PROJECT DESCRIPTION:

Tesoro Environmental Resources Company proposes to discharge treated groundwater from a groundwater cleanup project located at the above-mentioned facility. Soil and groundwater beneath the site are impacted with petroleum fuel compounds. Prior to discharge, the extracted groundwater will be treated by an aboveground treatment system consisting of granular activated carbon adsorbers that have been inoculated with proprietary biological microbes.

VOLUME AND DESCRIPTION OF DISCHARGE:

Up to 28,800 gallons per day of treated groundwater will be discharged into a storm drain that flows into the Los Angeles River (Latitude: 34° 08' 38", Longitude: 118° 22' 11"), a water of the United States. The site location map and the process flow diagram are shown in Figures 1 and 2, respectively.

FREQUENCY OF DISCHARGE:

The discharge of treated groundwater will be intermittent and will continue until the site cleanup has been completed.

REUSE OF WATER:

The reuse of pumped groundwater at the site was evaluated. The immediate vicinity of the site is for commercial use. The pumped groundwater cannot be reused for irrigation because there are no immediate areas that will need irrigation at the site. The disposal of water to sanitary sewer is not cost effective. Therefore, the majority of the groundwater will be discharged into the storm drains.
