Re: HRC Tier II applications

The Tier II submittal for THP 1-08-48 unit 4 had been submitted longer than 45 days ag .

Via this letter, HRC is re-applying for coverage for all this unit under the WWDR. The information previously submitted has not been changed and the fees have been paid.

If you have any questions please call me.

Sincerely,

Jon Woessner North Area Manager Humboldt Redwood Co., LLC RPF# 2571

April 21, 2009

Ms. Catherine Kuhlman California Regional Water Quality Control Board North Coast Region 5550 Skylane Blvd, Suite A Santa Rosa, CA 95403

Subject: Enrollment of THP 1-08-048 HUM (Unit 4) in the Freshwater Creek WWDR, "Tier II"

Dear Ms. Kuhlman:

HRC is requesting Tier II enrollment under Watershed-Wide Waste Discharge Requirement (WWDR) Order No. R1-2006-0041 for unit 4 of THP 1-08-048 HUM. This unit is comprised of 31.9 acres of Selection (16.0 clear-cut equivalent acres). Total acres currently enrolled or proposed for enrollment under Order No. R1-2006-0041 Tier II is shown in the Attached Pre-Harvest Planning Report provided by Forester, Mr. Wayne Rice. The Erosion Control Plan (ECP), Form 200 and an annual waste discharge enrollment fee have already been submitted for this THP.

Landslide risks associated with this plan were evaluated in compliance with the Freshwater Creek and Elk River WWDR Permit Acreage Enrollment and Compliance Monitoring Program Quality Assurance Project Plan (Version 2.0, September 1, 2006) approved by the Executive Officer of the North Coast Regional Water Quality Control Board. This approach uses commonly accepted standards for geologic practices in forest management (Sidle et al. 1985, Soeters and Van Western 1996, and Sidle and Ochiai 2006) to assess factors known to contribute to landslides, such as steepness of slope, slope convergence, hydrology, geologic features, and visibly unstable areas. Overlapping and complementary scientific techniques combining state-of-the-art digital elevation model (DEM) slope stability models, field investigation, and terrain analysis were used in this assessment.

In summary the THP unit is predominantly underlain by Wildcat Group sediments. The sediments are deposited atop Yager Terrane sandstone where adjacent to the Class I watercourses. The Wildcat sediments are composed of moderate to well consolidated silts, sands and clays. The Yager terrane is composed of well indurated sandstone. Previously mapped deep seated mass wasting within the unit was limited to one feature. This feature showed no reactivation resulting from the initial harvest and subsequent road building. Two dormant historic shallow landslides were identified during THP development and were removed from harvest. Due to the retention of the 90 square feet of basal area, the appropriate application of both cable and ground based yarding, and the wide RMZ buffers, we consider this unit to meet the requirements for Tier II enrollment. No changes were needed to this unit to meet the Tier II requirements.

The THP proposes an uneven-age silviculture retaining 90 sqft of basal area. Sub-merchantable trees and those with specific wildlife value characteristics (e.g., cavities, large limbs, broken tops, snags,

etc.) will be retained within the harvest area to the extent feasible. Cable and ground based yarding is approved for the unit. Post-harvest no site preparation will occur.

Greater detail regarding this landslide hazard assessment is provided in the attached *THP Unit Review for Tier 2 Enrollment*. The licensed geologist involved with the Tier 2 landslide risk evaluation has concluded the proposed harvest operation, if implemented as planned and approved, will result in a negligible increase in potential for post-harvest landsliding; and thereby meets the applicable Zero Delivery of landslide related sediment performance standards of NCRWQCB Orders R1-2006-0041 and R1-2008-0071.

Please do not hesitate to contact me should you have any questions or comments regarding this application for enrollment into WWDR (Order No. R1-2006-0041).

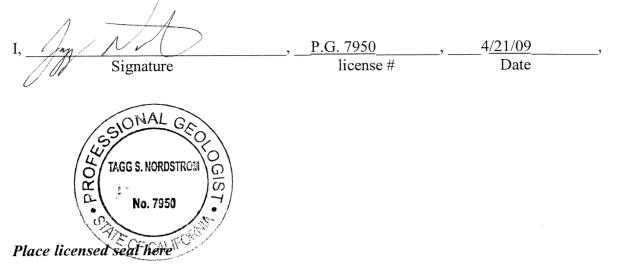

Respectfully,

apr 1. 12

Wayne D. Rice, RPF #2622 Humboldt Redwood Company, LLC

Professional Certification of Design

hereby certify, in accordance with North Coast Regional Water Quality Control Board (NCRWQCB) Order Nos. R1-2006-0039 and R1-2006-0041, that the attached application and the description of THP modifications, and the materials submitted along with:

THP No. <u>1-08-048 HUM (Little 34)</u> Unit #____

- a. are in accordance with accepted practices, and recognized professional standards;
- b. comply with the requirements of the Monitoring and Reporting Program No. R1-2006-0103, approved by the Executive Officer of the North Coast Regional Water Quality Control Board; and
- c. provided that the THP is properly implemented, operated, and maintained, are adequate for the THP to meet the applicable Zero Net Delivery performance standards of NCRWQCB Orders R1-2006-0039, R1-2006-0041, and R1-2006-0103, insofar as such performance can reasonably be predicted by accepted engineering geologic practices.

The opinions presented in the subject THP have been developed using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable engineering geologists practicing in this or similar localities. No other warranty, expressed or implied, is made as to the professional advice included in this report.

Summary of Changes to THP Prescriptions Based on Tier II Analysis in this Unit:

Geologic Review	Forestry Silviculture/Site Prep Plan	Operational Design Plan
4-1	 For reasons other than slope stability hazard, silviculture is now group selection with at target retention of 90 ft². No site preparation will occur due to partial harvesting. 	No change to approved yarding methods.

Geological Summary (information presented from existing bodies of work):

The harvest unit occupies a broadly shaped, east-trending, descending ridge. The northern boundary is a well defined Class II watercourse, the eastern boundary is Little Freshwater Creek (Class I), the southern boundary is also Little Freshwater Creek (Class I), and the western boundary is a Class II watercourse.

Slope forms vary from broadly convex to concave and planar. The underlying geology is the lower facies of undifferentiated Wildcat Group sediments composed of interbedded mudstone, silts, fine sands, and infrequent pebbles and conglomerates in contact with Yager terrane sandstone which is mapped adjacent the Class I watercourse (Little Freshwater Creek). The bedrock is compact and predominantly held together by consolidation. Yager terrane bedrock is located in the lower elevations of the unit adjacent the Class I watercourse. CGS (1999) maps debris slide slopes / source areas that correlate with the northern boundary Class II watercourse and an isolated patch of steeply inclined slopes in the south (Figure 3). Additionally, Figure 3 shows the two overlapping, dormant deep seated landslides within the western most portion of the unit.

Watershed Analysis deep seated landslide mapping (Figure 6) shows two deep seated landslides (low to low-moderate hazard rating) in the west and consistent with CGS mapping. Figure 6 also shows a low to moderate rated deep seated landslide in the eastern portion of the unit.

Figure 2 (Hillslope Shade) marginally shows supporting slope morphology for the Figure 3 and 6 deep seated landslides. The hillslope shade provides excellent viewing of well rounded, uniformly weathered slopes flanking typically linear watercourse that have incised within the hillslopes. This suggests that the observed landscape is in response to long periods of weathering atop uniform formation material.

Two unstable areas were identified within the unit during THP development. Both are located within no harvest areas.

The harvest unit was evaluated at the THP level with respect to clearcut silviculture. As mandated by new management, the silviculture has changed to group selection with 90 sq. feet of basal area retention pre acre. This change is not in response to perceived high slope stability hazard, however, the retention of timber on the slopes further reduces the potential for harvest related mass wasting.

For this evaluation, the harvest unit has been reviewed as one polygon.

THP Unit: #4 Polygon: 4-1

A) General Observations

The observed slope forms (concave, convex) extend acres in size and are obvious to distinguish. Slope inclination are consistently between 20 and 40% along the broad ridge top and extend to 40 through >60% where flanking the well incised prominent watercourses.

Class I watercourses define the eastern and southern harvest unit boundary. The Typical Class I Riparian Management Zone includes a no harvest inner band that extends to 50 feet. Dependent on slope inclination, the outer band of the RMZ may extend from 100 to 150 feet from the watercourse transition line. Harvesting is permitted in the outerband provided that a minimum of 50% canopy closure is maintained post harvest. For this unit, the entire RMZ has been established as a no harvest zone

Three Class II watercourses are located within the unit. Two of them define northern and western boundary of the unit. The third watercourse extends into the unit ~300 feet from the south. Typical Riparian Management Zones for the Class II watercourses includes a 30-foot no harvest inner band and a selection buffer that extends the RMZ out to between 75 and 100 feet. The outerband may be harvested but must retain a minimum of 60% canopy closure. For this unit, the Forester has implemented the entire RMZ for the Class I and II as no harvest.

Five Class III watercourses extend into the operational portions of the unit (beyond the Class I and II no harvest RMZ). These watercourses are located within poorly defined channels and terminate well before the ridgetop. The implemented THP mitigation for the Class III watercourses includes the retention of all trees growing within the active channel and all trees 8 inches and less within 15 feet of the channel. The new silviculture has bolstered Class III mitigations to include a 50' RMZ where side slopes greater than 50% exist and maintaining 75 sq. ft (or whatever the unit wide target retention is if grater than 75 ft²) evenly distributed in the buffer. Where side slopes are less than 50% employ a 25' RMZ that maintains 75 sq. ft (or whatever the unit wide target retention is if grater the terminus of class III with slopes greater than 40% or immediately above a headwall swale. Additionally sub-merchantable trees and those with specific wildlife value characteristics (e.g., cavities, large limbs, broken tops, snags, etc.) will be retained within the harvest area to the extent feasible).

Four locations of value 1 SHALSTAB are modeled within the unit. Three of the locations are located within no harvest RMZ. The remaining location is one pixel in size and located within a Class III channel. The area is located within a Class III RMZ. Several locations of value 2 SHLASTAB are located throughout the unit. The majority of the modeled locations are located within RMZs. Only a few locations are located within the unit and away from the watercourses.

A) General Observations

Debris slide slopes mapped (Figure 3) within the unit include the north-facing flanking slopes of the northern boundary Class II watercourse. Another area mapped on the south-facing slopes is steeply inclined. These areas appear to have been mapped as potential source areas.

Mass Wasting Potential (MWP) modeled for the unit (Figure 4) is regionally low. Where slopes increase in inclination and are consistent in location with the CGS mapping of debris slide slope, the MWP increases to moderate or high.

Two unstable are located within the unit. One is located to the north in the Class II no harvest RMZ. The other unstable area is located in the southwest corner of the unit. The landslide extends beyond the Class II RMZ. Where extending beyond the Class II RMZ, the landslide has been flagged with no harvest flagging.

The stand is predominantly redwood and fir. The original harvest was a ground based clearcut yarded either to the downslope watercourse or the ridge top. A second entry occurred sometime in the 1990s. This was a cable yarded thinning of the stand.

B) Harvest Related Impacts and Hillslope Sensitivity

The slopes within the unit have experienced clearcut, burning and donkey yarding (a legacy method that dragged the large diameter, felled timber to railroads).

Regionally, the catchment area for the corresponding watercourse appears to remain low.

The potential for the development of shallow debris slides increases significantly where roads are constructed across steeply inclined slopes and incorporate fills. These activities are not proposed in this plan.

Partially harvesting the slopes within the unit is likely to further reduce the potential for mass wasting.

The extensive RMZs were designed to provide sediment filtration bands adjacent the watercourses should extensive sediment be generated from the clearcut harvesting. The current level of harvest will retain both canopy closure and slash from the harvested trees potentially increasing the effectiveness of the sediment filtration band.

B) Harvest Related Impacts and Hillslope Sensitivity

Overall hillslope sensitivity to harvest activities appears minimal with respect to mass wasting.

C) Forestry / Silviculture Plan

The silviculture has been amended to selection with a target retention of 90 square feet of basal area per acre. This change is a management decision to convert the stand management from even aged to uneven aged. This change does represent a change in response to perceived slope instability.

Site preparation has been changed to none.

D) Operational Design Plan

THP approved yarding method is both ground based and cable. Given the steeply inclined slopes and interfluvial ridges, deflection is good and minimal ground disturbance is anticipated where cable yarded. The ground based yarding will be concentrated to the rounded ridge top.

Brief descriptions of the models used in this evaluation:

SHALSTAB was first described in Dietrich and Montgomery (1994). SHALSTAB is a simple, physically-based model based on the Mohr-Coulomb failure law that can be used to map shallow landslide potential. The model calculates the potential for failure using gridded digital elevation data. The simplicity of the model lies in the formulation of slope stability parameters that allow the model to be run parameter-free using default values suggested by the authors or determined by local measurement. Because the model uses no field measurements of critical characteristics that determine slope stability, the evaluation of potential instability is only an approximation. In applying SHALSTAB for Tier 2 enrollment, HRC has run the model on a 10-m spatial grid using LiDAR elevation data and applied the parameters as suggested by the model authors. HRC's application of the method and parameters is described in HRC (2008).

Mass Wasting Potential (MWP) modeling is a cursory regional assessment that numerically values soil, slope inclination, geology type, and geomorphology with respect to past mass wasting (HRC, 1999). The sums of the values specific to an area are measured against a set ranking system that extends from very low to extreme. The models intent is to highlight areas of high potential for instability at the planning level. The model's use at the site specific level is limited in that pedogenic soil types are used, not textures, the geologic formations utilized provide one value for all of the incorporated facies, and the model is heavily biased if past mass wasting has occurred or has been mapped as occurring in the area.

Table 3. Summary of THPs by Yarding System and Site Preparation for Freshwater Creek

Humboldt Redwood Company LLC

Erosion Control Plan (ECP) for the "Little 34" THP 1-08-048HUM

Updated ECP – for purpose of identifying **Tier 2** erosion control sites specific to unit 4 (2009 enrollment requests); Unit 4 has no erosion control sites located on the spur road system leading specifically to This unit, or in this unit.

This plan is being included in the THP to partially meet the requirements of the North Coast Regional Water Quality Control Board Watershed-wide Discharge Requirements. (**WWDRs**)

All operational portions of this ECP that are to be enforced through the Forest Practice Rules have been included in Section II of the THP.

Version 20080819

Humboldt Redwood Company LLC Erosion Control Plan (ECP)

This document addresses the requirements of the California Regional Water Quality Control Board, North Coast Region Order No. R1-2006-0041 (Freshwater Creek) for an Erosion Control Plan (ECP) related to timber harvest activities on Non-Federal lands in the North Coast Region (Sec. III D2 and D3). The responsible party for this ECP is Humboldt Redwood Company LLC, P.O. Box 712 Scotia, CA 95565 (707) 764-2330.

This ECP is submitted for:THP Name:Little 341-08-048HUMContact Person:Jon WoessnerPhone:(707) 764-4376

The landowner is committed to a wide variety of measures to prevent and minimize the discharge or threatened discharge of sediment from controllable sediment discharge sources as part of this project into the waters of the state in violation of applicable water quality requirements. Prevention and Minimization of Controllable Sediment Discharge Sources associated with this project are identified in the *Controllable Sediment Sources* table. The specific conditions of sediment discharge sources and a summary of prevention and minimization measures (Section I) are identified in the table. General prevention and minimization measures for the project (Section II) are incorporated in the ECP by reference.

The RPF and/or the RPF Designee have conducted an inventory of potential "controllable sediment discharge sources" within the project area. As defined in California Regional Water Quality Control Board Order No. R1-2006-0041 (Freshwater Creek).

"Controllable sediment discharge source" means sites or locations, both existing and those created by proposed timber harvest activities, within the Project area that meet all the following conditions:

- 1. is discharging or has the potential to discharge sediment to waters of the state in violation of applicable water quality requirements or other provisions of these WWDRs,
- 2. was caused or affected by human activity, and
- 3. may feasibly and reasonably respond to prevention."

Upon guidance of the North Coast Regional Water Quality Control Board (NCRWQCB) staff, discharge from the source must be likely to occur during the life of the Timber Harvesting Plan (THP) and WWDR. (Holly Lundborg, personal communication)

The inventory method consisted of an appurtenant road survey, aerial photos and ground assessments of the harvest units, and a complete ground assessment of all watercourses and associated stream protection zones.

The schedule for implementing the prevention and minimization management measures for the controllable sediment sources will be consistent with the duration of the THP. These measures will be implemented in accordance with the priority level assigned to each site. High priority sites will be addressed first with low priority sites to follow. Work at all sites will be accomplished prior to THP expiration. The general prevention and minimization measures will be implemented concurrent with operations.

I. Inventory and Treatment of Controllable Sediment Sources

All controllable sediment sources are listed in the attached "Erosion Control Plan" table. These sources have been assigned a treatment priority of low, medium or high based on: 1) potential for significant sediment delivery to a Class I, II or III channel; 2) treatment immediacy (a subjective combination of event probability and sediment delivery); and 3) treatment cost-effectiveness.

The Prioritization for implementing prevention and minimization measures for road-related and non road-related controllable sediment sources is based upon guidance provided in Order No. R1-2006-0041 (Freshwater Creek) Highest priority is assigned to the largest sediment discharge sources that discharge to waters that support domestic water supplies or fish. The landowner's prioritization method considers this guidance, and combines it with consideration for accessibility and level of imminent risk of significant sediment discharge. Sources that receive a high priority rating will be treated by a date certain as noted in the Controllable Sediment Sources table. Sources that receive a low or medium rating are determined to have a low to moderate risk of imminent discharge and will be treated prior to completion of the THP, or as otherwise indicated.

Non-road related controllable sediment sources can include skid road crossings, yarding furrow, skid road in watercourse, perched skid road fill, skid road rutting, landslide, layouts, railroad grade, incline, etc.

Information specific to Controllable Sediment Discharge Sources is listed in the Controllable Sediment Sources Table, below. An explanation of information provided in that table is provided below.

II. General Prevention and Minimization Measures for Controllable Sediment Discharge

In addition to the site specific measures detailed above, the general measures proposed in this project, either as required by another State or Federal regulating agency, or as a matter of Humboldt Redwood Company policy, will prevent or minimize future sediment delivery. These measures include, but are not limited to measures incorporated in the THP Section Items as follows:

THP Section II:

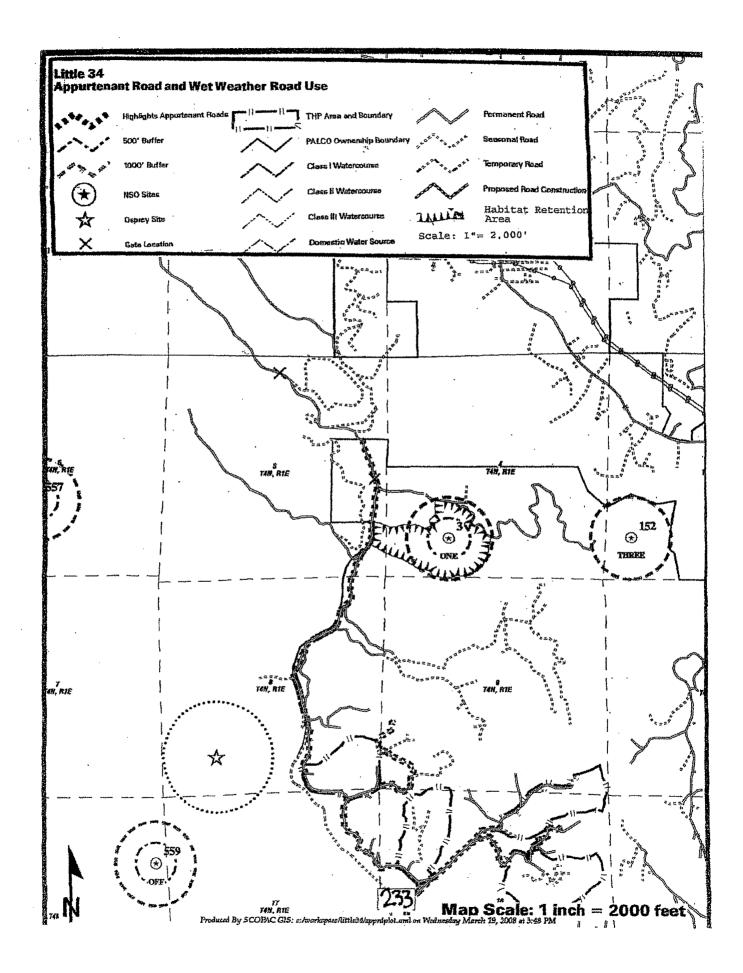

- Item 14 Describes silvicultural prescriptions
- (i) Site Preparation Disclosure of selected site preparation treatments and mitigation measures
- Item 16 <u>Harvesting Practices</u> Describes yarding systems, equipment utilized, equipment limitations, and drainage facility installation timing
 - Inclusive through (m) equipment use limitations and mitigation
- Item 18 <u>Soil Stabilization</u> waterbreak requirements, mitigation to minimize soil disturbance and sediment transport
- Item 20 Ground Based Equipment Use Location
- Item 21 <u>Ground Based Equipment Use in Sensitive Areas</u> locations, descriptions of operations, limitations and mitigation measures
- Item 22 <u>Alternative Practices to Harvesting and Erosion Control</u>
- Item 23 <u>Winter Operations</u> Provides descriptions of limitations and mitigation measures required during winter period operations and Winter Operating Plan
- Item 24 <u>Roads and Landings</u> Describes road and landing construction and re-construction operations, limitations, drainage relief structure installation, mitigation measures, road maintenance, inspections and wet weather road use restrictions
- Item 25 <u>Site Specific Measures to Reduce Adverse Impacts and Special Instructions to the LTO</u>
- Item 26 <u>Watercourse and Lake Protection (WLPZ)</u>
- Item 27 <u>"In Lieu" WLPZ Practice(s)</u>
- Item 28 <u>Downstream Water Users Notification and Domestic Water Supply Protection</u> Description of protection measures
- Item 29 <u>Sensitive Watershed</u> Identifies whether the plan is located in a designated sensitive watershed and mitigation measures
- Item 29 1 <u>Hillslope Management (HCP 6.3.3.7)</u> Describes HCP hillslope management measures required as per watershed analysis

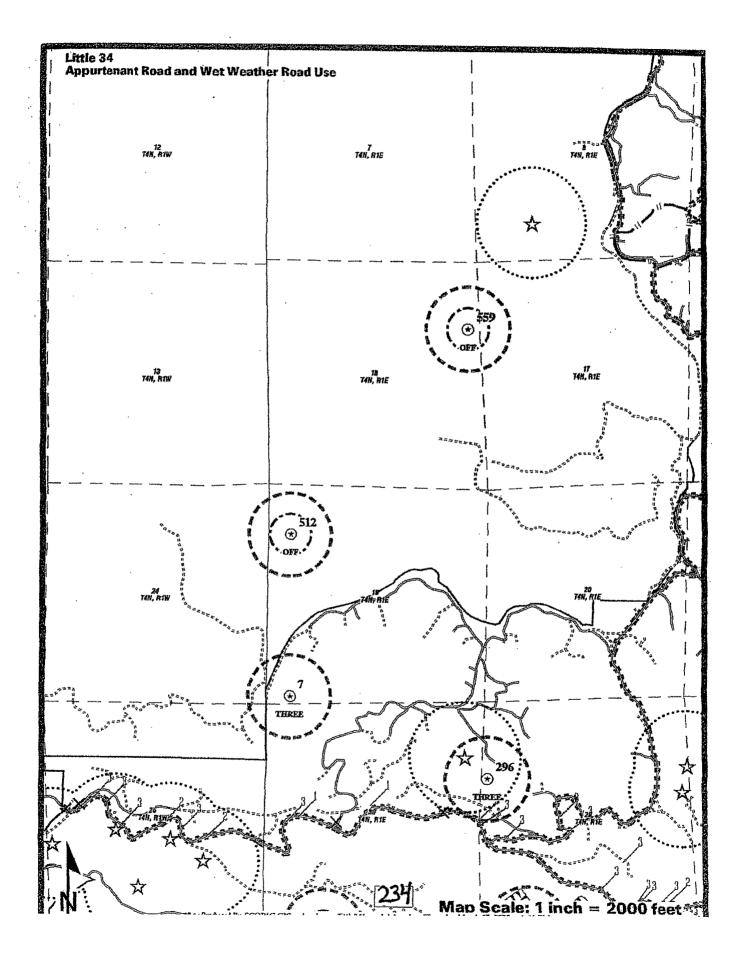

THP Section V:

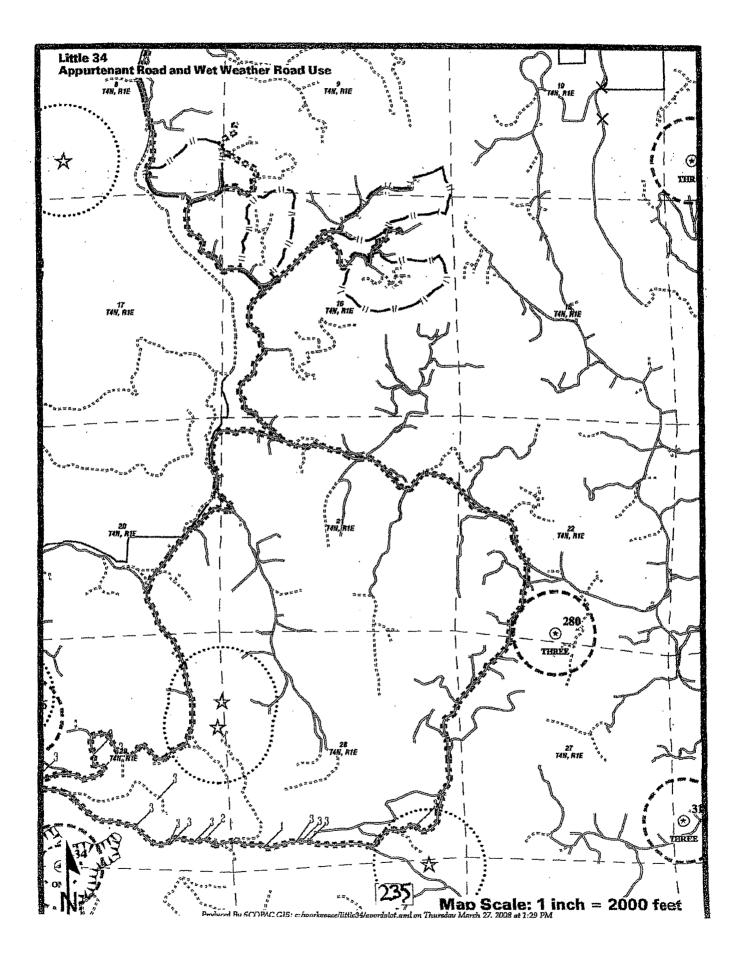

<u>Sediment Reduction from Roads and THP Sediment Production</u>--Including Table 1 – "Sediment Delivery for Units and Roads for this THP," references, letter regarding Road related sediment assessment for this THP with the calculations of deliverable net cubic yards of sediment, calculations and PWA information related to the THP project area when available

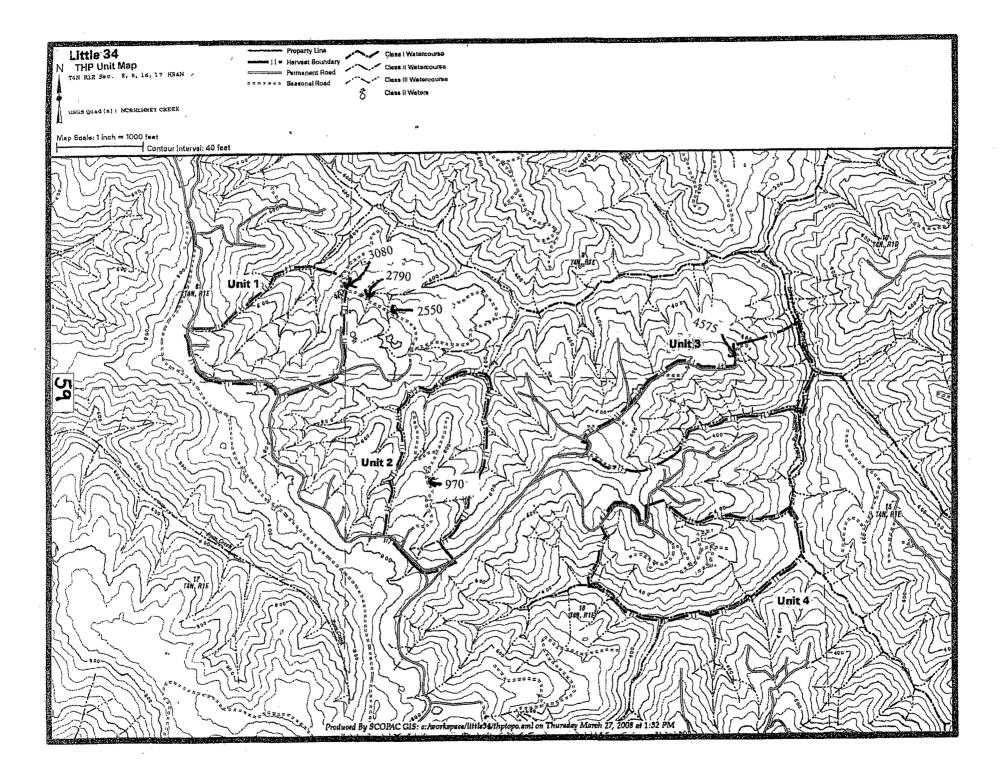

Maps attached:

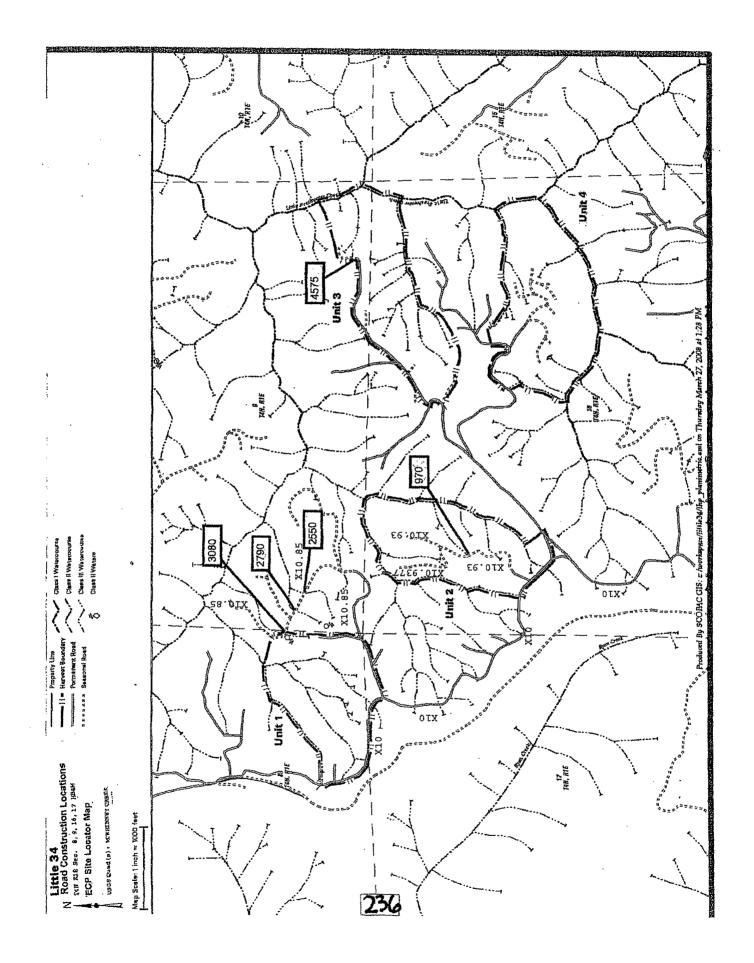

- Appurtenant Road and Wet Weather Road Use map
- Road Construction Locations/ECP Site Locator Map

- III Inspection Plan and Reporting Requirements
- A. Inspection Plan

The Inspection Plan is designed to ensure that all required management measures are installed and functioning prior to rainfall events; that the management measures are effective in controlling sediment discharge sources throughout the winter period; and that no new controllable sediment discharge sources developed.

- B. Qualified and trained professionals will conduct all specified inspections of the project site to identify areas causing or contributing to a violation of the applicable water quality requirements or other provisions of these WWDRs. The responsible party for inspection and reporting is **Jon Woessner (707) 764-4376**.
- C. No inspections are required in Project Areas where Timber Harvest Activities have not yet commenced.
- D. Project Areas where Timber Harvest Activities have commenced and no winter period Timber Harvest Activities have occurred inspections will be conducted each year and throughout the duration of the Project while Timber Harvest Activities occur.
 - a. The Project is covered under WWDRs and the following inspection requirements will begin at the startup of timber harvest activities within the Project area:
 - i. By November 15 to assure Project Areas are secure for the winter period;
 - ii. Once following ten (10) inches of cumulative rainfall commencing on November 15 and prior to March 1, as worker safety and access allows; and
 - iii. After April 1 and before June 15 to assess the effectiveness of management measures designed to address controllable sediment discharges and to determine if any new controllable sediment discharges sources have developed.
 - b. Project Areas with Winter Period Timber Harvest Activities will conduct inspections of such Project Areas while Timber Harvesting Activities occur and the Project is covered under the WWDRs as follows:
 - i. Immediately following cessation of winter period Timber Harvest Activities to assure areas with winter Timber Harvest Activities are secure for the winter;
 - ii. Once following ten (10) inches of cumulative rainfall commencing on November 15 and prior to March 1, as worker safety and access allows; and
 - iii. After April 1 and before June 15 to assess the effectiveness of management measures designed to address controllable sediment discharges and to determine if any new controllable sediment discharges sources have developed.
 - c. Inspection reports will identify where management measures have been ineffective and when repairs and design changes will be implemented to correct management measure failures.
 - d. After completing the required inspections, and when it has been determined new controllable sediment discharges sources have developed, the ECP, implementation schedule, and inspection plan will be updated, if required, consistent with the WWDRs and submit the updated documents to the Regional Water Board to maintain coverage under the WWDRs. If the approved amendment is found to be out of compliance with the WWDRs, the Project will be amended to be consistent with the provisions of the WWDR within 30 days, or coverage under the WWDRs will be terminated. The Project will then be required to seek Project coverage under an individual WDR.
 - e. Equipment, materials, and workers will be available for rapid response to failures and emergencies, implement, as feasible, emergency management measures depending upon field conditions and worker safety for access.
- D. If during the inspection or during the course of conducting timber harvest activities, a violation of an applicable water quality requirement or conditions of WWDRs is discovered, the following procedures will be followed:
 - a. When it has been determined that discharges are causing or contributing to a violation or an exceedence of an applicable water quality requirement or a violation of a WWDR prohibition:
 - i. Corrective measures will be implemented immediately following the discovery that applicable water quality requirements were exceeded or a prohibition violated, followed by notification to the Regional Board by telephone as soon as possible but no later than 48 hours after the discharge has been discovered. The notification will be followed by a report within 14 days to the Regional Board, unless otherwise directed by the Executive Officer, that includes:
 - 1. the date the violation was discovered;

- 2. the name and title of the person(s) discovering the violation;
- 3. a map showing the location of the violation site;
- 4. a description of recent weather conditions prior to discovering the violation;
- 5. the nature and cause of the water quality requirement violation or exceedence or WWDR prohibition violation;
- 6. photos of the site characterizing the violation;
- 7. the management measure(s) currently being implemented;
- 8. any maintenance or repair of management measures;
- 9. any additional management measures which will be implemented to prevent or reduce discharges that are causing or contributing to the violation or exceedence of applicable water quality requirements or WWDR prohibition violation; and,
- 10. The signature and title of the person preparing the report.
- 11. The report will include an implementation schedule for corrective actions and describe the actions taken to reduce the discharges causing or contributing to violation or exceedence of applicable water quality requirements or WWDR prohibition violation.
- E. For other inspections conducted where violations are not discovered, a summary report will be submitted to Executive Officer by June 30th for each year of coverage under the WWDRs or upon termination of coverage. The summary report, at a minimum will include the date of inspections, the inspector's name, the location of each inspection, and the title and name of the person submitting the summary report.

If helicopter operations are proposed for this project, please find attached a Columbia Helicopters, Inc. (CHI) <u>Fuel Spill</u> <u>Prevention and Cleanup Plan For Columbia Helicopters Field Operations</u>.

Explanation	of Information Included in the Controllable Sediment Sources Table					
Column Heading	Explanation					
Site No.	Site identification unique to project area					
Site Type	A description of the existing site. Example: Humboldt Crossing; Culvert Crossing; Unstable Fill; Unstable Cut Slope; Diversion Potential.					
Estimate of Potential Erosion	A quantitative estimate of the volume, in cubic yards, of the total amount of potential erosion/displacement of soil that will occur should the site entirely fail. The landowner often uses a methodology developed by Pacific Watershed Associates to estimate erosion, which assumes 100% delivery of calculated volume—use of this method for individual sites is noted in Site Description.					
Potential Sediment Delivery Percent	An estimate of the relative potential for sediment delivery expressed as a percent of the total amount of Potential Erosion that will be discharged to waters of the State should the site fail.					
Sediment Prevention Volume	The volume, in cubic yards, of sediment discharge estimated to be prevented by implementation of the prescribed treatment. Volume represents the Estimate of Potential Erosion multiplied by the Potential Sediment Delivery Percent.					
Priority for Treatment	Treatment priority reflects the immediacy of sediment discharge and the relative risk to the receptor, should the site fail. Low priority sites are ones that will not likely deliver significant amounts of sediment during the life of the WWDR permit, and will be treated prior to filing of THP work completion report, which does not exceed 5-years following THP approval date. Medium or high priority sites indicate potentially imminent discharge, and the timing of treatment is indicted in Implementation Schedule column.					
Implementation Schedule	Indicates the timing of implementing the prevention and minimization measures listed in the Treatment column.					
Site Description	Provides sufficient information that describes the existing condition of the site and factors that inform the chosen treatment methods and implementation schedule. This information will include a description of how the existing condition of the site (ie. stable or unstable) will be affected by different storm events, and whether sediment discharge is imminent. For example, an unstable site could easily discharge significant amounts of sediment in a small storm, thus the treatment priority should be higher. Conversely, a stable site that may take one or more very large storms to trigger discharge could be lower treatment priority. If PWA method is used to calculate erosion/delivery volumes, it will noted here.					
Treatment	Sediment discharge prevention and minimization measures that will be implemented at the site, including treatment specifications if necessary.
