** Prior to approval of infiltration BMPs, implementing agencies shall conduct a geotechnical investigation of each infiltration BMP site to evaluate infiltration suitability. If infiltration rates are sufficient to accommodate an infiltration BMP, the geotechnical investigation shall recommend design measures necessary to prevent excessive lateral spreading that could destabilize neighboring structures. Implementing agencies shall implement these measures in project designs.

Significant Effect

Cumulative impacts on geology and soils would have a less than significant impact on the environment with implementation of mitigation.

Description of Significant Impact

The cumulative effect of multiple infiltration projects could increase the severity of perched or migrating water, which has the potential to inundate underground utilities or structures. Mitigation Measure GEO-1 would minimize the cumulative impact to regional infrastructure from perched or migrating water. The management of groundwater pumping among regional managers prevents impacts to structural foundations resulting from groundwater mounding from existing recharge efforts. Mitigation Measure GEO-2 would reduce the cumulative effects to soil stability from elevated groundwater levels to a less-than-significant level.

Finding

The proposed program's cumulative impact to geology and soils is considered significant; however, potential adverse effects caused by the proposed program would be mitigated to a less-than-significant level.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce cumulative impacts related to geology and soils. The cumulative project impacts are considered significant but would be reduced to a level that is less than significant with implementation of Mitigation Measures GEO-1 and GEO-2.

> **GEO-1:** Prior to approval of infiltration BMPs, implementing agencies shall conduct a geotechnical investigation of each infiltration BMP site to evaluate infiltration suitability. If infiltration rates are sufficient to accommodate an infiltration BMP, the geotechnical investigation shall recommend design measures necessary to prevent excessive lateral spreading that could destabilize neighboring structures. Implementing agencies shall implement these measures in project designs.
>
> **GEO-2:** Prior to installing BMPs designed to recharge the local groundwater supplies, the implementing agency shall notify local groundwater managers, including the Upper Los Angeles River Area Water Master, the Water Replenishment District of Southern California, or the San Gabriel Water Master as well as local water producers such as local municipalities and water companies. The implementing agency shall coordinate BMP siting efforts with groundwater managers and producers to mitigate high groundwater levels while increasing local water supplies.

5.6 Greenhouse Gas Emissions

The proposed program would not have any environmental effects related to greenhouse gas emissions that are potentially significant but can be mitigated to less-than-significant levels.

5.7 Hazards and Hazardous Materials

Significant Effect

The proposed program would create a significant hazard to the public or the environment through the accumulation of potentially hazardous materials into BMPs (Impact 3.7-2).

Description of Significant Impact

Because of their function as water conveyance systems, the entire storm sewer system, as augmented by structural BMPs, would collect and retain sediment and chemicals from urban runoff, along with any accidental or illicit spills of hazardous materials. The introduction of hazardous materials into the storm sewer system could occur in large events as in a catastrophic spill, or could occur in small concentrations as in petroleum hydrocarbons and heavy metals picked up and carried by stormwater in urban runoff from the streets. Contaminants in the runoff water or as discrete concentrated spills could accumulate in the soils and vegetation of structural BMPs. To address the accumulation of contaminants in soil at BMPs, operations and maintenance plans for BMPs that might accumulate constituents in surface soils and media will be developed to include periodic removal and replacement of these potentially impacted surface materials to reduce the potential for long-term loading leading to hazardous concentrations in soils and groundwater.

Finding

The proposed program has the potential to create a significant hazard to the public or the environment through the accumulation of potentially hazardous materials into BMPs. The implementation of Mitigation Measure HAZ-1 would reduce impacts to a less-than-significant level.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts related to the creation of a significant hazard to the public or the environment through the accumulation of potentially hazardous materials into BMPs to less-than-significant. With the implementation of Mitigation Measure HAZ-1, these impacts would be considered less than significant.

> **HAZ-1:** Implementing agencies shall prepare and implement maintenance practices that include periodic removal and replacement of surface soils and media that may accumulate constituents that could result in further migration of constituents to sub-soils and groundwater. A BMP Maintenance Plan shall be prepared by Implementing Agencies upon approval of the BMP projects that identifies the frequency and procedures for removal and/or replacement of accumulated debris, surface soils and/or media (to depth where constituent concentrations do not represent a hazardous conditions and/or have the potential to migrate further and impact groundwater) to avoid accumulation of hazardous concentrations and the potential to migrate further to sub-soils and groundwater. The Maintenance Plan shall include vector control requirements. The BMP Maintenance Plan

> may consist of a general maintenance guideline that applies to several types of smaller distributed BMPs. For smaller distributed BMPs on private property, these plans may consist of a maintenance covenant that includes requirements to avoid the accumulation of hazardous concentrations in these BMPs that may impact underlying sub-soils and groundwater. Structural BMPs shall be designed to prevent migration of constituents that may impact groundwater.

Significant Effect

The proposed program would be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, could create a significant hazard to the public or the environment (Impact 3.7-4).

Description of Significant Impact

It is possible that a proposed BMP may be located on a hazardous materials site listed on the Cortese List, which would expose construction workers, the public, and the environment to hazardous materials during earth-moving activities, introducing a significant impact.

Finding

The proposed program has the potential to result in significant impacts related to the project location on a site which is included on a list of hazardous materials sites, and, as a result, could create a significant hazard to the public or the environment. The implementation of Mitigation Measure HAZ-2 would reduce impacts to a less-than-significant level.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts related to hazardous materials to less-than-significant. With the implementation of Mitigation Measures HAZ-2, these impacts would be considered less than significant.

> **HAZ-2:** Prior to the initiation of any construction requiring ground-disturbing activities in areas where hazardous material use or management may have occurred, the implementing agencies shall complete a Phase I Environmental Site Assessment (ESA) in accordance with American Society for Testing and Materials Standard E1527-13 for each construction site. Any recommended follow up sampling (Phase II activities) set forth in the Phase I ESA shall be implemented prior to construction. The results of Phase II studies, if necessary, shall be submitted to the local overseeing agency and any required remediation or further delineation of identified contamination shall be completed prior to commencement of construction.

Significant Effect

For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, for a project within the vicinity of a private airstrip, the proposed program could result in a safety hazard for people residing or working in the project area (Impact 3.7-5).

Description of Significant Impact

Some structural BMPs, such as detention basins that store water for a period of time or constructed wetlands that would increase or improve wildlife habitat, could be constructed on or near airports and could result in attracting wildlife. Deer and birds are known wildlife hazards to airports. If the proposed project is at or near an airport, this could increase hazards to aircraft from wildlife.

Finding

The proposed program, if located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, for a project within the vicinity of a private airstrip, has the potential to result in safety hazard for people residing or working in the project area. The implementation of Mitigation Measures HAZ-3 would reduce impacts to a less-than-significant level.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts related to hazardous materials to less-than-significant. With the implementation of Mitigation Measures HAZ-3, these impacts would be considered less than significant.

> **HAZ-3:** Implementing Agencies shall require that those BMPs that are within an airport land use plan area are compatible with criteria specified in FAA Advisory Circular No: 150/5200-33B (FAA, 2007). If the proposed BMP is within the minimum separation criteria, the implementing agency shall consult with the airport and collaboratively evaluate whether the potential increase in wildlife hazards can be mitigated.

Significant Effect

The proposed program would result in cumulatively significant impacts to hazardous materials.

Description of Significant Impact

Most of the distributed BMPs would be small in scale and would not result in cumulatively significant impacts due to increased hazards from construction or operation. However, the combination of BMPs throughout the region would change the flow paths of stormwater and urban runoff that currently occurs in the region, resulting in the retention of pollutants generally within the soil of the BMPs that use soil for filtration and retention. Cumulatively, throughout the region, the retention and treatment of pollutants within each watershed and the reduction of pollutant loading in waterways will substantially benefit water and sediment quality of the region's habitats, rivers, and beaches. Therefore, the project's potential contribution to cumulative effects on hazards and hazardous materials is considered beneficial.

Finding

The proposed program has the potential to result in cumulatively considerable impacts related to hazardous resources. Hazardous material could be released during project construction or operation. The implementation of appropriate safety measures during construction of the proposed project, as well as any other cumulative project, would reduce the impact to a level that would not contribute to cumulative effects. Implementation of Mitigation Measures HAZ-1, HAZ-2, and HAZ-3 would reduce impacts to less-than-significant levels.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce cumulative impacts caused by the project. With the implementation of Mitigation Measures HAZ-1, HAZ-2, and HAZ-3, impacts would be less than significant.

5.8 Hydrology and Water Quality

Significant Effect

The proposed program would result in higher groundwater levels and could potentially affect groundwater quality (Impact 3.8-2).

Description of Significant Impact

Regional BMPs would recharge stormwater into the groundwater basin and could raise local groundwater levels following major storm events. Distributed infiltration BMPs would typically be too small to have a measureable effect on local groundwater levels. The increased water supplies captured by the infiltration basins through the EWMP areas would be a beneficial impact of the projects. Infiltration BMPs would not be suitable in areas of low permeability, though, and potential locations would need to be evaluated for suitability. Concentrations of contaminants found in stormwater runoff could increase, resulting in contaminated shallow soils and groundwater.

Finding

The proposed program has the potential to result significant impacts related to higher groundwater levels and degradation of groundwater quality. The implementation of Mitigation Measures HYDRO-1 through HYDRO-3 would reduce impacts to a less-than-significant level.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts related to higher groundwater levels and potential degradation of groundwater quality to less-than-significant. With the implementation of Mitigation Measures HYDRO-1 through HYDRO-3, these impacts would be considered less than significant.

> **HYDRO-1:** Prior to approving an infiltration BMP, the Permittee shall conduct an evaluation of the suitability of the BMP location. Appropriate infiltration BMP sites should avoid areas with low permeability where recharge could adversely affect neighboring subsurface infrastructure.
>
> **HYDRO-2:** Prior to approving an infiltration BMP, the Permittee shall identify pretreatment technologies, type, and depth of filtration media; depth to groundwater; and other design considerations necessary to prevent contaminants from impacting groundwater quality. The design shall consider stormwater quality data within the BMP's

collection area to assess the need and type of treatment and filtration controls. Local design manuals and ordinances requiring minimum separation distance to groundwater shall also be met as part of the design.

HYDRO-3: Prior to the installation of an infiltration BMP, the Permittee shall conduct a regulatory database review for contaminated groundwater sites within a quarter mile of the proposed infiltration facility. The review shall include locations of on-site wastewater treatment systems. The Permittee shall identify whether any contaminated groundwater plumes or leach fields are present and whether coordination with the local and state environmental protection overseeing agency and responsible party is warranted prior to final design of infiltration facility.

5.9 Land Use and Agriculture

The proposed program would not have any environmental effects on land use that are potentially significant and that cannot be mitigated to less-than-significant levels.

5.10 Noise

Significant Effect

The proposed program would result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project (Impact 3.10-3).

Description of Significant Impact

No operational noise levels would be generated by the structural BMPs given their passive manner of operation. However, it is anticipated that some of the centralized and regional structural BMPs would require the use of irrigation pump stations and associated components to divert the collected stormwater. At these structural BMP sites, noise levels generated from the long-term operation of the pumps and associated components could result in increased noise levels in the surrounding noise environment.

Finding

The proposed program has the potential to result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project. The implementation of Mitigation Measures NOISE-1 and NOISE-2 would reduce impacts to a less-than-significant level.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts related to a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project. With the implementation of Mitigation Measures NOISE-1 and NOISE-2 included below, these impacts would be considered less than significant.

NOISE-1: The implementing agencies shall implement the following measures during construction as needed:

- Include design measures necessary to reduce the construction noise levels to where feasible. These measures may include noise barriers, curtains, or shields.
- Place noise-generating construction activities (e.g., operation of compressors and generators, cement mixing, general truck idling) as far as possible from the nearest noise-sensitive land uses.
- Locate stationary construction noise sources as far from adjacent noise-sensitive receptors as possible.
- If construction is to occur near a school, the construction contractor shall coordinate the with school administration in order to limit disturbance to the campus. Efforts to limit construction activities to non-school days shall be encouraged.
- For the centralized and regional BMP projects located adjacent to noise-sensitive land uses, identify a liaison for these off-site sensitive receptors, such as residents and property owners, to contact with concerns regarding construction noise and vibration. The liaison's telephone number(s) shall be prominently displayed at construction locations.
- For the centralized and regional BMP projects located adjacent to noise-sensitive land uses, notify in writing all landowners and occupants of properties adjacent to the construction area of the anticipated construction schedule at least 2 weeks prior to groundbreaking.

NOISE-2: All structural BMPs that employ mechanized stationary equipment that generate noise levels shall comply with the applicable noise standards established by the implementing agency with jurisdiction over the structural BMP site. The equipment shall be designed with noise-attenuating features (e.g., enclosures) and/or located at areas (e.g., belowground) where nearby noise-sensitive land uses would not be exposed to a perceptible noise increase in their noise environment.

5.11 Population and Housing and Environmental Justice

The proposed program would not have any environmental effects related to population, housing and environmental justice that would be potentially significant, but could be mitigated to less than significant levels.

5.12 Public Services and Recreation

Significant Effect

The proposed program would not result in substantial adverse physical impacts associated with the provision of, or need for, new or physically altered governmental fire protection facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protective services (Impact 3.12-1).

Description of Significant Impact

The structural BMPs are not habitable structures, would not be constructed with flammable materials, and would not require fire protection services. Because of the relative scale of these infrastructure improvements, the construction of the various structural BMPs are not expected to result in the need for new or physically altered fire protection facilities. However, construction of new structural BMPs in streets, sidewalks, parkland, or other facilities (these may include public service facilities such as police stations, fire stations, and municipal maintenance yards) within existing high-density urban, commercial, industrial, and transportation areas, as well as associated staging areas, could temporarily disrupt the provision of fire services, resulting in potentially significant impacts.

Finding

The proposed program has the potential to result in substantial adverse physical impacts associated with the provision of, or the need for, new or physically altered governmental fire protection facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection services. Implementation of Mitigation Measure PS-1 would reduce impacts to a less-than-significant level.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project related to significant cumulative impacts associated with public services. With the implementation of Mitigation Measure PS-1, these impacts would be considered less than significant.

> **PS-1:** The Permittee implementing the EWMP project shall provide reasonable advance notification to service providers such as fire, police, and emergency medical services as well as to local businesses, homeowners, and other residents adjacent to and within areas potentially affected by the proposed EWMP project about the nature, extent, and duration of construction activities. Interim updates should be provided to inform them of the status of the construction activities.

5.13 Transportation and Circulation

Significant Effect

The proposed program would intermittently and temporarily increase traffic levels and traffic delays due to vehicle trips generated by construction workers and construction vehicles on area roadways (Impact 3.13-1).

Description of Significant Impact

Vehicle trips would be generated primarily by construction workers commuting to and from the BMP work sites, and by trucks hauling materials and equipment to and from the sites. The construction traffic impacts associated with each individual structural BMP project would be short-term in nature and limited to the period of time when construction activity is taking place for that particular project. Although project-related traffic would be temporary, supplemental project-level analysis of potential site-specific impacts could determine that addition of project-generated traffic would be considered substantial in relation to traffic flow conditions on local roadways. For this program-level assessment, this impact is considered potentially significant.

Finding

The proposed program will potentially intermittently and temporarily increase traffic levels and traffic delays due to vehicle trips generated by construction workers and construction vehicles on area roadways; however, implementation of Mitigation Measure TRAF-1 would reduce impacts to a less-than- significant level.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts related to temporary and intermittent increase in traffic levels and traffic delays due to vehicle trips generated by construction workers and construction vehicles on area roadways to less-than-significant. With the implementation of Mitigation Measure TRAF-1, below, this impact would be considered less than significant.

TRAF-1: For projects that may affect traffic, implementing agencies shall require that contractors prepare a construction traffic control plan. Elements of the plan should include, but are not necessarily limited to, the following:

- Develop circulation and detour plans to minimize impacts to local street circulation. Use haul routes minimizing truck traffic on local roadways to the extent possible.
- To the extent feasible, and as needed to avoid adverse impacts on traffic flow, schedule truck trips outside of peak morning and evening commute hours.
- Install traffic control devices as specified in Caltrans' Manual of Traffic Controls for Construction and Maintenance Work Zones where needed to maintain safe driving conditions. Use flaggers and/or signage to safely direct traffic through construction work zones.

- Coordinate with facility owners or administrators of sensitive land uses such as police and fire stations, hospitals, and schools. Provide advance notification to the facility owner or operator of the timing, location, and duration of construction activities.

Significant Effect

The proposed program would contribute to cumulative impacts to traffic and transportation (Impact 3.13-4).

Description of Significant Impact

During construction of the structural BMPs, intermittent and temporary traffic-related impacts in the cumulative context would occur. The proposed program has the potential to contribute to potentially significant cumulative construction-related impacts as a result of (1) cumulative projects (such as land development projects) that generate increased traffic at the same time on the same roads as would the proposed program, causing increased congestion and delays; and (2) infrastructure projects in roads that would be used by project construction workers and trucks, which could delay project-generated vehicles past the work zones of those other projects.

Finding

The proposed program is expected to cumulatively impact traffic and transportation; however, implementation of Mitigation Measure TRAF-1 is expected to reduce impacts to a less-than-significant level.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts related to cumulative impacts to traffic and transportation to less than significant. With the implementation of Mitigation Measure TRAF-1, these impacts would be considered less than significant.

5.14 Utilities and Service Systems

Significant Effect

The proposed program would require new or expanded water supply resources or entitlements or require or result in the construction of new water facilities or expansion of existing facilities, the construction of which could cause significant environmental effects (Impact 3.14-3).

Description of Significant Impact

Implementation of the EWMPS would not increase water demand due to the relatively short construction period for structural BMPs. Impacts to the existing water supplies are anticipated to be beneficial as a result of the stormwater and non-stormwater runoff infiltration and conservation BMPs implemented across the EWMP areas. Construction requiring ground disturbance could encounter buried utilities including water supply infrastructure. Construction of BMPs to detain stormwater and dry-weather flows may reduce flows downstream, thereby reducing access to beneficial uses downstream. As part of the project design, Implementing Agencies would be required to identify the potential for underground utilities and determine whether they would need to be relocated to accommodate the BMP. Dry-weather flows in coastal streams and foothills are largely fed by groundwater seepage or wastewater discharges. Any detention of storm flows upstream would not substantially reduce storm flows downstream or significantly impede access to storm flow.

Finding

The proposed program is not expected to require expansion of existing water entitlements or result in the construction of new facilities that could result in environmental effects; the proposed program would further reduce its impact by implementing Mitigation Measure UTIL-1.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts related to landfill capacity to less than significant. With the implementation of Mitigation Measure UTIL-1, these impacts would be considered less than significant.

> **UTIL-1:** Prior to implementation of BMPs, the implementing agency shall conduct a search for local utilities above and below ground that could be affected by the project. The implementing agencies shall contact each utility potentially affected and relocate the utility if necessary to ensure access and services are maintained.
>
> **UTIL-2:** Prior to approval of BMPs, implementing agencies shall evaluate the potential for impacts to downstream beneficial uses including surface water rights. Implementing agencies shall not approve BMPs that result in preventing access to previously appropriated surface water downstream.

Significant Effect

The proposed program would be served by a landfill with insufficient permitted capacity to accommodate the proposed program's solid waste disposal needs or the proposed program could not comply with federal, state, and local statuses and regulations related to solid waste (Impact 3.14-4).

Description of Significant Impact

Construction activities associated with the structural BMPs would include excavation and demolition of some existing infrastructure, which would produce solid waste requiring disposal in the nearest landfill. Some of the EWMPs are required to implement trash Total Maximum Daily Limits (TMDLs) and associated trash removal structural BMPs, which would require the disposal of the trash collected by the BMPs, thereby increase the amount of trash being sent to landfills. The non-structural BMPs would include street cleaning, landscape management, and storm drain operation, which produce debris and trash requiring disposal, which could exceed landfill limits.

The new trash collected that is associated with proposed trash removal structural BMPs and non-structural BMPs such as street cleaning and landscape management would be accommodated with existing and planned trash disposal facilities. Based on landfill capacity in the Los Angeles region, there appears to be ample availability to receive the expected trash generated by the program. The program would comply with all federal, state, and local statutes and regulations related to solid waste, including the Los Angeles County Construction and Demolition Debris Recycling and Reuse Program.

Finding

The program is not expected to be served by a landfill with insufficient capacity to accommodate its waste disposal needs and would comply with all solid waste regulations; however, implementation of Mitigation Measure UTIL-2 would further reduce impacts to a less-than-significant level

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts related to landfill capacity to less than significant. With the implementation of Mitigation Measure UTIL-2, these impacts would be considered less than significant.

> **UTIL-3:** Implementing agencies shall encourage construction contractors to recycle construction materials and divert inert solids (asphalt, brick, concrete, dirt, fines, rock, sand, soil, and stone) from disposal in a landfill where feasible. Implementing agencies shall incentivize construction contractors with waste minimization goals in bid specifications where feasible.

Significant Effect

The proposed program would result in less than significant cumulative impacts to utilities and service systems.

Description of Significant Impact

Structural BMPS constructed to treat, infiltrate, and/or store stormwater and non-stormwater throughout the watershed would not generate wastewater or require wastewater treatment or result in adverse cumulative impacts from operation or construction. Installation of storm drainage facilities identified in the proposed EWMPs would not substantially affect existing storm drain facilities. Impacts to the existing water supplies are anticipated to be beneficial as a result of the stormwater and non-stormwater runoff infiltration and conservation BMPs implemented across the EWMP areas. Construction and operation of the structural BMPs would generate solid waste; however, landfills serving the program area are expected to have sufficient capacity to accommodate the amount of waste generated. Disposal of the solid waste generated during construction and operation would comply with all pertinent regulations and statutes. All other projects implemented in the area would also be required to comply with federal, state, and local solid waste regulations and statutes. The use of energy anticipated for the proposed program is minor when compared to the County-wide use of electricity. The proposed program would use energy-efficient equipment and would not result in wasteful consumption. The non-structural BMPs would include street cleaning, landscape management, and storm drain operation, which would produce debris and trash for disposal.

Finding

The proposed program would not likely result in cumulative impacts to utilities and service systems. The proposed program would further reduce its cumulative impact on utilities and service systems to a less-than-significant-level by implementing Mitigation Measures UTIL-1 and UTIL-2.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce cumulative impacts related to utilities and service systems. With the implementation of Mitigation Measure UTIL-1 and UTIL-2, these impacts would be considered less than significant.

6.0 Significant and Unavoidable Environmental Impacts

As described above in Section 5.0, the impacts identified above as being less than significant with the implementation of mitigation measures could be significant and unavoidable if the proposed mitigation measures are not adopted and implemented by the Implementing Agencies for projects within their jurisdiction. Because the District cannot ensure that these Implementing Agencies will adopt and implement the proposed mitigation measures, the District finds that the impacts identified in section 5.0 may also be significant and unavoidable with respect to projects where the District will not be an implementing agency. The impacts discussed below were identified in the Final Program EIR as being "significant and unavoidable" for the program because they cannot be mitigated to a less-than-significant level.

6.1 Aesthetics

The proposed program would not have any environmental effects on aesthetics that cannot be mitigated to a less-than-significant level.

6.2 Air Quality

Significant Effect

The proposed program could violate air quality standards or contribute substantially to an existing or projected air quality violation (Impact 3.2-2).

Description of Significant Impact

Construction activities at the individual project sites would temporarily create emissions of dust, fumes, equipment exhaust, and other air contaminants. Through representative “worst-case” construction scenarios of each structural BMP type, ranging from small-, medium-, and large-scale projects, the magnitude of the daily emissions that can be generated by each structural BMP type is presented. The maximum daily construction emissions for the three structural BMP project types were estimated using the California Emissions Estimator Model (CalEEMod). The construction-related emissions of criteria air pollutants for the three structural BMP types were modeled based on general information provided in the project description and CalEEMod default settings along with reasonable assumptions based on other similar types of projects. The model found that for smaller BMPs including distributed BMPs, air emissions would not be significant and would not require mitigation measures. For some of the larger regional and centralized BMPs, the model shows that the maximum daily level of construction-generated emissions of NOx would exceed the applicable SCAQMD-recommended thresholds under the worst-case construction scenarios. Implementation of Mitigation Measures AIR-1 and AIR-2 would reduce emissions, but they may not reduce these emissions to levels below the SCAQMD thresholds for every structural BMP project, as the amount of emissions generated, the land area that would need disturbing, and the length of the construction schedule for each structural BMP project would vary. Implementation of large regional or centralized BMPs could result in temporary significant and unavoidable air emissions during peak periods of construction.

Long term operation of the proposed program would not result in substantial emissions of criteria air pollutants. There would be no new land use projects which would generate daily vehicle emissions. Inspection and maintenance activities would occur to the project site, but would be periodic throughout the year and would result in minimal emissions. Equipment for pump stations and ancillary components would be electrically powered, so would not generate emissions at the project site.

Finding

The proposed program would implement projects that could exceed identified emissions thresholds, and therefore have the potential to violate any air quality standard or substantially contribute to an existing or projected air quality violation. Implementation of Mitigation Measures AIR-1 and AIR-2 would help reduce this impact, but construction emissions would remain significant and unavoidable for some larger projects. Impacts from operational emissions would be considered less-than-significant.

Brief Explanation of the Rationale for Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts related to the violation of any air quality standard or substantial contribution to an existing or projected air quality violation. Implementation of Mitigation Measures AIR-1 and AIR-2 would help reduce the impact, but impacts from construction emissions would remain significant and unavoidable for some of the larger projects. Impacts from operational emissions would be less than significant.

> **AIR-1:** Implementing agencies shall require for large regional or centralized BMPs the use of low-emission equipment meeting Tier II emissions standards at a minimum and Tier III and IV emissions standards where available as CARB-required emissions technologies become readily available to contractors in the region.
>
> **AIR-2:** For large construction efforts that may result in significant air emissions, implementing agencies shall encourage contractors to use lower-emission equipment through the bidding process where appropriate.

Significant Effect

The proposed program could result in a cumulatively considerable net increase of any criteria pollutant for which the program region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors) (Impact 3.2-3). The proposed program could result in a significant cumulative impact to air quality.

Description of Significant Impact

As the Basin is currently in nonattainment for ozone, PM_{10}, and $PM_{2.5}$, cumulative development consisting of the proposed program along with other reasonably foreseeable future projects in the Basin as a whole could violate an air quality standard or contribute to an existing or projected air quality violation. Under conditions where multiple structural BMPs would be constructed concurrently in the EWMP areas, it is anticipated that the total aggregate construction emissions generated from these multiple structural BMP projects on a daily basis would exceed the SCAQMD's significance thresholds for criteria pollutants. Even with implementation of Mitigation Measures AIR-1 and AIR-2, the resulting aggregate daily emissions may not be reduced to levels below the SCAQMD thresholds should multiple structural BMP projects be constructed concurrently. Thus, construction-related air quality impacts associated with the proposed program would be considered significant and unavoidable. With respect to operational emissions, program implementation would not result in substantial long-term regional emissions of criteria air pollutants and would not exceed the SCAQMD thresholds of significance for criteria pollutants. As such, the proposed program's operational emissions would not be cumulatively considerable and cumulative air quality impacts would be less than significant.

Finding

As air pollutants for which the Basin is in nonattainment (i.e., ozone, PM_{10}, and $PM_{2.5}$) would be emitted as a result of the proposed program in excess of SCAQMD's thresholds for construction activities, these pollutant emissions would, in conjunction with other past, current, and probable future projects, be cumulatively considerable, and cumulative impacts would be significant and unavoidable. Implementation of Mitigation Measures AIR-1 and AIR-2 would reduce cumulative air quality impacts, but not to a level that is less than significant. With respect to operational emissions, program implementation would not result in substantial long-term regional emissions of criteria air pollutants and would not exceed the SCAQMD thresholds of significance for criteria pollutants. As such, the proposed program's operational emissions would not be cumulatively considerable and cumulative air quality impacts would be less than significant.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts. Even after the implementation of Mitigation Measures AIR-1 and AIR-2, impacts related to cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard remain significant and unavoidable for construction. Program implementation would not result in substantial long-term regional emissions of criteria pollutants with respect to operational emissions, therefore operational emissions would be less than significant.

> **AIR-1:** Implementing agencies shall require for large regional or centralized BMPs the use of low-emission equipment meeting Tier II emissions standards at a minimum and Tier III and IV emissions standards where available as CARB-required emissions technologies become readily available to contractors in the region.
> **AIR-2:** For large construction efforts that may result in significant air emissions, implementing agencies shall encourage contractors to use lower-emission equipment through the bidding process where appropriate.

6.3 Biological Resources

The proposed program would not have any environmental effects on biological resources that cannot be mitigated to a less-than-significant level.

6.4 Cultural Resources

Significant Effect

The proposed program would cause a substantial adverse change in the significance of an historical resource as defined in §15064.5. (Impact 3.4-1)

Description of Significant Impact

Implementation of structural BMPs could impact significant historic built environment resources that exist within the program area, which may include not only buildings and structures, but also built infrastructure such as concrete channels, dams, sidewalks, and roads. Impacts to the could include not only physical demolition or alteration of built environment resources, but also changes to the historic setting of a resource, and impacts that may adversely affect that ability of a resource to convey its significance. Similarly, potentially significant buried archaeological resources could still exist within the program area, beneath and between structures and roads. If previously undiscovered artifacts or buried archaeological resources are uncovered during excavation or construction, significant impacts could occur. Not all EWMP projects may result in a significant and unavoidable impact with regard to historical resources, as impacts associated with each project would be dependent on location; presence, nature, and significance of any historical resources within the construction area; and specific impacts to historical resources. In some circumstances, no mitigation is sufficient to maintain the historic integrity of the affected archaeological and other cultural resource or its surroundings, therefore implementation of the proposed program may ultimately result in a substantial adverse change.

Finding

The proposed program's potential to cause a substantial adverse change in the significance of an historical resource is considered significant. Potential adverse effects caused by the proposed program could be minimized by mitigation measures; however the impact would remain significant and unavoidable.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts that would cause a substantial adverse change in the significance of an historical resource. The project impacts are considered significant and unavoidable; implementation of Mitigation Measures CUL-1 through CUL-4 would help minimize impacts.

> **CUL-1:** For individual EWMP projects that could impact buildings or structures (including infrastructure) 45 years old or older, implementing agencies shall ensure that a historic built environment survey is conducted or supervised by a qualified historian or architectural historian meeting the Secretary of the Interior's Professional Qualification Standards for Architectural History. Historic built environment resources shall be evaluated for their eligibility for listing in the CRHR or local register prior to the implementing agency's approval of project plans. If eligible resources that would be considered historical resources under CEQA are identified, demolition or substantial alteration of such resources shall be avoided. If avoidance is determined to be infeasible, the implementing agency shall require the preparation of a treatment plan to include, but not be limited to, photo-documentation and public interpretation of the resource. The plan will be submitted to the implementing agency for review and approval prior to implementation.
>
> **CUL-2:** Implementing agencies shall ensure that individual EWMP projects that require ground disturbance shall be subject to a Phase I cultural resources inventory on a project-specific basis prior to the implementing agency's approval of project plans. The study shall be conducted or supervised by a qualified archaeologist, defined as an archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards for Archaeology, and shall be conducted in consultation with the local Native American representatives expressing interest. The cultural resources inventory shall include a cultural resources records search to be conducted at the South Central Coastal Information Center; scoping with the NAHC and with interested Native Americans identified by the NAHC; a pedestrian archaeological survey where deemed appropriate by the qualified archaeologist; and formal recordation of all identified archaeological resources on California Department of Parks and Recreation 523 forms and significance evaluation of such resources presented in a technical report following the guidelines in *Archaeological Resource Management Reports (ARMR): Recommended Contents and Format*, Department of Parks and Recreation, Office of Historic Preservation, State of California, 1990.
>
> If potentially significant archaeological resources are encountered during the survey, the implementing agency shall require that the resources are evaluated by the qualified archaeologist for their eligibility for listing in the CRHR and for significance as a historical resource or unique archaeological resource per CEQA Guidelines Section 15064.5. Recommendations shall be made for treatment of these resources if found to be

significant, in consultation with the implementing agency and the appropriate Native American groups for prehistoric resources. Per CEQA Guidelines Section 15126.4(b)(3), preservation in place shall be the preferred manner of mitigation to avoid impacts to archaeological resources qualifying as historical resources. Methods of avoidance may include, but shall not be limited to, project reroute or redesign, project cancellation, or identification of protection measures such as capping or fencing. Consistent with CEQA Guidelines Section 15126.4(b)(3)(C), if it is demonstrated that resources cannot be avoided, the qualified archaeologist shall develop additional treatment measures, which may include data recovery or other appropriate measures, in consultation with the implementing agency, and any local Native American representatives expressing interest in prehistoric or tribal resources. If an archaeological site does not qualify as an historical resource but meets the criteria for a unique archaeological resource as defined in Section 21083.2, then the site shall be treated in accordance with the provisions of Section 21083.2.

CUL-3: The implementing agency shall retain archaeological monitors during ground-disturbing activities that have the potential to impact archaeological resources qualifying as historical resources or unique archaeological resources, as determined by a qualified archaeologist in consultation with the implementing agency, and any local Native American representatives expressing interest in the project. Native American monitors shall be retained for projects that have a high potential to impact sensitive Native American resources, as determined by the implementing agency in coordination with the qualified archaeologist.

CUL-4: During project-level construction, should subsurface archaeological resources be discovered, all activity in the vicinity of the find shall stop and a qualified archaeologist shall be contacted to assess the significance of the find according to CEQA Guidelines Section 15064.5. If any find is determined to be significant, the archaeologist shall determine, in consultation with the implementing agency and any local Native American groups expressing interest, appropriate avoidance measures or other appropriate mitigation. Per CEQA Guidelines Section 15126.4(b)(3), preservation in place shall be the preferred means to avoid impacts to archaeological resources qualifying as historical resources. Methods of avoidance may include, but shall not be limited to, project reroute or redesign, project cancellation, or identification of protection measures such as capping or fencing. Consistent with CEQA Guidelines Section 15126.4(b)(3)(C), if it is demonstrated that resources cannot be avoided, the qualified archaeologist shall develop additional treatment measures, such as data recovery or other appropriate measures, in consultation with the implementing agency and any local Native American representatives expressing interest in prehistoric or tribal resources. If an archaeological site does not qualify as an historical resource but meets the criteria for a unique archaeological resource as defined in Section 21083.2, then the site shall be treated in accordance with the provisions of Section 21083.2.

Significant Effect

The proposed program would result in cumulatively significant impacts to cultural resources.

Description of Significant Impact

Cumulative impacts to cultural resources in the cultural resources geographic scope of analysis could occur if other existing or proposed projects, in conjunction with the proposed program, had or would have impacts on cultural resources that, when considered together, would be significant. With implementation of Mitigation Measures CUL-2, CUL-3 and CUL-4, cumulatively significant environmental impacts to unique archaeological resources would be reduced to a less than significant level. With implementation of Mitigation Measures CUL-5 and CUL-6, cumulative impacts to paleontological resources would be less than significant. Further, implementation of CUL-7 would reduce potentially significant impacts to human remains should they be encountered during ground-disturbing activities to a less-than-significant level. Implementation of the proposed program may ultimately result in a substantial adverse change to historical resources through various development activities for which no possible mitigation may be available to maintain the historic integrity of the affected resource or its surroundings, and impacts to historical resources would remain significant and unavoidable at a program level. Therefore, the implementation of structural BMPs may contribute to a cumulatively significant environmental impact to historical resources.

Finding

The proposed program has the potential to result in cumulatively considerable impacts related to cultural resources, specifically in regard to substantial adverse changes in the significance of historical resources resulting from excavation activities associated with projects in the cumulative impacts scenario. The implementation of Mitigation Measures CUL-1 through CUL-7 would reduce impacts relating to unique archaeological resources, paleontological resources, and human remains to a less-than-significant level, however, these mitigation measures would not reduce impacts to historical resources below a significant level.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce cumulative impacts caused by the project. With the implementation of Mitigation Measures CUL-1 through CUL-7, these cumulative cultural resource impacts would be reduced, but still considered significant and unavoidable.

6.5 Geologic and Mineral Resources

The proposed program would not have any environmental effects related to geology and soils that cannot be mitigated to a less-than-significant level.

6.6 Greenhouse Gas Emissions

The proposed program would not have any environmental effects related to greenhouse gas emissions that cannot be mitigated to a less-than-significant level.

6.7 Hazards and Hazardous Materials

The proposed program would not have any environmental effects related to hazards and hazardous materials that cannot be mitigated to a less-than-significant level.

6.8 Hydrology and Water Quality

The proposed program would not have any environmental effects on hydrology and water quality that cannot be mitigated to a less-than-significant level.

6.9 Land Use and Agriculture

The proposed program would not have any environmental effects on land use and planning that cannot be mitigated to a less-than-significant level.

6.10 Noise

Significant Effect

The proposed program would result in exposure of persons to, or generation of, noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies (Impact 3.10-1).

Description of Significant Impact

The proposed program would result in a temporary increase in noise levels during construction at the project sites. Noise generated during temporary construction is anticipated, and because of the possibility that certain structural BMP projects may exceed noise levels established by their respective local jurisdictions, this impact would be significant and unavoidable.

Finding

The proposed program has the potential to result in exposure of persons to, or generation of, noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. Implementation of Mitigation Measures NOISE-1 and NOISE-2 would reduce the proposed program's construction-related noise levels by requiring the project contractor to locate equipment such that noise is directed away from sensitive receptors and to maintain noise controls on standard construction equipment. In addition, the mitigation measures would require a construction noise coordinator to resolve complaints about noise. However, even with the project's adherence to all applicable noise requirements and guidelines in addition to implementation of Mitigation Measures NOISE-1 and NOISE-2, it is anticipated that there would be times during the project's construction activities where the nearest sensitive receptors would be exposed to a perceptible increase in noise levels. Therefore, the project would result in perceptible increases in noise levels during construction and this impact would be considered significant and unavoidable.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts related to exposure of persons to, or generation of, noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. Even with the implementation of Mitigation Measures NOISE-1 and NOISE-2, these impacts would still be considered significant and unavoidable.

Significant Effect

The proposed program would result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project (Impact 3.10-4).

Description of Significant Impact

During construction of the distributed, centralized, and regional structural BMPs, temporary or periodic increases in noise levels in and around each structural BMP site would result from the operation of construction equipment. Where a structural BMP site is located within 25 feet of an existing noise-sensitive land use, the resulting construction noise levels at that existing land use could reach as high as 95 dBA L_{eq} during excavation activities, which would result in a substantial noise increase over existing ambient noise levels at that existing land use. Therefore this impact would be significant and unavoidable. The identification of a significant and unavoidable program-level impact in this Program EIR for the proposed program, however, does not preclude the finding of future less-than-significant impacts for individual structural BMP projects.

Finding

The proposed program has the potential to result in a substantial temporary or periodic increase in ambient noise levels above levels existing without the project in the vicinity of individual projects. Implementation of Mitigation Measure NOISE-1 would reduce the project's construction-related noise levels by requiring the project contractor to locate equipment such that noise is directed away from sensitive receptors and to maintain noise controls on standard construction equipment. In addition, the mitigation measures would require a construction noise coordinator to resolve complaints about noise. However, even with the project's adherence to all applicable noise requirements and guidelines in addition to implementation of the mitigation measure, it is anticipated that there would be times during the project's construction activities where the nearest sensitive receptors would be exposed to a perceptible change in noise levels. Therefore, the proposed program would result in perceptible increases in noise levels during construction and this impact would be considered significant and unavoidable.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts related to a substantial temporary or periodic increase in ambient noise levels. With the implementation of Mitigation Measure NOISE-1 included, impacts would still be significant and unavoidable during construction.

Significant Effect

The proposed program would result in significant cumulative construction noise impacts.

Description of Significant Impact

Noise and vibration are both defined as localized phenomena that significantly reduce in magnitude as distance from the source increases. The structural BMPs associated with the proposed program would be constructed in multiple jurisdictions of Los Angeles County, which aside from the County also includes 46 cities and LACFCD. As such, these structural BMP projects would be generally spread over a large geographic area within the County. These structural BMPs in combination with other current and planned projects in the County would result in an increase in construction-related noise levels, which would temporarily increase the ambient noise levels of the existing noise environment in areas where a construction project would occur. This would result in significant and unavoidable impacts for construction.

Finding

The proposed program has the potential to result in the exposure of persons to noise levels in excess of applicable standards. Even with implementation of Mitigation Measures NOISE-1 and NOISE-2, impacts would still be significant and unavoidable during construction.

Brief Explanation of the Rationale for the Finding

CEQA requires that all feasible and reasonable mitigation be applied to the project to reduce impacts related to inappropriate noise levels. Even with implementation of Mitigation Measures NOISE-1 and NOISE-2, impacts would still be significant and unavoidable during construction.

6.11 Population and Housing and Environmental Justice

The proposed program would not have any environmental effects on population, housing and environmental justice that cannot be mitigated to a less-than-significant level.

6.12 Public Services and Recreation

The proposed program would not have any environmental effects on public services and recreation that cannot be mitigated to a less-than-significant level.

6.13 Transportation and Circulation

The proposed program would not have any environmental effects on transportation and traffic that cannot be mitigated to a less-than-significant level.

6.14 Utilities and Service Systems

The proposed program would not have any environmental effects on utilities that cannot be mitigated to a less-than-significant level.

7.0 Findings Regarding Project Alternatives

The following findings and brief explanation of the rationale for the findings regarding program alternatives identified in the EIR are set forth to comply with the requirements of Section 15091(s)(3) of the *CEQA Guidelines*.

The consideration of alternatives is an integral component of the CEQA process. The selection and evaluation of a reasonable range of alternatives provides the public and decision-makers with information on ways to avoid or lessen environmental impacts created by a proposed program. When selecting alternatives for evaluation, CEQA requires alternatives that meet most of the basic objectives of the project, while avoiding or substantially lessening the program's significant effects. Thus, objectives for the proposed program were considered by this board in evaluating the alternatives. These objectives are:

- To collaborate among agencies (Permittee jurisdictions) across the watershed to promote more cost-effective and multi-beneficial water quality improvement projects to comply with the MS4 Permit;
- To develop watershed-wide EWMPs that will, once implemented, remove or reduce pollutants from dry- and wet-weather urban runoff in a cost-effective manner; and
- To reduce the impact of stormwater and non-stormwater on receiving water quality.

7.1 No Program Alternative

Under this alternative, the existing land uses on the project site would continue to operate as they do under existing conditions. The existing land uses would continue for an indefinite period and no physical changes within the proposed program area would occur. In addition, existing ancillary structures, such as buildings, roadways and parkways within the project area, would remain in their current capacity. The No Project Alternative would maintain the current zoning and land use designations.

Finding

This alternative would not meet the first and second objectives to collaborate among agencies across the watershed to prepare EWMPs that promote more cost-effective and multi-beneficial water quality improvement projects. However, compliance with the MS4 Permit is still required regardless of implementation of the EWMP. Under the No Project Alternative some water quality projects would be implemented in an effort to achieve compliance with the MS4 permit.

This alternative would result in slightly greater impacts to air quality with regards to emissions generated, because the programs would need to be installed rapidly and more BMPs would likely be required as a result of the inefficiencies of multiple boundaries. Hydrology and water quality impacts would also be greater, as an installation grace period would not be granted for BMPs outside of the EWMP, increasing the likelihood of noncompliance with the MS4 Permit. All other impacts would be similar under this alternative when compared with the proposed program. This alternative would not eliminate significant and unavoidable impacts when associated with the proposed project.

7.2 Non-Structural BMPs Only Project Alternative

This alternative would involve implementation of the proposed program and its associated non-structural BMPs only. No structural BMPs would be implemented.

Finding

This alternative would not meet any of the objectives of the proposed program to collaborate among agencies to promote more cost-effective and multi-beneficial water quality improvement projects and to prepare EWMPs to reduce pollutant loading. Non-Structural BMPs are generally implemented individually in each jurisdiction.

Since no facilities would be constructed, temporary impacts to the environment would be less than the proposed program for many topic areas. However, impacts to population and housing, land use, and recreation would be greater than the proposed program. This alternative would result in greater impacts to aesthetics, as it would not include green-streets and grassy swales that would improve local aesthetics. Impacts to hydrology and water quality would also be greater under this alternative, as achieving water quality objectives with no structural BMPs would be unlikely.

7.3 Distributed Structural and Non-Structural BMPs Only Program Alternative (No Centralized or Regional)

This alternative would involve implementation of the proposed program and only its associated distributed structural BMPs and non-structural BMPs.

Finding

This alternative would achieve the first and third project objectives to collaborate among agencies to promote more cost-effective and multi-beneficial water quality improvement projects that reduce the impact of stormwater on receiving water quality. However, it would likely require more BMPs to meet the MS4 Permit water quality objectives, as distributed structural BMPs tend to be smaller in nature and are located in a wide distribution throughout the watershed. Therefore, it would not meet the second project objective (developing EWMPS that will remove or reduce pollutants from urban runoff and removal of stormwater and non-stormwater impacts on receiving water quality).

Since much of the impacts of program implementation would occur during construction of the large-scale regional and centralized BMPs, this alternative would result in fewer construction impacts than the proposed project and fewer impacts to aesthetics. However, the alternative would result in greater impacts to land use planning/agriculture, as eliminating the use of large open space areas for BMPs would require a more dispersed land use acquisition for small scale BMPs, thereby increasing potential land use compatibility impacts. This alternative would eliminate the water quality benefit and more likely potential to comply with the MS4 Permit provided by large-scale regional BMPs, and would therefore result in greater hydrology and water quality impacts. All other impacts under this alternative would be similar to the proposed program.

7.4 Environmentally Superior Alternative

The purpose of the alternatives analysis is to consider a reasonable range of alternatives that could feasibly attain most of the basic project objectives and avoid or substantially lessen significant program impacts.

The *CEQA Guidelines* require the identification of an environmentally superior alternative of a project other than or the "no project" alternative (CEQA Guidelines Section 15126.6 (e)(2)). An environmentally superior alternative is an alternative to the project that would reduce and/or eliminate the significant environmental impacts associated with the project without creating other significant impacts and without substantially reducing and/or eliminating the environmental benefits attributable to the project.

Finding

The Environmentally Superior Alternative would be the proposed program itself. The proposed program would avoid increasing the impacts to hydrology and water quality that would occur under all three of the alternatives.

The No Program Alternative would require that individual Permittees design and construct BMPs locally to achieve MS4 Permit compliance. None of the significant and unavoidable impacts of the proposed alternative would be avoided by this alternative. Furthermore, since the ability to achieve compliance with MS4 Permit water quality objectives would be reduced if each Permittee were on their own, impacts to hydrology and water quality would be greater under this alternative.

The Distributed Structural BMPs Only Alternative would result in construction of an increased number of distributed BMPs This alternative would result in fewer impacts to air quality, cultural resources and noise, and would therefore reduce the significant and unavoidable impacts associated with the proposed program. However, since the ability to achieve compliance with MS4 Permit water quality objectives would be reduced without the larger-scale centralized and regional BMPs, impacts to hydrology and water quality would be greater under this alternative.

The Non-Structural BMPs Only Alternative would avoid all of the significant and unavoidable impacts associated with construction of the structural BMPs. In addition, nearly all of the impacts associated with the proposed alternative would be avoided, including impacts from infiltration to neighboring subsurface structures, mobilization of contaminants, and site-specific impacts to cultural and biological resources. However, since the ability to achieve compliance with MS4 Permit water quality objectives would be substantially reduced, impacts to water quality would be greater under this alternative, and compliance with the MS4 Permit would be unlikely. Even though this alternative would avoid significant and unavoidable impacts of construction and operation of structural BMPs, the failure to meet water quality objectives and achieve MS4 Permit compliance would outweigh the avoidance of the other impacts.

Since the proposed alternative would provide the best chance of achieving regional water quality objectives, it is considered the environmentally superior alternative.

<u>Exhibit B</u>

STATEMENT OF OVERRIDING CONSIDERATIONS

State CEQA Guidelines Section 15093

For

Enhanced Watershed Management Programs

Final Program Environmental Impact Report
(SCH# 2014081106)

Lead Agency: Los Angeles County Flood Control District

The California Environmental Quality Act (CEQA) requires a public agency to balance the benefits of a proposed project against its significant unavoidable adverse impacts in determining to approve the project. The Enhanced Watershed Management Programs (EWMP) would result in some environmental effects that, although mitigated to the extent feasible by the implementation of mitigation measures proposed for the program, would remain significant and unavoidable adverse impacts, as discussed in the final program environmental impact report (PEIR) and CEQA findings of fact. These impacts are summarized below and constitute those impacts for which this statement of overriding considerations is made.

Air Quality

1) <u>Impact 3.2-2 (The project would violate air quality standards or contribute substantially to an existing or projected air quality violation)</u>. Construction of large regional or centralized BMPs associated with the proposed program could result in temporary significant and unavoidable air emissions during peak periods of construction. The exceedance of applicable SCAQMD-recommended air quality thresholds would be generated primarily during the grading phase of proposed projects, when emissions associated with off-road construction equipment and on-road soil hauling activities would occur. Mitigation measures are incorporated to reduce the severity of the emissions during construction by requiring the use of low-emission equipment which meets Tier II emissions standards at a minimum. However, because there are no feasible mitigation measures that can be implemented to prevent violation of air quality standards during construction, impacts to air quality would remain significant and unavoidable despite implementation of Mitigation Measures AIR-1 and AIR-2.

2) <u>Impact 3.2-3 (The project could result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)).</u> The proposed project would result in a cumulatively considerable net increase of criteria pollutants for which the project region is nonattainment. The Los Angeles Basin is currently in nonattainment for ozone, PM_{10}, and $PM_{2.5}$, which indicates that combined

with other reasonably foreseeable future projects in the Basin, the proposed program could violate an air quality standard. Even with implementation of mitigation measures, the resulting aggregate daily emissions may not be reduced to levels below the SCAQMD thresholds should multiple structural BMP projects be constructed concurrently throughout the Basin. As pollutants for which the Basin is in nonattainment (i.e., ozone, PM_{10}, and $PM_{2.5}$) could exceed SCAQMD's respective thresholds for construction, these pollutant emissions would be cumulatively considerable, and impacts would be significant and unavoidable despite implementation of Mitigation Measures AIR-1 and AIR-2. Operational emissions for the program would not exceed air quality standards therefore would not be cumulatively considerable; cumulative air quality impacts would be less than significant after implementation of structural BMPs.

Cultural Resources

3) Impact 3.4-1 (The project would cause a substantial adverse change in the significance of an historical resource as defined in §15064.5.). The proposed project would result in significant and unavoidable impacts to historical resources in the project area. Historical resources can include not only buildings and structures, but also any object, site area, place, record, or manuscript which a lead agency determines to be historically significant, or which is listed in or determined eligible for listing in the CRHR. Known archaeological resources, as well as unknown and unrecorded archaeological resources that may be unearthed during construction activities associated with implementation of structural BMPs, could be impacted by individual projects. As program implementation actions move forward, individual projects would undergo additional CEQA review prior to construction to assess impacts to specific cultural resources not addressed in this program-level EIR. Mitigation measures will be implemented to lessen impacts to historical resources through historic built environment surveys, cultural resources inventories, archaeological monitoring, and assessment of findings if applicable during ground-disturbing operations. However, because the degree of impact and the applicability, feasibility, and success of these measures cannot be accurately predicted for each specific project at this time, the program level impact related to archaeological and cultural resources that qualify as historical resources is considered significant and unavoidable. With implementation of Mitigation Measures CUL-1 through CUL-4, impacts would remain significant and unavoidable.

4) Cumulative Impact, Cultural Resources (The project would result in cumulative impacts to cultural resources). Development of the proposed project together with simultaneous development of nearby, reasonably foreseeable planned projects in the area would result in significant cumulative cultural resources impacts. The program could cause impacts on cultural and paleontological resources during the construction period or as a result of operation and maintenance or closure and decommissioning activities. Cumulative impacts to cultural resources in the cultural resources geographic scope of analysis could occur if other existing or proposed projects, in conjunction with the proposed program, had or would have impacts on cultural resources that, when considered together, would be significant. While implementation of mitigation measures would reduce impacts to historical resources, the proposed program may ultimately result in a substantial adverse change to historical resources through development activities for which no possible mitigation may be available to maintain historic integrity of an affected resource or its surroundings. Therefore, despite implementation of Mitigation Measures CUL-1 through CUL-7, the program would have cumulatively significant and unavoidable environmental impact to historical resources.

Noise

5) Impact 3.10-1 (The proposed project would result in exposure of persons to, or generation of, noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies). During construction of the proposed program, noise levels would be increased temporarily and intermittently to levels substantially greater than existing ambient noise levels in the area. Mitigation measures would help reduce construction noise impacts, requiring construction activities to be conducted in accordance with the applicable local noise regulations and standards, the implementation of noise reduction devices and techniques during construction activities, and advance notification to the surrounding noise-sensitive receptors of a structural BMP site about upcoming construction activities and their hours of operation. Certain structural BMP projects may exceed noise levels established by their respective local jurisdictions, though, which would make this impact significant and unavoidable despite implementation of Mitigation Measures NOISE-1 and NOISE-2.

6) Impact 3.10-4 (The proposed project would result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project). During construction of the distributed, centralized, and regional structural BMPs, temporary or periodic increases in noise levels in and around each structural BMP site would result from the operation of construction equipment. Under circumstances where structural BMP sites are located immediately adjacent to existing sensitive land uses, the noise impacts related to a substantial temporary or periodic increase in ambient noise levels above levels existing without the structural BMPs would remain significant, even with implementation of mitigation measures. Individual project-level assessment in the future, though, may result in a finding of less-than-significant for temporary increases in noise levels. Despite implementation of Mitigation Measure NOISE-1, the impact would remain significant and unavoidable for this program.

7) Cumulative Impact, Noise (The project would result in significant cumulative construction noise impacts). Construction of the structural BMPs, in combination with other current and planned projects in the County would result in an increase in construction-related noise levels, which would temporarily increase the ambient noise levels of the existing noise environment in areas where a construction project would occur. Despite implementation of Mitigation Measures NOISE-1 and NOISE-2, cumulative impacts for construction would remain significant and unavoidable.

In addition to the impacts identified above, the District finds that the following impacts are significant and unavoidable solely because the mitigation proposed to reduce these impacts to less-than-significant levels is within the control and jurisdiction of other public agencies who will be implementing the EWMPs. Although the District will implement these mitigation measures for projects over which it has jurisdiction, the District cannot ensure that other Implementing Agencies will adopt and implement the proposed mitigation measures for projects over which they have jurisdiction. The District therefore cannot state with certainty that these impacts will be mitigated to less-than-significant levels, meaning that they may remain significant and unavoidable. The statement of overriding considerations is therefore also made for the following impacts:

Aesthetics

8) Impact 3.1-1(The proposed program could create a substantial adverse effect on a scenic vista). During construction, equipment and materials required for temporary ground disturbances would

be visible from public vantage points, but would not affect any scenic vistas past the temporary construction periods. Given the predominantly urban character of potential pump station sites and temporary nature of construction activities, impacts would be considered less than significant. A majority of structural BMPs would be located underground and would not introduce impacts to scenic vistas. Aboveground structures such as pump stations would be located in urbanized areas and would generally be single-story buildings. Such aboveground structures have the potential to impact scenic vistas, but will be required to be designed so as not to contrast existing neighborhood aesthetic features. The Program EIR identified Mitigation Measure AES-1 that would reduce impacts to a less-than-significant level. However, without implementation of this mitigation measure, the impact would be significant and unavoidable.

9) Impact 3.1-2 (The proposed program could substantially damage scenic resources, including but not limited to, trees, rocks, outcroppings, and historic buildings within a state scenic highway).Parts of the proposed program may be visible from designated scenic highways or other locally designated scenic roadways in the project area. Rock outcroppings and historic buildings would likely not be disturbed by the project as most of the BMPs will be underground and not visible after construction is complete. Construction of the proposed program would involve removal of vegetation from individual project sites. Larger structures may result in significant impacts to scenic resources within state scenic highway. The Program EIR identified Mitigation Measure AES-1 that would reduce impacts to a less-than-significant level. However, without implementation of this mitigation measure, the impact would be significant and unavoidable.

10) Impact 3.1-3 (The proposed program could substantially degrade the existing visual character or quality of the site and its surroundings). Construction activities would visually degrade the project site and its surroundings as a result of the appearance of demolition materials, excavated areas, stockpiles, and other materials. Due to the temporary nature of construction, these adverse effects are considered less than significant. Once constructed, the BMPs would be located predominantly in urban areas and largely underground, which will not have a permanent effect on the visual character or quality of an area. Aboveground structures may degrade existing visual character of project areas as they will add to the visual landscape. Without proper maintenance of BMPs, especially wet ponds or constructed wetlands, there is a potential for substantial degradation of existing visual quality of project sites due to algal growth or public littering. The Program EIR identified Mitigation Measures AES-1 and AES-2 that would reduce impacts to a less-than-significant level. However, without implementation of these mitigation measures, the impact would be significant and unavoidable.

11) Cumulative Impact, Aesthetics (The proposed program would result in a less than significant cumulative aesthetic impact with mitigation). Cumulative projects in the program region have the potential to result in cumulative impacts to aesthetic resources if they would result in the removal or substantial adverse change of visual character or image of a neighborhood, community, state scenic highway, or localized area. Given that the BMPs will be located in primarily urbanized areas, introduction of structural BMPs would result in only minor changes to the visual landscape. The cumulative impacts of aboveground structures could have a significant impact to the aesthetic environment due to their potential size and location. Overall, implementation of BMPs is anticipated to have a positive impact on the aesthetic environment through the creation of open space areas and less impervious surfaces in urbanized or residential areas. The Program EIR identified Mitigation Measures AES-1 and AES-2 that would reduce cumulative impacts

associated with aesthetics to a less-than-significant level. However, without implementation of these mitigation measures, the impact would be significant and unavoidable.

Air Quality

12) Impact 3.2-4 (The proposed program could expose sensitive receptors to substantial pollutant concentrations). While construction-related traffic on local roadways would occur during construction, the net increase of construction vehicle trips to the existing traffic volumes on local roadways would be relatively small and would not result in carbon monoxide (CO) hotspots. These construction-related trips would only occur in the short-term, and because trip-generating land uses are not associated with the proposed program, impacts associated with CO hotspots would be less than significant. Off-road heavy-duty diesel equipment would be used only temporarily at each individual structural BMP site, therefore the construction activities associated with each structural BMP project in the EWMP areas would not expose sensitive receptors to substantial emissions of TACs. During construction of the individual structural BMPs in the project area, sensitive receptors such as residences, schools, hospitals, and daycare centers would be exposed to significant adverse localized air quality impacts. Operation of structural BMPs would not involve the emission of toxic air contaminants (TAC), and would operate passively without use of mechanical equipment. Project operation would not introduce health risks associated with TAC emissions. Construction activities could expose sensitive receptors to criteria air pollutants from vehicle exhaust and dust. Depending on the size and scope of the individual structural BMPs, a localized significance threshold (LST) analysis may be required to ensure construction emissions would not exceed SCAQMD's LSTs or result in pollutant emissions that would cause or contribute to the exceedance of the most stringent applicable federal or state ambient air quality standards. The Program EIR identified Mitigation Measure AIR-3 that would reduce this impact to a less-than-significant level. However, without implementation of this mitigation measure, the impact would be significant and unavoidable.

13) The proposed program could create objectionable odors affecting a substantial number of people (Impact 3.2-5). The proposed program does not include any uses typically associated with odor complaints including agricultural uses, wastewater treatment plants, food processing plans, and landfills, among others. During the construction phase, exhaust odors from equipment may produce discernible odors typical of most construction sites and would be a temporary source of nuisance to adjacent uses. These odors would be temporary and intermittent in nature, so would not be considered a significant environmental impact. Certain BMPs such as restored creeks and estuaries may result in odors from saturated mud or algal blooms when left permanently wet. This may result in a severe nuisance for sensitive receptors near such BMPs, and regular maintenance may be sufficient to reduce odors in some situations. The Program EIR identified Mitigation Measures AES-2 and AIR-4 that would reduce impacts to a less-than-significant levels. However, without implementation of these mitigation measures, the impact would be significant and unavoidable.

Biological Resources

14) Impact 3.3-1 (The proposed program would have a substantial adverse impact, either directly or through habitat modifications, on species identified as special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or the U.S. Fish and Wildlife Service). Construction of structural BMPs may affect large open space or

riparian habitats that would have a higher potential to support special-status wildlife species, such as streams, wetlands, and upland scrub or oak woodlands. Mitigation Measures BIO-1 through BIO-8 require suitability studies for potential BMP sites for their potential to impact valued habitats, and require impact characterization, minimization and compensation for impacts to highly valued habitats in consultation with the USFWS and CDFW. The proposed program will implement BMPs that are designed to retain dry-weather flows, which could reduce wetted area or completely eliminate flows in certain drainages that support sensitive species. The Program EIR identified Mitigation Measures BIO-1 through BIO-8 that would reduce the impact to a less-than-significant level. However, without implementation of these mitigation measures, the impact would be significant and unavoidable.

15) Impact 3.3-2 (The proposed program would have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the CDFW or USFWS). Significant Ecological Areas (SEA), as identified by the Los Angeles County General Plan, riparian, and other sensitive communities are not expected to occur within the disturbance areas of the BMP projects since the majority of the structural BMPs would occur in developed or disturbed areas. While some regional and centralized structural BMPs could occur within or adjacent to SEAs, riparian habitat or other sensitive natural communities, these types of BMPs would provide multi-beneficial water quality and habitat restoration improvements to the applicable EWMP watershed. Additionally, each development proposed within a designated SEA must undergo a performance review process for compliance with the SEA design compatibility criteria and other standards for approval by the LA County Department of Regional Planning. Future project-level environmental review processes would consider all proposed projects on a case-by-case basis to determine whether an individual project would impact riparian or other sensitive natural communities. Site-specific mitigation measures would be required to minimize and reduce potentially significant impacts to riparian and other sensitive natural communities. The Program EIR identified Mitigation Measures BIO-1 through BIO-8 that would reduce this impact to less than significant levels. However, without implementation of these mitigation measures, the impact would be significant and unavoidable.

16) Impact 3.3-3 (The proposed program would have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means). Wetlands occur throughout the EWMP areas, and once project facility locations are determined, exact locations and acreages of jurisdictional areas located within or adjacent to impact areas shall be determined through a formal jurisdictional delineation. For projects impacting native vegetation within jurisdictional drainages, the implementing agency would be required to obtain California Fish and Game Code Section 1602 compliance and Section 404 compliance from the USACE and Section 401 Certification from the RWQCB. In addition, implementation of Mitigation Measures BIO-1 through BIO-9 would ensure compliance with state and federal regulations relating to potentially jurisdictional features, including wash habitat vegetation that may fall under CDFW jurisdiction. Any projects impacting native vegetation within jurisdictional drainages would be required to comply with California Fish and Game Code Section 1602 compliance and Section 404 compliance from the USACE and Section 401 Certification from the RWQCB. The Program EIR identified Mitigation Measures BIO-1 through BIO-9 that would reduce this impact to less than significant levels. However, without implementation of these mitigation measures, the impact would be significant and unavoidable.

17) Impact 3.3-5 (The proposed program would conflict with local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance). The proposed program would mainly be constructed within highly urbanized and disturbed areas within existing infrastructure. Any impacts to oak trees within Los Angeles County would be required to comply with the Oak Tree Preservation Ordinance (or other tree ordinances established by the local city). A tree permit may be required if impacts to oak trees or other protected trees are determined to be necessary. The Program EIR identified Mitigation Measure BIO-10 that would reduce this impact to less than significant levels. However, without implementation of this mitigation measure, the impact would be significant and unavoidable.

18) Cumulative Impacts, Biological Resources (The proposed program would result in cumulative biological resource impacts). Cumulatively, throughout the region, the retention of stormwater and treatment of pollutants within each watershed, and the reduction of pollutant loading in waterways would substantially benefit the water quality of the region's aquatic and coastal habitats, as well as the plants and wildlife dependent on them. Implementation of the BMPs would also return the local hydrology to a more natural condition. Although some drainage segments may exhibit reduced riparian habitat or wetlands over time due to the reduced dry-weather flow, the cumulative effect would be offset by increased groundwater recharge and seepage supporting expanded wetland and riparian vegetation supporting local flora and fauna populations. Therefore, the program's potential contribution to cumulative effects on biological resources is considered less than significant. For regional and centralized BMPs at the larger scale, the Program EIR identified Mitigation Measures BIO-1 through BIO-10 that would reduce this impact to less than significant levels. However, without implementation of these mitigation measures, the impact would be significant and unavoidable.

Cultural Resources

19) Impact 3.4-2 (The proposed program could cause a substantial adverse change in the significance of unique archaeological resources as defined in §15064.5). The program area, which spans most of Los Angeles County, should be considered sensitive for archaeological resources, with degree of sensitivity varying across the program area based on specific environmental factors. Any structural BMP which involves grading, trenching, excavation, vegetation removal, or other forms of ground disturbance could impact archaeological resources. The Program EIR identified Mitigation Measures CUL-2 through CUL-4 that would reduce this impact to less than significant levels. However, without implementation of these mitigation measures, the impact would be significant and unavoidable.

20) Impact 3.4-3 (The proposed program could directly or indirectly destroy a unique paleontological resource or site or unique geologic feature). The program area is underlain by a number of high or undetermined paleontological sensitivity units, which may contain significant paleontological resources. Significant paleontological resources can be uncovered even in areas of low sensitivity, though, and it is possible that ground-disturbing construction activities associated with structural BMPs could result in the inadvertent discovery of paleontological resources, which could be a significant impact. The Program EIR identified Mitigation Measures CUL-5 and CUL-6 that would reduce this impact to less than significant levels. However, without implementation of these mitigation measures, the impact would be significant and unavoidable.

21) Impact 3.4-4 (The proposed program could disturb human remains, including those interred outside of formal cemeteries). There is no indication, either from the archival research results or the archaeological survey, that any particular location in the project area has been used for human burial purposes in the recent or distant past. However, in the event that human remains are inadvertently discovered during project construction activities, the human remains could be inadvertently damaged, which could be a significant impact. The proposed program's potential to uncover buried archaeological deposits including human remains is considered significant. The Program EIR identified Mitigation Measures CUL-7. However, without implementation of this mitigation measure, the impact would be significant and unavoidable.

Geologic and Mineral Resources

22) Impact 3.5-3 (The proposed program could be located on a geological unit or soil that is unstable, or that would become unstable as a result of the program, and potentially result in on-site or off-site non-seismically induced geologic hazards such as landslides, lateral spreading, subsidence, collapse or sinkholes, settlement, or slope failure). Infiltration of water into subsurface soils can increase soil instability and result in saturated soils, soil piping through preferential pathways, breakouts due to infiltrated water finding utility trenches and other preferential pathways, and raising the local groundwater levels such that infrastructure foundations and underground structures could be affected by unstable soils. Structural BMPs could potentially be undermined by unstable soils or impact adjacent infrastructure and buildings. The Program EIR identified Mitigation Measure GEO-1 that would reduce this impact to less than significant levels. However, without implementation of this mitigation measure, the impact would be significant and unavoidable.

23) Cumulative Impacts, Geologic and Mineral Resources (Cumulative impacts on geology and soils would have a less than significant impact on the environment with implementation of mitigation). The cumulative effect of multiple infiltration projects could increase the severity of perched or migrating water, which has the potential to inundate underground utilities or structures. Mitigation Measure GEO-1 would minimize the cumulative impact to regional infrastructure from perched or migrating water. The management of groundwater pumping among regional managers prevents impacts to structural foundations resulting from groundwater mounding from existing recharge efforts. Mitigation Measure GEO-2 would reduce the cumulative effects to soil stability from elevated groundwater levels to a less-than-significant level. The Program EIR identified Mitigation Measures GEO-1 and GEO-2 that would reduce this impact to less than significant levels. However, without implementation of these mitigation measures, the impact would be significant and unavoidable.

Hazards and Hazardous Materials

24) Impact 3.7-2 (The proposed program would create a significant hazard to the public or the environment through the accumulation of potentially hazardous materials into BMPs). Because of their function as water conveyance systems, the entire storm sewer system, as augmented by structural BMPs, would collect and retain sediment and chemicals from urban runoff, along with any accidental or illicit spills of hazardous materials. The introduction of hazardous materials into the storm sewer system could occur in large events as in a catastrophic spill, or could occur in small concentrations as in petroleum hydrocarbons and heavy metals picked up and carried by stormwater in urban runoff from the streets. Contaminants in the runoff water or as discrete

concentrated spills could accumulate in the soils and vegetation of structural BMPs. To address the accumulation of contaminants in soil at BMPs, operations and maintenance plans for BMPs that might accumulate constituents in surface soils and media will be developed to include periodic removal and replacement of these potentially impacted surface materials to reduce the potential for long-term loading leading to hazardous concentrations in soils and groundwater. The Program EIR identified Mitigation Measure HAZ-1 that would reduce this impact to less than significant levels. However, without implementation of this mitigation measure, the impact would be significant and unavoidable.

25) Impact 3.7-4 (The proposed program would be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, could create a significant hazard to the public or the environment). It is possible that a proposed BMP may be located on a hazardous materials site listed on the Cortese List, which would expose construction workers, the public, and the environment to hazardous materials during earth-moving activities, introducing a significant impact. The Program EIR identified Mitigation Measure HAZ-2 that would reduce this impact to less than significant levels. However, without implementation of this mitigation measure, the impact would be significant and unavoidable.

26) Impact 3.7-5 (For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, for a project within the vicinity of a private airstrip, the proposed program could result in a safety hazard for people residing or working in the project area). Some structural BMPs, such as detention basins that store water for a period of time or constructed wetlands that would increase or improve wildlife habitat, could be constructed on or near airports and could result in attracting wildlife. Deer and birds are known wildlife hazards to airports. If the proposed project is at or near an airport, this could increase hazards to aircraft from wildlife. The Program EIR identified Mitigation Measure HAZ-3 that would reduce this impact to less than significant levels. However, without implementation of this mitigation measure, the impact would be significant and unavoidable.

27) Cumulative Impacts, Hazards and Hazardous Materials (The proposed program would result in cumulatively significant impacts to hazardous materials). Most of the distributed BMPs would be small in scale and would not result in cumulatively significant impacts due to increased hazards from construction or operation. However, the combination of BMPs throughout the region would change the flow paths of stormwater and urban runoff that currently occurs in the region, resulting in the retention of pollutants generally within the soil of the BMPs that use soil for filtration and retention. Cumulatively, throughout the region, the retention and treatment of pollutants within each watershed and the reduction of pollutant loading in waterways will substantially benefit water and sediment quality of the region's habitats, rivers, and beaches. Therefore, the project's potential contribution to cumulative effects on hazards and hazardous materials is considered beneficial. The Program EIR identified Mitigation Measures HAZ-1 and HAZ-2 that would reduce this impact to less than significant levels. However, without implementation of these mitigation measures, the impact would be significant and unavoidable.

Hydrology and Water Quality

28) Impact 3.8-2 (The proposed program would result in higher groundwater levels and could potentially affect groundwater quality). Regional BMPs would recharge stormwater into the

groundwater basin and could raise local groundwater levels following major storm events. Distributed infiltration BMPs would typically be too small to have a measureable effect on local groundwater levels. The increased water supplies captured by the infiltration basins through the EWMP areas would be a beneficial impact of the projects. Infiltration BMPs would not be suitable in areas of low permeability, though, and potential locations would need to be evaluated for suitability. Concentrations of contaminants found in stormwater runoff could increase, resulting in contaminated shallow soils and groundwater. The Program EIR identified Mitigation Measures HYDRO-1 through HYDRO-4 that would reduce this impact to less than significant levels. However, without implementation of Mitigation Measures HYDRO-1 through HYDRO-3, the impact would be significant and unavoidable.

Noise

29) Impact 3.10-3 (The proposed program would result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project). No operational noise levels would be generated by the structural BMPs given their passive manner of operation. However, it is anticipated that some of the centralized and regional structural BMPs would require the use of irrigation pump stations and associated components to divert the collected stormwater. At these structural BMP sites, noise levels generated from the long-term operation of the pumps and associated components could result in increased noise levels in the surrounding noise environment. The Program EIR identified Mitigation Measures NOISE-1 and NOISE-2 that would reduce this impact to less than significant levels. However, without implementation of these mitigation measures, the impact would be significant and unavoidable.

Public Services and Recreation

30) Impact 3.12-1 (The proposed program would not result in substantial adverse physical impacts associated with the provision of, or need for, new or physically altered governmental fire protection facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protective services). The structural BMPs are not habitable structures, would not be constructed with flammable materials, and would not require fire protection services. Because of the relative scale of these infrastructure improvements, the construction of the various structural BMPs are not expected to result in the need for new or physically altered fire protection facilities. However, construction of new structural BMPs in streets, sidewalks, parkland, or other facilities (these may include public service facilities such as police stations, fire stations, and municipal maintenance yards) within existing high-density urban, commercial, industrial, and transportation areas, as well as associated staging areas, could temporarily disrupt the provision of fire services, resulting in potentially significant impacts. The Program EIR identified Mitigation Measure PS-1 that would reduce this impact to less than significant levels. However, without implementation of this mitigation measure, the impact would be significant and unavoidable.

Transportation and Circulation

31) Impact 3.13-1 (The proposed program would intermittently and temporarily increase traffic levels and traffic delays due to vehicle trips generated by construction workers and construction vehicles on area roadways). Vehicle trips would be generated primarily by construction workers commuting to and from the BMP work sites, and by trucks hauling materials and equipment to

and from the sites. The construction traffic impacts associated with each individual structural BMP project would be short-term in nature and limited to the period of time when construction activity is taking place for that particular project. Although project-related traffic would be temporary, supplemental project-level analysis of potential site-specific impacts could determine that addition of project-generated traffic would be considered substantial in relation to traffic flow conditions on local roadways. For this program-level assessment, this impact is considered potentially significant. The Program EIR identified Mitigation Measure TRAF-1 that would reduce this impact to less than significant levels. However, without implementation of this mitigation measure, the impact would be significant and unavoidable.

32) Impact 3.13-4 (The proposed program would contribute to cumulative impacts to traffic and transportation). During construction of the structural BMPs, intermittent and temporary traffic-related impacts in the cumulative context would occur. The proposed program has the potential to contribute to potentially significant cumulative construction-related impacts as a result of (1) cumulative projects (such as land development projects) that generate increased traffic at the same time on the same roads as would the proposed program, causing increased congestion and delays; and (2) infrastructure projects in roads that would be used by project construction workers and trucks, which could delay project-generated vehicles past the work zones of those other projects. The Program EIR identified Mitigation Measure TRAF-1 that would reduce this impact to less than significant levels. However, without implementation of this mitigation measure, the impact would be significant and unavoidable.

Utilities and Service Systems

33) Impact 3.14-3 (The proposed program would require new or expanded water supply resources or entitlements or require or result in the construction of new water facilities or expansion of existing facilities, the construction of which could cause significant environmental effects). Construction requiring ground disturbance could encounter buried utilities including water supply infrastructure. Construction of BMPs to detain stormwater and dry-weather flows may reduce flows downstream, thereby reducing access to beneficial uses downstream. Dry-weather flows in coastal streams and foothills are largely fed by groundwater seepage or wastewater discharges. Any detention of dry weather flows or storm flows upstream could substantially reduce flows downstream or significantly impede access to flows. The Program EIR identified Mitigation Measures UTIL-1 through UTIL-3 that would reduce this impact to less than significant levels. However, without implementation of Mitigation Measures UTIL-2 and UTIL-3, the impact would be significant and unavoidable.

34) Impact 3.14-4 (The proposed program would be served by a landfill with insufficient permitted capacity to accommodate the proposed program's solid waste disposal needs or the proposed program could not comply with federal, state, and local statuses and regulations related to solid waste). Construction activities associated with the structural BMPs would include excavation and demolition of some existing infrastructure, which would produce solid waste requiring disposal in the nearest landfill. Some of the EWMPs are required to implement trash Total Maximum Daily Limits (TMDLs) and associated trash removal structural BMPs, which would require the disposal of the trash collected by the BMPs, thereby increase the amount of trash being sent to landfills. The non-structural BMPs would include street cleaning, landscape management, and storm drain operation, which produce debris and trash requiring disposal, which could exceed landfill limits. The new trash collected that is associated with proposed trash removal structural BMPs and non-

structural BMPs such as street cleaning and landscape management would be accommodated with existing and planned trash disposal facilities. Based on landfill capacity in the Los Angeles region, there appears to be ample availability to receive the expected trash generated by the program. The program would comply with all federal, state, and local statutes and regulations related to solid waste, including the Los Angeles County Construction and Demolition Debris Recycling and Reuse Program. The Program EIR identified Mitigation Measures UTIL-2 that would reduce this impact to less than significant levels. However, without implementation of this mitigation measure, the impact would be significant and unavoidable.

35) <u>Cumulative Impacts, Utilities and Service Systems (The proposed program could result in significant cumulative impacts to utilities and service systems).</u> Structural BMPS constructed to treat, infiltrate, and/or store stormwater and non-stormwater throughout the watershed would not generate wastewater or require wastewater treatment or result in adverse cumulative impacts from operation or construction. Installation of storm drainage facilities identified in the proposed EWMPs would not substantially affect existing storm drain facilities. Impacts to the existing water supplies are anticipated to be beneficial as a result of the stormwater and non-stormwater runoff infiltration and conservation BMPs implemented across the EWMP areas. Construction and operation of the structural BMPs would generate solid waste; however, landfills serving the program area are expected to have sufficient capacity to accommodate the amount of waste generated. Disposal of the solid waste generated during construction and operation would comply with all pertinent regulations and statutes. All other projects implemented in the area would also be required to comply with federal, state, and local solid waste regulations and statutes. The use of energy anticipated for the proposed program is minor when compared to the County-wide use of electricity. The proposed program would use energy-efficient equipment and would not result in wasteful consumption. The non-structural BMPs would include street cleaning, landscape management, and storm drain operation, which would produce debris and trash for disposal. The Program EIR identified Mitigation Measures UTIL-1 through UTIL-3 that would reduce this impact to less than significant levels. However, without implementation of Mitigation Measures UTIL-2 and UTIL-3, the impact would be significant and unavoidable.

Findings

The Los Angeles County Flood Control District finds and determines that it has considered the identified means of lessening or avoiding the project's significant effects and that to the extent any significant direct or indirect environmental effects, including cumulative project impacts, remain unavoidable or not reduced to below a level of significance after mitigation, such impacts are at an unacceptable level in light of the social, legal, economic, environmental, technological, and other project benefits discussed below, and such benefits override, outweigh, and make "acceptable" any such remaining environmental impacts of the project (*CEQA Guidelines* Section 15092(b)).

The following benefits and considerations outweigh the identified significant and unavoidable adverse environmental impacts. All of these benefits and considerations are based on the facts set forth in the findings, the Final PEIR, and the record of proceedings for the project. Each of these benefits and considerations is a separate and independent basis that justifies approval of the project, so that if a court were to set aside the determination that any particular benefit or consideration would occur and justifies project approval, this Commission would otherwise stand by its determination that the remaining benefit(s) or considerations are sufficient to justify and substantiate project approval.

Facts

Each benefit set forth below constitutes an overriding consideration warranting approval of the project, independent of the other benefits, and the District determines that the adverse environmental impacts of the project are "acceptable" if any of these benefits would be realized. The project would provide benefits to the County of Los Angeles as follows:

1) The proposed program would help the District, in partnership with 85 other Permittees, to achieve compliance with the MS4 permit issued by the Los Angeles RWQCB in 2012.

2) The proposed program would result in improved water quality in receiving waters throughout the County including the major rivers, streams, and the ocean through the retention, detention, or treatment of stormwater and dry weather flow.

3) The proposed program would help the District, in partnership with 85 other Permittees, to achieve TMDL water quality objectives identified by the Los Angeles RWQCB.

4) The proposed program would benefit communities within the County in developing multi-benefit facilities.

5) The proposed project would benefit certain communities within the County in augmenting groundwater supplies with captured stormwater.

6) Implementation of the proposed program would help support and be consistent with the State of California Ocean Plan promoting improved ocean water quality for multiple beneficial uses.

7) Implementation of the proposed program would be consistent with the stated goals and policies of the Los Angeles Region Basin Plan prepared by the Regional Water Quality Control Board pursuant to California Water Code Section 13240.

8) Implementation of the proposed program would promote and be consistent with the County of Los Angeles 2014 Low Impact Development Standards Manual.

MITIGATION MONITORING AND REPORTING PROGRAM

Public Resources Code, Section 21081.6 (Assembly Bill 3180) requires that mitigation measures identified in environmental review documents prepared in accordance with California Environmental Quality Act (CEQA) are implemented after a project is approved. Therefore, this Mitigation Monitoring and Reporting Program (MMRP) has been prepared to ensure compliance with the adopted mitigation measures during the implementation of the Enhanced Watershed Management Programs (EWMPs) (proposed program). LACFCD is the agency responsible for implementation of the mitigation measures identified in the EIR.

This MMRP provides LACFCD with a convenient mechanism for quickly reviewing all the mitigation measures including the ability to focus on select information such as timing. The MMRP includes the following information for each mitigation measure:

- The phase of the project during which the required mitigation measure must be implemented;
- The phase of the project during which the required mitigation measure must be monitored;
- The enforcement agency; and
- The monitoring agency.

The MMRP includes a checklist to be used during the mitigation monitoring period. The checklist will verify the name of the monitor, the date of the monitoring activity, and any related remarks for each mitigation measure.

Mitigation Monitoring and Reporting Program

Mitigation Measure	Implementation Phase	Monitoring Phase	Enforcement Agency	Level of Significance After Mitigation	Verification of Compliance	
					Initial	Date
Aesthetics						
AES-1: Aboveground structures shall be designed to be consistent with local zoning codes and applicable design guidelines and to minimize features that contrast with neighboring development.	Final Plans and Specifications	Final Plans and Specifications; Operation	Los Angeles County Flood Control District or Implementing Agency	Less than significant		
AES-2: Implementing agencies shall develop BMP maintenance plans that are approved concurrently with each structural BMP approval. The maintenance plans must include measures to ensure functionality of the structural BMPs for the life of the BMP. These plans may include general maintenance guidelines that apply to a number of smaller distributed BMPs.	Final Plans and Specifications	Final Plans and Specifications; Operation	Los Angeles County Flood Control District or Implementing Agency	Less than significant		
Air Quality						
AIR-1: Implementing agencies shall require for large Regional or Centralized BMPs the use of low-emission equipment meeting Tier II emissions standards at a minimum and Tier III and IV emissions standards where available as CARB-required emissions technologies become readily available to contractors in the region.	Final Plans and Specifications	Final Plans and Specifications; Operation	Los Angeles County Flood Control District or Implementing Agency	Significant and unavoidable for construction; less than significant for operations		
AIR-2: For large construction efforts that may result in significant air emissions, implementing agencies shall encourage contractors to use lower-emission equipment through the bidding process where appropriate.	Final Plans and Specifications	Final Plans and Specifications; During Construction	Los Angeles County Flood Control District or Implementing Agency	Significant and unavoidable for construction; less than significant for operations		
AIR-3: For large construction efforts associated with Regional or Centralized BMPs, implementing agencies shall conduct a project-specific LST analysis where necessary to determine local health impacts to neighboring land uses. Where it is determined that construction emissions would exceed the applicable LSTs or the most stringent applicable federal or state ambient air quality standards, the structural BMP project shall reduce its daily construction intensity (e.g., reducing the amount of equipment used daily, reducing the amount of soil graded/excavated daily) to a level where the structural BMP project's construction emissions would no longer exceed SCAQMD's LSTs or result in pollutant emissions that would cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standards.	Final Plans and Specifications	During Construction	Los Angeles County Flood Control District or Implementing Agency	Less than significant		
AIR-4: During planning of structural BMPs, implementing agencies shall assess the potential for nuisance odors to affect a substantial number of people. BMPs that minimize odors shall be considered the priority when in close proximity to sensitive receptors.	Prior to Final Plans and Specifications	Final Plans and Specifications	Los Angeles County Flood Control District or Implementing Agency	Less than significant		

Mitigation Monitoring and Reporting Program

Mitigation Measure	Implementation Phase	Monitoring Phase	Enforcement Agency	Level of Significance After Mitigation	Verification of Compliance	
Biological Resources						
BIO-1: Prior to approving a Regional or Centralized BMP, the Permittee shall conduct an evaluation of the suitability of the BMP location. Appropriate BMP sites should avoid impacting large areas of native habitats including upland woodlands and riparian forests that support sensitive species to the extent feasible. The evaluation shall include an assessment of potential downstream impacts resulting from flow diversions.	Prior to Final Plans and Specifications	Final Plans and Specifications	Los Angeles County Flood Control District or Implementing Agency	Less than significant		
BIO-2: Prior to ground disturbing activities in areas that could support sensitive biological resources, a habitat assessment shall be conducted by a qualified biologist to determine the potential for special-status wildlife species to occur within affected areas, including areas directly or indirectly impacted by construction or operation of the BMPs.	Prior to Ground Disturbing Activities	Pre-Construction	Los Angeles County Flood Control District or Implementing Agency	Less than significant		
BIO-3: If a special-status wildlife species is determined to be present or potentially present within the limits of construction activities, a qualified biologist shall conduct pre-construction surveys of proposed work zones and within an appropriately sized buffer around each area as determined by a qualified biologist within 14 days prior to ground disturbing activities. Any potential habitat capable of supporting a special-status wildlife species shall be flagged for avoidance if feasible.	Prior to Ground Disturbing Activities	Pre-Construction	Los Angeles County Flood Control District or Implementing Agency	Less than significant		
BIO-4: If avoidance of special-status species or sensitive habitats that could support special-status species (including, but not limited to, critical habitat, riparian habitat, and jurisdictional wetlands/waters) is not feasible, the Permittee shall consult with the appropriate regulating agency (USACE/USFWS or CDFW) to determine a strategy for compliance with the Endangered Species Act, California Fish and Game Code, and other regulations protecting special-status species and sensitive habitats. The Permittee shall identify appropriate impact minimization measures and compensation for permanent impacts to sensitive habitats and species in consultation with regulatory agencies. Construction of the project will not begin until the appropriate permits from the regulatory agencies are approved.	Final Plans and Specifications	Final Plans and Specifications	Los Angeles County Flood Control District or Implementing Agency	Less than significant		
BIO-5: If construction and vegetation removal is proposed between February 1 and August 31, a qualified biologist shall conduct a pre-construction survey for breeding and nesting birds and raptors within 500-feet of the construction limits to determine and map the location and extent of breeding birds that could be affected by the project. Active nest sites located during the pre-construction surveys shall be avoided until the adults and young are no longer reliant on the nest site for survival as determined by a qualified biologist.	Pre-Construction	During Construction	Los Angeles County Flood Control District or Implementing Agency	Less than significant		
BIO-6: All construction areas, staging areas, and right-of-ways shall be staked, flagged, fenced, or otherwise clearly delineated to restrict the limits of construction to the minimum necessary near areas that may support special-status wildlife species as determined by a qualified biologist.	Pre-Construction	During Construction	Los Angeles County Flood Control District or Implementing Agency	Less than significant		

Mitigation Monitoring and Reporting Program

Mitigation Measure	Implementation Phase	Monitoring Phase	Enforcement Agency	Level of Significance After Mitigation	Verification of Compliance
BIO-7: Prior to construction in areas that could support special status plants, a qualified botanist shall conduct a pre-construction floristic inventory and focused rare plant survey of project areas to determine and map the location and extent of special-status plant species populations within disturbance areas. This survey shall occur during the typical blooming periods of special-status plants with the potential to occur. The plant survey shall follow the CDFW Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities (November 24, 2009).	Pre-Construction	Pre-Construction	Los Angeles County Flood Control District or Implementing Agency	Less than significant	
BIO-8: If temporary construction-related impacts to special-status plant populations are identified within a disturbance area, the implementing agencies shall prepare and implement a special-status species salvage and replanting plan. The salvage and replanting plan shall include measures to salvage, replant, and monitor the disturbance area until native vegetation is re-established under the direction of CDFW and USFWS.	Pre-Construction	During Construction; Operation	Los Angeles County Flood Control District or Implementing Agency	Less than significant	
BIO-9: Prior to construction, a qualified wetland delineator shall be retained to conduct a formal wetland delineation in areas where potential jurisdictional resources (i.e., wetlands or drainages) subject to the jurisdiction of USACE, RWQCB, and CDFW, may be affected by the project. If jurisdictional resources are identified in the EWMP area and would be directly or indirectly impacted by individual projects, the qualified wetland delineator shall prepare a jurisdictional delineation report suitable for submittal to USACE, RWQCB, and CDFW for purposes of obtaining the appropriate permits. Habitat mitigation and compensation requirements shall be implemented prior to construction in accordance with Mitigation Measure BIO-4.	Pre-Construction	Pre-Construction	Los Angeles County Flood Control District or Implementing Agency	Less than significant	
BIO-10: Oak trees and other protected trees shall be avoided to the extent feasible. If trees may be impacted by project construction, a certified arborist shall conduct a tree inventory of the construction impact area. If any oak trees or other protected trees will be impacted by BMP construction, the implementing agency shall obtain any required County or City permits.	Pre-Construction	During Construction	Los Angeles County Flood Control District or Implementing Agency	Less than significant	
Cultural Resources					
CUL-1: For individual EWMP projects that could impact buildings or structures (including infrastructure) 45 years old or older, implementing agencies shall ensure that a historic built environment survey is conducted or supervised by a qualified historian or architectural historian meeting the Secretary of the Interior's Professional Qualification Standards for Architectural History. Historic built environment resources shall be evaluated for their eligibility for listing in the CRHR or local register prior to the implementing agency's approval of project plans. If eligible resources that would be considered historical resources under CEQA are identified, demolition or substantial alteration of such resources shall be avoided. If avoidance is determined to be infeasible, the implementing agency shall require the preparation of a treatment plan to include, but not be	Final Plans and Specifications	During Construction	Los Angeles County Flood Control District or Implementing Agency	Less than significant	

RB-AR 9773

Mitigation Monitoring and Reporting Program

Mitigation Measure	Implementation Phase	Monitoring Phase	Enforcement Agency	Level of Significance After Mitigation	Verification of Compliance
limited to, photo-documentation and public interpretation of the resource. The plan will be submitted to the implementing agency for review and approval prior to implementation.					
CUL-2: Implementing agencies shall ensure that individual EWMP projects that require ground disturbance shall be subject to a Phase I cultural resources inventory on a project-specific basis prior to the implementing agency's approval of project plans. The study shall be conducted or supervised by a qualified archaeologist, defined as an archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards for Archaeology, and shall be conducted in consultation with the local Native American representatives expressing interest. The cultural resources inventory shall include a cultural resources records search to be conducted at the South Central Coastal Information Center; scoping with the NAHC and with interested Native Americans identified by the NAHC; a pedestrian archaeological survey where deemed appropriate by the qualified archaeologist; and formal recordation of all identified archaeological resources on California Department of Parks and Recreation 523 forms and significance evaluation of such resources presented in a technical report following the guidelines in *Archaeological Resource Management Reports (ARMR): Recommended Contents and Format*, Department of Parks and Recreation, Office of Historic Preservation, State of California, 1990. If potentially significant archaeological resources are encountered during the survey, the implementing agency shall require that the resources are evaluated by the qualified archaeologist for their eligibility for listing in the CRHR and for significance as a historical resource or unique archaeological resource per *CEQA Guidelines* Section 15064.5. Recommendations shall be made for treatment of these resources if found to be significant, in consultation with the implementing agency and the appropriate Native American groups for prehistoric resources. Per *CEQA Guidelines* Section 15126.4(b)(3), preservation in place shall be the preferred manner of mitigation to avoid impacts to archaeological resources qualifying as historical resources. Methods of avoidance may include, but shall not be limited to, project re-route or re-design, project cancellation, or identification of protection measures such as capping or fencing. Consistent with *CEQA Guidelines* Section 15126.4(b)(3)(C), if it is demonstrated that resources cannot be avoided, the qualified archaeologist shall develop additional treatment measures, which may include data recovery or other appropriate measures, in consultation with the implementing agency, and any local Native American representatives expressing interest in prehistoric or tribal resources. If an archaeological site does not qualify as an historical resource but meets the criteria for a unique archaeological resource as defined in Section 21083.2, then the site shall be treated in accordance with the provisions of Section 21083.2.	Final Plans and Specifications	During Construction	Los Angeles County Flood Control District or Implementing Agency	Less than significant	
CUL-3: The implementing agency shall retain archaeological monitors during ground-disturbing activities that have the potential to impact archaeological resources qualifying as historical resources or unique archaeological resources, as determined by a qualified archaeologist in consultation with the implementing	During Ground-Disturbing Activities	During Ground-Disturbing Activities	Los Angeles County Flood Control District or Implementing Agency	Less than significant	

Mitigation Monitoring and Reporting Program

Mitigation Measure	Implementation Phase	Monitoring Phase	Enforcement Agency	Level of Significance After Mitigation	Verification of Compliance	
agency, and any local Native American representatives expressing interest in the project. Native American monitors shall be retained for projects that have a high potential to impact sensitive Native American resources, as determined by the implementing agency in coordination with the qualified archaeologist.						
CUL-4: During project-level construction, should subsurface archaeological resources be discovered, all activity in the vicinity of the find shall stop and a qualified archaeologist shall be contacted to assess the significance of the find according to *CEQA Guidelines* Section 15064.5. If any find is determined to be significant, the archaeologist shall determine, in consultation with the implementing agency and any local Native American groups expressing interest, appropriate avoidance measures or other appropriate mitigation. Per *CEQA Guidelines* Section 15126.4(b)(3), preservation in place shall be the preferred means to avoid impacts to archaeological resources qualifying as historical resources. Methods of avoidance may include, but shall not be limited to, project re-route or re-design, project cancellation, or identification of protection measures such as capping or fencing. Consistent with *CEQA Guidelines* Section 15126.4(b)(3)(C), if it is demonstrated that resources cannot be avoided, the qualified archaeologist shall develop additional treatment measures, such as data recovery or other appropriate measures, in consultation with the implementing agency and any local Native American representatives expressing interest in prehistoric or tribal resources. If an archaeological site does not qualify as an historical resource but meets the criteria for a unique archaeological resource as defined in Section 21083.2, then the site shall be treated in accordance with the provisions of Section 21083.2	During Construction	During Construction	Los Angeles County Flood Control District or Implementing Agency	Less than significant		
CUL-5: For individual structural BMP projects that require ground disturbance, the implementing agency shall evaluate the sensitivity of the project site for paleontological resources. If deemed necessary, the implementing agency shall retain a qualified paleontologist to evaluate the project and provide recommendations regarding additional work, potentially including testing or construction monitoring.	Final Plans and Specifications	Final Plans and Specifications; During Construction	Los Angeles County Flood Control District or Implementing Agency	Less than significant		
CUL-6: In the event that paleontological resources are discovered during construction, the implementing agency shall notify a qualified paleontologist. The paleontologist will evaluate the potential resource, assess the significance of the find, and recommend further actions to protect the resource.	During Construction	During Construction	Los Angeles County Flood Control District or Implementing Agency	Less than significant		
CUL-7: The implementing agency shall require that, if human remains are uncovered during project construction, work in the vicinity of the find shall cease and the County Coroner shall be contacted to evaluate the remains, following the procedures and protocols set forth in Section 15064.5 (e)(1) of the CEQA Guidelines. If the County Coroner determines that the remains are Native American, the Coroner will contact the Native American Heritage Commission, in accordance with Health and Safety Code Section 7050.5, subdivision (c), and Public Resources Code 5097.98 (as amended by AB 2641). The NAHC will then	During Construction	During Construction	Los Angeles County Flood Control District or Implementing Agency	Less than significant		

Mitigation Monitoring and Reporting Program

Mitigation Measure	Implementation Phase	Monitoring Phase	Enforcement Agency	Level of Significance After Mitigation	Verification of Compliance
designate a Most Likely Descendant of the deceased Native American, who will engage in consultation to determine the disposition of the remains.					
Geological and Mineral Resources					
GEO-1: Prior to approval of infiltration BMPs, implementing agencies shall conduct a geotechnical investigation of each infiltration BMP site to evaluate infiltration suitability. If infiltration rates are sufficient to accommodate an infiltration BMP, the geotechnical investigation shall recommend design measures necessary to prevent excessive lateral spreading that could destabilize neighboring structures. Implementing agencies shall implement these measures in project designs	Final Plans and Specifications	Final Plans and Specifications	Los Angeles County Flood Control District or Implementing Agency	Less than significant	
GEO-2: Prior to installing BMPs designed to recharge local groundwater supplies, the Implementing Agency shall notify local groundwater managers including the Upper Los Angeles River Area Water Master, the Water Replenishment District of Southern California, or the San Gabriel Water Master as well as local water producers such as local municipalities and water companies. The Implementing Agency shall coordinate BMP siting efforts with groundwater managers and producers to mitigate high groundwater levels while increasing local water supplies.	Final Plans and Specifications; prior to BMP Installation	Final Plans and Specification; prior to BMP Installation	Los Angeles County Flood Control District or Implementing Agency	Less than significant	
Hazards and Hazardous Materials					
HAZ-1: Implementing agencies shall prepare and implement maintenance practices that include periodic removal and replacement of surface soils and media that may accumulate constituents that could result in further migration of constituents to sub-soils and groundwater. A BMP Maintenance Plan shall be prepared by Implementing Agencies upon approval of the individual BMP projects that identifies the frequency and procedures for removal and/or replacement of accumulated debris, surface soils and/or media (to depth where constituent concentrations do not represent a hazardous conditions and/or have the potential to migrate further and impact groundwater) to avoid accumulation of hazardous concentrations and the potential to migrate further to sub-soils and groundwater. The Maintenance Plan shall include vector control requirements. The BMP Maintenance Plan may consist of a general maintenance guideline that applies to several types of smaller distributed BMPs. For smaller distributed BMPs on private property, these plans may consist of a maintenance covenant that includes requirements to avoid the accumulation of hazardous concentrations in these BMPs that may impact underlying sub-soils and groundwater. Structural BMPs shall be designed to prevent migration of constituents that may impact groundwater.	Final Plans and Specifications	Final Plans and Specifications; Operation	Los Angeles County Flood Control District or Implementing Agency	Less than significant	
HAZ-2: Prior to the initiation of any construction requiring ground-disturbing activities in areas where hazardous material use or management may have occurred, the implementing agencies shall complete a Phase I Environmental	Prior to Construction	Prior to Construction	Los Angeles County Flood Control District or Implementing Agency	Less than significant	

RB-AR 9776

Mitigation Monitoring and Reporting Program

Mitigation Measure	Implementation Phase	Monitoring Phase	Enforcement Agency	Level of Significance After Mitigation	Verification of Compliance	
Site Assessment (ESA) in accordance with American Society for Testing and Materials (ASTM) Standard E1527-13 for each construction site. Any recommended follow up sampling (Phase II activities) set forth in the Phase I ESA shall be implemented prior to construction. The results of Phase II studies, if necessary, shall be submitted to the local overseeing agency and any required remediation or further delineation of identified contamination shall be completed prior to commencement of construction.						
HAZ-3: Implementing Agencies shall require that those BMPs that are within an airport land use plan area are compatible with criteria specified in FAA Advisory Circular No: 150/5200-33B (FAA, 2007). If the proposed BMP is within the minimum separation criteria, the Implementing Agency shall consult with the airport and collaboratively evaluate whether the potential increase in wildlife hazards can be mitigated.	Final Plans and Specifications	Final Plans and Specifications	Los Angeles County Flood Control District or Implementing Agency	Less than significant		
Hydrology and Water Quality						
HYDRO-1: Prior to approving an infiltration BMP, the Permittee shall conduct an evaluation of the suitability of the BMP location. Appropriate infiltration BMP sites should avoid areas with low permeability where recharge could adversely affect neighboring subsurface infrastructure.	Final Plans and Specifications	Final Plans and Specifications	Los Angeles County Flood Control District or Implementing Agency	Less than significant		
HYDRO-2: Prior to approving an infiltration BMP, the Permitee shall identify pre-treatment technologies, type, and depth of filtration media; depth to groundwater; and other design considerations necessary to prevent contaminants from impacting groundwater quality. The design shall consider stormwater quality data within the BMP's collection area to assess the need and type of treatment and filtration controls. Local design manuals and ordinances requiring minimum separation distance to groundwater shall also be met as part of the design.	Final Plans and Specifications	Final Plans and Specifications	Los Angeles County Flood Control District or Implementing Agency	Less than significant		
HYDRO-3: Prior to the installation of an infiltration BMP, the Permittee shall conduct a regulatory database review for contaminated groundwater sites within a quarter mile of the proposed infiltration facility. The review shall include locations of on-site wastewater treatment systems that could be affected by the BMP. The Permittee shall identify whether any contaminated groundwater plumes or leach fields are present within close proximity to the BMP location that could be affected by infiltrated water and whether coordination with the local and state environmental protection overseeing agency and responsible party is warranted prior to final design of infiltration facility.	Final Plans and Specifications	Final Plans and Specifications	Los Angeles County Flood Control District or Implementing Agency	Less than significant		
HYDRO-4: Prior to approving a structural BMP, the implementing agencies shall conduct an evaluation of the potential hydromodification impacts of the project. The evaluation shall recommend design measures necessary to prevent or minimize any identified impacts, including flooding, erosion and/or scour. Design measures could include velocity dissipaters and bank re-enforcement components. Implementing agencies shall include these measures in project designs.	Final Plans and Specifications	Final Plans and Specifications	Los Angeles County Flood Control District or Implementing Agency	Less than significant		

Mitigation Monitoring and Reporting Program

Mitigation Measure	Implementation Phase	Monitoring Phase	Enforcement Agency	Level of Significance After Mitigation	Verification of Compliance	
Noise						
NOISE-1: The implementing agencies shall implement the following measures during construction as needed:: • Include design measures necessary to reduce the construction noise levels where feasible. These measures may include noise barriers, curtains, or shields. • Place noise-generating construction activities (e.g., operation of compressors and generators, cement mixing, general truck idling) as far as possible from the nearest noise-sensitive land uses. • Locate stationary construction noise sources as far from adjacent noise-sensitive receptors as possible. • If construction is to occur near a school, the construction contractor shall coordinate the with school administration in order to limit disturbance to the campus. Efforts to limit construction activities to non-school days shall be encouraged. • For the centralized and regional BMP projects located adjacent to noise-sensitive land uses, identify a liaison for these off-site sensitive receptors, such as residents and property owners, to contact with concerns regarding construction noise and vibration. The liaison's telephone number(s) shall be prominently displayed at construction locations. For the centralized and regional BMP projects located adjacent to noise-sensitive land uses, notify in writing all landowners and occupants of properties adjacent to the construction area of the anticipated construction schedule at least 2 weeks prior to groundbreaking.	During Construction	During Construction	Los Angeles County Flood Control District or Implementing Agency	Significant and unavoidable for construction, less than significant for operations (threshold 3.10-1); less than significant (threshold 3.10-3); significant and unavoidable (threshold 3.10-4);		
NOISE-2: All structural BMPs that employ mechanized stationary equipment that generate noise levels shall comply with the applicable noise standards established by the implementing agency with jurisdiction over the structural BMP site. The equipment shall be designed with noise-attenuating features (e.g., enclosures) and/or located at areas (e.g., belowground) where nearby noise-sensitive land uses would not be exposed to a perceptible noise increase in their noise environment.	Final Plans and Specifications, Operation	Final Plans and Specifications; Operation	Los Angeles County Flood Control District or Implementing Agency	Significant and unavoidable for construction, less than significant for operations (threshold 3.10-1); less than significant (threshold 3.10-3)		
Public Services and Recreation						
PS-1: The Permittee implementing the EWMP project shall provide reasonable advance notification to the service providers such as fire, police, local businesses, home owners and residents of adjacent to and within areas potentially affected by the proposed EWMP project about the nature, extent and duration of construction activities. Interim updates should be provided to inform them of the status of the construction activities.	Pre-Construction; During Construction	Pre-Construction; During Construction	Los Angeles County Flood Control District or Implementing Agency	Less than significant		

Mitigation Monitoring and Reporting Program

Mitigation Measure	Implementation Phase	Monitoring Phase	Enforcement Agency	Level of Significance After Mitigation	Verification of Compliance	
Transportation and Circulation						
TRAF-1: For projects that may affect traffic, implementing agencies shall require that contractors prepare a construction traffic control plan. Elements of the plan should include, but are not necessarily limited to, the following: • Develop circulation and detour plans to minimize impacts to local street circulation. Use haul routes minimizing truck traffic on local roadways to the extent possible. • To the extent feasible, and as needed to avoid adverse impacts on traffic flow, schedule truck trips outside of peak morning and evening commute hours. • Install traffic control devices as specified in Caltrans' Manual of Traffic Controls for Construction and Maintenance Work Zones where needed to maintain safe driving conditions. Use flaggers and/or signage to safely direct traffic through construction work zones. • Coordinate with facility owners or administrators of sensitive land uses such as police and fire stations, hospitals, and schools. Provide advance notification to the facility owner or operator of the timing, location, and duration of construction activities.	Final Plans and Specifications; During Construction	Final Plans and Specifications; During Construction	Los Angeles County Flood Control District or Implementing Agency	Less than significant		
Utilities and Service Systems						
UTIL-1: Prior to implementation of BMPs, the implementing agency shall conduct a search for local utilities above and below ground that could be affected by the project. The implementing agencies shall contact each utility potentially affected to address relocation of the utility if necessary to ensure access and services are maintained.	Final Plans and Specifications	Final Plans and Specifications; During Construction	Los Angeles County Flood Control District or Implementing Agency	Less than significant		
UTIL-2: Prior to approval of BMPs, implementing agencies shall evaluate the potential for impacts to downstream beneficial uses including surface water rights. Implementing agencies shall not approve BMPs that result in preventing access to previously appropriated surface water downstream.	Final Plans and Specifications	Final Plans and Specifications	Los Angeles County Flood Control District or Implementing Agency	Less than significant		
UTIL-3: Implementing agencies shall encourage construction contractors to recycle construction materials and divert inert solids (asphalt, brick, concrete, dirt, fines, rock, sand, soil, and stone) from disposal in a landfill where feasible. Implementing agencies shall incentivize construction contractors with waste minimization goals in bid specifications where feasible.	Final Plans and Specifications; During Construction	During Construction	Los Angeles County Flood Control District or Implementing Agency	Less than significant

State Clearinghouse Number (if submitted to State Clearinghouse): 2014081106

Project Title: Enhanced Watershed Management Programs (EWMP)

Project Applicant: Los Angeles County Flood Control District (LACFCD)

Project Location (include county): Throughout Los Angeles County

Project Description:
EWMPs are customized water quality improvement programs developed through computer modeling to determine projects and practices that can be implemented in a watershed to meet water quality standards while achieving other benefits such as flood control, water conservation, and recreational improvements. Certain MS4 Permittees have developed EWMPs for watersheds throughout the county to comply with the 2012 MS4 Permit. The EWMPs will be submitted to the LA Regional Water Quality Control Board for review and approval. Permittees implementing individual projects proposed in EWMPs will perform further environmental review as necessary.

This is to advise that the LA County Flood Control District has approved the above
(☒ Lead Agency or ☐ Responsible Agency)

described project on May 26, 2015 (date) and has made the following determinations regarding the above described project.

1. The project [☒ will ☐ will not] have a significant effect on the environment.
2. ☒ An Environmental Impact Report was prepared for this project pursuant to the provisions of CEQA.
   ☐ A Negative Declaration was prepared for this project pursuant to the provisions of CEQA.
3. Mitigation measures [☒ were ☐ were not] made a condition of the approval of the project.
4. A mitigation reporting or monitoring plan [☒ was ☐ was not] adopted for this project.
5. A statement of Overriding Considerations [☒ was ☐ was not] adopted for this project.
6. Findings [☒ were ☐ were not] made pursuant to the provisions of CEQA.

This is to certify that the final EIR with comments and responses and record of project approval, or the negative Declaration, is available to the General Public at:
www.LACoH2Osheds.com or LADPW, 900 S Fremont Ave, 5th Floor, Alhambra, CA
