Subject: 2012 Integrated Report - Dieldrin Lines of Evidence

Hello Katharine,

Dieldrin Lines of Evidence for the following water bodies from the mussel watch data set should not be used in assessments for the 2012 Integrated Report:

Bodega Head (LOE 31747)

Klamath River Flint Rock Head (LOE 31751)

For the above water bodies, the dieldrin results (calculated wet weight) exceeded the guideline; however, the calculated results are below the calculated minimum level. Analyte results that are below the minimum level cannot be used as valid results for Integrated Report assessments.

Thank you,
Lisa
