### Session Description

Over 5,000 municipal stormwater permittees are required to develop a post-construction program to address stormwater runoff from new development and redevelopment. The post-construction programs must include requirements to install BMPs and ensure maintenance of those BMPs. To implement an effective program, municipalities need to look beyond the individual site to assess how post-construction controls will affect the entire watershed. This presentation will describe the post-construction program requirements and how innovative programs such as **Low Impact Development and Smart Growth** can be used to help meet these requirements.

**Speaker:** Nikos Singelis, Senior Program Analyst with EPA's NPDES Stormwater Program.

Remember to test your system because you must have the capability of playing sound in order to attend this webcast. You do not need a telephone in order to hear the webcast - a computer with sound is required. The "test your system" link is below. If you need additional technical support, click on the "Help" link below. Also, this webcast is free!!
