BEFORE THE CALIFORNIA STATE WATER RESOURCES CONTROL BOARD

IN THE MATTER OF:

SPRAWLDEF and DAVID TAM,

Petitioners,

vs.

SAN FRANCISCO BAY REGIONAL WATER QUALITY CONTROL BOARD,

Respondent, and

WASTE CONNECTIONS, INC.,

Real Party in Interest.

Matter No.

PETITION FOR REVIEW

OF DECISION BY SAN FRANCISCO BAY REGIONAL WATER QUALITY CONTROL BOARD

POTRERO HILL LANDFILL WDRs
ORDER NO. R2-2011-0032

[Water Code §13320, 23 CCR §2051]

I. INTRODUCTION

Pursuant to California Water Code §13320, petitioners SPRAWLDEF ("Sustainability, Parks, Recycling And Wildlife Legal Defense Fund") and DAVID TAM respectfully seek State Water Resources Control Board for review of the San Francisco Regional Water Quality Control Board's approval of waste discharge requirements (WDRs) for the Potrero Hills Landfill.

Located in Solano County, the Potrero Hills Landfill seeks the WDRs to expand the landfill from 190 to 535 acres and to accept 10 times the daily volume previously permitted.
The San Francisco Bay Regional Water Quality Control Board (RWQCB) voted on May 11, 2011 to approve an Updated Waste Discharge Requirements and Water Quality Certification (the “Order”) for the expansion of the Potrero Hills Landfill. On May 19, 2011, by cover letter dated May 18, 2011, the Board transmitted the final Order no. R2-2011-0032.

The approved Order violates the Basin Plan for the site of the Potrero Hills Landfill expansion. The expansion would bury the natural aquatic resources of Spring Branch Creek. The creek is situated in a valley which drains into the 85,000-acre, state-protected Suisun Marsh. The Marsh constitutes 10 percent of California’s remaining wetlands.

The expanded landfill will eliminate presumptive beneficial uses of the Creek, as well as wetlands and habitat associated with the Creek. See the Order, item 95, page 23.

The Order violates the Basin Plan Fill Policy which requires that “wetland disturbance should be avoided whenever possible” and only after all possible avoidance has been achieved. This project violates those standards.

Instead the Regional Board accepts as “mitigation” land already protected in the Suisun Marsh Secondary Protection Area. Land already protected is not “mitigation.” As discussed below, the Regional Board failed to adopt clear alternatives, instead deferring to a financial analysis of the discharger which justified the destruction of value.

The Order violates state statutes by accepting the later disposal of high-moisture sludge and biosolids which the Board’s own staff concluded could result in pollution into protected waters. The Regional Board improperly deferred its findings to the adoption of a management plan to be submitted later without the opportunity for public review and comment.

Finally the Water Certification issued with the Order approves an alternative analysis provided by the project proponent. Substantial contrary evidence was introduced which proves that the landfill expansion is unneeded because of a glut of already-approved landfill capacity and because the cost calculations provided by the landfill vastly overstate the financial impracticability of a scaled-back project.

Petitioners seek an order to void the approvals of the Regional Board and to order the preservation of Spring Branch Creek, prohibition of sludge and biosolids disposal or spreading, and a genuine alternatives analysis which recognizes the abundance of alternative landfill capacity.
II. PARTIES

Petitioner SPRAWLDEF is a California non-profit public benefit corporation with its principal office in El Cerrito, California. The organization's mission is the legal defense of environmental programs for the promotion of socio-economic sustainability, parks, recycling, wildlife and natural features of Northern California.

The organization's directors live in the San Francisco Bay area and benefit from the proper enforcement and permitting of solid waste facilities. As particularly relevant here, the organization's members benefit from eliminating or reducing the impacts of the Potrero Hills Landfill upon the environmentally treasured Suisun Marsh.

Petitioner David Tam is an individual, a resident of Berkeley, California. He is a board member of SPRAWLDEF and was a board member of SPRAWLDEF at all times relevant to this action. He benefits from the protection of the Suisun Marsh, which he has visited on several occasions, and also by the strict enforcement of environmental protection in the Bay Area.

Respondent, San Francisco Bay Regional Water Quality Control Board, with its principal offices in Oakland, California, was at all times relevant hereto an agency of the state of California with certain authorities under the Porter-Cologne Water Quality Act.

Real Party in Interest Waste Connections, Inc. is the successor to Republic Services' ownership and operation of the Potrero Hills Landfill since on or about April 3, 2009. Waste Connections has its main offices in Folsom, California.

III. JURISDICTION AND NOTICE

California Water Code §13320 provides: "Within 30 days of any action or failure to act by a regional board... an aggrieved person may petition the state board to review that action or failure to act.

Pursuant to 23 CCR §2051, petitioner states the following:

a) Petitioner will submit this petition upon the Regional Board and the discharger.

b) Petitioner requests preparation of the administrative record in the matter.

c) A list of others interest in the subject matter is provided herewith as Exhibit A.
IV. STATEMENT OF POINTS & AUTHORITIES

Petitioner makes the following allegations based upon its information and belief.

The County of Solano approved Revision No. 2 to Marsh Development Permit MD-88-09 (U-88-33) on September 13, 2005 (Resolution No. 2005-203, hereafter “the Permit” or the “County Permit”).

The County Permit would expand the Potrero Hills Landfill onto 167 acres of a 210-acre parcel adjacent to the existing landfill, and change landfill operations, including changes to waste processing, increased operation hours and additional night-lighting. The increased footprint would add approximately 74.7 million cubic yards of fill capacity, an expansion of more than three times its current authorized capacity of 21.5 million cubic yards.

In addition to the physical expansion, the expansion project would involve constructing various ancillary structures, such as a new truck/container washing facility, a landfill gas-to-energy power plant, a visitor center, new power lines and changes to existing PG&E transmission lines, a water pipeline and storage tanks, and new sedimentation basins.

THE PROJECT SITE AND ITS SPECIAL PROTECTIONS

The Suisun Marsh Preservation Act (Marsh Act) of 1977 was passed by the legislature to preserve and protect valuable marsh habitat and upland grass-lands within the Suisun Marsh.

“Suisun Marsh” and “marsh” refer to water-covered areas, tidal marsh, diked-off wetlands, seasonal marshes, lowland grasslands, upland grasslands, and cultivated lands designated for special protection by the Suisun Marsh Preservation Act of 1977. California Public Resources Code §§ 29000 et seq., also referred to hereafter as the Act, or the Marsh Act. The Suisun Marsh includes both the primary and secondary management areas as shown on the Suisun Marsh Preservation Plan Map. PRC §29101.

According to the Marsh Act’s legislative findings, the Suisun Marsh consists “of approximately 55,000 acres of marshland and 30,000 acres of bays and sloughs, and comprising almost 10 per cent of the remaining natural wetlands in California.”

The Act (§29002) states that: “… the Suisun Marsh represents a unique and irreplaceable resource to the people of the state and nation; that future residential, commercial, and industrial developments could adversely affect the wildlife value of the area; and that it is the policy of the state to preserve and protect the resources of this nature for the enjoyment of the current and succeeding generations.”
The plan for protecting the marsh is laid out and adopted as the Suisun Marsh Preservation Plan, which includes the mapping of the marsh, including its primary and secondary management areas. PRC §29113 and Fish & Game Code §1850.

Potrero Hills Landfill is located within the secondary management area of the Suisun Marsh, in an unincorporated area of Solano County, approximately two miles southeast of the City of Fairfield. See Order, section 4.

Solano County, the local government with jurisdiction over the project, has primary permitting authority over development within the secondary management area under a Local Protection Plan (LPP). The landfill began operations in 1986, four years after the approval of LPP was adopted in 1982.

In adopting the Marsh Act, the legislature grandfathered in the operations of a pre-existing landfill which the Solano Garbage Company was operating in the primary management area and adjacent to Hill Slough.

Section 29409 of the Marsh Act states: "Notwithstanding the policies of the Preservation plan, the local protection program may not preclude the future development of a new solid waste disposal site in the Potrero Hills if it can be demonstrated that the construction and operation of solid waste facilities at that site would not have significant, adverse ecological or aesthetic impacts on the marsh."

The County approved a new Potrero Hills landfill site in 1984 (Permit No. MD-82-19; U-82-56). When the Potrero Hills Landfill first opened in 1986 at its new site, it brought in on average between 225 to 324 tons of waste per day from Fairfield, Suisun City, Travis Air Force Base, Rio Vista and the Green Valley unincorporated areas of Solano County.

The Marsh Act requires that "existing uses should continue in the upland grasslands and cultivated areas surrounding the critical habitats of the Suisun Marsh in order to protect the Marsh and preserve valuable marsh-related wildlife habitats. Where feasible, the value of the upland grasslands and cultivated lands as habitat for marsh-related wildlife should be enhances."

Thus the protected areas of the Marsh—considered as "mitigation" under the Order here—are already protected under the Marsh Act.
MEASURE E IMPORT LIMITATIONS AND THE PERMIT APPROVALS

Important in any discussion of alternatives to the proposed Potrero Hills Landfill expansion is Measure E. Solano County voters passed Measure E in November, 1984 limiting the importation of out-of-County wastes to 95,000 tons per year, or about 300 tons per day. Measure E was passed by 68.7 percent of Solano County voters.

When the Solano County Board of Supervisors initially approved the landfill expansion on September 13, 2005, the environmental impact report certified to support the permit pursuant to the California Environmental Quality Act (CEQA) was challenged in Solano County Superior Court. The Court twice threw out the EIR as inadequate before finally certifying the document as adequate as mitigated in 2009.

While the EIR supporting the landfill expansion and marsh development permit was being revised to meet the Court’s writ orders, SPRAWLDEF and David Tam, petitioners here, objected that the County permit violated Measure E.

The expanded Potrero Hills Landfill as approved under the Order would receive waste from other counties around the Bay Area totaling approximately 2,300-2,400 tons per day. Almost 840,000 tons per year come to the landfill from other jurisdictions—a clear violation of the limits set by Measure E.

In comments raised by SPRAWLDEF in the County’s June 9, 2009 certification of the once-again revised EIR’s, County Counsel reiterated the County’s position that Measure E was unconstitutional and that it would not be enforced. Strongly convinced of the initiative’s constitutionality, SPRAWLDEF filed suit in Solano County seeking an order that the County enforce the measure.¹

On May 12, 2010, the Solano County Superior Court ruled that Measure E was constitutional and enforceable. However, the ruling did not enjoin or invalidate the County’s use permit.

Thus at this time, Measure E constitutes a legal limit on the quantity of waste imported to the landfill. It is also a clear alternative which must be evaluated in any purported need for the project. Petitioners maintain that the only need for the expansion is to allow Waste Connections, Inc., its new owner through a federally imposed divestiture, to underbid other existing landfills.

¹ Solano County Superior Court case no. FSO33700, filed June 12, 2009.
ARGUMENTS

This is an unneeded landfill. Currently a glut of landfill capacity exists in the Bay Area and throughout California. According to a June 9, 2011 article in the Sacramento Bee, based on figures from CalRecycle, almost 50 years of landfill capacity is permitted in California. And need is actually diminishing as communities and citizens continue to succeed reducing and recycling their waste.

This expansion would needlessly destroy aquatic resources in one of the most valued California wetlands—the Suisun Marsh. The “mitigation” upon which the Order justifies this destruction is a chimera. The “preservation” land is already preserved under the Marsh Protection Act.

The project should be denied its WDRs or in the alternative the project should be scaled back to cause less impact by saving Spring Branch Creek.

1. Covering Spring Branch Creek will impermissibly destroy presumptive uses and threaten water quality.

The project site is located two to three miles upstream of the brackish Suisun Marsh. An ephemeral surface water runoff channel, the valley of Spring Branch Creek, exists along the southern edge of the expansion site and runs from east to west.

Spring Branch Creek is formed from two smaller waterways to the east and south, which drain from the hills into swales that continue to the headwaters of the creek. Spring Branch Creek flows west into First Mallard Branch, a tributary of Cutoff and Suisun Sloughs.

Spring Branch Creek downstream of the landfill flows into the stock-water pond constructed offsite by the dump operator in 1995. No residential or commercial structures are located within the project drainage area.

Approximately 210 acres of upland grassland habitat would be affected by the proposed expansion authorized by the Order. In addition, the aquatic habitats on the expansion site that would be affected include an approximately 0.44-acre portion of Spring Branch Creek and its tributaries, several seasonal wetlands, and the filling of ponds.

The expansion project involves destruction by burial of the eastern portion of Spring Branch Creek that falls within the landfill expansion project. The project entails constructing a buttress fill along the southern edge of the landfill expansion area and allowing water that now flows in Spring Branch Creek
to carry flow from the eastern Potrero Hills Valley south around the landfill. The main creek flow will be routed into a 6,500-foot, pre-cast concrete pipeline placed at the bottom of the soil buttress area.

Spring Branch Creek is identified in the *Suisun Marsh Preservation Plan Supplement* (SMPP) as one of 11 streams in the Suisun Marsh Area. In 2006 BCDC appointed a five-member science panel. Their report identified Spring Branch Creek as a stream, with riparian vegetation and a bed and bank and supports this characterization with photographic evidence. In addition, the Solano County General Plan depicts Spring Branch Creek with the symbol for "stream and creek." The terms stream and creek are used interchangeably in both legal and non-legal definitions. Spring Branch Creek is shown as an intermittent stream on every USGS topographic map depicting the Potrero Hills.

The California Department of Fish and Game (DFG) defined Spring Branch Creek as a jurisdictional water, meaning that it is a river, lake or stream. The United States Army Corps of Engineers identified Spring Branch Creek as an intermittent stream in at least two separate public notices describing the project, which define the tributaries of Spring Branch Creek as streams as well. Both documents also note the presence of riparian vegetation.

The scientific panel commissioned by BCDC evaluated the impacts on Spring Branch Creek. It notes that the expansion "effectively eliminates the natural, remaining upper Spring Branch Creek watershed and permanently reconfigures the Spring Branch Creek valley" and that the "changes will disrupt and impede watershed run-off and stream flow, alter the creek’s water temperature, and have the potential to affect other water quality parameters such as turbidity and salinity."

The report finds that the upstream channelization and relocation of Spring Branch Creek will decrease its ecological value and have repercussions, likely negative, on the lower watershed as it flows west into Suisun Marsh at First Mallard Slough.

According to the U.S. Army Corps of Engineers (Corps), this would result in impacts to approximately 2.42 acres of Section 404-jurisdictional wetlands and other waters of the United States, 0.076 acre of isolated waters of the State of California, and 0.61 acre of non-jurisdictional pond habitat.

---

1 Potrero Hills Landfill has not obtained a Streambed Alteration Permit from DFG at the time of the Order.

---

PETITION FOR REVIEW BY SWQCB
According to section 2.2.1 of the relevant Basin Plan: “The beneficial uses of any specifically identified water body generally apply to all its tributaries.” Here the Suisun Marsh is the water body. It is one of the most environmentally precious water bodies in the state. See the Order, section 94, page 23. The tributaries here are the waters that flow from the uplands to the Marsh, through what the project proposes will be turned into a mountain of garbage.

The surface water protections of the Basin Plan, section 2.2.1, are violated because, as noted by the Order, the Plan’s Wetland Fill Policy requires that wetland disruption be minimized whenever possible. See the Order, page 24, section 96.

The secondary protection area of the Suisun Marsh is recognized as important to the Marsh because of the drainage from the uplands to the Marsh. The proposed project, as noted in the record, will impact the connection between the uplands and the Marsh; but the Order ignores these connections, the project disruption and the consequent impacts to the Marsh.

Despite these substantially if not abundantly evident violations of the Regional Basin Plan’s wetland and surface water policies, the Regional Board accepted them merely on the basis of the proponent’s “Clean Water Act section 404(b)(1) Alternatives Analysis.”

That rationalization is clearly improper.

2. The proponent’s “alternatives analysis” provides no substantial evidence that the Order avoids wetland loss “whenever possible.”

The financial impacts to a private company—the Wall-Street-traded garbage company Waste Connections here—are irrelevant to the requirement that the project not adversely impact the Marsh ecology.

The Order by the Regional Water Quality Control Board however simply defers to the economic rationalization of the losses to aquatic value by referring to the proponent’s alternatives analysis. See the Order, item 96, page 24.

The alternatives analysis by Waste Connections fails to include substantial evidence of avoidance of impacts. Instead the proponent and the Order rest compliance entirely on the mitigation acreage—acreage which is already protected.
The alternatives analysis required under the Clean Water Act.

The Order approves exemption from the requirement of the Clean Water Act prohibiting discharge on wetlands and federal waters, where an alternative exists. This finding, relying as it does only on the proponent's self-serving information and ignoring other facts, is arbitrary and capricious.

The Clean Water Act, under 40 CFR §230.10, provides:

(a) Except as provided under section 404(b)(2), no discharge of dredged or fill material shall be permitted if there is a practicable alternative to the proposed discharge which would have less adverse impact on the aquatic ecosystem, so long as the alternative does not have other significant adverse environmental consequences.

Thus, under the Act, no discharge is allowed if a "practicable" alternative has "less adverse impact on the aquatic ecosystem."

Section 230.10(a)(2) defines "practicable":

(2) An alternative is practicable if it is available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purposes. If it is otherwise a practicable alternative, an area not presently owned by the applicant which could reasonably be obtained, utilized, expanded or managed in order to fulfill the basic purpose of the proposed activity may be considered.

Thus, under the Act, no discharge is allowed if a "practicable" alternative has "less adverse impact on the aquatic ecosystem."

Here the objective is "economical and environmentally sound landfill disposal capacity..." See page v of the landfill's alternative analysis.

It should be noted that "taking into consideration cost" clearly does not mean simply that an alternative is more expensive, only that the alternative is impractical because of cost. Under this definition, also, landfilling elsewhere could be "maintained" or "utilized" as an alternative.

The burden is on the project proponent to affirmatively demonstrate, and to "clearly" rebut, the presumption of any "practicable" alternative to landfill wetland destruction. 40 CFR 230.10(b)(3). The
Potrero Hills Landfill proponent has provided nothing near an affirmative demonstration of the lack of practicable alternatives. Rather, facts clearly show:

- Most—85 percent—of the waste disposed at the landfill is from jurisdictions outside Solano County, and those jurisdictions all have alternative landfill options available right now. It is only because the Potrero Hills Landfill under-prices its rates on the back of the Suisun Marsh environment that out-of-county wastes are disposed there.

- The Hay Road Landfill in Solano County is a viable alternative for the County-generated waste disposed at the Potrero Hills Landfill. The court has ordered the County to enforce Measure E, limiting out-of-county imports to 95,000 tons a year, making the existing Hay Road Landfill sufficient to accommodate the waste generated in the County.

- No clear rebuttal has been offered by the proponent to the presumption that practicable alternatives to the proposed landfill exist that do not involve wetlands. The proponent typically dismisses any other landfill capacity out-of-hand. This is not sufficient to meet the analysis required under Section 404(1)(b).

The "no project" alternative is not analyzed.

The Order is fundamentally flawed because it fails to analyze not expanding the landfill. Under 40 CFR §230.5(b) of the Clean Water Act, the alternative analysis must be performed as follows:

(c) Examine practicable alternatives to the proposed discharge, that is, not discharging into the waters of the U.S. or discharging into an alternative aquatic site with potentially less damaging consequences (§ 230.10(a)).

The facts are clear in the record that abundant already-existing, permitted landfill capacity exists in the Bay Area. Thus not discharging into the Suisun Marsh protected area is possible while still having "economical and environmentally sound landfill disposal capacity," as the proponent puts it.

Even the proponent’s self-serving analysis acknowledges that landfill capacity exists which will not entail the impacts of the project. See for example, the Contra Costa landfill surveyed on page 22 of the landfill’s analysis. But the proponent concludes that: “This site is a currently operating landfill facility;
therefore, it is not available for development of the proposed project. Therefore it is not a practicable alternative.”

Perhaps. But the existence of the currently operating facility would meet the need for landfill availability, which is the project’s basic purpose. Currently operating landfill facilities would meet that basic purpose without impacting additional wetlands.

Thus the “no project” alternative is clearly viable.

*The modified design cannot be rejected solely on Waste Connection’s profit impact.*

A modified landfill design could preserve the hydrological connection between the uplands and Suisun Marsh, benefitting all the values assigned to the uplands and marsh in the Basin Plan. Under this alternative, the landfill would be scaled back to preserve Spring Branch Creek. This alternative was originally proposed by staff with the BCDC and was evaluated in the proponent’s alternatives analysis.

The Order accepts the landfill’s justification for not modifying the site design to avoid covering Spring Branch Creek. The only justification for failing to require this alternative is the loss of profit to the landfill. And the only basis for this determination is the landfill’s self-serving evaluation. See pages 11 and 37 of the landfill’s analysis.

Preservation of Spring Branch Creek—on-site alternatives 3 and 4, under the proponent’s analysis—would result in a smaller landfill. The proponent’s alternatives analysis claims that this would result in impractically higher unit costs. But even accepting that Waste Connections’ marginal return will diminish, no evidence whatsoever is provided that this is “impracticable.” No cost sensitivity analysis is provided that compares tipping charges at the other landfill alternatives for example. Landfills are built in phases—cell by cell. Thus unit costs can be determined cell by cell. But this was not done.

SPRAWLDEF maintains that the discharger’s profits are an improper basis for rejecting alternatives. But even accepting that they are, SPRAWLDEF provides substantial evidence in the submitted analysis of expert Ken Wells that the reduced landfill footprint that would save Spring Branch Creek would have negligible impact on Waste Connection’s tipping fee rates.

In the end, the Order appears to accept—improperly—that “impracticable” means “less profit” under Waste Connections’ analysis. And this is not an analysis that complies with CWA §404(b)(1) or provides a sufficient analysis to justify the Basin Plan impacts.
3. The Order improperly defers assurance that sludge and biosolid management will not impact waters and uses.

Title 27 of the California Code of Regulations (CCR) prohibits the discharge of high-moisture sludges (greater than 50 percent solids content, by weight). 27 CCR §20200(d)(3). The Order, section 19, page 5.

As Title 27, as clarified in 2004 by the State Water Board’s General WDRs Order No. 2004-0012-DWQ, dictates that the Suisun Marsh, both the primary and secondary protection areas, are not allowed to accept biosolids or sludge for land spreading.

Waste Connections wants to bury or land spread high-moisture sludge or sludges that will be spread for solar drying at the site, sludges that will be used as alternative daily cover (ADC), or sludges that will be applied as a soil amendment.

On-site management of high-moisture content sludges increases the potential for water quality impacts. There is no management plan for these wastes and the Joint Technical Document (JTD) for the landfill expansion has not been approved by the County of Solano LEA. Thus there was no data available for public review regarding how the landfill will measure the moisture content of wastes and waste-soil mixtures, nor does the Order describe in detail how high-moisture content wastes will be managed within the landfill property.

If not managed properly, sludges can be a threat to surface water quality if allowed to contact and mix with stormwater runoff. High-moisture wastes can cause excessive leachate generation if the moisture-holding capacity of the waste pile is exceeded. Finally, sludges can create nuisance conditions due to strong, foul odors.

The Order would allow acceptance of sludge and even appears to entertain land spreading of sludge and biosolids, without a publicly reviewed and approved Sludge Management Plan (SMP). The SMP must state how the moisture content of sludges and sludge-waste mixtures will be measured; it must describe how and where high-moisture content wastes will be stored on site; and it must describe the processes by which sludges will be treated to achieve acceptable moisture content prior to discharge into a disposal cell or used as Alternative Daily Cover (ADC).

Furthermore because of the potentially significant environmental impacts cited above, any SMP will be required to be reviewed under the California Environmental Quality Act (CEQA). Information to be
considered under CEQA will include the potential for water quality impacts, excess leachate production, and
nuisance concerns and whether these impacts are able to be mitigated.

The Order acknowledges the potential of “water quality impacts, excess leachate production and
nuisance concerns associated with sludges...” Such impacts, unless addressed adequately, will have
consequences on the quality of the Marsh and its Basin Plan values.

Similar objection is made to the biosolids which would be allowed under the Order. See page 5 of
the Order. The Order would violate the protections against biosolid disposal or land spreading at the site.
The final approval necessary must be through Solano County and BCDC.

Instead the Order permits biosolid disposal prior to the necessary approvals. This is improper. With-
out the administrative review and public participation through Solano County and BCDC, including any
amendments to the Marsh Local Protection Plan, the approvals are conducted in a void, lacking sub-
stantial evidence necessary to provide the approval. An initial study under CEQA on the biosolids and
sludge management should be performed before the adoption of any Order.

CONCLUSION

Petitioners respectfully beg the State Water Quality Control Board to stay or rescind the Order until
real alternatives are properly evaluated, in particular the scaled-back alternative which would preserve
Spring Branch Creek. Potential environmental impacts of sludge and biosolid handling at the site should
be properly assessed before the adoption of any Order.
